Available online 25 December 2004

Abstract—New pyridylthioether-based dendrons bearing a thiol moiety at their focal point have been prepared by a convergent synthetic approach. These dendrons were readily attached to a $Fe_2(CO)_6$ core to generate two-directional dendritic molecules incorporating an iron-carbonyl cluster.

1. Introduction

Organic-inorganic composites deriving from the encapsulation of metal clusters within dendrimer molecules are emerging as a new class of nanosized materials that are expected to have applications in many areas including catalysis, molecular recognition, and photoactive device engineering.³ In these materials, the chemical interaction between an organic array and the inorganic counterpart can be either covalent or noncovalent. The noncovalent method of incorporation, which uses dendrimers as both nanoreactor that sequesters metal ions and stabilizer, leads to dendrimerencapsulated metal nanoclusters. Moreover, the size of such metallic nanoparticles can be controlled by the size of the dendrimer template.4 Typically, the synthetic strategy to achieve encapsulation relies on complexation of metal ions into the dendrimer interior and their subsequent chemical reduction to zero-valent form. Most syntheses of these nanocomposites concern noble metals^{1,4–7} but dendrimers incorporating copper⁸ have also been reported. Recently, Fréchet-type dendritic wedges⁹ focally functionalized with a metal-coordinating group, such as a thiol¹⁰ or 4-pyridone¹¹ moiety, were assembled around gold clusters affording dendron-stabilized gold nanoparticles in which the average size of the metallic nanoparticles seems to be correlated to the generation number of the dendritic wedges.

The covalent encapsulation of a metal cluster inside dendritic architectures was first reported by Gorman and

Keywords: Dendrimers; Metallodendrimers; Dendrons; Pyridylthioethers; Iron-carbonyl cluster.

co-workers who prepared metallodendrimers containing a $[Fe_4S_4]^{2+}$ cluster core unit via replacement of bulky aliphatic thiols at the four vertices of this cluster by dendron-functionalized aromatic thiols. The main object of Gorman's research group, however, was to understand the relationship between dendritic structure and electrochemical properties of encapsulated iron–sulfur clusters. The main object of the structure and electrochemical properties of encapsulated iron–sulfur clusters.

Because dendritic wedges bearing a thiol functionality at their focal point play a key role in the chemistry of both noncovalent and covalent dendrimer-encapsulated metal clusters we decided to explore the synthesis of a new series of thiol-functionalized pyridylthioether-based dendrons.

There are two features of our dendrons that make them appealing as precursors of dendron-functionalized inorganic clusters. First, the S–N–S terdentate ligands constituting the dendritic framework are potential binding sites of transition metals. ¹⁴ This, therefore, may enable the preparation of heterometallic dendritic assemblies. Second, the pyridylthioether-based repeating units are directly connected through phenyl groups affording a scaffold that could facilitate the electron transfer between dendron units and a focal point.

A prerequisite to successfully achieve the covalent encapsulation of transition-metal clusters using these types of focally-functionalized dendrons, is an efficient synthetic methodology that provides easy access to products of high purity.

To accomplish such a task we have chosen to investigate the chemistry of the dinuclear hexacarbonyls of formula $[Fe_2(CO)_6(SR)_2]$. It has been previously shown that the

reactions between $Fe_3(CO)_{12}$ and bulky aromatic thiols afford compounds of the type $[Fe_2(CO)_6(\mu\text{-SR})_2]$ in good yields. ¹⁵

We focused our efforts on the preparation of analogous systems with dendritic topologies. The results of the synthetic studies which allowed us to assembly novel pyridyl thioether dendrons around an iron-carbonyl core are presented here.

2. Results and discussion

The synthetic route we have adopted to prepare a dendrimer-encapsulated $Fe_2(CO)_6$ core unit consists of treating commercially available $Fe_3(CO)_{12}$ with a dendron-functionalized aromatic thiol which was synthesized via convergent methodology. The building block designed for the synthesis of all dendron generations, namely compound 12, is depicted in Scheme 2, along with the synthetic approach we have developed for its preparation.

The synthesis of 12 was initiated from the commercial diacid 1, (Scheme 1) which was converted to dimethyl 4-chloropyridine-2,6-dicarboxylate 2 in 71% yield according to suitably modified literature procedures. ¹⁶ Subsequent reduction of the ester functionalities to alcohols, using NaBH₄ in methanol, ¹⁷ afforded diol 3 in 96% yield. Halopyridine 3 was then treated with boronic acid 4, prepared ¹⁸ in high yield and purity from 4-bromobenzenethiol, employing the Suzuki cross-coupling conditions (toluene/H₂O, Na₂CO₃, Pd(PPh₃)₄) to give the aryl-substituted pyridine derivative 5 in 61% yield after chromatographic purification. Although we have obtained the desired compound 5 in reasonable yield, the purification step was arduous because of the difficulty in separating 5 from the starting materials. To overcome this problem and to improve the yield of cross-coupling product an alternative approach to 5 was explored.

Since the order of reactivity of the aryl halides towards oxidative addition to a Pd(0) complex suggests that iodopyridines are much more effective substrates than the corresponding chloropyridines, the chloro-substituted pyridine 2 was converted to the corresponding iodo derivative 6 in 93% yield by sonochemical reaction with acetyl chloride, and NaI in dry CH₃CN. 19 Unfortunately, the coupling reaction of 6 with boronic acid 4 under anhydrous conditions in the presence of CsF as base²⁰ only afforded 7 in moderate yield (40–60%). However, the yields compare well with those reported by Lohse,²¹ who investigated the reactivity of methyl 4-chloropyridine-2-carboxylate in a Suzuki reaction. These relatively low yields, presumably due to the sensitivity to base of the esters functions, prompted us to pursue the preparation of 5 from diol 3 by a four-step procedure that proved to give superior results regarding achievable yield of compound 5.

Thus, as outlined in Scheme 2, the hydroxyl functions of 3 were acylated with Ac₂O and trietylamine to afford the corresponding acetate 8 in essentially quantitative yield. To increase the reactivity of 8 in cross-coupling reactions the chloro group of this compound was replaced by iodo employing trans-halogenation conditions (AcCl/NaI, CH₃CN, room temperature, ultrasonic irradiation) to produce compound 9 in 95% yield. As expected, halopyridine 9 furnished the arylpyridine 10 in excellent yield (96%) by a Suzuki reaction using boronic acid 4 as coupling partner of 9, Pd(PPh₃)₄ as catalyst, NaHCO₃ as base, and toluene/H₂O as solvent system. Due to the acetyl groups protecting the hydroxyl moieties, the solubility of 10 in organic solvents was significantly enhanced relative to the unprotected derivative allowing easy separation and purification by silica gel chromatography of this material after reaction. Furthermore, the acetate moiety can be selectively and cleanly removed under mild basic conditions. Accordingly, deacetylation of compound 10 by alkaline methanolysis generated the diol 5, as formed by Suzuki coupling of 3 with 4, in 98% yield (88% overall yield from 3).

Scheme 1. Synthesis of the intermediates 5 and 7.

Scheme 2. Synthesis of the building block 12.

Reaction of **5** with methanesulfonyl chloride and triethylamine furnished the corresponding chloride **11** in 96% yield, which was subsequently converted into its iodo analogue **12** in 99% yield by reaction with NaI in acetone because iodides easily undergo a nucleophilic substitution. On the contrary, direct conversion of diol **5** to diiodide **12** by $I_2/midazole/PPh_3^{22}$ gave poor yields.

The reactivity of the pyridine-based building block 12 evidently emerges in the synthesis of the first-generation dendron. As a matter of fact, coupling diiodide 12 with slightly over 2 equiv of thiophenol under standard etherification conditions (DMF/ K_2CO_3) proceeded quickly (2 h, room temperature) to give the protected first-generation dendron 13 in 97% yield (Scheme 3).

 $\textbf{Scheme 3.} \ Synthesis \ of \ dendrons: (i) \ DMF/K_2CO_3, \ rt; (ii) \ thioanisole, \ TFA, \ CF_3SO_3H, \ rt.$

It is well-known that some S-thiophenol protecting groups, such as thioethers, are particularly stable and their selective removal may be difficult to accomplish in high yield.²³ Nevertheless, the *tert*-butyl moiety in compound 13 could be easily removed using the thioanisole-trifluoromethanesulfonic acid (TFMSA)-trifluoroacetic acid system²⁴ to produce the desired thiol-funtionalized dendron 14 in 95% yield. In accordance with a convergent growth strategy thiol 14 was then reacted with diiodide 12, under conditions similar to those used for 13, to give the second-generation dendron 15 (79%), which was deprotected to the corresponding thiol 16 in 97% yield by reacting with thioanisoletrifluoromethanesulfonic acid (TFMSA)-TFA at room temperature for 4 h (Scheme 3). While the deprotection proceeds smoothly, the purification of the crude product of this reaction by silica gel chromatography proved to be unsuitable affording the thione form of 16 (Chart 1), as

Chart 1. Thione form of pyridylthioether-based dendrons focally functionalized with a thiol unit.

confirmed by NMR and mass spectrometry analysis. Thus to circumvent this problem, the thiol **16** was purified by repeated precipitation from dichloromethane—hexane mixtures.

The third-generation dendritic wedge 17 was prepared in a similar way to its earlier generation analogue. However, the coupling of 12 with thiol 16 gives 17 in moderate yields (61%), presumably due both to steric problems and the inherent low stability of the thiol moiety. Following the same procedure that gave compounds 14 and 16, dendron 17 was deprotected to furnish the corresponding thiol derivative 18 in 92% yield.

All dendrons display NMR spectra consistent with their structures. The aliphatic regions in the ¹H NMR spectra provide the most important information since the aliphatic protons give well-resolved signals. The number of singlets at around 4.25–4.36 ppm due to CH₂S protons clearly corresponds with the generation of the dendron involved. Moreover, the relative integrations for these signals and the aromatic proton signals match perfectly with the proposed structures.

Finally, the conversion from *tert*-butyl protected dendron to the corresponding thiol derivative was easily confirmed by the complete absence of the signal associated with the *tert*-butyl moiety coupled with the presence of a new resonance at 3.52–3.55 ppm for the SH group.

The last step of our approach involved the assembly of the

HS-Gn: n = 1, 14; n = 2, 16; n = 3, 18

Scheme 4. Synthesis of dendrimers with Fe₂(CO)₆ as core.

synthesized dendrons around a transition-metal cluster. To this end we initially reacted $Fe_3(CO)_{12}$ with thiol **14** in THF, using triethylamine as a base, followed by treatment with $HgCl_2$ in a one-pot procedure (Scheme 4), which has been suggested from the communication describing the reactions of alkyl- and arylmercuric halides with $[Et_3NH][((-CO)-((-RS)Fe_2(CO)_6]]]$ complexes. According to the above procedure, the desired cluster compound **19** was obtained in 74% yield after chromatographic purification. The analogous reaction of $Fe_3(CO)_{12}$ with dendron-functionalized thiols **16** and **18** afforded the iron cluster dendrimers **20** and **21** in 69 and 49% yield, respectively (Scheme 4).

The formation of metallodendrimers 19-21 was confirmed by disappearance of the thiol signal in their ¹H NMR spectra. The ¹H NMR spectrum of the third generation dendrimer 21 in CDCl₃ was broad and structureless, probably as a consequence of restricted movement of the attached dendrons, but consistent with the proposed structure in DMSO-d6 at 50 °C. However, the structure of 21 could be established unambiguously by ¹³C NMR that showed the expected resonances for the aliphatic and aromatic carbons of the dendritic building block as well as the signal for the carbonyl groups of the cluster core. Further evidence for the formation of 19-21 was provided by their IR spectra that showed in the carbonyl region the expected absorbances for complexes of this type. ¹⁵ To confirm the molecular masses of the synthesized metallodendrimers, the MALDI-TOF technique was applied. Unfortunately, MALDI-TOF mass spectra of molecules 19-21 did not show the expected molecular ion peaks, but instead signals corresponding to the mass of the starting dendron were observed. Therefore these results indicate that the structure of the iron-carbonyl core dendrimers is too weak to withstand the conditions of the MALDI-TOF analysis.

Electrospray ionization technique was also used as an alternative mass analysis in an attempt to provide characterization of the dendritic complexes. However, these attempts were unsuccessful.

Though the mass spectrometric studies did not provide straightforward evidence for the formation of 19–21, the elemental analysis data coupled with the NMR and IR spectra offered clear indication that the desired compounds had been successfully obtained.

3. Conclusions

Following a convergent strategy a series of novel pyridylthioether dendrimers that incorporate a Fe₂(CO)₆ unit in the core have been assembled by coupling commercially available triiron dodecacarbonyl with synthetic monodendrons. These dendrons have been constructed by employing the activated and protected building block 4-[4-*tert*-butylthio(phenyl)]-2,6-bis(iodomethyl)pyridine (12) which has been efficiently generated by a multistep sequence. The key dendron growth steps involved coupling via Williamson reaction conditions followed by deprotection of the thiol function. The formation of the novel metallodendrimers is supported by ¹H, ¹³C, and FT-IR spectroscopy, and elemental analyses. Preliminary experiments confirm that these metal cluster core dendrimers are capable of binding the same number of palladium atoms as the tridentate SNS units affording a metallodendrimer that incorporates two kinds of transition metal centres in its structure. The preparation and investigation of these complexes are currently underway. We are also investigating the electrochemical properties of these dendritic systems to gain insight into structure-property relationships.

4. Experimental

4.1. General comments

Tetrahydrofuran (THF) was distilled from sodium benzophenone ketyl immediately before use. Methanol and acetone were dried and stored over 3 and 4 Å molecular sieves, respectively. *N*,*N*-Dimethylformamide (DMF), dichloromethane, acetonitrile and triethylamine were distilled from calcium hydride. Other solvents and reagents were used as received. Flash chromatography was performed on 230–400 mesh silica gel (Macherey–Nagel). ¹H NMR and ¹³C NMR spectra were obtained in CDCl₃ solutions, unless otherwise indicated, on a Bruker Avance 300 spectrometer using the solvent signal as internal standard. IR spectra were recorded on a Perkin–Elmer FT-IR spectrometer. Melting points were taken in capillary tubes with a Buchi 535 apparatus and are uncorrected.

Mass spectra of dendrimers were obtained by Matrix Assisted Laser Desorption Ionisation Mass Spectrometry (MALDI-MS), using a Voyager-DE PRO instrument (Applied Biosystems, Foster City, CA, USA), operating in positive linear mode. The instrumental conditions were: acceleration voltage: 20 keV; grid voltage=93%; guide wire=0.3%; delay time=200 ns. The matrix used was (2-(p-hydroxy-phenylazo)benzoic acid (HABA), at a concentration of 10 mg/mL in choloroform. 0.5 mg of dendrimer was dissolved in 1 mL of CHCl₃ and 5 μ L of this solution were added to the same volume of the matrix solution. About 1 μ L of the resulting solution was deposited on the stainless steel sample holder and allowed to dry before introduction into the mass spectrometer.

ESI mass spectra were obtained using an LCQ (Finnigan, Palo Alto, CA, USA), operating in positive ion modes. The entrance capillary temperature was 270 °C and the capillary voltage was kept at $+3~\rm kV$. Sample solutions (at a concentration of about $5\!\times\!10^{-6}~M$ in CHCl $_3$) were introduced by direct infusion at a flow rate of 8 $\mu L/min$. The He pressure inside the trap was kept constant. The pressure directly read by ion gauge (in the absence of the N_2 stream) was $2.8\!\times\!10^{-5}$ Torr.

4.1.1. Dimethyl 4-chloropyridine-2,6-dicarboxylate (2). A mixture of anhydrous 4-hydroxypyridine-2,6-dicarboxylic acid (64.45 g, 0.32 mol) and PCl₅ (200.2 g, 0.96 mol) in CCl₄ (300 mL) was heated under reflux for 4 h. Then dry methanol (200 mL) was added dropwise over a period of 40 min, and the resulting mixture was heated under reflux for 1 h. The solvent was evaporated to afford a tan yellow solid which was dissolved in water (500 mL) and

neutralized with Na₂CO₃. The resulting solid was collected by filtration, washed with water and dissolved in CHCl₃ (400 mL). The organic solution was washed with saturated aqueous Na₂CO₃ (3×200 mL), brine (200 mL), and dried over MgSO₄. Removal of the solvent under reduced pressure and recrystallization of the residue from methanol gave **2** as white crystals (52.6 g, 71%). Mp 139–140 °C. IR (KBr), ν : 1722, 1710, 1578 cm⁻¹. ¹H NMR: δ 4.02 (s, 6H, CH₃), 8.29 (s, 2H, PyH). ¹³C NMR: δ 53.9 (CH₃), 128.7 (3,5-PyC), 147.2 (4-PyC), 149.8 (2,6-PyC), 164.5 (CO). 4.1.2. 4-Chloro-2,6-bis(hydroxymethyl)pyridine (3). This compound was prepared from **2** following a literature procedure ¹⁷ in 96% yield.

4.1.3. 4-[4-tert-Butylthio(phenyl)]-2,6-bis(hydroxymethyl)pyridine (5). *Method A.* A stirred mixture of diol **3** (1.00 g, 5.76 mmol), 4-(*tert*-butylthio)phenylboronic acid **4** (2.42 g, 11.52 mmol), Pd(PPh₃)₄ (1.33 g, 1.52 mmol) in toluene (100 mL) and saturated aqueous Na₂CO₃ (50 mL) was heated under reflux under argon for 64 h. After cooling to room temperature the reaction mixture was extracted with ethyl acetate (3×50 mL) and the combined organic extracts were dried over MgSO₄. The solvent was removed under reduced pressure and the residue was subjected to flash chromatography on silica gel eluting with 5–10% methanol in CHCl₃. Removal of the solvent followed by precipitation of the residue from CH₂Cl₂/hexane gave **5** as a white solid (1.07 g, 61%).

Method B. A stirred solution of 10 (4.00 g, 10.32 mmol) and CH₃ONa (4.13 mmol, from 94 mg of Na) in dry methanol (50 mL) was heated under reflux under argon for 4 h. Then the reaction mixture was evaporated to dryness and the residue taken up in CH₂Cl₂ (150 mL). The resulting organic solution was washed with water $(2 \times 50 \text{ mL})$ and dried over MgSO₄. The solvent was removed under reduced pressure and the residue was precipitated from CH₂Cl₂/hexane to afford 5 as a white solid (3.08 g, 98%). Mp 119-120 °C. 4.1.4. Dimethyl 4-iodopyridine-2,6-dicarboxylate (6). Acetyl chloride (5.15 g, 65.61 mmol) was added to a mixture of chloropyridine **2** (5.00 g, 21.77 mmol) and NaI (65.28 g, 435.5 mmol) in dry CH₃CN (150 mL) at 0 °C. The reaction mixture was sonicated for 5 h under an argon atmosphere maintaining the bath temperature below 50 °C. After cooling to 0 °C saturated aqueous Na₂CO₃ (75 mL) and CH₂Cl₂ (150 mL) were added. The organic layer was washed with saturated aqueous Na₂S₂O₃ (100 mL), water (2×100 mL), and dried over MgSO₄. Removal of the solvent under reduced pressure and recrystallization of the

residue from methanol gave **6** as a white solid (6.51 g, 93%). Mp 174–175 °C. Anal. calcd for C₂₁H₂₅NO₄S (387.49): C, 65.09; H, 6.50; N, 3.61. Found: C, 65.11; H, 6.48; N, 3.42.

4.1.9. 4-[4-tert-Butylthio(phenyl)]-2,6-bis(cloromethyl)**pyridine** (11). Methanesulfonyl chloride (8.49 g, 74.15 mmol) was slowly added over 10 min to a cooled solution (0 °C) of 5 (7.50 g, 24.72 mmol) in dry CH₂Cl₂ (100 mL) containing triethylamine (8.0 g, 79.1 mmol) under argon. The mixture was stirred at room temperature for 2 h, then was heated to reflux for 14 h and, after cooling to room temperature, CH₂Cl₂ (100 mL) and saturated aqueous NaHCO₃ (100 mL) were added. The organic layer was washed with water, dried over MgSO₄ and filtered. The filtrate was passed through a silica plug eluting with CH₂Cl₂. Removal of the solvent under reduced pressure gave 11 as a pale brown solid (8.10 g, 96%). Mp 82–83 °C. IR (KBr), ν 1605 cm⁻¹. ¹H NMR: δ , 1.35 (s, 9H t-Bu) 4.74 (s, 4H, CH₂), 7.64 (d, J=8.6 Hz, 2H, 2-PhH), 7.67 (s, 2H, PyH), 7.68 (d, J=8.6 Hz, 2H, 2-PhC). ¹³C NMR: δ 31.4 (C(CH₃)₃), 46.9 (C(CH₃)₃), 46.9 (CH₂), 120.4 (3,5-PyC), 127.5 (2-PhC), 135.2 (4-PhC), 138.1 (1-PhC), 138.4 (3-PhC), 150.5 (4-PyC), 157.4 (2,6-PyC). Anal. calcd for C₁₇H₁₉Cl₂NS (340.31): C, 60.00; H, 5.63; N, 4.12. Found: C, 59.81; H, 5.58; N, 4.26.

4.1.10. 4-[4-tert-Butylthio(phenyl)]-2,6-bis(iodomethyl)pyridine (12). A stirred solution of 11 (3.02 g, 8.86 mmol) and NaI (6.64 g, 44.31 mmol) in dry acetone (50 mL) was heated under reflux under argon for 2 h. The solvent was removed under reduced pressure and the residue was dissolved in CH₂Cl₂ (100 mL). The organic solution was washed with saturated aqueous Na₂S₂O₃ (100 mL), water and dried over MgSO₄. The mixture was filtered and the solvent was removed from the filtrate affording 12 as a pale yellow solid (4.58 g, 99%). Mp 155 °C Dec. IR (KBr), ν : 1603 cm⁻¹. ¹H NMR: δ, 1.34 (s, 9H, t-Bu) 4.56 (s, 4H, CH₂), 7.49 (s, 2H, PyH) 7.59 (d, J = 8.5 Hz, 2H, 2-PhH), 7.66 (d, J = 8.5 Hz, 2H, 3-PhH). ¹³C NMR: δ 5.7 (CH₂), 30.9 (C(CH₃)₃), 46.4 (C(CH₃)₃), 119.7 (3,5-PyC), 126.9 (2-PhC), 134.6 (4-PhC), 137.5 (1-PhC), 137.9 (3-PhC), 149.7 (4-PyC), 158.8 (2,6-PyC). Anal. calcd for C₁₇H₁₉I₂NS (523.21): C, 39.02; H, 3.66; N, 2.68. Found: C, 39.11; H, 3.61; N, 2.83. ESI/MS m/z: 524 [M+H]⁺ (Rel. Int. = 100%).

4.1.11. tert-BuS-G1 (13). To a stirred suspension of

anhydrous K₂CO₃ (2.19 g, 15.86 mmol) and benzenethiol (1.33 ml, 13.01 mmol) in dry DMF (30 mL) was added **12** (3.32 g, 6.34 mmol) portionwise over 10 min. The resulting mixture was stirred at room temperature under an argon atmosphere for 2 h and then evaporated to dryness. The residue was extracted with CH₂Cl₂ (100 mL) and the organic extract was washed with saturated aqueous Na₂CO₃ (50 mL), water (2×50 mL), and dried over MgSO₄. After removal of the solvent under reduced pressure, the resulting crude product was recrystallized from methanol to give 13 as a white solid (2.98 g, 97%). Mp 54–55 °C. IR (KBr), ν: 1599 cm⁻¹. ¹H NMR: δ, 1.33 (s, 9H, t-Bu), 4.31 (s, 4H, CH₂), 7.22 (tt, 2H, J=7.1, 1.4 Hz, CH₂S-PhH), 7.27 (tt, 4H, J=7.3, 1.4 Hz, CH_2S-PhH), 7.37 (dd, 4H, J = 8.0, 1.5 Hz, CH_2S-PhH), 7.37 (s, 2H, PyH), 7.41 (d, 2 H, J = 8.3 Hz, 2 -PhH), $^{7.59}$ (d, 2 H, 2 Hz, 3 -PhH). 13 C NMR: δ , 31.4 (C(CH₃)₃), 41.0 (CH₂), 46.8 (C(CH₃)₃), 119.7 (3,5-PyC), 126.8, 127.4, 129.3, 130.3, 134.5, 136.2, 138.2, and 138.6 (PhC), 149.2 (4-PyC), 158.4 (2,6-PyC). MALDI-TOF MS m/z: 488 [M+H]⁺; calcd for C₂₉H₃₀NS₃: 488.7.

4.1.12. HS-G1 (14). To a stirred solution of **13** (4.22 g, 8.64 mmol) in thioanisole (20 mL) was slowly added trifluoroacetic acid (2.9 mL, 38.9 mmol) and triflic acid (2.7 mL, 30.25 mmol). The resulting mixture was kept stirring at room temperature under an argon atmosphere for 4 h and then CH₂Cl₂ (100 mL) was added. The organic layer was washed with saturated aqueous NaHCO₃ (50 mL), water $(2 \times 50 \text{ mL})$, and dried over MgSO₄. After filtration, the organic phase was evaporated to dryness and the residue was purified by repeated precipitation from CH₂Cl₂/hexane to give **14** as a yellow solid (354 g, 95%). Mp 110–110.5 °C. IR (KBr) ν : 1605 cm⁻¹. ¹H NMR: δ , 3.54 (s, 1H, SH), 4.30 (s, 4H, CH₂), 7.19 (tt, 2H, J=7.0, 1.5 Hz, CH₂S-PhH), 7.26 (btt, 4H, J=7.5, 1.5 Hz, CH₂S-PhH), 7.33-7.31 (m, 4H, CH₂S-Ph*H*), 7.32 (s, 2H, PyH), 7.34–7.83 (m, 4H, PhH). ¹³C NMR: δ, 40.4 (CH₂), 118.9 (3,5-PyC), 126.4, 127.5, 128.8, 129.4, 129.9, 132.7, 135.1, and 135.6 (PhC), 148.7 (4-PyC), 157.8 (2,6-PyC). MALDI-TOF MS m/z: 432 [M+H]⁺, calcd for $C_{25}H_{22}NS_3$: 432.6.

4.1.13. *tert*-BuS-G2 (15). This compound was prepared analogously to 13 by reacting 14 (1.00 g, 2.32 mmol), K₂CO₃ (396 mg, 2.87 mmol) and **12** (577 mg, 1.10 mmol) in dry DMF (15 mL), except the reaction mixture was stirred at room temperature over a period of 4 h instead of 2 h. After workup, the crude product was purified by flash chromatography on silica gel eluting with 2.5-5% ethyl acetate in CH₂Cl₂ to give 15 as a pale yellow glassy solid (987 mg, 79%). IR (KBr) ν : 1601 cm⁻¹. ¹H NMR: δ , 1.32 (s, 9H, t-Bu), 4.27 (s, 8H, CH₂), 4.36 (s, 4H, CH₂), 7.17 (tt, 4H, J=7.2, 1.3 Hz, CH₂S-PhH), 7.24 (tt, 8H, J=7.5, 1.4 Hz, CH₂S-PhH), 7.33-7.48 (m, 18H, 2,6-PhH and CH₂S-PhH), 7.29 (s, 4H, Py'H), 7.46 (s, 2H, PyH), 7.59 (d, 2H, J = 8.3 Hz, 3,5-PhH). ¹³C NMR: δ , 30.9 (C(CH_3)₃), 39.9 (CH₂), 40.4 (CH₂), 46.3 (C(CH₃)₃), 118.9 (3,5-Py'C), 119.4 (3,5-PyC), 126.3, 126.9, 127.3, 128.8, 129.2, 129.7, 134.4, 135.6, 135.7, 137.6, 137.8, and 137.9 (PhC), 148.6 (4-Py'C), 149.1 (4-PyC), 157.6 (2,6-PyC), 157.8 (2,6-Py'C). MALDI-TOF MS m/z: 1132. $[M+H]^+$, calcd for $C_{67}H_{60}N_3S_7$: 1131.7.

4.1.14. HS-G2 (16). This compound was prepared

analogously to **14** starting from **15** (2.00 g, 1.77 mmol) and purified by repeated precipitation from CH₂Cl₂/hexane to give **16** as a yellow glassy solid (1.85 g, 97%). IR (KBr) ν : 1607 cm⁻¹. ¹H NMR: δ 3.55 (s, 1H, SH), 4.28 (s, 8H, CH₂), 4.34 (s, 4H, CH₂), 7.15–7.45 (m, 38H, PyH, Py'H, PhH and CH₂S-PhH). ¹³C NMR: δ, 39.9 (CH₂), 40.4 (CH₂), 118.9 (3,5-Py'C), 119.0 (3,5-PyC), 126.3, 127.3, 127.4, 128.8, 129.4, 129.5, 135.5, 135.6, 135.7, 136.6, 137.6, and 138.1 (PhC), 148.7 (4-Py'C), 148.9 (4-PyC), 157.5 (2,6-PyC), 157.7 (2,6-Py'C). MALDI-TOF MS m/z: 1075 [M+H]⁺, calcd for C₆₃H₅₂N₃S₇: 1075.6.

4.1.15. tert-BuS-G3 (17). This compound was prepared analogously to 13 by reacting 16 (2.00 g, 1.86 mmol), K₂CO₃ (311 mg, 2.25 mmol) and **12** (453 mg, 0.866 mmol) in dry DMF (25 mL), except the reaction mixture was stirred at room temperature for 18 h instead of 2 h. After workup, the crude product was purified by flash chromatography on silica gel eluting with CH₂Cl₂/EtOAc/NEt₃ 9:1:0.5 to give **17** as a pale yellow glassy solid (1.27 g, 61%). IR (KBr) ν : 1602 cm⁻¹. ¹H NMR: δ , 1.31 (s, 9H, t-Bu), 4.26 (s, 16H, CH₂), 4.30 (s, 8H, CH₂), 4.33 (s, 4H, CH_2) 7.15 (tt, 8H, J=7.0, 1.4 Hz, CH_2S-PhH), 7.22 (tt, 16H, J=7.6, 1.3 Hz, CH₂S-PhH), 7.27–7.60 (m, 58H, PvH, Py'H, Py"H, PhH and CH₂S-PhH). 13 C NMR: δ , 31.0 $(C(CH_3)_3)$, 39.8 (CH_2) , 39.9 (CH_2) , 40.5 (CH_2) , 46.4 $(C(CH_3)_3)$, 118.9 (3,5-Py"C), 119.1 (3,5-Py'C), 119.4 (3,5-PyC), 126.4, 126.9, 127.3, 127.4, 128.9, 129.1, 129.2, 129.3, 129.8, 134.5, 135.3, 135.6, 135.8, 137.7, 137.8, and 138.1 (PhC), 148.6 (4-Py"C), 149.0 (4-Py'C), 149.2 (4-PyC), 157.5 (2,6-PyC), 157.6 (2,6-Py'C), 157.8 (2,6-Py"C). MALDI-TOF MS m/z: 2418 [M+H]⁺, calcd for $C_{143}H_{120}N_7S_{15}$: 2417.5.

4.1.16. HS-G3 (**18**). This compound was prepared analogously to **14** starting from **17** (1.27 g, 0.525 mmol) and purified by repeated precipitation from CH₂Cl₂/hexane to give **18** as a yellow glassy solid (1.18 g, 92%).

IR (KBr) ν : 1603 cm⁻¹. ¹H NMR: δ 3.52 (s, 1H, SH), 4.25 (s, 16H, CH₂), 4.30 (s, 8H, CH₂), 4.34 (s, 4H, CH₂) 7.12–7.38 (m, 82H, PyH, Py'H, Py"H, PhH and CH₂S-PhH). ¹³C NMR: δ 39.7 (CH₂), 39.8 (CH₂), 40.4 (CH₂), 118.9 (3,5-Py"C), 119.0 (3,5-Py'C), 119.1 (3,5-PyC), 126.3, 127.3, 127.5, 127.6, 128.8, 128.9, 129.1, 129.2, 129.7, 134.9, 135.1, 135.5, 135.7, 137.6, 137.9, and 138.0 (PhC), 148.6 (4-Py"C), 148.8 (4-Py'C), 149.0 (4-PyC), 157.4 (2,6-PyC), 157.5 (2,6-Py'C), 157.8 (2,6-Py"C). MALDI-TOF MS m/z: 2362 [M+H]⁺, calcd for C₁₃₉H₁₁₂N₇S₁₅: 2361.4.

4.1.17. [Fe₂(CO)₆]-[S-G1]₂ (19). To a stirred solution of Fe₃(CO)₁₂ (1.17 g, 2.32 mmol) and **14** (1.00 g, 2.32 mmol) in dry THF (30 mL) was added triethylamine (235 mg, 2.32 mmol) and, after 30 min, HgCl₂ (629 mg, 2.32 mmol). The resulting mixture was stirred under argon for 14 h, filtered through celite, and washed with CH₂Cl₂ (100 mL). After the solvent was removed, the residue was purified by flash chromatography on silica gel eluted with CHCl₃ to give **19** as a red glassy solid (980 mg, 74%). IR (KBr) ν : 2073, 2035, 1996, 1598 cm⁻¹. ¹H NMR: δ, 4.30 (s, 8H, CH₂), 7.15 (t, 4H, J=6.9 Hz, CH₂S-PhH), 7.26 (t, 8H, J=7.5 Hz, CH₂S-PhH), 7.39 (d, 8H, J=7.1 Hz, CH₂S-PhH), 7.51 (s, 4H, Py), 7.50–7.52 (m, 8H, PhH). ¹³C NMR: δ 40.0

(CH₂), 119.1 (3,5-PyC), 126.4, 127.2, 129.2, 129.5, 129.6, 133.1, 136.7, and 137.8 (PhC), 148.2 (4-PyC), 158.8 (2,6-PyC), 208.7 (CO). Anal. calcd for $C_{56}H_{40}Fe_2N_2O_6S_6$ (1141.01): C, 58.95; H, 3.53; N, 2.46. Found: C, 58.30; H, 3.58; N, 2.50.

4.1.18. [Fe₂(CO)₆]-[S-G2]₂ (20). This compound was prepared analogously to **19** starting from **16** (1.00 g, 0.931 mmol) and purified by flash chromatography on silica gel eluted with 7.5–10% ethyl acetate in CH₂Cl₂ to give **20** as a red glassy solid (778 mg, 69%). IR (KBr) v: 2073, 2037, 1996, 1601 cm⁻¹. ¹H NMR: δ , 4.25 (s, 16H, CH₂), 4.32 (s, 8H, CH₂), 7.12–7.41 (m, 76H, PyH, Py'H, PhH and CH₂S-PhH). ¹³C NMR: δ , 39.8 (CH₂), 40.5 (CH₂), 118.9 (3,5-Py'C), 119.1 (3,5-PyC), 126.3, 126.6, 126.8, 127.3, 128.8, 129.0, 129.7, 132.5, 134.5, 135.5, 135.7, and 137.6 (PhC), 148.4 (4-Py'C), 148.6 (4-PyC), 157.7 (2,6-PyC), 157.8 (2,6-Py'C), 207.9 (CO). Anal. calcd for C₁₃₂H₁₀₀Fe₂-N₆O₆S₁₄ (2426.86): C, 65.33; H, 4.15; N, 3.46. Found: C, 64.86; H, 3.94; N, 3.57.

4.1.19. $[Fe_2(CO)_6]$ - $[S-G3]_2$ (21). This compound was prepared analogously to 19 starting from 18 (1.00 g, 0.423 mmol) and purified by flash chromatography on silica gel eluted with 5% ethyl acetate in CHCl₃ to give 21 as a pale red glassy solid (520 mg, 49%). IR (KBr) ν : 2073, 2036, 1995, 1599 cm⁻¹. ¹H NMR (DMSO-d6, 50 °C): 4.25 (bs, 32H, CH₂), 4.26 (bs, 16H, CH₂), 4.32 (bs, 8H, CH₂), 7.10 (bt, 16H, J=7.2, CH₂S-PhH), 7.20 (bt, 32H, J=7.2, CH₂S-PhH), 7.29-7.47 (m, 116H, PyH, Py'H, Py"H, PhH and CH₂S-PhH). ¹³C NMR: δ, 39.7 (CH₂), 39.9 (CH₂), 40.5 (CH₂), 118.9 (3,5-Py"C), 119.0 (3,5-Py'C), 119.2 (3,5-PyC), 126.3, 126.7, 126.9, 127.3, 128.8, 129.2, 129.7, 134.5, 135.1, 135.5, 135.7, 137.6, 138.0, and 138.1 (PhC), 148.6 (4-Py"C), 148.8 (4-Py'C), 149.0 (4-PyC), 157.3 (2,6-PyC), 157.5 (2,6-Py'C), 157.8 (2,6-Py"C) 207.8 (CO). Anal. calcd for C₂₈₄H₂₂₀Fe₂N₁₄O₆S₃₀ (4998.55): C, 68.24; H, 4.44; N, 3.92. Found: C, 68.18; H, 4.25; N, 3.71.
