# Summary

For those who have a part in the development and carrying out of public policy, an understanding of population movement and change in the State is essential. The facts about the State population presented herein indicate some sobering thoughts for consideration. The fact that the population is growing older is not unusual. Neither is the fact that the number of females in the State population is increasing. But these facts seem to be complicated by indications that out-migration is attracting males who are in their most productive years. This means that greater occupational attraction for males must be made by the State or else its activities may need to be more oriented to the contributions of women and older people.

The "saturation" picture of the State relative to population indicates that the entire State is facing a problem in keeping up with the movement of technological development. If new bases for economic support of a population and new technological developments are not forthcoming, the State will not have a continually increasing population base from which to draw the financial resources to provide the standard of living which its population will desire. The median income picture for the State puts it in a rather unfavorable position in our modern, competitive nation.

Further knowledge about migration of the State population is needed. Changes within the State provide differing sizes and types of groups for district and local policies to cover. The changing age and sex ratio of the population provides a continually changing group of people to which policies must be suited. When migration operates to further complicate the changes in age and sex-ratio of a State population, it is often easy for policies to be improperly oriented to the public they are trying to serve.

# West Virginia and Her Population

J. JOEL MOSS

THIS report was prepared to provide a ready reference for some of the most relevant facts about the population of West Virginia. The first half of the report covers details and trends of population growth and change in the State from 1900 to 1950. The second half indicates general characteristics of the State population in 1950. Emphasis is placed on analyses of the population trends and characteristics by counties and other sub-groupings. Special attention is given to changes occurring in population characteristics over the 1940-1950 decade.

## POPULATION GROWTH AND CHANGE, 1900-1950

At the turn of the century, West Virginia had a population of nearly one million (958,000). This population had almost doubled by 1950. Greatest increases came in the years 1910-1930 when the State was fed by a high birth rate and by a flow of immigrants, many from Europe. The increases grew smaller with each decade after 1930 until the 1955 Census reports indicated that the State was losing population faster than it was gaining it.

There were 464,704 births and 171,254 deaths in the State from 1940 to 1950. The natural increase (excess of births over deaths) for the decade was, therefore, 293,450. The total increase in the State population from 1940 to 1950, as reported by the U. S. Census, was only 103,578. This means that the State lost 189,872 persons from the total natural increase. Had the State kept all of the increase, its 1950 population (without the benefit of any migration into the State), would have been 2,195,424 instead of 2,005,552. Thus, the State lost 9 per cent of its potential 1950 population. This trend to outmigration provided the reason for finding a decreasing population in 1955.

While the State population was expanding and diminishing, changes were occurring in its residential location. In 1900, 13 per cent of the population was classified as Urban, the remainder Rural. The Rural Non-Farm category was first used in 1920. At that time, 25 per cent of the State population was Urban, 42 per cent Rural Non-Farm, and 33 per cent Rural Farm.

The Urban population increased steadily from 1920 until it comprised 34.6 per cent of the population in 1950. The Rural Non-Farm population had small percentage increases over the decades. The Rural Farm population gradually declined until, in 1950, it comprised only 20.5 per cent of the State population.

A general picture of the change in the Rural-Urban residence in the State is given in Table 1, which also indicates, by decades, the size of the population and compares the rate of increase in the State with that of the United States as a whole. Figure 1 provides a graphic picture of the changes in Rural-Urban distribution of the State population, by decades, from 1910 to 1950.

## Age Groupings in the State

One of the most important influences on policies which must serve the public is the age grouping of the population. What has happened to the age groupings of the population in West Virginia? The median age (the age at which half the population was older and half younger) was 20.3 years in 1900. This had increased to 26.3 years by 1950. This indicates a continuing increase in the ratio of older people to those of younger ages.

In 1900, 68 per cent of the State population was under 30 years of age. This had dropped to 60 per cent by 1950. The greatest influence on this drop was the decreasing birth rate, but the State experienced also an increase in the proportion of people aged 65 years and over from 1900 to 1950. In 1900, 3.5 per cent of the State population was in this older age group. This percentage had risen to 6.8 per cent by 1950. Interestingly enough, the first sizeable increase in the older population in any one decade took place during the depression years (1930-40). Table 2 gives a picture of the changing age groupings of the State population from 1900 to 1950.

## Sex-Ratio of the Population

The female population of the State has gradually been catching up with the male population. There were 39,684 more males than females in 1900. This gave a sex-ratio of 108.6 (108.6 males per 100 females). The excess of males in 1950 was only 7,022 or a sex-ratio of 100.7.

A steady increase in the female population occurred until 1930. Since that time the rate of increase has been getting smaller, but still exceeds that of the males. Males have experienced a continually declining rate of increase with each decade since 1900. The population

*Rural Non-Farm designation was not utilized until the 1920 Census.
**A new definition of Urban population was used in 1950. Figures for 1950 were shown in the Census for both old and new Urban definitions.
+ Not ascertainable.

**Per cent**

FIGURE 1.   Rural-Urban distribution of West Virginia population, 1910-195

of the State increased by 37,705 males and 65,873 females from 194 to 1950.

In what age groupings has the sex-ratio changed the most?   Male and females make up about the same percentage of the State populatio in the group 65 years and over. The major increase in females has bee in the 15-34 age group, in which they now outnumber the male

This appears to be an age group in which the State loses some of its male population by migration. However, had the females not experienced a greater decrease in birth rate during the 1930-1940 period than the males, there would probably now be more females than males in West Virginia. Table 3 shows the breakdown of males and females by age groups relative to the total male, total female, and total State population, 1900 and 1950.

One common method of portraying the age-sex breakdown of any population is by means of the age-sex pyramid. Since the percentages in any one census age-grouping are small, the State pyramid does not reveal a distinct graphical picture of sex difference by age groups for the State population. However, when we compare the State pyramid with similar pyramids of the Urban, Rural Non-Farm and Rural-Farm populations, some differences appear. These pyramids are presented in figures 2-5.

The Urban pyramid exhibits a smaller percentage of people in the younger age groups than is true of the State pyramid. But it exhibits a larger percentage of population in ages 20-35 than is true for the State. The Rural Non-Farm pyramid is much like that of the State but does exhibit a greater concentration of population in the 0-14 age group. The Rural-Farm pyramid stands out most distinctly because of its heavy percentage of population in the 0-19 age group, a sudden drop in percentage in the 20-35 age group, and greater concentration of population after age 35.

A more detailed picture can be given by showing the percentage breakdown of the population by age, sex, and residence. Females outnumber males in the Urban population but not in the Rural. Males exceed females in all age groups in the Rural Non-Farm population, except the 15-29 age group. Males exceed females in all age groups in the the Rural-Farm population except the 25-34 age group. Males exceed females only in the baby years (0-4) in the Urban population. (See Table 4.)

| Total | 48.3 | 51.7 | 50.8 | 49.2 | 52.3 | 47.7 |

# Nativity of the Population

In 1900, 93 per cent of the total population of the State was native-born white, 4.6 per cent non-white, and 2.3 per cent foreign-born white. The native-white population made up nearly the same percentage of the State population in 1950 as in 1900 (92.5 per cent), but the non-white population had increased to 5.8 per cent. The peak of the non-white population growth in the State has apparently passed. It came in 1930, when non-whites made up 6.6 per cent of the State population.

The foreign-born population reached its peak in 1910 when it comprised 4.7 per cent of the State population. It comprised 1.7 per cent of the State population in 1950. Figure 6 charts the changes in the percentage of non-whites and foreign-born whites from 1900 to 1950. Approximately one-third of the non-white population, in 1950, resided in the eight counties (Kanawha, Putnam, Cabell, Wayne, Marshall, Ohio, Brooke and Hancock) which make up the Standard Metropolitan Areas of the State.

# Standard Metropolitan Areas

The Standard Metropolitan Area represents a geographical unit employed by the U. S. Census Bureau for categorizing comparable urbanization areas. This unit is made up of cities of 50,000 population or over (called Central Cities) together with their urban fringes and the rest of the counties within which these lie. West Virginia has three Central Cities, Charleston, Huntington, and Wheeling. The concept of the Standard Metropolitan Area allows for the crossing of State lines. Thus, in the Huntington and Wheeling areas, the total Metropolitan Area includes some counties in Kentucky or Ohio.

The eight counties in West Virginia which are included in the three Standard Metropolitan Areas contained nearly one-third (32 per cent) of the total State population in 1950, including about one-third of the total non-white population. Table 5 gives a breakdown of the State population by sex and metropolitan-non-metropolitan county residence, and includes the extent of increase or decrease in these resident populations from 1940 to 1950.

In the eight metropolitan counties, the burden of population growth for both males and females is concentrated outside the Central Cities. The Central Cities seem to have reached a static position as far as population growth is concerned. In the non-metropolitan counties population increase appears only in the cities of 10,000 and over.

A look at the age and sex distribution of the population in these metropolitan-non-metropolitan residence groupings indicates where
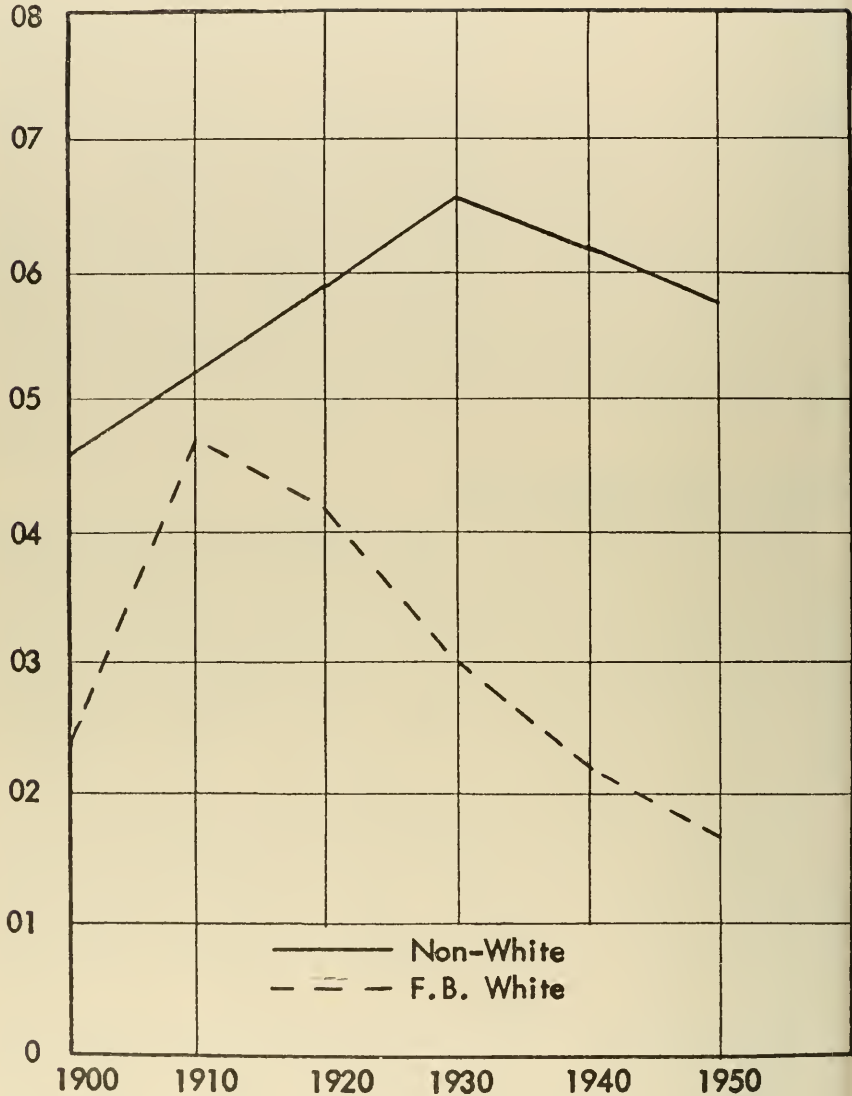

Per cent

FIGURE 6. Percentage of non-white and foreign-born whites in West Virginia population, 1900-1950.

population growth and loss is occurring. In the metropolitan counties, a general decrease appeared in age groups 10-24. In the non-metropolitan

16

TABLE 5. PERCENTAGE BREAKDOWN OF THE POPULATION OF WEST VIRGINIA BY SEX AND BY METROPOLITAN-NON-METROPOLITAN CLASSIFICATION, IN 1940 AND 1950, WITH INDICATION OF INCREASE OR DECREASE IN PER CENT

| MET-NON-MET CLASSIFICATION | MALES | | | FEMALES | | |
|---|---|---|---|---|---|---|
| | 1950 | 1940 | PER CENT DIFF. | 1950 | 1940 | PER CENT DIFF. |

counties, the decrease extended from age 10 through age 29. Population decrease occurred among males in more age groupings than was true for females. The greatest range of age groups with population decrease appeared in the Central Cities. The least range appeared in the non-metropolitan cities of 10,000 and over. Table 6 indicates the age groupings, by sex and by metropolitan-non-metropolitan residence, in which decrease in population occurred from 1940 to 1950. All age groupings which do not appear in this table experienced some population growth over the decade.

TABLE 6. AGE GROUPINGS, BY SEX AND METROPOLITAN-NON-METROPOLITAN COUNTY RESIDENCE, WHICH LOST POPULATION FROM 1940-1950

17

It appears that any population growth in the State is associated with the more urbanized areas. The U. S. Census reports categorize the urban population in three ways: Urban Places, Central Cities, and Urbanized Areas. Urban Places include all places with 2,500 or more population. There were 61 Urban Places in West Virginia in 1950. This was 16 more than in 1940. Three of the 61 Urban Places were Central Cities, with populations of 50,000 and over; 11 had populations of 25,000-50,000; 15 of 5,000-10,000, and 32 of 2,500-5,000. The Central Cities plus their "urban fringe" of smaller Urban Places make up the Urbanized Areas. The Urbanized Areas of West Virginia contained 14.6 per cent of the total State population in 1950.

## Counties

Fourteen counties had less population in 1950 than they had in 1900. Mason County was the only one of these 14 which did not lose population from 1940 to 1950. Seventeen counties had increases in population of 1 to 50 per cent from 1900 to 1950. Population loss was experienced in 13 of these 17 counties from 1940 to 1950. Thus, of the 31 counties mentioned above, 26 lost population from 1940 to 1950, accounting for all but two of a total of 28 counties which lost population during the decade.

Twelve counties had an increase of 51 to 200 per cent in population from 1900 to 1950.[1] Two of these counties lost population from 1940 to 1950 (Clay and Webster). Twelve counties had more than a 200 per cent increase from 1900 to 1950. These twelve counties were Boone, Brooke, Cabell, Hancock, Harrison, Kanawha, Logan, Mercer, Mingo, McDowell, Raleigh, and Wyoming. None of the twelve lost population during the 1940-1950 decade. These 24 counties with population increases of over 50 per cent from 1900-1950, have carried the burden of population growth in West Virginia.

The State is divided into three magisterial divisions. A look at county population growth within these divisions will help locate the sections of the State most responsible for population growth and for population loss. Figure 7 indicates the magisterial districts and the amount of loss or gain in population by counties from 1900 to 1950.

[1] Monongalia County, on the basis of Census figures, appeared to have a percentage increase of over 200 per cent since 1950. However, approximately 5,000 of the 1950 population of the county was accounted for by students, from outside the county, attending the University. These students were included in the 1950 Census figures for Monongalia County. The presence of students at other colleges in the State would affect the percentages for other counties. However the influence would be smaller and, therefore, has not been considered in this report.
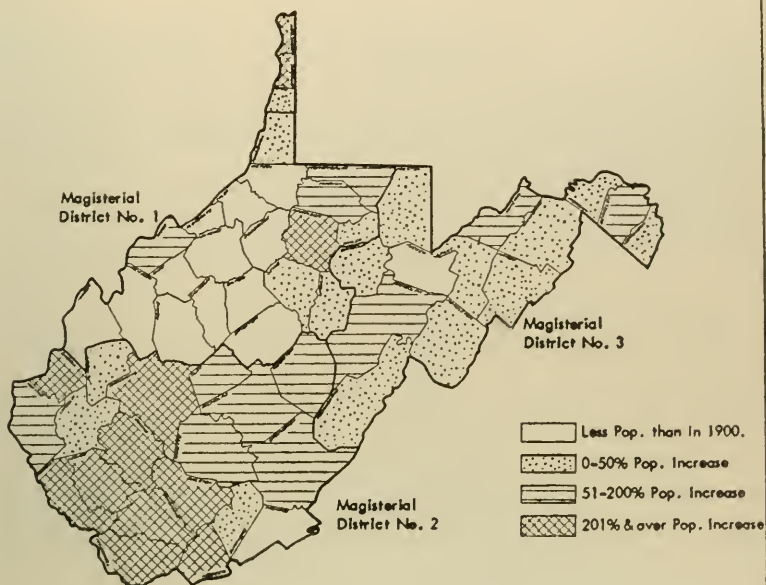

FIGURE 7. Percentage gain or loss in population of West Virginia counties, by magisterial districts, 1900-1950.

A. **District One:** This district includes the northwestern part of the State. Twenty-two counties are involved in this district and half of them had less population in 1950 than they had in 1900. This section has suffered the greatest population loss in the State. Fifteen of the 22 counties lost population from 1940 to 1950. The growth here has come largely from Monongalia, Hancock, Brooke, Harrison, Wood, and Marion counties.

B. **District Two:** This district includes the 20 counties in the southern part of the State. Population growth has been a general characteristic of these counties. Much of the state's population growth is a result of the growth in this magisterial district. Monroe County was the only one that lost population from 1900 to 1950. Clay and Monroe counties lost population from 1940 to 1950.

C. **District Three:** The eastern part of the State comprises the third magisterial district. No large population growth appears in any of the 13 counties involved and seven counties lost population from 1940 to 1950. Tucker is the only county smaller in population than it was in 1900. Randolph, Mineral, and Berkeley counties show the most growth in this district.

When we compute the natural increase in population for the counties (the excess of births over deaths), and look at 1950's potential population, the picture looks even less rosy. The potential population is found by taking the 1940 census figures and adding the

19

amount of natural increase from 1940 to 1950. The differences between this potential and the 1950 census figure is the amount of gain or loss of population. The percentage gain or loss is found by dividing the amount of gain or loss by the 1950 potential.[2] Kanawha and Wyoming were the only counties which did not lose population when viewed in terms of potential 1950 population. All other counties lost some population, even though their 1950 census total may have been greater than the 1940 census total.[3] (See Figure 8.)

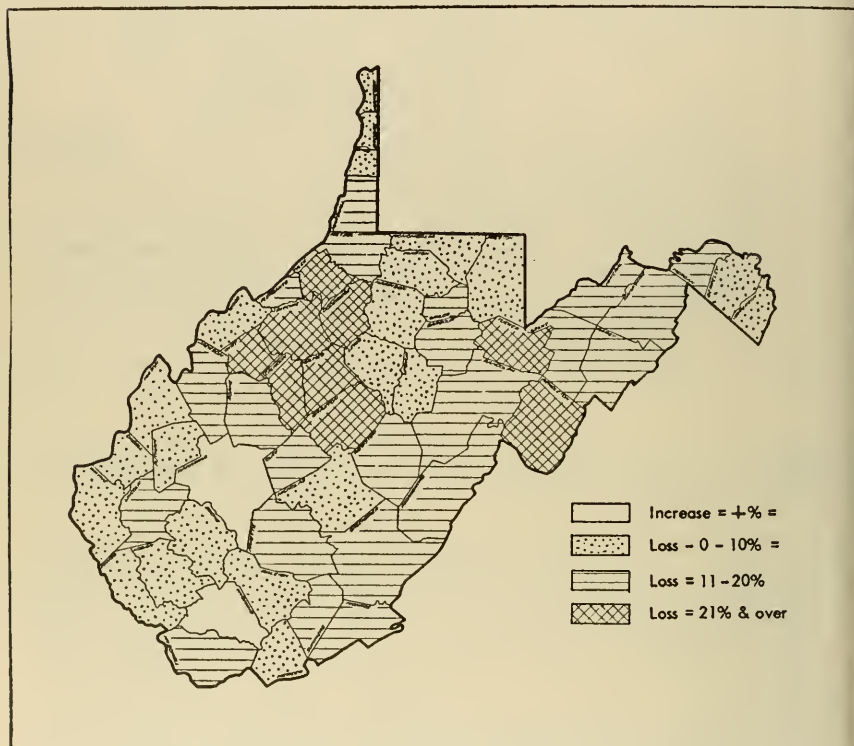

FIGURE 8. Percentage gain or loss of population in West Virginia counties from 1950 potential population.

A detailed account of population growth and change for each county, including the natural increase, general loss by migration and

[2]For example: If a county had a population of 50,000 in 1940 and a natural increase of 10,000, the potential 1950 population would be 60,000. If, in the 1950 Census reports, the county population was reported as 54,000, it would mean that the county had a loss of 6,000 from its potential population. The percentage loss is found by dividing the 6,000 by the potential population of 60,000, giving a 10 per cent loss.

[3]Monongalia County must again be considered differently. When the 5,000 student population is substracted from the county population, the county exhibits a 5 per cent loss of population rather than a 4 per cent gain.

extent of gain or loss of population relative to the potential population in 1950, is given in Table 7.

## Population "Saturation" in West Virginia

The concept of "saturation" as used here, refers to the size of population which may be absorbed by a county, given its present resources and the extent of its technological development. This concept does not suggest what is the optimum population for a county. It simply reflects the absorption capacity of the county at the present. Expansion of the resources of a county through technological change could alter its "saturation" point.

Using the percentages in Figure 8 as a rough basis for analysis, it appears that practically all counties in varying degrees have reached their saturation point. Kanawha and Wyoming are the only two that have not yet reached "saturation." Twenty-two counties lost from 1 to 10 per cent of their potential 1950 population; 22 counties lost from 11 to 20 per cent; and nine counties lost 21 per cent or more.

The above figures give no indication of possible migration into the State. However, if any people migrated into West Virginia, it means that the counties lost even more of their potential population than Figure 8 indicates. Where is out-migration occurring? It is occurring all over the State!

## West Virginia's Future Population

What may West Virginia expect in the future as far as population growth is concerned? It is evident, of course, that any expectations will be influenced by changes in the "saturation" point of the counties. Without considering these changes, certain estimates of the future population can be gleaned from the U. S. Census, based upon what has happened in the past. The census estimates are based on differing assumptions about the pattern of birth rates and migration in the future. Therefore, any use of the estimates should take into consideration the assumptions under which they were made.

Perhaps the most accurate future population picture for the State can be given by indicating the largest and smallest estimates made by the U. S. Census. This gives a range within which future populations will usually fall, according to past census trends. The highest estimates would be 2,059,614 in 1960 and 2,130,855 in 1965. This would be an increase of about 125,000 people from 1950 to 1965. Such an increase would be less than half the natural increase in West Virginia from 1940 to 1950! The lowest estimates of population growth in the State would

TABLE 7. POPULATION CHANGE IN WEST VIRGINIA COUNTIES, 1900 TO 1950, AND 1940 TO 1950, WITH BIRTH AND DEATH RATES, NATURAL INCREASE, EXTENT OF POPULATION INCREASE, 1940-1950, POTENTIAL 1950 POPULATION AND PERCENTAGE LOSS OR GAIN FROM 1950 POPULATION POTENTIAL

*Natural Increase is the excess of births over deaths in the period given.
**Total Population Gain or Loss, 1940–50, refers to the gain or loss indicated by the U. S. Census plus or minus that indicated in natural increase. If, for example, a county lost population according to the census, it lost all its natural increase plus the loss indicated by census figures.
†Potential Population 1950 refers to the figure obtained by adding the natural increase to 1940 census figures.
‡Percentage gain or loss of 1950 population potential is obtained by dividing the total gain or loss from 1940–1950 by the 1950 potential population figure.
¹Monongalia County is given special treatment since it numbers in its 1950 census about 5,000 students at the University who come from outside the county. Figures show the position of the county with and without the student population considered.

be 1,959,222 in 1960 and 1,942,845 in 1965. This would represent a loss of about 63,000 people between 1950 and 1965, besides the loss of all natural increase. Thus, West Virginia's 1965 population may be anywhere from 3 per cent smaller to 6 per cent larger than its 1950 population.

# GENERAL CHARACTERISTICS OF WEST VIRGINIA'S POPULATION, 1950

## Dependency in the State

The aging of the West Virginia population has been a consistent trend from 1900 to the present. With the population growing older, and with a changing birth rate, the question arises: "How much of the population is in the working-age group, and how much is dependent?" A general evaluation of the extent of dependency may be found by using the dependency ratio. This defines the working-age population as the group aged 20-64. The dependency ratio is computed by figuring the ratio of those 65 years or over and under 15 years of age per 100 (or 1,000) persons in the working-age group.

The extent of dependency is not as great in West Virginia now as it was in 1900. It is not concentrated so heavily in the group under 15 years of age. Decreases in the birth rate plus an increase in the number of aged people in the State suggest that different types of dependency demands may now appear. The increase in those 65 years of age and over in the population has taken a noticeable upturn since 1930.

Analysis of the dependency ratio must consider that in 1950 there were 2,844 more females than males in the State's 20-64 age population. Since the majority of the labor force is made up of males, it appears that the problem of dependency in the state is greater than the dependency ratio might indicate. In 1950, the dependency ratio in the State was 72.8. This means that there was less than one dependent person for every person in the working-age group. Figure 9 shows the changes in dependency ratio in the State from 1900 to 1950.

Where in the State is the dependency ratio greatest? The ratio is highest in the Rural-Farm population and lowest in the Urban population. Though the Urban has the lowest total dependency ratio, it does carry a higher load of aged dependents than the Rural Non-Farm population. Table 8 indicates the dependency ratio of the State by rural-urban residence.

Per Cent

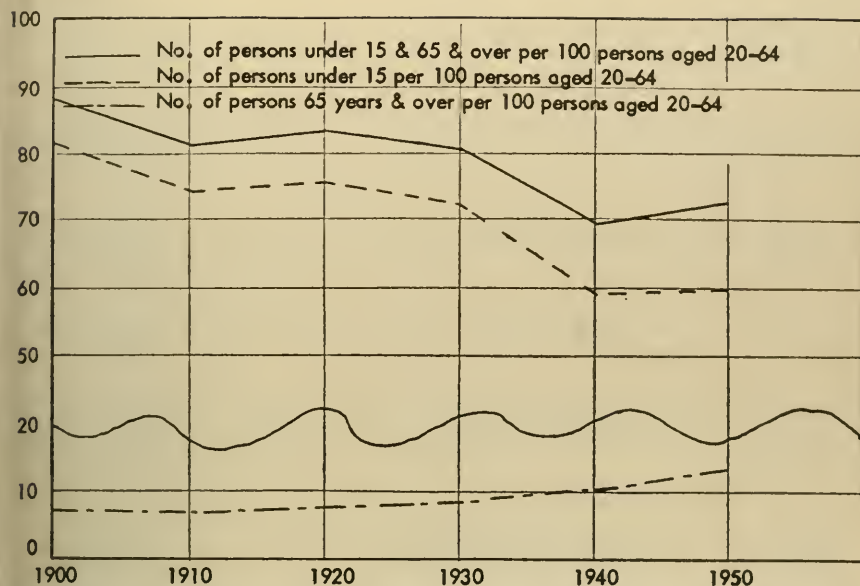

FIGURE 9. Dependency ratio in West Virginia, 1900-1950, with separate ratio for those 15 years and under, and 65 years and over.

TABLE 8. RATIO OF POPULATION UNDER 15 AND OVER 65 YEARS, TO POPULATION 20-64 YEARS, BY RURAL-URBAN RESIDENCE, 1950

| DEPENDENCY RATIO | STATE | URBAN | RURAL-NONFARM | RURAL-FARM |
|---|---|---|---|---|
| Persons under 15 years and 65 + per 100 persons 20-64 years .......... | 72.8 | 53.6 | 81.7 | 94.2 |
| Persons under 15 years per 100 persons 20-64 years ................. | 59.8 | 41.0 | 71.0 | 74.8 |
| Persons 65 + years per 100 persons 20-64 ................. | 13.0 | 12.6 | 10.7 | 19.5 |

A check of the census figures seemed to indicate that the small cities were carrying a relatively heavy dependency load. However, when the cities were checked by dependency ratios (see Table 9) this idea was not substantiated. On the basis of metropolitan-non-metropolitan county residence, the dependency ratio was found to be greatest in the more rural areas and least in the Central Cities. Over the 1940-1950 period, the ratio of dependents under 15 years remained fairly constant. The ratio of those 65 years and over increased by at least three or more

25

In the column on percentage of the population non-white, some cities are marked—meaning the percentage is too small to indicate.

persons in all residential areas except the areas of the metropolitan counties outside the Central Cities.

The greatest dependency ratio in cities over 10,000 is found in South Parkersburg (65.8), where there are many young people. Following South Parkersburg in dependency ratio are Wheeling, Martinsburg and Moundsville. Tables 9 and 10 give detailed population characteristics for each of the Urban Places and for the counties of the State. Table 11 gives a ranking of these larger cities according to total dependency ratio, and for persons under 15, and 65 years and over separately.

Among the smaller towns, those with the most young people have the highest dependency ratios. Leading the list is McComas with a ratio of 91.2, of which 83.4 is accounted for by youngsters. McComas is closely followed by Verdunville-Mudford, War, Omar-Barnabus, and Sprague. Each of these towns ranks high in fertility rate when compared with the rest of the smaller towns in the State.

The highest ratio of aged population to the working-age population is found in Weston (22.7), followed by Mannington, Charles Town, Salem and Philippi. The total dependency ratio in Weston is only 50.6 which is near the bottom of the total dependency rankings of the smaller towns. Table 12 gives the rank order of towns of 2,500 to 10,000 population in dependency ratio. It also indicates how much of the dependency ratio is accounted for by young and older people.

On a county basis, the dependency ratio is greatest in Clay (103.1), Lincoln (101.2), and Calhoun (97.6). In each case, most of the dependency is attributable to persons 15 years and under. At the other extreme, Ohio County has the smallest dependency ratio (56.4), followed by Cabell (57.5) and Hancock (58.3). The rank order of the counties by dependency ratio indicates that youngsters make up most of the dependency. However, enough discrepancies appear to suggest that a high birth rate will not be absolute evidence that a county will rank high in its dependency ratio.

# Birth Rates in West Virginia

Changes in birth rates may be analyzed by use of the "fertility rate." The fertility rate is a ratio of the number of births occurring per 1,000 women of childbearing age. Childbearing age is usually figured on the basis of ages 15-45, 20-45, or 15-49 years. The latter figure was used in this report.

In 1940, the fertility rate for the State was 401.3. By 1950, it had increased to 479.0. The increase was widespread over the State. It was most noticeable in the cities of 10,000 and over; next in the Cen-

tral Cities. It was least noticeable in the metropolitan county areas lying outside the Central Cities.

Among the cities of 10,000 and over, the fertility rate varies from 301.0 (Huntington) to 424.0 (Moundsville). The range in the smaller towns, below 10,000 population, is from 282.0 (Weston) to 720. (Mc-Comas). Among the counties, Ohio has the lowest fertility rate (338.9), and Clay the highest (646.2).

On a rural-urban basis, the Rural-Farm rate (590.2) and the Rural Non-Farm rate (553.8) were above the fertility rate of the State (479.0). The Urban rate (351.5) was far below the State rate. Figure 9 gives a picture of the general decline in birth rate in the State from 1900 to 1950.

The impact of the "baby boom" of the 1940-1950 period tended to check the general declining trend of the birth rate. Where will it level off? On the basis of expected trends, the levelling off will likely be above the 1930-1940 rate, and below the 1940-1950 rate. Such an expectation appears feasible because the peak of the birth boom in the 1940-1950 period was reached before 1950.

## School-Age Population and Enrollment in the Future

One major concern relative to the birth rate is the future school enrollment in the State. General predictions suggest a continuing increase of students through the 1960's. What can be seen from the census figures which might help in analyzing the situation? If census age-groups 5-24 are considered the school-age population, an increase is found from 1900 to 1940 in this group. From 1940 to 1950, a decrease occurred. There were 54,395 more persons of school age in the State in 1940 than in 1950. Part of this decrease is attributable to the declining birth rate and part of it to out-migration. From 1940 to 1950, there was an increase of 43,528 people, ages 0-4, so that by 1955 (without the effects of migration) one could expect a school-age population of 802,-916. This would be 25,824 more than in 1940.

According to the U. S. Census figures, out-migration is occurring in West Virginia. Census estimates list the State population in July, 1955, as 2, 001,000—which is 4,552 less than in 1950. If we assume that the percentage of the population in the State, aged 5-24, changes at the same rate as that in the United States as a whole, 36.9 per cent of the State population should be aged 5-24 by 1955. This percentage of the estimated 1955 population is 738,369, or 16,010 more than the 1950 figures, but still 38,723 less than those of 1940.

A high and low estimate of future school-age population may be found by using the above procedure on the estimates of future popula-

TABLE 10.  SELECTED CHARACTERISTICS OF WEST VIRGINIA POPULATION BY COUNTIES, 1950

tion in the State. (See pp. 21). The high estimate of school-age population for 1960 is 811,488 or 34,396 more than the 1940 figure of 777,092. The low estimate is 771,933 or 5,159 less than the 1940 figure. The high estimate for 1965 is 875,781 or an increase of 98,689 over the 1940 figure. The low estimate is 798,509 or 21,417 more than the 1940 figures. Table 13 presents figures for the school-age population projections from 1940 through 1965.

What about that portion of the school-age population available for higher education? If we take the 15-24 age group as a basis, none of the estimates for 1965 indicates as large a population in this age group as was found in the State in 1940! In 1940, there were 379,313 persons aged 15-24 in the State. The highest estimate found in Table 13 for this age group is 375,030 in 1965, which is 4,283 less than the 1940 figure!

School enrollments, however, are influenced by another factor, the percentage of the school-age population that actually enrolls in school. The total school enrollment, aged 5-24, in 1950 was 438,285. This amounted to 60.6 per cent of the 1950 school-age population. In the Urban areas, the percentage was 59.8. The Rural Non-Farm percentage was 59.7, and the Rural Farm percentage was 63.8.

School enrollments in the State had an increase of 20,149 students during the 1930-1940 decade, an increase of 1/10 of 1 per cent. From 1940 to 1950, a 4 per cent increase occurred in the percentage of the school-age population enrolled in school. In spite of this increase the

Figures for 1960 and 1965 are derived from calculations assuming that the change
in age groups in West Virginia will be comparable to similar changes in the United
States as a whole. The results of such a procedure have been found to be a little too
high, especially when we consider that the State is not expected to grow at a rate
comparable to the population in the U.S. as a whole. Therefore, on the basis of the
calculations utilized here, it could well be possible that the 1960 and 1965 figures are
higher than they may be expected to be unless drastic changes occur in the State.

by 1960 about 65 per cent of the school-age population would be en-
rolled. This percentage of the highest estimate of school-age population
for 1960 (811,488) gives a school enrollment of 527,467. This figure would
be 87,344 more than the enrollment in 1940. This percentage of the
lowest estimate of the 1960 school-age population (771,933) gives a
school enrollment of 501,756. This would be about 61,633 more than
the 1940 enrollment. Table 14 indicates the changes in the percentage
of the school-age population enrolled in school from 1910 to 1950.

# Education of the State Population

The West Virginia educational trend is toward an increasing num-
ber of school years completed. In 1940, 18 per cent of the population 2

ears and over had completed high school. The 1950 figure was
24.9 per cent. The median years schooling completed by the group
n 1940 was 7.8; by 1950, 8.3 years.

Looking at the median years of schooling completed in 1950 by
esidence grouping, the highest median was found in the cities of 10,-
000 and over (10.5), followed closely by the Central Cities (10.2). The
median years completed for the metropolitan counties was 8.7. This
median was higher than the State median which was influenced by the
ower median (8.1) in the non-metropolitan counties. Table 15 in-
dicates the amount of schooling of the State population with a break-
down for both rural-urban and metropolitan-non-metropolitan counties.

The median years of schooling completed in 1950 in cities of 10,-
000 and over ranged from 8.8 for Moundsville to 12.1 for South Charles-
on. Five of the fourteen cities involved had a median of less than 10
ears schooling completed. (See Table 9.)

The median years schooling completed in the smaller towns in
1950 was lower than in the larger cities. It ranged from 6.2 years (Ver-
dunville-Mudford) to 12.1 years (St. Albans). The majority of the
small towns had a median of 10 years or less completed. Only 13 of
he 47 towns had a median of 10 years or more.

The median years schooling completed for the counties in 1950
ranged from 7.5 in Clay County to 9.3 in Cabell County. Thirty-six
of the 55 counties had a median between 8.0 and 8.5 years. (See Table 10.)

# The Labor Force

The "labor force" includes that part of the population which, at some time during a year, helps support the total population by working. In 1950, there were 692,105 males and 707,775 females 14 years of age and over in the State. Of these totals, 76.2 per cent of the males and 19.5 per cent of the females were listed in the State's labor force.

Some decrease appeared among the males from 1940 to 1950 in all age groups 16 years and over in the labor force. An increase occurred in the number of males listed aged 14 and 15 years. It is interesting to note the large percentage of older men still included in the labor force. In 1950, 56 per cent of the males aged 65-69, 41 per cent of those aged 70-74, and 21 per cent of those 75 years and over were listed in the labor force.

Females in the labor force increased by at least 3 per cent in all age groups from 1940 to 1950. Most noticeable increases were in the 35-44 age group, where the percentage increased from 16.8 in 1940 to 24.2 in 1950; in the 45-54 age group, with an increase from 13.8 to 21.7 per cent, and in the 55-64 age group, with an increase from 9.9 to 15.4 per cent.

Considering the labor force by rural-urban residence, a greater percentage of Urban females are found in the labor force than in either rural group. Twenty-nine per cent of the Urban females were in the labor force in 1950, as compared with 14.3 per cent of the Rural Non-Farm and 9.8 per cent of the Rural Farm women. Urban females and males enter the labor force earlier in life than do their country cousins. In older age groups, the Rural Farm group has more males and the Urban group has more females in the labor force than do other residence groups.

Figure 10 indicates the changes in the percentage of females and males involved in the labor force by age, from 1940 to 1950. Figure 11 indicates the percentage of females and males in the labor force according to rural-urban residence. Figure 12 indicates the age breakdown of females in the labor force by rural-urban residence.

The Rural Non-Farm and the Rural Farm groups exhibit similar patterns in the participation of women in the labor force until about age 39. The Rural Farm group participation begins to decline rapidly beyond age 39, whereas in the Rural Non-Farm group an increase continues in the number of women working until age 44. Beyond this, the Rural Non-Farm group exhibits a continuing decrease in the percentage of women involved in the labor force.

GURE 10.   Percentage of males and females in West Virginia labor force,
age, 1940 and 1950.

## cupations of West Virginia People

In April, 1950, 628,157 people were employed in West Virginia: ,781 (79 per cent) were males and 132,376 (21 per cent) were ales. This represented an increase of 21 per cent over the total em- yed in 1940. This increase included a 16.9 per cent increase in males ployed and a 39.8 per cent increase in females employed. The popu- on 14 years and over in West Virginia increased by 46,831 females l only 3,799 males from 1940 to 1950. As a result the females now number the males in the labor force age range (not in the actual labor ce) by 27,362 persons!

Table 16 shows the number of persons employed in the State in 0 by sex and by the various occupational groupings used in the S. Census reports. The increases or decreases in number employed in h of these occupations from 1940 to 1950 are also given. The greatest nber of people (31.5 per cent of all employed in the State) were em-

Per Cent

FIGURE 11. Percentage of males and females in West Virginia labor for
by rural-urban residence, 1950

ployed in the *Operatives and Kindred Workers* grouping. The occup
tional grouping listed as *Craftsmen, Foremen and Kindred Workers* ran
ed second, employing 14.6 per cent of the working persons in the Sta
These two occupational groupings also exhibited the greatest numeric
increase in the number employed from 1940 to 1950.

**FIGURE 12.** Percentage of females in West Virginia labor force, by age and rural-urban residence, 1950.

The greatest decrease in number of people employed from 1940 to 1950 occurred in the occupational grouping of *Farmers and Farm Managers*, which lost some 12,882 persons. Private *Household Workers* lost 1,254, and *Farm Laborers, Unpaid and Family Workers* had a loss of 5,163. The decreases which occurred in the occupations dealing with farming were mainly decreases in the employment of males. The decrease in number employed in household services was largely a decrease in females.

The greatest increase in the employment of males came in the two areas using the most employees in the State—*Operatives and Kindred Workers,* and *Craftsmen, Foremen and Kindred Workers.* The only other category in which the number of males employed increased by 1,000 workers or more was in *Clerical and Kindred Workers.*

Nearly half the increase in females employed from 1940 to 1950 came in the category *Clerical and Kindred Workers*, with an increase of 14,378. The number of females employed in the State increased by 1,000 or more workers in the following categories: *Sales Workers, Operatives and Kindred Workers,* and *Service Workers, Except Private Household.* In the *Professional, Technical and Kindred Workers,* the amount of increase was just under 5,000 workers for both males and females.

Males and females are found in comparatively equal numbers in the following occupational groupings: *Professional, Technical and Kindred Workers, Clerical and Kindred Workers, Sales Workers,* and

*Figures for the separate male and female percentages are calculated from the total employed in the State, not from the separate male and female employed totals.
—This symbol refers to the fact that the percentage is below one per cent and therefore has not been considered for this table.

dication of how many women are found in particular occupational groupings in relation to the number of men found in each. It is interesting to note that in some of the occupational groupings, such as *Craftsmen, Foremen and Kindred Workers*, the percentage increase in number of females employed is tremendously high. There are but few women employed in occupations of that category, but percentage-wise, they increased more than 100 per cent from 1940 to 1950.

# Major Industries and the Population

The leading industry in the State in 1950 was *Mining*, employing 21.7 per cent of the total employed. *Manufacturing* ranked second, employing 19.2 per cent. *Wholesale and Retail Trade* employed 15.8 per cent and *Agriculture, Forestry and Fisheries* employed 10.0 per cent.

In the Urban world, the leading industry was *Manufacturing*, followed by the *Wholesale and Retail Trade, Transportation and Commerce*, and *Professional and Related Services*. In the Rural Non-Farm areas, the pattern was the same as that for the State as a whole, except that *Transportation* ranked fourth, in place of *Agriculture, Forestry and Fisheries*. In the Rural Farm world, *Agriculture, Forestry and Fisheries* led in employment, followed by *Mining, Manufacturing*, and *Wholesale and Retail Trade*.

Though *Mining* is the leading industry in the State, if 1940-1950 figures can be taken as an indication, it is beginning to lose its prominence. From 1940 to 1950 the number of persons employed in *Mining* increased, but the percentage of the total population employed was less in 1950 than it had been in 1940. (The total population base was larger from which the percentage were computed.) Meanwhile, *Manufacturing*, and *Wholesale and Retail Trade* both exhibited noticeable increases in the percentage of total population employed over the same period of time.

Numerically, the greatest increase in employed population from 1940 to 1950 occurred in *Wholesale and Retail Trades* (33,084), followed by *Manufacturing* (27,979). The greatest numerical decrease occurred in *Agriculture, Forestry and Fisheries* (18,023). The only other industry showing a decline in population employed was *Personal, Entertainment and Recreation Services*. Table 18 indicates the employment of population by the four leading industries in the State and by rural-urban groupings.

The decrease in *Agriculture, Forestry and Fisheries* from 1940 to 1950 involved both men and women. Although the number of females employed in *Personal, Entertainment, and Recreation Services* decreased, the number of males employed therein increased.

Greatest increases in number of males employed over the decade were in the *Wholesale and Retail Trades* (13,907), *Mining* (10,033), and *Manufacturing* (9,807). Greatest increases in number of females employed came in *Wholesale and Retail Trade* (19,177, the biggest increase over the decade for either sex), and in *Professional and Related Services* (8,658).

TABLE 18. LEADING INDUSTRIES IN WEST VIRGINIA BY PERCENTAGE OF
EMPLOYED WORKERS UTILIZED, CLASSIFIED BY RURAL-URBAN RESIDENCE

| LEADING INDUSTRIES IN STATE | PER CENT EMPLOYED | LEADING INDUSTRIES (URBAN) | PER CENT EMPLOYED | LEADING INDUSTRIES RNF* | PER CENT EMPLOYED | LEADING INDUSTRIES RF** | PER CENT EMPLOYED |
|---|---|---|---|---|---|---|---|
| 1. Mining . | 21.7 | Mfg. | 26.0 | Mining | 39.9 | Agr. | 46.0 |
| 2. Mfg. ...... | 19.2 | Trade | 22.4 | Mfg. | 14.9 | Mining | 16.4 |
| 3. Trade ... | 15.8 | Transp. & Commerce | 10.9 | Trade | 13.2 | Mfg. | 12.6 |
| 4. Agr. Etc. ........ | 10.0 | Prof & Rel. Serv. | 10.4 | Transp. | 7.6 | Trade | 5.7 |
| Total Population Employed | 628,157 | | 265,172 | | 247,577 | | 115,408 |

*RNF—Rural Non-farm
**RF—Rural Farm

Some interesting trends appear in the employment of males and
females by industries. Males make up the majority of workers in most
industries except *Personal, Entertainment and Recreation Services* and
the *Professional and Related Services.* Only a small difference appears
in the number of males and females employed in the *Wholesale and
Retail Trade* and in *Finance, Insurance, and Real Estate.* Table 19
indicates the employment of the State population by industry, sex, and
rural-urban residence.

The percentage of the labor force in each county employed in each
of the four leading West Virginia industries is given in Table 20. It
further indicates the change in percentage employed from 1940 to 1950.
Greatest increases in the leading industry, *Mining,* came in Lincoln,
Mingo, Nicholas and Webster counties. Greatest decreases in *Mining*
came in Putnam, Raleigh, Mineral and Tucker counties.

*Manufacturing,* the second leading industry, had its greatest in-
creases in Pocahontas, Putnam, Monroe and Clay counties. Mineral,
Harrison and Berkeley counties had the only decreases in this industry.

*Wholesale and Retail Trade,* the third ranking industry, experienced
from a 1.4 per cent to a 5.7 per cent increase in all counties except Har-
rison, which had a 2.0 per cent decrease.

*Agriculture, Forestry, and Fisheries,* the fourth leading industry, ex-
perienced a decrease in percentage of population employed in all but
eleven counties. The greatest decreases came in Clay, Nicholas, Wyom-
ing and Putnam counties. Most of the increases in number employed in
this industry over the decade were below 5 per cent. Exceptions, how-
ever, were Calhoun, Pendleton, and Webster counties.

TABLE 19. PERCENTAGE OF EMPLOYED MALES AND FEMALES PER MAJOR INDUSTRY, CLASSIFIED ACCORDING TO RURAL-URBAN RESIDENCE WITH INDUSTRY RANKED

44

# Marital Status of the State Population

Marriage was more popular in West Virginia in 1950 than in 1940 —but so was divorce! In 1950, 69 per cent of the males and 68.5 per cent of the females 15 years of age and over were married. These figures represent an increase of 7.6 per cent for males and 5.1 per cent for females over the 1940 figures. The greatest increase in the percentage married, for both males and females, appeared in ages 20-29. A 1 per cent increase in divorce among both males and females, and a 1 per cent increase in number of females widowed appeared over the decade.

Males exhibited a decrease in percentage widowed in all age groups except ages 15-24. Females had a decrease in all age groups in percentage widowed except ages 15-19 and 55-65. The greatest increase for both males and females in percentage divorced came in the 45-54 age group. However, from age 25 years up, males exhibited an increase of about 1 per cent, whereas females had slightly more than 1 per cent increase in ages 25-54, and decreased thereafter.

The highest percentage of married males was found in the Urban group (71 per cent), followed by the Rural Non-Farm and then the Rural Farm group. Both the Rural Non-Farm and the Urban groups had a higher percentage of married males than the State as a whole.

Rural Farm males are the slowest to get married, but they appear to remain married longer than the other groups. The Rural Non-Farm group had a higher percentage of married males than the other residence groups—until age 65, at which age the Rural Farm males lead. Figure 13 indicates the percentage of males, 15 years and over, married, by age and rural-urban residence in 1950.

Urban and Rural Non-Farm females have a somewhat lower percentage married than the percentage for the State as a whole. As with the males, Rural Farm females are slower to marry. Rural Farm males and females seem to survive marriage longer than either of the other groups. Figure 14 indicates the percentage of females 15 years and over, married, by age and rural-urban residence, in 1950.

The highest divorce rate was found among Urban females and the lowest among Rural Farm females. The Urban group has the highest divorce rate in the State for both males and females and the Rural Farm group has the lowest.

There seems to be no one age group in which divorces are concentrated. A jump in percentage appeared at age 25, reaching a percentage peak for females in the 35-44 age group, and for males in the 45-54 age group. Minor fluctuation appeared in this pattern between the various rural-urban residence groups. Rural Farm females exhibited the widest variation in pattern, reaching the percentage peak in divorce

45

TABLE 20. PERCENTAGE OF COUNTY LABOR FORCE IN FOUR LEADING INDUSTRIES, WITH GAIN OR LOSS IN PERCENTAGE OF LABOR FORCE EMPLOYED IN GIVEN INDUSTRY FROM 1940-1950

| COUNTY | PER CENT LABOR FORCE EMPLOYED IN MINING | PER CENT LABOR FORCE EMPLOYED IN MFG. | PER CENT LABOR FORCE EMPLOYED IN WHOLESALE & RETAIL TRADE | PER CENT LABOR FORCE EMPLOYED IN AGR., FOR. & FISH. | INCREASE OR DECREASE IN PER CENT OF LABOR FORCE EMPLOYED FROM 1940 TO 1950 IN FOLLOWING INDUSTRIES | | | |

FIGURE 13. Percentage of West Virginia males, 15 years and over, married, by age and rural-urban residence, 1950.

FIGURE 14. Percentage of West Virginia females, 15 years and over, married, by age and rural-urban residence, 1950.

in ages 25-29. This suggests that if Rural Farm women divorce, they do it early in marriage. Table 21 indicates the percentage of the population divorced by age, sex and rural-urban residence in 1950.

The Urban group has the greatest concentration of widows. The Rural Farm group has the most widowers. The Rural Farm women tend to marry later in life than their resident neighbors in the cities. They are also less likely to become widows, despite the presence of many widowers in the Rural Farm population. Perhaps this is indicative that widows tend to leave the Rural Farm areas for the towns and cities.

The pattern of widowing among males does not reach serious consideration until about age 65. For females, it begins to surge upwards in the 45-54 age period and increases steadily thereafter. Only 3.5 per cent of all males 15 years and over are widowers, compared with 10.5 per cent of the females. Table 22 indicates the percentage of the population widowed by age, sex, and rural-urban residence.

TABLE 21. PERCENTAGE OF WEST VIRGINIA POPULATION, 15 YEARS AND OVER, DIVORCED, BY AGE, SEX, AND RURAL-URBAN RESIDENCE

| Average | 3.8 | 10.5 | 3.9 | 12.4 | 3.6 | 9.4 | 4.2 | 9.1 |

*This high a figure at such a young age appears like a typing mistake, but it is not. Perhaps it is accounted for by the young mothers in the rural-farm world who die in childbirth.

# Income in West Virginia

Three thousand dollars or less was the yearly income recorded in the 1950 census for 62 per cent of the population in West Virginia. This percentage was computed on the basis of 1949 figures. Carrying the figures further, it was noted that 77.9 per cent made $4,000 or less, and 35 per cent made less than $2,000. The modal group earned between $2,000 and $3,000. In the Urban world, 45 per cent of the families were making $3,000 or less, as compared with 64.7 per cent of the Rural Non-Farm and 79.9 per cent of the Rural Farm families.

The U. S. Census provides an indication of median income in two categories: *Families,* and *Families and Unrelated Individuals.* The figures in the paragraph above are based on the income of *Families.* Figures for *Families and Unrelated Individuals* are usually lower than figures for *Families.* Table 23 presents the median income for the State and for the rural-urban residence groupings. It indicates the figures for both categories and also compares median incomes in West Virginia with those of the United States as a whole.

TABLE 23. MEDIAN INCOME OF FAMILIES AND OF FAMILIES AND UNRELATED INDIVIDUALS IN WEST VIRGINIA AND IN THE UNITED STATES AS A WHOLE, 1949, BY RURAL-URBAN RESIDENCE

| RESIDENCE GROUP | FAMILIES | | FAMILIES AND UNRELATED INDIVIDUALS | |
|---|---|---|---|---|
| | WEST VIRGINIA | UNITED STATES | WEST VIRGINIA | UNITED STATES |
| State or Nation ........ | $2584 | $3073 | $2344 | $2619 |
| Urban ........................... | 3209 | 3431 | 2778 | 2970 |
| Rural Non-Farm ...... | 2499 | 2560 | 2341 | 2186 |
| Rural Farm ................ | 1581 | 1729 | 1411 | 1567 |

The median income for *Families* in the State fell nearly $500 below that for the U. S. as a whole. Median income of *Families and Unrelated Individuals* did not lag as far behind the U. S. figures. In fact, the Rural Non-Farm group of the State had a higher median income for *Families and Unrelated Individuals* than that found for the Rural Non-Farm group of the U. S. as a whole.

A picture of the median income of cities and counties in the State can be found by referring to Tables 9 and 10. Data are given on median income for both *Families* and *Families and Unrelated Individuals* by counties and by larger cities. Income figures are available only on median income of *Families* for smaller cities.

The median income for *Families and Unrelated Individuals* in cities of 10,000 and over ranged from $4,045 in South Charleston to

$2,463 in Moundsville.[4]  The average median income for *Families and Unrelated Individuals* in all the larger cities was $2,841.64.  The median income for *Families and Unrelated Individuals* in the smaller Urban Places (2,500-10,000 population), ranged from $4,033 in St. Albans to $1,415 in Buckhannon.  The average median income for all the smaller Urban Places was $2,681.83.

The median income for *Families and Unrelated Individuals* in the counties ranged from $3,362 in Hancock to $1,053 in Calhoun.  The average median income for all counties was $1,936.18.  The median income for *Families* in the counties ranged from $3,596 in Hancock to $1,150 in Calhoun.

There appeared to be a relationship between the size of median income in the county and the amount of loss of population the county experienced from its potential 1950 population.  This relationship was tested by statistical correlational techniques.  The results tended to support the assumption that the smaller the median income in the county in 1949, the greater the loss from the potential population of the county in 1950.

[4]The median income in this category for Morgantown is given as $1,875. However, once again the school population probably acts as an influence upon the data.  The median income for Families in Morgantown is $3,154.
