Flower power Chemical ecology to feed a sustainable world bread and chickpea

Chantal Hamel, Semi-arid Prairie Agricultural Research Centre

Canada

Efficiency of production needed

- **7 Billion people to feed & rising**
- **Disappearing fossil fuel & phosphate**

Efficiency of production needed

- **7 Billion people to feed & rising**
- **Disappearing fossil fuel & phosphate**

**Canada is a leading wheat exporting country,
in the top 5 chickpea producing countries
Chickpea 3rd leguminous food crop**

Overall goal

A photograph of several ripe wheat ears with golden-yellow grains, set against a soft-focus background of more wheat and a warm orange glow.

**Ecology for
effective nutrient use by crops with
better plant-microbe associations**

Rhizobium

Fusarium

Pythium

Trichoderma

Mycorrhiza

Ascochyta

Penicillium

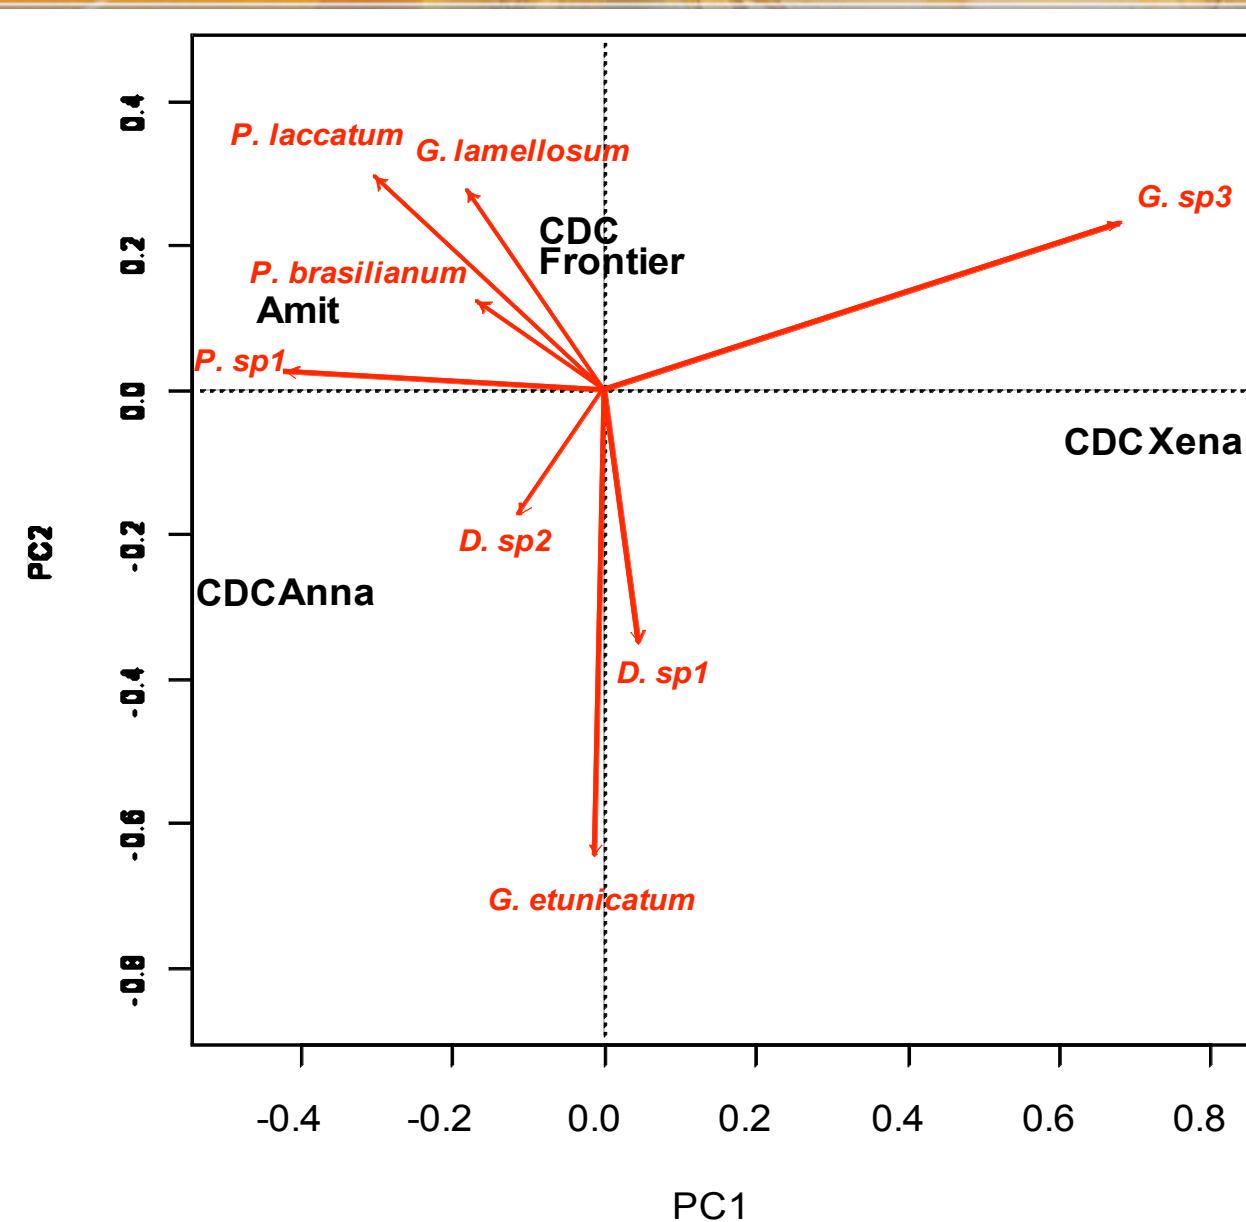

Azospirillum

Azospirillum

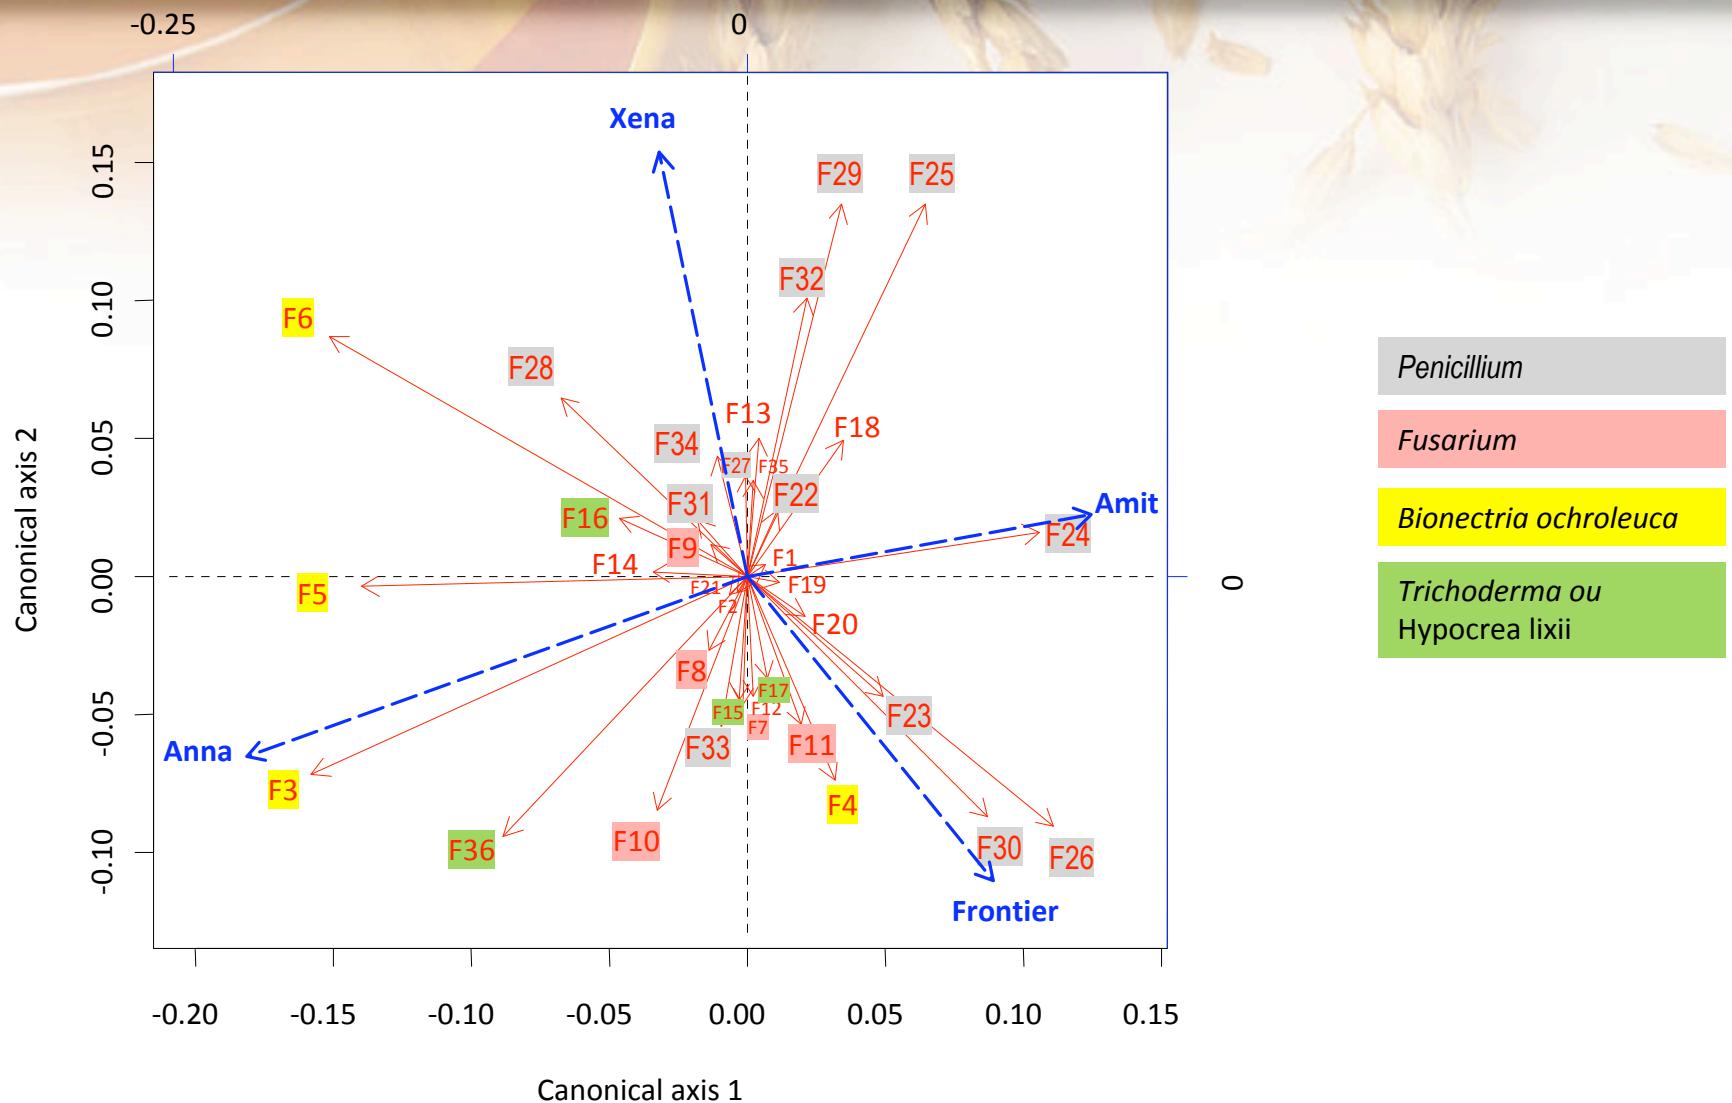

Plant friends and foes

Selective effect of chickpea cultivars on symbiotic soil fungi

Selective effect of chickpea cultivars on soil fungi

Crop plants have poor environmental adaptation

Adapted plants live in harmony. How?

Dynamic equilibrium through multiple interactions

Foes

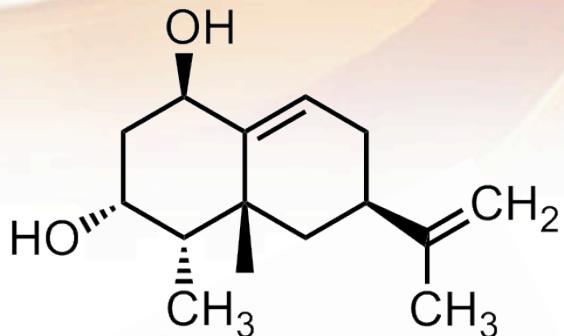

- Herbivory
- Pathology

Friends

- Growth promotion
- Nutrition
- Protection
- Pollination
- Dissemination

Plants use chemical signals and weapons

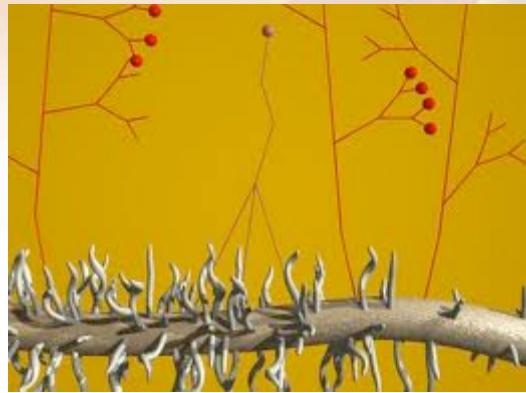

Phytochemicals can...

- Orient friends
- Control fungal pests
- Orient foes
- Alert relatives

To find phytochemicals that...

AM fungi

Fusarium

- Orient friends
- Control fungal pests

Chickpea – Wheat

Seeking phytochemicals orienting AM fungi

3 Kabuli Chickpea: 2 Desi Chickpea:

- Amit
- CDC Xena
- CDC Frontier

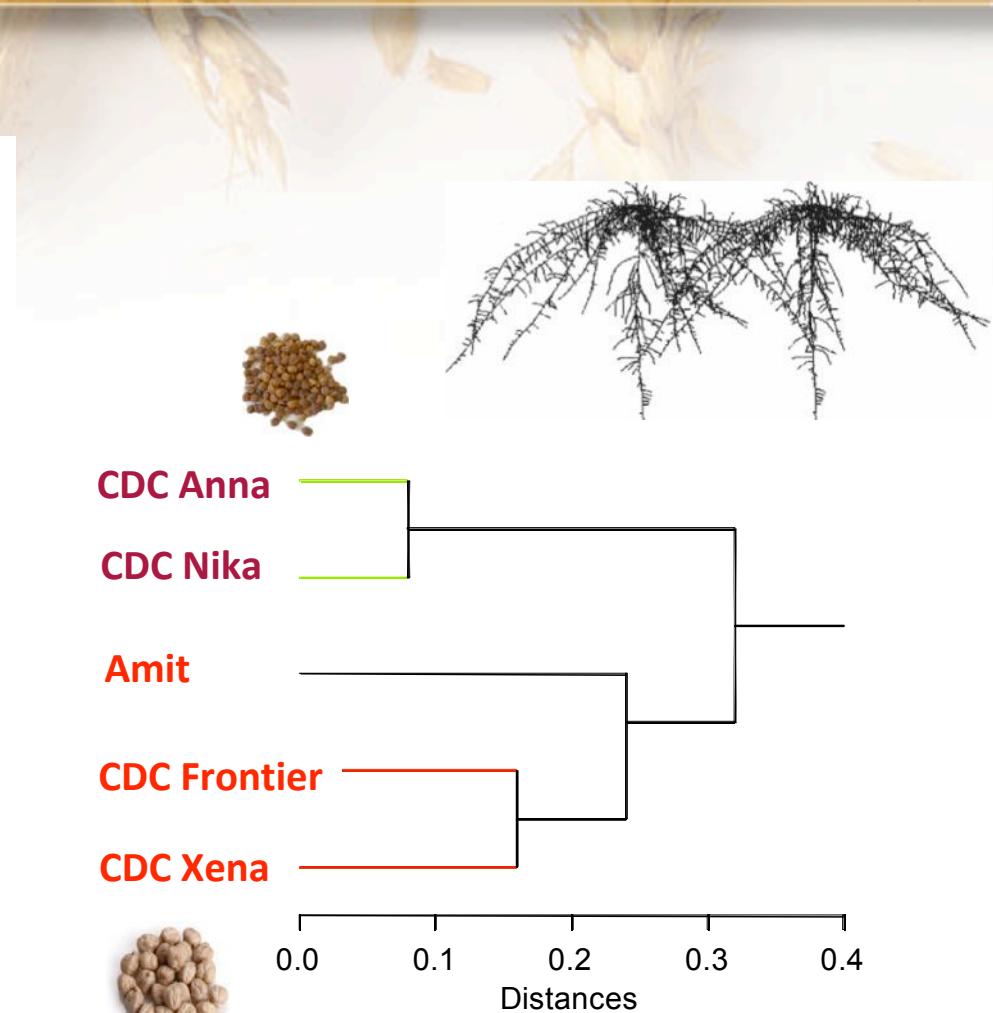

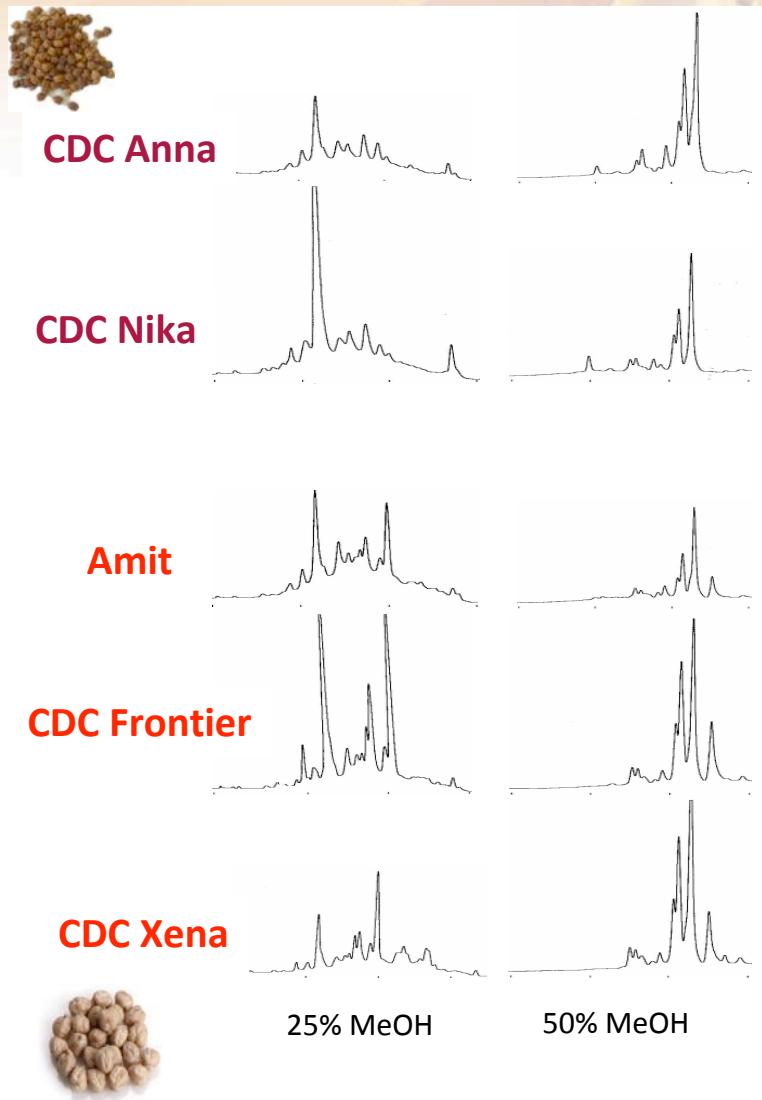

- CDC Anna
- CDC Nika

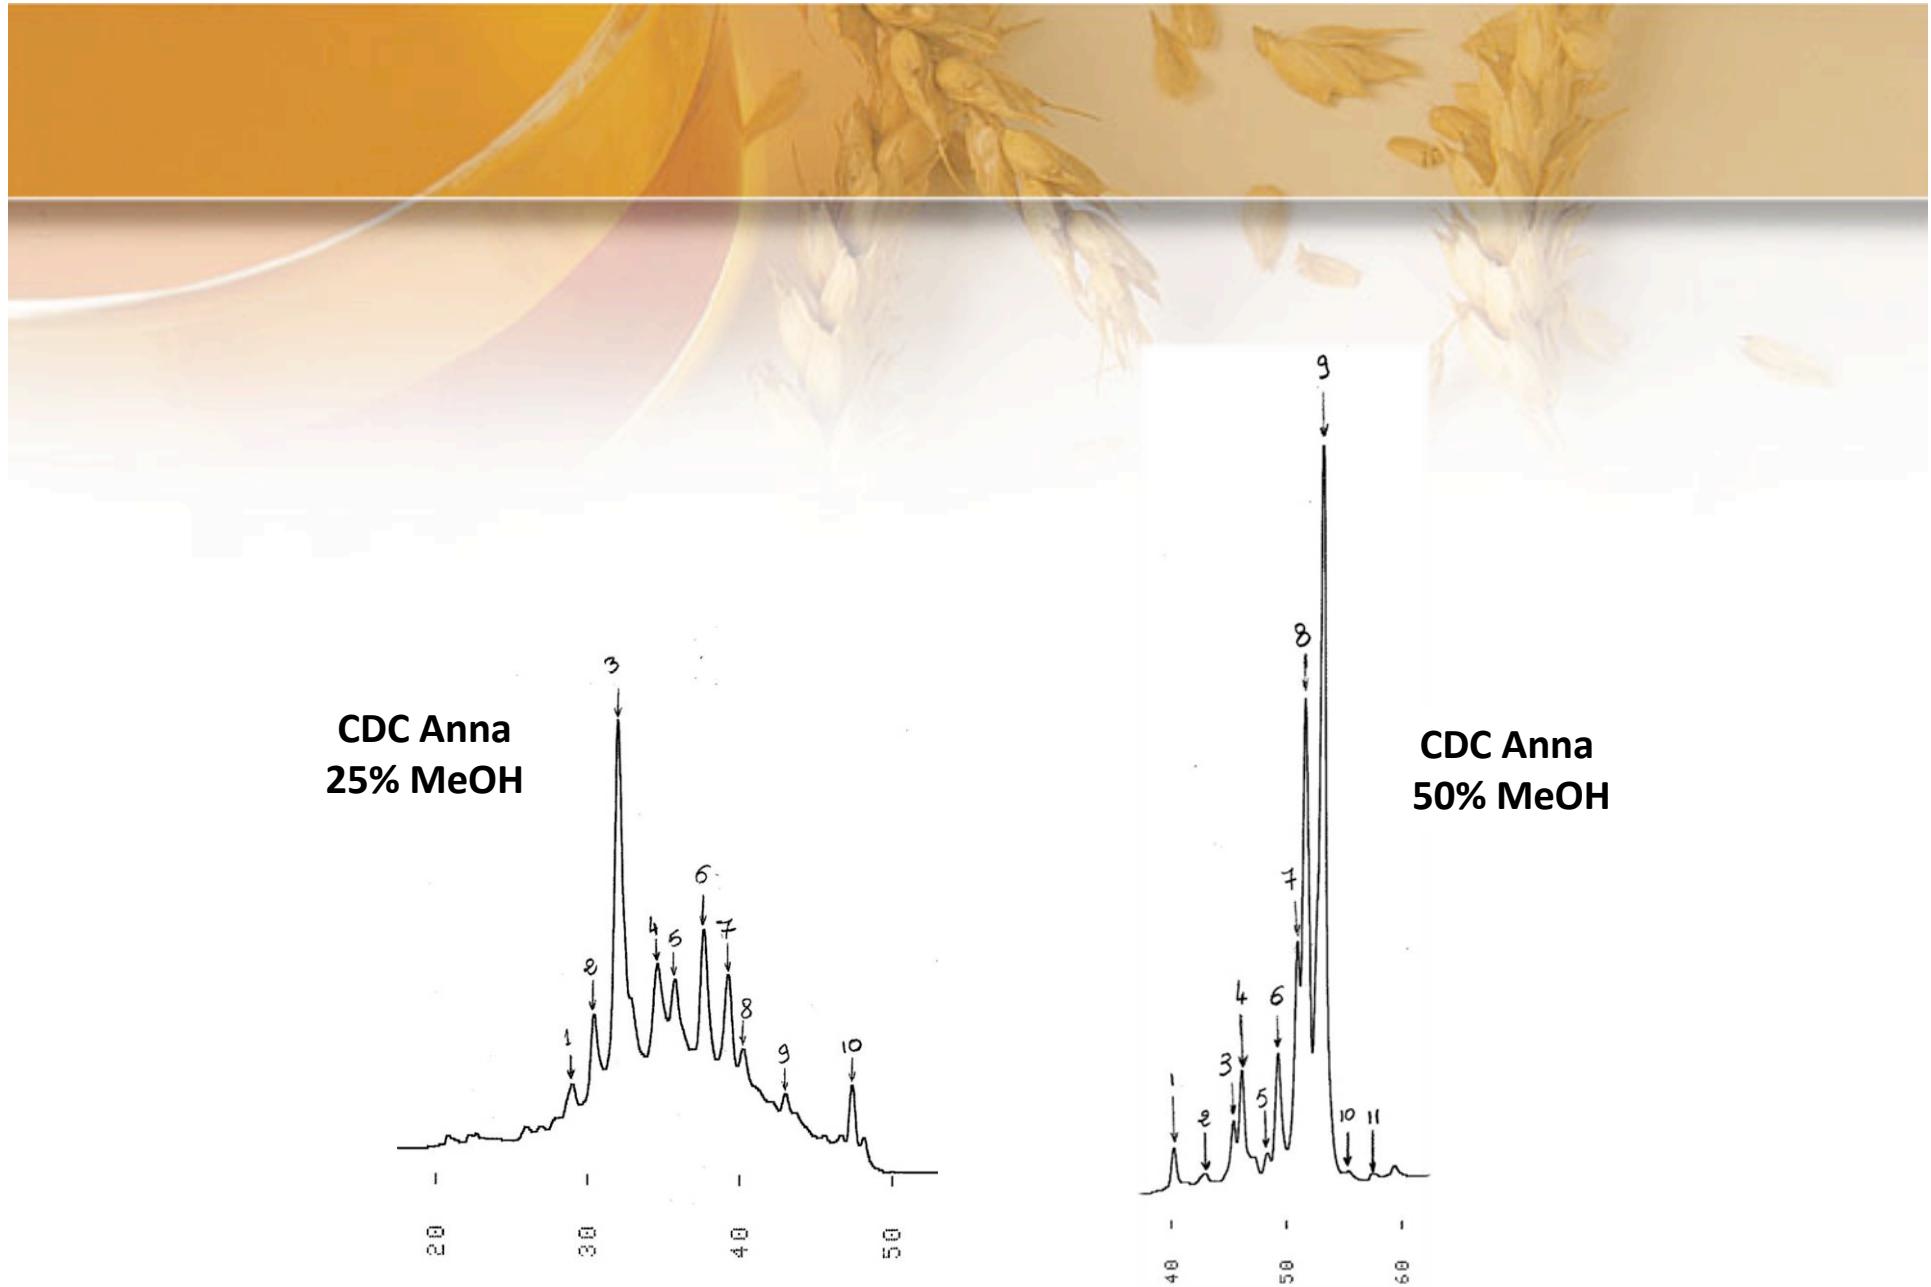

- Calcined clay
- 500 g roots per genotype, no replicates
- MeOH extract
- Flash chromatophy based solubility in MeOH
- HPLC separation
- Bioassay on AM fungi spores

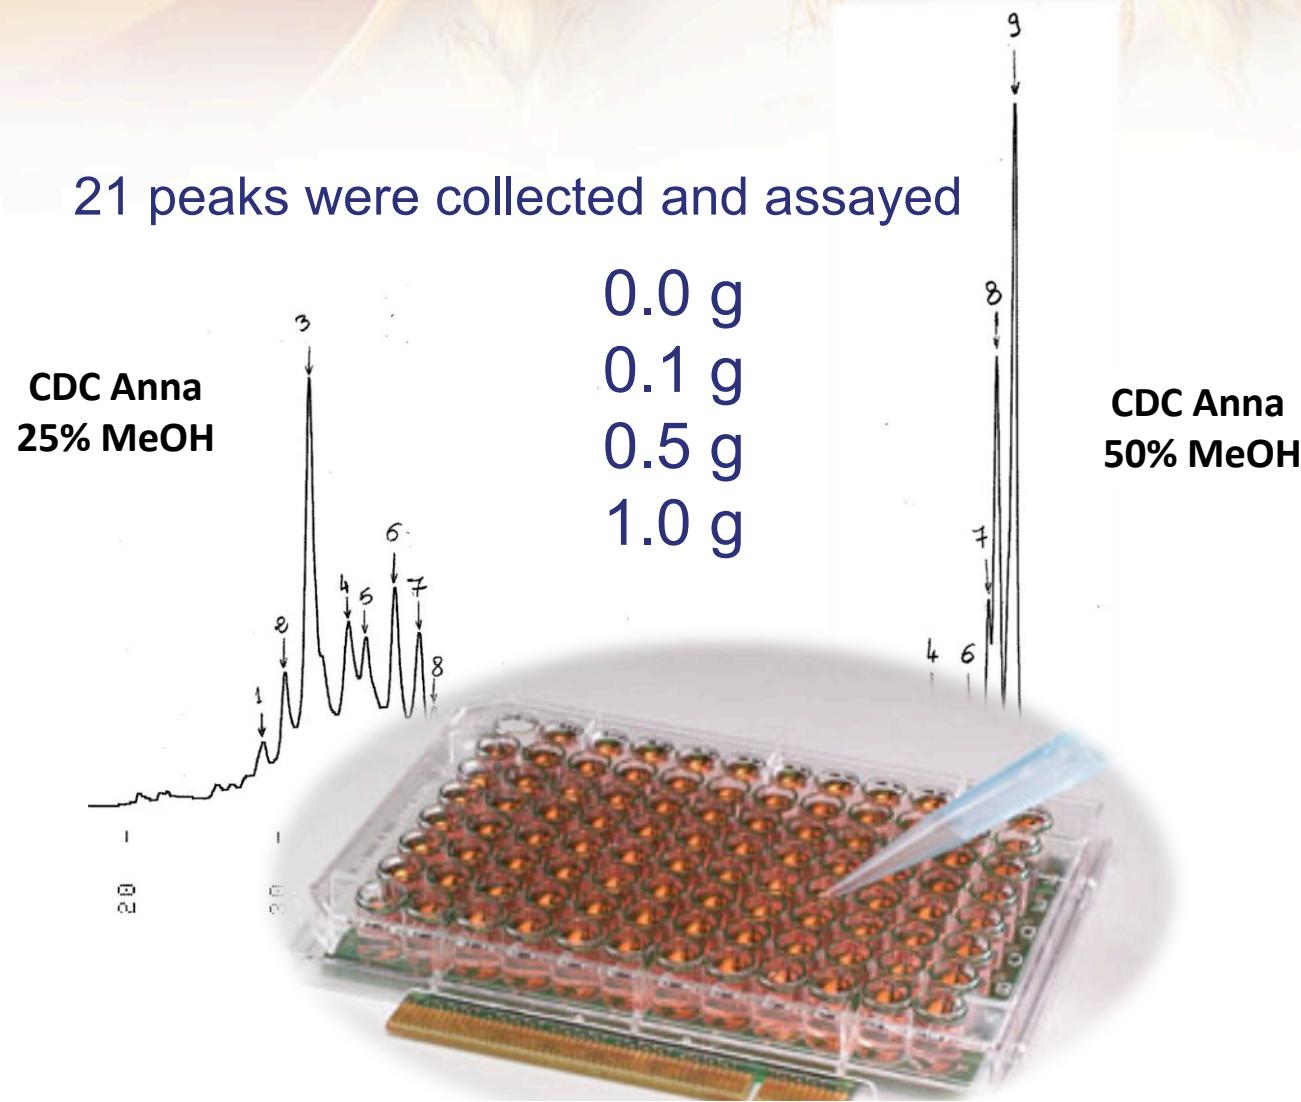

Variations in the composition of chickpea bioactive root extract fractions, as shown by HPLC profiles and UPGMC clustering

Assess the bioactivity of HPLC fractions on AM fungi

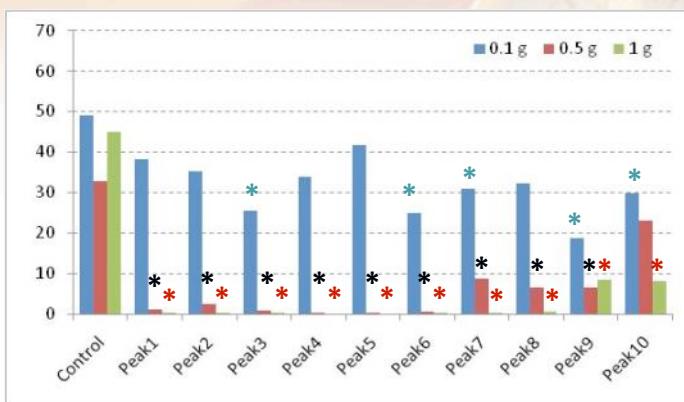

21 peaks were collected and assayed

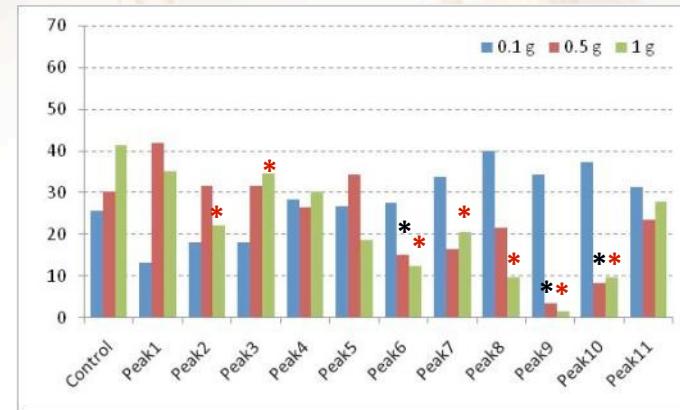

% inhibitory effect of HPLC fractions on AM fungi spore germination

(P < 0.007)

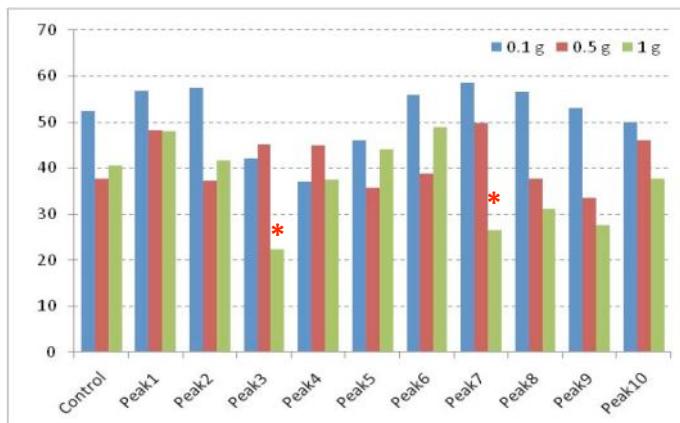

G. etunicatum 25% MeOH

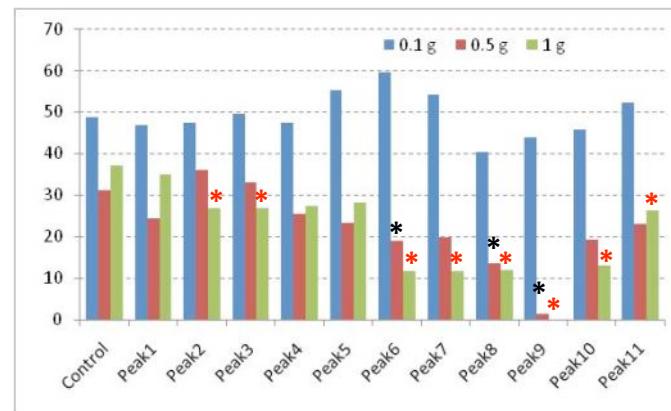

G. etunicatum 50% MeOH

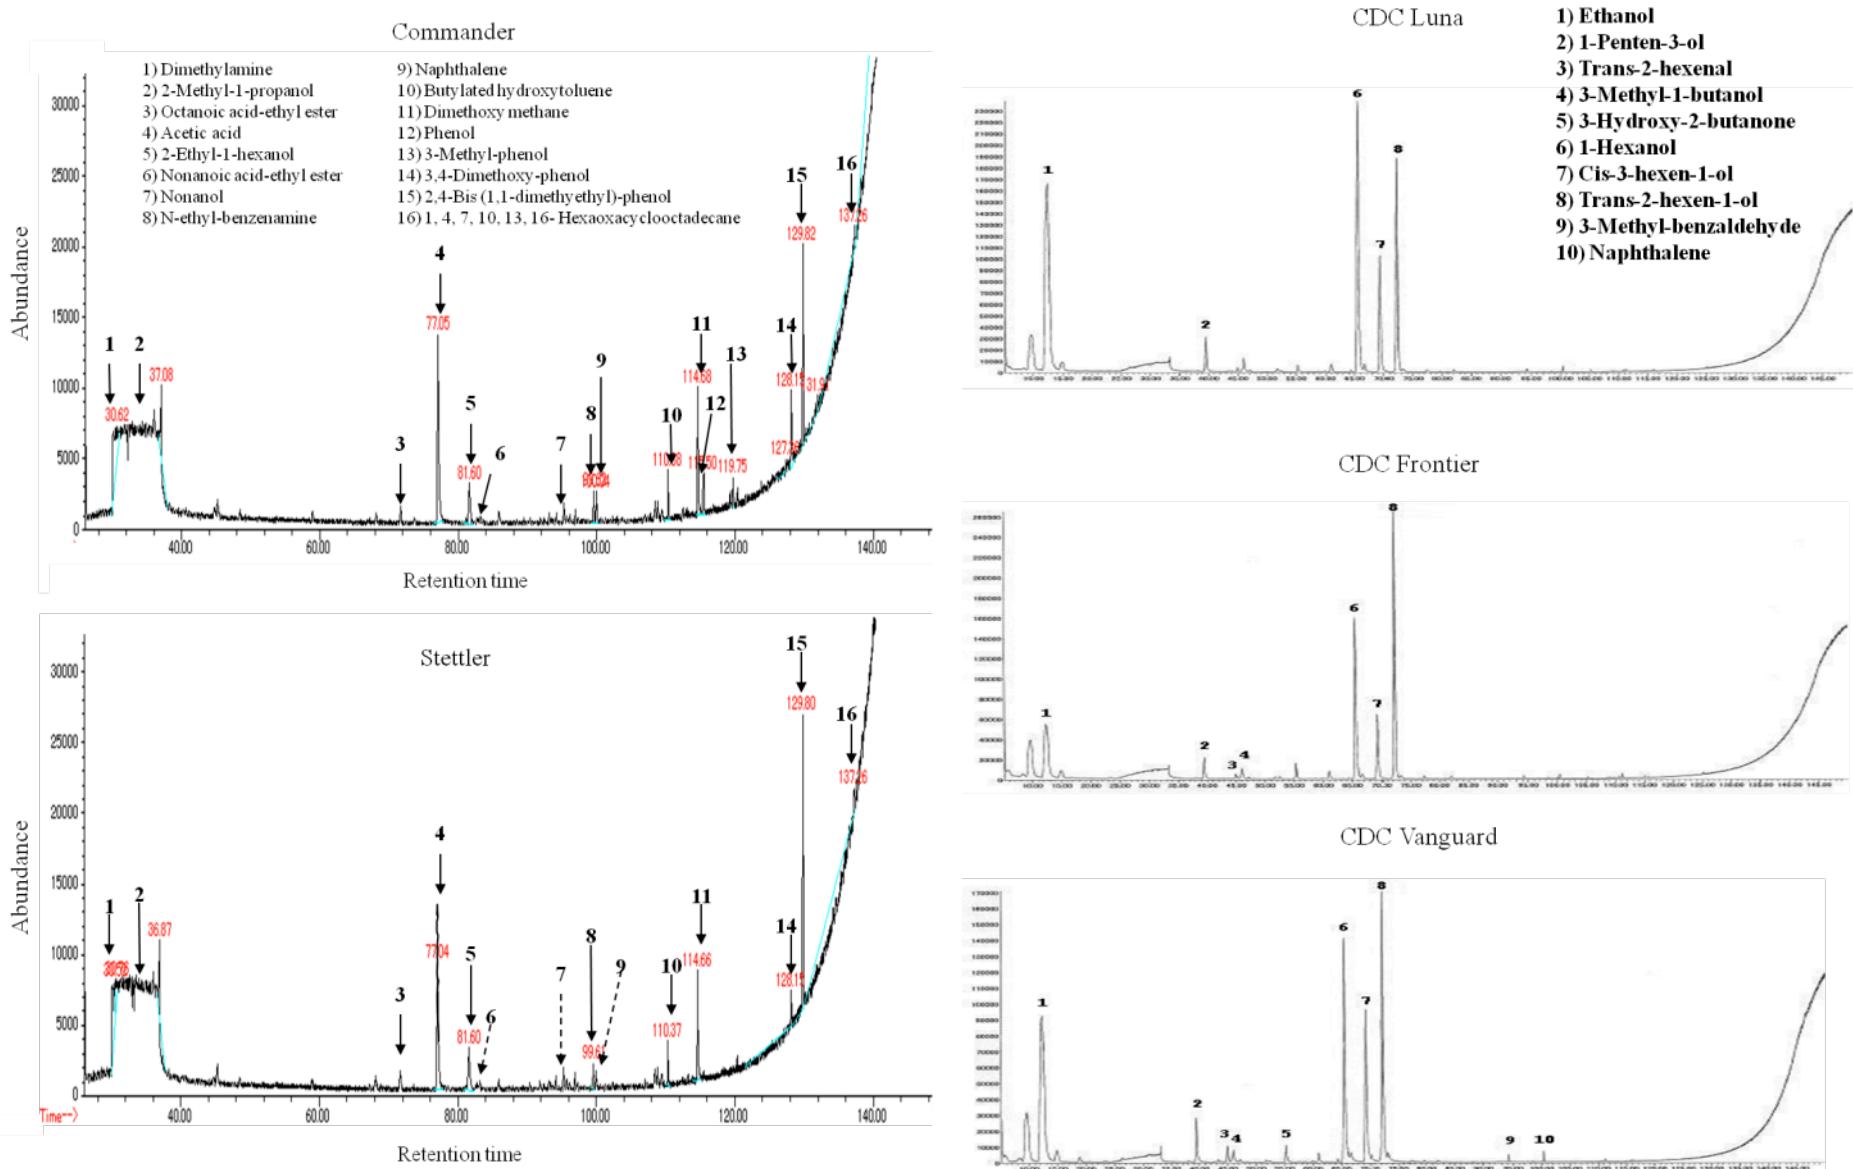

Gi. rosea 25% MeOH

Gi. rosea 50% MeOH

GC-MS analysis of wheat and chickpea volatiles phytochemicals

Seeking potency against *Fusarium*

Fusarium graminearum
Fusarium avenaceum

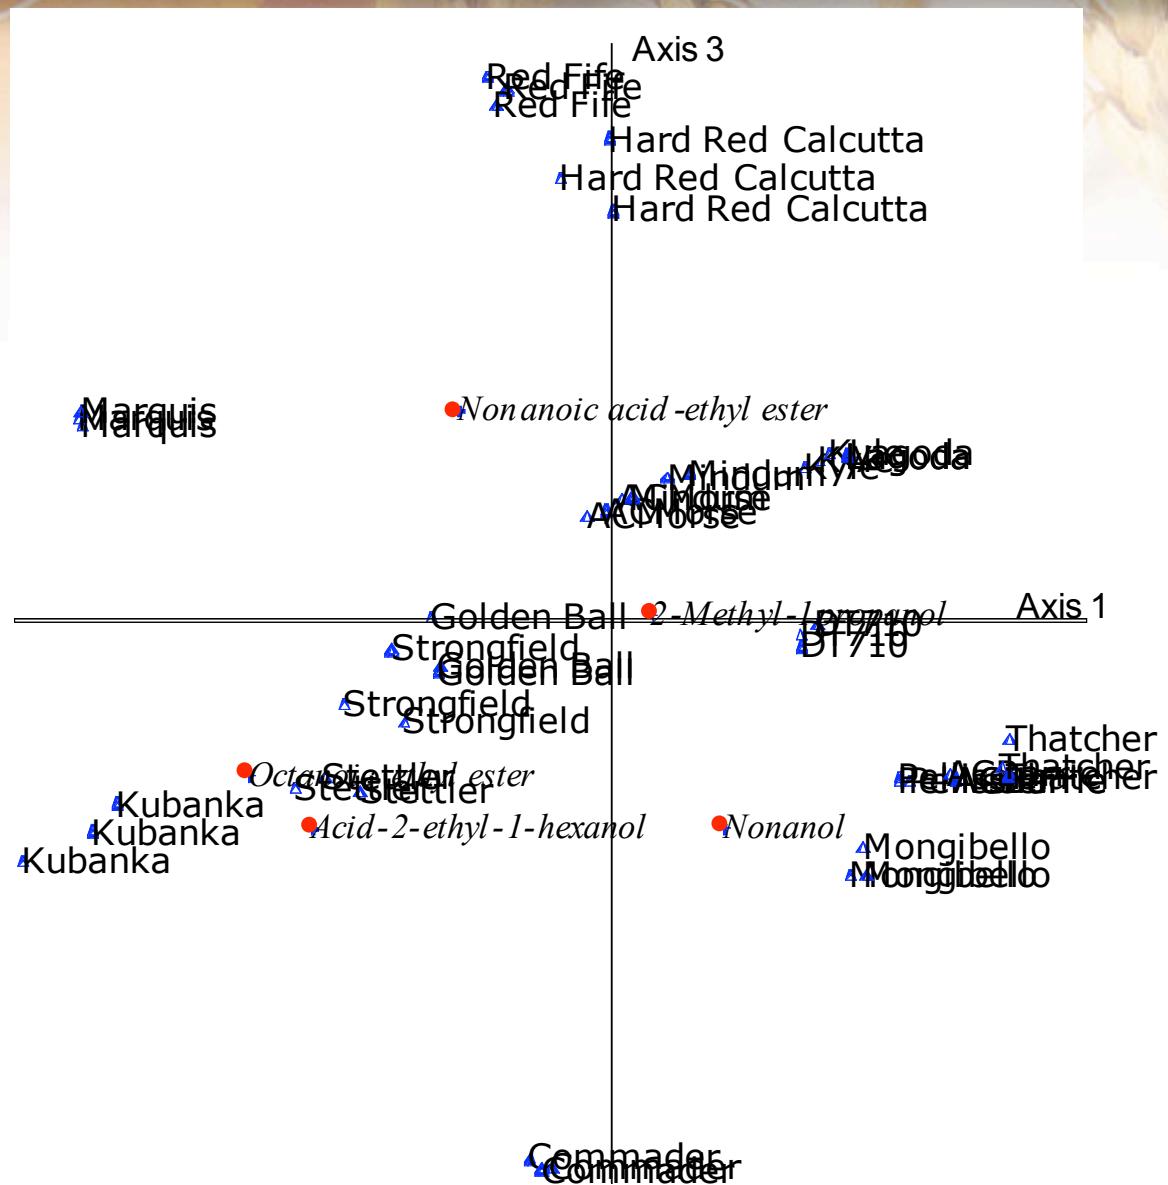

0, 2, 10, 50 µL

Fusarium inhibition by volatiles from chickpea and wheat

		Radial growth as % of control	
	Amount (μL)	<i>F. avenaceum</i>	<i>F. graminearum</i>
Cis-3-hexen-1-ol	2	99	87
	10	86	75
	50	0	0
1- Hexanol	2	92	93
	10	0	81
	50	0	0
Trans-2-hexenal	2	0	45
	10	0	0
	50	0	0
Trans-2-hexen-1-ol	2	0	88
	10	0	14
	50	0	0
2-ethyl-1-hexanol	2	24	16
	10	0	0
	50	0	0

Application: Have crops produce appropriate phytochemicals

In summary

- Efficiency of fertilizer use must increase
- Pathogens reduce / PGPM raise fertilizer use efficiency
- Seeking a ‘stick and carrot’ strategy to improve crop microbial environment we found:
 - i) phytochemicals inhibiting AM fungi germination
 - ii) phytochemicals inhibiting *Fusarium* growth
- Phytochemicals are tools to raise fertilizer use efficiency
