The long-term trends in soil carbon stock and crop productivity depending on management in Estonia

Kauer, K., Tein, B. and Loit, E.

Estonian University of Life Sciences, Institute of Agricultural and Environmental Sciences, Kreutzwaldi 1, 51014 Tartu, Estonia.

karin.kauer@emu.ee

The dynamics of soil organic carbon (SOC) content and crop productivity were studied on three still continuing field experiments situated at the experimental station of the Estonian University of Life Sciences in Tartu, Estonia. Also the SOC model ICBM applied under Nordic conditions was tested for C stock calculations.

Experiment 1 established in 1964 on till material excavated to a depth of 1.5-3 m. The material was almost free from SOC (0.6 g kg^{-1}). 19 treatments.

Experiment 2 with 3-crop rotation (potato - spring wheat - spring barley) was established in 1989. Experimental factors were organic (without amendment, solid cattle manure and alternative organic fertilisers) and mineral fertilisers (0, 40, 80, 120 and 160 kg N ha^{-1}).

Experiment 3 with 5-crop rotation (barley undersown with red clover - red clover - winter wheat - pea - potato) was established in 2008. Experimental factors were organic (catch crops as green manures, catch crops as green manures combined with composted cattle manure) and conventional farming systems. The conventional farming systems differed in the amounts of mineral fertilizers used.

ICBM Model

ICMB is a five-parameter model (depending on how the model is used) that has two state variables, young and old soil organic carbon (Figure 1).

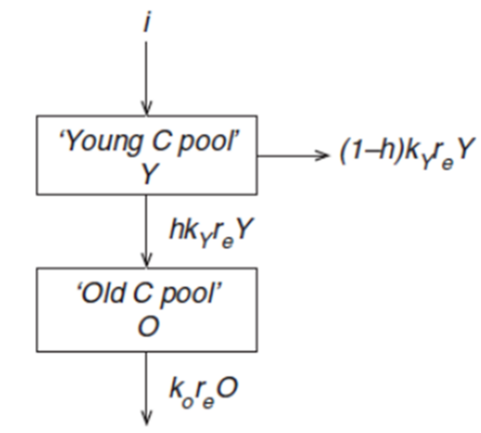

Figure 1. Structure of the ICBM: i=annual C inputs to soil, k_Y and k_O= first order decomposition rate constants for the young (Y) and old (O) soil organic carbon pools, h=humification coefficient, r_e=soil climate-management parameter.

Table 1. The crops DM yields of experiments

Experiment	Crop	DM yield of main product, t ha^{-1}
Experiment 1	Barley	1.2[1]
	Grasses	1.6[2]
	Grasses-clover	2.7[2]
Experiment 2	Potato	5.1
	Spring wheat	2.9
	Barley	3.0
Experiment 3	barley	2.9
	Clover	8.4
	Pea	2.3
	Potato	7.6
	Winter wheat	3.8

[1] Aboveground biomass measured at the of grain formation stage;
[2] Aboveground biomass

Table 2. The relative plant C allocation coefficients for calculations of annual NPP and C inputs

Crop	Relative plant C allocation coefficients			
	$R_{Product}$	R_{Shoot}	R_{Root}	$R_{Extra\text{-}root\ material}$
Barley[1]	0.451	0.400	0.090	0.059
Wheat[1]	0.322	0.482	0.118	0.078
Clover[1]	0.571	0.000	0.260	0.169
Pea[2]	0.233	0.577	0.115	0.075

[1] Based on Bolinder et al., 2007;
[2] Based on calculation of equations in Bolinder et al., 2007 (harvest index of pea 0.36 (Nisar et al., 2011) and shoot/root ratio 3.24 (Kumar and Goh, 2000)).
