

Interview To
Emirjeta Adhami
(Chief of Environment Department Academy of
Science Hydrometeorological Institute)

Q: Which is your experience in the realization of the programme of monitoring of the quality of superficial waters in the within of the Programme of the Environmental Protection?

A: The Hydrometeorological Institute has the task to apply the programme of environmental monitoring in some hidrometerological main parameters about quality of the air and waters. One of these tasks is also the programme of monitoring of superficial waters in Albania and it is carried out in collaboration with the Ministry of the Environment. On account of it the Institute realized a net of monitoring in the rivers, lagoons and coasts. For this programme, the main parameters of the water pollution and the frequency of the sampling have been defined, having present the fact to take a reliable and useful information for the local and central institutions. This information is worth in order to estimate the state of superficial waters in our country so as to take measures in order to have the pollution or to reduce it. To realize a more effective program it is need the improvement of the analysis and sampling technologies, the realization of a net of automatic stations of transmission on-line and a better collaboration among the scientific institutes for the environmental monitoring.
