ABSTRACT: Communesins, isolated from the mycelium of a strain of *Penicillium* sp., are cytotoxic heptacyclic indole alkaloids bearing a bis-aminal structure and two contiguous quaternary carbon centers. Towards a total synthesis of communesin F, we synthesized a pentacyclic ABCDG ring skeleton via carboborylation of 1,3-diene and a Friedel-Crafts-type cyclization, resulting in the formation of an azepine ring through a Bi(OTf)₃-catalyzed S_N2' reaction.

16 Introduction

17 Communesins A and B, which were originally isolated by Numata and co-workers from the mycelium of a strain 18 of *Penicillium* sp. attached to the marine alga *Enteromorpha intestinalis*, are heptacyclic indole alkaloids (Figure 1).¹ 19 Spectroscopic analyses, including nuclear magnetic resonance (NMR) spectroscopy (¹H NMR, ¹³C NMR including 20 2D NMR) and high-resolution mass spectrometry, have revealed that their structures are quite unique. They are 21 characterized by a heptacyclic skeleton bearing two aminals and two contiguous quaternary carbon centers. To date, 22 nine congeners have been reported,²⁻⁶ and perophoramidine is also known as a structurally related bis-amidine indole 23 alkaloid.⁷ Recently, Tang and co-workers confirmed that communesins can be biosynthetically produced through the 24 coupling of aurantioclavine and tryptamine based on genetic inactivation studies.⁸ Communesins show cytotoxicity 25 against P388 lymphocytic leukemia cells (ED₅₀ A: $3.5 \,\mu$ g/mL, B: $0.45 \,\mu$ g/mL) and potent insecticidal activity towards 26 silkworms (LD₅₀ D: 300 μ g/g, E: 80 μ g/g). Because of their unique structure and biological activity, many research 27 groups have conducted synthetic studies of communesins in which various synthetic methods were developed.⁹⁻¹⁴ 28 The first racemic total synthesis of communesin F was achieved by Qin and co-workers based on an intramolecular 29 cyclopropanation strategy.¹⁵ Weinreb and Funk also reported total synthesis of communes in F, independently.^{16,17} The 30 first asymmetric total syntheses of communesins A, B and F were accomplished by Ma and co-workers.^{18,19} Asymmetric total syntheses were also reported by Stoltz, Movassaghi, Yang, and Chen, independently.²⁰⁻²³ We have 31 32 also engaged in the development of synthetic strategies for this class of alkaloids including communesins, 33 perophoramidine and aurantioclavin.^{24–31}

36 Results and Discussion

37 Recently, we have developed palladium(Pd)-catalyzed carbosilylation of 1.3-diene with carbamoyl chloride for the 38 synthesis of several spirooxindoles.³² Extending this reaction, a Pd-catalyzed carboborylation of 1,3-diene was 39 developed for a synthesis of iminoindoline.³⁰ Considering our developed method, it was envisioned that communesin 40 F would be accessed from a pentacyclic skeleton II through intermediate I by the introduction of an aminoethyl unit 41 and the formation of amidine. The pentacyclic skeleton II would be constructed from a tetracyclic compound IV via 42 III by the introduction of an allyl alcohol unit, resulting in an $S_N 2^2$ reaction for the formation of an azepine ring and 43 a reduction of amidine. The tetracyclic compound IV can be synthesized by a carboborylation of 1,3-diene VI and an intramolecular Friedel-Crafts-type reaction of a resultant iminoindoline V.³⁰ Following this retrosynthetic analysis, 44 45 we have recently succeeded in the construction of tetracyclic skeleton IV (R = OMe) from diene VI (R = OMe) 46 through iminoindoline V (R = OMe). However, compound 1 could not be converted to compound 2 through removal 47 of the methyl group, although we tried various conditions including BBr3, BCl3, AlCl3, LiCl, Ph2PLi and 48 pMeC₆H₄SLi (Scheme 1b).³³ These reaction conditions resulted in the removal of a Cbz group or the decomposition 49 of compound 1. Therefore, we needed to revise our initial synthetic route and planned to employ a 1,3-diene-50 containing triflate (R = OTf) to avoid a protecting group manipulation. The use of a substrate bearing a triflate group 51 for Pd-catalyzed carboborylation would extend its reaction scope, and it might react itself under the reaction 52 conditions. In the current manuscript, we report the construction of a pentacyclic skeleton of communesin F by 53 extending our strategy based on carboborylation of 1,3-diene.

54

59 The synthesis started with a removal of a methyl group on a phenolic hydroxyl group. A methoxy aniline derivative 60 3, which was prepared from t-butyl(3-methoxyphenyl)carbamate in four steps,³⁰ was treated using BBr₃ to give a 61 phenol (Scheme 2). The resultant phenolic hydroxy group was silvlated with tert-butyldimethylsilyl (TBS) chloride 62 and imidazole to give compound 4. A half reduction of a lactone with diisobutylaluminum hydride (DIBAL-H) was 63 followed by Wittig olefination, which gave diene 5 through internal transfer of a TBS group. After the formation of 64 urea by a treatment of phenyl isocyanate, a phenolic hydroxy group was protected as a triflate. A removal of a TBS group was followed by a Mitsunobu reaction with $pNsNHBoc^{34}$ to give compound 8, which was converted to 65 66 carbodiimide 9 through dehydration with CBr₄, PPh₃ and Et₃N.

With carbodiimide **9** containing a diene moiety, we investigated whether the triflate is intact under the reaction conditions of Pd-catalyzed carboborylation of 1,3-diene. In the previous literature, there is no report concerning 69 Pd(II)-catalyzed Miyaura borylation of triflates and diborone without a ligand, but reactions using 70 diphenylphosphinoferrocene³⁵ or the reaction of arylbromide have been reported.³⁶ Therefore, it was expected that a 71 triflate group would be intact during the carboborylation of 1,3-diene. As expected, the reaction of 9 proceeded 72 smoothly under the established conditions (Pd(OAc)₂, (pinB)₂, xylene, 50°C) to give an allyl borane, which was 73 treated with $NaBO_3 \cdot 4H_2O$ to give allyl alcohol 10. After silvlation of allyl alcohol 10, a *tert*-butoxyoxycarbonyl (Boc) group was introduced to an amidine nitrogen for further transformation. The treatment of compound 11 using 74 75 tetrabutylammonium fluoride gave an allyl alcohol along with the removal of a triflate group, which was converted 76 to allyl bromide 12 under standard conditions. Unfortunately, the resultant allyl bromide 12 could not be converted 77 to compound 13 through a treatment of Tf_2O and pyridine. On the other hand, when HF pyridine was used, a 78 triethylsilyl group was selectively removed with the triflate group intact. The resultant allyl alcohol was also 79 converted to allyl bromide 13 containing a triflate group, while a small amount of compound 14 was also obtained 80 through the removal of a Boc group.

84

85 Next, we investigated Friedel-Crafts-type cyclization of allyl bromides 12 and 13 to construct a tetracyclic ABCD ring skeleton. Previously, we have reported the cyclization of compound 15 containing a methoxy group using 10 86 mol% of Bi(OTf)₃ and 3.5 equivalents of AgOTf (Table 1, entry 1).^{30,37–39} The reaction gave compound **16a** in 49% 87 88 yield along with 16b in 30% yield. We initially applied these conditions to a cyclization of compound 13 containing 89 a triflate group. However, the reaction gave a complex mixture instead of any cyclized products 17a and 17b (entry 90 2). On the other hand, the cyclization of compound 12 containing a phenolic hydroxy group proceeded under the 91 same conditions to give compounds 18a and 18b in 63% and 30% yields with excellent stereochemistry, respectively 92 (entry 3). The stereochemistry was determined by a comparison with our previous results³⁰ and a NOESY experiment 93 of a derivatized compound 28 (Scheme 4, vide infra). When 3.5 equivalents of AgOTf was reduced to 1.2 equivalents, 94 the formation of byproduct 18b was suppressed to 17% yield (entry 4). Finally, the yield of the desired product 18a 95 was improved to 80% yield using 1.05 equivalents of AgOTf (entry 5). AgOTf was essential for this Friedel-Crafts-96 type reaction (entry 6)

101 After the construction of a tetracyclic ABCD ring skeleton containing an amidine, we turned our attention to the

^{*}complex mixtrue. ** Starting material **12** was recovered in 77% yield.

102 formation of an azepine ring (G ring). A treatment of compound 18a with Tf₂O and pyridine gave compound 17a in 103 91% yield (Scheme 3). To introduce an allyl alcohol unit, Suzuki-Miyaura coupling with vinyl boronic ester 19 was 104 examined. When compound 17a and vinyl boronic ester 19 were treated with a catalytic amount of Pd(dba)₂, SPhos 105 and K₃PO₄, or Pd(PPh₃)₄ and Na₂CO₃ in N,N-dimethylformamide (DMF) at 100°C, respectively, these reactions gave 106 the desired product 20 in low yields (Table 2, entries 1 and 2). However, conditions involving Pd(PPh₃)₄ and Na₂CO₃ 107 in toluene and ethanol at 100°C improved the yield to 56% (entry 3). The removal of the pNs and trimethylsilyl 108 (TMS) group gave allyl alcohol **21** in 66% yield over two steps. To construct the azepine ring, mesylation of a tertiary 109 alcohol was initially attempted through a treatment using methanesulfonyl chloride (MsCl) and Et₃N.¹⁸ However, a 110 dehydration occurred to give diene 23 instead of the desired cyclized product 22. Interestingly, when compound 21 111 was treated with pyridinium *p*-toluenesulfonate (PPTS),¹⁵ ortho-amide **24** was observed (as assessed using ¹H NMR 112analysis). A related structure was observed in synthetic studies of dehaloperophoramidine reported by Somfai and 113 co-workers.^{13,14} We considered the thermodynamic stability of possible equilibrium products such as simplified 114compounds 25, 26 and 27 through density functional theory (DFT) calculations (Figure 2). These calculations 115 revealed that ortho-amide 26 was the most stable isomer among these compounds. These results indicate that the 116 formation of the ortho-amide through acid activation using PPTS from amidine would be a competitive process with 117 the formation of the azepine ring via the S_N2 reaction of the tertiary alcohol, and the equilibrium tends to be biased 118 towards the ortho-amides such as compounds 24 and 26. Therefore, we expected that it would be difficult to achieve 119 the formation of azepine 22 from compound 21 containing the amidine moiety.

126

130 Therefore, a reduction of amidine 20 was investigated prior to the formation of the azepine ring to avoid the formation 131 of the ortho-amide (Scheme 4). When compound 20 was treated using NaBH₄, the desired product was not obtained. 132 In the case of DIBAL-H, the removal of a Boc group occurred instead of the reduction of the amidine. However, in 133 sharp contrast, treatment using catecholborane⁴⁰ gave the desired product **28** in 65% yield as a 3.3:1 mixture of 134 diastereomers. A NOESY experiment indicated that the stereochemistry of the major isomer was a trans-fused 135 structure, which would be epimerized to a *cis*-fused structure later. Because a reducing reagent approached from the 136 less hindered face, the trans isomer was obtained as a major product in this reaction. After the removal of Boc and 137 the TMS groups, the formation of an azepine ring was investigated again. When compound 29 was treated using 138 MsCl and Et₃N,¹⁸ the reaction gave diene **31** in 48% yield and the desired cyclized product **30** was not detected at all 139 (Table 3, entry 1). When Bi(OTf)₃ was employed at -15° C as a Lewis acid, the reaction proceeded to give the desired 140product **30** as a major product albeit in low yield (entry 2).^{41,42} The reaction using Bi(OTf)₃ at -40°C gave the desired 141 product 30 in 17% yield with recovery of the starting material (entry 3). However, under room temperature reaction

142 conditions the starting material 29 was consumed completely to give the desired azepine 30 in 55% yield, while diene 143 31 was obtained in 34% yield (entry 4). The obtained pentacyclic compound 30 would be useful for further 144 derivatization, and now we are investigating further transformations to achieve a total synthesis of communesin F.

151 In summary, we have investigated the synthesis of a pentacyclic ABCDG ring skeleton of communesin F based on 152 carboborylation of 1,3-diene, a Bi(OTf)₃-catalyzed Friedel-Crafts-type reaction and azepine ring formation. It is 153 interesting that a triflate group was intact under the conditions required for Pd-catalyzed carboborylation of 1,3-diene. 154 Additionally, it was essential that the resultant amidine was reduced prior to the formation of the azepine ring through 155 Bi(OTf)₃-catalyzed cyclization to avoid an undesired formation of ortho-amide. We are currently investigating further 156 transformation of the pentacyclic compound to complete the synthesis of communesin F. 157

Experimental Procedure 158

159 General. All non-aqueous reactions were carried out under a positive pressure of argon in over-dried glassware. 160 Analytical thin-layer chromatography was performed using Silica gel 60 plates (Merck, Darmstadt, Germany). Silica 161 gel column chromatography was performed using Kanto silica gel 60 (particle size 63–210 µm, Kanto, Tokyo, Japan) 162 and Chromatorex BW-300 (Fuji silysia, Aichi, Japan). Proton nuclear magnetic resonance (¹H NMR) spectra were 163 recorded using a JNM-ECA 500 (JEOL, Tokyo, Japan) at 500 MHz or a JNM-AL 400 (JEOL) at 400 MHz. Chemical 164 shifts were reported relative to Me₄Si (δ 0.00) in CDCl₃ or the residual solvent peak in C₆D₆ (δ 7.16). Multiplicity 165 was indicated by one or more of the following: s (singlet); d (doublet); t (triplet); q (quartet); m (multiplet); br (broad). 166 Carbon nuclear magnetic resonance (13C NMR) spectra were recorded using a JNM-ECA 500 at 126 MHz or a JNM-167 AL 400 at 100 MHz. Chemical shifts were reported relative to CDCl₃ (§ 77.0) or C₆D₆ (§ 128.0). Infrared spectra 168 were recorded using a FT/IR-4100 Fourier-transform infrared spectrometer (JASCO, Tokyo, Japan) with ATR 169 (attenuated total reflectance). Low and high resolution mass spectra were recorded using a JMS-700 mass 170spectrometer (JEOL) for FAB-MS and a LCMS-IT-TOF (Shimadzu, Kyoto, Japan) for ESI-MS.

Silylether 4: To a solution of aniline **3** (2.06 g, 9.40 mmol) in CH_2Cl_2 (94.0 mL) was added a solution of BBr₃ (25.0 g, 94.0 mmol) in CH_2Cl_2 (94.0 mL) at -78 °C. The mixture was stirred at -78 °C for 20 min, and then warmed to room temperature. After 2 h, saturated aqueous NaHCO₃ and 1M aqueous NaOH were added to the reaction mixture until the mixture became basic. The mixture was extracted with EtOAc. The combined organic layers were washed with brine, and dried over Na₂SO₄. Concentration under reduced pressure gave a crude demethylated lactone.

179 To a solution of the above crude lactone in anhydrous DMF (20.0 mL) were added TBSCl (2.80 g, 18.8 mmol) and 180 imidazole (1.90 g, 28.2 mmol) at 0 °C. The mixture was stirred at room temperature for 3 h. After addition of water, 181 the mixture was extracted with extracted with Et₂O. The combined organic layers were washed with brine and dried 182 over Na₂SO₄. After concentration under reduced pressure, purification by flash column chromatography on silica gel 183 (5-40% EtOAc/hexane) gave silvlether 4 (1.88 g, 63% in 2 steps) as a pale yellow solid: ¹H NMR (500 MHz, CDCl₃) 184 δ 6.99 (dd, 1H, *J* = 8.0, 8.0 Hz), 6.35 (dd, 1H, *J* = 8.0, 1.1 Hz), 6.27 (dd, 1H, *J* = 8.0, 1.1 Hz), 6.06 (dd, 1H, *J* = 1.7, 1.2 Hz), 4.53 (dd, 2H, J = 6.3, 5.8 Hz), 3.76 (br, 2H), 2.72 (dd, 2H, J = 6.3, 5.7 Hz), 0.94 (s, 9H), 0.21 (s, 6H); ¹³C 185 186 NMR (126 MHz, CDCl₃) & 164.4, 156.1, 153.1, 144.0, 129.8, 120.3, 115.5, 108.7, 108.6, 66.5, 28.2, 25.6, 18.1, -4.1; 187 IR (ATR, cm⁻¹) 3369, 2954, 2891, 2857, 1716, 1625, 1580, 1462, 1398, 1302, 1257, 1219, 1081, 1020; MS (FAB) 188 m/z 320 [M + H]⁺; HRMS calcd for C₁₇H₂₆NO₃Si [M + H]⁺ 320.1682; Found: m/z 320.1685.

(*E*)-Dienylaniline 5: To a solution of silylether 4 (1.25 g, 3.91 mmol) in CH₂Cl₂ (40.0 mL) was added DIBAL-H (1M
in toluene, 7.80 mL, 7.80 mmol) at -78 °C. After the mixture was stirred at -78 °C for 2 h, saturated aqueous Na/K
tartrate was added to the reaction solution. The resultant mixture was stirred vigorously at room temperature for 2 h,
and extracted with EtOAc. The combined organic layers were washed with brine and dried over Na₂SO₄.
Concentration under reduced pressure gave a crude acetal.

- 196 To a suspension of MePPh₃Br (4.89 g, 13.7 mmol) in anhydrous THF (25.0 mL) was added KHMDS (1M solution 197 in THF; 12.0 mL, 11.7 mmol) at 0 °C, and the mixture was stirred at 0 °C for 30 min. To the yellow mixture was then 198 added a solution of the above crude acetal in anhydrous THF (15 mL) via cannula. The reaction mixture was stirred 199 at room temperature for 2 h. After addition of water, the resultant mixture was extracted with EtOAc. The combined 200 organic layers were washed with brine and dried over Na₂SO₄. After concentration under reduced pressure, 201 purification by flash column chromatography on silica gel (5-40% EtOAc/hexane) gave (E)-dienylaniline 5 (963.1 202 mg, 77% in 2 steps) as a yellow oil: ¹H NMR (500 MHz, CDCl₃) δ 6.95 (dd, 1H, J = 8.0, 8.0 Hz), 6.77 (ddd, 1H, J =203 16.9, 10.9, 10.3 Hz), 6.36 (dd, 1H, J = 8.0, 0.8 Hz), 6.29 (d, 1H, J = 11.1 Hz), 6.25 (dd, 1H, J = 10.3 Hz), 5.27 (dd, 204 1H, J = 16.9, 1.2 Hz), 5.24 (d, 1H, J = 10.3 Hz), 3.75 (br, 1H), 3.63 (br, 1H), 3.60 (br, 2H), 2.98 (br, 1H), 2.38 (br, 1H), 2 205 1H), 0.88 (s, 9H), 0.08 (s, 6H); ¹³C NMR (126 MHz, CDCl₃) & 154.9, 144.7, 136.6, 132.4, 132.1, 128.7, 119.3, 115.8, 206 106.9, 106.0, 60.6, 33.3, 25.7, 18.1, -5.5; IR (ATR, cm⁻¹) 3375, 2955, 2924, 2857, 1618, 1581, 1464, 1234, 1088; 207 MS (FAB) m/z 320 [M + H]⁺; HRMS calcd for C₁₈H₃₀NO₂Si [M + H]⁺ 320.2046; Found: m/z 320.2045.

242 (E)-Dienylurea 8: To a solution of (E)-dienylalcohol 7 (992.0 mg, 2.17 mmol), pNsNHBoc (786.0 mg, 2.60 mmol) 243 and PPh₃ (682.0 mg, 2.60 mmol) in THF (12.0 mL) was added a solution of di-tert-butyl azodicarboxylate (598.7 244 mg, 2.60 mmol) in THF (10.0 mL). The mixture was stirred at room temperature for 13.5 h. After addition of saturated 245 aqueous NH₄Cl, the mixture was extracted with EtOAc. The combined organic layers were washed with brine and 246dried over Na₂SO₄. After concentration under reduced pressure, purification by flash column chromatography on 247 silica gel (10-40% EtOAc/hexane) gave the mixture of (E)-dienvlurea 8 and pNsNHBoc. The mixture was dissolved 248in CHCl₃, washed with 1M aqueous NaOH and brine, dried over Na₂SO₄. Concentration under reduced pressure gave 249 (*E*)-dienylurea **8** (1.43 g, 89%) as a pale yellow solid: ¹H NMR (500 MHz, CDCl₃) & 8.35-8.32 (m, 3H), 8.04 (d, 2H, 250J = 9.1 Hz), 7.47 (br, 1H), 7.37-7.29 (m, 5H), 7.17 (br, 1H), 7.13-7.09 (m, 1H), 6.98 (d, 1H, J = 8.3 Hz), 6.79 (ddd, 251 1H, J = 16.3, 10.9, 10.6 Hz), 6.24 (d, 1H, J = 10.9 Hz), 5.42-5.38 (m, 2H), 3.88-3.78 (m, 2H), 3.15-3.09 (m, 1H), 252 2.76-2.70 (m, 1H), 1.32 (s, 9H); ¹³C NMR (126 MHz, CDCl₃) & 152.6, 150.9, 150.5, 147.3, 145.1, 138.5, 138.4, 253 137.7, 131.3, 129.4, 129.4, 129.1, 128.1, 125.9, 124.6, 124.1, 122.6, 121.3, 120.0, 118.4 (q, *J* = 321 Hz), 115.1, 86.5, 25446.2, 33.4, 27.9; IR (ATR, cm⁻¹) 3349, 2929, 2854, 1732, 1668, 1534, 1446, 1420, 1368, 1351, 1291, 1249, 1212, 255 1139, 1055, 961; MS (FAB) *m/z* 741 [M + H]⁺; HRMS calcd for C₃₁H₃₂F₃N₄O₁₀S₂ [M + H]⁺ 741.1512; Found: *m/z* 256 741.1512.

2722-Iminoindoline 10: To a solution of carbodiimide 9 (56.4 mg, 0.0780 mmol) in anhydrous xylene (1.0 mL) were 273 added bis(pinacolato)diboron (39.6 mg, 0.156 mmol) and Pd(OAc)₂ (3.5 mg, 0.0156 mmol) and the reaction 274 atmosphere was replaced by the Ar atmosphere. The mixture was stirred at 50 °C for 1 h, and then cooled to 0 °C. 275 After addition of water (1.0 mL) and sodium perborate tetrahydrate (72.0 mg, 0.468 mmol), the mixture was stirred 276 vigorously at room temperature for 1 h. The mixture was then extracted with EtOAc. The combined organic layers 277 were washed with brine and dried over Na₂SO₄. After concentration under reduced pressure, purification by flash 278column chromatography on silica gel (20-60% EtOAc/hexane) gave 2-iminoindoline 10 (42.4 mg, 73%) as a yellow 279 oil: ¹H NMR (500 MHz, CDCl₃) & 8.26 (d, 2H, J = 8.9 Hz), 7.94 (d, 2H, J = 8.9 Hz), 7.79 (d, 2H, J = 8.0 Hz), 7.40-280 7.34 (m, 4H), 7.13 (dd, 1H, J = 7.5, 7.4 Hz), 6.98 (br, 1H), 6.93-6.90 (m, 1H), 6.07 (ddd, 1H, J = 15.8, 5.2, 4.8 Hz), 281 5.78 (d, 1H, J = 16.0 Hz), 4.23 (d, 2H, J = 4.9 Hz), 3.45 (ddd, 1H, J = 14.0, 11.8, 4.0 Hz), 3.22 (ddd, 1H, J = 14.3, 282 12.0, 4.3 Hz), 2.89 (ddd, 1H, J = 12.6, 12.6, 4.3 Hz), 2.54 (ddd, 1H, J = 12.6, 12.4, 4.0 Hz), 1.94 (br, 1H), 1.31 (s, 283 9H); ¹³C NMR (126 MHz, CDCl₃) δ 170.5, 158.9, 150.3, 150.0, 145.1, 144.9, 138.6, 133.2, 131.1, 129.2, 129.1, 284127.6, 127.5, 124.1, 123.9, 120.0, 118.5 (q, J = 320 Hz), 117.9, 114.4, 85.7, 62.8, 59.0, 43.4, 33.0, 27.7; IR (ATR, 285 cm⁻¹) 3380, 3106, 2936, 2877, 1732, 1561, 1534, 1439, 1420, 1349, 1247, 1213, 1138, 1083, 1014, 907; MS (FAB) 286 m/z 741 [M + H]⁺; HRMS calcd for C₃₁H₃₂F₃N₄O₁₀S₂ [M + H]⁺ 741.1512; Found: m/z 741.1508.

289 N-Boc-iminoindoline 11: To a solution of 2-iminoindoline 10 (39.4 mg, 0.0532 mmol) in CH₂Cl₂ (1.0 mL) were 290 added Et₃N (23.0 µL, 0.160 mmol) and TESCl (16.0 µL, 0.106 mmol) at 0 °C. The mixture was stirred at room 291 temperature for 2 h. After addition of water, the mixture was extracted with EtOAc. The combined organic layers 292 were washed with brine and dried over Na₂SO₄. After concentration under reduced pressure, purification by short 293 column chromatography on neutral silica gel (10-30% EtOAc/hexane) gave a crude TES-protected iminoindoline. 294 To a solution of the above crude iminoindoline in CH₂Cl₂ (1.0 mL) were added ⁱPr₂NEt (37.0 µL, 0.213 mmol), 295 Boc₂O (34.9 mg, 0.160 mmol) and DMAP (6.5 mg, 0.0532 mmol) at 0 °C. The mixture was stirred at room 296 temperature for 1.5 h. After concentration of the resultant mixture under reduced pressure, purification of the residue 297 by flash column chromatography on silica gel (10-30% EtOAc/hexane) gave N-Boc-iminoindoline 11 (33.7 mg, 84% 298 in 2 steps) as a colorless oil: ¹H NMR (500 MHz, CDCl₃) δ 8.26 (d, 2H, J = 8.9 Hz), 8.05 (d, 2H, J = 8.8 Hz), 7.73 299 (d, 1H, J = 8.0 Hz), 7.41 (dd, 1H, J = 8.6, 8.3 Hz), 7.31 (dd, 2H, J = 7.8, 7.7 Hz) 7.12 (d, 1H, J = 8.3 Hz), 7.06-7.02 300 (m, 3H), 5.93 (d, 1H, J = 15.5 Hz), 5.66 (d, 1H, J = 15.5 Hz), 4.17 (d, 2H, J = 4.3 Hz), 3.85-3.79 (m, 1H), 3.65-3.62 (m, 1H), 2.70-2.63 (m, 2H), 1.27 (s, 9H), 1.18 (s, 9H), 0.92 (dd, 9H, J = 8.0, 7.8 Hz), 0.57 (q, 6H, J = 7.8 Hz); ¹³C 301 302 NMR (126 MHz, CDCl₃) & 153.2, 150.2, 150.1, 149.0, 147.9, 145.9, 145.6, 143.5, 131.5, 130.5, 129.4, 129.1, 128.7, 303 123.9, 123.8, 122.1, 120.5, 118.3 (q, J = 321 Hz), 115.8, 114.1, 85.3, 84.8, 62.6, 54.0, 43.2, 34.7, 27.7, 27.4, 6.7, 4.3; 304 IR (ATR, cm⁻¹) 2955, 2876, 1731, 1698, 1617, 1594, 1535, 1456, 1421, 1370, 1348, 1287, 1251, 1218, 1141, 1046, 305 1014, 917, 822; MS (FAB) m/z 955 [M + H]⁺; HRMS calcd for C₄₂H₅₄F₃N₄O₁₂S₂Si [M + H]⁺ 955.2901; Found: m/z306 955.2900.

402 Aminal **29**: To a solution of aminal **28** (10.8 mg, 0.0130 mmol) in THF (1.3 mL) was added TBAF (1M in THF, 15.6 403 μ L, 0.0156 mmol) at 0 °C. The mixture was stirred at 0 °C for 4 h. After addition of saturated aqueous NH₄Cl, the 404 resultant mixture was extracted with EtOAc. The combined organic layers were washed with brine and dried over 405 Na₂SO₄. After concentration under reduced pressure, purification by flash column chromatography on silica gel (5-406 30% EtOAc/hexane) gave an alcohol (7.6 mg, 77%) as a yellow oil.

To a solution of the above alcohol (7.6 mg, 9.99×10^{-3} mmol) in MeCN (1.0 mL) were added K₂CO₃ (9.6 mg, 0.0695 mmol) and PhSH (6.3 µL, 0.0614 mmol). The mixture was stirred at room temperature for 12 h, and then diluted

409 with EtOAc. The organic layer was washed with water and brine, and then dried over Na₂SO₄. After concentration
