Sun-Induced Fluorescence (SIF)

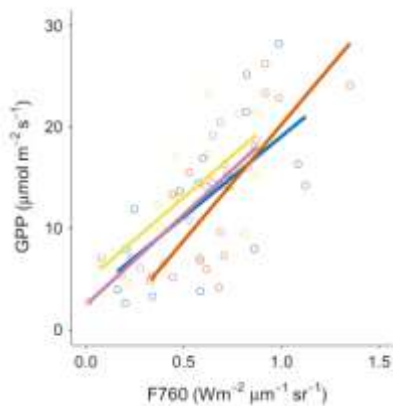

GPP – SIF

Global scale

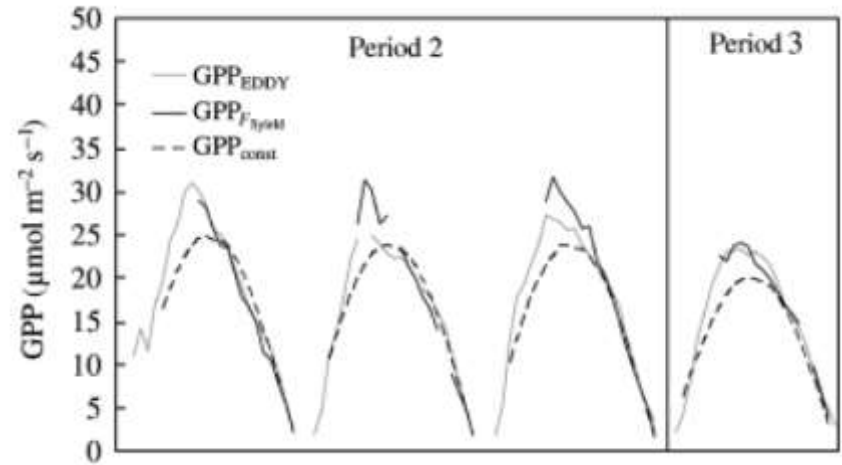

Guanter et al. 2014

Local scale

Ecosystem scale

Damm et al. 2010

$$GPP \approx F_{760} \times \frac{LUE_p}{F_{esc} * LUE_f}$$

FLEX 2022

Problem statement

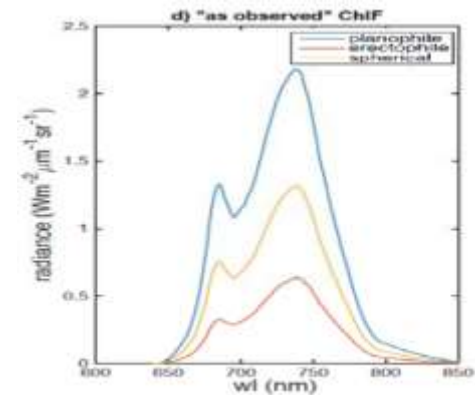

$$GPP \approx F_{760} \times \frac{LUE_p}{F_{esc} * LUE_f}$$

- **LUE_p**, **LUE_f** and **F_{esc}** are hard to measure or parametrize

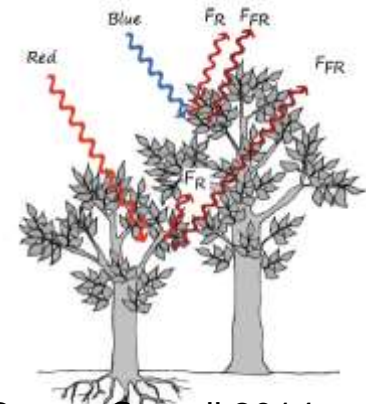

- *F_{esc}* very useful because allow to obtain SIF emitted at leaf level

- SIF emission should carry more physiological information

- Not clear how successful this approach is at predicting GPP under *high spatial variability*

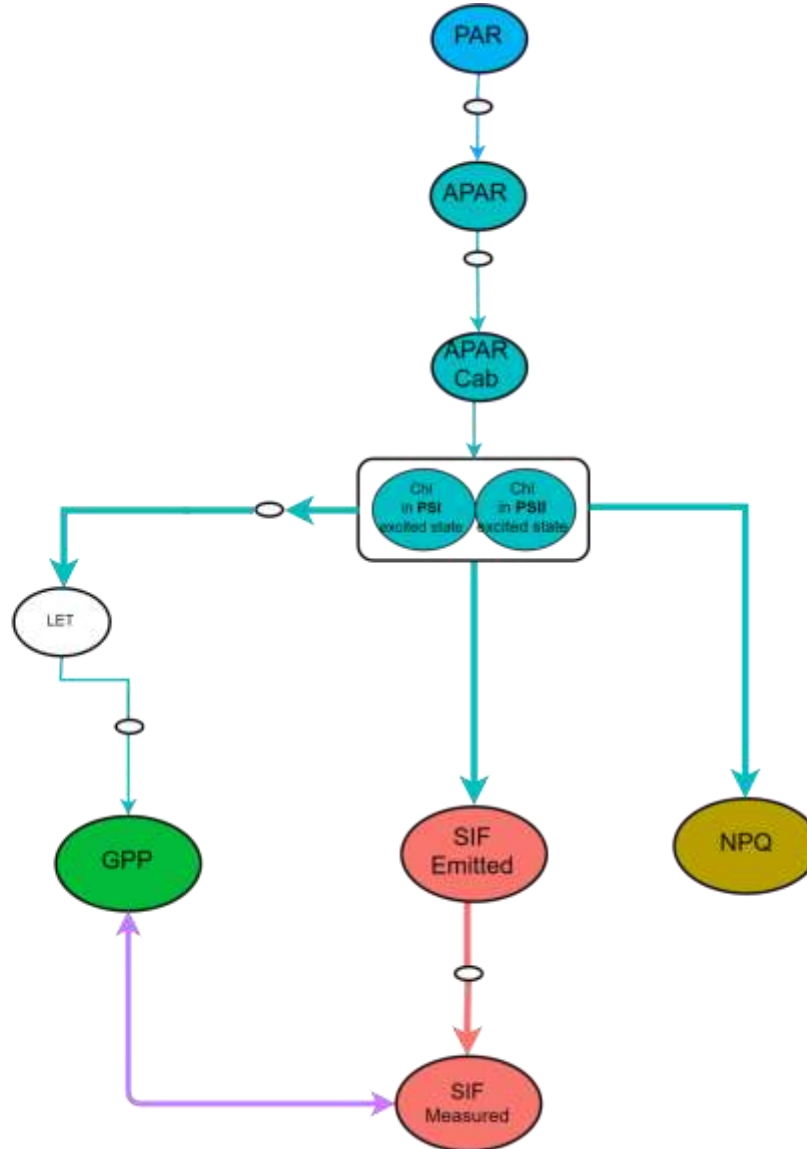

Migliavacca 2017

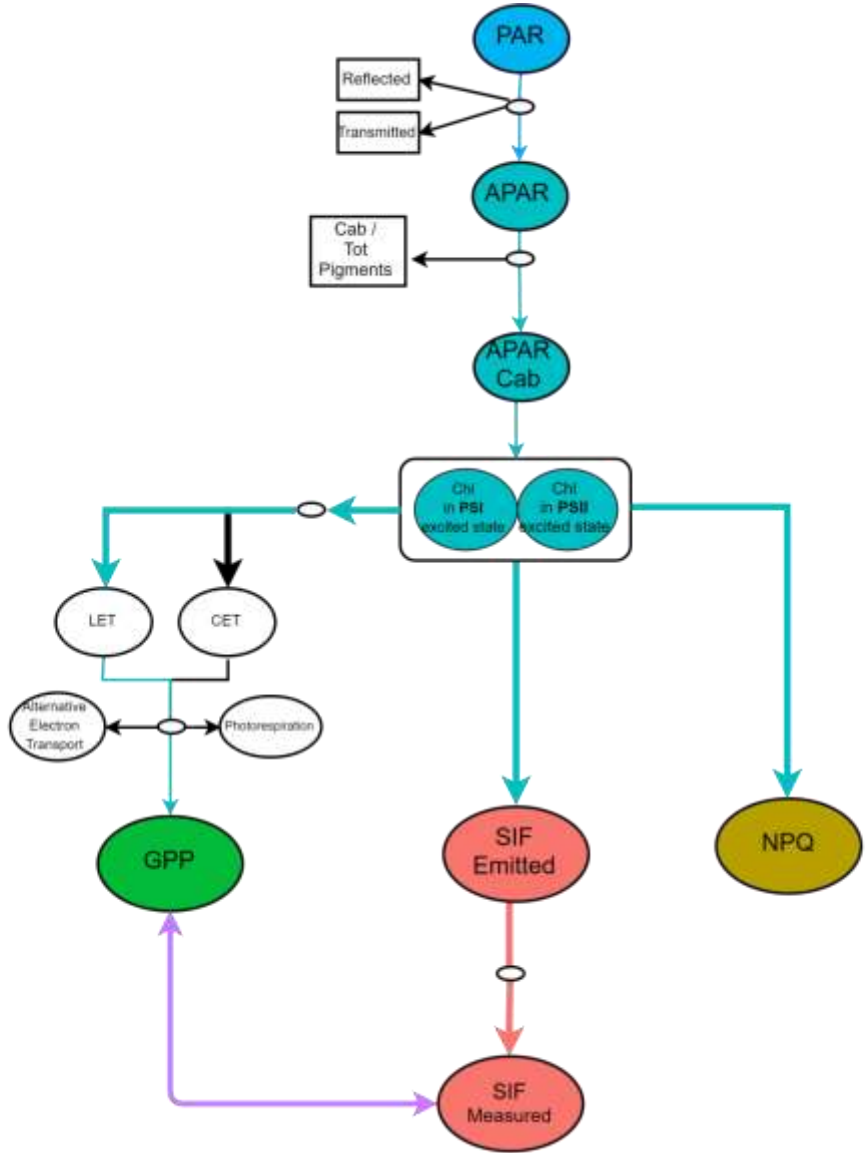

Porcar-Castell 2014

Objectives

Evaluation of the *effect* of fertilization on GPP- SIF dynamics

Evaluation of the *processes* that link GPP and SIF

Majadas, Spain – Nutrient manipulation

$$F_{esc} = \frac{F760_{observed}}{F760_{emitted} / \pi}$$

SCOPE model

- GPP from chambers
- Water fluxes
- Hyperspectral measurements
- SIF
- Leaf traits (N, Cab)
- Structural traits (LAI, LAD)
- Plant abundance

Validation with
measured GPP
and SIF

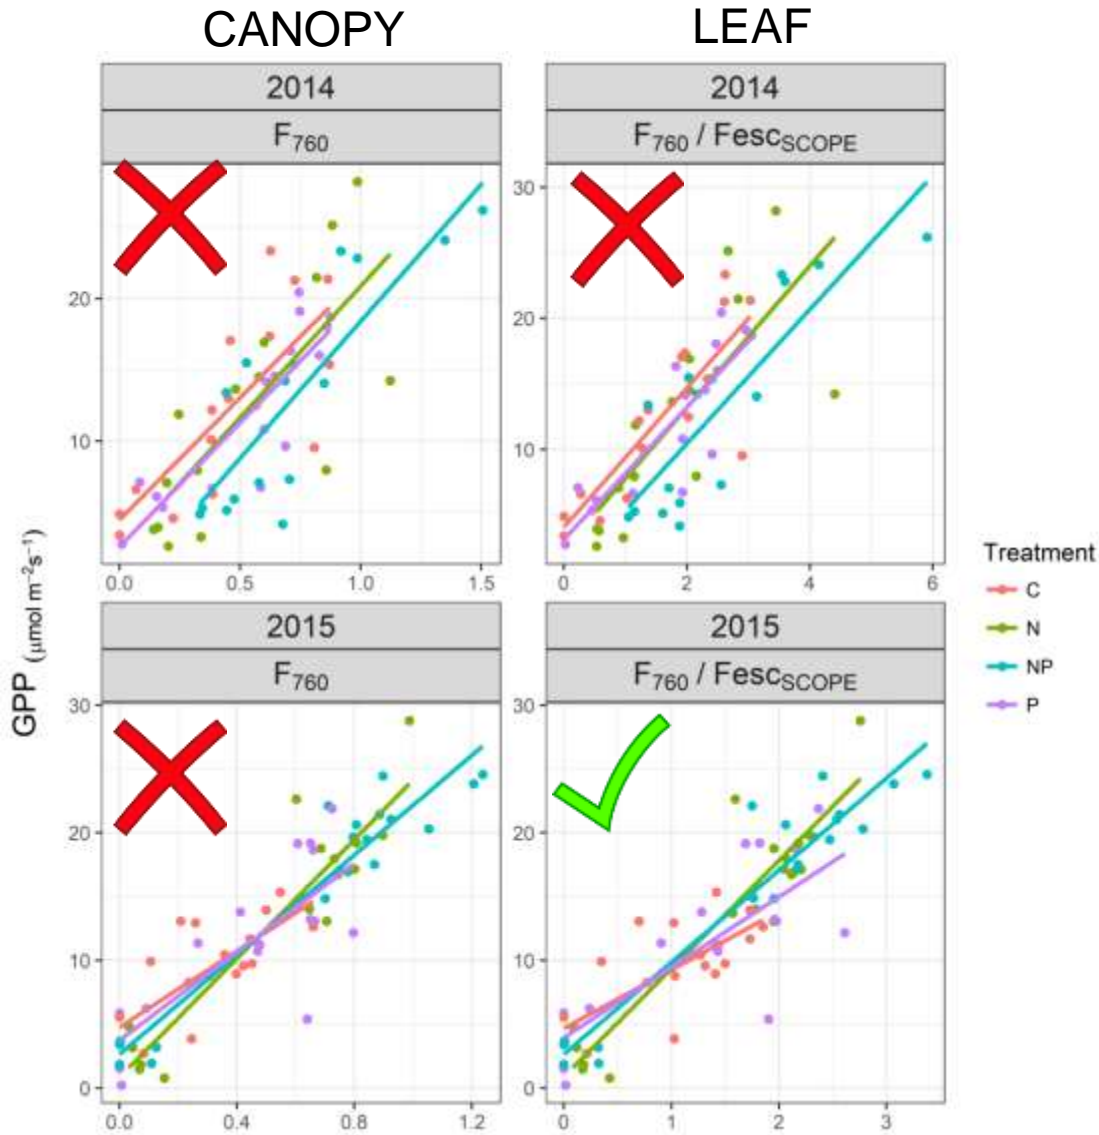

**SCOPE
model**

**Fluorescence
emission**

**Fesc and
LUEf**

- **Relative importance analysis** to identify predictors of terms of LUE
 - Use this knowledge to **reconstruct the theoretical framework in an *empirical way***
 - **Path analysis** to statistically analyze the theoretical framework proposed
-

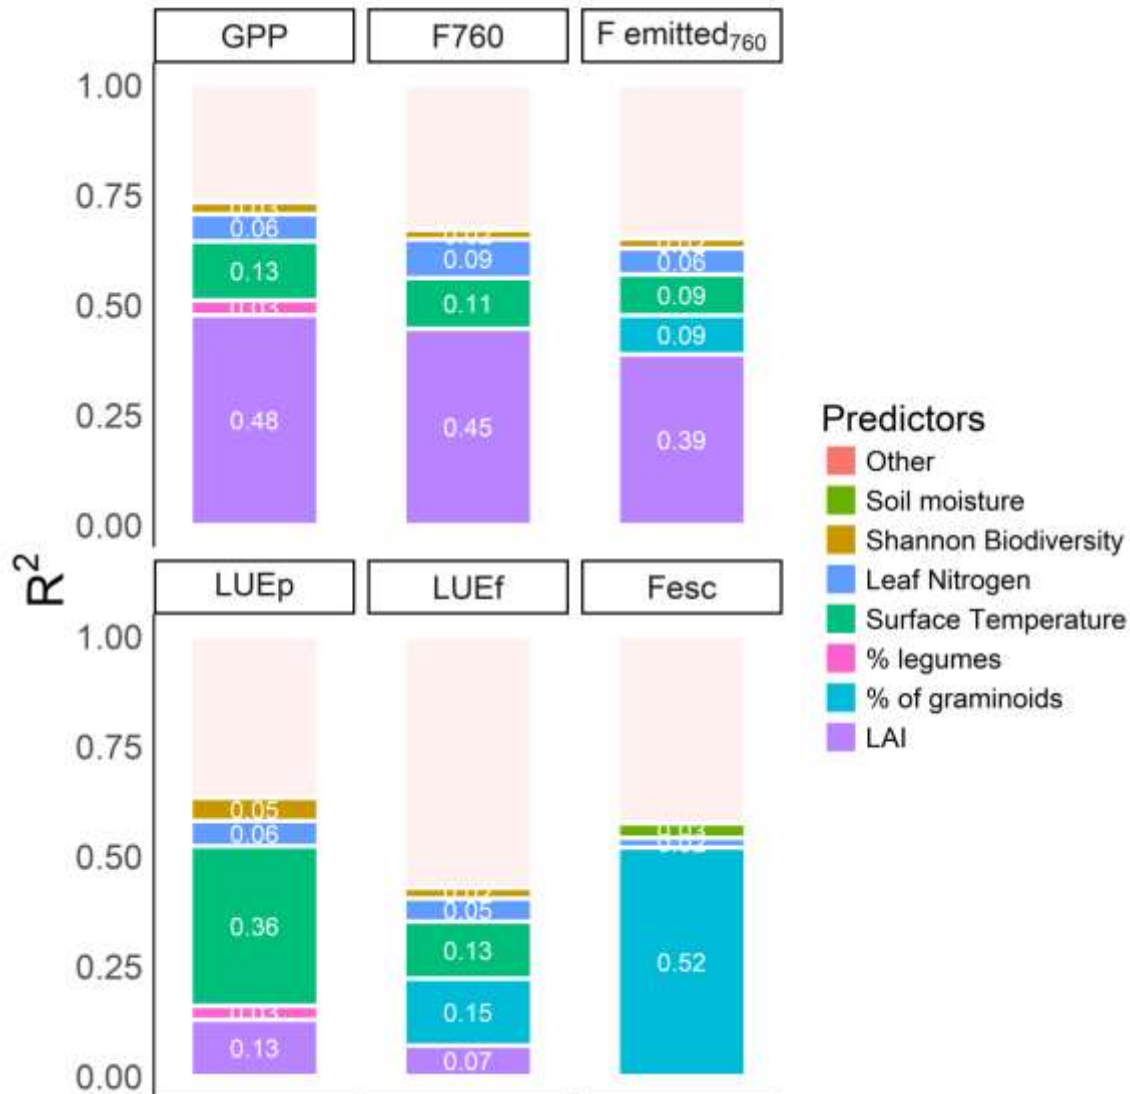

Effect of fertilization on SIF emission

Is there an interaction between Nitrogen treatment and SIF when predicting GPP?

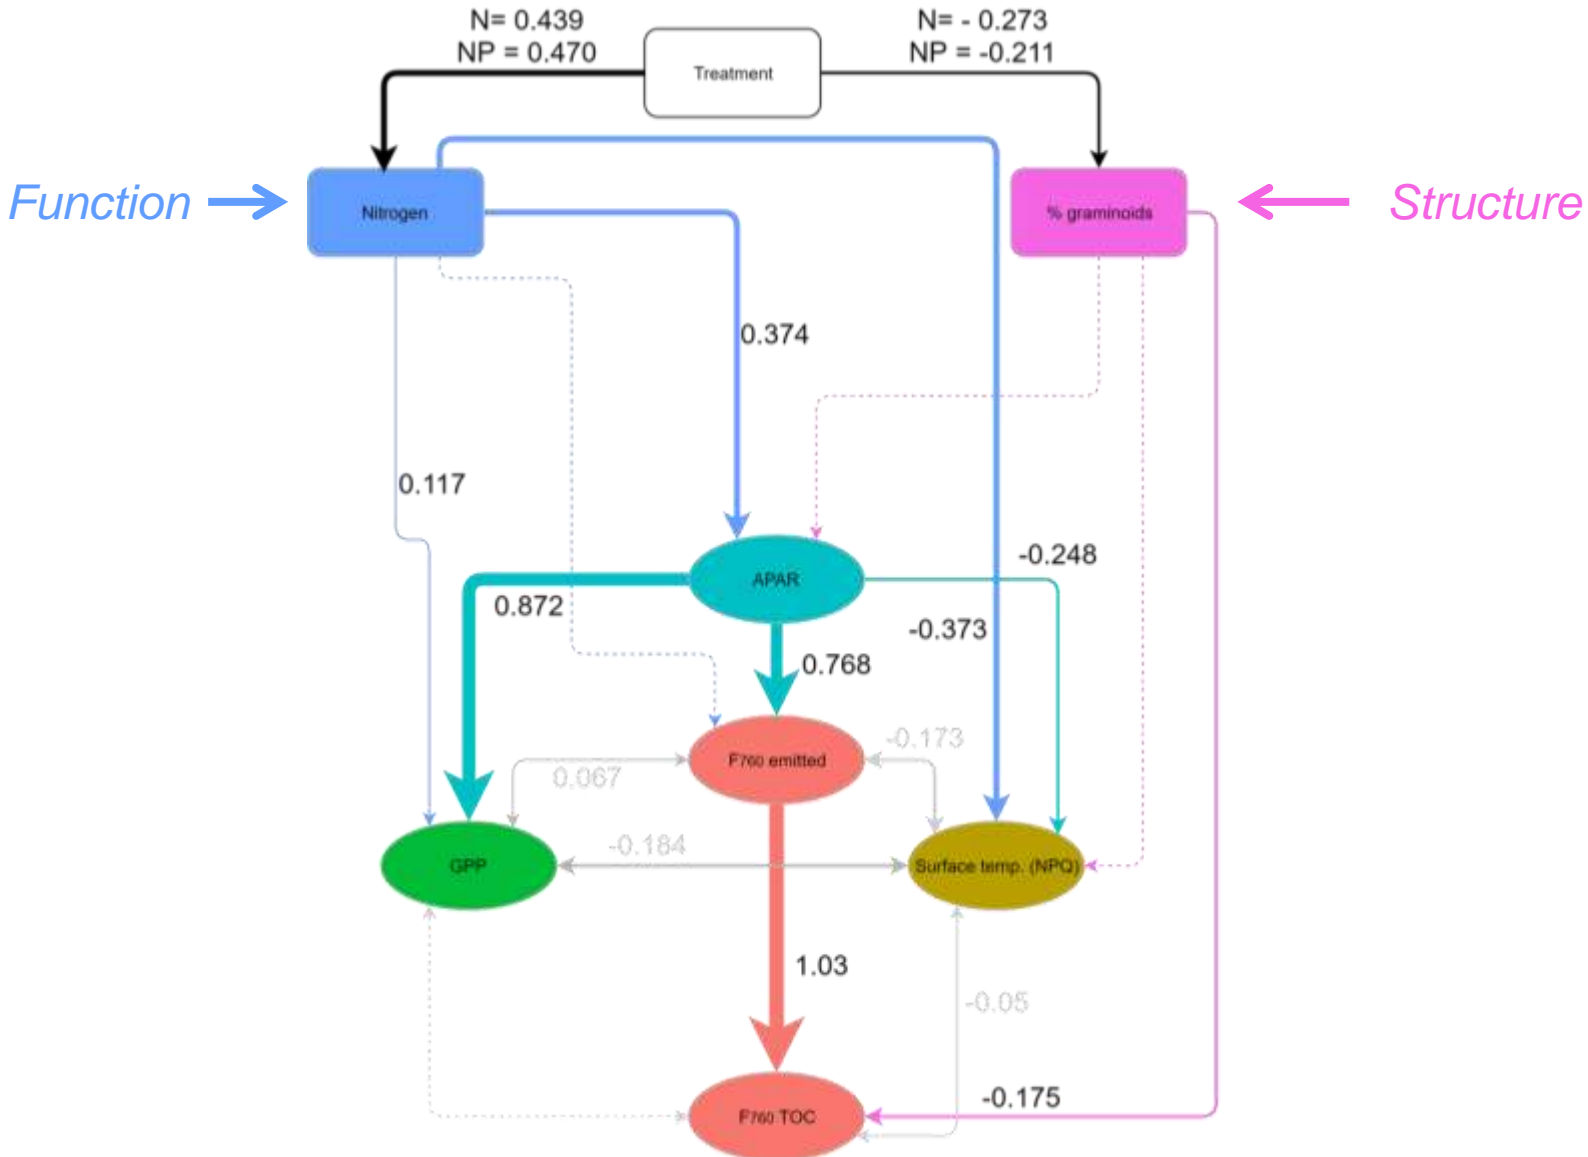

- Treatment effect is captured at the emission level, but *canopy structure compensates*

Relative importance analysis (Img)

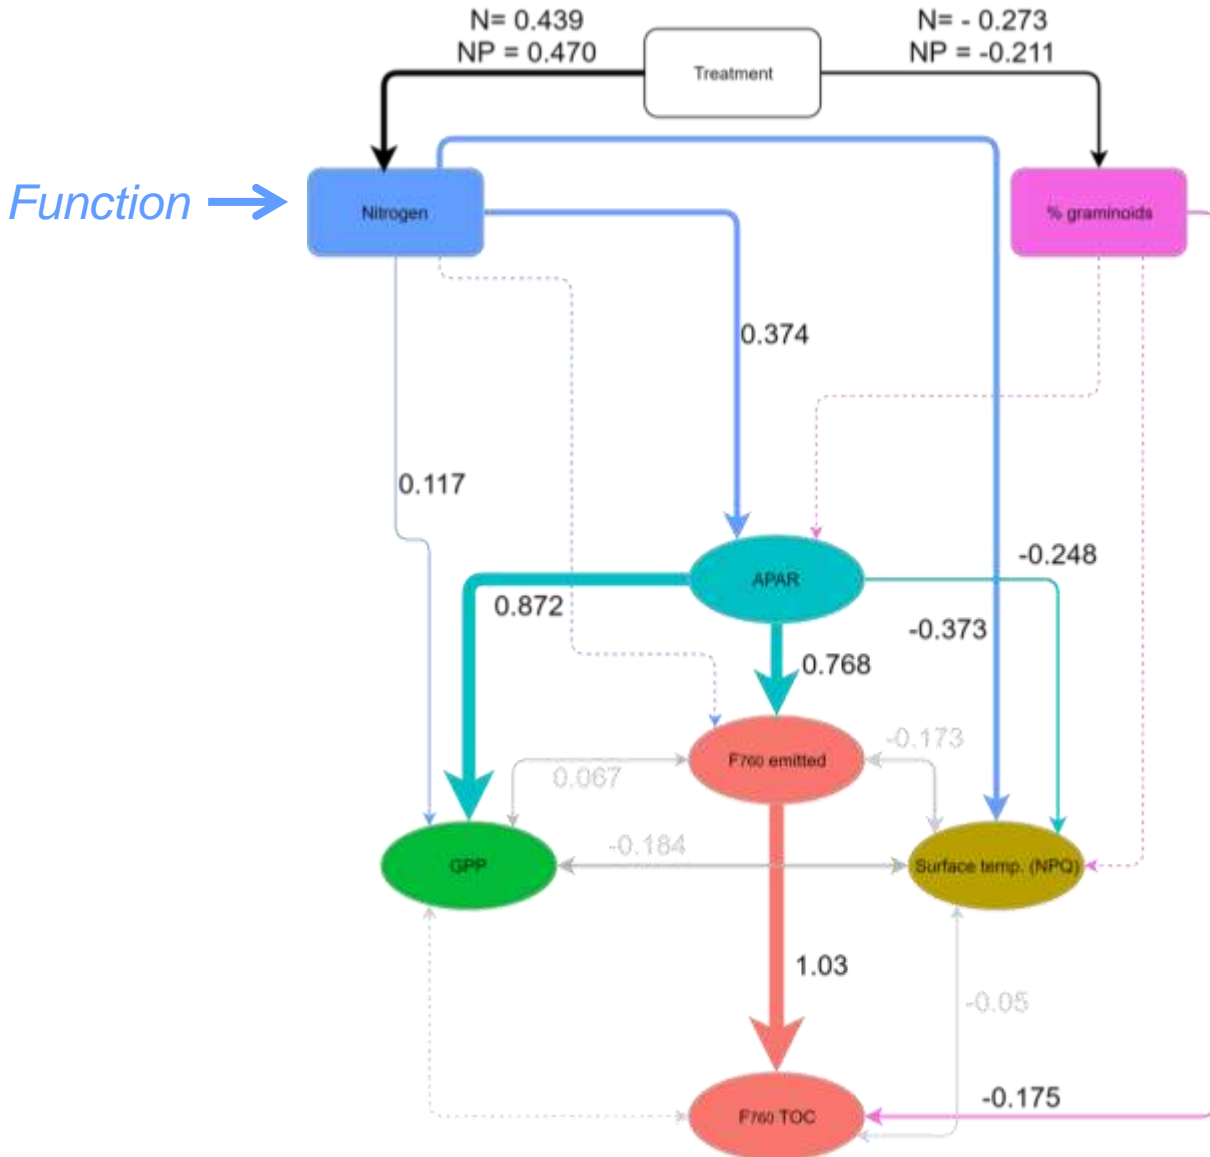

- GPP and F760 share the same predictors
- Fesc is mainly a function of plant type ← LAI

Path analysis

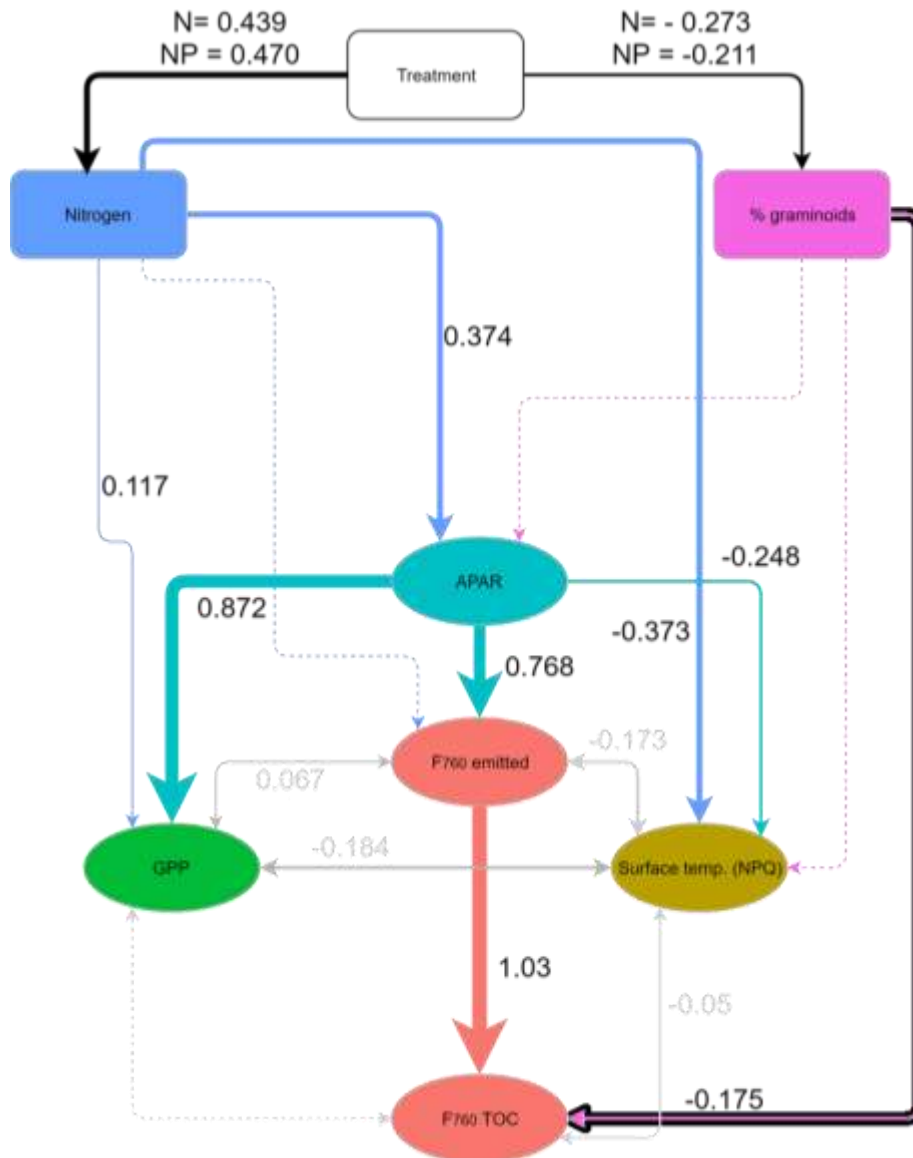

Path analysis

Explicitly representing the drivers and processes of GPP - SIF

Structure

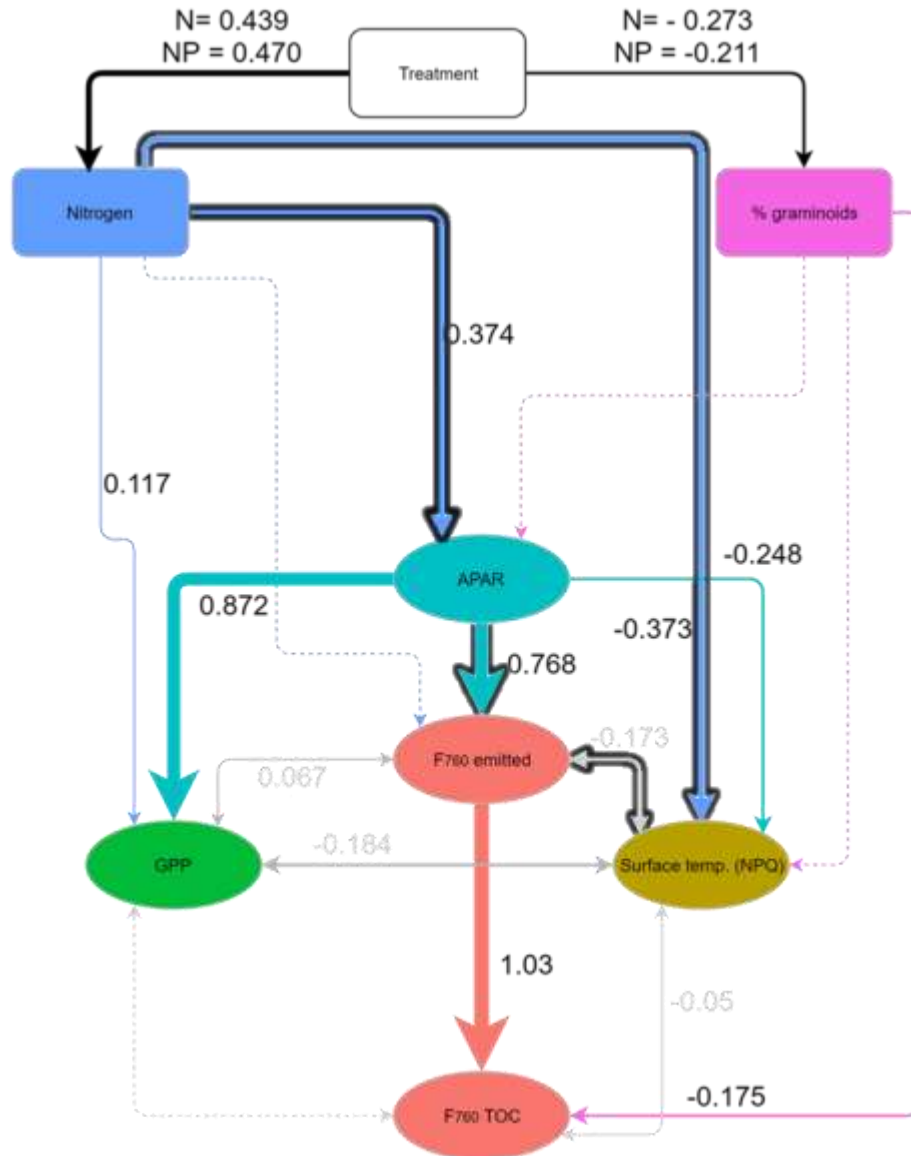

Path analysis

Explicitly representing the drivers and processes of GPP - SIF

- **Structure** does affect **F760**, in a direct way

Path analysis

Explicitly representing the drivers and processes of GPP - SIF

- **Structure** does affect **F760**, in a direct way
- **Function** does influence **F760** emitted in a indirect way
 - Effect mediated by **APAR** and **NPQ**

Conclusions and next steps

Treatment

SIF emission carries out more **physiological information** and responds to treatment

Processes

Nitrogen fertilization affects both structural and functional traits, → SIF emission

Changes in **Leaf N** affect more indirectly **SIF emission**

Towards empirical Fesc descriptions
