HYDROGRAFISKE NORMALER OG LANGTIDSVARIASJONER I NORSKE KYSTFARVANN

*HYDROGRAPHIC NORMALS AND LONG-TERM
VARIATIONS IN NORWEGIAN COASTAL WATERS*

Av

Jan Aure og Øyvind Østensen

HAVFORSKNINGSINSTITUTTET

Mai 1993

FORORD

I 1930-årene startet Dr. Jens Eggvin, ved Fiskeridirektoratets Havforskningsinstitutt, arbeidet med å etablere en rekke faste hydrografiske stasjoner langs norskekysten bemannet med lokale observatører. Observasjonene på kyststasjonene har, sammen med andre observasjoner ved Havforskningsinstituttet, vært benyttet til å holde oppsyn med klimaforholdene i norske havområder.

I det følgende presenteres månedsnormaler og standardavvik for temperatur, saltholdighet og tetthet ved 9 kyststasjoner mellom Skagerrak og Barentshavet. Langtidsvariasjonene i temperatur og saltholdighet er vist som årlege kvartalsmidler.

Vi vil spesielt takke våre dyktige observatører som i alle år har stått på i våre værharde kystområder. Ved HI har Ole Gjervik, Henrik Myran og Øyvind Strand sørget for saltanalyser, temperaturkorrekSJoner, kontroll og innlegging av data på EDB. Forskningsstasjonen Flødevigen har utført observasjonene ved Torungen.

Observatører:

INGØY. Henrik Pettersen (1968-1974), Alf Pedersen (1974-1978), **Bjørn Klausen (1978-).**

EGGUM. Hans Eggvin (1935-1958), Birger Solheim (1959-1971), **Bård Børresen (1973-).**

SKROVA: Waldermar Ellingsen (1935-1966), Arne Hemmingsen (1966-83), **Johan og Jonny Kristiansen (1983-).**

BUD : Peder og Hans Nausthaug(1971-1979), **Aarstein og Karsten Viken (1979-).**

SOGNESJØEN: Martin Leirvåg (1968-)

UTSIRA: Andreas Miljeteig (1942-1967), Thomas Helgesen (1968-1975), Hans og Tordis Klovning (1975-89), **Johannes Skålnes (1989-).**

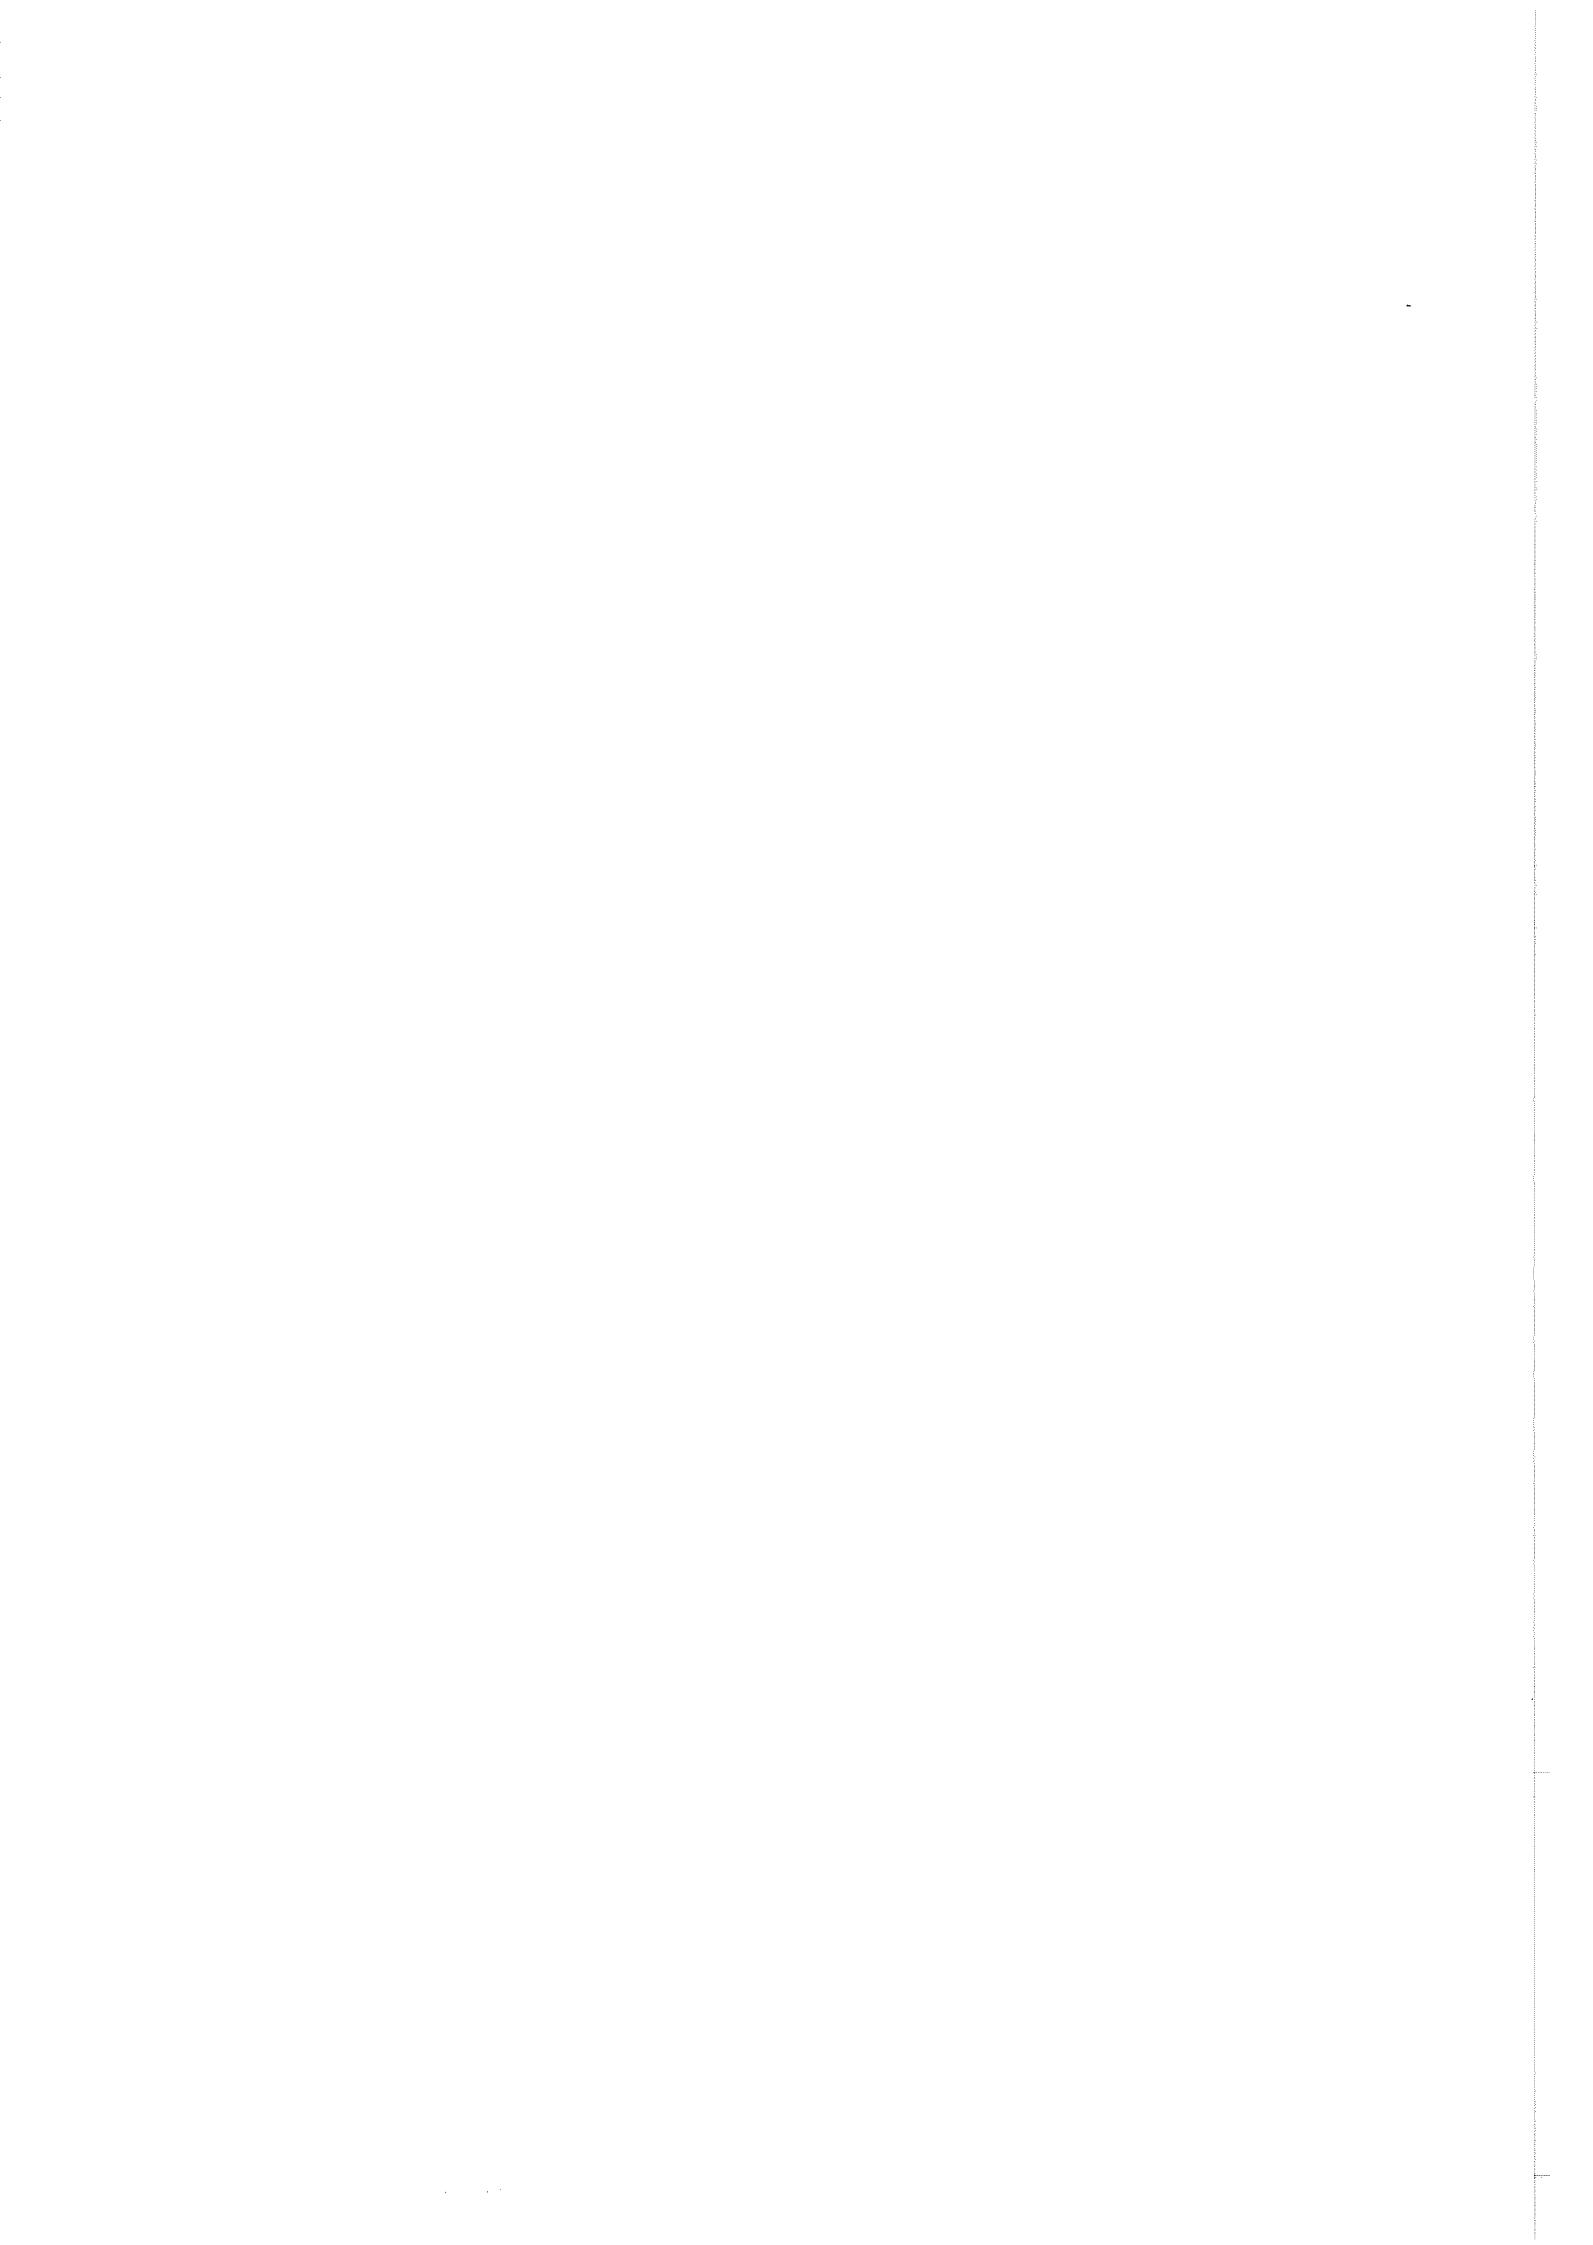

LISTA: Anton Haugen(1942-1945), Olav B. Husebø (1945-1953), Lars Olsen (1953-1957), Karl Hansen (1957-1966), **Hans Heimvoll (1966-).**

1. INNLEDNING

I perioden mellom 1935 og 1947 etablerte Fiskeridirektoratets Havforskningsinstitutt en rekke faste hydrografiske stasjoner fra Skagerrak til Nordkapp (Fig.1 og Tabell1). Hensikten var å etablere en langtidsserie for overvåkning av havklimaet og som i første rekke skulle knyttes til fiskeriene. Senere har det vist seg at de hydrografiske dataene fra de faste stasjonene også har blitt etterspurt av en rekke fagmiljøer, forvaltning og firma/enkeltpersoner.

Langs Norskekysten er det to hovedvanntyper som dominerer: Atlanterhavsvann og Kystvann (Fig. 2). Atlanterhavsvannet, som strømmer inn i Norskehavet ved Færøyene og Shetland, har en middeltemperatur på ca 9°C og saltholdigheter er over 35. En gren av det varme og salte Atlanterhavsvannet følger norskekysten fra Stadt og nordover, mens en mindre del går sørover inn i Nordsjøen langs vestkanten av Norskerenna. Denne forlengete grenen av "Golfstrømmen" har stor betydning for temperaturforholdene langs norskekysten og da spesielt vintertemperaturene i Nord-Norge.

Kystvannet, med saltholdigheter under ca 35, har hovedsakelig sitt opphav i overskuddet av ferskvann som tilføres Skagerrak fra Østersjøen (ca 500 km³ pr. år) og sørlige Nordsjøen (ca 190 km³ pr år). Langs norskekysten er den årlige ferskvannstilførselen fra land omlag 400 km³. Kystvannet blander seg med det dypereliggende salttere Atlanterhavsvannet, slik at saltholdigheten øker nordover langs kysten. Blandingen fører også til at forskjellen i temperatur og saltholdighet mellom overflatelaget og de dypere lag blir mindre jo lengre nord en kommer. Den økende innblandingen av Atlanterhavsvann nordover motvirker også avkjølingen vinterstid i nordlige kystfarvann. Kystvannets vertikalutbredelse nær kysten varierer mellom 50 og 150m, med økende dybde nordover.

Strømhastighetene i den norske Kyststrøm kan bli ganske høye med hastigheter opp til ca 100 cm/sek (2kop). Midlere strøm eller reststrøm varierer mellom 15 og 40 cm/sek og er som regel sterkest i de øvre 50m. Den totale vanntransporten i Kyststrømmen er omlag 1 mill. m³ pr sek. utenfor kysten av Sørvestlandet og øker nordover.

Vind og tidevann kan føre til store korttidsendringer i Kyststrømmen. Tidevannet langs norskekysten varierer mye. I området utenfor Lista er tidevannsforskjellene meget små og øker nordover langs kysten. I Nord-Norge kan tidevannsforskjellen være over 3 meter og vi vil følgelig her finne de sterkeste tidevannsstrømmene. Vind kan føre til opp og -nedstrømninger av vannmasser langs kysten, som spesielt langs den sørlige del av kysten kan resultere i store korttidsendringer i strøm, temperatur, saltholdighet og tetthet. Sesong og langtidsvariasjoner i temperatur og saltholdighet er koblet til endringer i

meteorologiske forhold, ferskvannstilførsel og innstrømning av Atlanterhavsvann.

Fjordene importerer/eksporterer vannmasser fra/til kysten og tilføres ferskvann fra land. Vannutskiftningen mellom kyst og fjord bestemmes bla av tidevann,vind, tetthets (trykk)forskjeller mellom kyst og fjord og ferskvannstilførsel. Som nevnt foran eksportereres store mengder ferskvann via fjordene til kystområdene i løpet av året.

In the period from 1935 to 1947, dr. Jens Eggvin at the Institute of Marine Research, established fixed hydrographic stations in Norwegian coastal waters between Skagerrak and the Barents Sea (Fig.1 and Table1). The main purpose was monitoring of the ocean climate in relation to fisheries.

Later on the hydrographic information from the fixed stations also have been used by other institutions/firms working within the marine environment .

The two water masses dominating along the Norwegian coast is the Atlantic Water and the Norwegian Coastal Water. According to the general accepted definition, water of salinity above 35 is Atlantic Water and that of salinity below 35 Coastal Water. The Atlantic Water, entering the Norwegian Sea in the the Faeroe-Shetland area, has an average temperature of about 9 °C (Fig.2).

The Norwegian Coastal Water is mainly a mixture of Atlantic water and fresh water carried out from the Baltic (500 km³ per year) and run-off along the Norwegian coast (400km³ per year). The fresh water runoff to the Southern North Sea (190 km³ per year) also contribute to the Norwegian Coastal Water. The vertical distribution of the Norwegian Coastal Water vary between 50 and 150m depth, increasing northward.

The velocity in the Norwegian Coastal Current can reach considerable values. Off the southern and southwestern coast velocities exceeding 100 cm/sec are frequently observed. The residual current along the coast vary between 15 and 40 cm/sec. The volume transport in the Norwegian Coastal Current at the southwest coast is about 1 mill m³ per sec, increasing northward.

The variations of temperature, salinity and density can be divided in three parts , short - term, seasonal and long-term variations, driven by changes in meteorological conditions, fresh water supply, tides and Atlantic Water inflow.

The hydrographic conditions along the coast have a great influence on the water exchange and the hydrographic conditions in the intermediate and deep layer of fjords.

2. OBSERVASJONER

Lokaliseringen av de faste hydrografiske stasjonene er vist i Fig.1 og posisjoner, observasjonsperioder, antall stasjoner og største måledyp er angitt i Tabell 1 og 2.

Standard måledyp er : 0m, 5,10, 20, 30,50,75, 100, 125, 150, 200, 250 og 300 m

Temperaturene er målt med vendetermometre med nøyaktighet på ca 0.01°C.

Saltholdighet ble før 1965 analysert ved titrering. Etter 1965 er saltholdighetene målt med Salinometer. Nøyaktigheten i saltholdighetene for begge målemetodene er ca 0.01.

Tetthetsanomalien Sigma-t = Tetthet-1000 (kg/m³) er beregnet ut fra saltholdighet temperatur og trykk (dyp) .

Etter 1992 er flere av de faste stasjonene utstyrt med STD-sonder for måling av temperatur, saltholdighet og trykk(dyp). Temperatur og saltholdighet kalibreres henholdsvis med vendetermometer og vannprøver analysert for saltholdighet på Salinometer. Etter kalibrering er nøyaktigheten ca 0.01 både for saltholdighet og temperatur.

De faste hydrografiske stasjonene observeres nå vanligvis 1-2 ganger pr. måned, med unntak av Skrova-stasjonen som ofte observeres 3-4 ganger pr. måned.

Positions, names, observation-periods, total number of stations and maximum observation depths of the fixed hydrographic stations are given in Table 1 , 2 and Fig.1.

Standard observation depths are : 0m, 5, 10, 20, 30, 50, 75, 100, 125, 150, 200, 250 and 300m..

Temperature was observed by reversing thermometers and salinity by a laboratory Salinometer at the Institute of Marine Research. Before 1970 salinity was analyzed by titration. The accuracy for both temperature and salinity was about 0.01.

The density anomaly Sigma-t = density-1000 (kg/m³) is calculated by salinity,temperature and pressure.

The observation frequency usually vary between 1 and 4 times per month.

3. RESULTATER

De hydrografiske observasjonene er presentert som følger:

I - Månedsmidler og standardavvik for temperatur, saltholdighet og tetthet i et normal år (Tabeller og Figurer).

II- Årlige kvartalsmidler for temperatur og saltholdighet i dybdeintervallene: 0-30m, 50-150m og 200-300m. Middelverdier og standardavvik er lagt inn på figurene som henholdsvis heltrukken og stiplet linje (Figurer).

Kvartal hvor antall stasjoner var mindre enn 3, dvs mindre enn 1 stasjon pr måned, er merket med (▼).

1.kvartal: jan.-mars **2.kvartal:** apr.-juni **3.kvartal:** juli-sept **4.kvartal:** okt.-des.

The hydrographic observations are presented as follows:

I - Monthly mean and standard deviation of temperature, salinity and density in a normal year. (Tables and Figures)

II- Yearly quarterly mean temperature and salinity in the depth- intervals: 0-30m, 50-150m and 200-300m. Mean values and standard deviations are respectively shown by full and dotted lines (Figures).

Quarter where the number of stations was less then 3 (one per month) is marked with (▼).

1.quarter: Jan.-March **2.quarter:** Apr.-June **3.quarter:** Juli-Sept. **4.quarter:** Okt.-Des.
