Go Ask the Freshmen: How Millenials Define Information Literacy and Their Own Skill Levels

Don Latham & Melissa Gross

Georgia Conference on Information Literacy,
October 3 & 4, 2008

Background

- Information literacy (IL) skills are crucial in today's society
 - AASL/AECT's Information Power (1998)
 - K-12 environment
 - ACRL's IL Competency Standards (2000)
 - Higher education environment
- These standards reflect how information professionals define IL
- Little research has been conducted into how students perceive and experience information and their own IL skill levels

Research Questions

- How do college freshmen define information literacy?
- 2. How do they describe information seeking in self-generated vs. imposed tasks?
- 3. How do they describe their own IL skill levels?
- 4. How have they learned what they know about information seeking?
- 5. How do they prefer to learn new or additional skills?

Theoretical Frameworks

- Competency theory (Kruger & Dunning, 1999) suggests that non-proficient individuals are less likely than proficient students to be able to self-assess their skill set accurately
 - Previous research suggests that competency theory applies in the domain of IL (Gross & Latham, 2007).
- Imposed query (Gross, 1995)
 - Self-generated tasks: in response to a personal need or interest
 - Imposed tasks: given by one person to another (assignment)
- Bruce (1997) studied how educators in higher ed understand IL
 - Very little research has been done into how undergraduates understand IL and their own IL skills

Participants

- 20 second-semester freshmen at Florida State University
- Top 10% and bottom 10% of freshmen class targeted, based on admissions data: high school GPA and standardized test score (ACT or adjusted SAT)
- Students recruited via email solicitation
- Participants given gift cards to the university bookstore.

Interviews

- Each interview lasted 45 to 60 minutes
- Both researchers were present during the interview--one asked the questions; the other took notes.
- The interviews were recorded and later transcribed by a graduate assistant
- Both researchers coded the interviews and then compared their coding
- Analysis used constant comparative method

Testing

- Students took the test within one week after being interviewed
- Information Literacy Test (ILT), developed at James Madison University (JMU), measures information literacy, based on the ACRL Competency Standards and has been validated and tested for reliability
- Students were told that those who scored in the top 15% on the ILT would be eligible for a drawing to receive one of two \$50 gift cards
- Response time analysis performed by JMU

Demographics

- 15 (75%) females; 5 (25%) males
- Almost all were 18 or 19 years of age
- 17 (85%) from the top 10% of their class; 3 (15%) from the bottom 10% of their class
- They represented a variety of majors (8 STEM, 5 business/economics, 3 music, 3 humanities, 2 education, 1 undecided) * [*Note: 2 people were double majoring]

Results: ILT Scores

Overall, these students have "proficient" information literacy skills

- One student scored as advanced, with a score of 54 (90%)
- One student scored as non-proficient, with a score of 38 (63%)
- 18/20 students scored as proficient, with scores between 39 and 53 (65% - 88%)
- Therefore, the interview data should be considered as representing the views of <u>proficient</u> students

Perceptions of information literacy

- Students were unfamiliar with the term "information literacy"
- Students see information seeking as comprised of thinking and learning skills, more than as computer or library skills
- Success is finding what you need to know, not the process, or the skills you use to get there

Imposed versus self-generated information seeking

Imposed = Constrained	Self-Generated = Open
A limited number of acceptable resources	A wealth of resources are available
can be used ("academic" sources needed)	(though fewer tend to be consulted)
Deadline/Due date	You decide when you are done
Need to develop interest (especially if it	Motivated by genuine interest, even if that
isn't naturally there)	interest is casual
Product/Presentation required	Product not required

Imposed queries are facilitated by

- Assignments that allow students to make a choice or personalize the assignment in some way
- Domain knowledge or previous experience with a topic, even if it is a topic the student doesn't like
- Ability to develop an interest in a topic if such an interest isn't naturally present

Preferred resources: People

- People as a resource can take 3 roles:
 - Informant someone who knows the answer
 - Agent someone who will find the answer
 - Tutor someone who will teach skill(s) needed to find the answer
- Choosing who to talk to:
 - Availability
 - Established relationship
 - Informal before formal relationships

Preferred Resources: Internet

- For both imposed and self-generated information a search engine (Google) is the first stop
- Concerns about source quality are minimal
 - "You hear teachers and professors tell you all the time, be wary of the Internet. But I've never really had a bad experience where I've had some, like, horribly wrong information or whatnot."

Self-views of information literacy

- Confident about their ability, but don't feel that they know/do anything special
- Computer skills and information seeking are activities they have been engaged in over the course of their life and have adapted to "naturally"
- Feel they stand out in terms of their ability to put in the effort needed to find information, persevere with the search, and draw on their interest in learning
- one student said, it is not the benefit of having the Internet, but rather, "the benefits of my curiosity"

What information skills would you want to improve or acquire?

- Some said library skills, but most couldn't think of anything
- For example one respondent said: "What is there to know? "I honestly don't know how much greater information literacy needs to be, even on a higher research level... I think once you learn the basic level there isn't a ton of room for improvement."

Perceptions of attaining information literacy

How they know what they know

- Most see themselves as "self taught"
- Many credit a parent (usually mom) and friends or peers
- Formal training, if it occurs, tends to take place in elementary school library
- A couple of participants recalled a specific teacher in their first year at the university who made a point of teaching information literacy in the classroom

New skills are best learned

- When they are needed
- Face-to-face, one-on-one
- In a comfortable environment (from someone you feel comfortable with)
- With a chance to practice
- Classroom okay of it includes the above
- Rather than use an electronic tutorial, they are more likely to just ask someone for help

Future Research

- Identifying (and recruiting) the nonproficient
- Developing a model of student views of information literacy
- Moving from understanding to intervening and establishing a minimum skill level for non-proficient students

Acknowledgements

We wish to thank:

- Online Computer Library Center and the Association of Library and Information Science Educators for their kind support of this work in the form of an OCLC/ALISE LISRGP grant
- Annette Goldsmith, a doctoral student at FSU, for her assistance in transcribing the interviews

Questions?

Things to think about in practice

- The term "information literacy" did not resonate with these students
- They did have a good grasp of the characteristics of an information literate individual, but in broad strokes
- Instruction librarians may want to ask students to brainstorm about their information seeking process
- Many students are self or peer taught
- Motivation and the ability to develop an interest is an issue for imposed queries
- Students, regardless of skill are likely to see themselves as competent
