Supplement. Habitat locations and features for *Uca* species from the Atlantic coast of Brazil.

Table S1. *Uca* spp. Site localities and principal habitat characteristics for *Uca* collected along the Atlantic coast of Brazil between May 2009 and August 2010. State abbreviations: AP = Amapá, BA = Bahia, CE = Ceará, ES = Espírito Santo, MA = Maranhão, PE = Pernambuco, PR = Paraná, RJ = Rio de Janeiro, SP = São Paulo, SC = Santa Catarina. Habitat abbreviations: mngv = mangrove. Subgenus/species abbreviations: bu = *Minuca* (*M.*) *burgersi*, cm = *Leptuca* (*L.*) *cumulanta*, lp = (*L.*) *leptodactyla*, ma = *Uca* (*U.*) *maracoani*, md = (*M.*) *mordax*, rp = (*M.*) *rapax*, th = *Boboruca* (*B.*) *thayeri*, ur = (*L.*) *uruguayensis*, vc = (*M.*) *vocator*, and vi = (*M.*) *victoriana*

State	Site designation (municipality/feature)	Georeference (latitude, longitude)	Habitat osmolality (mOsm kg ⁻¹ H ₂ O)	Habitat type	Species

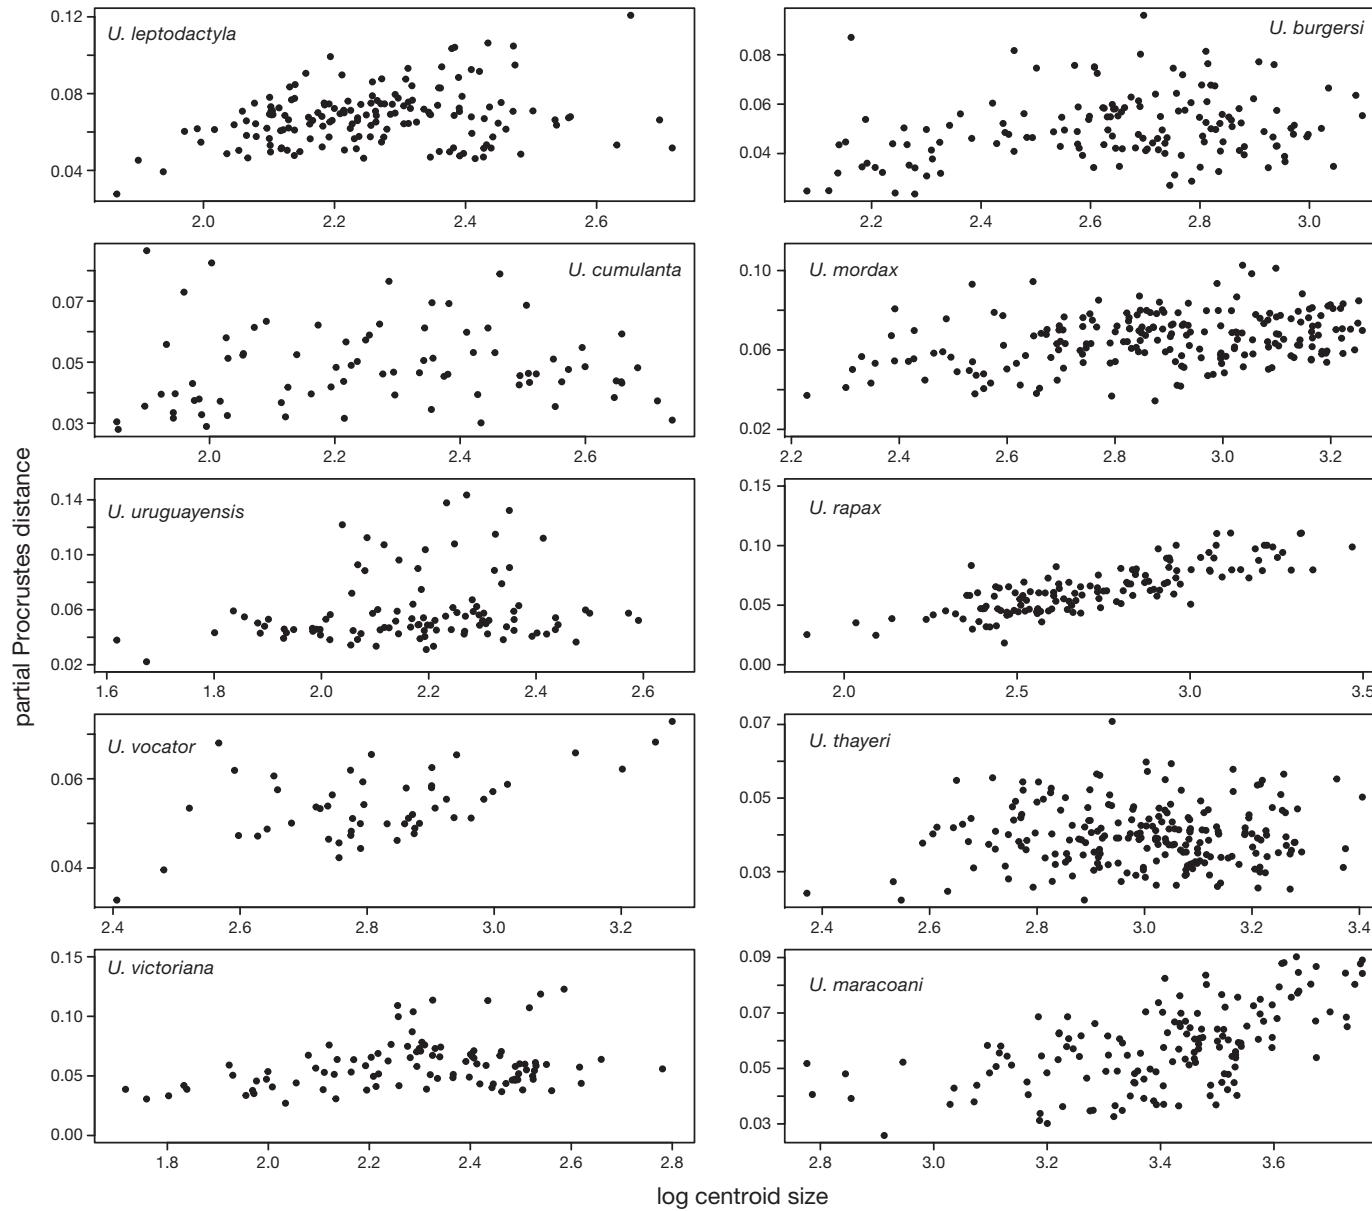

Fig. S1. *Uca* spp. Allometric growth in each species of *Uca* from Brazil. The y-axis is Procrustes distance between each specimen and the mean shape of the smallest 3 specimens, and the x-axis is natural log of centroid size. Where allometric growth occurs, distances increase with size. Some species show tightly constrained allometric growth (e.g. *U. rapax*). Others have much less allometric growth (e.g. *U. cumulanta*). However, as long as the relationship between partial and uniform warp scores is log-linear with centroid size, variation due to allometric growth can be removed by regressing each against size, as implemented in Standard6 (Sheets 2001–2007). Also see Hopkins & Thurman (2010)
