10 Abstract

A survey of UK-based pig farmers and veterinarians was conducted, in order to 11 investigate attitudes to pain and the use of pain relief in pigs. Survey respondents were asked 12 13 to indicate which anti-inflammatory drugs they used or prescribed for pigs, how often these were administered, and the level of pain they associated with particular conditions. The 14 survey found that veterinarians used a range of anti-inflammatory products to treat pigs with 15 lameness. While both farmers and veterinarians gave similar pain scores overall, farmers 16 rated gastrointestinal disease as more painful and conversely veterinarians scored lameness 17 18 higher. Female and younger respondents gave higher pain scores than males and older respondents. 19

20

21 Overall, farmers and veterinarians had a positive attitude towards pain relief in pigs with the majority agreeing that animals recovered more promptly when pain relief was 22 23 administered. Most farmers agreed that the recognition and management of pain is an 24 important part of pig husbandry, and many expressed an interest in finding out more about identifying pain in this species as well as the treatment options available. The study 25 highlighted potential barriers to the increased application of pain relief in pigs in that almost 26 one third of veterinarians and two thirds of farmers did not agree that they discussed pain 27 28 management with each other, while other respondents indicated that they found it difficult to 29 recognise pain in pigs, and did not know how to treat it appropriately.

32 Introduction

Despite recent advances in the assessment of pain in farm animals (Guatteo et al., 33 2012; Prunier et al., 2013), the application of appropriate pain relief is thought to be low 34 (Flecknell, 2008). Possible reasons for this mismatch include cost, farming culture or 35 tradition, practicality, the availability of and training in the use of analgesic drugs, and 36 restrictions on the use of such compounds in food producing animals (Mellor et al., 2008). 37 Previous studies examining attitudes towards pain and its mitigation in farm animals have 38 found that, in general, females and more recent veterinary graduates gave higher scores when 39 40 asked to quantify painful conditions (Huxley and Whay, 2006; Laven et al., 2009; Raekallio et al., 2003; Thomsen et al., 2010). In the case of cattle veterinarians, the use of analgesia for 41 certain conditions was associated with higher pain ratings for those conditions (Huxley and 42 43 Whay, 2006). Cattle farmers in Denmark scored painful conditions higher than veterinarians, but were less in favour of using analgesia, while veterinarians were more likely to agree that 44 cows benefitted from analgesia (Thomsen et al., 2012). 45

46

Although the cost of analgesia remains an issue for cattle farmers in the UK, this 47 barrier to their use could be over-estimated by veterinarians (Huxley and Whay, 2007). Other 48 factors potentially negatively impacting on the increased use of analgesia, include a lack of 49 knowledge, and limited drug availability (Whay and Huxley, 2005; Hewson et al., 2007). A 50 51 number of products are licenced for the treatment of painful conditions in pigs including nonsteroidal anti-inflammatory drugs containing the active ingredients meloxicam, ketoprofen, 52 flunixin, sodium salicylate and tolfenamic acid, along with the corticosteroid dexamethasone 53 54 and the mild analgesic paracetamol (VMD, 2011). These drugs are all classified as POM-V, so must be prescribed by a veterinary surgeon following clinical assessment of the animal or 55 group of animals (NOAH, 2014). However, given that veterinary visits for individual cases of 56

pigs experiencing pain would not be economically sustainable, once diagnosed and treated by
a veterinarian, further cases of the condition can be treated by the farm staff, a record of
which is regularly checked by the attending veterinarian.

60

Given that, to our knowledge, the attitudes of pig farmers and veterinarians towards
pain and pain relief in pigs in the UK have never been clearly defined, this survey was
established to ascertain these attitudes and identify the scale and frequency of the use of antiinflammatory drugs in the aleviation of pain in this species.

65

66 Materials and methods

67 *Questionnaire design*

68 Separate questionnaires were designed for farmers and veterinarians using Snap software (Snap Surveys Ltd.) in both paper and online (via Snap WebHost) formats. The first 69 section asked farmers about the farm on which they work, and veterinarians about their 70 71 veterinary practice. Both questionnaires listed the following drugs by active ingredient (brand names were included in the farmer questionnaire): meloxicam, ketoprofen, flunixin, sodium 72 salicylate, tolfenamic acid, dexamethasone and paracetamol. Survey respondents were given 73 the opportunity to identify which drugs they used (both farmers and veterinarians) or 74 75 prescribed (veterinarians only) for pigs. All respondents were asked to indicate how often 76 ('almost always', 'frequently', 'sometimes', 'rarely', or 'never') they used or prescribed these drugs for lameness in breeding pigs. Veterinarians were given the opportunity to indicate if 77 they had not given advice in relation to lameness, and farmers could record that they had 78 79 never encountered the condition on their premises.

81 Respondents were also asked to rate eight different conditions with regard to the pain they considered breeding pigs experienced, on an ordinal scale from '0' (no pain) to '10' 82 (very severe pain). Both farmer and veterinarian questionnaires also listed statements about 83 84 pain and the use of pain relief in pigs, and asked respondents to indicate their level of agreement ('strongly agree', 'agree', 'neither agree nor disagree', 'disagree', or 'strongly 85 disagree'). Questionnaires also collected other respondent information including: age, gender, 86 percentage of working time spent with pigs, and years of experience working with pigs. 87

88

89 Questionnaire distribution

The questionnaires were piloted on five veterinarians and five farmers working at 90 university pig units before they were distributed throughout the UK between September 2012 91 92 and June 2013. Several distribution methods were used in order to maximise the 93 questionnaire's 'reach'. E-mail invitations to participate along with one week reminders, containing a link to the online questionnaire were automatically sent to 129 veterinarians 94 95 using Snap WebHost. Paper copies, along with a postage-paid envelope, were also sent out to 10 veterinary practices whose websites indicated that they worked with pigs. Twenty-nine 96 97 members of the Scottish professional pig managers group were also e-mailed a link to the farmer version of the questionnaire, also followed up by one week reminders. Paper copies of 98 the farmer questionnaire were included in the December 2012 issue of *Pig World* magazine¹, 99 which at that time had 4200 subscribers, 3000 of which were pig farmers (i.e. farm owners, 100 managers and stockpersons). A small number of paper copies of the questionnaire were 101 distributed to pig farmers at BPEX² meetings, during veterinary visits to farms, and at the 102 Royal Highland Show³. 103

³ See: www.rovalhighlandshow.org/

104 *Data analysis*

Both on-line and paper responses were transferred into Exel and analysed using 105 Minitab 15 and Genstat (11th Ed.). Spreadsheets were cross-checked to minimise errors and 106 results were considered statistically significant at $P \le 0.05$, and tendencies discussed at $P \le$ 107 0.1. For the frequency of anti-inflammatory use to treat lameness, counts of farmers and 108 veterinarians in each category ('almost always' to 'never') were tabulated and analysed using 109 a Chi-Square test. Pain scores were analysed for differences between farmers and 110 veterinarians, by gender and age group using ordinal logistic regression. For analysis of 111 112 agreement between statements relating to perception of pain and use of pain relief, responses were coded between 'strongly agree' (1) and 'strongly disagree' (5), and responses of 'don't 113 114 know' or 'no response' were treated as missing values, so that differences between farmers 115 and veterinarians could be analysed using Mann-Whitney U tests.

116

117 **Results**

Fifty-two questionnaires were completed by veterinarians: 34 online (responses from 118 the e-mailed link to the questionnaire), 18 on paper (from postal questionnaires sent to 10 119 practices). A total of 64 were returned by farmers: 10 online, 54 on paper (12 from the 120 Scottish Professional Pig Managers' Group, 45 through Pig World Magazine, and nine from 121 other sources). Assuming the number of veterinarians working with pigs in the UK taken 122 123 from our database (n = 129) was accurate, the response rate for veterinarians was approximately 40%. If we estimate the farmer questionnaire reached approximately 3000 pig 124 farmers, the response rate for farmers was 2%. Table 1 illustrates respondents by age, gender, 125 126 and occupation. Of the veterinarians surveyed, 20 worked in mixed practice, 17 in large animal practice, nine in pig practice, two for a pig production company, and one in a small 127

animal practice, for a pharmaceutical company, and in academia, respectively. Onerespondent did not indicate where they worked.

130

131	Veterinary respondents worked with pigs between 1 and 100% of their time (mean,
132	$60.2 \pm 41.3\%$), and had between one and 45 years experience of working with pigs (mean,
133	18.6 ± 12.4 years). Fifty farmer respondents worked on breeder-grower-finisher farms, eight
134	on breeder-weaner farms, two on breeder-grower farms, three had no breeding sows, and one
135	respondent did not say. The mean size of the breeding herd on the farms on which
136	respondents worked was 635 ± 1482 (37493 total breeding pigs). Farmers typically spent
137	between 5 - 100 % of their time working directly with pigs (mean, 66.2 \pm 30.8%), and had
138	between 3- 62 years of experience of this type of farming (mean, 30.8 ± 12.5 years).

139

140 Use of anti-inflammatory drugs

Veterinarians used a greater range of drugs than farmers, with all respondents 141 identifying at least one whereas, 24.6% of farmers did not identify any drug treatment (the 142 majority used only one; Fig.1). The most frequently used drug by active ingredient was 143 meloxicam, followed by dexamethasone, ketoprofen, flunixin, sodium salicylate, paracetamol 144 and tolfenamic acid (Table 2). The distribution of responses from farmers and veterinarians 145 on the use of these compounds for lameness is illustrated in Fig.2. Veterinarians used anti-146 inflammatories more frequently than farmers for lameness in breeding pigs ($\chi^2 = 15.42$, P =147 0.004 [47 farmers and 51 veterinarians]). 148

149

```
150 Pain scoring
```

151 The distribution of pain scores given by farmers and veterinarians for various152 conditions is given in Fig. 3 and Table 3. Overall, scores did not differ between farmers and

veterinarians, although veterinarians allocated higher scores for lameness and tended to score higher for normal farrowing, while farmers gave higher scores for cases of gastrointestinal disease. Pain scores differed overall by age group, and for conditions such as leg fractures, infectious mastitis, farrowing (normal and difficult) and gastrointestinal disease, all with younger respondents attributing higher scores. Pain scores also differed by gender, with females scoring significantly higher for both normal and difficult farrowing and 'shoulder sores'.

160

161 Agreement statements

The levels of agreement with statements about pain and the use of pain relief by farmers and veterinarians are presented in Table 4. There were no differences in the responses of farmers and veterinarians to the statements: 'it is difficult to recognise pain in pigs'; 'pain relief drugs are too expensive for pig farmers to use regularly'; and 'I feel I know enough about pain and how to treat pain in pigs'. Veterinarians tended to disagree slightly more than farmers with the statements: 'there are not enough pain relief drugs available to use in pigs with painful conditions'; and 'pigs are not as sensitive to pain as humans'.

169

While overall, respondents agreed with the statement 'pigs recover better with pain 170 relief', veterinarians agreed more strongly, and interestingly 20.3% of farmers either returned 171 172 a response of 'don't know' or did not reply at all. For the statement 'I regularly discuss pain and pain relief options with pig farmers (for veterinarians) or with my pig veterinarian (for 173 farmers)', veterinarians agreed more than farmers. For the agreement statements only given 174 175 to farmers, 87.5% agreed or strongly agreed that 'recognising and managing pain is an important part of pig keeping', and 70.3% agreed or strongly agreed that they 'would like to 176 know more about pain and how to treat pain in pigs'. For statements only given to 177

veterinarians, 53.9% agreed or strongly agreed that 'not enough is known about the benefit of
pain relief', and 51.9% agreed or strongly agreed that they 'keep up-to-date with the latest
literature on pain relief for pigs'.

181

182 Discussion

The response rate of veterinarians to our survey at 40%, was higher than the 27% 183 response to a survey on attitudes to pain and the use of analgesics in cattle by UK-based 184 veterinarians, although from the much smaller sample population of pig veterinarians 185 186 practicing in the UK (54 pig vs. 641 cattle veterinarians) (Huxley and Whay, 2006). At 2%, the response rate of farmers was lower than the 15% achieved in an equivalent cattle survey 187 in the UK (Huxley and Whay, 2007). However, the total number of breeding pigs 188 189 respresented by farmer respondents was 37493, with an average herd size of 635. The 190 average pig herd size (for farms with > five sows) in the UK in 2012 was 153 breeding pigs (DEFRA, 2014), and in December 2013, the UK national herd was 398000 spread over 6100 191 pig holdings (BPEX, 2014). Therefore, the results of the farmer returns represent larger pig 192 farms, some 9% of the UK breeding herd. The method of distribution of the questionnaire to 193 farmers probably introduced selection bias, as individuals interested in reading Pig World 194 magazine and/or were attending the Scottish professional pig managers group meetings are 195 196 likely to be more interested in learning more about pig keeping. There is also likely to have 197 been some bias with the veterinarian questionnaire respondents, as those particularly interested in pain and pain management in pigs may have been more likely to respond. 198

199

The percentage of respondents using anti-inflammatories by active ingredient
 demonstrates the order of popularity of drugs, which probably represents a balance between
 cost, availability, efficacy, pharmaceutical form, withdrawal period and other factors. By far

203 the most frequently used drug was meloxicam, a result also found in a survey of pig farmers in Victoria, Australia (Wilson et al., 2014). This is not surprising as more products 204 containing meloxicam as the active ingredient, compared with the other anti-inflammatory 205 206 products, are listed on the Veterinary Medicines Directorate product information database (VMD, 2011). In addition, due to a difference in the mode of action of meloxicam compared 207 with other non-steroidal anti-inflammatory drugs, it has low ulcerogenic activity (Engelhardt 208 209 et al., 1995). The drugs used by the fewest respondents, despite being less expensive, included sodium salicylate and paracetamol, which are only available for oral administration 210 211 (via feed and water) and tolfenamic acid, which only has one product listed for use in pigs (VMD, 2011). 212

213

214 In this study all veterinarians used or prescribed anti-inflammatories to treat lameness in gilts and sows and 98% used or prescribed anti-inflammatory drugs at least sometimes for 215 lameness, compared with 65.2% of pig veterinarians based in Canada surveyed between 2004 216 and 2005 (Hewson et al., 2007). Despite no overall difference in pain scores, results differed 217 between farmers and veterinarians in the use of anti-inflammatories: all veterinarians used at 218 219 least one drug, whereas one quarter of farmers did not use any. Veterinarians used or prescribed anti-inflammatory drugs for lameness more often than farmers used them. It is 220 221 possible that veterinarians only see severe cases of lameness, so would be more inclined to 222 provide an anti-inflammatory, or that farmers rely on their veterinarians to provide this type of treatment, which could account for this difference. Farmers may only treat severe cases of 223 lameness, as the cost of the products, and the time and practicality of administering them may 224 225 only seem worthwhile in these severe cases, especially on large farms. Some of the farmer respondents may not have been responsible for drug treatment, so may not have known what 226 227 products are used on their farms. Compared with farmers, more veterinarians in this study

strongly agreed that pigs recover better with pain relief. Similarly, cattle veterinarians in
Denmark agreed more often than farmers that cows benefit from, and recover faster with
analgesics (Thomsen et al., 2012). However, 20.3% of the farmers in that survey responded
that they did not know or did not reply to this statement, and, given that many do not use any
anti-inflammatories, it is possible that they were not aware of the benefits.

233

Similarly to previous survey studies of veterinarians (Huxley and Whay, 2006; Laven 234 et al., 2009; Lorena et al., 2013; Raekallio et al., 2003), females in this study scored higher 235 236 than males, and younger respondents gave higher scores. It is interesting that females scored higher for farrowing (both normal and difficult) and shoulder sores, and differences in score 237 by age group varied between conditions. In contrast to a previous study, where farmers 238 239 scored pain higher than veterinarians for several cattle diseases (Thomsen et al., 2012), here 240 farmers and veterinarians generally gave similar scores for painful conditions in pigs. Farmers did give higher scores to gastrointestinal disease, and veterinarians tended to score 241 242 higher for lameness and farrowing, but other demographic factors may be influencing these results. Uneven numbers of respondents across combinations of gender, age, and occupation 243 categories, with very few female farmers and older female veterinarians, means interactions 244 between these factors could not be investigated. However, larger studies of cattle 245 246 veterinarians showed no significant interaction between age group and gender (Huxley and 247 Whay, 2006; Laven et al., 2009), so it is possible that gender and age group differences in this study are independent of one another. 248

249

In this study, 64% of veterinarians felt there were enough pain relief drugs available,
however, in a previous study in Canada, veterinary respondents agreed that more analgesics
are needed for use in livestock (Hewson et al., 2007). This is not surprising as many drugs are

currently available in the UK, and veterinarians are able to use other analgesic drugs under
the cascade system. In Canada, veterinarians working with pigs agreed slightly overall that
owners are not willing to pay for analgesia (Hewson et al., 2007) and 65.3% of veterinarians
working in cattle practice in the UK in 2004 agreed that cost is a major issue for cattle
farmers (Whay and Huxley, 2005), but in this study, only 29% of veterinarians and 19% of
farmers agreed that analgesic drugs are too expensive.

259

Thirty-seven per cent of veterinarians and 48% of farmers agreed that they feel they 260 261 know enough about pain and how to treat pain in pigs, and 52% of veterinarians agreed that they keep up-to-date with the latest literature on pain relief for pigs, whereas only 32% of 262 veterinarians working with pigs in Canada considered their knowledge of analgesia to be 263 264 adequate (Hewson et al., 2007). However, this does mean that many farmers and 265 veterinarians feel their knowledge about pain and pain management is less than adequate, and feel it is difficult to recognise pain in pigs. Similarly, many veterinarians do not keep up-to-266 267 date with the latest literature on pain relief in pigs, which could ultimately negatively impact on its use. Fifty-three per cent of cattle farmers based in the UK agreed that veterinarians and 268 farmers do not discuss pain control in cattle sufficiently (Huxley and Whay, 2007), while in 269 the current study 62% of veterinarians, and approximately half this percentage of farmers 270 agreed that they discuss pain and pain relief options in pigs with each other. 271

272

In a survey of Norwegian dairy farmers, 70% agreed or strongly agreed that 'animals experience physical pain as humans do' (Kielland et al., 2010). In the current study, 48% of farmers and 67% of veterinarians disagreed or strongly disagreed that 'pigs are not as sensitive to pain as humans'. This sentiment could influence the behaviour of farmer towards the management of pain in pigs. Negative attitudes in stockpersons towards pigs correlate with negative behavioural interactions with this species (Coleman, 1998). Improving such
attitudes and modifying human behaviour, resulted in improvements in both the behaviour
and productivity of pigs (Hemsworth et al., 1994). A positive attitude towards pain
management in pigs was shown by respondents to the current survey, as 88% of farmers
agreed that 'recognising and managing pain is an important part of pig keeping', and 70%
wished to know more about pain and how to treat it in this species. A large proportion of both
farmers and veterinarians agree with the statement: 'pigs recover better with pain relief'.

285 Conclusions

286 This survey has demonstrated that anti-inflammatory drugs are widely used to treat lameness in breeding pigs, with high agreement by participants that pigs recover better with 287 pain relief, and, overall, there was a positive attitude to the recognition and management of 288 289 pain. However, this research also highlights potential barriers to the increased use of pain 290 relief for pigs, identifying lack of up-to-date knowledge, poor communication between farmers and veterinarians, and the fact that many older male respondents gave low scores for 291 292 painful conditions. Understanding the attitudes of pig farmers and veterinarians to pain and pain management could help target future education, training and research strategies in this 293 area. 294

295 Conflict of interest statement

296 Neither of the authors of this paper has a financial or personal relationship with other297 people or organisations that could inappropriately influence or bias the content of this paper.

Demographic profile of survey respondents.

370 Percentage of farmers and veterinarians who use (farmers) or use/prescribe

Drug (as per active	Veterinarians (%)	Farmers (%)
ngredient)		
Meloxicam	92.3	41.0
Dexamethasone	69.2	37.7
Ketoprofen	50.0	14.8
Flunixin	36.5	9.8
Sodium salicylate	38.5	1.6
Paracetamol	28.8	3.3
Folfenamic acid	15.4	6.6

371 (veterinarians) analgesic drugs by active ingredient.

374 Median (first and third quartile), and mean (standard error of the mean) pain scores as allocated by farmers and veterinarians, by

275	gender and age group for	alaht any ditionaling	huseding miga	wages a stirval-
375	gender and age group for	' eignt conditions in	nreening nigs.	respectively.
575	genuer und age group for	eigne contaitions in	bi counts piss,	respectively.

377 Frequency (and %) of farmers and veterinarians (vet) in agreement with statements about pain, and the use of pain relief, in pigs.

	Farmer/	Frequency (%)							rs vs. arians
Statement	vet	Strongly agree (1)	Agree (2)	Neither (3)	Disagree (4)	Strongly disagree (5)	Don't know/no reply	Coded mean	P value
It is difficult to recognise pain in pigs	Farmer Vet	2 (3.1) 3 (5.8)	19 (29.7) 18 (34.6)	3 (4.7) 7 (13.5)	24 (37.5) 19 (36.5)	13 (20.3) 5 (9.6)	3 (4.7) 0 (0.0)	3.1 3.3	0.132
Pain relief drugs are too expensive for pig farmers to use regularly	Farmer Vet	3 (4.7) 6 (11.5)	9 (14.0) 9 (17.3)	17 (26.6) 10 (19.2)	22 (34.4) 20 (38.5)	6 (9.4) 5 (9.6)	7 (10.9) 2 (3.9)	3.4 3.2	0.646
I feel I know enough about pain and how to treat pain in pigs	Farmer Vet	6 (9.4) 4 (7.7)	25 (39.0) 15 (28.9)	14 (21.9) 16 (30.8)	14 (21.9) 15 (28.8)	2 (3.1) 2 (3.8)	3 (4.7) 0 (0.0)	2.7 2.9	0.223
There aren't enough pain relief drugs available to use on pigs with painful conditions	Farmer Vet	0 (0.0) 4 (7.7)	9 (14.0) 4 (7.7)	19 (29.7) 11 (21.1)	14 (21.9) 29 (55.8)	3 (4.7) 4 (7.7)	19 (29.7) 0 (0.0)	3.2 3.5	0.064
Pigs are not as sensitive to pain as humans	Farmer Vet	4 (6.3) 1 (1.9)	16 (25.0) 8 (15.4)	7 (10.9) 4 (7.7)	15 (23.4) 16 (30.8)	16 (25.0) 19 (36.5)	6 (9.4) 4 (7.7)	3.4 3.9	0.056
Pigs recover better with pain relief	Farmer Vet	12 (18.7) 24 (46.2)	34 (53.1) 25 (48.1)	4 (6.3) 2 (3.8)	$\begin{array}{c} 0 \ (0.0) \\ 0 \ (0.0) \end{array}$	1 (1.6) 1 (1.9)	13 (20.3) 0 (0.0)	1.9 1.6	0.041
I regularly discuss pain and pain relief options with pig farmers (vets) or my veterinary surgeon (farmer)	Farmer Vet	5 (7.8) 5 (9.6)	14 (21.9) 27 (52.0)	19 (29.7) 10 (19.2)	19 (29.7) 10 (19.2)	5 (7.8) 0 (0.0)	2 (3.1) 0 (0.0)	3.1 2.5	0.003

Fig. 1. Numbers of anti-inflammatory drugs used by farmers and veterinarians responding to

379 survey questionnaire.

- Fig. 2. Frequency ('almost always', 'frequently', 'sometimes', 'rarely', and 'never') with
- which anti-inflammatory drugs are used (or prescribed) by farmers (in black) and
- veterinarians (in white) for the treatment of lameness in breeding pigs.

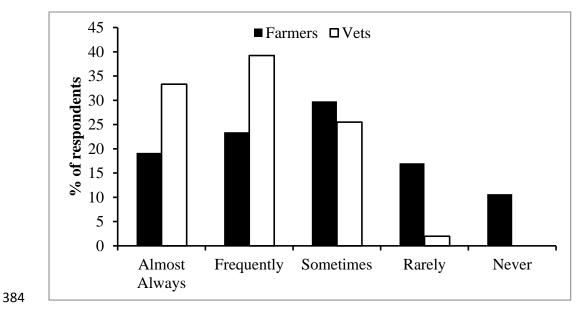

Fig. 3. Distribution of pain scores (from '0' [no pain] to '10' [most severe pain]) for eight conditions surveyed in breeding pigs as given by farmers (in black) and veterinarians (in white).
