ABSTRACT

The second year of the Maine Peat Resource Evaluation Program, which is funded by the U.S. Department of Energy to assess the fuel potential of Maine's peat deposits, was completed in 1980. During the 1980 field season, 56 peat deposits in Piscataquis, Somerset, Aroostook, Kennebec, and Waldo Counties were investigated. These deposits range in size from 44 to 1,344 acres and contain from 50,000 to 3,200,000 short tons of air-dried peat. A total of 14,262 acres containing an estimated 23,908,000 short tons of air-dried peat were evaluated. This report provides details on each deposit investigated.

A third year of field work has been completed, but the report for that work has not yet been published. Combining the preliminary results of that work with the data in this report and the data from the report covering the first year, a total of 44,340 acres in 163 deposits containing 83,757,000 short tons of air-dried peat have been surveyed under Maine Peat Resource Evaluation Program.

When the findings of the Maine Resource Evaluation Program are added to those obtained during earlier surveys of Maine peat deposits beginning in 1909, a total of 343 deposits have been surveyed throughout the State. These deposits cover about 93,742 acres and contain an estimated 142,500,100 short tons air-dried peat.

INTRODUCTION

Peat is the residuum formed by the partial decay and disintegration of plants. It accumulates in environments where moist soil conditions or standing water bodies inhibit the chemical and biological breakdown of plant material, such as swamps and marshes. Peat has been used for many years in agriculture and horticulture primarily because of its ability to retain many times its own weight in water. It has also been used as a domestic fuel for hundreds of years because, in a geologic sense, peat may be thought of as young coal. More recently, peat has been used by nations such as Ireland and the Soviet Union to generate electricity. At the present time, virtually all of the peat harvested in the United States is used in agriculture and horticulture. However, in light of the increasing costs of traditional energy sources, peat is being more closely scrutinized as an alternate fuel source.

The State of Maine is known to have significant peat resources. While current estimates vary, it has been suggested that there are perhaps 6,000 to 8,000 individual peat deposits in Maine comprising a total land area of 500,000 to 750,000 acres. The current resource inventory has been developed to provide a more comprehensive analysis of available peat resources.

This report summarizes the second year of a program to document the fuel potential of Maine's peat resources. It

includes the results of laboratory analyses and estimates of peat resources, as well as maps and sections of individual peat deposits. These data may be utilized to assess more accurately the energy potential of Maine's peatlands.

THE MAINE PEAT RESOURCE EVALUATION PROGRAM

In July 1979, the Maine Office of Energy Resources, in conjunction with the Maine Geological Survey, began the Maine Peat Resource Evaluation Program. The Program, which is funded by the U.S. Department of Energy (DOE), was undertaken to determine the amount and location of fuel-grade peat deposits that may be harvested and utilized in an environmentally acceptable manner in Maine. Similar DOE/State Peat Resource Evaluation Programs are also being carried out in twelve other states, including Alaska, Michigan, Minnesota, North Carolina and South Carolina, whose programs began in 1979. Georgia, Florida, Louisiana, Massachusetts, New York, and Rhode Island initiated programs in 1980 and 1981.

Research on the fuel potential of Maine's peat resources began earlier in the twentieth century. The first investigations were conducted by Bastin and Davis (1909), and Soper and Osbon (1922) of the U.S. Geological Survey. They were followed by Trefethen and Bradford (1944) of the Maine Geological Survey. The Maine Peat

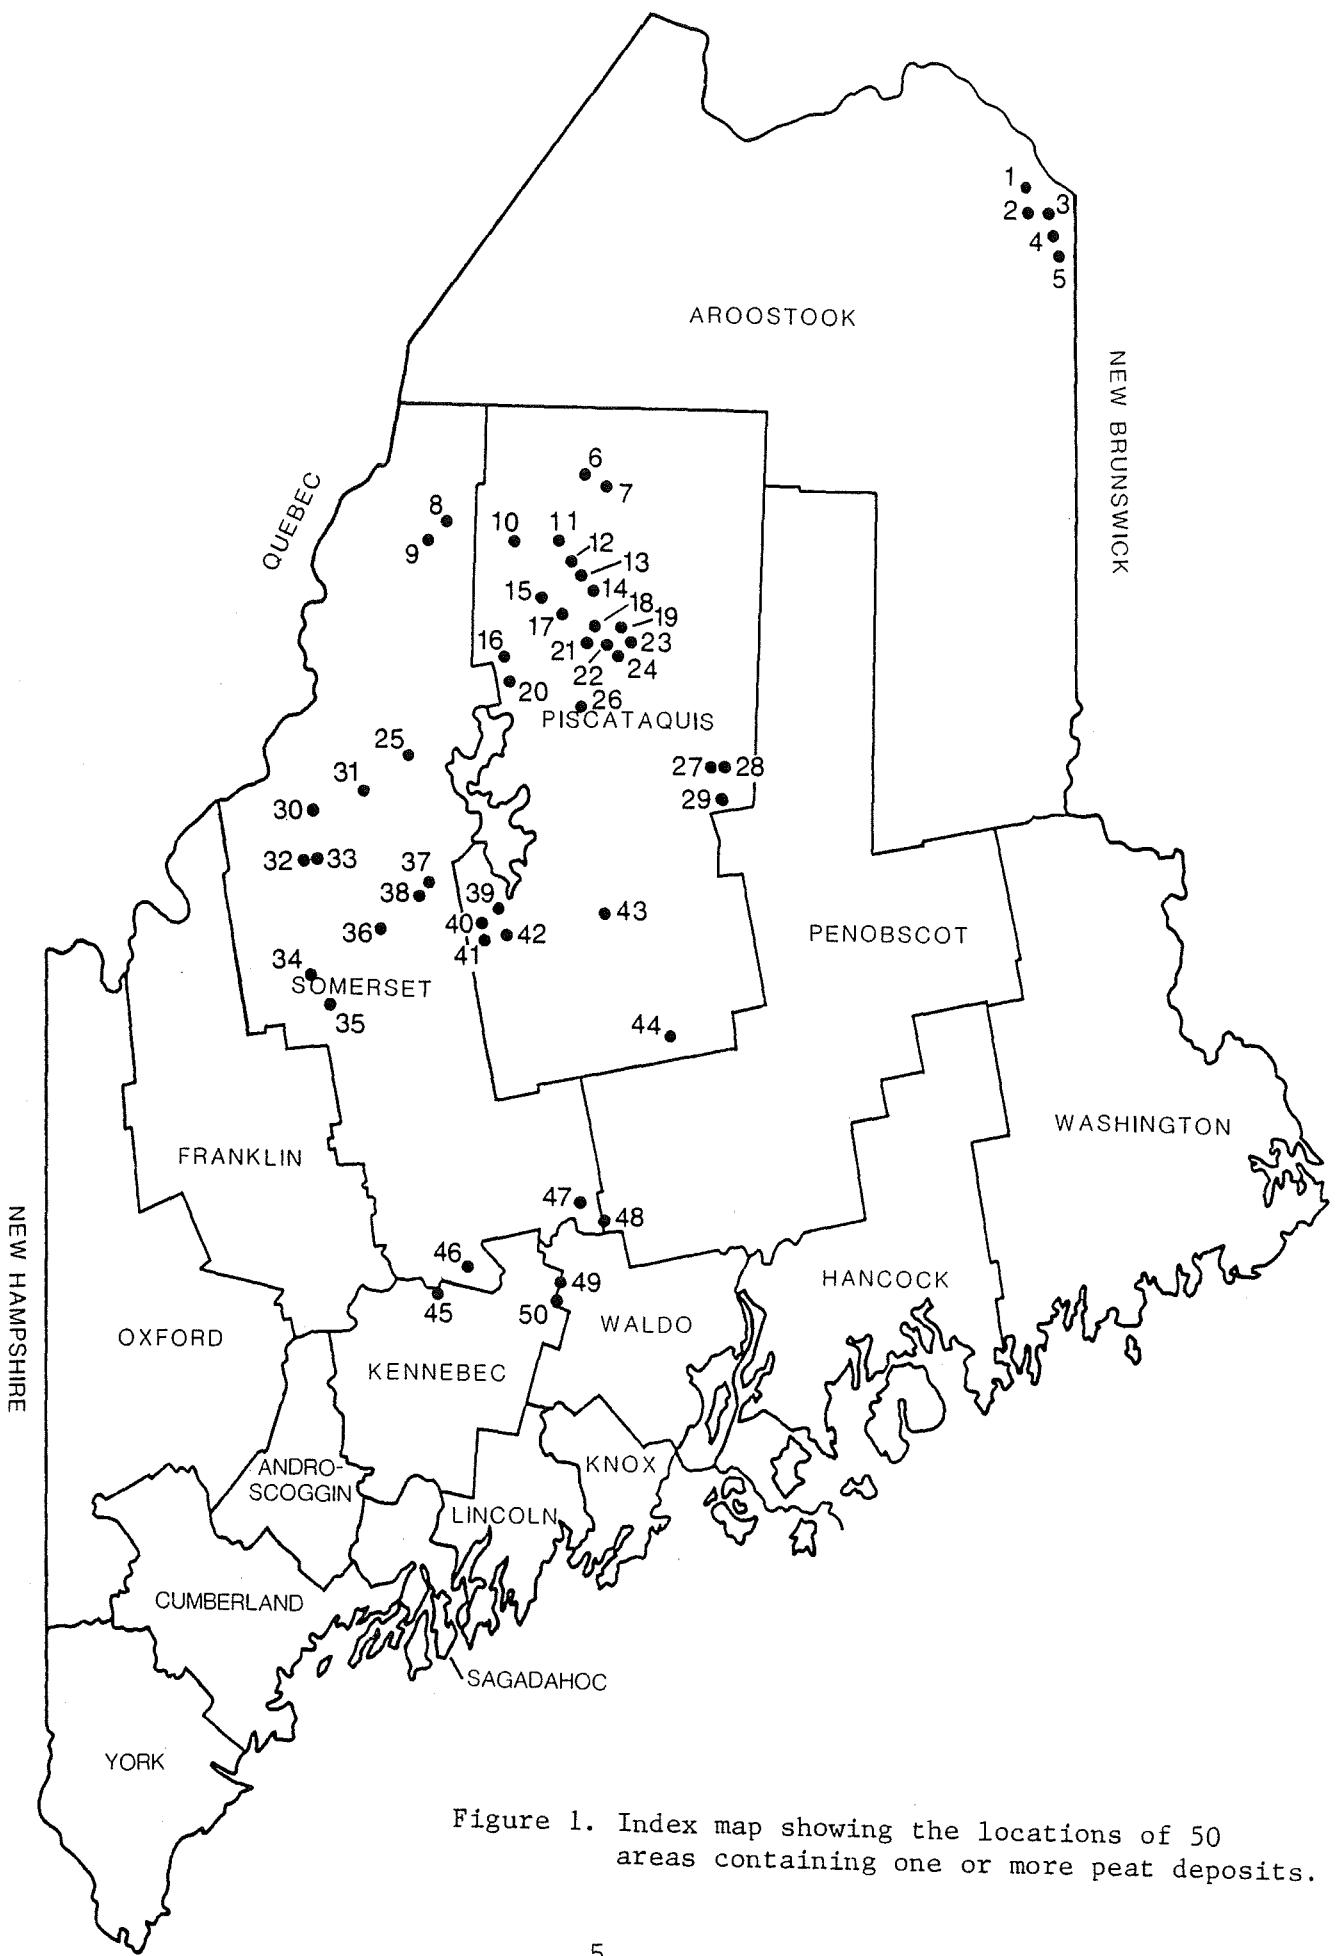

Resource Evaluation Program was designed to build upon the peat research and inventory conducted in Maine by the Maine and U.S. Geological Surveys in the 1970's (Cameron, 1975; Cameron and Massey, 1978; Cameron and Anderson, 1979).

During the first field season of the Program, 1979, 57 deposits in Aroostook, Penobscot, Piscataquis, and Washington Counties were investigated (Cameron and Anderson, 1980a, 1980b; Davis et.al., 1980). Fifty deposits in Piscataquis, Somerset, Aroostook, Kennebec, and Waldo Counties (Figure 1) were evaluated during the 1980 field season (Cameron and Mullen, 1981). In 1981, research efforts were concentrated in the western and southern counties where 56 deposits were surveyed.

GEOLOGIC SETTING OF MAINE PEAT DEPOSITS

Maine is part of the Northern Appalachian Province. Its bedrock consists primarily of metamorphosed sedimentary rocks which range in age from approximately 350 to 600 million years. The metasediments were intruded by numerous bodies of granitic rock. Both the granite bodies and the metamorphic rocks have been subjected to several episodes of folding and faulting, as well as millions of years of weathering resulting in rounded mountains and well established drainage patterns.

Much of Maine's bedrock is covered by glacial sediments deposited during several episodes of glaciation

in the last several hundred thousand years. Large continental glaciers (as opposed to small alpine glaciers found in mountain valleys) spread southward from Canada until much of northern North America was covered by a sheet of ice hundreds to thousands of feet thick. These ice sheets eroded the bedrock and deposited a blanket of sand, gravel, boulders, silt, and clay. As the last ice sheet retreated, between about 13,500 and 12,500 years ago, much of southern Maine was submerged as the ocean inundated land that had been depressed by the great thickness of ice. Fossiliferous marine sand, silt, and clay were deposited on top of the bedrock and glacial sediments. The ocean gradually receded as the land surface slowly rebounded.

Erosion by glaciers and deposition of glacial and marine sediments significantly altered preglacial morphology and drainage, creating environments favorable for the formation of peat. Streams and rivers were slowed or dammed. Ponds and lakes formed in bedrock basins or in poorly drained depressions, particularly those underlain by glacial or marine silt and clay deposits. Where drainage was impaired, the accumulation of undecayed organic material was enhanced.

FORMATION OF PEAT DEPOSITS IN MAINE

The typical peat deposit in Maine is a composite deposit and consists of a filled-basin (the most common

type of deposit in the United States) overlain by a built-up deposit (a more common type in northern Europe). Its formation begins in a clay-bottomed basin or depression with the accumulation of floating plant remains. Aquatic plants, such as pond lilies and bulrushes, are able to root when a sufficient depth of organic material is attained. Continued accumulation of aquatic plant material gradually displaces the ponded water. Plants, such as mosses, reeds, sedges, and grasses grow upward and then outward as the basin is filled. This growth is accompanied by a rise of the water table. A dome with a perched water table develops when sphagnum moss dominates the vegetation assemblage. (Cameron, 1975).

Cameron (1975) suggests five physiographic forms for Maine peat deposits:

1. Valley occupied by a stream.
2. Closed basin (remnant of initial pond may be present).
3. Plateaulike dome on gentle clay, sand, or gravel surface.
4. Domes with secondary ponds developed on moss peat.
5. Coalesced domes occupying several basins.

CLASSIFICATION OF PEAT

In its natural environment, peat contains varying amounts of water and inorganic matter (sediment). The

amount and proportion of the decayed vegetation, water, and inorganic material will differ not only between individual peat deposits, but also within a single deposit, depending on factors such as the type of plant material accumulated, climatic conditions, age, water table fluctuations, and amount of sediment washed in.

Because of the wide range of physical characteristics exhibited by peat, a number of peat classification schemes have been derived. The U.S. Bureau of Mines divides peat into three categories: 1) moss peat, formed primarily of sphagnum, hypnum, and other mosses; 2) reed-sedge peat, formed primarily from reeds, sedges, marsh grasses, cattails, and associated plants; 3) peat humus, derived from peat so decomposed the original plant remains are not identifiable.

The American Society for Testing Materials (ASTM) developed a more specific classification to address industry needs:

"Sphagnum moss peat (peat moss).- The oven-dried peat contains a minimum of 66 2/3 percent sphagnum moss fiber of the total content of weight. These fibers are stems and leaves of sphagnum in which the fibrous and cellular structure is recognizable.

Hypnum moss peat.- The oven-dried peat contains a minimum of 33 1/3 percent fiber content by weight, of hypnum moss fibers compose more than 50 percent. These fibers are stems and leaves of various hypnum mosses in which the fibrous and cellular structure is recognizable.

Reed-sedge peat.- The oven-dried peat contains a minimum of 33 1/3 percent fiber by weight, of which reed-sedge and other nonmoss fibers compose more than 50 percent.

Peat humus.- The oven-dried peat contains less than 33 1/3 percent fiber by weight.

Other peat.- This covers all forms of peat not herein classified." (Cameron, 1975, p. c9-c10.)

Most of the peat resources surveyed under the Maine Peat Resource Evaluation Program may be classified as moss peat and reed-sedge peat.

METHODS OF INVESTIGATION

Prior to the field season, all aerial photographs, topographic, soils, and geologic maps, and previously published information available for the region selected for investigation were assembled. Potential sites were selected utilizing these materials. These potential sites were ranked based on factors such as accessibility and the likelihood of a deposit containing significant peat resources.

In the field, the extent of the deposits was determined by pace and compass traverses, with the bearing and spacing of the traverses dependent on the size and configuration of the deposit. At regular intervals along the traverses (generally 500 feet), cores were obtained with a Macauley or Davis peat sampler. Samples were taken for subsequent laboratory analysis, and factors such as surface vegetation, type and distribution of peat (both horizontally and vertically), and geomorphic characteristics were noted.

Estimates of commercial-quality resources were made in

accordance with ASTM (1969) standards based on acre-feet of peat where the peat is five or more feet thick and has an ash content not greater than 25 percent. The formula used for converting acre-feet of peat to short tons of air dried peat was developed by Bastin and Davis, who summarized the procedure:

"the quantity of peat in a deposit may readily be calculated with enough accuracy for practical purposes, by obtaining its average depth and its area, and that it will yield at least 200 tons of dry machine-made fuel per acre, for each foot in depth." (Bastin and Davis, 1909, p. 24.)

A total of 471 samples were collected during the 1980 field season. Proximate and ultimate analyses and heating values of 302 samples were determined by the DOE laboratory in Grand Forks, North Dakota (Table 5). The U.S. Geological Survey lab in Denver analyzed 129 samples for trace elements. The Plant and Soil Science Department at the University of Maine at Orono determined the bulk density of 40 samples (Table 4).

State and county maps showing the location of surveyed peat deposits have been compiled. Maps of individual deposits showing the type, distribution, and depth of peat, sample sites, and the surficial geology of the area adjacent to the deposits (Figures 2-51), as well as sections showing the vertical distribution of peat type and actual sample depth (Figures 2a-51a) have also been prepared.

RESULTS OF THE MAINE PEAT
RESOURCE EVALUATION PROGRAM

During the 1980 field season, fifty peat deposits in Aroostook, Piscataquis, Somerset, Kennebec and Waldo Counties were investigated. The deposits range in size from 44 to 1,344 acres and contain from 50,000 to 3,204,800 short tons air-dried peat (Tables 1 and 3). The total resources of commercial-quality peat are estimated to be 23,908,000 short tons air-dried peat occupying 14,262 acres. Virtually all of the deposits studied may be classed as reed-sedge (hemic) and moss (fibrich) peat.

Table 1 summarizes the results of the first three field seasons of the Maine Peat Resource Evaluation Program. The figure given for the total estimated resources in 1981 is preliminary; it may be revised when all the laboratory analyses for samples collected that year are received.

To date, nearly 350 Maine peat deposits have been surveyed in some detail for their economic potential. The results of these surveys, which began in 1909, are shown in Table 2. Several earlier investigations were incomplete and estimates of fuel grade peat or areal extent were sometimes not made. In addition, complete laboratory analyses were not performed for most of the earlier surveys.

Table 1. Results of the Maine Peat Resource Evaluation Program

FIELD SEASON	# OF DEPOSITS SURVEYED	RANGE IN SIZE (ACREAGE)	RANGE IN RESOURCES	TOTAL ACREAGE	TOTAL RESOURCE
1979	57	30 - 2,645	30,000 - 6,953,000	18,268	32,113,000
1980	50	44 - 1,344	50,000 - 3,204,800	14,262	23,908,000
1981	56	27 - 751	*37,800 - 2,010,800	13,810	*27,736,400
TOTAL	163			44,340	*83,757,400

*Preliminary estimate

Table 3. Location, areal extent, and estimated resources of the 50 areas containing peat deposits surveyed during the 1980 field season.

Deposit Number	Location	Acres of commercial quality peat (peat generally at least 5 feet thick with ash content not exceeding 25 per cent)	Estimated resources (short tons air-dried peat)
1	Orchard Bog, Caswell Plantation, Van Buren 15 minute Quadrangle, Aroostook County	262 with average thickness of 6 feet	314,400
2	Bog at Little Black Brook Lake, Caswell Plantation, Van Buren 15 minute Quadrangle, Aroostook County	50 of which 35 have average thickness 10 feet and 15 have average thickness of 6 feet	88,000
3	Bogs between Deer and Mud Lakes, Caswell Plantation, Van Buren 15 minute Quadrangle, Aroostook County	309 of which 235 have average thickness of 8 feet and 74 have average thickness of 5 feet	450,000
4	Bog northwest of Pierce Lake and west of Route 165, Caswell Plantation, Fort Fairfield 15 minute Quadrangle, Aroostook County	45 with average thickness of 6 feet	54,000
5	Bog 2 miles northeast of Limestone on U.S. - Canada boundary, Limestone Twp., Fort Fairfield 15 minute Quadrangle, Aroostook County	44 of which 27 have average thickness of 10 feet and 17 have average thickness of 5 feet	71,000
6	Bog south of Churchill Lake and east of Thoroughfare, T9 R12 WELS, Churchill Lake 15 minute Quadrangle, Piscataquis County	115 of which 95 have average thickness of 7 feet and 20 have average thickness of 5 feet	153,000
7	Bog along Soper Brook at Soper Pond, T8 R12 WELS (Soper Mtn. Twp.), Spider Lake 15 minute Quadrangle, Piscataquis County	235 of which 35 have average thickness of 12 feet, 180 have average thickness of 8 feet, and 20 have average thickness of 5 feet	392,000

Deposit Number	Location	Acres of commercial quality peat (peat generally at least 5 feet thick with ash content not exceeding 25 per cent)	Estimated resources (short tons air-dried peat)
8	Marsh along Baker Branch, St. John River, T7 R16 WELS, Baker Lake and Saint John Pond 15 minute Quadrangles, Somerset County	235 with average thickness of 4 feet	188,000
9	Sweeney Bog, T6 R17 WELS, Saint John Pond 15 minute Quadrangle, Somerset County	362 of which 180 have average thickness of 10 feet, 140 have average thickness of 8 feet, and 42 have average thickness of 5 feet	626,000
10	Bogs along Ciss Stream, T6 R14 WELS and T7 R14 WELS, Caucomgomoc Lake 15 minute Quadrangle, Piscataquis County	200 of which 120 have average thickness of 6 feet and 80 have average thickness of 5 feet	224,000
11	Ellis Bog complex, T6 R13 WELS and T7 R13 WELS, Chesuncook 15 minute Quadrangle, Piscataquis County	947 of which 120 have average thickness of 10 feet, 155 have average thickness of 8 feet, and 672 have average thickness of 5 feet	1,160,000
12	Carry Bog, T6 R13 WELS, Chesuncook 15 minute Quadrangle, Piscataquis County	202 with average thickness of 8 feet	323,200
13	Bog along Dottle Brook, T6 R12 WELS, Chesuncook 15 minute Quadrangle, Piscataquis County	185 with average thickness of 6 feet	222,000
14	Bog along Cuxabexis Stream at southeast end of Cuxabexis Lake, T5 R12 WELS, Chesuncook 15 minute Quadrangle, Piscataquis County	100 with average thickness of 5 feet	100,000
15	Bogs at mouth of the West Branch, Penobscot River, and east of Brandy Pond, T5 R13 WELS (Chesuncook Twp.), Chesuncook 15 minute Quadrangle, Piscataquis County	50 with average thickness of 5 feet	50,000

Deposit Number	Location	Acres of commercial quality peat (peat generally at least 5 feet thick with ash content not exceeding 25 per cent)	Estimated resources (short tons air-dried peat)
16	Bogs at Cassidy Deadwater, T4 R15 WELS, Caucomgomoc Lake and North East Carry 15 minute Quadrangles, Piscataquis County	250 with average thickness of 5 feet	250,000
17	Bog south of Duck Pond, T4 R12 WELS, Chesuncook 15 minute Quadrangle, Piscataquis County	210 of which 120 have average thickness of 10 feet and 90 have average thickness of 6 feet	348,000
18	Bog on Ripogenus Stream north of Ripogenus Pond, T4 R12 WELS, Chesuncook 15 minute Quadrangle, Piscataquis County	55 with average thickness of 10 feet	110,000
19	Bog on Ripogenus Stream, T4 R12 WELS, Telos Lake 15 minute Quadrangle, Piscataquis County	87 with average thickness of 7 feet	121, 800
20	Bogs along the West Branch of the Penobscot River and Lobster Stream, T3 R15 WELS (North East Carry Twp.), North East Carry 15 minute Quadrangle, Piscataquis County	117 with average thickness of 5 feet	117,000
21	Bog at Ripogenus Pond, T4 R12 WELS, Ragged Lake 15 minute Quadrangle, Piscataquis County	56 of which 45 have average thickness of 10 feet and 11 have average thickness of 5 feet	101,000
22	Bog west of Soubunge Mountain, T4 R12 WELS, Harrington Lake 15 minute Quadrangle, Piscataquis County	Not recommended for peat resources on basis of insufficient thickness	-

	Deposit	Location	Acres of commercial quality peat (peat generally at least 5 feet thick with ash content not ex- ceeding 25 per cent)	Estimated re- sources (short tons air-dried peat)
23	Bog along Soper Brook, T4 R11 WELS, Harrington Lake 15 minute Quadrangle, Piscataquis County	170 with average thickness of 7 feet	238,000	
24	Bog at Brighton Deadwater, T4 R12 WELS and T3 R12 WELS, Harrington Lake 15 minute Quadrangle, Piscataquis County	Not recommended for peat re- sources on basis of poor quality and quantity	-	
25	Bog southwest of Tomhegan Pond, T2 R3 NBKP (Soldier Town Twp.), Seboomook Lake 15 minute Quadrangle, Somerset County	85 with average thickness of 5 feet	85,000	
26	Bog along Ragged Stream, T2 R12 WELS, Ragged Lake 15 minute Quadrangle, Piscataquis County	167 with average thickness of 6 feet	200,400	
27	Bogs west of Millinocket Road, T2 R9 WELS and T1 R9 WELS, Katahdin 15 minute Quadrangle, Piscataquis County	214 of which 34 have average thickness of 10 feet, 85 have average thickness of 7 feet, and 95 have average thickness of 5 feet	282,000	
28	Bogs east of Millinocket Road, T2 R9 WELS and T1 R9 WELS, Katahdin 15 minute Quadrangle, Piscataquis County	348 of which 100 have average thickness of 7 feet, 88 have average thickness of 6 feet, and 160 have average thickness of 5 feet	405,600	
29	Bog between Millinocket Lake and Millinocket Road, T1 R9 WELS, Norcross 15 minute Quadrangle, Piscataquis County	170 of which 115 have average thickness of 7 feet, and 55 have average thickness of 5 feet	216,000	

Deposit	Location	Acres of commercial quality peat (peat generally at least 5 feet thick with ash content not ex- ceeding 25 per cent)	Estimated re- sources (short tons air-dried peat)
30	Bog north of Moose River and south of Jackman Mill, Jackman Twp., Long Pond 15 minute Quadrangle, Somerset County	125 with average thickness of 5 feet	125,000
31	Twelve Mile Bog, T3 R1 NBKP (Long Pond Twp.), Long Pond 15 minute Quadrangle, Somerset County	153 with average thickness of 12 feet	367,200
32	No. 5 Bog south of Attean Pond, T5 R1 NBKP (Attean Twp.), T4 R7 BKP WKR (Bradstreet Twp.), and T5 R7 BKP WKR, Attean 15 minute Quadrangle, Somer- set County	1,344 of which 982 have average thickness of 13 feet, and 362 have average thickness of 9 feet	3,204,800
33	Moose River area east of No. 5 Bog, T4 R7 BKP WKR (Bradstreet Twp.), Attean and Long Pond 15 minute Quadrangles, Somerset County	170 which 70 have average thick- ness of 10 feet, and 100 have average thickness of 5 feet	240,000
34	Dead River area south of Spencer Rips, T3 R4 BKP WKR, Pierce Pond 15 minute Quadrangle, Somerset County	345 with average thickness of 5 feet	345,000
35	Bog at Black Brook Pond, T2 R4 BKP WKR (Pierce Pond Twp.), Little Bigelow Moun- tain 15 minute Quadrangle, Somerset County	510 of which 235 have average thickness of 13 feet, and 275 have average thickness of 5 feet	886,000
36	Johnson Bog, West Forks Plantation, Pierce Pond 15 minute Quadrangle, Somerset County	430 of which 135 have average thickness of 15 feet, 110 have average thickness of 10 feet, and 185 have average thickness of 5 feet	810,000

Deposit	Location	Acres of commercial quality peat (peat generally at least 5 feet thick with ash content not ex- ceeding 25 per cent)	Estimated re- sources (short tons air-dried peat)
37	Little Indian Bog along Little Indian Stream, T1 R6 BKP EKR (Indian Stream Twp.), The Forks 15 minute Quadrangle, Somerset County	360 of which 95 have average thickness of 12 feet, 160 have average thickness of 7 feet, and 105 have average thickness of 5 feet	557,000
38	Bog southeast of Harris Dam at outlet of Indian Pond, T1 R6 BKP EKR (Indian Stream Twp.) and T2 R5 BKP EKR (Squaretown Twp.), The Forks 15 minute Quadrangle, Somerset County	175 of which 110 have average thickness of 12 feet and 65 have thickness of 5 feet	329,000
39	Bog one mile south of Greenville Junction, T3 R5 BKP EKR (Little Squaw Twp.), Greenville 15 minute Quadrangle, Piscataquis County	283 of which 105 have average thickness of 12 feet, 138 have average thickness of 7 feet, and 40 have average thickness of 5 feet	485,200
40	Ira Bog, T3 R5 BKP EKR (Little Squaw Twp.), Greenville 15 minute Quadrangle, Piscataquis County	100 with average thickness of 10 feet	200,000
41	West Shirley Bog, T3 R5 BKP EKR (Little Squaw Twp.), Greenville 15 minute Quadrangle, Piscataquis County	515 of which 135 have average thickness of 9 feet, 190 have average thickness of 10 feet, and 190 have average thickness of 5 feet	813,000
42	East Shirley Bog, T3 R5 BKP EKR (Little Squaw Twp.), Greenville 15 minute Quadrangle, Piscataquis County	115 of which 55 have average thickness of 10 feet, and 60 have average thickness of 5 feet	170,000
43	Caribou Bog south of Indian Pond, T7 R9 NWP, Sebec Lake 15 minute Quadrangle, Piscataquis County	235 of which 130 have average thickness of 14 feet, and 105 have average thickness of 5 feet	469,000

Deposit	Location	Acres of commercial quality peat (peat generally at least 5 feet thick with ash content not ex- ceeding 25 per cent)	Estimated re- sources (short tons air-dried peat)
44	Bog along Alder Stream 2 miles northeast of Atkinson Mills, Atkinson Twp., Dover-Foxcroft 15 minute Quadrangle, Piscataquis County	710 of which 235 have average thickness of 10 feet, and 475 have average thickness of 6 feet	1,040,000
45	Bogs adjacent to North Bay and west of Varney Hill and Bickford Hill, Smithfield and Belgrade Twps., Norridgewock 15 minute Quadrangle, Somerset and Kennebec Counties	460 of which 70 have average thickness of 15 feet, 250 have average thickness of 11 feet, and 140 have average thickness of 5 feet	900,000
46	Bog northwest of Toulouse Corner, Fairfield Twp., Waterville 15 minute Quadrangle, Somerset County	130 with average thickness of 13 feet	338,000
47	Big Meadow Bog south of Pittsfield, Pittsfield and Detroit Twps., Pittsfield 15 minute Quadrangle, Somerset County	805 of which 260 have average thickness of 13 feet, and 545 have average thickness of 5 feet	1,221,000
48	Bogs south of Detroit and north of Carlton Pond, Detroit and Plymouth Twps., Pittsfield and Burnham 15 minute Quadrangles, Somerset and Penobscot Counties	665 of which 150 have average thickness of 25 feet, 318 have average thickness of 15 feet, 102 have average thickness of 11 feet, and 95 have average thickness of 5 feet	2,023,400
49	Bogs north and east of Fowler Bog, Unity Twp., Burnham 15 minute Quadrangle, Kennebec and Waldo Counties.	630 of which 302 have average thickness of 10 feet, 213 have average thickness of 8 feet, and 115 have average thickness of 5 feet	1,059,800
50	Fowler Bog, Albion and Unity Twps., Burnham 15 minute Quadrangle, Kennebec and Waldo Counties.	732 with average thickness 8 feet	1,171,200

ESTIMATED PEAT RESOURCES

Acres	Average thickness (feet)	Tons air-dried peat
235	8	376,000
74	5	74,000
—	—	—
309		450,000

EXPLANATION

- [Solid black box] Generally open heath;
peat averages 8 ft. thick
- [Hatched box] Open heath and forested bog;
peat averages 5 ft. thick
- [Dashed box] Bedrock and
glacial moraine
