Establishing Lake-specific Nutrient Criteria

6 Discussion

Scientists versus Engineers

Questions asked: "Why?" versus "How?"

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ - 三 - のへぐ

Scientists versus Engineers

- Questions asked: "Why?" versus "How?"
- Reasoning mode: induction versus deduction

Scientists versus Engineers

- Questions asked: "Why?" versus "How?"
- Reasoning mode: induction versus deduction
- An uncertain answer versus a definite answer

◆□▶ ◆□▶ ▲□▶ ▲□▶ ■ ののの

Scientists versus Engineers

- Questions asked: "Why?" versus "How?"
- Reasoning mode: induction versus deduction
- An uncertain answer versus a definite answer
- Limited versus "unlimited" chances of experimentation

Two Branches of Statistics

- Definition of probability: long-run frequency versus degree of belief
- Neyman and Pearson (1933) two approaches of testing statistical hypotheses
 - Thomas Bayes "probabilities a posteriori of the possible causes of a given event"
 - Bertrant and Borel hypothetical deduction
 - "no test of this kind could give reliable result"
 - useful with properly selected en quelque sorte remarquable character of data

"Pr(Trump will make Merkel great again)" is meaningful

Bayesian Statistics

Compared to the long-run frequency view of statistics, Bayesian –

- is coherent: everything under one equation $p(\theta|y) \propto p(\theta)p(y|\theta)$
- is consistent with how we think about chance –

"Pr(Trump will make Merkel great again)" is meaningful

Bayesian Statistics

Compared to the long-run frequency view of statistics, Bayesian –

- is coherent: everything under one equation $p(\theta|y) \propto p(\theta)p(y|\theta)$
- is consistent with how we think about chance –

"Pr(Bavaria wins tomorrow) = 0.74" is meaningful

Bayesian Statistics

Compared to the long-run frequency view of statistics, Bayesian –

- is coherent: everything under one equation $p(\theta|y) \propto p(\theta)p(y|\theta)$
- is consistent with how we think about chance –

"Pr(Bavaria wins tomorrow) = 0.74" is meaningful

- results are easy to interpret no more p-value, nor "statistical significance"
- but needs a prior distribution.

What is a Prior?

The non-normative definition:

 A prior of an uncertain quantity is the probability distribution that would express one's beliefs about the quantity – Wikipedia

◆□▶ ◆□▶ ▲□▶ ▲□▶ ■ ののの

What is a Prior?

The non-normative definition:

- A prior of an uncertain quantity is the probability distribution that would express one's beliefs about the quantity – Wikipedia
 - We do not usually define our uncertainty using probability distribution

◆□▶ ◆□▶ ▲□▶ ▲□▶ ■ ののの

What is a Prior?

The non-normative definition:

- A prior of an uncertain quantity is the probability distribution that would express one's beliefs about the quantity – Wikipedia
 - We do not usually define our uncertainty using probability distribution
 - We use probability, but we are bad at getting the probability right (Human judgment relies on heuristics and is often biased. Tversky and Kahneman (1974) *Science* 185:1124-1131).

When Prior Is Known

The Bayes estimator is the best with respect to Bayes risk

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ - 三 - のへぐ

When Prior Is Known

The Bayes estimator is the best with respect to Bayes riskThe difficulty used to be computation

When Prior Is Known

- The Bayes estimator is the best with respect to Bayes risk
- The difficulty used to be computation
- MCMC resolved the computation problem

When Prior Is Known

- The Bayes estimator is the best with respect to Bayes risk
- The difficulty used to be computation
- MCMC resolved the computation problem
 - Adrian F.M. Smith (now Sir Adrian Smith) quit statistics because "all the Bayesian problems are solved."

◆□▶ ◆□▶ ▲□▶ ▲□▶ ■ ののの

But How Do We Derive a Prior?

The personal belief definition is of no help

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ - 三 - のへぐ

But How Do We Derive a Prior?

- The personal belief definition is of no help
- There are numerous papers on how to derive a prior that does not contain real information

◆□▶ ◆□▶ ▲□▶ ▲□▶ ■ ののの

But How Do We Derive a Prior?

- The personal belief definition is of no help
- There are numerous papers on how to derive a prior that does not contain real information

(日) (日) (日) (日) (日) (日) (日)

• Jeffery's prior – $\pi(\mu, \sigma^2) \propto 1/\sigma^2$

But How Do We Derive a Prior?

- The personal belief definition is of no help
- There are numerous papers on how to derive a prior that does not contain real information
 - Jeffery's prior $\pi(\mu, \sigma^2) \propto 1/\sigma^2$
 - Uninformative (flat) prior -N(0, 100), gamma(0.001, 0.001)

◆□▶ ◆□▶ ◆□▶ ◆□▶ ● ● ● ●

Updating is the key

What Is a Prior and How to Derive One?

Stein's Paradox and Empirical Bayes

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ - 三 - のへぐ

Stein's Paradox

Stein's Paradox and Empirical Bayes

Stein's Paradox

- Efron and Morris (1977) "Stein's Paradox in Statistics" Scientific American
 - A class of shrinkage estimators out perform both MLE and Bayes estimator

◆□▶ ◆□▶ ◆□▶ ◆□▶ ● ● ● ●

- An empirical Bayes interpretation of Stein's paradox
- The batting average example
- Qian et al (2015) ES&T 49: 5913-20.

Stein's Paradox and Empirical Bayes

A Normative Definition of a Prior

- Prior distribution of an uncertain parameter for a population is the distribution of the same parameter across similar (exchangeable) populations
- Examples:
 - Prior of a baseball player's batting average distribution of batting averages of all players in the same league;
 - Prior of the mean phosphorus concentration of Sandusky River – distribution of mean phosphorus concentrations in all similar sized streams in Lake Erie watershed;
 - Expert opinion: a summary of life long observations on the same parameter.

Environmental Standard Compliance Assessment

Overview

- Qian, et al (2015) ES&T 49: 5913-20
- Monitoring data of TP from streams in the Lake Erie watershed from USGS
- Streams grouped by US EPA's nutrient ecoregion
- One site in NY had few data points (with > 50% censorship)
- Data from rest of the sites used to develop priors

- Examples

Environmental Standard Compliance Assessment

The Hierarchical Model

TP concentrations were modeled using a multilevel model

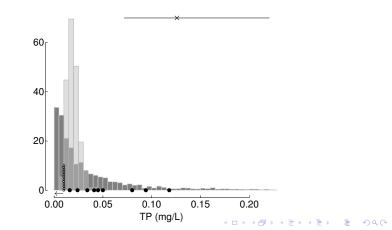

$$\begin{array}{lll} y_{ijkl} &=& \beta_0 + \beta_{1i} + \beta_{2j} + \beta_{3k} + \epsilon_{ijkl} \\ \beta_{1i} &\sim& \textit{N}(0, \sigma_{\beta_1}^2) \\ \beta_{2ji} &\sim& \textit{N}(0, \sigma_{\beta_2}^2) \\ \beta_{3k} &\sim& \textit{N}(0, \sigma_{\beta_3}^2) \end{array}$$

ijkl: *I*th observation is in *i*th site, *j*th year, and *k*th season.
Estimated parameters are used to develop priors
Assuming σ²'s follow an inverse-gamma distribution

- Environmental Standard Compliance Assessment

Bayesian Updating

TP distribution for the NY site – updated using informative priors derived using data from sites in the same ecoregion

Establishing Lake-specific Nutrient Criteria

The Chla - Nutrient Relationship

- Qian, et al. (2018) (submitted to ES&T)
- Establishing nutrient criteria using data from multiple lakes
 - Why nutrient criteria should be lake-specific
 - The role of cross-lake data derive a common prior

 $\log(chla_{ij}) = \beta_{0j} + \beta_{1j}\log(TP_{ij}) + \beta_{2j}\log(TN_{ij}) + \beta_{3j}\log(TP_{ij})\log(TN_{ij}) + \varepsilon_{ij}$

$$\begin{pmatrix} \beta_{0j} \\ \beta_{1j} \\ \beta_{2j} \\ \beta_{3j} \end{pmatrix} \sim MVN \left[\begin{pmatrix} \mu_{\beta_0} \\ \mu_{\beta_1} \\ \mu_{\beta_2} \\ \mu_{\beta_3} \end{pmatrix}, \Sigma \right]$$

The hyper-parameter distribution (RHS) is the prior for individual lates.

- Establishing Lake-specific Nutrient Criteria

Spatial Variation

▲ロト ▲御 ト ▲ 臣 ト ▲ 臣 ト ○ ○ の Q @

Establishing Lake-specific Nutrient Criteria

Bayesian Updating

- Updating is not limited to similar data collection methods
- Updating can be sequential we can gradually refine the model
- Maintain a robust sampling program for model updating over time –

- improving the model
- detecting temporal changes

Summary

 Bayesian method is always better, provided we have the right prior

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ - 三 - のへぐ

 Bayesian method is always better, provided we have the right prior

◆□▶ ◆□▶ ▲□▶ ▲□▶ ■ ののの

 James-Stein estimator and empirical Bayes – prior distribution is "among-group" distribution

Summary

Bayesian method is always better, provided we have the right prior

- James-Stein estimator and empirical Bayes prior distribution is "among-group" distribution
- The Bayesian hierarchical modeling

Summary

 Bayesian method is always better, provided we have the right prior

- James-Stein estimator and empirical Bayes prior distribution is "among-group" distribution
- The Bayesian hierarchical modeling
- Models based on cross-sectional data should be considered as prior models

Summary

- Bayesian method is always better, provided we have the right prior
- James-Stein estimator and empirical Bayes prior distribution is "among-group" distribution
- The Bayesian hierarchical modeling
- Models based on cross-sectional data should be considered as prior models
- Inference about individual "group" should be based on the posterior derived using group-specific data

A Beginning, Rather Than the End

Developing a prior – the first step of a modeling work

- Group-specific inference posterior
- A practice dictated by the Simpson's paradox
