1. Introduction

The "*Fletán Artico 2011*" spring survey is the continuation of the Spanish survey series that Azti-Tecnalia started in 2008. The objective is to obtain biomass and abundance indices to determine the population structure of Greenland halibut (*Reinhardtius hippoglossoides*) in the protection area of the Svalbard Archipelago, ICES Division IIb, during the spring.

The Arctic Fisheries Working Group (AFWG), group within ICES in charge of the advice for this stock, states, that the stock has been at a low level for several years. But there are indications of an increase in recent years. The advice for the fishery in 2011 was the same as the advice given in previous years: "*The stock has remained at a relatively low size in the last 25 years at catch levels of 15 000–25 000 t. In order to increase the SSB, catches should be kept well below that range. Catches should be below 13 000 t as advised since 2003; this is the level below which SSB has increased in the past*" (ICES, 2010).

The main aim of the survey is to obtain indices of abundance by age and data of the spatial and bathymetric distribution of the Arctic Greenland halibut (*Reinhardtius hippoglossoides*) population.

In addition to the main objective, complementary information was collected, both of Greenland halibut as of the main accompanying species. Thus, the following objectives were also covered within the survey:

- To obtain length/weight relationships parameters by sex.
- To obtain information about Greenland halibut feeding behaviour.
- Likewise, information will be obtained on accompanying fish fauna.

2. Survey design and methods

2.1 Vessel specifications

B/C Nuevo Virgen de la Barca was the selected vessel to conduct *Fletan Ártico 2011* survey in June, being its main characteristics:

Nationality: Spanish

Registered port & number: 3^a VI-59972

Overall length: 56m.

Tonnage: 971 GT

Year: 1988

Engine: 2555CV

Equipment:

Echo sounder: *Simrad ES60*

Scanmar net sensors.

2.2 Gear specifications

Pedreira type bottom trawl gear was used. This gear is often used in the commercial Greenland halibut fishery.

In figure 3, included in annex II, a trawl gear plane is shown. This gear is mounted with a 37.5 meters of headline and a 52 meters long rockhooper..

Gear main characteristics:

- Ground gear

- o Central section (8,2 m), with 21" rubber discs separated by dividers.
 - o Lateral section (6,4m), with 18" rubber discs separated by dividers.

- Floats: 250mm diameter floats.
- Codend: (Polyethylene 28 mm), with 140mm mesh size + 40mm cover codend.
- Legs: 17 m.
- Doors: "Inyector doors", Shark model 2800 Kg.

2.3 Survey planning

The Survey took place from 1st to 19th June. 114 hauls were carried out. Table 1, included in the annex I, shows specific data by haul.

As previous years, the survey was developed in a depth range between 500 and 1500 meters on the west slope of the Svalbard archipelago, covering an area between 73° 30' N and 80° 00 ' N (Figure 1, annex II). For the sampling scheme, the stratification designed in 1994 was used. In the table below latitude and depth range limits for each stratum, as well as the surface area and the number of valid hauls made is shown.

Strata	Latitud	Depth (m)	Area (squared nautical miles)	nº hauls
1	76° 00' - 81° 00' N	500- 699	702	26
2	76° 00' - 81° 00' N	700- 999	1263	26
3	76° 00' - 81° 00' N	1000-1500	2693	5
4	73° 30' - 76° 00' N	500- 699	488	29
5	73° 30' - 76° 00' N	700- 999	761	23
6	73° 30' - 76° 00' N	1000-1500	1672	5

The duration of each haul was 30 to 60 minutes, since the moment when the net was on the bottom until the haul back. The moment in which the gear was properly configured in the bottom was controlled thanks to Scanmar sensors, in addition to know the geometry of the net and the distance between doors.

Catches were sorted and weighted by species. Greenland halibut and principal accompanying species were also measured in length. Otoliths and stomach contents were also collected.

3. Results

3.1 Catches

Detailed data of each haul are shown in table 1 included in Annex I. Figure 2, in Annex II shows the map with the prospected area and the position of each haul performed.

As it is shown in the following figure, 93 % of the total catches in weight correspond to Greenland halibut, while the rest of fishes and invertebrates suppose 6.5 % and 0.5 % respectively.

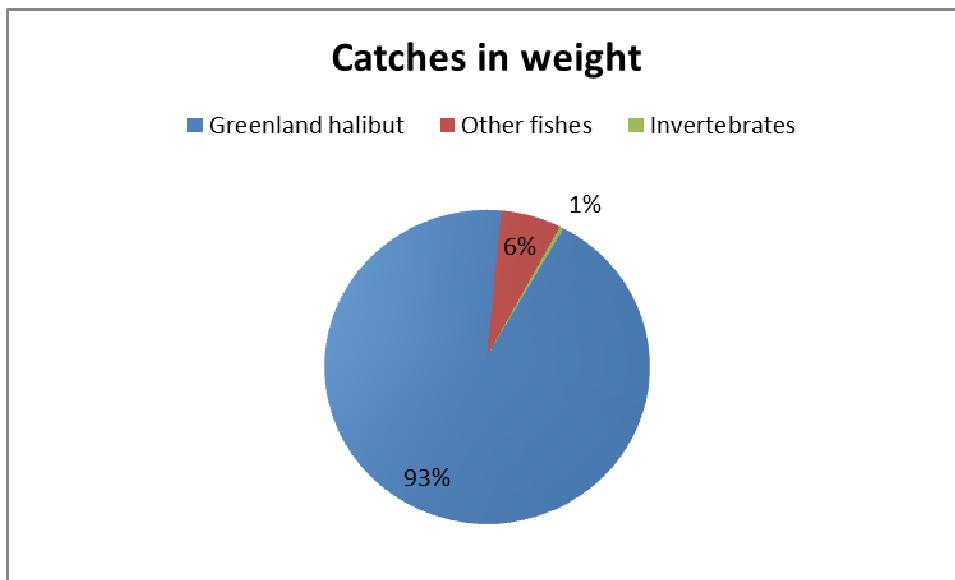

Figure 1. Greenland halibut percentage in the catches during *Fletán Ártico 2011 Survey*

Table 2, included in Annex I, shows all species catches by haul. Greenland halibut was the principal species, with 136 610,54 kg captured. Cod (4 703,27 kg), redfish (1 816,94 kg), and wolffish (899,11 kg) were the main accompanying species.

The main Greenland halibut catches were recorded in depths between 600 and 800 meters, reaching its maximum values between 650 and 750 meters depth (figure 2). Below the 1000 meters deep, catches of halibut were scarce, being under 300kg all of them.

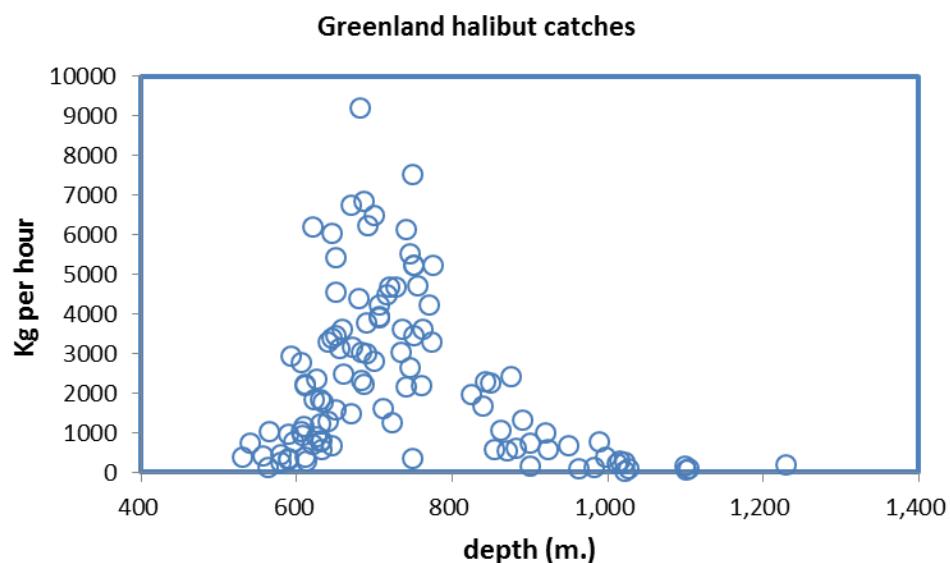

Figure 2. Greenland halibut catches in relation to depth, during *Campaña Fletán Ártico 2011 Survey*.

However, it seems that the depth is not the unique factor related with the abundance of Greenland halibut. Including the latitude in the analysis, we can see how hauls carried out further south, below the latitude 76°30'N, show greater abundance (figure 4, annex II).

This means, that analyzing catches by stratum, as shown in figure 3, deeper strata, 3 and 6, would show lower concentration of Greenland halibut, while the shallower strata of the south, strata 4 and 5, show greatest concentrations. In these strata of greater concentration, the variability was also higher.

Catch by stratum

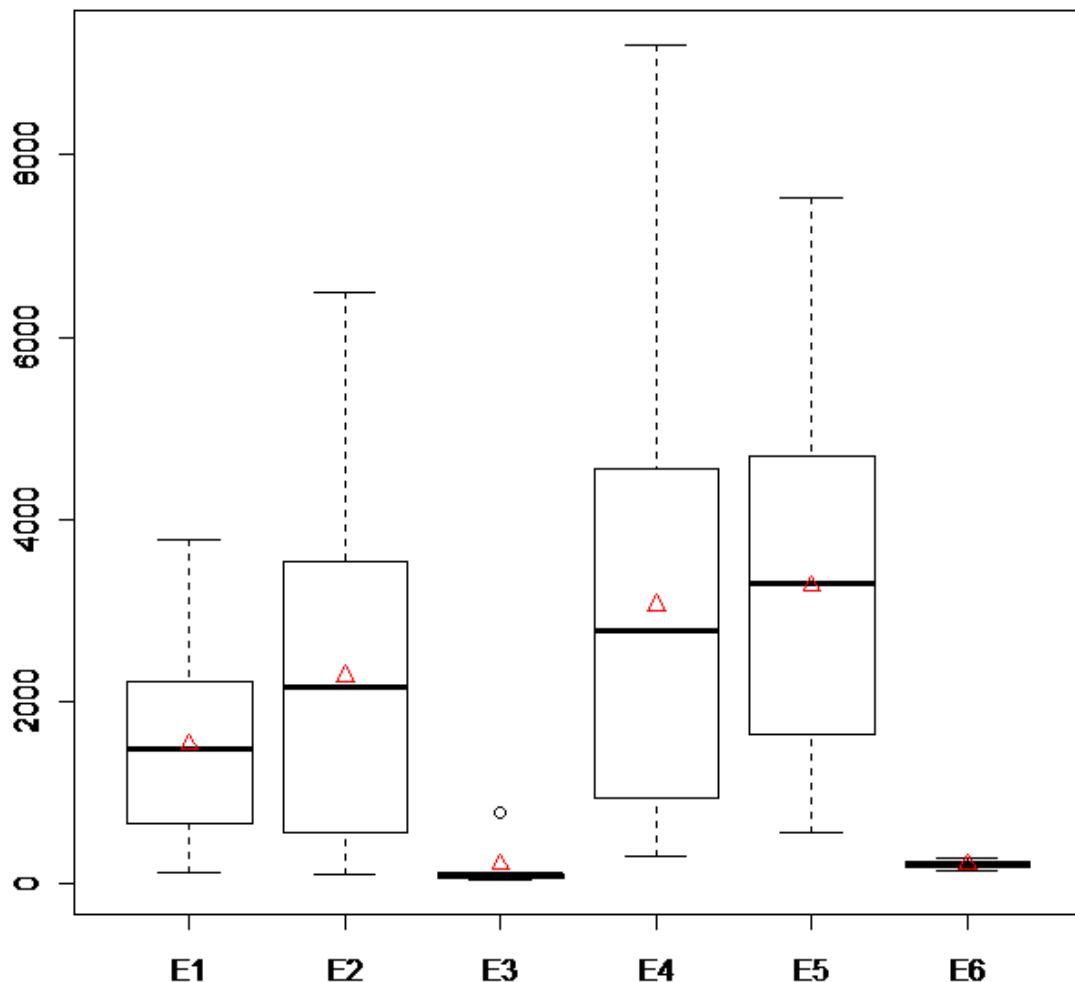

Figure 3.Greenland halibut catches (Kg) by stratum. (Mean (▲), median (—) and percentiles 25 & 75.

Figures 5, 6, 7, 8, 9, 10 and 11 of annex II, show the maps of the catches by haul of the main accompanying species.

None of them presents a clear distribution pattern in relation to the latitude except from the redfish that appears mostly in the southern latitudes.

3.2 Greenland halibut biomass and abundance

The abundance and biomass was estimated with the Swept Area method, as in previous years.

The estimated Greenland halibut biomass in this survey was 98 142 ton and the abundance, 117 666 (x1000) individuals. This supposes an increase of 59% in biomass and 55 % in abundance, comparing with last May survey in 2009. It has to be pointed out that with the purpose of comparing data, no survey was deployed in May during 2010.

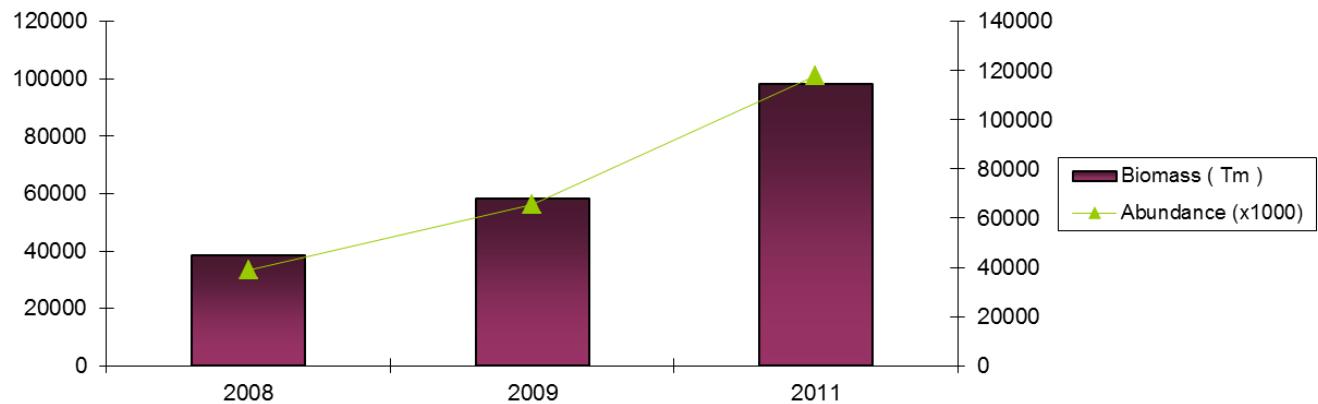

Figure4.Comparison between 2008, 2009 and 2011 May survey Greenland halibut biomass and abundance results.

Table 3 included in the annex I, shows the biomass and abundance values by stratum.

3.3 Accompanying fauna biomass

Biomass valued estimated for the accompanying fauna were really low. These values indicate that, in the slope of Svalbard Archipelago, Greenland halibut constitutes the dominant species. Table 4 of Annex II, shows estimated biomass values for the main accompanying species.

3.4 Length distribution

The population's structure was similar to the described in previous surveys (Ruiz J., *et al.*, 2009. (Paz X., *et al*, 2006). Length range for both sexes was from 31 cm to 99 cm. As in previous cruises, the male proportion was higher, 66 % of males versus 34 % females.

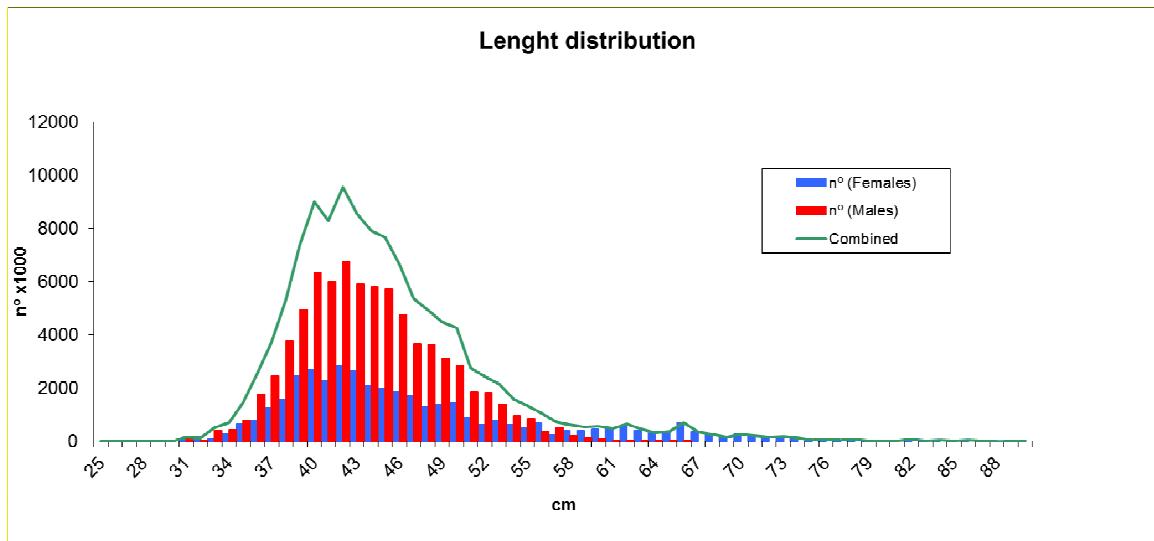

Figure5. Greenland halibut length distribution in Svalbard

4. CONCLUSION

Main conclusions derived from the results obtained during the *Campaña Fletán Ártico 2011 Survey*:

- Positive trend in the stock of Greenland halibut (*Reinhardtius hippoglossoides*) in the Archipelago of Svalbard continues, as the increase in the biomass and abundance shows. Nevertheless, absolute biomass and abundance values must be taken with care, principally due to the used gear, less efficiency with the benthonic species as the Greenland halibut and skates and better with species less associated to the bottom, as cod and redfish.
- Inter-annual stability situation continue. Both spatial and bathymetric distributions, as the structure of the population are similar to those describe in previous years and by other authors (Mugerza & Ruiz, 2008. Paz X., et al, 2006. Godo and Haug, 1989).
- The Greenland halibut is the dominant species on the slope of Svalbard Archipelago, and the only recourse open to commercial exploitation to depths greater than 500m., been the trawl fishery in that bathymetric range monospecific, addressed to the Greenland halibut.

- In general, after 4 years of data, trends can be extracted from the series. It is outstanding the increase in biomass along the data series. More detailed analysis will be desired to be deployed if data series would be elongated. Thus, physical parameters could be overlapped to the geographical distribution of catches for a better understanding of the stock distribution. This work is expected to be carried out in the future as data series is getting longer.

Table4 (cont). Accompanying fauna biomass (Tn) by strata in the Svalbard Archipelago.

Rough head grenadier					
Strata	Total Area	Nº Hauls	Swept Area	Catch (Kg)	Biomass (t)
1	702	25	1,16	69	42
2	1.263	23	1,02	51	63
3	2.693	5	0,22	1	14
4	488	29	1,47	114	38
5	761	23	1,07	177	126
6	1.672	5	0,22	14	105
Total	7.579	110	5,17	427	387

Blue whiting					
Strata	Total Area	Nº Hauls	Swept Area	Catch (Kg)	Biomass (t)
1	702	25	1,16	57	34
2	1.263	23	1,02	12	15
3	2.693	5	0,22	0	0
4	488	29	1,47	153	51
5	761	23	1,07	14	10
6	1.672	5	0,22	0	0
Total	7.579	110	5,17	236	110

Thorny skate					
Strata	Total Area	Nº Hauls	Swept Area	Catch (Kg)	Biomass (t)
1	702	25	1,16	83	50
2	1.263	23	1,02	149	184
3	2.693	5	0,22	32	403
4	488	29	1,47	33	11
5	761	23	1,07	98	69
6	1.672	5	0,22	16	121
Total	7.579	110	5,17	411	837

7. ANNEX II: FIGURES Campaña Fletán Ártico 2011

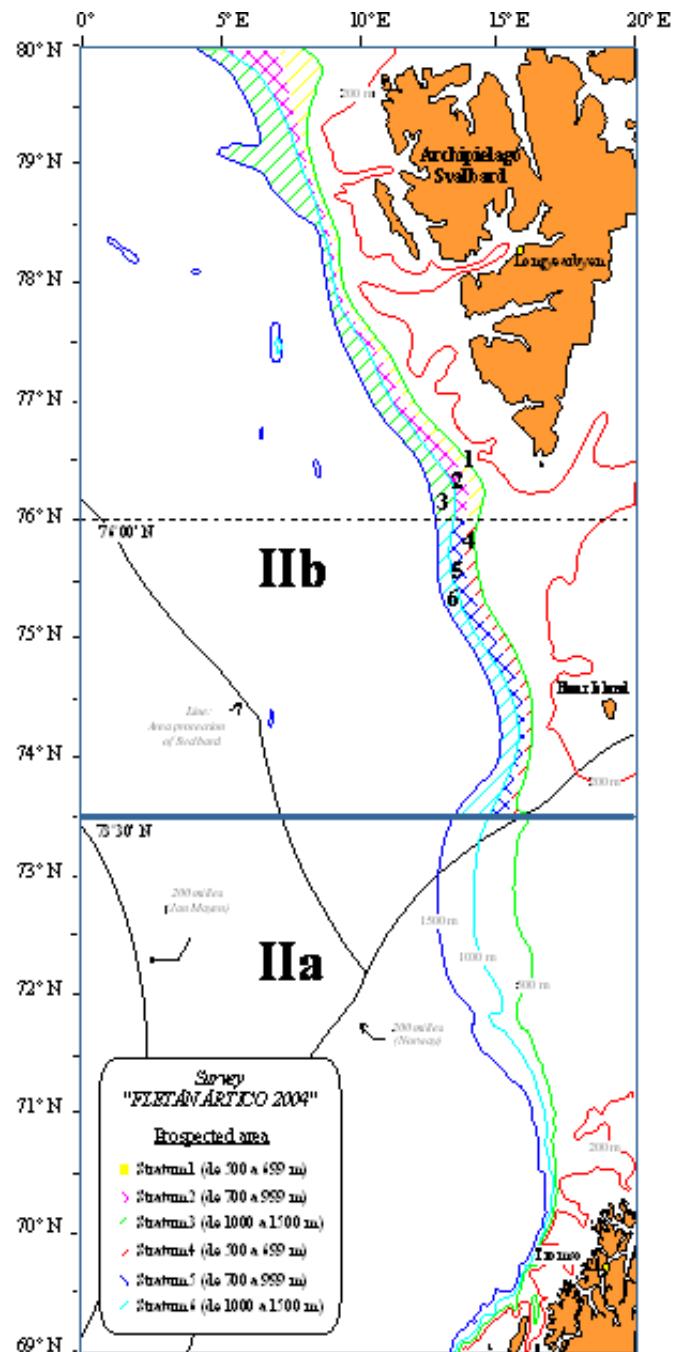

Figure1. Map of the area showing the six considered strata and its ranges of depth.

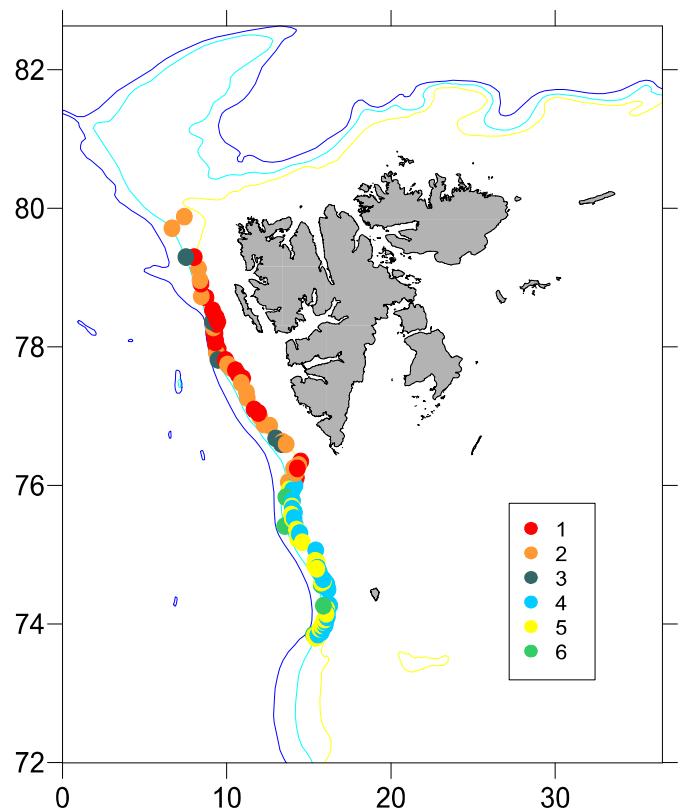

Figure2. Map showing the positions of the hauls by strata made during the *Campaña Fletán Ártico 2011* Survey.

Burlón: 58 m
 Cable: 18 mm \varnothing
 Forro en el cabo de Nylon 14 mm \varnothing

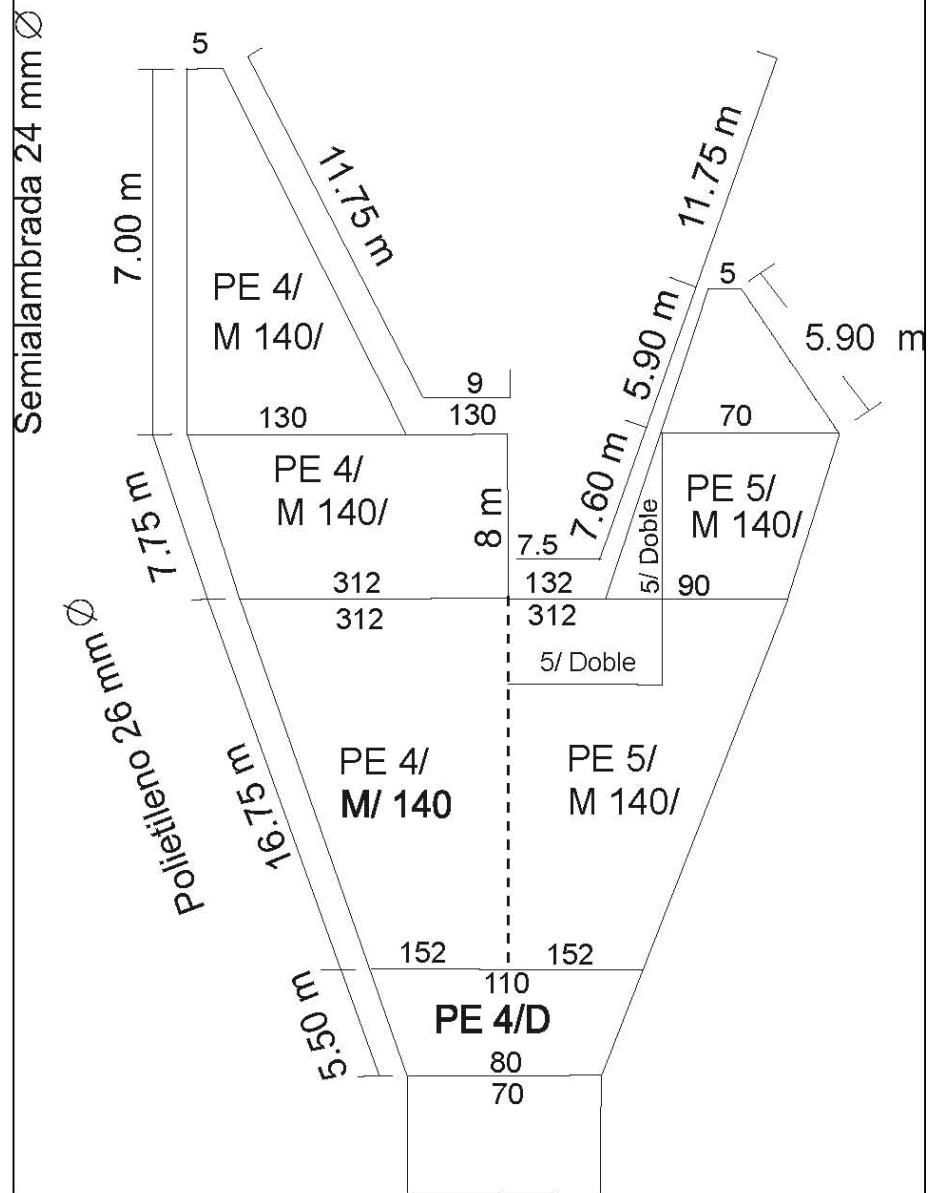

Figure 3. Schematic of the net plan of the Spanish "Pedreira" survey trawl

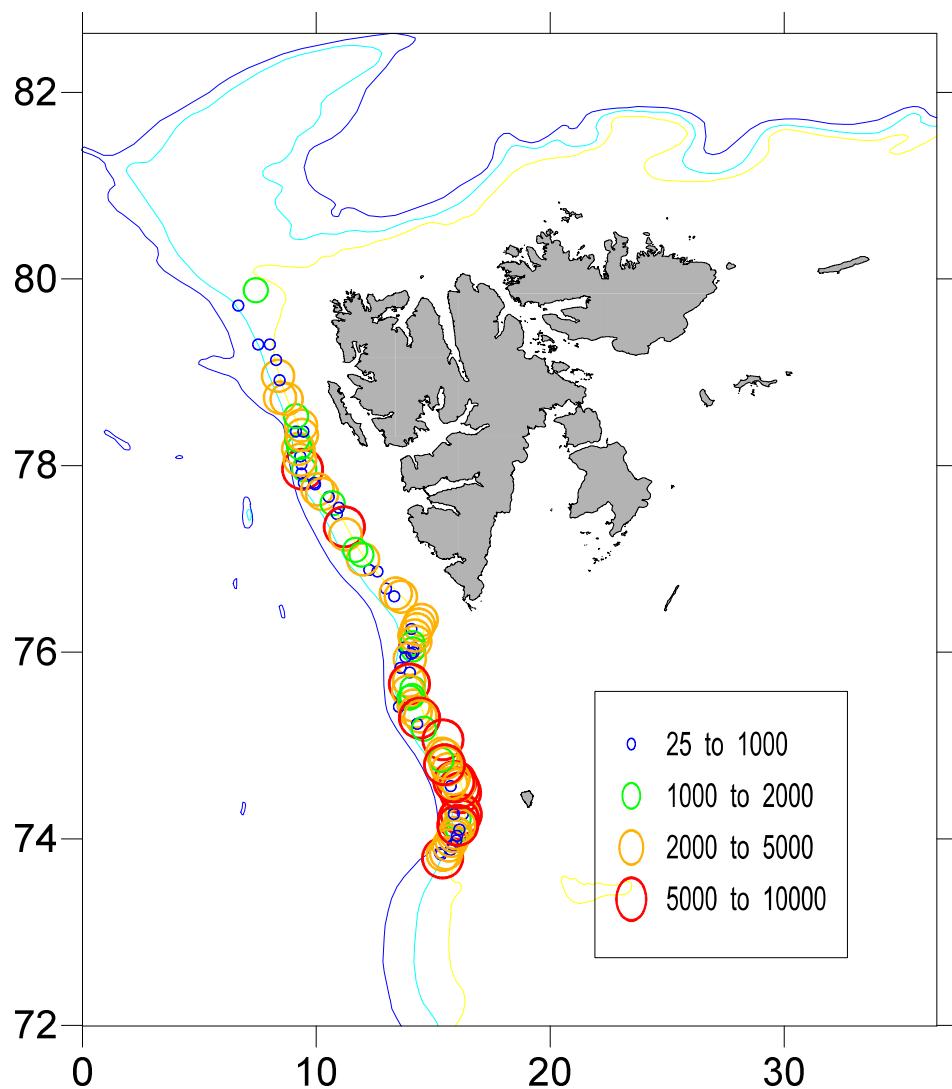

Figure4. Distribution of the **Greenland halibut** catches (Kg/h).

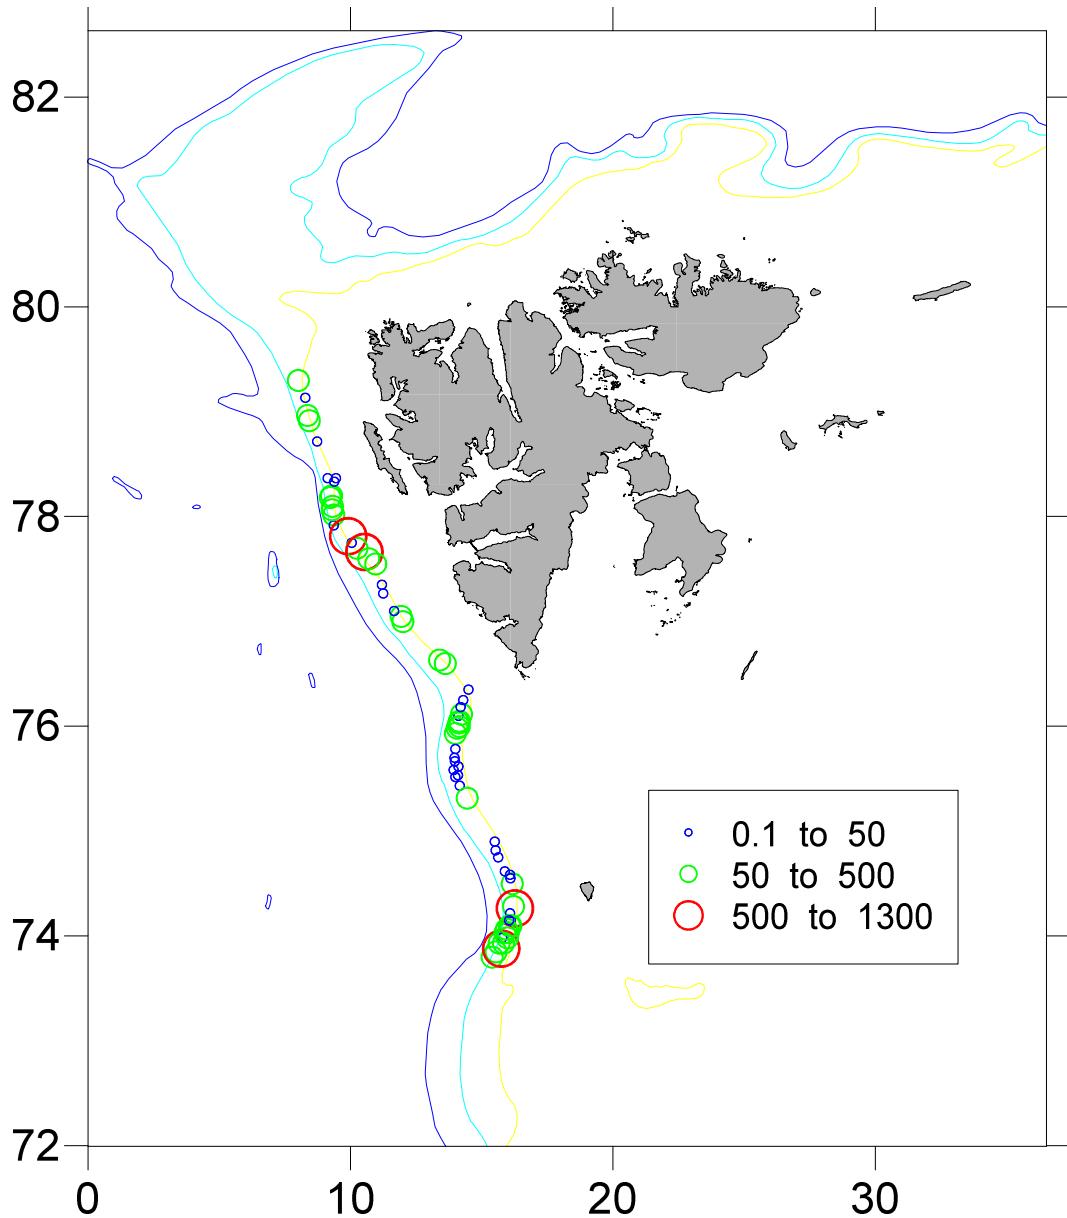

Figure5. Distribution of the **Cod** catches (Kg/h).

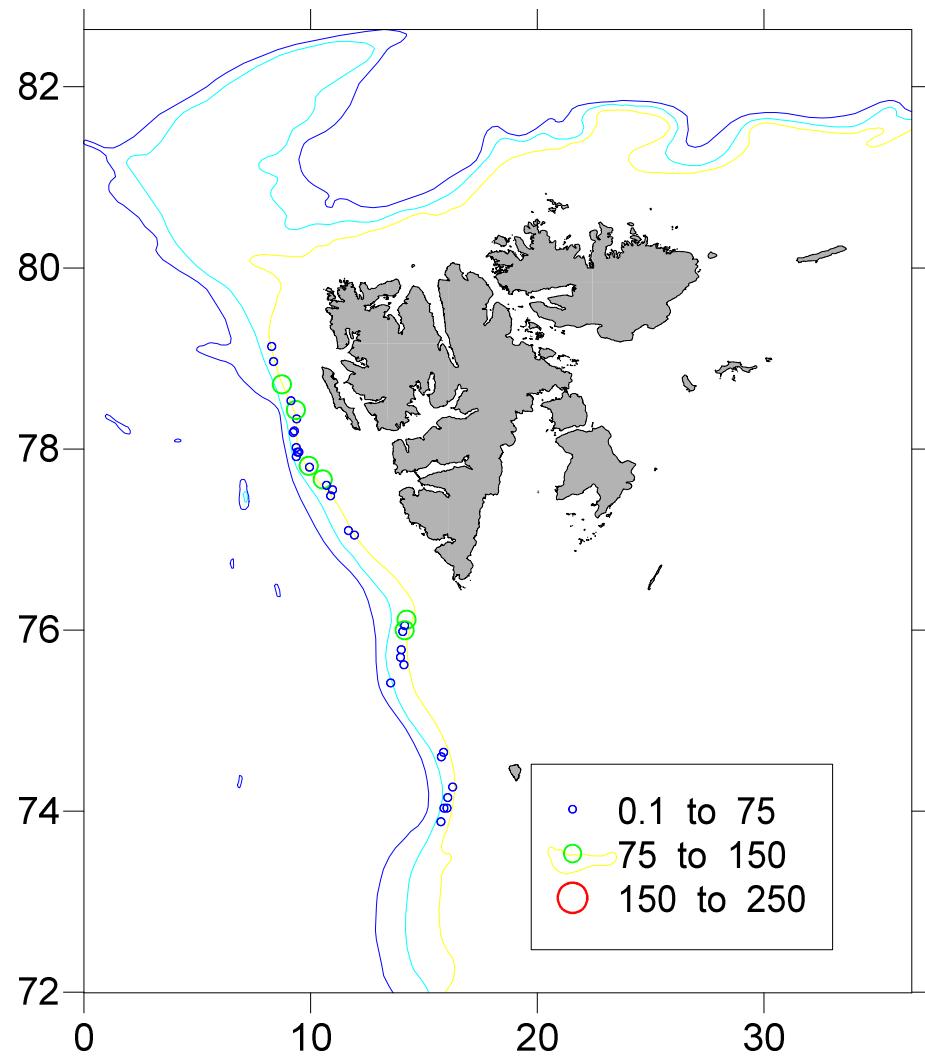

Figure 6. Distribution of the **wolffish** catches (Kg/h).

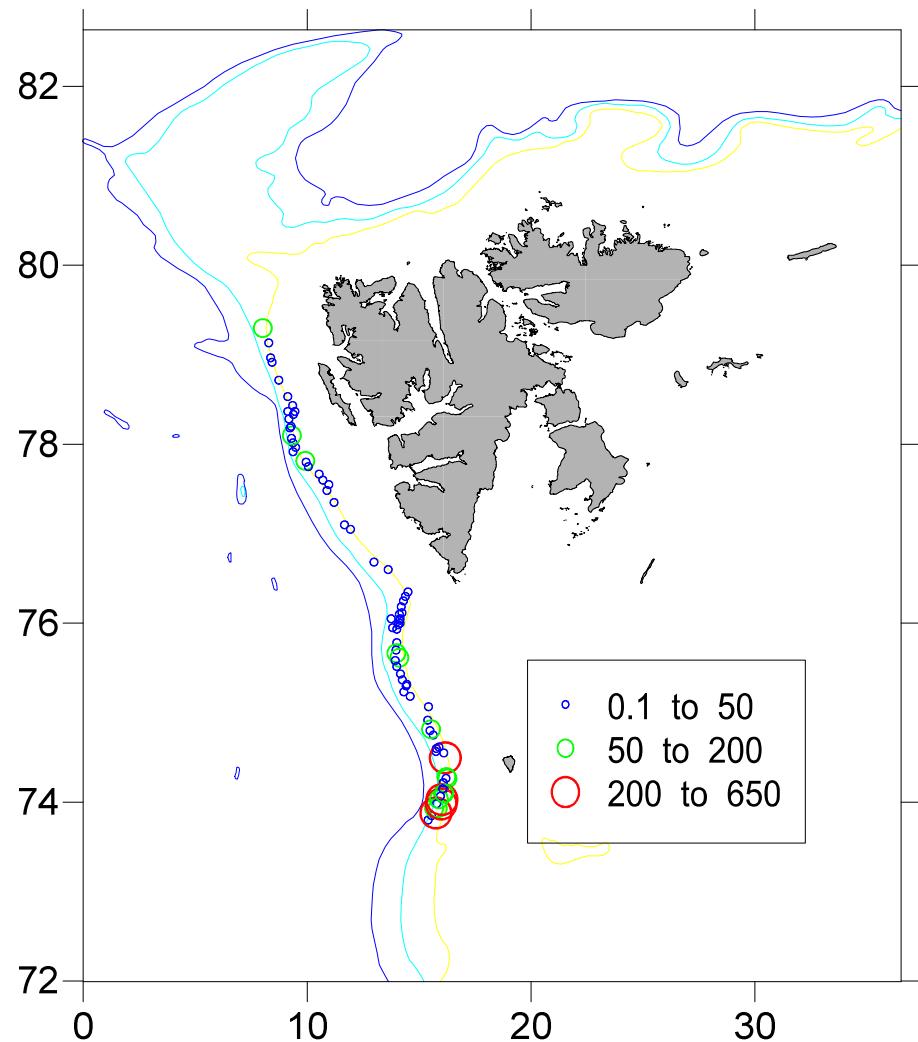

Figure 7. Distribution of the **redfish** catches (Kg/h).

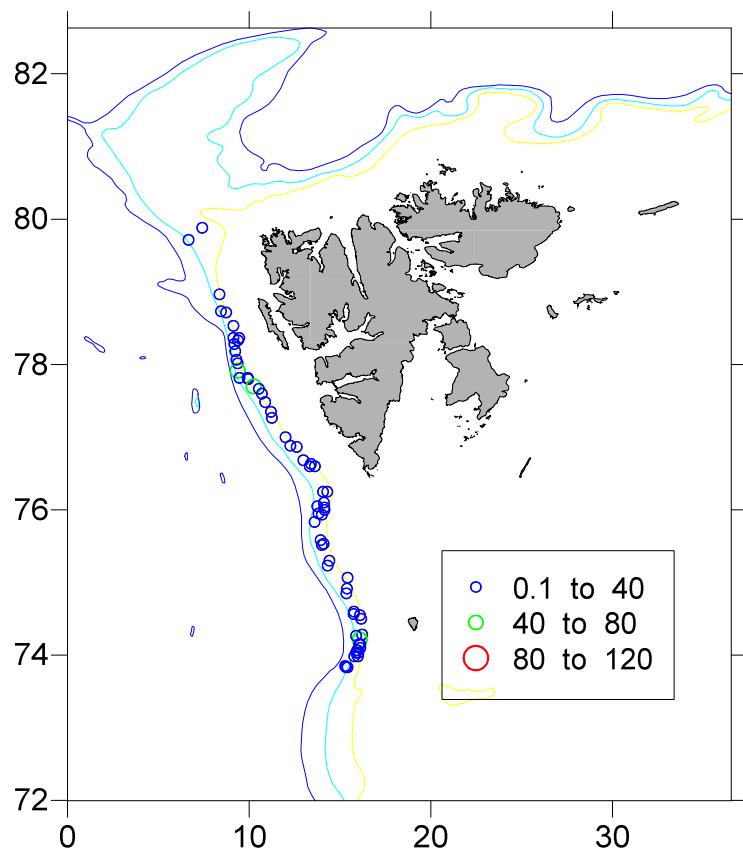

Figure 8. Distribution of the **thorny skate** catches (Kg/h)

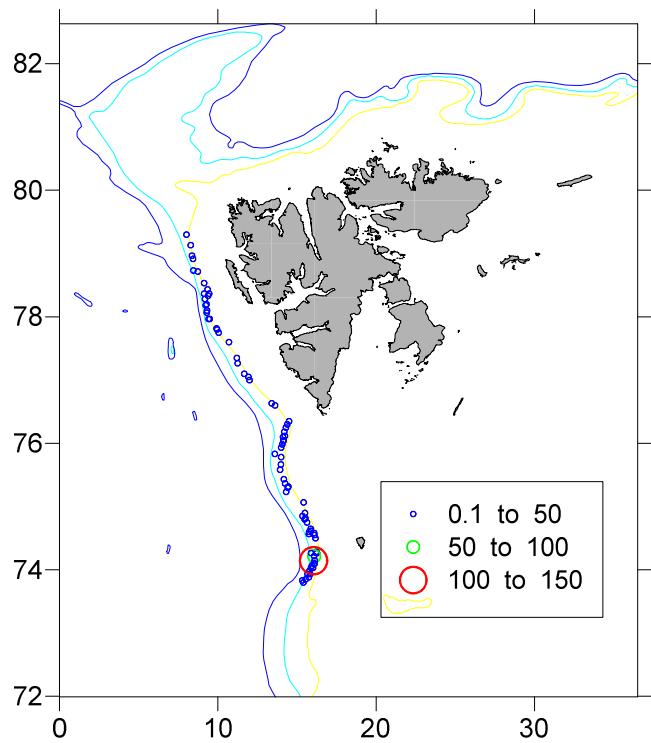

Figure 9. Distribution of the **grenadier** catches (Kg/h)

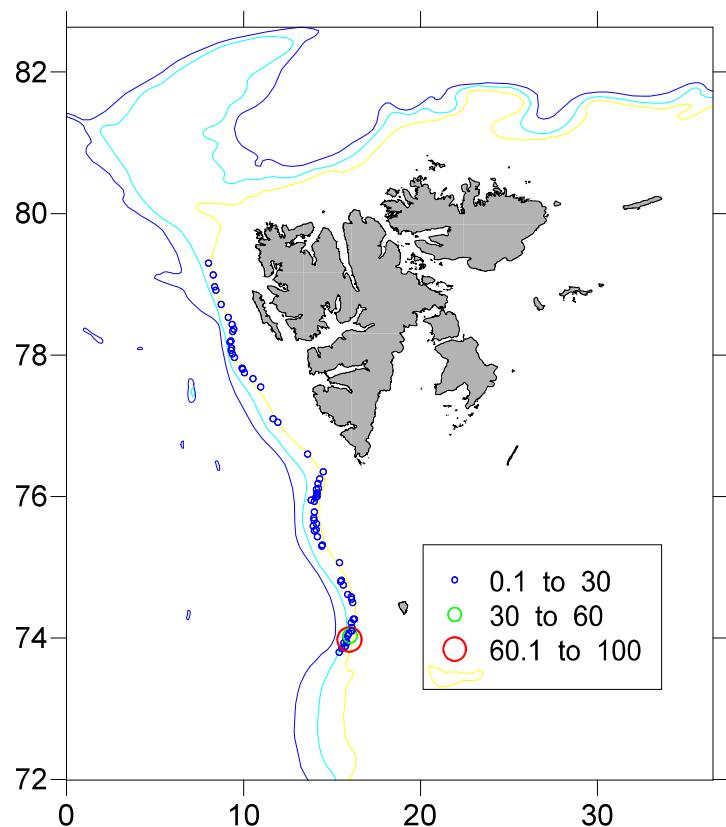

Figure 10. Distribution of the **blue whiting** catches (Kg/h)
