- Information related to the capacity development interventions implemented by the CFA (with MFS II funding) (see also Step 2) to strengthen the capacity of the SPO. For example, the training on financial management of the SPO staff could be related to any information on financial management of the SPO. This information was coded in Nvivo.

In addition, the response by the CFA to the changes in 5C indicators format, was auto-coded.

The in-country team was responsible for timely collection of information from the SPO (before the fieldwork starts). This set of information dealt with:

- MFS II supported capacity development interventions during the MFS II period (2011 until now).
- Overview of all trainings provided in relation to a particular outcome areas/organisational capacity change since the baseline.
- For each of the identified MFS II supported trainings, training questionnaires have been developed to assess these trainings in terms of the participants, interests, knowledge and skills gained, behaviour change and changes in the organisation (based on Kirkpatrick's model), one format for training participants and one for their managers. These training questionnaires were sent prior to the field visit.
- Changes expected by SPO on a long-term basis ('Support to capacity development sheet - endline - SPO perspective').

For the selection of change/ outcome areas the following criteria were important:

- The change/ outcome area is in one of the two capabilities selected for process tracing: capability to act and commit or the capability to adapt and self-renew. This was the first criteria to select upon.
- There was a likely link between the key organisational capacity change/ outcome area and the MFS II supported capacity development interventions. This also was an important criteria. This would need to be demonstrated through one or more of the following situations:
 - In the 2012 theory of change on organisational capacity development of the SPO a link was indicated between the outcome area and MFS II support;
 - During the baseline the CFA indicated a link between the planned MFS II support to organisational development and the expected short-term or long-term results in one of the selected capabilities;
 - During the endline the CFA indicated a link between the implemented MFS II capacity development interventions and observed short-term changes and expected long-term changes in the organisational capacity of the SPO in one of the selected capabilities;
 - During the endline the SPO indicated a link between the implemented MFS II capacity development interventions and observed short-term changes and expected long-term changes in the organisational capacity of the SPO in one of the selected capabilities.

Reviewing the information obtained as described in Step 1, 2, and 3 provided the basis for selecting key organisational capacity change/ outcome areas to focus on for process tracing. These areas were to be formulated as broader outcome areas, such as 'improved financial management', 'improved monitoring and evaluation' or 'improved staff competencies'.

Note: the outcome areas were to be formulated as intermediates changes. For example: an improved monitoring and evaluation system, or enhanced knowledge and skills to educate the target group on

climate change. Key outcome areas were also verified - based on document review as well as discussions with the SPO during the endline.

*Step 4. Construct the **detailed, initial causal map** (theoretical model of change) – CDI & in-country team*

A detailed initial causal map was developed by the CDI team, in collaboration with the in-country team. This was based on document review, including information provided by the CFA and SPO on MFS II supported capacity development interventions and their immediate and long-term objectives as well as observed changes. Also, the training questionnaires were reviewed before developing the initial causal map. This detailed initial causal map was to be provided by the CDI team with a visual and related narrative with related references. This initial causal map served as a reference point for further reflection with the SPO during the process tracing endline workshop, where relationships needed to be verified or new relationships established so that the second (workshop-based), detailed causal map could be developed, after which further verification was needed to come up with the final, concluding detailed causal map.

It's important to note that organisational change area/ outcome areas could be both positive and negative.

For each of the selected outcomes the team needed to make explicit the theoretical model of change. This meant finding out about the range of different actors, factors, actions, and events etc. that have contributed to a particular outcome in terms of organisational capacity of the SPO.

A model of change of good quality includes:

- The causal pathways that relate the intervention to the realised change/ outcome;
- Rival explanations for the same change/ outcome;
- Assumptions that clarify relations between different components or parts;
- Case specific and/or context specific factors or risks that might influence the causal pathway, such as for instance the socio-cultural-economic context, or a natural disaster;
- Specific attributes of the actors e.g. CFA and other funders.

A model of change (within the 5C study called a 'detailed causal map') is a complex system which produces intermediate and long-term outcomes by the interaction of other parts. It consists of parts or causes that often consist of one actor with its attributes that is implementing activities leading to change in other parts (Beach & Pedersen, 2013). A helpful way of constructing the model of change is to think in terms of actors carrying out activities that lead to other actors changing their behaviour. The model of change can be explained as a range of activities carried out by different *actors* (including the CFA and SPO under evaluation) that will ultimately lead to an outcome. Besides this, there are also '*structural*' elements, which are to be interpreted as external factors (such as economic conjuncture); and *attributes* of the actor (does the actor have the legitimacy to ask for change or not, what is its position in the sector) that should be looked at (Beach & Pedersen, 2013). In fact Beach and Pedersen, make a fine point about the subjectivity of the actor in a dynamic context. This means, in qualitative methodologies, capturing the changes in the actor, acted upon area or person/organisation, in a non sequential and non temporal format. Things which were done recently could have corrected behavioural outcomes of an organisation and at the same time there could be processes which incrementally pushed for the same change over a period of time. Beach and Pedersen espouse this methodology because it captures change in a dynamic fashion as against the methodology of logical framework. For the MFS II evaluation it was important to make a distinction between those paths in the model of change that are the result of MFS II and rival pathways.

The construction of the model of change started with the identified key organisational capacity change/ outcome, followed by an inventory of all possible subcomponents that possibly have caused the change/ outcome in the MFS II period (2011-up to now, or since the baseline). The figure below presents an imaginary example of a model of change. The different colours indicate the different types of support to capacity development of the SPO by different actors, thereby indicating different pathways of change, leading to the key changes/ outcomes in terms of capacity development (which in this case indicates the ability to adapt and self-renew).

Figure 1 An imaginary example of a model of change

Step 5. Identify types of evidence needed to verify or discard different causal relationships in the model of change – in-country teams with support from CDI team

Once the causal mechanism at theoretical level were defined, empirical evidence was collected so as to verify or discard the different parts of this theoretical model of change, confirm or reject whether subcomponents have taken place, and to find evidence that confirm or reject the causal relations between the subcomponents.

A key question that we needed to ask ourselves was, “What information do we need in order to confirm or reject that one subcomponent leads to another, that X causes Y?”. The evaluation team needed to agree on what information was needed that provides empirical manifestations for each part of the model of change.

There are four distinguishable types of evidence that are relevant in process tracing analysis: *pattern*, *sequence*, *trace*, and *account*. Please see the box below for descriptions of these types of evidence.

The evaluation team needed to agree on the types of evidence that was needed to verify or discard the manifestation of a particular part of the causal mechanism. Each one or a combination of these different types of evidence could be used to confirm or reject the different parts of the model of change. This is what is meant by robustness of evidence gathering. Since causality as a concept can bend in many ways, our methodology, provides a near scientific model for accepting and rejecting a particular type of evidence, ignoring its face value.

Types of evidence to be used in process tracing

Pattern evidence relates to predictions of statistical patterns in the evidence. For example, in testing a mechanism of racial discrimination in a case dealing with employment, statistical patterns of employment would be relevant for testing this part of the mechanism.

Sequence evidence deals with the temporal and spatial chronology of events predicted by a hypothesised causal mechanism. For example, a test of the hypothesis could involve expectations of the timing of events where we might predict that if the hypothesis is valid, we should see that the event B took place after event A took place. However, if we found that event B took place before event A took place, the test would suggest that our confidence in the validity of this part of the mechanism should be reduced (disconfirmation/ falsification).

Trace evidence is evidence whose mere existence provides proof that a part of a hypothesised mechanism exists. For example, the existence of the minutes of a meeting, if authentic ones, provide strong proof that the meeting took place.

Account evidence deals with the content of empirical material, such as meeting minutes that detail what was discussed or an oral account of what took place in the meeting.

Source: Beach and Pedersen, 2013

Below you can find a table that provides guidelines on what to look for when identifying types of evidence that can confirm or reject causal relationships between different parts/ subcomponents of the model of change. It also provides one example of a part of a causal pathway and what type of information to look for.

Table 9

Format for identifying types of evidence for different causal relationships in the model of change (example included)

Part of the model of change	Key questions	Type of evidence needed	Source of information
Describe relationship between the subcomponents of the model of change	Describe questions you would like to answer so as to find out whether the components in the relationship took place, when they took place, who was involved, and whether they are related	Describe the information that we need in order to answer these questions. Which type of evidence can we use in order to reject or confirm that subcomponent X causes subcomponent Y? Can we find this information by means of : Pattern evidence; Sequence evidence; Trace evidence; Account evidence?	Describe where you can find this information
Example: Training workshops on M&E provided by MFS II funding and other sources of funding	Example: What type of training workshops on M&E took place? Who was trained? When did the training take place? Who funded the training? Was the funding of training provided before the training took place? How much money was available for the training?	Example: Trace evidence: on types of training delivered, who was trained, when the training took place, budget for the training Sequence evidence on timing of funding and timing of training Content evidence: what the training was about	Example: Training report SPO Progress reports Interviews with the CFA and SPO staff Financial reports SPO and CFA

Please note that for practical reasons, the 5C evaluation team decided that it was easier to integrate the specific questions in the narrative of the initial causal map. These questions would need to be addressed by the in country team during the process tracing workshop so as to discover, verify or discard particular causal mechanisms in the detailed, initial causal map. Different types of evidence was asked for in these questions.

*Step 6. **Collect data** to verify or discard causal mechanisms and develop workshop-based, detailed causal map – in-country team*

Once it was decided by the in-country and CDI evaluation teams what information was to be collected during the interaction with the SPO, data collection took place. The initial causal maps served as a basis for discussions during the endline workshop with a particular focus on process tracing for the identified organisational capacity changes. But it was considered to be very important to understand from the perspective of the SPO how they understood the identified key organisational capacity change/outcome area has come about. A new detailed, workshop-based causal map was developed that included the information provided by SPO staff as well as based on initial document review as described in the initial detailed causal map. This information was further analysed and verified with other relevant information so as to develop a final causal map, which is described in the next step.

*Step 7. **Assess the quality of data and analyse data**, and develop the **final detailed causal map** (model of change) – in-country team and CDI team*

Quality assurance of the data collected and the evidence it provides for rejecting or confirming parts of causal explanations are a major concern for many authors specialised in contribution analysis and process-tracing. Stern et al. (2012), Beach and Pedersen (2013), Lemire, Nielsen and Dybdal (2012), Mayne (2012) and Delahais and Toulemonde (2012) all emphasise the need to make attribution/contribution claims that are based on pieces of evidence that are rigorous, traceable, and credible. These pieces of evidence should be as explicit as possible in proving that *subcomponent X causes subcomponent Y* and ruling out other explanations. Several tools are proposed to check the nature and the quality of data needed. One option is, Delahais and Toulemonde's Evidence Analysis Database, which we have adapted for our purpose.

Delahais and Toulemonde (2012) propose an Evidence Analysis Database that takes into consideration three criteria:

- Confirming/ rejecting a causal relation (yes/no);
- Type of causal mechanism: intended contribution/ other contribution/ condition leading to intended contribution/ intended condition to other contribution/ feedback loop;
- Strength of evidence: strong/ rather strong/ rather weak/ weak.

We have adapted their criteria to our purpose. The in-country team, in collaboration with the CDI team, used the criteria in assessing whether causal relationships in the causal map, were strong enough. This has been more of an iterative process trying to find additional evidence for the established relationships through additional document review or contacting the CFA and SPO as well as getting their feedback on the final detailed causal map that was established. Whilst the form below has not been used exactly in the manner depicted, it has been used indirectly when trying to validate the information in the detailed causal map. After that, the final detailed causal map is established both as a visual as well as a narrative, with related references for the established causal relations.

<i>Example format for the adapted evidence analysis database (example included)</i> Description of causal relation	Confirming/ rejecting a causal relation (yes/ no)	Type of information providing the background to the confirmation or rejection of the causal relation	Strength of evidence: strong/ rather strong/ rather weak/ weak	Explanation for why the evidence is (rather) strong or (rather) weak, and therefore the causal relation is confirmed/ rejected
e.g. Training staff in M&E leads to enhanced M&E knowledge, skills and practice	e.g. Confirmed	e.g. Training reports confirmed that staff are trained in M&E and that knowledge and skills increased as a result of the training		

Step 8. Analyse and conclude on findings– in-country team and CDI team

The final detailed causal map was described as a visual and narrative and this was then analysed in terms of the evaluation question two and evaluation question four: “*To what degree are the changes identified in partner capacity attributable to development interventions undertaken by the MFS II consortia (i.e. measuring effectiveness)?*” and “*What factors explain the findings drawn from the questions above?*” It was analysed to what extent the identified key organisational capacity change can be attributed to MFS II supported capacity development interventions as well as to other related factors, interventions and actors.

4. Explaining factors – evaluation question 4

This paragraph describes the data collection and analysis methodology for answering the fourth evaluation question: “**What factors explain the findings drawn from the questions above?**”

In order to explain the changes in organisational capacity development between baseline and endline (evaluation question 1) the CDI and in-country evaluation teams needed to review the indicators and how they have changed between baseline and endline and what reasons have been provided for this. This has been explained in the first section of this appendix. It has been difficult to find detailed explanations for changes in each of the separate 5c indicators, but the 'general causal map' has provided some ideas about some of the key underlying factors actors and interventions that influence the key organisational capacity changes, as perceived by the SPO staff.

For those SPOs that are selected for process tracing (evaluation question 2), more in-depth information was procured for the identified key organisational capacity changes and how MFS II supported capacity development interventions as well as other actors, factors and interventions have influenced these changes. This is integrated in the process of process tracing as described in the section above.

5. Methodological reflection

Below a few methodological reflections are made by the 5C evaluation team.

Use of the 5 core capabilities framework and qualitative approach: this has proven to a be very useful framework to assess organisational capacity. The five core capabilities provide a comprehensive picture of the capacity of an organisation. The capabilities are interlinked, which was also reflected in the description of standard indicators, that have been developed for the purpose of this 5C evaluation

and agreed upon for the eight countries. Using this framework with a mainly qualitative approach has provided rich information for the SPOs and CFAs, and many have indicated this was a useful learning exercise.

Using standard indicators and scores: using standard indicators is useful for comparison purposes. However, the information provided per indicator is very specific to the SPO and therefore makes comparison difficult. Whilst the description of indicators has been useful for the SPO and CFA, it is questionable to what extent indicators can be compared across SPOs since they need to be seen in context, for them to make meaning. In relation to this, one can say that scores that are provided for the indicators, are only relative and cannot show the richness of information as provided in the indicator description. Furthermore, it must be noted that organisations are continuously changing and scores are just a snapshot in time. There cannot be perfect score for this. In hindsight, having rubrics would have been more useful than scores.

General causal map: whilst this general causal map, which is based on key organisational capacity changes and related causes, as perceived by the SPO staff present at the endline workshop, has not been validated with other sources of information except SPO feedback, the 5C evaluation team considers this information important, since it provides the SPO story about how and which changes in the organisation since the baseline, are perceived as being important, and how these changes have come about. This will provide information additional to the information that has been validated when analysing and describing the indicators as well as the information provided through process tracing (selected SPOs). This has proven to be a learning experience for many SPOs.

Using process tracing for dealing with the attribution question: this theory-based and mainly qualitative approach has been chosen to deal with the attribution question, on how the organisational capacity changes in the organisations have come about and what the relationship is with MFS II supported capacity development interventions and other factors. This has proven to be a very useful process, that provided a lot of very rich information. Many SPOs and CFAs have already indicated that they appreciated the richness of information which provided a story about how identified organisational capacity changes have come about. Whilst this process was intensive for SPOs during the process tracing workshops, many appreciated this to be a learning process that provided useful information on how the organisation can further develop itself. For the evaluation team, this has also been an intensive and time-consuming process, but since it provided rich information in a learning process, the effort was worth it, if SPOs and CFAs find this process and findings useful.

A few remarks need to be made:

- Outcome explaining process tracing is used for this purpose, but has been adapted to the situation since the issues being looked at were very complex in nature.
- Difficulty of verifying each and every single change and causal relationship:
- Intensity of the process and problems with recall: often the process tracing workshop was done straight after the general endline workshop that has been done for all the SPOs. In some cases, the process tracing endline workshop has been done at a different point in time, which was better for staff involved in this process, since process tracing asks people to think back about changes and how these changes have come about. The word difficulties with recalling some of these changes and how they have come about. See also the next paragraph.
- Difficulty of assessing changes in knowledge and behaviour: training questionnaire is have been developed, based on Kirkpatrick's model and were specifically tailored to identify not only the interest but also the change in knowledge and skills, behaviour as well as organisational changes as a result of a particular training. The retention ability of individuals, irrespective of their position in the organisation, is often unstable. The 5C evaluation team experienced that it was difficult for people to recall specific trainings, and what they learned from those trainings. Often a change in knowledge, skills and behaviour is a result brought about by a combination of different factors, rather than being traceable to one particular event. The detailed causal maps that have been established, also clearly pointed this. There are many factors at play that make people change their behaviour, and this is not just dependent on training but also internal/personal (motivational) factors as well as factors within the organisation, that stimulate or hinder a person to change behaviour. Understanding how behaviour change works is important when trying to really understand the extent to which behaviour has changed as a result of different factors, actors and interventions. Organisations change because people

change and therefore understanding when and how these individuals change behaviour is crucial. Also attrition and change in key organisational positions can contribute considerably to the outcome.

Utilisation of the evaluation

The 5C evaluation team considers it important to also discuss issues around utility of this evaluation. We want to mention just a few.

Design – mainly externally driven and with a focus on accountability and standard indicators and approaches within a limited time frame, and limited budget: this MFS II evaluation is originally based on a design that has been decided by IOB (the independent evaluation office of the Dutch Ministry of Foreign Affairs) and to some extent MFS II organisations. The evaluators have had no influence on the overall design and sampling for the 5C study. In terms of learning, one may question whether the most useful cases have been selected in this sampling process. The focus was very much on a rigorous evaluation carried out by an independent evaluation team. Indicators had to be streamlined across countries. The 5C team was requested to collaborate with the other 5C country teams (Bangladesh, Congo, Pakistan, Uganda) to streamline the methodological approach across the eight sampled countries. Whilst this may have its purpose in terms of synthesising results, the 5C evaluation team has also experienced the difficulty of tailoring the approach to the specific SPOs. The overall evaluation has been mainly accountability driven and was less focused on enhancing learning for improvement. Furthermore, the timeframe has been very small to compare baseline information (2012) with endline information (2014). Changes in organisational capacity may take a long, particularly if they are related to behaviour change. Furthermore, there has been limited budget to carry out the 5C evaluation. For all the four countries (Ethiopia, India, Indonesia, Liberia) that the Centre for Development Innovation, Wageningen University and Research centre has been involved in, the budget has been overspent.

However, the 5C evaluation team has designed an endline process whereby engagement of staff, e.g. in a workshop process was considered important, not only due to the need to collect data, but also to generate learning in the organisation. Furthermore, having general causal maps and detailed causal maps generated by process tracing have provided rich information that many SPOs and CFAs have already appreciated as useful in terms of the findings as well as a learning process.

Another issue that must be mentioned is that additional requests have been added to the country teams during the process of implementation: developing a country based synthesis; questions on design, implementation, and reaching objectives of MFS II funded capacity development interventions, whilst these questions were not in line with the core evaluation questions for the 5C evaluation.

Complexity and inadequate coordination and communication: many actors, both in the Netherlands, as well as in the eight selected countries, have been involved in this evaluation and their roles and responsibilities, were often unclear. For example, 19 MFS II consortia, the internal reference group, the Ministry of Foreign Affairs, Partos, the Joint Evaluation Trust, NWO-Wotro, the evaluators (Netherlands and in-country), 2 external advisory committees, and the steering committee. Not to mention the SPO's and their related partners and consultants. CDI was involved in 4 countries with a total number of 38 SPOs and related CFAs. This complexity influenced communication and coordination, as well as the extent to which learning could take place. Furthermore, there was a distance between the evaluators and the CFAs, since the approach had to be synchronised across countries, and had to adhere to strict guidelines, which were mainly externally formulated and could not be negotiated or discussed for the purpose of tailoring and learning. Feedback on the final results and report had to be provided mainly in written form. In order to enhance utilisation, a final workshop at the SPO to discuss the findings and think through the use with more people than probably the one who reads the report, would have more impact on organisational learning and development. Furthermore, feedback with the CFAs has also not been institutionalised in the evaluation process in the form of learning events. And as mentioned above, the complexity of the evaluation with many actors involved did not enhance learning and thus utilization.

5C Endline process, and in particular thoroughness of process tracing often appreciated as learning process: The SPO perspective has also brought to light a new experience and technique of self-assessment and self-corrective measures for managers. Most SPOs whether part of process tracing or not, deeply appreciated the thoroughness of the methodology and its ability to capture details with robust connectivity. This is a matter of satisfaction and learning for both evaluators and SPOs. Having a process whereby SPO staff were very much engaged in the process of self-assessment and reflection has proven for many to be a learning experience for many, and therefore have enhanced utility of the 5C evaluation.

Appendix 2 Background information on the five core capabilities framework

The 5 capabilities (5C) framework was to be used as a framework for the evaluation of capacity development of Southern Partner Organisations (SPOs) of the MFS II consortia. The 5C framework is based on a five-year research program on 'Capacity, change and performance' that was carried out by the European Centre for Development Policy Management (ECDPM). The research included an extensive review of the literature and sixteen case studies. The 5C framework has also been applied in an IOB evaluation using 26 case studies in 14 countries, and in the baseline carried out per organisation by the MFS II organisations for the purpose of the monitoring protocol.

The 5C framework is structured to understand and analyse (changes in) the capacity of an organization to deliver (social) value to its constituents. This introduction briefly describes the 5C framework, mainly based on the most recent document on the 5C framework (Keijzer et al., 2011).

The 5C framework sees capacity as an **outcome** of an **open system**. An organisation or collaborative association (for instance a network) is seen as a system interacting with wider society. The most critical practical issue is to ensure that relevant stakeholders share a common way of thinking about capacity and its core constituents or capabilities. Decisive for an organisation's capacity is the context in which the organisation operates. This means that **understanding context issues** is crucial. The use of the 5C framework requires a multi-stakeholder approach because shared values and results orientation are important to facilitate the capacity development process. The 5C framework therefore needs to **accommodate the different visions** of stakeholders and conceive different strategies for raising capacity and improving performance in a given situation.

The 5C framework defines capacity as '**producing social value**' and identifies five core capabilities that together result in that overall capacity. Capacity, capabilities and competences are seen as follows:

- **Capacity** is referred to as the overall ability of an organisation or system to create value for others;
- **Capabilities** are the collective ability of a group or a system to do something either inside or outside the system. The collective ability involved may be technical, logistical, managerial or generative (i.e. the ability to earn legitimacy, to adapt, to create meaning, etc.);
- **Competencies** are the energies, skills and abilities of individuals.

Fundamental to developing capacity are inputs such as human, material and financial resources, technology, and information. To the degree that they are developed and successfully integrated, capabilities contribute to the overall capacity or ability of an organisation or system to create value for others. A single capability is not sufficient to create capacity. All are needed and are strongly interrelated and overlapping. Thus, to achieve its development goals, the 5C framework says that every organisation or system must have **five basic capabilities**:

1. The capability to act and commit;
2. The capability to deliver on development objectives;
3. The capability to adapt and self-renew;
4. The capability to relate (to external stakeholders);
5. The capability to achieve coherence.

In order to have a common framework for evaluation, the five capabilities have been reformulated in outcome domains and for each outcome domain performance indicators have been developed.

There is some overlap between the five core capabilities but together the five capabilities result in a certain level of capacity. Influencing one capability may have an effect on one or more of the other capabilities. In each situation, the level of any of the five capabilities will vary. Each capability can become stronger or weaker over time.

Appendix 3 Results - changes in organisational capacity of the SPO - 5C indicators

Below you will find a description for each of the indicators under each of the capabilities, what the situation is as assessed during the endline, how this has changed since the baseline and what are the reasons for change.

Results - changes in organizational capacity of FSCE - 5C indicators

Below you will find a description for each of the indicators under each of the capabilities, what the situation is as assessed during the endline, how this has changed since the baseline and what are the reasons for change.

Capability to act and commit

1.1. Responsive leadership: 'Leadership is responsive, inspiring, and sensitive'

This is about leadership within the organization (operational, strategic). If there is a larger body then you may also want to refer to leadership at a higher level but not located at the local organization.

Leadership has changed since the baseline. The existence of some internal problems, marked by poor collaboration and tensions between the Program department and the finance department, negatively affected the functioning of the organization both at Head Quarters level, as well as with regards to the relations between Head Quarter and Area Program Offices (APOs). Because of these internal problems in May 2013 FSCE governance with the Board initiated an organizational development (OD) study. Based on the findings and recommendations of this OD Study, changes were proposed and a new Director was appointed in March 2014. In May 2014 the new Director in consultation with the Board started a reorganization in order to improve the internal functioning of the organization and to ensure quality program development, implementation and reporting. So the organization is now in a change process based on the implementation of the OD findings in which a weak management in the decision making process was found to be the crucial problem of the organization.

Capable and committed leaderships are now hired including the Executive Director, and systems and formal communications are being developed. Some improvements have been observed since the baseline in-terms of staff meetings (management and staff meetings on weekly and monthly basis respectively) at head office level but only recently. It is too early to see other changes. Commitment of the board to initiate the OD assessment and change the previous management, MFS II support in providing training on organizational management, and support from other donors like Save the Children International who financed the OD study was recognized as positive contributions for the changes in leadership and organizational structure.

However, there is still frustration among staffs on the poor and unresponsive leadership of the management particularly the previous one. The internal problems with the previous management negatively affected the functioning of the organization which caused a reduction in funding sources. This budget reduction has led to staffs layoff. In that sense the situation is worse compared to the baseline. Some staffs noted an improvement for this indicator considering that the organization and leadership is on its way up again now. But this was all very recent at the time of the endline survey (May 2014) and more staff considered this indicator to have deteriorated compared to the baseline situation.

Score: from 4 to 3.5 (slight deterioration)

1.2. Strategic guidance: 'Leaders provide appropriate strategic guidance (strategic leader and operational leader)'

This is about the extent to which the leader(s) provide strategic directions

The key change observed since the baseline in FSCE was the organizational development process (re-structuring or of FSCE in terms of organizational set up and leadership) based on the findings of the organizational development (OD) study conducted in May 2013, which was initiated and enacted by the Executive Board (EB) and the General assembly (GA) through establishing a Change Management Committee (CMC) to follow the process. A number of recommendations came out of the OD study, and previous leadership, who was blamed for problems of responsiveness in terms of timely decision making and communications, especially the Director, was laid off in February 2014 and a new Executive Director was hired in March 2014. Though the role/stimulus of the new leadership is not known yet, slight improvements appeared in terms of communication and team work after the change in leadership at the head office level, but not at the Area Program offices (FSCE has 3 regional and 2 city area offices). It requires time to translate changes to the lower level. This is due to that fact that the new Director, who was appointed just before the time of this survey (two months), didn't have enough time to play a big role in the change process of FSCE. FSCE has also slight improvements in program implementation specifically stopping child labour and promoting the area specific community based MS approach. The strategic plan was revised and validated, medical insurance policy improved and the Board has started guiding the HQs staff recently.

However, according to most staffs and the OD assessment report, since the baseline internal problems affected a good functioning of the organization both at Head Quarters level and the relation between Head Quarter and Area Program offices due to lack of on-time reporting to donors by FSCE. Some staffs also noted that implementation of the OD recommendations to restructure the organization was delayed which has led to frustration of staffs and some head office staff resigned the organization. FSCE has revised its strategic plan, but the document is not endorsed by the board yet and not communicated to all staffs. As a result, projects are designed in a conventional way rather than with clear strategic directions. Generally, the overall functioning of the organization was missing coordination, a formal flow of performing obligations and there was weak communication between branch offices and the head office as well as with donors. Meanwhile, according to some staffs, there was no interference by the board members in the day to day activities of the organization during and after the baseline which needs to be corrected in the baseline report.

Score: from 3.5 to 2.5 (deterioration)

1.3. Staff turnover: 'Staff turnover is relatively low'

This is about staff turnover.

Since 2012, annual staff turnover in FSCE has increased due to the fact that especially the annual budget of the organization has declined, and some projects have phased out without having found new funds to substitute the phased out projects, particularly in the past two years. Consequently, the number of staffs has declined and some staffs have resigned the organization due to the low salary scale and the uncondusive working environment during the previous management. Most of head office management staff has changed due to the recommendations of the OD study. In summary, there has been high staff turnover and layoff due to budget constraints, lack of competitive salary and/or an uncondusive working environment. Staffs performance valuation is not well managed and there is no performance based annual salary increment in the organization.

On the other hand, some staffs stated that staff turnover did not alarmingly change compared to the baseline in FSCE and that salary scale adjustment and increments had a positive impact on staff turnover.

Score: from 3 to 2 (deterioration)

1.4. Organizational structure: 'Existence of clear organizational structure reflecting the objectives of the organization'

FSCE has an organizational structure that governs its operations with clear distinction of powers, roles and responsibilities. This was evident in the evaluation report of the Adama project by Kinderpostzegels (CFA) in October 2013, "FSCE has an organizational manual introduced in 2011 that defines and outlines organizational and relationship arrangements". Staff has a copy of the organizational structure and are able to understand the objectives of the organization. Recently new staff arrangements have been made with distinction of roles and responsibilities.

Score: from 3 to 3.5 (slight improvement)

1.5. Articulated strategies: 'Strategies are articulated and based on good situation analysis and adequate M&E'

FSCE had a strategic plan from 2010 to 2014 that served as mother document to guide the organization in developing operational plans, working manuals and procedures. This strategic plan was later revised to cover 2012-2014. Strategies are well articulated in the organization. Situation analysis and monitoring and evaluation are used to inform strategies. According to the alliance evaluation report on the Adama project, the monitoring practices of FSCE are based on the current management and operational structure and systems. FSCE assesses variations by comparing plans and performances. Variations are discussed and corrections are recommended at the end of quarterly monitoring and annual review meetings. Adjustments according to this feedback are followed during the next monitoring event, i.e. the next monitoring always starts by asking the progress on previous feedback and recommendations. Annual monitoring is also conducted together with a Kinderpostzegels representative.

Score: From 4 to 4 (no change)

1.6. Daily operations: 'Day-to-day operations are in line with strategic plans'

This is about the extent to which day-to-day operations are aligned with strategic plans.

FSCE has been guided by strategic plans in its organizational directions and operations. However, this strategic plan has been revised and is in the process of being endorsed. Hence, since FSCE is in a process of change at present, it is not possible to give any conclusive comments about changes. However, some staffs reflected that the day to day interventions are not in line with the strategic plan of the organization. Because some project interventions are not implemented under the original framework of the Strategic Plan E.g. EM, FGM, HTP, etc. There is also no strategy for Project Sustainability in the Strategic Plan document though recommendations were given by Kinderpostzegels to review the current Strategic Plan document and to incorporate strategies for Project sustainability.

Score: from 4 to 3.5 (slight deterioration)

1.7. Staff skills: 'Staff have necessary skills to do their work'

This is about whether staff have the skills necessary to do their work and what skills they might they need.

In this regard, conflicting views are given. According to some staffs, capacity and competence of staffs is gradually improved since the baseline. Staffs are improving their academic competence through trainings [organized by themselves] and experience. Little training is organized for staffs. Program management capacity of area program offices with regard to community based multi-stakeholder initiation has improved through experience. The organization also hired skilled and experienced staffs. However, others indicated that since there were no training opportunities for staffs, staff skills have not improved except by job experience. A staff development (capacity improvement) strategy in the

form of training, coaching and mentoring exists but has not changed (much) since 2012 according to these staffs. Other staffs noted that there is no relevant training opportunity and not all planned capacity building workshops were organized due to the 30/70 provision of the new NGO legislation. Therefore, the CSO law in which training costs must be counted as administrative expenses and the internal problems of the organization in terms of communication and authority have negatively affected staff skill improvement. Furthermore, since staff has left the organisation due to poor management, this has negatively affected the overall staff capacity in terms of available knowledge and skills.

Score: From 4 to 3.5 (slight deterioration)

1.8. Training opportunities: 'Appropriate training opportunities are offered to staff'

This is about whether staff at the SPO is offered appropriate training opportunities

Usually, FSCE conducts training need assessments. However, it mostly failed to conduct capacity building trainings as mentioned above. Some staffs noted that there are no well-structured and planned training opportunities based on need assessments in the organization. In fact, little training on selected thematic areas was organized for staffs since 2012. Training was given for Program managers and HRM and Finance in Addis by an external consultant. However, there is no adequate capacity building training for all staff of FSCE since the baseline, even though it was mentioned at monitoring feedback, review meetings and other means of communication. According to staff, the reason for this was that the organization has put less emphasis on getting training funds either by soliciting funds from donors or availing the training from administrative budget. Government CSO policy has also contributed for the decreasing training opportunities in FSCE.

Score: from 3.5 to 2.5 (deterioration)

1.9.1. Incentives: 'Appropriate incentives are in place to sustain staff motivation'

This is about what makes people want to work here. Incentives could be financial, freedom at work, training opportunities, etc.

According to most staffs, provision of appropriate staff incentive mechanisms in FSCE has not changed since the baseline. A salary change was done during the baseline and there was no change after that except the provision of a transport allowance for staff. However, some staffs have illustrated that training opportunities have declined after the baseline and FSCE has no proper strategy and means to motivate and recognize staffs. The benefit package of the organization is very poor compared to other similar organizations and the working environment is becoming poor and not conducive.

Score: From 3.5 to 2.5 (slight deterioration)

1.9.2. Funding sources: 'Funding from multiple sources covering different time periods'

This is about how diversified the SPOs funding sources are over time, and how the level of funding is changing over time.

FSCE has longstanding experience and working relationships with different funding sources at international and local level. However, it is gradually deteriorating since the baseline with a decreasing annual budget of the organization. The total funding amount has slightly declined especially in 2013 and FSCE has lost partnership with major donors. The organization was not able to attract new funding sources and new proposals are not developed since the baseline. The reasons for declining funding sources are different. According to some staffs, it is due to the fact that FSCE has poor leadership and communication systems both at the head office and area program level, which led to lack of planning ahead and making necessary adjustments. Also, the organization has not assigned a specific unit or body to develop concept notes and proposals. For others, it is due to the interest of some donors to work in coalition rather than in individual partnerships. Besides, the restrictive NGO

legislation of Ethiopia has created difficulties or made it impossible for NGOs to engage in income generating activities, especially on local funding for rights and advocacy related interventions. Others perceived that the private sector in Ethiopia is not much interested in funding social activities of NGOs. On the other hand, some staffs feel that slight improvements can be observed particularly in 2014 where UNICEF has recently started to give financial support.

Score: From 4.5 to 3.5 (deterioration)

1.9.3. Funding procedures: 'Clear procedures for exploring new funding opportunities'

This is about whether there are clear procedures for getting new funding and staff are aware of these procedures.

In this regard, FSCE has not changed since the baseline according to the response of most respondents. However, there is no clear fundraising system or procedures: this is not well organized and a proper partner management strategy is lacking. FSCE has not yet developed a resource mobilization guideline or manual (RMG/M) to clarify approaches adopted at different levels.

Score: from 3 to 3 (no change)

Summary of capability to act and commit

The key change observed since the baseline in FSCE was the change of leadership and the organizational development process (re-structuring of FSCE in terms of organizational set up) based on the findings from the organizational development (OD) study. In May 2013 this organizational development (OD) study was initiated, which was completed in Dec 2013. The previous leadership was blamed for lack of responsiveness in terms of timely decision making and solving internal communication problems. The director was laid off in February 2014 and a new Executive Director was appointed in March 2014. The overall functioning of the organization was missing coordination, a formal flow of performing obligations and there was weak communication between branch offices and the head office as well as with donors due to internal problems marked by poor collaboration and tensions between the program and finance department during the previous management. However, though the role/stimulus of the new leadership is not known yet, slight improvements have appeared in terms of communication and team work after the change in leadership, but at the head office level only. Despite these difficulties, FSCE managed to slightly improve program implementation, specifically in stopping child labour and promoting the area specific community based MS approach. FSCE has been guided by a strategic plan in its organizational directions and operations. This strategic plan has been revised and is in the process of being endorsed.

Some staffs are still frustrated because the implementation of the OD recommendation to restructure the organization was not immediately effective. Consequently, some staffs have resigned. Other staffs have resigned due to low salary scale and uncondusive working environment, particularly during the previous management. Staff performance valuation is not well managed and there is no performance based annual salary increment in the organization. On the other hand, some staffs said that staff turnover has not alarmingly changed compared to the baseline in FSCE, and that (recent) salary scale adjustments and increments have brought a positive impact on staff turnover. Some staffs stated that training opportunities have declined after the baseline and that FSCE has no proper strategy and means to motivate and appreciate staffs. The benefit packages of the organization are very poor compared to similar organizations and the working environment has become poor and not conducive. FSCE conducts training need assessments; however, it mostly failed to conduct trainings as identified due to the provision of the 30/70 NGO legislation of the government. Only few trainings on selected thematic areas have been organized for selected staffs, but the organization has hired skilled and experienced staffs since 2012. FSCE has longstanding experience and working relationship with diversified funding sources at international and local level. However, it is gradually deteriorating resulting in a decreasing annual budget and losing partnerships with major donors. The organization was not able to attract new funding sources and new proposals were not developed.

Furthermore, there is no clear fundraising system or procedure: this is not well organized and a proper partner management strategy is lacking. FSCE has not yet developed a resource mobilization guideline or manual (RMG/M) to clarify approaches adopted at different levels

Score: from 3.6 to 3.0 (slight deterioration)

Capability to adapt and self-renew

2.1. M&E application: 'M&E is effectively applied to assess activities, outputs and outcomes'
This is about what the monitoring and evaluation of the SPO looks at, what type of information they get at and at what level (individual, project, organizational).

As was the case at the time of baseline period, FSCE has well developed M&E guidelines and a participatory M&E system to ensure regular monitoring and evaluation. Hence, according to most staffs, in country team evaluators and the alliance responses, nothing has changed in this sense, neither for the better nor for the worse in this particular indicator. Nevertheless, FSCE management at the head office has put greater emphasis on the importance of undertaking timely monitoring and reporting and taking the necessary corrective actions. Hence the monitoring work has become more consistent and regular, and feedback is well communicated and taken. This is complemented by in house training on monitoring and reporting provided in 2012. Because of this, especially the outcome oriented reporting improved and now APOs are undertaking both program and project level monitoring by developing the necessary checklists, and started to document the findings. Generally, there is improvement in implementing outcome measurement and frequent supervision and regular feedback processes are in place since the change in leadership. Some staffs noted that outcome oriented reports of the area program offices are manifestations of this change. Based on the findings and recommendations of this midterm evaluation of the Adama project, the M&E practice of FSCE in Adama has improved in outcome/impact level reporting instead of only output level reporting. However, there is no evidence that this improvement is observed in other project offices and at the head office level. According to some staffs, the organization has started collecting and following outcome level information and reporting system after getting training and exposure visits supported by MFS II. On the other hand, some staffs noted that there is no M&E framework with outcome indicators including how this will be collected, monitored and reported. They feel that in the baseline report of 2012 this was a bit exaggerated. On the other hand, some staffs feel that FSCE is not properly implementing and documenting the planning and reporting of program interventions. There are cases in which FSCE didn't develop proactive program plans substantiated by benchmarks that led to measure outcomes and impacts at different levels. According to some staff the progress in the documentation system is gradually deteriorating, which is affecting the learning part. However, FSCE has established an M&E task force very recently since the hiring of the new Executive Director. This task force was established to undertake tasks identified and discussed during biannual review meeting. Practical change is not yet observed, but maybe that's too early to be expected taking the short time of the new establishment in to account. FSCE has an organizational monitoring system and practice at the head office rather than project-based monitoring. Monitoring and reporting by head office staff is done for all projects in aggregation rather than specifically for each project.

Score: from 4 to 4 (no change)

2.2.M&E competencies: 'Individual competencies for performing M&E functions are in place'
This is about whether the SPO has a trained M&E person; whether other staff have basic understanding of M&E; and whether they know what information to collect, how to process the information, how to make use of the information so as to improve activities etc.

Since 2013 FSCE has put more emphasis on reporting on results at outcome indicators level at the request of the C&D Alliance (Kinderpostzegels and Terre des Hommes). FSCE now has trained and experienced PME personnel that is better able to practice M&E. M&E at organizational and program level is more consistently and regularly practiced than ever before, including sharing of the findings timely. Moreover, staffs understand and appreciate the importance of M&E and act accordingly; and know what information to collect, how to process the information, and how to make use of the information to improve activities. The one day training on M&E with the focus on reporting at outcome

level given during the Annual MFS II Partners Meeting in May 2014 (of MFS II partners of the C&D Alliance in Ethiopia) where staff members of FSCE participated, was recognized as an one of the inputs for the change. Generally, there is improvement in implementing outcome measurement and frequent supervision and regular feedback processes are in place since the change in leadership. Some staffs noted that outcome oriented reports of the area program offices are manifestations of this change. However, according to some staffs, there is no M&E unit under the Area program office. Instead there is only a senior social worker. But, M&E is carried out by a team of experts from the head office twice a year (biannual) for all 7 area program offices. Starting from September 1, 2014 the three APOs at Addis Ababa merged into one APO and now FSCE has 5 APOs under it.

Score: from 3.5 to 4 (slight improvement)

2.3. M&E for future strategies: 'M&E is effectively applied to assess the effects of delivered products and services (outcomes) for future strategies'

This is about what type of information is used by the SPO to make decisions; whether the information comes from the monitoring and evaluation; and whether M&E info influences strategic planning.

FSCE has conducted a midterm project evaluation in 2013 executed by a local consultant. The M&E system of FSCE was one of the subjects of this midterm evaluation. Based on the findings and recommendations of this midterm evaluation of the Adama project, the M&E practice of FSCE in Adama has improved in outcome/impact level reporting instead of only output level reporting. However, there is no evidence that this improvement is observed in other project offices and at the head office level.

After the change in leadership very recently in 2014, FSCE has tried to establish a data base to be used by management and program staffs for their day to day decision making purposes. FSCE is now in the process of installing and configuring WAN (Wide Area Network) system in the organization to support the M&E system. Hence, the organization management is now using the findings of M&E at organizational and program level for making timely decisions, including the recommendation of the M&E task force to filter/review the communication process from the source to the end (data collection, coalition, analysis, reporting, sharing and documentation), preparation of workable guidelines and manuals for reporting on progress for proposal development and appraisal. However, according to some staffs, there are still issues that need attentions especially on the linkages between the head office and project level, where M&E is not applied for decision making purposes and the existing M&E is not systematized and consistent, except for M&E practices in Adama.

Score: from 3.5 to 4 (slight improvement)

2.4. Critical reflection: 'Management stimulates frequent critical reflection meetings that also deal with learning from mistakes'

This is about whether staff talk formally about what is happening in their programs; and, if so, how regular these meetings are; and whether staff are comfortable raising issues that are problematic.

According to most of the responses, there is a slight change in critical reflection where regular meetings on weekly and monthly basis are in place and as a result ideas and information are starting to be shared smoothly among each other. Especially after the change in leadership in FSCE attention was given to the monitoring feedback and timely corrective actions/decisions have started to be taken accordingly at all levels. Besides, Area Program staffs are undertaking meetings once a week for sharing of information. Volunteers like community conversation facilitators, peer educators, school clubs Non Formal Education Facilitators, Community workers including social workers have experience sharing meetings to take timely corrective action. However, this is all very recent since March 2014 and cannot reflect change yet. Others also noted that some area program offices are doing well, while this does not apply to all area program offices even under the new leadership. Generally, most of the respondents agreed that it was because of the previous leadership in FSCE not reacting well to some internal problems and/or tensions that prevented the occurrence of significant change in the performance of the organization compared to the situation of 2012. Because people were too occupied with these internal problems and the reorganization process and they have not improved in this area of attention.

Score: from 4 to 3.5 (slight deterioration)

2.5. Freedom for ideas: 'Staff feel free to come up with ideas for implementation of objectives
This is about whether staff feel that ideas they bring for implementation of the program are welcomed and used.

In this regard, frequency of meetings for the development of new ideas increased at present compared to the previous leadership. Some improvement is observed in cooperation and collaboration among program and finance staffs recently. However, due to the very short period of change observed (almost three months) and due to the organizational internal problems with leadership and communication during the previous management, things were worse than during the baseline period.

Score: from 4 to 3.5 (slight deterioration)

2.6. System for tracking environment: 'The organization has a system for being in touch with general trends and developments in its operating environment'
This is about whether the SPO knows what is happening in its environment and whether it will affect the organization.

FSCE works in partnership with different likeminded organizations and stakeholders in its operational areas. The organization has good relationships with stakeholders and partners and implements MFS II project interventions through MSCCPS as observed in the baseline. The organization scans the external environment to ensure timeliness and quality reporting.

Score: –from 3.5 to 3.5 (no change)

2.7. Stakeholder responsiveness: 'The organization is open and responsive to their stakeholders and the general public'
This is about what mechanisms the SPO has to get input from its stakeholders, and what they do with that input.

FSCE uses MSCCPS as an overarching strategy to implement its program interventions. This allows FSCE to be responsive to stakeholders. This strategy also caused FSCE to have good relationships with stakeholders and to be open for the community and target children. The key stakeholders have been engaged in the community based multi-stakeholders child protection structures and a number of child protection issues are addressed in a holistic manner. The current shift of the stakeholder engagement process (of more community involvement in local level action planning) gives due attention to and makes use of the knowledge, expertise and experience of the target communities and authorities to initiate, implement and manage comprehensive program interventions of their locality in a sustainable way, as opposed to their previous involvements. The Multi-stakeholder Councils develop jointly Memoranda of Understanding (MOU), undertake baseline surveys on child problems, develop adaptive planning, shared duties and responsibilities and conduct reflective meetings weekly or bi-weekly. However, staffs noted that there is no change compared to the baseline in this regard hence FSCE still follows the multi-stakeholder approach to place child protection systems at the community level with good results. The approach helped FSCE to involve key stakeholders in monitoring. Day-to-day monitoring is not only done by project staff but the community and government structures are also involved as evidenced by the mid-term evaluation report of the Adama project.

Score: from 4 to 4 (no change)

Summary of capability to adapt and self-renew

FSCE has well developed M&E guidelines and participatory M&E systems to ensure regular monitoring and evaluation. There is improvement in outcome oriented reporting and now Area Program Offices (APOs) are undertaking both program and project level monitoring by developing the necessary checklists, and started to document the findings. According to some staff the documentation system is gradually deteriorating, which is affecting the learning part and there is no data base M&E system.

However, FSCE has established an M&E task force very recently since the hiring of the new Executive Director. There is improvement in implementing outcome measurement and frequent supervision and regular feedback processes are in place. After the change in leadership very recently in 2014, FSCE has established a data base to be used by management and program staffs for their day to day decision making purposes. The data base is now electronically installed and configured with the Wide Area Network (WAN) system in the organization to support the M&E systems. However, according to some staffs, there are issues that need attention, e.g. on the linkages between the head office and project level, where M&E is not applied for decision making purposes and the existing M&E is not systematized and consistent.

Since the change in leadership (March 2014) there is a slight improvement in critical reflection where regular meetings on weekly and monthly basis are in place and as a result ideas and information are shared smoothly among each other. Before this, this was weaker due to poor management. The frequency of meetings for the development of new ideas and an improvement in cooperation and collaboration among program and finance staffs have also been observed at present compared to the previous leadership. FSCE works in partnership with different likeminded organizations and stakeholders in its operational areas and this helps in scanning the environment. Key stakeholders are engaged in the community based multi-stakeholders child protection structures and a number of child protection issues are addressed in a holistic manner.

Score: 3.8 to 3.8 (no change)

Capability to deliver on development objectives

3.1. Clear operational plans: 'Organization has clear operational plans for carrying out projects which all staff fully understand'

This is about whether each project has an operational work plan and budget, and whether staff use it in their day-to-day operations.

As it was during the baseline FSCE has clear operational plans at all level, and these plans are broken down in quarterly plans that are well communicated with the respective departments/work units. The gap that was observed in understanding and utilization of program guidelines during the baseline period is still a challenge for the full implementation of activities.

Score: from 3.5 to 3.5 (no change)

3.2. Cost-effective resource use: 'Operations are based on cost-effective use of its resources'

This is about whether the SPO has the resources to do the work, and whether resources are used cost-effectively.

Though the geographic location and target groups of FSCE are different, APOs are doing the same capacity building training at one place for stakeholders coming from different projects to minimize cost, time and better delivery of service. Moreover, the organization uses shared offices, facilities and other resources. FSCE's complementary project/ program interventions are found to be cost effective however some projects implemented in transit towns are not cost effective. There are also some fragmented project interventions that need extra leverage to be cost effective. Compared to the baseline situation, to be cost effective the organization is now developing guidelines on project proposal development, project appraisal, realignment of activities and budgets in the annual action plan, and is undertaking financial activities with deadlines and reviewing the M&E system and M&E application.

On the other hand some staffs mentioned that nothing has changed much compared to the baseline situation, that FSCE still has a comprehensive budget and budgetary control system in place, and that this is effectively used for control. They also pointed out that FSCE has a good financial system and is now using Peachtree Accounting software for recording and reporting its accounts.

Score: from 4 to 4.25 (very slight improvement)

3.3. Delivering planned outputs: 'Extent to which planned outputs are delivered'

This is about whether the SPO is able to carry out the operational plans.

Almost all staff mentions that the situation is the same as in the baseline situation, FSCE still carries out its operational plans with minimum deviations from what has been planned. Some staff mention an improvement of planned versus accomplished activities and that the utilization of budget is getting better. But still there is a room for improvement of carrying out planned activities and bringing deliverables.

Score: from 4.5 to 4.5 (no change)

3.4. Mechanisms for beneficiary needs: 'The organization has mechanisms in place to verify that services meet beneficiary needs'

This is about how the SPO knows that their services are meeting beneficiary needs

Since 2010 the organization has followed a multi-stakeholder approach which is a holistic and comprehensive approach to address beneficiaries' needs. FSCE has become a model organization in Africa in leading children from labour to school and making local government responsible using the area based Child Labour Free Zone (CLFZ) approach. They learned this from an Indian SPO during a study tour before the baseline. As a result the organization was visited by a West African NGO to share their best practices and experiences in this regard. It was observed that the approach has brought and increased sense of ownership by the CBOs and that projects now working through existing community structures. However, further strengthening is needed to ensure the deliverables are meeting the needs of the beneficiaries through engaging different stakeholders in designing, implementing, monitoring and evaluation of the project activities.

Score: from 4.5 to 4.5 (no change)

3.5. Monitoring efficiency: 'The organization monitors its efficiency by linking outputs and related inputs (input-output ratios)'

This is about how the SPO knows they are efficient or not in their work.

As in the baseline period, projects are designed with logical framework tools, which is mostly donor's requirement. The projects have comprehensive budgets and expected outputs and outcomes. However, these days fully implementing and controlling projects with these variables set in the documents has become difficult. This is mainly because of turnover of well-trained staffs and limited orientation and capacity building invested in the newly hired staffs. However, FSCE is in a process of change that may influence its organizational and operating systems and practices, including its management, planning, and monitoring systems. As the change is still underway, it is not possible to give any conclusive comments on this change. Measuring input output ratio would be needed in this regard. But, most staff agrees that since the process of change focuses on streamlining FSCE operations and enhancing its effectiveness and efficiency, it hoped that the current projects could benefit from the outcome.

Score: from 4 to 4 (no change)

3.6. Balancing quality-efficiency: 'The organization aims at balancing efficiency requirements with the quality of its work'

This is about how the SPO ensures quality work with the resources available

FSCE does not have clear program quality guidelines or indicators. It rather uses different program management guidelines as an input for program quality and efficiency together. It also uses different proxy indicators to measure quality of program/ project interventions. According to some staff, the organization has improved the quality of work in all regards through undertaking assessments, close follow up and the application of data base management electronically.

Other staff noted that nothing has changed since the baseline and FSCE still has no program guidelines. Instead procedures and work-tasks are used as proxy indicators to measure quality. As a

recommendation, they suggested that FSCE needs to have clear guidelines, standards and staffs capacity building trainings for balancing quality-efficiency.

Score: from 3.5 to 3.5 (no change)

Summary of capability to deliver on development objectives

As indicated in the baseline period, FSCE has a clear operational plan broken down on a quarterly basis; complementary project/ program interventions are found to be cost effective and the organization still has a comprehensive budget and budgetary control system. Besides, the organization still carries out its operational plans with minimum deviations from what has been planned and follows a multi-stakeholder approach to address beneficiaries' needs. Projects are designed with the logical framework based on donor requirements. In the last two years a better performance has been observed in utilization of budgets in terms of planned versus accomplished activities, and the organization has started to collect and follow outcome level information and reporting systems. FSCE doesn't have clear program quality guidelines or indicators. It rather uses different program management guidelines as an input for balancing program quality and efficiency

Score: from 4.0 to 4.3 (slight improvement)

Capability to engage

4.1. Stakeholder engagement in policies and strategies: 'The organisation maintains relations/ collaboration/alliances with its stakeholders for the benefit of the organisation'

This is about whether the SPO engages external groups in developing their policies and strategies, and how.

FSCE has properly used stakeholder management guidelines in its program management. This helped FSCE to let different stakeholders participate in different program/ project interventions as well as in designing policies and guidelines. According to the self-assessment result FSCE continues to use the existing stakeholder management guidelines that help to involve various stakeholders at different levels, not only in making policies and strategies but also in implementation. The organization has also used MSCCPS to engage different stakeholders in the whole project/program process. Some area program offices have prepared child protection guidelines for CBOs and relevant actors, but the rest of the existing practices are unchanged. The most innovative approach of the Adama CLFZ project is its strong community based and location specific interventions, according to an evaluation. This model is a context-based adaptation of the Indian MV Foundation learned from the exposure visit organized by Kinderpostzegels. FSCE creatively adapted the approach to local context and facilitated and influenced the creation of the MSCPS which is composed of existing CBOs and government institutions which have stakes in the protection and education of children.

Score: from 4 to 4.5 (slight improvement)

4.2. Engagement in networks: 'Extent to which the organization has relationships with existing networks/alliances/partnerships'

This is about what networks/alliances/partnerships the SPO engages with and why; with they are local or international; and what they do together, and how do they do it.

FSCE has a good track record and reputation that enables it to spearhead strong networks with other NGOs on issues of child labour and other child related activities. They also have good relationships with government and donors. As a result the organization has been a member of different networks and forums at local, national and international level. The organization has recently participated in a post millennium development goals development program for child labour related activities. However, some staffs noted that FSCE has not engaged in new networks since the baseline period but rather maintained their existing networks. Hence, very little or nothing has changed in this regard. The mid-term evaluation report of the CFA (Kinderpostzegels Foundation) in 2013, mentioned that networking

among the Alliance partners is not sufficient to enable adequate horizontal sharing of experiences, best practices, resources and information on the common agenda of awareness raising activities and provision of services to children.

Score: from 4 to 4 (no change)

4.3. Engagement with target groups: 'The organization performs frequent visits to their target groups/ beneficiaries in their living environment'

This is about how and when the SPO meets with target groups.

FSCE has good relationships with the community and is very close to its target beneficiaries. This is mainly due to the application of area based approaches and the establishment of MSCCPS as overarching strategy. Dedication and commitment of front line staffs and stakeholders was the key for progress. They visit them regularly and work together with the children/ beneficiaries. The management of the organization is undertaking bi-annual visits to target areas, bi-annual organizational review and reflection meetings, and quarterly review meetings with the technical staffs (program, finance and others) at the head office level. APO core staff undertakes regular follow up of target groups and additional visits are conducted based on the monitoring together with visitors and donors. However, this was already observed during the baseline period so nothing has changed but FSCE has maintained its good performance in engaging target groups.

Score: from 4 to 4 (no change)

4.4. Relationships within organization: 'Organizational structure and culture facilitates open internal contacts, communication, and decision-making'

How do staff at the SPO communicate internally? Are people free to talk to whomever they need to talk to? When and at what forum? What are the internal mechanisms for sharing information and building relationships?

There is no free and open relationship between staffs in FSCE compared to the baseline. Relationships within the organization have deteriorated due to the change process and leadership problems at different levels. Because of the existence of internal problems some tensions and disturbed working relations occurred particularly between the Program and Finance unit at Head Office level and this contributed to declining availability of project funds for on time project implementation and reporting. However, after the findings and recommendations of the OD Study in 2013, in May 2014 the new Director in consultation with the Board started restructuring the organization in order to improve the internal functioning of the organization. Hence, regular staff meetings have created more information sharing and better communication among staffs at head office level recently, but this development has not yet reached the Area Program Offices (APOs).

Score: from 4 to 3 (deterioration)

Summary of capability to engage

FSCE continues to use the existing stakeholder management guidelines that helps to involve various stakeholders at different levels, not only in making policies and strategies but also in implementation. The organization has also used MSCCPS to engage different stakeholders in policies and strategies as well as program implementation. FSCE has a good track record and reputation that enables it to spearhead strong networking with other NGOs on issues of child labour and other child related activities and has also good relationship with government and donors. However, some staffs noted that FSCE has not engaged in new networks since the baseline period but rather maintained the existing networks. FSCE has maintained its good performance in engaging target groups. Relationships within the organization have deteriorated due to the change process and leadership problems at different levels. However, after the change in leadership in March 2014, regular staff meetings have created information sharing and better communication among staffs at head office level but this has not yet reached the Area Program Offices (APOs).

Score: from 4 to 3.9 (very slight deterioration)

Capability to achieve coherence

5.1. Revisiting vision, mission: 'Vision, mission and strategies regularly discussed in the organization'
This is about whether there is a vision, mission and strategies; how often staff discuss/revise vision, mission and strategies; and who is involved in this.

FSCE has revised its strategic plan in 2014. Also, the Mission and Vision statement were revised, and the core programs reviewed. Moreover, an organizational development process was undertaken with significant improvements in the organizational structure, program and finance management, communication and human resource strategies. These changes occurred after the change in leadership early 2014 based on the recommendations of the OD assessment in 2013. There was no change during the previous management in this regard. However, the organization has gaps in orienting staffs about the (new) strategic plan and learning from each other according to some staffs.

Score: From 4 to 4.5 (Slight improvement)

5.2. Operational guidelines: 'Operational guidelines (technical, admin, HRM) are in place and used and supported by the management'
This is about whether there are operational guidelines, which operational guidelines exist; and how they are used.

Major changes are observed in FSCE since the baseline in this regard including the revision of the organizational structure, the development of a Human Resource Policy and Procedure, the Organizational Development (OD) assessment, the revision of the strategic plan, and the change in leadership. The reasons for these changes were diverse ranging from global and organizational dynamics, the need to stay in business [NGO Market], and the problems of responsiveness and communication, especially at the leadership position/level, to bring radical changes in FSCE in terms of timely decision making and communication. Review of the existing operational manuals and the development of new guidelines/directions is in progress after the change in leadership in March 2014. FSCE has all the necessary operational guidelines to help the organization with technical administration and HRM operations.

There is an organizational manual that covers the operational structures, functional responsibilities and operating procedures. The organization also uses a Planning, Budgeting, monitoring and evaluation manual. FSCE uses Peachtree Accounting software for recording and reporting its accounts. FSCE has a financial system that works well according to the Adama mid-term evaluation report in 2013. However, according to the same report updating the financial manual was necessary following recent developments in the technology. However, some staffs feel that FSCE has not shown change in this respect but rather maintained the existing operational guidelines. Other staff noted that the organization lacks orientation and introduction of policies, working manuals, etc. for new staffs. Not all staffs have access to the existing manuals and guidelines. The documents are not prepared in the local language i.e. Amharic Language, which would be friendlier for clerical staffs. According to these staffs, because of some internal problems, marked by poor collaboration and tensions between the program department and the finance department, the overall functioning of the organization is missing coordination and formal flows of performing obligations.

Score: from 4 to 4 (no change)

5.3. Alignment with vision, mission: 'Projects, strategies and associated operations are in line with the vision and mission of the organization'
This is about whether the operations and strategies are line with the vision/mission of the SPO.

FSCE has been guided by its strategic plan in its organizational directions and operations. It had a strategic plan that defined its work for the duration of 2010-2014. However, this strategic plan has been revised and is in the process of being endorsed. The projects and associated operations are still in line with the vision and mission of the organization. However, realignment with the newly changed organizational level strategies and program categorization is required. Cascading slight changes and approaches of programs to area program offices are not done yet.

Score: from 4.5 to 4 (slight deterioration)

5.4. Mutually supportive efforts: 'The portfolio of project (activities) provides opportunities for mutually supportive efforts'

This is about whether the efforts in one project complement/support efforts in other projects.

Efforts are made to ensure complementarity of child protection projects by giving attention to prevention, promotion, rehabilitation and integration of children in need. The annual C&D Alliance partners meetings (MFS II) induced more collaboration and hereby complementarity of program activities. Initially FSCE didn't see the added value of participating but now they do and more synergy has been created by developing proposals together, exchange visits, joint strategies and new knowledge and insights.

Score: from 4 to 4(no change)

Summary of capability to achieve coherence

FSCE has revised its strategic plan in 2012 Hence, the Mission and Vision statements were revised also, and the core programs were reviewed. Moreover, an organizational development process was undertaken and improvements in the organizational structure, program and finance management, communication and human resource strategies have been observed. The organization has clear gaps in orienting staffs about the strategic plan and learn from each other. FSCE has revised its organizational structure, developed Human Resource Policy and Procedure, conducted Organizational Development (OD) assessment, revised its strategic plan, and changed leadership after the baseline. Review of the existing operational manuals and development of new guideline/directions is also in progress after the change in leadership in March 2014. FSCE has generally all the necessary operational guidelines which help the organization for technical administration and HRM operations. The organization has also been using a Planning, Budgeting, monitoring and evaluation manual. FSCE uses Peachtree Accounting software for recording and reporting its accounts. However, the organization lacks orientation and introduction of policies, working manuals, etc. to new staff. Though projects and associated operations are still in line with the vision and mission of the organization, realignment with the newly changed organizational strategy and program categorization is required. Cascading of changes and approaches of programs to area program offices is not yet done. Efforts are made to ensure complementarity of the child protection projects by giving attention to prevention, promotion, rehabilitation and integration. The organization uses shared offices, facilities and other resources and services and are mutually supportive according to some staffs.

Score: from 4.1 to 4.1 (no change)

Report CDI-15-055

The Centre for Development Innovation works on processes of innovation and change in the areas of food and nutrition security, adaptive agriculture, sustainable markets, ecosystem governance, and conflict, disaster and reconstruction. It is an interdisciplinary and internationally focused unit of Wageningen UR within the Social Sciences Group. Our work fosters collaboration between citizens, governments, businesses, NGOs, and the scientific community. Our worldwide network of partners and clients links with us to help facilitate innovation, create capacities for change and broker knowledge.

The mission of Wageningen UR (University & Research centre) is 'To explore the potential of nature to improve the quality of life'. Within Wageningen UR, nine specialised research institutes of the DLO Foundation have joined forces with Wageningen University to help answer the most important questions in the domain of healthy food and living environment. With approximately 30 locations, 6,000 members of staff and 9,000 students, Wageningen UR is one of the leading organisations in its domain worldwide. The integral approach to problems and the cooperation between the various disciplines are at the heart of the unique Wageningen Approach.

FOLLOW-UP REPORT: C3

An impact analysis of a project to protect Girls and Young Women against Violence in Addis Ababa and Adama towns, Ethiopia¹

Elisabetta de Cao, Marloes Huis, Samson Jemaneh and Robert Lensink

PRELIMINARY: PLEASE DON'T CITE

¹ Part of the report is based on Huis, Suhlmann, Lensink and Hansen (2013).

Basic Information:

Southern Partner Organisation (SPO): FSCE (Forum on Sustainable Child Empowerment)

Name of Dutch organisation responsible for project: Defence for Children – ECPAT Netherlands

Name of Consortium: Child Rights Alliance

Name lead organization: Plan NL

Start Date project: 1 April 2011

End Date project: 31 December 2015

Selected MDG: MDG 3

1. Introduction

Violence against women is probably the most widespread form of abuse worldwide. According to DFID (2012), about one third of all women and girls in the world have been affected by violence. Therefore, it does not come as a surprise that all over the world programs, led by various institutions such as Women's Right Organizations and Microfinance organizations, have been developed to address violence and harmful practices against women and girls. Indeed, a reduction in violence against women and young girls is one of the key development goals. However, apart from some anecdotic evidence, and a few papers that provide practical guidelines about "what works" in terms of reducing violence against women (see, for instance DFID, 2012), there are almost no impact evaluations of programs addressing violence against women and young girls available.

This study reports the findings of an impact evaluation of a project conducted by the Ethiopian non-government and not-for profit making organization "Forum on Sustainable Child Empowerment" (FSCE). The project "Girl Power: Protection of Girls and Young Women against Violence in Addis Abeba and Adama towns" strives to offer protection, growth and development for children and young women. FSCE uses a so-called Multi-stakeholder child protection system (MSCPS) approach to establish child protection efforts in its child protection programming. In order to improve girls and young women's protection against gender-based violence, FSCE conducts a series of activities, which are meant to supplement each other. These activities focus at three levels (1) a reduction of gender-based violence against girls and young women at the individual level; (2) an increase in values in communities to ensure that girls and young women are better protected at the social-cultural community level and (3) to promote government acts for better protection of girls and young women. The activities include a broad list of interventions, such as awareness campaigns using media, community conversations, capacity building activities at school clubs (Girls Clubs) and Community Based Organizations –mainly via so-called IDDIRs-, and provision of protective services to girls and young women, such as the establishment of a temporary shelter for trafficked and migrated children as well as the development of a recovery and reintegration program for sexually abused and exploited girls.

The project is part of the broader country-wide “Girl Power Programme.” Within the “Girl Power Programme” different MFS organisations and Southern Partner Organisations work together. The Girl Power Programme is designed by different partners in coordination and alignment. Sometimes activities of different projects within the “Girl Power Programme” are difficult to disentangle. For instance, the “Child Helpline” project (C2) is also part of the nation-wide “Girl Power Programme.” Both projects have similar aims, which the SPOs try to achieve by different types of activities. These activities are meant to complement and strengthen each other. Since the C2 and C3 projects are both part of the same country-wide programme, the impact evaluations for C2 and C3 complement each other. Thus, to get a more complete picture of the impact of the activities conducted within the country-wide “Girl Power Programme” it may be relevant to also consider the evaluation report for project C2.

The amount and diversity of activities of FSCE make it impossible to consider all interventions in detail. Rather, the report focuses on the most important activities of FSCE, being the interventions directly related to Girls Clubs, IDDIRs, the recovery and reintegration program followed by street girls, and the temporary shelter. It also pays, although to a minor extent, attention to the community conversations. The complimentary report for the Child Helpline project (C2) will explicitly focus on the community conversations.

The study takes a mixed method approach by using both quantitative and qualitative information. Regarding the temporary shelter, we only conduct a qualitative evaluation because gathering follow-up information to enable a quantitative analysis is too complicated since the children leaving the temporary shelter often come from far and follow up would be too expensive. The project interventions take place in Addis Ababa and Adama. However, in order to make the evaluation attainable, we concentrate on the activities and beneficiaries located in Adama Town.

The analysis provides mixed results. The quantitative analyses focus on different indicators for abuse and female empowerment. While girls at girls clubs believe that FSCEs interventions have reduced violence, we do not find any quantitative evidence of improved outcome indicators that can be attributed to the interventions at the girls clubs. However, the study suggests significantly positive effects of the reintegration program of FSCE for street girls, and we provide some quantitative evidence that IDDIR members have changed their attitudes regarding abuse and female empowerment due to

interventions of FSCE. In addition, the qualitative analyses suggest that the temporary shelters of FSCE contribute to the goal of the Girl Power Program to fight injustice and violence against girls. Overall, the analyses suggest that the program of FSCE positively contributes to reducing violence against young women and girls.

The report is organized as follows. Section 2 presents the context of the evaluated project. This section will also provide some relevant findings from the literature. Section 3 describes the project. It will provide information about the different activities that are organized as part of the project, and it will present important project information. Section 4 explains the data collection. This section will also present descriptive statistics, explain data problems we were faced with, conducts a power analysis, and gives details about the attrition we were confronted with. Section 5 explains the analysis and presents the main results of the quantitative and qualitative impact analyses. Subsequently, Section 6 provides a discussion of the evaluation results. Section 8 concludes the report.

2. Context²

Ethiopia has been one of the fastest growing non-oil economies in the World, with an annual average growth rate of GDP of 5.19 percent from 1982 until 2013 (NBOE, 2014). Yet, Ethiopia is still one of the poorest countries in the world, with a GDP per capita of 513 USD in 2011/2012 (MWCY, 2014). While the percentage of people living below the total poverty line is improving (from 46% in 1995 until 30% in 2010/2011), it is still very high (MWCY, 2014). The same holds for the under- five mortality rates, which declined from about 20% in 1990 to 7% in 2012 (MWCY, 2014).

The federal government of Ethiopia enacted in 2001 a new Family Code based on the principal of gender equality (OECD Development Centre, 2014). This Code e.g. stipulates a minimum age for marriage at 18 years. However, early marriages are still common, especially in rural areas. Moreover, in parts of Southern and Eastern Ethiopia, kidnaping young women for marriage purposes still happens. Domestic violence is a criminal offence. Yet, violence against women remains widespread. Estimates suggest that around 70% of Ethiopian women suffered physical violence from their partner (OECD Development Centre, 2014). Moreover, it appears that many women are prevented from seeking legal

² This section is to a large extent similar to Section 2 in the evaluation report for the “Child Helpline”project (C2).

compensation if confronted with physical violence. There are no reliable figures available on the **actual** cases of rape and sexual assault since many women remain silent. However, official figures suggest that many women are suffering from rape - in 2005, there were 938 reported rape incidents in Addis Ababa- while only 103 offenders were punished. Female genital mutilation (FGM) is forbidden according to the new Penal Code. Yet, estimates suggest that still between 70%-80% of women is subject to FGM (OECD Development Centre, 2014). Despite the fact that women and men have equal rights officially, there is still a severe gender disparity in Ethiopia. In 2013, Ethiopia is ranked 118 (out of a total of 136 countries) in the Global Gender Gap index (World Economic Forum, 2014). This index provides country rankings on gender disparity based on economic, political, education and health criteria.

There are several official legal provisions that aim to protect children. Yet the abuse and exploitation of children is common practice in Ethiopia. For instance, Ethiopia belongs to the group of countries with the highest percentages of child labor. A survey in 2001 even suggested that approximately 80 percent of the children, of which a considerable percentage is below 15, are engaged in child labor activities. Most of these children originate from the rural areas. Even more problematic is the growing phenomenon of sexual abuse and exploitation of children in Ethiopia. Child sexual abuse and exploitation mainly takes place in the form of abduction, early marriage, FMG, rape, incest, and child trafficking. Estimates show that each year around 1.2 million children in Ethiopia are victims of trafficking (UNICEF, 2014). A baseline study from FSCE (2004), focusing on child abuse in Desse –a city in north-central Ethiopia- states that child prostitution, the seduction of schoolgirls for sexual purposes, and sexual offences against female students, is a major problem. This study also argues that child sex work on the street and in drinking places (bars and hotels) is increasing.

Particularly children from economically deprived families and street children are at risk. The term street child refers to a child who works on the streets to earn money for herself or her family, and to a child that lives on the streets and is homeless. Especially in urban areas there is an increasing number of street children. In 2011, the amount of street children in Addis Ababa and Adama amounted to 12,000 and nearly 4000, respectively (UNICEF, 2014).

In 1984/85 Ethiopia was affected by a severe drought in the country, especially in the Northern region of Wollo province. A major consequence was that many children were left parentless and forced to live in

the streets of major cities. This event was one of the reasons the “Forum for Sustainable Child Empowerment” (FSCE) was established in 1989 by Ethiopians.

3. Project description

3.1 Project Activities

The “girl power” project of FSCE focuses on protection against violence of girls and young women in Addis Ababa and Adama Town. Our analyses focus on the activities in Adama. In Adama, FSCE focuses on four target kebele’s: 01, 05, 06 and 07. The project is part of a nationwide project in which different organisations work together, among which the non-governmental organisation “Enhancing Child Focused Activities”(ECFA) (project C2). The project started on April 1, 2011 and will end December 31, 2015. The project is funded by the Dutch Ministry of Foreign Affairs, via the Dutch NGO ECPAT Netherlands. FSCE is a southern partner organization of ECPAT. Total funds for the project amount Euro 323,000. For a breakdown of the budget in different activities, see 4.6 below.

In order to reduce violence against girls and women, FSCE conducts a broad series of activities, ranging from awareness campaigns, media performances, skills building initiatives, provision of (socio-legal) protective services to girls and young women, organising trainings and workshops for community based organizations, capacity building activities on school clubs and girls and young women associations to give live skills training; activities at community based organisations, etcetera. We focus here on the main activities, which we have grouped according to two levels: Individual level and the Socio-cultural community level. The “girl power project” also addresses the Institutional (government) level. The main objective is that the government acts for better protection of girls and young women. These activities, which mainly relate to lobby and advocacy measures, will not be considered in this evaluation.

We continue by briefly describing the main activities the paper focuses on.

A) Individual (household) level.

At the individual level, we address three categories of interventions: activities related to Girls Clubs, FSCE's recovery and reintegration program and FSCEs temporary shelter.

Girls Clubs

One of the most important interventions of FSCE refers to girls clubs inside and outside of schools. The girls' club activities focus on e.g.:

- Awareness creation using mini-media at the schools
- Promoting peer discussion/dialogue among the girls regarding gender based violence
- Calling parents to school and opening up discussion with club members
- Empowering educational capacity of the girls using mini-library established in the schools
- Tutorial support for the girls by school teachers

FSCE conducts activities in 4 primary schools in Addis Ketema, and in 5 primary schools and 2 high schools in Adama. In Addis Ketema, each school has 70 members, so in total 280 members. Per year there are 18 sessions organised per school. So in total over the project period, there were $18 \times 4 \times 4 = 288$ sessions at school clubs in Addis Ketema. In Adama, the 7 schools have 2178 school club members (of which 1701 are female), see the table below.

Table 1: Number of girls club members in Adama

Name of school	Male	Female	Total
Adama No. 1	14	51	65
Adama No. 2	196	545	741
Adama No. 3	122	285	407
Adama No. 5	69	299	368
Adama No. 6	20	200	220
Goro Secondary	50	220	270

Adama Secondary	6	101	107
Total	477	1701	2178

Per month there is a discussion organised at each school. These discussions took place 10 months per year, i.e. per year there are $7*7*10= 70$ sessions organised at Girls clubs in Adama. There were also so-called mini-medias organised, where information is disseminated.

FSCE's recovery and reintegration program

FSCE operates a recovery and reintegration program for sexually abused or exploited girls. The goal of FSCE with regard to sexually abused or exploited girls is mainly to prevent them from being sexually or physically abused and to teach them better ways of life. Before the CSO legislation in 2009 (ICNL, 2012) FSCE offered a drop-in centre where the girls could come and leave and a safe home where they received trainings. However, nowadays the support offered for these girls is community-based and aims at reintegration. The main activities are as follows: (1) Identify children that require rehabilitation and reintegration; (2) Withdrawing the abused children from the environment that exposed them to difficult positions; (3) Providing physiological and psychological recovery and social reintegration services and (4) Providing vocational training and income generating activities and support to reintegrate them with society (FSCE, 2014). FSCE targets 80 vulnerable children per year. These children receive vocational skills training, and some initial start-up capital to start their own income generating activities. The recovery and reintegration program concentrates in Adama city.

It can be difficult to offer support for these girls because it is a hidden problem. Most girls have another job to cover up working in the sexual business; they for example sell items such as potatoes or eggs at night. However, most girls are identified while working in bars where they have a higher status than the girls selling items on the streets as the latter often don't know how to protect themselves and will get abused more. While these girls work on the streets they are defined as off-the-street-girls by FSCE. FSCE differentiates between on-the-street children, mostly boys, who spend their whole life on the streets

and off-the-street children who work on the streets but sleep at (a) home. FSCE focuses on off-the-street children, this account for most female street children who often work in the bars or hotels as sexual workers or sell items on the street at night but go home to sleep. These girls often end up working in this business due to financial reasons as they seek an income to survive and/or get an education. While other work, such as selling potatoes, can earn them about 10 to 15 birr per night they can earn 50 up to 100 birr per night by working in the sex industry. In most cases the girls are identified by kebele workers who bring them to FSCE, adding up to about 150 girls who are supported yearly. The goal of the recovery and reintegration program is to prevent sexual abuse, teach the girls how to earn money and start a new life. If the girl's family can be traced the girls will be placed back with their family, however if there is no family in the vicinity FSCE will rent a house for a group of two or three girls where they will stay for six months. Girls younger than fourteen years will be re-enrolled in school, up to third grade the girls can receive schooling from FSCE, after this FSCE will provide them with schoolbooks and uniforms to go to governmental schools. Children over the age of fourteen will be given vocational training and will receive a business starting capital to change their life. When they start with their new business they will receive 1000 birr and later they will receive the same amount again. However, providing these girls with a starting budget is often not sufficient. Therefore also services such as counselling and medical support are offered. In addition a coffee ceremony is organised for the community, and family if applicable, where the girl will live to ensure that they will be accepted in the community.

FSCE's temporary shelter

FSCE also operates a temporary shelter for trafficked, migrated, and physically abused children. The temporary shelter focuses on trafficked and migrated children and on children who have been domestically, physically or emotionally abused. The shelter focuses on both girls and boys. The aim of the shelter is to retain the child from the situation in which it finds itself, to offer guidance and counselling and take care of the children's immediate needs. In addition the family of the trafficked or migrated child is traced and the child is send back. Through the temporary shelter the children are thus protected against different kinds of abuse and reunified with their family. The children stay at the shelter for a maximum of three weeks; on average they however stay for only three or four days. The police play a rather important part in the work of the temporary shelter as they not only bring the

children to the temporary shelter but also return them to their families after the children have used the facilities of the temporary shelter when FSCE has paid for the costs of the re-unification. While occasionally children decide to come to the shelter after they experience the hard life of working on the street, in general the police will bring the children to the temporary shelter.

The temporary shelter consists of a boy's bedroom, two girl's bedrooms, bedrooms for the staff members, a kitchen, a living with games and a television, a courtyard, a bathroom, and the program office of the recovery and reintegration program. Around thirteen children can be accommodated at the shelter at the same time. Nowadays most children are trafficked or migrated, however, also abused domestic workers or girls who were abused at home can pass through the shelter. At the shelter the children receive food, shelter, medical services, counselling and the opportunity to share their experiences. The counselling is aimed at reunifying the children with their family again and preventing them from returning to the streets. The staff consists of four female community workers and two male guards. Both the community workers and the security guards work in shifts. The community workers facilitate food and counselling, take care of sanitation and provide medical service. When the children are ready to be reunified with their family FSCE provides the police with the financial support to facilitate the transport.

B) Socio-cultural community level. At social/community level the interventions are done mainly via community based organisations (CBOs), mainly via Iddirs, see below. Moreover, FSCE organises so-called community conversations.

Iddirs

IDDIRs are among the most widespread forms of Civil society organizations in Ethiopia. They exist both in urban and rural areas bypassing the boundaries of gender, generation, wealth, education, religion and ethnicity. Iddirs are associations established by members who mutually decide to contribute a fixed amount of money on constant intervals (mostly on a monthly basis), which is channelled to help cover for burial expenses when a spouse, a child or immediate relatives of a family passes away. Iddirs are

types of communal support associations organized voluntarily and originally formed by families who live in the same locality for the main and articulated purposes of reciprocal help in financial and service in times of funeral. The Iddir members are expected to take care of all practical matters relating to funeral, including announcing the death of one of its members, putting up the Iddir tent in the compound of house of the deceased or the vicinity, where the mourning family will be offered the respects and condolences from relatives and friends. The Iddirs also donate a specific amount of cash to the family of the deceased to cover miscellaneous expenses related to the funeral and related activities. Payments of monthly amounts of contributions are made to a member nominated as treasurer. The organizational structure of Iddir also includes a secretary that keeps the roster of members in addition to the treasurer and iddir chair person. Iddir at present are not found in their original purposes of establishment in most parts of the country, undergoing significant transformation and considerable degree of formalization. Iddir remained for some years, as a means of procuring substantial assistance mainly during the time of mourning of members. More recently, Iddirs have gained some attention from the government as well as NGOs in Ethiopia, as potential partners in development which can be attributed to the global paradigm shift in development theory that recognizes the role of civil society organizations as actors in development. They are progressively changing in scope and orientation over the years. Providing aid in the form of insurance and credit schemes in some cases in time of death and sickness has become a less important function, while development activities such as taking hand in building street or community development activities like schools, and above all providing security along with local authorities is assumed to be more central role.

FSCE in Adama works in partnership with Iniredada Iddir Coalition. According to available documents from FSCE , this iddir coalition was formed in 2003 by bringing together 10 primary iddirs which agreed to come together in to one umbrella association with a view to strengthen their role in the area of OVC care and support as well as extending care and support for elders. The coalition Ineredada Iddirs Association, (literally meaning ‘let’s support one other”) is legally registered by the Ministry of Justice in 2004. Following this, the Association has opened its own bank account. FSCE Adama Area Program Office has been working with this strong coalition of Iddirs since its establishment taking in to consideration the advantages of ensuring the active participation of the community and other stakeholders in its project implementation and in creating an enabling environment for the community

to be part of the development endeavours. As documents referred has shown, the Iddredada Iddirs Association has been supporting 130 orphans 68 male and 62 female, through their guardians, in the targeted Kebele's as of operation with the financial support of FSCE Adama Area Program Office. The support includes monthly financial support of Birr 80 per child, psychosocial support for the children and their guardians as well as provision of revolving funds for the guardians to ensure the sustainability of the support for the children.

Community conversations

The community conversation program by FSCE aims at awareness creation in the community with regard to children's and women's rights. Community conversations are organized for groups of 60-70 kebele members in the target kebeles of the organizations. Most of the participants are selected from different groups in the community because of their active role in the community and/or their believed ability to convince others. In addition some participants personally decide to participate. The facilitators try to include children in the community conversations to make the group representative of the kebele with an age range of 4 to 80 years old. The organizations are responsible for organizing the program, training the community conversation facilitators, providing coffee, tea, and bread, dispersing correct and good information, and providing certificates when the participants completed all sessions. FSCE organizes a session every 15 days for at least eight consecutive months per group of participants.

The overall aim of the community conversations is to create awareness and raise the key child protection indicators in the target kebeles. The community conversations offer participants the opportunity to increase their knowledge on children's and women's rights as well as child protection. In addition, the participants are trained to identify and refer cases of child abuse. At the first meeting the CC facilitator provides initial topics but the participants determine the specific topics that will be discussed based on the relevance of the issues in their kebele.

During the project period, 13 community conversation groups with 70 participants (so in total involving 910 community members, of which 50% are male) were organised in Addis Ketema. A total round of community conversations in Addis Ketema takes 9 months; per month there are two session. This implies that in Addis Ketema there were $2 \times 9 \times 13 = 234$ sessions per year. Over the project period, this

amounts to $4 \times 234 = 936$ community conversation sessions in Addis Ketema. In Adama, there were 8 community conversation groups organised. Also in Adama there were two sessions per month. Per year, there were $12 \times 16 = 192$ sessions in Adama. Hence, over the entire project period there were about $4 \times 192 = 768$ community conversations sessions conducted in Adama.

3.2 Objectives and outcome variables

The Girl Power Program aims to promote equal rights for girls and young women, and to support their participation in political, social, educational, and economic fields, and to fight injustice and violence against girls and young women. In general terms, the project aims to promote gender equality and empowerment of women.

The problem we are faced with is that there are neither rigorous evaluations of programmes addressing violence against girls and young women, nor is there consensus about the indicators that can be used to measure the impact of this type of programs (Bloom, 2008). Bloom (2008) provides an extensive survey of the literature, and develops a compendium of possible indicators. Our outcome indicators are based on this report. More specifically, we use indicators for violence (abuse), female circumcision, early marriage, female empowerment and paid sex. In line with several other studies, we differentiate between psychological, physical, and sexual abuse. Table 2 below briefly explains the main outcome indicators we use in this study. The full questionnaire on which these indicators are based can be obtained on request.

Table 2: Outcome variables

Psychological abuse	Have you been psychologically/emotionally abused (in whatever way) during the last year?
Physically abuse	During the last year did you get physically abused by anyone?
Sexual abuse	Have you been sexually abused in the last year?
Refuse female	FGM is a violation of human rights or FGM should stop

circumcision	
Continuation early marriage	Agree with continuation of early marriages
Female empowerment	A female empowerment index based on six questions. Higher means more female empowerment.
Money for sex	Have you been offered money or other material gifts in exchange for sex or sexual favors during the last year?

3.3 Theory of change

The different interventions of FSCE are meant to complement each other in terms of reducing violence against girls and young women. FSCE deliberately intervenes at the individual level and at the community level (and also at the government level). The activities at the individual level, such as the temporary shelter, the reintegration programme, and the girls clubs, aim to directly protect young women and girls (and for some interventions boys as well) against different kinds of sexual, psychological and physical abuse. These activities are also meant to teach them better ways of life, and to inform them about where to report cases of violence and how to seek justice. However, these individual measures will not become effective if social values, norms and attitudes at the community level are not changing. Indeed, one of the major barriers to reduce violence against girls and young women, are traditions, beliefs and norms within the communities (DFID, 2012). Therefore, the impact of the interventions crucially depends on the degree to which the program succeeds in affecting the values within the community. FSCE tries to tackle these barriers at the community level by e.g. organising community conversations, and by addressing IDDIRs. These interventions thus aim to address so-called harmful traditional practices (HTPs), a term that refers to practices and cultures which affect the health and well-being of women (Alem et al., 2013)). The community conversations, but also to interventions at IDDIRS, offer participants the opportunity to increase their knowledge on children’s and women’s rights as well as child protection. In addition, the participants are trained to identify and refer cases of child abuse. A simple diagrammatic presentation of the theory of change is given in Table 3.

Table 3: Theory of change

Intervention	Outputs	Outcomes	Final outcome
Temporary shelter	Amount of women/ girls/ boys that take part in	Values, beliefs and attitudes start to change;	Girls and young women are free from all forms of gender-based violence and the threat of such violence
Reintegration programme	different programmes;	Violence against women is beginning to be seen as unacceptable	
Girls Clubs	Amount of individuals that due to programmes are	Different forms of abuse/ violence against women start to reduce	
Community conversations	directly prevented against abuse; women/girls know their rights and where to report abuses; prevention and response mechanisms at all levels exist and are active	Women empowerment increases; early marriages decrease; women are less confronted with requests to provide sexual favours	
IDDIRs			
Community conversations			

4. Data collection

4.1 Description of the surveys

The full questionnaire can be obtained on request. The questionnaire is divided in the following blocks:

- Block 1, block 2 and block 14: should be answered by enumerator.

- Blocks 3, 4, 5, 6 and 7: should be answered by adults from iddirs; girls from school clubs/girls clubs and “street girls” (both controls and treatments). Block 3 aims to obtain back ground information from the respondents. Block 4 asks information about the marital status; Block 5 tries to obtain general information about FSCE; Block 6 gives general information about iddirs, girls clubs and street girls; and block 7 deals with female empowerment

- Blocks 8, 9, 10, 11, 12 and 13 deals with different forms of violence and abuse, employment and female circumcision. These blocks are only answered by girls from girls clubs and street girls that pass through the recovery and reintegration program.

4.2 Sampling design and sample sizes

We conducted a baseline and a follow up survey, and sampled three different groups of beneficiaries: (1) girls at girls clubs; (2) Adults who are member of an Iddir (funeral organizations) and (3) street girls from recovery and reintegration program.

During the baseline, we sampled 150 beneficiaries per group. The three groups of beneficiaries are taken from Kebeles (the smallest administrative unit of Ethiopia; a neighborhood) where FSCE is active. Details are provided in tables 4, 5 and 6 below. The different groups of “treatment” individuals were randomly selected using lists with members of Girls clubs, Idders (the funeral organizations) and street girls. Those lists were kindly provided by “FSCE” Our group of street girls is randomly selected from a list of girls –provided by FSCE- that have passed through the recovery reintegration program were. Control individuals are sampled in neighborhoods (kebeles) and girls clubs where FSCE is not active. During the baseline we also sampled “control” street girls, but it turned out to be impossible to sample them twice. The “control” street girls sampled during the baseline also turned out to be quite different from the “treated” street girls, who had followed the recovery and reintegration program. For these reasons we decided to entirely ignore the “control” street girls in the quantitative analyses, and perform a simple before-after analysis for this group, as will be explained before.

Table 4: sampling for girls clubs in baseline

Status	Name of school	No. of girls members	No. of girls selected
Treatment	Adama no. 1 elementary school	17	2
Treatment	Adama no. 2. elementary school	324	27
Treatment	Adama no. 3 elementary school	147	12
Treatment	Adama no. 5 elementari school	274	23
Treatment	Adama no. 6 elementary school	171	14

Treatment	Goro high school	426	35
Treatment	Adama high school	452	37
Control	Adama No. 4 elementary school	93	36
Control	Adama Boset school	160	60
Control	Burka Elementary school	80	30
Control	Dembela highschool	58	24

Table 5 : Sampling for IDDIRs in Baseline

Status	Kebele	Name of IDDIR	No. of members	No. selected
Treatment	1	54 and 31	300	34
Treatment	7	7	251	28
Treatment	1	55	287	33
Treatment	1	56	273	31
Treatment	1	57	215	24
Control	4	62	95	28
Control	14	Telehaymanot	135	44
Control	5	10	149	40
Control	14	70	128	38

Table 6 : sampling for Girls that followed recovery and reintegration programme

Status	Kebele	No of street girls selected
Treatment	6	88
Treatment	7	62

Since it turned out to be extremely difficult during the follow up survey to find girls, especially the “control street girls” that were sampled during the baseline, we were faced with serious drop outs (attrition). Table 6 below provides our actual sample sizes for the three groups, for the baseline and endline

Table 7 : Actual Sample sizes and attrition rates

	Girls clubs	IDDIR	Street Girls
Baseline: Treated	128	127	85
Endline: Treated	49	104	55
Attrition rate Treated	$0.01*(128-49)/128=0.62$	0.18	0.38
Baseline: Control	126	128	0
Endline: Control	65	108	0
Attrition rate control	$0.01*(126-65)/126=0.48$	0.16	

The table shows that especially for girls from girls clubs attrition is high. Below we will give an explanation for the high rate of attrition.

4.3 Implication of power calculations

A potential concern of our evaluation is that we lack sample size to detect a real impact of one of the interventions in this project, resulting in a Type II error. Theoretically, a power analysis can assess whether this is a serious risk. However, it is not obvious how to perform power analyses for our analyses. Many simplifying assumptions need to be made in order to make the problem tractable. Moreover, we consider a broad range of outcome variables, and use different types of regression techniques. Our approach, therefore, will only be indicative and will provide some extremely rough estimates covering a range of contingencies. One of the main problems we are faced with is that we need to make an assumption of the effect size for the underlying population. Since there are virtually no quantitative studies available that can guide us in terms of expected effect sizes, we decided to follow Cohen's definitions of small, medium and large effect sizes (Cohen, 1988, chap. 9), and calculate minimum required sample sizes for the three assumed effect sizes, using the STATA program *powerreg*, which is specifically designed to do power calculations for multiple regression models. Results are given in Appendix D, Table D1.

It appears that required sample sizes vary dramatically depending on the expected effect sizes. By comparing minimum required sample sizes with the actual sample sizes, it seems as if we will be able to detect medium and large effects sizes. However, we will not be able to detect small effect sizes. Thus

there is indeed a risk that we will not be able to detect real impacts, as several interventions are not very intensive and are directed at a higher level (such as the interventions at IDDIRs and Girls clubs).

4.4 Other data problems

Attrition of respondents during the follow up survey conducted in June 2014 is attributed to various reasons. The attrition rate was particularly high on the Girls Clubs sample compared to IDDIRs and Street Girls. This is attributed to a number of factors including lack of proper documentation of club members at schools, absence of girl's clubs coordinators who are knowledgeable about the program activities and who could have provided adequate information on locating the club members and other reasons. The fact that Girls club coordinators left schools, and files recordings of girls club members interviewed during the baseline were not readily available couple with lack of good knowledge about club memberships among teachers at the schools where the clubs were located and also poor documentation by schools. Besides, Girls Clubs members who used to be elementary school (less than Grade 8) students which constitute the majority of sample during the baseline data collection moved to high schools where the Girls clubs are no longer active and little information was available at these schools about girl's club activities. On the other hand, some of the girls interviewed during the baseline moved to high schools where the Girls Clubs were found. Nevertheless, tracing these girls which came from elementary schools had been a daunting task because the list of members in the high school was not updated.

For the IDDIRs, attrition is attributed to deceased IDDIR members, IDDIR members who changed location and respondents who traveled away for long period from area of residence. For Street Girls, we even had to sample a completely new control group since we had a very hard time to trace the control street girls interviewed during the baseline. Eventually, we even decided not to use "control" street girls in the quantitative analyses. To sum up, poor documentation of sampling frame by the pertinent institutions, mobility of respondents, and lack of organized lists of street girls are the major factors contributing to attrition during the End line survey.

4.6 Availability of financial data

The total budget for this project equals 323000 Euro. Table 8 below provides a breakdown of the project budget in different types of activities. The activities that we consider are part of 1 (Outputs at the individual (household) level and 2 (Outputs at Socio-Cultural (communities) level.

Table 8: Breakdown of project budget

	2011	2012	2013	2014	2015	Total
1: Outputs at Individual (households) Level	20.741	29.110	29.110	29.110	29.110	137.183
2: Outputs at Socio-cultural (communities) Level	19.151	18.458	18.458	18.458	18.458	92.983
3: Outputs at Institutional (government) Level	9.419	10.191	10.191	10.191	10.191	50.183
4: Outputs at Civil Society Level	2.939	3.991	3.991	3.991	3.991	18.903
5: Outputs at Country Steering Committee Level	950	950	950	950	950	4.750
6: Outputs at PME Level	3.800	3.800	3.800	3.800	3.800	19.000
Total	57.000	66.500	66.500	66.500	66.500	323.000

1: Outputs at Individual (households) Level- this includes activities like

- Media messages specifically targeted to girls and young women and/or boys to provide information on gender equality and women's rights (radio, TV etc.)
- Training & workshops on gender equality & rights and/or overall empowerment (life skills, leadership, participation etc.), including training of trainers
- Sport events or activities
- Support to victims of gender based violence (social, legal, counselling, medical referral etc.) through shelter facilities
- Support to victims of gender based violence (social, legal, counselling, medical referral etc.) at community level
- Setting up and supporting child helplines
- Provision of scholarships and/or material support for (post-) primary education
- Providing access to vocational skills trainings
- Saving & loans schemes

2: Outputs at Socio-cultural (communities) Level- this includes activities like

- Awareness raising/sensitization meetings & events (promotion of girl friendly attitudes and non-violence)
- Facilitate and support child welfare committees and other community based protection initiatives
- Meetings with traditional leaders in communities Girl Power issues •
- Media messages specifically targeted at communities on gender equality and women's rights

3: Outputs at Institutional (government) Level- this includes activities like

- Training to government frontline professionals at local, district, province, regional or national level (health professionals, teachers, police)
- Lobby & advocacy activities on laws and policies related to girls empowerment, child rights and women's rights

4: Outputs at Civil Society Level- this includes activities like

- Capacity support to CSO's by partners
- Capacity support to girls' club & other grassroots organizations by partners
- Strengthening CSO networks
- Training media professionals on Girl Power issues
- Participation in local, regional, national or international lobby networks and initiatives

For our evaluation, the outputs at individual level (1) and the outputs at Socio-Cultural level (2) are relevant. Unfortunately, despite many requests, we did not receive a further breakdown of the financial budget in terms of the activities we consider.

4.7 Descriptive analysis

Appendix A reports descriptive statistics for the baseline and follow-up data. It should be noted that we lack pre-treatment information, implying that the baseline is not a real baseline. Baseline statistics simply reflect a first measurement moment. In line with the sampling strategy, we present baseline and endline tables for three groups, that is Girls Clubs, Iddirs and Street Girls. Regarding the Girls Clubs, the tables suggest that treated girls are somewhat older, followed a little bit more education, and are more psychologically and emotionally abused. Moreover, a higher percentage of the treated girls, as expected, does know FSCE. Concerning Iddirs, the tables suggest that, during the a baseline, a lower percentage of treated individuals followed post primary education, and is willing to report cases of sexual and or physical abuses and violence at the police station. It is remarkable that both during

baseline and endline, a lower percentage of treated individuals seems to agree with the statement that the circumcision of women and girls is a terrible violation of fundamental human rights. In line with the Girls Clubs, a higher percentage of treated individuals from Iddirs does know FSCE. Regarding street girls, we lack reliable information from a relevant control group during the baseline. Yet, we were able to obtain relevant information on treated and non-treated street girls during the follow-up survey. Street girls from the treatment area seem to be a bit older, and were confronted with more sexual abuse. Moreover, a considerably higher percentage of the street girls in treatment areas have heard about FSCE.

5. Analyses and results

This section explains the analyses and presents the results of the impact evaluation. Section 5.1 describes the approach we have used, and points out some of the caveats we were faced with. The main results, including some sensitivity analyses, are presented in Section 5.2.

5.1 Methodology

We use qualitative and quantitative impact evaluation techniques. Concerning the qualitative evaluation, we conducted several focus group discussions and in depth interviews. In addition to the qualitative evaluation we conducted a quantitative evaluation for the interventions related to Girls Clubs, Iddirs and street girls that have followed the recovery and reintegration program. Before giving more details about the methodology we have used for the quantitative evaluation, it is important to point at one of the main methodological caveats we were faced with, and that is that our baseline survey took place after the project had formally started. Since the treatment status does not change over time, we cannot conduct standard before-after analyses or standard difference-in-differences analyses to measure impact of the program. The analyses consider the development of outcomes in treatments and controls between two points of time - that is, in 2012 and about two years later. In fact, we consider the impact of being one additional time period -measured by the time between the baseline and follow up survey- in the program. It is also important to note that, with the exception of the street girls, we are not dealing with persons who have actually been treated, but with persons who participate in IDDIRs and/or Girls Clubs that have been treated. The quantitative evaluation may therefore also be thought of as an attempt to identify the intention to treat effect.

The quantitative impact evaluation methodology is as follows. We conducted a baseline survey and a follow up survey for IDDIRs, Girls Clubs and Street girls that have follow the reintegration programme. By using the data from the baseline and the follow up survey, we conducted a double-difference (DD) method in a regression framework for IDDIRs and Girls Clubs. Basically, we estimated the following model with ordinary least squares (OLS):

$$Y_{i,t} = \alpha Treat_i + \beta Time_t + \gamma Treat_i * Time_t + \delta Control_{i,t} + \varepsilon_{i,t}$$

Where Y refers to a vector of outcome variables; $Treat$ is a dichotomous dummy variable with a one for individuals in the treatment group and a zero for individuals in the control group; $Time$ is a time dummy, with a one for the baseline survey and a one for the follow up survey; $Control$ is a (vector) of control variables and ε is an error term. The subscript i refers to individual, the subscript t to time. The coefficient of interest is γ , which measures the impact of the program. Note that the interactive term gives a zero for the “treatment” group in the follow survey and a zero otherwise. Since the baseline survey is not a “real” pre-intervention baseline, as it is not conducted before the program started, γ measures the *incremental* impact of the program, i.e. the impact of being “longer” in the program.

For the Girls Clubs and the Iddirs, we estimate the above given equation with a balanced and an unbalanced panel. For both the balanced and unbalanced estimates we estimate the models with and without control variables. The DD model using a balanced panel provides results that are similar to a normal difference-in-differences regression. It also is equivalent to a fixed effects model, including a time dummy, with fixed effects for the treatment status. As we interviewed the same individuals twice, the DD model, without additional control variables, is also equivalent to a fixed effects model using fixed effects at the individual level, including a time dummy. The advantage of a DD specification with a balanced panel is that “fixed effects” are taken into account, and hence that sample selection biases due to unobserved heterogeneity that does not change over time is controlled for. We estimate with and without controls to test the robustness of the results. If the parameter of interest γ does not change dramatically if controls are included, there is some confidence that the results are robust. Moreover, the degree to which the parameter γ changes gives some indication about the possible impact of sample selection bias due to unobserved time-varying heterogeneity. Finally, including control helps to improve

the precision of the estimates. The different estimates serve as sensitivity analyses regarding the impact of the different treatments.

Since we are confronted with serious attrition, i.e. some individuals are dropped from the sample in the follow up survey for various reasons, constructing a balanced panel implies that information from the baseline is lost, which lowers the sample to be used in the estimates, and hence the power of the estimates. Therefore, we also estimated the DD model on an unbalanced panel. The advantage is that a larger sample can be used to estimate the equation; the disadvantage is that the estimates do not fully control for unobserved heterogeneity that does not change over time.

For the street girls we followed another approach. Since street girls continuously move, and are not formally registered, it appeared impossible to sample the same “control” street girls during the baseline and the endline. For the “treated” streetgirls, however, we were able to follow the same street girls in the baseline and endline using information from FSCE. Therefore, we performed a simple before-after analysis for street girls. We realize that this may result in some sample selection biases since we were not able to compare changes over time with changes over time of a control group. Yet, we did not have much of another choice. Please also recall that our analysis does not measure the impact of the project as such, but the incremental effect, for our baseline survey took place after the project had been started. In case of the street girls, the “baseline” survey actually took place just after those girls had participated in the program. This implies that our estimates could be thought of as an attempt to measure the sustainability of the intervention. We estimated the following equation for street girls:

$$Y_{i,t} = \tau Time_t + \sigma Control_{i,t} + \varepsilon_{i,t}$$

The parameter of interest is in this case: τ

5.2 Results

This section presents, per intervention type, results of the impact evaluation.

FSCEs temporary shelter

Regarding the temporary shelter for trafficked, migrated, and physically abused children by FSCE, we only conducted a qualitative evaluation. A first insight in the work done by this shelter is offered through means of interviews with three important stakeholders in combination with a short small sample-questionnaire administered to three girls who were at the temporary shelter at time of this study. The questionnaire was administered by the head of the temporary shelter in Adama.

The temporary shelter focuses on trafficked and migrated children and on children who have been domestically, physically or emotionally abused. The shelter focuses on both girls and boys, as is illustrated in an overview of the children who passed through the temporary shelter between 2009 and 2013 (Table 9).

Table 9: Overview of the children who have used the facilities of the temporary shelter per year between 2009 and 2013.

Year	Sex	Trafficked	Migrated	Sexually abused	Physically abused	Street Children	Others	Total
2009	M	6	2	3	-	-	2	13
	F	8	7	10	16	-	8	49
	T	14	9	13	16	-	10	62
2010	M							16
	F							37
	T							53
2011	M	10	24	-	4	2	1	41
	F	17	18	1	15	-	1	52
	T	27	42	1	19	2	2	93
2012	M	25	24	-	-	-	-	49
	F	27	21	2	23	-	-	73
	T	52	45	2	23	-	-	122
2013	M							

	F							
	T							
		93	96	16	58	2	12	330
								277

Note: For the year 2010 no detailed information on the background of the children passing through the temporary shelter was available, therefore only the total number of beneficiaries is given.

A situation-description of one of the children who passed through the temporary shelter is offered below. This illustrates how most children end up in the temporary shelter; either by encounter with the police or through advice of citizens or community groups such as IDDIR's, trafficked, migrated or abused children are identified and brought to the temporary shelter by the police.

Ten children were taken from the countryside to stay in a small house in Adama city. They would only get one piece of bread and one cup of tea in the morning, during the whole day they would have to sell lottery tickets and at night they would again only get bread and tea. Sometimes, one of the children decides to leave and starts living on the street or sometimes this man [the trafficker] kicks them out because they used 1 birr to buy some food. When they start living on the street the police will bring them to the temporary shelter for trafficked and migrated street children."

It is believed that FSCE's shelter has succeeded when the children are reunified with their family, however follow up is not possible because the children often come from far and follow up would be too expensive. Due to the lack of follow up it is difficult to estimate the success rate of the temporary shelter. However, of the one hundred twenty-two children who passed through the shelter in 2012 only three or four returned again, which might indicate that the reunification is rather successful. Sometimes children do however return to the shelter a second time, in most cases children leave their home again because their family still does not have the income to provide for them or to give them an education. If children would return a second time they would however not receive the support of the shelter again. While the work of the temporary shelter could be improved when a follow-up was part of the program,

the value of the shelter is evident. The shelter offers children a gateway to escape from abuse and directs them to safe ways of life through reunification with their family, which is highly valuable.

*It helped me not to be on the street, I got food, clothing and shelter. -
- 11-year-old girl*

*It save me from street life, save me from physical abuse and I got food support.
- 12-year-old girl*

By providing children with an opportunity to return home and hopefully have a better future than they had when they were admitted to the temporary shelter, FSCE contributes to the goal of the Girl Power Program to fight injustice and violence against girls.

FSCE's recovery and reintegration program

A first insight in the recovery and reintegration program is offered through means of interviews with three important stakeholders in combination with a short small sample-questionnaire administered to seven girls who have been helped through the program. The questionnaire was administered by the head of the temporary shelter in Adama.

It appears that up to 70% of the girls succeeds to retain their new business when community workers follow up on them after one or two years. While it is not clear why these girls did succeed, their character and a supporting environment are identified as possible factors. For the girls who fall back financial factors might be a reason as they receive a low salary compared to what they earned working in the sex industry. It is believed that especially girls with no family around are prone to fall back because they don't receive the love, care and encouragement to continue their education or their new job. The help offered by FSCE for the sexually abused or exploited girls is seen as highly valuable by both the stakeholders and the beneficiaries. The seven girls who answered a short questionnaire about the support they received all indicated that FSCE had helped them to change their lives.

*[I have learned] how to save and use money and it brought attitudinal change that if I work it is possible to change myself
- 18-year-old girl.*

I am so happy to stop my previous work and start a new business and I see a different future now
- 18-year-old girl.

Also the stakeholders believe in the value of the program as it protects girls from sexual abuse and abusive environments, and offers them the opportunity to start a new life. In addition it is stressed that the support from the community is increasing since recently a fund raising resulted in the offer of free medical support for 150 girls and education and vocational training for a selected number. While the program is seen as valuable some possible improvements are suggested as well. It would be good to provide continuous life skill training, continuous business training and additional support.

In addition to the qualitative evaluation, we conducted a quantitative evaluation of a group of street girls that have passed through the recovery and reintegration program. As explained in the methodology section, we interviewed a group of street girls twice, just after they have completed the recovery and reintegration program, and about a year later. The quantitative analysis shows whether girls who have completed the program show improvement in terms of indicators for violence (abuse), female circumcision, early marriage, female empowerment and paid sex. Since it appeared to be impossible to survey a reliable control group, and since no information prior to entering the recovery and reintegration program is available, the quantitative results are only indicative for the impact of this program in terms of sustainability. The detailed results are presented in Tables B2, B4, B6, B9, B12, B15 and B17 in Appendix B. A summary of the results is provided in Table 10 below.

Table 10: Impact of FSCE's recovery and reintegration program

	Psychological Abuse	Physically Abuse	Sexual Abuse	Refuse Female Circumcision	Continuation Early Marriage	Female Empowerment	Money for Sex
Street Girls	SR	SR	SR	NI	NI	NI	SR

Notes: NI: no impact; NM: Not measured; SR: Significant reduction; SP: significantly positive. 1 only significant for the estimates using unbalanced panels.

The table shows that “street girls” who have passed through *FSCE*’s recovery and reintegration program were less confronted with psychological, physical, and sexual abuse at the time of the end line survey as compared to the baseline survey. They were also less troubled by requests for paid sex. While it is not possible to unambiguously contribute these improvements in outcome indicators to only *FSCE*s treatments, it at the least suggests that the recovery and reintegration program contribute to reducing violence against street girls. Hence, it may be concluded that with regard to the Girl Power Program, the recovery and reintegration program works towards supporting girls and young women in their participation in society and in protecting them against injustice and violence.

Iddirs

Concerning *IDDIRs* , we interviewed adults, and primarily looked at indicators that signal behavioral changes. We did not focus on indicators that directly measure whether *IDDIR* members were confronted with violence/ abuse of any kind. A survey of the regression results regarding the main indicators is provided in Table 11 below. Detailed results are presented in Appendix B

Table 11: Impact of *FSCE*’s interventions at *IDDIRs*

	Refuse Female Circumcision	Continuation Early Marriage	Female Empowerment
<i>IDDIRs</i>	SP	SR	SP

Notes: SR: Significant reduction; SP: significantly positive.

The table shows that attitudes and values regarding female abuse and gender issues of adult members of *IDDIRs* where interventions of *FSCE* took place are improving as compared to values of members of control *IDDIRs*. There is a significant increase in adults who find female circumcision a violation of human rights, and oppose the idea of early marriage. Moreover, female empowerment seems to be improving. These results suggest that *FSCE*s interventions at *IDDIRs* contribute positively to changes in values and attitudes that are important in terms of reducing violence and abuse against girls and young women.

Girls clubs

Regarding girls at girls clubs, we addressed the same outcome indicators as for street girls. A summary of the regressions results is given in Table 10. Detailed results are presented in Appendix B. The table below shows that *FSCE*'s interventions at girls clubs did not succeed in a significantly different change in outcome indicators as compared to girls from control girls clubs. There only seems to be some difference regarding their ideas about early marriage.

Table 12: Impact of *FSCE*'s interventions at girls clubs

	Psychological Abuse	Physically Abuse	Sexual Abuse	Refuse Female Circumcision	Continuation Early Marriage	Female Empowerment	Money for Sex
Street Girls	NI	NI	NI	NI	SR ¹	NI	NI

Notes: NI: no impact; NM: Not measured; SR: Significant reduction; SP: significantly positive. 1 only significant for the estimates using unbalanced panels.

In order to get better information about what “treated” girls at the girls clubs think about the treatments organized by *FSCE*, we asked several additional questions at the endline. The questions, to be answered by Yes or No, were as followed

Question 1: Do you think the activities by girls clubs helped to protect you and your peers from emotional abuses in and out of school? Question 8.3 in questionnaire

Question 2: Do you think the activities by girls clubs helped to protect you and your peers from physical abuses in and out of school? Question 9.4 in questionnaire

Question 3: Do you think the activities by girls clubs helped to protect you and your peers from sexual abuses in and out of school? Question 10.5 in questionnaire

Question 4: Do you think the activities by girls clubs helped to protect you and your peers from sexual exploitation in and out of school? Question 11.5 in questionnaire

Table 13 provides the analyses of answers to these questions. The table shows that, while we do not find significant positive impacts of the program in terms of changes of outcome indicators, girls at girls clubs believe that activities at girls clubs are very important to reduce violence against young women and girls. This provides some indication about the importance of the interventions at girls clubs

Table 13: What do girls at girls clubs think about activities organized by FSCE

Question 3	49	90
Question 4	49	94

6. Discussion

6.1 Methodological caveats

This is a notoriously difficult project to evaluate due to the vast amount of different activities, which complement each other, and are difficult to disentangle. Several interventions are also open to everybody (such as the media performances), which makes it likely that control groups are contaminated by the interventions as well. In addition, *FSCE* works together with other organizations as part of the nation-wide girl power program. These organizations not necessarily conduct the same interventions as *FSCE*, but the ultimate aim is the same. Since interventions by collaborating organizations (such as *ECPA*) sometimes take place in other areas (*Kebeles*), it may well be the case that our “control” groups are contaminated by similar interventions by other organizations. Moreover, the project focuses on changing attitudes and values, which are very difficult to measure. The combination of many different activities, outcome variables that can only be measured with huge measurement errors, probably small effect sizes since control groups may be contaminated by interventions by other organizations, and relatively small sample sizes, implies that the power of our estimates is low. This implies that we can only identify medium or large impacts, probably larger than to be expected. Even more problematic is that our first measurement was done a significant period after the start of the project, and hence does not provide real baseline information. The implication is that we were not able

to rigorously measure the **average** impact of the project as such; we could only measure the **additional** impact of the project during the post-first measurement period. For one of the interventions considered –the impact of the recovery program – we were even not able to sample a reliable control group. Hence, the quantitative analysis faces several serious challenges. It is precisely for this reason that we added several qualitative analyses, such as small focus group discussions, and in depth interviews with some beneficiaries from the program.

6.2 Did the project reach its objectives?

The main aim of this project is to reduce violence against girls and young women. Since we have not analysed all components within this project, we cannot give an overall assessment. Yet, by considering some of the main interventions we are able to value the project. Our analyses suggests that the project contributes to the main objectives as street girls are less confronted with sexual, physical and psychological abuse. Moreover, FSCEs interventions at IDDIRs appear to contribute positively to changes in values and attitudes that are important in terms of reducing violence and abuse against girls and young women. We, however, did not find significant impacts of the interventions at girls clubs. Further research needs to be done to find out how the differences in impact can be explained. It needs to be recalled, that regarding the quantitative analyses related to street girls, the group for which we found the most positive results, we were not able to select a valid control group. This makes the street girls analyses less rigorous as compared to the other analyses, partly suggesting that impact results become bigger the less rigorous the analysis is. Hence, while it seems as if street girls benefit substantially from FSCEs interventions, it may be the case that the rather positive impact results are not attributable to FSCE interventions. On the other hand, as we have pointed out several times, we were faced with severe methodological caveats, which may (partly) explain why we did not find any impact of the interventions at Girls clubs.

6.2 How relevant are the results?

A reduction in violence against women and young girls is one of the key development goals at the moment. Hence, the issues that this project addresses are extremely important. So projects with similar

objectives seem to be relevant and welcome. However, it seems worthwhile to further investigate whether it is relevant to upscale some of the activities, and to downscale others, for our analyses points at significant impacts of the “recovery and reintegration program”, while the interventions at Girls Clubs seem less effective.

6.3 How efficient was the project?³

The project has a five years budget of EURO 323.000. The activities spread out over many interventions, at the individual, community and government level. Due to the variety of interventions within this project, and the absence of any benchmark data for most of these interventions, we are not able to assess the efficiency of the entire project. Moreover, FSCE targets vulnerable children and families directly (for which we have some data), but also indirectly (via others), for which we lack any data. Yet, by considering some of the interventions separately, we may be able to conduct a partial efficiency analysis.

Concerning the community conversations, during the project period, 13 community conversation groups were organized in Addis Ketema, with 70 participants, and 8 community conversation groups in Adama, with 60 participants. This implies, that over the entire project period 1390 persons have been “treated” by community conversations. Concerning Iddirs, the Adama Iddir coalition has 11 individual iddirs with a total of nearly 3000 members. If we assume that In Addis Ketema the same amount of

³ It should be noticed that a detailed financial efficiency analysis is not possible for we were not able to obtain a breakdown of the budget in terms of the main activities we consider in this report (i.e. we don't know which parts of the budget are spent on girls clubs, community conversations and IDDIRS). We also lack a financial breakdown of activities in Addis Ketema and Adama. Therefore, the financial efficiency analysis should be seen as indicative for the cost-effectiveness only.

individuals were member of an Iddir, the total amount of Iddir members would amount to 6000. Hence, in total approximately 7390 subjects have either been treated via community conversations, or via Iddirs. The total budget for at the socio-cultural level equals 92983. This would imply that per capita, around 12.5 euro has been spent on Iddirs and/or community conversations, assuming that the major part of the socio-cultural budget has been used to finance community conversations and activities at Iddirs. This per capita costs is in the range of per capita costs 8.25 US dollar and 19.24 USD (taken from , AIID, 2014, p.18), cost efficiency therefore seems to be reasonable.

Regarding “girls clubs” the outputs are as follows. In Addis Ketema, directly and indirectly there are 280 children influenced by FSCEs activities; in Adama even 2178 children. So in total, 2458 children are treated by FSCE interventions at Girls Clubs. The total budget for outputs at the individual level equals Euro 137183. If we assume that about 50% of this budget is used to finance activities at girls clubs, the cost per girl treated equals around 27.5 Euro. We lack a good benchmark for Girls clubs, but can use costs associated with the cost of youth training in Ethiopia, which range between 4.5 USD and 59 USD per child, depending on the focus of the activities. The per capita costs for the girls clubs therefore seem to be within the range of costs related to costs of youth training.

Next we consider the reintegration program. Before the CSO legislation in 2009 (ICNL, 2012) FSCE offered a drop-in centre where the girls could come and leave and a safe home where they received trainings. However, nowadays the support offered for these girls is community-based and aims at reintegration. The reintegration program targets 80 vulnerable children directly per year (FSCE, 2014). If we assume that indeed 80 children are directly treated via this programme component, about $5 \times 80 = 400$ children are treated. Another major activity concerns the reintegration program. In total 330 individuals passed through the reintegration program during the project period (see Table 9). Hence, around 750 individuals benefited from either the temporary shelter or the reintegration program. If we assume that around 50% of the budget for outputs at the individual is used for these activities, the per capita costs equal around 900 euro, which seem high. But then again, the assumptions we have made may not hold.

7. Conclusion

This report documents an impact assessment of a project implemented by FSCE and funded by ECPAT Netherlands. The project is part of a nationwide project in which also “Enhancing Child Focused Activities”(ECFA) (project C2) participates. The main aim of the project is to reduce violence against girls and women. In order to contribute to this aim, FSCE conducts a broad series of activities, such as awareness campaigns, media performances, skills building initiatives, provision of (socio-legal) protective services to girls and young women, trainings and workshops for community based organizations, and capacity building activities on school clubs. The evaluation focused on the main activities, which we have grouped according to two levels: Individual level and the Socio-cultural community level.

The main findings are as follows: 1) the recovery and reintegration program seems to help supporting girls and young women to participate in society and to protect them against injustice and violence; 2) FSCEs interventions at IDDIRs seem to contribute positively to changes in values and attitudes that are important in terms of reducing violence and abuse against girls and young women and 3) While girls at girls clubs believe that activities at girls clubs are very important to reduce violence against young women and girls, we were not able to detect significant positive impacts of the interventions at girls clubs in terms of changes of outcome indicators.

Overall, while we realize the impact evaluation caveats we were faced with, and the difficulties in rigorously evaluating this program, we are positive about the contents and quality of the interventions that are conducted by FSCE in terms of the Girl Power project. The impression we achieved from the interviews with beneficiaries from the program, and the results from the quantitative and qualitative analyses, suggests that the interventions contribute to a change in values and attitudes, and help to reduce violence against women.

Because of the many methodological caveats, the evaluation results should be taken with some caution. Yet, the evaluation suggests that the project was well-designed and suitable for the environment in which it was implemented. Given the enormously important issues that this project aims to address - reducing violence against girls and young women- funding of this type of projects seem recommendable. However, the evaluation also signals that some interventions are more successful than others. We signaled quite positive effects from the recovery and reintegration program. However, we were not able to provide quantitative evidence for substantial impacts of the interventions at girls clubs. It seems therefore valuable to assess whether some activities should be upscaled, while others could be downscaled.

We end this report by valuing the program in terms of the main evaluation questions.

Table 14: Valuing the program

Statement (How much do you agree with the following statements?)	Score 1 = not at all 10 = completely
The project was well designed	8
The project was implemented as intended	9
The project reached all its objectives	6
The observed results are attributable to the project interventions	5 ¹
The observed results are relevant to the project beneficiaries	9
The project was implemented efficiently	6/7 ²

¹ : due to the many methodological caveats, the evaluation is not “rigorous” in terms of identifying causal effects. So, we cannot be sure that the observed results are attributable to project interventions.

² we only considered some of the broad range of project interventions, and the break- up of the budget in terms of the activities we consider turned out to be tedious. It seems as if the project was cost-effective, but we lack cost information about other interventions aiming at similar outcomes so that a full scale efficiency analysis is impossible.

Report CDI-15-058

Kusters, C.S.L, T. van Ingen, E. Zerfu, D. Kefyalew, B. Peters, N.N. Buizer, 2014. *Endline report Ethiopia, HOA-REC. Capacity of Southern Partner Organisations (5c) component*. Centre for Development Innovation, Wageningen UR (University & Research centre). Report CDI- 15-058. Wageningen.

This report presents the findings of the endline of the evaluation of the organisational capacity component of the MFS II country evaluations. The focus of this report is Ethiopia, HOA-REC. The format is based on the requirements by the synthesis team and NWO/WOTRO. The endline was carried out in 2014. The baseline was carried out in 2012.

Key words: 5C (five core capabilities); attribution; baseline; causal map; change; CFA (Co-financing Organisation) endline; organisational capacity development; SPO (Southern Partner Organisation).

Acknowledgements

We are grateful to all the people that have contributed to this report. We particularly would like to thank the Southern Partner Organisation Horn of Africa Regional Environmental Organisation (HOA-REC) and the Co-Financing Agencies ICCO for their endless patience and support during this challenging task of collecting the endline data. We hope that this endline report will provide useful insights to HOA-REC, ICCO, consortia, the synthesis team, IOB and NWO/Wotro and other interested parties and other interested parties.

The Ethiopia 5C evaluation team

List of abbreviations and acronyms

AAU	Addis Ababa University
ACCA	Association of Chartered Certified Accountants
Causal map	Map with cause-effect relationships. See also 'detailed causal map'.
Causal mechanisms	The combination of parts that ultimately explains an outcome. Each part of the mechanism is an individually insufficient but necessary factor in a whole mechanism, which together produce the outcome
CDI	Centre for Development Innovation, Wageningen UR, the Netherlands
CFA	Co-Financing Agency
CSO	Civil Society Organization
Detailed causal map	Also 'model of change'. the representation of all possible explanations – causal pathways for a change/ outcome. These pathways are that of the intervention, rival pathways and pathways that combine parts of the intervention pathway with that of others. This also depicts the reciprocity of various events influencing each other and impacting the overall change. In the 5C evaluation identified key organisational capacity changes and underlying reasons for change (causal mechanisms) are traced through process tracing (for attribution question).
EDEI	Ethiopia-Dutch Energy Initiative
EPP	Environmental Partnership Programme
EU	European Union
General causal map	Causal map with key organisational capacity changes and underlying reasons for change (causal mechanisms), based on SPO perception.
GIS&RS	Geospatial Information System and Remote Sensing
HoA-REC	Horn of Africa Regional Environmental Organisation
ICCO	Interchurch organization for development cooperation
IFPRI	International Food Policy Research Institute
MDG	Millennium Development Goal
M&E	Monitoring and Evaluation
MFS	Dutch co-financing system
MIS	Management Information System
MoFA	Ministry of Foreign Affairs
NGO	Non-Governmental Organisation
NICHE	Netherlands Initiative for Capacity development in Higher Education
NUFFIC	Netherlands organisation for international cooperation in higher education
OD	Organisational Development
PME	Planning, Monitoring and Evaluation
PRA	Priority Result Area
SPO	Southern Partner Organisation
ToC	Theory of Change
Wageningen UR	Wageningen University & Research centre
WASH	Water, Sanitation and Hygiene
WB	World Bank
5 C	Capacity development model which focuses on 5 core capabilities

1 Introduction & summary

1.1 Purpose and outline of the report

The Netherlands has a long tradition of public support for civil bi-lateral development cooperation, going back to the 1960s. The Co-Financing System (*Medefinancieringsstelsel*, or 'MFS') is its most recent expression. MFS II is the 2011-2015 grant framework for Co-Financing Agencies (CFAs), which is directed at achieving a sustainable reduction in poverty. A total of 20 consortia of Dutch CFAs have been awarded €1.9 billion in MFS II grants by the Dutch Ministry of Foreign Affairs (MoFA).

The overall aim of MFS II is to help strengthen civil society in the South as a building block for structural poverty reduction. CFAs receiving MFS II funding work through strategic partnerships with Southern Partner Organisations.

The MFS II framework stipulates that each consortium is required to carry out independent external evaluations to be able to make valid, evaluative statements about the effective use of the available funding. On behalf of Dutch consortia receiving MFS II funding, NWO-WOTRO has issued three calls for proposals. Call deals with joint MFS II evaluations of development interventions at country level. Evaluations must comprise a baseline assessment in 2012 and a follow-up assessment in 2014 and should be arranged according to three categories of priority result areas as defined by MoFA:

Achievement of Millennium Development Goals (MDGs) & themes;

Capacity development of Southern partner organisations (SPO) (5 c study);

Efforts to strengthen civil society.

This report focuses on the assessment of capacity development of southern partner organisations. This evaluation of the organisational capacity development of the SPOs is organised around **four key evaluation questions**:

1. *What are the changes in partner organisations' capacity during the 2012-2014 period?*
2. *To what degree are the changes identified in partner capacity attributable to development interventions undertaken by the MFS II consortia (i.e. measuring effectiveness)?*
3. *Were the efforts of the MFS II consortia efficient?*
4. *What factors explain the findings drawn from the questions above?*

The purpose of this report is to provide endline information on one of the SPOs involved in the evaluation: HOA-REC in Ethiopia. The baseline report is described in a separate document.

Chapter 2 describes general information about the Southern Partner Organisation (SPO). Here you can find general information about the SPO, the context in which the SPO operates, contracting details and background to the SPO. In chapter 3 a brief overview of the methodological approach is described. You can find a more detailed description of the methodological approach in appendix 1. Chapter 4 describes the results of the 5c endline study. It provides an overview of capacity development interventions of the SPO that have been supported by MFS II. It also describes what changes in organisational capacity have taken place since the baseline and why (evaluation question is 1 and 4). This is described as a summary of the indicators per capability as well as a general causal map that provides an overview of the key organisational capacity changes since the baseline, as experienced by the SPO. The complete overview of descriptions per indicator, and how these have changed since the baseline is described in appendix 3. The complete visual and narrative for the key organisational capacity changes that have taken place since the baseline according to the SPO staff present at the endline workshop is presented in chapter 4.2.2.

Chapter 5 presents a discussion on the findings and methodology and a conclusion on the different evaluation questions.

The overall methodology for the endline study of capacity of southern partner organisations is coordinated between the 8 countries: Bangladesh (Centre for Development Studies, University of Bath; INTRAC); DRC (Disaster Studies, Wageningen UR); Ethiopia (CDI, Wageningen UR); India (CDI, Wageningen UR); Indonesia (CDI, Wageningen UR); Liberia (CDI, Wageningen UR); Pakistan (IDS; MetaMeta); (Uganda (ETC). Specific methodological variations to the approach carried out per country where CDI is involved are also described in this document.

This report is sent to the Co-Financing Agency (CFA) and the Southern Partner Organisation (SPO) for correcting factual errors and for final validation of the report.

1.2 Brief summary of analysis and findings

Since the baseline, two years ago, improvements took place in all of the capabilities.

Over the last two years many small improvements and one slight deterioration took place in the indicators under the capability to act and commit. The management of HoA-REC/N is striving to be more responsive and to decentralise decision making. There are weekly management meetings and program officers have become more independent. There has been a slight improvement in the strategic guidance that management gives as they are strengthening program partnerships (to tap into new sources) and have pointed out six strategic objectives that will help HoA-REC/N better achieve its mission and vision. Staff turnover has increased among program and support staff, especially highly skilled staff and staff working in the remote areas. Since the baseline, the organisation has created an organisational structure with a new more decentralised grouping of programs and more clear roles and responsibilities. There has been a very slight improvement in staff skills especially in program design, implementation and M&E. Staff recruitment criteria have been revised and new staff that is hired is qualified in experience and education. Staffs have improved their skills due to more opportunities for trainings either in-house or abroad on technical topics such as climate change and carbon emissions as well as crosscutting topics like communication. HoA-REC/N now has a standard form to objectively assess staff performance and identify training needs. The incentives for staff to work at the organisation have improved very slightly because of the revised HR manual that has been put online, and staffs are now able to be informed about their entitlements. Over the last two years HoA-REC/N has diversified its funding with support from ICCO in developing proposals and improving their reporting capacity. The organisation now has a fundraising strategy in place and has assigned a consultant to liaise with the fundraising officer and identify calls for proposals, and develop proposals together.

In the capability to adapt and self-renew HoA-REC/N saw many improvements. The organisation has put in place M&E software application system (Akvo FLOW). Staff has had training on using this tool and also on outcome mapping with support from ICCO. The M&E unit has been strengthened and now has three fulltime and one part-time staff. Management also raised awareness about the importance of M&E among other staff. Staffs are now using the monitoring system and data has been collected on a timely basis. Through the M&E software application system management has quick access to M&E findings and is using this in decision-making for future strategies. Staff is encouraged to speak out new ideas especially concerning proposal development and is recognised for providing these ideas. A communications officer has been hired under the public relations (PR) and communications department, who tracks HoA-REC/N's operating environment and is in regular contact with program staff. Staff uses this information e.g. when preparing proposals and capacity building for the PR and communications unit. A revised organogram and newly recruited staff has further helped with this. Over the last two years HoA-REC/N has become more responsive to stakeholders because program staffs frequently communicate with and work closely together with them.

In terms of the capability to deliver on development objectives, HoA-REC/N also showed improvements in many indicators. The organisation has clear operational plans and budgets in place and technical staff now provide specification on each item for procurement in the project's budget. Now that HoA-REC/N has moved to its new premises, there is no longer a lack of offices and all staff

work together which saves costs in terms of time and transport. Reaching planned outputs has improved since the baseline. Because of an improved M&E system and a strengthened M&E unit, the M&E system is now working for almost all departments in the organisation and the M&E staff analyses reports on project input and output basis to monitor efficiency. HoA-REC/N has improved in balancing the quality and efficiency of its work because of the good functioning of the M&E unit that looks into this, updating of operational guidelines and ICCO recommendation to work with organisations that have the required structures and contacts in place for certain topics.

In the capability to relate, HoA-REC/N very slightly improved in engaging in networks. The organisation's expertise has always been in networking, but over the last two years they established new networks with TERI, IRC, the Stockholm Environmental Institute, and UMass Boston.

Finally, HoA-REC/N has improved in a few indicators under the capability to achieve coherence. HoA-REC/N has developed a strategic plan for the period of 2015-2020 and has revised its mission, vision and strategies with key staff, an external consultant and network partners. The organisation's vision and mission are now very well-articulated and project agreements have been amended based on the organisation's new vision and mission. Projects have become more mutually supportive because of better communication and synergy between programs and projects for example for the climate and WASH programs.

During the endline workshop the following key organisational capacity changes were brought up by HoA-REC/N's staff in the 'general causal map': increase in number and quality of staff; clear roles and responsibilities for staff and programme created; improved knowledge on development of implementation strategy; improved knowledge and understanding of logframe and preparation of M&E tools; improved report quality and time of reporting; improved knowledge of financial planning and budget management; and improved knowledge and understanding about procurement procedures. The evaluators considered it important to also note down the SPO's story about what they perceived as key organisational capacity changes since the baseline, as this would also provide more information about reasons for change, which were difficult to get for the individual indicators. Also for some issues there may not have been relevant indicators available in the list of core indicators provided by the evaluation team.

According to HoA-REC/N staff, the number and quality of staff increased because they set a requirement to hire only experienced and qualified staff, who they were able to hire after the revision of the salary scale and staff benefits (with support of the Dutch Embassy) and because of HoA-REC/N's affiliation to the University (attracts staff that wants to be academician and practitioner at the same time). The number and quality of staff also increased because of the creation of clear roles and responsibilities for staff and programmes.

These clear roles and responsibilities were created because four thematic program areas were identified, which in turn was the result of developing a new organogram and more clarification on the organisational focus. These last developments both happened after a capacity assessment was carried out by PricewaterhouseCoopers (PWC) in 2012 (funded by the Dutch Embassy).

HoA-REC/N improved its knowledge on developing an implementation strategy because of their increased emphasis on looking for calls for proposals and the sharing and coaching on proposal development and project implementation because of deployment of expatriate staff for sharing and exposure through MFS II.. The organisation increasingly focussed on looking for calls for proposals because of a need for diversifying funding sources which was identified by the capacity assessment by PWC (funded by Dutch Embassy).

HoA-REC/N improved its knowledge and understanding of logframes and preparation of M&E tools because of sharing and coaching on proposal development and project implementation (funded by MFS II); and a training on M&E by MDF in 2013 (funded by the Dutch Embassy).

The organisation improved the quality and timing of their reporting because of the M&E training by MDF in 2013; the automation of the financial and monitoring system established by support of Nuffic and MFS II; and the training they received on project cycle management (PCM) in 2012 funded by Nuffic.

HoA-REC/N now has knowledge on financial planning and budget management because of the automation of the financial and monitoring system established by support of Nuffic and MFS II and the training on PCM they received in 2012 funded by Nuffic.

Finally, HoA-REC/N improved its knowledge and understanding about procurement procedures because of the same PCM training in 2012.

In general most of the capacity building initiatives that were implemented since 2012, were based on the recommendations of the capacity assessment carried out by PWC in 2012 with financial support from the Dutch embassy. According to HoA-REC/N, MFS II funded capacity development interventions have played a role in improved knowledge on development of implementation strategy; improved knowledge and understanding of logframe and preparation of M&E tools; improved quality and timing of reporting; and improved knowledge of financial planning and budget management. This was through sharing by expatriate staff and exposure through MFS II, the automation of the financial and monitoring system established with support of Nuffic and MFS II. However, internal factors like their affiliation to the university, development of a new organogram, deciding and clarification of organisational focus have also played an important role in the key organisational capacity changes that the HoA-REC/N staff considered important since the baseline in 2012. Support from other funders, like the Dutch Embassy and Nuffic, in terms of training and funding of revision of salary scales, has also been mentioned among the underlying factors for these changes.

2 Context and General Information about the SPO – HOA-REC

2.1 General information about the Southern Partner Organisation – HOA-REC

Ethiopia	
Consortium 1	WASH Alliance
Responsible Dutch NGO	ICCO
Project (if applicable)	Innovative WASH, water purification with Moringa (C12 MDG sample)
Consortium 2	ICCO Alliance
Responsible Dutch NGO	ICCO
Projects (if applicable)	1. Integrated approach to meet rural household energy needs 2. Sustainable energy project (C9 in MDG sample) 3. Carbon credit team and financial capacity building project
Southern partner organisation	Horn of Africa Regional Environmental Organisation (HOA-REC)

The project/ partner is part of the sample for the following evaluation components:

Achievement of MDGs and themes	
Achievement of MDGs and themes	X
Capacity development of Southern partner organisations	X
Efforts to strengthen civil society	

2.2 The socio-economic, cultural and political context in which the partner operates

The Horn of Africa has faced an alarming rate of environmental degradation, which has produced famines, massive economic and social dislocations, and widespread resource-based conflicts. Over the last half a century the region's temperature has shown a rising trend while rainfall has had a decreasing trend. During the same time period large parts of the region, which are arid or semi-arid, have faced rapid rates of degradation, in the form of deforestation, loss of vegetation and biodiversity, increased soil erosion, desiccation, and desertification. While the causes for the worsening degradation may not be fully understood, they relate to global climatic changes and various types of local human activities. The actual effects and potential implications of the growing rates of degradation are also hard to map out accurately. There is little doubt, however, that they pose a growing threat to human security in the region.

In the Horn of Africa, increasing scarcity and degradation of natural resources seriously threatens human well-being. The population in the region (Ethiopia, Eritrea, Sudan, Djibouti, Somalia, Kenya and Uganda) has increased fourfold in the past 50 years and continues to grow rapidly. Farmers need to feed more mouths and extra areas of land are needed, at the expense of forest and pasture lands. With a high and stable number of pastoral communities and decreasing amount of pasture land, pressure on land and water grows. The mounting need for fertile soils and irrigated land is intensified by high international demands for food and energy. Investors from all over the world are ready to invest in commercial farming in Sudan, Kenya, Uganda and Ethiopia. With inadequate soil and water

management measures being taken, this growing pressure on natural resources leads to a decrease in the quality and quantity of soils, forests and water resources.

Not all protected areas are adequately guarded by the responsible authorities against the threats faced by increasing demands for land and wood, which seriously disturbs the hydrological, economic, social and cultural services these ecosystems provide. Land tenure systems, resource allocations and planning processes insufficiently take into account people's needs and this whole set of ecosystem services.

Overexploitation of wood, fish, farm lands and grazing lands can thus lead to tremendous forest degradation, biodiversity loss, land degradation and resource scarcity. This exacerbates food and water insecurity in many parts of the region. Deforestation, for instance, can heavily disturb climatic and hydrological regimes. This is demonstrated in the Mau Forest, Kenya's largest "water tower". Despite its official status as protected area, thousands of farmers entered the Mau forest in the past 20 years. Large parts of the forest were cut to prepare the land for cultivation.

In light of the above, the Horn of Africa Regional Environment Centre and Network (HOA-REC/N) focuses on environmental concerns and sustainable development options with the Horn of Africa-in Sudan, Kenya, Ethiopia, Eritrea, Djibouti and Somalia. HOA-REC/N is an autonomous institution under the Addis Ababa University. It facilitates, strengthens and advocates for initiatives and activities relating to environmental conservation and natural resource management, including the promotion of sustainable energy and climate change adaptation and mitigation in the region. HOA-REC/N links these initiatives to its various partners-international organizations, government bodies and private enterprises in order to enhance environmental governance and management, contribute to sustainable development and improve livelihoods within the region.

HOA-REC/N programmatic areas include Horn of Africa regional Environmental Centre, Gullele Botanic Garden, Friends of Gullele Botanic Garden, Horn of Africa Regional Environmental Network, Demand driven action Research, The Horn Re-engineering Program, Energy partnership program, environmental governance and education program, parks and buffer zone management program, Central Rift Valley Program, and Climate Change and adaptation program.

The Centre and Network aim to improve environmental governance and management by focusing on:

- Promoting and advocating environmental knowledge, awareness and behavioural change
- Influencing the adjustment of environmental policies and legislation based on enhanced and enlarged dialogues on environmental issues
- Building institutional and human capacity in the environmental sphere
- Stimulating and facilitating selected environmental programs of CBOs, NGOs, research institutions and academia.

With MFS II funding two HoA-REC programmes are supported:

1. The Fair Climate Programme – Sustainable Energy project – ICCO Alliance
2. The WASH Programme - Innovative WASH, water purification with Moringa project – WASH Alliance
3. Carbon credit team and financial capacity building project

For all Programmes ICCO is the implementing CFA.

2.3 Contracting details

When did cooperation with this partner start:

December 2009 (ICCO).

What is the MFS II contracting period:

Sustainable Energy project (ICCO Alliance): 2011-2014

Innovative WASH (WASH Alliance): January 2012 – December 2015

Carbon credit team and financial capacity building (ICCO Alliance): 2011-to date

Did cooperation with this partner end? YES/NO

Sustainable Energy project (ICCO Alliance): NO

Innovative WASH (WASH Alliance): NO

Carbon credit team and financial capacity building (ICCO Alliance): NO

If yes, when did it finish?

Sustainable Energy project (ICCO Alliance): N.A.

Innovative WASH (WASH Alliance): N.A.

Carbon credit team and financial capacity building (ICCO Alliance): N.A.

What is the reason for ending the cooperation with this partner:

Sustainable Energy project (ICCO Alliance): N.A.

Innovative WASH (ICCO-WASH Alliance): N.A.

Carbon credit team and financial capacity building (ICCO Alliance): 2011-to date

If not, is there an expected end date?

Sustainable Energy project (ICCO Alliance): December 2014

Innovative WASH (ICCO-WASH Alliance): December 2015

Carbon credit team and financial capacity building (ICCO Alliance): December 2015

2.4 Background to the Southern Partner Organisation

History

In cooperation with several Ethiopian environmental NGOs and with the Royal Netherlands Embassy in Ethiopia, the Addis Ababa University (AAU) has taken the initiative to establish the Horn of Africa Regional Environmental Center (HOA-REC) that supports a regional environmental network (HOA-REN). HOA-REC was established in 2006 with a vision of improving environmental governance and management in the horn of Africa. The organization's mission was to bridge the gap between CBOs on environmental governance. The strategy of the organization included capacity building, advocacy, networking and institution building. Its target groups were CBOs, and academic institutions in the horn of Africa. HOA-REC started operation with five persons including the executive director and the program coordinator with a budget of 2 million Euros from the Dutch government. It was pointed out that no capacity development activities took place in 2006 and as the organization was under Addis Ababa University. Lack of autonomy was experienced as an important factor during the period.

In 2008 both the centre and the network started functioning. The vision, mission, strategies and target group remained the same as it was during the establishment phase. The number of target groups increased in 2007. The staff number increased to 10, with two students and two graduates. The budget reached 3.5 million Euro with funding from the Dutch Government. Communication training for support staff was mentioned as the capacity strengthening activity conducted during the year. Lack of autonomy was indicated as an important factor that affected operations during the period.

In 2009/10, HOA-REC became autonomous and obtained a legal status. Its vision during this period included improving environmental awareness, protection and governance in the horn of Africa. The target group increased in number. The staff number reached 30 with staff for M&E, public relations, administration and finance, and climate change program. The budget in 2009 was about 2.1 million euros with funding from the Dutch government. Capacity strengthening activities during the period included MBA training for one staff and ACCA training for another staff. Extending partnership with Nuffic and EU were indicated as important influencing factors.

In 2011/12 HOA-REC became a fully integrated centre and AAU as a separate centre, funding sources diversified and the centre became accountable to the vice president of the University. The vision, mission, and strategies are under revision as a five-year strategic plan is under preparation. In Ethiopia, the organization is focusing on Gambella and Rift Valley to see the impact of the intervention. The staff number has reached 50 with addition of new project staff. The budget has increased to 6.3 million euro. The funding sources also got diversified including EU, ICCO, Dutch government, AAU, and Christian Aid. Capacity strengthening activities undertaken during the year included project management training and development of finance and administration system. The

new CSO legislation is reported to have positively affected the change in Dutch government funding priorities. This was indicated as important influencing factors and actors.

Nowadays HoAREC is a big organisation, implementing and coordinating many projects funded by different bilateral and multilateral donors. The Fair Climate and WASH programs are quite modest components of their big programmes in water, environment, fair climate, parks and buffer zones and food security etc.

The Horn of Africa Regional Environment Centre (HoA-REC) and the Horn of Africa Regional Environment Network (HoA-REN) were founded in 2006. They were established to help consolidate the efforts of environmental organisations operating in the HoA region and to establish a platform for collaboration between different stakeholders. The HoA region is comprised of Ethiopia, Eritrea, Djibouti, Kenya, Somalia, Sudan, South Sudan and Uganda.

HoA-REC is an autonomous institution within Addis Ababa University, and facilitates cooperation between member organisations and other environmental actors--including the private sector and government--to carry out activities "on the ground". HoA-REC also serves as the secretariat for the larger HoA-REN. The Centre has several components, of which the most important ones are the partnership programmes, capacity upgrading and demand driven action research. Concerning the latter, HoA-REC aims to motivate students in environmentally-related fields by offering practice-oriented research options in field situations.

HoA-REN is a network of members and partners consisting of environmental CBOs, NGOs and higher learning institutes from all countries (Djibouti, Eritrea, Ethiopia, Kenya, Somalia and Sudan) in the HoA (Horn of Africa) region. Members of the network are indigenous civil society organizations and higher learning and research institutes. Partners of the network consist mainly of non-indigenous (international) organizations working on environmental issues in the region. The network promotes intensive cooperation among and exchange of information and experiences between endogenous NGOs, CBOs, research institutions and universities in HoA region. The network strives to facilitate experience exchange between the countries in the region because there is a great deal of untapped environmental knowledge in the region which is currently not utilized to its fullest potential. In addition, HoA-REN also partners with government bodies, businesses and international organizations to achieve an optimal impact on the ground. Over the past five years, HoA-REC/N has been working towards improving environmental governance and management at all levels within the HoA region.

Vision

The vision of the Horn of Africa Regional Environment Centre and Network is to contribute to:

- Sustainable development
- Environmental conservation
- Prevention of conflict escalation around access to natural resources in the Horn of Africa.

Mission

To attain the above stated vision, the Centre and Network have formulated the following mission:

- To improve environmental governance and management in the Horn of Africa Region, encompassing Ethiopia, Sudan, Djibouti, Kenya, Somalia and Eritrea.

Strategies

Ultimately, the Centre and Network aim to improve environmental governance and management by focusing on:

- Promoting and advocating environmental knowledge, awareness and behavioural change
- Influencing the adjustment of environmental policies and legislation based on enhanced and enlarged dialogues on environmental issues
- Building institutional and human capacity in the environmental sphere
- Stimulating and facilitating selected environmental programmes of CBOs, NGOs, research institutions and academia.

3 Methodological approach and reflection

3.1 Overall methodological approach and reflection

This chapter describes the methodological design and challenges for the assessment of capacity development of Southern Partner Organisations (SPOs), also called the '5C study'. This 5C study is organised around **four key evaluation questions**:

1. What are the changes in partner organisations' capacity during the 2012-2014 period?
2. To what degree are the changes identified in partner capacity attributable to development interventions undertaken by the MFS II consortia (i.e. measuring effectiveness)?
3. Were the efforts of the MFS II consortia efficient?
4. What factors explain the findings drawn from the questions above?

It has been agreed that the question (3) around efficiency cannot be addressed for this 5C study. The methodological approach for the other three questions is described below. At the end, a methodological reflection is provided.

Note: this methodological approach is applied to 4 countries that the Centre for Development Innovation, Wageningen University and Research centre is involved in in terms of the 5C study (Ethiopia, India, Indonesia, Liberia). The overall approach has been agreed with all the 8 countries selected for this MFS II evaluation. The 5C country teams have been trained and coached on this methodological approach during the evaluation process. Details specific to the SPO are described in chapter 5.1 of the SPO report A detailed overview of the approach is described in appendix 1.

The first (changes in organisational capacity) and the fourth evaluation question are addressed together through:

- **Changes in the 5C indicators since the baseline:** standard indicators have been agreed upon for each of the five capabilities of the five capabilities framework (see appendix 2) and changes between the baseline, and the endline situation have been described. For data collection a mix of data collection methods has been used, including self-assessments by SPO staff; interviews with SPO staff and externals; document review; observation. For data analysis, the Nvivo software program for qualitative data analysis has been used. Final descriptions per indicator and per capability with corresponding scores have been provided.
- **Key organisational capacity changes – 'general causal map':** during the endline workshop a brainstorm has been facilitated to generate the key organisational capacity changes as perceived by the SPO since the baseline, with related underlying causes. For this purpose, a visual as well as a narrative causal map have been described.

In terms of the attribution question (2 and 4), '**process tracing**' is used. This is a theory-based approach that has been applied to a selected number of SPOs since it is a very intensive and costly methodology, although it provides rich information and can generate a lot of learning within the organisations. This approach was presented and agreed-upon during the synthesis workshop on 17-18 June 2013 by the 5C teams for the eight countries of the MFS II evaluation. A more detailed description of the approach was presented during the synthesis workshop in February 2014. The synthesis team, NWO-WOTRO, the country project leaders and the MFS II organisations present at the workshop have accepted this approach. It was agreed that this approach can only be used for a selected number of SPOs since it is a very intensive and costly methodology. Key organisational capacity changes/ outcomes of the SPO were identified, based on their relationship to the two selected capabilities, the capability to act and commit the capability to adapt and self-renew, and an expected relationship with CFA supported capacity development interventions (MFS II funding). It was agreed to

focus on these two capabilities, since these are the most targeted capabilities by the CFAs, as established during the baseline process.

Please find below an explanation of how the above-mentioned evaluation questions have been addressed in the 5C evaluation.

At the end of this appendix a brief methodological reflection is provided.

3.2 Assessing changes in organisational capacity and reasons for change - evaluation question 1 and 4

This section describes the data collection and analysis methodology for answering the first evaluation question: **What are the changes in partner organisations' capacity during the 2012-2014 period?** And the fourth evaluation question: **“What factors explain the findings drawn from the questions above?”**

In order to explain the changes in organisational capacity development between baseline and endline (evaluation question 1) the CDI and in-country evaluation teams needed to review the indicators and how they have changed between baseline and endline and what reasons have been provided for this. This is explained below. It has been difficult to find detailed explanations for changes in each of the separate 5c indicators, but the 'general causal map' has provided some ideas about some of the key underlying factors actors and interventions that influence the key organisational capacity changes, as perceived by the SPO staff.

The evaluators considered it important to also note down a consolidated SPO story and this would also provide more information about what the SPO considered to be important in terms of organisational capacity changes since the baseline and how they perceived these key changes to have come about. Whilst this information has not been validated with sources other than SPO staff, it was considered important to understand how the SPOs has perceived changes in the organisation since the baseline.

For those SPOs that are selected for process tracing (evaluation question 2), more in-depth information is provided for the identified key organisational capacity changes and how MFS II supported capacity development interventions as well as other actors, factors and interventions have influenced these changes. This is integrated in the next session on the evaluation question on attribution, as described below and in the appendix 1.

How information was collected and analysed for addressing evaluation question 1 and 4, in terms of description of changes in indicators per capability as well as in terms of the general causal map, based on key organisational capacity changes as perceived by the SPO staff, is further described below.

During the baseline in 2012 information has been collected on each of the 33 agreed upon indicators for organisational capacity. For each of the five capabilities of the 5C framework indicators have been developed as can be seen in Appendix 2. During this 5C baseline, a summary description has been provided for each of these indicators, based on document review and the information provided by staff, the Co-financing Agency (CFA) and other external stakeholders. Also a summary description has been provided for each capability. The results of these can be read in the baseline reports.

The description of indicators for the baseline in 2012 served as the basis for comparison during the endline in 2014. In practice this meant that largely the same categories of respondents (preferably the same respondents as during the baseline) were requested to review the descriptions per indicator and indicate whether and how the endline situation (2014) is different from the described situation in 2012¹.

¹ The same categories were used as during the baseline (except beneficiaries, other funders): staff categories including management, programme staff, project staff, monitoring and evaluation staff, field staff, administration staff; stakeholder categories including co-financing agency (CFA), consultants, partners.

Per indicator they could indicate whether there was an improvement or deterioration or no change and also describe these changes. Furthermore, per indicator the interviewee could indicate what interventions, actors and other factors explain this change compared to the baseline situation. See below the specific questions that are asked for each of the indicators. Per category of interviewees there is a different list of indicators to be looked at. For example, staff members were presented with a list of all the indicators, whilst external people, for example partners, are presented with a select number of indicators, relevant to the stakeholder.

The information on the indicators was collected in different ways:

- 1) **Endline workshop at the SPO - self-assessment and 'general causal map'**: similar to data collection during the baseline, different categories of staff (as much as possible the same people as during the baseline) were brought together in a workshop and requested to respond, in their staff category, to the list of questions for each of the indicators (self-assessment sheet). Prior to carrying out the self-assessments, a brainstorming sessions was facilitated to develop a 'general causal map', based on the key organisational capacity changes since the baseline as perceived by SPO staff. Whilst this general causal map is not validated with additional information, it provides a sequential narrative, based on organisational capacity changes as perceived by SPO staff;
- 2) **Interviews with staff members**: additional to the endline workshop, interviews were held with SPO staff, either to provide more in-depth information on the information provided on the self-assessment formats during the workshop, or as a separate interview for staff members that were not present during the endline workshop;
- 3) **Interviews with externals**: different formats were developed for different types of external respondents, especially the co-financing agency (CFA), but also partner agencies, and organisational development consultants where possible. These externals were interviewed, either face-to-face or by phone/Skype. The interview sheets were sent to the respondents and if they wanted, these could be filled in digitally and followed up on during the interview;
- 4) **Document review**: similar to the baseline in 2012, relevant documents were reviewed so as to get information on each indicator. Documents to be reviewed included progress reports, evaluation reports, training reports, etc. (see below) since the baseline in 2012, so as to identify changes in each of the indicators;
- 5) **Observation**: similar to what was done in 2012, also in 2014 the evaluation team had a list with observable indicators which were to be used for observation during the visit to the SPO.

Below the key steps to assess changes in indicators are described.

Key steps to assess changes in indicators are described

1. Provide the description of indicators in the relevant formats – CDI team
2. Review the descriptions per indicator – in-country team & CDI team
3. Send the formats adapted to the SPO to CFA and SPO – in-country team (formats for SPO) and CDI team (formats for CFA)
4. Collect, upload & code the documents from CFA and SPO in NVivo – CDI team
5. Organise the field visit to the SPO – in-country team
6. Interview the CFA – CDI team
7. Run the endline workshop with the SPO – in-country team
8. Interview SPO staff – in-country team
9. Fill-in observation sheets – in-country team
10. Interview externals – in-country team
11. Upload and auto-code all the formats collected by in-country team and CDI team in NVivo – CDI team
12. Provide to the overview of information per 5c indicator to in-country team – CDI team
13. Analyse data and develop a draft description of the findings per indicator and for the general questions – in-country team
14. Analyse data and develop a final description of the findings per indicator and per capability and for the general questions – CDI team
15. Analyse the information in the general causal map –in-country team and CDI-team

Note: the CDI team include the Dutch 5c country coordinator as well as the overall 5c coordinator for the four countries (Ethiopia, India, Indonesia, Liberia). The 5c country report is based on the separate SPO reports.

Please see appendix 1 for a description of the detailed process and steps.

3.3 Attributing changes in organisational capacity - evaluation question 2 and 4

This section describes the data collection and analysis methodology for answering the second evaluation question: ***To what degree are the changes identified in partner capacity attributable to (capacity) development interventions undertaken by the MFS II consortia (i.e. measuring effectiveness)?*** and the fourth evaluation question: ***“What factors explain the findings drawn from the questions above?”***

In terms of the attribution question (2), ‘process tracing’ is used. This is a theory-based approach that has been applied to a selected number of SPOs since it is a very intensive and costly methodology, although it provides rich information and can generate a lot of learning within the organisations. Key organisational capacity changes/ outcomes of the SPO were identified, based on their relationship to the two selected capabilities, the capability to act and commit the capability to adapt and self-renew, and an expected relationship with CFA supported capacity development interventions (MFS II funding). It was agreed to focus on these two capabilities, since these are the most targeted capabilities by the CFAs, as established during the baseline process.

Below, the selection of SPOs for process tracing as well as the different steps involved for process tracing in the selected SPOs, are further explained.

3.3.1 Selection of SPOs for 5C process tracing

Process tracing is a very intensive methodology that is very time and resource consuming (for development and analysis of one final detailed causal map, it takes about 1-2 weeks in total, for different members of the evaluation team). It has been agreed upon during the synthesis workshop on 17-18 June 2013 that only a selected number of SPOs will take part in this process tracing for the purpose of understanding the attribution question. The selection of SPOs is based on the following criteria:

- MFS II support to the SPO has not ended before 2014 (since this would leave us with too small a time difference between intervention and outcome);
- Focus is on the 1-2 capabilities that are targeted most by CFAs in a particular country;
- Both the SPO and the CFA are targeting the same capability, and preferably aim for similar outcomes;
- Maximum one SPO per CFA per country will be included in the process tracing.

The intention was to focus on about 30-50% of the SPOs involved. Please see the tables below for a selection of SPOs per country. Per country, a first table shows the extent to which a CFA targets the five capabilities, which is used to select the capabilities to focus on. A second table presents which SPO is selected, and takes into consideration the selection criteria as mentioned above.

For the detailed results of this selection, in the four countries that CDI is involved in, please see appendix 1. The following SPOs were selected for process tracing:

- Ethiopia: AMREF, ECFA, FSCE, HUNDEE (4/9)
- India: BVHA, COUNT, FFID, SMILE, VTRC (5/10)
- Indonesia: ASB, ECPAT, PtPPMA, YPI, YRBI (5/12)
- Liberia: BSC, RHRAP (2/5).

3.3.2 Key steps in process tracing for the 5C study

In the box below you will find the key steps developed for the 5C process tracing methodology. These steps will be further explained here. Only key staff of the SPO is involved in this process: management; programme/ project staff; and monitoring and evaluation staff, and other staff that could provide information relevant to the identified outcome area/key organisational capacity change. Those SPOs selected for process tracing had a separate endline workshop, in addition to the ‘general endline workshop. This workshop was carried out after the initial endline workshop and the interviews during the field visit to the SPO. Where possible, the general and process tracing endline workshop

have been held consecutively, but where possible these workshops were held at different points in time, due to the complex design of the process. Below the detailed steps for the purpose of process tracing are further explained. More information can be found in Appendix 1.

Key steps in process tracing for the 5C study

1. Identify the planned MFS II supported capacity development interventions within the selected capabilities (capability to act and commit and capability to adapt and self-renew) – CDI team
2. Identify the implemented MFS II supported capacity development interventions within the selected capabilities (capability to act and commit and capability to adapt and self-renew) – CDI team
3. Identify initial changes/ outcome areas in these two capabilities – CDI team & in-country team
4. Construct the detailed, initial causal map (theoretical model of change) – CDI team & in-country team
5. Identify types of evidence needed to verify or discard different causal relationships in the model of change – in-country teams, with support from CDI team
6. Collect data to verify or discard causal mechanisms and construct workshop based, detailed causal map (model of change) – in-country team
7. Assess the quality of data and analyse data and develop final detailed causal map (model of change) – in-country team with CDI team
8. Analyse and conclude on findings– CDI team, in collaboration with in-country team

3.3.3 Methodological reflection

Below a few methodological reflections are made by the 5C evaluation team. These can also be found in appendix 1.

Use of the 5 core capabilities framework and qualitative approach: this has proven to be a very useful framework to assess organisational capacity. The five core capabilities provide a comprehensive picture of the capacity of an organisation. The capabilities are interlinked, which was also reflected in the description of standard indicators, that have been developed for the purpose of this 5C evaluation and agreed upon for the eight countries. Using this framework with a mainly qualitative approach has provided rich information for the SPOs and CFAs, and many have indicated this was a useful learning exercise.

Using standard indicators and scores: using standard indicators is useful for comparison purposes. However, the information provided per indicator is very specific to the SPO and therefore makes comparison difficult. Whilst the description of indicators has been useful for the SPO and CFA, it is questionable to what extent indicators can be compared across SPOs since they need to be seen in context, for them to make meaning. In relation to this, one can say that scores that are provided for the indicators, are only relative and cannot show the richness of information as provided in the indicator description. Furthermore, it must be noted that organisations are continuously changing and scores are just a snapshot in time. There cannot be perfect score for this. In hindsight, having rubrics would have been more useful than scores.

General causal map: whilst this general causal map, which is based on key organisational capacity changes and related causes, as perceived by the SPO staff present at the endline workshop, has not been validated with other sources of information except SPO feedback, the 5C evaluation team considers this information important, since it provides the SPO story about how and which changes in the organisation since the baseline, are perceived as being important, and how these changes have

come about. This will provide information additional to the information that has been validated when analysing and describing the indicators as well as the information provided through process tracing (selected SPOs). This has proven to be a learning experience for many SPOs.

Using process tracing for dealing with the attribution question: this theory-based and mainly qualitative approach has been chosen to deal with the attribution question, on how the organisational capacity changes in the organisations have come about and what the relationship is with MFS II supported capacity development interventions and other factors. This has proven to be a very useful process, that provided a lot of very rich information. Many SPOs and CFAs have already indicated that they appreciated the richness of information which provided a story about how identified organisational capacity changes have come about. Whilst this process was intensive for SPOs during the process tracing workshops, many appreciated this to be a learning process that provided useful information on how the organisation can further develop itself. For the evaluation team, this has also been an intensive and time-consuming process, but since it provided rich information in a learning process, the effort was worth it, if SPOs and CFAs find this process and findings useful.

A few remarks need to be made:

- Outcome explaining process tracing is used for this purpose, but has been adapted to the situation since the issues being looked at were very complex in nature.
- Difficulty of verifying each and every single change and causal relationship:
 - Intensity of the process and problems with recall: often the process tracing workshop was done straight after the general endline workshop that has been done for all the SPOs. In some cases, the process tracing endline workshop has been done at a different point in time, which was better for staff involved in this process, since process tracing asks people to think back about changes and how these changes have come about. The word difficulties with recalling some of these changes and how they have come about. See also the next paragraph.
 - Difficulty of assessing changes in knowledge and behaviour: training questionnaire is have been developed, based on Kirkpatrick's model and were specifically tailored to identify not only the interest but also the change in knowledge and skills, behaviour as well as organisational changes as a result of a particular training. The retention ability of individuals, irrespective of their position in the organisation, is often unstable. The 5C evaluation team experienced that it was difficult for people to recall specific trainings, and what they learned from those trainings. Often a change in knowledge, skills and behaviour is a result brought about by a combination of different factors, rather than being traceable to one particular event. The detailed causal maps that have been established, also clearly pointed this. There are many factors at play that make people change their behaviour, and this is not just dependent on training but also internal/personal (motivational) factors as well as factors within the organisation, that stimulate or hinder a person to change behaviour. Understanding how behaviour change works is important when trying to really understand the extent to which behaviour has changed as a result of different factors, actors and interventions. Organisations change because people change and therefore understanding when and how these individuals change behaviour is crucial. Also attrition and change in key organisational positions can contribute considerably to the outcome.

Utilisation of the evaluation

The 5C evaluation team considers it important to also discuss issues around utility of this evaluation. We want to mention just a few.

Design – mainly externally driven and with a focus on accountability and standard indicators and approaches within a limited time frame, and limited budget: this MFS II evaluation is originally based on a design that has been decided by IOB (the independent evaluation office of the Dutch Ministry of Foreign Affairs) and to some extent MFS II organisations. The evaluators have had no influence on the overall design and sampling for the 5C study. In terms of learning, one may question whether the most useful cases have been selected in this sampling process. The focus was very much on a rigorous evaluation carried out by an independent evaluation team. Indicators had to be streamlined across countries. The 5C team was requested to collaborate with the other 5C country teams (Bangladesh, Congo, Pakistan, Uganda) to streamline the methodological approach across the eight sampled

countries. Whilst this may have its purpose in terms of synthesising results, the 5C evaluation team has also experienced the difficulty of tailoring the approach to the specific SPOs. The overall evaluation has been mainly accountability driven and was less focused on enhancing learning for improvement. Furthermore, the timeframe has been very small to compare baseline information (2012) with endline information (2014). Changes in organisational capacity may take a long, particularly if they are related to behaviour change. Furthermore, there has been limited budget to carry out the 5C evaluation. For all the four countries (Ethiopia, India, Indonesia, Liberia) that the Centre for Development Innovation, Wageningen University and Research centre has been involved in, the budget has been overspent.

However, the 5C evaluation team has designed an endline process whereby engagement of staff, e.g. in a workshop process was considered important, not only due to the need to collect data, but also to generate learning in the organisation. Furthermore, having general causal maps and detailed causal maps generated by process tracing have provided rich information that many SPOs and CFAs have already appreciated as useful in terms of the findings as well as a learning process.

Another issue that must be mentioned is that additional requests have been added to the country teams during the process of implementation: developing a country based synthesis; questions on design, implementation, and reaching objectives of MFS II funded capacity development interventions, whilst these questions were not in line with the core evaluation questions for the 5C evaluation.

Complexity and inadequate coordination and communication: many actors, both in the Netherlands, as well as in the eight selected countries, have been involved in this evaluation and their roles and responsibilities, were often unclear. For example, 19 MFS II consortia, the internal reference group, the Ministry of Foreign Affairs, Partos, the Joint Evaluation Trust, NWO-Wotro, the evaluators (Netherlands and in-country), 2 external advisory committees, and the steering committee. Not to mention the SPO's and their related partners and consultants. CDI was involved in 4 countries with a total number of 38 SPOs and related CFAs. This complexity influenced communication and coordination, as well as the extent to which learning could take place. Furthermore, there was a distance between the evaluators and the CFAs, since the approach had to be synchronised across countries, and had to adhere to strict guidelines, which were mainly externally formulated and could not be negotiated or discussed for the purpose of tailoring and learning. Feedback on the final results and report had to be provided mainly in written form. In order to enhance utilisation, a final workshop at the SPO to discuss the findings and think through the use with more people than probably the one who reads the report, would have more impact on organisational learning and development. Furthermore, feedback with the CFAs has also not been institutionalised in the evaluation process in the form of learning events. And as mentioned above, the complexity of the evaluation with many actors involved did not enhance learning and thus utilization.

5C Endline process, and in particular thoroughness of process tracing often appreciated as learning process: The SPO perspective has also brought to light a new experience and technique of self-assessment and self-corrective measures for managers. Most SPOs whether part of process tracing or not, deeply appreciated the thoroughness of the methodology and its ability to capture details with robust connectivity. This is a matter of satisfaction and learning for both evaluators and SPOs. Having a process whereby SPO staff were very much engaged in the process of self-assessment and reflection has proven for many to be a learning experience for many, and therefore have enhanced utility of the 5C evaluation.

4 Results

4.1 MFS II supported capacity development interventions

Below an overview of the different MFS II supported capacity development interventions of HoAREC/N that have taken place since the baseline in 2012 are described. The information is based on the information provided by ICCO.

Table 1

Information about MFS II supported capacity development interventions since the baseline in 2012

Title of the MFS II supported capacity development intervention	Objectives	Activities	Timing and duration	Budget
financial capacity strengthening and PME, and staff training.	<ul style="list-style-type: none"> - important for proper implementation and reporting - To be a strong regional institution that can increase adaptability of communities and increase their development using African solutions to challenges. 	Finance officer (ICCO-Kampala) went to partners to teach financial staff on how to comply to financial formats and reporting to donors.	2012?	
Capacitating the carbon credit technical team	<ul style="list-style-type: none"> - To have them be able to develop bankable carbon projects - green development taking root in all communities where we work and improvement in livelihoods of farming communities 	In Ethiopia and India: study tour for 2 staff + staff from Ministry of Energy	End of 2012	
On job training for the WASH coordinator on FIETS proofing of programs	<ul style="list-style-type: none"> - For Financial, Institutional, Environmental, Technical and Social (FIETS) sustainability of programmes - 	The WASH coordinator was trained in looking at all aspects of sustainability: Financially, Institutional, Environmental, Technical and Social (FIETS) in various ways, e.g. financially by sending financial staff to ICCO Kampala Micro-finance staff (2012) and the budget tracking training to ensure that farmers can get the funds and are able to pay back loans ; institutional by ensuring sustainable management of water pumps; environmentally by using hand pumps for irrigation and doing research to the effects of moringa for water purification; technical by using local repairable techniques and social by the HRBA training in Kenya.		
Training on FLOW tool for M&E + training on outcome mapping	<ul style="list-style-type: none"> - To improve reporting and project cycle management - organisational improvement in reporting, data collection, communication and visibility of results 		beginning of 2013	

Title of the MFS II supported capacity development intervention	Objectives	Activities	Timing and duration	Budget
Training on Human Rights Based Approach (HRBA) in programming	- To increase communities' claim making power to duty bearers	4 days HRBA + 2 days budget tracking + field visit in Kenya		10.000 Euro including workshop costs, transport and consultancy fees from Ethiopia to Kenya (for all WASH partners?)
Training on budget tracking to enable communities monitor budget allocation and expenditure after disbursement				
Exchange visit to WASH Alliance in Kenya to learn on how they carry out activities		<i>Two times:</i> - <i>H Rights Based Approach programming to general office beginning of 2013</i> - <i>Budget tracking first week of October 2014</i>

4.2 Changes in capacity and reasons for change - evaluation question 1 and 4

Below you can find a description of the changes in each of the five core capabilities (4.2.1). This information is based on the analysis of the information per each of the indicators. This detailed information for each of the indicators describes the current situation, and how and why it has changed since the baseline. In addition to this staff present at the endline workshop were asked to indicate what were the key changes in the organisation since the baseline. The most important is key organisational capacity changes have been identified, as well as the reasons for these changes to come about. This is described in a general causal map, both as a visual as well as a narrative. The detailed general map is described in chapter 4.2.2.

4.2.1 Changes in the five core capabilities

Capability to Act and Commit

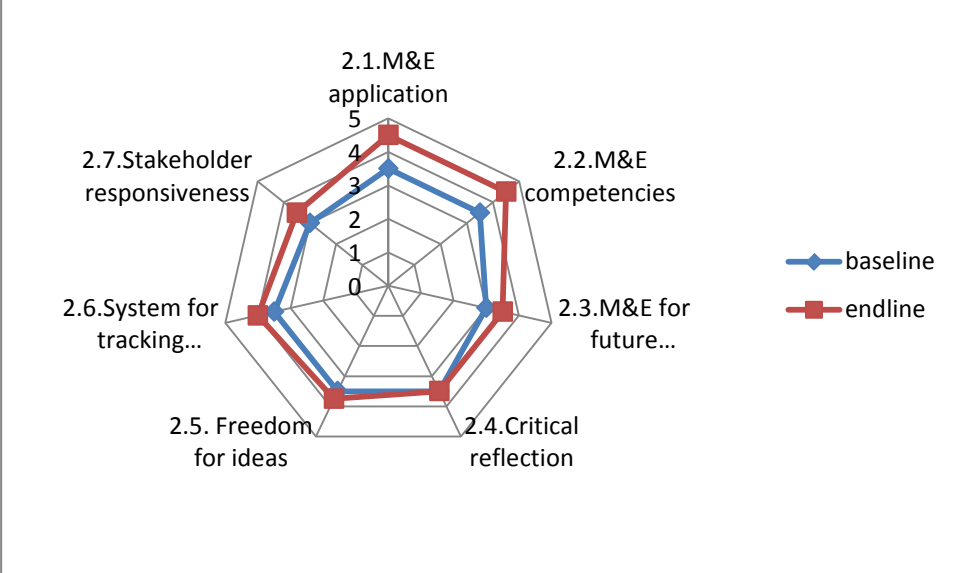

The Horn of Africa Regional Environment Centre and Network (HoA-REC/N) management is striving to provide more responsive and inspiring leadership. The management listens to the weekly program update reports and reacts accordingly. Though the management has indicated decision making has decentralized, some staffs noted that most of the decisions are still made by higher level and other staff members have not been involved in the decision-making process. Since the management has focused on strategic issues through strengthening programs partnership, the organization has implemented more projects from diverse sources. However, staff turnover is higher compared to the baseline in 2012, especially for highly specialized professions and finance and has particularly worsened in some areas such as Gambela because of the local situation, an area which is remote with a hot, humid climate and poor infrastructure. Whilst management indicated that staff salaries had improved with a salary revision, most staff indicated that the salary revision and benefits weren't sufficient compared to other organisations. HoA-REC/N has revised its HR manual and standardized the benefit packages for all staff, while the salary revision has given the staff better pay, though this was contested by other staff members.

Horn of Africa Regional Environmental Center and Network has moved its office to the newly established one and has developed an organizational structure with a new grouping of the programs and clarified their roles and responsibilities. However, the organization has not made any attempt to revise its strategic plan in the past years. Currently discussions are ongoing within the management to develop a new strategic plan, under facilitation by an external consultant. Meanwhile, the annual plan was in line with the strategic objectives, and project agreement provisions and an automated project monitoring system were put in place and are being used to keep track of implementation. For this to be effective, staff members now have better skills to carry out the program design and implementation and to do M&E work. This is because all staff members have been given training on project cycle management and shared experiences through exposure visits. More staff members have the opportunity to get trainings either in-house or abroad on various topics: ranging from technical job-related issues such as carbon emission reduction measures and climate change, to cross-cutting topics like communication, M&E and project management.. The organization has widened its funding sources after the baseline because new donors like the World Bank for CIC project, DFID for SCIP project, French Embassy for the water allocation plan project, NORAD and SIDA have become funding partners of the organization since the baseline in 2012. This was due to the fact that the organization developed a fundraising strategy,

assigned a capacity development consultant to identify calls for proposals, liaise with the fundraising officer and develop proposals together.

Score: from 3.4 to 3.7 (very slight improvement)

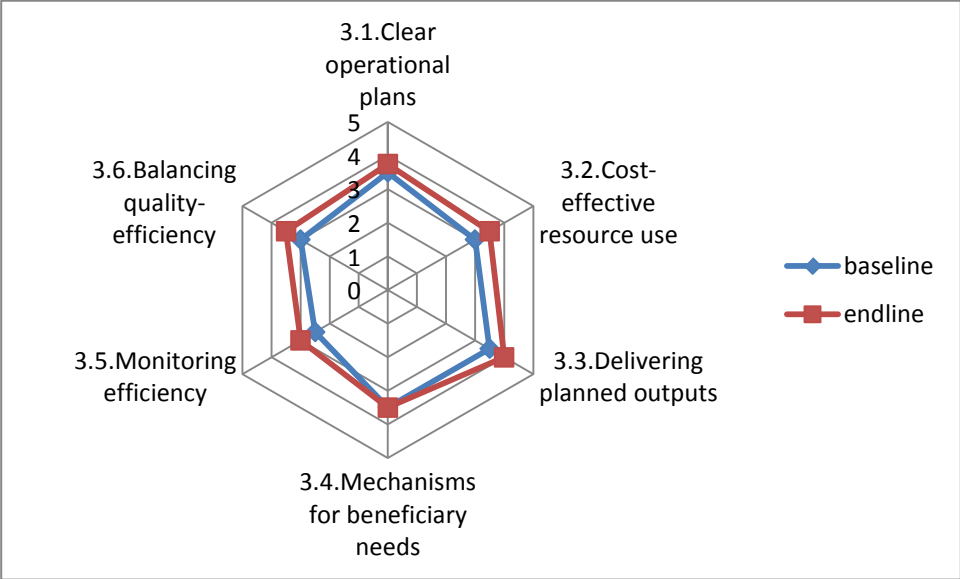

Capability to adapt and self-renew

HOA-REC/N has focused on a holistic participatory M&E approach and has put in place an effective, online accessible, M&E system (Akvo FLOW). Besides, program coordinators are familiar with the system and report to the M&E unit. The management also fully supports the M&E unit and has helped to raise awareness to all staff during coordination and staff meetings. Apart from the new M&E software application system, HoA-REC/N has hired qualified staff and provided full support for the M&E unit. Parallel to the organization's M&E system, external evaluations are conducted on behalf of donors, such as a Mid-Term Evaluation for the WASH Alliance in 2013, and a PWC assessment of the Dutch Embassy-supported project. The M&E competencies of the organization have improved due to the trainings on outcome measurement, planning and coordination provided in 2013 by MFS II budget support and in-house training on M&E organized for all program staff. As a result the organization has developed a M&E manual and a performance monitoring plan template that can be adopted to all projects coming to the center. This helped to standardize the usage of templates and checklists, using the new automated system as a minimum requirement. The information from the M&E system has also helped for decision-making for future strategies and also to see progress by the management. On the other hand, though staff members can reflect their ideas openly during the course of project implementation, there has not been any feedback from the management and there was a challenge of not acknowledging staff contributions by some program/project heads. In contrast with this, staff members were encouraged by the management to exercise their potential through free discussion and to come up with ideas. It was noted that some indicated that staff were more comfortable to raise issues in written form, rather than in discussion. HoA-REC/N has hired a communications officer under the PR and Communication department to assist in scanning the environment and promote the organization toward a wider audience locally and globally. Consultation with stakeholders in project development and implementation has improved since 2012. Furthermore, projects and program staff and stakeholders have frequently communicated and closely worked together.

Score: from 3.4 to 3.9 (slight improvement)

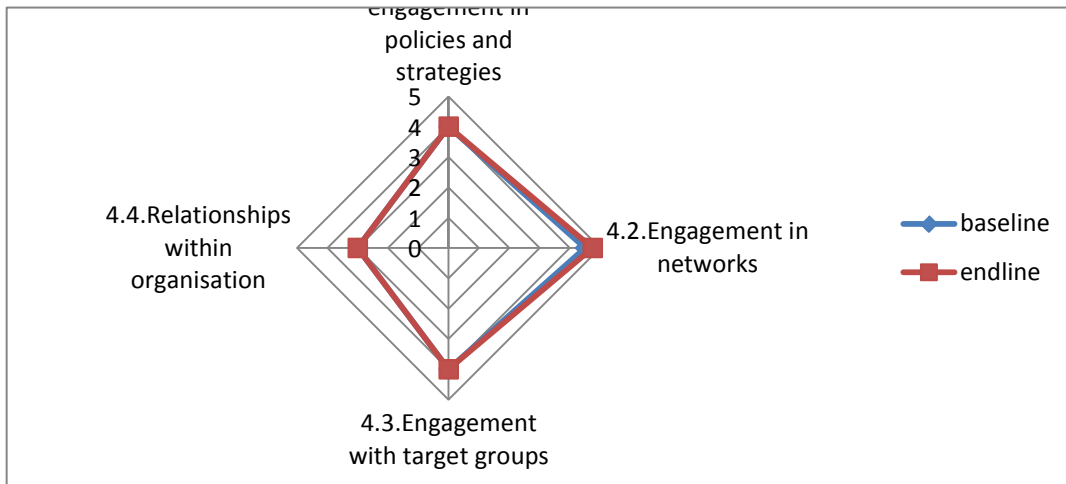

Capability to deliver on development objectives

The organization programs and projects have clear operational and budget plans, and the plans serve as a crucial source to implement the strategic plan. Technical staff are well aware of not only the preparation of operational plans with a budget, but also provide specifications on each item for procurement. HoA-REC/N has used resources in a cost-effective manner and this was evident in the annual consolidated audit report. Besides, the organization has moved to its new premises with sufficient space and the lack of offices for staff is no longer a problem and this has further enhanced using resources cost-effectively. The majority of the planned activities have been accomplished successfully though a few activities were still being processed due to extended procurement processes, mainly the bureaucratic procurement procedures by the University of Addis Ababa. HoA-REC/N has developed mechanisms to check beneficiary needs through frequent field visits to satellite or field offices where partners of HOAREC have daily interaction with the target groups and beneficiaries. Particularly, field offices are more close with beneficiaries and understand their needs better through participatory discussions at different stages of a project including design, implementation and evaluation. The SPO has developed an M&E system and recruited new staff members for the M&E unit. All projects are monitored as per the donors' requirement. Hence, the M&E unit is proactive and project staff and the M&E unit monitor the program performance regularly. Staffs try to address quality-efficiency issues during project design and implementations with the available budget. The M&E unit tried to look at the quality-efficiency of all programs under the organization. Besides, program staffs strictly follow the annual work plan, budget plan and performance monitoring plan to balance quality-efficiency. The M&E unit also measures efficiency, by looking at inputs and outputs.

Score: from 3.2 to 3.5 (slight improvement)

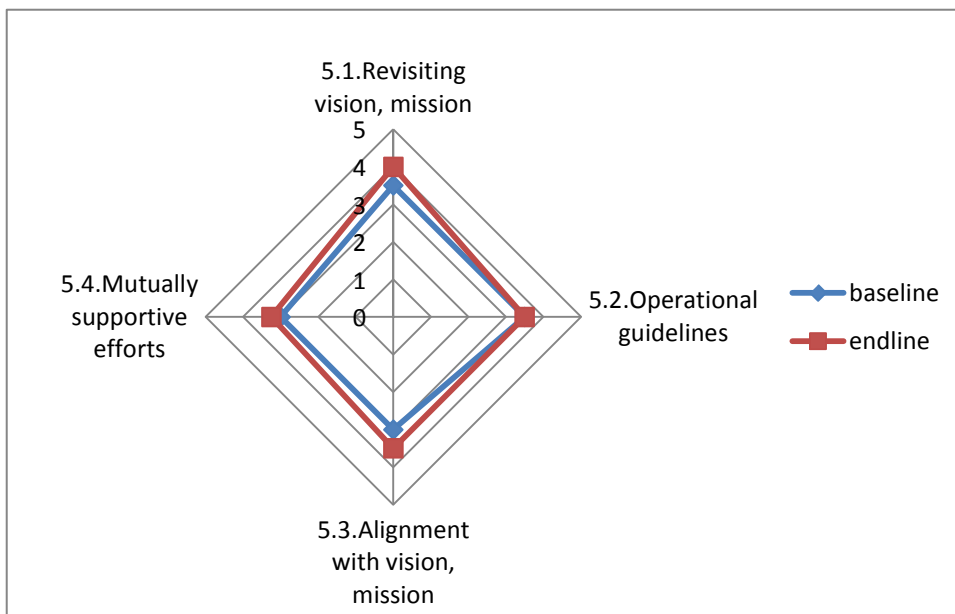

Capability to relate

HoA-REC/N participated with stakeholders during the strategic plan development through gathering information using questionnaires and organized workshop for network members. There is also strong collaboration with all stakeholders, and planning, workshops and field missions are still done with stakeholders. Networking is one of the core areas of HoA-REC/N, it has established good relations with many environmental organizations. For instance, HoA-REC/N has hosted TERI (The Environment and Resource Institute) India and established partnerships with other organizations including IRC (International Water and Sanitation) in the Hague, the Stockholm Environmental Institute, and UMass Boston. Moreover, HoA-REC/N made regular field trips to project sites to observe the status on project/program implementations. For this to be effective, administration makes available field vehicles as per request of respective programs/projects.. As a result according to the carbon credit project annual report in 2013, the project was able to bring about a remarkable change among the targeted local communities. Similarly, relationships within the organization have slightly changed due to the fact that staff capacity in communication, particularly electronic communication, has improved, which in turn was due to the training on communication provided for staffs by the Dutch partners. In contrast with this, some staff members noted that communication is still a major problem in HoA-REC/N, where staff meetings are not very regular, no group retreat is organized, there is no assigned formal body in the organization to receive any complaints, and projects have no room to receive any complaints.

Score: from 3.9 to 3.9 (no change)

Capability to achieve coherence

In this regard, HoA-REC/N has developed a strategic plan for the period of 2015-2020 and have revised its vision, mission and strategies with the participation of staffs, network partners and an external consultant. The organization's vision and mission are well articulated and ready for endorsement. All projects proposed by implementing partners were appraised and approved in consultation with the organization's vision, mission and strategic plan document. Besides, project agreements have also been amended based on the new organizations' vision and mission. According to the staff self-assessment, project strategies are designed in view of addressing local problems in a sustainable manner which is in line with the organization vision and mission. Moreover, there has been better communication and synergy between programs and projects where most projects were implemented with the involvement of different partners. HoA-REC/N has not developed new operational guidelines since the baseline in 2012 except the HR manual which is not yet finalized.

Score: from 3.2 to 3.6 (slight improvement)

4.2.2 Key organisational capacity changes - general causal map

Below you can find a description of the key changes in organizational capacity of HOAREC since the baseline as expressed by HOAREC staff during the endline workshop. First, a description is given of how this topic was introduced during the endline workshop by summarising key information on HOAREC from the baseline report. This information included a brief description of the vision, mission and strategies of the organisation, staff situation, clients and partner organisations. This then led into a discussion on how HOAREC has changed since the baseline.

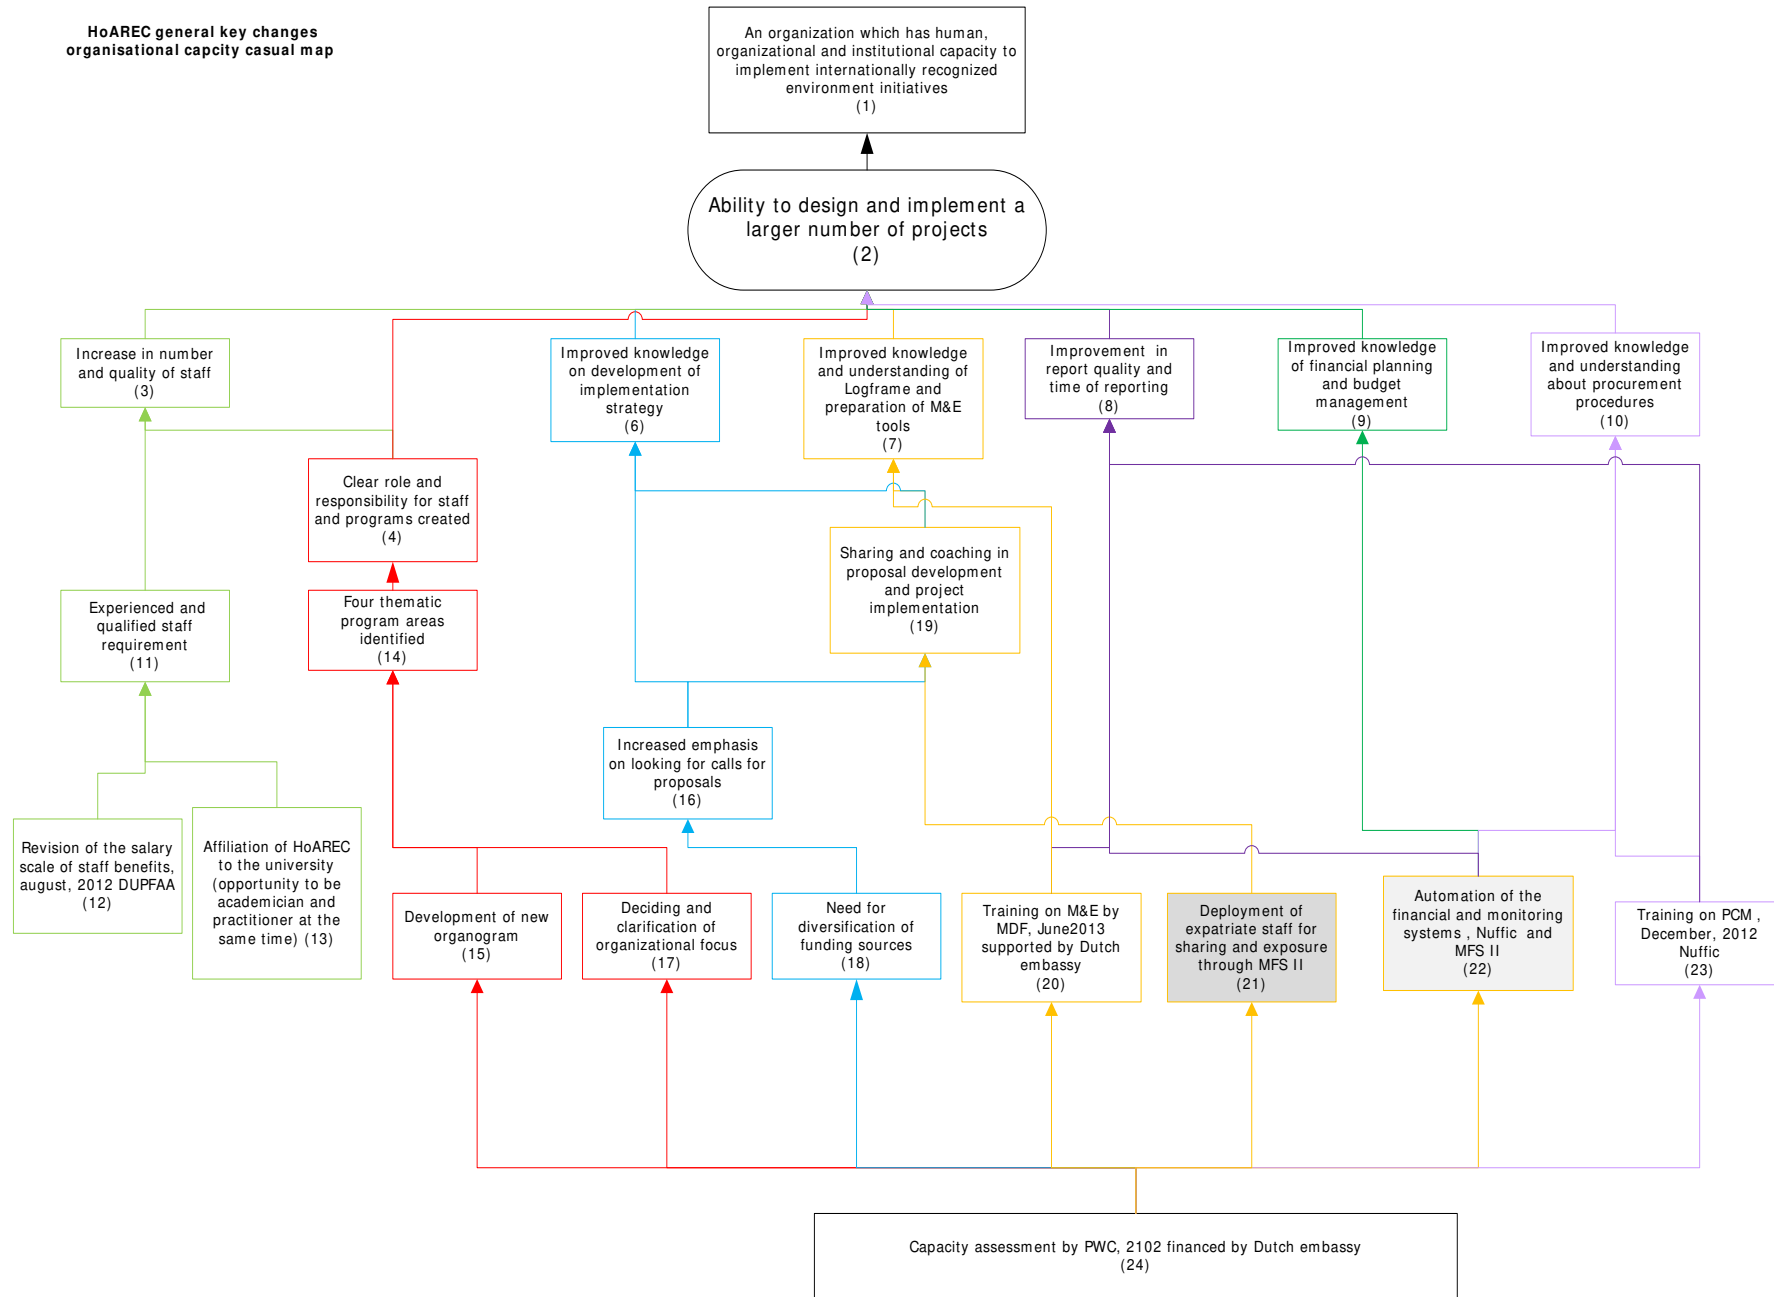

The endline workshop was conducted on November 12, 2014, at HOAREC headquarters in Addis Abeba. nine HOAREC staff of five job categories participated: management, program, M&E, field and administration, and finance staff. Following the self-assessment on November 20, 2014 staff brainstormed about and developed a causal map for the key changes that happened in HOAREC since the MFS II baseline survey in 2012 in the area of organizational capacity.

At the endline workshop it was clarified that the overall organizational capacity goal of HOAREC **an organization which has human, organizational, and institutional capacity to implement internationally recognized environment initiatives** (1). HoAREC as an organization took a big stride in reorganizing itself to become a well-functioning organization starting 2012. In this process the organization has developed an ability to design and implement more number of projects (2) since 2012. This happened as a result of the following:

- Increase in number and quality of staff (3)
- Clear roles and responsibilities for staff and programme created (4)
- Improved knowledge on development of implementation strategy (6)
- Improved knowledge and understanding of logframe and preparation of M&E tools (7)
- Improved report quality and time of reporting (8)
- Improved knowledge of financial planning and budget management (9)
- Improved knowledge and understanding about procurement procedures (10)

Each of these key organizational capacity changes is further explained below. The numbers correspond to the numbers in the visual.

**HoAREC general key changes
organisational capacity casual map**

Increase in number and quality of staff (3)

After creating clear roles and responsibilities for staff and programs (4) HoAREC went ahead to fill the vacant as well as the newly created positions with experienced and qualified staff (11). They were able to get and hire experienced people because they managed to pay a competitive salary due to the favorable condition created as a result of the revised staff salary and benefit in 2012 (12) with the support of the support of the Dutch embassy in Addis Ababa. In addition, the affiliation of HoAREC to Addis Ababa University helped to attract experienced professionals who would like to be academicians and practitioners at the same time (13). Partly professionals working in the other departments of the university also wanted to transfer to HoAREC due to this opportunity.

Clear roles and responsibilities for staff and program created (4)

The roles and responsibilities for staff and programmes have been clarified as a result of identifying for programme thematic areas (14), which in turn was the result of developing a new organogram (15) and more clarification on the organizational focus (17). The capacity assessment that was carried out by PWC in 2012 informed these changes. Earlier HoAREC had a blurred role and responsibility in the University.

Improved knowledge in development of implementation strategy (6)

HoAREC now has a better capacity to develop implementation strategies dealing with environmental issues. This happened as a result of the knowledge staff built through the sharing and coaching in proposal development and project implementation (19) by the expatriate staff deployed in the organization (21). The expatriate deployment is associated to the MFS II funding and the expatriates involve local staff while preparing proposals, implementing projects and in day to day operational issues. In the process the capacity of local staff in all aspects of project design and implementation is improved.

This also coincided with the HoAREC's emphasis to seriously look for calls for proposals (16) in order to diversify funding sources (18) avoid the reliance on the Dutch Embassy alone.

Improved knowledge and understanding of logframe and preparation of M&E tools (7)

HoAREC staff had limited knowledge on using logframes for planning as well as M&E. However, since 2012 they acquired this skill and have also started using it. This happened because of two interventions. One, the sharing and coaching by the expatriate staff (19) deployed with MFS II funding (21) and two the three days training on M&E by MDF (Dutch consultancy firm) in June 2013 given for 32 staff members of HoAREC working on different projects with the financial support of the Dutch Embassy (20).

Improved report quality and time of reporting (8)

The training (20) mentioned above (on M&E by MDF in June 2013) helped in improving reporting quality and timing (8). In addition, the automation of the financial and monitoring system established by the support of NUFFIC and MFS II (22) and the training they received on project cycle management (PCM) organized in 2012 by Nuffic (23) played a role. HoAREC feel that, now, the comments coming from the recipients of the report have reduced and they are also able to send reports timely.

Knowledge of financial planning and budget management (9)

One other area which showed improvement according to staff present at the endline workshop, was the knowledge in financial planning and budget management (9). This relates to the way HoAREC developed its annual work plan and budget. The organization is able to clearly show the plans of every activity and also attach the related budget. This was the result of the automation of the financial and monitoring systems established through the support of the Nuffic and MFS II (22) and the training they received on Project Cycle Management (PCM) organized in 2012 by Nuffic (23).

Knowledge and understanding about procurement procedures (10)

Since the HoAREC started to become operational as an autonomous body after the baseline period, most of the management operation were refined to suit the new organizational structure and organogram. This required new knowledge and understanding about procurement procedures (10). In this regard the training organized on PCM in 2012 helped in creating the required knowledge.

In general most of the capacity building initiatives that were implemented since 2012 were based on the results of the capacity assessment carried out by PWC (PricewaterhouseCoopers, a multinational professional services network) in 2012 with financial support from the Dutch embassy. They identified the gaps that should be filled for the success of HoAREC.

5 Discussion and conclusion

5.1 Methodological issues

In preparation for the assessment, the Ethiopian 5C assessment team visited HoAREC staff in the organizations HQs in Addis Ababa and explained the purpose and the process of the 5C end line assessment. During the visit, both teams agreed on the workshop dates including the type and number of staff who will attend the workshop. In addition, the assessment team also gave the “support to capacity development sheet” to be filled by HoAREC staff. The Ethiopian 5C assessment team conducted the assessment in three visits. First visit, to conduct the self-assessment workshop with a total of seven staff members and ask the staff to fill the self-assessment form in their respective five subgroups (management (2); program(2); M&E (1); and field (2)).

This was followed by a second visit to carry out a brainstorming session and develop a general causal map that explains the key organisational capacity changes that have occurred in HoAREC since the baseline in 2012. The third visit was made to conduct an interview with one representative from each subgroup to triangulate the information collected through the self-assessment and to better understand the change in HoAREC’s capacity since the baseline in 2012. This was done after the 5C assessment team reviewed the completed self-assessment forms. Some of the interviews were done through emails because respondents were busy and this method was thought to be flexible so that they fill the form when they feel it is convenient for them.

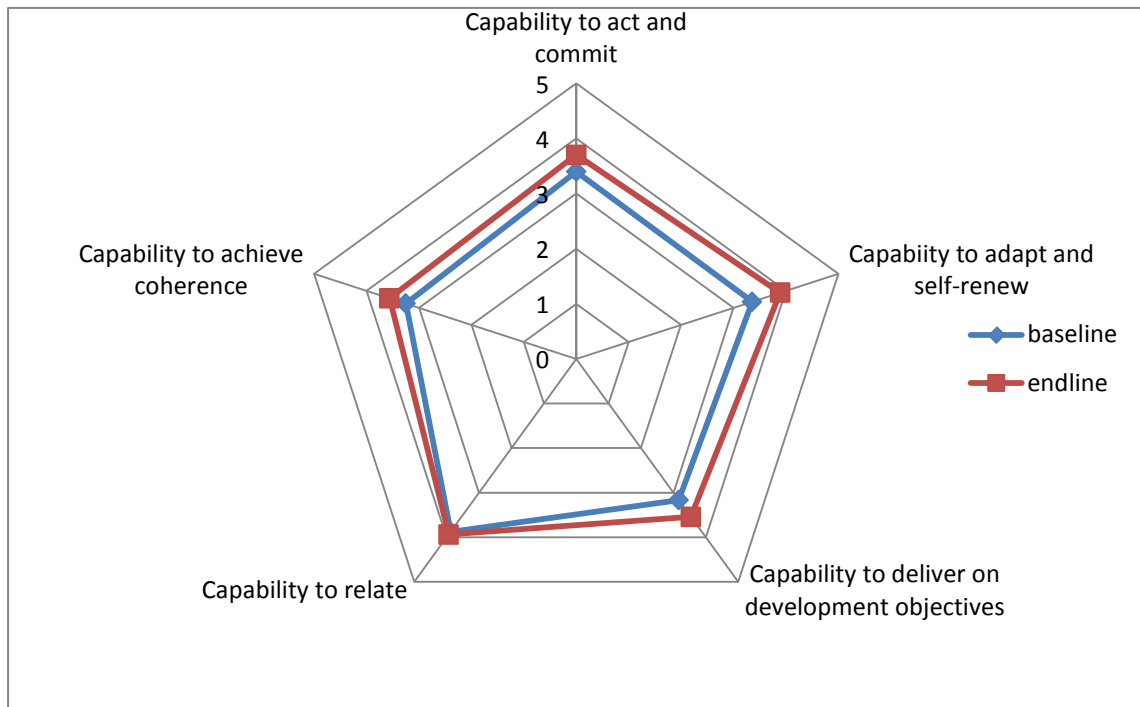

The plan of the evaluation team to also conduct two interviews with HoAREC partners didn’t materialize because the interview overlapped with other activities that were to be carried out by the self-assessment team in the SPO. In addition, the attempt to interview OD consultants also didn’t materialize because there was not much work done by OD consultants for HoAREC. Therefore, it was not possible to get OD consultants knowledgeable about the 5C indicators.

By and large, there has been a lot of information available to be able to do adequate data analysis.

5.2 Changes in organisational capacity

This section aims to provide an answer to the first and fourth evaluation questions:

1. *What are the changes in partner organisations' capacity during the 2012-2014 period?*
4. *What factors explain the findings drawn from the questions above?*

Below the changes in each of the five core capabilities are further explained, by referring to the specific indicators that changed. In all of these capabilities improvements took place.

Over the last two years many small improvements and one slight deterioration took place in the indicators under the capability to act and commit. The management of HoA-REC is striving to be more responsive and to decentralise decision making. There are weekly management meetings and program officers have become more independent. There has been a slight improvement in the strategic guidance that management gives as they are strengthening program partnerships (to tap into new sources) and have pointed out six strategic objectives that will help HoA-REC better achieve its mission and vision. Staff turnover has increased among program and support staff, especially highly skilled staff and staff working in the remote areas. Since the baseline, the organisation has created an organisational structure with a new more decentralised grouping of programs and more clear roles and responsibilities. There has been a very slight improvement in staff skills especially in program design, implementation and M&E. Staff recruitment criteria have been revised and new staff that is hired is qualified in experience and education. Staff have improved their skills due to more opportunities for trainings either in-house or abroad on technical topics such as climate change and carbon emissions as well as crosscutting topics like communication. HoA-REC now has a standard form to objectively assess staff performance and identify training needs. The incentives for staff to work at the organisation have improved very slightly because of the revised HR manual that has been put online, and staff are now able to be informed about their entitlements. Over the last two years HoA-REC has diversified its funding with support from ICCO in developing proposals and improving their reporting capacity. The organisation now has a fundraising strategy in place and has assigned a consultant to liaise with the fundraising officer and identify calls for proposals, and develop proposals together.

In the capability to adapt and self-renew HoA-REC saw many improvements. The organisation has put in place M&E software application system (Akvo FLOW). Staff has had training on using this tool and also on outcome mapping with support from ICCO. The M&E unit has been strengthened and now has three fulltime and one part-time staff. Management also raised awareness about the importance of M&E among other staff. Staff are now using the monitoring system and data has been collected on a timely basis. Through the M&E software application system management has quick access to M&E findings and is using this in decision-making for future strategies. Staff is encouraged to speak out new ideas especially concerning proposal development and is recognised for providing these ideas. A communications officer has been hired under the public relations (PR) and communications department, who tracks HoA-REC's operating environment and is in regular contact with program staff. Staff uses this information when e.g. preparing proposals and capacity building for the PR and communications unit, a revised organogram and newly recruited staff has further helped with this. Over the last two years HoA-REC has become more responsive to stakeholders because program staff frequently communicate with and work closely together with them.

In terms of the capability to deliver on development objectives, HoA-REC also showed improvements in many indicators. The organisation has clear operational plans and budgets in place and technical staff now provide specification on each item for procurement in the project's budget. Now that HoA-REC has moved to its new premises, there is no longer a lack of offices and all staff work together which saves costs in terms of time and transport. Reaching planned outputs has improved since the baseline. Because of an improved M&E system and a strengthened M&E unit, the M&E system is now working for almost all departments in the organisation and the M&E staff analyses reports on project input and output basis to monitor efficiency. HoA-REC has improved in balancing the quality and efficiency of its work because of the good functioning of the M&E unit that looks into this, updating of operational guidelines and ICCO recommendation to work with organisations that have the required structures and contacts in place for certain topics.

In the capability to relate, HoA-REC very slightly improved in engaging in networks. The organisation's expertise has always been in networking, but over the last two years they established new networks with TERI, IRC, the Stockholm Environmental Institute, and UMass Boston.

Finally, HoA-REC has improved in a few indicators under the capability to achieve coherence. HoA-REC/N has developed a strategic plan for the period of 2015-2020 and has revised its mission, vision and strategies with key staff, an external consultant and network partners. The organisation's vision and mission are now very well-articulated and project agreements have been amended based on the organisation's new vision and mission. Projects have become more mutually supportive because of better communication and synergy between programs and projects for example for the climate and WASH programs.

During the endline workshop some key organisational capacity changes were brought up by HoA-REC's staff in the 'general causal map': increase in number and quality of staff; clear roles and responsibilities for staff and programme created; improved knowledge on development of implementation strategy; improved knowledge and understanding of logframe and preparation of M&E tools; improved report quality and time of reporting; improved knowledge of financial planning and budget management; and improved knowledge and understanding about procurement procedures. The evaluators considered it important to also note down the SPO's story about what they perceived as key organisational capacity changes since the baseline, and this would also provide more information about reasons for change, which were difficult to get for the individual indicators. Also for some issues there may not have been relevant indicators available in the list of core indicators provided by the evaluation team.

According to HoA-REC staff, the number and quality of staff increased because they set a requirement to only hire experienced and qualified staff, who they were able to hire after the revision of the salary scale and staff benefits (with support of the Dutch Embassy) and because of HoA-REC's affiliation to the University (attracts staff that wants to be academician and practitioner at the same time). The number and quality of staff also increased because of the creation of clear roles and responsibilities for staff and programmes. These clear roles and responsibilities were created because four thematic program areas were identified, which in turn was the result of developing a new organogram and more clarification on the organisational focus. Both these last developments happened after a capacity assessment was carried out by PricewaterhouseCoopers (PWC) in 2012 (funded by the Dutch Embassy). HoA-REC improved its knowledge on developing an implementation strategy because of their increased emphasis on looking for calls for proposals and the sharing and coaching on proposal development and project implementation because of deployment of expatriate staff for sharing and exposure through MFS II (funded by MFS II). The organisation increasingly focussed on looking for calls for proposals because of a need for diversifying funding sources which was identified by the capacity assessment by PWC (funded by Dutch Embassy).

HoA-REC improved its knowledge and understanding of logframes and preparation of M&E tools because of sharing and coaching on proposal development and project implementation (funded by MFS II); and a training on M&E by MDF in 2013 (funded by the Dutch Embassy). The organisation improved the quality and timing of their reporting because of the M&E training by MDF in 2013 (funded by the Dutch Embassy); the automation of the financial and monitoring system established by support of Nuffic and MFS II; and the training they received on project cycle management (PCM) in 2012 funded by Nuffic. HoA-REC now has knowledge on financial planning and budget management because of the automation of the financial and monitoring system established by support of Nuffic and MFS II and the training on PCM they received in 2012 funded by Nuffic. Finally, HoA-REC improved its knowledge and understanding about procurement procedures because of the same PCM training in 2012. In general most of the capacity building initiatives that were implemented since 2012 were

based on the results of the capacity assessment carried out by PWC in 2012 with financial support from the Dutch embassy.

According to HoA-REC, MFS II funded capacity development interventions have thus played a role in improved knowledge on development of implementation strategy; improved knowledge and understanding of logframe and preparation of M&E tools; improved knowledge of financial planning and budget management. This was through sharing by expatriate staff and exposure through MFS II, the automation of the financial and monitoring system established with support of Nuffic and MFS II. However, internal factors like their affiliation to the university, development of a new organogram, deciding and clarification of organisational focus have also played an important role in the key organisational capacity changes that the HoA-REC staff considered important since the baseline in 2012. Support from other funders, like the Dutch Embassy and Nuffic, in terms of training and funding of revision of salary scales, has also been mentioned among the underlying factors for these changes.

List of Respondents

Alliance/ CFA officers:

No.	Name	Function
1	Rachel Kyozira	Program Officer ICCO, Central & eastern Africa regional Office
2	Dieneke de Groot	Planning, Monitoring & Evaluation advisor; Secretary ICCO Alliance
3		
4		

HOAREC staff:

No.	Name	Function in the organisation
1	Araya Asfaw (PhD)	Executive Manager
2	Almaz Tadesse (PhD)	Programe coordinator
3	Michael Abera	PME coordinator
4	Kasahun Bedane	WASH Project Officer
5	Adane Kebede	CCP Coordinator
6	Etsub Assefa	Energy Project Officer
7	Rawda Seman	STRONGBOW

Others:

Appendix 1 Methodological approach & reflection

1. Introduction

This appendix describes the methodological design and challenges for the assessment of capacity development of Southern Partner Organisations (SPOs), also called the '5C study'. This 5C study is organised around four key evaluation questions:

1. What are the changes in partner organisations' capacity during the 2012-2014 period?
2. To what degree are the changes identified in partner capacity attributable to development interventions undertaken by the MFS II consortia (i.e. measuring effectiveness)?
3. Were the efforts of the MFS II consortia efficient?
4. What factors explain the findings drawn from the questions above?

It has been agreed that the question (3) around efficiency cannot be addressed for this 5C study. The methodological approach for the other three questions is described below. At the end, a methodological reflection is provided.

In terms of the attribution question (2), 'process tracing' is used. This is a theory-based approach that has been applied to a selected number of SPOs since it is a very intensive and costly methodology, although it provides rich information and can generate a lot of learning within the organisations. This approach was presented and agreed-upon during the synthesis workshop on 17-18 June 2013 by the 5C teams for the eight countries of the MFS II evaluation. A more detailed description of the approach was presented during the synthesis workshop in February 2014. The synthesis team, NWO-WOTRO, the country project leaders and the MFS II organisations present at the workshop have accepted this approach. It was agreed that this approach can only be used for a selected number of SPOs since it is a very intensive and costly methodology. Key organisational capacity changes/ outcomes of the SPO were identified, based on their relationship to the two selected capabilities, the capability to act and commit the capability to adapt and self-renew, and an expected relationship with CFA supported capacity development interventions (MFS II funding). It was agreed to focus on these two capabilities, since these are the most targeted capabilities by the CFAs, as established during the baseline process.

Please find below an explanation of how the above-mentioned evaluation questions have been addressed in the 5C evaluation.

Note: the methodological approach is applied to 4 countries that the Centre for Development Innovation, Wageningen University and Research centre is involved in in terms of the 5C study (Ethiopia, India, Indonesia, Liberia). The overall approach has been agreed with all the 8 countries selected for this MFS II evaluation. The 5C country teams have been trained and coached on this methodological approach during the evaluation process. Details specific to the SPO are described in chapter 5.1 of the SPO report. At the end of this appendix a brief methodological reflection is provided.

2. Changes in partner organisation's capacity – evaluation question 1

This section describes the data collection and analysis methodology for answering the first evaluation question: **What are the changes in partner organisations' capacity during the 2012-2014 period?**

This question was mainly addressed by reviewing changes in 5c indicators, but additionally a 'general causal map' based on the SPO perspective on key organisational capacity changes since the baseline

has been developed. Each of these is further explained below. The development of the general causal map is integrated in the steps for the endline workshop, as mentioned below.

During the baseline in 2012 information has been collected on each of the 33 agreed upon indicators for organisational capacity. For each of the five capabilities of the 5C framework indicators have been developed as can be seen in Appendix 2. During this 5C baseline, a summary description has been provided for each of these indicators, based on document review and the information provided by staff, the Co-financing Agency (CFA) and other external stakeholders. Also a summary description has been provided for each capability. The results of these can be read in the baseline reports.

The description of indicators for the baseline in 2012 served as the basis for comparison during the endline in 2014. In practice this meant that largely the same categories of respondents (preferably the same respondents as during the baseline) were requested to review the descriptions per indicator and indicate whether and how the endline situation (2014) is different from the described situation in 2012.² Per indicator they could indicate whether there was an improvement or deterioration or no change and also describe these changes. Furthermore, per indicator the interviewee could indicate what interventions, actors and other factors explain this change compared to the baseline situation. See below the specific questions that are asked for each of the indicators. Per category of interviewees there is a different list of indicators to be looked at. For example, staff members were presented with a list of all the indicators, whilst external people, for example partners, are presented with a select number of indicators, relevant to the stakeholder.

The information on the indicators was collected in different ways:

- 1) **Endline workshop at the SPO - self-assessment and 'general causal map'**: similar to data collection during the baseline, different categories of staff (as much as possible the same people as during the baseline) were brought together in a workshop and requested to respond, in their staff category, to the list of questions for each of the indicators (self-assessment sheet). Prior to carrying out the self-assessments, a brainstorming sessions was facilitated to develop a 'general causal map', based on the key organisational capacity changes since the baseline as perceived by SPO staff. Whilst this general causal map is not validated with additional information, it provides a sequential narrative, based on organisational capacity changes as perceived by SPO staff;
- 2) **Interviews with staff members**: additional to the endline workshop, interviews were held with SPO staff, either to provide more in-depth information on the information provided on the self-assessment formats during the workshop, or as a separate interview for staff members that were not present during the endline workshop;
- 3) **Interviews with externals**: different formats were developed for different types of external respondents, especially the co-financing agency (CFA), but also partner agencies, and organisational development consultants where possible. These externals were interviewed, either face-to-face or by phone/Skype. The interview sheets were sent to the respondents and if they wanted, these could be filled in digitally and followed up on during the interview;
- 4) **Document review**: similar to the baseline in 2012, relevant documents were reviewed so as to get information on each indicator. Documents to be reviewed included progress reports, evaluation reports, training reports, etc. (see below) since the baseline in 2012, so as to identify changes in each of the indicators;
- 5) **Observation**: similar to what was done in 2012, also in 2014 the evaluation team had a list with observable indicators which were to be used for observation during the visit to the SPO.

Below the key steps to assess changes in indicators are described.

² The same categories were used as during the baseline (except beneficiaries, other funders): staff categories including management, programme staff, project staff, monitoring and evaluation staff, field staff, administration staff; stakeholder categories including co-financing agency (CFA), consultants, partners.

Key steps to assess changes in indicators are described

1. Provide the description of indicators in the relevant formats – CDI team
2. Review the descriptions per indicator – in-country team & CDI team
3. Send the formats adapted to the SPO to CFA and SPO – in-country team (formats for SPO) and CDI team (formats for CFA)
4. Collect, upload & code the documents from CFA and SPO in NVivo – CDI team
5. Organise the field visit to the SPO – in-country team
6. Interview the CFA – CDI team
7. Run the endline workshop with the SPO – in-country team
8. Interview SPO staff – in-country team
9. Fill-in observation sheets – in-country team
10. Interview externals – in-country team
11. Upload and auto-code all the formats collected by in-country team and CDI team in NVivo – CDI team
12. Provide to the overview of information per 5c indicator to in-country team – CDI team
13. Analyse data and develop a draft description of the findings per indicator and for the general questions – in-country team
14. Analyse data and develop a final description of the findings per indicator and per capability and for the general questions – CDI team
15. Analyse the information in the general causal map –in-country team and CDI-team

Note: the CDI team include the Dutch 5c country coordinator as well as the overall 5c coordinator for the four countries (Ethiopia, India, Indonesia, Liberia). The 5c country report is based on the separate SPO reports.

Below each of these steps is further explained.

*Step 1. Provide the **description of indicators** in the relevant formats – CDI team*

- These formats were to be used when collecting data from SPO staff, CFA, partners, and consultants. For each of these respondents different formats have been developed, based on the list of 5C indicators, similar to the procedure that was used during the baseline assessment. The CDI team needed to add the 2012 baseline description of each indicator. The idea was that each respondent would be requested to review each description per indicator, and indicate whether the current situation is different from the baseline situation, how this situation has changed, and what the reasons for the changes in indicators are. At the end of each format, a more general question is added that addresses how the organisation has changed its capacity since the baseline, and what possible reasons for change exist. Please see below the questions asked for each indicator as well as the more general questions at the end of the list of indicators.

General questions about key changes in the capacity of the SPO

What do you consider to be the key changes in terms of how the organisation/ SPO has developed its capacity since the baseline (2012)?

What do you consider to be the main explanatory reasons (interventions, actors or factors) for these changes?

List of questions to be asked for each of the 5C indicators (The entry point is the the description of each indicator as in the 2012 baseline report):

1. *How has the situation of this indicator changed compared to the situation during the baseline in 2012? Please tick one of the following scores:*
 - -2 = Considerable deterioration
 - -1 = A slight deterioration
 - 0 = No change occurred, the situation is the same as in 2012
 - +1 = Slight improvement
 - +2 = Considerable improvement
2. *Please describe what exactly has changed since the baseline in 2012*

3. *What interventions, actors and other factors explain this change compared to the baseline situation in 2012? Please tick and describe what interventions, actors or factors influenced this indicator, and how. You can tick and describe more than one choice.*
- Intervention, actor or factor at the level of or by **SPO**:
 - Intervention, actor or factor at the level of or by the **Dutch CFA (MFS II funding)**:
 - Intervention, actor or factor at the level of or by the **other funders**:
 - **Other** interventions, actors or factors:
 - Don't know.

Step 2. Review the descriptions per indicator – in-country team & CDI team

Before the in-country team and the CDI team started collecting data in the field, it was important that they reviewed the description for each indicator as described in the baseline reports, and also added to the endline formats for review by respondents. These descriptions are based on document review, observation, interviews with SPO staff, CFA staff and external respondents during the baseline. It was important to explain this to respondents before they filled in the formats.

Step 3. Send the formats adapted to the SPO to CFA and SPO – in-country team (formats for SPO) and CDI team (formats for CFA)

The CDI team was responsible for collecting data from the CFA:

- 5C Endline assessment Dutch co-financing organisation;
- 5C Endline support to capacity sheet – CFA perspective.

The in-country team was responsible for collecting data from the SPO and from external respondents (except CFA). The following formats were sent before the fieldwork started:

- 5C Endline support to capacity sheet – SPO perspective.
- 5C Endline interview guides for externals: partners; OD consultants.

Step 4. Collect, upload & code the documents from CFA and SPO in NVivo – CDI team

The CDI team, in collaboration with the in-country team, collected the following documents from SPOs and CFAs:

- Project documents: project proposal, budget, contract (Note that for some SPOs there is a contract for the full MFS II period 2011-2015; for others there is a yearly or 2-yearly contract. All new contracts since the baseline in 2012 will need to be collected);
- Technical and financial progress reports since the baseline in 2012;.
- Mid-term evaluation reports;
- End of project-evaluation reports (by the SPO itself or by external evaluators);
- Contract intake forms (assessments of the SPO by the CFA) or organisational assessment scans made by the CFA that cover the 2011-2014 period;
- Consultant reports on specific inputs provided to the SPO in terms of organisational capacity development;
- Training reports (for the SPO; for alliance partners, including the SPO);
- Organisational scans/ assessments, carried out by the CFA or by the Alliance Assessments;
- Monitoring protocol reports, especially for the 5C study carried out by the MFS II Alliances;
- Annual progress reports of the CFA and of the Alliance in relation to capacity development of the SPOs in the particular country;
- Specific reports that are related to capacity development of SPOs in a particular country.

The following documents (since the baseline in 2012) were requested from SPO:

- Annual progress reports;
- Annual financial reports and audit reports;
- Organisational structure vision and mission since the baseline in 2012;
- Strategic plans;

- Business plans;
- Project/ programme planning documents;
- Annual work plan and budgets;
- Operational manuals;
- Organisational and policy documents: finance, human resource development, etc.;
- Monitoring and evaluation strategy and implementation plans;
- Evaluation reports;
- Staff training reports;
- Organisational capacity reports from development consultants.

The CDI team will code these documents in NVivo (qualitative data analysis software program) against the 5C indicators.

Step 5. Prepare and organise the field visit to the SPO – in-country team

Meanwhile the in-country team prepared and organised the logistics for the field visit to the SPO:

- **General endline workshop** consisted about one day for the self-assessments (about ½ to ¾ of the day) and brainstorm (about 1 to 2 hours) on key organisational capacity changes since the baseline and underlying interventions, factors and actors ('general causal map'), see also explanation below. This was done with the five categories of key staff: managers; project/ programme staff; monitoring and evaluation staff; admin & HRM staff; field staff. Note: for SPOs involved in process tracing an additional 1 to 1½ day workshop (managers; program/project staff; monitoring and evaluation staff) was necessary. See also step 7;
- **Interviews with SPO staff** (roughly one day);
- **Interviews with external respondents** such as partners and organisational development consultants depending on their proximity to the SPO. These interviews could be scheduled after the endline workshop and interviews with SPO staff.

General causal map

During the 5C endline process, a 'general causal map' has been developed, based on key organisational capacity changes and underlying causes for these changes, as perceived by the SPO. The general causal map describes cause-effect relationships, and is described both as a visual as well as a narrative.

As much as possible the same people that were involved in the baseline were also involved in the endline workshop and interviews.

Step 6. Interview the CFA – CDI team

The CDI team was responsible for sending the sheets/ formats to the CFA and for doing a follow-up interview on the basis of the information provided so as to clarify or deepen the information provided. This relates to:

- 5C Endline assessment Dutch co-financing organisation;
- 5C Endline support to capacity sheet - CFA perspective.

Step 7. Run the endline workshop with the SPO – in-country team

This included running the endline workshop, including facilitation of the development of the general causal map, self-assessments, interviews and observations. Particularly for those SPOs that were selected for process tracing all the relevant information needed to be analysed prior to the field visit, so as to develop an initial causal map. Please see Step 6 and also the next section on process tracing (evaluation question two).

An endline workshop with the SPO was intended to:

- Explain the purpose of the fieldwork;
- Carry out in the self-assessments by SPO staff subgroups (unless these have already been filled prior to the field visits) - this may take some 3 hours.
- Facilitate a brainstorm on key organisational capacity changes since the baseline in 2012 and underlying interventions, factors and actors.

Purpose of the fieldwork: to collect data that help to provide information on what changes took place in terms of organisational capacity development of the SPO as well as reasons for these changes. The baseline that was carried out in 2012 was to be used as a point of reference.

Brainstorm on key organisational capacity changes and influencing factors: a brainstorm was facilitated on key organisational capacity changes since the baseline in 2012. In order to kick start the discussion, staff were reminded of the key findings related to the historical time line carried out in the baseline (vision, mission, strategies, funding, staff). This was then used to generate a discussion on key changes that happened in the organisation since the baseline (on cards). Then cards were selected that were related to organisational capacity changes, and organised. Then a 'general causal map' was developed, based on these key organisational capacity changes and underlying reasons for change as experienced by the SPO staff. This was documented as a visual and narrative. This general causal map was to get the story of the SPO on what they perceived as key organisational capacity changes in the organisation since the baseline, in addition to the specific details provided per indicator.

Self-assessments: respondents worked in the respective staff function groups: management; programme/ project staff; monitoring and evaluation staff; admin and HRM staff; field staff. Staff were assisted where necessary so that they could really understand what it was they were being asked to do as well as what the descriptions under each indicator meant.

Note: for those SPOs selected for process tracing an additional endline workshop was held to facilitate the development of detailed causal maps for each of the identified organisational change/ outcome areas that fall under the capability to act and commit, and under the capability to adapt and self-renew, and that are likely related to capacity development interventions by the CFA. See also the next section on process tracing (evaluation question two). It was up to the in-country team whether this workshop was held straight after the initial endline workshop or after the workshop and the follow-up interviews. It could also be held as a separate workshop at another time.

Step 8. Interview SPO staff – in-country team

After the endline workshop (developing the general causal map and carrying out self-assessments in subgroups), interviews were held with SPO staff (subgroups) to follow up on the information that was provided in the self-assessment sheets, and to interview staff that had not yet provided any information.

Step 9. Fill-in observation sheets – in-country team

During the visit at the SPO, the in-country team had to fill in two sheets based on their observation:

- 5C Endline observation sheet;
- 5C Endline observable indicators.

Step 10. Interview externals – in-country team & CDI team

The in-country team also needed to interview the partners of the SPO as well as organisational capacity development consultants that have provided support to the SPO. The CDI team interviewed the CFA.

Step 11. Upload and auto-code all the formats collected by in-country team and CDI team – CDI team

The CDI team was responsible for uploading and auto-coding (in Nvivo) of the documents that were collected by the in-country team and by the CDI team.

Step 12. Provide the overview of information per 5C indicator to in-country team – CDI team

After the analysis in NVivo, the CDI team provided a copy of all the information generated per indicator to the in-country team for initial analysis.

Step 13. Analyse the data and develop a draft description of the findings per indicator and for the general questions – in-country team

The in-country team provided a draft description of the findings per indicator, based on the information generated per indicator. The information generated under the general questions were linked to the general causal map or detailed process tracing related causal map.

Step 14. Analyse the data and finalize the description of the findings per indicator, per capability and general – CDI team

The CDI team was responsible for checking the analysis by the in-country team with the Nvivo generated data and to make suggestions for improvement and ask questions for clarification to which the in-country team responded. The CDI team then finalised the analysis and provided final descriptions and scores per indicator and also summarize these per capability and calculated the summary capability scores based on the average of all indicators by capability.

Step 15. Analyse the information in the general causal map –in-country team & CDI team

The general causal map based on key organisational capacity changes as perceived by the SPO staff present at the workshop, was further detailed by in-country team and CDI team, and based on the notes made during the workshop and where necessary additional follow up with the SPO. The visual and narrative was finalized after feedback by the SPO. During analysis of the general causal map relationships with MFS II support for capacity development and other factors and actors were identified. All the information has been reviewed by the SPO and CFA.

3. Attributing changes in partner organisation's capacity – evaluation question 2

This section describes the data collection and analysis methodology for answering the second evaluation question: **To what degree are the changes identified in partner capacity attributable to (capacity) development interventions undertaken by the MFS II consortia (i.e. measuring effectiveness)?**

In terms of the attribution question (2), 'process tracing' is used. This is a theory-based approach that has been applied to a selected number of SPOs since it is a very intensive and costly methodology, although it provides rich information and can generate a lot of learning within the organisations. Key organisational capacity changes/ outcomes of the SPO were identified, based on their relationship to the two selected capabilities, the capability to act and commit the capability to adapt and self-renew, and an expected relationship with CFA supported capacity development interventions (MFS II funding). It was agreed to focus on these two capabilities, since these are the most targeted capabilities by the CFAs, as established during the baseline process. The box below provides some background information on process tracing.

Background information on process tracing

The essence of process tracing research is that scholars want to go beyond merely identifying correlations between independent variables (Xs) and outcomes (Ys). Process tracing in social science is commonly defined by its addition to trace causal mechanisms (Bennett, 2008a, 2008b; Checkle, 2008; George & Bennett, 2005). A causal mechanism can be defined as “a complex system which produces an outcome by the interaction of a number of parts” (Glennan, 1996, p. 52). Process tracing involves “attempts to identify the intervening causal process – the causal chain and causal mechanism – between an independent variable (or variables) and the outcome of the dependent variable” (George & Bennett, 2005, pp. 206-207).

Process tracing can be differentiated into three variants within social science: theory testing, theory building, and explaining outcome process tracing (Beach & Pedersen, 2013).

Theory testing process tracing uses a theory from the existing literature and then tests whether evidence shows that each part of hypothesised causal mechanism is present in a given case, enabling within case inferences about whether the mechanism functioned as expected in the case and whether the mechanism as a whole was present. No claims can be made however, about whether the mechanism was the only cause of the outcome.

Theory building process tracing seeks to build generalizable theoretical explanations from empirical evidence, inferring that a more general causal mechanism exists from the fact of a particular case.

Finally, explaining outcome process tracing attempts to craft a minimally sufficient explanation of a puzzling outcome in a specific historical case. Here the aim is not to build or test more general theories but to craft a (minimally) sufficient explanation of the outcome of the case where the ambitions are more case centric than theory oriented.

Explaining outcome process tracing is the most suitable type of process tracing for analysing the causal mechanisms for selected key organisational capacity changes of the SPOs. This type of process tracing can be thought of as a single outcome study defined as seeking the causes of the specific outcome in a single case (Gerring, 2006; in: Beach & Pedersen, 2013). Here the ambition is to craft a minimally sufficient explanation of a particular outcome, with sufficiency defined as an explanation that accounts for all of the important aspects of an outcome with no redundant parts being present (Mackie, 1965).

Explaining outcome process tracing is an iterative research strategy that aims to trace the complex conglomerate of systematic and case specific causal mechanisms that produced the outcome in question. The explanation cannot be detached from the particular case. Explaining outcome process tracing refers to case studies whose primary ambition is to explain particular historical outcomes, although the findings of the case can also speak to other potential cases of the phenomenon. Explaining outcome process tracing is an iterative research process in which ‘theories’ are tested to see whether they can provide a minimally sufficient explanation of the outcome. Minimal sufficiency is defined as an explanation that accounts for an outcome, with no redundant parts. In most explaining outcome studies, existing theorisation cannot provide a sufficient explanation, resulting in a second stage in which existing theories are re-conceptualised in light of the evidence gathered in the preceding empirical analysis. The conceptualisation phase in explaining outcome process tracing is therefore an iterative research process, with initial mechanisms re-conceptualised and tested until the result is a theorised mechanism that provides a minimally sufficient explanation of the particular outcome.

Below a description is provided of how SPOs are selected for process tracing, and a description is provided on how this process tracing is to be carried out. Note that this description of process tracing provides not only information on the extent to which the changes in organisational development can be attributed to MFS II (evaluation question 2), but also provides information on other contributing factors and actors (evaluation question 4). Furthermore, it must be noted that the evaluation team has developed an adapted form of ‘explaining outcome process tracing’, since the data collection and analysis was an iterative process of research so as to establish the most realistic explanation for a particular outcome/ organisational capacity change. Below selection of SPOs for process tracing as well as the different steps involved for process tracing in the selected SPOs, are further explained.

Selection of SPOs for 5C process tracing

Process tracing is a very intensive methodology that is very time and resource consuming (for development and analysis of one final detailed causal map, it takes about 1-2 weeks in total, for

different members of the evaluation team). It has been agreed upon during the synthesis workshop on 17-18 June 2013 that only a selected number of SPOs will take part in this process tracing for the purpose of understanding the attribution question. The selection of SPOs is based on the following criteria:

- MFS II support to the SPO has not ended before 2014 (since this would leave us with too small a time difference between intervention and outcome);
- Focus is on the 1-2 capabilities that are targeted most by CFAs in a particular country;
- Both the SPO and the CFA are targeting the same capability, and preferably aim for similar outcomes;
- Maximum one SPO per CFA per country will be included in the process tracing.

The intention was to focus on about 30-50% of the SPOs involved. Please see the tables below for a selection of SPOs per country. Per country, a first table shows the extent to which a CFA targets the five capabilities, which is used to select the capabilities to focus on. A second table presents which SPO is selected, and takes into consideration the selection criteria as mentioned above.

ETHIOPIA

For Ethiopia the capabilities that are mostly targeted by CFAs are the capability to act and commit and the capability to adapt and self-renew. See also the table below.

Table 1

The extent to which the Dutch NGO explicitly targets the following capabilities – Ethiopia

Capability to:	AMREF	CARE	ECFA	FSCE	HOA- REC	HUND EE	NVEA	OSRA	TTCA
Act and commit	5	4	5	5	5	3	4	4	3
Deliver on development objectives	2	1	1	1	2	1	1	2	1
Adapt and self-renew	4	2	3	4	2	5	3	3	3
Relate	3	1	2	2	3	2	1	3	1
Achieve coherence	2	2	1	1	1	1	1	1	1

Note: Number 1 stands for not targeted, 5 for intensively targeted. These scores are relative scores for the interventions by the CFA to strengthen the capacity of the SPO. The scores are relative to each other, a higher score means that this capability gets more attention by the CFA compared to other capabilities.

Source: country baseline report, Ethiopia.

Below you can see the table describing when the contract with the SPO is to be ended, and whether both SPO and the CFA expect to focus on these two selected capabilities (with MFS II funding). Based on the above-mentioned selection criteria the following SPOs are selected for process tracing: AMREF, ECFA, FSCE, HUNDEE. In fact, six SPOs would be suitable for process tracing. We just selected the first one per CFA following the criteria of not including more than one SPO per CFA for process tracing

Table 2

SPOs selected for process tracing – Ethiopia

Ethiopia – SPOs	End of contract	Focus on capability to act and commit – by SPO	Focus on capability to act and commit – by CFA	Focus on capability to adapt and self-renew – by SPO	Focus on capability to adapt and self-renew – by CFA	CFA	Selected for process tracing
AMREF	Dec 2015	Yes	Yes	Yes	Yes	AMREF NL	Yes
CARE	Dec 31, 2015	Partly	Yes	Yes	Yes – slightly	CARE Netherlands	No - not fully matching
ECFA	Jan 2015	Yes	Yes	Yes	Yes	Child Helpline International	Yes
FSCE	Dec 2015	Yes	Yes	Yes	Yes	Stichting Kinderpostzegels Netherlands (SKN); Note: no info from Defence for Children – ECPAT Netherlands	Yes
HOA-REC	Sustainable Energy project (ICCO Alliance): 2014 Innovative WASH (WASH Alliance): Dec 2015	Yes	Yes	Yes	Yes - slightly	ICCO	No - not fully matching
HUNDEE	Dec 2014	Yes	Yes	Yes	Yes	ICCO & IICD	Yes
NVEA	Dec 2015 (both)	Yes	Yes	Yes	Yes	Edukans Foundation (under two consortia); Stichting Kinderpostzegels Netherlands (SKN)	Suitable but SKN already involved for process tracing FSCE
OSRA	C4C Alliance project (farmers marketing): December 2014 ICCO Alliance project (zero grazing): 2014 (2 nd phase)	Yes	Yes	Yes	Yes	ICCO & IICD	Suitable but ICCO & IICD already involved for process tracing - HUNDEE
TTCA	June 2015	Partly	Yes	No	Yes	Edukans Foundation	No - not fully matching

INDIA

For India the capability that is mostly targeted by CFAs is the capability to act and commit. The next one in line is the capability to adapt and self-renew. See also the table below in which a higher score means that the specific capability is more intensively targeted.

Table 3

The extent to which the Dutch NGO explicitly targets the following capabilities – India³

Capability to:	BVHA	COUNT	DRISTI	FFID	Jana Vikas	Samar thak Samiti	SMILE	SDS	VTRC
Act and commit	5	3	4	4	4	4	4	3	5
Deliver on development objectives	1	5	1	1	1	1	1	2	1
Adapt and self-renew	2	2	1	3	1	1	4	1	4
Relate	3	1	1	1	1	1	2	1	2
Achieve coherence	1	1	1	4	1	1	1	1	2

Note: Number 1 stands for not targeted, 5 for intensively targeted. These scores are relative scores for the interventions by the CFA to strengthen the capacity of the SPO. The scores are relative to each other, a higher score means that this capability gets more attention by the CFA compared to other capabilities.

Source: country baseline report, India.

Below you can see a table describing when the contract with the SPO is to be ended and whether SPO and the CFA both expect to focus on these two selected capabilities (with MFS II funding). Based on the above-mentioned selection criteria the following SPOs are selected for process tracing: BVHA, COUNT, FFID, SMILE and VTRC. Except for SMILE (capability to act and commit only), for the other SPOs the focus for process tracing can be on the capability to act and commit and on the capability to adapt and self-renew.

Table 4

SPOs selected for process tracing – India

India – SPOs	End of contract	Focus on capability to act and commit – by SPO	Focus on capability to act and commit – by CFA	Focus on capability to adapt and self-renew – by SPO	Focus on capability to adapt and self-renew – by CFA	CFA	Selected for process tracing
BVHA	2014	Yes	Yes	Yes	Yes	Simavi	Yes; both capabilities
COUNT	2015	Yes	Yes	Yes	Yes	Woorden Daad	Yes; both capabilities
DRISTI	31-03-2012	Yes	Yes	No	no	Hivos	No - closed in 2012
FFID	30-09-2014	Yes	Yes	Yes	Yes	ICCO	Yes

³ RGVN, NEDSF and Women's Rights Forum (WRF) could not be reached timely during the baseline due to security reasons. WRF could not be reached at all. Therefore these SPOs are not included in Table 1.

India – SPOs	End of contract	Focus on capability to act and commit – by SPO	Focus on capability to act and commit – by CFA	Focus on capability to adapt and self-renew – by SPO	Focus on capability to adapt and self-renew – by CFA	CFA	Selected for process tracing
Jana Vikas	2013	Yes	Yes	Yes	No	Cordaid	No - contract is and the by now; not fully matching focus
NEDSF							No – delayed baseline
RGVN							No - delayed baseline
Samarthak Samiti (SDS)	2013 possibly longer	Yes	Yes	Yes	No	Hivos	No - not certain of end date and not fully matching focus
Shivi Development Society (SDS)	Dec 2013 intention 2014	Yes	Yes	Yes	No	Cordaid	No - not fully matching focus
Smile	2015	Yes	Yes	Yes	Yes	Wilde Ganzen	Yes; first capability only
VTRC	2015	Yes	Yes	Yes	Yes	Stichting Red een Kind	Yes; both capabilities

INDONESIA

For Indonesia the capabilities that are most frequently targeted by CFAs are the capability to act and commit and the capability to adapt and self-renew. See also the table below.

Table 5

The extent to which the Dutch NGO explicitly targets the following capabilities – Indonesia

Capability to:	ASB	Daya kologi	ECPAT	GSS	Lem baga Kita	Pl. PPMA	Rifka Annisa	WIIP	Yad upa	Yayasan Kelola	YPI	YRBI
Act and commit	4	4	4	5	4	4	5	3	3	2	5	4
Deliver on development objectives	1	1	1	2	2	1	2	1	1	1	1	1
Adapt and self-renew	3	1	2	4	2	3	4	4	1	1	4	3
Relate	1	1	2	3	3	2	1	2	2	2	3	2
Achieve coherence	1	1	1	2	1	1	2	2	1	1	2	1

Note: Number 1 stands for not targeted, 5 for intensively targeted. These scores are relative scores for the interventions by the CFA to strengthen the capacity of the SPO. The scores are relative to each other, a higher score means that this capability gets more attention by the CFA compared to other capabilities.

Source: country baseline report, Indonesia.

The table below describes when the contract with the SPO is to be ended and whether both SPO and the CFA expect to focus on these two selected capabilities (MFS II funding). Based on the above-mentioned selection criteria the following SPOs are selected for process tracing: ASB, ECPAT, Pt.PPMA, YPI, YRBI.

Table 6

SPOs selected for process tracing – Indonesia

Indonesia – SPOs	End of contract	Focus on capability to act and commit – by SPO	Focus on capability to act and commit – by CFA	Focus on capability to adapt and self-renew – by SPO	Focus on capability to adapt and self-renew – by CFA	CFA	Selected for process tracing
ASB	February 2012; extension Feb,1, 2013 – June,30, 2016	Yes	Yes	Yes	Yes	Hivos	Yes
Dayakologi	2013; no extension	Yes	Yes	Yes	No	Cordaid	No: contract ended early and not matching enough
ECPAT	August 2013; Extension Dec 2014	Yes	Yes	Yes, a bit	Yes	Free Press Unlimited - Mensen met een Missie	Yes
GSS	31 December 2012; no extension	Yes	Yes	Yes, a bit	Yes	Free Press Unlimited - Mensen met een Missie	No: contract ended early
Lembaga Kita	31 December 2012; no extension	Yes	Yes	No	Yes	Free Press Unlimited - Mensen met een Missie	No - contract ended early
Pt.PPMA	May 2015	Yes	Yes	No	Yes	IUCN	Yes, capability to act and commit only
Rifka Annisa	Dec, 31 2015	No	Yes	No	Yes	Rutgers WPF	No - no match between expectations CFA and SPO
WIIP	Dec 2015	Yes	Not MFS II	Yes	Not MFS II	Red Cross	No - Capacity development interventions are not MFS II financed. Only some overhead is MFS II

Indonesia – SPOs	End of contract	Focus on capability to act and commit – by SPO	Focus on capability to act and commit – by CFA	Focus on capability to adapt and self-renew – by SPO	Focus on capability to adapt and self-renew – by CFA	CFA	Selected for process tracing
Yayasan Kelola	Dec 30, 2013; extension of contract being processed for two years (2014-2015)	Yes	Not really	Yes	Not really	Hivos	No - no specific capacity development interventions planned by Hivos
YPI	Dec 31, 2015	Yes	Yes	Yes	Yes	Rutgers WPF	Yes
YRBI	Oct, 30, 2013; YRBI end of contract from 31st Oct 2013 to 31st Dec 2013. Contract extension proposal is being proposed to MFS II, no decision yet.	Yes	Yes	Yes	Yes	ICCO	Yes
Yadupa	Under negotiation during baseline; new contract 2013 until now	Yes	Nothing committed	Yes	Nothing committed	IUCN	No, since nothing was committed by CFA

LIBERIA

For Liberia the situation is arbitrary which capabilities are targeted most CFA's. Whilst the capability to act and commit is targeted more often than the other capabilities, this is only so for two of the SPOs. The capability to adapt and self-renew and the capability to relate are almost equally targeted for the five SPOs, be it not intensively. Since the capability to act and commit and the capability to adapt and self-renew are the most targeted capabilities in Ethiopia, India and Indonesia, we choose to focus on these two capabilities for Liberia as well. This would help the synthesis team in the further analysis of these capabilities related to process tracing. See also the table below.

Table 7

The extent to which the Dutch NGO explicitly targets the following capabilities – Liberia

Capability to:	BSC	DEN-L	NAWOCOL	REFOUND	RHRAP
Act and commit	5	1	1	1	3
Deliver on development objectives	3	1	1	1	1
Adapt and self-renew	2	2	2	2	2
Relate	1	2	2	2	2
Achieve coherence	1	1	1	1	1

Note: Number 1 stands for not targeted, 5 for intensively targeted. These scores are relative scores for the interventions by the CFA to strengthen the capacity of the SPO. The scores are relative to each other, a higher score means that this capability gets more attention by the CFA compared to other capabilities.

Source: country baseline report, Liberia.

Below you can see the table describing when the contract with the SPO is to be ended, and whether both SPO and the CFA expect to focus on these two selected capabilities (with MFS II funding). Also, for two of the five SPOs capability to act and commit is targeted more intensively compared to the other capabilities. Based on the above-mentioned selection criteria the following SPOs are selected for process tracing: BSC and RHRAP.

Table 8

SPOs selected for process tracing – Liberia

Liberia – SPOs	End of contract	Focus on capability to act and commit – by SPO	Focus on capability to act and commit – by CFA	Focus on capability to adapt and self-renew – by SPO	Focus on capability to adapt and self-renew – by CFA	CFA	Selected for process tracing
BSC	Dec 31, 2015	Yes	Yes	Yes	Yes	SPARK	Yes
DEN-L	2014	No	No	Unknown	A little	ICCO	No – not matching enough
NAWOCOL	2014	Yes	No	No	A little	ICCO	No – not matching enough
REFOUND	At least until 2013 (2015?)	Yes	No	Yes	A little	ICCO	No – not matching enough
RHRAP	At least until 2013 (2014?)	Yes	Yes	Yes	Yes	ICCO	Yes

Key steps in process tracing for the 5C study

In the box below you will find the key steps developed for the 5C process tracing methodology. These steps will be further explained here. Only key staff of the SPO is involved in this process: management; programme/ project staff; and monitoring and evaluation staff, and other staff that could provide information relevant to the identified outcome area/key organisational capacity change. Those SPOs selected for process tracing had a separate endline workshop, in addition to the ‘ general endline workshop. This workshop was carried out after the initial endline workshop and the interviews during the field visit to the SPO. Where possible, the general and process tracing endline workshop have been held consecutively, but where possible these workshops were held at different points in time, due to the complex design of the process. Below the detailed steps for the purpose of process tracing are further explained.

Key steps in process tracing for the 5C study

1. Identify the planned MFS II supported capacity development interventions within the selected capabilities (capability to act and commit and capability to adapt and self-renew) – CDI team
2. Identify the implemented MFS II supported capacity development interventions within the selected capabilities (capability to act and commit and capability to adapt and self-renew) – CDI team
3. Identify initial changes/ outcome areas in these two capabilities – CDI team & in-country team
4. Construct the detailed, initial causal map (theoretical model of change) – CDI team & in-country team
5. Identify types of evidence needed to verify or discard different causal relationships in the model of change – in-country teams, with support from CDI team
6. Collect data to verify or discard causal mechanisms and construct workshop based, detailed causal map (model of change) – in-country team
7. Assess the quality of data and analyse data and develop final detailed causal map (model of change) – in-country team with CDI team
8. Analyse and conclude on findings– CDI team, in collaboration with in-country team

Some definitions of the terminology used for this MFS II 5c evaluation

Based upon the different interpretations and connotations the use of the term causal mechanism we use the following terminology for the remainder of this paper:

A **detailed causal map** (or **model of change**) = the representation of all possible explanations – causal pathways for a change/ outcome. These pathways are that of the intervention, rival pathways and pathways that combine parts of the intervention pathway with that of others. This also depicts the reciprocity of various events influencing each other and impacting the overall change.

A **causal mechanism** = is the combination of parts that ultimately explains an outcome. Each part of the mechanism is an individually insufficient but necessary factor in a whole mechanism, which together produce the outcome (Beach and Pedersen, 2013, p. 176).

Part or **cause** = one actor with its attributes carrying out activities/ producing outputs that lead to change in other parts. The final part or cause is the change/ outcome.

Attributes of the actor = specificities of the actor that increase his chance to introduce change or not such as its position in its institutional environment.

*Step 1. Identify the **planned MFS II supported capacity development interventions** within the selected capabilities (capability to act and commit and capability to adapt and self-renew) – CDI team*

Chapter 4.1 and 4.2 in the baseline report were reviewed. Capacity development interventions as planned by the CFA for the capability to act and commit and for the capability to adapt and self-renew were described and details inserted in the summary format. This provided an overview of the capacity development activities that were originally planned by the CFA for these two capabilities and assisted in focusing on relevant outcomes that are possibly related to the planned interventions.

*Step 2. Identify the **implemented capacity development interventions** within the selected capabilities (capability to act and commit and capability to adapt and self-renew) – CDI team*

The input from the CFA was reviewed in terms of what capacity development interventions have taken place in the MFS II period. This information was found in the 'Support to capacity development sheet - endline - CFA perspective' for the SPO, based on details provided by the CFA and further discussed during an interview by the CDI team.

The CFA was asked to describe all the MFS II supported capacity development interventions of the SPO that took place during the period 2011 up to now. The CDI team reviewed this information, not only the interventions but also the observed changes as well as the expected long-term changes, and

then linked these interventions to relevant outcomes in one of the capabilities (capability to act and commit; and capability to adapt and self-renew).

*Step 3. Identify **initial changes/ outcome areas** in these two capabilities – by CDI team & in-country team*

The CDI team was responsible for coding documents received from SPO and CFA in NVivo on the following:

- **5C Indicators**: this was to identify the changes that took place between baseline and endline. This information was coded in Nvivo.
- Information related to the capacity development interventions implemented by the CFA (with MFS II funding) (see also Step 2) to strengthen the capacity of the SPO. For example, the training on financial management of the SPO staff could be related to any information on financial management of the SPO. This information was coded in Nvivo.

In addition, the response by the CFA to the changes in 5C indicators format, was auto-coded.

The in-country team was responsible for timely collection of information from the SPO (before the fieldwork starts). This set of information dealt with:

- MFS II supported capacity development interventions during the MFS II period (2011 until now).
- Overview of all trainings provided in relation to a particular outcome areas/organisational capacity change since the baseline.
- For each of the identified MFS II supported trainings, training questionnaires have been developed to assess these trainings in terms of the participants, interests, knowledge and skills gained, behaviour change and changes in the organisation (based on Kirkpatrick's model), one format for training participants and one for their managers. These training questionnaires were sent prior to the field visit.
- Changes expected by SPO on a long-term basis ('Support to capacity development sheet - endline - SPO perspective').

For the selection of change/ outcome areas the following criteria were important:

- The change/ outcome area is in one of the two capabilities selected for process tracing: capability to act and commit or the capability to adapt and self-renew. This was the first criteria to select upon.
- There was a likely link between the key organisational capacity change/ outcome area and the MFS II supported capacity development interventions. This also was an important criteria. This would need to be demonstrated through one or more of the following situations:
 - In the 2012 theory of change on organisational capacity development of the SPO a link was indicated between the outcome area and MFS II support;
 - During the baseline the CFA indicated a link between the planned MFS II support to organisational development and the expected short-term or long-term results in one of the selected capabilities;
 - During the endline the CFA indicated a link between the implemented MFS II capacity development interventions and observed short-term changes and expected long-term changes in the organisational capacity of the SPO in one of the selected capabilities;
 - During the endline the SPO indicated a link between the implemented MFS II capacity development interventions and observed short-term changes and expected long-term changes in the organisational capacity of the SPO in one of the selected capabilities.

Reviewing the information obtained as described in Step 1, 2, and 3 provided the basis for selecting key organisational capacity change/ outcome areas to focus on for process tracing. These areas were to be formulated as broader outcome areas, such as 'improved financial management', 'improved monitoring and evaluation' or 'improved staff competencies'.

Note: the outcome areas were to be formulated as intermediates changes. For example: an improved monitoring and evaluation system, or enhanced knowledge and skills to educate the target group on climate change. Key outcome areas were also verified - based on document review as well as discussions with the SPO during the endline.

*Step 4. Construct the **detailed, initial causal map** (theoretical model of change) – CDI & in-country team*

A detailed initial causal map was developed by the CDI team, in collaboration with the in-country team. This was based on document review, including information provided by the CFA and SPO on MFS II supported capacity development interventions and their immediate and long-term objectives as well as observed changes. Also, the training questionnaires were reviewed before developing the initial causal map. This detailed initial causal map was to be provided by the CDI team with a visual and related narrative with related references. This initial causal map served as a reference point for further reflection with the SPO during the process tracing endline workshop, where relationships needed to be verified or new relationships established so that the second (workshop-based), detailed causal map could be developed, after which further verification was needed to come up with the final, concluding detailed causal map.

It's important to note that organisational change area/ outcome areas could be both positive and negative.

For each of the selected outcomes the team needed to make explicit the theoretical model of change. This meant finding out about the range of different actors, factors, actions, and events etc. that have contributed to a particular outcome in terms of organisational capacity of the SPO.

A model of change of good quality includes:

- The causal pathways that relate the intervention to the realised change/ outcome;
- Rival explanations for the same change/ outcome;
- Assumptions that clarify relations between different components or parts;
- Case specific and/or context specific factors or risks that might influence the causal pathway, such as for instance the socio-cultural-economic context, or a natural disaster;
- Specific attributes of the actors e.g. CFA and other funders.

A model of change (within the 5C study called a 'detailed causal map') is a complex system which produces intermediate and long-term outcomes by the interaction of other parts. It consists of parts or causes that often consist of one actor with its attributes that is implementing activities leading to change in other parts (Beach & Pedersen, 2013). A helpful way of constructing the model of change is to think in terms of actors carrying out activities that lead to other actors changing their behaviour. The model of change can be explained as a range of activities carried out by different *actors* (including the CFA and SPO under evaluation) that will ultimately lead to an outcome. Besides this, there are also '*structural*' elements, which are to be interpreted as external factors (such as economic conjuncture); and *attributes* of the actor (does the actor have the legitimacy to ask for change or not, what is its position in the sector) that should be looked at (Beach & Pedersen, 2013). In fact Beach and Pedersen, make a fine point about the subjectivity of the actor in a dynamic context. This means, in qualitative methodologies, capturing the changes in the actor, acted upon area or person/organisation, in a non sequential and non temporal format. Things which were done recently could have corrected behavioural outcomes of an organisation and at the same time there could be processes which incrementally pushed for the same change over a period of time. Beach and Pedersen espouse this methodology because it captures change in a dynamic fashion as against the methodology of logical framework. For the MFS II evaluation it was important to make a distinction between those paths in the model of change that are the result of MFS II and rival pathways.

The construction of the model of change started with the identified key organisational capacity change/ outcome, followed by an inventory of all possible subcomponents that possibly have caused the change/ outcome in the MFS II period (2011-up to now, or since the baseline). The figure below presents an imaginary example of a model of change. The different colours indicate the different types of support to capacity development of the SPO by different actors, thereby indicating different pathways of change, leading to the key changes/ outcomes in terms of capacity development (which in this case indicates the ability to adapt and self-renew).

Figure 1 An imaginary example of a model of change

Step 5. Identify types of evidence needed to verify or discard different causal relationships in the model of change – in-country teams with support from CDI team

Once the causal mechanism at theoretical level were defined, empirical evidence was collected so as to verify or discard the different parts of this theoretical model of change, confirm or reject whether subcomponents have taken place, and to find evidence that confirm or reject the causal relations between the subcomponents.

A key question that we needed to ask ourselves was, “What information do we need in order to confirm or reject that one subcomponent leads to another, that X causes Y?”. The evaluation team needed to agree on what information was needed that provides empirical manifestations for each part of the model of change.

There are four distinguishable types of evidence that are relevant in process tracing analysis: *pattern*, *sequence*, *trace*, and *account*. Please see the box below for descriptions of these types of evidence.

The evaluation team needed to agree on the types of evidence that was needed to verify or discard the manifestation of a particular part of the causal mechanism. Each one or a combination of these different types of evidence could be used to confirm or reject the different parts of the model of change. This is what is meant by robustness of evidence gathering. Since causality as a concept can bend in many ways, our methodology, provides a near scientific model for accepting and rejecting a particular type of evidence, ignoring its face value.

Types of evidence to be used in process tracing

Pattern evidence relates to predictions of statistical patterns in the evidence. For example, in testing a mechanism of racial discrimination in a case dealing with employment, statistical patterns of employment would be relevant for testing this part of the mechanism.

Sequence evidence deals with the temporal and spatial chronology of events predicted by a hypothesised causal mechanism. For example, a test of the hypothesis could involve expectations of the timing of events where we might predict that if the hypothesis is valid, we should see that the event B took place after event A took place. However, if we found that event B took place before event A took place, the test would suggest that our confidence in the validity of this part of the mechanism should be reduced (disconfirmation/ falsification).

Trace evidence is evidence whose mere existence provides proof that a part of a hypothesised mechanism exists. For example, the existence of the minutes of a meeting, if authentic ones, provide strong proof that the meeting took place.

Account evidence deals with the content of empirical material, such as meeting minutes that detail what was discussed or an oral account of what took place in the meeting.

Source: Beach and Pedersen, 2013

Below you can find a table that provides guidelines on what to look for when identifying types of evidence that can confirm or reject causal relationships between different parts/ subcomponents of the model of change. It also provides one example of a part of a causal pathway and what type of information to look for.

Table 9

Format for identifying types of evidence for different causal relationships in the model of change (example included)

Part of the model of change	Key questions	Type of evidence needed	Source of information
Describe relationship between the subcomponents of the model of change	Describe questions you would like to answer so as to find out whether the components in the relationship took place, when they took place, who was involved, and whether they are related	Describe the information that we need in order to answer these questions. Which type of evidence can we use in order to reject or confirm that subcomponent X causes subcomponent Y? Can we find this information by means of : Pattern evidence; Sequence evidence; Trace evidence; Account evidence?	Describe where you can find this information
Example: Training workshops on M&E provided by MFS II funding and other sources of funding	Example: What type of training workshops on M&E took place? Who was trained? When did the training take place? Who funded the training? Was the funding of training provided before the training took place? How much money was available for the training?	Example: Trace evidence: on types of training delivered, who was trained, when the training took place, budget for the training Sequence evidence on timing of funding and timing of training Content evidence: what the training was about	Example: Training report SPO Progress reports Interviews with the CFA and SPO staff Financial reports SPO and CFA

Please note that for practical reasons, the 5C evaluation team decided that it was easier to integrate the specific questions in the narrative of the initial causal map. These questions would need to be addressed by the in country team during the process tracing workshop so as to discover, verify or discard particular causal mechanisms in the detailed, initial causal map. Different types of evidence was asked for in these questions.

*Step 6. **Collect data** to verify or discard causal mechanisms and develop workshop-based, detailed causal map – in-country team*

Once it was decided by the in-country and CDI evaluation teams what information was to be collected during the interaction with the SPO, data collection took place. The initial causal maps served as a basis for discussions during the endline workshop with a particular focus on process tracing for the identified organisational capacity changes. But it was considered to be very important to understand from the perspective of the SPO how they understood the identified key organisational capacity change/outcome area has come about. A new detailed, workshop-based causal map was developed that included the information provided by SPO staff as well as based on initial document review as described in the initial detailed causal map. This information was further analysed and verified with other relevant information so as to develop a final causal map, which is described in the next step.

*Step 7. **Assess the quality of data and analyse data**, and develop the **final detailed causal map** (model of change) – in-country team and CDI team*

Quality assurance of the data collected and the evidence it provides for rejecting or confirming parts of causal explanations are a major concern for many authors specialised in contribution analysis and process-tracing. Stern et al. (2012), Beach and Pedersen (2013), Lemire, Nielsen and Dybdal (2012), Mayne (2012) and Delahais and Toulemonde (2012) all emphasise the need to make attribution/contribution claims that are based on pieces of evidence that are rigorous, traceable, and credible. These pieces of evidence should be as explicit as possible in proving that *subcomponent X causes subcomponent Y* and ruling out other explanations. Several tools are proposed to check the nature and the quality of data needed. One option is, Delahais and Toulemonde's Evidence Analysis Database, which we have adapted for our purpose.

Delahais and Toulemonde (2012) propose an Evidence Analysis Database that takes into consideration three criteria:

Confirming/ rejecting a causal relation (yes/no);

Type of causal mechanism: intended contribution/ other contribution/ condition leading to intended contribution/ intended condition to other contribution/ feedback loop;

Strength of evidence: strong/ rather strong/ rather weak/ weak.

We have adapted their criteria to our purpose. The in-country team, in collaboration with the CDI team, used the criteria in assessing whether causal relationships in the causal map, were strong enough. This has been more of an iterative process trying to find additional evidence for the established relationships through additional document review or contacting the CFA and SPO as well as getting their feedback on the final detailed causal map that was established. Whilst the form below has not been used exactly in the manner depicted, it has been used indirectly when trying to validate the information in the detailed causal map. After that, the final detailed causal map is established both as a visual as well as a narrative, with related references for the established causal relations.

<i>Example format for the adapted evidence analysis database (example included)</i>	Confirming/ rejecting a causal relation (yes/ no)	Type of information providing the background to the confirmation or rejection of the causal relation	Strength of evidence: strong/ rather strong/ rather weak/ weak	Explanation for why the evidence is (rather) strong or (rather) weak, and therefore the causal relation is confirmed/ rejected
Description of causal relation				
e.g. Training staff in M&E leads to enhanced M&E knowledge, skills and practice	e.g. Confirmed	e.g. Training reports confirmed that staff are trained in M&E and that knowledge and skills increased as a result of the training		

Step 8. Analyse and conclude on findings– in-country team and CDI team

The final detailed causal map was described as a visual and narrative and this was then analysed in terms of the evaluation question two and evaluation question four: “*To what degree are the changes identified in partner capacity attributable to development interventions undertaken by the MFS II consortia (i.e. measuring effectiveness)?*” and “*What factors explain the findings drawn from the questions above?*” It was analysed to what extent the identified key organisational capacity change can be attributed to MFS II supported capacity development interventions as well as to other related factors, interventions and actors.

4. Explaining factors – evaluation question 4

This paragraph describes the data collection and analysis methodology for answering the fourth evaluation question: “**What factors explain the findings drawn from the questions above?**”

In order to explain the changes in organisational capacity development between baseline and endline (evaluation question 1) the CDI and in-country evaluation teams needed to review the indicators and how they have changed between baseline and endline and what reasons have been provided for this. This has been explained in the first section of this appendix. It has been difficult to find detailed explanations for changes in each of the separate 5c indicators, but the 'general causal map' has provided some ideas about some of the key underlying factors actors and interventions that influence the key organisational capacity changes, as perceived by the SPO staff.

For those SPOs that are selected for process tracing (evaluation question 2), more in-depth information was procured for the identified key organisational capacity changes and how MFS II supported capacity development interventions as well as other actors, factors and interventions have influenced these changes. This is integrated in the process of process tracing as described in the section above.

5. Methodological reflection

Below a few methodological reflections are made by the 5C evaluation team.

Use of the 5 core capabilities framework and qualitative approach: this has proven to a be very useful framework to assess organisational capacity. The five core capabilities provide a comprehensive picture of the capacity of an organisation. The capabilities are interlinked, which was also reflected in the description of standard indicators, that have been developed for the purpose of this 5C evaluation

and agreed upon for the eight countries. Using this framework with a mainly qualitative approach has provided rich information for the SPOs and CFAs, and many have indicated this was a useful learning exercise.

Using standard indicators and scores: using standard indicators is useful for comparison purposes. However, the information provided per indicator is very specific to the SPO and therefore makes comparison difficult. Whilst the description of indicators has been useful for the SPO and CFA, it is questionable to what extent indicators can be compared across SPOs since they need to be seen in context, for them to make meaning. In relation to this, one can say that scores that are provided for the indicators, are only relative and cannot show the richness of information as provided in the indicator description. Furthermore, it must be noted that organisations are continuously changing and scores are just a snapshot in time. There cannot be perfect score for this. In hindsight, having rubrics would have been more useful than scores.

General causal map: whilst this general causal map, which is based on key organisational capacity changes and related causes, as perceived by the SPO staff present at the endline workshop, has not been validated with other sources of information except SPO feedback, the 5C evaluation team considers this information important, since it provides the SPO story about how and which changes in the organisation since the baseline, are perceived as being important, and how these changes have come about. This will provide information additional to the information that has been validated when analysing and describing the indicators as well as the information provided through process tracing (selected SPOs). This has proven to be a learning experience for many SPOs.

Using process tracing for dealing with the attribution question: this theory-based and mainly qualitative approach has been chosen to deal with the attribution question, on how the organisational capacity changes in the organisations have come about and what the relationship is with MFS II supported capacity development interventions and other factors. This has proven to be a very useful process, that provided a lot of very rich information. Many SPOs and CFAs have already indicated that they appreciated the richness of information which provided a story about how identified organisational capacity changes have come about. Whilst this process was intensive for SPOs during the process tracing workshops, many appreciated this to be a learning process that provided useful information on how the organisation can further develop itself. For the evaluation team, this has also been an intensive and time-consuming process, but since it provided rich information in a learning process, the effort was worth it, if SPOs and CFAs find this process and findings useful.

A few remarks need to be made:

- Outcome explaining process tracing is used for this purpose, but has been adapted to the situation since the issues being looked at were very complex in nature.
- Difficulty of verifying each and every single change and causal relationship:
- Intensity of the process and problems with recall: often the process tracing workshop was done straight after the general endline workshop that has been done for all the SPOs. In some cases, the process tracing endline workshop has been done at a different point in time, which was better for staff involved in this process, since process tracing asks people to think back about changes and how these changes have come about. The word difficulties with recalling some of these changes and how they have come about. See also the next paragraph.
- Difficulty of assessing changes in knowledge and behaviour: training questionnaire is have been developed, based on Kirkpatrick's model and were specifically tailored to identify not only the interest but also the change in knowledge and skills, behaviour as well as organisational changes as a result of a particular training. The retention ability of individuals, irrespective of their position in the organisation, is often unstable. The 5C evaluation team experienced that it was difficult for people to recall specific trainings, and what they learned from those trainings. Often a change in knowledge, skills and behaviour is a result brought about by a combination of different factors, rather than being traceable to one particular event. The detailed causal maps that have been established, also clearly pointed this. There are many factors at play that make people change their behaviour, and this is not just dependent on training but also internal/personal (motivational) factors as well as factors within the organisation, that stimulate or hinder a person to change behaviour. Understanding how behaviour change works is important when trying to really understand the extent to which behaviour has changed as a result of different factors, actors and interventions. Organisations change because people

change and therefore understanding when and how these individuals change behaviour is crucial. Also attrition and change in key organisational positions can contribute considerably to the outcome.

Utilisation of the evaluation

The 5C evaluation team considers it important to also discuss issues around utility of this evaluation. We want to mention just a few.

Design – mainly externally driven and with a focus on accountability and standard indicators and approaches within a limited time frame, and limited budget: this MFS II evaluation is originally based on a design that has been decided by IOB (the independent evaluation office of the Dutch Ministry of Foreign Affairs) and to some extent MFS II organisations. The evaluators have had no influence on the overall design and sampling for the 5C study. In terms of learning, one may question whether the most useful cases have been selected in this sampling process. The focus was very much on a rigorous evaluation carried out by an independent evaluation team. Indicators had to be streamlined across countries. The 5C team was requested to collaborate with the other 5C country teams (Bangladesh, Congo, Pakistan, Uganda) to streamline the methodological approach across the eight sampled countries. Whilst this may have its purpose in terms of synthesising results, the 5C evaluation team has also experienced the difficulty of tailoring the approach to the specific SPOs. The overall evaluation has been mainly accountability driven and was less focused on enhancing learning for improvement. Furthermore, the timeframe has been very small to compare baseline information (2012) with endline information (2014). Changes in organisational capacity may take a long, particularly if they are related to behaviour change. Furthermore, there has been limited budget to carry out the 5C evaluation. For all the four countries (Ethiopia, India, Indonesia, Liberia) that the Centre for Development Innovation, Wageningen University and Research centre has been involved in, the budget has been overspent.

However, the 5C evaluation team has designed an endline process whereby engagement of staff, e.g. in a workshop process was considered important, not only due to the need to collect data, but also to generate learning in the organisation. Furthermore, having general causal maps and detailed causal maps generated by process tracing have provided rich information that many SPOs and CFAs have already appreciated as useful in terms of the findings as well as a learning process.

Another issue that must be mentioned is that additional requests have been added to the country teams during the process of implementation: developing a country based synthesis; questions on design, implementation, and reaching objectives of MFS II funded capacity development interventions, whilst these questions were not in line with the core evaluation questions for the 5C evaluation.

Complexity and inadequate coordination and communication: many actors, both in the Netherlands, as well as in the eight selected countries, have been involved in this evaluation and their roles and responsibilities, were often unclear. For example, 19 MFS II consortia, the internal reference group, the Ministry of Foreign Affairs, Partos, the Joint Evaluation Trust, NWO-Wotro, the evaluators (Netherlands and in-country), 2 external advisory committees, and the steering committee. Not to mention the SPO's and their related partners and consultants. CDI was involved in 4 countries with a total number of 38 SPOs and related CFAs. This complexity influenced communication and coordination, as well as the extent to which learning could take place. Furthermore, there was a distance between the evaluators and the CFAs, since the approach had to be synchronised across countries, and had to adhere to strict guidelines, which were mainly externally formulated and could not be negotiated or discussed for the purpose of tailoring and learning. Feedback on the final results and report had to be provided mainly in written form. In order to enhance utilisation, a final workshop at the SPO to discuss the findings and think through the use with more people than probably the one who reads the report, would have more impact on organisational learning and development. Furthermore, feedback with the CFAs has also not been institutionalised in the evaluation process in the form of learning events. And as mentioned above, the complexity of the evaluation with many actors involved did not enhance learning and thus utilization.

5C Endline process, and in particular thoroughness of process tracing often appreciated as learning process: The SPO perspective has also brought to light a new experience and technique of self-assessment and self-corrective measures for managers. Most SPOs whether part of process tracing or not, deeply appreciated the thoroughness of the methodology and its ability to capture details with robust connectivity. This is a matter of satisfaction and learning for both evaluators and SPOs. Having a process whereby SPO staff were very much engaged in the process of self-assessment and reflection has proven for many to be a learning experience for many, and therefore have enhanced utility of the 5C evaluation.

Appendix 2 Background information on the five core capabilities framework

The 5 capabilities (5C) framework was to be used as a framework for the evaluation of capacity development of Southern Partner Organisations (SPOs) of the MFS II consortia. The 5C framework is based on a five-year research program on 'Capacity, change and performance' that was carried out by the European Centre for Development Policy Management (ECDPM). The research included an extensive review of the literature and sixteen case studies. The 5C framework has also been applied in an IOB evaluation using 26 case studies in 14 countries, and in the baseline carried out per organisation by the MFS II organisations for the purpose of the monitoring protocol.

The 5C framework is structured to understand and analyse (changes in) the capacity of an organization to deliver (social) value to its constituents. This introduction briefly describes the 5C framework, mainly based on the most recent document on the 5C framework (Keijzer et al., 2011).

The 5C framework sees capacity as an **outcome** of an **open system**. An organisation or collaborative association (for instance a network) is seen as a system interacting with wider society. The most critical practical issue is to ensure that relevant stakeholders share a common way of thinking about capacity and its core constituents or capabilities. Decisive for an organisation's capacity is the context in which the organisation operates. This means that **understanding context issues** is crucial. The use of the 5C framework requires a multi-stakeholder approach because shared values and results orientation are important to facilitate the capacity development process. The 5C framework therefore needs to **accommodate the different visions** of stakeholders and conceive different strategies for raising capacity and improving performance in a given situation.

The 5C framework defines capacity as '**producing social value**' and identifies five core capabilities that together result in that overall capacity. Capacity, capabilities and competences are seen as follows:

Capacity is referred to as the overall ability of an organisation or system to create value for others;

Capabilities are the collective ability of a group or a system to do something either inside or outside the system. The collective ability involved may be technical, logistical, managerial or generative (i.e. the ability to earn legitimacy, to adapt, to create meaning, etc.);

Competencies are the energies, skills and abilities of individuals.

Fundamental to developing capacity are inputs such as human, material and financial resources, technology, and information. To the degree that they are developed and successfully integrated, capabilities contribute to the overall capacity or ability of an organisation or system to create value for others. A single capability is not sufficient to create capacity. All are needed and are strongly interrelated and overlapping. Thus, to achieve its development goals, the 5C framework says that every organisation or system must have **five basic capabilities**:

1. The capability to act and commit;
2. The capability to deliver on development objectives;
3. The capability to adapt and self-renew;
4. The capability to relate (to external stakeholders);
5. The capability to achieve coherence.

In order to have a common framework for evaluation, the five capabilities have been reformulated in outcome domains and for each outcome domain performance indicators have been developed.

There is some overlap between the five core capabilities but together the five capabilities result in a certain level of capacity. Influencing one capability may have an effect on one or more of the other capabilities. In each situation, the level of any of the five capabilities will vary. Each capability can become stronger or weaker over time.

Appendix 3 Results - changes in organisational capacity of the SPO - 5C indicators

Below you will find a description for each of the indicators under each of the capabilities, what the situation is as assessed during the endline, how this has changed since the baseline and what are the reasons for change.

Capability to act and commit

1.1. Responsive leadership: 'Leadership is responsive, inspiring, and sensitive'

This is about leadership within the organisation (operational, strategic). If there is a larger body then you may also want to refer to leadership at a higher level but not located at the local organisation.

The Horn of Africa Regional Environment Centre and Network (HoA-REC/N) management is striving to provide more responsive and inspiring leadership. The management listens to the weekly program update reports and reacts accordingly. There are monthly coordination meetings plus quarterly all staff meetings to facilitate organizational learning and to discuss any other staff welfare or other issue related to the organisation. Regarding information and communication, more advanced IT system in place for internal communication. Gender mainstreaming at program level and internal communication within the organization have improved. HoA-REC/N has managed to bring female staff on board who are also in management. According to management gender considerations are made in the recruitment places and there are plans to hire a gender expert. Reports from programs are submitted more timely than before but financial reporting is not up to standards due to staff turnover. To tackle this issue, the SPO has hired new staff members and has caught up on most of the pending financial reports according to the CFA assessment. Some staff members noted that most of the decisions are still made by the higher level, that other staff are not involved in the decision making process, and that gender mainstreaming has not yet reached all levels. Besides, there is weak administration and centralized decision-making in the organization. However, the management indicated that decision-making has been decentralized and there are weekly management meetings to address issues. Decentralization seems to mean that program officers are more independent in developing projects and securing budgets. These program officers report to management and the M&E department. The management indicated that gender is mainstreamed in all projects though there is no gender focal person in the organization. According to the observation by the evaluators, since the leadership is still associated with academic work it may be difficult to follow up the day to day work. However, as a result of its autonomy given by the university in some of the operations there could be some changes.

Score: from 3 to 3.5 (slight improvement)

1.2. Strategic guidance: 'Leaders provide appropriate strategic guidance (strategic leader and operational leader)'

This is about the extent to which the leader(s) provide strategic directions

The self-assessment indicated that decision making has been decentralized as mentioned in the baseline. Furthermore, the management has focused on strategic issues through strengthening programs partnership. This has resulted in more projects from diverse sources. Most of the current

projects now are Ethiopia-focused, therefore the center is focusing on regional projects based on the strategic plan of the network. It was observed that the management also seemed mostly preoccupied by academic issues. At the moment the management leads the process of developing the next five-year strategic plan (2012 - 2015) and it is going to be launched on November 26, 2014 during the HoA-REM 7 regional meeting. The process included consultation of program/project staff, partner organizations, donors, the board, network members and other relevant stakeholders. The management is now focusing to provide strategic directions by pointing out six strategic objectives that help to better achieve its mission and vision. This strategy development process was facilitated by an external facilitator.

Score: from 2.5 to 3 (Slight improvement)

1.3. Staff turnover: 'Staff turnover is relatively low'

This is about staff turnover.

In this regard, staff turnover has increased both in program and support areas according to the self-assessments. Staff turnover is higher especially for highly specialized professions and finance, and is particularly worse in some areas such as Gambela because of the local situation, where the area is very remote with a very hot, humid climate and no or insufficient infrastructure. Staff turnover is also influenced by the fact that the organization has had no salary and benefit package improvement and is not attractive as compared to other similar organizations. Besides, the benefit packages are not clearly stated for the whole staff according to most of the self-assessment response. Some staff members have also indicated that there was no access to training, unequal training opportunities among staff, low promotion of staff, and no incentives and awards by the organization in general. However, the management indicated that the new salary revision helped to maintain staffs. The attachment of the SPO to the university has attracted some staff members who would like to work in development and academics. Nevertheless, the annual report of the carbon trading project in 2013 indicated that some of the challenges faced during project implementation included the work burden to accomplish project activities due to a delayed start of the project; staff turn-over; and lack of skilled manpower in the areas of the carbon project.

Score: from 4 to 3.5 (Slight deterioration)

1.4. Organizational structure: 'Existence of clear organizational structure reflecting the objectives of the organization'

Observable indicator: Staff have copy of org structure and understand this

As a result of its improved autonomous structure and also the move to diversify its funding sources, the organization has created an organizational structure with a new grouping of the programs and clarified their roles and responsibilities. Horn of Africa Regional Environmental center and Network has moved its office to the newly constructed premises. The decentralized structure means that program officers are more responsible for their respective tasks, even though most of the leadership decisions are still made at the management level. Program officers are now more focused on program implementation, resource mobilisation and monitoring and evaluation.

Score: From ? to 3.5

1.5. Articulated strategies: 'Strategies are articulated and based on good situation analysis and adequate M&E'

Observable indicator: strategies are well articulated. Situation analysis and monitoring and evaluation are used to inform strategies.

HoA-REC/N have a strategic plan for the period of 2010-2015 and the organization has not made any attempt to revise it during that time. Currently discussions are ongoing about the new strategic directions for after 2015. However, additional funding has been accessed for carbon trading and as indicated in the baseline the programs are always based on a proper context analysis.

Score: from 4 to 4 (No change)

1.6. Daily operations: 'Day-to-day operations are in line with strategic plans'

This is about the extent to which day-to-day operations are aligned with strategic plans.

The organization has improved slightly in this regard, and project implementation delays have become less except for some projects that require international procurement, which usually depend on the university's pace. The annual plan was in line with the strategic objectives and project agreement provisions. The management has put an automated project monitoring system in place that is being used to keep track of implementation. Management mentioned that this has helped very much - monthly monitoring reports help to see which projects need an intervention when not performing as planned. Project implementations have been in line with the organization strategic plan, although some staff still mentioned that high work volumes, lengthy financial procedures and the lack of logical frameworks impact the daily operations. Although most of the planned activities have been executed within planned program/project period, some activities still lagged behind the schedules. The organization has generally made considerable improvements in fast tracking implementation of projects and programs and this was manifested in their WASH performance in the whole alliance in 2013.

Score: from 4 to 4 (no change)

1.7. Staff skills: 'Staff have necessary skills to do their work'

This is about whether staff have the skills necessary to do their work and what skills they might they need.

The staff now have better skills to carry out program design and implementation, and also doing M&E work. The expatriates who came as a result of MFS II support have helped in building staff capacity through coaching and working together. All staff members have been given training on project cycle management and share experience through exposure visits. Monitoring and Evaluation trainings have been provided. More staff members have gotten the opportunity to have trainings either in-house or abroad on various topics, from technical job-related topics such as Climate change and Carbon emission mitigation measures, to cross-cutting topics such as communication, M&E and project management. There have also been trainings on WASH, accounting, Human Rights based Approach (HRBA) in programming, and budget tracking. The staff recruitment criteria were revised since 2012 and the new staffs are qualified both in education and experience. However, some staff members noted that it is difficult to say whether staff skills on Program Cycle Management has improved or not because HoA-REC/N is not often involved in program/project implementation, since it mainly works in partnership with other implementing partners and provide budget, and technical assistance through mentoring, coaching, training and M&E. A few projects are being implemented by HoA-REC/N such as the carbon project. Usually when there is a call for a concept note/proposal, program/project coordinators are assigned to execute the task. Capabilities of staff members in program

implementation has greatly improved due to coaching and training of staff and this was observed where staff is able to develop pro-poor carbon projects and get insight on how to access international carbon markets. Besides, the way staff report, monitor and implement project shows that they have learnt a lot on project cycle management and also they have more networks from which they learn and strengthen their capabilities.

Score: from 4 to 4.25 (very slight improvement)

1.8. Training opportunities: 'Appropriate training opportunities are offered to staff'

This is about whether staff at the SPO are offered appropriate training opportunities

More staff members have gotten the opportunity to have trainings either in-house or abroad on various topics, from technical job-related topics such as Climate change and Carbon emission mitigation measures, to cross-cutting topics such as communication, M&E and project management. In 2013 HoA-REC/N initiated the development of a standard template to objectively assess staff performance and to fill gaps through recommended trainings in an organized manner. As a result, different trainings like PCM training, WASH training, accounting training for finance staff supported by the Dutch embassy, training on Human Rights based Approach (HRBA) in programming, and training on budget tracking to enable communities to monitor budget allocation and expenditure after disbursement, (by external consultant) etc. to mention a few were given to staff. There was also a field visit in Kenya in 2014 to share experiences and best practices. In sum, the organization has made attempts to enhance staff skills by organizing various relevant training programs. However, the budgets for such training programs are still limited according to the self-assessment. Some staffs noted that the organization does not have mechanisms to evaluate the impact of the trainings, assessment has not been conducted for further trainings, and a mechanism to make good use of the resources allocated for training is lacking.

Score: from 3.5 to 4 (slight improvement)

1.9.1. Incentives: 'Appropriate incentives are in place to sustain staff motivation'

This is about what makes people want to work here. Incentives could be financial, freedom at work, training opportunities, etc.

Since 2012, HoA-REC/N revised its HR manual and standardized, but not improved, benefit packages for all staff regardless of the project they are involved in. The revised HR manual is shared via internet and is now more transparent and staff members are better aware about their entitlements. Hence, the salary revision has made the staff to get better pay, although according to some staffs, it is still not comparison with other organisations. Some staffs felt that benefit packages of staffs are still the same particularly provident (e.g. pension) fund or any other similar schemes are still missing. HoA-REC/N does not remit any pension contributions for its employees as required by law on Private Organization Employees' Pension Proclamation No. 715/2011 dated 24 June 2011. The organization also lacks a scheme for staff promotion and reward for best performing staff. Nevertheless, there is an enabling environment in terms of having freedom at work, and the organisation.

Score: from 3.5 to 3.75 (very slight improvement)

1.9.2. Funding sources: 'Funding from multiple sources covering different time periods'

This is about how diversified the SPOs funding sources are over time, and how the level of funding is changing over time.

The organization has diversified its funding sources. Apart from the existing donors, World Bank for CIC project, DFID for SCIP project, French Embassy for the water allocation plan project, NORAD and SIDA have become funding partners of the organization. Besides, discussions with the Japanese government on possible collaboration is underway. ICCO has supported HoA-REC/N on fundraising and helped in proposal development particularly for EU funding that makes HoA-REC/N the first Ethiopian organization to get EU funds. ICCO also contributed in developing a financial management system with WB funding, and supported the development of an M&E system for the energy projects with a volunteer from the Netherlands. This has improved the organization's reporting and also fundraising capacity for bigger donors. Furthermore, improved capacity of the organization in project management, communication and good reputation have helped a lot in this regard. Focus on carbon credit schemes has also turned out to be a good move- many donors have an interest in carbon reduction schemes.

Score: From 4 to 4.25 (Very slight improvement)

1.9.3. Funding procedures: 'Clear procedures for exploring new funding opportunities'

This is about whether there are clear procedures for getting new funding and staff are aware of these procedures.

Horn of Africa Regional Environmental Center and Network (HoA-REC/N) has developed a fundraising strategy and assigned a consultant to liaise with the fundraising officer and identify calls for proposals, and develop proposals together. In the evaluation report from 2012 for the carbon project, the recommendation showed that HoA-REC/N needs a resource mobilization strategy and to develop a long term plan for the future. The organization has improved communication, partnership and networking capacity, and the partnership programs based on the strategic plan clearly articulate the mission and vision of the Centre (HoA-REC/N). Hence, the SPO has shared information through partners, and created a strong collaboration with implementing partners. The Centre provides basic funds for proposal development. Program/project staff are involved in looking for funding opportunities and staff are free to take their own initiative to look for new funding sources in consultation with program/project heads. However, the culture of such initiative is not well developed.

Score: From 2 to 3 (improvement)

Summary of capability to act and commit

The Horn of Africa Regional Environment Centre and Network (HoA-REC/N) management is striving to provide more responsive and inspiring leadership. The management listens to the weekly program update reports and reacts accordingly. Though the management has indicated decision making has decentralized, some staffs noted that most of the decisions are still made by higher level and other staff members have not been involved in the decision-making process. Since the management has focused on strategic issues through strengthening programs partnership, the organization has implemented more projects from diverse sources. However, staff turnover is higher compared to the baseline in 2012, especially for highly specialized professions and finance and has particularly worsened in some areas such as Gambela because of the local situation, an area which is remote with a hot, humid climate and poor infrastructure. Whilst management indicated that staff salaries had improved with a salary revision, most staff indicated that the salary revision and benefits weren't sufficient compared to other organisations. HoA-REC/N has revised its HR manual and standardized

the benefit packages for all staff, while the salary revision has given the staff better pay, though this was contested by other staff members.

Horn of Africa Regional Environmental Center and Network has moved its office to the newly established one and has developed an organizational structure with a new grouping of the programs and clarified their roles and responsibilities. However, the organization has not made any attempt to revise its strategic plan in the past years. Currently discussions are ongoing within the management to develop a new strategic plan, under facilitation by an external consultant. Meanwhile, the annual plan was in line with the strategic objectives, and project agreement provisions and an automated project monitoring system were put in place and are being used to keep track of implementation. For this to be effective, staff members now have better skills to carry out the program design and implementation and to do M&E work. This is because all staff members have been given training on project cycle management and shared experiences through exposure visits. More staff members have the opportunity to get trainings either in-house or abroad on various topics: ranging from technical job-related issues such as carbon emission reduction measures and climate change, to cross-cutting topics like communication, M&E and project management.. The organization has widened its funding sources after the baseline because new donors like the World Bank for CIC project, DFID for SCIP project, French Embassy for the water allocation plan project, NORAD and SIDA have become funding partners of the organization since the baseline in 2012. This was due to the fact that the organization developed a fundraising strategy, assigned a capacity development consultant to identify calls for proposals, liaise with the fundraising officer and develop proposals together.

Score: from 3.4 to 3.7 (very slight improvement)

Capability to adapt and self-renew

2.1. M&E application: 'M&E is effectively applied to assess activities, outputs and outcomes'

This is about what the monitoring and evaluation of the SPO looks at, what type of information they get at and at what level (individual, project, organizational).

HOA-REC/N has focused on a holistic participatory approach and has a strong monitoring system. The organization has put in place an effective, online-accessible, M&E system (Akvo FLOW) and the section is equipped with professionals who manage the system. Hence, all donor-required reports are consolidated in the M&E unit. This unit is now strengthened and has three full-time and one part-time staff. In addition the unit helped to mainstream M&E within programs/projects and managed to develop the M&E system. Program coordinators are familiar with the system and report to the M&E unit regularly, while the M&E unit compiles the reports and presents these during regular meetings. Besides, refresher trainings were provided to all staff on how to use the new M&E system, and also intensive coaching, and follow up was carried out. The management also fully supported the M&E unit and helped to raise awareness to all staff members during coordination and staff meetings. Therefore, the M&E system is now widely known by staff. Akvo FLOW tool training for M&E and outcome mapping was provided for the WASH coordinator by ICCO through the Dutch WASH Alliance at the beginning of 2013. Also M&E tools, baseline data and the web tool monitoring (FLOW) with a standardized system were developed. Baselines are done and outputs are monitored in both qualitative and quantitative manners. External M&E also takes place: for example, the WASH Alliance conducted a Mid-term Evaluation in 2013, with a consultant from MDF. PriceWaterhouseCoopers provided support in the development of the M&E system and has also performed an evaluation of the Dutch Embassy-supported project. ICCO supported the development of an M&E system for the energy projects with a volunteer from the Netherlands. As a result better reporting in terms of quality of data and traceability of information has been observed in the organization.

Score: From 3.5 to 4.5 (improvement)

2.2. M&E competencies: 'Individual competencies for performing M&E functions are in place'

This is about whether the SPO has a trained M&E person; whether other staff have basic understanding of M&E; and whether they know what information to collect, how to process the information, how to make use of the information so as to improve activities etc.

Apart from the new M&E software application system (Akvo FLOW), HoA-REC/N has hired qualified staff and provided full support for the M&E unit. The organization has hired five M&E staff (one coordinator and one M&E specialist (for CIC project), two M&E officers and one M&E consultant) who are competent in M&E since 2013. Besides, trainings on topics like outcome measurement, planning and coordination were provided in 2013 with MFS II budget support by ICCO. In-house training on M&E was also organized for all program staff. This enhanced understanding of staff on important M&E topics and on the M&E system. As a result, staff are now using the monitoring system and data has been collected on a timely basis.

Score: From 3.5 to 4.5 (improvement)

2.3. M&E for future strategies: 'M&E is effectively applied to assess the effects of delivered products and services (outcomes) for future strategies'

This is about what type of information is used by the SPO to make decisions; whether the information comes from the monitoring and evaluation; and whether M&E info influences strategic planning.

The M&E unit has developed an M&E manual and a performance monitoring plan template that can be adopted to all projects coming to the center. This helped to standardize the usage of templates and checklists and now HoAREC&N is using the new automated system as a minimum requirement. New proposals are based on data collected from past project implementation. The information from the M&E system has helped with decision-making for future strategies. Management is now able to see progress in one click rather than depending on manual M&E procedures. Besides, the M&E section is usually represented in weekly and monthly management meetings, which helps the management to make informed decisions. Furthermore, the M&E unit is involved in planning, reporting and influences strategic decision making by managers.

Score: From 3 to 3.5 (improvement)

2.4. Critical reflection: 'Management stimulates frequent critical reflection meetings that also deal with learning from mistakes'

This is about whether staff talk formally about what is happening in their programs; and, if so, how regular these meetings are; and whether staff are comfortable raising issues that are problematic.

Staffs have openly discussed challenges faced during the course of project implementation and they were supposed to meet regularly and inform the management on issues of concern. However, there has not been any feedback for more than a year from the management and there is an issue with a lack of acknowledgement of staff's skill/capacity or contribution by some program/project heads. Programs started reporting on a weekly basis and these reports are to be presented to the management by the M&E coordinator that gives programs to share reports every week and also for the management to take swift action whenever necessary. The staff self-assessment has noted that staff members were more comfortable to raise issues in a written fashion, rather than in discussion. Besides, staff meetings were not regular though there have been some regular meetings at program/project level where staff discusses activity implementations and major challenges. It turns out that staff suggestions for changing these situations have not been taken up.

Score: From 3.5 to 3.5 (No change)

2.5. Freedom for ideas: 'Staff feel free to come up with ideas for implementation of objectives

This is about whether staff feel that ideas they bring for implementation of the program are welcomed and used.

Staff members were encouraged by the management to exercise their potential and come up with new ideas, particularly for proposal development, and there is good understanding in working together. Some staff members have been promoted after performance-related evaluations and this has boosted staff to come out and speak out with new ideas. This is due to recommendations from the O-scan by ICCO Alliance every 2 years, which is a requirement for the WASH Alliance 5C scan. However, some staffs noted that there is no specific change in this regard.

Score: From 3.5 to 3.75 (Very slight improvement)

2.6. System for tracking environment: 'The organization has a system for being in touch with general trends and developments in its operating environment'

This is about whether the SPO knows what is happening in its environment and whether it will affect the organization.

HoA-REC/N has hired a communications officer under the Public Relations and Communication department and this has helped in promoting the organization toward a wider audience locally and globally. It has provided access to the staff and partners on emerging issues, topics, news etc. Besides, the officer who is in charge of communications also feeds into discussions on what is happening in the operation environment with program staff. Though there is no unit specifically, the program staff with input from the communications officer and staffs from the program units use the information when necessary for planning new proposals, amending implementation and policy influencing. For this to be effective, the organization has provided capacity building training for the public relations and communications unit, revised the organogram /organization structure, and recruited new staff. They also conduct baselines and during monitoring discuss with stakeholders on changes in the context.

Score: From 3.5 to 4 (Slight improvement)

2.7. Stakeholder responsiveness: 'The organization is open and responsive to their stakeholders and the general public'

This is about what mechanisms the SPO has to get input from its stakeholders, and what they do with that input.

HoA-REC/N frequently reaches out to its stakeholders in different project sites through the provision of the necessary assistance and mentoring services in line with the project/program objectives. Meetings are arranged as planned, and there is smooth and proactive communication with partners during planning and implementation. There is also better engagement and response between duty bearers and rights holders. However, network members' participation is limited though the network members have now developed a strategic plan for the next five years and the Centre will assist in implementing the plan. Nevertheless, consultation with stakeholders in project development and implementation has improved since 2012. Furthermore, project and program staff and stakeholders have frequently communicated and closely worked together. This was evident where the EU and TERI project reached out to its stakeholders in different project sites and provided the necessary assistance and mentoring services in line with the project/program objectives.

Score: From 3 to 3.5 (Slight improvement)

Summary capability to adapt and self-renew

HOA-REC/N has focused on a holistic participatory M&E approach and has put in place an effective, online accessible, M&E system (Akvo FLOW). Besides, program coordinators are familiar with the system and report to the M&E unit. The management also fully supports the M&E unit and has helped to raise awareness to all staff during coordination and staff meetings. Apart from the new M&E software application system, HoA-REC/N has hired qualified staff and provided full support for the M&E unit. Parallel to the organization's M&E system, external evaluations are conducted on behalf of donors, such as a Mid-Term Evaluation for the WASH Alliance in 2013, and a PWC assessment of the Dutch Embassy-supported project. The M&E competencies of the organization have improved due to the trainings on outcome measurement, planning and coordination provided in 2013 by MFS II budget support and in-house training on M&E organized for all program staff. As a result the organization has developed a M&E manual and a performance monitoring plan template that can be adopted to all projects coming to the center. This helped to standardize the usage of templates and checklists, using the new automated system as a minimum requirement. The information from the M&E system has also helped for decision-making for future strategies and also to see progress by the management. On the other hand, though staff members can reflect their ideas openly during the course of project implementation, there has not been any feedback from the management and there was a challenge of not acknowledging staff contributions by some program/project heads. In contrast with this, staff members were encouraged by the management to exercise their potential through free discussion and to come up with ideas. It was noted that some indicated that staff were more comfortable to raise issues in written form, rather than in discussion. HoA-REC/N has hired a communications officer under the PR and Communication department to assist in scanning the environment and promote the organization toward a wider audience locally and globally. Consultation with stakeholders in project development and implementation has improved since 2012. Furthermore, projects and program staff and stakeholders have frequently communicated and closely worked together.

Score: from 3.4 to 3.9 (slight improvement)

Capability to deliver on development objectives

3.1. Clear operational plans: 'Organization has clear operational plans for carrying out projects which all staff fully understand'

This is about whether each project has an operational work plan and budget, and whether staff use it in their day-to-day operations.

All programs and projects have an operational and budget plan, and the plan serves as a crucial source to implement the strategic plan. The financial status of each program/project is updated during coordination meetings with all staff. Technical staff are well aware of not only the preparation of the operational plan with a budget but they also provide specifications on each item for procurement. This has been done by revising all items procured by the project. However, there are some communication issues related to procurement: between project staff and procurement staff which causes delays and dissatisfaction. These have to do with specification of procurement needs but also with university bureaucracy.

Score: From 3.5 to 3.75 (Very slight improvement)

3.2. Cost-effective resource use: 'Operations are based on cost-effective use of its resources'

This is about whether the SPO has the resources to do the work, and whether resources are used cost-effectively.

Since its establishment, HoA-REC/N has been audited by an external auditor annually and projects are audited separately based on the contract agreement signed. In addition, there is a consolidated audit report. HoA-REC/N has moved to its new premises with sufficient space and the earlier lack of offices for staff is no longer a problem. Having moved to their own premises, with all staff working together as a broader reduction in terms of time, logistics, etc., and hereby making the organization more cost-effective in terms of using its resources. It has also secured space in town for some of its projects. With regard to finance and procurement, both departments have been staffed with highly qualified professionals. Procurement guidelines are designed in line with the requirements of major funders such as the EU, World Bank and DFID, and have been entirely used in the course of project implementations and helped during procurements of all project items. However, some staffs noted that the financial and procurement service is still slow due to the fact that the organization still operates under the College of Natural Science's budget center in Addis Ababa University (AAU). Hence, the existing AAU procurement procedures have been the major challenges for timely delivery of various procurements by different programs in HoA-REC/N, and the organization wants to establish an independent budget center for the future. The financial system is in place and staff members were hired, but they recently experienced a turnover in the finance department which affected the delivery of reports in time.

Score: From 3 to 3.5 (Slight improvement)

3.3. Delivering planned outputs: 'Extent to which planned outputs are delivered'

This is about whether the SPO is able to carry out the operational plans.

HoA-REC/N has moved to new premises and changed systems to reduce bureaucracy as a result of the recommendations by ICCO. The 3rd interim narrative report also confirmed that the majority of the planned activities have been accomplished successfully. However, few activities were still ongoing due to extended procurement processes: particularly some activities related to large procurements were still in process of either delivery or subject to rebidding or cancellation. Though there is improvement in delivering planned outputs compared with the previous period, implementations of planned activities have still been lagging compared to the schedule according to the self-assessment. The existing bureaucratic procurement procedures of AAU were considered as the major challenges.

Score: From 3.5 to 4 (Slight improvement)

3.4. Mechanisms for beneficiary needs: 'The organization has mechanisms in place to verify that services meet beneficiary needs'

This is about how the SPO knows that their services are meeting beneficiary needs

HoA-REC/N has developed mechanisms to check beneficiary needs through frequent field visits to satellite or field offices where partners of HoA-REC/N have day-to-day interactions with the target groups and beneficiaries. In particular, field offices are closer to beneficiaries and understand their needs better through participatory discussions at different stages of a project including design, implementation and evaluation. However, there is no defined mechanism on downward accountability. It was evident in the EU-Energy Project Evaluation Report that the project is relevant to the needs of the target groups and beneficiaries.

Score: From 3.5 to 3.5 (No change)

3.5. Monitoring efficiency: 'The organization monitors its efficiency by linking outputs and related inputs (input-output ratio's)'

This is about how the SPO knows they are efficient or not in their work.

HoA-REC/N has developed an M&E system and recruited new staffs for the M&E unit and all projects are monitored as per the donors' requirement. Hence, the M&E unit is proactive and project staff and the M&E unit monitor the program performance regularly. There is also on-going monitoring to assess whether the objectives and strategies developed are relevant to the changing situation on the ground, and if the results are on track for all aspects of the project. Routine program monitoring was done through standard monitoring and reporting procedures and forms, following donor requirements and globally accepted best practices. The M&E system is now working for almost all departments in the organizations and the M&E staff analyze reports on project input and output basis. However, according to the final evaluation report for the Sustainable Development Project in 2013, assessing the effectiveness of HoA-REC/N was challenging because it was difficult to ascertain what results and outcomes were achieved and whether these were directly attributable to the project.

Score: From 2.5 to 3 (Slight improvement)

3.6. Balancing quality-efficiency: 'The organisation aims at balancing efficiency requirements with the quality of its work'

This is about how the SPO ensures quality work with the resources available

HoA-REC/N staffs ensure balancing quality with efficiency during project design and implementations with the available budget. The M&E unit tried to look at the quality-efficiency of all programs under the organization. Besides, program staffs strictly follow the annual work plan, budget plan and performance monitoring plan. Baseline assessments, mid-term evaluations and end line evaluations have been conducted in order to improve the quality of work. The organization has updated operational guidelines recently and hence there are financial and operational improvements in terms of both quality and efficiency. The MFS II co-funder (ICCO) has advised the SPO to work with other organizations who have the required structures and contacts, e.g. for the energy saving project where they started to work with farmers unions and Oromia coffee farmers cooperative unions instead of starting new offices. This helped to improve quality and efficiency. Furthermore, there is an improved quality of reporting with better program design and improved context analysis linked to the interventions, but also networking, lobby and advocacy.

Score: From 3 to 3.5 (Slight improvement)

Summary capability to deliver on development objectives

The organization programs and projects have clear operational and budget plans, and the plans serve as a crucial source to implement the strategic plan. Technical staffs are well aware of not only the preparation of operational plans with a budget, but also provide specifications on each item for procurement. HoA-REC/N has used resources in a cost-effective manner and this was evident in the annual consolidated audit report. Besides, the organization has moved to its new premises with sufficient space and the lack of offices for staff is no longer a problem and this has further enhanced using resources cost-effectively. The majority of the planned activities have been accomplished successfully though a few activities were still being processed due to extended procurement processes, mainly the bureaucratic procurement procedures by the University of Addis Ababa. HoA-REC/N has developed mechanisms to check beneficiary needs through frequent field visits to satellite or field offices where partners of HOAREC have daily interaction with the target groups and

beneficiaries. Particularly, field offices are more close with beneficiaries and understand their needs better through participatory discussions at different stages of a project including design, implementation and evaluation. The SPO has developed an M&E system and recruited new staff members for the M&E unit. All projects are monitored as per the donors' requirement. Hence, the M&E unit is proactive and project staff and the M&E unit monitor the program performance regularly. Staffs try to address quality-efficiency issues during project design and implementations with the available budget. The M&E unit tried to look at the quality-efficiency of all programs under the organization. Besides, program staffs strictly follow the annual work plan, budget plan and performance monitoring plan to balance quality-efficiency. The M&E unit also measures efficiency, by looking at inputs and outputs.

Score: from 3.2 to 3.5 (slight improvement)

Capability to relate

4.1. Stakeholder engagement in policies and strategies: 'The organisation maintains relations/ collaboration/alliances with its stakeholders for the benefit of the organisation'

This is about whether the SPO engages external groups in developing their policies and strategies, and how.

HoA-REC/N participated with stakeholders during strategic plan development through gathering information using questionnaires and organized workshop for network members. There is a strong collaboration with all stakeholders, and planning, workshops and field missions are still done with stakeholders. For example they have established a high level Steering Committee for the Gambella and Rift Valley regions and this is a milestone in dealing with environmental governance. There is strong communication between stakeholders and staff members are trained in communication, networking and team work. The WASH project report has also verified that partner staff attend district coordination meetings in the target districts. HOA-REC/N is part of the Ethiopia WASH Alliance (EWA), in which all actors discuss updates on their activities, share ideas and experiences with regards to implementation, challenges faced, and work together to identify solutions.

Score: From 4 to 4 (no change)

4.2. Engagement in networks: 'Extent to which the organization has relationships with existing networks/alliances/partnerships'

This is about what networks/alliances/partnerships the SPO engages with and why; with they are local or international; and what they do together, and how do they do it.

Networking is one of the expertise areas of HoA-REC/N and the organization has established good relations with many environmental organizations. For instance, HoA-REC/N has hosted TERI (The Environment and Resource Institute) India and established partnerships with many other organizations including IRC (International Water and Sanitation) in the Hague, the Stockholm Environmental Institute, and UMass Boston. This is due to the fact that HoA-REC/N has good communication with its network members, organizes workshops and invites network members to discuss various thematic issues and areas of collaboration. According to some staff members, due to its nature the organization is involved in different networks and this also increases every time due to improved lobby and advocacy capacity of the management. Besides, the partnership modality has prepared the organization on how to link and jointly work with carbon affiliated local partners. Finally, the partners have conducted regular meetings to discuss emerging issues like project progress, new initiatives such as the Joint Crediting Mechanism (JCM), and to resolve some of the challenges faced in due process.

Score: From 4.5 to 4.75 (Very slight improvement)

4.3. Engagement with target groups: 'The organization performs frequent visits to their target groups/beneficiaries in their living environment'

This is about how and when the SPO meets with target groups.

HoA-REC/N has made regular field trips to project/program sites to observe the status of project/program implementation. For this to be effective, administration makes available field vehicles as per request of the respective programs. This was possible due to the purchase of additional vehicles. Besides, the organization has facilitated and mobilized resources, and assigned responsible persons for this. However, some staffs noted that since HoA-REC/N is not a direct implementer of activities and has implemented its activities through partners, there has no room for frequent contact with the target groups for the organization. According to the CFA assessment however HoA-REC/N has increased the negotiation power of the beneficiaries or target groups towards the duty bearers. As an example, according to the carbon credit project annual report in 2013, the project to introduce fuel efficient solar stoves (FSS) was able to bring about a remarkable attitude change among the targeted local communities through stove promotion, local stakeholder consultations, and awareness creation activities. The Gimbi FSS project is the case in point where the local communities have understood the importance of the FSS and are eager to accept the stoves.

Score: From 4 to 4 (no change)

4.4. Relationships within organization: 'Organizational structure and culture facilitates open internal contacts, communication, and decision-making'

How do staff at the SPO communicate internally? Are people free to talk to whomever they need to talk to? When and at what forum? What are the internal mechanisms for sharing information and building relationships?

Staff capacity in communication, particularly on electronic communication, has been enhanced which was due to the training on communication provided for staff by the Dutch partners. Staffs during the self-assessment noted that communication in HoA-REC/N seems better among staff members but that communication with the management needs improvement. The CFA assessment also stated that staff can talk to whomever freely on different issues and they can influence some decisions especially for program directions. However, communication is still a major problem in HoA-REC/N where staff meetings are not regular, no group retreat is organized, there is no formal body in the organization to receive complaints, and projects have no room to receive any complaints. Some staff members also pointed out that internal communication has declined. This was also evident in the EU Energy project evaluation report where communication problems between central offices in Addis Ababa and one of their partners (i.e. REST) and its field office did not help either.

Score: From 3 to 3 (No change)

Summary capability to relate

HoA-REC/N participated with stakeholders during the strategic plan development through gathering information using questionnaires and organized workshop for network members. There is also strong collaboration with all stakeholders, and planning, workshops and field missions are still done with stakeholders. Networking is one of the core areas of HoA-REC/N, it has established good relations with many environmental organizations. For instance, HoA-REC/N has hosted TERI (The Environment and Resource Institute) India and established partnerships with other organizations including IRC

(International Water and Sanitation) in the Hague, the Stockholm Environmental Institute, and UMass Boston. Moreover, HoA-REC/N made regular field trips to project sites to observe the status on project/program implementations. For this to be effective, administration makes available field vehicles as per request of respective programs/projects.. As a result according to the carbon credit project annual report in 2013, the project was able to bring about a remarkable change among the targeted local communities. Similarly, relationships within the organization have slightly changed due to the fact that staff capacity in communication, particularly electronic communication, has improved, which in turn was due to the training on communication provided for staffs by the Dutch partners. In contrast with this, some staff members noted that communication is still a major problem in HoA-REC/N, where staff meetings are not very regular, no group retreat is organized, there is no assigned formal body in the organization to receive any complaints, and projects have no room to receive any complaints.

Score: from 3.9 to 3.9 (no change)

Capability to achieve coherence

5.1. Revisiting vision, mission: 'Vision, mission and strategies regularly discussed in the organisation'

This is about whether there is a vision, mission and strategies; how often staff discuss/revise vision, mission and strategies; and who is involved in this.

HoA-REC/N has developed a strategic plan for the period of 2015-2020 and has revised its mission, vision and strategies with the participation of some key staffs, and with the involvement of an external consultant and network partners. However, some staffs noted that though HoA-REC/N has developed the strategic plan with the participation of network partners, only few staff members were involved during the development process. Besides, the process of strategic plan development has remained almost similar as before based on the CFA assessment.

Score: From 3.5 to 4 (Slight improvement)

5.2. Operational guidelines: 'Operational guidelines (technical, admin, HRM) are in place and used and supported by the management'

This is about whether there are operational guidelines, which operational guidelines exist; and how they are used.

In this regard, HoA-REC/N has not developed new operational guidelines since the baseline in 2012 except the HR manual, and this is still in progress and not yet finalized.

Score: From 3.5 to 3.5 (No change)

5.3. Alignment with vision, mission: 'Projects, strategies and associated operations are in line with the vision and mission of the organization'

This is about whether the operations and strategies are line with the vision/mission of the SPO.

The organization's vision and mission are well articulated and ready for endorsement at present. All projects proposed by implementing partners were appraised and approved in consultation with the organization vision, mission and strategic plan document. Besides, project agreements have also been amended based on the new organizations' vision and mission. According to the staff self-assessment, project strategies have been designed in view of addressing local problems in a sustainable manner

which is in line with the organization's vision and mission. This was evident where the biogas project has targeted mainly Oromia region because of the abundant availability of livestock in the region which addressed local problems using local inputs/resources; while the solar cooker was introduced by the EU energy project in mostly lowland areas where abundant sunshine is available.

Score: From 3 to 3.5 (Slight improvement)

5.4. Mutually supportive efforts: 'The portfolio of project (activities) provides opportunities for mutually supportive efforts'

This is about whether the efforts in one project complement/support efforts in other projects.

In this regard, there is better communication and synergy between programs and projects. Most projects were implemented with the involvement of different programs. For example the CRV and Gambella projects have involved all three partnership programs i.e. social and ecological sustainability, Climate Resilience and Environmental Governance programs. There has been an improvement in mutually supportive efforts between the climate and WASH programs. However, a few staff members indicated that linkages between project/programs in the organization are still poor.

Score: From 3 to 3.25 (Very slight improvement)

Summary capability to achieve coherence

In this regard, HoA-REC/N has developed a strategic plan for the period of 2015-2020 and have revised its vision, mission and strategies with the participation of staffs, network partners and an external consultant. The organization's vision and mission are well articulated and ready for endorsement. All projects proposed by implementing partners were appraised and approved in consultation with the organization's vision, mission and strategic plan document. Besides, project agreements have also been amended based on the new organizations' vision and mission. According to the staff self-assessment, project strategies are designed in view of addressing local problems in a sustainable manner which is in line with the organization vision and mission. Moreover, there has been better communication and synergy between programs and projects where most projects were implemented with the involvement of different partners. HoA-REC/N has not developed new operational guidelines since the baseline in 2012 except the HR manual which is not yet finalized.

Score: from 3.2 to 3.6 (slight improvement)

Centre for Development Innovation
Wageningen UR
P.O. Box 88
6700 AB Wageningen
The Netherlands

www.wageningenUR.nl/cdi

Report CDI-15-058

The Centre for Development Innovation works on processes of innovation and change in the areas of food and nutrition security, adaptive agriculture, sustainable markets, ecosystem governance, and conflict, disaster and reconstruction. It is an interdisciplinary and internationally focused unit of Wageningen UR within the Social Sciences Group. Our work fosters collaboration between citizens, governments, businesses, NGOs, and the scientific community. Our worldwide network of partners and clients links with us to help facilitate innovation, create capacities for change and broker knowledge.

The mission of Wageningen UR (University & Research centre) is 'To explore the potential of nature to improve the quality of life'. Within Wageningen UR, nine specialised research institutes of the DLO Foundation have joined forces with Wageningen University to help answer the most important questions in the domain of healthy food and living environment. With approximately 30 locations, 6,000 members of staff and 9,000 students, Wageningen UR is one of the leading organisations in its domain worldwide. The integral approach to problems and the cooperation between the various disciplines are at the heart of the unique Wageningen Approach.

PART 0 – INTRODUCTION

Dear Sir/Madam, we work for IFPRI. We would like to ask you some questions about your household food production, utilization and income. Taking part in this study is voluntary. If you choose to take part, you have the right to stop at any time and there will be no consequences. We would like to thank you for your full cooperation in advance.

(*Enumerator: I have completed the informed consent process on the first page prior to administering the questionnaire. Enumerator's name and ID:*)

1	Name of the head of household	
2	Sex of the head (0=female, 1=male)	
3	Telephone no. of the household head or other household member	
4	First name of the respondent (<i>given name</i>) and Sex __	
5	Middle name of the respondent (<i>father's name</i>)	
6	Last name of the respondent (<i>grand father's name</i>)	
7	Relationship of respondent to head of household (<i>codes A</i>)	
8	Date of Interview (" dd/ mm/ yyyy ") <i>Gregorian calendar</i>	/ / 2012

Clan/ Ethnic Q1.9 (Code E) 1=Oromo 2=Amhara 3=Somali 4=Tigraway 5=Sidama 6=Gurage 7=Other (SPECIFY:_ _____)	Occupation (codes F) 1. Work on the family farm 2. Salaried 3. Casual labor 4. Self-employed in business (other than the farm), 5. Student 6. Not employed 7. Housekeeping and child care 8. Livestock herding 9. Other (specify):							

Identification code	Zone	District	PA	HH	Ind.

2. Housing conditions

2.1. Do you own this house?	0=No 1=Yes		
2.2. Major material exterior wall is made of the main residence	1=Wood and Mud 2=Wood and Grass 3=Reed and Bamboo 4=Mud and Stones	5=Cement and Stones 6=Hollow Bricks 7=Bricks 8=mud bricks 9=Other (specify)	
2.3. Major material floor is made of	1=Earth/Mud 2=Wood 3=Cement	4=Ceramics/Tiles 5=Other (specify)	
2.4. Major material roof is made of	1=Corrugated Iron Sheet 2=Thatch and Grass 3=Wood and Mud	4=Reed and Bamboo 5=Clay 6=Other (specify)	
2.5. Total number of rooms in the house			
2.6. Does the house have access to electricity?	0=No 1=Yes		
2.7. Does the house have access to piped water?	0=No 1=Yes		
2.8. Total number of outbuildings including kitchens but not including toilets			
2.9. Type of toilet facility the household uses	1=Pit latrine (Private) 2=Pit latrine (Shared) 3=Flush toilet (Private) 4=Flush toilet (Shared)	5=Field/Forest 6=Containers (Household utensils) 7=Other (specify)	

PART II: Household cash expenditures

3. Frequent cash expenditures (weekly)

	Item name	(3.1) In the last 7 days did your household spend money on this item? (0=no, 1=yes)	(3.2) How much did the household spend on the item in the last 7 days ? [ETB]
1	Food and drinks (cash only)		
2	Cigarettes/tobacco/suret/gaya		
3	Fire wood		
4	Charcoal		
5	Kerosene		
6	Candles		
7	Gas for lantern		
8	Battery (dry cell)		
9	Cow dung		
10	Other fuel (not electricity), specify _____		

Identification code	Zone	District	PA	HH	Ind.

4. Monthly cash expenditures

	Item name	(4.1) In the last 30 days did your household spend money on this item? (0=no, 1=yes)	(4.2) How much did the household spend on the item in the last 30 days ? [ETB]
1	Grain milling charge		
2	Electricity		
3	Water bill		
4	Soap/washing & cleaning products		
5	Personal care (barber, hair dresser, toothpaste, etc)		
6	Transport expenses		
7	Communication (cell phone charging and air time, mail,		
8	Entertainment (socializing)		
9	House rent/mortgage payment		
10	Iddir contribution		
11	Hired labor		
12	Other, specify		

5. Less frequent expenditures (in the last 12 months)

	Item name	(5.1) In the past 12 months , did your household spend money on [ITEM]? (0=no, 1=yes)	(5.2) How much did the household spend on [ITEM] in the last 12 months ? (ETB)
1	Clothes and shoes (including school uniforms)		
2	Furniture (tables, chairs, beds, etc)		
3	Blankets/bedsheets		
4	School fees and other educational expenses		
5	Social events (wedding, funeral, etc)		
6	Housing improvement (latrine, new roof, etc)		
7	Human health expenses (medicine, hospital , ...)		
8	Vehicle purchase or repair (car, bicycle, motorcycle)		
9	Contributions & membership fees (associations/church/sports etc)		
10	Taxes		
12	Bond		
11	Other, specify		

Identification code	Zone	District	PA	HH	Ind.

PART III -BIOMASS

6. Livestock ownership: Please describe your household's livestock assets:

(6.1)	Does anyone of your household own animals/ livestock? 1=yes 0=no -> go to 8					
	(6.2) Animal type	(6.3) Do you own [ANIMAL TYPE]? 0=No 1=Yes	(6.4) Number owned by the household	(6.5) Do you collect and use the dung? 1=yes 0=no ->next	(6.6) What is the main use of the dung? 1= fuel 2=manure for crop production 3=other, specify_____	(6.7) What is the secondary use (if any)? 1=construction 2=making household utensils 3= cash sources
1	Cow					
2	Heifer					
3	Calf					
4	Bull					
5	Oxen					
6	Goats					
7	Sheep					
8	Camel					
9	Donkey					
10	Horse/mule					
11	Poultry					
12	Bee hives (with colony)					

7. Home consumption of livestock products

7.1	In the past 7 days, did you consume any animal products produced in the household? 1=yes 0 =0		
	(7.2) If yes to Q 7.1 make a list of all products that they consumed, then ask Q (7.3)	(7.3) How much did you consume?

Identification code	Zone	District	PA	HH	Ind.

Researchers affiliated with IFPRI would like to learn more about this interview and to seek feedback from you.

X11 Which is the result of the interview?	1=Interview completed 2= Interview partly completed 3= Refusal, no interview obtained 4= No respondent at home 5= Other (SPECIFY _____)	
X12 What language the main language you used for the interview?	1=Amharic 2=Oromigna 3=Tigrigna 4=Somali 5=Guaragigna 6=English 7=Other (SPECIFY: _____)	
X13 Did you use any other languages?	1=Yes → SPECIFY: _____ 0=No	
X14 Which one (anyone else) beside respondent was present during the interview?	0=No one 1=Husband/wife 2=A child ≥ 5 years 3=A child < 5 years 4=An adult, household member 5=An adult, non-household member	
X15 Did the respondent find some of the questions difficult, embarrassing, or confusing?	1=Yes 0=No	
X16 What questions did the respondent find difficult, embarrassing, or confusing? (write the section/part and question number)	_____ _____ _____ _____	
X17 What is your evaluation of the accuracy of respondent's answers?	1=Excellent 2=Good 3=Fair 4=Not so good 5=Very bad	
X18 Do you believe the work you are doing for this project is difficult?	1=Very difficult 2=Somewhat difficult 3=About ok 4=Very easy	

THE END Thank you very much for your time and all your hard work.

C9 – Sustainable energy

Marrit van den Berg¹, Elisabetta De Cao^{2,3}, Steffen Eriksen³, Chilot Y. Tizale⁴, Tefera Wondwosen⁵

1 Wageningen University, Netherlands

2 University of Oxford, United Kingdom

3 University of Groningen, Netherlands

4 Ethiopian Institute of Agricultural Research

5 International Food Policy Research Institute - Addis Ababa

1. Introduction

This paper provides an evaluation of the “Sustainable energy: Integrated Approach to Meet Rural Household Energy Needs of Ethiopia” led by The Horn of Africa Regional Environmental Network and Centre (HOA-REC&N). The project is funded under the ACP-EU Energy Facility with MFSII co-funding from ICCO, Kerk-in-Actie, SCN, and EKN. Between 2011 and 2015, the project plans to stimulate the distribution of fuel saving stoves, solar lanterns, solar cook kits, solar home systems, plant oil cookers, and construction of biogas for cooking and lighting using a market-based approach. In this evaluation, we try to answer the following questions:

1. What are the changes under MDG7 –to ensure environmental sustainability, MDG1 –to eradicate poverty and hunger, and MDG4 –to improve maternal health, during the 2012 – 2014 period?
2. To what degree are these changes at target group level attributable to the development interventions of HOAREC&N (i.e. measuring effectiveness)?
3. What is the relevance of these changes?
4. Were the development interventions of HOAREC&N efficient?
5. What factors explain the findings drawn from the questions above?

Access to modern energy is extremely low in rural Ethiopia. He project tries to change this in six districts in the regional states of Oromiya, Amhara and Tigray. While the market-based approach has the potential of reaching sustainable impact if the technologies marketed suit local preferences and needs, our evaluation does not show impact. This could be due to a combination of project delays and the early date of our endline, which was about a year before the official project end.

The structure of the paper is as follows. We first present the context of smallholder livestock production in the target districts and give a description of the project. Subsequently, we present the methodology and data. This is followed by an analyses of the results, an discussion, and a conclusion.

2. Context

Biomass is the main source of energy for the majority of Ethiopian households. Most households use fuel wood and agricultural residues with traditional inefficient stoves. According to a survey conducted by the project implementers in mid-June 2010, for example, each household consumed an estimated 1 ton of solid biomass fuels per year, out of which 620kg was fuel wood (HOAREC&N, 2010). As a result, the natural regeneration capacity of forests and woodlands has been severely eroded in most parts of Ethiopia. FAO (2005) estimates that in the remaining wooded areas of the highlands of Ethiopia stocks are declining by over 0.5% per year.

Also at the household level, the use of biomass as energy source has severe implications. The effort spent on collection and use of biomass fuels, a time-consuming and strenuous job mostly done by women, hampers gender equality and is a significant barrier for more productive use of effort to increase income. In addition, in search for other sources of fuel because of declining access to forests and woodlands, people increasingly use agricultural residues and cattle dung as fuel rather than for maintaining soil fertility, which has had severe impacts on yields and the long term productivity of land. The use of biomass for cooking –often on open fires, has exposed women and children to indoor air pollutants and fire hazards, both causing significant health problems.

Few rural households have access to electricity, which severely limits access to information and communication. Most households still use very low efficiency kerosene wick lamps and pay very high fuel prices. The quality of light available from these lamps is insufficient for most tasks including reading. Exclusion from the electricity infrastructure thus excludes people from information and better education. This has direct impact on economic enterprise (market information, climate information related production decisions) and social welfare (learning for children, family and local networks). Prior effort to introduce renewable energy services through local micro enterprises have not been entirely successful because these enterprises could not reach sufficient number of customers or could not meet the demand for local service (maintenance) requirements of customers.

3. Project description

The project aims to address the issues described above to contribute to improving economic prosperity, social well-being, environmental sustainability and climate change (and hence to contribute to MDG 7 a and b, MDG 1 and MDG5) through creating access to sustainable energy in rural and peri-urban areas in Ethiopia. The project is funded under the ACP-EU Energy Facility with HOAREC as main applicant. Other partners are: SNV, ICCO, EAEDPC, ANCEDA, PISDA, ENDA-Ethiopia, ORDA, REST and GIZ. The total budget was €3,258,877, of which €486,483 was funded by MFS II. Though the project initiated 4 August 2011, field implementation did not start until the end of 2012. The project is scheduled to end 3 August 2015. Prior efforts to introduce renewable energy services through micro enterprises have not been entirely successful because they could not reach sufficient number of customers or could not meet the demand for local service (maintenance) requirements of customers. Opportunities for enterprises are limited in rural and small urban areas in Ethiopia due to a highly geographically-dispersed market with little disposable cash income. Local enterprises are micro-scale, often family based, with very low productivities. This action has concentrated on a limited number of districts to create adequate market for enterprises and the necessary network of renewable energy service providers for system sustainability. It also envisaged diversifying the range of renewable energy products and services provided by enterprises therefore increasing the potential market for them.

The six districts for implementation of the action are situated in the regional states of Oromiya, Amhara and Tigray. The final beneficiaries are expected to be 182,000 households or 1,092,000 inhabitants of these districts. Prior to the project, household energy use in the rural areas of these districts exhibited similar characteristics in that most households derived their cooking fuels from fuel wood and agricultural residues (with three stone open-fire stoves) and used kerosene lamps for lighting. The households were also similar in that their income covered subsistence requirements with little surplus available to trade. There was little income diversification between and within households. Livelihoods are vulnerable to availability and timing of rains and households often face drought risks. The sites are known to be severely affected by forest depletion and land degradation and obviously exposed to extreme lack of modern sources of energy. The selection criteria were: off-grid area (no electricity connection now and for the coming 5-10 years); women, girls and children suffer significant health problems due to exposure to indoor air pollutants (CO and particulate matter) and fire hazards while cooking; relatively severe problem in terms of deforestation and fuel wood shortage. Within these

districts, twenty target *kebeles* were selected with minimum of 500 households, preferably located near to or on main roads and near to the rural market areas (if any), with no or a minimum number of sustainable energy entrepreneurs or projects but able to provide land for centre construction in relatively short period of time and water availability.

The project has established one small enterprise with 10 members –called Renewable Energy Technology Centre (RETC) or SME, in each of the 20 target kebeles. The total population of these kebeles, which can be considered as the direct target population, consists of ten thousand households (HOAREC&N, 2013). The members were trained in the production of sustainable energy appliances and business management. The SMEs are supposed to manufacture stoves, complement these stoves with bio-gas and solar technologies, to disseminate, create awareness, sell and provide after sales installation and maintenance services. The first batch of stoves is financed by the project (in three phases). The money collected from the end users will be accumulated at a special account at the MFI and serve as a revolving fund to continue the business. Solar devices are imported, and difficulties to find good suppliers somewhat delayed the project. The RETCs will be linked to importers and directly buy from them without the use of middlemen.

Potential clients are promised a “full package”, stoves plus solar technologies at a reasonable price, which differs by area and product. Prices are set by the SMEs themselves. For imported items like the solar home systems, the national project steering committee has agreed on a 10 percent profit margin. The price of stoves depends on local costs of inputs, transport, and labor and may therefore differ between SMEs. Clients can either pay cash or credit. There is a 30% discount if they pay in the first year, 20% in the second, 0 in the third. There is 1 year guarantee if the technologies break down. Only if the clients damage the technologies themselves, they pay some service charge.

In May 2014, production had reportedly taken off. Each RETC had produced about 200 mirt stoves, while the rocket stoves were still under production. For bio-gas, potential areas had been identified and 157 installations (of 200 planned) have been registered and are under construction. The RETCS members were being trained in the production of solar cookers. Yet, difficulties in finding a suitable supplier and strict regulations had delayed imports of solar systems and lanterns. This has resulted in limited adoption of the technologies. The stoves had been distributed in some areas, but in other people were waiting for the full package. Most farmers are reportedly willing to pay in cash. The project will start dissemination in October 2014, and as long as there is sufficient demand for the

products of the RETCs, they will continue with their business. The local MFI has agreed to take care of the financial aspects.

4. Methodology

The objective of this report is to describe changes in wellbeing that could be attributed to participation in the Sustainable Energy project. The challenge in any impact evaluation is to isolate the causal role of the intervention from other determinants of wellbeing (Armendariz, 2010). When comparing the situation of beneficiaries before and after an intervention, the observed changes in outcome variables cannot solely be attributed to the intervention, as there are many other changes in the environment of the respondents during the project period. Comparing beneficiaries with a control group of non-beneficiaries does not automatically provide the solution. Beneficiaries could for instance have been wealthier than non-beneficiaries when the program started or *vice versa*. This and other factors can make some people more likely to choose to participate in the program, thus causing self-selection bias. Besides self-selection bias, program placement bias is also frequently observed in evaluation studies. NGOs target their projects purposely at specific, often disadvantaged, areas. If the control group's physical, economic and social environment does not match that of the beneficiaries, this will result in differences not caused by the intervention and thus in biased estimates of impact.

The standard approach to overcome these issues is to conduct a randomized controlled trial (RTC). Before the program starts two groups will be created at random. One group will receive the treatment (treatment group) while the other group will act as a benchmark (control group). Because of the randomization the members in the control group represent the members in the treatment group. After the treatment has taken place, both groups can be compared on the outcomes of interest. Differences in outcomes can now solely be attributed to the treatment. However, creating two groups at random, a necessary step for RTCs, is not always possible because of the program implementation or ethical reasons.

As we had no influence on the design of the sustainable energy program, we use an alternative to RCTs: a so-called double difference (DD) model. In order to apply a DD model one needs to have information about relevant indicators of the treatment group and the control group at two points in time, preferably before (baseline) and after (endline) the intervention. One can then measure the difference in the

changes in outcome indicators for treatment and control group –or project income between baseline and endline. While the RTC methodology ensures that the only difference between members in the treatment and control group is the treatment, the DD method only eliminates differences between members of the two groups that do not change over time. So the disadvantage of the DD method over the RTC method is that it does not automatically distinguish between the impact of time-varying characteristics between members of the two groups and the impact of the treatment. A (partial) solution to this problem is to include as many time varying characteristics into the DD model as possible so that only the influence of unobserved time-varying characters remains.

The DD method works best if the treatment and comparison group are as comparable as possible. One popular method to achieve this is the propensity score method (PSM) (Rosenbaum(1983)). The basic idea is to match beneficiary households to households from the control group who are observationally similar in terms of characteristics that are not affected by the intervention. These include stable characteristics of the household head and the household. If there is a proper baseline, like for this study, outcome variables during baseline can also be used for matching, because they were not yet affected by the treatment. In practice, PSM involves running a binary regression of the project participation indicator on the relevant set of characteristics. The result is the propensity score: the estimated probability that a household is a beneficiary. The DD method is then applied to households with propensity scores in the range in which both beneficiaries and non-beneficiaries are observed (the *common support*): non-beneficiaries with a very low propensity score and beneficiaries with a very high propensity score are discarded.

After making the two groups comparable using PSM, a balancing test can be conducted. Although debated in the literature, a balancing test is generally used to determine if the observable controls are distributed similarly between the two groups in question.¹ If any significant difference exists between the two groups, a balancing test should pick up this difference and indicate that the current composition of the data could lead to a biased estimate of the treatment effect. The balancing test is conducted as a set of OLS regressions in which each control variable is individually regressed on a constant and the treatment dummy. The standard errors in the regressions are clustered at the kebele level to account for intraclass correlation. The coefficient of the treatment dummy now gives us an unbiased estimator of the difference between the control and treatment group at the time of the baseline survey.

¹ For a summary of the literature and further discussion of balancing tests see Kleyman (2009)

As indicated above, we first applied PSM and then estimated a DD model. Econometrically speaking the double difference estimator is given by the following expression:

$$Y_{ijt} = \alpha + \beta_1 Post_t + \beta_2 D_j^T + \beta_3 Post_t D_j^T + \gamma X_{ijt} + \varepsilon_{ijt} \quad (1)$$

Where Y_{ijt} denotes an outcome variable for respondent i in group j at time t , D_j^T is a dummy variable equal to one if the respondent belonged to the treatment group, $Post_t$ is a binary variable that takes the value one if the observation corresponds to the post-treatment time period, X_{ijt} is a set of controls², and ε_{ijt} denotes the error term. Then, β_3 in (1) is the treatment estimate of the intervention's impact on outcome Y . That is, β_3 measures the difference between the treatment and control group in the growth of outcome Y , and is an unbiased estimate of the average impact on the dependent variable Y of being assigned to the treatment group provided there is only selection on the observed variables.

Although a combination of PSM and DD can solve many potential biases in the data, some bias may remain. As PSM assumes selection on observables, bias can still be caused by selection on unobservables. Adding DD to PSM helps picking up the time- invariant heterogeneity, but bias can still remain due to time-variant unobservables. Yet, a positive significant effect in the DD model is a strong indication of an influential intervention. An insignificant effect -or even a significant negative effect, however does not necessarily imply that the intervention does not work -or even does harm, as in our analysis we only measure short-term effects.

Some of the outcome variables considered in the analysis are binary. In these cases, we estimated a linear probability model (LPM) and report the marginal effect of D_i^C for the impact of the sustainable energy project on outcome Y .³ In all models the standard errors are clustered at the kebele level. Clustering at the kebele level provides a relatively low amount of clusters (18), but big enough clusters. It is important to cluster the standard errors, as the data might be subject to intraclass correlation, that is, households in the same kebele are likely to be more similar on a wide variety of measures than households that are not part of the same kebele. The higher intraclass correlation, the less unique

² Additional covariates are included to control for various characteristics of the households. This not only helps with the precision of the estimates, but also reduces the problem of omitted variable bias. This is necessary to obtain unbiased measures of the treatment effects.

³ In recent literature, Puhani (2012) shows that in a nonlinear difference-in-difference, such as the one used in this study, the cross difference is not equal to the treatment effect. Instead the treatment effect comes from the cross derivative (or cross difference) of the conditional expectation of the observed outcome minus the cross derivative of the conditional expectation of the potential outcome without treatment. Although this calculation of the treatment effect is appealing, this study will follow common practice in the field and report the estimate of β_3 in the case of a LPM.

information each household provides. This has to be taken into account when running the regressions by inflating the standard errors.

It is often the case that there is some level of attrition (or dropping out) and/or new entry in the dataset. The DD model presented in (1) can be estimated using an unbalanced panel, keeping in all observations, including the ones which we only observe in one time period. It can also be estimated using a balanced panel, dropping observations which we only observe in one period. Estimating (1) using an unbalanced panel increases the power, but as the sample becomes more heterogeneous the results might be distorted. As in this case, the number of new entries and drop outs are very low, as will be seen in the following section, all estimations will be done on the unbalanced panel.

5. Data

We collected baseline data in September 2012, before field implementation of the project started. To get sufficient variability in the data, we collected baseline data in as many target kebeles as feasible and in an equal number of comparison kebeles. We excluded one of the project districts (Arsi Negelle) because of the presence of many other projects (including innovative WASH) and for cost reasons. For the latter reason, we randomly dropped 3 more kebeles. This resulted in 13 target and comparison kebeles, Comparison kebeles are kebeles nearby the selected target kebeles but outside the influence of the planned selected that fulfilled the project selection criteria. In each of the kebeles, we selected a random sample of households, as the project targets all households: technologies are promoted and offered, but the distribution is market-based. In all but one district, we selected 25 households. In the final district (Boset), we selected only 19 households per kebele due to the relatively high number of kebeles sampled.

We did an online survey between mid-May and mid-June 2014, which was more than a year before the project end. While we intended to re-interview all baseline households, we had to make some changes. A total of eight kebeles in our sample appeared to be on-grid and thus did not qualify the project criteria. The project implementers dropped most of the intended target kebeles that were on-grid from the project and replaced them with off-grid kebeles. However, one of the on-grid kebeles in our baseline survey was nevertheless included in the project (Shilum Elmi). We therefore decided to keep this kebele in the sample along with the closest of the other on-grid kebeles in our baseline (Santagelada) and to

add an additional covariate controlling for electricity. We dropped the other on-grid kebeles from the sample. This resulted in a larger number of control than treatment kebeles. As one of the replacement kebeles of the project (Melka) was part of the control group in our baseline, we moved it from the control group into the treatment group to even out the sample somewhat. Finally, the project implementers removed one kebele from the project due to unavailability of water for stove construction (Newi). This kebele was replaced by a kebele which we originally selected as control (Merer). We decided to maintain both kebeles and simply switched their roles.

The final baseline sample used in this study included 490 households; 212 in the treatment group and 278 in the control group. The follow-up survey included 459 households (196 in the treatment group and 263 in the control group). As no new entries were observed, the data revealed a total of 31 drop outs. As this is a relatively low, we do not expect that drop-outs distort the results.

We used the same questionnaire during baseline and endline. The questionnaire contains general questions on household composition and housing conditions, household expenditures and food security, crop production and consumption, land and livestock endowments, and detailed questions related to cooking devices present in the household, type of fuel used, time spend collecting fuel and the health of household members.

Table 1. Sample framework of data used in the analysis

Region	Woreda/District	Treatment		Comparison		Total Sample

5.1 Descriptive statistics and balancing tests

The descriptive statistics and balancing tests presented here are based on the common support resulting from the estimated propensity score.⁴ The set of covariates chosen for the estimation of the propensity score is the same as the set of controls used in the DD regressions.

Figure 1 below displays the distribution of the propensity score in the treatment and control group. Plotting the distribution of the propensity score is helpful to see if there are any problems in the common support. The distributions seem to have a wide area from which they overlap, thus indicating a good common support. Specifically, the region of the estimated common support is [.231, .951] and only 7 observations are outside this range.⁵

⁴ The descriptive statistics and balancing test conducted here are based on the following set of covariates: Sex, Age, Married, Ethnicity, Job, Members, Land, Pack animals and Goat & Sheep. Hence, no outcome indicators are added to the set, as this set differs depending on the outcome variable in question.

⁵ Actually, more observations are dropped, but this is due to missing values in some of the covariates.

Figure 1: Distribution of the propensity scores in the control and treatment group

the treatment and control household were comparable for both control and outcome variables (Tables 1 and 2). At baseline, most of the household heads in the sample were middle-aged married Oromo men with farming as primary occupation. They owned on average around 1 hectare of land, 1 pack animal and 4 goats and/or sheep for a family of 6. Total expenditures per capita were a little under Birr 2,800 per capita. Only 12-14% of household owned any energy-saving device⁶, and on average women and children spent 9-10 hours per week to collect around 33 kg of fuel wood. Women were ill for 1 day on average in the four weeks prior to the survey, children 0.5 day. Respiratory problems and coughing were reported for 5-17 percent of women and children. Overall the balancing tests revealed a good balance between the two groups.

⁶ Energy-saving devices refers to the household being in possession of one of the following items: Fuel saving stove, plant oil cooker, solar cookit, solar lantern, biogas digester and electric stove.

Table 1: Summary statistics and balancing tests for controls

Dependent variable	Summary Statistics				Balancing tests
	Control		Treatment		Treatment
	N	Mean	N	Mean	
(1)	(2)	(3)	(4)	(5)	
<i>Characteristics of the household head</i>					
Sex (male=1)	270	0.88	211	0.87	-0.006 (0.044)
Age	269	42.63	210	41.90	-0.733 (1.436)
Married and living with spouse (yes=1)	271	0.88	211	0.87	-0.011 (0.046)
Ethnic Oromo (yes=1)	271	0.72	211	0.63	-0.094 (0.211)
Primary occupation: Family farming (y=1)	271	0.87	211	0.85	-0.019 (0.048)
<i>Household characteristics</i>					
Members (#)	270	5.78	211	5.95	0.170 (0.368)
Land (ha)	255	1.14	189	1.03	-0.107 (0.175)
Pack animals (#)	270	1.05	211	0.89	-0.619 (0.247)

Electricity (yes=1)	271	0.00	210	0.09	0.082 (0.082)

Notes: Column 2 and 4 presents the mean of the control and treatment group respectively. Column 5 displays the coefficient from separate OLS regressions. Standard errors are clustered at the kebele level. The summary statistics and balancing tests are based on the common support as given by the propensity score with all the control variables used as covariates. Robust standard errors in parentheses. ***Significant at the 1 percent level. **Significant at the 5 percent level. *Significant at the 10 percent level.

Table 2: Summary statistics and balancing tests for outcomes

Dependent variable	Summary Statistics				Balancing tests
	Control		Treatment		Treatment
	N	Mean	N	Mean	
	(1)	(2)	(3)	(4)	(5)
Energy-saving devices	271	0.14	210	0.13	-0.012 (0.051)
Time spent collecting fuel wood (hours/week)	271	10.26	211	9.08	-1.181 (1.705)
Wood use (kgs/week)	271	32.52	211	32.51	-0.011 (6.917)
Sick days women (past four weeks)	270	0.89	211	1.24	0.352 (0.418)
Sick days kids (past four weeks)	270	0.49	211	0.47	-0.015 (0.240)
Respiratory problems women (yes=1)	270	0.09	211	0.07	-0.019 (0.029)
Respiratory problems kids (yes=1)	270	0.05	211	0.05	-0.004 (0.023)
Cough women (yes=1)	270	0.10	211	0.12	0.018 (0.034)
Cough kids (yes=1)	270	0.16	211	0.13	-0.035 (0.041)
Total expenditures per capita	269	2.783	209	2,757	-25.488 (424.717)

Notes: Column 2 and 4 presents the mean of the control and treatment group respectively. Column 5 displays the coefficient from separate OLS regressions. Standard errors are clustered at the kebele level. The summary statistics and balancing tests are based on the common support as given by the propensity score with all the control variables used as covariates. Robust standard errors in parentheses ***Significant at the 1 percent level. **Significant at the 5 percent level. *Significant at the 10 percent level.

6. Results and Discussion

Table 3 reports all the estimates for the outcomes considered in this project. Each column presents the results for a different approach used. Column 1 displays the results from the DD without any control variables added to the specification. Column 2 shows the results from the DD model including additional control variables. Column 3 shows the PSM+DD model without controls. In the final column the estimates from the PSM+DD model including controls are reported. The sample in the estimations of the

final two columns is restricted to only include observations on the common support as given by the propensity score.

Table 3: Impact of program on main outcome variables

Variables	(1) DD – no controls	(2) DD	(3) PSM+DD - no controls	(4) PSM+DD
Energy-saving devices	NI	NI	NI	NI
Time spent collecting fuel wood (hrs/week)	NI	NI	NI	NI
Wood use (kgs)	NI	NI	NI	NI
Sick days women	NI	NI	NI	NI
Sick days children under 15	NI	NI	NI	NI
Respiratory problems women	NI	NI	NI	NI
Respiratory problems children under 15	NI	NI	NI	NI
Cough women	NI	NI	NI	NI
Cough children under 15	NI	NI	NI	NI
Total expenditures/capita	NI	NI	NI	NI

Notes: NI: no impact; NM: Not measured; SD: Significant decrease; SI: significant increase. Controls include: Sex, age, marital status, members, ethnicity, job, land, pack animals, and goat & sheep. See detailed estimation results in the appendix.

We found no significant effects of the project on any of the outcome variables. The only outcome variables that changed significantly between baseline and endline –but not differently for treatment and comparison group, are the use of fuel wood and total expenditures per capita. Both increased: fuel wood use by approximately 12 kg, and expenditures per capita by approximately 1,000 Birr (see Table A4). The latter can probably mostly be explained by the high inflation rate of 34 percent in 2012. Yet the increase in fuel wood use and the associated additional pressure on the environment and women’s time and health suggest that a switch to energy-saving technologies has become even more pressing than before the start of the project.

This lack of measurable results is no surprise given the delays of the project. However, we must also consider the possibility that our sample was too small to observe reasonable differences with statistical significance. Ownership of energy-saving devices went up from 14 percent of households to 21 percent for controls, and from 13 percent to 36 percent for households in the target communities. However, these (non-significant) differences did not result in lower use of fuelwood or less respiratory diseases. As indicated above, fuelwood use has increased overall, and this increase may be even higher among project beneficiaries: the measured effect size is an (insignificant) additional increase of 10 kg/week compared to the control group. In addition, the observed, insignificant coefficients for respiratory

diseases are positive, which if anything would point at a relative increase in respiratory diseases in the project villages.

We have no benchmarks to do an efficiency analysis. However, we can compare the price of a solar home system offered by the SMEs with information from the literature. The cost for the SMEs is €600, including a margin of 10% this implies a price of €660 the clients. The Solar Energy Foundation Ethiopia offered a system for a price of € 167 in 2009 ([https://energypedia.info/wiki/Solar_Home_System_\(SHS\)_Costs#cite_note-](https://energypedia.info/wiki/Solar_Home_System_(SHS)_Costs#cite_note-)). Though this system may have more limited capacity, the difference is large.

7. Discussion

Access to modern energy services is critical for achieving the Millennium Development Goals. It plays role in reducing poverty, improving maternal health, reducing child mortality, and reducing pressure on the environment (The UN Millennium Project, 2005). Nonetheless, many households in developing countries still rely on traditional energy sources. According to WHO and UNDP (2009), 2.6 billion people in developing countries use solid fuels – wood, animal dung, coal, charcoal, and agricultural residues, of which 625 million live in Sun-Saharan Africa. Only six percent of African households relying on tradition biomass for cooking use improved stoves.

Reliance on traditional biomass fuel and the use of traditional stoves –which are energy inefficient and emit abundant smoke, has undesirable socio-economic. As women and children are responsible for fuel collection an women are responsible for food preparation, these groups are specifically affected (IEA, 2006). Every year about 2 million people die prematurely from illness associated with indoor air pollution (IAP), which is more than those of malaria or tuberculosis (WHO, 2011; IEA, 2010). A significant portion of these IAP-related deaths are due to biomass fuel (IEA, 2006). Besides respiratory illnesses, the health impacts of IAP include eye irritation, back pains due to carrying heavy loads of fuel, and burns from open fire, which are estimated result in 300 thousand deaths each year globally (Treiber, 2012). In addition, according to UN Women Watch (2009) women in poor rural areas spend two to twenty hours per week on traditional biomass collection. In rural Ethiopia this is on average close to six hours per week per household (Damte et al., 2012). show that in Ethiopia on average close to 6 hours per week per household was spent on fuel wood collection.

Evidence of the aggregate environmental impacts is mixed. As collection of fuel wood is usually performed on trees outside forests, it mostly results in localized deforestation and its role in large scale forest depletion is low (IEA, 2006). In contrast, a study for India shows that the effect of biomass fuels on air pollution is substantial, contributing 33 to 56 percent of total black carbon emission (Lambe and Atteridge, 2012).

Introduction of new technologies forms an important approach to minimizing the harmful effects of the use of biomass fuels. Recent technological developments allow the small-scale use of solar energy by individual households. The introduction of Improved cooking stoves dates back to the oil crises of the 1970s but has recently received intensified attention due to climate change and health concerns (Ruiz-Mercado et al., 2011). These stoves are energy efficient and have better combustion and low smoke emission. The Global Alliance for Clean Cook Stoves, an international initiative led by the UN Foundation, aims at the adoption of clean and efficient cook stoves in 100 million homes by 2020 (<http://www.unfoundation.org/what-we-do/campaigns-and-initiatives/cookstoves/>). The national program of Ethiopia has envisaged to have disseminated 9 million improved stoves by the end of 2015 and further increase to 34 million by 2030 (FDRE, 2012). In addition to this national program, there are private initiatives, of which the project under evaluation is one.

The project follows a market-led approach to reach a sustainable impact. The idea is to kick-start small businesses who will keep operating profitably after the project has ended. While this approach certainly has potential, our evaluation has not been able to prove the kick-start or the sustainability, possibly due to the early endline survey. However, setting-up sustainable energy enterprises targeting the rural poor is far from easy. In a study on business models for improved stoves in India, Shrimali et al (2011) conclude that none of the twelve companies interviewed targeted individuals earning less than \$2/day. These households supposedly did not have the money to afford improved stoves. Relatedly, Barnes et al (2005) point out that the potential for adoption of improved stoves is significantly higher in urban households and households with higher incomes that are more likely to purchase rather than collect biomass. We have little information on the prices of the devices marketed by the SMEs as these depend partly on local costs. However, the imported solar home systems seem quite expensive. Still, the project reports high expressed demands.

For adoption and willingness to pay, the design and technology of the devices are essential. This means that these must be very carefully selected to suit local customs and preferences, especially when cooking is involved.

8. Conclusion

The project tackles very important issue: the lack of access to modern energy in rural households. The market-based approach has the potential of reaching sustainable impact if the technologies marketed suit local preferences and needs. We need more information to assess whether this is the case. Our current data do not show any impact, but impact could still arise in the last project year or beyond..

Table 4 Evaluation conclusions

Statement	Rating ¹	Comments
The project was well designed	7.5	Market-based approach has potential for sustainability, but must be well-fitted to the situation. We have limited information on this
The project was implemented as designed	8	Except for delays, the project was implemented as designed.
The project reached all its objectives	1	We found no significant impact. This could be due to the early endline..
The observed results are attributable to the project interventions	8	Dif-in-dif analysis with real baseline.
The observed results are relevant to the project beneficiaries	8	Modern energy devices could greatly improve wellbeing and decrease biomass use.
The project was implemented efficiently	5	Solar home system seems expensive, but for the remainder we have no benchmarks.

¹ Our agreement on a scale for 1 (not at all) to 10 (completely)

PART 0 – INTRODUCTION

Dear Sir/Madam, we work for IFPRI. We would like to ask you some questions about your household food production, utilization and income. Taking part in this study is voluntary. If you choose to take part, you have the right to stop at any time and there will be no consequences. We would like to thank you for your full cooperation in advance.

(Enumerator: I have completed the informed consent process on the first page prior to administering the questionnaire. Enumerator's name and ID:)

1	Name of the head of household	
2	Sex of the head (0=female, 1=male)	
3	Telephone no. of the household head or other household member	
4	First name of the respondent (<i>given name</i>)	__
5	Middle name of the respondent (<i>father's name</i>)	
6	Last name of the respondent (<i>grand father's name</i>)	
7	Relationship of respondent to head of household (<i>codes A</i>)	
8	Date of Interview (" dd/ mm/ yyyy ") <i>Gregorian calendar</i>	/ / 2012
9	Time the interview started, 24 hour clock (" hh: mm ")	:
10	Time the interview ended, 24 hour clock (" hh: mm ")	:

Identification code	Zone	District	PA	HH	Ind.

2. Housing conditions

2.1. Do you own this house?	0=No	1=Yes	
2.2. Major material exterior wall is made of the main residence	1=Wood and Mud 2=Wood and Grass 3=Reed and Bamboo 4=Mud and Stones	5=Cement and Stones 6=Hollow Bricks 7=Bricks 8=mud bricks 9=Other (specify)	
2.3. Major material floor is made of	1=Earth/Mud 2=Wood 3=Cement	4=Ceramics/Tiles 5=Other (specify)	
2.4. Major material roof is made of	1=Corrugated Iron Sheet 2=Thatch and Grass 3=Wood and Mud	4=Reed and Bamboo 5=Clay 6=Other (specify)	
2.5. Total number of rooms in the house			
2.6. Does the house have access to electricity?	0=No	1=Yes	
2.7. Does the house have access to piped water?	0=No	1=Yes	
2.8. Total number of outbuildings including kitchens but not including toilets			
2.9. Type of toilet facility the household uses	1=Pit latrine (Private) 2=Pit latrine (Shared) 3=Flush toilet (Private) 4=Flush toilet (Shared)	5=Field/Forest 6=Containers (Household utensils) 7=Other (specify)	

PART II: Household cash expenditures

3. Frequent cash expenditures (weekly)

	Item name	(3.1) In the last 7 days did your household spend money on this item? <i>(0=no, 1=yes, DK=don't know)</i>	(3.2) How much did the household spend on the item in the last 7 days ? [ETB]
1	Food and drinks (cash only)		
2	Cigarettes/tobacco/suret/gaya		
3	Fire wood		
4	Charcoal		
5	Kerosene		
6	Candles		
7	Gas for lantern		
8	Battery (dry cell)		

Identification code	Zone	District	PA	HH	Ind.

4. Monthly cash expenditures

	Item name	(5.1) In the last 30 days did your household spend money on this item? (0=no, 1=yes)	(5.2) How much did the household spend on the item in the last 30 days ? [ETB]
1	Grain milling charge		
2	Electricity		
3	Water bill		
4	Soap/washing & cleaning products		
5	Personal care (barber, hair dresser, toothpaste, etc)		
6	Transport expenses		
7	Communication (cell phone charging and air time, mail, ...)		
8	Entertainment (socializing)		
9	House rent/mortgage payment		
10	Iddir contribution		
11	Hired labor		
12	Other, specify		

5. Less frequent expenditures (in the last 12 months)

	Item name	(6.1) In the past 12 months , did your household spend money on [ITEM]? (0=no, 1=yes)	(6.2) How much did the household spend on [ITEM] in the last 12 months ? (ETB)
1	Clothes and shoes (including school uniforms)		
2	Furniture (tables, chairs, beds, etc)		
3	Blankets/bedsheets		
4	School fees and other educational expenses		
5	Social events (wedding, funeral, etc)		
6	Housing improvement (latrine, new roof, etc)		
7	Human health expenses (medicine, hospital , ...)		
8	Vehicle purchase or repair (car, bicycle, motorcycle)		
9	Contributions & membership fees (associations/church/sports etc)		
10	Taxes		
11	Other, specify		

Identification code	Zone	District	PA	HH	Ind.

PART III –AGRICULTURE: ASSETS AND HOME CONSUMPTION

6. Livestock ownership: Please describe your household’s livestock assets:

6.1	Does anyone of your household own livestock? 1=yes 0=no -> go to 8		
	(6.2) Animal type	(6.3) Do you own [ANIMAL TYPE]? 1=Yes, 0=No	(6.4) Number owned by the household
1.1	Cow		
1.2	Calf		
1.3	Heifer		
1.4	Bull		
1.5	Oxen		
2	Goats		
3	Sheep		
4	Camel		
5	Donkey		
6	Horse		
7	Poultry		

7. Home consumption of livestock products

7.1	In the past 7 days, did you consume any animal products produced in the household? 1=yes 0=no		
7.2	If yes to Q 7.1, make a list of all products that they consumed. Then ask Q (7.3) (Code)	(7.3) How much did you consume?	
		a. Unit (code)	b. quantity

PART III- WASH

9. Water supply

	Purpose	(9.1) What is your main source of water for [purpose]? (code)	(9.2) What distance do you go to collect water in the DRY season (round trip)? (code)	(9.3) What distance do you go to collect water in the RAINY season (round trip)? (code)	(9.4) How long do you queue at the water point during the DRY season? (code)	(9.5) How long do you queue at the water point during the RAINY season? (code)	(9.6) How much water does your household use for the daily [...]? (code)	(9.7) Who usually goes to this source to fetch the water for your household? (code)
1	Drinking							
2	Cloth and bath							
3	Livestock							
Source codes (9.1)		Distance codes (9.2 & 9.3)		Time codes (9.4 & 9.5)		Quantity codes (9.6)		Code (9..7)
1. Surface water (river/lake/pond, stream, canal) 2. Piped water into the house/household tap 3. Public tap/standpipe 4. Protected dug well 5. Protected spring 6. Borehole 7. Unprotected well 8. Unprotected spring 9. Household water facility (self-supply) 10. Rainwater tank 11. Cart with small tank 12. Other: Specify.....		1=200 metres and less 2= 200-1000 metres 3=1000-2000 metres 4=2000-3000 metres 5=More than 3000 metres		1=Less than 10 min. 2=10-20 minutes 3=20-30 minutes 4=30-40 minutes 5=More than 40 min.		1= less than 1 bucket (20 liters) 2= between 1-3 buckets 3=3-5 buckets 4=more than 5 buckets		1=Women 2=Men 3=Children

10. Drinking water

10.1	How do you store your drinking water?	1= covered container 2= uncovered container	
10.2	Cleanness of the drinking water container (to be observed by the enumerator)	1= clean container 2= not clean inside the container	
10.3	What household treatment do you use for drinking water?	1=none 2=boiling 3=agar 4=moringa 5=other, specify _____	

Identification code	Zone	District	PA	HH	Ind.

11. Sanitation

11.1	What type of latrine facilities exist for household use?	1= no latrine 2= traditional latrine (uncovered, rudimentary, uneven, difficult to clean, flies exist) 3=improved pit latrine (covered, cement slab/sand plate, cleanable, even, no flies) 4=Eco-san toilet 5=flush toilet 6=other, specify _____	
11.2	Is there evidence of the use of a latrine at household level (observation)? (Faeces in the pit, maintained, visible access, no spider webs)	1=yes 0=no	
11.3	Does your community have a latrine that is open for public use (community latrines)?	1=yes 0=no	
11.4	If yes to Q 11.3, What type of latrine is this?	2= traditional latrine (uncovered, rudimentary, uneven, difficult to clean, flies exist) 3=improved pit latrine (covered, cement slab/sand plate, cleanable, even, no flies) 4=Eco-san toilet 5=flush toilet	
11.5	Does anyone from your household ever use the public (community) latrine?	1=yes 0=no	
11.6	If no to q. 11.5, why not? (Code)	1. It is located at far distance 2. It is not clean 3. We have our own toilet 4. Other (specify) -----	
11.7	How do you wash your hands after using the toilet?	1=No hand washing 2=Washing without running water 3=Washing with running water only 4=Washing with running water and soap/ash	

12. Moringa production

12.1	Is there a moringa nursery in or nearby your community?	2=don't know 1=yes 0=no	
12.2	If yes to q.12.1, does anyone of your household work there?	1=yes 0=no	
12.3	Do you or your household own moringa trees?	1=yes 0=no ->13	
12.4	If yes to q.12.3, how many?		
12.5	Have they already produced seeds?	1=yes 0=no	
12.6	If yes to q.12.5, what have you done with the produce?	1=used at home; 2 = sold; 3 = both	

Identification code	Zone	District	PA	HH	Ind.

PART IV Health

13. Water-Borne diseases

Member code	13.1 During the last 4 weeks, how many days of your primary daily activities did you miss due to poor health?	13.2 Did you experience diarrhoea in the last 4 weeks? 1=yes 0=no ->next person	13.3 If yes Q 13.2, How many days did you experience diarrhoea?	Children 0-6 only					
				13.4 Did [NAME] experience diarrhoea in the last 4 weeks? 1=yes 0=no ->next person	13.5 If yes to Q 13.4 For how many consecutive days did ----- HH member have diarrhea? (only report the longest period)	13.6 Was it mixed with blood? 1=yes 0=no	13.7 Was it mixed with mucus? 1=yes 0=no	13.8 Was it a pale liquid? 1=yes 0=no	13.9 Which were the other symptoms? (more than one is allowed) 0=no other symptoms 1=vomit 2=fever 3=cramps 4=nausea 5=other (specify)

1=Yes 0=No

Identification code	Zone	District	PA	HH	Ind.

PART V - FOOD SECURITY

14. Household Food Insecurity

14.1	In the last 12 months, did you at any time not have enough food? 0 = no; 1 =yes											
14.2	In the past 12 months, for how many months did you not have enough food to meet your family needs? Check below (✓)											
	1. JAN	2. FEB	3. MAR	4. APR	5. MAY	6. JUN	7. JUL	8. AUG	9. SEP	10. OCT	11. NOV	12. DEC
14.3	Did you receive any food aid during the past 12 months? 0 = no; 1 =yes											
14.4	If yes to Q14.3 in which months of the year did you receive food aid? Check below (✓).											
	1. JAN	2. FEB	3. MAR	4. APR	5. MAY	6. JUN	7. JUL	8. AUG	9. SEP	10. OCT	11. NOV	12. DEC

For each of the following questions, consider what has happened in the **past 1 month**. Please answer whether this happened never, rarely (once or twice), sometimes (3-10 times), or often (more than 10 times) in the past 1 month? (Circle the answer)

	Event	Frequency of event			
		Never (0 times)	Rarely (1-2times)	Sometimes (3-10 times)	Often > 10 times
14.5	Did you worry that your household would not have enough food?	0	1	2	3
14.6	Were you or any household member not able to eat the kinds of foods you preferred because of a lack of resources?	0	1	2	3
14.7	Did you or any household member eat a limited variety of foods due to a lack of resources?	0	1	2	3
14.8	Did you or any household member eat food that you did not want to eat because a lack of resources to obtain other types of food?	0	1	2	3
14.9	Did you or any household member eat a smaller meal than you felt you needed because there was not enough food?	0	1	2	3
14.10	Did you or any other household member eat fewer meals in a day because there was not enough food?	0	1	2	3
14.11	Was there ever no food at all in your household because there were no resources to get more?	0	1	2	3
14.12	Did you or any household member go to sleep at night hungry because there was not enough food?	0	1	2	3
14.13	Did you or any household member go a whole day without eating anything because there was not enough food?	0	1	2	3

Identification code	Zone	District	PA	HH	Ind.

14.14 ON AVERAGE, How many meals were eaten yesterday in this household, by children of less than 5 years old ?								
14.15 ON AVERAGE How many meals were eaten yesterday in this household by children of 5-15 years of age ?								
14.16 ON AVERAGE , How many meals were eaten yesterday in this household, by one household members with more than 15 years of age ?								
14.17 Which one of the following categories of food was eaten in this household during the last 7 days ? (Mark with x if a food category was present in the diet for that specific day, leave blank otherwise)								
Categories of food	Yesterday	2 days ago	3 days ago	4 days ago	5 days ago	6 days ago	7 days ago	
01. Cereals and root-crops (rice, bread, millet, cassava, potatoes, etc...)								
02. Pulses (peanuts, haricots, sesame, chick peas, lentilles, green peas, other peas...)								
03. Fruit								
04. Meat/Fish								
05. Dairy products (milk, butter, cheese, yoghurt, etc...)								
06. Eggs								
07. Vegetable oil/fat (ghee, oils...)								
08. Sugar, honey, drinks with sugar (coca cola, fanta, etc..)								
09. Vegetable								
10. Any other food item								

15. Access to rural services in the last 12 months

15.1	Do you have a bank account? (0=no; 1=yes)	
15.2	If yes to (Q 15.1), how much money do you currently have in the account (ETB)	
15.3	Did you try to obtain a loan last year (0=no; 1=yes)	
15.4	If yes to (Q 15.3), did you get the loan? (0=no; 1=yes)	
15.5	If yes to (Q 15.4), how much credit did you receive? [ETB]	
15.6	Did you have access to agricultural extension last year? (0=no; 1=yes)	
15.7	If yes (Q 15.6), how many contacts did you have over the last 12 months (visits, field days, consultations, ...)	

THE END Thank you very much for your time.

Identification code	Zone	District	PA	HH	Ind.

FINAL PART: ENUMERATOR NOTE

Researchers affiliated with IFPRI would like to learn more about you and your background.

X1 What is your sex?	1=Male 0=Female	
X2 What is your age?	[_ _]	
X5 What is the language you grew up speaking?	1=Amharic 2=Oromigna 3=Tigrigna 4=Somali 5=Guaragigna 6=English 7=Other (SPECIFY:_____)	
X7 What ethnic group do you belong to?	1=Oromo 2=Amhara 3=Somali 4=Tigraway 5=Sidama 6=Gurage 7=Other (SPECIFY:_____)	
X8 What is the highest level of schooling that you have completed?	1=First cycle primary school (1-4) 2=Second cycle primary school (5-8) 3=Secondary school (9-10) 4=Diploma 5=BA or BSc 6=Master's Degree 7=Phd	
X9 Did you have previous interviewing experience?	1=Yes → X10 0=No → X11	
X10 For which organization did you work as interviewers?	IFPRI.....1 National Statistics Office2 NGO survey team.....3 None.....4 Other (SPECIFY:_____).5	

Identification code	Zone	District	PA	HH	Ind.

Researchers affiliated with IFPRI would like to learn more about this interview and to seek feedback from you.

X11 Which is the result of the interview?	1=Interview completed 2= Interview partly completed 3= Refusal, no interview obtained 4= No respondent at home 5= Other (SPECIFY _____)	
X12 What is the main language you used for the interview?	1=Amharic 2=Oromigna 3=Tigrina 4=Somali 5=Guaragigna 6=English 7=Other (SPECIFY: _____)	
X13 Did you use any other languages?	1=Yes → SPECIFY: _____ 0=No	
X14 Which one (anyone else) beside respondent was present during the interview?	0=No one 1=Husband/wife 2=A child ≥ 5 years 3=A child < 5 years 4=An adult, household member 5=An adult, non-household member	
X15 Did the respondent find some of the questions difficult, embarrassing, or confusing?	1=Yes 0=No	
X16 What questions did the respondent find difficult, embarrassing, or confusing? (write the section/part and question number)	_____ _____ _____ _____	
X17 What is your evaluation of the accuracy of respondent's answers?	1=Excellent 2=Good 3=Fair 4=Not so good 5=Very bad	
X18 Do you believe the work you are doing for this project is difficult?	1=Very difficult 2=Somewhat difficult 3=About ok 4=Very easy	

THE END Thank you very much for your time and all your hard work.

C12 – Innovative WASH – (Water purification with Moringa)

1. Introduction

This paper provides an evaluation of the Innovative WASH project coordinated by HOA-REC&N and financed by ICCO within the MFSII framework for the Dutch Ministry of Foreign Affairs. In this evaluation, we try to answer the following questions:

1. What are the changes under MDG7c - to halve, by 2015, the proportion of the population without sustainable access to safe drinking water and basic sanitation- during the 2012 – 2014 period?
2. To what degree are these changes at target group level attributable to the development interventions of HOA-REC&N and its partners (i.e. measuring effectiveness)?
3. What is the relevance of these changes?
4. Were the development interventions of HOA-REC&N and its partners efficient?
5. What factors explain the findings drawn from the questions above?

We collected data from 240 households in the project area and 261 households in comparable nearby areas at two periods in time: in September 2012, around the start of field implementation, and in September 2014, a year before project end. We then compared the changes in the relevant outcome indicators between these two groups. We find that respondents on average experienced positive changes with respect to MGD7C during the 2012-2014 period, but that these changes cannot be attributed to the intervention of HOAREC/N: The situation improved more in the comparison areas than in the project areas. This lack of impact is not due to obvious design changes in the project under evaluation, which is conform international ideas of effective interventions. We discuss possible answers to this puzzle.

The structure of the paper is as follows. We first present the context of WASH in Ethiopia and give a description of the project. Subsequently, we present the methodology and data. This is followed by an analyses of the results, an discussion, and a conclusion.

2. Context

Despite its abundant surface and groundwater resources, Ethiopia has one of Africa's lowest rates of access to regular water supplies, sanitation, and hygiene. According to the World Health Organization (WHO) and local non-governmental organizations, only 22 percent of the population has access to safe water, and only 13 percent of the population has access to adequate sanitation facilities. The Central Rift Valley region (CRV), where population growth remains high while economic diversification is limited, forms no exception to this general pattern.

The CRV suffer from lack of sufficient access to water for domestic use and irrigation. Currently, citizens—particularly women and girls—spend considerable time and effort searching for water. Children most of their time on looking for water and looking after livestock, at the cost of going to school. The CRV has proven underground water reserves, but the high fluoride concentration and high cost of wells has limited their exploitation. Producing the wells with local labour and technologies will bring prices down, as well as create a market for Small and Medium scale Enterprises.

In addition to water quantity, water quality is a problem. Cost-effectively increasing access to clean drinking water is a tremendous challenge, particularly among the rural poor, who often cannot afford water treatment chemicals or technologies. The use of Moringa is a simple, indigenous, inexpensive, and naturally-derived alternative. Seed material from the Moringa tree is a coagulant, which offers an alternative to expensive chemicals used for water purification. Additional uses for Moringa include traditional medicine, livestock fodder, and oil extraction for cooking fuel. Thus, if a supply chain is established, farmers could significantly boost their incomes by raising Moringa, while at the same time providing clean drinking water for their families.

Currently, toilet facilities are scarce in rural areas. Ecological sanitation, or eco-san, is an equitable and sustainable paradigm which has the potential to improving food security and health and sanitation, especially among the most disadvantaged groups. The practice of eco-san considers composted human waste a natural fertilizer that helps improves crop yields and closes the loop between sanitation and agriculture.

3. Project description

The project is led by the Horn of Africa Regional Environment Centre and Network (HoA-REC&N) was intended to run for five years with financing of ICCO and WASTE through the Dutch WaSH alliance with a total budget of €708,738. However, communication in the preparation of the agreement was very slow, and WASTE decided to withdraw. After a delay, HoA-REC&N started the project preparations in July 2011 according to the full proposal, recognizing the need to find additional funding or downscale the intervention. In 2013, the project was downscaled as no additional funding could be secured. The new total budget was €251,099.60. The project will run for four years instead of five, with field implementation for only three years, and will end by September 2015. In addition, project activities regarding the introduction and promotion of moringa were cancelled, as the tree takes 4-5 years to mature.

The project has three implementing partners, all based in Oromia but operating in different districts: Sustainable Environment and Development Action (SEDA), Arsi Nature Conservation and Environmental Development Association (ANCEDA), Rift Valley Children and Women Development Organization (RCWDO).

The main objective of the project is to reduce poverty and improve health, environmental, and economic conditions through empowering the people and creating an environment with increased access to and use of safe water and sanitation services as well as improved hygiene practices for women and marginalized groups.

This main objective is translated into two supporting objectives:

1. Improved access to and use of safe water and sanitation services and improved hygiene practices
2. Civil Society actors are strengthened to jointly and individually better to respond the needs of the communities and influence decision making on WASH service delivery

The present report focusses on the first objective. According to the project philosophy, by making the WaSH technologies available and known, people will adopt them and thus increase their access to (safe) water and sanitation. This will result in a reduction in water-borne illnesses and time spent water-

hauling. As a result, more effort can be spend on income-generating activities, leading to higher income/expenditures.

Project implementation started on 22 August 2012 in 26 kebeles in the districts Arsi Negelle, Adami Tulu Jido Kombolcha, and Dugda in the East Shoa Zone and West Arsi Zone of the Oromia Regional State. The total population in these kebeles is 3,926 households, or 19,805 people. Reported activities include awareness campaigns and sanitation training, construction of (private and public) latrines, community training of health workers, the introduction of low-cost manual well technologies and well development, and the establishment of WASH committees and multi-stakeholder structures. Ecosan toilets (153) were constructed in 2012, but this activity was not included in 2013 due to a limited budget. Yet as the toilets are constructed using locally available materials and a group of beneficiaries has been trained on the job, in principle household could adopt ecosan toilets without project support.

4. Methodology

The objective of this report is to describe changes in wellbeing that could be attributed to participation in the Innovative WASH project. The challenge in any impact evaluation is to isolate the causal role of the intervention from other determinants of wellbeing (Armendariz, 2010). When comparing the situation of beneficiaries before and after an intervention, the observed changes in outcome variables cannot solely be attributed to the intervention, as there are many other changes in the environment of the respondents during the project period. Comparing beneficiaries with a control group of non-beneficiaries does not automatically provide the solution. Beneficiaries could for instance have been wealthier than non-beneficiaries when the program started or *vice versa*. This and other factors can make some people more likely to choose to participate in the program, thus causing self-selection bias. Besides self-selection bias, program placement bias is also frequently observed in evaluation studies. NGOs target their projects purposely at specific, often disadvantaged, areas. If the control group's physical, economic and social environment does not match that of the beneficiaries, this will result in differences not caused by the intervention and thus in biased estimates of impact.

The standard approach to overcome these issues is to conduct a randomized controlled trial (RTC). Before the program starts two groups will be created at random. One group will receive the treatment

(treatment group) while the other group will act as a benchmark (control group). Because of the randomization the members in the control group represent the members in the treatment group. After the treatment has taken place, both groups can be compared on the outcomes of interest. Differences in outcomes can now solely be attributed to the treatment. However, creating two groups at random, a necessary step for RTCs, is not always possible because of the program implementation or ethical reasons.

As we had no influence on the design of the sustainable energy program, we use an alternative to RCTs: a so-called double difference (DD) model. In order to apply a DD model one needs to have information about relevant indicators of the treatment group and the control group at two points in time, preferably before (baseline) and after (endline) the intervention. One can then measure the difference in the changes in outcome indicators for treatment and control group –or project income between baseline and endline. While the RTC methodology ensures that the only difference between members in the treatment and control group is the treatment, the DD method only eliminates differences between members of the two groups that do not change over time. So the disadvantage of the DD method over the RTC method is that it does not automatically distinguish between the impact of time-varying characteristics between members of the two groups and the impact of the treatment. A (partial) solution to this problem is to include as many time varying characteristics into the DD model as possible so that only the influence of unobserved time-varying characters remains.

The DD method works best if the treatment and comparison group are as comparable as possible. One popular method to achieve this is the propensity score method (PSM) (Rosenbaum(1983)). The basic idea is to match beneficiary households to households from the control group who are observationally similar in terms of characteristics that are not affected by the intervention. These include stable characteristics of the household head and the household. If there is a proper baseline, like for this study, outcome variables during baseline can also be used for matching, because they were not yet affected by the treatment. In practice, PSM involves running a binary regression of the project participation indicator on the relevant set of characteristics. The result is the propensity score: the estimated probability that a household is a beneficiary. The DD method is then applied to households with propensity scores in the range in which both beneficiaries and non-beneficiaries are observed (the *common support*): non-beneficiaries with a very low propensity score and beneficiaries with a very high propensity score are discarded.

After making the two groups comparable using PSM, a balancing test can be conducted. Although debated in the literature, a balancing test is generally used to determine if the observable controls are distributed similarly between the two groups in question.¹ If any significant difference exists between the two groups, a balancing test should pick up this difference and indicate that the current composition of the data could lead to a biased estimate of the treatment effect. The balancing test is conducted as a set of OLS regressions in which each control variable is individually regressed on a constant and the treatment dummy. The standard errors in the regressions are clustered at the kebele level to account for intraclass correlation. The coefficient of the treatment dummy now gives us an unbiased estimator of the difference between the control and treatment group at the time of the baseline survey.

As indicated above, we first applied PSM and then estimated a DD model. Econometrically speaking the double difference estimator is given by the following expression:

$$Y_{ijt} = \alpha + \beta_1 Post_t + \beta_2 D_j^T + \beta_3 Post_t D_j^T + \gamma X_{ijt} + \varepsilon_{ijt} \quad (1)$$

Where Y_{ijt} denotes an outcome variable for respondent i in group j at time t , D_j^T is a dummy variable equal to one if the respondent belonged to the treatment group, $Post_t$ is a binary variable that takes the value one if the observation corresponds to the post-treatment time period, X_{ijt} is a set of controls², and ε_{ijt} denotes the error term. Then, β_3 in (1) is the treatment estimate of the intervention's impact on outcome Y . That is, β_3 measures the difference between the treatment and control group in the growth of outcome Y , and is an unbiased estimate of the average impact on the dependent variable Y of being assigned to the treatment group provided there is only selection on the observed variables.

Although a combination of PSM and DD can solve many potential biases in the data, some bias may remain. As PSM assumes selection on observables, bias can still be caused by selection on unobservables. Adding DD to PSM helps picking up the time- invariant heterogeneity, but bias can still remain due to time-variant unobservables. Yet, a positive significant effect in the DD model is a strong indication of an influential intervention. An insignificant effect -or even a significant negative effect, however does not necessarily imply that the intervention does not work -or even does harm, as in our analysis we only measure short-term effects.

¹ For a summary of the literature and further discussion of balancing tests see Kleyman (2009)

² Additional covariates are included to control for various characteristics of the households. This not only helps with the precision of the estimates, but also reduces the problem of omitted variable bias. This is necessary to obtain unbiased measures of the treatment effects.

Some of the outcome variables considered in the analysis are binary. In these cases, we estimated a linear probability model (LPM) and report the marginal effect of D_i^C for the impact of the sustainable energy project on outcome Y .³ In all models the standard errors are clustered at the kebele level. Clustering at the kebele level provides a relatively low amount of clusters (18), but big enough clusters. It is important to cluster the standard errors, as the data might be subject to intraclass correlation, that is, households in the same kebele are likely to be more similar on a wide variety of measures than households that are not part of the same kebele. The higher intraclass correlation, the less unique information each household provides. This has to be taken into account when running the regressions by inflating the standard errors.

5. Data

The project is targeted towards the entire population in the areas: technologies are promoted and offered, but the distribution is market-based. We have therefore selected our sample from the entire population of the target and comparison areas. To get sufficient variability in the data, we collected data in as many target kebeles as feasible and in an similar number of comparison kebeles.

The project targets 26 target kebeles selected on the basis of: low sanitation coverage; low drinking water coverage; proven implementation capacity of the partnering organizations in the areas; and accessibility.. One of the kebeles was also targeted by the Sustainable Energy project (C9), which aims at have some of the same impacts (higher income, better health), and therefore excluded from our sample. three kebeles were eliminated due to confusion about whether they were treated or not. For practical reasons, we eliminated another three kebeles to end up with 19 target kebeles in each of which we interviewed 12 or 13 households that were randomly selected from lists compiled by the project office in the respective woredas.

³ In recent literature, Puhani (2012) shows that in a nonlinear difference-in-difference, such as the one used in this study, the cross difference is not equal to the treatment effect. Instead the treatment effect comes from the cross derivative (or cross difference) of the conditional expectation of the observed outcome minus the cross derivative of the conditional expectation of the potential outcome without treatment. Although this calculation of the treatment effect is appealing, this study will follow common practice in the field and report the estimate of β_3 in the case of a LPM.

Using the project criteria for kebele selection, we selected 21 comparison kebeles that were outside the influence of the project but close to the treatment kebeles (table 1). For each kebele, we randomly selected 12/13 households per kebele from the records of the respective kebele administrative offices.

	Sub-total sample		170
	GRAND TOTAL SAMPLE		501

¹ These villages were dropped from the project at downscaling. While we initially sampled them as treatment villages, we therefore moved them to the control group.

The resulting sample includes 501 households: 240 in the treatment group and 261 in the control group. The baseline data were collected in September 2012, around the start of field implementation, and the follow-up data in October 2014, almost a year before project end. All households could be re-interviewed and there were no new entries.

The same questionnaire was used during baseline and endline. The main topics were: household composition, expenditures, agricultural production, water, sanitation, (Moringa,) water-borne diseases, and food security.

5.1 Descriptive statistics and balancing tests

The descriptive statistics and balancing tests presented here are based on the common support as a result of the estimated propensity score.⁴ The set of covariates chosen for the estimation of the propensity score is the same as the set of controls used in the DD regressions.

Figure 1 below displays the distribution of the propensity score in the treatment and control group. Plotting the distribution of the propensity score is helpful to see if there are any problems in the common support. The distributions seem to have a wide area from which they overlap, thus indicating a good common support. Specifically, the region of the estimated common support is given by [.135, .776] and only 5 observations are outside this range.

Figure 1: Distribution of the propensity scores in the control and treatment group

⁴ The descriptive statistics and balancing test conducted here are based on the following set of covariates: Sex, age, marital status, ethnicity, years of formal education, Job, household size, Land, number of animals.

At baseline, most of the household heads in the sample were middle-aged men with farming as primary occupation (Table 2). They owned on average around 2 hectares of land for a family of 8. Education was low. The average farmer owned around 18 oxen/cows.

Table 2: Summary statistics and balancing tests for controls

Dependent variable	Summary Statistics				Balancing tests
	Control		Treatment		Treatment
	N	Mean	N	Mean	
	(1)	(2)	(3)	(4)	(5)
<i>Characteristics of the household head</i>					
Sex (male=1)	297	0.91	192	0.90	-0.011 (0.027)
Age	295	43.17	192	42.75	-0.423 (1.054)
Married	297	0.91	195	0.90	-0.012 (0.026)
Ethnicity (1=Oromo)	297	0.96	195	0.91	-0.043 (0.045)
Formal education	297	4.33	188	4.61	0.273 (0.565)
Job (farmer=1)	297	0.91	195	0.92	0.014 (0.026)
Household size	297	8.03	192	7.69	-0.334 (0.600)
Land (ha)	296	2.15	192	1.98	-0.176 (0.273)
Number of bovines	297	18.82	195	17.71	-1.107 (2.654)

Notes: Column 2 and 4 presents the mean of the control and treatment group respectively. Column 5 displays the coefficient from a separate OLS regression. Standard errors are clustered at the kebele level. The summary statistics and balancing tests are based on the common support as given by the propensity score with all the control variables used as covariates. Robust standard errors in parentheses ***Significant at the 1 percent level. **Significant at the 5 percent level. *Significant at the 10 percent level.

The level of sanitation indeed low (table 3): Although most households cover their water container, the enumerators only considered the container clean in about 40% of cases, and only about 17 percent of households purified their drinking water. Just over 70 percent of households had a traditional latrine and about three percent an improved latrine. The remainder used a public traditional latrine, though

this was rare –especially in the project villages, or went into the field. About 80 percent washes hands after latrine use. Yet, only two percent of household members was reported to have diarrhea on average. During the dry season, people had to walk around three minutes to the nearest water source and were queuing for another three minutes. Moringa trees were rare.

Table 3: Summary statistics and balancing tests for outcomes

Dependent variable	Summary Statistics				Balancing tests
	Control		Treatment		Treatment
	N	Mean	N	Mean	
	(1)	(2)	(3)	(4)	(5)
Share of family members with diarrhea in the last 4 weeks	206	0.02	77	0.03	0.018 (0.015)
Months without sufficient food	297	1.85	195	1.55	-0.291* (0.166)

Notes: Column 2 and 4 presents the mean of the control and treatment group respectively. Column 5 displays the coefficient from a separate OLS regression. Standard errors are clustered at the kebele level. The summary statistics and balancing tests are based on the common support as given by the propensity score with all the control variables used as covariates. Robust standard errors in parentheses ***Significant at the 1 percent level. **Significant at the 5 percent level. *Significant at the 10 percent level. ¹ Set 0 if no public latrine is used.

Total expenditures per capita were around 2,000 Birr and household reported on average a bit less than two months in which they did not have sufficient food. We found small differences between households in treatment and control kebeles. The only statistically significant differences were the availability of improved latrines at household level, which was slightly higher in the treatment villages (seven percent compared to one), the use of traditional public latrines, which was nine percentage points higher in the comparison villages, water queuing, which was about half a minute shorter in the treatment villages, and finally a small difference in the reported number of months without sufficient food, which was between one and two on average for both treatment and control group. Put differently, the balancing tests revealed only small imbalances between the two groups.

6. Results

Table 4 reports the conclusion of the estimates for the outcomes considered in this project. Each column presents the results for a different approach used. Column 1 displays the results from the DD without any control variables added to the specification. Column 2 shows the results from the DD model including additional control variables. Column 3 shows the PSM+DD model without controls. In the final column the estimates from the PSM+DD model including controls are reported. The sample in these estimations of the final two columns is restricted to only include observations on the common support as given by the propensity score. The results are robust for the estimation method.

We do not find evidence that the project increased access to and use of safe water and sanitation services and improved hygiene practices and subsequently decreased the incidence of diarrhea, which was rare to begin with, and increased expenditures. Hand washing increased for both groups but more for the comparison villages, and the share of improved latrines in the project villages declined slightly to the level of the comparison villages at baseline (see table A4 for details). For the rest, we do not find significant differences between the changes in outcome indicators between households in project and comparison households.

This lack of significant results does not seem to be caused by the limited size of the sample. Ecosan toilets were only reported two households (one in a project kebele, the other in a comparison kebele). This suggests that the construction of ecosan toilets did not go beyond these constructed with project resources. For the other indicators, we had more observations. Yet, looking at more detail at the results of our analysis (table A4), we observe that the only about half of the insignificant coefficients have the expected coefficient for positive project impact. Moreover, the coefficients point at relatively small effects. In fact, for all share indicators, we could have significantly detected a difference of less than nine percentage points, sometimes even just one percentage point.

Table 4: Impact of program on main outcome variables

Variables	(1) DD – no controls	(2) DD	(3) PSM+DD - no controls	(4) PSM+DD
Share of family members with diarrhea	NI	NI	NI	NI
Months without sufficient food	NI	NI	NI	NI

Improved latrine	SD	SD	SD	SD
Public latrine	NI	NI	NI	NI
Traditional public latrine	NI	NI	NI	NI
Improved public latrine	NI	NI	NI	NI
Hand washing	SD	SD	SD	SD
Total expenditures per capita	NI	NI	NI	NI

Notes: NI: no impact; NM: Not measured; SD: Significant decrease; SI: significantly increase. 1 only significant for the estimates using unbalanced panels. Controls include: Sex, age, marital, Household size, education, ethnicity, job, land, pack animals, and goat & sheep. See detailed estimation results in the appendix. *Kids in the sample are 15 and below. *** p<0.01, ** p<0.05, * p<0.1.

Interestingly, Table A4 reveals that most of the outcome indicators show a significant overall improvement between baseline and endline for both groups combined (β_1 in equation (1)). The results suggest that the incidence of diarrhea, the number of months without sufficient food, and distance and queuing at water source decreased, while hand washing, the incidence of covered and clean water containers and the use of traditional private and public latrines increased between baseline and endline. As we selected comparison kebeles outside the influence of the project, these results must be interpreted as a general trend and not as project impact.

Given these results, we cannot conclude that the project reached its objectives. We find that in the two years after project implementation the WASH situation of the people in the project area did not improve more than the situation for people in comparable areas. However, this does not necessarily mean that the project has failed. We collected our endline data with one more year to go for the project. It is possible that the provision of trainings and the establishment of WASH committees and multi-stakeholder structures in the first two years will provide a sound basis for reaching impact in the final project year, or even after the project ends. Moreover, our data are not suitable to test whether the project has achieved their objective to strengthen civil society to influence decision making on WASH service delivery. However, it can be considered surprising that we did not find evidence of the use of newly constructed public latrines. This could be because few people are using them, or because they are too few to be detected in our survey.

Table 5 presents a rough efficiency analysis for two selected project outputs. The costs for well-digging was low compared to values found in the literature for Ethiopia.

Table 5: Impact of program on main outcome variables

Output	Unit costs	Unit cost benchmark	Source benchmark
Eco-san toilets	?	Int\$ 13.70-Int\$ 346.00	Simpson-Hebert (2009) and Jackson, B.(2005) (Ethiopia)
Dug wells	Int\$683	Int\$ 1,643.00-Int\$ 3,052.00	Sutton et al. (2012) (Ethiopia)

7. Discussion

This project intends to contribute to reaching Target 7C of the Millennium Development Goals, which aims to “halve, by 2015, the proportion of the population without sustainable access to safe drinking water and basic sanitation”. Despite the progress made, 2.5 billion people, or more than one third of the world’s population, still lack access to improved sanitation facilities, of which one billion resort to open defecation (WHO/UNICEF, 2014). In addition, 748 million people remained without access to an improved source of drinking water (id). The areas of drinking water and sanitation are treated together as the impact of deficiencies in either area overlap strongly. For example, childhood diarrhea is closely associated with insufficient water supply, inadequate sanitation, and, in addition, with poor hygiene practices. So the general opinion is that to get a strong positive impact on public health, these areas must be addressed together. The international development arena therefore speaks of WASH, which stands for Water, Sanitation, and Hygiene. The GLAAS 2014 report by UN Water and WHO concludes that national finance for WASH is insufficient, suggesting an important role for international aid. The report also stresses the need for more funding for WASH activities in rural areas.

Access to water supply and sanitation in Ethiopia low, even when compared to other countries in Sub-Saharan Africa. The Joint Monitoring Program for Water Supply and Sanitation of WHO and UNICEF estimated access to improved water supply and improved sanitation to 26 percent and 8 percent respectively for rural areas in 2008. While this was a considerable increase compared to earlier years and substantial improvements have been made since 2008, major improvements still need to be made to reach universal coverage. Our baseline survey shows that at the start of the project only one (control area) to six (treatment area) percent of households had access to an improved latrine at household level and one percent or less used improved public latrines. A substantial share of the other households had a traditional latrine, but previous research in Ethiopia shows that pit latrines have no significant effect on child health: Children often avoid using them because they are dirty and of low quality. (Cameron, 2009). Moreover, while 98 percent of survey respondents covered their water storage container, this container was dirty in about 40 percent of cases and only seventeen percent of the respondents used some kind of treatment for their drinking water. On the other hand, reported use of hand-washing after toilet use was quite high at 78 percent on average, and reported cases of diarrhea were not high at two percent of household members in the past four weeks. On average, women had to walk around 3 minutes to the nearest source of drinking water and wait about the same time in the dry season.

These data indicate that the project is highly relevant and the joint WASH approach matches international practices and insights. The choice to drop the Moringa component was wise, given the limited timespan of the (downscaled) project compared to the growing period of Moringa trees. Yet it should be replaced by the promotion of other water purification methods.

The remaining project components are quite standard for a WASH project: construction of simple rural water supply facilities, education and training components for sanitation and hygiene promotion, and construction of improved sanitation facilities. Inclusion of an important school and community component in the project is supported by recent studies: GLAAS 2014 points out that WASH in schools lacks attention despite its importance for child health, school attendance, and fostering lifelong healthy hygiene habits. This undermines a country's capacity to prevent health outbreaks.

Yet we find the main objective of the project –“to reduce poverty and improve health, environmental, and economic conditions”- overambitious. As the Policy and Operations Evaluation Department, Ministry of Foreign Affairs, the Netherlands states in a policy review of the impact of WASH programs (partly) funded by the Dutch government in five countries (IOB, 2012):

Poor rural beneficiaries of water and sanitation programmes are still poor in other ways, even if their water is safe, their health is better and women and girls have more time available. If the rest of the economy remains poor and if local and national institutions continue to lack resources, the achievements of water and sanitation efforts are limited, and their sustainability will be questionable. Like other basic social services, they will need long term financial and institutional support. In other words, progress is needed towards many MDGs if progress towards water and sanitation targets is to be effective and sustainable.

For the project under evaluation it means two things. First, some modesty as to what could realistically be achieved would be advisable, as is also reflected in the specific objectives. (Yet we realize that the big claims may just be a strategic choice to attract funding.) More importantly, Long-term public involvement is needed for sustainability. The above-cited report stresses the development and strengthening of government capacities at provincial and district level. The project tries to achieve this through the establishment of sanitation committees and multi-stakeholder structures. As indicated before, our evaluation does not provide evidence of the effectiveness of this approach.

We do not find evidence of short-term impacts at household level. The question is whether this is due to the early timing of our endline, due to some design errors in the project, or due to poor implementation.

We cannot give a definite answer, but the literature provides some indications. As the project activities are quite standard, we can draw on the lessons from previous evaluations.

The Dutch policy review concludes that the impact of education and training on the construction and use of toilets has in many cases been limited, and that poor households' willingness to pay for improved latrines is sometimes overestimated (IOB, 2012) . This could explain the limited uptake of Ecosan toilets. The same study concludes that health impacts of the water and sanitation interventions evaluated was limited, as the full potential is realized only when all of the following conditions are met: there is enough, uncontaminated drinking water all year around, large scale use of toilets and hand-washing at all critical times. This implies that only if sufficient progress is made on all project components, health effects could be observed. Yet a recent synthetic review of WASH impact studies concludes that the evidence on the combined impact of multiple interventions is mixed and that further studies are needed for more conclusiveness on whether water and sanitation/hygiene interventions are substitutes or complements in improving health (Waddington et al, 2009). The same review stresses the importance of taking into account the context and behavioral mechanisms in program design. This means that programs can fail because they fail to consider local preferences but also that adoption may be slow. More research is needed to assess whether either of these explanations can explain the lack of impact observed in the present evaluation.

The current evaluation gives a good view of changes at the household level in the two years after the project start: the baseline survey was done around the start of field implementation and the comparison group is appropriate. However, what is missing is qualitative information of uptake of technologies and behavioral change. Moreover, the endline survey was relatively early in the project cycle.

8. Conclusion

In conclusion, we find that the respondents experienced positive changes with respect to MGD7C during the 2012-2014 period: the incidence of diarrhea and distance and queuing at water source decreased, while hand washing, the incidence of covered and clean water containers and the use of traditional private and public latrines increased. However, this cannot be attributed to the intervention of HOAREC/N, as the situation improved more in the comparison areas (see also table 5). This lack of impact is not due to obvious design changes in the project under evaluation, which is conform international ideas of effective interventions. Two possible reasons for the lack of evidence are: failure

to consider local preferences or slow adoption rates due to the need for behavioral changes. A combination of qualitative and quantitative research (after the project end) could provide more insight.

Table 5

Statement	Rating ¹	Comments
The project was well designed	9	Project activities concur with common insights on effective projects. However, we do not have enough data to test appropriateness for the local context and preferences
The project was implemented as designed	8	All activities of the downscaled project were implemented, though sometimes on a smaller scale than intended due to the limited budget.
The project reached all its objectives	1	While we find overall improvements in WASH, these are not higher for households in the project areas. The lack of results could be due to the early endline.
The observed results are attributable to the project interventions	8	Dif-in-dif with real baseline (not randomized)
The observed results are relevant to the project beneficiaries	8	Limited access to improved latrines and clean water
The project was implemented efficiently	8	Few benchmarks available, but the limited data available points at high efficiency.

¹Our agreement on a scale for 1 (not at all) to 10 (completely)

Report CDI-15-059

Kusters, C.S.L., T. van Ingen, E. Zerfu, D. Kefyalew, B. Peters, N.N. Buizer, 2014. *Endline report Ethiopia, HUNDEE. Capacity of Southern Partner Organisations (5c) component*. Centre for Development Innovation, Wageningen UR (University & Research centre). Report CDI-15-059. Wageningen.

This report presents the findings of the endline of the evaluation of the organisational capacity component of the MFS II country evaluations. The focus of this report is Ethiopia, HUNDEE. The format is based on the requirements by the synthesis team and NWO/WOTRO. The endline was carried out in 2014. The baseline was carried out in 2012.

Key words: 5C (five core capabilities); attribution; baseline; causal map; change; CFA (Co-financing Organisation) endline; organisational capacity development; SPO (Southern Partner Organisation).

Acknowledgements

We are grateful to all the people that have contributed to this report. We particularly would like to thank the Southern Partner Organisation HUNDEE Oromo Grassroots Development Initiative (HUNDEE) and the Co-Financing Agencies ICCO and IICD for their endless patience and support during this challenging task of collecting the endline data. We hope that this endline report will provide useful insights to HUNDEE, ICCO, IICD, consortia, the synthesis team, IOB and NWO/Wotro and other interested parties and other interested parties.

1 Introduction & summary

1.1 Purpose and outline of the report

The Netherlands has a long tradition of public support for civil bi-lateral development cooperation, going back to the 1960s. The Co-Financing System (*Medefinancieringsstelsel*, or 'MFS') is its most recent expression. MFS II is the 2011-2015 grant framework for Co-Financing Agencies (CFAs), which is directed at achieving a sustainable reduction in poverty. A total of 20 consortia of Dutch CFAs have been awarded €1.9 billion in MFS II grants by the Dutch Ministry of Foreign Affairs (MoFA).

The overall aim of MFS II is to help strengthen civil society in the South as a building block for structural poverty reduction. CFAs receiving MFS II funding work through strategic partnerships with Southern Partner Organisations.

The MFS II framework stipulates that each consortium is required to carry out independent external evaluations to be able to make valid, evaluative statements about the effective use of the available funding. On behalf of Dutch consortia receiving MFS II funding, NWO-WOTRO has issued three calls for proposals. Call deals with joint MFS II evaluations of development interventions at country level. Evaluations must comprise a baseline assessment in 2012 and a follow-up assessment in 2014 and should be arranged according to three categories of priority result areas as defined by MoFA:

Achievement of Millennium Development Goals (MDGs) & themes;

Capacity development of Southern partner organisations (SPO) (5 c study);

Efforts to strengthen civil society.

This report focuses on the assessment of capacity development of southern partner organisations. This evaluation of the organisational capacity development of the SPOs is organised around **four key evaluation questions**:

1. *What are the changes in partner organisations' capacity during the 2012-2014 period?*
2. *To what degree are the changes identified in partner capacity attributable to development interventions undertaken by the MFS II consortia (i.e. measuring effectiveness)?*
3. *Were the efforts of the MFS II consortia efficient?*
4. *What factors explain the findings drawn from the questions above?*

The purpose of this report is to provide endline information on one of the SPOs involved in the evaluation: HUNDEE in Ethiopia. The baseline report is described in a separate document.

Chapter 2 describes general information about the Southern Partner Organisation (SPO). Here you can find general information about the SPO, the context in which the SPO operates, contracting details and background to the SPO. In chapter 3 a brief overview of the methodological approach is described. You can find a more detailed description of the methodological approach in appendix 1. Chapter 4 describes the results of the 5c endline study. It provides an overview of capacity development interventions of the SPO that have been supported by MFS II. It also describes what changes in organisational capacity have taken place since the baseline and why (evaluation question is 1 and 4). This is described as a summary of the indicators per capability as well as a general causal map that provides an overview of the key organisational capacity changes since the baseline, as experienced by the SPO. The complete overview of descriptions per indicator, and how these have changed since the baseline is described in appendix 3. The complete visual and narrative for the key organisational capacity changes that have taken place since the baseline according to the SPO staff present at the endline workshop is presented in 4.2.2.

For those SPOs involved in process tracing a summary description of the causal maps for the identified organisational capacity changes in the two selected capabilities (capability to act and commit; capability to adapt and self-renew) is provided (evaluation questions 2 and 4). These causal maps describe the

identified key organisational capacity changes that are possibly related to MFS II interventions in these two capabilities, and how these changes have come about. More detailed information can be found in 4.3.

Chapter 5 presents a discussion on the findings and methodology and a conclusion on the different evaluation questions.

The overall methodology for the endline study of capacity of southern partner organisations is coordinated between the 8 countries: Bangladesh (Centre for Development Studies, University of Bath; INTRAC); DRC (Disaster Studies, Wageningen UR); Ethiopia (CDI, Wageningen UR); India (CDI, Wageningen UR); Indonesia (CDI, Wageningen UR); Liberia (CDI, Wageningen UR); Pakistan (IDS; MetaMeta); (Uganda (ETC). Specific methodological variations to the approach carried out per country where CDI is involved are also described in this document.

This report is sent to the Co-Financing Agency (CFA) and the Southern Partner Organisation (SPO) for correcting factual errors and for final validation of the report.

1.2 Brief summary of analysis and findings

Since the baseline, two years ago, improvements took place in all of the capabilities.

Many improvements took place in the indicators under the capability to act and commit. The leader at HUNDEE is responsive and the Board has become more engaged in decision making and guiding the management since the baseline. Board and management meetings are held on a more regular basis. In 2014 HUNDEE updated its organogram. The new organisational structure segregates staff duties and provides more clarity on roles and responsibilities. The board, management and different donors felt the need for this more clear organisational structure because of the expansion of the organisation in terms of themes and geography. Strategies are now articulated based on situation analysis and M&E findings. Staff skills in HUNDEE have improved, especially in using ICT for data collection, sharing of information, community managed disaster risk management, reporting, resilient livelihoods etc. because of many trainings offered by different donors including ICCO and IICD under MFS II (C4C Alliance). No staff has left the organisation since the baseline and most staff have enjoyed working at HUNDEE for over ten years because of the enabling work environment. The salary scale has improved shortly before the endline evaluation. HUNDEE also revised its HR policy and provides limited staff loans. The total annual budget of HUNDEE doubled from 25 million in 2012 to 50 million in 2014 because the credibility of the organisation and the resource mobilisation capacity improved. This resource mobilisation capacity was also supported by ICCO through quality assurance of their proposals. With the new organisational structure there are now dedicated staff members for resource mobilisation, there is more clarity on responsibilities in this matter and there is a more proactive approach to exploring new funding opportunities.

In the capability to adapt and self-renew HUNDEE also improved in many indicators. The organisation has slightly improved its M&E application because staff capacity to exercise and internalize the organisational accountability framework has increased. There is now an M&E team for each unit to strengthen the M&E system. ICCO has also been supporting HUNDEE to monitor and evaluate at different levels of impact and has provided training on downward accountability since 2009 (MFS II funded since 2011). The organisation is using M&E findings slightly more strategically as these findings have been used in project development. In terms of critical reflection, HUNDEE has institutionalized transparency and collective decision making and has established a grievance committee to resolve conflicts. HUNDEE keeps tracking its operating environment and has expanded its channels for getting information through working with other NGOs. Through implementing downward accountability, HUNDEE has become more responsive to its stakeholders and has gained the trust of the community.

In terms of the capability to deliver on development objectives, HUNDEE shows some improvement. The organisation has very slightly improved in having more clear operational plans that consider financial inflation so that there is no budget shortage for implementation. HUNDEE now has a budgeting officer and has improved in its planning and resource allocation. Administration costs have been reduced to work more cost-effectively. Through mainstreaming downward accountability mechanisms HUNDEE is well aware of client satisfaction in projects funded by various donors.

In the capability to relate, HUNDEE has improved as well. Understanding of the importance of working in networks has improved at top management level due to the advice of ICCO. HUNDEE is working more with networks and gets more information through them. Through the downward accountability mechanism, field staff and program staff have become more responsive to the target groups and visit them frequently. Within the organisation, between head office and field offices communication and information sharing has improved through the use of ICT. The new organisational structure also entails a formal communication and documentation system.

Finally, HUNDEE has improved in three of the four indicators under the capability to achieve coherence. Staffs are now more aware of the vision, mission and strategy of the organisation and are involved in the process of revisiting them, which creates a sense of ownership. There was an improvement in operational guidelines because the HR and financial policy were revised and a Disaster Risk Reduction guideline was developed (with ICCO's support). HUNDEE's programs have grown to be more complementary. In the operation areas all projects fall under one unified leadership.

The evaluators considered it important to also note down the SPO's story in terms of changes in the organisation since the baseline, because this would provide more information about reasons for change, which were difficult to get for the individual indicators. Also for some issues there may not have been relevant indicators available in the list of core indicators provided by the evaluation team.

During the endline workshop the following key organisational capacity changes were brought up by HUNDEE's staff: "improved capacity to facilitate behavioural change in rural communities"; "improved capacity in adaptive management"; "improved capacity in communication and information sharing"; "improved capacity to apply an integrated (multidisciplinary) M&E system"; "improved capacity in resource mobilization"; and "improved capacity to design drought resilient livelihood programs in pastoral and semi-pastoral areas".

According to HUNDEE staff present at the endline workshop, the capacity to facilitate behavioural change in rural communities improved because of the ability to use the appreciative inquiry approach through training on Asset Based Community Development (ABCD) by the COADY institute in 2012; and the ability to identify opinion leaders or other power centres due to understanding the power of mass mobilization which they gained during training on mass mobilization by GIZ in 2013.

Secondly, the organisation improved its capacity in adaptive management in the sense of adapting strategies to the interest and areas of concern of the government by understanding these interests and concerns. They gained this understanding by identification of possible alternatives that would be in agreement with the new CSO regulation and that could be accepted by the government, at an internal reflection meeting on adaptive management by HUNDEE.

Thirdly, HUNDEE improved its capacity in communication and information sharing because of access to information technology (broadband network, computers, smart phones etc. funded by MFS II), knowledge and skills in data management and computer utilisation for different purposes (due to MFS II funded computer skills trainings), and knowledge and skills on data collection, sharing and receiving by using smart phones because of a MFS II funded training on this topic.

Fourthly, the organisation improved its capacity to apply an integrated (multidisciplinary) M&E system because HUNDEE realized the need to involve all department units in M&E and clarifying the M&E responsibilities for the different programs/departments and M&E manager. Both these developments were due to the realisation that the work cannot be done by one person after HUNDEE expanded its work in terms of geographic areas and themes. The need to involve all departments in M&E also came from the need for quality reporting which takes all programmes into account. How this capacity was improved and the role of MFS II funded interventions will be further explained in the process tracing on this subject further below.

Fifthly, HUNDEE improved their resource mobilisation capacity because they started preparing big proposals, had a good track record, were willing to diversify their work, realised that donors' preferences are changing because of general limitations in terms of funding and the general manager showed networking and leadership capacity. HUNDEE started to prepare big proposals because of knowledge on detailed program proposal preparation they gained during a financial management training by Trocaire in 2013 and because they were forced to look for big projects to run the

organisation because of the CSO regulation that allows only 30 percent of the project budget to be used for administrative purpose.

Finally the organisation improved its capacity to design drought resilient livelihood programs in pastoral and semi-pastoral areas because of their improved skills in preparation of proposals related to Community based Disaster Risk Reduction and Management (CDRRM) and their improved capacity to implement resilience projects. The knowledge on CDRRM and implementing it was gained through training on CDRRM and the experience sharing/visit to Tigray, Dire Dawa and Awassa in 2013 (both MFS II funded), due to the needs assessment carried out in 2013 by the IRR consortium to identify capacity gaps in the area of CDRRM with the support of ICCO (MFS II funded).

All in all, there is some mention of MFS II funded capacity development interventions in the improved capacity for integrated M&E; improved capacity in communication and information sharing; and improved capacity to design drought resilient livelihood programs. During process tracing these and more MFS II funded interventions (such as trainings on these computer skills, and the use of smart phones and CMDRR; and the provision of broadband connection, computers and smart phones) have clearly come up, see further below. Other factors that were mentioned by HUNDEE staff include external factors like trainings by other funders (GIZ, Trocaire); changing funding climate; and CSO regulations. Also, there have been internal factors like internal reflections; expanding the program and have a good relationships with the government.

'Process tracing' was used to get more detailed information about the organisational capacity changes that were possibly related to specific MFS II capacity development interventions. For HUNDEE the organisational capacity changes that were focused on were "Enhanced resource mobilisation capacity", "Improved competences for gender mainstreaming", "Improved ICT capacity for information sharing and communication" and "Improved M&E practices including institutionalized downward accountability". These are further explained below.

Based on the process tracing causal map, it can be said that HUNDEE's enhanced resource mobilisation capacity can partly be attributed to MFS II supported capacity development interventions, notably by improved financial management capacity: through training and technical support on adapting financial system and accounting procedures in line with CSA regulations (although this was also done by other organisations); and through coaching and mentorship. Furthermore, the organisation increased its knowledge on funding trends and donor intelligence partly because of an improved ICT infrastructure (MFS II funded). There are also other factors to which enhanced resource mobilisation capacity of HUNDEE can be attributed. These include internal factors like experience from working on development projects, and experience and feedback from previous fields funding proposals. But there has also been support from other donors like by OXFAM Canada, who provided the training on gender analysis tools, and oriented the organisation to principals and useful empowerment tools integrated into to the ABCD approach, both useful for donor requirements in these areas. Then a range of funders have also contributed to the earlier mentioned trainings related to financial management capacity. Being an active member of new and existing consortia and networks helped them in understanding the importance of networks for resource mobilisation.

HUNDEE's improved competences for gender mainstreaming can partly be attributed to MFS II supported capacity development interventions, notably in the area of women in value chain development: i.e. training, coaching and an exchange visit to Kenya in relation to gender in value chain development which helped the organisation to review projects with a gender lens and increase their knowledge on these issues. Especially Oxfam Canada has also played an important, even more important role in terms of supporting annual organisation wide gender audits; and training on gender analysis with related tools and manual. Other donors have also played a role in terms of promoting gender mainstreaming and providing training on gender mainstreaming (CST). Internal factors like previous experience and establishing a gender task force have also played a role. And a USAID funded project has helped the organisation in addressing gender related issues.

ICT capacity has improved which can almost entirely be attributed to MFS II funded capacity development interventions by IICD and ICCO (C4C Alliance), by providing training and hardware: in particular training capacity based data collection using smart phones; training on data analysis software and website development; training on basic computer skills; and training on computer troubleshooting and hardware maintenance; provision of smart phones; provision of DVD and video deck; provision of

Wi-Fi internet infrastructure and computers. The 6NGO consortium meeting has been the main source of some of these ideas and proposals. The provision of smartphones by USAID and the engagement of the agricultural research centre documenting information for technology use have a relatively minor role.

Based on the process tracing causal map it can be said that the “improved M&E practices including institutionalised downward accountability”, can partly be attributed to MFS II supported capacity development interventions, and particularly in the area of downward accountability through the training trajectory on downward accountability that started in 2009 (MFS I) by the workshop organised by ICCO on client satisfaction instruments, and continued in 2011 with MFS II funding; including the training sessions on participatory filmmaking. In terms of improved competences to apply RBM and M&E tools, this can be attributed to efforts by training and coaching supported by MFS II (in M&E and PIM) but also training by other funders, including the World Bank, Trocaire, and Christian Aid.

2 Context and General Information about the SPO – HUNDEE

2.1 General information about the Southern Partner Organisation (HUNDEE)

Ethiopia	
Consortium	Connect for Change Consortium (C4C)
Responsible Dutch NGO	ICCO and IICD

Achievement of MDGs and themes	X
Capacity development of Southern partner organisations	X
Efforts to strengthen civil society	

2.2 The socio-economic, cultural and political context in which the partner operates

Ethiopia is one of the Sub-Saharan countries of Africa which liberalized their economies and developed poverty reduction strategies that underpin market-led strategies for broad based agricultural development and economic growth. This strategy makes agriculture a top priority to bring about sustainable development. Within agriculture, these strategies place heavy emphasis on the grain sector for improved production, privatization and commercialization. While agricultural development policy of

¹ HUNDEE takes part in the Consortium of 6 NGOs (C6NGOs) - namely Africa Development Aid Association (ADAA), Centre for Development Initiative (CDI), Ethiopian Rural Self Help Association (ERSHA), and Facilitator for Change (FC), HUNDEE-Oromo Grassroots Development Initiative and Oromo Self Reliance Association (OSRA). Together they promote Farmer Marketing Organisations (FMOs) in five administrative zone of Oromia Regional State: South West Shoa, East Shoa, West Shoa, West Arsi and Bale Zone, that together implement the economic development programme of Connect4Change. Contract partner for Connect4Change is Facilitator for Change.

Ethiopia is designed to support market-led agricultural development, competitiveness of smallholder producers and commercialization of small scale production depends on the development of viable and remunerative market linkages which the policy actions still lack to address mostly at the lower end of value chains.

On the other hand, agricultural productivity in Ethiopia is very low compared to other Sub-Saharan African countries. Various literatures indicate that inefficiency of domestic agricultural markets is mentioned as one of the factors held responsible for the reduced productivity of farmers and for the poor performances of the agricultural sector in the developing countries, particularly in Ethiopia. The capacity of smallholder farmers to produce the required quality and quantity of product as per the demand of the buyers is not well developed due to the limited agricultural extension services. Audio video recording on the improved agricultural practices could support for the increased production, productivity and quality of agricultural production.

Farmers Marketing Organisations (FMOs) are registered cooperatives under country's legal framework to serve members' common economic, social and cultural needs and aspirations through a jointly owned and democratically controlled enterprise. Currently, FMOs are proposing formation of an apex organisation, union of FMOs, which operate by an appointed manager, with sufficient decision making power and appropriate staffs. Union is recommended for organizing and bulking produce, assessing and accessing profitable market linkages, and providing market information to member FMOs. FMOs have faced constraints in the production and marketing of their agricultural produce that lowers their efficacy and competitiveness. FMOs do not have access to market information system that enables them to know prices and flows in markets outside of their own as shown in the following constraint analysis diagram teff value chain. This limits farmers' ability to deliver grain to unknown markets or to set contracts to go into effect at a future point in time, thus limiting their scope of spatial or temporal arbitrage. Furthermore, in the presence of asymmetric market information and weak institutional capabilities, it has been found out that, corruptions by elite local farmers and traders have caused high transaction costs crippling farmers' livelihood in the vicious cycle of poverty.

The consortium of six NGOs namely Africa Development Aid Association (ADAA), Centre for Development Initiative (CDI), Ethiopian Rural Self Help Association (ERSHA), Facilitator for Change (FC), HUNDEE-Oromo Grassroots Development Initiative and Oromo Self Reliance Association (OSRA) are promoting Farmers Marketing Organisations (FMOs) in five administrative zone of Oromia Regional State: South West Shoa, East Shoa, West Shoa, West Arsi and Bale Zone.

The core intention of HUNDEE along with other C6NGOs members has been to stimulate market access strategies for poverty alleviation. Currently, the second ICCO funded project on "Farmers Competitiveness on Agricultural Commodity Value Chain" has been launched. Value chain development approach has been followed by C6NGOs during the course of time to hit the intended target. After the recent programme review processes held by C6NGOs, lead firm (Union Model) approaches has been selected for the way forwards (2011 to 2014) in support of value chain development and high impact intervention strategy. Though valuable activities have been planned with this approach, still missing links exists when one come to programmatic requirements that calls for complementary actions which upgrades value chains and foster innovation in the value chain system as a whole.

In addition, HUNDEE – Oromo Grassroots Development Initiative is one of the indigenous NGO established a decade ago and operating in the Oromia Regional State with vision of Development of a rural society in Ethiopia in which government and civil institutions at all levels take their responsibility to empower and ensure the social, economic and cultural advancement of resource poor communities.

Towards effective realization of its organisational mission, HUNDEE currently facilitates the implementation of six major programmes in the field of development and civic education streams.

These include:

1. Promotion of community Cereal Banks and their networks
2. Civic Education with special focus on Women's Rights
3. Environmental Rehabilitation, Protection and Education
4. Women's Economic Support, Dabaree (heifers scheme).
5. Older Persons Economic Support scheme
6. Community based child development projects

Community organizing, gender and community awareness raising on HIV/AIDS pandemic remain cross cutting issues in all our programmes.

2.3 Contracting details

When did cooperation with this partner start?

2006

What is the MFS II contracting period?

September 2011 – December 2014

Did cooperation with this partner end?

NO

If yes, when did it finish?

N.A.

What is the reason for ending the cooperation with this partner:?

N.A.

If not, is there an expected end date?

December 2014

2.4 Background to the Southern Partner Organisation

History

HUNDEE – Oromo Grassroots Development Initiative is an indigenous NGO established in 1995. It is a local non-governmental organisation based on the philosophy that poor rural communities should be responsible for their own development. HUNDEE acts as a facilitator in this process. HUNDEE's major programmes include community organizing, cereal bank promotion and networks, civic education, environmental rehabilitation, and women's and older persons' economic support.

HUNDEE has five branch offices of which four offices are located in a 100km radius of Addis Ababa. They have 24 professional staff with tertiary level education in economics, sociology, management, law, agriculture and accounting and 52 other staff members including field animators, tree nursery foremen, drivers and other support staff.

The organisations' mission at establishment was to assist and empower resource poor rural and peri-urban communities to attain food security and increased household income and sustainable livelihood in Oromia National Regional. There was no formal strategic plan at the beginning. Capacity strengthening activities done during the first years included project management training, project development hands-on training, computer introduction and provision of office facilities to boost the office capacity. Misrepresentation by government regarding the organisation was indicated as important influencing factor during the period.

In the period 1998-2001, a vision statement was drafted which included human dignity and prosperity as the vision of the organisation. The strategy during these years were revitalizing community support systems and traditional institutions, e.g. household asset building, inclusiveness of different community groups, establishment of a MFI (Microfinance Institution), where HUNDEE is a major shareholder. Capacity strengthening activities done during these years included organisational development, strategic plan development, M&E system development, financial system development, leading organisation on marketing cooperatives trainings. The microfinance regulation of National Bank of Ethiopia forced HUNDEE to stop delivering credit service. Hence the regulation was indicated as important influencing factors.

2001-2005 was put as a third critical milestone period in the evolution of HUNDEE. The vision was well articulated and its mission was enabling small farmers, women, older persons, youth, and other marginalized groups to get organized around common issues of concern for livelihoods and to revitalize proven community-based traditional support system and institutions. The strategies during the period included right based approach, differentiating between direct and indirect programme costs, and inclusion of manufacturing to solve market problems in surplus areas, community assets development, and capacity building for target groups. Capacity building activities undertaken included technical training, transforming capacity building and asset-based community development, and marketing enterprise development. Training on facilitating community development and organisational development (adaptive management) were identified as important influencing factors in the period 2001-2005.

In the period, 2006-2009, the vision and mission remained the same as the previous period. The strategies of the organisation in this period included downward accountability (taken from ICCO), outcome based reporting (evolved from output based approach, result based approach, local resource mobilized). Capacity strengthening activities included different targeted trainings on M&E, project design, gender etc. and generative capacity building. The important influencing factors indicated by HUNDEE staff for the period 2006-2009 included the facilitation of farmers' access to remunerative markets, and the 2009 CSO legislation.

For the period 2010 to 2012, a new vision was put in place. The strategy of HUNDEE included total organisational approach. Holistic approach was also adopted in 2010. Geographical expansion: east Wolega, Borena, Sebeta, Finfine surrounding special zone were added and pastoralists were added as new target group. More functions were created such as community facilitators, nurse, veterinary experts, marketing experts, project experts and SHG monitors. Capacity strengthening activities during the period included strategic plan development, adaptive training after CSO law, organisational gender audit training, orientation on programmatic approach, capacity building on downward accountability and empowerment for addressing poverty. Furthermore, DOT Ethiopia, technical partner in the C4C Consortium, supports HUNDEE with technical issues and ICT-related trainings. The global financial crisis which resulted in reduced funding, and climate change which led to the engagement of HUNDEE on Disaster risk reduction programmes, were indicated as important influencing factors during the period.

Vision

A just world where women and men, and girls and boys, live in dignity and prosperity.

Mission

- Enable small farmers, women, older persons, youth and other marginalized groups to get organized around common issues of concern for livelihoods, and to revitalize proven community based traditional support system & institutions;
- Reduce vulnerability of target groups to transitory food shortage;
- Enable target groups to rehabilitate their degraded land;
- Empower women to attain economic and social rights, and eradicate all forms of violence and discrimination against them in Oromia regional state;
- Relate with government, civil institutions and NGOs to further our possible implement our development our development activities together with them.

Strategies

The five major programmatic areas that are developed against the backdrop of organisational vision, mission and goals described above are:

- Cereal Banks promotion and Value Chain Development;
- Community Education, Women Empowerment and Development Research;
- Community Based Child Development and Youth Capacity Building;
- Environment, Livelihoods and Adaptation to climate change; and
- Social Service Development.

3 Methodological approach and reflection

3.1 Overall methodological approach and reflection

This chapter describes the methodological design and challenges for the assessment of capacity development of Southern Partner Organisations (SPOs), also called the '5C study'. This 5C study is organised around **four key evaluation questions**:

1. What are the changes in partner organisations' capacity during the 2012-2014 period?
2. To what degree are the changes identified in partner capacity attributable to development interventions undertaken by the MFS II consortia (i.e. measuring effectiveness)?
3. Were the efforts of the MFS II consortia efficient?
4. What factors explain the findings drawn from the questions above?

It has been agreed that the question (3) around efficiency cannot be addressed for this 5C study. The methodological approach for the other three questions is described below. At the end, a methodological reflection is provided.

Note: this methodological approach is applied to 4 countries that the Centre for Development Innovation, Wageningen University and Research centre is involved in in terms of the 5C study (Ethiopia, India, Indonesia, Liberia). The overall approach has been agreed with all the 8 countries selected for this MFS II evaluation. The 5C country teams have been trained and coached on this methodological approach during the evaluation process. Details specific to the SPO are described in chapter 5.1 of the SPO report A detailed overview of the approach is described in appendix 1.

The first (changes in organisational capacity) and the fourth evaluation question are addressed together through:

- **Changes in the 5C indicators since the baseline:** standard indicators have been agreed upon for each of the five capabilities of the five capabilities framework (see appendix 2) and changes between the baseline, and the endline situation have been described. For data collection a mix of data collection methods has been used, including self-assessments by SPO staff; interviews with SPO staff and externals; document review; observation. For data analysis, the Nvivo software program for qualitative data analysis has been used. Final descriptions per indicator and per capability with corresponding scores have been provided.
- **Key organisational capacity changes – 'general causal map':** during the endline workshop a brainstorm has been facilitated to generate the key organisational capacity changes as perceived by the SPO since the baseline, with related underlying causes. For this purpose, a visual as well as a narrative causal map have been described.

In terms of the attribution question (2 and 4), '**process tracing**' is used. This is a theory-based approach that has been applied to a selected number of SPOs since it is a very intensive and costly methodology, although it provides rich information and can generate a lot of learning within the organisations. This approach was presented and agreed-upon during the synthesis workshop on 17-18 June 2013 by the 5C teams for the eight countries of the MFS II evaluation. A more detailed description of the approach was presented during the synthesis workshop in February 2014. The synthesis team, NWO-WOTRO, the country project leaders and the MFS II organisations present at the workshop have accepted this approach. It was agreed that this approach can only be used for a selected number of SPOs since it is a very intensive and costly methodology. Key organisational capacity changes/outcomes of the SPO were identified, based on their relationship to the two selected capabilities, the capability to act and commit the capability to adapt and self-renew, and an expected relationship with CFA supported capacity development interventions (MFS II funding). It was agreed to focus on these two capabilities, since these are the most targeted capabilities by the CFAs, as established during the baseline process.

Please find below an explanation of how the above-mentioned evaluation questions have been addressed in the 5C evaluation.

At the end of this appendix a brief methodological reflection is provided.

3.2 Assessing changes in organisational capacity and reasons for change - evaluation question 1 and 4

This section describes the data collection and analysis methodology for answering the first evaluation question: **What are the changes in partner organisations' capacity during the 2012-2014 period?** And the fourth evaluation question: **“What factors explain the findings drawn from the questions above?”**

In order to explain the changes in organisational capacity development between baseline and endline (evaluation question 1) the CDI and in-country evaluation teams needed to review the indicators and how they have changed between baseline and endline and what reasons have been provided for this. This is explained below. It has been difficult to find detailed explanations for changes in each of the separate 5c indicators, but the 'general causal map' has provided some ideas about some of the key underlying factors actors and interventions that influence the key organisational capacity changes, as perceived by the SPO staff.

The evaluators considered it important to also note down a consolidated SPO story and this would also provide more information about what the SPO considered to be important in terms of organisational capacity changes since the baseline and how they perceived these key changes to have come about. Whilst this information has not been validated with sources other than SPO staff, it was considered important to understand how the SPOs has perceived changes in the organisation since the baseline.

For those SPOs that are selected for process tracing (evaluation question 2), more in-depth information is provided for the identified key organisational capacity changes and how MFS II supported capacity development interventions as well as other actors, factors and interventions have influenced these changes. This is integrated in the next session on the evaluation question on attribution, as described below and in the appendix 1.

How information was collected and analysed for addressing evaluation question 1 and 4, in terms of description of changes in indicators per capability as well as in terms of the general causal map, based on key organisational capacity changes as perceived by the SPO staff, is further described below.

During the baseline in 2012 information has been collected on each of the 33 agreed upon indicators for organisational capacity. For each of the five capabilities of the 5C framework indicators have been developed as can be seen in Appendix 2. During this 5C baseline, a summary description has been provided for each of these indicators, based on document review and the information provided by staff, the Co-financing Agency (CFA) and other external stakeholders. Also a summary description has been provided for each capability. The results of these can be read in the baseline reports.

The description of indicators for the baseline in 2012 served as the basis for comparison during the endline in 2014. In practice this meant that largely the same categories of respondents (preferably the same respondents as during the baseline) were requested to review the descriptions per indicator and indicate whether and how the endline situation (2014) is different from the described situation in 2012².

Per indicator they could indicate whether there was an improvement or deterioration or no change and also describe these changes. Furthermore, per indicator the interviewee could indicate what interventions, actors and other factors explain this change compared to the baseline situation. See below the specific questions that are asked for each of the indicators. Per category of interviewees there is a different list of indicators to be looked at. For example, staff members were presented with a list of all the indicators, whilst external people, for example partners, are presented with a select number of indicators, relevant to the stakeholder.

² The same categories were used as during the baseline (except beneficiaries, other funders): staff categories including management, programme staff, project staff, monitoring and evaluation staff, field staff, administration staff; stakeholder categories including co-financing agency (CFA), consultants, partners.

The information on the indicators was collected in different ways:

- 1) **Endline workshop at the SPO - self-assessment and 'general causal map'**: similar to data collection during the baseline, different categories of staff (as much as possible the same people as during the baseline) were brought together in a workshop and requested to respond, in their staff category, to the list of questions for each of the indicators (self-assessment sheet). Prior to carrying out the self-assessments, a brainstorming sessions was facilitated to develop a 'general causal map', based on the key organisational capacity changes since the baseline as perceived by SPO staff. Whilst this general causal map is not validated with additional information, it provides a sequential narrative, based on organisational capacity changes as perceived by SPO staff;
- 2) **Interviews with staff members**: additional to the endline workshop, interviews were held with SPO staff, either to provide more in-depth information on the information provided on the self-assessment formats during the workshop, or as a separate interview for staff members that were not present during the endline workshop;
- 3) **Interviews with externals**: different formats were developed for different types of external respondents, especially the co-financing agency (CFA), but also partner agencies, and organisational development consultants where possible. These externals were interviewed, either face-to-face or by phone/Skype. The interview sheets were sent to the respondents and if they wanted, these could be filled in digitally and followed up on during the interview;
- 4) **Document review**: similar to the baseline in 2012, relevant documents were reviewed so as to get information on each indicator. Documents to be reviewed included progress reports, evaluation reports, training reports, etc. (see below) since the baseline in 2012, so as to identify changes in each of the indicators;
- 5) **Observation**: similar to what was done in 2012, also in 2014 the evaluation team had a list with observable indicators which were to be used for observation during the visit to the SPO.

Below the key steps to assess changes in indicators are described.

Key steps to assess changes in indicators are described

1. Provide the description of indicators in the relevant formats – CDI team
2. Review the descriptions per indicator – in-country team & CDI team
3. Send the formats adapted to the SPO to CFA and SPO – in-country team (formats for SPO) and CDI team (formats for CFA)
4. Collect, upload & code the documents from CFA and SPO in NVivo – CDI team
5. Organise the field visit to the SPO – in-country team
6. Interview the CFA – CDI team
7. Run the endline workshop with the SPO – in-country team
8. Interview SPO staff – in-country team
9. Fill-in observation sheets – in-country team
10. Interview externals – in-country team
11. Upload and auto-code all the formats collected by in-country team and CDI team in NVivo – CDI team
12. Provide to the overview of information per 5c indicator to in-country team – CDI team
13. Analyse data and develop a draft description of the findings per indicator and for the general questions – in-country team
14. Analyse data and develop a final description of the findings per indicator and per capability and for the general questions – CDI team
15. Analyse the information in the general causal map –in-country team and CDI-team

Note: the CDI team include the Dutch 5c country coordinator as well as the overall 5c coordinator for the four countries (Ethiopia, India, Indonesia, Liberia). The 5c country report is based on the separate SPO reports.

Please see appendix 1 for a description of the detailed process and steps.

3.3 Attributing changes in organisational capacity - evaluation question 2 and 4

This section describes the data collection and analysis methodology for answering the second evaluation question: ***To what degree are the changes identified in partner capacity attributable***

to (capacity) development interventions undertaken by the MFS II consortia (i.e. measuring effectiveness)? and the fourth evaluation question: **“What factors explain the findings drawn from the questions above?”**

In terms of the attribution question (2), ‘process tracing’ is used. This is a theory-based approach that has been applied to a selected number of SPOs since it is a very intensive and costly methodology, although it provides rich information and can generate a lot of learning within the organisations. Key organisational capacity changes/ outcomes of the SPO were identified, based on their relationship to the two selected capabilities, the capability to act and commit the capability to adapt and self-renew, and an expected relationship with CFA supported capacity development interventions (MFS II funding). It was agreed to focus on these two capabilities, since these are the most targeted capabilities by the CFAs, as established during the baseline process.

Below, the selection of SPOs for process tracing as well as the different steps involved for process tracing in the selected SPOs, are further explained.

3.3.1 Selection of SPOs for 5C process tracing

Process tracing is a very intensive methodology that is very time and resource consuming (for development and analysis of one final detailed causal map, it takes about 1-2 weeks in total, for different members of the evaluation team). It has been agreed upon during the synthesis workshop on 17-18 June 2013 that only a selected number of SPOs will take part in this process tracing for the purpose of understanding the attribution question. The selection of SPOs is based on the following criteria:

- MFS II support to the SPO has not ended before 2014 (since this would leave us with too small a time difference between intervention and outcome);
- Focus is on the 1-2 capabilities that are targeted most by CFAs in a particular country;
- Both the SPO and the CFA are targeting the same capability, and preferably aim for similar outcomes;
- Maximum one SPO per CFA per country will be included in the process tracing.

The intention was to focus on about 30-50% of the SPOs involved. Please see the tables below for a selection of SPOs per country. Per country, a first table shows the extent to which a CFA targets the five capabilities, which is used to select the capabilities to focus on. A second table presents which SPO is selected, and takes into consideration the selection criteria as mentioned above.

For the detailed results of this selection, in the four countries that CDI is involved in, please see appendix 1. The following SPOs were selected for process tracing:

- Ethiopia: AMREF, ECFA, FSCE, HUNDEE (4/9)
- India: BVHA, COUNT, FFID, SMILE, VTRC (5/10)
- Indonesia: ASB, ECPAT, PtPPMA, YPI, YRBI (5/12)
- Liberia: BSC, RHRAP (2/5).

3.3.2 Key steps in process tracing for the 5C study

In the box below you will find the key steps developed for the 5C process tracing methodology. These steps will be further explained here. Only key staff of the SPO is involved in this process: management; programme/ project staff; and monitoring and evaluation staff, and other staff that could provide information relevant to the identified outcome area/key organisational capacity change. Those SPOs selected for process tracing had a separate endline workshop, in addition to the ‘ general endline workshop. This workshop was carried out after the initial endline workshop and the interviews during the field visit to the SPO. Where possible, the general and process tracing endline workshop have been held consecutively, but where possible these workshops were held at different points in time, due to the complex design of the process. Below the detailed steps for the purpose of process tracing are further explained. More information can be found in Appendix 1.

Key steps in process tracing for the 5C study

1. Identify the planned MFS II supported capacity development interventions within the selected capabilities (capability to act and commit and capability to adapt and self-renew) – CDI team
2. Identify the implemented MFS II supported capacity development interventions within the selected capabilities (capability to act and commit and capability to adapt and self-renew) – CDI team
3. Identify initial changes/ outcome areas in these two capabilities – CDI team & in-country team
4. Construct the detailed, initial causal map (theoretical model of change) – CDI team & in-country team
5. Identify types of evidence needed to verify or discard different causal relationships in the model of change – in-country teams, with support from CDI team
6. Collect data to verify or discard causal mechanisms and construct workshop based, detailed causal map (model of change) – in-country team
7. Assess the quality of data and analyse data and develop final detailed causal map (model of change) – in-country team with CDI team
8. Analyse and conclude on findings– CDI team, in collaboration with in-country team

3.3.3 Methodological reflection

Below a few methodological reflections are made by the 5C evaluation team. These can also be found in appendix 1.

Use of the 5 core capabilities framework and qualitative approach: this has proven to be a very useful framework to assess organisational capacity. The five core capabilities provide a comprehensive picture of the capacity of an organisation. The capabilities are interlinked, which was also reflected in the description of standard indicators, that have been developed for the purpose of this 5C evaluation and agreed upon for the eight countries. Using this framework with a mainly qualitative approach has provided rich information for the SPOs and CFAs, and many have indicated this was a useful learning exercise.

Using standard indicators and scores: using standard indicators is useful for comparison purposes. However, the information provided per indicator is very specific to the SPO and therefore makes comparison difficult. Whilst the description of indicators has been useful for the SPO and CFA, it is questionable to what extent indicators can be compared across SPOs since they need to be seen in context, for them to make meaning. In relation to this, one can say that scores that are provided for the indicators, are only relative and cannot show the richness of information as provided in the indicator description. Furthermore, it must be noted that organisations are continuously changing and scores are just a snapshot in time. There cannot be perfect score for this. In hindsight, having rubrics would have been more useful than scores.

General causal map: whilst this general causal map, which is based on key organisational capacity changes and related causes, as perceived by the SPO staff present at the endline workshop, has not been validated with other sources of information except SPO feedback, the 5C evaluation team considers this information important, since it provides the SPO story about how and which changes in the organisation since the baseline, are perceived as being important, and how these changes have come about. This will provide information additional to the information that has been validated when analysing and describing the indicators as well as the information provided through process tracing (selected SPOs). This has proven to be a learning experience for many SPOs.

Using process tracing for dealing with the attribution question: this theory-based and mainly qualitative approach has been chosen to deal with the attribution question, on how the organisational capacity changes in the organisations have come about and what the relationship is with MFS II

supported capacity development interventions and other factors. This has proven to be a very useful process, that provided a lot of very rich information. Many SPOs and CFAs have already indicated that they appreciated the richness of information which provided a story about how identified organisational capacity changes have come about. Whilst this process was intensive for SPOs during the process tracing workshops, many appreciated this to be a learning process that provided useful information on how the organisation can further develop itself. For the evaluation team, this has also been an intensive and time-consuming process, but since it provided rich information in a learning process, the effort was worth it, if SPOs and CFAs find this process and findings useful.

A few remarks need to be made:

- Outcome explaining process tracing is used for this purpose, but has been adapted to the situation since the issues being looked at were very complex in nature.
- Difficulty of verifying each and every single change and causal relationship:
 - Intensity of the process and problems with recall: often the process tracing workshop was done straight after the general endline workshop that has been done for all the SPOs. In some cases, the process tracing endline workshop has been done at a different point in time, which was better for staff involved in this process, since process tracing asks people to think back about changes and how these changes have come about. The word difficulties with recalling some of these changes and how they have come about. See also the next paragraph.
 - Difficulty of assessing changes in knowledge and behaviour: training questionnaire is have been developed, based on Kirkpatrick's model and were specifically tailored to identify not only the interest but also the change in knowledge and skills, behaviour as well as organisational changes as a result of a particular training. The retention ability of individuals, irrespective of their position in the organisation, is often unstable. The 5C evaluation team experienced that it was difficult for people to recall specific trainings, and what they learned from those trainings. Often a change in knowledge, skills and behaviour is a result brought about by a combination of different factors, rather than being traceable to one particular event. The detailed causal maps that have been established, also clearly pointed this. There are many factors at play that make people change their behaviour, and this is not just dependent on training but also internal/personal (motivational) factors as well as factors within the organisation, that stimulate or hinder a person to change behaviour. Understanding how behaviour change works is important when trying to really understand the extent to which behaviour has changed as a result of different factors, actors and interventions. Organisations change because people change and therefore understanding when and how these individuals change behaviour is crucial. Also attrition and change in key organisational positions can contribute considerably to the outcome.

Utilisation of the evaluation

The 5C evaluation team considers it important to also discuss issues around utility of this evaluation. We want to mention just a few.

Design – mainly externally driven and with a focus on accountability and standard indicators and approaches within a limited time frame, and limited budget: this MFS II evaluation is originally based on a design that has been decided by IOB (the independent evaluation office of the Dutch Ministry of Foreign Affairs) and to some extent MFS II organisations. The evaluators have had no influence on the overall design and sampling for the 5C study. In terms of learning, one may question whether the most useful cases have been selected in this sampling process. The focus was very much on a rigorous evaluation carried out by an independent evaluation team. Indicators had to be streamlined across countries. The 5C team was requested to collaborate with the other 5C country teams (Bangladesh, Congo, Pakistan, Uganda) to streamline the methodological approach across the eight sampled countries. Whilst this may have its purpose in terms of synthesising results, the 5C evaluation team has also experienced the difficulty of tailoring the approach to the specific SPOs. The overall evaluation has been mainly accountability driven and was less focused on enhancing learning for improvement. Furthermore, the timeframe has been very small to compare baseline information (2012) with endline information (2014). Changes in organisational capacity may take a long, particularly if they are related to behaviour change. Furthermore, there has been limited budget to carry out the 5C evaluation. For all the four countries (Ethiopia, India, Indonesia, Liberia) that the Centre for Development Innovation, Wageningen University and Research centre has been involved in, the budget has been overspent.

However, the 5C evaluation team has designed an endline process whereby engagement of staff, e.g. in a workshop process was considered important, not only due to the need to collect data, but also to generate learning in the organisation. Furthermore, having general causal maps and detailed causal maps generated by process tracing have provided rich information that many SPOs and CFAs have already appreciated as useful in terms of the findings as well as a learning process.

Another issue that must be mentioned is that additional requests have been added to the country teams during the process of implementation: developing a country based synthesis; questions on design, implementation, and reaching objectives of MFS II funded capacity development interventions, whilst these questions were not in line with the core evaluation questions for the 5C evaluation.

Complexity and inadequate coordination and communication: many actors, both in the Netherlands, as well as in the eight selected countries, have been involved in this evaluation and their roles and responsibilities, were often unclear. For example, 19 MFS II consortia, the internal reference group, the Ministry of Foreign Affairs, Partos, the Joint Evaluation Trust, NWO-Wotro, the evaluators (Netherlands and in-country), 2 external advisory committees, and the steering committee. Not to mention the SPO's and their related partners and consultants. CDI was involved in 4 countries with a total number of 38 SPOs and related CFAs. This complexity influenced communication and coordination, as well as the extent to which learning could take place. Furthermore, there was a distance between the evaluators and the CFAs, since the approach had to be synchronised across countries, and had to adhere to strict guidelines, which were mainly externally formulated and could not be negotiated or discussed for the purpose of tailoring and learning. Feedback on the final results and report had to be provided mainly in written form. In order to enhance utilisation, a final workshop at the SPO to discuss the findings and think through the use with more people than probably the one who reads the report, would have more impact on organisational learning and development. Furthermore, feedback with the CFAs has also not been institutionalised in the evaluation process in the form of learning events. And as mentioned above, the complexity of the evaluation with many actors involved did not enhance learning and thus utilization.

5C Endline process, and in particular thoroughness of process tracing often appreciated as learning process: The SPO perspective has also brought to light a new experience and technique of self-assessment and self-corrective measures for managers. Most SPOs whether part of process tracing or not, deeply appreciated the thoroughness of the methodology and its ability to capture details with robust connectivity. This is a matter of satisfaction and learning for both evaluators and SPOs. Having a process whereby SPO staff were very much engaged in the process of self-assessment and reflection has proven for many to be a learning experience for many, and therefore have enhanced utility of the 5C evaluation.

4 Results

4.1 MFS II supported capacity development interventions

Below an overview of the different MFS II supported capacity development interventions of HUNDEE that have taken place since the baseline in 2012 are described. The information is based on the information provided by ICCO and IICD.

Table 1

Information about MFS II supported capacity development interventions since the baseline in 2012

Title of the MFS II supported capacity development intervention	Objectives	Activities	Timing and duration	Budget
Finance Management of Hundee by the ICCO Finance Officer through the Consortium framework in Ethiopia	<ul style="list-style-type: none"> - To enhance the capacity of the organization in aspects of timely, quality and good financial & record systems. - Institutionalizing financial systems and enhanced involvement of all stakeholders in programming, implementation and monitoring of its programs 	Budgeting, Financing Reporting, Grants management (Donor relations & sub-grant management) – through FC C6NGO consortium	May 2013	About €2,500 covering transport, accommodation and upkeep costs
Training workshop on downward accountability	capacitate the SPO (together with the other 5 NGOs in the consortium) to pilot some downward accountability tools, which in turn aim at improving the quality and effectiveness of the services of SPO to its clients, its accountability to its clients, etc; Mainstreaming downward accountability in all its programs and institutionalize the approach. The SPO adopted ICT solutions that can be conveniently used to disseminate and collect information using a mobile phone	Introduction training course on Downward Accountability (2009 – MFS1) Field work preparation & Implementation with coaching on the side (2010 – MFS1) Sense-making Workshop (August 2010 MFS1) Participatory film making (March 2011 – MFS 2) Round 2 Field work – with training session and coaching (November 2011 – MFS2) Participatory film making (December 2012- MFS 2) Final dissemination conference December 2012 - MFS	See previous column	The whole program was about 75K Euro, including production of a book, 2 movies, website, trainings, meetings, consultant and 6 participating organisations. So Hundee share was 1/6 of 75K = 12.500 Euro.
Coaching Gender Mainstreaming in value chain within the Consortium framework	To enhance equitable participation of both men and women in its program; Mainstream gender in all its programs as cross cutting issues	No info	2013	No info
Staff training on application of ICT tools for development, and website development under the C4C framework.	This was what SPOs needed and included as part of its ICT project that relates to FED program (Fair Economic Development); Provide access to up-to-date and reliable information sources to its target groups, which are smallholder farmers and their organizations	Provide access to up-to-date and reliable information sources to its target groups, which are smallholder farmers and their organizations	2013	No info

Title of the MFS II supported capacity development intervention	Objectives	Activities	Timing and duration	Budget
cross country experience exchange for management members and Directors on FED and ICT covering Kenya & Ethiopia	learning from one another so as to enhance their respective development results; Strong link with market actors leading to self-sustainability.	Learning & Sharing Experiences especially on ICT and business approaches	October, 2013	€21,000 (€10,000 from ICCO and €11,000 from IICD)

4.2 Changes in capacity development and reasons for change - evaluation question 1 and 4

Below you can find a description of the changes in each of the five core capabilities (4.2.1). This information is based on the analysis of the information per each of the indicators. This detailed information for each of the indicators describes the current situation, and how and why it has changed since the baseline. In addition to this staff present at the endline workshop were asked to indicate what were the key changes in the organisation since the baseline. The most important is key organisational capacity changes have been identified, as well as the reasons for these changes to come about. This is described in a general causal map, both as a visual as well as a narrative. The detailed general map is described in 4.2.2.

4.2.1 Changes in the five core capabilities

Capability to Act and Commit

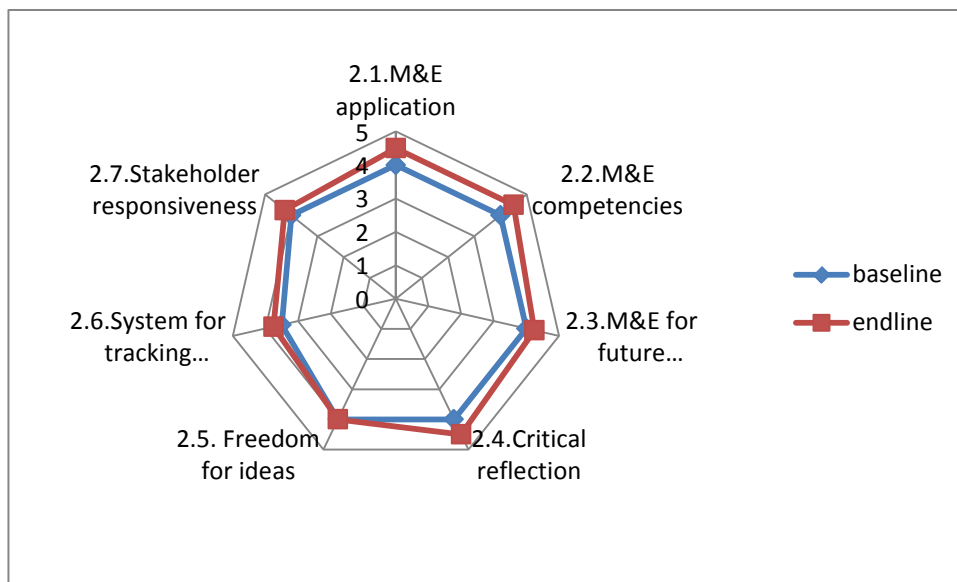

There exists responsive, transparent, collective and accountable leadership role in HUNDEE. The leadership effectively engages in all organizational aspects, including strategic and operational issues. The Board of Directors is helping the organization in defining the strategic directions, and most importantly, on a regular basis advises the management team on coping with changing circumstances. HUNDEE has been focused on the realization of its long-term objectives and goal through organizational development, improving the resource base/funding of the organization, enhancing on-going learning through consistent application of PME, maintaining and enforcing good public relations, and ensuring

program quality and outreach expansion. There has been no staff turnover in HUNDEE since the baseline. Rather, most of the staff members (particularly the senior ones) have been working at the organization for more than ten and above years due to the existing enabling working environment. Most of the staffs who participated in the baseline assessment were present in the end line assessment. A new organizational structure clearly defines roles and responsibilities of staffs and hence there are well-articulated job descriptions of staff. Besides, strategies are well articulated at HUNDEE in a way that situation analysis and monitoring and evaluation are used to inform strategies. HUNDEE day to day operations were already in line with the strategic plan. HUNDEE field staffs, due to regular trainings and capacitating activities within the C6NGO framework (MFS II), were able to improve their planning, monitoring and follow up, and reporting of project activities. Efforts were made to focus on outcomes rather than outputs in their reports. Accordingly, significant changes have been observed in the quality of the reports. Staff skill at HUNDEE has improved since the baseline particularly in relation to using ICT for data collection and sharing information, and use of community managed disaster risk management program implementation. HUNDEE staff training need assessments were undertaken at various levels and trainings were provided on different topics as identified in the gaps analysis. Short-term trainings on subjects quite related to the project/program engagements were facilitated for selected staff by different donors and networks. Regarding incentives, HUNDEE reasonably improved the salary scale, although some staff indicated not to have seen this taken place, while a transport service has been given to core and senior staff since 2012. The organization's funding sources have improved, hence the total annual budget of the organization increased from 25 million in 2012, to 33 million in 2013, and 50 million in 2014. As a result HUNDEE intervention areas increased from seven decentralized offices to nine area offices. Funding procedures changed in the sense that fundraising, proposal development and income generation are specifically designated to senior management and the general manager and, in collaboration with program staff, are more proactive in terms of resource mobilization and engaged in approaching different donors through lobbying and competing in different calls for proposals.

Score: from 3.7 to 4.2 (slight improvement)

Capability to adapt and self-renew

Participatory project monitoring has become practice in HUNDEE and has not changed greatly since the baseline. HUNDEE regularly conducts participatory monitoring and downward accountability. These lessons are adopted continuously. TROCAIRE and other donors have given training on downward accountability and HUNDEE has developed a draft organizational accountability framework and oriented staff members on accountability and complaint handling. Staff capacity to exercise and internalize the accountability framework has increased. Hence, HUNDEE has started to document best practices to use

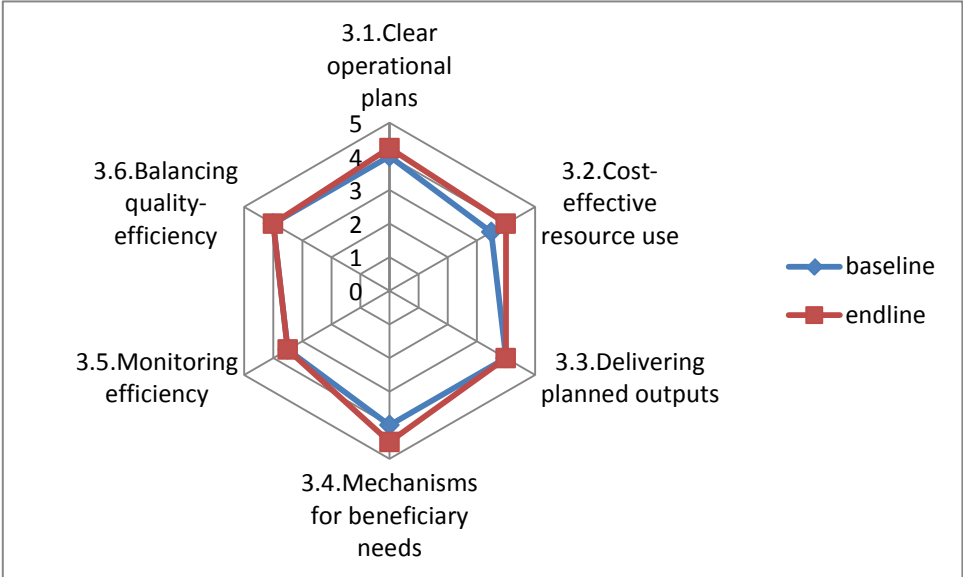

for scaling up. The organization has also refined and continuously adapted data collection tools, and conducted participatory review and reflection. There is internal reflection to improve M&E activities. Quality and practicability of indicators has improved, and an the information gathering template is developed and practiced. There is more of a focus on collecting data at outcome level, and information generated informed strategic decision-making. However, training on Programme Impact Measurement provided by ICCO is not always implemented by staff due to lack of budget. Furthermore outcome level information is mainly collected by external evaluation consultants. The M&E findings have considered and utilized in project development and lesson learnt shared among project staff and senior management at head office level. Staffs have now better idea about how the information produced from M&E is used as an input in the organization’s future strategic direction. On the other hand, HUNDEE have established grievance committee to resolve conflicts and manuals are prepared due to the introduction of downward accountability.

The organization has established an M&E team for each unit to make the entire staff (programs and finance and administration) to get involved on issues of monitoring and evaluation in a regular basis. Staffs’ understanding about the importance of monitoring and evaluation and their attitude has improved. Frequent orientation on the importance and functionality of monitoring and evaluation has been given to staff at all levels by the senior staff. Besides, M&E unit staffs have enough understanding to practice M&E. Frequency of monitoring increased along with the increased number of staff involved, and training on MEL (Monitoring, Evaluation and Learning) that was provided for staff.

Regarding critical reflection, field staff meetings are held on a quarterly, bi-annual and annual basis, so as to reflect ideas and views. There have been frequent meetings with program personnel to reflect on program/operational issues and staff are now free to reflect on any issue. The top management also inspires critical reflection among staffs at all levels and there is a good culture to adapt new initiatives that are important for the organization. New findings generated during evaluation and implementation are appreciated and the management has committed to strengthen results. Most of the activities in scanning the environment were done made by the General Manager, senior staff and project coordinators, and is mainly based on collaborating with other NGOs.

Score: from 3.9 to 4.2 (slight improvement)

Capability to deliver on development objectives

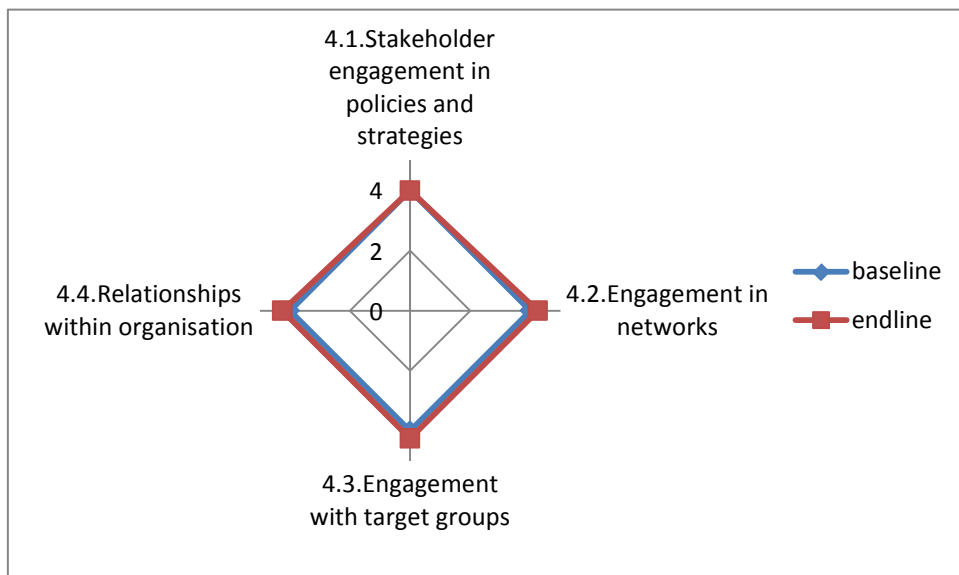

HUNDEE has considered inflation during project proposal development and there is no budget shortage for project implementation. Operational plans prepared at head office level. Confusion in implementation is reduced by creating awareness through lessons from projects assessment reports and recommendations as well as feedback during field visits. Every year operational plans with budgets are prepared and submitted to Civil Society Organisations as well as shared with each area office. Hence, all

projects have an operational plan and budget, and the plans are used in the day to day activities. HUNDEE planning and resource allocation have improved and an appropriate person for budget control and planning has been assigned (like budgeting officer). This showed the organization has given due attention to the cost effective approach without compromising quality services. HUNDEE has sustained its strength in delivering planned outputs as specified in the agreement. However, the monitoring and evaluation unit has been organized in a new way that core program and finance staffs take a leading role to easily monitor projects and programs of the organization. Plans are implemented as expected in some projects whereas in others set targets may not be fully met due to financial constraints, delays in release of finances and procurement as a result of bureaucratic procedures. HUNDEE has put in place systems and tools to measure client satisfactions through regular monitoring meetings with different committees and beneficiaries are fully participating in the whole process of a project. Unlike during the time of the baseline, downward accountability tools are mainstreamed in all program levels due to the fact that organization-wide trainings were given on downward accountability tools including client satisfaction to exercise in various projects funded by ICCO, CCRDA, KNH, CST, and ESP2. In addition to the M&E unit, the newly assigned Program Operation Department took responsibility to oversee organizational project budget utilization and activity implementation. Both the economic use of resources and delivery of standard quality outputs are checked and all staffs are well aware about quality services.

Score: from 3.8 to 4.0 (very slight improvement)

Capability to relate

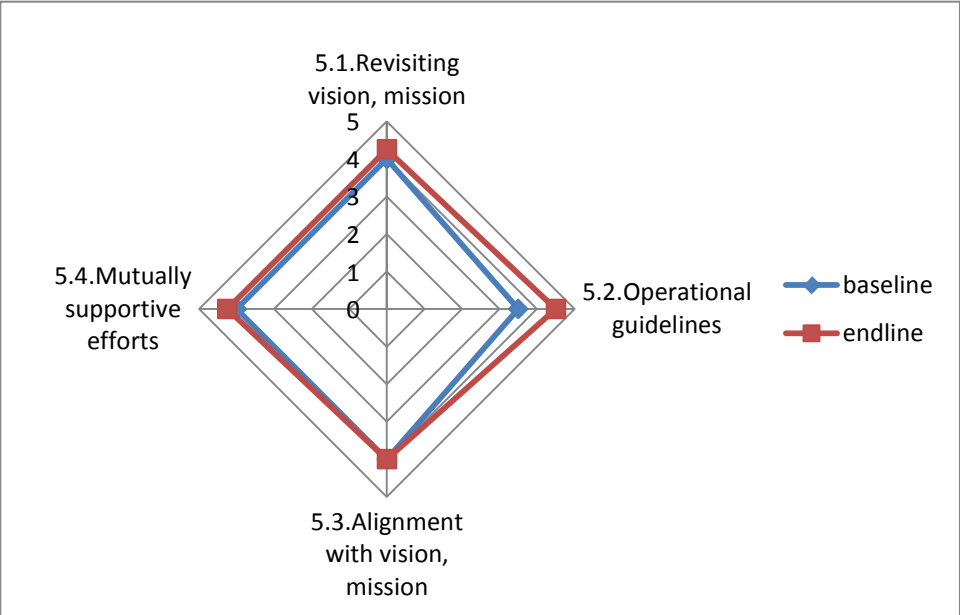

HUNDEE involves its stakeholders at program formulation and implementation levels, and the organization maintains good relationships with its stakeholders even though there is limited engagement in terms of developing policies and strategies for HUNDEE, according to the CFA assessment. HUNDEE staffs hold regular meetings with stakeholders during project launching, planning, review workshops, reporting and feedback sessions, and the SPO is open to collaboration with stakeholders. Stakeholders participate from problem identification to evaluation, and their inputs are taken seriously. HUNDEE has engaged with the existing and new networks like the consortium of self-help groups Ethiopia. HUNDEE's top leaders and management team strongly recognize and value the role that partnership and networking between civil society organizations as well as with other relevant development actors can play in the design, implementation and effective delivery of development services. Hence, the organization has improved its bargaining power as a result of engagement in networks which in turn helps to get and provide information as well as share experiences.

HUNDEE is currently a member of such national consortiums and networks as CCRDA (Consortium of Christian Relief and Development Association), PANE (Poverty Action Network of Ethiopia), and harmful traditional practices (HTP's) national Network, CoSAPE (Consortium of Self-Help Group Approach

promoters in Ethiopia) and the like. At regional level, HUNDEE is among the founding members of NeCSO (Network of Civil Society organizations in Oromia) and is also part of a steering committee of the GO-NGO forum currently headed and hosted by the government of the regional state. There is continued improvement of community satisfaction in HUNDEE development services and increased community responsiveness. In the seminar report on downward accountability and client feedback mechanisms in 2012 showed that farmers have become more critical and take part in decision-making, more than before. HUNDEE has improved communication and information sharing due to better internet access through the support of ICT project for ICT training and provision of ICT materials like smart mobile and Wi-Fi internet provided by ICCO. There is good communication system with top management both upwards and horizontally within the organization.

Score: from 4 to 4.2 (very slight improvement)

Capability to achieve coherence

Vision, mission and strategies are regularly discussed in the organization. HUNDEE has reviewed the vision, mission and programs objective in a more gender sensitive manner, and strategic documents and project proposals are designed in line with this. There has been increased awareness of staff on the vision, mission and strategy of HUNDEE, and staff have been involved in this process, which is also created a sense of ownership. In terms of policy and operational documents for the organisation, HUNDEE has produced a draft code of conduct and a child protection policy. The financial manual has also been revised to capture the costs of programs and activities. The HR and financial policies are updated or revised to capture the current situation. Moreover, the organization has developed Disaster Risk Reduction (DRR) guidelines through the support of ICCO. HUNDEE's previous two strategic planning documents provided a roadmap for overall organizational operations and aligning of its core programs and policy initiatives to key organizational areas. It has also served as primary source of inspiration out of which its operational plans are derived and developed during the last couple of years. Moreover, HUNDEE has improved its degree of complementarity and synergy between programs. An example of this is with the project involving cereal banks and value chain development, self-help groups and Dabaree projects, Community Managed Disaster Risk (CMDRR) and the livelihood enhancement program and the like.

Score: from 3.9 to 4.2 (Slight improvement)

4.2.2 Key organisational capacity changes - general causal map

Below you can find a description of the key changes in organizational capacity of HUNDEE since the baseline as expressed by HUNDEE staff during the endline workshop, which was held on the 3rd of October at the HUNDEE Head Office in Addis Ababa. First, a description is given of how this topic was introduced during the endline workshop by summarising key information on HUNDEE from the baseline report. This information included a brief description of the vision, mission and strategies of the organisation, staff situation, clients and partner organisations. This then led into a discussion on how HUNDEE has changed since the baseline.

The ten endline workshop participants mentioned that the goal of Hundee in capacity building is to improve their capacity to implement activities in a larger area, a larger client coverage and with more quality [1] and, according to workshop participants over the last two years, since the baseline in 2012, Hundee has been able to improve its capacity specifically in the following areas:

1. Improved capacity to facilitate behavioural change [2];
2. Improved capacity in adaptive management [3];
3. Improved capacity in communication and information sharing [4];
4. Improved capacity to apply an integrated (multidisciplinary) M&E system [5];
5. Improved capacity in resource mobilization [6]; and
6. Improved capacity to design drought resilient livelihood programs in pastoral and semi-pastoral areas

Each of these six key organisational capacity changes is explained below.

Improved capacity to facilitate behavioural change in rural communities (2)

At the endline workshop Hundee staff mentioned that before the baseline in 2012 facilitation was used only to change the belief of women and the society at large about women and their role in society. Now facilitation is used to change most of the negative traditional practices seen in the rural areas. For example, the attitude of rural people towards hygiene and using health services. The improved capacity to facilitate behavioural change was due to

- a. Ability to use the appreciative inquiry approach (9). This approach helped to identify what the community has and what it lacks. HUNDEE got this knowledge as a result of the training on Asset Based Community Development (ABCD) delivered by the COADY institute in 2012 [12];
- b. Since facilitating requires initially convincing influential people, about the ability to identify the opinion leaders or other power centres is useful (8). HUNDEE already had this knowledge in relation to using Abageda/elders (Oromo traditional leaders/elders). This related also to understanding the power of mass mobilization (10). This understanding was gained as a result of training on mass mobilization that was organized in Kenya and Sierra Leone in 2013 by GIZ (11). This approach has specifically helped in tackling the problem of Harmful Traditional Practices (HTPSs), to enhance women empowerment etc. The ability to tackle HTPS is also due to the training on Asset Based Community Development (ABCD) in 2012 by the COADY Institute [12].

Improved capacity in adaptive management (3)

This relates to the capacity HUNDEE gained in scanning the external and internal environment and make it fit with the situation. One area in this regard, is understanding the interest of the government and its areas of concern (13). To identify possible alternatives that could be accepted by the government (14) and which are also in agreement with the new CSO regulation (16), HUNDEE carried out an internal reflection on adaptive management (15) and tried to come up with possible intervention strategies. For example, HTPs are both human rights and public health issues. The CSO regulation restricts NGOs not to work on HTPs as a human right issue. Understanding this dilemma, HUNDEE decided to work on it as a public health issues and this helped to reduce the problem. This lesson helped HUNDEE to find alternative ways to do the work.

Improved capacity in communication and information sharing (4)

HUNDEE is now better connected and has access to information technology (19) as a result of the broadband network connection it acquired at the HQs in 2014 with MFS II support [18], and the provision of computers, smart phones, LCD, CDMA in 2013 by ICCO and IICD (MFS II funding) [17]. This

enabled HUNDEE to communicate better internally at the HQs and with field offices. Furthermore, staff gained knowledge and skills in data management and other computer skills to be able to use this hardware for different purposes (20), which was a result of the training on computer skills delivered in 2013 by ICCO and IICD (MFS II funding) [22]. Knowledge and skills in data collection and data sharing using smart phones [21] was gained as a result of the training on utilization of smart phones organized in 2013 by ICCO and II and PCI (Project Concern International)(MFS II funding) [23].

Improved capacity to apply an integrated (multidisciplinary) M&E system (5)

Currently M&E in HUNDEE is carried out in a team with the involvement of programs. This change happened because HUNDEE realized the need to involve all department units in M&E (24) and prepare quality reports which include the perception of different programs and disciplines (25). As a result the role of the M&E unit became coordination of the M&E processes. This changed role was carried out by clarifying M&E responsibilities for the different programs/departments, and assigning the coordination role to the M&E manager (26). In addition, the expansion of HUNDEE in terms of area and sector coverage (27) has also led HUNDEE to think differently and realize that the M&E cannot be handled by one person only (27a) How this capacity was improved will be further detailed in the M&E process tracing causal map.

Improved capacity in Resource mobilization (6)

Currently more funds are available and an increased number of donors is working with HUNDEE compared to the baseline condition. This is due to:

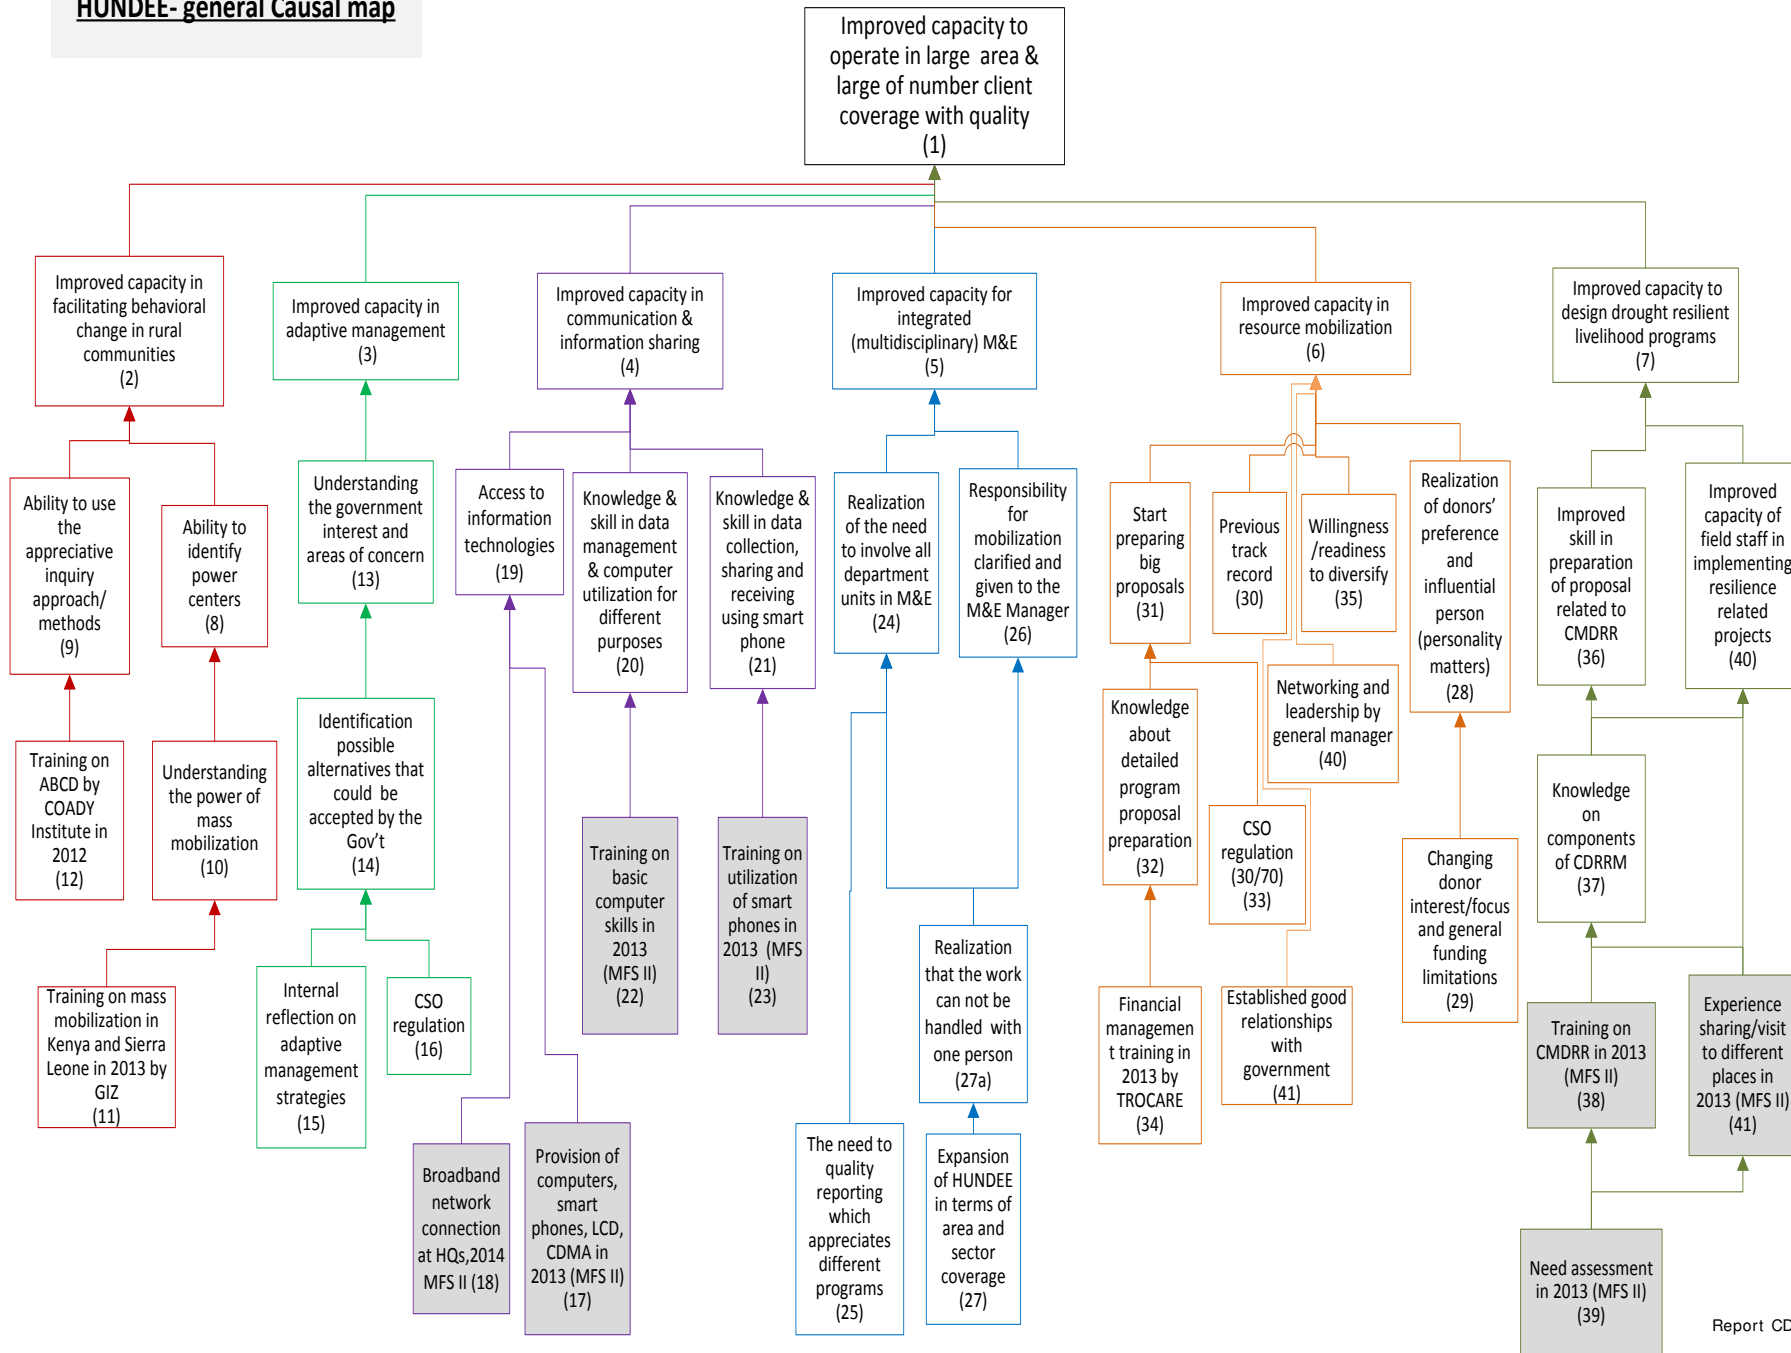

- a. Starting to prepare big proposals (31);
- b. Previous track record (good experience) (30) which shows HUNDEE's ability in implementing and completing projects;
- c. The willingness to diversify (35) or work on new sectors such as health and pastoral areas and,
- d. Realising donors' preferences for influential persons (28), which is due to the changing trend of donors interest (shift to certain interventions) and the general limitation in terms of funding [29]. Through the networking and leadership capability of HUNDEE, particularly the general manager (40), the organization is respected by different donors and has better chances to get funds. In addition it has established good relationships with the government bodies which did not exist before the baseline (41). For example, recently, HUNDEE was recommended by the Oromia bureau of Agriculture to conduct a program on FTC to be financed by donors.

Why HUNDEE started to prepare big proposals was the result of the knowledge it gained in detailed program proposal preparation (32) which helped to clearly and concisely cost activities while preparing proposals. This improved knowledge and skills was a result of the financial management training it received in 2013 by TROCARE (34). In addition, the CSO regulation which limits NGOs to use only 30% of the project budget for administrative purposes and 70 % for program implementation (33) forced HUNDEE to look for big projects and get enough money for running the organization.

Improved capacity to design drought resilient livelihood programs in pastoral and semi-pastoral areas (7)

HUNDEE used to work mainly in highland areas on programs focusing on settled farmers. However, since the baseline in 2012 it has improved its capacity to design programs that contribute to drought resilient livelihoods (7). This capacity enables HUNDEE to work on pastoral livelihoods in addition to the work it is doing on highland livelihoods. This capacity has improved as a result of the knowledge the staff developed regarding Community based Disaster Risk Reduction and Management (CDRRM) (37) and the capacity to implement resilience projects (40). The knowledge on CDRRM and implementing it was gained through the training on CDRRM [38] and the experience sharing/visit to Tigray, Dire Dawa and Awassa (41), both organized in 2013. These areas are considered to have best practices related to community resilience building. The training as well as the experience sharing visit were supported by ICCO (MFS II funding). These trainings came about from the needs assessment carried out in 2013 by the IRR consortium (39) to identify capacity gaps in the area of CDRRM with the support of ICCO (MFSII funded).

HUNDEE- general Causal map

4.3 Attributing changes in organisational capacity development - evaluation question 2 and 4

Note: for each country about 50% of the SPOs has been chosen to be involved in process tracing, which is the main approach chosen to address evaluation question 2. For more information please also see chapter 3 on methodological approach. For each of these SPOs the focus has been on the capability to act and commit and the capability to adapt and self-renew, since these were the most commonly addressed capabilities when planning MFS II supported capacity development interventions for the SPO.

For each of the MFS II supported capacity development interventions -under these two capabilities- an 'outcome area' has been identified, describing a particular change in terms of organisational capacity of the SPO since the baseline. Process tracing has been carried out for each outcome area. The following outcome areas have been identified under the capability to act and commit and the capability to adapt and self-renew. Also the MFS II capacity development interventions that could possibly be linked to these outcome areas are described in the table below.

Table 2

Information on selected capabilities, outcome areas and MFS II supported capacity development interventions since the baseline

Capability	Outcome area	MFS II supported capacity development intervention
To act and commit	Enhanced resource mobilization capacity	
	Improved ICT capacity for information sharing and communication	
	Improved competencies for gender mainstreaming	
To adapt and self-renew	Improved M&E competencies including institutionalized downward accountability	

The next sections will describe the results of process tracing for each of the outcome areas. This includes describing the identified key organisational capacity changes, what these changes are expected to lead to and what are the underlying reasons for these organisational capacity changes.

4.3.1 Enhanced resource mobilization capacity

Below you will find a description of the 'Enhanced resource mobilization capacity' and how this has come about. Numbers in the visual correspond with numbers in the narrative.

HUNDEE staff present at the endline workshop believe that they have improved in the area of resource mobilization capacity (1) (*sources: endline workshop; 2012 Annual performance report*). As a result, HUNDEE is more pro-active to tap into available sources of funding and they have managed to secure funds for multiyear (3-5 years) projects (31), e.g. the Malt Barley and HAM Foundation projects (*source: CFA assessment sheet A*). In addition, the improved resource mobilisation capacity has resulted in an increase of the total annual budget of the SPO by about 50% (*source: CFA assessment sheet A*) or, according to the endline workshop participants, from around 10 million Birr before the baseline to around 30 million now (*source: endline workshop*) (31).

Participants of the endline workshop mentioned that the enhanced resource mobilisation capacity (1) can be attributed to the following factors:

- Improved capacity in project proposal development (2)
- Improved financial management capacity (3)
- Improved understanding of the usefulness of networking (4)

- Improved knowledge about current funding trends and donor intelligence (5)
- Improved ability to engage target communities and make them aware of their potentials for their own development (6)

These key factors are further explained below. Numbers in the visual correspond to numbers in the narrative.

Improved capacity in project proposal development (2)

ECFA's project proposal development capacity (2) has improved since the baseline (*sources: endline workshop; CFA assessment sheet A*), i.e. now HUNDEE has the capacity to prepare proposals that have a better chance to be financed by donors. This happened mainly because of the improved capacity and analytical skills to prepare project proposals (9) (*source: endline workshop*) which HUNDEE staff acquired through the long experience they had in implementing different kinds of rural development projects (10) (*source: endline workshop*). Furthermore, HUNDEE's understanding of the power of group work in project proposal development (8) (*source: endline workshop*) which the organization acquired from its experience (10) helped to mobilize multi-disciplinary teams for project proposals (32). Also, the knowledge and skills HUNDEE has in gender analysis and its use in project proposal preparation (7) (*source: endline workshop*) contributed to the improved capacity for project proposal development (1). The gender component is considered as a major issue in rural development projects. These competences (7) have been further developed because of the training on a gender analysis tools organized in Tanzania with financial support from Oxfam Canada in 2014 (11). Two gender specialists from HQs participated in the training (*source: endline workshop*).

Improved financial management capacity (3)

Participants at the endline workshop as well as the CFA consider the financial management capacity to have improved (*sources: endline workshop; CFA assessment sheet B*), and that this is another reason for improved resource mobilisation capacity of the organisation (1). The improved financial management capacity (3) has enabled the finance unit to prepare a consolidated budget for the organization. Earlier they were only preparing project budgets and not for the whole organization (*source: endline workshop*). According to the endline workshop participants contributing factors to this improvement (3) are: Improved capacity, of small as well as large area offices, to manage a larger number of projects (12) (*source: endline workshop*) which mainly happened as a result of the experience they gained by working on different development projects (10) (*source: endline workshop*).

Improved ability to fulfil the financial donor requirements (13): HUNDEE is now capable to provide acceptable and timely progress and audit reports to both donors (13) (*source: endline workshop; CFA assessment sheet B*) and the government (16) (*source: endline workshop*). The donor report preparation capacity (13) improved as a result of a financial management training organized by ICCO in Hawassa (MFS II funded) in 2013 (14) (*sources: endline workshop; CFA assessment sheet B; 2013, 19 Annual performance report*) and the pre-award assessment by donors (final stage of the funding process where financial capacity of the organisation is assessed) and the technical financial support provided by ICCO regional office (15; MFS II funding) (*sources: endline workshop*).

The ability to fulfil government financial reporting requirements (16) improved as a result of an orientation and training provided for finance staff on accounting procedures and adaption to the Ethiopian Civil Societies Agency (CSA) regulations (by PACT, 2010) and ICCO (17) (*source: endline workshop*) which happened as a result of the technical support provided for the adaptation of the financial system to CSA regulations, by PACT in 2010 and ICCO (18). The technical support from PACT focused on major points related to management of finance that could have impact on NGO and its adaptation to CSA regulations. It also includes coaching on financial management and system development. On the other hand, the ICCO support was both financial and technical support in coaching through hiring a consultant at consortium level on organizational development tools (including in strategic plan revision, financial management and accounting manuals and M&E manual particularly PIM (performance impact monitoring)). This was done after 2012 (*source: endline workshop*).

Improved competences in preparing realistic project budget and financial reports (21) (*source: endline workshop; CFA assessment sheet B*): the knowledge on preparing realistic budgets is related to

understanding how to determine the costs associated with the activities and expenses of a project. This has also made financial reporting during implementation easier and more reliable. Endline workshop participants believe that improved knowledge about how to identify gaps related to payment, collection and accounting structures (19) (*source: endline workshop*) contributed to this competence (21). This knowledge was gained as a result of the training provided to the financial personnel on financial management for NGOs (MANGO) by CST, CSSP, ICCO (MFS II funded) and Misereor (20) (*source: endline workshop*) and the financial management training organized by ICCO in 2013, Hawassa (MFS-II) (14) (*source: endline workshop; CFA assessment sheet B*). This training helped the financial personnel to improve their knowledge about internal control, risk assessment, planning, reporting and other financial operations. Also, coaching and mentorship by ICCO regional office experts during visits has deepened this knowledge (30) (*source: endline workshop*).

Improved understanding of the usefulness of networking (4)

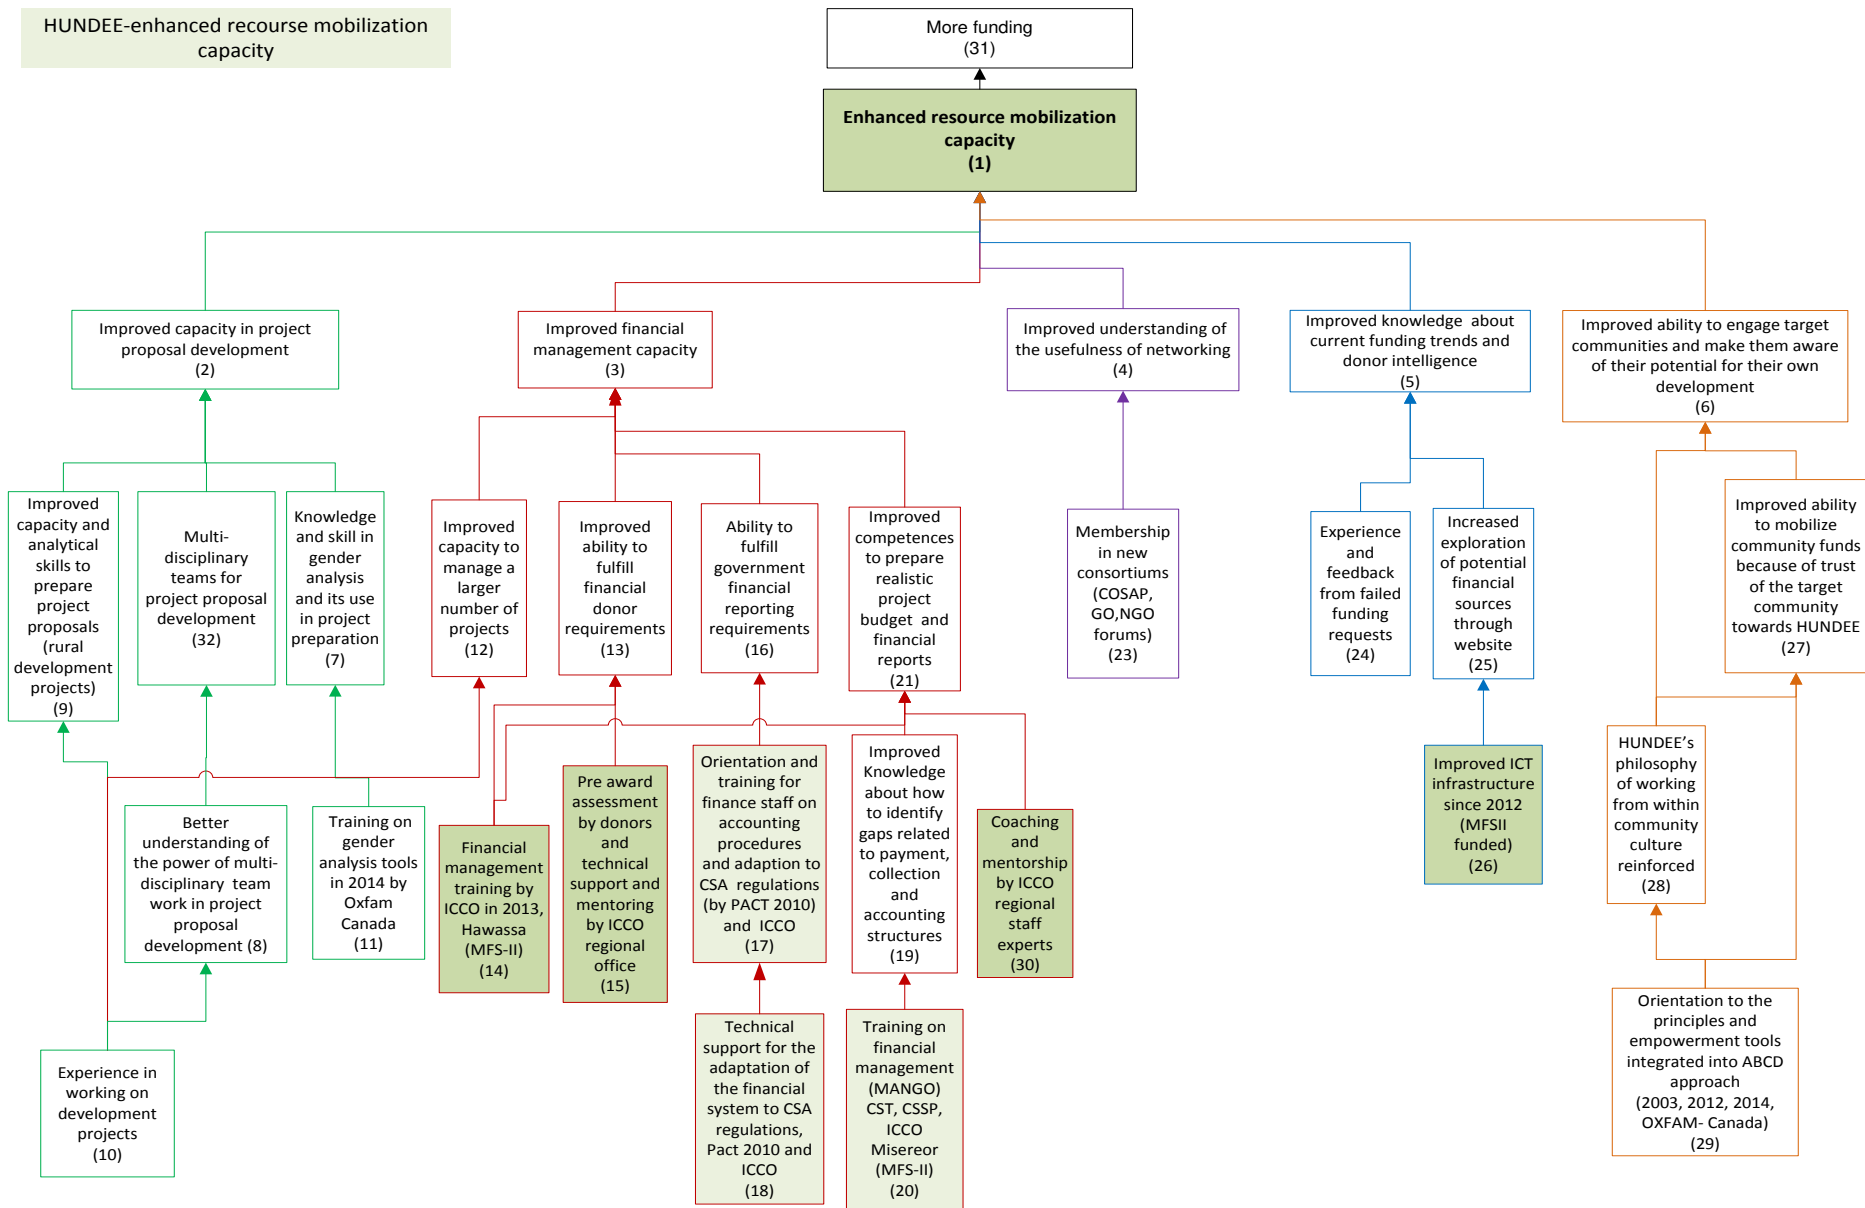

HUNDEE actively participates in different networks and is also a member of different consortiums such as COSAP, GO, and NGO forums (23) (*source: endline workshop*). In these networks information about funding opportunities is shared. Network members also recommend other (peer) organizations when asked by other funding organizations. Understanding the benefits of networks from the outset HUNDEE has enshrined this in its SPM (strategic plan and management) (*source: endline workshop*). However, the understanding (4) has further improved after the baseline when HUNDEE got a better understanding about the interest and potentials of the different networks.

Improved knowledge about current funding trends and donor intelligence (5)

This knowledge relates to understanding global trends in activities that have a better chance to be funded and the current strategic directions of the major development partners. HUNDEE came to know about this after reflecting on several proposal submission attempts made, and the negative responses it received (24) (*source: endline workshop*). This forced HUNDEE to understand more about the issue through continuous exploration of potential financial sources, for example through websites (25) (*source: endline workshop*), using the improved ICT infrastructure provided by MFS II in 2012 (26) (*source: endline workshop*).

Improved ability to engage target communities and make them aware of their potentials for their own development (6)

HUNDEE has a long standing philosophy about working with the community (28) (*sources: endline workshop; CFA assessment sheet B*). This philosophy involves respecting the communities' cultures and norms including getting their consent on the interventions that will be implemented. Since HUNDEE applies this in all its activities with the community, they trust HUNDEE. As this trust is built over time, the ability to mobilize community resources has shown improvement since 2012 (27) (*sources: endline workshop; CFA assessment sheet B; 2012 Annual performance report; 13_019519 Proposal Malt barley value chain project - Final*). The community trusts and their involvement in project design and implementation also attracts funders. In addition, the orientation that some HUNDEE staff received about the principles and useful empowerment tools integrated into Asset Based Community based Development (ABCD) approach by Oxfam Canada in 2003 (29) Training was provided by Oxfam Canada both in 2003 for different staff drawn from project staff and head office and specifically in 2012 for head offices staff held at Derbrezeit in March 2014 (*sources: endline workshop; 2012 Annual performance report*) helped to reinforce its existing philosophy (28) and the community trust and community resource mobilization capacity (*source: endline workshop*).

4.3.2 Improved ICT capacity for information sharing and communication

Below you will find a description of the '**Improved ICT capacity for information sharing and communication**' and how this has come about. Numbers in the visual correspond with numbers in the narrative.

HUNDEE staff present at the endline workshop believe HUNDEE has improved in the area of ICT capacity for information sharing and communication (1) (*sources: endline workshop; CFA assessment sheet B*). This reflected in for example, obtaining more reliable and valid data (24) (*source: endline workshop*). Furthermore, the community (target groups) started to use smart phones for sharing information and marketing (25), also as a result of staff, making more use of ICT technologies (26). This includes sharing price information through text messages. The target groups started to use computers for data storage and word processing (especially farmers cooperatives) and to learn improved agricultural technologies through the use of ICT; such as, TV and video deck (25) (*source: endline workshop*). The C4C Consortium (MFS II) has invested in improving the ICT infrastructure for HUNDEE and its target groups, and in the knowledge and skills to use ICT, aiming to establish access to up-to-date and reliable information sources for its target groups, which are smallholder farmers and their organizations. According to the CFA evidence for success is that HUNDEE now has ICT infrastructures (ICT centres, tools & gadgets, MIS); that staff are able to use this ICT infrastructure; improved access to telephone & internet connection and networks for HUNDEE staff; that ICT centres are established for its target groups-farmer unions; the hiring of an ICT officer to support its target groups and an updated website (*sources: CFA assessment sheets A and B; annual performance reports 2012 and 2013*).

According to HUNDEE endline workshop participants this change in improved capacity in ICT for communication and information sharing (1) happened as a result of:

- Improved competencies on ICT for data collection using smart phone and computer based data analysis (2)
- Enhanced interest and competencies on the use of ICT (TV, video deck) for technology dissemination (3)
- Improved competencies in the use of about social media, internet & office applications (5)
- Improved skills in computer hardware maintenance (6)

These key factors are further explained below.

Improved competencies on ICT for data collection using smart phones and computer based data analysis (2)

One of the causal factors of the improved ICT capacity (1) is improved competencies on ICT for data collection using smart phones (2) (*sources: endline workshop; Report seminar downward accountability & client feedback mechanism 2012 Ethiopia 11.12.12*). These competencies help HUNDEE staff to collect data on the MFS II related project using smart phones. The data are collected and sent to Kenya for analysis. The main reasons for the improved ICT competencies (2) are described below.

- The initial idea was developed as a result of information sharing during the ICT project development by value chain consortium members, in Addis Ababa, 2012 (15) (*source: endline workshop*).
- Furthermore there was a felt necessity to improve efficiency in data collection, storage and analysis (7) (*source: endline workshop*). The frequently used paper based data collection method was taking a long time for data collection and entry. Therefore, to reduce the time taken and improve efficiency HUNDEE as well as the CFA showed interest to use smart phones for data collection. This was suggested by ICCO during the project proposal on ICT at the 6NGOs consortium meeting in Addis in 2012 (23) (*source: endline workshop*).
- In line with this, smart phones were provided by ICCO in 2013, MFSII funded (ICCO alliance) (9) (*source: endline workshop; feedback ICCO*) and by PCI/USAID in 2013 for the purpose of the women empowerment projects and to be used by the women's self-help groups (10) (*source: endline workshop*). This was complemented by a training on ICT based data collection using smart phones in May 2013 by AKVO (ICCO, MFS II funded) (8) (*source: endline workshop; CFA Assessment sheet B*).

Improved knowledge and skills in data analysis for data collected by HUNDEE (4) (*sources: endline workshop; CFA Assessment sheet B*). This is not for sophisticated analysis but for preliminary data analysis to carry out descriptive analysis. The training on different data analysis software that was given by DOT Ethiopia, and was financed by ICCO (ICCO Alliance) (MFS II) (16) (*source: endline workshop; CFA Assessment sheet B*), helped in creating this capacity.

Enhanced interest and competencies for the use of ICT (TV, video deck) for technology dissemination (3)

These **enhanced interest and competencies** (3) (*source: endline workshop*) relate to the use of ICT for disseminating improved agriculture technology in a relatively efficient way. The interventions and factors that contributed to these **enhanced interest and competencies** are described below.

- The decision and desire to use multimedia and group methods (12) (*source: endline workshop*): in the projects that are aimed at training on and disseminating agricultural technologies to farmers, HUNDEE wanted to use ICT to reach a wider audience. This was initially recommended by IICD during proposal development of the ICT project at the six NGOs consortium meeting (MFS II) (23).
- In line with this, to help in preparation of the training materials and documenting the information for technology use, agriculture research centers were involved (11), MFS II funded (*source: endline workshop*).
- Since most of the information sharing was done through TV and video, the provision of TV and video decks by C4C/IICD/ICCO in 2013 (MFS II funded) facilitated the implementation (13) (*source: endline workshop*).

In further deepening the knowledge, the exchange visit financed by C4C/IICD to Kenya on Fair Economic Development (FED) and ICT, October 2013 (MFS II) (22) (*sources: endline workshop; Report - ETHIOPIA EXCHANGE VISIT to Kenya Oct 2013 - final v 2; CFA assessment sheet B;*) was instrumental because it helped in learning and sharing experiences on ICT (14) (*source: endline workshop; Report - ETHIOPIA EXCHANGE VISIT to Kenya Oct 2013 - final v 2*).

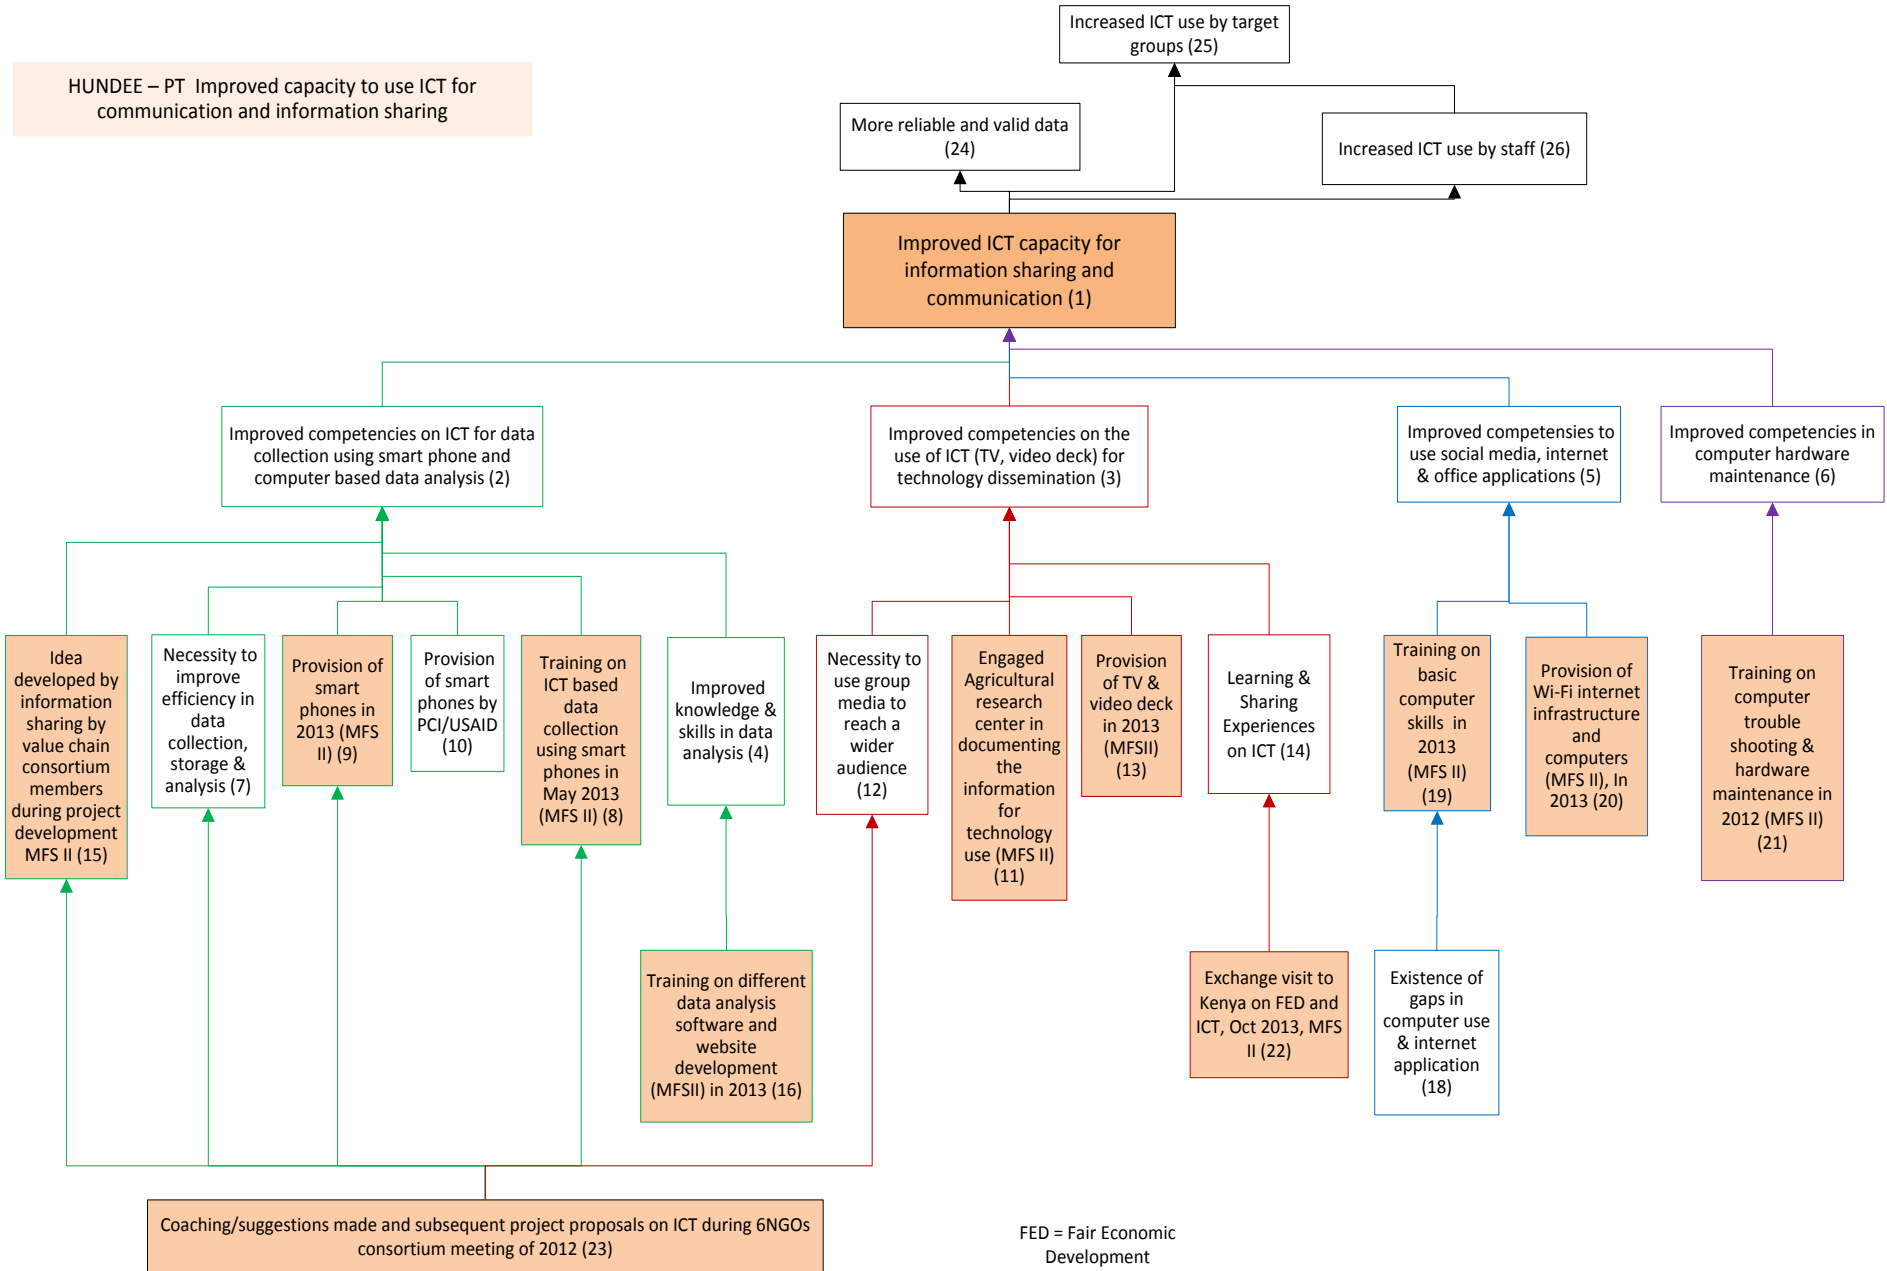

Improved competencies in the use of social media, internet & office application (5)

Improved competencies in the use of social media, internet & office application (5) (*source: endline workshop; 2012 Annual performance report*) was another reason for improved competencies to use ICT (1). Since there was gap in computer use and internet application in HUNDEE (18) (*source: endline workshop*), C4C/IICD organized a training on basic computer application that was delivered by DOT Ethiopia in 2013 (19) (*source: endline workshop; CFA Assessment sheet B*). The knowledge gained through this training was put into use with the provision of wi-fi internet infrastructure and computers by C4C/IICD/ICCO in 2013 (20) (*source: endline workshop*).

Improved competencies in basic computer hardware maintenance (6)

The fourth reason for improved ICT capacity was improved competencies in basic computer hardware maintenance (6) (*source: endline workshop*). This is a primary skill for only a small number of staff. However, staff wanted to mention it as an important skill. The skill was developed through the training on trouble shooting and minor computer hardware maintenance in 2012 by DOT Ethiopia financed by C4C/IICD/ICCO (21) (*source: endline workshop*).

On the whole the support by C4C/IICD/ICCO (MFS II funding) has greatly influenced the improved ICT capacity of HUNDEE.

4.3.3 Improved competencies for gender mainstreaming

Below you will find a description of the 'Improved competencies for gender mainstreaming in its programs' and how this has come about. Numbers in the visual correspond with numbers in the narrative.

HUNDEE staffs present at the endline workshop consider that they have improved in the area of gender mainstreaming (1) (*sources: endline workshop; CFA assessment sheets B*). This is evidenced by women's economic and social empowerment becoming almost a common denominator of programs HUNDEE is implementing, and enhanced female participation and roles in decision-making and management activities of HUNDEE programmes at both household and community levels, and also at the level of the 6NGO consortium framework (10) (*sources: endline workshop; 2013 Annual performance report; Beyene-HUNDEE final report submitted*).

The long term expectation for MFS II support in gender mainstreaming is to mainstream gender in all its programs as a cross cutting issue (*source: CFA assessment sheet B*).

According to HUNDEE staff present at the endline workshop contributing factors to the improved competencies for gender mainstreaming (1) consist of the following:

1. Alignment of HUNDEE's organizational systems, policies, procedures and programs to adequately reflect HUNDEE's commitment to gender equality (15)
2. Improved knowledge about women and value chain development (9)
3. Improved competencies to address gender issues, empower women and improve women's economic development (6)
4. Improved knowledge and understanding about gender based reporting (22)

These four key factors are further explained below.

Alignment of HUNDEE's organizational systems, policies, procedures and programs, to adequately reflect HUNDEE's commitment to gender equality and increasing female staff participation in decision –making (15) (*sources: endline workshop; HUNDEE - 2012 Plan Background*) is one of the reasons for HUNDEE's improved competencies for gender mainstreaming (1). One of the visible results at organisational level is an increasing female staff participation in decision–making (*sources: endline workshop; CFA assessment sheets B*).

According to the Strategic plan 2010-2014, working on gender equality and women empowerment initiatives is not a matter of choice for HUNDEE, but rather a guiding principle, which means that making HUNDEE sensitive and responsive to gender equality issues requires continuous reviewing and alignment of its systems, policies, procedures and programs/projects. This commitment was the result of an organisation wide gender audit exercise, which is done every year since 2008 (16), with the support of Oxfam Canada (*sources: endline workshop; Strategic plan (Final) 2010-2014*), which as a result identified critical areas that needed improvement and critical engagement to achieve organizational transformation towards being and becoming gender sensitive and responsive (17) (*sources: endline workshop; Strategic plan (Final) 2010-2014*). The improved knowledge on gender sensitiveness and response (17) has also improved because of reviewing all HUNDEE's projects with a gender lens (18) (*source: endline workshop; CFA assessment sheet B*). Both were encouraged by ICCO (MFS II funded) and other donors promoting gender mainstreaming to enhance equitable participation of both men and women in its programs (3) (*source: endline workshop; CFA assessment sheet B; 13_033484 Project Plan Basic Hundee malt barley input AvR 05 13_034024; Beyene-HUNDEE final report submitted; Hundee project proposal v2 12-7-2012*). Within the MFS II Consortium Framework reviewing projects with a gender lens (18) has been promoted through the training in "Gender and Value Chain Development" in 2012 (23), MFS II funded (*sources: endline workshop; 2012 annual report*) and through gender coaching by "Fair and Sustainable" consultancy services, Ethiopia Office (MFS II funded) (2) (*source: endline workshop; CFA assessment sheet B*). More recently, in 2014 a training in gender analysis tools by Oxfam Canada (30) (*source: endline workshop*), where staff got introduced to gender analysis tools and a

gender analysis manual (29), helped to improve the knowledge on areas that needed improvement in terms of being gender sensitive and responsive (*source: endline workshop*).

HUNDEE also showed its commitment to being gender sensitive and responsive (26) by improved operationalization of the gender task force (25), which was established in 2009 (27) before the MFSII baseline survey. This renewed commitment (26) and operationalization of the task force (25) was triggered because of the gap observed as a result of the gender audit carried out in 2012 supported by Oxfam Canada (16b). In line with this, a ToR on the responsibilities and structure and accountability of the gender task force was prepared (*source: endline workshop*).

Improved knowledge about women and value chain development (9)

HUNDEE is part of a consortium of 6 NGOs (“C6NGO”) in an ICCO and IICD led MFS II funded Farmers Marketing Organisations programme. Since the start of the consortium a shift was made in the approach from food security to market and value chain development (VCD). From the start ICCO has made gender mainstreaming in value chains and important issue within the C6NGOs Consortium framework. Within the MFS II Consortium framework gender mainstreaming in value chains has been promoted by coaching through “Fair and Sustainable” consultancy services, Ethiopia Office (MFS II funded) (2) (*sources: endline workshop; CFA assessment sheets B*). As a result, the number of women has increased as participants as well as at decision making levels in the C6NGOs Consortium framework (*sources: endline workshop; CFA assessment sheets B*). Furthermore, HUNDEE’s knowledge about women in value chain development (9) was deepened by the training on “Gender and Value Chain Development” (23) in 2012 (ICCO, MFS II funded). Another contributing factor was an exchange visit to Kenya in October 2013 (19, MFS II funded) (*source: endline workshop; Report - ETHIOPIA EXCHANGE VISIT to Kenya Oct 2013*), in which the visitors were exposed to how women were able to participate actively on VCD issues (9).

Improved competencies to address gender issues, empower women, and to promote women’s economic development (6)

A third reason for the improved competencies to mainstream gender (1) are the improved competencies to address gender issues, empower women, and to promote women’s economic development (6) (*source: endline workshop; 2012 Annual performance report; Beyene-HUNDEE final report*).

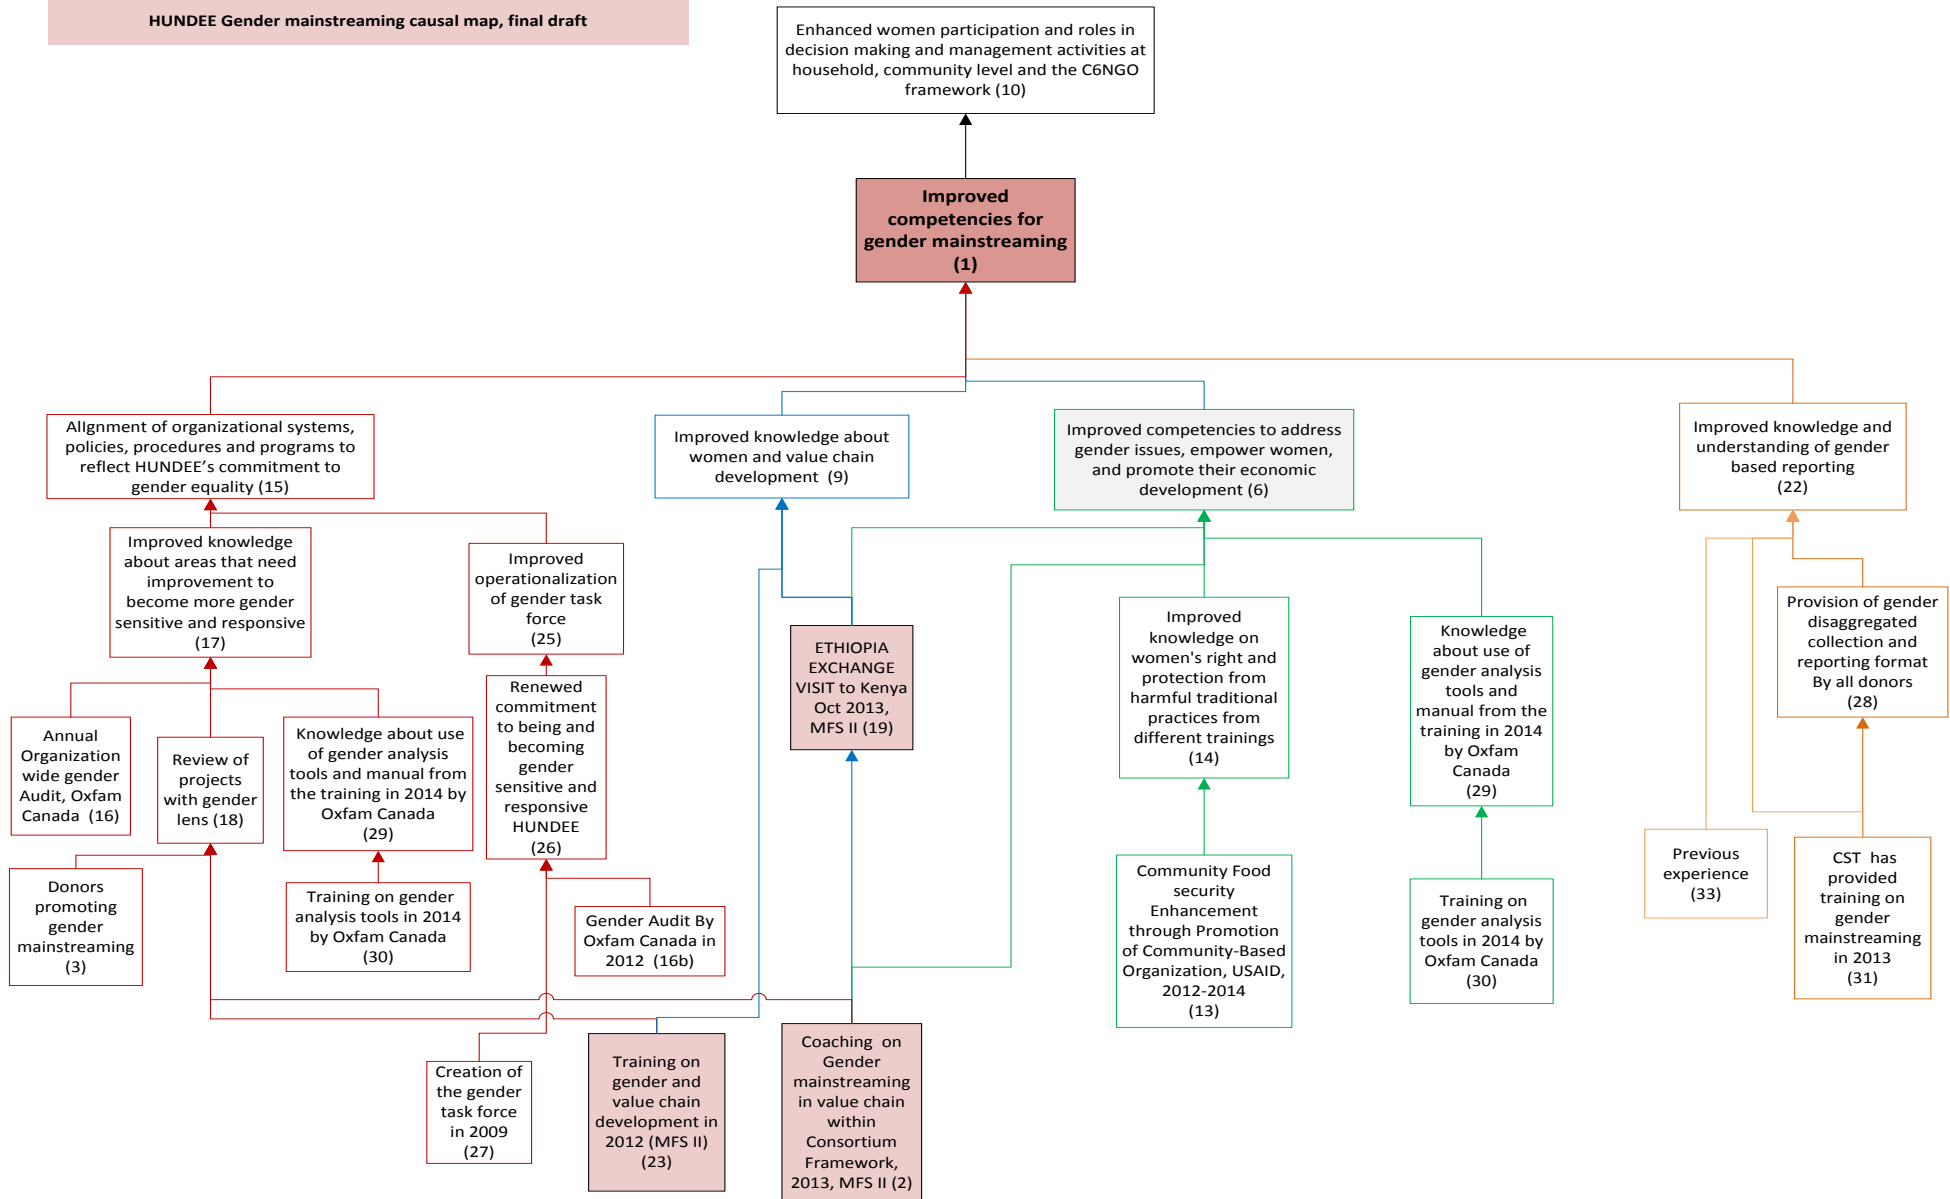

Reasons for improving these competencies (6) include:

- The exposure during the MFS II funded exchange visit to Kenya (19) in October 2013, on e.g. how to improve women’s membership and leadership, address gender issues, empower women and promote women’s economic development in VCD (*source: endline workshop; Report - ETHIOPIA EXCHANGE VISIT to Kenya Oct 2013*);
- The coaching in gender mainstreaming in value chain development within the MFS II funded C6NGO Consortium Framework (2);
- The self-help groups approach used by the Community Food Security Enhancement through the Promotion of Community-Based Organization project, funded by USAID (13), 2012-2014 (*sources: endline workshop; Community Food Security Enhancement (Narrative report)*) was a women-empowerment approach, and staff improved their knowledge on women’s rights and protection from harmful traditional practices by different trainings of this project (14) (*sources: endline workshop; Community Food Security Enhancement (Narrative report)*);
- Competences to analyse and address gender issues (6) was also enhanced by the improved knowledge about how to use gender analysis tools and a gender manual (29) from the gender analysis training in 2014 by Oxfam Canada (30) (*source: endline workshop*).

Knowledge and understanding in gender based reporting (22)

HUNDEE has built the knowledge and understanding to prepare gender-based reports (22) (*source: endline workshop*). In addition to the past experience (33), HUNDEE made the step to comply to donor interests which was also supported by training. For example, CST (CAFOD, SCIAF, Trocaire) provided training on gender mainstreaming in 2013 (31). CST and also other donors, including MFSII, provided reporting formats that helped gender disaggregated data collection and reporting (28).

HUNDEE Gender mainstreaming causal map, final draft

4.3.4 Improved M&E practices including institutionalized downward accountability

Below you will find a description of the 'Improved M&E practices including institutionalized downward accountability'. Numbers in the visual correspond with numbers in the narrative.

HUNDEE has improved its M&E practices with a special emphasis on downward accountability (1) as evidenced by successfully implementing tools such as consumer panel and consumer satisfaction survey in its program (1) (*sources: endline workshop; CFA assessment sheet B, Report seminar downward accountability & client feedback mechanism 2012 Ethiopia 11.12.12*). Measuring satisfaction/dissatisfaction of services became part of the monitoring program. It is not just used at project level, but it has also become institutionalized at organizational level (1) (*sources: endline workshop; CFA assessment sheet B, Report seminar downward accountability & client feedback mechanism 2012 Ethiopia 11.12.12*). The improved M&E practices, including downward accountability, have led to a shift in mind-set in both providers as well as clients: farmers have become more critical and take part in decision-making, more than before (6). Furthermore, field workers and staff have become more responsive to the needs of their clients (26) (*sources: endline workshop; Report seminar downward accountability & client feedback mechanism 2012 Ethiopia 11.12.12*).

HUNDEE deploys impact assessment tools for proving and improving (33). Furthermore, data collection and analysis play an integral role in decision-making and planning (35) (*sources: endline workshop; Report seminar downward accountability & client feedback mechanism 2012 Ethiopia 11.12.12*), and significant changes have been observed in the quality of the reports (12) (*sources: endline workshop; CFA assessment sheet A*) according to the CFA the quality of reports had immensely improved by the end of 2013. The reports are well aligned now with contracts reporting conditions which was not the case at the start of 2012.

M&E practices including institutionalised downward accountability (1) have improved as a result of:

- Improved competences to apply downward accountability methods and tools (30)
- Improved competences to apply RBM and M&E tools (31)

These factors are further described below.

Improved competences to apply downward accountability methods and tools (30)

The improved competences to apply downward accountability methods and tools (30) (*sources: endline workshop; CFA assessment sheet B*) is the result of piloting downward accountability tools (5), adapting and enforcing downward accountability (27) and improved knowledge on social accountability tools, theory and practice (24).

Piloting downward accountability tools (5) (*sources: endline workshop; CFA assessment sheet B; Report seminar downward accountability & client feedback mechanism 2012 Ethiopia 11.12.12*) was due to what was learned with other HUNDEE staff on the topic (10) (*sources: endline workshop; CFA assessment sheet B; final dissemination workshop (3) report*). It's been the result of processes that were initiated already in 2009, when ICCO organised a workshop (MFS I funding) to introduce client satisfaction instruments (CSI) (11) (*sources: endline workshop; CFA assessment sheet B*). After participating in this workshop, the C6NGO consortium (MFS II funded), including HUNDEE, decided to join the pilot. It was thought that CSI would enable the service taker (client) to get better quality service; also it was expected to improve the credibility among clients (trust worthiness, good relationship, and transparency). These capacity development interventions which started in 2009 with MFS I funds, consisted of an introductory training on Downward Accountability (2009), field work with coaching from ICCO (2010) and a sense-making workshop (2010) (11) (*sources: endline workshop; CFA assessment sheet B*). The process was continued with MFS II funds, and this consisted of a participatory film making training and a second round of field work with training session and coaching by ICCO in 2011 (pre-MFS II evaluation baseline) and another participatory film making session in 2012 (4) (*sources: endline workshop; CFA assessment sheet B*) and a final dissemination conference in December 2012 (3) (after MFSII 5c baseline) (*sources: endline workshop; CFA assessment sheet B; Report seminar downward*

accountability & client feedback mechanism 2012 Ethiopia 11.12.12). In these workshops staff learned about a range of topics, such as Client Satisfaction Instruments (CSI) (8) (*sources: endline workshop; CFA assessment sheet B; Report seminar downward accountability & client feedback mechanism 2012 Ethiopia 11.12.12*), which was also due to the workshop on downward accountability in 2009 (MFS I) and 2012 (MFS II). Furthermore, knowledge and skills for participatory film making was improved (7) due to the training sessions on participatory film making (4) in 2011 and 2012 (*sources: endline workshop; CFA assessment sheet B*). Knowledge was also improved on Public expenditure Tracking Systems (PETS) (14) (*sources: endline workshop; Report seminar downward accountability & client feedback mechanism 2012 Ethiopia 11.12.12*), which was the result of the downward accountability workshop in 2012 (MFS II) (3) (*sources: endline workshop; CFA assessment sheet B*). Also staff had increased their knowledge on Promoting Financial Transparency and Accountability (FTA) under the Protection of Basic Services (PBS) Project (15) (*sources: endline workshop; Report seminar downward accountability & client feedback mechanism 2012 Ethiopia 11.12.12*) as a result of the downward accountability workshop in 2012 (MFS II) (3) (*sources: endline workshop; CFA assessment sheet B; Report seminar downward accountability & client feedback mechanism 2012 Ethiopia 11.12.12*). This capacity development was done in the context of the C6NGO framework. Therefore only a limited number of staff participated but HUNDEE staff indicated they passed on their knowledge to other HUNDEE staff (10) (*sources: endline workshop; CFA assessment sheet B; final dissemination workshop (3) report*).

Apart from piloting downward accountability tools (5), staff's competencies to apply downward accountability methods and tools (30) have also been influenced by adapting and enforcing downward accountability, which was reflected in the HUNDEE 2010-2014 Strategic Plan and the 2013-2015 Operational Plan (27) (*sources: endline workshop; HUNDEE three year operational plan (2013- 2015); Strategic plan (Final) 2010-2014*). To help HUNDEE adapt and institutionalize downward accountability an orientation and TOT training on Humanitarian Accountability Partnership (HAP) was organized by Cafod/Sciaf/Trocaire (CST) in 2012, ICCO in 2013 and Danish Church Aid (DCA) in 2014 (33) (*source: endline workshop*). Furthermore, the seed money provided by CCRDA in 2014 (34) (*source: endline workshop*) facilitated the implementation of HAP which is a process of self-assessment to see how much HUNDEE has institutionalized social accountability.

Another influencing factor has been the improved knowledge on social accountability tools, theory and practice (24) (*sources: endline workshop; 2013 annual performance report*) which was the result of being part of the "Social accountability program", a government program sponsored by the World Bank (22) (*sources: endline workshop; 2013 annual performance report*) that was launched in 2013 with HUNDEE as one of the implementing partners. The downward accountability seems for a large extent to be initiated and driven by the C6NGO framework and ICCO and is now really institutionalized in HUNDEE. It was also supported by CST which funded a project on mainstreaming downward accountability from 2010-13.

Improved knowledge and skills to apply RBM and M&E tools (31)

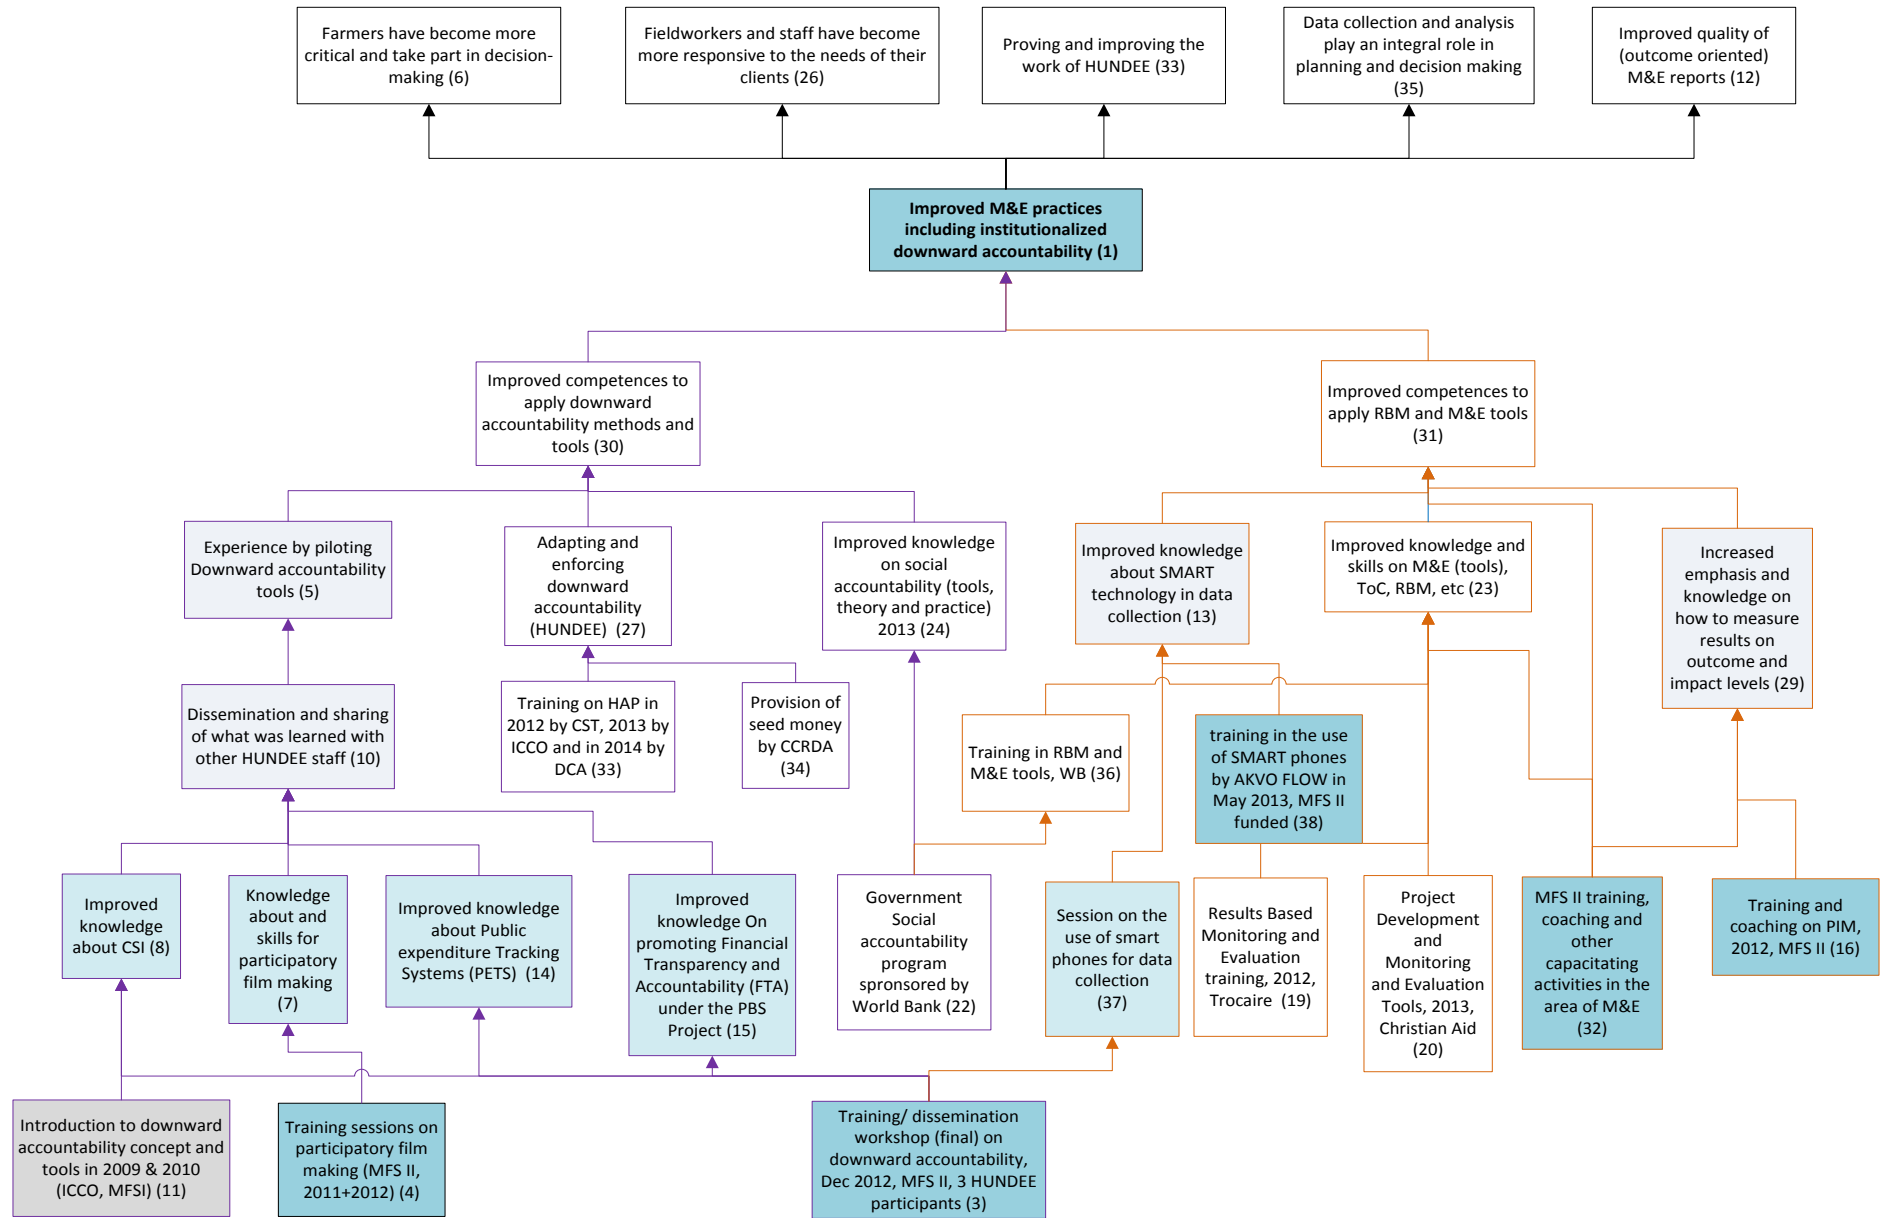

The other reason for improved M&E practices, including downward accountability, was improved competences to apply Rights Based Management (RBM) and M&E tools (31). This has been the result of various changes and capacity development interventions which are mentioned below.

- Knowledge on SMART technology in data collection has been improved (13) (*sources: endline workshop; Report seminar downward accountability & client feedback mechanism 2012 Ethiopia 11.12.12*), i.e. the use of smart phones for data collection for M&E purposes. This knowledge was gained during a session on the use of smart phones for data collection (37) during the final MFS II funded training/dissemination workshop on downward accountability, Dec 2012, MFS II (3) (*sources: endline workshop; Report seminar downward accountability & client feedback mechanism 2012 Ethiopia 11.12.12*), and from a one day training in the use of SMART phones by AKVO in May 2013, MFS II funded (38) (*source: feedback HUNDEE*)
- Staff's knowledge and skills have also been improved in (P)M&E tools like the Theory of Change (ToC), RBM and other M&E tools (23), (*sources: 2013 annual performance report*).

This was the result of four capacity development interventions: the government funded social accountability program (sponsored by the World Bank) (22) (*sources: endline workshop; 2013 annual performance report*), where HUNDEE was one of the implementing partners. For this programme, in 2013 selected staff were trained in (among others) Results Based Management (RBM), and Monitoring and Evaluation (Tools) (36), (*sources: endline workshop; 2013 annual performance report*). These knowledge and skills were also built by the participation of 2 staff in a Result Based Monitoring and Evaluation training provided by Trocaire) in 2012 (19) (*sources: endline workshop; 2012 annual performance report*), and the participation of 2 staff in a Project Development and Monitoring and Evaluation Tools training provided by Christian Aid in 2013, in Yabelo (20) (*sources: endline workshop*). Furthermore, continuous MFS II training, coaching and other capacitating activities within the C6NGO framework in the area of M&E (32) (*sources: endline workshop; CFA assessment sheets A and B*) have contributed to improved knowledge, skills and competences in the area of M&E. ICCO (MFS I and II) has over time supported HUNDEE to effectively implement its M&E activities through providing technical support and by introducing various approaches. Information on activities, results and finances are put together and analysed by ICCO while monitoring and evaluating its programmes at various levels. ICCO, through MFS II funding, has also supported strengthening of the capacity of the SPO through monitoring visits and exposure visits. Such as the linking and learning across the East African Region. Due to regular trainings, coaching and other capacitating activities within the C6NGO framework, HUNDEE staff were able to improve their planning, monitoring and follow up, and reporting of project activities. Information at outcome and impact level are now given attention, well analysed and documented (*sources: endline workshop; CFA assessment sheets A and B*).

A third reason for improved competences to apply Rights Based Management (RBM) and M&E tools (31) has been the increased emphasis and knowledge on how to measure results at outcome and impact levels (29) (*sources: endline workshop; Strategic plan (Final) 2010-2014*). This was mainly due to the continuous training and coaching by ICCO (MFS II) in general (32) (*sources: endline workshop*) and more specifically the training and coaching organized on Performance Impact Monitoring (PIM) by ICCO (MFS II) in 2012 (16) (*sources: endline workshop; CFA assessment sheet A*): this has oriented the monitoring and reporting towards following how each activity leads to impact. This is being followed in all HUNDEE implemented projects. All area offices report using the formats developed for the purpose to report on PIM (12). During coaching and field visits, ICCO staff supervise how this is implemented.

HUNDEE Improved M&E capacity causal map - draft

5 Discussion and conclusion

5.1 Methodological issues

In preparation for the assessment, the Ethiopian 5C assessment team visited Hundee staff in the organizations HQs in Addis Ababa and explained the purpose and the process of the 5C end line assessment. During the visit the team agreed on the workshop dates including the type and number of staff who will attend the workshop. In addition, the team also gave the “support to capacity development sheet” to be filled by HUNDEE staff.

The Ethiopian 5C assessment team conducted the assessment in four visits. The first visit was to conduct the self-assessment workshop and ask the staff to fill the self-assessment form in their respective five subgroups (management; program; M&E; HRM and administration and field staff). Out of the ten participants, five have also participated in the 2012 baseline study. This was followed by a second visit to carry out a brainstorming session and develop a general causal map that explains the key organisational capacity changes that have occurred in Hundee since the baseline in 2012. The third visit was made to conduct an interview with one representative from each subgroup to triangulate the information collected through the self-assessment and to better understand the change in Hundee’s capacity since the baseline in 2012. This was done after the 5C assessment team reviewed the completed self-assessment forms. Finally, the fourth visit was made to carry out the process-tracing workshop. In the process tracing workshop four organisational capacity change areas that were identified based on the review of the various documents received from the SPO and CFA including the result of the self-assessment workshop were presented to the workshop participants. First they were asked if they also agree with the team’s assessment in terms of these key organisational capacity changes to focus on during process tracing. These were organisation capacity changes within the capability to act and commit and the capability to adapt and self-renew and could possibly be linked to MFS II capacity development interventions.

The process tracing exercise helped to get the information for description of organisational capacity changes, and the attribution of these changes in Hundee to specific factors and (MFS II and non-MFS II funded) capacity development interventions.

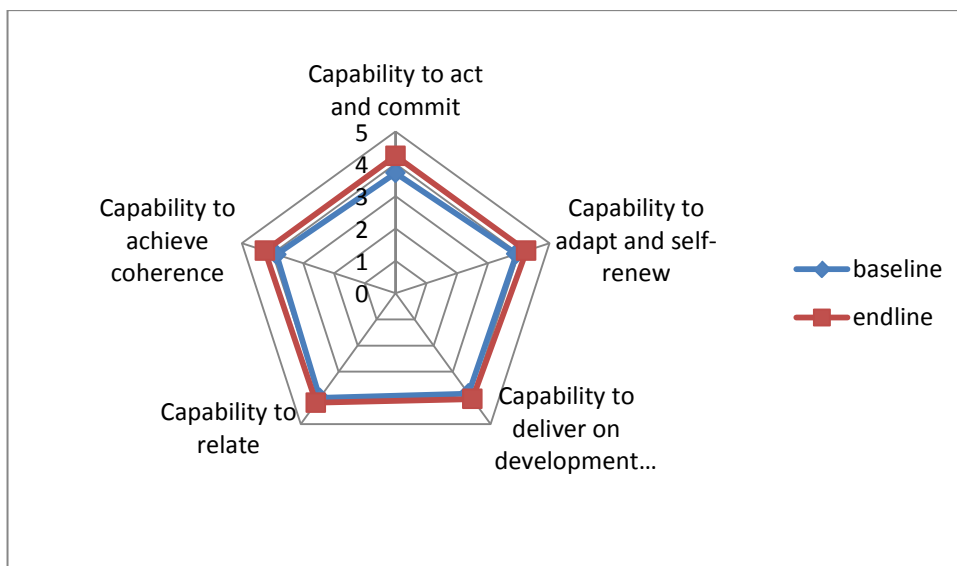

The plan of the evaluation team to also conduct two interviews with Hundee partners didn’t materialize because the interview overlapped with other activities that were to be carried out by the assessment team in the SPO. Hundee is an organization, which does not involve consultants for its activities. It tries to accomplish activities with its own staff. Therefore, no consultant interviews have been carried out. In addition, the plan to have an interview with the general manager of Hundee failed because he was unable to get time since he was on leave during the interview period.

By and large, there has been a lot of information available to be able to do adequate data analysis.

5.2 Changes in organisational capacity development

This section aims to provide an answer to the first and fourth evaluation questions:

1. *What are the changes in partner organisations' capacity during the 2012-2014 period?*
4. *What factors explain the findings drawn from the questions above?*

Below the changes in each of the five core capabilities are further explained, by referring to the specific indicators that changed. In all of these capabilities improvements took place.

Over the last two years many improvements took place in the indicators under the capability to act and commit. The leader at HUNDEE is responsive and the Board has become more engaged in decision making and guiding the management since the baseline. Board and management meetings are held on a more regular basis. In 2014 HUNDEE updated its organogram. The new organisational structure segregates staff duties and provides more clarity on roles and responsibilities. The board, management and different donors felt the need for this more clear organisational structure because of the expansion of the organisation in terms of themes and geography. Strategies are now articulated based on situation analysis and M&E findings. Staff skills in HUNDEE have improved, especially in using ICT for data collection, sharing of information, community managed disaster risk management, reporting, resilient livelihoods etc. because of many trainings offered by different donors including ICCO under MFS II. No staff has left the organisation since the baseline and most staff have enjoyed working at HUNDEE for over ten years because of the enabling work environment. The salary scale has improved shortly before the endline evaluation. HUNDEE also revised its HR policy and provides limited staff loans. The total annual budget of HUNDEE doubled from 25 million in 2012 to 50 million in 2014 because the credibility of the organisation and the resource mobilisation capacity improved. This resource mobilisation capacity was also supported by ICCO through quality assurance of their proposals. With the new organisational structure there are now dedicated staff members for resource mobilisation, there is more clarity on responsibilities in this matter and there is a more proactive approach to exploring new funding opportunities.

In the capability to adapt and self-renew HUNDEE also improved in many indicators. The organisation has slightly improved its M&E application because staff capacity to exercise and internalize the organisational accountability framework has increased. There is now an M&E team for each unit to strengthen the M&E system. ICCO has also been supporting HUNDEE to monitor and evaluate at different levels of impact and has provided training on downward accountability in 2012 and 2013. The organisation is using M&E findings slightly more strategically as these findings have been used in project development. In terms of critical reflection, HUNDEE has institutionalized transparency and collective decision making and has established a grievance committee to resolve conflicts. HUNDEE keeps tracking its operating environment and has expanded its channels for getting information through working with other NGOs. Through implementing downward accountability, HUNDEE has become more responsive to its stakeholders and has gained the trust of the community.

In terms of the capability to deliver on development objectives, HUNDEE shows some improvement. The organisation has very slightly improved in having more clear operational plans that consider financial inflation so that there is no budget shortage for implementation. HUNDEE now has a budgeting officer and has improved in its planning and resource allocation. Administration costs have been reduced to work more cost-effectively. Through mainstreaming downward accountability mechanisms HUNDEE is well aware of client satisfaction in projects funded by various donors.

In the capability to relate, HUNDEE has improved as well. Understanding of the importance of working in networks has improved at top management level due to the advice of ICCO. HUNDEE is working more with networks and gets more information through them. Through the downward accountability mechanism, field staff and program staff have become more responsive to the target groups and visit them frequently. Within the organisation, between head office and field offices communication and information sharing has improved through the use of ICT. The new organisational structure also entails a formal communication and documentation system.

Finally, HUNDEE has improved in three of the four indicators under the capability to achieve coherence. Staff are now more aware of the vision, mission and strategy of the organisation and are involved in the process of revisiting them, which creates a sense of ownership. There was an improvement in operational guidelines because the HR and financial policy were revised and a Disaster Risk Reduction guideline was developed (with ICCO's support). HUNDEE's programs have grown to be more complementary. In the operation areas all projects fall under one unified leadership.

During the endline workshop some key organisational capacity changes were brought up by HUNDEE's staff: improved capacity to facilitate behavioural change in rural communities; improved capacity in adaptive management; improved capacity in communication and information sharing; improved capacity to apply an integrated (multidisciplinary) M&E system; improved capacity in resource mobilization; and improved capacity to design drought resilient livelihood programs in pastoral and semi-pastoral areas. The evaluators considered it important to also note down the SPO's story and this would also provide more information about reasons for change, which were difficult to get for the individual indicators. Also for some issues there may not have been relevant indicators available in the list of core indicators provided by the evaluation team. Please note that this information has not been validated with other sources. But then again, this wasn't the purpose of this 5C evaluation.

According to HUNDEE staff present at the endline workshop, the capacity to facilitate behavioural change in rural communities improved because of understanding about the appreciative inquiry approach (through a training on Asset Based Community Development (ABCD) by the COADY institute in 2012) and knowledge about identifying the opinion leaders or other power centres. HUNDEE gained this latter knowledge through understanding the power of mass mobilization which they gained during training on mass mobilization by GIZ in 2013. Secondly, the organisation improved its capacity in adaptive management because they understood the interest and areas of concern of the government. They gained this understanding by identification of possible alternatives that could be accepted by the government that would be in agreement with the new CSO regulation and that came out of the internal reflection on adaptive management by HUNDEE. Thirdly, HUNDEE improved its capacity in communication and information sharing because of access to information technology (broadband network, computers, smart phones etc. funded by MFS II), knowledge and skills in data management and computer utilisation for different purposes (due to a MFS II funded computer skills training), and knowledge and skills on data collection, sharing and receiving by using smart phones because of an MFS II funded training on this topic. Fourthly, the organisation improved its capacity to apply an integrated (multidisciplinary) M&E system because HUNDEE realized the need to involve all department units in M&E and the M&E responsibilities for the different programs/departments and M&E manager were clarified. Both these developments were due to the realisation that the work cannot be done by one person after HUNDEE expanded its work in terms of geographic areas and themes. The need to involve all departments in M&E also came from the need for quality reporting which takes all programmes into account. How this capacity was improved and the role of MFS II funded interventions will be further explained in 5.3. Fifthly, HUNDEE improved their resource mobilisation capacity because they started preparing big proposals, had a good track record, were willing to diversify their work, realised that donors' preferences are changing because of general limitations in terms of funding and the general manager showed networking and leadership capacity. HUNDEE started to prepare big proposals because of knowledge on detailed program proposal preparation they gained during a financial management training by Trocaire in 2013 and because they were forced to look for big projects to run the organisation because of the CSO regulation that allows only 30 percent of the project budget to be used for administrative purpose.

Finally, and according to HUNDEE staff, the organisation improved its capacity to design drought resilient livelihood programs in pastoral and semi-pastoral areas because of their improved skill in preparation of proposals related to Community based Disaster Risk Reduction and Management

(CDRRM) and their improved capacity to implement resilience projects. The knowledge on CDRRM and implementing it was gained through training on CDRRM and the experience sharing/visit to Tigray, Dire Dawa and Awassa in 2013 (both funded by MFS II). This training and experience sharing/visit came about from the needs assessment carried out in 2013 by the IRR consortium to identify capacity gaps in the area of CDRRM with the support of ICCO (MFS II funded). All in all, there is some mention of MFS II funded capacity development interventions in the improved capacity for integrated M&E; improved capacity in communication and information sharing; and improved capacity to design drought resilient livelihood programs. During process tracing these and more MFS II funded interventions (such as trainings on these computer skills, and the use of smart phones and CMDRR; and the provision of broadband connection, computers and smart phones) have clearly come up and we therefore refer to 5.3, where the role of MFS II funded capacity development interventions in organisational capacity changes of HUNDEE will be further explained. Other factors that were mentioned by HUNDEE staff include external factors like trainings by other funders (GIZ, Trocaire); changing funding climate; and CSO regulations. Also, there have been internal factors like internal reflections; expanding the program and have a good relationships with the government.

5.3 Attributing changes in organisational capacity development to MFS II

This section aims to provide an answer to the second and fourth evaluation questions:

1. *To what degree are the changes identified in partner capacity attributable to development interventions undertaken by the MFS II consortia (i.e. measuring effectiveness)?*
2. *What factors explain the findings drawn from the questions above?*

To address the question of attribution it was agreed that for all the countries in the 5C study, the focus would be on the capability to act and commit and the capability to adapt and self-renew, with a focus on MFS II supported organisational capacity development interventions that were possibly related to these capabilities. 'Process tracing' was used to get more detailed information about the changes in these capabilities that were possibly related to the specific MFS II capacity development interventions. The organisational capacity changes that were focused on were:

- Enhanced resource mobilisation capacity
- Improved ICT capacity for information sharing and communication
- Improved competences for gender mainstreaming
- Improved M&E practices including institutionalized downward accountability

The first and the third organisational capacity changes fall under the capability to act and commit. The last one (M&E) falls under the capability to adapt and self-renew. The second one falls under both mentioned capabilities. The organisational capacity change areas that were chosen are based on document review as well as discussions with the SPO and CFA. Each of these organisational capacity changes is further discussed below.

The following issues are discussed for the MFS II funded activities that are related to the above mentioned organisational capacity changes:

- a. Design: the extent to which the MFS II supported capacity development intervention was well-designed. (Key criteria: relevance to the SPO; SMART objectives)
- b. Implementation: the extent to which the MFS II supported capacity development was implemented as designed (key criteria: design, according to plans during the baseline);
- c. Reaching objectives: the extent to which the MFS II capacity development intervention reached all its objectives (key criteria: immediate and long-term objectives, as formulated during the baseline);
- d. The extent to which the observed results are attributable to the identified MFS II supported capacity development intervention (reference made to detailed causal map, based on 'process tracing').

Please note that whilst (d) addresses the evaluation question related to attribution (evaluation question 2), the other three issues (a, b and c) have been added by the synthesis team as additional reporting requirements. This was done when fieldwork for the endline process had already started, and therefore inadequate information is available on this. Then again, this wasn't the purpose of this 5c evaluation.

Enhanced resource mobilisation capacity

The following MFS II capacity development interventions supported by ICCO were linked to the key organisational capacity change "Enhanced resource mobilisation capacity":

1. Financial management training in Hawassa in 2013 (14)
2. Technical support, coaching and mentoring by ICCO regional office/staff (15+30)
3. Orientation, training and other support for finance staff on accounting procedures and adaptation to CSA regulations (17+18)
4. Training on financial management for NGOs (MANGO) by CST, CSSP, ICCO (MFS II funded) and Misereor (20)
5. Improved ICT infrastructure since 2012 (26)

The above mentioned MFS II funded capacity development interventions are included here as well as in the causal maps and narratives. This is because the effects of these interventions were observed during process tracing as related to the organisational capacity change area "enhanced resource mobilization capacity", and they came up during document review, endline workshop, interviews and self-assessments.

1. Financial management training in Hawassa in 2013 (14)

Design

This intervention was not mentioned as planned during the baseline. Details about the specific design cannot be provided, since this wasn't the focus of the evaluation. However, during the endline assessment ICCO indicated that this training was given to enhance the capacity of the organization in aspects of timely, quality and good financial & record systems, and that the longer term expectation was institutionalized financial systems and enhanced involvement of all stakeholders in programming, implementation and monitoring of its programs.

Financial management training was not mentioned as important in the Theory of Change (ToC) developed during the MFS II 5C baseline survey. However, establishing and strengthening accountability systems was mentioned as important, so in that sense this training was relevant to the organisation.

The expected effects were not formulated in a SMART way (specific, measurable, achievable, relevant and time-bound). However, the evaluation team did not ask the CFA for SMART objectives specifically, but rather asked about the expected immediate and long term effects of the interventions.

Implementation

The training was conducted in Hawassa in May 2013, and was given by two ICCO finance officers. The HUNDEE managing director attended this training. Topics dealt with are: Budgeting, Financial Reporting, and Grants management (Donor relations & sub-grant management) through the FC C6NGO consortium.

As far as the evaluation team knows, it was implemented as designed, however, details about the specific design cannot be provided, since this wasn't the focus of the evaluation.

Reaching objectives

Not having objectives that were defined as SMART objectives makes it difficult to assess this issue. However, based on the process tracing causal map it can be said that the training helped the financial personnel to improve their knowledge about internal control, risk assessment, planning, reporting and other financial operations. It improved their ability to fulfil financial donor requirements, and to prepare realistic project budgets and financial reports. ICCO observed as a result of this training timelier and better quality reporting. This all contributed to an improved financial management capacity. The immediate objective of this training seems to be achieved. To what extent the longer term objective/expectation has been achieved is not possible to assess.

2. Technical support, coaching and mentoring by ICCO regional office/ staff (15+ 30)

This support was not specifically mentioned as planned for during the baseline but HUNDEE staff mentioned at the endline workshop that this technical support, coaching and mentoring by ICCO regional office/staff has been helpful to improve their ability to fulfil financial donor requirements, and to prepare realistic project budgets and financial reports, in addition to the training mentioned above, and that it also deepened their knowledge about internal control, risk assessment, planning, reporting and other financial operations. This contributed to an improved financial management capacity. Because no further details are known this intervention cannot be further analysed, then again this wasn't the purpose of this evaluation.

3. Orientation, training and other support for finance staff on accounting procedures and adaption to CSA regulations (17+ 18)

This support was not specifically mentioned as planned for during the baseline but HUNDEE staff mentioned at the endline workshop that this support has been helpful to fulfil the Ethiopian government financial reporting requirements for the Civil Societies Agency (CSA) regulations: ICCO support was both financial and technical support in coaching, through hiring a consultant at consortium level on organizational development tools (including strategic plan revision, financial management and accounting manuals and M&E manual particularly PIM (performance impact monitoring)). Because no further details are known this intervention cannot be further analysed, then again this wasn't the purpose of this evaluation.

4. Training on financial management for NGOs (MANGO) by CST, CSSP, ICCO (MFS II funded) and Misereor (20)

This was another capacity development intervention that was (only) mentioned at the endline workshop. Based on the process tracing causal map it can be said that the training helped the financial personnel to improve their knowledge about internal control, risk assessment, planning, reporting and other financial operations, and to improved knowledge about how to identify gaps related to payment, collection and accounting structures. This contributed to improved competences to prepare realistic project budget and financial reports. It is not known to which extent ICCO contributed to this training. Because no further details are known this intervention cannot be further analysed, then again this wasn't the purpose of this evaluation.

5. Improved ICT infrastructure since 2012 (26)

The provision or improvement of ICT infrastructure with laptops, computers, CDMA phones, and flash disks, at head office and local offices, was planned for during the baseline survey, along with training in basic computer skills. The expected immediate effect was improved efficiency in communication using electronics technology in report writing and designing. The long term expectation was a more effective and efficient resource use. At the endline workshop it was mentioned as having been helpful to explore websites for potential financial sources, and to be more knowledgeable about current donor trends and requirements.

Attribution of observed results to MFS II capacity development interventions

The enhanced resource mobilization capacity is due to:

1. Improved capacity in project proposal development (2)
2. Improved financial management capacity (3)
3. Improved understanding of the usefulness of networking (4)
4. Improved knowledge about current funding trends and donor intelligence (5)
5. Improved ability to engage target communities and make them aware of their potentials for their own development (6)

(see 4.3.1)

The improved financial management capacity can to a large extent, and the improved knowledge about current funding trends and donor intelligence to some extent be attributed to MFS II supported capacity development interventions. Based on the process tracing causal map the other related changes cannot be attributed to MFS II supported capacity development interventions. These five changes will be discussed hereunder:

1. The improved capacity in project proposal development can be attributed to HUNDEE's improved capacity and analytical skills, and ability to mobilize multi-disciplinary teams for project proposal writing, both acquired through the long experience they have in implementing different kinds of rural

development projects. Also, the knowledge and skills HUNDEE has in gender analysis and its use in project proposal preparation, a major issue in rural development projects, contributed to the improved capacity for project proposal development. These competences were further developed by training in gender analysis tools in Tanzania with financial support from Oxfam Canada in 2014.

2. The improved financial management capacity can be attributed to:

- a. An improved capacity to manage a larger number of projects, which, is related to experience in working on development projects.
- b. An improved ability to fulfil financial donor requirements, which can to a large extent be attributed to MFS II supported capacity development interventions, i.e. the financial management training in Hawassa in 2013 and the technical financial support and mentoring by ICCO regional office. This improved ability can to some extent be attributed to the pre award assessments by donors in general, i.e. the organisational financial capacity assessment at the final stage of the funding process.
- c. An improved ability to fulfil Ethiopian government financial reporting requirements, which can partly be attributed to MFS II supported capacity development interventions, i.e. by technical support provided for the adaptation of the financial system to CSA regulations, and and the subsequent orientation and training provided for finance staff on accounting procedures and adaption to the Ethiopian CSA regulations. PACT provided similar support.
- d. Improved competences to prepare realistic project budgets and financial reports, which can to a large extent be attributed to MFS II supported capacity development interventions, i.e. by the financial coaching and mentorship of ICCO regional office experts, the financial management training by ICCO in 2013 in Hawassa, and training on financial management (MANGO), which was provided by? ICCO (MFS II) and others.

3. The improved understanding of the usefulness of networking (4) can be attributed to becoming and being active participant in several networks and consortia, where funding opportunities are exchanged and peer organization recommend each other for funding.

4. The improved knowledge about current funding trends and donor intelligence can be attributed to experience and feedback from failed funding requests in general and to the increased exploration of potential financial sources through websites. The latter can be attributed to the improved ICT infrastructure, which was provided with MFS II funding.

5. The improved ability to engage target communities and make them aware of their potentials for their own development can be attributed to HUNDEE's long standing philosophy about working with the community, respecting the communities' cultures and norms including getting their consent on the interventions that will be implemented. This has contributed to building trust over time, and mobilized community resources. The community trust and their involvement in project design and implementation also attracts funders. In addition, the orientation that some HUNDEE staff received about the principles and useful empowerment tools integrated into the Asset Based Community based Development (ABCD) approach by Oxfam Canada in 2003, 2012 and 2014 helped to reinforce HUNDEE's philosophy and the community trust and community resource mobilization capacity.

On the whole, based on the process tracing causal map, it can be said that HUNDEE's enhanced resource mobilisation capacity can partly be attributed to MFS II supported capacity development interventions, notably by improved financial management capacity: through training and technical support on adapting financial system and accounting procedures in line with CSA regulations (although this was also done by other organisations); through coaching and mentorship. Furthermore, the organisation increased its knowledge on funding trends and donor intelligence partly because of an improved ICT infrastructure (MFS II). There are also other factors to which enhanced resource mobilisation capacity of HUNDEE can be attributed. These include internal factors like experience working on development projects, and experience and feedback from previous fields funding proposals. But there has also been support from other donors like by OXFAM Canada, provided the training on gender analysis tools and oriented the organisation to principals and useful empowerment tools integrated into to the ABCD approach. Then a range of funders have also contributed to the earlier mentioned trainings related to financial management capacity. Being an active member of new and existing consortia and networks helped them in understanding the importance of networks for resource mobilisation.

Improved ICT capacity for information sharing and communication

The following MFS II capacity development interventions supported by ICCO were linked to the key organisational capacity change “Improved ICT capacity for information sharing and communication”:

1. Training on ICT based data collection using smart phones in May 2013 (8)
2. Coaching/suggestions made and subsequent project proposals on ICT during 6NGOs consortium meeting of 2012 (23)
3. Training on different data analysis software and website development in 2013 (16)
4. Exchange visit to Kenya on FED and ICT, Oct 2013 (22)
5. Training on basic computer skills in 2013 (19)
6. Training on computer troubleshooting & hardware maintenance in 2012 (21)

Note: hardware was also provided in terms of smartphones, TV and video deck, and computers and wifi internet infrastructure. These are discussed where relevant under the related capacity development interventions mentioned above. The above mentioned MFS II funded capacity development interventions are included here as well as in the causal maps and narratives. This is because the effects of these interventions were observed during process tracing as related to the organisational capacity change area “Improved ICT capacity for information sharing and communication”, and they came up during document review, endline workshop, interviews and self-assessments.

1. Training on ICT based data collection using smart phones in May 2013 (8)

This training was not specifically mentioned as planned for during the baseline but HUNDEE staff present at the endline workshop indicated that the knowledge gained at this training improved their knowledge and skills to collect data on the MFS II related project using smart phones. The data are collected and sent to Kenya for analysis. The initial idea was developed as a result of information sharing during the ICT project development by value chain consortium members, in Addis Ababa in 2012, see further below. Furthermore, there was a felt necessity to improve efficiency in data collection, storage and analysis. The frequently used paper based data collection method was taking a long time for data collection and entry. Therefore, to reduce the time taken and improve efficiency HUNDEE as well as the CFA showed interest to use smart phones for data collection. In line with this, smart phones were provided by ICCO in 2013. This was complemented by training by AKVO on ICT based data collection using smart phones (MFS II funded by ICCO Alliance). The training was given to the ICT project focal person and ICT expert for one day in May 2013. The training focused on methods of data collection using smart phones loaded with data collection tool (questionnaires). Nowadays the community (target groups) started to use smart phones for sharing information and marketing, also as a result of staff making more use of ICT technologies. This includes sharing price information through text messages. The introduction and use of smart phones seem to be successful. However, because no further details are known this intervention cannot be further analysed.

2. Coaching/ suggestions made and subsequent project proposals on ICT during 6NGOs consortium meeting of 2012 (23)

These 6NGOs consortium meetings were not specifically mentioned as planned for during the baseline. HUNDEE staff particularly mentioned the meeting of 2012, in which the ICT project was developed because it resulted in several suggestions and initiatives that were developed and implemented after this workshop, notably the use of smart phones for data collection and information sharing for the target groups (FMOs) as described above, and the use of multimedia and group methods for training and disseminating agricultural technologies to farmers. HUNDEE wanted to use ICT to reach a wider audience. In line with this, to help in preparation of the training materials and documenting the information for technology use, agriculture research centres were involved. Furthermore, since most of the information sharing was done through TV and video, the provision of TV and video decks by C4C/IICD/ICCO in 2013 facilitated the implementation. Nowadays the target groups started to use computers for data storage and word processing (especially farmers cooperatives) and to learn improved agricultural technologies through the use of ICT, such as TV and video deck. Because no further details are known this intervention cannot be further analysed.

3. Training on different data analysis software, and website development, in 2013 (16) **Design**

5. Training on basic computer skills in 2013 (19)

These trainings were planned during the baseline survey and given as one training. Details about the specific design are not known, but that wasn't the focus of this evaluation. Specific immediate and long term objectives were not given during the baseline survey, although in general terms the objective was to "improve efficiency in communication using electronics technology in report writing and designing". At the endline survey it was mentioned that the immediate objective of this training was to enable HUNDEE to use its ICT infrastructures (ICT centres, tools & gadgets, MIS), that was also provided with MFSII funding and to "improve efficiency in communication using electronics technology in report writing and designing". The long term objective was the provision of access to up-to-date and reliable information sources to its target groups, which are smallholder farmers and their organization, and "the effective and efficient use of resources". It was also mentioned that this training was to fill the gap in computer use and internet application at HUNDEE.

Computer skills or ICT were not mentioned as important in the Theory of Change (ToC) developed during the MFS II 5C baseline survey, but it was mentioned as having been useful during the endline workshop.

The expected effects were not formulated in a SMART way (specific, measurable, achievable, relevant and time-bound). However, the evaluation team did not ask the CFA for SMART objectives specifically, but rather asked about the expected immediate and long term effects of the interventions.

Implementation

The training took place in 2013 and was given by Digital Opportunities Trust (DOT) Ethiopia. A total of 15 staff members drawn from Finance and Administration and Program Operations Management Departments and Monitoring and Evaluation unit of HUNDEE have received training on basic computer skills and various software applications (SPSS, Access, Adobe, Photo Shop, etc.). Similar training was also provided for about 12 local project staff working in HUNDEE's Bale and West Shoa program offices. As far as the evaluation team knows, it was implemented as designed, however, details about the specific design cannot be provided, since this wasn't the focus of the evaluation.

Reaching objectives

Based on the process tracing causal map it can be said that participation in the training resulted in an improved knowledge & skills in data analysis using the ICT infrastructure for data collected by HUNDEE and an improved understanding about social media, internet & office applications. The knowledge gained through this training was put into use with the provision of wi-fi internet infrastructure and computers by ICCO in 2013. According to the CFA evidence for success is that HUNDEE now has ICT infrastructures (ICT centres, tools & gadgets, MIS); that staff are able to use this ICT infrastructure; improved access to telephone & internet connection and networks for HUNDEE staff; that ICT centres are established for its target groups-farmer unions; the hiring of an ICT officer to support its target groups and an updated website. The target groups started to use computers for data storage and word processing (especially farmers cooperatives) and to learn improved agricultural technologies through the use of ICT; such as TV and video deck. It seems that the short term objective has been reached and also the long term objective to a large extent. However, not having objectives that were defined as SMART objectives makes it difficult to assess.

4. Exchange visit to Kenya on FED and ICT, Oct 2013 (22)

Design

This intervention was not mentioned as planned for during the baseline survey. Details about the specific design are not known, but that wasn't the focus of this evaluation. However, immediate and long term objectives were given during the endline survey: the immediate objective was a cross country experience exchange among HUNDEE and Consortium members in Kenya and Ethiopia to facilitate learning from one another to enhance their development results. The long term objective was to have established a strong link with market actors leading to self-sustainability.

This intervention was not mentioned as important in the Theory of Change (ToC) developed during the MFSII 5C baseline survey, but it was mentioned as having been useful during the endline workshop.

The expected effects were not formulated in a SMART way (specific, measurable, achievable, relevant and time-bound). However, the evaluation team did not ask the CFA for SMART objectives specifically, but rather asked about the expected immediate and long term effects of the interventions.

Implementation

The exchange visit took place in October 2013. HUNDEE director and one senior management staff participated. The focus was to exchange experiences on the use of ICT and business approaches. As far as the evaluation team knows, this intervention was implemented as designed.

Reaching objectives

Based on the process tracing causal map it can be said that participation in the exchange visit deepened the understanding and interest relates in the use of ICT for disseminating improved agriculture technology in an efficient way. Furthermore, according to the CFA, it enhanced the outlook with regard to production for market, i.e. a change of mind set to adapting production to market demands. It seems that the short term objective has been reached and the long term objective to a some extent. However, not having objectives that were defined as SMART objectives makes it difficult to assess.

6. Training on computer troubleshooting & hardware maintenance in 2012 (21)

This training was not specifically mentioned as planned for during the baseline but HUNDEE staff present at the endline workshop indicated that the knowledge and skills gained in this training, i.e. in basic computer hardware maintenance and trouble shooting, was a pre-requisite for improved ICT capacity. Therefore, although this is a primary skill for only a small number of staff, staff wanted to mention it as an important skill. Because no further details are known this intervention cannot be further analysed.

Attribution of observed results to MFS II capacity development interventions

The improved ICT capacity was due to:

1. Improved ICT competencies for data collection using smart phone and computer based data analysis (2)
 2. enhanced interest and competencies on the use of ICT (TV, video deck) for technology dissemination (3)
 3. Improved competencies to use social media, internet & office applications (5)
 4. Improved competencies in computer hardware maintenance (6)
- (see 4.3.2)

Based on the process tracing causal map it can be said that the latter three contributing causes can be completely and the first one almost completely attributed to MFS II supported capacity development interventions.

1. The improved ICT for data collection using smartphone computer-based data analysis, can be partly attributed to the training on ICT based data collection using smart phones; the training MFS II funded training on different data analysis software and website development; and the provision of smart phones by (also MFS II funded). Ideas and proposals for these ICT interventions were developed during the 6NGO consortium meeting in 2012 (MFS II). Also PCI/USAID provided smartphones for women's self-help groups.

2. The enhanced interest and competencies in the use of ICT for technology dissemination can to a great extent be attributed to MFS II supported capacity development interventions such as the provision of the organisation with a TV and video deck, and the exchange visits to Kenya, which helped the organisation in gaining competencies on the use of ICT for technology dissemination. The 6NGOs Consortium meeting has sparked of these initiatives. Furthermore, the agricultural research centre documenting information for technology use has helped to improve this interest and competencies, by assisting in preparing training materials and documenting the information for technology use. To involve them was an initiative of the 6NGO consortium (MFS II funded).

3. The improved competencies to use social media, Internet and office applications can be fully attributed to MFS II capacity development interventions such as training on basic computer skills, the provision of Wi-Fi Internet's structure and computers, which helped to improve these competences.

4. Improved competencies in computer hardware maintenance can also be fully attributed to MFS II supported capacity development interventions, in particular the training on computer troubleshooting and hardware maintenance.

On the whole, ICT capacity has improved which can almost entirely be attributed to MFS II funded capacity development interventions, by providing training and hardware: in particular training capacity based data collection using smart phones; training on data analysis software and website development; training on basic computer skills; and training on computer troubleshooting and hardware maintenance; provision of smart phones; provision of DVD and video deck; provision of Wi-Fi internet infrastructure and computers. The 6NGO consortium meeting has been the main source of some of these ideas and proposals. The provision of smartphones by USAID and the engagement of the agricultural research centre documenting information for technology use have a relatively minor role.

Improved competences for gender mainstreaming

The following MFS II capacity development interventions supported by ICCO were linked to the key organisational capacity change "Improved competences for gender mainstreaming":

1. Training on gender and value chain development in 2012 (23)
2. Coaching on Gender mainstreaming in value chain within Consortium Framework (2)
3. Exchange visit to Kenya Oct 2013 (19)

The above mentioned MFS II funded capacity development interventions are included here as well as in the causal maps and narratives. This is because the effects of these interventions were observed during process tracing as related to the organisational capacity change area "Improved competences for gender mainstreaming", and they came up during document review, endline workshop, interviews and self-assessments.

1. Training on gender and value chain development in 2012 (23)

This intervention was not mentioned as planned for during the baseline, but HUNDEE staff mentioned this at the endline workshop: this training not only helped to improve their knowledge on gender and value chain development, but that within the MFS II Consortium Framework reviewing projects with a gender lens has been promoted through this training. This contributed to improved knowledge about areas that needed improvement to become more gender sensitive and responsive. Because no further details are known this intervention cannot be further analysed, then again this wasn't the purpose of this evaluation.

2. Coaching on Gender mainstreaming in value chain within Consortium Framework in 2013 (2)

Design

This intervention was not mentioned as planned for during the baseline. Details about the specific design cannot be provided, since this wasn't the focus of the evaluation. However, during the endline assessment ICCO indicated that this training was given to enhance equitable participation of both men and women in its program. The longer term expectation was that HUNDEE would mainstream gender in all its programs as cross cutting issue.

Gender mainstreaming was not mentioned as important in the Theory of Change (ToC) developed during the MFS II 5C baseline survey. However, according to their Strategic plan 2010-2014, working on gender equality and women empowerment initiatives is not a matter of choice for HUNDEE, but rather a guiding principle, so the subject is relevant to the organisation.

The expected effects were not formulated in a SMART way (specific, measurable, achievable, relevant and time-bound). However, the evaluation team did not ask the CFA for SMART objectives specifically, but rather asked about the expected immediate and long term effects of the interventions.

Implementation

The Ethiopian office of Fair and Sustainable implemented this intervention in 2013. Details about how this coaching was conducted are not known by the evaluation team. As far as the evaluation team knows, it was implemented as designed, however, since details about the specific design cannot be provided, since this wasn't the focus of the evaluation.

Reaching objectives

Not having objectives that were defined as SMART objectives makes it difficult to assess this issue. However, based on the process tracing causal map it can be said that the coaching improved HUNDEE's staffs' knowledge on gender and value chain development, and that within the MFS II Consortium Framework reviewing projects with a gender lens was promoted through this training. This contributed to improved knowledge about areas that needed improvement to become more gender sensitive and responsive. The coaching also improved competencies to address gender issues, empower women, and promote their economic development. Within the C6NGOs consortium framework the number of women has increased as participants as well as at decision making levels. The immediate objective of this intervention seems to be achieved. To what extent the longer term objective/expectation has been achieved is not possible to assess.

3. Exchange visit to Kenya Oct 2013 (19)

HUNDEE staff mentioned at the endline workshop that this exchange visit contributed to HUNDEE's knowledge about women in value chain development in general, and how to improve women's membership and leadership, address gender issues, empower women and promote women's economic development in VCD. This contributed to improved competencies to address gender issues, empower women, and promote their economic development. This intervention will be further analysed under "improved ICT capacity".

Attribution of observed results to MFS II capacity development interventions

According to HUNDEE staff present at the endline workshop, contributing factors to the improved competencies for gender mainstreaming consist of the following:

1. Alignment of HUNDEE's organizational systems, policies, procedures and programs to adequately reflect HUNDEE's commitment to gender equality (15)
2. Improved knowledge about women and value chain development (9)
3. Improved competencies to address gender issues, empower women and improve women's economic development (6)
4. Improved knowledge and understanding about gender based reporting (22)
(see 4.3.3)

The first and third related changes can for a small part, the second one entirely, and the last one cannot be attributed to MFS II supported capacity development interventions.

1. Alignment of HUNDEE's organizational systems, policies, procedures to reflect gender equality can be attributed to:

- a. Improved knowledge about areas that need improvement to become more gender sensitive and responsive, which can be partly attributed to MFS II supported capacity development interventions, i.e. the training and coaching in gender mainstreaming in VCD, which made the organisation review its projects with a gender lens. OXFAM Canada has also played an even more important role in terms of annual organisation wide gender audits and training on gender analysis tools and providing tools and a manual. Furthermore, other donors have promoted gender mainstreaming.
- b. HUNDEE's commitment and operationalization of its gender task force, which was created in 2009 but further operationalised after a gender audit by Oxfam Canada in 2012.

2. The improved knowledge about women and value chain development (VCD) can entirely be attributed to MFS II supported capacity development interventions, i.e. the training and coaching in women in VCD, and the exchange visit to Kenya in 2013.

3. The improved competencies to address gender issues, empower women and improve women's economic development can partly be attributed to MFS II supported capacity development interventions, i.e. the coaching in gender mainstreaming in VCD, and the exchange visit to Kenya in

2013, as described above. On the other hand this can be attributed to the gender training, tools, and manual provided by Oxfam Canada, and improved knowledge on women's right and protection from harmful traditional practices from different trainings of the Community Food Security Enhancement through Promotion of Community-Based Organization project of USAID, 2012-2014.

4. The improved knowledge and understanding about gender based reporting cannot be attributed to MFS II supported capacity development interventions, but was due to HUNDEE's own experience, CST training on gender mainstreaming in 2013, and donor gender disaggregated reporting formats in general.

Overall, HUNDEE's improved competences for gender mainstreaming can partly be attributed to MFS II supported capacity development interventions: i.e. training, coaching and an exchange visit to Kenya in relation to gender in value chain development which helped the organisation to review projects with a gender lens and increase their knowledge on these issues. Especially Oxfam Canada has also played an important, even more important role in terms of supporting annual organisation wide gender audits; a training on gender analysis with related tools and manual. Other donors have also played a role in terms of promoting gender mainstreaming and providing training on gender mainstreaming (CST). Internal factors like previous experience and establishing a gender task force have also played a role. And a USAID funded project has helped the organisation in addressing gender related issues.

Improved M&E practices including institutionalized downward accountability

The following MFS II capacity development interventions supported by ICCO were linked to the key organisational capacity change "Improved M&E practices including institutionalized downward accountability":

1. Training sessions on participatory film making (2011+2012) (4)
 2. Training/ dissemination workshop (final) on downward accountability, Dec 2012 (3)
 3. Training in the use of SMART phones by AKVO in May 2013 (38)
 4. Training, coaching and other capacitating activities in the area of M&E (32)
 5. Training and coaching on PIM, 2012 (16)
- (see 4.3.1)

The above mentioned MFS II funded capacity development interventions are included here as well as in the causal maps and narratives. This is because the effects of these interventions were observed during process tracing as related to the organisational capacity change area 'Improved M&E practices including institutionalized downward accountability'³, and they came up during document review, endline workshop, interviews and self-assessments.

1. Training sessions on participatory film making (2011+2012) (4)

This training was not specifically mentioned as planned for during the baseline survey in 2012 but HUNDEE staff present at the endline workshop indicated that the knowledge and skills about participatory filmmaking gained in this training, contributed to the dissemination and sharing of what was learned with other HUNDEE staff as one of the downward accountability tools. The ICCO trainer considers participatory film making as a PME and a capacity development tool since it encourages participants to reflect and learn from their experiences and draw lessons for a broader audience. This participatory training was done twice, in 2011 and 2012 as part of a training trajectory on downward accountability that started in 2009. Because no further details are known this intervention cannot be further analysed. Then again, this wasn't the purpose of this evaluation.

2. Training/ dissemination workshop (final) on downward accountability, Dec 2012 (3)

Design

This workshop, or training in downward accountability was not mentioned as planned for during the baseline survey, only in general terms as M&E capacity development. Likewise, only one objective in general terms was given during the baseline survey "Effective monitoring and evaluation undertaken".

³ Hereafter referred to as "Improved M&E practices"

However, this workshop was the concluding workshop of a longer training trajectory on downward accountability that started in 2009. At the endline survey it was mentioned that this training trajectory was undertaken to capacitate HUNDEE (together with the other 5 NGOs in the 6NGO consortium) to pilot downward accountability tools, aiming at improving the quality and effectiveness of the services of HUNDEE to its clients, its accountability to its clients, etc. The long term expectation was mainstreaming downward accountability in all its programs and institutionalizing the approach.

Strengthening accountability mechanisms, including downward accountability was mentioned in the Theory of Change (ToC) developed during the MFS II 5C baseline survey. HUNDEE adopted the downward accountability in its strategies in 2009, inspired by a workshop (2009) organised by ICCO (MFS I funding) to introduce client satisfaction instruments (CSI). The 6NGO consortium, including HUNDEE, decided to join the pilot because it was thought that CSI would enable the service taker (client) to get better quality service; also it was expected to improve the credibility among clients (trust worthiness, good relationship, and transparency). Therefore it can be said that the whole training trajectory was very relevant.

The expected effects were not formulated in a SMART way (specific, measurable, achievable, relevant and time-bound). However, the evaluation team did not ask the CFA for SMART objectives specifically, but rather asked about the expected immediate and long term effects of the interventions.

Implementation

As mentioned above, the workshop was the final intervention of a training trajectory on downward accountability that started in 2009, and included the following elements:

- 1) Introduction training course on Downward Accountability (2009, MFS1)
- 2) Field work preparation & Implementation with coaching on the side (2010, MFS1)
- 3) Sense-making Workshop (August 2010, MFS1)
- 4) Participatory film making (March 2011, MFS 2)
- 5) Round 2 Field work – with training session and coaching (November 2011, MFS2)
- 6) Participatory film making (December 2012, MFS 2)
- 7) Final dissemination conference (December 2012, MFS2)

On top of the downward accountability tools like Client Satisfaction Instruments (CSI) and participatory film making, at the final dissemination workshop participants also increased their knowledge on Promoting Financial Transparency and Accountability (FTA) under the Protection of Basic Services (PBS) Project, Public expenditure Tracking Systems (PETS), and the use of smart phones for data collection. At the final workshop/conference, three HUNDEE staff participated. It is not known who participated at the other interventions in this training trajectory. However, it is known that field staff was trained by staff who participated at this workshop to learn about Client Satisfaction Instruments and to help with the implementation of the pilots. As far as the evaluation team knows, it was implemented as designed, however, more details about the specific design cannot be provided, since this wasn't the focus of the evaluation.

Reaching objectives

Reaching the objectives of the workshop cannot be seen separately from reaching the objectives of the whole training trajectory. Based on the process tracing causal map it can be said that as a result of this training trajectory, HUNDEE is successfully implementing tools such as consumer panel and consumer satisfaction surveys in its program. Measuring satisfaction/ dissatisfaction of services became part of the monitoring program. It is not just used at project level, but it has also become institutionalized at organizational level. The improved M&E practices, including downward accountability, have led to a shift in mind-set in both providers as well as clients: farmers have become more critical and take part in decision-making, more than before. Furthermore, field workers and staff have become more responsive to the needs of their clients. Based on the above it seems that the short term objective has been reached and also the long term objective to a large extent. However, not having objectives that were defined as SMART objectives makes it difficult to assess.

3. Training in the use of SMART phones by AKVO in May 2013 (38)

This training was not specifically mentioned as planned for during the baseline but HUNDEE staff present at the endline workshop indicated that the knowledge gained at this training improved their knowledge and skills to collect data on the MFS II related project using smart phones. The data are

collected and sent to Kenya for analysis. The initial idea was developed as a result of information sharing during the ICT project development by value chain consortium members, in Addis Ababa in 2012, see further below. Furthermore, there was a felt necessity to improve efficiency in data collection, storage and analysis. The frequently used paper based data collection method was taking a long time for data collection and entry. Therefore, to reduce the time taken and improve efficiency HUNDEE as well as the CFA showed interest to use smart phones for data collection. In line with this, smart phones were provided by ICCO in 2013. This was complemented by training by AKVO on ICT based data collection using smart phones (MFS II funded by ICCO Alliance). The training was given to the ICT project focal person and ICT expert for one day in May 2013. The training focused on methods of data collection using smart phones loaded with data collection tool (questionnaires).

Nowadays the community (target groups) started to use smart phones for sharing information and marketing, also as a result of staff making more use of ICT technologies. This includes sharing price information through text messages. The introduction and use of smart phones seem to be successful.

However, because no further details are known this intervention cannot be further analysed.

4. Training, coaching and other capacitating activities in the area of M&E (32)

Design

This is not a particular intervention but in general terms M&E capacity development was planned for during the baseline survey, with the objective “Effective monitoring and evaluation undertaken”. Other specific objectives were not given.

Strengthening and creating effective M&E mechanisms was mentioned in the Theory of Change (ToC) developed during the MFS II 5C baseline survey. Therefore the training, coaching and other capacitating activities in the area of M&E were relevant.

The expected effects were not formulated in a SMART way (specific, measurable, achievable, relevant and time-bound). However, the evaluation team did not ask the CFA for SMART objectives specifically, but rather asked about the expected immediate and long term effects of the interventions.

Implementation

ICCO (MFS I and II) has over time supported HUNDEE to effectively implement its M&E activities through providing technical support and by introducing various approaches, like Results Based Management (RBM) and M&E tools. Information on activities, results and finances are put together and analysed by ICCO while monitoring and evaluating its programmes at various levels. ICCO, through MFS II funding, has also supported strengthening of the capacity of the SPO through monitoring visits and exposure visits. Such as the linking and learning across the East African Region. ICCO has also put increased emphasis measuring results at outcome and impact levels. As far as the evaluation team knows, it was implemented as designed, however, more details about the specific design cannot be provided, since this wasn't the focus of the evaluation.

Reaching objectives

Based on the process tracing causal map it can be said that, in addition to the results achieved in the area of downward accountability described above, HUNDEE staff have improved their knowledge, skills and competences in applying M&E (tools), ToC, RBM, etc.; and on measuring results at outcome and impact level. HUNDEE now deploys impact assessment tools for proving and improving. Furthermore, data collection and analysis play an integral role in decision-making and planning, and significant changes have been observed in the quality of the reports: according to the CFA the quality of reports had immensely improved. The reports are well aligned now with contracts reporting conditions, which was not the case at the start of 2012. Based on the above it seems that HUNDEE has strengthened and improved its M&E. In the absence of SMART objectives, it is difficult to assess whether they have been reached.

4. Training and coaching on PIM, 2012 (16)

The training and coaching on performance impact monitoring (PIM) was in fact part of the training, coaching and other capacity development support mentioned above and as such not mentioned separately as planned during the baseline survey. However, operationalizing the performance impact monitoring (PIM) manual was mentioned in the Theory of Change (ToC) developed during the MFS II 5C baseline survey, and it was mentioned separately during the endline survey, which indicates its

relevance. Based on the process tracing causal map it can be said that the training and coaching on PIM has increased the emphasis and knowledge on how to measure results on outcome and impact levels (29).

Attribution of observed results to MFS II capacity development interventions

The “improved M&E practices including institutionalised downward accountability” was due to:

1. Improved competences to apply downward accountability methods and tools (30)
2. Improved competences to apply RBM and M&E tools (31)

Both contributing factors can be partly be attributed to MFS II supported capacity development interventions.

1. The improved competences to apply downward accountability methods and tools can be attributed to:

- Experience by piloting Downward accountability tools (5)
- Adapting and enforcing downward accountability (HUNDEE) (27)
- Improved knowledge on social accountability (tools, theory and practice) 2013 (24)
- The first one can be almost entirely attributed to all MFS II funded capacity development interventions, knowledge and competencies related to the learning trajectory on downward accountability mentioned above, starting from 2009 with MFS I funding, as well as the training sessions on participatory filmmaking.
- The second one can be attributed to HUNDEE’s own dedication to apply downward accountability methods and tools, which is reflected in the HUNDEE 2010-2014 Strategic Plan and the 2013-2015 Operational Plan. To help HUNDEE adapt and institutionalize downward accountability an orientation and TOT training on Humanitarian Accountability Partnership (HAP) was organized by Cafod/Sciaf/Trocaire (CST) in 2012, ICCO in 2013 and Danish Church Aid (DCA) in 2014. Furthermore, the seed money provided by CCRDA in 2014 facilitated the implementation of HAP which is a process of self-assessment to see how much HUNDEE has institutionalized social accountability.
- The improved knowledge on social accountability tools, theory and practice was the result of being part of the “Social accountability program”, a government program sponsored by the World Bank that was launched in 2013 with HUNDEE as one of the implementing partners.

2. The improved competences to apply RBM and M&E tools can be attributed to

- Improved knowledge about SMART technology in data collection (13)
- Improved knowledge and skills on M&E (tools), ToC, RBM, etc. (23)
- Increased emphasis and knowledge on how to measure results on outcome and impact levels (29).

The first and the last change can be attributed to MFS II capacity development interventions, the second change to some extent:

- The improved knowledge about SMART technology in data collection can be attributed to the session on the use of smart phones for data collection at the final workshop on downward accountability (MFS II) in December 2012, and from a one day training in the use of SMART phones by AKVO in May 2013.
- The improved knowledge and skills on M&E (tools), ToC, RBM, etc. can partly be attributed to the knowledge and skills acquired by the MFS II capacity development interventions, notably the training, coaching and other capacitating activities in the area of M&E. However, other funders together played a more important role: the training in Results Based Management (RBM), and Monitoring and Evaluation (Tools) in 2013 of selected staff for the government funded social accountability program sponsored by the World Bank; the participation of 2 staff in a Results Based Monitoring and Evaluation training provided by Trocaire in 2012; and the participation of 2 staff in a Project Development and Monitoring and Evaluation Tools training provided by Christian Aid in 2013.
- The increased emphasis and knowledge on how to measure results on outcome and impact levels can be attributed to the MFS II training, coaching and other capacitating activities in the

area of M&E and the training and coaching on participatory impact monitoring (PIM), both MFS II funded.

On the whole, based on the process tracing causal map it can be said that the “improved M&E practices including institutionalised downward accountability”, can partly be attributed to MFS II supported capacity development interventions, and particularly in the area of downward accountability through the training trajectory on downward accountability that started in 2009 (MFS I) the workshop organised by ICCO on client satisfaction instruments, and continued with MFS II funding; including the training sessions on participatory filmmaking. In terms of improved competences to apply RBM and M&E tools, this can be attributed to efforts by training and coaching supported by MFS II (M&E and PIM) but also training by different funders, including the World Bank, Trocaire, and Christian Aid.

Appendix 1 Methodological approach & reflection

1.1 Introduction

This appendix describes the methodological design and challenges for the assessment of capacity development of Southern Partner Organisations (SPOs), also called the '5C study'. This 5C study is organised around four key evaluation questions:

1. What are the changes in partner organisations' capacity during the 2012-2014 period?
2. To what degree are the changes identified in partner capacity attributable to development interventions undertaken by the MFS II consortia (i.e. measuring effectiveness)?
3. Were the efforts of the MFS II consortia efficient?
4. What factors explain the findings drawn from the questions above?

It has been agreed that the question (3) around efficiency cannot be addressed for this 5C study. The methodological approach for the other three questions is described below. At the end, a methodological reflection is provided.

In terms of the attribution question (2), 'process tracing' is used. This is a theory-based approach that has been applied to a selected number of SPOs since it is a very intensive and costly methodology, although it provides rich information and can generate a lot of learning within the organisations. This approach was presented and agreed-upon during the synthesis workshop on 17-18 June 2013 by the 5C teams for the eight countries of the MFS II evaluation. A more detailed description of the approach was presented during the synthesis workshop in February 2014. The synthesis team, NWO-WOTRO, the country project leaders and the MFS II organisations present at the workshop have accepted this approach. It was agreed that this approach can only be used for a selected number of SPOs since it is a very intensive and costly methodology. Key organisational capacity changes/ outcomes of the SPO were identified, based on their relationship to the two selected capabilities, the capability to act and commit the capability to adapt and self-renew, and an expected relationship with CFA supported capacity development interventions (MFS II funding). It was agreed to focus on these two capabilities, since these are the most targeted capabilities by the CFAs, as established during the baseline process.

Please find below an explanation of how the above-mentioned evaluation questions have been addressed in the 5C evaluation.

Note: the methodological approach is applied to 4 countries that the Centre for Development Innovation, Wageningen University and Research centre is involved in in terms of the 5C study (Ethiopia, India, Indonesia, Liberia). The overall approach has been agreed with all the 8 countries selected for this MFS II evaluation. The 5C country teams have been trained and coached on this methodological approach during the evaluation process. Details specific to the SPO are described in chapter 5.1 of the SPO report. At the end of this appendix a brief methodological reflection is provided.

1.2 Changes in partner organisation's capacity – evaluation question 1

This section describes the data collection and analysis methodology for answering the first evaluation question: **What are the changes in partner organisations' capacity during the 2012-2014 period?**

This question was mainly addressed by reviewing changes in 5c indicators, but additionally a 'general causal map' based on the SPO perspective on key organisational capacity changes since the baseline has been developed. Each of these is further explained below. The development of the general causal map is integrated in the steps for the endline workshop, as mentioned below.

During the baseline in 2012 information has been collected on each of the 33 agreed upon indicators for organisational capacity. For each of the five capabilities of the 5C framework indicators have been developed as can be seen in Appendix 2. During this 5C baseline, a summary description has been provided for each of these indicators, based on document review and the information provided by staff, the Co-financing Agency (CFA) and other external stakeholders. Also a summary description has been provided for each capability. The results of these can be read in the baseline reports.

The description of indicators for the baseline in 2012 served as the basis for comparison during the endline in 2014. In practice this meant that largely the same categories of respondents (preferably the same respondents as during the baseline) were requested to review the descriptions per indicator and indicate whether and how the endline situation (2014) is different from the described situation in 2012.⁴ Per indicator they could indicate whether there was an improvement or deterioration or no change and also describe these changes. Furthermore, per indicator the interviewee could indicate what interventions, actors and other factors explain this change compared to the baseline situation. See below the specific questions that are asked for each of the indicators. Per category of interviewees there is a different list of indicators to be looked at. For example, staff members were presented with a list of all the indicators, whilst external people, for example partners, are presented with a select number of indicators, relevant to the stakeholder.

The information on the indicators was collected in different ways:

- 1) **Endline workshop at the SPO - self-assessment and 'general causal map'**: similar to data collection during the baseline, different categories of staff (as much as possible the same people as during the baseline) were brought together in a workshop and requested to respond, in their staff category, to the list of questions for each of the indicators (self-assessment sheet). Prior to carrying out the self-assessments, a brainstorming sessions was facilitated to develop a 'general causal map', based on the key organisational capacity changes since the baseline as perceived by SPO staff. Whilst this general causal map is not validated with additional information, it provides a sequential narrative, based on organisational capacity changes as perceived by SPO staff;
- 2) **Interviews with staff members**: additional to the endline workshop, interviews were held with SPO staff, either to provide more in-depth information on the information provided on the self-assessment formats during the workshop, or as a separate interview for staff members that were not present during the endline workshop;
- 3) **Interviews with externals**: different formats were developed for different types of external respondents, especially the co-financing agency (CFA), but also partner agencies, and organisational development consultants where possible. These externals were interviewed, either face-to-face or by phone/Skype. The interview sheets were sent to the respondents and if they wanted, these could be filled in digitally and followed up on during the interview;
- 4) **Document review**: similar to the baseline in 2012, relevant documents were reviewed so as to get information on each indicator. Documents to be reviewed included progress reports, evaluation reports, training reports, etc. (see below) since the baseline in 2012, so as to identify changes in each of the indicators;
- 5) **Observation**: similar to what was done in 2012, also in 2014 the evaluation team had a list with observable indicators which were to be used for observation during the visit to the SPO.

Below the key steps to assess changes in indicators are described.

⁴ The same categories were used as during the baseline (except beneficiaries, other funders): staff categories including management, programme staff, project staff, monitoring and evaluation staff, field staff, administration staff; stakeholder categories including co-financing agency (CFA), consultants, partners.

Key steps to assess changes in indicators are described

16. Provide the description of indicators in the relevant formats – CDI team
17. Review the descriptions per indicator – in-country team & CDI team
18. Send the formats adapted to the SPO to CFA and SPO – in-country team (formats for SPO) and CDI team (formats for CFA)
19. Collect, upload & code the documents from CFA and SPO in NVivo – CDI team
20. Organise the field visit to the SPO – in-country team
21. Interview the CFA – CDI team
22. Run the endline workshop with the SPO – in-country team
23. Interview SPO staff – in-country team
24. Fill-in observation sheets – in-country team
25. Interview externals – in-country team
26. Upload and auto-code all the formats collected by in-country team and CDI team in NVivo – CDI team
27. Provide to the overview of information per 5c indicator to in-country team – CDI team
28. Analyse data and develop a draft description of the findings per indicator and for the general questions – in-country team
29. Analyse data and develop a final description of the findings per indicator and per capability and for the general questions – CDI team
30. Analyse the information in the general causal map –in-country team and CDI-team

Note: the CDI team include the Dutch 5c country coordinator as well as the overall 5c coordinator for the four countries (Ethiopia, India, Indonesia, Liberia). The 5c country report is based on the separate SPO reports.

Below each of these steps is further explained.

*Step 1. Provide the **description of indicators** in the relevant formats – CDI team*

- These formats were to be used when collecting data from SPO staff, CFA, partners, and consultants. For each of these respondents different formats have been developed, based on the list of 5C indicators, similar to the procedure that was used during the baseline assessment. The CDI team needed to add the 2012 baseline description of each indicator. The idea was that each respondent would be requested to review each description per indicator, and indicate whether the current situation is different from the baseline situation, how this situation has changed, and what the reasons for the changes in indicators are. At the end of each format, a more general question is added that addresses how the organisation has changed its capacity since the baseline, and what possible reasons for change exist. Please see below the questions asked for each indicator as well as the more general questions at the end of the list of indicators.

General questions about key changes in the capacity of the SPO

What do you consider to be the key changes in terms of how the organisation/ SPO has developed its capacity since the baseline (2012)?

What do you consider to be the main explanatory reasons (interventions, actors or factors) for these changes?

List of questions to be asked for each of the 5C indicators (The entry point is the the description of each indicator as in the 2012 baseline report):

1. *How has the situation of this indicator changed compared to the situation during the baseline in 2012? Please tick one of the following scores:*
 - -2 = Considerable deterioration
 - -1 = A slight deterioration
 - 0 = No change occurred, the situation is the same as in 2012
 - +1 = Slight improvement
 - +2 = Considerable improvement

2. *Please describe what exactly has changed since the baseline in 2012*
3. *What interventions, actors and other factors explain this change compared to the baseline situation in 2012? Please tick and describe what interventions, actors or factors influenced this indicator, and how. You can tick and describe more than one choice.*
 - Intervention, actor or factor at the level of or by **SPO**:
 - Intervention, actor or factor at the level of or by the **Dutch CFA (MFS II funding)**:
 - Intervention, actor or factor at the level of or by the **other funders**:
 - **Other** interventions, actors or factors:
 - Don't know.

Step 2. Review the descriptions per indicator – in-country team & CDI team

Before the in-country team and the CDI team started collecting data in the field, it was important that they reviewed the description for each indicator as described in the baseline reports, and also added to the endline formats for review by respondents. These descriptions are based on document review, observation, interviews with SPO staff, CFA staff and external respondents during the baseline. It was important to explain this to respondents before they filled in the formats.

Step 3. Send the formats adapted to the SPO to CFA and SPO – in-country team (formats for SPO) and CDI team (formats for CFA)

The CDI team was responsible for collecting data from the CFA:

- 5C Endline assessment Dutch co-financing organisation;
- 5C Endline support to capacity sheet – CFA perspective.

The in-country team was responsible for collecting data from the SPO and from external respondents (except CFA). The following formats were sent before the fieldwork started:

- 5C Endline support to capacity sheet – SPO perspective.
- 5C Endline interview guides for externals: partners; OD consultants.

Step 4. Collect, upload & code the documents from CFA and SPO in NVivo – CDI team

The CDI team, in collaboration with the in-country team, collected the following documents from SPOs and CFAs:

- Project documents: project proposal, budget, contract (Note that for some SPOs there is a contract for the full MFS II period 2011-2015; for others there is a yearly or 2-yearly contract. All new contracts since the baseline in 2012 will need to be collected);
- Technical and financial progress reports since the baseline in 2012;.
- Mid-term evaluation reports;
- End of project-evaluation reports (by the SPO itself or by external evaluators);
- Contract intake forms (assessments of the SPO by the CFA) or organisational assessment scans made by the CFA that cover the 2011-2014 period;
- Consultant reports on specific inputs provided to the SPO in terms of organisational capacity development;
- Training reports (for the SPO; for alliance partners, including the SPO);
- Organisational scans/ assessments, carried out by the CFA or by the Alliance Assessments;
- Monitoring protocol reports, especially for the 5C study carried out by the MFS II Alliances;
- Annual progress reports of the CFA and of the Alliance in relation to capacity development of the SPOs in the particular country;
- Specific reports that are related to capacity development of SPOs in a particular country.

The following documents (since the baseline in 2012) were requested from SPO:

- Annual progress reports;
- Annual financial reports and audit reports;
- Organisational structure vision and mission since the baseline in 2012;

- Strategic plans;
- Business plans;
- Project/ programme planning documents;
- Annual work plan and budgets;
- Operational manuals;
- Organisational and policy documents: finance, human resource development, etc.;
- Monitoring and evaluation strategy and implementation plans;
- Evaluation reports;
- Staff training reports;
- Organisational capacity reports from development consultants.

The CDI team will code these documents in NVivo (qualitative data analysis software program) against the 5C indicators.

Step 5. Prepare and organise the field visit to the SPO – in-country team

Meanwhile the in-country team prepared and organised the logistics for the field visit to the SPO:

- **General endline workshop** consisted about one day for the self-assessments (about ½ to ¾ of the day) and brainstorm (about 1 to 2 hours) on key organisational capacity changes since the baseline and underlying interventions, factors and actors ('general causal map'), see also explanation below. This was done with the five categories of key staff: managers; project/ programme staff; monitoring and evaluation staff; admin & HRM staff; field staff. Note: for SPOs involved in process tracing an additional 1 to 1½ day workshop (managers; program/project staff; monitoring and evaluation staff) was necessary. See also step 7;
- **Interviews with SPO staff** (roughly one day);
- **Interviews with external respondents** such as partners and organisational development consultants depending on their proximity to the SPO. These interviews could be scheduled after the endline workshop and interviews with SPO staff.

General causal map

During the 5C endline process, a 'general causal map' has been developed, based on key organisational capacity changes and underlying causes for these changes, as perceived by the SPO. The general causal map describes cause-effect relationships, and is described both as a visual as well as a narrative.

As much as possible the same people that were involved in the baseline were also involved in the endline workshop and interviews.

Step 6. Interview the CFA – CDI team

The CDI team was responsible for sending the sheets/ formats to the CFA and for doing a follow-up interview on the basis of the information provided so as to clarify or deepen the information provided. This relates to:

- 5C Endline assessment Dutch co-financing organisation;
- 5C Endline support to capacity sheet - CFA perspective.

Step 7. Run the endline workshop with the SPO – in-country team

This included running the endline workshop, including facilitation of the development of the general causal map, self-assessments, interviews and observations. Particularly for those SPOs that were selected for process tracing all the relevant information needed to be analysed prior to the field visit, so as to develop an initial causal map. Please see Step 6 and also the next section on process tracing (evaluation question two).

An endline workshop with the SPO was intended to:

- Explain the purpose of the fieldwork;
- Carry out in the self-assessments by SPO staff subgroups (unless these have already been filled prior to the field visits) - this may take some 3 hours.
- Facilitate a brainstorm on key organisational capacity changes since the baseline in 2012 and underlying interventions, factors and actors.

Purpose of the fieldwork: to collect data that help to provide information on what changes took place in terms of organisational capacity development of the SPO as well as reasons for these changes. The baseline that was carried out in 2012 was to be used as a point of reference.

Brainstorm on key organisational capacity changes and influencing factors: a brainstorm was facilitated on key organisational capacity changes since the baseline in 2012. In order to kick start the discussion, staff were reminded of the key findings related to the historical time line carried out in the baseline (vision, mission, strategies, funding, staff). This was then used to generate a discussion on key changes that happened in the organisation since the baseline (on cards). Then cards were selected that were related to organisational capacity changes, and organised. Then a 'general causal map' was developed, based on these key organisational capacity changes and underlying reasons for change as experienced by the SPO staff. This was documented as a visual and narrative. This general causal map was to get the story of the SPO on what they perceived as key organisational capacity changes in the organisation since the baseline, in addition to the specific details provided per indicator.

Self-assessments: respondents worked in the respective staff function groups: management; programme/ project staff; monitoring and evaluation staff; admin and HRM staff; field staff. Staff were assisted where necessary so that they could really understand what it was they were being asked to do as well as what the descriptions under each indicator meant.

Note: for those SPOs selected for process tracing an additional endline workshop was held to facilitate the development of detailed causal maps for each of the identified organisational change/ outcome areas that fall under the capability to act and commit, and under the capability to adapt and self-renew, and that are likely related to capacity development interventions by the CFA. See also the next section on process tracing (evaluation question two). It was up to the in-country team whether this workshop was held straight after the initial endline workshop or after the workshop and the follow-up interviews. It could also be held as a separate workshop at another time.

Step 8. Interview SPO staff – in-country team

After the endline workshop (developing the general causal map and carrying out self-assessments in subgroups), interviews were held with SPO staff (subgroups) to follow up on the information that was provided in the self-assessment sheets, and to interview staff that had not yet provided any information.

Step 9. Fill-in observation sheets – in-country team

During the visit at the SPO, the in-country team had to fill in two sheets based on their observation:

- 5C Endline observation sheet;
- 5C Endline observable indicators.

Step 10. Interview externals – in-country team & CDI team

The in-country team also needed to interview the partners of the SPO as well as organisational capacity development consultants that have provided support to the SPO. The CDI team interviewed the CFA.

Step 11. Upload and auto-code all the formats collected by in-country team and CDI team – CDI team

The CDI team was responsible for uploading and auto-coding (in Nvivo) of the documents that were collected by the in-country team and by the CDI team.

*Step 12. Provide the **overview of information** per 5C indicator to in-country team – CDI team*

After the analysis in NVivo, the CDI team provided a copy of all the information generated per indicator to the in-country team for initial analysis.

*Step 13. **Analyse the data and develop a draft description** of the findings per indicator and for the general questions – in-country team*

The in-country team provided a draft description of the findings per indicator, based on the information generated per indicator. The information generated under the general questions were linked to the general causal map or detailed process tracing related causal map.

*Step 14. **Analyse the data and finalize the description** of the findings per indicator, per capability and general – CDI team*

The CDI team was responsible for checking the analysis by the in-country team with the Nvivo generated data and to make suggestions for improvement and ask questions for clarification to which the in-country team responded. The CDI team then finalised the analysis and provided final descriptions and scores per indicator and also summarize these per capability and calculated the summary capability scores based on the average of all indicators by capability.

*Step 15. **Analyse the information** in the general causal map –in-country team & CDI team*

The general causal map based on key organisational capacity changes as perceived by the SPO staff present at the workshop, was further detailed by in-country team and CDI team, and based on the notes made during the workshop and where necessary additional follow up with the SPO. The visual and narrative was finalized after feedback by the SPO. During analysis of the general causal map relationships with MFS II support for capacity development and other factors and actors were identified. All the information has been reviewed by the SPO and CFA.

1.3 Attributing changes in partner organisation's capacity – evaluation question 2

This section describes the data collection and analysis methodology for answering the second evaluation question: ***To what degree are the changes identified in partner capacity attributable to (capacity) development interventions undertaken by the MFS II consortia (i.e. measuring effectiveness)?***

In terms of the attribution question (2), 'process tracing' is used. This is a theory-based approach that has been applied to a selected number of SPOs since it is a very intensive and costly methodology, although it provides rich information and can generate a lot of learning within the organisations. Key organisational capacity changes/ outcomes of the SPO were identified, based on their relationship to the two selected capabilities, the capability to act and commit the capability to adapt and self-renew, and an expected relationship with CFA supported capacity development interventions (MFS II funding). It was agreed to focus on these two capabilities, since these are the most targeted capabilities by the CFAs, as established during the baseline process. The box below provides some background information on process tracing.

Background information on process tracing

The essence of process tracing research is that scholars want to go beyond merely identifying correlations between independent variables (Xs) and outcomes (Ys). Process tracing in social science is commonly defined by its addition to trace causal mechanisms (Bennett, 2008a, 2008b; Checkle, 2008; George & Bennett, 2005). A causal mechanism can be defined as “a complex system which produces an outcome by the interaction of a number of parts” (Glennan, 1996, p. 52). Process tracing involves “attempts to identify the intervening causal process – the causal chain and causal mechanism – between an independent variable (or variables) and the outcome of the dependent variable” (George & Bennett, 2005, pp. 206-207).

Process tracing can be differentiated into three variants within social science: theory testing, theory building, and explaining outcome process tracing (Beach & Pedersen, 2013).

Theory testing process tracing uses a theory from the existing literature and then tests whether evidence shows that each part of hypothesised causal mechanism is present in a given case, enabling within case inferences about whether the mechanism functioned as expected in the case and whether the mechanism as a whole was present. No claims can be made however, about whether the mechanism was the only cause of the outcome.

Theory building process tracing seeks to build generalizable theoretical explanations from empirical evidence, inferring that a more general causal mechanism exists from the fact of a particular case.

Finally, explaining outcome process tracing attempts to craft a minimally sufficient explanation of a puzzling outcome in a specific historical case. Here the aim is not to build or test more general theories but to craft a (minimally) sufficient explanation of the outcome of the case where the ambitions are more case centric than theory oriented.

Explaining outcome process tracing is the most suitable type of process tracing for analysing the causal mechanisms for selected key organisational capacity changes of the SPOs. This type of process tracing can be thought of as a single outcome study defined as seeking the causes of the specific outcome in a single case (Gerring, 2006; in: Beach & Pedersen, 2013). Here the ambition is to craft a minimally sufficient explanation of a particular outcome, with sufficiency defined as an explanation that accounts for all of the important aspects of an outcome with no redundant parts being present (Mackie, 1965).

Explaining outcome process tracing is an iterative research strategy that aims to trace the complex conglomerate of systematic and case specific causal mechanisms that produced the outcome in question. The explanation cannot be detached from the particular case. Explaining outcome process tracing refers to case studies whose primary ambition is to explain particular historical outcomes, although the findings of the case can also speak to other potential cases of the phenomenon. Explaining outcome process tracing is an iterative research process in which ‘theories’ are tested to see whether they can provide a minimally sufficient explanation of the outcome. Minimal sufficiency is defined as an explanation that accounts for an outcome, with no redundant parts. In most explaining outcome studies, existing theorisation cannot provide a sufficient explanation, resulting in a second stage in which existing theories are re-conceptualised in light of the evidence gathered in the preceding empirical analysis. The conceptualisation phase in explaining outcome process tracing is therefore an iterative research process, with initial mechanisms re-conceptualised and tested until the result is a theorised mechanism that provides a minimally sufficient explanation of the particular outcome.

Below a description is provided of how SPOs are selected for process tracing, and a description is provided on how this process tracing is to be carried out. Note that this description of process tracing provides not only information on the extent to which the changes in organisational development can be attributed to MFS II (evaluation question 2), but also provides information on other contributing factors and actors (evaluation question 4). Furthermore, it must be noted that the evaluation team has developed an adapted form of ‘explaining outcome process tracing’, since the data collection and analysis was an iterative process of research so as to establish the most realistic explanation for a particular outcome/ organisational capacity change. Below selection of SPOs for process tracing as well as the different steps involved for process tracing in the selected SPOs, are further explained.

Selection of SPOs for 5C process tracing

Process tracing is a very intensive methodology that is very time and resource consuming (for development and analysis of one final detailed causal map, it takes about 1-2 weeks in total, for different members of the evaluation team). It has been agreed upon during the synthesis workshop on 17-18 June 2013 that only a selected number of SPOs will take part in this process tracing for the purpose of understanding the attribution question. The selection of SPOs is based on the following criteria:

- MFS II support to the SPO has not ended before 2014 (since this would leave us with too small a time difference between intervention and outcome);
- Focus is on the 1-2 capabilities that are targeted most by CFAs in a particular country;
- Both the SPO and the CFA are targeting the same capability, and preferably aim for similar outcomes;
- Maximum one SPO per CFA per country will be included in the process tracing.

The intention was to focus on about 30-50% of the SPOs involved. Please see the tables below for a selection of SPOs per country. Per country, a first table shows the extent to which a CFA targets the five capabilities, which is used to select the capabilities to focus on. A second table presents which SPO is selected, and takes into consideration the selection criteria as mentioned above.

ETHIOPIA

For Ethiopia the capabilities that are mostly targeted by CFAs are the capability to act and commit and the capability to adapt and self-renew. See also the table below.

Table 1

The extent to which the Dutch NGO explicitly targets the following capabilities – Ethiopia

Capability to:	AMREF	CARE	ECFA	FSCE	HOA-REC	HUND-EE	NVEA	OSRA	TTCA
Act and commit	5	4	5	5	5	3	4	4	3
Deliver on development objectives	2	1	1	1	2	1	1	2	1
Adapt and self-renew	4	2	3	4	2	5	3	3	3
Relate	3	1	2	2	3	2	1	3	1
Achieve coherence	2	2	1	1	1	1	1	1	1

Note: Number 1 stands for not targeted, 5 for intensively targeted. These scores are relative scores for the interventions by the CFA to strengthen the capacity of the SPO. The scores are relative to each other, a higher score means that this capability gets more attention by the CFA compared to other capabilities.

Source: country baseline report, Ethiopia.

Below you can see the table describing when the contract with the SPO is to be ended, and whether both SPO and the CFA expect to focus on these two selected capabilities (with MFS II funding). Based on the above-mentioned selection criteria the following SPOs are selected for process tracing: AMREF, ECFA, FSCE, HUNDEE. In fact, six SPOs would be suitable for process tracing. We just selected the first one per CFA following the criteria of not including more than one SPO per CFA for process tracing

Table 2

SPOs selected for process tracing – Ethiopia

Ethiopia – SPOs	End of contract	Focus on capability to act and commit – by SPO	Focus on capability to act and commit – by CFA	Focus on capability to adapt and self-renew – by SPO	Focus on capability to adapt and self-renew – by CFA	CFA	Selected for process tracing
AMREF	Dec 2015	Yes	Yes	Yes	Yes	AMREF NL	Yes
CARE	Dec 31, 2015	Partly	Yes	Yes	Yes – slightly	CARE Netherlands	No - not fully matching
ECFA	Jan 2015	Yes	Yes	Yes	Yes	Child Helpline International	Yes
FSCE	Dec 2015	Yes	Yes	Yes	Yes	Stichting Kinderpostzegels Netherlands (SKN); Note: no info from Defence for Children – ECPAT Netherlands	Yes
HOA-REC	Sustainable Energy project (ICCO Alliance): 2014 Innovative WASH (WASH Alliance): Dec 2015	Yes	Yes	Yes	Yes - slightly	ICCO	No - not fully matching
HUNDEE	Dec 2014	Yes	Yes	Yes	Yes	ICCO & IICD	Yes
NVEA	Dec 2015 (both)	Yes	Yes	Yes	Yes	Edukans Foundation (under two consortia); Stichting Kinderpostzegels Netherlands (SKN)	Suitable but SKN already involved for process tracing FSCE
OSRA	C4C Alliance project (farmers marketing): December 2014 ICCO Alliance project (zero grazing): 2014 (2 nd phase)	Yes	Yes	Yes	Yes	ICCO & IICD	Suitable but ICCO & IICD already involved for process tracing - HUNDEE
TTCA	June 2015	Partly	Yes	No	Yes	Edukans Foundation	No - not fully matching

INDIA

For India the capability that is mostly targeted by CFAs is the capability to act and commit. The next one in line is the capability to adapt and self-renew. See also the table below in which a higher score means that the specific capability is more intensively targeted.

Table 3

The extent to which the Dutch NGO explicitly targets the following capabilities – India⁵

Capability to:	BVHA	COUNT	DRISTI	FFID	Jana Vikas	Samar thak Samiti	SMILE	SDS	VTRC
Act and commit	5	3	4	4	4	4	4	3	5
Deliver on development objectives	1	5	1	1	1	1	1	2	1
Adapt and self-renew	2	2	1	3	1	1	4	1	4
Relate	3	1	1	1	1	1	2	1	2
Achieve coherence	1	1	1	4	1	1	1	1	2

Note: Number 1 stands for not targeted, 5 for intensively targeted. These scores are relative scores for the interventions by the CFA to strengthen the capacity of the SPO. The scores are relative to each other, a higher score means that this capability gets more attention by the CFA compared to other capabilities.

Source: country baseline report, India.

Below you can see a table describing when the contract with the SPO is to be ended and whether SPO and the CFA both expect to focus on these two selected capabilities (with MFS II funding). Based on the above-mentioned selection criteria the following SPOs are selected for process tracing: BVHA, COUNT, FFID, SMILE and VTRC. Except for SMILE (capability to act and commit only), for the other SPOs the focus for process tracing can be on the capability to act and commit and on the capability to adapt and self-renew.

Table 4

SPOs selected for process tracing – India

India – SPOs	End of contract	Focus on capability to act and commit – by SPO	Focus on capability to act and commit – by CFA	Focus on capability to adapt and self-renew – by SPO	Focus on capability to adapt and self-renew – by CFA	CFA	Selected for process tracing
BVHA	2014	Yes	Yes	Yes	Yes	Simavi	Yes; both capabilities
COUNT	2015	Yes	Yes	Yes	Yes	Woorden Daad	Yes; both capabilities
DRISTI	31-03-2012	Yes	Yes	No	no	Hivos	No - closed in 2012
FFID	30-09-2014	Yes	Yes	Yes	Yes	ICCO	Yes

⁵ RGVN, NEDSF and Women's Rights Forum (WRF) could not be reached timely during the baseline due to security reasons. WRF could not be reached at all. Therefore these SPOs are not included in Table 1.

India – SPOs	End of contract	Focus on capability to act and commit – by SPO	Focus on capability to act and commit – by CFA	Focus on capability to adapt and self-renew – by SPO	Focus on capability to adapt and self-renew – by CFA	CFA	Selected for process tracing
Jana Vikas	2013	Yes	Yes	Yes	No	Cordaid	No - contract is and the by now; not fully matching focus
NEDSF							No – delayed baseline
RGVN							No - delayed baseline
Samarthak Samiti (SDS)	2013 possibly longer	Yes	Yes	Yes	No	Hivos	No - not certain of end date and not fully matching focus
Shivi Development Society (SDS)	Dec 2013 intention 2014	Yes	Yes	Yes	No	Cordaid	No - not fully matching focus
Smile	2015	Yes	Yes	Yes	Yes	Wilde Ganzen	Yes; first capability only
VTRC	2015	Yes	Yes	Yes	Yes	Stichting Red een Kind	Yes; both capabilities

INDONESIA

For Indonesia the capabilities that are most frequently targeted by CFAs are the capability to act and commit and the capability to adapt and self-renew. See also the table below.

Table 5

The extent to which the Dutch NGO explicitly targets the following capabilities – Indonesia

Capability to:	ASB	Daya kologi	ECPAT	GSS	Lem baga Kita	Pt. PPM/A	Rifka Annisa	WIIP	Yad upa	Yayasan Kelola	YPI	YRBI
Act and commit	4	4	4	5	4	4	5	3	3	2	5	4
Deliver on development objectives	1	1	1	2	2	1	2	1	1	1	1	1
Adapt and self-renew	3	1	2	4	2	3	4	4	1	1	4	3
Relate	1	1	2	3	3	2	1	2	2	2	3	2
Achieve coherence	1	1	1	2	1	1	2	2	1	1	2	1

Note: Number 1 stands for not targeted, 5 for intensively targeted. These scores are relative scores for the interventions by the CFA to strengthen the capacity of the SPO. The scores are relative to each other, a higher score means that this capability gets more attention by the CFA compared to other capabilities.

Source: country baseline report, Indonesia.

The table below describes when the contract with the SPO is to be ended and whether both SPO and the CFA expect to focus on these two selected capabilities (MFS II funding). Based on the above-mentioned selection criteria the following SPOs are selected for process tracing: ASB, ECPAT, Pt.PPMA, YPI, YRBI.

Table 6
SPOs selected for process tracing – Indonesia

Indonesia – SPOs	End of contract	Focus on capability to act and commit – by SPO	Focus on capability to act and commit – by CFA	Focus on capability to adapt and self-renew – by SPO	Focus on capability to adapt and self-renew – by CFA	CFA	Selected for process tracing
ASB	February 2012; extension Feb,1, 2013 – June,30, 2016	Yes	Yes	Yes	Yes	Hivos	Yes
Dayakologi	2013; no extension	Yes	Yes	Yes	No	Cordaid	No: contract ended early and not matching enough
ECPAT	August 2013; Extension Dec 2014	Yes	Yes	Yes, a bit	Yes	Free Press Unlimited - Mensen met een Missie	Yes
GSS	31 December 2012; no extension	Yes	Yes	Yes, a bit	Yes	Free Press Unlimited - Mensen met een Missie	No: contract ended early
Lembaga Kita	31 December 2012; no extension	Yes	Yes	No	Yes	Free Press Unlimited - Mensen met een Missie	No - contract ended early
Pt.PPMA	May 2015	Yes	Yes	No	Yes	IUCN	Yes, capability to act and commit only
Rifka Annisa	Dec, 31 2015	No	Yes	No	Yes	Rutgers WPF	No - no match between expectations CFA and SPO
WIIP	Dec 2015	Yes	Not MFS II	Yes	Not MFS II	Red Cross	No - Capacity development interventions are not MFS II financed. Only some overhead is MFS II

Indonesia – SPOs	End of contract	Focus on capability to act and commit – by SPO	Focus on capability to act and commit – by CFA	Focus on capability to adapt and self-renew – by SPO	Focus on capability to adapt and self-renew – by CFA	CFA	Selected for process tracing
Yayasan Kelola	Dec 30, 2013; extension of contract being processed for two years (2014-2015)	Yes	Not really	Yes	Not really	Hivos	No - no specific capacity development interventions planned by Hivos
YPI	Dec 31, 2015	Yes	Yes	Yes	Yes	Rutgers WPF	Yes
YRBI	Oct, 30, 2013; YRBI end of contract from 31st Oct 2013 to 31st Dec 2013. Contract extension proposal is being proposed to MFS II, no decision yet.	Yes	Yes	Yes	Yes	ICCO	Yes
Yadupa	Under negotiation during baseline; new contract 2013 until now	Yes	Nothing committed	Yes	Nothing committed	IUCN	No, since nothing was committed by CFA

LIBERIA

For Liberia the situation is arbitrary which capabilities are targeted most CFA's. Whilst the capability to act and commit is targeted more often than the other capabilities, this is only so for two of the SPOs. The capability to adapt and self-renew and the capability to relate are almost equally targeted for the five SPOs, be it not intensively. Since the capability to act and commit and the capability to adapt and self-renew are the most targeted capabilities in Ethiopia, India and Indonesia, we choose to focus on these two capabilities for Liberia as well. This would help the synthesis team in the further analysis of these capabilities related to process tracing. See also the table below.

Table 7

The extent to which the Dutch NGO explicitly targets the following capabilities – Liberia

Capability to:	BSC	DEN-L	NAWOCOL	REFOUND	RHRAP
Act and commit	5	1	1	1	3
Deliver on development objectives	3	1	1	1	1
Adapt and self-renew	2	2	2	2	2
Relate	1	2	2	2	2
Achieve coherence	1	1	1	1	1

Note: Number 1 stands for not targeted, 5 for intensively targeted. These scores are relative scores for the interventions by the CFA to strengthen the capacity of the SPO. The scores are relative to each other, a higher score means that this capability gets more attention by the CFA compared to other capabilities.

Source: country baseline report, Liberia.

Below you can see the table describing when the contract with the SPO is to be ended, and whether both SPO and the CFA expect to focus on these two selected capabilities (with MFS II funding). Also, for two of the five SPOs capability to act and commit is targeted more intensively compared to the other capabilities. Based on the above-mentioned selection criteria the following SPOs are selected for process tracing: BSC and RHRAP.

Table 8

SPOs selected for process tracing – Liberia

Liberia – SPOs	End of contract	Focus on capability to act and commit – by SPO	Focus on capability to act and commit – by CFA	Focus on capability to adapt and self-renew – by SPO	Focus on capability to adapt and self-renew – by CFA	CFA	Selected for process tracing
BSC	Dec 31, 2015	Yes	Yes	Yes	Yes	SPARK	Yes
DEN-L	2014	No	No	Unknown	A little	ICCO	No – not matching enough
NAWOCOL	2014	Yes	No	No	A little	ICCO	No – not matching enough
REFOUND	At least until 2013 (2015?)	Yes	No	Yes	A little	ICCO	No – not matching enough
RHRAP	At least until 2013 (2014?)	Yes	Yes	Yes	Yes	ICCO	Yes

Key steps in process tracing for the 5C study

In the box below you will find the key steps developed for the 5C process tracing methodology. These steps will be further explained here. Only key staff of the SPO is involved in this process: management; programme/ project staff; and monitoring and evaluation staff, and other staff that could provide information relevant to the identified outcome area/key organisational capacity change. Those SPOs selected for process tracing had a separate endline workshop, in addition to the ' general endline workshop. This workshop was carried out after the initial endline workshop and the interviews during the field visit to the SPO. Where possible, the general and process tracing endline workshop have been held consecutively, but where possible these workshops were held at different points in time, due to the complex design of the process. Below the detailed steps for the purpose of process tracing are further explained.

Key steps in process tracing for the 5C study

1. Identify the planned MFS II supported capacity development interventions within the selected capabilities (capability to act and commit and capability to adapt and self-renew) – CDI team
2. Identify the implemented MFS II supported capacity development interventions within the selected capabilities (capability to act and commit and capability to adapt and self-renew) – CDI team
3. Identify initial changes/ outcome areas in these two capabilities – CDI team & in-country team
4. Construct the detailed, initial causal map (theoretical model of change) – CDI team & in-country team
5. Identify types of evidence needed to verify or discard different causal relationships in the model of change – in-country teams, with support from CDI team
6. Collect data to verify or discard causal mechanisms and construct workshop based, detailed causal map (model of change) – in-country team
7. Assess the quality of data and analyse data and develop final detailed causal map (model of change) – in-country team with CDI team
8. Analyse and conclude on findings– CDI team, in collaboration with in-country team

Some definitions of the terminology used for this MFS II 5c evaluation

Based upon the different interpretations and connotations the use of the term causal mechanism we use the following terminology for the remainder of this paper:

A **detailed causal map** (or **model of change**) = the representation of all possible explanations – causal pathways for a change/ outcome. These pathways are that of the intervention, rival pathways and pathways that combine parts of the intervention pathway with that of others. This also depicts the reciprocity of various events influencing each other and impacting the overall change.

A **causal mechanism** = is the combination of parts that ultimately explains an outcome. Each part of the mechanism is an individually insufficient but necessary factor in a whole mechanism, which together produce the outcome (Beach and Pedersen, 2013, p. 176).

Part or **cause** = one actor with its attributes carrying out activities/ producing outputs that lead to change in other parts. The final part or cause is the change/ outcome.

Attributes of the actor = specificities of the actor that increase his chance to introduce change or not such as its position in its institutional environment.

*Step 1. Identify the **planned MFS II supported capacity development interventions** within the selected capabilities (capability to act and commit and capability to adapt and self-renew) – CDI team*

Chapter 4.1 and 4.2 in the baseline report were reviewed. Capacity development interventions as planned by the CFA for the capability to act and commit and for the capability to adapt and self-renew were described and details inserted in the summary format. This provided an overview of the capacity development activities that were originally planned by the CFA for these two capabilities and assisted in focusing on relevant outcomes that are possibly related to the planned interventions.

*Step 2. Identify the **implemented capacity development interventions** within the selected capabilities (capability to act and commit and capability to adapt and self-renew) – CDI team*

The input from the CFA was reviewed in terms of what capacity development interventions have taken place in the MFS II period. This information was found in the 'Support to capacity development sheet - endline - CFA perspective' for the SPO, based on details provided by the CFA and further discussed during an interview by the CDI team.

The CFA was asked to describe all the MFS II supported capacity development interventions of the SPO that took place during the period 2011 up to now. The CDI team reviewed this information, not only the interventions but also the observed changes as well as the expected long-term changes, and then linked these interventions to relevant outcomes in one of the capabilities (capability to act and commit; and capability to adapt and self-renew).

*Step 3. Identify **initial changes/ outcome areas** in these two capabilities – by CDI team & in-country team*

The CDI team was responsible for coding documents received from SPO and CFA in NVivo on the following:

- **5C Indicators:** this was to identify the changes that took place between baseline and endline. This information was coded in Nvivo.
- Information related to the **capacity development interventions implemented by the CFA** (with MFS II funding) (see also Step 2) to strengthen the capacity of the SPO. For example, the training on financial management of the SPO staff could be related to any information on financial management of the SPO. This information was coded in Nvivo.

In addition, the response by the CFA to the changes in 5C indicators format, was auto-coded.

The in-country team was responsible for timely collection of information from the SPO (before the fieldwork starts). This set of information dealt with:

- MFS II supported capacity development interventions during the MFS II period (2011 until now).
- Overview of all trainings provided in relation to a particular outcome areas/organisational capacity change since the baseline.
- For each of the identified MFS II supported trainings, training questionnaires have been developed to assess these trainings in terms of the participants, interests, knowledge and skills gained, behaviour change and changes in the organisation (based on Kirkpatrick's model), one format for training participants and one for their managers. These training questionnaires were sent prior to the field visit.
- Changes expected by SPO on a long-term basis ('Support to capacity development sheet - endline - SPO perspective').

For the selection of change/ outcome areas the following criteria were important:

- The change/ outcome area is in one of the two capabilities selected for process tracing: capability to act and commit or the capability to adapt and self-renew. This was the first criteria to select upon.
- There was a likely link between the key organisational capacity change/ outcome area and the MFS II supported capacity development interventions. This also was an important criteria. This would need to be demonstrated through one or more of the following situations:

- In the 2012 theory of change on organisational capacity development of the SPO a link was indicated between the outcome area and MFS II support;
- During the baseline the CFA indicated a link between the planned MFS II support to organisational development and the expected short-term or long-term results in one of the selected capabilities;
- During the endline the CFA indicated a link between the implemented MFS II capacity development interventions and observed short-term changes and expected long-term changes in the organisational capacity of the SPO in one of the selected capabilities;
- During the endline the SPO indicated a link between the implemented MFS II capacity development interventions and observed short-term changes and expected long-term changes in the organisational capacity of the SPO in one of the selected capabilities.

Reviewing the information obtained as described in Step 1, 2, and 3 provided the basis for selecting key organisational capacity change/ outcome areas to focus on for process tracing. These areas were to be formulated as broader outcome areas, such as 'improved financial management', 'improved monitoring and evaluation' or 'improved staff competencies'.

Note: the outcome areas were to be formulated as intermediates changes. For example: an improved monitoring and evaluation system, or enhanced knowledge and skills to educate the target group on climate change. Key outcome areas were also verified - based on document review as well as discussions with the SPO during the endline.

*Step 4. Construct the **detailed, initial causal map** (theoretical model of change) – CDI & in-country team*

A detailed initial causal map was developed by the CDI team, in collaboration with the in-country team. This was based on document review, including information provided by the CFA and SPO on MFS II supported capacity development interventions and their immediate and long-term objectives as well as observed changes. Also, the training questionnaires were reviewed before developing the initial causal map. This detailed initial causal map was to be provided by the CDI team with a visual and related narrative with related references. This initial causal map served as a reference point for further reflection with the SPO during the process tracing endline workshop, where relationships needed to be verified or new relationships established so that the second (workshop-based), detailed causal map could be developed, after which further verification was needed to come up with the final, concluding detailed causal map.

It's important to note that organisational change area/ outcome areas could be both positive and negative.

For each of the selected outcomes the team needed to make explicit the theoretical model of change. This meant finding out about the range of different actors, factors, actions, and events etc. that have contributed to a particular outcome in terms of organisational capacity of the SPO.

A model of change of good quality includes:

- The causal pathways that relate the intervention to the realised change/ outcome;
- Rival explanations for the same change/ outcome;
- Assumptions that clarify relations between different components or parts;
- Case specific and/or context specific factors or risks that might influence the causal pathway, such as for instance the socio-cultural-economic context, or a natural disaster;
- Specific attributes of the actors e.g. CFA and other funders.

A model of change (within the 5C study called a 'detailed causal map') is a complex system which produces intermediate and long-term outcomes by the interaction of other parts. It consists of parts or causes that often consist of one actor with its attributes that is implementing activities leading to change in other parts (Beach & Pedersen, 2013). A helpful way of constructing the model of change is to think in terms of actors carrying out activities that lead to other actors changing their behaviour.

The model of change can be explained as a range of activities carried out by different *actors* (including the CFA and SPO under evaluation) that will ultimately lead to an outcome. Besides this, there are also '*structural*' elements, which are to be interpreted as external factors (such as economic conjuncture); and *attributes* of the actor (does the actor have the legitimacy to ask for change or not, what is its position in the sector) that should be looked at (Beach & Pedersen, 2013). In fact Beach and Pedersen, make a fine point about the subjectivity of the actor in a dynamic context. This means, in qualitative methodologies, capturing the changes in the actor, acted upon area or person/organisation, in a non sequential and non temporal format. Things which were done recently could have corrected behavioural outcomes of an organisation and at the same time there could be processes which incrementally pushed for the same change over a period of time. Beach and Pedersen espouse this methodology because it captures change in a dynamic fashion as against the methodology of logical framework. For the MFS II evaluation it was important to make a distinction between those paths in the model of change that are the result of MFS II and rival pathways.

The construction of the model of change started with the identified key organisational capacity change/ outcome, followed by an inventory of all possible subcomponents that possibly have caused the change/ outcome in the MFS II period (2011-up to now, or since the baseline). The figure below presents an imaginary example of a model of change. The different colours indicate the different types of support to capacity development of the SPO by different actors, thereby indicating different pathways of change, leading to the key changes/ outcomes in terms of capacity development (which in this case indicates the ability to adapt and self-renew).

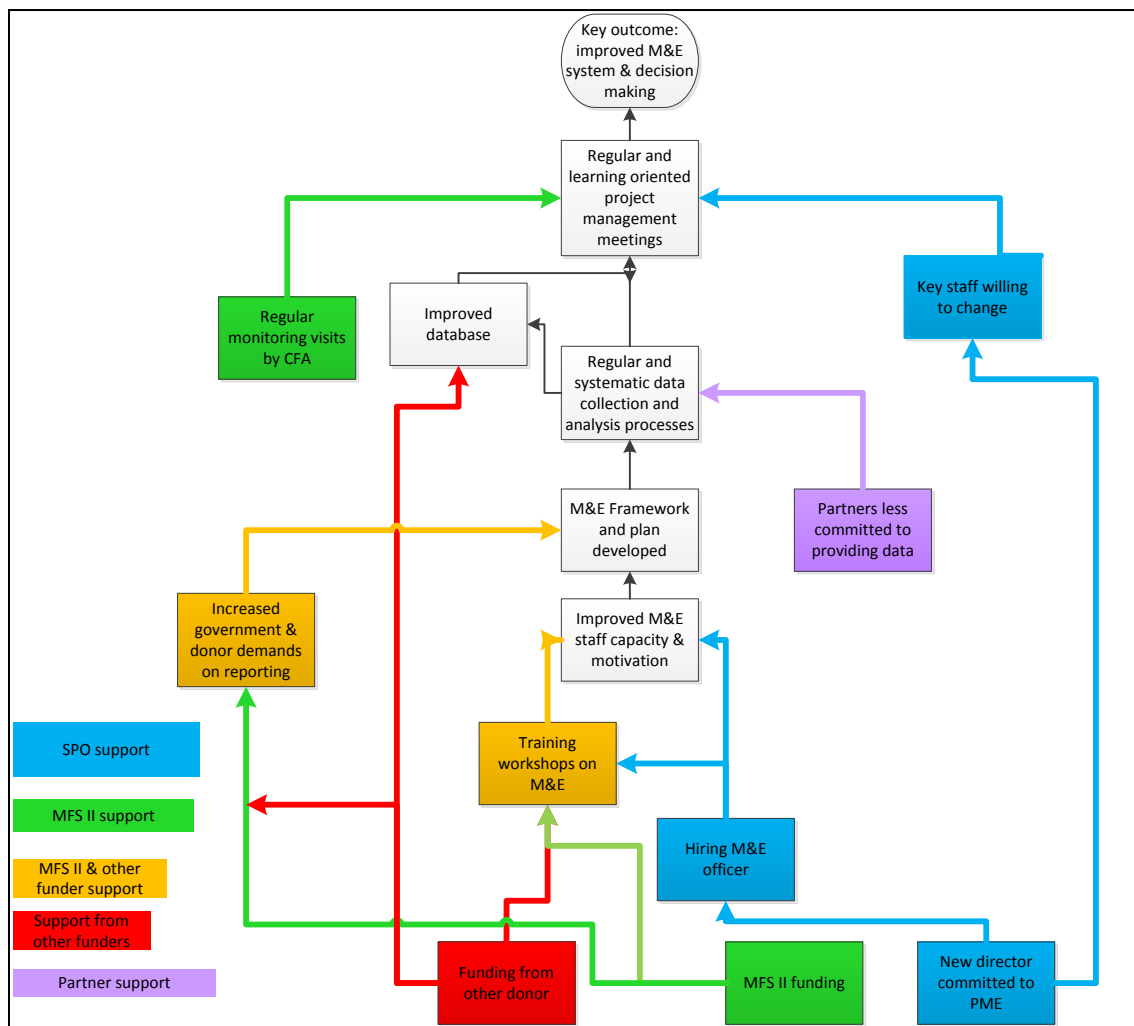

Figure 1 An imaginary example of a model of change

*Step 5. Identify **types of evidence** needed to verify or discard different causal relationships in the model of change – in-country teams with support from CDI team*

Once the causal mechanism at theoretical level were defined, empirical evidence was collected so as to verify or discard the different parts of this theoretical model of change, confirm or reject whether subcomponents have taken place, and to find evidence that confirm or reject the causal relations between the subcomponents.

A key question that we needed to ask ourselves was, “*What information do we need in order to confirm or reject that one subcomponent leads to another, that X causes Y?*”. The evaluation team needed to agree on what information was needed that provides empirical manifestations for each part of the model of change.

There are four distinguishable types of evidence that are relevant in process tracing analysis: *pattern, sequence, trace, and account*. Please see the box below for descriptions of these types of evidence.

The evaluation team needed to agree on the types of evidence that was needed to verify or discard the manifestation of a particular part of the causal mechanism. Each one or a combination of these different types of evidence could be used to confirm or reject the different parts of the model of change. This is what is meant by robustness of evidence gathering. Since causality as a concept can bend in many ways, our methodology, provides a near scientific model for accepting and rejecting a particular type of evidence, ignoring its face value.

Types of evidence to be used in process tracing

Pattern evidence relates to predictions of statistical patterns in the evidence. For example, in testing a mechanism of racial discrimination in a case dealing with employment, statistical patterns of employment would be relevant for testing this part of the mechanism.

Sequence evidence deals with the temporal and spatial chronology of events predicted by a hypothesised causal mechanism. For example, a test of the hypothesis could involve expectations of the timing of events where we might predict that if the hypothesis is valid, we should see that the event B took place after event A took place. However, if we found that event B took place before event A took place, the test would suggest that our confidence in the validity of this part of the mechanism should be reduced (disconfirmation/ falsification).

Trace evidence is evidence whose mere existence provides proof that a part of a hypothesised mechanism exists. For example, the existence of the minutes of a meeting, if authentic ones, provide strong proof that the meeting took place.

Account evidence deals with the content of empirical material, such as meeting minutes that detail what was discussed or an oral account of what took place in the meeting.

Source: Beach and Pedersen, 2013

Below you can find a table that provides guidelines on what to look for when identifying types of evidence that can confirm or reject causal relationships between different parts/ subcomponents of the model of change. It also provides one example of a part of a causal pathway and what type of information to look for.

Table 9

Format for identifying types of evidence for different causal relationships in the model of change (example included)

Part of the model of change	Key questions	Type of evidence needed	Source of information
Describe relationship between the subcomponents of the model of change	Describe questions you would like to answer so as to find out whether the components in the relationship took place, when they took place, who was involved, and whether they are related	Describe the information that we need in order to answer these questions. Which type of evidence can we use in order to reject or confirm that subcomponent X causes subcomponent Y? Can we find this information by means of : Pattern evidence; Sequence evidence; Trace evidence; Account evidence?	Describe where you can find this information
Example: Training workshops on M&E provided by MFS II funding and other sources of funding	Example: What type of training workshops on M&E took place? Who was trained? When did the training take place? Who funded the training? Was the funding of training provided before the training took place? How much money was available for the training?	Example: Trace evidence: on types of training delivered, who was trained, when the training took place, budget for the training Sequence evidence on timing of funding and timing of training Content evidence: what the training was about	Example: Training report SPO Progress reports Interviews with the CFA and SPO staff Financial reports SPO and CFA

Please note that for practical reasons, the 5C evaluation team decided that it was easier to integrate the specific questions in the narrative of the initial causal map. These questions would need to be addressed by the in-country team during the process tracing workshop so as to discover, verify or discard particular causal mechanisms in the detailed, initial causal map. Different types of evidence was asked for in these questions.

*Step 6. **Collect data** to verify or discard causal mechanisms and develop workshop-based, detailed causal map – in-country team*

Once it was decided by the in-country and CDI evaluation teams what information was to be collected during the interaction with the SPO, data collection took place. The initial causal maps served as a basis for discussions during the endline workshop with a particular focus on process tracing for the identified organisational capacity changes. But it was considered to be very important to understand from the perspective of the SPO how they understood the identified key organisational capacity change/outcome area has come about. A new detailed, workshop-based causal map was developed that included the information provided by SPO staff as well as based on initial document review as described in the initial detailed causal map. This information was further analysed and verified with other relevant information so as to develop a final causal map, which is described in the next step.

*Step 7. **Assess the quality of data and analyse data**, and develop the final detailed causal map (model of change) – in-country team and CDI team*

Quality assurance of the data collected and the evidence it provides for rejecting or confirming parts of causal explanations are a major concern for many authors specialised in contribution analysis and process-tracing. Stern et al. (2012), Beach and Pedersen (2013), Lemire, Nielsen and Dybdal (2012), Mayne (2012) and Delahais and Toulemonde (2012) all emphasise the need to make attribution/contribution claims that are based on pieces of evidence that are rigorous, traceable, and credible. These pieces of evidence should be as explicit as possible in proving that *subcomponent X causes*

subcomponent Y and ruling out other explanations. Several tools are proposed to check the nature and the quality of data needed. One option is, Delahais and Toulemonde's Evidence Analysis Database, which we have adapted for our purpose.

Delahais and Toulemonde (2012) propose an Evidence Analysis Database that takes into consideration three criteria:

- Confirming/ rejecting a causal relation (yes/no);
- Type of causal mechanism: intended contribution/ other contribution/ condition leading to intended contribution/ intended condition to other contribution/ feedback loop;
- Strength of evidence: strong/ rather strong/ rather weak/ weak.

We have adapted their criteria to our purpose. The in-country team, in collaboration with the CDI team, used the criteria in assessing whether causal relationships in the causal map, were strong enough. This has been more of an iterative process trying to find additional evidence for the established relationships through additional document review or contacting the CFA and SPO as well as getting their feedback on the final detailed causal map that was established. Whilst the form below has not been used exactly in the manner depicted, it has been used indirectly when trying to validate the information in the detailed causal map. After that, the final detailed causal map is established both as a visual as well as a narrative, with related references for the established causal relations.

<i>Example format for the adapted evidence analysis database (example included)</i> Description of causal relation	Confirming/ rejecting a causal relation (yes/ no)	Type of information providing the background to the confirmation or rejection of the causal relation	Strength of evidence: strong/ rather strong/ rather weak/ weak	Explanation for why the evidence is (rather) strong or (rather) weak, and therefore the causal relation is confirmed/ rejected
e.g. Training staff in M&E leads to enhanced M&E knowledge, skills and practice	e.g. Confirmed	e.g. Training reports confirmed that staff are trained in M&E and that knowledge and skills increased as a result of the training		

Step 8. Analyse and conclude on findings– in-country team and CDI team

The final detailed causal map was described as a visual and narrative and this was then analysed in terms of the evaluation question two and evaluation question four: *“To what degree are the changes identified in partner capacity attributable to development interventions undertaken by the MFS II consortia (i.e. measuring effectiveness)?”* and *“What factors explain the findings drawn from the questions above?”* It was analysed to what extent the identified key organisational capacity change can be attributed to MFS II supported capacity development interventions as well as to other related factors, interventions and actors.

1.4 Explaining factors – evaluation question 4

This paragraph describes the data collection and analysis methodology for answering the fourth evaluation question: “**What factors explain the findings drawn from the questions above?**”

In order to explain the changes in organisational capacity development between baseline and endline (evaluation question 1) the CDI and in-country evaluation teams needed to review the indicators and how they have changed between baseline and endline and what reasons have been provided for this. This has been explained in the first section of this appendix. It has been difficult to find detailed explanations for changes in each of the separate 5c indicators, but the 'general causal map' has provided some ideas about some of the key underlying factors actors and interventions that influence the key organisational capacity changes, as perceived by the SPO staff.

For those SPOs that are selected for process tracing (evaluation question 2), more in-depth information was procured for the identified key organisational capacity changes and how MFS II supported capacity development interventions as well as other actors, factors and interventions have influenced these changes. This is integrated in the process of process tracing as described in the section above.

1.5 Methodological reflection

Below a few methodological reflections are made by the 5C evaluation team.

Use of the 5 core capabilities framework and qualitative approach: this has proven to be a very useful framework to assess organisational capacity. The five core capabilities provide a comprehensive picture of the capacity of an organisation. The capabilities are interlinked, which was also reflected in the description of standard indicators, that have been developed for the purpose of this 5C evaluation and agreed upon for the eight countries. Using this framework with a mainly qualitative approach has provided rich information for the SPOs and CFAs, and many have indicated this was a useful learning exercise.

Using standard indicators and scores: using standard indicators is useful for comparison purposes. However, the information provided per indicator is very specific to the SPO and therefore makes comparison difficult. Whilst the description of indicators has been useful for the SPO and CFA, it is questionable to what extent indicators can be compared across SPOs since they need to be seen in context, for them to make meaning. In relation to this, one can say that scores that are provided for the indicators, are only relative and cannot show the richness of information as provided in the indicator description. Furthermore, it must be noted that organisations are continuously changing and scores are just a snapshot in time. There cannot be perfect score for this. In hindsight, having rubrics would have been more useful than scores.

General causal map: whilst this general causal map, which is based on key organisational capacity changes and related causes, as perceived by the SPO staff present at the endline workshop, has not been validated with other sources of information except SPO feedback, the 5C evaluation team considers this information important, since it provides the SPO story about how and which changes in the organisation since the baseline, are perceived as being important, and how these changes have come about. This will provide information additional to the information that has been validated when analysing and describing the indicators as well as the information provided through process tracing (selected SPOs). This has proven to be a learning experience for many SPOs.

Using process tracing for dealing with the attribution question: this theory-based and mainly qualitative approach has been chosen to deal with the attribution question, on how the organisational capacity changes in the organisations have come about and what the relationship is with MFS II supported capacity development interventions and other factors. This has proven to be a very useful process, that provided a lot of very rich information. Many SPOs and CFAs have already indicated that they appreciated the richness of information which provided a story about how identified organisational

capacity changes have come about. Whilst this process was intensive for SPOs during the process tracing workshops, many appreciated this to be a learning process that provided useful information on how the organisation can further develop itself. For the evaluation team, this has also been an intensive and time-consuming process, but since it provided rich information in a learning process, the effort was worth it, if SPOs and CFAs find this process and findings useful.

A few remarks need to be made:

- Outcome explaining process tracing is used for this purpose, but has been adapted to the situation since the issues being looked at were very complex in nature.
- Difficulty of verifying each and every single change and causal relationship:
- Intensity of the process and problems with recall: often the process tracing workshop was done straight after the general endline workshop that has been done for all the SPOs. In some cases, the process tracing endline workshop has been done at a different point in time, which was better for staff involved in this process, since process tracing asks people to think back about changes and how these changes have come about. The word difficulties with recalling some of these changes and how they have come about. See also the next paragraph.
- Difficulty of assessing changes in knowledge and behaviour: training questionnaire is have been developed, based on Kirkpatrick's model and were specifically tailored to identify not only the interest but also the change in knowledge and skills, behaviour as well as organisational changes as a result of a particular training. The retention ability of individuals, irrespective of their position in the organisation, is often unstable. The 5C evaluation team experienced that it was difficult for people to recall specific trainings, and what they learned from those trainings. Often a change in knowledge, skills and behaviour is a result brought about by a combination of different factors, rather than being traceable to one particular event. The detailed causal maps that have been established, also clearly pointed this. There are many factors at play that make people change their behaviour, and this is not just dependent on training but also internal/personal (motivational) factors as well as factors within the organisation, that stimulate or hinder a person to change behaviour. Understanding how behaviour change works is important when trying to really understand the extent to which behaviour has changed as a result of different factors, actors and interventions. Organisations change because people change and therefore understanding when and how these individuals change behaviour is crucial. Also attrition and change in key organisational positions can contribute considerably to the outcome.

Utilisation of the evaluation

The 5C evaluation team considers it important to also discuss issues around utility of this evaluation. We want to mention just a few.

Design – mainly externally driven and with a focus on accountability and standard indicators and approaches within a limited time frame, and limited budget: this MFS II evaluation is originally based on a design that has been decided by IOB (the independent evaluation office of the Dutch Ministry of Foreign Affairs) and to some extent MFS II organisations. The evaluators have had no influence on the overall design and sampling for the 5C study. In terms of learning, one may question whether the most useful cases have been selected in this sampling process. The focus was very much on a rigorous evaluation carried out by an independent evaluation team. Indicators had to be streamlined across countries. The 5C team was requested to collaborate with the other 5C country teams (Bangladesh, Congo, Pakistan, Uganda) to streamline the methodological approach across the eight sampled countries. Whilst this may have its purpose in terms of synthesising results, the 5C evaluation team has also experienced the difficulty of tailoring the approach to the specific SPOs. The overall evaluation has been mainly accountability driven and was less focused on enhancing learning for improvement. Furthermore, the timeframe has been very small to compare baseline information (2012) with endline information (2014). Changes in organisational capacity may take a long, particularly if they are related to behaviour change. Furthermore, there has been limited budget to carry out the 5C evaluation. For all the four countries (Ethiopia, India, Indonesia, Liberia) that the Centre for Development Innovation, Wageningen University and Research centre has been involved in, the budget has been overspent.

However, the 5C evaluation team has designed an endline process whereby engagement of staff, e.g. in a workshop process was considered important, not only due to the need to collect data, but also to generate learning in the organisation. Furthermore, having general causal maps and detailed causal maps generated by process tracing have provided rich information that many SPOs and CFAs have already appreciated as useful in terms of the findings as well as a learning process.

Another issue that must be mentioned is that additional requests have been added to the country teams during the process of implementation: developing a country based synthesis; questions on design, implementation, and reaching objectives of MFS II funded capacity development interventions, whilst these questions were not in line with the core evaluation questions for the 5C evaluation.

Complexity and inadequate coordination and communication: many actors, both in the Netherlands, as well as in the eight selected countries, have been involved in this evaluation and their roles and responsibilities, were often unclear. For example, 19 MFS II consortia, the internal reference group, the Ministry of Foreign Affairs, Partos, the Joint Evaluation Trust, NWO-Wotro, the evaluators (Netherlands and in-country), 2 external advisory committees, and the steering committee. Not to mention the SPO's and their related partners and consultants. CDI was involved in 4 countries with a total number of 38 SPOs and related CFAs. This complexity influenced communication and coordination, as well as the extent to which learning could take place. Furthermore, there was a distance between the evaluators and the CFAs, since the approach had to be synchronised across countries, and had to adhere to strict guidelines, which were mainly externally formulated and could not be negotiated or discussed for the purpose of tailoring and learning. Feedback on the final results and report had to be provided mainly in written form. In order to enhance utilisation, a final workshop at the SPO to discuss the findings and think through the use with more people than probably the one who reads the report, would have more impact on organisational learning and development. Furthermore, feedback with the CFAs has also not been institutionalised in the evaluation process in the form of learning events. And as mentioned above, the complexity of the evaluation with many actors involved did not enhance learning and thus utilization.

5C Endline process, and in particular thoroughness of process tracing often appreciated as learning process: The SPO perspective has also brought to light a new experience and technique of self-assessment and self-corrective measures for managers. Most SPOs whether part of process tracing or not, deeply appreciated the thoroughness of the methodology and its ability to capture details with robust connectivity. This is a matter of satisfaction and learning for both evaluators and SPOs. Having a process whereby SPO staff were very much engaged in the process of self-assessment and reflection has proven for many to be a learning experience for many, and therefore have enhanced utility of the 5C evaluation.

Appendix 2 Background information on the five core capabilities framework

The 5 capabilities (5C) framework was to be used as a framework for the evaluation of capacity development of Southern Partner Organisations (SPOs) of the MFS II consortia. The 5C framework is based on a five-year research program on 'Capacity, change and performance' that was carried out by the European Centre for Development Policy Management (ECDPM). The research included an extensive review of the literature and sixteen case studies. The 5C framework has also been applied in an IOB evaluation using 26 case studies in 14 countries, and in the baseline carried out per organisation by the MFS II organisations for the purpose of the monitoring protocol.

The 5C framework is structured to understand and analyse (changes in) the capacity of an organization to deliver (social) value to its constituents. This introduction briefly describes the 5C framework, mainly based on the most recent document on the 5C framework (Keijzer et al., 2011).

The 5C framework sees capacity as an **outcome** of an **open system**. An organisation or collaborative association (for instance a network) is seen as a system interacting with wider society. The most critical practical issue is to ensure that relevant stakeholders share a common way of thinking about capacity and its core constituents or capabilities. Decisive for an organisation's capacity is the context in which the organisation operates. This means that **understanding context issues** is crucial. The use of the 5C framework requires a multi-stakeholder approach because shared values and results orientation are important to facilitate the capacity development process. The 5C framework therefore needs to **accommodate the different visions** of stakeholders and conceive different strategies for raising capacity and improving performance in a given situation.

The 5C framework defines capacity as '**producing social value**' and identifies five core capabilities that together result in that overall capacity. Capacity, capabilities and competences are seen as follows:

Capacity is referred to as the overall ability of an organisation or system to create value for others;

Capabilities are the collective ability of a group or a system to do something either inside or outside the system. The collective ability involved may be technical, logistical, managerial or generative (i.e. the ability to earn legitimacy, to adapt, to create meaning, etc.);

Competencies are the energies, skills and abilities of individuals.

Fundamental to developing capacity are inputs such as human, material and financial resources, technology, and information. To the degree that they are developed and successfully integrated, capabilities contribute to the overall capacity or ability of an organisation or system to create value for others. A single capability is not sufficient to create capacity. All are needed and are strongly interrelated and overlapping. Thus, to achieve its development goals, the 5C framework says that every organisation or system must have **five basic capabilities**:

The capability to act and commit;

The capability to deliver on development objectives;

The capability to adapt and self-renew;

The capability to relate (to external stakeholders);

The capability to achieve coherence.

In order to have a common framework for evaluation, the five capabilities have been reformulated in outcome domains and for each outcome domain performance indicators have been developed.

There is some overlap between the five core capabilities but together the five capabilities result in a certain level of capacity. Influencing one capability may have an effect on one or more of the other capabilities. In each situation, the level of any of the five capabilities will vary. Each capability can become stronger or weaker over time.

Appendix 3 Results - changes in organisational capacity of the SPO - 5C indicators

Below you will find a description for each of the indicators under each of the capabilities, what the situation is as assessed during the endline, how this has changed since the baseline and what are the reasons for change.

Capability to act and commit

1.1. Responsive leadership: 'Leadership is responsive, inspiring, and sensitive'

This is about leadership within the organization (operational, strategic). If there is a larger body then you may also want to refer to leadership at a higher level but not located at the local organization.

There exists a responsive, transparent, collective and accountable leadership role in HUNDEE. The leadership actually and effectively engages in all organizational aspects, including strategic and operational issues. The Board of Directors is helping the organization to define the strategic directions, and most importantly advises the management team on coping with changing circumstances on a quarterly, bi-annual and annual basis. In general, the influence of the board in the decision making process of the organization improved since the baseline. The Board is more engaged in providing general guidance to the management team, and demands evidence in respect to implementation of its recommendations. The Board has been helpful in guiding the management to achieve program outputs and outcomes and fully acts and speaks as the owner of the organization. The Board and management have made efforts to represent HUNDEE within the civil society landscape as one of the most effective and legitimate organisations among its constituencies and partners. Staff members of HUNDEE noted that strategic issues are identified and solutions sought in participation with all concerned bodies throughout the structure of the organization. Bi-annual staff review meetings have been organized and conducted to discuss strategic issues and solicit solutions for challenges. Management became more responsive and action-oriented, and reflections on the feed backs of project monitoring have taken place when needed. On the other hand, some staff members indicated that the manner of leadership is still the same with the same Managing Director who has continued to engage in all organizational aspects, including strategic and operational issues through support and encouragement by ICCO. Through the Consortium framework (C6NGO), the leadership skills of both the management and staff have been enhanced through shared trainings and exchanges.

Score: From 4 to 4.5 (slight improvement)

1.2. Strategic guidance: 'Leaders provide appropriate strategic guidance (strategic leader and operational leader)'

This is about the extent to which the leader(s) provide strategic directions

HUNDEE is currently implementing the five year strategic plan developed before the baseline period that enabled the organization to identify and effectively work on core organizational issues and strategies. Hence, HUNDEE has been focused on the realization of its long-term objectives and goal through organizational development, improving the resource base/funding of the organization, enhancing on-going learning through consistent application of PME, maintaining and enforcing good public relations, and ensuring program quality and outreach expansion since the baseline. Particularly,

the focus of the organization for the last two years was on getting more funds through preparing competent proposals and timely reporting. The strategic direction was not updated since the baseline. According to some staff members in the self-assessment, HUNDEE leadership used to give strategic guidance based on the organizations values rooted in helping the community, and this has continued since the baseline. This approach is still considered satisfactory according to these members of staff. Most staff members stated that HUNDEE has improved its capacity to cascade values and principles of the organization to all staffs and stakeholders through periodic workshops on a bi-annual basis. Mentoring and coaching are part of the overall process of organizational management at HUNDEE. The top management has created a conducive environment for experience sharing and performance monitoring among the different branch offices, and improved top management responsiveness to requests of area offices and backstopping. The board and management meetings are held on a more regular basis. The Board has approved a new organization chart that allowed program teams to focus more on thematic or program areas under a Program Department, rather than on managerial issues. The new organizational structure has allowed the staffs under the program unit to focus on program implementation than managerial issues. The administration and finance department is reorganized to give effective support to the programs and accountability lines have been made very clear after the baseline. Both the Board and the Management Team felt that the old structure needed to be replaced by a new one that will be congruent to the considerable expansion of the organization, both in terms of geography and new themes it tries to address. Some staff members noted that engaging in continuous organizational learning and in-house reflection has significantly enhanced capacity of the top management and the whole staff in understanding current development discourses as well as helped to further refine and enrich intervention approaches, strategies and programs for better results.

Score: From 3.5 to 4 (slight improvement)

1.3. Staff turnover: 'Staff turnover is relatively low'

This is about staff turnover.

There has been no staff turnover in HUNDEE since the baseline. Rather most of the staffs particularly the senior staff members have been working for more than ten and above years in the organization due to the existing enabling working environment. The basic reason is that commitment, supportive leadership and collegial relationship has existed in the organization. Most of the staff who participated in the baseline assessment were present in the end line assessment. There was no leadership change which could have created an unstable environment. Besides, some staff members who are working on the VCD and C4C projects did not leave the organization, and seem to be highly motivated due to the nature and innovativeness of the work they are involved in.

Score: From 4 to 4.25 (very slight improvement)

1.4. Organizational structure: 'Existence of clear organizational structure reflecting the objectives of the organization'

Observable indicator: Staff have copy of org structure and understand this

The organizational structure has been improved to capture the new arrangement in mainstreaming M&E and gender since the baseline. The organization has updated its organogram (organizational structure) in 2014 and all staff members were fully engaged during the development process and final discussion. Besides, the new organizational structure clearly defined roles and responsibilities of the staff and there is a well-articulated job description for each staff member. In addition to the commitment of the management and Board of Directors, ICCO has helped the organization in discharging of duties and responsibilities both at organizational level and particularly in value chain and ICT project implementation. Different donors also encouraged the development of clear organizational structures and the segregation of staff duties.

The Board has approved a new organization chart that allowed program teams to focus more on thematic or program areas under a Program Department. The administration and finance department is reorganized to give effective support to the programs and accountability lines have been made very clear after the baseline. Both the Board and the Management Team felt that the old structure needed to be replaced by a new one that will be congruent to the considerable expansion of the organization, both in terms of geography and new themes it tries to address.

Score: from ? (no baseline information) to 4

1.5. Articulated strategies: 'Strategies are articulated and based on good situation analysis and adequate M&E'

Strategies are well articulated in HUNDEE in a way that situation analysis and monitoring and evaluation are used to inform strategies. The organization consistently reviews and aligns organizational systems, policies, procedures and programs to adequately reflect HUNDEE's commitment to gender equality and to enhance organizational competitiveness in the changing environment by the end of the planned period. To ensure this, the organization has prepared a TOR to conduct an organization-wide assessment, annual participatory review and reflection forums, situation analysis and establishing a gender audit task force. This was described in the 2013 annual plan and has been implemented.

Score: from ? (No baseline information) to 4

1.6. Daily operations: 'Day-to-day operations are in line with strategic plans'

This is about the extent to which day-to-day operations are aligned with strategic plans.

HUNDEE day to day operations were already in line with the strategic plan and there was no change in this regard. HUNDEE has an annual plan which is aligned to the strategic plan as well as the government development plan (National Transformation Plan). There are joint project activities plans at project offices through the involvement of different stakeholders at community level and review meetings take place quarterly and bi-annually at each respective area office. The project operations are developed into monthly and weekly action plans. There is also effective monitoring and evaluation by the head office team and area office as well as by external consultants. HUNDEE field staffs, due to regular trainings and capacitating activities within the C6NGO framework (MFS II), were able to improve their planning, monitoring and follow up, and reporting of project activities. Efforts were made to focus on outcomes rather than outputs in their reports. Accordingly, significant changes have been observed in the quality of the reports. However, it was noted that often plans are not implemented within the given time frame, and delay of implementation has been observed. This is sometimes due to delays in approvals from local authorities which is to a large extent caused by the NGO law. Besides, before the baseline there was an accountability session on a weekly basis to update progresses and revise plans but recently after the baseline this has not been repeated.

Score: from 4 to 4 (no change)

1.7. Staff skills: 'Staff have necessary skills to do their work'

This is about whether staff have the skills necessary to do their work and what skills they might they need.

Staff skill at HUNDEE has improved since the baseline particularly related to using ICT for data collection, sharing information and the use of community managed disaster risk management program implementation. The ICT skills came as a result of training as well as the infrastructure created through MFS II funds. Staff skills have improved due to experience working with HUNDEE for a long time, experience sharing, and different training and provision of ICT tools like CDMA, smart mobile, flash disc

and Wi-Fi internet access etc. Hence, basic ICT based documentation and information sharing is being practiced by both the Head office and Area offices staff through broadband and mobile internet technologies. Skills in interaction with FMOs has improved, and client satisfaction feedback is used to support FMOs. Project implementation capacity of HUNDEE staffs has been improved and this was demonstrated where 69% of the FMOs who had worked with them since 2011 were supported and graduated at the end of 2013 to effectively participate in the local market. The quality of reports also immensely improved and the reports were well aligned with contract reporting conditions by the end of 2013, which was not the case at the start of 2012 according to the CFA feedback. ICCO and other donors have helped the organization through training to improve staff skills not only in ICT but also implementation of new thematic areas like Community-based Disaster Risk Management, resilient livelihood for pastoralist communities; livestock development and marketing; principles and practices of social accountability; downward accountability etc. Some staffs noted that members of the middle managerial level (program officers) are now capable in project proposal development and are able to communicate with donors. This organizational layer has become more independent since 2012 due to the fact that the top management is becoming more confident of staff skills in this regard. There is also improved capacity of staff in the area of basic business skills and designing business investment related projects due to the provision of training for staff on basic business skill and entrepreneurship. More information about enhanced staff skills and what the training staff received it is described below in 1.8.

Score: From 3.5 to 4.5 (improvement)

1.8. Training opportunities: 'Appropriate training opportunities are offered to staff'

This is about whether staff at the SPO are offered appropriate training opportunities

HUNDEE staff training needs assessments were undertaken at various levels and trainings were provided on different topics as identified in the "gaps analysis" since the baseline. Hence, short-term trainings on subjects quite related to the project/program engagements were facilitated for selected staff by different donors and networks. These include training on livelihood and Marketing, Child Welfare and Development, Financial Management, Project Development and Monitoring & Evaluation, Female Genital Mutilation and Harmful Traditional Practices, Women and Value Chain Development, Value Chain Development Strategies and Livelihood, Basic Computer Skills, Self-Help Groups Promotion Operational Modalities, Results Based Management, Monitoring and Evaluation Tools, Child Support Index (CSI), and Journey of Life, to mention some. These trainings were implemented in partnership with Pact Ethiopia, Oxfam Canada, ICCO, Trocaire/Cafod/Sciaf Joint Office, Consortium of Self-help groups Promoters in Ethiopia (CoSAP) and Misereor with a duration ranging from 2 to 5 days. Besides, training on financial Management, leadership and management in humanitarian works, behavioral change facilitation/techniques and tools, project development, Results Based Management, value chain theory and application including ICT in value chain, Community-Based Disaster Risk Reduction, humanitarian accountability, and social accountability, theory and practice, and CMDRR training was given based on capacity assessment. Overseas training opportunities and exchange visits have also been organized for a few senior level professionals, and the training was cascaded down to lower level functionaries. According to some staff members, HUNDEE has gone through different phases as a result of the Dutch CFA support and has adjusted itself to organizational development supported by its mentor and funder, ICCO. This support has helped the organization to stay afloat and become more effective in the promotion of farmer's marketing organizations dedicated to value chain promotion. ICCO has also helped the organization with the new orientation to become more innovative and business oriented through the organizational development program. As a result of this, HUNDEE had the opportunity to make exchange visits to Kenya and Uganda to have a feel of how NGOs are supporting farmers running their own business enterprise. There has also been regular reflection and coaching on which knowledge and experience is exchanged within the organization.

Score: From 3.5 to 4.5 (improvement)

1.9.1. Incentives: 'Appropriate incentives are in place to sustain staff motivation'

This is about what makes people want to work here. Incentives could be financial, freedom at work, training opportunities, etc.

Generally, the organization has made efforts to improve its staff remuneration. HUNDEE has made a salary revision and the salary scale was improved recently before the endline. Transport service (car at HQ) is given to core and senior staff since 2012. As mentioned during the baseline report there has been an enabling working environment for staffs in HUNDEE, and the new salary scales motivate the staff to discharge their duties and responsibilities. The newly approved organizational structure and salary scale goes with the current inflation rate and market price in the country. This is due to the fact that HUNDEE has taken a long time to realize the strong commitment of staff members by addressing issues related to salary increment and cope with inflation. HUNDEE has also revised its HR policy and provides a limited staff loan for staff in case the need arises. However, some staff members indicated that though the board and management have promised to increase the salary scale it is not yet been implemented.

Score: From 3 to 3.5 (slight improvement)

1.9.2. Funding sources: 'Funding from multiple sources covering different time periods'

This is about how diversified the SPOs funding sources are over time, and how the level of funding is changing over time.

The total annual budget of the organization increased from 25 million in 2012, to 33 million in 2013, and 50 million in 2014. As a result the HUNDEE intervention area increased from seven decentralized offices to nine area offices. This is due to the fact that managerial capacity in lobbying with different donors for resources mobilization has improved and the credibility of the organization (due to good performance) has also increased. Besides, the organization has focused on development of competitive proposals and there was a call to participate in an innovative fund in 2013 by ICCO. New donors have started to support the organisation financially since the baseline. HUNDEE is now operating in new areas like pastoral areas and with new interventions related to health issues for instance. Besides, HUNDEE management works on resources mobilization through diversifying its donors: the SPO has managed to secure funding for multi-year (3-5 years) projects, e.g. HAM Foundation and Malt Barley projects. Positive developments are also that the Oromia regional State recommends some donors to come and work with HUNDEE due to its good image as an effective and accountable grassroots organization.. In summary, the source of funding has been diversified and the level of funding has been increasing overtime since the baseline. For instance, the total annual budget of the SPO has increased by about 50%. ICCO worked well with HUNDEE to fund-raise through quality-assurance of their proposals, and fund management. This was reflected for instance in the project proposal of Malt Barley projects.

Score: From 4 to 5 (improvement)

1.9.3. Funding procedures: 'Clear procedures for exploring new funding opportunities'

This is about whether there are clear procedures for getting new funding and staff are aware of these procedures.

HUNDEE has revised its organizational structure in a way that includes fundraising, proposal development and income generation through designating specific people for resource mobilization. Senior management and the General Manager are responsible for resource mobilization and are engaged in approaching different donors through lobbying and competing in different calls for proposals. Program managers also involved in resource mobilisation. Responsibility for resource mobilization is better defined for HUNDEE management and competent staff in developing project proposals. Besides,

quality of proposals improved to operate in the competitive environment for funding since both the numbers and quality of staff increased since the baseline. According to the some staff, there is no new way of getting funds like organizing events for fundraising and no separate unit for fundraising in the organization. The main issue is that there is a more pro-active approach to tapping into available sources of funding.

Score: From 4 to 4.5 (slight improvement)

Summary of capability to act and commit

There exists responsive, transparent, collective and accountable leadership role in HUNDEE. The leadership effectively engages in all organizational aspects, including strategic and operational issues. The Board of Directors is helping the organization in defining the strategic directions, and most importantly, on a regular basis advises the management team on coping with changing circumstances. HUNDEE has been focused on the realization of its long-term objectives and goal through organizational development, improving the resource base/funding of the organization, enhancing on-going learning through consistent application of PME, maintaining and enforcing good public relations, and ensuring program quality and outreach expansion. There has been no staff turnover in HUNDEE since the baseline. Rather, most of the staff members (particularly the senior ones) have been working at the organization for more than ten and above years due to the existing enabling working environment. Most of the staff who participated in the baseline assessment were present in the end line assessment. A new organizational structure clearly defines roles and responsibilities of staffs and hence there are well-articulated job descriptions of staff. Besides, strategies are well articulated at HUNDEE in a way that situation analysis and monitoring and evaluation are used to inform strategies. HUNDEE day to day operations were already in line with the strategic plan. HUNDEE field staffs, due to regular trainings and capacitating activities within the C6NGO framework (MFS II), were able to improve their planning, monitoring and follow up, and reporting of project activities. Efforts were made to focus on outcomes rather than outputs in their reports. Accordingly, significant changes have been observed in the quality of the reports. Staff skill at HUNDEE has improved since the baseline particularly in relation to using ICT for data collection and sharing information, and use of community managed disaster risk management program implementation. HUNDEE staff training need assessments were undertaken at various levels and trainings were provided on different topics as identified in the gaps analysis. Short-term trainings on subjects quite related to the project/program engagements were facilitated for selected staff by different donors and networks. Regarding incentives, HUNDEE reasonably improved the salary scale, although some staff indicated not to have seen this taken place, while a transport service has been given to core and senior staff since 2012. The organization's funding sources have improved, hence the total annual budget of the organization increased from 25 million in 2012, to 33 million in 2013, and 50 million in 2014. As a result HUNDEE intervention areas increased from seven decentralized offices to nine area offices. Funding procedures changed in the sense that fundraising, proposal development and income generation are specifically designated to senior management and the general manager and, in collaboration with program staff, are more proactive in terms of resource mobilization and engaged in approaching different donors through lobbying and competing in different calls for proposals.

Score: from 3.7 to 4.2 (slight improvement)

Capability to adapt and self-renew

2.1. M&E application: 'M&E is effectively applied to assess activities, outputs and outcomes'

This is about what the monitoring and evaluation of the SPO looks at, what type of information they get at and at what level (individual, project, organizational).

Participatory project monitoring has become practice in HUNDEE and has not changed greatly since the baseline. HUNDEE regularly conducts participatory monitoring and downward accountability. These lessons are adopted continuously. TROCAIRE and other donors have given training on downward

accountability and HUNDEE has developed a draft organizational accountability framework and oriented staff members on accountability and complaint handling. Staff capacity to exercise and internalize the accountability framework has increased. Hence, HUNDEE has started to document best practices (for example, downward accountability implementation process, disaster risk practices, livelihood enhancement projects, etc.) to use for scaling up. The organization has also refined and continuously adapted data collection tools, and conducted participatory review and reflection. There is internal reflection to improve M&E activities. The organization has established an M&E team for each unit to make the entire staff (programs and finance and administration) to get involved on issues of monitoring and evaluation in a regular basis. Accordingly seven teams were established under the Monitoring & Evaluation unit that strengthened the existing M&E system. Hence, frequency of monitoring increased along with the increased number of staff involved, and training on MEL (Monitoring, Evaluation and Learning) was provided for staff. Therefore, the involvement of all program units has improved in the application of M&E and reflection on the feedback generated through monitoring and evaluation has improved. On top of this, ICCO has over time been supporting HUNDEE to effectively implement its M&E activities through providing technical support and introduction of various approaches. Information on activities, results and finance are put together and analyzed while monitoring and evaluating its programs at various levels. Information at outcome and impact level are now given attention, well analyzed and documented. ICCO, through MFSII funding, has supported strengthening of the capacity of the SPO through monitoring and exposure visits. Moreover, linking and learning across the East African Region facilitated by ICCO has also benefited HUNDEE in this regard. Quality and practicability of indicators have improved, and an information gathering template has been developed and practiced.

Score: From 4 to 4.5 (slight improvement)

2.2. M&E competencies: 'Individual competencies for performing M&E functions are in place'

This is about whether the SPO has a trained M&E person; whether other staff have basic understanding of M&E; and whether they know what information to collect, how to process the information, how to make use of the information so as to improve activities etc.

The organization has established an M&E team for each unit to make the entire staff (programs and finance and administration) to get involved on issues of monitoring and evaluation in a regular basis. Accordingly seven teams were established under the Monitoring & Evaluation unit that strengthened the existing M&E system. Hence, frequency of monitoring increased along with the increased number of staff involved, and training on MEL (Monitoring, Evaluation and Learning) was provided for staff. Staffs understanding about the importance of monitoring and evaluation and their attitude towards this has improved. Frequent orientation on the importance and functionality of monitoring and evaluation has been given to staff at all levels by the senior staff. ICCO and other donors have strong interest in strengthening of M&E to ensure quality performance of projects, and in capacitating senior staff in Performance Impact Monitoring (PIM) development. Although staffs were trained on PIM by ICCO they have not continuously used it because of budget limitations. Besides, M&E unit staffs have enough understanding to practice M&E. The training on downward accountability was provided by ICCO through hiring a consultant, Jerry from Kenya in 2012 and 2013. Almost all project staff has good knowledge of M&E through joint and shared capacity support under the C6NGO framework. Furthermore, the organization has conducted a capacity building for 70 staff at the end of 2014. There is a responsible person to coordinate the M&E activities. HUNDEE area office staff members are more aware of results/outcomes reporting. The malt barley project plan also verified this by saying that HUNDEE and other consortium members performed frequent follow up and monitoring on the general situation of the target group. TROCAIRE and other donors have given training on downward accountability and HUNDEE has developed a draft organizational accountability framework and oriented staff members on accountability and complaint handling. Staff capacity to exercise and internalize the accountability framework has increased.

Score: From 4 to 4.5 (slight improvement)

2.3. M&E for future strategies: 'M&E is effectively applied to assess the effects of delivered products and services (outcomes) for future strategies'

This is about what type of information is used by the SPO to make decisions; whether the information comes from the monitoring and evaluation; and whether M&E info influences strategic planning.

HUNDEE has showed slight improvement in this regard with focus at the level of outcomes and impact, and in terms of processing and utilizing the M&E information. For this to be effective interdisciplinary teams were established to support M&E to report at output and outcome levels. The M&E findings have been considered and were utilized in project development. The lessons learnt were shared among project staff and senior management at head office level. Staffs have now a better idea about how the information produced from M&E can be used as an input in the organization's future strategic direction. However, information that is used for future strategies is obtained by external evaluators most of the time. ICCO and other donors also encourage using lessons learnt from the monitoring and evaluation findings. As a result, the organization has started to incorporate outcome and impact in monitoring and reporting. In response, donors have provided feedback on reports focusing on outcomes rather than activities and outputs. Although staffs were trained on PIM (Performance Impact monitoring) by ICCO they have not continuously used it because of budget limitations.

Score: From 4 to 4.25 (very slight improvement)

2.4. Critical reflection: 'Management stimulates frequent critical reflection meetings that also deal with learning from mistakes'

This is about whether staff talk formally about what is happening in their programs; and, if so, how regular these meetings are; and whether staff are comfortable raising issues that are problematic.

HUNDEE has established a grievance committee to resolve conflicts and manuals are prepared due to the introduction of downward accountability. The training on downward accountability was provided by ICCO through hiring a consultant, Jerry from Kenya in 2012 and 2013. Besides, field staff meetings that are held on a quarterly, bi-annual and annual basis, have also been organized to reflect ideas and views. There have been frequent meetings with program personnel to reflect on program/operational issues and staff are free to reflect on any issue. The top management also inspires critical reflection among staffs at all levels and there is a good culture to adapt new initiatives that are important for the organization. The organization has also felt that engaging in continuous organizational learning and in-house reflection has significantly enhanced organizational leaders, management and project staff members in understanding the current development discourses as well as in further refining and enriching intervention approaches, strategies and programs for better results. It was also evident in the organization 2014 annual plan, where HUNDEE has institutionalized transparency and collective decision making by the end of 2014.

Score: From 4 to 4.5 (slight improvement)

2.5. Freedom for ideas: 'Staff feel free to come up with ideas for implementation of objectives'

This is about whether staff feel that ideas they bring for implementation of the program are welcomed and used.

The organization still has a flat not hierarchical kind of organizational system and as a result the door is open for all staffs to reflect ideas. Ideas of all staff members on new findings are appreciated by management and by senior staff. Moreover, new findings generated during evaluation and implementation are strongly appreciated and the management is committed to strengthen results. Staff members have full freedom to bring new ideas and their ideas are used for the implementation of the program. There is a high freedom to present one's own ideas and the environment motivates staff to be innovative in implementing objectives of the organization. Ideas are always welcomed and used

based on its relevance and feasibility. It is observed that all HUNDEE staffs especially technical staffs are free to forward ideas that contribute to effectiveness and efficiency of programming and implementation of activities.

Score: From 4 to 4 (no change)

2.6. System for tracking environment: 'The organization has a system for being in touch with general trends and developments in its operating environment'

This is about whether the SPO knows what is happening in its environment and whether it will affect the organization.

In this regard according to the self-assessment, HUNDEE has been operating in a similar way as the base line period. Most of the activities in scanning the environment were done by the General Manager, senior staff and project coordinators. The strategic plan of the organization has stated that while mechanisms for scanning the environment remain relevant even today, the fact that HUNDEE is working with other NGOs has expanded channels of getting information.

Score: From 3.5 to 3.75 (very slight improvement)

2.7. Stakeholder responsiveness: 'The organization is open and responsive to their stakeholders and the general public'

This is about what mechanisms the SPO has to get input from its stakeholders, and what they do with that input.

HUNDEE has enhanced the implementation of downward accountability and this has helped to get trust from the community. This is due to the fact that all the project activities are clearly explained or communicated to the community, and the government-NGO forum has been used to explain the operations of HUNDEE. The commitment of the staff and the awareness training given to stakeholders influenced this change. TROCAIRE and other donors have given training on downward accountability and HUNDEE has developed a draft organizational accountability framework and oriented staff members on accountability and complaint handling. Staff capacity to exercise and internalize the accountability framework has increased. Hence, HUNDEE has started to document best practices (for example, downward accountability implementation process, disaster risk practices, livelihood enhancement projects, etc.) to use for scaling up. Besides, social accountability projects implemented by HUNDEE have contributed to the promotion of downward accountability. Moreover, stakeholders are familiarized on HUNDEE's problem handling mechanism during the project launching workshop. Based on the report of the seminar on downward accountability and client feedback mechanism in 2012, farmers have become more critical and take part in decision-making, more than before, while fieldworkers and staff have become more responsive to the needs of their clients.

Score: From 4 to 4.25 (Very slight improvement)

Summary capability to adapt and self-renew

Participatory project monitoring has become practice in HUNDEE and has not changed greatly since the baseline. HUNDEE regularly conducts participatory monitoring and downward accountability. These lessons are adopted continuously. TROCAIRE and other donors have given training on downward accountability and HUNDEE has developed a draft organizational accountability framework and oriented staff members on accountability and complaint handling. Staff capacity to exercise and internalize the accountability framework has increased. Hence, HUNDEE has started to document best practices to use for scaling up. The organization has also refined and continuously adapted data collection tools, and conducted participatory review and reflection. There is internal reflection to improve M&E activities. Quality and practicability of indicators has improved, and an the information gathering template is

developed and practiced. There is more of a focus on collecting data at outcome level, and information generated informed strategic decision-making. However, training on Programme Impact Measurement provided by ICCO is not always implemented by staff due to lack of budget. Furthermore outcome level information is mainly collected by external evaluation consultants. The M&E findings have considered and utilized in project development and lesson learnt shared among project staff and senior management at head office level. Staffs have now better idea about how the information produced from M&E is used as an input in the organization's future strategic direction. On the other hand, HUNDEE have established grievance committee to resolve conflicts and manuals are prepared due to the introduction of downward accountability.

The organization has established an M&E team for each unit to make the entire staff (programs and finance and administration) to get involved on issues of monitoring and evaluation in a regular basis. Staffs understanding about the importance of monitoring and evaluation and their attitude has improved. Frequent orientation on the importance and functionality of monitoring and evaluation has been given to staff at all levels by the senior staff. Besides, M&E unit staffs have enough understanding to practice M&E. Frequency of monitoring increased along with the increased number of staff involved, and training on MEL (Monitoring, Evaluation and Learning) that was provided for staff.

Regarding critical reflection, field staff meetings are held on a quarterly, bi-annual and annual basis, so as to reflect ideas and views. There have been frequent meetings with program personnel to reflect on program/operational issues and staff are now free to reflect on any issue. The top management also inspires critical reflection among staffs at all levels and there is a good culture to adapt new initiatives that are important for the organization. New findings generated during evaluation and implementation are appreciated and the management has committed to strengthen results. Most of the activities in scanning the environment were done made by the General Manager, senior staff and project coordinators, and is mainly based on collaborating with other NGOs.

Score: from 3.9 to 4.2 (slight improvement)

Capability to deliver on development objectives

3.1. Clear operational plans: 'Organisation has clear operational plans for carrying out projects which all staff fully understand'

This is about whether each project has an operational work plan and budget, and whether staff use it in their day-to-day operations.

The planning procedures follow the project proposal document and the operational plan is prepared at head office level. The project activities are first explained and discussed with project staff. Confusion in implementation is reduced by creating awareness through lessons from projects assessment reports and recommendation as well as feedback during field visits. Besides, consortium meetings and discussions have helped in clarifying project activities. Moreover, most organizations (donors) have now allowed to revise plans based on feedback and this helps to clarify the issues which are not clear. There is a systematic induction for new employees and intensive orientation for finance personnel. Unlike the baseline period, HUNDEE has considered financial inflation during project proposal development and there is no budget shortage for project implementation. Projects are timely implemented due to better planning practices, appropriate allocation of staff, and frequent follow-up on the projects by the M&E staff and supervisors. Activities are specifically assigned to each staffs involved in the project and hence timely follow up of project implementation is being achieved. Every project officer, finance department and area office coordinator has a copy of the project implementation plan and budget so that everyone is well aware of the implementation plan. Every year an operational plan with budget is prepared and submitted to CSO as well as shared with each area office. According to the CFA assessment, all projects have an operational plan and budget, and the plans are used in the day to day activities. An improvement is noted in submission of operational plans. However, the financial status of the project is not timely communicated.

Score: From 4 to 4.25 (Very slight improvement)

3.2. Cost-effective resource use: 'Operations are based on cost-effective use of its resources'

This is about whether the SPO has the resources to do the work, and whether resources are used cost-effectively.

HUNDEE planning and resource allocation have improved, and appropriate persons for budget control and planning are assigned (such as a budgeting officer). Training on budget tracking was provided to relevant staff by other donors (non-MFS II). Some staff members stated that though it is difficult to conduct input-output analysis, the organization has given due attention to the cost effective approach without compromising quality services. The allocation of operational and administration costs are guided by the 30/70 CSO guideline, and the community and other stakeholder's contributions are being recorded. Some staffs noted that unless the situation unexpectedly changes, the budget is expensed as planned. Besides, vehicle-related costs are expensed according to the budget line item in the project. Nevertheless the vehicle maintenance cost is huge for which the organization has to generate money from different funding sources. There is proportionally less administration cost compared with the baseline period in the organization.

Score: From 3.5 to 4 (slight improvement)

3.3. Delivering planned outputs: 'Extent to which planned outputs are delivered'

This is about whether the SPO is able to carry out the operational plans.

HUNDEE has sustained its strength in delivering planned outputs as specified in the agreement. It was seen that project implementation capacity of HUNDEE staff has been improved and this was demonstrated for example where 69% of the FMOs who had worked with them since 2011 were supported and have graduated at the end of 2013 to effectively participate in the local market. However, monitoring and evaluation has been organized in a new way that core program and finance staff take a leading role to easily monitor projects and programs of the organization. HUNDEE has started a new reporting system that consists of an output reporting system to check whether the planned outputs of both physical and financial performance are attained. The M&E unit uses this as a bench mark for further analysis. According to the CFA assessment, there has been an improvement in delivering the required planned outputs as per the plan. Plans are implemented as expected in some projects whereas in others set targets may not be fully met due to financial constraints, delays in release of finances and procurement as a result of bureaucratic procedures.

Score: From 4 to 4 (no change)

3.4. Mechanisms for beneficiary needs: 'The organization has mechanisms in place to verify that services meet beneficiary needs'

This is about how the SPO knows that their services are meeting beneficiary needs

In this regard, HUNDEE has put in place systems and tools to measure client satisfaction through regular monitoring meetings with different committees and beneficiaries that fully participate in the whole process of the project. Unlike during the time of the baseline, downward accountability tools are mainstreamed in all program levels due to the fact that organization-wide trainings were given on downward accountability tools including client satisfaction to exercise in various projects by ICCO, CCRDA, KNH, CST, and ESP2. HUNDEE has involved target groups right from inception to the whole process of a project. The organization conducts participatory project evaluations that involve stakeholders and adjustments are made on critical needs of target groups. Participatory discussions with beneficiaries take place at different stages of a project including design, implementation and evaluation stage. Workshops, field visits and stakeholder consultation forums have been pointed out as

mechanisms through which the organization checks whether services meet beneficiary needs. Beneficiaries also provide feedback on the quality of services they are getting from the SPO.

Score: From 4 to 4.5 (slight improvement)

3.5. Monitoring efficiency: 'The organization monitors its efficiency by linking outputs and related inputs (input-output ratio's)'

This is about how the SPO knows they are efficient or not in their work.

Due attention is given and results were realized to measure both at head office and area offices the implementation of projects as per plan, and accomplishments in terms of outputs realised, timeliness and resource allocation. E

To increase efficiency in budget utilization the organization assigned a budget officer. In addition to the M&E unit, the newly assigned Program Operation Department took responsibility to oversee organizational project budget utilization and activity implementation. The organization has improved communication between the top management and staff members, and the frequency of field visit and data collection was increased. However, there is no formal system for input-output ratio analysis. Finance and program departments have not yet routinized the discussion of cost efficiency.

Score: From 3.5 to 3.5 (no change)

3.6. Balancing quality-efficiency: 'The organization aims at balancing efficiency requirements with the quality of its work'

This is about how the SPO ensures quality work with the resources available

In this regard, HUNDEE has gone through the principle of 'value for money' in all resource utilization. Both the economic use of resources and delivery of standard quality outputs are checked and all staffs are well aware about quality services through the experience that they've gained over the years. As indicated in the baseline, HUNDEE has also not yet developed an efficiency-quality guideline and made no progress in this regard.

Score: From 4 to 4 (no change)

Summary capability to deliver on development objectives

HUNDEE has considered inflation during project proposal development and there is no budget shortage for project implementation. Operational plans prepared at head office level. Confusion in implementation is reduced by creating awareness through lessons from projects assessment reports and recommendations as well as feedback during field visits. Every year operational plans with budgets are prepared and submitted to Civil Society Organisations as well as shared with each area office. Hence, all projects have an operational plan and budget, and the plans are used in the day to day activities. HUNDEE planning and resource allocation have improved and an appropriate person for budget control and planning has been assigned (like budgeting officer). This showed the organization has given due attention to the cost effective approach without compromising quality services. HUNDEE has sustained its strength in delivering planned outputs as specified in the agreement. However, the monitoring and evaluation unit has been organized in a new way that core program and finance staffs take a leading role to easily monitor projects and programs of the organization. Plans are implemented as expected in some projects whereas in others set targets may not be fully met due to financial constraints, delays in release of finances and procurement as a result of bureaucratic procedures. HUNDEE has put in place systems and tools to measure client satisfactions through regular monitoring meetings with different committees and beneficiaries are fully participating in the whole process of a project. Unlike during the time of the baseline, downward accountability tools are mainstreamed in all

program levels due to the fact that organization-wide trainings were given on downward accountability tools including client satisfaction to exercise in various projects funded by ICCO, CCRDA, KNH, CST, and ESP2. In addition to the M&E unit, the newly assigned Program Operation Department took responsibility to oversee organizational project budget utilization and activity implementation. Both the economic use of resources and delivery of standard quality outputs are checked and all staffs are well aware about quality services.

Score: from 3.8 to 4.0 (very slight improvement)

Capability to relate

4.1. Stakeholder engagement in policies and strategies: 'The organisation maintains relations/ collaboration/alliances with its stakeholders for the benefit of the organisation'

This is about whether the SPO engages external groups in developing their policies and strategies, and how.

HUNDEE involves its stakeholders at program formulation and implementation levels, and the organization maintains good relationships with its stakeholders, even though there is limited engagement on policy matters according to the CFA assessment. HUNDEE staffs hold regular meetings with stakeholders during project launching, planning, review workshops, reporting and feedback sessions, and the SPO is open to collaboration with stakeholders. Stakeholders participate from problem identification to evaluation, and their inputs are taken seriously. HUNDEE has engaged with the existing and new networks like the consortium of self-help groups Ethiopia. According to the staff self-assessment, HUNDEE has always tried to look out of the box and learn from the experience of other organizations with which they have working relationships. For example the organization has limited experience in working in pastoralist and agro-pastoralist areas of the country. Open mindedness of the organization in close alliance with NGOs that have tangible experience working with pastoralist communities make it possible to engage with these target groups.

Score: From 4 to 4 (no change)

4.2. Engagement in networks: 'Extent to which the organization has relationships with existing networks/alliances/partnerships'

This is about what networks/alliances/partnerships the SPO engages with and why; with they are local or international; and what they do together, and how do they do it.

HUNDEE's top leaders and management team recognize and value the role that partnership and networking has between civil society organizations and other relevant development actors can play in the design, implementation and effective delivery of development services. Hence, the organization has improved its bargaining power as a result of engagement in networks which in turn helps to get and provide information as well as share experience. Furthermore, major donors showed a clear preference for applications coming from alliances rather than from single competitors. Due to this reason, the organization has joined a number of such alliances either as a member or as a lead agency due to increased recognition of HUNDEE among network organizations. This was evident in the annual performance report in 2012 where HUNDEE is currently a member of such national consortiums and networks as CCRDA (Consortium of Christian Relief and Development Association), PANE (Poverty Action Network of Ethiopia), harmful traditional practices (HTP's) national Network, CoSAPE (Consortium of Self-Help Group Approach promoters in Ethiopia) and the like. At regional level, HUNDEE is one of the founding members of NeCSO (Network of Civil Society organizations in Oromia) and also part of the steering committee of the GO-NGO forum currently headed and hosted by the government of the regional state. In addition, HUNDEE is currently promoting the implementation of a three year value chain development project in partnership with and consortium of six local NGO's. In sum, HUNDEE has actively participated in different networks and forums and plays a leadership role in

the networks , such as CCDRA, 6NGO forum, due to the fact that understanding the need in working with networks by the top management has improved and due to ICCO's advice to work in networks. Besides, the FED Alliance/Consortium of 6 NGOs pioneered by ICCO is expressing an interest to work together even when the program is over in December 2014. A good example of this is the expression of intent of working as alliance for the Clinton Foundation project on value chains with small farmers producing maize and soya beans for producing supplementary food for children.

Score: From 4 to 4.25 (very slight improvement)

4.3. Engagement with target groups: 'The organisation performs frequent visits to their target groups/beneficiaries in their living environment'

This is about how and when the SPO meets with target groups.

HUNDEE had good culture in this regard and has maintained it because engaging in effective networking and collaboration with key stakeholders and all boundary partners is crucial for smooth implementation of development programs/projects and delivery of efficient, effective and quality of services to the intended beneficiaries. The program managers, M&E unit and focal persons frequently visit target beneficiaries. Frequent field monitoring and evaluation by different donors has been undertaken. There is continued improvement of community satisfaction in HUNDEE development services and increased community responsiveness. In the seminar report on downward accountability and client feedback mechanisms in 2012 showed that farmers have become more critical and take part in decision-making, more than before. Fieldworkers and staff have become more responsive to the needs of their clients.

Score: From 4 to 4.25 (very slight improvement)

4.4. Relationships within organisation: 'Organisational structure and culture facilitates open internal contacts, communication, and decision-making'

How do staff at the SPO communicate internally? Are people free to talk to whomever they need to talk to? When and at what forum? What are the internal mechanisms for sharing information and building relationships?

HUNDEE has improved communication and information sharing due to better internet access through the support of the ICT project for ICT training and provision of ICT materials like smart mobiles and Wi-Fi internet supported by ICCO. There is a good communication system with top management both upwards, and horizontally within the organization. The improved access to telephone and internet between HUNDEE office and field offices has facilitated efficient communication and information exchanges among staff members and stakeholders. Besides, the new organizational structure opens a door for a formal communication and documentation system that enables every individual to present their ideas freely at every level of the organizational structure. Staffs have open access to communicate with top management and board when needed.

Score: From 4 to 4.25 (very slight improvement)

Summary capability to relate

HUNDEE involves its stakeholders at program formulation and implementation levels, and the organization maintains good relationships with its stakeholders even though there is limited engagement in terms of developing policies and strategies for HUNDEE, according to the CFA assessment. HUNDEE staffs hold regular meetings with stakeholders during project launching, planning, review workshops, reporting and feedback sessions, and the SPO is open to collaboration with stakeholders. Stakeholders participate from problem identification to evaluation, and their inputs are taken seriously. HUNDEE has engaged with the existing and new networks like the consortium of

self-help groups Ethiopia. HUNDEE's top leaders and management team strongly recognize and value the role that partnership and networking between civil society organizations as well as with other relevant development actors can play in the design, implementation and effective delivery of development services. Hence, the organization has improved its bargaining power as a result of engagement in networks which in turn helps to get and provide information as well as share experiences.

HUNDEE is currently a member of such national consortiums and networks as CCRDA (Consortium of Christian Relief and Development Association), PANE (Poverty Action Network of Ethiopia), and harmful traditional practices (HTP's) national Network, CoSAPE (Consortium of Self-Help Group Approach promoters in Ethiopia) and the like. At regional level, HUNDEE is among the founding members of NeCSO (Network of Civil Society organizations in Oromia) and is also part of a steering committee of the GO-NGO forum currently headed and hosted by the government of the regional state. There is continued improvement of community satisfaction in HUNDEE development services and increased community responsiveness. In the seminar report on downward accountability and client feedback mechanisms in 2012 showed that farmers have become more critical and take part in decision-making, more than before. HUNDEE has improved communication and information sharing due to better internet access through the support of ICT project for ICT training and provision of ICT materials like smart mobile and Wi-Fi internet provided by ICCO. There is good communication system with top management both upwards and horizontally within the organization.

Score: from 4 to 4.2 (very slight improvement)

Capability to achieve coherence

5.1. Revisiting vision, mission: 'Vision, mission and strategies regularly discussed in the organisation'

This is about whether there is a vision, mission and strategies; how often staff discuss/revise vision, mission and strategies; and who is involved in this.

There has been increased awareness of staff on the vision, mission and strategy of HUNDEE, and staff have been involved in this process, which also created a sense of ownership. Considerable improvement can be seen at the strategy and policy level due to regularity and efficient participation of the board and staff. Vision, mission and strategies are to be regularly discussed in the organization according to the HUNDEE 2012 Plan Background information, although it is not clear whether this is also being done. The organization has reviewed the vision, mission and program objectives to add a more gender sensitive perspective. Strategic documents and project proposals are designed in line with this. Furthermore, each work unit has the responsibility to introduce new employees to the vision, mission and values of the organization and induction is given priority by HUNDEE.

Score: From 4 to 4.25 (very slight improvement)

5.2. Operational guidelines: 'Operational guidelines (technical, admin, HRM) are in place and used and supported by the management'

This is about whether there are operational guidelines, which operational guidelines exist; and how they are used.

There was a strong reminder from the board to revisit all policies and guidelines to facilitate smooth functioning of the organization. Due to this, some changes have been made, but the work is still in progress. Management is fully cognizant of the urgency of updating policies, manuals and while fully engaged in developing new ones. Hence, HUNDEE has produced a draft code of conduct and a child protection policy. The financial manual was also revised to capture the costs of programs and activities. The HR and financial policies are updated or revised to capture the current situation. Moreover, the organization has developed a Disaster Risk Reduction (DRR) guideline through the support of ICCO. The training and coaching provide by MFSII partners and the Regional Office on finance matters and

issues were useful inputs for the revision exercise that has been going on. The SPO has also drawn lessons for the preparation of DRR manuals through the use of a risk analysis report undertaken by other partners to update the aforementioned manuals and guidelines.

Score: From 3.5 to 4.5 (improvement)

5.3. Alignment with vision, mission: 'Projects, strategies and associated operations are in line with the vision and mission of the organization'

This is about whether the operations and strategies are line with the vision/mission of the SPO.

HUNDEE's previous two strategic planning documents provided a roadmap for overall organizational operations and aligning of its core programs and policy initiatives to key organizational areas. It has also served as primary source of inspiration out of which its operational plans are derived and developed during the last couple of years. Thus, all programs are more related to the organization's vision, mission and strategic objectives. HUNDEE has diversified its program and reached more areas and target groups since the baseline, but these are still in line with the vision, mission and strategies of the organization.

Score: From 4 to 4 (no change)

5.4. Mutually supportive efforts: 'The portfolio of project (activities) provides opportunities for mutually supportive efforts'

This is about whether the efforts in one project complement/support efforts in other projects.

In this regard, HUNDEE has improved a degree of complementarity and synergy between programs and this is explained by the implementation of cereal banks and value chain development, self-help groups and Dabaree projects, Community Managed Disaster Risk (CMDRR) and the livelihood enhancement program and the like. There has been a new orientation that all are responsible for the success of projects implementation in a mutually supportive manner. In the operation areas all projects are under unified leadership, and program performance assessment are included to the extent to which 'mutuality' exists between and among projects. HUNDEE has diversified its program and reached more areas and target groups since the baseline. Particularly the training on Disaster Risk Reduction given to the staff has helped the organization to improve skills on designing suitable programs and projects for the underserved nomadic communities pertaining to resilient livelihood to droughts.

Score: From 4 to 4.25 (very slight improvement)

Summary capability to achieve coherence

Vision, mission and strategies are regularly discussed in the organization. HUNDEE has reviewed the vision, mission and programs objective in a more gender sensitive manner, and strategic documents and project proposals are designed in line with this. There has been increased awareness of staff on the vision, mission and strategy of HUNDEE, and staff have been involved in this process, which is also created a sense of ownership. In terms of policy and operational documents for the organisation, HUNDEE has produced a draft code of conduct and a child protection policy. The financial manual has also been revised to capture the costs of programs and activities. The HR and financial policies are updated or revised to capture the current situation. Moreover, the organization has developed Disaster Risk Reduction (DRR) guidelines through the support of ICCO. HUNDEE's previous two strategic planning documents provided a roadmap for overall organizational operations and aligning of its core programs and policy initiatives to key organizational areas. It has also served as primary source of inspiration out of which its operational plans are derived and developed during the last couple of years. Moreover, HUNDEE has improved its degree of complementarity and synergy between programs. An example of this is with the project involving cereal banks and value chain development, self-help

groups and Dabaree projects, Community Managed Disaster Risk (CMDRR) and the livelihood enhancement program and the like.

Score: from 3.9 to 4.2 (Slight improvement)

www.wageningenUR.nl/cdi

Report CDI-15-059

The Centre for Development Innovation works on processes of innovation and change in the areas of food and nutrition security, adaptive agriculture, sustainable markets, ecosystem governance, and conflict, disaster and reconstruction. It is an interdisciplinary and internationally focused unit of Wageningen UR within the Social Sciences Group. Our work fosters collaboration between citizens, governments, businesses, NGOs, and the scientific community. Our worldwide network of partners and clients links with us to help facilitate innovation, create capacities for change and broker knowledge.

The mission of Wageningen UR (University & Research centre) is 'To explore the potential of nature to improve the quality of life'. Within Wageningen UR, nine specialised research institutes of the DLO Foundation have joined forces with Wageningen University to help answer the most important questions in the domain of healthy food and living environment. With approximately 30 locations, 6,000 members of staff and 9,000 students, Wageningen UR is one of the leading organisations in its domain worldwide. The integral approach to problems and the cooperation between the various disciplines are at the heart of the unique Wageningen Approach.

A QUESTIONNAIRE FOR THE IMPACT EVALUATION OF FARMERS MARKET ORGANIZATIONS IN ETHIOPIA

Project Location: Oromia Region

Type of survey: END line

Respondents: Farmer households

The survey is conducted by:
International Food policy research Institute,
Eastern and Southern Regional Office, Addis
Ababa, Ethiopia

PART E- Livestock Production

Livestock: Please describe your household's livestock assets:

	Animal type	E01 Number owned now	E04 How many did you sell for the last 12 months	E05 Total value received from the sale of all this animals in ETB
1	Cow			
2	Oxen			
3	Heifer			
4	Bull			
6	Goats			
7	Sheep			
8	Camel			
9	Donkey			
10	Horse			
11	Poultry			
12	Bee hives			

Part F- Access to Markets and Marketing

Distance from markets/roads

	Markets/Roads	F01. How far is your home from the following markets and roads in KM	F01_1. How far is your home from the following markets and roads in hrs
1	Dry season gravel road		
2	All weathered-gravel road		
3	Asphalt road		
4	Cooperative		
5	Village market		
6	Woreda market		
7	Zonal/regional market		
8	Central market		

Is there any person or company which buys the following commodities or services in your Kebele? (ask for each commodity or service)

	<i>Commodities or services</i>	<i>F05a. Yes/no</i>	<i>F05b. Type of buyer/seller</i>	<i>F05c. How many?</i>	<i>F05d. Certainty of the market 1=good 2=bad</i>	<i>F05e. If no, what about in your Woreda</i>	<i>F05f. Type of buyer /seller</i>	<i>F05g. How many?</i>	<i>F05h. Certainty of the market 1=good 2=bad</i>
1	<i>Teff</i>								
2	<i>Bread wheat</i>								
3	<i>Durum wheat</i>								
4	<i>Food barley</i>								
5	<i>Malt barley</i>								
6	<i>Maize</i>								
7	<i>Chickpea</i>								
8	<i>Haricot bean</i>								
9	<i>Oil crops</i>								
10	<i>Vegetables</i>								
11	<i>Fruits</i>								
12	<i>Milk</i>								
13	<i>Butter</i>								

Type of buyer/seller: 1=consumer 2=wholesaler 3=retailer 4=cooperative 5=NGO 6=Government office
How many: 1=1-2 2=3-5 3=6-10 4= >10

Is there any person or company which sells the following commodities or services in your Kebele? (ask for each commodity or service)

	<i>Commodities or services</i>	<i>F05i. Yes/no</i>	<i>F05j. Type of buyer/seller</i>	<i>F05k. How many?</i>	<i>F0l. Certainty of the market 1=good 2=bad</i>	<i>F05m. If no, what about in your Woreda</i>	<i>F05n. Type of buyer /seller</i>	<i>F05o. How many?</i>	<i>F05p. Certainty of the market 1=good 2=bad</i>
1	<i>Fertilizer</i>								
2	<i>Improved seeds</i>								
3	<i>Herbicides/pesticides</i>								
4	<i>Machinery rental</i>								
5	<i>Grain bank</i>								
6	<i>Transportation service</i>								

Type of buyer/seller: 1=consumer 2=wholesaler 3=retailer 4=cooperative 5=NGO 6=Government office
How many: 1=1-2 2=3-5 3=6-10 4= >10

Market information:			Answer
I	Do you ask (search) price information prior to selling your output?	1=Yes 2=No	
J	If you want to know the market price Tef/wheat/maize today, can you get it?	1=Yes 2=No	
K	If yes, whom you ask	1=check from Radio or TV 2= other farmers 3=DAs/agricultural office 4= Traders in the village 5= traders in distant markets	6=relatives/friends 7= FMO 8= ECX 9=others
L	If the answer for F12 is 2 and above How do you ask them?	1=face to face contact 2 =through third person 3== through phone	
M	If the answer F13 is phone, how did you receive?	1= Calling 2=SMS 3=through special application software	
N	How reliable/relevant is the information you obtain through mobile phones?	1=perfect, 2= very good, 3= good, 4= somewhat reliable, 5= not reliable	
O	If you do not use mobile phones to ask for price information, why?	1=I do not have mobile phone 2=I do not have any reliable source to ask 3=The information through mobile phone is not reliable and relevant 4= others	

Output marketing : Describe the crops and animal products sold last year (2006 EC)								
	Commodity	F09 Have you sold the following agricultural products in 2006? √ = yes, × =no	F10 How frequent you sell	F11 Total quantity sold in 2006 in quintal	F12 Total Birr received	F13 Place of sale	F14 Buyer	F15 If not to the FMO, why?
1	Teff (qt)							
2	Wheat (qt)							
3	Maize (qt)							
4	Barley (qt)							
5	Chickpea (qt)							
6	Lentil (qt)

G. FMO and its services <<if A09a=2, scape to H >>

Membership to FMO			Answer
G03	Are you a member of the FMO in your Kebele?	1= yes 0=no	
G04	If no, why?	1= the FMO is very far 2= I am not eligible 3= No benefit of being member 4=others specify	
G05	If yes, since when you became a member	Year (E.C)	
G06	If yes; What is your role in the FMO?	1=Ordinary member 2=Committee member 3=Chair	
G07	If yes, do you participate in meetings (regarding activities of FMO, selling, finance)	1= yes, always 2= yes, regularly 3= yes, rarely 0=no	
G08	If yes, how much did you pay for the membership	ETB	
G09a	If yes, do you own shares in the FMO?	1=yes 0=no	
G09	If yes to G09a, how many shares do you own	number	
G10	Did you receive a dividend last year?	1= yes 0=no	
G11	If yes, how much	ETB	

Selling to the FMO: ask even if the respondent is not a member

G12. Have you sold any output to the FMO last year-2006?

1=yes 0=no

If yes, ask G14

	Commodity	G14 Total quantity sold in quintal	G15 Total Birr received	G16 When did you sell? (month)	G17 When did you receive the cash? 0= on cash, 1=within one week 2=more than one weeks	G18 Why did you choose to sell to the FMO and not to another buyer? (code A)
1						
2						
3						
4						
5						

Code A: 1= No other buyers available at that time, 2=they offered the best price, 3=they pay a dividend, 4=the FMO is an important organization for farmers, 5= we are obliged to sell to the FMO 6= they provide transport services, 7= they provide storage services, 8=they provide credit, 9= other, specify-----

Services obtained from FMO:

	Services	G19 Have you ever obtained/purchased the following services from the FMO? √ = yes, × =no	G20 Did you obtain the following services within the last 12 months? √ = yes, × =no	G21 How do you rate the services? 1=bad 2=fair, 3=good, 4= very good 5=excellent

G31. Group of the respondent 1=A 2=B

G32. If A, I will read to you the following statements and you will tell me on how many of them do you agree.

1. I always sell to traders I know on the local market
2. Fertilizer is generally available for farmers in my kebele
3. Outputs are easily sold in the primary market close to the kebele
4. The FMO in my kebele strengthens the position of farmers in the market

Answer

G33. If B, I will read to you the following statements and you will tell me on how many of them do you agree.

1. I always sell to traders I know on the local market
2. Fertilizer is generally available for farmers in my kebele
3. Outputs are easily sold in the primary market close to the kebele

Answer

G34. If A, I will read to you the following statements and you will tell me on how many of them do you agree.

1. Private traders in my kebele generally cheat
2. Access to proper seeds for farmers is badly organized
3. The road infrastructure in my kebele makes it difficult to transport my crop

Answer

G35. If B, I will read to you the following statements and you will tell me on how many of them do you agree.

1. Private traders in my kebele generally cheat
2. Access to proper seeds for farmers is badly organized
3. The road infrastructure in my kebele makes it difficult to transport my crop
4. The FMO is a weak organization as important decisions are not made by its members

Answer

PART H-Non-farm Income and Household expenditures

Non-farm income:				
	Income sources	H01 Have you generated any income from the following sources last year (2006 E.C) √ = yes, × =no	H02 Total amount your family generated last year in ETB	H03 Who generated? (1=household head, 2= other family member, 3=both)
1	Casual labour			
2	Salary			
3	Trade			
4	Handicraft			
5	Remittance			
6	Aid (cash or food)			

Frequent cash expenditures (weekly)			
	Item name	H04 In the last 7 days did your household spend money on this item? √ = yes, × =no	H05 How much did the household spend on the item in the <i>last 7 days</i> ? [ETB]
1	Food and drinks (cash only)		
2	Cigarettes/tobacco etc)		
4	Fire wood		
5	Charcoal		
6	Kerosene		
7	Other fuel (not electricity)		

Monthly cash expenditures			
	Item name	H06 In the last 30 days did your household spend money on this item? √ = yes, × =no	H07 How much did the household spend on the item in the <i>last 30 days</i> ? [ETB]
1	Electricity		
2	Water and grabage disposal		
3	Soap/washing & cleaning products		
4	Personal care (barber, hair dresser, toothpaste,		
5	Transport expenses		
6	Communication (cell phone, mail, ...)		
7	Entertainment (socializing)		
8	House rent		

Less frequent expenditures (in the last 12 months)			
	Item name	H08 In the past 12 months , did your household spend money on this item? √ = yes, × =no	H09 How much did the household spend on the item in the <i>last 12 months?</i> (ETB)
1	Clothes and shoes (including school uniforms)		
2	Furniture (tables, chairs, beds, etc)		
3	Blankets/bedsheets		
4	School fees and other educational expenses		
5	Social events (wedding, funeral, etc)		
6	Housing improvement (latrine, new roof, etc)		
7	Human health expenses (medicine, hospital , ...)		
8	Vehicle purchase or repair (car, bicycle, motorcycle)		
9	Contributions & membership fees (associations/church/sports etc)		
10	Taxes		

PART I - FOOD SECURITY

Household Food insecurity Scale: For each of the following questions, consider what has happened in the past 1 month. Please answer whether this happened never, rarely (once or twice), sometimes (3-10 times), or often (more than 10 times) in the past 1 month? (Circle the answer)					
Event		Frequency of event			
		Never (0 times)	Rarely (1-times)	Sometimes (3-10 times)	Often > 10 times
I01	Did you worry that your household would not have enough food?	0	1	2	3
I02	Were you or any household member not able to eat the kinds of foods you preferred because of a lack of resources?	0	1	2	3
I03	Did you or any household member eat a limited variety of foods due to a lack of resources?	0	1	2	3
I04	Did you or any household member eat food that you did not want to eat because a lack of resources to obtain other types of food?	0	1	2	3
I05	Did you or any household member eat a smaller meal than you felt you needed because there was not enough food?	0	1	2	3
I06	Did you or any other household member eat fewer meals in a day because there was not enough food?	0	1	2	3
I07	Was there ever no food at all in your household because there were no resources to get more?	0	1	2	3
I08	Did you or any household member go to sleep at night hungry because there was not enough food?	0	1	2	3
I09	Did you or any household member go a whole day without eating anything because there was not enough food?	0	1	2	3

Dietary Diversity Score: Which one of the following categories of food was eaten in this household during the last 7 days? (Mark with x if a food category was present in the diet for that specific day, X otherwise)

	Categories of food	I10 Yesterday	I11 During the last 7 days
1	Cereals and root-crops (rice, bread, injera, millet, potatoes, etc...)		
2	Pulses (peanuts, haricots, sesame, chick peas, lentilles, green peas, other peas...)		
3	Fruit		
4	Meat/Fish		
5	Dairy products (milk, butter, cheese, yoghurt, etc...)		
6	Eggs		
7	Vegetable oil/fat (ghee, oils...)		
8	Sugar, honey, drinks with sugar (coca cola, fanta, etc..)		
9	Any other food item Specify -----		

Please check if the questionnaire is complete

1. Introduction

The general aim of this project was to support the “Integration of ICT in the Agricultural Commodity Value Chain”. The project was implemented by a consortium of 6 NGOs (ADAA, CDI, ERSHA, FC, HUNDEE, OSRA) in five administrative zones of Oromia Regional State and promoting Farmers Marketing Organizations (FMOs). One of the NGOs (FC) represented the other NGOs and lead and managed the consortium. The core intention of the six NGOs was to stimulate market access strategies for poverty alleviation. Two projects proposed by the consortium and addressing the same target group were supported by Dutch NGOs. One project, for which ICCO was the responsible Dutch NGO (see Report MFSII Joint Evaluation C7), focused on organizational support for FMOs and their Unions, while the second project (this evaluation), for which IICD was the responsible Dutch NGO, provided an ICT infrastructure for the involved FMOs, their Unions and the NGOs supporting these farmers’ organizations. Access to information was expected to improve the livelihoods of smallholder farmers: ‘the consortium of NGOs has identified that lack of reliable information is the main challenge to improve farmers’ competitiveness in the agricultural commodity value chain to achieve the overall objective’(project document, August 2011).

The objective of this project was to improve the livelihood of smallholder farmers by promoting market oriented autonomous farmers organizations (137 FMOs and 6 Unions) that provided their members and other farmers in their vicinity with greater market access, which, in turn, enhanced their participation in local markets. It was expected that ICT utilization would bring about innovations in the value chain, easy ways of information sharing, dissemination and collaborations in the value chains while laying a foundation for informal and formal market integration or value chain upgrading. By doing so, it was expected to contribute to increased market participation, market efficiency and better prices for farmers and, ultimately, to poverty reduction.

Impact of this project is measured through a ‘difference-in-difference’ analysis. Farmers (control group and treatment group) were interviewed in September 2012 (baseline) and September 2014 (endline). Several outcomes on specified indicators, as mentioned in the project document, are assessed and also some more general indicators for improved livelihoods (food security and income from agricultural activities) are analyzed. With regard to the outcome indicators we confirm a successful increase in sales to the FMO. However, at the same time we observe some serious weaknesses: 50% of the members in the endline study do not sell to the FMO, most of the surplus is sold to private traders and the role of the

FMO in providing market information is still at its infancy. We conclude that it is too early to assess the efficiency of the project as significant investments are made in ICT but the effect on outcome indicators is still lacking or weak. It is too ambitious to expect that Unions could be established, an ICT infrastructure created and outcomes realized within a three year time-period.

The report is structured as follows. The next section describes the context of the project. Subsequently, an overview of project activities is provided. Section 4 discusses the data collection. Section 5 provides the findings and section 6 discuss the results. The final section draws conclusions.

2. Context

From the project document (August 2011) we take the following description of the context of the project: “Ethiopia is one of the Sub-Saharan African countries which liberalized their economies and developed poverty reduction strategies that underpin market-led strategies for broad based agricultural development and economic growth. This strategy makes agriculture a top priority to bring about sustainable development. Within agriculture, these strategies place heavy emphasis on the grain sector for improved production, privatization and commercialization. While agricultural development policy of Ethiopia is designed to support market-led agricultural development, competitiveness of smallholder producers and commercialization of small scale production depends on the development of viable and remunerative market linkages which the policy actions still lack to address mostly at the lower end of value chains.”

“Agricultural productivity in Ethiopia is very low compared to other Sub-Saharan African countries. Various literatures indicate that inefficiency of domestic agricultural markets is mentioned as one of the factors held responsible for the reduced productivity of farmers and for the poor performances of the agricultural sector in the developing countries, particularly in Ethiopia. However, the capacity of smallholder farmers to produce the required quality and quantity of product as per demand of the buyers is not well developed due to the limited agricultural extension services. Audio-visual learning materials on different topics (textbooks, guidelines, CDROM, video and audio) on the improved agricultural practices could support for the increased production, productivity and quality of agricultural production.”

The government of Ethiopia provides support for the further development of cooperatives. The current poverty-reduction strategy confirms the need to support producer cooperatives as a means of strengthening and empowering smallholders' market participation in the liberalized market environment (FDRE, 2005).

This context is in line with a large body of literature showing that farmers market organizations reappeared on the international development agenda (Bernard et al., 2010; Bernard et al., 2008; Fisher and Qaim, 2011; World Bank, 2007). Some of the involved FMOs have a background in former cereal banks and have been re-established in the 90s. Now these organizations are seen as important instruments linking farmers to markets, increasing agricultural productivity, and ultimately reducing rural poverty. Through collective action, farmers market organizations are expected to strengthen the farmers' market position and to improve rural livelihoods. The empirical study of Bernard et al. (2010) on cooperatives in Ethiopia concluded that cooperatives can secure higher prices for their members' output although this ability does not necessarily lead to an increase in the quantity of output commercialized by the members. They also conclude that the poorest of the poor tend to face considerable constraints on membership in marketing cooperatives. However, poorer non-member households still benefit from positive spill-overs. The World Bank (2008, p155) addresses this as a challenge for producer organizations to resolve the conflict between efficiency and equity: "Producer organizations typically operate in the context of rural communities where they are subject to norms and values of social inclusion and solidarity. This may clash with the requirements of professional, business-oriented organizations that must help members compete to survive in the market place".

In particular this project promotes farmers' marketing organizations and their competitiveness in agricultural commodity value chains. The final objective is to address poverty in the targeted farming communities. The indirect objective formulated for this project is to improve the capability of the NGOs and the position of FMOs in agricultural value chains through ICT supported services. The direct beneficiaries are smallholders. The targeted smallholders have a weak position in agricultural markets. Their production was low in quantity and quality. They have no access to reliable and relevant information. As a result they gained low income from the sales of their products, which in turn exposed them to transitory food insecurity.

3. Project description (taken from the C4C project proposal)

The consortium of six NGOs namely Africa Development Aid Association (ADAA), Centre for Development Initiative (CDI), Ethiopian Rural Self Help Association (ERSHA), Facilitator for Change (FC), HUNDEE-Oromo Grassroots Development Initiative and Oromo Self Reliance Association (OSRA) are promoting Farmers Marketing Organizations (FMOs) in five administrative zones of Oromia Regional State: South West Shoa, East Shoa, West Shoa, West Arsi and Bale Zone. The missions of these NGOs are quite similar and concern for example, “integrated community development”, “to restore self-sufficiency in the life of people in Ethiopia” or “to see a poverty free Ethiopia where men and women equally enjoy dignified life”. These NGOs are involved in the implementation of all kinds of donor-financed projects. Their activities concern among others education, health services, women and child protection, water supply and sanitation, agricultural crop production and Farmers Marketing Organizations (FMOs).

Since 2006 former Cereal Banks are encouraged to become oriented towards market oriented entities or ‘Farmers Marketing Organizations (FMOs)’. ICCO facilitated this transformation. Cereal Banks were selected (115 FMOs) that could make the shift from a food security to a market oriented organization. Starting 2008, five NGOs (CDI, ERSHA, FC, HUNDEE and OSRA) decided to promote the program in a harmonized approach to improve the quality of work in a more cost efficient way (first program period 2008-2010). For this, they anonymously selected FC as a lead organization for the program. After one year of implementation in 2009, the African Development Aid Association (ADAA) having experience in promoting CBs, joined the consortium.

In the project proposal we read the following about the vision behind the project: “As the weakest link in the value chain is at the lower level of the chain, i.e. at farmers and farmers’ market organizations level, the focus of these NGOs is on improving the capacity of FMOs for production enhancement and improved market linkages. The farmers and FMOs have little access to reliable market information to be competitive in the market. The consortium members believe that information and communications technology (ICT) offers a growing number of ways to exploit opportunities and address constraints to value chain growth and competitiveness.”

Dependent on regional circumstances the FMOs are specializing in trading one or two of the following six commodities: Teff, Malt Barley, Haricot Bean, Lean seed, Wheat and Maize. The consortium planned to create 7 Unions of FMOs to allow members to benefit from economies of scale and market power. Through this organization farmers are also expected to be able to hire a skilled Union manager improving the financial and technical capabilities and market information management.

The ICT project (C5) has two components, ICT for organizational strengthening and transparency (information about the FMO membership base, information about buyers and suppliers) and ICT for market & production information. The ICT infrastructure for market information is implemented at union level and all unions are covered. Thus, ICT for market information covers all FMOs through the Union. Only a subset of FMOs receives ICT support for organizational strengthening and transparency (54 FMOs were planned to receive computers).

The project was formerly designed for two years and four months of implementation (September 2011-2013). However, due to the long process of project approval the project commenced in January 2012 and ended in December 2013. Project activities continue as a new project and additional budget was approved for the years 2014/2015.

The project objectives for 2011 – 2013 are:

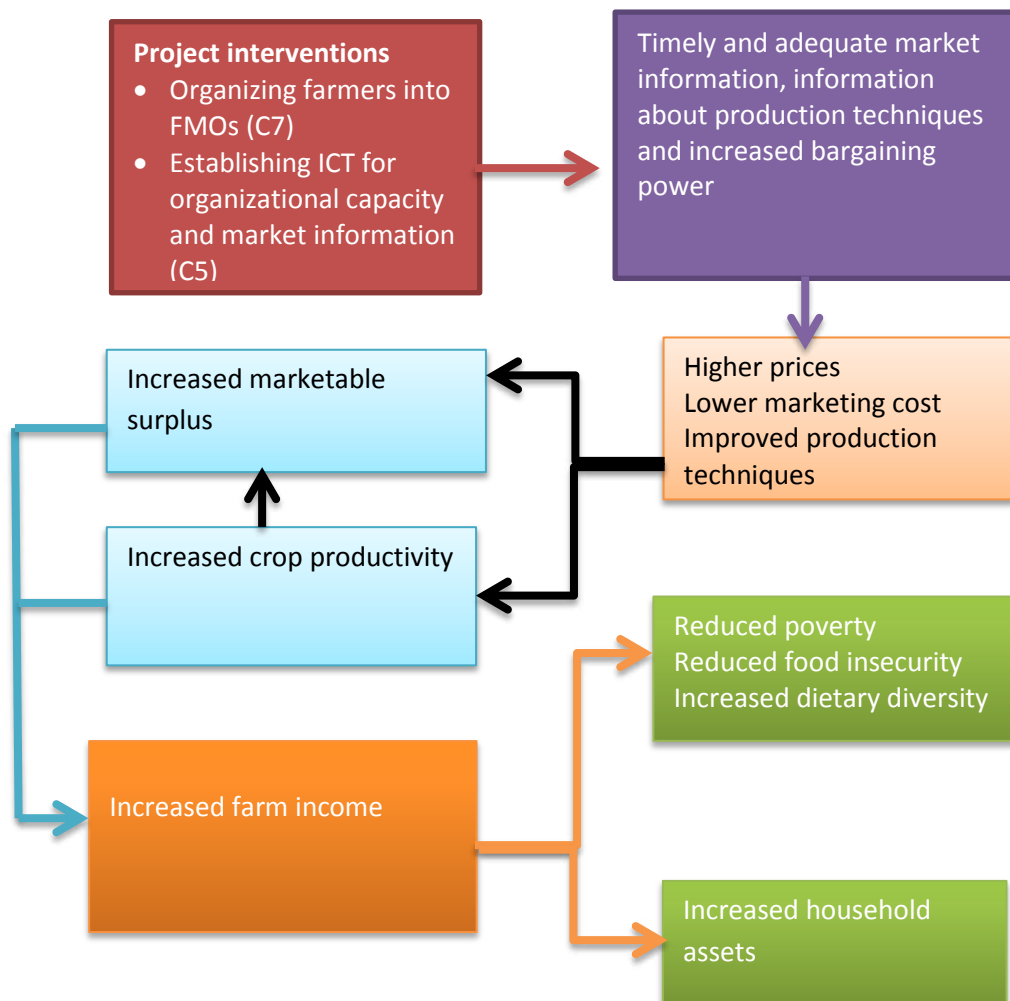

1. Enhanced efficiency and effectiveness of the 6 NGOs for the promotion of value chain development using ICT
2. Enhanced competitiveness of 115 FMOs in the decision making process of their 13,560 member households through accessing relevant and reliable market information
3. Enhanced efficiency and effectiveness of 137 FMOs/Union using ICT services that improve 16,440 member households' productivity by 2013.

The first objective targets the NGOs. In the project document is described that first the NGOs needed to enhance their capacity through information sharing and learning. The improved effectiveness and efficiency resulting from this was expected to play a significant role in increasing incomes of smallholders. The second objective targets the 115 FMOs, former Cereal Banks that were expected to make the strategic shift from a food security or supply driven production system to a market oriented (demand driven) approach. Improved market information (outputs and inputs) would help farmers to make the right production decisions.

The third objective focuses on technical agricultural information dissemination (production techniques and weather forecasts) to improve productivity and quality and targets a larger group of farmers/FMOs. In line with the project objectives and activities as described in the project proposal we derive the following theory of change for this project (Figure 1).

Financial support from IICD/ICCO (525,049 Euro is the project budget for 6 NGOs). The major planned activities of the project include developing a database of members, FMOs/Unions, input suppliers and buyers, linking FMOs/unions to reliable information sources, provision of training on ICT usage, coaching and mentoring of FMOs/unions in data collection, data entry, interpretation and utilization, facilitate the production enhancing of e-bulletins (sending by email) and bulletins.

Figure 1: Theory of change and expected impact of the project:

Which outputs, actions and outcomes were envisaged?

With regard to **objective 1**, “enhanced efficiency and effectiveness of the 6 NGOs for the promotion of value chain development using ICT”, two outputs were expected:

- Established management information system (membership) for the 6NGOs through the use of ICT
- Improved networking and collaboration among consortium members and other stakeholders for learning and information sharing

The following activities were envisaged:

- 1 Need Assessment of ICT usage at each organizational level
- 2 Deploying social media / website development / update / content development
- 3 Equipping each NGO with ICT tools
- 4 Training of NGO staff, Application of ICT tools for communication and development
- 5 Experience sharing visit

The following outcomes (verifiable indicators) were specified in the logical framework of the project document regarding objective 1:

- 1 6 NGOs equipped with ICT (computers, printers, network)
- 2 6 NGOs apply ICT tools for development
- 3 NGOs opened discussion points
- 4 90% of NGO project staff accessed ICT for communication and technical skill improvement
- 5 Improved understanding on a range of business related issues

In the final project report concerning the activities in 2013 we read that all these planned activities were implemented in line with the project document. The needs assessment was carried out, the ICT infrastructure at NGO level is operational, NGO staff was trained and the experience sharing visit was organized (visit to a similar consortium in Kenya). Although we did not verify the last two more qualitative outcomes (4 and 5) we expect that results come close to the intended goals as all the planned activities were implemented.

With regard to **objective 2**, “enhanced competitiveness of 115 FMOs in the decision making process of their 13,560 member households through accessing relevant and reliable market information”, the following output was specified:

- An established interactive market information system through the use of ICT

The following activities were envisaged:

- 1 Establishing a central information desk at union level
- 2 Identify and link to potential information sources
- 3 Organizing workshops on the development of interactive market information systems for chain actors and supporters
- 4 Preparation of e-bulletin about FMOs business portfolio (downward accountability) for members.
- 5 Training on ICT devices usage for FMO leaders (basic skills, sms texting, market info management, website accessing)

The following outcomes (verifiable indicators) were specified in the logical framework of the project document regarding objective 2:

- 1 Improved access to market information by FMOs and members
- 2 Improved trade performance – 50% increase in sales and profit of FMOs
- 3 50% increase in business transaction turnover with reliable buyers
- 4 10% increase in number of members
- 5 Improved access to business and support product services
- 6 90% of the members are satisfied by the services of FMOs and Unions

In the final project report on project activities in 2013 we read that most of these activities were implemented. Four ICT centres were established at Union level in four different sites (TuluBollo – FC and OSRA, Ambo – ERSHA, Ginchi – HUNDEE, Shashemene – ADAA and CDI). The Hundura Becho Union also provides computer skill training to surrounding community members at certificate level. These training activities provide income and assist the Union to cover ICT related costs. Out of the planned 54 FMOs only 24 FMOs are provided with computers, mainly due to lack of access to electricity. Those FMOs that received the computers are now using it for report writing and data management. It is claimed that 44 FMOs are able to store and retrieve their data easily (they modernized their data management system).

The link to potential information sources is still at its infancy. Information from the ECX is exploited by 2000 farmers (project report 2013), a new software product (TERRA) will be launched, the bulletin to update FMO members only knows a first number. FMO leaders

prepared audit reports but they are waiting to disseminate the information to their members.

In 2012, a three-day workshop was organized for chain actors on the development of an interactive market information system. In the same year a three-days training for Unions and 44 FMOs was organized. In the reporting period 659 persons are trained on SMS texting, computer skills and on how to request market information from sources like the ECX (Ethiopian Commodity Exchange).

With regard to the verifiable indicators we note that our household study will discuss the results regarding indicators 1-2-5-6 (Section 5). In the project report 2013 it is claimed that those FMOs which are exchanging information increased their turnover more than 6 times. At the same time the annual report of the C7 project provides a less promising picture and notes that the average working capital utilization rate was only 87%. It is also reported that the membership rate increased by 7% (1142 members)

With regard to **objective 3**, “enhanced efficiency and effectiveness of 137 FMOs/Union using ICT services that improve 16,440 member households’ productivity by 2013”, the following output was specified:

- Established MIS

The following activities were envisaged:

- 1 Creating general awareness on ICT to the community at large
- 2 Deploying social media for knowledge sharing and discussion
- 3 Developing audio visual on improved agricultural technology
- 4 Establishing and disseminating e-library on a bi-annual basis

The following outcomes (verifiable indicators) were specified in the logical framework of the project document regarding objective 3:

- 1 75% of the members accessed information on production and quality enhancing technologies
- 2 Improved productivity of agricultural commodities by 25%
- 3 Improved product quality and traceability of agricultural commodities
- 4 Increased outreach to ICT utilization by 15.000 low income smallholder farmers

Regarding the activities the project report (2013) noted that the most important changes regarding ICT is the general awareness created at FMO and Union level. They are familiar

with ICT tools. An audio/visual documentary on the agronomic practices of three commodities was developed. This material serves targeted households and other farmers as well. This enabled the project to reach and benefit more people than initially expected.

With regard to the verifiable indicators we note that our household study will discuss the results regarding indicators 1-2-4 (Section 5). From the information available at NGO level we conclude that 5781 (almost 40%) small-scale producers and entrepreneurs use ICT to access production and market information

The overall goal of the project is the improvement of livelihoods of smallholder farmers through integrating ICT in their daily practices. Two verifiable indicators were formulated in the project proposal regarding this goal (logical frame): an increase in crop sales income and personal investment at HH level (new livestock asset, HH utensils, children at school, construction material etc.). With regard to crop sales income we read in Section 8.7 of the project document that a 25% increase in income from crop sales is strived for. In the household study (Section 5) we discuss the results we obtained regarding these indicators.

The household study allows us to test some outcome indicators at household level. We recall the following specific outcome indicators and translated them in effects at household level:

- 1 Improved access to market information for members. *Indicator: F07, F09, F011, G19.4*
- 2 Improved trade performance – 50% increase in sales to the FMOs. *Indicator: F12, F14, F18, G13-G18*
- 3 Increased membership (10%). *Indicator: G03*
- 4 90% of the members are satisfied with the services of FMOs and Unions. *Indicator: G21*
- 5 75% of the members accessed information on production and quality enhancing technologies. *Indicator: G19*
- 6 Improved productivity of agricultural commodities by 25%. *Indicator: D09*
- 7 Increased outreach to ICT utilization by low-income smallholder farmers. *Indicator: F07, F09*

We also test the following more general outcome indicators derived from the overall goal of the project:

- 1 An annual increase of crop sales income (25%). *Indicator: F12, F14*
- 2 An increase in personal investment at HH level (new livestock asset, HH utensils, children at school, construction material etc.). *Indicator: livestock, mobile phone, radio*
- 3 Food security. *Indicator: I01 – I11*

4. Method

The objective of this evaluation is to describe changes in outcome indicators that can be attributed to participation in the project. The challenge in any impact evaluation is to isolate the causal role of the intervention from other determinants (Armendariz, 2010). When comparing the situation of beneficiaries before and after an intervention, the observed changes in outcome variables cannot solely be attributed to the intervention, as there are many other changes in the environment of the respondents during the project period. Comparing beneficiaries with a control group of non-beneficiaries does not automatically provide the solution. Beneficiaries could for instance have been wealthier than non-beneficiaries when the program started or *vice versa*. This and other factors can make some people more likely to choose to participate in the program, thus causing self-selection bias. Besides self-selection bias, program placement bias is also frequently observed in evaluation studies. NGOs target their projects purposely at specific, often disadvantaged, areas. If the control group's physical, economic and social environment does not match that of the beneficiaries, this will result in differences not caused by the intervention and thus in biased estimates of impact.

The standard approach to overcome these issues is to conduct a randomized control trial (RCT). Before the program starts two groups will be created at random. One group will receive the treatment (treatment group) while the other group will act as a benchmark (control group). Because of the randomization the members in the control group represent the members in the treatment group. After the treatment has taken place, both groups can be compared on the outcomes of interest. Differences in outcomes can now solely be attributed to the treatment. However, creating two groups at random, a necessary step for RCTs, is not always possible because of program implementation or ethical reasons. As we were not involved in the design of the project, we use an alternative to RCTs: a so-called double difference (DD) model. In order to apply a DD model one needs to have information about relevant indicators of the treatment group and the control group at two points in time, preferably before (baseline) and after (end-line) the intervention. While the RCT methodology ensures that the only difference between members in the treatment and control group is the treatment, the DD method only eliminates differences between members of the two groups that do not change over time. So the disadvantage of the DD method over the RCT method is that it does not automatically distinguish between the impact of time-varying characteristics between members of the two groups and the impact

of the treatment. A (partial) solution to this problem is to include as many time varying characteristics into the DD model as possible so that only the influence of unobserved time-varying characters remains.

The DD method works best if the treatment and comparison group are as comparable as possible. One popular method to achieve this is the propensity score method (PSM) (Rosenbaum, 1983). The basic idea is to match beneficiary households to households from the control group who are observationally similar in terms of characteristics that are not affected by the intervention. These include stable characteristics of the household. If there is a proper baseline, outcome variables during baseline can also be used for matching, because they were not yet affected by the treatment. In practice, PSM involves running a binary regression of the project participation indicator on the relevant set of characteristics. The result is the propensity score: the estimated probability that a household is a beneficiary. The DD method is then applied to households with propensity scores in the range in which both beneficiaries and non-beneficiaries are observed (the *common support*): non-beneficiaries with a very low propensity score and beneficiaries with a very high propensity score are discarded.

As indicated above, we first applied PSM and then estimated a DD model. Econometrically speaking the double difference estimator is given by the following expression:

$$Y_{ijt} = \alpha + \beta_1 Post_t + \beta_2 D_j^T + \beta_3 Post_t D_j^T + \gamma X_{ijt} + \varepsilon_{ijt} \quad (1)$$

Where Y_{ijt} denotes an outcome variable for respondent i in group j at time t , D_j^T is a dummy variable equal to one if the respondent belonged to the treatment group, $Post_t$ is a binary variable that takes the value one if the observation corresponds to the post-treatment time period, X_{ijt} is a set of controls¹, and ε_{ijt} denotes the error term. Then, β_3 in (1) is the treatment estimate of the intervention's impact on outcome Y . That is, β_3 measures the difference between the treatment and control group in the growth of outcome Y , and is an unbiased estimate of the average impact on the dependent variable Y of being assigned to the treatment group provided the assumption of no selection on un-observables holds.

¹ Additional covariates are included to control for various characteristics of the households. This not only helps with the precision of the estimates, but also reduces the problem of omitted variable bias. This is necessary to obtain unbiased measures of the treatment effects.

Although a combination of PSM and DD can solve many potential biases in the data, some bias may remain. As PSM assumes selection on observables, bias can still be caused by selection on un-observables. Adding DD to PSM helps picking up the time-invariant heterogeneity, but bias can still remain due to time-variant un-observables. We note that the possibility of time varying heterogeneity between control and treatment groups is less likely in this study as both groups are located in the same region and belong to the same agro-ecology and administrative system. We were also informed that no specific interventions were taking place in the Kebeles that are part of the control group. Yet, a positive significant effect in the DD model is a strong indication of an influential intervention. An insignificant effect (or even a significant negative effect), however does not necessarily imply that the intervention does not work, as in our analysis we only measure short-term effects.

Many of the outcome variables considered in the analysis are binary. In these cases, we estimated a linear probability model (LPM) and report the marginal effect of D_t^C for the impact of the project on outcome Y.

It is often the case that there is some level of attrition (or dropping out) and/or new entry in the dataset. The DD model presented in (1) can be estimated using an unbalanced panel, keeping in all observations, including the ones which we only observe in one time period. It can also be estimated using a balanced panel, dropping observations which we only observe in one period. Estimating (1) using an unbalanced panel increases the power, but as the sample becomes more heterogeneous the results might be distorted. As we deal with a number of drop-outs in the endline survey (Table 1) all estimations are done on the balanced panel.

5. Data collection

This project C5 is strongly linked to the MFS II C7 – project of the FMO consortium. C7 deals with the same regions, FMOs and SPOs (NGOs). The subset of FMOs that participated in C5 project activities is sometimes smaller than the total number of FMOs involved in C7. Only 24 FMOs received an ICT infrastructure (treatment group 1) and only 44 FMOs participated in the trainings. However, the support given to the Unions, benefited all the FMOs as they have access to the market information and the information regarding production techniques. The projects are complementary. C7 is more oriented towards the strengthening of the organization of the FMOs and their Unions. This project (C5) focuses on the ICT service at Union/FMO level. Due to these linkages it is not possible to isolate the effects and impact of

each project. Taking the complementarity into account it is also not useful to do that for the different indicators. However, some of the outcome indicators specified for C5 (outcome indicators 1-5-7) are more related to the ICT focus area of the project.

We conducted a survey of farmer households to measure the effects of the project. A first survey took place in September/October 2012 and a second survey in October/December 2014. The September 2012 survey can be considered as a kind of baseline but two limitations have to be taken into account. First, we described in Section 2 that most of the treated FMOs had already a relationship with the involved Ethiopian and Dutch NGOs and received support in the past to strengthen their organization. The performance of the FMOs may reflect the effects of earlier projects from which they benefitted. Moreover, implementation of the project activities (C5) started in January 2012. Knowing that it takes some time to observe the first effects of the intervention and that the data regarding the farming system resulted from decisions made before January, it seems to be reasonable to assume that the observations made for the first survey can be considered to be a baseline. The second survey can be regarded as a kind of end-line result. Although the project finished at the end of 2013 and the survey took place in October 2014, it is argued that the information obtained about the farming activities resulted from decisions made at the end of the project.

Next to the surveys we also did some qualitative studies at the level of the treated FMOs (ADAA - Abdi Rabii, Hawi Gudina, Borato Gaalo; CDI - Dolu Kersa, Jalela, Meda Gudina; HUNDEE – Kituma, Suqui Waqeyo, Goda Racha; FC – Siba Robe, Feyine, Rimessa). Five students of Groningen University interviewed FMO responsables, NGO fieldstaff and farmers to describe project activities. These qualitative studies were used to interpret the results of the survey data.

C7 and C5 cover all FMOs. We distinguish 2 treatment groups:

- T1. The treatment group, smallholders member of the ‘treated’ FMOs C7 and C5 (ICT for market information and ICT for organizational strengthening – objective 2).
- T2. The treatment group, smallholders member of the ‘treated’ FMOs C7 and C5 (ICT for market information only – objective 3)

We expect that the first treatment group is getting a more intensive treatment as computers are made available at the FMO’s office. This may facilitate transparency and information

dissemination at FMO level. We also expect that the selected FMOs for the more intensive treatment are also the better performing FMOs. Therefore, a first assessment of outcome indicators will concern the analysis of differences between treatment 1 and treatment 2 groups.

We distinguish two control groups:

- C1. Control group: smallholders from the same Kebele/village non-members of the FMO. This will help us to capture spill-over effects.
- C2. Control group: smallholders in another Kebele/village without access to FMO services

We sampled 4 NGOs: Hundee, FC, ADAA and CDI. Hundee and FC are selected as they have been indicated as local SPOs in the project documentation distributed by WOTRO. ERSHA and OSRA are not sampled as they operate in the same areas where HUNDEE and FC are operating. Due to budget constraints we had to limit the number of FMOs and households interviewed.

Table 1: Distribution of the NGOs and FMOs across Woredas

NGO	Woreda	No. of FMOs supported by C7 and C5 (only ICT for market information)	No of FMOs supported by C7 and C5 (ICT for market information and organizational strengthening)	Total
HUNDEE	Sinana	4	1	5
	Agarfa	2	0	2
	Dinsho	0	1	1
	Goba	2	1	3
	Jeldu	1	4	5
	Dandi	5	0	5
	Dawo	3	0	3
FC	Seddán Sodo	8	3	11
	Becho	2	3	5
	Dewo	3	4	7
ADAA	Arsi Negele	5	5	10
	Shashemene	2	4	6
CDI	Shala	1	4	5
	Shashemene	5	4	9
	Siraro	5	0	5
Total		48	34	82

The Woredas are in different regions of the country (Table 1). The FMOs are selected in two steps: first the Woreda, then FMOs. Woredas are first selected to make our comparison groups similar. If we choose the treatment group from one Woreda and the other treatment and non-treatment control group from another Woreda, we may get very heterogeneous groups in terms of crops they produce, productivity, access to markets, roads etc. We select non-participating farmers (C1) in the same Kebele as farmers selected for T1 and T2. Random

selection of Woredas is not followed due to uneven distribution of FMOs across Woredas. We purposely selected those Woredas with a reasonable number of FMOs.

We intended to take 32 farmers from each sampled FMO, giving 256 observations for each treatment (T1 and T2). For the control group C1, 16 farmers were selected from the same Kebele (16 FMOs), giving 256 observations. For control group C2, 32 farmers were selected per Kebele without an FMO (8 Kebeles giving 256 observations). Note that an FMO is organized per Kebele. Hence we find only one FMO in a Kebele. The FMOs marked with * are receiving both C7 and C5, the FMOs/Kebeles marked with ** receive only C5 ICT market information. The difference is interpreted as a difference in the degree of treatment. Two FMOs are selected for each treatment from Arsi Negele and Shashemene because of the large number of FMOs in these Woredas. Likewise two control Kebeles without an FMO are selected from these Woredas.

Table 2: Full sample baseline and endline

Woreda	Kebele/FMO	Full sample size				SPO
		FMO members (T1+T2)		Non-FMO members (C1+C2)		
		Baseline	Endline	Baseline	Endline	
Sinana	Kituma *	39	35	14	14	HUNDEE
	Bikilitu**	29	28	15	15	HUNDEE
	Sambitu	-	-	32	28	-
Jeldu	Suqui Wageyo*	33	28	15	13	HUNDEE
	Goda Racha**	32	32	16	15	HUNDEE
	Kilbe Abo	-	-	32	31	-
Seddán Sodo	Siba Robe*	32	30	16	14	FC
	Wuli Gotera**	32	30	17	15	FC
	Ale Abeba	-	-	31	31	-
Dewo	Feyine*	32	32	16	15	FC
	Rimmessa**	32	27	16	12	FC
	Kecheicho Gerbi	-	-	32	32	-
Arsi-Negele	Abdi rabii *	40	39	8	8	ADAA
	Hawi Gudina*	37	37	11	11	ADAA
	Borata gaalo **	33	31	14	13	ADAA
	Gadisa Dahmota**	31	29	17	16	ADAA
	Ali Wayo	-	-	32	32	-
	Kersa Ilala	-	-	32	30	-
Shashemene	Dolu Karsa *	38	33	10	10	CDI
	Jalela *	46	45	1	1	CDI
	Meda-Gudina**	32	30	16	13	CDI
	Awara Badessa **	32	28	16	14	CDI
	Bute Filicha	-	-	32	32	-
	Alelu Illu	-	-	32	31	-
Total		550	514	473	446	
Attrition rate			6.55%		5.71%	

The FMOs/Kebeles marked with * are receiving both C7 and C5, the FMOs/Kebeles marked with ** receive only C5 ICT market information.

The intended number of respondents somewhat differs from the realized numbers. Three reasons explain this deviation. First, in some villages and in particular in Jalela, it was difficult

to find non-members of the FMO. As required investment for membership is quite small (50-100 Birr) and social pressure to become member may exist, it was difficult to find non-members in Jalela. Second, sampling of members and non-members was done on the basis of information provided by the FMO. During the interviews it sometimes became clear that a member (non-member) considered himself or herself a non-member (member). The third reason is attrition. About 60 observations were lost due to the decease of the household head, the household moved to another Kebele or the household was not available for the end-line interview. As attrition was relatively well distributed over the Kebeles (Table 2) and the total number is limited, it is expected that the results are not affected by attrition.

The questionnaire addressed characteristics of the household and the farming system and consisted of 8 blocks of questions: household composition, household assets, land and crop production, livestock, access to markets and marketing, the FMO and its services, non-farm income and household expenditures, food security (Annex).

6. Analyses and results

Table 3 presents some descriptive statistics for household characteristics in the baseline study. In general we observe only minor differences in the averages between the treatment and the control groups. This implies that comparison of these farmers to identify treatment effects is promising as the 'common support' can be expected to be large. The age of the household head in the control group is somewhat lower and the household size somewhat smaller (Table 3). Education levels are the same for the treatment and the control group. Quite a number of the farmers is illiterate (30%) and the average number of years of education is quite low (4 years). The main occupation for nearly all interviewees is farming. The farmers in the treatment group own a bit more land (1.8ha vs 1.5ha²). We conclude that differences between the averages for the two groups are quite small, although some differences between the groups are significant. In order to control for these differences propensity score matching is applied for the 'difference-in-difference' analysis (see method section).

² Land ownership is taken as a control variable as property rights are fixed over time. The government distributes the ownership right to farmers. Land use is more flexible as land can be rented-out or rented-in. Therefore we take the cultivated area (land area under crop) as an outcome variable (Table 5).

Table 3: Household characteristics (control variables)

	Total	N	Treatment	N	Control	N	t-stat
Demographics:							
HH Head male (%)	92	1023	91	550	93	473	1.16
HH Head Age	43.7	1023	44.5	550	42.9	473	-2.10**
Number of adults (>=15)	3.4	1023	3.5	550	3.3	473	-1.59
Household size	6.6	1023	6.8	550	6.5	473	-2.07**
Head of the household Muslim (%)	52	1020	54	549	49	471	-1.59
Head of the household Christian (%)	47	1020	45	549	50	471	1.45
Head married living with spouse (%)	91	1022	91	549	91	473	0.23
Education and Occupation:							
Education level in years finished	4.3	1023	4.3	550	4.4	473	0.29
Head illiterate (%)	30	1022	29	549	31	473	0.53
Head with some elementary education (%)	37	1022	35	549	39	473	1.31
Head with some secondary education (%)	14	1022	13	549	14	473	0.39
Farming Main occupation (%)	94	1001	94	535	94	466	0.10
Assets							
Land owned (ha)	1.7	1023	1.8	550	1.5	473	-2.34**
Distance to Woreda market (km)	9.7	959	10.0	514	9.3	445	-1.99**
Distance to all-weather roads (km)	4.6	1023	4.7	550	4.4	473	-0.67

note: ***=Significant at the 1 percent level, **=Significant at the 5 percent level, *=Significant at the 10 percent level.

Table 4, 5, 6 and 7 provide descriptive statistics for several outcome indicators. Table 4 reports information about general assets and expenditures showing that the averages for the treatment and control groups are quite similar. Interestingly, food *insecurity* somewhat decreased (improvement) for the treated group and leads to a significant difference if compared with the score for the control group in the outline. Mobile phone ownership increased significantly among farmers and, in particular among farmers in the treatment group.

Table 4: Outcome indicators: Expenditures, Food Insecurity and Assets

	Total	N	Treatment	N	Control	N	t-stat
Expenditures and Food Insecurity							
Expenditures last 7 days ETB per capita (baseline)	34.5	981	31.9	524	37.4	457	1.23
Expenditures last 7 days ETB per capita (endline)	40.3	959	38.0	514	42.9	445	1.29
Food Insecurity (baseline)	15.7	1023	15.9	550	15.6	473	-0.65
Food Insecurity (endline)	15.5	960	15.1	514	16.0	446	2.63***
Assets							
Household access to electricity (%) (baseline)	16	1018	14	549	19	469	1.96**
Household access to electricity (%) (endline)	18	943	15	508	23	435	3.08***
Household access to piped water (%) (baseline)	12	1014	13	547	10	467	-1.05
Household access to piped water (%) (endline)	12	943	13	508	12	435	-0.59
Do you own a radio? (%) (baseline)	47	1023	46	550	49	473	0.78
Do you own a radio? (%) (endline)	49	960	50	514	49	446	-0.30
Do you own a mobile phone? (%) (baseline)	46	1023	47	550	45	473	-0.78
Do you own a mobile phone? (%) (endline)	69	960	72	514	66	446	-2.24**

note: ***=Significant at the 1 percent level, **=Significant at the 5 percent level, *=Significant at the 10 percent level.

Table 5 provides some indicators for the farming system. The average fertilizer use decreased for both groups. In line with the land owned the land area under crop is somewhat higher for the treatment group. We also observe an increase in the cultivated area in the endline survey. The percentage of farmers using improved seeds is larger among members of the

FMO (treatment group). The average total quantity per hectare (in quintals) for four crops (teff, wheat, barley, maize) is quite stable and similar for treatment and control groups. We take the 4 most important crops together in order to get a reasonable amount of observations for each of the groups. The average total quantity sold and the total value of the sales are also quite similar for the treated and control groups. We observe an increase in production as a result of an increase in the cultivated area. This also explains part of the increase in sales value. Increasing prices explain the other part of the latter change.

We observe a small increase in livestock owned by the households in the period under study for both treated and control farmers. Treated farmers have on average a bit more livestock than farmers in the control group. In the baseline study only a few farmers indicated that the FMO was the most important source of market information. It is disappointing to observe that in the endline less than 10% of the farmers of the treated group (members of the FMO) indicate that the FMO is the most important source of market information. Interestingly the use of the mobile phone for getting access to market information seems to decrease among farmers (treatment and control group). This is somewhat disturbing as mobile phone ownership increased and the project invested in access to market information through mobile phones.

note: ***=Significant at the 1 percent level, **=Significant at the 5 percent level, *=Significant at the 10 percent level.

Table 6 provides information about the selling and buying behavior of farmers. Among members (treatment group) the use of the FMO to buy fertilizer and seeds is quite stable for the baseline and the endline. About 45% of the members buy these inputs through the FMO. Interestingly, the role of the FMO for these inputs increases in particular among non-members (control group). Less than 50% of the farmers is selling output to the FMO. Remarkably this percentage is not increasing over time. The difference between control and treated groups is significant.

Table 6: Outcome indicators: Selling to/buying from FMO

*We note that all questions regarding the FMO are not applicable to farmers in control group 2 as these villages generally do not have access to FMO services. The control group for these questions is C1. Only the questions regarding sales to traders provides the average for C1 and C2 (average quantity sold to traders, teff/wheat average and prices). ***=Significant at the 1 percent level, **=Significant at the 5 percent level, *=Significant at the 10 percent level.

The total average quantity sold is quite similar for treatment and control groups (Table 5). Figures show an increase in total average sales for the period under study: 7.9 quintal to 10.7 quintal (35%). The vast majority of the output is sold to private traders as the number of observations for sales to private traders is much higher than the number of sales to the FMO. We calculated this figure for the four most important crops (teff, wheat, barley, maize). For

the two most popular crops we further analyzed the sales and the prices (Table 6). The quantity of teff and wheat sold increased significantly for all farmers. Interestingly, the FMO seems to play a relatively more important role as an increasing share is sold to the FMO, in particular by FMO members. At the same time we observe that, to date, most of the output is sold to private traders. In the endline 83 (83) farmers, members of the FMO, sold teff (wheat) to the FMO while 130 (222) farmers sold to private traders. It is also noted that the average quantities sold are quite similar. The table also indicates that the price differences between sales to the FMO and private traders are not very different. Some spillover effects become clear as non-members living in the FMO village (Control group 1) also sell to the FMO.

Table 7: Outcome indicators: FMO Services use and perceptions

FMO is a weak organization	37	688	36	509	41	179	1.24
Since the FMO market information is easier	62	688	64	509	56	179	-2.04**
Major purpose of FMO is access to inputs/cons. goods	63	688	66	509	55	179	-2.51**
Major purpose of FMO is providing good selling opportunities	78	688	81	509	71	179	-2.68***

*We note that all questions regarding the FMO are not applicable to farmers in control group 2 as these villages generally do not have access to FMO services. The control group for these questions is C1. ***=Significant at the 1 percent level, **=Significant at the 5 percent level, *=Significant at the 10 percent level.

Table 7 provides information about the use of FMO services and perceptions regarding the importance of the FMO. Somewhat more than 50% of the members used the FMO during the last year to get training on agricultural production, training on marketing and business and price information. For some of these services spill-over effects are quite high. In the endline study a large number of non-members indicate that they also use the FMO for these services. Perceptions regarding the role of the FMO are quite good (somehow agree). We note that scores are acceptable but do not increase over time. About 36% of the farmers in the treatment group confirm the statement that the FMO is a 'weak' organization. In general we

observe that the members are more positive about the FMO than the non-members living in the FMO village (control group 1).

The next step in the analysis is to isolate the treatment effect for the period under study. The difference-in-difference method (see method section) will be applied to analyze differences between the subgroups T1/T2/C1/C2. Differences over time and between Zones can be allocated to three effects:

- the change in the outcome variable (endline minus baseline) for the control C1/C2
- the difference in the outcome variable between the treatment T1/T2 and the control C1/C2 at the moment of the baseline
- the effect of the treatment during the period under study (endline minus baseline)

For our analysis the third effect is most important as it isolates the effect of the treatment on the treated. In the Annex the results of the analysis are given.

First we compare treatment differences between T1 and T2. We already explained that the treatment for T1 is more intensive as computer facilities are made available at FMO level. In order to test for the importance of these differences we check whether there is a significant difference in treatment effects that results from the different treatments. We do not present the results in the annex or the tables as we came to the conclusion that the different treatment does not lead to differences in the treatment effect. No significant differences in treatment are observed for expenditures, assets, farming system indicators and sales to the FMO. Remarkably, the effect on the food insecurity index and expenditures per capita was negative (5% level), meaning that the treatment effect for food insecurity was stronger (more negative meaning a further *reduction of food insecurity*), but negative on weekly expenditures. We conclude that the differences in the treatment between T1 and T2 are too small to result in significantly different outcomes.

Table 8 shows that only a few treatment effects are identified. If treatment groups T1 and T2 are compared with control group 1 the non-significance could be interpreted as the result of spillover effects. Only with regard to food insecurity and ownership of cows the treated groups show a somewhat better performance. However, most treatment effects are also not significant if the treated groups are compared with the farmers who do not have access to FMO services (C2). Food insecurity shows a treatment effect in the targeted direction. For fertilizer and improved seeds this effect is rather negative as increased use of these inputs in the C2 group is even stronger (also see tables 5 and 6). We see some improvement regarding

the FMO as a major source of information. This is a somewhat trivial result as FMOs are not operating in C2. We recall that less than 10% of the farmers in T1/T2 indicate that the FMO is their most important source for market information. Quite disappointing is that there are no treatment effects observed regarding the average quantity per hectare, the average quantity sold and the value of sales. We conclude that differences in the performance of treatment and control groups with regard to these indicators cannot be attributed to the treatment.

Table 8: Treatment effects: Expenditures, Food Insecurity, Assets, Farming System

	Control 1	Control 2

Market information received through mobile	ns	ns

note: ***=Significant at the 1 percent level, **=Significant at the 5 percent level, *=Significant at the 10 percent level, ns=not significant.

Table 9 confirms the average results already presented in Table 6. With regard to the buying of fertilizer we observe a negative treatment effect reflecting the steady increase of procurement of fertilizer from the FMO by non-members (C1) living in the same area. In Table 8 we compared the treated groups with farmers having no access to FMO services. Regarding total average sales and production per hectare no significant differences were identified between treated and control groups. The significant difference that exists is that there is an increase in the sales to the FMO by the members as well as the non-members living in the same Kebele.

Table 9: Treatment effects: Selling to/buying from FMO

Control 1	
<i>Buying inputs from the FMO</i>

Average quantity sold to traders	
qt of teff sold to trader	ns
qt of wheat sold to trader	ns

note: ns=not significant

Table 10 shows that the estimated total value of sales to the FMO more than doubled (147%) for members (T1 and T2). The value of sales to private traders increased with 'only' 31%. The figures are somewhat lower but still encouraging for the increase in quantities (control for price increases). The figures are derived from the information presented in Table 5. Here we would certainly find a significant treatment effect if T1/T2 would be compared with C2. The fact that none of the C2 farmers sells to the FMO makes this exercise somewhat trivial as farmers in this control group (C2) have to sell 100% of their output to private traders.

Table 10: Estimated distribution of sales to the FMO and private traders (four crops)

	Sales to FMO and private traders			
	Total Quantity (four crops, quintal)		Total Value (four crops, ETB)	
	FMO	Private traders	FMO	Private traders
Baseline	878	3360	560,880	2,327,150
Endline	1657	3942	1,384,248	3,061,593
% increase	89%	17%	147%	31%

note: as the number of observations in the endline is lower than the number of observations in the baseline (550 vs 514) we corrected the outcomes of the endline study with the factor $550/514 = 1.07$.

Table 11 shows effects on the use of services obtained. As indicated in Table 7 use of services was quite stable among members. Significant increases were observed for the non-members living in the same village (C1). This is confirmed by the negative treatment effects observed in Table 11. With regard to the perceptions no differences in treatment effects are identified, which is also in line with the averages presented in Table 7. We recall that we did not ask farmers who have no access to FMOs (C2) to reply these questions as they have no experience with the services of an FMO.

Table 11: Treatment effect: Services obtained and perceptions regarding the FMO

Better prices through the FMO (baseline)	ns

note: ***=Significant at the 1 percent level, **=Significant at the 5 percent level, *=Significant at the 10 percent level, ns=not significant.

7. Discussion

In this section we recall the specific outcome indicators as specified in section 3 and discuss the results of our analysis pertaining to these outcomes:

- 1 Improved access to market information for members. *Indicator survey: F07, F09, F011, G19.4*

The results we obtain for this outcome are somewhat mixed. About 50% of the members obtained information from the FMO (Table 7). A minority (less than 10%) indicates that the FMO is the major source of market information (Table 5). The problem with this objective is the word ‘improved’. We failed to observe a convincing positive trend in the baseline and the endline scores.

- 2 Improved trade performance – 50% increase in sales to the FMOs. *Indicator survey: F12, F14, F18, G13-G18*

If we calculate the sales to the FMO for members we observe an increase in the quantity (89%) and the value (147%). This shows that, even if we control for price changes, this targeted outcome is realized (Table 5). We urge to nuance this result as private traders continue to play the major role in output marketing. Moreover, 50% of the members do not sell to the FMO and prefer private traders.

- 3 Increased membership (10%). *Indicator survey: G03*

Our data provide some indication for the increase in membership. We interviewed 471 farmers who indicated to be member of the FMO in the baseline as well as in the endline. In total 41 farmers notified in the endline that they left the FMO. However, in total 60 farmers were not member in the baseline but became member in the endline. This shows a net increase of 19 members (4%).

- 4 90% of the members are satisfied by the services of FMOs and Unions. *Indicator survey: G21*
We observe that on average farmers are quite satisfied with the FMO (Table 7). Although the target of 90% is too ambitious (closer to 75-80%).

- 5 75% of the members accessed information on production and quality enhancing technologies. *Indicator survey: G19*
Our data show that this percentage is between 50 to 60% of the members (Table 7)

- 6 Improved productivity of agricultural commodities by 25%. *Indicator survey: D09*
We fail to observe a significant increase in yields (Table 5). We also fail to identify a treatment effect, confirming that the treatment group did not outperform both control groups.

- 7 Increased outreach to ICT utilization by low income smallholder farmers. *Indicator survey: F07, F09*
Taking the amount of investments made it will be difficult to observe no effect at all. However, what is disappointing is that less than 10% of the members indicate that the FMO is their major source of market information. We also observed that the use of ICT at the FMO level is a major problem due to a lack of electricity and, in particular, low education (this observation is based on the qualitative studies of the FMOs in the Kebeles). We conclude that the use of these instruments at FMO level is quite ineffective.

- 8 An increase in crop sales income (25%). *Indicator survey: F12, F14*
The increase in value is indeed large and above the target of 25% (Table 5). We note that the increase is not the result of an increase in yield but the effect of price increases and an increase in the cultivated area. To some extent the result is disappointing as we are not able to identify a treatment effect, meaning that the improvement cannot be attributed to the project intervention.

- 9 An increase in personal investment at HH level (new livestock asset, HH utensils, children at school, construction material etc.). *Indicator survey: livestock, mobile phone, radio*
The ownership of livestock somewhat increased and, in particular the ownership of mobile phones became more popular. However, no treatment effects are identified, so this change cannot be attributed to the project.

10 Food security. *Indicator survey: I01 – I11*

Food security somewhat improved and our data indicate that this can be attributed to the project. This implies that food security improved more among the treated farmers if compared with the scores of the control groups (C1 and C2).

8. Conclusion

We conclude that this project realized some of its objectives. However, it also failed to realize others. We recall that 50% of the members in the endline study did not sell to the FMO, that most of the surplus is sold to private traders and that the role of the FMO in providing market information is still at its infancy. The FMOs' turnover increased, but the total turnover of the FMOs is still much lower than the marketable surpluses FMO members produce. We do not have any information about the financial position of the Unions. However, if the realized turnover of the FMOs is taken into account the question raises whether the involved costs of the organization can be recouped. In the start-up phase this may be accepted, but for the near future this may lead to major problems. Increasing the turnover of Unions is key, not by increasing the number of members, but by further increasing the share of the members' surplus sold through the FMO. This implies that the commitment of farmers to sell through the FMO has to increase further. It is exactly this commitment that may be questioned as so many farmers prefer to sell to private traders and no incentive exists to reorient them towards the FMO. The qualitative studies we made in several Kebeles show that this commitment concerns a serious challenge.

Table 12: Project final scores

On a scale of 1 to 10, with 1 being “not at all” and 10 being “completely”, for this project, how much do you agree with the following statements:	
The project was well designed.	8
The project was implemented as designed.	7
The project reached all its objectives.	5
The observed results are attributable to the project interventions.	7
The observed results are relevant to the project beneficiaries.	6
The project was implemented efficient.	6

On the basis of the project proposal and the annual reports we conclude that this project was well designed and implemented. With regard to the implementation some delays are reported for the installation of the ICT facilities at FMO level. We doubt whether this activity

is effective at this moment in time. Probably it would have been better to wait with these investments until the moment that the FMO organization would be stronger and managed by people with the required reading and writing skills. The project reached some of its objectives but also failed to realize others. More important, we failed to identify several expected treatment effects (except for food security), which make it difficult to attribute the results to project interventions. The observed results are relevant for the project beneficiaries but further improvement is needed. It is too early to assess the efficiency of the project as significant investments are made in ICT but the effect on outcome indicators is still lacking or weak. Moreover, effective use and the realization of effects at farm level require a certain learning period. The project has been too ambitious in expecting that Unions could be established, an ICT infrastructure created and outcomes realized in a three year period. In line with this we would advise to fund a similar project in the future but to extend the implementation period in order to organize the FMOs/Unions and to introduce ICT facilities at FMO level properly. The FMOs/Unions still face serious challenges and cannot survive without external support. The worst thing that may happen is a sudden end of project support as this may jeopardize past investments.

Regarding the project evaluation we note that several limitations affected the evaluation. Most important is that the two year time difference between the baseline and the endline is very short. As mentioned above a learning period is required to assess the opportunities. It is well possible that the major outcomes of this project will become measurable only in the coming years.

Report CDI- 15-052

Kusters, C.S.L, T. van Ingen, E. Zerfu, D. Kefyalew, D. Getu, B. Peters, N.N. Buizer, 2014. *Endline report Ethiopia, NVEA. Capacity of Southern Partner Organisations (5c) component*. Centre for Development Innovation, Wageningen UR (University & Research centre). Report CDI- 15-052. Wageningen.

This report presents the findings of the endline of the evaluation of the organisational capacity component of the MFS II country evaluations. The focus of this report is Ethiopia, NVEA. The format is based on the requirements by the synthesis team and NWO/WOTRO. The endline was carried out in 2014. The baseline was carried out in 2012.

Key words: 5C (five core capabilities); attribution; baseline; causal map; change; CFA (Co-financing Organisation) endline; organisational capacity development; SPO (Southern Partner Organisation).

Acknowledgements

We are grateful to all the people that have contributed to this report. We particularly would like to thank the Southern Partner Organisation New Vision in Education Association (NVEA) and the Co-Financing Agencies Edukans Foundation and Stichting Kinderpostzegels Nederland (SKN) for their endless patience and support during this challenging task of collecting the endline data. We hope that this endline report will provide useful insights to NVEA, Edukans, SKN, consortia, the synthesis team, IOB and NWO/Wotro and other interested parties and other interested parties.

The Ethiopia 5C evaluation team

List of abbreviations and acronyms

ABE	Alternative Basic Education
BEN-E	Basic Education Network Ethiopia
BEQIP	Basic Education Quality Improvement Program
Causal map	Map with cause-effect relationships. See also 'detailed causal map'.
Causal mechanisms	The combination of parts that ultimately explains an outcome. Each part of the mechanism is an individually insufficient but necessary factor in a whole mechanism, which together produce the outcome
CBOs	Community Based Organizations
CDI	Centre for Development Innovation, Wageningen UR, the Netherlands
CFA	Co-Financing Agency
CSO	Civil Society Organization
C4C	Connect for Change Consortium
C&DA	Child and Development Alliance
DEC	Development Expertise Center
Detailed causal map	Also 'model of change'. the representation of all possible explanations – causal pathways for a change/ outcome. These pathways are that of the intervention, rival pathways and pathways that combine parts of the intervention pathway with that of others. This also depicts the reciprocity of various events influencing each other and impacting the overall change. In the 5C evaluation identified key organisational capacity changes and underlying reasons for change (causal mechanisms) are traced through process tracing (for attribution question).
EF	Edukans Foundation
General causal map	Causal map with key organisational capacity changes and underlying reasons for change (causal mechanisms), based on SPO perception.
ICCO	Interchurch organization for development cooperation
IFPRI	International Food Policy Research Institute
IICD	International Institute for Communication and Development
MDG	Millennium Development Goal
M&E	Monitoring and Evaluation
MFS	Dutch co-financing system
MIS	Management Information System
NGO	Non-Governmental Organisation
NVEA	New Vision in Education Association
OD	Organisational Development
PME	Planning, Monitoring and Evaluation
Process tracing	Theory-based approach to trace causal mechanisms
SKN	Stichting Kinderpostzegels Nederland
SPO	Southern Partner Organisation
ToC	Theory of Change
Wageningen UR	Wageningen University & Research centre
5 C	Capacity development model which focuses on 5 core capabilities

1 Introduction & summary

1.1 Purpose and outline of the report

The Netherlands has a long tradition of public support for civil bi-lateral development cooperation, going back to the 1960s. The Co-Financing System (*Medefinancieringsstelsel*, or 'MFS') is its most recent expression. MFS II is the 2011-2015 grant framework for Co-Financing Agencies (CFAs), which is directed at achieving a sustainable reduction in poverty. A total of 20 consortia of Dutch CFAs have been awarded €1.9 billion in MFS II grants by the Dutch Ministry of Foreign Affairs (MoFA).

The overall aim of MFS II is to help strengthen civil society in the South as a building block for structural poverty reduction. CFAs receiving MFS II funding work through strategic partnerships with Southern Partner Organisations.

The MFS II framework stipulates that each consortium is required to carry out independent external evaluations to be able to make valid, evaluative statements about the effective use of the available funding. On behalf of Dutch consortia receiving MFS II funding, NWO-WOTRO has issued three calls for proposals. Call deals with joint MFS II evaluations of development interventions at country level. Evaluations must comprise a baseline assessment in 2012 and a follow-up assessment in 2014 and should be arranged according to three categories of priority result areas as defined by MoFA:

Achievement of Millennium Development Goals (MDGs) & themes;

Capacity development of Southern partner organisations (SPO) (5 c study);

Efforts to strengthen civil society.

This report focuses on the assessment of capacity development of southern partner organisations. This evaluation of the organisational capacity development of the SPOs is organised around **four key evaluation questions**:

1. *What are the changes in partner organisations' capacity during the 2012-2014 period?*
2. *To what degree are the changes identified in partner capacity attributable to development interventions undertaken by the MFS II consortia (i.e. measuring effectiveness)?*
3. *Were the efforts of the MFS II consortia efficient?*
4. *What factors explain the findings drawn from the questions above?*

The purpose of this report is to provide endline information on one of the SPOs involved in the evaluation: NVEA in Ethiopia. The baseline report is described in a separate document.

Chapter 2 describes general information about the Southern Partner Organisation (SPO). Here you can find general information about the SPO, the context in which the SPO operates, contracting details and background to the SPO. In chapter 3 a brief overview of the methodological approach is described. You can find a more detailed description of the methodological approach in appendix 1. Chapter 4 describes the results of the 5c endline study. It provides an overview of capacity development interventions of the SPO that have been supported by MFS II. It also describes what changes in organisational capacity have taken place since the baseline and why (evaluation question is 1 and 4). This is described as a summary of the indicators per capability as well as a general causal map that provides an overview of the key organisational capacity changes since the baseline, as experienced by the SPO. The complete overview of descriptions per indicator, and how these have changed since the baseline is described in appendix 3. The complete visual and narrative for the key organisational capacity changes that have taken place since the baseline according to the SPO staff present at the endline workshop is presented in chapter 4.22..

Chapter 5 presents a discussion on the findings and methodology and a conclusion on the different evaluation questions.

The overall methodology for the endline study of capacity of southern partner organisations is coordinated between the 8 countries: Bangladesh (Centre for Development Studies, University of Bath; INTRAC); DRC (Disaster Studies, Wageningen UR); Ethiopia (CDI, Wageningen UR); India (CDI, Wageningen UR); Indonesia (CDI, Wageningen UR); Liberia (CDI, Wageningen UR); Pakistan (IDS; MetaMeta); (Uganda (ETC)). Specific methodological variations to the approach carried out per country where CDI is involved are also described in this document.

This report is sent to the Co-Financing Agency (CFA) and the Southern Partner Organisation (SPO) for correcting factual errors and for final validation of the report.

1.2 Brief summary of analysis and findings

Since the baseline, two years ago, improvements took place in all of the capabilities.

Over the last two years many improvements took place in the indicators under the capability to act and commit. The management has become more responsive and takes swift action on issues raised by staff. Field staff is now participating in the management committee and there is a close collaboration between management, partners and beneficiaries. Strategic guidance has improved over the last two years in both formal and informal ways. Board members are giving better technical back-up for program and administrative staff, regular meetings are taking place and the reporting mechanism has strengthened. Staff turnover has been negligible in the last two years because of successful staff retention initiatives that were introduced after the feedback of the baseline evaluation in 2012.

Incentives for staff have increased as the per diem rate increased, some medical and education costs are covered, salaries increased by 10 percent and there are more training opportunities for staff. Staffs have improved their skills especially in report and proposal writing, project planning and management. DEC, CCRDA, Kinderpostzegels, Edukans and the World Bank have supported NVEA in this by giving trainings. Daily operations are in line with the strategic plan and this has improved because of recruitment of new staff and training on Project M&E. The overall fundraising capacity of NVEA has improved since the baseline: they have acquired new projects in 2013 and 2014 and MFS II funding has also increased. A new funding procedure that the organisation adopted is proposal writing in clusters, in this way they obtained funding from the British Embassy.

In the capability to adapt and self-renew NVEA saw some improvements. The organisation's M&E application improved slightly because of establishing a cost-effective M&E system, using an M&E manual for project follow up and facilitating M&E on a quarterly basis. The program and project staffs have been trained in M&E and have gained experience in this. Since the baseline, NVEA is making very slightly more use of its M&E findings by compiling track records, communicating lessons learned to stakeholders and using them for decision making on strategies. Room for critical reflection has slightly improved because all levels of staff are now welcome to raise issues and these are taken up and are often acted upon by management.

In terms of the capability to deliver on development objectives, NVEA shows slight improvement in its operational plans. The field staffs now also make operational plans and day-to-day plans are developed. After the baseline in 2012, NVEA assigned an internal auditor to assure that budgets are used properly and in a transparent way. Finance staff is documenting their work more effectively and procurement is done in a more cost-effective way. Since the ESAP 2 (Ethiopian Social Accountability Program Phase 2) has been launched in 2013, NVEA has improved its bottom-up approach in doing needs assessments among beneficiaries of their programs to ensure their needs are being met.

In the capability to relate, NVEA has shown very slight improvements in engaging in networks because they are now involved in a new partnership with the British Embassy. Frequency of visits to target groups has increased because thanks to Kinderpostzegels, NVEA now has motor bikes to visit the target groups more often. There has been a very slight improvement in internal relations because of better documentation and use of minutes of meetings.

Finally, NVEA has improved in a few indicators under the capability to achieve coherence. In 2013 NVEA revised its vision, mission, goal, objective and core functions to include adaptations in line with the changing development agenda. New operational guidelines were developed since the baseline on

topics including HRM, M&E, Child Protection Policy, SRH manual and resource mobilisation. In the implementation of all its program components, NVEA ensures mutually supportive efforts by establishing good relationships with the concerned government organisations, CBOs, and communities.

During the endline workshop some key organisational capacity changes were brought up by NVEA's staff in the 'general causal map': improved capacity to prepare winning proposals; improved capacity for networking and partnerships; improved capacity in financial reporting and compiling; improved capacity in social cognition and team spirit; and improved capacity in PME. The evaluators considered it important to also note down the SPO's story about what they considered to be key organisational capacity changes since the baseline, and this would also provide more information about reasons for change, which were difficult to get for the individual indicators. Also for some issues there may not have been relevant indicators available in the list of core indicators provided by the evaluation team.

According to NVEA staff, their capacity to prepare winning proposals improved because staff has knowledge on which key components to include in proposals. This was due to training on project cycle management in 2013 (funded by Basic Education Network Ethiopia (BEN-E), training on fundraising by BEN-E and sharing experiences during these trainings.

The organisation has improved its capacity in partnerships and networking because of improved knowledge on partnerships and networking. This knowledge was gained through a training on networking by the Ethiopia Center for Disability and Development (ECDD) in 2013; through advice from Kinderpostzegels and Edukans (MFS II funded) regarding donor preferences for working with partners for better impact; and by implementing the social accountability program in 2013 (funded by the World Bank).

NVEA improved its capacity in financial reporting and compilation due to better knowledge about a functioning financial system and the assignment of an internal auditor. NVEA learned about a functioning financial system through the feedback of the MFS II 5c baseline evaluation in 2012, feedback and recommendations from Kinderpostzegels (MFS II funded) and a training on financial management and budgeting in 2013 by Edukans (MFS II funded).

According to NVEA staff they improved their capacity in social cognition and team spirit due to regular review meetings (on a quarterly basis) which were introduced as a result of the feedback and advice of the NVEA board, of Kinderpostzegels (MFS II funded) and experience from other organisations.

Finally, NVEA improved its capacity in PME because of improved knowledge in preparing results based reports and on conducting checklist based M&E supervision. Knowledge on preparing reports improved because of a training on Results Based Management (RBM) in 2012 (funded by MFS II); a training on RBM in 2014 by Cheshire Service Ethiopia; and the preparation of M&E guidelines by a consultant in 2013 (partly funded by MFS II). Knowledge on M&E supervision improved because of these M&E guidelines; a training on M&E in 2013 by board members (partially MFS II funded); and regular quarterly monitoring.

According to NVEA, MFS II funded capacity development interventions have thus played a role in improved capacity in networking and partnerships; improved capacity in financial reporting and compilation; Improved capacity in social cognition & team spirit; and improved PME capacity. This was through training, advice and feedback, and the development of an M&E guideline. However, internal factors like advice from board members, assigning an internal auditor and regular review meetings have also played an important role in the key organisational capacity changes that the NVEA staff considered important since the baseline in 2012. Support from other funders, like BEN-E, the World Bank, Cheshire Service Ethiopia in terms of training, has also been mentioned as among the underlying factors for these changes.

2 Context and General Information about the SPO – NVEA

2.1 General information about the Southern Partner Organisation (SPO)

Ethiopia	
Consortium 1	Connect4Change (C4C)
Responsible Dutch NGO	Edukans Foundation
Project (if applicable)	Improving the Teaching-Learning Processes and Educational Management through ICT
Consortium 2	ICCO Alliance
Responsible Dutch NGO	Edukans Foundation
Project (if applicable)	Education for all project
Consortium 3	Child and Development Alliance
Responsible Dutch NGO	Stichting Kinderpostzegels Nederland (SKN)
Project (if applicable)	Non formal alternative basic education in Sibule Woreda (Project C1 MFS II sample)
Southern partner organisation	New Vision in Education Association (NVEA) http://www.nveadeseth.org/

The project/partner is part of the sample for the following evaluation components:

Achievement of MDGs and themes	
Achievement of MDGs and themes	X
Capacity development of Southern partner organisations	X
Efforts to strengthen civil society	

2.2 The socio-economic, cultural and political context in which the partner operates

The aim of the project is creating access to basic education for disadvantaged children in the first cycle of primary schools in rural areas of Sibule Woreda, East Wollega Zone, Oromiya Regional State by constructing ABE Centres (Alternative Basic Education Centres). To achieve this, centres are set up with support of local community to organize awareness raising campaigns to promote the rights of the child in particular the right on education and to fight harmful traditional practices such as child labour, early marriage, rape, and abduction to reach education for all. By building the capacity of school community and community representatives through trainings, materials support, class room construction and renovation and vocational skill training for parents of the children, the project aims at improving the quality of education for these children.

Non Formal Education as is given at the ABE Centres is not as informal as it seems. In Ethiopia all ABE (Alternative Basic Education) Centres follow a nationwide Non Formal Education (NFE) curriculum. Three years of NFE education gives the right to access to grade 5 of formal schools. Until the year 2010/11, 3 years of NFE used to give the right to access grade 5 of formal schools. However, as the result of the policy change by the government, the duration of the NFE has been decided to be equal to the formal schooling and similar curriculum is used for the NGO run ABECs. NFE is characterized by the following aspect compared to formal schools: (1) Teaching is often done in local language. (2) School times and hours are more flexible. The school year can start a little later due to the harvest season. (3) Teachers at ABE Centres, called facilitators, in principle are recruited from the local community. They speak the local language and understand the local culture. Facilitators are recruited, deployed and trained by the employing NGO/CSO. Sometimes, when the expertise of the District/Woreda Education Office is required, trainings are conducted together with the sponsoring

NGO. (4) ABE Centres are more child-friendly and teaching is more child-focussed. (5) School classes in ABE Centres are smaller, maximum 50 compared to 60-100 children per class in formal schools.

The strategy of Kinderpostzegels and its Southern partner NVEA is that the ABE Centres have to be created by the local community themselves. The local partners stimulate and support this process. However, only if the community members (i.e. the parents) are really convinced of the importance of education for their children, are interested in improving access to education for them and are willing to invest in the creation, maintenance and functioning of a centre the project will support them to realize this. The local community is asked to contribute in kind and in labour for the creation of it. This is often done via the traditional Iddir system, a traditional system to raise funds for social events. In addition, a plot of land has to be reserved where the ABE Centre can be constructed, plus a plot of land of which the product serves as income for the running and maintenance costs of the centre.

Sibu Sire is a district administered by the Eastern Wollega zone, Oromiya regional state. Sire the administrative town of the district is located at 281 km west of Addis Ababa. The district is classified into 19 rural and 3 urban villages. The total population of the district is estimated to be 115,229 with 53.2% female and 46.8% male inhabitants. The majority (83%) is living in rural areas. According to the District Education Office report (2012/2013), there are 32 first cycle (1-4) formal primary schools and 4 ABECs providing basic education to 15317 (49% girls) students. Besides, there are 6 kindergartens privately owned enrolling 352 (45%F) children operating with the support of 12 (84%F) certified teachers. Even though there were 2129 (48.2% girls) out-of-school children reported at the end of 2006 academic year in the 19 rural villages of the district, 687 (47.6% girls) of them have accessed basic education through formal schools and NVEA's ABE centre. In total, 1449 (10.9% girls) children repeated in all grades in the 36 first cycle primary schools in the year 2006/2013. From the year 2008 to date, 7 ABECs have been established with the financial support of Kinderpostzegels out of which 3 of them were handed-over to the community and the DEO in year 2011.

The major reasons that prevent children from going to school and force them to drop out or repeat are lack of pedagogical training of teachers (no child-centred approach), long distance from schools, and extreme poverty. More precisely, families dependent on rain-based agricultural activities (only one rainy season), most families have female household heads and are big, rural communities dependent on traditional methods of farming, suffer from reduced soil fertility due to intensive farming on the same plots of lands year after year, and a high illiteracy rate in rural areas. NVEA as well as relevant local government agencies address HTPS like early marriage and abduction with community sensitizations and capacity building trainings, and these have been drastically improved.

2.3 Contracting details

When did cooperation with this partner start:

With Kinderpostzegels: July 2006

With Edukans: 2007

What is the MFS II contracting period:

With Kinderpostzegels: January 2011 – December 2015

With Edukans: January 2011 – December 2015

Did cooperation with this partner end? NO

If yes, when did it finish?

With Kinderpostzegels: N.A.

With Edukans: N.A.

What is the reason for ending the cooperation with this partner:

With Kinderpostzegels: N.A.

With Edukans: N.A.

If not, is there an expected end date?

With Kinderpostzegels: In case of good performance Kinderpostzegels will renew its cooperation with NVEA for the period after 2015

With Edukans: No

2.4 Background to the Southern Partner Organisation

History

New Vision in Education Association (NVEA) is an Ethiopian Non-Government Organization established in November 2000, with the objective to improve access to quality education for disadvantaged children in rural areas of Ethiopia, NVEA is founding member of BEN-E (Basic Education Network Ethiopia), also partner of Edukans and of Kinderpostzegels.

The founding members are experienced professionals constituted from the fields of Education, Health, Sociology and other related community development areas. It is a non-profit making and child focused voluntary organization registered at the Ministry of Justice in January 2001 with the mandate to operate as a development organization throughout the country. Abiding with the legal requirements of Ethiopia, it concluded both operational and project agreements with the concerned line ministries at the federal as well as regional levels. NVEA is administered and managed by a director whose job assignments are supported and supervised by the governing board of trustees. The board is made up of 5 members drawn from the 12 general assembly members out of whom 4 are female. The board supports and supervises the secretariat.

NVEA is currently running the Non Formal Alternative Basic Education project supported by Kinderpostzegels in the Sibu Sire area in East Wollega Zone. Bako basic education quality improvement and Ambo C4C supported by Edukans Foundation are implemented in Bako as well as Ambo towns of Western Shoa Zone. NVEA started operations in 2001. There was no well-articulated vision, mission, and goal of the organization when it started operations. In 2007, the organization developed a strategic plan, well-articulated vision, and mission and goal statements. New partnerships were also established at this time. The number and functions of staff expanded to six with new functions added such as accountant, secretary, project coordinators, facilitators and janitors, among the new functions created. There were 15 part time staff in 2007. Capacity building activities during the year included strategic planning, PM&E, gender education, constituency building, HIV/AIDs, resource mobilization and action research training. The year 2009 was marked by the new CSO legislation and new working procedure affecting the organization. The vision, mission, goal, strategies and target groups remained the same as preceding years. Staff number increased to 20 full time and 10 part time staff. Capacity strengthening activities done during the period included PM&E, resource mobilization, HIV/AIDs, PRA and strategic planning. The CSO law which was introduced during the year and which limited right-based approach and advocacy affected funds mobilization initiatives and became an important influencing factor.

In 2011-12, the strategic plan was revised and new policy documents on human resource and finance were prepared. Quality basic primary education was added to the organization's strategy. The staff functions expanded to include program officer and project manager as newly introduced job categories. The budget doubled to 2, 657,792 ETB with funding from Edukans, World Population Foundation, Rutgers, IICD, Kinderpostzegels, Path International and Learn for Work. Currently, our funding partners are ICCO Cooperation, Kinderpostzegels, Lilianne Foundation, British Embassy to Ethiopia, and the World Bank. Capacity strengthening activities undertaken included financial resource management, gender budgeting, proposal writing, active learning methodology, RBM, ICT & inclusive education.

As the result of the revision of the Strategic Plan in 2012, the Vision and Mission statements have been reshaped in relation to the objectives and profile of NVEA:

Vision

To see every child (in Ethiopia) accessing quality primary education at the right age and close-to-home.

Mission

To expand inclusive quality basic education and early childhood care through non-formal programs that mitigate the impacts of HTPs & HIV/AIDs by developing infrastructure and strive to improve rural agricultural technology.

Strategies

Main strategic actions include:

- Provide Non-Formal (Alternative) Basic Education.
- Promoting Integrated Adult Functional Literacy(Non-Formal Vocational Skill Training)
- Prevention &Control of HIV/AIDs and promoting SRH in &out of schools
- Promoting Early childhood care and education
- Community capacity building.
- Promote inclusive education focussing on Disability
- Improve rural Agricultural Technology &Promoting Environmental Protection (Ensure Food Security)

3 Methodological approach and reflection

3.1 Overall methodological approach and reflection

This chapter describes the methodological design and challenges for the assessment of capacity development of Southern Partner Organisations (SPOs), also called the '5C study'. This 5C study is organised around **four key evaluation questions**:

1. What are the changes in partner organisations' capacity during the 2012-2014 period?
2. To what degree are the changes identified in partner capacity attributable to development interventions undertaken by the MFS II consortia (i.e. measuring effectiveness)?
3. Were the efforts of the MFS II consortia efficient?
4. What factors explain the findings drawn from the questions above?

It has been agreed that the question (3) around efficiency cannot be addressed for this 5C study. The methodological approach for the other three questions is described below. At the end, a methodological reflection is provided.

Note: this methodological approach is applied to 4 countries that the Centre for Development Innovation, Wageningen University and Research centre is involved in in terms of the 5C study (Ethiopia, India, Indonesia, Liberia). The overall approach has been agreed with all the 8 countries selected for this MFS II evaluation. The 5C country teams have been trained and coached on this methodological approach during the evaluation process. Details specific to the SPO are described in chapter 5.1 of the SPO report A detailed overview of the approach is described in appendix 1.

The first (changes in organisational capacity) and the fourth evaluation question are addressed together through:

- **Changes in the 5C indicators since the baseline:** standard indicators have been agreed upon for each of the five capabilities of the five capabilities framework (see appendix 2) and changes between the baseline, and the endline situation have been described. For data collection a mix of data collection methods has been used, including self-assessments by SPO staff; interviews with SPO staff and externals; document review; observation. For data analysis, the Nvivo software program for qualitative data analysis has been used. Final descriptions per indicator and per capability with corresponding scores have been provided.
- **Key organisational capacity changes – 'general causal map':** during the endline workshop a brainstorm has been facilitated to generate the key organisational capacity changes as perceived by the SPO since the baseline, with related underlying causes. For this purpose, a visual as well as a narrative causal map have been described.

In terms of the attribution question (2 and 4), '**process tracing**' is used. This is a theory-based approach that has been applied to a selected number of SPOs since it is a very intensive and costly methodology, although it provides rich information and can generate a lot of learning within the organisations. This approach was presented and agreed-upon during the synthesis workshop on 17-18 June 2013 by the 5C teams for the eight countries of the MFS II evaluation. A more detailed description of the approach was presented during the synthesis workshop in February 2014. The synthesis team, NWO-WOTRO, the country project leaders and the MFS II organisations present at the workshop have accepted this approach. It was agreed that this approach can only be used for a selected number of SPOs since it is a very intensive and costly methodology. Key organisational capacity changes/ outcomes of the SPO were identified, based on their relationship to the two selected capabilities, the capability to act and commit the capability to adapt and self-renew, and an expected relationship with CFA supported capacity development interventions (MFS II funding). It was agreed to

focus on these two capabilities, since these are the most targeted capabilities by the CFAs, as established during the baseline process.

Please find below an explanation of how the above-mentioned evaluation questions have been addressed in the 5C evaluation.

At the end of this appendix a brief methodological reflection is provided.

3.2 Assessing changes in organisational capacity and reasons for change - evaluation question 1 and 4

This section describes the data collection and analysis methodology for answering the first evaluation question: **What are the changes in partner organisations' capacity during the 2012-2014 period?** And the fourth evaluation question: **“What factors explain the findings drawn from the questions above?”**

In order to explain the changes in organisational capacity development between baseline and endline (evaluation question 1) the CDI and in-country evaluation teams needed to review the indicators and how they have changed between baseline and endline and what reasons have been provided for this. This is explained below. It has been difficult to find detailed explanations for changes in each of the separate 5c indicators, but the 'general causal map' has provided some ideas about some of the key underlying factors actors and interventions that influence the key organisational capacity changes, as perceived by the SPO staff.

The evaluators considered it important to also note down a consolidated SPO story and this would also provide more information about what the SPO considered to be important in terms of organisational capacity changes since the baseline and how they perceived these key changes to have come about. Whilst this information has not been validated with sources other than SPO staff, it was considered important to understand how the SPOs has perceived changes in the organisation since the baseline.

For those SPOs that are selected for process tracing (evaluation question 2), more in-depth information is provided for the identified key organisational capacity changes and how MFS II supported capacity development interventions as well as other actors, factors and interventions have influenced these changes. This is integrated in the next session on the evaluation question on attribution, as described below and in the appendix 1.

How information was collected and analysed for addressing evaluation question 1 and 4, in terms of description of changes in indicators per capability as well as in terms of the general causal map, based on key organisational capacity changes as perceived by the SPO staff, is further described below.

During the baseline in 2012 information has been collected on each of the 33 agreed upon indicators for organisational capacity. For each of the five capabilities of the 5C framework indicators have been developed as can be seen in Appendix 2. During this 5C baseline, a summary description has been provided for each of these indicators, based on document review and the information provided by staff, the Co-financing Agency (CFA) and other external stakeholders. Also a summary description has been provided for each capability. The results of these can be read in the baseline reports.

The description of indicators for the baseline in 2012 served as the basis for comparison during the endline in 2014. In practice this meant that largely the same categories of respondents (preferably the same respondents as during the baseline) were requested to review the descriptions per indicator and indicate whether and how the endline situation (2014) is different from the described situation in 2012¹.

¹ The same categories were used as during the baseline (except beneficiaries, other funders): staff categories including management, programme staff, project staff, monitoring and evaluation staff, field staff, administration staff; stakeholder categories including co-financing agency (CFA), consultants, partners.

Per indicator they could indicate whether there was an improvement or deterioration or no change and also describe these changes. Furthermore, per indicator the interviewee could indicate what interventions, actors and other factors explain this change compared to the baseline situation. See below the specific questions that are asked for each of the indicators. Per category of interviewees there is a different list of indicators to be looked at. For example, staff members were presented with a list of all the indicators, whilst external people, for example partners, are presented with a select number of indicators, relevant to the stakeholder.

The information on the indicators was collected in different ways:

- 1) **Endline workshop at the SPO - self-assessment and 'general causal map'**: similar to data collection during the baseline, different categories of staff (as much as possible the same people as during the baseline) were brought together in a workshop and requested to respond, in their staff category, to the list of questions for each of the indicators (self-assessment sheet). Prior to carrying out the self-assessments, a brainstorming sessions was facilitated to develop a 'general causal map', based on the key organisational capacity changes since the baseline as perceived by SPO staff. Whilst this general causal map is not validated with additional information, it provides a sequential narrative, based on organisational capacity changes as perceived by SPO staff;
- 2) **Interviews with staff members**: additional to the endline workshop, interviews were held with SPO staff, either to provide more in-depth information on the information provided on the self-assessment formats during the workshop, or as a separate interview for staff members that were not present during the endline workshop;
- 3) **Interviews with externals**: different formats were developed for different types of external respondents, especially the co-financing agency (CFA), but also partner agencies, and organisational development consultants where possible. These externals were interviewed, either face-to-face or by phone/Skype. The interview sheets were sent to the respondents and if they wanted, these could be filled in digitally and followed up on during the interview;
- 4) **Document review**: similar to the baseline in 2012, relevant documents were reviewed so as to get information on each indicator. Documents to be reviewed included progress reports, evaluation reports, training reports, etc. (see below) since the baseline in 2012, so as to identify changes in each of the indicators;
- 5) **Observation**: similar to what was done in 2012, also in 2014 the evaluation team had a list with observable indicators which were to be used for observation during the visit to the SPO.

Below the key steps to assess changes in indicators are described.

Key steps to assess changes in indicators are described

1. Provide the description of indicators in the relevant formats – CDI team
2. Review the descriptions per indicator – in-country team & CDI team
3. Send the formats adapted to the SPO to CFA and SPO – in-country team (formats for SPO) and CDI team (formats for CFA)
4. Collect, upload & code the documents from CFA and SPO in NVivo – CDI team
5. Organise the field visit to the SPO – in-country team
6. Interview the CFA – CDI team
7. Run the endline workshop with the SPO – in-country team
8. Interview SPO staff – in-country team
9. Fill-in observation sheets – in-country team
10. Interview externals – in-country team
11. Upload and auto-code all the formats collected by in-country team and CDI team in NVivo – CDI team
12. Provide to the overview of information per 5c indicator to in-country team – CDI team
13. Analyse data and develop a draft description of the findings per indicator and for the general questions – in-country team
14. Analyse data and develop a final description of the findings per indicator and per capability and for the general questions – CDI team
15. Analyse the information in the general causal map –in-country team and CDI-team

Note: the CDI team include the Dutch 5c country coordinator as well as the overall 5c coordinator for the four countries (Ethiopia, India, Indonesia, Liberia). The 5c country report is based on the separate SPO reports.

Please see appendix 1 for a description of the detailed process and steps.

3.3 Attributing changes in organisational capacity - evaluation question 2 and 4

This section describes the data collection and analysis methodology for answering the second evaluation question: ***To what degree are the changes identified in partner capacity attributable to (capacity) development interventions undertaken by the MFS II consortia (i.e. measuring effectiveness)?*** and the fourth evaluation question: ***“What factors explain the findings drawn from the questions above?”***

In terms of the attribution question (2), ‘process tracing’ is used. This is a theory-based approach that has been applied to a selected number of SPOs since it is a very intensive and costly methodology, although it provides rich information and can generate a lot of learning within the organisations. Key organisational capacity changes/ outcomes of the SPO were identified, based on their relationship to the two selected capabilities, the capability to act and commit the capability to adapt and self-renew, and an expected relationship with CFA supported capacity development interventions (MFS II funding). It was agreed to focus on these two capabilities, since these are the most targeted capabilities by the CFAs, as established during the baseline process.

Below, the selection of SPOs for process tracing as well as the different steps involved for process tracing in the selected SPOs, are further explained.

3.3.1 Selection of SPOs for 5C process tracing

Process tracing is a very intensive methodology that is very time and resource consuming (for development and analysis of one final detailed causal map, it takes about 1-2 weeks in total, for different members of the evaluation team). It has been agreed upon during the synthesis workshop on 17-18 June 2013 that only a selected number of SPOs will take part in this process tracing for the purpose of understanding the attribution question. The selection of SPOs is based on the following criteria:

- MFS II support to the SPO has not ended before 2014 (since this would leave us with too small a time difference between intervention and outcome);
- Focus is on the 1-2 capabilities that are targeted most by CFAs in a particular country;
- Both the SPO and the CFA are targeting the same capability, and preferably aim for similar outcomes;
- Maximum one SPO per CFA per country will be included in the process tracing.

The intention was to focus on about 30-50% of the SPOs involved. Please see the tables below for a selection of SPOs per country. Per country, a first table shows the extent to which a CFA targets the five capabilities, which is used to select the capabilities to focus on. A second table presents which SPO is selected, and takes into consideration the selection criteria as mentioned above.

For the detailed results of this selection, in the four countries that CDI is involved in, please see appendix 1. The following SPOs were selected for process tracing:

Ethiopia: AMREF, ECFA, FSCE, HUNDEE (4/9)

India: BVHA, COUNT, FFID, SMILE, VTRC (5/10)

Indonesia: ASB, ECPAT, PtPPMA, YPI, YRBI (5/12)

Liberia: BSC, RHRAP (2/5).

3.3.2 Key steps in process tracing for the 5C study

In the box below you will find the key steps developed for the 5C process tracing methodology. These steps will be further explained here. Only key staff of the SPO is involved in this process: management; programme/ project staff; and monitoring and evaluation staff, and other staff that could provide information relevant to the identified outcome area/key organisational capacity change. Those SPOs selected for process tracing had a separate endline workshop, in addition to the ‘ general endline workshop. This workshop was carried out after the initial endline workshop and the interviews

during the field visit to the SPO. Where possible, the general and process tracing endline workshop have been held consecutively, but where possible these workshops were held at different points in time, due to the complex design of the process. Below the detailed steps for the purpose of process tracing are further explained. More information can be found in Appendix 1.

Key steps in process tracing for the 5C study

1. Identify the planned MFS II supported capacity development interventions within the selected capabilities (capability to act and commit and capability to adapt and self-renew) – CDI team
2. Identify the implemented MFS II supported capacity development interventions within the selected capabilities (capability to act and commit and capability to adapt and self-renew) – CDI team
3. Identify initial changes/ outcome areas in these two capabilities – CDI team & in-country team
4. Construct the detailed, initial causal map (theoretical model of change) – CDI team & in-country team
5. Identify types of evidence needed to verify or discard different causal relationships in the model of change – in-country teams, with support from CDI team
6. Collect data to verify or discard causal mechanisms and construct workshop based, detailed causal map (model of change) – in-country team
7. Assess the quality of data and analyse data and develop final detailed causal map (model of change) – in-country team with CDI team
8. Analyse and conclude on findings– CDI team, in collaboration with in-country team

3.3.3 Methodological reflection

Below a few methodological reflections are made by the 5C evaluation team. These can also be found in appendix 1.

Use of the 5 core capabilities framework and qualitative approach: this has proven to be a very useful framework to assess organisational capacity. The five core capabilities provide a comprehensive picture of the capacity of an organisation. The capabilities are interlinked, which was also reflected in the description of standard indicators, that have been developed for the purpose of this 5C evaluation and agreed upon for the eight countries. Using this framework with a mainly qualitative approach has provided rich information for the SPOs and CFAs, and many have indicated this was a useful learning exercise.

Using standard indicators and scores: using standard indicators is useful for comparison purposes. However, the information provided per indicator is very specific to the SPO and therefore makes comparison difficult. Whilst the description of indicators has been useful for the SPO and CFA, it is questionable to what extent indicators can be compared across SPOs since they need to be seen in context, for them to make meaning. In relation to this, one can say that scores that are provided for the indicators, are only relative and cannot show the richness of information as provided in the indicator description. Furthermore, it must be noted that organisations are continuously changing and scores are just a snapshot in time. There cannot be perfect score for this. In hindsight, having rubrics would have been more useful than scores.

General causal map: whilst this general causal map, which is based on key organisational capacity changes and related causes, as perceived by the SPO staff present at the endline workshop, has not been validated with other sources of information except SPO feedback, the 5C evaluation team considers this information important, since it provides the SPO story about how and which changes in the organisation since the baseline, are perceived as being important, and how these changes have come about. This will provide information additional to the information that has been validated when

analysing and describing the indicators as well as the information provided through process tracing (selected SPOs). This has proven to be a learning experience for many SPOs.

Using process tracing for dealing with the attribution question: this theory-based and mainly qualitative approach has been chosen to deal with the attribution question, on how the organisational capacity changes in the organisations have come about and what the relationship is with MFS II supported capacity development interventions and other factors. This has proven to be a very useful process, that provided a lot of very rich information. Many SPOs and CFAs have already indicated that they appreciated the richness of information which provided a story about how identified organisational capacity changes have come about. Whilst this process was intensive for SPOs during the process tracing workshops, many appreciated this to be a learning process that provided useful information on how the organisation can further develop itself. For the evaluation team, this has also been an intensive and time-consuming process, but since it provided rich information in a learning process, the effort was worth it, if SPOs and CFAs find this process and findings useful.

A few remarks need to be made:

- Outcome explaining process tracing is used for this purpose, but has been adapted to the situation since the issues being looked at were very complex in nature.
- Difficulty of verifying each and every single change and causal relationship:
 - Intensity of the process and problems with recall: often the process tracing workshop was done straight after the general endline workshop that has been done for all the SPOs. In some cases, the process tracing endline workshop has been done at a different point in time, which was better for staff involved in this process, since process tracing asks people to think back about changes and how these changes have come about. The word difficulties with recalling some of these changes and how they have come about. See also the next paragraph.
 - Difficulty of assessing changes in knowledge and behaviour: training questionnaire is have been developed, based on Kirkpatrick's model and were specifically tailored to identify not only the interest but also the change in knowledge and skills, behaviour as well as organisational changes as a result of a particular training. The retention ability of individuals, irrespective of their position in the organisation, is often unstable. The 5C evaluation team experienced that it was difficult for people to recall specific trainings, and what they learned from those trainings. Often a change in knowledge, skills and behaviour is a result brought about by a combination of different factors, rather than being traceable to one particular event. The detailed causal maps that have been established, also clearly pointed this. There are many factors at play that make people change their behaviour, and this is not just dependent on training but also internal/personal (motivational) factors as well as factors within the organisation, that stimulate or hinder a person to change behaviour. Understanding how behaviour change works is important when trying to really understand the extent to which behaviour has changed as a result of different factors, actors and interventions. Organisations change because people change and therefore understanding when and how these individuals change behaviour is crucial. Also attrition and change in key organisational positions can contribute considerably to the outcome.

Utilisation of the evaluation

The 5C evaluation team considers it important to also discuss issues around utility of this evaluation. We want to mention just a few.

Design – mainly externally driven and with a focus on accountability and standard indicators and approaches within a limited time frame, and limited budget: this MFS II evaluation is originally based on a design that has been decided by IOB (the independent evaluation office of the Dutch Ministry of Foreign Affairs) and to some extent MFS II organisations. The evaluators have had no influence on the overall design and sampling for the 5C study. In terms of learning, one may question whether the most useful cases have been selected in this sampling process. The focus was very much on a rigorous evaluation carried out by an independent evaluation team. Indicators had to be streamlined across countries. The 5C team was requested to collaborate with the other 5C country teams (Bangladesh, Congo, Pakistan, Uganda) to streamline the methodological approach across the eight sampled countries. Whilst this may have its purpose in terms of synthesising results, the 5C evaluation team

has also experienced the difficulty of tailoring the approach to the specific SPOs. The overall evaluation has been mainly accountability driven and was less focused on enhancing learning for improvement. Furthermore, the timeframe has been very small to compare baseline information (2012) with endline information (2014). Changes in organisational capacity may take a long, particularly if they are related to behaviour change. Furthermore, there has been limited budget to carry out the 5C evaluation. For all the four countries (Ethiopia, India, Indonesia, Liberia) that the Centre for Development Innovation, Wageningen University and Research centre has been involved in, the budget has been overspent.

However, the 5C evaluation team has designed an endline process whereby engagement of staff, e.g. in a workshop process was considered important, not only due to the need to collect data, but also to generate learning in the organisation. Furthermore, having general causal maps and detailed causal maps generated by process tracing have provided rich information that many SPOs and CFAs have already appreciated as useful in terms of the findings as well as a learning process.

Another issue that must be mentioned is that additional requests have been added to the country teams during the process of implementation: developing a country based synthesis; questions on design, implementation, and reaching objectives of MFS II funded capacity development interventions, whilst these questions were not in line with the core evaluation questions for the 5C evaluation.

Complexity and inadequate coordination and communication: many actors, both in the Netherlands, as well as in the eight selected countries, have been involved in this evaluation and their roles and responsibilities, were often unclear. For example, 19 MFS II consortia, the internal reference group, the Ministry of Foreign Affairs, Partos, the Joint Evaluation Trust, NWO-Wotro, the evaluators (Netherlands and in-country), 2 external advisory committees, and the steering committee. Not to mention the SPO's and their related partners and consultants. CDI was involved in 4 countries with a total number of 38 SPOs and related CFAs. This complexity influenced communication and coordination, as well as the extent to which learning could take place. Furthermore, there was a distance between the evaluators and the CFAs, since the approach had to be synchronised across countries, and had to adhere to strict guidelines, which were mainly externally formulated and could not be negotiated or discussed for the purpose of tailoring and learning. Feedback on the final results and report had to be provided mainly in written form. In order to enhance utilisation, a final workshop at the SPO to discuss the findings and think through the use with more people than probably the one who reads the report, would have more impact on organisational learning and development. Furthermore, feedback with the CFAs has also not been institutionalised in the evaluation process in the form of learning events. And as mentioned above, the complexity of the evaluation with many actors involved did not enhance learning and thus utilization.

5C Endline process, and in particular thoroughness of process tracing often appreciated as learning process: The SPO perspective has also brought to light a new experience and technique of self-assessment and self-corrective measures for managers. Most SPOs whether part of process tracing or not, deeply appreciated the thoroughness of the methodology and its ability to capture details with robust connectivity. This is a matter of satisfaction and learning for both evaluators and SPOs. Having a process whereby SPO staff were very much engaged in the process of self-assessment and reflection has proven for many to be a learning experience for many, and therefore have enhanced utility of the 5C evaluation.

4 Results

4.1 MFS II supported capacity development interventions

Below an overview of the different MFS II supported capacity development interventions of NVEA that have taken place since the baseline in 2012 are described. The information is based on the information provided by DEC.

Table 1

Information about MFS II supported capacity development interventions since the baseline in 2012

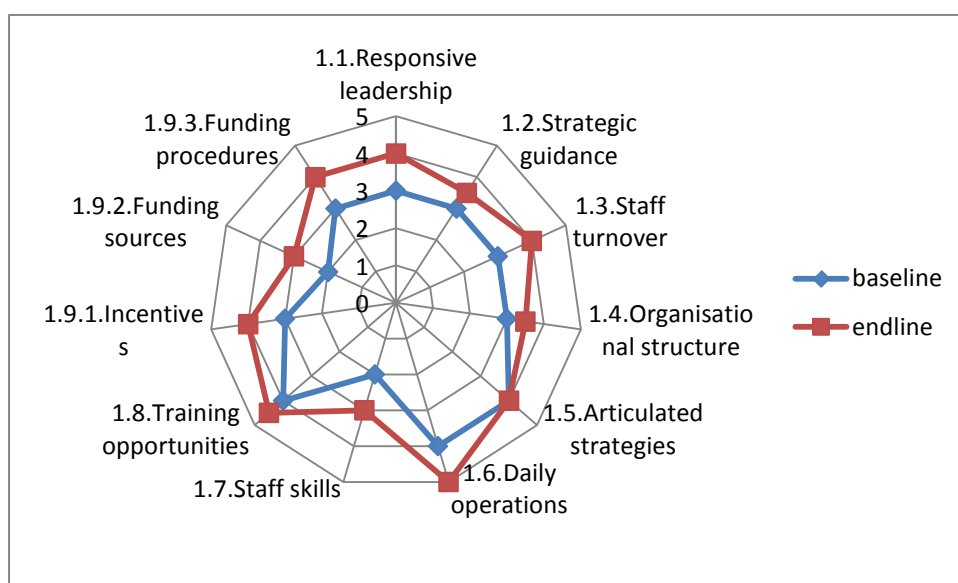

Title of the MFS II supported capacity development intervention	Objectives	Activities	Timing and duration	Budget
Training on active learning implementation for the organization's education focal person.	<ul style="list-style-type: none"> - Active learning training as major component in education quality improvement program - Students' academic achievement improved 	Twice a year training for all participants then training is passed to teachers twice in half a year. Topics dealt with: <ul style="list-style-type: none"> - Time management - Child Centred Approach - Prepare SMART lesson plans - Use of suitable learning media - Facilitation Skills - Active learning methodologies and - M&E techniques 	since June 2013 each quarter 5 days training	about 1100 Euros every year
Training on Education Management Information System	<ul style="list-style-type: none"> - Effective school management for quality education - Well organized and properly documented schools data and information 	<ul style="list-style-type: none"> - The EMIS software is developed, validated, installed at all primary schools; teachers and SMT are trained on its utilization - Only minimum computer skills for teachers. NVEA staff check if they can open the system and teach them how to use it. 	First developed software, first version sept 2013, then it was practiced and adapted version Oct 2014 training was given to partners. NVEA staff is now consulting schools in the use of the software.	about 900 Euros every year

4.2 Changes in capacity and reasons for change - evaluation question 1 and 4

Below you can find a description of the changes in each of the five core capabilities (4.2.1). This information is based on the analysis of the information per each of the indicators. This detailed information for each of the indicators describes the current situation, and how and why it has changed since the baseline. In addition to this staff present at the endline workshop were asked to indicate what were the key changes in the organisation since the baseline. The most important is key organisational capacity changes have been identified, as well as the reasons for these changes to come about. This is described in a general causal map, both as a visual as well as a narrative. The detailed general map is described in 4.2.2.

4.2.1 Changes in the five core capabilities

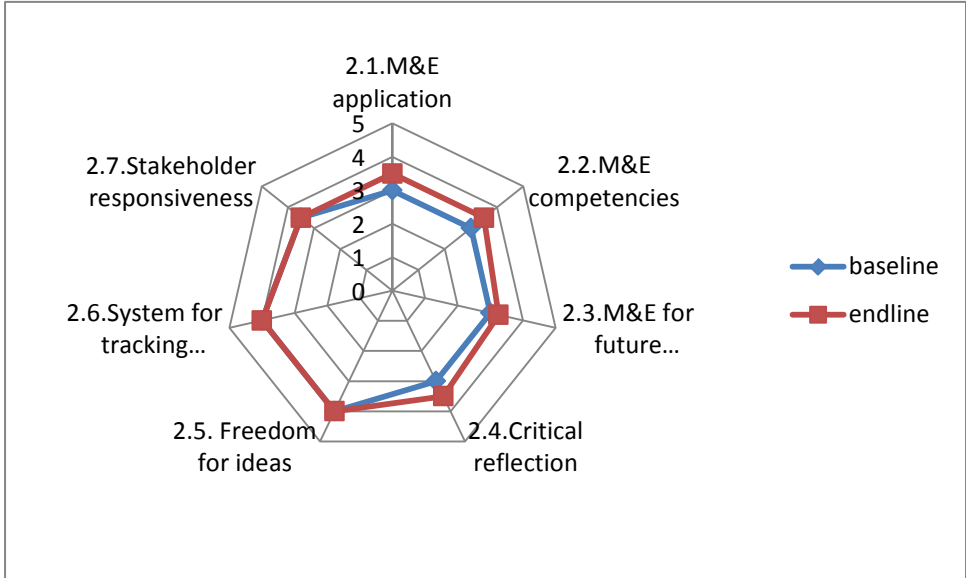

Capability to Act and Commit

The commitment of the top management in building better team spirit, staff motivation and shared decision making has improved compared to the baseline situation. Currently, the executive director influence has reduced and his role is becoming more based on facilitation. As a result staff members are empowered to make independent decisions. Participation of the field staff in the management committee is a new phenomenon in NVEA. Strategic guidance has improved compared to the baseline situation through formal and informal ways of communication. The existence of regular meetings with the staff and reporting mechanism is becoming an encouraging means to bring novel ideas to inform and develop strategic directions. The board members have also provided a better technical back-up for program and administrative staff in the last two years. Staff members are satisfied with most terms and conditions of the organization as similar to the baseline situation and as a result staff turnover is low. The organization has a clear organizational structure that all staffs are able to access and understand. NVEA has assigned clear roles and responsibilities for respective program and administrative staff. Compared to the baseline situation NVEA has become well-structured in both program and finance divisions. Besides, the organization has revised its strategic plan in 2012 for the next five years and since then each and every activity of the organization has been in line with the strategic plan. However, funding opportunities have also broadened the issues that NVEA is covering such as disability and livelihoods. The operational and the action plans are developed in line with the revised strategic plan. Different training opportunities have been in place for staffs and both by the organization itself and partners and trainings are cascading to others non-participant staffs. NVEA has also hired new staffs in order to have the appropriate staff

members on board. Hence, staff members are better equipped with different skills and knowledge to perform their respective assignments effectively and efficiently compared to the baseline situation. In addition to the different training opportunities that existed in NVEA since the baseline, the organization has also improved its incentive structure for staff including increased the per diem rate, medical cost coverage and 25 % education cost coverage as well as salary increment every year based on staff performance. NVEA has a fundraising strategy document since the baseline and has also been working hard on fundraising activities and has been able to secure more funds. As a result a number of new projects were launched in 2013 and 2014.

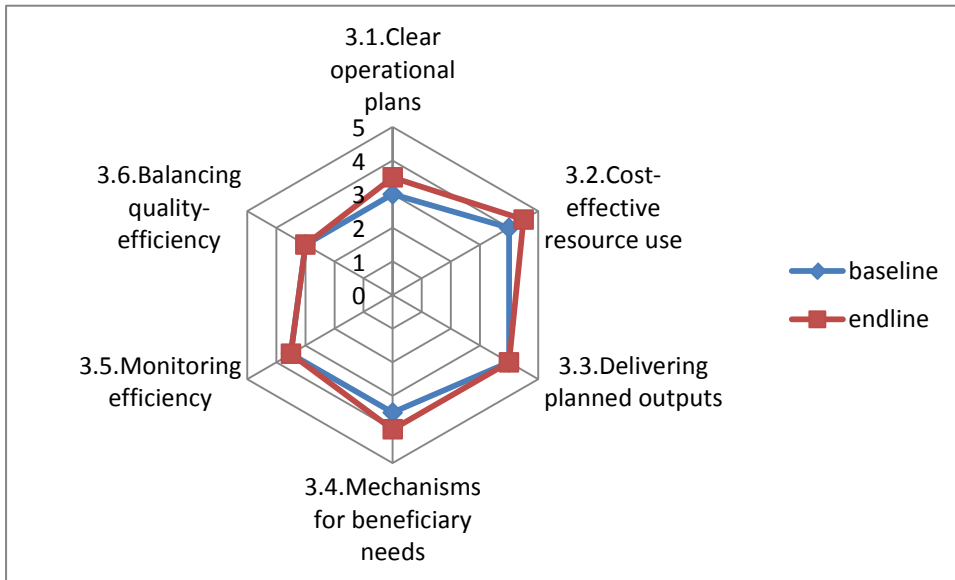

Score: from 3.1 to 3.9 (slight improvement)

Capability to adapt and self-renew

Compared to the baseline situation, NVEA has established a cost-effective monitoring and evaluation system. NVEA uses its M&E manual for project follow-up and it has facilitated and carried out M&E on quarterly basis by a team of ‘evaluators’ drawn from key stakeholders at project areas, project staff and program staff from head office. The program and project staff have been trained on M&E and have ample experience and competence in application of M&E. However, NVEA has not been good in undertaking a systematic outcome evaluation and impact assessment involving a wide range of stakeholders. This has largely been due to lack of a user–friendly manual to guide the process, lack of expertise within the organization and shortage of funds to hire external evaluators. On the other hand, staff indicated that the monitoring feedbacks have been well documented periodically and communicated on the spot with community representatives and key stakeholders. Feedback and results of M&E are used as an input to revise the strategic plan of the organization and used for future project planning and evaluation, but as indicated, a systematic evaluation at the levels of outcomes and impacts in collaboration with stakeholders is still lacking in the NFBE project Sibule. There is also an improvement in sharing ideas and recognition by others staff members. Learning among staffs is improved and staffs are encouraged to come up with new ideas and ideas are respected and taken constructively. Similar to the baseline situation NVEA has tracked the environment by using different means. Dynamics of the external environment forced the organization to strengthen partnerships and networking with different SPOs and CBOs. NVEA has been responsive to stakeholders starting from the initial stage of any intervention. Stakeholders have been consulted and engaged in the planning, implementation and M&E of projects and only in consensus with them are the interventions are being implemented.

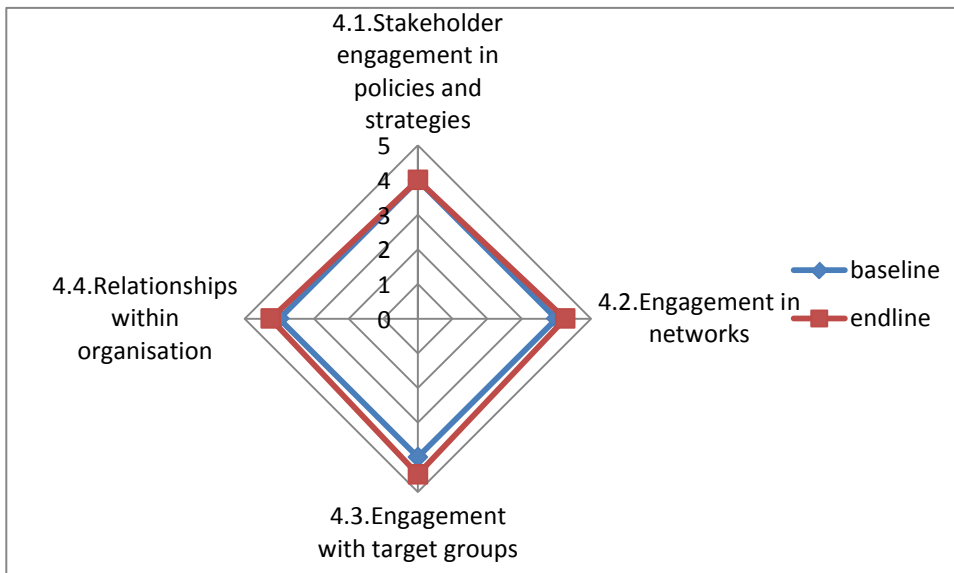

Score: from 3.4 to 3.6 (very slight improvement)

Capability to deliver on development objectives

NVEA has an operational plan for each project. This operational plan is prepared through a participatory approach of all staff members so that each person is able to understand the operational plan clearly. The organization’s funds are used properly and in a transparent way due to the fact that NVEA has assigned an internal auditor in order to properly follow up and inspect the implementation of the financial procedures. Besides, Now NVEA is intervening in 20 primary schools, a fourfold increment compared to the baseline situation. The organization competency in providing quality reports within the limited time has also improved. NVEA has been considering the needs of the beneficiaries by conducting needs assessments. Accordingly a bottom-up approach is implemented and beneficiaries are directly involved in the whole planning process. Quality is the central point of each activity in NVEA. The organization uses Check lists and beneficiary feedback to measure and follow up on efficiency and quality during monitoring and evaluation. However, measuring inputs to related outputs is not happening.

Score: from 3.5 to 3.7 (slight improvement)

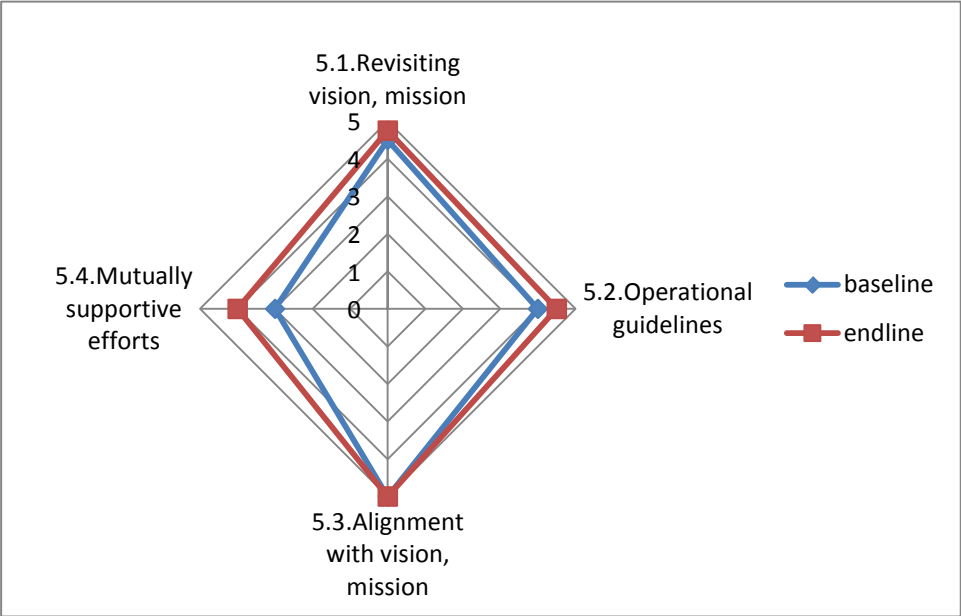

Capability to relate

Relevant external stakeholders are consulted in the preparation of different policies and strategies for project implementation. To be specific after the baseline period, stakeholders at district and zone level have been involved in developing the Child Protection Policy and Sexual and Reproductive Health policy. NVEA maintains a strong partnership with different partners and stakeholders including specific

government offices and has become a member of a new partnership with the British Embassy. Target groups have been involved in regular review meetings and monitoring to measure whether the interventions meet their needs as well as to set possible recommended solutions for identified gaps. Kinderpostzegels (MFS II funding) has purchased motor bikes and the program staff members are now able to frequently visit the target groups. Relationships within the organization have also been improved through regular management and staff meetings, face to face communications, email, telephone, and (when necessary) urgent meetings have been conducted. NVEA has improved its documentation and utilization of minutes of meetings for smooth communication.

Score: from 4 to 4.2 (very slight improvement)

Capability to achieve coherence

The vision and mission of the organization have been revised in 2013. Hence, mission statements are updated to include all development agendas. New operational guidelines have been developed since the baseline. These include; HRM guidelines, M&E manual, track record manual, board selection criteria and others. Child Protection Policy Manual, Sexual reproductive health manual, and resource mobilization manuals are also developed in 2013. The project strategies and action plans are all in line with the vision and mission of the organization. The management together with the board members monitor the alignments of operational plans to the vision and mission of the organisation. Besides, NVEA has been working in mutually supportive efforts through establishing good partnerships and working relationships with different concerned government organizations at different levels, CBOs, and the community at grass roots level.

Score: from 4.1 to 4.6 (slight improvement)

4.2.2 Key organisational capacity changes - general causal map

Below you can find a description of the key changes in organizational capacity of NVEA since the baseline as expressed by NVEA staff during the endline workshop. First, a description is given of how this topic was introduced during the endline workshop by summarising key information on NVEA from the baseline report. This information included a brief description of the vision, mission and strategies of the organisation, staff situation, clients and partner organisations. This then led into a discussion on how NVEA has changed since the baseline.

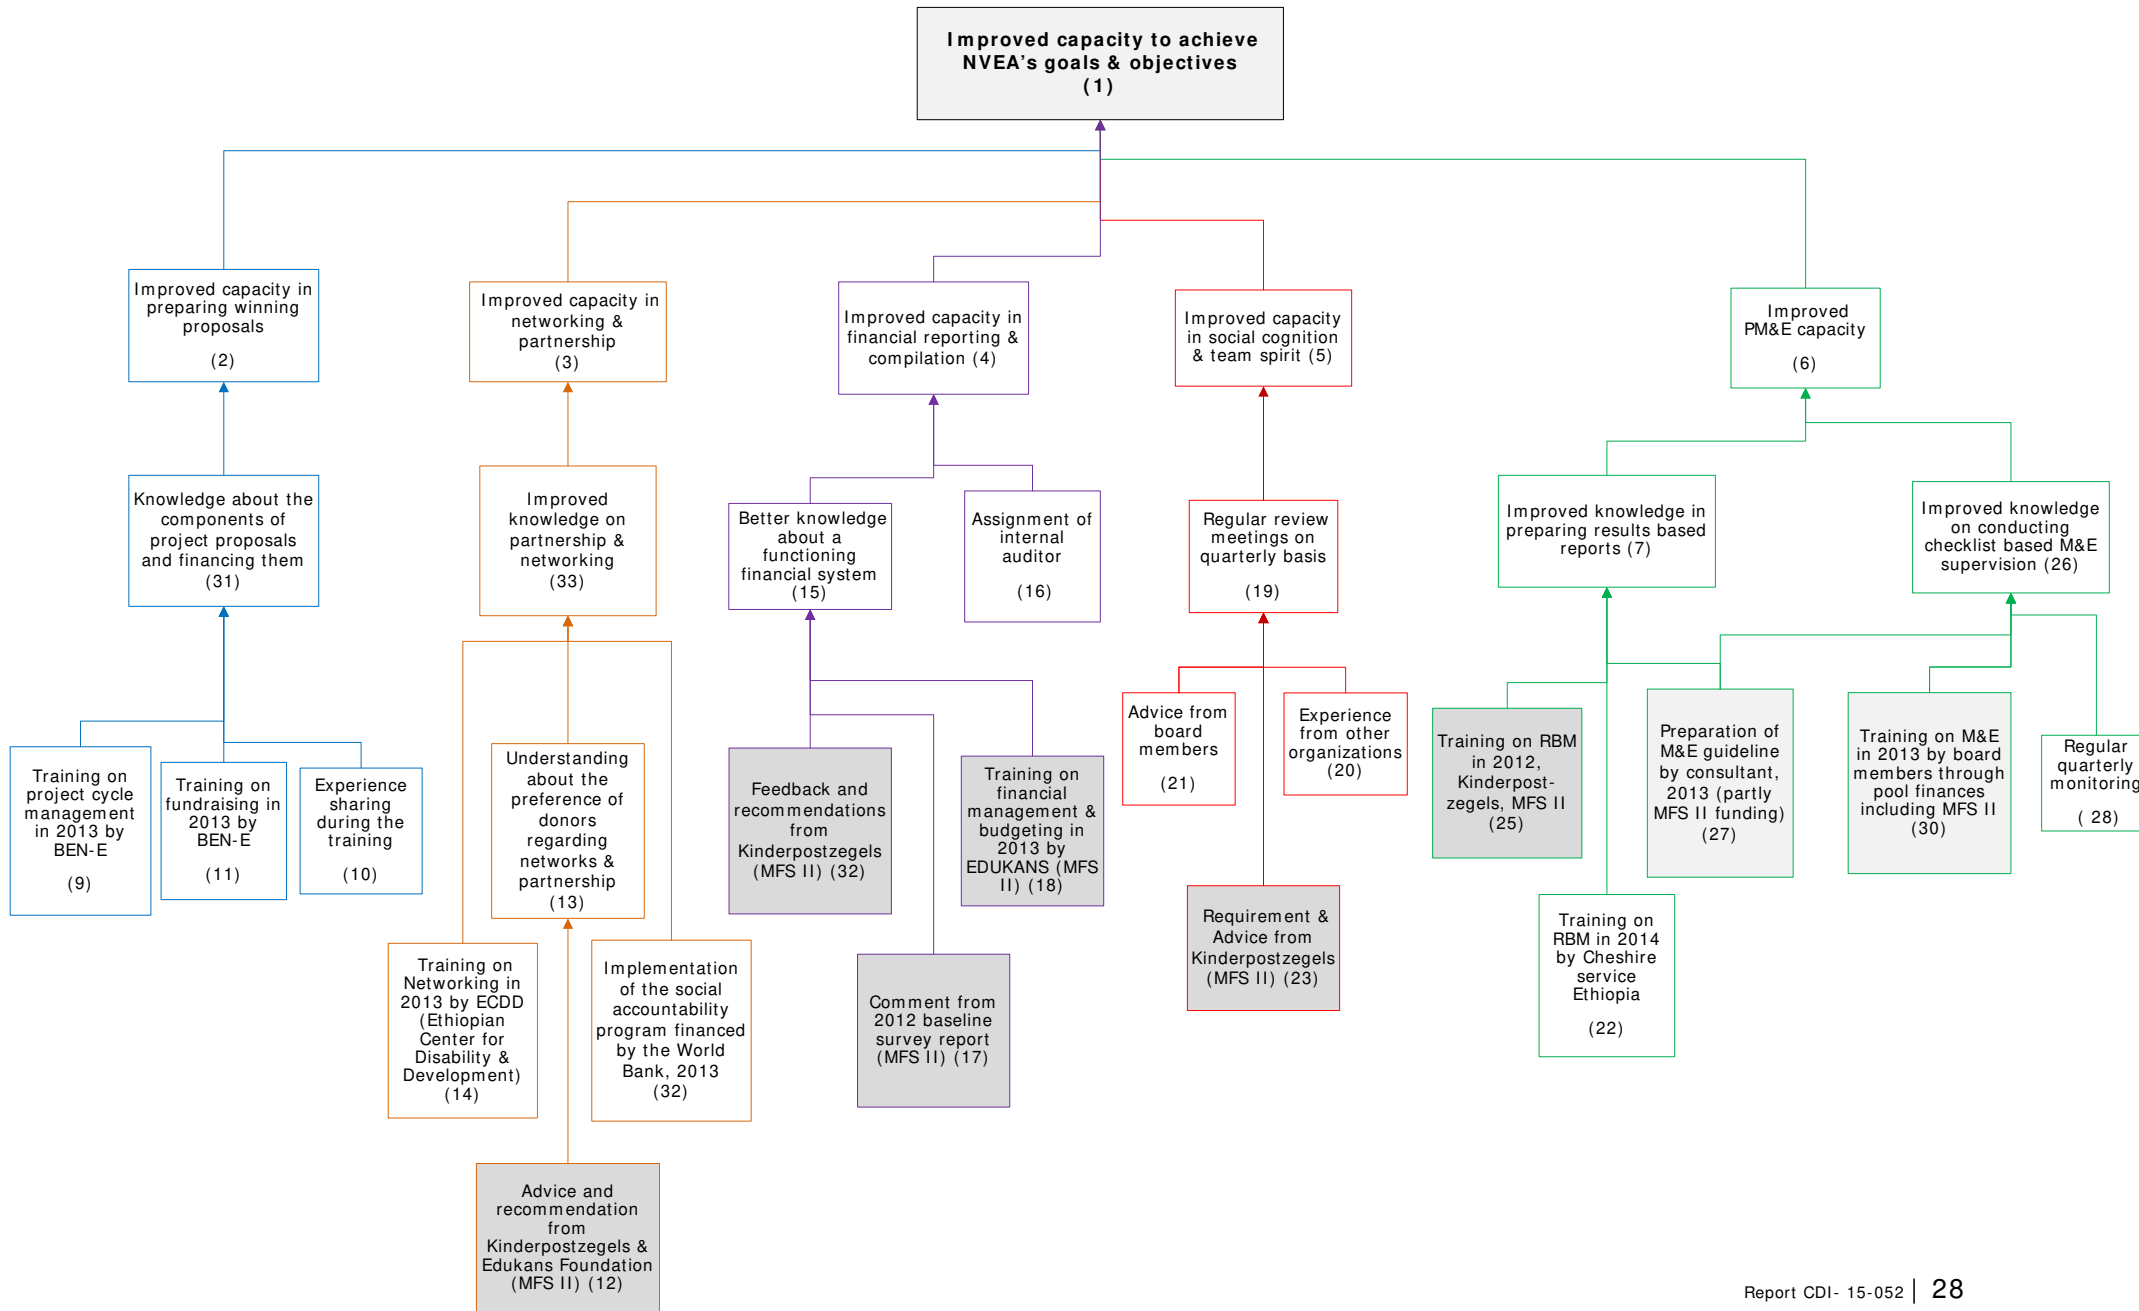

The endline workshop was conducted on September 6, 2014, at NVEA headquarters in Addis Abeba. Nine NVEA staff of five job categories participated: management, program, M&E, field staff and administration and finance staff. Following the self-assessment, staff brainstormed about and developed a causal map for the key changes that happened in NVEA since the MFS II baseline survey in 2012 in the area of organizational capacity.

At the endline workshop it was clarified that the overall organizational capacity goal of NVEA is **improved capacity to achieve NVEA's goals and objectives (1)**. Staff agreed that in the process to achieve this goal, NVEA has improved the following capacities since the baseline in 2012:

- Improved capacity to prepare winning proposals (2)
- Improved capacity for networking and partnerships (3)
- Improved capacity in financial reporting and compiling (4)
- Improved capacity in social cognition and team spirit (5)
- Improved capacity in PME (6)

Each of these five key organizational capacity changes is further explained below. The numbers correspond to the numbers in the visual below.

NVEA Key organisational capacity changes causal map

Improved capacity to prepare winning proposals (2)

NVEA now has a better capacity in preparing winning proposals (2): staff now has knowledge on what key components to include in proposals, as required by donors (31). For example, they now know how to prepare an M&E framework for a proposal. Because of this, three proposals have been accepted (two proposals by Bill and Melinda Gates foundation and one by Cheshire foundations. One proposal submitted to Edukans foundation was dropped at the last review round.

The interventions and factors that helped NVEA to prepare winning proposals, include the training on Project cycle management that was organized and funded by Basic Education Network (BEN)- E (Ethiopia) in 2013 (9) and the training on fundraising by the same organization (11). Both trainings helped staff to gain knowledge on the basic components of a project proposal and getting donors that will finance it (31). Apart from the trainings, the experience sharing during these trainings were also instrumental for the improvement in knowledge (10).

Improved capacity in partnerships and networking (3)

NVEA has improved its partnership capacity related to how to engage key stakeholders in the project cycle - planning, implementation, monitoring and evaluation and network with organizations that work on education and children's issues. The main factor that contributed to this is the knowledge NVEA got on partnership and networking (33). NVEA acquired this knowledge through the training on networking that was organized by the Ethiopian Center for disability and development (ECDD) in 2013 (14) and the information and advice given to them by Kinderpostzegels and Edukans foundations (MFS II funded) (12) on preference of donors regarding working with partners and networks for better impact (13). In addition, the implementation of the social accountability program which is financed by the World Bank in 2013 (32) enabled NVEA to get practical knowledge on how to work better with partners and networks.

Improved capacity in financial reporting and compilation (4)

The financial reports that are now being prepared by the finance staff have improved and they receive fewer comments as they fulfill the requirements of the financial report set by donors and the government. Furthermore, the financial reports are now submitted on time. The interventions that supported this improvement include the steps taken by NVEA to improve the financial system and comply with the feedback that it received from donors, including Kinderpostzegels (32) regarding its inefficient financial system which was run by junior staff. The comment that was mentioned in the 2012 MFS II 5c baseline survey reinforced the feedback (17). In line with this, the training they received on financial management and budgeting (18) in 2013 by Edukans which gave them an all-round knowledge about the creation of an efficient and effective financial system (15) became instrumental. The training also helped them to share knowledge with others on how they run their financial systems. To make the system sustainable they also assigned an internal auditor (16) who makes sure that the financial transactions are compliant to the procedures and regulations set in the financial manual.

Improved capacity in social cognition and team spirit (5)

Majority of NVEA staffs are less experienced and junior to development work. Therefore, creation of a mechanism that helps them to follow the day-to-day operations and things that are happening in the organization were difficult to create social cognition. This refers to a capacity related to creation of an atmosphere where all staffs are well informed about what is happening in the organization. This in turn has inculcated a team spirit among all staff. NVEA believes that this is a capacity that has improved after 2012 mainly because of regular review meetings, carried out on quarterly basis (19). Before 2012, meetings were not held regularly. This was as a result of the feedback and advice of different stakeholders, including the NVEA board (21) and Kinderpostzegels (23). In addition, the experience NVEA got from other organizations (20) also contributed to convince NVEA to institutionalize the regular quarterly meetings and update the staff about the current happenings.

Improved capacity in PME (6)

Currently NVEA has a better PME capacity, which has become useful for the organization to monitor its performance, as well as to donors who now receive regular and better quality reports. The factors that contributed to this are described below:

-
- Improved knowledge in preparing results based reports (7): this knowledge has enabled NVEA to report not only on activities but also on how these activities have resulted in outcomes. NVEA built this knowledge through the training on Results Based Management (RBM) in 2012 by Kinderpostzegels (MFS II) (25) and RBM in 2014 by Cheshire service Ethiopia (22). The M&E guideline that was prepared by a consultant in 2013, with partial contribution of MFS II funding (pool funding), guided the staff on what, how and when to collect data and how the reporting process was to be done (27).
 - Knowledge on conducting checklist based M&E supervision (26): Before the baseline in 2012 NVEA staff used to conduct monitoring and supervision of projects without having a systematically prepared checklist or guideline. This has now improved and HQs staff as well as the field staff has knowledge in preparing and conducting regular monitoring and supervision (26). The training on M&E in 2013 by board members through the partial financial contribution of MFS II (pool funding) (30) helped them to gain the knowledge. In addition, the M&E guideline prepared by the consultant gave them a concrete example on what kind of checklist for data collection could be used by NVEA (27). The regular quarterly monitoring (28) that is carried out in the HQs also enabled them to refine their knowledge on the kinds of information needed for NVEA and how it should be collected.

5 Discussion and conclusion

5.1 Methodological issues

In preparation for the assessment, the Ethiopian 5C assessment team visited NVEA staff in the organizations HQs in Addis Ababa and explained the purpose and the process of the 5C end line assessment. During the visit the team agreed on the workshop dates including the type and number of staff who will attend the workshop. In addition, the team also gave the “support to capacity development sheet” to be filled by NVEA staff.

The Ethiopian 5C assessment team conducted the assessment in three visits. First visit, to conduct the self-assessment workshop with total of nine staff members and ask the staff to fill the self-assessment form in their respective five subgroups (management(1); program(1); M&E(1); HRM and administration (4) and field staff (2)). This was followed by a second visit to carry out a brainstorming session and develop a general causal map that explains the key organisational capacity changes that have occurred in NVEA since the baseline in 2012. The third visit was made to conduct an interview with one representative from each subgroup to triangulate the information collected through the self-assessment and to better understand the changes in NVEA’s capacity since the baseline in 2012. This was done after the 5C assessment team reviewed the completed self-assessment forms.

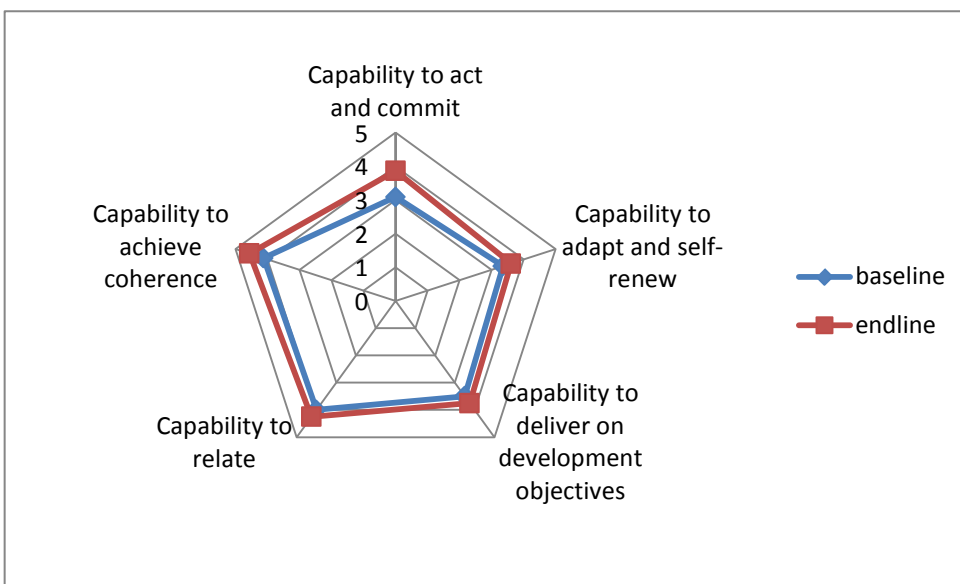

The plan of the evaluation team to also conduct two interviews with NVEA partners didn’t materialize because the interview overlapped with other activities that were to be carried out in the SPO by the assessment team because getting the SPO’s partners required the assessment team to travel to the field sites of the SPO which are far from Addis. No OD consultant has been interviewed. Due to the new CSO regulation, most of the SPOs are not involving consultants frequently because it puts a burden to their administrative cost (the agency categorizes consultancy as overhead). If consultants are hired at all, then is it mainly technical but not OD consultants.

By and large, there has been a lot of information available to be able to do adequate data analysis.

5.2 Changes in organisational capacity

This section aims to provide an answer to the first and fourth evaluation questions:

1. *What are the changes in partner organisations' capacity during the 2012-2014 period?*
4. *What factors explain the findings drawn from the questions above?*

Below the changes in each of the five core capabilities are further explained, by referring to the specific indicators that changed. In all of these capabilities improvements took place.

Over the last two years many improvements took place in the indicators under the capability to act and commit. The management has become more responsive and takes swift action on issues raised by staff. Field staff is now participating in the management committee and there is a close collaboration between management, partners and beneficiaries. Strategic guidance has improved over the last two years in both formal and informal ways. Board members are giving better technical back-up for program and administrative staff, regular meetings are taking place and the reporting mechanism has strengthened. Staff turnover has been negligible in the last two years because of successful staff retention initiatives that were introduced after the feedback of the baseline evaluation in 2012. Incentives for staff have increased as the per diem rate increased, some medical and education costs are covered, salaries increased by 10 percent and there are more training opportunities for staff. Staffs have improved their skills especially in report and proposal writing, project planning and management. DEC, CCRDA, Kinderpostzegels, Edukans and the World Bank have supported NVEA in this by giving trainings. Daily operations are in line with the strategic plan and this has improved because of recruitment of new staff and training on Project M&E. The overall fundraising capacity of NVEA has improved since the baseline: they have acquired new projects in 2013 and 2014 and MFS II funding has also increased. A new funding procedure that the organisation adopted is proposal writing in clusters, in this way they obtained funding from the British Embassy.

In the capability to adapt and self-renew NVEA saw some improvements. The organisation's M&E application improved slightly because of establishing a cost-effective M&E system, using a M&E manual for project follow up and facilitating M&E on a quarterly basis. The program and project staff have been trained in M&E and have gained experience in this. Since the baseline, NVEA is making a very slightly more use of its M&E findings by compiling track records, communicating lessons learned to stakeholders and using them for decision making on strategies. Room for critical reflection has slightly improved because all levels of staff are now welcome to raise issues and these are taken up and are often acted upon by management.

In terms of the capability to deliver on development objectives, NVEA shows slight improvement in its operational plans. The field staff now also make operational plans and day-to-day plans are developed. After the baseline in 2012, NVEA assigned an internal auditor to assure that budgets are used properly and in a transparent way. Finance staff is documenting their work more effectively and procurement is done in a more cost-effective way. Since the ESAP 2 (Ethiopian Social Accountability Program Phase 2) has been launched in 2013, NVEA has improved its bottom-up approach in doing needs assessments among beneficiaries of their programs to ensure their needs are being met.

In the capability to relate, NVEA has shown very slight improvement in engaging in networks because they are now involved in a new partnership with the British Embassy. Frequency of visits to target groups has increased because thanks to Kinderpostzegels, NVEA now has motor bikes to visit the target groups more often. There has been a very slight improvement in internal relations because of better documentation and use of minutes of meetings.

Finally, NVEA has improved in a few indicators under the capability to achieve coherence. In 2013 NVEA revised its vision, mission, goal, objective and core functions to include adaptations in line with the changing development agenda. New operational guidelines were developed since the baseline on topics including HRM, M&E, Child Protection Policy, SRH manual and resource mobilisation. In the implementation of all its program components, NVEA ensures mutually supportive efforts by establishing good relationships with the concerned government organisations, CBOs, and communities.

During the endline workshop some key organisational capacity changes were brought up by NVEA's staff in the 'general causal map': improved implementation capacity in holistic approach; improved capacity to prepare winning proposals; improved capacity for networking and partnerships; improved capacity in financial reporting and compiling; improved capacity in social cognition and team spirit; and improved capacity in PME. The evaluators considered it important to also note down the SPO's story about what they considered to be key organisational capacity changes since the baseline, and this would also provide more information about reasons for change, which were difficult to get for the individual indicators. Also for some issues there may not have been relevant indicators available in the list of core indicators provided by the evaluation team.

According to NVEA staff, their capacity to prepare winning proposals improved because staff has knowledge on which key components to include in proposals. This was due to a training on project

cycle management in 2013 (funded by Basic Education Network Ethiopia (BEN-E), a training on fundraising by BEN-E and sharing experiences during these trainings. The organisation has improved its capacity in partnerships and networking because of improved knowledge on partnerships and networking. This knowledge was gained through a training on networking by the Ethiopia Center for Disability and Development (ECDD) in 2013; through advice from Kinderpostzegels and Edukans (MFS II funded) on preferences of donors regarding working with partners for better impact and by implementing the social accountability program in 2013 (funded by the World Bank). NVEA improved its capacity in financial reporting and compilation due to better knowledge about a functioning financial system and the assignment of an internal auditor. NVEA learned about a functioning financial system through the feedback of the MFS II 5c baseline evaluation in 2012, feedback and recommendations from Kinderpostzegels (MFS II funded) and a training on financial management and budgeting in 2013 by Edukans (MFS II funded). According to NVEA staff they improved their capacity in social cognition and team spirit due to regular review meetings (on a quarterly basis) which were introduced as a result of the feedback and advice of the NVEA board, a requirement of Kinderpostzegels (MFS II funded) and experience from other organisations. Finally, NVEA improved its capacity in PME because of improved knowledge in preparing results based reports and on conducting checklist based M&E supervision. Knowledge on preparing reports improved because of a training on Results Based Management (RBM) in 2012 (funded by MFS II); a training on RBM in 2014 by Cheshire Service Ethiopia; and the preparation of M&E guidelines by a consultant in 2013 (partly funded by MFS II). Knowledge on M&E supervision improved because of these M&E guidelines; a training on M&E in 2013 by board members (partially MFS II funded); and regular quarterly monitoring. According to NVEA, MFS II funded capacity development interventions have thus played a role in improved capacity in networking and partnerships; improved capacity in financial reporting and compilation; and improved PME capacity. This was through training, advice and feedback, and the development of a M&E guideline. However, internal factors like advice from board members, assigning an internal auditor and regular review meetings have also played an important role in the key organisational capacity changes that the NVEA staff considered important since the baseline in 2012. Support from other funders, like BEN-E, the World Bank, Cheshire Service Ethiopia in terms of training, has also been mentioned as among the underlying factors for these changes.

List of Respondents

Alliance/ CFA officers:

No.	Name	Function
1	Gezahegn Lamessa	C4C Programme Coordinator DEC Ethiopia
2	Aart van den Broek	Manager Education Programmes Edukans
3	Hendrien Maat	C4C coordinator Ethiopia; senior education specialist Edukans
4	Liana Hoornweg	Programme Officer Education, ICCO Cooperation Regional Office; ICCO Contact for Edukans

NVEA staff:

No.	Name	Function in the organisation
1	Dessaegn Lemessa	Executive . Director
2	Shumi Kenno	Program Coordinator (M&E Unit)
3	Gishu Abera	Program Officer
4	Firehiwot Tezera	Finance Officer
5	Senayit Dadhi	Assistant Finance Officer
6	Amsalework Tiret	Secretary
7	Yodit Dereje	Cashier
8	Gelan Bekuma	Project coordinator (Sibu Sire)
9	Sekata Assefa	Project Coordinator (Bako-Tibe)

Appendix 1 Methodological approach & reflection

1. Introduction

This appendix describes the methodological design and challenges for the assessment of capacity development of Southern Partner Organisations (SPOs), also called the '5C study'. This 5C study is organised around four key evaluation questions:

1. What are the changes in partner organisations' capacity during the 2012-2014 period?
2. To what degree are the changes identified in partner capacity attributable to development interventions undertaken by the MFS II consortia (i.e. measuring effectiveness)?
3. Were the efforts of the MFS II consortia efficient?
4. What factors explain the findings drawn from the questions above?

It has been agreed that the question (3) around efficiency cannot be addressed for this 5C study. The methodological approach for the other three questions is described below. At the end, a methodological reflection is provided.

In terms of the attribution question (2), 'process tracing' is used. This is a theory-based approach that has been applied to a selected number of SPOs since it is a very intensive and costly methodology, although it provides rich information and can generate a lot of learning within the organisations. This approach was presented and agreed-upon during the synthesis workshop on 17-18 June 2013 by the 5C teams for the eight countries of the MFS II evaluation. A more detailed description of the approach was presented during the synthesis workshop in February 2014. The synthesis team, NWO-WOTRO, the country project leaders and the MFS II organisations present at the workshop have accepted this approach. It was agreed that this approach can only be used for a selected number of SPOs since it is a very intensive and costly methodology. Key organisational capacity changes/ outcomes of the SPO were identified, based on their relationship to the two selected capabilities, the capability to act and commit the capability to adapt and self-renew, and an expected relationship with CFA supported capacity development interventions (MFS II funding). It was agreed to focus on these two capabilities, since these are the most targeted capabilities by the CFAs, as established during the baseline process.

Please find below an explanation of how the above-mentioned evaluation questions have been addressed in the 5C evaluation.

Note: the methodological approach is applied to 4 countries that the Centre for Development Innovation, Wageningen University and Research centre is involved in in terms of the 5C study (Ethiopia, India, Indonesia, Liberia). The overall approach has been agreed with all the 8 countries selected for this MFS II evaluation. The 5C country teams have been trained and coached on this methodological approach during the evaluation process. Details specific to the SPO are described in chapter 5.1 of the SPO report. At the end of this appendix a brief methodological reflection is provided.

2. Changes in partner organisation's capacity – evaluation question 1

This section describes the data collection and analysis methodology for answering the first evaluation question: **What are the changes in partner organisations' capacity during the 2012-2014 period?**

This question was mainly addressed by reviewing changes in 5c indicators, but additionally a 'general causal map' based on the SPO perspective on key organisational capacity changes since the baseline

has been developed. Each of these is further explained below. The development of the general causal map is integrated in the steps for the endline workshop, as mentioned below.

During the baseline in 2012 information has been collected on each of the 33 agreed upon indicators for organisational capacity. For each of the five capabilities of the 5C framework indicators have been developed as can be seen in Appendix 2. During this 5C baseline, a summary description has been provided for each of these indicators, based on document review and the information provided by staff, the Co-financing Agency (CFA) and other external stakeholders. Also a summary description has been provided for each capability. The results of these can be read in the baseline reports.

The description of indicators for the baseline in 2012 served as the basis for comparison during the endline in 2014. In practice this meant that largely the same categories of respondents (preferably the same respondents as during the baseline) were requested to review the descriptions per indicator and indicate whether and how the endline situation (2014) is different from the described situation in 2012.² Per indicator they could indicate whether there was an improvement or deterioration or no change and also describe these changes. Furthermore, per indicator the interviewee could indicate what interventions, actors and other factors explain this change compared to the baseline situation. See below the specific questions that are asked for each of the indicators. Per category of interviewees there is a different list of indicators to be looked at. For example, staff members were presented with a list of all the indicators, whilst external people, for example partners, are presented with a select number of indicators, relevant to the stakeholder.

The information on the indicators was collected in different ways:

- 1) **Endline workshop at the SPO - self-assessment and 'general causal map'**: similar to data collection during the baseline, different categories of staff (as much as possible the same people as during the baseline) were brought together in a workshop and requested to respond, in their staff category, to the list of questions for each of the indicators (self-assessment sheet). Prior to carrying out the self-assessments, a brainstorming sessions was facilitated to develop a 'general causal map', based on the key organisational capacity changes since the baseline as perceived by SPO staff. Whilst this general causal map is not validated with additional information, it provides a sequential narrative, based on organisational capacity changes as perceived by SPO staff;
- 2) **Interviews with staff members**: additional to the endline workshop, interviews were held with SPO staff, either to provide more in-depth information on the information provided on the self-assessment formats during the workshop, or as a separate interview for staff members that were not present during the endline workshop;
- 3) **Interviews with externals**: different formats were developed for different types of external respondents, especially the co-financing agency (CFA), but also partner agencies, and organisational development consultants where possible. These externals were interviewed, either face-to-face or by phone/Skype. The interview sheets were sent to the respondents and if they wanted, these could be filled in digitally and followed up on during the interview;
- 4) **Document review**: similar to the baseline in 2012, relevant documents were reviewed so as to get information on each indicator. Documents to be reviewed included progress reports, evaluation reports, training reports, etc. (see below) since the baseline in 2012, so as to identify changes in each of the indicators;
- 5) **Observation**: similar to what was done in 2012, also in 2014 the evaluation team had a list with observable indicators which were to be used for observation during the visit to the SPO.

Below the key steps to assess changes in indicators are described.

² The same categories were used as during the baseline (except beneficiaries, other funders): staff categories including management, programme staff, project staff, monitoring and evaluation staff, field staff, administration staff; stakeholder categories including co-financing agency (CFA), consultants, partners.

Key steps to assess changes in indicators are described

16. Provide the description of indicators in the relevant formats – CDI team
17. Review the descriptions per indicator – in-country team & CDI team
18. Send the formats adapted to the SPO to CFA and SPO – in-country team (formats for SPO) and CDI team (formats for CFA)
19. Collect, upload & code the documents from CFA and SPO in NVivo – CDI team
20. Organise the field visit to the SPO – in-country team
21. Interview the CFA – CDI team
22. Run the endline workshop with the SPO – in-country team
23. Interview SPO staff – in-country team
24. Fill-in observation sheets – in-country team
25. Interview externals – in-country team
26. Upload and auto-code all the formats collected by in-country team and CDI team in NVivo – CDI team
27. Provide to the overview of information per 5c indicator to in-country team – CDI team
28. Analyse data and develop a draft description of the findings per indicator and for the general questions – in-country team
29. Analyse data and develop a final description of the findings per indicator and per capability and for the general questions – CDI team
30. Analyse the information in the general causal map –in-country team and CDI-team

Note: the CDI team include the Dutch 5c country coordinator as well as the overall 5c coordinator for the four countries (Ethiopia, India, Indonesia, Liberia). The 5c country report is based on the separate SPO reports.

Below each of these steps is further explained.

*Step 1. Provide the **description of indicators** in the relevant formats – CDI team*

- These formats were to be used when collecting data from SPO staff, CFA, partners, and consultants. For each of these respondents different formats have been developed, based on the list of 5C indicators, similar to the procedure that was used during the baseline assessment. The CDI team needed to add the 2012 baseline description of each indicator. The idea was that each respondent would be requested to review each description per indicator, and indicate whether the current situation is different from the baseline situation, how this situation has changed, and what the reasons for the changes in indicators are. At the end of each format, a more general question is added that addresses how the organisation has changed its capacity since the baseline, and what possible reasons for change exist. Please see below the questions asked for each indicator as well as the more general questions at the end of the list of indicators.

General questions about key changes in the capacity of the SPO

What do you consider to be the key changes in terms of how the organisation/ SPO has developed its capacity since the baseline (2012)?

What do you consider to be the main explanatory reasons (interventions, actors or factors) for these changes?

List of questions to be asked for each of the 5C indicators (The entry point is the the description of each indicator as in the 2012 baseline report):

1. *How has the situation of this indicator changed compared to the situation during the baseline in 2012? Please tick one of the following scores:*
 - -2 = Considerable deterioration
 - -1 = A slight deterioration
 - 0 = No change occurred, the situation is the same as in 2012
 - +1 = Slight improvement
 - +2 = Considerable improvement
2. *Please describe what exactly has changed since the baseline in 2012*
3. *What interventions, actors and other factors explain this change compared to the baseline situation in 2012? Please tick and describe what interventions, actors or factors influenced this indicator, and how. You can tick and describe more than one choice.*
 - Intervention, actor or factor at the level of or by **SPO**:

- Intervention, actor or factor at the level of or by the **Dutch CFA (MFS II funding)**:
- Intervention, actor or factor at the level of or by the **other funders**:
- **Other** interventions, actors or factors:
 - Don't know.

*Step 2. **Review** the descriptions per indicator – in-country team & CDI team*

Before the in-country team and the CDI team started collecting data in the field, it was important that they reviewed the description for each indicator as described in the baseline reports, and also added to the endline formats for review by respondents. These descriptions are based on document review, observation, interviews with SPO staff, CFA staff and external respondents during the baseline. It was important to explain this to respondents before they filled in the formats.

*Step 3. **Send the formats** adapted to the SPO to CFA and SPO – in-country team (formats for SPO) and CDI team (formats for CFA)*

The CDI team was responsible for collecting data from the CFA:

- 5C Endline assessment Dutch co-financing organisation;
- 5C Endline support to capacity sheet – CFA perspective.

The in-country team was responsible for collecting data from the SPO and from external respondents (except CFA). The following formats were sent before the fieldwork started:

- 5C Endline support to capacity sheet – SPO perspective.
- 5C Endline interview guides for externals: partners; OD consultants.

*Step 4. **Collect, upload & code the documents** from CFA and SPO in NVivo – CDI team*

The CDI team, in collaboration with the in-country team, collected the following documents from SPOs and CFAs:

- Project documents: project proposal, budget, contract (Note that for some SPOs there is a contract for the full MFS II period 2011-2015; for others there is a yearly or 2-yearly contract. All new contracts since the baseline in 2012 will need to be collected);
- Technical and financial progress reports since the baseline in 2012;.
- Mid-term evaluation reports;
- End of project-evaluation reports (by the SPO itself or by external evaluators);
- Contract intake forms (assessments of the SPO by the CFA) or organisational assessment scans made by the CFA that cover the 2011-2014 period;
- Consultant reports on specific inputs provided to the SPO in terms of organisational capacity development;
- Training reports (for the SPO; for alliance partners, including the SPO);
- Organisational scans/ assessments, carried out by the CFA or by the Alliance Assessments;
- Monitoring protocol reports, especially for the 5C study carried out by the MFS II Alliances;
- Annual progress reports of the CFA and of the Alliance in relation to capacity development of the SPOs in the particular country;
- Specific reports that are related to capacity development of SPOs in a particular country.

The following documents (since the baseline in 2012) were requested from SPO:

- Annual progress reports;
- Annual financial reports and audit reports;
- Organisational structure vision and mission since the baseline in 2012;
- Strategic plans;
- Business plans;
- Project/ programme planning documents;
- Annual work plan and budgets;
- Operational manuals;
- Organisational and policy documents: finance, human resource development, etc.;
- Monitoring and evaluation strategy and implementation plans;
- Evaluation reports;

- Staff training reports;
- Organisational capacity reports from development consultants.

The CDI team will code these documents in NVivo (qualitative data analysis software program) against the 5C indicators.

Step 5. Prepare and organise the field visit to the SPO – in-country team

Meanwhile the in-country team prepared and organised the logistics for the field visit to the SPO:

- **General endline workshop** consisted about one day for the self-assessments (about ½ to ¾ of the day) and brainstorm (about 1 to 2 hours) on key organisational capacity changes since the baseline and underlying interventions, factors and actors ('general causal map'), see also explanation below. This was done with the five categories of key staff: managers; project/ programme staff; monitoring and evaluation staff; admin & HRM staff; field staff. Note: for SPOs involved in process tracing an additional 1 to 1½ day workshop (managers; program/project staff; monitoring and evaluation staff) was necessary. See also step 7;
- **Interviews with SPO staff** (roughly one day);
- **Interviews with external respondents** such as partners and organisational development consultants depending on their proximity to the SPO. These interviews could be scheduled after the endline workshop and interviews with SPO staff.

General causal map

During the 5C endline process, a 'general causal map' has been developed, based on key organisational capacity changes and underlying causes for these changes, as perceived by the SPO. The general causal map describes cause-effect relationships, and is described both as a visual as well as a narrative.

As much as possible the same people that were involved in the baseline were also involved in the endline workshop and interviews.

Step 6. Interview the CFA – CDI team

The CDI team was responsible for sending the sheets/ formats to the CFA and for doing a follow-up interview on the basis of the information provided so as to clarify or deepen the information provided. This relates to:

- 5C Endline assessment Dutch co-financing organisation;
- 5C Endline support to capacity sheet - CFA perspective.

Step 7. Run the endline workshop with the SPO – in-country team

This included running the endline workshop, including facilitation of the development of the general causal map, self-assessments, interviews and observations. Particularly for those SPOs that were selected for process tracing all the relevant information needed to be analysed prior to the field visit, so as to develop an initial causal map. Please see Step 6 and also the next section on process tracing (evaluation question two).

An endline workshop with the SPO was intended to:

- Explain the purpose of the fieldwork;
- Carry out in the self-assessments by SPO staff subgroups (unless these have already been filled prior to the field visits) - this may take some 3 hours.
- Facilitate a brainstorm on key organisational capacity changes since the baseline in 2012 and underlying interventions, factors and actors.

Purpose of the fieldwork: to collect data that help to provide information on what changes took place in terms of organisational capacity development of the SPO as well as reasons for these changes. The baseline that was carried out in 2012 was to be used as a point of reference.

Brainstorm on key organisational capacity changes and influencing factors: a brainstorm was facilitated on key organisational capacity changes since the baseline in 2012. In order to kick start the discussion, staff were reminded of the key findings related to the historical time line carried out in the

baseline (vision, mission, strategies, funding, staff). This was then used to generate a discussion on key changes that happened in the organisation since the baseline (on cards). Then cards were selected that were related to organisational capacity changes, and organised. Then a 'general causal map' was developed, based on these key organisational capacity changes and underlying reasons for change as experienced by the SPO staff. This was documented as a visual and narrative. This general causal map was to get the story of the SPO on what they perceived as key organisational capacity changes in the organisation since the baseline, in addition to the specific details provided per indicator.

Self-assessments: respondents worked in the respective staff function groups: management; programme/ project staff; monitoring and evaluation staff; admin and HRM staff; field staff. Staff were assisted where necessary so that they could really understand what it was they were being asked to do as well as what the descriptions under each indicator meant.

Note: for those SPOs selected for process tracing an additional endline workshop was held to facilitate the development of detailed causal maps for each of the identified organisational change/ outcome areas that fall under the capability to act and commit, and under the capability to adapt and self-renew, and that are likely related to capacity development interventions by the CFA. See also the next section on process tracing (evaluation question two). It was up to the in-country team whether this workshop was held straight after the initial endline workshop or after the workshop and the follow-up interviews. It could also be held as a separate workshop at another time.

Step 8. Interview SPO staff – in-country team

After the endline workshop (developing the general causal map and carrying out self-assessments in subgroups), interviews were held with SPO staff (subgroups) to follow up on the information that was provided in the self-assessment sheets, and to interview staff that had not yet provided any information.

Step 9. Fill-in observation sheets – in-country team

During the visit at the SPO, the in-country team had to fill in two sheets based on their observation:

- 5C Endline observation sheet;
- 5C Endline observable indicators.

Step 10. Interview externals – in-country team & CDI team

The in-country team also needed to interview the partners of the SPO as well as organisational capacity development consultants that have provided support to the SPO. The CDI team interviewed the CFA.

Step 11. Upload and auto-code all the formats collected by in-country team and CDI team – CDI team

The CDI team was responsible for uploading and auto-coding (in Nvivo) of the documents that were collected by the in-country team and by the CDI team.

Step 12. Provide the overview of information per 5C indicator to in-country team – CDI team

After the analysis in NVivo, the CDI team provided a copy of all the information generated per indicator to the in-country team for initial analysis.

Step 13. Analyse the data and develop a draft description of the findings per indicator and for the general questions – in-country team

The in-country team provided a draft description of the findings per indicator, based on the information generated per indicator. The information generated under the general questions were linked to the general causal map or detailed process tracing related causal map.

Step 14. Analyse the data and finalize the description of the findings per indicator, per capability and general – CDI team

The CDI team was responsible for checking the analysis by the in-country team with the Nvivo generated data and to make suggestions for improvement and ask questions for clarification to which

the in-country team responded. The CDI team then finalised the analysis and provided final descriptions and scores per indicator and also summarize these per capability and calculated the summary capability scores based on the average of all indicators by capability.

Step 15. Analyse the information in the general causal map –in-country team & CDI team

The general causal map based on key organisational capacity changes as perceived by the SPO staff present at the workshop, was further detailed by in-country team and CDI team, and based on the notes made during the workshop and where necessary additional follow up with the SPO. The visual and narrative was finalized after feedback by the SPO. During analysis of the general causal map relationships with MFS II support for capacity development and other factors and actors were identified. All the information has been reviewed by the SPO and CFA.

3. Attributing changes in partner organisation's capacity – evaluation question 2

This section describes the data collection and analysis methodology for answering the second evaluation question: ***To what degree are the changes identified in partner capacity attributable to (capacity) development interventions undertaken by the MFS II consortia (i.e. measuring effectiveness)?***

In terms of the attribution question (2), 'process tracing' is used. This is a theory-based approach that has been applied to a selected number of SPOs since it is a very intensive and costly methodology, although it provides rich information and can generate a lot of learning within the organisations. Key organisational capacity changes/ outcomes of the SPO were identified, based on their relationship to the two selected capabilities, the capability to act and commit the capability to adapt and self-renew, and an expected relationship with CFA supported capacity development interventions (MFS II funding). It was agreed to focus on these two capabilities, since these are the most targeted capabilities by the CFAs, as established during the baseline process. The box below provides some background information on process tracing.

Background information on process tracing

The essence of process tracing research is that scholars want to go beyond merely identifying correlations between independent variables (Xs) and outcomes (Ys). Process tracing in social science is commonly defined by its addition to trace causal mechanisms (Bennett, 2008a, 2008b; Checkle, 2008; George & Bennett, 2005). A causal mechanism can be defined as “a complex system which produces an outcome by the interaction of a number of parts” (Glennan, 1996, p. 52). Process tracing involves “attempts to identify the intervening causal process – the causal chain and causal mechanism – between an independent variable (or variables) and the outcome of the dependent variable” (George & Bennett, 2005, pp. 206-207).

Process tracing can be differentiated into three variants within social science: theory testing, theory building, and explaining outcome process tracing (Beach & Pedersen, 2013).

Theory testing process tracing uses a theory from the existing literature and then tests whether evidence shows that each part of hypothesised causal mechanism is present in a given case, enabling within case inferences about whether the mechanism functioned as expected in the case and whether the mechanism as a whole was present. No claims can be made however, about whether the mechanism was the only cause of the outcome.

Theory building process tracing seeks to build generalizable theoretical explanations from empirical evidence, inferring that a more general causal mechanism exists from the fact of a particular case.

Finally, explaining outcome process tracing attempts to craft a minimally sufficient explanation of a puzzling outcome in a specific historical case. Here the aim is not to build or test more general theories but to craft a (minimally) sufficient explanation of the outcome of the case where the ambitions are more case centric than theory oriented.

Explaining outcome process tracing is the most suitable type of process tracing for analysing the causal mechanisms for selected key organisational capacity changes of the SPOs. This type of process tracing can be thought of as a single outcome study defined as seeking the causes of the specific outcome in a single case (Gerring, 2006; in: Beach & Pedersen, 2013). Here the ambition is to craft a minimally sufficient explanation of a particular outcome, with sufficiency defined as an explanation that accounts for all of the important aspects of an outcome with no redundant parts being present (Mackie, 1965).

Explaining outcome process tracing is an iterative research strategy that aims to trace the complex conglomerate of systematic and case specific causal mechanisms that produced the outcome in question. The explanation cannot be detached from the particular case. Explaining outcome process tracing refers to case studies whose primary ambition is to explain particular historical outcomes, although the findings of the case can also speak to other potential cases of the phenomenon. Explaining outcome process tracing is an iterative research process in which ‘theories’ are tested to see whether they can provide a minimally sufficient explanation of the outcome. Minimal sufficiency is defined as an explanation that accounts for an outcome, with no redundant parts. In most explaining outcome studies, existing theorisation cannot provide a sufficient explanation, resulting in a second stage in which existing theories are re-conceptualised in light of the evidence gathered in the preceding empirical analysis. The conceptualisation phase in explaining outcome process tracing is therefore an iterative research process, with initial mechanisms re-conceptualised and tested until the result is a theorised mechanism that provides a minimally sufficient explanation of the particular outcome.

Below a description is provided of how SPOs are selected for process tracing, and a description is provided on how this process tracing is to be carried out. Note that this description of process tracing provides not only information on the extent to which the changes in organisational development can be attributed to MFS II (evaluation question 2), but also provides information on other contributing factors and actors (evaluation question 4). Furthermore, it must be noted that the evaluation team has developed an adapted form of ‘explaining outcome process tracing’, since the data collection and analysis was an iterative process of research so as to establish the most realistic explanation for a particular outcome/ organisational capacity change. Below selection of SPOs for process tracing as well as the different steps involved for process tracing in the selected SPOs, are further explained.

Selection of SPOs for 5C process tracing

Process tracing is a very intensive methodology that is very time and resource consuming (for development and analysis of one final detailed causal map, it takes about 1-2 weeks in total, for different members of the evaluation team). It has been agreed upon during the synthesis workshop on

17-18 June 2013 that only a selected number of SPOs will take part in this process tracing for the purpose of understanding the attribution question. The selection of SPOs is based on the following criteria:

- MFS II support to the SPO has not ended before 2014 (since this would leave us with too small a time difference between intervention and outcome);
- Focus is on the 1-2 capabilities that are targeted most by CFAs in a particular country;
- Both the SPO and the CFA are targeting the same capability, and preferably aim for similar outcomes;
- Maximum one SPO per CFA per country will be included in the process tracing.

The intention was to focus on about 30-50% of the SPOs involved. Please see the tables below for a selection of SPOs per country. Per country, a first table shows the extent to which a CFA targets the five capabilities, which is used to select the capabilities to focus on. A second table presents which SPO is selected, and takes into consideration the selection criteria as mentioned above.

ETHIOPIA

For Ethiopia the capabilities that are mostly targeted by CFAs are the capability to act and commit and the capability to adapt and self-renew. See also the table below.

Table 1

The extent to which the Dutch NGO explicitly targets the following capabilities – Ethiopia

Capability to:	AMREF	CARE	ECFA	FSCE	HOA-REC	HUN-DEE	NVEA	OSRA	TTCA
Act and commit	5	4	5	5	5	3	4	4	3
Deliver on development objectives	2	1	1	1	2	1	1	2	1
Adapt and self-renew	4	2	3	4	2	5	3	3	3
Relate	3	1	2	2	3	2	1	3	1
Achieve coherence	2	2	1	1	1	1	1	1	1

Note: Number 1 stands for not targeted, 5 for intensively targeted. These scores are relative scores for the interventions by the CFA to strengthen the capacity of the SPO. The scores are relative to each other, a higher score means that this capability gets more attention by the CFA compared to other capabilities.

Source: country baseline report, Ethiopia.

Below you can see the table describing when the contract with the SPO is to be ended, and whether both SPO and the CFA expect to focus on these two selected capabilities (with MFS II funding). Based on the above-mentioned selection criteria the following SPOs are selected for process tracing: AMREF, ECFA, FSCE, HUNDEE. In fact, six SPOs would be suitable for process tracing. We just selected the first one per CFA following the criteria of not including more than one SPO per CFA for process tracing

Table 2*SPOs selected for process tracing – Ethiopia*

Ethiopia – SPOs	End of contract	Focus on capability to act and commitment – by SPO	Focus on capability to act and commitment – by CFA	Focus on capability to adapt and self-renew – by SPO	Focus on capability to adapt and self-renew – by CFA	CFA	Selected for process tracing
AMREF	Dec 2015	Yes	Yes	Yes	Yes	AMREF NL	Yes
CARE	Dec 31, 2015	Partly	Yes	Yes	Yes – slightly	CARE Netherlands	No - not fully matching
ECFA	Jan 2015	Yes	Yes	Yes	Yes	Child Helpline International	Yes
FSCE	Dec 2015	Yes	Yes	Yes	Yes	Stichting Kinderpostzegels Netherlands (SKN); Note: no info from Defence for Children – ECPAT Netherlands	Yes
HOA-REC	Sustainable Energy project (ICCO Alliance): 2014 Innovative WASH (WASH Alliance): Dec 2015	Yes	Yes	Yes	Yes - slightly	ICCO	No - not fully matching
HUNDEE	Dec 2014	Yes	Yes	Yes	Yes	ICCO & IICD	Yes
NVEA	Dec 2015 (both)	Yes	Yes	Yes	Yes	Edukans Foundation (under two consortia); Stichting Kinderpostzegels Netherlands (SKN)	Suitable but SKN already involved for process tracing FSCE
OSRA	C4C Alliance project (farmers marketing): December 2014 ICCO Alliance project (zero grazing): 2014 (2 nd phase)	Yes	Yes	Yes	Yes	ICCO & IICD	Suitable but ICCO & IICD already involved for process tracing - HUNDEE
TTCA	June 2015	Partly	Yes	No	Yes	Edukans Foundation	No - not fully matching

INDIA

For India the capability that is mostly targeted by CFAs is the capability to act and commit. The next one in line is the capability to adapt and self-renew. See also the table below in which a higher score means that the specific capability is more intensively targeted.

Table 3

The extent to which the Dutch NGO explicitly targets the following capabilities – India³

Capability to:	BVHA	COUNT	DRISTI	FFID	Jana Vikas	Samarthak Samiti	SMILE	SDS	VTRC
Act and commit	5	3	4	4	4	4	4	3	5
Deliver on development objectives	1	5	1	1	1	1	1	2	1
Adapt and self-renew	2	2	1	3	1	1	4	1	4
Relate	3	1	1	1	1	1	2	1	2
Achieve coherence	1	1	1	4	1	1	1	1	2

Note: Number 1 stands for not targeted, 5 for intensively targeted. These scores are relative scores for the interventions by the CFA to strengthen the capacity of the SPO. The scores are relative to each other, a higher score means that this capability gets more attention by the CFA compared to other capabilities.

Source: country baseline report, India.

Below you can see a table describing when the contract with the SPO is to be ended and whether SPO and the CFA both expect to focus on these two selected capabilities (with MFS II funding). Based on the above-mentioned selection criteria the following SPOs are selected for process tracing: BVHA, COUNT, FFID, SMILE and VTRC. Except for SMILE (capability to act and commit only), for the other SPOs the focus for process tracing can be on the capability to act and commit and on the capability to adapt and self-renew.

Table 4

SPOs selected for process tracing – India

India – SPOs	End of contract	Focus on capability to act and commit – by SPO	Focus on capability to act and commit – by CFA	Focus on capability to adapt and self-renew – by SPO	Focus on capability to adapt and self-renew – by CFA	CFA	Selected for process tracing
BVHA	2014	Yes	Yes	Yes	Yes	Simavi	Yes; both capabilities
COUNT	2015	Yes	Yes	Yes	Yes	Woorden Daad	Yes; both capabilities
DRISTI	31-03-2012	Yes	Yes	No	no	Hivos	No - closed in 2012
FFID	30-09-2014	Yes	Yes	Yes	Yes	ICCO	Yes

³ RGVN, NEDSF and Women's Rights Forum (WRF) could not be reached timely during the baseline due to security reasons. WRF could not be reached at all. Therefore these SPOs are not included in Table 1.

India – SPOs	End of contract	Focus on capability to act and commit – by SPO	Focus on capability to act and commit – by CFA	Focus on capability to adapt and self-renew – by SPO	Focus on capability to adapt and self-renew – by CFA	CFA	Selected for process tracing
Jana Vikas	2013	Yes	Yes	Yes	No	Cordaid	No - contract is and the by now; not fully matching focus
NEDSF							No – delayed baseline
RGVN							No - delayed baseline
Samarthak Samiti (SDS)	2013 possibly longer	Yes	Yes	Yes	No	Hivos	No - not certain of end date and not fully matching focus
Shivi Development Society (SDS)	Dec 2013 intention 2014	Yes	Yes	Yes	No	Cordaid	No - not fully matching focus
Smile	2015	Yes	Yes	Yes	Yes	Wilde Ganzen	Yes; first capability only
VTRC	2015	Yes	Yes	Yes	Yes	Stichting Red een Kind	Yes; both capabilities

INDONESIA

For Indonesia the capabilities that are most frequently targeted by CFAs are the capability to act and commit and the capability to adapt and self-renew. See also the table below.

Table 5

The extent to which the Dutch NGO explicitly targets the following capabilities – Indonesia

Capability to:	ASB	Daya kologi	ECPAT	GSS	Lem baga Kita	Pt. PPM A	Rifka Annisa	WIIP	Yad upa	Yayasan Kelola	YPI	YRBI
Act and commit	4	4	4	5	4	4	5	3	3	2	5	4
Deliver on development objectives	1	1	1	2	2	1	2	1	1	1	1	1
Adapt and self-renew	3	1	2	4	2	3	4	4	1	1	4	3
Relate	1	1	2	3	3	2	1	2	2	2	3	2
Achieve coherence	1	1	1	2	1	1	2	2	1	1	2	1

Note: Number 1 stands for not targeted, 5 for intensively targeted. These scores are relative scores for the interventions by the CFA to strengthen the capacity of the SPO. The scores are relative to each other, a higher score means that this capability gets more attention by the CFA compared to other capabilities.

Source: country baseline report, Indonesia.

The table below describes when the contract with the SPO is to be ended and whether both SPO and the CFA expect to focus on these two selected capabilities (MFS II funding). Based on the above-mentioned selection criteria the following SPOs are selected for process tracing: ASB, ECPAT, Pt.PPMA, YPI, YRBI.

Table 6

SPOs selected for process tracing – Indonesia

Indonesia – SPOs	End of contract	Focus on capability to act and commit – by SPO	Focus on capability to act and commit – by CFA	Focus on capability to adapt and self-renew – by SPO	Focus on capability to adapt and self-renew – by CFA	CFA	Selected for process tracing
ASB	February 2012; extension Feb,1, 2013 – June,30, 2016	Yes	Yes	Yes	Yes	Hivos	Yes
Dayakologi	2013; no extension	Yes	Yes	Yes	No	Cordaid	No: contract ended early and not matching enough
ECPAT	August 2013; Extension Dec 2014	Yes	Yes	Yes, a bit	Yes	Free Press Unlimited - Mensen met een Missie	Yes
GSS	31 December 2012; no extension	Yes	Yes	Yes, a bit	Yes	Free Press Unlimited - Mensen met een Missie	No: contract ended early
Lembaga Kita	31 December 2012; no extension	Yes	Yes	No	Yes	Free Press Unlimited - Mensen met een Missie	No - contract ended early
Pt.PPMA	May 2015	Yes	Yes	No	Yes	IUCN	Yes, capability to act and commit only
Rifka Annisa	Dec, 31 2015	No	Yes	No	Yes	Rutgers WPF	No - no match between expectations CFA and SPO
WIIP	Dec 2015	Yes	Not MFS II	Yes	Not MFS II	Red Cross	No - Capacity development interventions are not MFS II financed. Only some overhead is MFS II

Indonesia – SPOs	End of contract	Focus on capability to act and commit – by SPO	Focus on capability to act and commit – by CFA	Focus on capability to adapt and self-renew – by SPO	Focus on capability to adapt and self-renew – by CFA	CFA	Selected for process tracing
Yayasan Kelola	Dec 30, 2013; extension of contract being processed for two years (2014-2015)	Yes	Not really	Yes	Not really	Hivos	No - no specific capacity development interventions planned by Hivos
YPI	Dec 31, 2015	Yes	Yes	Yes	Yes	Rutgers WPF	Yes
YRBI	Oct, 30, 2013; YRBI end of contract from 31st Oct 2013 to 31st Dec 2013. Contract extension proposal is being proposed to MFS II, no decision yet.	Yes	Yes	Yes	Yes	ICCO	Yes
Yadupa	Under negotiation during baseline; new contract 2013 until now	Yes	Nothing committed	Yes	Nothing committed	IUCN	No, since nothing was committed by CFA

LIBERIA

For Liberia the situation is arbitrary which capabilities are targeted most CFA's. Whilst the capability to act and commit is targeted more often than the other capabilities, this is only so for two of the SPOs. The capability to adapt and self-renew and the capability to relate are almost equally targeted for the five SPOs, be it not intensively. Since the capability to act and commit and the capability to adapt and self-renew are the most targeted capabilities in Ethiopia, India and Indonesia, we choose to focus on these two capabilities for Liberia as well. This would help the synthesis team in the further analysis of these capabilities related to process tracing. See also the table below.

Table 7

The extent to which the Dutch NGO explicitly targets the following capabilities – Liberia

Capability to:	BSC	DEN-L	NAWOCOL	REFOUND	RHRAP
Act and commit	5	1	1	1	3
Deliver on development objectives	3	1	1	1	1
Adapt and self-renew	2	2	2	2	2
Relate	1	2	2	2	2
Achieve coherence	1	1	1	1	1

Note: Number 1 stands for not targeted, 5 for intensively targeted. These scores are relative scores for the interventions by the CFA to strengthen the capacity of the SPO. The scores are relative to each other, a higher score means that this capability gets more attention by the CFA compared to other capabilities.

Source: country baseline report, Liberia.

Below you can see the table describing when the contract with the SPO is to be ended, and whether both SPO and the CFA expect to focus on these two selected capabilities (with MFS II funding). Also, for two of the five SPOs capability to act and commit is targeted more intensively compared to the other capabilities. Based on the above-mentioned selection criteria the following SPOs are selected for process tracing: BSC and RHRAP.

Table 8

SPOs selected for process tracing – Liberia

Liberia – SPOs	End of contract	Focus on capability to act and commit – by SPO	Focus on capability to act and commit – by CFA	Focus on capability to adapt and self-renew – by SPO	Focus on capability to adapt and self-renew – by CFA	CFA	Selected for process tracing
BSC	Dec 31, 2015	Yes	Yes	Yes	Yes	SPARK	Yes
DEN-L	2014	No	No	Unknown	A little	ICCO	No – not matching enough
NAWOCOL	2014	Yes	No	No	A little	ICCO	No – not matching enough
REFOUND	At least until 2013 (2015?)	Yes	No	Yes	A little	ICCO	No – not matching enough
RHRAP	At least until 2013 (2014?)	Yes	Yes	Yes	Yes	ICCO	Yes

Key steps in process tracing for the 5C study

In the box below you will find the key steps developed for the 5C process tracing methodology. These steps will be further explained here. Only key staff of the SPO is involved in this process: management; programme/ project staff; and monitoring and evaluation staff, and other staff that could provide information relevant to the identified outcome area/key organisational capacity change. Those SPOs selected for process tracing had a separate endline workshop, in addition to the ' general endline workshop. This workshop was carried out after the initial endline workshop and the interviews during the field visit to the SPO. Where possible, the general and process tracing endline workshop have been held consecutively, but where possible these workshops were held at different points in time, due to the complex design of the process. Below the detailed steps for the purpose of process tracing are further explained.

Key steps in process tracing for the 5C study

Identify the planned MFS II supported capacity development interventions within the selected capabilities (capability to act and commit and capability to adapt and self-renew) – CDI team

Identify the implemented MFS II supported capacity development interventions within the selected capabilities (capability to act and commit and capability to adapt and self-renew) – CDI team

Identify initial changes/ outcome areas in these two capabilities – CDI team & in-country team

Construct the detailed, initial causal map (theoretical model of change) – CDI team & in-country team

Identify types of evidence needed to verify or discard different causal relationships in the model of change – in-country teams, with support from CDI team

Collect data to verify or discard causal mechanisms and construct workshop based, detailed causal map (model of change) – in-country team

Assess the quality of data and analyse data and develop final detailed causal map (model of change) – in-country team with CDI team

Analyse and conclude on findings– CDI team, in collaboration with in-country team

Some definitions of the terminology used for this MFS II 5c evaluation

Based upon the different interpretations and connotations the use of the term causal mechanism we use the following terminology for the remainder of this paper:

A **detailed causal map** (or **model of change**) = the representation of all possible explanations – causal pathways for a change/ outcome. These pathways are that of the intervention, rival pathways and pathways that combine parts of the intervention pathway with that of others. This also depicts the reciprocity of various events influencing each other and impacting the overall change.

A **causal mechanism** = is the combination of parts that ultimately explains an outcome. Each part of the mechanism is an individually insufficient but necessary factor in a whole mechanism, which together produce the outcome (Beach and Pedersen, 2013, p. 176).

Part or **cause** = one actor with its attributes carrying out activities/ producing outputs that lead to change in other parts. The final part or cause is the change/ outcome.

Attributes of the actor = specificities of the actor that increase his chance to introduce change or not such as its position in its institutional environment.

*Step 1. Identify the **planned MFS II supported capacity development interventions** within the selected capabilities (capability to act and commit and capability to adapt and self-renew) – CDI team*

Chapter 4.1 and 4.2 in the baseline report were reviewed. Capacity development interventions as planned by the CFA for the capability to act and commit and for the capability to adapt and self-renew were described and details inserted in the summary format. This provided an overview of the capacity development activities that were originally planned by the CFA for these two capabilities and assisted in focusing on relevant outcomes that are possibly related to the planned interventions.

*Step 2. Identify the **implemented capacity development interventions** within the selected capabilities (capability to act and commit and capability to adapt and self-renew) – CDI team*

The input from the CFA was reviewed in terms of what capacity development interventions have taken place in the MFS II period. This information was found in the 'Support to capacity development sheet - endline - CFA perspective' for the SPO, based on details provided by the CFA and further discussed during an interview by the CDI team.

The CFA was asked to describe all the MFS II supported capacity development interventions of the SPO that took place during the period 2011 up to now. The CDI team reviewed this information, not only the interventions but also the observed changes as well as the expected long-term changes, and then linked these interventions to relevant outcomes in one of the capabilities (capability to act and commit; and capability to adapt and self-renew).

*Step 3. Identify **initial changes/ outcome areas** in these two capabilities – by CDI team & in-country team*

The CDI team was responsible for coding documents received from SPO and CFA in NVivo on the following:

- 5C Indicators: this was to identify the changes that took place between baseline and endline. This information was coded in Nvivo.
- Information related to the capacity development interventions implemented by the CFA (with MFS II funding) (see also Step 2) to strengthen the capacity of the SPO. For example, the training on financial management of the SPO staff could be related to any information on financial management of the SPO. This information was coded in Nvivo.

In addition, the response by the CFA to the changes in 5C indicators format, was auto-coded.

The in-country team was responsible for timely collection of information from the SPO (before the fieldwork starts). This set of information dealt with:

- MFS II supported capacity development interventions during the MFS II period (2011 until now).
- Overview of all trainings provided in relation to a particular outcome areas/organisational capacity change since the baseline.
- For each of the identified MFS II supported trainings, training questionnaires have been developed to assess these trainings in terms of the participants, interests, knowledge and skills gained, behaviour change and changes in the organisation (based on Kirkpatrick's model), one format for training participants and one for their managers. These training questionnaires were sent prior to the field visit.
- Changes expected by SPO on a long-term basis ('Support to capacity development sheet - endline - SPO perspective').

For the selection of change/ outcome areas the following criteria were important:

- The change/ outcome area is in one of the two capabilities selected for process tracing: capability to act and commit or the capability to adapt and self-renew. This was the first criteria to select upon.
- There was a likely link between the key organisational capacity change/ outcome area and the MFS II supported capacity development interventions. This also was an important criteria. This would need to be demonstrated through one or more of the following situations:
 - In the 2012 theory of change on organisational capacity development of the SPO a link was indicated between the outcome area and MFS II support;
 - During the baseline the CFA indicated a link between the planned MFS II support to organisational development and the expected short-term or long-term results in one of the selected capabilities;
 - During the endline the CFA indicated a link between the implemented MFS II capacity development interventions and observed short-term changes and expected long-term changes in the organisational capacity of the SPO in one of the selected capabilities;
 - During the endline the SPO indicated a link between the implemented MFS II capacity development interventions and observed short-term changes and expected long-term changes in the organisational capacity of the SPO in one of the selected capabilities.

Reviewing the information obtained as described in Step 1, 2, and 3 provided the basis for selecting key organisational capacity change/ outcome areas to focus on for process tracing. These areas were to be formulated as broader outcome areas, such as 'improved financial management', 'improved monitoring and evaluation' or 'improved staff competencies'.

Note: the outcome areas were to be formulated as intermediates changes. For example: an improved monitoring and evaluation system, or enhanced knowledge and skills to educate the target group on climate change. Key outcome areas were also verified - based on document review as well as discussions with the SPO during the endline.

*Step 4. Construct the **detailed, initial causal map** (theoretical model of change) – CDI & in-country team*

A detailed initial causal map was developed by the CDI team, in collaboration with the in-country team. This was based on document review, including information provided by the CFA and SPO on MFS II supported capacity development interventions and their immediate and long-term objectives as well as observed changes. Also, the training questionnaires were reviewed before developing the initial causal map. This detailed initial causal map was to be provided by the CDI team with a visual and related narrative with related references. This initial causal map served as a reference point for further reflection with the SPO during the process tracing endline workshop, where relationships needed to be verified or new relationships established so that the second (workshop-based), detailed causal map could be developed, after which further verification was needed to come up with the final, concluding detailed causal map.

It's important to note that organisational change area/ outcome areas could be both positive and negative.

For each of the selected outcomes the team needed to make explicit the theoretical model of change. This meant finding out about the range of different actors, factors, actions, and events etc. that have contributed to a particular outcome in terms of organisational capacity of the SPO.

A model of change of good quality includes:

- The causal pathways that relate the intervention to the realised change/ outcome;
- Rival explanations for the same change/ outcome;
- Assumptions that clarify relations between different components or parts;
- Case specific and/or context specific factors or risks that might influence the causal pathway, such as for instance the socio-cultural-economic context, or a natural disaster;
- Specific attributes of the actors e.g. CFA and other funders.

A model of change (within the 5C study called a 'detailed causal map') is a complex system which produces intermediate and long-term outcomes by the interaction of other parts. It consists of parts or causes that often consist of one actor with its attributes that is implementing activities leading to change in other parts (Beach & Pedersen, 2013). A helpful way of constructing the model of change is to think in terms of actors carrying out activities that lead to other actors changing their behaviour. The model of change can be explained as a range of activities carried out by different *actors* (including the CFA and SPO under evaluation) that will ultimately lead to an outcome. Besides this, there are also '*structural*' elements, which are to be interpreted as external factors (such as economic conjuncture); and *attributes* of the actor (does the actor have the legitimacy to ask for change or not, what is its position in the sector) that should be looked at (Beach & Pedersen, 2013). In fact Beach and Pedersen, make a fine point about the subjectivity of the actor in a dynamic context. This means, in qualitative methodologies, capturing the changes in the actor, acted upon area or person/organisation, in a non sequential and non temporal format. Things which were done recently could have corrected behavioural outcomes of an organisation and at the same time there could be processes which incrementally pushed for the same change over a period of time. Beach and Pedersen espouse this methodology because it captures change in a dynamic fashion as against the methodology of logical framework. For the MFS II evaluation it was important to make a distinction between those paths in the model of change that are the result of MFS II and rival pathways.

The construction of the model of change started with the identified key organisational capacity change/ outcome, followed by an inventory of all possible subcomponents that possibly have caused the change/ outcome in the MFS II period (2011-up to now, or since the baseline). The figure below presents an imaginary example of a model of change. The different colours indicate the different types of support to capacity development of the SPO by different actors, thereby indicating different pathways of change, leading to the key changes/ outcomes in terms of capacity development (which in this case indicates the ability to adapt and self-renew).

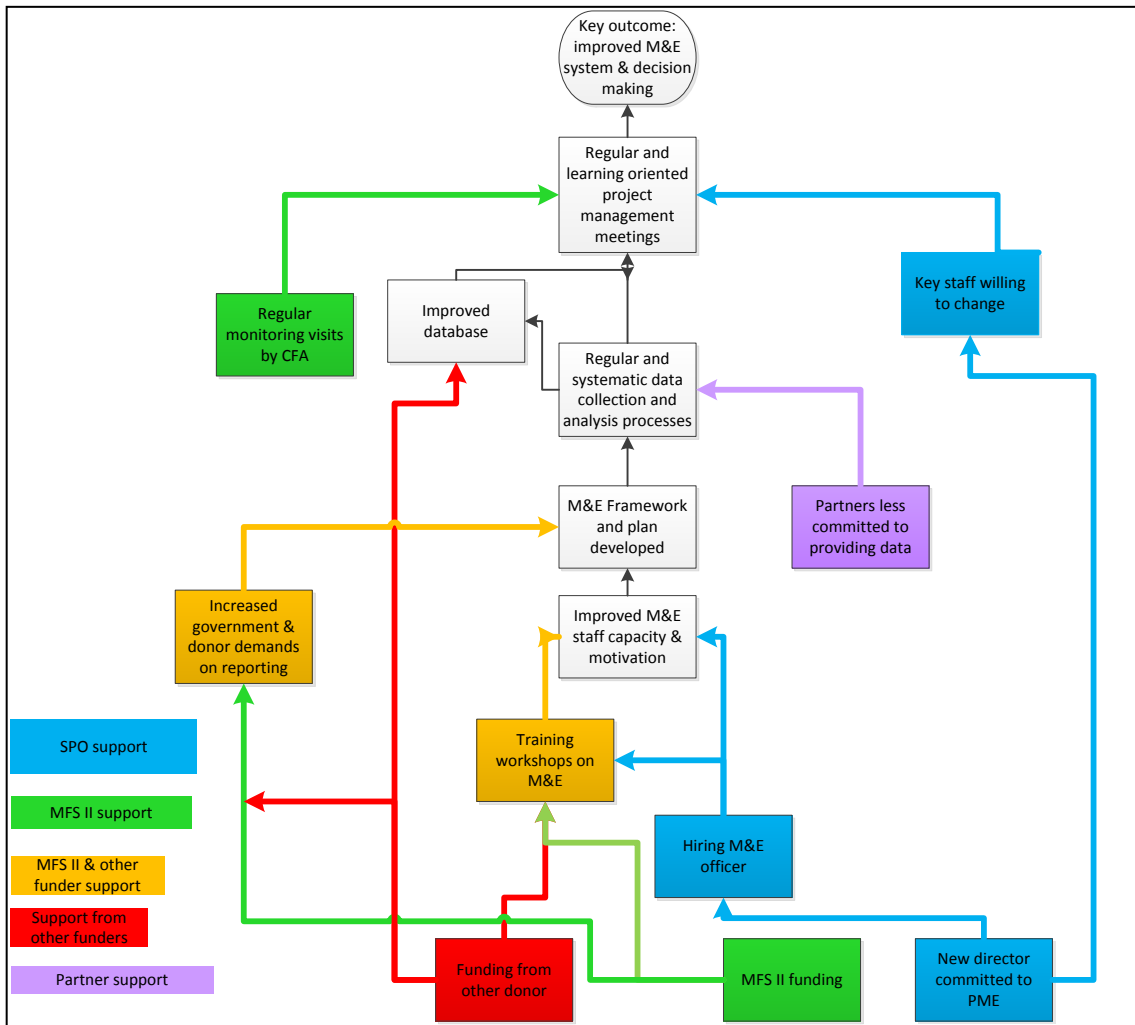

Figure 1 An imaginary example of a model of change

Step 5. Identify **types of evidence** needed to verify or discard different causal relationships in the model of change – in-country teams with support from CDI team

Once the causal mechanism at theoretical level were defined, empirical evidence was collected so as to verify or discard the different parts of this theoretical model of change, confirm or reject whether subcomponents have taken place, and to find evidence that confirm or reject the causal relations between the subcomponents.

A key question that we needed to ask ourselves was, “What information do we need in order to confirm or reject that one subcomponent leads to another, that X causes Y?”. The evaluation team needed to agree on what information was needed that provides empirical manifestations for each part of the model of change.

There are four distinguishable types of evidence that are relevant in process tracing analysis: *pattern*, *sequence*, *trace*, and *account*. Please see the box below for descriptions of these types of evidence.

The evaluation team needed to agree on the types of evidence that was needed to verify or discard the manifestation of a particular part of the causal mechanism. Each one or a combination of these different types of evidence could be used to confirm or reject the different parts of the model of change. This is what is meant by robustness of evidence gathering. Since causality as a concept can bend in many ways, our methodology, provides a near scientific model for accepting and rejecting a particular type of evidence, ignoring its face value.

Types of evidence to be used in process tracing

Pattern evidence relates to predictions of statistical patterns in the evidence. For example, in testing a mechanism of racial discrimination in a case dealing with employment, statistical patterns of employment would be relevant for testing this part of the mechanism.

Sequence evidence deals with the temporal and spatial chronology of events predicted by a hypothesised causal mechanism. For example, a test of the hypothesis could involve expectations of the timing of events where we might predict that if the hypothesis is valid, we should see that the event B took place after event A took place. However, if we found that event B took place before event A took place, the test would suggest that our confidence in the validity of this part of the mechanism should be reduced (disconfirmation/ falsification).

Trace evidence is evidence whose mere existence provides proof that a part of a hypothesised mechanism exists. For example, the existence of the minutes of a meeting, if authentic ones, provide strong proof that the meeting took place.

Account evidence deals with the content of empirical material, such as meeting minutes that detail what was discussed or an oral account of what took place in the meeting.

Source: Beach and Pedersen, 2013

Below you can find a table that provides guidelines on what to look for when identifying types of evidence that can confirm or reject causal relationships between different parts/ subcomponents of the model of change. It also provides one example of a part of a causal pathway and what type of information to look for.

Table 9

Format for identifying types of evidence for different causal relationships in the model of change (example included)

Part of the model of change	Key questions	Type of evidence needed	Source of information
Describe relationship between the subcomponents of the model of change	Describe questions you would like to answer a so as to find out whether the components in the relationship took place, when they took place, who was involved, and whether they are related	Describe the information that we need in order to answer these questions. Which type of evidence can we use in order to reject or confirm that subcomponent X causes subcomponent Y? Can we find this information by means of : Pattern evidence; Sequence evidence; Trace evidence; Account evidence?	Describe where you can find this information
Example: Training workshops on M&E provided by MFS II funding and other sources of funding	Example: What type of training workshops on M&E took place? Who was trained? When did the training take place? Who funded the training? Was the funding of training provided before the training took place? How much money was available for the training?	Example: Trace evidence: on types of training delivered, who was trained, when the training took place, budget for the training Sequence evidence on timing of funding and timing of training Content evidence: what the training was about	Example: Training report SPO Progress reports interviews with the CFA and SPO staff Financial reports SPO and CFA

Please note that for practical reasons, the 5C evaluation team decided that it was easier to integrate the specific questions in the narrative of the initial causal map. These questions would need to be addressed by the in country team during the process tracing workshop so as to discover, verify or discard particular causal mechanisms in the detailed, initial causal map. Different types of evidence was asked for in these questions.

*Step 6. **Collect data** to verify or discard causal mechanisms and develop workshop-based, detailed causal map – in-country team*

Once it was decided by the in-country and CDI evaluation teams what information was to be collected during the interaction with the SPO, data collection took place. The initial causal maps served as a basis for discussions during the endline workshop with a particular focus on process tracing for the identified organisational capacity changes. But it was considered to be very important to understand from the perspective of the SPO how they understood the identified key organisational capacity change/outcome area has come about. A new detailed, workshop-based causal map was developed that included the information provided by SPO staff as well as based on initial document review as described in the initial detailed causal map. This information was further analysed and verified with other relevant information so as to develop a final causal map, which is described in the next step.

*Step 7. **Assess the quality of data and analyse data**, and develop the **final detailed causal map (model of change)** – in-country team and CDI team*

Quality assurance of the data collected and the evidence it provides for rejecting or confirming parts of causal explanations are a major concern for many authors specialised in contribution analysis and process-tracing. Stern et al. (2012), Beach and Pedersen (2013), Lemire, Nielsen and Dybdal (2012), Mayne (2012) and Delahais and Toulemonde (2012) all emphasise the need to make attribution/ contribution claims that are based on pieces of evidence that are rigorous, traceable, and credible. These pieces of evidence should be as explicit as possible in proving that *subcomponent X causes subcomponent Y* and ruling out other explanations. Several tools are proposed to check the nature and the quality of data needed. One option is, Delahais and Toulemonde's Evidence Analysis Database, which we have adapted for our purpose.

Delahais and Toulemonde (2012) propose an Evidence Analysis Database that takes into consideration three criteria:

- Confirming/ rejecting a causal relation (yes/no);
- Type of causal mechanism: intended contribution/ other contribution/ condition leading to intended contribution/ intended condition to other contribution/ feedback loop;
- Strength of evidence: strong/ rather strong/ rather weak/ weak.

We have adapted their criteria to our purpose. The in-country team, in collaboration with the CDI team, used the criteria in assessing whether causal relationships in the causal map, were strong enough. This has been more of an iterative process trying to find additional evidence for the established relationships through additional document review or contacting the CFA and SPO as well as getting their feedback on the final detailed causal map that was established. Whilst the form below has not been used exactly in the manner depicted, it has been used indirectly when trying to validate the information in the detailed causal map. After that, the final detailed causal map is established both as a visual as well as a narrative, with related references for the established causal relations.

<i>Example format for the adapted evidence analysis database (example included)</i>	Confirming/ rejecting a causal relation (yes/ no)	Type of information providing the background to the confirmation or rejection of the causal relation	Strength of evidence: strong/ rather strong/ rather weak/ weak	Explanation for why the evidence is (rather) strong or (rather) weak, and therefore the causal relation is confirmed/ rejected
Description of causal relation	e.g. Confirmed	e.g. Training reports confirmed that staff are trained in M&E and that knowledge and skills increased as a result of the training		

Step 8. Analyse and conclude on findings– in-country team and CDI team

The final detailed causal map was described as a visual and narrative and this was then analysed in terms of the evaluation question two and evaluation question four: “*To what degree are the changes identified in partner capacity attributable to development interventions undertaken by the MFS II consortia (i.e. measuring effectiveness)?*” and “*What factors explain the findings drawn from the questions above?*” It was analysed to what extent the identified key organisational capacity change can be attributed to MFS II supported capacity development interventions as well as to other related factors, interventions and actors.

4. Explaining factors – evaluation question 4

This paragraph describes the data collection and analysis methodology for answering the fourth evaluation question: “**What factors explain the findings drawn from the questions above?**”

In order to explain the changes in organisational capacity development between baseline and endline (evaluation question 1) the CDI and in-country evaluation teams needed to review the indicators and how they have changed between baseline and endline and what reasons have been provided for this. This has been explained in the first section of this appendix. It has been difficult to find detailed explanations for changes in each of the separate 5c indicators, but the 'general causal map' has provided some ideas about some of the key underlying factors actors and interventions that influence the key organisational capacity changes, as perceived by the SPO staff.

For those SPOs that are selected for process tracing (evaluation question 2), more in-depth information was procured for the identified key organisational capacity changes and how MFS II supported capacity development interventions as well as other actors, factors and interventions have influenced these changes. This is integrated in the process of process tracing as described in the section above.

5. Methodological reflection

Below a few methodological reflections are made by the 5C evaluation team.

Use of the 5 core capabilities framework and qualitative approach: this has proven to a be very useful framework to assess organisational capacity. The five core capabilities provide a comprehensive picture of the capacity of an organisation. The capabilities are interlinked, which was also reflected in

the description of standard indicators, that have been developed for the purpose of this 5C evaluation and agreed upon for the eight countries. Using this framework with a mainly qualitative approach has provided rich information for the SPOs and CFAs, and many have indicated this was a useful learning exercise.

Using standard indicators and scores: using standard indicators is useful for comparison purposes. However, the information provided per indicator is very specific to the SPO and therefore makes comparison difficult. Whilst the description of indicators has been useful for the SPO and CFA, it is questionable to what extent indicators can be compared across SPOs since they need to be seen in context, for them to make meaning. In relation to this, one can say that scores that are provided for the indicators, are only relative and cannot show the richness of information as provided in the indicator description. Furthermore, it must be noted that organisations are continuously changing and scores are just a snapshot in time. There cannot be perfect score for this. In hindsight, having rubrics would have been more useful than scores.

General causal map: whilst this general causal map, which is based on key organisational capacity changes and related causes, as perceived by the SPO staff present at the endline workshop, has not been validated with other sources of information except SPO feedback, the 5C evaluation team considers this information important, since it provides the SPO story about how and which changes in the organisation since the baseline, are perceived as being important, and how these changes have come about. This will provide information additional to the information that has been validated when analysing and describing the indicators as well as the information provided through process tracing (selected SPOs). This has proven to be a learning experience for many SPOs.

Using process tracing for dealing with the attribution question: this theory-based and mainly qualitative approach has been chosen to deal with the attribution question, on how the organisational capacity changes in the organisations have come about and what the relationship is with MFS II supported capacity development interventions and other factors. This has proven to be a very useful process, that provided a lot of very rich information. Many SPOs and CFAs have already indicated that they appreciated the richness of information which provided a story about how identified organisational capacity changes have come about. Whilst this process was intensive for SPOs during the process tracing workshops, many appreciated this to be a learning process that provided useful information on how the organisation can further develop itself. For the evaluation team, this has also been an intensive and time-consuming process, but since it provided rich information in a learning process, the effort was worth it, if SPOs and CFAs find this process and findings useful.

A few remarks need to be made:

- Outcome explaining process tracing is used for this purpose, but has been adapted to the situation since the issues being looked at were very complex in nature.
- Difficulty of verifying each and every single change and causal relationship:
- Intensity of the process and problems with recall: often the process tracing workshop was done straight after the general endline workshop that has been done for all the SPOs. In some cases, the process tracing endline workshop has been done at a different point in time, which was better for staff involved in this process, since process tracing asks people to think back about changes and how these changes have come about. The word difficulties with recalling some of these changes and how they have come about. See also the next paragraph.
- Difficulty of assessing changes in knowledge and behaviour: training questionnaire is have been developed, based on Kirkpatrick's model and were specifically tailored to identify not only the interest but also the change in knowledge and skills, behaviour as well as organisational changes as a result of a particular training. The retention ability of individuals, irrespective of their position in the organisation, is often unstable. The 5C evaluation team experienced that it was difficult for people to recall specific trainings, and what they learned from those trainings. Often a change in knowledge, skills and behaviour is a result brought about by a combination of different factors, rather than being traceable to one particular event. The detailed causal maps that have been established, also clearly pointed this. There are many factors at play that make people change their behaviour, and this is not just dependent on training but also internal/personal (motivational) factors as well as factors within the organisation, that stimulate or hinder a person to change behaviour. Understanding how behaviour change works is important when trying to really understand the extent to which behaviour has changed as a

result of different factors, actors and interventions. Organisations change because people change and therefore understanding when and how these individuals change behaviour is crucial. Also attrition and change in key organisational positions can contribute considerably to the outcome.

Utilisation of the evaluation

The 5C evaluation team considers it important to also discuss issues around utility of this evaluation. We want to mention just a few.

Design – mainly externally driven and with a focus on accountability and standard indicators and approaches within a limited time frame, and limited budget: this MFS II evaluation is originally based on a design that has been decided by IOB (the independent evaluation office of the Dutch Ministry of Foreign Affairs) and to some extent MFS II organisations. The evaluators have had no influence on the overall design and sampling for the 5C study. In terms of learning, one may question whether the most useful cases have been selected in this sampling process. The focus was very much on a rigorous evaluation carried out by an independent evaluation team. Indicators had to be streamlined across countries. The 5C team was requested to collaborate with the other 5C country teams (Bangladesh, Congo, Pakistan, Uganda) to streamline the methodological approach across the eight sampled countries. Whilst this may have its purpose in terms of synthesising results, the 5C evaluation team has also experienced the difficulty of tailoring the approach to the specific SPOs. The overall evaluation has been mainly accountability driven and was less focused on enhancing learning for improvement. Furthermore, the timeframe has been very small to compare baseline information (2012) with endline information (2014). Changes in organisational capacity may take a long, particularly if they are related to behaviour change. Furthermore, there has been limited budget to carry out the 5C evaluation. For all the four countries (Ethiopia, India, Indonesia, Liberia) that the Centre for Development Innovation, Wageningen University and Research centre has been involved in, the budget has been overspent.

However, the 5C evaluation team has designed an endline process whereby engagement of staff, e.g. in a workshop process was considered important, not only due to the need to collect data, but also to generate learning in the organisation. Furthermore, having general causal maps and detailed causal maps generated by process tracing have provided rich information that many SPOs and CFAs have already appreciated as useful in terms of the findings as well as a learning process.

Another issue that must be mentioned is that additional requests have been added to the country teams during the process of implementation: developing a country based synthesis; questions on design, implementation, and reaching objectives of MFS II funded capacity development interventions, whilst these questions were not in line with the core evaluation questions for the 5C evaluation.

Complexity and inadequate coordination and communication: many actors, both in the Netherlands, as well as in the eight selected countries, have been involved in this evaluation and their roles and responsibilities, were often unclear. For example, 19 MFS II consortia, the internal reference group, the Ministry of Foreign Affairs, Partos, the Joint Evaluation Trust, NWO-Wotro, the evaluators (Netherlands and in-country), 2 external advisory committees, and the steering committee. Not to mention the SPO's and their related partners and consultants. CDI was involved in 4 countries with a total number of 38 SPOs and related CFAs. This complexity influenced communication and coordination, as well as the extent to which learning could take place. Furthermore, there was a distance between the evaluators and the CFAs, since the approach had to be synchronised across countries, and had to adhere to strict guidelines, which were mainly externally formulated and could not be negotiated or discussed for the purpose of tailoring and learning. Feedback on the final results and report had to be provided mainly in written form. In order to enhance utilisation, a final workshop at the SPO to discuss the findings and think through the use with more people than probably the one who reads the report, would have more impact on organisational learning and development. Furthermore, feedback with the CFAs has also not been institutionalised in the evaluation process in the form of learning events. And as mentioned above, the complexity of the evaluation with many actors involved did not enhance learning and thus utilization.

5C Endline process, and in particular thoroughness of process tracing often appreciated as learning process: The SPO perspective has also brought to light a new experience and technique of self-assessment and self-corrective measures for managers. Most SPOs whether part of process tracing or not, deeply appreciated the thoroughness of the methodology and its ability to capture details with robust connectivity. This is a matter of satisfaction and learning for both evaluators and SPOs. Having a process whereby SPO staff were very much engaged in the process of self-assessment and reflection has proven for many to be a learning experience for many, and therefore have enhanced utility of the 5C evaluation.

Appendix 2 Background information on the five core capabilities framework

The 5 capabilities (5C) framework was to be used as a framework for the evaluation of capacity development of Southern Partner Organisations (SPOs) of the MFS II consortia. The 5C framework is based on a five-year research program on 'Capacity, change and performance' that was carried out by the European Centre for Development Policy Management (ECDPM). The research included an extensive review of the literature and sixteen case studies. The 5C framework has also been applied in an IOB evaluation using 26 case studies in 14 countries, and in the baseline carried out per organisation by the MFS II organisations for the purpose of the monitoring protocol.

The 5C framework is structured to understand and analyse (changes in) the capacity of an organization to deliver (social) value to its constituents. This introduction briefly describes the 5C framework, mainly based on the most recent document on the 5C framework (Keijzer et al., 2011).

The 5C framework sees capacity as an **outcome** of an **open system**. An organisation or collaborative association (for instance a network) is seen as a system interacting with wider society. The most critical practical issue is to ensure that relevant stakeholders share a common way of thinking about capacity and its core constituents or capabilities. Decisive for an organisation's capacity is the context in which the organisation operates. This means that **understanding context issues** is crucial. The use of the 5C framework requires a multi-stakeholder approach because shared values and results orientation are important to facilitate the capacity development process. The 5C framework therefore needs to **accommodate the different visions** of stakeholders and conceive different strategies for raising capacity and improving performance in a given situation.

The 5C framework defines capacity as '**producing social value**' and identifies five core capabilities that together result in that overall capacity. Capacity, capabilities and competences are seen as follows:

Capacity is referred to as the overall ability of an organisation or system to create value for others;

Capabilities are the collective ability of a group or a system to do something either inside or outside the system. The collective ability involved may be technical, logistical, managerial or generative (i.e. the ability to earn legitimacy, to adapt, to create meaning, etc.);

Competencies are the energies, skills and abilities of individuals.

Fundamental to developing capacity are inputs such as human, material and financial resources, technology, and information. To the degree that they are developed and successfully integrated, capabilities contribute to the overall capacity or ability of an organisation or system to create value for others. A single capability is not sufficient to create capacity. All are needed and are strongly interrelated and overlapping. Thus, to achieve its development goals, the 5C framework says that every organisation or system must have **five basic capabilities**:

- 1) The capability to act and commit;
- 2) The capability to deliver on development objectives;
- 3) The capability to adapt and self-renew;
- 4) The capability to relate (to external stakeholders);
- 5) The capability to achieve coherence.

In order to have a common framework for evaluation, the five capabilities have been reformulated in outcome domains and for each outcome domain performance indicators have been developed.

There is some overlap between the five core capabilities but together the five capabilities result in a certain level of capacity. Influencing one capability may have an effect on one or more of the other capabilities. In each situation, the level of any of the five capabilities will vary. Each capability can become stronger or weaker over time.

Appendix 3 Results - changes in organisational capacity of the SPO - 5C indicators

Below you will find a description for each of the indicators under each of the capabilities, what the situation is as assessed during the endline, how this has changed since the baseline and what are the reasons for change.

Capability to act and commit

1.1. Responsive leadership: 'Leadership is responsive, inspiring, and sensitive'

This is about leadership within the organisation (operational, strategic). If there is a larger body then you may also want to refer to leadership at a higher level but not located at the local organisation.

Compared to the baseline situation, clear roles and responsibilities are assigned for respective program and administrative staff. The commitment of the top management in building better team spirit, staff motivation and shared decision making has improved compared to the baseline situation. Currently, the executive director influence has reduced and his role is becoming more based on facilitation. As a result staff members are empowered to make independent decisions. Participation of the field staff in the management committee is a new phenomenon in NVEA. The organization is open to new ideas and staffs are free to come up with different ideas and the management is responsive by providing swift action to tackle the issues raised. Overall there is an improvement in proper handling of staff. An improvement has also been observed in the close collaboration between management and the partners and beneficiaries.

Score: from 3 to 4 (improvement)

1.2. Strategic guidance: 'Leaders provide appropriate strategic guidance (strategic leader and operational leader)'

This is about the extent to which the leader(s) provide strategic directions

Strategic guidance has improved compared to the baseline situation through formal and informal ways of communication. Among the formal ways, a regular meeting with the staff in place and the reporting mechanism is becoming an encouraging means to bring novel ideas to inform and develop strategic directions. The board members have also provided a better technical back-up for program and administrative staff in the last two years. The board members provide guidance on budget utilization, reporting mechanisms and procedures. Each board member has supported the organization in different ways. For example, one of the board members provided training for program staff on Result-based Management and report writing skills. Another member developed a concept note on food security, while a third board member supports auditing systems. NVEA has trained and assigned one of its staff members as an internal auditor to assist the finance staff and reconcile the program activities with their respective budget every two months.

Score: from 3 to 3.5 (improvement)

1.3. Staff turnover: 'Staff turnover is relatively low'

This is about staff turnover.

Based on the feedback of baseline evaluation result of 2012 NVEA has worked to create a better working environment, the board has made the salary of the staff more attractive, incentives have been improved and a letter of appreciation has been given to the best performers to recognize their effort. In addition to this, training has been provided at least twice a year. World Bank has provided trainings on Social Accountability twice a year since 2012. Besides this, staff members are satisfied

with most terms and conditions of the organization as similar to the baseline situation. As a result staff turnover is negligible in the last two years.

Score: from 3 to 4 (improvement)

1.4. Organisational structure: 'Existence of clear organisational structure reflecting the objectives of the organisation'

Observable indicator: Staff have copy of org structure and understand this

In terms of having a clear organizational structure key informants do not observe any change compared to the baseline situation. NVEA has assigned clear roles and responsibilities for respective program and administrative staff. There is an organizational structure and policy manual. The organogram of the organization is posted in a clearly visible location. However, compared to the baseline situation NVEA has become better structured in both program and finance divisions.

Score: from 3 to 3.5 (slight improvement)

1.5. Articulated strategies: 'Strategies are articulated and based on good situation analysis and adequate M&E'

Observable indicator: strategies are well articulated. Situation analysis and monitoring and evaluation are used to inform strategies.

NVEA has developed a new strategic plan (2012-2016) in 2012. NVEA included interventions on disability and livelihood, interventions that were already part of the activities but not articulated in the previous strategic plan. Programs like child protection policy was developed with the sponsorship of Kinderpostzegels to help us become more responsive and inclusive.

Score: from 4 to 4 (no change)

1.6. Daily operations: 'Day-to-day operations are in line with strategic plans'

This is about the extent to which day-to-day operations are aligned with strategic plans.

The organization has revised its strategic plan in 2012 for the next five years (2012-2016) and since then each and every activity of the organization has been in line with the strategic plan. The operational plans are developed in line with the revised strategic plan. To work in line with the strategic plan new staff members have been recruited and training on Project M&E has been given. Past experiences and lessons learned are used as inputs to have a better implementation capacity in line with the strategic plan.

Score: from 4 to 5 (improvement)

1.7. Staff skills: 'Staff have necessary skills to do their work'

This is about whether staff have the skills necessary to do their work and what skills they might they need.

Compared to the baseline situation a range of capacity building support has been given to the staffs both by the organization itself and partners. Staff has received training in report writing, proposal writing, facilitation and presentation skills, and result based management. Staffs capacity and performance in project planning and implementation have improved. DEC, CCRDA and Kinderpostzegels are the major partners who actively worked on enhancing the staffs capacity through training. The organization uses a cascading approach to sharing skills and knowledge to all other non-participant staffs. In order to have the appropriate staff members on board additional recruitment also took place. Experience sharing has been used as a tool to enhance staffs capacity. Hence, compared to the baseline situation staff members are better equipped with different skills and knowledge to perform their respective assignments effectively and efficiently.

Score: from 2 to 3 (improvement)

1.8. Training opportunities: 'Appropriate training opportunities are offered to staff'

This is about whether staff at the SPO are offered appropriate training opportunities

A number of trainings have been given in the last two years in NVEA and its partners. Via the Edukans foundation, through the Connect 4 Change Alliance, training on education management information systems and on five organizational capabilities has been given twice a year since 2012. Training on quality education was also given in 2013 and 2014 by ICCO. The Social Accountability Training by the World Bank in 2013 and 2014 and the Kinderpostzegels (C&D alliance) training on M&E, RBM and data collection twice per year are among the trainings to be mentioned. BEN-Ethiopia and CCRDA has also given a training on proposal writing and fund raising, and on M&E in 2013 respectively. In general, it is noticed that training opportunities have improved at NVEA compared to the baseline situation. But as it was in the baseline the 70/30 CSO law is still hampers the provision of better trainings.

Score: from 4 to 4.5 (slight improvement)

1.9.1. Incentives: 'Appropriate incentives are in place to sustain staff motivation'

This is about what makes people want to work here. Incentives could be financial, freedom at work, training opportunities, etc.

Compared to the baseline situation an improvement in incentive structure has been observed. NVEA has increased the per diem rate since 2013, it also introduced a 500 birr medical cost coverage and 25 % education cost coverage. There is also a 10 percent or more salary increment every year based on staff performance. Different top up mechanisms are also in place whenever additional assignments are given to staff. The improvement in the availability of different training opportunities and the enabling working environment in the organization are also considered incentives to motivate staffs in their job.

Score: from 3 to 4 (improvement)

1.9.2. Funding sources: 'Funding from multiple sources covering different time periods'

This is about how diversified the SPOs funding sources are over time, and how the level of funding is changing over time.

NVEA has been working hard on fundraising activities and they have been able to secure more funds since the baseline in 2012. In 2013 and 2014 a number of new projects were launched. Examples are the British Embassy Civil society support program to support Livelihood Improvement Scheme (LIS) for Unemployed Girls in Oromia region, the Direct Child Assistance and Enabling Environment for CWDs, (endorsed by Liliane Foundation and to be financed through Cheshire Service Ethiopia) and the World Bank Ethiopian Social Accountability Program – II in Sibru Sire and Bako Tibe Districts since January 2013. MFS II CFA financial support has also increased compared to the baseline situation. In general, the overall fundraising capacity of NVEA has improved compared to the baseline situation.

Score: from 2 to 3 (improvement)

1.9.3. Funding procedures: 'Clear procedures for exploring new funding opportunities'

This is about whether there are clear procedures for getting new funding and staff are aware of these procedures.

NVEA has a fundraising strategy document since the baseline but recently the staffs' capacity has improved so that they can write competitive proposals. Besides, from the perspective of the programmatic approach, proposal writing in clusters has been a new form of funding procedures. As a result of the cluster proposal writing they got funding from British Embassy together with other partner SPOs.

Score: from 3 to 4 (improvement)

Summary of the capability to act and commit

The commitment of the top management in building better team spirit, staff motivation and shared decision making has improved compared to the baseline situation. Currently, the executive director influence has reduced and his role is becoming more based on facilitation. As a result staff members are empowered to make independent decisions. Participation of the field staff in the management committee is a new phenomenon in NVEA. Strategic guidance has improved compared to the baseline situation through formal and informal ways of communication. The existence of regular meetings with the staff and reporting mechanism is becoming an encouraging means to bring novel ideas to inform and develop strategic directions. The board members have also provided a better technical back-up for program and administrative staff in the last two years. Staff members are satisfied with most terms and conditions of the organization as similar to the baseline situation and as a result staff turnover is low. The organization has a clear organizational structure that all staffs are able to access and understand. NVEA has assigned clear roles and responsibilities for respective program and administrative staff. Compared to the baseline situation NVEA has become well-structured in both program and finance divisions. Besides, the organization has revised its strategic plan in 2012 for the next five years and since then each and every activity of the organization has been in line with the strategic plan. However, funding opportunities have also broadened the issues that NVEA is covering such as disability and livelihoods. The operational and the action plans are developed in line with the revised strategic plan. Different training opportunities have been in place for staffs and both by the organization itself and partners and trainings are cascading to others non-participant staffs. NVEA has also hired new staffs in order to have the appropriate staff members on board. Hence, staff members are better equipped with different skills and knowledge to perform their respective assignments effectively and efficiently compared to the baseline situation. In addition to the different training opportunities that existed in NVEA since the baseline, the organization has also improved its incentive structure for staff including increased the per diem rate, medical cost coverage and 25 % education cost coverage as well as salary increment every year based on staff performance. NVEA has a fundraising strategy document since the baseline and has also been working hard on fundraising activities and has been able to secure more funds. As a result a number of new projects were launched in 2013 and 2014.

Score: from 3.1 to 3.9 (slight improvement)

Capability to adapt and self-renew

2.1. M&E application: 'M&E is effectively applied to assess activities, outputs and outcomes'

This is about what the monitoring and evaluation of the SPO looks at, what type of information they get at and at what level (individual, project, organisational).

Compared to the baseline situation, NVEA has established a cost-effective monitoring and evaluation system. NVEA uses its M&E manual for project follow-up and it has facilitated M&E on a quarterly basis. Monitoring project intervention at different levels is carried out by team of 'evaluators' drawn from key stakeholders at project areas, project staff and program staff from head office. The monitoring feedback has been well documented periodically and communicated on the spot with community representatives and key stakeholders. However, according to the annual report carried 2012 NFBE project Sibulire NVEA, even with an increasing number of its projects and areas of operation, NVEA has not been good in undertaking a systematic outcome evaluation and impact assessment involving a wide range of stakeholders in this project. This relates specifically to this project. This has largely been due to the lack of a user-friendly manual to guide the M&E process, lack of expertise within the organization and shortage of funds to hire external evaluators.

Score: from 3 to 3.5 (slight improvement)

2.2. M&E competencies: 'Individual competencies for performing M&E functions are in place'

This is about whether the SPO has a trained M&E person; whether other staff have basic understanding of M&E; and whether they know what information to collect, how to process the information, how to make use of the information so as to improve activities etc.

Compared to the baseline situation, it is reported that NVEA has a well-developed M&E manual which helps the program staff effectively to apply the M&E system in the field. At the same time, the program and project staff have trained on M&E more than one time, and have ample experience in M&E as well as data collection. NVEA has also organized in house training on these topics. Refreshment training on Results Based Management has been undertaken.

Score: from 3 to 3.5 (slight improvement)

2.3. M&E for future strategies: 'M&E is effectively applied to assess the effects of delivered products and services (outcomes) for future strategies'

This is about what type of information is used by the SPO to make decisions; whether the information comes from the monitoring and evaluation; and whether M&E info influences strategic planning.

Feedback and results of M&E are used as an input to revise the strategic plan of the organization. M&E reports are being used for future project planning and evaluation. The M&E feedback is also being used for improvement and decisions for future strategies. NVEA has compiled track records and lessons learned and has communicated this to key stakeholders. The weaknesses identified through M&E have been under revision for correction. However, systematic evaluation at the levels of outcomes and impacts involving a wide range of stakeholders is not being done yet in the NFBE project Sibuhire and this negatively influences the use of monitoring and evaluation for future strategies.

Score: from 3 to 3.25 (slight improvement)

2.4. Critical reflection: 'Management stimulates frequent critical reflection meetings that also deal with learning from mistakes'

This is about whether staff talk formally about what is happening in their programs; and, if so, how regular these meetings are; and whether staff are comfortable raising issues that are problematic.

Similar to the baseline situation, every three months staff and management meetings are organised to reflect on the performance of the organization. There is an improvement in sharing ideas and recognition by others staff members. Learning among staffs is improved and feedback is taken from lower level staff to higher staff. Staff ideas are taken positively and used constructively. As an example, based on the idea raised by the financial unit, each project office opened a bank account through joint signatories. This idea was recognized by the management. Staff members are working in a supportive manner through discussion and negotiation. Nowadays, it has become a culture to take the local issues into consideration to develop proposals or to take certain decisions. Staff members have the right to raise issues related to salary and incentives, and in fact great improvement has been seen in this regard: per diem and accommodation rate have improved radically.

Score: from 3 to 3.5 (slight improvement)

2.5. Freedom for ideas: 'Staff feel free to come up with ideas for implementation of objectives'

This is about whether staff feel that ideas they bring for implementation of the program are welcomed and used.

Similar to the baseline situation, NVEA fostered good learning, free discussion and an enabling working environment. Staffs are encouraged to come up with new ideas and ideas are respected and taken constructively. Sensitive issues such as salary increment have also been raised without any hesitation. Ideas have been welcomed and treated in the way that harmonious relationship of staff members is maintained and individual interests are been considered. Strong and smooth relationships between staff and management has made it possible to express ideas freely.

Score from 4 to 4 (No change)

2.6. System for tracking environment: 'The organisation has a system for being in touch with general trends and developments in its operating environment'

This is about whether the SPO knows what is happening in its environment and whether it will affect the organization.

Similar to the baseline situation NVEA has tracked the environment by using different means. NVEA has engaged in different networks and forums that enable to share experience and to update itself. Dynamics in the external environment forced the organization to strengthen partnerships and networking with different SPOs and CBOs. NVEA has maintained its close relationship and collaboration both with the government and non-government organizations to share concerns. Consultative meetings, media and magazines are some of the means of tracking the working environment.

Score: from 4 to 4 (no change)

2.7. Stakeholder responsiveness: 'The organisation is open and responsive to their stakeholders and the general public'

This is about what mechanisms the SPO has to get input from its stakeholders, and what they do with that input.

NVEA has continued to be responsive as it has been in the baseline situation. Stakeholders have been the starting point for any intervention. Before carrying out ongoing or new projects stakeholders have been consulted. Only in consensus with them are the interventions continued. For example, where schools would be constructed, discussions took place beforehand whether the community would be able to contribute matching funds for construction. During General Assembly meetings ideas generated from key stakeholders and board members on how to diversify resources or how to incorporate issues of green economy within schools are always considered. Giving due respect to the values and norms of the community has helped NVEA to get community trust and support in all their interventions. At the grassroots level, CBOs and FBO are closely working with NVEA to encourage the community as a whole to take part in development endeavours.

Score: from 3.5 to 3.5 (no change)

Summary of the capability to adapt and self-renew

Compared to the baseline situation, NVEA has established a cost-effective monitoring and evaluation system. NVEA uses its M&E manual for project follow-up and it has facilitated and carried out M&E on quarterly basis by a team of 'evaluators' drawn from key stakeholders at project areas, project staff and program staff from head office. The program and project staff have been trained on M&E and have ample experience and competence in application of M&E. However, NVEA has not been good in undertaking a systematic outcome evaluation and impact assessment involving a wide range of stakeholders. This has largely been due to lack of a user-friendly manual to guide the process, lack of expertise within the organization and shortage of funds to hire external evaluators. On the other hand, staff indicated that the monitoring feedbacks have been well documented periodically and communicated on the spot with community representatives and key stakeholders. Feedback and results of M&E are used as an input to revise the strategic plan of the organization and used for future project planning and evaluation, but as indicated, a systematic evaluation at the levels of outcomes and impacts in collaboration with stakeholders is still lacking in the NFBE project Sibuhire. There is also an improvement in sharing ideas and recognition by others staff members. Learning among staffs is improved and staffs are encouraged to come up with new ideas and ideas are respected and taken constructively. Similar to the baseline situation NVEA has tracked the environment by using different means. Dynamics of the external environment forced the organization to strengthen partnerships and networking with different SPOs and CBOs. NVEA has been responsive to stakeholders starting from the initial stage of any intervention. Stakeholders have been consulted and engaged in the planning, implementation and M&E of projects and only in consensus with them are the interventions are being implemented.

Score: from 3.4 to 3.6 (very slight improvement)

Capability to deliver on development objectives

3.1. Clear operational plans: 'Organisation has clear operational plans for carrying out projects which all staff fully understand'

This is about whether each project has an operational work plan and budget, and whether staff use it in their day-to-day operations.

NVEA has an operational plan for each project. This operational plan is prepared through a participatory approach of all staff members so that each person is able to understand the operational plan clearly. Compared to the baseline situation, the operational plans have started to be developed for the day to day activities of the program. Unlike during the baseline, the field staff has started to prepare operational plans. The project staff requests budgets by preparing specifications based on the operational plan.

Score: from 3 to 3.5 (Slight improvement)

3.2. Cost-effective resource use: 'Operations are based on cost-effective use of its resources'

This is about whether the SPO has the resources to do the work, and whether resources are used cost-effectively.

After the baseline period, in order to properly follow up and inspect the financial procedure of the organization, an internal auditor was assigned from the members of the current staff. Accordingly, the budgets are used properly and in a transparent way. Compared to the baseline situation, the finance staffs have improved their documentation systems effectively. Now procurements are undertaken by collecting pro forma or announcing bids in order to be cost effective. The management also allowed the finance staff to get trainings that boost their skills.

Score from 4 to 4.5 (slight improvement)

3.3. Delivering planned outputs: 'Extent to which planned outputs are delivered'

This is about whether the SPO is able to carry out the operational plans.

Now NVEA is intervening in 20 primary schools, a fourfold increment compared to the baseline situation. This is due to the accumulated experience of the SPO and the commitment of the vibrant and junior staff members. The organization's capacity in providing quality reports within the limited time has improved. NVEA has established a system to measure outputs and outcomes of the project by comparing these with its respective plans. To this effect, checklists and different indicators are incorporated to measure project results. Unlike the baseline situation, the program staff members have been capable of developing logframes effectively. The management let the program staff get trainings on project cycle management and other related topics so that their capacity to deliver planned outputs can be enhanced.

Score: from 4 to 4 (no change)

3.4. Mechanisms for beneficiary needs: 'The organisation has mechanisms in place to verify that services meet beneficiary needs'

This is about how the SPO knows that their services are meeting beneficiary needs

NVEA has been considering the needs of the beneficiaries by conducting needs assessments. Accordingly a bottom-up approach is implemented instead of top-down and beneficiaries are directly involved in planning. This issue has improved especially since ESAP 2 (Ethiopian Social Accountability Program Phase 2) has been launched in 2013. Now the vulnerable groups (people with disabilities, HIV infected women, youth) are taking part in planning, monitoring and evaluating the services being rendered to them including services from the government. Establishing a stakeholder forum which invites both service users and providers to assess their intervention is another means for addressing the beneficiaries need.

Score: from 3.5 to 4 (slight improvement)

3.5. Monitoring efficiency: 'The organisation monitors its efficiency by linking outputs and related inputs (input-output ratios)'

This is about how the SPO knows they are efficient or not in their work.

To measure and follow up the organization uses efficiency monitoring and evaluation check lists, beneficiary feedback, and pre-designed economic strategy. However, some staff members stated that the organization does not do an input-output ratio analysis to measure efficiency.

Score: from 3.5 to 3.5 (o change)

3.6. Balancing quality-efficiency: 'The organisation aims at balancing efficiency requirements with the quality of its work'

This is about how the SPO ensures quality work with the resources available

Quality is the central point of each activity in NVEA. In NVEA activities are not accomplished only for the sake of fulfilling requirements; rather, the question of quality is compulsory while intervening. As a result NVEA always trying to maintain quality and efficiency. But there is no new thing in the end line period.

Score: from 3 to 3 (no change)

Summary capability to deliver on development objectives

NVEA has an operational plan for each project. This operational plan is prepared through a participatory approach of all staff members so that each person is able to understand the operational plan clearly. The organization's funds are used properly and in a transparent way due to the fact that NVEA has assigned an internal auditor in order to properly follow up and inspect the implementation of the financial procedures. Besides, Now NVEA is intervening in 20 primary schools, a fourfold increment compared to the baseline situation. The organization competency in providing quality reports within the limited time has also improved. NVEA has been considering the needs of the beneficiaries by conducting needs assessments. Accordingly a bottom-up approach is implemented and beneficiaries are directly involved in the whole planning process. Quality is the central point of each activity in NVEA. The organization uses Check lists and beneficiary feedback to measure and follow up on efficiency and quality during monitoring and evaluation. However, measuring inputs to related outputs is not happening.

Score: from 3.5 to 3.7 (slight improvement)

Capability to relate

4.1. Stakeholder engagement in policies and strategies: 'The organisation maintains relations/ collaboration/alliances with its stakeholders for the benefit of the organisation'

This is about whether the SPO engages external groups in developing their policies and strategies, and how.

As it has been done in the baseline, relevant external stakeholders are consulted in the preparation of different policies and strategies for project implementation. To be specific after the baseline period, stakeholders at district and zone level have been involved in developing the Child Protection Policy and Sexual and Reproductive Health policy. However some staffs stated that they did not see any significant difference in participatory strategy development.

Score: from 4 to 4 (no change)

4.2. Engagement in networks: 'Extent to which the organization has relationships with existing networks/alliances/partnerships'

This is about what networks/alliances/partnerships the SPO engages with and why; with they are local or international; and what they do together, and how do they do it.

NVEA maintains a strong partnership with different partners and stakeholders including specific government offices. Hence, NIVEA's partnership with Basic Education (BEN)-Ethiopia, Consortium on Christian Relief Development Association (CCRDA) and Consortium of Health Associations (CORHA) and Development Expertise Consortium (DEC) Oromia cluster still exists since the baseline period. NVEA is now also included in a new partnership with the British Embassy. NVEA is working to form partnerships with international partners and potential stakeholders.

Score: from 4 to 4.25 (slight improvement)

4.3. Engagement with target groups: 'The organisation performs frequent visits to their target groups/beneficiaries in their living environment'

This is about how and when the SPO meets with target groups.

Target groups level review meetings are held and monitoring by target groups are conducted frequently to measure whether the interventions meets their needs as well as to set possible recommended solutions for identified gaps. During the baseline period the main problem to frequently visit beneficiaries was related to transport but now Kinderpostzegels has purchased motor bikes and the program staff members are able to frequently visit the target groups.

Score: from 4 to 4.5 (slight improvement)

4.4. Relationships within organisation: 'Organisational structure and culture facilitates open internal contacts, communication, and decision-making'

How do staff at the SPO communicate internally? Are people free to talk to whomever they need to talk to? When and at what forum? What are the internal mechanisms for sharing information and building relationships?

Similar to the baseline situation, regular management and staff meetings, face to face communications, email, telephone, and (when necessary) urgent meetings have been conducted. During the endline period NVEA has improved its documentation and utilization of meeting minutes. Lesson documentation and track records have shown a slight improvement in the organization.

Score: from 4 to 4.25 (very slight Improvement)

Summary of the capability to relate

Relevant external stakeholders are consulted in the preparation of different policies and strategies for project implementation. To be specific after the baseline period, stakeholders at district and zone level have been involved in developing the Child Protection Policy and Sexual and Reproductive Health policy. NVEA maintains a strong partnership with different partners and stakeholders including specific government offices and has become a member of a new partnership with the British Embassy. Target groups have been involved in regular review meetings and monitoring to measure whether the interventions meet their needs as well as to set possible recommended solutions for identified gaps. Kinderpostzegels (MFS II funding) has purchased motor bikes and the program staff members are now able to frequently visit the target groups. Relationships within the organization have also been improved through regular management and staff meetings, face to face communications, email, telephone, and (when necessary) urgent meetings have been conducted. NVEA has improved its documentation and utilization of minutes of meetings for smooth communication.

Score: from 4 to 4.2 (very slight improvement)

Capability to achieve coherence

5.1. Revisiting vision, mission: 'Vision, mission and strategies regularly discussed in the organisation'

This is about whether there is a vision, mission and strategies; how often staff discuss/revise vision, mission and strategies; and who is involved in this.

The vision and mission of the organization have been revised in 2013. Hence, mission statements are updated to include all development agendas. For instance, the previous mission has not considered

agricultural issues, but the revised one does address this since agriculture is now one of NVEA's program areas. The goal, objective and core functions of the organization have also been revised.

Score: from 4.5 to 4.75 (slight improvement)

5.2. Operational guidelines: 'Operational guidelines (technical, admin, HRM) are in place and used and supported by the management'

This is about whether there are operational guidelines, which operational guidelines exist; and how they are used.

New operational guidelines have been developed since the baseline. These include; HRM guidelines, M&E manual, track record manual, board selection criteria and others. Child Protection Policy Manual, Sexual reproductive health manual, and resource mobilization manuals are also developed in 2013. Nevertheless, some staffs did not see the change in operational guidelines and manuals development.

Score: from 4 to 4.5 (slight improvement)

5.3. Alignment with vision, mission: 'Projects, strategies and associated operations are in line with the vision and mission of the organisation'

This is about whether the operations and strategies are line with the vision/mission of the SPO.

NVEA continues to work in line with its mission and vision as it was in the baseline. The projects, strategies and action plans are all in line with the vision and mission of the organization. The management together with the board members monitor the alignments.

Score: from 5 to 5 (no change)

5.4. Mutually supportive efforts: 'The portfolio of project (activities) provides opportunities for mutually supportive efforts'

This is about whether the efforts in one project complement/support efforts in other projects.

In the implementation of all its program components, NVEA has established good partnerships and working relationships with different concerned government organizations at different levels, CBO's, and the community at grass roots level. This is important since the involvement of the District Education Office, the Social Affairs Offices, the Finance and Economic Development Bureau and the Health Office is very mandatory in achieving the program goals. This has enabled NVEA to collaborate on issues of mutual concern and the organization has been able to further strengthen its engagement in promoting access to basic education for the rights of the disadvantaged children as well as to the members of the community.

Score: from 3 to 4 (improvement)

Summary of the capability to achieve coherence

The vision and mission of the organization have been revised in 2013. Hence, mission statements are updated to include all development agendas. Report CDI-15-052

The Centre for Development Innovation works on processes of innovation and change in the areas of food and nutrition security, adaptive agriculture, sustainable markets, ecosystem governance, and conflict, disaster and reconstruction. It is an interdisciplinary and internationally focused unit of Wageningen UR within the Social Sciences Group. Our work fosters collaboration between citizens, governments, businesses, NGOs, and the scientific community. Our worldwide network of partners and clients links with us to help facilitate innovation, create capacities for change and broker knowledge.

The mission of Wageningen UR (University & Research centre) is 'To explore the potential of nature to improve the quality of life'. Within Wageningen UR, nine specialised research institutes of the DLO Foundation have joined forces with Wageningen University to help answer the most important questions in the domain of healthy food and living environment. With approximately 30 locations, 6,000 members of staff and 9,000 students, Wageningen UR is one of the leading organisations in its domain worldwide. The integral approach to problems and the cooperation between the various disciplines are at the heart of the unique Wageningen Approach.

Abstract

Despite all efforts to increase primary school enrolment among rural children in developing countries, some students still do not attend school. The current intervention aimed to increase access to education and improve quality of education for these working and outside school children by offering non-formal education in the first cycle of primary school (e.g., different and additional learning materials). In close collaboration with the communities and government, New Vision in Education Association (NVEA) constructed four Alternative Basic Education Centers (ABE Centers). This evaluation focused on the primary beneficiaries of the project, namely children in the first cycle of primary school of two ABE centers. We compared children who were enrolled in the two newly opened ABE centers with children in two governmental schools. Children were interviewed in September 2012 in their first weeks of school in grade 1 and again in May 2014 at the end of grade 2. Important to note, after a year NVEA had to adapt the curriculum in the ABE centers to the teaching in governmental schools. Nonetheless, at the time of the endline ABE centers differed from the governmental schools with respect to a better equipped learning environment (e.g., additional learning materials and better infrastructure). Balance tests and double difference analyses are reported for the outcomes of this project. In sum, ABE Centers increased access to education and the quality of education, important aspects of the Millennium Development Goal 2. The results indicated that students in the ABE centers overall performed better on a learning test (driven by subtests in the language of instruction, math, and English) compared to students in the governmental schools. Keeping methodological challenges in mind, efficiency calculations suggested that the project was quite cost effective.

1. Introduction

Primary school enrollment rates of 82.5 % in low income countries are lower than those in high income countries where 95.6 % of the children attend primary education (World Bank, 2012). The difference is even bigger when comparing the percentage of students who finish their primary education: only 71.5% of the students complete their primary education in low income countries compared to 98.9% in high income countries (World Bank, 2012). One approach to increase school enrollment and decrease school dropout is to offer non-formal education. The paper set out to evaluate the non-formal alternative basic education project (ABE centers) in Sibu Sire Woreda, Ethiopia. This project was funded by Kinderpostzegels and implemented by New Vision in Education Association (NVEA). The main objective of this project was to create access to basic education improving the quality of education for disadvantaged children in the first cycle of primary schools in this rural area by constructing Alternative Basic Education Centers (ABE Centers). This evaluation focused on the primary beneficiaries of the project, namely primary school children. We compared children who are enrolled in two newly opened ABE centers with children in governmental schools. We interviewed children in September 2012 in their first weeks of school in grade 1 and again in May 2014 at the end of grade 2. Balance tests and Double Difference analyses are reported for the project outcomes with respect to quality of education, important aspects of the Millennium Development Goal 2. This report begins by presenting the local context in which the project has been implemented. This is followed by a description of the project, budget, result chain, and theory of change. Next, the methodology and data collection are described. Next, the analyses and results are presented. The paper ends with a discussion of the results, efficiency calculations, and conclusions.

2. Context

The aim of the project is to create access to basic education for disadvantaged children in the first cycle of primary schools in rural areas of Sibu Sire Woreda, East Wollega Zone, Oromiya Regional State by constructing Alternative Basic Education Centers (ABE Centers). To achieve this, centers are set up with support of the local community. In addition, awareness raising campaigns are organized to promote the rights of the child in particular, the right on education, and to fight harmful traditional practices such as child labour, early marriage, rape, and abduction. By building the capacity of school community and community representatives through trainings, materials support, classroom construction and renovation and vocational skill training for parents, the project aims at improving the quality of education for these children.

Non-formal education as it is given at the ABE Centers is not as informal as it seems. In Ethiopia all ABE centers follow a nationwide Non Formal Education (NFE) curriculum. Three years of NFE education give the right to access to grade 5 of formal schools. So three years of NFE equal 4 years of formal education. NFE is characterized by the following aspects compared to formal schools. (1) Teaching is often done in the local language. (2) School times and hours are more flexible. The school year can start a bit later due to the harvest season. On specific days when students have to help their parents, teaching can start a bit later. (3) Teachers at ABE centers, called facilitators, are in principle recruited from the local community. They speak the local language and understand the local culture. Facilitators and teachers can be recruited and trained by the NGOs in collaboration with the District Education Office. (4) ABE centers are more child-friendly and teaching is more child-focused. (5) School classes in ABE centers are smaller, with a maximum of 50 compared to 60-100 children per class in formal schools.

The strategy of Kinderpostzegels and its Southern partner NVEA is that the ABE centers have to be created by the local communities themselves. The local partners stimulate and support this process. However, only if the community members (i.e., the parents) are really convinced of the importance of education for their children, are interested in improving access to education for them and are willing to invest in the creation, maintenance and functioning of a center, the project will support them to realize this. The local community is asked to contribute in kind and in labour. This is often done via the traditional Iddir system, a traditional system to raise funds for social events. In addition, a second plot of land needs to be reserved for agricultural production in order to meet the running and maintenance costs of the center.

Sibu Sire is a district administered by the Eastern Wollega zone, Oromiya regional state. Sire, the administrative town of the district, is located at 281 km west of Addis Ababa. The district is classified into 19 rural and 3 urban villages. At the time of the baseline assessment *in September 2012*, the total population of the district was estimated to be 115,229 with 53.2% female and 46.8% male inhabitants. The majority (83%) was living in rural areas. According to the District Education Office report (2002/2010), there were 25 formal primary schools and 2 ABECs providing basic education to 9,065 students (52% girls). Besides, there were two privately owned kindergartens enrolling sixty-nine children, which were, however, poorly managed by untrained teachers and principals. In addition, there were still 966 (51.4% girls) out-of-school children in the seven rural villages of the district and 694 (53.16% females) first cycle drop-outs loitering in Sire and small towns of the district. At that time, 326 (53.16% girls) of them had access to basic education in three already opened NVEA's ABE centers. In total, 874 (54.2% girls) children repeated a grade in the first cycle of primary school. To date, this project has supported the opening of four new ABE centers of which two centers were opened in September 2012 with the support of MFS II funds.

The major reasons that prevent children from going to school and force them to drop out or repeat grades are lack of pedagogical training of teachers (no child-centered approach), long distances to schools, and extreme poverty. The living circumstances of the families are characterized by being dependent on rain-based agricultural activities (there is only one rainy season), the fact that most families have a female household head and are big, that rural communities dependent on traditional methods of farming, suffer from reduced soil fertility due to intensive farming on the same plots of lands year after year, and a high illiteracy rate in rural areas. Except around the existing ABE centers, harmful traditional practices have not yet been discussed (i.e., interventions that aim to change these) in the selected seven rural villages.

3. Project description

3.1. Project duration and budget

The project started in January 2011 and will finish in December 2015. The cooperation of Kinderpostzegels with NVEA started in July 2006. The involvement of Kinderpostzegels with the actual Non Formal Education project started right at the beginning of this project in January 2011. The Dutch NGO used the following criteria to select the Southern partner NVEA: being active in the field of non-formal basic education projects for out-of-school children in rural areas, having sufficient capacity to implement a development project focused on improving access to quality education for disadvantaged working children, being an open and learning organization, and implementing projects on a child right's based approach. Over the last eleven years, according to the documents, NVEA is the only NGO intervening in Sibu Sire District to provide basic education to disadvantaged children. Last year they received an award from the regional government for their contribution in this region. Villages in which ABE centers were set up were carefully selected by the SPO, because the aim is that the community takes over responsibility and also gets involved in setting up the school. Under MFS I between 2008-2010 three ABE centers were set up and handed over to the district education office in 2011.

For the five year duration of the project, there was a budget of ETB 4.569.493,22 (approximately 182.929,14 Euro). The biggest part was funded by MFS II money from Kinderpostzegels (96.65 %) and a small part of the budget was contributed by the community. Table 1 provides a details overview of the budget split up per year.

Table 1: Overview of the budget comparing contribution of Kinderpostzegel and community split up per year

Year	Budget in ETB	Percentage of budget funded by MFS II	Contribution of MFS II in ETB	Community contribution in ETB
2011	622.478	95.61%	595.147	27.331
2012	857.598	96.7%	829.208	28.390
2013	977.554,3	97.4%	952.174,30	25.380
2014	1.071.862,92	97.43%	1.044.358,92	27.504
2015 (not approved)	1.040.000 (estimated)	96.1%	1.000.000 (max. 40.000 Euro estimated)	40.000
Total	4.569.493,22 (182.929,14 Euro)	96.65%	4.420.888,22	148.605

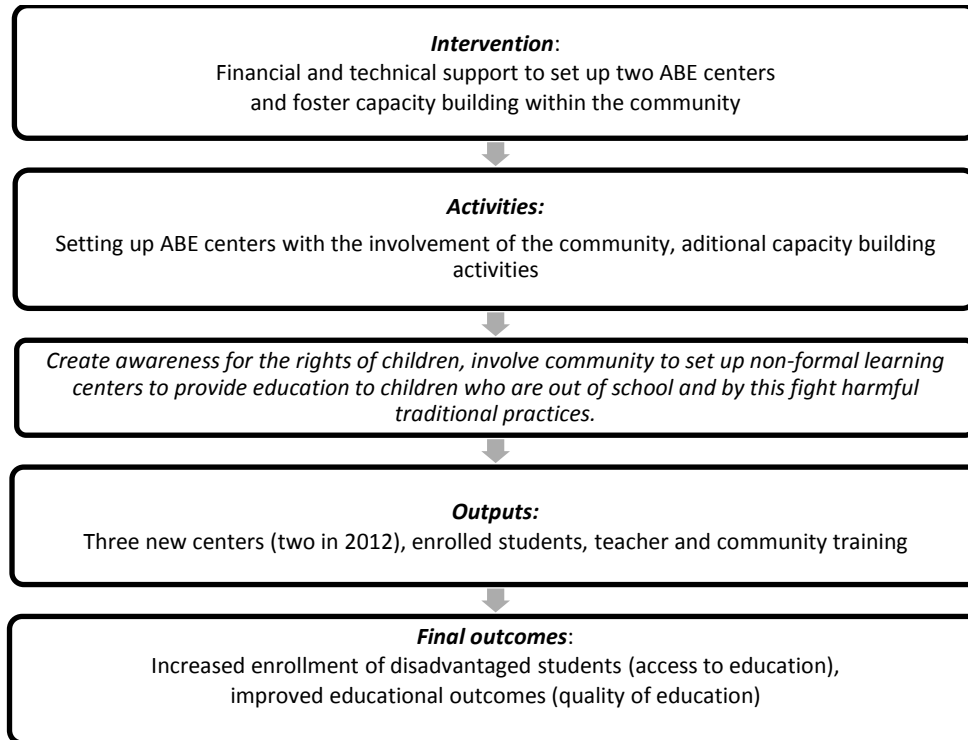

3.2. Project objective, activities, and theory of change

By involving the community, this project aims to strengthen the rights of children and fight harmful traditions. Three main objectives are defined that contribute at achieving this higher-order goal of the project. The main beneficiaries of the project are out-of-school and working children in six targeted villages in rural areas of Sibu Sire Woreda. The first main objective of the project is to create *access to basic education* in the first cycle of primary school for so far out-of-school children by constructing ABE centers. The project involved the school community and community representatives through trainings and material support to build the capacity to construct new classrooms and renovate old ones. The second main objective is to improve the *quality of education* for these children by offering non-formal basic education (NFE), a good learning environment, and training teachers. The third main objective is to *increase the income* levels by providing vocational skill training for jobless youth and parents of the children (especially mothers).

This evaluation focused on the outputs, outcomes, and activities of three newly opened ABE centers because all project documents and outputs referred to all three centers. Important to note is that outcomes that were assessed among students were only asked to students that attended one of the two ABE centers that opened in 2012, namely Danbi Dima and Gedo Sire. These two centers opened at the same time; the other center already opened prior to this evaluation. As this evaluation was set out for only two years, we focused on the activities which should result in the anticipated shorter-term outcomes. Thus, this evaluation did not include activities that aimed at achieving the anticipated long-term outcome of poverty reduction. To be able to study these long-term outcomes longer time horizons would have been necessary. To conclude, the main focus of this evaluation lies on the first two objectives that aim at contributing to the Millennium Development Goal 2 and on students as the main beneficiaries.

The graphical theory of change illustrates the envisioned impact of the project (see Figure 1). Below, specific aspects will be described in detail.

Figure 1: Graphical theory of change for the impact of the project

With MFS II funds, Kinderpostzegels provided financial and technical support as well as capacity building. For specific activities please refer to the project document (NVEA Sibulire ABE multi-annual project 2012-2015, 19.12.2011). The main **activities** are:

- The construction of four ABE centers (two planned to open in September 2012) with the active contribution of the local communities.
- Offering non-formal education in the ABE centers.
- Organizing initial and refreshment trainings for facilitators and teachers to improve their performance.
- Organizing awareness raising workshops to decrease the prevalence of harmful traditional practices within the community.

The project aimed at achieving the following **outputs**: set up four ABE Centers in which 1200 children have access to education; each ABE center should be equipped with one resource center, one staffroom, three dry pit latrines, and four additional classrooms; offering non-formal education; 310 facilitators and teachers

receive training; 180 parents, teachers and school management staff will have been aware of the rights of children to education and of the impact of illiteracy. The final main **outcomes** are increased enrollment of these students (access to education) and improved educational outcomes (quality of education). Specific outcome indicators were discussed with NVEA and will be described in detail below (see section 4.2).

The **theory of change** states how specific activities should result in the envisioned outcomes. In this case, ABE centers are set up with active support of local community (contribution in kind and labour) to offer education for out-of-school and working children in this region. In addition, by organizing trainings for facilitators and teachers, the project aims at improving the quality of education. Furthermore, trainings and workshops are organized for teachers and the community to promote the rights of the child in particular, the right on education and to fight harmful traditional practices such as child labour, early marriage, rape, and abduction.

Important to note, the current evaluation focused on the overall outputs of the four ABE centers funded by MFS II but focused on assessing the outcomes among students who were enrolled in the newest two ABE centers which were opened at the time of the baseline study in September 2012.

3.3 Changes in the project activities

There are two important changes in the project activities that are relevant for the evaluation. The first one is related to the non-formal education approach. One year ago NVEA had to change their teaching approach. They were not allowed to follow the nationwide Non Formal Education (NFE) curriculum anymore which provided specific school materials and books. One change is that teaching is now based on the school books used in governmental schools. Another change is the number of school years student can attend an ABE center before they have to transfer to a governmental school. Previously students who attended one of the ABE centers used to transfer in grade 5 to a governmental school. Now students can only attend an ABE center up to grade 3 and then have to transfer to a governmental school in grade 4. We collected additional information to be able to identify the remaining differences between education in an ABE center and a governmental school. Table 4 in the Appendix provides a specific overview of the similarities and differences between the ABE centers and governmental schools in the sample. To sum up, seven differences between these two educational systems and specific learning environments still exist. First, ABE centers still use additional learning materials (supplementary school books to the governmental school books). Second, they have additional sport materials that can be used during break or in the school clubs. Third, the infrastructure of the ABE centers is better (e.g., teacher and resource room, three separate latrines for boys, girls, and teachers). Fourth, additional school clubs are offered to students. Fifth, teachers receive additional pedagogical training (e.g.,

active learning, quality basic education, project management, sustainability, inclusive education, minimum of six trainings per year). Sixth, students continuously write school tests to monitor their learning progress. Finally, the number of disabled students who attend the school is higher compared to the number at governmental schools. Important to note, the intended number of students per grade in an ABE center used to be below 50 compared to 60-100 in governmental schools. The current data shows that this difference does not exist anymore. In 2013, in the two ABE centers 60 students attended grade 1 in Geda Sire and 47 students in Danbi Dima in comparison to the governmental schools in which there were 56 students in Mao and 91 students in Badesa. In addition, NVEA mentioned that teachers and facilitators in the ABE centers organize tutorial classes particularly for girls who had to miss classes or exams due to various reasons such as helping their parents.

The second change in the project activities is related to the training that NVEA provides for teachers and facilitators. In the meantime the government has requested NVEA to also train the teachers at the governmental schools. Thus, spill-over effects with respect to the additional pedagogical training may have occurred. In addition, teachers who previously have been working at an ABE center may have changed to a governmental school. The potential impact of these two important changes of the project activities will be discussed later (see section 6. Discussion).

4. Data collection

4.1 Data sources

This evaluation is based on two main sources of data, namely (1) gathered sources of data and information and (2) a survey that was conducted among children. First, prior to visiting the project site, information was gathered from Kinderpostzegels and NVEA. This information included project reports, project monitoring data, and financial data. The evaluation team met once with a representative from Kinderpostzegels in the Netherlands and three times with representatives from NVEA in Ethiopia (June 2012, May 2013, and April 2014) to understand the project and its progress as well as to obtain relevant project documents. Second, we interviewed children to investigate the outcomes of the program among these beneficiaries. The survey and the results will be described below. Representatives of the evaluation team visited the field sites during the data collection in September 2012 and May 2014.

4.2 Description of the surveys

Children were individually interviewed by native speakers. The endline questionnaires were translated to the local languages to make sure that students understood the questions (e.g., Benet-Martínez & Hong, 2014). The baseline interview lasted on average 30 minutes and the endline on average 60 minutes. The full questionnaire can be obtained on request. The questionnaire was divided into seven sections. The majority of questions in each section was asked at baseline and endline, a few questions were revised at the endline, and one section was added (section 1.5, school performance test). The first part assessed demographic information about students' age, gender, religion, ethnicity, and mother tongue. The next section, section 1.5, included a school performance test which was only asked at the endline. As there is no standardized school performance test available for grade 2 across Ethiopia, we extensively developed one school test in collaboration with educational experts and field workers across Ethiopia. In this school test, students were asked seven questions about the subject environmental science, fourteen questions about the language of instruction (Oromo), eleven mathematical questions, and six English questions. For each subject the questions increased in difficulty. One master thesis, which is still in progress, explains in detail how this measure was developed and carefully pre-tested (Geiger & Hansen, in preparation). The third section included questions about cognitive skills and health indicators. Section four included questions about students' identity. Students' school engagement and future aspirations were assessed in section five. Next, questions about the classroom interaction and learning were assessed, before students were asked questions about their socioeconomic background. The items of the presented results are provided in Table 5 in the Appendix.

In addition, we requested information about students' grades, absence (e.g., due to illness), and whether students had to repeat a grade. Unfortunately, we could only collect information about the grades of some students (see results). We did not receive any information about students' absence or who had to repeat a class. The enumerators tried to get more detailed information about attrition, trying to reach students who were not present in school during the interview period in May 2014. Unfortunately, the enumerators were only able to receive some general information about the reasons why some students were not present during this data collection time. Therefore, we could not include school attendance and grade repetition as outcome variables. Thus, we included self-report measures for students' motivation and intention to drop out of school. Table 6 provides an overview of the assessed outcomes that were included in this evaluation.

Table 6. Overview of assessed outcomes

Main outcomes	Source	Specific outcomes	Assessed at
Access to education	School records	Number of enrolled students	Baseline & endline
Quality of education	Student survey	Cognitive ability (recall)	Baseline & endline
	Student survey	Cognitive ability (remember order)	Baseline & endline
	Student survey	Motivation to attend school	Baseline & endline
	Student survey	Intention to drop out	Baseline & endline
	Student survey	Control beliefs about students' performance	Baseline & endline
	Student survey	School performance test (overall, environmental science, language of instruction, math, English)	Endline
	School records	Grades in language of instruction, environmental science, math, and English	Endline

4.3 Sampling design and sample sizes

The evaluation included three groups, one treatment and two comparison groups (see Table 8 in the Appendix for the selected schools and their location). All students in the two recently opened ABE centers were selected for this evaluation (*treatment group*). As the ABE centers just opened at the time of the baseline assessment in September 2012 we could only include students in grade 1. Next, we selected two comparison groups: First, children not enrolled in any school and that lived in remote areas where access to the nearest school was difficult. Second, children enrolled in formal education in a governmental school. The selection is more precisely explained below:

1. *Comparison group (out of school children)*: Regarding the choice of kebeles where to sample children that do not attend school, we used the following methods in consultation with the head of the district education office and knowledgeable persons of the kebeles. We looked at all the 19 kebeles in the district and reviewed where there was a relative scarcity of schools. Looking at the education offices records, we identified some kebeles with 5 schools compared to some with only 2 schools. Accordingly, we decided to select two kebeles: namely Burka Talo (3 schools) and Bujura (2 schools) from which we sampled children that did not attend school. The main reasons not to attend schools were that most of the children had to work in agricultural activities for the family (the parents decide for the children), compared to other villages of the district infrastructures were not developed and access to the nearest school was difficult (children had to travel a long distance to go to school). Once these villages were selected, children who were not able to go to school were identified in consultation with kebele administrators and selected for the interview. At the time of the data collection for the endline, the majority of the children who had been sampled for this comparison group did attend a school in their neighborhood. We decided to not interview this group again. Thus, unfortunately 156 children dropped out of the sample.

2. *Comparison group (governmental schools)*: We selected governmental schools with similar facilities as the ABE centers (latrines etc.) in a nearby kebele. The governmental schools had only four grades from 1-4 like ABE centers and shared similar socio-economic conditions. Finally, two government schools namely Ma’o and Badessa were selected for the sample. We selected all students in the first grade of both schools (one section in one school and two sections in the other).

In addition, the comparison schools and areas, and potential participants/schools shared pre-program characteristics, agro climatic conditions, and initial infrastructural development. Careful selection of comparison schools aimed to overcome (most of) the purposive program placement bias (for example, children not enrolled in any schools live quite far from the ABE centers), while matching methods aimed at limiting self-selection bias.

At baseline 220 students in the ABE centers, 156 out of school and working children (comparison group 1), and 121 students attending a governmental school (comparison group 2; see Table 7 for an overview per school) were interviewed. At the endline 75 students were interviewed in the ABE centers and 76 in the governmental schools (comparison schools). The other comparison group of out of school and working children could unfortunately not be included in the final analyses.

Table 7. Overview of sample design and sample sizes

	1. Students in the two ABE Centers (non-formal education; <i>treatment group</i>)	2. Students in village without a school (<i>comparison group</i>)	3. Students in a governmental school in another kebele (formal education; <i>comparison group</i>)
Baseline	School 1: Gedo Sire School, Bikila kebele # students: 115 (2 sections)	Burka Xalo kebele: 41	School 1: Mao # students: 46 (1 section)
	School 2: Danbi Dima School, Jarso Wama kebele # students: 105 (2 sections)	Bujura kebele: 115	School 2: Badesa # students: 75 (1 section)
Baseline total	220 students	156 children	121 students
Endline	School 1: Gedo Sire School, Bikila kebele # students: 29 (2 sections)	At the time of the endline all children attended a school in the neighbourhood	School 1: Mao # students: 46 (1 section)
	School 2: Danbi Dima School, Jarso Wama kebele # students: 46 (2 sections)		School 2: Badesa # students: 30 (1 section)
Endline total	75 students		76 students
Attrition rate	65.91%	100%	37.19%

4.4 Attrition to follow-up

In the baseline 497 children were interviewed. In the follow-up 289 children were interviewed, out of which 179 were also interviewed during the baseline. Therefore, the overall attrition was very high, about 63% (1-179/497). The main reason for this high attrition rate was that one comparison group dropped out of the sample ($n = 156$). We ran additional analyses to check whether the attrition was random (see Appendix Table 3). Three differences emerged with respect to ethnicity, gender, and number of brothers. The first one can be explained by the fact that attrition was highest in the treatment group that included the highest number of Amharic children (the majority in this region is Oromo). We controlled for the other two variables in the analyses.

We identified three additional reasons for the high attrition. First, the enumerators faced another challenge during the endline data collection. They were surprised when they realized that the students who were interviewed at baseline (selected as grade 1 students) now attended grade 1 or 3 and not grade 2. It seems as if some of the students transferred to grade 0 or 2 shortly after the baseline assessment. Second, at the time of the data collection it was maize planting season and very rainy in the woreda. Several students had to help their families with row planting which is very labor intensive and were thus not in school. Third, some students have transferred to other schools or dropped out of school in the meantime. Unfortunately, we could not get any detailed information or documents to check which students had dropped out of school, transferred schools, or were just not present during the data collection time. We decided to additionally interview all students who were present in the sampled classes. Table 6 in the Appendix provides an overview of the interviewed and additionally sampled number of students per school.

4.5 Implication of power calculations

A potential concern of our evaluation is that we lacked sample size to detect a real impact of this project, resulting in a Type II error. Theoretically, a power analysis can assess whether this is a serious risk. However, it was not obvious how to perform power analyses for our analyses. Many simplifying assumptions need to be made in order to make the problem tractable. Moreover, we considered a broad range of outcome variables, and use different types of regression techniques. Our approach, therefore, will only be indicative and will provide some extremely rough estimates covering a range of contingencies. One of the main problems we were faced with is that we needed to make an assumption about the effect size for the underlying population. Since there are virtually no quantitative studies available that could guide us in terms of expected effect sizes, we decided to follow Cohen's definitions of small, medium and large effect sizes (Cohen, 1988, chap. 9) and calculate minimum required sample sizes for the effect size of 0.8. Based on this assumption we calculated the

minimal detectable effect size for the main outcomes variables separately, using the STATA program powerreg, which is specifically designed to do power calculations for multiple regression models. Results are given in Table 8 below.

Table 8: Minimal detected effect size

Outcome variable	Minimal detected effect size
Cognitive ability (recall)	.05
Cognitive ability (remember order)	.07
Motivation to attend school	.11
School drop out	.27
Control beliefs	.18
Good grade	.32
Test environmental science	.03
Grade environmental science	7.25

4.6 Other data problems

The reasons of the high attrition have been discussed above. Furthermore, we were not able to receive the school records (absence, grade repeated, grades) for all students (see discussion in section 4.2).

4.7 Availability of financial data

The total budget for this project was around 182.929,14 Euro (final budget for 2015 not decided yet). Table 9 below provides a breakdown of the project budget in different types of activities. Kinderpostzegels and NVEA differentiate between three different strategies: 1) costs directed at poverty alleviation/direct action, 2) capacity building, and 3) policy dialogue. The first strategy includes all costs with respect to the construction and renovation of schools as well as all additional materials (school and educational materials, sport materials, agricultural inputs, salaries etc.). The second strategy includes all costs with respect to the training that are offered to teachers and the community. The third strategy includes activities aimed at creating and stimulating the policy dialogue by for example organizing a workshop with involved stakeholders. At the time of the writing of this report the final budget for 2015 was still not approved. Thus, we could only add estimates. Furthermore, due to political reasons NVEA can decide on how of the budget they will spend on each strategy in 2015. As this information was not available at the time of the report writing, we can only offer a rough analysis. The main funds of the total budget over the five years were invested in the direct actions (strategy one). Only small parts of the budget were invested in the second strategy of capacity building and the third

strategy of policy dialogue. On average one workshop was organized per year. As the budget included all activities in the region (all 6 ABE centers) and not only the two newly opened centers that were selected for this evaluation, the efficiency discussion will focus on the whole project.

Table 9. Breakdown of the project budget in two strategies

Year	Total budget	Budget in ETB <i>costs directing poverty alleviation/direct action</i>	Budget in ETB <i>Costs influencing capacity building</i>	Budget in ETB <i>Costs Influencing policy/policy dialogue²</i>	Overhead costs ¹	Contingency ¹
2011	622.478	367.686	52.722	19.200	182.870	/
2012	857.598	401.581	46.675	63.080	346.262	/
2013	977.554,3	824.723	37.890	3.000	43.281	43.281
2014	1.071.862,92	901.619	62.080	3.300	48.350	29.010
2015 (not approved)	1.040.000 (estimated)	Not approved Yet ²	Not approved yet ²	Not approved Yet ²	Not approved yet	Not approved yet
<i>Total</i>	4.569.493,22 (182.929,14 Euro)					
<i>Percentage</i>						

Note. ¹ Overhead and contingency costs were limited to 5% of the budget after 2013. ² In 2015 Kinderpostzegel allowed NVEA decide on how much budget they would spend on each strategy.

4.8 Descriptive analysis

We first checked the intended outputs of the program (see Table 10). Four new ABE centers were opened and offered access to education to 903 (48% girls; see Appendix Table 7) students (the goal was 1200 students). The infrastructure of the centers was equal and according to the planning. The goal was to offer non-formal education in these centers. This goal had to be adapted; the centers now had to follow the teaching curriculum of the governmental schools. Thus, aspects of non-formal alternative basic education that included for example different school materials could not be continued. However, during harvest time students may still come to school a bit later if they have to help their parents on the fields. In addition, we compared the learning environment of the two ABE centers with the two selected governmental schools (see section 3.3 and Table 4 in the Appendix). This analysis showed that the ABE centers still differed in some aspects from the governmental schools: supplementary school books, additional sport materials for the breaks, and better infrastructure in general. Furthermore, as we did not receive concrete numbers for the training goal for the teachers and facilitators we could not include them into the final analysis. Finally, we did not receive concrete goals about the organization of events to make parents, teachers and school management staff aware about the rights of children to education and on the impact of illiteracy. Thus, we could not include this analysis in

the report. In sum, the main goal such as opening 4 ABE centers with a specific infrastructure was achieved. However, the number of enrolled students was lower than intended and the curriculum had to be adjusted. As mentioned above we cannot draw conclusions about the other outputs.

Table 10: Output and achievements

Output	Goal	Achieved
Set up ABE Centers	4	achieved
Access to education for students in four ABE centers	1200	903, lower number of students enrolled
Each ABE center should be equipped one resource center, one staffroom, three dry pit latrines, and four additional classrooms	1 resource center 1 staffroom 3 dry pit latrines 4 additional classrooms	achieved
Offering non-formal education	in all ABE centers	Had to be adapted to the education in governmental schools (see section 3.3)
Facilitators and teachers receive training: <ul style="list-style-type: none"> • Child-centered teaching skill training for 100 facilitators & teachers for 2 days • Initial training for 80 new Facilitators of the 6 ABECs for 3 days • Train 95 teachers from the 4 ABECs on the skills & techniques of teaching CWD & inclusive education for 2 days 	310	Not specified
Parents, teachers and school management staff are aware about the rights of children to education and on the impact of illiteracy	180	Not specified
<i>Notes.</i> For Outputs and goals we referred to NVEA (2011, project proposal on Sibu Sire Integrated ABE project).		

On the district level, we were able to compare important indicators such as school enrollment, repetition, out-of-school-children, and kindergartens, based on the District Education Office report from 2002/2010 and 2006/2013. First, the number of first cycle formal primary schools has increased from 25 in 2012 to 32 in 2014 that provide education from grade 1-4. The number of enrolled students has increased from 9,065 students (52% girls including 2 ABE centers) in 2012 to 14,414 children (49% girls) in addition to the four newly opened ABE centers in 2014. In 2012, 874 (54.2% girls) children had to repeat a grade in the first cycle of primary school; in 2014, 1,449 children (10.9% girls). Thus, 43.3% fewer girls had to repeat a grade. With respect to out of school children, the numbers are difficult to compare as the number of villages differs. In 2012, there were still 966 (51.4% girls) out-of-school children in the seven rural villages of the district; whereas in 2014 there were still 1442 out-of-school children (48.2% girls) in 19 rural villages in the district. At

the time of the baseline study there were only two private kindergartens with sixty-nine children, which were, however, poorly managed by untrained teachers and principals. At the time of the endline study this number has increased to six privately owned kindergartens that were operating in Sire town with 352 enrolled children (84% girls) and 12 certified teachers (84% women).

The survey conducted with the students included a range of information designed to control for differences in socio-economic characteristics and demographic structure across children and the households they lived in. We chose questions that children of this age can easily answer. Descriptive statistics and balancing tests based on the first assessment for the two comparison groups and treatment group are provided in Table 11. Table 12 provides an overview of the descriptive statistics and balancing tests for the baseline and follow-up data focusing on the main outcomes. As can be seen from Table 12, the first comparison group (out of school and working children) was not included in the endline assessment.

The statistics from Table 11 tend to suggest that the two main groups of this evaluation (comparison 2 and treatment) differ in some aspects. With respect to the educational background, parents of children in the treatment group seemed to be more likely to be able to read and write compared to the comparison group 2 of students attending a governmental school. Furthermore, the number of brothers was smaller in the treatment compared to the comparison group 2. We included these variables next to more general demographics (age, gender, ethnicity, religion etc.) in the final analyses. Table 12 presents the summary statistics of the main outcome variables. No balancing tests showed significant differences. We will discuss these more in depth in the following section.

Table 11: Summary statistics and balancing tests for controls

Dependent variable	Summary Statistics						Balancing tests	
	Comparison 1		Comparison 2		Treatment		Treatment - C1	Treatment - C2
	N	Mean	N	Mean	N	Mean

Notes: Columns 2, 4 and 6 present the mean of the control and treatment group respectively. Columns 7 and 8 display the coefficient from a separate OLS regression. In panel B no balancing tests are conducted as there are only endline data available. Standard errors are clustered at the village level. ¹ The scores were computed by an average of two items assessing the retrospective construction of a scale ranging from 1 for *very low* to 4 for *very high*. ² Students were asked to choose one out of two statements describing their personal control belief on how they can achieve specific goals such as a good grade in life. One statement represented a strong internal control belief that it depends on their own efforts and the other represented a strong external belief that it depends on other pure luck. All answer representing internal control belief were summed up. In total, students received 2 of these questions. The reported score could vary from 0 for *no personal control belief* to 2 for a *strong personal control belief*. ³ Results are representing the percentage of correct answers. ⁴ Grades were not available for all students who were interviewed at the endline. Robust standard errors in parentheses. *** $p < .001$, ** $p < .05$, * $p < .1$.

5. Analyses and results

This section explains the analyses and presents the results of the impact evaluation. Section 5.1 describes the approach we have used, and points out some of the caveats we were faced with. The main results are presented in Section 5.2.

5.1 Methodology

The objective of this report is to describe changes in school engagement and learning outcomes that could be attributed to attending an ABE center. The challenge in any impact evaluation is to isolate the causal role of the intervention from other determinants of well-being (e.g., Armendariz & Murdoch, 2010). When comparing the situation of beneficiaries before and after an intervention, the observed changes in outcome variables cannot solely be attributed to the intervention, as there are many other changes in the environment of the respondents during the project period. Comparing beneficiaries with a control group of non-beneficiaries does not necessarily provide the solution. Beneficiaries could for instance have been smarter than non-beneficiaries when the program started or *vice versa*. This and other factors can make some children more likely to choose to attend a school, thus causing self-selection bias. Besides self-selection bias, program placement bias is also frequently observed in evaluation studies. NGOs target their projects purposely at specific, often disadvantaged, areas. If the control group's physical, economic, and social environment does not match that of the beneficiaries, this will result in differences not caused by the intervention and, thus, in biased estimates of impact.

The standard approach to overcome these issues is to conduct a randomized controlled trial (RTC). Before the program starts, two groups will be created at random. One group will receive the treatment (treatment group) while the other group will act as a benchmark (control group). Because of the randomization the members in the control group represent the members in the treatment group. After the treatment has taken place, both groups can be compared on the outcomes of interest. Differences in outcomes can now solely be attributed to the treatment. However, creating two groups at random, a necessary step for RTCs, is not always possible because of the program implementation or ethical reasons.

As we had no influence on the design of the non-formal alternative basic education program, we used an alternative to RCTs: a so-called double difference (DD) model. In order to apply a DD model, one needs to have information about relevant indicators of the treatment group and the control group before (baseline) and after (end line) the intervention. While the RTC methodology ensures that the only difference between members in the treatment and control group is the treatment, the DD method only eliminates differences

between members of the two groups that do not change over time. So the disadvantage of the DD method over the RTC method is that it does not automatically distinguish between the impact of time-varying characteristics between members of the two groups and the impact of the treatment. A (partial) solution to this problem is to include as many time-varying characteristics into the DD model as possible so that only the influence of unobserved time-varying characters remains.

To test whether the treatment and control group are comparable at baseline, a balancing test can be conducted. Although debated in the literature, a balancing test is generally used to determine if the observable controls are distributed similarly between the two groups in question.¹ If any significant difference exists between the two groups, a balancing test should pick up this difference and indicate that the current composition of the data could lead to a biased estimate of the treatment effect. The balancing test is conducted as a set of OLS regressions in which each control variable is individually regressed on a constant and the treatment dummy. The standard errors in the regressions are clustered at the village level to account for intraclass correlation. The coefficient of the treatment dummy gives an unbiased estimator of the difference between the control and treatment group at the time of the baseline survey.

Econometrically speaking the double difference estimator is given by the following expression:

$$Y_{ijt} = \alpha + \beta_1 Post_t + \beta_2 D_j^T + \beta_3 Post_t D_j^T + \gamma X_{ijt} + \varepsilon_{ijt} \quad (1)$$

Where Y_{ijt} denotes an outcome variable for respondent i in group j at time t , D_j^T is a dummy variable equal to one if the respondent belonged to the treatment group, $Post_t$ is a binary variable that takes the value one if the observation corresponds to the post-treatment time period, X_{ijt} is a set of controls², and ε_{ijt} denotes the error term. Then, β_3 in (1) is the treatment estimate of the intervention's impact on outcome Y . That is, β_3 measures the difference between the treatment and control group in the growth of outcome Y . It is an unbiased estimate of the average impact of being assigned to the treatment group on the dependent variable Y .

Some of the outcome variables considered in the analysis are binary. In these cases, a linear probability model (LPM) is estimated and the marginal effect of D_i^C for the impact of the non-formal alternative education project on outcome Y is reported.³ In all models the standard errors are clustered at the village level.⁴

¹ For a summary of the literature and further discussion of balancing tests see Kleyman (2009).

² Additional covariates are included to control for various characteristics of the households. This not only helps with the precision of the estimates, but also reduces the problem of omitted variable bias. This is necessary to obtain unbiased measures of the treatment effects.

³ In recent literature, Puhani (2012) shows that in a nonlinear difference-in-difference, such as the one used in this study, the cross difference is not equal to the treatment effect. Instead the treatment effect comes from the cross derivative

Clustering at the village level provides a relatively large amount of clusters (39). It is important to cluster the standard errors as the data might be subject to intraclass correlation, that is, students in the same village are likely to be more similar on a wide variety of measures than students that are not part of the same village. The higher intraclass correlation, the less unique information each student provides. This has to be taken into account by inflating the standard errors when running the regressions. The number of classes was too low to cluster the analyses.

It is often the case that there is some level of attrition (or dropping out) and/or new entry in the dataset. The double difference model presented in (1) can be estimated using an unbalanced panel, keeping in all observations, including the ones which we only observe in one time period. It can also be estimated using a balanced panel, dropping observations which we only observe in one period. Estimating (1) using an unbalanced panel increases the power, but as the sample becomes more heterogeneous the results might be distorted. As the number of new entries and drop-outs are very high (see section 4) all estimations will be done on the restricted panel.

Although a double difference analysis can solve some potential biases in the data, some bias may remain. A double difference analysis helps picking up the time-invariant heterogeneity, but bias can still remain due to time-variant unobservables. Yet, a positive significant effect in the double difference model is a strong indication of an influential intervention. An insignificant effect or even a significant negative effect, however, does not necessarily imply that the intervention does not work or does harm, as in our analysis we only measure short-term effects.

5.2 Results

The impact analysis is based on a double difference model. The main results are based on the data treated as two repeated cross-sections. The main reason to do that is the high attrition rate (63%, see section 4.4). In addition, we also report a double difference panel analysis based on the children that were interviewed twice (179 kids). Furthermore, since in the endline a set of new questions are added to derive a school test score, we report some basic analysis on the difference on the test scores between the treated and untreated students.

Table 13 displays all analyses including controlling variables (parents read and write, books at home, study help at home, number of brothers and sisters, number of animals in the household, sex, age, ethnicity,

(or cross difference) of the conditional expectation of the observed outcome minus the cross derivative of the conditional expectation of the potential outcome without treatment. Although this calculation of the treatment effect is appealing, this study will follow common practice in the field and report the estimate of β_3 in the case of an LPM.

⁴ In educational science, common practice would have been to cluster at the class level instead of the village level. However, due to the low number of classes, clustering was done at the village level for this project.

religion, and number of meals per day). Table 14 provides an overview of the same analyses without controlling for any variables. The discussion of our results will focus on the results provided in Table 13.

No significant differences between students in the ABE centers and students in the governmental schools occurred for the variables that we assessed at baseline and endline. However, the indicators of quality of education showed some interesting results. Overall (summing up all school tests per subject), children in the ABE centers scored higher in the school performance test compared to students in the governmental schools. This effect was driven by significant differences in the subtests in language of instruction (Oromo), math, and English. Test scores in environmental science did not differ. Inspection of the means in Table 12 show that across conditions almost all students answered all questions on environmental science correctly.

The analyses provided similar results for the analyses of student's grades. However, we want to stress that we did not receive grades for all students and that grades are no reliable indicators for students' performance. They mainly depend on the teacher's judgment. More precisely, in testing sessions students are asked to individually answer questions by the teacher. The teacher gives every student one question which can greatly differ in difficulty. Thus, students do not answer the same questions. The current analyses show that students in the ABE centers received higher grades in Oromo and math but lower grades in English compared to students in governmental schools.

6. Discussion

The discussion is structured in three main parts. We will first shortly address some methodological caveats before discussing whether the project reached its objective. We will next discuss the relevance of these results and finally discuss the efficiency of the project.

6.1. Methodological caveats

As this project is categorized as a Millennium Development Goal 2 project, our evaluation focused on children as the main beneficiaries and on the first two strategies, access to education and quality of education. We selected first grade students and followed them for two years. As students just started their education, we could not assess learning performance at the baseline. Given these reality constraints our key outcome variable of school performance could only be measured at the endline. Other factors due to the selection of the sample may have also influenced the reported results from the endline. To indirectly rule out a selection bias, we assessed cognitive abilities with two abstract reasoning tests at baseline (and endline). We did not find any impacts. This is not that surprising because these abilities were not explicitly trained in the schools. As the subsamples did not differ in both abstract reasoning tests, we assume that the subsamples did not systematically differ in students cognitive learning abilities which are also aspects of intelligence (Neisser et al., 1996). This provides some additional empirical reasoning that the observed differences in learning outcomes (as measured at endline) might be in fact driven by the intervention.

6.2 Did the project reach its objective?

The main aim of this project is to *provide access* and *improve quality of education* for out-of-school and working children in rural areas. The project involved the communities and the government in the rolling out of the project. Ultimately, communities shall take over the ABE centers after a few years. From the beginning of the project, the community was involved in constructing the ABE centers. They offered their contribution in kind. In addition, the government was involved and contributed the teaching staff for the ABE centers. NVEA offered financial and technical support in the construction phase as well as capacity building activities to teach the community and teachers about relevant topics with respect to education, the rights of children, fighting harmful traditions, health, and income generating activities. The project was well designed involving relevant local stakeholders to ensure sustainability of the program. The first main objective was achieved by opening four new ABE centers (two in September 2012). In total, 903 students achieved access to education, a bit less than original intended (goal was 1,200 students). The second objective was to improve the quality of education. As we did not receive all information, we could not check the outputs such as the number of training that teachers should have received. In addition, we interviewed children twice, first when they started

going to school in grade 1 and two years later at the end of grade 2. We did not find any differences with respect to students' general cognitive abilities, motivation to attend school, or intention to drop out. However, we found that students' school performance was better in the ABE centers compared to the governmental schools. Despite the changes in the project activities (ABE centers are now no longer allowed to follow their own curriculum, but have to use the governmental school books) and "spill-over" effects of the project (trainings are now also offered to teachers from governmental schools; some teachers from ABE centers may have transferred to governmental schools), we still found some significant impacts. Our additional comparison of the learning environments between the two ABE centers and two governmental schools (see Appendix Table 4) showed that the ABE centers still differed in some important aspect from the governmental schools. In sum, despite these changes, the project showed a higher quality of education with respect to the learning environment as well as learning outcomes of students.

6.3. How relevant are these results?

To date, many children around the world still do not have access to primary education, especially in African countries (World Bank, 2012). This project set up schools in rural areas where students did not have access to a school yet and where the government had not yet invested in further development. Investments in education are important because education one of the most important drivers for economic development (Hanushek & Woessmann, 2007). This project did not only offer access to education of so far disadvantaged children, but also aimed to improve the quality of education. By offering (1) a new *learning environment* through (partly) adapting the nation-wide Non Formal Education (NFE) curriculum and offering additional materials and training, (2) *training teachers*, and (3) organizing events to create awareness for *inclusive education*, the project aimed at improving the quality of education.

Previous research in high- and low-income countries showed that the *learning environment* impacts on students' well-being and performance. For example, the quality of the learning environment was related to students' school attendance (Branham, 2004). Students in Nigeria indicated that a depressing learning environment could decrease school attendance. On the contrary, an improved learning environment had the potential to increase students' motivation to attend school as well as their motivation to learn (Asiyai, 2014).

Another means to improve the quality of education is the capacity building of teachers by offering *training*. For example, data from low-income countries in 2012 showed that 19.5 % of the primary school teachers had not received a minimum of organized teacher training normally required being qualified to teach at the primary level in the given country (World Bank, 2014). Other research showed that across six African countries, general teacher education and teachers' mathematical and reading skills were very low (Pryor, Akyeampong, Westbrook, & Lussier, 2012). Even more dramatic are the results from a study in Kenia, where

grade 6 teachers achieved only 61 % correct answers on a mathematics tests from grade 6 (Ngware, Oketch, Mutisya, & Abuya, 2010). These results illustrate the sometimes low education level of teachers. Offering training to teachers can help to improve the educational level, increase their factual knowledge, and improve their pedagogical skills. The latter is also very relevant with respect to teachers' openness for the needs of slow learners and students with disabilities (*inclusive education*). In Africa the inclusion of children with special needs is still to a great extent influenced by traditional beliefs, culture, and attitudes. As a result many people oppose the inclusion of children with special needs in normal classes and only a few teachers are trained to be able to offer inclusive education. Thus, training teachers in inclusive education is a promising and needed means through which the inclusion of special needs children in schools can be encouraged and improved (Abosi & Koay, 2008). This project contributes to this development. In sum, the educational level, factual and pedagogical knowledge of teachers clearly influences students' performance. For example, across 45 countries higher teaching quality in mathematics was related to lower rates of low achievement (Mullis, Martin, Foy, & Arora, 2012) and teacher's subject knowledge was related to students' achievement gains (Glewwe, Hanushek, Humpage, & Ravina, 2011).

To conclude, offering access to education for working and out-of-school children in rural areas as well as improving the quality of education by providing a learning environment with additional school and learning materials, better infrastructure, intensive teacher training, and awareness for inclusive education are important steps to improve the future prospects of students in general.

6.4 How efficient was the project?

The project has a five year budget of 4.569.493,22 ETB (182.929,14 Euro) which is split up in activities that can be categorized in the three main strategies of the project partner (for an overview see Table 9): 1) costs direct poverty alleviation/direct action, 2) capacity building, and 3) policy dialogue. The largest amount of the budget was spent on the construction and renovation of ABE centers and a much smaller percentage on capacity building, with a strong focus on teacher training to further improve the quality of education. Thus, we tried to compare benchmarks for these two activities.

In order to determine the efficiency of a project one needs a benchmark project that is fully efficient and uses about the same inputs as the project under evaluation. One can compare the outputs of both projects in order to determine how efficient the assessed project is. Since such a benchmark is lacking the determination of efficiency is problematic. Therefore, we have decided to focus on the price per main activity calculated from the amount of specific activity funded by the project's budget and compare these with prices per activity of similar projects found in the literature on primary education. To conclude, we can only offer a very rough discussion of the efficiency of the project. A literature review provided benchmarks for the costs of

an ABE center between Int\$ 3.434- 19.747 for an average 167 enrolled students per school (World Bank, 2005; Unicef, 2011, see Table 14). In the current project, the largest amount of the budget was spent on constructing and equipping the four ABE centers (not including teacher salaries). This amount ranged between ETB 367.686 in 2012 and ETB 901.619 in 2014 for 4 ABE centers and 903 students (in 2014/2015). These figures can only be compared very roughly suggesting that the project was quite cost efficient with respect to the ABE centers.

With respect to the costs of the teacher training, a cross-country study from 2002 including Trinidad and Tobago, Ghana, Lesotho, and Malawi showed the costs of training teachers in each of these countries (Lewin, 2002). The costs from a similar context in Ethiopia ranged from Int\$ 1.500 to Int\$ 6.440. Please keep in mind that this data was collected in 2002. For example, based on the budgets from 2013 and 2014, a teacher training on quality basic education for 40 persons was calculated with ETB 8.360 and a training about inclusive education for 40 persons twice a year was calculated with ETB 12.070 (one training ETB 6.035). On average, training costs ranged between roughly ETB 6.000 and 8.500 for 40 participants. Thus, based on this rough comparison the results suggest that the project was quite cost efficient with respect to the teacher training costs as well.

Table 14: Benchmarks for costs of ABE center and teacher training

	Number	Total people who profited from	Project	Benchmark
ABE center	4	903 students of ABE centers	ETB 367.686 - 901.619 per year for 4 centers	Int\$ 3.434- 19.747 for on average 167 enrolled students per school
Teacher training			Roughly between ETB 6.000-8.500 f	Int\$ 1.500-6.440

Notes. Benchmarks for ABE centers are based on World Bank (2005) and Unicef (2011) and for teacher training on Lewin (2002).

However, this efficiency has not been translated into effectiveness. The analysis presented above shows that with respect to the key objectives, 903 students have received access to the first cycle of primary education and ABE centers have a better equipped learning environment and that students showed better school performance compared to governmental schools. The project seems to have improved the quality of education. It may be argued that these effects have been achieved by the cost of Euros 202.58 per child.

7. Conclusion

The project main objective with respect to the Millennium Development Goal 2 was to (1) provide access to education of out-of-school and working children in the rural region and (2) improve the quality of education by offering non-formal basic education in the first cycle of primary education. Through capacity building activities, the project involved the community to help constructing and renovating so-called ABE centers. Moreover, the project organized additional capacity-building activities to train teachers and the community in pedagogical methods as well as in topics to fight harmful traditions. Finally, workshops with involved stakeholders were organized to stimulate policy dialogue.

The main findings are as follows:

1. *Increased access to education:* In total, four ABE centers were opened and offered access to basic education in the first cycle of primary school for 903 children in rural areas in Sibu Sire woreda, Ethiopia.
2. *Improved quality of education:* The outputs showed that the learning environment in the two ABE centers, which were opened in 2012, was better equipped than the environment in the governmental schools in this area. With respect to the outcomes, students showed better schools performance in the ABE centers compared to the governmental schools.

Overall, while we realize the impact evaluation caveats we were faced with and the difficulties in rigorously evaluating this project, we end this report by evaluating the project in terms of the main evaluation questions (see Table 14). Based on the statistical analyses, the field work that was conducted, and the information we gathered from the existing reports we have the impression that the project was very well designed and set out to have a sustainable impact. The community and government were involved to set up and later take over the ABE centers. The non-formal teaching approach, however, had to be adapted to the governmental school approach which resulted in a lower evaluation of the implementation. Despite this change the project still reached most of its objectives. Based on the employed analyses methodological caveats (i.e., the rigorousness of the evaluation), we gave a 7 for the extent to which the observed results can be attributed to the project intervention. This result is based on the fact that we could not do DID analyses for the main outcome of school performance, only had a rather small sample, and high attrition. Furthermore, the observed results in access to education and quality of education (better learning environment, better learning performance) are very relevant for the beneficiaries. Additional efficiency analyses showed that the project was implemented in a quite cost efficient way. Based on the available data and reality constraints (e.g., teacher salaries were finance by the government and not the project) we could only offer a very rough analyses.

Table 14: Overview evaluation of the project

On a scale of 1 to 10, with 1 being “not at all” and 10 being “completely”, for this project, how much do you agree with the following statements:	
The project was well designed.	10
The project was implemented as designed.	7
The project reached all its objectives.	8
The observed results are attributable to the project interventions.	7
The observed results are relevant to the project beneficiaries.	10
The project was implemented efficient.	8

Notes: All the columns present the coefficient estimates of the Double Difference regressions. The model regresses the outcome variable on a treatment dummy (equaling 1 if the household belongs to the treatment group and 0 otherwise), a year dummy (equaling 0 for the recall period and 1 for the time of the survey) and an interaction of those. Columns 6-14 have no baseline data available and are therefore estimated using endline data only. Results in column 6-10 show the percentage of correct answers. All regressions have the standard errors clustered at the village level and are estimated without controls. Robust standard errors in parentheses. *** $p < .01$, ** $p < .05$, * $p < .1$.

Table 5. Overview of items of the presented results

SECTION 1.5: SCHOOL PERFORMANCE

Items SP01-07 assess environmental science, SP08-13 language of instruction, SP14-20 math, SP21-26 English

SP01	<p>Give the student the STUDENT SHEET and a pen. Say: "I will ask you some questions about things you learn in school. This is NOT a test and it will NOT be graded. I will first ask some questions about environmental science. What happens if you do not wash your hands before eating?" Label the answer as correct when the child names at least one of the possible answers.</p>	<p>Any of the answers is correct: - <i>I become sick</i> - <i>I can get a disease</i> - <i>Any disease</i></p> <p>1 Correct 2 Incorrect/ does not know</p>	
SP02	<p>Say: "Name a food that comes from an animal."</p>	<p>Any of the answers is correct: <i>milk, cheese, yoghurt, meat</i></p> <p>1 Correct 2 Incorrect/ does not know</p>	
SP03	<p>Say: "Why are small children not allowed to play with a knife/blade?"</p>	<p>Any of the answers is correct: - <i>Because they can cut themselves</i> - <i>Because it is dangerous</i> - <i>Because they can hurt others</i> - <i>HIV transmission</i></p> <p>1 Correct 2 Incorrect/ does not know</p>	
SP04	<p>Say: "What is the use of the ears?"</p>	<p>Correct answer: <i>hear, listen</i></p> <p>1 Correct 2 Incorrect/ does not know</p>	
SP05	<p>Show to the first question on the student sheet and say: "Show me the roots."</p>	<p>1 Correct 2 Incorrect/ does not know</p>	
			
SP06	<p>Say: "What are the roots for?"</p>	<p>Any of the answers is correct: - <i>To get water/ nutrition</i> - <i>Not to fall over</i> - <i>Storing nutrition</i></p> <p>1 Correct 2 Incorrect/ does not know</p>	
SP07	<p>Say: "What kind of food does a lion like?"</p>	<p>Correct answer: <i>meat or any animal</i></p> <p>1 Correct 2 Incorrect/ does not know</p>	
SP08	<p>Say "I will ask you some questions about reading and writing. Please point to the letter I read." Show the 2. question on the student sheet.</p>	Correct	Incorrect/ does not know
	R	1	2
	Q	1	2
	B	1	2
SP09	<p>Say: "Please read each letter."</p>	Correct	Incorrect/ does not know
	F	1	2
	S	1	2
	X	1	2
SP10	<p>Say: "Please read each word."</p>	Correct	Incorrect/ does not know
	House	1	2
	Ox	1	2
	Goat	1	2
SP11	<p>Say: "Please write each word."</p>	Correct	Incorrect/ does not know
	Dog	1	2
	Ball	1	2
	Earth	1	2

SP12	<p>Say: "Write the name of the thing you see on the picture."</p> 	1 Correct 2 Incorrect/ does not know	
SP13	<p>Say: "I will say one sentence to you. Write it down! Abebe went to school."</p>	Correct	Incorrect/ does not know
	Abebe	1	2
	went	1	2
	to school.	1 1	2 2
SP14	<p>Say: "I will now ask some math questions. Please read the numbers here."</p>	Correct	Incorrect/ does not know
	8	1	2
	2 5	1 1	2 2
SP15	<p>Say: "Please read the numbers here."</p>	Correct	Incorrect/ does not know
	23	1	2
	10 68	1 1	2 2
SP16	<p>Say: "On the paper you can see some math questions. Please fill in the correct answers." Read the question.</p> $\begin{array}{r} 3 \\ + 5 \\ \hline \end{array}$	Correct answer = 8 1 Correct 2 Incorrect/ does not know	
SP17	<p>Read the question.</p> $\begin{array}{r} 8 \\ - 2 \\ \hline \end{array}$	Correct answer = 6 1 Correct 2 Incorrect/ does not know	
SP18	<p>Read the question.</p> $2 \times 5 =$	Correct answer = 10 1 Correct 2 Incorrect/ does not know	
SP19	<p>Read the question.</p> $6 \div 3 =$	Correct answer = 2 1 Correct 2 Incorrect/ does not know	
SP20	<p>Say: "Abebech has two sons and four daughters. How many children does she have?"</p>	Correct answer = 6 1 Correct 2 Incorrect/ does not know	
SP21	<p>Say: "I will now ask some English questions. Where is the 'pen'!" (pen in English) Do not point to the pen nor show it to the child.</p>	Correct answer: Child points to or holds up a pen. 1 Correct 2 Incorrect/ does not know	
SP22	<p>Say: "Stand up!" (stand up in English)</p>	Correct answer: Child stands up 1 Correct 2 Incorrect/ does not know	
SP23	<p>Say: "Show me your 'ear'." (ear in English)</p>	Correct answer: Child points to his/ her ear. 1 Correct 2 Incorrect/ does not know	
SP24	<p>Point to your nose. Say: "Say this in English!"</p>	Correct answer: Child says "nose" 1 Correct 2 Incorrect/ does not know	
SP25	<p>Say: "Write down what it is." Point to the pen. If the child does not know the word in English, say "pen".</p>	Correct answer: Child writes "pen" 1 Correct 2 Incorrect/ does not know	
SP26	<p>Say: "Write down what it is." Point to your nose. If the child does not know the word in English, say "nose".</p>	Correct answer: Child writes "nose" 1 Correct 2 Incorrect/ does not know	

SECTION 2: COGNITIVE SKILLS & HEALTH

CSH01 Cognitive ability (recall)	<i>Say: "Listen carefully to me! I will read out a list of thing. After I read, please recall the things I mentioned?"</i> The list includes the following things: House, Sun, Book, Arm, Fire, Animal, Stone, and Friend (<i>Tick all correctly recalled and not recorded items</i>)		Items	Recalled	Not recalled
			House	1	2
			Sun	1	2
			Book	1	2
			Arm	1	2
			Fire	1	2
			Animal	1	2
			Stone	1	2
		Friend	1	2	
Which statements fit best to you? Please choose one of the two alternatives: <i>Read each item with both option (CSH03-CSH05_4) and let the child choose one option (1 or 2).</i>					
CSH03 CSH04 Control beliefs	When you lose a game, is it:				
	1	because the other player is good at the game, or			
	2	because you don't play well.			
	When you learn something quickly, is it:				
	1	because you listened very good, or			
	2	because someone who is older explained it carefully.			
CSH04_1 Getting a good grade	When you get a good grade in class, is it.				
	1	because the test was very easy, or			
	2	because you know a lot.			
CSH06 Cognitive ability (remember order)	<i>Make sure that you have five different objects students are familiar with. Arrange all five objects in this order from left to write (small stone – pencil – leave – blade of grass – pen) on a table or the ground in front of the child. And say:</i> Look at the order of these things and try to remember it! Close your eyes. <i>Put all objects together in front of the child and say:</i> Open your eyes and try to put the objects back in the same order! <i>Circle one for correct and 2 for incorrect arrangement.</i>				
					
	1	1	1	1	1
	2	2	2	2	2

SECTION 5: MOTIVATION & FUTURE

		<i>Say: "We want to know what is important for you, some things are not important for children! Please answer what you think.":</i> <i>All questions should be answered in the following two steps:</i>			
<i>First ask whether it applies "No" or "Yes"!</i>		No		Yes	
<i>Next ask, "how much"!</i>		<i>Not at all</i>	<i>Not</i>	<i>A little bit</i>	<i>Very much</i>
MF05 MF06 Motivation	Do you like to go to school?	1	2	3	4
	Are you motivated to go to school?	1	2	3	4
MF07 MF08 Drop out	Have you ever thought about quitting school?	1	2	3	4
	Do you sometimes intend to stop going to school?	1	2	3	4

Table 6. Overview of number of students who were interviewed and resampled per school provided from the data collection team

Name of the school	Condition	List of students in the sample	Actual students in School Roster	Interviewed students	Out of school Students	Replaced students
Denbi Dima	Treatment	105	39	28		32
Gedo sire	Treatment	15	51	45		47
Mao	Control		36	30		26
Bedessa	Control		42	38		37
<i>Total</i>			168	141	156	142

Table 7. Overview of number of enrolled students in the four ABE centers funded by MDFS II

ABE center	Number of enrolled children (grade 1-3)			O-Level		
	Girls	Boys	Total	Girls	Boys	Total
Dembidema	85	96	181	25	17	42
Gedo Sire	117	126	243	-	-	-
Cheka	137	141	278	24	43	67
Yubdo	41	51	92	-	-	-
Total	380	414	794	49	60	109

Report CDI-15-056

Kusters, C.S.L, T. van Ingen, E. Zerfu, D. Kefyalew, B. Peters, N.N. Buizer, 2014. *Endline report Ethiopia, OSRA. Capacity of Southern Partner Organisations (5c) component*. Centre for Development Innovation, Wageningen UR (University & Research centre). Report CDI- 15-056. Wageningen.

This report presents the findings of the endline of the evaluation of the organisational capacity component of the MFS II country evaluations. The focus of this report is Ethiopia, OSRA. The format is based on the requirements by the synthesis team and NWO/WOTRO. The endline was carried out in 2014. The baseline was carried out in 2012.

Key words: 5C (five core capabilities); attribution; baseline; causal map; change; CFA (Co-financing Organisation) endline; organisational capacity development; SPO (Southern Partner Organisation).

Acknowledgements

We are grateful to all the people that have contributed to this report. We particularly would like to thank the Southern Partner Organisation Oromo Self Reliance Association (OSRA) and the Co-Financing Agencies ICCO and IICD for their endless patience and support during this challenging task of collecting the endline data. We hope that this endline report will provide useful insights to OSRA, ICCO IICD, consortia, the synthesis team, IOB and NWO/Wotro and other interested parties and other interested parties.

The Ethiopia 5C evaluation team

List of abbreviations and acronyms

Causal map	Map with cause-effect relationships. See also 'detailed causal map'.
Causal mechanisms	The combination of parts that ultimately explains an outcome. Each part of the mechanism is an individually insufficient but necessary factor in a whole mechanism, which together produce the outcome
CDI	Centre for Development Innovation, Wageningen UR, the Netherlands
CFA	Co-Financing Agency
CS	Civil Society
CSO	Civil Society Organisation
C4C	Connect for Change Consortium
C6NGO	Consortium of 6 NGO's (ADAA, CDI, ERSHA, FC, OSRA, HUNDEE) in "Integration of information and communication technologies on agricultural value chain" project under the lead of FC
Detailed causal map	Also 'model of change'. the representation of all possible explanations – causal pathways for a change/ outcome. These pathways are that of the intervention, rival pathways and pathways that combine parts of the intervention pathway with that of others. This also depicts the reciprocity of various events influencing each other and impacting the overall change. In the 5C evaluation identified key organisational capacity changes and underlying reasons for change (causal mechanisms) are traced through process tracing (for attribution question).
FC	Facilitators for Change
FED	Fair Economic Development
FMO	Farmers Marketing Organisation
General causal map	Causal map with key organisational capacity changes and underlying reasons for change (causal mechanisms), based on SPO perception.
ICCO	Inter-church organisation for development cooperation
IFPRI	International Food Policy Research Institute
IICD	International Institute for Communication and Development
MDG	Millennium Development Goal
M&E	Monitoring and Evaluation
MFS	Dutch co-financing system
MIS	Management Information System
MoFA	Ministry of Foreign Affairs
NGO	Non-Governmental Organisation
OD	Organisational Development
OSRA	Oromo Self Reliance Association
PME	Planning, Monitoring and Evaluation
PRA	Priority Result Area
Process tracing	Theory-based approach to trace causal mechanisms
RCT	Randomized Control Trials
SPO	Southern Partner Organisation
SSI	Semi-structured Interview
ToC	Theory of Change
Wageningen UR	Wageningen University & Research centre
5 C	Capacity development model which focuses on 5 core capabilities

1 Introduction & summary

1.1 Purpose and outline of the report

The Netherlands has a long tradition of public support for civil bi-lateral development cooperation, going back to the 1960s. The Co-Financing System (*Medefinancieringsstelsel*, or 'MFS') is its most recent expression. MFS II is the 2011-2015 grant framework for Co-Financing Agencies (CFAs), which is directed at achieving a sustainable reduction in poverty. A total of 20 consortia of Dutch CFAs have been awarded €1.9 billion in MFS II grants by the Dutch Ministry of Foreign Affairs (MoFA).

The overall aim of MFS II is to help strengthen civil society in the South as a building block for structural poverty reduction. CFAs receiving MFS II funding work through strategic partnerships with Southern Partner Organisations.

The MFS II framework stipulates that each consortium is required to carry out independent external evaluations to be able to make valid, evaluative statements about the effective use of the available funding. On behalf of Dutch consortia receiving MFS II funding, NWO-WOTRO has issued three calls for proposals. Call deals with joint MFS II evaluations of development interventions at country level. Evaluations must comprise a baseline assessment in 2012 and a follow-up assessment in 2014 and should be arranged according to three categories of priority result areas as defined by MoFA:

- Achievement of Millennium Development Goals (MDGs) & themes;
- Capacity development of Southern partner organisations (SPO) (5 c study);
- Efforts to strengthen civil society.

This report focuses on the assessment of capacity development of southern partner organisations. This evaluation of the organisational capacity development of the SPOs is organised around **four key evaluation questions**:

1. *What are the changes in partner organisations' capacity during the 2012-2014 period?*
2. *To what degree are the changes identified in partner capacity attributable to development interventions undertaken by the MFS II consortia (i.e. measuring effectiveness)?*
3. *Were the efforts of the MFS II consortia efficient?*
4. *What factors explain the findings drawn from the questions above?*

The purpose of this report is to provide endline information on one of the SPOs involved in the evaluation: OSRA in Ethiopia. The baseline report is described in a separate document.

Chapter 2 describes general information about the Southern Partner Organisation (SPO). Here you can find general information about the SPO, the context in which the SPO operates, contracting details and background to the SPO. In chapter 3 a brief overview of the methodological approach is described. You can find a more detailed description of the methodological approach in appendix 1. Chapter 4 describes the results of the 5c endline study. It provides an overview of capacity development interventions of the SPO that have been supported by MFS II. It also describes what changes in organisational capacity have taken place since the baseline and why (evaluation question is 1 and 4). This is described as a summary of the indicators per capability as well as a general causal map that provides an overview of the key organisational capacity changes since the baseline, as experienced by the SPO. The complete overview of descriptions per indicator, and how these have changed since the baseline is described in appendix 3. The complete visual and narrative for the key organisational capacity changes that have taken place since the baseline according to the SPO staff present at the endline workshop is presented in appendix 4.

Chapter 5 presents a discussion on the findings and methodology and a conclusion on the different evaluation questions.

The overall methodology for the endline study of capacity of southern partner organisations is coordinated between the 8 countries: Bangladesh (Centre for Development Studies, University of Bath; INTRAC); DRC (Disaster Studies, Wageningen UR); Ethiopia (CDI, Wageningen UR); India (CDI, Wageningen UR; Indonesia (CDI, Wageningen UR); Liberia (CDI, Wageningen UR); Pakistan (IDS; MetaMeta); Uganda (ETC). Specific methodological variations to the approach carried out per country where CDI is involved are also described in this document.

This report is sent to the Co-Financing Agency (CFA) and the Southern Partner Organisation (SPO) for correcting factual errors and for final validation of the report.

1.2 Brief summary of analysis and findings

Since the baseline, two years ago, improvements took place in all of the capabilities.

Over the last two years many small improvements took place in the indicators under the capability to act and commit. Since the baseline, decision making has been further decentralised within OSRA, giving a decision-making role to programs and departments. The board members have become more responsive and involved in organisational issues. There is a very slight improvement in senior management leading and following up on strategic issues. Due to dwindling foreign funding, OSRA needed to strengthen its resource mobilisation strategy and performance, which they are doing by hiring qualified staff and involving stakeholders in planning and implementation. There is an improvement in collecting outcome related information which is used for operational management, but not yet used to articulate strategies. Staff trainings were provided on different topics since the baseline based on a training needs assessment done among OSRA staff. Most trainings were funded by ICCO and other donors like CRRDA. OSRA has made some improvements in incentives for staff by revising the salary scale and the HR policy; and introducing limited loan schemes for staff. OSRA has diversified its funding and the total amount of funding has increased with 30 percent since the baseline. Among the new projects there are some multi-year (3-5 year) projects. There is now a separate unit dedicated to fundraising, proposal development and income generation.

In the capability to adapt and self-renew OSRA saw many improvements. The application of M&E improved because forms have been developed that help collect and report at outcome and impact level and OSRA has started to report case studies. ICCO is supporting OSRA in its M&E activities through providing technical support, training and introduction of various approaches. There are now two M&E teams: one at the head office and another at the area level. A monitoring officer is responsible for coordinating M&E activities. He has improved his skills in collecting and analysing information as a result of the ICT based interventions through the financial support of IICD. Area office staff has also improved their skills in reporting and documenting changes.

In terms of the capability to deliver on development objectives, OSRA has improved in various indicators. Planning is now done in a more participatory way and there are operational plans per project in place. Staffs use the operational work plans and budgets to guide them in their day-to-day activities. There is a very slight improvement in monitoring efficiency because of training on RBM in 2013 and experience of staff has helped with crudely comparing inputs with outputs. OSRA has improved their way of balancing quality and efficiency because they have prepared quality of work monitoring tools and these have been communicated to staff. For ensuring efficiency there is a well-designed project management plan in place for each project.

In the capability to relate, OSRA slightly deteriorated in the indicator on engaging in networks. Though they continued to network in their alliances, in the zero grazing project there was limited coordination among stakeholders and the collaboration with financial service institutes was not effectively done. OSRA is however, engaging more with its target groups after feedback they gained from MFS II expertise field reports and improved leadership and management. OSRA's outreach has increased through the various projects they are involved in, in which the community is actively engaged. With

regards to the relations within OSRA, access to telephone and internet at the head and field offices has improved, facilitating efficient communication between staff.

Finally, OSRA has shown some improvement in the indicators under the capability to achieve coherence. The mission and the vision of OSRA have been regularly discussed since the baseline, with efficient participation of the staff especially in strategy and policy formulation. There has been an improvement in OSRA's operational guidelines: there now are revised and updated HRM, accounting and financial policy manuals in place. New procurement guidelines and financial formats have been developed.

During the endline workshop some key organisational capacity changes were brought up by OSRA's staff in the 'general causal map': improved capacity to reach a larger numbers of beneficiaries (also increased geographical coverage); improved M&E capacity; decentralization of planning process; improved capacity in project design and fund raising; and improved capacity to involve and mobilize the community. The evaluators considered it important to also note down the SPO's story about what they considered to be key organisational capacity changes since the baseline, and this would also provide more information about reasons for change, which were difficult to get for the individual indicators. Also for some issues there may not have been relevant indicators available in the list of core indicators provided by the evaluation team.

According to OSRA's staff, they improved their capacity to reach a large number of beneficiaries because of their improved resource mobilisation capacity due to increased staff numbers (following the advice of OSRA's board partly funded by MFS II) which helped in proposal writing; and improved capacity to mobilise and involve the community because of the trust they gained from the community and from donors.

OSRA improved its M&E capacity because of donors' demand for outcome data; improved capacity to collect client satisfaction information and provide feedback to the community; feedback from donor after field visit (MFS II funded); and experience from other networks. OSRA improved its capacity to collect client satisfaction information because of a seminar on downward accountability and client satisfaction feedback in 2012 (funded by MFS II); and the development of a manual on downward accountability in 2012 (funded by MFS II).

OSRA decentralised its planning process because of past experience and problems in the planning process and enhanced capacity of process staff. Staff enhanced their capacity because of on the job training by HQ staff; training on project development in 2013 by CCRDA; and training on gender mainstreaming in value chain development in 2012 (funded by MFS II).

According to OSRA staff, the organisation has improved its capacity in project design and fundraising because of enhanced capacity of staff; creation of an independent fundraising unit due to an OSRA future directions assessment report; and hiring new staff; improved management to scan the environment; and training on mainstreaming Community Managed Disaster Risk Reduction (CMDRR) (funded by MFS II). The organisation became better at scanning their environment because of regular monthly review meetings; training on leadership and management by CCRDA and Colombia University in 2013; and donor staff's feedback after field visits (MFS II funded).

Finally, OSRA improved its capacity to involve and mobilise the community because of trust gained by the community; donor requirements and advice; and past experience gained in project implementation.

According to OSRA's staff, MFS II funded capacity development interventions have thus played a role in improved M&E capacity; decentralization of planning process; and improved capacity in project design and fund raising. This was through a seminar on downward accountability, development of a manual on the same topic; feedback from field visits; training on gender mainstreaming in value chain development; and training on CMDRR. However, internal factors like advice of their Board; trust of community and donors; experiences in other networks; past experiences; on the job training; recommendation from the OSRA future directions assessment report; and meetings have also played an important role in the key organisational capacity changes that the OSRA's staff considered important since the baseline in 2012. Support from other funders, like CCRDA and Colombia University; in terms of training, has also been mentioned among the underlying factors for these changes.

2 Context and General Information about the SPO – OSRA

2.1 General information about the Southern Partner Organisation (OSRA)

Ethiopia	
Consortium 1	Connect4Change (C4C)
Responsible Dutch NGO	ICCO and IICD
Project (if applicable)	Integration of information and communication technologies on agricultural value chain commodities OSRA is a member of the C6 consortium, under consortium lead Facilitators for Change (FC)
Consortium 2	ICCO Alliance
Responsible Dutch NGO	ICCO
Project (if applicable)	Zero Grazing Project , Project C10 MFS II MDG sample
Southern partner organisation	Oromo Self Reliance Association

The project/ partner is part of the sample for the following evaluation components:

Achievement of MDGs and themes	
Achievement of MDGs and themes	X
Capacity development of Southern partner organisations	X
Efforts to strengthen civil society	

2.2 The socio-economic, cultural and political context in which the partner operates

Oromia is the largest Regional National State in Ethiopia in terms of population size and area coverage. The estimated area is about 363,136km², accounting for about 34.3% of the country's total area. It is divided into 18 zones, 303 districts (264 rural districts and 39 urban centres) and more than 6,630 Peasant and Urban Dwellers Associations. The total population of the region is about 34 million with over 86% living in rural areas.

The average annual rainfall of the region is ranging from 400 mm (in some parts of Borena in Southern Oromia) to over 2400mm (in some parts of highlands such as Ilubabor Zone). The average temperature ranges from less than 7.5 oC to more than 27.5 oC. There is an irregularity in the timing and amount of rainfall in some parts of the region, especially in the lowland areas. This sometimes causes occurrence of drought and famine, resulting in human crisis.

Oromia has a huge natural resources base and many development potentials. These are the large population size, large arable land/ agricultural resource base, huge surface water resources, energy

resources, mineral resources, wildlife resources, tourism resources and historical and cultural resources.

Agriculture is the mainstay of the people in the region with about 89% of the population earning their living from this sector. Small scale /subsistence agriculture accounts for about 98% of the total agricultural production in the regional state. Livestock husbandry is also one of the main economic activities that complement crop production. However, husbandry practices in the region are of a very traditional type and need to be modernized to enhance the productivity of livestock in the region by capacitating and sensitizing the rural communities.

The largest proportion of the regional GDP is accounted for by agriculture (66.7%), followed by services (21.2%) and industry (12.1%).

Currently, OSRA is operating within seven districts found in four zones of the region. These are West, South West, and East Shewa Zones, and Special Zone surrounding Addis Ababa. Though areas are located relatively near to Addis Ababa, the population has been suffering from lack of basic services and infrastructures.

Most of the districts are divided into three agro climatic zones namely the highland, midland and lowland. Most people in the districts are mainly engaged in mixed farming system. Farmers produce cereals (teff, wheat, barley, maize, sorghum), pulses, vegetables combined with animal husbandry that includes cattle, shoats and equines. There are community members or farmers that do not have land, seeds, farm implements or a combination of some of these that could help them produce on their own. Inadequate infrastructure development and other social services are other dimensions that indicate the low standard of living of the community in OSRA's operational areas.

Promotion of farmers marketing organisations in value chain development, and zero grazing and improved dairy production are the two programmes that OSRA is implementing in some of these districts with financial support from ICCO. The project on value chain and farmers marketing organisations is being implemented in collaboration with other local partners of ICCO . OSRA's part in the programme is to support 18 selected farmers marketing organisations (FMOs) in four districts in the region. OSRA is implementing zero grazing and dairy improvement projects in Akaki and Ada'a districts. The project has targeted resource poor farmers residing in selected peasant associations/kebeles of the districts. The overall objective of the project is to improve the livelihood rural households in the intervention areas through promotion of zero grazing and improved livestock production

2.3 Contracting details

When did cooperation with this partner start:

February 2006

What is the MFS II contracting period:

C4C Alliance project (farmers marketing): September 2011 – December 2014

ICCO Alliance project (zero grazing): 2010 – 2012; 2012 – 2014 (2nd phase)

Did cooperation with this partner end? YES/ NO

C4C Alliance project: NO

ICCO Alliance project: NO

If yes, when did it finish?

C4C Alliance project: N.A.

ICCO Alliance project: N.A.

What is the reason for ending the cooperation with this partner:

C4C Alliance project: N.A.

ICCO Alliance project: N.A.

If not, is there an expected end date?

C4C Alliance project: December 2014

ICCO Alliance project: December 2014

2.4 Background to the Southern Partner Organisation

History

OSRA is an indigenous non-governmental, non-political, secular, non-profit making voluntary development organisation. It was registered by the Ministry of Justice and re-registered as Ethiopian Residents Charities in accordance with charities and Societies Proclamation 621/2009 in October 2009.

The Oromo Self-Reliance Association (OSRA) was established in 1995 with a vision of reduction of poverty, and improving literacy and well-being in Oromia region. Its mission at establishment was to help people in Oromia regional state to help themselves. The organisation followed an integrated holistic rural development strategy which includes development of water, natural resource and cooperatives. It served target groups which included rural communities for 2 districts in west Shoa, Ejere and Adaberga woredas. At the beginning, the organisation was staffed by 2 volunteers without division of tasks. The total budget was 150,000 ETB with funding from individual donors who participated in fund raising events. No capacity strengthening activities were undertaken by the organisation during this period. The existence of a conducive environment for NGOs and nationalistic view of individuals were indicated as important influencing factors.

A five-year project was commenced in 1997 by OSRA. Its vision, mission and strategy remained the same as the previous years. The operational strategy became well refined during this period. The target groups included women, small groups of vegetable producers, poor farmers, and school youth. There were 6 staff members whose functions included programme & project officers, manager, community animators and guard. The budget increased to 490,464 ETB with funding from World Solidarity Movement), Pact Ethiopia, and USA, and Netherlands Embassies. Capacity strengthening activities undertaken during this period included permanent project management, monitoring and coaching. The involvement of major donors during the period was indicated as an important influencing factor.

The organisation expanded its operational area in 2001. Its vision became well-articulated and was stated as "to see poverty-free society in Oromia regional state". The mission of the organisation was to implement community based integrated rural development through participatory approaches. In 1997, its strategy was affected by a new regulation by the National Bank of Ethiopia regarding the provision of micro-finance service. As OSRA used to provide microfinance as part of its programmes until 1997, the new regulation forced the separation of the microfinance programme into a separate MFI as per the proclamation. To this effect a new MFI affiliated to OSRA was created. The organisation expanded its area of operation to include target groups in south west Shoa. Staff numbers also increased to 25 with newly created staff functions, such as office coordinators, and administration & finance. The budget expanded to 1.1 million ETB with funding from the same donors, Belgium Embassy and CCRDA. Capacity strengthening activities conducted during the year included needs assessment, project design, and M&E training. The microfinance regulation was stated as important influencing factor for the organisation during the period.

In 2006, OSRA became part of the consortium of NGOs promoting cereal banks and farmers marketing organizations. The consortium has been implementing the same program in different parts of Oromia with financial support from ICCO. Its vision, mission, and strategy remained the same as previous periods. The organisation expanded further to 2 woredas in South west Shoa. The staff number reached 30 with a new M&E function added. The budget reached 4.7 million ETB with funding from Water Canada, Oxfam-America, France Embassy, ICCO, and CCFD. Experience sharing exchange with local ICCO partners was indicated as capacity building activity undertaken during this period. Funding for consortium of NGOs instead of individual NGOs was noted as an important influencing factor during this period.

The year 2009 was put as critical milestone period for OSRA due to the new CSO law. The organisation incorporated a sectoral approach in its strategy during this period while its vision and mission

remained the same as earlier years. The target groups of its programmes included opinion leaders and Abageda traditional Oromo religious leaders. The staff number in 2009 was 32 with no additional functions compared to 2006. The budget increased to 6 million ETB with additional funders coming on board which included EU and the World Bank. Capacity strengthening activities undertaken during this period included business development service, marketing and value chain training. The global financial crisis and the new directives following the 2009 CSO legislation were pointed out as important influencing factors during the period.

Vision

To see poverty free, food secured and self-reliant society in Oromiya.

Mission

OSRA implements participatory integrated rural development projects, to assist marginalized and resource poor community members to improve food security, self-reliance, and family health and to support environmental protection, through building their capacity and mobilization of internal and external resources. Operating in four zones of Oromia region, OSRA's programmes are based on the belief that the rural communities it works with are best suited to shape and sustain their own development. Hence, OSRA's motto is to help people help themselves.

Strategies

Since its establishment, OSRA has been implementing different integrated rural development projects with a mission to exert maximum efforts in contributing towards poverty alleviation efforts of the country. The main programme components are:

- Rural water supply, hygiene and Sanitation;
- Food security, nutrition and livelihood improvement;
- Promotion of cereal banks, farmers marketing organisations and value chains;
- Promotion of zero grazing & improved heifer breed introduction;
- Sensitization on Gender and anti-harmful traditional practices;
- Environmental protection;
- Horticultural and homestead vegetable crop production and promotion;
- Family planning and HIV/AIDS pandemic;
- Improve income opportunities of poor farmers, female- headed households and landless youth in the target;
- Small ruminant fattening.

OSRA works with poor and marginalized communities including poor women, men, boys, girls, children, schools, community based organisations, farmers and farmers' organisation in rural areas.

3 Methodological approach and reflection

3.1 Overall methodological approach and reflection

This chapter describes the methodological design and challenges for the assessment of capacity development of Southern Partner Organisations (SPOs), also called the '5C study'. This 5C study is organised around **four key evaluation questions**:

1. What are the changes in partner organisations' capacity during the 2012-2014 period?
2. To what degree are the changes identified in partner capacity attributable to development interventions undertaken by the MFS II consortia (i.e. measuring effectiveness)?
3. Were the efforts of the MFS II consortia efficient?
4. What factors explain the findings drawn from the questions above?

It has been agreed that the question (3) around efficiency cannot be addressed for this 5C study. The methodological approach for the other three questions is described below. At the end, a methodological reflection is provided.

Note: this methodological approach is applied to 4 countries that the Centre for Development Innovation, Wageningen University and Research centre is involved in in terms of the 5C study (Ethiopia, India, Indonesia, Liberia). The overall approach has been agreed with all the 8 countries selected for this MFS II evaluation. The 5C country teams have been trained and coached on this methodological approach during the evaluation process. Details specific to the SPO are described in chapter 5.1 of the SPO report A detailed overview of the approach is described in appendix 1.

The first (changes in organisational capacity) and the fourth evaluation question are addressed together through:

- **Changes in the 5C indicators since the baseline:** standard indicators have been agreed upon for each of the five capabilities of the five capabilities framework (see appendix 2) and changes between the baseline, and the endline situation have been described. For data collection a mix of data collection methods has been used, including self-assessments by SPO staff; interviews with SPO staff and externals; document review; observation. For data analysis, the Nvivo software program for qualitative data analysis has been used. Final descriptions per indicator and per capability with corresponding scores have been provided.
- **Key organisational capacity changes – 'general causal map':** during the endline workshop a brainstorm has been facilitated to generate the key organisational capacity changes as perceived by the SPO since the baseline, with related underlying causes. For this purpose, a visual as well as a narrative causal map have been described.

In terms of the attribution question (2 and 4), 'process tracing' is used. This is a theory-based approach that has been applied to a selected number of SPOs since it is a very intensive and costly methodology, although it provides rich information and can generate a lot of learning within the organisations. This approach was presented and agreed-upon during the synthesis workshop on 17-18 June 2013 by the 5C teams for the eight countries of the MFS II evaluation. A more detailed description of the approach was presented during the synthesis workshop in February 2014. The synthesis team, NWO-WOTRO, the country project leaders and the MFS II organisations present at the workshop have accepted this approach. It was agreed that this approach can only be used for a selected number of SPOs since it is a very intensive and costly methodology. Key organisational capacity changes/ outcomes of the SPO were identified, based on their relationship to the two selected capabilities, the capability to act and commit the capability to adapt and self-renew, and an expected relationship with CFA supported capacity development interventions (MFS II funding). It was agreed to

focus on these two capabilities, since these are the most targeted capabilities by the CFAs, as established during the baseline process.

Please find below an explanation of how the above-mentioned evaluation questions have been addressed in the 5C evaluation.

At the end of this appendix a brief methodological reflection is provided.

3.2 Assessing changes in organisational capacity and reasons for change - evaluation question 1 and 4

This section describes the data collection and analysis methodology for answering the first evaluation question: **What are the changes in partner organisations' capacity during the 2012-2014 period?** And the fourth evaluation question: **“What factors explain the findings drawn from the questions above?”**

In order to explain the changes in organisational capacity development between baseline and endline (evaluation question 1) the CDI and in-country evaluation teams needed to review the indicators and how they have changed between baseline and endline and what reasons have been provided for this. This is explained below. It has been difficult to find detailed explanations for changes in each of the separate 5c indicators, but the 'general causal map' has provided some ideas about some of the key underlying factors actors and interventions that influence the key organisational capacity changes, as perceived by the SPO staff.

The evaluators considered it important to also note down a consolidated SPO story and this would also provide more information about what the SPO considered to be important in terms of organisational capacity changes since the baseline and how they perceived these key changes to have come about. Whilst this information has not been validated with sources other than SPO staff, it was considered important to understand how the SPOs has perceived changes in the organisation since the baseline.

For those SPOs that are selected for process tracing (evaluation question 2), more in-depth information is provided for the identified key organisational capacity changes and how MFS II supported capacity development interventions as well as other actors, factors and interventions have influenced these changes. This is integrated in the next session on the evaluation question on attribution, as described below and in the appendix 1.

How information was collected and analysed for addressing evaluation question 1 and 4, in terms of description of changes in indicators per capability as well as in terms of the general causal map, based on key organisational capacity changes as perceived by the SPO staff, is further described below.

During the baseline in 2012 information has been collected on each of the 33 agreed upon indicators for organisational capacity. For each of the five capabilities of the 5C framework indicators have been developed as can be seen in Appendix 2. During this 5C baseline, a summary description has been provided for each of these indicators, based on document review and the information provided by staff, the Co-financing Agency (CFA) and other external stakeholders. Also a summary description has been provided for each capability. The results of these can be read in the baseline reports.

The description of indicators for the baseline in 2012 served as the basis for comparison during the endline in 2014. In practice this meant that largely the same categories of respondents (preferably the same respondents as during the baseline) were requested to review the descriptions per indicator and indicate whether and how the endline situation (2014) is different from the described situation in 2012¹.

¹ The same categories were used as during the baseline (except beneficiaries, other funders): staff categories including management, programme staff, project staff, monitoring and evaluation staff, field staff, administration staff; stakeholder categories including co-financing agency (CFA), consultants, partners.

Per indicator they could indicate whether there was an improvement or deterioration or no change and also describe these changes. Furthermore, per indicator the interviewee could indicate what interventions, actors and other factors explain this change compared to the baseline situation. See below the specific questions that are asked for each of the indicators. Per category of interviewees there is a different list of indicators to be looked at. For example, staff members were presented with a list of all the indicators, whilst external people, for example partners, are presented with a select number of indicators, relevant to the stakeholder.

The information on the indicators was collected in different ways:

1. **Endline workshop at the SPO - self-assessment and 'general causal map'**: similar to data collection during the baseline, different categories of staff (as much as possible the same people as during the baseline) were brought together in a workshop and requested to respond, in their staff category, to the list of questions for each of the indicators (self-assessment sheet). Prior to carrying out the self-assessments, a brainstorming sessions was facilitated to develop a 'general causal map', based on the key organisational capacity changes since the baseline as perceived by SPO staff. Whilst this general causal map is not validated with additional information, it provides a sequential narrative, based on organisational capacity changes as perceived by SPO staff;
2. **Interviews with staff members**: additional to the endline workshop, interviews were held with SPO staff, either to provide more in-depth information on the information provided on the self-assessment formats during the workshop, or as a separate interview for staff members that were not present during the endline workshop;
3. **Interviews with externals**: different formats were developed for different types of external respondents, especially the co-financing agency (CFA), but also partner agencies, and organisational development consultants where possible. These externals were interviewed, either face-to-face or by phone/Skype. The interview sheets were sent to the respondents and if they wanted, these could be filled in digitally and followed up on during the interview;
4. **Document review**: similar to the baseline in 2012, relevant documents were reviewed so as to get information on each indicator. Documents to be reviewed included progress reports, evaluation reports, training reports, etc. (see below) since the baseline in 2012, so as to identify changes in each of the indicators;
5. **Observation**: similar to what was done in 2012, also in 2014 the evaluation team had a list with observable indicators which were to be used for observation during the visit to the SPO.

Below the key steps to assess changes in indicators are described.

Key steps to assess changes in indicators are described

1. Provide the description of indicators in the relevant formats – CDI team
2. Review the descriptions per indicator – in-country team & CDI team
3. Send the formats adapted to the SPO to CFA and SPO – in-country team (formats for SPO) and CDI team (formats for CFA)
4. Collect, upload & code the documents from CFA and SPO in NVivo – CDI team
5. Organise the field visit to the SPO – in-country team
6. Interview the CFA – CDI team
7. Run the endline workshop with the SPO – in-country team
8. Interview SPO staff – in-country team
9. Fill-in observation sheets – in-country team
10. Interview externals – in-country team
11. Upload and auto-code all the formats collected by in-country team and CDI team in NVivo – CDI team
12. Provide to the overview of information per 5c indicator to in-country team – CDI team
13. Analyse data and develop a draft description of the findings per indicator and for the general questions – in-country team
14. Analyse data and develop a final description of the findings per indicator and per capability and for the general questions – CDI team
15. Analyse the information in the general causal map –in-country team and CDI-team

Note: the CDI team include the Dutch 5c country coordinator as well as the overall 5c coordinator for the four countries (Ethiopia, India, Indonesia, Liberia). The 5c country report is based on the separate SPO reports.

Please see appendix 1 for a description of the detailed process and steps.

3.3 Attributing changes in organisational capacity - evaluation question 2 and 4

This section describes the data collection and analysis methodology for answering the second evaluation question: ***To what degree are the changes identified in partner capacity attributable to (capacity) development interventions undertaken by the MFS II consortia (i.e. measuring effectiveness)?*** and the fourth evaluation question: ***“What factors explain the findings drawn from the questions above?”***

In terms of the attribution question (2), ‘process tracing’ is used. This is a theory-based approach that has been applied to a selected number of SPOs since it is a very intensive and costly methodology, although it provides rich information and can generate a lot of learning within the organisations. Key organisational capacity changes/ outcomes of the SPO were identified, based on their relationship to the two selected capabilities, the capability to act and commit the capability to adapt and self-renew, and an expected relationship with CFA supported capacity development interventions (MFS II funding). It was agreed to focus on these two capabilities, since these are the most targeted capabilities by the CFAs, as established during the baseline process.

Below, the selection of SPOs for process tracing as well as the different steps involved for process tracing in the selected SPOs, are further explained.

3.3.1 Selection of SPOs for 5C process tracing

Process tracing is a very intensive methodology that is very time and resource consuming (for development and analysis of one final detailed causal map, it takes about 1-2 weeks in total, for different members of the evaluation team). It has been agreed upon during the synthesis workshop on 17-18 June 2013 that only a selected number of SPOs will take part in this process tracing for the purpose of understanding the attribution question. The selection of SPOs is based on the following criteria:

- MFS II support to the SPO has not ended before 2014 (since this would leave us with too small a time difference between intervention and outcome);
- Focus is on the 1-2 capabilities that are targeted most by CFAs in a particular country;
- Both the SPO and the CFA are targeting the same capability, and preferably aim for similar outcomes;
- Maximum one SPO per CFA per country will be included in the process tracing.

The intention was to focus on about 30-50% of the SPOs involved. Please see the tables below for a selection of SPOs per country. Per country, a first table shows the extent to which a CFA targets the five capabilities, which is used to select the capabilities to focus on. A second table presents which SPO is selected, and takes into consideration the selection criteria as mentioned above.

For the detailed results of this selection, in the four countries that CDI is involved in, please see appendix 1. The following SPOs were selected for process tracing:

- Ethiopia: AMREF, ECFA, FSCE, HUNDEE (4/9)
- India: BVHA, COUNT, FFID, SMILE, VTRC (5/10)
- Indonesia: ASB, ECPAT, PtPPMA, YPI, YRBI (5/12)
- Liberia: BSC, RHRAP (2/5).

3.3.2 Key steps in process tracing for the 5C study

In the box below you will find the key steps developed for the 5C process tracing methodology. These steps will be further explained here. Only key staff of the SPO is involved in this process: management; programme/ project staff; and monitoring and evaluation staff, and other staff that could provide information relevant to the identified outcome area/key organisational capacity change. Those SPOs selected for process tracing had a separate endline workshop, in addition to the ' general endline workshop. This workshop was carried out after the initial endline workshop and the interviews during the field visit to the SPO. Where possible, the general and process tracing endline workshop have been held consecutively, but where possible these workshops were held at different points in time, due to the complex design of the process. Below the detailed steps for the purpose of process tracing are further explained. More information can be found in Appendix 1.

Key steps in process tracing for the 5C study

1. Identify the planned MFS II supported capacity development interventions within the selected capabilities (capability to act and commit and capability to adapt and self-renew) – CDI team
2. Identify the implemented MFS II supported capacity development interventions within the selected capabilities (capability to act and commit and capability to adapt and self-renew) – CDI team
3. Identify initial changes/ outcome areas in these two capabilities – CDI team & in-country team
4. Construct the detailed, initial causal map (theoretical model of change) – CDI team & in-country team
5. Identify types of evidence needed to verify or discard different causal relationships in the model of change – in-country teams, with support from CDI team
6. Collect data to verify or discard causal mechanisms and construct workshop based, detailed causal map (model of change) – in-country team
7. Assess the quality of data and analyse data and develop final detailed causal map (model of change) – in-country team with CDI team
8. Analyse and conclude on findings– CDI team, in collaboration with in-country team

3.3.3 Methodological reflection

Below a few methodological reflections are made by the 5C evaluation team. These can also be found in appendix 1.

Use of the 5 core capabilities framework and qualitative approach: this has proven to be a very useful framework to assess organisational capacity. The five core capabilities provide a comprehensive picture of the capacity of an organisation. The capabilities are interlinked, which was also reflected in the description of standard indicators, that have been developed for the purpose of this 5C evaluation and agreed upon for the eight countries. Using this framework with a mainly qualitative approach has provided rich information for the SPOs and CFAs, and many have indicated this was a useful learning exercise.

Using standard indicators and scores: using standard indicators is useful for comparison purposes. However, the information provided per indicator is very specific to the SPO and therefore makes comparison difficult. Whilst the description of indicators has been useful for the SPO and CFA, it is questionable to what extent indicators can be compared across SPOs since they need to be seen in context, for them to make meaning. In relation to this, one can say that scores that are provided for the indicators, are only relative and cannot show the richness of information as provided in the indicator description. Furthermore, it must be noted that organisations are continuously changing and scores are just a snapshot in time. There cannot be perfect score for this. In hindsight, having rubrics would have been more useful than scores.

General causal map: whilst this general causal map, which is based on key organisational capacity changes and related causes, as perceived by the SPO staff present at the endline workshop, has not been validated with other sources of information except SPO feedback, the 5C evaluation team considers this information important, since it provides the SPO story about how and which changes in the organisation since the baseline, are perceived as being important, and how these changes have come about. This will provide information additional to the information that has been validated when analysing and describing the indicators as well as the information provided through process tracing (selected SPOs). This has proven to be a learning experience for many SPOs.

Using process tracing for dealing with the attribution question: this theory-based and mainly qualitative approach has been chosen to deal with the attribution question, on how the organisational capacity changes in the organisations have come about and what the relationship is with MFS II supported capacity development interventions and other factors. This has proven to be a very useful process, that provided a lot of very rich information. Many SPOs and CFAs have already indicated that they appreciated the richness of information which provided a story about how identified organisational capacity changes have come about. Whilst this process was intensive for SPOs during

the process tracing workshops, many appreciated this to be a learning process that provided useful information on how the organisation can further develop itself. For the evaluation team, this has also been an intensive and time-consuming process, but since it provided rich information in a learning process, the effort was worth it, if SPOs and CFAs find this process and findings useful.

A few remarks need to be made:

- Outcome explaining process tracing is used for this purpose, but has been adapted to the situation since the issues being looked at were very complex in nature.
- Difficulty of verifying each and every single change and causal relationship:
 - Intensity of the process and problems with recall: often the process tracing workshop was done straight after the general endline workshop that has been done for all the SPOs. In some cases, the process tracing endline workshop has been done at a different point in time, which was better for staff involved in this process, since process tracing asks people to think back about changes and how these changes have come about. The word difficulties with recalling some of these changes and how they have come about. See also the next paragraph.
 - Difficulty of assessing changes in knowledge and behaviour: training questionnaire is have been developed, based on Kirkpatrick's model and were specifically tailored to identify not only the interest but also the change in knowledge and skills, behaviour as well as organisational changes as a result of a particular training. The retention ability of individuals, irrespective of their position in the organisation, is often unstable. The 5C evaluation team experienced that it was difficult for people to recall specific trainings, and what they learned from those trainings. Often a change in knowledge, skills and behaviour is a result brought about by a combination of different factors, rather than being traceable to one particular event. The detailed causal maps that have been established, also clearly pointed this. There are many factors at play that make people change their behaviour, and this is not just dependent on training but also internal/personal (motivational) factors as well as factors within the organisation, that stimulate or hinder a person to change behaviour. Understanding how behaviour change works is important when trying to really understand the extent to which behaviour has changed as a result of different factors, actors and interventions. Organisations change because people change and therefore understanding when and how these individuals change behaviour is crucial. Also attrition and change in key organisational positions can contribute considerably to the outcome.

Utilisation of the evaluation

The 5C evaluation team considers it important to also discuss issues around utility of this evaluation. We want to mention just a few.

Design – mainly externally driven and with a focus on accountability and standard indicators and approaches within a limited time frame, and limited budget: this MFS II evaluation is originally based on a design that has been decided by IOB (the independent evaluation office of the Dutch Ministry of Foreign Affairs) and to some extent MFS II organisations. The evaluators have had no influence on the overall design and sampling for the 5C study. In terms of learning, one may question whether the most useful cases have been selected in this sampling process. The focus was very much on a rigorous evaluation carried out by an independent evaluation team. Indicators had to be streamlined across countries. The 5C team was requested to collaborate with the other 5C country teams (Bangladesh, Congo, Pakistan, Uganda) to streamline the methodological approach across the eight sampled countries. Whilst this may have its purpose in terms of synthesising results, the 5C evaluation team has also experienced the difficulty of tailoring the approach to the specific SPOs. The overall evaluation has been mainly accountability driven and was less focused on enhancing learning for improvement. Furthermore, the timeframe has been very small to compare baseline information (2012) with endline information (2014). Changes in organisational capacity may take a long, particularly if they are related to behaviour change. Furthermore, there has been limited budget to carry out the 5C evaluation. For all the four countries (Ethiopia, India, Indonesia, Liberia) that the Centre for Development Innovation, Wageningen University and Research centre has been involved in, the budget has been overspent.

However, the 5C evaluation team has designed an endline process whereby engagement of staff, e.g. in a workshop process was considered important, not only due to the need to collect data, but also to

generate learning in the organisation. Furthermore, having general causal maps and detailed causal maps generated by process tracing have provided rich information that many SPOs and CFAs have already appreciated as useful in terms of the findings as well as a learning process.

Another issue that must be mentioned is that additional requests have been added to the country teams during the process of implementation: developing a country based synthesis; questions on design, implementation, and reaching objectives of MFS II funded capacity development interventions, whilst these questions were not in line with the core evaluation questions for the 5C evaluation.

Complexity and inadequate coordination and communication: many actors, both in the Netherlands, as well as in the eight selected countries, have been involved in this evaluation and their roles and responsibilities, were often unclear. For example, 19 MFS II consortia, the internal reference group, the Ministry of Foreign Affairs, Partos, the Joint Evaluation Trust, NWO-Wotro, the evaluators (Netherlands and in-country), 2 external advisory committees, and the steering committee. Not to mention the SPO's and their related partners and consultants. CDI was involved in 4 countries with a total number of 38 SPOs and related CFAs. This complexity influenced communication and coordination, as well as the extent to which learning could take place. Furthermore, there was a distance between the evaluators and the CFAs, since the approach had to be synchronised across countries, and had to adhere to strict guidelines, which were mainly externally formulated and could not be negotiated or discussed for the purpose of tailoring and learning. Feedback on the final results and report had to be provided mainly in written form. In order to enhance utilisation, a final workshop at the SPO to discuss the findings and think through the use with more people than probably the one who reads the report, would have more impact on organisational learning and development. Furthermore, feedback with the CFAs has also not been institutionalised in the evaluation process in the form of learning events. And as mentioned above, the complexity of the evaluation with many actors involved did not enhance learning and thus utilization.

5C Endline process, and in particular thoroughness of process tracing often appreciated as learning process: The SPO perspective has also brought to light a new experience and technique of self-assessment and self-corrective measures for managers. Most SPOs whether part of process tracing or not, deeply appreciated the thoroughness of the methodology and its ability to capture details with robust connectivity. This is a matter of satisfaction and learning for both evaluators and SPOs. Having a process whereby SPO staff were very much engaged in the process of self-assessment and reflection has proven for many to be a learning experience for many, and therefore have enhanced utility of the 5C evaluation.

4 Results

4.1 MFS II supported capacity development interventions

Below an overview of the different MFS II supported capacity development interventions of OSRA that have taken place since the baseline in 2012 are described. The information is based on the information provided by ICCO and OSRA.

Table 1

Information about MFS II supported capacity development interventions since the baseline in 2012

Title of the MFS II supported capacity development intervention	Objectives	Activities	Timing and duration	Budget
Training on Programmatic Approach (PA) held in Kampala, Uganda	realizing fundamental change with partner organizations and other stakeholders; Institutionalizing programmatic approach through enhanced involvement of all stakeholders in programming, implementation and monitoring of its programs	No info	2012 or 2013	€35,000 covering 16 organisations in Kenya, Ethiopia, Uganda and Rwanda.
Training workshop on downward accountability	capacitate the SPO (together with the other 5 NGOs in the consortium) to pilot some downward accountability tools, which in turn aim at improving the quality and effectiveness of the services of SPO to its clients, its accountability to its clients, etc; Mainstreaming downward accountability in all its programs and institutionalize the approach. The SPO adopted ICT solutions that can be conveniently used to disseminate and collect information using a mobile phone	Introduction training course on Downward Accountability (2009 – MFS1) Field work preparation & Implementation with coaching on the side (2010 – MFS1) Sense-making Workshop (August 2010 MFS1) Participatory film making (March 2011 – MFS 2) Round 2 Field work – with training session and coaching (November 2011 – MFS2) Participatory film making (December 2012- MFS 2) Final dissemination conference December 2012 - MFS	See previous column	OSRA share was 1/6 of 75K = 12.500 Euro.
Coaching Gender Mainstreaming in value chain	To enhance equitable participation of both men and women in its program; Mainstream gender in all its programs as cross cutting issues	No info	2013	No info
Staff training on application of ICT tools for development, and website development across the organizational set – up staff	This was what SPOs needed and included as part of its ICT project that relates to FED program (Fair Economic Development); Provide access to up-to-date and reliable information sources to its target groups, which are smallholder farmers and their organizations	Provide access to up-to-date and reliable information sources to its target groups, which are smallholder farmers and their organizations	2013	No info

Title of the MFS II supported capacity development intervention	Objectives	Activities	Timing and duration	Budget
cross country experience exchange for management members and Directors on FED and ICT covering Kenya & Ethiopia	learning from one another so as to enhance their respective development results; Strong link with market actors leading to self-sustainability.	Learning & Sharing Experiences especially on ICT and business approaches	October, 2013	€21,000 (€10,000 from ICCO and €11,000 from IICD)
Finance Management of OSRA by the ICCO Finance Officer through the Consortium framework in Ethiopia.	enhance the capacity of the organization in aspects of timely, quality and good financial & record systems;	Budgeting, Financing Reporting, Grants management (Donor relations & sub-grant management) – through FC C6NGO consortium	May 2013; Ethiopia	About €2,500 covering transport, accommodation and upkeep costs
Training on different computer software application Broad band internet installation	Efficiency in using computer software Good capacity in networking with other partners locally and internationally	Knowledge on different computer software acquired ; Internet communication tremendously improved ;		
Provision of computers, printers and digital camera, GPS	Staff can use computers and other facilities for effective project execution	Access to computer facility improved ;		
Experience exchange visit on ICT (Kenya)	Knowledge on how to integrate ICT to any business activities	Practical experience on ICT;		
Training on programming approach	Good experience on programming approach will help a lot in the future	Knowledge on programming approached acquired ;		
Capacity assessment modules used for baseline survey and final evaluation is an asset for us	Know how on what is needed for good capacity as an organisation	Good understanding on capacity development parameters ;

4.2 Changes in capacity and reasons for change - evaluation question 1 and 4

Below you can find a description of the changes in each of the five core capabilities (4.2.1). This information is based on the analysis of the information per each of the indicators. This detailed information for each of the indicators describes the current situation, and how and why it has changed since the baseline. See also appendix 4. In addition to this staff present at the endline workshop were asked to indicate what were the key changes in the organisation since the baseline. The most important is key organisational capacity changes have been identified, as well as the reasons for these changes to come about. This is described in a general causal map, both as a visual as well as a narrative. The detailed general map is described in 4.2.2.

4.2.1 Changes in the five core capabilities

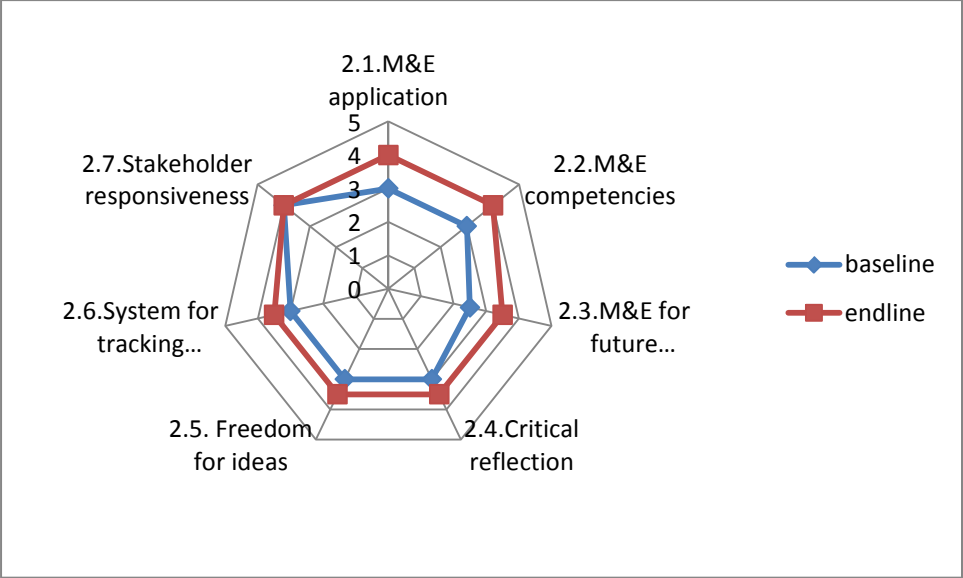

Capability o Act and Commit

OSRA has built on its experiences to bring changes and has strived to build consensus and collective decision-making. As indicated in the baseline period, OSRA has a participatory, open, responsive and transparent leadership style, since then OSRA has become more assertive and sharpened up their operational strategy after the change in management (new director). In terms of the strategic guidance, the board has initiated the study on charting growth directions for OSRA and this has helped to create a new department unit (fundraising- income generation department). On the other hand, OSRA has revised remuneration packages of staff; changed HR policy, and introduced limited loan schemes for staff for emergencies. However, some staff members said they still were not satisfied and hence more staffs resigned from the organization. Staff training needs assessments were undertaken to identify skill gaps at various levels and trainings were provided on different topics since the baseline. Staffs have improved their skill through different on-the-job trainings to accomplish planned activities and make timely reports. As a result the organization is better focused and has a good impact on the ground. Other trainings included: training of trainers on programmatic approach; downward accountability and client feedback mechanisms; environmental protection; and project management. Some of these have been funded by ICCO. The source of funding has been diversified to some extent and the level of funding has been increasing over time since the baseline. This is because OSRA has revised its organizational structure in a way that includes fundraising, proposal development and income generation as a designated unit/department that is responsible for resource mobilization. Besides, staff have been well aware on the organization funding strategy.

Score: from 3.2 to 3.4 (very slight improvement)

Capability to adapt and self-renew

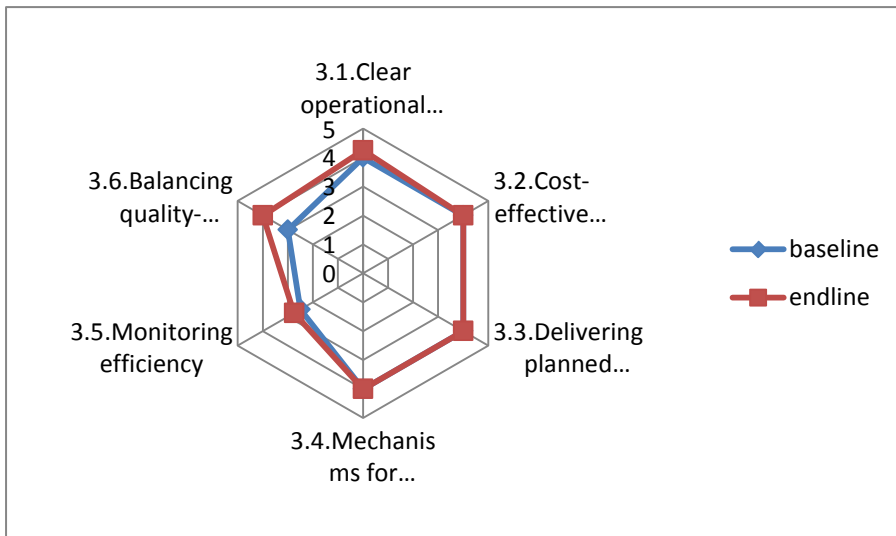

Outcome and impact level data collection has started and an M&E data collection guideline and M&E manual are under preparation. The organization has developed forms that help to collect and report at outcome and impact level. OSRA has also started to report case studies. To realize this, ICCO has supported the organization in different ways: training on Most Significant Change (MSC) technique; downward accountability experience sharing meeting; and conducting client satisfaction assessments for charting growth directions for OSRA. In addition to this, the organizational commitment to build up own experiences, learning from experiences and ICCO staff monitoring visits were indicated as the contributing factors for the improved efforts of OSRA to change its previous approach and style of monitoring.

Area office staff is well oriented and has started to report and document changes observed at result and outcome level since the baseline. The organization performance evaluation and implementation capacity has improved. Besides, the results obtained from M&E are used for developing a new strategy or scaling-up best practices after the baseline. Staff members are able to reflect their ideas freely and there has been improvement in the frequency of staff meetings to deal with programmatic issues together with management. In these meetings the context environment is scanned, which has contributed to the effectiveness in program implementation. Staff inputs are highly appreciated in OSRA and they have been encouraged to feel free to come up with new ideas. Environmental scanning has been undertaken by OSRA to identify factors affecting effective implementation of programs/projects. OSRA has good experience particularly in organizing regular meetings with stakeholders during project launching, planning, review workshops, reporting and feedback sessions. Hence, stakeholders are fully engaged in the whole project process and there is always room to collaborate and work with stakeholders.

Score: from 3.1 to 3.7 (slight improvement)

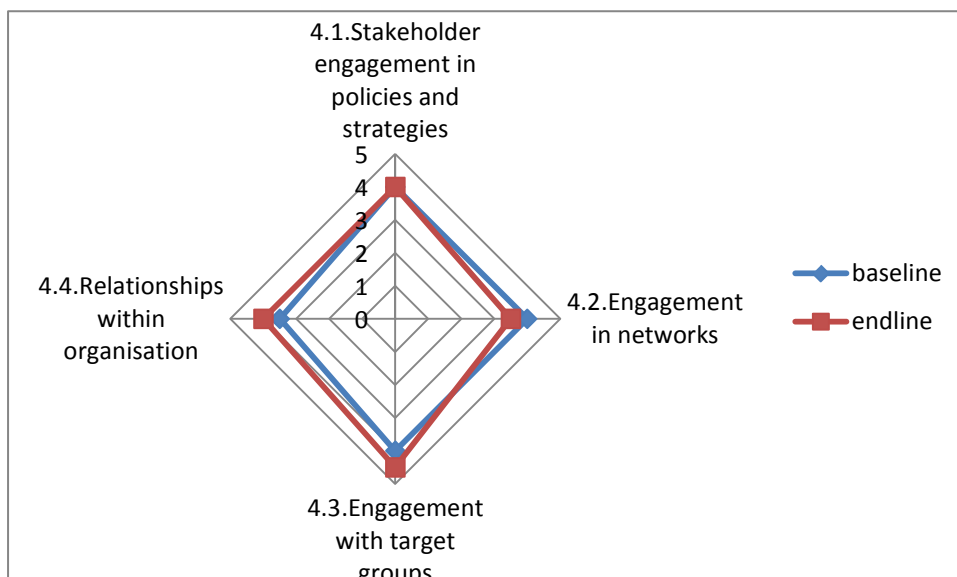

Capability to deliver on development objectives

Generally, planning is shifted from a top down to a bottom up approach, and has become more participatory as operational plans are made by projects and further reviewed at head office level to endorse towards the government agency and partners. The Oromo Self Reliance Association (OSRA) has used shared offices, desktop computers and motor bicycles for their day to day operations and hereby aims to use its resources cost-effectively. The training on RBM (Results Based Management) in 2013 by CAFOD/SCI AF/Trocaire and the improved experience of staffs through time and exposure along with community feedback has helped to crudely compare inputs with outputs and thus measure efficiency. OSRA has prepared quality of work monitoring tools and communicated these tools to staff members and minimum standard guidelines developed by different donors has helped the organization to measure quality of work. OSRA's project management approach (more decentralised decision-making and planning) was also significantly efficient and appropriate to attain the expected outputs and outcomes of the project. OSRA has maintained its strong experience to verify beneficiary needs and there are no clear observed changes in mechanisms for verifying beneficiary needs since the baseline. There have been no changes in terms of delivering planning outputs and generally this is done according to plan.

Score: from 3.6 to 3.8 (very slight improvement)

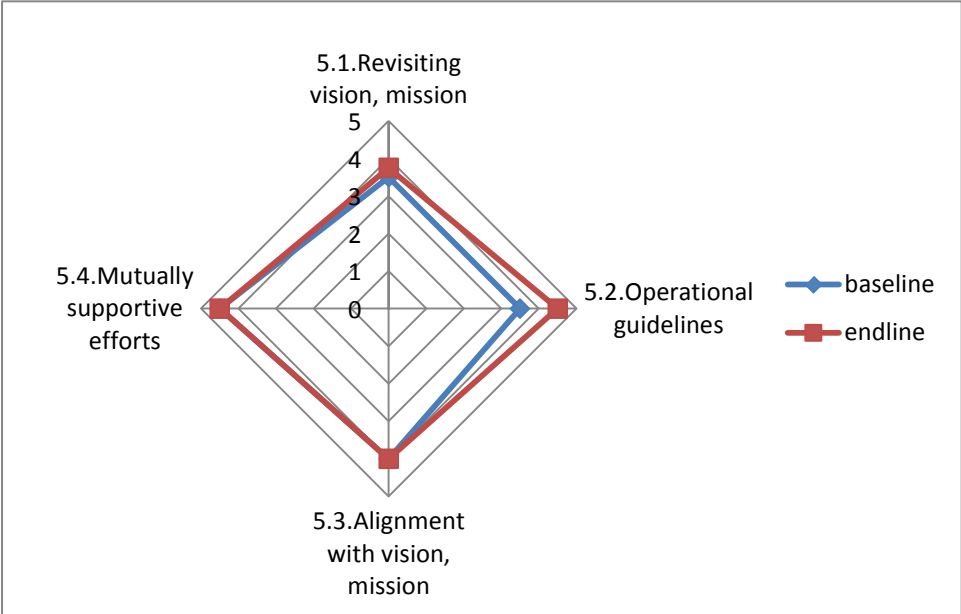

Capability to relate

OSRA has a good track record in the involvement of stakeholders in policies and strategies along with engagement with program formulation and implementation. The organization has also maintained networking and experience sharing with its all development alliances in a sustainable manner since the baseline. However, according to the report on the zero grazing project, although different forums have been organized to create linkages with various stakeholders, particularly at local level, there is still a need for additional efforts and commitment of all concerned stakeholders to establish effective linkages and networking to improve the service given to the farmers in the project areas. OSRA has made a great deal of effort in engaging target groups in project planning and M&E phases. Hence, OSRA has well set up outreach covering substantial numbers of target groups which has conveniently integrated ICT solution-based interventions into their FED program activities. It has improved access to telephone and internet connections and networks within the head and field offices. This has facilitated efficient communication and information exchange among staff members since the baseline. Staff members are able to communicate freely both horizontally and vertically, and ideas are shared and recognized. The ICT project supported by ICCO has improved the organization communication capacity from CDMA to broad band at head office level, and area offices use CDMA for internet services.

Score: from 3.9 to 4.0 (very slight improvement)

Capability to achieve coherence

The mission and vision of OSRA have been regularly discussed, internalized and popularized since the baseline. Hence there is an improvement in revisiting the organization’s vision and mission due to regularity and efficient participation of the board and staff, particularly at strategy and policy formulation. OSRA has revised and updated the HRM policy manuals and accounting and financial procedures in November 2012. Based on these manuals new financial formats, procurement guideline and procedures have been developed, and the petty cash regulation has changed since the baseline. Besides, the intervention strategies of the project were well articulated in systematic ways and they were significantly correlated with the organization’s stated objectives. In similar ways, the overall approaches and implementation activities of the project were appropriately fitting to the organization’s intervention strategies. There is still a strong complementarity among all programs. They are integrated, and being implemented in a holistic manner in OSRA as indicated in the baseline.

Score: from 3.9 to 4.2 (Slight improvement)

4.2.2 Key organisational capacity changes - general causal map

Below you can find a description of the key changes in organizational capacity of OSRA since the baseline as expressed by OSRA staff during the endline workshop. First, a description is given of how this topic was introduced during the endline workshop by summarising key information on OSRA from the baseline report. This information included a brief description of the vision, mission and strategies of the organisation, staff situation, clients and partner organisations. This then led into a discussion on how OSRA has changed since the baseline.

The endline workshop was conducted on August 25th and 26th, at OSRA headquarters, Alemegena, Oromia region. Thirteen OSRA staff of five job categories participated: management, program, M&E, field and administration, and finance staff. Following the self-assessment on August 25th, staff brainstormed about and developed a causal map for the key changes that happened in OSRA since the MFS II baseline survey in 2012 in the area of organizational capacity on August 26th.

At the endline workshop it was clarified that the overall organizational capacity goal of OSRA is improved capacity to implement community based projects (integrated projects) (1). Staff agreed that in the process to achieve this goal OSRA has improved the following capacities since the baseline in 2012:

Improved capacity to reach a larger numbers of beneficiaries (both in terms of number of beneficiaries and geographical coverage) (2)

Improved M&E capacity (3)

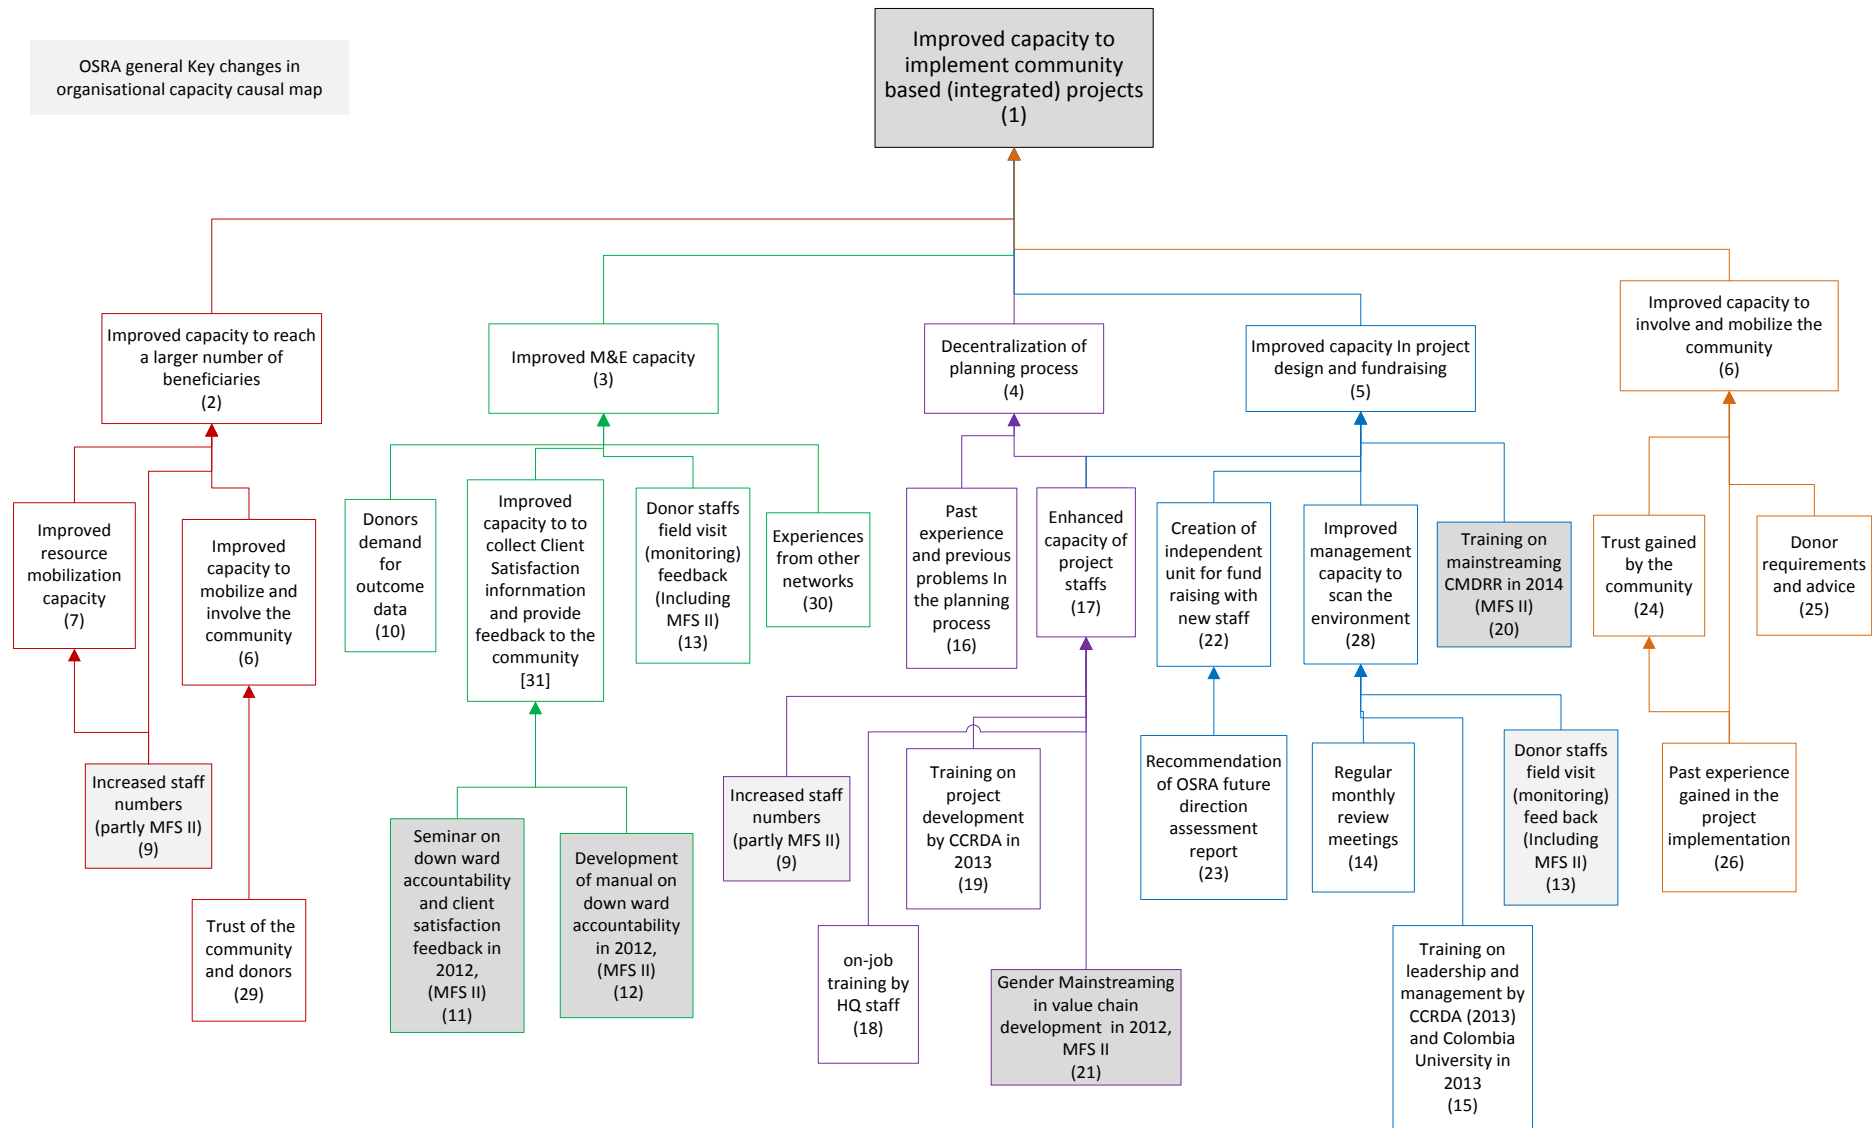

Decentralization of planning process (4)

Improved capacity in project design and fund raising (5)

Improved capacity to involve and mobilize the community (6)

Each of these five key organizational capacity changes is further explained below. The numbers correspond to the numbers in the visual below.

OSRA general Key changes in organisational capacity causal map

Improved capacity to reach a larger number of beneficiaries (in terms of both number of beneficiaries and geographical areas) (2)

OSRA has expanded (earlier working in Akaki, Ada, Ada Berga, Tole, Illu and Bechao) to new *kebeles* and *woredas* (Woliso and Goro woredas were added). Hence, since the baseline in 2012 OSRA has expanded its operations from 6 to 8 woredas.

This happened because of the following:

Improved resource mobilization capacity (7): OSRA was able to get more funding from donors.

Increased numbers of staff [9] has helped in preparing documents including the kind of proposals that donors require. These documents helped in getting more funding that could be used to reach a larger number of beneficiaries.

Improved capacity to mobilize and involve the community (6): As a result of OSRA's presence in the region doing development work it has gained the trust of the people as well as donors [29]. This helped OSRA to Increase staff numbers (9). Obviously when there is more staff in an organization it allows the organization to reach a larger area and reach more beneficiaries. MFS II contributed through the pool fund in hiring the new staffs. One of the reasons to hire new staff, for example, the resource mobilization manager was the advice from OSRA board (32).

Improved M&E capacity (3)

According to staff present at the workshop, OSRA has now built the capacity to collect and report not only on outputs but also on outcome related data.

This happened as a result of:

- Donors demand for outcome data (10): Donors including MFS II partners require outcome related information. This incited OSRA to work towards collecting and reporting outcome related information.
- Seminar on downward accountability and client satisfaction feedback organized by ICCO with MFS II funding, Dec. 2012 (11). The seminar discussed on how to collect client satisfaction information and provide feedback to the community (31). The feedback is based on M&E information and improved the utility of M&E. Another reason for the improved capacity to collect client satisfaction information and provide feedback to the community (31) was the development of a manual on downward accountability (12), which was developed in December 2012 with MFS II support. This helped staff to follow the procedures that ensure downward accountability, and to share M&E data with the community so that the community is informed about what is happening.
- Donor staffs field visit (monitoring) feedback (13): donors including the MFS II partners conduct field visits. M&E is among the points they give feedback on. They give feedback to field- as well as the HQ staff about the kind of data that should be collected, and the reporting processes and methods. They regularly follow up if this is being practiced or not. This process has helped OSRA to get better data and to build OSRA's M&E capacity.
- Experiences from other networks (30): OSRA participates in different networks operating in its target area as well as field of interest. The discussion in these networks helps to understand what kind of data is collected by other organisations and how. OSRA takes the opportunity to learn and also emulate what it believes useful for the organization.

Decentralization of planning process (4)

OSRA has now empowered field staff to conduct the initial planning at the area office level. This is found to be a basis for decentralized planning (4). HQs staff only give technical support and help in compilation of the plans coming from the field. This happened as a result of past experience and previous problems in the planning process (16). Earlier most plans were prepared by the HQ staff. When this was rolled out the area office had problems in understanding and implementing it. To reduce this problem HQs gave the responsibility of making the initial plan to the area offices and this was found helpful. This was made possible because area office staff got enhanced capacity to plan (17) through on the job training given by HQ staff (18). Another reason for enhanced capacity of staff to plan and design projects was the training on project development supported and funded by CCRDA (Consortium of Christian Relief and Development Association) (19). Furthermore, training on gender mainstreaming in value chain development was done in 2012 and supported by MFS II (21). This also enhanced staff capacity in project design (21). However, still there is no clear delineation on how the

decentralization of the planning process will be fully operationalized since the field planning is used for getting ideas from the field staff to prepare the final planning in the HQs. Hence it is difficult to call it a real decentralization.

Improved capacity in project design and fundraising (5)

OSRA has improved its capacity in designing projects and raising funds from within the country and abroad.

This happened variety of reasons:

- Staffs capacity to plan and design projects has improved since the baseline (17) and this supported the improved capacity of the organisation to design projects and thus raise funds (5). This was already explained above.
- A new and separate structure for fund raising was created and new staff with the level of (fundraising) manager was hired (22). This was implemented following the recommendations made in the OSRA future direction assessment report (23) which was done at the request of the board members of the general assembly.
- Improved management capacity to scan the environment (28): this capacity helped the management to follow trends in fundraising as well as to identify areas of intervention. The management built this capacity as a result of monthly review meetings (14) and the training on leadership and management organized by CCRDA in 2013 (15). The regular monthly review meetings (14) with staff helped to share information. Furthermore, the donor partner feedback [13] when they come for field visits also helped to the management to build their capacity (28).
- On some specific projects which are related to Community Managed Disaster Risk Management (CMDRR), the training on mainstreaming CMDRR which was organized in 2014 with the financial support of MFS II (20) was also considered helpful by the staff to enhance their capacity in project design and fundraising [5].

Improved capacity to involve and mobilize the community (6)

OSRA's capacity to involve and mobilize the community has improved (6). As a result, the community increased its willingness to participate in interventions identified by OSRA. For example, in the zero grazing project, which is financed by MFS II, the share of the financial contribution is (45:55) i.e. 45 % from OSRA and 55% from the community. This happened, similar to what was seen for other capacities, as a result of the experiences OSRA gained in the past in project implementation (26). This has also helped OSRA to gain the trust of the community (24). For example, recently, a community requested OSRA to build an irrigation facility in their locality and showed their willingness to cover the cost from their own sources. Donors' requirements and advice to involve the community (25) in matters that affect them has also made OSRA to regularly think how and when to involve the community. Therefore, it is a combination of internal development as well as external influence that brought about this capacity change.

5 Discussion and conclusion

5.1 Methodological issues

In preparation for the assessment, the Ethiopian 5C assessment team visited OSRA staff in the organizations HQs in Alemgena town and explained the purpose and the process of the 5C end line assessment. During the visit, both teams agreed on the workshop dates including the type and number of staff who will attend the workshop. In addition, the assessment team also gave the “support to capacity development sheet” to be filled by OSRA staff. The Ethiopian 5C assessment team conducted the assessment in three visits. First visit, to conduct the self-assessment workshop with a total of 13 participants and ask the staff to fill the self-assessment form in their respective five subgroups (management (2); program(2); M&E(1); HRM and administration (2) and field staff (6)). This was followed by a second visit to carry out a brainstorming session and develop a general causal map that explains the key organisational capacity changes that have occurred in OSRA since the baseline in 2012. The third visit was made to conduct an interview with one representative from each subgroup to triangulate the information collected through the self-assessment and to better understand the change in OSRA’s capacity since 2012. This was done after the 5C assessment team reviewed the completed self-assessment forms. The interview with field staff was carried out by travelling to the project site of the organization.

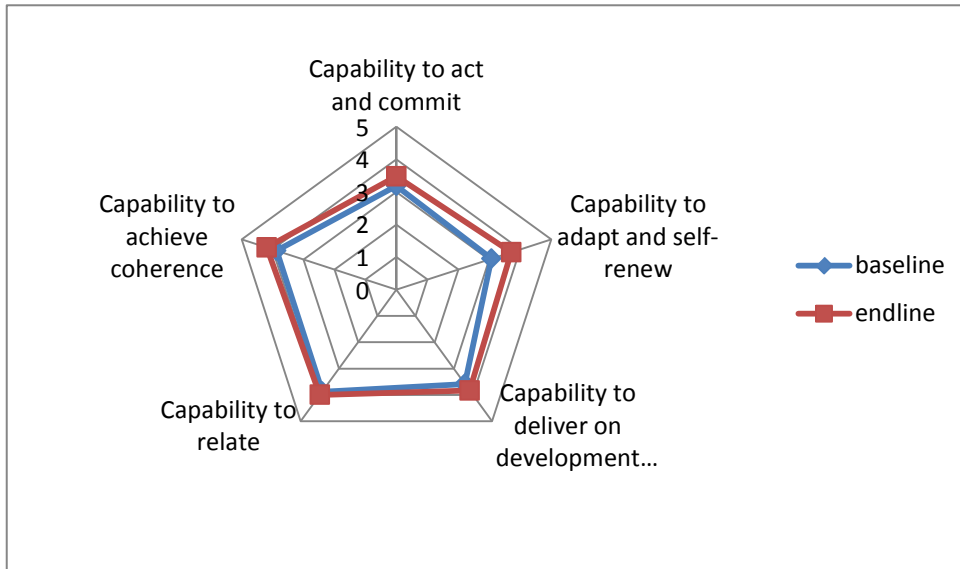

The plan of the evaluation team to also conduct two interviews with OSRA partners didn’t materialize. The interviewee declined to respond the questions because he had little knowledge about the questions asked and his knowledge about the current status of the organization was limited. No OD consultant has been interviewed. Due to the new CSO regulation, most of the SPOs are not involving consultants frequently because it puts a burden to their administrative cost (the agency categorizes consultancy as overhead). If consultants are hired at all, then is it mainly technical but not OD consultants.

By and large, there has been a lot of information available to be able to do adequate data analysis.

5.2 Changes in organisational capacity

This section aims to provide an answer to the first and fourth evaluation questions:

1. *What are the changes in partner organisations' capacity during the 2012-2014 period?*
4. *What factors explain the findings drawn from the questions above?*

Below the changes in each of the five core capabilities are further explained, by referring to the specific indicators that changed. In all of these capabilities improvements took place.

Over the last two years many small improvements took place in the indicators under the capability to act and commit. Since the baseline, decision making has been further decentralised within OSRA, giving a decision-making role to programs and departments. The board members have become more responsive and involved in organisational issues. There is a very slight improvement in senior management leading and following up on strategic issues. Due to dwindling foreign funding, OSRA needed to strengthen its resource mobilisation strategy and performance, which they are doing by hiring qualified staff and involving stakeholders in planning and implementation. There is an improvement in collecting outcome related information which is used for operational management (not yet used to articulate strategies). An A training needs assessment has been done among OSRA staff to identify skill gaps and trainings were provided on different topics since the baseline. Most trainings were funded by ICCO and other donors like CRRDA. OSRA has made some improvements in incentives for staff: they have revised the salary scale; the HR policy, and introduced limited loan schemes for staff. OSRA has diversified its funding and the total amount of funding has increased with 30 percent since the baseline. Among the new projects there are some multi-year (3-5 year) projects. There is now a separate unit dedicated to fundraising, proposal development and income generation.

In the capability to adapt and self-renew OSRA saw many improvements. The application of M&E improved because forms have been developed that help collect and report at outcome and impact level and OSRA has started to report case studies. ICCO is supporting OSRA in its M&E activities through providing technical support, training and introduction of various approaches. There are now two M&E teams: one at the head office and another at the area level. A monitoring officer is responsible for coordinating M&E activities. He has improved his skills in collecting and analysing information as a result of the ICT based interventions through the financial support of IICD. Area office staff has also improved their skills in reporting and documenting changes.

In terms of the capability to deliver on development objectives, OSRA has improved in various indicators. Planning is now done in a more participatory way and there are operational plans per project in place. Staff use the operational work plans and budgets to guide them in their day-to-day activities. There is a very slight improvement in monitoring efficiency because of a training on RBM in 2013 and experience of staff has helped with crudely comparing inputs with outputs. OSRA has

improved in the way that they are balancing quality and efficiency because they have prepared quality of work monitoring tools and these have been communicated to staff. For ensuring efficiency there is a well-designed project management plan in place for each project.

In the capability to relate, OSRA slightly deteriorated in the indicator on engaging in networks. Though they continued to network in their alliances, in the zero grazing project there was limited coordination among stakeholders and the collaboration with financial service institutes was not effectively done. OSRA is however, engaging more with its target groups after feedback they gained from MFS II expertise field reports and improved leadership and management. OSRA's outreach has increased through the various projects they are involved in and where the community is actively engaged in. With regards to the relations within OSRA, access to telephone and internet at the head and field offices has improved, facilitating efficient communication between staff.

Finally, OSRA has shown some improvement in the indicators under the capability to achieve coherence. The mission and the vision of OSRA have been regularly discussed since the baseline, with efficient participation of the staff especially in strategy and policy formulation. There has been an improvement in OSRA's operational guidelines: there now are revised and updated HRM, accounting and financial policy manuals in place. New procurement guidelines and financial formats have been developed.

During the endline workshop some key organisational capacity changes were brought up by OSRA's staff in the 'general causal map': improved capacity to reach a larger numbers of beneficiaries (also increased geographical coverage); improved M&E capacity; decentralization of planning process; improved capacity in project design and fund raising; and improved capacity to involve and mobilize the community. The evaluators considered it important to also note down the SPO's story about what they considered to be key organisational capacity changes since the baseline, and this would also provide more information about reasons for change, which were difficult to get for the individual indicators. Also for some issues there may not have been relevant indicators available in the list of core indicators provided by the evaluation team.

According to OSRA's staff, they improved their capacity to reach a large number of beneficiaries because of their improved resource mobilisation capacity; their increased staff numbers (partly funded by MFS II); and improved capacity to mobilise and involve the community. The increased number of staff members has helped in improving OSRA's resource mobilisation capacity through document preparation. More staff was hired following the advice of OSRA's board. OSRA has become better at involving the community because of the trust they gained from the community and from donors. OSRA improved its M&E capacity because of donors' demand for outcome data; improved capacity to collect client satisfaction information and provide feedback to the community; feedback from donor after field visit (MFS II funded); and experience from other networks. OSRA improved its capacity to collect client satisfaction information because of a seminar on downward accountability and client satisfaction feedback in 2012 (funded by MFS II); and the development of a manual on downward accountability in 2012 (funded by MFS II). OSRA decentralised its planning process because of past experience and problems in the planning process and enhanced capacity of process staff. Staff enhanced their capacity because of on the job training by HQ staff; training on project development in 2013 by CCRDA; and training on gender mainstreaming in value chain development in 2012 (funded by MFS II). The organisation has improved its capacity in project design and fundraising because of enhanced capacity of staff; creation of an independent fundraising unit and hiring new staff; improved management to scan the environment; and training on mainstreaming Community Managed Disaster Risk Reduction (CMDRR) (funded by MFS II). The separate fundraising unit was created because of a recommendation from the OSRA future directions assessment report. The organisation became better at scanning their environment because of regular monthly review meetings; training on leadership and management by CCRDA and Colombia University in 2013; and donor staff's feedback after field visits (MFS II funded). Finally, OSRA improved its capacity to involve and mobilise the community because of trust gained by the community; donor requirements and advice; and past experience gained in project implementation.

According to OSRA's staff, MFS II funded capacity development interventions have thus played a role in improved M&E capacity; decentralization of planning process; and improved capacity in project design and fund raising. This was through a seminar on downward accountability, development of a manual on the same topic; feedback from field visits; training on gender mainstreaming in value chain

development; and training on CMDRR. However, internal factors like advice of their Board; trust of community and donors; experiences in other networks; past experiences; on the job training; recommendation from the OSRA future directions assessment report; and meetings have also played an important role in the key organisational capacity changes that the OSRA's staff considered important since the baseline in 2012. Support from other funders, like CCRDA and Colombia University; in terms of training, has also been mentioned among the underlying factors for these changes.

List of Respondents

Alliance/ CFA officers:

No.	Name	Function
1	David Kamukama	Regional Business & Economic Development Advisor, ICCO Regional Office Central & Eastern Africa;
2	Dieneke de Groot	ICCO Planning, Monitoring & Evaluation advisor; Secretary ICCO Alliance

OSRA staff:

No.	Name	Function in the organisation
1	Alemayehu Hechessa	G/manager
2	Retta Lemma	Program Manager
3	Nigusie Gedefa	Fund Raising-IG Officer
4	Wondimu Geleta	M&E Officer
5	Gutema Kumela	ICT Officer
6	Haji Jemal	Health and Sanitation Officer
7	Hana Bulti	Acting HR & Finance
8	Tesfaye Teressa	WASH Project F/Officer
9	Ayele Gezu	WASH Project Officer
10	Takele Tolera	A/Office Coordinator
11	Dejene Bekele	WASH F/Officer
12	Urgessa Lamssa	FMO/ Anim
13	Demitu Hirphasa	Casher Accountant

Appendix 1 Methodological approach & reflection

1. Introduction

This appendix describes the methodological design and challenges for the assessment of capacity development of Southern Partner Organisations (SPOs), also called the '5C study'. This 5C study is organised around four key evaluation questions:

1. What are the changes in partner organisations' capacity during the 2012-2014 period?
2. To what degree are the changes identified in partner capacity attributable to development interventions undertaken by the MFS II consortia (i.e. measuring effectiveness)?
3. Were the efforts of the MFS II consortia efficient?
4. What factors explain the findings drawn from the questions above?

It has been agreed that the question (3) around efficiency cannot be addressed for this 5C study. The methodological approach for the other three questions is described below. At the end, a methodological reflection is provided.

In terms of the attribution question (2), 'process tracing' is used. This is a theory-based approach that has been applied to a selected number of SPOs since it is a very intensive and costly methodology, although it provides rich information and can generate a lot of learning within the organisations. This approach was presented and agreed-upon during the synthesis workshop on 17-18 June 2013 by the 5C teams for the eight countries of the MFS II evaluation. A more detailed description of the approach was presented during the synthesis workshop in February 2014. The synthesis team, NWO-WOTRO, the country project leaders and the MFS II organisations present at the workshop have accepted this approach. It was agreed that this approach can only be used for a selected number of SPOs since it is a very intensive and costly methodology. Key organisational capacity changes/ outcomes of the SPO were identified, based on their relationship to the two selected capabilities, the capability to act and commit the capability to adapt and self-renew, and an expected relationship with CFA supported capacity development interventions (MFS II funding). It was agreed to focus on these two capabilities, since these are the most targeted capabilities by the CFAs, as established during the baseline process.

Please find below an explanation of how the above-mentioned evaluation questions have been addressed in the 5C evaluation.

Note: the methodological approach is applied to 4 countries that the Centre for Development Innovation, Wageningen University and Research centre is involved in in terms of the 5C study (Ethiopia, India, Indonesia, Liberia). The overall approach has been agreed with all the 8 countries selected for this MFS II evaluation. The 5C country teams have been trained and coached on this methodological approach during the evaluation process. Details specific to the SPO are described in chapter 5.1 of the SPO report. At the end of this appendix a brief methodological reflection is provided.

2. Changes in partner organisation's capacity – evaluation question 1

This section describes the data collection and analysis methodology for answering the first evaluation question: **What are the changes in partner organisations' capacity during the 2012-2014 period?**

This question was mainly addressed by reviewing changes in 5c indicators, but additionally a 'general causal map' based on the SPO perspective on key organisational capacity changes since the baseline has been developed. Each of these is further explained below. The development of the general causal map is integrated in the steps for the endline workshop, as mentioned below.

During the baseline in 2012 information has been collected on each of the 33 agreed upon indicators for organisational capacity. For each of the five capabilities of the 5C framework indicators have been developed as can be seen in Appendix 2. During this 5C baseline, a summary description has been provided for each of these indicators, based on document review and the information provided by staff, the Co-financing Agency (CFA) and other external stakeholders. Also a summary description has been provided for each capability. The results of these can be read in the baseline reports.

The description of indicators for the baseline in 2012 served as the basis for comparison during the endline in 2014. In practice this meant that largely the same categories of respondents (preferably the same respondents as during the baseline) were requested to review the descriptions per indicator and indicate whether and how the endline situation (2014) is different from the described situation in 2012.² Per indicator they could indicate whether there was an improvement or deterioration or no change and also describe these changes. Furthermore, per indicator the interviewee could indicate what interventions, actors and other factors explain this change compared to the baseline situation. See below the specific questions that are asked for each of the indicators. Per category of interviewees there is a different list of indicators to be looked at. For example, staff members were presented with a list of all the indicators, whilst external people, for example partners, are presented with a select number of indicators, relevant to the stakeholder.

² The same categories were used as during the baseline (except beneficiaries, other funders): staff categories including management, programme staff, project staff, monitoring and evaluation staff, field staff, administration staff; stakeholder categories including co-financing agency (CFA), consultants, partners.

The information on the indicators was collected in different ways:

1. **Endline workshop at the SPO - self-assessment and 'general causal map'**: similar to data collection during the baseline, different categories of staff (as much as possible the same people as during the baseline) were brought together in a workshop and requested to respond, in their staff category, to the list of questions for each of the indicators (self-assessment sheet). Prior to carrying out the self-assessments, a brainstorming sessions was facilitated to develop a 'general causal map', based on the key organisational capacity changes since the baseline as perceived by SPO staff. Whilst this general causal map is not validated with additional information, it provides a sequential narrative, based on organisational capacity changes as perceived by SPO staff;
2. **Interviews with staff members**: additional to the endline workshop, interviews were held with SPO staff, either to provide more in-depth information on the information provided on the self-assessment formats during the workshop, or as a separate interview for staff members that were not present during the endline workshop;
3. **Interviews with externals**: different formats were developed for different types of external respondents, especially the co-financing agency (CFA), but also partner agencies, and organisational development consultants where possible. These externals were interviewed, either face-to-face or by phone/Skype. The interview sheets were sent to the respondents and if they wanted, these could be filled in digitally and followed up on during the interview;
4. **Document review**: similar to the baseline in 2012, relevant documents were reviewed so as to get information on each indicator. Documents to be reviewed included progress reports, evaluation reports, training reports, etc. (see below) since the baseline in 2012, so as to identify changes in each of the indicators;
5. **Observation**: similar to what was done in 2012, also in 2014 the evaluation team had a list with observable indicators which were to be used for observation during the visit to the SPO.

Below the key steps to assess changes in indicators are described.

Key steps to assess changes in indicators are described

- Provide the description of indicators in the relevant formats – CDI team
- Review the descriptions per indicator – in-country team & CDI team
- Send the formats adapted to the SPO to CFA and SPO – in-country team (formats for SPO) and CDI team (formats for CFA)
- Collect, upload & code the documents from CFA and SPO in NVivo – CDI team
- Organise the field visit to the SPO – in-country team
- Interview the CFA – CDI team
- Run the endline workshop with the SPO – in-country team
- Interview SPO staff – in-country team
- Fill-in observation sheets – in-country team
- Interview externals – in-country team
- Upload and auto-code all the formats collected by in-country team and CDI team in NVivo – CDI team
- Provide to the overview of information per 5c indicator to in-country team – CDI team
- Analyse data and develop a draft description of the findings per indicator and for the general questions – in-country team
- Analyse data and develop a final description of the findings per indicator and per capability and for the general questions – CDI team
- Analyse the information in the general causal map –in-country team and CDI-team

Note: the CDI team include the Dutch 5c country coordinator as well as the overall 5c coordinator for the four countries (Ethiopia, India, Indonesia, Liberia). The 5c country report is based on the separate SPO reports.

Below each of these steps is further explained.

*Step 1. Provide the **description of indicators** in the relevant formats – CDI team*

- These formats were to be used when collecting data from SPO staff, CFA, partners, and consultants. For each of these respondents different formats have been developed, based on the list of 5C indicators, similar to the procedure that was used during the baseline assessment. The CDI team needed to add the 2012 baseline description of each indicator. The idea was that each respondent would be requested to review each description per indicator, and indicate whether the current situation is different from the baseline situation, how this situation has changed, and what the reasons for the changes in indicators are. At the end of each format, a more general question is added that addresses how the organisation has changed its capacity since the baseline, and what possible reasons for change exist. Please see below the questions asked for each indicator as well as the more general questions at the end of the list of indicators.

General questions about key changes in the capacity of the SPO

What do you consider to be the key changes in terms of how the organisation/ SPO has developed its capacity since the baseline (2012)?

What do you consider to be the main explanatory reasons (interventions, actors or factors) for these changes?

List of questions to be asked for each of the 5C indicators (The entry point is the the description of each indicator as in the 2012 baseline report):

1. *How has the situation of this indicator changed compared to the situation during the baseline in 2012? Please tick one of the following scores:*
 - -2 = Considerable deterioration
 - -1 = A slight deterioration
 - 0 = No change occurred, the situation is the same as in 2012
 - +1 = Slight improvement
 - +2 = Considerable improvement
2. *Please describe what exactly has changed since the baseline in 2012*
3. *What interventions, actors and other factors explain this change compared to the baseline situation in 2012? Please tick and describe what interventions, actors or factors influenced this indicator, and how. You can tick and describe more than one choice.*
 - Intervention, actor or factor at the level of or by **SPO**:
 - Intervention, actor or factor at the level of or by the **Dutch CFA (MFS II funding)**:
 - Intervention, actor or factor at the level of or by the **other funders**:
 - **Other** interventions, actors or factors:
 - Don't know.

*Step 2. **Review** the descriptions per indicator – in-country team & CDI team*

Before the in-country team and the CDI team started collecting data in the field, it was important that they reviewed the description for each indicator as described in the baseline reports, and also added to the endline formats for review by respondents. These descriptions are based on document review, observation, interviews with SPO staff, CFA staff and external respondents during the baseline. It was important to explain this to respondents before they filled in the formats.

Step 3. Send the formats adapted to the SPO to CFA and SPO – in-country team (formats for SPO) and CDI team (formats for CFA)

The CDI team was responsible for collecting data from the CFA:

- 5C Endline assessment Dutch co-financing organisation;
- 5C Endline support to capacity sheet – CFA perspective.

The in-country team was responsible for collecting data from the SPO and from external respondents (except CFA). The following formats were sent before the fieldwork started:

- 5C Endline support to capacity sheet – SPO perspective.
- 5C Endline interview guides for externals: partners; OD consultants.

Step 4. Collect, upload & code the documents from CFA and SPO in NVivo – CDI team

The CDI team, in collaboration with the in-country team, collected the following documents from SPOs and CFAs:

- Project documents: project proposal, budget, contract (Note that for some SPOs there is a contract for the full MFS II period 2011-2015; for others there is a yearly or 2-yearly contract. All new contracts since the baseline in 2012 will need to be collected);
- Technical and financial progress reports since the baseline in 2012; .
- Mid-term evaluation reports;
- End of project-evaluation reports (by the SPO itself or by external evaluators);
- Contract intake forms (assessments of the SPO by the CFA) or organisational assessment scans made by the CFA that cover the 2011-2014 period;
- Consultant reports on specific inputs provided to the SPO in terms of organisational capacity development;
- Training reports (for the SPO; for alliance partners, including the SPO);
- Organisational scans/ assessments, carried out by the CFA or by the Alliance Assessments;
- Monitoring protocol reports, especially for the 5C study carried out by the MFS II Alliances;
- Annual progress reports of the CFA and of the Alliance in relation to capacity development of the SPOs in the particular country;
- Specific reports that are related to capacity development of SPOs in a particular country.

The following documents (since the baseline in 2012) were requested from SPO:

- Annual progress reports;
- Annual financial reports and audit reports;
- Organisational structure vision and mission since the baseline in 2012;
- Strategic plans;
- Business plans;
- Project/ programme planning documents;
- Annual work plan and budgets;
- Operational manuals;
- Organisational and policy documents: finance, human resource development, etc.;
- Monitoring and evaluation strategy and implementation plans;
- Evaluation reports;
- Staff training reports;
- Organisational capacity reports from development consultants.

The CDI team will code these documents in NVivo (qualitative data analysis software program) against the 5C indicators.

Step 5. Prepare and organise the field visit to the SPO – in-country team

Meanwhile the in-country team prepared and organised the logistics for the field visit to the SPO:

- **General endline workshop** consisted about one day for the self-assessments (about ½ to ¾ of the day) and brainstorm (about 1 to 2 hours) on key organisational capacity changes since the baseline and underlying interventions, factors and actors ('general causal map'), see also explanation below. This was done with the five categories of key staff: managers; project/ programme staff; monitoring and evaluation staff; admin & HRM staff; field staff. Note: for SPOs involved in process tracing an additional 1 to 1½ day workshop (managers; program/project staff; monitoring and evaluation staff) was necessary. See also step 7;
- **Interviews with SPO staff** (roughly one day);
- **Interviews with external respondents** such as partners and organisational development consultants depending on their proximity to the SPO. These interviews could be scheduled after the endline workshop and interviews with SPO staff.

General causal map

During the 5C endline process, a 'general causal map' has been developed, based on key organisational capacity changes and underlying causes for these changes, as perceived by the SPO. The general causal map describes cause-effect relationships, and is described both as a visual as well as a narrative.

As much as possible the same people that were involved in the baseline were also involved in the endline workshop and interviews.

Step 6. Interview the CFA – CDI team

The CDI team was responsible for sending the sheets/ formats to the CFA and for doing a follow-up interview on the basis of the information provided so as to clarify or deepen the information provided. This relates to:

- 5C Endline assessment Dutch co-financing organisation;
- 5C Endline support to capacity sheet - CFA perspective.

Step 7. Run the endline workshop with the SPO – in-country team

This included running the endline workshop, including facilitation of the development of the general causal map, self-assessments, interviews and observations. Particularly for those SPOs that were selected for process tracing all the relevant information needed to be analysed prior to the field visit, so as to develop an initial causal map. Please see Step 6 and also the next section on process tracing (evaluation question two).

An endline workshop with the SPO was intended to:

- Explain the purpose of the fieldwork;
- Carry out in the self-assessments by SPO staff subgroups (unless these have already been filled prior to the field visits) - this may take some 3 hours.
- Facilitate a brainstorm on key organisational capacity changes since the baseline in 2012 and underlying interventions, factors and actors.

Purpose of the fieldwork: to collect data that help to provide information on what changes took place in terms of organisational capacity development of the SPO as well as reasons for these changes. The baseline that was carried out in 2012 was to be used as a point of reference.

Brainstorm on key organisational capacity changes and influencing factors: a brainstorm was facilitated on key organisational capacity changes since the baseline in 2012. In order to kick start the discussion, staff were reminded of the key findings related to the historical time line carried out in the baseline (vision, mission, strategies, funding, staff). This was then used to generate a discussion on key changes that happened in the organisation since the baseline (on cards). Then cards were

selected that were related to organisational capacity changes, and organised. Then a 'general causal map' was developed, based on these key organisational capacity changes and underlying reasons for change as experienced by the SPO staff. This was documented as a visual and narrative. This general causal map was to get the story of the SPO on what they perceived as key organisational capacity changes in the organisation since the baseline, in addition to the specific details provided per indicator.

Self-assessments: respondents worked in the respective staff function groups: management; programme/ project staff; monitoring and evaluation staff; admin and HRM staff; field staff. Staff were assisted where necessary so that they could really understand what it was they were being asked to do as well as what the descriptions under each indicator meant.

Note: for those SPOs selected for process tracing an additional endline workshop was held to facilitate the development of detailed causal maps for each of the identified organisational change/ outcome areas that fall under the capability to act and commit, and under the capability to adapt and self-renew, and that are likely related to capacity development interventions by the CFA. See also the next section on process tracing (evaluation question two). It was up to the in-country team whether this workshop was held straight after the initial endline workshop or after the workshop and the follow-up interviews. It could also be held as a separate workshop at another time.

Step 8. Interview SPO staff – in-country team

After the endline workshop (developing the general causal map and carrying out self-assessments in subgroups), interviews were held with SPO staff (subgroups) to follow up on the information that was provided in the self-assessment sheets, and to interview staff that had not yet provided any information.

Step 9. Fill-in observation sheets – in-country team

During the visit at the SPO, the in-country team had to fill in two sheets based on their observation:

- 5C Endline observation sheet;
- 5C Endline observable indicators.

Step 10. Interview externals – in-country team & CDI team

The in-country team also needed to interview the partners of the SPO as well as organisational capacity development consultants that have provided support to the SPO. The CDI team interviewed the CFA.

Step 11. Upload and auto-code all the formats collected by in-country team and CDI team – CDI team

The CDI team was responsible for uploading and auto-coding (in Nvivo) of the documents that were collected by the in-country team and by the CDI team.

Step 12. Provide the overview of information per 5C indicator to in-country team – CDI team

After the analysis in NVivo, the CDI team provided a copy of all the information generated per indicator to the in-country team for initial analysis.

Step 13. Analyse the data and develop a draft description of the findings per indicator and for the general questions – in-country team

The in-country team provided a draft description of the findings per indicator, based on the information generated per indicator. The information generated under the general questions were linked to the general causal map or detailed process tracing related causal map.

Step 14. Analyse the data and finalize the description of the findings per indicator, per capability and general – CDI team

The CDI team was responsible for checking the analysis by the in-country team with the Nvivo generated data and to make suggestions for improvement and ask questions for clarification to which the in-country team responded. The CDI team then finalised the analysis and provided final

descriptions and scores per indicator and also summarize these per capability and calculated the summary capability scores based on the average of all indicators by capability.

Step 15. Analyse the information in the general causal map –in-country team & CDI team

The general causal map based on key organisational capacity changes as perceived by the SPO staff present at the workshop, was further detailed by in-country team and CDI team, and based on the notes made during the workshop and where necessary additional follow up with the SPO. The visual and narrative was finalized after feedback by the SPO. During analysis of the general causal map relationships with MFS II support for capacity development and other factors and actors were identified. All the information has been reviewed by the SPO and CFA.

3. Attributing changes in partner organisation’s capacity – evaluation question 2

This section describes the data collection and analysis methodology for answering the second evaluation question: ***To what degree are the changes identified in partner capacity attributable to (capacity) development interventions undertaken by the MFS II consortia (i.e. measuring effectiveness) ?***

In terms of the attribution question (2), ‘process tracing’ is used. This is a theory-based approach that has been applied to a selected number of SPOs since it is a very intensive and costly methodology, although it provides rich information and can generate a lot of learning within the organisations. Key organisational capacity changes/ outcomes of the SPO were identified, based on their relationship to the two selected capabilities, the capability to act and commit the capability to adapt and self-renew, and an expected relationship with CFA supported capacity development interventions (MFS II funding). It was agreed to focus on these two capabilities, since these are the most targeted capabilities by the CFAs, as established during the baseline process. The box below provides some background information on process tracing.

Background information on process tracing

The essence of process tracing research is that scholars want to go beyond merely identifying correlations between independent variables (Xs) and outcomes (Ys). Process tracing in social science is commonly defined by its addition to trace causal mechanisms (Bennett, 2008a, 2008b; Checkle, 2008; George & Bennett, 2005). A causal mechanism can be defined as “a complex system which produces an outcome by the interaction of a number of parts” (Glennan, 1996, p. 52). Process tracing involves “attempts to identify the intervening causal process – the causal chain and causal mechanism – between an independent variable (or variables) and the outcome of the dependent variable” (George & Bennett, 2005, pp. 206-207).

Process tracing can be differentiated into three variants within social science: theory testing, theory building, and explaining outcome process tracing (Beach & Pedersen, 2013).

Theory testing process tracing uses a theory from the existing literature and then tests whether evidence shows that each part of hypothesised causal mechanism is present in a given case, enabling within case inferences about whether the mechanism functioned as expected in the case and whether the mechanism as a whole was present. No claims can be made however, about whether the mechanism was the only cause of the outcome.

Theory building process tracing seeks to build generalizable theoretical explanations from empirical evidence, inferring that a more general causal mechanism exists from the fact of a particular case.

Finally, explaining outcome process tracing attempts to craft a minimally sufficient explanation of a puzzling outcome in a specific historical case. Here the aim is not to build or test more general theories but to craft a (minimally) sufficient explanation of the outcome of the case where the ambitions are more case centric than theory oriented.

Explaining outcome process tracing is the most suitable type of process tracing for analysing the causal mechanisms for selected key organisational capacity changes of the SPOs. This type of process tracing can be thought of as a single outcome study defined as seeking the causes of the specific outcome in a single case (Gerring, 2006; in: Beach & Pedersen, 2013). Here the ambition is to craft a minimally sufficient explanation of a particular outcome, with sufficiency defined as an explanation that accounts for all of the important aspects of an outcome with no redundant parts being present (Mackie, 1965).

Explaining outcome process tracing is an iterative research strategy that aims to trace the complex conglomerate of systematic and case specific causal mechanisms that produced the outcome in question. The explanation cannot be detached from the particular case. Explaining outcome process tracing refers to case studies whose primary ambition is to explain particular historical outcomes, although the findings of the case can also speak to other potential cases of the phenomenon. Explaining outcome process tracing is an iterative research process in which ‘theories’ are tested to see whether they can provide a minimally sufficient explanation of the outcome. Minimal sufficiency is defined as an explanation that accounts for an outcome, with no redundant parts. In most explaining outcome studies, existing theorisation cannot provide a sufficient explanation, resulting in a second stage in which existing theories are re-conceptualised in light of the evidence gathered in the preceding empirical analysis. The conceptualisation phase in explaining outcome process tracing is therefore an iterative research process, with initial mechanisms re-conceptualised and tested until the result is a theorised mechanism that provides a minimally sufficient explanation of the particular outcome.

Below a description is provided of how SPOs are selected for process tracing, and a description is provided on how this process tracing is to be carried out. Note that this description of process tracing provides not only information on the extent to which the changes in organisational development can be attributed to MFS II (evaluation question 2), but also provides information on other contributing factors and actors (evaluation question 4). Furthermore, it must be noted that the evaluation team has developed an adapted form of ‘explaining outcome process tracing’, since the data collection and analysis was an iterative process of research so as to establish the most realistic explanation for a particular outcome/ organisational capacity change. Below selection of SPOs for process tracing as well as the different steps involved for process tracing in the selected SPOs, are further explained.

Selection of SPOs for 5C process tracing

Process tracing is a very intensive methodology that is very time and resource consuming (for development and analysis of one final detailed causal map, it takes about 1-2 weeks in total, for different members of the evaluation team). It has been agreed upon during the synthesis workshop on 17-18 June 2013 that only a selected number of SPOs will take part in this process tracing for the purpose of understanding the attribution question. The selection of SPOs is based on the following criteria:

- MFS II support to the SPO has not ended before 2014 (since this would leave us with too small a time difference between intervention and outcome);
- Focus is on the 1-2 capabilities that are targeted most by CFAs in a particular country;
- Both the SPO and the CFA are targeting the same capability, and preferably aim for similar outcomes;
- Maximum one SPO per CFA per country will be included in the process tracing.

The intention was to focus on about 30-50% of the SPOs involved. Please see the tables below for a selection of SPOs per country. Per country, a first table shows the extent to which a CFA targets the five capabilities, which is used to select the capabilities to focus on. A second table presents which SPO is selected, and takes into consideration the selection criteria as mentioned above.

ETHIOPIA

For Ethiopia the capabilities that are mostly targeted by CFAs are the capability to act and commit and the capability to adapt and self-renew. See also the table below.

Table 1

The extent to which the Dutch NGO explicitly targets the following capabilities – Ethiopia

Capability to:	AMREF	CARE	ECFA	FSCE	HOA- REC	HUND EE	NVEA	OSRA	TTCA
Act and commit	5	4	5	5	5	3	4	4	3
Deliver on development objectives	2	1	1	1	2	1	1	2	1
Adapt and self-renew	4	2	3	4	2	5	3	3	3
Relate	3	1	2	2	3	2	1	3	1
Achieve coherence	2	2	1	1	1	1	1	1	1

Note: Number 1 stands for not targeted, 5 for intensively targeted. These scores are relative scores for the interventions by the CFA to strengthen the capacity of the SPO. The scores are relative to each other, a higher score means that this capability gets more attention by the CFA compared to other capabilities.

Source: country baseline report, Ethiopia.

Below you can see the table describing when the contract with the SPO is to be ended, and whether both SPO and the CFA expect to focus on these two selected capabilities (with MFS II funding). Based on the above-mentioned selection criteria the following SPOs are selected for process tracing: AMREF, ECFA, FSCE, HUNDEE. In fact, six SPOs would be suitable for process tracing. We just selected the first one per CFA following the criteria of not including more than one SPO per CFA for process tracing

Table 2

SPOs selected for process tracing – Ethiopia

Ethiopia – SPOs	End of contract	Focus on capability to act and commit – by SPO	Focus on capability to act and commit – by CFA	Focus on capability to adapt and self-renew – by SPO	Focus on capability to adapt and self-renew – by CFA	CFA	Selected for process tracing
AMREF CARE	Dec 2015 Dec 31, 2015	Yes Partly	Yes Yes	Yes Yes	Yes Yes – slightly	AMREF NL CARE Netherlands	Yes No - not fully matching Yes
ECFA	Jan 2015	Yes	Yes	Yes	Yes	Child Helpline International Stichting Kinderpostzegels Netherlands (SKN); Note: no info from Defence for Children – ECPAT Netherlands ICCO	Yes
FSCE	Dec 2015	Yes	Yes	Yes	Yes		
HOA-REC	Sustainable Energy project (ICCO Alliance): 2014 Innovative WASH (WASH Alliance): Dec 2015	Yes	Yes	Yes	Yes - slightly		No - not fully matching
HUNDEE NVEA	Dec 2014 Dec 2015 (both)	Yes Yes	Yes Yes	Yes Yes	Yes Yes	ICCO & IICD Edukans Foundation (under two consortia); Stichting Kinderpostzegels Netherlands (SKN) ICCO & IICD	Yes Suitable but SKN already involved for process tracing FSCE
OSRA	C4C Alliance project (farmers marketing): December 2014 ICCO Alliance project (zero grazing): 2014 (2 nd phase)	Yes	Yes	Yes	Yes		Suitable but ICCO & IICD already involved for process tracing - HUNDEE
TTCA	June 2015	Partly	Yes	No	Yes	Edukans Foundation	No - not fully matching

INDIA

For India the capability that is mostly targeted by CFAs is the capability to act and commit. The next one in line is the capability to adapt and self-renew. See also the table below in which a higher score means that the specific capability is more intensively targeted.

Table 3

The extent to which the Dutch NGO explicitly targets the following capabilities – India³

Capability to:	BVHA	COUNT	DRIST I	FFID	Jana Vikas	Samar thak Samiti	SMILE	SDS	VTRC
Act and commit	5	3	4	4	4	4	4	3	5
Deliver on development objectives	1	5	1	1	1	1	1	2	1
Adapt and self-renew	2	2	1	3	1	1	4	1	4
Relate	3	1	1	1	1	1	2	1	2
Achieve coherence	1	1	1	4	1	1	1	1	2

Note: Number 1 stands for not targeted, 5 for intensively targeted. These scores are relative scores for the interventions by the CFA to strengthen the capacity of the SPO. The scores are relative to each other, a higher score means that this capability gets more attention by the CFA compared to other capabilities.

Source: country baseline report, India.

Below you can see a table describing when the contract with the SPO is to be ended and whether SPO and the CFA both expect to focus on these two selected capabilities (with MFS II funding). Based on the above-mentioned selection criteria the following SPOs are selected for process tracing: BVHA, COUNT, FFID, SMILE and VTRC. Except for SMILE (capability to act and commit only), for the other SPOs the focus for process tracing can be on the capability to act and commit and on the capability to adapt and self-renew.

Table 4

SPOs selected for process tracing – India

India – SPOs	End of contract	Focus on capability to act and commit – by SPO	Focus on capability to act and commit – by CFA	Focus on capability to adapt and self-renew – by SPO	Focus on capability to adapt and self-renew – by CFA	CFA	Selected for process tracing
BVHA	2014	Yes	Yes	Yes	Yes	Simavi	Yes; both capabilities
COUNT	2015	Yes	Yes	Yes	Yes	Woorden Daad	Yes; both capabilities
DRISTI	31-03-2012	Yes	Yes	No	no	Hivos	No - closed in 2012
FFID	30-09-2014	Yes	Yes	Yes	Yes	ICCO	Yes

³ RGVN, NEDSF and Women's Rights Forum (WRF) could not be reached timely during the baseline due to security reasons. WRF could not be reached at all. Therefore these SPOs are not included in Table 1.

India – SPOs	End of contract	Focus on capability to act and commit – by SPO	Focus on capability to act and commit – by CFA	Focus on capability to adapt and self-renew – by SPO	Focus on capability to adapt and self-renew – by CFA	CFA	Selected for process tracing
Jana Vikas	2013	Yes	Yes	Yes	No	Cordaid	No - contract is and the by now; not fully matching focus
NEDSF							No – delayed baseline
RGVN							No - delayed baseline
Samarthak Samiti (SDS)	2013 possibly longer	Yes	Yes	Yes	No	Hivos	No - not certain of end date and not fully matching focus
Shivi Development Society (SDS)	Dec 2013 intention 2014	Yes	Yes	Yes	No	Cordaid	No - not fully matching focus
Smile	2015	Yes	Yes	Yes	Yes	Wilde Ganzen	Yes; first capability only
VTRC	2015	Yes	Yes	Yes	Yes	Stichting Red een Kind	Yes; both capabilities

INDONESIA

For Indonesia the capabilities that are most frequently targeted by CFAs are the capability to act and commit and the capability to adapt and self-renew. See also the table below.

Table 5

The extent to which the Dutch NGO explicitly targets the following capabilities – Indonesia

Capability to:	ASB	Daya kologi	ECPAT	GSS	Lem bago Kita	Pl. PPMA	Rifka Annisa	WIIP	Yad upa	Yayasan Kelola	YPI	YRBI
Act and commit	4	4	4	5	4	4	5	3	3	2	5	4
Deliver on development objectives	1	1	1	2	2	1	2	1	1	1	1	1
Adapt and self-renew	3	1	2	4	2	3	4	4	1	1	4	3
Relate	1	1	2	3	3	2	1	2	2	2	3	2
Achieve coherence	1	1	1	2	1	1	2	2	1	1	2	1

Note: Number 1 stands for not targeted, 5 for intensively targeted. These scores are relative scores for the interventions by the CFA to strengthen the capacity of the SPO. The scores are relative to each other, a higher score means that this capability gets more attention by the CFA compared to other capabilities.

Source: country baseline report, Indonesia.

The table below describes when the contract with the SPO is to be ended and whether both SPO and the CFA expect to focus on these two selected capabilities (MFS II funding). Based on the above-mentioned selection criteria the following SPOs are selected for process tracing: ASB, ECPAT, Pt.PPMA, YPI, YRBI.

Table 6

SPOs selected for process tracing – Indonesia

Indonesia – SPOs	End of contract	Focus on capability to act and commit – by SPO	Focus on capability to act and commit – by CFA	Focus on capability to adapt and self-renew – by SPO	Focus on capability to adapt and self-renew – by CFA	CFA	Selected for process tracing
ASB	February 2012; extension Feb,1, 2013 – June,30, 2016	Yes	Yes	Yes	Yes	Hivos	Yes
Dayakologi	2013; no extension	Yes	Yes	Yes	No	Cordaid	No: contract ended early and not matching enough
ECPAT	August 2013; Extension Dec 2014	Yes	Yes	Yes, a bit	Yes	Free Press Unlimited - Mensen met een Missie	Yes
GSS	31 December 2012; no extension	Yes	Yes	Yes, a bit	Yes	Free Press Unlimited - Mensen met een Missie	No: contract ended early
Lembaga Kita	31 December 2012; no extension	Yes	Yes	No	Yes	Free Press Unlimited - Mensen met een Missie	No - contract ended early
Pt.PPMA	May 2015	Yes	Yes	No	Yes	IUCN	Yes, capability to act and commit only
Rifka Annisa	Dec, 31 2015	No	Yes	No	Yes	Rutgers WPF	No - no match between expectations CFA and SPO
WIIP	Dec 2015	Yes	Not MFS II	Yes	Not MFS II	Red Cross	No - Capacity development interventions are not MFS II financed. Only some overhead is MFS II

Indonesia – SPOs	End of contract	Focus on capability to act and commit – by SPO	Focus on capability to act and commit – by CFA	Focus on capability to adapt and self-renew – by SPO	Focus on capability to adapt and self-renew – by CFA	CFA	Selected for process tracing
Yayasan Kelola	Dec 30, 2013; extension of contract being processed for two years (2014-2015)	Yes	Not really	Yes	Not really	Hivos	No - no specific capacity development interventions planned by Hivos
YPI	Dec 31, 2015	Yes	Yes	Yes	Yes	Rutgers WPF	Yes
YRBI	Oct, 30, 2013; YRBI end of contract from 31st Oct 2013 to 31st Dec 2013. Contract extension proposal is being proposed to MFS II, no decision yet.	Yes	Yes	Yes	Yes	ICCO	Yes
Yadupa	Under negotiation during baseline; new contract 2013 until now	Yes	Nothing committed	Yes	Nothing committed	IUCN	No, since nothing was committed by CFA

LIBERIA

For Liberia the situation is arbitrary which capabilities are targeted most CFA's. Whilst the capability to act and commit is targeted more often than the other capabilities, this is only so for two of the SPOs. The capability to adapt and self-renew and the capability to relate are almost equally targeted for the five SPOs, be it not intensively. Since the capability to act and commit and the capability to adapt and self-renew are the most targeted capabilities in Ethiopia, India and Indonesia, we choose to focus on these two capabilities for Liberia as well. This would help the synthesis team in the further analysis of these capabilities related to process tracing. See also the table below.

Table 7

The extent to which the Dutch NGO explicitly targets the following capabilities – Liberia

Capability to:	BSC	DEN-L	NAWOCOL	REFOUND	RHRAP
Act and commit	5	1	1	1	3
Deliver on development objectives	3	1	1	1	1
Adapt and self-renew	2	2	2	2	2
Relate	1	2	2	2	2
Achieve coherence	1	1	1	1	1

Note: Number 1 stands for not targeted, 5 for intensively targeted. These scores are relative scores for the interventions by the CFA to strengthen the capacity of the SPO. The scores are relative to each other, a higher score means that this capability gets more attention by the CFA compared to other capabilities.

Source: country baseline report, Liberia.

Below you can see the table describing when the contract with the SPO is to be ended, and whether both SPO and the CFA expect to focus on these two selected capabilities (with MFS II funding). Also, for two of the five SPOs capability to act and commit is targeted more intensively compared to the other capabilities. Based on the above-mentioned selection criteria the following SPOs are selected for process tracing: BSC and RHRAP.

Table 8

SPOs selected for process tracing – Liberia

Liberia – SPOs	End of contract	Focus on capability to act and commit – by SPO	Focus on capability to act and commit – by CFA	Focus on capability to adapt and self-renew – by SPO	Focus on capability to adapt and self-renew – by CFA	CFA	Selected for process tracing
BSC	Dec 31, 2015	Yes	Yes	Yes	Yes	SPARK	Yes
DEN-L	2014	No	No	Unknown	A little	ICCO	No – not matching enough
NAWOCOL	2014	Yes	No	No	A little	ICCO	No – not matching enough
REFOUND	At least until 2013 (2015?)	Yes	No	Yes	A little	ICCO	No – not matching enough
RHRAP	At least until 2013 (2014?)	Yes	Yes	Yes	Yes	ICCO	Yes

Key steps in process tracing for the 5C study

In the box below you will find the key steps developed for the 5C process tracing methodology. These steps will be further explained here. Only key staff of the SPO is involved in this process: management; programme/ project staff; and monitoring and evaluation staff, and other staff that could provide information relevant to the identified outcome area/key organisational capacity change. Those SPOs selected for process tracing had a separate endline workshop, in addition to the ' general endline workshop. This workshop was carried out after the initial endline workshop and the interviews during the field visit to the SPO. Where possible, the general and process tracing endline workshop have been held consecutively, but where possible these workshops were held at different points in time, due to the complex design of the process. Below the detailed steps for the purpose of process tracing are further explained.

Key steps in process tracing for the 5C study

1. Identify the planned MFS II supported capacity development interventions within the selected capabilities (capability to act and commit and capability to adapt and self-renew) – CDI team
2. Identify the implemented MFS II supported capacity development interventions within the selected capabilities (capability to act and commit and capability to adapt and self-renew) – CDI team
3. Identify initial changes/ outcome areas in these two capabilities – CDI team & in-country team
4. Construct the detailed, initial causal map (theoretical model of change) – CDI team & in-country team
5. Identify types of evidence needed to verify or discard different causal relationships in the model of change – in-country teams, with support from CDI team
6. Collect data to verify or discard causal mechanisms and construct workshop based, detailed causal map (model of change) – in-country team
7. Assess the quality of data and analyse data and develop final detailed causal map (model of change) – in-country team with CDI team
8. Analyse and conclude on findings– CDI team, in collaboration with in-country team

Some definitions of the terminology used for this MFS II 5c evaluation

Based upon the different interpretations and connotations the use of the term causal mechanism we use the following terminology for the remainder of this paper:

- A **detailed causal map** (or **model of change**) = the representation of all possible explanations – causal pathways for a change/ outcome. These pathways are that of the intervention, rival pathways and pathways that combine parts of the intervention pathway with that of others. This also depicts the reciprocity of various events influencing each other and impacting the overall change.
- A **causal mechanism** = is the combination of parts that ultimately explains an outcome. Each part of the mechanism is an individually insufficient but necessary factor in a whole mechanism, which together produce the outcome (Beach and Pedersen, 2013, p. 176).
- **Part** or **cause** = one actor with its attributes carrying out activities/ producing outputs that lead to change in other parts. The final part or cause is the change/ outcome.
- **Attributes of the actor** = specificities of the actor that increase his chance to introduce change or not such as its position in its institutional environment.

*Step 1. Identify the **planned MFS II supported capacity development interventions** within the selected capabilities (capability to act and commit and capability to adapt and self-renew) – CDI team*

Chapter 4.1 and 4.2 in the baseline report were reviewed. Capacity development interventions as planned by the CFA for the capability to act and commit and for the capability to adapt and self-renew were described and details inserted in the summary format. This provided an overview of the capacity development activities that were originally planned by the CFA for these two capabilities and assisted in focusing on relevant outcomes that are possibly related to the planned interventions.

*Step 2. Identify the **implemented capacity development interventions** within the selected capabilities (capability to act and commit and capability to adapt and self-renew) – CDI team*

The input from the CFA was reviewed in terms of what capacity development interventions have taken place in the MFS II period. This information was found in the 'Support to capacity development sheet - endline - CFA perspective' for the SPO, based on details provided by the CFA and further discussed during an interview by the CDI team.

The CFA was asked to describe all the MFS II supported capacity development interventions of the SPO that took place during the period 2011 up to now. The CDI team reviewed this information, not only the interventions but also the observed changes as well as the expected long-term changes, and then linked these interventions to relevant outcomes in one of the capabilities (capability to act and commit; and capability to adapt and self-renew).

*Step 3. Identify **initial changes/ outcome areas** in these two capabilities – by CDI team & in-country team*

The CDI team was responsible for coding documents received from SPO and CFA in NVivo on the following:

- 5C Indicators: this was to identify the changes that took place between baseline and endline. This information was coded in Nvivo.
- Information related to the capacity development interventions implemented by the CFA (with MFS II funding) (see also Step 2) to strengthen the capacity of the SPO. For example, the training on financial management of the SPO staff could be related to any information on financial management of the SPO. This information was coded in Nvivo.

In addition, the response by the CFA to the changes in 5C indicators format, was auto-coded.

The in-country team was responsible for timely collection of information from the SPO (before the fieldwork starts). This set of information dealt with:

- MFS II supported capacity development interventions during the MFS II period (2011 until now).
- Overview of all trainings provided in relation to a particular outcome areas/organisational capacity change since the baseline.
- For each of the identified MFS II supported trainings, training questionnaires have been developed to assess these trainings in terms of the participants, interests, knowledge and skills gained, behaviour change and changes in the organisation (based on Kirkpatrick's model), one format for training participants and one for their managers. These training questionnaires were sent prior to the field visit.
- Changes expected by SPO on a long-term basis ('Support to capacity development sheet - endline - SPO perspective').

For the selection of change/ outcome areas the following criteria were important:

- The change/ outcome area is in one of the two capabilities selected for process tracing: capability to act and commit or the capability to adapt and self-renew. This was the first criteria to select upon.
- There was a likely link between the key organisational capacity change/ outcome area and the MFS II supported capacity development interventions. This also was an important criteria. This would need to be demonstrated through one or more of the following situations:
 - In the 2012 theory of change on organisational capacity development of the SPO a link was indicated between the outcome area and MFS II support;
 - During the baseline the CFA indicated a link between the planned MFS II support to organisational development and the expected short-term or long-term results in one of the selected capabilities;
 - During the endline the CFA indicated a link between the implemented MFS II capacity development interventions and observed short-term changes and expected long-term changes in the organisational capacity of the SPO in one of the selected capabilities;
 - During the endline the SPO indicated a link between the implemented MFS II capacity development interventions and observed short-term changes and expected long-term changes in the organisational capacity of the SPO in one of the selected capabilities.

Reviewing the information obtained as described in Step 1, 2, and 3 provided the basis for selecting key organisational capacity change/ outcome areas to focus on for process tracing. These areas were to be formulated as broader outcome areas, such as 'improved financial management', 'improved monitoring and evaluation' or 'improved staff competencies'.

Note: the outcome areas were to be formulated as intermediates changes. For example: an improved monitoring and evaluation system, or enhanced knowledge and skills to educate the target group on climate change. Key outcome areas were also verified - based on document review as well as discussions with the SPO during the endline.

*Step 4. Construct the **detailed, initial causal map** (theoretical model of change) – CDI & in-country team*

A detailed initial causal map was developed by the CDI team, in collaboration with the in-country team. This was based on document review, including information provided by the CFA and SPO on

MFS II supported capacity development interventions and their immediate and long-term objectives as well as observed changes. Also, the training questionnaires were reviewed before developing the initial causal map. This detailed initial causal map was to be provided by the CDI team with a visual and related narrative with related references. This initial causal map served as a reference point for further reflection with the SPO during the process tracing endline workshop, where relationships needed to be verified or new relationships established so that the second (workshop-based), detailed causal map could be developed, after which further verification was needed to come up with the final, concluding detailed causal map.

It's important to note that organisational change area/ outcome areas could be both positive and negative.

For each of the selected outcomes the team needed to make explicit the theoretical model of change. This meant finding out about the range of different actors, factors, actions, and events etc. that have contributed to a particular outcome in terms of organisational capacity of the SPO.

A model of change of good quality includes:

- The causal pathways that relate the intervention to the realised change/ outcome;
- Rival explanations for the same change/ outcome;
- Assumptions that clarify relations between different components or parts;
- Case specific and/or context specific factors or risks that might influence the causal pathway, such as for instance the socio-cultural-economic context, or a natural disaster;
- Specific attributes of the actors e.g. CFA and other funders.

A model of change (within the 5C study called a 'detailed causal map') is a complex system which produces intermediate and long-term outcomes by the interaction of other parts. It consists of parts or causes that often consist of one actor with its attributes that is implementing activities leading to change in other parts (Beach & Pedersen, 2013). A helpful way of constructing the model of change is to think in terms of actors carrying out activities that lead to other actors changing their behaviour. The model of change can be explained as a range of activities carried out by different *actors* (including the CFA and SPO under evaluation) that will ultimately lead to an outcome. Besides this, there are also '*structural*' elements, which are to be interpreted as external factors (such as economic conjuncture); and *attributes* of the actor (does the actor have the legitimacy to ask for change or not, what is its position in the sector) that should be looked at (Beach & Pedersen, 2013). In fact Beach and Pedersen, make a fine point about the subjectivity of the actor in a dynamic context. This means, in qualitative methodologies, capturing the changes in the actor, acted upon area or person/organisation, in a non sequential and non temporal format. Things which were done recently could have corrected behavioural outcomes of an organisation and at the same time there could be processes which incrementally pushed for the same change over a period of time. Beach and Pedersen espouse this methodology because it captures change in a dynamic fashion as against the methodology of logical framework. For the MFS II evaluation it was important to make a distinction between those paths in the model of change that are the result of MFS II and rival pathways.

The construction of the model of change started with the identified key organisational capacity change/ outcome, followed by an inventory of all possible subcomponents that possibly have caused the change/ outcome in the MFS II period (2011-up to now, or since the baseline). The figure below presents an imaginary example of a model of change. The different colours indicate the different types of support to capacity development of the SPO by different actors, thereby indicating different pathways of change, leading to the key changes/ outcomes in terms of capacity development (which in this case indicates the ability to adapt and self-renew).

Figure 1 An imaginary example of a model of change

Step 5. Identify **types of evidence** needed to verify or discard different causal relationships in the model of change – in-country teams with support from CDI team

Once the causal mechanism at theoretical level were defined, empirical evidence was collected so as to verify or discard the different parts of this theoretical model of change, confirm or reject whether subcomponents have taken place, and to find evidence that confirm or reject the causal relations between the subcomponents.

A key question that we needed to ask ourselves was, “What information do we need in order to confirm or reject that one subcomponent leads to another, that X causes Y?”. The evaluation team needed to agree on what information was needed that provides empirical manifestations for each part of the model of change.

There are four distinguishable types of evidence that are relevant in process tracing analysis: pattern, sequence, trace, and account. Please see the box below for descriptions of these types of evidence.

The evaluation team needed to agree on the types of evidence that was needed to verify or discard the manifestation of a particular part of the causal mechanism. Each one or a combination of these different types of evidence could be used to confirm or reject the different parts of the model of change. This is what is meant by robustness of evidence gathering. Since causality as a concept can bend in many ways, our methodology, provides a near scientific model for accepting and rejecting a particular type of evidence, ignoring its face value.

Types of evidence to be used in process tracing

Pattern evidence relates to predictions of statistical patterns in the evidence. For example, in testing a mechanism of racial discrimination in a case dealing with employment, statistical patterns of employment would be relevant for testing this part of the mechanism.

Sequence evidence deals with the temporal and spatial chronology of events predicted by a hypothesised causal mechanism. For example, a test of the hypothesis could involve expectations of the timing of events where we might predict that if the hypothesis is valid, we should see that the event B took place after event A took place. However, if we found that event B took place before event A took place, the test would suggest that our confidence in the validity of this part of the mechanism should be reduced (disconfirmation/ falsification).

Trace evidence is evidence whose mere existence provides proof that a part of a hypothesised mechanism exists. For example, the existence of the minutes of a meeting, if authentic ones, provide strong proof that the meeting took place.

Account evidence deals with the content of empirical material, such as meeting minutes that detail what was discussed or an oral account of what took place in the meeting.

Source: Beach and Pedersen, 2013

Below you can find a table that provides guidelines on what to look for when identifying types of evidence that can confirm or reject causal relationships between different parts/ subcomponents of the model of change. It also provides one example of a part of a causal pathway and what type of information to look for.

Table 9

Format for identifying types of evidence for different causal relationships in the model of change (example included)

Part of the model of change	Key questions	Type of evidence needed	Source of information
Describe relationship between the subcomponents of the model of change	Describe questions you would like to answer so as to find out whether the components in the relationship took place, when they took place, who was involved, and whether they are related	Describe the information that we need in order to answer these questions. Which type of evidence can we use in order to reject or confirm that subcomponent X causes subcomponent Y? Can we find this information by means of : Pattern evidence; Sequence evidence; Trace evidence; Account evidence?	Describe where you can find this information
Example: Training workshops on M&E provided by MFS II funding and other sources of funding	Example: What type of training workshops on M&E took place? Who was trained? When did the training take place? Who funded the training? Was the funding of training provided before the training took place? How much money was available for the training?	Example: Trace evidence: on types of training delivered, who was trained, when the training took place, budget for the training Sequence evidence on timing of funding and timing of training Content evidence: what the training was about	Example: Training report SPO Progress reports Interviews with the CFA and SPO staff Financial reports SPO and CFA

Please note that for practical reasons, the 5C evaluation team decided that it was easier to integrate the specific questions in the narrative of the initial causal map. These questions would need to be

addressed by the in country team during the process tracing workshop so as to discover, verify or discard particular causal mechanisms in the detailed, initial causal map. Different types of evidence was asked for in these questions.

Step 6. *Collect data to verify or discard causal mechanisms and develop workshop-based, detailed causal map – in-country team*

Once it was decided by the in-country and CDI evaluation teams what information was to be collected during the interaction with the SPO, data collection took place. The initial causal maps served as a basis for discussions during the endline workshop with a particular focus on process tracing for the identified organisational capacity changes. But it was considered to be very important to understand from the perspective of the SPO how they understood the identified key organisational capacity change/outcome area has come about. A new detailed, workshop-based causal map was developed that included the information provided by SPO staff as well as based on initial document review as described in the initial detailed causal map. This information was further analysed and verified with other relevant information so as to develop a final causal map, which is described in the next step.

Step 7. *Assess the quality of data and analyse data, and develop the final detailed causal map (model of change) – in-country team and CDI team*

Quality assurance of the data collected and the evidence it provides for rejecting or confirming parts of causal explanations are a major concern for many authors specialised in contribution analysis and process-tracing. Stern et al. (2012), Beach and Pedersen (2013), Lemire, Nielsen and Dybdal (2012), Mayne (2012) and Delahais and Toulemonde (2012) all emphasise the need to make attribution/ contribution claims that are based on pieces of evidence that are rigorous, traceable, and credible. These pieces of evidence should be as explicit as possible in proving that *subcomponent X causes subcomponent Y* and ruling out other explanations. Several tools are proposed to check the nature and the quality of data needed. One option is, Delahais and Toulemonde's Evidence Analysis Database, which we have adapted for our purpose.

Delahais and Toulemonde (2012) propose an Evidence Analysis Database that takes into consideration three criteria:

Confirming/ rejecting a causal relation (yes/no);

Type of causal mechanism: intended contribution/ other contribution/ condition leading to intended contribution/ intended condition to other contribution/ feedback loop;

Strength of evidence: strong/ rather strong/ rather weak/ weak.

We have adapted their criteria to our purpose. The in-country team, in collaboration with the CDI team, used the criteria in assessing whether causal relationships in the causal map, were strong enough. This has been more of an iterative process trying to find additional evidence for the established relationships through additional document review or contacting the CFA and SPO as well as getting their feedback on the final detailed causal map that was established. Whilst the form below has not been used exactly in the manner depicted, it has been used indirectly when trying to validate the information in the detailed causal map. After that, the final detailed causal map is established both as a visual as well as a narrative, with related references for the established causal relations.

<i>Example format for the adapted evidence analysis database (example included)</i>	Confirming/ rejecting a causal relation (yes/ no)	Type of information providing the background to the confirmation or rejection of the causal relation	Strength of evidence: strong/ rather strong/ rather weak/ weak	Explanation for why the evidence is (rather) strong or (rather) weak, and therefore the causal relation is confirmed/ rejected
Description of causal relation				
e.g. Training staff in M&E leads to enhanced M&E knowledge, skills and practice	e.g. Confirmed	e.g. Training reports confirmed that staff are trained in M&E and that knowledge and skills increased as a result of the training		

Step 8. Analyse and conclude on findings– in-country team and CDI team

The final detailed causal map was described as a visual and narrative and this was then analysed in terms of the evaluation question two and evaluation question four: *“To what degree are the changes identified in partner capacity attributable to development interventions undertaken by the MFS II consortia (i.e. measuring effectiveness)?”* and *“What factors explain the findings drawn from the questions above?”* It was analysed to what extent the identified key organisational capacity change can be attributed to MFS II supported capacity development interventions as well as to other related factors, interventions and actors.

4. Explaining factors – evaluation question 4

This paragraph describes the data collection and analysis methodology for answering the fourth evaluation question: **“What factors explain the findings drawn from the questions above?”**

In order to explain the changes in organisational capacity development between baseline and endline (evaluation question 1) the CDI and in-country evaluation teams needed to review the indicators and how they have changed between baseline and endline and what reasons have been provided for this. This has been explained in the first section of this appendix. It has been difficult to find detailed explanations for changes in each of the separate 5c indicators, but the 'general causal map' has provided some ideas about some of the key underlying factors actors and interventions that influence the key organisational capacity changes, as perceived by the SPO staff.

For those SPOs that are selected for process tracing (evaluation question 2), more in-depth information was procured for the identified key organisational capacity changes and how MFS II supported capacity development interventions as well as other actors, factors and interventions have influenced these changes. This is integrated in the process of process tracing as described in the section above.

5. Methodological reflection

Below a few methodological reflections are made by the 5C evaluation team.

Use of the 5 core capabilities framework and qualitative approach: this has proven to be a very useful framework to assess organisational capacity. The five core capabilities provide a comprehensive picture of the capacity of an organisation. The capabilities are interlinked, which was also reflected in the description of standard indicators, that have been developed for the purpose of this 5C evaluation and agreed upon for the eight countries. Using this framework with a mainly qualitative approach has provided rich information for the SPOs and CFAs, and many have indicated this was a useful learning exercise.

Using standard indicators and scores: using standard indicators is useful for comparison purposes. However, the information provided per indicator is very specific to the SPO and therefore makes comparison difficult. Whilst the description of indicators has been useful for the SPO and CFA, it is questionable to what extent indicators can be compared across SPOs since they need to be seen in context, for them to make meaning. In relation to this, one can say that scores that are provided for the indicators, are only relative and cannot show the richness of information as provided in the indicator description. Furthermore, it must be noted that organisations are continuously changing and scores are just a snapshot in time. There cannot be perfect score for this. In hindsight, having rubrics would have been more useful than scores.

General causal map: whilst this general causal map, which is based on key organisational capacity changes and related causes, as perceived by the SPO staff present at the endline workshop, has not been validated with other sources of information except SPO feedback, the 5C evaluation team considers this information important, since it provides the SPO story about how and which changes in the organisation since the baseline, are perceived as being important, and how these changes have come about. This will provide information additional to the information that has been validated when analysing and describing the indicators as well as the information provided through process tracing (selected SPOs). This has proven to be a learning experience for many SPOs.

Using process tracing for dealing with the attribution question: this theory-based and mainly qualitative approach has been chosen to deal with the attribution question, on how the organisational capacity changes in the organisations have come about and what the relationship is with MFS II supported capacity development interventions and other factors. This has proven to be a very useful process, that provided a lot of very rich information. Many SPOs and CFAs have already indicated that they appreciated the richness of information which provided a story about how identified organisational capacity changes have come about. Whilst this process was intensive for SPOs during the process tracing workshops, many appreciated this to be a learning process that provided useful information on how the organisation can further develop itself. For the evaluation team, this has also been an intensive and time-consuming process, but since it provided rich information in a learning process, the effort was worth it, if SPOs and CFAs find this process and findings useful.

A few remarks need to be made:

- Outcome explaining process tracing is used for this purpose, but has been adapted to the situation since the issues being looked at were very complex in nature.
- Difficulty of verifying each and every single change and causal relationship:
- Intensity of the process and problems with recall: often the process tracing workshop was done straight after the general endline workshop that has been done for all the SPOs. In some cases, the process tracing endline workshop has been done at a different point in time, which was better for staff involved in this process, since process tracing asks people to think back about changes and how these changes have come about. The word difficulties with recalling some of these changes and how they have come about. See also the next paragraph.
- Difficulty of assessing changes in knowledge and behaviour: training questionnaire is have been developed, based on Kirkpatrick's model and were specifically tailored to identify not only the interest but also the change in knowledge and skills, behaviour as well as organisational changes as a result of a particular training. The retention ability of individuals, irrespective of their position in the organisation, is often unstable. The 5C evaluation team experienced that it was difficult for people to recall specific trainings, and what they learned from those trainings. Often a change in

knowledge, skills and behaviour is a result brought about by a combination of different factors, rather than being traceable to one particular event. The detailed causal maps that have been established, also clearly pointed this. There are many factors at play that make people change their behaviour, and this is not just dependent on training but also internal/personal (motivational) factors as well as factors within the organisation, that stimulate or hinder a person to change behaviour. Understanding how behaviour change works is important when trying to really understand the extent to which behaviour has changed as a result of different factors, actors and interventions. Organisations change because people change and therefore understanding when and how these individuals change behaviour is crucial. Also attrition and change in key organisational positions can contribute considerably to the outcome.

Utilisation of the evaluation

The 5C evaluation team considers it important to also discuss issues around utility of this evaluation. We want to mention just a few.

Design – mainly externally driven and with a focus on accountability and standard indicators and approaches within a limited time frame, and limited budget: this MFS II evaluation is originally based on a design that has been decided by IOB (the independent evaluation office of the Dutch Ministry of Foreign Affairs) and to some extent MFS II organisations. The evaluators have had no influence on the overall design and sampling for the 5C study. In terms of learning, one may question whether the most useful cases have been selected in this sampling process. The focus was very much on a rigorous evaluation carried out by an independent evaluation team. Indicators had to be streamlined across countries. The 5C team was requested to collaborate with the other 5C country teams (Bangladesh, Congo, Pakistan, Uganda) to streamline the methodological approach across the eight sampled countries. Whilst this may have its purpose in terms of synthesising results, the 5C evaluation team has also experienced the difficulty of tailoring the approach to the specific SPOs. The overall evaluation has been mainly accountability driven and was less focused on enhancing learning for improvement. Furthermore, the timeframe has been very small to compare baseline information (2012) with endline information (2014). Changes in organisational capacity may take a long, particularly if they are related to behaviour change. Furthermore, there has been limited budget to carry out the 5C evaluation. For all the four countries (Ethiopia, India, Indonesia, Liberia) that the Centre for Development Innovation, Wageningen University and Research centre has been involved in, the budget has been overspent.

However, the 5C evaluation team has designed an endline process whereby engagement of staff, e.g. in a workshop process was considered important, not only due to the need to collect data, but also to generate learning in the organisation. Furthermore, having general causal maps and detailed causal maps generated by process tracing have provided rich information that many SPOs and CFAs have already appreciated as useful in terms of the findings as well as a learning process.

Another issue that must be mentioned is that additional requests have been added to the country teams during the process of implementation: developing a country based synthesis; questions on design, implementation, and reaching objectives of MFS II funded capacity development interventions, whilst these questions were not in line with the core evaluation questions for the 5C evaluation.

Complexity and inadequate coordination and communication: many actors, both in the Netherlands, as well as in the eight selected countries, have been involved in this evaluation and their roles and responsibilities, were often unclear. For example, 19 MFS II consortia, the internal reference group, the Ministry of Foreign Affairs, Partos, the Joint Evaluation Trust, NWO-Wotro, the evaluators (Netherlands and in-country), 2 external advisory committees, and the steering committee. Not to mention the SPO's and their related partners and consultants. CDI was involved in 4 countries with a total number of 38 SPOs and related CFAs. This complexity influenced communication and coordination, as well as the extent to which learning could take place. Furthermore, there was a distance between the evaluators and the CFAs, since the approach had to be synchronised across countries, and had to adhere to strict guidelines, which were mainly externally formulated and could not be negotiated or discussed for the purpose of tailoring and learning. Feedback on the final results and report had to be provided mainly in written form. In order to enhance utilisation, a final workshop at the SPO to discuss the findings and think through the use with more people than probably the one who reads the report, would have more impact on organisational learning and development.

Furthermore, feedback with the CFAs has also not been institutionalised in the evaluation process in the form of learning events. And as mentioned above, the complexity of the evaluation with many actors involved did not enhance learning and thus utilization.

5C Endline process, and in particular thoroughness of process tracing often appreciated as learning process: The SPO perspective has also brought to light a new experience and technique of self-assessment and self-corrective measures for managers. Most SPOs whether part of process tracing or not, deeply appreciated the thoroughness of the methodology and its ability to capture details with robust connectivity. This is a matter of satisfaction and learning for both evaluators and SPOs. Having a process whereby SPO staff were very much engaged in the process of self-assessment and reflection has proven for many to be a learning experience for many, and therefore have enhanced utility of the 5C evaluation.

Appendix 2 Background information on the five core capabilities framework

The 5 capabilities (5C) framework was to be used as a framework for the evaluation of capacity development of Southern Partner Organisations (SPOs) of the MFS II consortia. The 5C framework is based on a five-year research program on 'Capacity, change and performance' that was carried out by the European Centre for Development Policy Management (ECDPM). The research included an extensive review of the literature and sixteen case studies. The 5C framework has also been applied in an IOB evaluation using 26 case studies in 14 countries, and in the baseline carried out per organisation by the MFS II organisations for the purpose of the monitoring protocol.

The 5C framework is structured to understand and analyse (changes in) the capacity of an organization to deliver (social) value to its constituents. This introduction briefly describes the 5C framework, mainly based on the most recent document on the 5C framework (Keijzer et al., 2011).

The 5C framework sees capacity as an **outcome** of an **open system**. An organisation or collaborative association (for instance a network) is seen as a system interacting with wider society. The most critical practical issue is to ensure that relevant stakeholders share a common way of thinking about capacity and its core constituents or capabilities. Decisive for an organisation's capacity is the context in which the organisation operates. This means that **understanding context issues** is crucial. The use of the 5C framework requires a multi-stakeholder approach because shared values and results orientation are important to facilitate the capacity development process. The 5C framework therefore needs to **accommodate the different visions** of stakeholders and conceive different strategies for raising capacity and improving performance in a given situation.

The 5C framework defines capacity as '**producing social value**' and identifies five core capabilities that together result in that overall capacity. Capacity, capabilities and competences are seen as follows:

- **Capacity** is referred to as the overall ability of an organisation or system to create value for others;
- **Capabilities** are the collective ability of a group or a system to do something either inside or outside the system. The collective ability involved may be technical, logistical, managerial or generative (i.e. the ability to earn legitimacy, to adapt, to create meaning, etc.);
- **Competencies** are the energies, skills and abilities of individuals.

Fundamental to developing capacity are inputs such as human, material and financial resources, technology, and information. To the degree that they are developed and successfully integrated, capabilities contribute to the overall capacity or ability of an organisation or system to create value for others. A single capability is not sufficient to create capacity. All are needed and are strongly interrelated and overlapping. Thus, to achieve its development goals, the 5C framework says that every organisation or system must have **five basic capabilities**:

1. The capability to act and commit;
2. The capability to deliver on development objectives;
3. The capability to adapt and self-renew;
4. The capability to relate (to external stakeholders);
5. The capability to achieve coherence.

In order to have a common framework for evaluation, the five capabilities have been reformulated in outcome domains and for each outcome domain performance indicators have been developed.

There is some overlap between the five core capabilities but together the five capabilities result in a certain level of capacity. Influencing one capability may have an effect on one or more of the other

capabilities. In each situation, the level of any of the five capabilities will vary. Each capability can become stronger or weaker over time.

Appendix 3 Results - changes in organisational capacity of the SPO - 5C indicators

Below you will find a description for each of the indicators under each of the capabilities, what the situation is as assessed during the endline, how this has changed since the baseline and what are the reasons for change.

Capability to act and commit

1.1. Responsive leadership: 'Leadership is responsive, inspiring, and sensitive'

This is about leadership within the organization (operational, strategic). If there is a larger body then you may also want to refer to leadership at a higher level but not located at the local organization.

OSRA has built on its experiences to bring changes in the organisation and has strived to build consensus & collective decision making. As indicated in the baseline period, there is a participatory, open, responsive and transparent leadership style at OSRA and the management has become democratic and created harmony and team spirit to resolve conflicts. Since the baseline decentralization of the organization has further enhanced. Herewith the decision-making roles of programs and other departments have increased. The involvement of board members in the organizational issues has improved. Decisions are now made based on facts and through collective decision-making practices in which four members (General Manager, Admin & Finance, Program Manager, M&E and Fundraising program officers) take part. This is different than during the baseline. There is also a monthly management review meeting at head office level to update progress and to provide timely corrective measures. Short term training on leadership for senior management staff has helped to improve the situation on leading and following up on strategic issues. According to some staffs, OSRA has become more assertive and sharpened up their operational strategy after the change in management (new director).

On the other hand, some staffs noted that low attention has been given to area offices by the head office and the top management is not visible to the field staffs. Besides, according to the staff decision-making is not timely, and not based on facts and not transparent and participatory. However, there is slight improvement in timely provision of logistic materials but not still satisfactory since there is direct interference from the head office on the project procurement process.

Score: From 3.5 to 4 (Slight improvement)

1.2. Strategic guidance: 'Leaders provide appropriate strategic guidance (strategic leader and operational leader)'

This is about the extent to which the leader(s) provide strategic directions

What has actually changed is the regularity and involvement of the board of directors which closely follows up the management and provides strategic directions on policy matters. Some staff has been trained in specific skills like planning and monitoring. Short term training on leadership for senior management staff has helped to improve the situation on leading and following up on strategic issues. There is a shift throughout the organization structure to look for changes/results of the interventions. Generally, OSRA has a well-established structure both in governance and management. In terms of the strategic guidance, the board has initiated the study on charting growth directions for OSRA and this has helped to create a new department unit (section) and upgrading of the M&E unit. However, operational leadership has not changed much. The dwindling situation of resources due to government CSO policy and the competitive external environment to get funds has forced the organization to strengthen its resource mobilization strategy and performance. As a result, the organization has improved staff capacity through hiring qualified professionals, trainings etc. and improved participation of all stakeholders in planning and implementing various projects. Responsibility is shared by way of collective decision-making based on organizational strategic objectives. Changes have been attempted to improve the management style of the organization to include shared responsibilities such as:

participatory planning, implementation, monitoring and evaluation, reporting, and immediate decision-making. However, there is no demonstrated change in this regard besides the intention to update its strategic documents.

Score: From 3.5 to 3.75 (very slight improvement)

1.3. Staff turnover: 'Staff turnover is relatively low'

This is about staff turnover.

Few staff has changed positions and others have left the organization. However, though the organization has provided new salary increment, most of the staffs are not satisfied and hence more staff members have resigned from the organization since the baseline in 2012. There is very low staff benefit package with low salary and per-diem rate as well as no motivation given to staff by top management. This is partly due to low source of funding, the government's 30/70 NGO legislation, and the fact that the top management hasn't given enough attention to the problem. The staff members that have left the organization have been replaced by new staff members, though with a minimum salary increment.

Score: From 2 to 2 (No change)

1.4. Organizational structure: 'Existence of clear organizational structure reflecting the objectives of the organization'

Observable indicator: Staff have copy of org structure and understand this

OSRA generally has a well-established structure both in terms of governance and management.

Score: From 4 to 4 (No change)

1.5. Articulated strategies: 'Strategies are articulated and based on good situation analysis and adequate M&E'

Observable indicator: strategies are well articulated. Situation analysis and monitoring and evaluation are used to inform strategies.

Strategies are done by external consultants with good situation analysis. In terms of utilization of M&E in the preparation of the strategic plan, the experience is limited. M&E is used mainly for accountability purposes and operational management (when preparing annual plans.). The slight improvement seen in this is with regard to the capacity created to collect outcome related information which was used in the operational management.

Score: From 2.5 to 3 (slight improvement)

1.6. Daily operations: 'Day-to-day operations are in line with strategic plans'

This is about the extent to which day-to-day operations are aligned with strategic plans.

There has been considerable improvement as staffs have been skilled to accomplish planned activities and make timely reports. Resources have been mobilized from different sources and field staffs were able to improve their planning, monitoring and follow up, and reporting skill through training and coaching.

Area office staff is engaging in plan preparation for quarterly and monthly implementation operations in a flexible manner, based on their local context. They also have been undertaking review meetings with all the stakeholders to adjust plans. This is the improvement the organization has brought through learning from experiences and adaption from others that have been engaging in similar activities through networking. Technical staff was capacitated planning, timely implementation and reporting and this has supported the operational planning. The organization was established by founders who had a vision to change the community of their origin. Therefore, they always try to see how the daily operations are in-line with the goal ascribed in the strategy. The board (founders) follow the progress and activities of the organization and make sure the activities are in-line with the strategy. However, some staffs noted that there is no change in this regard and there is lack of funding and they are unable to recruit additional competent staff.

Score: From 4 to 4 (no change)

1.7. Staff skills: 'Staff have necessary skills to do their work'

This is about whether staff have the skills necessary to do their work and what skills they might they need.

Different on-the-job trainings have been carried out to upgrade or improve staff skills. The field staff has improved skills in project planning, implementation, monitoring and timely reporting and documentation through training and coaching. Efforts were made to focus on outcomes rather than outputs in their reports. Accordingly, significant changes have been observed in the quality of the reports. Area offices have been able to prepare their plan and identify outcome-related data and reports. In addition, they are able to identify client needs, prepare and/or modify reporting format through experience sharing with experienced workers. Other topics staff were trained on include: Training of Trainers (TOT) on the Programmatic approach; Downward Accountability & Client Feedback Mechanisms; TOT on Gender Mainstreaming in value chain; Environmental Protection (Disaster Risk Reduction Management (DRRM)); in different project management capacity building trainings and opportunities (most staff). It is not clear who exactly benefitted from these different trainings. For more info please see indicators 1.8.

Some staffs noted that there is still a lack of skill to develop winning proposals both at area office level and at head office. That is the reason why OSRA has no new donors since the baseline except the existing one. Besides, there is also a gap in maintaining skilled and trained staff. Few staff on the other hand noted that the situation is similar with the baseline period in this particular issues.

Score: From 4 to 4 (No change)

1.8. Training opportunities: 'Appropriate training opportunities are offered to staff'

This is about whether staff at the SPO are offered appropriate training opportunities

An OSRA staff training needs assessment to identify skill gaps was undertaken at various levels and trainings were provided on different topics since the baseline. As a result of the training needs assessment the respective area offices submitted their training needs, and actions have been taken by the organization. OSRA provided training opportunities for staff members, especially for area office coordinators and officers. To mention some of the trainings, Training of Trainers (TOT) on the Programmatic approach by ICCO alliance in Kampala, Uganda in 2012; the National Seminar on Downward Accountability & Client Feedback Mechanism conducted in Addis Ababa, Ethiopia in 11 December 2012; and a TOT on Gender Mainstreaming in value chain by the facilitation of FNS. ICCO has also provided training on Environmental Protection (Disaster Risk Reduction Management (DRRM)) and most staff members participated in different project management capacity building trainings and opportunities. ICCO has also made some arrangements to capacitate OSRA staffs through engagement in different functions to improve the effectiveness and efficiency of program/project implementation by ensuring gender equity and participation to obtain benefits particularly from the grain value chain project. OSRA has also started to support upgrading of staffs educational status since the baseline. Some staffs have been able to attend further education (first degree or second degree) through self-sponsorship and the organization has allowed the time they spent for education. However, some staffs indicated that there was no significant change regarding staff training opportunities took place since the baseline, since these were not created particularly for area office staff compared to staff at the head office. Most of the trainings like DRR, ICT, exposure visits, value chain were organized and supported by ICCO/CFA and other donors like CCRDA.

Score: From 3 to 3.5 (Slight improvement)

1.9.1. Incentives: 'Appropriate incentives are in place to sustain staff motivation'

This is about what makes people want to work here. Incentives could be financial, freedom at work, training opportunities, etc.

The organization has made efforts to improve its staff remuneration. Consequently, it has revised its salary scale; HR policy, and introduced limited loan schemes for staff in case the need arises. OSRA has improved job grades (improvements responsibilities and improved salaries) and salary benefits compared to the baseline. Though staffs are still not satisfied. OSRA has made adjustments to some degree to increase staff benefits in the form of salary and other incentives such as awards for best performing staffs working on Value Chain programs, allowance for transportation etc. However,

according to some staff members the new salary increment made by OSRA is not sufficient compared to other NGOs and the government payment scale.

Score: From 2 to 2.5 (slight improvement)

1.9.2. Funding sources: 'Funding from multiple sources covering different time periods'

This is about how diversified the SPOs funding sources are over time, and how the level of funding is changing over time.

The source of funding has been diversified to some extent and the level of funding has been increasing over time since the baseline. For instance, the total annual budget of the SPO has increased by about 30%. Moreover, the SPO has managed to secure funding for multi-year (3-5 years) projects like water & sanitation, and livelihood projects. OSRA has also managed to get a co-financer (ICCO) that can enable the SPO to address more target groups in its projects (IICD funded). Generally a slight improvement has been noticed in the fund-raising drive where few funds were obtained like from HAM Foundation and the Water & Sanitation projects (IICD). However, some staffs noted that there is nothing new in this regard since the baseline except the establishment of a Fundraising Income Generation unit led by the Fundraising manager.

Score: From 3.5 to 4 (Slight improvement)

1.9.3. Funding procedures: 'Clear procedures for exploring new funding opportunities'

This is about whether there are clear procedures for getting new funding and staff are aware of these procedures.

OSRA has revised its organizational structure in a way that includes fundraising, proposal development and income generation as a designated unit/department that is responsible for resource mobilization. This newly established fundraising - income generation unit is led by the fundraising manager. OSRA staff have improved awareness on the organization's funding strategy. The organization has developed forms that will help to collect and report at outcome and impact level. OSRA has also started to report case studies. To realize this, ICCO has supported the organization in different ways: through providing linkages to build capacity in fundraising; training on Most Significant Change (MSC); organize downward accountability experience sharing meeting; and conducting client satisfaction assessments for charting growth directions for OSRA. However, the new department is not well organized or functional yet according to some staffs.

Score: From 3 to 3.5 (Slight improvement)

Summary of capability to act and commit

OSRA has built on its experiences to bring changes and has strived to build consensus and collective decision-making. As indicated in the baseline period, OSRA has a participatory, open, responsive and transparent leadership style, since then OSRA has become more assertive and sharpened up their operational strategy after the change in management (new director). In terms of the strategic guidance, the board has initiated the study on charting growth directions for OSRA and this has helped to create a new department unit (fundraising- income generation department). On the other hand, OSRA has revised remuneration packages of staff; changed HR policy, and introduced limited loan schemes for staff for emergencies. However, some staff members said they still were not satisfied and hence more staffs resigned from the organization. Staff training needs assessments were undertaken to identify skill gaps at various levels and trainings were provided on different topics since the baseline. Staffs have improved their skill through different on-the-job trainings to accomplish planned activities and make timely reports. As a result the organization is better focused and has a good impact on the ground. Other trainings included: training of trainers on programmatic approach; downward accountability and client feedback mechanisms; environmental protection; and project management. Some of these have been funded by ICCO. The source of funding has been diversified to some extent and the level of funding has been increasing over time since the baseline. This is because OSRA has revised its organizational structure in a way that includes fundraising, proposal development and income generation as a designated unit/department that is responsible for resource mobilization. Besides, staff have been well aware on the organization funding strategy.

Score: from 3.2 to 3.4 (very slight improvement)

Capability to adapt and self-renew

2.1. M&E application: 'M&E is effectively applied to assess activities, outputs and outcomes'

This is about what the monitoring and evaluation of the SPO looks at, what type of information they get at and at what level (individual, project, organizational).

OSRA has made some improvement in this area through a focus on outcomes to address strategic issues during planning and targeting. An M&E data collection guideline and manual are under preparation. There has been a slight improvement of focus on data collection at field level with orientation to impact and outcome levels. The organization's performance evaluation and implementation capacity has improved, and this was evident on the report of zero grazing where OSRA has improved access to market information through providing a market data information system for Farmer Market Organizations (FMOs) using ICT. ICCO has been supporting OSRA to effectively implement its M&E activities through providing technical support, training and introduction of various approaches. The organization has developed forms that will help to collect and report at outcome and impact level. OSRA has also started to report case studies. To realize this, ICCO has supported the organization in different ways: training on Most Significant Change (MSC) technique; downward accountability experience sharing meeting; and conducting client satisfaction assessments for charting growth directions for OSRA. The downward accountability meeting, the staff satisfaction study, organizational commitment to build up own experiences, learning from experiences and ICCO staff monitoring visits were indicated as the contributing factors for the improved efforts of OSRA to change its previous approach and style of monitoring. However, some staff members indicated that limited attention is given to impact level changes and documentation of information.

Score: From 3 to 4 (improvement)

2.2. M&E competencies: 'Individual competencies for performing M&E functions are in place'

This is about whether the SPO has a trained M&E person; whether other staff have basic understanding of M&E; and whether they know what information to collect, how to process the information, how to make use of the information so as to improve activities etc.

Two M&E teams were established, both at area and head office level. Each team has their own regular M&E session, and there exists a stronger working relationship between the two teams. Staff members have mentioned that they have improved their knowledge and skills through experiences and exposures in applying M&E. A monitoring officer, who is responsible to coordinate M&E activities has improved his skill in collecting and analysing information as a result of the ICT based interventions through the financial support of IICD (C4C alliance). Area office staff has been well oriented and has started to report and document changes observed at result and outcome level since the baseline. The downward accountability meeting, and the staff satisfaction study, organizational commitment to build up own experiences, learning from experiences and ICCO staff monitoring visits were indicated as the contributing factor for the improved efforts of OSRA to change its previous approach and style of monitoring.

There has been considerable improvement as staff members have been trained to accomplish planned activities and make timely reports. Resources have been mobilized from different sources and field staff was able to improve their planning, monitoring and follow up, and reporting skill through training and coaching. Efforts were made to focus on outcomes rather than outputs in their reports. Accordingly, significant changes have been observed in the quality of the reports.

Score: From 3 to 4 (improvement)

2.3. M&E for future strategies: 'M&E is effectively applied to assess the effects of delivered products and services (outcomes) for future strategies'

This is about what type of information is used by the SPO to make decisions; whether the information comes from the monitoring and evaluation; and whether M&E info influences strategic planning.

In this regard, there has been a slight change in terms of focus at the level of outcomes and impact, and in terms of processing and utilizing the information. Staffs have received slightly more information and orientation on the information produced from M&E and how it relates to the OSRA's future strategic direction. OSRA has started to incorporate outcome and impact level monitoring, and reporting and feedback has been provided on reports focusing on outcomes rather than activities and

outputs level. The results obtained from M&E is used for developing new strategies or scaling-up best practices. For example, a women self-help group intervention implemented in one area was expanded to other areas based on the results collected during M&E by the SPO. An M&E manual is under preparation and area office staff members are being trained in M&E concepts and approaches through exposure visits. The organization has also built its experiences and is committed to providing timely feedback after M&E so as to give directions for future project implementation.

Score: From 2.5 to 3.5 (improvement)

2.4. Critical reflection: 'Management stimulates frequent critical reflection meetings that also deal with learning from mistakes'

This is about whether staff talks formally about what is happening in their programs; and, if so, how regular these meetings are; and whether staff are comfortable raising issues that are problematic.

There has been an improvement in the frequency of staff meetings to deal with programmatic issues together with management. In these meetings the context environment is scanned and this has contributed to the effectiveness in program/project implementation. The PME capacity has improved, hence a stronger need is felt to reflect on lessons learnt. This has induced the higher frequency of staff meetings. Consequently, the organization has started to organize regular meetings: monthly meetings for the management, quarterly meetings for both the management and technical staffs only and annual meetings for the whole staffs. The commitment and experience of the management to enhance critical reflection, field visit report and feedback of MFS II guests, review meetings with key stakeholders to learn from mistakes, and experiences and knowledge obtained over time were indicated as major factors for the improved situation of critical reflection in OSRA. However, some staffs noted that meetings have not been organized for critical reflection since the baseline.

Score: From 3 to 3.5 (slight improvement)

2.5. Freedom for ideas: 'Staff feel free to come up with ideas for implementation of objectives'

This is about whether staff feel that ideas they bring for implementation of the program are welcomed and used.

Staff inputs are highly appreciated in OSRA and they have been encouraged to feel free to come up with new ideas. It was observed that OSRA staff, especially technical staff, were free to forward ideas that contribute to the effectiveness and efficiency of program planning and implementation of activities. The valuable commitment of the organization to accommodate new ideas and appreciate free ideas of staff members, the training given on leadership and management, along with improved experiences and skills of individual staff members has helped to improve freedom of ideas. According to some staff, the report included in the baseline makes mention of some complaints of the field staff and this has triggered the current observed change in OSRA. Besides, ICCO and other donors like CCRDA continuously encourage staff freedom to come up with different ideas and learning in a recognized manner.

Score: From 3 to 3.5 (slight improvement)

2.6. System for tracking environment: 'The organization has a system for being in touch with general trends and developments in its operating environment'

This is about whether the SPO knows what is happening in its environment and whether it will affect the organization.

Environmental scanning has been undertaken by OSRA to identify factors affecting effective implementation of programs/projects. OSRA has improved membership in networks and forums in the period of the baseline and recently the organization has become a member of the WASH Alliance, led by the Water Aid and by the Food security and Environmental forum after the baseline survey in addition to the existing ones. OSRA has conveniently integrated ICT based interventions into their FED program activities, especially to access market information using mobile phones. Most of these issues have not changed since the baseline at OSRA: for example, there are still regular review meetings with stakeholders. Regular exchanges of ideas, experience sharing within consortium and networks, the interest of ICCO and other donors to work in a consortium and compete for new funding forced the management to align with other organisations. Furthermore, a consortium of Oromia NGOs sends donor updates about calls for proposals through email regularly. The staff at the area office are

supported by the officers from the head office to discern factors negatively affecting the normal performance of OSRA.

Score: From 3 to 3.5 (Slight improvement)

2.7. Stakeholder responsiveness: 'The organization is open and responsive to their stakeholders and the general public'

This is about what mechanisms the SPO has to get input from its stakeholders, and what they do with that input.

In this regard, OSRA has good experience particularly in organizing regular meetings with stakeholders during project launching, planning, review workshops, reporting and feedback sessions. Stakeholders are fully engaged in the whole project process and there is always room to collaborate and work with stakeholders. This is due to the fact that OSRA has a commitment to sustain the strong relationship it has with stakeholders. Besides, the organization also provided training of key stakeholders on important issues when it is required according to some staff members.

Score: From 4 to 4 (No change)

Summary of capability to adapt and self-renew

Outcome and impact level data collection has started and an M&E data collection guideline and M&E manual are under preparation. The organization has developed forms that help to collect and report at outcome and impact level. OSRA has also started to report case studies. To realize this, ICCO has supported the organization in different ways: training on Most Significant Change (MSC) technique; downward accountability experience sharing meeting; and conducting client satisfaction assessments for charting growth directions for OSRA. In addition to this, the organizational commitment to build up own experiences, learning from experiences and ICCO staff monitoring visits were indicated as the contributing factors for the improved efforts of OSRA to change its previous approach and style of monitoring.

Area office staff is well oriented and has started to report and document changes observed at result and outcome level since the baseline. The organization performance evaluation and implementation capacity has improved. Besides, the results obtained from M&E are used for developing a new strategy or scaling-up best practices after the baseline. Staff members are able to reflect their ideas freely and there has been improvement in the frequency of staff meetings to deal with programmatic issues together with management. In these meetings the context environment is scanned, which has contributed to the effectiveness in program implementation. Staff inputs are highly appreciated in OSRA and they have been encouraged to feel free to come up with new ideas. Environmental scanning has been undertaken by OSRA to identify factors affecting effective implementation of programs/projects. OSRA has good experience particularly in organizing regular meetings with stakeholders during project launching, planning, review workshops, reporting and feedback sessions. Hence, stakeholders are fully engaged in the whole project process and there is always room to collaborate and work with stakeholders.

Score: from 3.1 to 3.7 (slight improvement)

Capability to deliver on development objectives

3.1. Clear operational plans: 'Organization has clear operational plans for carrying out projects which all staff fully understand'

This is about whether each project has an operational work plan and budget, and whether staff use it in their day-to-day operations.

Unlike during the baseline, operational plans are made per project and further reviewed at head office level to endorse towards the government agency and partners. Generally planning is shifted from a top down to a bottom up approach, and has become more participatory. This is due to the fact that gaps were identified during M&E at field level where the field staff members were complaining about the existing planning process and commitment of the management body to understand and act on the problem. The organization has facilitated a participatory planning session with all staff & stakeholders, thus all staff clearly understand their specific project activity. Staff now use the operational work plan and budget as a guiding framework for their day-to-day operations. All staff members are well informed during annual planning or technical review meeting, project launching, and during periodic

monitoring and reporting. However, some staff members noted that the operational plan would be modified by the program manager at the head office level after it is prepared by the field staff. These modifications are generally considered fine by field staff. Changes have been made to ensure participation of technical staff at the area offices while developing annual operational plans in order to contextualize and allow them to include their ideas.

Score: From 4 to 4.25 (Slight improvement)

3.2. Cost-effective resource use: 'Operations are based on cost-effective use of its resources'

This is about whether the SPO has the resources to do the work, and whether resources are used cost-effectively.

Oromo Self Reliance Association (OSRA) has no vehicle at area office level (there are three area offices namely; Tulu Bolo, Adaberga and Dukem area offices). They are used to sharing offices, desktop computers and motor bicycles for their day to day operations. Besides, the audit report for the year ending 31st December 2013 gave a fair opinion concerning the financial statements of OSRA. No issues were mentioned on the management letter. OSRA financial Report figures for 2011 are consistent with the figures in the Audit Report. ICCO income is visible in the Audit Report. The quality of the Audit report is very high and very understandable. Generally, the audits show that financial resources have not been wasted.

Score: From 4 to 4 (no change)

3.3. Delivering planned outputs: 'Extent to which planned outputs are delivered'

This is about whether the SPO is able to carry out the operational plans.

In this regard, most of the staff assessments and interview results showed that OSRA has not changed in the delivery of planned outputs since the baseline. This is due to the fact that the organization has not engaged in very big projects and hence there is no major difference in output delivery. However, according to the interview with program staff, most of the activities are achieved beyond the plan and reports are delivered on a timely basis as usual. This is also supported by the CFA assessment sheet where it is indicated that OSRA has submitted reports timely, though there are sometimes delays as a result of consolidation of information from the field.

Score: From 4 to 4 (No change)

3.4. Mechanisms for beneficiary needs: 'The organization has mechanisms in place to verify that services meet beneficiary needs'

This is about how the SPO knows that their services are meeting beneficiary needs

OSRA has maintained its strong experience to verify beneficiary needs and there are no clear observed changes in mechanisms for verifying beneficiary needs since the baseline. The self-assessment sheet information indicated that OSRA has a beneficiary needs assessment mechanism with participation of beneficiaries, gender based and with no discrimination of sex, age, disabilities and ethnics. Reports also indicated that selection of project beneficiaries was undertaken based on criteria which have been set jointly with all stakeholders at the local level.

Score: From 4 to 4 (no change)

3.5. Monitoring efficiency: 'The organization monitors its efficiency by linking outputs and related inputs (input-output ratios)'

This is about how the SPO knows they are efficient or not in their work.

Though indicated in the baseline, the SPO has not designed a new tool to calculate input-output ratio so as to monitor efficiency. The training on RBM (Results Based Management) in 2013 by Trocaire/SCIAF/CAFOD (CST joint Ethiopia office, Sustainable Livelihoods) and the improved experience of staff members through time and exposure long with community feedback was also said to have helped to crudely compare inputs with outputs. Monitoring guidelines are under preparation and there was discussion on results. On the other hand, CSt (Cafod/SCIAF/Trocaire) has introduced a new model (logic model) to monitor efficiency to see results based management and suggested to go through with this approach in the future. However, there is no evidence whether the organization has applied this.

Score: From 2.5 to 2.75 (very slight improvement)

3.6. Balancing quality-efficiency: 'The organization aims at balancing efficiency requirements with the quality of its work'

This is about how the SPO ensures quality work with the resources available

OSRA has prepared quality of work monitoring tools and these have been communicated to staff members. In this regard, minimum standard guidelines developed by different donors have helped the organization to measure quality of work based on the set guidelines. OSRA's project management approach was also significantly efficient and appropriate to attain the expected outputs and outcomes of the project. To ensure the efficiency of the project implementation in light of the required inputs and outputs/outcomes, the organization has followed a well-designed project management plan. The organization has also dealt with project quality management as one of the most valuable project implementation processes. The discussion made with area office staffs and the relevant stakeholders revealed that the planning, the day to day monitoring, control and involvement of the stakeholders at every level of operation were the standard processes employed by the organization to undertake project quality management.

Score: From 3 to 4 (improvement)

Summary of capability to deliver on development objectives

Generally, planning is shifted from a top down to a bottom up approach, and has become more participatory as operational plans are made by projects and further reviewed at head office level to endorse towards the government agency and partners. The Oromo Self Reliance Association (OSRA) has used shared offices, desktop computers and motor bicycles for their day to day operations and hereby aims to use its resources cost-effectively. The training on RBM (Results Based Management) in 2013 by CAFOD/SCI AF/Trocaire and the improved experience of staffs through time and exposure along with community feedback has helped to crudely compare inputs with outputs and thus measure efficiency. OSRA has prepared quality of work monitoring tools and communicated these tools to staff members and minimum standard guidelines developed by different donors has helped the organization to measure quality of work. OSRA's project management approach (more decentralised decision-making and planning) was also significantly efficient and appropriate to attain the expected outputs and outcomes of the project. OSRA has maintained its strong experience to verify beneficiary needs and there are no clear observed changes in mechanisms for verifying beneficiary needs since the baseline. There have been no changes in terms of delivering planning outputs and generally this is done according to plan.

Score: from 3.6 to 3.8 (very slight improvement)

Capability to relate

4.1. Stakeholder engagement in policies and strategies: 'The organization maintains relations/ collaboration/alliances with its stakeholders for the benefit of the organization'

This is about whether the SPO engages external groups in developing their policies and strategies, and how.

In this regard, OSRA has a good track record in the involvement of stakeholders in its policies and strategies along with engagement with program formulation and implementation. Hence, the OSRA has been committed to maintain this good track record after the baseline.

Score: from 4 to 4 (No change)

4.2. Engagement in networks: 'Extent to which the organization has relationships with existing networks/alliances/partnerships'

This is about what networks/alliances/partnerships the SPO engages with and why; with they are local or international; and what they do together, and how do they do it.

OSRA, as observed in the baseline period, is a member of various networks and consortia that helped the organization to gain experience and best practices both at the local and the international level. Hence, according to the majority of self-assessment and interview results, OSRA has maintained networking and experience sharing with all its development alliances in a sustainable manner since the baseline. However, according to the report on the zero grazing project, although different forums have

been organized to create linkages with various stakeholders particularly at local level, additional efforts and commitment of all concerned stakeholders is needed to establish effective linkages and networking to improve the services given to the farmers in the project areas. Hence, there was limited coordination among the stakeholders and this was evident where the coordination and collaborations planned with WASASA and/or other financial service institutes was not effectively done.

Score: From 4 to 3.5 (Slight deterioration)

4.3. Engagement with target groups: 'The organization performs frequent visits to their target groups/beneficiaries in their living environment'

This is about how and when the SPO meets with target groups.

The self-assessments and interview results indicated that the situation observed during the baseline has continued in a strongly improved manner in this particular indicator. OSRA has made a great deal of effort in engaging target groups in project planning and M&E phases. This is due to the fact that the organization has appreciated and utilized donor recommendations, gained feedback from MFS II expertise field reports, and improved leadership and management. OSRA has well set up outreach covering substantial numbers of target groups, through convenient integration of ICT solution based interventions into their FED program activities. The annual narrative report on zero grazing for 2013 revealed that OSRA has organized community sensitization sessions during project launching to create awareness and familiarize the communities with project objectives, strategy, and implementation approaches. The organization has established target group selection criteria together with stakeholders, and facilitated review meetings and experience exchange among farmers in the target areas. Therefore, the interest of the community members to participate in the project was considered with due attention.

Score: From 4 to 4.5 (Slight improvement)

4.4. Relationships within organization: 'Organizational structure and culture facilitates open internal contacts, communication, and decision-making'

How do staff at the SPO communicate internally? Are people free to talk to whomever they need to talk to? When and at what forum? What are the internal mechanisms for sharing information and building relationships?

OSRA has improved access to telephone and internet connection and networks at head and field offices. This has facilitated efficient communication and information exchange among staff members since the baseline. Staff members are able to communicate freely both horizontally and vertically and ideas are shared and recognized. The ICT project supported by ICCO has improved the organizational communication capacity from CDMA (code division multiple access) to broad band at head office level and area offices use CDMA for internet services. The existence of a clear organizational structure and transparent leadership has also helped to improve relationships within OSRA. Besides, OSRA has organized regular meetings for staff and some trainings (such as training on basic computer skills by MFS II and SPSS software training in 2013 by Dot Ethiopia) have improved staff communication which in turn helped good relationship within organization. Commitment within the organization to enhance information technology in organization for day to day activities is also mentioned by some staff members.

Score: From 3.5 to 4 (Slight improvement)

Summary of capability to relate

OSRA has a good track record in the involvement of stakeholders in policies and strategies along with engagement with program formulation and implementation. The organization has also maintained networking and experience sharing with its all development alliances in a sustainable manner since the baseline. However, according to the report on the zero grazing project, although different forums have been organized to create linkages with various stakeholders, particularly at local level, there is still a need for additional efforts and commitment of all concerned stakeholders to establish effective linkages and networking to improve the service given to the farmers in the project areas. OSRA has made a great deal of effort in engaging target groups in project planning and M&E phases. Hence, OSRA has well set up outreach covering substantial numbers of target groups which has conveniently integrated ICT solution-based interventions into their FED program activities. It has improved access to telephone and internet connections and networks within the head and field offices. This has

facilitated efficient communication and information exchange among staff members since the baseline. Staff members are able to communicate freely both horizontally and vertically, and ideas are shared and recognized. The ICT project supported by ICCO has improved the organization communication capacity from CDMA to broad band at head office level, and area offices use CDMA for internet services.

Score: from 3.9 to 4.0 (very slight improvement)

Capability to achieve coherence

5.1. Revisiting vision, mission: 'Vision, mission and strategies regularly discussed in the organisation'

This is about whether there is a vision, mission and strategies; how often staff discuss/revise vision, mission and strategies; and who is involved in this.

The mission and vision of OSRA are regularly discussed, internalized and popularized since the baseline. Hence, there is an improvement in this regard due to regularity and efficient participation of the board and staff particularly in strategy and policy formulation. This was induced by the focus on the graduation of Farmer Marketing Organizations (FMOs) to make them independent from OSRA support. The necessity to have a good strategy to attract funding has been also considered as major priority. However, and the mission and vision have not changed since the baseline.

Score: From 3.5 to 3.75 (very slight improvement)

5.2. Operational guidelines: 'Operational guidelines (technical, admin, HRM) are in place and used and supported by the management'

This is about whether there are operational guidelines, which operational guidelines exist; and how they are used.

Operational guidelines are available and used regularly as indicated during the baseline. However, OSRA has revised and updated the HRM, accounting, and financial policy manuals and procedures in November 2012. Based on these manuals new financial formats, procurement guideline and procedures have been developed, and the petty cash regulation has changed since the baseline. The organization felt the need to revise and develop manuals and guidelines due to donor requirements and the management realized the problem. Finally, training on leadership and HR by CCRDA has also helped in developing operational guidelines.

Score: From 3.5 to 4.5 (improvement)

5.3. Alignment with vision, mission: 'Projects, strategies and associated operations are in line with the vision and mission of the organization'

This is about whether the operations and strategies are line with the vision/mission of the SPO.

According to narrative and financial reports on zero grazing, the intervention strategies of the project were well articulated in systematic ways and they were significantly correlated with the organization's stated objectives. In similar ways, the overall approaches and implementation activities of the project were appropriately fitting to the organization's intervention strategies. Hence, OSRA has been implementing project interventions in line with the vision and mission of the organization since the baseline.

Score: From 4 to 4 (No change)

5.4. Mutually supportive efforts: 'The portfolio of project (activities) provides opportunities for mutually supportive efforts'

This is about whether the efforts in one project complement/support efforts in other projects.

Similar to the situation during the baseline period, there is strong complementarity among all programs and most of the programs/projects are integrated and are being implemented in a holistic manner in OSRA.

Score: From 4.5 to 4.5 (No change)

Summary capability to achieve coherence

The mission and vision of OSRA have been regularly discussed, internalized and popularized since the baseline. Hence there is an improvement in revisiting the organization's vision and mission due to

regularity and efficient participation of the board and staff, particularly at strategy and policy formulation. OSRA has revised and updated the HRM policy manuals and accounting and financial procedures in November 2012. Based on these manuals new financial formats, procurement guideline and procedures have been developed, and the petty cash regulation has changed since the baseline. Besides, the intervention strategies of the project were well articulated in systematic ways and they were significantly correlated with the organization's stated objectives. In similar ways, the overall approaches and implementation activities of the project were appropriately fitting to the organization's intervention strategies. There is still a strong complementarity among all programs. They are integrated, and being implemented in a holistic manner in OSRA as indicated in the baseline.

Score: from 3.9 to 4.2 (Slight improvement)

Report CDI-15-056

The Centre for Development Innovation works on processes of innovation and change in the areas of food and nutrition security, adaptive agriculture, sustainable markets, ecosystem governance, and conflict, disaster and reconstruction. It is an interdisciplinary and internationally focused unit of Wageningen UR within the Social Sciences Group. Our work fosters collaboration between citizens, governments, businesses, NGOs, and the scientific community. Our worldwide network of partners and clients links with us to help facilitate innovation, create capacities for change and broker knowledge.

The mission of Wageningen UR (University & Research centre) is 'To explore the potential of nature to improve the quality of life'. Within Wageningen UR, nine specialised research institutes of the DLO Foundation have joined forces with Wageningen University to help answer the most important questions in the domain of healthy food and living environment. With approximately 30 locations, 6,000 members of staff and 9,000 students, Wageningen UR is one of the leading organisations in its domain worldwide. The integral approach to problems and the cooperation between the various disciplines are at the heart of the unique Wageningen Approach.

PART 0 – INTRODUCTION

Dear Sir/Madam, we work for IFPRI. We would like to ask you some questions about your household food production, utilization and income. Taking part in this study is voluntary. If you choose to take part, you have the right to stop at any time and there will be no consequences. We would like to thank you for your full cooperation in advance.

(Enumerator: I have completed the informed consent process on the first page prior to administering the questionnaire. Enumerator's name and ID:)

1	Name of the head of household	
2	Sex of the head (0=female, 1=male)	
3	Telephone no. of the household head or other household member	
4	First name of the respondent (<i>given name</i>) and Sex <input type="checkbox"/>	
5	Middle name of the respondent (<i>father's name</i>)	
6	Last name of the respondent (<i>grand father's name</i>)	
7	Relationship of respondent to head of household (<i>codes A</i>)	
8	Date of Interview (" dd/ mm/ yyyy ") <i>Gregorian calendar</i>	/ / 2012
9	Time the interview started, 24 hour clock (" hh: mm ")	:
10	Time the interview ended, 24 hour clock (" hh: mm ")	:

5. Monthly cash expenditures

	Item name	(5.1) In the last 30 days did your household spend money on this item? (0=no, 1=yes)	(5.2) How much did the household spend on the item in the last 30 days ? [ETB]
1	Grain milling charge		
2	Electricity		
3	Water bill		
4	Soap/washing & cleaning products		
5	Personal care (barber, hair dresser, toothpaste, etc)		
6	Transport expenses		
7	Communication (cell phone charging and air time, mail, \		
8	Entertainment (socializing)		
9	House rent/mortgage payment		
10	Iddir contribution		
11	Hired labor		
12	Other, specify		

6. Less frequent expenditures (in the last 12 months)

	Item name	(6.1) In the past 12 months , did your household spend money on [ITEM]? (0=no, 1=yes)	(6.2) How much did the household spend on [ITEM] in the last 12 months ? (ETB)
1	Clothes and shoes (including school uniforms)		
2	Furniture (tables, chairs, beds, etc)		
3	Blankets/bedsheets		
4	School fees and other educational expenses		
5	Social events (wedding, funeral, etc)		
6	Housing improvement (latrine, new roof, etc)		
7	Human health expenses (medicine, hospital , ...)		
8	Vehicle purchase or repair (car, bicycle, motorcycle)		
9	Contributions & membership fees (associations/church/sports etc)		
10	Taxes		
11	Bond		
12	Other, specify		

Identification code	Zone	District	PA	HH	Ind.

PART III CROPS

7. Crop production and consumption

7.1	Do you or your household own land for agricultural activities (crop, forage, livestock production) 1. Yes 0. No				
7.2	If yes to Q7.1, how much land does your household own? (ha)				
7.3	Did you or any member of your household engage in crop production during 2012 crop season? 1. Yes 0. No				
7.4	If yes to Q 7.3, Did you use any of the produce for home consumption? 1. Yes 0. No				
7.5	<i>List all crops consumed (Code)</i>	(7.6) How much did you produce?		(7.7) How much did you consume?

1. Introduction

This paper provides an evaluation of the Zero Grazing of the Oromia Self Reliance Association (OSRA) financed by ICCO within the MFSII framework for the Dutch Ministry of Foreign Affairs. In this evaluation, we try to answer the following questions:

1. What are the changes under MDG1 -to eradicate poverty and hunger, during the 2012 – 2014 period and what are the differences between the target group and comparable households in 2012?
2. To what degree are these changes and differences attributable to the development interventions of OSRA (i.e. measuring effectiveness)?
3. What is the relevance of these changes?
4. Were the development interventions of OSRA efficient?
5. What factors explain the findings drawn from the questions above?

In addition to this, we did an evaluation of the first phase of the project, which ended in 2012. We observe limited impact of both phases. During phase 2, we observe an increase in the average amount of fodder produced, which could directly result from the project. Also total expenditure increased in the project areas compared to the control areas. However, we cannot explain this from the project activities, as we hardly observe dairy sales and increased self-consumption of dairy (which we cannot statistically prove) cannot realistically be large enough to explain this difference. We do not see adoption of zero grazing or a change in herd composition towards improved cattle. The limited impact is likely to be due at least partly to the lack of a marketing component in the project: if farmers do not have access to a market for dairy products, incentives for productive investments are very limited.

The structure of the paper is as follows. We first present the context of smallholder livestock production in the target districts and give a description of the project. Subsequently, we present the methodology and data. This is followed by an analyses of the results, an discussion, and a conclusion.

2. Context¹

After experiencing severe country-wide famines in both the 1970s and 1980s, Ethiopia seems to have ventured on a pathway towards development and food security. Since 1992, the Ethiopian Government has adopted a strategy of Agricultural Development-Led industrialization, which involved substantial liberalisation of the economy. Per capita incomes increased by over 50 percent from 2001 to 2009, and poverty rates declined by 33 percent from the mid-1990s to 2011 (www.WorldBank.org). Yet the poverty rate is still high at 30% and the food security situation is precarious. In the past two decades there have been several major, though localized, food production shortfalls, and even in normal years an estimated 44 percent of the population is undernourished (Schmidt and Dorosh, 2009). Further broad-based development is thus needed to improve the situation of the remaining poor and food insecure. Though growth in industry and services has outpaced agricultural growth, the latter has made a major contribution to overall growth and has been essential for poverty alleviation.

A recent study on strategic priorities for agricultural development in Eastern and Central Africa concludes that milk would be the most important commodity subsector for growth-inducing investment and that milk is especially important for Ethiopia, Eritrea, and Sudan (Omamo et al, 2006). Ethiopia's dairy sector holds a large potential for development (Ahmed et al, 2004; Negassa et al, 2012). Income and population growth are expected to lead to substantial increases in the demand for dairy. On the supply side, the country holds the largest livestock population in Africa, and the climate is suitable for dairying (Ahmed et al, 2004). Yet compared to the neighbouring countries, the government has done little to improve the dairy sector and its productivity is low (Negassa et al, 2012).

Development of the dairy sector may positively affect the lives of many people, as production is spread widely over the rural population. The traditional smallholder system produces 97 percent of Ethiopia's total milk production (Ahmed, et al 2004). Most milk is produced in the highlands on farms with mixed-crop livestock production systems and, increasingly scarce, communal grazing lands. Milk is mainly used for home consumption, and the marketed surplus is small. Households on average own two to four cattle, of which 45 percent are draft cattle and 25 percent is used for dairy production (Negassa et al,

¹ This section is partly based on an early paper based on the baseline data: Elisabetta De Cao, Chilot Y. Tizale, Marrit van den Berg, and Tefera Wondwosen (2013). Paper presented t the CSAE Conference 2013: Economic Development in Africa, Oxford , UK, 17th - 19th March 2013.

2012). Most cattle are of indigenous breeds, with low production levels compared to crossbreds or exotic breeds.

Not just the production, but also marketing and processing is generally informal and small scale. Only a very small portion of the production is industrially processed. The remainder is administered by cooperatives and smallholders. These cottage dairy products and the fresh fluid milk are sold and consumed locally. Even in the dairy market in Addis Ababa, the majority (75%) of the products sold come from traditional processing; 17% are processed in local industry and 8% is imported (Francesconi, 2009).

The OSRA Zero Grazing project targets dairy production in ten rural kebeles in four districts in the neighboring Special Zone and East Shewa Zone of Oromia National Regional State: Akaki, Ada'a, Gimbichu, and Sebata. These districts are located close to the capital, Addis Ababa (35-45 km), but infrastructure is poorly developed. The main economic activity in the area is agriculture, as is common in the Ethiopian highlands. The area is characterized by black cotton soils, and rainfall is adequate and evenly distributed. The principal crops produced are teff, chickpea and wheat. As a secondary activity, the farmers engage in livestock rearing for draught power, food, income and asset accumulation. Mostly, farmers rear different types of local livestock, and the returns from the rearing activities are low and declining. As the majority of the farmland has been allocated to crop production, only small pieces of land, such as road sides, are left for grazing. As a consequence, crop residuals are the main source of food for the animals, accounting for more than 50% of the annual requirements.

In the years before the project, there have been several attempts to boost dairy production and incomes, but these have not resulted in substantial changes in the sector. In collaboration with district agricultural offices, Debreziet Agricultural Research Center (DZARC) of the Ethiopian Institute of Agricultural Research (EIAR) and the International Livestock Research Center (ILRI), have promoted crossbred cows, improved feeds, and improved health management. In addition, the extension service has since long promoted Artificial Insemination (AI).

3. Project description

Within this context, OSRA has executed a program to stimulate income from the production of milk and milk products through the introduction of improved breeds and the intensification of management

through zero grazing. After a one-year pilot in 2008-2009, the project was intended to start Jan 1, 2010. However, there was a delay in the approval of the proposal, which in turn delayed actual implementation such that project activities only started in the last quarter of 2010. Due to this delay, the end-date of the project was postponed from December 31, 2011 to November 31, 2012. The overall budget was €104,264.50.

The ultimate objectives of the project were:

1. Improvement in family income from sales of milk and milk products.
2. Reduction in the pressure on grazing land through promotion of zero grazing.
3. Improvement of the capacity of the target households on zero grazing and improved diary production and management.
4. Improved access to input and output markets, extension support and technical services in the area of artificial insemination (AI), feed and health management, and finance that are relevant to promote zero grazing.

The project activities were diverse. A central nursery site was established to gather different multipurpose seedlings used for animal feed. This was done to lower the pressure on the already sparse grazing land and to improve the availability of feed. In order to improve the AI services, AI technicians were trained. In addition, AI crushes used for restraining cows during AI were constructed, along with various AI materials. Furthermore, motor bikes were provided to the district livestock development, health and marketing agencies, to improve access. Farmer access to support services and markets was promoted through the organization of workshops with community representatives and service providers. In addition, the capacity for zero grazing and improved livestock management was stimulated through training of experts, development agents and farmers and through the facilitation of experience exchange among farmers.

The project beneficiaries were cattle-holding farm households in ten selected kebeles of Akaki and Ada'a districts. The selection of the target kebeles was based, among others, on: the number of population/households in the area; the cattle population, especially improved and/or Borena breeds in the localities; and the accessibility of the localities so that technical and other supports be provided to target groups. Within the kebeles, a total of 1,700 farmers were selected for participation in training and representatives were invited to workshops with service providers. The selection of these direct project beneficiaries was conducted jointly with the Livestock Development, Health and Marketing Agency, de-

velopment agents, kebele administrations and the representative community members based on the interest of the community member to participate, those who have local breeds or exotic breeds, accessibility to road infrastructure, female headed households, and experience in promoting improved forage at backyard or farm boundaries.

The project assumes that the results of all project activities spill over to the remainder farmers in the community. Knowledge and experience is supposedly shared, and improved services and access to AI benefit all farmers in the kebeles. However, the Livestock development, Health and Marketing agency was unable to assign trained AI staff to Artificial Insemination. Besides, the office transferred the trained AI to other locations.

By the end of the initial project, a second phase was approved. The extension started with a small delay in April 2013 because the government needed to evaluate the first phase and appraise the proposal. The second phase is planned to finish in 2015. While in first phase was targeted to ten kebeles, the project is now scaled up to twenty kebeles. The new phase continued with the introduction of improved breeds, distribution of fodder seeds, training (another 2000 farmers), and improvement of AI services (capacity building support). According to the project implementers, during 2013 a total of 410 cows were inseminated out of which 189 have given birth to calves. Likewise in 2014 620 cows were inseminated by the AI technicians in both districts out of which 260 cows have given birth to calves.

New activities were milk processing and the introduction of bio-gas technologies. The latter activity has been included because to improve overall welfare by using waste to produce energy. OSRA provides materials like cement. The plan was to reach 200 households in two years. Yet, as the costs were higher than envisaged, only 83 instead of 100 households were reached in 2013. About 10-15 percent of these households had started to use the installations in the summer of 2014. Because of the high costs, OSRA has sought collaboration with the government.

In addition, the second phase involved the distribution of heifers, contrary to the first phase. The identification of the suppliers was problematic. The project initially planned to distributed heifers of the local breed Boren, but had to change into the improved Frisians. In addition, the rainy season delayed distribution. Ultimately, the project reached 67 households out of the 100 planned. They all received the improved breed, but had to pay 40 percent of the costs. Reportedly, so far no milk has been marketed but production has increased from 1 to 3 liters per day. The milk is shared with neighbors.

Reported challenges are the accessibility of the farmers and government bureaucracy. During our visit in May 2014, project staff indicated that they were able to do 60-70% of activities planned in 2013, and 45%-50% of the planned 2014 activities so far. Some activities, like training would continue until mid-September.

4. Methodology

The objective of this report is to describe changes in wellbeing that could be attributed to participation in the Zero Grazing project. The challenge in any impact evaluation is to isolate the causal role of the intervention from other determinants of wellbeing (Armendariz (2010)). When comparing the situation of beneficiaries before and after an intervention, the observed changes in outcome variables cannot solely be attributed to the intervention, as there are many other changes in the environment of the respondents during the project period. Comparing beneficiaries with a control group of non-beneficiaries does not automatically provide the solution. Beneficiaries could for instance have been wealthier than non-beneficiaries when the program started or *vice versa*. This and other factors can make some people more likely to choose to participate in the program, thus causing self-selection bias. Besides self-selection bias, program placement bias is also frequently observed in evaluation studies. NGOs target their projects purposely at specific, often disadvantaged, areas. If the control group's physical, economic and social environment does not match that of the beneficiaries, this will result in differences not caused by the intervention and thus in biased estimates of impact.

The standard approach to overcome these issues is to conduct a randomized controlled trial (RTC). Before the program starts two groups will be created at random. One group will receive the treatment (treatment group) while the other group will act as a benchmark (control group). Because of the randomization the members in the control group represent the members in the treatment group. After the treatment has taken place, both groups can be compared on the outcomes of interest. Differences in outcomes can now solely be attributed to the treatment. However, creating two groups at random, a necessary step for RTCs, is not always possible because of the program implementation or ethical reasons.

As we had no influence on the design of the zero grazing program, we use an alternative to RCTs: the propensity score method (PSM) (Rosenbaum(1983)). The basic idea is to match beneficiary households to households from the control group who are observationally similar in terms of characteristics that are not affected by the intervention. These include stable characteristics of the household head and the household. In practice, PSM involves running a binary regression of the project participation indicator on the relevant set of characteristics. The result is the propensity score: the estimated probability that a household is a beneficiary. For further analysis, we study only households with propensity scores in the range in which both beneficiaries and non-beneficiaries are observed (the *common support*): non-beneficiaries with a very low propensity score and beneficiaries with a very high propensity score are discarded. For these households, we conducted a balancing test. Although debated in the literature, a balancing test is generally used to determine if the observable controls are distributed similarly between the two groups in question.² If any significant difference exists between the two groups, a balancing test should pick up this difference and indicate that the current composition of the data could lead to a biased estimate of the treatment effect. The balancing test is conducted as a set of OLS regressions in which each control variable is individually regressed on a constant and the treatment dummy. The standard errors in the regressions are clustered at the kebele level to account for intraclass correlation. The coefficient of the treatment dummy now gives us an unbiased estimator of the difference between the control and treatment group at the time of the baseline survey, provided that there is only selection on the observed characteristics. A similar set of OLS regressions is used for the impact indicators. The coefficients of the treatment dummy now give an unbiased estimator of project impact, again provided that the assumption of selection on observed characteristics only holds.

When data on beneficiaries and controls are available for two points in time, a so-called double difference (DD) model can be used. Ideally, data are available from before (baseline) and after (end line) the intervention, so that the complete change due to the project can be measured. For the current evaluation, we had information for two periods in time of which the first was almost at the end of the original project, while the second was after the extension. The DD estimates will therefore measure the additional impact of the project extension.

While the RTC methodology ensures that the only difference between members in the treatment and control group is the treatment, the DD method only eliminates differences between members of the two groups that do not change over time. So the disadvantage of the DD method over the RTC method

² For a summary of the literature and further discussion of balancing tests see Kleyman (2009)

is that it does not automatically distinguish between the impact of time-varying characteristics between members of the two groups and the impact of the treatment. A (partial) solution to this problem is to include as many time varying characteristics into the DD model as possible so that only the influence of unobserved time-varying characters remains. As the DD method works best if the treatment and comparison group are as comparable as possible, we apply the DD method to households within the common support of the PSM only.

Econometrically speaking the double difference estimator is given by the following expression:

$$Y_{ijt} = \alpha + \beta_1 Post_t + \beta_2 D_j^T + \beta_3 Post_t D_j^T + \gamma X_{ijt} + \varepsilon_{ijt} \quad (1)$$

Where Y_{ijt} denotes an outcome variable for respondent i in group j at time t , D_j^T is a dummy variable equal to one if the respondent belonged to the treatment group, $Post_t$ is a binary variable that takes the value one if the observation corresponds to the post-treatment time period, X_{ijt} is a set of controls³, and ε_{ijt} denotes the error term. Then, β_3 in (1) is the treatment estimate of the intervention's impact on outcome Y . That is, β_3 measures the difference between the treatment and control group in the growth of outcome Y , and is an unbiased estimate of the average impact on the dependent variable Y of being assigned to the treatment group provided the assumption of no selection on unobservables holds.

Some of the outcome variables considered in the analysis are binary. In these cases, we estimated a linear probability model (LPM) and report the marginal effect of D_i^G for the impact of the sustainable energy project on outcome Y .⁴ In all models the standard errors are clustered at the kebele level. Clustering at the kebele level provides a relatively low amount of clusters (18), but big enough clusters. It is important to cluster the standard errors, as the data might be subject to intraclass correlation, that is, households in the same kebele are likely to be more similar on a wide variety of measures than households that are not part of the same kebele. The higher intraclass correlation, the less unique information

³ Additional covariates are included to control for various characteristics of the households. This not only helps with the precision of the estimates, but also reduces the problem of omitted variable bias. This is necessary to obtain unbiased measures of the treatment effects.

⁴ In recent literature, Puhani (2012) shows that in a nonlinear difference-in-difference, such as the one used in this study, the cross difference is not equal to the treatment effect. Instead the treatment effect comes from the cross derivative (or cross difference) of the conditional expectation of the observed outcome minus the cross derivative of the conditional expectation of the potential outcome without treatment. Although this calculation of the treatment effect is appealing, this study will follow common practice in the field and report the estimate of β_3 in the case of a LPM.

each household provides. This has to be taken into account when running the regressions by inflating the standard errors.

It is often the case that there is some level of attrition (or dropping out) and/or new entry in the dataset. The DD model presented in (1) can be estimated using an unbalanced panel, keeping in all observations, including the ones which we only observe in one time period. It can also be estimated using a balanced panel, dropping observations which we only observe in one period. Estimating (1) using an unbalanced panel increases the power, but as the sample becomes more heterogeneous the results might be distorted. As in this case, the number of new entries and drop outs are very low, as will be seen in the following section, all estimations will be done on the unbalanced panel.

Although a combination of PSM and DD can solve many potential biases in the data, some bias may remain. As PSM assumes selection on observables, bias can still be caused by selection on unobservables. Adding DD to PSM helps picking up the time-invariant heterogeneity, but bias can still remain due to time-variant unobservables. Yet, a positive significant effect in the PSM and especially the DD model is a strong indication of an influential intervention. An insignificant effect -or even a significant negative effect, however does not necessarily imply that the intervention does not work -or even does harm, as in our analysis we only measure short-term effects.

5. Data

Data for both the baseline survey and follow-up were collected in four districts in the neighboring Special Zone and East Shewa Zone of Oromia National Regional State: Akaki, Ada'a, Gimbichu, and Sebata. The baseline survey was conducted in September 2012 –so just before the end of the first phase of the project, and included 495 farm households equally divided over three groups: farm households with direct participation in the project; farm households with dairy animals with indirect participation through spillover effects at the district level (but not in the same kebele), and farm households with dairy animals outside the project districts. The first group was randomly selected from project participants in four project kebeles (all project kebeles not involved in the pilot), and the other households were randomly selected from farmers with dairy livestock in kebeles comparable to the project kebeles in terms of soils, rainfall, farm size, crops, role of livestock, infrastructure and other relevant characteristics. The follow-up survey was collected in Mid-May to Mid-June 2014, a few months before the end of

the Second Phase, in a similar manner as the baseline survey and revealed a very low amount of drop outs and new entries (4 and 1 respectively).

The questionnaire contains general questions on household composition and housing conditions, household expenditures and food security, crop production and consumption, land and livestock endowments, and detailed questions related to dairy cattle and production, involving grazing, fodder production, health, milk production, production costs, marketing, and home consumption.

We found no significant differences between the control and the “spillover” groups in household characteristics and technology adoption in the baseline survey. This suggests that there were no significant spillover effects of the intervention. Such effects were expected because households in the “spillover” group would benefit from the improvements in the AI service. Unfortunately, these improvements were not realized for reasons explained above: Trained AI staff was not assigned to AI, and some were transferred to other locations. This means that although trainings were given, this has not resulted in better trained AI staff in the treatment kebeles. As a result, the spillover and control group were merge into one large non-treatment group. The results presented in this project thus only distinguish between two groups.

5.1 Descriptive statistics and balancing test

The descriptive statistics and balancing tests presented here are based on the common support as a result of the estimated propensity score. The set of covariates chosen for the estimation of the propensity score is the same as the set of controls used in the DD regressions. It is important to note that while these tests are conducted on the baseline survey, the survey was conducted after the intervention was implemented. We therefore do balancing tests only on those variables that we expect not to be influenced by the intervention –the controls.

Figure 1 below displays the distribution of the propensity score in the treatment and control group. Plotting the distribution of the propensity score is helpful to see if there are any problems in the common support. The distributions seem to have a wide area from which they overlap, thus indicating that only a few observations are dropped from the sample. Specifically, the region of the estimated common support is given by $[-.1457, .7317]$ given a total number of 12 observations who are dropped from the sample.

Figure 1: Distribution of the propensity scores in the control and treatment group

Most of the household heads in the sample are middle-aged Oromo men with farming as primary occupation (Table 1). They own on average 2 hectares of land, about three oxen and four sheep/goats for a family of 7. Education of the household head is very low at less than three years on average. Overall the balancing tests reveal a good balance between the two groups in terms of the controls variables. The only significant difference between the two groups is found in the education variable but this amounts to less than a year.

Table 1: Summary statistics and balancing tests for controls

Dependent variable	Summary Statistics				Balancing tests
	Control		Treatment		Treatment
	No.	Mean	No.	Mean	
	(1)	(2)	(3)	(4)	(5)
<i>Characteristics of the household head</i>					
Sex (male=1)	308	0.88	158	0.90	0.019 (0.037)

Goat & Sheep (#)	308	3.67	158	4.27	0.600 (0.700)

Notes: Column 2 and 4 presents the mean of the control and treatment group respectively. Column 5 displays the coefficient from a separate OLS regression. Standard errors are clustered at the kebele level. The summary statistics and balancing tests are based on the common support as given by the propensity score. Robust standard errors in parentheses ***Significant at the 1 percent level. **Significant at the 5 percent level. *Significant at the 10 percent level.

6. Results

6.1 The initial project (2010-2012)

Overall, the beneficiary and control households do not differ much with respect to the outcome indicators. We found some small but significant differences. However, these seem to point at mild selection bias rather than at impact. Beneficiary households own nine indigenous cows on average compared to 8 for those in non-project kebeles. The number of crossbred and exotic cows is low: less than one on average. While the average number of crossbreds per household does not differ significantly between beneficiaries and non-beneficiaries, the number of exotic cows is slightly higher for the controls: 0.08 for the control group and 0.01 for the treatment group. Yet this difference is too small to be meaningful. Milk production is low for both groups at about 200 liters per cow per year (slightly higher for the control group) with about 10 kg of milk or derived products consumed per household in the seven days before the survey. Only three farmers (in the non-project kebeles) sold milk (not included in the PSM). AI is practiced slightly more by the non-project farmers: by ten percent compared to three percent of project beneficiaries. Usage is too low to detect differences in costs. On average, cows graze almost 11 months of the year, implying very little adoption of zero grazing. Still, the cows of the project beneficiaries graze a bit less on average than those of the controls: 10.2 months compared to 10.9 months. Also, project farmers are more likely to grow fodder, but average fodder production is the same between treatment and control farmers. Overall, the differences between project beneficiaries and controls are very small and not consistently pointing at positive project impact.

Table 2: Summary statistics and impact tests for outcomes

Dependent variable	Summary Statistics				Impact tests
	Control		Treatment		Treatment
	No.	Mean	No.	Mean	
	(1)	(2)	(3)	(4)	(5)

Notes: Column 2 and 4 presents the mean of the control and treatment group respectively. Column 5 displays the coefficient from a separate OLS regression. Standard errors are clustered at the kebele level. The summary statistics and balancing tests are based on the common support as given by the propensity score. [°]All dairy products are converted to kgs of fresh milk. ^{°°}The total cost for the insemination times the number of cows that got pregnant divided by the total number of cows inseminated. Robust standard errors in parentheses ***Significant at the 1 percent level. **Significant at the 5 percent level. *Significant at the 10 percent level.

6.2 Phase 2 (2013-2014)

Table 3 reports all the estimates with the respective statistics from all the different approaches used in this project. The results are mostly robust to the approach selected. Beneficiaries households increased their expenditures (including home consumption of crops and animal products) by 790 birr more than the control household during Phase 2 of the project. This is quite substantial compared to the overall increase between baseline and endline of 2,334 birr (year effect), which is similar to baseline income and at least partly explained by inflation. However, our results suggest that this was not due to a chang-

es in milk production or consumption, for which no significant difference is observed. Moreover, milk sales are still very rare. Yet, we do observe a relative increase in fodder production levels for farmers in the treatment kebeles, though the share of farmers growing fodder did not change significantly. However, though we observe an overall decrease in the average number of months that cows are grazing –and hence an increase in zero grazing, this is not larger for the project area. We find no changes in the use of AI or the effective costs of AI for either project farmers or controls. Relatedly, we find no significant difference in the size and composition of the herd, except for a small increase of the number of indigenous cows for the treatment group, but this effect disappears when we use a combination of DD and PM.

The question remains whether we find few evidence of project results because of lack of impact or because our sample was too small to have sufficient power. We therefore computed the minimum effect size that we could detect with our sample given the heterogeneity of the sample. For herd composition, we could generally detect a difference of less than 0.1 animal. Only for indigenous calves this was higher: 0.23. For grazing months, we could detect an average difference of 0.94 months, which is quite small. We can thus conclude that our analysis is quite accurate with respect to herd composition and grazing. For home consumption of dairy products and milk production the numbers are much higher: 8.93 kg per week for consumption –which is an additional increase of almost the same magnitude as the average weekly consumption in the baseline survey, and 65.65 liters per year per cow for production –which is equivalent to about one third of average baseline production. These minimum effect sizes are so high because of the large differences between households. The observed (insignificant) effect on milk production is about 32 liters per year and the observed (insignificant) impact on dairy consumption is about 3.7 kg per week, which are both somewhat substantial but much lower than the increases of 2-5 liters per day mentioned in FGDs during an evaluation of the initial project commissioned by OSRA (Gudeta, 2013). Yet, we can be sure that if the project resulted in increased milk production, this has not led to sales of milk and increased incomes at least not in our sample. Similarly, the impact coefficients for AI point in the right direction and are relatively high. Our sample is not sufficient to tell whether these are project impacts or statistical artefacts. However, we do not find evidence of an increase in the number of crossbred calves, and this finding is quite accurate.

Table 3: Estimation results

	(1)	(2)	(3)	(4)
Variables	DD	DD	PSM+DD	PSM+DD

		- with controls		- with controls

Crossbred calve	NI	NI	NI	NI	
Exotic calve	NI	NI	NI	NI	
AI	NI	NI	SI	NI	
Effective costs AI ^o	NI	NI	NI	NI	
#grazing months	NI	NI	NI	NI	
Milk production /cow (liters/year)	NI	NI	NI	NI	
Home consumption of dairy (kg/week) °	NI	NI	NI	NI	
Fodder production	NI	NI	NI	NI	
Fodder quantity	SI	SI	SI	SI	
Total expenditures per capita	SI	SI	NI	SI	

Notes: NI: no impact; NM: Not measured; SD: Significant decrease; SI: significant increase. Controls include: Sex, age, marital status, members, ethnicity, job, land, pack animals, and goat & sheep. See detailed estimation results in the appendix.

Our analysis suggests that the impact of the project has been limited. Though we cannot completely be sure that this is not due to the limited power of our sample, we feel confident to say that the project did not result in a widespread adoption of zero grazing, sales of dairy, or an increase in ownership of improved cattle among participating households. It is possible that the project participants in our sample,

which were selected based on participation in the initial project, did not participate in the second project. However, this is not because they already benefited sufficiently in the 2010-2012 project: we do not find impact for this project either.

6.3 Efficiency analysis

To assess the efficiency of the project, we computed unit costs for selected activities and compared these to values found in the literature. The cost of the training of AI technicians was only 61% of that of a similar, but somewhat shorter, training in Indonesia. Also the farmer trainings were much lower than data found in the literature: Int\$50 per trained farmer compare to Int\$521-819 in Bangladesh. However, the large difference in values suggests different training lengths. More money was spent per farmer for the distribution of seedlings and seeds than found in the literature. However, both the quantity and type of seeds are different, so these numbers are hard to compare. Overall, we find it difficult to compare the unit costs computed for the project with unit costs from the literature. The most reliable comparison seems that for the AI technician training, which suggests the project was quite efficient.

Table 4 Efficiency estimates (based on the 2010/11 financial reports)

Activity	Unit costs	Unit cost benchmark	Source benchmark
Forage seeds and planting materials distributed	Int\$19 for seedlings and seeds	Int\$ 9.70 for seeds and other inputs	Teweldmehidin, M. Y., & Conroy, A. B. (2010). (Namibia)
Livestock training	Int\$50 (training on zero grazing & improved heifer management, business management skill, book keeping)	Int\$ 521.00-Int\$ 819.00 (vocational education)	Dohmen (ILO, 2009) and Dar, A. et al. (2006) (Bangladesh)
Training of AI technician (per person trained)	Int\$ 1,672 (45 days training)	Int\$ 2,726.00 (one month training)	Subagiyo, 2010 (Indonesia)

Note: See Table A5 in the appendix for unit costs calculations

7. Discussion

Previous research in Ethiopia shows that the adoption of improved dairy technology results in higher per capita incomes and higher intake of calories, protein, and iron (Ahmed et al, 2004). Yet adoption is constrained by increasing fodder scarcity and a lack of economic incentives to produce marketable surplus (Lemma et al, 2008a). The demand for milk and milk products has increased, putting an upward

pressure on prices, but marketing systems are not well-established (Lemma et al, 2008b). Also the lack of health infrastructure and veterinary services are a disincentive for acquiring improved breeds (Negassa et al, 2012). Improved dairy technologies related to housing, feeding and healthcare largely improve milk production performance for crossbred cows, but have only a limited effect on the productivity of local cows (Mekonnen et al, 2010). Sustainable commercialisation of smallholder dairy in Ethiopia therefore requires an integrated approach involving technological as well as institutional innovations.

The project activities correspond to part of these observations. Yet, the focus is completely on technology and the output market is ignored. As indicated above, a lack of economic incentives due to an underdeveloped marketing system will limit the adoption of improved technologies. In fact, during our discussion with OSRA, the organisation indicated that those farmers who received subsidized improved heifers substantially increased their production, but did not yet sell milk. Instead, they shared it with their neighbours. While in itself this could result in higher food and nutrition security, it suggests limited incentives for further investments. Relatedly, the evaluation of the initial project commissioned by OSRA indicated that farmers show no interest taking credit for purchasing improved cattle (Gudeta, 2013). Future projects should therefore include a component of improving linkages to output markets. Especially given the location of the kebeles close to Addis Abeba this is a missed opportunity in the present project.

8. Conclusion

Our evaluation shows an increase in total expenditure in the project areas compared to the control areas. In addition, we observe an increase in fodder production. While the latter could well be a direct result of the project, it is unlikely that this is the case for the increase in expenditures: Milk sales are extremely rare and a possible increase in milk consumption (that we do not observe due to limited power of the sample) cannot explain the relatively large increase. Grazing decreased between the surveys, but equally in treatment and control areas.

Given the low levels of income in the region and the scarcity of fodder, the observed changes are highly relevant. However, for the project to be more effective, it should have included a market component to increase the profitability of dairy production and generate incentives for investment. Due to lack of

good benchmarks, we do not want to give a general evaluation of project efficiency. However, the AI training seemed highly efficient.

Table 5 Evaluation conclusions

Statement	Rating ¹	Comments
The project was well designed	5	Integrated technological innovations, but lack of attention for output markets
The project was implemented as designed	7	Costs and bureaucracy were underestimated, which resulted in some delays, downscaling and cost recovery from participants.
The project reached all its objectives	5	Some evidence of impact on fodder production, slight decrease in grazing.
The observed results are attributable to the project interventions	6	The results for phase 1 are based on the baseline only and could result from other factors than the project. The results for phase 2 are based on the DD method, which is relatively reliable. Yet, we cannot explain the increase in expenditures from the project due to the lack of impact on sales and consumption. For some variables, standard deviations are high. Cross-variable comparison of impact estimates is helpful .
The observed results are relevant to the project beneficiaries	8	Increased expenditures and fodder production are important. Zero grazing can benefit the area
The project was implemented efficiently	8	Difficult to say due to lack of good benchmarks, but the (AI) trainings seem highly efficient.

¹Our agreement on a scale for 1 (not at all) to 10 (completely)

Report CDI- 15-053

Kusters, C.S.L, T. van Ingen, E. Zerfu, D. Kefyalew, D. Getu, B. Peters, N.N. Buizer, 2014. *Endline report Ethiopia, TTCA. Capacity of Southern Partner Organisations (5c) component*. Centre for Development Innovation, Wageningen UR (University & Research centre). Report CDI- 15-053. Wageningen.

This report presents the findings of the endline of the evaluation of the organisational capacity component of the MFS II country evaluations. The focus of this report is Ethiopia, TTCA. The format is based on the requirements by the synthesis team and NWO/WOTRO. The endline was carried out in 2014. The baseline was carried out in 2012.

Key words: 5C (five core capabilities); attribution; baseline; causal map; change; CFA (Co-financing Organisation) endline; organisational capacity development; SPO (Southern Partner Organisation).

Acknowledgements

We are grateful to all the people that have contributed to this report. We particularly would like to thank the Southern Partner Organisation Teacher Training Centre Ayssaita (TTCA) and the Co-Financing Agency Edukans for their endless patience and support during this challenging task of collecting the endline data. We hope that this endline report will provide useful insights to TTCA, Edukans, consortia, the synthesis team, IOB and NWO/Wotro and other interested parties and other interested parties.

The Ethiopia 5C evaluation team

List of abbreviations and acronyms

ABE	Alternative Basic Education
ACTE	Ayssaita College of Teachers Education
BEN-E	Basic Education Network Ethiopia
BEQIP	Basic Education Quality Improvement Program
BESO	Basic Education Strategic Objective
BPR	Business Process Reengineering
Causal map	Map with cause-effect relationships. See also 'detailed causal map'.
Causal mechanisms	The combination of parts that ultimately explains an outcome. Each part of the mechanism is an individually insufficient but necessary factor in a whole mechanism, which together produce the outcome
CBO	Community Based Organisation
CDI	Centre for Development Innovation, Wageningen UR, the Netherlands
CFA	Co-Financing Agency
CPD	Continuous Professional Development
CS	Civil Society
CSO	Civil Society Organization
C4C	Connect for Change Consortium
DEC	Development Expertise Center
Detailed causal map	Also 'model of change'. the representation of all possible explanations – causal pathways for a change/ outcome. These pathways are that of the intervention, rival pathways and pathways that combine parts of the intervention pathway with that of others. This also depicts the reciprocity of various events influencing each other and impacting the overall change. In the 5C evaluation identified key organisational capacity changes and underlying reasons for change (causal mechanisms) are traced through process tracing (for attribution question).
General causal map	Causal map with key organisational capacity changes and underlying reasons for change (causal mechanisms), based on SPO perception.
EF	Edukans Foundation
ESDP	Education Sector Development Programme
GEQIP	General Education Quality Improvement Package
HDP	Higher Diploma Program
IFPRI	International Food Policy Research Institute
IQPEP	Improving Quality of Primary Education Programme
M&E	Monitoring and Evaluation
MDG	Millennium Development Goal
MFS	Dutch co-financing system
MIS	Management Information System
MoFA	Ministry of Foreign Affairs
NGO	Non-Governmental Organisation
OD	Organisational Development
PME	Planning, Monitoring and Evaluation
PRA	Priority Result Area
Process tracing	Theory-based approach to trace causal mechanisms
SPO	Southern Partner Organisation
SSI	Semi-structured Interview
ToC	Theory of Change

Wageningen UR	Wageningen University & Research centre
5 C	Capacity development model which focuses on 5 core capabilities

1 Introduction & summary

1.1 Purpose and outline of the report

The Netherlands has a long tradition of public support for civil bi-lateral development cooperation, going back to the 1960s. The Co-Financing System (*Medefinancieringsstelsel*, or 'MFS') is its most recent expression. MFS II is the 2011-2015 grant framework for Co-Financing Agencies (CFAs), which is directed at achieving a sustainable reduction in poverty. A total of 20 consortia of Dutch CFAs have been awarded €1.9 billion in MFS II grants by the Dutch Ministry of Foreign Affairs (MoFA).

The overall aim of MFS II is to help strengthen civil society in the South as a building block for structural poverty reduction. CFAs receiving MFS II funding work through strategic partnerships with Southern Partner Organisations.

The MFS II framework stipulates that each consortium is required to carry out independent external evaluations to be able to make valid, evaluative statements about the effective use of the available funding. On behalf of Dutch consortia receiving MFS II funding, NWO-WOTRO has issued three calls for proposals. Call deals with joint MFS II evaluations of development interventions at country level. Evaluations must comprise a baseline assessment in 2012 and a follow-up assessment in 2014 and should be arranged according to three categories of priority result areas as defined by MoFA:

- Achievement of Millennium Development Goals (MDGs) & themes;
- Capacity development of Southern partner organisations (SPO) (5 c study);
- Efforts to strengthen civil society.

This report focuses on the assessment of capacity development of southern partner organisations. This evaluation of the organisational capacity development of the SPOs is organised around **four key evaluation questions**:

1. *What are the changes in partner organisations' capacity during the 2012-2014 period?*
2. *To what degree are the changes identified in partner capacity attributable to development interventions undertaken by the MFS II consortia (i.e. measuring effectiveness)?*
3. *Were the efforts of the MFS II consortia efficient?*
4. *What factors explain the findings drawn from the questions above?*

The purpose of this report is to provide endline information on one of the SPOs involved in the evaluation: TTCA in Ethiopia. The baseline report is described in a separate document.

Chapter 2 describes general information about the Southern Partner Organisation (SPO). Here you can find general information about the SPO, the context in which the SPO operates, contracting details and background to the SPO. In chapter 3 a brief overview of the methodological approach is described. You can find a more detailed description of the methodological approach in appendix 1. Chapter 4 describes the results of the 5c endline study. It provides an overview of capacity development interventions of the SPO that have been supported by MFS II. It also describes what changes in organisational capacity have taken place since the baseline and why (evaluation question is 1 and 4). This is described as a summary of the indicators per capability as well as a general causal map that provides an overview of the key organisational capacity changes since the baseline, as experienced by the SPO. The complete overview of descriptions per indicator, and how these have changed since the baseline is described in appendix 3. The complete visual and narrative for the key organisational capacity changes that have taken place since the baseline according to the SPO staff present at the endline workshop is presented in chapter 4.2.2.

Chapter 5 presents a discussion on the findings and methodology and a conclusion on the different evaluation questions.

The overall methodology for the endline study of capacity of southern partner organisations is coordinated between the 8 countries: Bangladesh (Centre for Development Studies, University of Bath; INTRAC); DRC (Disaster Studies, Wageningen UR); Ethiopia (CDI, Wageningen UR); India (CDI, Wageningen UR; Indonesia (CDI, Wageningen UR); Liberia (CDI, Wageningen UR); Pakistan (IDS; MetaMeta); Uganda (ETC). Specific methodological variations to the approach carried out per country where CDI is involved are also described in this document.

This report is sent to the Co-Financing Agency (CFA) and the Southern Partner Organisation (SPO) for correcting factual errors and for final validation of the report.

1.2 Brief summary of analysis and findings

Since the baseline, two years ago, improvements took place in all of the capabilities.

Over the last two years many small improvements took place in the indicators under the capability to act and commit. Members of management have become more responsive and proactive and the academic dean is more easily approached by all staff. The management has become better at providing strategic guidance and staffs are able to discuss the strategic plan, which is available for all departments, with management. TTCA is using M&E feedback and takes the current situation into consideration when articulating operational plans. Staff skills have improved since the baseline, as college teachers now have second degrees, while they used to have first degrees; key tutors and the vice dean have been trained through the C4C Alliance (MFS II); and staff is making better use of ICT. There has been a slight improvement in the training opportunities that are offered to staff. Trainings through the C4C alliance (DEC) are for a limited number of staff, but USAID, MoE and Save the Children UK have also offered training opportunities for staff. There has been a very slight improvement in the funding situation of TTCA because UNICEF and UNESCO have started supporting primary schools. No new funding procedures are in place but some (successful) efforts have been made to approach donors by writing proposals for funding for e.g. ICT infrastructure, reference books, library etc.

In the capability to adapt and self-renew TTCA saw some improvements. Teaching practices are now evaluated in a more integrated way through joint M&E practice involving teachers, the department head and academic dean. Improvements have been observed in the number of staff evaluations, the utilization of evaluation reports, preparations of students' results in a timely fashion, and in delivery of scheduled progress reports by Department heads. The student and teacher behaviour observation matrix that is provided by the C4C alliance (MFS II funding) provides inputs for strategic planning and also to make actions and corrections. Opportunities for critical reflection have improved slightly as review meetings are organised to discuss progress and design improvement actions. TTCA has seen a very slight improvement in the way it is tracking its operating environment. Through sharing experience within the C4C alliance, linkages with primary schools and working closely with communities, TTCA understands better what is happening in its environment.

In terms of the capability to deliver on development objectives, TTCA has improved in some indicators. The centre has improved in delivering planned outputs because active teaching and learning strategies are now applied and teachers are aware of the need to actively involve students in the learning process. Mechanisms to check whether service meet beneficiaries' (students') needs, have improved very slightly because every 20 days there are discussions with students' representatives from each department and the students council about the teaching-learning process and other issues in the college with the academic dean and the respective heads of departments. Despite the limited resources, TTCA is trying to balance efficiency and quality by improving the quality of education and trainings.

In the capability to relate, TTCA improved in all indicators. According to management TTCA has improved its relations with external groups and is considering partners' feedback and reflection in their

strategy and future activity towards improving the quality of education. The college has started collaborating with Dessie and Jimma CTEs (through the C4C alliance) and therefore their engagement in networks improved slightly. TTCA is engaging slightly more with its target groups as there is now a formal system to support DEC intervention at schools, and parents' involvement in e.g. the preparation of strategies is encouraged. Within TTCA there is a slight improvement in relations between top management and staff as they are engaging more in open discussions and dialogue.

Finally, TTCA has shown a very slight improvement in the indicator "mutually supportive efforts" under the capability to achieve coherence. The college has started to work with other NGOs like USAID, UNESCO and UNICEF to complete projects and there are good efforts to help cluster schools through e.g. the provision of computers.

During the endline workshop some key organisational capacity changes were brought up by TTCA's staff in the 'general causal map': "improved knowledge in the application of active learning approaches and teaching skills"; "improvement in ICT utilization"; and "improved skills in compiling and recording student grades". The evaluators considered it important to also note down the SPO's story about what they considered to be key organisational capacity changes since the baseline, as this would also provide more information about reasons for change, which were difficult to get for the individual indicators. Also for some issues there may not have been relevant indicators available in the list of core indicators provided by the evaluation team.

According to TTCA staff, they have improved their knowledge in the application of active learning approaching and teaching skills because of progressively built knowledge on the different approaches of active learning and the improvement in ICT utilisation. Knowledge was progressively built during a training for mathematics and science teachers by the MoE and JICA (Japan International Cooperation Agency) in 2013; a training on active learning organized by USAID in 2012; Continuous Professional Development (CPD) on different subjects by the MoE and the college; practice active learning approaches in project elementary schools (MFS II funded), which teachers has learned during a series of trainings by DEC in 2012-2014 (MFS II funded) and through continuous supervision and follow up by DEC, UvA and Edukans in 2012-2014 (MFS II funded).

TTCA improved its utilisation of ICT because of installation of required infrastructure by DEC (MFS II funded); material (computer etc.) provision by USAID before 2012; and material provision and training by DEC during 2012-2013 (MFS II funded).

The college improved its skills in compiling and recording student grades because of improvement in ICT utilisation; cascading of the MIS training by USAID for the management before 2012 to other staff; and guidance and coaching by the college management, which was triggered by the USAID MIS training.

According to TTCA's staff, MFS II funded capacity development interventions have thus played a role in improved knowledge in the application of active learning approaches and teaching skills; improvement in ICT utilization; and the improved skills in compiling and recording student grades. This was through MFS II funded trainings, supervision and the provision of ICT infrastructure and material. However, internal factors like Continuous Professional Development by the college have also played an important role in the key organisational capacity changes that the TTCA's staff considered important since the baseline in 2012. Support from other funders, like MoE, JICA, USAID, in terms of trainings and material provision, has also been mentioned among the underlying factors for these changes.

2 Context and General Information about the SPO – TTCA

2.1 General information about the Southern Partner Organisation (SPO)

Ethiopia	
Consortium	Connect for Change (C4C)
Responsible Dutch NGO	Edukans Foundation (EF)
Project	Improving the Teaching-Learning Processes and Educational Management through ICT (C4 in MDG sample)
Southern Partner Organisation	Teacher Training Centre Ayssaita (TTCA)

The project/ partner is part of the sample for the following evaluation components:

Achievement of MDGs and themes	
Achievement of MDGs and themes	X
Capacity development of Southern partner organisations	X
Efforts to strengthen civil society	

2.2 The socio-economic, cultural and political context in which the partner operates

The fact that a large majority of the Ethiopian population lives in rural areas and in fairly dispersed communities poses specific problems for the education sector: spreading education and ensuring equitable access to education presents challenges in such a geographic context. In addition, the existence of many pastoral and semi-pastoralist groups raises issues of organization of the school system and also of the relevance of the curriculum. Nevertheless, Ethiopia, which had fewer than 2,000 primary schools 15 years ago now has 28,000, and is on the verge of providing access to education for all of its 20 million school age children. Development aid experts say Ethiopia has devoted as much as one quarter of all public expenditures to schools during the past few years. This commitment is prompting international donors to pump in an estimated \$150 million a year to support the effort.

Access to education in Ethiopia was a point of discussion and has been big on the agenda since decades. The average general enrolment rate of education in the country in 1991 was only 19 %. Access at all levels of the education system increased at a rapid rate in line with a sharp increase (more than 100 folds) in the number of teachers, schools and institutions. The long journey towards addressing the issue involved all education stakeholders which have been endeavoured to bring the enrolment rate to over 97% at present. However, the campaign made for access has precipitated quality of education in the whole country in all levels of education.

As access to education improves, it is also necessary to shift attention to quality concerns in general and to those inputs and processes which translate more directly into improved student learning and which help change the school into a genuine learning environment. These are: quality-focused school supervision, internal school leadership, increased student participation, school-community partnerships, etc. The General Education Quality Improvement Package (GEQIP), which was launched

a few years ago, has started this process. Education policies aimed at improving quality will build on GEQIP and further develop the package. GEQIP will thus become an integral part of ESDP IV.

Quality is also a crucial challenge at higher education level: due to the rapid expansion of this sub-sector, there is now an increased need to focus on quality improvement with regard to human and material resources as well as reform processes. The challenge of quality is closely linked to the challenge of completion. While access to primary education has increased, many children still do not complete the first cycle of primary and repetition and drop-out rates remain high throughout the whole cycle. Drop-out is particularly high in the early primary grades. This highlights the need to work on expanding early childhood education, which helps prepare children for primary school and which is at the moment still very scarce. One issue which needs more attention than in previous years is the low quality of school infrastructure, due to a strong reliance on low cost constructions (mainly through community support).

TTCA is one of the Partners/Target groups selected for the MFS II C4C “Improving the Teaching-Learning Processes and Educational Management through ICT” Program. This C4C programme is being implemented by 8 local civil society organizations (CSOs) that are partners of Edukans Foundation, 4 Community based organizations (CBOs), and 3 TTCs (of which TTCA is one) in 75 primary schools. The Development Expertise Centre (DEC) plays a coordinating role of the programme. While the local CSOs implement the program in primary schools where they are working, the TTCs implement it in their own campus as well as in the nearby primary schools to exercise the knowledge and skills they get from the program. For experience sharing and knowledge transfer, both CSOs and TTCs join and discuss on common issues and how to go about through the coordination.

The general objective of the programme is to contribute towards quality in primary education through improving the teaching learning processes and enhancing educational managements. The specific programme objectives are to capacitate educational institutions; enable the teachers and instructors apply active learning methodologies; improve the capacity of administration staffs in educational management; enhance friendly supportive supervision system in schools and TTCs.

Ayssaita Teachers Training College is found in Afar Regional State in the North- Eastern part of Ethiopia. Ayssaita College of Teachers Education was established in 2008. The college mainly focuses on primary teachers training targeting on the pastoralist community. Ayssaita TTC is currently training about 300 candidates annually. As the region is not yet fully using the Afar language for primary education system, the college in particular and the region in general will benefit a lot from the programme. The implementation of C4C in the compound of this TTC and the exercise teachers do in primary schools help education system maintain quality of education.

2.3 Contracting details

When did cooperation with this partner start:

July 2011

What is the MFS II contracting period:

July 2011 – June 2015

Did cooperation with this partner end?

No

If yes, when did it finish?

N.A.

What is the reason for ending the cooperation with this partner:

N.A.

If not, is there an expected end date?

June 2015.

2.4 Background to the Southern Partner Organisation

History

Aysaita College of Teachers Education (ACTE or TTCA) was established in 2007 with the vision of improving the backward life style of Afar region pastoralists. The mission of TTCA was to produce disciplined primary school teachers who can alleviate backwardness of the Afar community. The strategy of the organization in 2007 was cluster-based curriculum and no specialization. Three departments and 100 diploma and certificate students were indicated as target groups. The number of staff was 45 including 12 teachers and support staff. The funders included regional government and USAID/BESO. Capacity strengthening activities included gender training for instructors and librarian. Important influencing factors and actors pointed out by TTCA staff include limited power supply which influenced working condition including teaching learning process.

In 2011, the leadership of the College was changed. The vision during this time was to see an institute capable of producing teachers with democratic culture, well qualified and competent for teaching-learning process. ACTE's mission during the period was to reduce the shortage of primary school teachers and equip them with skills and competencies, deliver on the job training to improve capacity and problem solving research. The strategy was based on both cluster-based and linear approach (based on specialization). The number of students reached 223 (65 diploma, 78 certificate and 80 alternative basic education). In 2011, there were 98 staff including 23 teachers and the rest being support staff. The 2011 budget was 4372047 ETB from regional government, federal government (General Education Quality Improvement Program) and USAID. Capacity strengthening activities undertaken during the period included licensing for higher diploma program (HDP), metrology, Pedagogy (active learning), action research, classroom management, human resource management, financial management, and strategic planning training. Lack of teacher computer skills, initiation of HDP, purchase of laboratory equipment, and supply of more books have been indicated as important influencing factors affecting the college during the year.

The year 2012 was put as another critical milestone by the staff because of changes such as, change in physical environment and implementation of business process reengineering (BPR). The vision and mission were the same as in 2011. The strategy this time became fully linear which was based on specialization. The target group in 2012 included 247 students (31 evening extension, 78 diploma and 138 certificate. There were 137 staff in 2012 including 31 teachers and 106 support staff. The budget increased to 5847455 ETB with funders including regional government, federal government; MFSII and USAID. Capacity strengthening activities carried out during the period included higher diploma program (HDP), gender training, inclusive education, adult education, instructional planning, early childhood care and education, and training on data base. Experience sharing with three colleges (Kotebe, Dese, Hawasa), natural science training, different management training were also mentioned as capacity strengthening activities done during the period. The fact that the college developed its own curriculum and the subsequent development of course outlines and modules together with more experience sharing visits by staff were noted as important influencing factors during the year.

Vision

To see an institute capable of producing teachers with democratic culture, well qualified and competent for teaching-learning process.

Mission

To reduce the shortage of primary school teachers and equip them with skills and competencies, deliver on the job training to improve capacity and problem solving research.

Strategies

The college mainly focuses on primary teachers training targeting on the pastoralist community. Aysaita. It is currently training about 300 candidates annually.

3 Methodological approach and reflection

3.1 Overall methodological approach and reflection

This chapter describes the methodological design and challenges for the assessment of capacity development of Southern Partner Organisations (SPOs), also called the '5C study'. This 5C study is organised around **four key evaluation questions**:

1. What are the changes in partner organisations' capacity during the 2012-2014 period?
2. To what degree are the changes identified in partner capacity attributable to development interventions undertaken by the MFS II consortia (i.e. measuring effectiveness)?
3. Were the efforts of the MFS II consortia efficient?
4. What factors explain the findings drawn from the questions above?

It has been agreed that the question (3) around efficiency cannot be addressed for this 5C study. The methodological approach for the other three questions is described below. At the end, a methodological reflection is provided.

Note: this methodological approach is applied to 4 countries that the Centre for Development Innovation, Wageningen University and Research centre is involved in in terms of the 5C study (Ethiopia, India, Indonesia, Liberia). The overall approach has been agreed with all the 8 countries selected for this MFS II evaluation. The 5C country teams have been trained and coached on this methodological approach during the evaluation process. Details specific to the SPO are described in chapter 5.1 of the SPO report A detailed overview of the approach is described in appendix 1.

The first (changes in organisational capacity) and the fourth evaluation question are addressed together through:

- **Changes in the 5C indicators since the baseline:** standard indicators have been agreed upon for each of the five capabilities of the five capabilities framework (see appendix 2) and changes between the baseline, and the endline situation have been described. For data collection a mix of data collection methods has been used, including self-assessments by SPO staff; interviews with SPO staff and externals; document review; observation. For data analysis, the Nvivo software program for qualitative data analysis has been used. Final descriptions per indicator and per capability with corresponding scores have been provided.
- **Key organisational capacity changes – 'general causal map':** during the endline workshop a brainstorm has been facilitated to generate the key organisational capacity changes as perceived by the SPO since the baseline, with related underlying causes. For this purpose, a visual as well as a narrative causal map have been described.

In terms of the attribution question (2 and 4), '**process tracing**' is used. This is a theory-based approach that has been applied to a selected number of SPOs since it is a very intensive and costly methodology, although it provides rich information and can generate a lot of learning within the organisations. This approach was presented and agreed-upon during the synthesis workshop on 17-18 June 2013 by the 5C teams for the eight countries of the MFS II evaluation. A more detailed description of the approach was presented during the synthesis workshop in February 2014. The synthesis team, NWO-WOTRO, the country project leaders and the MFS II organisations present at the workshop have accepted this approach. It was agreed that this approach can only be used for a selected number of SPOs since it is a very intensive and costly methodology. Key organisational capacity changes/ outcomes of the SPO were identified, based on their relationship to the two selected capabilities, the capability to act and commit the capability to adapt and self-renew, and an expected relationship with CFA supported capacity development interventions (MFS II funding). It was agreed to

focus on these two capabilities, since these are the most targeted capabilities by the CFAs, as established during the baseline process.

Please find below an explanation of how the above-mentioned evaluation questions have been addressed in the 5C evaluation.

At the end of this appendix a brief methodological reflection is provided.

3.2 Assessing changes in organisational capacity and reasons for change - evaluation question 1 and 4

This section describes the data collection and analysis methodology for answering the first evaluation question: **What are the changes in partner organisations' capacity during the 2012-2014 period?** And the fourth evaluation question: **“What factors explain the findings drawn from the questions above?”**

In order to explain the changes in organisational capacity development between baseline and endline (evaluation question 1) the CDI and in-country evaluation teams needed to review the indicators and how they have changed between baseline and endline and what reasons have been provided for this. This is explained below. It has been difficult to find detailed explanations for changes in each of the separate 5c indicators, but the 'general causal map' has provided some ideas about some of the key underlying factors actors and interventions that influence the key organisational capacity changes, as perceived by the SPO staff.

The evaluators considered it important to also note down a consolidated SPO story and this would also provide more information about what the SPO considered to be important in terms of organisational capacity changes since the baseline and how they perceived these key changes to have come about. Whilst this information has not been validated with sources other than SPO staff, it was considered important to understand how the SPOs has perceived changes in the organisation since the baseline.

For those SPOs that are selected for process tracing (evaluation question 2), more in-depth information is provided for the identified key organisational capacity changes and how MFS II supported capacity development interventions as well as other actors, factors and interventions have influenced these changes. This is integrated in the next session on the evaluation question on attribution, as described below and in the appendix 1.

How information was collected and analysed for addressing evaluation question 1 and 4, in terms of description of changes in indicators per capability as well as in terms of the general causal map, based on key organisational capacity changes as perceived by the SPO staff, is further described below.

During the baseline in 2012 information has been collected on each of the 33 agreed upon indicators for organisational capacity. For each of the five capabilities of the 5C framework indicators have been developed as can be seen in Appendix 2. During this 5C baseline, a summary description has been provided for each of these indicators, based on document review and the information provided by staff, the Co-financing Agency (CFA) and other external stakeholders. Also a summary description has been provided for each capability. The results of these can be read in the baseline reports.

The description of indicators for the baseline in 2012 served as the basis for comparison during the endline in 2014. In practice this meant that largely the same categories of respondents (preferably the same respondents as during the baseline) were requested to review the descriptions per indicator and indicate whether and how the endline situation (2014) is different from the described situation in 2012¹.

¹ The same categories were used as during the baseline (except beneficiaries, other funders): staff categories including management, programme staff, project staff, monitoring and evaluation staff, field staff, administration staff; stakeholder categories including co-financing agency (CFA), consultants, partners.

Per indicator they could indicate whether there was an improvement or deterioration or no change and also describe these changes. Furthermore, per indicator the interviewee could indicate what interventions, actors and other factors explain this change compared to the baseline situation. See below the specific questions that are asked for each of the indicators. Per category of interviewees there is a different list of indicators to be looked at. For example, staff members were presented with a list of all the indicators, whilst external people, for example partners, are presented with a select number of indicators, relevant to the stakeholder.

The information on the indicators was collected in different ways:

1. **Endline workshop at the SPO - self-assessment and 'general causal map'**: similar to data collection during the baseline, different categories of staff (as much as possible the same people as during the baseline) were brought together in a workshop and requested to respond, in their staff category, to the list of questions for each of the indicators (self-assessment sheet). Prior to carrying out the self-assessments, a brainstorming sessions was facilitated to develop a 'general causal map', based on the key organisational capacity changes since the baseline as perceived by SPO staff. Whilst this general causal map is not validated with additional information, it provides a sequential narrative, based on organisational capacity changes as perceived by SPO staff;
2. **Interviews with staff members**: additional to the endline workshop, interviews were held with SPO staff, either to provide more in-depth information on the information provided on the self-assessment formats during the workshop, or as a separate interview for staff members that were not present during the endline workshop;
3. **Interviews with externals**: different formats were developed for different types of external respondents, especially the co-financing agency (CFA), but also partner agencies, and organisational development consultants where possible. These externals were interviewed, either face-to-face or by phone/Skype. The interview sheets were sent to the respondents and if they wanted, these could be filled in digitally and followed up on during the interview;
4. **Document review**: similar to the baseline in 2012, relevant documents were reviewed so as to get information on each indicator. Documents to be reviewed included progress reports, evaluation reports, training reports, etc. (see below) since the baseline in 2012, so as to identify changes in each of the indicators;
5. **Observation**: similar to what was done in 2012, also in 2014 the evaluation team had a list with observable indicators which were to be used for observation during the visit to the SPO.

Below the key steps to assess changes in indicators are described.

Key steps to assess changes in indicators are described

1. Provide the description of indicators in the relevant formats – CDI team
2. Review the descriptions per indicator – in-country team & CDI team
3. Send the formats adapted to the SPO to CFA and SPO – in-country team (formats for SPO) and CDI team (formats for CFA)
4. Collect, upload & code the documents from CFA and SPO in NVivo – CDI team
5. Organise the field visit to the SPO – in-country team
6. Interview the CFA – CDI team
7. Run the endline workshop with the SPO – in-country team
8. Interview SPO staff – in-country team
9. Fill-in observation sheets – in-country team
10. Interview externals – in-country team
11. Upload and auto-code all the formats collected by in-country team and CDI team in NVivo – CDI team
12. Provide to the overview of information per 5c indicator to in-country team – CDI team
13. Analyse data and develop a draft description of the findings per indicator and for the general questions – in-country team
14. Analyse data and develop a final description of the findings per indicator and per capability and for the general questions – CDI team
15. Analyse the information in the general causal map –in-country team and CDI-team

Note: the CDI team include the Dutch 5c country coordinator as well as the overall 5c coordinator for the four countries (Ethiopia, India, Indonesia, Liberia). The 5c country report is based on the separate SPO reports.

Please see appendix 1 for a description of the detailed process and steps.

3.3 Attributing changes in organisational capacity - evaluation question 2 and 4

This section describes the data collection and analysis methodology for answering the second evaluation question: ***To what degree are the changes identified in partner capacity attributable to (capacity) development interventions undertaken by the MFS II consortia (i.e. measuring effectiveness)?*** and the fourth evaluation question: ***“What factors explain the findings drawn from the questions above?”***

In terms of the attribution question (2), ‘process tracing’ is used. This is a theory-based approach that has been applied to a selected number of SPOs since it is a very intensive and costly methodology, although it provides rich information and can generate a lot of learning within the organisations. Key organisational capacity changes/ outcomes of the SPO were identified, based on their relationship to the two selected capabilities, the capability to act and commit the capability to adapt and self-renew, and an expected relationship with CFA supported capacity development interventions (MFS II funding). It was agreed to focus on these two capabilities, since these are the most targeted capabilities by the CFAs, as established during the baseline process.

Below, the selection of SPOs for process tracing as well as the different steps involved for process tracing in the selected SPOs, are further explained.

3.3.1 Selection of SPOs for 5C process tracing

Process tracing is a very intensive methodology that is very time and resource consuming (for development and analysis of one final detailed causal map, it takes about 1-2 weeks in total, for different members of the evaluation team). It has been agreed upon during the synthesis workshop on 17-18 June 2013 that only a selected number of SPOs will take part in this process tracing for the purpose of understanding the attribution question. The selection of SPOs is based on the following criteria:

- MFS II support to the SPO has not ended before 2014 (since this would leave us with too small a time difference between intervention and outcome);
- Focus is on the 1-2 capabilities that are targeted most by CFAs in a particular country;
- Both the SPO and the CFA are targeting the same capability, and preferably aim for similar outcomes;
- Maximum one SPO per CFA per country will be included in the process tracing.

The intention was to focus on about 30-50% of the SPOs involved. Please see the tables below for a selection of SPOs per country. Per country, a first table shows the extent to which a CFA targets the five capabilities, which is used to select the capabilities to focus on. A second table presents which SPO is selected, and takes into consideration the selection criteria as mentioned above.

For the detailed results of this selection, in the four countries that CDI is involved in, please see appendix 1. The following SPOs were selected for process tracing:

- Ethiopia: AMREF, ECFA, FSCE, HUNDEE (4/9)
- India: BVHA, COUNT, FFID, SMILE, VTRC (5/10)
- Indonesia: ASB, ECPAT, PtPPMA, YPI, YRBI (5/12)
- Liberia: BSC, RHRAP (2/5).

3.3.2 Key steps in process tracing for the 5C study

In the box below you will find the key steps developed for the 5C process tracing methodology. These steps will be further explained here. Only key staff of the SPO is involved in this process: management; programme/ project staff; and monitoring and evaluation staff, and other staff that could provide information relevant to the identified outcome area/key organisational capacity change. Those SPOs selected for process tracing had a separate endline workshop, in addition to the ‘ general

endline workshop. This workshop was carried out after the initial endline workshop and the interviews during the field visit to the SPO. Where possible, the general and process tracing endline workshop have been held consecutively, but where possible these workshops were held at different points in time, due to the complex design of the process. Below the detailed steps for the purpose of process tracing are further explained. More information can be found in Appendix 1.

Key steps in process tracing for the 5C study

1. Identify the planned MFS II supported capacity development interventions within the selected capabilities (capability to act and commit and capability to adapt and self-renew) – CDI team
2. Identify the implemented MFS II supported capacity development interventions within the selected capabilities (capability to act and commit and capability to adapt and self-renew) – CDI team
3. Identify initial changes/ outcome areas in these two capabilities – CDI team & in-country team
4. Construct the detailed, initial causal map (theoretical model of change) – CDI team & in-country team
5. Identify types of evidence needed to verify or discard different causal relationships in the model of change – in-country teams, with support from CDI team
6. Collect data to verify or discard causal mechanisms and construct workshop based, detailed causal map (model of change) – in-country team
7. Assess the quality of data and analyse data and develop final detailed causal map (model of change) – in-country team with CDI team
8. Analyse and conclude on findings– CDI team, in collaboration with in-country team

3.3.3 Methodological reflection

Below a few methodological reflections are made by the 5C evaluation team. These can also be found in appendix 1.

Use of the 5 core capabilities framework and qualitative approach: this has proven to be a very useful framework to assess organisational capacity. The five core capabilities provide a comprehensive picture of the capacity of an organisation. The capabilities are interlinked, which was also reflected in the description of standard indicators, that have been developed for the purpose of this 5C evaluation and agreed upon for the eight countries. Using this framework with a mainly qualitative approach has provided rich information for the SPOs and CFAs, and many have indicated this was a useful learning exercise.

Using standard indicators and scores: using standard indicators is useful for comparison purposes. However, the information provided per indicator is very specific to the SPO and therefore makes comparison difficult. Whilst the description of indicators has been useful for the SPO and CFA, it is questionable to what extent indicators can be compared across SPOs since they need to be seen in context, for them to make meaning. In relation to this, one can say that scores that are provided for the indicators, are only relative and cannot show the richness of information as provided in the indicator description. Furthermore, it must be noted that organisations are continuously changing and scores are just a snapshot in time. There cannot be perfect score for this. In hindsight, having rubrics would have been more useful than scores.

General causal map: whilst this general causal map, which is based on key organisational capacity changes and related causes, as perceived by the SPO staff present at the endline workshop, has not been validated with other sources of information except SPO feedback, the 5C evaluation team considers this information important, since it provides the SPO story about how and which changes in the organisation since the baseline, are perceived as being important, and how these changes have come about. This will provide information additional to the information that has been validated when

analysing and describing the indicators as well as the information provided through process tracing (selected SPOs). This has proven to be a learning experience for many SPOs.

Using process tracing for dealing with the attribution question: this theory-based and mainly qualitative approach has been chosen to deal with the attribution question, on how the organisational capacity changes in the organisations have come about and what the relationship is with MFS II supported capacity development interventions and other factors. This has proven to be a very useful process, that provided a lot of very rich information. Many SPOs and CFAs have already indicated that they appreciated the richness of information which provided a story about how identified organisational capacity changes have come about. Whilst this process was intensive for SPOs during the process tracing workshops, many appreciated this to be a learning process that provided useful information on how the organisation can further develop itself. For the evaluation team, this has also been an intensive and time-consuming process, but since it provided rich information in a learning process, the effort was worth it, if SPOs and CFAs find this process and findings useful.

A few remarks need to be made:

- Outcome explaining process tracing is used for this purpose, but has been adapted to the situation since the issues being looked at were very complex in nature.
- Difficulty of verifying each and every single change and causal relationship:
 - Intensity of the process and problems with recall: often the process tracing workshop was done straight after the general endline workshop that has been done for all the SPOs. In some cases, the process tracing endline workshop has been done at a different point in time, which was better for staff involved in this process, since process tracing asks people to think back about changes and how these changes have come about. The word difficulties with recalling some of these changes and how they have come about. See also the next paragraph.
 - Difficulty of assessing changes in knowledge and behaviour: training questionnaire is have been developed, based on Kirkpatrick's model and were specifically tailored to identify not only the interest but also the change in knowledge and skills, behaviour as well as organisational changes as a result of a particular training. The retention ability of individuals, irrespective of their position in the organisation, is often unstable. The 5C evaluation team experienced that it was difficult for people to recall specific trainings, and what they learned from those trainings. Often a change in knowledge, skills and behaviour is a result brought about by a combination of different factors, rather than being traceable to one particular event. The detailed causal maps that have been established, also clearly pointed this. There are many factors at play that make people change their behaviour, and this is not just dependent on training but also internal/personal (motivational) factors as well as factors within the organisation, that stimulate or hinder a person to change behaviour. Understanding how behaviour change works is important when trying to really understand the extent to which behaviour has changed as a result of different factors, actors and interventions. Organisations change because people change and therefore understanding when and how these individuals change behaviour is crucial. Also attrition and change in key organisational positions can contribute considerably to the outcome.

Utilisation of the evaluation

The 5C evaluation team considers it important to also discuss issues around utility of this evaluation. We want to mention just a few.

Design – mainly externally driven and with a focus on accountability and standard indicators and approaches within a limited time frame, and limited budget: this MFS II evaluation is originally based on a design that has been decided by IOB (the independent evaluation office of the Dutch Ministry of Foreign Affairs) and to some extent MFS II organisations. The evaluators have had no influence on the overall design and sampling for the 5C study. In terms of learning, one may question whether the most useful cases have been selected in this sampling process. The focus was very much on a rigorous evaluation carried out by an independent evaluation team. Indicators had to be streamlined across countries. The 5C team was requested to collaborate with the other 5C country teams (Bangladesh, Congo, Pakistan, Uganda) to streamline the methodological approach across the eight sampled countries. Whilst this may have its purpose in terms of synthesising results, the 5C evaluation team has also experienced the difficulty of tailoring the approach to the specific SPOs. The overall

evaluation has been mainly accountability driven and was less focused on enhancing learning for improvement. Furthermore, the timeframe has been very small to compare baseline information (2012) with endline information (2014). Changes in organisational capacity may take a long, particularly if they are related to behaviour change. Furthermore, there has been limited budget to carry out the 5C evaluation. For all the four countries (Ethiopia, India, Indonesia, Liberia) that the Centre for Development Innovation, Wageningen University and Research centre has been involved in, the budget has been overspent.

However, the 5C evaluation team has designed an endline process whereby engagement of staff, e.g. in a workshop process was considered important, not only due to the need to collect data, but also to generate learning in the organisation. Furthermore, having general causal maps and detailed causal maps generated by process tracing have provided rich information that many SPOs and CFAs have already appreciated as useful in terms of the findings as well as a learning process.

Another issue that must be mentioned is that additional requests have been added to the country teams during the process of implementation: developing a country based synthesis; questions on design, implementation, and reaching objectives of MFS II funded capacity development interventions, whilst these questions were not in line with the core evaluation questions for the 5C evaluation.

Complexity and inadequate coordination and communication: many actors, both in the Netherlands, as well as in the eight selected countries, have been involved in this evaluation and their roles and responsibilities, were often unclear. For example, 19 MFS II consortia, the internal reference group, the Ministry of Foreign Affairs, Partos, the Joint Evaluation Trust, NWO-Wotro, the evaluators (Netherlands and in-country), 2 external advisory committees, and the steering committee. Not to mention the SPO's and their related partners and consultants. CDI was involved in 4 countries with a total number of 38 SPOs and related CFAs. This complexity influenced communication and coordination, as well as the extent to which learning could take place. Furthermore, there was a distance between the evaluators and the CFAs, since the approach had to be synchronised across countries, and had to adhere to strict guidelines, which were mainly externally formulated and could not be negotiated or discussed for the purpose of tailoring and learning. Feedback on the final results and report had to be provided mainly in written form. In order to enhance utilisation, a final workshop at the SPO to discuss the findings and think through the use with more people than probably the one who reads the report, would have more impact on organisational learning and development. Furthermore, feedback with the CFAs has also not been institutionalised in the evaluation process in the form of learning events. And as mentioned above, the complexity of the evaluation with many actors involved did not enhance learning and thus utilization.

5C Endline process, and in particular thoroughness of process tracing often appreciated as learning process: The SPO perspective has also brought to light a new experience and technique of self-assessment and self-corrective measures for managers. Most SPOs whether part of process tracing or not, deeply appreciated the thoroughness of the methodology and its ability to capture details with robust connectivity. This is a matter of satisfaction and learning for both evaluators and SPOs. Having a process whereby SPO staff were very much engaged in the process of self-assessment and reflection has proven for many to be a learning experience for many, and therefore have enhanced utility of the 5C evaluation.

4 Results

4.1 MFS II supported capacity development interventions

Below an overview of the different MFS II supported capacity development interventions of TTCA that have taken place since the baseline in 2012 are described. The information is based on the information provided by Edukans and IICD.

Table 1

Information about MFS II supported capacity development interventions since the baseline in 2012

Title of the MFS II supported capacity development intervention	Objectives	Activities	Timing and duration	Budget
Training of 5 key tutors (including the vice dean) of Assayta CTE and 20 key teachers of 5 primary schools about applying the Active Teaching and Learning Methodology	To improve the quality of education (moving from a teacher centered towards a student –centered approach)	Bottom-up approach: (1) take time to understand the education institution and its context before we develop a training programme. (2) develop a tailor made training programme – together with the tutors of the teachers college – aiming to hand over responsibility for the methodology change as soon as possible	During the 4-year programme provide continuous feedback and support to the Teachers college (twice year by Edukans/UoA and in between the training session by DEC Ethiopia): on-the-job training	€ 52.535 of which 85% MFS II funding: € 44.008
Education Management Information System (EMIS) for School Management team and key teachers	- Effective education management as a way of improving the schools and quality of education - Effective use the EMIS for school data management at the institution	The SMT participated in the EMIS development process and validated before it was developed in to software. SMT aware of using the EMIS for school data management	The process started in the second year intervention of the program (2012)	No info
Basic ICT Support and training for School Management team and key teachers	Support teachers to work towards quality of education; enable teachers to prepare lessons and keep students' records properly; Teachers able to use computers to prepare lesson, explore information and keeping records in their daily teaching learning process	Teaching learning process fully supported by ICT and integration of ICT and education.	At the begging of the project and refreshment trainings as required (all the key teachers and SMT in the targeted five primary schools)	No info

4.2 Changes in capacity and reasons for change - evaluation question 1 and 4

Below you can find a description of the changes in each of the five core capabilities (4.2.1). This information is based on the analysis of the information per each of the indicators. This detailed information for each of the indicators describes the current situation, and how and why it has changed since the baseline. In addition to this staff present at the endline workshop were asked to indicate what were the key changes in the organisation since the baseline. The most important is key organisational capacity changes have been identified, as well as the reasons for these changes to come about. This is described in a general causal map, both as a visual as well as a narrative. The detailed general map is described in 4.2.2.

4.2.1 Changes in the five core capabilities

Capability to Act and Commit

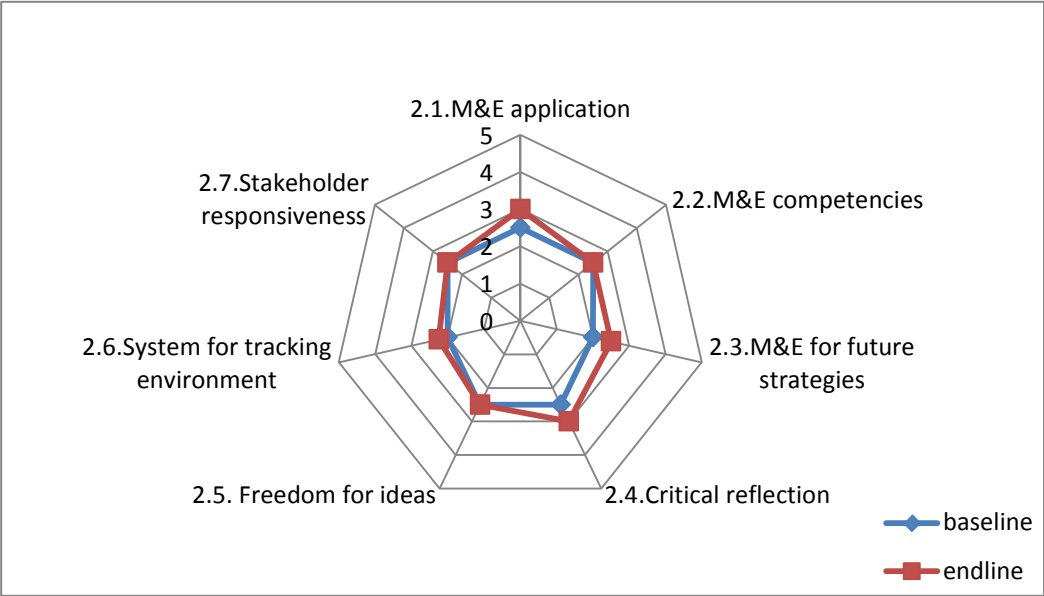

An overall very slight improvement has been observed in the colleges' capability to act and commit. The leadership of the college has shown an improvement in their willingness, commitment and capacity of managing the college. They have become more responsive and proactive. It resulted in a better provision of strategic guidance, and more openness and transparency in decision making. The middle management has freedom to exercise their responsibilities. The management has become close to the staff and they have discussed on the college's strategic plan and the day to day operational guide of the college is extracted from this. The college has worked in line with the strategic plan set by the Ministry of Education according to the education and training policy of the country and the region and the practical implementation of this is based on this strategic plan as well as based on monitoring results. The strategic plan is not shared with all staff and they are thus not all aware of this. The organizational structure of TTCA has not been changed and revised since the baseline and it is clearly communicated with staff and extensible to all. In line with the strategic plan the teaching methodology has improved from teacher centered to student-centered active learning. With support from the C4C alliance (MFS II funding) an ICT room has been established and the ICT technology supports teachers in preparing modules, lesson plans and other course materials. This stimulates staff in addition to having extension payment and training and experience sharing opportunities. Furthermore, incentives like upgrading staffs academic status from second to first degree has helped to retain staffs. Training has been provided to

staff in terms of recruitment of new students (i.e. in the proper utilization of the selection criteria), material or module preparation, practicum implementation and preparation of volunteer’s guideline, gender, quality education and property management. Different organisations supported these trainings: DEC, USAID, MoE, Save the Children UK. The C4C alliance (MFS II funding) has supported training on active learning, moving from teacher-centered to student centered learning. The government has remained the major funder of the college whereas DEC also increased its contribution (from MFS II) and additional funds were received from C4C for establishing ICT infrastructure. UNICEF and UNESCO have started to collaborate with the college to support primary school mother tongue education.

Score: from 2.9 to 3.2 (very slight improvement)

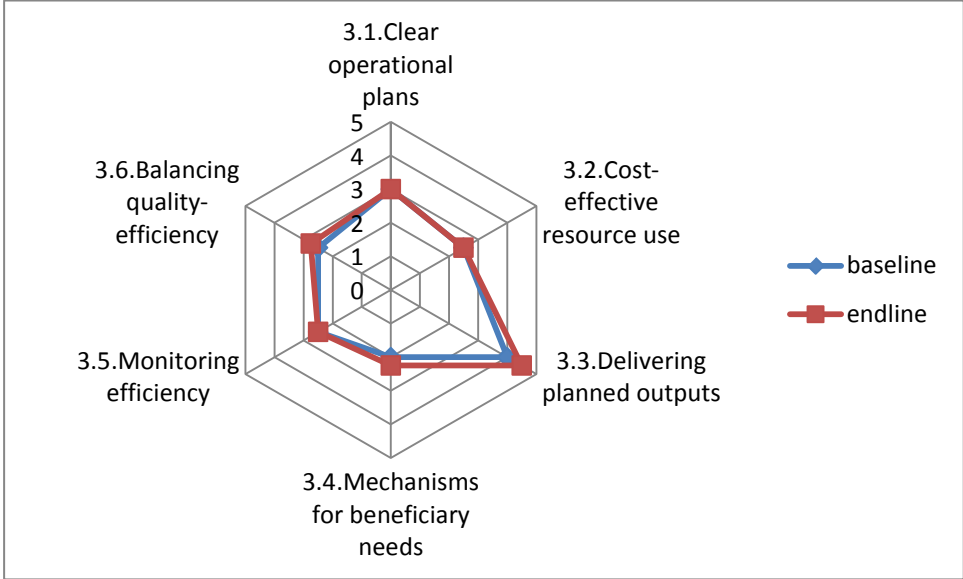

Capability to adapt and self-renew

DEC had accomplished the evaluation of its 15 implementing partners. The C4C pilot primary schools are also supervised by DEC in collaboration with the implementing partners. Shortage of administrative budget to monitor project activities at school level is found to be a major challenge for the implementing partners. TTCA has set up a joint M&E practice by teachers, department head and academic dean, where the evaluation report is utilized to make corrective actions, to give timely feedback to students and to report the progress. Staffs are well aware of the staff performance evaluation on what is to be evaluated and how. The C4C alliance provided and trained staff on an observation Matrix which has 16 indicators, of which 8 focus on behavior of the teacher and 8 on the behavior of the students. This is now used twice a year. Classes of key tutors as well as non-key tutors are observed. Insight in the progress made has been given by the CTE and communicated to the University of Amsterdam. The observation tool has become a monitoring tool for CTE tutors for assessing the quality of teaching and learning at classroom level. This also provides insights for strategic planning, along with inputs from few stakeholders. TTCA closely works with primary schools where they support and supervise them. There has been a slight improvement in terms of frequency of meetings and the dean has become more open and supportive to staff to share their ideas.

Score: from 2.4 to 2.6 (very slight improvement)

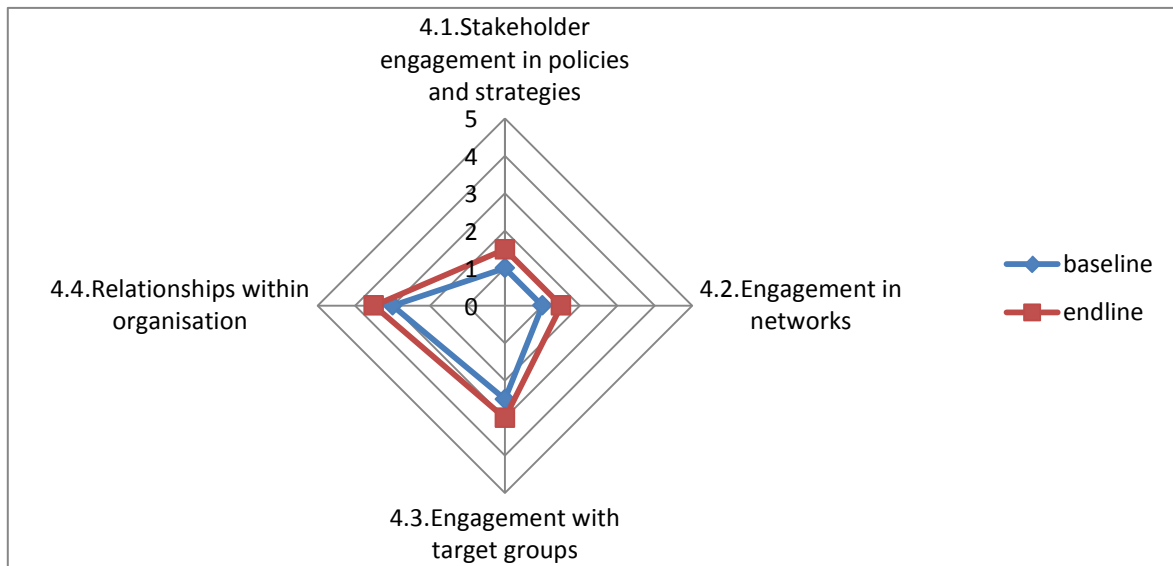

Capability to deliver on development objectives

All the activities of the college have their own operational plan with their respective budget. The operational plans are developed through a bottom up discussion, where all department heads and process owners discuss issues with their respected staffs. It's after this the academic commission and the management committee starts to follow up on the implementation of the operational plan. Operational plans are made at the end of each C4C project visit – for the coming 6 months. It is observed that fiscal and financial plans have started to be prepared timely by the Department heads. TTCA is trying to manage resources in a cost effective way, where budgets are allocated by prioritizing activities. Colleges and department heads are informed about their allotted budget so as to use these cost-effectively. Though there is no standardized monitoring system in the college yet, the vice dean has started to frequently supervise tutors and provide immediate feedback. Students' class representatives are also consulted frequently about the teaching learning process and other related issues and the identified gaps and problems are addressed accordingly. Active Teaching and Learning strategies are better applied at the college since 2013 by the key tutors which has enhanced quality of the work. Despite the limited resources, the college is trying to bring efficiency and quality in the college by improving the quality of education, partly through applying the Active Teaching and Learning strategies at the college since 2013 by the key tutors. This has also helped to improve on achieving objectives.

Score: from 2.75 to 2.9 (very slight improvement)

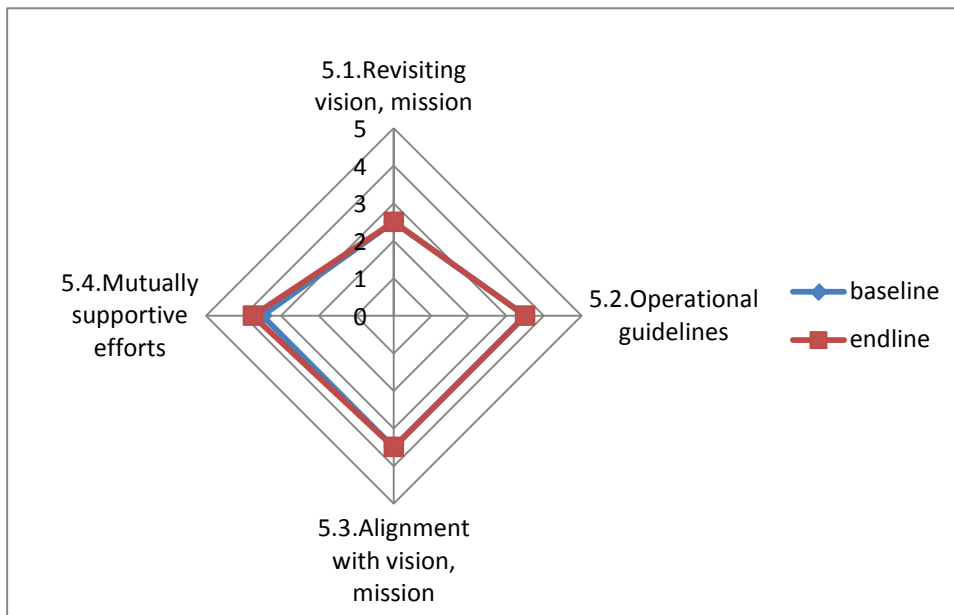

Capability to relate

There is a slight improvement in the ability of management to engage with external stakeholders. The feedbacks of the stakeholders have been considered during the preparation the college’s strategic plan. Efforts are also made with parents to increase parents’ involvement in education. TTCA has also collaborated with similar colleges such as Dessie and Jimma college of teacher education, where experiences and materials such as modules, curriculums are shared among their staffs. TTCA has also closely engaged with C4C intervention primary schools. In addition, the top level management, particularly the academic vice dean, has improved engagement with the staffs.

Score: from 1.9 to 2.4 (slight improvement)

Capability to achieve coherence

Vision, mission and strategies are discussed when the need arises. The strategies and activities of TTCA are still in line with these vision and mission. Other funding organisations like UNICEF and UNESCO have come on board to support implementation of mutually supportive efforts. TTCA still has operational guidelines in place on HRM, finance, goods and service procurement, trainee’s selection and others and most of these guidelines are used for practical activities. However, these guidelines still require updating

and still staff do not seem to have adequate understanding of the guidelines. It is only the Education Management Information System (EMIS) that has developed and installed on computers of the 75 schools in the end line period.

Score: from 3.3 to 3.3 (no change)

4.2.2 Key organisational capacity changes - general causal map

Below you can find a description of the key changes in organizational capacity of TTCA since the baseline as expressed by TTCA staff during the endline workshop. First, a description is given of how this topic was introduced during the endline workshop by summarising key information on TTCA from the baseline report. This information included a brief description of the vision, mission and strategies of the organisation, staff situation, clients and partner organisations. This then led into a discussion on how TTCA has changed since the baseline.

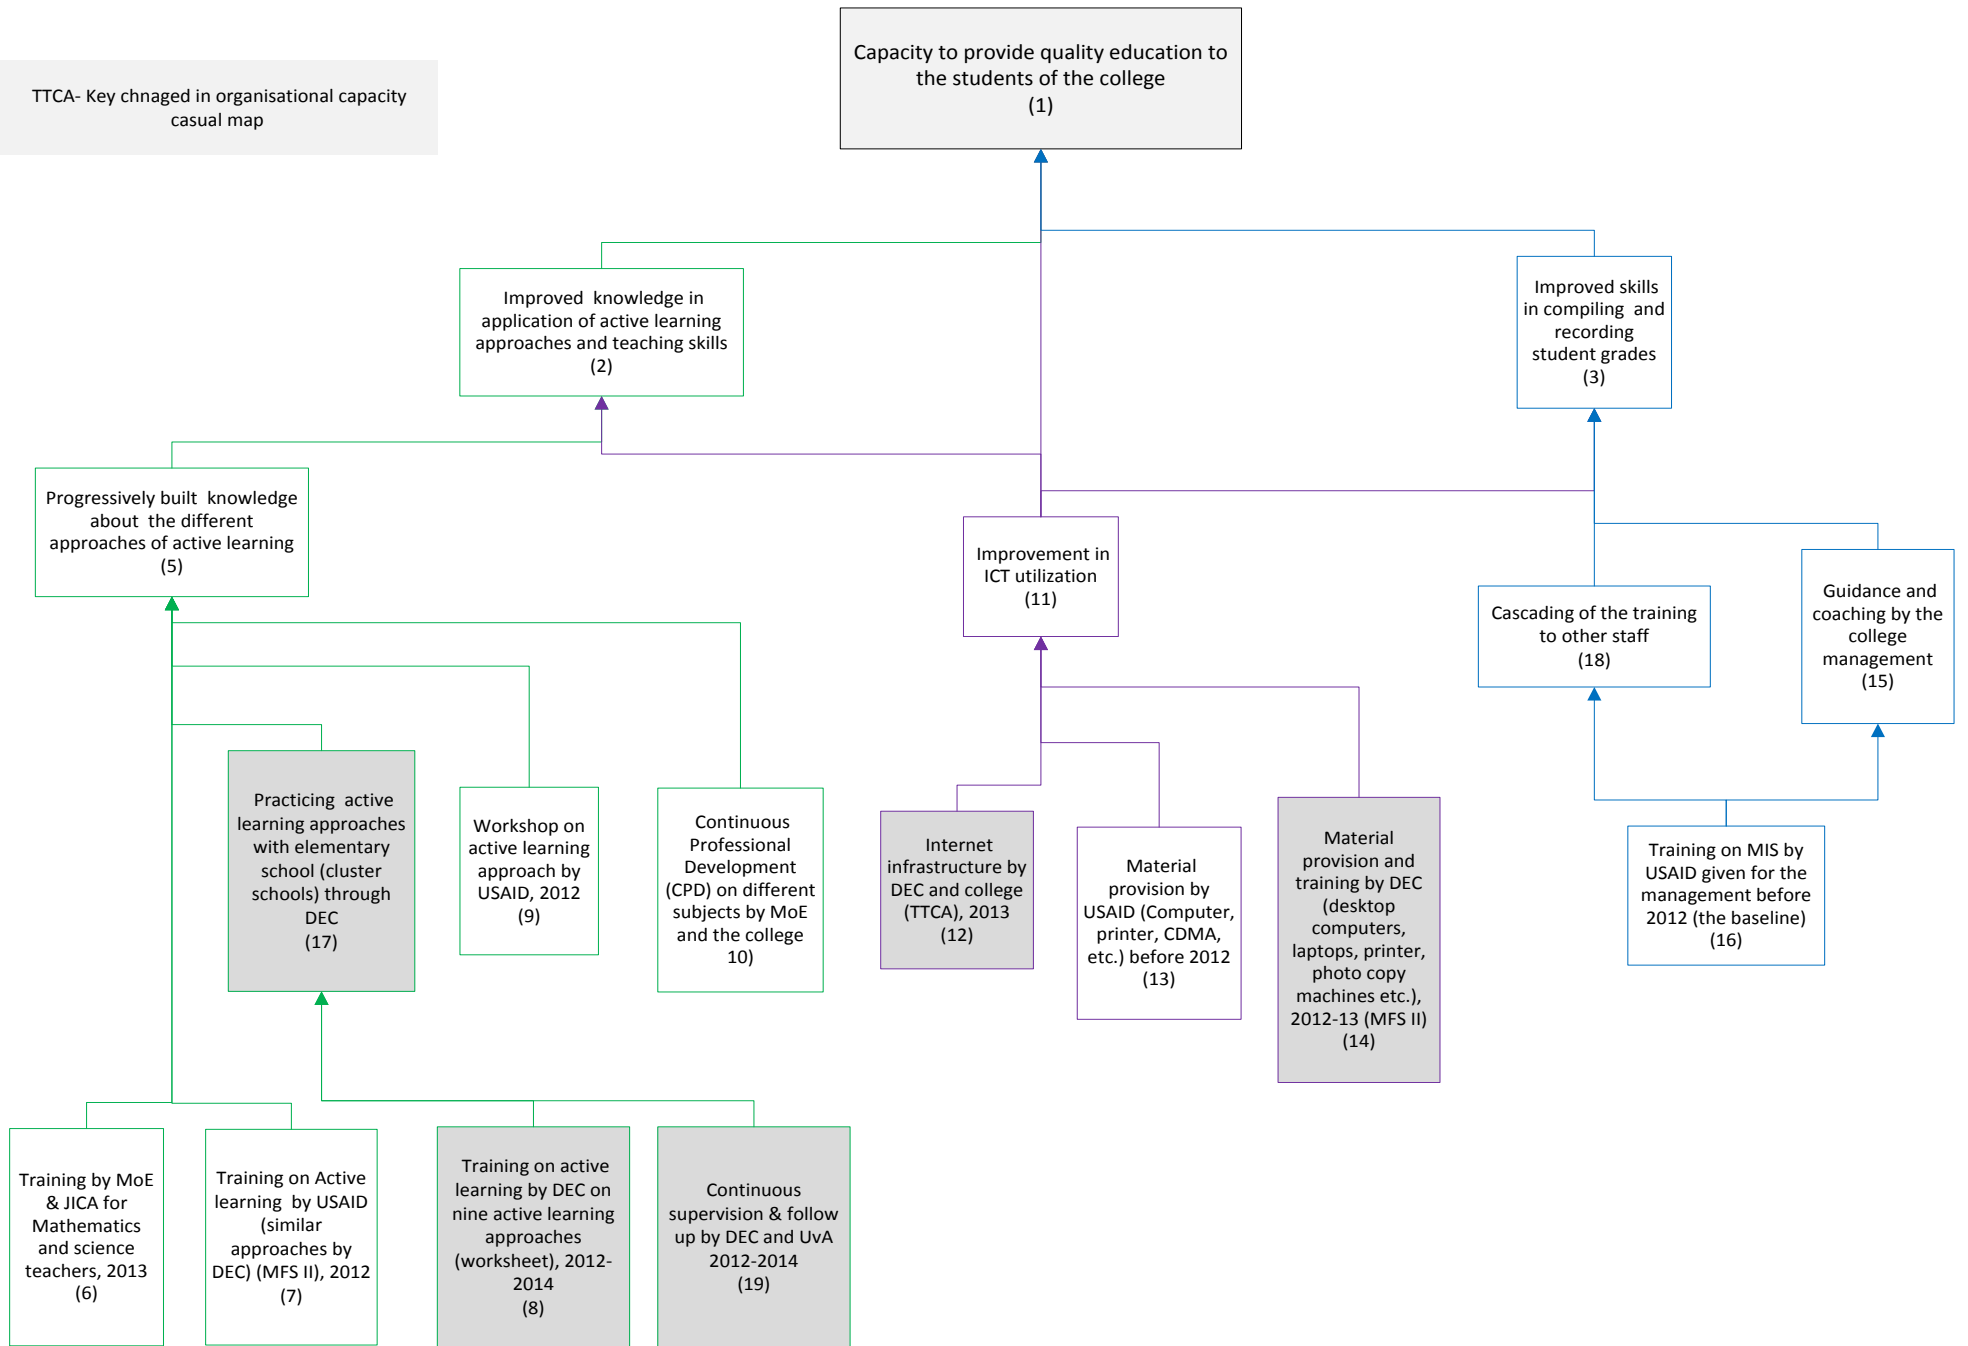

The endline workshop was conducted on May 01, 2014 starting from 9:00 am to 5:00 pm, at Assayita Teacher Training Centre office, Assayta, Afar Region, TTCA staff of five categories- management, program, M&E, field office and administration and finance- participated. From 11 staffs participating only three staffs had been in the baseline assessment carried out in 2012.

The goal of TTCA f is to provide quality education to the students of the college (1). Staff agreed that in the process of achieving this, the following three major changes were observed:

- Improved knowledge in the application of active learning approaches and teaching skills (2)
- Improvement in ICT utilization (11)
- Improved skills in compiling and recording student grades [3]

Each of these three key organisational capacity changes is explained below. The numbers correspond to the numbers in the visual.

TTCA- Key changes in organisational capacity casual map

Improved knowledge in the application of active learning approaches and teaching skills (2)

This refers to the knowledge gained by the college faculty to enhance the active learning of the college students. This includes the use of active learning approaches that increase the participation of students in the classroom (5).

This knowledge was gained as a result of different capacity development interventions which include different trainings and workshop and, improvement in ICT utilization.

Training and workshops:

The trainings that were given include: the training for mathematics and science teachers which was organized by the MoE and JICA (Japan International Cooperation Agency) in 2013 (6). This training targeted mathematics and science teachers and focused on how to deliver these courses interactively to improve the understanding of students. The other training was on active learning organized by USAID in 2012 (7) which was given to the majority of the faculty. Similar series of trainings were given on the nine modules/components by DEC (MFS II funded) from 2012 -2014 (8). This training was delivered to four focal teachers of the college identified by the (MFSII funded) project. These four teachers also had the opportunity to practice the active learning approaches they learned on the MFS II implemented in project elementary schools (cluster schools) (17).

The main difference between the two types of trainings was that the DEC trainings complemented training with continuous supervision and follow up by DEC and the experts coming from the University of Amsterdam, the Netherlands (19). However, the USAID supported training targeted the whole faculty of the TTCA. In addition, USAID also complemented this with a workshop on active learning (9). Note: Currently the focus of most donors and the government is related to active learning. However, the unique thing with DEC is trainers from the Netherlands coming twice a year and DEC staff visiting the college up to four times per year.

The other staff training intervention that contributed to the improved knowledge in application of active learning approaches and teaching skills (2) was the Continuous Professional Development (CPD) on different subjects (10) by the MoE and the college. This professional development training is provided to all faculties on the subjects the faculty is teaching including active teaching and learning methods. The workshop participants gave high value to this program.

It needs to be noted that active learning as a concept and practice was introduced not only by the Development Expertise Centre (DEC) but also by other stakeholders, such as through the Higher Diploma Program (HDP) of the ministry of Education and the World Bank.

The training given by DEC (MFS II funded) was attended by faculty members selected by the college as focal persons for the active learning project that is implemented by DEC. Some faculty members feel that the training received by the four faculty members was not cascaded to other teachers. Therefore, when reading this part of the causal map on this subject (8 and 19) we need to understand that the training was given to only a limited number of faculty staff.

The Academic Vice Dean mentioned that the change that happened in relation to active learning was a result of capacity building by HDP and DEC. Currently the focus of most donors and the government is related to active learning. However, the unique thing with DEC is trainers from the Netherlands coming twice a year and DEC staff visiting the college up to four times per year.

Improvement in ICT utilization (11)

The improvement in utilization of information and communication technology (ICT) (11) relates to the improved ability of the college staff to use computers, so as to access the internet for collecting information that is to be used in preparing lecture notes. In addition, it also refers to the use of computers for word processing and visualization techniques related to activities that help to improve the lecture notes as well as their delivery (e.g. preparation and presentation of power point slides). This was made possible because the college got computers and accessories (printers, photocopy machines etc.) from DEC in 2012 and 2013 with MFS II funding (14). Similarly, to improve internet access DEC installed the required infrastructure (financed the installation of land line broadband internet connection and provided CDMA's- Code Division Multiple Access) (12). However, earlier to this the college also received computers from USAID (13). Therefore, the computers received from both sources were instrumental in improvement of the knowledge in the ICT utilization.

Improved skills in compiling and recording student grades [3]

One activity, which contributes to quality education, is the proper recording and handling of student grades. TTCA believes that it has continuously improved in this. Now the college staff has better knowledge and skills in how to compile and record student grades [3]. This enabled to decrease student complaints regarding incorrect grading and misplacement of student grades.

The factors that helped in this include the training on MIS organized by USAID for the management before 2012 (16). However, since the management cascaded the training to other staff (18) and complemented it with guidance and coaching (15) it has contributed to the improvement of the skills in compiling and recording of more staff (3). Since the MIS utilizes the ICT facility, the improvement made in ICT utilization (11) was also helpful here.

5 Discussion and conclusion

5.1 Methodological issues

In preparation for the assessment, the Ethiopian 5C assessment team contacted, through telephone, TTCA's general manager located in the organization's HQs in Asayta town to explain the purpose and the process of the 5C end line assessment. In addition, the team also sent through email the "support to capacity development sheet" to be filled by TTCA staff.

Following this, the assessment team travelled to the area to carry out the assessment. The assessment team stayed for one week in Asayta town and visited the college on three occasions. During the first visit to the college, the self-assessment was carried out workshop with a total of 11 participants and the staffs were asked to fill the self-assessment form in their respective five subgroups (management (1); program (3); M&E (2); HRM and administration (2) and field staff (3). It was difficult to make clear cut groupings based on the above mentioned categories as the college structure differs from other organizations. Though some staff members may be given leadership responsibilities they are still faculty members and are required to teach. Therefore, to form the groups we based the responsibilities they are given other than the teaching. In the self-assessment exercise we learned that the HRM and administration were unable to fill the form on their own due to their English language skills. Therefore, the assessment team combined the self-assessment and interview and conduct an interview. In a second visit a brainstorming session was organized to develop a general causal map that explains the key organisational capacity changes that have occurred in TTCA since the baseline in 2012. In the third visit an interview was conducted with one representative from each subgroup to triangulate the information collected through the self-assessment and to better understand the changes in TTCA's capacity since 2012. This was done after the 5C assessment team reviewed the completed self-assessment forms.

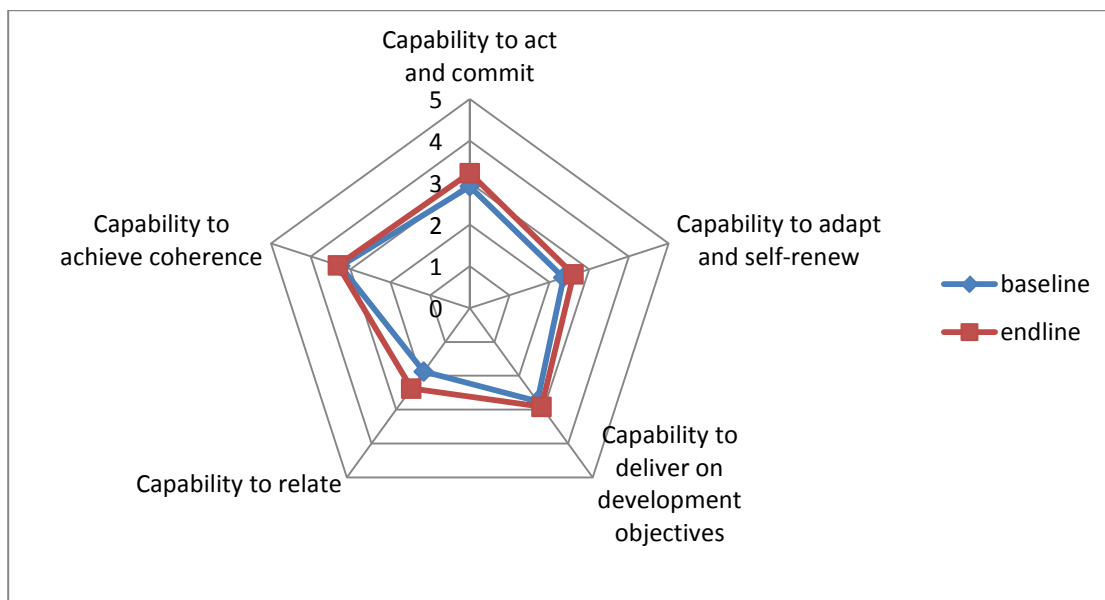

The plan of the evaluation team to conduct three interviews with TTCA partners did materialize. Instead, the evaluation team had an interview with the principals of three schools that were partner to TTCA. No consultants were interviewed since the college does not work with consultants.

By and large, there has been a lot of information available to be able to do adequate data analysis.

5.2 Changes in organisational capacity

This section aims to provide an answer to the first and fourth evaluation questions:

1. *What are the changes in partner organisations' capacity during the 2012-2014 period?*
4. *What factors explain the findings drawn from the questions above?*

Below the changes in each of the five core capabilities are further explained, by referring to the specific indicators that changed. In all of these capabilities improvements took place.

Over the last two years many small improvements took place in the indicators under the capability to act and commit. Members of management have become more responsive and proactive and the academic dean is more easily approached by all staff. The management has become better at providing strategic guidance and staff are able to discuss the strategic plan, which is available for all departments, with management. TTCA is using M&E feedback and takes the current situation into consideration when articulating operational plans. Staff skills have improved since the baseline, as college teachers now have second degrees, while they used to have first degrees; key tutors and the vice dean have been trained through the C4C alliance; and staff is making better use of ICT. There has been a slight improvement in the training opportunities that are offered to staff. Trainings through the C4C alliance (DEC) are for a limited number of staff, but USAID, MoE and Save the Children UK have also offered training opportunities for staff. There has been a very slight improvement in the funding situation of TTCA because UNICEF and UNESCO have started supporting primary schools. No new funding procedures are in place but some (successful) efforts have been made to approach donors by writing proposals for funding for e.g. ICT infrastructure, reference books, library etc.

In the capability to adapt and self-renew TTCA saw some improvements. Teaching practices are now evaluated in a more integrated way through joint M&E practice involving teachers, the department head and academic dean. Improvements have been observed in the number of staff evaluations, the utilization of evaluation reports, preparations of students' results in a timely fashion, and in delivery of scheduled progress reports by Department heads. The student and teacher behaviour observation matrix that is provided by the C4C alliance (MFS II funding) provides inputs for strategic planning and also to make actions and corrections. Opportunities for critical reflection have improved slightly as review meetings are organised to discuss progress and design improvement actions. TTCA has seen a very slight improvement in the way it is tracking its operating environment. Through sharing experience within the C4C alliance, linkages with primary schools and working closely with communities, TTCA is understanding better what is happening in its environment.

In terms of the capability to deliver on development objectives, TTCA has improved in some indicators. The centre has improved in delivering planned outputs because active teaching and learning strategies are now applied and teachers are aware of the need to actively involve students in the learning process. Mechanisms to check whether service meet beneficiaries' (students') needs have improved very slightly because every 20 days there are discussions with students' representatives from each department and students council about the teaching-learning process and other issues in the college with the academic dean and the respective heads of departments. Despite the limited resources, TTCA is trying to balance efficiency and quality by improving the quality of education and trainings.

In the capability to relate, TTCA improved in all indicators. According to management TTCA has improved its relations with external groups and is considering partners' feedback and reflection in their strategy and future activity towards improving the quality of education. The college has started collaborating with Dessie and Jimma CTEs (through the C4C alliance) and therefore their engagement in networks improved slightly. TTCA is engaging slightly more with its target groups as there is now a formal system to support DEC intervention at schools and parents' involvement in e.g. the preparation of strategies is encouraged. Within TTCA there is a slight improvement in relations between top management and staff as they are engaging more in open discussions and dialogue.

Finally, TTCA has shown a very slight improvement in the indicator "mutually supportive efforts" under the capability to achieve coherence. The college has started to work with other NGOs like USAID, UNESCO and UNICEF to complete projects and there are good efforts to help cluster schools through e.g. the provision of computers.

During the endline workshop some key organisational capacity changes were brought up by TTCA's staff in the 'general causal map': improved knowledge in the application of active learning approaches and teaching skills; improvement in ICT utilization; and improved skills in compiling and recording student grades. The evaluators considered it important to also note down the SPO's story about what they considered to be key organisational capacity changes since the baseline, and this would also provide more information about reasons for change, which were difficult to get for the individual indicators. Also for some issues there may not have been relevant indicators available in the list of core indicators provided by the evaluation team.

According to TTCA staff, they have improved their knowledge in the application of active learning approaching and teaching skills because of progressively built knowledge on the different approaches of active learning and the improvement in ICT utilisation. Knowledge was progressively built during a training for mathematics and science teachers by the MoE and JICA (Japan International Cooperation Agency) in 2013; a training on active learning organized by USAID in 2012; Continuous Professional Development (CPD) on different subjects by the MoE and the college; practice active learning approaches in project elementary schools (MFS II funded), which teachers has learned during a series of trainings by DEC in 2012-2014 (MFS II funded) and through continuous supervision and follow up by DEC, UvA and Edukans in 2012-2014 (MFS II funded). TTCA improved its utilisation of ICT because of installation of required infrastructure by DEC (MFS II funded); material (computer etc.) provision by USAID before 2012; and material provision and training by DEC during 2012-2013 (MFS II funded). The college improved its skills in compiling and recording student grades because of improvement in ICT utilisation; cascading of the MIS training by USAID for the management before 2012 to other staff; and guidance and coaching by the college management (which was triggered by the USAID MIS training).

According to TTCA's staff, MFS II funded capacity development interventions have thus played a role in improved knowledge in the application of active learning approaches and teaching skills; improvement in ICT utilization; and the improved skills in compiling and recording student grades. This was through MFS II funded trainings, supervision and the provision of ICT infrastructure and material. However, internal factors like Continuous Professional Development by the college have also played an important role in the key organisational capacity changes that the TTCA's staff considered important since the baseline in 2012. Support from other funders, like MoE, JICA, USAID; in terms of trainings and material provision has also been mentioned among the underlying factors for these changes.

Anwar Mohammed, Simble General Elementary School, Partner of TTCA.

Seid Mohammed, Arado Elementary school, Principal of the schoolPartner, Partner TTCA.

Appendix 1 Methodological approach & reflection

1. Introduction

This appendix describes the methodological design and challenges for the assessment of capacity development of Southern Partner Organisations (SPOs), also called the '5C study'. This 5C study is organised around four key evaluation questions:

1. What are the changes in partner organisations' capacity during the 2012-2014 period?
2. To what degree are the changes identified in partner capacity attributable to development interventions undertaken by the MFS II consortia (i.e. measuring effectiveness)?
3. Were the efforts of the MFS II consortia efficient?
4. What factors explain the findings drawn from the questions above?

It has been agreed that the question (3) around efficiency cannot be addressed for this 5C study. The methodological approach for the other three questions is described below. At the end, a methodological reflection is provided.

In terms of the attribution question (2), 'process tracing' is used. This is a theory-based approach that has been applied to a selected number of SPOs since it is a very intensive and costly methodology, although it provides rich information and can generate a lot of learning within the organisations. This approach was presented and agreed-upon during the synthesis workshop on 17-18 June 2013 by the 5C teams for the eight countries of the MFS II evaluation. A more detailed description of the approach was presented during the synthesis workshop in February 2014. The synthesis team, NWO-WOTRO, the country project leaders and the MFS II organisations present at the workshop have accepted this approach. It was agreed that this approach can only be used for a selected number of SPOs since it is a very intensive and costly methodology. Key organisational capacity changes/ outcomes of the SPO were identified, based on their relationship to the two selected capabilities, the capability to act and commit the capability to adapt and self-renew, and an expected relationship with CFA supported capacity development interventions (MFS II funding). It was agreed to focus on these two capabilities, since these are the most targeted capabilities by the CFAs, as established during the baseline process.

Please find below an explanation of how the above-mentioned evaluation questions have been addressed in the 5C evaluation.

Note: the methodological approach is applied to 4 countries that the Centre for Development Innovation, Wageningen University and Research centre is involved in in terms of the 5C study (Ethiopia, India, Indonesia, Liberia). The overall approach has been agreed with all the 8 countries selected for this MFS II evaluation. The 5C country teams have been trained and coached on this methodological approach during the evaluation process. Details specific to the SPO are described in chapter 5.1 of the SPO report. At the end of this appendix a brief methodological reflection is provided.

2. Changes in partner organisation's capacity – evaluation question 1

This section describes the data collection and analysis methodology for answering the first evaluation question: **What are the changes in partner organisations' capacity during the 2012-2014 period?**

This question was mainly addressed by reviewing changes in 5c indicators, but additionally a 'general causal map' based on the SPO perspective on key organisational capacity changes since the baseline has been developed. Each of these is further explained below. The development of the general causal map is integrated in the steps for the endline workshop, as mentioned below.

During the baseline in 2012 information has been collected on each of the 33 agreed upon indicators for organisational capacity. For each of the five capabilities of the 5C framework indicators have been developed as can be seen in Appendix 2. During this 5C baseline, a summary description has been provided for each of these indicators, based on document review and the information provided by staff, the Co-financing Agency (CFA) and other external stakeholders. Also a summary description has been provided for each capability. The results of these can be read in the baseline reports.

The description of indicators for the baseline in 2012 served as the basis for comparison during the endline in 2014. In practice this meant that largely the same categories of respondents (preferably the same respondents as during the baseline) were requested to review the descriptions per indicator and indicate whether and how the endline situation (2014) is different from the described situation in 2012.² Per indicator they could indicate whether there was an improvement or deterioration or no change and also describe these changes. Furthermore, per indicator the interviewee could indicate what interventions, actors and other factors explain this change compared to the baseline situation. See below the specific questions that are asked for each of the indicators. Per category of interviewees there is a different list of indicators to be looked at. For example, staff members were presented with a list of all the indicators, whilst external people, for example partners, are presented with a select number of indicators, relevant to the stakeholder.

The information on the indicators was collected in different ways:

1. **Endline workshop at the SPO - self-assessment and 'general causal map'**: similar to data collection during the baseline, different categories of staff (as much as possible the same people as during the baseline) were brought together in a workshop and requested to respond, in their staff category, to the list of questions for each of the indicators (self-assessment sheet). Prior to carrying out the self-assessments, a brainstorming sessions was facilitated to develop a 'general causal map', based on the key organisational capacity changes since the baseline as perceived by SPO staff. Whilst this general causal map is not validated with additional information, it provides a sequential narrative, based on organisational capacity changes as perceived by SPO staff;
2. **Interviews with staff members**: additional to the endline workshop, interviews were held with SPO staff, either to provide more in-depth information on the information provided on the self-assessment formats during the workshop, or as a separate interview for staff members that were not present during the endline workshop;
3. **Interviews with externals**: different formats were developed for different types of external respondents, especially the co-financing agency (CFA), but also partner agencies, and organisational development consultants where possible. These externals were interviewed, either face-to-face or by phone/Skype. The interview sheets were sent to the respondents and if they wanted, these could be filled in digitally and followed up on during the interview;
4. **Document review**: similar to the baseline in 2012, relevant documents were reviewed so as to get information on each indicator. Documents to be reviewed included progress reports, evaluation reports, training reports, etc. (see below) since the baseline in 2012, so as to identify changes in each of the indicators;

² The same categories were used as during the baseline (except beneficiaries, other funders): staff categories including management, programme staff, project staff, monitoring and evaluation staff, field staff, administration staff; stakeholder categories including co-financing agency (CFA), consultants, partners.

-
- 1) **Observation:** similar to what was done in 2012, also in 2014 the evaluation team had a list with observable indicators which were to be used for observation during the visit to the SPO.

Below the key steps to assess changes in indicators are described.

Key steps to assess changes in indicators are described

1. Provide the description of indicators in the relevant formats – CDI team
2. Review the descriptions per indicator – in-country team & CDI team
3. Send the formats adapted to the SPO to CFA and SPO – in-country team (formats for SPO) and CDI team (formats for CFA)
4. Collect, upload & code the documents from CFA and SPO in NVivo – CDI team
5. Organise the field visit to the SPO – in-country team
6. Interview the CFA – CDI team
7. Run the endline workshop with the SPO – in-country team
8. Interview SPO staff – in-country team
9. Fill-in observation sheets – in-country team
10. Interview externals – in-country team
11. Upload and auto-code all the formats collected by in-country team and CDI team in NVivo – CDI team
12. Provide to the overview of information per 5c indicator to in-country team – CDI team
13. Analyse data and develop a draft description of the findings per indicator and for the general questions – in-country team
14. Analyse data and develop a final description of the findings per indicator and per capability and for the general questions – CDI team
15. Analyse the information in the general causal map –in-country team and CDI-team

Note: the CDI team include the Dutch 5c country coordinator as well as the overall 5c coordinator for the four countries (Ethiopia, India, Indonesia, Liberia). The 5c country report is based on the separate SPO reports.

Below each of these steps is further explained.

*Step 1. Provide the **description of indicators** in the relevant formats – CDI team*

- These formats were to be used when collecting data from SPO staff, CFA, partners, and consultants. For each of these respondents different formats have been developed, based on the list of 5C indicators, similar to the procedure that was used during the baseline assessment. The CDI team needed to add the 2012 baseline description of each indicator. The idea was that each respondent would be requested to review each description per indicator, and indicate whether the current situation is different from the baseline situation, how this situation has changed, and what the reasons for the changes in indicators are. At the end of each format, a more general question is added that addresses how the organisation has changed its capacity since the baseline, and what possible reasons for change exist. Please see below the questions asked for each indicator as well as the more general questions at the end of the list of indicators.

General questions about key changes in the capacity of the SPO

What do you consider to be the key changes in terms of how the organisation/ SPO has developed its capacity since the baseline (2012)?

What do you consider to be the main explanatory reasons (interventions, actors or factors) for these changes?

List of questions to be asked for each of the 5C indicators (The entry point is the the description of each indicator as in the 2012 baseline report):

1. How has the situation of this indicator changed compared to the situation during the baseline in 2012? Please tick one of the following scores:
 - 2 = Considerable deterioration
 - 1 = A slight deterioration
 - 0 = No change occurred, the situation is the same as in 2012
 - +1 = Slight improvement
 - +2 = Considerable improvement
2. Please describe what exactly has changed since the baseline in 2012
3. What interventions, actors and other factors explain this change compared to the baseline situation in 2012? Please tick and describe what interventions, actors or factors influenced this indicator, and how. You can tick and describe more than one choice.
 - Intervention, actor or factor at the level of or by **SPO**:
 - Intervention, actor or factor at the level of or by the **Dutch CFA (MFS II funding)**:
 - Intervention, actor or factor at the level of or by the **other funders**:
 - Other** interventions, actors or factors:
 - Don't know.

Step 2. **Review** the descriptions per indicator – in-country team & CDI team

Before the in-country team and the CDI team started collecting data in the field, it was important that they reviewed the description for each indicator as described in the baseline reports, and also added to the endline formats for review by respondents. These descriptions are based on document review, observation, interviews with SPO staff, CFA staff and external respondents during the baseline. It was important to explain this to respondents before they filled in the formats.

Step 3. **Send the formats** adapted to the SPO to CFA and SPO – in-country team (formats for SPO) and CDI team (formats for CFA)

The CDI team was responsible for collecting data from the CFA:

- 5C Endline assessment Dutch co-financing organisation;
- 5C Endline support to capacity sheet – CFA perspective.

The in-country team was responsible for collecting data from the SPO and from external respondents (except CFA). The following formats were sent before the fieldwork started:

- 5C Endline support to capacity sheet – SPO perspective.
- 5C Endline interview guides for externals: partners; OD consultants.

Step 4. **Collect, upload & code the documents** from CFA and SPO in NVivo – CDI team

The CDI team, in collaboration with the in-country team, collected the following documents from SPOs and CFAs:

- Project documents: project proposal, budget, contract (Note that for some SPOs there is a contract for the full MFS II period 2011-2015; for others there is a yearly or 2-yearly contract. All new contracts since the baseline in 2012 will need to be collected);
- Technical and financial progress reports since the baseline in 2012;.
- Mid-term evaluation reports;
- End of project-evaluation reports (by the SPO itself or by external evaluators);
- Contract intake forms (assessments of the SPO by the CFA) or organisational assessment scans made by the CFA that cover the 2011-2014 period;

- Consultant reports on specific inputs provided to the SPO in terms of organisational capacity development;
- Training reports (for the SPO; for alliance partners, including the SPO);
- Organisational scans/ assessments, carried out by the CFA or by the Alliance Assessments;
- Monitoring protocol reports, especially for the 5C study carried out by the MFS II Alliances;
- Annual progress reports of the CFA and of the Alliance in relation to capacity development of the SPOs in the particular country;
- Specific reports that are related to capacity development of SPOs in a particular country.

The following documents (since the baseline in 2012) were requested from SPO:

- Annual progress reports;
- Annual financial reports and audit reports;
- Organisational structure vision and mission since the baseline in 2012;
- Strategic plans;
- Business plans;
- Project/ programme planning documents;
- Annual work plan and budgets;
- Operational manuals;
- Organisational and policy documents: finance, human resource development, etc.;
- Monitoring and evaluation strategy and implementation plans;
- Evaluation reports;
- Staff training reports;
- Organisational capacity reports from development consultants.

The CDI team will code these documents in NVivo (qualitative data analysis software program) against the 5C indicators.

Step 5. Prepare and organise the field visit to the SPO – in-country team

Meanwhile the in-country team prepared and organised the logistics for the field visit to the SPO:

- **General endline workshop** consisted about one day for the self-assessments (about ½ to ¾ of the day) and brainstorm (about 1 to 2 hours) on key organisational capacity changes since the baseline and underlying interventions, factors and actors ('general causal map'), see also explanation below. This was done with the five categories of key staff: managers; project/ programme staff; monitoring and evaluation staff; admin & HRM staff; field staff. Note: for SPOs involved in process tracing an additional 1 to 1½ day workshop (managers; program/project staff; monitoring and evaluation staff) was necessary. See also step 7;
- **Interviews with SPO staff** (roughly one day);
- **Interviews with external respondents** such as partners and organisational development consultants depending on their proximity to the SPO. These interviews could be scheduled after the endline workshop and interviews with SPO staff.

General causal map

During the 5C endline process, a 'general causal map' has been developed, based on key organisational capacity changes and underlying causes for these changes, as perceived by the SPO. The general causal map describes cause-effect relationships, and is described both as a visual as well as a narrative.

As much as possible the same people that were involved in the baseline were also involved in the endline workshop and interviews.

Step 6. Interview the CFA – CDI team

The CDI team was responsible for sending the sheets/ formats to the CFA and for doing a follow-up interview on the basis of the information provided so as to clarify or deepen the information provided.

This relates to:

- 5C Endline assessment Dutch co-financing organisation;
- 5C Endline support to capacity sheet - CFA perspective.

Step 7. Run the endline workshop with the SPO – in-country team

This included running the endline workshop, including facilitation of the development of the general causal map, self-assessments, interviews and observations. Particularly for those SPOs that were selected for process tracing all the relevant information needed to be analysed prior to the field visit, so as to develop an initial causal map. Please see Step 6 and also the next section on process tracing (evaluation question two).

An endline workshop with the SPO was intended to:

- Explain the purpose of the fieldwork;
- Carry out in the self-assessments by SPO staff subgroups (unless these have already been filled prior to the field visits) - this may take some 3 hours.
- Facilitate a brainstorm on key organisational capacity changes since the baseline in 2012 and underlying interventions, factors and actors.

Purpose of the fieldwork: to collect data that help to provide information on what changes took place in terms of organisational capacity development of the SPO as well as reasons for these changes. The baseline that was carried out in 2012 was to be used as a point of reference.

Brainstorm on key organisational capacity changes and influencing factors: a brainstorm was facilitated on key organisational capacity changes since the baseline in 2012. In order to kick start the discussion, staff were reminded of the key findings related to the historical time line carried out in the baseline (vision, mission, strategies, funding, staff). This was then used to generate a discussion on key changes that happened in the organisation since the baseline (on cards). Then cards were selected that were related to organisational capacity changes, and organised. Then a 'general causal map' was developed, based on these key organisational capacity changes and underlying reasons for change as experienced by the SPO staff. This was documented as a visual and narrative. This general causal map was to get the story of the SPO on what they perceived as key organisational capacity changes in the organisation since the baseline, in addition to the specific details provided per indicator.

Self-assessments: respondents worked in the respective staff function groups: management; programme/ project staff; monitoring and evaluation staff; admin and HRM staff; field staff. Staff were assisted where necessary so that they could really understand what it was they were being asked to do as well as what the descriptions under each indicator meant.

Note: for those SPOs selected for process tracing an additional endline workshop was held to facilitate the development of detailed causal maps for each of the identified organisational change/ outcome areas that fall under the capability to act and commit, and under the capability to adapt and self-renew, and that are likely related to capacity development interventions by the CFA. See also the next section on process tracing (evaluation question two). It was up to the in-country team whether this workshop was held straight after the initial endline workshop or after the workshop and the follow-up interviews. It could also be held as a separate workshop at another time.

Step 8. Interview SPO staff – in-country team

After the endline workshop (developing the general causal map and carrying out self-assessments in subgroups), interviews were held with SPO staff (subgroups) to follow up on the information that was provided in the self-assessment sheets, and to interview staff that had not yet provided any information.

Step 9. Fill-in observation sheets – in-country team

During the visit at the SPO, the in-country team had to fill in two sheets based on their observation:

- 5C Endline observation sheet;
- 5C Endline observable indicators.

Step 10. Interview externals – in-country team & CDI team

The in-country team also needed to interview the partners of the SPO as well as organisational capacity development consultants that have provided support to the SPO. The CDI team interviewed the CFA.

Step 11. Upload and auto-code all the formats collected by in-country team and CDI team – CDI team

The CDI team was responsible for uploading and auto-coding (in Nvivo) of the documents that were collected by the in-country team and by the CDI team.

Step 12. Provide the overview of information per 5C indicator to in-country team – CDI team

After the analysis in NVivo, the CDI team provided a copy of all the information generated per indicator to the in-country team for initial analysis.

Step 13. Analyse the data and develop a draft description_of the findings per indicator and for the general questions – in-country team

The in-country team provided a draft description of the findings per indicator, based on the information generated per indicator. The information generated under the general questions were linked to the general causal map or detailed process tracing related causal map.

Step 14. Analyse the data and finalize the description of the findings per indicator, per capability and general – CDI team

The CDI team was responsible for checking the analysis by the in-country team with the Nvivo generated data and to make suggestions for improvement and ask questions for clarification to which the in-country team responded. The CDI team then finalised the analysis and provided final descriptions and scores per indicator and also summarize these per capability and calculated the summary capability scores based on the average of all indicators by capability.

Step 15. Analyse the information in the general causal map –in-country team & CDI team

The general causal map based on key organisational capacity changes as perceived by the SPO staff present at the workshop, was further detailed by in-country team and CDI team, and based on the notes made during the workshop and where necessary additional follow up with the SPO. The visual and narrative was finalized after feedback by the SPO. During analysis of the general causal map relationships with MFS II support for capacity development and other factors and actors were identified. All the information has been reviewed by the SPO and CFA.

3. Attributing changes in partner organisation's capacity – evaluation question 2

This section describes the data collection and analysis methodology for answering the second evaluation question: **To what degree are the changes identified in partner capacity attributable to (capacity) development interventions undertaken by the MFS II consortia (i.e. measuring effectiveness)?**

In terms of the attribution question (2), 'process tracing' is used. This is a theory-based approach that has been applied to a selected number of SPOs since it is a very intensive and costly methodology, although it provides rich information and can generate a lot of learning within the organisations. Key organisational capacity changes/ outcomes of the SPO were identified, based on their relationship to the two selected capabilities, the capability to act and commit the capability to adapt and self-renew, and an expected relationship with CFA supported capacity development interventions (MFS II funding). It was agreed to focus on these two capabilities, since these are the most targeted capabilities by the CFAs, as established during the baseline process. The box below provides some background information on process tracing.

Background information on process tracing

The essence of process tracing research is that scholars want to go beyond merely identifying correlations between independent variables (Xs) and outcomes (Ys). Process tracing in social science is commonly defined by its addition to trace causal mechanisms (Bennett, 2008a, 2008b; Checkle, 2008; George & Bennett, 2005). A causal mechanism can be defined as “a complex system which produces an outcome by the interaction of a number of parts” (Glennan, 1996, p. 52). Process tracing involves “attempts to identify the intervening causal process – the causal chain and causal mechanism – between an independent variable (or variables) and the outcome of the dependent variable” (George & Bennett, 2005, pp. 206-207).

Process tracing can be differentiated into three variants within social science: theory testing, theory building, and explaining outcome process tracing (Beach & Pedersen, 2013).

Theory testing process tracing uses a theory from the existing literature and then tests whether evidence shows that each part of hypothesised causal mechanism is present in a given case, enabling within case inferences about whether the mechanism functioned as expected in the case and whether the mechanism as a whole was present. No claims can be made however, about whether the mechanism was the only cause of the outcome.

Theory building process tracing seeks to build generalizable theoretical explanations from empirical evidence, inferring that a more general causal mechanism exists from the fact of a particular case.

Finally, explaining outcome process tracing attempts to craft a minimally sufficient explanation of a puzzling outcome in a specific historical case. Here the aim is not to build or test more general theories but to craft a (minimally) sufficient explanation of the outcome of the case where the ambitions are more case centric than theory oriented.

Explaining outcome process tracing is the most suitable type of process tracing for analysing the causal mechanisms for selected key organisational capacity changes of the SPOs. This type of process tracing can be thought of as a single outcome study defined as seeking the causes of the specific outcome in a single case (Gerring, 2006; in: Beach & Pedersen, 2013). Here the ambition is to craft a minimally sufficient explanation of a particular outcome, with sufficiency defined as an explanation that accounts for all of the important aspects of an outcome with no redundant parts being present (Mackie, 1965).

Explaining outcome process tracing is an iterative research strategy that aims to trace the complex conglomerate of systematic and case specific causal mechanisms that produced the outcome in question. The explanation cannot be detached from the particular case. Explaining outcome process tracing refers to case studies whose primary ambition is to explain particular historical outcomes, although the findings of the case can also speak to other potential cases of the phenomenon. Explaining outcome process tracing is an iterative research process in which ‘theories’ are tested to see whether they can provide a minimally sufficient explanation of the outcome. Minimal sufficiency is defined as an explanation that accounts for an outcome, with no redundant parts. In most explaining outcome studies, existing theorisation cannot provide a sufficient explanation, resulting in a second stage in which existing theories are re-conceptualised in light of the evidence gathered in the preceding empirical analysis. The conceptualisation phase in explaining outcome process tracing is therefore an iterative research process, with initial mechanisms re-conceptualised and tested until the result is a theorised mechanism that provides a minimally sufficient explanation of the particular outcome.

Below a description is provided of how SPOs are selected for process tracing, and a description is provided on how this process tracing is to be carried out. Note that this description of process tracing provides not only information on the extent to which the changes in organisational development can be attributed to MFS II (evaluation question 2), but also provides information on other contributing factors and actors (evaluation question 4). Furthermore, it must be noted that the evaluation team has developed an adapted form of ‘explaining outcome process tracing’, since the data collection and analysis was an iterative process of research so as to establish the most realistic explanation for a particular outcome/ organisational capacity change. Below selection of SPOs for process tracing as well as the different steps involved for process tracing in the selected SPOs, are further explained.

Selection of SPOs for 5C process tracing

Process tracing is a very intensive methodology that is very time and resource consuming (for development and analysis of one final detailed causal map, it takes about 1-2 weeks in total, for different members of the evaluation team). It has been agreed upon during the synthesis workshop on 17-18 June 2013 that only a selected number of SPOs will take part in this process tracing for the purpose of understanding the attribution question. The selection of SPOs is based on the following criteria:

- MFS II support to the SPO has not ended before 2014 (since this would leave us with too small a time difference between intervention and outcome);
- Focus is on the 1-2 capabilities that are targeted most by CFAs in a particular country;
- Both the SPO and the CFA are targeting the same capability, and preferably aim for similar outcomes;
- Maximum one SPO per CFA per country will be included in the process tracing.

The intention was to focus on about 30-50% of the SPOs involved. Please see the tables below for a selection of SPOs per country. Per country, a first table shows the extent to which a CFA targets the five capabilities, which is used to select the capabilities to focus on. A second table presents which SPO is selected, and takes into consideration the selection criteria as mentioned above.

ETHIOPIA

For Ethiopia the capabilities that are mostly targeted by CFAs are the capability to act and commit and the capability to adapt and self-renew. See also the table below.

Table 1

The extent to which the Dutch NGO explicitly targets the following capabilities – Ethiopia

Capability to:	AMREF	CARE	ECFA	FSCE	HOA- REC	HUND EE	NVEA	OSRA	TTCA
Act and commit	5	4	5	5	5	3	4	4	3
Deliver on development objectives	2	1	1	1	2	1	1	2	1
Adapt and self-renew	4	2	3	4	2	5	3	3	3
Relate	3	1	2	2	3	2	1	3	1
Achieve coherence	2	2	1	1	1	1	1	1	1

Note: Number 1 stands for not targeted, 5 for intensively targeted. These scores are relative scores for the interventions by the CFA to strengthen the capacity of the SPO. The scores are relative to each other, a higher score means that this capability gets more attention by the CFA compared to other capabilities.

Source: country baseline report, Ethiopia.

Below you can see the table describing when the contract with the SPO is to be ended, and whether both SPO and the CFA expect to focus on these two selected capabilities (with MFS II funding). Based on the above-mentioned selection criteria the following SPOs are selected for process tracing: AMREF, ECFA, FSCE, HUNDEE. In fact, six SPOs would be suitable for process tracing. We just selected the first one per CFA following the criteria of not including more than one SPO per CFA for process tracing

Table 2

SPOs selected for process tracing – Ethiopia

Ethiopia – SPOs	End of contract	Focus on capability to act and commit – by SPO	Focus on capability to act and commit – by CFA	Focus on capability to adapt and self-renew – by SPO	Focus on capability to adapt and self-renew – by CFA	CFA	Selected for process tracing
AMREF	Dec 2015	Yes	Yes	Yes	Yes	AMREF NL	Yes
CARE	Dec 31, 2015	Partly	Yes	Yes	Yes – slightly	CARE Netherlands	No - not fully matching
ECFA	Jan 2015	Yes	Yes	Yes	Yes	Child Helpline International	Yes
FSCE	Dec 2015	Yes	Yes	Yes	Yes	Stichting Kinderpostzegels Netherlands (SKN); Note: no info from Defence for Children – ECPAT Netherlands	Yes
HOA-REC	Sustainable Energy project (ICCO Alliance): 2014 Innovative WASH (WASH Alliance): Dec 2015	Yes	Yes	Yes	Yes - slightly	ICCO	No - not fully matching
HUNDEE	Dec 2014	Yes	Yes	Yes	Yes	ICCO & IICD	Yes
NVEA	Dec 2015 (both)	Yes	Yes	Yes	Yes	Edukans Foundation (under two consortia); Stichting Kinderpostzegels Netherlands (SKN)	Suitable but SKN already involved for process tracing FSCE
OSRA	C4C Alliance project (farmers marketing): December 2014 ICCO Alliance project (zero grazing): 2014 (2 nd phase)	Yes	Yes	Yes	Yes	ICCO & IICD	Suitable but ICCO & IICD already involved for process tracing - HUNDEE
TTCA	June 2015	Partly	Yes	No	Yes	Edukans Foundation	No - not fully matching

INDIA

For India the capability that is mostly targeted by CFAs is the capability to act and commit. The next one in line is the capability to adapt and self-renew. See also the table below in which a higher score means that the specific capability is more intensively targeted.

Table 3

The extent to which the Dutch NGO explicitly targets the following capabilities – India³

Capability to:	BVHA	COUNT	DRIST I	FFID	Jana Vikas	Samar thak Samiti	SMILE	SDS	VTRC
Act and commit	5	3	4	4	4	4	4	3	5
Deliver on development objectives	1	5	1	1	1	1	1	2	1
Adapt and self-renew	2	2	1	3	1	1	4	1	4
Relate	3	1	1	1	1	1	2	1	2
Achieve coherence	1	1	1	4	1	1	1	1	2

Note: Number 1 stands for not targeted, 5 for intensively targeted. These scores are relative scores for the interventions by the CFA to strengthen the capacity of the SPO. The scores are relative to each other, a higher score means that this capability gets more attention by the CFA compared to other capabilities.

Source: country baseline report, India.

Below you can see a table describing when the contract with the SPO is to be ended and whether SPO and the CFA both expect to focus on these two selected capabilities (with MFS II funding). Based on the above-mentioned selection criteria the following SPOs are selected for process tracing: BVHA, COUNT, FFID, SMILE and VTRC. Except for SMILE (capability to act and commit only), for the other SPOs the focus for process tracing can be on the capability to act and commit and on the capability to adapt and self-renew.

Table 4

SPOs selected for process tracing – India

India – SPOs	End of contract	Focus on capability to act and commit – by SPO	Focus on capability to act and commit – by CFA	Focus on capability to adapt and self-renew – by SPO	Focus on capability to adapt and self-renew – by CFA	CFA	Selected for process tracing
BVHA	2014	Yes	Yes	Yes	Yes	Simavi	Yes; both capabilities
COUNT	2015	Yes	Yes	Yes	Yes	Woorden Daad	Yes; both capabilities
DRISTI	31-03-2012	Yes	Yes	No	no	Hivos	No - closed in 2012
FFID	30-09-2014	Yes	Yes	Yes	Yes	ICCO	Yes

³ RGVN, NEDSF and Women's Rights Forum (WRF) could not be reached timely during the baseline due to security reasons. WRF could not be reached at all. Therefore these SPOs are not included in Table 1.

India – SPOs	End of contract	Focus on capability to act and commit – by SPO	Focus on capability to act and commit – by CFA	Focus on capability to adapt and self-renew –by SPO	Focus on capability to adapt and self-renew – by CFA	CFA	Selected for process tracing
Jana Vikas	2013	Yes	Yes	Yes	No	Cordaid	No - contract is and the by now; not fully matching focus
NEDSF							No – delayed baseline
RGVN							No - delayed baseline
Samarthak Samiti (SDS)	2013 possibly longer	Yes	Yes	Yes	No	Hivos	No - not certain of end date and not fully matching focus
Shivi Development Society (SDS)	Dec 2013 intention 2014	Yes	Yes	Yes	No	Cordaid	No - not fully matching focus
Smile	2015	Yes	Yes	Yes	Yes	Wilde Ganzen	Yes; first capability only
VTRC	2015	Yes	Yes	Yes	Yes	Stichting Red een Kind	Yes; both capabilities

INDONESIA

For Indonesia the capabilities that are most frequently targeted by CFAs are the capability to act and commit and the capability to adapt and self-renew. See also the table below.

Table 5

The extent to which the Dutch NGO explicitly targets the following capabilities – Indonesia

Capability to:	ASB	Daya kologi	ECPAT	GSS	Lem baga Kita	Pl. PPMA	Rifka Annisa	WIIP	Yad upa	Yayasan Kelola	YPI	YRBI
Act and commit	4	4	4	5	4	4	5	3	3	2	5	4
Deliver on development objectives	1	1	1	2	2	1	2	1	1	1	1	1
Adapt and self-renew	3	1	2	4	2	3	4	4	1	1	4	3
Relate	1	1	2	3	3	2	1	2	2	2	3	2
Achieve coherence	1	1	1	2	1	1	2	2	1	1	2	1

Note: Number 1 stands for not targeted, 5 for intensively targeted. These scores are relative scores for the interventions by the CFA to strengthen the capacity of the SPO. The scores are relative to each other, a higher score means that this capability gets more attention by the CFA compared to other capabilities.

Source: country baseline report, Indonesia.

The table below describes when the contract with the SPO is to be ended and whether both SPO and the CFA expect to focus on these two selected capabilities (MFS II funding). Based on the above-mentioned selection criteria the following SPOs are selected for process tracing: ASB, ECPAT, Pt.PPMA, YPI, YRBI.

Table 6
SPOs selected for process tracing – Indonesia

Indonesia – SPOs	End of contract	Focus on capability to act and commit – by SPO	Focus on capability to act and commit – by CFA	Focus on capability to adapt and self-renew – by SPO	Focus on capability to adapt and self-renew – by CFA	CFA	Selected for process tracing
ASB	February 2012; extension Feb,1, 2013 – June,30, 2016	Yes	Yes	Yes	Yes	Hivos	Yes
Dayakologi	2013; no extension	Yes	Yes	Yes	No	Cordaid	No: contract ended early and not matching enough
ECPAT	August 2013; Extension Dec 2014	Yes	Yes	Yes, a bit	Yes	Free Press Unlimited - Mensen met een Missie	Yes
GSS	31 December 2012; no extension	Yes	Yes	Yes, a bit	Yes	Free Press Unlimited - Mensen met een Missie	No: contract ended early
Lembaga Kita	31 December 2012; no extension	Yes	Yes	No	Yes	Free Press Unlimited - Mensen met een Missie	No - contract ended early
Pt.PPMA	May 2015	Yes	Yes	No	Yes	IUCN	Yes, capability to act and commit only
Rifka Annisa	Dec, 31 2015	No	Yes	No	Yes	Rutgers WPF	No - no match between expectations CFA and SPO
WIIP	Dec 2015	Yes	Not MFS II	Yes	Not MFS II	Red Cross	No - Capacity development interventions are not MFS II financed. Only some overhead is MFS II

Indonesia – SPOs	End of contract	Focus on capability to act and commit – by SPO	Focus on capability to act and commit – by CFA	Focus on capability to adapt and self-renew – by SPO	Focus on capability to adapt and self-renew – by CFA	CFA	Selected for process tracing
Yayasan Kelola	Dec 30, 2013; extension of contract being processed for two years (2014-2015)	Yes	Not really	Yes	Not really	Hivos	No - no specific capacity development interventions planned by Hivos
YPI	Dec 31, 2015	Yes	Yes	Yes	Yes	Rutgers WPF	Yes
YRBI	Oct, 30, 2013; YRBI end of contract from 31st Oct 2013 to 31st Dec 2013. Contract extension proposal is being proposed to MFS II, no decision yet.	Yes	Yes	Yes	Yes	ICCO	Yes
Yadupa	Under negotiation during baseline; new contract 2013 until now	Yes	Nothing committed	Yes	Nothing committed	IUCN	No, since nothing was committed by CFA

LIBERIA

For Liberia the situation is arbitrary which capabilities are targeted most CFA's. Whilst the capability to act and commit is targeted more often than the other capabilities, this is only so for two of the SPOs. The capability to adapt and self-renew and the capability to relate are almost equally targeted for the five SPOs, be it not intensively. Since the capability to act and commit and the capability to adapt and self-renew are the most targeted capabilities in Ethiopia, India and Indonesia, we choose to focus on these two capabilities for Liberia as well. This would help the synthesis team in the further analysis of these capabilities related to process tracing. See also the table below.

Table 7

The extent to which the Dutch NGO explicitly targets the following capabilities – Liberia

Capability to:	BSC	DEN-L	NAWOCOL	REFOUND	RHRAP
Act and commit	5	1	1	1	3
Deliver on development objectives	3	1	1	1	1
Adapt and self-renew	2	2	2	2	2
Relate	1	2	2	2	2
Achieve coherence	1	1	1	1	1

Note: Number 1 stands for not targeted, 5 for intensively targeted. These scores are relative scores for the interventions by the CFA to strengthen the capacity of the SPO. The scores are relative to each other, a higher score means that this capability gets more attention by the CFA compared to other capabilities.

Source: country baseline report, Liberia.

Below you can see the table describing when the contract with the SPO is to be ended, and whether both SPO and the CFA expect to focus on these two selected capabilities (with MFS II funding). Also, for two of the five SPOs capability to act and commit is targeted more intensively compared to the other capabilities. Based on the above-mentioned selection criteria the following SPOs are selected for process tracing: BSC and RHRAP.

Table 8

SPOs selected for process tracing – Liberia

Liberia – SPOs	End of contract	Focus on capability to act and commit – by SPO	Focus on capability to act and commit – by CFA	Focus on capability to adapt and self-renew – by SPO	Focus on capability to adapt and self-renew – by CFA	CFA	Selected for process tracing
BSC	Dec 31, 2015	Yes	Yes	Yes	Yes	SPARK	Yes
DEN-L	2014	No	No	Unknown	A little	ICCO	No – not matching enough
NAWOCOL	2014	Yes	No	No	A little	ICCO	No – not matching enough
REFOUND	At least until 2013 (2015?)	Yes	No	Yes	A little	ICCO	No – not matching enough
RHRAP	At least until 2013 (2014?)	Yes	Yes	Yes	Yes	ICCO	Yes

Key steps in process tracing for the 5C study

In the box below you will find the key steps developed for the 5C process tracing methodology. These steps will be further explained here. Only key staff of the SPO is involved in this process: management; programme/ project staff; and monitoring and evaluation staff, and other staff that could provide information relevant to the identified outcome area/key organisational capacity change. Those SPOs selected for process tracing had a separate endline workshop, in addition to the ' general endline workshop. This workshop was carried out after the initial endline workshop and the interviews during the field visit to the SPO. Where possible, the general and process tracing endline workshop have been held consecutively, but where possible these workshops were held at different points in time, due to the complex design of the process. Below the detailed steps for the purpose of process tracing are further explained.

Key steps in process tracing for the 5C study

1. Identify the planned MFS II supported capacity development interventions within the selected capabilities (capability to act and commit and capability to adapt and self-renew) – CDI team
2. Identify the implemented MFS II supported capacity development interventions within the selected capabilities (capability to act and commit and capability to adapt and self-renew) – CDI team
3. Identify initial changes/ outcome areas in these two capabilities – CDI team & in-country team
4. Construct the detailed, initial causal map (theoretical model of change) – CDI team & in-country team
5. Identify types of evidence needed to verify or discard different causal relationships in the model of change – in-country teams, with support from CDI team
6. Collect data to verify or discard causal mechanisms and construct workshop based, detailed causal map (model of change) – in-country team
7. Assess the quality of data and analyse data and develop final detailed causal map (model of change) – in-country team with CDI team
8. Analyse and conclude on findings– CDI team, in collaboration with in-country team

Some definitions of the terminology used for this MFS II 5c evaluation

Based upon the different interpretations and connotations the use of the term causal mechanism we use the following terminology for the remainder of this paper:

A detailed causal map (or model of change) = the representation of all possible explanations – causal pathways for a change/ outcome. These pathways are that of the intervention, rival pathways and pathways that combine parts of the intervention pathway with that of others. This also depicts the reciprocity of various events influencing each other and impacting the overall change.

A causal mechanism = is the combination of parts that ultimately explains an outcome. Each part of the mechanism is an individually insufficient but necessary factor in a whole mechanism, which together produce the outcome (Beach and Pedersen, 2013, p. 176).

Part or cause = one actor with its attributes carrying out activities/ producing outputs that lead to change in other parts. The final part or cause is the change/ outcome.

Attributes of the actor = specificities of the actor that increase his chance to introduce change or not such as its position in its institutional environment.

*Step 1. Identify the **planned MFS II supported capacity development interventions** within the selected capabilities (capability to act and commit and capability to adapt and self-renew) – CDI team*

Chapter 4.1 and 4.2 in the baseline report were reviewed. Capacity development interventions as planned by the CFA for the capability to act and commit and for the capability to adapt and self-renew were described and details inserted in the summary format. This provided an overview of the capacity development activities that were originally planned by the CFA for these two capabilities and assisted in focusing on relevant outcomes that are possibly related to the planned interventions.

*Step 2. Identify the **implemented capacity development interventions** within the selected capabilities (capability to act and commit and capability to adapt and self-renew) – CDI team*

The input from the CFA was reviewed in terms of what capacity development interventions have taken place in the MFS II period. This information was found in the 'Support to capacity development sheet - endline - CFA perspective' for the SPO, based on details provided by the CFA and further discussed during an interview by the CDI team.

The CFA was asked to describe all the MFS II supported capacity development interventions of the SPO that took place during the period 2011 up to now. The CDI team reviewed this information, not only the interventions but also the observed changes as well as the expected long-term changes, and

then linked these interventions to relevant outcomes in one of the capabilities (capability to act and commit; and capability to adapt and self-renew).

*Step 3. Identify **initial changes/ outcome areas** in these two capabilities – by CDI team & in-country team*

The CDI team was responsible for coding documents received from SPO and CFA in NVivo on the following:

- 5C Indicators: this was to identify the changes that took place between baseline and endline. This information was coded in Nvivo.
- Information related to the capacity development interventions implemented by the CFA (with MFS II funding) (see also Step 2) to strengthen the capacity of the SPO. For example, the training on financial management of the SPO staff could be related to any information on financial management of the SPO. This information was coded in Nvivo.

In addition, the response by the CFA to the changes in 5C indicators format, was auto-coded.

The in-country team was responsible for timely collection of information from the SPO (before the fieldwork starts). This set of information dealt with:

- MFS II supported capacity development interventions during the MFS II period (2011 until now).
- Overview of all trainings provided in relation to a particular outcome areas/organisational capacity change since the baseline.
- For each of the identified MFS II supported trainings, training questionnaires have been developed to assess these trainings in terms of the participants, interests, knowledge and skills gained, behaviour change and changes in the organisation (based on Kirkpatrick's model), one format for training participants and one for their managers. These training questionnaires were sent prior to the field visit.
- Changes expected by SPO on a long-term basis ('Support to capacity development sheet - endline - SPO perspective').

For the selection of change/ outcome areas the following criteria were important:

- The change/ outcome area is in one of the two capabilities selected for process tracing: capability to act and commit or the capability to adapt and self-renew. This was the first criteria to select upon.
- There was a likely link between the key organisational capacity change/ outcome area and the MFS II supported capacity development interventions. This also was an important criteria. This would need to be demonstrated through one or more of the following situations:
 - In the 2012 theory of change on organisational capacity development of the SPO a link was indicated between the outcome area and MFS II support;
 - During the baseline the CFA indicated a link between the planned MFS II support to organisational development and the expected short-term or long-term results in one of the selected capabilities;
 - During the endline the CFA indicated a link between the implemented MFS II capacity development interventions and observed short-term changes and expected long-term changes in the organisational capacity of the SPO in one of the selected capabilities;
 - During the endline the SPO indicated a link between the implemented MFS II capacity development interventions and observed short-term changes and expected long-term changes in the organisational capacity of the SPO in one of the selected capabilities.

Reviewing the information obtained as described in Step 1, 2, and 3 provided the basis for selecting key organisational capacity change/ outcome areas to focus on for process tracing. These areas were to be formulated as broader outcome areas, such as 'improved financial management', 'improved monitoring and evaluation' or 'improved staff competencies'.

Note: the outcome areas were to be formulated as intermediates changes. For example: an improved monitoring and evaluation system, or enhanced knowledge and skills to educate the target group on climate change. Key outcome areas were also verified - based on document review as well as discussions with the SPO during the endline.

*Step 4. Construct the **detailed, initial causal map** (theoretical model of change) – CDI & in-country team*

A detailed initial causal map was developed by the CDI team, in collaboration with the in-country team. This was based on document review, including information provided by the CFA and SPO on MFS II supported capacity development interventions and their immediate and long-term objectives as well as observed changes. Also, the training questionnaires were reviewed before developing the initial causal map. This detailed initial causal map was to be provided by the CDI team with a visual and related narrative with related references. This initial causal map served as a reference point for further reflection with the SPO during the process tracing endline workshop, where relationships needed to be verified or new relationships established so that the second (workshop-based), detailed causal map could be developed, after which further verification was needed to come up with the final, concluding detailed causal map.

It's important to note that organisational change area/ outcome areas could be both positive and negative.

For each of the selected outcomes the team needed to make explicit the theoretical model of change. This meant finding out about the range of different actors, factors, actions, and events etc. that have contributed to a particular outcome in terms of organisational capacity of the SPO.

A model of change of good quality includes:

- The causal pathways that relate the intervention to the realised change/ outcome;
- Rival explanations for the same change/ outcome;
- Assumptions that clarify relations between different components or parts;
- Case specific and/or context specific factors or risks that might influence the causal pathway, such as for instance the socio-cultural-economic context, or a natural disaster;
- Specific attributes of the actors e.g. CFA and other funders.

A model of change (within the 5C study called a 'detailed causal map') is a complex system which produces intermediate and long-term outcomes by the interaction of other parts. It consists of parts or causes that often consist of one actor with its attributes that is implementing activities leading to change in other parts (Beach & Pedersen, 2013). A helpful way of constructing the model of change is to think in terms of actors carrying out activities that lead to other actors changing their behaviour. The model of change can be explained as a range of activities carried out by different *actors* (including the CFA and SPO under evaluation) that will ultimately lead to an outcome. Besides this, there are also '*structural*' elements, which are to be interpreted as external factors (such as economic conjuncture); and *attributes* of the actor (does the actor have the legitimacy to ask for change or not, what is its position in the sector) that should be looked at (Beach & Pedersen, 2013). In fact Beach and Pedersen, make a fine point about the subjectivity of the actor in a dynamic context. This means, in qualitative methodologies, capturing the changes in the actor, acted upon area or person/organisation, in a non sequential and non temporal format. Things which were done recently could have corrected behavioural outcomes of an organisation and at the same time there could be processes which incrementally pushed for the same change over a period of time. Beach and Pedersen espouse this methodology because it captures change in a dynamic fashion as against the methodology of logical framework. For the MFS II evaluation it was important to make a distinction between those paths in the model of change that are the result of MFS II and rival pathways.

The construction of the model of change started with the identified key organisational capacity change/ outcome, followed by an inventory of all possible subcomponents that possibly have caused the change/ outcome in the MFS II period (2011-up to now, or since the baseline). The figure below presents an imaginary example of a model of change. The different colours indicate the different types of support to capacity development of the SPO by different actors, thereby indicating different pathways of change, leading to the key changes/ outcomes in terms of capacity development (which in this case indicates the ability to adapt and self-renew).

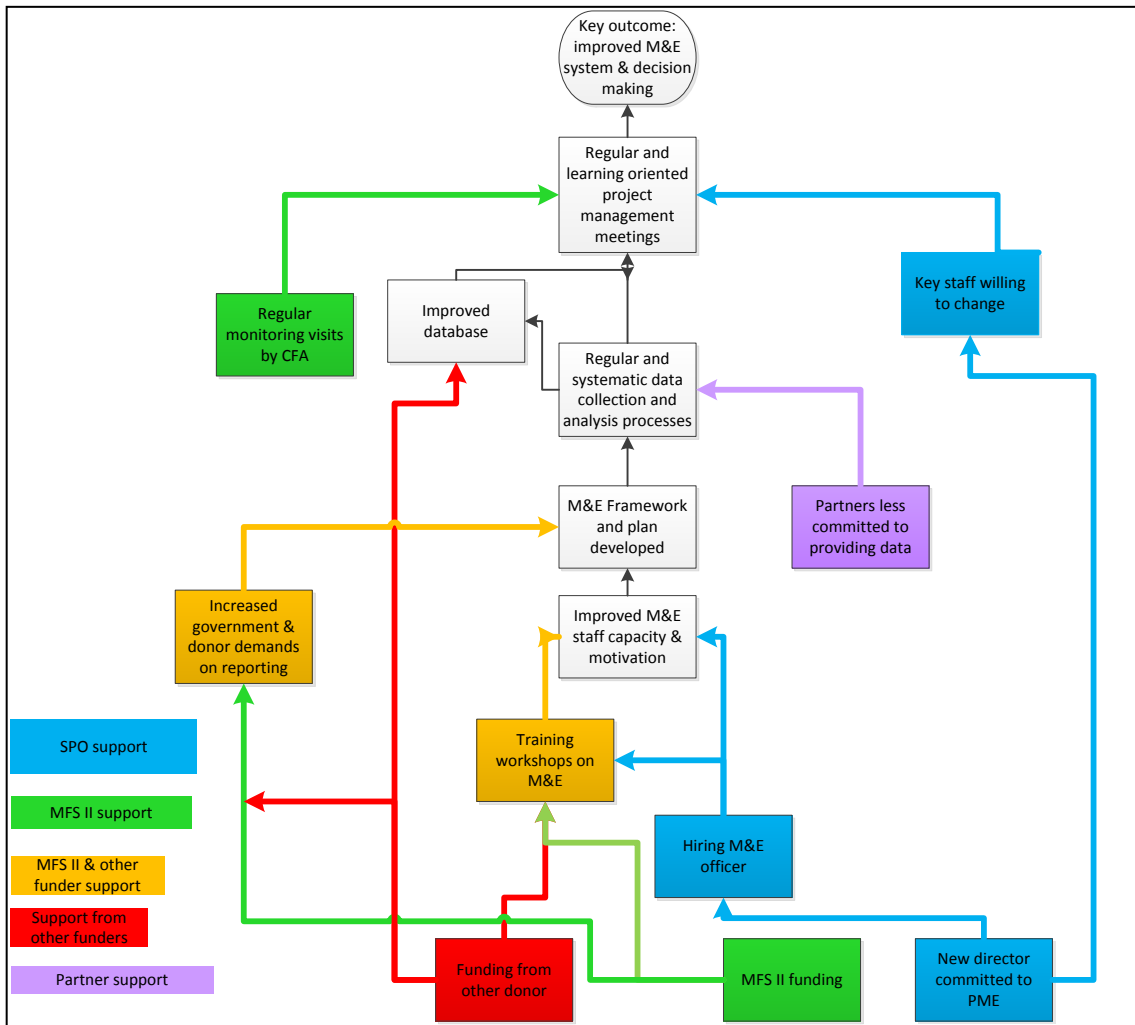

Figure 1 An imaginary example of a model of change

Step 5. Identify types of evidence needed to verify or discard different causal relationships in the model of change – in-country teams with support from CDI team

Once the causal mechanism at theoretical level were defined, empirical evidence was collected so as to verify or discard the different parts of this theoretical model of change, confirm or reject whether subcomponents have taken place, and to find evidence that confirm or reject the causal relations between the subcomponents.

A key question that we needed to ask ourselves was, “What information do we need in order to confirm or reject that one subcomponent leads to another, that X causes Y?”. The evaluation team needed to agree on what information was needed that provides empirical manifestations for each part of the model of change.

There are four distinguishable types of evidence that are relevant in process tracing analysis: *pattern*, *sequence*, *trace*, and *account*. Please see the box below for descriptions of these types of evidence.

The evaluation team needed to agree on the types of evidence that was needed to verify or discard the manifestation of a particular part of the causal mechanism. Each one or a combination of these different types of evidence could be used to confirm or reject the different parts of the model of change. This is what is meant by robustness of evidence gathering. Since causality as a concept can bend in many ways, our methodology, provides a near scientific model for accepting and rejecting a particular type of evidence, ignoring its face value.

Types of evidence to be used in process tracing

Pattern evidence relates to predictions of statistical patterns in the evidence. For example, in testing a mechanism of racial discrimination in a case dealing with employment, statistical patterns of employment would be relevant for testing this part of the mechanism.

Sequence evidence deals with the temporal and spatial chronology of events predicted by a hypothesised causal mechanism. For example, a test of the hypothesis could involve expectations of the timing of events where we might predict that if the hypothesis is valid, we should see that the event B took place after event A took place. However, if we found that event B took place before event A took place, the test would suggest that our confidence in the validity of this part of the mechanism should be reduced (disconfirmation/ falsification).

Trace evidence is evidence whose mere existence provides proof that a part of a hypothesised mechanism exists. For example, the existence of the minutes of a meeting, if authentic ones, provide strong proof that the meeting took place.

Account evidence deals with the content of empirical material, such as meeting minutes that detail what was discussed or an oral account of what took place in the meeting.

Source: Beach and Pedersen, 2013

Below you can find a table that provides guidelines on what to look for when identifying types of evidence that can confirm or reject causal relationships between different parts/ subcomponents of the model of change. It also provides one example of a part of a causal pathway and what type of information to look for.

Table 9

Format for identifying types of evidence for different causal relationships in the model of change (example included)

Part of the model of change	Key questions	Type of evidence needed	Source of information
Describe relationship between the subcomponents of the model of change	Describe questions you would like to answer so as to find out whether the components in the relationship took place, when they took place, who was involved, and whether they are related	Describe the information that we need in order to answer these questions. Which type of evidence can we use in order to reject or confirm that subcomponent X causes subcomponent Y? Can we find this information by means of : Pattern evidence; Sequence evidence; Trace evidence; Account evidence?	Describe where you can find this information
Example: Training workshops on M&E provided by MFS II funding and other sources of funding	Example: What type of training workshops on M&E took place? Who was trained? When did the training take place? Who funded the training? Was the funding of training provided before the training took place? How much money was available for the training?	Example: Trace evidence: on types of training delivered, who was trained, when the training took place, budget for the training Sequence evidence on timing of funding and timing of training Content evidence: what the training was about	Example: Training report SPO Progress reports Interviews with the CFA and SPO staff Financial reports SPO and CFA

Please note that for practical reasons, the 5C evaluation team decided that it was easier to integrate the specific questions in the narrative of the initial causal map. These questions would need to be

addressed by the in country team during the process tracing workshop so as to discover, verify or discard particular causal mechanisms in the detailed, initial causal map. Different types of evidence was asked for in these questions.

Step 6. *Collect data to verify or discard causal mechanisms and develop workshop-based, detailed causal map – in-country team*

Once it was decided by the in-country and CDI evaluation teams what information was to be collected during the interaction with the SPO, data collection took place. The initial causal maps served as a basis for discussions during the endline workshop with a particular focus on process tracing for the identified organisational capacity changes. But it was considered to be very important to understand from the perspective of the SPO how they understood the identified key organisational capacity change/outcome area has come about. A new detailed, workshop-based causal map was developed that included the information provided by SPO staff as well as based on initial document review as described in the initial detailed causal map. This information was further analysed and verified with other relevant information so as to develop a final causal map, which is described in the next step.

Step 7. *Assess the quality of data and analyse data, and develop the final detailed causal map (model of change) – in-country team and CDI team*

Quality assurance of the data collected and the evidence it provides for rejecting or confirming parts of causal explanations are a major concern for many authors specialised in contribution analysis and process-tracing. Stern et al. (2012), Beach and Pedersen (2013), Lemire, Nielsen and Dybdal (2012), Mayne (2012) and Delahais and Toulemonde (2012) all emphasise the need to make attribution/ contribution claims that are based on pieces of evidence that are rigorous, traceable, and credible. These pieces of evidence should be as explicit as possible in proving that *subcomponent X causes subcomponent Y* and ruling out other explanations. Several tools are proposed to check the nature and the quality of data needed. One option is, Delahais and Toulemonde's Evidence Analysis Database, which we have adapted for our purpose.

Delahais and Toulemonde (2012) propose an Evidence Analysis Database that takes into consideration three criteria:

Confirming/ rejecting a causal relation (yes/no);

Type of causal mechanism: intended contribution/ other contribution/ condition leading to intended contribution/ intended condition to other contribution/ feedback loop;

Strength of evidence: strong/ rather strong/ rather weak/ weak.

We have adapted their criteria to our purpose. The in-country team, in collaboration with the CDI team, used the criteria in assessing whether causal relationships in the causal map, were strong enough. This has been more of an iterative process trying to find additional evidence for the established relationships through additional document review or contacting the CFA and SPO as well as getting their feedback on the final detailed causal map that was established. Whilst the form below has not been used exactly in the manner depicted, it has been used indirectly when trying to validate the information in the detailed causal map. After that, the final detailed causal map is established both as a visual as well as a narrative, with related references for the established causal relations.

<i>Example format for the adapted evidence analysis database (example included)</i>	Confirming/ rejecting a causal relation (yes/ no)	Type of information providing the background to the confirmation or rejection of the causal relation	Strength of evidence: strong/ rather strong/ rather weak/ weak	Explanation for why the evidence is (rather) strong or (rather) weak, and therefore the causal relation is confirmed/ rejected
Description of causal relation				
e.g. Training staff in M&E leads to enhanced M&E knowledge, skills and practice	e.g. Confirmed	e.g. Training reports confirmed that staff are trained in M&E and that knowledge and skills increased as a result of the training		

Step 8. Analyse and conclude on findings– in-country team and CDI team

The final detailed causal map was described as a visual and narrative and this was then analysed in terms of the evaluation question two and evaluation question four: “*To what degree are the changes identified in partner capacity attributable to development interventions undertaken by the MFS II consortia (i.e. measuring effectiveness)?*” and “*What factors explain the findings drawn from the questions above?*” It was analysed to what extent the identified key organisational capacity change can be attributed to MFS II supported capacity development interventions as well as to other related factors, interventions and actors.

4. Explaining factors – evaluation question 4

This paragraph describes the data collection and analysis methodology for answering the fourth evaluation question: “**What factors explain the findings drawn from the questions above?**”

In order to explain the changes in organisational capacity development between baseline and endline (evaluation question 1) the CDI and in-country evaluation teams needed to review the indicators and how they have changed between baseline and endline and what reasons have been provided for this. This has been explained in the first section of this appendix. It has been difficult to find detailed explanations for changes in each of the separate 5c indicators, but the ‘general causal map’ has provided some ideas about some of the key underlying factors actors and interventions that influence the key organisational capacity changes, as perceived by the SPO staff.

For those SPOs that are selected for process tracing (evaluation question 2), more in-depth information was procured for the identified key organisational capacity changes and how MFS II supported capacity development interventions as well as other actors, factors and interventions have influenced these changes. This is integrated in the process of process tracing as described in the section above.

5. Methodological reflection

Below a few methodological reflections are made by the 5C evaluation team.

Use of the 5 core capabilities framework and qualitative approach: this has proven to be a very useful framework to assess organisational capacity. The five core capabilities provide a comprehensive picture of the capacity of an organisation. The capabilities are interlinked, which was also reflected in the description of standard indicators, that have been developed for the purpose of this 5C evaluation and agreed upon for the eight countries. Using this framework with a mainly qualitative approach has

provided rich information for the SPOs and CFAs, and many have indicated this was a useful learning exercise.

Using standard indicators and scores: using standard indicators is useful for comparison purposes. However, the information provided per indicator is very specific to the SPO and therefore makes comparison difficult. Whilst the description of indicators has been useful for the SPO and CFA, it is questionable to what extent indicators can be compared across SPOs since they need to be seen in context, for them to make meaning. In relation to this, one can say that scores that are provided for the indicators, are only relative and cannot show the richness of information as provided in the indicator description. Furthermore, it must be noted that organisations are continuously changing and scores are just a snapshot in time. There cannot be perfect score for this. In hindsight, having rubrics would have been more useful than scores.

General causal map: whilst this general causal map, which is based on key organisational capacity changes and related causes, as perceived by the SPO staff present at the endline workshop, has not been validated with other sources of information except SPO feedback, the 5C evaluation team considers this information important, since it provides the SPO story about how and which changes in the organisation since the baseline, are perceived as being important, and how these changes have come about. This will provide information additional to the information that has been validated when analysing and describing the indicators as well as the information provided through process tracing (selected SPOs). This has proven to be a learning experience for many SPOs.

Using process tracing for dealing with the attribution question: this theory-based and mainly qualitative approach has been chosen to deal with the attribution question, on how the organisational capacity changes in the organisations have come about and what the relationship is with MFS II supported capacity development interventions and other factors. This has proven to be a very useful process, that provided a lot of very rich information. Many SPOs and CFAs have already indicated that they appreciated the richness of information which provided a story about how identified organisational capacity changes have come about. Whilst this process was intensive for SPOs during the process tracing workshops, many appreciated this to be a learning process that provided useful information on how the organisation can further develop itself. For the evaluation team, this has also been an intensive and time-consuming process, but since it provided rich information in a learning process, the effort was worth it, if SPOs and CFAs find this process and findings useful.

A few remarks need to be made:

- Outcome explaining process tracing is used for this purpose, but has been adapted to the situation since the issues being looked at were very complex in nature.
- Difficulty of verifying each and every single change and causal relationship:
- Intensity of the process and problems with recall: often the process tracing workshop was done straight after the general endline workshop that has been done for all the SPOs. In some cases, the process tracing endline workshop has been done at a different point in time, which was better for staff involved in this process, since process tracing asks people to think back about changes and how these changes have come about. The word difficulties with recalling some of these changes and how they have come about. See also the next paragraph.
- Difficulty of assessing changes in knowledge and behaviour: training questionnaire is have been developed, based on Kirkpatrick's model and were specifically tailored to identify not only the interest but also the change in knowledge and skills, behaviour as well as organisational changes as a result of a particular training. The retention ability of individuals, irrespective of their position in the organisation, is often unstable. The 5C evaluation team experienced that it was difficult for people to recall specific trainings, and what they learned from those trainings. Often a change in knowledge, skills and behaviour is a result brought about by a combination of different factors , rather than being traceable to one particular event. The detailed causal maps that have been established, also clearly pointed this. There are many factors at play that make people change their behaviour, and this is not just dependent on training but also internal/personal (motivational) factors as well as factors within the organisation, that stimulate or hinder a person to change behaviour. Understanding how behaviour change works is important when trying to really understand the extent to which behaviour has changed as a result of different factors, actors and interventions. Organisations change because people change and therefore understanding when and how these

individuals change behaviour is crucial. Also attrition and change in key organisational positions can contribute considerably to the outcome.

Utilisation of the evaluation

The 5C evaluation team considers it important to also discuss issues around utility of this evaluation. We want to mention just a few.

Design – mainly externally driven and with a focus on accountability and standard indicators and approaches within a limited time frame, and limited budget: this MFS II evaluation is originally based on a design that has been decided by IOB (the independent evaluation office of the Dutch Ministry of Foreign Affairs) and to some extent MFS II organisations. The evaluators have had no influence on the overall design and sampling for the 5C study. In terms of learning, one may question whether the most useful cases have been selected in this sampling process. The focus was very much on a rigorous evaluation carried out by an independent evaluation team. Indicators had to be streamlined across countries. The 5C team was requested to collaborate with the other 5C country teams (Bangladesh, Congo, Pakistan, Uganda) to streamline the methodological approach across the eight sampled countries. Whilst this may have its purpose in terms of synthesising results, the 5C evaluation team has also experienced the difficulty of tailoring the approach to the specific SPOs. The overall evaluation has been mainly accountability driven and was less focused on enhancing learning for improvement. Furthermore, the timeframe has been very small to compare baseline information (2012) with endline information (2014). Changes in organisational capacity may take a long, particularly if they are related to behaviour change. Furthermore, there has been limited budget to carry out the 5C evaluation. For all the four countries (Ethiopia, India, Indonesia, Liberia) that the Centre for Development Innovation, Wageningen University and Research centre has been involved in, the budget has been overspent.

However, the 5C evaluation team has designed an endline process whereby engagement of staff, e.g. in a workshop process was considered important, not only due to the need to collect data, but also to generate learning in the organisation. Furthermore, having general causal maps and detailed causal maps generated by process tracing have provided rich information that many SPOs and CFAs have already appreciated as useful in terms of the findings as well as a learning process.

Another issue that must be mentioned is that additional requests have been added to the country teams during the process of implementation: developing a country based synthesis; questions on design, implementation, and reaching objectives of MFS II funded capacity development interventions, whilst these questions were not in line with the core evaluation questions for the 5C evaluation.

Complexity and inadequate coordination and communication: many actors, both in the Netherlands, as well as in the eight selected countries, have been involved in this evaluation and their roles and responsibilities, were often unclear. For example, 19 MFS II consortia, the internal reference group, the Ministry of Foreign Affairs, Partos, the Joint Evaluation Trust, NWO-Wotro, the evaluators (Netherlands and in-country), 2 external advisory committees, and the steering committee. Not to mention the SPO's and their related partners and consultants. CDI was involved in 4 countries with a total number of 38 SPOs and related CFAs. This complexity influenced communication and coordination, as well as the extent to which learning could take place. Furthermore, there was a distance between the evaluators and the CFAs, since the approach had to be synchronised across countries, and had to adhere to strict guidelines, which were mainly externally formulated and could not be negotiated or discussed for the purpose of tailoring and learning. Feedback on the final results and report had to be provided mainly in written form. In order to enhance utilisation, a final workshop at the SPO to discuss the findings and think through the use with more people than probably the one who reads the report, would have more impact on organisational learning and development. Furthermore, feedback with the CFAs has also not been institutionalised in the evaluation process in the form of learning events. And as mentioned above, the complexity of the evaluation with many actors involved did not enhance learning and thus utilization.

5C Endline process, and in particular thoroughness of process tracing often appreciated as learning process: The SPO perspective has also brought to light a new experience and technique of self-assessment and self-corrective measures for managers. Most SPOs whether part of process tracing or not, deeply appreciated the thoroughness of the methodology and its ability to capture details with robust connectivity. This is a matter of satisfaction and learning for both evaluators and SPOs. Having

a process whereby SPO staff were very much engaged in the process of self-assessment and reflection has proven for many to be a learning experience for many, and therefore have enhanced utility of the 5C evaluation.

Appendix 2 Background information on the five core capabilities framework

The 5 capabilities (5C) framework was to be used as a framework for the evaluation of capacity development of Southern Partner Organisations (SPOs) of the MFS II consortia. The 5C framework is based on a five-year research program on 'Capacity, change and performance' that was carried out by the European Centre for Development Policy Management (ECDPM). The research included an extensive review of the literature and sixteen case studies. The 5C framework has also been applied in an IOB evaluation using 26 case studies in 14 countries, and in the baseline carried out per organisation by the MFS II organisations for the purpose of the monitoring protocol.

The 5C framework is structured to understand and analyse (changes in) the capacity of an organization to deliver (social) value to its constituents. This introduction briefly describes the 5C framework, mainly based on the most recent document on the 5C framework (Keijzer et al., 2011).

The 5C framework sees capacity as an **outcome** of an **open system**. An organisation or collaborative association (for instance a network) is seen as a system interacting with wider society. The most critical practical issue is to ensure that relevant stakeholders share a common way of thinking about capacity and its core constituents or capabilities. Decisive for an organisation's capacity is the context in which the organisation operates. This means that **understanding context issues** is crucial. The use of the 5C framework requires a multi-stakeholder approach because shared values and results orientation are important to facilitate the capacity development process. The 5C framework therefore needs to **accommodate the different visions** of stakeholders and conceive different strategies for raising capacity and improving performance in a given situation.

The 5C framework defines capacity as '**producing social value**' and identifies five core capabilities that together result in that overall capacity. Capacity, capabilities and competences are seen as follows:

- **Capacity** is referred to as the overall ability of an organisation or system to create value for others;
- **Capabilities** are the collective ability of a group or a system to do something either inside or outside the system. The collective ability involved may be technical, logistical, managerial or generative (i.e. the ability to earn legitimacy, to adapt, to create meaning, etc.);
- **Competencies** are the energies, skills and abilities of individuals.

Fundamental to developing capacity are inputs such as human, material and financial resources, technology, and information. To the degree that they are developed and successfully integrated, capabilities contribute to the overall capacity or ability of an organisation or system to create value for others. A single capability is not sufficient to create capacity. All are needed and are strongly interrelated and overlapping. Thus, to achieve its development goals, the 5C framework says that every organisation or system must have **five basic capabilities**:

1. The capability to act and commit;
2. The capability to deliver on development objectives;
3. The capability to adapt and self-renew;
4. The capability to relate (to external stakeholders);
5. The capability to achieve coherence.

In order to have a common framework for evaluation, the five capabilities have been reformulated in outcome domains and for each outcome domain performance indicators have been developed.

There is some overlap between the five core capabilities but together the five capabilities result in a certain level of capacity. Influencing one capability may have an effect on one or more of the other capabilities. In each situation, the level of any of the five capabilities will vary. Each capability can become stronger or weaker over time.

Appendix 3 Results - changes in organisational capacity of the SPO - 5C indicators

Below you will find a description for each of the indicators under each of the capabilities, what the situation is as assessed during the endline, how this has changed since the baseline and what are the reasons for change.

Capability to act and commit

1.1. Responsive leadership: 'Leadership is responsive, inspiring, and sensitive'

This is about leadership within the organisation (operational, strategic). If there is a larger body then you may also want to refer to leadership at a higher level but not located at the local organisation.

Some staffs stated that in terms of leadership not much has changed since 2012 and that it even deteriorated through loss of inspiration, sensitivity and responsiveness on the overall activities of the college. In contrary the above argument, others believe that there is a slight improvement in the leadership of the college. They stated that the leaders have increased their commitment for change together with their enhanced decision making capacity, which comes partly through upgrading their academic status from first degree to second degree. Since the baseline, openness and transparency have improved, discussions with staffs. It is also mentioned that the members of management are becoming responsive and proactive. Compared to the baseline situation the academic dean is more easily approached and easily accessible to all staffs in his office. Similarly, the idle management has been given full authorities to exercise their responsibilities. Trainings have been given to the staffs during the last two years which was according to their demand during the baseline assessment. As a result, the teacher's commitment has improved and they started to work during their spare time on the week days and weekends.

Score: from 2.5 to 3 (slight improvement)

1.2. Strategic guidance: 'Leaders provide appropriate strategic guidance (strategic leader and operational leader)'

This is about the extent to which the leader(s) provide strategic directions

Although some staff members believe that there is no change compared to the baseline in providing strategic guidance from the management, other staff members are mentioning the slight improvement that they observed. They stated that the improvement in the capacity, commitment and willingness of the management results in a better provision of strategic guidance. Accordingly, the strategic plan is already handed over to the departments. And hence, staffs are able to discuss on the strategic plan with management. In line with the strategic plan the active learning approach has improved.

Score: from 3 to 3.5 (slight improvement)

1.3. Staff turnover: 'Staff turnover is relatively low'

This is about staff turnover.

In terms of numbers there is no staff turnover since the baseline but teachers are dissatisfied by the existing situation in the college and they are looking for opportunities to leave the college. On the other hand, some staffs and the management believe that the staff turnover is low due to that fact that the college sets incentives for the teachers such as an opportunity to upgrade their academic status and academic rank.

Score: from 3 to 3 (no change)

1.4. Organizational structure: 'Existence of clear organizational structure reflecting the objectives of the organization'

Observable indicator: Staff have copy of org structure and understand this

The organizational structure of TTCA has not been changed and revised since the baseline. The structure is clearly communicated with staffs and accessible to all staff even it was posted on the Dean and Academic Dean Office. Most of the staffs also have a copy of the organizational structure.

Score: from 3.5 to 3.5 (no change)

1.5. Articulated strategies: 'Strategies are articulated and based on good situation analysis and adequate M&E'

Observable indicator: strategies are well articulated. Situation analysis and monitoring and evaluation are used to inform strategies.

In this regard TTCA has started participatory supervision of progresses within the college and monitored primary schools supported by DEC on a regular basis. As a result the college has used monitoring and evaluation feedback to articulate operational plans with the consideration of current situation. However, the college has worked in line with the strategic plan set by the Ministry of Education according to the education and training policy of the country and the region. The college aims to practically follow the strategic plan on their day to day activities. However, the strategic document is not shared with all staff and they are not all well aware of the strategic plan.

Score: from 2.5 to 3 (slight improvement)

1.6. Daily operations: 'Day-to-day operations are in line with strategic plans'

This is about the extent to which day-to-day operations are aligned with strategic plans.

The day to day operational guide of the college is extracted from the strategic plan. To have a better implementation the management discussed with staffs as well as the academic commission to ensure the implementation is in line with the strategic plan. Despite such slight improvements, late submission of deliverables and late registration of students has continued to be a challenge after the baseline. In terms of financial and material orders and procurement of goods, specific formats are prepared to handle the issues.

Score: from 3 to 3 (no change)

1.7. Staff skills: 'Staff have necessary skills to do their work'

This is about whether staff have the skills necessary to do their work and what skills they might they need.

Since 2012 four key tutors and the vice dean have been trained (twice a year), through the C4C alliance (MFS II) in Active Teaching and Learning strategies and their implementation. As a result teacher and tutor motivation has increased. Compared to the baseline situation, an improvement in teaching methodology from teacher-centered to student-centered resulted in an improvement in students learning outcomes. It is also believed that the improvements in staff skills are due to the fact that college teachers who had a first degree during the baseline now have a second degree which contributed to the increased learning outcomes of the students. Staff is now using ICT technologies in a better way than during the baseline situation. Teachers are using ICT to prepare modules, lesson plans and other course materials. It is also mentioned that experience sharing between different regions has its own share in improving staffs skill. Different staff have been trained on a variety of issues: recruitment of new students (i.e. in the proper utilization of the selection criteria), material or module preparation, practicum implementation and preparation of volunteer's guideline, gender, quality education and property management.

Score: from 3 to 4 (improvement)

1.8. Training opportunities: 'Appropriate training opportunities are offered to staff'

This is about whether staff at the SPO is offered appropriate training opportunities

Compared to the baseline situation a slight improvement in creating training opportunities are observed in the last two years. Training opportunities in the area of Active Teaching and Learning are offered by C4C though it is only for a limited number of staff. In addition to the above training, staff members have participated in different trainings such as recruitment of new students (i.e. in the proper utilization of the selection criteria), material or module preparation, practicum implementation and preparation of volunteer's guideline. DEC, USAID, MoE, Save the Children UK and others have been the stakeholders in providing such training opportunities. After the baseline training and awareness creation for support staff on different issues such as gender, quality education and property management have been given. Besides training opportunities experience sharing between different regions has been taking place.

Score: from 4 to 4.5 (slight improvement)

1.9.1. Incentives: 'Appropriate incentives are in place to sustain staff motivation'

This is about what makes people want to work here. Incentives could be financial, freedom at work, training opportunities, etc.

In terms of providing incentives two contrasting views are observed. The first group stated that, the availability of a good internet connection, extension and module preparation payment and participatory decision making is an improvement in the college. But the other group argued that there is a slight deterioration in providing appropriate incentives. Currently, there is no payment for module preparation and extension work. In addition, there is no budget for educational research and educational opportunities. In the cases that the payments are there for extension and module preparation it is not paid on time. Whilst some respondents indicated there was no salary increment, the evaluation team observed that the salary of the government civil servants has been adjusted since July 2014. Hence, the teachers are also benefited from the adjustment. There has been no adjustment in house allowance by considering the inflation. DEC mentioned that they are not engaged in providing financial incentives. Training opportunities have contributed to staff motivation.

Score: from 2.5 to 2.5 (no change)

1.9.2. Funding sources: 'Funding from multiple sources covering different time periods'

This is about how diversified the SPOs funding sources are over time, and how the level of funding is changing over time.

Similar to the baseline situation, government is the main source of the college funds. There is a slight budget increment compared to the baseline situation. The C4C alliance (MFS II funds) has been supporting the college by providing material support, particularly in expanding and developing the ICT infrastructure, such as an ICT room for instructors with 10 desktops; two laptops, two printers and one laminating machine. Recently, UNICEF and UNESCO has started to support primary schools to promote mother tongue education.

Score from 3 to 3.25 (very slight improvement)

1.9.3. Funding procedures: 'Clear procedures for exploring new funding opportunities'

This is about whether there are clear procedures for getting new funding and staff are aware of these procedures.

No new funding opportunities are created after the baseline. But some efforts are made to approach donors by writing proposals for setting up the ICT infrastructure, to get funds for reference books, for building the library and a latrine for girls, and solar panels to support the surrounding primary schools. The one successful story in this regard is in 2013 Assayta CTE, which— together with DEC in Addis Ababa – developed a project proposal, requesting for additional C4C funds for the college – in order to establish an ICT resource room for the tutors. The proposal was approved by Edukans and DEC (Addis Ababa) provided the CTE with computers, printers and internet connection for the total amount of 10.000 Euro (fully funded by MFS II).

Score from 2 to 2.25 (very slight improvement)

Summary of the capability to act and commit

An overall slight improvement has been observed in the colleges' capability to act and commit. The leadership of the college has shown an improvement in their willingness, commitment and capacity of managing the college. They have become more responsive and proactive. It resulted in a better provision of strategic guidance, and more openness and transparency in decision making. The middle management has freedom to exercise their responsibilities. The management has become close to the staff and they have discussed on the college's strategic plan and the day to day operational guide of the college is extracted from this. The college has worked in line with the strategic plan set by the Ministry of Education according to the education and training policy of the country and the region and the practical implementation of this is based on this strategic plan as well as based on monitoring results. The strategic plan is not shared with all staff and they are thus not all aware of this. The organizational structure of TTCA has not been changed and revised since the baseline and it is clearly communicated with staff and extensible to all. In line with the strategic plan the teaching methodology has improved from teacher centered to student-centered active learning. With support from the C4C alliance (MFS II funding) an ICT room has been established and the ICT technology supports teachers in preparing modules, lesson plans and other course materials. This stimulates staff in addition to having extension payment and training and experience sharing opportunities. Furthermore, incentives like upgrading staffs academic status from second to first degree has helped to retain staffs. Training has been provided to staff in terms of recruitment of new students (i.e. in the proper utilization of the selection criteria), material or module preparation, practicum implementation and preparation of volunteer's guideline, gender, quality education and property management. Different organisations supported these trainings: DEC, USAID, MoE, Save the Children UK. The C4C alliance (MFS II funding) has supported training on active learning, moving from teacher-centered to student centered learning. The government has remained the major funder of the college whereas DEC also increased its contribution (from MFS II) and additional funds were received from C4C for establishing ICT infrastructure. UNICEF and UNESCO have started to collaborate with the college to support primary school mother tongue education.

Score: from 2.9 to 3.2 (very slight improvement)

Capability to adapt and self-renew

2.1. M&E application: 'M&E is effectively applied to assess activities, outputs and outcomes'

This is about what the monitoring and evaluation of the SPO looks at, what type of information they get at and at what level (individual, project, organisational).

It is stated that after the baseline monitoring and evaluation of all 15 implementing partners and 75 schools by DEC has taken place. In addition, 45 C4C pilot primary schools were supervised by DEC in collaboration with the partners. Shortage of administrative budget to monitor project activities at school level is a major challenge for the implementing partners. Similar to the baseline situation, teaching practices are evaluated or supervised regularly, but now it is handled in a more integrated way: through joint M&E practice involving teachers, department head and academic dean. Compared to the baseline situation an improvement in the number of staff evaluations, in the utilization of evaluation reports to make corrections, in preparations of students' results in a timely fashion, and in delivery of scheduled progress reports by Department heads are observed. However, some staff members argue that there is no monitoring and evaluation done by department heads. Only the academic dean is working at his full potential. Others stated that the M&E situation of the college is as similar as the baseline situation. The C4C alliance provided an observation Matrix which has 16 indicators, of which 8 focus on behavior of the teacher and 8 on the behavior of the students. This is now used twice a year. Classes of key tutors as well as non-key tutors are observed. Insight in the progress made has been given by the CTE and communicated to the University of Amsterdam. The observation tool has become a monitoring tool for CTE tutors for assessing the quality of teaching and learning at classroom level.

Score: from 2.5 to 3 (slight improvement)

2.2. M&E competencies: 'Individual competencies for performing M&E functions are in place'

This is about whether the SPO has a trained M&E person; whether other staff have basic understanding of M&E; and whether they know what information to collect, how to process the information, how to make use of the information so as to improve activities etc.

It is almost similar with the baseline situation. There is no competent M&E trained person in the college. But, regarding to the staff members' performance evaluation, they are well informed on what is to be evaluated and how since the result of staff performance evaluation is sometimes given to them in the form of written feedback by their supervisors or head of Department. After the baseline there was a training given by C4C on Active Teaching and Learning to the key tutors about the Observation Matrix which has 16 indicators, of which 8 focus on behavior of the teacher and 8 on the behavior of the students.

Score: from 2.5 to 2.5 (no change)

2.3. M&E for future strategies: 'M&E is effectively applied to assess the effects of delivered products and services (outcomes) for future strategies'

This is about what type of information is used by the SPO to make decisions; whether the information comes from the monitoring and evaluation; and whether M&E info influences strategic planning.

The observation matrix that is provided by the C4C alliance (MFS II funding) has become a monitoring tool for CTE tutors for assessing the quality of teaching and learning at classroom level. This provides an input for strategic planning and also to make actions and corrections. However, some of the key informants did not observe such improvement.

Score from 2 to 2.5 (slight improvement)

2.4. Critical reflection: 'Management stimulates frequent critical reflection meetings that also deal with learning from mistakes'

This is about whether staff talk formally about what is happening in their programs; and, if so, how regular these meetings are; and whether staff are comfortable raising issues that are problematic.

Staff members pointed out that there is no improvement regarding critical reflection meetings - some staff members even mentioned there has not been such a thing at all. On the other hand other staff members stated that regular meetings are established (quarterly and annually) and review meetings are organized to review their progress and design improvement actions. They also mentioned that there was a meeting of all staff members at the beginning of the year to discuss strengths and weaknesses and build and improve on these. In addition, communication and meetings with department heads take place once in two weeks and during these meetings discussion, dialogue and critical reflection was done.

Score: from 2.5 to 3 (slight improvement)

2.5. Freedom for ideas: 'Staff feel free to come up with ideas for implementation of objectives'

This is about whether staff feel that ideas they bring for implementation of the program are welcomed and used.

As it was in the baseline it is difficult to discuss sensitive issues with management. It is mentioned that, staffs can express their ideas to the academic dean freely, and he is optimistic in encouraging good ideas. It is mentioned that in their annual meetings staff try to talk about strengths, weaknesses, and progress on designed actions particularly with the academic dean. It was also mentioned that the Vice dean of the college is supporting the 4 key tutors to apply Active Teaching and Learning at classroom level and allows the team to try out new ideas, like working in small groups, preparing worksheets, concept building etc. The college management argued that they create a conducive environment for freedom of ideas and they are positive about accepting and implementing good ideas as long as they are in line with the college's strategic objectives.

Score: from 2.5 to 2.5 (no change)

2.6. System for tracking environment: 'The organisation has a system for being in touch with general trends and developments in its operating environment'

This is about whether the SPO knows what is happening in its environment and whether it will affect the organization.

No adequate information was provided in systems to track the environment. But, staff members, as well as management pointed out that to learn from similar colleges in other regions experience sharing has been organized by the C4C alliance for 12 instructors to Jimma CTE. Jimma CTE tutors have visited Assayta for knowledge sharing, motivation and exchange of ideas. An improvement has been observed in the last two years whereby linkages with primary schools are created through supervision, training and material support. Similarly, efforts are also made to closely work with communities through training such as gender and voluntarism. This can contribute to understanding what is happening in the environment although there is no system in place to track this.

Score: from 2 to 2.25 (very slight improvement)

2.7. Stakeholder responsiveness: 'The organisation is open and responsive to their stakeholders and the general public'

This is about what mechanisms the SPO has to get input from its stakeholders, and what they do with that input.

In the last two years, the tutors of Assayta CTE are all linked to one or two primary schools in the catchment area of the CTE. They are visiting the schools for monitoring purposes (supporting and training the teachers) and supervising the practice of the student teachers in the respective schools. TTCA has provided trainings to 13 primary schools teachers and get feedback from them as well. Though it is not sufficient some staff members argued that the college is trying to communicate with stakeholders and received their reflection. On the other hand, some other staffs mentioned the college is not working in collaboration with stakeholders on student selection and recruitment, entrance exam preparation for new entry students, M&E during practicum, etc. and also it does not have a formal forum with the primary schools as it is used to be in the baseline.

Score: from 2.5 to 2.5 (no change)

Summary of the capability to adapt and self-renew

DEC had accomplished the evaluation of its 15 implementing partners. The C4C pilot primary schools are also supervised by DEC in collaboration with the implementing partners. Shortage of administrative budget to monitor project activities at school level is found to be a major challenge for the implementing partners. TTCA has set up a joint M&E practice by teachers, department head and academic dean, where the evaluation report is utilized to make corrective actions, to give timely feedback to students and to report the progress. Staffs are well aware of the staff performance evaluation on what is to be evaluated and how. The C4C alliance provided and trained staff on an observation Matrix which has 16 indicators, of which 8 focus on behavior of the teacher and 8 on the behavior of the students. This is now used twice a year. Classes of key tutors as well as non-key tutors are observed. Insight in the progress made has been given by the CTE and communicated to the University of Amsterdam. The observation tool has become a monitoring tool for CTE tutors for assessing the quality of teaching and learning at classroom level. This also provides insights for strategic planning, along with inputs from few stakeholders. TTCA closely works with primary schools where they support and supervise them. There has been a slight improvement in terms of frequency of meetings and the dean has become more open and supportive to staff to share their ideas.

Score: from 2.4 to 2.6 (very slight improvement)

Capability to deliver on development objectives

3.1. Clear operational plans: 'Organisation has clear operational plans for carrying out projects which all staff fully understand'

This is about whether each project has an operational work plan and budget, and whether staff use it in their day-to-day operations.

Similar to the baseline situation, all the projects that are on-going at the institution have operational work plans and assigned budgets. These are used in day-to-day activities through discussions with the academic commission or management. Before coming to discussions with the committee, all department heads and process owners discussed these plans and budgets with their respective staff. However, some staff members mentioned that, contrary to the above statement, even though the departments have a planned budget it is not announced to staff. A slight improvement has been observed in timely preparation of physical and financial plans by Department heads. It is also reported that, operational plans are made at the end of each C4C project visit – for the coming 6 months. But it remains unclear whether these plans are shared with the non key staff.

Score: from 3 to 3 (no change)

3.2. Cost-effective resource use: 'Operations are based on cost-effective use of its resources'

This is about whether the SPO has the resources to do the work, and whether resources are used cost-effectively.

TTCA has limited funding and tries to buy resources for all units, both for academia and administrative units, by prioritizing the needs. The existing resources are used cost-effectively in the college with discussions and prioritizations with admin department. Support staffs are aware about the resources (funding and materials) so as to use these cost-effectively. Unlike in the baseline situation the annual budget of the college is known by the respective department heads and this helps to plan and use resources cost-effectively. However, regarding the ICT infrastructure situation all the problems that have mentioned in the baseline are not solved, although the CTE received 10 new computers from the C4C project and DEC provided internet for the college.

Score: from 2.5 to 2.5 (no change)

3.3. Delivering planned outputs: 'Extent to which planned outputs are delivered'

This is about whether the SPO is able to carry out the operational plans.

Even though some staffs do not feel any changes compared to the baseline in terms of delivering planned outputs, Active Teaching and Learning strategies are better applied at the college since 2013 by the key tutors. Tutors no longer start a lesson with a definition on the blackboard, but introduce a new topic by using a mind-map, education materials or worksheets. They are more aware of the need to involve students actively in the learning process.

Score: from 4 to 4.5 (slight improvement)

3.4. Mechanisms for beneficiary needs: 'The organisation has mechanisms in place to verify that services meet beneficiary needs'

This is about how the SPO knows that their services are meeting beneficiary needs

Compared to the baseline situation, there are discussions with students' representatives from each department and students council once in 20 days about the teaching-learning process and other issues in the college with the academic dean and the respective heads of departments. Hence, there is a slight improvement in identifying the gaps and addressing student problems, now students have started to talk about what is right or wrong. Contrary to the above statement, it is also mentioned that tutors do supervise trainees at school but there is no feedback mechanisms in place to find out what the needs of the students are related to the content of the curriculum and the methodology delivered by the CTE.

Score: from 2 to 2.25 (very slight improvement)

3.5. Monitoring efficiency: 'The organisation monitors its efficiency by linking outputs and related inputs (input-output ratios)'

This is about how the SPO knows they are efficient or not in their work.

A slight improvement is made by the vice dean of the college. Unlike the baseline situation, the vice dean has started to visit classrooms of the tutors and to provide feedback on their performance, but there is no standardized monitoring system at the college yet. Though it is not confirmed by others one respondent stated that they set up a check list to evaluate daily activity and performance evaluation twice a year where by an immediate feedback is given to the respective entity or individual. The identified gaps are trying to be addressed through discussion and training. However, this slight improvement is not observed by some of the key informants. Also there is no clear indication that efficiency is measure by comparing inputs to outputs.

Score: from 2.5 to 2.5 (no change)

3.6. Balancing quality-efficiency: 'The organisation aims at balancing efficiency requirements with the quality of its work'

This is about how the SPO ensures quality work with the resources available

Compared to the baseline situation, despite the limited resources, the college is trying to bring efficiency and quality in the college by improving the quality of education. But this effort is not recognized by other staffs and they said that the management did not support the staff with required resources. However, teachers are striving for the quality. Other key informants have also pointed out that quality of training at the college (key tutors) has improved but transfer of skills and knowledge from key tutors to non-key tutors remains a challenge.

Score: from 2.5 to 2.75 (very slight improvement)

Summary of the capability to deliver on development objectives

All the activities of the college have their own operational plan with their respective budget. The operational plans are developed through a bottom up discussion, where all department heads and process owners discuss issues with their respected staffs. It's after this the academic commission and the management committee starts to follow up on the implementation of the operational plan. Operational plans are made at the end of each C4C project visit – for the coming 6 months. It is observed that fiscal and financial plans have started to be prepared timely by the Department heads . TTCA is trying to manage resources in a cost effective way, where budgets are allocated by prioritizing activities. Colleges and department heads are informed about their allotted budget so as to use these cost-effectively. Though there is no standardized monitoring system in the college, the vice dean has started to frequently supervise tutors and provide immediate feedback. Students' class representatives are also consulted frequently about the teaching learning process and other related issues and the identified gaps and problems are addressed accordingly. Active Teaching and Learning strategies are better applied at the college since 2013 by the key tutors which has enhanced quality of the work. Despite the limited resources, the college is trying to bring efficiency and quality in the college by improving the quality of education, partly through applying the Active Teaching and Learning strategies at the college since 2013 by the key tutors. This has also helped to improve on achieving objectives.

Score: from 2.75 to 2.9 (very slight improvement)

Capability to relate

4.1. Stakeholder engagement in policies and strategies: 'The organisation maintains relations/ collaboration/alliances with its stakeholders for the benefit of the organisation'

This is about whether the SPO engages external groups in developing their policies and strategies, and how.

The change in this indicator has not been noticed by the majority of staff members as it used to be in the baseline situation. Heads of education at district level, primary and secondary school and the community are engaged in preparation of strategies and the college has good relationship with these actors. There is still no engagement of external groups in developing policies and strategies of TTCA, which is a government institution that uses strategies in line with government policies. However, the management now stated that the college has started good relations with its external groups especially

during engagement in preparation of strategies. Hence, partners' feedback and reflections are considered in the strategy and future activity towards improving the quality of education.

Score: from 1 to 1.5 (slight improvement)

4.2. Engagement in networks: 'Extent to which the organization has relationships with existing networks/alliances/partnerships'

This is about what networks/alliances/partnerships the SPO engages with and why; with they are local or international; and what they do together, and how do they do it.

Some say there is no network at all. But some others say the college started collaborating with Dessie and Jimma CTEs as a result of the experience-sharing trip after the baseline. Sharing documents, modules, and curriculums has already started. Ideas and lessons are also shared among the CTEs.

Score: from 1 to 1.5 (slight improvement)

4.3. Engagement with target groups: 'The organisation performs frequent visits to their target groups/beneficiaries in their living environment'

This is about how and when the SPO meets with target groups.

TTCA continues to frequently supervise primary schools under the C4C program similar to the baseline situation. But the contact is limited with specific number of staffs associated with the project. Compared to the baseline situation a formal system has been established to support DEC intervention schools following the evaluation of the schools by DEC. After the baseline period efforts have been made to increase parents' involvement in education, for example, in the preparation of strategies.

Score: from 2.5 to 3 (slight improvement)

4.4. Relationships within organisation: 'Organisational structure and culture facilitates open internal contacts, communication, and decision-making'

How do staff at the SPO communicate internally? Are people free to talk to whomever they need to talk to? When and at what forum? What are the internal mechanisms for sharing information and building relationships?

Compared to the baseline situation the vice dean of the college regularly organizes meetings with the tutors and is coaching tutors on-the-job. There is an improvement in open discussion and dialogue with top management, particularly with the academic dean and hence, an improvement in information sharing and collaboration among staff is taking place. The management further pointed out that there are written and oral communications and everyone is free to talk to the management. There are meetings with instructors, department heads, , student representatives and the management committee on a regular basis. However, some staff members believe that the situation is still the same as with the baseline situation.

Score: from 3 to 3.5 (slight improvement)

Summary of the capability to relate

There is a slight improvement in the ability of management to engage with external stakeholders. The feedbacks of the stakeholders have been considered during the preparation the college's strategic plan. Efforts are also made with parents to increase parents' involvement in education. TTCA has also collaborated with similar colleges such as Dessie and Jimma college of teacher education, where experiences and materials such as modules, curriculums are shared among their staffs. TTCA has also closely engaged with C4C intervention primary schools. In addition, the top level management, particularly the academic vice dean, has improved engagement with the staffs.

Score: from 1.9 to 2.4 (slight improvement)

Capability to achieve coherence

5.1 . Revisiting vision, mission: 'Vision, mission and strategies regularly discussed in the organisation'

This is about whether there is a vision, mission and strategies; how often staff discuss/revise vision, mission and strategies; and who is involved in this.

The college's vision and mission had been printed and posted in each staffs office so that they can be familiar with it. The value and vision of the college is reviewed and changed as required but the mission is still constant.

Score: from 2.5 to 2.5 (no change)

5.2. Operational guidelines: 'Operational guidelines (technical, admin, HRM) are in place and used and supported by the management'

This is about whether there are operational guidelines, which operational guidelines exist; and how they are used.

There is no change occurred, the situation is the same as in 2012 in terms of setting up operational guidelines: TTCA has operational guidelines in place on HRM, finance, goods and service procurement, trainee's selection and others. Most of these guidelines are used for practical activities. However, these guidelines still require updating and still staff do not seem to have adequate understanding of the guidelines. It is only the Education Management Information System (EMIS) that has developed and installed on computers of the 75 schools in the end line period.

Score: from 3.5 to 3.5 (no change)

5.3. Alignment with vision, mission: 'Projects, strategies and associated operations are in line with the vision and mission of the organization'

This is about whether the operations and strategies are line with the vision/mission of the SPO.

Similar to the baseline situation, all project intervention strategies continue to be in line with the mission and vision of the college.

Score: from 3.5 to 3.5 (no change)

5.4. Mutually supportive efforts: 'The portfolio of project (activities) provides opportunities for mutually supportive efforts'

This is about whether the efforts in one project complement/support efforts in other projects.

Compared to the baseline situation C4C (DEC) support has supplemented the college with material support and the college also started to work with other NGOs like USAID, UNESCO, UNICEF to complete projects. There are good efforts by the college and other stakeholders to help cluster schools through the provision of computers, science kits for teachers, training on active learning etc.

Score: from 3.5 to 3.75 (very slight improvement)

Summary of the capability to achieve coherence

Vision, mission and strategies are discussed when the need arises. The strategies and activities of TTCA are still in line with these vision and mission. Other funding organisations like UNICEF and UNESCO have come on board to support implementation of mutually supportive efforts. TTCA still has operational guidelines in place on HRM, finance, goods and service procurement, trainee's selection and others and most of these guidelines are used for practical activities. However, these guidelines still require updating and still staff do not seem to have adequate understanding of the guidelines. It is only the Education Management Information System (EMIS) that has developed and installed on computers of the 75 schools in the end line period.

Score: from 3.3 to 3.3 (no change)

Report CDI-15-053

The Centre for Development Innovation works on processes of innovation and change in the areas of food and nutrition security, adaptive agriculture, sustainable markets, ecosystem governance, and conflict, disaster and reconstruction. It is an interdisciplinary and internationally focused unit of Wageningen UR within the Social Sciences Group. Our work fosters collaboration between citizens, governments, businesses, NGOs, and the scientific community. Our worldwide network of partners and clients links with us to help facilitate innovation, create capacities for change and broker knowledge.

The mission of Wageningen UR (University & Research centre) is 'To explore the potential of nature to improve the quality of life'. Within Wageningen UR, nine specialised research institutes of the DLO Foundation have joined forces with Wageningen University to help answer the most important questions in the domain of healthy food and living environment. With approximately 30 locations, 6,000 members of staff and 9,000 students, Wageningen UR is one of the leading organisations in its domain worldwide. The integral approach to problems and the cooperation between the various disciplines are at the heart of the unique Wageningen Approach.

Abstract

Primary school enrollment rates have increased over the last years to 82.5 % in low income countries. However, the quality of education in these countries is often quite low because many teachers received only little training. The current program aimed to improve the quality of education by offering an ICT supported school management system and teacher training in teaching-learning processes. This paper set out to evaluate the “Improving the Teaching-Learning Processes and Educational Management through ICT” project that was implemented by the Teacher Training College Ayssaita, Ethiopia. This evaluation focused on the primary beneficiaries of the project, namely primary school children. We compared children who were enrolled in pilot schools and who were taught by a trained teacher with children in the same schools who were taught by not yet trained teachers and with children in governmental schools (taught by not yet trained teachers). Students were interviewed in September 2012 in their first weeks of school in grade 1 and again in May 2014 at the end of grade 2. Balance tests and double difference analyses are reported for the project outcomes, which are indicators of quality of education and therefore important aspects of the Millennium Development Goal 2. The program faced several challenges that strongly influenced the implementation and especially the rigorness of the evaluation, such as high teacher-turn overrate, high migration of students, security issues, and a relevant change in teaching which were outside the control of the teacher training college. Keeping methodological and reality challenges in mind, the current evaluation found only evidence for increased motivation to attend school but no further impacts among students.

1. Introduction

Primary school enrollment rates have increased over the last years to 82.5 % in low income countries (World Bank, 2012). However, the quality of education in these countries is often quite low. For example, data from low-income countries in 2012 showed that 19.5 % of the primary school teachers had not received a minimum of organized teacher training normally required to be qualified to teach at the primary level in the given country (World Bank, 2014). One approach to increase the quality of education is capacity building with respect to teacher training. This paper set out to evaluate the “Improving the Teaching-Learning Processes and Educational Management through ICT” project in Ayssaita, Ethiopia. This project was funded by Directorate-General for International Cooperation (DGIS) through IICD and Edukans and implemented by Development Expertise Centre (DEC) at the Teacher Training College in Ayssaita. The main objectives of this project were to train teachers (at the teacher training college and working in schools) in teaching-learning processes and educational management with ICT to improve the quality of education for primary school students. This evaluation focused on the primary beneficiaries of the project, namely primary school children. We compared children who were enrolled in pilot schools and who were taught by a trained teacher with children in the same schools who were taught by not yet trained teachers and with children in governmental schools (taught by not yet trained teachers). Students were interviewed in September 2012 in their first weeks of school in grade 1 and again in May 2014 at the end of grade 2. Balance tests and double difference analyses are reported for the project outcomes, indicators of quality of education which are important aspects of the Millennium Development Goal 2. The report begins by presenting the local context in which the project has been implemented. This is followed by a description of the project, budget, result chain, and theory of change. Next, the methodology and data collection are described. The analyses and results are presented. The paper ends with a discussion of the results, efficiency calculations, and conclusions.

2. Context

Education is one of the priorities of the government in Ethiopia. In 1991, the average enrollment rate in Ethiopia was only 19 %. Since then access at all levels of the education system increased at a rapid rate in line with a sharp increase (more than hundredfold) in the number of teachers, schools and institutions (ESDP III, 2010). To date, the enrolment rate has increased to over 97 %. However, this rapid development has precipitated a decline of the quality of education in the whole country on all levels of education.

Thus, there is an acute need to pay more attention to quality assurance in general and to activities and processes which can improve student learning. These activities and processes should help to change schools

into learning environments that offer, for example, quality-focused school supervision, internal school leadership, increased student participation, or school-community partnerships. During the last years campaigns and education policies were developed to improve the quality of education. Effort has been invested at all educational levels including Early Childhood Care and Education (ECCE), primary education (grades 1-8), secondary education (grades 9-12) and Functional Adult Literacy. The quality improvement program integrates core priorities such as teacher and leader development and Information and Communication Technologies (ICT).

The evaluated project is part of an Ethiopian wide program called Connect4Change (C4) which was designed by EF/DEC and the International Institute for Communication and Development (IICD). This program is set up for five years between 2011-2015 mainly funded by DGIS. This program focuses on improving (1) the teaching- learning processes and (2) educational management in a few teachers training colleges (TTCs) and primary schools in Ethiopia. The ultimate goal is to thereby improve the quality of education. Out of fifteen different program sites Ayssiata was randomly selected. Ayssiata is situated in Afar, Zone 1, in the eastern part of the country, 700 km from Addis Ababa. The Ayssiata College of Teachers Education (Ayssiata TTC) undertakes the project activities in two major areas: on its own campus as well as in five neighbouring schools. The intake capacity of the college was about 600 trainees per year at the time of the baseline assessment in September 2012. The college mainly focuses on training primary teachers to work in schools for pastoralist communities. During the implementation period of the project, five primary schools were provided with a computer lab for teaching staff.

The literacy level as well as standard of living in this area in Affar is still very low. Only 48.57% of the total population in Afar had access to safe drinking water (Central Statistical Agency of Ethiopia, 2004). A more recent evaluation of two other MFS II evaluations in the same region indicated that 60 % of the population had access to safe drinking water (see project WASH C13 and project reproductive health C11 of Amref). A recent study compared educational indicators of all 75 pilot schools of the program with 30 control schools across Ethiopia. Results showed that the five schools in Ayssiata scored far below the other 70 pilot schools (Connect4chance, 2014). From 2011 to 2014 results show some slight improvement across the five schools. The learning results slightly increased by 1.21 grade points from 64.00 in 2011 to 65.20 in 2014 (grades range between 0 for very bad to 100 very good). The school dropout rate slightly decreased by 3.06% from 9.37% in 2011 to 6.31% in 2014. The completion or success rate (leaving school with a certificate) greatly increased by 64.07% from 17.91% in 2011 to 85.06% in 2014 (see Appendix, Table 1). To improve quality of education the government and stakeholders working on education face three main challenges¹:

¹ In general, the low literacy level of the pastoral community could be due to: lack of access to schools at vicinity of the pastoral communities; lack of awareness of the importance of education particularly of girls; the need for child labor for herding and domestic chore; lack of alternative basic education or non-formal schools; lack of appropriate schools such as mobile schools to educate the children; shortage of food is a critical problem reducing enrollment and increase

1. The majority of people live in pastoralist communities and frequently move to search for water and pasture for their cattle. Children follow their parents and can often not regularly attend school. In this area it is a challenge to teach students in constructed permanent schools.
2. The hot temperature in this area does not allow students to walk long distances to school every day.
3. It is difficult to recruit Afar speaking teachers. Most teachers are recruited from other areas of Ethiopia. Many of them do not want to stay for a long time in area that has limited facilities. Thus, the turnover rate of teachers is quite high. This in turn also affects the quality of education.

3. Project description

3.1. Project duration and budget

The project started in June 2011 and it is supposed to finish in June 2015. In 2008, Development Expertise Centre (DEC), a local frontline office for Edukans Foundation, and Graduate School of Teaching and Learning (GSTL) of University of Amsterdam (The Netherlands) in collaboration with ministry of education and regional bureaus started implementing a pilot program for three years. This program 'Basic Education Quality Improvement program (BEQIP)' was implemented in some selected primary schools in Amhara and Oromiya Regional States in Ethiopia. The program started with introducing digital video as ICT tool for reviewing the teaching and learning process. In March 2010, a roundtable was organized in Addis Ababa to share the results of the BEQIP to partners and stakeholders. Based on the output of the roundtable, EF/DEC and International Institute for Communication and Development (IICD) have designed an outline for a country-wide program called C4C for the years 2011-2015.

The evaluated project is one program site of this Ethiopian-wide program. The Southern Partner of DEC in Ayssiata is the Ayssaita College of Teachers Education (CTE). This teacher training college was established in 2008, located 700 Km East from Addis Ababa. In 2012, the college trained 600 teachers per year for primary schools in pastoralist communities.

The project was initiated by Dutch NGOs. They selected DEC as a Southern partner to develop and implement the project in close cooperation. The Dutch NGOs and representatives from the University of Amsterdam (UvA) regularly visit the project sites and aim to build capacity by training teachers and school management staff.

The C4C Ethiopia contract is between Edukans and (1) the University of Amsterdam and (2) DEC in Ethiopia and not with the 15 implementing partners of the program separately. Thus, the budget indicated

school dropouts; early and mandatory (Absuma) marriage of girls; and lack of access to water and health services around the schools.

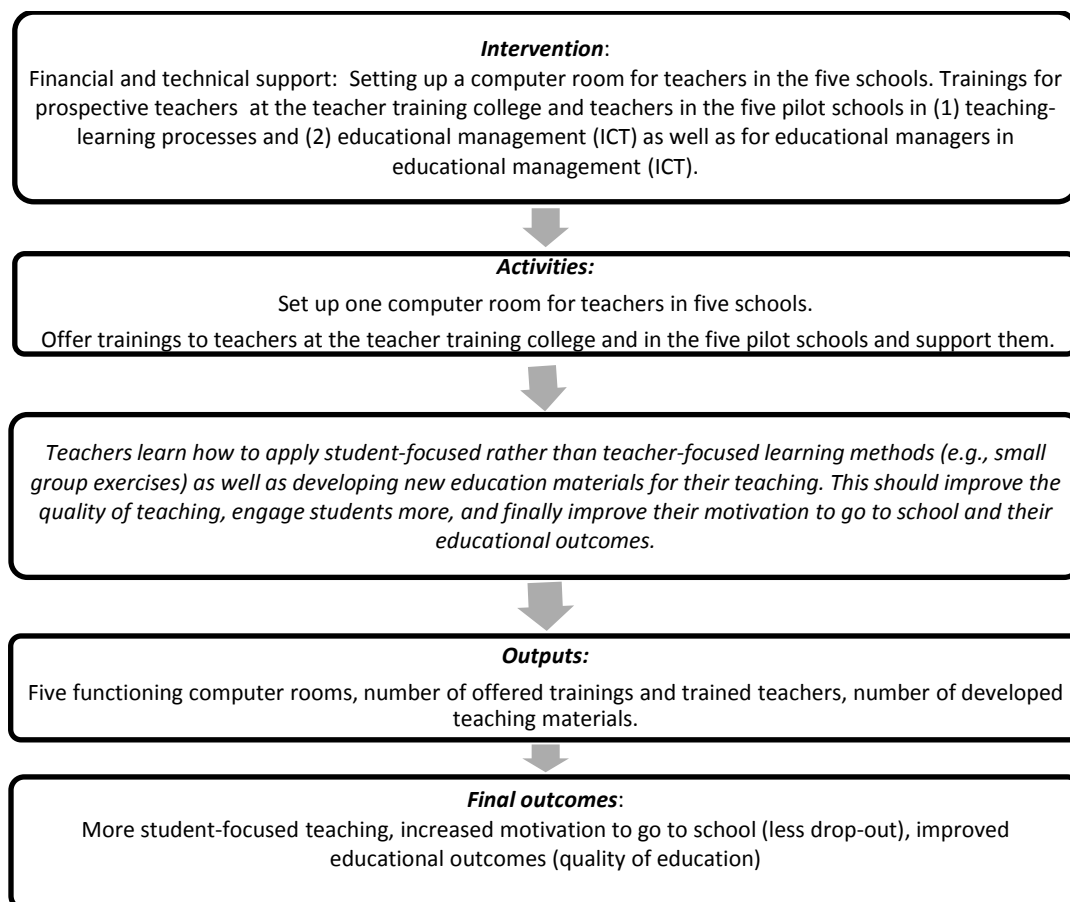

below is a 15th of the whole budget and not the specific budget for Ayssaita CTE. The total budget (2011-2015) €995.364 divided by 15 partners/project sites is around €66.358 Euro per partner/project site. For the five year duration the MFSII funding for Ayssaita CTE is €61.518 which is 83% of the total project budget. ICT-related capacity building is provided by IICDs technical partner DOT Ethiopia and Leverage Plc (for further details see Table 4).

3.2. Project objective, activities, and theory of change

The aim of the project is to improve the teaching-learning processes and educational management in primary schools in Ethiopia. Young teachers in the teacher college in Ayssaita and teachers in five schools were trained to improve the quality of education. More precisely, computer rooms were set up for teachers in the five schools. Furthermore, teachers were trained in teaching-learning processes (e.g., applying different teaching styles such as small group discussions in class) and in using ICT for their educational management (i.e. digitalize and update learning media and lesson plans). The latter training is expected to result in more efficient school management which should free up some time of the teachers to be able to set up extracurricular activities for students. In addition, managers in schools were trained in education management to improve the decision-making in primary schools. Finally, this all should lead to the development of a supportive friendly supervision system in the schools. To conclude, the ultimate objective of this project is to improve the quality of teaching and improve students' performance in school.

The graphical theory of change illustrates the envisioned impact of the project (see Figure 1). Below specific aspects will be described in detail.

Figure 1: Graphical theory of change for the impact of the project

The intervention included three main **activities**. First, each school allocated one computer room for teachers only equipped with computers and a printer for their educational management. Second, the intervention offered two types of training for prospective teachers at the teacher training college and teachers in the five pilot schools in (1) teaching-learning processes given by representatives of the UvA and (2) educational management (ICT) for teachers as well as for educational managers in educational management (ICT) to improve quality of education for students. ICT-related capacity building is provided by IICDs technical partner DOT Ethiopia and Leverage Plc.

The project **activities** focused on the teachers and included the following:

- Provide computers for teaching staff in school
- Teacher training on teaching-learning processes in class
- Teacher and school management trainings on applying educational management
- School visits to support teachers

The **outputs** can be divided into the three different activities. Concrete outputs are:

- Set up one computer room in each of the five pilot school
- 4 district level education experts trained in data management and communication skills to ease school-district networking
- 560 prospective teachers trained in ICT related issues which would help them in practicing
- 30 primary education staff members working in 5 schools trained in school management
- 30 college level instructors trained in teaching-learning processes
- 65 primary teachers, 5 supervisors and 5 principals trained in C4C to implement in classroom levels

Specific output indicators were specified but not quantified:

- Integration of ICT in their future carrier
- Number of action researches carried out
- Number of digital learning media produced
- Number of videos produced and analyzed
- Round experience sharing carried out

The **theory of change** states how specific activities should result in the envisioned outcomes. In this case, teachers have access to a computer room to prepare their teaching lessons and school management. In addition, the teachers are trained in (1) teaching-learning processes and (2) educational management. They learn how to apply student-focused rather than teacher-focused learning methods (e.g., small group exercises) as well as how to develop new education materials for their teaching. The training will help them to refine their teaching methods and prepare new education materials to use in class. Applying these new insights (i.e., engaging students in student-focused learning activities, using newly developed education materials), students will be more interested and motivated. This should help students to more easily and successfully learn the subject. This increased motivation in learning should decrease school drop-out and finally increase students' performance. Important to note is that the project designers expected that trained teachers would train their colleagues who did not have the chance to participate in a training. This snowball effect should increase the number of teachers who were trained in teaching methods.

3.3 Changes in the project activities

The project faced seven main threats with respect to the planned implementation which resulted in changes in the project activities. First, at the time of the baseline study one computer room for teachers was built in each of the five pilot schools. However, at that time the computers could not yet be used due to technical problems. At the time of endline study this problem had not entirely been fixed. The information we could get is that the

ICT equipment is only functioning in some schools that have stable electricity. Teachers of other schools without any electricity can go to a center in the town after work and on weekends. This center was set up by DEC.

Second, as expected the teacher turn-over rate was very high. We requested more detailed information about this issue from the SPO to be able to illustrate this threat with numbers (list with teachers we sampled in the baseline to check whether and when they left). We did not receive any information yet. Based on the data from the teacher survey, only four out of twenty-two teachers were interviewed twice. However, only one teacher was trained in teaching methods (not in school management) and was still teaching the same class.

Third, the government has changed the teaching system last year. So far each class up to grade 4 was taught by one teacher (i.e., self-contained). Since last year each class is taught by several teachers, one teaching environmental science, one math and so forth. This is likely to influence the impact of the project. It could have positive spill-over effects if one teacher who has been trained uses his new skills in several classes. However, it could also happen that the trained teachers do not use these new methods anymore (e.g., too much work teaching several classes, influence by older teachers).

Fourth, as far as we are informed so far only one school management training was conducted.

Fifth, based on our data we did not find any evidence that teachers who received training would train their colleagues afterwards.

Sixth, during the last two years the government has built a large sugar plant in the area of the schools that were selected for this evaluation. Many pastoralist families were forced to move away which has caused a lot of unrest among the inhabitants. As a result the enumerators could not travel to one of the treatment schools (see section 4.3 for more details).

Seventh, the communities in Afar are pastoralists. Migration within these communities is very high. Furthermore, students' school absence is very high which in turn affects students' performance and the result of the evaluation as well. The potential impact of these seven threats for the project activities will be discussed later.

4. Data collection

4.1 Data sources

This evaluation is based on two main sources of data, namely (1) gathered sources of data and information and (2) a survey that was conducted among children. First, prior to visiting the project site, information was gathered from IICD, Edukans and DEC. This information included project reports, project monitoring data, and financial data. The evaluation team met once with a representative from Edukans in the Netherlands and three

times with representatives from Edukans, IICD, and DEC in Ethiopia (June 2012, May 2013, and April 2014) to understand the project and its progress as well as to obtain relevant project documents. It was agreed on focusing on evaluating primarily the impact among students as the involved stakeholders monitored the trained teaching staff themselves. Second, we interviewed children to investigate the outcomes of the program among these beneficiaries. The survey and the results will be described below. Representatives of the evaluation team visited the field sites during the data collection in September 2012 and May 2014.

4.2 Description of the surveys

Children were individually interviewed by native speakers. The endline questionnaires were translated to the local languages to make sure that students understand the questions (e.g., Benet-Martínez & Hong, 2014). The baseline interview lasted on average 30 minutes and the endline on average 60 minutes. The full questionnaire can be obtained on request. The questionnaire was divided into seven sections. The majority of questions in each section were asked at baseline and endline, a few questions were revised at the endline, and one section was added (section 1.5, school performance test). The first part assessed demographic information about students' age, gender, religion, ethnicity, and mother tongue. Section 1.5 included a school performance test which was only asked at endline. As there is no standardized school performance test available for grade 2 across Ethiopia, we extensively developed one school test in collaboration with educational experts and field workers across Ethiopia. In this school test, students were asked seven questions about the subject environmental science, fourteen questions about the language of instruction, eleven mathematical questions, and six English questions. For each subject the questions increased in difficulty. One master thesis which is still in progress explains in detail how this measure was developed and carefully pre-tested (Geiger & Hansen, in preparation). The third section included questions about cognitive skills and health indicators. Section four included questions about students' identity. Students' school engagement and future aspirations were assessed in section five. Next, questions about the classroom interaction and learning were assessed, before students were asked questions about their socioeconomic background. The items of the presented results are provided in Table 15 in the Appendix.

In addition, we requested information about students' grades, absence (e.g., due to illness), and whether students had to repeat a grade. Unfortunately, the field officers were not able to obtain this information from the schools. Thus, we did not receive any information about students' absence or who had to repeat a class. The enumerators tried to get more detailed information about attrition; of each student who was not present in school during the interview period in May 2014. Unfortunately, the enumerators were only able to receive some general information of the reasons why some students were not present during this data collection time. Thus, we could not include school attendance and grade repetition as outcome variables. Thus,

we included self-report measures for students' motivation and intention to drop out of school. Table 1 provides an overview of the assessed outcomes that were included in this evaluation.

Table 1. Overview of assessed outcomes

Main outcomes	Source	Specific outcomes	Assessed at
Access to education	School records	Number of enrolled students	Baseline & endline
Quality of education	Student survey	Cognitive ability (recall)	Baseline & endline
	Student survey	Cognitive ability (remember order)	Baseline & endline
	Student survey	Motivation to attend school	Baseline & endline
	Student survey	Intention to drop out	Baseline & endline
	Student survey	Control beliefs about students' performance	Baseline & endline
	Student survey	School performance test (overall, environmental science, language of instruction, math, English)	Endline
	Student survey	Control belief about students' performance (additional item)	Endline
	Student survey	Teaching approach in class used by the teacher	Endline
	Student survey	Teaching equipment used in class by the teacher	Endline

4.3 Sampling design and sample sizes

The evaluation included three groups, one treatment and two comparison groups. The sampling of the *treatment group* is described first. The beneficiaries are students (and teachers) from the five pilot schools that were part of the program and who directly (teachers) and indirectly (students) profit from the teacher trainings. In particular, we sampled three schools out of five and in each school one 1st grade class (note that there is only one 1st grade class in each school, except one where there are 2 sections and we randomly picked one). All students and teachers of the selected classes were part of the survey. As the ultimate goal of the program is to improve the performance of students in primary education, we decided to mainly focus on students as beneficiaries. Next, we sampled two different comparison groups. In particular, the *first comparison group* includes three schools that are part of the program. The sample consists of students and teachers of two 1st grade classes where the teachers have not been trained, but will be trained in future. The reason why we picked these two schools out of the total five is that in the remaining three schools there are only 1st grade classes in which teachers have already been trained. Important to note, ideally we wanted to compare classes with trained and untrained teachers in one school to compare the impact of the intervention in the same learning environment. Given the small schools this was not possible. Thus, we tried to sample comparable schools. We were aware that the learning environment is crucial and that these differ between urban and rural schools. However, given the reality constraints we chose the most suitable comparison schools. In addition, we controlled for several controlling variables to capture important differences (e.g., demographics, educational background of parents,

village). The *second comparison group* consists of two governmental schools which are not part of the program and teachers were not yet trained at the TTC. The sample includes students and teachers of 1st grade classes. These schools were selected from the same area and were comparable to the pilot schools in terms of infrastructure, size, and socioeconomic background of students and teachers. Importantly, these schools were not equipped with a computer room. These schools were not selected randomly as there are not many schools in this area.

At baseline 180 students were interviewed in the treatment schools who were taught by trained teachers, 261 students who were taught by untrained teachers (comparison group 1), and 59 students from governmental school (comparison group 2; see Table 2 for an overview per school). At the endline 79 students were interviewed in the treatment schools, 257 in comparison group 1, and 29 in the governmental schools (comparison group 2). For security reasons the enumerators could not visit one of the treatment schools, Handeg ($n = 52$). As attrition was very high we additionally interviewed students in the schools who were not interviewed in the baseline.

Table 2. Overview of sample design and sample sizes

	1. Students taught by <i>trained teachers in pilot schools (treatment group)</i>	2. Students taught by <i>not trained teachers in same pilot school (comparison group 1)</i>	3. Students taught in <i>governmental schools in which teachers are not trained (comparison group 2)</i>
Baseline	School 1: Arado (urban) #students: 84	School 1: Cindile (urban) #students: 162	School 1: Gabule (urban) #students: 33
	School 2: Handeg (remote) #students: 44	School 2: Yewuket Chora (urban) #students: 99	School 2: Galifage (urban) #students: 26
	School 3: Hamitole (remote) #students: 52		
Baseline total	180 students	261 students	59 students
Endline	School 1: Arado #students: 59	School 1: Cindile #students: 158	School 1: Gabule #students: 22
	School 2: Handeg #students: 0 <i>Dropped out of the sample due to security reasons!</i>	School 2: Yewuket Chora #students: 99	School 2: Galifage #students: 7
	School 3: Hamitole #students: 20		
Endline total	79	257	29
Attrition rate	56.11 %	1.53%	50.85%

4.4 Attrition to follow-up

At the baseline assessment in September 2012, 500 students were interviewed. At the endline assessment only 365 students were interviewed of which only 183 were interviewed twice (baseline and endline). During the field work we decided to also interview 182 new students from the same classes. Therefore, the overall attri-

tion was very high, about 64% (1-183/500). Additional analyses to check for attrition showed no systematic effects, except one significant difference (whether students received help with their school work at home, see Table 14).

We identified three main reasons for the high attrition (see also discussion in section 3.3). First, due to security reasons the enumerators could not travel to Handeg school. Second, many pastoralist families moved away because a new factory that was built by the government. Third, migration among pastoralist communities is very high in general. Fourth, at the time of the data collection it was very hot (around 42 degrees). Many children did not attend school, many of them have to travel long distances. Fifth, many students had to repeat a grade, transferred to a nearer school, or even dropped out of school. Unfortunately, we could not get any detailed information or documents to check which students dropped out of school, transferred schools, or were just not present during the data collection time. This is somehow surprising as the newly deployed school management system should have supported this. The enumerators tried to get as much information as possible. However, as the teacher turn-over rate is also very high, many teachers did not know all the students that were enrolled in their classes. We decided to additionally interview all students who were now also in the sampled classes.

4.5 Implication of power calculations

A potential concern of our evaluation is that we lack sample size to detect a real impact of one of the interventions in this project, resulting in a Type II error. Theoretically, a power analysis can assess whether this is a serious risk. However, it is not obvious how to perform power analyses for our analyses. Many simplifying assumptions need to be made in order to make the problem tractable. Moreover, we consider a broad range of outcome variables, and use different types of regression techniques. Our approach, therefore, will only be indicative and will provide some extremely rough estimates covering a range of contingencies. One of the main problems we are faced with is that we need to make an assumption of the effect size for the underlying population. Since there are virtually no quantitative studies available that can guide us in terms of expected effect sizes, we decided to follow Cohen's definitions of small, medium and large effect sizes (Cohen, 1988, chap. 9), and calculate minimum required sample sizes for the effect size of 0.8. Based on this assumption we calculated the minimal detectable effect size for the main outcomes variables separately using the STATA program `powerreg`, which is specifically designed to do power calculations for multiple regression models. Results are given in Table 3 below.

Table 3. Minimal detected effect size

Outcome variable	Minimal detected effect size	
	<i>Whole sample</i>	<i>Trained teacher in Arado 'case study analysis'</i>
Cognitive ability (recall)	.04	.04
Cognitive ability (remember order)	.60	.06
Motivation to attend school		
Intention to drop out of school		.22
Control beliefs	.14	.14
Good grade	.18	.18
Test overall school performance		.08
Test environmental science	.06	.06
Test language of instruction		.11
Test math	.10	.10
Test English		.12
Teacher explain everything to students	.06	.06
Teacher ask question to students	.10	.10
Students have to do exercises alone	.10	.10
Students discuss and work in small groups	.10	.10
Students discuss and work with neighbor	.10	.10
Students can ask questions during class		.10
Teacher used print copies	.02	.02

4.6 Other data problems

The reasons of the high attrition have been discussed above (see section 4.4). Furthermore, we were not able to receive the school records from the schools (absence, grade repeated, grades) for all students (see discussion in section 4.2).

4.7 Availability of financial data

The total budget for this project was around €61.518 of which 83% were funded by MFS II. Table 4 below provides a breakdown of the project budget in different types of activities. The largest amount of the total budget over the five years 68% was invested in capacity building activities. 32% were invested in setting up and managing the computer facilities. We did not receive more detailed information on how much of the budget was spent on each type of the training (teaching-learning processes versus school management). During our first meetings we were informed that these two types of training would be organized in separate sessions. However, the project reports suggest that both aspects have also been addressed in one training.

Table 4. Breakdown of the project budget in capacity building and ICT for Ayssaita CTE

Year	Budget in Euro	% of budget funded by MFS II	Budget spent on capacity building	Budget spent on ICT	Extra support for CTE
2011	10.823	85	5.323	5.500	
2012	11.847	76	9.847	2.000	
2013	21.026	87	10.350	676	10.000
2014	11.026	85	10.350	676	
2015	6.796	82	6.130	666	
Total	61.518	83	42.000	9.518	10.000

4.8 Descriptive analysis

We first tried to check the intended outputs (see Table 5) split up for the three main activities of this project; ICT infrastructure in schools and the two different types of training. The school visits to support teachers were not quantified in the documents we have received. The ICT infrastructure was set up but due to power cuts and a lack of expertise sometimes not functioning. In addition to the computer rooms in schools DEC set up a center in town. The outputs with respect to the teacher training seem to suggest that fewer participants may have attended the training than intended. Based on the participant lists we concluded that only 41 teachers attended the teaching method workshops organized by colleagues from the UvA (see Appendix Table 16). This was less than it was stated in the intended outputs of the project. As far as we know only one teacher training for school management was organized in 2012.

Table 5: Output and outcome goals and achievements

Output	Goal	Achieved
Set up one computer room in each of the five pilot school	5	Partially achieved, 5 computer rooms are build and equipped, not always functioning, in addition 1 center is set up by DEC in the town
Teacher training on teaching-learning processes in class (number of participating teachers)	<ul style="list-style-type: none"> • 30 college level instructors trained in teaching-learning processes • 65 primary teachers, 5 supervisors and 5 principals trained in C4C to implement in classroom levels 	<p>Mentioned in the documents: 28 teachers 6 principals 3 supervisors 500 prospective teachers</p> <p>However, less based on participant lists (see Appendix Table 12): 41 primary teachers</p>
Teacher and school management trainings on applying educational management	<ul style="list-style-type: none"> • 560 prospective teachers trained in ICT related issues • 30 primary education staff members working in 5 schools trained in school management 	Not clear
School visits to support teachers	Not quantified	
<p><i>Notes.</i> For Outputs and goals we referred to the following word document 'Project 18. Connect4Change Information about Ayssaita 2011.docx'. For achievements we referred to the following documents 'Annual report of Connect for Change Program Ethiopia, ET1115H04, January 2014' and 'Country Progress Report Connect4Change Ethiopia, January 2014, DEC'.</p>		

Next, we checked the results of the teacher survey (see Table 6). We interviewed 12 teachers at baseline and 22 teachers at the endline. The teachers were selected because they were teaching the classes that were selected for the student survey. We interviewed more teachers at the endline because the teaching system had changed in 2013. At baseline only one teacher would teach one class in all subjects (i.e., self-contained teaching). At the time of the endline this system had changed, several teachers were now teaching each class (i.e., one teacher would teach specific subjects in all classes of the school). The sample below includes teachers from the pilot and governmental schools. At baseline four teachers had received training; two in school management and two in teaching learning processes. At the endline only two teachers indicated to have received one training in teaching-learning methods and none indicated to have received training on educational management in the last 12 months.² Based on the documents we received we checked whether the teachers whom we interviewed at baseline were still teaching at the same schools at endline. Important to note, only *one* teacher at Arado school was still teaching the same students in one class.

As expected the teacher turn-over rate was very high (only one teacher stayed). However, based on our yearly discussions with DEC we expected that new teachers would be trained and take over the positions of the leaving teachers. Our small sample and its results do not provide any evidence for this assumption. The current results seem to suggest that none of the interviewed teachers was trained after the baseline assessment by an already trained teacher or participated in a training.

Table 6: Descriptive results of teacher survey of the baseline and endline assessment

Baseline							
Variable	N	M	n	n	SD	min	max
Gender	12	0.75	3 men	9 women	0.45	0	1

Teaching learning processes*	22	0.09	2 yes	20 no	0.29	0	1

Note. Answers are coded with *yes=1, no=0.

² We were informed that the precondition to offer this training at a school is that the school management system needs to be in place. As this was not the case a learning by doing approach was used which is a kind of capacity building yet not valued like an organized training workshop with a daily allowance.

The student survey included a range of information designed to control for differences in socio-economic characteristics and demographic structure across children and the households they lived in. We chose questions that children of this age can easily answer. Descriptive statistics and balancing tests based on the baseline assessment for the two comparison groups and treatment group are provided in Table 7. Table 8 provides an overview of the descriptive statistics and balancing tests for the baseline and follow-up data focusing on the main outcomes.

The statistics from Table 7 suggest that the three groups of this evaluation differ in some aspects. With respect to the educational background, parents of children in the treatment group seem to be more likely to be able to read and write, have books at home, and help students with their school work compared to students in the governmental schools (comparison group 2) but less so compared to students in the pilot schools in which teachers were not trained at the baseline (comparison group 1). Furthermore, we assessed some indicator of poverty. More precisely, the number of animals was larger in the treatment compared to the comparison group 1. Finally, children in the treatment group ate more meals per day compared to the comparison group 2 and fewer meals per day compared to the comparison group 1. We included these variables as control variables next to more general demographics (age, gender, ethnicity, religion etc.) in the final analyses.

Table 8 presents the summary statistics of the main outcome variables. Two differences were found comparing students in the treatment schools with students in pilot schools without trained teachers. More precisely, students indicated less often that teachers would use printed copies (in both groups printed copies were hardly never used) and chairs were more frequently missing in class. Furthermore, four significant differences were found between students in the treatment schools and governmental schools. Students in the treatment schools showed better cognitive abilities (recall and order) and more frequently indicated that teachers used teacher-focused teaching methods (teacher explained everything to students and asked question to student) compared to students in governmental schools at baseline. We will discuss these more in depth in the following section.

Table 7: Summary statistics and balancing tests for controls

Dependent variable	Summary Statistics						Balancing tests	
	Comparison 1		Comparison 2		Treatment		Treatment - C1	Treatment - C2

Notes. Column 2, 4 and 6 presents the mean of the two comparison and treatment group respectively. Column 7 and 8 displays the coefficient from a separate OLS regression. In panel B no balancing tests are conducted as there are only endline data available. Standard errors are clustered at the village level. ¹The scores were computed by an average of two items assessing the retrospective construction of a scale ranging from 1 for *very low* to 4 for *very high*. ²Students were asked to choose one out of two statements describing their personal control belief on how they can achieve specific goals such as a good grade in life. One statement represented a strong internal control belief that it depends on their own efforts and the other represented a strong external belief that it depends on other pure luck. All answer representing internal control belief were summed up. In total, students received 2 of these questions. The reported score could vary from 0 for *no personal control belief* to 2 for a *strong personal control belief*. ³Grades were not available for all students who were interviewed at the endline. Robust standard errors in parentheses *** $p < .001$, ** $p < .05$, * $p < .1$.

5. Analyses and results

This section explains the analyses and presents the results of the impact evaluation. Section 5.1 describes the approach we have used, and points out some of the caveats we were faced with. The main results are presented in Section 5.2.

5.1 Methodology

The objective of this report is to describe changes in school engagement and learning outcomes that could be attributed to teacher training. The challenge in any impact evaluation is to isolate the causal role of the intervention from other determinants of well-being (e.g., Armendariz & Murdoch, 2010). When comparing the situation of beneficiaries before and after an intervention, the observed changes in outcome variables cannot solely be attributed to the intervention, as there are many other changes in the environment of the respondents during the project period. Comparing beneficiaries with a control group of non-beneficiaries does not necessarily provide the solution. Beneficiaries could for instance have been wealthier than non-beneficiaries when the program started or *vice versa*. This and other factors can make some students more likely to choose a specific school, thus causing self-selection bias. Besides self-selection bias, program placement bias is also frequently observed in evaluation studies. NGOs target their projects purposely at specific, often disadvantaged, areas. If the control group's physical, economic and social environment does not match that of the beneficiaries, this will result in differences not caused by the intervention and thus in biased estimates of impact.

The standard approach to overcome these issues is to conduct a randomized controlled trial (RTC). Before the program starts two groups will be created at random. One group will receive the treatment (treatment group) while the other group will act as a benchmark (control group). Because of the randomization the members in the control group represent the members in the treatment group. After the treatment has taken place, both groups can be compared on the outcomes of interest. Differences in outcomes can now solely be attributed to the treatment. However, creating two groups at random, a necessary step for RTCs, is not always possible because of the program implementation or ethical reasons.

As we had no influence on the design of the “Improving the Teaching-Learning Processes and Educational Management through ICT” project, we use an alternative to RCTs: a so-called double difference (DD) model. In order to apply a DD model, one needs to have information about relevant indicators of the treatment group and the control group before (baseline) and after (end line) the intervention. While the RCT methodology ensures that the only difference between members in the treatment and control group is the treatment, the DD method only eliminates differences between members of the two groups that do not change over time. So the disadvantage of the DD method over the RTC method is that it does not automatically distinguish between the impact of time-varying characteristics between members of the two groups and the impact of the treatment. A (partial) solution to this problem is to include as many time varying characteristics into the DD model as possible so that only the influence of unobserved time-varying characters remains.

To test whether the treatment and one control group are comparable at baseline, a balancing test can be conducted. Although debated in the literature, a balancing test is generally used to determine if the observable controls are distributed similarly between the groups in question.³ If any significant difference exists between the three groups in question, a balancing test should pick up this difference and indicate that the current composition of the data could lead to a biased estimate of the treatment effect. The balancing test is conducted as a set of OLS regressions in which each control variable is individually regressed on a constant and the treatment dummy. The standard errors in the regressions are clustered at the village level to account for intra-class correlation. The coefficient of the treatment dummy now gives us an unbiased estimator of the difference between the control and treatment group at the time of the baseline survey.

Econometrically speaking the double difference estimator is given by the following expression:

$$Y_{ijt} = \alpha + \beta_1 Post_t + \beta_2 D_j^T + \beta_3 Post_t D_j^T + \gamma X_{ijt} + \varepsilon_{ijt} \quad (1)$$

Where Y_{ijt} denotes an outcome variable for respondent i in group j at time t , D_j^T is a dummy variable equal to one if the respondent belonged to the treatment group, $Post_t$ is a binary variable that takes the value one if

³ For a summary of the literature and further discussion of balancing tests see Kleyman (2009).

the observation corresponds to the post-treatment time period, X_{ijt} is a set of controls⁴, and ε_{ijt} denotes the error term. Then, β_3 in (1) is the treatment estimate of the intervention's impact on outcome Y. That is, β_3 measures the difference between the treatment and control group in the growth of outcome Y. It is an unbiased estimate of the average impact of being assigned to the treatment group on the dependent variable Y.

Some of the outcome variables considered in the analysis are binary. In these cases, a linear probability model (LPM) is estimated and the marginal effect of D_i^C for the impact of the project on outcome Y is reported.⁵ In all models the standard errors are clustered at the village level.⁶ Clustering at the village level provides a relatively high amount of clusters (79), these clusters are big enough. It is important to cluster the standard errors, as the data might be subject to intraclass correlation, that is, students from the same villages are likely to be more similar on a wide variety of measures than students who do not live in the same village. The higher intraclass correlation, the less unique information each student provides. This has to be taken into account when running the regressions by inflating the standard errors.

It is often the case that there is some level of attrition (or dropping out) and/or new entry in the dataset. The double difference model presented in (1) can be estimated using an unbalanced panel, keeping in all observations, including the ones which we only observe in one time period. It can also be estimated using a balanced panel, dropping observations which we only observe in one period. Estimating (1) using an unbalanced panel increases the power, but as the sample becomes more heterogeneous the results might be distorted. As the number of new entries and drop-outs are very high (see section 4) all estimations will be done on the restricted panel.

Although a double difference analyses can solve some potential biases in the data, some bias may remain. A double difference analyses helps picking up the time-invariant heterogeneity, but bias can still remain due to time-variant unobservables. Yet, a positive significant effect in the double difference model is a strong indication of an influential intervention. An insignificant effect or even a significant negative effect, however, does not necessarily imply that the intervention does not work or does harm, as in our analysis we only measure short-term effects.

⁴ Additional covariates are included to control for various characteristics of the households. This not only helps with the precision of the estimates, but also reduces the problem of omitted variable bias. This is necessary to obtain unbiased measures of the treatment effects.

⁵ In recent literature, Puhani (2012) shows that in a nonlinear difference-in-difference, such as the one used in this study, the cross difference is not equal to the treatment effect. Instead the treatment effect comes from the cross derivative (or cross difference) of the conditional expectation of the observed outcome minus the cross derivative of the conditional expectation of the potential outcome without treatment. Although this calculation of the treatment effect is appealing, this study will follow common practice in the field and report the estimate of β_3 in the case of a LPM.

⁶ In educational science, common practice would have been to cluster at the class level instead of the village level. However, due to the low number of classes, clustering was done at the village level for this project.

5.2 Results

The impact analysis is based on a DD procedure. The main reason to do that is the high attrition rate (64%, see section 4.7). Furthermore, since in the endline a set of new questions are added to derive a school performance score, we report some basic cross-sectional analysis on the difference of the test scores between the treated and untreated students. Results of the teacher survey showed that only one trained teacher was still around and teaching the same class as two years ago in Arado school (urban). First, we compared results of this unique class with the comparison group 1 (pilot schools without trained teachers, urban area). In addition, results are based on the data treated as two repeated cross sections. We also report a DD panel analysis based on the children that were interviewed twice (179 students).

Table 9-10 present the results for the restricted sample (students who were interviewed twice, based on the baseline distribution) comparing the only class that is still taught by a trained teachers at the Arado school with students in pilot schools who were not taught by a trained teacher (comparison group 1) including controlling variables (parents read and write, books at home, study help at home, number of brother and sisters, number of animals in the household, sex, age, ethnicity, religion, and number of meals per day). Tables 11-12 provide an overview of the same analyses without controlling for any variables. The discussion of our results will focus on the results provided in Table 9-10. In the Appendix the results for the bigger restricted sample (including Hamitole) and full sample are presented (see Appendix Tables 2-5).

Overall, the analyses did not show any benefits in *school performance* (see test scores, Table 9) or a change to *student-centered teaching* (see classroom interaction indicators, Table 10) for students taught by one trained teacher compared to the students taught by untrained teachers. However, interestingly, students taught by a trained teacher indicated to be more motivated to attend school compared to the comparison group. To learn more about the *learning environment in the class room* we inspected the mean differences of teaching materials and methods at endline (see Table 13). These answers were given by the children! With respect to teaching materials, results showed that teachers never brought printed copies to class or used a computer. Books and blackboards were always used. With respect to teaching approach, we did not find significant differences (see Table 10) but interesting results on a more descriptive level. All most all students indicated that teaching was mainly dominated by the teacher who explained everything to the students, followed by the teacher asking students questions. Next, students indicated to do exercises alone as well as to discuss and work in small groups. The latter is an aspect of a more learner-centered teaching approach.

To conclude, in the selected sample we only found one anticipated impact with respect to increased motivation to attend school. No further positive impacts were found. However, it is important to keep in mind that the teacher turn-over rate was dramatically high (only one teacher was still around two years later) and

the teaching approach from self-contained classes changed to a system in which several teachers taught one class. These changes have greatly influenced the results and do not allow drawing strong conclusions.

6. Discussion

The discussion is structured in three main parts. We will first shortly address some methodological caveats before discussing whether the project reached its objective. We will next discuss the relevance of these results and finally discuss the efficiency of the project.

6.1. Methodological caveats

This project was very challenging to evaluate due to the changes in the project activities and especially because of the context in which the program was implemented. Three main aspects influenced the analyses, the high teacher turn-over in the selected schools, the changed teaching approach (from self-contained classes to several teacher teaching one class), and the high attrition rate of 64% driven by security reasons and a high number of students who moved away with their families. These reality constraints greatly influenced the interpretation of the current results.

Furthermore, all schools in this region were rather small so that we could often only sample one class in each school. We selected classes from the five pilot schools as we were expecting that between 2012 and 2014 more teachers within these schools should be trained or if teachers would leave they should be substitute by trained teachers. However, at the endline only one class was taught by a trained teacher (still the same

teacher as two years ago) in an urban area which we could compare with two comparison schools (with untrained teachers) in an urban area as well.

As this project was categorized as a Millennium Development Goal 2 project, our evaluation focused on children as the main beneficiaries. We selected first grade students and followed them for two years. As students just started their education, we could not assess learning performance at the baseline. Given these reality constraints our key outcome variable of school performance could only be measured at the endline. Other factors due to the selection of the sample may have also influenced the reported results at the endline. To indirectly rule out a selection bias, we assessed cognitive abilities with two abstract reasoning tests at baseline (and endline). We did not find any impacts at the endline. This is not that surprising because these abilities were not explicitly trained in the schools.

6.2 Did the project reach its objective?

The main aim of this project is to *improve quality of education* through teacher training in teaching-learning processes and educational management with ICT. The ultimate objective was to change the teaching approach from teacher-led to more student-centered teaching as well as to improve students' school performance.

The selected project site was one out of 15 sites that were selected for a nation-wide program. In Ayssaita the program was implemented by the College of Teachers Education. As described above (see for example section 2 and 3.3) the context in which this program was implemented was very challenging. High teacher turn-over rate impeded sustainable impacts of the program. In addition, the majority of the families are pastoralists who frequently move to other places. Students often have to walk long distances to school, move away, transfer to other schools, or even drop out of school. In addition to these important challenges, the present evaluation showed that not all intended outputs were achieved. For example, power cuts do not allow teachers and trainees at the teacher training college to use the computers on a regular basis. As the program is set up as a nation-wide program we did not receive clear documentation to check the precise numbers of teachers, managers, and trainees who received training in this project site. We requested this during our field visits. Thus, we cannot draw clear conclusions whether the outputs were achieved. Based on our analyses, with all methodological limitations in mind, we found only one positive impact, namely increased motivation to attend school. This effect might be driven by a motivated teacher who encourages students to attend school. Offering additional training in such a challenging context might be motivating for teachers to fight their daily struggles. Keeping the methodological caveats in mind, we cannot draw strong conclusions about the impacts.

One important aspect to keep in mind: this evaluation could not cover possible spill-over effects of the teacher training. It could be the case that trained teachers that moved to other areas may apply their new teaching knowledge in their new environment. By this other students might profit from the capacity building that these teachers have received.

6.3. How relevant are these results?

Education is one of the most important drivers for economic development (Hanushek, & Woessmann, 2007). This project aimed to improve the quality of education through teacher training. This project set up the infrastructure to have access to computers for teachers in five primary schools and in a center in town which was available for all teachers in the region. In addition, this project provided two types of training for teachers (teaching methods and school management). Especially the capacity building focus of teachers is important to further improve the quality of education. For example, data from low-income countries in 2012 showed that 19.5 % of the primary school teachers had not received a minimum of organized teacher training normally required to be qualified to teach at the primary level in the given country (World Bank, 2014). Other research showed that across six African countries general teacher education and teachers' mathematical and reading skills was very low (Pryor, Akyeampong, Westbrook, & Lussier, 2012). The results from a study in Kenya are even more drastic: grade 6 teachers achieved only 61 % correct answers of a mathematics tests from grade 6 (Ngware, Oketch, Mutisya, & Abuya, 2010). These results illustrate the sometimes low education level of teachers. Offering training to teachers can help to improve the educational level but also can help to improve their pedagogical skills. Teachers' factual and pedagogical knowledge clearly influences students' performance. For example, across 45 countries higher teaching quality in mathematics was related with lower rates of low achievement (Mullis, Martin, Foy, & Arora, 2012) and teacher's subject knowledge was related to students' achievement gains (Glewwe, Hanushek, Humpage, & Ravina, 2011). In addition, research illustrates the learning benefits of offering learner-centered over teacher-centered education (e.g., Smart, Witt, Scott, 2012; Weimer, 2002). For example, with regard to writing skills (Kahl & Venette, 2010) as well as problem-solving skills and making informed decisions (Brough, 2012), students perform better when a more learner-centered approach is used. Thus, improving the quality of education by offering teacher training and the opportunity to search for and develop new school materials with computers are two important steps to improve the future prospects of students in general.

6.4 How efficient was the project?

In order to determine the efficiency of a project one needs a benchmark project that is fully efficient and uses about the same inputs as the project under evaluation. One can compare the outputs of both projects in order to determine how efficient the assessed project is. Since such a benchmark is lacking the determination of efficiency is problematic. Therefore, we have decided to focus on the price per main activity calculated from the amount of specific activity funded by the project's budget and these are compared with prices per activity of similar projects found in the literature on primary education. To conclude, we can only offer a very rough discussion of the efficiency of the project. Furthermore, clear information from the project is missing as well.

A literature review provided only two relevant benchmarks for this project. With respect to the costs of the teacher training, we found two different benchmarks. First, training teachers in ICT costs approximately Int\$ 2,845.00 per teacher per year. On average 2 trainings were budgeted each year. These costs ranged between €3,500 -5,367.75 per training for 25-33 participants. These costs seem to be much lower but do not include continuous teaching and further support which might be crucial to achieve success. Second, a cross-country study from 2002 including Trinidad and Tobago, Ghana, Lesotho, and Malawi showed the costs of training teachers in each of these countries (Lewin, 2002; World Bank, 2005). The costs from a similar context such in Ethiopia ranged from Int\$ 1.500 to Int\$ 6.440. Please keep in mind that this data was collected in 2002. Unfortunately, we did not receive any information about the costs of the training in teaching learning processes.

Table 17: Benchmarks for costs

	Number (school or training)	Total people who should profited from	Project	Benchmark
ICT infrastructure	5 computer rooms +1 computer center in town	28 teachers, 6 principals, and 3 supervisors, 500 trainees at the TTC should have access to the computers ¹	€19,518	not available
Teacher training	25-33 participants per technical training on utilizing IT system for educational management (up to 6 days)	across Ethiopia: 289 participants ²	€3,500 -5,367.75 per training for 25-33 participants	Int\$ 2,845.00 per teacher/year
	Teaching learning processes	in Ayssaita 41 teachers participated ³	no information available	Int\$ 1.500-6.440

Notes. Benchmark for ICT systems for educational management are based on Unwin (2004) and Osín (1998) and for teaching learning training on Lewin (2002) and World Bank (2005).¹ This information as based on the program report from 2014. ²This number and the average workshop costs are calculated based on the program's budget across all 15 sites. ³We did not receive further information about how many teachers and trainees at the TTC have been trained. This number stems from the participant lists we received from Mark Hoekstra.

The project has a five year budget of around €61.518 (83% were funded by MFS II) which is split up in two activities, namely ICT infrastructure and the two types of training. 32% of the budget was spent on the ICT infrastructure and 68% of the budget on capacity building through training. Important to note is that the schools are run and financed by the government. Thus, this project offers access to computers and capacity building through training teachers. We were not able to calculate further efficiency calculations because we

lack information and the context has greatly influence the results of this evaluation with respect to the student outcomes (learning outcomes and teaching approach).

7. Conclusion

The project's main objective with respect to the Millennium Development Goal 2 was to (1) offer access to computers and (2) provide training in teaching learning methods and school management to primary school teachers. By improving teachers teaching skills the ultimate goal of this project was to improve quality of education by changing the teaching style to a learner-centered style and improving students' school performance. Important to note is that this evaluation focused on the teachers at the pilot schools and mainly their students. Another part of this MFS II evaluation focused on the teacher training college and evaluated the indicators of capacity building. This report provides more insights on the processes and impacts among teachers.

Overall, the project was greatly influence by the context in which it was implemented. High teacher turn-over rate, security issues, and an even higher migration of students' families made this evaluation even more difficult. Computers were set up and offered access for teachers and trainees at the teacher training college. However, the computers did not seem to work on a regular basis. Setting up the IT infrastructure is very challenging in such a dry environment in which power cannot be guaranteed. In addition, some teachers were trained but most of them move away after some time due to the harsh environment. Our very limited analyses found evidence for one positive impact, namely increased motivation to attend school of those students who were taught by a teacher who received teacher training. This evaluation did not show clear evidence for a change towards a learner-centered teaching style and improved school performance of students.

While we realize the impact evaluation caveats we faced with and the difficulties in rigorously evaluating this project, we cannot end this report by clearly evaluating the project in terms of all main evaluation questions (see Table 14). The project was implemented mainly among teachers (in the teacher training college and working in pilot schools) and the evaluation design mainly focused on the students as beneficiaries. The capacity building of the teacher training college was evaluated in a separate report! The project was well designed. However, it could not be implemented as designed. Computers did not function on a regular basis due to the remote and harsh environment. The teacher training college trained trainees and some teachers of the pilot schools received training. However, they usually do not stay longer then 1-2 years because of the remote and harsh environment. The project in the project site in Ayssaita (one partner out of 15 partners and 5 schools out of 75 schools) did not reach all its objectives with respect to the impacts for students. We only learned in January 2015 that the activities were greatly affected by a budget cut of 40% by DGIS. Based on the methodological caveats (i.e., the rigorousness of the evaluation), we gave a 3 for the extent to which the observed results can be attributed to the project intervention. This result is based on the evaluation design and the fact

that we could not do DID analyses for the main outcome of school performance, only had a rather small sample, and high attrition. The increased motivation of the students to attend school could be a positive impact that we have observed. However, it could also solely be driven by a highly dedicated teacher or a teacher who profited from the teacher training. To conclude, to improve the quality of education capacity building among teachers is crucial to improve teaching-learning processes and by this students' school performance (see also section 6.3).

Table 14: Overview evaluation of the project

On a scale of 1 to 10, with 1 being “not at all” and 10 being “completely”, for this project, how much do you agree with the following statements:	
The project was well designed.	8
The project was implemented as designed.	5
The project reached all its objectives.	3 ¹
The observed results are attributable to the project interventions.	3
The observed results are relevant to the project beneficiaries.	4 ²
The project was implemented efficient.	5 ³

Notes. ¹ The project was implemented and teachers were trained. However, the high teacher-turnover rate, security issues, and the fact that classes are not any more self-contained (several teachers are teaching one class) strongly influenced the results and, thus, the evaluation of the objectives. ²The main objective was to train teachers to improve the quality of education and in turn to improve students' school performance. Teachers were trained. However, the teacher-turn-over rate was dramatically high in this challenging context. Important to note, the evaluation mainly focused on the students. The majority of students were, thus, taught by quickly changing teachers and teachers who were not trained. A threat to the robustness of this evaluation! Thus, based on the result no conclusions for the effectiveness of the project for students can be drawn. The results did not show improved school performance but improved motivation to attend school.³ Important to note, due to missing information and a lack of benchmarks we could not do a proper efficiency calculation.
