ROY, AILES beam line, Synchrotron Soleil, Gif-sur-Yvette, France; JEAN-FRANÇOIS LAMPIN, UMR CNRS 8520, Institut d'Electronique de Microélectronique et de Nanotechnologie, Villeneuve d'Ascq, France; GAËL MOURET, Laboratoire de Physico-Chimie de l'Atmosphère, Université du Littoral Côte d'Opale, Dunkerque, France.*

Our consortium^a is currently developing a new spectrometer on the AILES beamline of the SOLEIL synchrotron facility to achieve sub-MHz resolution in the THz and far-IR regions. This spectrometer is based on heterodyne mixing of the far-IR synchrotron radiation with various local oscillators (LOs). In past years, we used a frequency multiplication chain to provide LO frequencies which enabled both a deep characterization of the spectral composition of the synchrotron emission^b and the recording of its first Doppler limited absorption lines (of D₂O)^c. We recently improved our set-up and measured absorption lines using a far-IR molecular laser pumped by a 10 μm QCL as the LO. The principle of the spectrometer, together with the first experimental results, will be presented in the talk.
