42

43 **Running title:** MS4A4A functional interaction with Dectin-1 in macrophages

44

45 **ABSTRACT**

46

47 The plasma membrane tetraspan molecule MS4A4A is selectively expressed by
48 macrophage-lineage cells, but its function is unknown. Here we report that MS4A4A was
49 restricted to murine and human mononuclear phagocytes and was induced during
50 monocyte-to-macrophage differentiation in the presence of interleukin 4 or
51 dexamethasone. Human MS4A4A was coexpressed with M2/M2-like molecules in subsets
52 of normal tissue-resident macrophages, infiltrating macrophages from inflamed synovium,
53 and tumor-associated macrophages. MS4A4A interacted and co-localized with the β -
54 glucan receptor Dectin-1 in lipid rafts. In response to Dectin-1 ligands, MS4A4A-deficient
55 macrophages showed defective signaling and defective production of effector molecules.
56 In experimental models of tumor progression and metastasis, MS4A4A deficiency in
57 macrophages had no impact on primary tumor growth, but was essential for Dectin-1-
58 mediated activation of macrophages and natural killer (NK) cell-mediated metastasis
59 control. Thus, MS4A4A is a tetraspan molecule selectively expressed in macrophages
60 during differentiation and polarization, essential for Dectin-1 dependent activation of NK
61 cell-mediated resistance to metastasis.

64

65 INTRODUCTION

66

67 Macrophages are central players in the pathophysiology of infections and cancer,
68 being capable of adapting to the local microenvironment assuming a range of different
69 phenotypes. During infections, macrophages sense pathogens through pattern recognition
70 receptors and by the release of immune mediators orchestrate the activation of
71 proinflammatory immune responses. This can be mimicked *in vitro* by the exposure to
72 bacterial compounds and interferon γ (IFN- γ), which promotes a classical activation of
73 macrophages (M1), endowed with pro-inflammatory features. At the opposite side of a
74 spectrum of activation phenotypes, interleukin 4 (IL-4) and other stimuli induce
75 macrophages to acquire an alternative phenotype (M2)^{1,2}. Macrophages also coordinate
76 immune responses by complex bidirectional interplay with other immune cells. In tumors,
77 in particular, tumor-associated macrophages (TAMs) establish a network with tumor and
78 host cells supporting a protumoral microenvironment^{3,4}. TAMs promote tumor progression
79 by different means, ranging from stimulation of angiogenesis to suppression of adaptive
80 immune responses through the triggering of the activity of inhibitory immune checkpoint
81 molecules, such as PD-L1, PD-L2, and VISTA⁵. Based on this, targeting TAMs represents
82 a major therapeutic option under investigation³. Several markers have been reported to
83 identify specific macrophage subsets as well as distinct macrophage activation profiles^{6,7},
84 ⁸. The present study investigated in particular the expression and function of the tetraspan
85 molecule membrane spanning 4-domains A4A (MS4A4A), which belongs to the
86 transcription signature of M2-polarized macrophages and TAMs^{6,9}. MS4A4A was
87 selectively expressed in tissue-resident macrophages, in homeostatic as well as in
88 inflammatory conditions, and was highly expressed in TAMs, both in humans and mice.
89 MS4A4A functionally associated with Dectin-1 in macrophage lipid rafts and was required
90 for the full activation of Syk-dependent signaling pathway and consequent production of

91 cytokines and reactive oxygen intermediates upon Dectin-1 engagement. Though
92 macrophage-selective genetic inactivation of *Ms4a4a* had no impact on primary
93 mesenchymal carcinogenesis and transplanted tumor growth, we found that MS4A4A-
94 deficient macrophages were impaired in their ability to support Dectin-1-dependent cross-
95 talk with natural killer (NK) cells, resulting in uncontrolled metastatic spread.
96

97 **RESULTS**

98

99 **MS4A4A expression is restricted to macrophages.**

100 Transcriptomic data from others and us have previously identified MS4A4A as a putative
101 marker of human macrophages undergoing IL-4-dependent alternative activation^{6,9}. When
102 investigated at the protein level by flow cytometry, macrophages were the only leukocyte
103 population scoring positive, while circulating myeloid (polymorphonuclear neutrophils
104 (PMNs), monocyte subsets, myeloid and plasmacytoid dendritic cells) and lymphoid cells
105 (NK, NKT, T, B) scored negative (Fig. 1a). Monocyte-derived dendritic cells did not
106 express MS4A4A (Supplementary Fig. 1a,b) and were also negative for MS4A6A
107 (Supplementary Fig. 1c,d) and MS4A7 (Supplementary Fig. 1e-f), two other members of
108 the MS4A family highly expressed on macrophages⁶. *In vitro*, MS4A4A expression
109 progressively increased during macrophage colony-stimulating factor (M-CSF)-dependent
110 monocyte differentiation to macrophages (Fig. 1b). When regulation of MS4A4A
111 expression in mature macrophages was investigated, we first confirmed its induction in
112 alternative macrophages activated by IL-4, but not by other stimuli inducing M2-like
113 phenotypes such as transforming growth factor- β (TGF- β) and IL-10 (Fig. 1c). We then
114 identified the glucocorticoid hormone dexamethasone (Dex) as a second potent inducer of
115 MS4A4A expression, alone or in combination with IL-4 (Fig. 1c,d). *MS4A4A* transcript
116 abundance was increased by Dex treatment at 18 h, at which time a significant increase in
117 MS4A4A protein expression was also detected (Fig. 1e,f). Glucocorticoids were also
118 demonstrated to act as potent MS4A4A inducers *in vivo*, as *MS4A4A* transcript levels were
119 strongly upregulated in circulating monocytes isolated from Graves' syndrome patients
120 upon acute exposure to methylprednisolone (Fig. 1g). Conversely, Dex treatment was
121 unable to induce expression of MS4A4A, MS4A6A, or MS4A7 in monocyte-derived
122 dendritic cells (Supplementary Fig. 1). Both in resting macrophages and more prominently

123 in macrophages activated by Dex and IL-4 in combination, MS4A4A expression was
124 significantly enriched in the CD163⁺ macrophage subset, while its expression did not
125 correlate with CD36 and CD206 expression (Fig. 1h).

126 To define MS4A4A expression in tissues, we first interrogated the public gene
127 expression database RefExA, which indicated expression of the *MS4A4A* transcript in
128 several normal human tissues (Supplementary Fig. 2a). Analysis of cell type-specific gene
129 expression revealed that *MS4A4A* expression was restricted to macrophages
130 (Supplementary Fig. 2b). In agreement with those data, immunohistochemical analysis
131 detected MS4A4A expression in several human tissues, including colon, lung, and skin
132 (Fig. 2). Also *in vivo*, combined staining confirmed that MS4A4A expression was restricted
133 to the CD163⁺ macrophages (Fig. 1b,e,h). Importantly, lung plasmacytoid dendritic cells
134 (CD303⁺; Fig. 1c), colon dendritic cells (CD1c⁺; Fig. 1f), and skin Langerhans cells
135 (CD207⁺; Fig. 1i) did not express MS4A4A. Finally, when MS4A4A expression was
136 investigated in the synovium of early rheumatoid arthritis (RA) patients, a prototypic
137 chronic inflammatory condition, MS4A4A resulted again predominantly expressed by a
138 subset of CD163⁺ macrophages (Fig. 3a,b) and was not detected in CD3⁺ T cells, CD20⁺ B
139 cells, or CD138⁺ plasma cells (Fig. 3c) infiltrating the inflamed synovium. Taken together,
140 these results indicate that both in normal and in chronic inflammatory conditions MS4A4A
141 expression is restricted to tissue-resident macrophages, where it is upregulated by IL-4
142 and glucocorticoid hormones.

143

144 **MS4A4A is not functionally relevant for protumoral functions of tumor-associated**
145 **macrophages.**

146 The gene expression database TCGA also reported the *MS4A4A* transcript signature in a
147 large number of human tumors (Supplementary Fig. 3a), though in some cases to a lower
148 extent as compared to corresponding normal tissues. Consistent with this,

149 immunohistochemical analysis detected MS4A4A expression in melanoma, as well as in
150 colon and lung tumors. Combined analysis confirmed that its expression was restricted to
151 CD163⁺ TAMs (Fig. 4a,c,e), in agreement with results obtained on *in vitro* differentiated
152 human macrophages and in inflamed synovium. A strong correlation between *MS4A4A*
153 and *CD163* transcript levels and, to minor extent, other M2/TAM markers, was also evident
154 in the TCGA cancer dataset (Supplementary Fig. 3b). Importantly, tumor-associated
155 dendritic cells did not express MS4A4A (Fig. 4b,d,f).

156 As the absence of a specific antibody prevented us from investigating the
157 expression of mouse MS4A4A protein, we evaluated *Ms4a4a* expression at the transcript
158 level by qPCR. Consistent with results obtained in the human setting, macrophages were
159 the only leukocyte population present in mouse spleen with detectable *Ms4a4a* transcripts
160 (Supplementary Fig. 4a). IL-4 or Dex, alone or in combination, strongly augmented
161 *Ms4a4a* expression, while the M1 polarizing treatment IFN- γ and lipopolysaccharide (LPS)
162 failed to induce its expression (Supplementary Fig. 4b). In line with abundant MS4A4A
163 expression detected by immunohistochemistry in human TAMs, we detected elevated
164 levels of the murine *Ms4a4a* transcripts in murine TAMs isolated from animals bearing
165 LCC and B16F1 tumors, as well as xenograft tumors of the human kidney cancer cell line
166 A498 (Fig. 4g).

167 As *Ms4a4a* was highly expressed in murine TAMs, we investigated its functional
168 relevance for carcinogenesis and tumor progression in different tumoral experimental
169 models. To this purpose, mice with macrophage-selective deletion of *Ms4a4a* were
170 generated. *Ms4a4a* expression was successfully abrogated in bone marrow-derived
171 macrophages (BMDMs) of *Ms4a4a^{fl/fl}Lys^{Cre/+}* animals (indicated here as *Ms4a4a^{-/-}*;
172 Supplementary Fig. 4c), with no apparent phenotype or impact on the development for any
173 immune cell subset (Supplementary Fig. 4d). When animals were tested, we found no
174 difference in appearance, incidence, and growth of primary tumors in mice having

175 MS4A4A-competent or -incompetent macrophages, neither in the B16F1 transplanted
176 tumor model (Fig. 4h) nor in a model of mesenchymal carcinogenesis based on 3-
177 methylcholanthrene (3-MCA) exposure (Fig. 4i,j). We conclude that, though highly
178 expressed in TAMs, MS4A4A has no functional relevance for their ability to promote
179 primary tumor growth, at least under the experimental conditions tested.

180

181 **MS4A4A colocalizes with Dectin-1 in lipid rafts.**

182 In search for a functional role of MS4A4A in macrophages, we considered the structural
183 homology of MS4A proteins with tetraspanins, which are known to engage latero-lateral
184 interactions with other membrane proteins and influence their functional properties^{10,11}. By
185 performing a split-ubiquitin yeast two-hybrid screening, an approach previously applied to
186 identify partners of other MS4A members¹², we identified membrane proteins interacting
187 with MS4A4A. These included MS4A4A itself as well as MS4A6A and MS4A7, two other
188 MS4A family members highly expressed in alternative macrophages⁶, suggesting that on
189 the macrophage plasma membrane these three MS4A members may interact among
190 themselves. We then validated MS4A4A interaction with itself as well as the other two
191 MS4A proteins in CHO-K1 transfected cells by FLIM-FRET analysis (Fig. 5a–c), which
192 indicates that these proteins likely organize in clusters on plasma membranes. Conversely,
193 FLIM-FRET experiments did not reveal interaction of MS4A4A with the tetraspanins CD63
194 (Förster radius 1.24 ± 0.15 vs 1.27 ± 0.06 for vector- and MS4A4A-transfected cells,
195 respectively; $p > 0.05$) and CD9 (Förster radius 1.28 ± 0.06 vs 1.26 ± 0.05 for vector- and
196 MS4A4A-transfected cells, respectively; $p > 0.05$). Candidate MS4A4A interactors
197 emerged from the split-ubiquitin yeast two-hybrid screening also included the membrane
198 receptor for β -glucan Dectin-1, whose interaction with MS4A4A also was confirmed by
199 FLIM-FRET analysis (Fig. 5d). Flow cytometry analysis indicated that macrophages had
200 high co-expression of MS4A4A and Dectin-1, both under resting conditions and upon Dex

201 treatment (Supplementary Fig. 5). Confocal microscopy experiments revealed that
202 MS4A4A and Dectin-1 colocalization was significantly increased by the Dectin-1 agonist
203 zymosan, which also induced a significant increase in the colocalization index of both
204 MS4A4A and Dectin-1 with the lipid rafts tracer CT-B (Fig. 5e-h). Super-resolution
205 stimulated emission depletion (STED) microscopy further confirmed increased
206 colocalization of MS4A4A and Dectin-1 upon zymosan stimulation, as well as increased
207 colocalization of both proteins with CT-B (Fig. 5i-k). Interestingly, treatment with the
208 cholesterol-depleting agent methyl- β -cyclodextrin (M β CD) completely abrogated the
209 zymosan-induced increase in Dectin-1 colocalization with MS4A4A (Fig. 5i-l). Taken
210 together, these results indicate that, upon exposure to Dectin-1 agonists, MS4A4A and
211 Dectin-1 colocalizes in lipid rafts on the macrophage plasma membrane, suggesting a
212 functional relevance of MS4A4A on Dectin-1 signaling.

213

214 **MS4A4A is required for Dectin-1 signalling activity.**

215 We next investigated the role of MS4A4A in Dectin-1 function. Dectin-1 was similarly
216 expressed on BMDMs generated from *Ms4a4a*^{-/-} and wild-type mice, and no difference
217 was observed in the rate of Dectin-1 internalization induced by its agonist zymosan (Fig.
218 6a). Similarly, binding of zymosan-FITC particles was identical in BMDMs generated from
219 *Ms4a4a*^{-/-} and wild-type animals (Fig. 6b). MS4A4A expression was also not relevant for
220 Dectin-1 internalization and phagocytosis when *Aspergillus fumigatus* conidia were used
221 (Fig. 6c).

222 In order to investigate the relevance of MS4A4A for Dectin-1 signaling,
223 phosphorylation events for the three main signaling pathways acting downstream Dectin-1
224 (Syk, p38, and ERK) were assessed in BMDMs generated from *Ms4a4a*^{-/-} and wild-type
225 mice. Upon zymosan challenge, only Syk phosphorylation was significantly reduced in
226 *Ms4a4a*^{-/-} as compared to wild-type BMDMs (Fig. 6d), while ERK and p38 phosphorylation

227 was unaffected (Fig. 6e-f). Similar results were obtained when curdlan and depleted
228 zymosan, two Dectin-1-specific agonists, were used, but not when BMDMs were
229 stimulated with phorbol 12-myristate 13-acetate (PMA) (Supplementary Fig. 6a–c). Neither
230 p38 nor ERK phosphorylation were influenced by MS4A4A expression with any of the
231 stimuli used (Supplementary Fig. 6d-e). In accordance with reduced Syk phosphorylation,
232 upon zymosan challenge *Ms4a4a*^{-/-} BMDMs released less pro-inflammatory cytokines,
233 including IL-6 and tumor necrosis factor (TNF), and produced less ROS as compared to
234 wild-type BMDMs (Fig. 6g–i). The same defect was observed when depleted zymosan and
235 curdlan were used (Supplementary Fig. 6f,g,i,j). Of note, the absence of MS4A4A did not
236 impact on cytokine production by BMDMs stimulated with TLR agonists, such as LPS (Fig.
237 6g–h) or Pam3Cys (Supplementary Fig. 6h,k).

238 Taken together, these results indicate that MS4A4A is dispensable for Dectin-1-
239 mediated microbial recognition and phagocytosis, but is required to support optimal Syk
240 phosphorylation and production of inflammatory cytokines and ROS following Dectin-1
241 engagement.

242

243 **MS4A4A contributes to Dectin-1-mediated protection against metastasis.**

244 Dectin-1 has recently been shown to allow dendritic cell/macrophage-dependent
245 recognition of tumor-associated molecular patterns on some tumor cells¹³. This Dectin-1-
246 mediated recognition pathway was shown to have an impact on the metastatic potential of
247 the low metastatic B16F1 melanoma cells. Conversely, this pathway had no relevance for
248 the metastatic potential of the highly metastatic B16F10 melanoma cells, which were found
249 negative for the appropriate N-glycan structures recognized by Dectin-1¹³. In accordance
250 with this evidence, we observed a higher binding of wheat germ agglutinin (WGA), which
251 recognizes N-acetylglucosamine residues, on the surface of B16F1 cells as compared to
252 B16F10 cells (Fig. 7a). As shown for the pathogen-derived Dectin-1 agonists, the tumor

253 B16F1 cells were able to trigger Syk phosphorylation and cytokine production by BMDMs.
254 Importantly, both Syk phosphorylation and IL-6 secretion induced by B16F1 cells were
255 reduced in *Ms4a4a*^{-/-} as compared to wild-type cells (Fig. 7b,c).

256 Prompted by this observation, we assessed the relevance of Dectin-1 and MS4A4A
257 expression in macrophages for the metastatic potential *in vivo* of B16F1 and B16F10 cells.
258 In agreement with earlier observations¹³, B16F1 cells showed a significant higher
259 metastatic potential in Dectin-1-deficient animals (*Clec7a*^{-/-}) compared to wild-type mice,
260 whereas no difference was observed in the number of metastasis generated by B16F10
261 cells (Fig. 7d,e, respectively). Similarly to previous observations on Dectin-1-deficient
262 animals¹³, macrophage-specific *Ms4a4a* deletion had no effect on the metastatic
263 spreading of B16F10, but resulted in a significant increase in the number of B16F1
264 metastasis, whose metastatic potential became comparable to that of B16F10 (Fig. 7f,g,
265 and Supplementary Fig. 7a). Of note, the number of B16F1 metastasis was not further
266 increased when mice double-deficient for *MS4A4A* and *Dectin-1* (*Ms4a4a*^{-/-}*Clec7a*^{-/-})
267 were used, consistent with the idea the two molecules cooperate in a common recognition
268 pathway (Supplementary Fig. 7b). Importantly, the increased B16F1 metastatic spreading
269 observed in the absence of Dectin-1 or MS4A4A was also evident when N-glycans-
270 depleted B16F1 cells were injected in wild-type animals (Fig. 7h). Similar experiments
271 were then performed with two colon carcinoma cell lines that exhibit different metastatic
272 potential. As observed for B16 cells, the low metastatic MC38 cells showed high WGA
273 binding and an increased number of metastasis when injected in both *Clec7a*^{-/-} and
274 *Ms4a4a*^{-/-} mice as compared to wild-type mice (Supplementary Fig. 8a,b,d). Conversely,
275 the highly metastatic SL4 cells, which showed lower WGA binding as compared to MC38
276 (Supplementary Fig. 8a), generated the same number of metastasis in both *Clec7a*^{-/-} and
277 *Ms4a4a*^{-/-} animals compared to wild-type animals (Supplementary Fig. 8c,e). Taken
278 together, these results suggest that the expression of MS4A4A on macrophages is

279 required for Dectin-1-mediated control of metastatic spreading of highly N-glycosylated
280 tumor cells.

281 *In vitro* experiments have identified NK cells as effector cells in B16F1 killing¹³.
282 Consistent with this, NK cell depletion by the use of an anti-NK1.1 antibody resulted in a
283 significant increase in B16F1 lung metastasis and abrogated the difference observed
284 between *Ms4a4a*^{-/-} and wild-type animals (Fig. 8a,b). Conversely, NK cell depletion did
285 not abrogate the difference observed in the number of MC38 liver metastasis
286 (Supplementary Fig. 8d). As confocal microscopy analysis showed that NK cells and
287 macrophages were located in close proximity in B16F1 lung metastasis, suggesting a
288 possible cross-talk between NK cells and macrophages in metastatic lesions
289 (Supplementary Fig. 7c), we then investigated the role of macrophage MS4A4A in NK cell
290 activation. Though *Ms4a4a* deletion had no impact on the abundance of NK cells and
291 macrophages in the lungs bearing B16F1 metastatic lesions (Fig. 8c for NK cells;
292 Supplementary Fig. 7d-g for macrophages), macrophage expression of MS4A4A was
293 required for optimal recognition by NK cells of tumor targets. NK cell cytotoxicity, assessed
294 *in vitro* as the frequency of CD107a⁺ cells in a degranulation assay, was significantly lower
295 when B16F1 cells were cultured with splenocytes from *Ms4a4a*^{-/-} mice as compared to the
296 wild-type counterpart (Fig. 8d). Of note, defective activation of NK cells was not observed
297 when B16F10 cells were used as targets (Supplementary Fig. 7h).

298 Previous studies suggested that Dectin-1 triggering by tumor cells induces the
299 expression on macrophage plasma membrane of calcium homeostasis modulator family
300 member 6 (CALHM6), also known as IFN regulatory factor 3-dependent NK-activating
301 molecule (INAM), which in turn promotes NK cell activation leading to tumor cell killing¹³.
302 Consistent with this, the induction of *Calhm6* expression in BMDMs cocultured with B16F1
303 cells was defective when *Ms4a4a*^{-/-} cells were used (Fig. 8e). A similar defect was
304 observed when Dectin-1 ligands were used, but not when BMDMs were activated using

305 LPS (Supplementary Fig. 7i,j,k). The lack of MS4A4A also affected the cytokine profile
306 induced in BMDMs by tumor cell recognition. While induction of *I12p40* after B16F1
307 engagement did not require MS4A4A expression on BMDMs (Fig. 8f), *Ms4a4a*^{-/-} BMDMs
308 expressed significantly less *I15* and *I18* transcripts as compared to wild-type BMDMs
309 (Fig. 8g,h respectively). A similar defect was evident when BMDMs were stimulated with
310 zymosan (Supplementary Fig. 7l). In accordance with this finding, IFN- γ production by NK
311 cells was significant lower when B16F1 cells were cocultured with *Ms4a4a*^{-/-} splenocytes
312 as compared to wild-type littermates (Fig. 8i). Taken together, these results are consistent
313 with a non-redundant role of MS4A4A expression in macrophages in controlling tumor
314 metastatization by supporting a Dectin-1-dependent recognition of N-glycans on tumor
315 cells and triggering NK cell-mediated tumor cell killing.
316

317 **DISCUSSION**

318

319 MS4A4A is a member of the MS4A family, encoded in a 600 Kb region on
320 chromosome 11q12-13 in human and chromosome 19 in mouse genome^{14,15}. MS4A4A
321 has been reported by us and by others as a macrophage-restricted transcript associated
322 with M2/M2-like polarization, and genome-wide association studies have correlated SNP
323 variants within the MS4A4A/MS4A6A locus with late onset Alzheimer's disease and
324 cutaneous systemic sclerosis¹⁶. Recent studies have described MS4A4A as a
325 chemosensor expressed by necklace sensory neurons¹⁷ and as a partner of the receptor
326 tyrosine kinase KIT in mast cells¹⁸, but its function in macrophages is unknown.

327 MS4A proteins are characterized by a common structural organization based on
328 four putative highly hydrophobic transmembrane domains, two extracellular loops, and
329 short cytoplasmic N- and C-terminals, tightly resembling tetraspanins¹⁹. Tetraspanins, a
330 large family of cell-surface proteins with a similar structural organization, are known to
331 establish homo and heterocomplexes called tetraspanin-enriched microdomains in which
332 they engage lateral interactions with different partners, influencing their trafficking and
333 signalling properties^{11,20,21,22}. Of note, some MS4A proteins, including CD20/MS4A1,
334 FcεR1β/MS4A2, and the highly MS4A4A-related protein MS4A4B, have been shown to
335 enter oligomeric complexes in lipid rafts, where they interact and influence signalling
336 properties of associated partners^{12,23,24}. Furthermore, MS4A4A has been reported to
337 regulate the signalling activity of the receptor tyrosine kinase KIT controlling its endocytic
338 recycling and degradation pathways by a mechanism that involves colocalization of KIT
339 with caveolin-1 in lipid rafts in mast cells¹⁸. Here we have demonstrated that, after Dectin-1
340 engagement by zymosan, Dectin-1 and MS4A4A translocate in lipid rafts on macrophage
341 plasma membrane. Of note, Dectin-1 has already been reported to interact with
342 tetraspanins, which control its availability on the plasma membrane and the quantity of

343 cytokines produced after zymosan engagement²⁵. Finally, we also provided evidence of
344 MS4A4A association with itself and with MS4A6A and MS4A7, other two members of the
345 MS4A family with a macrophage-restricted expression pattern, and showed that in the
346 absence of MS4A4A expression the signalling properties of Dectin-1 are affected. Taken
347 together, our results suggested that these three MS4A proteins might contribute to the
348 organization of specific microdomains on the plasma membrane of macrophages where
349 signalling properties of membrane receptors, including Dectin-1, are regulated.

350 Dectin-1 is a pattern recognition receptor belonging to the non-classical C-type
351 lectin receptor family²⁶. Dectin-1 plays a pivotal role in controlling a wide range of fungal
352 infections, including species of *Candida*, *Aspergillus*, *Pneumocystis*, and *Coccidioides*^{26,27}.
353 More recently, a role of Dectin-1 in the resistance to a broader range of microorganisms, in
354 autoimmunity, and in tumor cell recognition has also been recognized²⁸. The signalling
355 activity of Dectin-1 after ligand engagement requires clustering into a phagocytic
356 synapse²⁹ and results in enhanced phagocytosis, respiratory burst activity, and
357 inflammatory cytokines secretion^{30,31}. The Dectin-1 signalling pathway in macrophages is
358 still ill defined^{32,33,34}. It has however been demonstrated that Dectin-1 signaling activity in
359 macrophages is delayed as compared to dendritic cells, and that it leads to both Syk-
360 independent and Syk-dependent signalling pathways, which control phagocytosis and
361 production of effector molecules (cytokines and ROS), respectively^{32,35,36,37}. Our evidence
362 that MS4A4A-deficient macrophages show normal phagocytic properties but reduced Syk
363 phosphorylation and impaired cytokine and ROS production indicates that MS4A4A is
364 functionally relevant for the Syk-dependent signalling pathway in macrophages. In
365 macrophages, MS4A4A expression was significantly increased by IL-4 and, intriguingly,
366 glucocorticoids. In patients with Graves' disease treated with methylprednisolone,
367 MS4A4A induction was observed in circulating monocytes, thus providing an *in vivo*
368 confirmation of the regulation found *in vitro*. Glucocorticoid hormones are potent regulators

369 of immunity and inflammation and macrophages are a prime target for their action under
370 physiological and pharmacological conditions³⁸. Glucocorticoid hormones not only
371 suppress inflammatory cytokines production, but also orchestrate tissue remodeling and
372 reshape macrophage functions with the induction of anti-inflammatory molecules such as
373 the IL-1 decoy receptor IL-1R2³⁹ and selected chemokines⁴⁰. Moreover, glucocorticoid
374 hormones have been suggested to set components of the innate immune system in an
375 alert mode, priming for immediate/early responses to pathogens³⁸. Given the coupling of
376 MS4A4A with a microbial sensor, its induction could be a component of this early aspect of
377 the pathophysiology of glucocorticoid hormones. Irrespective of its significance, monocyte
378 expression of MS4A4A could serve as a biomarker of the response of mononuclear
379 phagocytes to these agents.

380 Macrophages have been shown to promote activation of NK cell anti-tumoral
381 activities through direct cell-cell contacts or soluble mediators, including IL-15 and IFN-
382 β ^{41,42}. In this setting, recent evidence in a melanoma model indicates that macrophage
383 recognition of tumor cell-associated molecular patterns via Dectin-1 is associated with
384 reduction of tumor burden and metastatic spreading due to the activation of cytotoxic NK
385 cells¹³. NK cells are known to play a major role in resistance against hematologic
386 neoplasms, while their role in solid tumors is usually considered less relevant⁴³. Recent
387 results challenge this long held view by showing that inactivation of the NK cell checkpoint
388 IL-1R8 unleashes NK cell mediated resistance against carcinogenesis at NK cell-rich
389 anatomical sites, such as the liver and the lung⁴⁴. In line with this general view, results
390 reported here indicate that when macrophages are engaged via Dectin-1 with B16F1
391 melanoma cells, the absence of MS4A4A impairs their ability to upregulate
392 CALHM6/INAM, secrete IFN- γ inducing cytokines, and trigger NK cell-mediated cytotoxic
393 response, thus hampering NK cell ability to control tumor metastatization to the lung.
394 Considering these evidences and the observation that MS4A4A is barely detectable in the

395 various subsets of circulating monocytes and induced during their differentiation to
396 macrophages, we conclude that MS4A4A expression on TAM is likely required to support
397 the interaction between NK cells and TAM observed in metastatic foci, where this cross-
398 talk activates NK cells-mediated tumor cell killing. MS4A4A therefore does not contribute
399 to the protumoral functions of TAM infiltrating primary tumors and conversely its
400 expression in macrophages at metastatic sites is required for appropriate NK cell-mediated
401 anti-tumoral functions. These results are well in line with previous results by us and others
402 showing that the organ immunological context is indeed a key determinant of effective
403 antitumor effector mechanisms⁴⁵, with divergent impact of immune manipulations on
404 primary versus metastatic tumors^{46,47}. There is evidence that the tissue contexture
405 contributes to shaping the microenvironment of tumors originating in different organs⁴.
406 Moreover, complex and diverse mechanisms orchestrate the formation of metastatic
407 niches at sites of secondary localization of tumors⁴⁸. Accordingly, it has long been known
408 that immune mechanisms can have divergent impact of primary tumors and metastasis^{3,47},
409 as shown here for the MS4A4A-Dectin-1 interaction. Thus, in a therapeutic perspective,
410 pathways of immune resistance at sites of secondary localization should be taken into
411 account.

412 Several studies are ongoing with the aim of targeting TAM as a promising immune
413 strategy to impact on tumor biology^{3,49}. MS4A4A belongs to the same protein family of
414 CD20 (also known as MS4A1)¹⁴, whose targeting by specific monoclonal antibodies has
415 proven to be effective for the treatment of hematological and autoimmune disorders⁵⁰.
416 Thus, from a translational perspective, our discovery of MS4A4A as a new M2/TAM
417 marker raises the interesting possibility that it may represent a valid target for TAM
418 depletion, though the anti-tumoral effect has to be balanced with the negative impact on
419 metastasis spreading we have shown here. Finally, targeting the MS4A4A/Dectin-1

420 interaction may allow fine-tuning of uncontrolled, pathogen-triggered innate immune
421 responses.

587 **FIGURE LEGENDS**

588

589 **Figure 1. MS4A4A expression and its regulation in human macrophages.**

590 a-c) Flow cytometry analysis of MS4A4A surface expression on human leukocyte subsets
591 (a), monocytes during M-CSF-dependent differentiation to macrophages (b), and
592 differentiated macrophages treated for 18 h as indicated or not (M0) (c). Results are
593 shown as mean \pm SEM of relative Mean Fluorescence Intensity (MFI; fold on isotype). Two
594 biologically independent experiments were performed, with each dot representing a
595 biologically independent sample (a: 3 donors for CD14^{hi}/CD16^{neg} monocytes,
596 CD14^{lo}/CD16^{pos} monocytes, NK, NKT, T, mDC, and pDC; 4 for CD14^{dim}/CD16^{pos}
597 monocytes, B, PMN; 8 for macrophages; b: 2 donors for day 7 after M-CSF treatment, 3
598 for monocytes and day 3 after M-CSF treatment; 4 for day 1 and 5 after M-CSF treatment;
599 c: 3 donors). Statistical analysis by one-way ANOVA.

600 d) MS4A4A expression on human macrophages treated with IL-4 plus Dex (Dex+IL-4) or
601 not (Medium) for 18 h. DAPI staining of nuclei is shown in blue. Immunofluorescence
602 images are representative of one experiment out of three biologically independent
603 performed.

604 e-f) Time-course of *MS4A4A* mRNA (e) and plasma membrane protein (f) in human
605 macrophages treated with Dex for the indicated time. Results are shown as mean \pm SEM
606 of fold change (e) or relative MFI (f; fold change on M0). Two biologically independent
607 experiments were performed (3 donors for e and 5 for f). Statistical analysis by two-tailed
608 one sample Student's t test.

609 g) Expression levels of *MS4A4A* mRNA in monocytes isolated from three Graves'
610 syndrome orbitopathy patients before and 6 h after injection with 1 g methylprednisolone.
611 Results are shown as fold change on untreated cells (open columns).

612 h) Flow cytometry analysis of macrophage plasma membrane expression of MS4A4A and
613 other indicated M2 markers (CD36, CD163, CD206) in resting conditions (-) or after
614 exposure for 18 h to IL-4 plus M Dex (+). Two biologically independent experiments were
615 performed (4 donors).

616

617 **Figure 2. Macrophage expression of MS4A4A in human tissues.**

618 MS4A4A expression on formalin fixed paraffin-embedded sections of human colon (a-c),
619 lung (d-f), and skin (g-i). MS4A4A is visualized in brown (single staining in b-e-h, left and
620 middle panels). In double-stained sections, MS4A4A expression (brown) was combined
621 with CD163 (blue) in b-e-h right panels, CD1c (blue) in c, CD303 (blue) in f, and CD207
622 (blue) in i. Omission of primary antibodies was used as negative control (a-d-g panels).
623 Magnification: 100X (a-d-f and b-e-h left panels; scale bar: 200 μ m), 200X (c-f-i; scale bar:
624 100 μ m) and 400X (b-e-h, middle and right panels; scale bar: 50 μ m). One set of images
625 out of five healthy tissues analyzed is shown.

626

627 **Figure 3. MS4A4A expression is restricted to CD163⁺ macrophages in inflamed**
628 **synovium.**

629 a and c) Representative immunofluorescence images of MS4A4A expression on formalin
630 fixed paraffin-embedded sections of synovial tissue from early RA patients. MS4A4A
631 staining is visualized in yellow, CD68 in green, CD3/CD20/CD138/CD163 in red. Nuclei
632 were counterstained with DAPI and are visualized in blue. Matching isotype control
633 antibodies were used as negative control. Magnification: 15X for upper panels (scale bar:
634 250 μ m), and 40X for lower panels (scale bar: 70 μ m). One set of images out of five RA
635 patients analyzed is shown.

636 b) Percentage of synovial macrophages (CD68⁺ cells) from early RA patients positive for
637 MS4A4A and/or CD163, quantified by immunofluorescence in five RA patients.

638

639 **Figure 4. MS4A4A is expressed in murine TAMs but is dispensable for primary**
640 **tumor growth.**

641 a-f) MS4A4A expression on formalin fixed paraffin-embedded sections of human colon
642 adenocarcinoma (a-b), lung adenocarcinoma (c-d), and melanoma (e-f). MS4A4A is
643 visualized in brown (single staining in a-c-e, left and middle panels). In double-stained
644 sections, MS4A4A expression (brown) was combined with CD163 (blue) in a-c-e right
645 panels, CD1c (blue) in b, CD303 (blue) in d, and CD207 (blue) in f. Magnification: 100X in
646 a-c-e left panels (scale bar: 200 μ m), 200X in b-d-f panels (scale bar: 100 μ m), and 400X
647 in a-c-e middle and right panels (scale bar: 50 μ m). One set of images out of five cancer
648 tissues analyzed is shown.

649 g) Expression levels of the *MS4A4A* mRNA in murine TAM isolated from B16F1 tumors,
650 Lewis lung carcinoma (LLC) tumors, and human renal cancer cell A498 tumor xenografts.
651 Data are normalized to actin and expressed as mean \pm SEM of *MS4A4A* relative
652 expression in TAMs compared to corresponding PECs, used as control. Results pooled
653 data (4 mice per group) from one representative experiment out of three run in triplicate for
654 A498 model and from one experiment (3 mice per group) for LLC and B16F1 models.

655 h) Tumor growth curve in *Ms4a4a*^{-/-} (open symbol) and wild-type (closed symbol) mice
656 upon s.c. injection of B16F1 melanoma cells. Results are shown as mean \pm SEM. Two
657 biologically independent experiments were performed (11 mice). No statistical difference at
658 any time point by two-tailed unpaired Student's t test.

659 i-j) Tumor volume (i) and incidence (j) of 3-methylcholanthrene-induced fibrosarcoma in
660 *Ms4a4a*^{-/-} (open symbol) and wild-type (closed symbol) mice. Results are shown as mean
661 \pm SEM. Two biologically independent experiments were performed (16 mice). No statistical
662 difference at any time point by two-tailed unpaired Student's t test.

663

664 **Figure 5. MS4A4A and Dectin-1 associate in lipid rafts after zymosan engagement.**

665 a-d) FLIM-FRET analysis of eGFP mean fluorescence lifetime in CHO-K1 cells expressing
666 eGFP-MS4A4A alone (V) or in combination with mCherry-MS4A4A (6 for V and 7 for
667 MS4A4A), mCherry-MS4A6A (6 for V and 4 for MS4A6A), mCherry-MS4A7 (7 for V and 6
668 for MS4A7), and mCherry-Dectin-1 (4 for V and 8 for Dectin-1). FRET efficiency (E) and
669 Förster radius (R) are indicated. Results are shown as mean \pm SEM.

670 e-h) Colocalization of MS4A4A and Dectin-1 in lipid rafts (stained with cholera toxin; CT-B)
671 in human macrophages treated with 100 μ g/ml zymosan. Panel e reports the kinetic of
672 colocalization of MS4A4A and Dectin-1, panels f and g the kinetics of localization of
673 MS4A4A and Dectin-1 in lipid rafts, respectively. Results are shown as mean \pm SEM of the
674 colocalization index (Manders coefficient) in 20-78 cells from three donors analyzed. Error
675 bars are included in symbols. Statistical analysis in comparison with time 0 was performed
676 by one-way ANOVA. Images referring to the 30 min time point are shown in panel h, with
677 nuclei counterstained with DAPI visualised in white. Scale bars: 10 μ m.

678 i-l) STED analysis of MS4A4A and Dectin-1 in lipid rafts (stained with CT-B) in human
679 macrophages treated (+) or not (-) for 15 min with 100 μ g/ml zymosan alone or in
680 combination with 5 mM M β CD. Panel i shows images from one experiment representative
681 of two analyzed. Panels j to l report the colocalization rate (%) of MS4A4A in lipid rafts,
682 Dectin-1 in lipid rafts, and MS4A4A and Dectin-1, respectively. Results are shown as
683 mean \pm SEM of the colocalization rate in 20-33 cells from 2 donors analyzed. Scale bars:
684 5 μ m. Statistical analysis by two-tailed unpaired (Mann-Whitney) Student's t test (j and k)
685 and one-way ANOVA (l).

686

687 **Figure 6. MS4A4A is required for Dectin-1 signalling.**

688 Dectin-1 expression and function in BMDMs from wild-type (closed symbol) and *Ms4a4a*^{-/-}
689 (open symbol) mice.

690 a) Dectin-1 surface expression upon stimulation with 100 µg/ml zymosan (solid line) or 100
691 ng/ml LPS (dashed line). Results are shown as relative MFI (fold on isotype) mean ± SEM.
692 Five biologically independent experiments were performed (time 0: 15 wild-type and 25
693 *Ms4a4a*^{-/-} mice; 5 min: 11 wild-type and 20 *Ms4a4a*^{-/-} mice; 15 min: 4 wild-type and 5
694 *Ms4a4a*^{-/-} mice; 30 min: 4 wild-type and 3 *Ms4a4a*^{-/-} mice; 30 min with LPS: 6 wild-type
695 and 5 *Ms4a4a*^{-/-} mice).

696 b) Binding of zymosan-FITC. Results are shown as MFI mean ± SEM (time 0, 5, and 15
697 min: 6 wild-type and 6 *Ms4a4a*^{-/-} mice; 30 min: 4 wild-type and 4 *Ms4a4a*^{-/-} mice).

698 c) Phagocytosis of *Aspergillus fumigatus* conidia-FITC. Results are shown as mean ± SEM
699 of percentage (left y-axis, solid lines) and relative MFI (fold on untreated; right y-axis,
700 dotted lines) of FITC⁺ cells gated on F4/80⁺ cells. Three biologically independent
701 experiments were performed. At all time points, 6 wild-type and 8 *Ms4a4a*^{-/-} mice.

702 d-f) Phosphorylation of Syk (d), ERK (e), and p38 (f) after stimulation with 100 µg/ml
703 zymosan. Results are shown as relative MFI (fold on untreated) mean ± SEM. Five
704 biologically independent experiments for d (time 5: 4 wild-type and 5 *Ms4a4a*^{-/-} mice; time
705 15: 8 wild-type and 12 *Ms4a4a*^{-/-} mice), three for e (time 5: 4 wild-type and 7 *Ms4a4a*^{-/-}
706 mice; time 15: 4 wild-type and 5 *Ms4a4a*^{-/-} mice), four for f (time 5: 4 wild-type and 4
707 *Ms4a4a*^{-/-} mice; time 15: 4 wild-type and 8 *Ms4a4a*^{-/-} mice). Statistical analysis by two-
708 tailed unpaired (Mann-Whitney) Student's t test.

709 g-h) Secretion of IL-6 (g) and TNF (h) after stimulation for 6 h with 100 µg/ml zymosan or
710 100 ng/ml LPS. Cytokine levels in untreated cells were below detection limit. Results are
711 shown as mean ± SEM. Four biologically independent experiments were performed (g: 7
712 wild-type and 7 *Ms4a4a*^{-/-} mice for zymosan; 6 wild-type and 7 *Ms4a4a*^{-/-} mice for LPS; h: 7
713 wild-type and 6 *Ms4a4a*^{-/-} mice for zymosan, 7 wild-type and 8 *Ms4a4a*^{-/-} mice for LPS).
714 Statistical analysis by two-tailed unpaired (Mann-Whitney) Student's t test.

715 i) ROS production after stimulation with 100 µg/ml zymosan. Results are shown as MFI
716 mean ± SEM (6 wild-type and 6 *Ms4a4a*^{-/-} mice). Statistical analysis by two-tailed unpaired
717 Student's t test.

718

719 **Figure 7. MS4A4A regulates Dectin-1 recognition and control of B16F1 metastasis**

720 a) Flow cytometry analysis of WGA binding on B16F1 and B16F10 cells. Results are
721 shown as representative dot plot (left) and mean ± SEM of relative MFI (fold on unstained;
722 right). Six biologically independent experiments were performed (10 independent
723 samples). Statistical analysis by two-tailed unpaired (Mann-Whitney) Student's t test.

724 b) Syk phosphorylation in BMDMs from *Ms4a4a*^{-/-} (open symbol) and wild-type (closed
725 symbol) mice primed for 18 h with 10 ng/ml GM-CSF and cocultured at 1:1 ratio with
726 apoptotic B16F1 cells. Results are shown as relative MFI (fold on unstained) mean ± SEM.
727 Three biologically independent experiments were performed (11 wild-type and 6 *Ms4a4a*^{-/-}
728 mice). Statistical analysis by two-tailed unpaired (Mann-Whitney) Student's t test.

729 c) Cytokine secretion by BMDMs from *Ms4a4a*^{-/-} (open symbol) and wild-type (closed
730 symbol) mice primed for 18 h with 10 ng/ml GM-CSF and cocultured with B16F1 cells for 6
731 h. Cytokine levels in untreated cells were below detection limit. Results are shown as
732 mean ± SEM. Two biologically independent experiments were performed (6 wild-type and
733 6 *Ms4a4a*^{-/-} mice). Statistical analysis by two-tailed unpaired (Mann-Whitney) Student's t
734 test.

735 d-e) Number of metastatic foci in lungs from *Clec7a*^{-/-} (open symbol) and wild-type (WT,
736 closed symbol) mice upon i.v. injection of B16F1 (d) or B16F10 (e) cells. Results are
737 shown as mean ± SEM. Three biologically independent experiments for B16F1 cells (9
738 wild-type and 16 *Clec7a*^{-/-} mice), one for B16F10 cells (7 wild-type and 6 *Clec7a*^{-/-} mice).
739 Statistical analysis by two-tailed unpaired (Mann-Whitney) Student's t test.

740 f-g) Number of metastatic foci in lungs from *Ms4a4a*^{-/-} (open symbol) and wild-type (WT,
741 closed symbol) mice upon i.v. injection of B16F1 (f) or B16F10 (g) cells. Results are shown
742 as mean ± SEM. Five biologically independent experiments for B16F1 cells (23 wild-type
743 and 26 *Ms4a4a*^{-/-} mice), three for B16F10 cells (12 wild-type and 15 *Ms4a4a*^{-/-} mice).
744 Statistical analysis by two-tailed unpaired (Mann-Whitney) Student's t test.

745 h) Number of metastatic foci in lungs from wild-type mice upon i.v. injection of B16F1
746 treated for 1 h with 25 U/ml N-glycosidase F (N-glyc, open symbol) or buffer (NT, closed
747 symbol). Results are expressed as mean ± SEM. Two biologically independent
748 experiments were performed (12 mice for NT, 11 for N-glyc). Statistical analysis by two-
749 tailed unpaired (Mann-Whitney) Student's test.

750

751 **Figure 8. Expression of MS4A4A in macrophages is required for NK-mediated**
752 **Dectin-1-triggered protection against metastasis.**

753 a-b) Representative images (a) and number (b) of lung metastasis in *Ms4a4a*^{-/-} (open
754 symbol) and wild-type (closed symbol) mice injected i.v. with B16F1 cells upon NK cell
755 depletion by anti-NK1.1 treatment. Results are shown as mean ± SEM. Two biologically
756 independent experiments were performed. Statistical analysis by one-way ANOVA and
757 two-tailed unpaired Student's t test.

758 c) NK cell infiltrating the lungs of *Ms4a4a*^{-/-} (open symbol) and wild-type (WT, closed
759 symbol) mice injected i.v. with B16F1 cells. Results are shown as mean ± SEM of absolute
760 numbers (n) of Live/CD45⁺/CD3⁻/NK1.1⁺ cells. Three biologically independent experiments
761 were performed (9 wild-type and 6 *Ms4a4a*^{-/-} mice). Statistical analysis by two-tailed
762 unpaired Student's t test.

763 d) Degranulation of NK cells after engagement with B16F1 cells in the presence of
764 splenocytes from *Ms4a4a*^{-/-} (open symbol) and wild-type (WT, closed symbol) mice.
765 Results are shown as mean ± SEM of percentage of CD107a⁺ NK cells gated on

766 Live/CD45⁺/CD3⁻/NK1.1⁺ splenocytes. Two biologically independent experiments were
767 performed (4 wild-type and 5 *Ms4a4a*^{-/-} mice). Statistical analysis by two tailed unpaired
768 (Mann-Whitney) Student's t test.

769 e-h) Expression levels of *Calhm6* (e), *Il12p40* (f), *Il15* (g), and *Il18* (h) mRNA in *Ms4a4a*^{-/-}
770 (open symbol) and wild-type (WT, closed symbol) BMDMs primed with 10 ng/ml GM-CSF
771 cocultured for 24 h with B16F1 apoptotic cells. Results are shown as mean ± SEM of fold
772 of induction. Two biologically independent experiments were performed (f: 5 wild-type and
773 8 *Ms4a4a*^{-/-} mice; g: 5 wild-type and 8 *Ms4a4a*^{-/-} mice; h: 4 wild-type and 8 *Ms4a4a*^{-/-} mice;
774 i: 4 wild-type and 4 *Ms4a4a*^{-/-} mice). Statistical analysis by two-tailed unpaired Student's t
775 test.

776 i) IFN- γ production by NK cells after engagement with B16F1 cells in the presence of
777 splenocytes from *Ms4a4a*^{-/-} (open symbol) and wild-type (WT, closed symbol) mice.
778 Results are shown as mean ± SEM of percentage of IFN- γ ⁺ NK cells gated on
779 Live/CD45⁺/CD3⁻/NK1.1⁺ splenocytes. Two biologically independent experiments were
780 performed (5 wild-type and 6 *Ms4a4a*^{-/-} mice). Statistical analysis by two tailed unpaired
781 (Mann-Whitney) Student's t test.

782

783 **METHODS**

784

785 **Cells.**

786 Human peripheral blood mononuclear cells were isolated from buffy coats of healthy
787 donors and monocytes were obtained by serial centrifugation as described⁶ and approved
788 by the institutional Ethical Committee of the Humanitas Clinical and Research Center.
789 Monocytes were treated for 7 days with 50 ng/ml recombinant human (rh) GM-CSF
790 (Miltenyi Biotech) plus 40 ng/ml rhIL-4 (Peprotech) to obtain dendritic cells, and to 100
791 ng/ml rhM-CSF (R&D Systems) to obtain macrophages. Macrophages were activated *in*
792 *vitro* by 18 h incubation with either 100 ng/ml 055:B5 LPS (Sigma-Aldrich) plus 20 ng/ml
793 rhIFN- γ (Peprotech), 20 ng/ml rhIL-10 (Miltenyi Biotech), 10 ng/ml rhTGF- β (Miltenyi
794 Biotech), 10^{-6} M dexamethasone (Dex; Sigma-Aldrich), 20 ng/ml rhIL-4, or 10^{-6} M Dex plus
795 20 ng/ml IL-4. Murine bone marrow-derived macrophages (BMDMs) were generated by 6
796 days of culture with 20 ng/ml recombinant murine (rm) M-CSF (Miltenyi Biotech) and were
797 cultured for 18 h with 100 ng/ml LPS plus 20 ng/ml rmIFN- γ (R&D Systems) or 20 ng/ml
798 rmIL-4 (R&D Systems). TAMs were isolated from s.c. B16F1 (0.1×10^6) or Lewis lung
799 carcinoma (LLC; 1×10^6) tumors into C57BL/6J (Charles River Laboratories) or A498
800 human renal tumor cells (1×10^6) grown in NOD/scid/IL-2R- γ^{null} mice (NOD.Cg-
801 *Prkdc^{scid}Il2rg^{tm1Wjl}*/SzJ; Jackson Laboratory). After mice were sacrificed (day 14 for LLC
802 tumors, day 18 for A498 tumors, day 20 for B16F1 tumors), tumors were harvested and
803 disaggregated. Peritoneal exudate macrophages (PECs) were collected by peritoneal
804 lavage. Tumor suspension cells and PECs were stained for F4/80 and CD11b and
805 F4/80⁺/CD11b⁺ TAMs and PECs were sorted using an Influx flow sorter (BD Bioscience)
806 and immediately lysed for RNA extraction. B16F1 and B16F10 cells were cultured in RPMI
807 1640, 10% FBS, 1% L-glutamine, 1% penicillin/streptomycin, 1% HEPES (Lonza). B16F1

808 cells were induced to apoptosis by 5 min heat-shock at 65°C followed by 5 min on ice.
809 MC38 cells were cultured in Dulbecco's modified Eagle medium (DMEM; Lonza), 10%
810 FBS, 1% L-glutamine, 1% penicillin/streptomycin, 1% sodium pyruvate, 1% non-essential
811 amino acids (Lonza). SL4 cells were cultured in DMEM:F12 (1:1) medium (Lonza), 10%
812 FBS, 1% L-glutamine, 1% penicillin/streptomycin. Chinese hamster ovary (CHO-K1) cells
813 were grown in DMEM, 10% FBS, 100 U/ml penicillin/streptomycin, and 25 mM HEPES pH
814 7.2 (Gibco). Transfectants were obtained by lipofection with Lipofectamine 2000 according
815 to manufacturer's instructions, and selected with 650 µg/ml G418 (Invitrogen).

816

817 **Patients' samples.**

818 Monocytes from patients with active severe Graves orbitopathy were collected before and
819 6 h after the first i.v. infusion of 1 g methylprednisolone. A signed informed consent for
820 blood/serum collection and storage and for its use for research purposes was obtained by
821 the Endocrinology Unit, Fondazione IRCCS Ca' Granda Policlinico. In agreement with the
822 institutional policy, the Ethical Committee approval was not required, as patients did not
823 undergo tests or therapies other than those routinely proposed for their specific disease.
824 Rheumatoid arthritis (RA) synovium samples were retrieved from early (<12 months
825 symptoms) patients fulfilling the ACR/EULAR 2010 criteria⁵¹ for RA diagnosis, recruited
826 into the Pathobiology of Early Arthritis Cohort (PEAC; [http://www.peac-](http://www.peac-mrc.mds.qmul.ac.uk/)
827 [mrc.mds.qmul.ac.uk/](http://www.peac-mrc.mds.qmul.ac.uk/)) at Bart's Health NHS Trust in London. After obtaining written
828 informed consent, patients underwent an ultrasound-guided needle synovial biopsy of the
829 most inflamed accessible joint⁵². Synovial tissue samples were immediately fixed in 4%
830 formaldehyde (Merck) and subsequently paraffin-embedded. The study was approved by
831 the institutional Ethical Committee (No. 05/Q0703/198). Histological analysis of normal and
832 tumoral tissue samples was performed on material obtained from the Surgical Pathology
833 Unit, ASST-Spedali Civili in Brescia. Experiments performed on archival material were

834 approved by the institutional Ethical Committee (WV-Immunocancer 2014 to WV, IRB
835 code NP906). When requested, an informed consent was obtained from all participants.

836

837 **Immunohistochemical and immunofluorescence analysis.**

838 MS4A4A expression was analyzed on 4- μ m formalin-fixed paraffin-embedded sections of
839 normal tissues (skin, lung, colon) and corresponding neoplastic samples (five melanomas,
840 five lung adenocarcinomas, five colon adenocarcinomas) by staining with anti human
841 MS4A4A (rabbit polyclonal, dilution 1:4.000; Sigma-Aldrich) and revealing using Novolink
842 Polymer (Leica Biosystems) as secondary reagent. The chromogen reaction was
843 developed using diaminobenzidine. For double immunostains, MS4A4A was combined
844 with CD1c (clone OT12F4; Abcam), CD163 (clone 10D6; Thermo Fisher Scientific), CD207
845 (clone 12D6; Vector Laboratories), and CD303 (clone 124B3.13; Dendritics). The second
846 antibody reactivity was detected using a Mach 4 alkaline phosphatase system with Ferangi
847 Blue (Biocare Medical) as chromogen. Slides were counterstained with hematoxylin.
848 Omission of primary antibody was also performed as control staining. Immunostained
849 sections were photographed using the DP73 Olympus digital camera mounted on the
850 Olympus BX60 microscope and analyzed by the acquisition software CellSens Standard.
851 Images were then processed using Adobe Photoshop Cs4 Portable. MS4A4A expression
852 on inflamed synovium was performed on 3- μ m formalin-fixed paraffin embedded sections
853 obtained from five patients by multiplex immunofluorescence staining using a tyramide
854 signal amplification protocol and an anti-MS4A4A rabbit polyclonal anti human antibody
855 (dilution 1:2000; Sigma-Aldrich) in combination with CD68 (mouse anti human IgG1, clone
856 KP1; Dako), CD163 (mouse anti human IgG1, clone 10D6; Leica Biosystems), CD3
857 (mouse anti human IgG1, clone F7.2.38; Dako), CD20 (mouse anti human IgG2a, clone
858 L26; Dako), and CD138 (mouse anti human IgG1, clone MI15; Dako). Matching isotypes
859 were used as controls. Nuclei were counterstained with 4',6-diamidino-2'-phenylindole

860 (DAPI, 300 nM; Invitrogen) and mounted with ProLong Antifade Mountant (Thermo Fisher
861 Scientific). Sections were imaged with the digital slide scanner Nanozoomer S60
862 (Hamamatsu Photonics). The quantification of CD68/MS4A4A/CD163⁺ cells was
863 performed using the cell count plugin of the Image J software. TAMs and NK cells
864 infiltrating experimental metastasis were analyzed on frozen sections (10 μm thick)
865 obtained from tissue blocks of B16F1 metastasis-bearing lungs. Sections were thawed and
866 fixed with 4% PFA for 5 min, washed and incubated for 15 min in PBS supplemented with
867 0.05% Tween-20, 2% BSA, 5% donkey serum (Sigma-Aldrich), and incubated for 1 h with
868 purified polyclonal goat anti mouse NKp46 (R&D System), rat anti mouse F4/80
869 (Serotech), and rabbit anti mouse Ki-67 (Cell Signalling). After extensively wash, sections
870 were incubated for 1 h with Alexa Fluor (488, 568, 647)-conjugated species-specific cross-
871 adsorbed detection antibodies (Molecular Probes). Nuclei were stained using DAPI.
872 Sections were mounted with 20 μl FluorSave reagent (Calbiochem). Fluorescent high-
873 resolution images were acquired with a Leica SP8 STED 3X confocal microscope (Leica
874 HC PL APO 60X/1.40 oil STED white objective system) and analyzed by LAS-X software.

875

876 **Animal colonies.**

877 Wild-type C57BL/6J mice were obtained by Charles River Laboratories (Calco, Italy). Mice
878 with macrophage-specific *Ms4a4a* inactivation in C57BL/6J background were achieved
879 breeding mice carrying floxed *Ms4a4a* alleles (*Ms4a4a*^{fl/fl}; Ozgene) with mice expressing
880 Cre under the control of the promoter of the *Lys* gene, encoding for the myeloid-restricted
881 lysozyme M protein (*Lys*^{Cre/+}; B6.129P2-*Lyz2*^{tm1(cre)lfo/J} from Jackson Laboratory).
882 *Ms4a4a*^{fl/fl}*Lys*^{Cre/+} mice (here indicated as *Ms4a4a*^{-/-}) were born in Mendelian ratios,
883 reproduced normally, and did not show significant differences in body weight compared to
884 control floxed littermates (*Ms4a4a*^{fl/fl}*Lys*^{+/+}, here used as wild-type animals). *Ms4a4a*^{-/-}
885 mice were co-housed with littermates in individually ventilated cages in a specific

886 pathogen-free/viral antibody-free animal facility at Humanitas Clinical and Research
887 Center. Mice in C57BL/6J background with *Dectin-1* inactivation (*Clec7a*^{-/-}; B6.129S6-
888 *Clec7a*^{tm1Gdb/J}) were obtained by Jackson Laboratory. To obtain double-deficient mice
889 (here indicated as *Ms4a4a*^{-/-}*Clec7a*^{-/-}), *Clec7a*^{-/-} mice were bred with
890 *Ms4a4a*^{fl/fl}/ubiquitinC^{Cre/+} animals (B6.Cg^{Tg(UBC-cre/ERT2)1Ejb}/2J from Jackson Laboratory).
891 Animals were housed in ventilated cages in a specific pathogen-free/viral antibody-free
892 animal facility at Humanitas Clinical and Research Center. Experiments were performed
893 using sex- and age-matched mice.

894

895 **Experimental models.**

896 The 3-methylcholanthrene (3-MCA)-induced tumor model was performed with 100 µg 3-
897 MCA as previously described⁵³. In the melanoma B16F1 model, tumor dimension was
898 monitored in mice s.c. injected with 0.1×10^6 B16F1 cells as previously described¹³. Lung
899 metastasis were analyzed in the lungs 10 days after i.v. injection with 0.3×10^6 B16F1 or
900 B16F10 cells and 14 days after i.v. injection with 0.3×10^6 SL4 cells. To visualize
901 metastasis, lungs from mice injected with SL4 were fixed and stained over night with
902 Bouin's Solution (Histoline). Liver metastasis were analyzed 14 days after i.s. injection with
903 0.25×10^6 MC38 cells. For NK cell depletion in the melanoma model, mice were i.p.
904 injected with 200 µg anti-NK1.1 (BioXcell) or its isotype control 3 days before and 100 µg
905 anti-NK1.1 or isotype control 3 and 7 days after B16F1 cells injection and metastasis were
906 evaluated at day 10. For NK cell depletion in the colon carcinoma model, mice were i.p.
907 injected with 200 µg anti-NK1.1 (BioXcell) or its isotype control 5 and 3 days before and 3
908 and 7 and 10 days after MC38 cells injection and metastasis were evaluated at day 12.
909 Animal procedures were reviewed and approved by the institutional Ethical Committee at
910 Humanitas Clinical and Research Center and were in accordance with national (D.L. N.

911 116, G.U. suppl. 40, 18-2-1992 and N. 26, G.U. 4-3-2014) and international laws and
912 policies (EEC Council Directive 2010/63/EU, OJ L 276/33 22-9-2010; National Institutes of
913 Health Guide for the Care and Use of Laboratory Animals, US National Research Council,
914 2011). The study was approved by the Italian Ministry of Health (approvals n. 89/2013-B
915 issued on the 8/4/2013, 6B2B3.N.ERY issued on 06/12/2017, and 949/2018-PR issued on
916 the 20/12/2018).

917

918 **Split-ubiquitin assay.**

919 The split-ubiquitin assay was performed as previously described¹². Briefly, a split-ubiquitin
920 NubG-X library, derived from monocyte-derived human macrophages treated with 10^{-6} M
921 Dex, was directionally cloned into the prey vector pBT3-N and the bait protein MS4A4A
922 cDNA was cloned into the bait vector pBT3-STE, in which the LexA-VP16-Cub cassette is
923 fused to the N-terminus. The yeast strain NMY51 (MATa his3-200 trp1-901 leu2-3,112
924 ade2 LYS2::(lexAop)4-HIS3 ura3::(lexAop)8-LacZ ade2::(lexAop)8-ADE2 GAL4) was
925 transformed using standard procedures . Transformants were grown on selective medium
926 lacking leucine, tryptophan, histidine and adenine, with addition of 20 mM 3-amino-1,2,4-
927 triazole. Positive clones were sequenced by colony PCR (pPR3N-FOR: 5'-
928 GTCGAAAATTCAAGACAAGG-3'; pPR3N-REV: 5'-AAGCGTGACATAACTAATTAC-3').
929 Library plasmids were isolated from positive clones and retransformed into NMY51 to test
930 bait dependency. Prey sequences activating the histidine and adenine reporters in the
931 presence of MS4A4A and not the empty pBT3-STE vector were considered as potential
932 MS4A4A interactors.

933

934 **Flow cytometry.**

935 For direct multi-color flow cytometry (FACS Canto II and LRS Fortessa; BD Bioscience),
936 cells were incubated for 30 min at 4°C with directly conjugated anti-human or anti-mouse

937 protein antibodies (Supplementary Tables 1 and 2, respectively, Life Science Reporting
938 Summary) and their appropriate isotype controls. Live/dead cell discrimination was
939 performed staining with the Zombie Aqua Fixable Viability Kit (BioLegend). For MS4A6A
940 and MS4A7 surface staining, purified MS4A6A (Abnova) and MS4A7 (Novusbio)
941 antibodies were used as primary antibodies and anti human IgG-Alexa Fluor 488
942 (Invitrogen) as secondary antibody. Wheat germ agglutinin Alexa Fluor 594-conjugated
943 (WGA; ThermoFisher) was used to detect N-acetylglucosamine residues on the surface of
944 tumor cells. To block Fc receptors, a purified anti mouse CD16/CD32 (BioLegend) was
945 used. For intracellular staining, cells were permeabilized and fixed using the
946 FoxP3/Transcription Factor Staining Buffer Set (eBioscience). Phosphoproteins were
947 detected as previously described²⁹ using the anti-phospho-Syk-Tyr525/526 antibody (Cell
948 Signalling) and the anti-phospho-p38-Thr180/Tyr182 antibody (Cell Signalling) as primary
949 antibodies and an anti rabbit IgG Alexa Fluor 647 as secondary antibody (Invitrogen) or
950 the directly conjugated anti-phospho-ERK Alexa Fluor 647 antibody (BD Pharmigen),
951 according to protocols recommended by the manufacturers. To analyze immune cell
952 infiltration, lungs were incubated for 1 h at 37°C in 1% DNase I in HBSS supplemented
953 with 1 mg/ml collagenase D (Roche) and then for 10 min in 5 mM EDTA on ice. The cell
954 suspension was passed through a 70 µm filter, red cells were lysed with ACK (Lonza), and
955 then cells were stained and analyzed by flow cytometry. Data were analyzed with FACS
956 Diva (BD) and Flow Jo (Treestar) software. Gating strategies are reported in
957 Supplementary Note.

958

959 **Imaging analysis.**

960 Freshly isolated human monocytes were differentiated to macrophages directly on 14-mm
961 diameter cover glasses (Menzel-Gläser) in 24-well plates and treated as described above.
962 Cells were fixed with 4% PFA (Euromedex). For intracellular staining, cells were

963 permeabilized with 0.1% Triton X-100 (Sigma-Aldrich), 2% BSA (Biosera), 5% goat serum
964 (Dako) in PBS. Cells were then incubated for 18 h with a purified mouse anti human
965 MS4A4A MoAb (R&D System) and a purified goat anti human Dectin-1 polyclonal (R&D
966 System) and then for 1 h with Alexa Fluor (488, 647)-conjugated species-specific cross
967 adsorbed detection antibodies (Molecular Probes). Nuclei were stained using DAPI. Lipid
968 rafts were stained with the Vybrant Lipid Raft Labeling Kit, based on the cholera toxin
969 subunit B (CT-B) labeled with the red-fluorescent Alexa Fluor 594 dye (Molecular Probes),
970 following the manufacturer protocol. High-resolution images (1024 × 1024 pixels) were
971 acquired with an Olympus Fluoview FV1000 laser scanning confocal microscope with 60X
972 (N.A. 1.4) plan-apochromat oil immersion objective (Olympus) and analyzed with ImageJ
973 software (NIH). Quantitative colocalization and statistical analysis were performed with
974 Imaris Coloc 4.2 (Bitplane AG) software and FV1000 1.6 colocalization software
975 (Olympus) and ImageJ Coloc2 plugin. Representative images were smoothed with a
976 Gaussian filter and upscaled with bicubic interpolation (ImageJ). For STED microscopy,
977 human macrophages were stained with purified mouse anti human MS4A4A monoclonal
978 Ab (R&D System) and a purified goat anti human Dectin-1 polyclonal (R&D System) and
979 then for 1 h with Alexa Fluor (568, 647)-conjugated species-specific cross-adsorbed
980 detection antibodies (Molecular Probes). Lipid rafts were stained with the Vybrant Lipid
981 Raft Labeling Kit, based on the CT-B labeled with the green-fluorescent Alexa Fluor 488
982 324 dye (Molecular Probes), following the manufacturer protocol. Mowiol was used as
983 mounting medium. Alexa Fluor 488, 568 and 647 were excited with a 400 Hz white light
984 laser tuned at 485/493, 561/569 and 635/643 nm, respectively, and emission was
985 collected at 505-550, 580-620, and 650-700 nm, respectively. A gating between 0.4 to 7 ns
986 was applied to avoid collection of reflection and autofluorescence and sequential
987 acquisition was applied to avoid fluorescence overlap. The 775 nm CW-depletion laser
988 (30% of power; ≈90 mW) was used for Alexa Fluor 488, 568 and 647 excitations. STED

989 analysis was performed on ROI corresponding to the traced freehand area of the image of
990 a single cell (3-5 ROIs per image) and xyz images (1928 × 1928 px; px size, 0.05 μm; vx
991 size, 0.2 μm) were acquired in a z-stack (30-40 images; 0.2 μm slice) with a Leica SP8
992 STED 3X confocal microscope system adopting a Leica HC PL APO 100x/1.40 oil STED
993 white objective at 706-929 mAU. CW-STED and gated CW-STED were applied to Alexa
994 Fluor 488 and Alexa Fluor 568 and 647, respectively. A linear background subtraction was
995 applied to all z-stack STED images. The colocalization rate was measured with the LASX
996 software after a maximum intensity projection of the non-deconvolved images. Collected
997 images were deconvolved with Huygens Professional software. To evaluate the interaction
998 between MS4A4A and its putative partners, we investigated by Fluorescence Lifetime
999 Imaging Microscopy (FLIM) the Fluorescence Resonance Energy Transfer (FRET) from an
1000 excited MS4A4A-eGFP donor molecule to ground state proximal acceptor molecules
1001 chimerized to the fluorescent protein mCherry⁵⁴. To this purpose, eGFP-MS4A4A and
1002 mCherry chimerized candidate partners were cotransfected in 2×10^5 CHO-K1 cells
1003 seeded onto poly-L-lysine treated coverslips, cells were fixed, irradiated with a 830 nm
1004 light to excite the donor, and imaged using a TriM Scope II two photon laser scanning
1005 microscope (LaVision Biotec) equipped with a 60X water immersion lens (LUMFL60x;
1006 Olympus). Light was separated using a IR700 long pass filter and detected with the FLIM
1007 X16 TCSPC module 350 (LaVision Biotec). FLIM data were fitted with single exponential
1008 and background correction using Inspector Pro (LaVision Biotec). FRET efficiency (E)
1009 and Förster radius (R), which express the distance between the molecules, are reported.

1010

1011 **Gene expression analysis.**

1012 For real-time PCR assay (qPCR), cells were lysed with QIAzol Reagent (Qiagen) and total
1013 RNA was extracted using miRNeasy mini kit (Qiagen). RNA was converted in cDNA using
1014 the High-Capacity cDNA Reverse Transcription Kit (Applied Biosystems) and quantification

1015 of the transcripts reported in Supplementary Table 3 was performed following the
1016 recommended protocols for SYBR Green Master Mix (Applied Biosystems). Results were
1017 normalized on human *GAPDH* or murine *Gapdh*. qPCR was performed with the ViiA™ 7
1018 Real-Time PCR System (Applied Biosystems). To determine *MS4A4A* gene expression
1019 levels in different human tissues and cells lines and in different cancer types, the
1020 Laboratory for Systems Biology and Medicine RefExA database
1021 (http://sbmdb.genome.rcast.u-tokyo.ac.jp/refexa/main_search.jsp) and the Cancer
1022 Genome Atlas database (TCGA; <https://doi.org/10.7908/C11G0KM9>) through the
1023 Firebrowse repository (<http://firebrowse.org/>) were used. Gene expression levels as rsem
1024 values were downloaded and distribution boxplots were performed using the ggplot2 R
1025 package version 2.2.1. Correlation between *MS4A4A* and TAM markers transcripts were
1026 performed using the 'rcorr' function implemented in Hmisc R package version 4.0.3
1027 adopting the Pearson's correlation method. Significant correlations ($p < 0.05$) were plotted
1028 using the NMF R package version 0.20.6. Genes with a not significant correlation show a
1029 coefficient equal to zero. Mentioned source data are provided in Supplementary Fig. 3.

1030

1031 **NK cell functional assays.**

1032 NK cell degranulation was investigated by CD107a surface expression, as previously
1033 reported⁴². Briefly, splenocytes isolated from *Ms4a4a*^{-/-} and wild-type mice were treated
1034 for 18 h with 100 ng/ml rmlL-2 and co-cultured for 4 h with B16F1 or B16F10 cells (E:T
1035 ratio 12:1). Percentage of CD107a⁺ NK cells (Live/CD45⁺/CD3⁻/NK1.1⁺) was analyzed by
1036 flow cytometry. IFN- γ production was investigated on splenocytes isolated from *Ms4a4a*^{-/-}
1037 and wild-type mice treated for 12 h with 50 ng/ml rmlL-2 and co-cultured for 4 h with
1038 B16F1 and additional 2 h with Golgi plug (BD Pharmingen). Percentage of IFN- γ ⁺ NK cells
1039 (Live/CD45⁺/CD3⁻/NK1.1⁺) was analyzed by flow cytometry.

1040

1041 **Macrophage functional assays.**

1042 To study Dectin-1 functional activities, BMDMs were primed for 18 h with 10 ng/ml GM-
1043 CSF and treated with 100 µg/ml zymosan (InvivoGen), 100 µg/ml depleted zymosan
1044 (InvivoGen), 100 µg/ml curdlan (Wako Chemicals), 100 ng/ml LPS, 100 ng/ml PMA
1045 (Sigma-Aldrich), 100 ng/ml Pam3Cys (Enzo Life Science), 20 µg/ml fluorescein-conjugated
1046 zymosan bioparticles (Molecular Probes), or 5×10^6 *Aspergillus fumigatus* conidia-FITC.
1047 To deplete lipid rafts, macrophages were treated for 15 min with 100 µg/ml zymosan alone
1048 or in combination with 5 mM methyl-β-cyclodextrin (MβCD; Sigma-Aldrich). ROS
1049 production was investigated using the CellRox Deep Red reagent (Life Technologies)
1050 according to the manufacturer's instructions. Live-cell widefield microscopy was performed
1051 monitoring fluorescence at 350ex/461em (Hoechst) and 640ex/665em (CellROX) with a
1052 Cell-R epi-fluorescence microscope (Olympus). ROI were analyzed using the Xcellence
1053 software (Olympus). Secreted cytokines were measured by ELISA (Duoset; R&D System).

1054

1055 **Statistical analysis.**

1056 Results were expressed as means ± SEM from multiple independent experiments. One-
1057 way ANOVA and two-tailed Student's *t* test were performed using Prism (GraphPad)
1058 and/or Excel (Microsoft) software. ROUT test was applied to determine outliers.

1059

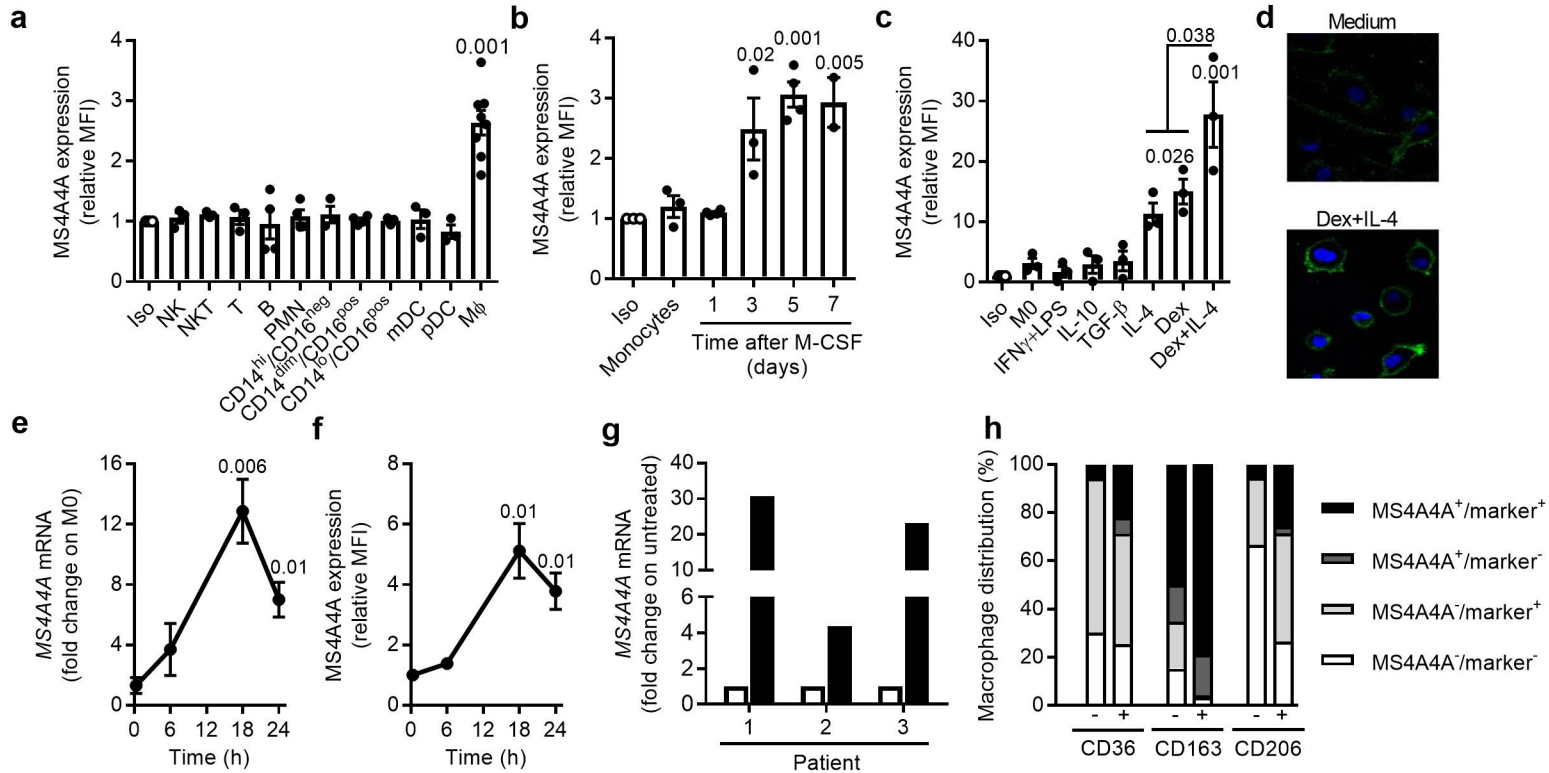

1060 **Data availability.**

1061 The data that support the findings of this study are available from the corresponding author
1062 upon reasonable request. *Ms4a4a^{fl/fl}* animals have been developed by the research team
1063 and are available after evaluation of potential conflict of interest upon MTA.
