### INTRODUCTION

Mergers and acquisitions contracting begins with an information problem.<sup>1</sup> In order to value the assets for sale, buyers need to know details concerning operations, revenues and expenditures, customer and employee relationships, and a wide array of contingent liabilities. Inaccurate or incomplete information on any of these points could result in mispricing the assets. Sellers, who presently own and operate the assets, have access to this information. But much of it is costly to produce—buried within the organization, diffusely held by agents, or dependent upon expert intermediaries—and costly to verify. This information problem threatens to inhibit transactions or lead to severe discounts in price.<sup>2</sup>

The contractual solution to this problem centers on the representations and warranties. Although technically distinct—representations are statements of fact; warranties are promises that a stated fact is true<sup>3</sup>—the distinction collapses in practice

---

1. See Ronald J. Gilson, *Value Creation by Business Lawyers: Legal Skills and Asset Pricing*, 94 YALE L.J. 239, 267–93 (1984) (discussing contractual responses to “the failure of the costless information assumption”); accord Albert Choi & George Triantis, *Strategic Vagueness in Contract Design: The Case of Corporate Acquisitions*, 119 YALE L.J. 848, 856 (2010) (“The challenge of contract design is largely the management of information problems.”).

2. Choi & Triantis, *supra* note 1, at 860 (“Bearing in mind the risk of adverse selection with respect to this [information asymmetry], the buyer might decline to contract or demand a significant discount on the price.”).

3. The legal distinction is that representations, as mere statements, cannot give rise to liability without justifiable reliance, while warranties, as contracts, can. *CBS Inc. v. Ziff-Davis Publ. Co.*, 553 N.E.2d 997 (N.Y. 1990) (holding that a purchaser who had been informed of a misrepresentation prior to closing lacked reliance and therefore could not recover for the misrepresentation but could recover for the contractual warranty).

because the two are simultaneously offered and collectively referred to as “reps.”<sup>4</sup> The reps address the information problem at the heart of M&A contracting by allocating the burden of information production, refining the scope of information required, and enhancing the credibility of information provided.

Consider an example recently in the news.<sup>5</sup> In the wake of allegations of sexual misconduct involving such prominent executives as Harvey Weinstein, Les Moonves, and others, buyers have begun to ask sellers for a rep that “no allegations of sexual harassment have been made to the Company against any individual in his or her capacity as an employee of the Company.”<sup>6</sup> The seller might flatly refuse this request, leaving the risk of latent misconduct wholly on the buyer. But this reaction may cause the buyer to reduce the purchase price on account of the risk or even to abandon the transaction altogether. A more likely response, therefore, is for the seller to agree to the rep after qualifying its scope—narrowing it to the knowledge of specific individuals, a confined period of time, and the conduct of a limited set of employees.<sup>7</sup> These qualifiers limit the scope of the seller’s

---

4. The section of the contract containing the representations and warranties typically begins with a preamble stating that “the Company represents and warrants” with no distinction between the two. See John C. Coates IV, *M&A Contracts: Purposes, Types, Regulation, and Patterns of Practice*, in RESEARCH HANDBOOK ON MERGERS & ACQUISITIONS 29, 38–39 n.36 (Claire A. Hill & Steven Davidoff Solomon eds., 2016) (“M&A contracts do not typically distinguish between them, but include them together without identification.”); see also Glenn D. West, *Reps and Warranties Redux—A New English Case, an Old Debate Regarding a Distinction with or Without a Difference*, WEIL INSIGHTS: GLOBAL PRIV. EQUITY WATCH (Aug. 2, 2016), <https://privateequity.weil.com/insights/reps-warranties-redux-new-english-case-old-debate-regarding-distinction-without-difference/> [https://perma.cc/XCM5-JG6B]. For the sake of brevity, this Article will follow standard practice and refer to representations and warranties together as “reps.” Also, for the sake of brevity, it will refer to mergers and acquisitions as “M&A.”

5. Nabila Ahmed, *Wall Street Is Adding a New ‘Weinstein Clause’ Before Making Deals*, BLOOMBERG (Aug. 1, 2018), <https://www.bloomberg.com/news/articles/2018-08-01/-weinstein-clause-creeps-into-deals-as-wary-buyers-seek-cover>; Matt Levine, *#MeToo Is a Due Diligence Issue Now*, BLOOMBERG: OPINION (Aug. 2, 2018), <https://www.bloomberg.com/opinion/articles/2018-08-02/-metoo-is-a-due-diligence-issue-now> [https://perma.cc/R7GG-2XX4].

6. Agreement and Plan of Merger by and Among Forest City Realty Trust, Inc., Antlia Holdings LLC, and Antlia Merger Sub Inc., dated as of July 30, 2018, § 5.08(n) (on file with author).

7. This appears to be what happened to the rep quoted above. It ultimately appeared in the merger agreement as follows: “[t]o the Knowledge of the Company, in the last five (5) years, no allegations of sexual harassment have been

inquiry and, thereby, contain the cost of producing the information. Having agreed to offer the rep, the seller will review its HR records and, if any allegations do appear, provide the information to the buyer on a separate disclosure schedule.<sup>8</sup> Armed with this information, the buyer can more accurately assess the risk and, ultimately, price the deal.

In this way, transacting parties negotiate reps to compel disclosure. Reps do not appear in acquisition agreements because they are, strictly speaking, true. Nor do reps create liability risk merely to entitle one side to extra proceeds post-closing. Rather, reps impose liability risk on the party with better access to information in order to induce efficient disclosure.<sup>9</sup> The liability risk generated by the reps is the engine driving the exchange of information in the deal, motivating its production and ensuring its credibility, thus improving price accuracy.

The fact that transacting parties now commonly avoid liability for misinformation by shifting the risk to an insurer thus comes as an affront to the standard account of M&A contracting. Instead of allocating the cost of misinformation among themselves, transacting parties increasingly transfer it, more or less entirely, to a third-party insurer.<sup>10</sup> Representations and Warranty Insurance (RWI), an insurance product that covers losses from breached reps, is the vehicle for this outsourcing of risk. RWI may be used as a supplement or, increasingly, a substitute

---

made to the Company against any individual in his or her capacity as an employee of the Company . . . at a level of Senior Vice President or above." *Id.*; see also *infra* note 90 and accompanying text (discussing knowledge qualifiers generally).

8. See generally Matthew Jennejohn, *The Architecture of Contract Innovation*, 59 B.C. L. REV. 71, 85 (2018) (noting that disclosure schedules "are an expansion of the representations and warranties and may also be over one hundred pages").

9. Following canonical economic theory, the parties allocate this burden to the one that can produce the relevant information most efficiently—ordinarily, the seller. See, e.g., RICHARD A. POSNER, *ECONOMIC ANALYSIS OF LAW* 102 (4th ed. 1992) ("In general, if not in every particular case, the owner will have access at lower cost than the buyer to information about the characteristics of his property and can therefore avoid mistakes about these characteristics more cheaply than prospective buyers can."); Ronald H. Coase, *The Problem of Social Cost*, 3 J.L. & ECON. 1, 16 (1960) (noting that in a positive transaction cost environment, "the costs of reaching the same [efficient] result by altering and combining rights through the market may be so great that this optimal arrangement of rights, and the greater value of production which it would bring, may never be achieved").

10. See *infra* Part II.

for seller liability. It is already widespread in private acquisitions—estimates suggest that it was used in 30–50% of private deals in 2017.<sup>11</sup> Moreover, the use of RWI continues to grow. Coverage is now available from more than twenty insurers, with new entrants coming into the market each year, insuring deals from \$50 million to over \$1 billion in size.<sup>12</sup>

The substitution, in whole or in part, of third-party insurance for seller liability under the contract raises a host of challenging questions. How, for example, can it enhance efficiency to allocate risk to a third-party insurer that plainly has less access to relevant information than the seller? Instead, the transacting parties' superior access to information suggests adverse selection, which threatens the accuracy of risk-pooling and the stability coverage.<sup>13</sup> Likewise, how does the presence of insurance impact M&A contracting? RWI invokes the specter of moral hazard—the tendency of insured parties to reduce precautions—suggesting less careful reps, a less comprehensive diligence process, and greater risk embedded in the deal.<sup>14</sup> Similarly, if sellers are no longer liable for inaccurate or incomplete disclosures, how can buyers have the same degree of trust in the information they receive?

Fundamentally, insofar as the imposition of liability through reps is the key to resolving the information problem at the heart of M&A contracting, RWI would seem to inhibit efficient contracting by creating a credible commitment problem. The introduction of RWI thus suggests greater potential for misinformation in M&A, leading to increased mispricing risk, which

---

11. Deals are “public” or “private” depending upon whether the target company or assets in the acquisition is publicly traded or privately held. See *infra* Part I.A. On the widespread use of RWI in private acquisitions, see *infra* note 131 and accompanying text.

12. See, e.g., *M&A Trends: Representations and Warranties Insurance*, GOODWIN PROCTER, LLP (Mar. 22, 2018), <https://www.goodwinlaw.com/publications/2018/03/m-and-a-trends-representations> [<https://perma.cc/B9SF-7AKS>] (noting that “[t]he number of insurers jumped from a handful to over 20 today”). On the insurance and deal size, see *infra* Part II.A.

13. See Michael Rothschild & Joseph Stiglitz, *Equilibrium in Competitive Insurance Markets: An Essay on the Economics of Imperfect Information*, 90 Q.J. ECON. 629 (1976) (modeling adverse selection in insurance markets); see also *infra* Part II.B (discussing distortions introduced by the possibility of adverse selection in RWI).

14. Steven Shavell, *On Moral Hazard and Insurance*, 93 Q.J. ECON. 541, 541 (1979) (“Moral hazard refers here to the tendency of insurance protection to alter an individual’s motive to prevent loss.”); see also Tom Baker, *On the Generalization of Moral Hazard*, 75 TEX. L. REV. 237, 239 (1996).

might induce buyers to discount or abandon otherwise wealth-enhancing transactions. RWI, in other words, threatens to recreate the very problem that the reps were designed to solve.

But, if RWI creates these problems, why do transacting parties buy it? And why do insurers sell it? Conventional explanations for the purchase of insurance do not fit RWI. Insurance is a tool that allows risk-averse parties to minimize risk by spreading it.<sup>15</sup> But the parties to most M&A transactions are corporations or investment funds, neither of which is risk-averse and both of which have access to more or less the same risk-spreading technologies as insurance companies.<sup>16</sup> Considering that insurance companies charge a premium for taking on risk and that this premium necessarily exceeds the present value of losses insured, why would an otherwise risk-neutral corporation seek to transfer risk to an insurance company?<sup>17</sup> The purchase of RWI is even more puzzling once one sees the credible commitment and moral hazard problems introduced by the insurance. Yet transacting parties purchase RWI at steadily increasing rates, and insurers continue to sell the product in spite of these risks.<sup>18</sup>

Although these puzzles go directly to the heart of M&A contracting, RWI is entirely absent from the scholarly literature. This Paper aims to fill that gap, offering the first account of RWI and its role in M&A. It does so by focusing on three interrelated questions: First, how does RWI affect M&A contracting? Second, why do transacting parties use RWI? And third, given the risks of adverse selection and moral hazard embedded in these policies, why do insurers sell RWI?

Finding data to address these questions is a challenge. RWI policies are not publicly available. Transacting parties are generally under no obligation to disclose the purchase of RWI in SEC

---

15. See ROBERT COOTER & THOMAS ULEN, *LAW & ECONOMICS* 178 (6th ed. 2012) (“Insurance spreads risk among policy holders. In general, spreading risk more broadly reduces the amount that anyone must bear.”).

16. That is, the creation of reserves and diversification. See *infra* note 242 and accompanying text.

17. The insurance premium must incorporate not only the present value of expected losses but also the insurance company’s costs and profit margin. See KARL BORCH, *ECONOMICS OF INSURANCE* 13–15 (Knut K. Aase & Agnar Sandmo eds., 1990) (explaining that insurance premiums equal the sum of expected claims plus administrative expenses plus a reward to the insurer for bearing the risk).

18. See *infra* Part IV.

filings or to their investors.<sup>19</sup> Nor are RWI policies publicly filed with state insurance regulators.<sup>20</sup> The details of these policies—their limits, retentions, premiums, and claims activity—are not available in any publicly accessible database. The opacity of this market calls for alternative methods of collecting data. Accordingly, this Paper follows a two-pronged empirical methodology—one qualitative, one quantitative.<sup>21</sup>

First, the Paper employs qualitative methods to gather essential information on how RWI is used in practice and how industry professionals and transacting parties understand its role.<sup>22</sup> I began compiling this information by collecting the literature, attending industry conferences, and interviewing market participants, but the centerpiece of my qualitative empirical methodology was a survey of market participants—including insurers, brokers, lawyers, and private equity buyers. The survey consisted of approximately thirty-five questions, some of which were brief and factual (inquiring, for example, into typical limits,

---

19. Many transacting parties in private acquisitions are not SEC-registered companies and therefore are generally not required to make SEC filings at all. *See infra* Part I.A.

20. For more information on the regulatory structure of insurance, see Robert H. Jerry, II & Steven E. Roberts, *Regulating the Business of Insurance: Federalism in an Age of Difficult Risk*, 41 WAKE FOREST L. REV. 835 (2006) (describing and critiquing the state-based regulatory structure of insurance law).

21. Qualitative empirical methods can shed light into areas where quantitative data is absent. Such methods were pioneered in legal scholarship by Lisa Bernstein and Robert Ellickson, among others. *See* ROBERT C. ELICKSON, ORDER WITHOUT LAW: HOW NEIGHBORS SETTLE DISPUTES (1991) (using field interviews to demonstrate how California farmers settle conflicts through norms, rather than law); Lisa Bernstein, *Opting Out of the Legal System: Extralegal Contractual Relations in the Diamond Industry*, 21 J. LEGAL STUD. 115 (1992) (using interviews and participant observation to describe the extralegal ordering in the diamond industry); *see also* TOM BAKER & SEAN J. GRIFFITH, ENSURING CORPORATE MISCONDUCT (2010) (using interviews to study Directors' and Officers' (D&O) insurance); MITU GULATI & ROBERT E. SCOTT, THE THREE AND A HALF MINUTE TRANSACTION: BOILERPLATE AND THE LIMITS OF CONTRACT DESIGN (2013) (using interviews to understand the meaning of contract boilerplate).

22. *See generally* Omri Ben-Shahar & Lior Jacob Strahilevitz, *Interpreting Contracts via Surveys and Experiments*, 92 N.Y.U. L. REV. 1753 (2017) (advocating for solving disputes over interpretations of contracts by surveying consumers' interpretations of the relevant provision); John F. Coyle, *Interpreting Forum Selection Clauses*, 104 IOWA L. REV. 1791 (2019) (surveying lawyers to shed light on how they understand and use boilerplate forum selection terms); Tess Wilkinson-Ryan & David A. Hoffman, *The Common Sense of Contract Formation*, 67 STAN. L. REV. 1269 (2015) (surveying consumer attitudes toward contract formation).

premiums, and deductibles) while others were open-ended, seeking lengthy comments or opinions (asking, for example, why respondents have used RWI or how RWI has affected the transaction process).<sup>23</sup> In the summer of 2018, I distributed the survey through my own contacts and through the mailing list of a leading industry conference, and I encouraged those receiving the survey not only to complete it themselves but also to forward the link to colleagues or acquaintances that might have a perspective on the relevant issues.<sup>24</sup> Ultimately, the survey was completed by ninety-two respondents with experience in RWI.<sup>25</sup> Those completing the survey identified themselves in the following roles: three private equity managers,<sup>26</sup> sixteen lawyers advising on M&A transactions in which RWI had been involved (deal lawyers),<sup>27</sup> twenty-nine insurers providing RWI coverage,<sup>28</sup> thirty-two RWI brokers,<sup>29</sup> one accountant advising on RWI matters, and eight lawyers advising on RWI claims (claims lawyers).<sup>30</sup>

---

23. The exact number of questions a respondent received depended upon the respondent's role in the industry and their level of experience with RWI.

24. In other words, I followed "snowball" sampling techniques. See Leo A. Goodman, *Snowball Sampling*, 32 ANNALS MATHEMATICAL STAT. 148 (1961) (defining snowball sampling techniques); see also Tom Baker & Sean J. Griffith, *The Missing Monitor in Corporate Governance: The Directors' & Officers' Liability Insurer*, 95 GEO. L.J. 1795, 1798 n.12 (2007) (describing and applying snowball sampling techniques).

25. The survey was completed by 121 respondents, but the threshold question: "Have you ever encountered RWI in any professional capacity?" was answered in the affirmative by only ninety-two respondents. Respondents answering this question in the negative were dropped from the survey without being asked any further questions. Sean J. Griffith, RWI Survey, Results Collected June–Sept. 2018 (unpublished survey results) (on file with author) [hereinafter RWI Survey].

26. The private equity (PE) respondents characterized themselves as always or nearly always on the buy side of transactions involving RWI. *Id.* PE #1, 2 (describing that both had done ten or more M&A transactions over the last three years, and both said they had used RWI in four to six such transactions).

27. The deal lawyers (DL) in the sample reported spending an average of 64% of their time on M&A. *Id.* DL #1–15. Most reported being involved in more than ten transactions over the past three years (71%) and having used RWI in more than ten transactions over the past three years (57%). *Id.*

28. The insurer respondents (I) underwrite an average of 211 primary RWI policies annually (median 50). *Id.* I #1–30. They underwrite an average of 135 excess policies annually (median 40). *Id.*

29. The broker respondents (B) place an average of 186 RWI policies annually (median 75). *Id.* B #1–31.

30. As a group the claims lawyer respondents (CL) spent an average of 67%

This was not a random sample. The goal of this part of the research, however, was not to provide definitive answers but rather to shed light upon an otherwise opaque market by soliciting a broad range of perspectives and reporting shared understandings and, when they arose, areas of disagreement. In this, I was helped by the fact that RWI remains a narrow specialty field. Most of the participants know each other, either through business dealings or through the two main professional conferences on the subject. As a result, I soon found that the people I met were referring me to others I already knew. I spoke with as many of these people as I could, took extensive interview notes, and sent all of them the survey.<sup>31</sup> These efforts form the basis of my qualitative research.

In addition, I also followed a more traditional quantitative empirical methodology to study the impact of RWI on acquisition agreements. In this part of the research, I assembled a data set of over 500 acquisition agreements, approximately half of which had used RWI in the transaction and half of which had not.<sup>32</sup> I then hand-coded various provisions in the agreements in order to compare differences between contracts with and without RWI with the goal of learning how RWI affects M&A transactions.

Analysis of this data reveals a broad transfer of mispricing risk from buyers and sellers to insurers.<sup>33</sup> RWI allows sellers to minimize risk at exit and allows buyers to mitigate risk aversion in selecting investments. Yet RWI threatens to introduce frictions into the contracting process of which the breadth of coverage is both a cause and an effect. In turn, the insurer manages the risk of adverse selection and moral hazard by free riding on the buyer's incentive to price accurately and also through the threat of exclusions. The result is a delicate balance that may not weather shifts in either the deal market or the underwriting cycle.

From this Introduction, the Paper proceeds as follows. Part I provides an overview of M&A contracting, focusing on responses to the central information problem and distinguishing

---

of their practice on insurance coverage claims issues and devoted an average of 58% of their insurance practice on RWI. *Id.* CL #1–8.

31. Ultimately, the survey was supplemented by fourteen interviews with market participants.

32. Transactions involving RWI often contain a reference to RWI in the acquisition agreement. *See infra* Part III.

33. *See infra* Part V.

---

---

between public and private deals. Part II introduces RWI, describing typical coverages, claims, and patterns of use. In addition, Part II outlines distortions to the M&A contracting process that may be introduced by insurance. Part III addresses the first of this Paper's three central questions—how RWI affects M&A contracting—by analyzing how insured and uninsured transactions differ on key terms. Part IV uses survey data to address the second major question—why transacting parties purchase RWI—against the background literature on corporate insurance. Part V addresses the third question—how insurers are able to sell RWI in light of its risks—by focusing on insurers' strategies for managing adverse selection and containing moral hazard. The Paper then closes with a brief summary and conclusion.

### I. INFORMATION PROBLEMS IN M&A

The information problem at the heart of most buy-sell transactions is not that the parties have no incentive to share information. Because they recognize that uninformed buyers will assume the worst about the underlying asset and discount their bids accordingly, sellers have strong incentives to disclose.<sup>34</sup> Rather, the crux of the problem is that trustworthy information is expensive. Information relevant to valuation is often diffused through agents across the organization, making it costly to produce.<sup>35</sup> Moreover, experts may be needed to produce specialized information, adding additional costs. Accountants, for example, may be brought in to produce financial information, and lawyers

---

34. Sellers will disclose even unfavorable information in order to avoid worst-case scenario discounting. See, e.g., Sanford Grossman, *The Informational Role of Warranties and Private Disclosure About Product Quality*, 24 J.L. & ECON. 461, 470 (1981). Grossman illustrates with the example of an apple seller. Apples are sold in boxes, and the seller cannot lie (because fraud is illegal) but can offer as much or as little information as she likes about how many apples are in the box. If the seller says nothing, a rational buyer will conclude that there are no apples in the box. If she says that there are at least six apples in the box, the buyer will conclude that there are six and only six apples in the box. This logic leads the seller to say exactly how many apples are in each box because she will want to say at least that amount (to maximize her per apple revenue) and (because she cannot lie) no more. *Id.* at 465–66; see generally, FRANK H. EASTERBROOK & DANIEL R. FISCHER, *THE ECONOMIC STRUCTURE OF CORPORATE LAW* (1991) (applying this insight to securities law).

35. To produce this information, the seller's top managers will need to inquire of departmental managers who will need to inquire of line managers who will need to inquire of employees in the field and so on. Such inquiries create the additional risk of leaks, compromising the confidentiality of negotiations.

and other consultants may be brought in to assess contingent liabilities.

Verification increases information costs. Buyers will want to confirm that seller disclosures reflect actual fact. Their concern is not necessarily that they are being intentionally misled—legal rules place the risk of fraud firmly on sellers.<sup>36</sup> Rather, because incorrect or incomplete information is harmful regardless of the seller's intent, buyers will want to protect against unintentional errors and omissions as well. Buyers will therefore ask sellers to demonstrate not only what they know but also how they know it, thereby adding a layer of cost. Here again agency problems compound costs as does the need for independent experts to verify information produced by the seller.<sup>37</sup>

The reps respond to these information problems. In M&A contracting, however, the reps respond differently depending upon whether the acquisition target is public or privately held. This Part therefore begins by highlighting relevant differences in public and private deals. It then proceeds to an overview of how reps address information problems in M&A.

#### A. PUBLIC AND PRIVATE DEALS

There are significant differences in M&A contracting depending upon whether the target company is publicly traded or privately held. Two such differences are worth noting here. First, there is a lesser degree of information asymmetry in public deals as a result of the regular disclosure of information required of publicly traded companies. Second, private deals very often involve private equity funds on either the buy side or the sell side of the transaction, often both.

The key difference between publicly traded and privately held companies is the amount of publicly available business and

---

36. See, e.g., MODEL PENAL CODE § 224.7 (AM. LAW INST. 1962); RESTATEMENT (THIRD) OF TORTS: LIAB. FOR ECON. HARM § 9 (AM. LAW INST., Tentative Draft No. 2 2014); RESTATEMENT (SECOND) OF CONTRACTS § 162 (AM. LAW INST. 1981).

37. Because agents' interests are not always aligned with those of their principals, sell-side executives negotiating the transaction will need to verify information provided by their agents. For instance, it may serve an employee's interests—in receiving a bonus or avoiding termination—to inflate sales numbers. Anticipating this, managers will not trust everything their agents tell them but rather will seek to confirm much of what they are told. The verification costs outside the organization are thus replicated within the organization.

financial information as to each. SEC rules require public companies to file audited financial statements every year and to file unaudited financial statements every quarter.<sup>38</sup> Annual reports also contain extensive discussion of business results, operations, identification of subsidiaries and affiliates as well as disclosure of the revenues contributed by major products or departments, a description of property owned, and information on management.<sup>39</sup> In addition, public companies are under an obligation to periodically report on important changes to their business, such as the entrance into important contracts, merger and acquisition activity, the issuance of securities, changes in officers and directors, and amendment of bylaws.<sup>40</sup> Securities laws also require reporting companies to take steps to verify public disclosures, requiring that financial statements be audited by outside experts and certified by corporate officers.<sup>41</sup> Securities law also imposes significant liability risk on public companies and their agents from inaccurate or incomplete information.<sup>42</sup> This wealth of information is closely followed by investment analysts, and incorporated into the market price of public company shares.

By contrast, much less information is available about private companies. Although privately held companies may be very large in terms of assets, revenues, and even the number of shareholders, they are not required by securities laws to disclose the information required of public companies.<sup>43</sup> Because information

---

38. SEC rules also require public companies to implement record-keeping and internal control procedures to guarantee the accuracy of financial statements. Additionally, public company CEOs and CFOs must personally certify financial statements filed with the SEC. Sarbanes-Oxley Act, 15 U.S.C. § 7241(a)(5) (2018).

42. See Securities Act of 1933, 15 U.S.C. § 77k(a) (2018); Securities Exchange Act of 1934, 15 U.S.C. § 78t(b) (2018); 17 C.F.R. § 240.10b-5 (2018).

43. Uber, for example, had been valued at more than \$120 billion when it was still “privately held” by an assortment of accredited investors, private equity and venture capital funds, and corporate investors. Liz Hoffman et al., *Uber Proposals Value Company at \$120 Billion in a Possible IPO*, WALL ST. J. (Oct. 16, 2018), <https://www.wsj.com/articles/uber-proposals-value-company-at-120-billion-in-a-possible-ipo-1539690343> [<https://perma.cc/EB7G-8JHG>].

is costly, private companies typically produce far less of it than public companies and rarely, if ever, disclose it publicly.<sup>44</sup>

The vast differences in the amount and quality of information available directly affect deal dynamics in public versus private acquisitions. Public company due diligence is largely done through a review of information available in SEC filings. Similarly, because there is less need for public companies to call forth unknown sources of risk, the reps are less extensive than in private deals. Perhaps the greatest difference, however, is that in public company deals there is no indemnity, and the reps do not survive the closing.<sup>45</sup> Breaches of reps in public company deals thus only matter if they are discovered prior to the closing and are sufficiently large to enable the buyer at least to threaten not to close. Public company deals provide no remedy at all for breaches discovered after the closing.<sup>46</sup> The basic justification for this structure is the availability of information concerning the seller and thus the absence of the information asymmetry that is fundamental to private company deals.

A second distinction between public and private deals is the role played by private equity funds. Although private equity funds can be involved in public company deals—specifically, in take-private transactions—they are almost always involved in private deals. Private equity funds finance the private deal market.

Private equity funds buy and sell controlling stakes in businesses.<sup>47</sup> Private equity firms, such as Bain Capital or Blackstone, organize individual funds to raise capital from investors. Private equity investors are typically other investment funds, such as pension and hedge funds, corporations, or wealthy individuals.<sup>48</sup> Funds are organized as limited partnerships, with the investors serving as limited partners and the private equity

---

44. Disclosing information publicly destroys its value and therefore any incentive to produce it.

45. Coates, *supra* note 4, at 41.

46. This is true unless there is fraud. *See supra* notes 36, 42.

47. Elisabeth de Fontenay, *The Myth of the Ideal Investor*, 41 SEATTLE U. L. REV. 425, 442 (2018) (“[P]rivate equity funds hold controlling stakes in mature businesses, giving them clear incentives to exert effort to maximize corporate value.” (emphasis omitted)).

48. Investors in private equity must be either “accredited investors” or “qualified buyers.” Under the SEC’s “Accredited Investor” definition, an investor must have an annual income of at least \$200,000 and a net worth of at least \$1 million. Qualified buyers must either have \$1 million under management or meet a \$2 million net worth threshold. 17 C.F.R. § 230.501 (2019).

firm, or partners from that firm, serving as the general partner. The limited partners provide 98–99% of a fund's equity capital, with the remaining 1–2% provided by the general partner.<sup>49</sup> Nevertheless, the general partner has exclusive managerial control over the fund. Limited partners do not vote or exercise any meaningful control over the life of the fund. Investment returns are shared between limited and general partners at an 80% and 20% ratio, but only if gains exceed an 8% “hurdle rate,” below which all investment returns are paid to the limited partners.<sup>50</sup> Above the hurdle rate, limited partners receive 80%, and general partners receive 20% as their carried interest (or “carry”).<sup>51</sup> In addition, the general partner receives an annual 2% “management fee,” initially calculated as a percentage of committed capital but later as a percentage of invested capital.<sup>52</sup> The management fee is paid over the life of the fund, irrespective of performance.

Acquisitions financed by private equity are highly leveraged. Typically, funds contribute 30–40% of deal price as equity and finance the rest with debt.<sup>53</sup> Private equity funds have a short to intermediate time-horizon for their acquisitions.<sup>54</sup> Funds lock up investor capital during the life of the fund, typically ten years, after which they must return it to investors.<sup>55</sup> Returning investor capital, of course, means selling the portfolio companies acquired during the life of the fund.<sup>56</sup> Because not all acquisitions take place at the inception of the fund, this may

55. *Id.*

56. *Id.* at 443.

mean a significantly shorter time-horizon for some portfolio companies.<sup>57</sup> The industry average is less than six years.<sup>58</sup>

This structure of private equity shapes incentives in the market for private companies. Private equity funds have incentives to sell companies at or above the 8% hurdle rate.<sup>59</sup> Below the hurdle rate, private equity managers may prefer to keep funds invested so that they continue to earn their 2% management fee, rather than liquidating the losing investment and returning funds to investors.<sup>60</sup> Above the hurdle rate, funds will seek to maximize gains in the sale but, other things being equal, may prefer to sell quickly in order to avoid the limits on the fund's life.<sup>61</sup> Whether a portfolio company investment beats the 8% hurdle rate is thus central in determining the disposition of the asset.

## B. CONTRACTUAL SOLUTIONS

Acquisition agreements respond to information problems principally through the reps.<sup>62</sup> Reps address information problems in three ways.<sup>63</sup> First, they allocate the burden of producing information.<sup>64</sup> Second, they define the scope of information required.<sup>65</sup> And third, they create credibility mechanisms to mitigate verification costs.<sup>66</sup> This is no small task. The reps account

---

57. *Id.*

58. *Id.* (reporting an industry average portfolio company holding period of five and a half years).

59. *Id.*

60. KLAAS P. BAKS & LAWRENCE M. BENVENISTE, EMORY CTR. FOR ALT. INV., ALIGNMENT OF INTEREST IN THE PRIVATE EQUITY INDUSTRY 7 (2010).

61. de Fontenay, *supra* note 47, at 443.

62. Other provisions that respond to information problems include the indemnity and the termination provisions. But insofar as these provisions are triggered by breached reps, the reps may be seen as the key provision. *See infra* notes 112–19 and accompanying text.

63. This list is derived from Gilson's seminal account. *See* Gilson, *supra* note 1, at 271–87 (summarizing how representations and warranties: (1) facilitate the transfer of information to the buyer; (2) facilitate the production of previously nonexistent information; (3) place limits on “what information to look for and how hard to try”; and (4) address verification costs).

64. *See infra* Part I.B.1.

65. *See infra* Part I.B.2.

66. *See infra* Part I.B.3.

for more words and, by some estimates, more time and attention than any other part of the contract.<sup>67</sup>

### 1. Allocating the Burden of Production

Reps allocate the burden of information production by transferring the risk of inaccurate or incomplete information from one party to the other. At the outset of the transaction process, the buyer bears the burden of inaccurate or incomplete information insofar as any such misinformation may lead to a mispricing of the assets for sale.<sup>68</sup> The reps transfer this risk to the seller through statements that create adverse consequences to the seller—cancellation risk or liability risk—if they are false.<sup>69</sup> The threat of these consequences induces the seller to invest in producing trustworthy information.

Most of the information produced through the reps is not contained in the acquisition agreement itself, but rather is produced on a supplemental disclosure schedule that formally qualifies statements made in the reps.<sup>70</sup> Thus, in spite of a contractual rep stating, for example, that there is no pending or threatened litigation, the disclosure schedule may in fact list many such cases, all of which become formal exceptions to the

---

67. JAMES C. FREUND, ANATOMY OF A MERGER: STRATEGIES AND TECHNIQUES FOR NEGOTIATING CORPORATE ACQUISITIONS 229 (1975) (estimating that “lawyers spend more time negotiating ‘Representations and Warranties of the Seller’ than any other single article in the typical acquisition agreement”); Coates, *supra* note 4, at 40 tbl.2.1 (studying word counts in public merger agreements).

68. HOWARD T. SPILKO & SCOTT A. ABRAMOWITZ, WESTLAW PRACTICAL LAW 5-422-5017, KEY NEGOTIATING POINTS IN PRIVATE ACQUISITION AGREEMENTS COMPARISON CHART 1 (2020).

69. *Id.* Although the buyer also makes basic reps—for example, as to the validity of its organization and its authority to enter the transaction—the seller’s reps are typically far more extensive. *See, e.g.*, Coates, *supra* note 4, at 40 tbl.2.1 (demonstrating, from a data set of public company acquisitions, that the seller reps are much more extensive, in terms of word count, than buyer reps). However, when the deal consideration is stock of the buyer, the buyer may be asked to make reps as robust as the seller’s, so called “mirror reps,” because in accepting stock consideration, the seller essentially becomes the owner of the buyer’s business just as the buyer becomes the owner of the seller’s business. *See id.* at 41 (noting that reps regarding buyer financial statements in stock deals are common).

70. Coates, *supra* note 4, at 41. Often this occurs in the preamble to the reps, stating that “[e]xcept as set forth in the Disclosure Schedule, the Company represents and warrants to Buyer as follows . . . .” Stock Purchase Agreement, dated as of Jan. 30, 2018, by and among Lifetouch Inc. and Shutterfly, Inc., at 17 (on file with author) [hereinafter Lifetouch-Shutterfly Agreement].

statement made in the rep.<sup>71</sup> In this way, statements made in the reps are true only insofar as they are not contradicted by the disclosure schedules.<sup>72</sup>

The information sought through the reps divides roughly into two types. Basic information as to the seller's organizational status and legal capacity to carry out the transaction is provided through a set of "fundamental" reps.<sup>73</sup> More specific information concerning the assets for sale is sought through the "general" reps—for example, reps concerning the seller's financial statements, material contracts, and pending or threatened litigation.<sup>74</sup> Sellers may offer reps—such as the "full disclosure" rep<sup>75</sup> and the "no undisclosed liabilities" rep<sup>76</sup>—attesting to the comprehensiveness of their disclosures. But even without these reps, sellers have a strong incentive to disclose fully because any contradictory information omitted from the disclosure schedule fails to qualify the rep and, when subsequently discovered, puts the seller in breach.<sup>77</sup>

---

71. Why not just disclose this information in the agreement itself? One possible answer is brevity. The disclosure schedules may be much longer than the acquisition agreement itself. *See Jennejohn, supra* note 8, at 85. Incorporating this information into the agreement itself would make it unwieldy. A second answer is regulatory. The SEC requires the public disclosure of acquisition agreements under certain circumstances. It does not require the public disclosure of disclosure schedules. Parties may therefore use disclosure schedules to avoid publicly disclosing the potentially sensitive information that appears there. *See FRUEND, supra* note 67, at 235.

72. *See Coates, supra* note 4, at 50 (describing how, through the disclosure schedules, the reps trigger the release of "extensive information that the buyer can use in planning for integration as well as to firm up pricing").

73. These include representations as to the capitalization, organization, and due authority of the seller, as well as ownership of the relevant assets. *See id.* at 41 ("Fundamental' representations consist of those needed to insure the buyer obtains the basic legal package entitling it to control over the assets it expects . . .").

74. *See id.*

75. *Id.* at 41–42. The full disclosure rep expressly states that seller disclosures are complete and do not contain any material omission. The full disclosure rep may also be referred to as the "10b-5" rep because it frequently tracks the language of Rule 10b-5. Securities Exchange Act of 1934, 15 U.S.C. § 78t(b) (2018); 17 C.F.R. § 240.10b-5 (2018).

76. SPILKO & ABRAMOWITZ, *supra* note 68, at 1–2. Sellers also frequently provide a "no undisclosed liabilities" rep, certifying that no such liabilities have arisen, at least since the date of the last financial statements. *Id.*

77. *See Gilson, supra* note 1, at 282 (discussing how some sellers agree to indemnify the buyer if a breach of rep occurs).

A breached rep can create two remedies: cancellation of the transaction or damages. When discovered prior to closing, a breach may entitle the buyer to cancel the transaction if, as is often the case, the agreement makes accuracy of the reps a condition to close.<sup>78</sup> Breaches discovered prior to closing may also entitle the buyer to damages.<sup>79</sup> When a breach is discovered after closing, cancellation is no longer possible, but damages may be.<sup>80</sup>

Most contracting parties opt out of common law damages remedies in favor of an indemnification provision in the acquisition agreement.<sup>81</sup> In order to create a right to post-closing damages, the indemnification provision provides a “survival” period for the reps, often twelve to eighteen months, during which damages may be sought according to the terms of the indemnification provision.<sup>82</sup> These remedies are the foundation of the transfer of risk to the seller. By exposing the seller to the risk of cancellation

---

78. See SPILKO & ABRAMOWITZ, *supra* note 68, at 2–4 (discussing closing conditions). This condition works in conjunction with the “bring down” covenant to allow buyers to cancel transactions at no cost for breaches discovered at any time prior to closing. *Id.* The “bring down” covenant effectively makes the reps speak a second time, at the closing date, in addition to the signing date. *Id.* In such an agreement, breaches may occur if subsequently discovered information demonstrates the falsity of a rep at the time of either signing or closing. *Id.*

79. See *CBS Inc. v. Ziff-Davis Publ. Co.*, 553 N.E.2d 997, 1000–01 (N.Y. 1990) (allowing damages for breach of warranty prior to closing).

80. For example, misrepresentations, if material, may lead to either to rescission, restitution, or damages depending upon whether the seller’s intent was innocent, negligent, or fraudulent. RESTATEMENT (SECOND) OF CONTRACTS § 164 (AM. LAW INST. 1981); RESTATEMENT (SECOND) OF TORTS § 538 (AM. LAW INST. 1977). Breaches of warranty give rise to damages without regard to intent. See, e.g., *Nunn v. Chem. Waste Mgmt., Inc.*, 856 F.2d 1464, 1469 (10th Cir. 1988).

81. See, e.g., *Lifetouch-Shutterfly Agreement*, *supra* note 70 (“Each of Buyer and Seller acknowledge and agree that . . . with respect to any breach of any representation, warranty, covenant or agreement by the other party hereto . . . shall be pursuant to the provisions set forth in this Article IX . . .”). See *infra* notes 112–21 and accompanying text for further discussion of indemnification provisions.

82. See SPILKO & ABRAMOWITZ, *supra* note 68, at 7 (discussing survival provisions). Unlike the bring-down covenant, the survival provision does not have the effect of making the representations and warranties speak again. *Id.* Contradictory information still must invalidate a representation or warranty *when made*—either at signing or, in connection with the bring-down, at closing. *Id.* The survival provision merely extends the period when evidence of a pre-existing contradiction can be discovered and remedied. *Id.*

and damages, the reps give the seller a strong incentive to produce all relevant information.<sup>83</sup>

## 2. Defining the Scope of Production

Although they may accept the burden of information production, sellers are likely unwilling to shoulder it at any and all cost.<sup>84</sup> A second key function of the reps is thus to define the scope of information required in order to contain information costs.<sup>85</sup> Although these savings redound directly to the seller, avoiding wasteful information costs is an objective shared by both parties since any such costs reduce the joint gains available for division between them.<sup>86</sup> Acquisition agreements therefore contain qualifiers that limit the scope of the reps.<sup>87</sup> These qualifiers narrow the risk of breach and thereby decrease the seller's burden of inquiry.<sup>88</sup>

Qualifiers that speak to knowledge and materiality are among the most common.<sup>89</sup> Knowledge qualifiers narrow the

---

83. *See id.* at 1 (discussing risk allocation between buyers and sellers and how indemnification clauses support the allocation of risk).

84. Gilson, *supra* note 1, at 271. A “flat” or unqualified rep may be breached by any contradictory information, regardless of its origin or its significance. *Id.* at 282. A breach could be caused by literally anything known by anyone, but having to disclose what every last person in the firm knows about every little thing may impose greater search costs than the seller can bear and may result in more information than the buyer needs.

85. *Id.* at 277.

86. *Id.* at 270.

87. *See, e.g.*, Lifetouch-Shutterfly Agreement, *supra* note 70, § 6.2.

88. Gilson, *supra* note 1, at 270.

89. There are others. Reps may be given specific date limitations or dollar thresholds. Moreover, qualifiers may be unique to particular reps. For example, the No Undisclosed Liability rep may be qualified by reference to Generally Accepted Accounting Principles (GAAP). GAAP requires reporting of a balance sheet liability for loss contingencies only if the impact can be reasonably estimated and it is probable that a loss has occurred. Otherwise a note to the financial statements is required disclosing a contingent liability if it is at least reasonably possible that a loss has occurred. CODIFICATION OF ACCOUNTING STANDARDS AND PROCEDURES, Statement on Auditing Standards No. 5, § 8 (Am. Inst. of Certified Pub. Accountants 1975). Therefore, qualifying a no undisclosed liability rep by GAAP effectively means that loss contingencies whose probability of occurrence are remote are excluded from the rep and thus need not be disclosed. *See, e.g.*, Agreement and Plan of Merger by and among Darden Restaurants, Inc. and Cheddar's Restaurant Holding Corp., dated March 27, 2017, § 2.6(b) [hereinafter Darden-Cheddar Agreement] (“The Company does not have any material liability that would be required to be set forth or reserved against in financial statements prepared in accordance with GAAP . . .”).

seller's inquiry to a subset of agents within the organization.<sup>90</sup> Similarly, materiality qualifiers narrow the seller's inquiry to a threshold level of significance.<sup>91</sup> Materiality can be defined relative to the target's business as a whole, as when the defined-term Material Adverse Effect (MAE) is invoked to qualify a rep,<sup>92</sup> or relative only to the subject matter of a particular rep.<sup>93</sup> Qualifying reps relative to the business as a whole creates less scope for breach. Accordingly, reps are more often MAE-qualified in public than in private deals, reflecting the decreased risk of misinformation associated with public companies.<sup>94</sup>

In private deals, meanwhile, it is not unusual for the indemnity provision to contain a "materiality scrape" eliminating materiality for purposes of the indemnity.<sup>95</sup> Materiality scrapes can

---

90. SPILKO & ABRAMOWITZ, *supra* note 68, at 6. Knowledge qualifiers name *who* within an organization must be in possession of the relevant information and define those individuals' knowledge as actual or constructive. *Id.* Constructive knowledge imputes some amount of inquiry to the named individuals, often "due inquiry of their direct reports," attributing to them what they would have known if they had so inquired, regardless of whether they in fact did. Specific reps will then be qualified by incorporation of this general definition, thereby serving to limit the amount of inquiry necessary under the rep. *See, e.g.*, Darden-Cheddar Agreement, *supra* note 89, § 1.15 (defining knowledge).

91. Gilson, *supra* note 1, at 277. Materiality qualifiers define *what* information is relevant to a particular rep. *Id.*

92. *See, e.g.*, Darden-Cheddar Agreement, *supra* note 89, § 2.1 ("The Company is duly qualified to transact business and is in good standing in each jurisdiction in which its ownership of property or assets or the conduct of its business as currently conducted requires it to qualify, except where the failure to so qualify would not, either individually or in the aggregate, reasonably be expected to have a Material Adverse Effect."). The definition of Material Adverse Effect is heavily negotiated because, in addition to qualifying reps, it is also made a condition to close, potentially triggering a walk away right for the buyer. *See generally* Adam B. Badawi & Elisabeth de Fontenay, *Is There a First-Drafter Advantage in M&A* 36–37 (Duke Law Sch. Pub. Law & Legal Theory Series, No. 2019-21, 2019), [https://papers.ssrn.com/sol3/papers.cfm?abstract\\_id=3317622](https://papers.ssrn.com/sol3/papers.cfm?abstract_id=3317622) (describing the importance of the MAE as a condition to close).

93. For example, a tax rep might state that a company has filed all material returns and that its returns are accurate in all material respects. *See, e.g.*, Darden-Cheddar Agreement, *supra* note 89, § 2.8(a) ("The Company . . . has timely filed . . . all material Tax Returns . . . and all such Tax Returns are true, complete and correct in all material respects."). Under this formulation, in order to constitute breach, tax inaccuracies need not harm business operations as a whole. Rather, they need only be inaccurate in some meaningful way on a particular return.

94. *See supra* notes 38–46 and accompanying text.

95. *See, e.g.*, Darden-Cheddar Agreement, *supra* note 89, § 5.2(a) (providing indemnification for losses from breached reps, "disregarding any qualifications

be partial or full.<sup>96</sup> A partial scrape eliminates materiality in calculating loss, not in determining whether a breach has occurred.<sup>97</sup> A full scrape, by contrast, eliminates materiality for both purposes.<sup>98</sup> As a result, in agreements with a full scrape, any inaccuracy, large or small, will be counted as a breach, materiality notwithstanding.<sup>99</sup> Materiality scrapes are not used in public deals because public deals generally lack an indemnity provision.<sup>100</sup>

Agreements with a full scrape beg a question: Why include the word “materiality” at all? The answer lies in the attempt to separate disclosure standards from liability standards. Scraping materiality as a liability standard leaves it in place as a principle of disclosure. Insofar as sellers disclose to the reps, they need disclose only material matters.<sup>101</sup> Thus, while omission of the materiality concept would maximize both the seller’s liability and its disclosure burden, a full scrape maintains maximum liability but limits the burden of disclosure. Why a seller might want to assume this liability burden and whether it is ever really possible to separate disclosure from liability are questions explored below. Suffice it to say, for now, that the answer to both

---

as to Material Adverse Effect, materiality or phrases of like import contained in such representations and warranties . . .”).

96. JOHN J. McDONALD & MATTHEW J. AARONSON, WESTLAW PRACTICAL LAW W-001-3444, THE INDEMNIFICATION CLAIM PROCESS IN M&A TRANSACTIONS 5 (2018).

97. *Id.* The original, partial, form of the materiality scrape seems to have entered acquisition agreements in order to solve the so-called “double materiality” problem in which sellers benefited from arguing not only that an inaccuracy had to be material to constitute breach but that losses from the breach had to be material in order to count towards damages. *See id.*; *see also* Tyler B. Dempsey, *Seller Beware: Potential Pitfalls and Unintended Consequences of the ‘Materiality Scrape,’* A.B.A. SEC. BUS. L.: PRAC. RES. FOR BUS. LAWYERS, June 2008, at 2, [https://www.goodwinlaw.com/-/media/files/publications/attorney-articles/2008/scraping\\_by.pdf](https://www.goodwinlaw.com/-/media/files/publications/attorney-articles/2008/scraping_by.pdf) [<https://perma.cc/W4VG-NWWJ>]. In response, buyers answered that sellers already had protection—in the form of baskets and mini-baskets, discussed *infra* note 115 and accompanying text, against insignificant losses being claimed against the indemnity. As a result, they argued that materiality should be scraped from the reps for purpose of determining loss. *See generally id.*; John LeClaire et al., *Scraping By*, MERGERS & ACQUISITIONS: DEALMAKER’S J., July 2008.

98. McDONALD & AARONSON, *supra* note 96, at 5.

99. *See* LeClaire et al., *supra* note 97, at 3 (stating that all losses arising from a breach are recoverable even if they are not material).

100. *See supra* note 45 and accompanying text.

101. McDONALD & AARONSON, *supra* note 96, at 5.

questions may be related to the transfer of liability risk under an RWI policy.<sup>102</sup>

### 3. Enhancing Credibility

Buyers may hesitate to lift their discounts until they have confirmed the accuracy of information provided by sellers. M&A contracting provides two basic verification mechanisms: due diligence and indemnification.<sup>103</sup> These operate as complements, not substitutes. Together they enhance the credibility of seller disclosures, thereby enabling the buyers to increase their bids.

In due diligence, the seller provides access to documents and perhaps also to key facilities and personnel.<sup>104</sup> The process is arduous and costly, consuming the time of employees and top level executives inside the company as well as lawyers, accountants, and other outside experts.<sup>105</sup> Parties may therefore seek to use the imposition of legal liability, through the indemnification provision, to limit the scope of diligence.<sup>106</sup> More indemnification may imply less need for due diligence.

---

102. For further discussion of this point, see *infra* note 224 and accompanying text.

103. See MCDONALD & AARONSON, *supra* note 96, at 8 (discussing indemnification and due diligence).

104. *Id.* Documents are typically deposited into a virtual or physical “data room,” containing, for example, sales data and other financial information, along with copies of material contracts and summaries of important litigation. *Id.*

105. See Jeffrey Manns & Robert Anderson IV, *The Merger Agreement Myth*, 98 CORNELL L. REV. 1143, 1184 (2013) (“Diligence is expensive and may not be the best way to uncover information already in the possession of the target.”).

106. In the words of then-Vice Chancellor Strine:

Due diligence is expensive, and parties to contracts in the mergers and acquisitions arena often negotiate for contractual representations that minimize a buyer’s need to verify every minute aspect of a seller’s business . . . . By obtaining the representations it did, [the buyer] placed the risk that [the company’s] financial statements were false and that [the company] was operating in an illegal manner on [the seller]. Its need then, as a practical business matter, to independently verify those things was lessened because it had the assurance of legal recourse against [the seller] in the event the representations turned out to be false.

Cobalt Operating, LLC v. James Crystal Enters., LLC, No. Civ. A. 714-VCS, 2007 WL 2142926, at \*28 (Del. Ch. July 20, 2007) (holding that plaintiff’s failure to uncover fraud during due diligence was not unreasonable and plaintiff satisfied its burden as a fraud plaintiff to show justifiable reliance).

The converse, however, is not true. More due diligence does not imply less need for indemnification.<sup>107</sup> Legal liability is the engine driving the diligence process.<sup>108</sup> Due diligence, like the disclosures it seeks to verify, depends upon information provided by the seller.<sup>109</sup> Without the threat of legal liability in the background, confirmatory evidence offered in connection with the diligence process would be as dubious as the information it supposedly confirms.<sup>110</sup> Legal liability breaks this cycle of doubt and, in doing so, forms the ultimate basis of the seller's credibility.<sup>111</sup>

Indemnification provisions in M&A contracts essentially operate as a form of insurance.<sup>112</sup> The seller undertakes to insure the buyer for breaches of reps,<sup>113</sup> and like other forms of insurance, the seller's indemnity has a limit of liability (the cap)<sup>114</sup> as well as a deductible or retention amount (the basket).<sup>115</sup> Caps

---

107. See Manns & Anderson IV, *supra* note 105, at 1184–85 (“[R]epresentations and warranties that have teeth . . . serve as a means of signaling information, which eliminates the need for costly investigations of quality (e.g., due diligence). The signaling function only works, however, when a cost is imposed on the maker of the warranty when the warranty is untrue.”).

108. MCDONALD & AARONSON, *supra* note 96, at 8 (stating that information provided in due diligence is taken into account when determining whether the buyer has an indemnification claim).

109. See *id.* (stating that a substantial amount of information is provided by the seller through the due diligence process).

110. Due diligence can only check the consistency of the seller's representations against other evidence provided by the seller. See *id.* (discussing how due diligence information may be used to determine indemnification claims).

111. See Thomas C. Schelling, *An Essay on Bargaining*, 46 AM. ECON. REV. 281, 299 (1956) (“[T]he right to be sued is the power to accept a commitment.”).

112. Albert Choi & George Triantis, *The Effect of Bargaining Power on Contract Design*, 98 VA. L. REV. 1665, 1693 (2012) (“[R]epresentations and warranties allocate risks and might be thought of as insurance products within acquisition agreements.”).

113. John C. Coates, *Allocating Risk Through Contract: Evidence from M&A and Policy Implication 10* (Aug. 22, 2012) (unpublished manuscript), [https://papers.ssrn.com/sol3/papers.cfm?abstract\\_id=2133343](https://papers.ssrn.com/sol3/papers.cfm?abstract_id=2133343) (“[I]t is the combination of representations with explicit indemnification clauses that is typically the principal way in which both misevaluation and value-shifting risks are allocated.” (emphasis omitted)). Although most private company acquisitions involve an indemnification provision, public company acquisitions typically do not. See *supra* Part I.A.

114. Coates, *supra* note 113, at 10. The cap is often tied to the escrow amount.

115. See *id.* Baskets appear in two basic types: (1) “first dollar baskets,” in which losses must exceed the basket amount in order to be payable, but once this amount is exceeded, are fully payable from the first dollar of loss; and (2)

and baskets, like limits and retentions, allow for the sharing of risk.<sup>116</sup> The higher the indemnity cap and the lower the basket, the greater the seller's risk.<sup>117</sup> The lower the indemnity cap and the higher the basket, the greater the buyer's risk.<sup>118</sup> Finally, like most insurance policies, the seller's indemnity has an effective term of coverage—the survival period.<sup>119</sup> Through these terms of the indemnity, the seller agrees to insure the reps within a specified range of liability and for a specified period of time.<sup>120</sup>

Indemnification provisions also specify how the parties will manage claims, providing procedures for claiming and contesting breach.<sup>121</sup> Escrow accounts, into which sellers may deposit a portion of the deal price to fund claims of breach,<sup>122</sup> may also be referenced in the indemnification provision.<sup>123</sup> Indemnification claims against escrow accounts are handled by escrow agents,

---

“deductible baskets,” which operate like ordinary insurance deductibles in compensating only loss in excess of the threshold amount. *Id.* There may also be “mini-baskets,” which require each loss to meet a minimum amount before it can be counted towards the larger basket amount. SPILKO & ABRAMOWITZ, *supra* note 68, at 8.

116. See Coates, *supra* note 113, at 10.

117. See SPILKO & ABRAMOWITZ, *supra* note 68, at 8–10.

118. See *id.*

119. See RONALD E. WHITNEY ET AL., REPRESENTATION AND WARRANTY INSURANCE FOR M&A TRANSACTIONS 7 (2018).

120. See McDONALD & AARONSON, *supra* note 96, at 5–6.

121. See *id.* at 10–14 (describing typical procedures). The indemnification provision specifies the general contents of the notice—a reasonably detailed description of the issue and identification of the representations and warranties upon which the claim is based—and requires sellers to respond within a specified period of time. *Id.* The provision may also mandate a period of negotiation before litigation can formally commence. *Id.*

122. Escrow accounts serve as a kind of hostage arrangement until the indemnity's survival period ends. See *id.* at 6 (defining escrow). Leaving hostages is a recognized device to enhance credibility and thereby support exchange. Oliver E. Williamson, *Credible Commitments: Using Hostages To Support Exchange*, 73 AM. ECON. REV. 519, 537 (1983) (demonstrating that “the use of hostages to support exchange is widespread and economically important”); see also Gilson, *supra* note 1, at 282 (citing Williamson and noting that “the hostage metaphor rings especially true because the seller's promise to indemnify the buyer is frequently backed by . . . retention of a portion of the consideration as a fund to assure the seller's performance of its indemnification obligation”).

123. See, e.g., Darden-Cheddar Agreement, *supra* note 89, § 5.6 (stating procedures for making claims against escrow and for distribution of escrowed funds at the end of the survival period).

typically banks, empowered to release funds only when instructed jointly by the parties or, in the case of disputed indemnity claims, when provided with a court order.<sup>124</sup> Escrow arrangements thus provide credit-backing, but claims administration ultimately depends upon either agreement or litigation.

## II. INSURANCE AGAINST MISINFORMATION: RWI

RWI is an insurance policy to cover losses from breached reps.<sup>125</sup> RWI evolved out of tax-liability policies sold in the London market in the 1980s.<sup>126</sup> RWI coverage soon expanded internationally, but it took much longer to become widespread in the United States.<sup>127</sup> Although some form of RWI coverage has been

---

124. These terms typically appear in a separate escrow agreement between the transacting parties and the escrow agent. *See, e.g.*, Concurrent Computer Corp., Current Report (Form 8-K) Exh. 2.1 Escrow Agreement between Vecima Networks, Inc., Concurrent Computer Corp., and Suntrust Bank § 3.3(a)–(b) (Dec. 15, 2017) (providing for the release of escrow funds on the basis of either joint written consent of the seller and buyer or a final judicial decision).

125. Peter Rosen & Gary Blitz, Latham & Watkins LLP & Aon Transaction Solutions, Address at the 2017 University of Michigan Law School Symposium, Trends and Features of Transactional Liability Insurance and its Effects on the M&A Marketplace 1 (Oct. 20, 2017).

126. The RWI policies that emerged in the 1990s evolved out of tax policies sold by Lloyd's of London in connection with leasing transactions in the 1980s. *See id.* at 2.

127. *Id.* A form of RWI, known as “Warranty and Indemnity Insurance” or “WII,” is widespread across deal-markets from Europe to Australia. *See generally* ALEXANDER KEVILLE ET AL., WILSON TOWERS WATSON: TRANSACTION RISK ASSURANCE – ENGLISH COVERAGE VS. US COVERAGE 1 (discussing WII in England); Andrew Clark, *Why Take the Risk? W&I Insurance in M&A Transactions in Australia*, LEXOLOGY (May 20, 2017), <https://www.lexology.com/library/detail.aspx?g=6a6057fa-c254-49c4-ba71-5e708d27f4f8> [<https://perma.cc/37JP-2249>] (discussing WII policies in Australia). However, WII policies typically provide a much narrower form of coverage than RWI. *See id.* (discussing the limitations of WII policies). This is partly a result of the idiosyncrasies of foreign deal markets, in which all information in the data room is deemed to qualify the reps in the acquisition agreement. *See id.*; *see also* KEVILLE ET AL., *supra*. There is, in other words, no need to separately qualify reps by information summarized on a separate disclosure schedule. Moreover, WII providers may insure a narrower set of reps than those that are operative in the deal, covering only the reps that appear on a separate “warranty spreadsheet,” without regard to the terms as they actually appear in the acquisition agreement. *See* KEVILLE ET AL., *supra*. These practices are not followed in the US market. Instead, providers of WII have begun to enhance their policies to provide “US style” coverage. *See* HOWDEN INS. GRP., HOWDEN M&A ANNUAL REVIEW: MERGERS AND ACQUISITION INSURANCE 2017 INSIGHTS 7 (2017).

available in the U.S. since the 1990s, due to the arduous weeks- or months-long diligence process insisted upon by insurers, early policy forms were seen to inhibit, rather than facilitate transactions.<sup>128</sup> As a result, RWI was not often used.

Since 2013, however, use of RWI in the U.S. deal market has exploded.<sup>129</sup> Respondents to my survey unanimously reported a vast expansion of RWI coverage in recent years.<sup>130</sup> Deal lawyer respondents estimated using RWI in 50% of their transactions in 2017.<sup>131</sup>

Although now common in private deals, RWI remains rare in public deals.<sup>132</sup> Respondents report that RWI is most often used when private company targets are purchased by private equity buyers (72%) and occasionally when private company targets are bought by public company buyers (21%).<sup>133</sup> Respondents report that RWI is rare when public company targets are taken

---

128. For example, an industry publication describing the earlier form of RWI notes that: “[i]nsurance companies would underwrite by redoing diligence. That is an arduous underwriting process that would take weeks and would be very intrusive to the transaction.” *Transactional Liability Insurance—It’s Gaining Momentum*, INS. & RISK MGMT. KNOWLEDGE ALL. (2015), <http://irmka.scic.com/2015/06/04/transactional-liability-insurance/>; accord Rosen & Blitz, *supra* note 125, at 3 (“Originally, insurers would typically undertake a lengthy and independent diligence review of the target company with respect to the representations and warranties to be covered by a given policy. This process could take months in total . . . and was typically intrusive to the in-process transaction.”).

129. Rosen & Blitz, *supra* note 125, at 2; Coakley et al., LOCKTON & DORSEY & WHITNEY LLP, THE NEW NORMAL? RECENT DEVELOPMENTS IN THE USE OF REPRESENTATION AND WARRANTY INSURANCE IN M&A TRANSACTIONS 4 (Sept. 11, 2018), <https://www.dorsey.com/-/media/files/uploads/images/091118-dorsey-seminar-use-of-reps-and-warranty-insurance-in-ma-transactions.pdf?la=en> [<https://perma.cc/XAK7-4GCA>].

130. Asked whether underwriting volume of RWI policies has increased, decreased, or stayed the same since last year, respondents unanimously reported that it has increased. RWI Survey, *supra* note 25, CL #57.

131. *Id.* CL #30.

132. See, e.g., Omri Even-Tov & James Ryans, Representations and Warranties Insurance in Mergers and Acquisitions 4 (Nov. 18, 2019) (unpublished manuscript), [https://papers.ssrn.com/sol3/papers.cfm?abstract\\_id=3361184](https://papers.ssrn.com/sol3/papers.cfm?abstract_id=3361184) (analyzing proprietary sample of 1,690 RWI policies issued worldwide between 2011 and 2016 consisting exclusively of non-public targets).

133. RWI Survey, *supra* note 25, CL #4. This is consistent with my sample of publicly filed acquisition agreements referencing RWI, the vast majority of which (85%) involved public buyers and private sellers. Private buyers of private sellers would not have shown up in the sample because private companies are not required to publicly file acquisition agreements. See *supra* Part I.A.

private and even more so when public companies buy other public companies.<sup>134</sup> However, it is important to remember that private deals are not necessarily small deals. RWI coverage is available for transaction sizes from \$50 million to over \$1 billion.<sup>135</sup>

A partial explanation for the expansion of RWI in the United States is that insurers learned to underwrite the product faster, largely by free-riding upon the underlying due diligence of the parties themselves rather than undertaking an extensive due diligence effort of their own.<sup>136</sup> Once underwriting was expedited, the product could be sold within the tight time-frame of deals.<sup>137</sup> Whether and how the product responds to the interests of the transacting parties is a subject explored at length below.<sup>138</sup>

#### A. BASIC TERMS OF COVERAGE

RWI, like other forms of insurance, transfers risk from the buyer of the insurance, the policyholder, to an insurance carrier.<sup>139</sup> Early RWI policies, offered “a bridge to get the deal done”

---

134. Forty-nine respondents reported that, on average, of their RWI Deals, 4% involved public companies being taken private, and 2% involved public to public deals. The medians reported for these transaction types were 1% and 0%, respectively. RWI Survey, *supra* note 25, CL #40, 62, 106.

135. Respondents reported the use of RWI across transaction sizes, but it appears to be slightly more common at lower transaction values. *Id.* Asked to associate RWI use with deal size, respondents replied that 31% of the transactions in which RWI was used had a deal value of less than \$100 million, 25% had a deal value of \$100 million to \$250 million, 19% had a deal value of \$250 million to \$500 million, 19% had a deal value of \$500 million to \$1 billion, and 6% had a deal value above \$1 billion. *Id.* CL #35, 65. These estimates are roughly consistent with AIG’s estimate of its RWI policy distribution. See AIG, M&A INSURANCE COMES OF AGE 3 (2017), <https://www.aig.com/content/dam/aig/america-canada/us/documents/insights/aig-manda-claims-intelligence-r-and-w.pdf> [<https://perma.cc/36V2-546L>] (estimating policy distribution across deal sizes: 45% deals under \$100 million, 26% deals between \$100 million and \$250 million, 14% deals between \$250 million and \$500 million, 9% deals between \$500 million and \$1 billion, and 7% deals over \$1 billion).

136. See *Transactional Liability Insurance—It’s Gaining Momentum*, *supra* note 128 (stating that “insurance companies have realized that they don’t need to redo the diligence. What they do now is review the diligence that was done . . . . What was a multi-week, if not a multi-month process has been reduced to . . . two weeks, and is frequently done over a weekend.”). For further detail on the insurers’ diligence efforts, see *infra* Part V.B.

137. See Rosen & Blitz, *supra* note 125, at 3 (noting that shortening the underwriting process has made RWI more attractive to transacting parties).

138. See *infra* Part III.

139. See *generally Representation and Warranty Insurance*, PERKINS COIE, <https://www.perkinscoie.com/en/insurance-recovery-resource-library-1/>

when transacting parties could not agree on an indemnity amount.<sup>140</sup> If buyers wanted a higher indemnity than sellers were willing to offer, they might purchase an RWI policy to bridge the gap.<sup>141</sup> In such cases, RWI coverage could be viewed as a compliment to the seller's indemnity. Recently, however, coverage has broadened such that RWI now frequently substitutes for the seller's indemnity.<sup>142</sup> Survey respondents reported that roughly one third of recent RWI policies were written to cover deals in which there was no seller indemnity.<sup>143</sup> Moreover, when indemnities do appear in deals in which RWI is present, they are likely to be significantly smaller than the traditional 10% seller indemnity.<sup>144</sup> When a seller indemnity was present alongside an RWI policy, respondents estimated it at 3% of deal value on average, with a median estimate of 1%.<sup>145</sup>

RWI policies can be underwritten to cover either sellers or buyers. The original policy form covered sellers' indemnification obligations ("sell-side" policies) but was subsequently adapted to cover buyers directly ("buy-side" policies). Buy-side policies now predominate, constituting over 90% of all RWI policies sold for the past several years.<sup>146</sup> This does not necessarily mean that

---

representation-and-warranty-insurance.html [https://perma.cc/FH7F-4JSC] (discussing the essential characteristics of RWI).

140. Interview with anonymous RWI Broker (Apr. 18, 2018) (on file with author).

141. If, for example, the buyer demands a \$20 million indemnity, but the seller is only willing to offer an indemnity up to \$10 million, the parties may buy side-RWI to bridge the \$10 million gap. The efficiency of RWI for this purpose, as opposed to other forms of finance, remains an open question. *See supra* Part III.D; *infra* Part V.A.4 (discussing the Alternative Finance hypothesis).

142. Chapman et al., *Representations and Warranties Insurance in M&A Transactions*, HARV. L. SCH. F. ON CORP. GOVERNANCE & FIN. REG. (Dec. 11, 2017), <https://corpgov.law.harvard.edu/2017/12/11/representations-and-warranties-insurance-in-ma-transactions/> [https://perma.cc/4V5X-U33D] (discussing the evolution of RWI policies).

143. Respondents reported that an average of 63% (median 70%) of recent policies covered transactions that also included a seller indemnity. RWI Survey, *supra* note 25, Question 15.

144. *Id.* Questions 16, 73; *see also infra* Table 1 (comparing indemnities in acquisition agreements with and without RWI).

145. *Id.*

146. Coakley et al., *supra* note 129, at 7 (showing 90% buy-side in 2014, 95% in 2015, 99% in 2016, and 95% in 2017); *accord* ARTHUR J. GALLAGHER & CO, REPRESENTATIONS & WARRANTIES INSURANCE 2 (2017), <https://docplayer.net/39240972-Representations-warranties-insurance-gallagher-management-liability-practice.html> [https://perma.cc/W4F9-T5UR] ("Today, over 90% of these insurance policies are purchased by the buyer, even if the seller funds part

the buyer pays for the policy. RWI is a transaction cost, allocated between the buyer and seller like any other cost or benefit in the transaction.<sup>147</sup> Likewise, the predominance of buy-side policies should not be taken to mean that it is always buyers who shop for and obtain coverage. Sellers may arrange for insurance to cover the buyer upon consummation of the underlying acquisition—an arrangement referred to as the “seller-to-buyer flip” or “stapled insurance.”<sup>148</sup> In any case, insurance brokers are typically involved in placing RWI coverage.<sup>149</sup>

Like other forms of insurance, RWI has limits, retentions, and premiums.<sup>150</sup> Survey respondents confirmed the statistics commonly reported in the industry literature: typical limits are 10% of deal value.<sup>151</sup> Typical premiums are 3% of limits.<sup>152</sup> And

---

or all of the insurance purchase.”). Survey respondents confirmed the overwhelming predominance of buy-side policies, with the majority of estimating that buy side policies dominate sell side policies at a rate of 95% to 5% or 99% to 1%. RWI Survey, *supra* note 25, Question 84.

147. See, e.g., Lifetouch-Shutterfly Agreement, *supra* note 70, at 10 (allocating to the seller “one-half of the R&W Insurance Premium”); see also *Transactional Liability Insurance—It’s Gaining Momentum*, *supra* note 128 (“[F]requently when the product is used, the buyer and seller will split the cost.”).

148. Rosen & Blitz, *supra* note 125, at 6 (describing the design of a “Stapled Insurance Package”); *Transactional Liability Insurance—It’s Gaining Momentum*, *supra* note 147 (noting the “seller flip”); see also WILLIS TOWERS WATSON, “STAPLING” WARRANTY & INDEMNITY INSURANCE.

149. *Transactional Liability Insurance—It’s Gaining Momentum*, *supra* note 128.

150. Stephen Lee & Ai Tajima, *M&A Trends: Representations and Warranties Insurance*, GOODWIN PROCTOR LLP (Mar. 22, 2018), <https://www.goodwinlaw.com/publications/2018/03/m-and-a-trends-representations> [<https://perma.cc/BF75-VNYT>].

151. Mean and median limits were 9.75% and 10%, respectively. Mean and median premiums were 3.04% and 3%, respectively. In comments, respondents reported that factors influencing limits purchased include industry and level of regulation within the industry, audited financials, and international operations. RWI Survey, *supra* note 25, Question 91. Insurers, in their comments, noted that “10% of deal value is the general rule,” but also noted that “some RWI insurers are unwilling to write policies with limits below \$5 million” which may result in very small (less than \$50 million) deals purchasing more than the typical limit amount. *Id.* Question 12.

152. Commenting on factors influencing the premium, respondents listed industry, size, and the number of carriers willing to offer a quote. One deal lawyer respondent included “the extent of due diligence in the deal.” *Id.* DL #14. But another deal lawyer commented that the range is “typically 3–4%” and that the “market is pretty stable on this.” *Id.* DL #8. A buyer confirmed this, commenting that premium tends to be “a pretty standard rate with not much variability.” *Id.* PE #2.

typical deductibles are approximately 1% of deal value.<sup>153</sup> Limits anchor around 10%, one insurer remarked, because the purpose was “to replace the seller escrow that used to predominate 5–10 years ago.”<sup>154</sup>

RWI policies track the liability and indemnity provisions in the underlying acquisition agreement. A standard policy form defines “Breach” as “any breach of, or inaccuracy in, the representations and warranties set forth in . . . the Acquisition Agreement.”<sup>155</sup> “Loss” likewise refers back to amounts to which policyholders are entitled “[p]ursuant to the terms of the Acquisition Agreement . . . .”<sup>156</sup> *Known* liabilities are excluded from coverage, whether known prior to negotiations or uncovered during the diligence process.<sup>157</sup> Insurers may also add exclusions if they are uncomfortable with the level of disclosure or the quality of diligence around a suspected area of risk.<sup>158</sup> Historically, policies also had a package of standard exclusions,<sup>159</sup> but these have largely been negotiated away as coverage has broadened in the current market.<sup>160</sup>

The broadening of RWI coverage can be seen in the elimination of the exclusion of losses relating to diminution-in-value or multiplied damages (DIV/multiplied damages).<sup>161</sup> DIV/multiplied damages measure losses not by the amount of loss caused by the breach itself but by the effect of the loss on the value attributed

---

153. The mean and median deductibles reported were 1.5% and 1% of deal value respectively. *Id.* Question 13. In comments, respondents reported that the market standard for deductibles is 1%, dropping to 0.5% twelve months after closing. *Id.* Respondents reported that some deals, especially larger deals, may have deductibles below 1%. *Id.*

154. *Id.* I #21.

161. *10 Points–Reps & Warranties Insurance*, THE NAT’L LAW REVIEW (Sept. 4, 2019), <https://www.natlawreview.com/article/10-points-reps-warranties-insurance> [<https://perma.cc/94VB-BKHP>].

to the target business at the time of the acquisition.<sup>162</sup> For example, if the buyer paid a 12x multiple of earnings before interest, taxes, depreciations, and amortization (EBITDA) for a target company and an undisclosed liability had the effect of reducing EBITDA by \$10 million, the buyer might claim \$120 million of loss under a DIV/multiplied damages theory as opposed to \$10 million of direct loss. DIV/multiplied damages may be seen as a type of consequential damages.<sup>163</sup> The consequence of the breach is the mispricing of the acquisition. DIV/multiplied damages can thus be thought of as mispricing damages.

Although DIV/multiplied damages had formerly been excluded from coverage under RWI policies, the market has now settled on a practice of “following silence with silence.”<sup>164</sup> If the underlying acquisition agreement does not expressly exclude DIV/multiplied damages, neither will the RWI policy.<sup>165</sup> In this situation, insurers will at least entertain the possibility of providing coverage for DIV/multiplied damages should they

---

162. See, e.g., Michael Gill & Frank Mascari, *Confusion Reigns: Applying the Multiplied Damages Exception in Representations and Warranties Insurance Policies*, BLOOMBERG BNA 2–3 (Jan. 25, 2016), <https://www.mayerbrown.com/-/media/files/news/2016/01/confusion-reigns-applying-the-multiplied-damages-e/files/spconfusionmalr125/fileattachment/spconfusionmalr125.pdf> [https://perma.cc/JA4K-SBJZ]. Agreements may expressly include or exclude DIV/multiplied damages, often in the indemnity provision or in the definition of loss. See, e.g., Agreement and Plan of Merger among Eastside Distilling, Inc. and Craft Canning LLC, dated Jan. 11, 2019 (on file with author) (defining “losses” to include “without limitation, incidental, consequential, special or indirect damages (including loss of revenue, diminution of value or any damages based on any type of multiple)”).

163. See Glenn D. West & Sara G. Duran, *Reassessing the “Consequences” of Consequential Damage Waivers in Acquisition Agreements*, 63 BUS. LAW. 777, 779 (2008) (noting that “many deal professionals and their counsel believe that all lost profits are consequential damages and vice versa” but arguing that diminution in value and multiplied damages are conceptually distinct from consequential damages); see also Glenn D. West, *Consequential Damages Redux: An Updated Study of the Ubiquitous and Problematic “Excluded Losses” Provision in Private Company Acquisition Agreements*, 70 BUS. LAW. 971 (2015) (updating prior study). The definition of loss may also expressly include or exclude consequential damages. See, e.g., Asset Purchase Agreement among BPSGreenland, Inc. and Easton Sports, Inc. et al., dated 2014, § 6.5(b) (on file with author) (expressly providing for “consequential, incidental, special and indirect damages” for indemnified parties).

164. See, e.g., Interview with anonymous RWI Broker (Sept. 25, 2018) (on file with author) (“Going silent on DIV in the merger agreement means opting in to DIV damages in the insurance policy.”).

165. *Id.*

arise.<sup>166</sup> At the same time, according to market participants, insurers are unwilling to contractually commit to covering DIV/multiplied damages by expressly including them in either the acquisition agreement or the policy, but if on the other hand, DIV/multiplied damages are expressly excluded in the acquisition agreement, they will be uncovered under the policy because coverage tracks the definition of loss in the underlying acquisition agreement.<sup>167</sup> In other words, the market has settled on an uneasy state where DIV/multiplied damages are *implicitly* covered.

Insurers may have been willing to broaden coverage to include DIV/multiplied damages because the additional risk seemed small. Historically, claims under RWI policies have been neither frequent nor severe. Deal lawyers report claim frequency under RWI policies as roughly equal to claim frequency under a seller indemnity.<sup>168</sup> AIG, a leading underwriter of RWI, reports receiving a notice of claim on approximately 20% of its policies, escalating slightly with transaction size.<sup>169</sup> Aon, a leading broker of RWI, reports relatively flat claim frequency, around 15%, for policy years 2013–2015.<sup>170</sup>

When claims do come in under RWI policies, respondents reported that they are most likely to arise under the financial

---

166. Insurers offer coverage for DIV/multiplied damages through silence rather than expressly including the damages measure because “insurers don’t want any implication that they’re obligated to pay multiplied or DIV damages, they simply want to provide the Insured with the opportunity to present their case for multiplied damages when appropriate.” Email from anonymous RWI Broker to author (Aug. 1, 2018) (on file with author).

167. See *e.g.* RWI Survey, *supra* note 25, Question 88, B#15.

168. *Id.* Question 49 (showing that a majority of respondents indicated that claims are as likely to be filed against an indemnity as an RWI policy).

169. AIG, TAXING TIMES FOR M&A INSURANCE 3 (2019), <https://www.aig.com/content/dam/aig/america-canada/us/documents/business/management-liability/aig-manda-claimsintelligence-2019-w-and-i.pdf> [<https://perma.cc/GR26-NKLP>] (reporting claim frequency of 18% for deals under \$100 million and 23% for deals over \$1 billion). By contrast, survey respondents generally estimated claims frequency to be more common at lower transaction sizes. Respondents (39) reporting: 27% less than \$100M, 34% \$100–250M, 21% \$250–500M, 11% \$500M–\$1B, 7% over \$1B. RWI Survey, *supra* note 25, Question 87.

170. Aon data shows claim frequency at 14.6% for RWI policies underwritten in 2013, 17.6% for 2014 policies, and 13% for 2015 policies. Rosen & Blitz, *supra* note 125, at 7.

statement rep.<sup>171</sup> Other commonly named sources of RWI claims include the tax rep,<sup>172</sup> the compliance with law rep,<sup>173</sup> and reps relating to labor and employment matters.<sup>174</sup> These reports are consistent with industry studies.<sup>175</sup>

Claim severity—losses claimed against RWI policies—also appears to be low overall.<sup>176</sup> Survey respondents confirmed this,

---

171. Seventy-two percent (13/18) of respondents named the financial statement rep as the leading source of RWI claims. RWI Survey, *supra* note 25, Question 90 (asking respondents to name the top five sources of RWI claims). Two other respondents named the next leading source: the tax rep. No other source was named more than once. *Id.*

172. *Id.* Twenty-eight percent (5/18) of respondents named the tax rep as the second leading source of RWI claims. The same number of respondents named the financial statements rep as the second leading source of RWI claims. Respondents named litigation rep and other third-party claims three times as the second leading source of RWI claims.

173. *Id.* Respondents cited compliance with the law rep twice as much as the second leading source of RWI claims. Overall, respondents named it six times as one of the top five leading sources of RWI claims.

174. *Id.* Respondents named reps relating to labor and employment six times as one of the top five sources of RWI claims.

175. AIG, *supra* note 169, at 5 (reporting 19% of claims arise as a result of the financial statement reps, 18% arise from the tax rep, 15% arise from the compliance with laws rep, and 13% from the material contracts reps). Within the financial statements' reps, AIG reports that claims involving accounting rules breaches are most common (at 26%), followed by claims involving misstatements of accounts receivable (25%), then claims involving undisclosed liabilities (19%), then claims involving misstatements of inventory (17%), and finally, claims involving overstatements of cash holdings or profits (13%). AIG, *supra* note 135. Financial statement claims seem to be the most common source of claims for policies underwritten outside the United States as well. See HOWDEN INS. GRP., *supra* note 127, at 10 (noting that 29% of claims in non-US data set involved financial statement breaches, followed by tax (16%) and undisclosed litigation (16%)). Aon reports the leading sources of claims as the financial statements rep (31%), followed by the IP and tax reps (both at 19%). Rosen & Blitz, *supra* note 125, at 7. *But see* Coakley et al., *supra* note 129, at 3 (reporting leading source of claims in its data set to be claims involving defective equipment (27%)).

176. AIG reports the average claim severity for material claims (losses claimed in excess of \$100,000) as follows: 41% claimed losses between \$100,000 and \$1 million (average claim \$360,000), 44% claimed losses from \$1 million to \$10 million (average claim \$4 million), and 15% claimed losses in excess of \$10 million (average claim \$19 million). AIG, *supra* note 169, at 3. With regard to severity, Aon reported in 2017: “[o]f 145 claims since 1999, seventy-three remain open and are early in the claims process, twenty-five were resolved within the applicable retention, seventeen have been inactive/ dormant, sixteen resulted in loss payment and just four were ultimately denied by the insurer.” Rosen & Blitz, *supra* note 125, at 7.

noting that claims rarely exceed 10% of policy limits.<sup>177</sup> Several respondents commented that settlements rarely exceed the deductible.<sup>178</sup> Asked to report on the largest claim they had seen paid under an RWI policy in the last five years, many participants answered approximately \$20 million.<sup>179</sup> One answered over \$100 million.<sup>180</sup> Several said \$0.<sup>181</sup>

Finally, the term of coverage under RWI policies may exceed the survival period of a seller's indemnity.<sup>182</sup> RWI policies may cover breaches of the general reps for as long as three years (compared to twelve to eighteen months under a seller's indemnity) and fundamental reps for twice as long, often six years.<sup>183</sup> However, the relevance of this difference may be exaggerated because most claims for breach arise after the buyer's first audit of the acquired company, typically within twelve to eighteen months.<sup>184</sup> Survey respondents confirmed that vast majority of claims come in within the first eighteen months of closing.<sup>185</sup>

## B. POTENTIAL DISTORTIONS

Insurance introduces several potential distortions to the M&A contracting process. Two of these problems, adverse selection and moral hazard, are paradigmatic problems of insurance with potential applications to RWI. A third, the recreation of the credible commitment problem, is specific to the M&A contracting process. This Section briefly introduces each.

---

177. Respondents (25) reporting: 44% under 10% limits, 20% within 10–35% of limits, 16% within 35–70% of limits, 4% within 70–90% limits, and 16% over 90% of limits. RWI Survey, *supra* note 25, Question 88.

178. See, e.g., RWI Survey, B #20 (“I have not seen a claim breach the retention.”); *id.* B #10 (“Most claims settle within the retention.”); *id.* B #9 (“All are settled below retention.”).

179. *Id.* Question 89.

180. *Id.*

181. *Id.*

182. *AIG Study Shows How, Why M&A Insurance Claims Frequency Is Rising*, INS. J. (Apr. 24, 2017), <https://www.insurancejournal.com/news/national/2017/04/24/448692.htm> [<https://perma.cc/AM27-EH83>] (attesting policy lengths of up to seven years).

183. Coakley et al., *supra* note 129; see also *supra* note 73 and accompanying text (distinguishing between general and fundamental reps).

184. AIG, *supra* note 169, at 4 (showing that 74% of RWI claims are noticed within eighteen months).

185. Respondents (38) reporting: 17% first noticed zero to six months from inception, 20% six to twelve months, 18% twelve to eighteen months, 4% eighteen to twenty-four months, and 1% twenty-four months or longer. RWI Survey, *supra* note 25, Question 86.

Adverse selection is created by information asymmetry: consumers have information about risk that underwriters lack and use this information in deciding whether and how much insurance to buy.<sup>186</sup> For insurers, adverse selection implies that risk pools contain higher than average risks and, consequently, that policies priced to the average risk are underpriced.<sup>187</sup> For consumers, adverse selection implies that low and average risk policyholders subsidize higher risk policyholders and thus overpay.<sup>188</sup> Once consumers learn this subsidization, low and average risk policyholders exit insurance markets, leading risk pools to be composed of steadily worse risks and, eventually, to collapse.<sup>189</sup>

RWI poses a clear threat of adverse selection. The transacting parties likely understand the riskiness of their deal better than the insurer, and they may use this information to their advantage in deciding whether to purchase RWI. Recall that RWI is not purchased in every deal. In spite of the growth of the market, participants estimate that the insurance was involved in less than half of private deals last year.<sup>190</sup> Parties might self-insure for less risky deals and purchase RWI only for deals of above-average risk. Moreover, the availability of RWI allows buyers to entertain high risk deals that they might not otherwise consider, simply buying insurance for the riskiest transactions.<sup>191</sup>

---

186. Peter Siegelman, *Adverse Selection in Insurance Markets: An Exaggerated Threat*, 113 YALE L.J. 1223, 1223 (2004) (asserting that “[t]he phrase ‘adverse selection’ was originally coined by insurers to describe the process by which insureds utilize private knowledge of their own riskiness when deciding to buy or forgo insurance”).

187. Michael Rothschild & Joseph Stiglitz, *Equilibrium in Competitive Insurance Markets: An Essay on the Economics of Imperfect Information*, 90 Q.J. ECON. 629 (1976) (modeling adverse selection in a market of “Strongs” and “Frails”).

188. *Id.*

189. See, e.g., Roberta Romano, *What Went Wrong with Directors’ and Officers’ Liability Insurance?*, 14 DEL. J. CORP. L. 1, 27–29 (1989) (explaining that the collapse of the D&O market in the mid-1980s resulted from adverse selection).

190. See *supra* note 131 and accompanying text.

191. Seen in this light, adverse selection in RWI operates as a kind of *ex ante* moral hazard. The availability of insurance and the lesser inability of insurers to distinguish risk leads transacting parties to consider riskier transactions and to insure transactions with a higher degree of inherent risk.

Moral hazard, like adverse selection, can lead to the accumulation of risk in insurance pools and, hence, the destabilization of insurance markets. But, unlike adverse selection, moral hazard does not arise from the inherent riskiness of prospective insureds, but from actions taken by insureds.<sup>192</sup> More specifically, moral hazard is the tendency of insurance to increase loss by reducing the insured's incentive to prevent it.<sup>193</sup> In the context of RWI, where losses are generated by misinformation, moral hazard may explain the transacting parties' reduced enthusiasm for due diligence. And indeed, survey respondents reported that in their experience, RWI often leads to greater laxity in the diligence process.<sup>194</sup>

Neither moral hazard nor adverse selection occurs in every insurance market. For example, adverse selection does not occur in the absence of private information about risk or when relatively few consumers possess the requisite private information, nor does it occur when the insurer has superior information or predictive power.<sup>195</sup> Likewise, moral hazard may be less concerning when the underlying activity contains its own incentives to take care.<sup>196</sup> The extent to which adverse selection and moral hazard affect RWI and the mechanisms available to insurers to

---

192. Alma Cohen & Peter Siegelman, *Testing for Adverse Selection in Insurance Markets*, 77 J. RISK & INS. 39, 71 (2010) (asserting that “[u]nlike adverse selection, which has to do with ‘hidden information,’ moral hazard has to do with ‘hidden action’”).

193. See *supra* note 14 and accompanying text. Moral hazard may also refer to policyholders' actions after a loss occurs, sometimes referred to as *ex post* moral hazard. See, e.g., Georges Dion & Pierre St-Michel, *Worker's Compensation and Moral Hazard*, 73 REV. ECON. & STAT. 236, 236 (1991) (discussing *ex post* moral hazard in connection with workers' compensation insurance).

194. See, e.g., RWI Survey, *supra* note 25, PE #2 (“I believe Sellers are less discerning on disclosure schedules [due to RWI].”); *id.* I #23 (noting “less [due diligence is] . . . being completed” under RWI policies and that RWI “speeds up [due diligence]”); *accord id.* DL #2 (noting “less negotiation regarding rep and warranty scope” with RWI); *id.* B #19 (“[T]he reps are slightly less aggressively negotiated when there is RWI.”); *id.* B #1 (stating that RWI “shortens negotiation of reps”); *id.* B #14 (observing that “much less time is spent negotiating reps” but also noting that “[b]uyers and [s]ellers are still thorough in the diligence and disclosure process”). More generally, the “streamlining” of the acquisition process noted above may suggest lax diligence. See *infra* note 231 and accompanying text.

195. Cohen & Siegelman, *supra* note 192, at 63.

196. For example, the threat that careless driving poses to the life and limb of the driver may limit the scope of moral hazard in the context of automobile insurance. See Baker, *supra* note 14, at 279.

address these threats are discussed in greater detail below.<sup>197</sup> Insofar as they persist, however, they may lead to inadequate loss reserves and unreliable due diligence.

More generally, RWI threatens to distort the M&A contracting process by undermining the transacting parties' ability to make credible commitments. As discussed above, legal liability for misinformation is the basis of the seller's credibility.<sup>198</sup> A seller who can be sued for disclosing false information or for failing to disclose relevant information is a seller who can be believed, hence the indemnification provisions common in private M&A.<sup>199</sup> But RWI transfers a seller's liability for misinformation, in whole or in part, to a third-party insurer.<sup>200</sup> In no-indemnity deals, for example, this transfer of risk is more or less complete. Although it is still the seller that provides the buyer with the information, it is the insurer that bears the risk. Having transferred liability for misinformation to an insurer, sellers are unlikely to exert the same degree of care in the information they produce. Therefore, errors and omissions are potentially more likely. Understanding that sellers are no longer motivated by the threat of legal liability, rational buyers will discount seller disclosures to reflect this lack of credibility. In this way, RWI effectively reintroduces the credible commitment problem into M&A contracting.

These insurance-induced distortions impose frictions on efficient contracting. Ultimately, they suggest above-average risk accumulation in RWI policies, a less reliable exchange of information, and less seller credibility. If either the insurers or the transacting parties do not introduce mechanisms to contain these threats, the predictable result is greater discounting and broken transactions, the very problem that the reps were designed to solve.

### III. HOW DOES RWI AFFECT M&A CONTRACTING?

Survey participants overwhelmingly asserted that RWI changes the nature of the underlying transaction.<sup>201</sup> If they are

---

197. See *infra* Part V.

198. See *supra* note 111 and accompanying text.

199. *Id.*

200. *Supra* note 139 and accompanying text.

201. Eighty-nine percent of all respondents. See RWI Survey, *supra* note 25, Questions 11, 38, 74.

right, these changes ought to manifest themselves in the acquisition agreement. The question thus becomes how acquisition agreements in deals with RWI differ from acquisition agreements in deals without it. This Part reports the results of an empirical study into that question. Its findings support the proposition that RWI has evolved into a broad-based coverage, under which the insurer agrees to bear considerably greater risk than the typical seller under the typical indemnity.

In order to analyze the effect of RWI on M&A contracting empirically, I conducted a comparative study of acquisition agreements. I assembled a database of acquisition agreements by searching the Westlaw Practical Law database for acquisition agreements making reference to RWI,<sup>202</sup> supplementing the results by repeating the same searches on Intelligize,<sup>203</sup> an online platform that facilitates searches of the exhibits to SEC filings.<sup>204</sup> Combining these searches yielded 271 acquisition agreements through year-end 2018 making reference to RWI in the underlying transaction.<sup>205</sup> Although the Westlaw and Intelligize databases go back to 2010 and 2008 respectively, acquisitions making reference to RWI began to appear only as of 2012 and to appear with regularity only as of 2015. The number of acquisition agreements making reference to RWI then began to increase dramatically. The incidence of acquisition agreements making reference to RWI is summarized in Figure 1 below.

---

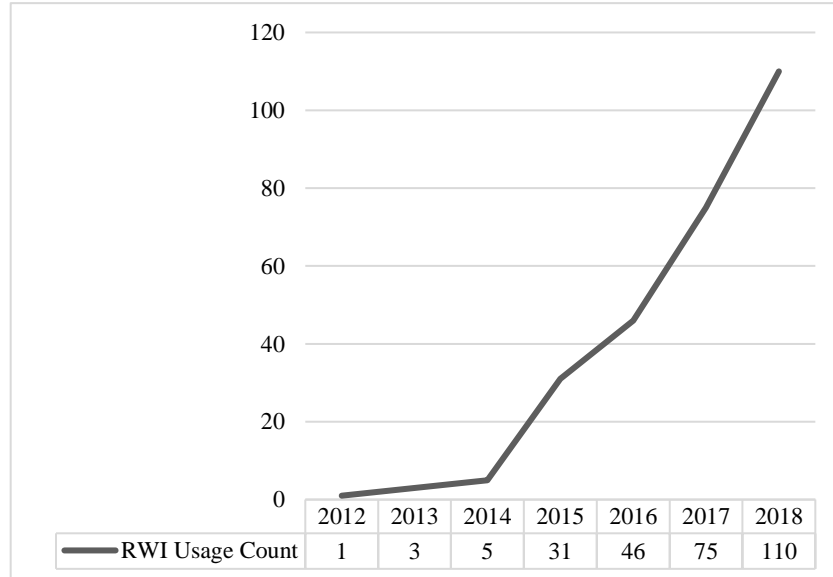

202. The principal Westlaw database includes “all publicly filed acquisition agreements entered into after January 1, 2010, with a signing value of at least \$25 million involving the acquisition of (i) all or substantially all of the assets of private US companies, (ii) at least a majority of the outstanding stock of private US companies or (iii) business units of US companies.” *Private Acquisition Agreements Database*, WESTLAW (search on Westlaw Practical Law with search term “Private Acquisition Agreements”).

203. The Intelligize database contains publicly filed acquisition agreements in excess of \$1 million, from 2008 to the present. INTELLIGIZE, <https://www.intelligize.com/about/> (last visited Mar. 8, 2020).

204. I searched under various formulations of the phrase. For example: “Rep & Warranty Insurance,” “RW Insurance,” “R&W Insurance,” “RWI,” and others.

205. The reference to RWI in the acquisition agreement often appeared as a covenant, a condition to closing, or as part of a provision describing how the parties would divide transaction costs.

**Figure 1: Acquisition Agreements Making Reference to RWI**

The acquisition agreements in this sample involved private targets or privately held assets (99% of the sample) and public company acquirors (83% of the sample).<sup>206</sup> This result reflects, in part, the regulatory environment. Public companies must file material contracts as exhibits to their SEC filings.<sup>207</sup> Acquisition agreements, when they are of a sufficient size relative to the public company, are material contracts. Private companies, however, have no such filing or disclosure obligations. Because both the Westlaw and Intelligize databases are based on SEC filings, the only way for an acquisition agreement to find its way into my data set was through the involvement of a public company, either as the buyer or the seller. My data set therefore is likely missing deals between purely private parties (funds and founders, for example, or sales from one private equity fund to another) as well as those where the acquisition is not material to the public company. Nevertheless, in my data set, the public company is overwhelmingly the buyer, confirming the notion

206. My sample contained only three insured deals involving public company targets, all of which were take-private transactions, in which a public company is purchased by a private company or a private fund of investors.

207. 17 C.F.R. § 229.601(a)(4) (2019).

that RWI is principally a product for acquisitions of private companies.

Next, in order to construct a set of agreements for comparison purposes, I ran another search for private acquisition agreements in the Westlaw Practical Law database, this time excluding phrases referencing RWI, then further narrowing these results to deals signed on or after January 2015, the time period when RWI had begun to appear with regularity in the prior search. This yielded over 1,000 results, from which I randomly selected 274 agreements. After confirming the absence of any reference to RWI, I saved these agreements as my comparison set. The result of this process is a data set of 544 acquisition agreements, from 2012 through 2018 (predominantly 2015–2018), 270 of which contain some reference to RWI (hereinafter “insured deals”) and 274 of which do not (hereinafter “uninsured deals”). The average deal size among the insured deals was \$407 million compared to \$562 million for uninsured deals.

I then hand-coded the acquisition agreements in the data set for specific features of the reps and the indemnity provisions. I recorded the number of words in the reps and the number of words in the acquisition agreement overall. I coded for materiality scrapes and the presence of materiality qualifiers in the No Undisclosed Liability rep.<sup>208</sup> I coded the type of knowledge qualifier used in each agreement, actual or constructive, and recorded the presence of knowledge qualifiers in a standard set of reps—litigation, IP, financial statement, real property, tax, employee benefits, and material contracts.<sup>209</sup> With regard to the indemnity provisions, for example, I recorded the indemnity cap, basket amount and type, survival period, and escrow amount. I coded the definition of loss for whether or not it included DIV/multiplied damages. I also collected information concerning the buyer and seller, the deal value, industry, signing and closing dates, the law firms involved in the transaction, any alternative dispute resolution provisions, type of acquisition, and the presence or absence of debt financing.

---

208. See *supra* note 90 and accompanying text (discussing knowledge qualifiers).

209. I selected these reps specifically because they are standard reps present in most acquisitions.

**Table 1: Indemnification and Escrows**

	RWI Deals	Non-RWI Deals
<i>Deals with Indemnity (number)</i>	<i>223</i>	<i>224</i>
Indemnification Present (% of all deals)	83%	82%
Mean Indemnity Amount (% of deal value)	9%	10%
Median Indemnity Amount (% of deal value)	1%	10%
Indemnification Survival (months, average)	16	16
<i>N (all deals in sample)</i>	<i>270</i>	<i>274</i>
<i>Deals with Escrow (number)</i>	<i>175</i>	<i>102</i>
Escrow Present (% of indemnity deals)	78%	46%
Mean Escrow Amount (% of deal value)	2%	9%
Median Escrow Amount (% of deal value)	1%	6%
Escrow Survival (months, average)	17	17
<i>N (indemnity deals)</i>	<i>223</i>	<i>224</i>

Indemnity amounts calculated in Table 1 exclude no indemnity deals as well as deals where the indemnification amount includes an equity-based component, such as a purchase price adjustment, because equity values were unavailable, and the total indemnity amount therefore could not be calculated. There were 38 insured deals with no indemnity, and 44 uninsured deals with no indemnity. Escrow calculations in Table 1 are based on deals with indemnification and exclude all undisclosed and equity-based escrows.

As summarized in Table 1, above, the basic statistics concerning indemnity size and escrow amounts differ meaningfully between insured and uninsured deals. Although a seller's indemnity was similarly present in both groups (83% and 82%, respectively), the mean and median seller's indemnity for insured deals was 9% and 1%, respectively, versus 10% for uninsured deals. In

other words, fully half of the reported indemnities for insured deals were 1% or less of deal value. Recall that retentions in RWI Deals are typically set at 1% of deal value.<sup>210</sup> This means that most RWI Deals in my sample preserved a seller's indemnity only large enough to cover the retention.<sup>211</sup> Apart from the retention, in other words, most insured deals are zero indemnity deals. Uninsured deals, by contrast, have a fairly consistent seller's indemnity of approximately 10%.

Escrow accounts tell a similar story. Escrows were surprisingly common among insured deals—in 78% of deals, compared to 46% of uninsured deals.<sup>212</sup> However, the amounts escrowed differed meaningfully. The mean and median escrow amounts for insured deals were 2% and 1% respectively versus 9% and 6% for uninsured deals.<sup>213</sup> That escrows are more common but substantially lower in insured versus uninsured deals may indicate that sellers are often expected to escrow an amount related to their retention obligation under the RWI policy.

**Table 2: Baskets**

	RWI Deals	Non-RWI Deals
<i>Deals with Basket (number)</i>	179	189
Basket present (% of indemnity deals)	80%	84%
Basket as a percentage of indemnity amount (mean)	62%	18%
Basket as a percentage of indemnity amount (median)	50%	19%
<i>N (indemnity deals)</i>	223	224

Table 2 excludes no indemnity deals (because deals without indemnification do not have baskets) as well as deals where the indemnification amount includes an equity-based component, such as a purchase price adjustment, because equity values were unavailable, and the total indemnity amount therefore could not be calculated.

210. See *supra* note 153 and accompanying text.

211. Indemnities of 1% or less consisted of 52% of the insured deals in my sample. See RWI Survey, *supra* note 25, Question 43.

212. *Id.*

213. *Id.*

Evidence from baskets suggests further risk-shifting from seller to buyer in insured deals. As described in Table 2, above, baskets are equally common in insured versus uninsured deals where indemnification is present (80% versus 84% of deals). However, the mean and median basket size as a percentage of the indemnity differs. In insured deals, the median basket is 50% of the indemnity. This suggests that, in insured deals, baskets, like indemnities and escrows, relate back to the standard retention in RWI policies. Sellers offer indemnities and escrows large enough to cover the retention, and buyers agree, through the basket, to split the retention amount.

I sought evidence of moral hazard by comparing the length of the reps in insured versus uninsured deals. Because moral hazard suggests less effort in due diligence, I hypothesized that insured deals would have shorter reps than uninsured deals. However, there was no meaningful difference between insured and uninsured deals with respect to the number of words in the reps.<sup>214</sup> The acquisition agreements in insured deals tended to be longer on average than uninsured deals: 45,000 words compared to 41,000 words. But the percentage of words in the reps was essentially the same: 24%, on average, in insured deals compared to 22% in uninsured deals.<sup>215</sup> Thus, if moral hazard is present in RWI Deals, it is not manifest in the word-count of the reps.

Nor was there strong evidence of moral hazard in my review of knowledge qualifiers. Both insured (77%) and uninsured (79%) deals in my sample tended to use a form of constructive knowledge as the basis of the knowledge qualifier.<sup>216</sup> Moreover, the frequency with which a knowledge qualifier appeared in the set of reps that I analyzed was also similar (71% insured deals versus 66% uninsured deals).<sup>217</sup> The absence of a meaningful difference between the two sets of deals with respect to knowledge is ultimately unsurprising, given that policies use and define

---

214. *Id.*

215. *Id.*

216. *Id.*

217. *Id.* These reps included the litigation, IP, financial statement, real property, tax, employee benefits, and material contracts reps. Knowledge qualifiers appeared at slightly different rates for each reps. For example, knowledge qualifiers appeared in roughly 94% of litigation reps for both insured and uninsured deals, but they appeared in 89% of IP reps for insured deals compared to 76% of uninsured deals. Meanwhile, they appeared in financial statement reps in 22% of insured deals, but in 28% of uninsured deals. *Id.*

knowledge differently from the underlying acquisition agreement.<sup>218</sup>

To compare the use of materiality qualifiers, I focused on the No Undisclosed Liabilities rep, a term present in most acquisition agreements.<sup>219</sup> There are two common ways to qualify the No Undisclosed Liabilities rep: either with a basic materiality qualifier or by importing the concept of materiality from the accounting standards.<sup>220</sup> The No Undisclosed Liability rep can be qualified in either or both ways. However, it was slightly more common—24% versus 16%—for RWI Deals to be qualified in *neither* way.<sup>221</sup> A less qualified rep has a greater potential for breach, suggesting that insurers accept greater risk in RWI policies than the transacting parties typically allocate among themselves.

**Table 3: Materiality Scrape**

	RWI Deals	Non-RWI Deals
<i>Deals with Some Form of Materiality Scrape (number)</i>	191	165
Some Scrape Present (% of indemnity deals) <sup>***</sup>	78%	63%
Full Scrape (% of scrapes present)	52%	45%
Loss Only (% of scrapes present)	30%	43%
Breach Only (% of scrapes present)	18%	12%
<i>N</i>	244	262

Table 3 excludes no indemnity deals (because the materiality scrape typically appears as part of the indemnity provision) but includes deals with equity-based indemnity amounts, excluded from Tables 1 and 2. The difference between RWI Deals and Non-RWI Deals for the presence of some form of materiality scrape was highly statistically significant (<sup>\*\*\*</sup>  $p$ -value < 0.01) based on a Z-test of proportions.

A materiality scrape may have a more profound effect than any single materiality qualifier on the potential for breach since a scrape has the effect of removing the materiality qualifier

218. See *infra* note 366 and accompanying text.

219. It was present in 100% of insured deals and in 83% of uninsured deals. *Id.* Report.

220. See *supra* note 89.

221. RWI Survey, *supra* note 25, Report.

wherever it appears in the agreement.<sup>222</sup> Materiality scrapes are more common in RWI Deals than in Non-RWI Deals. As summarized in Table 3, above, 78% of RWI Deals contain some form of materiality scrape, compared to 63% of Non-RWI Deals. Slightly more than half (52%) of RWI Deals that contained scrapes contained “full scrapes”—scrapes for purposes of both loss and breach—while slightly less than half of Non-RWI Deals with scrapes (45%) contained full scrapes.<sup>223</sup>

A full scrape means that any inaccuracy in the reps—“foot faults,” in the words of one broker—will amount to a breach.<sup>224</sup> The only question is how much will be owed in damages. Sellers appear to be more willing to accept liability for foot faults when an insurer is paying the bill. Insurers are, no doubt, aware of this, and may treat the full scrape as an *ex ante* waiver of the right to contest the materiality of breach.<sup>225</sup> This may make business sense from the insurer’s perspective—contesting whether a material breach has occurred might make RWI coverage seem illusory and therefore difficult to sell. But it also demonstrates a way in which the breadth of RWI coverage exceeds the bounds of what sellers are typically willing to offer under an indemnity. The full materiality scrape is a means of transferring greater risk to the insurer than the seller might typically bear.

---

222. See *supra* notes 95–100 and accompanying text.

223. These results are consistent with studies by SRS Acquiom on their database of private deals. See SRS ACQUIOM, BUY-SIDE REPRESENTATIONS AND WARRANTIES INSURANCE (RWI) DEAL TERMS STUDY 23 (2018), <https://www.srsacquiom.com/resources/2018-srs-acquiom-ma-deal-terms-study/> (finding that in 2015–2017, 95% of deals with Buy-Side RWI contain a materiality scrape, compared to 85% of deals without, and that of deals with scrapes, 54% of deals with RWI contain double scrapes, compared to 30% of Non-RWI deals); see also SRS ACQUIOM, 2019 M&A DEAL TERMS STUDY 60 (2019), <https://www.srsacquiom.com/resources/2019-buy-side-reps-warranties-insurance-deal-terms-study/> (finding that of all 2018 deals containing a scrape, 47% contained a full scrape while 37% scraped only damages and 16% scraped only breach).

224. Interview with anonymous RWI Insurance Broker (July 31, 2018) (on file with author).

225. Insurers may also accept partial scrapes for reasons that parallel the “double materiality” argument. See *supra* note 97. Insofar as RWI policies have retentions, an insurer is double protected by a policy with a retention plus materiality much as a seller is double protected by an indemnity with a basket plus materiality. The double materiality argument, however, applies principally to loss-only scrapes, not to scrapes of materiality for determining breach or to full scrapes, both of which are more common in insured deals.

**Table 4: Damages Provisions**

	RWI Deals	Non-RWI Deals
Silent on Diminution in Value (DIV) Damages***	86%	71%
DIV Expressly Excluded	10%	19%
DIV Expressly Included	4%	10%
Silent on Multiplied Damages***	86%	82%
Multiplied Damages Expressly Excluded	14%	16%
Multiplied Damages Expressly Included	0%	1%
Silent on Consequential Damages***	65%	40%
Consequential Damages Expressly Excluded	30%	50%
Consequential Damages Expressly Included	5%	10%
<i>N</i>	215	233

Table 4 excludes no indemnity deals but includes all other agreements in which a damages provision could be found. The difference between RWI Deals and Non-RWI Deals with regard to *silence* on DIV, multiplied, and consequential damages was highly statistically significant (\*\*\*)  $p$ -value < 0.01) based on a Z-test of proportions.

Finally, I analyzed contractual attempts to limit or expand the scope of covered losses by including or excluding various measures of damages. Principal among these are DIV/multiplied damages which, as discussed above, amount to a commitment to make the buyer whole for any mispricing resulting from a breach. As shown in Table 4, acquisition agreements in RWI Deals are more likely to be silent on DIV damages than Non-RWI Deals (86% versus 71%). Moreover, Non-RWI Deals are almost twice as likely as RWI Deals to expressly exclude DIV damages (19% versus 10%).<sup>226</sup> This is consistent with the report of market participants that insurers are willing to “follow silence with silence” on DIV/multiplied damages. Because insurance

226. No difference in the frequency of “multiplied” versus “DIV” damages suggests that transacting parties view these terms as accomplishing essentially the same ends. Any difference may just reflect that one phrasing (DIV) is more commonly used. See RWI Survey, *supra* note 25, Report.

coverage tracks the underlying acquisition agreement, eliminating the express exclusion of DIV/multiplied damages means they are at least potentially covered. Insurers will not have a clear contractual basis for refusing them and must instead contend with the merits of the policyholder's argument that such damages ought to be covered. In contrast, in Non-RWI Deals, where there is no insurance benefit for remaining silent on such damages, the transacting parties are more likely to exclude them.<sup>227</sup> The analysis of DIV damages in acquisition agreements thus demonstrates another way in which RWI coverage is broader than the protection buyers often receive under a seller's indemnity.

Interestingly, a substantial number of insured deals expressly exclude consequential damages yet are silent on DIV/multiplied damages.<sup>228</sup> This is notable because there is at least some basis for treating DIV/multiplied damages as a form of consequential damages.<sup>229</sup> But if this is the case, then expressly excluding consequential damages might also operate to exclude DIV/multiplied damages when the agreement is otherwise silent. "Following silence with silence," in other words, might not work if the underlying agreement excludes consequential damages. The market participants to whom I floated this argument generally doubted it and stated that, in their experience, the argument has not been used by insurers to avoid claims. Still, these conversations took place in a soft market, in which insurers are eager to sell policies and potentially sensitive about taking coverage positions that undermine their ability to do so.<sup>230</sup> It is therefore possible that, when the market hardens, at least some insurers will take the position that DIV/multiplied damages are also swept into a broadly worded exclusion of consequential damages.

Summarizing the principal findings of this Part: in insured deals, indemnities tend to be either non-existent or limited to the standard retention amount under RWI policies—that is, 1% of deal value. By contrast, uninsured deals offer a substantially

---

227. *Id.*

228. RWI Deals are more likely to be silent on consequential damages than Non-RWI Deals (65% versus 40%). Moreover, RWI Deals are three times more likely to expressly exclude consequential damages than they are to expressly exclude DIV/multiplied damages (30% versus 10%). *Id.*

229. *See supra* note 163 and accompanying text.

230. *See infra* Part V.D (discussing the underwriting cycle of "hard" and "soft" markets in insurance).

larger indemnity, approaching 10% of deal value. The retention amount is often escrowed in insured deals, but it is also often split between the buyer and the seller by means of a basket, meaning the seller retains liability for only 0.5% of deal value. Furthermore, deals with insurance are more likely than uninsured deals to include a full materiality scrape and to remain silent on DIV damages, thereby increasing the risk of liability.

These findings suggest that RWI transfers greater liability risk to the insurer than the typical seller would be willing to bear. There is a sense in which this transfer of risk may serve to facilitate transactions, consistent with the suggestion of some respondents that RWI makes acquisition contracting more streamlined.<sup>231</sup> However, insofar as the seller no longer bears significant transaction risk, RWI creates a credible commitment problem. The seller is no longer trustworthy because it no longer stands behind its reps, the ordinary result of which is that the buyer walks away or severely discounts its price.

The scrape and implicit inclusion of DIV damages address the credible commitment problem. Through these commitments, the insurer promises to make the buyer whole from any losses caused by an untrustworthy seller. While this redounds to the benefit, most obviously, of buyers, it also benefits the seller by mitigating the discount the buyer would otherwise insist upon. The breadth of coverage in RWI Deals, in other words, is designed to respond to the commitment problem created by using RWI as a substitute for the seller's indemnity.

#### IV. WHY DO PARTIES PURCHASE RWI?

Still, the purchase of RWI presents a puzzle. Transacting parties are fully capable of allocating the risk of misinformation through the reps. Indeed, as noted above, the reps are a form of insurance within the acquisition agreement.<sup>232</sup> What advantage

---

231. RWI Survey, *supra* note 25, DL #15 (noting "more streamlined negotiation of acquisition agreement"); *id.* DL #9 (noting "standardization of certain terms in the agreement . . . which may streamline some of the underlying negotiations between buyer and seller"); *id.* DL #2 (noting "more streamlined agreements and negotiations"); *id.* I #22 (noting that presence of RWI "smooths negotiation of terms between buyer and seller attorneys for matters that are not material from an economic standpoint"); *id.* B #17 (noting "smoother negotiations of the purchase agreement"). There was, however, one dissenting view. *Id.* DL #1 (stating that RWI leads to "more robust representations" and "slows deal execution").

232. See *supra* note 112 and accompanying text.

is there for transacting parties in insuring the risk of misinformation through a third-party insurer instead of allocating it among themselves?

Commonly touted advantages of RWI include, from the seller's perspective, limited post-closing exposure, expedited exit, and less contentious transaction negotiations and, from the buyer's perspective, supplemental liability protection, greater collection security, and the protection of ongoing business relationships.<sup>233</sup> But each of these supposed benefits of RWI could be created by the transacting parties themselves, without the need for an intermediary insurance company. Liability risk can be reduced for either the seller or the buyer by varying the size of the seller's indemnity. Collection security can be enhanced by increasing funds held in escrow, and exit can be expedited by minimizing funds in escrow. That these choices frequently offset reflects the fundamental reality of allocating costs and benefits through negotiation.

Survey respondents often explained the purchase of RWI as a response to the "seller's market" in M&A.<sup>234</sup> In such a market, sellers resist escrow accounts and indemnification provisions,<sup>235</sup> and RWI provides a means by which sellers can avoid these obligations altogether.<sup>236</sup> Given the competitive market for target

---

233. See generally WHITNEY ET AL., *supra* note 119 (listing "advantages of R&W Insurance" to include all items listed in text as well as a few others such as "extending the survival period" of certain representations and warranties which also could be accomplished contractually between the parties to the acquisition agreement); see also Glenn D. West, *A New Reason for Private Equity Sellers To Hate Undefined "Fraud Carve-outs,"* WEIL INSIGHTS: GLOBAL PRIV. EQUITY WATCH (May 16, 2017), <https://privateequity.weil.com/insights/a-new-reason-for-private-equity-sellers-to-hate-undefined-fraud-carve-outs/> [https://perma.cc/H3QT-TSG7] ("Private equity sellers require certainty regarding post-closing exposure to claims when distributing the proceeds of a portfolio company sale to their limited partners . . . . [I]n many circumstances, the winning bidder [in an auction] is the buyer who offers complete, 'walk-away,' deal certainty.").

234. See, e.g., RWI Survey, *supra* note 25, DL #7 (emphasizing the "seller's market" in M&A).

235. For example, deal lawyers frequently emphasized that in the present sellers' market, RWI might be the only liability protection available. See, e.g., *id.* DL #14 (explaining RWI as the result of situations in which "the seller is unwilling to provide an indemnity or the buyer wants additional protection"); *id.* DL #8 (emphasizing RWI as the "only protection available—i.e., Seller will not provide substantial post-closing protection"); *id.* DL #1 (noting simply that RWI is purchased to "accommodate seller").

236. Asked why their clients purchase RWI, brokers emphasized the minimization of indemnification obligations. *Id.* B #3 (emphasizing sellers' desire "to limit their indemnification liability"); *accord id.* B #20 (emphasizing that sellers

companies, RWI may be seen as the best or only alternative for buyers concerned about liability risk.<sup>237</sup> RWI allows buyers to submit no-indemnity bids.<sup>238</sup> The growth of RWI, according to this account, is thus explained by the seller's negotiating power.<sup>239</sup>

But a seller's market in M&A does not mean buyers must purchase RWI. Insurance is not free, and the premiums charged by insurance companies necessarily exceed the actuarial probability of loss.<sup>240</sup> The purchase of RWI by either transacting party only makes sense if the benefits of the insurance exceed its cost. Put slightly differently, if RWI does not increase aggregate transactional gains by more than its cost, it would be more efficient for one side or the other to bear the risk in exchange for a commensurate adjustment to the deal price. The question thus becomes whether RWI is more efficient than self-insurance on either side of the transaction.

The purchase of insurance is often explained by risk aversion. But the parties to M&A transactions are essentially risk neutral.<sup>241</sup> The buyer, as discussed above, is either a corporation or a private equity fund, each of which has access to loss-spreading technologies that mimic those of insurance companies—the

---

want to “maximize funds at deal close and provide a finite escrow amount instead of variable”); *id.* B #19 (explaining that sellers “want to avoid an escrow” and prefer a “pure insurance play”); *id.* B #15 (noting desire to leave “less money tied up in escrow for [a] shorter period”); *id.* B #14 (acknowledging “[s]ellers not wanting to leave any material amount of proceeds in escrow”).

237. *Id.* DL #9 (emphasizing that RWI is bought, “as bidder, to be competitive”).

238. *Id.* B #3 (noting that RWI is purchased by buyers “because it is required by seller or in order to submit a more seller-friendly bid at auction”); *id.* B #10 (stating that RWI may give buyers a “better chance to win [an] auction”); *id.* DL #2 (stating the clients seek coverage “to be competitive in auction processes as a buyer [and] to enhance bids . . .”).

239. *Id.* B #19; *accord id.* B #1 (stating that RWI is “expected with PE clients; sellers are demanding it; it's becoming the new normal”).

240. In order to cover their costs and provide a return to their shareholders, insurance companies must charge a premium greater than the risk. *See supra* note 19 and accompanying text.

241. On risk-neutrality and large, sophisticated firms, see generally Victor P. Goldberg, *Aversion to Risk Aversion in the New Institutional Economics*, 146 J. INSTITUTIONAL & THEORETICAL ECON. 216 (1990); Victor P. Goldberg, *The Devil Made Me Do It: The Corporate Purchase of Insurance*, 5 REV. L. & ECON. 541 (2009) [hereinafter Goldberg, *Devil*]. For consideration of the possibility that the agents of risk-neutral large firms may be risk-averse, see *infra* Part IV.E.

creation of reserves and diversification<sup>242</sup>—which ought to render these entities risk neutral.<sup>243</sup> Moreover, because there is very often a private equity fund on the sell side of the transaction as well,<sup>244</sup> the only risk-averse party in corporate acquisitions would seem to be owner-managers without fund backing.<sup>245</sup> But transactions involving unfinanced owner-managers are relatively rare, and deals with such parties on both the buy side and the sell side are exceedingly so.<sup>246</sup> As a result, risk aversion cannot explain RWI as it exists today.

An explanation for the purchase of insurance by risk neutral entities must focus on benefits provided by insurance other than the spreading of risk. This is the focus in the literature on the corporate purchase of insurance, which suggests several possible ways in which insurance might add value to risk neutral purchasers, including loss prevention and loss mitigation advice, claims management expertise, counterparty insistence, and alternative corporate finance.<sup>247</sup> The Sections that follow use survey data to examine the applicability of these explanations to the

---

242. Corporations spread risk through their shareholder base. Firm-specific risk is idiosyncratic risk, and unlike systemic risk, idiosyncratic risk can be eliminated through diversification. Private equity funds spread risk both through their investment portfolio, which likely contains multiple corporate investments, and through their investor base, who like shareholders, can eliminate idiosyncratic risk through diversification.

243. See *supra* note 241.

244. See *supra* note 133 and accompanying text. As a pure risk spreading matter, it would almost certainly be more efficient for a private equity house to self-insure against breach of reps and warranties. This could be accomplished by having the private equity house hold reserve funds and charge a premium (or hold back gain) from individual funds (more effective risk spreading). Or, it could be done within individual funds. Or, it could be unreserved.

245. The prospect of undiversified owner-managers is the basis of the “protection of ongoing business relationships.” See *supra* note 236 and accompanying for an explanation of the term. Buyers may hesitate to collect from risk-averse owner-managers whom they have brought along to manage the acquired business.

246. Moreover, even when there are owner-managers on the sell side, as long as there is a corporation or fund on the buy side, self-insurance (with a concomitant adjustment to the purchase price) would seem to be superior to the purchase of insurance.

247. Mayers and Smith address the corporate insurance puzzle in a series of articles. See David Mayers & Clifford W. Smith, Jr., *Corporate Insurance and the Underinvestment Problem*, 54 J. RISK & INS. 45 (1987); David Mayers & Clifford W. Smith, Jr., *On the Corporate Demand for Insurance: Evidence from the Reinsurance Market*, 63 J. BUS. 19 (1990) [hereinafter Mayers & Smith, *Corporate Demand*]; see also Richard MacMinn & James Garven, *On the Demand*

context of RWI, ultimately concluding that another explanation, focusing on the agency relationships in private equity investing, offers the most persuasive explanation for current patterns of coverage.

#### A. LOSS-PREVENTION AND LOSS-MITIGATION SERVICES

Insurance companies are repeat players in the business of pricing risks and paying losses. This puts them in an excellent position not only to assess the actuarial probability of loss but also to develop techniques for their policyholders to minimize or prevent loss. Moreover, insurers can insist, as a condition of coverage, that policyholders adopt these techniques. In this way, risk-management comes bundled with the insurance policy. Companies may therefore purchase insurance in order to benefit from the insurer's loss prevention and mitigation expertise.<sup>248</sup>

The demand for loss prevention and mitigation services, however, is uneven across different lines of insurance.<sup>249</sup> A relevant comparison with RWI is Directors' and Officers' (D&O) Liability Insurance, a financial line that covers corporations and their managers from the risk of shareholder litigation.<sup>250</sup> Like RWI, D&O insurance has sophisticated corporate buyers and covers complex financial risks. Yet, in prior work with Tom Baker, I found that insurers do not offer loss prevention and mitigation

---

*for Corporate Insurance: Creating Value*, in HANDBOOK OF INSURANCE 487, 487 (George Dionne ed., 2d ed. 2013) (summarizing prior literature).

248. Scholars have studied the risk management function in various insurance lines. See KENNETH S. ABRAHAM, DISTRIBUTING RISK: INSURANCE, LEGAL THEORY, AND PUBLIC POLICY 57 (1986) (focusing on environmental risk); Tom Baker & Rick Swedloff, *Regulation by Liability Insurance: From Auto to Lawyers' Professional Liability*, 60 UCLA L. REV. 1412, 1421–22 (2013) (surveying loss prevention across different insurance lines); Omri Ben-Shahar & Kyle D. Logue, *Outsourcing Regulation: How Insurance Reduces Moral Hazard*, 111 MICH. L. REV. 197, 210–12 (2012) (drawing examples of loss mitigation and prevention programs from workers' compensation, automobile, and homeowners' insurance); Haitao Yin et al., *Risk-Based Pricing and Risk-Reducing Effort: Does the Private Insurance Market Reduce Environmental Accidents?*, 54 J.L. & ECON. 325, 336–37 (2011) (examining loss-prevention in environmental policies).

249. Baker & Swedloff, *supra* note 248, at 1445 (documenting varying levels of loss prevention and mitigation services, from “none” to “extensive” across different insurance lines).

250. See generally BAKER & GRIFFITH, *supra* note 21 (describing D&O insurance and its role in deterring corporate misconduct).

services for D&O policyholders.<sup>251</sup> We explained the absence of loss prevention in D&O largely by reference to information asymmetry. Unlike fire prevention information, which is broadly generalizable, information on how a particular company might minimize the risk of shareholder litigation is idiosyncratic and in the possession of that company alone. It would be costly for an insurer to acquire the information, and the value of the information, if not broadly applicable across the insurer's portfolio, might not enable the insurer to recoup its cost.<sup>252</sup> Moreover, D&O insurers have competitors for loss prevention and mitigation services—namely, in-house counsel and their outside law firm advisors. Insofar as lawyers are already trusted suppliers of corporate governance advice—indeed, many major law firms hold themselves out in precisely this way<sup>253</sup>—loss prevention and mitigation in connection with shareholder litigation may be a difficult business for D&O insurers to break into.<sup>254</sup> As a result, insurers have little or no incentive to invest in loss-prevention or mitigation services for D&O insurance.

RWI presents insurers with similar problems of information asymmetry and idiosyncratic risk. The basis of risk in RWI policies—the accuracy and completeness of the seller's disclosures—is wholly within the control of the transacting parties, specifically the seller. The insurer could invest in acquiring this information through extensive due diligence, but if it did so, it is unclear that the information would have an application beyond the transaction at hand.<sup>255</sup> Moreover, M&A transactions are heavily lawyered, and insofar as there are transactional practices to

---

251. *Id.* at 105–27; Tom Baker & Sean J. Griffith, *The Missing Monitor in Corporate Governance*, 95 GEO. L.J. 1795, 1808 (2007) (“D&O insurers do almost nothing to monitor the public corporations they insure, and D&O insurers do not condition the sale of insurance on compliance with loss prevention requirements in any systematic way.”).

252. The structure of policies, which limit an insurer's interest in any one risk, and the underwriting cycle, which at least in soft markets, inhibits cost recovery, also work to eliminate the insurer's incentive to invest in acquiring this information. Baker & Griffith, *supra* note 251, at 1839–40.

253. See, e.g., Martin Lipton, Wachtell Lipton Rosen & Katz, *Some Thoughts for Board Directors in 2018*, HARV. L. SCH. F. ON CORP. GOVERNANCE (Nov. 30, 2017), <https://corpgov.law.harvard.edu/2017/11/30/some-thoughts-for-boards-of-directors-in-2018/> [<https://perma.cc/LF59-5WV5>].

254. BAKER & GRIFFITH, *supra* note 21.

255. It is unclear, in other words, whether there are best practices in M&A contracting beyond basic due diligence that would minimize the risk of a post-closing indemnity claim.

minimize the risk of incomplete disclosures and post-closing indemnity claims, the obvious suppliers of these techniques would be the M&A lawyers that routinely negotiate similar transactions. RWI insurers seeking to provide loss prevention and mitigation services thus face problems from information asymmetry and competition that parallel those faced by D&O insurers.

Consistent with this analysis, survey participants reported that insurers do not offer loss-prevention or loss-mitigation services in connection with RWI. Although RWI underwriting generally begins before the acquisition agreement is finalized,<sup>256</sup> insurers often do not typically comment on acquisition agreements.<sup>257</sup> They do not mark-up drafts,<sup>258</sup> and where they do so, their comments would likely not be taken.<sup>259</sup> Insurers do review provisions, such as the definition of fraud, that may later affect their coverage position.<sup>260</sup> However, their review of these provisions is aimed at determining what risks to cover, not how to prevent loss to the transacting parties.<sup>261</sup> They are looking for exclusions, not trying to help the transacting parties prevent or mitigate loss.<sup>262</sup>

---

256. RWI Survey, *supra* note 25, Questions 75, 109 (32 respondents).

257. Answering how often insurers comment on the acquisition agreement, respondents (40) replied as follows: three always, five most of the time, three about half the time, twenty-four sometimes, and five never. *Id.* Questions 45, 77, 110.

258. *Id.* I #4 (“While underwriters will sometimes comment on which parts of the draft agreement they do not like or will not insure, they don’t typically ‘mark-up’ written revisions to the agreement.”).

259. Commenting on the prospect of insurer comments to the acquisition agreement, one deal lawyer remarked “we’d reject them if we ever saw them; they don’t get to comment on the docs.” *Id.* DL #8.

260. The definition of fraud in the acquisition agreement may affect the insurer’s subrogation rights under the policy. As a result, respondents frequently cited these provisions as a subject of insurer attention. *See, e.g., id.* I #3 (noting that insurers “typically comment on provisions that would affect the insurer’s subrogation rights, such as fraud limitation in the indemnity or release provisions”); *accord id.* B #3 (“[I]nsurers will insist on a market definition of fraud and that buyer have unimpaired rights (and thus insurer have unimpaired subrogation rights) against seller in the case of fraud.”).

261. *See, e.g., id.* DL # 9 (“[The] insurer doesn’t comment on the Agreement. [The] insurer may (in the Policy) propose to synthetically alter the terms of the agreement for purposes of coverage under the policy.”); *accord id.* B #10 (“Their comments are about how the Policy will deviate from the Acquisition Agreement, for example reading in a materiality or knowledge qualifier, following or not following the definition of Loss.”).

262. *See, e.g., id.* I #21 (“Insurers may propose exclusions where the agreement contains particularly obnoxious non-market provisions.”); *accord id.* B #14

Likewise, the insurer's involvement in due diligence is aimed not at helping buyers avoid loss, but at helping insurers identify issues to exclude from coverage.<sup>263</sup> Insurers do perform due diligence in underwriting RWI policies, but this diligence exercise is secondary to the primary due diligence performed by the transacting parties.<sup>264</sup> Insurers are given data room access and, perhaps most importantly, copies of due diligence reports prepared by buyer's counsel.<sup>265</sup> They generally do not get direct access to the seller.<sup>266</sup> Instead, insurers review previously prepared materials and then ask any follow-up questions on a relatively brief conference call with the deal team.<sup>267</sup> The insurer's due dil-

---

("Insurers typically don't insert themselves in the negotiations of the purchase agreement language itself, and handle any comments they have to reps through the policy language.")

263. Respondents reported that information uncovered in due diligence is far more likely to lead to exclusions than to any change in the policy premium (79% reporting that diligence is much more likely to lead to exclusions and 21% reporting that it is somewhat more likely to lead to exclusions). *Id.* Question 86; *accord id.* B #20 (noting that if the buyer's diligence is inadequate "you will have exclusions and unhappy insureds"); *id.* I #21 ("If buyer did not conduct reasonable [due diligence] in really risky areas then those areas might end up being excluded . . ."); *id.* I #2 ("If diligence is not adequate, the insurer will insert applicable exclusions in the policy covering the exposures not properly diligenced.")

264. *See id.* I #21 ("Insurers do not re-do the diligence—the process is really an audit of buyer's [due diligence]."); *id.* B #10 ("Carriers perform a secondary review of buy-side diligence. They need access to the data room and copies of internal and [third] party diligence reports."); *accord* Rosen & Blitz, *supra* note 125, at 4 ("[T]he insurer's process focuses on conducting secondary diligence of the buyer's primary diligence."); *Transactional Liability Insurance—It's Gaining Momentum*, *supra* note 128 ("[I]nsurance companies have realized that they don't need to redo the diligence. What they do now is review the diligence that was done. Then have one or two conversations with the buyer and the seller . . . [The] process . . . can easily be accomplished in two weeks, and is frequently done over a weekend.")

265. Asked how often insurers request additional information not already in the dataroom, respondents answered as follows: always (20%), most of the time (33%), half of the time (7%), sometimes (40%), never (0%). RWI Survey, *supra* note 25, Question 81.

266. Respondents (31) replied: 0% always, 3% most of the time, 0% half the time, 23% sometimes, and 74% never. *Id.* Question 82.

267. Insurers typically ask their questions during a two-hour underwriting call devoted to due diligence issues. *See, e.g., id.* B #9 (noting that in the insurer's due diligence process, "dataroom, [due diligence] reports and disclosure schedules are scoured and then a 2hr underwriting call with the deal team to

igence, unlike the buyer's due diligence, is not aimed at uncovering deficiencies in the underlying transaction, but rather at uncovering deficiencies in the buyer's diligence.<sup>268</sup> In doing so, the insurer is looking to protect its own interests by identifying risks to exclude from the policy, not helping the buyer avoid loss or mitigate risk.

It is true, of course, that excluding risks from coverage *ex post* may have an effect *ex ante* on the conduct of the transacting parties. Hence, regardless of their motivation, the insurers' review of merger agreements and involvement in diligence may lead buyers to make beneficial changes to the transaction process.<sup>269</sup> But it may also have the opposite effect. For example, one insurer observed that an effect of RWI coverage is that "certain 'uninsurable' reps are more likely to be left out of the agreement so as to allow the RWI policy coverage scope to match the agreement."<sup>270</sup> Leaving reps out of an agreement, however, does not mitigate the buyer's risk. It increases it.<sup>271</sup> Likewise, the fact that the insurer's review of the buyer's due diligence may lead to exclusions from the policy may lead buyers to be *less* thorough in its due diligence exercise in order to avoid uncovering facts that trigger exclusions.<sup>272</sup>

Whatever effect RWI may have on the incentives of the transacting parties, it seems clear that insurers do not provide loss prevention and mitigation services as such. Insurers do not specify improvements to negotiation or transaction processes *ex*

---

go through findings and other questions"); *id.* B #15 (noting that insurers "review reports prepared by advisors and ask questions during the [underwriting] call").

268. The insurer, in the words of one respondent, is "diligencing the diligence done by the buyer." *Id.* B #14. Other respondents commented that insurers are looking to confirm "robust, independent due diligence on the buy side." *Id.* B #3; *see also id.* I #4 ("Key is for the underwriters and their outside counsel to try to become comfortable that the right people (principals, advisors, etc.) performed the right type of diligence and disclosure and negotiation process for the size and type of deal at hand.").

269. Brokers, for example, noted that they advise their clients to conduct "robust" due diligence to prevent insurers from seeking additional exclusions for omissions in the diligence process. *Id.* B #3 (describing advice given to clients "to perform robust due diligence including writer reports from third-party advisors for legal, financial, tax and if applicable, environmental (at a minimum)").

270. *Id.* I #4.

271. An omitted rep is a rep that does not force any information out of the seller but rather leaves the buyer uninformed about the underlying risk.

272. This possibility is explored in greater detail *infra* Part V.B.

*ante* and condition coverage on the implementation of those improvements. Furthermore, buying an RWI policy does not seem to lead to the reduction in claims that might be associated with loss prevention services.<sup>273</sup>

#### B. CLAIMS MANAGEMENT EXPERTISE

Because liability insurers repeatedly handle claims, they may develop efficiencies in managing them,<sup>274</sup> either in the form of payment processing or litigation cost management.<sup>275</sup> With regard to payment processing, it is plainly much cheaper to handle auto or homeowner claims through an insurance adjuster than through litigation. And with regard to litigation costs, lines of insurance that cover defense costs often contain terms that allow insurers to choose defense counsel or that restrict the policyholder's choice to a pre-approved list.<sup>276</sup> These advantages, however, are inapplicable to the context of RWI.

First, with regard to claim processing, RWI payment procedures should be compared to indemnification procedures under the acquisition agreement.<sup>277</sup> Claims administration under an RWI policy largely mirrors indemnification procedures. In RWI claims, the insurer effectively takes the place of the seller-indemnitor.<sup>278</sup> To be paid under an RWI policy, a policyholder must provide notice, after which the insurer can either pay or dispute the claim. If the insurer disputes payment, the parties litigate, or threaten litigation, until the dispute is resolved with a settlement or court order. Because the claims process is effec-

---

273. Deal lawyers report that claims are about as likely under a seller indemnity as under an RWI policy. *See supra* note 168 and accompanying text.

274. Mayers & Smith, *Corporate Demand*, *supra* note 247, at 23 ("Insurance firms develop a comparative advantage in processing claims because of scale economies and . . . specialization.").

275. Charles Silver, *Basic Economics of the Defense of Covered Claims*, in RESEARCH HANDBOOK ON THE ECONOMICS OF INSURANCE LAW 438 (Daniel Schwarcz & Peter Siegelman eds., 2015) (characterizing most insurance policies as some combination of the duty to indemnify and the duty to defend).

276. *See* KENNETH S. ABRAHAM, *THE LIABILITY CENTURY: INSURANCE AND TORT LAW FROM THE PROGRESSIVE ERA TO 9/11* (2008) (tracing the evolution of claims management in liability policies).

277. *See supra* note 121 and accompanying text (describing the procedures for the notification and payment of claims contained in indemnification provisions).

278. *See supra* Part II.A (describing this phenomenon).

tively the same under an RWI policy as it is under a seller's indemnity, there is no obvious efficiency derived from an insurer's handling of RWI claims.<sup>279</sup>

Second, the ability of the insurer to control litigation costs is not the same under RWI as it might be under other lines of insurance. Insurers add the greatest value in controlling litigation costs where they defend policyholders against *third-party claims*, such as tort claimants.<sup>280</sup> But RWI insurers do not defend their policyholders.<sup>281</sup> Moreover, although there may be third-party claims under an RWI policy—for example, an undisclosed patent infringement claim<sup>282</sup>—the principal litigation exposure is not to third-party claims but rather to *first-party claims* between the buyer and the seller.<sup>283</sup> By stepping into the shoes of the seller in this litigation, the insurer effectively aligns itself with the seller *against* the policyholder. Policies may but do not always contain a dispute-resolution provision requiring arbitration in such cases, but given the adversarial nature of these proceedings and certain involvement of lawyers on both sides, it is unlikely that RWI significantly reduces the cost of claims.<sup>284</sup>

Consistent with this analysis, survey participants did not identify any advantage of insurers in managing claims. RWI claims are typically settled by direct negotiation with insurers,

---

279. Contrast this, again, with the involvement of an insurance adjuster for auto or homeowners claims. There, a third-party claims appraiser values claims, which are typically the basis of quick settlements between policyholders and the insurer. *E.g.*, *The Appraisal Clause Process*, COLLISION CLAIM ASSOC., INC., <https://www.collisionclaims.com/info-center/the-appraisal-clause-process/> [<https://perma.cc/E46A-K6CJ>] (noting that the purpose of including an appraisal clause is to facilitate settlement).

280. See Silver, *supra* note 275, at 438 (distinguishing between “duty to defend” and the “duty to indemnify” and discussing the impact of each on defense costs).

281. It is indemnity coverage, not duty to defend. AIG, Specialty Risk Protector Policy Template (on file with author).

282. Defense costs for such third-party claims may be covered under the RWI indemnity. *Id.*

283. See AIG, *supra* note 135, at 4.

284. See Email from anonymous RWI Broker to author (Dec. 7, 2018) (on file with author). Furthermore, considering that insurers have *less* claim-relevant information than sellers and that sellers have limited incentives to cooperate with insurers in the resolution of claims, information costs may make the resolution of insured claims less efficient than uninsured claims.

without formal arbitration, mediation, or adjudication.<sup>285</sup> Lawyers are involved on both sides, and litigation remains in the background. The lawyers argue over the elements of the claim, any defenses to coverage, and the amount of damages.<sup>286</sup> Of these, the biggest differences may be with respect to damages. For example, one claims lawyer noted, “I see a lot of reputable firms/clients making plaintiff-style damage arguments that find no support in caselaw or policy.”<sup>287</sup> Echoing these comments, an experienced insurer reported:

Real losses get paid by insurance. The issues come up when [the] Insured claims a breach, then calculates losses very generously (i.e. without backing out expenses, or assuming a customer contract lasts forever, etc.) and then applies a crazy unsupportable EBITDA multiple to that expanded number and then presents that number as their “loss” on a deal, and then demands immediate payment of the whole amount . . . [O]bviously no insurer can just write a check based on such a scenario without investigation and loss analysis, which then tends to bring the claim down significantly to be closer to the actual loss incurred.<sup>288</sup>

Asked to estimate what percentage of losses claimed against RWI policies are ultimately paid by insurers, survey respondents with experience in settling claims estimated the amount at 62% of claimed loss.<sup>289</sup> Insofar as settling RWI claims involve lawyers on both sides arguing over liability and damages, the process

---

285. RWI Survey, *supra* note 25, Question 53 (reporting that few claims are decided through mediation, arbitration, or adjudication).

286. *Id.* CL #3 (noting that the parties “mostly just debate over existence of breach and quantum of consequential loss and calculation of loss.”); *accord id.* B #15 (emphasizing “whether the breach is proven and damages are quantified”); *id.* DL #9 (emphasizing “validity of claim and loss”); *id.* CL #1 (emphasizing the “[s]trength of facts showing breach and Loss”); *id.* CL #2 (characterizing the settlement of RWI claims as “litigation risk adjustments”); *id.* I #21 (“It is just about negotiating to a fair amount of loss to be paid on a claim.”); *id.* CL #6 (emphasizing “[c]overage [i]ssues”); *id.* I #17 (noting that in settlement negotiations, the parties “dispute . . . whether a Breach occurred . . . dispute . . . calculation of Loss, [and] dispute over Actual Knowledge or other exclusions . . .”).

287. *Id.* CL #1; *accord id.* CL #2 (emphasizing “[o]ver reaching by the policyholders, lack of understanding by policyholder of [l]oss and claims”); *id.* CL #3 (emphasizing “[t]he insured’s overstatement of the damages caused by an alleged breach of a representation”).

288. *Id.* I #21. This respondent is an experienced insurer who has settled more than ten RWI claims and estimates that insurers pay 50% of claimed loss.

289. Overall, forty-four respondents reported experience with RWI claims, of which 44% had settled ten or more RWI claims; 19% settled five to nine RWI claims, 25% settled one to four RWI claims, and 13% reported having settled zero RWI claims. RWI Survey, *supra* note 25, Report.

might not seem to differ substantially from the settlement of uncovered claims or, indeed, from settlement negotiations generally.

Several respondents did insist that insurers may pay claims more easily than seller-indemnitors. However, this observation likely reflects market incentives more than it does claims management efficiencies. If insurers want to sell policies, they must also be seen as willing to pay claims.<sup>290</sup> Especially in the context of RWI, a new product without an established claims history, if insurers were overly resistant to paying claims, the market for the product might disappear.<sup>291</sup> Accordingly, insurers have offered coverage enhancements—most notably, the materiality scrape and DIV/multiplied damages—to facilitate the payment of claims under RWI policies.<sup>292</sup> Both of these coverage enhancements facilitate claims—no arguments over breach means one less step in processing claims, and the potential inclusion of DIV/multiplied damages means potentially higher recoveries.

Nevertheless, claims facilitation of this sort is not the same as claims management expertise. Insurers are not offering their skills in processing or defending claims. They are simply waiving defenses and agreeing to pay so that they can sell more policies. In this way, claims facilitation is related to the expansion of RWI coverage.<sup>293</sup> It is not a core element of RWI, but rather a feature of the soft market for coverage.<sup>294</sup> As a result, the relative ease of payment under RWI policies in the present market should not be attributed to the insurer's claims management expertise.

---

290. See generally Tom Baker & Sean J. Griffith, *How the Merits Matter: Directors' and Officers' Insurance and Securities Settlements*, 157 U. PA. L. REV. 755, 797 n.164 (2009) (quoting the head of claims at a D&O insurer stating that "I think it is easier to get money out of an insurance carrier than it is out of an insured. Why? Because it is a third-party's money. We are in the business of paying claims. That is what we do for a living.").

291. See, e.g., RWI Survey, *supra* note 25, DL #9 (emphasizing "the expectation is that insurers are going to pay valid claims (because the product won't survive if buyers don't have faith in it)").

292. See, e.g., *id.* DL #7 (emphasizing that RWI has changed the contracting process through the much greater prevalence of "materiality scrapes"); *id.* B #15 (emphasizing that RWI has induced "silence on consequential/ multiplied damages" in the acquisition agreement so that such forms of damages may be covered); *id.* B #11 (noting broadening coverage through "silence on multiplied or consequential damages").

293. See *supra* notes 129–31 and accompanying text (documenting this expansion).

294. See *infra* Part V.D.

C. PRESSURE FROM CREDITORS AND OTHER CONTRACTUAL COUNTERPARTIES

Policyholders may also buy insurance because contractual counterparties insist upon it.<sup>295</sup> Insurance eliminates the risk faced by creditors and suppliers from a large uninsured loss, such as a major factory burning down, allowing them to lower the cost of credit *ex ante*.<sup>296</sup> More generally, insurance signals stability.<sup>297</sup> In its absence, counterparties may be unwilling to contract or willing to do so only at significantly higher prices. As a result, companies may purchase insurance in order to facilitate a wide range of business transactions.

But unlike factories and apartment buildings, RWI insures one-time transactions, not ongoing productive assets. Moreover, the liabilities insured by RWI are not, in the absence of insurance, likely to render the buyer insolvent. Losses from a breached rep may mean that the buyer overpaid, but rarely will such liabilities exceed the price paid. The covered risk under an RWI policy, in other words, is considerably less grave than the risk of a plant burning down. It is therefore unlikely to rise to the attention of most contractual counterparties.

There is, however, one contractual counterparty that may insist on RWI—that is, acquisition creditors of the buyer.<sup>298</sup> For providers of debt capital in the acquisition, RWI-risk may indeed be severe because their loans are based on the expected value of the assets acquired. If the acquired company turns out to be worth substantially less than anticipated, the equity cushion protecting the loan is diminished, thereby increasing their risk. If information about the true (diminished) value of the acquisition is only revealed post-closing, after the loan has been made, it will be too late for the creditor to adjust to this increase in

---

295. Goldberg, *Devil*, *supra* note 241, at 546 (“Sellers, tenants, and borrowers are often required to provide proof that they carry adequate insurance.”).

296. J. David Cummins & Pauline Barriau, *Innovations in Insurance Markets: Hybrid and Securitized Risk Transfer Solutions*, in HANDBOOK OF INSURANCE, *supra* note 247, at 547, 548–50.

297. Goldberg, *Devil*, *supra* note 241, at 549–50 (arguing that obtaining insurance is a low cost proxy for viability, allowing counterparties to “free ride[]” on the insurer’s risk selection and monitoring efforts).

298. See TRAVIS BELL, SRS ACQUIOM, AN OVERVIEW OF REPRESENTATIONS AND WARRANTIES INSURANCE 2 (2016) (claiming that RWI can “[f]acilitate acquisition lending” because funds paid out under buy-side policies can be assigned to lenders, which “can be an important term for acquisition lenders, especially in highly leveraged acquisitions”).

risk—for example, by raising interest rates. As a result, acquisition-creditors might insist on RWI *ex ante* to protect them against the realization of a risk to which they cannot adjust *ex post*.

Support for this explanation can be found in the structure of the private M&A market. Debt is widely used in private company deals, and transactions involving private equity buyers are typically highly leveraged. Consistent with this transactional background, survey participants reported the use of third-party financing in over 70% of their deals involving RWI.<sup>299</sup> Furthermore, 64% of respondents replied that RWI is “of interest” to banks or other providers of third-party financing.<sup>300</sup>

However, when asked to comment further on the interest of acquisition creditors in RWI, survey respondents reported that creditors do not motivate the purchase of RWI.<sup>301</sup> Instead, creditors are principally interested in securing access to policy proceeds as collateral in the event of default.<sup>302</sup> While this demonstrates some level of creditor interest in RWI,<sup>303</sup> respondents generally reported that lenders do not value the coverage highly enough to insist upon it or to modify the terms of credit in recognition of it.<sup>304</sup> For example, one Deal Lawyer remarked: “The interest is only among certain lenders [or their] counsel, and modest when present; it’s focused on obtaining rights in the policy and any policy proceeds, as opposed to consideration as to whether to engage in the deal overall.”<sup>305</sup> Another described the lender’s interest in RWI as “[m]arginal,” something that is

---

299. Mean: 71%. Median: 75%. RWI Survey, *supra* note 25, Question 96.

300. This percentage is consistent when isolating the responses of those closest to the financing of the deal—the deal lawyers and the buyers/sellers—six of whom said RWI is of interest to banks, four of whom said it was not. *Id.* Question 97.

301. Instead, most respondents named private equity buyers or sellers as the principal driver of RWI coverage. *Id.* Questions 42, 108.

302. *See id.* I #21 (“[A]most all policies have free Loss Payee endorsements to pay loss directly to lenders.”); *id.* I #10 (“[L]enders . . . are often the loss payee on policies.”); *see, e.g., id.* DL #7 (“[L]enders often require collateral assignment of RWI.”); *id.* B #1 (“Lenders often want a collateral assignment of the policy.”).

303. *Id.* B #14 (“I don’t have knowledge of how this is affecting rates, but most deals now require a collateral assignment of proceeds of the RWI policy to the lenders, indicating that they see value in these policies.”).

304. *See, e.g., id.* B #9 (“[Creditors] like to know there is another party available for recourse in the case of breaches. Not sure there is a relationship between availability or rates though.”).

305. *Id.* DL #9.

“[n]ice to have but [that] doesn’t improve [the] economics [of the loan].”<sup>306</sup> Brokers surveyed generally agreed: “The lenders do not appear to place significant value on the RWI.”<sup>307</sup> Another noted that: “No special terms or other consideration are given for [RWI], as far as I know.”<sup>308</sup>

The survey evidence thus suggests that while creditors are interested in securing access to RWI proceeds as collateral when RWI is present, creditors are not themselves the driving force behind the use of RWI. Market participants report little or no difference in the ease of obtaining credit with or without RWI in the deal. They also report that the terms of credit do not change to reflect the presence or absence of RWI. The dramatic expansion in the use of RWI does not seem to have been driven by acquisition creditors.

#### D. ALTERNATIVE CORPORATE FINANCE

Insurance may also substitute for other sources of capital, such as debt or equity financing. Using insurance to protect internal cash-flows may thus be efficient when it is less expensive than raising capital externally.<sup>309</sup> Insurance may thus play a regular role in the capital structure of business, depending upon the cost of other sources of capital. It is, in effect, alternative corporate finance.

The importance of insurance as a tool of corporate finance may be enhanced by tax rules.<sup>310</sup> For example, insurance premiums are fully tax deductible while the deductible loss from replacing a destroyed asset may be limited by the asset’s book value, creating an incentive to purchase insurance rather than self-insuring for losses relating to depreciable assets.<sup>311</sup> RWI,

---

306. *Id.* DL #1. *But see id.* DL #2 (remarking that RWI may make credit “[e]asier to obtain”).

307. *Id.* B #21.

308. *Id.* B #19.

309. Kenneth A. Froot et al., *Risk Management: Coordinating Corporate Investment and Financing Policies*, 48 J. FIN. 1629, 1630 (1993) (identifying the external cost of capital as a potential explanation for the corporate purchase of insurance).

310. Mayers & Smith, *Corporate Demand*, *supra* note 247, at 20–21, 25.

311. See Brian G.M. Main, *Corporate Insurance Purchases and Taxes*, 50 J. RISK & INS. 197, 199 (1983) (noting that “self-insured property damage losses are tax deductible only to the extent of the tax base, or book value, of the destroyed asset. Income from insurance claims, on the other hand, is tax free as long as it is used to repair or replace the destroyed asset . . . .” and building,

however, does not provide coverage for a depreciable asset.<sup>312</sup> Instead, RWI is best understood as cash-flow protection insurance, replacing income lost when the cash-flows of an acquired business are lower than anticipated due to a breached rep.<sup>313</sup> Future income is a non-depreciable asset. When it fails to appear, for whatever reason, it is fully deductible in the sense that a reduction in income also reduces tax liability.<sup>314</sup> Hence, there is no mismatch in tax treatment between insurance and self-insurance in the context of RWI. As a result, although they may be relevant in other lines of insurance, tax advantages are unlikely to motivate the purchase of RWI.<sup>315</sup>

Still, the corporate finance explanation might apply to RWI insofar as the insurance is cheaper than alternative sources of capital. The alternative to RWI is, of course, self-insurance, funded by an adjustment to the price paid in the acquisition. Because either the seller or the buyer can self-insure, the adjustment to purchase price can be made by either seller or buyer. If the adjustment is made by the seller, it is most evident in the indemnity/escrow arrangement—that is, the portion of the purchase price set aside to cover breached reps.<sup>316</sup> If the adjustment is made by the buyer, there may be no indemnity/escrow arrangement, but rather an implicit holding back of some of the purchase price to cover breached reps.

---

from this example, a theory of the corporate insurance focusing on tax differentials between asset replacement via insurance versus self-insurance).

312. See, e.g., John E. Core, *On the Corporate Demand for Directors' and Officers' Insurance*, 64 J. RISK & INS. 63, 68 n.10 (1997) (dismissing tax effects as “second-order in magnitude” when the insurance does not cover a depreciable asset).

313. See *supra* notes 163–64 and accompanying text.

314. Even in the shortened (average six years) time horizons of private equity, losses from reduced future income streams are fully deductible insofar as they reduce the subsequent sale price of the portfolio company, producing a tax-deductible loss for the fund.

315. The tax benefit may be small relative to the load of the insurance premium even for those lines of insurance to which the benefits most apply. See, e.g., CharngYi Chen & Richard PonArul, *On the Tax Incentive for Corporate Insurance Purchase*, 56 J. RISK & INS. 306, 306 (1989) (evaluating the size of the tax benefit over the asset's life, given inflation and the speed of depreciation, and concluding that the tax benefit is “small relative to the typical load in insurance contracts” and therefore cannot be the “sole reason for corporate purchase of insurance”).

316. It may also be reflected in a higher deal price.

There may be several ways to finance self-insurance on both the buy side and the sell side. For example, rather than consigning sale proceeds to an escrow account, sellers could borrow to fund the escrow account or, what amounts to the same thing, borrow against funds deposited in escrow. Alternatively, private equity sellers could provide a guarantee from the GP or a letter of credit from a bank instead of a traditional escrow account. Or they could buy RWI. The relevant question underlying all of these alternatives, of course, is whether the seller's cost of capital is higher or lower than the insurance premium the seller must pay. Likewise, on the buy side, rather than holding back capital and bidding *less* for targets without an indemnity, buyers could simply *borrow more* and bid the same amount. Or they could buy RWI. Again, the principal consideration would be the relative cost of capital between taking on additional debt (or contributing additional equity) and buying insurance.

The data most relevant to this comparison are not available. Transacting parties publicly disclose neither the cost of their RWI policies nor their marginal cost of capital. Still, it is possible to make some observations from averages and other available information. Take, for example, a \$100 million acquisition. Taking the typical limits (10% of deal value), typical retention (1% of deal value), typical premium (3% of limits), and typical brokerage commission (18% of premium) all noted above, we arrive at a total cost of \$1.35 million for \$10 million of coverage.<sup>317</sup> The cost, in other words, is 13.5% of the total coverage, which, as also noted above, is very rarely paid, even in part.<sup>318</sup> How does this compare to other sources of capital? Could a buyer or seller borrow \$10 million as a hedge against potential breaches for an interest rate lower than 13.5%? The answer, of course, is very likely yes, especially in the historically low interest rate environment that coincided with the explosive growth of RWI policies.<sup>319</sup>

---

317. Coverage is effectively \$9 million because the policy responds only after the retention (\$1 million) and only up to the limit (\$10 million).

318. See *supra* notes 168–81 and accompanying text.

319. From 2012 through 2018, the time period depicted on Figure 1, *supra*, the federal funds rate—the interest rate on which much lending activity is based—rose slowly from 0.07% at the beginning of 2012 to 2.4% at the end of 2018. See *Federal Funds Data Historical Search*, FED. RES. BANK N.Y., <https://apps.newyorkfed.org/markets/autorates/fed-funds-search-page> [<https://perma.cc/76YN-YXYY>].

There is an additional reason to doubt that the growth of RWI can be explained by its value as a source of alternative corporate finance. The alternative finance explanation applies to both public and private transactions. If the principal advantage of RWI is that it lowers the cost of capital by providing a cheap source of acquisition finance, then that advantage would seem to be equally attractive in both public and private deals. Yet RWI is used almost exclusively in private deals.<sup>320</sup>

There is no technical obstacle to using RWI in public deals.<sup>321</sup> Although public deals lack survival and indemnification, reps could be made to survive closing exclusively for the purpose of RWI. Alternatively, if the parties were unable or unwilling to negotiate survival, insurers could offer “synthetic warranty” policies, in which the insurer would make warranties directly to the buyer under the insurance contract, effectively disintermediating the seller.<sup>322</sup> Indeed, considering that there is no post-closing remedy for breached reps in public deals, RWI might be especially valuable as a form of contingent consideration in such deals, if indeed it is cheaper than alternative sources of acquisition finance.<sup>323</sup>

That RWI is not used in public deals suggests that the principal purpose of RWI is *not* in fact its use as an alternative source of acquisition finance. If its principal advantage were acquisition finance, there would seem to be a ready and waiting market in public deals. Likewise, although direct comparative data is not publicly available, the average cost of RWI likely exceeds alternative sources of acquisition finance or at least did during the years of the product’s flourishing. The alternative finance explanation therefore cannot account for observed patterns in the use of RWI.

---

320. See *supra* notes 132–34.

321. Indeed, in other countries, notably Australia, RWI has been used in public deals. See AIG, *supra* note 135, at 5; Clark, *supra* note 127.

322. These policies have been used in other related liability contexts, such as tax liability policies. The seller, under such a policy, would provide due diligence to the insurer (as well as the buyer) so that the insurer could assess the risk and price it.

323. Manns & Anderson IV, *supra* note 105, at 1185–86 (describing contingent consideration mechanisms as a means to “better align the incentives of both parties” and “enhance the overall efficiency of transactions”).

## E. DIVERGENT RISK PREFERENCES

Each of the previous hypotheses for the purchase of RWI assumed a close alignment of interests between investors and managers. However, these interests may diverge. Fund managers may have reasons to favor RWI that their risk neutral investors do not. This leads to two possibilities. First, if RWI creates a benefit to fund managers that investors do not share, fund managers may use their authority to buy it at the expense of their investors. RWI may, in this case, reflect managerial agency costs. Alternatively, fund investors may willingly purchase RWI to protect against managerial risk aversion. RWI may, in this case, reflect efficient contracting.

RWI may be a product of agency costs insofar as it enables managers to show accounting returns (measured by IRR) that exceed real economic returns.<sup>324</sup> On the sell side, RWI may boost IRR by avoiding escrow accounts, which reduce IRR by delaying the return of proceeds.<sup>325</sup> Delay should be of less concern to diversified investors who care principally about real returns. By contrast, because managerial compensation depends in large part on IRR, managers may prefer even inefficient expenditures to support it.<sup>326</sup>

Slightly different incentives apply on the buy side. Given the relatively short time horizon during which they hold portfolio companies—an average of less than six years—overpaying for a portfolio company may threaten to reduce the private equity fund's IRR at exit. Private equity investors are likely to be indifferent because they can spread this risk through diversification.<sup>327</sup> But again, because fund managers are compensated exclusively on IRR, they may favor RWI as a means of protecting

---

324. Under such circumstances, corporate insurance may be a form of earnings management. If managers expect their investors to overlook recurring insurance costs but punish large single period losses, they will tend to buy insurance even if the present value of the premium payments exceeds the present value of the future loss. *See generally* Froot et al., *supra* note 309, at 1631 (suggesting that risk-hedging may provide private benefits to managers).

325. KIRK SANDERSON, *EQUITY RISK PARTNERS, THE BANKER'S GUIDE TO REPS AND WARRANTIES INSURANCE ECONOMICS* (2016) (demonstrating impact on IRR from reducing or eliminating the escrow account).

326. Spreading loss through diversification harms IRR because losses are simply passed along to investors, reducing returns. Self-insurance likewise reduces IRR because losses must be absorbed by the fund, reducing returns.

327. Private equity investors should therefore favor RWI only when it provides benefits other than risk-spreading that exceed the cost of the premium.

it even if the insurance provides no real returns to fund investors.<sup>328</sup> As a result, the use of RWI on either the buy side or the sell side of private equity deals may reflect managerial agency costs.

Another, perhaps more profound, difference in incentives arises from the divergence in risk preferences between private equity managers and private equity investors. Because *investors* can spread portfolio company risk across diversified investment portfolios, they can be assumed to be risk neutral.<sup>329</sup> But because fund *managers* contribute a significant labor component to private equity investments and labor is generally non-diversifiable, private equity managers cannot be regarded as risk neutral.<sup>330</sup> RWI might thus be a function of this difference in risk between fund managers and their investors.

Limited partner agreements already reflect this important divergence between manager and investor risk preferences. The “carry” allocates 20% of the investment gain to fund managers to encourage risk-seeking.<sup>331</sup> At the same time, losses are absorbed almost entirely by the limited partners.<sup>332</sup> Managers continue to earn their 2% management fee irrespective of fund performance.<sup>333</sup> This asymmetrical shifting of risk likely reflects differences in the ability to diversify investment risk between limited partners (who, as investors of capital, can diversify) and general partners (who, as investors of labor, cannot). Because labor invested in underperforming funds cannot be recouped elsewhere, individual managers who are not protected on the downside may abandon the fund in search of richer opportunities.<sup>334</sup>

---

328. Meanwhile, the private equity firm, although it is likely more diversified than the individual fund and therefore more willing to self-insure, has incentives that mirror those of the fund because its ability to raise future capital depends its funds' IRRs.

329. See *supra* notes 241–42 and accompanying text.

330. See generally Gilson, *supra* note 1, at 283–84 (noting that “owner-managers will also have an undiversifiable human capital investment in the company they manage”).

331. See *supra* note 50 and accompanying text.

332. Virtually all losses are absorbed because the management firm will have invested only 1–2% of the fund's equity capital.

333. See *supra* note 52 and accompanying text.

334. Fraidin & Foster make this point as follows:

Because private equity employees expect to share in the incentive compensation of a fund, early poor investments by the private equity fund can have a profoundly negative impact on the fund's ability to retain and hire talented investment professionals . . . . If it becomes unlikely

RWI may serve as an additional hedge against this risk, further insulating private equity managers from non-diversifiable loss. Although they are themselves indifferent to the spreading of portfolio company loss through insurance, limited partner investors may nevertheless be willing to buy RWI to prevent their undiversified managers from becoming risk averse in the selection of investment targets. In this way, RWI may be seen as an efficient term of private equity manager compensation. Through it, fund investors promise to compensate fund managers for losses due to misinformation. In the absence of the insurance product, it is unclear how investors could commit to make managers whole for this type of loss.<sup>335</sup>

Does RWI represent agency costs or an efficient compensation arrangement? Either explanation implies a close association between RWI and private equity. This association is widely acknowledged in the practitioner literature, and it is confirmed by survey participants. RWI is predominantly used in private equity deals, often when private equity is on both sides of the transaction.<sup>336</sup> Moreover, survey respondents overwhelmingly ranked private equity first in driving the use of RWI.<sup>337</sup> As one broker remarked, “[t]he majority of policies are still being purchased by PE buyers (or portfolio companies of PE buyers).”<sup>338</sup>

---

that the fund will make anything from incentive compensation, employees will realize that they will have to work for the rest of the life of the fund without the opportunity to share in the performance-based pay. As a result, instead of sticking around and helping the fund improve its relative returns, they may search for jobs at other funds . . . . The same argument applies to being able to hire new talent when the fund is below its hurdle rate. Talented employees are unlikely to join a fund that is already substantially below its hurdle rate and where they are less likely to receive incentive compensation from future successful deals.

Stephen Fraidin & Meredith Foster, *The Evolution of Private Equity and the Change in General Partner Compensation Terms in the 1980s*, 24 *FORDHAM J. CORP. & FIN. L.* 321, 353 (2019).

335. This explanation for RWI mirrors the explanation for Side A D&O insurance (managerial risk aversion) as opposed to Side B and C D&O insurance (agency costs). See BAKER & GRIFFITH, *supra* note 21, at 46–48.

336. Forty-nine respondents reported on average that 19% (median 10%) of RWI Deals involved PE on both buy and sell side; 31% (median 30%) involved PE on sell side only; 47% (median 40%) involved PE on buy side only; 12% (median 10%) reported PE on neither the buy nor the sell side. RWI Survey, *supra* note 25, Questions 41, 63, 107.

337. *Id.* Questions 42, 108.

338. *Id.* B #14.

Private equity fees are notoriously opaque.<sup>339</sup> In addition to the carry and 2% management fee, private equity firms also charge a range of fees directly to the portfolio companies they manage.<sup>340</sup> For example, private equity managers frequently charge transaction fees and monitoring fees directly to portfolio companies.<sup>341</sup> These fees can be significant—transaction fees often amount to between 1–2% of deal value.<sup>342</sup> Because the equity

---

339. Fees are difficult to anticipate from the limited partnership agreement. See Ludovic Phalippou, *Beware of Venturing into Private Equity*, 23 J. ECON. PERSP. 147, 157 (2009) (“Most fees and costs imposed by private equity buyout firms on their investors are complex and contain a multitude of dimensions. Investors will find it difficult to compare different contracts and to anticipate accurately the magnitude of fees.”). It is also difficult to estimate fees from private equity fund prospectuses. *Id.* at 160–61 (“[D]etails concerning the amount of fees charged in the past are never mentioned. Only 25 percent of the funds report overall past performance net of fees. These funds are typically those with top performance.”); accord Yuki Sato, *Opacity in Financial Markets*, 12 REV. FIN. STUD. 3502, 3505 (2014) (articulating a model in which financial firms use opacity to exploit less informed agents through asymmetric information and tactics that inhibit learning).

340. Portfolio company fees can be charged for a range of services:

[P]ortfolio company fees are taken directly out of the portfolio companies by the private equity firm and so are not directly visible to investors. These include a number of expenses: 1) transaction fees when purchasing and sometimes selling a portfolio company; 2) expenses related to proposed but unconsummated investments; 3) taxes, expenses of accountants, litigation, counsel, and annual meetings; 4) advisory and monitoring fees; and 5) director fees.

Phalippou, *supra* note 339, at 150.

341. According to a leading study of private equity contracting:

Aside from management fees and carried interest, the other two components of revenue are transaction fees and monitoring fees . . . . When a [buyout] fund buys or sells a company, it effectively charges a transaction fee, similar to the M&A advisory fees charged by investment banks . . . . In addition to transaction fees, [buyout] funds often charge a monitoring fee to their portfolio companies.

Andrew Metrick & Ayako Yasuda, *The Economics of Private Equity Funds*, 23 REV. FIN. STUD. 2303, 2313 (2010).

342. *Id.* at 2319 (“In the purchase of a new portfolio company, [buyout] funds typically charge a transaction fee to that company that is between 1% and 2% of transaction value.”). Moreover, evidence suggests that the fixed component of private equity compensation (fees) increases relative to the floating component (the carry) in seller’s markets. Robinson & Sensoy, *supra* note 52, at 2761–62 (finding that “during boom periods in private equity, when fund sizes grow, overall pay rises, even as a fraction of fund size. The overall rise is driven by increasing management fees, so in boom periods the composition of compensation shifts toward fixed compensation (fees) and away from variable compensation (carry).”).

in these companies is 98–99% owned by the funds' limited partners, these charges are almost entirely financed by fund investors in spite of their inability to control or even understand them.<sup>343</sup> RWI is one such portfolio company fee, which investors finance without being able to control.<sup>344</sup> The opacity and lack of investor control over the purchase of RWI may favor the agency cost explanation. However, the inability to control an expense does not necessarily imply that investors do not benefit from it.

In sum, RWI seems to be a product of incentives internal to private equity fund management. As such, it may reflect agency costs or an efficient compensation arrangement to mitigate fund manager risk aversion. Although the cost of RWI is borne by risk neutral investors, they may nevertheless benefit if the insurance increases their investment returns by preventing fund managers from becoming risk averse in the selection of portfolio companies in which to invest.

#### V. WHY DO INSURERS SELL RWI?

One character, the insurer, has so far been left out of the story. It is worth asking why the insurer is willing to sell RWI coverage. A simple answer is that it is profitable. Claims are neither frequent nor severe.<sup>345</sup> Instead, “most claims settle within

---

343. Metrick & Yasuda, *supra* note 341, at 2313 (“While this fee is rolled into the purchase price, the GP can still benefit if she owns less than 100% of the company and shares less than 100% of these transaction fees with her LPs. About 85% of [buyout] fund agreements require that GPs share at least some portion of these transaction fees with their LPs . . .”).

344. There is some evidence that investors accept opaque portfolio company fees because they recognize that excessive portfolio company fees eat into IRR which is the basis of managerial compensation. Phalippou, *supra* note 339, at 157 (“When asked, some investors say they ignore (voluntarily or involuntarily) such details. The investors who do not ignore them say that if a fund charges too much portfolio company fees, its return is negatively affected, which may upset its current investors; hence, such a fund would raise less money and collect less fees in the future.”). Alternatively, it may be agency costs all the way down. See Bruce I. Carlin, *Strategic Price Complexity in Retail Financial Markets*, 91 J. FIN. ECON. 278 (2009); Xavier Gabaix & David Laibson, *Shrouded Attributes, Consumer Myopia, and Information Suppression in Competitive Markets*, 121 Q.J. ECON. 505 (2006); Peter Morris & Ludovic Phalippou, *A New Approach to Regulating Private Equity*, 12 J. CORP. L. STUD. 59 (2012).

345. See *supra* notes 168–70 and accompanying text (on frequency) and notes 177–83 and accompanying text (on severity).

the retention.”<sup>346</sup> Insurers thus would seem to be doing just fine selling policies on which they rarely are made to pay.

But, upon closer analysis, RWI presents a puzzle for the insurer as well. And once again, the cause is a fundamental information problem. The insurer is in a far worse position with respect to information about risk than the insured. True, insurers track claims,<sup>347</sup> and they may, on the basis of claims data, be able to price the average risk.<sup>348</sup> Nevertheless, information relevant to the occurrence of a specific risk—the potential falsity of specific reps—resides not with the insurer but with the insured. This persistent information asymmetry gives rise to problems of adverse selection and moral hazard, problems that cannot be solved by pooling and pricing.<sup>349</sup>

From an insurer’s perspective, then, the question becomes how to contain the threat of adverse selection and moral hazard, for if it cannot, it seems impossible to sell RWI profitably over time. These are the questions of this Part. The first Section considers responses to the problem of adverse selection, and the second considers responses to moral hazard. Because both of these turn on the reliability of information produced by the transacting parties, the third Section considers insurers’ tools in responding to misrepresentation and fraud, and the final Section considers the role of the underwriting cycle in shaping the insurers’ response.

---

346. RWI Survey, *supra* note 25, B #10; *see also supra* note 178 and accompanying text.

347. *See* AIG, *supra* note 135; AIG, *supra* note 169.

348. One insurer illustrated this point with an analogy to the sale of worker’s compensation insurance to contractors during the Iraq war. There was no actuarial data available, at least at the start of the war, on the risk of worker’s compensation claims in a war zone. Yet an insurance company was willing to sell the coverage, but only at a significantly higher price than ordinary policies. The contractor, who simply passed the cost on to the US government, was happy to pay the inflated price, and the insurance company made significant profits on the coverage. The moral of the story: “you don’t need a mountain of actuarial data to sell coverage profitably.” Interview with anonymous Insurance Underwriter (Oct. 4, 2018) (on file with author).

349. *See* Rothschild & Stiglitz, *supra* note 13, at 642.

## A. ADVERSE SELECTION AND UNKNOWN UNKNOWNNS

Adverse selection can arise when insureds have superior risk-relevant information and use it to their advantage in obtaining insurance.<sup>350</sup> The structure of the RWI market suggests adverse selection. The parties to M&A transactions clearly have better access to information about risk than third-party insurers, and not every deal is insured.<sup>351</sup> The dynamics of adverse selection thus predict that RWI is purchased for riskier deals, potentially setting off a cycle of higher premiums, concentrated risk, and the eventual implosion of the risk pool.

Insurers address this threat through risk selection. There are some risks that insurers will not cover.<sup>352</sup> For example, one underwriter noted the risk inherent in technology deals in which the target company is acquired for its proprietary technology rather than its value as an operating company.<sup>353</sup> Insurers view such deals as excessively risky because buyers who value the company for a specific asset may disregard risks associated with the operating company, ultimately leaving them on insurer.<sup>354</sup> Careful risk selection in the underwriting process may thus help insurers contain adverse selection.

The fundamental structure of RWI policies also mitigates the risk of adverse selection. Recall that RWI fundamentally covers only unknown risks.<sup>355</sup> Risks that are known or uncovered during the due diligence process are excluded from coverage, preserving coverage only for “unknown unknowns.”<sup>356</sup> It is possible,

---

350. *See supra* Part II.B.

351. Adverse selection can arise regardless of which transacting party drives coverage. For example, sellers may insist upon RWI rather than an indemnity because they know their deal is especially risky. Or, buyers may bid on especially risky deals only with the knowledge that RWI coverage is available, self-insuring for other more benign risks.

352. Insurers can select risk by refusing to underwrite a policy or by excluding specific types of risk within a policy. The former is a tool for containing adverse selection, while the latter, as we shall see, is a tool for containing moral hazard.

353. Interview with anonymous Insurance Underwriter (Sept. 21, 2018) (on file with author).

354. *Id.*

355. *See supra* note 157 and accompanying text.

356. The division of information into knowns, known (discovered) unknowns, and unknown (undiscovered) unknowns recalls the famous observation of Donald Rumsfeld: “[T]here are known knowns; there are things we know we know. We also know there are known unknowns; that is to say we know there are some things we do not know. But there are also unknown unknowns – the ones we

of course, that transacting parties conceal what they know and that RWI creates incentives to avoid uncovering knowable but presently unknown information. But these problems—fraud and moral hazard—are distinguishable from adverse selection. Putting them momentarily aside leaves the fundamental question of adverse selection: do the transacting parties have knowledge superior to the insurer concerning the risk to be insured? Given that the risks insured are unknown unknowns—risks that are neither known at the time of contracting nor uncovered in the due diligence process—the obvious answer is: no. By definition, neither the insurer nor the insured knows the unknown.

In this way, RWI policies define coverage so as to exclude the possibility of *pure* adverse selection—that is, adverse selection without any admixture of strategic behavior or fraud. The real world, of course, is not pure, and insofar as strategic behavior and fraud are allowed to re-enter the picture, adverse selection reappears. The question thus becomes how well insurers deal with the risk of strategic behavior and fraud. These are the concerns of the next two sections.

#### B. MITIGATING MORAL HAZARD

Moral hazard occurs when the fact of coverage induces a policyholder to act carelessly, thereby increasing loss.<sup>357</sup> Moral hazard in RWI operates upon the parties' incentives to produce and exchange information. Having purchased RWI, the parties may search less diligently to uncover all relevant information concerning risk. Moreover, insofar as RWI provides coverage only for risks that remain unknown, the parties may actively avoid uncovering information that, once revealed, will be excluded from coverage. Both of these incentive problems are manifestations of moral hazard.

Insurers generally manage moral hazard through the policy's deductible and limits, terms that effectively allocate loss to the policyholder, thereby maintaining "skin in the game."<sup>358</sup> In the context of RWI, however, both of these tools have been shrinking. Until recently, retentions under RWI policies had been set at 2% of deal value and were typically split, with the

---

don't know we don't know." Donald H. Rumsfeld, U.S. Sec'y of Def., U.S. Dep't of Def., News Transcript (Feb. 12, 2002), <https://archive.defense.gov/Transcripts/Transcript.aspx?TranscriptID=2636> [https://perma.cc/QDQ5-TMMH].

357. See *supra* Part II.B.

358. See Baker, *supra* note 14, at 282–83.

buyer and the seller each bearing 1%.<sup>359</sup> Now retentions are often set at 1% of deal value, sometimes lower.<sup>360</sup> And policies may be structured to allocate the retention entirely to the buyer, leaving no liability at all upon the seller.<sup>361</sup> Meanwhile, as already noted, the seller's indemnity has in many cases vanished altogether.<sup>362</sup> As a result, survey respondents note, "sellers have little to no skin in the game."<sup>363</sup> But this only means that RWI coverage has evolved to move risk from sellers to buyers. And even as deductibles shrink as a percentage matter, they can retain significance as absolute values. For example, at 1% of deal value, the deductible on a \$500 million deal is \$5 million, enough to motivate at least some serious effort in due diligence.

In addition to policy limits and deductibles, RWI insurers seek to control the risk of moral hazard by supervising the due diligence process. As described above, insurers hire experienced M&A attorneys to review the primary due diligence performed by the transacting parties.<sup>364</sup> They review reports and underlying documents and ask further questions of the transacting parties during the underwriting call. If this secondary due diligence process reveals additional risks or flaws in the underlying due diligence, then that risk area will lead to exclusions from coverage. The potential for exclusions from coverage, in other words, is the insurers' ultimate means of keeping the transacting parties engaged.

Still, managing moral hazard through exclusions creates contradictory incentives on the part of the transacting parties. To see this, consider that the purpose of due diligence is to uncover risks, making the unknown known, yet RWI covers only unknown risks. Known risk areas are excluded from coverage. If

---

359. RWI Survey, *supra* note 25, I #21. ("Retention amounts used to be around two percent for a number of years—it would be split 50/50 between buyer basket and seller escrow and made a lot of sense for all parties. Unfortunately, with the market expanding the trend has been to reduce the 'skin' . . .").

360. *Id.* I #5 ("There has been market pressure over the past year or two to lower Initial Retentions. The normal rule of thumb is 1% of deal value as the initial retention, but some larger deals are slightly below that."); *id.* I #4 ("As recently as 2016 or so, RWI deductibles were often in the 2% range. [I]t's currently more typical to see RWI deductibles of 1% for plain vanilla, good sized deals (i.e., deal value north of \$50 million), but smaller deals and deals in tougher industries still sometimes see RWI deductibles higher than 1%.")

361. Chapman et al., *supra* note 142.

362. See *supra* notes 142–43 and accompanying text.

363. RWI Survey, *supra* note 25, B #14.

364. See *supra* Part III.

exclusions are also used to police the buyer's care in the due diligence process, the result is a Catch-22: due diligence can result in a loss of coverage either by uncovering risks or by failing to uncover them. A coverage maximizing strategy might therefore be to design the diligence process to appeal to insurers but not necessarily to uncover new information.<sup>365</sup>

The RWI policy is designed to curb such strategic behavior in due diligence, specifically through the definition of knowledge. RWI policies define knowledge by reference to members of the deal team, including lawyers, bankers, and accountants, not merely officers of the target company. For example, the policy form of a major RWI underwriter excludes from coverage losses arising from "any Breach of which any of the Deal Team Members had actual knowledge" prior to commencement of the policy and further instructs that "Deal Team Members" include both those "who (i) supervised, reviewed or conducted any due diligence, analysis or evaluation in connection with the Acquisition Agreement, and/or (ii) supervised, reviewed, prepared or negotiated the Acquisition Agreement."<sup>366</sup> This definition sweeps more broadly than the definition of knowledge in the underlying acquisition agreement, which is typically limited to named representatives of the seller.<sup>367</sup> By excluding losses arising from liabilities known by representatives of the buyer and the seller as well as any professionals that participated in the diligence and drafting process, RWI policies prevent parties from colluding with their representatives to suppress information from insurers.

Furthermore, incentives for strategic behavior in negotiation may be curbed by other means. Just as the incentive to engage in reckless driving introduced by automobile insurance may be mitigated by the danger it poses to life and limb of the driver, the risk of mispricing borne by the buyer may induce careful due diligence without regard to RWI.<sup>368</sup> The buyer's interest in accurate information for pricing purposes may drive the diligence process as much or more than the buyer's interest in maintain-

---

365. For example, buyers might thoroughly investigate known risks while expending less effort to reveal new ones, which remain covered for only so long as they remain unknown.

366. *AIG*, *supra* note 155, at 1 n.2.

367. *See supra* note 90 and accompanying text.

368. *See* Frank A. Sloan et al., *Tort Liability Versus Other Approaches for Deterring Careless Driving*, 14 INT'L REV. L. & ECON. 53, 55 (1994).

ing insurance coverage. Supervisory due diligence and exclusions are a part of the underwriting process, but both ultimately depend upon the underlying information exchange having a purpose other than insurance—namely pricing.

Nevertheless, there may be limits on the underwriter's ability to free ride on the pricing incentives of the transacting parties. For example, in some deals, especially multi-bidder auctions, due diligence may come after the deal is priced and, because the parties are no longer able to adjust price to newly discovered risks, reduce the parties' incentive to participate actively in due diligence.<sup>369</sup> There is also a more fundamental limitation created by the credible commitment problem described above.<sup>370</sup> Insofar as RWI eliminates seller liability for misinformation, it creates a credibility problem that will either lead buyers to walk away or severely discount pricing. RWI therefore broadened to keep buyers in the deal.<sup>371</sup> But this creates a contradiction. How can an insurer rely upon a buyer's incentives to price the deal right when the buyer is simultaneously relying upon the insurer to provide coverage in case the price is wrong? RWI cannot simultaneously be the cause of and the solution to the underlying information problem.

Relying on due diligence to solve moral hazard is thus imperfect. But due diligence is not the insurer's only weapon against strategic behavior. Insurers are also armed with a set of coverage defenses that may enable them to force transacting parties to participate faithfully in the diligence process, lest they void coverage. These are the subject of the next section.

### C. COVERAGE DEFENSES

Ultimately, the insurer's ability accurately to pool risks and control strategic behavior depends upon not being lied to or misled. Insurers mitigate the risk of fraud and misinformation

---

369. In an interview with a prominent deal lawyer, the lawyer conceded the potential for moral hazard, but asserted that it does not arise in every deal. The key factor, he suggested, was the timing of pricing—that is, before or after the diligence exercise. When pricing is the culmination of due diligence, as in an exclusive negotiation with a single bidder, the need to get the price right keeps the buyer engaged in the process. However, when pricing occurs prior to the diligence process, as in an auction setting, the lawyer acknowledged that “incentives can get screwy.” See Interview with anonymous Deal Lawyer (Sept. 28, 2018) (on file with author).

370. See *supra* notes 107–11 and accompanying text.

371. See *supra* notes 231–32 and accompanying text.

through coverage defenses. Coverage defenses allow insurers to re-impose risk on policyholders *ex post*, thereby creating an incentive for policyholders to care for the truth *ex ante*. In the context of RWI, the principal coverage defenses are the knowledge exclusion, rescission, subrogation, and negotiations around damages.

Standard insurance law allows an insurer to rescind a policy if the policyholder provides false material information without regard to whether the policyholder knew or should have known that the information was false.<sup>372</sup> Insurers might therefore be able to avoid coverage if the buyer provided the insurer with false due diligence information. As applied to RWI, this is somewhat contradictory. False reps and warranties, after all, are the basis of coverage.<sup>373</sup> The false information that triggers the policy, however, is information provided by the seller. Rescission is triggered by false information supplied by the policyholder. In a typical buy-side policy, this is the buyer, not the seller.

Subrogation is the flip side of rescission. Like rescission, subrogation is triggered by false information, but unlike rescission, subrogation typically creates rights against the seller. RWI policies typically include subrogation rights, in which an insurer may pursue for itself a policyholder's claim against a third party.<sup>374</sup> In the context of a typical buy-side policy, the insurer would step into the shoes of the buyer to pursue the seller for providing false or misleading information.

Both subrogation and rescission shift risk *ex post* from the insurer to the transacting parties. In the case of rescission, risk is shifted to the buyer. In the case of subrogation, it is shifted to the seller. A credible threat that risk may be shifted to them *ex post* may create *ex ante* incentives for the parties to take care in producing only truthful information to the insurer.

---

372. See TOM BAKER & KYLE D. LOGUE, INSURANCE LAW AND POLICY: CASES AND MATERIALS 93–94 (3d. ed. 2014).

373. Consider, for example, a seller who falsely claims no impairment to its material contracts. Provided no deal team member knows the statement is false, this is precisely what the policy is designed to cover. From a policy perspective, rescission of a buy-side policy will not induce the *seller* to take more care in its disclosures, though it may incentivize the buyer to press the seller harder.

374. See, e.g., AIG, *supra* note 155, at 6.

However, rescission and subrogation are rare. Rescission is unheard of in RWI.<sup>375</sup> And subrogation is not much more common. The vast majority of respondents (83%) reported never having been involved in a situation in which insurers asserted subrogation rights.<sup>376</sup> Those who had been involved in assertion of subrogation rights reported that subrogation only occurred when there was clear evidence of fraud.<sup>377</sup> Indeed, survey participants reported, the insurer's subrogation rights are expressly waived much more often than they are asserted.<sup>378</sup>

Nevertheless, rescission and subrogation may create value for insurers even if they are not litigated (or arbitrated) to an outright denial of coverage. Coverage defenses enhance an insurer's hand at settlement. An insurer that can credibly threaten to exclude, rescind, or subrogate may be able to settle RWI claims at a substantial discount. By agreeing to settle in spite of a potentially applicable defense, the insurer can effectively "cash out the coverage defense."<sup>379</sup> In so doing, a coverage defense can exert considerable force even if it does not lead to a complete avoidance of coverage.

But such tactics may not be widely used in RWI. This can be seen by reference to DIV/multiplied damages claims which insurers entertain in spite of not having an express contractual obligation to do so.<sup>380</sup> As discussed above, the market has settled

---

375. See Email from anonymous RWI Broker to author (Jan. 30, 2019) (on file with author) (stating unequivocally that rescission "Never" happens).

376. RWI Survey, *supra* note 25, Question 72.

377. *Id.* CL #6 (reporting involvement in a subrogation claim involving "intentional misconduct"); *id.* I #21 (reporting "clear fraud by seller"); *id.* CL #3 (reporting "fraud"); *id.* CL #1 (reporting "fraud or wrongdoing").

378. More than twice as many respondents (14) reported having been in a situation in which a subrogation waiver was sought than reported being in a situation in which subrogation rights were asserted (6). Asked to comment on circumstances under which subrogation waivers are sought, respondents replied: "In order to settle a working capital disputes [sic] in cases where there is no real likelihood of a fraud claim against the Seller, the Buyer (insured) can ask the insurer to waive its subrogation rights against the Seller (only fraud claims are possible by insurer vs. Seller) to give the Seller walkaway peace (and maybe a better settlement for the Buyer)." *Id.* CL #3; *accord id.* CL #2 (noting that subrogation waiver is "typically sought" and "typically granted but will be held back if there is any hint of possible bad behavior that needs more exploration").

379. See, e.g., Baker & Griffith, *supra* note 290, at 822 (discussing how D&O insurers "cash[] out" coverage defenses in negotiating claims payments, effectively forcing policyholders to share in the risk *ex post*).

380. See *supra* note 162 and accompanying text.

on a practice of “following silence with silence” in connection with DIV/multiplied damages.<sup>381</sup> But not excluding a form of damages plainly does not obligate an insurer to cover them. Moreover, because DIV/multiplied damages are arguably a form of consequential damages, insurers would seem to have a particularly strong case against covering DIV/multiplied damages when the underlying agreement excludes consequential damages, as it often does.<sup>382</sup> Nevertheless, these arguments are not pressed by insurers in order to avoid coverage. The reason, market participants reported, was that any such attempt to avoid coverage would lead that insurer to be frozen out of the market.<sup>383</sup>

If insurers are willing to pay damages that they may not be legally obligated to pay, it seems unlikely that they are aggressively using coverage defenses to drive down settlement values. This in turn might mean that the threat of *ex post* risk shifting is not fully internalized by transacting parties *ex ante* and that the threat of subrogation and rescission therefore do not effectively prevent the parties from providing false information to the insurer. This dynamic is likely influenced by the underwriting cycle, discussed in the next section.

#### D. THE UNDERWRITING CYCLE

Insurers’ reluctance to use coverage defenses may be explained, in part, by the insurance underwriting cycle. Insurance markets follow a boom and bust cycle as capital enters or exits the market.<sup>384</sup> As capital enters the insurance market, coverage expands and premiums fall, a phenomenon referred to in the industry as a “soft market.” As capital exits the market, often in response to a significant loss event, underwriting standards tighten and premiums rise—a “hard market.” The process is un-

---

381. See *supra* note 164 and accompanying text.

382. See *supra* note 163 and accompanying text.

383. See Interview with anonymous RWI Insurance Broker, *supra* note 224; Interview with anonymous Insurance Underwriter, *supra* note 348; Interview with anonymous Insurance Underwriter, *supra* note 353.

384. See generally Neil A. Doherty & James R. Garven, *Insurance Cycles: Interest Rates and the Capacity Constraint Model*, 68 J. BUS. 383 (1995) (explaining the underwriting cycle by reference to interest rates and capital constraints); see also Tom Baker, *Medical Malpractice and the Insurance Underwriting Cycle*, 54 DEPAUL L. REV. 393, 393–422 (2005) (exploring the underwriting cycle in connection with medical malpractice insurance).

derstood by industry participants as cyclical because each market gives rise, over time, to its antithesis.<sup>385</sup> Profitable underwriting in a hard market attracts new entrants who water down underwriting standards and reduce premiums, eventually giving rise to losses and the exit of underwriting capacity, which allows surviving underwriters to tighten standards and increase premiums and so on. The only question is when the cycle turns.

RWI has been in a soft cycle since it emerged as a widely used form of coverage, around 2015.<sup>386</sup> The soft cycle may explain the reluctance of RWI insurers to use coverage defenses aggressively. An insurer known to pay claims at a slower or lower rate than its competitors may find that it is not solicited by brokers for quotes. Given that there are currently over twenty providers of RWI coverage, it may be particularly easy for brokers to retaliate against insurers that refuse to pay claims.<sup>387</sup> And indeed, the structure of the RWI market around claims would seem to reflect this soft cycle dynamic.

A harder market might correct some of the incentive problems generated by RWI. Insurers might only offer policies when there is a substantial seller indemnity. They might stop offering full materiality scrapes or bring back the policy exclusion for DIV/multiplied damages. Likewise, a hard market might allow insurers to press coverage defenses *ex post*, thus inducing insureds to take greater care *ex ante*. To the extent that it produces a less expansive form of coverage, a harder market in RWI may mitigate the distortion of incentives by putting more of the transacting parties' skin in the game.

But it is worth wondering whether a hard market in RWI is even possible. RWI coverage might depend upon its breadth.<sup>388</sup> Buyers need coverage for the kind of large mispricing claims that impact whether a fund manager clears the 8% hurdle to the carried interest. Moreover, only broad coverage for DIV damages addresses the credible commitment problem inherent in eliminating seller liability. If coverage were to narrow in a harder market, it is unclear whether transacting parties would find anything of value in RWI. Without the current breadth of coverage, transacting parties might well find self-insurance through a seller indemnity to be efficient after all.

## CONCLUSION

RWI currently offers a broad transfer of mispricing risk from buyers and sellers to insurers. As a substitute for standard indemnity and escrow obligations, RWI allows sellers to minimize risk at exit. RWI may also provide value to private equity buyers by preventing managerial risk aversion in the selection of portfolio company investments. At the same time, however, RWI threatens to disrupt the contracting process by introducing a profound credible commitment problem: sellers who do not bear liability risk cannot be trusted and buyers who cannot trust their sellers will discount or reject what might otherwise be efficiency-enhancing transactions.

The structure of RWI coverage responds to these problems. In particular, the full scrape and the implicit inclusion of DIV/multiplied damages respond to the credible commitment problem by promising the buyer that it will be made whole from any losses caused by an untrustworthy seller. Insurers may be willing to undertake these commitments in an expanding market but less so as insurance markets contract. The tightening of coverage terms in a hardening market may cause the transacting parties to rediscover the credible commitment problem at the heart of RWI, which in turn may lead them to abandon the product.

The stability of RWI coverage depends upon a fragile balance of incentives and market forces. Transaction planners may be able to adjust to a world with or without it. But we will have to await the next phase of the underwriting cycle before we can know RWI's long-term impact on M&A contracting.
