Abstract:	
Author Comments:	This is the revised version of the paper that I submitted for consideration as a Response to/Commentary on Charles Yang's Target Article. I have shortened the ms, as requested (it now totals 1526 words, including 18 heading-related words), and also adjusted the presentation so that the components of the paper are more readily followable.

Less IS More: on the Tolerance Principle as a manifestation of Maximize Minimal Means

Theresa Biberauer

The formalist perspective on language acquisition Yang outlines may be ‘personal’ (Yang, 2018, p.1), but it offers a valuable illustration of the spirit guiding much 21st-century generative work. Central here is the drive to “reduce[] the explanatory burden traditionally placed on innate linguistic parameters” (Yang, 2018, p.5) by pursuing a three- (1a) rather than two-factor (1b) model of grammar acquisition and structure:

- (1) a. Universal Grammar (UG) + Primary Linguistic Data (PLD) + general cognitive principles → an adult (L1) grammar
- b. UG + PLD → an L1 grammar

Where (1b) foregrounded a richly specified UG, (1a) emphasizes a pared-down UG, and the grammar-shaping role of non-language-specific cognitive mechanisms, including “principles of data analysis ... used in language acquisition and other domains”, and “principles of efficient computation” (Chomsky, 2005, p.6). Yang’s Tolerance Principle (TP) offers an explicit formal proposal as to how a potential third-factor principle - which rests on humans’ well-established statistical sensitivity (Yang, 2004) - might interact with linguistic input to account for aspects of grammar acquisition and knowledge. As Yang convincingly demonstrates, the TP facilitates real insight into how “Less” can be “More” for child-acquirers. My purpose here is to endorse the “Less is More” spirit of Yang’s model, and to suggest how the “periphery”-oriented TP may be

1 integrated with a similarly “Less is More”-oriented three-factors approach to “core”
2
3 grammar, which potentially also sheds light on the difference between L1- and L2-
4
5 acquirers.
6
7
8
9

10 The TP is strongly lexically oriented: the tolerance calculation requires the
11
12 identification of a domain encompassing a specific number of lexical items to which a
13
14 hypothesized generalization could apply. For the calculation to be meaningful - for the
15
16 TP to drive acquisition - there additionally need to be exceptions to the hypothesized
17
18 rule. These requirements allow us to situate the TP in relation to a recently proposed
19
20 three-factors model, Biberauer (2017)’s so-called *Maximize Minimal Means (MMM)*-
21
22 model.
23
24
25
26
27
28
29

30 The MMM-model postulates that child-acquirers aim to maximally exploit the
31
32 knowledge at their disposal at all stages of the acquisition process, including the pre-
33
34 lexical stage. MMM itself is conceived as a non-language-specific learning bias, which
35
36 drives acquirers to construct their grammars incrementally on the basis of knowledge
37
38 accessible to them at a given point. The idea is essentially that lesser access to input to
39
40 begin with - less input which qualifies as **intake** - allows acquirers to focus their
41
42 attention on a sub-component of the input, which they are then able to master and
43
44 harness as the basis for access to more complex, previously inaccessible aspects of the
45
46 input.
47
48
49
50
51
52
53

54 Much evidence suggests that L1-acquisition does indeed progress in this “Goldilocks”
55
56 manner, with acquirers systematically attending to input that is neither too simple nor
57
58
59
60
61
62
63
64
65

1 too complex, but “just right” - thus parallelling what we see in other domains (e.g.
2
3 vision; Kidd, Piatandosi & Aslin, 2012). Consider, for example, the research
4
5 demonstrating *in utero* and very early post-birth sensitivity to prosody (Gervain &
6
7 Werker, 2008 give an overview). Prosody delivers various ‘edge’-oriented cues that
8
9 allow acquirers to begin to “chunk” the input-strings in accordance with the grammar of
10
11 their input-language(s) long before they have any lexical knowledge. Among other
12
13 things, prosody alerts pre-lexical infants to basic head-directionality (“OV” = ‘strong-
14
15 weak’ vs “VO” = ‘weak-strong’) and, during the first half-year, to the distinction
16
17 between content and functional items, leaving 6-month-olds with a content-item
18
19 preference. Thereafter, more fine-grained details become available, with, for example,
20
21 the distribution of consonants and vowels within already-identified linguistic chunks
22
23 facilitating the articulation of acquirers’ knowledge of, respectively, vocabulary and
24
25 inflectional morphology. Significant components of L1 knowledge are thus in place
26
27
28
29
30
31
32 **before** the TP can regulate acquisition.
33
34
35
36

37 With some vocabulary in place, acquirers discover the key distinction between the truly
38
39 arbitrary, memorization-requiring form-meaning mappings that characterize **content**
40
41 items - classic Saussurean arbitrariness - and the “higher-level” arbitrariness that defines
42
43 the recurring form and distribution of functional elements within a system - e.g. the
44
45 obligatory inflection of Italian verbs, or the systematic fronting difference between
46
47 lexical and auxiliary verbs in English questions. Biberauer (2017) proposes that such
48
49 ‘systematic departures from Saussurean arbitrariness’ cue the postulation of grammar-
50
51 defining formal ([F])-features alongside content-item-defining semantic and
52
53 phonological features (Chomsky, 1995). Two points are crucial: firstly, [F]s define the
54
55
56
57
58
59
60
61
62
63
64
65

1 formal make-up of functional categories, and, hence, parametric variation, or “core
2 grammar”. Secondly, the postulation of [F]s, in accordance with MMM-driven Feature
3 Economy (‘Postulate as few [F]s as possible to account for observed regularities’) and
4 Input Generalization (‘Maximize the use of already-postulated [F]s’), allows the
5 acquirer to optimize their knowledge of system-defining regularities in a manner
6 paralleling that driving the TP-governed postulation of “periphery”-oriented rules: both
7 reflect a response to the acquirer’s ‘search for [memorization-limiting - TB] productive
8 generalizations’ (Yang 2018, p.14), which is, at base, driven by MMM. Further, to the
9 extent that [F]s have both grammar- (Narrow Syntax) internal and realizational (PF)
10 consequences - triggering Agree and Move operations, and determining placement and
11 morphological realization - we can begin to refine our understanding of how “core” [F]-
12 mediated regularities and TP-sanctioned peripheral rules relate to one another, and what
13 acquisitional consequences one might expect.

32
33
34
35 Significantly, the conclusion that peripheral rules are more “surfacey”, with the TP
36 merely regulating realizational options, seems too simple. Consider the “size”-based
37 emergent (non-UG-given) parameter typology (2), and the associated ‘learning
38 pathway’ (3):
39
40
41
42
43
44
45

- 46
47 (2) For a given value v_i of a parametrically variant feature [F]:
48
49 a. **Macroparameters:** All heads of the relevant type, e.g. all probes/phase
50 heads, share v_i . Examples: harmonic head-finality, radical pro-drop.
51
52

55
56
57
58
59
60
61
62
63
64
65

- 1 b. **Mesoparameters:** All heads in a given natural class, e.g. [+V] or all C-/T-
 2 heads, share v_i . Examples: Chinese-style head-finality, Romance-style pro-
 3 drop, Verb-Second.
 4
 5 c. **Microparameters:** A small, lexically definable sub-class of functional heads,
 6 e.g. (modal) auxiliaries, subject clitics, show v_i . Examples: partial pro-drop,
 7 English-style Verb-Second.
 8
 9 d. **Nanoparameters:** One/more individual lexical items is/are specified for v_i .
 10 Examples: Bavarian-style pro-drop, English-style Conditional Inversion.

20 (3)

21 Does [F]-based P(ropery) characterise L(anguage)?

22 Key here is the idea that macro-, meso- and microparameters are formulated over
 23 natural classes, namely, categories defined over more/less detailed [F]-specifications.
 24 L1-acquisition is largely assumed to proceed “top-down”, with the acquirer’s initially
 25 underspecified grammar progressively becoming more articulated in [F] terms as more
 26 of the input becomes accessible, and earlier acquisition stages, accordingly, featuring
 27 various underspecified “shadow” phenomena. More restricted/specialized natural
 28 classes are featurally more complex, meaning that we expect “smaller” [F]-regulated
 29

1 phenomena to be fully acquired later than “bigger” ones. Importantly, “bigger” class-
2
3 based parameters do not seem to require acquirers to attend to TP-relevant lexical
4
5 (ir)regularities.
6
7

8
9
10 Nanoparameters are different, however: they govern non-[F]-unified individual lexical
11
12 items, are acquired bottom-up, independently of the general top-down process, and may
13
14 therefore be acquired early or late, depending on the complexity of the [F]s encoded on
15
16 the nanoparametrically specified items. Because nanoparameters don’t target an entire
17
18 natural class - consider (standard) English Conditional Inversion (CI), which affects
19
20 only a subset of English’s seven past-marked auxiliaries: *had*, *were*, *should* - and
21
22 because the class is quantifiable, they seem to exhibit the same profile as TP-sanctioned
23
24 “peripheral” rules. And English CI in fact satisfies the TP ($N/\ln N = 1.946$). In principle,
25
26 given the definition of nanoparameter, this need not always be the case, however,
27
28 leading us -seemingly correctly - to expect TP-regulated instability in the
29
30 nanoparametric corners of grammar. The TP may thus regulate not just the productivity
31
32 of regular rules like those discussed in Yang’s work, but also the stability of certain
33
34 types of exceptions, the nanoparameters, which often instantiate “left-overs” from a
35
36 more productive system.
37
38
39
40
41
42
43
44
45
46

47 What does this imply for our understanding of the differences between L1- and (adult)
48
49 L2-acquisition? Yang suggests that adult learners’ larger vocabularies effectively
50
51 undermine their ability to harness the TP with an L1-acquirer’s effectiveness, leaving
52
53 them unable to reap “Less is More”-type benefits. From an MMM perspective, this may
54
55 be part of the problem; more generally, however, it seems that adults’ abundance of
56
57
58
59
60
61
62
63
64
65

1 highly-developed resources - language-specific and general-cognitive - compromises
2
3 their ability to “get back to basics” so as to build up their grammars incrementally, via
4
5 the “Goldilocks”-route taken by L1-acquirers. If our discussion is on the right track, it
6
7 will not just be the lexically-based and thus potentially TP-regulated aspects of
8
9 grammar that L2-acquirers will achieve variable success with; invariant and thus non-
10
11 TP-regulated “bigger” properties will also be undercut by the knowledge and biases that
12
13 adults bring to the task. And, if that is correct, three-factors-inspired formal work has
14
15 much to offer to deepen our understanding of the surprising properties of L1-
16
17 acquisition, mono- and bilingual, and of the nature of the challenge facing L2-learners.
