Cruise 291 FRS 'Walther Herwig III'  
22.08. - 08.09.2006**

**Integrated Monitoring of Biological Effects of Contaminants,  
Fish Diseases and Chemical Pollutants  
in the North Sea and the Baltic Sea**

Chief Scientist: Dr. Michael Haarich

## 1 Abstract

As part of the regular activities of the Institute of Fishery Ecology of the Federal Research Centre for Fisheries, an integrated monitoring programme on contaminants, biological effects of contaminants and diseases in marine fish species, studies were conducted in 9 North Sea and 4 Baltic Sea areas. In addition to the examination of North Sea dab (*Limanda limanda*), Baltic cod (*Gadus morhua*) and Baltic flounder (*Platichthys flesus*) for macroscopically visible external and internal diseases and parasites, numerous samples were taken for studies on histopathological alterations in liver and spleen, contaminant-induced changes in enzyme activities (EROD), inorganic and organic contaminants and their metabolites (trace metals, organochlorines, PAH metabolites), age composition, condition factors, and organosomatic indices. In addition, hydrographical measurements were carried out (water temperature, salinity, oxygen content). Fish samples were frozen for the detection of radioactive substances and for measurements of contaminants in the framework of the OSPAR JAMP/CEMP and HELCOM /Combine monitoring programmes and research programmes.

The results of the examination of dab for macroscopic lesions largely confirmed with only few exceptions last year's findings. The prevalence of lymphocystis in dab from the North Sea and Baltic Sea has slightly increased, and the prevalence of liver tumours in North Sea dab has significantly increased compared to last years. The prevalence of hyperpigmentation remained still on an elevated level for the North Sea with the exception of the German Bight showing decreasing rates.

The prevalences of acute skin ulcerations in Baltic Sea cod varied depending on the investigation area between 0.0 % and 11.0 % and were thus comparable to the previous year. More results will be available after subsequent lab analyses of samples.

## 2 Objectives of the Cruise

1. Studies on biological effects of contaminants in fish
2. Studies on the occurrence of fish diseases and parasites
3. Sampling of fish for chemical analysis of radioactive substances, trace metals and organic contaminants
4. Hydrographical measurements (salinity, temperature, oxygen)
5. Sampling of livers and other organs of fish for subsequent histological and biochemical studies at 27 stations (see Table 1b).

### **3 Dates of the Cruise**

FRS 'Walther Herwig III' left Bremerhaven on 23.08.06. Station work was started at noon in area GB1 in the German Bight and continued in 8 other North Sea areas until 02.09.06. On Sunday 03.09. FRS 'Walther Herwig III' crossed the Kiel Channel, and work was continued in the Baltic Sea in four areas, starting on 04.09. in area B12 (Mecklenburg Bight). having finished the programme in the Kiel Bight, FRS 'Walther Herwig III' returned to the North Sea and, according to plan, the cruise ended in the morning of 08.09.2006 in Bremerhaven.

The location of the sampling areas and the cruise track as well as the cruise dates are shown in Figure 1, and Table 1a and 1b repectively. The scientific programme was interrupted by a short stay in Aberdeen to pick up a hydrographic device at Fisheries Research Services (FRS Aberdeen) , which had been lost by FRS 'Walther Herwig III' in February 2005 and found by a Scottish Fisherman.

In the 13 sampling areas (Fig. 1), a total of 53 fishing hauls was performed (towing time 1 h) (see Table 1a). In the North Sea, the GOV was used, in the Baltic Sea a 140 ft bottom trawl with rock hoppers. Hydrographical measurements were conducted at 27 stations (coordinates see Tab. 1b, results in Tab. 2).

### **4 Preliminary Results**

#### **4.1 Dab (*Limanda limanda*)**

In total, 6.573 dab were examined for the occurrence of externally visible diseases and parasites and 964 dab for the occurrence of macroscopic liver anomalies. Results are given in Table 4 and 5. Compared to the summer cruise in 2005, in some of the North Sea areas a slight increase of the prevalence of lymphocystis in dab could be observed with values of 1.7 % in area GB 1 (German Bight) up to 21.8 % in area P02 (Ekofisk Oil Field). Also for liver nodules > 2 mm diameter rates increased: for dab  $\geq$  25 cm total length between 7,3% (area N06, outer Firth of Forth) and 30,8% (N22, Sole Pit Gas Field) were determined; for the German Bight (area JMP/N01) the prevalence of 26,6 % was also significantly higher as in the previous year (9%).

The prevalence of acute stages of skin ulcerations was slightly increased compared to 2005, while the rest of the diseases/parasitoses recorded were similarly prevalent compared to previous years.

Prevalences of skin hyperpigmentation (increased aggregation of green to black pigment spots) were still on a high level with values between 4,5% (area P02) and 52,1% (area N06). However, in the German Bight a decrease was observed down to 17,2% for area JMP/N01. The prevalences rates of other investigated fish diseases remained on a relatively low and constant niveau.

In the Baltic Sea areas B01 and B12, prevalences of all diseases except lymphocystis were on a comparable lower level.

A variety of samples were taken for subsequent chemical analysis of contaminants as well as for biological effects measurements. More comprehensive results will be available after all samples obtained have been processed.

#### **4.2 Cod (*Gadus morhua*)**

1.263 cod from the Baltic Sea were examined for the occurrence of externally visible diseases and parasites (see Table 6). For the North Sea, only in area P01 a sufficient number of cod had been caught to be able to perform these investigations (see Tab. 5). The prevalences of acute/healing skin ulcerations were in the range of 0.0 % (area B01) to 11.9 % (area B12), and were thus for Baltic cod comparable to 2005.

#### **4.3 Flounder (*Platichthys flesus*)**

380 Baltic flounders were examined for externally visible diseases (Tab. 7). The prevalence of lymphocystis showed rates in the normally observed range from 0% (area B01) to 30.9% (area B11); acute/healing stages of skin ulcerations were found between 0% (areas B01, B12) and 3.7% (area B11). Prevalence of *Cryptocotyle* sp. was high in all areas.

### **5 Hazardous substances**

For subsequent analysis of hazardous substances (chlorinated organic pollutants, heavy metals and radionuclides) in the land-based laboratories, samples were immediately frozen (metal analysis) or dissected on board to get (sub-)samples of mainly liver and fillet after the biological data had been recorded. For the institute's programme, 190 samples were taken from 12 areas for analysis of organic substances (all dab samples = 84% dissected on board) and 165 samples from 11 areas for trace metal analysis, including the German core areas investigated in the framework of the international monitoring programmes of OSPAR and HELCOM for hazardous substances in biota from open sea areas. In addition, samples were taken for research projects (i) of the Federal Environmental Agency (UBA, Berlin), 175 dab from 7 areas, dissected: liver, fillet and gastrointestinal tract, otoliths, (ii) the Agency for Consumer Protection and Food Safety of Lower Saxony (LAVES, Cuxhaven) 12 pooled samples from 9 areas, and (iii) Federal Institute for Materials Research and Testing (BAM, Berlin) a large pooled sample for preparation of reference material. For the determination of radionuclides, 29 pooled samples from 11 areas were taken.

### **6 Miscellaneous**

The mean catch data of the most frequent fish species are provided in Table 2; Table 3 gives results of the hydrographic measurements.

### **7 Scientific participants**

1. Dr. Michael Haarich	IFÖ Hamburg (Chief Scientist)
2. Dr. Ulrich Rieth	IFÖ Hamburg
3. Ursula Kürschner	IFÖ Cuxhaven
4. Thomas Tepperies	IFÖ Cuxhaven
5. Alexander Schulz	IFÖ Hamburg
6. Alexandra Schünzen	IFÖ Hamburg
7. Christina Wehner	IFÖ Hamburg
8. Paul Kotterba	Univ. Hamburg
9. Nico Geveke	Univ. Oldenburg
10. Angela Junge	Univ. Rostock
11. Anne Schäfer	Univ. Rostock
12. Felix Baumgart	Univ. Rostock

### **8 Acknowledgements**

Thanks are due to Captain Vandrei and his crew and to the scientific staff for the excellent cooperation and atmosphere on board.

Dr. Michael Haarich  
(Chief Scientist)
