SECTION 1.5: SCHOOL PERFORMANCE

Items SP01-07 assess environmental science, SP08-13 language of instruction, SP14-20 math, SP21-26 English

SP01	<p><i>Give the student the STUDENT SHEET and a pen.</i> Say: "I will ask you some questions about things you learn in school. This is NOT a test and it will NOT be graded. I will first ask some questions about environmental science. What happens if you do not wash your hands before eating?" Label the answer as correct when the child names at least one of the possible answers.</p>	<p>Any of the answers is correct: - <i>I become sick</i> - <i>I can get a disease</i> - <i>Any disease</i></p> <p>1 Correct 2 Incorrect/ does not know</p>		
SP02	<p>Say: "Name a food that comes from an animal."</p>	<p>Any of the answers is correct: <i>milk, cheese, yoghurt, meat</i></p> <p>1 Correct 2 Incorrect/ does not know</p>		
SP03	<p>Say: "Why are small children not allowed to play with a knife/blade?"</p>	<p>Any of the answers is correct: - <i>Because they can cut themselves</i> - <i>Because it is dangerous</i> - <i>Because they can hurt others</i> - <i>HIV transmission</i></p> <p>1 Correct 2 Incorrect/ does not know</p>		
SP04	<p>Say: "What is the use of the ears?"</p>	<p>Correct answer: <i>hear, listen</i></p> <p>1 Correct 2 Incorrect/ does not know</p>		
SP05	<p>Show to the first question on the student sheet and say: "Show me the roots."</p>		<p>1 Correct 2 Incorrect/ does not know</p>	
SP06	<p>Say: "What are the roots for?"</p>	<p>Any of the answers is correct: - <i>To get water/ nutrition</i> - <i>Not to fall over</i> - <i>Storing nutrition</i></p> <p>1 Correct 2 Incorrect/ does not know</p>		
SP07	<p>Say: "What kind of food does a lion like?"</p>	<p>Correct answer: <i>meat or any animal</i></p> <p>1 Correct 2 Incorrect/ does not know</p>		
SP08	<p>Say "I will ask you some questions about reading and writing. Please point to the letter I read." Show the 2. question on the student sheet.</p>	Correct	Incorrect/ does not know	
	R	1	2	
	Q	1	2	
	B	1	2	
SP09	<p>Say: "Please read each letter."</p>	Correct	Incorrect/ does not know	
	F	1	2	
	S	1	2	
	X	1	2	
SP10	<p>Say: "Please read each word."</p>	Correct	Incorrect/ does not know	
	House	1	2

SP15	<p>Say: "Please read the numbers here."</p>	Correct	Incorrect/ does not know
	23	1	2
	10	1	2
SP16	<p>Say: "On the paper you can see some math questions. Please fill in the correct answers." Read the question.</p> $\begin{array}{r} 3 \\ + 5 \\ \hline \end{array}$	Correct answer = 8 1 Correct 2 Incorrect/ does not know	
	<p>Read the question.</p> $\begin{array}{r} 8 \\ - 2 \\ \hline \end{array}$	Correct answer = 6 1 Correct 2 Incorrect/ does not know	
	<p>Read the question.</p> $2 \times 5 =$	Correct answer = 10 1 Correct 2 Incorrect/ does not know	
SP19	<p>Read the question.</p> $6 \div 3 =$	Correct answer = 2 1 Correct 2 Incorrect/ does not know	
SP20	<p>Say: "Abebech has two sons and four daughters. How many children does she have?"</p>	Correct answer = 6 1 Correct 2 Incorrect/ does not know	
SP21	<p>Say: "I will now ask some English questions. Where is the 'pen'!" (pen in English) Do not point to the pen nor show it to the child.</p>	Correct answer: Child points to or holds up a pen. 1 Correct 2 Incorrect/ does not know	
SP22	<p>Say: "Stand up!" (stand up in English)</p>	Correct answer: Child stands up 1 Correct 2 Incorrect/ does not know	
SP23	<p>Say: "Show me your 'ear'." (ear in English)</p>	Correct answer: Child points to his/ her ear. 1 Correct 2 Incorrect/ does not know	
SP24	<p>Point to your nose. Say: "Say this in English!"</p>	Correct answer: Child says "nose" 1 Correct 2 Incorrect/ does not know	
SP25	<p>Say: "Write down what it is." Point to the pen. If the child does not know the word in English, say "pen".</p>	Correct answer: Child writes "pen" 1 Correct 2 Incorrect/ does not know	
SP26	<p>Say: "Write down what it is." Point to your nose. If the child does not know the word in English, say "nose".</p>	Correct answer: Child writes "nose" 1 Correct 2 Incorrect/ does not know	

SECTION 2: COGNITIVE SKILLS & HEALTH

CSH01 Cognitive ability (recall)	<i>Say: "Listen carefully to me! I will read out a list of thing. After I read, please recall the things I mentioned?" The list includes the following things: House, Sun, Book, Arm, Fire, Animal, Stone, and Friend (Tick all correctly recalled and not recorded items)</i>		Items	Recalled	Not recalled
			House	1	2
			Sun	1	2
			Book	1	2
			Arm	1	2
			Fire	1	2
			Animal	1	2
			Stone	1	2
	Which statements fit best to you? Please choose one of the two alternatives: Read each item with both option (CSH03-CSH05_4) and let the child choose one option (1 or 2).				
CSH03 CSH04 Control beliefs	When you lose a game, is it:				
	1	because the other player is good at the game, or			
	2	because you don't play well.			
	When you learn something quickly, is it:				
	1	because you listened very good, or			
	2	because someone who is older explained it carefully.			
CSH04_1 Getting a good grade	When you get a good grade in class, is it.				
	1	because the test was very easy, or			
	2	because you know a lot.			
CSH06 Cognitive ability (remember order)	Make sure that you have five different objects students are familiar with. Arrange all five objects in this order from left to write (small stone – pencil – leave – blade of grass – pen) on a table or the ground in front of the child. And say: Look at the order of these things and try to remember it! Close your eyes. Put all objects together in front of the child and say: Open your eyes and try to put the objects back in the same order! Circle one for correct and 2 for incorrect arrangement.				
					
	1	1	1	1	1
	2	2	2	2	2

SECTION 5: MOTIVATION & FUTURE

Say: "We want to know what is important for you, some things are not important for children! Please answer what you think." All questions should be answered in the following two steps:						
First ask whether it applies "No" or "Yes"!			No		Yes	
Next ask, "how much"!			<i>Not at all</i>	<i>Not</i>	<i>A little bit</i>	<i>Very much</i>
MF05 MF06 Motivation	Do you like to go to school?		1	2	3	4
	Are you motivated to go to school?		1	2	3	4
MF07 MF08 Drop out	Have you ever thought about quitting school?		1	2	3	4
	Do you sometimes intend to stop going to school?		1	2	3	4

SECTION 6: CLASSROOM

C04 Classroom interaction and learning	How do you learn in class? Explain how the teacher is teaching. <i>DO NOT read all options aloud and tick boxes that apply.</i>		Yes	No
		The teacher explains everything to all students.	1	2
		The teacher asks questions to all students.		
		Students have to do exercises alone.	1	2
		Students discuss and work in small groups.	1	2
		Students discuss and work with their neighbor.	1	2
C05 Learning environment	What kind of learning materials do you have in class? <i>DO NOT read all options aloud and tick boxes that apply.</i>		Yes	No
		Books	1	2
		Prints/copies	1	2
		Computer	1	2
		Blackboard	1	2

Abstract

Children of the many language minorities often do not attend school, have a higher dropout rate, or face language difficulties. To improve access and quality of education for these language minority students, the organization SIL set up the multilingual education project in the Benishangul Gumuz region in West Ethiopia. The main objective of this project was to study the minority languages of Bertha, Gumuz, and Shinasha, to translate the school books into the minority languages, and to train teachers to be able to teach in these minority languages. This evaluation focused on the primary beneficiaries of the project, namely primary school children from the Bertha and Shinasha community. We compared three different groups of children: 1) language minority children from Bertha and Shinasha communities who are taught in their mother tongue, 2) language minority students who are taught in another dominant language (Amharic) and 3) Amharic children taught in Amharic. Children were interviewed in September 2012 in their first weeks of school in grade 1 and in May 2014 at the end of grade 2. Balance tests and double difference analyses are reported for the project outcomes. In sum, this project increased access to education for students from the Bertha and Shinasha community. With respect to indicators of quality of education which are important aspects of the Millennium Development Goal 2, Bertha but not Shinasha students following mother tongue education overall performed better on a learning test (driven by subtests in the environmental science, language of instruction, math, and English) compared to language minority students following education in Amharic. In addition, Bertha girls following mother tongue education showed higher levels of self-esteem and motivation to attend school and Bertha boys stronger learner empowerment compared to the control group. Keeping methodological challenges in mind, the partial efficiency calculations suggested that the project was cost efficient and effective.

1. Introduction

Ethiopia is a very diverse country; both ethnically and linguistically as more than 80 distinct languages are spoken (Paul, Simmons, & Jennings, 2013). Children of the many language minorities often do not attend school, have a higher dropout rate, or face language difficulties (e.g., Chávez, Belkin, Hornback, & Adams, 1991). To improve access and the quality of education for these language minority students, the government supports initiatives working in the field of mother tongue education (SIL, 2011). The paper set out to evaluate the multilingual education program in the Benishangul Gumuz region in West Ethiopia. This project was funded by Wycliffe and implemented by SIL (Summer Institute of Linguistics) Ethiopia. The main objectives of this project was to study the minority languages of Bertha, Gumuz, and Shinasha, to translate the school books into the minority languages, and to train teachers to be able to teach in these minority languages. This evaluation focused on the primary beneficiaries of the project, namely children. We compared three different groups of children: 1) language minority children from Bertha and Shinasha communities who are taught in their mother tongue, 2) language minority students who are taught in another dominant language (Amharic) and 3) Amharic children taught in Amharic in September 2012 in their first weeks of school in grade 1 and in May 2014 at the end of grade 2. Balance tests and Double Difference analyses are reported for the outcomes of this project. In sum, this project increased access to education and some indicators of quality of education, important aspects of the Millennium Development Goal 2. The report begins by presenting the local context in which the project has been implemented. This is followed by a description of the project, budget, result chain, and theory of change. Next the methodology and data collection are described. The analyses and results are further presented. The paper ends with a discussion of the results, efficiency calculations, and conclusions.

2. Context

In Ethiopia more than eighty languages are spoken. The majority of them are oral languages. The Ethiopian government policy supports the study of minority languages and development of mother tongue education. To date, more than twenty Ethiopian languages are taught in mother tongue programs starting from the first grade in public schools.

In the Benishangul Gumuz region several languages are spoken, the Nilo-Saharan languages of Bertha, Gumuz, Mao Tongo, Kwama, Gwama, and the Omotic languages Bambassi Mao, and Borna (Shinasha). These languages are oral minority languages and have seen limited development of school material in their own mother tongue. Five of the seven language communities in this cluster are predominantly Muslim while the other two are Christian or Animistic. Bertha are the biggest group in this regions with 183.259 people, followed by the second biggest group the Gumuz with 159.418 people and the third biggest group the Shinasha with

52.637 people. The Mao group has 43.535 and the Komo and Gwama 7.795 people (Population Census of Ethiopia, 2007). The location of the region with limited economic activities has furthermore prevented the region from strong development.

Several aspects illustrate the current situation of these language minorities. Education in this region is mainly provided in Amharic, one of the national languages of Ethiopia. There are 21.444 seven year-olds and 80% of these children speak little to no Amharic in this region (Population Census of Ethiopia, 2007). Teaching in primary school is most commonly self-contained (i.e., one teacher is teaching all subjects in one class from grade 1 to 4). The language of instruction in school used to be only in Amharic. This self-contained system is difficult for teachers and students who face language barriers and struggle to communicate with each other. In fact, students from minority languages in the Benishangul Gumuz region showed the lowest educational performance levels across Ethiopia (Third National Learning Assessment of Grade Eight Students' in Ethiopia). The vast majority of students do not proceed beyond grade five. The adult illiteracy rate is very high (> 70%) and only a few students enter higher education. This may also limit opportunities for social and economic development. Poverty is also one major cause of the problems in education. The majority of people in this region are living below the poverty line. Due to poor infrastructure and scarcity of schools, students often have to walk long distances to school. In a society where education traditionally is not very valued, long journeys to school may decrease children's time to be able to help their parents with household duties. All these factors such as poverty, long journeys to schools, ethnic conflicts, and social customs contribute to high school drop-out rates. As a result these language minorities seem to face the risk of cultural degradation and low self-esteem.

Almost twenty years ago, the regional government has made language development a priority and has requested the assistance of SIL. In 1996, the regional government officially requested that SIL Ethiopia would begin studying the languages of the region and produce learning materials for non-formal education. In 2004, this agreement was transitioned into a four-year project agreement between SIL and the Regional Educational Bureau (REB) for the development of a program for formal education in the Bertha, Gumuz, and Shinasha languages. This project was designed to further linguistic analysis and develop orthographies, educational primers, and dictionaries in the three languages. That 2004 agreement was renewed in February 2009 and expanded to include all the indigenous people groups of the region. Due to limited capacity and experience the REB decided to first focus on three languages (Bertha, Gumuz and Shinasha). These languages were selected because they are the most widely spoken languages. In 2013 the program has stopped for the development of the Gumuz language. Within the Gumuz community several dialects are spoken. Developing school materials and a teaching curriculum for one overall language/dialect was not possible. As the community could not find consent on this issue the development of this project arm was finished in 2013 (see also section 4.).

The aim of the project is to improve access and quality of education for children who speak Bertha, Shinasha, Mao, and Komo as their mother tongue in the Benishangul-Gumuz Regional State. The project set

out to study these minority languages, to develop school books for the minority languages, and to train teachers to be able to teach in these minority languages. First school materials have been developed for Bertha, Gumuz, and Shinasha. The languages Mao and Komo are currently still being studied. Thus, this evaluation focused on the languages Bertha and Shinasha. As this project aimed at contributing to the Millennium Development Goal 2, we focused on students as primary beneficiaries of this project.

3. Project description

3.1. Project duration and budget

The project started in 1996. At that time the regional government officially invited SIL Ethiopia to study the languages of the region and produce primers for non-formal education. In 2004 this agreement was transitioned into a four-year project agreement between SIL Ethiopia and the Regional Education Bureau to develop a program for formal education in the Bertha, Gumuz, and Shinasha languages. The program for Gumuz was officially terminated in 2013 when the community could not find consent to develop school materials for one overall language/dialect. The cooperation between SIL Ethiopia and Wycliffe Netherlands in this specific language development program started on 1-10-2009. The funding from Wycliffe so far will end in 2015.

The MFS II funding consists of a grant part and a self-share part by Wycliffe Netherlands. For the period 2011-2015 the distribution of MFS II grants and self-share funding is according to Table 1 below. Each year a new plan and project proposal were submitted and funds were granted for one year. The total amount of MFS II funding for the period 2011-2015 is € 206.389. In addition, SIL received € 151.247 from Wycliffe (self-share). Total project budget is € 357.636.

Table 1: Overview of the budget comparing contribution of MFS II and Wycliffe split up per year

Year	MFSII grant	Self-share Wycliffe Netherlands	Total per year
2011	€ 44.458	€ 62.114	€ 106.572
2012	€ 45.000	€ 25.000	€ 70.000
2013	€ 41.911	€ 22.987	€ 64.898
2014	€ 37.510	€ 20.573	€ 58.083
2015	€ 37.510	€ 20.573	€ 58.083
Total	€ 206.389	€ 151.247	€ 357.636

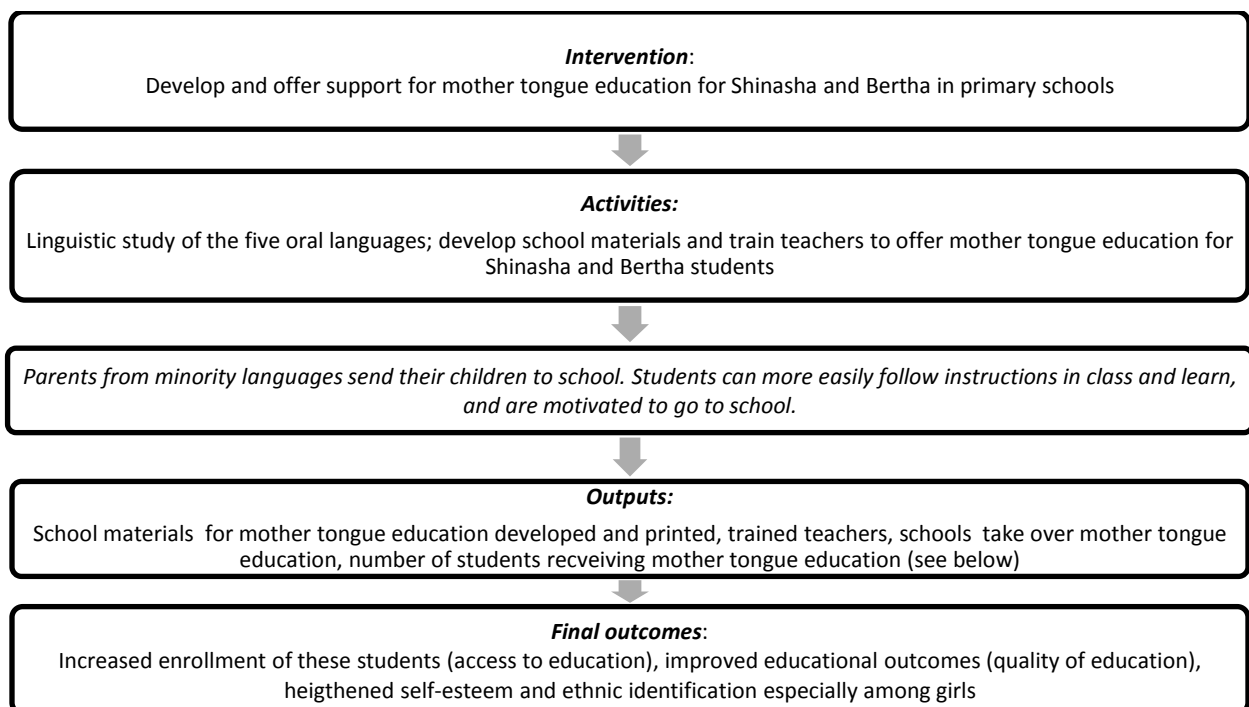

3.2. Project objective, activities, and theory of change

This project aims to improve access to and quality of education for over 15,000 children from minority languages in the region who start school each year. These language minority students do not speak Amharic as their mother tongue and so far often faced language difficulties in school where Amharic is the language of instruction. By offering mother tongue education in primary school the program aims to enable students to more easily follow the instructions in class, learn, and in turn show better school performance. This should prepare them to get access to higher education afterwards. Moreover, the program aims to especially support girls. Many of them are raised monolingual in their mother tongue (minority language) and those who live in rural communities typically have more household obligations than boys. As a result, their interactions with other languages are more limited. Thus, mother tongue education should help these girls to be able to understand instructions in class and to learn.

The minority languages in this region are oral languages. SIL extensively studies these languages, develops dictionaries, and develops school materials for mother tongue education. As two languages (Mao and Komo) were still being studied at the time of this evaluation we decided to only focus on the three minority languages (Bertha, Gumuz, and Shinasha) for which school materials had been developed. Only for the languages Bertha and Shinasha we could employ a treatment/comparison longitudinal design, as mentioned above the language Gumuz was not included in our longitudinal analyses.

The graphical theory of change illustrates the envisioned impact of the project (see Figure 1). Below specific aspects will be described in detail.

Figure 1: Graphical theory of change for the impact of the project

With MFS II funds, SIL developed and provides school materials in three minority languages (Bertha, Shinasha, Gumuz - which was later terminated; see section 4) to teachers and students and offers training and support for teachers. The project assists the Benishangul-Gumuz regional state in its efforts to deliver mother tongue education for three minority languages. The schools are managed by the regional state. This evaluation will focus on mother tongue education in Shinasha and Bertha.

The project **activities** include material development, distribution, and training. In addition, to general school books SIL developed cultural relevant materials for teachers and students for these minority languages. Furthermore, teachers are trained and supported to be able to teach in one of the minority languages. SIL coaches teachers and continuously tries to improve the teaching material in close collaboration with the teachers. Specific actions are described in the Multi-annual Work Plan 2011-2015.

The main **outputs** can be differentiated in three categories: school material development and number of copies of material, number of teacher training with respect to mother tongue education, and number of schools that have taken on mother tongue education as well as number of students who follow mother tongue education. Not all outputs were quantified because they depend on the development stage of the material; some of the outputs were not clearly specified for each language in the documents we received. The outputs below were quantified (see BGR indicator sets 2011-02-21):

School material development and copies of material:

- 44 subjects revised after 1 year testing
- 6000 prints of material for grade 4
- 2 training events on writing and development of material
- 40 participants trained on writing and development of material
- 2 languages for which bridging materials developed for grade 4
- 20 text stories are available in each language
- General dictionary for 2 languages developed:
 - 3000 copies printed in Bertha
 - 2000 copies printed in Shinasha
- School dictionary for 2 languages developed:
 - 2000 copies printed in Bertha
 - 2000 copies printed in Shinasha
- Entries in common dictionaries as drafts (total):
 - 7000 in Bertha (entries before project start: 1300)
 - 7000 in Shinasha (entries before project start: 1000)

Teacher training with respect to mother tongue education:

- 28 teachers that show improved performance by coaching in Bertha region
- 8 teachers had introduction into material per grade
- 47 teachers trained on development and use of supplementary material

Schools have taken on Mother Tongue education

- 200 schools have taken on Mother Tongue education
- around 15,000 students who follow mother tongue education

The ***theory of change*** states how specific activities should result in the envisioned outcomes. The community expressed a desire to have mother tongue education at schools. By offering mother tongue education and awareness-raising for this program the project aims to involve more minority language students in school (*increase enrolment*). Thus, offering mother tongue education should motivate more parents to send their children to school. By developing translated school materials, including cultural sensitive materials (specific stories) and training teachers to teach in minority languages the project sets out to improve the *quality of education* for the minority students. This improved education should lead to better performance of the students in primary school, and this in turn should offer them access to higher education afterwards and stimulate economic development of the region in the long-run as education is a driver of social and economic development. In general, especially girls should profit from mother tongue education because they are often monolingual. Being able to follow the teaching in their mother tongue should increase self-esteem among girls.

3.3 Changes in the project activities

There is one important change with respect to the project activities. As mentioned above, in 2013 the program has stopped the development of the Gumuz language. Within the Gumuz community several dialects are spoken. Developing school materials and a teaching curriculum for one overall language/dialect was not possible. As the community could not find consent on this issue the development of this project arm was finished in 2013. After consulting with SIL in Ethiopia we decided not to interview Gumuz children again. Thus, we did not include the Gumuz in our analyses.

4. Data collection

4.1 Data sources

This evaluation is based on two main sources of data, namely (1) gathered sources of data and information and (2) a survey that was conducted among children. First, prior to visiting the project site, information was gathered from Wycliffe and SIL Ethiopia. This information included project reports, previously conducted research

reports, project monitoring data, and financial data. The evaluation team talked once with a representative from Wycliffe in the Netherlands and met each year with representatives from SIL in Addis and Assosa (June 2012, May 2013, April 2014) to understand the project and its progress as well as to obtain relevant project documents. Second, we interviewed children to investigate the outcomes of the program among these beneficiaries. The survey and the results will be described below. Representatives of the evaluation team visited the field sites during the data collection in September 2012, May 2013, and May 2014. In addition, two master theses and one research internship report were conducted (partly still in progress) in the context of this evaluation.

4.2 Description of the surveys

Children were individually interviewed by native speakers. The endline questionnaires were translated to the local languages to make sure that students understood the questions (e.g., Benet-Martínez & Hong, 2014). The baseline interview lasted on average 30 minutes and the endline on average 60 minutes. The full questionnaire can be obtained on request. The questionnaire was divided into seven sections. The majority of questions in each section were asked at baseline and endline, a few questions were revised at the endline, and one section was added (section 1.5, school performance test). The first part assessed demographic information about students' age, gender, religion, ethnicity, and mother tongue. The next session, section 1.5, included a school performance test which was only asked at endline. As there is no standardized school performance test available for grade 2 across Ethiopia, we extensively developed one school test in collaboration with educational experts and field workers across Ethiopia. In this school test, students were asked seven questions about the subject environmental science, fourteen questions about the language of instruction, eleven mathematical questions, and six English questions. For each subject the questions increased in difficulty. One master thesis which is still in progress explains in detail how this measure was developed and carefully pre-tested (Geiger & Hansen, in preparation). The third section included questions about cognitive skills and health indicators. Section four included questions about students' identity. Students' school engagement and future aspirations were assessed in section five. Next, questions about the classroom interaction and learning were assessed, before students were asked questions about their socioeconomic background. The items of the presented results are provided in Table 10 in the Appendix.

In addition, we requested information about students' grades, absence (e.g., due to illness), and whether students had to repeat a grade. Unfortunately, the field officers were not able to obtain this information from the schools. Thus, we did not receive any information about students' absence or who had to repeat a class. The enumerators tried to get more detailed information about attrition; of each student who was not present in school during the interview period in May 2014. Unfortunately, the enumerators were only able to receive some general information of the reasons why some students were not present during this data

collection time. Thus, we could not include school attendance and grade repetition as outcome variables. We therefore included self-report measures for students' motivation and intention to drop out of school. Table 2 provides an overview of the assessed outcomes that were included in this evaluation.

Table 2. Overview of assessed outcomes

Main outcomes	Source	Specific outcomes	Assessed at
Access to education	School records	Number of enrolled students	Baseline & endline
Quality of education	Student survey	Cognitive ability (recall)	Baseline & endline
	Student survey	Cognitive ability (remember order)	Baseline & endline
	Student survey	Motivation to attend school	Baseline & endline
	Student survey	Intention to drop out	Baseline & endline
	Student survey	Control beliefs about students' performance	Baseline & endline
	Student survey	Self-esteem	Baseline & endline
	Student survey	Ethnic identification	Baseline & endline
	Student survey	Students help each other in class	Endline
	Student survey	School performance test (overall, environmental science, language of instruction, math, English)	Endline

4.3 Sampling design and sample sizes

The evaluation included three groups, one treatment and two comparison groups (see Table 12 in the Appendix). We sampled three groups of beneficiaries consisting of students from three different language minorities who are taught in their mother tongue namely, Bertha, Gumuz, and Shinasha. These groups were sampled from six out of twenty pilot schools in the region (treatment, mother tongue education). These six pilot schools were chosen because they fulfilled the study design requirements (see comparison groups below). Within these six schools two sections of grade 1 were randomly selected and all students sampled:

- 2 schools Millinnium and Zigi where Shinasha students are taught in Shinasha (note that there are only 2 schools where Shinasha students are taught in Shinasha);
- 2 schools Dibate and Gilgelbeles where Gumuz students are taught in Gumuz (note that there are only 2 schools where Gumuz students are taught in Gumuz);
- 2 schools Sherkole and Garabiche where Bertha students are taught in Bertha (note that there are 4 schools where Bertha students are taught in Bertha).

In each school we sampled the only 1st grade class. Only in one school Millennium there were two 1st grade classes/sections and we randomly picked only one section. An overview of the 20 pilot schools is presented in Table 11 in the Appendix.

The two selected comparison groups include (1) students from schools where minority language students (Bertha, Gumuz, and Shinasha) were taught in Amharic (comparison group 1) and (2) students from schools where Amharic students were taught in Amharic (comparison group 2). In particular, for comparison

group 1 we sampled all the schools (Millinium and Gilgelbles for Shinasha students; Walamba and Mangare for Gumuz students; Berogsh for Bertha students) and in each school we sampled the unique 1st grade class. Note that some of the schools include also a mother tongue track which is good to control for example for school effects on minority language students' performance. For comparison group 2 we sampled 2 schools out of 3 in the area where Amharic students were taught in Amharic (Gilgelbeles and Bambis). Each school had two 1st grade classes, but we randomly picked only one section per school. Table 3 provides an overview how many students were sampled from each school at baseline and endline.

Table 3. Overview of sample design and sample sizes

	Treatment group	Comparison group 1	Comparison group 2
	<i>Shinasha students taught in Shinasha (mother tongue; treatment group)</i>	<i>Shinasha students taught in Amharic (comparison group)</i>	<i>Amharic raised students taught in Amharic (comparison group)</i>

Endline total	109 students	53 students	62 students
Attrition	1.80%	27.40%	7.46%

4.4 Attrition to follow-up

In the baseline 657 children were interviewed. In the follow-up 455 children were interviewed, out of which 320 were also interviewed during the baseline. The overall attrition was very high, about 48.55% (1-320/657). However, Table 3 provides a more detailed and positive overview of the attrition based on the minority language and condition. The main reason for the high overall attrition is the “drop out” of 165 Gumuz students who were not interviewed again. We conducted additional analyses to check for systematic effects due to attrition. Two significant effects emerged but can be explained. Children in grade 0 who had mistakenly sampled at baseline were not included in the endline explain the significant difference in age and Gumuz who are mostly Orthodox were not included in the endline (see Table 9).

In the remaining groups of the study design attrition ranges between 0% and 27.40 %. During the data collection the enumerators faced several challenges: two schools had been closed for several days so that the enumerators walked from home to home to find some of the students, some students had transferred to other schools, migrated with their families, were ill, repeated a grade, or were mistakenly sampled as first graders at baseline while they attended grade 0.

4.5 Implication of power calculations

A potential concern of our evaluation is that we lack sample size to detect a real impact of one of the interventions in this project, resulting in a Type II error. Theoretically, a power analysis can assess whether this is a serious risk. However, it is not obvious how to perform power analyses for our analyses. Many simplifying assumptions need to be made in order to make the problem tractable. Moreover, we consider a broad range of outcome variables, and use different types of regression techniques. Our approach, therefore, will only be indicative and will provide some extremely rough estimates covering a range of contingencies. One of the main problems we are faced with is that we need to make an assumption of the effect size for the underlying population. Since there are virtually no quantitative studies available that can guide us in terms of expected effect sizes, we decided to follow Cohen’s definitions of small, medium and large effect sizes (Cohen, 1988, chap. 9), and calculate minimum required sample sizes for the effect size of 0.8. Based on this assumption we calculated the minimal detectable effect size for the main outcomes variables separately using the STATA program `powerreg`, which is specifically designed to do power calculations for multiple regression models. Results are given in Table 4 below.

Table 4: Minimal detected effect size

Outcome variable	Minimal detected effect size			
	<i>Shinasha boys</i>	<i>Shinasha girls</i>	<i>Bertha boys</i>	<i>Bertha girls</i>
Cognitive ability (recall)	.20	.08	.07	.09
Cognitive ability (remember order)	.31		.11	.11

Test math	.08	.10		.15
Test English	.12	.11		.10
Help other students	.21	.19	.23	.22

4.6 Other data problems

Questionnaires were translated to the local languages. Students in the treatment group were interviewed in their mother tongue. The enumerators were faced with language difficulties when interviewing students in the first comparison group, minority language students who are taught in Amharic. Ideally these students should have been asked the more personal questions in their mother tongue and the school performance test in Amharic. Students had great difficulties understanding the later questions. Thus, the enumerators translated most questions, if they were able, to the students' mother tongue. This point illustrates the challenges these minority students face when attending a school in which the language of instruction is not their mother tongue. However, this may have also influence our results. Minority students taught in Amharic may have now performed a bit better on the school test as the questions were sometimes translated for them.

4.7 Availability of financial data

As mentioned above (see section 3.1) the MFS II funding consists of a grant part and a self-share part by Wycliffe Netherlands. The total amount of MFS II funding for the period 2011-2015 was € 206.389. In addition, SIL received € 151.247 from Wycliffe (self-share). Total project budget was € 357.636. Furthermore, we received the costs of the main activities. A teacher training for trainees for two weeks cost approximately 140,000 ETB (€ 5,500). The development of the Gumuz grade 1 book cost approximately 200,000 ETB (€ 8000).

4.8 Descriptive analysis

We first checked the intended outputs of the program (see Table 5). The outputs can be distinguished into three main categories: material development as well as copies of school material, number of teachers that received training with respect to mother tongue education, and number of schools that took over mother tongue education. First, school materials were developed and copied for teachers and students. As can be seen in table 5 most goals were achieved (some minor differences). Efforts were invested in developing new school materials. The number of text books for grade 4 was much higher than intended. Second, the project also focused on teacher training to make teachers familiar with the school material and teach them how to use the additional school materials. In total, more than 198 teachers received an introduction into the school material (grade 1-4) in indicating that the goal of 150 was achieved. We did not receive any more detailed information about training in supplementary material. In addition, efforts were invested to coach teachers to improve their performance. During field visits we learned that more activities were invested to monitor and coach teachers. In each language motivated and talented teachers were supervising other teachers to further improve their factual and pedagogical skills with respect to mother tongue education in school. In total, 103 schools took over mother tongue education, as a subject or as a mother tongue track. The final goal had to be decreased because the development of the language Gumuz was not continued. Most importantly, 24,817 students received access to mother tongue education more than originally planned (around 15,000).

Table 5: Output and achievements

Output	Goal	Achieved
<i>School material development and copies of material:</i>		
• subjects revised after 1 year testing	44	44
• prints of school material for grade 4	6000	10,060 ¹
• training events on writing and development of material	2	5
• participants trained on writing and development of material	40	38
• languages for which bridging materials developed for grade 4	2	3
• text stories are available in each language	20	25 on average
• general dictionary for 2 languages developed:		
▪ copies printed in Bertha	3000	2000
▪ copies printed in Shinasha	2000	Online only so far
• school dictionary for 2 languages developed:		
▪ copies printed in Bertha	2000	2000
▪ copies printed in Shinasha	2000	2000
▪ copies printed in Gumuz	2000	2000
• Entries in common dictionaries as drafts (total):	7000	Not specified
▪ in Bertha (entries before project start: 1300)	7000	Not specified
▪ in Shinasha (entries before project start: 1000)		

Output	Goal	Achieved
<i>Schools have taken on Mother Tongue education</i>	200 ³	103 schools <i>Bertha:</i> <ul style="list-style-type: none"> • 27 mother tongue education • 45 as a subject <i>Shinasha:</i> <ul style="list-style-type: none"> • 5 mother tongue education • 26 as a subject
<i>Students receiving mother tongue education</i>	around 15,000	24,817
<p><i>Notes.</i> For outputs and goals we referred to BGR indicator sets 2011-02-21. Information about the achieved goals was provided by SIL.</p> <p>¹ Overview of printed text books in grade 4: in total 3,480 mother tongue school books in <i>Bertha</i> (language subject ST =2000; environmental science ST=700; maths ST=700; language TG = 20; environmental science TG= 20; maths TG= 20; eathetics =20); in total 2,980 mother tongue school books in <i>Shinasha</i> (language subject =2000; environmental science=450; maths =450; language subject TG =15; environmental science TG=15; maths TG=15; eathetics =15); in total 3,600 mother tongues school books in <i>Gumuz</i> (language subject =2500; environmental sience=560 ; maths =560; language subject TG =20; environmental science TG= 20; maths TG= 20; eathetics =20).</p> <p>² Overview of plans per year: 20 teachers in 2011, 20 teachers in 2012, 80 teachers in 2013, and 40 teachers in 2014.</p> <p>³ This number still included Gumuz communities. Thus, the final achieved goal was lower.</p>		

The survey conducted with the students included a range of information designed to control for differences in socio-economic characteristics and demographic structure across children and the households they lived in. We chose questions that children of this age can easily answer. Descriptive statistics and balancing tests based on the first assessment for the two comparison groups and treatment group for the Shinasha and Bertha group separately are provided in Table 5 and 6. Table 7 and 8 provide an overview of the descriptive statistics and balancing tests for the baseline and follow-up data focusing on the main outcomes.

The statistics from Table 5 and 6 suggest that the three groups of this evaluation (treatment and two comparison groups) differ in some aspects. With respect to the educational background, parents of Shinasha students who learn in their mother tongue (treatment) seem to be less likely to be able to read and write and help their children with their school work compared to parents of Amharic children (comparison 2) (see Table 5). Furthermore, the number of siblings differs between several groups (see Table 5 and 6). Furthermore, this data suggests that Shinasha students who learn in their mother tongue (treatment) eat less meals per day compared Amharic children (comparison 2; see Table 5). We included these variables next to more general demographics (age, gender, ethnicity, religion etc.) in the final analyses. Table 7 and 8 presents the summary statistics of the main outcome variables. Shinasha and Bertha students who attended schools with mother tongue education showed higher ethnic identification compared to their fellow students who attended schools that taught in Amharic at the baseline. This difference may be driven by a selection bias or by the fact that having access to mother tongue education may already increase students' identification with their ethnic group, being valued as a member of this group. We will discuss these more in depth in the following section. As

one specific objective was that girls might develop stronger self-esteem when following mother tongue education compared to learning in a second language, in this context Amharic, we split up these analyses for gender.

Notes: Column 2, 4 and 6 presents the mean of the control and treatment group respectively. Column 7 and 8 displays the coefficient from a separate OLS regression. In panel B no balancing tests are conducted as there are only endline data available. Standard errors are clustered at the village level. ¹ The scores were computed by an average of two items assessing the retrospective construction of a scale ranging from 1 for *very low* to 4 for *very high*. ² Students were asked to choose one out of two statements describing their personal control belief on how they can achieve specific goals such as a good grade in life. One statement represented a strong internal control belief that it depends on own efforts and the other represented a strong external belief that it depends on other pure luck. All answer representing internal control belief were summed up. In total, students received 2 of these questions. The reported score could vary from 0 for *no personal control belief* to 2 for a *strong personal control belief*. ³ Three items assessing self-esteem were averaged. ⁴ Results are representing the percentage of correct answers. Robust standard errors in parentheses. *** $p < .001$, ** $p < .05$, * $p < .1$.

5. Analyses and results

This section explains the analyses and presents the results of the impact evaluation. Section 5.1 describes the approach we have used, and points out some of the caveats we were faced with. The main results are presented in Section 5.2.

5.1 Methodology

The objective of this report is to describe changes in school engagement, self-esteem, ethnic identification, and learning outcomes that could be attributed to following mother tongue education. The challenge in any impact evaluation is to isolate the causal role of the intervention from other determinants of well-being (e.g., Armendariz & Murdoch, 2010). When comparing the situation of beneficiaries before and after an intervention, the observed changes in outcome variables cannot solely be attributed to the intervention, as there are many other changes in the environment of the respondents during the project period. Comparing beneficiaries with a control group of non-beneficiaries does not necessarily provide the solution. Beneficiaries could for instance have been wealthier or smarter than non-beneficiaries when the program started or *vice versa*. This and other factors can make some students more likely to be sent to a specific school, thus causing self-selection bias. Besides self-selection bias, program placement bias is also frequently observed in evaluation studies. NGOs target their projects purposely at specific, often disadvantaged, areas. If the control group's physical, economic and social environment does not match that of the beneficiaries, this will result in differences not caused by the intervention and thus in biased estimates of impact.

The standard approach to overcome these issues is to conduct a randomized controlled trial (RTC). Before the program starts two groups will be created at random. One group will receive the treatment (treatment group) while the other group will act as a benchmark (control group). Because of the randomization the members in the control group represent the members in the treatment group. After the treatment has taken place, both groups can be compared on the outcomes of interest. Differences in outcomes can now solely be attributed to the treatment. However, creating two groups at random, a necessary step for RTCs, is not always possible because of the program implementation or ethical reasons.

As we had no influence on the design of the multilingual education program, we use an alternative to RTCs: a so-called double difference (DD) model. In order to apply a DD model, one needs to have information about relevant indicators of the treatment group and the (two) control group(s) before (baseline) and after (end line) the intervention. While the RTC methodology ensures that the only difference between members in the treatment and control group is the treatment, the DD method only eliminates differences between members of the two groups that do not change over time. So the disadvantage of the DD method over the RTC method is that it does not automatically distinguish between the impact of time-varying characteristics be-

tween members of the three groups and the impact of the treatment. A (partial) solution to this problem is to include as many time varying characteristics into the DD model as possible so that only the influence of unobserved time-varying characters remains.

To test whether the treatment and one control group are comparable at baseline, a balancing test can be conducted. Although debated in the literature, a balancing test is generally used to determine if the observable controls are distributed similarly between the two groups in question.¹ If any significant difference exists between the two groups, a balancing test should pick up this difference and indicate that the current composition of the data could lead to a biased estimate of the treatment effect. The balancing test is conducted as a set of OLS regressions in which each control variable is individually regressed on a constant and the treatment dummy. The standard errors in the regressions are clustered at the village level to account for intraclass correlation. The coefficient of the treatment dummy now gives us an unbiased estimator of the difference between the control and treatment group at the time of the baseline survey.

Econometrically speaking the double difference estimator is given by the following expression:

$$Y_{ijt} = \alpha + \beta_1 Post_t + \beta_2 D_j^T + \beta_3 Post_t D_j^T + \gamma X_{ijt} + \varepsilon_{ijt} \quad (1)$$

Where Y_{ijt} denotes an outcome variable for respondent i in group j at time t , D_j^T is a dummy variable equal to one if the respondent belonged to the treatment group, $Post_t$ is a binary variable that takes the value one if the observation corresponds to the post-treatment time period, X_{ijt} is a set of controls², and ε_{ijt} denotes the error term. Then, β_3 in (1) is the treatment estimate of the intervention's impact on outcome Y . That is, β_3 measures the difference between the treatment and control group in the growth of outcome Y . It is an unbiased estimate of the average impact of being assigned to the treatment group on the dependent variable Y .

Some of the outcome variables considered in the analysis are binary. In these cases, a linear probability model (LPM) is estimated and the marginal effect of D_i^C for the impact of the project on outcome Y is reported.³ In all models the standard errors are clustered at the village level.⁴ Clustering at the village level provides a relatively high amount of clusters (56), big enough clusters. It is important to cluster the standard errors, as the data might be subject to intraclass correlation, that is, students who live in the same villages are likely to be

¹ For a summary of the literature and further discussion of balancing tests see Kleyman (2009).

² Additional covariates are included to control for various characteristics of the households. This not only helps with the precision of the estimates, but also reduces the problem of omitted variable bias. This is necessary to obtain unbiased measures of the treatment effects.

³ In recent literature, Puhani (2012) shows that in a nonlinear difference-in-difference, such as the one used in this study, the cross difference is not equal to the treatment effect. Instead the treatment effect comes from the cross derivative (or cross difference) of the conditional expectation of the observed outcome minus the cross derivative of the conditional expectation of the potential outcome without treatment. Although this calculation of the treatment effect is appealing, this study will follow common practice in the field and report the estimate of β_3 in the case of a LPM.

⁴ In educational science, common practice would have been to cluster at the class level instead of the village level. However, due to the low number of classes, clustering was done at the village level for this project.

more similar on a wide variety of measures than students who do not live in the same village. The higher intra-class correlation, the less unique information each student provides. This has to be taken into account when running the regressions by inflating the standard errors.

It is often the case that there is some level of attrition (or dropping out) and/or new entry in the dataset. The double difference model presented in (1) can be estimated using an unbalanced panel, keeping in all observations, including the ones which we only observe in one time period. It can also be estimated using a balanced panel, dropping observations which we only observe in one period. Estimating (1) using an unbalanced panel increases the power, but as the sample becomes more heterogeneous the results might be distorted. As the number of new entries and drop-outs are very high (see section 4) all estimations will be done on the restricted panel.

Although a DD analyses can solve some potential biases in the data, some bias may remain. A double difference analyses helps picking up the time-invariant heterogeneity, but bias can still remain due to time-variant unobservables. Yet, a positive significant effect in the DD model is a strong indication of an influential intervention. An insignificant effect or even a significant negative effect, however, does not necessarily imply that the intervention does not work or does harm, as in our analysis we only measure short-term effects.

5.2 Results

The impact analysis is based on a DD procedure. The main results are based on the data treated as two repeated cross sections. The main reason to do that is because the attrition rate differed per group (see section 4.3). In addition, we also report a DD panel analysis based on the children that were interviewed twice (320 children). Furthermore, since in the endline a set of new questions are added to derive a school performance score, we report some basic analysis on the difference of the test scores between the treated and untreated students. One specific objective of the program was that girls from language minorities, in this case Shinasha and Bertha, might develop a stronger self-esteem when following mother tongue education compared to girls who followed education in a second language, in this context Amharic. Thus, we added the same DD analyses as described above split up for gender. The results of the balancing tests (see Table 7 and 8) suggest that, when comparing students learning in their mother tongue (language minority: Shinasha and Bertha) with Amharic students, Amharic students score higher on several outcome variables. Thus, we conducted all analyses comparing the treatment group against both comparison groups together or separately. Based on the results we decided to only report the estimates for comparing the treatment with the comparison group of language minority students learning in Amharic (comparison group 1). The balancing tests also showed differences between language minority and Amharic students that could be solely attributed to cultural and ethnic differences. To conclude, we decided to compare students from the same language minority who are either

taught in their mother tongue or Amharic. We believe this provides the best test of the effectiveness of the intervention. We will first present the results for the Shinasha and next for the Bertha analyses.

5.2.1 Shinasha

Tables 9-10 display all analyses for the restricted sample of the Shinasha analyses first including controlling variables (parents read and write, books at home, study help at home, number of brother and sisters, number of animals in the household, sex, age, ethnicity, religion, and number of meals per day) and afterwards without controls. The restricted sample included 118 students who participated in the baseline and endline assessment. The analyses for the unrestricted sample can be found in the Appendix (Tables 1-2). The discussion of our results will focus on the results provided in Table 9 and 10.

The main objective of the program was to improve *school performance* among Shinasha students following the mother tongue track compared to Shinasha students following education in Amharic. In addition, we investigated students' *ethnic identification*, *self-esteem*, and one aspect of *learner empowerment* (whether students help each other in class).

Surprisingly, the results showed that Shinasha children who were taught in their mother tongue did not perform better on *school performance tests* compared to Shinasha children who were taught in Amharic. The results did not show any positive impacts. In contrast, children in the mother tongue track scored even lower on the subtest in Shinasha compared to children who were tested in their knowledge in Amharic who followed the Amharic track. This result seems to be a bit surprising at first sight. However, previous research that was conducted within the Shinasha community may help to understand these results (Küspert-Rakotondrainy, 2013). Shinasha, even though they have experienced displacement and assimilation attempts by other ethnic groups, managed to achieve and keep a strong position in society. Education is valued among the Shinasha and children are sent to school. Compared to many other minority groups several Shinashas attend higher education and hold important positions in society. However, in the last decennia Shinasha children often do not learn Shinasha at home and parents often speak other dominant languages at home. A recent comparative case study (Küspert-Rakotondrainy, 2013) compared Gumuz and Shinasha. Shinasha want to bring back and strengthen their traditional culture which has started to become less important for some people. As a result they want to use mother tongue education in school to teach their children their mother tongue. To date, however, many Shinasha students who start attending school cannot speak their mother tongue yet and struggle in school. The current results, especially with respect to mother tongue education in Shinasha, provide first evidence for this effect.

Furthermore, we did not find any impacts with respect to ethnic identification and one aspect of learner empowerment. However, Shinasha students taught in their mother tongue showed lower levels of self-esteem compared to Shinasha students taught in Amharic. Based on our reasoning above this might be ex-

plained by the fact that Shinasha students who start mother tongue education struggle to learn in Shinasha. Learning Shinasha might be for some children like learning a new language.

As we did not find any further systematic differences between girls and boys, we did not include the full analyses in this report. Results, however, can be obtained on request.

5.2.2 Bertha

Tables 11-12 display all analyses for the restricted sample of the Bertha first including controlling variables (parents read and write, books at home, study help at home, number of brother and sisters, number of animals in the household, sex, age, ethnicity, religion, and number of meals per day) and afterwards without. The restricted sample included 202 students who participated in the baseline and endline assessment. The analyses for the unrestricted sample can be found in the Appendix (Tables 3-4). The discussion of our results will focus on the results provided in Table 11 and 12.

Overall, the program did not increase students' *ethnic identification, self-esteem, and learner empowerment*.

However, the results showed that Bertha children who were taught in their mother tongue showed better *school performance* compared to Bertha children who were taught in Amharic. This effect was found in the overall test score as well as the single test scores of the different subjects such as environmental science, Bertha, math, and English. More precisely, Bertha students in the mother tongue track performed 16.4 % better on the overall school performance test than Bertha students following their education in Amharic (16.7 % in environmental science; 15.9 % in Bertha as language of instruction; 12.3 % in math; 17.9 % in English).

In addition, we conducted the same analyses separately for girls and boys (see Appendix Table 5-8). Besides the impacts in school performance, Bertha boys in the mother tongue track indicated to help their fellow students in school and hold stronger self-control beliefs to be able to achieve goals in life compared to Bertha boys who were taught in Amharic. Interestingly, girls in the mother tongue track showed an increase in self-esteem compared to girls who were taught in Amharic. A similar effect was found among girls but not boys with respect to self-reported motivation to attend school. More precisely, girls in the mother tongue track were more motivated over time to attend school in the mother tongue track compared to those girls who followed school in an Amharic track. In contrast to the boys, however, Bertha girls in the mother tongue track showed lower levels of self-control beliefs compared to the comparison group.

6. Discussion

The discussion is structured in three main parts. We will first shortly address some methodological caveats before discussing whether the project reached its objective. We will next discuss the relevance of these results and finally discuss the efficiency of the project.

6.1. Methodological caveats

This project was categorized as a Millennium Development Goal 2 project, our evaluation focused on children as the main beneficiaries. We have selected first grade students and followed them for two years. As students just started their education and in the comparison group were first confronted with Amharic we could not assess learning performance at the baseline. Given these reality constraints our key outcome variable of school performance could only be measured at the endline. Other factors due to the selection of the sample may have also influenced these results. To indirectly rule out a selection bias, we assessed cognitive abilities with two abstract reasoning tests at baseline (and endline). As the subsamples did not differ in both abstract reasoning tests at baseline, we assume that the subsamples did not systematically differ in students cognitive abilities which are also aspects of intelligence (Neisser et al., 1996).

6.2 Did the project reach its objective?

The main aim of this project is to *provide access to and improve quality of education* for language minority students of Shinasha and Bertha in rural areas of the Benishangul Gumuz region. The project was set up in close collaboration with the educational office and governmental schools that introduced mother tongue education. The project was well designed involving relevant local stakeholders to ensure sustainability of the program. The first main objective was achieved by offering mother tongue education in 103 schools to 9,210 Shinasha and 15,607 Bertha students. The second objective was to improve the quality of education. We interviewed children twice: first at the time when they started going to school in grade 1 and second two years later at the end of grade 2. We found different results for the Shinasha students and the Bertha students. We did not find any positive impact among Shinasha students. This might be explained by the fact that Shinasha want to bring their ethnic culture by sending their children to mother tongue education. In the last decennia Shinasha have put great value on education. Children went to school in which Amharic or Oromia were the languages of instructions. Today, several Shinasha entered higher education and now hold important positions in society. Thus, their mother tongue was spoken less frequently. Children who not enter primary school and are supposed to follow the instruction in Shisha struggle. Our results suggest that especially Bertha students who received mother tongue education showed better overall school performance on all subtests in environmental science, Bertha, math, and English compared to Bertha students who received their education in Amharic. Ber-

the girls who followed the mother tongue track also developed a higher self-esteem, an increased motivation to attend school but also lower levels of self-control (to be able to achieve goals in life) compared to Bertha girls in the Amharic track. Bertha boys who followed the mother tongue track more frequently indicated to help their fellow students (an aspect of learner empowerment) and hold stronger levels of self-control compared to the comparison group of Bertha boys following education in Amharic. In sum, the project provided impacts for Bertha students with respect to aspects of identity as well as learning outcomes.

6.3. How relevant are these results?

To date, many children around the world still do not have access to primary education, especially in African countries (World Bank, 2012). Education is one of the most important drivers for economic development (Hanushek & Woessmann, 2007). This project offered access to mother tongue education in the first cycle of primary school to so far disadvantaged children. In the Universal Declaration of Human Rights of 1948, the UNESCO advocates the use of mother tongue as language of instruction in primary schools (UNESCO, 1953). By offering mother tongue education to students and training teachers to teach in these minority languages the project aimed at improving the quality of education. In general, children who are taught in their mother tongue can more easily follow the class instructions compared to children who are taught in a second language. The latter often struggle with the instructions, experience frustration when they have difficulties in following the class and concentrating on the school content (Cummins, 2001). A common belief may be that children who have more exposure to a dominant language in society should show better performance and future success. However, previous linguistic and psychological research provides evidence for better school performance of language minority students who follow a mother tongue education program compared to students who follow a second language programs in primary school (e.g., Wright, Taylor, & Macarthur, 2000). More precisely, children who first learn in their mother tongue can then profit from their abilities and skills when they afterwards learn a second language (Wright, Taylor, & Macarthur, 2000). Students educated in their mother tongue language learn faster, at a higher level, and are more involved than students educated in a second language (Wright & Taylor, 1995; UNESCO, 2010). Moreover, minority language students who are taught in their mother tongue develop a stronger appreciation of their minority language and culture, in psychological terms a higher status. Furthermore, students from higher status groups in general perform better in school (e.g., Cummins, 2001).

Especially the capacity building focus of teachers is important to further improve the quality of education. For example, data from low-income countries in 2012 showed that 19.5 % of the primary school teachers had not received a minimum of organized teacher training normally required to be qualified to teach at the primary level in the given country (World Bank, 2014). Other research showed that across six African countries general teacher education and teachers' mathematical and reading skills was very low (Pryor, Akyeam-

pong, Westbrook, & Lussier, 2012). More dramatically are the results from a study in Kenya, grade 6 teachers achieved only 61 % correct answers of a mathematics tests from grade 6 (Ngware, Oketch, Mutisya, & Abuya, 2010). These results illustrate the sometimes low education level of teachers. Offering training to teachers can help to improve the educational level, increase their factual knowledge, and improve their pedagogical skills. The educational level, factual and pedagogical knowledge of teachers clearly influences students' performance. For example, across 45 countries higher teaching quality in mathematics was related to lower rates of low achievement (Mullis, Martin, Foy, & Arora, 2012) and teacher's subject knowledge was related to students' achievement gains (Glewwe, Hanushek, Humpage, & Ravina, 2011). Thus, offering access to mother tongue education and improving the quality of education through intensive teacher training are important steps to improve the future prospects of language minority students.

6.4 How efficient was the project?

In order to determine the efficiency of a project one needs a benchmark project that is fully efficient and uses about the same inputs as the project under evaluation. One can compare the outputs of both projects in order to determine how efficient the assessed project is. Since such a benchmark is lacking the determination of efficiency is problematic. Therefore, we have decided to focus on the price per main activity calculated from the amount of specific activity funded by the project's budget and these are compared with prices per activity of similar projects found in the literature on primary education. To conclude, we can only offer a very rough and partial discussion of the efficiency of the project.

As mentioned above (see section 3.1) the MFS II funding consists of a grant part and a self-share part by Wycliffe Netherlands. The total amount of MFS2 funding for the period 2011-2015 was € 206.389. In addition, SIL received € 151.247 from Wycliffe (self-share). Thus, the project has a five year budget of € 357.636 which is split up in activities that can be categorized in the development and copies of school materials and teacher training. The largest part of the budget was spent on the development and printing of school materials and a smaller part of the budget on teacher training. Important to note is that the schools are run and financed by the government. Thus, this project offers new teaching materials and capacity building to train teachers for the government.

A literature review provided benchmarks for the costs of mother tongue education in school per child (Patrinos & Velez, 2009, see Table 13) and the unit costs of a textbook (Vawda & Patrinos, 1999). We did not find a benchmark for the cost of developing school materials for a new oral language that had to be studied first. The amount that SIL spent on the development of one of the minority languages (€ 8,000) seems to be very low. This activity requires the expertise from different disciplines such as linguistics and pedagogics and includes extensive "content-work". More precisely, first the oral language has to extensively been studied be-

fore dictionaries can be developed and in turn cultural-sensitive school materials be designed. This work can last up to a few years.

With respect to the costs of the teacher training, a cross-country study from 2002 including Trinidad and Tobago, Ghana, Lesotho, and Malawi showed the costs of training teachers in each of these countries (Lewin, 2002; World Bank, 2005). The costs from a similar context such in Ethiopia ranged from Int\$ 1.500 to Int\$ 6.440. Please keep in mind that this data was collected in 2002 and trainings on average last between 2-7 days. SIL has spent on average 140,000 ETB (€ 5,500) for one teacher training for 30 participants which lasted for two weeks. This amount is in the range of the benchmark (which is already 13 years old). Thus, this comparison seems to suggest that the training was very cost efficient.

Table 13: Project information and benchmarks for costs of mother tongue education in school, development of school materials, and teacher training

	Number	Total people who profited from	Project	Benchmark
Mother tongue education in school	103 schools	24,817 students receiving mother tongue education (9,210 Shinasha; 15,607 Bertha)	/	Int\$ 100 per student per year to receive mother tongue education
Development of school material for one language	2 languages are taught (3 in development stage)	/	€ 8,000 ¹	Int\$ 13,62 unit costs of a text book, Int\$ 2,12 reprint costs ²
Teacher training		30 teachers per training, 198 teachers received training	€ 5,500 ²	Int\$ 1.500-6.440

Notes. Benchmark for mother tongue education is based on Patrinos & Veley (2009), benchmarks for the unit costs of multilingual text books is based on Vawda & Patrinos (1999) and for teacher training based on Lewin (2002) and World Bank (2005). ¹The original project costs for the development of school materials for Gumuz were approximately 200,000 ETB (€ 8,000). ² It is important to mention and be cautious about these unit costs. They greatly depend on the economy of scale; the larger the amount of books produced the smaller the unit costs. ³ The original project costs for one teacher training for 30 participants over two weeks were approximately 140,000 ETB (€ 5,500).

However, this efficiency has not been translated into effectiveness. The analysis presented above shows that with respect to the key objectives, 24,187 Shinasha and Bertha students have received access to mother tongue education. The analyses further showed that providing mother tongue education increased the quality of education for these students resulting in better school performance among Bertha students compared Bertha students who were taught in Amharic. It may be argued that these effects have been achieved by

the cost of € 14.41 per child of which € 8.32 were funded by MFSII. This is a very rough estimate as the budget also included the development of three other languages (Gumuz, Mao, and Komo). Keeping all methodological caveats in mind, this partial efficiency analysis suggests that the project has been cost efficient and effective.

7. Conclusion

The project's main objectives with respect to the Millennium Development Goal 2 was to (1) provide access to mother tongue education for language minority students (Shinasha and Bertha) in the Benishangul Gumuz region and (2) by this also improve the quality of education for these language minority students in the first cycle of primary education. School and learning materials were developed and teachers were trained to teach in the two minority languages.

The main findings are as follows:

1. *Increased access to education:* Since the beginning of the funding MFS II funding phase 103 schools have started offering mother tongue education. In total, 9,210 Shinasha and 15,607 Bertha students have received access to mother tongue education.
2. *Improved quality of education:* The quantitative analyses showed Bertha receiving mother tongue education showed better overall school performance than Bertha students who received education in Amharic (second language). Bertha girls showed developed higher levels of self-esteem and motivation to attend school but lower self-control; whereas Bertha boys showed stronger learner empowerment (i.e. more frequently helping other students) and more self-control compared to the comparison group. We did not find any positive impacts for Shinasha students. In contrast, they scored even lower in Shinsha and showed lower levels of self-esteem compared to a control group. This might be caused by the fact that many Shinsha families do not speak their mother tongue at home. As a result Shinasha students may struggle to follow the teaching in their mother tongue. Encouraging parents to speak their mother tongue at home might be a first step to help keeping the Shinsha language alive.

Overall, while we realize the impact evaluation caveats we were faced with and the difficulties in rigorously evaluating this project, we end this report by evaluating the project in terms of the main evaluation questions (see Table 14). Based on the project visits, project documents, and quantitative analysis we evaluate this program as very well designed. SIL has the unique and multidisciplinary expertise to conduct linguistic research, develop school materials, and train teachers in mother tongue education so that schools can take on mother tongue education. This program is conducted in close collaboration with the government and regional educational offices. The program was almost completely implemented as designed. School materials were already developed by SIL for Gumuz when the community started discussing about the relevance of the different dialects of Gumuz and could not find agreement. Furthermore, the first main goal of offering access to

mother tongue education was achieved (less schools as planned, but more students who receive mother tongue education). We found clear impact for Bertha students but not for Shinasha students. Based on the employed analyses and methodological caveats (i.e., the rigorousness of the evaluation), we gave a 7 for the extent to which the observed results can be attributed to the project intervention. This result is based on the fact that we could not do DID analyses for the main outcome of school performance, only had a rather small sample, and high attrition. The observed results are very relevant for the Bertha students (evaluated with a 10). With respect to the Shinasha students the results are not that clear; they seem to struggle when they have to follow the mother tongue education. Finally, our partial efficiency analysis suggests that the program was cost effective as well as efficient.

Table 14: Overview evaluation of the project

On a scale of 1 to 10, with 1 being “not at all” and 10 being “completely”, for this project, how much do you agree with the following statements:	
The project was well designed.	10
The project was implemented as designed.	9
The project reached all its objectives.	7 ¹
The observed results are attributable to the project interventions.	7
The observed results are relevant to the project beneficiaries.	8 ²
The project was implemented efficient.	10

Notes. ¹Outputs were achieved for two minority languages, namely Bertha and Shinasha. However, only Bertha students showed expected impacts.² A 10 for the results among Bertha students and a 6 among Shinasha students.

Notes: Logistic regression to check for if the attrition observed in the data was random.

Table 10: Overview of items of the presented results

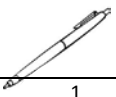

SECTION 1.5: SCHOOL PERFORMANCE

Items SP01-07 assess environmental science, SP08-13 language of instruction, SP14-20 math, SP21-26 English

SP01	<p>Give the student the STUDENT SHEET and a pen. Say: "I will ask you some questions about things you learn in school. This is NOT a test and it will NOT be graded. I will first ask some questions about environmental science. What happens if you do not wash your hands before eating?" Label the answer as correct when the child names at least one of the possible answers.</p>	<p>Any of the answers is correct: - I become sick - I can get a disease - Any disease</p> <p>1 Correct 2 Incorrect/ does not know</p>		
SP02	<p>Say: "Name a food that comes from an animal."</p>	<p>Any of the answers is correct: milk, cheese, yoghurt, meat</p> <p>1 Correct 2 Incorrect/ does not know</p>		
SP03	<p>Say: "Why are small children not allowed to play with a knife/blade?"</p>	<p>Any of the answers is correct: - Because they can cut themselves - Because it is dangerous - Because they can hurt others -HIV transmission</p> <p>1 Correct 2 Incorrect/ does not know</p>		
SP04	<p>Say: "What is the use of the ears?"</p>	<p>Correct answer: hear, listen</p> <p>1 Correct 2 Incorrect/ does not know</p>		
SP05	<p>Show to the first question on the student sheet and say: "Show me the roots."</p>		<p>1 Correct 2 Incorrect/ does not know</p>	
SP06	<p>Say: "What are the roots for?"</p>	<p>Any of the answers is correct: - To get water/ nutrition - Not to fall over - Storing nutrition</p> <p>1 Correct 2 Incorrect/ does not know</p>		
SP07	<p>Say: "What kind of food does a lion like?"</p>	<p>Correct answer: meat or any animal</p> <p>1 Correct 2 Incorrect/ does not know</p>		
SP08	<p>Say "I will ask you some questions about reading and writing. Please point to the letter I read." Show the 2. question on the student sheet.</p>	Correct	Incorrect/ does not know	
	R	1	2	
	Q	1	2	
	B	1	2	
SP09	<p>Say: "Please read each letter."</p>	Correct	Incorrect/ does not know	
	F	1	2	
	S	1	2	
	X	1	2	
SP10	<p>Say: "Please read each word."</p>	Correct	Incorrect/ does not know	
	House	1	2	
	Ox	1	2	
	Goat	1	2	
SP11	<p>Say: "Please write each word."</p>	Correct	Incorrect/ does not know	
	Dog	1	2	
	Ball	1	2	
	Earth	1	2	

SP12	<p>Say: "Write the name of the thing you see on the picture."</p> 	<p>1 Correct 2 Incorrect/ does not know</p>	
SP13	<p>Say: "I will say one sentence to you. Write it down! Abebe went to school."</p>	<p>Correct</p>	<p>Incorrect/ does not know</p>
	<p>Abebe</p>	<p>1</p>	<p>2</p>
	<p>went</p>	<p>1</p>	<p>2</p>
	<p>to</p>	<p>1</p>	<p>2</p>
SP14	<p>Say: "I will now ask some math questions. Please read the numbers here."</p>	<p>Correct</p>	<p>Incorrect/ does not know</p>
	<p>8</p>	<p>1</p>	<p>2</p>
	<p>2</p>	<p>1</p>	<p>2</p>
	<p>5</p>	<p>1</p>	<p>2</p>
SP15	<p>Say: "Please read the numbers here."</p>	<p>Correct</p>	<p>Incorrect/ does not know</p>
	<p>23</p>	<p>1</p>	<p>2</p>
	<p>10</p>	<p>1</p>	<p>2</p>
	<p>68</p>	<p>1</p>	<p>2</p>
SP16	<p>Say: "On the paper you can see some math questions. Please fill in the correct answers." Read the question.</p> $\begin{array}{r} 3 \\ + 5 \\ \hline \end{array}$	<p>Correct answer = 8 1 Correct 2 Incorrect/ does not know</p>	
SP17	<p>Read the question.</p> $\begin{array}{r} 8 \\ - 2 \\ \hline \end{array}$	<p>Correct answer = 6 1 Correct 2 Incorrect/ does not know</p>	
SP18	<p>Read the question.</p> <p>$2 \times 5 =$</p>	<p>Correct answer = 10 1 Correct 2 Incorrect/ does not know</p>	
SP19	<p>Read the question.</p> <p>$6 \div 3 =$</p>	<p>Correct answer = 2 1 Correct 2 Incorrect/ does not know</p>	
SP20	<p>Say: "Abebech has two sons and four daughters. How many children does she have?"</p>	<p>Correct answer = 6 1 Correct 2 Incorrect/ does not know</p>	
SP21	<p>Say: "I will now ask some English questions. Where is the 'pen'!" (pen in English) Do not point to the pen nor show it to the child.</p>	<p>Correct answer: Child points to or holds up a pen. 1 Correct 2 Incorrect/ does not know</p>	
SP22	<p>Say: "Stand up!" (stand up in English)</p>	<p>Correct answer: Child stands up 1 Correct 2 Incorrect/ does not know</p>	
SP23	<p>Say: "Show me your 'ear'." (ear in English)</p>	<p>Correct answer: Child points to his/ her ear. 1 Correct 2 Incorrect/ does not know</p>	
SP24	<p>Point to your nose. Say: "Say this in English!"</p>	<p>Correct answer: Child says "nose" 1 Correct 2 Incorrect/ does not know</p>	
SP25	<p>Say: "Write down what it is." Point to the pen. If the child does not know the word in English, say "pen".</p>	<p>Correct answer: Child writes "pen" 1 Correct 2 Incorrect/ does not know</p>	
SP26	<p>Say: "Write down what it is." Point to your nose. If the child does not know the word in English, say "nose".</p>	<p>Correct answer: Child writes "nose" 1 Correct 2 Incorrect/ does not know</p>	

SECTION 2: COGNITIVE SKILLS & HEALTH

CSH01 Cognitive ability (re-call)	<i>Say: "Listen carefully to me! I will read out a list of thing. After I read, please recall the things I mentioned?"</i> The list includes the following things: House, Sun, Book, Arm, Fire, Animal, Stone, and Friend (<i>Tick all correctly recalled and not recorded items</i>)		Items	Recalled	Not recalled
			House	1	2
			Sun	1	2
			Book	1	2
			Arm	1	2
			Fire	1	2
			Animal	1	2
			Stone	1	2
Friend	1	2			
Which statements fit best to you? Please choose one of the two alternatives: <i>Read each item with both option (CSH03-CSH05_4) and let the child choose one option (1 or 2).</i>					
CSH03 CSH04 Control beliefs	When you lose a game, is it:				
	1	because the other player is good at the game, or			
	2	because you don't play well.			
	When you learn something quickly, is it:				
	1	because you listened very good, or			
	2	because someone who is older explained it carefully.			
CSH04_1 Getting a good grade	When you get a good grade in class, is it.				
	1	because the test was very easy, or			
	2	because you know a lot.			
CSH06 Cognitive ability (re-member order)	<i>Make sure that you have five different objects students are familiar with. Arrange all five objects in this order from left to write (small stone – pencil – leave – blade of grass – pen) on a table or the ground in front of the child. And say: Look at the order of these things and try to remember it! Close your eyes. Put all objects together in front of the child and say: Open your eyes and try to put the objects back in the same order! Circle one for correct and 2 for incorrect arrangement.</i>				
					
	1	1	1	1	1
	2	2	2	2	2

SECTION 4: IDENTITY

		<i>Say: "We want to know what is important for you, some things are not important for children! Please answer what you think.":</i> <i>All questions should be answered in the following two steps:</i>			
<i>First ask whether it applies "No" or "Yes"!</i>		No		Yes	
<i>Next ask, "how much"!</i>		<i>Not at all</i>	<i>Not</i>	<i>A little bit</i>	<i>Very much</i>
I02	How important is it to you that you are [<i>name their ethnic group</i>]?	1	2	3	4
I03 Ethnic identification	How do you feel about being [<i>name their ethnic group</i>]?	1	2	3	4
I06 I07 I08 Self-esteem	Do you have good opinions about yourself?	1	2	3	4
	Are you respected by other children?	1	2	3	4
	Are you able to do most things as well as your friends?	1	2	3	4

SECTION 5: MOTIVATION & FUTURE

		<i>Say: "We want to know what is important for you, some things are not important for children! Please answer what you think.": All questions should be answered in the following two steps:</i>			
<i>First ask whether it applies "No" or "Yes"!</i>		No		Yes	
<i>Next ask, "how much"!</i>		<i>Not at all</i>	<i>Not</i>	<i>A little bit</i>	<i>Very much</i>
MF05 MF06 Motivation	Do you like to go to school?	1	2	3	4
	Are you motivated to go to school?	1	2	3	4
MF07 MF08 Drop out	Have you ever thought about quitting school?	1	2	3	4
	Do you sometimes intend to stop going to school?	1	2	3	4

Table 11: Overview of number of students and teachers in pilot schools that have implemented mother tongue education (stand July 2012)

No	Language	School Names	Grade 1		Grade 2		Grade 3		Grade 4		Teachers	
			M	F	M	F	M	F	M	F	M	F
1	Shinasha	Bullen Millennium School	70	54	66	54	40	41	56	50	7	1

Report CDI-15-030

Klaver, D.C., Jacobs, J., Tefera, W., Getaw, H., Dereje Getu D., February 2015, *ADAA end line report; MFS II country evaluations, Civil Society component*, Centre for Development Innovation, Wageningen UR (University & Research centre) and International Food Policy Research Institute (IFPRI). Report CDI-15-030. Wageningen.

This report describes the findings of the end line assessment of the African Development Aid Organisation (ADAA) that is a partner of Stichting Kinderpostzegels Nederland (SKN).

The evaluation was commissioned by NWO-WOTRO, the Netherlands Organisation for Scientific Research in the Netherlands and is part of the programmatic evaluation of the Co-Financing System - MFS II financed by the Dutch Government, whose overall aim is to strengthen civil society in the South as a building block for structural poverty reduction. Apart from assessing impact on MDGs, the evaluation also assesses the contribution of the Dutch Co-Funding Agencies to strengthen the capacities of their Southern Partners, as well as the contribution of these partners towards building a vibrant civil society arena.

This report assesses ADAA's contribution towards strengthening Civil Society in Ethiopia and it uses the CIVICUS analytical framework. It is a follow-up of a baseline study conducted in 2012. Key questions that are being answered comprise changes in the five CIVICUS dimensions to which ADAA contributed; the nature of its contribution; the relevance of the contribution made and an identification of factors that explain OSSA's role in civil society strengthening.

Keywords: Civil Society, CIVICUS, theory based evaluation, process-tracing

Acknowledgements

IFPRI and CDI are thanking the staff and the leaders of all Southern Partner Organisations that participated in collecting information for the evaluation of the contribution of these partner organisations to creating a vibrant civil society in Ethiopia. They also thank the Co-Funding Agencies and the Dutch Consortia they are a member of for making background documents available. We also hope that this evaluation will help you in better positioning yourself in the Civil Society Arena in your country.

1 Introduction

This report presents the civil society end line findings of ADAA in Ethiopia which is a partner of Stichting Kinderpostzegels Nederland (SKN) under the Child and Development Alliance. It is a follow-up to the baseline assessment that was carried out in 2012. According to the information provided during the baseline study ADAA is working on MDG 2: Education

These findings are part of the overall evaluation of the joint MFS II evaluations to account for results of MFS II-funded or –co-funded development interventions implemented by Dutch CFAs and/or their Southern Partner Organisations (SPO) and to contribute to the improvement of future development interventions. The civil society evaluation uses the CIVICUS framework and seeks to answer the following questions:

- What are the changes in civil society in the 2012-2014 period, with particular focus on the relevant MDGs & themes in the selected country?
- To what degree are the changes identified attributable to the development interventions of the Southern partners of the MFS II consortia (i.e. measuring effectiveness)?
- What is the relevance of these changes?
- What factors explain the findings drawn from the questions above?

The CIVICUS framework that comprises five dimensions (civic engagement, level of organization, practice of values, perception of impact and contexts influencing agency by civil society in general) has been used to orient the evaluation methodology.

Changes in the civil society arena of the SPO

In the 2012 – 2014 period the two most important changes that took place in the civil society arena of the SPO are related to civic engagement and perception of impact. With regards to the first dimension we observe a slight improvement in terms of community involvement through Community Conversation Groups (CCG) and reaching out to traditional and religious leaders. It is furthermore observed that civic engagement has been enhanced through the increase in school enrolment rates as well as attendance rates and a reduction in the number of dropouts.

With regards to perception of impact, we observe that ADAA efforts to create community structures in the form of community conversation groups enhanced community involvement and created a shared idea of responsibility for development and the wellbeing of children. ADAA's child labour free zone approach by forming Child labour free zone committees and Child Well-Being Advisory Committees (CWAC) ensures a common sense for action and brings important stakeholders together on different levels.

ADAA's collaboration with the public sector intensified in the past two years. In the first place they acknowledge ADAA's role in the construction of schools and ABE centres that help to realise their public policy 'Education for All'. In the second place they acknowledge that ADAA's work with communities is effective and increasing child enrolment and decreasing the number of school drop outs.

These findings were obtained through an analysis of documents, a workshop and follow-up interviews with ADAA, and interviews with external resources persons working in civil society organisations that receive support from ADAA; other civil society organisations with whom the SPO is collaborating; public or private sector agents and; external resource persons capable of overlooking the MDG or theme on which the SPO is concentrating.

Contribution analysis

Based upon an analysis of the projects and programmes financed by the Dutch CFAs a selection was made of SPOs to be included in an in-depth process tracing trajectory and those to be included for a quick contribution assessment. ADAA was not selected for in-depth process tracing and hence a quick assessment on contribution was done.

The first outcome that we looked at is the extent to which ADAA contributed to an increased school attendance of vulnerable children and a reduced number of children being burdened with household tasks. We conclude that, in particular the CCGs are estimated to explain 80 % of the outcome and, together with the CWACs and the presence of ABE centres provide the most plausible explanation of the outcomes. ADAA received both MFS II funding from SKN as well as funding from the National Lottery (NPL-Nationale Postcode Loterij) and SKN in the "Stop Kinderarbeid Campagne" (amount unknown).

For the outcome of women being economically empowered to buy educational material for their children, we conclude that both the local government and ADAA have significantly contributed.

For the second outcome of strengthening intermediate organisations the in-country evaluation team was not able to assess the performance of any of the CCGs, the CWACs, the Parent Teacher Associations, the Centre Management Committees, the Social Accountability Committees, the school clubs. Hence, no conclusions on their performance nor ADAA's role in strengthening them could be drawn.

Relevance

Interviews with staff of ADAA, with external resource persons, as well as contextual information helped to assess the relevance of ADAA's interventions in terms of; its Theory of Change (ToC) for Civil Society (SC) as designed during the baseline study; the context in which ADAA is operating; and the CS policies of SKN.

With regards to the 2012 ToC established with ADAA, we observed a shift from improving the school/ABE centre's performance through Parent Teacher Associations (PTA), youth clubs and Centre Management Committees (CMC) towards strengthening community based structures and networks in which in particular the PTA and the CMCs participate and that are capable of covering all households. Given the results in terms of increased school attendance including Children With Disabilities (CWD) and less school drop outs this reorientation seems to have been relevant, but on the other side no information is available that assesses the quality of education ensured at the ABE centres and the role of the CMC's in these, as well as that of PTAs in formal schools.

Against the background of children playing a prominent role in household, agricultural and livestock keeping tasks in the Siraro district, the interventions of ADAA are relevant, starting from constructing nearly all schools and ABE centres in the woreda, of which 3 new centres since 2012, that have the potential to become registered as formal schools to mobilising households and communities to the importance of sending children to school, to raise their awareness that disabilities are related to diseases and not to traditional believes. Apart from mobilising entire communities, the interventions of ADAA are also very relevant in terms of constantly engaging with local officials at kebele and woreda level. This helps to keep them informed and they have made meaningful contributions to ADAA's project.

Collaboration between the Ethiopian partners of the C&D Alliance has not yet materialised in terms of joint learning and efforts to jointly engage in a constructive dialogue with government officials for improved service delivery in the education sector although this is being promoted by the Alliance. All partner organisations of SKN supported with MFS II funds are however members of BEN –Based Education Network. It is via this network that Ethiopian partners of SKN engage in dialogue with the national government.

At SPO level and in particular ADAA, constructive dialogue is taking place. SKN is confident that ADAA has made structural improvements in the education system in Siraro Woreda and that these will persist after the project has closed. This is based upon previous projects in other locations where the former ABE centres continue to expand.

Explaining factors

The information related to factors that explain the above findings was collected at the same time as the data were gathered for the previous questions. The evaluation team looked at internal factors within the ADAA, the external context in which it operates and the relations between ADAA and Stichting Kinderpostzegels Nederland (SKN).

The evaluators observe considerable underspending for civil society/capacity building initiatives in 2012 and 2013 which might possibly indicate that with more support to the CCGs, the SHGs the PTAs,

the CWACs, these CBOs might increase their performance. They also observe that although records are well kept and outputs are being measured, no information is being collected at the level of outcome such as performance of the CBOs and effects of the SHGs at household level.

The most important external factors that may impact upon ADAA's performance are related to the construction and supply of the ABE centres, being mainly water scarcity, lack of labour in remote areas due to government regulation, and lack of text books. Though serious efforts have been made to entail a smooth transmission of the ABE schools to the Woreda education office, incentives on the side of the education office to safeguard donor funds could hamper the process.

The relations between SKN and ADAA seem constructive.

The following chapter briefly describes the political context, the civil society context and the relevant background with regards to the MDG/theme ADAA is working on. Chapter three provides background information on ADAA, the relation of its MFS II interventions with the CIVICUS framework and specific information on the contract with Stichting Kinderpostzegels Nederland (SKN). An evaluation methodology has been developed for the evaluation of the Civil Society component which can be found in appendix 2 of the country report; however, deviations from this methodology, the choices made with regards to the selection of the outcomes for contribution analysis, as well as difficulties encountered during data collection are to be found in chapter 4. The answers to each of the evaluation questions are being presented in chapter 5, followed by a discussion on the general project design in relation to CS development; an assessment of what elements of the project design may possibly work in other contexts or be implemented by other organisations in chapter 6. Conclusions are presented in chapter 7.

2 Context

This chapter describes the context in which ADAA operates. It focusses in particular on trends with regards to the political context, the civil society context and civil society issues in relation to the MDGs 2 that ADAA is working on.

2.1 Political context

The Ethiopian Government has enacted a five year Growth and Transformation Plan (GTP) to implement over the period of 2011-2015.¹ Two of the major objectives of the plan are to maintain at least an average real GDP growth rate of 11%, meet the Millennium Development goals, and expand and ensure the qualities of education and health services thereby achieving the MDGs in the social sectors (FDRE, 2010). The government acknowledged that NGO's and CSO have an important role to play in the implementation of this plan: According to the preamble of the new charities and societies proclamation NO. 621/2009 of Ethiopia, civil society's role is to help and facilitate in the overall development of the country². This is manifested in the government's approach of participatory development planning procedures. For example, NGOs established a taskforce under the umbrella of the CCRDA to take part in the formulation of the country's first Poverty Reduction Strategy paper formulation. They were a major stakeholder in the planning process of the five year GTP plan. Despite fears that the NO. 621/2009 proclamation was thought to have negative impacts on Civil Society, the number of newly registered charities and societies have increased considerably. 800 new charities and civil societies were registered between 2010/11 and 2011/12 and as of February 2012, these were implementing over 113.916 projects in different social, economic and governance related sectors. Governance related projects comprise interventions in the area of democracy and good governance, peace and security, human rights, justice, and capacity building. The charities and societies are most engaged in the health sector (19.8%), followed by child affairs (11.9%), education (9.2%), governance (8.3%) and other social issues (7.8%). These figures are more or less similar to the pre-proclamation period, and would imply that new charities or societies have replaced foreign and Ethiopian charities that are not allowed to work on sectors related to governance and human rights.³ This might indicate that there might have been some flexibility in the interpretation of some of the provisions of the proclamation.

2.2 Civil Society context

This section describes the civil society context in Ethiopia that is not SPO specific. The socioeconomic, socio-political, and sociocultural context can have marked consequences for civil society, perhaps more significantly at the lower levels of social development. The information used is in line with the information used by CIVICUS.⁴

2.2.1 Socio-economic context

Table 1

Ethiopia's rank on respectively the Human Development Index, World Bank Voice and Accountability Index and Failed State Index

Ranking Body	Rank	Ranking Scale (best – worst possible)
UN Human Development Index	173 (2013)	1 – 187
World Bank Voice & Accountability Indicators	12 (2012)	100 – 0
Failed State Index	19 (2013)	177 – 1

Sources: UNDP, World Bank Governance Indicators, and Fund for Peace

The Human Development Index (HDI) is a summary measure for assessing long-term progress in three basic dimensions of human development: a long and healthy life, access to knowledge and a decent standard of living.⁵ Ethiopia's HDI value for 2013 is 0.435— which is in the low human development category—positioning the country at 173 out of 187 countries and territories. Between 2000 and 2013, Ethiopia's HDI value increased from 0.284 to 0.435, an increase of 53.2 percent or an average annual increase of about 3.34 percent.

An alternative non-monetary measure of poverty and well-being is the Basic Capabilities Index (BSI). This index is based on key human capabilities that are indispensable for survival and human dignity.⁶ Ethiopia falls with a BCI of 58 in the critical BCI category, which means the country faces major obstacles to achieving well-being for the population. 10% of children born alive do not grow to be five years old, only 6 % of women are attended by skilled health personnel and only 33% of school age children are enrolled in education and attain five years of schooling.

Ethiopia scores relatively low on the Social and Economic Rights Fulfilment Index (SERF Index)⁷. In 2012 Ethiopia is only protecting 58.10% of all its social and economic rights feasible given its resources, and the situation has worsened between 2010 and 2012. Especially the right to food and the right to housing remain problematic.

The Transparency International's Global Corruption Barometer survey shows how 1,000 Ethiopian people assess corruption and bribery in their home country: A low score indicates that a country is perceived as highly corrupt, while a high score indicates that a country is perceived as very clean. Ethiopia has a Corruption Perception Index score of 3.3 out of 10 in 2014, which places the country on position 110 out of 174 countries.⁸ Survey participants were furthermore asked to rate their perceptions of corruption within major institutions in their home country on a scale of 1 to 5, 5 being most corrupt and 1 being least corrupt⁹. With a range of perceived corruption scores from around 2 (military, education and NGO's) to over 3 (private sector, public officials, and judiciary), most major institutions are perceived as corrupt.

Ethiopia's economic freedom score in 2014 is 50.0, making its economy the 151st freest out of 174 countries in the 2014 Index. Its 2014 score is 0.6 point higher than in 2013 due to improvements in five of the 10 economic freedoms, including business freedom, labour freedom, and fiscal freedom. Ethiopia is ranked 35th out of 46 countries in the Sub-Saharan Africa region, and its overall score continues to be below the regional average.¹⁰

⁵ A long and healthy life is measured by life expectancy. Access to knowledge is measured by: i) mean years of education among the adult population, which is the average number of years of education received in a life-time by people aged 25 years and older; and ii) expected years of schooling for children of school-entry age, which is the total number of years of schooling a child of school-entry age can expect to receive if prevailing patterns of age-specific enrolment rates stay the same throughout the child's life. Standard of living is measured by Gross National Income (GNI) per capita expressed in constant 2011 international dollars converted using purchasing power parity (PPP) rates.

2.2.2 Socio-political context

In February 2009, the Government adopted the NO. 621/2009 Proclamation which is Ethiopia's first comprehensive law governing the registration and regulation of NGOs. This law violates international standards relating to the freedom of association. Notably, the Proclamation restricts NGOs that receive more than 10% of their financing from foreign sources from engaging in essentially all human rights and advocacy activities.

The UN Special Rapporteur on the rights to freedom of peaceful assembly and of association, Mr. Maina Kiai, has commented that "The enforcement of these provisions has a devastating impact on individuals' ability to form and operate associations effectively, and has been the subject of serious alarms expressed by several United Nations treaty bodies." Mr. Kiai went on to recommend that "the Government revise the 2009 CSO law due to its lack of compliance with international norms and standards related to freedom of association, notably with respect to access to funding".¹¹ The Ethiopian Proclamation may effectively silence civil society in Ethiopia by starving NGOs of resources, and thus essentially extinguish their right to expression.¹²

In November 2011, the Ethiopian Charities and Societies Agency issued the Guideline on Determining the Administrative and Operational Costs of CSOs, which is applicable to all charities and societies (international and domestic). Retroactive to July 2011, when approved by the Agency without any consultation with organizations or donors, the "70/30" regulation limits administrative costs for all charities and societies to a maximum of 30% of their budgets.¹³

Freedom of assembly and association are guaranteed by the constitution but limited in practice. Organizers of large public meetings must request permission from the authorities 48 hours in advance. Applications by opposition groups are routinely denied. Peaceful demonstrations were held outside mosques in July 2012, but the security forces responded violently, detaining protestors, including several prominent Muslim leaders. A total of 29 Muslims were eventually charged with offences under the antiterrorism law. They were awaiting trial at year's end.¹⁴

Table 2

Ethiopia's rank on respectively the World Bank Rule of Law Index, Transparency International Perception of Corruption Index and Freedom House's Ratings of Freedom

Ranking Body	Rank	Ranking Scale (best – worst possible)
World Bank Rule of Law Index	31 (2012)	100 – 0
Transparency International perception of corruption index	111 (2013)	1 – 178
Freedom House: Freedom in the World	Status: Not Free Political Rights: 6 Civil Liberties: 6 (2014)	Free/Partly Free/Not Free 1 – 7 1 – 7

Sources: World Bank Governance Indicators, Transparency International and Freedom House

Freedom House evaluates the state of freedom in 195 countries annually. In 2014, Ethiopia scored a 6 on both the political rights and civil liberties ratings, indicating that the country is neither politically free nor performing on protecting civil rights.¹⁵ Its total aggregate scores from the Freedom House Index decreased with 15 points in the 2008-2012 period.¹⁶

The media are dominated by state-owned broadcasters and government-oriented newspapers. One of the few independent papers in the capital, Addis Neger, closed in 2009, claiming harassment by the authorities. Privately-owned papers tend to steer clear of political issues and have low circulations. A

¹¹ see UN Human Rights Council, Report of the Special Rapporteur on the rights to freedom of peaceful assembly and of association, Maina Kiai, April 24, 2013.

2008 media law criminalizes defamation and allows prosecutors to seize material before publication in the name of national security¹⁷.

Trade union rights are tightly restricted. All unions must be registered, and the government retains the authority to cancel registration. Two-thirds of union members belong to organizations affiliated with the Confederation of Ethiopian Trade Unions, which is under government influence. Independent unions face harassment. There has not been a legal strike since 1993.

Women are relatively well represented in Parliament, having won 152 seats in the lower house in the 2010 elections. Legislation protects women's rights, but they are routinely violated in practice. Enforcement of the law against rape and domestic abuse is patchy, with cases routinely stalling in the courts. Forced child labour is a significant problem, particularly in the agricultural sector. Same-sex sexual activity is prohibited by law and punishable with imprisonment.¹⁸

2.2.3 Socio-cultural context

The World Values Survey Wave 2005-2009 asked 1500 Ethiopians the question: "Generally speaking, would you say that most people can be trusted or that you need to be very careful in dealing with people?" Out of 1500 respondents, only 21,4 % stated that most people can be trusted. 66,2% indicated they needed to be very careful.¹⁹ Additionally, only 36,1% of the respondents mentioned 'tolerance and respect for other people' as a quality that needs to be encouraged to learn children at home.²⁰ 74% of the respondents think that churches are giving adequate answers to people's spiritual needs.²¹

2.3 Civil Society context issues with regards to the MDG

The activities in the education sector are since 2010/11 directed by the fourth Education Sector Development Program (ESDP IV), which is part of a twenty-year education sector indicative plan, within the framework of the Education and Training Policy (ETP). The ETP was adopted in 1994 as the country's new constitution became effective and among the important changes which came with it was that education administration was decentralized to the regional states (MOE 2010/2011). The Ministry of Education (MOE) has a coordinating role in the provision of education, and sets forward frameworks and policies while the regions are the main implementers and they control the financing of education.

Primary education is the highest priority for the government and receives the highest share from the total estimated expenditure of ESDP IV (MOE 2010/2011). The federal ministry funds regional governments which allocate funds to Regional Education Bureaus (REBs) which in turn allocate funds to Zonal Education Bureaus (ZEB). Regions have a great deal of discretion in allocating funding to education and in choosing priorities and strategies. In a separate funding stream, the regional councils directly allocate funding to the woreda administrations through block grants and these also have a large amount of discretion in how to allocate these grants. The majority of the woreda block grants, ranging from 33 % to 66 %, usually go to education, with most of the resources being spent on teachers' salaries. The non-salary budget per student is small.

In recent years, the Ethiopian educational authorities, like governments in several other developing countries have embraced Alternative Basic Education (ABE) programs in an attempt to achieve Education for All. The ABE program is a condensed version of the first cycle of formal primary school (grades 1-4) and is a variation of Non-formal education (NFE) with features similar to the 'community

¹⁷ Puddington, Arch (2013) <https://freedomhouse.org/report/freedom-world/2014/ethiopia-0>

¹⁸ Idem

¹⁹ <http://www.worldvaluessurvey.org/WVSONline.jsp>

²⁰ Idem

²¹ Idem

school' approach to education. In 2005/06 the Gross Enrolment Ratio in ABE was at least 5,5 % in Ethiopia and a steadily increasing share of the school age population is enrolled in the program.²²

In the last five years the number of primary school children has grown from 15,340,786 in 2007/08 to 16,989,784 in 2011/12 showing an 11.0% growth over the same period of time for both boys and girls (MOE 2012). Despite the remarkable growth, the education system is challenged by significant dropout rates and high number of out-of school children. Reaching out the most marginalized out-of-school children which includes children who are in the remotest parts of the country, children from pastoral communities, children who are in food insecure and conflict prone areas and those children who are in difficult circumstance (such as children with disabilities, trafficked children, street children, victims of child labor, etc.) is the most challenging aspect of expanding primary education opportunities. Out-of-school children are found all over Ethiopia. According to the MOE (EMIS:2010), there were 3,015,350 out of school children in Ethiopia making 17.8% of the total primary school age children in the country²³.

In an effort to reduce poverty and enhance decentralized public service delivery to the poor, the Government of Ethiopia, with the support of International Development Partners, embarked on a project known as the Protection of Basic Social Services in 2006. The PBS program piloted a social accountability initiative in 2006 that helped empower citizens to voice their needs and demands relating to basic public services. In the context of PBS, Social Accountability can be understood as the processes by which ordinary citizens, who are the users of public services, voice their needs, preferences and demands regarding public services; it also brings citizens into dialogue with local governments and service providers to contribute to improved quality public basic services through joint action plans. The Ethiopian Social Accountability Program 1 (ESAP 1) aimed to empower Ethiopia's poor so that they may voice their concerns and priorities over access to basic services – water, sanitation, health, education and agriculture. ESAP1 ended on June 30, 2009, and an independent evaluation was conducted as basis for a new phase. The evaluation revealed that use of appropriate social accountability mechanisms can work in Ethiopia and have beneficial outcomes for the actors involved as well as for the quality of basic services. As a component of PBS 2, the government launched the Ethiopia Social Accountability Program 2 (ESAP2) in February 2012. Working through civil society organizations, ESAP2 tries to bring local governments and service providers into dialogue with citizens and community organizations as an important step in working together in providing better quality public basic services.²⁴

3 ADAA and its contribution to civil society/policy changes

3.1 Background of the SPO

Established in 1998, African Development Aid Association (ADAA) is an indigenous non-profit making local non-governmental organization. The NGO has been registered with the Ministry of Justice and signed general agreements with the Federal Disaster Preparedness & Prevention Commission. It has also specific working agreements with the offices of government line departments and with Oromia Regional Government Finance and Economic Development Bureau. ADAA has also been re-registered in accordance with the requirements of the new CSO legislation of Ethiopia in the NGO typology of Resident Charitable Society.

Like other NGOs, ADAA has a General Assembly as the highest organ of governance, a board and secretariat lead by the Executive Director. It has its own offices in Addis Ababa & an area development office in Shashamene town 250 km south of Addis Ababa from where it coordinates different projects including the SKN assisted ABECs. ADAA is an organization that has been involved in expanding ABE and has a relatively long track record in this sector. It has the necessary organizational, staff and logistical arrangements for reaching out and supporting its field activities.

ADAA's project goal is to contribute to Education for All by 2015 and to improve the primary education enrolment statistics of the country, which is believed to lead to improvement of the living standards of the wider population.

Vision:

An empowered, healthy and prosperous African community where women and children rights are respected.

Mission:

Develop the capacities of communities to become self-reliant and to upgrade their living standards.

Strategies:

Integrated community development approaches, particularly improving:

- Quality, availability and accessibility of education and health services;
- Food Security and Environmental Conservation;
- Livelihoods & Local Market Development;
- Women Empowerment and Eradication of HTPs and,
- Capacity Building of Partners Organizations.

3.2 MFS II interventions related to Civil Society

The project proposal describes nine outputs that mostly can be associated with one of the CIVICUS dimensions:

Civic Engagement

The increase in number of children enrolled from the ten ABE centres, including more girls, (output 1); the efforts to prevent early forced marriages and female genital mutilation (output 3), and; the inclusion of children with disabilities into the school system (output 4) all contribute towards an increased participation of individuals to advance shared interests.

Level of Organisation

ADAA aims to network with like-minded NGOs in the education sector and it is also member of the C6NGOs consisting of ADAA, CDI, ERSHA, FC, OSRA and HUNDEE (output 9), which will help the

organisation to be better positioned in the civil society arena. Its efforts to establish 10 women self-help groups also contributes to more collaborative efforts in the civil society arena that ultimately help poor families to send their children to school (output 6). This creation of SHG also can be interpreted as being part of the 'perception of impact' dimension of CIVICUS. ADAA is also member of BEN – Basic Education Network (former BEAE).

Practice of Values

ADAA formulated an output in favour of more gender balance in its organisation, but no information has been documented that confirms a positive change (output 8).

Perception of impact

Two other outputs contribute towards impact in the education sector; the first relates to the involvement of district education office experts regularly following and supporting ABE centres (output 7) and the second engages community leaders to create child labour free zones in their respective kebeles.

4 Data collection and analytical approach

4.1 Adjustments made in the methodology of the evaluation

Originally ADAA was selected for in-depth process tracing but when CDI visited the Ethiopian team in July 2014 it became clear that due to time constraint to conduct process tracing for more than four SPOs, only a quick assessment of ADAA was feasible.

4.2 Difficulties encountered during data collection

The evaluation team encountered difficulties in compiling all information from the project documents as a means to obtain a complete overview of outcomes and outputs achieved in line with the logical framework. Whereas the project documents contain a lot of information, reporting is mainly done on output level and not at the level of objectives.

4.3 Identification of two outcome areas

This project was not selected for in-depth-process tracing. Nevertheless, based on the changes in the 2012-2014 period, two outcome areas were selected. During the evaluation workshop it became clear ADAA has a strong focus on the 'civic engagement' outcome area. A second outcome area could only be thought of after a long discussion, being 'strengthening intermediate organisations'. For the civic engagement dimension three outcomes were formulated being: school attendance of vulnerable children has increased; children are less burdened with household tasks; and women are economically empowered to buy educational material for their children. For the dimension of strengthening intermediate organisations the outcomes defined are: an increased awareness of the community about the importance of education and the negative effects of child labour and an increased awareness of students and the youth on Harmful Traditional Practices (HTP) and HIV/AIDS.

5 Results

5.1 Results obtained in relation to intervention logic

An inventory was made of progress being made by ADAA in comparison to its project documents. However the quality of the progress reports may have hampered the presentation of facts and figures.

The project comprises five specific objectives:

1. Planned: 2800 students in 10 ABE centres will have successfully complete 1st primary education and 85% of them join second primary education in year 2015: Until 2014, 3652 students were enrolled in the then ABE centres, of which 1523 girls. An unknown number of very poor children and disabled children has enrolled, and mothers have been organised into ten self-help groups as to be able to pay for school related costs. ABE centers follow the Non Formal Education curriculum which has been officially recognized by the National Government. Similar also the ABE centers are officially recognized by the Government and as such fall under the supervision of the WEO (Woreda Education Office). In these ABE centres education is ensured by teachers trained by SKN and ADAA.
2. Prevalence of FGM and EFM reduced by 25% in year 2015: no percentages are available but ADAA managed to prevent five early forced marriages and 14 Female Genital Mutilations. As a result of awareness raising activities and CCG activities of ASAA in almost all intervention 'kebeles' of the project, local traditional leaders formulated by-laws that prohibit FGM. These by-laws are reinforced by the traditional and religious leaders via social sanctions, like excluding the offenders from 'sharing fire'.
3. Teachers in 10 ABE centres have improved professional competence and teaching skills and a healthy and friendly school environment is created in 10 ABE centres: a number of courses have been administered, as well as meetings were conducted where experiences could be exchanged. The relations between the 10 ABE centres and nearby formal schools have grown stronger.
4. Two kebeles free from child labour: according to our understanding 10 community conversation groups (one per kebele); 10 child labour free zone committees (kebele offices and community elders); 10 child wellbeing advisory committees (CWACs) have been established but no mention has been made of kebeles where child labour is completely abandoned.

Important achievements were made on most of the project outputs, especially in terms of enrolment rates and training efforts.

In addition to the MFS II fund and supporting the fourth objective of creating child labour free zones, SKN obtained funding from the "Stop Kinderarbeid Campagne" (amount unknown).

5.2 Changes in civil society in the 2012-2014 period

5.2.1 Civic engagement

Civic engagement describes the formal and informal activities and participation undertaken by individuals to advance shared interests at different levels. Participation within civil society is multi-faceted and encompasses socially-based and politically-based forms of engagement.

Civic engagement slightly increased since the baseline study, mostly in terms of community involvement through community conversation groups and reaching out to traditional and religious leaders. Between 2011 and 2013 ADAA decided to involve community representatives next to people from the concerned government offices in participatory risk assessments (PRA) in order to address the

needs of the target groups in a more holistic matter²⁵. Other developments in the civic engagement area since the baseline include:

- Attendance rates have increased by the use of two volunteers per kebele who meet school teachers every day to assess attendance.²⁶ From the documents it cannot be retrieved whether these efforts really had an impact. In 2013, a total of 49 volunteers have been trained by ADAA on methods to create child labour free Kebeles, to conduct child inventory at community level and the usage of tools in mobilizing community to send children to school.
- ADAA received for the NFB project in Siraro MFS II funding for the period 2011-2015 with the objective to improve access to basic education by the establishment of ABE centers in 10 Kebeles. In 2011 a first number of 7 ABE Centers have been established, to be followed by the creation of an additional number of 3 ABE centers in 2012. Hence, in total 10 ABE centers have been established with MFSII Funds. According to the documents 3652 children, of which 1532 girls, are enrolled in the ABE programme at the end of 2013, which is 152 more than the 3500 planned. The majority of people interviewed confirm that enrolment rates have gone up and the number of drop-outs has been reduced.
- The inclusion of disabled children in the school system has been a focus point since the baseline. Between 2012 and 2014 seven children with different disabilities have been identified via house to house registration and enrolled in the ABE centres. Whereas a field monitoring report of 2012 states that not much has been done in supporting Children With Disabilities²⁷, the 2013 Alliance research report of Berke and Ero²⁸ states that an improved environment has been created in the ABE centres for disabled children.

5.2.2 Level of organization

This dimension assesses the organisational development, complexity and sophistication of civil society, by looking at the relationships among the actors within the civil society arena.

ADAA's engagement in civil society

ADAA did not engage in new networks since the baseline. Some new programmes with existing networks have been developed like a program with the Consortium of Reproductive Health Association (CORHA) on reproductive health for young students and a program on assistance for women self-help groups with the Sustainable Land Use Forum (SLUF)²⁹: Funding for the start-up capital provided for the SHGs came mainly from the SLUF.

The Child and Development Alliance stimulates that its partners learn from each other. However no evidence was found that such collaboration has intensified since the baseline and one explanation given for this is that partners in the Alliance see themselves as competing organisations.³⁰ A second explanation is that the geographic dispersion of the MFSII partners which make networking and collaboration more complicated.

ADAA is a member of the C6NGOs Consortium of 6 NGO's (ADAA, CDI, ERSHA, FC, OSRA, HUNDEE) which receives funding from ICCO for the implementing of the "Integration of information and communication technologies on agricultural value chain" project under the lead of FC. Networking in this consortium also not perceived as being sufficient to enable adequate horizontal sharing of experiences, best practices, resources and information on a common agenda of awareness raising activities and provision of services to children.³¹ ADAA is also member of the Basic Education Network BEN.

²⁹ Interview with program manager

³⁰ Interview with SKN

³¹ Executive staff and Program staff ADAA

Level of organisation at community level

ADAA is empowering community structures to defend the interest of disadvantaged groups. The community conversation groups for example consist of some 60 persons that for 7 months attend meetings every fortnight, including kebele officials. After these 7 months new people from the community are selected. Meanwhile members talk to their neighbours and consult with the volunteers. Influential and respected religious and traditional leaders who are being trained by ADAA are in charge of getting the message across in the community conversation groups with regards to education, abolishment of HTPs and child labour. Some indications exist that these CCGs are now claiming their rights vis-à-vis service providers or the government.

One public sector official however states that there is no civil society organisation that is capable to defend the interest of marginalized groups since this is a task of the government³². In light of the restricted political environment for L&A in Ethiopia, this could be interpreted as a political statement based on the dominant ideology of the government that only the state is able to take care of the well-being, interests and 'rights' of the population, including the marginalized.

5.2.3 Practice of Values

Practice of Values refers to the internal practice of values within the civil society arena. Important values that CIVICUS looks at, such as transparency, democratic decision making, taking into account diversity, are deemed crucial to gauge not only progressiveness but also the extent to which civil society's practices are coherent with their ideals.

No significant change was mentioned by the interviewees on practice of values: ADAA still reports all its activities and financial utilization to community representatives, government, traditional and religious leaders, CMCs and other stakeholders on a quarterly basis. Reporting to the general constituency and external auditing is done on an annual basis.

5.2.4 Perception of Impact

Perception of Impact assesses the perceived impact of civil society actors on politics and society as a whole as the consequences of collective action. In this, the perception of both civil society actors (internal) as actors outside civil society (outsiders) is taken into account. Specific sub dimensions for this evaluation are the extent to which ADAA has contributed to engage more people in social or political activities, has contributed to strengthening CSOs and their networks, has influenced public and private sector policies.

Between 2011 and 2013 a total of 10 new community conversation groups (CCGs) were established with 50-60 members consisting of community leaders, religious leaders (Aba Gedas), previous circumcisers, and other persons from concerned governmental bodies. These members stay in one group for 7 months and then they are replaced by other members of the community to increase the number of people reached. A facilitator for change has been assigned by ADAA to facilitate the groups. The community conversation groups are used as an entry point to mobilize and encourage the community to engage in different developmental activities (i.e. house registration) and make them aware of the need for minimizing child labour, reducing child drop out, preventing early marriage, and fight against HTPs. To make the conversation more natural, attractive and adapted to the local context, ADAA provides coffee for the participants (in the form of coffee ceremonies). During the baseline ADAA expressed the ambition to reach a 100% eradication of HTPs via the CCGs by 2014. From the documents it cannot be concluded whether this goal has been reached, though it is stated that the CCGs reached consensus to take social action and that Education Cluster office representatives and local authorities assisted in implementing the sanctions.

Next to the 10 Community Conversation Groups, ADAA also created 10 child labour free zone committees and 10 Child Well-Being Advisory Committees (CWAC). The Child Labor Free Zone Committees (CLFZC) consist of kebele officials and community elders and they are formed to ensure

³² Interview with program manager

the sustainability of the ABE centres³³. The CWACs consist of the kebele's chairman, health extension workers, development agents, school directors, religious leaders, representatives of women associations. This committee is structured to function from the smallest governance system i.e "team" to the whole kebele administrative systems. Identification of out of school children, prevent student dropout, return drop out students, and encourage girl's education are among the major duties of this committee³⁴.

Between 2011 and 2013, one SHG per kebele consisting of destitute mothers (hence 10 in total) has been established and 1000 birr has been provided for each SHG. Each SHG received basic training on business planning, savings and on how to run and scale up their business. The mothers have a weekly meeting and saving timetable. During their weekly meeting, they discuss both business and their family life. The women of one self-help group interviewed said they were proud they could now buy their children school facilities: they have become model women in their community and they are encouraging other women to also form or join a SHG.

In the interviews it is furthermore mentioned that awareness on child labour has increased due to the organisation of community conversation groups, the existence of model households, different committees (Parent Teacher Associations (PTA), Centre Management Committees (CMC), CWAC), and the idirs. The in- and out of school clubs are trying to increase the youths' awareness on HTP and HIV/AIDS. Their performance is however questioned since the children in these clubs are of young age and the number of students they reach is small.³⁵ However some children have started to influence their parents.³⁶³⁷

In 2011, the action plan formulated a recommendation to establish relationships with the private sector. The results-feedback sheet in 2013 states these efforts have been limited due to the absence of development oriented private sector in the area. The executive leader confirms in the interview that no changes have occurred since the baseline. According to the field staff some efforts have been made in linking farmer cooperatives to financiers.

Collaboration with the public sector intensified in the past two years. They are attending meetings and workshops convened by ADAA and receive quarterly reports on school attendance of Children. In the first place they acknowledge ADAA's role in the construction of schools and ABE centres that help to realise their public policy 'Education for All'. In the second place they acknowledge that ADAA's work with communities is effective and increasing child enrolment and decreasing the number of school drop outs. One official stated: "ADAA influenced our office and its work on its strategy for reducing dropouts and retention of children. The organization engages community members to go house to house and bring back drop outs by enhancing community awareness on the value of education. We had tried and failed before. Now we have learned. For example in Shirkeno Keta Primary school out of 394 children last year half of them dropped out. This year with lesson from ADAA there are only few children who dropped out. Dropping out has reduced by 50%. In this respect; we want to follow ADAA's footprints", Dalu Tuye, Planning and program expert of Siraro WEO.³⁸ During the endline assessment the same Woreda Education Office states that they have started to copy ADAA's community approach.

According to SKN, ADAA, in its relations with local government officials, also has found appropriate strategies to engage them for improved service delivery by emphasizing that children have rights that need to be respected³⁹.

³⁹ Interview with SKN

5.2.5 Civil Society Environment

The social, political and economic environment in which civil society operates affects its room for manoeuvre. The civil society context has been described in chapter 3. In this section we describe how ADAA is coping with that context.

Although both the government and ADAA want to achieve the national government's goal of 'education for all' some concerns need to be addressed in order to sustain the changes when the project closes in 2015.

- In the first place all ABE centres are to be formally registered before they enter into the national education system. ADAA has been working on this since the first schools were constructed. Experiences though from other SKN partners learn that occasionally local governments, in search for a continuation of the project, do not proceed to the formalization of the ABE centres.
- In the second place, the formal school system only employs teachers which graduated from Teacher Training Colleges. ADAA's ABE centres are run by facilitators trained by the NGO and which have been elected by local communities. These facilitators have received special courses in child-centered education during the project and ADAA is offering these facilitators to obtain their official diploma through officially recognized summer schools. Since 2013, newly employed facilitators all are teachers that graduated from TTC. Moreover, as of 2013 the already employed facilitators that have no teachers certificate follow summer courses at the TTC with the support of the WEO, with the perspective of acquiring the teachers certificate after having followed 3 summer courses.

For the past 5 years ADAA has been able to engage in a constructive dialogue with the local government which also has helped the NGO to address these sustainability issues.

5.3 To what degree are the changes identified attributable to the development interventions of the Southern partners of the MFS II consortia (i.e. measuring effectiveness)?

5.3.1 Civic engagement

Three outcomes were identified to assess the extent to which ADAA has contributed to the CIVICUS dimension 'civic engagement'; increased school attendance of vulnerable children; children are less burdened with household tasks, and; women are economically empowered to buy educational material for their children. These three outcomes are interrelated and hence will be dealt with together in terms of attribution.

Increased school attendance and decreased school dropouts

The five most important reasons for children not attending school are the following:

- There are no schools or ABE centres;
- Children are spending their time on household chores, work on farmland or keep an eye on the herd⁴⁰;
- Families are not well settled and migrate to other places in search of drinking water or grazing grounds for their cattle;
- Children With Disabilities do not have access to schools or ABE centres;
- Families cannot afford to pay for school materials and contributions needed to send their children to school.

The following table shows how school attendance has increased in the ten ABE centres supported by ADAA in the 2012 – 2014 period.

⁴⁰ At the start of the project in January 2011 almost all children that were enrolled in 2012 were out-of-school working children (additional note made by CFA)

Table 4*Student enrolment and school dropouts between 2012 and 2014; ten ABE centres supported by ADAA*

Years	Total Enrolment	Female enrolment	Dropout
2012	3132		441
2013	3522		190
2014	3652	1523	150
0-level in 2014	542	249	

Sources: Records provided by ADAA

Though there is some indication that attendance rates have gone up since the baseline study⁴¹, a local advisor of SKN observed that when on field visit in early 2013 that in the ABE centres visited, a significant number of school age and pre-school age children were in the compound, but not attending classes.⁴² This might possibly indicate that teachers were absent⁴³.

A total of 2414 (1096 girls & 1319 boys) children were identified out of school of which 12 were CWD during house-to-house visits in one month between 2012 and 2013. 2141 of these children (986 girls) and four CWD enrolled in three ABE centres. A total of 350 children with disabilities or from destitute families received support for different education materials.⁴⁴ We observe here that these figures do not match with the increase presented in table 4.

In trying to increase attendance rates, ADAA uses multiple interventions.

- Community conversation groups (one in each kebele, with 50-60 members⁴⁵) and influential leaders are used to raise the awareness of parents and officials about the importance of sending children to schools and about HTP. Members join these groups for 7 months and then they are replaced by other members of the community to increase the number of people reached. Among the members are influential (religious and traditional) leaders, (ABE) Centre Management Committees and local officials. Facilitators of change trained by ADAA together with the influential community leaders organise the CCGs. In total 7697 persons participated in these CCGs in the 2012 – 2014 period.
- Each Kebele has two ADAA trained facilitators of change. Apart from facilitating the CCGs they support teachers in teaching methods and record keeping. Their selection among other things is based on their residence in the kebele and upon approval of the local leader(s).
- Two ADAA-trained volunteers per kebele check attendance rates by going to the ABE centres and meet with the teachers on a daily basis.⁴⁶ The volunteers furthermore enhance community participation by conducting house-to-house visits.
- A thorough needs assessment is conducted before choosing a location for a new ABE centre to ensure easy accessibility.⁴⁷
- ADAA also created 10 Child Well-Being Advisory Committees (CWAC) at kebele level and one at woreda level. Woreda and kebele representatives of local government, including those of women associations meet periodically to address issues of school drop-outs, school attendance rates as well as searching for solutions. At sub kebele level (cluster or zonal) another committee that represents 30-40 households and a more decentralised structure that regroups 5 households are in charge of closely monitoring and supporting households to send their children to school⁴⁸. These entities conduct house-to-house visits to address school attendance.

⁴¹ Interviews conducted with the executive leader, field staff, and SPO staff. Records provided by ADAA also point to a decrease in the number of dropouts: 441 in 2012, 190 in 2013, and 150 in 2014.

⁴² Observed by local advisor of Stichting Kinderpostzegels, during a field visit observation beginning 2013

⁴³ Interpretation by evaluation team

⁴⁴ SKN: Powerpoint presentation on the accomplishments of a one year project on Child Labour Free Zone Project implemented by ADAA

⁴⁵ In each kebele there are three zones, in each zone there are 13-15 Geres/Got (organisation of five community members in one group), and each Got has many Shenes (one to five household cell formations). The CCs are held at Gere level and hence there are 50-60 people participating in the CC.

⁴⁶ In 2013, 49 volunteers were trained by ADAA.

⁴⁷ Interview with executive leader

⁴⁸ SKN: Powerpoint presentation on the accomplishments of a one year project on Child Labour Free Zone Project implemented by ADAA

- The Child Labor Free Zone Committees (CLFZC) consists of kebele officials and community elders and they are formed to ensure the sustainability of the ABE centres⁴⁹.

These interventions, in particular the CCGs that are estimated to explain 80 % of the outcome and the CWACs and the presence of ABE centres provide the most plausible explanation of the outcomes. ADAA received both MFS II funding from SKN as well as funding from "Stop Kinderarbeid Campagne" (amount unknown). The funding ADAA receives from the "Stop Kinderarbeid Campagne" is not used for the NFB project financed with MFSII Funds, but for another project in 7 other Kebeles of Siraro district. The 10 ABE Centers established in 2011 and 2012 in which the abovementioned 3652 children enrolled are the result of only the MFSII funding.

The local government working towards achieving its 'Education for All' policy is also making efforts to increase school attendance. They identify households/parents as a role model for others in order to change the perceptions of communities with regards to sending children to school and child labour, but state that this approach compared to the house-to-house visits organized by ADAA are less successful.⁵⁰ The Education bureau therefore started to collaborate with ADAA on door to door registration.

Female Self Help Groups

Whilst confronted with the fact that a number of families cannot afford to send their children to school, ADAA organized self-help groups (SHGs) of destitute mothers to start income generating activities that would help them to buy educational materials for their children. In 2014, some (but not all) mothers in these SHGs generated enough money to buy school equipment⁵¹. One of the SHGs was able to save enough to be granted a bank loan and they have bought farming land. The interviews with SHG members suggest a strong motivation of women to be self-sufficient and being able to buy school materials for their children. Attendance rates of children is also discussed among members in the SHGs.⁵² It is furthermore suggested that the SHGs go beyond economic benefits for the members, as women feel less dependent on their husbands, are able to hire help in household tasks, and also improve their habits with regards to hygiene and clothing⁵³. No information is available about the success rates of all ten SHGs and the extent to which the mothers can now send their children to school.

Contributions by ADAA consist of the following:

- Identifying children that cannot attend school because their parents are poor. Organising the mothers in SHGs so that they can start their own income generating activities and meanwhile covering the costs for stationary of 50 children (in 2013).
- The above mentioned efforts to organise Community Conversation Groups in which influential community leaders participate as well as local officials and to establish a structure that monitors school attendance for children from household level to kebele and woreda level (CWAC) which conducts house-to-house visits to discuss problems and solutions.

Contributions by the government consist of linking SHGs to Micro Finance Institutions.

Some women in the SHGs also serve as model women in the community⁵⁴, which suggests that the government is basing its role model approach upon households supported by ADAA. We conclude that both the local government and ADAA explain the above outcome.

5.3.2 Strengthening Intermediate Organisations

The in-country evaluation team did not assess the performance of any of the 10 CCGs, the CWACs, the Parent Teacher Associations, the Centre Management Committees, the Social Accountability Committees, the school clubs, all of which are based upon the work of volunteers and occasionally with support of local government officials.

⁴⁹ Monitoring report ADAA 2012

⁵⁰ Idem

⁵² Interview with external resource person

⁵³ Idem

⁵⁴ Interview with External research person

From the documents made available CDI understands the following:

The Community Conversation Groups and the Child Well-being Advisory Committees are based upon traditionally existing institutions in society. At the lowest level five households form one network through which communication from ADAA and from the government passes. These networks are regrouped at zonal level into groups of 50 to 60 households (Geres), the structure used to have the community conversations. The kebele is the first administrative level on top of the Geres, followed by the Woreda administration.

According to the in-country evaluation team ADAA does not pay that much attention on the internal performance of separate structures but focusses on the outcomes of these structures.⁵⁵ As described in the previous paragraph, the outcomes of these structures are however promising.

5.4 What is the relevance of these changes?

5.4.1 Relevance of the changes in relation to the Theory of Change of 2012

The 2012 theory of change constructed with ADAA formulates one overall goal; "Strengthening community groups which play an active role in improving the educational situation of Siraro Woreda.

For this to happen four conditions needed to be in place: strengthened youth clubs in school; Parent Teacher Associations; Centre Management Committees, and; Community Conversation groups.

Though we observe that a lot has been done in the past years to increase the attendance rate of children ADAA's focus has shifted from improving the school/ABE centre's performance through PTAs, youth clubs and CMCs towards strengthening community based structures and networks in which in particular the PTA and the CMCs participate and that are capable of covering all households.

Given the results in terms of increased school attendance including CWD and less school drop outs this reorientation seems to have been relevant, but on the other side no information is available that assesses the quality of education ensured at the ABE centres and the role of the CMC's in these, as well as that of PTAs in formal schools.

The field staff also believes that ADAA's is now increasing its scope in the woreda because since 2012 the number of projects increased to five; two by ICCO and three by SKN.

5.4.2 Relevance of the changes in relation to the context in which the SPO is operating

The rural population in Siraro district is growing tef and maize and keeping livestock as the most important livelihoods strategies. However grazing land for cattle has declined and is increasingly restricted to waste land, roadsides, edges of cropping fields and fallow land during the wet season. Cattle keeping is constrained by shortage of water, therefore households sometimes migrate to other areas as a means to secure their livelihoods.⁵⁶ Children play a prominent role in household, agricultural and livestock keeping tasks which, apart from migration to other locations, also explain that not all children go to school despite the national policy "Education for All".

The most important causes for disability in Ethiopia can be prevented because they relate to contagious diseases and poverty; therefore much can be done to integrate disabled children into the school system, if communities are made aware that also disabled children have the right to education⁵⁷.

⁵⁵ Discussion with ADAA staff during workshop

⁵⁶ Amenu, K., Markemann, A., Roessler, R., Siegmund-Schultze, M., Abebe, G. and Zárate, A.V. 2013. Constraints and challenges of meeting the water requirements of livestock in Ethiopia: Cases of Lume and Siraro districts. *Tropical Animal Health and Production* 45(7): 1539-1548

⁵⁷ Berhanu Berke, Debebe Ero. September 2013

Against this back ground the interventions of ADAA are relevant, starting from constructing nearly all schools and ABE centres in the woreda, of which 7 were established in 2011 and 3 new centres since 2012, that have the potential to become registered as formal schools to mobilising households and communities to the importance of sending children to school, to raise their awareness that disabilities are related to diseases and not to traditional believes.

Apart from mobilising entire communities, the interventions of ADAA are also very relevant in terms of constantly engaging with local officials at kebele and woreda level. This helps to keep them informed and they have made meaningful contributions to ADAA's project.

5.4.3 Relevance of the changes in relation to the policies of the MFS II alliance and the CFA

SKN is implementing two programmes in Ethiopia; that of "stop child labour through education" and "the girl's rights" programme. ADAA is contributing to both programmes with its focus on school enrolment, harmful traditional practices and child labour.

The MFS II programme of Child and Development Alliance of which SKN is a member does not have a specific civil society policy. In practice though most of the projects implemented do heavily rely upon the functioning of community based structures such as CCGs, PTAs and volunteers and organising these into networks from local to woreda level, which are important instruments to increase the CIVICUS dimension "civic engagement" including important elements such as social inclusion.

Collaboration between the Ethiopian partners of the C&D Alliance has not yet materialised in terms of joint learning (CIVICUS dimension "level of organisation") although this is being promoted by the Alliance. Efforts to jointly engage in a constructive dialogue with government officials for improved service delivery in the education sector is done via the Basic Education Network (BEN), of which all SKN partners with MFS II funding are a member. Because of this important role of BEN, this network receives financial support of SKN from the MFSII Program. At SPO level, and in particular ADAA, constructive dialogue is taking place (CIVICUS dimension "perception of impact").

SKN is confident that ADAA has made structural improvements in the education system in Siraro Woreda and that these will persist after the project has closed. This is based upon previous projects in other locations where the former ABE centres continue to expand.

5.5 Explaining factors

5.5.1 Internal factors

In the 2011 action plan it was recommended that ADAA would develop a marketing and communication strategy to timely inform stakeholders about ongoing activities. In 2013, the goal of regular publication was not met because no budget was allocated due to the problem of complying with the 70/30 regulation. ADAA did manage to put electronic publications on their website.

ADAA produced reports that show plans and performances of its activities. The reports are indicative of the number of children accessing education, health and other services. The reports also show the number of community members and sector government staff covered through awareness raising workshops, events and capacity building programs etc. Nonetheless, although these are ways measuring results in the form of outputs, they do not adequately gauge impacts or changes in attitude and behaviour.

MFS II funds budgeted for civil society building in this project is approximately 10% of the total budget. The realisation of 2012 however shows overspending on overhead costs (115%) and underspending on the civil society/capacity building activities (53%)⁵⁸. For 2013, the civil society

⁵⁸ Annual Financial Report NFBE project January to December 2012

component is overspent, but this is mainly due to the purchase of a field vehicle⁵⁹. The actual amount spent on civil society building in this project appears marginal.

5.5.2 External factors

The field staff mentions they believe the European financial crisis has improved since they receive more funding and are able to expand the intervention scope of ADAA.

In the Woredas ADAA is operating in there is a water shortage which leads to children dropping out of school since parents decide to relocate. Scarcity of water also resulted in a delay in construction activities. To solve this issue, ADAA tried to motivate and organise the community to bring water from distant areas using donkeys or horse carts.

Other external factors influencing the performance of the ABE centres are: shortage of student text books; the difficulty of recruiting female facilitators; market fluctuation in the price of industrial materials; lack of sanitary facilities in some centres; difference in the quality of facilitators; and overcrowded classes due to increased school enrolment of 'out of school children'.⁶⁰ Another factor influencing the construction of the ABE centres, especially in the rural areas is the new government tax regulation which forbids masons and carpenters without TIN (Tax Identification Number) to take on construction work. As a result, especially in rural communities no one is able to do the work since there is no government office that facilitates the TIN procedure.

5.5.3 Relations CFA-SPO

In their last contract, SKN mentions the project will be terminated by the end of 2015. They advise ADAA to already prepare the local community and other relevant actors for the phasing out and to make sure that all ABE Centres established with the support of the project will be sustainable and ready for handing over to the Woreda Education Office as to become formal schools. From experience in other areas, SKN insisted that ADAA would involve the Woreda Education office from the start of the project to make sure there was support for handing over the 10 ABE centres in 2015. Also in providing budget for building extra classrooms in 2013-2014, a 'matching fund' of the government was demanded⁶¹. As a response, the office assigned one teacher for all centres. The project office furthermore lobbied with the WEO to cover the salaries of some facilitators as of the 2013 Ethiopian academic year. From the documents it could not be retrieved whether the WEO did indeed cover the salaries as for that academic year

6 Discussion

6.1 Design of the intervention

Research on Non-Formal Education (NFE) initiatives indicate that this type of approaches to education may be more relevant and accessible to students and community members than formal education, including that it may enhance the participation of girls and marginalized populations. It may also be less costly to both the implementers and the communities than formal education (Anis, 2007). Other research suggests that NFE in reality are, or may be perceived as being neither of second rate to formal education, and thus neither be more relevant to the communities nor enhance the demand and participation in education (Bedanie et al., 2007).

A study conducted by Linussen (2009) looked at how participants and guardians of participants perceive the quality and relevance of the Alternative Basic Education (ABE) program in the Amhara National Region of Ethiopia. The findings indicate that the participants of the program and guardians of participants in ABE which were included in the study valued the ABE program positively to a large extent. Some areas of improvement were identified, such as the infrastructure of the Alternative Basic Education Centres (ABEC); the order and discipline in the ABECs; and the attendance of the facilitators. In other areas, such as the organization of the education and the intended strategies on adapting to local needs were perceived to be of good quality, but it should be ensured that those intentions are being followed up in practice.

ADAA's approach in setting up the ABE centres seems holistic in their use of facilitators to support the teachers and their involvement of stakeholders in PTAs and CMCs. The documents do not elaborate on the quality of education in the centres however and a coherent plan on how the ABE centres will be handed over to be the responsibility of the education office in 2015 is missing.

Linussen (2009) furthermore suggests in her research that some modifications of the school calendar, in order to make it more compatible with the farming seasons would possibly signify an improvement and lower the risks of some students dropping out from school. Admassi (2003) comes to a similar conclusion in his research on the conjunction of schooling with children's participation in child care, farm care, and other household responsibilities. The result suggests that combining work with school attendance is common among school children in Ethiopia, although some activities may hamper school attendance more than others. Hence, a gradual policy towards child labour may be necessary in the context of subsistence economies, where initial interventions should aim at making the combination of work and school attendance possible rather than immediately eliminating child labour. To achieve this, introduction of a flexible school system that recognizes the peak demand seasons for family and agricultural labour may be necessary.

ADAA's intervention strategy in increasing enrolment rates and reducing dropouts is built on community involvement and linking and networking within the civil society arena by bringing influential actors together in either community conversation groups or committees. The creation of these new community structures is a promising intervention, particularly because they have a clear vision and know their mandate. These structures bring various actors together that each know their role and hence complement each other. Their potential lies in their capacity to ensure common action for good quality and accessible education.

However, according to the information available with the evaluation team, ADAA and SKN have not considered modifications of the school calendar and opted for an immediate elimination of child labour which might hamper their efforts and that of the Government to ensure 'Education for All'.

In terms of replicability, working through influential leaders and creating awareness with the use of traditional systems such as is the case with ADAA's CCGs and CWACs that involve local officials might possibly be replicable. However their success will depend upon the socio-cultural context in which such a project would be implemented, as well as the commitment of the local government services to take part in the project. A more gradual approach that combines child labour with school attendance needs

to be further investigated, in particular when working in areas that largely depend upon a subsistence economy.

6.2 Evaluation methodology

A methodology was design to conduct this evaluation – see appendix 2. The methodology in itself provides enough guidance to conduct a Theory Based Evaluation, although the process tracing methodology requires substantial understanding of the different steps to take.

Generally speaking we observe that the CIVICUS framework has never been used for evaluation purposes, and that the period between the baseline and end line study hardly covers two years, whereas the entire MFS II period covers 5 years. Furthermore, we observe that the interventions by the SPOs do not distinguish interventions that relate to Civil Society or Policy influencing from other interventions. This makes it occasionally difficult to obtain a clear focus for the civil society evaluation.

Critical steps in the evaluation methodology are the following:

1. Linking project interventions from the SPO to the CIVICUS framework. The project documents do not provide this information and are based upon the interpretation by the evaluation team in the Netherlands.
2. The extent to which the project documentation enables the Dutch team to understand the in-country realities. If the quality of the reports is weak, then the guidance provided to the in-country evaluation team is weak. Therefore deciding upon the outcomes to be selected for in-depth process tracing was sometimes hampered by incomplete and un-clear project documents.
3. After the workshop with the SPO, the in-country team had to decide upon which outcomes they will focus on for the in-depth process tracing. There was a tendency to selecting positive outcomes achieved.
4. Designing the model of change that explains the outcome achieved, followed by the inventory of rival pathways to explain that outcome has also proven to be a critical and difficult step. In this phase it is critical that the evaluation team works together to brainstorm on alternative pathways. A major challenge is that in-country teams at this moment of the evaluation have obtained a lot of information from the SPO, and not from other NGOs or resource persons, which possibly might strengthen their bias in favour of attributing change to the SPO.
5. The following step of identifying the information needs to confirm or reject these pathways and to identify the method of collecting the information needed. Also this step has most chances to be successful when the evaluators work together.

Information gathering to assess the relevance of the changes in civil society and the explaining factors generally speaking was not challenging.

Critical conditions for this evaluation methodology are:

1. Project documents and progress reports need to be available in time, and they need to systematically report not only on outputs but also on effects on the changes in peoples livelihoods (civic engagement), and at least the performance of organisations that received support from the SPO. None of the SPOs in the sample have an M&E system in place that measures the organizational capacity of the organisations they support.
2. The evaluation team needs to have a thorough understanding of the CIVICUS framework and the interpretation of the indicators used for this evaluation.
3. The evaluation team needs to understand how process-tracing works and the in-country evaluation teams need to develop a critical stand towards the interventions of the SPO that enables them to identify rival explanations for the outcomes achieved and to identify the appropriate questions to confirm or reject pathways. Because this is a new methodology, much depends upon the team's previous experiences of theory-based evaluations.
4. The methodology developed and in more generally terms theory-based evaluations are more time-consuming than randomized control trials.
5. The process-tracing methodology requires a continuous process of analysis of information obtained and identification of further information needs to be able to make a plausible contribution claim.

This capacity of critical reflection is one of the core capacities needed to successfully conduct a theory-based evaluation like process-tracing.

7 Conclusion

Changes in the civil society arena of the SPO

In the 2012 – 2014 period the two most important changes that took place in the civil society arena of the SPO are related to civic engagement and perception of impact. With regards to the first dimension we observe a slight improvement in terms of community involvement through community conversation groups and reaching out to traditional and religious leaders. It is furthermore observed that civic engagement has been enhanced through the increase in school enrolment rates as well as attendance rates and a reduction in the number of dropouts.

With regards to perception of impact, we observe that ADAA efforts to create community structures in the form of community conversation groups enhanced community involvement and created a shared idea of responsibility for development and the wellbeing of children. ADAA's child labour free zone approach by forming Child labour free zone committees and Child Well-Being Advisory Committees (CWAC) ensures a common sense for action and brings important stakeholders together on different levels.

ADAA's collaboration with the public sector intensified in the past two years. In the first place they acknowledge ADAA's role in the construction of schools and ABE centres that help to realise their public policy 'Education for All'. In the second place they acknowledge that ADAA's work with communities is effective and increasing child enrolment and decreasing the number of school drop outs.

Contribution Analysis

The first outcome that we looked at is the extent to which ADAA contributed to an increased school attendance of vulnerable children and a reduced number of children being burdened with household tasks. We conclude that, in particular the CCGs are estimated to explain 80 % of the outcome and, together with the CWACs and the presence of ABE centres provide the most plausible explanation of the outcomes. ADAA received both MFS II funding from SKN as well as funding from the National Lottery (NPL-Nationale Postcode Loterij) and SKN in the "Stop Kinderarbeid Campagne" (amount unknown).

For the outcome of women being economically empowered to buy educational material for their children, we conclude that both the local government and ADAA have significantly contributed.

For the second outcome of strengthening intermediate organisations the in-country evaluation team was not able to assess the performance of any of the CCGs, the CWACs, the Parent Teacher Associations, the Centre Management Committees, the Social Accountability Committees, the school clubs. Hence, no conclusions on their performance nor ADAA's role in strengthening them could be drawn.

Relevance

With regards to the 2012 ToC established with ADAA, we observed a shift from improving the school/ABE centre's performance through PTAs, youth clubs and CMCs towards strengthening community based structures and networks in which in particular the PTA and the CMCs participate and that are capable of covering all households. Given the results in terms of increased school attendance including CWD and less school drop outs this reorientation seems to have been relevant, but on the other side no information is available that assesses the quality of education ensured at the ABE centres and the role of the CMC's in these, as well as that of PTAs in formal schools.

Against the background of children playing a prominent role in household, agricultural and livestock keeping tasks in the Siraro district, the interventions of ADAA are relevant, starting from constructing nearly all schools and ABE centres in the woreda, of which 3 new centres since 2012, that have the potential to become registered as formal schools to mobilising households and communities to the importance of sending children to school, to raise their awareness that disabilities are related to diseases and not to traditional believes. Apart from mobilising entire communities, the interventions of ADAA are also very relevant in terms of constantly engaging with local officials at kebele and woreda

level. This helps to keep them informed and they have made meaningful contributions to ADAA’s project.

Collaboration between the Ethiopian partners of the C&D Alliance has not yet materialised in terms of joint learning although this is being promoted by the Alliance. Efforts to jointly engage in a constructive dialogue with government officials for improved service delivery in the education sector is done via the Basic Education Network (BEN), of which all SKN partners with MFS II funding are a member. Because of this important role of BEN, this network receives financial support of SKN from the MFSII Program. At SPO level, and in particular ADAA, constructive dialogue is taking place. SKN is confident that ADAA has made structural improvements in the education system in Siraro Woreda and that these will persist after the project has closed. This is based upon previous projects in other locations where the former ABE centres continue to expand.

Explaining factors

The evaluators observe considerable underspending for civil society/capacity building initiatives in 2012 and 2013 which might possibly indicate that with more support to the CCGs, the SHGs the PTAs, the CWACs, these CBOs might increase their performance. They also observe that although records are well kept and outputs are being measured, no information is being collected at the level of outcome such as performance of the CBOs and effects of the SHGs at household level. The most important external factors that may impact upon ADAA’s performance are related to the construction and supply of the ABE centres, being mainly water scarcity, lack of labour in remote areas due to government regulation, and lack of text books. Though serious efforts have been made to entail a smooth transmission of the ABE schools to the Woreda education office, incentives on the side of the education office to safeguard donor funds could hamper the process. The relations between SKN and ADAA seem constructive.

Design

In terms of replicability, working through influential leaders and creating awareness with the use of traditional systems such as is the case with ADAA’s CCGs and CWACs that involve local officials might possibly be replicable. However their success will depend upon the socio-cultural context in which such a project would be implemented, as well as the commitment of the local government services to take part in the project. A more gradual approach that combines child labour with school attendance needs to be further investigated, in particular when working in areas that largely depend upon a subsistence economy.

Table 5
Summary of findings.

When looking at the MFS II interventions of this SPO to strengthen civil society and/or policy influencing, how much do you agree with the following statements?	Score
The CS interventions were well designed	7
The CS interventions were implemented as designed	7
The CS interventions reached their objectives	6
The observed outcomes are attributable to the CS interventions	8
The observed CS outcomes are relevant to the beneficiaries of the SPO	8

Score between 1 to 10, with 1 being “not at all” and 10 being “completely”

Appendix 1 Civil Society Scores

In-country team to fill in the scores for each SPO

This table presents the appreciation of the evaluation team regarding changes occurred for each indicator between 2012 and 2014 on a scale of -2 to + 2

- 2 = Considerable deterioration

- 1 = A slight deterioration

0 = no change occurred, the situation is the same as in 2012

+1 = slight improvement

+2 = considerable improvement

Dimension		Indicators	Question	Change
Civic engagement	1	Needs of marginalised groups	How does your organisation take the needs of your beneficiaries/target groups, in particular marginalised groups into account in your planning, actions, activities, and/or strategies?	+1
	2	Involvement of target groups	What is the level of participation of your beneficiaries/target groups, in particular marginalised groups in the analysis, planning and evaluation of your activities?	+1
	3	Political engagement	How intense is your (individual staff or organisational) participation in locally-nationally elected bodies and/or sectoral user groups?	Not applicable
Level of organisation	5	Relations with other organisations	In the past 12 months what has been the most intensive interaction you had with other CSOs?	+1
	5	Frequency of dialogue with closest CSO	In the past 12 months how many meetings did you have with the CSO that you have most intensive interaction with?	+1
	6	Defending the interests of marginalised groups	Which CSO are most effective in defending the interests of your target groups? In the past 12 months, how did you relate to those CSOs?	+1
	7	Composition current financial resource base	How does your organisation finance institutional costs such as workshops of the General Assembly (if applicable); attendance to workshops of other CSOs; costs for organisational growth and/or networking?	+1
Practice of Values	8	Downward accountability	To what extent can mandatory social organs (steering committee, general assembly, internal auditing group) ask your executive leaders to be accountable to them?	0
	9	Composition of social organs	What % of members of your mandatory social organs belong to the marginalised target groups you are working with/for?	0
	10	External financial auditing	How regularly is your organisation audited externally?	0
Perception of impact	11	Client satisfaction	What are the most important concerns of your target groups? How do your services take into account those important concerns?	+2
	12	Civil society impact.	In the past 12 months, what impact did you have on building a strong civil society?	+1
	13	Relation with public sector organisations.	In the past 12 months, what interaction did you have with public sector organisations to realise your programme and organisations' objectives?	+1

	14	Relation with private sector organisations	In the past 12 months, what interaction did you have with private sector organisations to realise your programme and organisations' perspective?	0
	15	Influence upon public policies, rules, regulations	How successful have you been in influencing public policies and practices in the past 2 years?	+1
	16	Influence upon private sector agencies' policies, rules, regulations.	How successful have you been in influencing private sector policies and practices in the past 2 years?	0
CS context				
	17	Coping strategies	In the past 2 years, how did your organisation cope with these changes in the context that may have been positive or negative consequences for civil society.	0

Appendix 2 Changes in civil society indicators between 2012 and 2014

1. Civic Engagement

1.1 Needs of marginalised groups SPO

ADAA conducted a Participatory Risk Appraisal together with community representatives and concerned government offices and in comparison to 2011, the needs of targets have started to be addressed in a holistic manner towards the end-line.

Community Conversation groups and social accountability committees (SAC) have been organized and include marginalized persons. These entities are now claiming their rights vis-à-vis service providers or the government. These community groups are also increasingly contributing to some of ADAA's project objectives, such as improved school enrolment and the reduction of Harmful Traditional Practices and Female Genital Mutilation.

The Community Conversation groups regroup some 50-60 people, including religious and traditional leaders (Aba Geda), women, youth, previous circumcisers and representatives of local government bodies and these ceremonies are used to discuss the abolishment of child labour, the importance of sending children to school, traditional harmful practices such as female genital mutilation. It is said that these practices have decreased significantly since the baseline.

ADAA's intervention zone now counts many households that are a model for other households and hence are changing the mentality of the community with regards to child labour and education.⁶² The following table presents the enrolment of students and dropouts in absolute figures in the past years.

Table 4

Student enrolment and school dropouts between 2012 and 2014; ten ABE centres supported by ADAA

Years	Total Enrolment	Female enrolment	Dropout
2012	3132		441
2013	3522		190
2014	3652	1523	150
0-level in 2014	542	249	

Children of in particular destitute women and families receive special support by ADAA. These women are organised in SHGs to generate income that help the women to purchase educational materials for their children. One of the SHGs has already saved enough money to ask for a bank loan, buy up land and start farming. These women testified to how their lives have changed and how they can now pay for school and home expenses for their children and themselves. The women interviewed were very confident about their benefits from being in the SHG. They were also proud that they are motivating other women to do the same. They observe that their change is not just about buying school materials for their children school facilities but also about themselves changing with respect to hygiene and clothing. They are outspoken and have clear plans to expand in the future.

⁶² ADAA, the kebeles and also the Educations Bureau. Idirs and committees (CC groups, PTAs, CMCs, child wellbeing advisory committee)

ADAA provided stationary for 50 students in 2013 and organised their mothers organized into a SHG, which helped these children to turn back to school. In 2014 those same children could buy their own school materials.

Students and other categories in society are also being informed about HTP and HIV AIDS in their youth clubs, however their perspectives on these issues has only slightly changed, but some children have started to influence their parents.⁶³⁶⁴ This might be explained by the fact that ADAA is not taking these clubs into account or that the children in these clubs are not yet reaching adolescent age.

ADAA's awareness creation activities on the importance of sending children to school has increased the number of children going to school and a decrease of the number of school drop outs⁶⁵. Also children are said to not being burdened by household chores⁶⁶.

Score: +1

1.2 Involvement of target groups SPO

In 2011 there was limited involvement of beneficiaries during monitoring and evaluation results feedback. In 2013 have started to involve Beneficiaries' in monitoring exercises but planning to increase their involvement during Evaluation. ADAA increased the level of participation of target groups by capacitating and strengthening Parent Teacher Associations (PTA) and centre management committees (CMT). In addition, social accountability committees and child wellbeing advisory committees were established for the advanced participation of beneficiaries in every project management cycle.

Score: +1

1.3 Intensity of political engagement SPO

ADAA does not involve in any political activities as an NGO as this is not part of its directive to reaching its mission hence the score 0.

Score: not applicable

2. Level of Organisation

2.1 Relations with other organisations SPO

Since 2011, ADAA's engagement with children related networks and forums has increased. ADAA has started to engage with networks as CORHA on the issue of reproductive health for young students and with SLUF on issues like environmental conservation, women SHGs. Both networks complement ADAA's work with school clubs (sexual and reproductive health), creating green and attractive environments and improving livelihood of parents so that they can contribute to the education of their children. ADAA also started collaborating with WABI, a local NGO in Amhara region to create an experience sharing platform or to publish a booklet on child labour.

ADAA is a member of the consortium of self-help group approach promoters (COSAP).

It is also a member of the Consortium of 6 NGO's, comprising ADAA, CDI, ERSHA, FC, OSRA, and HUNDEE (C6NGOs) that is implementing the "Integration of information and communication technologies in agricultural value chains" project with ICCO funding.

⁶³ Berhanu Berke, Debebe Ero. September 2013. Awareness Raising Activities And Strategies: Ethiopia Research in Support of the Learning Agenda under the Child & Development Alliance, final report Addis Ababa, Ethiopia

⁶⁴ Club members

⁶⁵ regular attendance monitoring by the schools (CMC and PTAs), ADAA volunteers and facilitators and the Education Bureau.

⁶⁶ CC group leaders

With regards to the Child and Development Alliance the evaluation team observes that networking amongst the Ethiopian partners of this Alliance is not sufficient to enable adequate horizontal sharing of experiences, best practices, resources and information on common agenda of awareness raising activities and provision of services to children. Designated persons and more regular meetings are needed to document lessons and best practices amongst Ethiopian partners and those from other countries. ADAA is still dependent upon SKN to cover the costs of meetings where the partnerships can be build.

Score: 0

2.2 Defending the interests of marginalised groups SPO

Since the SPO is not allowed to directly engage in issues related to lobbying and influencing, they empower and strengthen the community structures by organising different sensitisation and consultative meetings and awareness raising programs to enable them to defend the interest of the disadvantaged groups. These activities are mostly carried out through community conversations and training influential leaders (religious and traditional leaders).

ADAA also showed the way to the office in terms of approaching the issue of child labour and education by approaching the community leaders instead of trying to enforce the change. It is through the CSOs (CCGs, SHG, Clubs etc) that ADAA was able to distribute its messages of HTPs. It trained few representatives of the community and religious/traditional leaders who are able to organise discussions in these CSOs and to raise the awareness of the participants. And as such there are many children in schools and many more taken out of child labour also the practice of other harmful practices like FGM so the CSOs played a big role in changing the ways of the community for the better.

Score: +1

2.3 Composition financial resource base SPO

ADAA's financial resource base has increased because it increased the number of projects under implementation and their nature. There are additional staff members; ADAA covers all its administration costs and other staff capacity building costs from its sources. Sources are MFSII and other funders outside of its Dutch partners. As ADAA has five projects funded by Dutch grants, two by ICCO and three by SKN this increases the share of costs for organizational growth and networking.

Score: +1

2.4 Defending the interests of marginalised groups CSO

ADAA is not allowed to directly lobby and advocate for improved education. Instead they empower and strengthen the community structures so that these are able to defend the interest of the disadvantaged groups. Influential leaders (religious and traditional leaders) play an important role in these. However no information is available that shows how these structures hold local government offices accountable.

Score: +1

3. Practice of Values

3.1 Downward accountability SPO

According to a capacity assessment of 2011, the role of the board and that of the management are clearly defined and separated. Executives are fully accountable to social organs. During the annual general assembly meetings the management of ADAA has to account for its finances and the progress being made on its project implementation.

ADAA has a clear organizational structure, personnel policy, job positions, clear recruitment and placement and regular staff meetings. It also invests in staff development when opportunities are available.

ADAA reports all its activities and financial utilization to all stakeholders (Community representatives, government, traditional and religious leaders, CMCs, etc) on a quarterly basis (E.g. report to the federal and regional bureaus on a quarterly basis, and to the general constituency annually. This has been the trend of the SPO throughout the years hence; no change is seen since the baseline.

Score: 0

3.2 Composition of social organs SPO

According to ADAA's field staff and executive leadership marginalised groups that represent different categories of society are represented in the Board of ADAA (20-30%). A baseline study conducted with the PCAT tool of Terre des Hommes in 2011 reported that board members are chosen on the basis of their qualification, professionalism and commitment. ADAA's board members are elected on the general assembly meeting where the founding members, beneficiaries or community representatives and government officials including the CS Agency representatives are present. The criteria for election are based on the professional and technical capacity, and willingness of the person/persons to serve the organisation on a voluntary basis.

This situation has not changed in 2014.

Score: 0

3.3 External financial auditing SPO

The SPO has adequate internal and budget control system and practice; good record keeping practice (i.e. transaction recording, duly signed by concerned authorities and filing); asset control and capital investment system; operate under minimum overhead cost which indicates organizational efficiency; Adequate cash handling system and practice; employment is as per the approved budget; accounting package exists and is used and the SPO operate with strict compliance to government regulations. Accordingly the SPO is audited regularly get audited by an external auditor on annual basis for government report. The Dutch partners support for external auditing. ADAA also gets a second audit which on a yearly basis to be sent to its donor.

Score: 0

4. Perception of Impact

4.1 Client satisfaction SPO

There are no records kept to assess to what extent school children are satisfied with the education and the learning environment they get at school, or how satisfied women, member of SHGs are. Only some indications exist with regards to these:

"The improved environment created in ABE Centres and schools have encouraged disabled children to become successful students. Among the many, the case of a female student in ADAA project area of Siraro is an example. According to Temsgen Jori, ADAA Sirao field coordinator, a female disabled student from Sembete Lenco by the name Besa Alak successfully completed level three and joined grade five last year and is now in grade six in Senbete Sinkile formal school as one of the good performing students in the school".⁶⁷

⁶⁷ Berhanu Berke, Debebe Ero. September 2013. Awareness Raising Activities And Strategies: Ethiopia Research in Support of the Learning Agenda under the Child & Development Alliance, final report Addis Ababa, Ethiopia

The SHGs make women more confident that they can generate an income and they are proud of being able to do so. They observe their change not just with respect to buying their children school facilities but also in changing themselves with respect to hygiene and clothing. They are outspoken and have clear plans to expand in the future which showed their determination to better themselves more.

Before students used to stay home for lack of equipment but since 2013, 50 students were selected and supplied with stationary and their mothers organized into a SHG they have come back to school. Plus those same 50 kids are not supported in 2014 b/c they were able to buy their own facilities.

The in-country evaluation team observes that respondents were very emotional about the existence of schools for their children and how much they regret that they did not learning about the importance of education sooner. Some parents are learning from their children (one father learned how to sign his signature from his child). They were very thankful of ADAA and the other actors in the area. Also respondents that did not send their children to school talked in a very convincing way about the benefits of education.

Community leaders are intensely cooperating with ADAA staffs as facilitators of CCGs and volunteers engaged in mobilising children to attend school. They are eager to introduce change in their community after ADAA has trained them to do so.

Score: +2

4.2 Civil society impact SPO

The Community Based structures in place enable volunteers and community members to discuss school attendance, child labour and harmful traditional practices and therefore raise the awareness of the entire community. A Community Conversation Group consists of maximum 60 members that meet every fortnight during 7 months, after which other people are selected to attend these meetings. Individual members meanwhile also talk to their neighbours and consult with the volunteers. As the traditional leaders are the most respected part of society they use these people as a leverage to convince other households. The CCGs are changing people's perspective on issues as HIV, Hygiene, education, child labour and the like.

The main factor for the current success in ADAA's intervention is through Community Conservation Groups followed by follow-up activities. It explains changes in the perspectives of entire communities for an estimated 80%. The main strategy consisted of creating the awareness of traditional and religious leaders and elderly people, followed by the creation of the CCGs as a vector for change. As a farmer, member of the CCG states during the visit of the in-country evaluation team: "before we were not convinced about the relevance of education, we thought a child that stayed at home and helped out was more useful than the one that went to school. We thought if one child went to school it was enough and the rest can stay home. After ADAA coordinated us and informed us on the importance of such things we have changed a lot. Now all CCG members are more aware about hygiene, education and the like. For instance our group gathers and discusses every week and we are also learning household skills".

The same is applies for the youth clubs in schools. Intensive follow-up of these clubs by their teachers and good communication helped the children to gain their confidence and engage in open discussion.

In the view of strengthening relation among ABE and formal schools it is found important to create relation with school cluster resource centres that play a role in capacity building of teachers. Accordingly, target schools have created necessary relation with these centres and they have gained necessary support from the centres. In line with this, the activities such as question and answer program have been carried out among different centres and other nearby formal schools; sport tournament among students and among different centres have been undertaken; Experience sharing events has been carried out among different centres have been undertaken. Still no significant change has been observed in this aspect in terms of increasing enrolment from the baseline. However, the conducive environment at schools is expected to decrease dropouts as the students discuss with their teachers whenever they are faced with difficulties.

Score: +2

4.3 Relation with public sector organisations SPO

There is increased involvement of the public sector in ADAA's activities and most intense collaboration is with the health offices, cooperative promotion offices, agricultural offices, women and children offices, Education Bureau, finance and economy office and other kebele and woreda offices. These are also involved in the planning, implementation and evaluating of the project.

The woreda education officer acknowledges that when child registration is done on a house-to-house basis many more children are enrolling. Schools and NGOs working in the education sector regularly report to the education office and they do regular follow-ups. ADAA reports to concerned government offices on a quarterly basis.

The same officer stated in a report prepared for the Child and Development Alliance": "ADAA influenced our office and its work on its strategy for reducing dropouts and retention of children. The organization engages community members to go house to house and bring back drop outs by enhancing community awareness on the value of education. We had tried and failed before. Now we have learned. For example in Shirkeno Keta Primary school out of 394 children last year half of them dropped out. This year with lesson from ADAA there are only few children who dropped out. Dropping out has reduced by 50%. In this respect; we want to follow ADAA's footprints", Dalu Tuye, Planning and program expert of Siraro WEO.⁶⁸

Almost all schools/ABEs in the ten woredas were built by ADAA, and the Education Office acknowledges that without ADAA it could not have implemented its 'education for all' policy. Its most important concern with the implementation of this policy is to engage with the community. When ADAA engaged with the community through community leaders this bridge between the local government and the community was established.

Score: +1

4.4 Relation with private sector agencies SPO

ADAA doesn't have that much of a relationship with private sector offices, mainly due to the absence of development oriented private sector in terms of access to education. However the SPO has established several relations with the private sector for its FMO projects.

Score: Not applicable

4.5 Influence upon public policies, rules, regulations SPO

One of the main successes of the awareness raising activities and strategies along with associated services for disadvantaged children undertaken by C& D Alliance partners is the influence they made on sector government agencies with which they are partnering. The research team, in its various interviews and Focus Group Discussions in many localities and government sector organizations has been able to get sufficient evidence on how much the partner organizations have contributed towards changing the perceptions of the officials and staff of the relevant organizations with regards to the wellbeing of children. The Education Bureau also said that ADAA plays a big role on girls' education. There were a lot of dropouts before but ADAA has decreased this and if the office knows ADAA is working on certain areas then we are confident it will do a good job so they cover other locations. They have now copied the approach through the community after seeing the positive progress from ADAA.

Score: +1

4.6 Influence upon private sector agencies' policies, rules, regulations SPO

There is no change in this aspect from the baseline

Score: Not applicable

⁶⁸ Berhanu Berke, Debebe Ero. September 2013. Awareness Raising Activities And Strategies: Ethiopia Research in Support of the Learning Agenda under the Child & Development Alliance, final report Addis Ababa, Ethiopia

5. Environment

5.1 Coping strategies

Regardless of the achievements of ADAA, it faces challenges such as shortage of student text books; scarcity of water that resulted delay in construction activities and in some kebeles and student dropouts because they have to fetch water in remote areas; lack of local contractors for the construction of additional classrooms; market fluctuation in the price of industrial materials; lack of sanitary facilities in some centres such as absence of latrine and skill gap among facilitators. In response to these challenges ADAA has made some efforts to resolve these. Examples are for instance:

- Instead of giving every student his text book, these are now distributed through the school cluster resource centre and students are being advised to use these books as a group.
- Trying to convince the community to bring water from distant areas using donkey/horse carts instead of sending their children;
- Outsourcing a local contractor from another area to complete the construction on time (even though it has a cost implications);
- Construction of toilet in the centres is underway and short term trainings and in-service summer trainings have been given to facilitators/teachers.

Report CDI-15-030

The Centre for Development Innovation works on processes of innovation and change in the areas of food and nutrition security, adaptive agriculture, sustainable markets, ecosystem governance, and conflict, disaster and reconstruction. It is an interdisciplinary and internationally focused unit of Wageningen UR within the Social Sciences Group. Our work fosters collaboration between citizens, governments, businesses, NGOs, and the scientific community. Our worldwide network of partners and clients links with us to help facilitate innovation, create capacities for change and broker knowledge.

The mission of Wageningen UR (University & Research centre) is 'To explore the potential of nature to improve the quality of life'. Within Wageningen UR, nine specialised research institutes of the DLO Foundation have joined forces with Wageningen University to help answer the most important questions in the domain of healthy food and living environment. With approximately 30 locations, 6,000 members of staff and 9,000 students, Wageningen UR is one of the leading organisations in its domain worldwide. The integral approach to problems and the cooperation between the various disciplines are at the heart of the unique Wageningen Approach.

Klaver, D.C., Jacobs, J., Tefera, W., Getaw, H., Dereje Getu D., February 2015, *Catholic Church of Gamo Gofa and South Omo (CCGG&SO) end line report; MFS II country evaluations, Civil Society component*, Centre for Development Innovation, Wageningen UR (University & Research centre) and International Food Policy Research Institute (IFPRI). Report CDI-15-035. Wageningen.

This report describes the findings of the end line assessment of the Ethiopian Catholic Church of Gamo Gofa and South Omo (SSGG&SO) that is a partner of CORDAID.

The evaluation was commissioned by NWO-WOTRO, the Netherlands Organisation for Scientific Research in the Netherlands and is part of the programmatic evaluation of the Co-Financing System - MFS II financed by the Dutch Government, whose overall aim is to strengthen civil society in the South as a building block for structural poverty reduction. Apart from assessing impact on MDGs, the evaluation also assesses the contribution of the Dutch Co-Funding Agencies to strengthen the capacities of their Southern Partners, as well as the contribution of these partners towards building a vibrant civil society arena.

This report assesses CCGG&SO's contribution towards strengthening Civil Society in Ethiopia and it used the CIVICUS analytical framework. It is a follow-up of a baseline study conducted in 2012. Key questions that are being answered comprise changes in the five CIVICUS dimensions to which CCGG&SO contributed; the nature of its contribution; the relevance of the contribution made and an identification of factors that explain CCGG&SO's role in civil society strengthening.

Keywords: Civil Society, CIVICUS, theory based evaluation, process-tracing

1 Introduction

This report presents the civil society end line findings of the Catholic Church of Gamo Gofa and South Omo (CCGG&SO) in Ethiopia which is a partner of Cordaid under the Communities of Change consortium. It is a follow-up to the baseline assessment that was carried out in 2012. According to the information provided during the baseline study CCGG&SO is working on MDG 1.

These findings are part of the overall evaluation of the joint MFS II evaluations to account for results of MFS II-funded or –co-funded development interventions implemented by Dutch CFAs and/or their Southern Partner Organisations (SPO) and to contribute to the improvement of future development interventions. The civil society evaluation uses the CIVICUS framework and seeks to answer the following questions:

- What are the changes in civil society in the 2012-2014 period, with particular focus on the relevant MDGs & themes in the selected country?
- To what degree are the changes identified attributable to the development interventions of the Southern partners of the MFS II consortia (i.e. measuring effectiveness)?
- What is the relevance of these changes?
- What factors explain the findings drawn from the questions above?

The CIVICUS framework that comprises five dimensions (civic engagement, level of organization, practice of values, perception of impact and contexts influencing agency by civil society in general) has been used to orient the evaluation methodology.

Changes in the civil society arena of the SPO

In the 2012 – 2014 period CCGG&SO has seen a decrease of its civil society arena as well as the possibilities to collaborate with the local government. Most of its achievements on civic engagement date back from before the 2012 assessment; its collaboration with other NGO's decreased (level of organisation); its impact upon both civil society and upon the government decreased as well as its relation with the woreda government (perception of impact). Only its dimension 'practice of values' remained the same.

These findings were obtained through an analysis of documents, a workshop and follow-up interviews with CCGG&SO, and interviews with external resources persons working in civil society organisations that receive support from CCGG&SO; other civil society organisations with whom CCGG&SO is collaborating; public or private sector agents and; external resource persons capable of overlooking the MDG or theme on which CCGG&SO is concentrating.

Contribution analysis

Based upon an analysis of the projects and programmes financed by the Dutch CFAs a selection was made of SPOs to be included in an in-depth process tracing trajectory and those to be included for a quick contribution assessment. CCGG&SO is amongst those SPOs selected for in-depth-process tracing.

The in-country evaluation team only looked at one outcome which is the capacity of community based organisations, and in particular health micro finance schemes, cooperatives, Saving and Internal Lending Communities (SILC) and groups organised around income generating activities to improve food security of an estimated 1300 households.

The evaluation team in the first place concludes that no evidence is available to state that 1300 households improved their food security situation. The most likely strategies that may explain improved food security at household level consist of CCGG&SO's support to introduce income generating activities as well as a food safety net programme that is currently in place. There is no information available that confirms that the popular health micro finance scheme contributes to increased food security. The cooperatives and the SILC are not contributing. CCGG&SO's has been minimal because the local government failed to follow up upon groups handed over as agreed; because CCGG&SO has not been operational since the beginning of 2014 due to internal problems that

escalated. CCGG&SO also does not have any monitoring and evaluation system in place that helps to assess progress towards impact at household level.

Relevance

Interviews with staff of CCGG&SO with external resource person, with the liaison officer of Cordaid, as well as contextual information helped to assess the relevance of CCGG&SO's interventions in terms of; its Theory of Change (ToC) for Civil Society (SC) as designed during the baseline study; the context in which CCGG&SO is operating; the CS policies of Cordaid.

In relation to its 2012 ToC that stated that the capacities of CBOs need to be build and that they need to network and also relate to the public sector, the evaluators conclude that no progress has been made and that CCGG&SO's interventions have not been relevant.

In relation to the external context in which CCGG&SO is operating interventions are relevant for Hamar woreda which is a very isolated and nearly abandoned area by the government. But in relation to the severe food security problems that the 43,000 inhabitants of the district face, the outcomes achieved are negligible.

Important civil society elements for the communities of change alliance consist of strong CBOs, good relations with local government and using opportunities to influence policies. None of these elements have materialised in the past two years.

Explaining factors

The most important explaining factor of the evaluation findings consists of CCGG&SO firing three staff in January 2014, which escalated when the three staff members allegedly accused the SPO of corruption and filed a complaint with the government. In consequence the office was closed and awaiting an audit imposed by the government. Although all allegations proved to be untrue, CCGG&SO now faced difficulties in getting back on track.

A second important factor is also that the Lower Omo Valley has many fertile grounds and a river suitable for the construction of a hydroelectric dam to be followed by large scale land acquisitions for irrigated agriculture. Indigenous people like those living in the Hamar district are not being informed, and the government proceeds with forced resettlements. According to Human Rights Watch, the government is implicated in human rights atrocities. This tense situation may possibly, in contrary to other zones where the evaluators are assessing civil society impact, explain the non-constructive collaboration between NGOs and the local government.

The following chapter briefly describes the political context, the civil society context and the relevant background with regards to the Health sector that CCGG&SO is working on. Chapter three provides background information on CCGG&SO, the relation of its MFS II interventions with the CIVICUS framework and specific information on the contract with Cordaid. An evaluation methodology has been developed for the evaluation of the Civil Society component which can be found in appendix 2 of the country report; however, deviations from this methodology, the choices made with regards to the selection of the outcomes for contribution analysis, as well as difficulties encountered during data collection are to be found in chapter 4. The answers to each of the evaluation questions are being presented in chapter 5, followed by a discussion on the general project design in relation to CS development; an assessment of what elements of the project design may possibly work in other contexts or be implemented by other organisations in chapter 6. Conclusions are presented in chapter 7.

2 Context

Political context This paragraph briefly describes the context CCGG&SO is working in. A description of the Civil Society Context assessed according to the CIVICUS framework is provided in appendix 3 of the country report for Civil Society.

2.1 Political context

The Ethiopian Government has enacted a five year Growth and Transformation Plan (GTP) to implement over the period of 2011-2015.¹ Two of the major objectives of the plan are to maintain at least an average real GDP growth rate of 11%, meet the Millennium Development Goals, and expand and ensure the qualities of education and health services thereby achieving the MDGs in the social sectors (FDRE, 2010). The government acknowledged that NGO's and CSOs have an important role to play in the implementation of this plan: According to the preamble of the new charities and societies proclamation NO. 621/2009 of Ethiopia, civil society's role is to help and facilitate in the overall development of the country². This is manifested in the government's approach of participatory development planning procedures. For example, NGOs established a taskforce under the umbrella of the CCRDA to take part in the formulation of the country's first Poverty Reduction Strategy paper formulation. They were a major stakeholder in the planning process of the five year GTP plan. Despite fears that the NO. 621/2009 proclamation was thought to have negative impacts on Civil Society, the number of newly registered charities and societies have increased considerably. 800 new charities and civil societies were registered between 2010/11 and 2011/12 and as of February 2012, these were implementing over 113.916 projects in different social, economic and governance related sectors. Governance related projects comprise interventions in the area of democracy and good governance, peace and security, human rights, justice, and capacity building. The charities and societies are most engaged in the health sector (19.8%), followed by child affairs (11.9%), education (9.2%), governance (8.3%) and other social issues (7.8%). These figures are more or less similar to the pre-proclamation period, and would imply that new charities or societies have replaced foreign and Ethiopian charities that are not allowed to work on sectors related to governance and human rights.³ This might indicate that there might have been some flexibility in the interpretation of some of the provisions of the proclamation.

3 Description of CCGG&SO and its contribution to civil society/policy changes

3.1 Background of CCGG&SO

History

The Catholic Church of Gamo Gofa and South Omo is a church based NGO. It has been engaged in community based development interventions over the last 35 years. The church has a pastoral program and an Integrated Community Development Program (ICDP) that both have a holistic approach to human development. CC-GGSO has a development board which falls under the responsibility of the Vicariate of Sodo-Hossana. The Catholic Church 16 maintains the necessary degree of control and direction of the Integrated Community Development Programme through its own management structure and development board.

Cordaid has been supporting CC-GGSO since the mid-1980s. In 1996 the donor organisations Dreikönigsaktion Österreich, Cordaid and Misereor asked for an evaluation to ensure compliance to their requirement and to rectify drawbacks witnessed in the implementation of programmes. The evaluation led to a re-orientation and the formulation of a new strategic plan. The influence of the Holy Ghost fathers decreased and was later replaced by a professional board. Despite the slow pace in depletion of funds, the Church has been effective in recent years mainly due to good leadership, program focus and imitation of innovative projects that are in line with community demands and priorities.

Vision and mission:

The vision of the vicariate is to see a society where all its spiritual, physical, socio-cultural needs are met and where all people are living in harmony, solidarity, equity, justice and peace. The Church's mission is to contribute to the economic, social and spiritual development of its community, and to ensure growth and self-reliance. Sustainability as well as ownership are crucial values within this mission.

Main strategic actions:

Towards the realization of its vision and mission, the Church, through their social development wing, is undertaking its social and development projects through grass root level project site structures, comprising Community Based Technical facilitators assisted by the local community, and other line bureaus.

Interventions are identified through a series of consultations and assessments jointly undertaken with line bureaus and community representatives. Major areas of emphasis include:

- Health, HIV/AIDS prevention and awareness; water development;
- Education;
- Agriculture/Food Security, and
- WID/GAD promotion activities.

CCGG&SO is based in ARBA Minch and has 20 staff members. It has a program in Gamo Gofa and in South Omo, the latter being managed from a field office in Dimeka. Cordaid currently only supports the program in South Omo which has a program coordinator, three technical facilitators, one community based social facilitator, two community animators, one assistant director, one finance administrator and one accountant.

CCGG&SO is implementing its MFS II funded Integrated Community Development Project (ICDP) in South Omo. Its first phase (2010-2012) targeted the rural pastoral and agro-pastoral communities of the woredas Hamar (Kufur, Gedback, Lala, Algone and Dimeka town) and Malle (Golloberendo and

Doiso) in Southern Nations Nationalities and Peoples Regional State (SNNPRS). In the next phase (2013-2015) the project will target the pastoralist and agro-pastoralist communities in seven villages of Hamar Woreda namely: Kufur, Shanko, Woro, Wolfo, Simbele, Besheda and Dimeka. The overall goal of the project is to enable the selected communities to contribute proactively to the improvement of their living conditions.

3.2 MFS II interventions related to Civil Society

In terms of direct beneficiaries, the ICDP project does livelihood improvement interventions at individual level for 940 households (at least 50% women), an immunization program targeting 1296 children and 6269 women, an alternative basic education component for 180 children (20% girls) and functional adult literacy for 350 adults (20% women). Most of the project interventions will offer communal benefits to the entire target group, which is 14,054 people (approximately 2,969 households, out of which 42% are women headed households).

The ICDP programme in Hamar district, targeting seven communities comprises five result areas: Sanitation & hygiene conditions; community based, maternal & child health care; access to and quality of basic education for children and adults; household food security, and; women socially and economically empowered⁴.

This civil society evaluation will focus on household food security and women empowerment which relate to MDG 1 that Cordaid identified as the main intervention for CCGGS&O in 2012. This component comprises several activities in the agricultural and non-agricultural sectors and is linked to nutrition as well as to income. For the CIVICUS dimension 'civic engagement', results include:

- At least 600 women will be directly involved in the social and economic empowerment activities and have improvement in their livelihood
- Train selected heads/members of 100 households directly practicing the beekeeping for 5 days
- 80 women will benefit from the provision of goats
- 100 vulnerable community members will benefit from various skill trainings and seed capital
- Support backyard animal fattening initiatives of pastoralists
- Introduce small scale drip irrigation schemes for vegetable production near water schemes
- Train and equip 10 para-vet scouts on sharing bases
- Train pastoralists on improved dairy production & management techniques

For the dimension 'level of organisation', results include:

- At least six microfinance- projects will be initiated and implemented in Malle, this will benefit 8000 community members
- Two co-operatives will be organized and obtain legal entity and provide service to the community
- Establishment of goat production women groups by handing out 270 goats, and assist them to start animal husbandry

Results to look at for the dimension 'perception of impact' are:

- Exposure visit with a team of 24 people including participants of the Pastoral Field School (PFS), ICDP staff, government staff
- Link all beneficiaries that are involved in income generating activities (IGA) to 6 Saving and Internal Lending (SILC) activity. Examples of IGAs are collective dairy production, agriculture or horticulture around drip irrigation, collective goat production
- Two co-operatives will be organized and obtain a legal status and provide service to the community

⁴ Project kenschets and considerations

4 Data collection and analytical approach

4.1 Adjustments made in the methodology of the evaluation

CC-GGSO is implementing its MFS II funded Integrated Community Development Project (ICDP) in South Omo. Its first phase (2010-2012) targeted the rural pastoral and agro-pastoral communities of the woredas Hamar (Kufur, Gedback, Lala, Algone and Dimeka town) and Malle (Golloberendo and Doiso) in Southern Nations Nationalities and Peoples Regional State (SNNPRS). In the second phase (2013-2015) the project will target the pastoralist and agro-pastoralist communities in seven villages of Hamar Woreda namely: Kufur, Shanko, Woro, Wolfo, Simbele, Besheda and Dimeka.

This means that Kufur and Dimeka town receive support for the entire MFS II period (2010 – 2015) and that Gedback, Lala, Alagone, Golloberendo and Dioso received support during the 2010-2012 period and that Shanko, Woro, Wolfo, Simbele, Besheda are new kebeles in which CCGG&SO intervenes in the 2013 – 2015 period.

Initially, Cordaid mentioned that no project documentation was available. Later on, the evaluation team received project documents in hard copy that only covered the period January 2010 – June 2013. As a result the evaluation team encountered difficulties in compiling all information from the project documents as a means to obtain a complete overview of outcomes and outputs achieved in line with the logical framework.

4.2 Difficulties encountered during data collection

CCGG&SO was very collaborative in the whole process of the evaluation. They showed great hospitality by offering the guest houses to the evaluation team and because of their support it was possible to conduct the evaluation. Though this was the case, data collection turned out to be difficult as the SPO was still partially closed due to the audit conducted by the local government and consequently the files were not accessible. In addition, some key resource persons were not available during the evaluation process. In the in-country evaluation team found the process tracing tools relevant in tracing the changes occurred and explaining them. The team further observed that contextualisation in social, cultural and political terms was necessary to fully use these tools.

CCGG&SO did not have many documented evidence in terms of progress being made on their interventions. The SPO hands over groups/cooperatives to the local government after their establishment and after having given them the necessary training. Follow up efforts by CCGG&SO are minimal leading to the SPO not having up to date information.

4.3 Identification of two outcomes for in-depth process tracing

In-depth process tracing was used to explain one outcome achieved, which relates to the extent to which CCGG&SO's contributed to improved food security of households in 7 kebeles in the Hamar district. According to the SPO household food security of some 1300 direct beneficiaries should have been improved between 2010 and 2015. CCGG&SO states to have contributed to food security by means of the creation of Saving and Internal Lending Communities, Community Health Micro Finance Schemes, and cooperatives.

Because the office of CCGG&SO is closed, a second outcome achieved could not be identified.

5 Results

5.1 Results obtained in relation to project logframe

The Hamar community is still highly affected by deep-rooted harmful traditional practices, which include abandoning (killing) children for ritual reasons, biting women during the initiation ceremony, committing abortion if women conceive prior to this ritual ceremony, being resistant to girls education, and high spending for traditional events such as initiation, funerals, commemorations. These Harmful Traditional Practices, together with low levels of community participation in development efforts hinder the development of the Hamar Community.

In the second phase CCGG&SO included new villages in its program: Shanqo-Kelema, Shanqo-Wolfo, Woro, Besheda and Sembele and it phased out of most of the communities that received support 2010-2012 period such as the villages Doyso and Goloberendo of Malle woreda and that of Gedback, Algonie and Lala in Hamar woreda. The SPO pulled out of Malle woreda to focus on Hamar. Kufur & Demeka Zuria are few of the previous areas it has continued to work in. The livelihoods improvement component has now got funding through the joint CAFOD/SCIAF/Trocaire office (CST) that was not there previously.

Outputs for the January 2011 to December 2012 programme

4011 children and 2112 women (229 children and 1753 women planned) have been vaccinated; 650 persons (150 planned) attended nutrition demonstration sessions; 20 Health Extension Workers (HEW) were trained on first aid provision, 5 HEWs were trained on immunization practice and improved vaccine management and 10 traditional birth attendants (TBAs) (3 TBAs planned) were trained. These outputs relate to ICDP's result 'community based maternal & child health care'.

20 government workers and 23 students have been trained in computer skills; 14 community teachers have been trained and are serving in alternative basic education schools where 385 children are enrolled and have received scholastic materials; 4 school committees were formed and trained and 23 pastoralist students receive basic computer training and English. These outputs relate to ICDP's result 'access to and quality of basic education for children and adults'.

Another 651 people (457 female and 194 male) have been trained in nutrition practices, but the evaluators ignore if these are the same persons that attended the nutrition demonstrations. Eight micro-finance schemes with over 820 members have been set up where members can take out loans when referred to higher level health facilities (3 health insurance schemes planned). These outputs relate to ICDP's result 'household food security' and/or 'women socially and economically empowered'.

The reports do not mention how many mothers and children have been reached under the primary health care component (1829 mothers and children planned); if progress has been made with regards to biological family spacing methods; if a minor treatment service was created in Kufur; if 100 community members were trained on various health issues to serve as role models for community members; if 1200 individuals got health education and if information, education and communication materials on health issues were produced and distributed.

Outputs for the January – June 2013 period

The ICDP programme in Hamar district, targeting seven communities comprises five result areas: Sanitation & hygiene conditions; community based, maternal & child health care; access to and quality of basic education for children and adults; household food security, and; women socially and economically empowered⁵.

With regards to the expected result 'sanitation and hygiene' one training was planned for HEW on the topic 'community led total sanitation'.

⁵ Project kenschets and considerations

With regards to the health component, and in particular the vaccination programme, this has been carried out in all seven kebeles on a monthly basis, reaching 80 fully vaccinated children in the first semester of 2013. Four kebeles received information on the community based health insurance scheme.

The report further states that 8 micro-finance schemes were created which is three more than planned. This information is however in contradiction with the evaluation in the field where CCGG&SO staff mentioned the creation of 4 health micro-finance schemes.

At the time of the end evaluation, the SPO has started the construction of a new Health Centre in Shanqo with funding from CST.

The evaluation team has not received progress reports that cover project activities beyond June 2013. This might be due to the fact that the CCGG&SO office has been closed for several months since the beginning of 2014.

CCGG&SO office in Hamar district was closed in the first semester of 2014, after three fired staff members filed a complaint with the local government, allegedly accusing CCGG&SO of corruption. Although the allegations proved to be false, CCGG&SO has difficulties to get back on track.

5.2 Changes in civil society in the 2012-2014 period

5.2.1 Civic engagement

Civic engagement describes the formal and informal activities and participation undertaken by individuals to advance shared interests at different levels. Participation within civil society is multi-faceted and encompasses socially-based and politically-based forms of engagement.

Before the start of phase two of the project (2013-2015), orientation meetings were held in each kebele to familiarize communities with the project plan. Over 200 people participated in the meetings, out of which 60 were women. Clarifications were made on the implementation strategies, role of communities, government and the project.

Having agreed upon the targeting criteria with the community, the beneficiary identification process started. Community leaders, agricultural extension workers, and the project team played a leading role in the beneficiary identification process and their selection. In general the Hamar community is reluctant to try new ideas until they see someone else try it and succeed, so they do not volunteer to much interventions. In this light, involving them actively in project design and extensive awareness creation seems important.

Eventually, 30 beneficiaries were selected for vegetable production and put into groups of 10 in the 2010-2012 period. They were then trained on land management and vegetation using the training manuals developed by government experts. Trained beneficiaries are then provided with farming materials and seeds by CCGG&SO and provided with a land plot by the government. CCGG&SO contributes with transportation when possible aside from following up at least for the first few months. The Development Agents in the Agriculture offices at the various sites also provided consulting service and follow up. This supports capacitate the groups which then leads to improved income and nutrition of group members. However, most of the groups put together for this purpose have either lost some of their members (reaching up to 5 members) or have all members working individually. Reason for leaving the group is mostly the nature of the community to work individually than wait for each other to work as a group. They are pastoralists so herding cattle is their main activity and growing vegetables comes second.

CCGG has also created awareness on the benefits of cooperatives and collected and established 3 cooperatives in the area between 2012-2014: one in town and two in rural areas. The two in the rural areas were handed over to the government for follow up but due to the lack of follow up the two have failed in performing well. The one in the town is operating well. They are expected to provide consumer goods such as oil and sugar aside from other goods to prohibit traders from inflating the prices in times of shortage.

The main changes in community involvement were observed in the first few months of 2012 where the SPO had community discussions on phase two of the project and selection of new beneficiaries. However, due to the emergence of internal problems the SPO has not been in contact with any parts of the community for almost a year between the baseline and the end-line study.

Score baseline 2012 on an absolute scale from 0-3: 2
Score end line 2014, relative change on a scale of (-2, +2): -1

5.2.2 Level of organization

This dimension assesses the organisational development, complexity and sophistication of civil society, by looking at the relationships among the actors within the civil society arena.

The baseline study mentions strong interaction between CCGG&SO and the 30 community groups established by CCGG&SO to discuss the progress obtained with regards to the implementation of the project and to come with joint proposal for solutions. However the situation in 2014 has deteriorated because all activities have been handed over to the local government who fails to provide the necessary guidance.

Practice also learns that community groups, in particular the vegetable groups are not working, because individuals of these groups prefer to work on their own plot and realise considerably higher yields and incomes than the collective groups.

CCGG&SO participates in the annual NGO forum called by the government where the 11 NGOs working in the area participate. However, this forum serves as a political instrument where the government discusses its points and asks the support/ adherence of the attending NGOs. There are several NGOs working in the area like Action for Development (working on water and sanitation- also working on IGA where groups are producing soap from aloe vera grown in the area), AMREF (Health), Save the Children (Children) and Mom Child (OVC). The SPO also participates in an annual review meeting on health where NGOs participate but as the direct responsible person is no longer with the organization details were not available.

Collaboration with the NGOs in the area has not increased since the baseline. NGOs in the area still prefer to work within their own space and time rather than communicating and collaborating with each other. Currently there also is little dialogue going on between CCGG&SO and Red Cross after the first aid training and handing over of the ambulance.

CCGG&SO's financial resource base for Hamar woreda has increased since the baseline.

Score baseline 2012 on an absolute scale from 0-3: 2
Score end line 2014, relative change on a scale of (-2, +2): -1

5.2.3 Practice of Values

Practice of Values refers to the internal practice of values within the civil society arena. Important values that CIVICUS looks at such as transparency, democratic decision making, taking into account diversity that are deemed crucial to gauge not only progressiveness but also the extent to which civil society's practices are coherent with their ideals.

Since the baseline, annual audit of accounts have been made by external auditors based on the preference of the donor partners in selection/ commissioning of audit firms. The necessary actions were taken on the report by program management and the reports were shared among stakeholders (donors and government partners).

People of marginalized target groups are not represented in the official organs of the SPO, because the community by and large is illiterate to get representation in the CC development structures and the necessity is yet to be debated at the higher organization level and clarified if the constitution of the Social & Development Coordinating offices allow that. The trend & practice of having representations of marginalized groups in their immediate community organizations has not changed since 2012.

In 2014, all monthly staff cost, from store keeper, mechanic, cashier and watchmen to community animators, technical facilitators and program coordinator, had increased by at least 40 since 2011. This increase is reasonable in light of the high inflation rate in the country.

Score baseline 2012 on an absolute scale from 0-3: 2
Score end line 2014, relative change on a scale of (-2, +2): 0

5.2.4 Perception of Impact

Perception of Impact assesses the perceived impact of civil society actors on politics and society as a whole as the consequences of collective action. In this, the perception of both civil society actors (internal) as actors outside civil society (outsiders) is taken into account. Specific sub dimensions for this evaluation are the extent to which the SPO has contributed to engage more people in social or political activities, has contributed to strengthening CSOs and their networks, has influenced public and private sector policies.

Civil society arena

In 2013 CCGG&SO mainly concentrated on either individual or group IGA activities in the livelihood component of the programme: In 2012, 144 vulnerable women were involved in goat keeping; 97 people (59 women) engaged in vegetable production; 97 persons (40 % women) received skills training in carpentry, grain mill maintenance and tailoring; an unknown number of women were organised in poultry groups. These women can also receive counselling and consultancy from the local Development Agents. CCGG&SO selects IGA beneficiaries together with kebele officers and provide training together with experts from the Woreda in different IGA's such as vegetable production, beekeeping, fattening, carpentry, and poultry. After the training the beneficiaries are supplied with inputs and monitored by CCGG&SO and the DA's at Kebele level.

The results of CCGG&SO to support IGAs are mixed. Some beneficiaries that were involved in the goat groups indicate their lives have changed for the better, others mention their goats died and they ended up with nothing⁶. The same applies to the women who received chickens. The groups formed around vegetable production stayed together for one season only and then individual members decided to disburse further on their own. These individuals see no benefits in working in a group since with their own efforts they earn considerably more⁷. Some beneficiaries are making money from carpentry and poultry. They mention that honey production is not successful as the bees wouldn't stay in the hives provided for them.

According to the pastoral office the most significant change in relation of the introduction of IGAs is that of changing mindsets that stimulate people to try different IGAs. The office observes an impressive mental change regarding the readiness to try vegetable production. CCGG&SO organises coffee ceremonies to inform beneficiaries about different income generating activities. It is mentioned by a beneficiary that he would never had tried vegetable production if it has not been introduced by CCGG&SO.⁸

GGCC&SO planned that all IGA beneficiaries would earn enough to start saving in SILCs or in community health micro finance schemes. The plan was to have six SILCs operational in six kebeles by 2015. The 2013 project document learns that by the end of 2015 some 1050 households should be able to increase their income and hence become a potential member of the SILC⁹. A SILC is managed by a group of 15 – 30 self selected members. In 2013, CCGG&SO established two SILC groups in

⁶ Interview with female beneficiaries involved in goat keeping.

⁷ Interview with vegetable group member

⁸ Interview with beneficiary from Shanko

⁹ in the 2013 – 2015 period, 100 pastoralists from 7 kebeles should be able to earn an income through improved dairy production and management; 100 households from 7 kebeles should be able to earn an income through the introduction of improved seedlings for fruit varieties; 100 households should be able to earn an income through beekeeping; 100 households should be able to earn an income through animal fattening; 90 households, through improved drip irrigation should be able to earn an income through vegetable production. In the 2010-2012 period, some 100 persons were targeted for vegetable production. In the 2013 – 2015 period, 200 women should be able to earn an income through IGA. In the 2013 – 2015 period, At least 180 households, later 360 households should be able to increase their income through goat keeping solidarity groups. In the 2010 – 2012 period the target was 208 women to be involved in goat keeping. In the 2010-2012 period, 100 persons should be able to earn an income after a skills training

Demeka town, one group having 34 members (5 male and 34 female- this SILC was established before 2012 and had 12 members in 2012) and one group having 7 members (all members). Savings are kept by the SILC treasurer and not interest rates are paid, whilst Ethiopia's inflation rate between 2006 and 2014 is estimated at 19 percent a year. Saving in the official micro finance institution is more beneficial because some interest is being paid and because people can withdraw money when needed.

In the 2010-2012, eight community health micro finance schemes were established instead of the four planned, and they counted 821 families instead of 1600 families planned. The 2013 – 2015 programme foresees 7 of such schemes, 1 in each kebele (those in Malle were not anymore followed because another church started working in that district). At the beginning of 2014, 1 health scheme in four kebeles was realised. The health schemes were given 5000 birr initial capital. The health schemes mobilise local resources in terms of livestock or cash. Based upon those community savings, CCGG&SO also contributes funds in order to create an emergency and resilience community fund for medical purposes. Members are able to borrow money and then reimburse after having sold livestock, honey etc on the local market (once a week). The group has its own management committee in which the HEW, kebele leaders and community members are represented. They have their own bylaws. No figures are available of members currently associated with these health micro finance schemes and neither their performance in terms of service delivery to members.

None of the three cooperatives is functional. CCGG&SO organised two multipurpose cooperatives and one consumer cooperative which are supposed to help their members improve their lives. They claim to have stabilised the local inflation level and to prevent shortage of supplies by purchasing consumables from wholesale suppliers and selling these with a minimum of profit. The government cooperative promotion office who is in charge of supervising all three cooperatives fails to do so because they do not receive the financial support from the woreda administration. In addition, the government is unwilling to provide the cooperatives with working area, particularly in the Demeka area, which troubles their existence since they are not able to pay the rent.

Although CCGG&SO's interventions have not reached many people and interventions in the 2013 – 2015 period are considerably lagging behind plans, some individuals have changed their mind sets because they understand the utility of income diversification. In particular the poultry and goat scheme have proven to be beneficial for widows and destitute women. These few successes inspire others to also diversify their livelihood strategies and some are said to have become change agents. Negative unintended effects of the project however, are in the fields of the phase out strategy, high expectations by the community and the unknown effects of the project interventions on culture.

Collaboration with the public sector and policy influencing

Collaboration with the public sector has deteriorated since the baseline. In the first place CCGG&SO and some 10 other NGOs participate in annual meetings convened by the government, who set its own agenda and to ask participating NGOs to adhere to this agenda rather than stimulating dialogue. CCGG&SO, after having established groups for income generating activities and cooperatives, has to handle over these activities to the woreda government, who fails to supervise these activities. An ambulance given to the Red Cross was confiscated by the health office and in not always used to transport sick people.

The six months closure of CCGG&SO in the beginning of 2014 and imposed by the local government was the lowest point in relations with the government since 2012.

Collaboration with the private sector and policy influencing

Apart from working with suppliers of advisory services or materials, CCGG&SO is not collaborating with the private sector.

Score baseline 2012 on an absolute scale from 0-3: 2
Score end line 2014, relative change on a scale of (-2, +2): -1

5.2.5 Civil Society Environment

The social, political and economic environment in which civil society operates affects its room for manoeuvre. The civil society context has been described in chapter 3. In this section we describe how CCGG&SO is coping with that context. The 2009 Proclamation to Provide for the Registration and

Regulation of Charities and Societies (CSP) and the related "70/30" regulation that limits administrative costs for all charities and societies to 30% of their budgets.

A corrective management decision to fire three staff members in the Hamar program who broke regulations in January 2014 has resulted in unfavourable turn of events. The fired employees filed a complaint with the local government, leading to the closure of the office from March to July 2014. The former employees asked for an unconditional return and an investigation and audit of accounts. Meanwhile, the SPO did its best to hold talks with the authorities that ended up in deadlocks because nobody in local government was cooperative.

CCGG&SO reported the event to the Regional Bureau of Finance via its headquarters, the Vicariate of Soddo & the Ethiopian Catholic Secretariat (ECS), which recommended a mediation process between the local government office and CCGG&SO at the beginning of the dispute. Later, upon receipt of a letter of the zonal Administrator, an investigation was carried out. The investigation took place after a lapse of two months. Based on the findings of the investigators, a report was sent to the Federal Central Statistics Agency (CSA) which sent down a delegation to resolve the issue and accordingly it was agreed to open the office.

In its decision, the Federal CSA commended on the responsiveness of the SPO on five points out of the ten points reported by the Regional Bureau of Finance. The Bureau of Finance also cited weaknesses and measures to be taken by the CCGG&SO. Weaknesses of the local government were also been spelt out and advised not to repeat. As a result, the false allegations made against the church are clarified and the issues that need legal attention concerning the fired employees are referred to the labour court. It is agreed to get back to program implementation. The current position of the partnership with the government is similar to the way it was before.

However, the whole incident has created division, triggered confusion, and threats were made against fellow staff members. Additionally, false and disproportionate rumours about the leadership and its transparency were going around. As a result, staff composition has changed. The human resources administration and their manuals for job performance appraisal and supplies procurement are under review and reassurance was given to donors that system overhaul is being made.

Score end line 2014, relative change on a scale of (-2, +2): -1

5.3 To what degree are the changes attributable to the Southern partner ?

This paragraph assesses the extent to which CCGG&SO contributed to increased food security in Hamar district in the 2010 -2015 period. Starting with an outcome, the evaluation team developed a model of change that identifies different pathways that possibly explain the outcome achieved. Data collection was done to obtain evidence that confirms or rejects each of these pathways. Based upon this assessment, the evaluation team concludes about the most plausible explanation of the outcome and the most plausible relation between (parts of) pathways and the outcome. The relations between the pathways and the outcomes can differ in nature as is being explained in table 4.

Table 4
Nature of the relation between parts in the Model of Change

Nature of the relation between parts and other parts or outcome	
The part is the only causal explanation for the outcome. No other interventions or factors explain it. (necessary and sufficient)	
The part does not explain the outcome at all: other subcomponents explain the outcomes.	
The part explains the outcome but other parts explain the outcome as well: there are multiple pathways (sufficient but not necessary)	
The part is a condition for the outcome but won't make it happen without other factors (necessary but not sufficient)	
The part is a contributory cause it is part of a 'package' of causal actors and factors that together are sufficient to produce the intended effect.	

The following paragraph assesses CCGG&SO's contribution to two outcomes. Each paragraph first describes the outcome achieved and the evidence obtained to confirm that the outcome has been achieved. It then presents the pathways identified that possibly explain the outcomes, as well as present information that confirms or refutes these pathways. The last section concludes in the first place about the most plausible explanation of the outcome, followed by a conclusion regarding the role of the SPO in explaining the outcome.

5.3.1 Strong organisations lead to improved food security of households in the Hamar district

Outcome and evidence found

The evaluation team looked at the extent to which the SILCs, the health micro finance schemes secured savings for their members, who also benefitted from support given by CCGG&SO to start income generating activities such as goat keeping, poultry, carpentry, beekeeping, horticulture. According to CCGG&SO some 1300 participants, in particular women, should have been involved in these IGA and hence become a member of the SILCs or the health micro finance scheme, which in turn should lead to improved food security. Another strategy to improve food security consisted of setting up cooperatives.

The evaluation team did *not find* evidence regarding the exact number of persons adhering to the cooperatives, the health micro finance schemes and the SILCs showing trends in the 2010-2014 period in Hamar district. The evaluation team did *not find* any figures that show that food security in general has improved in Hamar district in the 2010 -2015 period.

The following pathways were identified that each should lead to improved food security:

1. Households are able to access small loans and emergency grants via SILCs put in place by CCGG&SO
2. Community Health Micro Finance Schemes make households more resilient to health and food security problems. These were put in place by CCGG&SO
3. Cooperatives provide consumer goods to prohibit traders from inflating prices in times of shortage. Three of such cooperatives were created by CCGG&SO
4. Food security is most likely to be increased through individual IGA. A number of IGAs were supported by CCGG&SO
5. Households earn an income through the cash/food for work programme and will access the Household Asset Building program with an initial capital from government. This is a programme run by the Government.

There is one underlying assumption in CCGG&SO's model that states that those beneficiaries that participate in IGA at a certain moment become member of the SILC or the Health Micro Finance Scheme.

Evidence that confirms or rejects pathways

Pathway 1: Households are able to access small loans and emergency grants via SILCs

A SILC is managed by a group of 15 – 30 self selected members and offers a safe opportunity to save and allows them access to small loans or emergency grants. CCGG&SO planned to have 6 SILCs operational in 6 kebeles in the 2012 -2014 period and that some 1050 persons should have been able to increase their income through IGAs and hence become a member of the SILC by 2015.

Information that rejects this pathway:

Only two SILC groups are operational in Demeka town, one that started with 12 members in 2012 and has 34 members of which 9 women in 2014 and one with seven members only. In comparison to the expectation of having 6 SILCs and 1050 members according to plan this result is neglectible.

As already mentioned before, members who deposit their savings can not access it for a whole year and no interest rates are applied when savings are kept in a savings box: The average inflation in Ethiopia is estimated at 19 % between 2006 and 2014 and therefore it is more attractive for people and groups to deposit their savings at the micro finance institution that they can have access to at any moment and that is supposed to give some interest.

The Omo micro-finance confirms that groups (vegetable group and stove group) but also individuals who belong to groups have accounts with them and are saving on a regular basis.

Information that confirms this:

One SILC group confirms that there is a relation between IGAs and savings. The seven members of the SILC group started this because they are a stove group¹⁰.

Pathway 2: Community Health Micro Finance Schemes make households more resilient to health and food security problems

The health micro finance schemes mobilise both resources in cash and kind. Based upon those community savings, CCGG&SO also contributes funds in order to create an emergency and resilience community fund for medical purposes. Members can borrow money and then reimburse after having sold livestock, honey etc on the local market (once a week). The group has its own management committee in which the HEW, kebele leaders and community members are represented. They have their own bylaws.

Information that confirms this pathway

Eight community health micro finance schemes were established between 2010 and 2012 instead of the four planned, including 821 families instead of 1600 families planned. During the 2013 – 2014 period four additional schemes were realised in four kebeles, whereas seven of such schemes were foreseen.¹¹ These health schemes were given 5000 birr initial capital. One interviewee explains there is a lot of interest in the schemes because people hear positive stories from the ones who benefitted.

Assumption to pathway 1 and 2:

Both pathways assume that beneficiaries that participate in IGA earn enough money to save in the SILC or the Health micro finance scheme.

Information that *confirms* the assumption consists of one initial trial to establish a SILC in Dimeka town failed due to too low income levels.¹² Apart from a stove group that created its SILC *there is no evidence* that

supports the assumption, although some of the IGA yielded better incomes, such as was the case with horticulture which is more successful as an individual rather than as a group (126 beneficiaries of which 59 women); the goat (144

women) and the poultry scheme

(figures unknown); and carpentry and others IGAs (97 persons of which 40 % female).

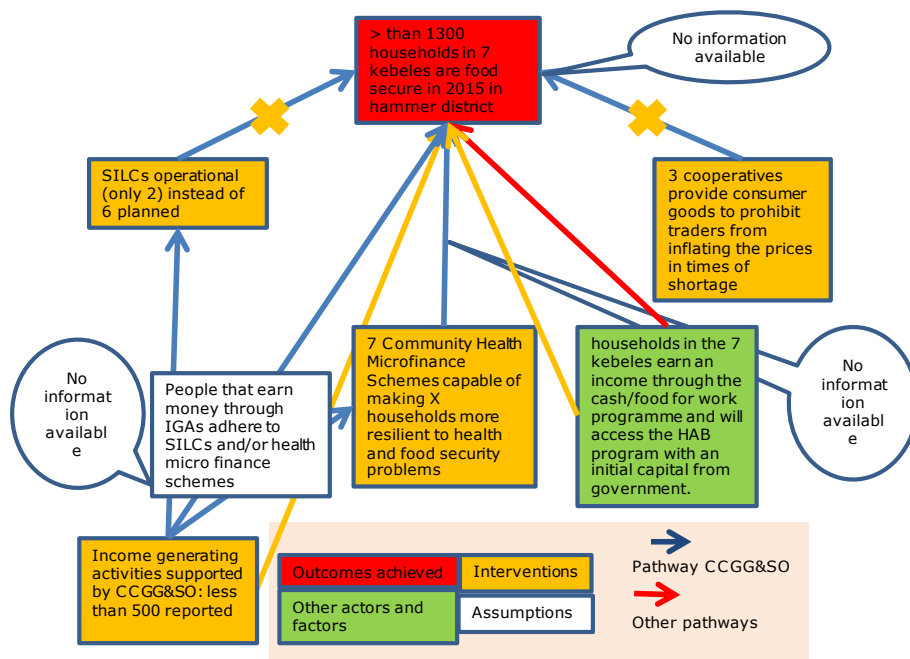

Figure 1: Pathways that possibly explain outcomes and conclusions about the nature of the relations between pathways and the outcome, intermediate organisations

¹⁰ Interview with SPO staff

¹¹ Those in Malle were not followed anymore because another church started working in that district

¹² Based on project documents

Pathway 3: Cooperatives provide consumer goods to prohibit traders from inflating prices in times of shortage

Information that *rejects* this pathway:

None of the three cooperatives created by CCGG&SO is operational: these cooperatives were handed over to the Woreda government who failed to ensure a good supervision and technical assistance to keep the cooperatives running. The cooperatives claim to have stabilised the local inflation level and to prevent shortage of supplies by purchasing consumables from wholesale suppliers and selling these with a minimum of profit.

Pathway 4: Food security is most likely to be increased through individual IGA

Information that *confirms* this is available in particular for horticulture, goat keeping, poultry and carpentry but not for beekeeping. According to CCGGSO some 500 persons received individual IGAs which were expected to grow to 1050 persons. No exact figures are however available.

However the number of people that have engaged in IGA due to CCGG&SO are by far the 1300 expected at the outcome level.

Pathway 5: Households earn an income through the cash/food for work programme and will access the Household Asset Building program with an initial capital from the government

Information that *confirms* this is that over 45 % of the 43,000 people living in Hamar woreda are supported by Productive Safety Net Programs.¹³ In this program, vulnerable groups either get direct support or contribute labour and get paid.

Information that *rejects* this pathway consists of the fact that this program is not very sustainable as it may help to solve transitory food shocks, but that it cannot help to break the poverty circle. By design, beneficiaries have to graduate after they accumulate assets but graduation in this Woreda has not yet started. Targeting problems, small grants and frequent drought in the area make the program unsuccessful and it just only helps to narrow the food gap.

Conclusions

A first conclusion is that there is no information available that food security improved for some 1300 beneficiaries of the CCGG&SO program. Food security may have been increased for a fraction of the approximately 500 persons that received support in terms of diversifying their IGAs. This pathway and that of the Productive Safety Net Program both might sufficiently but not necessarily explain increased food security for a very limited number of Hamar Woreda's population. There is no information available to confirm that the health micro finance schemes improve food security at household level. The creation of SILCs and cooperatives has not at all contributed to improved food security and that of the popular health micro finance insurance schemes is unknown. These are hence non necessary and not sufficient causes to explain increased food security.

The role of CCGG&SO has been minimal in increasing food security for the following reasons: In the first place, after handing over some of the activities such as the cooperatives, the vegetable groups and others, the woreda government failed to develop adequate technical assistance strategies; in the second place CCGG&SO was not operational anymore since January 2014, and; in the third place CCGG&SO does not have a monitoring and evaluation system in place to assess outcome and impact at household level and therefore leading to important information gaps for the evaluation team.

5.4 What is the relevance of these changes?

5.4.1 Relevance of the changes in relation to the Theory of Change of 2012

In its 2012 ToC CCGG&SO formulated its overall goal with regards to civil society as "Improved health, improved livelihood, and education of the people of South Omo by creating self-sufficient and performing civil societies". In order to reach this goal CCGG&SO identified five conditions that need to be in place: the capacities of civil society organisations need to be build; civil society needs to network between each other and public sector; follow up on a culture sensitive strategy for CSOs' activities is

¹³ Kenschets and considerations

needed; local skills and knowledge need to be identified and developed, and CSO's need a conducive environment.

Until so far we conclude that the conditions have not been met since the groups and cooperatives formed are not functioning. Hence, civil society is not yet able to provide services to society. An exemption can be made for the goat groups as these groups are functioning as the women grasp this opportunity to become less dependent on men¹⁴.

5.4.2 Relevance of the changes in relation to the context in which CCGG&SO is operating

The 7 kebeles from the Hamar District were identified to be the project target areas because of their relative level of poverty, the fact that they were poorly addressed by development actors and the availability of local resource potentials to build on.¹⁵ The target group consists of semi pastoralists whose main way of living is livestock herding, but when the weather is conducive they grow different crops such as maize and sorghum. In recent years, the area has been severely affected by consecutive drought resulting in frequent crop failures. Accordingly, the government has been providing food aid for a number of years, followed by the recent productive safety net program. Since the Woreda is far from the centre, pastoralists are marginalized in terms of infrastructure and other basic facilities such as health and education. The evaluation team even learned that some of the kebeles were totally forgotten by the local government, and they did not have schools, health posts or rural roads. In this regard, CCGG&SO's presence is relevant but negligible given the insignificant number of beneficiaries (a maximum of 500 persons) reached and the severe food security problems in the district that has some 43,000 inhabitants.

5.4.3 Relevance of the changes in relation to the policies of the MFS II alliance and Cordaid

For Cordaid, Community Based Organisations form the main strongholds of societies and hence strengthening civil society means working via- and strengthening the capacity of CBOs and that of volunteers. Cordaid believes that strengthening forces within communities will bring about change. Since the Ethiopian civil society context leaves little room for policy influencing Cordaid tries to create awareness by supporting other themes such as livelihood improvement or economic empowerment. In relation to CCGG&SO Cordaid stressed the importance to include government people in training efforts so improve relations. This has resulted in a quick approval of road construction works and improvements in irrigation systems.¹⁶

In their 'eindafweging' Cordaid furthermore highlights the importance of CCGG&SO in relation to policy influencing as the Catholic Church has been talking (diplomatically) to a number of Embassies and donors (a.o. DFID and USAID) about the current worrying developments in South Omo. This evaluation found no support for this claim.

5.5 Explaining factors

5.5.1 Internal factors

The closure of the Hamar office between March and July 2014 did not only cause a delay in the implementation of the activities of CCGG&SO¹⁷, the termination of the contracts of some employees also created division, triggered confusion, and threats were made against fellow staff members. Additionally, false and disproportionate rumours about the leadership and its transparency were going

¹⁴ Interview with member of cooperative

¹⁵ Based on project documents

¹⁶ Interview with CORDAID Programme Officer

¹⁷ In the project documents it is mentioned that 'new activities for 2013 to 2014 are half -implemented due to the recent set back we met in our relationship with local government during the first six months of 2014'.

around. As a result, the staff composition has changed. Human resources administration procedures including job performance appraisal & supplies procurement manuals are under review and reassurance was given to donors that system overhaul is being made.

As a consequence, CCGG&SO's monitoring and evaluation efforts were not adequate. This was even reinforced by the bad follow up of the local government on groups/cooperatives which resulted in a gap between CCGG&SO's knowledge of the status and the actual status. With the three people that were fired a lot of CCGG&SO's institutional knowledge had gone.

5.5.2 External factors

Inaccessibility of the area, recurrent drought, unpredictable rains, land availability, and epidemics are common features of the district that challenge the effectiveness of CCGG&SO. Especially water shortage is a problem, community members are now fetching water from the river themselves which is very difficult.¹⁸ Additionally, High national inflation increased costs for nearly all items needed by the project. CCGG&SO furthermore mentions that the -sometimes sudden- changes in government policy makes it very difficult for the project to adapt accordingly.¹⁹

Human Right Watches reports of human rights atrocities committed against indigenous people living in the Lower Omo Valley, including the hamar population. The valley has many fertile grounds, and the government is constructing a massive hydroelectric dam, to be associated with large scale land acquisitions for irrigated agriculture and the forced resettlement of indigenous people.²⁰ This situation is being largely ignored but may definitely explain the constrained civil society space in which CCGG&SO is operating.

5.5.3 Relations Cordaid-CCGG&SO

With the information available it is not possible to explore the relations between Cordaid and CCGG&SO and how they might have affected the evaluation findings of civil society.

¹⁸ Interview with beneficiary from Shanko

6 Discussion

6.1 Design of the intervention

CCGG&SO's intervention strategy in relation to the livelihood component of their program has been to first change the community's attitude by creating awareness and then to increase their resilience by deploying alternative sources of income through different IGAs. A number of reasons can be mentioned for the difference in effectiveness of the interventions, such as the group members' participation and dedication, water availability, land availability, communities' perception to different IGAs and the social context. In their project design CCGG&SO acknowledged that, especially in the pastoralist community they operate in, new technologies introduced in the community should be compatible to the existing traditions and should be simple to use and replicate.

As the pastoralist community is known to be reluctant to change, awareness creation on intensive alternative ways of earning an income is an apparent need. The fact that the beneficiaries are willing to try new activities points towards the success of CCGG&SO's awareness raising activities. Even though the project documents mention the forming of groups could be useful for training and peer-learning, the need to form groups for IGA activities does not become evident as beneficiaries point out they do not see the benefits and rather work individually²¹. This is especially the case in the male groups, as the female groups have a social and emancipatory component next to an economical one. The resistance of the community to work in groups could have been observed from the groups formed between 2010 and 2012. When designing a new programme in 2012 it could have been worthwhile to consider providing training in groups but support individuals to deploy their IGA.

6.2 Replication of the intervention

Little (2001) argues there are many reasons why pastoralists diversify their income strategies, and much local variation in rationale and activities should be anticipated. Diversification options vary according to gender and proximity to towns and settlements. In general, options for women (petty trade) differ from those available for men (wage employment, livestock trade). Salaried employment may be most vital for promotion of food security (idem, 2001). Herders who reside less than 40 kilometers from towns typically have more alternative income generating options than those living further away. He furthermore argues that diversification is not always the panacea that it assumes to be, since some forms of diversification may increase risk. Interventions should prioritize promotion of customary resource use strategies (promoting mobility and livestock species diversity) where possible. Medium-term investments should focus on rural education since education is most likely to lead to options for salaried employment. For the settled poor, activities such as dairy trade, sustainable fuel production (forestry), and re-stocking schemes may have the most value.

Berhanu, Colman, and Fayissa (2005) add that an examination of the pastoralist activity choices reveals that the younger households which are literate and have more exposure display a more diversified income portfolio preference. Their findings underscore the importance of human capital investment and related support services for improving risk. This last finding supports the human capacity development training approach of CCGG&SO, but also puts extra emphasis for the need for CCGG&SO to assure follow up and support services, which was not the case in the current program because constraint by the woreda government. Additionally, a focus on younger households who are more open for change could yield greater results.

²¹ Interview with beneficiary from Algone; Interview with beneficiary from Shanko

7 Conclusion

Changes in the civil society arena of the SPO

In the 2012 – 2014 period CCGG&SO has seen a decrease of its civil society arena as well as the possibilities to collaborate with the local government. Most of its achievements on civic engagement date back from before the 2012 assessment; its collaboration with other NGO's decreased (level of organisation); its impact upon both civil society and upon the government decreased as well as its relation with the woreda government (perception of impact). Only its dimension 'practice of values' remained the same.

Contribution analysis

For CCGG&SO, the in-country evaluation team only looked at one outcome which is the capacity of community based organisations, and in particular health micro finance schemes, cooperatives, Saving and Internal Lending Communities (SILC) and groups organised around income generating activities to improve food security of an estimated 1300 households.

The evaluation team in the first place concludes that no evidence is available to state that 1300 households improved their food security situation. The most likely strategies that may explain improved food security at household level consist of CCGG&SO's support to introduce income generating activities as well as a food safety net programme that is currently in place. There is no information available that confirms that the popular health micro finance scheme contributes to increased food security. The cooperatives and the SILC are not contributing. CCGG&SO's has been minimal because the local government failed to follow up upon groups handed over as agreed; because CCGG&SO has not been operational since the beginning of 2014 due to internal problems that escalated. CCGG&SO also does not have any monitoring and evaluation system in place that helps to assess progress towards impact at household level.

Relevance

In relation to its 2012 ToC that stated that the capacities of CBOs need to be build and that they need to network and also relate to the public sector, the evaluators conclude that no progress has been made and that CCGG&SO's interventions have not been relevant.

In relation to the external context in which CCGG&SO is operating interventions are relevant for Hamar woreda which is a very isolated and nearly abandoned area by the government. But in relation to the severe food security problems that the 43,000 inhabitants of the district face, the outcomes achieved are negligible.

Important civil society elements for the communities of change alliance consist of strong CBOs, good relations with local government and using opportunities to influence policies. None of these elements have materialised in the past two years.

Explaining factors

The most important explaining factor of the evaluation findings consists of CCGG&SO firing three staff in January 2014, which escalated when the three staff members allegedly accused the SPO of corruption and filed a complaint with the government. In consequence the office was closed and awaiting an audit imposed by the government. Although all allegations proved to be untrue, CCGG&SO now faced difficulties in getting back on track.

A second important factor is also that the Lower Omo Valley has many fertile grounds and a river suitable for the construction of a hydroelectric dam to be followed by large scale land acquisitions for irrigated agriculture. Indigenous people like those living in the Hamar district are not being informed, and the government proceeds with forced resettlements. According to Human Rights Watch, the government is implicated in human rights atrocities. This tense situation may possibly, in contrary to other zones where the evaluators are assessing civil society impact, explain the non-constructive collaboration between NGOs and the local government.

Design

Given the existing context in which SSGG&SO operates, the evaluators conclude that there was too much interference by the local government to make the interventions successful; that individual approaches for income generating activities than collective approaches would have made more sense, followed by continuous awareness raising activities to highlight how successful households that diversified their livelihood strategies are, and to develop strategies that help to send girls and schools to school as a means for further exposure.

Table 5
Summary of findings.

When looking at the MFS II interventions of this SPO to strengthen civil society and/or policy influencing, how much do you agree with the following statements?	Score
The CS interventions were well designed	4
The CS interventions were implemented as designed	3
The CS interventions reached their objectives	3
The observed outcomes are attributable to the CS interventions	3
The observed CS outcomes are relevant to the beneficiaries of the SPO	3

Score between 1 to 10, with 1 being "not at all" and 10 being "completely".

Appendix 1 Civil Society Scores

This table presents the appreciation of the evaluation team regarding changes occurred for each indicator between 2012 and 2014 on a scale of -2 to + 2

- 2 = Considerable deterioration

- 1 = A slight deterioration

0 = no change occurred, the situation is the same as in 2012

+1 = slight improvement

+2 = considerable improvement

Dimension		Indicators	Question	Change
Civic engagement	1	Needs of marginalised groups	How does your organisation take the needs of your beneficiaries/target groups, in particular marginalised groups into account in your planning, actions, activities, and/or strategies?	-1
	2	Involvement of target groups	What is the level of participation of your beneficiaries/target groups, in particular marginalised groups in the analysis, planning and evaluation of your activities?	0
	3	Political engagement	How intense is your (individual staff or organisational) participation in locally-nationally elected bodies and/or sectoral user groups?	0
Level of organisation	5	Relations with other organisations	In the past 12 months what has been the most intensive interaction you had with other CSOs?	0
	5	Frequency of dialogue with closest CSO	In the past 12 months how many meetings did you have with the CSO that you have most intensive interaction with?	-1
	6	Defending the interests of marginalised groups	Which CSO are most effective in defending the interests of your target groups? In the past 12 months, how did you relate to those CSOs?	0
	7	Composition current financial resource base	How does your organisation finance institutional costs such as workshops of the General Assembly (if applicable); attendance to workshops of other CSOs; costs for organisational growth and/or networking?	+1
Practice of Values	8	Downward accountability	To what extent can mandatory social organs (steering committee, general assembly, internal auditing group) ask your executive leaders to be accountable to them?	0
	9	Composition of social organs	What % of members of your mandatory social organs belong to the marginalised target groups you are working with/for?	0
	10	External financial auditing	How regularly is your organisation audited externally?	0
Perception of impact	11	Client satisfaction	What are the most important concerns of your target groups? How do your services take into account those important concerns?	+1
	12	Civil society impact.	In the past 12 months, what impact did you have on building a strong civil society?	0
	13	Relation with public sector organisations.	In the past 12 months, what interaction did you have with public sector organisations to realise your programme and organisations' objectives?	-2
	14	Relation with private sector organisations	In the past 12 months, what interaction did you have with private sector organisations to realise your programme and organisations' perspective?	0
	15	Influence upon public policies, rules, regulations	How successful have you been in influencing public policies and practices in the past 2 years?	-2
	16	Influence upon private sector agencies' policies, rules, regulations.	How successful have you been in influencing private sector policies and practices in the past 2 years?	0

CS context	17	Coping strategies	In the past 2 years, how did your organisation cope with these changes in the context that may have been positive or negative consequences for civil society.	-1
---------------	----	-------------------	---	----

Appendix 2 Changes in civil society indicators between 2012 and 2014

1. Civic Engagement

1.1 Needs of marginalised groups SPO

Awareness raising meetings were conducted in each kebele prior to the beginning of the academic calendar and the woreda cabinet members played a significant role in this regard to improve participation of pastoralists in the education program. Education committees are also involved in the implementation process. As a result, some Hamar community members are motivated to send children to school. However, there is still resistance to send children to school particularly for girls' education. The most important reasons are low level of community awareness, high demand for child labour for keeping livestock and extremely high dowry. Preparation is going on to organize a woreda level education forum with all concerned partners including higher government officials, influential community leaders and NGOs working in the education sector.

Although there are changes in the community since 2012 most of the changes observed are from the interventions prior to 2012. The SPO had administrative problems which then led to an audit by the local government temporarily suspending the plans and activities of the SPO. This and the lack of follow up on the side of the government led to deterioration on some of the interventions. For instance, a cooperative shop was closed due to lack of input, some vegetable groups have not started operation even though inputs have been stored in the area, some materials for water harvesting have been laying on project sites for more than 9 months without being installed hence not serving any purpose. Some of the groups put together have also been dissolved for lack of motivation among members.

Score: -1

1.2 Involvement of target groups SPO

Before the start of the second phase of the project, orientation meetings were held in each new kebele to familiarize communities with the project plan. Over 200 people participated in the meetings, out of which 60 were women. Clarifications were made on the implementation strategies, role of communities, government and the project. The participants showed their readiness to participate in the project to maximize their benefits. In the occasion an old man from Simbele said, "We are just like oxen that plough the field. Unless we move in the same direction, we won't perform a job" emphasizing the need for collaboration.

Having agreed upon the targeting criteria with the community, the beneficiary identification process was started on some project activities. Community leaders and agricultural extension workers played a leading role on beneficiary identification together with the project team. The selection criteria include: vulnerable households, female headed households, persons with disability, elderly people who do not have support, those interested to participate, those who can be models for others, local potential to implement the activity. CCGG&SO then enters the community to create awareness on the use of vegetable production in terms of income generation and nutrition. Volunteers from the community then register to be part of the groups being formed. In general the Hamar community is reluctant to try new ideas until they see someone else try it and succeed, so they do not volunteer too much.

Eventually, 30 beneficiaries were selected and put into groups of 10. Then they were trained on land management and vegetation using the training manuals developed by government experts and after this they received farming materials and seeds by CCGG&SO and a land plot by the government. CCGG&SO further contributes transportation costs when possible and follows-up the activities at least for the first few months. The Development Agents (DA) of the agriculture offices at the various sites

also provide consulting services and follow up. This support capacitates the groups which then leads to improved income and nutrition of group members. However, most of the groups put together for this purpose have either lost some of their members (reaching up to 5 members) or have all members working individually, because communities are not familiar with working as a group: They are pastoralists so herding cattle is their main activity and growing vegetables comes next.

CCGG has also created awareness on the benefits of cooperatives and established 3 cooperatives in the area: one in town and two in rural areas. The three cooperatives were handed over to the government for follow up who however failed to do so. Their purpose is to provide consumer goods such as oil and sugar aside other goods to prevent that traders increase prices in times of shortage.

The above outcomes help to motivate others when they realise the positive impacts for beneficiaries to also get engaged and to become successful. Those already involved in the intervention are also expected to further improve their livelihood, be able to afford/access better services and improve their food nutrition at household level. These changes in the Hamar society are relevant because they are changing people's mindset in terms of diversifying their income sources and in terms of consuming the products they produce with support of CCGG&SO. Concrete IGAs that motivate more people are poultry and goat keeping activities by destitute and widowed women, and vegetable growing.

Before 2012 women were oppressed but the government and NGOs like CCGG&SO are raising the awareness of for instance cooperative administrators about women's role, who in their turn will inform the community. Young women now are increasingly allowed to become a member of saving associations when their spouses die.

These aforementioned changes in community involvement were observed in the first few months of 2012 when CCGG&SO introduced the second phase of the project in the new kebeles and started the identification of new beneficiaries.

However, due to the emergence of internal problems the SPO has not been in contact with any parts of the community for almost a year until the conducting of the end-line study.

Score: 0

1.3 Intensity of political engagement SPO

The SPO does not involve in any political activities. No change has occurred since the baseline.

Score: 0

2 Level of Organisation

2.1 Relations with other organisations SPO

CCGG&SO, together with 10 other NGOs, participates in the annual NGO forum convened by the government. However, these meetings do not allow for further cooperation between the NGOs, but are used by the government to set its own agenda and to ask participating NGOs to adhere to this agenda. These NGOs are for example Action For Development (AFD), working on water and sanitation and IGA such as collective soap making with aloe vera as a local resource; AMREF working on the health sector; Save the Children and; Mom Child working with Orphans and Vulnerable Children.

CCGG&SO also participates in an annual review meeting on health but the person in charge is left and no further information is available.

CSOs in the area prefer to work individually rather than communicating and collaborating with each other because the locations they work are very different. CCGG&SO's initial collaboration with RED Cross stopped after the first aid training and handing over of the ambulance financed by the SPO.

CCGG&SO does not maintain relations with the IGA groups and cooperatives it creates and trains. After their creation all responsibilities are handed over to the woreda government. The government failed to supervise the three cooperatives. The SPO's interventions are limited to providing training at individual target group level, kebele and zonal level.

Score: 0

2.2 Frequency of dialogue with closest civil society organisation SPO

Until February 2014, CCGG&SO managed to have regular meetings with the eight health insurance schemes, attended zonal health and education sector review meetings and hold meetings with community leaders in the 7 Kebeles. Due to internal problems the SPO did not continue these contacts as of February 2014.

Score: -1

2.3 Defending the interests of marginalised groups SPO

There is no evidence that CCGG&SO has been capable of defending the interests of its beneficiaries.

Score: 0

2.4 Composition financial resource base SPO

The three year ICDP project of 2010 – 2012 had a budget of €391,045 and the three year ICDP project of 2013 – 2015 has a total budget of €834,884, whereas Cordaid's share increased from €150,000 to €225,000.

This information indicates that CCGG&So's financial resource base has increased with regards to the implementation of its project in Hamar.

Score: +1

3 Practice of Values

3.1 Downward accountability SPO

No changes occurred with regards to downward accountability since the baseline. There are no formal accountability mechanisms in place to inform beneficiaries.

However CC-GGSO conducts meetings during which progress is reported from its side and from the community groups. The various CCGG&SO departments and offices are accountable to their managers who in turn report to the executive leaders. These are accountable to the development board of the church. However field staff and lower level managers are relatively autonomous in the implementation of the ICDP at field level.

The strength of CC-GGSO with regard to downward accountability is the fact that the framework for project interventions is set by the executive leaders which, helps share accountability and improve transparency. However, delay on decision making was seen as one weakness.

The church is highly involved in dispersing its values of downward accountability. It also practices a democratic way of implementing things.

Score: 0

3.2 Composition of social organs SPO

The composition of social organs did not change since the baseline assessment. According to the director of CCGG&SO the high illiteracy rates of communities makes their participation in the social organs of Catholic Church impossible.

Score: 0

3.3 External financial auditing SPO

After three fired staff members filed a complaint with the Hamar woreda government, this in turn imposed an audit of the first two months of 2014, because suspicion had risen of financial irregularities in 2013. This extra audit served the purpose of transparency and cleared unfounded suspicions on the part of government partners.

Apart from this extra audit, annual audits have been made by external auditors based on the preference of the donor partners who seat in the selection commission.

The evaluation team has however only seen an external audit of 2011.

Score: 0

4 Perception of Impact

4.1 Client satisfaction SPO

Food security component

Target groups that are satisfied are women who access the revolving goat scheme and the poultry scheme; individuals who learned to grow vegetables, and; those engaged in carpentry.

Until so far 144 women have received 432 goats which in the meanwhile have produced 48 other goats that were passed on to new beneficiaries. Nevertheless some women lost their goats whereas one woman is said to have been able to buy a cow after having sold her goats.

Vegetable groups are not functioning as a group, but individuals are said to have benefited from this activity. Between 2012 and 2014, 126 beneficiaries (67 men and 59 women) were trained in horticulture and organised in groups. Most groups only stay together for one season after which members continue growing vegetables on their own plot, apparently earning much more money: one group sold vegetables for an amount of 600 birr, another group sold green pepper for 60 birr and onions for 70 birr, but an individual sold tomatoes in two rounds for 4500 birr and green peppers for 1000 birr. This last person was able to send his three children to school and save money in the micro-finance institution. Other individuals have bought mobile phones to access market information, have established business relations with traders in town and were capable to rebuild their houses with the income earned.

Vegetable growing is a new livelihoods activity in the area of mainly pastoralist populations, which has been introduced by CCGG&SO who also provides transportation services to market their produce in the nearby town. Although CCGG&SO observed already in the 2010 -2012 period that group wise horticulture was not working, they did not change their approach.

Not all women were lucky with their poultry activities: some of them were able to improve their livelihoods, such as a woman who sold the eggs in the first place and later her chickens as a means to buy a goat. Another woman told the evaluators that her chickens were either stolen or eaten by a wild animal.

Carpentry has been a successful activity, but no more information is available.

The beekeeping activity did not satisfy beneficiaries because there were technical problems with the hives. The government provided technical assistance but it is not known if this was before the technical problems arose or after.

Social component

The progress reports learn that in the 2010 – 2012 period 4011 children and 2112 women have been vaccinated; that many nutrition demonstration sessions were held reaching 650 persons and that HEW and TBAs were trained. Furthermore CCGG&SO handed over one ambulance to the woreda health centre. Only one of the three ambulances in the woreda is still functioning and the other two are misused for other purposes. However child delivery at the health centre increased from 185 to 250 and 257 children in the 2011 – 2014 period. The only documented information from the 2013 – 2015 period is that now 80 children are fully vaccinated since the first semester of 2013.

Children's access to education continues to be a delicate issue because elders resist sending their children to school, fearing to lose their culture and identity. No accurate data are available that describe the current situation with regards to school enrolment. Some girls and boys have started class in two of the seven kebeles in the ICDP. Functional adult literacy programmes are existing (level of operation not known) and their attendance is good because people understand the importance of education. It is however noted that alternative basic education and functional adult literacy were highly formalised whilst they are considered as informal education.

Almost all of the changes observed on the end-line survey were through the interventions done before 2012. Specifically, for instance, the group approach for vegetable groups is not functioning as expected due to the nature and practice of the community. The people of the area do not function well when working in groups so CCGG&SO could have made these observations from the 2010-2012 groups and changed the approach to more individual based. Almost all of the vegetable groups have gotten dissolved after one round.

General changes

The general situation also slightly improved in Hamar woreda because since 2012 10 kms of road was constructed which helped to increase access to farm inputs and access to health facilities with the ambulance provided by CCGG&SO.

Conclusion observations

Although CCGG&SO's interventions have not reached many people and interventions in the 2013 – 2015 period are considerably lagging behind plans, some individuals have changed their mind sets because they understand the utility of income diversification. In particular the poultry and goat scheme have proven to be beneficial for widows and destitute women. These few successes inspire others to also diversify their livelihood strategies and some are said to have become change agents.

Negative unintended effects of the project however, are in the fields of the phase out strategy, high expectations by the community and the unknown effects of the project interventions on culture.

Score: +1

4.2 Civil society impact SPO

CCGG&SO created both health micro finance groups and saving and internal lending communities (SILCs): Those are meant to help those beneficiaries involved in income generating activities to save money.

According to the progress documents of the 2010-2012 period, eight health micro finance schemes with more than 820 members have been created where members can take out loans when being referred to higher level health facilities. According to the in-country evaluation team, another four schemes were created in four kebeles in 2013. Each scheme was given a start-up capital of 5000 birr and members are expected to contribute some 5-10 birr every two months. Money is kept by the treasurer of the group and books are kept. Apparently these schemes are highly appreciated and participation is high but no figures that show membership increase over the past years, loans given and returned, and neither the situation of those eight schemes that were created in the 2012 -2012 period.

Contrary to health micro finance groups, SILCs were not given any capital. The 2013-2015 project document mentions the creation of six SILCs that should be able to service 1050 members who have received support from CCGG&SO for income generating activities. One experiment in Dimeka in 2012 failed, but CCGG&S), another SILC started with 12 members in 2012 and has 34 members in 2014, of which 29 are female. Another new group started in 2013 which has seven members.²²

SILC members have to save money for one year, and at the end of the year they divide savings again. Savings are kept by the SILC treasurer and not interest rates are paid, whilst Ethiopia's inflation rate between 2006 and 2014 is estimated at 19 percent a year. Saving in the official micro finance

²² Interview with SPO staff

institution is more beneficial because some interest is being paid and because people can withdraw money when needed.

None of the three cooperatives is functional. CCGG&SO organised two multipurpose cooperatives and one consumer cooperative which are supposed to help their members improve their lives. They claim to have stabilised the local inflation level and to prevent shortage of supplies by purchasing consumables from wholesale suppliers and selling these with a minimum of profit. The government cooperative promotion office who is in charge of supervising all three cooperatives fails to do so because they do not receive the financial support from the woreda administration. In addition, the government is unwilling to provide the cooperatives with working area, particularly in the Demeka area, which troubles their existence since they are not able to pay the rent.

Score: 0

4.3 Relation with public sector organisations SPO

CCGG&SO consults with community and the local government in its selection of beneficiaries for the various IGA groups. After the beneficiaries have been identified, trained and provided with necessary inputs the assumption is that the local government would provide a regular follow up and support which was also the risk observed since the local government is not following up and not cooperating or supporting these groups which is affecting their effectiveness aside from other factors.

The SPO also has contacts with government offices in the areas it is working on as it is necessary to involve these offices in putting in place the planned interventions. It is through the government offices in the different kebeles that the SPO is able to gather the community and distribute inputs. However, the outcome of this network is not as effective as it should be because of reasons like the high turnover of the Development Agents on sites, the lack of motivation of the Development Agents and hence the low follow up and the consulting service being provided.

Jinka FM Radio Station and Jinka Agricultural Research Centre (JARC) have been in technical collaboration with the SPO's health care & livelihoods improvement components. The Government Pastoralist Affairs Office has also provided the SPO with expertise in studying the potential and constraints of the beekeeping production in Hamar.

The government fails to support interventions by the CCGG&SO which they were supposed to take over: there are 26 cooperatives in the Hamar Woreda now which should be supervised by the cooperative promotion office financed by local government itself. No meetings are organised and the office acknowledges it is not doing as much as expected.

CCGG&SO's ambulance initially given to the Red Cross has been confiscated by the health office and is not always being used for the transportation of sick people.

The 2010-2012 report states that there is a high turnover of government staff and that 'the sudden changes in government policy made it very difficult for the project to adapt accordingly'. The six months closure of the program office by local government partners in Woreda/ Zone, was the lowest point in relations with the government since 2012.

Score: -2

4.4 Relation with private sector agencies SPO

Although CCGG&SO had started engaging in contractual agreements with private agencies and agricultural input suppliers such as local goat dealers, water well diggers, roof water harvesting facility makers, drip irrigation experts, boar goat breeding station, chicken breeding centre, field-crop seed multiplication centre & building contractors for its planned health centre establishment, the closure of the office in Demeka has suspended all these activities indefinitely.

Score: 0

4.5 Influence upon public policies, rules, regulations SPO

Given the actual relation between the government and the SPO, possibilities to influence policies have considerably decreased.

Score: -2

4.6 Influence upon private sector agencies' policies, rules, regulations SPO

Score: not applicable

5 Environment

5.1 Coping strategies

A corrective management decision to fire three staff members in the Hamar program who broke regulations in January 2014 has resulted in unfavourable turn of events. The fired employees filed a complaint with the local government, leading to the closure of the office from March to July 2014. The former employees asked for an unconditional return and an investigation and audit of accounts. Meanwhile, the SPO did its best to hold talks with the authorities that ended up in deadlocks because nobody in local government was cooperative.

CCGG&SO reported the event to the Regional Bureau of Finance via its headquarters, the Vicariate of Soddo & the Ethiopian Catholic Secretariat (ECS), which recommended a mediation process between the local government office and CCGG&SO at the beginning of the dispute. Later, upon receipt of a letter of the zonal Administrator, an investigation was carried out. The investigation took place after a lapse of two months. Based on the findings of the investigators, a report was sent to the Federal Central Statistics Agency (CSA) which sent down a delegation to resolve the issue and accordingly it was agreed to open the office.

In its decision, the Federal CSA commended on the responsiveness of the SPO on five points out of the ten points reported by the Regional Bureau of Finance. The Bureau of Finance also cited weaknesses and measures to be taken by the CCGG&SO. Weaknesses of the local government were also been spelt out and advised not to repeat. As a result, the false allegations made against the church are clarified and the issues that need legal attention concerning the fired employees are referred to the labour court. It is agreed to get back to program implementation. The current position of the partnership with the government is similar to the way it was before.

However, the whole incident has created division, triggered confusion, and threats were made against fellow staff members. Additionally, false and disproportionate rumours about the leadership and its transparency were going around. As a result, staff composition has changed. The human resources administration and their manuals for job performance appraisal and supplies procurement are under review and reassurance was given to donors that system overhaul is being made.

The Centre for Development Innovation works on processes of innovation and change in the areas of food and nutrition security, adaptive agriculture, sustainable markets, ecosystem governance, and conflict, disaster and reconstruction. It is an interdisciplinary and internationally focused unit of Wageningen UR within the Social Sciences Group. Our work fosters collaboration between citizens, governments, businesses, NGOs, and the scientific community. Our worldwide network of partners and clients links with us to help facilitate innovation, create capacities for change and broker knowledge.

The mission of Wageningen UR (University & Research centre) is 'To explore the potential of nature to improve the quality of life'. Within Wageningen UR, nine specialised research institutes of the DLO Foundation have joined forces with Wageningen University to help answer the most important questions in the domain of healthy food and living environment. With approximately 30 locations, 6,000 members of staff and 9,000 students, Wageningen UR is one of the leading organisations in its domain worldwide. The integral approach to problems and the cooperation between the various disciplines are at the heart of the unique Wageningen Approach.

Klaver D.C., Jacobs J., Hofstede, M.A., Tefera, W., Getaw, H., Dereje Getu D., February 2015, *Education for Development Association (EfDA) end line report; MFS II country evaluations, Civil Society component*, Centre for Development Innovation, Wageningen UR (University & Research centre) and International Food Policy Research Institute (IFPRI). Report CDI-15-073. Wageningen.

This report describes the findings of the end line assessment of the Ethiopian Education for Development Association (EfDA) that is a partner of Edukans Foundation under the Connect4Change (C4C) Consortium.

The evaluation was commissioned by NWO-WOTRO, the Netherlands Organisation for Scientific Research in the Netherlands and is part of the programmatic evaluation of the Co-Financing System - MFS II financed by the Dutch Government, whose overall aim is to strengthen civil society in the South as a building block for structural poverty reduction. Apart from assessing impact on MDGs, the evaluation also assesses the contribution of the Dutch Co-Funding Agencies to strengthen the capacities of their Southern Partners, as well as the contribution of these partners towards building a vibrant civil society arena.

This report assesses EfDA's contribution towards strengthening Civil Society in Ethiopia and it used the CIVICUS analytical framework. It is a follow-up of a baseline study conducted in 2012. Key questions that are being answered comprise changes in the five CIVICUS dimensions to which EfDA contributed; the nature of its contribution; the relevance of the contribution made and an identification of factors that explain EfDA's role in civil society strengthening.

Keywords: Civil Society, CIVICUS, theory based evaluation, process-tracing

Acknowledgements

IFPRI and CDI are thanking the staff and the leaders of all Southern Partner Organisations that participated in collecting information for the evaluation of the contribution of these partner organisations to creating a vibrant civil society in Ethiopia. They also thank the Co-Funding Agencies and the Dutch Consortia they are a member of for making background documents available. We hope that this evaluation can support you in better positioning yourself in the Civil Society Arena of Ethiopia.

1 Introduction

This report presents the civil society end line findings of the Education for Development Foundation (EfDA) in Ethiopia which is a partner of Edukans Foundation under the Connect4Change (C4C) consortium. It is a follow-up to the baseline assessment that was carried out in 2012. According to the information provided during the baseline study EfDA is working on MDG 2, Education and the introduction of ICT in schools with IICD and ICCO.

These findings are part of the overall evaluation of the joint MFS II evaluations to account for results of MFS II-funded or –co-funded development interventions implemented by Dutch CFAs and/or their Southern Partner Organisations (SPO) and to contribute to the improvement of future development interventions. The civil society evaluation uses the CIVICUS framework and seeks to answer the following questions:

- What are the changes in civil society in the 2012-2014 period, with particular focus on the relevant MDGs & themes in the selected country?
- To what degree are the changes identified attributable to the development interventions of the Southern partners of the MFS II consortia (i.e. measuring effectiveness)?
- What is the relevance of these changes?
- What factors explain the findings drawn from the questions above?

The CIVICUS framework that comprises five dimensions (civic engagement, level of organization, practice of values, perception of impact and contexts influencing agency by civil society in general) has been used to orient the evaluation methodology.

Changes in the civil society arena of the SPO

In the 2012 – 2014 period the two most important changes that took place in the civil society arena of EfDA are the following:

- Communities have become more committed to and aware of the importance of education, as a consequence of which they have started to build new classrooms with their own effort.
- Communities are now said to request the government to improve the school education system in other schools than those supported by EfDA, as well as to provide internet services for improved teaching learning.
- School management boards are said to be satisfied with the support provided by EfDA
- An improved awareness of the district administration that “educating girls is educating households”, has become the motto of many schools and communities.

Most changes reported in relation to the C4C project do not in the first place relate to changes in Civil Society. Where ICT is being introduced it has helped to introduce further active learning methods, improve school management, and provide student access to computers.

These findings were obtained through an analysis of documents, a workshop and follow-up interviews with EfDA, interviews with external resources persons working in civil society organisations are related to EfDA, and public or private sector agents.

Contribution analysis

Based upon an analysis of the projects and programmes financed by the Dutch CFAs a selection was made of SPOs to be included in an in-depth process tracing trajectory and those to be included for a quick contribution assessment. EFDA was selected for a quick assessment.

Outcomes directly related to the introduction of ICT in schools are; improved learning teaching methodologies being used, improved school management and the use of computers by students, and: communities are said to request their local administration for ICT equipment in other schools. Apart from these, teachers have improved their competencies in using active-learning methods due to a combination of both the ICT and the education project. These outcomes do however not relate to changes in civil society.

More civil society related outcomes but not to be attributed to the C4C project consist of schools increasingly taking into account gender differences, and emphasise the importance of education for girls. Furthermore some communities have started to take ownership of the education project and start building their own class rooms, ask their local government for good quality education and ICT equipment for schools.

Relevance

Interviews with staff of EfDA with external resource person, with the liaison officer of ICCD, as well as contextual information helped to assess the relevance of EfDA's interventions in terms of; its Theory of Change (ToC) for Civil Society (SC) as designed during the baseline study; the context in which EfDA is operating; the CS policies of C4C.

Changes attributed to the ICT project are not (yet) relevant in the light of the Theory of Change constructed in 2012, which aims at 'capacitating civil societies to have an active role in ensuring accessibility and quality of education for children'. This implies strengthening the school management board, Parent Teacher Associations and school clubs. Those structures have only benefitted to a limited extent of the C4C project.

With regards to the context in which EfDA is operating, we observe that support to the education sector is very relevant in the light of national policies but that uptake by the government for ICT in education is low because they do not have the financial means for ICT. Apart from this many schools do not have access to electricity and they have other conditions to be fulfilled before they can think of providing good quality education.

The changes achieved are not yet relevant for C4C who aims to contribute to civil society building by means of creating networks of local partners to influence policies in favour of ICT4Development.

Explaining factors

The information related to factors that explain the above findings was collected at the same time as the data were gathered for the previous questions. The evaluation team looked at internal factors within EfDA, the external context in which it operates and the relations between EfDA and C4C and ICCD.

The most important explaining factors that possibly explain the outcomes achieved are: EfDA's core business being education and in the second place ICT; its weak management and organisation capacity; conditions such as electricity and basic conditions for good education that need to be fulfilled before ICT can strengthen the quality of education, and; the increased trust between the SPOs involved in the C4C project and ICCD, that enhanced mutual learning.

The following chapter briefly describes the political context, the civil society context and the relevant background with regards to the Health sector that EfDA is working on. Chapter three provides background information on EfDA, the relation of its MFS II interventions with the CIVICUS framework and specific information on the contract with Edukans. An evaluation methodology has been developed for the evaluation of the Civil Society component which can be found in appendix 2 in the country report; however, deviations from this methodology, the choices made with regards to the selection of the outcomes for contribution analysis, as well as difficulties encountered during data collection are to be found in chapter 4. The answers to each of the evaluation questions are being presented in chapter 5, followed by a discussion on the general project design in relation to CS development; an assessment of what elements of the project design may possibly work in other contexts or be implemented by other organisations in chapter 6. Conclusions are presented in chapter 7.

2 Context

This paragraph briefly describes the context EfDA is working in. A description of the Civil Society Context assessed according to the CIVICUS framework is provided in appendix 3 of the country report for Civil Society.

2.1 Political context

The Ethiopian Government has enacted a five year Growth and Transformation Plan (GTP) to implement over the period of 2011-2015.¹ Two of the major objectives of the plan are to maintain at least an average real GDP growth rate of 11%, meet the Millennium Development goals, and expand and ensure the qualities of education and health services thereby achieving the MDGs in the social sectors (FDRE, 2010). The government acknowledged that NGO's and CSO have an important role to play in the implementation of this plan: According to the preamble of the new charities and societies proclamation NO. 621/2009 of Ethiopia, civil society's role is to help and facilitate in the overall development of the country². This is manifested in the government's approach of participatory development planning procedures. For example, NGOs established a taskforce under the umbrella of the CCRDA to take part in the formulation of the country's first Poverty Reduction Strategy paper formulation. They were a major stakeholder in the planning process of the five year GTP plan. Despite fears that the NO. 621/2009 proclamation was thought to have negative impacts on Civil Society, the number of newly registered charities and societies have increased considerably. 800 new charities and civil societies were registered between 2010/11 and 2011/12 and as of February 2012, these were implementing over 113.916 projects in different social, economic and governance related sectors. Governance related projects comprise interventions in the area of democracy and good governance, peace and security, human rights, justice, and capacity building. The charities and societies are most engaged in the health sector (19.8%), followed by child affairs (11.9%), education (9.2%), governance (8.3%) and other social issues (7.8%). These figures are more or less similar to the pre-proclamation period, and would imply that new charities or societies have replaced foreign and Ethiopian charities that are not allowed to work on sectors related to governance and human rights.³ This might indicate that there might have been some flexibility in the interpretation of some of the provisions of the proclamation.

2.2 Civil Society context issues with regards to the MDG

The activities in the education sector are since 2010/11 directed by the fourth Education Sector Development Program (ESDP IV), which is part of a twenty-year education sector indicative plan, within the framework of the Education and Training Policy (ETP). The ETP was adopted in 1994 as the country's new constitution became effective and among the important changes which came with it was that education administration was decentralized to the regional states (MOE 2010/2011). The Ministry of Education (MOE) has a coordinating role in the provision of education, and sets forward frameworks and policies while the regions are the main implementers and they control the financing of education.

¹ November 2010, *Growth and Transformation Plan 2011 – 2015*, Ministry of Finance and Economic Development, (November 2010), Federal Democratic Republic of Ethiopia

² February 2009, *Charities and Societies Proclamation (proc. no.621/2009)*, Federal Negarit Gazeta, Federal Democratic Republic of Ethiopia

³ UNDP, January 2014, *Civic Engagement for Effective Service Delivery in Ethiopia: Tools, Opportunities and Challenges*, UNDP Ethiopia Working Paper Series No. 2/2014

Primary education is the highest priority for the government and receives the highest share from the total estimated expenditure of ESDP IV (MOE 2010/2011). The federal ministry funds regional governments which allocate funds to Regional Education Bureaus (REBs) which in turn allocate funds to Zonal Education Bureaus (ZEB). Regions have a great deal of discretion in allocating funding to education and in choosing priorities and strategies. In a separate funding stream, the regional councils directly allocate funding to the woreda administrations through block grants and these also have a large amount of discretion in how to allocate these grants. The majority of the woreda block grants, ranging from 33 % to 66 %, usually go to education, with most of the resources being spent on teachers' salaries. The non-salary budget per student is small.

In recent years, the Ethiopian educational authorities, like governments in several other developing countries have embraced Alternative Basic Education (ABE) programs in an attempt to achieve Education for All. The ABE program is a condensed version of the first cycle of formal primary school (grades 1-4) and is a variation of Non-formal education (NFE) with features similar to the 'community school' approach to education. In 2005/06 the Gross Enrolment Ratio in ABE was at least 5,5 % in Ethiopia and a steadily increasing share of the school age population is enrolled in the program⁴

In the last five years the number of primary school children has grown from 15,340,786 in 2007/08 to 16,989,784 in 2011/12 showing an 11.0% growth over the same period of time for both boys and girls (MOE 2012). Despite the remarkable growth, the education system is challenged by significant dropout rates and high number of out-of school children. Reaching out the most marginalized out-of-school children which includes children who are in the remotest parts of the country, children from pastoral communities, children who are in food insecure and conflict prone areas and those children who are in difficult circumstance (such as children with disabilities, trafficked children, street children, victims of child labour, etc.) is the most challenging aspect of expanding primary education opportunities. Out-of-school children are found all over Ethiopia. According to the MOE (EMIS:2010), there were 3,015,350 out of school children in Ethiopia making 17.8% of the total primary school age children in the country.⁵

In an effort to reduce poverty and enhance decentralized public service delivery to the poor, the Government of Ethiopia, with the support of International Development Partners, embarked on a project known as the Protection of Basic Social Services in 2006. The PBS program piloted a social accountability initiative in 2006 that helped empower citizens to voice their needs and demands relating to basic public services. In the context of PBS, Social Accountability can be understood as the processes by which ordinary citizens, who are the users of public services, voice their needs, preferences and demands regarding public services; it also brings citizens into dialogue with local governments and service providers to contribute to improved quality public basic services through joint action plans. The Ethiopian Social Accountability Program 1 (ESAP 1) aimed to empower Ethiopia's poor so that they may voice their concerns and priorities over access to basic services – water, sanitation, health, education and agriculture. ESAP1 ended on June 30, 2009, and an independent evaluation was conducted as basis for a new phase. The evaluation revealed that use of appropriate social accountability mechanisms can work in Ethiopia and have beneficial outcomes for the actors involved as well as for the quality of basic services. As a component of PBS 2, the government launched the Ethiopia Social Accountability Program 2 (ESAP2) in February 2012. Working through civil society organizations, ESAP2 tries to bring local governments and service providers into dialogue with citizens and community organizations as an important step in working together in providing better quality public basic services.⁶

3 Description of EfDA and its contribution to civil society/policy changes

3.1 Background of EfDA

Education for Development Association (EfDA) is a national NGO established in 1999. Pestalozzi children's Foundation (PCF) was the primary supporter in the establishment of EfDA and some of the founders of the organization were staffs of PCF. Accordingly, most of the strategic objectives of EfDA are in line with that of PCF's.

Its vision is to see a literate, self-confident and productive community that is capable of solving their economic, social and environmental problems. For this to happen, EfDA wants to fill the gap in information, resources and technical skills that are needed to by communities to manage their own life and environment. As they work mostly in the field of educational activities, their main vision is to increase knowledge and skills of both teachers and students.

EfDA is working in Oromia Regional State in Jimma Horro, (East Wallaga Zone), Waliso (South West Shawa Zone) and Sululta (North Shawa). Apart from this state it is also intervening in Gumuz Regional State in Mao Komo Beneshangul (MK special Zone). It has project offices and training centres in Shambo and Woliso.

EfDA has accumulated good practices in the education sector and counts 40 staff members.

3.1 MFS II interventions related to Civil Society

The current project in which EfDA is involved with Edukans and IICD is "Improving the Teaching-Learning Processes and Educational Management through ICT (2011-2015)" in the Sululta district in Oromia state. This project is being coordinated by DEC (Development Expertise Centre), a local office for Edukans Foundation, and the Graduate School of Teaching and Learning (GSTL) of the University of Amsterdam (The Netherlands) in collaboration with the education line ministry and regional bureaus. A previous phase started in 2008 for three years with the name: 'Basic Education Quality Improvement programme (BEQIP)' in some selected primary schools in Amhara and Oromia Regional States in Ethiopia using digital video as ICT tools.

The general objective of the programme is to contribute towards quality in primary education through an improvement of teaching learning processes and enhancing educational managements. The programme has three components:

- Poverty alleviation, which aims to increase students' performance in schools and foresees interventions to improve the competencies of the teachers.
- Strengthening of CSO's, aiming to improve the leadership in 78 institutions, comprising Teacher Training Colleges, NGOs including EfDA and CBOs. These three categories are in charge of implementing the project.
- Persuasive Works, aiming to increase the awareness of a wide range of government officials from education offices at national regional, zonal and district level with regards to the use of ICT in education.

The programme initially was implemented by 4 NGOs, 3 Teacher Training Schools (TTC) and 4 CBOs in 3 regional states (Afar, Amhara and Oromia). Together these partners support 55 schools. EfDA is one of the NGOs and in charge of 5 schools. The programme is currently working with 75 schools and being implemented by 8 NGOs and the 3 TTCs and 4 CBOs, including those that are partnering in the Amhara cluster.

EfDA's main interventions in relation to civil society would relate to the third component, that of the persuasive works, which relates to the CIVICUS dimension 'perception of impact' and in particular that of collaborating and influencing public sector actors.

Another relation with civil society is the collaboration between the NGOs and the CBOs (and the Teacher Training Schools who are not part of civil society). This would refer to CIVICUS' dimension of 'level of organisation'.

Apart from this no other aspects relate to civil society.

3.2 Basic information

Table 1: basic information on EfDA

Name of SPO	Education for Development Association (EfDA)			
Consortium and CFA	Connect 4 Change, Edukans Foundation and IICD

4 Data collection and analytical approach

The evaluation question concerning change was conducted without any methodological adjustment. The evaluation team was able to collect all relevant information through workshop, document review, and interviews both at the head office of the SPO as well as from various stakeholders in the field. Thus, the approach has not required methodological adjustments of any kind. The information obtained from the SPO which was attested by the stakeholders stressed that the SPO particularly operates and brought noticeable changes in civic engagement and networking civil society orientations. As a result the study analysed the changes occurred in these two dimensions.

The SPO formed a network with other NGOs through a cluster approach. The aim of doing so was to improve its capacity through experience and resource sharing as well as enhance its visibility among the various actors. Hence, this evaluation analysed to what extent the networking resulted in an improved capacity of the SPO and facilitated its activity. With regard to civic engagement EfDA engages with schools with the interest of creating access to quality education and improving the academic performance of targeted students. The evaluation examined how successful the SPO has been in these aspects. Generally speaking the SPO was collaborative in the whole process. But the presence of several meetings in the various public offices and poor documentation had challenged the data collection to some extent.

5 Results

5.1 Results obtained in relation to intervention logic

As mentioned in chapter 3, the objectives of the C4C programme are based on three strategies. In this section we will describe EfDA's contribution to these strategies and their achievements in this.

The first strategy is direct poverty alleviation. The objective of C4C here is to increase the academic performances of 37.500 students in 75 primary schools from 46% to 64% by the end of the programme. EfDA contributes to this objective together with the other 14 partners of the network. EfDA works in twelve schools in one district. No figures about enrolment rates and school dropouts have been found in the documentation made available. EfDA conducted a baseline data collection on the level of students in 5 schools. Also, they trained 30 teachers in ICT skills and continued to work with them to improve their knowledge.

The second strategy is the strengthening of CSO's. This should be done by improving the efficiency of leadership in 78 institutions. One important activity for this is awareness raising in the communities on using ICT in schools. Also, educational management in schools is to be improved by developing skills and knowledge about supervision of institutions. EfDA's contribution in this is the installation and training on Educational Management and Information System (EMIS) at the five target schools. In the Sululta district, EfDA equipped five schools with five computers each, and relevant staff was trained in basic ICT literacy and management. EfDA also held ICT trainings and continued to support the trained teachers. However, the number of participants that were trained in ICT is unknown and the progress documents are not providing information on this.

The last strategy is persuasive works. The main objective for this strategy is to train education offices staff to understand the importance of ICT for improved educational quality. The goal was to train 54 experts from the ministry and regional bureaus. The progress reports are not providing information on the contribution of EfDA for this activity.

5.2 Changes in civil society in the 2012-2014 period

Most changes reported below do not in the first place relate to changes in Civil Society. This is in particular valid for changes that relate to improved learning-teaching methods and the introduction of ICT at this moment of time. Those changes that relate to the community, to the Parent Teacher Associations, and interventions to lobby the government are more relevant for the evaluation of civil society.

5.2.1 Civic engagement

Civic engagement describes the formal and informal activities and participation undertaken by individuals to advance shared interests at different levels. Participation within civil society is multi-faceted and encompasses socially-based and politically-based forms of engagement.

The interests of the target groups are discussed with EfDA through community meetings and a School Management Committee, which is the primary link between EfDA and the community. Also, EfDA looks at school reports provided by the school management board. EfDA focuses its work mostly on marginalised groups such as girls, poor women, orphans and vulnerable children. The strength of the organisation is that they see the capacity of their target group, rather than seeing them as people in need. The activities on which EfDA will focus are determined by listening to the needs of the community and combining these with the capacities available. The people involved in the project contribute to the project in terms of labour.

EfDA supports income generating activities of schools and students by supplying seedling for horticulture and urban agriculture and providing training on tailoring and carpentry within the school compound. Students are engaged in school gardening by making them responsible for the gardens and they are encouraged to scale it up in their home.⁷ In 2013, female teachers received a training on tailoring so they diversified their ways of generating an income and they cascaded their experience to students.⁸ Schools are furthermore assisted by EfDA to manage school resources properly and think of ways to earn additional income by for example selling grass, trees, wood or coffee, or by assisting schools in approaching alternative donors (like USAID).⁹

The main change compared to the baseline situation is that the community is taking more ownership of the project: After EfDA constructed a school building with three classrooms communities started their own building projects and constructed two more of such buildings.¹⁰ EfDA only contributed to the first intervention in terms of technical support and building materials. The other projects were fully supported by community effort. This is strengthened by involving local resources and community knowledge, which increases ownership by the local community. Outcomes of the project are being evaluated, which is a change since the start of the project.

Communities are now said to request the government to improve the school education system in other schools than those supported by EfDA, as well as to provide internet services for improved teaching methods. The education office mentions they are trying to scale up competence based tutorial classes and student-centred learning approaches, which were first introduced in EfDA schools, to non-intervention schools.¹¹

The C4C programme in Sululta is a major component of the education programme and after the five schools that were equipped with computers and were staff was trained in 2011, ICT is being used for both active learning and data management. In the meanwhile students have started to use computers in school.¹²

In Shambu district however, that is also part of the General Education Improvement Program (GEIP) implemented by EfDA, the introduction of ICT in the school programmes is a supplementary activity. Of the twelve schools EfDA works with under GEIP, only five schools have access to electricity and have been equipped with computers accordingly. The five schools are at different levels of implementation: only two schools (Buna Abuna and Shambu model school) are using the ICT intensively for active learning, the other schools are only using ICT for data management such as keeping students records or to prepare worksheets.¹³

Score baseline 2012 on an absolute scale from 0-3: 2
Score end line 2014, relative change on a scale of (-2, +2): 1

5.2.2 Level of organization

This dimension assesses the organisational development, complexity and sophistication of civil society, by looking at the relationships among the actors within the civil society arena.

The first relationship which should be mentioned here is the membership of the C4C consortium. The interaction with C4C has not been done only at programme level, but more at the overall level of work by SPOs. For example, EfDA is only working with 5 schools for this specific programme but is working at many other schools for the rest of their work. The meetings of the consortium have been focused on learning from one another and implementing work also in other areas. EfDA has been a good example of how to involve school management boards, and to create community ownership¹⁴. The interaction with C4C at first was mainly initiated by IICD, however in a later phase became mutual

⁷ Interview with Horo Woreda Education Office

⁸ Interview with PTA representative

⁹ Interview with PTA representative

¹⁰ Interview with Cluster Resource Center (CRC)

¹¹ Interview with Horo Woreda Education Office

¹³ Interview with Project Manager EfDA

¹⁴ Interview with Cluster Resource Center (CRC)

when the SPOs started to address questions which were also directed at the C4C members and they started to initiate more. This required a trust relationship to be established between the SPOs and IICD, and also between the SPOs and C4C.

EfDA is a member of the Consortium of Christian Relief and Development Association (CCRDA), the Basic Education Association (BEA-E), Pestalozzi Children's Foundation (PCF) partner's forum, and Oromia HIV/AIDS forum. This results in cooperation between many different organisations, mostly in terms of meetings. EfDA has attended 2 meetings with the CCRDA and 4 meetings with BEA-E in one year. Moreover, EfDA has become a founding member of the Network of Civil Society Organisations of Oromia (NeCSOO), which is helping them to attract more funding by joint fundraising. It has been confirmed by other organisations that EfDA has strong relations with other CSOs and that they are seen as the leader of the four NGOs working on ICT.

Another important cooperation EfDA is working on is meeting with different school boards. In an interview the school boards stated that they meet on average every two months with EfDA. Also, the district education office and school management attend trainings with EfDA twice a year. EfDA has organized and given different trainings for district office experts, School managements (directors, teachers, Parent Teacher Associations). The trainers are sometimes recruited from the district education office. The Kebele Education Training Board (KETB) stresses that the trainings given by EfDA has improved the networking and collaboration between KETB, PTA's and school management.¹⁵

Score baseline 2012 on an absolute scale from 0-3: 2
Score end line 2014, relative change on a scale of (-2, +2): 0

5.2.3 Practice of Values

Practice of Values refers to the internal practice of values within the civil society arena. Important values that CIVICUS looks at such as transparency, democratic decision making, taking into account diversity that are deemed crucial to gauge not only progressiveness but also the extent to which civil society's practices are coherent with their ideals.

With regards to downward accountability the results for EfDA are contradicting. From interviews it becomes clear that some perceive EfDA's board as suitable and transparent and others do not think it is functioning as it should. In general EfDA is perceived as a transparent organisation which makes information available to whomever is requesting it. One important policy in this respect is that all stakeholders, upon need, should be able to explain the project. However, during assessments conducted by Edukans in 2009 and 2012 it became clear that the management is weak and lacking leadership, and that reports towards donors are missing. The recommendation was to change some board members and improve the dynamics of the board. According to the evaluation team this has been done, but it does not become clear to what extent this happened. Therefore, there is not enough information to conclude about the changes in this dimension.

Score baseline 2012 on an absolute scale from 0-3: 1
Score end line 2014, relative change on a scale of (-2, +2): 0

5.2.4 Perception of Impact

Perception of Impact assesses the perceived impact of civil society actors on politics and society as a whole as the consequences of collective action. In this, the perception of both civil society actors (internal) as actors outside civil society (outsiders) is taken into account. Specific sub dimensions for this evaluation are the extent to which the SPO has contributed to engage more people in social or political activities, has contributed to strengthening CSOs and their networks, has influenced public and private sector policies.

EfDA has been working hard on ensuring the needs of their target groups. They are mainly working on skills development in teaching-learning including the integration of ICT. However, some schools have

¹⁵ Interview with KETB

been requesting material rather than support in skill development. As a result EfDA has worked with these schools to show them the importance of knowledge. As mentioned before, EfDA as an organisation is working closely together with the community. By implementing the projects with the consent of the community they ensure that all target groups are on board. This has resulted in a high satisfaction rate about the projects, and some clear positive results. The main activities are capacity building trainings in student-centred learning and competency based learning, material provision and close supervision. The teacher training course supposedly resulted in better performance and a change in teaching methods, plus limiting their workload. Also, it is said that students are performing better and drop-out rates have decreased as a result of these interventions.¹⁶

The positive effects of active-learning teaching methods are supported by the following table, which shows improvements in teacher competencies in 2012 and 2013 as measured by the University of Amsterdam. EfDA is operational in Oromia in 5 schools out of the 35 schools selected for the introduction of ICT. The general tendency is that teacher competences have improved between 2012 and 2013, including those in Oromia. The yellow market boxes highlight the three most positive improvements in each region.

Table 2:

Source: University of Amsterdam, Training Report 2012 and 2013, BEQUIP II

A similar trend is also observed by a teacher of one of the schools in Shambu district that also received ICT equipment and is actively using this, however is not part of the C4C project.¹⁷

School Management Committees (SMCs) and Parent Teacher Associations (PTAs) are said to be able to minimize student dropouts, increase awareness about the importance of education, and they play a role in community resource mobilization as they receive training on a yearly basis.¹⁸

Another important result of EfDA's work, in particular the education project has been the increased awareness on the importance of education for girls. EfDA has worked with the government to provide tutorials for low scoring students for subjects like English, maths and science. As a result the slogan used for this, "educating girls is educating households", has become the motto of many schools and communities. The tutorials are gender sensitive as girls get a separate and special tutorial and follow up.¹⁹ Additionally, latrines were built for boys and girls separately.²⁰ This has resulted in an increased number of female students and a reduction in drop-outs of female students.²¹

EfDA works in line with existing regulations in the education sector. They collaborate with public sector organisations in terms of information sharing, especially on project implementation and evaluation. EfDA also works closely with the Woreda Education Office as they identify and prioritize schools that

need support.²² Until so far the collaboration with the local administration has been inconsistent and had limited influence on changing decision-making.

Score end line 2014, relative change on a scale of (-2, +2): 1

5.2.5 Civil Society Environment

The social, political and economic environment in which civil society operates affects its room for manoeuvre. The civil society context has been described in chapter 3. In this section we describe how EfDA is coping with that context.

The 2009 Proclamation to Provide for the Registration and Regulation of Charities and Societies (CSP) and the related "70/30" regulation limit administrative costs for all charities and societies to 30% of their budgets. In consequence EfDA had to increase its search for additional funds and partners to ensure the existence of their administrative part. This is strongly linked with the high inflation rates, which caused prices for materials to increase. Also, EfDA had to invest a lot of time and energy in managing relations with government officials. This was mostly due to the high turnover and reshuffle of lower government officials.

However, there are also positive environmental forces to be identified. The eagerness and commitment of the community to implement education projects positively helped in achieving objectives and making the projects sustainable.

Score baseline 2012 on an absolute scale from 0-3: 2

Score end line 2014, relative change on a scale of (-2, +2): 0

5.3 To what degree are the changes attributable to the Southern partners?

With regards to the C4C project the following specific outcomes have been reported in relation to the introduction of ICT:

- The C4C programme in Sululta is a major component of the education programme and after the five schools that were equipped with computers and were staff was trained in 2011, ICT is being used for both active learning and data management. In the meanwhile students have started to use computers in school.²³
- In Shambu district, not part of the C4C programme, only five of the twelve schools that EfDA works with have access to electricity and were equipped with computers: two of the five schools use ICT intensively for active learning, the other schools are only using ICT for data management.²⁴
- Some communities have started to ask their local administration to equip schools with computers and internet facilities, which should be interpreted as the awareness for ICT being raised.

Table 2 in paragraph 5.2.4 shows that teachers are increasingly using active-learning methods in the schools supported by both the education and the ICT project. Unfortunately the information provided in the table, does not allow assessing the added value of the ICT component in the improvement of the teacher activities. Therefore the enhanced competencies are to be interpreted as the result of a combination of the education project and the C4C project together.

More civil society related outcomes but not to be attributed to the C4C project are the following:

- The increased awareness on the importance of education for girls, whilst using the slogan "educating girls is educating households"; tutorials being gender sensitive as girls get a separate and special

²² Interview with Horo Woreda Education Office

²³ Interview with Project Manager EfDA

²⁴ Interview with Project Manager EfDA

tutorial and follow up²⁵, and; separate latrines for boys and girls.²⁶ This has resulted in an increased number of female students and a reduction in drop-outs of female students.²⁷

- Communities taking more ownership of the project and starting to build their own classrooms. Some have started to ask their local administration for quality education, mentioning the schools supported by EfDA as an example, as well as asking the local administration to provide internet services for improved teaching methods.
- EfDA's efforts to persuade local administrations to equip schools with ICT equipment.

5.4 What is the relevance of these changes?

5.4.1 Relevance of the changes in relation to the Theory of Change of 2012

During the baseline assessment EfDA identified the change which they wanted to achieve as 'capacitating civil societies to have an active role in ensuring accessibility and quality of education for children'. In order to achieve this change a number of conditions had to happen. The school management board and Parent Teacher Associations need to be strengthened as well as school clubs.

Generally speaking communities become aware of the importance of education for their children, as can be notified by their efforts to construct schools with their own resources. Apart from this there is some indication, not substantiated, that communities start to ask their kebele administration for good quality education services including the use of ICT.

The ICT project however did not foresee the strengthening of the capacities of parent teacher associations. The ICT project, but more in particular EfDA's efforts to strengthen education services are relevant in the light of the ToC.

5.4.2 Relevance of the changes in relation to the context in which EfDA is operating

Education is an important factor in the overall development of Ethiopia and the government has its 'education for all' policy in which EfDA's work on improving the education services fits, as well its activities to work with communities on education issues.

However until so far the public administration at different levels has not taken up the importance of ICT, mainly because they cannot afford these including the financing of internet facilities, and because many schools do not avail of electricity. Apart from these, schools have other priorities to improve their education quality, such as class rooms, blackboard, student desks and stationary. The EfDA programme coordinator confirms the priority given by school management boards on these issues instead of ICT and added that the selection of Shambu district is inappropriate for an ICT intervention. Other districts like Sululta where EfDA is intervening are more appropriate for the introduction of ICT.

Local administrations are working on digital record keeping but they are not yet where they should be. The main reason for this is that many schools do not yet have ICT materials and cannot keep their records digitally. The resource person of IICD believes that EfDA has been an enabling party in the integration of ICT in education. By providing ICT materials to schools, the local government can get a better view of the results of students. This in turn is helping to improve the overall educational system.

5.4.3 Relevance of the changes in relation to the policies of the Connect4Change consortium and ICCD.

IICD's Civil Society approach consists of providing their partners with support and information upon demand. This will then promote social innovation. Additionally, ownership is one of IICD's core

²⁵ Interview with Horo Woreda Education Office

²⁶ Interview with PTA representative

²⁷ Interview with teacher of the Bune Abuna primary school

principles whereby they focus on co-develop projects in line with the needs of the community. The increased involvement of the community in the project set-up therefore seems relevant. In their Baseline study of Connect4Change²⁸, the alliances' contribution to civil society building consists of creating networks of local partners to influence policies in favour of ICT for Development. With regards to the demand side we observe that the activities conducted by EfDA are in the first place still addressing major conditions to be fulfilled in schools before they can become receptive for ICT in the education system.

With regards to the policy influencing part we observe that activities have been carried out by EfDA to lobby the district government for ICT in the education sector, until so far with limited success. On the other side some preliminary information exists that communities themselves have started to ask their kebele administration for improved education and access to ICT.

5.5 Explaining factors

5.5.1 Internal factors

No internal factors within EfDA have been identified that possibly explain the low level of integration of ICT within the schools they are supporting. However it has been said that EfDA does not consider ICT their core business and that working on ICT issues.

An organisational assessment made in October 2012, concludes that EfDA's scores for 'management and organisation' are weak and require action, and that those of 'finances' and 'project management' are in the category of okay.

5.5.2 External factors

The local/ district level administration show commitment to support EfDA's interventions in the education sector, but their possibilities to finance the sector and in particular ICT at school are limited.

One very important negative external factor is the lack of electricity which was mentioned earlier. Especially in the Shamba district this is a problem, making the implementation of ICT materials in the schools there very challenging. EfDA has concluded that the needs of these schools are not purely ICT-related, and has shifted its work towards the needed services.

However in the Sululta districts, schools have access to energy and have fulfilled other conditions to ensure education, and showed to be ready for the ICT component.

5.5.3 Relations EfDA and IICD/C4C

Being a part in the C4C network is beneficial to the work of all NGOs involved in the ICT programme. Learning from each other and sharing knowledge are important factors which can contribute to the projects. The interaction with C4C has not been done only at programme level, but more at the overall level of work by SPOs. For example, EfDA is only working with 5 schools for this specific programme but is working at many other schools for the rest of their work. The meetings of the consortium have been focused on learning from one another and implementing work also in other areas. EfDA has been a good example of how to involve the school management in the projects, and the importance of ownership by the community. The interaction with C4C at first was mainly initiated by IICD. However, later on in the partnership the SPOs started to address questions to the C4C members. This required a trust relationship to be established between the SPOs and IICD, and also between the SPOs and C4C.

IICD regularly meets with the technical teams of EfDA and they meet annually with the director of the organisation.

No factors were identified with regards to this relation that hamper or improve the introduction of ICT in the schools.

²⁸ Baseline study Connect4Change Alliance, 2011

6 Discussion

6.1 Design of the intervention

The ICT programme is an addition to the Basic Education Quality Improvement programme that EfDA it is implementing. The evaluation findings suggest that the district chosen for the integration of ICT in the school system is an important element for the success of the ICT project: Schools in Shambu do not all have access to energy, but the schools in Sululta do.

It is against this background that the evaluation team concludes that access to electricity, fully equipped schools, skilled teachers and good performing school management boards, are amongst the conditions to be fulfilled before a similar ICT project can be replicated.

7 Conclusion

Changes in Civil Society

In the 2012 – 2014 period the two most important changes that took place in the civil society arena of EfDA are the following:

- Communities have become more committed to and aware of the importance of education, as a consequence of which they have started to build new classrooms with their own effort.
- Communities are now said to request the government to improve the school education system in other schools than those supported by EfDA, as well as to provide internet services for improved teaching learning.
- School management boards are said to be satisfied with the support provided by EfDA
- An improved awareness of the district administration that “educating girls is educating households”, has become the motto of many schools and communities.

Most changes reported in relation to the C4C project do not in the first place relate to changes in Civil Society. Where ICT is being introduced it has helped to introduce further active learning methods, improve school management, and provide student access to computers.

These findings were obtained through an analysis of documents, a workshop and follow-up interviews with EfDA, interviews with external resources persons working in civil society organisations are related to EfDA, and public or private sector agents.

Contribution analysis

Based upon an analysis of the projects and programmes financed by the Dutch CFAs a selection was made of SPOs to be included in an in-depth process tracing trajectory and those to be included for a quick contribution assessment. EFDA was selected for a quick assessment.

Outcomes directly related to the introduction of ICT in schools are; improved learning teaching methodologies being used, improved school management and the use of computers by students, and: communities are said to request their local administration for ICT equipment in other schools. Apart from these, teachers have improved their competencies in using active-learning methods due to a combination of both the ICT and the education project. These outcomes do however not relate to changes in civil society.

More civil society related outcomes but not to be attributed to the C4C project consist of schools increasingly taking into account gender differences, and emphasise the importance of education for girls. Furthermore some communities have started to take ownership of the education project and start building their own class rooms, ask their local government for good quality education and ICT equipment for schools.

Relevance

Interviews with staff of EfDA with external resource person, with the liaison officer of ICCD, as well as contextual information helped to assess the relevance of EfDA’s interventions in terms of; its Theory of Change (ToC) for Civil Society (SC) as designed during the baseline study; the context in which EfDA is operating; the CS policies of C4C.

Changes attributed to the ICT project are not (yet) relevant in the light of the Theory of Change constructed in 2012, which aims at ‘capacitating civil societies to have an active role in ensuring accessibility and quality of education for children’. This implies strengthening the school management board, Parent Teacher Associations and school clubs. Those structures have only benefitted to a limited extent of the C4C project.

With regards to the context in which EfDA is operating, we observe that support to the education sector is very relevant in the light of national policies but that uptake by the government for ICT in education is low because they do not have the financial means for ICT. Apart from this many schools do not have access to electricity and they have other conditions to be fulfilled before they can think of providing good quality education.

The changes achieved are not yet relevant for C4C who aims to contribute to civil society building by means of creating networks of local partners to influence policies in favour of ICT4Development.

Explaining factors

The information related to factors that explain the above findings was collected at the same time as the data were gathered for the previous questions. The evaluation team looked at internal factors within EfDA, the external context in which it operates and the relations between EfDA and C4C and IICD.

The most important explaining factors that possibly explain the outcomes achieved are: EfDA’s core business being education and in the second place ICT; its weak management and organisation capacity; conditions such as electricity and basic conditions for good education that need to be fulfilled before ICT can strengthen the quality of education, and; the increased trust between the SPOs involved in the C4C project and IICD, that enhanced mutual learning.

Table 3
Summary of findings.

When looking at the MFS II interventions of this SPO to strengthen civil society and/or policy influencing, how much do you agree with the following statements?	Score
The CS interventions were well designed	8
The CS interventions were implemented as designed	8
The CS interventions reached their objectives	8
The observed outcomes are attributable to the CS interventions	7
The observed CS outcomes are relevant to the beneficiaries of the SPO	7

Score between 1 to 10, with 1 being "not at all" and 10 being "completely".

Appendix 1 Civil Society Scores

This table presents the appreciation of the evaluation team regarding changes occurred for each indicator between 2012 and 2014 on a scale of -2 to + 2

- 2 = Considerable deterioration

- 1 = A slight deterioration

0 = no change occurred, the situation is the same as in 2012

+1 = slight improvement

+2 = considerable improvement

Dimension		Indicators	Question	Change
Civic engagement	1	Needs of marginalised groups	How does your organisation take the needs of your beneficiaries/target groups, in particular marginalised groups into account in your planning, actions, activities, and/or strategies?	+1
	2	Involvement of target groups	What is the level of participation of your beneficiaries/target groups, in particular marginalised groups in the analysis, planning and evaluation of your activities?	+0
	3	Political engagement	How intense is your (individual staff or organisational) participation in locally-nationally elected bodies and/or sectoral user groups?	0
Level of organisation	5	Relations with other organisations	In the past 12 months what has been the most intensive interaction you had with other CSOs?	+1
	5	Frequency of dialogue with closest CSO	In the past 12 months how many meetings did you have with the CSO that you have most intensive interaction with?	+1
	6	Defending the interests of marginalised groups	Which CSO are most effective in defending the interests of your target groups? In the past 12 months, how did you relate to those CSOs?	0
	7	Composition current financial resource base	How does your organisation finance institutional costs such as workshops of the General Assembly (if applicable); attendance to workshops of other CSOs; costs for organisational growth and/or networking?	0
Practice of Values	8	Downward accountability	To what extent can mandatory social organs (steering committee, general assembly, internal auditing group) ask your executive leaders to be accountable to them?	0
	9	Composition of social organs	What % of members of your mandatory social organs belong to the marginalised target groups you are working with/for?	0
	10	External financial auditing	How regularly is your organisation audited externally?	0
Perception of impact	11	Client satisfaction	What are the most important concerns of your target groups? How do your services take into account those important concerns?	+1
	12	Civil society impact.	In the past 12 months, what impact did you have on building a strong civil society?	+1
	13	Relation with public sector organisations.	In the past 12 months, what interaction did you have with public sector organisations to realise your programme and organisations' objectives?	+1
	14	Relation with private sector organisations	In the past 12 months, what interaction did you have with private sector organisations to realise your programme and organisations' perspective?	0
	15	Influence upon public policies, rules, regulations	How successful have you been in influencing public policies and practices in the past 2 years?	0

	16	Influence upon private sector agencies' policies, rules, regulations.	How successful have you been in influencing private sector policies and practices in the past 2 years?	0
CS context	17	Coping strategies	In the past 2 years, how did your organisation cope with these changes in the context that may have been positive or negative consequences for civil society.	0

Appendix 2 Changes in civil society indicators between 2012 and 2014

1. Civic Engagement

1.1 Needs of marginalised groups SPO

EfDA takes the needs of the beneficiaries by holding meetings with the community and discussing major issues. There is also a School Management Committee that discusses community concerns with EfDA. The organization usually focuses on marginalized groups like poor women, orphans and vulnerable children. EfDA takes target groups not only as needy groups that should be given handouts but sees them as people who have the capacity to contribute towards their development. Taking the above into consideration, needs of the community are being collected through needs assessment, community conversations and requests by the community. When deciding on activities to be implemented, priority is set through discussion with the community and also taking into consideration what can be contributed by the target/marginalized groups. According to school managers and school board interviewed EfDA collects problems of schools by using checklists and the school reports.

The marginalized groups are purposely involved in all phases of project management in which they reflect their interest and use their right to comment in a slightly improved rate from the baseline. These changes are recognized through the contributions of actors and factors such as the local government, CBOs, Center Management Committee and the SPO using Dutch funding. Other funding organizations and existing government structure and system also contributed.

Score: +1

1.2 Involvement of target groups SPO

The target groups are involved in discussions held with the community and also through their representatives in the committee even though exact percentages cannot be given. Before undertaking any program activities, the SPO undertakes needs assessments and a situation analysis in which it identifies the need of the target group as the involvement of the target group is believed to be crucial for the success and sustainability of projects/programs. Nowadays the involvement of the target group in the whole cycle of project management is also becoming a requirement by donors. In addition the government is also becoming concerned with the involvements of the beneficiaries; hence more work is being done on it.

EfDA generally involves its target groups throughout the project cycle. During implementation target groups contribute resources, which in most of the cases are related to labour contribution (sometimes up to 50% of the cost of the project). Some of the challenges faced in following these procedures are the time taken to convince the community. Another challenge faced is that communities generally understand NGOs as aid providers instead of development partners. They tend to request more and more resources rather than mobilizing through their own efforts and try to change their status/lives.

When compared to the baseline there is a slight improvement as currently the community has realized that its involvement from the very beginning of the project is very important and community ownership in projects are one of the key elements of project implementation. Local resource contribution while constructing/renovating/ schools and community knowledge sharing to the teachers has improved and they are also evaluating the outcomes achieved. The community is now requesting the government to provide the same services as EfDA is delivering to schools that EfDA is not working with. For the schools supported by EfDA they are requesting the government to provide internet services for improved teaching learning.

On a different note, several external resource persons mentioned that the participation of beneficiaries in project analysis, planning, and evaluation is more or less fair but needs improvement. Still it was

confirmed that, within the project cycle, EFDA involves its target groups in the construction of school rooms, toilets etc. No evidence was found that beneficiaries participate in decision making processes.

Score: 0

1.3 Intensity of political engagement SPO

CSOs that receive foreign funding are not allowed to engage politically.

Score: 0

2. Level of organization

2.1 Relations with other organizations SPO

EfDA is a member of the Consortium of Christian Relief and Development Association (CCRDA), the Basic Education Association (BEA-E), Pestalozzi Children's Foundation (PCF) partners' forum, and Oromia HIV/AIDS forum. EfDA is also a founding member of Networks of Civil Society Organization of Oromia (NeCSOO), which is recently registered and got a full legal status. The SPO observes as a weakness that it plays a leading role in only limited networks and it wants this to be improved. But EFDA stated that leading the NeCSOO also helps to attract more funding. Advantages mentioned are the sharing of information and joint fund raising.

The relationship between EFDA and other organizations is very smooth and supportive. EfDA collaborates with organizations who share its vision and mission. The current environment from Funders encourages and demands organizations to create relations with each other. The interactions involve working together and experience sharing among network member NGOs, technical and material support and Experience sharing among school management committee has also become the new thinking and practice. Joint program planning, execution, monitoring, follow up, capacity building through training are also activities to be mentioned under this. The learning and experience mentioned above have paved a good ground for EfDA to join other similar cluster working on Ethiopian social accountability forum and by 2015 EfDA will take over the lead for five CSOs

EfDA is currently a lead organization for Oromia Cluster SPO to facilitate the financial and information flow from the donor to the cluster members and vice versa. Participatory monitoring among SPOs is also organized by the SPOs. The managing director of DEC confirmed that EfDA has strong relations with other CSOs, and that is actually a cluster leader of the 4 NGOs working on the ICT.

Score: +1

2.2 Frequency of dialogue with closest civil society organization SPO

EfDA has frequent meetings with different civil society organization such as with NeCSOO (two meetings in the last 12 months); the CCRDA (two times); BEA-E (4 times a year) and with Oromia cluster of NGOs working on education (initiated by Edukans foundation) up to six times during the last 12 months. Most important agenda points are joint resource mobilization. According to a board member, EfDA had more than 6 meetings the past 12 months with CCRDA, Oromia Cluster, Basic Education Association -Ethiopia, Gender Forum, and NeCSOO. The DEC managing director stated that EfDA is one of them and if it cooperates with other CSOs and government organizations the outcome would be high.

Field staff added to this that without meetings and dialogue EfDA couldn't have achieved project results that are based upon joint planning and active participation of EfDA's target groups. One of the school boards stated that it meets on average every two months with EfDA and with the district education office and school management attend training twice a year with EfDA and the district education office at zone level.

Various useful dialogues have been underway as a result of the experience gained in due course. The relationship and teamwork for more result has significantly improved since 2012. The partners are inspired to the extent of sharing missions and the flow of information and support of each other have

improved. The programmatic approach, where NGOs are expected to form a cluster, motivated more cooperation at program level: Trainings, experience and exposure visits, learning and sharing events.

Score: +1

2.3 Defending the interests of marginalized groups SPO

EfDA staff states that the Ethiopian charities law under which it is registered, defending the interest of target groups is not possible in terms of doing lobbying and advocacy. However, it also mentioned that some organizations that give financial support attempt to defend interest of marginalized groups but also face limitations. As a result, it has become difficult to practice it.

Intermediate organizations supported by EfDA mentioned that EfDA, the school management, school board, youth clubs and Parent Teacher Associations are the most effective organizations in defending the interest of target groups. Economic empowerment of PLWHIV combating Harmful Traditional Practices that affect mainly girls and women, support of unemployed school dropout girls, economical support for the disabled have been done and also currently under way through different projects from other financial sources are some of the mentioned changes since 2012. No statistical information was provided by the SPO to support these said changes.

Score: 0

2.4 Composition of financial resource base SPO

In each project budget EfDA has a certain percentage of the total budget assigned to head office costs and this is generally accepted by donors. This budget is used for financing the organization's costs of general assembly meetings. The general assembly members are not given per diem as it is a voluntary membership. This also makes the budget spent for organizing the general assembly to be reasonably low. The institutional costs/ administrative costs/ mainly fall under the 30 percent part of the total budget, as per the set government regulation. There is no change observed in this indicator since the baseline.

Score: 0

3. Practice of values

3.1 Downward accountability SPO

EfDA is to some extent accountable to its board but this is not day-to-day practice. It was mentioned that their commitment is limited and that they also lack the capacity to ask for this. In general the organizational guidelines are being respected and there is a transparent financial system. According to a board member, EfDA works with the community, government line departments, the Board members, and the staff, from initiating project ideas up to its implementation. Its projects are open to all stakeholders including the cost allocation and budget utilization. It is the policy of EfDA that all stakeholders upon need could explain any project and there is no confidentiality regarding its programs. EfDA is accountable for all its operations to all stakeholders particularly to the community for which the resources are mobilized. EfDA feels and takes as its main working culture to use all project resources for the intended purpose of the project. Moreover, for effective service rendering at grassroots level it is strongly believed that, the field staff should be empowered to make participatory decisions at the spot in many important areas. In this regard, EfDA makes strong efforts in building capacity of its field offices in terms of manpower training, in establishing financial and administrative systems needed for the delegation of authority. This forms ground work for the future when more field offices will be set up together with program expansion.

According to the DEC managing director anyone can enquire on the tasks EfDA is doing and will get sufficient response, and that EFDA is very transparent and accountable. This year it is also participating in downward accountability test along with other organizations to see the community satisfaction.

However, assessments conducted by Edukans in 2009 and in 2012 concluded that EfDA's board is not dynamic; that management is weak and lacking leadership; that conventional accounting procedures are not respected; that a consolidated report of all donor funding is missing, which hampers consolidated financial reporting and; that financial and administrative procedure are in place but need to be actualized in relation to organizational changes.

As per the recommendation of Edukans, some board members are changed and replaced by others to improve the dynamism of the board. The SPO is also using updated peach tree software at the financial personnel coordination office still there is a high lack of documentation of interventions made and outcomes achieved.

Score: 0

3.2 Composition of social organs SPO

There is not much information available about the composition of EfDA's Board. A board member mentions that the participation of women as staff and as member of the association is very low but that EfDA is striving to improve the situation.

The composition of board members is almost proportional (male and female). Two of the five board members are women currently. It is also a progress that two female accountants are employed, one at the coordination office and the other at the project site. The previously available female staffs are maintained to serve the organization.

Score: 0

3.3 External financial auditing SPO

Annual external auditing is part of EfDA's organizational code of conduct and also required by the government, funding organizations etc. However, the organizational assessment by Edukans highlights that conventional accounting procedures are not respected. In response, training has been given to the finance staff and the SPO is using Peachtree however, there are still gaps in documentation of financial activities.

Score: 0

4. Perception of impact

4.1 Client satisfaction SPO

EfDA as well as public and civil society actors mentioned that the concerns of its target groups are related to improving the education situation in the project area. This relates to the provision of teaching aids; rehabilitating old schools; improving offices and facilities for teachers and students; and ensuring quality education. In addition, there are some target groups that are interested to be empowered to enable them to negotiate with local administrative bodies about the services they are supposed to receive.

In addition, EfDA mentioned that some target groups look in the first place for material support rather than support in skill development. To resolve this, EfDA keeps reorienting its target groups' needs by helping them see the benefit of skills development.

Parent Teacher Association representatives mentioned that the community is satisfied with the service it is receiving from EfDA. The way EfDA implements its projects has the general community confidence and acceptance. It also has the principle of planning and implementing together with the community which has been strengthened and improved over the years. Hence, involvement of the community in managing, running and renovation of schools has been improved in the target schools. Other schools in nearby kebeles have started to learn from the target schools. The ongoing primary education quality support is funded by ICCO to be implemented by EfDA in close collaboration with the local government and community. The major activities are capacity building trainings on the use of ICT in the education system, ICT material provision and close supervision. Trainings are being provided for the teachers,

the PTAs; material and capacity building for schools, school improvement activities are the major interventions done in the project site. These interventions are said to have resulted in better performance of students and better learning system of the teachers, according to external resource persons. However, data could not be found to support it. The high performance was said to have been observed because teachers are able to type their exams and lectures on computers and duplicate them instead of using type writes which is time consuming and of lesser quality. Teachers are also able to support their lectures with pictures which makes it more clear to students to understand the topics of discussion. However, EfDA's program coordinator confirmed the focus has not been on ICT: only a few desktop computers have been provided and some schools are still waiting for them. In addition, most of the schools do not have electricity and this troubles the implementation of ICT related activities. He stresses that in the Shambu infrastructural problems were more pressing than in and Sululta districts and hence the interventions focused on classroom building, the provision of training and material support like providing blackboards and school chairs. Other districts, like Wolisa, would have been more appropriate for ICT interventions.

Score: +1

4.2 Civil society impact SPO

EfDA contributes through its network and membership by dialogue and influencing the local and national executive bodies using different mechanisms like training, workshops, learning tours. The target area is large and the needs are being addressed as much as possible but still needs to disseminate.

It was stated by the SPO and confirmed by the interviewed resource persons that the teachers trained in ICT and computer skill showed much change in their teaching methods and minimized their work burden. CBOs are being trained on awareness creation by EfDA. During the past 12 months the effects mentioned consisted of; enabling the school management committees (CMC) and PTAs to minimize the student dropout rate and improve girl's participation in target schools; increasing the awareness of target groups about the importance of education, and interacting closely with government offices, communities and students during problem identification. One of the expected changes as a result of the "Improving the Teaching-Learning Processes and Educational Management through ICT (2011-2015)" was that the integration of ICT in the day to day school activities will not only change trainers' teaching methodologies in becoming student centered, but also aim at opening up the ICT system to a wider community. In 2011 all 5 schools in the Sululta district have received ICT equipment and relevant staff trained in basic ICT literacy and management. The available documents from the SPO do not provide information on the exact outcomes of this introduction of ICT.

Score: +1

4.3 Relations with public sector organizations SPO

According to a board member the collaboration between EfDA and public sector organizations is limited on the introduction of new laws, guidelines; program monitoring and evaluation because the government sector offices are mandated to follow the NGO. National laws, policies and guide lines of the government do not allow otherwise.

However, EfDA indicated that during the last 12 months it had continuous interactions with district and zone education offices, Oromia regional health bureau and Kebele administration offices on education, health and livelihood related issues. In addition, EfDA used the existing government programs as a reference in its program planning and implementation. The managing director of DEC also confirms that EfDA has a very strong relationship with the public sector from the Woreda to the Kebele. It was also mentioned that close collaboration between the public sector and civil society organizations is essential for improving the impact in the education sector.

The specific interactions included; getting information from public sector actors while EfDA conducted baseline studies, jointly preparing plans, jointly implementing and monitoring projects. With regard to this, one specific point that can be mentioned is that EFDA conducted a participatory project evaluation at one of the project sites with the woreda public sector officers. However, EfDA admits

that these interactions lacked consistency and had limited influence on changing public sector actors' decision.

Through the interventions of EfDA, teachers and education offices understand the importance and decisive role of computers in their work hence have reorganized their activity. All the target schools are provided with ICT materials oriented on how to make use of the materials and take care of them. Despite the fact being that these 5 target schools are a drop in an ocean, the local government has taken some points from these efforts by EfDA.

Similarly, the education board and the PTAs associated with EfDA mentioned the following as examples to show how EfDA influenced public practices; EFDA has negotiated with the public offices and facilitated the provision of tutorials for low scoring students and girls, for subjects like English, maths and science; and EfDA convinced public officers on the use of some sign boards used to create awareness. As a result of these, the words most used in signboards have become the mottos of the schools in the project areas. An example of this is "educating girls is educating households-has been become the motto of the schools and communities".

Score: +1

4.4 Relation with private sector agencies SPO

A board member stated that there is no direct collaboration between EfDA and the private sectors, because the CSO law prohibits NGOs from income generating activities for their own benefit, but accepts collaboration when ultimate beneficiaries are being targeted. EfDA does not collaborate with private sector organisations.

Score: 0

4.5 Influence upon public policies, rules, regulations SPO

EfDA engaged in a dialogue with zonal and district education offices to obtain their commitment for improved education and the role of ICT. Issues raised included class-student size, class arrangements in view of ICT equipment, and the need for internet services for teachers. Until so these discussions have not been conclusive.

EfDA stated that since they are building the capacity of community based organizations which they assume will in turn help to influence the current public policies. In addition, as mentioned in EFDA's July to September progress report, the training given to the Ministry of Education, regional education bureaus, zone and woreda education officers about ICT education has helped in building consensus about the important role ICT plays in the education sector.

One of the strategies used to influence policies is by first providing evidence of things that work in order to help the government to adopt rules and regulations that facilitate the further implementation of the innovations (Evidence based policy influence). The "Improving the Teaching-Learning Processes and Educational Management through ICT (2011-2015)" is still in its early stages, so far no change is observed from the baseline.

Score: 0

4.6 Influence upon private sector agencies' policies, rules, regulations SPO

According to a board member there are no ways to influence these bodies. This is partially because of the inexistence of a well-established relationship between the private sector and EfDA. Recently, EfDA has attempted to approach them in an informal way by inviting them on experience sharing visits like was done in the Wolegga and Illibabur zone and some slight way is paved through motivating them through lobby activities. There were some sessions and campaigns to lobby and convince the private sector agencies and also informal approaches from EfDA board members and management team for their involvement. Still no significant change in this perspective was observed. The attempt made did not work well for the desired results.

Score: 0

5. Environment

5.1 Coping strategies

The 2009 law on registration and regulation of charities and societies has (negative) consequences for the achievement of EfDA's objectives, e.g. the 30/70 rule, and that this system views/considers a NGO as supporter of opposing political parties.

High inflation rates caused the escalation of prices for materials to be supplied to schools. Another factor is that of the turnover and reshuffles of lower level government officials means that EfDA has to invest considerable time and human resources in managing its relations with these officials. To reduce the effect of these detractive external conditions, EfDA has attempted to implement different strategies such as looking for additional funds to increase funding for operational purposes to maintain the administrative part of the budget of the organization.

There were also conducive environments, such as eagerness and commitment of the community on the education projects comprising in particular the education part of it and to a lesser extent the ICT component which does not reach communities. This positively helped in achieving the program objectives. The change in the community confidence and interest to work with EfDA is an improvement but the change at the official level is still the same as before.

The Centre for Development Innovation works on processes of innovation and change in the areas of food and nutrition security, adaptive agriculture, sustainable markets, ecosystem governance, and conflict, disaster and reconstruction. It is an interdisciplinary and internationally focused unit of Wageningen UR within the Social Sciences Group. Our work fosters collaboration between citizens, governments, businesses, NGOs, and the scientific community. Our worldwide network of partners and clients links with us to help facilitate innovation, create capacities for change and broker knowledge.

The mission of Wageningen UR (University & Research centre) is 'To explore the potential of nature to improve the quality of life'. Within Wageningen UR, nine specialised research institutes of the DLO Foundation have joined forces with Wageningen University to help answer the most important questions in the domain of healthy food and living environment. With approximately 30 locations, 6,000 members of staff and 9,000 students, Wageningen UR is one of the leading organisations in its domain worldwide. The integral approach to problems and the cooperation between the various disciplines are at the heart of the unique Wageningen Approach.

Klaver, D.C., Jacobs, J., Tefera, W., Getaw, H., Dereje Getu D., 2015, *EKHC end line report; MFS II country evaluations, Civil Society component*, Centre for Development Innovation, Wageningen UR (University & Research centre) and International Food Policy Research Institute (IFPRI). Report CDI-15-033 Wageningen.

Organisation Ethiopian Kale Heywit Church (EKHC) in Ethiopia is a partner of Tear Fund Netherlands under the ICCO Alliance.

The evaluation was commissioned by NWO-WOTRO, the Netherlands Organisation for Scientific Research in the Netherlands and is part of the programmatic evaluation of the Co-Financing System - MFS II financed by the Dutch Government, whose overall aim is to strengthen civil society in the South as a building block for structural poverty reduction. Apart from assessing impact on MDGs, the evaluation also assesses the contribution of the Dutch Co-Funding Agencies to strengthen the capacities of their Southern Partners, as well as the contribution of these partners towards building a vibrant civil society arena.

This report assesses EKHC's efforts to strengthening Civil Society in Ethiopia and for this exercise it used the CIVICUS analytical framework. It is a follow-up of a baseline study conducted in 2012. Key questions that are being answered comprise changes in the five CIVICUS dimensions to which EKHC contributed; the nature of its contribution; the relevance of the contribution made and an identification of factors that explain EKHC's role in civil society strengthening.

Keywords: Civil Society, CIVICUS, theory based evaluation, process-tracing

1 Introduction

This report presents the civil society end line findings of the Ethiopian Kale Heywit Church in Ethiopia which is a partner of Tear Fund under the ICCO Alliance. It is a follow-up to the baseline assessment that was carried out in 2012. According to the information provided during the baseline study, EKHC is working on the MDG 'Health'.

These findings are part of the overall evaluation of the joint MFS II evaluations to account for results of MFS II-funded or –co-funded development interventions implemented by Dutch Co-Funding Agencies (CFA) and/or their Southern Partner Organisations (SPO) and to contribute to the improvement of future development interventions. The civil society evaluation uses the CIVICUS framework and seeks to answer the following questions:

- What are the changes in civil society in the 2012-2014 period, with a particular focus on the relevant MDGs & themes in the selected country?
- To what degree are the changes identified attributable to the development interventions of the Southern partners of the MFS II consortia (i.e. measuring effectiveness)?
- What is the relevance of these changes?
- What factors explain the findings drawn from the questions above?

The CIVICUS framework comprises five dimensions (civic engagement, level of organization, practice of values, perception of impact and contexts influencing agency by civil society in general). It has been used to orient the evaluation methodology.

1.1 Changes in the civil society arena of the SPO

In the 2012 – 2014 period the two most important changes that took place in the civil society arena of the SPO are related to civic engagement and perception of impact. With regards to the first dimension we observe a slight increase since the baseline study in terms of more People Living With HIV (PLWHIV) and Orphans and Vulnerable Children (OVC). These are now being reached by Anti Aids clubs, girls clubs, grain banks, schools and the FBO forum and that these have contributed towards combating social exclusion. Most of these organisations, apart from the two new districts that were added to EKHC's intervention zone, were already established before the current programme started in 2011 and received continuous support by EKHC.

With regards to perception of impact (which also includes the increased outreach already mentioned under civic engagement), we observe that the Anti-Aids Clubs (AACs), the girls clubs and the FBO forum are better embedded into society. AACs increasingly requested to intervene when parents have problems with their children and they are engaging in other development activities in their community as well. In Arba Minch town the FBO forum which regroups Protestant, Catholic and Muslim congregations is attracting material and financial support from many sources and is engaged in a wide range of development activities. It has gained sufficient bargaining power to negotiate positive outcomes with the university and with local government.

Relations of both EKHC and the forum with local government representatives has become more formal and more regular and increasingly, private sector organisations support EKHC in the accomplishment of its objectives regarding HIV and AIDS.

These findings were obtained through an analysis of documents, a workshop and follow-up interviews with EKHC, and interviews with external resources persons working in civil society organisations that receive support from EKHC; other civil society organisations with whom the SPO is collaborating; public or private sector agents and; external resource persons capable of overlooking the MDG or theme on which the SPO is concentrating.

1.2 Contribution analysis

Based upon an analysis of the projects and programmes financed by the Dutch CFAs a selection was made of SPOs to be included in an in-depth process tracing trajectory and those to be included for a quick contribution assessment. EKHC was amongst those SPOs selected for in-depth-process tracing.

The first outcome that we looked at is the extent to which EKHC contributed to the reintegration of OVCs into the school community and to enhance their chances of becoming a full member in society. The pathway most likely explaining this reintegration consists in the first place of material support of diverse nature (food, school uniform, school contributions, etc) mobilised. The AACs, girls clubs and peer education groups are not able to sufficiently cater for these. Once these conditions have been met, counselling services by peers in the AACs, girls clubs and the education groups all do fulfil a meaningful role in the creation of solidarity by creating a level of trust and comfort with OVC that allows for more open discussions of sensitive topics. It remains difficult to disentangle the performance of the peer education system and that of the AACs, both implemented under the MFS II programme, because they overlap in terms of students taking part in both. EKHC's MFS II contribution consists of strengthening the performance of the above mentioned groups that seem to be socially sustainable because embedded in society but not in financial terms. Compared to the figures of OVCs and destitute children supported by the USAID program, also implemented by EKHC and reaching 2413 children with 260 volunteers (not only by counselling services but also by material support), the MFS II contribution seems to be rather limited.

The second outcome that we looked at is the capacity of the religious forum in Arba Minch town and the grain banks to ensure 'enhanced food and nutritional support for vulnerable groups'. The data available suggest that not only the religious forum and the grain banks provide food and nutritional support to vulnerable persons, but many other traditional and informal structures in society. There are multiple pathways that explain the outcome. The capacity of the FBO forum and the grain banks to deliver foods and nutritional support is limited; the first lacks a clear vision and mission in society, which might help it to concentrate on a few interventions rather than solving all problems in Arba Minch town. The grain banks suffer from the rampant inflation rate and cannot support more people and they are not capable of providing the food and nutrition requirements needed for PLWHIV under ART. EKHC's contribution to strengthening the performance of the forum and the grain banks is limited and most of these entities were already formed before the 2011 project started.

1.3 Relevance

Interviews with staff of EKHC, with external resource person, as well as contextual information helped to assess the relevance of EKHC's interventions in terms of; its Theory of Change (ToC) for Civil Society (SC) as designed during the baseline study; the context in which EKHC is operating; the CS policies of Tear Fund.

With regards to the 2012 ToC established with EKHC, the interventions and outcomes achieved are relevant to some extent because the AACs, the grain banks and the FBO forum have shown to be capable to fulfil a role of change agent in their community. The FBO forum lacks a clear vision and a position to take in society. Only the forum and the grain banks have proven to be capable of creating assets, whereas the AACs and the girls clubs are encountering difficulties. In particular the forum and the grain banks are based upon traditional institutions (idirs and churches) and have been able to take up new roles in society.

The changes introduced by EKHC seem to respond to the context and needs assessment conducted in 2010. However the information made available is not explicit on changes introduced on the two new project sites where EKHC intervenes since 2011.

With regards to the MFS II policies of the ICCO alliance the changes are relevant because they are based upon the networks of churches that increasingly need to play in development. Tears' approach of creating SHGs was not assessed in EKHC, but they are a sustainable and high return intervention. The relevance of the programmatic approach in which EKHC takes part is not evident, because not documented by EKHC.

1.4 Explaining factors

The information related to factors that explain the changes in CS, EKHC's contribution to these changes and the relevance of its interventions were collected at the same time as the data were gathered for the previous questions. Apart from searching for explaining factors related to these evaluation questions, the evaluation team was also informed about other important factors such as the organisational performance of EKHC, relations with Tear Fund that might have had an effect on its performance or external factors.

The most important internal factors that might explain failures in the implementation of the EKHC programme are the high transportation costs to join the new project sites and a high staff turnover. Apart from this considerable flaws exist in EKHCs financial and narrative reporting system.

The most external factors that may impact upon EKHC's performance are related to the 30/70 ratio for administrative versus operational costs imposed by the government; a high staff turnover in government offices and EKHC's approach regarding the creation of SHG that is different than the approach taken by other NGOs.

The relations between Tear and EKHC have become tenser since the co funding agency observed that EKHC's reporting and monitoring and evaluation standard does not provide quality. EKHC experiences difficulties with delays in budget releases and the annual contracts that delay the implementation of project activities and decrease EKHC's position to negotiate with the local government.

The following chapter briefly describes the political context, the civil society context and the relevant background with regards to the governance issues EKHC is working on. Chapter three provides background information on EKHC, the relation of its MFS II interventions with the CIVICUS framework and specific information on the contract with Tear Fund. An evaluation methodology has been developed for the evaluation of the Civil Society component which can be found in appendix 2 of the country report; however, deviations from this methodology, the choices made with regards to the selection of the outcomes for contribution analysis, as well as difficulties encountered during data collection are to be found in chapter 4. The answers to each of the evaluation questions are being presented in chapter 5, followed by a discussion on the general project design in relation to CS development; an assessment of what elements of the project design may possibly work in other contexts or be implemented by other organisations in chapter 6. Conclusions are presented in chapter 7.

2 Context

This paragraph briefly describes the context EKHC is working in. A description of the Civil Society Context assessed according to the CIVICUS framework is provided in appendix 3 of the country report for Civil Society.

2.1 Political context

The Ethiopian Government has enacted a five year Growth and Transformation Plan (GTP) to implement over the period of 2011-2015¹. Two of the major objectives of the plan are to maintain at least an average real GDP growth rate of 11%, meet the Millennium Development goals, and expand and ensure the qualities of education and health services thereby achieving the MDGs in the social sectors (FDRE, 2010). The government acknowledged that NGO's and CSO have an important role to play in the implementation of this plan: According to the preamble of the new charities and societies proclamation NO. 621/2009 of Ethiopia, civil society's role is to help and facilitate in the overall development of the country². This is manifested in the government's approach of participatory development planning procedures. For example, NGOs established a taskforce under the umbrella of the CCRDA to take part in the formulation of the country's first Poverty Reduction Strategy paper formulation. They were a major stakeholder in the planning process of the five year GTP plan. Despite fears that the NO. 621/2009 proclamation was thought to have negative impacts on Civil Society, the number of newly registered charities and societies have increased considerably. 800 new charities and civil societies were registered between 2010/11 and 2011/12 and as of February 2012, these were implementing over 113.916 projects in different social, economic and governance related sectors. Governance related projects comprise interventions in the area of democracy and good governance, peace and security, human rights, justice, and capacity building. The charities and societies are most engaged in the health sector (19.8%), followed by child affairs (11.9%), education (9.2%), governance (8.3%) and other social issues (7.8%). These figures are more or less similar to the pre-proclamation period, and would imply that new charities or societies have replaced foreign and Ethiopian charities that are not allowed to work on sectors related to governance and human rights³. This might indicate that there might have been some flexibility in the interpretation of some of the provisions of the proclamation.

2.2 Civil Society context issues with regards to the MDG

A 20-year Health Sector Development Programme consisting of a series of 5-year rolling programmes was established in 1997–1998. Currently, the Health Sector Development Program IV 2010/11-2014/15 is rolled out. The recently implemented Business Process Reengineering of the health sector has introduced a three-tier health care delivery system which is characterized by a first level of a Woreda/District health system comprising a primary hospital (with a population coverage of 60,000-100,000 people), health centres (1/15,000-25,000 persons) and their satellite Health Posts (1/3,000-5,000 persons) that are connected to each other by a referral system. A Primary Hospital, Health centres and health posts form a Primary Health Care Unit (PHCU) with each health centre having five

¹ November 2010, Growth and Transformation Plan 2011 – 2015, Ministry of Finance and Economic Development,(November 2010), Federal Democratic Republic of Ethiopia

² February 2009, Charities and Societies Proclamation (proc. no.621/2009), Federal Negarit Gazeta, Federal Democratic Republic of Ethiopia

³ UNDP, January 2014, Civic Engagement for Effective Service Delivery in Ethiopia: Tools, Opportunities and Challenges, UNDP Ethiopia Working Paper Series No. 2/2014

satellite health posts. The second level in the tier is a General Hospital with a population coverage of 1-1.5 million people; and the third a Specialized Hospital that covers population of 3.5-5 million.

The current health program also introduced a strategy to prevent and control major infectious diseases and to increase its coverage in the rural areas with the appointment of Health Extension Workers. Despite this still categories in society are still not being reached, including street children and youth, commercial sex workers, people with disabilities, PLWHIV, OVCs, destitute women and people living in geographically marginalized areas. In response to this gap, a number of actors, in particular NGOs, are striving to focus on the vulnerable groups of the community with the main purpose of improving access, quality and sustainability of health facilities and health services⁴.

The Ethiopian Health care system currently experiences a rapid expansion of private sector organisations and NGOs playing significant role in boosting the health service coverage and delivery of services through public/private/NGOs partnership. Health offices at different administrative levels from the Federal Ministry of Health to Regional Health Bureaus and Woreda Health Offices share decision making processes, decision powers, duties and responsibilities. The Federal and the Regional Offices are in charge of policy formulation and providing technical support whilst the Woreda Offices manage and coordinate the operation the district health system under their jurisdiction. The devolution of competencies to regional governments has resulted in a more decentralised decision making process.

Several reports indicate that Ethiopia the prevalence of HIV/AIDS has sharply decreased from 1.3 million persons in 2011 to 760,000 persons living with HIV/AIDS in 2013 (UNAIDS, 2013). However, the magnitude of socio-economic and psycho-social problems caused by the HIV/AIDS pandemic is still rampant: some 840,000 children lost one or both parents due to HIV/AIDS and were left behind without adequate parental care⁵.

The Arba Minch Zuria & Mirab Abaya woredas are known for a high prevalence of HIV/AIDS, because they are a transit way for many tourists and are a commercial hub for fruits like bananas and mangos, attracting transporters and labourers. Apart from these Arba Minch hosts universities and colleges which attracts many youth which are easily exposed to HIV infected persons. Youngsters that come to town for their education are easily exposed unprotected sex. Indications exist that stigma related to HIV/AIDS have been reduced in the urban areas, and therefore might increase the number of people that are being tested.

Several reports indicate that Ethiopia the prevalence of HIV/AIDS has sharply decreased from 1.3 million persons in 2011 to 760,000 persons living with HIV/AIDS in 2013 (UNAIDS, 2013). However, the magnitude of socio-economic and psycho-social problems caused by the HIV/AIDS pandemic is still rampant: some 840,000 children lost one or both parents due to HIV/AIDS and were left behind without adequate parental care⁶.

3. EKHC and its contribution to civil society/policy changes

3.1 Background of the SPO

History

The Ethiopian Kale Heywet Church was established in December 1927. The pioneers in the Church were native Ethiopians and Society of Integrated Missions (SIM). EKHC has a head office in Addis which comprises the Development Department and the Directorate General Secretary for Development works that are directly attached to the General Secretary of the church.

Vision:

EKHC's vision is to see a world where all the peoples of Ethiopia and beyond have heard the Gospel and become Christ's disciples and members of His Body – the Church, and actively involved in His service for holistic transformation.

Mission:

EKHC exists to serve God through proclaiming the Good News of Jesus Christ to the people of Ethiopia and beyond so that people may have eternal life, become Christ's disciples, and be fulfilled spiritually, socially, mentally, and physically so that they become salt and light for the glory of God.

Medan Acts (MA) is the Health/HIV department of the church at national level, and has 10 different programmes in different locations. Each location is quite independent, and may have a different approach. Different locations have often different donors and are different in strategy and activities. A characteristic of EKHC is that the structure is much compartmentalised, where different departments can work in a same area without much collaboration.

EKHC Medan Acts (MA) is being supported by Tear Fund for HIV related work in the Arba Minch area since 2005 and since 2006 under MFS I funding. The Head Quarter of Medan Acts is in Addis, and the programme office is in Arba Minch. Its main role with regards to HIV is on prevention and ensuring that People Living With HIV (PLWHIV) receive care and support through CBOs, FBOs and Anti AIDS Clubs. It completed its first phase in Jan, 2010 after which the project expanded to two new nearby woredas. In 2011 a one year pilot project was implemented in Arba Minchtown, six Kebeles of Arba Minchzuria woreda & seven Kebeles of Mirab Abaya woreda.

EKHC is one of seven Ethiopian partners in the Ethiopia Health Country Plan 2011-2015 of the ICCO Alliance. This Health HIV plan is the result of several consultations held in Ethiopia in 2010 and 2011, including a base line study implemented by local partners. It is the continuation of a new phase of cooperation between local partners in Ethiopia and Dutch partners of the ICCO Alliance.

The programme became operational in 2011 and evolved into a network of implementing partners that together and with other stakeholder draw lessons learned. Since 2012 the monitoring of the Ethiopia partners and the programme were decentralised to the ICCO Alliance Regional Office together with local staff of Dorcas, Red een Kind and Tearfund UK (called the Regional Working Organisation) that support the Ethiopian Health Program. Contracts are sent from the Netherlands after the ICCO office in Kampala has agreed.

With the support of the ICCO alliance, EKHC implemented two projects between 2012-2014, both part of the Health Sector Plan 2011-2015. The focus of this evaluation is on the project in Arba Minch called "Arba Minch Medan ACTS Comprehensive Community Based HIV Prevention & Control Project".

3.2 MFS II interventions related to Civil Society

The overall objective for the Arba Minch project is linked to the overall ICCO Alliance country level objective and is formulated as “improving the quality, accessibility and sustainability of the health system for the most vulnerable groups in Arba Minch town, Mirab Abaya, and Arba Minch Zuria woredas.” Outcomes include: well-established accountability mechanisms in which civil society effectively calls the health system to account for the delivery of equally accessible basic health care, and; capacitated change agents through which civil society promotes the effective prevention of Sexual and Reproductive Health problems, HIV transmission and disabilities; and well-established HRH policies, strategies & activities that improve the quality, accessibility and sustainability of the health system.

The following relations exist between EKHC’s interventions and the CIVICUS framework: between 2012 and 2014 the focus on capacitating AACs and gender clubs and training peer educators to reach vulnerable youth in the area relates to the dimension of Civic Engagement. Strengthening the FBO forum and forming self-help groups and grain banks to provide support services to the most vulnerable groups in society relates to the dimensions ‘perception of impact’ and/or ‘level of organisation’ in terms of strengthening civil society organisations. This evaluation therefore tries to focus on these two orientations.

3.3 Basic information

Table 3

Basic information

Topics	Answers
Name of SPO	EKHC
Consortium	ICCO Alliance
CFA	Tear Fund NL
Start date of cooperation	2007
MDG/theme	Health
MFS II project name 1	Arba MinchMedan ACTS comprehensive community based HIV prevention & control Project
Contract period	February 1, 2011 – January 31, 2015
Total budget Tear Fund	€ 376.354
Other donors if applicable	Other donor organisations that support EKHC are TearFund UK, EED, DORCAS AID International, Samaritan’s Purse – Canada, Canadian International Development Agency (CIDA), and Society of Integrated Missions (SIM) Ethiopia. It is not known to what extent these organisations also contribute to this particular project.
Estimation of % of budget for Civil Society ⁷	66 %

Sources: Project documents

⁷ Costs that relate to civil society development or policy influence are those costs that possibly contribute to the development of the CIVICUS dimensions, excluding coordination and office costs; staff costs and financial reserves.

4. Data collection and analytical approach

4.1 Adjustments made in the methodology of the evaluation

The project document has been formulated at the ICCO Alliance level for a period of five years which implies that annual plans and report are not taking into account the specific context in which EKHC operates. Progress reports only partially match the objectives formulated in the annual contracts with EKHC and most often describe activities and outputs implemented without linking these to the outcome level. Reporting on progress does not match with the contract periods. Apart from this it was hardly possible to accumulate information from different progress reports into a comprehensive overview enabling the evaluators to track progress against targets. The terminology used from one report to another was not consistent, making it therefore difficult to link EKHC's interventions to the CIVICUS framework and to set an orientation for the contribution analysis. This was only possible after the first workshop with EKHC after which the team could follow the evaluation methodology as planned.

Most important difficulties also are related to the fact that no difference is being made with support given to already existing structures before 2011 and newly created structure. It is not possible to tell how many new structures (AACs, gender clubs, grain banks, FBO forums, SHGs) were created in the new project and what differential support was given to both.

Also with regards to budgets and expenditure reports, the following issues have been observed. In the first place the 3 year budget has a different set up than the financial reports, therefore making comparisons impossible. Some budget lines in the financial reports are not included in the initial budget such as a budget line for capital items 542.101 which explains nearly 25% of all expenses and which according to Tear NL was spend on a second vehicle but wrongly recorded. The 2012/2013 budget seems completely overspent. Similar unclarified issues exists with regards to the contributions given to the forum, the grain banks and the AACs and expenditures made for the purchasing of formal bylaws by SHGs that however did not receive official papers.

4.2 Difficulties encountered during data collection

The evaluation team encountered difficulties in compiling all information from the project documents as a means to obtain a complete overview of outcomes and outputs achieved in line with the logical framework. Whereas the project is being implemented by EKHC in the Arba Minch area, the objectives set were on ICCO Alliance level and no comparison between actual outcomes and objectives could be made.

4.3 Identification of two outcomes for in-depth process tracing

In relation to the CIVICUS framework four strategic orientations for contribution analysis were identified: Ensuring that more people from more diverse background are engaging in civil society activities; ensuring that the organisations that receive support from the SPO are capable of playing their role in civil society – intermediate organisations; strengthening the relations with other organisations in civil society to undertake joint activities, and; influencing policies and practices of public or private sector organisations.

With regards to the efforts of EKHC this assessment looked at the extent to which EKHC helped to reintegrate OVC into the school community to enhance their chances of becoming a full member in society as a result of the peer education groups and the AAC and Gender clubs.

The second topic looks at the extent to which the FBO forum and grain banks are capable of providing food and nutritional support to vulnerable groups in society

5. Results

5.1 Results obtained in relation to project logframe

From the project documents we extracted the following information, which however has not been validated by EKHC or by the Co-Funding Agency. We reconstructed a logical framework based upon the annual contracts between Tear Fund NL and EKHC⁸. Results are covering the February 2011 – October 2013 period.

EKHC tries to reach its objectives by capacitating and supporting 15 (or 14 according to the budget) Anti Aids Clubs (AACs), 10 gender clubs, 15 schools, 63 SGH, between 22 and 25 grainbanks (numbers not clear), 1 CBO forum (which is the religious FBO forum of Arba Minch) and an unspecified number of volunteers. Community leaders, CBO- and FBO leaders are trained on numerous topics including lobby& advocacy, networking, entrepreneurial skills, community conversation skills. Peer educators are trained to inform youth on HIV related topics, to integrate vulnerable children into the school system and to decrease the number of drop-outs. EKHC furthermore initiated the religious FBO forum in the Arba Minch area in 2010, trained it and covered administrative costs between 2012 and 2014. Additionally, EKHC forms Self Help Groups (SHG) and grain banks to increase self-sufficiency in the area. Care and support services and referral of mothers to Prevention of Mother to Child Transmission (PMTCT) services is done via the FBO forum and volunteers. These volunteers receive training on adherence counselling and home based care services.

Objective 1: Well-established accountability mechanisms in which civil society effectively calls the health system to account for the delivery of equally accessible basic health care.

At this level no targets were formulated and we deduced from the report that 15 schools and 1 university, 10 gender clubs, 15 AACs, 1 CBO forum.

- Between 3200 and 3520 students were reached in 15 schools on HIV/AIDS, reproductive health and sexuality issues; the AACs reached 16977 persons and 7020 persons were reached by gender clubs. 544 pregnant women were linked to health institutions for PMCTC services; there is some indication that women become aware that female circumcision is a harmful practice;
- 60 female students received particular support in different schools through the peer education groups; 40 OVCs received educational material support because 6 schools generated income through their own agricultural plots;
- 66 CBO/FBO leaders and 240 idir⁹ members (we do not know if CBO stands for idir) received training by peers on gender issues;
- One religious forum was established in Arba Minch town for care and support before 2011 and it is currently supporting 40 persons on a monthly basis. The idirs and churches support 30 vulnerable people in the new project areas and by October 2013, 129 PLWHIV received food support from grain banks;
- 1 kebele administration provided half an acre of land for the strengthening of the care and support activity. The beneficiaries are now growing bananas on the land. A newly established grain bank in Mirab Abaya woreda organised a fund raising conference on their local churches and collected more than 32,000 Birr and 200 kg of maize.

No progress seems to have been made on the establishment of similar CBO forums in Mirab Abaya, and Arba Minch Zuria woredas.

⁸ Contract 2011046; 2012046 and 2012-2015 proposal

⁹ Among the most enduring, universal, effective, and relevant socio-economic informal institutions Ethiopians have created are Iquib and Idirs are an informal institution in Ethiopia; they are associations established among neighbors or workers to raise funds that will be used during emergencies, such as death within these groups and their families. An idir can be characterized as a traditional financial association.

No examples have been documented that explain how these organisations collaborate with the health system and hold it accountable. We further observe that limited information has been reported with regards to the girls clubs.

Objective 2: Capacitated change agents through which civil society promotes effective prevention of SRH problems, HIV transmission and disabilities. At this level no targets were formulated and the figures are not reliable.

- Initially each AAC was supposed to organise 2 coffee ceremonies per month (180 coffee ceremonies per 6 months; this was downsized to 1 coffee ceremony per month per AAC as of May 2013. On average, 84 % of the planned ceremonies took place.
- 8104 people have got voluntary counselling and testing services of which 3535 females (44%) and 68 (0.8%) PLWHIV were referred to health facilities for ART follow up.
- 22/25 grain banks are operational, representing a network of 75 CBOs and FBOs; 9 grain banks formed a union in Arba Minch, received a mill and are searching for legal recognition. The government has provided a house for the grain mill.
- 63 SHG have been established that support members in financial and in social terms

Objective 3: Well-established Human Resources for Health (HRH) policies, strategies & activities that improve the quality, accessibility and sustainability of the health system: No targets were formulated for this objective and from the reports no clarification was obtained about the nature of this objective: was it about the CBO forum or was it about coordinating interventions in the Health sector with other NGOs in the district as a means to prevent duplication of efforts.

5.2 Changes in civil society in the 2012-2014 period

5.2.1 Civic Engagement

Civic engagement describes the formal and informal activities and participation undertaken by individuals to advance shared interests at different levels. Participation within civil society is multi-faceted and encompasses socially-based and politically-based forms of engagement.

Civic engagement only slightly increased since the baseline study, mostly by means of more PLWHIV and OVCs now being reached by EKHC's interventions.

The youth was mainly reached by using peer-education methods through anti-aids clubs. Between 2012 and 2014, 126 high school students and 75 university students were trained to lead discussion on HIV/AIDS, reproductive health and sexuality issues. These peer-educators reached between 3200 and 3520 students in 15 schools. Another 17000 persons received similar information by means of Anti Aids Clubs outside school and 7020 persons were reached by gender clubs. 544 pregnant women were linked to health institutions for PPTCT services; there is some indication that women become aware that female circumcision is a harmful practice¹⁰.

- 63 SHGs were formed and are saving money that can be borrowed by individual members who want to start their own business. These SHG are also perceived by their members as a social safety net and as a platform to address issues as social exclusion¹¹.
- 22/25 grain banks are operational (9 in Arba Minch, 7 in Mirab Abay and 6 in Arba MinchZuria). Nine out of the existing grain banks in Arba Minch formed a union and received a grain mill from the government. By October 2013, 129 persons living with HIV received food support from grain banks.
- 8104 people received voluntary counselling and testing services of which 3535 females (44 %) and 68 (0.8%) PLWHIV were referred to health facilities for ART follow up.

These outcomes are the result of some 90 community volunteers providing care and support and counselling services, 75 university students engaging in peer education and 44 CBO and church leaders. (We are not sure about the numbers though).

¹⁰ Interview with programme staff

¹¹ Interviews with SHG members

EKHC closely works with churches and idir leaders for its programming and implementation of activities which are mainly male, hence increasing the risk of not being able to represent the needs and interests of women.

Both EKHC and the groups it works with are engaging in a political sense.

Score baseline 2012 on an absolute scale from 0-3: 2

Score end line 2014, relative change on a scale of (-2, +2): 1

5.2.2 Level of Organisation

This dimension assesses the organisational development, complexity and sophistication of civil society, by looking at the relationships among the actors within the civil society arena.

EKHC is one of seven Ethiopian partners jointly implementing the Ethiopia Health Country Plan 2011-2015 of the ICCO Alliance. It is the continuation of a new phase of cooperation between local partners in Ethiopia and Dutch partners of the ICCO Alliance. At programme level a number of objectives were set that indicate how EKHC changed with regards to its engagement with other NGOs.

The programme has been instrumental for all partners to share experiences and to learn lessons through the organisation of mutual project visits that also included public sector staff, as well as exposure visits to other organisations. These visits have stimulated reciprocal learning amongst partners.

The alliance partners received courses on lobby and advocacy and a manual was developed that is suitable for the Ethiopian context. However no joint strategies were developed to influence public policies and practices as a coalition, some use the course lessons to hold the public sector accountable at their project sites, which is not the case with EKHC. Alliance partners developed new ways to include their churches into development efforts, such as is the case with EKHC, and some learned how to use the local media such as radio broadcasting (no indications found with EKHC).

As observed at the level of EKHC, also the coalition is missing a monitoring and evaluation systems that helps to track progress being made and to draw lessons for improving the programme's effectiveness and efficiency.

This coalition of partners is still financially dependent upon the ICCO alliance and did not undertake any initiatives to attract other financial resources. Apart from this the Head Quarters of the partners, because not foreseen in the organisational set up, are not providing the support needed to sustain the coalition¹². According to Tear NL this issue is currently being addressed.

A positive trend observed is that EKHC is increasingly engaging with other religious congregations and not only its own protestant church¹³. Since 2010, Arba Minch town has a religious forum established by EKHC together with the local government that regroups Catholic, Muslim, Orthodox, and Protestant leaders and that are increasingly being solicited by the local government to resolve local conflicts. The forum is now self-supporting and provides support to 50 vulnerable people.

The Forum has constituted an Executive Committee of six members representing Orthodox Church (2 representatives), Protestant Church (2 representatives), Catholic Church (1 representatives) and Moslem (1 representative). It has developed its own bylaw, standard of work procedure in the process of beneficiary selection, service delivery and monitoring of activities¹⁴.

5.2.3 Practice of Values

Practice of Values refers to the internal practice of values within the civil society arena. Important values that CIVICUS looks at such as transparency, democratic decision making, taking into account diversity that are deemed crucial to gauge not only progressiveness but also the extent to which civil society's practices are coherent with their ideals.

Hardly any changes occurred with regards to the baseline study. Most representatives in the social organs of EKHC are mostly from middle classes, and marginalised groups and women are underrepresented. However, since 2012 more disabled representatives take part in these organs.

The evaluation team observed many unclarified issues related to the project budget and real expenditures that require a further analysis by competent experts. At the same time EKHC's financial resource base from donors is declining.

Score baseline 2012 on an absolute scale from 0-3: 2

Score end line 2014, relative change on a scale of (-2, +2): 0

5.2.4 Perception of Impact

Perception of Impact assesses the perceived impact of civil society actors on politics and society as a whole as the consequences of collective action. In this, the perception of both civil society actors (internal) as actors outside civil society (outsiders) is taken into account. Specific sub dimensions for this evaluation are the extent to which the SPO has contributed to engage more people in social or political activities, has contributed to strengthening CSOs and their networks, has influenced public and private sector policies.

Since the baseline slightly positive changes are registered with regards to the extent to which beneficiaries are satisfied with services delivered, the organisations supported by EKHC have proven to make a considerable contribution to the civil society arena and have engaged in satisfactory relations with government representatives and public services and with private sector organisations. No policies of public or private sector organisations were influenced.

In the first place we observe that no systems are in place that measure the extent to which EKHC's beneficiaries are satisfied with services and support delivered by the AAC, the grain banks, the SHGs, the girls clubs, the FBO forum in Arba Minch and the many volunteers and community leaders that have been trained. Some positive indications show us that the outreach of these entities has increased since 2012 and that SHG are successful in combating social exclusion. AACs increasingly are being seen as the structures to solve issues relating to children in schools and in society, and they are engaging in other development activities as well. However AAC members frequently shift from one place to another, and occasionally AAC face internal conflicts, both factors therefore weakening the performance of these clubs¹⁵.

The 22 – 25 grain banks are capable to support some 125 vulnerable people (PLWHIV and OVCs, disabled persons), however an increase in their number is hampered by inflation rates and consequent rises in prices of staple foods. These grain banks are embedded in their community through the idirs and the church.

In Arba Minch town the FBO forum which regroupes Protestant, Catholic and Muslim congregations is attracting material and financial support from both other NGOs, universities and the local government, which enable it to also support some 45 vulnerable people (PLWHIV and OVCs, disabled and elderly persons) on a regular base and engages in other less regular community activities. It has become self-sufficient. Upon invitation of the local government it is assisting in the resolution of conflicts and it has gained sufficient bargaining power to negotiate positive outcomes with the university and with local government.

According to the information made available no such forums have been established in Mirab Abaya, and Arba Minch Zuria woredas.

¹⁵ Input-output analysis

Relations of both EKHC and the forum with local government representatives has become more formal and more regular. This made the process of linking the 30 additional SHGs with microfinance institutions, which are established and sometimes managed by the government, easier. The government provides office space to the forum and the AACs and regularly is consulted by EKHC during meetings. They receive the technical and material support from EKHC that is necessary to play their roles in development.

Increasingly, private sector organisations support EKHC in the accomplishment of its objectives regarding HIV and AIDS. They provide free of charge health services, pay school fees or support OVC by ensuring vocational training.

No explicit policy influencing takes place targeting the public and the private sector.

Score baseline 2012 on an absolute scale from 0-3: 1
Score end line 2014, relative change on a scale of (-2, +2): 1

5.2.5 Civil Society Environment

It is very challenging to sign an agreement with government bodies for a project which only has a life span of one year. Yearly projects also mean that it is more difficult to adjust to the mandatory administrative/program budget ratio (30/70 ratio). Projects covering more years could probably solve this issue, providing more flexibility for EKHC. The regional Finance and Economic Development Bureau was strictly opposed to the initial starting date of the project set at February 2012, because at that moment EKHC was not capable to comply with the 30/70 ratio and was searching for additional funding. Finally, the official starting date was reported to May 2012 when additional funding was found with Help a Child. The 30/70 ratio also resulted in EKHC staff being underpaid.

The official agreement procedures with the government took a very long time and have delayed in particular those activities in the woredas (Mirab Abaya and Arba MinchZuria). High staff turnover in government offices explain these delays.

EKHC suffered from the absence of resource persons in Arba Minch that would be capable of providing courses on networking and lobby and advocacy which resulted in the postponement of these activities.

Score baseline 2012 on an absolute scale from 0-3: 1
Score end line 2014, relative change on a scale of (-2, +2): -1

5.3 To what degree are the changes identified attributable to the development interventions of the Southern partners of the MFS II consortia (i.e. measuring effectiveness)?

This paragraph assesses the extent to which some civil society outcomes achieved can be “attributed” to EKHC. Starting with an outcome, the evaluation team developed a model of change that identifies different pathways that possibly explain the outcome achieved. Data collection was done to obtain evidence that confirms or rejects each of these pathways. Based upon this assessment, the evaluation team concludes about the most plausible explanation of the outcome and the most plausible relation between (parts of) pathways and the outcome. The relations between the pathways and the outcomes can differ in nature as is being explained in table 4.

Table 4

Nature of the relation between parts in the Model of Change

Nature of the relation between parts and other parts or outcome	
The part is the only causal explanation for the outcome. No other interventions or factors explain it. (necessary and sufficient)	
The part does not explain the outcome at all: other subcomponents explain the outcomes.	
The part explains the outcome but other parts explain the outcome as well: there are multiple pathways (sufficient but not necessary)	
The part is a condition for the outcome but won't make it happen without other factors (necessary but not sufficient)	
The part is a contributory cause it is part of a 'package' of causal actors and factors that together are sufficient to produce the intended effect.	

Sources: Mayne, 2012; Stern et al, 2012

The following paragraph assesses EKHC's contribution to two outcomes. Each paragraph first describes the outcome achieved and the evidence obtained to confirm that the outcome has been achieved. It then presents the pathways identified that possibly explain the outcomes, as well as present information that confirms or refutes these pathways. The last section concludes in the first place about the most plausible explanation of the outcome, followed by a conclusion regarding the role of the SPO in explaining the outcome.

5.3.1 Civic engagement

The evaluation team looked at the extent to which EKHC's interventions helped to reintegrate OVCs into the school community to enhance their chances of becoming a full member in society. According to our information 60 female students received particular support in different schools through the peer education groups; 40 OVCs received educational material support because 6 schools generated income through their own agricultural plots.

EKHC does this by means of forming peer education groups within schools and by capacitating AACs and gender clubs in order for them to provide psychological support to OVC. The assumption is that students are more inclined to be influenced by their peers than by their parents or teachers. The cascade system of peer education furthermore ensures a wide coverage. The government is also involved in the re-integration of OVCs into the school system via the provision of special IDs that allow OVC to enter schools without a uniform, by exempting OVCs from paying school contributions, and by paying part of their health expenses. Apart from this volunteers employed by NGOs like USAID might also explain the enhanced inclusion of OVCs: they provide care and support services and distribute school uniforms, school materials and food to OVC.

Pathway 1: Enhanced inclusion through the efforts of peer education groups

The first pathway that might explain the integration of OVCs into the school system is the formation of peer education groups. EKHC trains a total of 50 students per year as peer educators. These students then go to their respective schools and train 8 students each and those 8 teach 10 other students. Hence training one peer educator will result into 80 fellow students also becoming peer educators. The first 50 educators get training from EKHC for 10 days and in turn they train the 8 students for 5 days. The peer education members are in grade 5 or higher. Between 2011 and 2013, 126 out of the 140 planned peer educators were trained by EKHC.

The following information *confirms* the importance of the peer education groups in integrating OVC into the school system:

- Field staff believes peers of OVCs in schools know best their needs and hence can be instrumental in helping them. The peer educators furthermore conduct counselling of OVC school drop-outs and try to convince them to come back. The peer education system works well in identifying drop-outs. One of the peer educators mentions he was able to bring back three out of four OVC that dropped out in his school.
- A high school teacher interviewed underlines the positive effects of peer pressure to increase school attendance. An elementary school teacher adds that because the peer discussions are open to anyone and the topics are interesting, OVCs come to school to see their peers and to attend the peer discussions. Hence, the peer education groups increase the social cohesion between students.

- The peer educators interviewed highlight that students are more prone to listen to the advice of their peers than to the scolding of parents and teachers. Sensitive topics such as sexuality and sexual behaviour which are not addressed by parents are discussed in the peer education groups. This argument is valid for both the in- and out of school clubs.

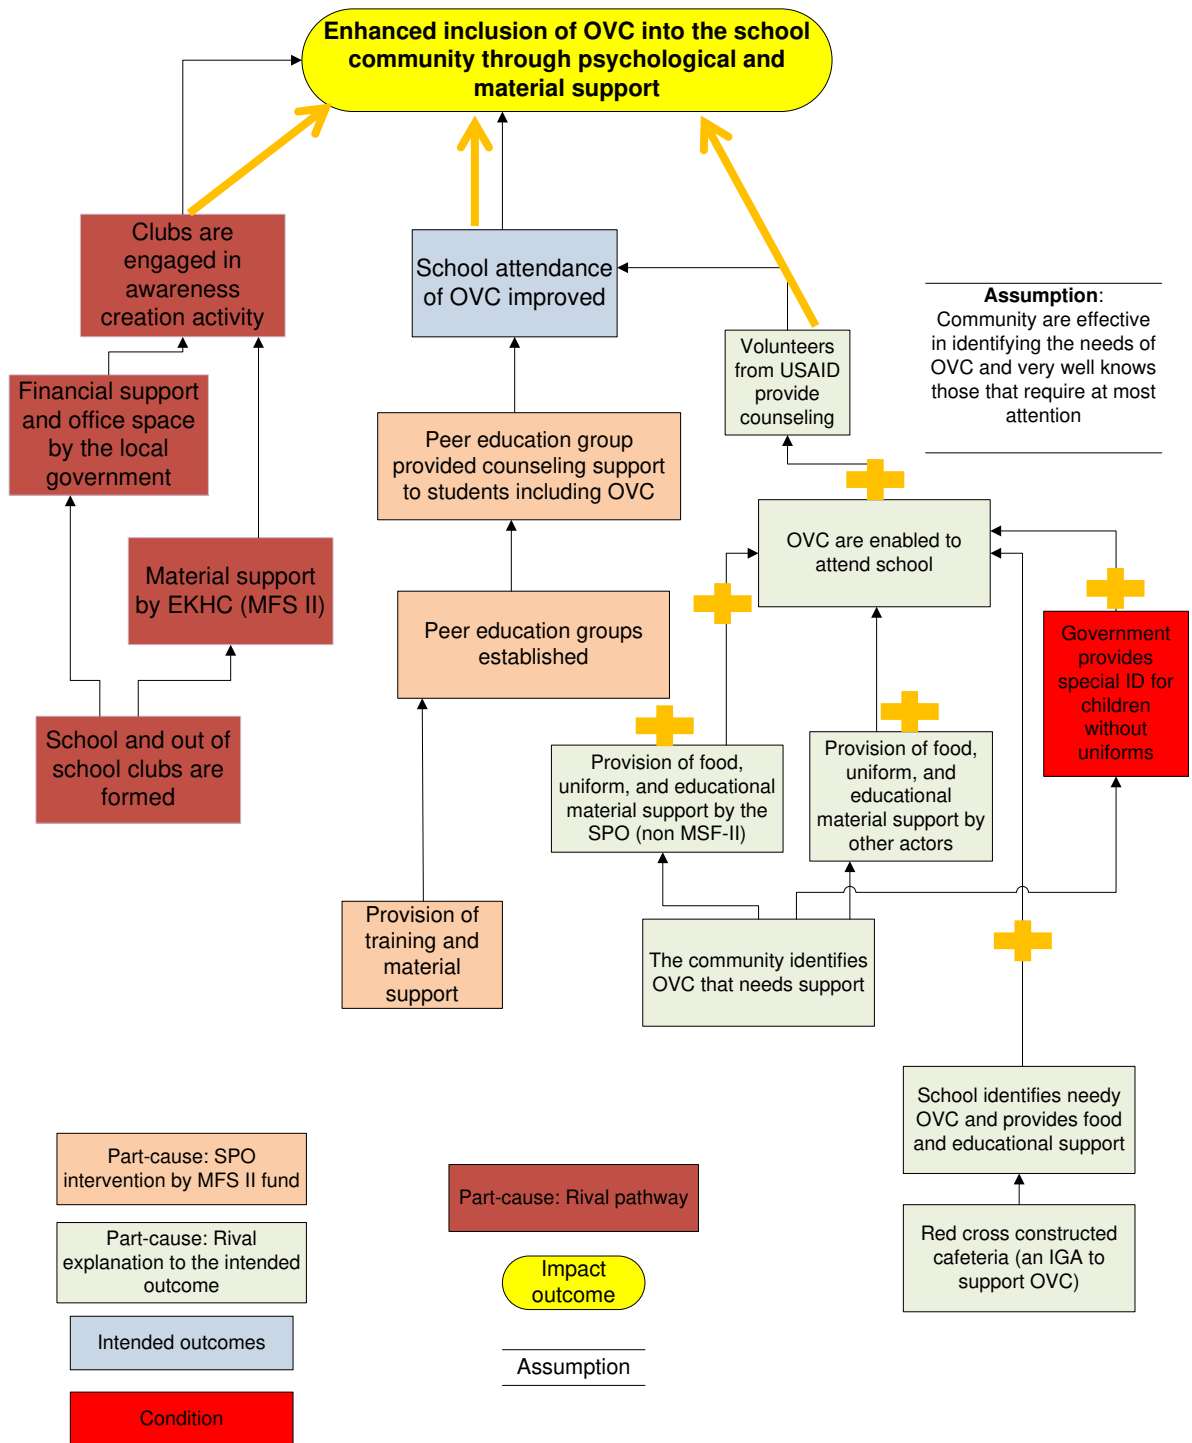

Figure 1: Pathways that possibly explain outcomes and conclusions about the nature of the relations between pathways and the outcome, enhanced inclusion of OVCs into school community

The following information collected highlights the fact that peer education groups *do not explain* the integration of OVCs into the school system:

- Though the cascade system looks promising in theory, the quality of the information transferred from peer educator to peer educator does not become clear from the data collected. The first educators are trained more extensively than their successors. Attendance rate of the students drops along the line: from the 10 students trained at the end only 60% finishes the full training¹⁶. The fact that peer educators need to be in grade 5 or higher means furthermore results in high succession rates. The peer educators who leave school recruit their successors. It does not become clear from the data collected how these successors are trained.
- The peer education groups focus mainly on awareness creation and they support OVCs through life skill advice. They do only have limited means to support OVCs with material or food support.

Pathway 2: Enhanced inclusion through awareness creation by AACs and gender clubs

The second pathway that might explain the inclusion of OVC into the school system is the awareness creation by AACs and gender clubs. These in- and out of school clubs conduct awareness creation sessions aimed at convincing communities not to socially exclude OVCs. They furthermore provide counselling services to OVCs, which mainly consist of psychological support but occasionally they provide financial and material support.

EKHC supported 14 AACs and 10 gender clubs between 2012 and 2014. The number of newly established AACs or gender clubs since the baseline and their location cannot be deducted from the documents. The AACs are said to have reached a total of 16,977 persons by means of coffee ceremonies, poetry presentations and 10 drama plays. Initially each AAC was supposed to organise 2 coffee ceremonies per month (180 coffee ceremonies per 6 months). This was however downsized to 90 coffee ceremonies since May 2013. On average 84 % of the planned ceremonies during that period took place¹⁷.

The documents give the impression that 10 gender clubs have been created between 2012 and 2014, in charge of one coffee ceremony per month. No figures are available for the number of coffee ceremonies organised except for the May-October 2013 period: 85% of the planned coffee ceremonies were conducted during that period. The gender clubs were able to reach 7.020 persons via the coffee ceremonies.

The following information *confirms* the importance of AACs and gender clubs in integrating OVC into the school system:

- The AACs work together with the Kebele Children and Youth office and the school to reach children that are not going to school¹⁸. The AACs have easy access to the youth in the community via their members and they are able to approach the most destitute children.

The following information collected highlights the fact that AACs and clubs *do not explain* the integration of OVCs into the school system:

- The financial capacity of the clubs is limited: the members of the AAC interviewed emphasize that their club can only materially support a handful of OVCs. The sustainability of these clubs in terms of providing material support is low.

Pathway 3: Enhanced inclusion through support provided by the local government

A third pathway that might contribute to the inclusion of OVCs into the school system is based on the efforts of the local government. The local education office provides various exemptions to improve the school attendance of OVCs. For example, vulnerable students who cannot afford uniforms are given a special ID to enter the school premises without uniforms. Though government schools are free, OVCs are exempted from paying school contributions like for example renovation fees. Furthermore, the government covers their health expenses in the locality and works together with NGOs like the GamoGofa development association to provide food and material support.

¹⁶ Based on attendance records of peer educator groups

¹⁷ No information available for the other periods

¹⁸ Interview with AAC member

The government is also working on bringing back school drop-outs. Kebele representatives are part of school committees that work together with Parent Teacher Associations (PTAs) to identify OVCs in town.

The following information *confirms* the importance of the local government in integrating OVC into the school system:

- The local government is willing to work together with different partners on the integration of OVCs. At Kebele level, the Children and Youth Office works with the AACs to identify OVCs and school drop-outs. At town level, the education bureau works together with school committees and PTAs to identify OVCs. After the selection process the government officials determine what support can be given via government services and through NGOs like PACT or the GamoGofa association.
- The local government has a broad strategy and support system like the exemption of admission fee and school contribution for destitute and OVC, OVC that can't afford to wear uniforms are given a specific ID where they are allowed to enter without uniform, and the Mayer's office covers a portion of health expenses from the regional annual budget.

The following information collected highlights the fact that the efforts of the local government *do not explain* the integration of OVCs into the school system:

- The local government takes a rather passive stance towards the implementation of their directive. As the interviewee of PACT confirms, actors need to approach the local education office to ask for support of identified OVCs. The local education office does not have a pro-active attitude towards supporting OVCs, but rather waits until NGOs approach them. The local government does not actively intervene although it has the mandate to do so. The education bureau confirms in an interview that their coverage of OVCs support is still rather low.

Pathway 4: Other actors and factors

The Red Cross constructed cafeteria in most of the schools in Arba Minch as a means to generate incomes to provide educational materials, uniform and sometimes food (maize) for destitute children. This initiative aims to ensure that students that are unable to attend class due to hunger or lack of learning materials can still integrate into the school system. NGOs like WFP, World learning also support these children with food and school materials, but these projects are phasing out.

EKHC is implementing an USAID project that provides school materials and food to destitute children (both OVC and otherwise). The USAID project also coordinates soft supports like tutorial and follows up on school attendance. This project works with 260 volunteers in and around Arba Minch, giving home based care, counselling and monitoring OVC's school performance. The project supports 2413 children of which 1297 have been linked with WFP and 38 have been linked to free technical and vocation education. Another actor supporting destitute children (OVC and others) is the local government that issues IDs for those children identified by the community so that they can attend school without the mandatory school uniform. The local government also has a monitoring system of school drop outs which is however not effective in bringing them back to school.

Conclusion

The most plausible explanation of the increased inclusion of OVCs into the school system is in the first place that they are being selected for an integration programme and that they receive material support like school uniforms, books, food and support in paying their school contributions. The peer education groups, AACs and gender clubs; NGOs like PACT and USAID that provided material and food support to 6,010 respectively 1,296 children; school cafeteria by the Red Cross, and: school gardens all are needed and are to be considered as a *condition* to enter the school system. This requires the coordination of multiple actors: In one kebele visited by the evaluation team, the local education office, the AAC, and the schools are working together and each fulfils a different role: the clubs have access to the most destitute OVCs and evidence exists that they can influence their peers; the school can guide the process of school integration; and the Kebele Children and Youth office can either involve a NGO to provide support needed or use their means available like providing an ID to exempt OVC from wearing school uniforms. All these are *conditions* that need to be in place before OVCs can actually start frequenting classes.

EKHC's peer education groups, the AACs and the girls clubs, as well as the 260 volunteers supported by USAID in and around Arba Minch, giving home based care, counselling and monitoring OVC's school

performance all do fulfil a role in the creation of solidarity by creating a level of trust and comfort with their peers that allows for more open discussions of sensitive topics. It remains difficult to disentangle the contribution of these social-cultural interventions: Both the peer education groups and AACs are involved in the prevention of drop-outs and they cover the same discussion topics.¹⁹ Additionally, students tend to be members of more than one club or group which means the effect of the peer education groups cannot be separated from other in- and out of school clubs. The USAID volunteers also provide counselling services and monitor monitoring OVC's school performance. All three approaches seem to contribute to an increased integration of OVCs into the school system and therefore each constitutes a *sufficient but not necessary explanation*: the peer education system itself can increase school attendance and performance, but this can also be attributed to the AACs the girl clubs and the USAID volunteers.

EKHC's contribution

EKHC's most important contribution under MFS II therefore lies in strengthening the performance of peer education groups, AACs and gender clubs that play an important role in socially integrating the OVCs. This according to the information available led to 60 female students receiving support in different schools through the peer education groups and 40 OVCs receiving educational material support through agricultural plots in 6 schools. Though it could be argued these interventions are more sustainable, compared to the figures of OVCs and destitute children supported by the USAID program, also implemented by EKHC and reaching 2413 children with 260 volunteers (not only by counselling services but also by material support), the MFS II contribution seems to be rather limited. A major factor that might explain this consists of the fact that no material support is included in the support of OVCs under MFS II whereas the USAID program also provides these. The advantage of the MFS II interventions is that they are embedded in society. As psychological, social and material support are all needed, a combined interventions strategy is preferred. Appendix 6 provides more detailed information.

5.3.2 Strengthening Intermediate Organisations

In order to assess the impact of capacity building efforts by EKHC on intermediate organisations, the evaluation team looked at the capacity of the religious forum in Arba Minch town and the grain banks to ensure 'enhanced food and nutritional support for vulnerable groups'. The FBO forum is currently supporting 45 persons on a monthly basis and 129 PLWHIV receive monthly food support from the grain banks.

Pathway 1: Food and nutritional support through the FBO forum – MFS II

The first MFS II related pathway is that of capacitating the FBO forum that was initiated by religious leaders together with EKHC in 2010 with the objective of providing support to the most vulnerable groups in the community. Between 2012 and 2014, EKHC trained the administrators of this forum on community conversation, resource mobilization, lobby and advocacy, planning, counselling, and leadership skills. The forum furthermore received 10.000 birr from EKHC to facilitate training and meeting costs. Next to EKHC the forum receives contributions from mosques, churches and other NGOs (World Vision provided the forum with 50.000 birr to organise a discussion forum with the government). The university also paid the forum 40.000 birr for discussions held. The forum furthermore opened a grocery shop to generate an income.

With the mobilised resources the forum supports 40 beneficiaries (OVC, PLWHIV and elderly) on a monthly basis by giving them 250 birr per month. Ten more beneficiaries receive between 120 and 180 birr occasionally. With the support of American volunteers, the forum provides home based care to 10 people every 15 days and distributes teff, onion, shiro and oil to beneficiaries. Marry Joy donated 10,000 pairs of shoes of all sizes for both adults and children, which were distributed via the forum.

Information collected that *confirms* the contribution of the FBO forum in enhancing food and nutritional support to vulnerable groups is that the forum has a broad resource base that allows them

¹⁹ Interview with peer educator

to provide structural support. The American volunteers seem to play an important role by providing the commodities to support the beneficiaries during home based care. The forum is furthermore well institutionalised and their influence in the community and with the local government is felt by the interviewees.

The following remarks can be made in relation to the contribution of the FBO forum in providing food and nutritional support:

- The forum itself says they are not able to provide as much support as needed as they are overburdened by the activities they are already performing. Their range of activities range from providing home based care to building and renovating homes for destitute families, to repairing latrines for handicapped people, to organising discussion forums with the government. This lack of focus results in a rather broad but shallow spectrum of support which makes their impact on food and nutritional support questionable.
- It does not become clear from the data collected how the beneficiaries for structural financial support are being selected; neither does it become clear whether they use the money to buy food. The selection of the people to be included in home based care activities can neither be deducted from the data. The provision of the commodities for both the grocery shop and the home based care activities by the American volunteers does not seem sustainable.
- Other actors such as idirs, clubs and community committees can also provide food and nutritional support (this has not been assessed by the evaluation team).

Pathway 2: Food and nutritional support through the grain banks – MFS II

A second pathway explains enhanced food and nutritional support via grain banks. Grain banks are formed by idirs and church representatives. EKHC started providing initial capital for grain banks in 2010 and two more grain banks per year after that. In 2014, EKHC provided start-up capital for a total of 22 grain banks (9 in Arba Minch, 7 in Mirab Abay, and 6 in Arba Minch Zuria). The nine grain banks in Arba Minch formed a union in 2013 and received a grain mill from the government.

After start up, the grain banks receive contributions from members on a monthly basis. Since the baseline the monthly amount has increased from 0.25 birr to 1 birr per month due to inflation and some grain banks have agreed to contribute up to 3 birr per month. There are also individuals who contribute more than the set amount and in the rural areas some members contribute in kind. EKHC supports the grain banks in their development by providing stationary materials and training on various subject like management skills (23 persons in 2013), planning, monitoring and evaluation (33 persons in 2013), and resource mobilisation (74 persons in 2013).

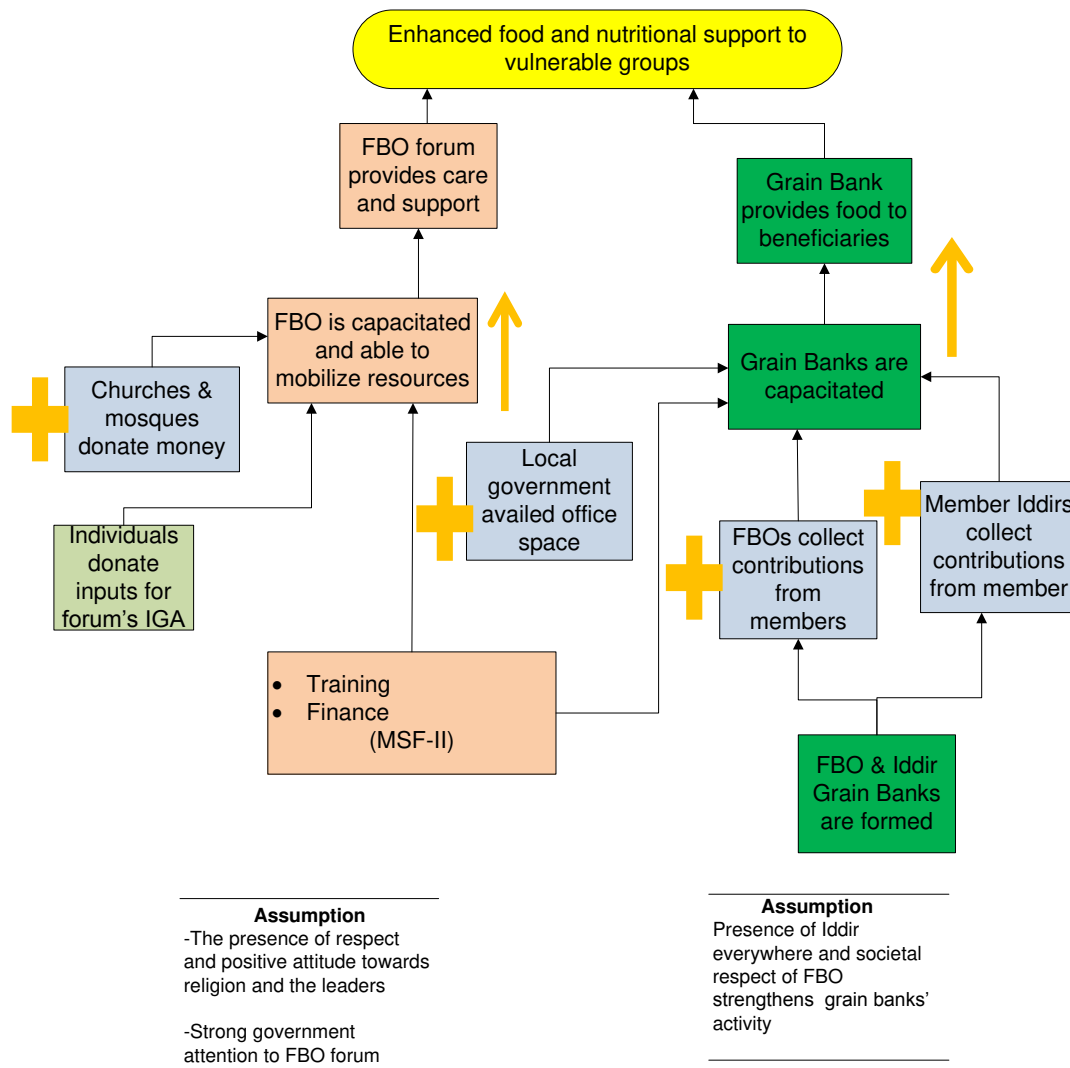

With the member contributions, the grain banks support 4-9 beneficiaries each which add up to around 125 beneficiaries in total. They mainly provide grain, oil, money and clothing to destitute people in the community. Besides food support, two or three volunteers of each grain bank conduct home based care at least two times a week. Some beneficiaries are also supported by the grain banks to engage in petty trade and saving activities.

Information that confirms that the grain banks increase food support to vulnerable groups is:

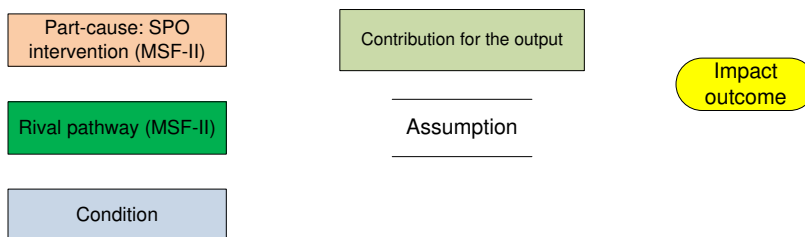

- The interviews give an indication that the food support given by the grain banks is structural, which is an indication of their effectiveness. The beneficiaries chosen to be supported are the most destitute in the community, mostly elderly and people with HIV/AIDS, which have no alternatives (like petty trade) to provide in their basic needs as they are physically impaired. The beneficiary interviewed receives food and oil on a monthly basis for the past three years. The grain bank members are well informed about the number of beneficiaries reached and the support provided and the grain bank union in Arba Minch was able to attain a grain mill. The social control of the members that provide care and support services is furthermore high. However, the documents received do not provide sufficient data on the financial and organisational performance.
- The grain banks try to increase food security in multiple ways: they provide direct food and nutritional support to OVCs, PLWHIV and elderly, but also give beneficiaries the opportunity to be involved in petty trade or saving activities. There is also a plan to invest the savings to build a store where larger volumes of grain, bought at a cheaper price, can be stored and there are plans to invest in opening up a store.

The following information collected highlights the fact that the efforts of the grain banks *do not explain* an increased provision of food and nutrition security.

- The food support given consists mainly of the same products being grain or oil. The nutritional value of these products is not sufficient in terms of the preferred nutrition needed in combination with ART.
- Even though the grain banks have increased their member's contribution they could not increase the

Legend

number of beneficiaries due to the inflation rate.

- Other actors such as idirs²⁰, clubs and community committees can also provide food and nutritional support (this has not been assessed by the evaluation team).

Pathway 3: Food and nutritional support through the Health Extension Programme

A third pathway explains increase food and nutrition security consists of the public health extension workers (HEW) who are assigned by the local government to extend the health service from the health

²⁰ Idirs provide food to individuals occasionally, but not on a structural basis

centres to the community. This approach exists for 3-4 years and is based upon the 1:5 approach adopted from the agricultural extension programme: one model family visited by the HEW has to pass a message along to 5 other families. Some 15-17 public messages have to be extended to households, comprising amongst others pre/post-natal care, PPTCT awareness creation, hygiene and sanitation, child nutrition, vaccination, reproductive health, male involvement in family planning, STD, environment protection, giving family planning pills and injection. During their household visits, these HEW could probably intervene by means of referring destitute people to those instances that are capable to provide the food and nutritional support needed.

Information that *confirms* the role of the HEW in providing food and nutritional support is the following: The HEW visit 8-10 households each per week and have the possibility to refer malnourished persons to public hospitals, PLWHIV to those organisations capable of providing food and nutrition supplies and support the local government in identifying these persons²¹.

Information that *rejects* their role in providing food and nutritional supplies is given by the Health Office and HEW themselves, telling that they are not engaging in this type of activity. Another informant also states that the extension system is not performing and that any services that is supposed to be delivered free of charge, including free ART, needs to be requested at the office.

Pathway 4: Food and nutritional support through other actors

As mentioned earlier, USAID support 2413 children of which 1297 have been linked to the World Food Programme and ONG PACT provides food support to 6,010 children. However the intervention structure is not known and this contribution analysis focusses in particular on the capacity of intermediate organisations to cater for food and nutrition support. Therefore we did not assess this pathway further.

Conclusion

The data available support the idea that vulnerable groups are easily identified and reached by the FBO forum and the grain banks which, based upon FBOs and idirs are grounded in society. Apart from these idirs that do not collaborate in grain banks, clubs and community committees also provide food and nutrition support to destitute persons.

The capacity of the FBO forum and the grain banks to deliver foods and nutritional support is limited in the following terms. Though through the forum a platform is created for actors to come together and decide on actions, the forum itself is being seen as the solution to all problems and lacks a clear vision and mission in society, which might help it to concentrate on a few interventions rather than solving all problems in Arba Minch town. The Grain Banks suffer from the rampant inflation rate that constrains them to support more people. Other actors that explain an increase in food and nutritional support are women groups, the WFP, PACT etc. Critical issues to look into when targeting PLWHIV under ART are in the first place the nutritious quality of the food supplies. Support provided by the grain banks does not meet these criteria.

All these different actors each explain an increase in the provision of food and nutrition supplies, implying that there are multiple ways that explain the outcome (*sufficient but not necessary explanation of the outcome*).

When taking into account the particular food and nutrition requirements for PLWHIV, the contribution of these pathways needs to be further assessed in terms of the quality of support given.

The role of EKHC

EKHC's role with regard to the outcome of increased food and nutritional to vulnerable groups support via the FBO forum and the grain banks is not convincing. EKHC's main contribution in relation to the FBO form is that of capacity building. No conclusions can be drawn with regards to the long term effectiveness of this intervention. Its intention to enhance food and nutritional support through the formation and support of grain banks is only partly successful in terms of food security since the low variety in food provided does not ensure enough variety in nutrients for PLWHIV and under ART.

²¹ PACT and HEW

5.4 What is the relevance of these changes?

5.4.1 Relevance of the changes in relation to the Theory of Change of 2012

In its 2012 ToC EKHC formulated its overall objective with regards to civil society as “empowered civil societies that comprises of agents of change for the self-sufficiency of their surroundings.” In order to reach this objective four conditions need to be in place: capacity building of CBOs; asset based community development through SHGs and cooperatives; promoting indigenous knowledge, and; strengthening networks among CBOs.

The progress reports highlight an impressive list of courses being given to various target groups, but the links between these courses and the performance of the AACs, girls clubs, grain banks, SHGs and the forum has not been documented. Those entities all have showed some progress in terms of becoming change agents as has been documented in paragraph 5.1. AACs play an important role in the integration of OVCs in the school system and in society, and they are also being solicited by parents and by the community, grain banks are capable of providing food and nutrition support and the FBO forum has gained a bargaining position that enables it to influence local institutions, including the local government and it is being solicited by the local government to manage conflicts. However it lacks a vision that will clarify its position into society; service provider, addressing issues with government services or addressing community conflicts?

With regards to asset based community development, some progress has been made and in particular at the level of the grain banks and the forum resources are being mobilised. Asset creation by AACs remains minimal as the AACs generate only a small income via organising activities for students such as table tennis tournaments or movie nights. The probability that AACs will be able to provide material support in large quantities seems unrealistic, as students have no income yet. Asset creation by the SHGs is unknown.

With regards to the promotion of indigenous knowledge we observe that especially the grain banks, established and managed by idirs or churches ensure that these are embedded in the existing institutions, however also assigning new roles to these institutions. The CBO forum is another example where existing institutions are now combining forces to make a change in society.

Apart from the forum in Arba Minch town we have not found evidence of networks being formed in the other woredas.

5.4.2 Relevance of the changes in relation to the context in which the SPO is operating

The need assessment conducted at the end of 2010 in Arba Minch Zuria and Mirab Abaya woredas revealed that the infection rate and impact of HIV is still high in the intervention area, especially among the adolescents coming to Arba Minch from the surrounding rural kebeles who go to secondary school or to the university. There is also a high-risk group of young immigrants, mainly females, coming from the rural areas to Arba Minch for casual labour such as household maid. These youth tend to live in overcrowded rooms which leaves room for casual and unprotected sex and hence the spread of Sexually Transmitted Infections and HIV²². The need assessment study furthermore concluded that awareness on HIV/AIDS and care and support services provided is higher in terms of quality, quantity and coverage in Arba Minch town as compared to Arba Minch Zuria and Mirab Abaya. Based on these findings EKHC determined to expand its activities to the rural areas as of 2011.

The progress reports however do not describe what the exact changes in these new areas are.

²² EKHC Arba Minch project proposal 2012-2015

5.4.3 Relevance of the changes in relation to the policies of the MFS II alliance and the CFA

Tear believes civil society is best strengthened by using the networks of churches. In the past, the churches did not fulfil a role in bringing people together in society next to religious gatherings. By forming and supporting NGOs and SHGs, Tear believes churches can play an important role in building civil society.

Tearfund helped introduce the SHGs approach to Ethiopia via EKHC in 2002. The first five SHGs were started by 100 women in Nazareth (Adama); today the number of SHGs as part of Tearfund funded programmes has increased to well over 12,000 across Ethiopia, impacting over 1 million people. The growth in numbers of SHGs has been primarily because local churches have embraced it and replicated it using their own resources. According to Tear forming self-help groups is a sustainable and high return intervention as was concluded in a cost-benefit study on SHGs in 2013²³.

One of the goals formulated in the Ethiopian Thematic Country Plan 2011-2015 was the programmatic cooperation between ICCO Alliance partners²⁴. It is believed that due to its size, the ICCO Alliance partners in Ethiopia would be able to link up with other health partners, and also identify issues which they can address together, e.g. in dealing with the government. It is furthermore stressed that since the issue of access to and quality of health care is complex, the ICCO Alliance wants to work from its strength of partnerships with large community organisations (FBOs), which have gained experience over a number of years. This will improve the local organisational strengths of communities, to make them more relevant. Within these local organisations there will be a provision that marginalised local groups will be especially targeted. By the possibilities of linking and learning, the results of different Partner Organisations can be brought to a higher level, where systemic issues can be addressed as an Alliance. Feedback provided by Tear to EKHC on the 2013 annual report however mentions no reporting on collaboration between EKHC and the other ICCO Alliance Partners.

5.5 Explaining factors

5.5.1 Internal factors

EKHC reports that the new implementation sites increased their transportation costs significantly. Additionally, their turnover of high skilled manpower is high without explaining why this is the case.

The financial reporting of EKHC lacks coherence: the 2 year budget over 2012-2013 shows a different set-up than the budget reported in the financial reports (the original budget for this period was Birr 1.836.790, the new budget given is Birr 1.757.608); there are items in the budget which were not included previously; and the annual budget is overspent with 20%. It is furthermore unclear how the budget is spent as the contributions for CBOs and expenses of trainings do not add up: the SPO gives 10,000 birr per year for the FBO forum and only gave initial capital for the 22 grain banks. After the first batch only one or two grain banks are formed per year and they are given initial capital of around 30,000 birr.

5.5.2 External factors

EKHC is supported by many donors next to Tear²⁵. In order to align with the 70/30% procedure they pay staff from different programmes. EKHC mentions it has become more difficult to raise funding in recent years due to the economic crisis. Since the 2012-2015 budget was submitted to the

²³ In October 2013, Tearfund UK and Tearfund Ireland funded a cost-benefit analysis of the SHGs in Ethiopia. The results of this study indicate the SHG intervention has a very high return, as much as £173 for every £1 spent, and is demonstrating transformational change²³. They however question the (long-term) effectiveness of peer-to-peer education, the grain banks and the FBO forum.

²⁴ Ethiopia Thematic Country Plan 2011-2015, ICCO alliance, update 2013.

²⁵ The Arba Minch Medan ACTS programme has only Tear as a funder

government, it is not custom to deviate from the original budget and EKHC struggles to gather funds for to comply with the original budget.

EKHC mentions a high staff turnover in government offices delayed the implementation of some project activities. The project agreement with the government took a very long time and has pulled back some activities from schedule, particularly those in the new rural project woredas (Mirab Abaya and Arba MinchZuria). It is very challenging to sign an agreement with government a project which has a life span of one year. With a lower budget it was difficult to adjust the administrative/program budget ratio (30/70 ratio). The regional Finance and Economic Development Bureau was strictly opposed to the starting date of project implementation (February 2012), because more than 3 months elapsed as EKHC was searching for additional funds. As a result EKHC had to postpone the starting date to May 2011.

One other challenge is the lack of commitment among church leaders to engage with the programme. This seems however to contradict with the success of the FBO forum mentioned in annual reports.

EKHC looked for consultants in Arba Minch to provide training on lobby and advocacy and networking, but suitable candidates were not available, leading to the postponement of these activities.

EKHC's approach with regards to the creation of SHGs is based upon the creation of internal savings. Other NGOs that have the policy to provide their SHGs with an initial capital are interfering in EKHCs approach, because they create false expectations of those persons that like to form a SHG under the guidance of EKHC.

5.5.3 Relations Tear-EKHC

Tear provided EKHC with serious feedback on EKHC's 2013 annual report by stating that all feedback given by Tear during previous periods was not addressed properly, implying that EKHC is not following up the feedback and is not taking appropriate measures accordingly. They furthermore state that observed that the monitoring and evaluation system in place does not help to relate inputs to outputs, that no gender disaggregated data are provided and that EKHC does not report on its collaboration with other NGOs and other projects it is implementing with other donor organisations.

A delay of the budget release from Tear has pushed forward the project activities for four months²⁶.

²⁶ This delay was caused by mistakes in the financial and audit reports, which first needed clarification before EKHC decided to release the budget.

6. Discussion

6.1 Design of the intervention

Peer education programs are based on the rationale that peers have a strong influence on individual behaviour (Medley, Kennedy, O'Reilly, and Sweat, 2009). As members of the target group, peer educators are assumed to have a level of trust and comfort with their peers that allows for more open discussions of sensitive topics (Campbell & MacPhail, 2002). Similarly, peer educators are thought to have good access to hidden populations that may have limited interaction with more traditional health programs. Peer education programs may be empowering to both the educator (Milburn, 1995; Strange, Forrest & Oakley, 2002) and to the target group by creating a sense of solidarity and collective action (Campbell & Mzaidume, 2001).

The above confirms EKHC's project design in terms of working with peer education and clubs to reach vulnerable youth groups and bring about behavioural change. Whereas the peer educators play a role in getting a message across to the vulnerable youth in society and convincing them of the importance of education, the clubs involve and inform the youth via coffee ceremonies. However, the selection procedures in place to identify peer educators are essential to program success. Similarly, how peer educators are recruited can determine how they are perceived by the target population. For example, peer educators chosen by their peers might be expected to be more popular, but less motivated than volunteers, or less skilled than peer educators chosen by program staff. Training and supervision of peer educators is also likely to be an important factor in intervention effectiveness. Retention of trained peer educators is crucial to program effectiveness and sustainability. Peer education is often believed to be more cost-effective than other interventions because it uses volunteers, or minimally paid peers to deliver information (Milburn, 1995).

The training along the chain of peer-educators, the high turnover rate among peer educators and the quality in training of successors in EKHC's programme questions the programme's effectiveness. The selection and the extent to which EKHC manages to motivate these young people (beyond material motivation) is not well documented and hence no conclusions can be drawn on this issue.

In 2011, Tear supported a Master thesis on the impact of SHGs on the capacities of the people in Meta Robi, Ethiopia²⁷. This thesis stresses that although a lot of effort and time goes to encouragement and convincement, attitude change can take place when visible impact is reached. New SHGs will emerge when husbands and other outsiders get convinced of the usefulness of the group. Therefore in newer groups more attention is to be paid to education and training, instead of encouragement and convincement. It is expected that others will follow when only a few start to cooperate initially. The interviews conducted with SHGs reveal a positive stance towards the usefulness of self-help groups and their contribution. In this thesis the crucial role of a capable and committed facilitator who helps in the early formation of a cluster level association (CLA)²⁸ to enhance independency after one or two years is furthermore highlighted. From the documents it could not be retrieved whether SHGs are facilitated well.

The grain banks managed by idirs and churches are to be considered as a long standing community based self-help system as well as the youth clubs such as the AACs and the girls clubs.

²⁷ Thesis Klaas Evers "Many hands make light work? The impact of self-help groups on the capabilities of people in Meta Robi, Ethiopia" (2011)

²⁸ Above SHGs, Cluster Level Associations (CLAs) are formed to represent and monitor a number of SHGs on village level. Per SHG 2 members are part of the CLA. Developed CLAs monitor the groups, initiate the formation of new groups and represent the interests of the SHGs to local governments and other relevant institutions (like Micro Finance Institutions (MFIs) and Banks).

With regards to replicability we observe that EKHC is using traditional institutions like the AACs, girls clubs, and grain banks that are being managed by idirs or churches that take up new roles assigned to them that orient them into development issues. Also other organisations like OSSA and MKC-RDA are making use of these existing institutions. Information and data are lacking with regards to EKHC's performance in supporting these structures to respond to these new roles and therefore it is difficult to conclude about the replicability of the project.

The creation of the religious forum is a promising intervention that helps to organise civil society at a level beyond idir and congregation. Similar experiences exist with OSSA and with JeCCDO. The vision and the mandate of such new structures need to be clear before these organisations become effective. Their potential lies in their capacity to hold public services accountable for good quality service. In terms of replicability we observe that the possibility of establishing such forums goes beyond the average project duration and largely depends upon the capacity of congregations or idirs willing to cooperate and the capacity of the SPO to create such a civil society space.

6.2 Evaluation methodology

A methodology was design to conduct this evaluation – see appendix 2. The methodology in itself provides enough guidance to conduct a Theory Based Evaluation, although the process tracing methodology requires substantial understanding of the different steps to take.

Generally speaking we observe that the CIVICUS framework has never been used for evaluation purposes, and that the period between the baseline and end line study hardly covers two years, whereas the entire MFS II period covers 5 years. Furthermore, we observe that the interventions by the SPOs do not distinguish interventions that relate to Civil Society or Policy influencing from other interventions. This makes it occasionally difficult to obtain a clear focus for the civil society evaluation.

Critical steps in the evaluation methodology are the following:

1. Linking project interventions from the SPO to the CIVICUS framework. The project documents do not provide this information and are based upon the interpretation by the evaluation team in the Netherlands.
2. The extent to which the project documentation enables the Dutch team to understand the in-country realities. If the quality of the reports is weak, then the guidance provided to the in-country evaluation team is weak. Therefore deciding upon the outcomes to be selected for in-depth process tracing was sometimes hampered by incomplete and un-clear project documents.
3. After the workshop with the SPO, the in-country team had to decide upon which outcomes they will focus on for the in-depth process tracing. There was a tendency to selecting positive outcomes achieved.
4. Designing the model of change that explains the outcome achieved, followed by the inventory of rival pathways to explain that outcome has also proven to be a critical and difficult step. In this phase it is critical that the evaluation team works together to brainstorm on alternative pathways. A major challenge is that in-country teams at this moment of the evaluation have obtained a lot of information from the SPO, and not from other NGOs or resource persons, which possibly might strengthen their bias in favour of attributing change to the SPO.
5. The following step of identifying the information needs to confirm or reject these pathways and to identify the method of collecting the information needed. Also this step has most chances to be successful when the evaluators work together.

Information gathering to assess the relevance of the changes in civil society and the explaining factors generally speaking was not challenging.

Critical conditions for this evaluation methodology are:

1. Project documents and progress reports need to be available in time, and they need to systematically report not only on outputs but also on effects on the changes in peoples livelihoods (civic engagement), and at least the performance of organisations that received support from the SPO. None of the SPOs in the sample have an M&E system in place that measures the organizational capacity of the organisations they support.

2. The evaluation team needs to have a thorough understanding of the CIVICUS framework and the interpretation of the indicators used for this evaluation.
3. The evaluation team needs to understand how process-tracing works and the in-country evaluation teams need to develop a critical stance towards the interventions of the SPO that enables them to identify rival explanations for the outcomes achieved and to identify the appropriate questions to confirm or reject pathways. Because this is a new methodology, much depends upon the team's previous experiences of theory-based evaluations.
4. The methodology developed and in more generally terms theory-based evaluations are more time-consuming than randomized control trials.
5. The process-tracing methodology requires a continuous process of analysis of information obtained and identification of further information needs to be able to make a plausible contribution claim. This capacity of critical reflection is one of the core capacities needed to successfully conduct a theory-based evaluation like process-tracing.

Conclusion

7.1 Changes in the civil society arena of the SPO

In the 2012 – 2014 period the two most important changes that took place in the civil society arena of the SPO are related to civic engagement and perception of impact. With regards to the first dimension we observe a slight increase since the baseline study in terms of more People Living With HIV (PLWHIV) and Orphans and Vulnerable Children (OVC). These are now being reached by Anti Aids clubs, girls clubs, grain banks, schools and the FBO forum and that these have contributed towards combating social exclusion. Most of these organisations, apart from the two new districts that were added to EKHC's intervention zone, were already established before the current programme started in 2011 and received continuous support by EKHC.

With regards to perception of impact (which also includes the increased outreach already mentioned under civic engagement), we observe that the Anti-Aids Clubs (AACs), the girls clubs and the FBO forum are better embedded into society. AACs increasingly requested to intervene when parents have problems with their children and they are engaging in other development activities in their community as well. In Arba Minch town the FBO forum which regroups Protestant, Catholic and Muslim congregations is attracting material and financial support from many sources and is engaged in a wide range of development activities. It has gained sufficient bargaining power to negotiate positive outcomes with the university and with local government.

Relations of both EKHC and the forum with local government representatives has become more formal and more regular and increasingly, private sector organisations support EKHC in the accomplishment of its objectives regarding HIV and AIDS.

These findings were obtained through an analysis of documents, a workshop and follow-up interviews with EKHC, and interviews with external resources persons working in civil society organisations that receive support from EKHC; other civil society organisations with whom the SPO is collaborating; public or private sector agents and; external resource persons capable of overlooking the MDG or theme on which the SPO is concentrating.

7.2 Contribution analysis

Based upon an analysis of the projects and programmes financed by the Dutch CFAs, four orientations strategic for civil society development were identified: Ensuring that more people from more diverse backgrounds are engaging in civil society activities; ensuring that the organisations that receive support from the SPO are capable of playing their role in civil society – intermediate organisations; strengthening the relations with other organisations in civil society to undertake joint activities, and; influencing policies and practices of public or private sector organisations. For Ethiopia the focus was initially on the intermediate organisations and on the position of SPOs in their respective networks. The Ethiopian team however concluded that there is little room for networking amongst NGOs that receive foreign funding in Ethiopia, and that NGOs mainly collaborate with each other by instigation of the government to come to a division of labour per district and region. Therefore the second strategic orientation for most SPOs is now focussing on civic engagement.

Based upon an estimation of the percentage of the MFS II project budget related to interventions that are relevant for civil society, those SPOs whose absolute budgets for civil society were most important were selected for in-depth process tracing on two outcomes. The evaluation team conducted a quick assessment on contribution for the other SPOs. EKHC was amongst those SPOs selected for in-depth-process tracing.

The first outcome that we looked at is the extent to which EKHC contributed to the reintegration of OVCs into the school community and to enhance their chances of becoming a full member in society.

The pathway most likely explaining this reintegration consists in the first place of material support of diverse nature (food, school uniform, school contributions, etc) mobilised. The AACs, girls clubs and peer education groups are not able to sufficiently cater for these, which is understandable as the activities they organise only generate a small amount of income and hence they can only provide in stationary material for a limited amount of children. Once these conditions have been met, counselling services by peers in the AACs, girls clubs and the education groups all do fulfil a meaningful role in the creation of solidarity by creating a level of trust and comfort with OVC that allows for more open discussions of sensitive topics. It remains difficult to disentangle the performance of the peer education system and that of the AACs, both implemented under the MFS II programme, because they overlap in terms of students taking part in both. EKHC's MFS II contribution consists of strengthening the performance of the above mentioned groups that seem to be socially sustainable because embedded in society but not in financial terms. Compared to the figures of OVCs and destitute children supported by the USAID program, also implemented by EKHC and reaching 2413 children with 260 volunteers (not only by counselling services but also by material support), the MFS II contribution seems to be rather limited.

The second outcome that we looked at is the capacity of the religious forum in Arba Minch town and the grain banks to ensure 'enhanced food and nutritional support for vulnerable groups'. The data available suggest that not only the religious forum and the grain banks provide food and nutritional support to vulnerable persons, but many other traditional and informal structures in society. There are multiple pathways that explain the outcome. The capacity of the FBO forum and the grain banks to deliver foods and nutritional support is limited; the first lacks a clear vision and mission in society, which might help it to concentrate on a few interventions rather than solving all problems in Arba Minch town. The grain banks suffer from the rampant inflation rate and cannot support more people and they are not capable of providing the food and nutrition requirements needed for PLWHIV under ART. EKHC's contribution to strengthening the performance of the forum and the grain banks is limited and most of these entities were already formed before the 2011 project started.

7.3 Relevance

Interviews with staff of EKHC, with external resource person, as well as contextual information helped to assess the relevance of EKHC's interventions in terms of; its Theory of Change (ToC) for Civil Society (SC) as designed during the baseline study; the context in which EKHC is operating; the CS policies of Tear Fund.

With regards to the 2012 ToC established with EKHC, the interventions and outcomes achieved are relevant to some extent because the AACs, the grain banks and the FBO forum have shown to be capable to fulfil a role of change agent in their community. The FBO forum lacks a clear vision and a position to take in society. Only the forum and the grain banks have proven to be capable of creating assets, whereas the AACs and the girls clubs are encountering difficulties. In particular the forum and the grain banks are based upon traditional institutions (idirs and churches) and have been able to take up new roles in society.

The changes introduced by EKHC seem to respond to the context and needs assessment conducted in 2010. However the information made available is not explicit on changes introduced on the two new project sites where EKHC intervenes since 2011.

With regards to the MFS II policies of the ICCO alliance the changes are relevant because they are based upon the networks of churches that increasingly need to play in development. Tears' approach of creating SHGs was not assessed in EKHC, but they are a sustainable and high return intervention. The relevance of the programmatic approach in which EKHC takes part is not evident, because not documented by EKHC.

7.4 Explaining factors

The information related to factors that explain the changes in CS, EKHC's contribution to these changes and the relevance of its interventions were collected at the same time as the data were

gathered for the previous questions. Apart from searching for explaining factors related to these evaluation questions, the evaluation team was also informed about other important factors such as the organisational performance of EKHC, relations with Tear Fund that might have had an effect on its performance or external factors.

The most important internal factors that might explain failures in the implementation of the EKHC programme are the high transportation costs to join the new project sites and a high staff turnover. Apart from this considerable flaws exist in EKHCs financial and narrative reporting system.

The most external factors that may impact upon EKHC’s performance are related to the 30/70 ratio for administrative versus operational costs imposed by the government; a high staff turnover in government offices and EKHC’s approach regarding the creation of SHG that is different than the approach taken by other NGOs.

The relations between Tear and EKHC have become tenser since the co funding agency observed that EKHC’s reporting and monitoring and evaluation standard does not provide quality. EKHC experiences difficulties with delays in budget releases and the annual contracts that delay the implementation of project activities and decrease EKHC’s position to negotiate with the local government.

Table 5
Summary of findings.

When looking at the MFS II interventions of this SPO to strengthen civil society and/or policy influencing, how much do you agree with the following statements?	Score
The CS interventions were well designed	7
The CS interventions were implemented as designed	6
The CS interventions reached their objectives	6
The observed outcomes are attributable to the CS interventions	5
The observed CS outcomes are relevant to the beneficiaries of the SPO	6

Score between 1 to 10, with 1 being “not at all” and 10 being “completely”.

Appendix 1 Civil Society Scoring Tool

This table presents the appreciation of the evaluation team regarding changes occurred for each indicator between 2012 and 2014 on a scale of -2 to + 2

- 2 = Considerable deterioration
- 1 = A slight deterioration
- 0 = no change occurred, the situation is the same as in 2012
- +1 = slight improvement
- +2 = considerable improvement

Dimension		Indicators	Question	Change in the indicators in the 2012 – 2014 period
Civic engagement	1	Needs of marginalised groups	How does your organisation take the needs of your beneficiaries/target groups, in particular marginalised groups into account in your planning, actions, activities, and/or strategies?	+1
	2	Involvement of target groups	What is the level of participation of your beneficiaries/target groups, in particular marginalised groups in the analysis, planning and evaluation of your activities?	+0
	3	Political engagement	How intense is your (individual staff or organisational) participation in locally-nationally elected bodies and/or sectoral user groups?	+0
Level of organisation	5	Relations with other organisations	In the past 12 months what has been the most intensive interaction you had with other CSOs?	+0
	5	Frequency of dialogue with closest CSO	In the past 12 months how many meetings did you have with the CSO that you have most intensive interaction with?	+1
	6	Defending the interests of marginalised groups	Which CSO are most effective in defending the interests of your target groups? In the past 12 months, how did you relate to those CSOs?	+0
	7	Composition current financial resource base	How does your organisation finance institutional costs such as workshops of the General Assembly (if applicable); attendance to workshops of other CSOs; costs for organisational growth and/or networking?	+0
Practice of Values	8	Downward accountability	To what extent can mandatory social organs (steering committee, general assembly, internal auditing group) ask your executive leaders to be accountable to them?	+0
	9	Composition of social organs	What % of members of your mandatory social organs belong to the marginalised target groups you are working with/for?	+0
	10	External financial auditing	How regularly is your organisation audited externally?	+0
Perception of impact	11	Client satisfaction	What are the most important concerns of your target groups? How do your services take into account those important concerns?	+1
	12	Civil society impact.	In the past 12 months, what impact did you have on building a strong civil society?	+1
	13	Relation with public sector organisations.	In the past 12 months, what interaction did you have with public sector organisations to realise your programme and organisations' objectives?	+1

	14	Relation with private sector organisations	In the past 12 months, what interaction did you have with private sector organisations to realise your programme and organisations' perspective?	+1
	15	Influence upon public policies, rules, regulations	How successful have you been in influencing public policies and practices in the past 2 years?	+0
	16	Influence upon private sector agencies' policies, rules, regulations.	How successful have you been in influencing private sector policies and practices in the past 2 years?	+0
CS context	17	Coping strategies	In the past 2 years, how did your organisation cope with these changes in the context that may have been positive or negative consequences for civil society.	-1

Appendix 2 Changes in civil society indicators between 2012 and 2014

2.1 Civic Engagement

2.1.1 Needs of marginalised groups SPO

Score: +1

As of 2011 the project has expanded to two new nearby woredas and it has been implementing a one year pilot project in Arba Minch town, six Kebeles of Arba Minch Zuria woreda & seven Kebeles of Mirab Abaya woreda.

- Between 3200 and 3520 students were reached in 15 schools on HIV/AIDS, reproductive health and sexuality issues; the AACs reached 16977 persons and 7020 persons were reached by gender clubs. 544 pregnant women were linked to health institutions for PPTCT services; there is some indication that women become aware that female circumcision is a harmful practice;
- 60 female students received particular support in different schools through the peer education groups; 40 OVCs received educational material support because 6 schools generated income through their own agricultural plots;
- One FBO forum for care and support was established before 2011 and is supporting 45 vulnerable persons including OVCs; The idirs and churches support 30 vulnerable people in the new project areas and by October 2013, 129 PLWHIV received food support from grain banks; 1 kebele administration provided half an acre of land for the strengthening of the care and support activity. The beneficiaries are now growing bananas on the land. A newly established grain bank in Mirab Abaya woreda organised a fund raising conference on their local churches and collected more than 32,000 Birr and 200 kg of maize.
- 84/120 Community Conversation sessions were organised on stigma and social exclusion due to aids, disabilities and sexual and reproductive health have been conducted by FBOs, CBOs and clubs and reached 750 people
- 8104 people received voluntary counselling and testing services of which 3535 females (44 %) and 68 (0.8%) PLWHIV were referred to health facilities for ART follow up.
- More than 42 CBO and church leaders received training on lobbying and advocacy, on networking which led to the establishment of a town level FBOs care and support forum in the first semester of the project.
- 9 grain banks formed a union in Arba Minch and received a mill from EKHC. They are still searching for legal recognition as a union. The government has provided a house for the grain mill. 22/25 grain banks received office furniture and stationeries. Each grain bank supports 4-9 beneficiaries and in total there are more than 120 beneficiaries.
- 63 SHG have been established. The group members are engaged in saving and any one of the members that is interested to engage on business borrows the money and latter return it with interest payment. The SHGs are also used as platform for the members to help one another and discuss health issues particularly HIV and social discrimination. SHG members also believe that they are a living proof of the changes seen through the effort of EHKC as they had nothing before and now they are coordinated and working together.

These outcomes are the result of some 90 community volunteers providing care and support and counselling services, 75 university students engaging in peer education and 44 CBO and church leaders. (We are not sure about the numbers).

2.1.2 Involvement of target groups SPO

Score: 0

No changes occurred since the baseline. EKHC closely works with churches and Idir leaders which are mainly male, hence implying a risk of taking into account the needs and interests of women. Working with the community has showed to increase their ownership for the project and the approach has increased the involvement of communities in care & support activities for PLWHIVs. The active participation of Anti Aids clubs in social mobilization has increased the voluntary counselling uptake. Two review meetings have taken place with volunteers in the period August 2011 – January 2012 and 6 review meetings between November 2012 and April 2013.

2.1.3 Intensity of political engagement SPO

Score: 0

EKHC is not engaged in political activities

2.2 Level of Organisation

2.2.1 Relations with other organisations SPO

Score: 0

EKHC is, together with Ethiopia Muluwongel Believers Church Relief and Development Organization – MKC-RDA, Evangelical Church Fellowship of Ethiopia (ECFE), and EECMY one of the Ethiopian coalition partners in the Ethiopia Health Country Plan 2011-2015 of the ICCO Alliance. The program has started implementing activities since 2011 and developed into a network in which lessons are learned from each other and from other important stakeholders. We do not have any information to be able to assess changes in the intensity of collaboration within this network.

There is no sexual and reproductive health alliance in Arba Minch to coordinate activities in the sector. However EKHC is a member of the USAID CORHA (Consortium of Reproductive Health Associations) but the intensity of collaboration is unknown.

The Medan Act project has sought a relationship with the urban ministries' department in Arba Minch in support of the creation of 30 SHG in Arba MinchZuria and Mirab Abaya woreda. The project is also working with CBOs, FBOs, AAC and schools, 22 grain banks, 15 AAC and 16 schools.

2.2.2 Frequency of dialogue with closest civil society organisation SPO

Score: +1

EKHC is increasingly engaging with non-protestant churches and with the Muslim community, and it is to be observed that Arba Minch town forum is a religious forum of Catholic, Muslim, Orthodox, and Protestant congregations.

EKHC organized Church and Community Mobilisation and Development (CCMD) quarterly meetings where members enhance and provide some experiences and gather ideas on approaches to various issues. EKHC also mobilises additional expertise required for the implementation of its programme through its network. Since the 2012 baseline engaged more frequently with other NGOs and the religious forum of which it is a member. In its capacity as a member of the religious forum, EKHC engaged in a dialogue with government offices and NGOs to enhance cooperation regarding a number of social issues.

2.2.3 Defending the interests of marginalised groups SPO

Score: 0

The only way in which EKHC is defending the interests of marginalised groups is through its community based interventions. Though EKHC collaborates with the government on program implementation, no traces have been found of EKHC defending the interests of these groups vis-à-vis local government or at higher administrative levels. By increasing the capacity of the FBO forum and the grain-banks EKHC indirectly defended the interests of PLWHIV and OVCs than EKHC itself.

2.2.4 Composition financial resource base SPO

Score: -1

Other donor organisations that support EKHC are Tear Fund UK, EED, DORCAS AID International, Samaritan's Purse – Canada, Canadian International Development Agency (CIDA), and Society of Integrated Missions (SIM) Ethiopia. It has become difficult to find funding in recent days which may be due to the economic crisis in many countries but the fact has affected the schedules of the SPO delaying its interventions.

2.3 Practice of Values

2.3.1 Downward accountability SPO

Score: 0

No changes occurred with regards to downward accountability.

EKHC's policies, procedures, administrative manual are well designed and give room for the General Assembly and the board to take corrective measures. However EKHC's monitoring and evaluation system need to be strengthened. At the project site stakeholders are informed about decisions taken in a transparent way. The quality of decisions taken may sometimes lack quality because those who are in the general assembly or in the board are elected based upon their role in church and not upon their professional competency. EKHC projects are accountable to community committees to which they report semi- annually or quarterly²⁹.

2.3.2 Composition of social organs SPO

Score: +1

EKHC's federal board consists of 4 representatives from each of 9 regions, 1 representative from each of four areas (areas are locations that are not large enough to be regions like Bale area, North area), 4 representatives of national youth association, 4 representatives of national female association and 4 implementers. This board is in turn accountable to the General assembly which consists of 2 representatives of each of the 95 to 100 assemblies and those in the board.

Even though most of the social organ groups of the Ethiopian Kale Heywet church are from middle classes, there are representatives from marginalized groups, but their presence is limited. In addition, women participation is low because of culture and social system. Since 2012 more disabled representatives take part in these organs.

²⁹ Baseline report 2012

2.3.3 External financial auditing SPO

Score: 0

As it is a set regulation by the government of Ethiopia for organizations unless stated otherwise have to report on their whole budget and expenditure activity there is no change seen on this indicator.

Also the FBO forum and grain banks are audited annually as required by law but AACs don't get audited which was the case also in the baseline.

2.4 Perception of Impact

2.4.1 Client satisfaction SPO

Score: +1

No systems are in place to measure the extent to which beneficiaries are satisfied with services and support delivered by the AAC, the grain banks, the SHGs, the girls clubs, the FBO forum in Arba Minch and the many volunteers and community leaders that have been trained. Only indications exist with regards to the following issues:

The CBO forum, grain banks, AAC and gender clubs increased their outreach since 2012. Motivation of the many community members is ensured by EHKC in terms of providing technical support and material – financial support to these organisations. Occasionally the government also provides office space or land. Churches provide moral support and material support if possible and organised a HIV testing session in church.

The 63 SHGs are also used as a platform for the members to help one another and discuss health issues particularly HIV and social discrimination. SHG members also believe that they are a living proof of the changes seen through the effort of EHKC as they had nothing before and now they are coordinated and working together.

The AACs organise community conversations on HIV and related health issues. Those clubs in school coordinate drama and poems on how to engage with OVCs in order to prevent social exclusion taking place. Out-of-School clubs do the same but reach youngsters in their respective kebeles. Parents have started sending children with problems to the AACs for counselling that in their turn also start to counsel others when they have resolved their own problems. Occasionally the AAC help resolve conflicts amongst children that grow out of hand at school or in the community. Apart from addressing health issues they increasingly engage in road and housing maintenance for destitute persons.

Grain banks are supporting destitute and PLWHIV on a monthly basis. Compared to the baseline almost all grain banks have added at least one regular beneficiary than what they started with. Since the baseline membership contribution has increased from 0.25 birr to 1 birr per month and some idirs/CBOs have agreed to contribute up to 3 birr. In the rural areas members also contribute in kind. The collected money is used to buy maize and oil. Each beneficiary gets 20-25kg of maize, 1 litter of oil and 10 birr for milling per month. There are also individuals who contribute more personally. With these contributions, the grain banks support 4-9 beneficiaries each- around 125 beneficiaries in total. However the number of beneficiaries does not increase very quickly due to high inflation rates. Representatives from the Idirs and church form its management committee and are accountable to the churches and Idirs that constituted the grain banks.

2.4.2 Civil Society Impact SPO

Score: 1

The FBO forum in Arba Minch town is well embedded in civil society and solicited by the local government to address community issues such as conflicts. The forum cooperates with other NGOs like Mercy Corps, Mary Joy, World Vision and also with the Arba Minch University in providing services to beneficiaries. It is able to deliver food, education, and clothing support to the elderly, OVC, and PLWHIV and currently supports 45 beneficiaries (OVC, PLWHIV and destitute) on a monthly basis

against the 15 persons during the baseline. On a more irregular basis it refers women for health treatments, reconstructs houses, constructs latrines, arranges free education for OVCs and feeds homeless people on holidays. Upon invitation of the local government the forum is helping to resolve conflicts. The forum also gained in its capacity to influence decisions made by the university to accept or not OVCs as students and through the discussion platforms it regularly organises with government officials.

Its financial resource base has increased since the baseline and sources have become more divers and it has become self-sufficient.

There is no relation between the FBO forum and the Grain Banks; both are supporting vulnerable people on their own way after having received the same technical support by EKHC.

EKHC's work on HIV/Aids related issues is now accepted by the church and they have started to support AACs and even coordinated a HIV testing session in church.

According to the information made available no such forums have been established in Mirab Abaya, and Arba Minch Zuria woredas.

2.4.3 Relation with public sector organisations SPO

Score: +1

During The Medan Act project EKHC established a regular and more formal collaboration with the urban government office in Arba Minch. As a result, support was given to the SHG approach and the local government supported the creation of 30 SHGs. EKHC furthermore participated in several meetings held with government offices and NGOs to discuss existing social issues and ways to address these. The provision of office space by the government for the forum and other CBOs EKHC is working with is an expression of good relationships between EKHC and the government offices. On the other side government officials receive trainings and material support that enable them to play their role in the programme and participate in meetings organised by EKHC.

EKHC not only has good relations with Arba Minch local government, but also with kebele administrators, health extension workers, schools, woreda finance offices and other related bodies.

There is no information available that describes how EKHC is collaborating with local government and public services in Mirab Abaya, and Arba Minch Zuria woredas and the kebeles under their supervision.

2.4.4 Relation with private sector agencies SPO

Score: +1

Private sector organisations contribute to the grain banks to support destitute people. EKHC also engaged with the private sector to ensure medical care for OVCs by private health centres, to ensure exemption of the payment of school fees, and to ensure that older OVCs receive vocational training. Networking discussions continue to take place since the baseline study.

2.4.5 Influence upon public policies, rules, regulations SPO

Score: 0

There is good collaboration with the public sector at the project location, but no policy influencing takes place.

2.4.6 Influence upon private sector agencies' policies, rules, regulations SPO

Score: 0

Not applicable

2.4.7 Client satisfaction CSO

Score: +1

2.5 Coping strategies in relation to context

2.5.1 Coping strategies

Score: -1

It is very challenging to sign an agreement with government bodies for a project which only has a life span of one year. Yearly projects also mean that it is more difficult to adjust to the mandatory administrative/program budget ratio (30/70 ratio). Projects covering more years could probably solve this issue, providing more flexibility for EKHC. The regional Finance and Economic Development Bureau was strictly opposed to the initial starting date of the project set at February 2012, because at that moment EKHC was not capable to comply with the 30/70 ratio and was searching for additional funding. Finally, the official starting date was reported to May 2012 when additional funding was found with Tear Fund UK. The 30/70 ratio also resulted in EKHC staff being underpaid.

The official agreement procedures with the government took a very long time and have delayed in particular those activities in the woredas (Mirab Abaya and Arba MinchZuria). High staff turnover in government offices explain these delays.

EKHC suffered from the absence of resource persons in Arba Minch that would be capable of providing courses on networking and lobby and advocacy which resulted in the postponement of these activities.

Report CDI-15-033

The Centre for Development Innovation works on processes of innovation and change in the areas of food and nutrition security, adaptive agriculture, sustainable markets, ecosystem governance, and conflict, disaster and reconstruction. It is an interdisciplinary and internationally focused unit of Wageningen UR within the Social Sciences Group. Our work fosters collaboration between citizens, governments, businesses, NGOs, and the scientific community. Our worldwide network of partners and clients links with us to help facilitate innovation, create capacities for change and broker knowledge.

The mission of Wageningen UR (University & Research centre) is 'To explore the potential of nature to improve the quality of life'. Within Wageningen UR, nine specialised research institutes of the DLO Foundation have joined forces with Wageningen University to help answer the most important questions in the domain of healthy food and living environment. With approximately 30 locations, 6,000 members of staff and 9,000 students, Wageningen UR is one of the leading organisations in its domain worldwide. The integral approach to problems and the cooperation between the various disciplines are at the heart of the unique Wageningen Approach.

Report CDI-15-072

Klaver, D.C., Hofstede, M.A., Tefera, W., Getaw, H., Dereje Getu D., February 2015, *Ethiopian Rural Self Help Association (ERSHA) end line report; MFS II country evaluations, Civil Society component*, Centre for Development Innovation, Wageningen UR (University & Research centre) and International Food Policy Research Institute (IFPRI). Report CDI-15-072. Wageningen.

This report describes the findings of the end line assessment of the Ethiopian Rural Self-Help Association (ERSHA) that is a partner of ICCO and IICD under the Connect4Change (C4C) Consortium.

The evaluation was commissioned by NWO-WOTRO, the Netherlands Organisation for Scientific Research in the Netherlands and is part of the programmatic evaluation of the Co-Financing System - MFS II financed by the Dutch Government, whose overall aim is to strengthen civil society in the South as a building block for structural poverty reduction. Apart from assessing impact on MDGs, the evaluation also assesses the contribution of the Dutch Co-Funding Agencies to strengthen the capacities of their Southern Partners, as well as the contribution of these partners towards building a vibrant civil society arena.

This report assesses ERSHA's contribution towards strengthening Civil Society in Ethiopia and it used the CIVICUS analytical framework. It is a follow-up of a baseline study conducted in 2012. Key questions that are being answered comprise changes in the five CIVICUS dimensions to which ERSHA contributed; the nature of its contribution; the relevance of the contribution made and an identification of factors that explain ERSHA's role in civil society strengthening.

Keywords: Civil Society, CIVICUS, theory based evaluation, process-tracing

1 Introduction

This report presents the civil society end line findings of the Ethiopian Rural Self-Help Association (ERSHA) which is a partner of ICCO and IICD under the Connect4Change (C4C) consortium. It is a follow-up to the baseline assessment that was carried out in 2012. According to the information provided during the baseline study ERSHA is working on MDG 1, Agriculture.

These findings are part of the overall evaluation of the joint MFS II evaluations to account for results of MFS II-funded or –co-funded development interventions implemented by Dutch CFAs and/or their Southern Partner Organisations (SPO) and to contribute to the improvement of future development interventions. The civil society evaluation uses the CIVICUS framework and seeks to answer the following questions:

- What are the changes in civil society in the 2012-2014 period, with particular focus on the relevant MDGs & themes in the selected country?
- To what degree are the changes identified attributable to the development interventions of the Southern partners of the MFS II consortia (i.e. measuring effectiveness)?
- What is the relevance of these changes?
- What factors explain the findings drawn from the questions above?

The CIVICUS framework that comprises five dimensions (civic engagement, level of organization, practice of values, perception of impact and contexts influencing agency by civil society in general) has been used to orient the evaluation methodology.

Changes in the civil society arena of the SPO

In the 2012 – 2014 period the two most important changes that took place with regards to the level of organisation and the perception of impact dimension of CIVICUS.

ERSHA's Farmer Market Organisations (FMOs) became more independent since the baseline. Eight of these, having access to electricity, were equipped with ICT tools to conduct digital transactions, which helped some of them to improve their bargaining position when negotiating with traders and gain more trust of their members. In the meanwhile they became a member of the Oromia Cooperatives Association. More women are said to take leadership positions in the FMOs, and female membership increased slightly from 27 % since the baseline to 27-30 %.

The union, endorsed by the government, managed to diversify its financial resource base. In the meanwhile it adhered to the Federation of Oromia Cooperative Unions.

ERSHA itself became a member of the East African Food Security Network of ICCO partners and engaged with their Kenya partners on ICT.

With regards to perception of impact, in particular the relations with the woreda administration are constructive: both the administration, the FMOs, the Union and ERSHA together explore how they can access potential market chains. Apart from this the local administration gave a clearance to the 14 MFOs to create their own union: officially only one union per district is allowed, but when the existing union refused the adhesion of the FMOs, these were allowed to create their own union. Additionally ERSHA has worked to link the union to different stakeholders such as the financial sector and to the Federation of Oromia Cooperative unions. In particular the relations with the Bank helped the union to diversify its financial resource base and to do investments that help the further marketing of agricultural produce.

These findings were obtained through an analysis of documents, a workshop and follow-up interviews with ERSHA, and interviews with external resources persons working in civil society organisations that receive support from ERSHA; other civil society organisations with whom ERSHA is collaborating; public

or private sector agents and; external resource persons capable of overlooking the MDG or theme on which ERSHA is concentrating.

Contribution analysis

Based upon an analysis of the projects and programmes financed by the Dutch CFAs a selection was made of SPOs to be included in an in-depth process tracing trajectory and those to be included for a quick contribution assessment. ERSHA was selected for a quick assessment.

The first outcome achieved that the evaluation team looked at was the increased capacities of the FMOs to serve their members: at least 6 of the eight FMOs are said to have improved their performance. The most plausible explanation of this outcome consists of both projects implemented by ERSHA and the other members of the C6NGO consortium; an ICCO funded project to create value chains and create FMO and Unions and; the ICT project implemented with IICD and the Connect4Change Alliance. Both together seem to provide a sufficient and necessary explanation of the outcome. The ICT component helps FMO leaders to track their financial situation, to more easily obtain price information to negotiate better prices and to increase relations of trust between FMO members and the management. However the enabling environment provided by the local government is to be seen as a condition to this success.

A second outcome achieved consists of the wider network in which the FMOs and the Union currently engage. These networks have both a business character (access to finance and to markets) and a civil society character (membership of the Federation of Oromia Cooperative unions and of the Oromia Cooperatives Association). Also in this case both project contributed to the outcome.

Relevance

Interviews with staff of ERSHA, with external resource persons, with ICCD as well as contextual information helped to assess the relevance of ERSHA's interventions in terms of; its Theory of Change (ToC) for Civil Society (SC) as designed during the baseline study; the context in which ERSHA is operating; the CS policies of ICCO and IICD.

With regards to the baseline ToC, the interventions and outcomes achieved are relevant because FMOs have been capacitated in terms of skills and knowledge of ICT, but also in taking ownership of their work and forming a union. In terms of the second condition ERSHA has not increased the networking much. This is largely due to the fact that they are already regularly meeting with the C6NGOs network. The largest change in this respect is the effort to form a partnership with Kenya. The area where ERSHA is lacking behind is the organisational development. The issues which were identified during the baseline have not been resolved.

The changes identified helped to increase farmers' trust in cooperative structures and to make access to markets easier to some extent and therefore are relevant; however their relevance would increase with the availability of a full-fledged market information system. The fact that one FMO, not on the power grid, managed to mobilise contributions from his members as a means to run a generator for electricity is to be interpreted as an indicator of the relevance of ICT as perceived by farmers.

With regards to IICD's and C4C's policies the changes are relevant because they contribute to its social innovation policy, in particular with regards to the creation of trust amongst stakeholders and increased connectivity.

Explaining factors

The information related to factors that explain the above findings was collected at the same time as the data were gathered for the previous questions. The evaluation team looked at internal factors within ERSHA, the external context in which it operates and the relations between ERSHA and ICCO/IICD.

Most important internal factors that explain the findings consist of a positive level of motivation of staff, but field staff missing the experiences necessary to engage with the private sector.

The most important external factor that explains the findings is that market information available is not always relevant, because only the Ethiopia Commodity Exchange provides regular information only in relation to export commodities. Access to internet facilities is generally low in Ethiopia, as well as having access to electricity; yet with the expansion of the mobile network access will improve over time.

The following chapter briefly describes the political context, the civil society context and the relevant background with regards to MDG 1 that ERSHA is working on. Chapter three provides background information on ERSHA, the relation of its MFS II interventions with the CIVICUS framework and specific information on the contract with ICCO. An evaluation methodology has been developed for the evaluation of the Civil Society component which can be found in appendix of the country report; however, deviations from this methodology, the choices made with regards to the selection of the outcomes for contribution analysis, as well as difficulties encountered during data collection are to be found in chapter 4. The answers to each of the evaluation questions are being presented in chapter 5, followed by a discussion on the general project design in relation to CS development; an assessment of what elements of the project design may possibly work in other contexts or be implemented by other organisations in chapter 6. Conclusions are presented in chapter 7.

2 Context

This paragraph briefly describes the context ERSHA is working in. A description of the Civil Society Context assessed according to the CIVICUS framework is provided in appendix 3 of the country report for Civil Society.

2.1 Political context

The Ethiopian Government has enacted a five year Growth and Transformation Plan (GTP) to implement over the period of 2011-2015.¹ Two of the major objectives of the plan are to maintain at least an average real GDP growth rate of 11%, meet the Millennium Development goals, and expand and ensure the qualities of education and health services thereby achieving the MDGs in the social sectors (FDRE, 2010). The government acknowledged that NGOs and CSOs have an important role to play in the implementation of this plan: According to the preamble of the new charities and societies proclamation NO. 621/2009 of Ethiopia, civil society's role is to help and facilitate in the overall development of the country.² This is manifested in the government's approach of participatory development planning procedures. For example, NGOs established a taskforce under the umbrella of the CCRDA to take part in the formulation of the country's first Poverty Reduction Strategy paper formulation. They were a major stakeholder in the planning process of the five year GTP plan. Despite fears that the NO. 621/2009 proclamation was thought to have negative impacts on Civil Society, the number of newly registered charities and societies have increased considerably. 800 new charities and civil societies were registered between 2010/11 and 2011/12 and as of February 2012, these were implementing over 113.916 projects in different social, economic and governance related sectors. Governance related projects comprise interventions in the area of democracy and good governance, peace and security, human rights, justice, and capacity building. The charities and societies are most engaged in the health sector (19.8%), followed by child affairs (11.9%), education (9.2%), governance (8.3%) and other social issues (7.8%). These figures are more or less similar to the pre-proclamation period, and would imply that new charities or societies have replaced foreign and Ethiopian charities that are not allowed to work on sectors related to governance and human rights.³ This might indicate that there might have been some flexibility in the interpretation of some of the provisions of the proclamation.

2.2 Civil Society context issues with regards to the MDG

ERSHA is a member of a consortium of six NGOs which is working on market access strategies for poverty alleviation of small-scale farmers. As part of the consortium, ERSHA has been supporting and strengthening farmers marketing organizations (FMOs) as well as forming and strengthening unions of FMOs. The activity includes linking FMOs and unions with chain actors, introducing of new high value crops, and integrating ICT to the FMOs and unions activity. It aims at increasing agricultural production, increasing household income, and enhancing the capacity of the target community.

¹ Growth and Transformation Plan 2011 – 2015, Ministry of Finance and Economic Development, (November 2010), Federal Democratic Republic of Ethiopia

² February 2009, Charities and Societies Proclamation (proc. no.621/2009), Federal Negarit Gazeta, Federal Democratic Republic of Ethiopia

³ UNDP, January 2014, Civic Engagement for Effective Service Delivery in Ethiopia: Tools, Opportunities and Challenges, UNDP Ethiopia Working Paper Series No. 2/2014

ICT can play a crucial role in benefiting the resource-strapped farmers with up to date knowledge and information on agricultural technologies, best practices, markets, price trends, and weather conditions. The experiences of most countries indicate that rapid development of ICT, which facilitates the flow of data and information, has tremendously enhanced the knowledge management practice in agriculture. However, in Ethiopia the use of ICT for the accumulation and dissemination of knowledge and information is still low. The major challenges inhibiting the use of ICT in disseminating agricultural knowledge and information primarily is the availability of relevant information and the low access level of access to ICT infrastructure and services.

Thus, the low level of ICT infrastructure in Ethiopia is believed to have hindered the agriculture sector from realizing its potential. It has inhibited the effectiveness of farmers training centres that are available at Kebele (i.e., the lowest administrative unit) level. The centres aim at closely supporting smallholder farmers in creating and delivering agricultural knowledge to increase productivity and production and to enhance efficiency. But, in most places, these training centres are not connected to modern ICT infrastructure and services. As a result, research-extension-farmer linkages are weak and costly as such linkages have to be fostered through physical contact such as training, field demonstration, field day program and visits. The low level of access to ICT infrastructure is also believed to have slowed the sharing and exchange of knowledge and information generated from research centres at national and regional levels. The contribution of access to ICT also includes the benefit of obtaining production and market information that help farmers sell their produce at the right price, moment and places. It also improves competitiveness of the actors involved through adding efficiency and effectiveness. But the fact that access to ICT service is low has limited the performance of farmers and the cooperatives they created.

3 Description of ERSHA and its contribution to civil society/policy changes

3.1 Background of ERSHA

History

Ethiopian Rural Self Help Association (ERSHA), is a national, Non-Governmental, not for profit development organization (NGO), registered under the Federal Ministry of Justice in October 1997 and has operational agreement with the Federal Disaster Prevention and Preparedness Commission (DPPC) and project agreements with different concerned Regional Bureaux.

ERSHA started its operations in January 1998 and implements projects in different parts of rural Ethiopia. The organization is involved in the implementation of rural development programs and is governed by a Board of Directors and a General Assembly.

Vision and mission:

Vision: To see a poverty free Ethiopia where men and women equally enjoy dignified life

Mission: ERSHA aims to support the rural community with special emphasis on the poor households in their efforts to attain food security by implementing gender sensitive and sustainable development programs, through active participation of stakeholders.

Main strategic actions:

ERSHA supports gender equality promotion, HIV/AIDS mitigation, natural resource development and environmental protection and indigenous capacity efforts as cross cutting development themes.

The values of ERSHA include solidarity with the poor and marginalized people, justice and equality, respect for the rights of women and children, integrity and partnership.

3.1 MFS II interventions related to Civil Society

ERSHA is one of the members of the Consortium of six NGOs (C6NGOs) that implement the 'Integration of ICT in Agricultural Commodity Value Chain' project with support of ICCO and the Connect for Change Alliance. Other members of C6NGOs are ADAA, CDI, ERSHA, FC, HUNDEE and OSRA.

The C6NGOs are responsible for the implementation of two projects with the support of the ICCO. One project focuses on organizational support for FMOs and their Unions for which ICCO is the responsible Dutch NGO and which is part of the ICCO alliance⁴ (see Report MFSII Joint Evaluation C7), while the above mentioned ICT project is being implemented under the responsibility of IICD as a member of the Connect for Change Alliance. This last project consists of the provision of ICT infrastructure for the involved FMOs, their Unions and the NGOs supporting these farmers' organizations."

⁴ Farmers Competitiveness on Agricultural Commodity Value Chain with the ICCO alliance

ERSHA's project sites for the two projects are West Shoa, Ambo area - Gosu (100 km from Addis Ababa) and Altufa (106 km from Addis Ababa). It will reach 14 out of 115 Farmers Marketing Organisations, 1400 – 1800 farm households (11% of all households), and 2700 indirect beneficiaries (11 %) of the entire project implemented by C6NGOs. ERSHA's general operations in Ambo have ended by September 2014 except the ICT activities as reported by the former program manager Mr. Olika Belachew on 25.10.2014.

The main interventions of the ICT project consist of capacitating Farmers Market Organisations (FMOs) and their members and the established unions in the area of ICT. This should improve their access to market information and would ultimately improve their efficiency and professional work.

3.2 Basic information

Table 1: basic information on ERSHA

Name of SPO	Ethiopian Rural Self Help Association (ERSHA)			
Consortium and CFA	ICCO/IICD Connect4Change (C4C)			
Project name	Integration of information and communication technologies on agriculture value chain commodities			
MDG/theme on which the CS evaluation focusses	1 – Agriculture			
Start date of cooperation between the CFA and the SPO	September 2011			
Other donors if applicable	Not specified by documents			
Contracts signed in the MFS II period	Period	# months	Total budget	Estimation of % for Civil Society
First Phase of the project	September 2011 - 2013	28	€525,000 Euro for C6NGOs, of which €81,900 earmarked for ERSHA.	5 %

Sources: project documents

4 Data collection and analytical approach

The data collection aimed at answering the question of change was conducted as planned. All relevant information were collected through discussion and document review from the SPO's head office in Addis Ababa as well as from various stakeholders in the field located in Guder. The field visit has not required methodological adjustments of any kind.

The two impact outcome orientations chosen for the evaluation were strengthening intermediate organizations (IO) and networking. Three management members including the executive manager have been consulted at the head office level and the field officer, the Woreda cooperation officer, the union leader and FMO leaders are consulted at the field level.

Both, the management staff and the field staff confirmed that ERSHA is contributing a lot to change the livelihood of the farmers by strengthening the farmer organizations. A continuous training, financial and material supply with the associated follow up is ERSHA's model of change. Similarly, respondents confirm that ERSHA's effort in creating a better networking is becoming fruitful.

In this data collection, we observed that the project coordinator is no longer in his position and we face a minor challenge in collecting some hard copy documentations. But, the other project staffs located in the project site were very cooperative and facilitated the data collection activity effective.

5 Results

5.1 Results obtained in relation to project logframe

The planned outputs and outcomes for the project 'integration of ICT in Agricultural Commodity Value Chain' are focused on the C6NGOs network. ERSHA's work is mainly based in Gosu and Altufa, and plans to reach 14 out of 115 Farmer Markets Organisations (FMOs). This leads to a total of 1400-1800 farm households and 2700 indirect beneficiaries reached. Unfortunately it is impossible to check the progress with regards to these numbers as the progress reports do not mention numbers or are inconsistent about them.

Three outputs are being mentioned in the progress reports and proposal. The first output is to 'establish a management information system at C6NGOs level through the use of ICT and improve networking and collaboration among consortium members and other stakeholders for learning and information sharing'. ERSHA's contribution to this is to enhance the efficiency and effectiveness of 14 FMOs for the promotion of value chain development using ICT. Basically this output can be seen as the foundation for the whole project as most activities are developed to enhance the ICT skills of the C6NGOs members. It was decided that a needs assessment would be done by every member of the consortium, and that staff members would be trained on ICT tools for communication and development, and website development. Progress reports mention that these activities all have been done, but are inconclusive about the number of participants. Also, new ICT tools were bought for the NGOs in order to capacitate them in their work.

The second output, 'establishing interactive market information system through the use of ICT', focuses on enhancing competitiveness of FMOs in the decision making process of their member households through accessing relevant and reliable market information. For ERSHA this means that they focus on 14 FMOs and 1075 member households. The main activities for this output are to train FMO leaders on ICT tools, mobile phone use and market information management. Other activities include facilitating training centres and providing FMOs with ICT materials. According to data sheets provided by IICD in 2013 and in 2014, 13718 FMO staff and members (of which 16 percent women) were trained by C6NGOs, however no detailed records were available for ERSHA. Progress reports further mention that the ICT training centre at the Ambo site was established by ERSHA and equipped with materials. Also, 8 of the 14 FMOs were equipped with ICT tools, the six remaining not having access to electricity. A last important step consisted of establishing a collaboration between Apposit and C6NGOs in 2013 to discuss data collection for the market information system during the project and in the future. Apposit is a private IT firm which develops software to collect market information. The initial plan was that the Union would collect market information themselves and distribute it to FMOs through this software. However, the software proved to be too expensive for the Union which caused them to doubt the added value of using it⁵. Apposit started collecting market information in Ambo and other places, but neither ERSHA nor the Union were involved in the process and until so far data were not made available.

According to the progress reports made available (those of 2012 and 2013) the following outcomes were reached:

- 5781 (1292 women) small-scale producers and entrepreneurs use ICT to access production and market information;
- More than 1111 farmers (142 women) are receiving wheat market information from Ethiopian Commodity Exchange (ECX) because of skills and experience gained from the project. However, this can only tell the trend of wheat prices rather than national market price information. They also use their computers to write letters to their customers in order to notify them the official grain prices

⁵ Information obtained from ERSHA after the first feedback round

and the existing stocks. The usage of ICT has simplified the communication systems with their customers. This has saved time, energy and money they spent in communication;

- More than 1265 (231 women) farmers have obtained mobile phone user skill and experiences
- The FMO's in ERSHA's target area formed an Union;
- 28% of the FMO's in ERSHA's target area graduated after fulfilling all steps and requirements to integrate ICT in the way they are doing business. This is said to have enhanced communication at different levels of the chain using mobile short messages i.e. communication between unions and FMO leaders and between FMO leaders and members. This further improved members' satisfaction and trade performances';
- FMOs which are exchanging information have increased their turnover rate;
- Most FMOs attracted new members and membership increased by 1142 (7%) with female membership increasing by 580 (11%);

The third and last output is 'enhanced efficiency and effectiveness of ICT services'. This output focuses on improving household productivity. The planned activities to achieve this are creating awareness on ICT in the community at large, deploying social media for knowledge sharing and discussion, developing audiovisual on improved agricultural technology. The progress reports state that several NGOs (not ERSHA) of the network have collaborated with research centres to develop learning materials whilst ERSHA has created general awareness on ICT usage.

5.2 Changes in civil society in the 2012-2014 period

5.2.1 Civic engagement

Civic engagement describes the formal and informal activities and participation undertaken by individuals to advance shared interests at different levels. Participation within civil society is multi-faceted and encompasses socially-based and politically-based forms of engagement.

ERSHA's main target group consists of 1400-1800 small-scale households and 2700 indirect beneficiaries. These are divided over 14 Farmer Market Organisations, of which some have formed a union. Unfortunately it does not become clear how many members this union has. The average FMO member is a small scale farmer. Between 27 and 30 per cent of the FMO members are women in 2014, compared to 27 % in 2011. Their participation is promoted in the bylaws of the FMOs. Since the baseline, the number of women taking leadership roles in FMOs has increased, although the total percentage of women has not increased. However, not all FMOs are including more women in their management committees and some are not including marginalised groups as they should be. Women are represented at the consortium level as they are part of the FMO management committee.

The total score for this dimension is +1, and this is mainly due to the increased involvement of women at a leadership level. The total number of women members in FMOs has not increased, although this was already identified as an issue during the baseline. Also, the total number of households and beneficiaries has not increased since the baseline.

Score baseline 2012 on an absolute scale from 0-3:	2
Score end line 2014, relative change on a scale of (-2, +2):	1

5.2.2 Level of organization

This dimension assesses the organisational development, complexity and sophistication of civil society, by looking at the relationships among the actors within the civil society arena.

Like during the baseline, collaboration between ERSHA and the other members of the C6NGOs consortium remained constructive as well as relations with the CCRDA and the Poverty Action Network Ethiopia (PANE). The same applies for ERSHA's relations with the FMOs and the Union that was formally established in 2012. A new East African Food Security Network with ICCO partners is currently being created and ERSHA engaged with their Kenya partners on ICT.

Since the baseline the FMOs and the union are increasingly taking the responsibility to defend the interests of their members. These structures have become more independent from ERSHA. In the meanwhile ERSHA's financial resource base has deteriorated with two donors ending their partnership.

Score baseline 2012 on an absolute scale from 0-3: 2
Score end line 2014, relative change on a scale of (-2, +2): 1

5.2.3 Practice of Values

Practice of Values refers to the internal practice of values within the civil society arena. Important values that CIVICUS looks at such as transparency, democratic decision making, taking into account diversity that are deemed crucial to gauge not only progressiveness but also the extent to which civil society's practices are coherent with their ideals.

ERSHA's executive leader is accountable to the General Assembly and the Board of Directors, which is unchanged since the baseline. During the baseline evaluation it was indicated that these bodies are less frequently informed than the government or donor organisations. Nothing changed in this respect. The FMOs and union leaders indicated that they are being informed by ERSHA about the project and phase out.

The Board of Directors is currently comprises four men and one woman. During the baseline there was no information available about the composition of the Board of Directors. Consequently it is not possible to indicate any change for this indicator. The same applies to the financial auditing, which is still done annually by an external firm. There is no information available on these audits.

Score baseline 2012 on an absolute scale from 0-3: NA
Score end line 2014, relative change on a scale of (-2, +2): 0

5.2.4 Perception of Impact

Perception of Impact assesses the perceived impact of civil society actors on politics and society as a whole as the consequences of collective action. In this, the perception of both civil society actors (internal) as actors outside civil society (outsiders) is taken into account. Specific sub dimensions for this evaluation are the extent to which the SPO has contributed to engage more people in social or political activities, has contributed to strengthening CSOs and their networks, and has influenced public and private sector policies.

Since the baseline FMO members have obtained better access to markets and to market information and became a member of the Oromia Cooperative Association. At the same time the union has diversified its resource base by taking a share in the Oromia Cooperative Bank and built a store and an office. The Union is now better connected to other stakeholders such as the Federation of Oromia Cooperative Unions.

Six of the 8 FMOs that accessed ICT equipment are now able to keep records of transactions made which helps them to set the sales price and with their mobile phones they can reach out to more traders and negotiate better prices. Two of the eight FMOs equipped still have a weak performance.

Relations with the public sector at district level are constructive: together with the district cooperative promotion office, FMOs, the Union and ERSHA address their common concern of market access. Although the regulations in place currently allow the presence of only one union per district, the FMOs obtained the clearance to establish their own union after the one existing union refused their membership.

ERSHA has made attempts to link the FMOs to flour and oil factories, but the organization lacks the necessary capacities at field level to connect the FMO to promising value chains. The organization is currently negotiating with an organization who knows how to supply market information via SMS, but an agreement on the intellectual property rights has not been fulfilled. In the meanwhile the FMOs and the union work with private sector organisations to sell their produce or to buy inputs.

Score baseline 2012 on an absolute scale from 0-3: 1
Score end line 2014, relative change on a scale of (-2, +2): 2

5.2.5 Civil Society Environment

The social, political and economic environment in which civil society operates affects its room for manoeuvre. The civil society context has been described in chapter 3. In this section we describe how ERSHA is coping with that context.

The 2009 Proclamation to Provide for the Registration and Regulation of Charities and Societies (CSP) and the related "70/30" regulation that limits administrative costs for all charities and societies to 30% of their budgets. This has resulted in a delay in the start of the ICT project as new administrative arrangements had to be taken by ICCO.

Also there is a lack of reliable and responsive private sector work in the area of ICT. Market information is not yet fully available and is not always accurate. So far only ECX (Ethiopia Commodity Exchange) provides information on a regular basis, yet this is only from the central trade market in Addis and considers only export commodities.

Score baseline 2012 on an absolute scale from 0-3: 1
Score end line 2014, relative change on a scale of (-2, +2): 0

5.3 To what degree are the changes attributable to the Southern partners?

5.3.1 FMOs have the capacity to serve their members.

According to the interviews, some but not all FMOs improved their services to their members. In the first place this is reflected by the fact that they function according to their bylaws, calling a general assembly two times a year, record transactions which are audited, and using their ICT equipment. FMOs have obtained the trust of their members who in consequence increased their sales volumes through the FMO. In addition, members have started to use improved seed varieties and started to grow cash crops to ensure a better access to markets. On their turn, some of the FMOs are said to have increased their sales volumes considerably, which gives them a better bargaining position on the market. As a member of the union, FMOs have further expanded their services to their members, by means of making available consumer goods.

The integration of the ICT component in the operations of the eight selected FMOs had the following contribution to this outcome: In the first place FMOs started recording their daily transactions in excel, which helped them to easily and effectively track their financial status which also helped in the auditing of each cooperative. In the second place FMO management started to use mobile phones and more easily obtain price information from many traders, also from other towns. This has increased their possibility to compare different traders and to negotiate better prices, implying that their bargaining power has increased. In the third place ICT is said to have helped increase the transparency of the FMO management towards their members and particular with regards to the payment of dividend.

Not all eight FMOs that were equipped with ICT tools improved their performance: two FMOs do not have the educational level, do not show commitment and do not take initiative and have high staff turnover. On the other side another FMO that does not have access to electricity mobilised contributions from its members to use a generator which then helped the FMO to access the ICT tools.

The most plausible explanation for this outcome consists of the technical support provided by ERSHA through both the ICCO alliance Value Chain Program and the ICT program. This is a sufficient and necessary explanation of the outcome. However the enabling environment provided by the local government, meaning Woreda level, is to be seen as a condition to this success.

It has however not been possible to assess exactly what the contribution has been of the ICT introduction and that of the value chain development project. Both interventions need to be seen as a causal package. ICT is mainly being used to improve processes and access to information.

5.3.2 Increased network to access financial services and access to markets

The second outcome achieved consists of the FMOs and the unions having increased their networks which led to improved access to financial services, in particular the Union being linked to the cooperative bank of Oromia in which it took a share and obtained a loan. This loan is said to be used by FMOs to pay their members upon delivery of agricultural produce because the Union transfers a sufficient amount of money to the FMOs as a means to manage their cash flows. Other network outcomes are that more sharing of lessons takes place amongst FMOs of C6NGOs; the Union becoming a member of the Oromia Cooperative federation, and; FMOs being able to sell produce to consumer cooperatives after conflicts had been resolved.

ERSHA's contribution consisted of facilitating experience sharing, providing technical assistance to the Union to engage with Oromia Cooperative Bank and Oromia cooperatives federation. Those contributions are to be attributed to both projects implemented by ERSHA and the C6NGOs. ERSHA, UNION, Oromia Cooperative bank and Oromia cooperatives federation play an important role. ICT interventions are contributing to this outcome as it helps to improve connectivity. As a result of ICT interventions it becomes possible to access information about stakeholders, but also to share information and documentation. Moreover, the technical assistance provided by ERSHA entailed providing a better membership overview which was a result of ICT interventions. ICT thus helps to connect between organisations, stakeholders, traders etc.

5.4 What is the relevance of these changes?

5.4.1 Relevance of the changes in relation to the Theory of Change of 2012

The ToC of 2012 states that the overall objective of ERSHA is to become an innovative and efficient civil society organisation that serves its clients. There are three conditions to reach this objective: 1) strengthening material and technical capabilities of FMOs and their members, 2) networking and partnership development and 3) strengthening ERSHA's organisational capacity to meet clients' and partners' needs.

The changes achieved as described in paragraph 5.2 show that progress has been made to meet all three conditions.

5.4.2 Relevance of the changes in relation to the context in which ERSHA is operating

The relevance of the changes in relation to the context has two components: that of organising farmers in value chains and supporting these chains with market information systems and ICT for the management of FMOs and Unions.

A differentiation needs to be made between the FMO business oriented cooperative structures and the government supported multi-purpose cooperatives that aim to support consumers and vulnerable households. Past governments have used cooperative structures for their Marxist policies, which in consequence has led to a distrust of farmers in any new cooperative structure. If the FMOs manage to increase the trust of farmers in their services as well as help farmers to sell their produce at a higher price, than the change is very relevant.

ICT services are an important factor in making the agricultural sector efficient. However, in Ethiopia the availability of ICT tools and services is limited. The ICT tools necessary for receiving information are not available everywhere and are difficult to come by. Moreover, the knowledge and skills of farmers in the area of ICT is very limited. ERSHA has worked on improving the knowledge and skills of FMOs in working with ICT tools. This has worked for 6 of the eight FMOs, the two remaining facing difficulties related to amongst others low education levels.

However market information for agricultural commodities is only limited to export crops and the collaboration with Apposit to collect market information for the FMOs and the Unions until so far has not been successful. Although some indications exist that sms-services help farmers and FMOs to collect market information and to improve their bargaining position, the absence of a market information system partially questions the relevance of the ICT project in relation to market access.

The changes identified helped to increase farmers' trust in cooperative structures and to make access to markets easier to some extent and therefore are relevant; however their relevance would increase with the availability of a full-fledged market information system.

5.4.3 Relevance of the changes in relation to the policies of Connect4Change

IICD's approach is that of social innovation and their Civil Society policy is that of providing their partners with support and information after having received a request for support. According to IICD ICT has shown to increase the trust between farmers and their FMOs because it helps to increase the transparency of the management of sales which is to be considered as a major contributor to social innovation.

The work of ERSHA has been relevant as the agricultural sector is not very organized when it comes to access to information. In this project IICD trained ERSHA to introduce the ICT in the FMOs and ICCO provided the necessary funding. ERSHA was the leading party to implement it in FMO practices. They have also taken an important role in creating awareness of the importance of this information for the farmers. They have raised awareness to a level where farmers are willing to pay a small price for receiving accurate information which can be used at their farm. They have started to realize that this can improve their livelihood.

5.5 Explaining factors

5.5.1 Internal factors

Despite the fact that ERSHA mentioned in its 2012 ToC that its own organisational performance needed to be addressed, only limited efforts have been taken until so far.

One of the areas that needs further attention – not related to the market information system however – is that staff at field level strengthens its capacities to engage with private sector actors as a means to integrate the FMOs in promising value chains. The staff is highly motivated in this organisation.

5.5.2 External factors

As mentioned above, only market information for export commodities is available in Ethiopia and a market information system to inform the farmers with whom C6NGOs are working and who are delivering on domestic markets is not yet available. Making the ICT tools available is a first step, however the second step of providing the FMOs and farmers with market information did not yet materialise.

The government of Ethiopia is increasingly looking at ICT as an important tool for development. The five year government plan under implementation, called Growth and Transformation Plan, argues that embracing ICT is essential to creating new jobs, new business opportunities, to education and to improving the effectiveness of government administration and service delivery. Nonetheless, it was found out that the Ethiopia's ICT initiatives have not been taken up by the private sector and therefore reliable statistics are not as easily available as in some other African countries that have been strategically ramping up their local ICT industry (Lixi and Dahan, 2014).⁶ According to International Telecommunication Union Key Global Telecom Indicators released in 2014⁷, Ethiopia registered improvement in the ICT growth. Nonetheless the performance of Ethiopia remained very low compared to other counties in Africa as well as other developing countries. The following figures show how Ethiopia performed in some of the key indicators:

- Percentage of individuals using internet improved from less than 0.2 in 2004 to about 1.5 percent in 2012,

⁶ Marc Lixi and Mariana Dahan. 2014. *ICT as an Enabler of Ethiopia*. World Bank

⁷ <http://knoema.com/ITUKGTI2014/international-telecommunication-union-key-global-telecom-indicators-2014?location=1000670-ethiopia>

- Fixed broadband subscription per 100 inhabitants increased to 0.045 in 2012 from 0.005 in 2010,
- Mobile cellular subscription per 100 inhabitants reached close to 24 from a figure that was well below 5 in 2008. As a result mobile subscription surpassed 23 million.

The International Telecommunication Union classified Ethiopia as one of the least performing in terms of ICT Development Index (IDI), which measures the level of ICT advancement in 166 countries by combining 11 indicators that focus on three areas – ICT access, ICT use and ICT skills. The result showed that Ethiopia stood 162 both in 2012 and 2013. The four countries that performed less than Ethiopia in both years were Eritria, Chad, Niger, and Central African Republic.

Price and affordability of ICT services is one of the challenges that is affecting access to the services in Ethiopia. If we take the cost of an entry-level fixed-broadband subscription as an example the performance was that in 2012 it cost Ethiopia USD 23.70 to access fixed broadband internet (ITU, 2013)⁸. The cost was higher than what several countries charged for the same service. In addition, the cost in Ethiopia was one of the most expensive in terms of gross national income per capita which amounted to 71 percent. As a result Ethiopia ranked as 18th most expensive country out of 169 countries in total.

This ICT context explains the difficulties that the C6NGOs have in negotiating the provision of market information with ICT businesses like Apposit.

5.5.3 Relations CFA-SPO

In September 2014 the field office of ERSHA was closed because of funding problems. In consequence the value chain project that helped to create the FMOs and the unions was closed, but the ICT project will continue until the end of 2015. As of that moment IICD only engages with the headquarters of ERSHA and lost contact with the field.

⁸ ITU. 2013. Measuring the Information Society. Geneva Switzerland

6 Discussion

6.1 Design of the intervention

The intervention is designed for the entire C6NGOs consortium which makes the goals and activities applicable to all involved organisations. ERSHA works with a limited number of FMOs but has been successful in implementing the programme. The FMOs and their members report that they feel better capable to perform in their business and use ICT in their work. The introduction of the ICT in the first place helps to keep data, but in the second place helps to negotiate better prices.

An important component that would be worthwhile to explore consists of a more systems approach oriented intervention that would, apart from the technical devices, also ensure that market information becomes reliable. This would improve the project design.

7 Conclusion

Changes in the civil society arena of the SPO

In the 2012 – 2014 period the two most important changes that took place with regards to the level of organisation and the perception of impact dimension of CIVICUS.

ERSHA's Farmer Market Organisations became more independent since the baseline. Eight of these, having access to electricity, were equipped with ICT tools to conduct digital transactions, which helped them to improve their bargaining position when negotiating with traders. In the meanwhile they became a member of the Oromia Cooperatives Association. More women are said to take leadership positions in the FMOs, and female membership increased slightly from 27 % since the baseline to 27-30 %.

The union, endorsed by the government, managed to diversify its financial resource base. In the meanwhile it adhered to the Federation of Oromia Cooperative Unions.

ERSHA itself became a member of the East African Food Security Network of ICCO partners and engaged with their Kenya partners on ICT.

With regards to perception of impact, in particular the relations with the local administration are constructive: both the administration, the FMOs, the Union and ERSHA together explore how they can access potential market chains. Apart from this the local administration gave a clearance to the 14 MFOs to create their own union: officially only one union per district is allowed, but when the existing union refused the adhesion of the FMOs, these were allowed to create their own union. Additionally ERSHA has worked to link the union to different stakeholders such as the financial sector and to the Federation of Oromia Cooperative unions. In particular the relations with the Bank helped the union to diversify its financial resource base and to do investments that help the further marketing of agricultural produce.

These findings were obtained through an analysis of documents, a workshop and follow-up interviews with ERSHA, and interviews with external resources persons working in civil society organisations that receive support from ERSHA; other civil society organisations with whom ERSHA is collaborating; public or private sector agents and; external resource persons capable of overlooking the MDG or theme on which ERSHA is concentrating.

Contribution analysis

The first outcome achieved that the evaluation team looked at was the increased capacities of the FMOs to serve their members: at least 6 of the eight FMOs are said to have improved their performance. The most plausible explanation of this outcome consists of both projects implemented by ERSHA and the other members of the C6NGO consortium; an ICCO funded project to create value chains and create FMO and Unions and; the ICT project implemented with IICD and the Connect4Change Alliance. Both together seem to provide a sufficient and necessary explanation of the outcome. The ICT component helps FMO leaders to track their financial situation, to more easily obtain price information to negotiate better prices and to increase relations of trust between FMO members and the management. However the enabling environment provided by the local government is to be seen as a condition to this success.

A second outcome achieved consists of the wider network in which the FMOs and the Union currently engage. These networks have both a business character (access to finance and to markets) and a civil society character (membership of the Federation of Oromia Cooperative unions and of the Oromia Cooperatives Association). Also in this case both project contributed to the outcome.

Relevance

With regards to the baseline ToC, the interventions and outcomes achieved are relevant because FMOs have been capacitated in terms of skills and knowledge of ICT, but also in taking ownership of their work and forming a union. In terms of the second condition ERSHA has not increased the networking much. This is largely due to the fact that they are already regularly meeting with the C6NGOs network. The largest change in this respect is the effort to form a partnership with Kenya. The area

where ERSHA is lacking behind is the organisational development. The issues which were identified during the baseline have not been resolved.

The changes identified helped to increase farmers' trust in cooperative structures and to make access to markets easier to some extent and therefore are relevant; however their relevance would increase with the availability of a full-fledged market information system. The fact that one FMO, not on the power grid, managed to mobilise contributions from his members as a means to run a generator for electricity is to be interpreted as an indicator of the relevance of ICT as perceived by farmers.

With regards to IICD's and C4C's policies the changes are relevant because they contribute to its social innovation policy, in particular with regards to the creation of trust amongst stakeholders and increased connectivity.

Explaining factors

Most important internal factors that explain the findings consist of a positive level of motivation of staff, but field staff missing the experiences necessary to engage with the private sector.

The most important external factor that explains the findings is that market information available is not always relevant. Access to mobile data networks is generally low in Ethiopia, as well as having access to electricity.

Design

The design of the intervention is replicable for other FMOs that have access to electricity, whose managers have the appropriate educational background and whose organisational performance is strong. Apart from this, similar interventions need to take into account the quality of the data entered into the market information system.

Table 2

Summary of findings.

When looking at the MFS II interventions of this SPO to strengthen civil society and/or policy influencing, how much do you agree with the following statements?	Score
The CS interventions were well designed	8
The CS interventions were implemented as designed	7
The CS interventions reached their objectives	7
The observed outcomes are attributable to the CS interventions	7
The observed CS outcomes are relevant to the beneficiaries of the SPO	6

Score between 1 to 10, with 1 being "not at all" and 10 being "completely".

Appendix 1 Civil Society Scores

This table presents the appreciation of the evaluation team regarding changes occurred for each indicator between 2012 and 2014 on a scale of -2 to + 2

- 2 = Considerable deterioration

- 1 = A slight deterioration

0 = no change occurred, the situation is the same as in 2012

+1 = slight improvement

+2 = considerable improvement

Dimension		Indicators	Question	Change in the indicators in the 2012 – 2014 period
Civic engagement	1	Needs of marginalised groups	How does your organisation take the needs of your beneficiaries/target groups, in particular marginalised groups into account in your planning, actions, activities, and/or strategies?	+1
	2	Involvement of target groups	What is the level of participation of your beneficiaries/target groups, in particular marginalised groups in the analysis, planning and evaluation of your activities?	+1
	3	Political engagement	How intense is your (individual staff or organisational) participation in locally-nationally elected bodies and/or sectoral user groups?	0
Level of organisation	5	Relations with other organisations	In the past 12 months what has been the most intensive interaction you had with other CSOs?	+1
	5	Frequency of dialogue with closest CSO	In the past 12 months how many meetings did you have with the CSO that you have most intensive interaction with?	+1
	6	Defending the interests of marginalised groups	Which CSO are most effective in defending the interests of your target groups? In the past 12 months, how did you relate to those CSOs?	+2
	7	Composition current financial resource base	How does your organisation finance institutional costs such as workshops of the General Assembly (if applicable); attendance to workshops of other CSOs; costs for organisational growth and/or networking?	-1
Practice of Values	8	Downward accountability	To what extent can mandatory social organs (steering committee, general assembly, internal auditing group) ask your executive leaders to be accountable to them?	+0
	9	Composition of social organs	What % of members of your mandatory social organs belong to the marginalised target groups you are working with/for?	0
	10	External financial auditing	How regularly is your organisation audited externally?	0
Perception of impact	11	Client satisfaction	What are the most important concerns of your target groups? How do your services take into account those important concerns?	+2
	12	Civil society impact.	In the past 12 months, what impact did you have on building a strong civil society?	+2
	13	Relation with public sector organisations.	In the past 12 months, what interaction did you have with public sector organisations to realise your programme and organisations' objectives?	+2
	14	Relation with private sector organisations	In the past 12 months, what interaction did you have with private sector organisations to realise your programme and organisations' perspective?	+1

	15	Influence upon public policies, rules, regulations	How successful have you been in influencing public policies and practices in the past 2 years?	+2
	16	Influence upon private sector agencies' policies, rules, regulations.	How successful have you been in influencing private sector policies and practices in the past 2 years?	0
CS context	17	Coping strategies	In the past 2 years, how did your organisation cope with these changes in the context that may have been positive or negative consequences for civil society?	0

Appendix 2 Changes in civil society indicators between 2012 and 2014

1. Civic Engagement

1.1 Needs of marginalised groups SPO

The ultimate target groups of the ICT project with the C6NGOs are 16,440 small holders and their households. Those of ERSHA are 14 FMOs, including one Union, 1400-1800 small scale households and 2700 indirect beneficiaries. 27-30% of FMO members are women and their membership is promoted by bylaws within the FMOs. According to ERSHA it takes the considerations of women and that of children in other projects into account in its project cycle. This was confirmed by the Union; FMO members are small farmers, including women, who face problems of market access due to lack of market information, in ability to use mobile phones and some other constraints. The same Union however observes that due to its early stage of formation, it has itself not yet engaged sufficiently enough with the 14 FMOs and their members. Since the baseline period an improvement in the number of women's in leadership of FMOs has observed.

Score: +1

1.2 Involvement of target groups SPO

Stakeholders' participation was the main feature of the project design cycle where by all members of the C6NGO consortium, government officials, and technical advisors from donor and other organizations are represented. In the process, farmers are represented by the FMO leaders. Women's are also represented through the women at the FMO management committee. Similarly, the union has the same structure to represent women. In general, more women take leadership positions during the end line as compared with the baseline. This is not true for all the FMOs, rather some FMOs are lagging behind in the inclusion of marginalized groups like women.

Score: +1

1.3 Intensity of political engagement SPO

SPOs that get funding from external donors are not allowed to engage in politics of the country.

Score: 0

2. Level of organization

2.1 Relations with other organizations SPO

Since the baseline period ERSHA has been actively collaborating with members of C6NGOs. It also took part in other civil society networks, such as the Consortium of Christian Relief and Development Association (CCRDA), Poverty Action Network Ethiopia (PANE), Sustainable Land use Forum. Effort has been made to create partnership with NGOs working particularly in Kenya and Uganda where by the outcome is to form an East Africa food security network (East African ICCO Partners network). The executive director and one technical team member of ERSHA went to Kenya to collaborate on areas of ICT which enabled ERSHA to learn more and share their best experiences too.

Score: +1

2.2 Frequency of dialogue with closest civil society organization SPO

ERHSA indicated that in the last 12 months it had 6 meetings with the C6NGO consortium. In addition the organization is closely interacting with the FMOs at least once in a month. The bi annual meeting is continued to be held as well.

Score: +1

2.3 Defending the interests of marginalized groups SPO

Since the baseline ERSHA and consortium are effective in defending the interests of the target groups. But these days the FMOs and the Union are capacitated to take over the role of ERSHA through their Union, so that they can defend the interest of their members. They are now even more capable in defending the interest of the member farmers since they became a member of the Oromia Federal Cooperatives Union.

Score: +2

2.4 Composition of financial resource base SPO

Despite the frequent efforts to diversify the funding base, ERSHA is not successful in doing so. Rather, ERSHA lost its former donors such as Oxfam Novib and Help a Child.

Score: -1

3. Practice of values

3.1 Downward accountability SPO

Similar to the baseline situations the executive leader of ERSHA is accountable to the General Assembly and the Board of Directors. However, these are less frequently informed than the government and donor organizations. It is also reported by the FMO and the Union leaders as they are informed about the projects and the project phase out.

Score: 0

3.2 Composition of social organs SPO

Like during the baseline two farmers are members in the general assembly of ERSHA. Currently, there are four men and one woman in ERSHA's Board of Directors.

Score: 0

3.3 External financial auditing SPO

ERHSA has continued to be audited annually by an external audit firm.

Score: 0

4. Perception of impact

4.1 Client satisfaction SPO

A union leader has mentioned that, ERSHA has given them several management and accountancy training and which enables them to be capacitated and to be successful. The same is true for the FMOs. Hence, these target beneficiaries are satisfied by ERSHAs efforts. Compared to the pre intervention period, members get a better access to market and market information. In addition, ERSHA has tried to link the union with different stakeholders. Currently, to diversify its financial

source, the “*Torban kutaye*” union purchased share from Oromia Cooperative Bank. It is also a member of Federation Oromia Cooperative unions to get loans and other services. The program also supported around 1.16 million Eth birr to construct a store and a office; at present construction of both store and office is finalized. Beyond storing union and FMOs inventory, the store is expected to generate additional income to the union as they can rent it to other organizations.

Score: +2

4.2 Civil society impact SPO

The FMOs and its union that are established by ERSHA are capacitated. Since the baseline period the FMO’s ICT knowledge has improved and now started a digital recording of transaction. Their bookkeeping has also improved. They have got now a better bargaining power in the market and also are in a better position to assess the market situation. These 14 FMOs established their own union and the union is performing good and got recognition from the cooperatives agency as a best performing newly established Union. They have their own store building and truck. They purchased share from Oromia cooperative bank and accessed loan twice. They are also now a member of the Oromia cooperatives association. However, there are some FMOs who still have a weak performance.

Other members of the C6NGO consortium consider ERSHA to be one of the strong local NGOs in Ethiopia, which is trustworthy organisation that has a proven track record in development. ERSHA is aware of key thematic areas and ‘best practices’ and has a sound understanding of factors that contribute to effective, efficient and sustainable performance.

Score: +2

4.3 Relations with public sector organizations SPO

ERSHA is working with the public sector throughout the project cycle. Most frequent collaboration consists of joint planning and implementation of activities. This was confirmed by Gourder Woreda Cooperative Promotion Office that states that it has a good working relationship. In the last 12 months ERSHA has carried out a project inception workshop with local government office representatives. Both FMOs, the woreda cooperative promotion office and ERSHA share a common problem of market access for farmers’ produce which the union as well as the FMOs are trying to solve. As a result the “Access to Market Information” project is seen as a foundation for easy access to market information developed by Oromia marketing agency with the financial support of the project. FMOs were linked with the source of market information i.e., Oromia Marketing agency and other related sources and with unions as well.

Score: +1

4.4 Relation with private sector agencies SPO

Though ERSHA is exerting some effort to connect FMOs with the private sector, it is usually short lived. ERSHA tried to integrate the FMOs in the appropriate value chain by connecting them with Oil factories and flour factories. One of the constraints that ERSHA is facing currently is that field staff lacks sufficient capacity in the field of value chain development and the role of private sector organizations. In addition, it has also worked with DOT Ethiopia for supplying market information via SMS but DOT Ethiopia and ERSHA do not agree on the ICT management ownership and they are still in negotiation. On the other hand the FMOs/ Union are working with the private sectors/dealers and buyers/ to sell their produces and to get inputs.

Score: +0

4.5 Influence upon public policies, rules, regulations SPO

The 2009 Ethiopian law on registration and regulation of charities and societies does not allow NGOs to influence policies, rules and regulations and ERSHA in consequence is not involved in any lobby and advocacy. But one scenario is reported a successful policy influence on the government organ, particularly in the woreda cooperation office. The 14 FMOs requested to become a member of the

AMBO cooperatives union which was refused by this union. Although the cooperative law only allows one union per district, they managed to influence the regional and zonal offices and obtained a clearance to establish their own union.

Score: +2

4.6 Influence upon private sector agencies' policies, rules, regulations SPO

ERSHA has not (yet) succeeded in influencing the policies of private sector organizations. It's most important strategy for doing so is however by bringing to together different actors in the value chain and their service provided to discuss and establish a win-win solution helps. Since it is not well planned in the project proposal, ERSHA find it difficult to influence policies of private sector organizations. Though it is not successful, it was reported that there was an attempt to link the producers with flour factory.

Score: 0

5. Environment

5.1 Coping strategies

The new civil society legislation on the allocation of administration cost (30/70) has delayed the start of the ICT project and as a result new administrative arrangements had to be taken by ICCO to accommodate for these inconveniences. Also, the unavailability of reliable and dependable private firms in the ICT sector, poor internet connection and availing reliable market information were major challenges.

Report CDI-15-072

The Centre for Development Innovation works on processes of innovation and change in the areas of food and nutrition security, adaptive agriculture, sustainable markets, ecosystem governance, and conflict, disaster and reconstruction. It is an interdisciplinary and internationally focused unit of Wageningen UR within the Social Sciences Group. Our work fosters collaboration between citizens, governments, businesses, NGOs, and the scientific community. Our worldwide network of partners and clients links with us to help facilitate innovation, create capacities for change and broker knowledge.

The mission of Wageningen UR (University & Research centre) is 'To explore the potential of nature to improve the quality of life'. Within Wageningen UR, nine specialised research institutes of the DLO Foundation have joined forces with Wageningen University to help answer the most important questions in the domain of healthy food and living environment. With approximately 30 locations, 6,000 members of staff and 9,000 students, Wageningen UR is one of the leading organisations in its domain worldwide. The integral approach to problems and the cooperation between the various disciplines are at the heart of the unique Wageningen Approach.

Klaver, D.C., Jacobs, J., Tefera, W., Getaw, H., Dereje Getu D., February 2015, *ADAA end line report; MFS II country evaluations, Civil Society component*, Centre for Development Innovation, Wageningen UR (University & Research centre) and International Food Policy Research Institute (IFPRI). Report CDI-15-070. Wageningen.

This report describes the findings of the end line assessment of the Jerusalem Children and Community Development Organisation (JeCCDO) that is a partner of Edukans Foundation under the ICCO alliance.

The evaluation was commissioned by NWO-WOTRO, the Netherlands Organisation for Scientific Research in the Netherlands and is part of the programmatic evaluation of the Co-Financing System - MFS II financed by the Dutch Government, whose overall aim is to strengthen civil society in the South as a building block for structural poverty reduction. Apart from assessing impact on MDGs, the evaluation also assesses the contribution of the Dutch Co-Funding Agencies to strengthen the capacities of their Southern Partners, as well as the contribution of these partners towards building a vibrant civil society arena.

This report assesses JeCCDO's contribution towards strengthening Civil Society in Ethiopia and it uses the CIVICUS analytical framework. It is a follow-up of a baseline study conducted in 2012. Key questions that are being answered comprise changes in the five CIVICUS dimensions to which JeCCDO contributed; the nature of its contribution; the relevance of the contribution made and an identification of factors that explain JeCCDO's role in civil society strengthening.

Keywords: Civil Society, CIVICUS, theory based evaluation, process-tracing

1 Introduction

This report presents the civil society end line findings of JeCCDO in Ethiopia which is a partner of Edukans Foundation under the ICCO Alliance. It is a follow-up to the baseline assessment that was carried out in 2012. According to the information provided during the baseline study JeCCDO is working on MDG 2: Education

These findings are part of the overall evaluation of the joint MFS II evaluations to account for results of MFS II-funded or –co-funded development interventions implemented by Dutch CFAs and/or their Southern Partner Organisations (SPO) and to contribute to the improvement of future development interventions. The civil society evaluation uses the CIVICUS framework (see appendix 1) and seeks to answer the following questions:

- What are the changes in civil society in the 2012-2014 period, with particular focus on the relevant MDGs & themes in the selected country?
- To what degree are the changes identified attributable to the development interventions of the Southern partners of the MFS II consortia (i.e. measuring effectiveness)?
- What is the relevance of these changes?
- What factors explain the findings drawn from the questions above?

The CIVICUS framework that comprises five dimensions (civic engagement, level of organization, practice of values, perception of impact and contexts influencing agency by civil society in general) has been used to orient the evaluation methodology.

Changes in the civil society arena of the SPO

In the 2012 – 2014 period the two most important changes that took place in the civil society arena of the JeCCDO relate to civic engagement and perception of impact. With regards to civic engagement an estimated 75 children with disabilities got access to primary school education. Access to education for disabled children means that they become an integrated part in society.

With regards to perception of impact the most significant changes consist of JeCCDO having built the capacities of Parent, Teacher and Students Associations and Kebele Education and Training Boards who are in charge of managing schools and ensuring that children, also those with disabilities, get access to these schools. These PTSAs and KETBs engage with local governments to solve practical problems that hamper childrens' access to schools. JeCCDO and the other partners in the Amhara cluster have strengthened their relations with the Regional Basic Education Forum and the SPO was able to formulate the rules and regulations of the forum in a more NGO friendly manner.

These findings were obtained through an analysis of documents, a workshop and follow-up interviews with the SPO, and interviews with external resources persons working in civil society organisations that receive support from the SPO; other civil society organisations with whom the SPO is collaborating; public or private sector agents and; external resource persons capable of overlooking the MDG or theme on which the SPO is concentrating.

Contribution analysis

Based upon an analysis of the projects and programmes financed by the Dutch CFAs a selection was made of SPOs to be included in an in-depth process tracing trajectory and those to be included for a quick contribution assessment. JeCCDO was selected for in-depth process tracing.

The evaluation team looked at the extent to which JeCCDO contributed to ensure quality education for marginalised and disabled children: JeCCDO's interventions explain that marginalized and disabled children access education, but other actors also contribute to this outcome.

The evaluation team looked at the extent to which JeCCDO contributed to the increase of the regional budget from 18 million in 2011 to 43 million birr (USD 2.1 million) in 2014. In the first place this can be explained by the federal policy to make more funds available for education. The allocation of these funds is being influenced by a regional forum in which all NGO's in the Amhara cluster participate, the regional Government – NGO forum in which JeCCDO participates, and the experience sharing visits

organised by each member of the Amhara cluster and in which government officials and potential donor organisations take part, will provide ideas for the woreda and zonal education bureaus for the allocation of budgets. JeCCDO is a rather big NGO with a good reputation and with strong relations at national, regional and local level: They manage to take high level government officials along on experience sharing visits which is an occasion to influence policies.

Relevance

With regards to the baseline ToC, the relevance of the interventions and outcomes could not be decided upon since outcomes of the trainings provided to educational CBOs were not documented.

With regards to the context in which JeCCDO is operating, its interventions and outcomes are relevant in that they were influential in prioritizing communities where pronounced government gaps were observed in discharging its responsibility of ensuring equitable social services, particularly for the disadvantaged segment of the community, because of their strong relations with the district education office.

With regards to the CS policies of Edukans and the ICCO cooperation, the interventions and outcomes on cluster level are relevant, because the partners made significant progress on community involvement and inclusiveness. However, JeCCDO's activities remained mainly in the establishment of creating a safe learning environment, and less in increasing community involvement. Hence their interventions and outcomes are less relevant with regards to the CS policies of Edukans and the ICCO cooperation.

Explaining factors

The information related to factors that explain the above findings was collected at the same time as the data were gathered for the previous questions. The evaluation team looked at internal factors within the JeCCDO, the external context in which it operates and the relations between JeCCDO and Edukans.

JeCCDO's gained a lot of experience in service provision activities and accordingly they have built strong relations with the local government in complementing their efforts in the education sector by building schools and providing education material. Their efforts in this field are acknowledged by many stakeholders and as a result JeCCDO sees no need to shift their focus to building a stronger civil society or increased community involvement as is expected on cluster level.

An external factor mentioned by the cluster members is the budget always reaching them 4 to 6 months later than due dates which causes delays in implementation of the program. Additionally, the 70-30 law is causing challenges for many organizations, also for the Amhara Cluster partners.

With regards to the relation between Edukans and JeCCDO we observe that the responsibility of the performance of the cluster partners lies with the lead partner WCAT.

The following chapter briefly describes the political context, the civil society context and the relevant background with regards to MDG 2 that JeCCDO is working on. Chapter three provides background information on JeCCDO, the relation of its MFS II interventions with the CIVICUS framework and specific information on the contract with Edukans Foundation. An evaluation methodology has been developed for the evaluation of the Civil Society component which can be found in appendix 2 of the country report; however, deviations from this methodology, the choices made with regards to the selection of the outcomes for contribution analysis, as well as difficulties encountered during data collection are to be found in chapter 4. The answers to each of the evaluation questions are being presented in chapter 5, followed by a discussion on the general project design in relation to CS development; an assessment of what elements of the project design may possibly work in other contexts or be implemented by other organisations in chapter 6. Conclusions are presented in chapter 7.

2 Context

This chapter describes the context in which JeCCDO operates. It focusses in particular on trends with regards to the political context, the civil society context and civil society issues in relation to the MDG 2 that JeCCDO is working on.

2.1 Political context

The Ethiopian Government has enacted a five year Growth and Transformation Plan (GTP) to implement over the period of 2011-2015.¹ Two of the major objectives of the plan are to maintain at least an average real GDP growth rate of 11%, meet the Millennium Development goals, and expand and ensure the qualities of education and health services thereby achieving the MDGs in the social sectors (FDRE, 2010). The government acknowledged that NGO's and CSO have an important role to play in the implementation of this plan: According to the preamble of the new charities and societies proclamation NO. 621/2009 of Ethiopia, civil society's role is to help and facilitate in the overall development of the country². This is manifested in the government's approach of participatory development planning procedures. For example, NGOs established a taskforce under the umbrella of the CCRDA to take part in the formulation of the country's first Poverty Reduction Strategy paper formulation. They were a major stakeholder in the planning process of the five year GTP plan. Despite fears that the NO. 621/2009 proclamation was thought to have negative impacts on Civil Society, the number of newly registered charities and societies have increased considerably. 800 new charities and civil societies were registered between 2010/11 and 2011/12 and as of February 2012, these were implementing over 113.916 projects in different social, economic and governance related sectors. Governance related projects comprise interventions in the area of democracy and good governance, peace and security, human rights, justice, and capacity building. The charities and societies are most engaged in the health sector (19.8%), followed by child affairs (11.9%), education (9.2%), governance (8.3%) and other social issues (7.8%). These figures are more or less similar to the pre-proclamation period, and would imply that new charities or societies have replaced foreign and Ethiopian charities that are not allowed to work on sectors related to governance and human rights.³ This might indicate that there might have been some flexibility in the interpretation of some of the provisions of the proclamation.

2.2 Civil Society context issues with regards to the MDG

The activities in the education sector are since 2010/11 directed by the fourth Education Sector Development Program (ESDP IV), which is part of a twenty-year education sector indicative plan, within the framework of the Education and Training Policy (ETP). The ETP was adopted in 1994 as the country's new constitution became effective and among the important changes which came with it was that education administration was decentralized to the regional states (MOE 2010/2011). The Ministry of Education (MOE) has a coordinating role in the provision of education, and sets forward frameworks and policies while the regions are the main implementers and they control the financing of education.

¹ *Growth and Transformation Plan 2011 – 2015*, Ministry of Finance and Economic Development, (November 2010), Federal Democratic Republic of Ethiopia

² *Charities and Societies Proclamation (proc. no.621/2009)*, February 2009, Federal Negarit Gazeta, Federal Democratic Republic of Ethiopia

³ UNDP, January 2014, *Civic Engagement for Effective Service Delivery in Ethiopia: Tools, Opportunities and Challenges*, UNDP Ethiopia Working Paper Series No. 2/2014

Primary education is the highest priority for the government and receives the highest share from the total estimated expenditure of ESDP IV (MOE 2010/2011). The federal ministry funds regional governments which allocate funds to Regional Education Bureaus (REBs) which in turn allocate funds to Zonal Education Bureaus (ZEB). Regions have a great deal of discretion in allocating funding to education and in choosing priorities and strategies. In a separate funding stream, the regional councils directly allocate funding to the woreda administrations through block grants and these also have a large amount of discretion in how to allocate these grants. The majority of the woreda block grants, ranging from 33 % to 66 %, usually go to education, with most of the resources being spent on teachers' salaries. The non-salary budget per student is small.

In recent years, the Ethiopian educational authorities, like governments in several other developing countries have embraced Alternative Basic Education (ABE) programs in an attempt to achieve Education for All. The ABE program is a condensed version of the first cycle of formal primary school (grades 1-4) and is a variation of Non-formal education (NFE) with features similar to the 'community school' approach to education. In 2005/06 the Gross Enrolment Ratio in ABE was at least 5,5 % in Ethiopia and a steadily increasing share of the school age population is enrolled in the program⁴

In the last five years the number of primary school children has grown from 15,340,786 in 2007/08 to 16,989,784 in 2011/12 showing an 11.0% growth over the same period of time for both boys and girls (MOE 2012). Despite the remarkable growth, the education system is challenged by significant dropout rates and high number of out-of school children. Reaching out the most marginalized out-of-school children which includes children who are in the remotest parts of the country, children from pastoral communities, children who are in food insecure and conflict prone areas and those children who are in difficult circumstance (such as children with disabilities, trafficked children, street children, victims of child labor, etc.) is the most challenging aspect of expanding primary education opportunities. Out-of-school children are found all over Ethiopia. According to the MOE (EMIS:2010), there were 3,015,350 out of school children in Ethiopia making 17.8% of the total primary school age children in the country⁵.

In an effort to reduce poverty and enhance decentralized public service delivery to the poor, the Government of Ethiopia, with the support of International Development Partners, embarked on a project known as the Protection of Basic Social Services in 2006. The PBS program piloted a social accountability initiative in 2006 that helped empower citizens to voice their needs and demands relating to basic public services. In the context of PBS, Social Accountability can be understood as the processes by which ordinary citizens, who are the users of public services, voice their needs, preferences and demands regarding public services; it also brings citizens into dialogue with local governments and service providers to contribute to improved quality public basic services through joint action plans. The Ethiopian Social Accountability Program 1 (ESAP 1) aimed to empower Ethiopia's poor so that they may voice their concerns and priorities over access to basic services – water, sanitation, health, education and agriculture. ESAP1 ended on June 30, 2009, and an independent evaluation was conducted as basis for a new phase. The evaluation revealed that use of appropriate social accountability mechanisms can work in Ethiopia and have beneficial outcomes for the actors involved as well as for the quality of basic services. As a component of PBS 2, the government launched the Ethiopia Social Accountability Program 2 (ESAP2) in February 2012. Working through civil society organizations, ESAP2 tries to bring local governments and service providers into dialogue with citizens and community organizations as an important step in working together in providing better quality public basic services.⁶

3 JeCCDO and its contribution to civil society/policy changes

3.1 Background of the SPO

Jerusalem Children and Community Development Organization (JeCCDO) is registered as an Ethiopian resident charity and operates in different parts of the nation with the aim of promoting the wellbeing of children.

It was established in 1985 as an indigenous, non-governmental, humanitarian organization in response to the needs of children who were left orphaned, displaced or lacked proper care and support due to civil war and drought. Since its creation the organisation has reached about 850,000 beneficiaries directly or indirectly per year. Even so, it works for a wider coverage.

JeCCDO has 3 main programmes. The first is Access to Basic Services for Orphans and Vulnerable Children, the second programme is Community Based Disaster Risk Reduction and the third is Capacity Development of Community Based Organisations (CBOs).

JeCCDO's *vision* is to see an Ethiopian society where all citizens promote the wellbeing of children.

Its mission is to facilitate community development processes where the wellbeing of children is effectively promoted in all its target areas.

Its development approach can be summarised as being child centred, family focused and community based whilst ensuring establishing partnerships with local Community Based Organisations. JeCCDO's core values are to stimulate community participation in child centred development, to be accountable and transparent to stakeholders, to respect community values, to ensure sustainability of development outcomes and to collaborate with others and networks to promote the wellbeing of children.

JeCCDO operates namely Bahir Dar (Amhara region), Debre Birhan (woreda), Debrezeit (woreda), Dire Dawa (urban and rural woreda), and Hawassa (SNNPR).

JeCCDO is one of the four NGOs that together implement Edukans' programme "Improving Access to Quality Basic Education for Marginalized Children in Amhara region". Together with Wabe Children's Aid and Training (WCAT), Nurture Education Development (NED) and Facilitator for Change (FC) it is operational in in three administrative zones in the Amhara region.

The programme focuses on Education for All (EFA) and includes Basic Education, Partner Formal Schools Support and Integrated Functional Adult Literacy. The target population consists of school age and pre-school age children for basic and pre-school education, and; adults and youths for integrated functional literacy.

Within the "Amhara Cluster Edukans Partners", JeCCDO's particular added value is that of its Integrated Development Approach and its interventions based upon grassroots community structures (CBOs).

3.2 MFS II interventions related to Civil Society

JeCCDO is one of the four NGOs that together implement Edukans' programme "Improving Access to Quality Basic Education for Marginalized Children in Amhara region". Together with Wabe Children's Aid and Training (WCAT), Nurture Education Development (NED) and Facilitator for Change (FC) it is operational in in three administrative zones in the Amhara region.

The programme focuses on Education for All (EFA) and includes Basic Education, Partner Formal Schools Support and Integrated Functional Adult Literacy. The target population consists of school age

and pre-school age children for basic and pre-school education, and; adults and youths for integrated functional literacy.

Within the “Amhara Cluster Edukans Partners”, JeCCDO’s particular added value is that of its Integrated Development Approach and its interventions based upon grassroots community structures (CBOs).

The programme objectives to which JeCCDO contributes are formulated at cluster level:

The first objective relates to Poverty Reduction and aims to provide access to quality basic education for out-of-school children; access to Integrated Functional Adult Literacy for adults and youths and; the education management and planning system in the ABECs and cluster.

The second objective relates to capacity building of civil society organizations that is being translated into improving the teaching learning environment in the schools and ABE centres. A teaching learning environment includes active teaching learning processes that are task related; further engagement of CBOs, CSOs, Centre Management Committee (CMC), Parent Teacher Associations (PTS), woreda and kebele education and training boards.

The third objectives relates to networking and dialogue, which is transformed into the identification of gaps of the implementation capacities of the Amhara cluster members and draw lessons for improvement; an increased commitment of woreda cabinet members to increase the education budget.

The programme relates in the following sense to the CIVICUS framework.

- *Civic Engagement:* The increase in number of children enrolled in primary education, including children with disabilities, and an increase in the number of adults enrolled in the Integrated Functional Adult Literacy (IFAL) Program contribute towards an increased participation of individuals to advance shared interests.
- *Level of Organisation:* JeCCDO aims to network with like-minded NGOs in the education sector and it is also member of the Government initiated NGO network and participates in the Amhara Region General Education Quality Improvement Forum, which will help the organisation to be better positioned in the civil society arena.
- *Perception of impact:* The programme aims to increase the involvement of district education office experts in the planning, management, and quality of education in JeCCDO’s intervention area and the consultative meeting with woreda cabinet members to increase the budget for education.

4 Data collection and analytical approach

4.1 Adjustments made in the methodology of the evaluation

The project documents made available in the beginning of 2014 only reported at Amhara cluster level and outcomes for JeCCDO specifically were only scarcely mentioned. Based upon this information the evaluation team experienced difficulties in identifying the civil society focus to take into consideration for JeCCDO. It was only after the first workshop with JeCCDO was organised that more information became available and the team could follow the evaluation methodology as planned.

4.2 Difficulties encountered during data collection

The evaluation team encountered difficulties in compiling all information from the project documents as a means to obtain a complete overview of outcomes and outputs achieved in line with the logical framework. Whereas the documents received at the beginning of 2014 contain a lot of information, reporting was mainly done at cluster level and not at the level of JeCCDO. It was only after the first workshop and during process tracing that more documents for JeCCDO came available. It was then observed that the reports on cluster level mention different figures and numbers than the documents provided by JeCCDO⁷.

In the field, there were challenges perceived in obtaining data and information both at the SPO level and public offices. SPO members were involved in meetings with donors, stakeholders, and also project visits which coincided with the scheduled evaluation work. For this reason the field work for the evaluation had to be repeatedly rescheduled and thus stretched the assignment duration. Likewise the concerned public offices were busy with meetings and conferences that forced some discussions to be conducted at 8 pm in the evening.

4.3 Identification of two outcome areas

This project was selected for in-depth-process tracing. In relation to the CIVICUS framework four strategic orientations for contribution analysis were identified: Ensuring that more people from more diverse background are engaging in civil society activities; ensuring that the organisations that receive support from the SPO are capable of playing their role in civil society – intermediate organisations; strengthening the relations with other organisations in civil society to undertake joint activities, and; influencing policies and practices of public or private sector organisations.

With regards to JeCCDO the focus was to assess to what extent their interventions helped to capacitate the PTSAs and CMCs to enhance inclusive education and hence improve access to quality education for marginalized children.

The second outcome that we looked at is the extent to which JeCCDO is capable to improve the access to quality education for marginalized children by networking and linking different actors in the civil society arena in order to enlarge the room for dialogue and capacity for change.

⁷ Especially on the number of trainings given and the number of disabled children provided with education material.

5 Results

5.1 Results obtained in relation to intervention logic

An inventory was made of progress being made by JeCCDO in comparison to its project documents, however progress on results was aggregated at Amhara cluster level and hardly any data were available at the level of JeCCDO. This could have hampered the presentation of facts and figures. Additionally allocation of outputs to specific objectives is not always clear, as training and material support is put under poverty reduction and capacity building.

The project comprises three specific objectives:

1. *Poverty reduction*

JeCCDO's annual reports elaborate on achievements in this area as JeCCDO's strategy focused on the upgrading and furnishing of ABE centres so they could comply with the new government regulation and become full cycle primary schools. Between 2011-2014, JeCCDO constructed and furnished libraries in three schools, constructed and equipped laboratories in three schools, and delivered combined desks, text books, reference books, stationary and sport materials for six schools. They furthermore planned that access to primary education should be increased by 5 to 10% in 2015 (baseline 2011), 40% of disabled children got improved educational services, and an increase of 30% of literate adults participating in school improvement programs. Until 2014, 5284 got access to primary education compared to 4552 in 2011, which is an increase of 16%. The number of disabled children in primary basic education increased, but the exact numbers could not be retrieved from the progress documents⁸. The number of adults who got access to the Integrated Functional Adult Literacy (IFAL) program increased from 120 in December 2011 to 177 in December 2013⁹, which is an increase of 47,5%.¹⁰

2. *Capacity building of civil society organisations*

Planned outcomes for this objective were formulated as an increase of the percentage of students participating in active teaching learning processes, and 60% of CBOs, CSOs, CMCs, PTSAs, woreda and Kebele education and training board involved in school improvement program. Reporting and activities on these objectives was mainly carried out on cluster level. JeCCDO's efforts lay mainly in the area of providing training. Reports mention refresher trainings and training on inclusive education for teachers and facilitators, trainings on active teaching methods, and basic computer trainings.

3. *Networking and Dialogue*

The planned outcome formulated is that woreda cabinets increase the budget for the improvement of education quality by 5-10%. JeCCDO reports that at the end of 2012 the budget increased with 2%, but they do not elaborate on their contribution to this change in relation to other actors. They did organise one consultative meeting with the woreda cabinet and they participated in an education conference in the Amhara region and in the joint networking and lobby of the "ATKLT" forum at Debre Markos Town. Additionally, JeCCDO participated in 9 joint discussion forums among CBOs, government, and the community between 2012 and 2014.

Based on the project documents, the most important achievements were made on the first and second objective.

⁸ The exact number of disabled students who got access to primary education could not be concluded upon based on the documents. The documents do mention the number of disabled children who were provided with educational material: 15 in 2011, 15 in 2012, and 45 in 2013 (other documents mention the numbers 30 and 45) .

⁹ For 2014 data was only available for the first 6 months (January to June). During these first six months 147 persons were enrolled in the FAL program.

¹⁰ Between 2011 and 2014 a total of 400 adults and youth were trained in the IFAL program

5.2 Changes in civil society in the 2012-2014 period

5.2.1 Civic engagement

Civic engagement describes the formal and informal activities and participation undertaken by individuals to advance shared interests at different levels. Participation within civil society is multi-faceted and encompasses socially-based and politically-based forms of engagement.

Civic engagement slightly increased since the baseline study, mostly in terms of stakeholder involvement through the implementation of a participatory and result based monitoring and evaluation system (RBME system) made possible with funding from Comic Relief (UK).¹¹ Another change mentioned by the program staff is that between 2012 and 2014 the project has been implemented via partner CBOs through sub-grant arrangements with intensive capacity development support.¹²

Other developments in the civic engagement area since the baseline include:

- The number of children who got access to primary education increased from 4552 (baseline) to 5284 (December 2013), which is an increase of 16%.
- The inclusion of disabled children has been a focus point since the baseline. More than 30 disabled children were provided with education materials and included in the school system between 2011 and June 2014. During the same period, sign language training was provided to 45 members of families with children with hearing disabilities.
- One of the members of the PTSA in Dilchibo mentions that the school mobilized the community to contribute 50 birr per year to be able to hire two janitors. This model was adopted during an experience sharing visit organised by JeCCDO.
- JeCCDO constructed separate toilets for girls, which led to less absence and higher performance of girls.¹³

No change was observed in terms of JeCCDO's political engagement.

Score baseline 2012 on an absolute scale from 0-3: 2

Score end line 2014, relative change on a scale of (-2, +2): 1

5.2.2 Level of organization

This dimension assesses the organisational development, complexity and sophistication of civil society, by looking at the relationships among the actors within the civil society arena.

JeCCDO continued to be an active member of different platforms at international, national and regional levels. At international level, JeCCDO, represented by its headquarters, is a member of the Coalition for Children Affected by AIDS in Canada and the Better Care Network for Children in the USA. At National level, the organization is a board member of the Consortium of Christian Relief and Development Association (CCRDA), which meets quarterly in Hawassa or Bahir Dar. At regional level, JeCCDO's field offices in Hawassa (SNNPR region) and Bahir Dar (Amhara region) are the chair and a member of the steering committee of the CCDRA regional platforms respectively.

At Amhara Field Office level, JeCCDO is involved in different thematic platforms such as education, health, WASH, Children has increased over the last two years. There are also quarterly meetings with the GO-NGO forum. In most of the cases, JeCCDO plays a leadership role in the regional platforms and networks.¹⁴ These platforms are mainly used for sharing experiences, scaling up good practices and improving program qualities. Topics discussed at this level include: the new CSO legislation mainly on the 70/30 proportions of program and administration cost; environmental and climate change issues particularly on the pollution of lake Hawassa; promotion of women self-help group as a local development approach; and social accountability issues on provision of quality basic services.

¹¹ Interview with management staff

¹² Interview with program staff

¹³ Mid-term external evaluation, forth coming

¹⁴ Interview with management staff

With regards to the capacity of JeCCDO to secure its resource base, the organization has been able to establish partnerships with new funding partners and scaling up relations with the existing ones.¹⁵ They secured funding from the Baring foundation for the second time and expanded their intervention at Negede Woito Community as of 2013 by mobilizing additional funds from other funding partners in the UK. The intervention in the Negede Woito community deals with socio-economic empowerment of the marginalized people in the community and the construction of model houses. With funding from the Edukans Foundation (secured through ISEE) a school capacity project was started in the Dek and Yiganda Community in the islands of Lake Tana.¹⁶

Score baseline 2012 on an absolute scale from 0-3: 2

Score end line 2014, relative change on a scale of (-2, +2): 1

5.2.3 Practice of Values

Practice of Values refers to the internal practice of values within the civil society arena. Important values that CIVICUS looks at, such as transparency, democratic decision making, taking into account diversity, are deemed crucial to gauge not only progressiveness but also the extent to which civil society's practices are coherent with their ideals.

In addition to the review and reflection sessions, JeCCDO has introduced an action committee in each project area, including the project zone in Amhara. These are composed of representatives from relevant government offices and community groups representing the beneficiaries. The action committees are part in the participatory M&E system and promote a participatory approach. For the HIV and Livelihood project in Debre Berhan financed by Stop Aids Now, a project steering committee was established, the members of which are drawn from the government and private sector, NGOs, Debre Berhan University, CBOs and associations of beneficiaries.¹⁷ JeCCDO reports its plans and performances to the action committee and project steering team for transparency, accountability as well as for devising next steps and solutions for challenges.

No significant change was mentioned by the interviewees on the composition of social organs or financial auditing.

Score baseline 2012 on an absolute scale from 0-3: 1

Score end line 2014, relative change on a scale of (-2, +2): 0

5.2.4 Perception of Impact

Perception of Impact assesses the perceived impact of civil society actors on politics and society as a whole as the consequences of collective action. In this, the perception of both civil society actors (internal) as actors outside civil society (outsiders) is taken into account. Specific sub dimensions for this evaluation are the extent to which JeCCDO has contributed to engage more people in social or political activities, has contributed to strengthening CSOs and their networks, has influenced public and private sector policies.

Capacity building of CBOs

The main achievement with MFS funds in this area between 2011 and 2013 is the capacity building of CBOs related to education (mainly being PTSA's, CMC's, the KTEB, and the SAC (Social Accountability Council) in the areas of inclusive learning and the introduction of ICT. JeCCDO planned to introduce ICT materials for 20 Alternative Basic Education schools (ABE) and provided training for their teachers and facilitators. From the documents it could be concluded that 21 CBO participants attended a workshop (topic unknown), and seven teachers and facilitators were trained in computer skills. The program staff adds that JeCCDO linked the CBOs with relevant government sectors for technical support and follow up. In addition, JeCCDO in Bahir Dar has been engaging in Ethiopian Social Accountability Program (ESAP II) focusing on education and WASH since 2013. The aim is to further

¹⁵ Interview with program staff

¹⁶ Interview with management staff

¹⁷ Interview with management staff

strengthen Social Accountability Councils which are operating mainly in schools to ensure quality of educational & WASH services. No results have yet been documented on this programme, which is of importance for civil society.

The programme staff furthermore mentions the expansion of JeCCDO to one of the rural kebeles at Dek Island of Lake Tana as an important achievement in the area of client satisfaction. Here a school capacity development project was started aimed at improving access to and quality of primary education at Gurer Primary school. The main activities at Dek Island with the funding from Edukans through ISEE are focusing on school improvement which includes: construction of classrooms, establishment of Water and Sanitation facilities in the school (both under progress at time of the interview); strengthening PTSA through trainings and experience sharing programs; and provision of learning teaching inputs.

A mid-term external evaluation (forthcoming) mentions that JeCCDO provided grants, equipment and furniture to school clubs to enable them generate income to sustain the supports of students from poor families. This is considered a viable strategy to promote access and quality of education in poor and marginalized communities on a sustainable manner.

Linking and Networking

At community level, JeCCDO organised the celebration of the yearly international literacy day and used local media to promote the event. Other forms of networking mentioned at community level are the school competition and child talent development as well as awarding best performing teachers so as to motivate them to achieve more. A downside of the increased participation of school principals in networking activities is their decreased effort to accomplish JeCCDO's activities in line with the planned period of the programs. The principals claim the frequent meetings that they engage in at zonal and regional level are reasons for the low effort they exerted¹⁸.

In terms of the relation with the public sector on regional level, JeCCDO continued to maintain good relations with the government: the organization received different certificates and awards of recognition mainly from regional governments including the Amhara Region Education bureau and Bahir Dar City Administration.¹⁹ In addition, upon invitations of respective regional governments JeCCDO has been sharing its experiences and good practices in its development approaches including in the education sector to governmental and non-governmental actors mainly in SNNPR and Dire Dawa City Administration.²⁰ The relation with the regional government is further strengthened via participation in the Amhara Region Basic Education Forum, which was organised eight times between 2011 and 2013²¹. In its engagement in the Forum, JeCCDO together with other member NGOs has managed to influence the government in terms of formulating the rules and regulation of the regional forum in a more NGO friendly manner where every actor has equal stake in the forum. In addition, JeCCDO has also been lobbying the government mainly in Amhara Region to give adequate mass-media coverage in the promotion of education sector.²²

JeCCDO has also been working closely with government universities mainly in the regional cities, including Addis Ababa University, Debre Berhan University, Hawassa University, Dire Dawa University and Bahir Dar University on research and joint learning and program implementation. Linking with the private sector is in an early stage and falls mainly within the HIV and livelihood project funded by Stop AIDS NOW. On an international level there has been contact with Heineken, and on local level the Amhara Credit and Savings Institute (ACSI) and the Ayou general hospital have been approached for possible collaboration and participation in the project's steering committee.²³

On a national level, as a focal organization to provide information to the Development Assistance Group in Ethiopia that is Tracking Trends in Ethiopia's Civil Society (TECS), and as a Board member of CCRDA, JeCCDO has been involved in the efforts to influence the government to reconsider the new

CSA legislation in general and the 70/30 program and administration cost proportion in particular.²⁴ From the project documents or the interviews conducted the contribution of JeCCDO to outcomes in this area could not be concluded upon.²⁵

Score baseline 2012 on an absolute scale from 0-3: 2
Score end line 2014, relative change on a scale of (-2, +2): 1

5.2.5 Civil Society Environment

The social, political and economic environment in which civil society operates affects its room for manoeuvre. The civil society context has been described in chapter 3. In this section we describe how ADAA is coping with that context.

In terms of the 70/30 percent regulation, JeCCDO is trying to adapt by initiating new projects that increase the program cost without causing significant administrative costs²⁶. Additionally, JeCCDO has become more selective and careful in identifying programs and establishing partnerships.

In accordance with new regulation on the upgrading of ABEs into formal schools in 2012, JeCCDO has transformed all ABEs qualifying for the standards set by the Amhara Region Education Bureau to formal first cycle primary schools. To accomplish this JeCCDO needed to upgrade and equip the ABEs, which was done successfully as all ABEs centred were promoted to formal school structures.²⁷ As a result of upgrading the ABEs, the CMCs are no longer functional.²⁸

Score baseline 2012 on an absolute scale from 0-3: 2
Score end line 2014, relative change on a scale of (-2, +2): 1

5.3 To what degree are the changes attributable to the Southern partners?

This paragraph assesses the extent to which some outcomes achieved can be “attributed” to JeCCDO. Starting with an outcome, the evaluation team developed a model of change that identifies different pathways that possibly explain the outcome achieved. Data collection was done to obtain evidence that confirms or rejects each of these pathways. Based upon this assessment, the evaluation team concludes about the most plausible explanation of the outcome and the most plausible relation between (parts of) pathways and the outcome. The relations between the pathways and the outcomes can differ in nature as is being explained in the following table.

Table 10
Nature of the relation between parts in the Model of Change

Nature of the relation between parts and other parts or outcome	
The part is the only causal explanation for the outcome. No other interventions or factors explain it. (necessary and sufficient)	
The part does not explain the outcome at all: other subcomponents explain the outcomes.	
The part explains the outcome but other parts explain the outcome as well: there are multiple pathways (sufficient but not necessary)	
The part is a condition for the outcome but won't make it happen without other factors (necessary but not sufficient)	
The part is a contributory cause it is part of a 'package' of causal actors and factors that together are sufficient to produce the intended effect.

²⁵ Additionally, Liana Hoornweg of the ICCO cooperation is not aware of any efforts of JeCCDO in this area.
²⁶ Interview with management staff and interview with program staff
²⁷ Based on email conversations between Edukans and JeCCDO
²⁸ Reflection of research team after workshop with management and program staff

The following paragraph assesses JeCCDO's contribution to two outcomes. Each paragraph first describes the outcome achieved and the evidence obtained to confirm that the outcome has been achieved. It then presents the pathways identified that possibly explain the outcomes, as well as present information that confirms or refutes these pathways. The last section concludes in the first place about the most plausible explanation of the outcome, followed by a conclusion regarding the role of the SPO in explaining the outcome.

5.3.1 Access to quality education for marginalised and disabled persons

The outcome achieved

The evaluation team looked at the contribution the Parent Teacher Associations, Centre Management Committees, and Kebele Education and Training Boards (KETB) made to improve marginalised children's, including disabled children, access to quality education. In the first place the number of students enrolled increased from 12,185 in 2012 to 14,420 in 7 schools supported by JeCCDO. In the second place more than 30 disabled children were provided with education materials and included in the school system between 2011 and June 2014 and sign language training was provided to 45 members of families with children with hearing disabilities.

The Parent Teacher Associations (for formal schools) and Centre Management Committees (for ABEs) are responsible for the quality of education, the monitoring of children and identification of failing students, and the management of the school budget. Since 2012 they are increasingly following the performance and the ethics of students with regards to learning. The PTSAs and CMCs have been in charge of prioritising activities that improve the quality of the education.

Also the Kebele Training and Education Board has become capable of addressing access to quality education. The board is established at Bahir Dar sub-city level and manages four schools located in the sub-city. Progress in their capacity to perform is reflected in terms of improved and timely registration of students, a decrease of school dropouts and, improved school discipline through continuous discussion with students and the community: prior to JeCCDO's intervention KEBT registration of children would continue until the end of November whereas classes start in September. As of 2011/2012 registration of school children finished in August. The dropout rate decreased from 10 to 5 percent due to the performing KEBTs and enrolment in the 7 schools that JeCCDO supports increased from 12,185 in 2012 to 14,420 children in 2014. The KETBs work together with the PTSAs and CMCs to set priorities for increased access and quality of education at school.

Pathway 1: PTSAs and CMCs explain improved access to quality education

Between 2012 and 2014 JeCCDO constructed school facilities, laboratories, libraries and latrines within 4 schools in the Bahir Dar area using MFS II funds. Additionally, the SPO provided ICT equipment and trained the teachers on basic computer training. The schools are managed by the PTSAs (Parent, Teacher and Students Associations) and CMCs (Centre Management Committee) that were strengthened by JeCCDO through providing office supplies and working material. Additionally, JeCCDO provided a workshop on school management and improvement programs in 2013 for 69 PTSA and Kebele Education and Training Board (KETB) members and organised four experience sharing visits for PTSAs, directors, and KETBs between 2011 and 2014.

The role of the PTSAs and CMCs differ per school, but overall both entities are responsible for the quality of education, the monitoring of children and identification of failing students, and the management of the school budget. A PTSA member interviewed elaborates they also use a list of registered households which they receive from Kebele offices to find disabled children. Besides this, they conduct awareness creation on the importance of the inclusiveness of children with a disability, even though the person interviewed admits other actors are more active in awareness creation activities. He furthermore states that the access for blind children has increased due to the implementation of an integrated/inclusive education system and the provision of necessary materials such as brail, tape recorders and walking sticks made available by JeCCDO. Teachers are furthermore trained on inclusive education²⁹.

²⁹ This is also recognised by the education office

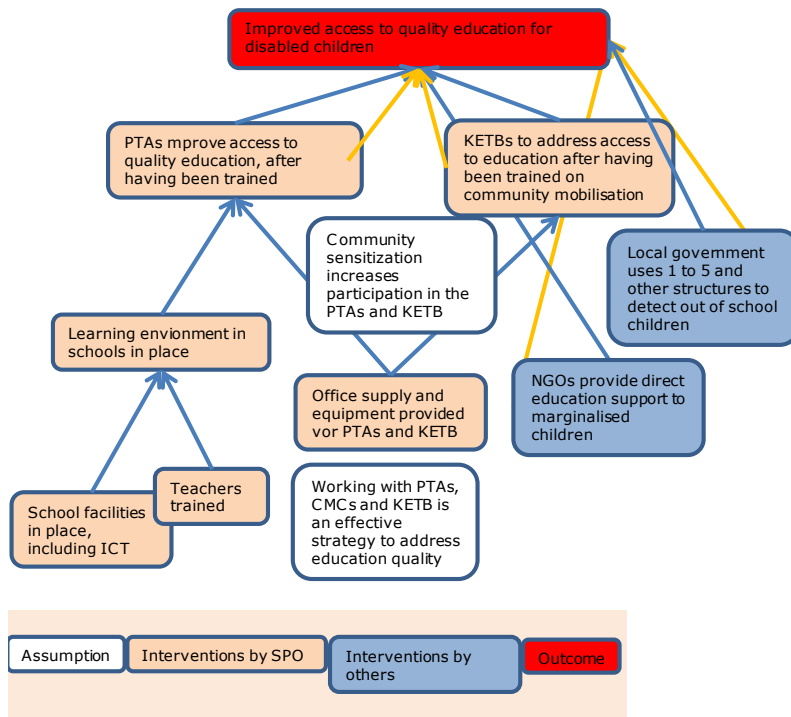

Figure 1: Pathways that possibly explain outcomes and conclusions about the nature of the relations between pathways and improved access to quality education for marginalised and disabled children.

As a result of these interventions, disabled children are in some schools able to function within the 1:5 educational system introduced by the government³⁰. The PTSA member adds both groups mix well as he observed that the hearing disabled children are mostly very bright in class and support the other students while the other students support the disabled by reading out loud.

Confirming evidence for this pathway is that the PTSAs were able to arrange the provision of one teacher per hearing disabled child during exams even though this is quite expensive.³¹ The evaluation team furthermore observed that in the schools with a special class for disabled children, this class was³² conducted during their presence even without the presence of CMC members. However, it is also mentioned that CMCs are no longer operational after the ABEs become formal schools.

Pathway 2: KETBs explain improved access to quality education

Towards the same outcome, JeCCDO used MFS II funds to provide office supply and work equipment to KETBs (Kebele Education and Training Boards) in order to increase their capacity. These KETBs also received training from JeCCDO on community mobilization and inclusiveness of children into the education system. The idea is that this support creates capable KETBs that can strongly address the issue of access to education.

Whereas the role of the PTSA’s and CMC’s in improving access to education of marginalized children lies more in facilitating the adaptation process to make the schools accessible for marginalized children, the role of the KETBs is more on the level of awareness creation within the community on the importance of education. the KETBs are well informed on the situation in each household with respect to children and their access to education.³³ They go around the community to organise awareness

³⁰ In other schools a special class is given to disabled children
³¹ Interview with school director
³² Reflection of research team after workshop with management and program staff
³³ Interview with education office

creation meetings and they register children that are not in school at kebele level (including disabled children)³⁴

Pathway 3: the local government explains improved access to quality education

As a rival towards bringing about access to quality education for marginalized children, is the government using a 1:5 structure and community based groups (like women development groups or model households) to gather information and act where needed to bring out of school children to attend schools.

The 1:5 system is applied in all levels of society; students, teachers and community. At the students' level students are put in groups of six, amongst which one outstanding, two medium and three low performing students so they can support each other. The groups in a class report to the principal teacher who then reports to the administration and the administration reports to the PTSA. On the teacher's level, the system is mostly used to cascade trainings and information. At community level, the 1:5 system addresses many topics including access to education. You find this system in both model families and groups.

In terms of disabled children, the education office states that the whole region of Amhara has around 300-400 disabled students in schools and it is believed that 15-20% of the whole population of Ethiopia has one form of disability. The government supports disabled children by providing 350br per month for transportation, 600br per year for a uniform and free materials like wheelchairs, crutches, and brails. The support is mostly given to the visually impaired.

Pathway 4: Other NGOs explain improved access to good quality education.

A second rival pathway consists of the interventions by other NGOs in the area. NGOs in the area provide direct educational support to marginalized and handicapped children by providing supplies like brail, walking cane/ crutches, wheelchairs and school materials.

According to all interviewees, the contribution of other NGOs in the area is mostly on facility provision, construction and the capacity building of teachers and not so much on capacitating the PTSAs and the KETBs. Almost all of the systems (inclusiveness, ICT, toilet, education system) that are in place for disabled children were proposed and put in place by NGOs.³⁵ According to the education office the GO-NGO platform is planning the construction of a school for the disabled in Bahir Dar. On the topic of awareness creation, NGOs contribute by facilitating community conversations with all stakeholders and capacitating the PTSAs and KETBs that do the awareness creation.

Conclusion

Broadly speaking there are several trajectories that need to be in place to ensure quality education for marginalised and disabled persons.

In the first place school buildings need to be in place, equipped with the necessary materials and additional tools for disabled children (ramps etc). In the second place, teachers and facilitators (the trainers in the ABE centres), need to have the qualifications and the skills to provide a child centred and learning environment and need to be present during school hours. JeCCDO and other NGOs are contributing to these in Amhara region. In the third place, schools need to be accessible for marginalised and disabled children. This requires a community approach geared to attitude changes in favour of education of children with disabilities. Both the local government, PTAs and KETBs play a role in the mobilisation of these children and in ensuring that they can participate in school classes socially and technically. JeCCDO has provided some training to PTSAs and KETBs although these activities are not part of its top priority interventions and other NGOs intervene on the same community issues.

JeCCDO's interventions therefore are necessary to explain increased access of marginalised and disabled children to quality education, but not sufficient: other actors as well contribute to this outcome.

³⁴ Interview with school director

³⁵ Interview with education office

5.3.2 Increased budget for education

For the second strategic orientation –networking- the same impact outcome was defined ‘improving access to quality basic education for marginalized children’. This contribution analysis looks at the extent to which JeCCDO and the other members of the Amhara Cluster, were able to influence policies at Amhara regional level.

Due to the existence of networks like the Government – NGO network where NGOs such as the Amhara cluster and others get to share experiences and ideas and discuss on issues relating to education the budget assigned for education has increased from around 18 million in 2011 to 43 million birr in 2014³⁶.

Pathway 1- the Amhara cluster regularly attends forum meetings at regional level

Information confirming this pathway

At regional level, each member of the Amhara cluster tries to engage with the Region General Education Quality Improvement forum of the government. The first pathway is believed to lead to the outcome of increased access to education for marginalized children, because the Amhara Cluster regularly attends the forum meetings, and presents its best practices and lessons learned regarding its work at the woreda level. As a result, their work has become more visible at the regional level and it is being respected by other stakeholders (including the regional government). As the cluster members are using the same approach, repetition of experiences by different NGOs in the forum resonates better amongst the audience and increases the visibility of the efforts by the Amhara cluster. In consequence the cluster has gained in respect and enables them to make suggestions for improved quality of- and access to- education that will be taken seriously.

The educational budget is being discussed in this forum but the forum is not that active as the district Government – NGO meetings. However the discussions in the regional forum raise the awareness of government officials at both district and regional level.

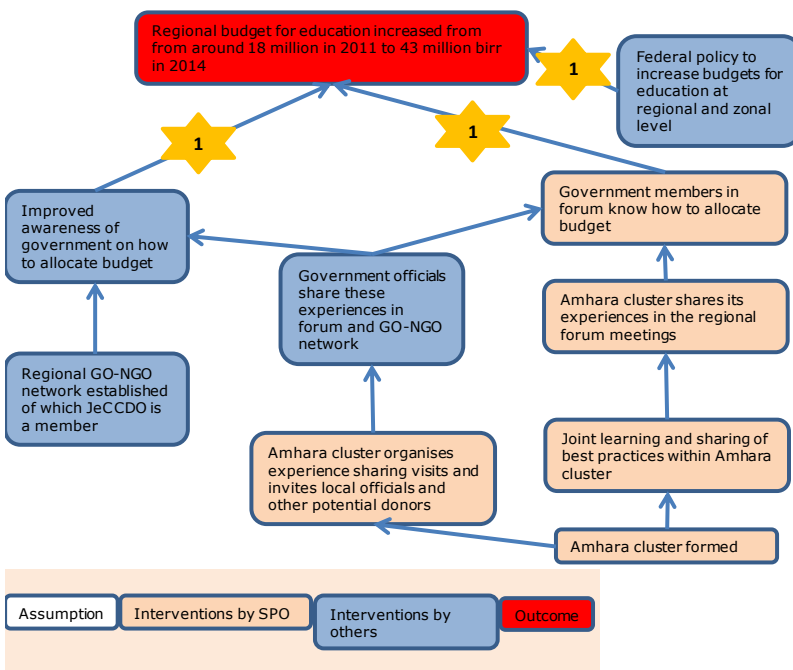

Figure 2: Pathways that possibly explain outcomes and conclusions about the nature of the relations between pathways and the increased budget for education in Amhara region.

The forum meetings in which the Amhara cluster participated between 2011 and 2014 led to an increased attention for input provisions for schools, for identifying areas where schools were needed to

³⁶ JeCCDO, WCAT and also the education bureau

ensure access to education.³⁷ The cluster was also made responsible for checking areas with severe community conditions that impede these communities to pay for school facilities and to provide focused support³⁸. According to WCAT the quality of education improved, especially in terms of usage of supporting materials, it to be interpreted as the contribution of the cluster.

The forum was initiated by JeCCDO and as a result the cluster members play an important role in the discussions of the forum.³⁹ Additionally, JeCCDO is a large organisation and has a good image which increases their bargaining position and credibility.⁴⁰ The education office however argues that one cannot really pick one or two NGOs playing a more important role in the forum as each NGO shares his experiences and provides his own input.

Information rejecting this pathway

Evidence rejecting this pathway is an alternative approach taken on by the cluster to influence policy, which are the experience sharing visits organised between the member partners. During these visits other stakeholders, like government officials or potential donors, are invited along.⁴¹ This way there is room for the partners to show best practices, to build a trust relationship and create a support base with important stakeholders. Because JeCCDO is a well-known organisation and maintains good relations with the government, the government officials that join these visits are high up and influential.⁴²

Pathway 2: JeCCDO is a member of the district government – NGO network

An alternative pathway to increase access to education via networking is formed by JeCCDO being a member of the district GONGO network called GONGOs.

The GONGO is established at the district level and here budget issues are being discussed when NGOs raise the issue. It is at this level also that issues such as enrolment or quality of education at kebele level are being raised.

JeCCDO, along with 25 other NGOs, participates in this network which is a formal government network for the education sector. This network comes together to discuss the government's direction and how NGOs can support the government in increasing children's access to education and in improving quality education. In these meetings NGOs also report on their efforts.⁴³ The GONGOs network is smaller⁴⁴ than the forum and their meetings are more frequent.⁴⁵

This pathway assumes that because JeCCDO is part of the GO-NGO network, it is able to share and discuss its best practices with other NGOs and concerned government offices in order to influence interventions and policy in the education sector, and therefore it plays a positive role in improving the education quality in the region. Because of the more frequent meetings, there is more room to discuss topics at the district GONGO level: only a limited amount of topics discussed here will be touched upon in the forum.⁴⁶

Pathway 3: Primary education is the highest priority for the government

As already mentioned in paragraph 2.3, primary education is the highest priority for the government and the federal ministry makes funds available to regional governments that then allocate funds to Regional Education Bureaus (REBs), followed by transfers to Zonal Education Bureaus (ZEB). Regions have a great deal of discretion in allocating funding to education and in choosing priorities and strategies. In a separate funding stream, the regional councils directly allocate funding to the woreda administrations through block grants and these also have a large amount of discretion in how to allocate these grants. The majority of the woreda block grants, ranging from 33 % to 66 %, usually go

³⁷ It was decided that there should at least be 1 school in one kebele

⁴² Interview with Aniley Amentie (DEC)

⁴³ JeCCDO also participates in other networks initiated by other NGOs with various aims, but none of these networks is directly related to improving access to basic education.

⁴⁴ All NGOs in the GONGO will also participate in the Region General Education Quality Improvement forum

⁴⁵ Interview with JeCCDO staff

⁴⁶ Interview with the education office

to education, with most of the resources being spent on teachers' salaries. The non-salary budget per student is small.

Conclusion

The education budget has increased significantly from 18 million in 2011 to 43 million birr (USD 2.1 million) in 2014. In the first place this can be explained by the federal policy to make more funds available for education. With regards to the allocation of these funds, the forum meeting and that of the GONGO network could inform the government at regional level on the most effective strategies to improve the quality of education. At woreda level, the experience sharing visits organised by each member of the Amhara cluster and in which government officials and potential donor organisations take part, will provide ideas for the woreda and zonal education bureaus for the allocation of budgets. The aforementioned pathways are seemingly a part of a causal package that together explain the outcomes.

JeCCDO's role in this is considerable, because it is a rather big NGO with a good reputation and with strong relations at national, regional and local level: They manage to take high level government officials along on experience sharing visits which is an occasion to influence policies.

5.4 What is the relevance of these changes?

5.4.1 Relevance of the changes in relation to the Theory of Change of 2012

The 2012 theory of change constructed with JeCCDO formulates one overall goal: "improve access to quality education in the Amhara region". The focus for civil society strengthening was to increase the involvement of CSOs in school management, which has been realised by the strengthening of PTSAs, KETBs, and the social accountability council (SAC). The interventions needed to strengthen these CBOs were 1) training and experience sharing, 2) material support, 3) networking and collaboration between CBOs and 4) creating an enabling environment in school management.

The situation of the PTSAs in 2010 was described in terms of no gender balance, a low degree of involvement in the management of schools and irregular meetings. JeCCDO expressed their goal to work towards PTSA's of which 50 % are women and to improve the performance of these PTSA's. In terms of performance, their focus was to expand the PTSAs responsibility from not only fixing students' disciplines, but also to be involved in improving the quality of education. According to JeCCDO, the education management in Basic Education Centers in the operational areas improved, because members of PTSAs, CMCs, and KETBs were trained in playing their roles in school improvement program in 21 schools and ABE centres and experience sharing visits were conducted. However, the reports do not mention any outcomes related to these activities. Information on gender balance in 2014 is missing in the documents provided.

During the baseline, JeCCDO also expressed the need to capacitate KETBs. In 2010, KETBs were established but not operational because the *kebeles* were not in a position to run them.⁴⁷ The goal was expressed that KETBs would increase the number of solved cases by 50 % in 2014 and that they will meet more regularly (75 % of meetings conducted according to standard). The project documents did not provide information whether these targets were met.

5.4.2 Relevance of the changes in relation to the context in which the SPO is operating

The current (2014) access to education in the Amhara region is 89%.⁴⁸ In accordance with new regulation on the development of ABEs to formal schools in 2012, JeCCDO has transformed all ABEs qualifying for the standards set by the Amhara Region Education Bureau formal first cycle primary

⁴⁷ Baseline report JeCCDO

⁴⁸ Project plan considerations 2014

schools. To accomplish this JeCCDO needed to upgrade and equip the ABEs, which was done successfully as all ABEs centred were promoted to formal school structures.

In this regard, JeCCDO complemented the government efforts in accessing quality education to children. Additionally, the project, together with the district education office, selected and addressed the schools, which were among the least performing before the intervention.⁴⁹ The majority of the communities served by the target schools are poor and had no adequate income to send their children to school. By doing so, JeCCDO also prioritized communities where pronounced government gaps were observed in discharging its responsibility of ensuring equitable social services, particularly for the disadvantaged segment of the community.

5.4.3 Relevance of the changes in relation to the policies of the MFS II alliance and the CFA

On the ICCO-alliance level, capacity building of southern partners is selected as a focal point and approximately 50% of the MFS II budget is allocated to reach this goal. Consequently, training is provided on cluster level to increase impact and also to increase the level playing field for policy influencing by creating a mass.⁵⁰ Next to building capacity, accountability towards the community is an important theme on alliance level. To involve the community, community dialogues are organised on kebele level by the cluster partners. It is said that JeCCDO also organises these community dialogues⁵¹ but this could not be verified based on the project documents.

ICCO expressed its appreciation for the clusters performance on implementing inclusive education.⁵² Compared to the other cluster members however, JeCCDO's outcomes in this area remain limited.⁵³ Within the Edukans' Star Model⁵⁴, JeCCDO's efforts are concentrated on the 'a safe learning environment' pillar as their outcomes mainly lay in improved education service provision and less on the 'inclusiveness of parents and community' pillar, even though both the leading partner as the CFA suggested they would divide their efforts over the pillars.⁵⁵

5.5 Explaining factors

5.5.1 Internal factors

Historically, JeCCDO's gained a lot of experience in service provision activities and accordingly they have built strong relations with the local government in complementing their efforts in the education sector by building schools and providing education material.⁵⁶ Their efforts in this field are acknowledged by many stakeholders and as a result JeCCDO sees no need to shift their focus to building a stronger civil society or increased community involvement as is expected on cluster level.⁵⁷

On the financial part, JeCCDO did not budget for personnel and other overhead costs.⁵⁸ I was also observed by the financial department of the CFA, that the civil society items in the program plan did not match the budgeted items in 2013.

⁵⁵ Interview with Liana Hoornweg – ICCO cooperation

⁵⁶ Idem

⁵⁷ Idem

⁵⁸ Project plan considerations 2014

5.5.2 External factors

An external factor mentioned by the cluster members is the budget always reaching them 4 to 6 months later than due dates which causes delays in implementation of the program.⁵⁹ Additionally, the 70-30 law is causing challenges for many organizations, also for the Amhara Cluster partners. As previously mentioned, 70% of costs have to be directed to project implementation, 30% is for training, overhead and networking. This is perceived as very tight, considering that the capacity building of partners and community based organizations (such CMC's and PTSA's) have to be paid from this budget. Ignoring these rules leads to disapproval of the program from the government, as a result of which the program may have to be terminated.

Other external factors that may have influenced the program's impact are the disinclination of teachers to use computers in their day to day teaching learning activities and the delay in the completion of school infrastructures such as libraries by contractors which resulted in to provide service to students in accordance with the framed schedules.⁶⁰

5.5.3 Relations CFA-SPO

The ICCO cooperation, representing Edukans, is the contracting partner. The role of the ICCO Alliance is to finance and advise the cluster during the implementation. For this reason, the program officer Education of the ICCO Alliance in Kampala coordinates the direct contact with the Amhara cluster. Relations between this program officer and the cluster lead WCAT are good, but her influence on the strategy of individual cluster members is minimal as this mandate has been handed over to the lead partner WCAT.⁶¹ In October 2014, explanation was asked by the Edukans on a perceived shift of focus from the cluster from creating better access to the relevance and quality of education.⁶² Additionally, the specific attention to children with disabilities was perceived as positive, though it was asked whether the outcomes of the efforts to include them could be monitored and shared.

6 Discussion

6.1 Design of the intervention

Research on Non-Formal Education (NFE) initiatives indicate that this type of approaches to education may be more relevant and accessible to students and community members than formal education, including that it may enhance the participation of girls and marginalized populations. It may also be less costly to both the implementers and the communities than formal education (Anis, 2007). Other research suggests that NFE in reality are, or may be perceived as being neither of second rate to formal education, and thus neither be more relevant to the communities nor enhance the demand and participation in education (Bedanie et al., 2007).

A study conducted by Linussen (2009) looked at how participants and guardians of participants perceive the quality and relevance of the Alternative Basic Education (ABE) program in the Amhara National Region of Ethiopia. The findings indicate that the participants of the program and guardians of participants in ABE which were included in the study valued the ABE program positively to a large extent. Some areas of improvement were identified, such as the infrastructure of the Alternative Basic Education Centres (ABEC); the order and discipline in the ABECs; and the attendance of the facilitators. In other areas, such as the organization of the education and the intended strategies on adapting to local needs were perceived to be of good quality, but it should be ensured that those intentions are being followed up in practice.

JeCCDO handed over the ABEs to the government in accordance with government regulation and adopted the approach of providing educational services to the ABE centres. Additionally they moved their focus to IFAL and the integration of disabled children into the school system. In terms of civil society building, JeCCDO's intervention strategy of being an educational service provider is not built on community involvement and linking and networking within the civil society arena by bringing influential actors together in either community conversation groups or committees. In contrast to the other Amhara cluster members, JeCCDO is not putting an emphasis on the organisation of community dialogues. As a result, the potential of building community capacity to ensure common action for good quality and accessible education is not reached. This makes the sustainability of the program questionable.

In terms of replicability, the construction of libraries, laboratories or latrines and the provision of educational material is replicable. However, JeCCDO's strong relation with the government on multiple levels has developed over the years as has its reputation. The local evaluation team also sees the advantages of these good relations: Working on a given location for a number of years and establishing close relationship with local public offices is a great asset, especially when touching cultural issues such as girls' education. Currently however, JeCCDO's good relations are only minimally used for policy influencing activities.

7 Conclusion

Changes in the civil society arena of the SPO

In the 2012 – 2014 period the two most important changes that took place in the civil society arena of the JeCCDO relate to civic engagement and perception of impact. With regards to civic engagement an estimated 75 children with disabilities got access to primary school education. Access to education for disabled children means that they can become an integrated part in society.

With regards to perception of impact the most significant changes consist of JeCCDO having built the capacities of Parent, Teacher and Students Associations and Kebele Education and Training Boards who are in charge of managing schools and ensuring that children, also those with disabilities, get access to these schools. These PTSAs and KETBs engage with local governments to solve practical problems that hamper childrens' access to schools. JeCCDO and the other partners in the Amhara cluster have strengthened their relations with the Regional Basic Education Forum and the SPO was able to formulate the rules and regulations of the forum in a more NGO friendly manner.

Contribution Analysis

The evaluation team looked at the extent to which JeCCDO contributed to ensure quality education for marginalised and disabled children. JeCCDO's interventions explain that marginalized and disabled children access education, but other actors also contribute to this outcome.

The evaluation team looked at the extent to which JeCCDO contributed to the increase of the regional budget from 18 million in 2011 to 43 million birr (USD 2.1 million) in 2014. In the first place this can be explained by the federal policy to make more funds available for education. The allocation of these funds is being influenced by a regional forum in which all NGO's in the Amhara cluster participate, the regional Government – NGO forum in which JeCCDO participates, and the experience sharing visits organised by each member of the Amhara cluster and in which government officials and potential donor organisations take part, will provide ideas for the woreda and zonal education bureaus for the allocation of budgets. JeCCDO is a rather big NGO with a good reputation and with strong relations at national, regional and local level: They manage to take high level government officials along on experience sharing visits which is an occasion to influence policies.

Relevance

With regards to the baseline ToC, the relevance of the interventions and outcomes could not be decided upon since outcomes of the trainings provided to educational CBOs were not documented

With regards to the context in which JeCCDO is operating, its interventions and outcomes are relevant in that they were influential in prioritizing communities where pronounced government gaps were observed in discharging its responsibility of ensuring equitable social services, particularly for the disadvantaged segment of the community, because of their strong relations with the district education office.

With regards to the CS policies of Edukans and the ICCO cooperation, the interventions and outcomes on cluster level are relevant, because the partners made significant progress on community involvement and inclusiveness. However, JeCCDO's activities remained mainly in the establishment of creating a safe learning environment, and less in increasing community involvement. Hence their interventions and outcomes are less relevant with regards to the CS policies of Edukans and the ICCO cooperation.

Explaining factors

JeCCDO's gained a lot of experience in service provision activities and accordingly they have built strong relations with the local government in complementing their efforts in the education sector by building schools and providing education material. Their efforts in this field are acknowledged by many stakeholders and as a result JeCCDO sees no need to shift their focus to building a stronger civil society or increased community involvement as is expected on cluster level.

An external factor mentioned by the cluster members is the budget always reaching them 4 to 6 months later than due dates which causes delays in implementation of the program. Additionally, the 70-30 law is causing challenges for many organizations, also for the Amhara Cluster partners.

With regards to the relation between Edukans and JeCCDO we observe that the responsibility of the performance of the cluster partners lies with the lead partner WCAT.

Design

With regards to the design of the intervention, JeCCDO’s intervention strategy of being an educational service provider is not built on community involvement and linking and networking within the civil society arena by bringing influential actors together in either community conversation groups or committees. In contrast to the other Amhara cluster members, JeCCDO is not putting an emphasis on civil society building, ensuring that communities see the importance of sending their children, also the disabled to school. As a result, the potential of building community capacity to ensure common action for good quality and accessible education is not reached. This makes the sustainability of the program questionable.

Table 5
Summary of findings.

When looking at the MFS II interventions of this SPO to strengthen civil society and/or policy influencing, how much do you agree with the following statements?	Score
The CS interventions were well designed	4
The CS interventions were implemented as designed	3
The CS interventions reached their objectives	5
The observed outcomes are attributable to the CS interventions	4
The observed CS outcomes are relevant to the beneficiaries of the SPO	6

Score between 1 to 10, with 1 being “not at all” and 10 being “completely”.

Appendix 1 Civil Society Scores

In-country team to fill in the scores for each SPO

This table presents the appreciation of the evaluation team regarding changes occurred for each indicator between 2012 and 2014 on a scale of -2 to + 2

- 2 = Considerable deterioration

- 1 = A slight deterioration

0 = no change occurred, the situation is the same as in 2012

+1 = slight improvement

+2 = considerable improvement

Dimension		Indicators	Question	Change
Civic engagement	1	Needs of marginalised groups	How does your organisation take the needs of your beneficiaries/target groups, in particular marginalised groups into account in your planning, actions, activities, and/or strategies?	+1
	2	Involvement of target groups	What is the level of participation of your beneficiaries/target groups, in particular marginalised groups in the analysis, planning and evaluation of your activities?	+1
	3	Political engagement	How intense is your (individual staff or organisational) participation in locally-nationally elected bodies and/or sectoral user groups?	0
Level of organisation	5	Relations with other organisations	In the past 12 months what has been the most intensive interaction you had with other CSOs?	+1
	5	Frequency of dialogue with closest CSO	In the past 12 months how many meetings did you have with the CSO that you have most intensive interaction with?	+1
	6	Defending the interests of marginalised groups	Which CSO are most effective in defending the interests of your target groups? In the past 12 months, how did you relate to those CSOs?	+1
	7	Composition current financial resource base	How does your organisation finance institutional costs such as workshops of the General Assembly (if applicable); attendance to workshops of other CSOs; costs for organisational growth and/or networking?	0
Practice of Values	8	Downward accountability	To what extent can mandatory social organs (steering committee, general assembly, internal auditing group) ask your executive leaders to be accountable to them?	+1
	9	Composition of social organs	What % of members of your mandatory social organs belong to the marginalised target groups you are working with/for?	0
	10	External financial auditing	How regularly is your organisation audited externally?	0
Perception of impact	11	Client satisfaction	What are the most important concerns of your target groups? How do your services take into account those important concerns?	+1
	12	Civil society impact.	In the past 12 months, what impact did you have on building a strong civil society?	+1
	13	Relation with public sector organisations.	In the past 12 months, what interaction did you have with public sector organisations to realise your programme and organisations' objectives?	+1
	14	Relation with private sector organisations	In the past 12 months, what interaction did you have with private sector organisations to realise your programme and organisations' perspective?	+1

	15	Influence upon public policies, rules, regulations	How successful have you been in influencing public policies and practices in the past 2 years?	+1
	16	Influence upon private sector agencies' policies, rules, regulations.	How successful have you been in influencing private sector policies and practices in the past 2 years?	0
CS context	17	Coping strategies	In the past 2 years, how did your organisation cope with these changes in the context that may have been positive or negative consequences for civil society.	+1

Appendix 2 Changes in civil society indicators between 2012 and 2014

1. Civic Engagement

1.1. Needs of marginalised groups SPO

The following table presents the number of beneficiaries reached for different activities through the poverty reduction component.

The SPO reported 16% increase in the number of children participating in basic education program from 4996 in the baseline to 5284 in 2013. Likewise, the number of children with disabilities who were provided with educational materials and were able to attend education with inclusive approach showed more than double increase in 2013 compared to the baseline figure. Increase was also observed in the number of adults who got access to the Integrated Functional Adult Literacy (IFAL) program. Noticeable change was also observed on the supply of learning materials to schools. But the list of realized outputs reported by the SPO was limited compared to its planned outputs. The number of beneficiaries reported by the SPO is stated in the table below.

Table

Number of beneficiaries reached through the poverty reduction component

Poverty Reduction	2011	2012	2013	2014 (January – June)	Total
Children participating in basic education programs	4996	4996	5284 (4578 ⁶³)		
Supply of learning materials to schools	4		145	1016 ⁶⁴	
Adults, women and youth participating in functional adult literacy program	120	195	177 (333 ⁶⁵)	147	
Adults, women and youth participating in functional adult literacy program	120	195	177 (333 ⁶⁶)	147	
Children with disabilities provided with educational materials and attending education with inclusive approach	15 (4 ⁶⁷)	15 (7 ⁶⁸)	45 (35 ⁶⁹ or 40 ⁷⁰)		75
Number of families trained on sign language			28	17	45
Number of managers, directors, experts and educational supervisors are trained on inclusive education			57		57

Source: project documents provided early 2014

The SPO closely works with schools and community based organizations in delivering its support to the beneficiaries. It sees the CBOs as instrumental entity for ensuring the participation of beneficiaries in project planning, implementation, monitoring and evaluation. The SPO highlighted that most of its projects have been implemented by partner CBOs through sub-grant arrangements with intensive capacity development supports. The SPO viewed this as one of the major changes compared to the

baseline. The realized output reported by the SPO, however, showed the presence of change in some activities and not in others. Change was reported on (i) training provided to 68 teachers and facilitators on active learning method in 2013, and (ii) the provision of (three) joint discussion forums among CBOs, governments and the community in 2013.

Score: +1

1.2. Involvement of target groups SPO

The activities that were implemented by the SPO were classified into three major Categories. These are poverty reduction, civil society strengthening, and networking and dialogue. Provision of educational materials for primary school children was made under the poverty reduction component which facilitated the teaching learning process for the children at the targeted schools. Trainings were provided for teachers on active teaching methodology with the aim of promoting inclusive education. The other focus of the project was on adult community members of the targeted community through functional adult literacy (FAL) which enabled them in every aspect of their life apart from the actual literacy and numeracy. Every input that are essential to conduct the FAL activities were fulfilled by the project. This includes stationery and pedagogical materials. In addition to this teaching aide were purchased and distributed to the targeted schools.

With regard to civil society strengthening, the SPO conducted workshops and trainings that aimed at strengthening the capacity of the PTSAs, KETB, and SAC (Social Accountability Council). The trainings that were administered to these institutions provided them with the ability and know-how to improve the management of the school and contribute to the quality of education.

Under the networking and dialogue component various activities were conducted, including celebration of an international literacy day, along with school competition and child talent development as well as awarding best performing teachers. The CSOs interviewed by the evaluation team pointed out the presence of noticeable change since the baseline. It was mentioned that education boards were able to intervene in school operations that help improve the timely registration of students. The involvement of the board helped in minimizing dropouts as well as improved school discipline. In addition, the board was instrumental in prioritizing the activities to be performed in each school it works with. In addition, it was involved in equipping or repairing various materials at class level such as blackboard, tables, chairs, etc. Likewise, PTSAs were instrumental in improving peace in the school, constructing new classes and repairing existing ones, as well as equipping the laboratory and library.

Score: +1

1.3.Intensity of political engagement SPO

The SPO does not involve in political activity whatsoever.

Score: 0

1.7.Trends in civic engagement.

The SPO reported the presence of positive trend concerning civic engagement. The positive trends were observed on the number of children who got access to primary education, the number of disabled children who got access to primary education, and the number of adults who got access to the integrated functional adult literacy (IFAL) program. On a cluster level the number of adults who got access to IFAL program in 22 schools reached 3621 in 2013 as compared to the baseline figure of 1743 adults. Furthermore, 597 IFAL instructors were capacitated.

Score: +1

2. Level of Organisation

2.1. Relations with other organisations SPO

JeCCDO is a member of the Amhara Cluster which was formed with the objective of drawing lessons, identify gaps and improve the implementation capacity of the cluster members. The cluster engaged with the education office of the local government through forums and sensitization workshop. In addition to the Amhara cluster, the involvement of JeCCDO with other SPOs has increased over the last two years. For instance, the SPO is an active member of different platforms both at national and international levels. At national level, the SPO is a board member of CCRDA, member of forums such as WASH, OVC network, etc. It is also an active member of HIV and Livelihood Learning and Linking Trajectory, HIV and Health forums, Environment/Green forums, Consortium of Organizations Promoting Self-Help Group, among others. JeCCDO is still chairing the board for Consortium of Organizations Implementing Self-Help Group approach. Due to its involvement in different thematic platforms (such as education, health, WASH, Children etc.) the SPO's relation with other SPOs has been increasing over the last two years. In most of the cases, JeCCDO plays leadership roles in the platforms and networks. It used these platforms for experience sharing, scaling up of good practices and improving program qualities.

Score: +1

2.2. Frequency of dialogue with closest civil society organisation SPO

JeCCDO has been participating in dialogues with members of the Amhara Cluster. It also engaged in dialogues with the CSOs it works with on key thematic issues such as on the new CSO legislation mainly on the 70/30 ratio of program versus administration cost, environmental and climate change issues, promotion of women self-help group, and social accountability issues on provision of quality basic services

The frequency and regularity of meetings with networks, platforms and forums has improved in the periods under review. This includes (i) monthly updates meeting of WASH, HIV and Health Forums, (ii) quarterly meetings of the consortium of organizations implementing SHGS, (iii) quarterly meetings of the HIV and Livelihood Learning and linking Trajectory, (iv) monthly meetings with partner CBOs at project areas, (v) quarterly meetings of GO-NGO forums at regional levels, and (vi) quarterly meetings of the steering committees of the CCRDA regional platforms mainly in Bahir Dar (Amharra region). On cluster level several dialogs have been conducted as of the baseline period. This includes celebrating international literacy day and disability day, consultative meetings with woreda cabinet members, and organizing school competition.

Score: +1

2.3. Defending the interests of marginalised groups SPO

JeCCDO was able to expand its intervention at Negede Woito Community as of 2013, by mobilizing additional fund from partners in the UK. The intervention deals with socio-economic empowerment of the marginalized Negede-Woyto community and construction of model houses. During the past two years, JeCCDO also initiated a new education project in an isolated community mainly on the Island of Lake Tana (Dek and Yiganda Community) and the Gende Tesfa Community in Dire Dawa City. It also provided training and various awareness creation workshops on inclusive education to various concerned CBOs (particularly PTSAs and KETBs) it works with. On the Amhara cluster level the activities performed include participation in literacy and disability days, and consultative meeting concerning performance differences and the influencing factors of the high and low score achiever students.

Score: +1

2.4.Composition financial resource base SPO

JeCCDO continued applying the same strategy in financing institutional costs. Thus, the situation is the same as in 2012. In other words, the SPO is still financing its institutional costs from its strategic grants and certain project funds allocated for institutional capacity development and program support costs.

Score: 0

3. Practice of Values

3.1.Downward accountability SPO

In addition to the review and reflection sessions, JeCCDO has put in place community groups which oversee the performance and quality of its programs. These include project steering teams and action committees at each project areas. The members of the action committee represent relevant government offices and community groups, mainly representing the beneficiaries. The members of the steering team are drawn from the government and private sector, NGOs, Debre Berhan University, CBOs and associations of beneficiaries. JeCCDO reports its plans and performances to the action committee and project steering team for transparency, accountability as well as for devising next steps and solutions for challenges.

Score: +1

3.2.Composition of social organs SPO

There is no change compared to the situation in the baseline. The SPO's framework does not have a mechanism that allows the inclusion of marginal target groups in the general assembly. As a result marginalized target group member are not members of mandatory social organs.

Score: 0

3.3.External financial auditing SPO

Annual regular external auditing is a requirement both by the Ethiopian law as well as funding partners. Thus no change has taken place as far as auditing is concerned. The SPO audits its accounts by external auditors annually and as per the requirements and standards. The audit is approved by the general assembly and sent to all concerned stakeholders including donors and the government.

Score: 0

4. Perception of Impact

4.1.Client satisfaction SPO

JeCCDO conducts guided reviews and reflections with beneficiaries and implementing partners to assess the concerns of its target groups. One of the comments provided by the CBOs and public actors was the need to expand JeCCDO's activity to rural schools. Over the past two years, JeCCDO expanded its reach by starting interventions in new areas which include Dek and Yiganda rural Kebeles and Hamusit town in Amhara Region and Godino community in Oromiya region. This project is aimed at improving access to and quality of primary education at Gurer Primary school. The main activities were focusing on school improvement which includes construction of classrooms, establishment of water and sanitation facilities in the school, strengthening PTAs through trainings and experience sharing programs, and provision of learning teaching inputs. Thus, client satisfaction is measured by the expansion of its activities to new locations and addresses the needs of the community.

Score: +1

4.2. Civil society impact SPO

There is a considerable change at organizational level in terms of establishing and implementing result based monitoring, evaluation and learning as well as documentation system. JeCCDO institutionalized this system by opening a separate unit and putting the necessary human resource in place. This brought about important improvements in tracking organizational and programmatic changes and process for decision making and learning. In order to ensure sustainability of impacts the SPO has linked the CBOs with relevant government sectors for technical support and follow up. In addition, JeCCDO has been engaging in Ethiopian Social Accountability Program (ESAP II) focusing on education and WASH. This helped to further strengthen Social Accountability Councils which are operating mainly in schools to ensure quality of educational & WASH services. The capacity of CBOs including PTSAs & KETBs has been enhanced through trainings, experience sharing and material support towards sustaining the outcomes.

The SPO constructed school facilities, laboratories, libraries and latrine within 4 schools in Bahir Dar (Amhara region). Furthermore, the SPO provided ICT equipment and trained the teachers on ICT which all contributes to the strengthened capacity of schools. As a result the facilities were effectively managed by the PTSAs and CMCs that are strengthened through office supplies, work equipment etc provided by JeCCDO.

Score: +1

4.3. Relation with public sector organisations SPO

JeCCDO engages with the public sectors in the localities it operates. It continued maintaining the good relation with the government at different levels. Due to its enhanced engagement and performance in the development sector, its relation with the public sector has been increased in all its operational areas. In recognition of its contributions, the regional governments including the Amhara Region Education Bureau and Bahir Dar City Administration awarded the SPO with Certificates. In addition, JeCCDO has been involved in sharing its experiences and good practices to various governmental and non-governmental actors.

The SPO has been closely working with government universities mainly in the regional cities. These include Addis Ababa University, Debre Berhan University, Hawassa University, Dire Dawa University and Bahir Dar University. The cooperation focuses on research and joint learning and program implementation. Furthermore, the SPO engaged in different platforms of governmental and non-governmental actors on issues of climate change, women empowerments, education, livelihood and HIV, WASH and children and youth issues.

At the Amhara cluster level several consultative meetings with the woreda cabinet members were held about the budget allocation and related matters as well as on the performance differences of children and the influencing factories.

Score: +1

4.4. Relation with private sector agencies SPO

The SPO have been in contact with international business ventures such as Heineken. It is also working with some business organization namely, Amhara Credit and Saving Institute (ACSI) and Ayu General Hospital in Debre Berhan town for the implementation of a HIV and Livelihood project. The changes observed in this regard were creating interests and winning the goodwill of the private business establishments to work together. It was also able to receive technical and professional support from these companies in providing credit services and supporting activities for orphan and vulnerable children support. In addition the firms engage in the project as members of the project's steering team.

Score: +1

4.5. Influence upon public policies, rules, regulations SPO

JeCCDO is a focal organization that provides information to TECS (Tracking Trends in Ethiopia's Civil Society) project. The project, among others, has conducted researches on the issues and challenges for CSOs in complying with the law and guidelines of the 2009 charities and societies proclamation. Furthermore, as a Board member of CCRDA, JeCCDO has been involved in the efforts to influence the government to reconsider the new CSA legislation in general and the 70/30 program and administration cost proportion in particular.

The SPO has also been actively involved in the Amhara Region Basic Education Forum initiated by the regional government. JeCCDO together with other member NGOs has managed to influence the rules and regulation of the forum to be NGO friendly and also every actor to have equal stake in the platform. In addition, JeCCDO has been lobbying the government mainly in Amhara Region to give adequate mass-media coverage in the promotion of education sector. The changes observed since the baseline in this regard include carrying out media based promotion on quality basic education, public awareness creation on promotion of girls education, implementation of workshop and training for government representatives in the education sector focusing on basic education, integrated function adult literacy, school improvement and inclusive and early childhood education. Furthermore, members of the Amhara cluster invested in a critical dialogue with the regional government at different level and participated in relevant forums and campaigns. This was done while taking into account the anti-advocacy laws that are put in place by the government of Ethiopia.

Score: +1

4.6. Influence upon private sector agencies' policies, rules, regulations SPO

There is no change observed in this indicator

Score: 0

5. Civil Society context

5.1. Coping strategies

JeCCDO is responding to the changing environments. It used to operate one ABE centre in the past but it ceased the operation as the regional government considered ABEs not relevant since it managed to attain full coverage of primary education. As the ABE qualified for the standards set by the Amhara Region Education Bureau, it was transformed to formal first cycle primary schools.

But, the challenging aspects of the 2009 charities and societies proclamation are still remaining to be difficult for the SPO as it has been the case before two years. But the SPO is trying to cope with these challenges by being more sensitive to costs categorized by the government as overhead expenditures. It is also focusing more on capital intensive projects that would enhance the proportions of program spending. JeCCDO continues empowering communities and CBOs so that they can engage in areas of program interventions restricted for JeCCDO. Using the new legislation as an opportunity, JeCCDO proceeded with the establishment of training centre for CBOs and other development actors mainly in Debre Zeit and licence is already secured. Preparations are also under way to set up another centre in Bahir Dar. In connection with this, JeCCDO has recently initiated the process for engaging itself in social enterprising program.

Report CDI-15-070

The Centre for Development Innovation works on processes of innovation and change in the areas of food and nutrition security, adaptive agriculture, sustainable markets, ecosystem governance, and conflict, disaster and reconstruction. It is an interdisciplinary and internationally focused unit of Wageningen UR within the Social Sciences Group. Our work fosters collaboration between citizens, governments, businesses, NGOs, and the scientific community. Our worldwide network of partners and clients links with us to help facilitate innovation, create capacities for change and broker knowledge.

The mission of Wageningen UR (University & Research centre) is 'To explore the potential of nature to improve the quality of life'. Within Wageningen UR, nine specialised research institutes of the DLO Foundation have joined forces with Wageningen University to help answer the most important questions in the domain of healthy food and living environment. With approximately 30 locations, 6,000 members of staff and 9,000 students, Wageningen UR is one of the leading organisations in its domain worldwide. The integral approach to problems and the cooperation between the various disciplines are at the heart of the unique Wageningen Approach.

Klaver, D.C., Jacobs, J., Tefera, W., Getaw, H., Dereje Getu D., February 2015, *MKC - RDA end line report; MFS II country evaluations, Civil Society component*, Centre for Development Innovation, Wageningen UR (University & Research centre) and International Food Policy Research Institute (IFPRI). Report CDI-15-069. Wageningen.

Meserete Kristos Church – Relief and Development Association (MKC-RDA) in Ethiopia is a partner of Tear Fund and ICCO under the ICCO Alliance.

The evaluation was commissioned by NWO-WOTRO, the Netherlands Organisation for Scientific Research in the Netherlands and is part of the programmatic evaluation of the Co-Financing System - MFS II financed by the Dutch Government, whose overall aim is to strengthen civil society in the South as a building block for structural poverty reduction. Apart from assessing impact on MDGs, the evaluation also assesses the contribution of the Dutch Co-Funding Agencies to strengthen the capacities of their Southern Partners, as well as the contribution of these partners towards building a vibrant civil society arena.

This report assesses MKC-RDA's efforts to strengthening Civil Society in Ethiopia and for this exercise it used the CIVICUS analytical framework. It is a follow-up of a baseline study conducted in 2012. Key questions that are being answered comprise changes in the five CIVICUS dimensions to which EKHC contributed; the nature of its contribution; the relevance of the contribution made and an identification of factors that explain EKHC's role in civil society strengthening.

Keywords: Civil Society, CIVICUS, theory based evaluation, process-tracing

Acknowledgements

IFPRI and CDI are thanking the staff and the leaders of all Southern Partner Organisations that participated in collecting information for the evaluation of the contribution of these partner organisations to creating a vibrant civil society in Ethiopia. They also thank the Co-Funding Agencies and the Dutch Consortia they are a member of for making background documents available. We hope that this evaluation can support you in better positioning yourself in the Civil Society Arena of Ethiopia.

1 Introduction

This report presents the civil society end line findings of Meserete Kristos Church – Relief and Development Association (MKC-RDA) in Ethiopia which is a partner of Tear Fund under the ICCO Alliance. It is a follow-up to the baseline assessment that was carried out in 2012. According to the information provided during the baseline study MKC-RDA is working on MDG 4, 5, 6: Health.

These findings are part of the overall evaluation of the joint MFS II evaluations to account for results of MFS II-funded or –co-funded development interventions implemented by Dutch CFAs and/or their Southern Partner Organisations (SPO) and to contribute to the improvement of future development interventions. The civil society evaluation uses the CIVICUS framework and seeks to answer the following questions:

- What are the changes in civil society in the 2012-2014 period, with particular focus on the relevant MDGs & themes in the selected country?
- To what degree are the changes identified attributable to the development interventions of the Southern partners of the MFS II consortia (i.e. measuring effectiveness)?
- What is the relevance of these changes?
- What factors explain the findings drawn from the questions above?

The CIVICUS framework that comprises five dimensions (civic engagement, level of organization, practice of values, perception of impact and contexts influencing agency by civil society in general) has been used to orient the evaluation methodology.

Changes in the civil society arena of the SPO

In the 2012 – 2014 period the two most important changes that took place in the civil society arena of the SPO are related to the Civic Engagement and Perception of Impact dimension of CIVICUS. MKC-RDA managed to increase the involvement of PLHIV in society by organising PLHIV together with other community members into SHG's, which has resulted in more people mutually supporting each other and a reduction in stigma and discrimination. The involvement of PWDs increased by involving them in decision making processes and mainstreaming disability issues. MKC-RDA uses church and FBO leaders to identify the needs of beneficiaries and they play an important role in awareness creation activities.

Most significant changes were identified within the Perception of Impact dimension. MKC-RDA helped establish 71 new SHGs and 27 FAL groups between 2011 and 2013. Next to realising improved income for PLWHIV, the SHGs members got increasingly engaged in providing support for HIV- infected and AIDS-affected people. MKC-RDA furthermore initiated religious fora which contributed to improved religious tolerance in the community and which are engaged in a wide range of development activities. In terms of relations with the public sector, MKC-RDA increased the engagement of sector offices by inviting them for different discussions, trainings and review meetings. In some cases personnel from the sector offices provide training to the SHGs and CBOs capacity building program organized by MKC-RDA. MKC-RDA also interacts with the small and micro business offices on legalization of the SHGs and FAL groups.

Given the role assigned to NGOs in Ethiopia, MKC-RDA is not engaged in advocacy activities. However, by inviting public sector representatives to participate in the general meetings it organises, the communication remains open and effective. MKC-RDA is attempting to work with private health centres and sponsors for the Idir coalition, but so far no concrete progress has been made.

These findings were obtained through an analysis of documents, a workshop and follow-up interviews with the SPO, and interviews with external resources persons working in civil society organisations that receive support from the SPO; other civil society organisations with whom the SPO is collaborating; public or private sector agents and; external resource persons capable of overlooking the MDG or theme on which the SPO is concentrating.

Contribution analysis

Based upon an analysis of the projects and programmes financed by the Dutch CFAs, four orientations strategic for civil society development were identified: Ensuring that more people from more diverse backgrounds are engaging in civil society activities; ensuring that the organisations that receive support from the SPO are capable of playing their role in civil society – intermediate organisations; strengthening the relations with other organisations in civil society to undertake joint activities, and; influencing policies and practices of public or private sector organisations. For Ethiopia the focus was initially on the intermediate organisations and on the position of SPOs in their respective networks. The Ethiopian team however concluded that there is little room for networking amongst NGOs in Ethiopia, and that NGOs mainly collaborate with each other by instigation of the government to come to a division of labour per district and region. Therefore the second strategic orientation for most SPOs is now focussing on civic engagement.

Based upon an estimation of the percentage of the MFS II project budget related to interventions that are relevant for civil society, those SPOs whose absolute budgets for civil society were most important were selected for in-depth process tracing on two outcomes. The evaluation team conducted a quick assessment on contribution for the other SPOs. For MKC-RDA a quick assessment on contribution was done.

The first outcome identified within the Strengthening Intermediate Organisations orientation is whether MKC-RDA contributed to a reduction in stigma and discrimination towards PLWHIV. The second outcome that we looked at within this orientation is the extent to which intermediate organisations like the idir and the religious fora were able of providing improved support to vulnerable people by mobilizing the community.

The main contributions by MKC-RDA to reach the first outcome consist of their efforts to form SHGs and the FAL groups that are mixed which enhance social integration. Its intention to organise people in SHGs, helps to create relations of mutual support amongst PLWHIV. Additionally, this creation of mutual support is a natural process as the groups are not formed with the aim of reducing stigma and discrimination, but it is more a natural result that emerges around other aims (i.e. generating an income or learning to read) and activities (i.e. building community latrines). This can be seen as a strength of this approach. Other actors and factors that explain the first outcome are: awareness raising campaigns of the government; community meetings organised by the government, and the awareness campaigns of school clubs. These factors and actors provide a necessary, but not sufficient explanation to the reduction of stigma and discrimination towards PLWHIV. The availability of ART drugs forms a condition for PLWHIV to function in the community and be able to engage in SHGs or FAL groups.

In relation to the second outcome, it can be concluded that the contribution of the idirs and the religious fora is significant. MKC-RDA's interventions work with existing community structures. The use of individual idirs to increase awareness and provide care and support services is a sustainable measure, as the idirs form the structure of the community; they are institutionalized and not likely to change easily. Working via these structures therefore increases the chances for sustainable interventions.

Within the second orientation, Civic Engagement, we looked at the extent to which MKC-RDA's interventions helped to reintegrate PLWHIV into society and improved their social and economic capital to become a full member in society. This by means of supporting the PLWHIV to increase their income via SHGs.

We conclude that SHGs help PLWHIV in terms of mutually supporting each other and therefore enhances their social capital. The livelihoods of PLWHIV improve in economic terms when they receive loans to start IGAs, however the success of these activities depend upon personal entrepreneurial skills of group members and the amount of the loan given by the SHG given: though success stories are found, PLWHIV tend to switch between different forms of petty trade and daily labourers whenever the opportunity arises. Again, the availability of ART drugs forms an important condition for PLWHIV to be able to engage in SHGs.

Relevance

Interviews with staff of MKC-RDA, with external resource person, with Tear, as well as contextual information helped to assess the relevance of MKC-RDA's interventions in terms of; its Theory of Change (ToC) for Civil Society (SC) as designed during the baseline study; the context in which MKC-RDA is operating; the CS policies of Tear.

With regards to the baseline ToC, the interventions and outcomes achieved are partly relevant since MKC-RDA's contributions are mostly related to the second contribution formulated in their ToC, being economic empowerment of CBOs and by the creation of Self Help Groups (SHG) and Functional Adult Literacy (FAL) groups.

With regards to the context in which MKC-RDA is operating, its interventions and outcomes achieved are relevant because there are only a few other civil society organization working in MKC-RDA's intervention area. The ones that are there are not working on the same topics and issues as MKC-RDA.

With regards to the CS policies of Tear, MKC-RDA's interventions and outcomes are relevant because the growth in numbers of SHGs fits their CS policy.

Explaining factors

The information related to factors that explain the above findings was collected at the same time as the data were gathered for the previous questions. The evaluation team looked at internal factors within the MKC-RDA, the external context in which it operates and the relations between MKC-RDA and Tear.

Internal factors within the SPO that explain the findings are internal staff inefficiency and the overspending on program staff and underspending of stakeholder meetings.

External factors that explain the findings are the difficulties encountered when trying to align the programme's budget with the Ethiopian legislation, getting the budget approved by the government, and extreme delays in budget releasing.

Factors that explain the findings that are related to the relation between the MKC-RDA and Tear are the questions raised on M&E efforts of MKC-RDA and the need for improvement in financial reporting.

The following chapter briefly describes the political context, the civil society context and the relevant background with regards to the MDG/theme MKC-RDA is working on. Chapter three provides background information on MKC-RDA, the relation of its MFS II interventions with the CIVICUS framework and specific information on the contract with ICCO/Tear. An evaluation methodology has been developed for the evaluation of the Civil Society component which can be found in appendix 2 of the country report; however, deviations from this methodology, the choices made with regards to the selection of the outcomes for contribution analysis, as well as difficulties encountered during data collection are to be found in chapter 4. The answers to each of the evaluation questions are being presented in chapter 5, followed by a discussion on the general project design in relation to CS development; an assessment of what elements of the project design may possibly work in other contexts or be implemented by other organisations in chapter 6. Conclusions are presented in chapter 7.

2 Context

This paragraph briefly describes the context MKC-RDA is working in. A description of the Civil Society Context assessed according to the CIVICUS framework is provided in appendix 3 of the country report for Civil Society.

2.1 Political context

The Ethiopian Government has enacted a five year Growth and Transformation Plan (GTP) to implement over the period of 2011-2015.¹ Two of the major objectives of the plan are to maintain at least an average real GDP growth rate of 11%, meet the Millennium Development goals, and expand and ensure the qualities of education and health services thereby achieving the MDGs in the social sectors (FDRE, 2010). The government acknowledged that NGO's and CSO have an important role to play in the implementation of this plan: According to the preamble of the new charities and societies proclamation NO. 621/2009 of Ethiopia, civil society's role is to help and facilitate in the overall development of the country². This is manifested in the government's approach of participatory development planning procedures. For example, NGOs established a taskforce under the umbrella of the CCRDA to take part in the formulation of the country's first Poverty Reduction Strategy paper formulation. They were a major stakeholder in the planning process of the five year GTP plan. Despite fears that the NO. 621/2009 proclamation was thought to have negative impacts on Civil Society, the number of newly registered charities and societies have increased considerably. 800 new charities and civil societies were registered between 2010/11 and 2011/12 and as of February 2012, these were implementing over 113.916 projects in different social, economic and governance related sectors. Governance related projects comprise interventions in the area of democracy and good governance, peace and security, human rights, justice, and capacity building. The charities and societies are most engaged in the health sector (19.8%), followed by child affairs (11.9%), education (9.2%), governance (8.3%) and other social issues (7.8%). These figures are more or less similar to the pre-proclamation period, and would imply that new charities or societies have replaced foreign and Ethiopian charities that are not allowed to work on sectors related to governance and human rights.³ This might indicate that there might have been some flexibility in the interpretation of some of the provisions of the proclamation.

2.2 Civil Society context issues with regards to the MDG

A 20-year Health Sector Development Programme consisting of a series of 5-year rolling programmes was established in 1997-1998. Currently, the Health Sector Development Program IV 2010/11-2014/15 is rolled out. The recently implemented Business Process Reengineering of the health sector has introduced a three-tier health care delivery system which is characterized by a first level of a Woreda/District health system comprising a primary hospital (with a population coverage of 60,000-100,000 people), health centres (1/15,000-25,000 persons) and their satellite Health Posts (1/3,000-5,000 persons) that are connected to each other by a referral system. A Primary Hospital, Health centres and health posts form a Primary Health Care Unit (PHCU) with each health centre having five

² February 2009, *Charities and Societies Proclamation (proc. no.621/2009)*, Federal Negarit Gazeta, Federal Democratic Republic of Ethiopia

³ UNDP, January 2014, *Civic Engagement for Effective Service Delivery in Ethiopia: Tools, Opportunities and Challenges*, UNDP Ethiopia Working Paper Series No. 2/2014

satellite health posts. The second level in the tier is a General Hospital with a population coverage of 1-1.5 million people; and the third a Specialized Hospital that covers population of 3.5-5 million.

The current health program also introduced a strategy to prevent and control major infectious diseases and to increase its coverage in the rural areas with the appointment of Health Extension Workers. Despite this categories in society are still not being reached, including street children and youth, commercial sex workers, people with disabilities, PLWHIV, OVCs, destitute women and people living in geographically marginalized areas. In response to this gap, a number of actors, in particular NGOs, are striving to focus on the vulnerable groups of the community with the main purpose of improving access, quality and sustainability of health facilities and health services⁴.

The Ethiopian Health care system currently experiences a rapid expansion of private sector organisations and NGOs playing significant role in boosting the health service coverage and delivery of services through public/private/NGOs partnership. Health offices at different administrative levels from the Federal Ministry of Health to Regional Health Bureaus and Woreda Health Offices share decision making processes, decision powers, duties and responsibilities. The Federal and the Regional Offices are in charge of policy formulation and providing technical support whilst the Woreda Offices manage and coordinate the operation of the district health system under their jurisdiction. The devolution of competencies to regional governments has resulted in a more decentralised decision making process.

Several reports indicate that for Ethiopia the prevalence of HIV/AIDS has sharply decreased from 1.3 million persons in 2011 to 760,000 persons living with HIV/AIDS in 2013 (UNAIDS, 2013). However, the magnitude of socio-economic and psycho-social problems caused by the HIV/AIDS pandemic is still rampant: some 840,000 children lost one or both parents due to HIV/AIDS and were left behind without adequate parental care.⁵

3 MKC-RDA and its contribution to civil society/policy changes

3.1 MKC-RDA

Meserete Kristos Church (MKC) is one of the indigenous churches in Ethiopia, established in 1951. It has over 670 local churches, 350 sub local congregations, and has a total of nearly 500,000 members. The church serves under the overall guiding principle of serving the whole person that includes spiritual and physical nurturing.

It's main development goals include: 1) improved food security at household level, 2) improved health access and facilities for the members of the community, 3) reduced prevalence of HIV-AIDS, 4) improvement in access to and quality of education, and 5) enhanced SHG development schemes.

Its development approach can be summarised as creating access to productive resources and participate development by facilitating community learning via the FAL program, organise CCs for community awareness, promotion of gender equality and women empowerment via the promotion of SHGs, building organisational capacity of CBOs, and building strong partnerships with all stakeholders and partners through proactive networking, information exchange, resource sharing and joint approach for development

MKC-RDA is currently implementing 8 Health, HIV & AIDs projects in different parts of the country and Fincha Shambu integrated HIV & AIDs project is one of these projects. It takes place in two rural districts/woredas, Horo and Abay Choman and two towns of Horo Guduru Wollega Zone in Oromia state. The programme focuses mainly on scaling up previously undertaken projects in areas that have been targeted during the last three years. These are; Shambu town (01 & 02 Kebeles), Fincha town (01 & 02 kebeles), 6 villages of Fincha valley (which collectively form "Agamsa" Kebele), four rural PAs (Sekala 01, Dibdibe Kistana, Gitilo Dale and Konbolcha Chancho) and one newly added Kebele called Gudetu Migrae. One new Kebele has been added after discussion with Government and other stake holders who notified MKC-RDA about the yearning demand for further intervention.

MKC-RDA is one of the Ethiopian partners in the Ethiopia Health Country Plan 2011-2015 of the ICCO Alliance. The Ethiopian coalition partners are:

- Ethiopia Muluwongel Believers Church Relief and Development Organization
- Ethiopia Kale Heywet Church – Medan Acts Programme (EKHC) (Kuriftu & Arbaminch),
- Evangelical Church Fellowship of Ethiopia (ECFE),
- Yemisrach Dimts Communication Services (EECMY-YDCS),
- Dorcas Aid International Kenya,
- BBBC
- EGCWDO

The program has started implementing activities since 2011 and developed into a network in which lessons are learned from each other and from other important stakeholders. Since 2012 the monitoring of the Ethiopia partners and the program has been decentralized by the Prisma members in the Netherlands. The ICCO Alliance Regional Office together with local staff of Dorcas, Red een Kind and Tearfund UK (called the Regional Working Organisation) are mandated to handle partner contracts and to support the Ethiopian Health Program.

3.2 MFS II interventions related to Civil Society

MKC-RDA's interventions aim to:

- Capacitate and empower local institutions that provide improved quality and affordable health services for vulnerable groups holistically;
- Ensure a decentralized and transparent basic health care delivery system, as evidenced by the involvement and addressing of vulnerable groups and key community leaders;
- Ensure that SHGs become performing and that PWD, PLHIVS, and vulnerable communities engage in income generating activities and become an integrated part of society.

The project documents however do not give an overview of the number of schools, idirs, local churches and other religious institutions involved in the development of HIV-AIDS policies. The same applies for the total number of SHG to be supported and membership figures.

All three above mentioned objectives have relations with the CIVICUS dimensions in terms of:

- Creating or strengthening local structures that by the end of the project need to be self-sustaining (level of organization/perception of impact);
- Collaboration between these structures and the formal health system (perception of impact).

Apart from this, MKC-RDA is one of the partners that implement the Ethiopian National Health Plan, and collaboration between these partners is an important element in the CIVICUS dimension 'level of organisation'.

3.3 Basic information

Table 1:

basic information on MKC-RDA

Total			€ 143.222		

4 Data collection and analytical approach

4.1 Adjustments made in the methodology of the evaluation

Based upon the documents made available at the beginning of 2014, the evaluation team identified 'strengthening intermediate organisations' as the first strategic orientation to focus on. It was observed that most of MKC-RDA's activities focus on forming support groups and training people in terms of HIV/AIDS related topics. MKC-RDA's final goal is to ensure that these groups become self-sufficient and continue the work without the support of MKC-RDA. After the workshop conducted with MKC-RDA's staff, the second civil society orientation chosen was civic engagement. The SPO members who participated in the evaluation discussion emphasized that the SPO mainly operates in these two outcomes.

4.2 Difficulties encountered during data collection

The evaluation team encountered difficulties in compiling all information from the project documents as a means to obtain a complete overview of outcomes and outputs achieved in line with the logical framework. The project documentation obtained in the beginning of 2014 missed the bi-annual report of January – June 2013, which caused difficulties in assessing changes over the 2011-2013 period. Another major difficulty during data collection was the quality of the progress reports. Although there were many reports available, they were very general and did not mention any specific achievements or outputs. As the proposals mention percentages to be reached by the end of the project, the progress reports do not report on exact numbers or percentages, and hence it was very difficult to conclude whether the targets were met. The targets set in the proposal did come back in the financial progress report of mid-2012 to mid-2013, and therefore this report was used to get an overview of MKC outputs and outcomes during the 2011-2013 period and decide upon a strategic orientation for the evaluation.

In the field, it was observed that many of the staff members that were involved in the baseline period were not available for the end line evaluation work. In addition some of the SPO members were repeatedly in the field which delayed the process because meetings were postponed and the required information was obtained late. The SPO's team working in the project site was very cooperative and facilitated the data collection activity effectively.

4.3 Identification of two outcomes for in-depth process tracing

In relation to the CIVICUS framework four strategic orientations for contribution analysis were identified: ensuring that more people from more diverse background are engaging in civil society activities; ensuring that the organisations that receive support from the SPO are capable of playing their role in civil society; strengthening the relations with other organisations in civil society to undertake joint activities, and; influencing policies and practices of public or private sector organisations.

With regard to strengthening of intermediate organizations three outcomes were identified: 1) reduction of stigma and discrimination towards PLHIV due to awareness creation, 2) improved

community and resource mobilization to support vulnerable people, and 3) improved joint community development.

The civic engagement activity of the SPO focused on establishing and supporting self-help groups (SHG) and providing awareness. The two outcomes related to SHG were 1) an increase in income for the SHG-members and 2) an improvement of their social interaction.

5 Results

5.1 Results obtained in relation to project logframe

An inventory was made of progress being made by MKC-RDA in comparison to its project documents. However the missing progress report of January-June 2013 have hampered the presentation of facts and figures.

Objectives	Level of achievement
85 % of stake holders in the project sites are able to mainstream and address health, disability, GBV, and HIV & AIDS issues and incorporated HIV & AIDS prevention, care, and support activities in their annual and operational plans.	80.2% of Local institutions have developed HIV & AIDS policy manuals (17 schools, 54 Idirs, 20 local churches, three other religion) (2011-2012) 82.2% of the local institutions have regular schedule of HIV and AIDS, and reproductive health works. (20 schools, 60 Idirs, 28 local churches, six other religious institutions (July 2012 – December 2012) 69 % in July – Dec 2013 report.
In 80 % of the religious institutions and associations, vulnerable community groups are actively involved in decision making processes and hence they developed and assured their trusts and acceptance on their community	<ol style="list-style-type: none"> 155 persons in the project sites participated in decision making meetings on health service representing the vulnerable community groups. Next they got involved in mobilizing their peers to be organized in SHGs, testing for HIV, to get SRH education and health services. (2011-2012) 167 persons (July 2012 – December 2012) 268 person (July – December 2013) 123 representatives of different institutions and volunteers stand working against stigma, denial and discrimination. In turn they mobilized communities at school, Idirs, churches and mosques, for HIV testing and thought the wider community on the basic facts of HIV, disability and negative impacts of Stigma and discrimination. (2011-2012) 142 representatives (July 2012 – December 2012) 178 (July – December 2013) 44 disabled persons PWD have gotten education on HIV and AIDS. Four of them are involved in awareness creation activities regarding disability. (2011-2012); 74 PWD (July 2012 – December 2012); 65 PWD (July – December 2013 report) 160 representatives of community institutions and volunteers involved on HIV counselling and testing (2011-2012). 13 community leaders involved (July 2012 – December 2012). As a result 3814 persons tested between July 2011 and December 2012: No HIV testing due to shortage testing kits in July – December 2013 report. Stigma, discrimination, and denials related to HIV and AIDS Reduced. (2011-2012) No reporting
80% of SHG members are able to cope up with the economic demand, ensure active participation of PWD, PLHIVS, and vulnerable communities in decision making, and sharing of resources and guaranteed their representation.	<ol style="list-style-type: none"> 44 persons of affected community group due to HIV & AIDs and disability which obtained representation in each of the following categories: target group; contributors; speakers; implementers; experts and decision makers in churches, SHGs and FAL circles. They speak on behalf of vulnerable community groups (2011-2012). 48 peoples speak on behalf of vulnerable groups (July 2012 – December 2012) 65 persons speak on behalf of vulnerable groups (July – December 2013) 20 % of PLHIVs who have trust in the community and speak boldly about their right and status. 108 PLHIV involved in stigma and discrimination reduction works at FAL, SHGs, and Idirs and community institutions. (2011-2012). 21 % have trust in the community (July 2012 – December 2012) 112 PLWHIV involved in stigma and discrimination reduction works (July 2012 – December 2012) 212 PLWHIV involved (July – December 2013) 14 % of disabled (including positives) which indicate that they are protected by religious institutions, CBOs, SHGs, Anti HIV clubs and associations. (2011-2012) This is 15 % (July 2012 – December 2012) 65 PLWHIV organized in SHG and FAL groups by church leaders (July – December 2013 report)

5.2 Changes in civil society in the 2012-2014 period

5.2.1 Civic engagement

Civic engagement describes the formal and informal activities and participation undertaken by individuals to advance shared interests at different levels. Participation within civil society is multi-faceted and encompasses socially-based and politically-based forms of engagement.

MKC identifies the needs of marginalized groups through various ways like community discussions, trainings and experience sharing. The quarterly report of 2013 mentions that 496 people from the program target groups (Persons Living with HIV (PLHIV), SHGs and Functional Adult Literacy (FAL) leaders and forum representatives, People With Disabilities (PWD), volunteers, Community Conversation (CC) facilitators and health professionals) participated in the discussions and trainings arranged. Additionally, MKC-RDA organised conversations between community members, health service providers and vulnerable groups to increase access to basic health services.

Furthermore, local stakeholders and line organizations participated in identifying the needs of the beneficiaries. Accordingly, change agents (such as church leaders) were capacitated to play a role in addressing stigma, denial and discrimination. Between 2011 and 2013, 48 FBO leaders and evangelists received training on community mobilization and 28 FBO leaders and evangelists were trained on gender and disability mainstreaming. Additionally, since the program mainstreamed disability issues⁶, 65 PWDs were involved in decision making meetings.

Other achievements in this area include:

- Discussion sessions for 4438 SHG members and 3041 vulnerable women on reproductive health, family planning, and PPTCT were conducted between 2011 and 2013.⁷ Additionally, psychosocial support was provided for 18 OVCs and Health education provided for PLHIVs in the project sites.
- Provide apple seedling for 30 rural SHGs and PLHIV so that they can sustain their response to OVC support (5 apple seedlings per person)
- Facilitate referral and mobile Health Testing and Counselling for 3500 people per year at three towns in collaboration with government health institutions
- 36 youths trained on peer education and facilitation skills
- 3814 persons tested between July 2011 and December 2012⁸
- Health education provided for PLHIVs in the project sites. The document mentions that at least 40 PLHIVs are reached once per quarter
- 6000 youths in the churches, schools and out of schools were reached via a cascade peer education system
- Community conversations on health and HIV with new idirs were conducted once a month.

MKC-RDA, apart from including church people also includes non-church people in its development activities by means of using CCMD and UMOJA strategies⁹. The UMOJA strategy involves capacity building of church leaders so they are able to involve the community in identifying local needs and use local resources to address these needs. Capacitating government institutions, like school health institutions and local CBOs like clubs further assured inclusion of the whole community.

Score baseline 2012 on an absolute scale from 0-3:	2
Score end line 2014, relative change on a scale of (-2, +2):	+1

5.2.2 Level of organization

This dimension assesses the organisational development, complexity and sophistication of civil society, by looking at the relationships among the actors within the civil society arena.

⁶ Mentioned in bi-annual report July-December 2013

⁷ Differences in percentages could not be calculated as the total numbers of SHG members, vulnerable women and youth educated against what was planned is missing in the project documents.

⁸ No HIV testing due to shortage testing kits in July - December 2013

⁹ UMOJA is a Swahili word expressing unity in the family, community, nation, and race.

It is reported that there are only a few other civil society organization working in MKC-RDA's intervention area.¹⁰ Those present are not working on the same topics and issues as MKC-RDA. This was also mentioned during the baseline evaluation, and explains the limited relations of MKC-RDA with other organisations. However, MKC did interact with CBO leaders and club leaders in the past two years during various trainings organised and discussions held.

Though there are a limited number of other NGOs in the intervention area, several discussions were held in the past twelve months with stakeholders at different levels. At the program/ village level weekly meetings with SHGs and FAL groups and monthly meetings with PLHIV associations, CC groups and local churches were organised. In these discussions MKC-RDA is represented by the program staff. Staff meetings were also held at organizational level. These are conducted every month, quarter and biannually, though these may be shifted or cancelled due to shortage of budget.

Defending the interests of marginalized groups is mainly done via local churches, Cluster Level Association (CLA) representatives, SHGs and FAL groups. These groups and representatives are capacitated through various trainings and awareness creation activities about their rights and responsibilities, which resulted in increased self-esteem amongst their members. For example, discussion sessions were organised with FBO leaders and evangelists on CCMD for 2 days, and similar discussions were held with CLA representatives on resource mobilization.

Local churches are believed to be important in defending the interests of marginalized groups as they are well aware about what is happening in the communities and are perceived as capable because they have received the necessary training.¹¹ At the moment, the programme works with 36 local churches. Next to churches, faith based organizations are perceived as having the capacity to defend the marginalized groups.¹²

Though no changes in the composition of the financial resource base of MKC-RDA were found, the effective implementation of the existing projects, including the one in Fincha Shambu, helped to acquire two new health projects.¹³ On a different level, school clubs and forums are working on fundraising activities together with the school and church community to help needy students, OVCs and PLHIV. As a result, OVC and PLHIV were supported with educational materials and sometimes they also got support finances for IGA. Similar local resource mobilization events were done in some other project sites as well.

Score baseline 2012 on an absolute scale from 0-3: 1

Score end line 2014, relative change on a scale of (-2, +2): 0

5.2.3 Practice of Values

Practice of Values refers to the internal practice of values within the civil society arena. Important values that CIVICUS looks at such as transparency, democratic decision making, taking into account diversity that are deemed crucial to gauge not only progressiveness but also the extent to which civil society's practices are coherent with their ideals.

No changes occurred since the baseline with regards to practice of values. Bi-annual review meetings with stakeholders are still conducted to ensure downward accountability and to trace the project implementation progress, as well as external audits are taking place in compliance with the rules and regulations in place. Finances are administered in Addis Ababa, because the capacity in Shambu is still limited. No information is available with regards to the board of MKC-RDA.

5.2.4 Perception of Impact

Perception of Impact assesses the perceived impact of civil society actors on politics and society as a whole as the consequences of collective action. In this, the perception of both civil society actors (internal) as actors outside civil society (outsiders) is taken into account. Specific sub dimensions for this evaluation are the extent to which the SPO has contributed to engage more people in social or political activities, has contributed to strengthening CSOs and their networks, has influenced public and private sector policies.

Individual beneficiaries as well as IOs stated the presence satisfaction with the activity of the SPO in the two years under review. The SPO helped establish 71 new SHGs and 27 FAL groups between 2011 and 2013 and these groups got involved in different income generating activities to improve their income. The rural SHG and FAL groups were able to engage in agricultural activities and benefit from the crops they harvested. In addition some of these groups (14 SHG and 4 FAL groups) were able to get approved as a legal entity by the concerned local administration office. They have also benefited from trainings, discussions and experience sharing stages that help improve the quality and quantity of the beneficiaries. Representatives of beneficiaries that are involved in the stakeholders meeting express satisfaction on the project results. MKC-RDA furthermore initiated religious fora. One of the benefits of the existence of a forum that was highlighted by the forum members is the improved religious tolerance in the community.

The main achievements of MKC-RDA in this area of civil society impact lie the establishment and support of SHGs, FAL, and religious fora. In addition to increased income, the SHGs members engaged in providing support for HIV- infected and AIDS-affected people. They further disseminated HIV and health information to community members and they mobilized members from five local churches and CBOs for voluntary HIV counselling and testing. The SHGs also worked with government institutions and public schools in combating HIV-related stigma, harmful traditional practices (particularly female genital cutting) and gender inequalities.

In addition, MKC-RDA helped to strengthen several Idirs in the locality. Traditionally, the Idirs are formed by the community to support one another in times of death and mourning. But with the involvement of the SPO around 69 Idirs changed their bylaws to engage in supporting vulnerable groups of the community in life (particularly OVC and PLHIV). In addition, CBO members discuss on issues particularly on HIV/AIDS, harmful traditional practices, and gender based violation

Project facilitators and local church leaders have been influential in facilitating HIV counselling and testing campaigns at schools and health institutions in collaboration with the district health office. Additionally, religious leaders and health professionals, including VCT counsellors, have discussed on the current status of counselling strategies and its role on HIV & AIDS prevention and control especially for the most vulnerable groups. Religious leaders' got involved in life skill education, marriage counselling and premarital HIV counselling and testing. Disability and gender mainstreaming discussion forums organised by MKC-RDA enabled them to gain the basic facts about the issues.

Other achievements in the area of civil society building include:

- The number of local institutions that developed HIV & AIDS policy manuals increased with 2% between 2011 and 2013. These local institutions include 20 schools, 60 Idirs, 28 local churches, six other religious institutions.¹⁴
- Of the PWD and PLHIV in the SHGS and FAL, 156 of them were organized by local church leaders and educated about issues of disability, HIV and AIDS, and saving and self-supportiveness;
- 1 cross experience sharing session among religious leaders, PLHIV associations and local community representatives on health and HIV/AIDS;
- 20 leaders of PLHIV associations, women associations and religious institutions trained on sustainable livelihood and DRR;
- 40 school leaders and members of AACs or girls clubs participated in a resource mobilization workshop;
- Consultation session organised for two days with hospital and health center workers, MFI, religious leaders, and district administrative representatives to strengthen the health network;
- Experience sharing stages organised among volunteer CC facilitators, Idirs, health extension workers and forum representatives once per year.

With regards to the relations of MKC-RDA with the public sector, they work closely with the concerned government sector offices in the Woreda, particularly with the health, child and women affairs, and finance and economic development offices. The sector offices are engaged by their participation in different discussions, trainings and review meetings. In some cases personnel from the sector offices provides training to the SHGs and CBOs capacity building program organized by MKC-RDA. A further change of public sector involvement since the baseline is the inclusion of ministers, next to FBO leaders, in a three day training on gender and disability mainstreaming.¹⁵ In addition government organizations like the zonal health office invites MKC-RDA during planning and review meetings. MKC-RDA also interacts with the small and micro business offices on legalization of the SHGs and FAL groups.

Given the role assigned to NGOs in Ethiopia, MKC-RDA is not engaged in advocacy activities. However, by inviting public sector representatives to participate in the general meetings it organises, the communication remains open and effective. Local administration is aware of MKC-RDA's interventions and both have developed operational procedures to collaborate.

MKC-RDA is attempting to work with private health centres and sponsors for the Idir coalition, but so far no concrete progress has been made. It is not influencing the policies and the practices of the private sector.

Score baseline 2012 on an absolute scale from 0-3: 2

Score end line 2014, relative change on a scale of (-2, +2): +1

5.2.5 Civil Society Environment

The social, political and economic environment in which civil society operates affects its room for manoeuvre. The civil society context has been described in chapter 3. In this section we describe how MKC-RDA is coping with that context.

MKC-RDA has been closely collaborating with CBOs, government offices and beneficiaries. This is believed to be the main strategy for ensuring the sustainability of the program. However, though they were legalized, only a few SHGs and FAL groups received land from the local government to operate their business. This was mainly due to higher restrictions and longer procedures on land allocation. MKC-RDA furthermore links SHG and FAL members who are not able to raise their own capital with micro finance institutions (MFI) so as to engage in income generating activities. But the problem was that there are no MFIs in some of the program areas.

¹⁴ From the project documents, the total numbers of schools, Idirs, local churches and other religious institutions that developed HIV-AIDS policies could not be retrieved and hence what % this is against the total number of these institutions is not known.

¹⁵ Interview with field staff

The proclamation on charities and societies also prohibit national NGOs that receive more than 10% of their funds from abroad to engage in lobby and advocacy on rights based issues. MKC-RDA's work has been affected because it cannot defend the interests of the PLWHIV and the marginalised groups it works with as before. However a new window of opportunity which is accepted is to work closely with public sector services that then may become aware of how to address burning issues in society.

Score end line 2014, relative change on a scale of (-2, +2): -1

5.3 To what degree are the changes attributable to the Southern partners?

5.3.1 Strengthening Intermediate Organisations

Two outcomes were identified to assess whether MKC-RDA has contributed to the CIVICUS dimension 'strengthening intermediate organisation'; a reduction in stigma and discrimination towards PLWHIV; and improved support to vulnerable people in the community.

Reduction of stigma and discrimination towards PLWHIV

The first outcome is the reduction of stigma and discrimination towards PLHIV in the project area. MKC-RDA uses multiple interventions in trying to reach this outcome. Two developments point to a decrease in stigma and discrimination towards PLWHIV. Firstly, the mix of both HIV positive and HIV negative people who engage in SHGs point towards a more tolerant approach to PLWHIV. Secondly, the number of PLWHIV active in public professions has increased. As of December 2014, 104 PLWHIV are teaching and creating awareness in the community.

This outcome has several explanations:

- MKC-RDA set a norm that at least 20 percent of the members of newly created SHGs should be PLWHIV and other vulnerable members of the community. MKC-RDA helped establish 73 new SHGs between 2011 and 2014 and provided some of them with seed money after start-up.¹⁶ The total number of SHG-members as of December 2014 was 1215 of which 154 members are PLWHIV and 23 PWD which is 14,6 % (20 % was planned)^{17 18}. The SHGs, apart from giving members the opportunity to start their own business, are also involved in community activities such as awareness raising, preparing community latrines or improving personal hygiene.
- MKC-RDA furthermore established 27 Functional Adult Literacy (FAL) groups of which the composition is a mix of PLWHIV, youth, females and other marginalized groups in the community. The 27 FAL groups have in total 361 members of which one is HIV positive and 23 are PWD (6,6%). As is the case with the SHGs, the activities of the FAL groups are not limited to improve literacy, but also comprise activities for the community.
- Traditionally, the idirs support their members in times of death and mourning. With support of MKC_RDA 69 idirs changed their bylaws to be more engaged in supporting vulnerable groups in the community (particularly OVC and PLHIV). This development is the result of sensitization and awareness creation activities. The data available show that two PLWHIV and 45 OVC have received support from the idirs, however no clear performance assessment has been done on the outcomes of the change of their bylaws.¹⁹
- MKC-RDA organises meetings with community members and district representatives to increase the awareness on HIV/AIDS. These discussion meetings also serve the purpose of introducing the SHG

¹⁶ MKC-RDA stopped providing seed money after a while because it was concluded together with Tear that this was not a sustainable intervention

¹⁷ HIV prevalence in Oromia state was only 1 percent in 2013 and has the lowest prevalence of HIV in Ethiopia, apart from SNNPR. (Country Progress Report on the HIV Response, 2014, Federal Democratic Republic of Ethiopia.

¹⁸ 17.6 percent of Ethiopia's population has a disability. WB and WHO quoted in: http://www.ilo.org/wcmsp5/groups/public/--ed_emp/---ifp_skills/documents/publication/wcms_112299.pdf

¹⁹ Data collected from the field office

concept and the possibility to join the FAL program. MKC-RDA works together with local government representatives and various CBOs to organise these meetings.

An important actor involved in the reduction of stigma and discrimination is the government. Not only are the health office and the women and youth office involved in the delivery of training organized by MKC-RDA, the government itself also organises community awareness meetings on awareness creation, distributes flyers and posters on the topic and endorses SHGs.

Another actor involved in efforts to reduce stigma and discrimination are the school clubs, like girls clubs and anti AIDS clubs. Many of the school clubs have stigma and discrimination campaigns to increase awareness amongst youth.

A factor influencing the outcome is the free availability of ART drugs. PLWHIV can live with effective ART treatment and as a result they are able to work and can engage with community members in a normal way.

The main contributions by MKC-RDA to reach this outcome consist of their efforts to form SHGs and the FAL groups that are mixed which enhance social integration. Its intention to organise people in SHGs helps to create relations of mutual support amongst PLWHIV also with members which are not HIV positive. Additionally, this creation of mutual support and social capital is a natural process as the groups are not formed with the aim of reducing stigma and discrimination, but it is more a natural result that emerges around other aims (i.e. generating an income or learning to read) and activities (i.e. building community latrines). This can be seen as strength of this approach.

Other actors and factors that explain the outcome are: awareness raising campaigns of the government; community meetings organised by the government, and the awareness campaigns of school clubs. These factors and actors provide a necessary, but not sufficient explanation to the reduction of stigma and discrimination towards PLWHIV. The availability of ART drugs forms a condition for PLWHIV to function in the community and be able to engage in SHGs or FAL groups.

Improved community mobilization to support vulnerable groups

Improved community mobilization to support vulnerable groups in the community is the second outcome under the strengthening of intermediate organisations dimension. The interventions of MKC-RDA in reaching this outcome focus on individual idirs and the establishment of five FBO forums in Fincha, Shambu, Sekela, Fincha Sugar Factory, and Migru.

Between 2011 and 2013, 69 idirs changed their bylaws with support of MKC-RDA to be more engaged in supporting vulnerable groups in the community. The interviewees observed a significant difference between the activities of the idirs before and after the adjustment of the bylaws and the accompanying support provided by MKC-RDA. Previously these idirs, in their traditional role, provided burial service and covered related costs when one of the idir members or a family member had died. But after the awareness creation training and sensitization discussions provided by MKC-RDA, the idirs amended their respective bylaws and started supporting not only idir members but also other vulnerable members of the community in times of sickness.

This extended support includes:

- covering education related expenses for OVC's²⁰;
- mobilize money and materials (such as clothing) from able idir members to provide support for vulnerable people of the community in the holiday period;
- the construction of homes for some destitute elders members;
- as a result of the awareness creation activity done by MKC-RDA, idir members who were HIV positive were exempted from the regular contribution when they are not able to pay; and
- HIV positive Idir members got exempted from the labor support required in times of mourning and funerals.

²⁰ An example was given that one Idir started covering education related expense (school uniform, pen, pencil, exercise books, etc) for 15 OVC selected by the locality.

The support given depends on the capacity of the Idir and the amount of money it managed to mobilize. While there are idirs that expanded their care and support services exclusively to their members, others extended their support to other vulnerable groups in the community.

MKC-RDA also initiated the creation of five fora composed of different religion (faith) based organisations operating (FBOs) in the locality. The first three forums provide educational support to 168 OVC since 2011. The last two forums (located in Fincha Sugar Factory and Migru) are not engaged in extending support to the community. The fora are chaired by the mayor of Fincha town and its members meet every two weeks and discuss issues related to youth, harmful traditional practices, and conflict resolution. MKC-RDA provided material support and training on topics like providing care and support to vulnerable group, awareness creation on HIV/AIDS, stigma and discrimination, harmful traditional practices, and peace and reconciliation trainings.

One of the significant contributions of the fora is the improved relationship among the different religions and denominations. Earlier it was unthinkable for Mosque leaders to go to a church and preach the congregation about mutual issues. The same holds true for a Christian to speak in the Mosque. But with the awareness creation and sensitization effort made by the fora it is now possible. This has improved the relationship and the sense of working together among the different religions and denominations. Before the fora were established there was no regular and joint discussion among the CBOs/FBOs and the government. It was only in times of conflict that the local government initiated such meetings. But the advent of the fora resulted in more regular meeting and reduced the possibility of conflict within the society as CBOs and FBOs have a platform to discuss disagreements. The fora are financially supported by the government offices. This financial contribution is partly used to support vulnerable groups in the community.

The government contributes to the outcome by buying uniforms and school materials to support vulnerable groups in some places in the intervention zone. In places where the local government does not provide material support, they communicate to schools to allow vulnerable students to be exempted from registration fee and to get access without having (wearing) a uniform.

In relation to the performance of the idirs and the religious forum, it can be concluded that the contribution of MKC-RDA is significant. Both the interventions work with existing community structures. The use of individual idirs to increase awareness and provide care and support services is a sustainable measure, as the idirs form the structure of the community; they are institutionalized and not likely to change easily. Working via these structures therefore increases the chances for sustainable interventions.

5.3.2 Civic engagement

With regards to MKC-RDA's efforts to enhancing people's engagement as well as to engaging more diverse and marginalised people into in civil society, the evaluation team looked at the extent to which MKC-RDA's interventions helped to reintegrate PLWHIV into society and improved their social and economic capital to become a full member in society. This by means of supporting the PLWHIV to increase their income via SHGs. Forming SHGs is a key strategy in MKC-RDAs policy. According to MKC-RDA, 71 new SHGs were established between 2011 and 2013. The SHGs consist of PLWHIV (targeted percentage of PLWHIV in SGHs is 20%) and other vulnerable members of the community.

Improved economic status of SHG members

The members of the SHGs are expected to improve their livelihoods through IGAs. Improved income through IGA largely depends upon how successful the group is to earn an income with petty trade which largely depends upon the use of the start-up capital given by MKC-RDA and the capacity and skills of the individuals within the group receiving this. The choice of the IGA to start the business is done by the members themselves, but MKC-RDA provides inputs for some IGA activities. MFSII funds were for example used to provide apple seedling (5 apple seedlings per person) for 30 rural SHGs and PLHIV. The field office conducted a performance evaluation on 71 SHGs based on their before and after situation (from economic and behavioural change point of view) and the level of mutual understanding among the members. The results showed that 30 SHGs are best performers, 23 are good performers (small change), and 18 performed poorly mainly due to conflicts among the group members.

Though most PLWHIV still engage in daily labour work a shift from daily labour or low-income petty trade such as roadside selling, charcoal making, and traditional alcohol making to better ventures such as processing and selling butter, grain retailing, or running a small café could be observed. An example is one SHG consisting of 17 destitute women which was established in 2012. Before joining the SHG the members were engaged in informal business activities such as wood selling, or daily labour. MKC-RDA approached the beneficiaries, provided them with training²¹, and advised them on how to form the SHG. Additionally, this SHG provides sensitization workshops on the benefits of forming SHG within the community. Its members initially contributed 4 birr per week and later increased it to 6 birr per week of which one birr is set aside for social purposes. When the money accumulated members started taking loans up to 1000 birr and started small level formal business activities. Currently members of the SHG are engaged on cattle fattening, grain retailing, vegetable selling, and selling home consumption item.

One of the main contributing factors for the improved economic status of the SHGs is the availability of obtaining a loan at low interest rate from the savings of the SHGs. Prior to this possibility members who would not qualify for a bank loan would borrow from individual money lenders with a 5 birr interest per day for every 100 birr borrowed. But through the SHG the members pay 5 birr interest per month for 100 birr borrowed. This enabled the members to start a business at lower cost. In some cases MKC-RDA provides SHGs with seed money to stimulate the economic possibilities. There are criteria for getting this fund in relation to the initiatives taken by the members. This approach was questioned by the CFA, as there is a risk of dependency.²² It was therefore decided to no longer provide the seed money to SHGs.

Improved social status of SHG members

An additional function of the SHGs is that people find encouragement to dare to expose themselves as HIV positive.²³ Every week the members meet to make their weekly contribution. From this contribution, members are also supported in times of crises, for example when someone dies. Furthermore, members visit each other when a member is sick and they provide advice and morale support. An SHG member interviewed stressed that the situation of the members has shown notable change after the involvement of the SPO: it was stated that forming the group has increased the level of support among them.

When members are unable to pay their credit/loan on time due to unforeseen circumstances the members discuss on the issue and usually exempt the person from paying the interest. This shows the presence of strong social interaction amongst members, though it questions the effectiveness of economic benefits if the exemptions are made on a large scale. Bylaws of the SHGs should provide the necessary guidance for these situations (no data collected on this).

We conclude that SHGs help PLWHIV in terms of mutually supporting each other and therefore enhances their social capital. The livelihoods of PLWHIV improve in economic terms when they receive start-up capital to start IGAs, however the success of these activities depend upon personal entrepreneurial skills of group members and the amount of the start-up capital given: though success stories are found, PLWHIV tend to switch between different forms of petty trade and daily labourers whenever the opportunity arises. Again, the availability of ART drugs forms an important condition for PLWHIV to be able to engage in SHGs.

²¹ MKC-RDA's provides life skill training to the SHGs on topics like time management, financial (money) management, and the importance of saving.

²² Tweede beoordeling HIV MKC-RDA

²³ Tweede beoordeling HIV MKC-RDA

5.4 What is the relevance of these changes?

5.4.1 Relevance of the changes in relation to the Theory of Change of 2012

In its 2012 ToC MKC-RDA formulated its overall goal with regards to civil society as “a holistic transformation of communities with respect to Health, HIV-AIDS and improve the quality of life of PLWHA (People Living with HIV-AIDS) or OVC (Orphans and Vulnerable Children) in Horo Gudru and Shambo Woredas.” To reach this goal, MKC-RDA believed a strong civil society is needed that is effective in delivering services. To come to a strong civil society MKC-RDA strived to contribute to four conditions: 1) strong networks between civil society actors, 2) economic empowerment of CBOs and by the creation of Self Help Groups (SHG) and Functional Adult Literacy (FAL) groups, 3) a well-equipped civil society with the necessary knowledge and skills of HIV/AIDS prevention and care, and 4) the existence of peace and reconciliation within the communities.

The biggest contribution of MKC-RDA is to the second contribution as they managed to establish 71 new SHGs and 27 FAL groups. Though peace and reconciliation was not an objective formulated in the program under evaluation, the FBO fora did result in improved mutual understanding and conflict resolution.

CBOs like school clubs, idirs and FBOs form the most important civil society actors as there are not many NGOs working on HIV/AIDS related issues in Fincha Shambu. MKC-RDA organised different meetings between the CBOs, FBOs and fora²⁴ to enhance networking, but results have not been documented.

5.4.2 Relevance of the changes in relation to the context in which the SPO is operating

It is reported that there are only a few other civil society organization working in MKC-RDA’s intervention area.²⁵ The ones that are there do not work on the same topics and issues as MKC-RDA. In this regard, the presence of MKC-RDA is relevant.

5.4.3 Relevance of the changes in relation to the policies of the MFS II alliance and the CFA

Tear believes civil society is best strengthened by using the networks of churches and SHGs. In the past, the churches did not fulfil a role in bringing people together in society next to religious gatherings. By forming and supporting NGOs and SHGs, Tear believes churches can play an important role in building civil society.

Tear Fund helped introduce the SHGs approach to Ethiopia via another partner (EKHC) in 2002. The first five SHGs were started by 100 women in Nazareth (Adama); today the number of SHGs as part of Tear Fund funded programmes has increased to well over 12,000 across Ethiopia, impacting over 1 million people. The growth in numbers of SHGs has been primarily because local churches have embraced it and replicated it using their own resources.

In 2013 research conducted by Tear concluded that forming self-help groups is a sustainable and high return intervention²⁶.

One of the goals formulated in the Ethiopian Thematic Country Plan 2011-2015 was the programmatic cooperation between ICCO Alliance partners.²⁷ It is believed that due to its size, the ICCO Alliance partners in Ethiopia would be able to link up with other health partners, and also identify issues which

²⁴ The fora meet twice a year to share experiences and learn from each other

²⁵ Interview with field staff

²⁶ In October 2013, Tearfund UK and Tearfund Ireland funded a cost-benefit analysis of the SHGs in Ethiopia. The results of this study indicate the SHG intervention has a very high return, as much as £173 for every £1 spent, and is demonstrating transformational change. They however question the (long-term) effectiveness of peer-to-peer education, the grain banks and the FBO forum.

²⁷ Ethiopia Thematic Country Plan 2011-2015, ICCO alliance, update 2013.

they can address together, e.g. in dealing with the government. It is furthermore stressed that since the issue of access to and quality of health care is complex, the ICCO Alliance wants to work from its strength of partnerships with large community organisations (FBOs), which have gained experience over a number of years. This will improve the local organisational strengths of communities, to make them more relevant. Within these local organisations there will be a provision that marginalised local groups will be especially targeted. By the possibilities of linking and learning, the results of different Partner Organisations can be brought to a higher level, where systemic issues can be addressed as an Alliance. The documents received do not report on collaboration between MKC-RDA and the other ICCO Alliance Partners.

5.5 Explaining factors

5.5.1 Internal factors

One internal factor observed by Tear that influenced the work of MKC-RDA is their internal staff efficiency. Since the team in the project office seems well equipped, the 1.3 staff position at headquarters is questioned by the CFA. Especially since the communication and reporting done by headquarters was poor.²⁸

The quarterly meetings with program staff were overspent with 25% in 2012, whereas the bi-annual meetings with stakeholders were underspent with 25%.

5.5.2 External factors

MKC-RDA states that they are negatively affected by the Proclamation on Charities and Civil Societies and that aligning the programme's budget with the 70:30 legislation is difficult. Many costs are considered administrative costs like trainers fees, building rent, refreshments, transportation costs and salaries. Monitoring and evaluation efforts become especially difficult to organise because transportation costs and salaries are all considered administrative costs. For example since the program is implemented in the rather remote areas of Horo Guduru Wollega Zone in Abay Chomen and in the Horo district, the allocated budget for mileage was already finished halfway through the 2013-14 program. The implementation of the activities in these locations could however continue because the head office provided additional support and motor cycles were used as mileage only applies for vehicles. At the moment, MKC-RDA is following up the activities of the SHG and Fora, but no trainings or meetings are conducted due to unavailability of budget.²⁹

Another problem mentioned by MKC-RDA is extreme delay of budget releasing to run the program.

5.5.3 Relations CFA-SPO

Tear provides elaborated feedback on program proposals and progress reports drafted by MKC-RDA. Questions are asked on M&E choices like whether indicators really measure outcomes and how certain data will be obtained. Tear asks MKC-RDA to be clear on what it wants to measure and how it will measure results.³⁰ The responses given by MKC-RDA indicate however that some progress in M&E is still to be made in order to answer adequately to the questions raised. Additionally, Tear highlights the need for improvement in financing, both at office level as well as at central level.³¹

The last contract between Tear NL and MKC-RDA ended in June 2014. A new contract is currently being negotiated.

6 Discussion

6.1 Design of the intervention

Community involvement is increasingly being cited as a vital precondition for creating health-enabling social contexts that enable and support people in optimizing their opportunities for health and well-being (Tawil, Verster, & O'Reilly, 1995, p. 1299). It is said to play a vital role in enabling health-related behaviours and reducing HIV transmission (van Wyk, Strebel, Peltzer, & Skinner, 2006), stigma reduction (Poku & Sandkjaer, 2007), facilitating timely and appropriate accessing of health and welfare services where these exist (Campbell & Cornish, 2010), and supporting optimal treatment adherence (Coetzee et al., 2004). Community mobilization is given a key role in international AIDS policy, due to its perceived role in tackling the challenges of "reach" and "sustainability" that plague many HIV/AIDS interventions. Policies envisage that community based organisations play a central role in taking responsibility for HIV/AIDS. The scale of the problem, as well as the social marginalization of many affected groups, make it impossible for health and welfare professionals and services to reach the vast number and variety of people vulnerable to HIV and affected by AIDS. Policy documents consistently argue that community organisations are better placed than formal public services to reach "hard-to-reach" groups. Furthermore community organisations, drawing on local human resources, and often including the inputs of unpaid volunteers, are seen as more sustainable in the long-term than costly and donor dependent external interventions. A second reason for the international interest in community mobilisation is a pragmatic one in the light of the overall scarcity of health workers in many marginalized settings in which HIV/ AIDS flourishes. A growing number of projects rely on grassroots community members to provide HIV-prevention and AIDS-care (Ogden, Esim, & Grown, 2006; Schneider, Hlophe, & van Rensburg, 2008; van Damme, Kober, & Laga, 2006).

The above confirms MKC-RDA's project design in terms of working with the idirs, SHGs, and FAL groups to reduce stigma and discrimination within the community. Whereas the idirs play a role in awareness raising activities and extended their mandate to possibly help to integrate PLWHIV in society, the SHGs play an important role in reaching out to the most vulnerable households in society and providing them the opportunity to function as fully fledged members of the community. The availability of ART drugs forms a condition for PLWHIV to function in the community and be able to engage in SHGs or FAL groups.

In 2011, Tear supported a Master thesis on the impact of SHGs on the capacities of the people in Meta Robi, Ethiopia.³² This thesis stresses that although a lot of effort and time goes to encouragement and convincement, attitude change can take place when visible impact is reached. New SHGs will emerge when husbands and other outsiders get convinced of the usefulness of the group. Therefore in newer groups more attention is to be paid to skills training rather than encouragement. It is expected that others will follow when only a few start to cooperate initially. The interviews conducted with SHGs reveal a positive stance towards the usefulness of self-help groups and their contribution. In this thesis the crucial role of a capable and committed facilitator who helps in the early formation of a cluster level association (CLA)³³ to enhance independency after one or two years is furthermore highlighted.

³² Thesis Klaas Evers "Many hands make light work? The impact of self-help groups on the capabilities of people in Meta Robi, Ethiopia" (2011)

³³ Above SHGs, Cluster Level Associations (CLAs) are formed to represent and monitor a number of SHGs on village level. Per SHG 2 members are part of the CLA. Developed CLAs monitor the groups, initiate the formation of new groups and represent the interests of the SHGs to local governments and other relevant institutions (like Micro Finance Institutions (MFIs) and Banks).

Whilst comparing MKC-RDA's intervention design with that of others, we observe the following differences:

- In the first place EKHC's religious forum, apart from providing support to vulnerable people and solving conflicts at district level, is also directly engaging with the local administration to improve health services to vulnerable people. From the information available about MKC-RDA we observe that the 5 religious forums do not engage for this purpose with local administration. An interview with JeCCDO on a health project also highlighted the role of CBO forums to lobby for improved services.
- In the second place, the SHG and FAL groups established with support from MKC-RDA, apart from working on their primary focus which is earning incomes through income generating activities and stimulating adult literacy respectively, are used for community activities. This is one of the unclear aspects in the design of the project. JeCCDO for instance has clearer roles and responsibilities for SHGs and does not use these for awareness raising and community development activities.

These differences in approaches, not only amongst the partners in the ICCO cooperation, but also of other partners, provide a rich opportunity to assess what the most effective designs are.

7 Conclusion

With regards to MKC-RDA's efforts to build a vibrant civil society we conclude the following.

Changes in the civil society arena of the SPO

In the 2012 – 2014 period the two most important changes that took place in the civil society arena of MKC-RDA are related to the Civic Engagement and Perception of Impact dimension of CIVICUS. MKC-RDA managed to increase the involvement of PLHIV in society by organising PLHIV together with other community members into SHG's, which has resulted in more people mutually supporting each other and a reduction in stigma and discrimination. The involvement of PWDs increased by involving them in decision-making processes and by mainstreaming disability issues. MKC-RDA uses church and FBO leaders to identify the needs of beneficiaries and they play an important role in awareness creation activities.

Most significant changes were identified within the Perception of Impact dimension. MKC-RDA helped establish 71 new SHGs and 27 FAL groups between 2011 and 2013. Next to realising improved income for PLWHIV, the SHGs members got increasingly engaged in providing support for HIV- infected and AIDS-affected people. MKC-RDA furthermore initiated religious fora which contributed to improved religious tolerance in the community and which are engaged in a wide range of development activities. In terms of relations with the public sector, MKC-RDA increased the engagement of sector offices by inviting them for different discussions, trainings and review meetings. In some cases personnel from the sector offices provide training to the SHGs and CBOs capacity building program organized by MKC-RDA. MKC-RDA also interacts with the small and micro business offices on legalization of the SHGs and FAL groups.

Given the role assigned to NGOs in Ethiopia, MKC-RDA is not engaged in advocacy activities. However, by inviting public sector representatives to participate in the general meetings it organises, the communication remains open and effective. MKC-RDA is attempting to work with private health centres and sponsors for the idir coalition, but so far no concrete progress has been made.

Contribution analysis

The first outcome identified within the Strengthening Intermediate Organisations orientation is whether MKC-RDA contributed to a reduction in stigma and discrimination towards PLWHIV. The second outcome that we looked at within this orientation is the extent to which intermediate organisations like the idir and the religious fora were able of providing improved support to vulnerable people by mobilizing the community.

The main contributions by MKC-RDA to reach the first outcome consist of their efforts to form SHGs and the FAL groups that are mixed which enhance social integration. Its intention to organise people in SHGs, helps to create relations of mutual support amongst PLWHIV. Additionally, this creation of mutual support is a natural process as the groups are not formed with the aim of reducing stigma and discrimination, but it is more a natural result that emerges around other aims (i.e. generating an income or learning to read) and activities (i.e. building community latrines). This can be seen as a strength of this approach. Other actors and factors that explain the first outcome are: awareness raising campaigns of the government; community meetings organised by the government, and the awareness campaigns of school clubs. These factors and actors provide a necessary, but not sufficient explanation to the reduction of stigma and discrimination towards PLWHIV. The availability of ART drugs forms a condition for PLWHIV to function in the community and be able to engage in SHGs or FAL groups.

In relation to the second outcome, it can be concluded that the contribution of the idirs and the religious fora is significant. MKC-RDA's interventions work with existing community structures. The use of individual idirs to increase awareness and provide care and support services is a sustainable measure, as the idirs form the structure of the community; they are institutionalized and not likely to change easily. Working via these structures therefore increases the chances for sustainable interventions.

Within the second orientation, Civic Engagement, we looked at the extent to which MKC-RDA’s interventions helped to reintegrate PLWHIW into society and improved their social and economic capital to become a full member in society. This by means of supporting the PLWHIV to increase their income via SHGs.

We conclude that SHGs help PLWHIV in terms of mutually supporting each other and therefore enhances their social capital. The livelihoods of PLWHIV improve in economic terms when they receive start-up capital to start IGAs, however the success of these activities depend upon personal entrepreneurial skills of group members and the amount of the start-up capital given: though success stories are found, PLWHIV tend to switch between different forms of petty trade and daily labourers whenever the opportunity arises. Again, the availability of ART drugs forms an important condition for PLWHIV to be able to engage in SHGs.

Relevance

With regards to the baseline ToC, the interventions and outcomes achieved are partly relevant since MKC-RDA’s contributions are mostly related to the second contribution formulated in their ToC, being economic empowerment of CBOs and by the creation of Self Help Groups (SHG) and Functional Adult Literacy (FAL) groups.

With regards to the context in which MKC-RDA is operating, its interventions and outcomes achieved are relevant because there are only a few other civil society organization working in MKC-RDA’s intervention area. The ones that are there, are not working on the same topics and issues as MKC-RDA.

With regards to the CS policies of Tear, MKC-RDA’s interventions and outcomes are relevant because the growth in numbers of SHGs fits their CS policy.

Explaining factors

Internal factors within the SPO that explain the findings are internal staff inefficiency and the overspending on program staff and underspending of stakeholder meetings. External factors that explain the findings are the difficulties encountered when trying to align the programme’s budget with the Ethiopian legislation, getting the budget approved by the government, and extreme delays in budget releasing.

Factors that explain the findings that are related to the relation between the MKC-RDA and Tear are the questions raised on M&E efforts of MKC-RDA and the need for improvement in financial reporting.

Design

With regards to the design of the intervention, we visited different partner organisations each working to address HIVAIDS, access to health services and addressing the social and economic inclusion of marginalised groups in society. This variety of approaches can be seized to assess what the most effective design would be, not only within the ICCO programmatic Health Programme, but also including other Ethiopian NGOs.

Table 2
Summary of findings.

When looking at the MFS II interventions of this SPO to strengthen civil society and/or policy influencing, how much do you agree with the following statements?	Score
The CS interventions were well designed	7
The CS interventions were implemented as designed	5
The CS interventions reached their objectives	6
The observed outcomes are attributable to the CS interventions	6
The observed CS outcomes are relevant to the beneficiaries of the SPO	6

Score between 1 to 10, with 1 being “not at all” and 10 being “completely”.

Appendix 1 Civil Society Scores

This table presents the appreciation of the evaluation team regarding changes occurred for each indicator between 2012 and 2014 on a scale of -2 to + 2

- 2 = Considerable deterioration

- 1 = A slight deterioration

0 = no change occurred, the situation is the same as in 2012

+1 = slight improvement

+2 = considerable improvement

Dimension		Indicators	Question	Change in the indicators in the 2012 – 2014 period
Civic engagement	1	Needs of marginalised groups	How does your organisation take the needs of your beneficiaries/target groups, in particular marginalised groups into account in your planning, actions, activities, and/or strategies?	+1
	2	Involvement of target groups	What is the level of participation of your beneficiaries/target groups, in particular marginalised groups in the analysis, planning and evaluation of your activities?	+0
	3	Political engagement	How intense is your (individual staff or organisational) participation in locally-nationally elected bodies and/or sectoral user groups?	+0
Level of organisation	5	Relations with other organisations	In the past 12 months what has been the most intensive interaction you had with other CSOs?	+ 1
	5	Frequency of dialogue with closest CSO	In the past 12 months how many meetings did you have with the CSO that you have most intensive interaction with?	+0
	6	Defending the interests of marginalised groups	Which CSO are most effective in defending the interests of your target groups? In the past 12 months, how did you relate to those CSOs?	-1
	7	Composition current financial resource base	How does your organisation finance institutional costs such as workshops of the General Assembly (if applicable); attendance to workshops of other CSOs; costs for organisational growth and/or networking?	+0
Practice of Values	8	Downward accountability	To what extent can mandatory social organs (steering committee, general assembly, internal auditing group) ask your executive leaders to be accountable to them?	+0
	9	Composition of social organs	What % of members of your mandatory social organs belong to the marginalised target groups you are working with/for?	+0
	10	External financial auditing	How regularly is your organisation audited externally?	+0
Perception of impact	11	Client satisfaction	What are the most important concerns of your target groups? How do your services take into account those important concerns?	+1
	12	Civil society impact.	In the past 12 months, what impact did you have on building a strong civil society?	+1
	13	Relation with public sector organisations.	In the past 12 months, what interaction did you have with public sector organisations to realise your programme and organisations' objectives?	+1
	14	Relation with private sector organisations	In the past 12 months, what interaction did you have with private sector organisations to realise your programme and organisations' perspective?	+0

	15	Influence upon public policies, rules, regulations	How successful have you been in influencing public policies and practices in the past 2 years?	+0
	16	Influence upon private sector agencies' policies, rules, regulations.	How successful have you been in influencing private sector policies and practices in the past 2 years?	+0
CS context				
	17	Coping strategies	In the past 2 years, how did your organisation cope with these changes in the context that may have been positive or negative consequences for civil society.	-1

Appendix 2 Changes in civil society indicators between 2012 and 2014

1. Civic Engagement

1.1 Needs of marginalised groups SPO

MKC acknowledges the importance of community involvement and participation to ensure program sustainability. The SPO therefore identifies the needs of marginalized groups through various ways like community discussions, trainings and experience sharing. Furthermore, local stakeholders and line organizations participate in identifying the needs of the beneficiaries. Accordingly, change agents (such as church leaders) are capacitated to play a role in addressing stigma, denial and discrimination. Between 2011 and 2013, 48 FBO leaders and evangelists received training on community mobilization and 28 FBO leaders and evangelists were trained on gender and disability mainstreaming. Additionally, since the program mainstreamed disability³⁴ issues, 65 PWDs were involved in decision making meetings.

Other achievements in this area include:

- Discussion sessions for 4438 SHG members and 3041 vulnerable women on reproductive health, family planning, and PPTCT were conducted between 2011 and 2013.³⁵ Additionally, psychosocial support was provided for 18 OVCs and Health education provided for PLHIVs in the project sites.
- Provide apple seedling for 30 rural SHGs and PLHIV so that they can sustain their response to OVC support (5 apple seedlings per person)
- Facilitate referral and mobile HCT campaign for 3500 people/year at three towns in collaboration with government health institutions
- 36 youths trained on peer education and facilitation skills
- 3814 persons tested between July 2011 and December 2012³⁶
- Health education provided for PLHIVs in the project sites. The document mentions that at least 40 PLHIVs are reached once per quarter.
- 6000 youths in the churches, schools and out of schools were reached via a cascade peer education system
- Community conversations on health and HIV with new idir CBOs were conducted once a month

Score: +2

1.2 Involvement of target groups SPO

It is reported that all categories of the community and local institutions participate in all programme implementation stages. The community and local institutions know the objective of the programme and they also participated in the planning and evaluation of the programme. They are planning at their village with collaboration of local institutions and volunteers. The quarterly report of 2013 mentions that 496 people from the program target groups (PWHIV, SHGs and FAL leader and forum representatives, PWD, volunteers, CC facilitators and health professional) participated in the discussions and trainings arranged. Additionally, MKC-RDA organised conversations between

³⁴ Mentioned in bi-annual report July-December 2013

³⁵ Differences in percentages could not be calculated as the total numbers of SHG members, vulnerable women and youth educated against what was planned is missing in the project documents.

³⁶ No HIV testing due to shortage testing kits in July – December 2013

community members, health service providers and vulnerable groups to increase access to basic health services.

MKC-RDA, apart from including church people also includes non-church people in its development activities by means of using CCMD and UMOJA strategies that guarantee the involvement of the whole community. Capacitating government institutions, like school health institutions and local CBOs like clubs further assured inclusion of the whole community.

Score: +1

1.3 Intensity of political engagement SPO

MKC-RDA does not involve in any political activities as an NGO. However, as was mentioned in the baseline, some of the programme activities like women empowerment and gender equality might be considered political. No change was observed in this area since the baseline.

Score: 0

2. Level of Organisation

2.1 Relations with other organisations SPO

It is reported that there are only a few other civil society organisations working in the two districts and towns that MKC-RDA's is covering³⁷ The ones that are there are not working on the same topics and issues as MKC-RDA. This was also mentioned during the baseline evaluation, and explains the limited relations of MKC-RDA with other organisations. However, MKC did interact with CBO leaders and club leaders in the past two years during various trainings and discussions held.

Score: 0

2.2 Frequency of dialogue with closest civil society organisation SPO

Though there are a limited number of other NGOs in the intervention area, different discussions were held in the past twelve months with stakeholders at different levels. At the program/ village level weekly meetings with SHGs and FAL and monthly meetings with PLHIV associations, CC groups and local churches were held. In these discussions MKC-RDA is represented by the program staff. Staff meetings were also held at organizational level. These are conducted every month, quarter and biannually, though these may be shifted or cancelled due to shortage of budget.

Score: +1

2.3 Defending the interests of marginalised groups SPO

Defending the interests of marginalized groups is mainly done via local churches, CLA representatives³⁸, SHGs and FAL groups. These groups and representatives are capacitated through various trainings and awareness creation activities about their rights and responsibilities, which increased the self-esteem among the group members. For example, discussion sessions were organised with FBO leaders and evangelists on CCMD for 2 days, and similar discussions were held with CLA representatives on resource mobilization.

Local churches are seen as important in defending the interests of marginalized groups as they are well aware about what is happening in the communities and are perceived as capable because they have received the necessary training.³⁹ Now the programme works with 36 local churches. Next to

³⁹ Interview with field staff

churches, other faith based organizations are perceived as having the capacity to defend the marginalized groups.⁴⁰

Score: +1

2.4 Composition financial resource base SPO

Though no changes in the composition of the financial resource base of MKC-RDA were found, the effective implementation of the existing projects, including the one in Fincha Shambu, helped to have two new health projects⁴¹. On a different level, school clubs and fora are working on fundraising activities together with the school and church community to help needy students, OVCs and PLHIV. There are five fora established in five locations where MKC operates. Each forum is composed of representatives from various religious institutions, sector offices of the local government, and Idirs. The objective was to promote societal behavioural change for development, conflict resolution, and maintaining peace and stability in the locality. Three of the five forums provide educational support to 186 OVC through mobilizing resources from the community. 69 individual idirs support 2 PLWHIV and 45 OVC.

Score: 0

3. Practice of Values

3.1 Downward accountability SPO

MKC RDA does not report on any significant changes in terms of downward accountability as they still involve program staff via quarterly review meetings. Bi-annual review meetings with stakeholders are also still conducted to ensure downward accountability and to trace the project implementation progress. The quarterly meetings with program staff were overspent with 25% in 2012, whereas the bi-annual meetings with stakeholders were underspent with 25%.

The project has a small office in Shambu town, where the coordinator and the social mobilising officer are based, together with 2 finance staff. The CFA questions the need for these two finance staff to run this programme. They propose the finance employees expand their work to the SHGs because the CFA noticed that assistance in financial control is needed there.⁴²

Score: 0

3.2 Composition of social organs SPO

There has no structural change in the SPO that can lead to social organs of the SPO.

Score: 0

3.3 External financial auditing SPO

It is mandated by the government that any organization has to report its financial situation on a yearly basis, where the budget year ends in June. In order to report on the financial activities of an organisation the company/institution/NGO must have a stamped audit report from an external auditor after thorough evaluation of the whole organizational activities.

All finances of MKC-RDA are administered in Addis Ababa, since the previous accountant in Shambu could not handle the system. The present accountant has worked for 10 months in a government office, and is still very new in the job. The CFA comments that it seemed important that he gets

⁴⁰ Interview with field staff

⁴¹ Interview with program manager

enough support, so that accounts can be done in Shambu itself in order for the finance work to become more accurate.⁴³

Score: 0

4. Perception of Impact

4.1 Client satisfaction SPO

Individual beneficiaries as well as intermediate organisations such as idirs, churches etc stated that they are satisfied with the activity of the SPO in the two years under review. The SPO helped establish 73 SHGs and 27 FAL groups between 2011 and 2014 and these groups got involved in different income generating activities to improve their income. The rural SHG and FAL groups were able to engage in agricultural activities and benefit from the crops they harvested. In addition some of these groups (14 SHG and 4 FAL groups) were able to get approved as a legal entity by the concerned local administration office. They have also benefited from trainings, discussions and experience sharing stages that help improve the quality and quantity of the beneficiaries. Representatives of beneficiaries that are involved in the stakeholders meeting express satisfaction on the project results. MKC-RDA furthermore initiated five religious fora. One of the benefits of the existence of the fora which was highlighted by the forum members is the improved religious tolerance in the community. The reduction in religious tolerance is seen from the willingness of church and mosque leaders to come together for common interest. That is, if the leaders showed increased mutual understanding it is believed to trickle down to the community

Score: +1

4.2 Civil society impact SPO

The main achievements of MKC-RDA in this area consist of the establishment and support of SHGs, FALs, and a religious forum. In addition, MKC-RDA helped to strengthen several idirs in the locality. The discussion made with the SHG revealed the presence of increased saving and income due to the formation and support of the groups. However, given the prevailing high cost of living and the lower interest rates it is observed that the income and saving generated are too little to fulfil in their basic needs. The performance of the SHGs was rather substantial from mobilization and information sharing point of view. They disseminated HIV and health information to more than 15,000 community members. They also mobilized members from five local churches and CBOs for voluntary HIV counselling and testing. They also worked with government institutions and public schools in combating HIV-related stigma, harmful traditional practices (particularly female genital cutting) and gender inequalities.

The Intermediate Organisations have showed noticeable improvement. The idirs are formed by the community to support one another in times of death and mourning. But with the involvement of the SPO about 69 idirs changed their bylaws to engage in supporting vulnerable groups of the community in life (particularly OVC and PLHIV). In addition, CBO members discuss on issues particularly on HIV/AIDS, harmful traditional practices, and gender based violence.

Project facilitators and local church leaders have been influential in facilitating HIV counselling and testing campaigns at schools and health institutions in collaboration with the district health office. Additionally, religious leaders and health professionals, including VCT counsellors, have discussed the current status of counselling strategies and its role in the prevention and control of HIV & AIDS, in particular for the most vulnerable groups. Religious leaders' got involved in life skill education, marriage counselling and premarital HIV counselling and testing. Disability and gender mainstreaming meetings organised by MKC-RDA enabled them to gain the basic facts about the issues.

⁴³ Tweede beoordeling HIV MKC-RDA (2013/14)

Other achievements in this area include:

- The number of local institutions that developed HIV & AIDS policy manuals increased with 2% between 2011 and 2013. These local institutions include 20 schools, 60 Idirs, 28 local churches, six other religious institutions.⁴⁴
- 1 cross experience sharing session among religious leaders, PLHIV associations and local community representatives on health and HIV/AIDS;
- 20 leaders of PLHIV associations, women associations and religious institutions trained on sustainable livelihood and Disaster Risk Reduction;
- 40 school leaders and members of AACs or girls clubs participated in a resource mobilization workshop;
- Consultation session organised for two days with hospital and health center workers, Micro Finance Institutions, religious leaders, and district administrative representatives to strengthen the health network.
- Experience sharing stages organised among volunteer CC facilitators, idirs, health extension workers and forum representatives once per year.

Score: +1

4.3 Relation with public sector organisations SPO

The SPO closely works with the concerned government sector offices in the Woreda, particularly with the health, child and women affairs, and finance and economic development offices. They engage with the sector offices in different discussions, trainings and review meetings. In some cases personnel from the sector offices provides training to the SHGs and CBOs capacity building program organized by MKC-RDA. A change in involvement since the baseline is the inclusion of ministers of the church, next to FBO leaders, in a three day training on gender and disability mainstreaming.⁴⁵

MKC-RDA is also involved as secretary in the GO-NGO forum organized at zonal level and established by the finance and economic development office to enhance the partnership relationship among NGO and government organizations that are operating in the area. In addition government organizations like the zonal health office invite MKC-RDA during planning and review meetings. MKC-RDA also interacts with the small and micro business offices regarding the legalization of the SHGs and FAL groups. Though the interviewees of MKC-RDA agreed relations with the public sector have increased since the baseline, subgroups were divided as to the magnitude of the change. The divergence occurred as one group said the changes were considerably high while the other group said it was only a small improvement. MKC continued to closely working with Fincha sugar factory mainly on HIV awareness creation and VCT campaigns. The head of the social affairs committee of the factory is heading a forum established in mid-2013.

Score: +1

4.4 Relation with private sector agencies SPO

No change occurred in this regard as the SPO does not work with the private sector.

Score: 0

4.5 Influence upon public policies, rules, regulations SPO

The situation is the same as the baseline in the sense that the SPO does not involve in any public policy influencing activity whatsoever. However, some of the program activities might be considered as political, such as women empowerment, gender equality and understanding of their right. Though there are no concrete results documented, it is mentioned that CBOs lobby district and kebele level

⁴⁴ From the project documents, the total numbers of schools, Idirs, local churches and other religious institutions that developed HIV-AIDS policies could not be retrieved and hence what % this is against the total number of these institutions is not known.

⁴⁵ Interview with field staff

sector offices (particularly children and women office and the health office) as well as prominent/influential people and elders at kebele level. Issues raised includes sending females to school, abolishing female gentile cutting, among others.

Score: 0

4.6 Influence upon private sector agencies' policies, rules, regulations SPO

MKC-RDA has not played any part in influencing the regulations and policies within the private sector as its communication with those in the private sector is very minimal.

Score: 0

5. Environment

5.1 Coping strategies

The SPO has been closely collaborating with the CBOs, government offices and beneficiaries. This is the main strategy for ensuring the sustainability of the program implementation. Although most SHGs and FAL groups received land from the local government to operate their business, a few did not because land allocation by the government has become highly restricted and a long procedure. The SPO attempts to link SHG and FAL members to micro finance institutions (MFI) as a means to engage in income generating activities, but not all places where MKC-RDA works has these MFIs in place.

The Centre for Development Innovation works on processes of innovation and change in the areas of food and nutrition security, adaptive agriculture, sustainable markets, ecosystem governance, and conflict, disaster and reconstruction. It is an interdisciplinary and internationally focused unit of Wageningen UR within the Social Sciences Group. Our work fosters collaboration between citizens, governments, businesses, NGOs, and the scientific community. Our worldwide network of partners and clients links with us to help facilitate innovation, create capacities for change and broker knowledge.

The mission of Wageningen UR (University & Research centre) is 'To explore the potential of nature to improve the quality of life'. Within Wageningen UR, nine specialised research institutes of the DLO Foundation have joined forces with Wageningen University to help answer the most important questions in the domain of healthy food and living environment. With approximately 30 locations, 6,000 members of staff and 9,000 students, Wageningen UR is one of the leading organisations in its domain worldwide. The integral approach to problems and the cooperation between the various disciplines are at the heart of the unique Wageningen Approach.

Klaver, D.C., Jacobs, J., Tefera, W., Getaw, H., Dereje Getu D., February 2015, *OSSA end line report; MFS II country evaluations, Civil Society component*, Centre for Development Innovation, Wageningen UR (University & Research centre) and International Food Policy Research Institute (IFPRI). Report CDI-15-019. Wageningen.

This report describes the findings of the end line assessment of the Ethiopian Organisation for Social Services for AIDS (OSSA) that is a partner of Cordaid.

The evaluation was commissioned by NWO-WOTRO, the Netherlands Organisation for Scientific Research in the Netherlands and is part of the programmatic evaluation of the Co-Financing System - MFS II financed by the Dutch Government, whose overall aim is to strengthen civil society in the South as a building block for structural poverty reduction. Apart from assessing impact on MDGs, the evaluation also assesses the contribution of the Dutch Co-Funding Agencies to strengthen the capacities of their Southern Partners, as well as the contribution of these partners towards building a vibrant civil society arena.

This report assesses OSSA's contribution towards strengthening Civil Society in Ethiopia and for this exercise it used the CIVICUS analytical framework. It is a follow-up of a baseline study conducted in 2012. Key questions that are being answered comprise changes in the five CIVICUS dimensions to which OSSA contributed; the nature of its contribution; the relevance of the contribution made and an identification of factors that explain OSSA's role in civil society strengthening.

Keywords: Civil Society, CIVICUS, theory based evaluation, process-tracing

1 Introduction

This report presents the civil society end line findings of the Organisation for Social Services for Aids (OSSA) in Ethiopia which is a partner of Cordaid under the Communities of Change consortium. It is a follow-up to the baseline assessment that was carried out in 2012. According to the information provided during the baseline study OSSA is working on MDG 4,5,6: Health.

These findings are part of the overall evaluation of the joint MFS II evaluations to account for results of MFS II-funded or –co-funded development interventions implemented by Dutch CFAs and/or their Southern Partner Organisations (SPO) and to contribute to the improvement of future development interventions. The civil society evaluation uses the CIVICUS framework (see appendix 1) and seeks to answer the following questions:

- What are the changes in civil society in the 2012-2014 period, with particular focus on the relevant MDGs & themes in the selected country?
- To what degree are the changes identified attributable to the development interventions of the Southern partners of the MFS II consortia (i.e. measuring effectiveness)?
- What is the relevance of these changes?
- What factors explain the findings drawn from the questions above?

The CIVICUS framework that comprises five dimensions (civic engagement, level of organisation, practice of values, perception of impact and contexts influencing agency by civil society in general) has been used to orient the evaluation methodology.

Changes in the civil society arena of the SPO

In the 2012 – 2014 period the two most important changes that took place in the civil society arena of OSSA are related to the Civic Engagement and Perception of Impact dimension of CIVICUS.

OSSA slightly managed to increase the involvement of the volunteers in supporting OVC and PLWHIV on a diverse range of issues and it managed to organise guardians into saving associations that, though not providing increased incomes, has contributed to more peoples mutually supporting each other. Apart from this its awareness raising activities help to integrate People Living with HIV (PLWHIV) and vulnerable families that take care of Orphans and Vulnerable Children (OVC) into society. OSSA also intensified its interactions with beneficiary groups to ensure that its interventions were relevant. These changes notified under Civic Engagement also partly explain those of the Perception of Impact dimension, because there is an overlap between both dimensions. Apart from this, a slight change occurred in the extent to which OSSA supported the idir coalition, the AACs, the PPTCTs in only in the first semester of 2014, intending to transfer OSSA's roles and responsibilities to these structures that are however not capable of fulfilling these. Its collaboration with the local government services intensified in the period under evaluation.

These findings were obtained through an analysis of documents, a workshop and follow-up interviews with the SPO, and interviews with external resources persons working in civil society organisations that receive support from the SPO; other civil society organisations with whom the SPO is collaborating; public or private sector agents and; external resource persons capable of overlooking the MDG or theme on which the SPO is concentrating.

Contribution analysis

Based upon an analysis of the projects and programmes financed by the Dutch NGOs, four orientations strategic for civil society development were identified: Ensuring that more people from more diverse background are engaging in civil society activities; ensuring that the organisations that receive support from the SPO are capable of playing their role in civil society – intermediate organisations; strengthening the relations with other organisations in civil society to undertake joint activities (networking), and; influencing policies and practices of public or private sector organisations. For Ethiopia the focus was initially on the intermediate organisations and on the position of SPOs in their respective networks. The Ethiopian team however concluded that there is little room for networking amongst NGOs in Ethiopia, and that NGOs mainly collaborate with each other by

instigation of the government to come to a division of labour per district and region. Therefore the second strategic orientation for most SPOs is now focussing on civic engagement.

Based upon an estimation of the percentage of the total MFS II budget related to interventions that are relevant for civil society, those SPOs whose absolute budgets for civil society were most important were selected for in-depth process tracing on two outcomes related to the above mentioned strategic orientations. The evaluation team conducted a quick assessment on contribution of the other SPOs. OSSA is amongst those SPOs selected for in-depth-process tracing.

The first outcome that we looked at is based upon the perception (no figures available) that OVCs and PLWHIV improved their social and economic capital to become a full member in society. The most plausible explanation of this change is that the system put in place to identify vulnerable OVCs and PLWHIV is effective; the access to free ART provided by the government, and; community conversations that not only make people aware that PLWHIV can live with effective ART treatments but also helps to identify possibly infected persons. When these conditions are in place, mutually support of PLWHIV, support to these people to engage in IGA or to assist them in finding jobs as daily labourers help them to further reintegrate into society. OSSA's most important contribution consists of their support to organise community conversations in the kebeles and covering other medical costs. Organising PLWHIV in a saving association helps to create mutual support, but obliging members of the association to save money on a bank account of a micro finance institution for one year in a context of rampant inflation is to be considered as an adverse effect of the intervention.

The second outcome that we looked at is the extent to which intermediate organisations like the idir coalition, individual idirs, AACs and the PPTCT support groups increased the number of persons being referred to health centres for testing and access to free ART when necessary. OSSA's most important strategy to work with an idir coalition does not provide the explanation to the outcome. Community conversations organised by idirs are effective and sustainable strategies. Another factor that explains the increase is the availability of free ART, compulsory testing of pregnant women at health centres and voluntary testing of health centre visitors. OSSA's role with regard to this outcome of increased referral systems is not convincing. Their work through the idir coalition does not explain the outcome and volunteers are not sufficiently motivated to do a good job.

Relevance

Interviews with staff of OSSA, with external resource persons, with the liaison officer of Cordaid, as well as contextual information helped to assess the relevance of OSSA's interventions in terms of; its Theory of Change (ToC) for Civil Society (SC) as designed during the baseline study; the context in which OSSA is operating; the CS policies of Cordaid.

With regards to the baseline ToC, the interventions and outcomes achieved are not relevant because OSSA wanted to create a civil society that is providing services to society through amongst others a strong idir coalition and strong AAC and PPTCT support groups. These groups are not performing.

With regards to the context in which OSSA is operating, its interventions and outcomes achieved are relevant in terms of supporting community conversations on HIVAIDS and working with volunteers that provide care and support services and assist PLWHIV and the guardians of OVC with IGAs. Through these interventions people can become part of society again. We observe however that the government itself also creates an environment to prevent HIVAIDS by increasing the possibilities for testing and by the administration of ART free of charge.

With regards to the CS policies of Cordaid, OSSA's interventions and outcomes are slightly relevant because its vision is that strong CBOs and motivated volunteers will bring about change. However OSSA did not succeed in strengthening the capacities of the organisations it works with.

Explaining factors

The information related to factors that explain the above findings was collected at the same time as the data were gathered for the previous questions. The evaluation team looked at internal factors within the OSSA, the external context in which it operates and the relations between OSSA and Cordaid.

With regards to internal factors, the evaluation team concludes that; human resources are missing at the OSSA branches that implement the project; OSSA, despite financial management training provided by Cordaid, still misses the capacity to properly manage projects financially. Apart from this, the four

project sites that Cordaid supports became independent from each other as of January 2014, further complicating adequate reporting on progress beyond output.

The most important external factors that explain the findings above are that: OSSA faces difficulties to comply with the 30/70% regulation, implying that it decided to economise on its monitoring and evaluation activities. Other factors are the high inflation rate that affects savings by beneficiaries and purchasing power of OSSA's staff and the frequent relocation of health centres which affects the financial capacity of volunteers to refer people to these centres.

With regards to the relation between OSSA and Cordaid we observe that Cordaid's decision to shift OSSA from the health to the education department in January 2013 implied an end to further collaboration and the implementation of an unsustainable exit strategy designed by OSSA.

The following chapter briefly describes the political context, the civil society context and the relevant background with regards to the Health sector that OSSA is working on. Chapter three provides background information on OSSA, the relation of its MFS II interventions with the CIVICUS framework and specific information on the contract with Cordaid. Deviations to the evaluation methodology and choice made with regards to the selection of the outcomes for contribution analysis, as well as difficulties encountered during data collection are to be found in chapter 4. The answers to each of the evaluation questions are being presented in chapter 5, followed by a discussion on the general project design in relation to CS development; an assessment of what elements of the project design may possibly work in other contexts or be implemented by other organisations in chapter 6. Conclusions are presented in chapter 7.

2 Context

This paragraph briefly describes the context OSSA is working in. A description of the Civil Society Context assessed according to the CIVICUS framework is provided in appendix 3 of the country report for Civil Society.

2.1 Political context

The Ethiopian Government has enacted a five year Growth and Transformation Plan (GTP) to implement over the period of 2011-2015¹. Two of the major objectives of the plan are to maintain at least an average real GDP growth rate of 11%, meet the Millennium Development goals, and expand and ensure the qualities of education and health services thereby achieving the MDGs in the social sectors (FDRE, 2010). The government acknowledged that NGO's and CSO have an important role to play in the implementation of this plan: According to the preamble of the new charities and societies proclamation NO. 621/2009 of Ethiopia, civil society's role is to help and facilitate in the overall development of the country². This is manifested in the government's approach of participatory development planning procedures. For example, NGOs established a taskforce under the umbrella of the CCRDA to take part in the formulation of the country's first Poverty Reduction Strategy paper formulation. They were a major stakeholder in the planning process of the five year GTP plan. Despite fears that the NO. 621/2009 proclamation was thought to have negative impacts on Civil Society, the number of newly registered charities and societies have increased considerably. 800 new charities and civil societies were registered between 2010/11 and 2011/12 and as of February 2012, these were implementing over 113.916 projects in different social, economic and governance related sectors. Governance related projects comprise interventions in the area of democracy and good governance, peace and security, human rights, justice, and capacity building. The charities and societies are most engaged in the health sector (19.8%), followed by child affairs (11.9%), education (9.2%), governance (8.3%) and other social issues (7.8%). These figures are more or less similar to the pre-proclamation period, and would imply that new charities or societies have replaced foreign and Ethiopian charities that are not allowed to work on sectors related to governance and human rights³. This might indicate that there might have been some flexibility in the interpretation of some of the provisions of the proclamation.

2.2 Civil Society context issues with regards to the MDG

A 20-year Health Sector Development Programme consisting of a series of 5-year rolling programmes was established in 1997–1998. Currently, the Health Sector Development Program IV 2010/11–2014/15 is rolled out. The recently implemented Business Process Reengineering of the health sector has introduced a three-tier health care delivery system which is characterized by a first level of a Woreda/District health system comprising a primary hospital (with a population coverage of 60,000–100,000 people), health centres (1/15,000–25,000 persons) and their satellite Health Posts (1/3,000–5,000 persons) that are connected to each other by a referral system. A Primary Hospital, Health centres and health posts form a Primary Health Care Unit (PHCU) with each health centre having five satellite health posts. The second level in the tier is a General Hospital with a population coverage of 1–1.5 million people; and the third a Specialized Hospital that covers population of 3.5–5 million.

The current health program also introduced a strategy to prevent and control major infectious diseases and to increase its coverage in the rural areas with the appointment of Health Extension Workers. Despite this still categories in society are still not being reached, including street children and youth, commercial sex workers, people with disabilities, PLWHIV, OVCs, destitute women and people living in geographically marginalized areas. In response to this gap, a number of actors, in particular NGOs, are striving to focus on the vulnerable groups of the community with the main purpose of improving access, quality and sustainability of health facilities and health services⁴.

The Ethiopian Health care system currently experiences a rapid expansion of private sector organisations and NGOs playing significant role in boosting the health service coverage and delivery of services through public/private/NGOs partnership. Health offices at different administrative levels from the Federal Ministry of Health to Regional Health Bureaus and Woreda Health Offices share decision making processes, decision powers, duties and responsibilities. The Federal and the Regional Offices are in charge of policy formulation and providing technical support whilst the Woreda Offices manage and coordinate the operation the district health system under their jurisdiction. The devolution of competencies to regional governments has resulted in a more decentralised decision making process.

Several reports indicate that Ethiopia the prevalence of HIV/AIDS has sharply decreased from 1.3 million persons in 2011 to 760,000 persons living with HIV/AIDS in 2013 (UNAIDS, 2013). However, the magnitude of socio-economic and psycho-social problems caused by the HIV/AIDS pandemic is still rampant: some 840,000 children lost one or both parents due to HIV/AIDS and were left behind without adequate parental care.⁵

3 OSSA and its contribution to civil society/policy changes

3.1 Background of OSSA

History

OSSA is an indigenous humanitarian organisation working in communities to reduce the spread of HIV/AIDS in Ethiopia. It was founded in 1989 by a group of religious ministers from various faiths in Ethiopia (Orthodox Christian, Catholic, Muslim and Evangelical) in conjunction with the Ministry of Health. The founding of OSSA was a response to the growing incidence of HIV/AIDS in Ethiopia.

For more than 20 years the organisation has been working on prevention of HIV infection as well as care and support for the infected and affected individuals and groups. It has a long experience of working with the community, government offices, international & bi-lateral organisations. Many of OSSA's activities take place for and with youth - as it is essential that the younger generation understands the ways in which HIV is spread and how to prevent it.

In 2013, OSSA supported over 20,000 OVC, 5,000 PLHIV (People Living with HIV) and a large number of AIDS affected families. OSSA also supports more than 200 Anti-AIDS and girls clubs which in turn are working with thousands of young men and women throughout the country. We observe however that these figures did not change since 2008.

OSSA is a rather large NGO with operations throughout the country operating from 11 branch offices, 6 sub branch offices and the head office and has an annual turnover of EUR 3.200.000. The organisation has about 405 staff members. In addition, OSSA works with more than 3,000 community volunteers and 221 community-based organisations at grassroots level. The OSSA Hawassa branch works with 140 community volunteers and 16 community based organisations (CBO) at the grassroots level. OSSA became a Linking Organisation for the International Aids Alliance in 2011. As a linking organisation the organisation works with young people in Ethiopia as part of the Link Up project: an ambitious, five country programme which aims to improve the sexual and reproductive health and rights of more than one million young people over three years.

Between 2011 and 2014 OSSA was working in Oromiya, Amhara, SNNPR, Tigray, Addis Ababa, Benishangul-Gumuz, Afar, Somali, Dire Dawa and Harari. OSSA has reached more than 660 kebeles with a total population of 2.8 million directly or indirectly through community-based care and support for OVC (Orphans and Vulnerable Children) and PLHIV, community conversations, stepping stones, peer education, youth dialogue, PAPAS (participatory AIDS prevention and support), Prevention of Mothers to Child Transmission (PMTCT), sexual reproductive health, family planning and livelihood schemes.

With many staff and volunteers and a large geographic coverage, OSSA is well respected and claims to be the largest HIV/AIDS specific NGO in the country. Its **vision** is to see local communities in which the spread of HIV is controlled, healthy sexual reproductive behaviours are being developed, adequate care and support are being provided to the infected and affected, and their human rights protected irrespective of their age and gender.

Mission

OSSA is dedicated to initiating, coordinating, facilitating and promoting local community-based responses, designed to reduce the spread of HIV, promote Human rights and justice & alleviate socio-economic impacts of HIV/AIDS.

Main strategic actions

The strategy between 2011 and 2014 for the Cordaid funded projects is to transform from direct household interventions to community interventions through capacity building, economic strengthening and transfer of responsibilities from OSSA to CBOs with emphasis on gender issues.

- Income Generating Activities (IGA) - through income generating activities OSSA tries to prevent and reduce the hazardous socio-economic and health impacts of HIV/AIDS on the life of OVC's and their guardians. OSSA selects OVC's together with stakeholders and kebele representatives. The selected OVC's receive a three day training on making a business plan. After the training OSSA provides start-up capital;
- Anti-AIDS and Reproductive Health clubs - these are established with the help of volunteer youths. The aim is to stem the spread of AIDS through improving youth awareness of HIV/AIDS on how the virus is passed on. OSSA provides the clubs with training and support. These clubs provide a way for peer-to-peer education to take place among young people;
- Provision and running of Voluntary Counselling & Testing (VCT) centres - VCT centres provide safe and confidential testing and counselling services to members of the public who wish to be tested for HIV;
- Care and support for people living with HIV and AIDS (PLWHA) - OSSA provides counselling services and financial support for people referred by various testing centres. If a parent dies from AIDS, OSSA continues to take care of his/her children;
- Hotline Information Service - this a free phone number that anyone can call for HIV/AIDS and Reproductive Health information and counselling. The phone line is manned by trained OSSA hotline counsellors. There are two lines, in the different local languages of Tigrigna and Amharic;
- Publication and distribution of IEC (information, education and communication) materials - OSSA publishes and distributes free leaflets, posters and newsletters aimed at building awareness of HIV/AIDS prevention and control. MFS II interventions related to Civil Society. With Cordaid's funds OSSA implemented two projects between 2008 and 2014 within its sub branches at Arba Minch, Shebedino, Hossana and Hawassa City Administration.

The project between 01-10-2008 and 31-12-2012 is called "Integrated HIV/AIDS prevention, care and treatment for people living with HIV/AIDS and OVC through Self-Reliance". Its overall objective is to improve the wellbeing of people living with HIV/AIDS, orphans and vulnerable children (OVCs), youth and families affected by AIDS pandemic. Outcomes are increased income, self-esteem, improved interpersonal relationships, nutritional status of 1100 PLWHA and OVC households; increased access of these households to health care services and protection of their rights; and a network of CBOs, FBOs, NGOs, women association, public service providers and micro finance institutions strengthened.

At the beginning of 2013 four baseline assessments were carried out at the four project sides to assess the needs of OSSA's target group. As a result the project between 01-01-2013 and 31-12-2013, called "HIV/AIDS prevention and impact mitigation on OVC's and their families/guardians", focused more on economic empowerment. The overall objective is to contribute to a sustainable economic and social empowerment of OVCs including HIV/AIDS affected children and youngsters, their guardians, families and their communities. OSSA tries to reach their objective by engaging and capacitating 8 CBO Coalition, 8 Anti Aid Clubs, voluntary counsellors, and 4 PPTCT Support groups in HIV/AIDS prevention, care and support programs and by strengthening the capacity of 200 OVCs and their guardians through income generating activities. Additionally OSSA provides material and psychosocial support to 200 orphan and vulnerable children and creates strong referral linkages with hospitals and health centres for health care services for the target beneficiaries. For the phase out period (01-01-2014 until 30-06-2014) the focus is on handing over the care and support program for 200 OVCs to the four CBO coalitions and youth clubs in the four project sides. The following relations exist between OSSA's interventions and the CIVICUS framework: in the last phase of the project CBO coalitions were prepared to become responsible for the implementation of different prevention, care and support activities. At the same time the AAC and the PPTCT groups were made responsible for the coordination and implementation of prevention activities for youngsters and the general population, respectively the care and support activities for OVCs and their families/guardians. They also provide basic information on PPTCT for HIV positive mothers. These relate to the dimension 'perception of impact' or 'level of organisation' in terms of strengthening civil society organisations.

The interventions considerably rely on volunteers, which directly relates to the CIVICUS dimension 'Civic Engagement'. The evaluation therefore tried to focus on these two orientations.

3.2 Basic information

4 Data collection and analytical approach

4.1 Adjustments made in the methodology of the evaluation

The project documentation obtained in the beginning of 2014, initially only covered the 2008-2012 project with OSSA and not information was available for the 2013 – 2014 period needed for the selection of recent outcomes. Based upon this information the evaluation team experienced difficulties in identifying the civil society focus to take into consideration for OSSA. It is only after the first workshop with OSSA was organised more information became available and the team could follow the evaluation methodology as planned.

4.2 Difficulties encountered during data collection

The evaluation team encountered difficulties in compiling all information from the project documents as a means to obtain a complete overview of outcomes and outputs achieved in line with the logical framework. Whereas the project is being implemented on four different sites, the information made available was not clear on what happened on each site.

The evaluation team has mainly collected information on the Harwassa site, one of the four sites. A second mission was necessary to collect additional information regarding the contribution analysis and to obtain more clarity on facts and figures related to the projects being implemented. Part of the missing data can be explained by the fact that OSSA does not have an M&E system in place for all sites to monitor progress, not only on outputs level but also at outcome level.

The evaluation team had no time to visit other project sites of the four that OSSA is working with. Therefore the risk of having obtained biased information is considerable.

4.3 Identification of two outcomes for in-depth process tracing

In relation to the CIVICUS framework four strategic orientations for contribution analysis were identified: Ensuring that more people from more diverse background are engaging in civil society activities; ensuring that the organisations that receive support from the SPO are capable of playing their role in civil society – intermediate organisations; strengthening the relations with other organisations in civil society to undertake joint activities, and; influencing policies and practices of public or private sector organisations.

With regards to OSSA the focus was to assess to what extent their MFS II interventions helped to engage people with each other as a means to improve the livelihoods of PLWHIV, as well as the livelihoods of those people that take care of OVCs – their guardians. The focus was on the role of the saving associations, the income generating activities for those persons that are able to perform such activities.

The second strategic orientation that we looked at is the extent to which the idir coalitions⁶ are capable of ensuring the access of OVC and PLWHIV to governmental services. In the last phase of the collaboration between Cordaid and OSSA (January – June 2014), the intention was to strengthen the capacities of the idir coalitions in which different kebeles are represented to ensure that OVCs and PLWHIV get access to government services such as education, health, financial services and to home based care and support organised with volunteers.

⁶ Among the most enduring, universal, effective, and relevant socio-economic informal institutions Ethiopians have created are Iqub and Idirs are an informal institution in Ethiopia; they are associations established among neighbours or workers to raise funds that will be used during emergencies, such as death within these groups and their families. An Idir can be characterized as a traditional financial association.

5 Results

5.1 Results obtained in relation to project logframe

An inventory was made of progress being made by OSSA in comparison to its project documents. However the quality of the progress reports may have hampered the presentation of facts and figures.

The 2008 – 2012 project comprise four specific objectives. The first objective meant to ensure government services and support from community volunteers for 500 OVCs and 500 PLWHIV by direct project interventions that improve the livelihoods of those targets. Important achievements were made on most of the project results, although 41 % of the target groups did not receive the start-up capital needed to run their own business, and other NGOs did not sufficiently step in to provide food and nutritional support. According to the understanding of the evaluation team, during this phase 60 volunteers received training in order to be able to support 1000 OVCs and PLWHIV. Only 325 of the 1000 OVCs and PLWHIV (33%) were regularly supported by the volunteers. Community conversations are being organised to raise the awareness of communities with regards to HIV/AIDS prevention. Its second objective meant to ensure that idirs (CBOs) and their coalitions were capable to take over the responsibilities of OSSA. New structures were put in place and existing structures were equipped, however OSSA was not able to ensure the training of these structures. The third objective was about staff capacity development which took place according to plan. Not enough data are available to confirm that OSSA ensured that one of the project sites would become sustainable.

In 2013, OSSA received another grant from Cordaid, covering the four project sites, implementing the same type of activities for 200 OVCs, including a training of 40 (old/new) volunteers to support these OVCs. The guardians of the OVCs were trained in business skills and 188 received a start-up capital. The operational costs of four idir coalitions, 12 AACs and 4 PPTCT groups were covered but no management training was provided.

Although the initial programme that was conceived in 2012 covered 3 years, Cordaid decided to stop its support to OSSA. Therefore in the January – June period, OSSA received support to ensure that the CBO coalitions, the AACs and the PPTCT would be able to take over the roles and responsibilities of OSSA on the four project sites. Cordaid only received this final report in December 2014.

5.2 Changes in civil society in the 2012-2014 period

5.2.1 Civic engagement

Civic engagement describes the formal and informal activities and participation undertaken by individuals to advance shared interests at different levels. Participation within civil society is multi-faceted and encompasses socially-based and politically-based forms of engagement.

In the beginning of 2013, OSSA conducted four baseline surveys at the different branches to generate input on needs of their target group for the 2013-2015 project⁷.

After additional discussions with community leaders (idir leaders), community members as well project members, OSSA decided to concentrate its interventions on saving association to support PLWHIV and guardians of OVCs⁸, while the strengthening of, the AACs, the PPTCT associations and volunteers and the establishment of a CBO coalition were considered as sustainable measures⁹. In 2013 three

⁷ The same was done for the 2008-2012 project

⁸ Interview with executive leadership

⁹ Both the needs assessment study and the discussion forums held were paid for by MFS II funds

saving associations were set-up with 55 members in total and one idir coalition with 128 members from 64 individual idirs was established in OSSA Hawassa. Four PPTCT women support group associations were established in 2012-2013 who, together with the girls clubs, reached 663 beneficiaries (462 females and 201 males) via the outreach programme. There was no budget for the creation of new AACs or girls clubs, neither did the existing 12 clubs receive any training between 2012 and 2014. OSSA planned to setup six guardian clubs in 2013, but no progress on this was reported in their 2013 annual report.

The clubs mainly reach the youth via peer education. Many community members are reached by awareness creation via the community or coffee ceremonies organized by individual idirs and the idir coalitions. As this approach fits the cultural and societal structure in Ethiopia well it is perceived as being effective in awareness creation¹⁰.

The contribution of the 60 volunteers that were trained during the 2008-2012 project¹¹ and the additional 40 volunteers trained in 2013, is not very clear. According to the documents made available these volunteers only reached 33 % of the OVCs and PLWHIV in that period. Minute meetings of general meetings organized by OSSA show that the attendance rate of volunteers to these meetings is low. These volunteers however have good relationships with the families they are supporting and they are essential in OSSA's intervention model. Each volunteer is however involved in a wide range of activities, from providing home based care and support to providing technical support IGA's or advising on legal support, which may be more time consuming than can be expected from a volunteer. Over time OSSA invested in trying to involve beneficiaries in the planning, implementing and monitoring phases of the projects via regular meetings with representatives of marginalized groups and via the CCs. It is observed that this involvement is more consistent than it was in 2012 and hence can be seen as a trend in civic engagement¹².

A preliminary conclusion on the impact of the government providing PLWHIV with free of charge ART is said to change in mentality of PLWHIV regarding their ability to work and to be valued as community members. Two PLWHIV agree that the community they live in have changed their attitudes positively towards them, but two other PLWHIV do not agree because they are not invited to community gathering and cannot participating in the preparation of weddings. According to a representative of the idir coalition people nowadays are more aware of how HIV is being transmitted and have become less afraid of interacting with PLWHIV.

When considering the intensity of civic engagement in terms of beneficiaries participating in the activities of OSSA, we observe a small improvement since the baseline study.

Score baseline 2012 on an absolute scale from 0-3:	2
Score endline 2014, relative change since 2012:	+1

5.2.2 Level of organisation

This dimension assesses the organisational development, complexity and sophistication of civil society, by looking at the relationships among the actors within the civil society arena.

OSSA's relations with other NGOs has not changed much in that it still focuses on avoiding duplication of efforts. Bi-annually a network of NGOs working on HIV/AIDS comes together to align efforts in the project sites where OSSA is working. OSSA's participation in other networks¹³ neither changed significantly, because, according to the evaluation team in Ethiopia, this would be interpreted as being involved in advocacy activities.

OSSA does not have an institutional budget to expand its network with other NGOs and to start learning from experiences.

¹⁰Interview with programme staff

¹¹Counselling training exceeded the budget by 337%

¹²Interview with executive leadership; field staff; and programme staff

¹³Two networks mentioned in the interviews are the CCRDA Southern platform, a network incorporating WFP, the Health Office and 6 other NGO's addressing PLWHIV and OVC issues, and the OVC network with the Women and Children Affairs Office, the Health Office, and around 10 NGO's/

Score baseline 2012 on an absolute scale from 0-3: 2
Score endline 2014, relative change since 2012: 0

5.2.3 Practice of Values

Practice of Values refers to the internal practice of values within the civil society arena. Important values that CIVICUS looks at such as transparency, democratic decision making, taking into account diversity that are deemed crucial to gauge not only progressiveness but also the extent to which civil society's practices are coherent with their ideals.

OSSA's general assembly has been revised in 2011 to incorporate representatives of beneficiaries and PLWHIV. This change has improved the information flow from OSSA to beneficiaries and vice versa¹⁴.

OSSA mainly reports to other NGOs, the government and beneficiaries on its operational activities and not on its financial status or utilization and no changes have been reported in the 2012-2014 period. The same applies for the composition of social organs and external financial auditing: as was the case in 2012, 0-10% of the marginalized target groups are members of the mandatory social organs and OSSA still conducts the obligatory annual audit by an external body.

Cordaid funded a Financial Management Training for OSSA in February 2012. A first follow up visit to assess how this Financial Management Capacity Building (FMCB) shows that only 19,4 of the instructions given were according implemented in April 2013. During the second follow-up visit in November 2013, OSSA's compliance with the FMCB reached 41,9%¹⁵. Financial progress reports in the 2008-2012 period show considerable overspending on salary, office and transportation costs¹⁶ and underspending on activity costs¹⁷.

From the rather big amount of questions asked in e-mail conversations between OSSA and the financial department of Cordaid on costs calculations and investments in the proposed budget for the phase-out proposal for January-June 2014 it seems OSSA still struggles with financial management issues.

Score baseline 2012 on an absolute scale from 0-3: 1
Score endline 2014, relative change since 2012: 0

5.2.4 Perception of Impact

Perception of Impact assesses the perceived impact of civil society actors on politics and society as a whole as the consequences of collective action. In this, the perception of both civil society actors (internal) as actors outside civil society (outsiders) is taken into account. Specific sub dimensions for this evaluation are the extent to which the SPO has contributed to engage more people in social or political activities, has contributed to strengthening CSOs and their networks, has influenced public and private sector policies.

As already mentioned above, in 2013 OSSA mainly concentrated on supporting guardians with the creation of GA in terms of providing training, and initial capital to 188 guardians of the 200 planned¹⁸. In the 2008-2012 period only 41 trained in IGA received a start-up capital .

Beneficiaries that were involved in IGA have changed for the better; those people who did not have anything to eat or wear in 2012 are now earning and supporting themselves gradually¹⁹. The guardian club for instance is involved in small business activities preparing food and selling animal feed. They are also encouraging others to engage in IGA's.

¹⁴Interview with executive leadership

¹⁵Second Follow up Financial Management Study

¹⁶For example, the Hawassa branch overspent their 2008-2012 budget with 136% with the largest increase in expenditure was on the Branch Manager.

¹⁷For example, vocational skill training has only cost 30% of the budget and free medication took up only 7%.

¹⁸Interview with Save the Generation Association

¹⁹Interview with field staff

In terms of civil society impact, OSSA supported one idir coalition that regroups 64 idirs, 6 girls clubs, 4 PPTCT mother support groups and worked with 60 volunteers in the Hawassa area between 2012 and 2014. Additionally OSSA has also supported the girls clubs to create a coalition and they have got a licence from the regional justice office to work as a CSO in 2013. Three OVC guardians and PLWHIV saving association were established in collaboration with Hawassa's town coordination office for micro finance between 2012-2014. These associations are saving consistently with few dropouts²⁰. However, the saving associations have a regulation that people cannot take a loan within the first year, implying that the level of IGAs being established is still low. After this year a person can only take a small loan of 1000 Birr only.. Given Ethiopia's high inflation rate the relevance of saving money on a bank account is questionable. The idir coalition, idirs, the AACs, the PPTCT women support groups and some volunteers do attend quarterly, semi-annual and annual meetings that are being organized by OSSA to report on the status of their tasks, challenges and best practices. These CBOs are expected to take over the care and support and awareness creation activities after the phase-out period, but the in country research team observed that most CBOs, are not strong enough to work with the intensity expected of them. An explanatory factor of this is that since OSSA has planned to work with them in 2008, hardly any technical support has been provided to prepare these CBOs on their future tasks. Another explanation is that the project with Cordaid, foreseen for three years, ended all of a sudden after 1,5 years with an exit strategy of only six months. One activity that might continue are the coffee ceremonies organized by the idirs to raise the awareness on the prevention and treatment of HIV/AIDs, because these structures and practices already existed before the project came.

In the 2012 – 2014 period the involvement of local government administration with OSSA's activities increased. There has been a slight improvement in the referral practices²¹, and local administrations are more involved in OSSA's project planning, implementation, monitoring and evaluation. Local administration sees OSSA as being supportive to the public sector because it addresses key issues within the community²². Although some expect OSSA to do more they have no complaints with the things done so far. These bodies get a regular report and communicate frequently with OSSA.

Given the role assigned to NGOs in Ethiopia, OSSA is not engaged in advocacy activities. However, inviting public sector representatives to participate in the general meetings it organises, the communication remains open and effective. Local administration is aware of OSSA's interventions and both have developed operational procedures to collaborate. (the hospital sends a slip for the treatment done to referred individuals, OSSA settles invoices after treatment, OSSA reports to the health office and women and children affairs office).

OSSA is attempting to work with private health centres and sponsors for the idir coalition, but so far no concrete progress has been made. It is not influencing the policies and the practices of the private sector.

Score baseline 2012 on an absolute scale from 0-3: 2
Score endline 2014 on relative changes: +1

5.2.5 Civil Society Environment

The social, political and economic environment in which civil society operates affects its room for manoeuvre. The civil society context has been described in chapter 3. In this section we describe how OSSA is coping with that context. The 2009 Proclamation to Provide for the Registration and Regulation of Charities and Societies (CSP) and the related "70/30" regulation that limits administrative costs for all charities and societies to 30% of their budgets²³.

This context constrained OSSA in terms of the man power it could hire and the field visits it could conduct. Accordingly, OSSA decided to reduce monitoring and evaluation efforts since staff costs for M&E all fall within the 30% limit. The fact that on the Hawassa project site only one project manager is executing most of the activities may also be the consequence of the new regulations. OSSA also had

²⁰Interviews with saving association members

²¹Interview with health office

²²Idem

²³Interview with health office

to relocate its offices to a cheaper place, which is time consuming. Not compiling to the law leads to a termination of its license to operate.

The proclamation on charities and societies also prohibit national NGOs that receive foreign finance to engage in lobby and advocacy on rights based issues. OSSA’s work has been affected because it cannot defend the interests of the children and the marginalised groups it works with as before. However a new window of opportunity which is accepted is to work closely with public sector services that than may become aware of how to address burning issues in society.

Another issue affecting the efforts of OSSA is the high inflation rate which influences the IGA activities done by the saving association. There is high inflation in the country, mostly ranging between 35% and 40%, hence; the initial capital given to individuals is not enough to boost their economic security (income earning and increasing number of meals per day). In response to this, the OSSA has increased the initial capital from 1500 Birr to 2500 Birr which in turn decreased the number of beneficiaries addressed.

Score baseline 2012 on an absolute scale from 0-3: 1
Score endline 2014 on relative changes: -1

5.3 To what degree are the changes attributable to the Southern partners?

This paragraph assesses the extent to which some outcomes achieved can be “attributed” to OSSA. Starting with an outcome, the evaluation team developed a model of change that identifies different pathways that possibly explain the outcome achieved. Data collection was done to obtain evidence that confirms or rejects each of these pathways. Based upon this assessment, the evaluation team concludes about the most plausible explanation of the outcome and the most plausible relation between (parts of) pathways and the outcome. The relations between the pathways and the outcomes can differ in nature as is being explained in table 2.

Nature of the relation between parts in the Model of Change

Nature of the relation between parts and other parts or outcome	
The part is the only causal explanation for the outcome. No other interventions or factors explain it. (necessary and sufficient)	
The part does not explain the outcome at all: other subcomponents explain the outcomes.	
The part explains the outcome but other parts explain the outcome as well: there are multiple pathways (sufficient but not necessary)	
The part is a condition for the outcome but won't make it happen without other factors (necessary but not sufficient)	
The part is a contributory cause it is part of a 'package' of causal actors and factors that together are sufficient to produce the intended effect.	

Sources: Mayne, 2012; Stern et al, 2012

The following paragraph assesses OSSA’s contribution to two outcomes. Each paragraph first describes the outcome achieved and the evidence obtained to confirm that the outcome has been achieved. It then presents the pathways identified that possibly explain the outcomes, as well as present information that confirms or refutes these pathways. The last section concludes in the first place about the most plausible explanation of the outcome, followed by a conclusion regarding the role of the SPO in explaining the outcome.

5.3.1 Civic engagement: improvement in livelihoods of PLWHIV

With regards to OSSA’s contribution to enhancing people’s engagement as well as to engaging more diverse and marginalised people into in civil society, the evaluation team looked at the extent to which OSSA’s interventions helped to reintegrate OVCs and PLWHIV into society and improved their social and economic capital to become a full member in society: This by means of supporting the guardians of OVCs and PLWHIV to increase their incomes. According to OSSA, the livelihoods of 55 persons have improved in economic and social terms through the establishment of the saving associations and an unknown number of vulnerable persons have improved their livelihoods through individual IGAs.

Improved income through IGA however largely depends upon how successful the person is to earn an income with petty trade which largely depends upon the use of the start-up capital given by OSSA and the capacity and skills of the person receiving this. Most PLWHIV also engage in daily labour work²⁴.

Pathway 1

The first pathway that might explain the re-integration of OVCs and PLWHIV into society is that OSSA created three saving associations in 2013 that in total have 55 members. The members consist of PLWHIV and guardians of OVC. The members of each association elect one chairman, one secretary, and a treasurer. After the formation of the groups, OSSA provided business venture and financial management trainings through the volunteers, also trained by OSSA. Then the saving associations receive a start-up capital from OSSA, varying between 1500 Birr and 2500 Birr according to OSSA's availability of funds and the consequences of the high inflation rates. The savings associations are obliged to open a group account at a Micro Finance Institution (MFI) and save 5-10 Birr per week/every two weeks for a consecutive 12 months. Members of each saving organisation gather on a weekly basis to put in the saving money. After a year they will become eligible to borrow from the group's savings to expand their business. The beneficiaries are involved in different petty trade activities such as selling enjera, charcoal, firewood, fruits, and vegetables.

During some of the gatherings of the saving associations, OSSA or volunteers provide advice on a wide range of issues, such as business administration, hygiene, ART administration, and other psychological advices on coping with HIV and stigmatisation. The gatherings are believed to increase the solidarity among members and reduce stigma amongst the members as they are also involved in supporting each other when one is sick or has a family calamity such as a funeral²⁵.

Before PLWHIV adhere to the saving associations, OSSA together with the idir coalition, idirs and during community conversations identified PLWHIV and ensured their referral to the health centres where they get ART treatment free of charge. Together with the coverage of additional medical costs by OSSA, PLWHIV are not bedridden and can become part of social and economic life.

The following information collected highlights the fact that the saving association *do not explain* the re-integration of PLWHIV and OVCs into society:

- Members of the saving associations increased their income because OSSA provided them with a start-up capital to start or expand their petty trade business and not because they increased their access to loans from the micro finance institutions. The extent to which collective savings will increase the group's access to future loans from the micro finance institutions is questionable, because not all members are saving on a regular basis because they lack the financial means to do so. Three persons one association already got access to a loan from the MFI/savings association before the end of the year, because they were in desperate need or had the possibility to expand their business. People in the associations are afraid that future loans from the FMI may be used for other purposes than expanding one's business²⁶. Another explanation that saving money on a bank account does not help to increase incomes is the inflation rate mentioned earlier.
- IGAs vary from working as daily labourers on a construction site and/or as civil servants working as cleaners (mainly females) to being engaged in petty trade similar to those exercised by the saving association members. Most PLWHIV can switch between petty trade and daily labourers whenever the opportunity arises. To a very small extent some of these PLWHIV are counselled by the volunteers from OSSA and/or some have received initial capital from idirs. Some of those that received capital from the idirs have been involved in sheep fattening, which is a better investment venture in comparison to petty trade or daily labour works in terms of economic gains.

The following information *confirms* the importance of the saving associations in re-integrating PLWHIV and OVC into society: Being a member of a saving association reduces stigma because the interaction between members goes beyond saving²⁷. Members visit each other when ill, support family members when needed, and advice each other on business and other related issues. It is furthermore allowed

²⁴Interviews with two members of a saving association

²⁵Interviews with beneficiaries and counsellors support this claim

²⁶Observation in-country evaluation team

²⁷Association members interviewed

that family members replace a member when he or she dies. Another PLWHIV who did not join the saving association fears the moment she will get ill since she then will not be able to earn an income and has no one to fall back on.

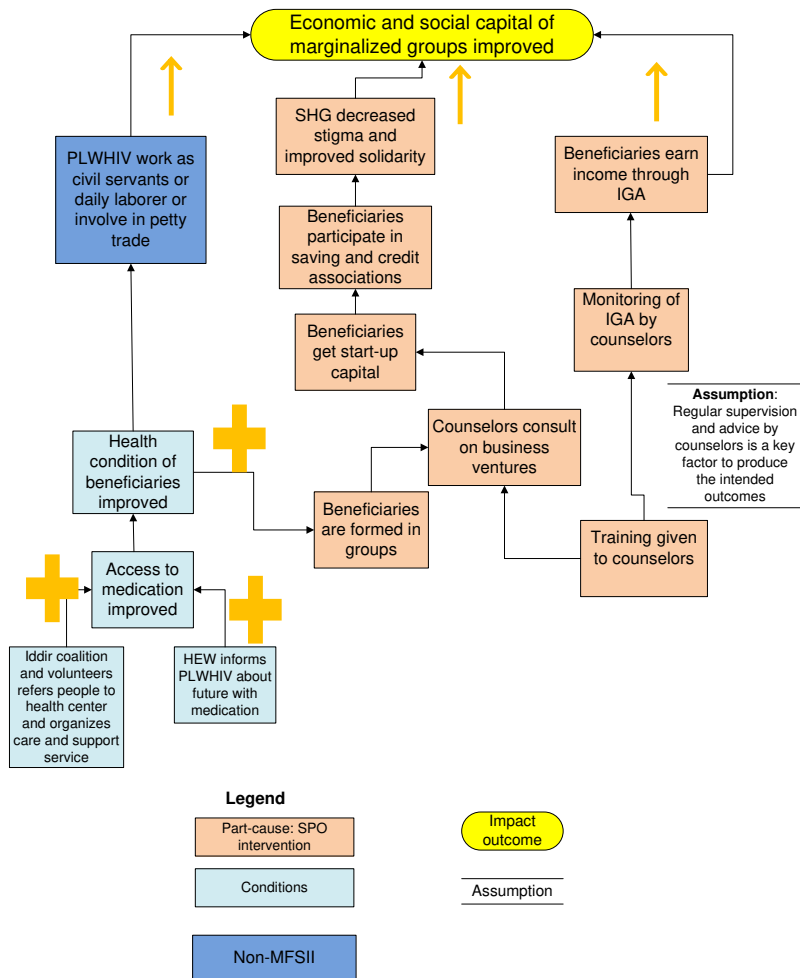

The role of volunteers used by OSSA to advise PLWHIV and the guardians of OVC is appreciated by members of the saving associations. Apart from being visited by Health Extension Workers 3-5 times a month who help them with health related issues like pill administration and hygiene, OSSA's volunteers visit them at least five times a month to provide similar care and support activities as well as helping them with chores and providing counselling. Additionally, they give advice on business related issues like book keeping and management issues. It is however not known if these volunteers only visit the 55 members of the saving associations established in 2013 only or if they also continue visiting the 986 persons that received a training on IGA during the 2008-2012 project, of which 584 persons also received a start-up capital.

Pathway 2

A second pathway that might explain the re-integration of OVCs and PLWHIV into society consists of people not adhering to a savings association, but start their own IGAs (petty trade) or start working as daily labourer on a construction site, become a civil servant as a cleaner etc. OSSA's contribution to improving the livelihoods of those PLWHIV and the guardians of the OVCs is limited and possibly might consist of OSSA referring these persons to the health centre to get the ART treatment and paying additional medical costs, OSSA volunteers sometimes giving them advice or having given them an initial training on IGA and/or start-up capital during the 2008-2012 period. However, these people are not a member of the saving associations put in place in 2013.

Information collected that confirms that people improve their livelihoods in economic and social terms and reintegrate in society *without support from OSSA* to start their own business are the following:

- One of the PLWHIV interviewed says starting ART meant she felt better and was able to work more, which led to an increase in income. She did not feel the need to join a saving association or look for other ways to get a loan. PLWHIV furthermore can turn to alternative forms of loans, such as via the idir. It was however observed that not many people can apply for a loan since not many idir have the financial means to do so. Only three or four PLWHIV were able to receive a loan from an idir between;
- Both the health extension worker and a volunteer interviewed believe that the reduction in stigma and discrimination is mainly caused by the availability of free ART drugs. This enables PLWHIV to function the same as others within the community. OSSA staff comments that most people need more medical support than only ART to be able to function, hence they cover these additional costs;

- The HEW and counsellor furthermore mention drama's and media activities as important factors in reducing stigma and discrimination. The representative of the idir coalition and a saving association member agree that the efforts of the government to reduce stigma via media channels are effective. The idir coalition representative furthermore believes the coffee ceremonies play an important role;
- Apart from receiving start-up capital from OSSA, some people manage to receive start-up capital from their idirs. One of those contributions helped a person to engage in sheep fattening, which is a better investment venture in comparison to petty trade or daily labour works in terms of economic gains. Another NGO, JECCDO also supports PLWHIV and OVC guardians with start-up capital but channels this through the idirs, rather than involving the Micro Finance Institutions. (no information available if JECCDO is working with the same 64 idirs as OSSA).

Conclusion

The most plausible explanation of the improvement of the economic and social livelihoods of PLWHIV and OVCs consist of ensuring their access to free ART by the government which requires an effective system of identifying people affected by HIV through the community conversations and the PPTCT women support groups. The community conversations not only help to identify HIV infected persons, but they also raise the awareness of others that PLWHIV can live with effective ART treatment and they can engage with them in a normal way. These are a *condition* for the further integration of PLWHIV and OVCs in the community. Saving associations help them in terms of mutually supporting each other and therefore enhances their social capital (*sufficient but not necessary explanation*), but in economic terms the saving associations improve the financial position of the micro-finance institution rather than that of the members of the saving association (*not sufficient and not necessary*). The livelihoods of PLWHIV and OVCs improve in economic terms when they receive individual start-up capital to start their own IGA, however the success of these activities depend upon personal entrepreneurial skills and the amount of the start-up capital given (*sufficient but not necessary cause*): PLWHIV switch between petty trade and daily labourers whenever the opportunity arises.

OSSA's most important contribution to the improvement of the economic and social livelihoods of PLWHIV and OVCs consists of their interventions related to raising the awareness of people in the kebeles about HIV/AIDS, testing them and referring them to the health centre for ART treatment and covering other medical costs. Its intention to organise people in saving associations, helps to create relations of mutual support amongst PLWHIV and the guardians of OVC and provides members to start their own business, however putting savings on a bank account of a Micro Finance Institution for a year decreases the value of the amount saved due to high inflation rates and creates uncertainty amongst its members about what they can expect in financial terms from the MFI in the future.

5.3.2 Strengthening IOs: improved referral to health services

For the second strategic orientation –strengthening intermediate organisations- the impact outcome is defined as “Improved referral to health services through referral and care and support efforts”. This contribution analysis looks at the extent to which intermediate organisations like the idir coalition, individual idirs, AACs and the PPTCT support groups have the capacity to refer people to health services.

Pathway 1

The first MFS II funded pathway is that of the formation of a coalition of idirs by OSSA Hawassa with the objective of improving the society's access to health services. The coalition consists of 128 members from 64 idirs in the Hawassa area (two persons from each idir). OSSA Hawassa provided financial and material support to the coalition and also capacitated the members with training including resource mobilization, community mobilization and probing, book keeping and business plan development.

Furthermore, cognizant of the coalition's role at grassroots level, the local government availed office space. In addition to the support extended by OSSA and the local government, the coalition is engaged in community and resource mobilization through its members. Additionally, the coalition is exploring the possibility of opening an internet café to generate a steady income (this is also being done in light of the phasing out period).

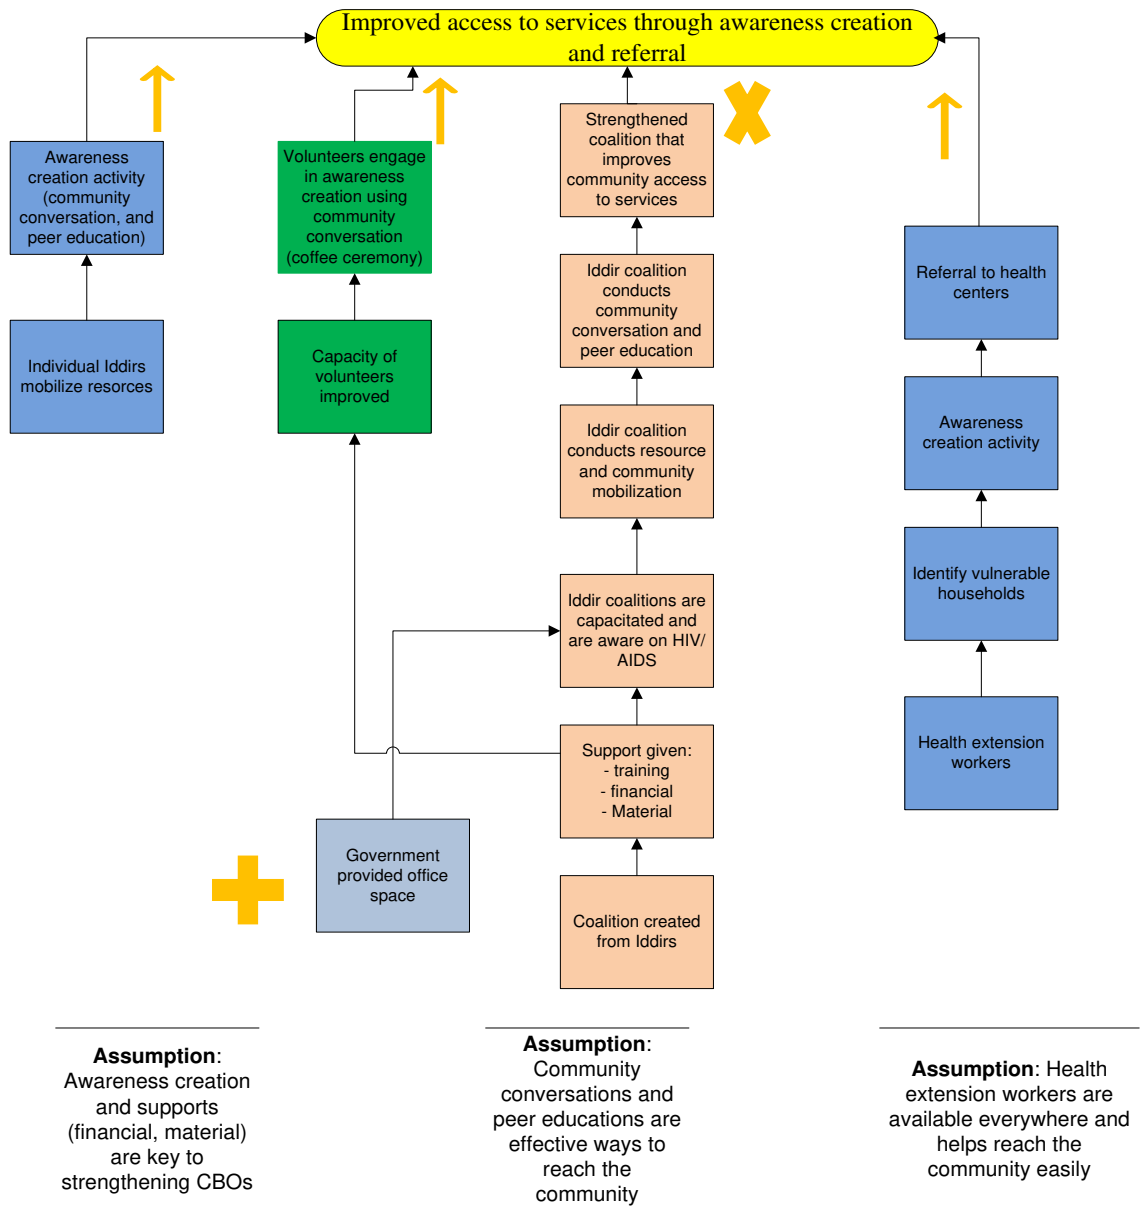

The coalition conducts community conversations through coffee ceremonies (CC) with members of each idir. These meetings mainly focus on PPTCT but other health challenges of the community are also discussed. In addition, peer education is conducted mainly on HIV and hygiene and sanitation issues.

The discussion has enabled the community to improve the awareness on health and also improved the access to health services.

Information that rejects this pathway as a causal explanation for improving the referral system to health centres is:

- Two respondents²⁸ state that not the idir coalition but the individual idirs are most

important in mobilising the community and in the identification of the most marginalized. These are most often eligible to free medication (other members of the community only receive free access to ART). Idirs form the structure of the community; they are institutionalized and not likely to change easily. Working via these structures therefore increases the chances for sustainable interventions²⁹.

Legend

Part-cause: SPO intervention (MSF-II)

Condition

Impact outcome

Rival pathway (MSF-II)

Rival pathway (not MFS-II)

Assumption

²⁸Health extension office and JeCCDO

²⁹Interview with JeCCDO

OSSA argues that they cannot work with 64 idirs separately and therefore value the existence of the coalition to facilitate communication with the individual idirs;

- The coalition lacks permanent staff and the board members work on a voluntary base, which is troublesome when they have other jobs to attend to as well.

Pathway 2

The second pathway is also supported by MFS-II funds and assumes that volunteers improve people's referral to health services. There are a total of 60 MFS II supported volunteers by OSSA. Volunteers receive training and financial and material support which enables them to better engage in awareness creation through CC.

Information that rejects the importance of the volunteers in referring people to the health centres is that:

- Volunteers need to refer people to the health centres for testing, whereas HEW carry mobile testing kits with them when visiting households. Volunteers receive an allowance to cover the transportation costs for those people they want to refer to the health centres but their allowances of 100 birr a month are too low;
- In comparison to HEW, volunteers lack the professional skills needed to provide care and support services and they do not receive a monthly salary. Therefore their motivation level is low. OSSA and the volunteers interviewed admit that it is difficult to mobilise volunteers.

Information that confirms the importance of the volunteers in referring people to the health centres is that volunteers are usually active in several domains; they are part of an idir, they can be volunteers for multiple NGO's, and if female they are usually also leaders of women development groups (established by the government). The training they receive can be from multiple sources as well; they can be trained by NGOs like OSSA or by HEW on the package of 17 topics.

Pathway 3

A third pathway explains increased referral to health services because the public health extension workers (HEW) who are assigned by the local government to extend the health service from the health centres to the community. The government is active in awareness creation in multiple ways: they use media campaigns; employees pay 2% of their salary for HIV control and prevention, which sends an important signal; and they use the HEW to get messages across to household level.

The use of HEW exists for 3-4 years and is based on the 1:5 approach adopted from the agricultural extension programme. This approach uses one model family to pass a message along to 5 other families. All governmental and political messages are passing through this system. Another example is the women development groups which are initiated by the government as well; female role models are appointed (and trained by HEW) and they train five groups of six women.

Information that confirms that the work of HEW increases the referral to health services is:

- Hawassa town has 112 HEW and one HEW has to visit 500 households every month. Through these visits HEW identify vulnerable people and provide awareness creation activities on the 15-17 government messages. These messages include pre/post natal care, PPTCT awareness creation, hygiene and sanitation, child nutrition, vaccination, reproductive health, male involvement in family planning, STD, environment protection, giving family planning pills and injection. Hence through these packages the HEW cover a wide spectrum. HEW also carry mobile testing kits with them during their visits which decreases the threshold for poor people who may not be able to cover transportation costs to health centres.

Information that rejects this explanation is that:

- HEW need to cover a wide range of extension issues that are not related to their sector: only 2 of the 17 messages are health related. The HEW explains this troubles them to really focus on health during their visits since many topics need to be covered. As a result they might not have the time needed to discuss HIV/AIDS issues and to identify people that need testing;
- JeCCDO comments that their experience with HEW is that only 3 to 4 out of 10 HEW is performing in terms of awareness creation and providing care and support services. Most difficult for HEW is to gain trust of the people since they are working in the governmental 1:5 approach. People associate them with politics and do not trust them or their support. The HEW however states that she feels

people are more inclined to trust them, because they keep information confidential in contrast to the idirs.

Other actors and factors

Other actors and factors that explain an increase in people being tested for HIV comprise the fact that:

- Health centres ask all visitors to do a test on HIV/AIDS and 90% of these visitors do agree;
- ART drugs are freely available (since 5 years) which decreases the threshold for testing;
- Testing is mandatory for women that give birth;
- Churches, mosques, and even families of the bride ask for a HIV certification before a marriage is agreed upon.

Conclusion

The data available do not provide sufficient evidence that the idir coalition explains the increase of people being referred to health centres for testing through awareness raising activities, because the coalition lacks permanent staff and failed to mobilise local resources (*not sufficient and not necessary part in the model of change*). These coffee ceremonies are also being organised by idirs who manage to reach all people in the community which helps to refer people potentially infected by HIV/AIDS to health centres for testing. Other actors and factors that explain an increase in people being tested consist of; volunteers visiting people; HEW to some extent because they are paid and professional but not trusted by the population; the fact that ART medication is free of charge, and; testing taking place in health centres for those who come for other reasons (voluntary testing) and for pregnant women (mandatory testing). All these factors and actors provide a necessary but not sufficient explanation to the increase of people being tested.

OSSA's role with regard to this outcome of increased referral systems is not convincing. Their work through the idir coalition does not explain the outcome and volunteers are not sufficiently motivated to do a good job after they receive training from OSSA.

5.4 What is the relevance of these changes?

5.4.1 Relevance of the changes in relation to the Theory of Change of 2012

In its 2012 ToC OSSA formulated its overall goal with regards to civil society as "A society that is well aware about HIV/AIDS and PLWHA and OVs that are well supported and are being cared for". Therefore "civil societies that are self-sufficient and able to give efficient service to society" are needed. For this to happen, the conditions need to be in place: strengthen networks among CBOs, establish new out of school youth clubs, organize new idir coalitions and build the capacity of CBOs.

Until so far we conclude that the preconditions have not been met and therefore civil society is not yet able to provide services to society. An exemption can be made for the individual idirs that possibly play a positive role in the kebeles, given the fact that these institutions are performing and that training these idirs will help to strengthen civil society.

The establishment of a new idir coalition is realised, but the outcomes of the idir coalition remain unclear. The same applies for the strengthening of the capacity of the AACs and the PPTCT support groups; according to the annual reports these have been capacitated, but results have not been documented. Between 2012 and 2014 there have been no significant changes in strengthening networks amongst NGOs. The networks that existed in 2012 remain unchanged and are still mainly focused on the prevention of duplication of efforts in the same kebeles and woredas. The 2012 – 2013 annual reports do not mention the existence of experience sharing forums and other platforms where OSSA and similar NGOs discuss the challenges faced and share the best practices that could be duplicated.

5.4.2 Relevance of the changes in relation to the context in which the SPO is operating

All interviewees feel the changes are relevant because they have seen that OSSA's interventions led to a change in the lives of marginalized people. The people interviewed believe there are still many people in the community that do not have sufficient knowledge on HIV and PPTCT or hygiene. These people need care and support services.

5.4.3 Relevance of the changes in relation to the policies of the MFS II alliance and the CFA

For Cordaid, CBOs form the main strongholds of societies and hence strengthening civil society means working via- and strengthening the capacity of CBOs and that of volunteers. Cordaid believes that strengthening forces within communities will bring about change. According to Cordaid OSSA's results of strengthening the AACs, the PPTCT support group and the idir Coalition was rather minimal.

5.5 Explaining factors

5.5.1 Internal factors

One internal factor that influenced the work of OSSA is its lack of human resources, at least in 2014: on the Hawassa project site only one program officer is in charge of most activities. OSSA furthermore explained that because of the 30/70% legislation they cut back on M&E budget and efforts. Although OSSA is complying with the 30/70 % legislation at the national level by aggregating all projects, the percentage of administrative costs in the Cordaid project is nearly 60 %³⁰.

The financial reports of the 2008-2012 project, that of 2013 and 2014 highlight overspending of the budget on salary, office and transportation costs, underspending on interventions and unclear expenditures at the Head Quarters of OSSA in Addis as well as a lack of capacity to financially manage Cordaid's project³¹. Despite a training organised by Cordaid on financial management in 2012, OSSA still seems to struggle with financial management in the January – June 2014 phase-out project.

5.5.2 External factors

OSSA states that they are negatively affected by the Proclamation on Charities and Societies S and that aligning the programme's budget with the legislation is difficult. Many costs are considered administrative costs like trainers fees, building rent, refreshments, transportation costs and salaries. Monitoring and evaluation efforts become especially difficult to organise because transportation costs and salaries are all considered administrative costs. OSSA Hawassa branch therefore decided to reduce the frequency of monitoring and evaluation visits from quarterly to yearly.

Another issue affecting the efforts of OSSA is the high inflation rate in Ethiopia. Due to the high inflation, the initial capital given to individuals turned out to be inadequate to boost participants' economic security (income earning and an increasing number of meals per day). In response, OSSA increased the initial capital from 1500 birr to 2500 birr which obviously led to a decrease in the number of beneficiaries addressed. Because of inflation, salaries of staff were also adjusted.

In relation to HIV/Aids prevention, awareness creation, and testing, additional external factors play a role. The government implemented a policy whereby health centre workers ask all patients whether they want a free HIV/Aids test. As a result, 90% of all people visiting the health centres are willingly tested on HIV/Aids. Additionally, all public sector offices allocate 2% of their salary to HIV care and

³⁰E-mail conversation between Cordaid and OSSA

³¹Annual report, 2013, input output analysis of 2008-2012 project, e-mail communications between Cordaid and OSSA for the phase-out project

support programmes. Influential church and mosque leaders also started preach on the importance of testing, ART, PMCT, and care & support.

5.5.3 Relations Cordaid-OSSA

In January 2013 a reorganisation took place within Cordaid which led to a change in the project coordination of OSSA from the Health Department to the Child and Education Unit. This transfer also reoriented Cordaid's focus from building the capacity of the AACs and PPTCT support groups to address HIVAIDs at community level to that of strengthening schools and youth clubs. Cordaid then realized that OSSA's work related to education consisted only of providing individual support to OVCs and their guardians and not on improving the performance of school systems. For this reason Cordaid decided to end its collaboration with OSSA and suggested a six month phase-out period from January to June 2014, to ensure that the CBO coalitions, AACs and the PPTCT support groups would be able to take over OSSA's work. OSSA showed little improvement in the final phase-out proposal and Cordaid's efforts for further improvement were minimized seen the discontinuation of the collaboration.

Not only did a reorganisation take place within Cordaid, the sub branches of OSSA also became independent. OSSA Hawassa branch used to be the coordinating body for reporting, but as of January 2014 the four branches became independent

Cordaid underlines that its decision to end the partnership with OSSA is based upon the changes within Cordaid and not the actual results achieved by OSSA. At the time of the interview (September 2014) Cordaid had not yet received the last progress report that covers the phase-out phase out period (January-June 2014) yet. The final report was received in December 2014.

An exit strategy was developed by OSSA which however proved to be unsustainable.

6 Discussion

6.1 Design of the intervention

Community involvement is increasingly being cited as a vital precondition for creating health-enabling social contexts that enable and support people in optimizing their opportunities for health and well-being (Tawil, Verster, & O'Reilly, 1995, p. 1299). It is said to play a vital role in enabling health-related behaviours and reducing HIV transmission (van Wyk, Strebel, Peltzer, & Skinner, 2006), stigma reduction (Poku & Sandkjaer, 2007), facilitating timely and appropriate accessing of health and welfare services where these exist (Campbell & Cornish, 2010), and supporting optimal treatment adherence (Coetzee et al., 2004). Community mobilization is given a key role in international AIDS policy, due to its perceived role in tackling the challenges of "reach" and "sustainability" that plague many HIV/AIDS interventions. Policies envisage that community based organisations play a central role in taking responsibility for HIV/AIDS. The scale of the problem, as well as the social marginalization of many affected groups, make it impossible for health and welfare professionals and services to reach the vast number and variety of people vulnerable to HIV and affected by AIDS. Policy documents consistently argue that community organisations are better placed than formal public services to reach "hard-to-reach" groups. Furthermore community organisations, drawing on local human resources, and often including the inputs of unpaid volunteers, are seen as more sustainable in the long-term than costly and donor dependent external interventions. A second reason for the international interest in community mobilisation is a pragmatic one in the light of the overall scarcity of health workers in many marginalized settings in which HIV/ AIDS flourishes. A growing number of projects rely on grassroots community members to provide HIV-prevention and AIDS-care (Ogden, Esim, & Grown, 2006; Schneider, Hlophe, & van Rensburg, 2008; van Damme, Kober, & Laga, 2006).

However, for the volunteers to be influential they need to be effective. Campbell and Cornish (2010: 1566) claim that the material context plays an important role in the effectiveness of volunteers: the lack of economic gain associated with project involvement often means that the project failed to resonate with peoples' economic aspirations, severely limiting its ability to mobilise volunteers to carry out project work, and undermining the status of the project in the community.

The above confirms OSSA's project design in terms of working with the idirs and the volunteers to reinforce the HEW of the government. Whereas the idirs play a role in awareness raising activities and possibly help to integrate PLWHIV in society, the volunteers play a crucial role in reaching out to the most vulnerable households in society and providing care and support services. However, working with volunteers implies that NGOs should find ways in which to motivate these, maybe not only in financial terms, but also in other terms such as meetings, training opportunities etc.

A comparison of OSSA's project design with that of JeCCDO, another NGO in Hawassa shows that JeCCDO also works with idirs and an idir coalition. JeCCDO's idirs have the role to set-up and monitor self-help groups that receive start-up capital via the idir that in their turn receive these from the NGO, and idirs receive the necessary training to do so as well as to engage with local administration to address issues. JeCCDO's Idir coalition has the role to influence local policies and practices and does not engage in awareness raising activities that are situated at the level of individual idirs. JeCCDO furthermore uses the government health extension workers to follow up on business progress when visiting PLWHIV. By using the idir and HEW they do not need their own volunteers to do monitoring.

This alternative and decentralised design questions that of OSSA, in particular with regards to the role of the idir coalition and that of the individual idirs and a more integrated way of working with HEW, as well as the role of the micro finance institutions and the saving associations.

A new project needs to carefully compare JeCCDO's and OSSA's intervention strategy.

7 Conclusion

With regards to OSSA's efforts to build a vibrant civil society we conclude the following.

Changes in the civil society arena of the SPO

In the 2012 – 2014 period the two most important changes that took place in the civil society arena of OSSA are related to the Civic Engagement and Perception of Impact dimension of CIVICUS.

OSSA slightly managed to increase the involvement of the volunteers in supporting OVCs and PLWHIV on a diverse range of issues and it managed to organise guardians into saving associations that, though not providing increased incomes, has contributed to more peoples mutually supporting each other. Apart from this its awareness raising activities help to integrate People Living with HIV (PLWHIV) and vulnerable families that take care of Orphans and Vulnerable Children into society. OSSA also intensified its interactions with beneficiary groups to ensure that its interventions were relevant. These changes notified under Civic Engagement also partly explain those of the Perception of Impact dimension, because there is an overlap between both dimensions. Apart from this, a slight change occurred in the extent to which OSSA supported the idir coalition, the AACs, the PPTCTs in only in the first semester of 2014, intending to transfer OSSA's roles and responsibilities to these structures that are however not capable of fulfilling these. Its collaboration with the local government services intensified in the period under evaluation.

Contribution analysis

The first outcome that we looked for the contribution analysis is based upon the perception (no figures available) that OVCs and PLWHIV improved their social and economic capital to become a full member in society. The most plausible explanation of this change is that the system put in place to identify vulnerable OVCs and PLWHIV is effective; the access to free ART provided by the government, and; community conversations that not only make people aware that PLWHIV can live with effective ART treatments but also helps to identify possibly infected persons. When these conditions are in place, mutually support of PLWHIV, support to these people to engage in IGA or to assist them in finding jobs as daily labourers help them to further reintegrate into society. OSSA's most important contribution consists of their support to organise community conversations in the kebeles and covering other medical costs. Organising PLWHIV in a saving association helps to create mutual support, but obliging members of the association to save money on a bank account of a micro finance institution for one year in a context of rampant inflation is to be considered as an adverse effect of the intervention.

The second outcome that we looked at is the extent to which intermediate organisations like the idir coalition, individual idirs, AACs and the PPTCT support groups increased the number of persons being referred to health centres for testing and access to free ART when necessary. OSSA's most important strategy to work with an idir coalition does not provide the explanation to the outcome. Community conversations organised by idirs are effective and sustainable strategies. Another factor that explains the increase is the availability of free ART, compulsory testing of pregnant women at health centres and voluntary testing of health centre visitors. OSSA's role with regard to this outcome of increased referral systems is not convincing. Their work through the idir coalition does not explain the outcome and volunteers are not sufficiently motivated to do a good job.

Relevance

With regards to the baseline ToC, the interventions and outcomes achieved are not relevant because OSSA wanted to create a civil society that is providing services to society through amongst others a strong idir coalition and strong AAC and PPTCT support groups. These groups are not performing.

With regards to the context in which OSSA is operating, its interventions and outcomes achieved are relevant in terms of supporting community conversations on HIVAIDS and working with volunteers that provide care and support services and assist PLWHIV and the guardians of OVC with IGAs. Through these interventions people can become part of society again. We observe however that the

government itself also creates an environment to prevent HIVAIDS by increasing the possibilities for testing and by the administration of ART free of charge.

With regards to the CS policies of Cordaid, OSSA’s interventions and outcomes are slightly relevant because its vision is that strong CBOs and motivated volunteers will bring about change. However OSSA did not succeed in strengthening the capacities of the organisations it works with.

Explaining factors

With regards to internal factors, the evaluation team concludes that; human resources are missing at the OSSA branches that implement the project; OSSA, despite financial management training provided by Cordaid, still misses the capacity to properly manage projects financially. Apart from this, the four project sites that Cordaid supports became independent from each other as of January 2014, further complicating adequate reporting on progress beyond output.

The most important external factors that explain the findings above are that: OSSA faces difficulties to comply with the 30/70% regulation, implying that it decided to economise on its monitoring and evaluation activities. Other factors are the high inflation rate that affects savings by beneficiaries and purchasing power of OSSA’s staff and the frequent relocation of health centres which affects the financial capacity of volunteers to refer people to these centres.

With regards to the relation between OSSA and Cordaid we observe that their decision to shift OSSA from the health to the education department in January 2013 implied an end to further collaboration and the implementation of an unsustainable exit strategy.

Design

With regards to the design of the intervention, we would recommend others to compare different interventions of several NGOs that work on HIVAIDS issues in local communities. The role of idirs and of volunteers in working with PLWHIV and OVCs is an important element, but need to be further elaborated. The same applies for the roles of idir coalitions set up by different NGOs. When aiming for improving the livelihoods of PLWHIV and guardians of OVCs, one needs to take into account the rampant inflation rate in Ethiopia, which does not at all favour savings on bank accounts. Organising PLWHIV and guardians of OVCs in self-help groups also will contribute to their further integration in society through mutual support mechanisms.

Table 3
Summary of findings.

When looking at the MFS II interventions of this SPO to strengthen civil society and/or policy influencing, how much do you agree with the following statements?	Score
The CS interventions were well designed	5
The CS interventions were implemented as designed	3
The CS interventions reached their objectives	2
The observed outcomes are attributable to the CS interventions	1
The observed CS outcomes are relevant to the beneficiaries of the SPO	5

Score between 1 to 10, with 1 being “not at all” and 10 being “completely”.

Appendix 1 Civil Society Scores

This table presents the appreciation of the evaluation team regarding changes occurred for each indicator between 2012 and 2014 on a scale of -2 to + 2

- 2 = Considerable deterioration

- 1 = A slight deterioration

0 = no change occurred, the situation is the same as in 2012

+1 = slight improvement

+2 = considerable improvement

Dimension		Indicators	Question	Change
Civic engagement	1	Needs of marginalised groups	How does your organisation take the needs of your beneficiaries/target groups, in particular marginalised groups into account in your planning, actions, activities, and/or strategies?	+1
	2	Involvement of target groups	What is the level of participation of your beneficiaries/target groups, in particular marginalised groups in the analysis, planning and evaluation of your activities?	+0
	3	Political engagement	How intense is your (individual staff or organisational) participation in locally-nationally elected bodies and/or sectoral user groups?	+0
Level of organisation	5	Relations with other organisations	In the past 12 months what has been the most intensive interaction you had with other CSOs?	+ 1
	5	Frequency of dialogue with closest CSO	In the past 12 months how many meetings did you have with the CSO that you have most intensive interaction with?	+0
	6	Defending the interests of marginalised groups	Which CSO are most effective in defending the interests of your target groups? In the past 12 months, how did you relate to those CSOs?	-1
	7	Composition current financial resource base	How does your organisation finance institutional costs such as workshops of the General Assembly (if applicable); attendance to workshops of other CSOs; costs for organisational growth and/or networking?	+0
Practice of Values	8	Downward accountability	To what extent can mandatory social organs (steering committee, general assembly, internal auditing group) ask your executive leaders to be accountable to them?	+0
	9	Composition of social organs	What % of members of your mandatory social organs belong to the marginalised target groups you are working with/for?	+0
	10	External financial auditing	How regularly is your organisation audited externally?	+0
Perception of impact	11	Client satisfaction	What are the most important concerns of your target groups? How do your services take into account those important concerns?	+1
	12	Civil society impact.	In the past 12 months, what impact did you have on building a strong civil society?	+1
	13	Relation with public sector organisations.	In the past 12 months, what interaction did you have with public sector organisations to realise your programme and organisations' objectives?	+1
	14	Relation with private sector organisations	In the past 12 months, what interaction did you have with private sector organisations to realise your programme and organisations' perspective?	+0

	15	Influence upon public policies, rules, regulations	How successful have you been in influencing public policies and practices in the past 2 years?	+0
	16	Influence upon private sector agencies' policies, rules, regulations.	How successful have you been in influencing private sector policies and practices in the past 2 years?	+0
CS context	17	Coping strategies	In the past 2 years, how did your organisation cope with these changes in the context that may have been positive or negative consequences for civil society.	-1

Appendix 2 Changes in civil society indicators between 2012 and 2014

2.1 Civic Engagement

2.1.1 Needs of marginalised groups SPO

In the beginning of 2013, OSSA conducted a needs assessment to identify where it should intervene. Based on this assessment done and discussions held with community leaders (idir leaders), community members as well the project members, orientations were identified. The saving association intervention was one of the orientations identified, while the strengthening of IOs (clubs, volunteer associations) and the establishment of an idir coalition (incorporating 64 idirs) were considered as sustainable measures. Aside from the assessment, OSSA conducts meetings with the clubs, volunteers and coalition it works with and the beneficiaries involved on a regular basis (quarterly meetings). They discuss if things are going smoothly or not and the solutions for the problems being witnessed including efficiency of IOs and implementers. These meetings are also used to report on the progress made by the project. The fact that the beneficiaries were involved in the planning of the project has helped in addressing the specific problems of beneficiaries.

In order to increase the awareness level of the community in general and the marginalized groups in particular, OSSA strengthened the capacities of youth clubs and the idir coalition. These organisations are educated and trained on different issues ranging from health issues such as HIV and PMTCT to skills like resource mobilization, peer education, and counselling. While the clubs work on peer education and awareness creation among the youth, the coalition in collaboration with the 64 member idirs works on increasing the awareness level of the whole community. Most household heads and/or spouses (all adults) attend the coffee ceremonies (CC) organized by the coalition and idirs. In both cases (clubs and coalition) when people come forth willing to be tested they refer them either to OSSA or health centres. The CCs are also used to create awareness on PMTCT which was also identified as a need of the marginalized group. Mothers identified on the CCs are asked for their willingness to be tested and then given direction on how to go about it. Those beneficiaries found to be HIV positive are supported by OSSA by being incorporated in the saving association (if they are interested) and by covering all their medical expenses. OSSA also supports their children if they are HIV positive. The care and support service may be at risk, since there doesn't seem to be a well-established platform or system for the volunteers and the coalition to communicate even though there are several coalition admins who are volunteers.

OSSA provided training to counsellors on health care issue particularly on hygiene and sanitation (H&S). This has resulted in improved knowledge and skills of the counsellors and resulted in better engagement on home to home visits as well as community conversation. The counsellors undertake awareness creation activities on nutrition management and housekeeping (such as washing of clothes and body). As a result, more and more families improved their knowledge and skills. OSSA also trained volunteers on the technique and approaches to providing counselling services to OVC. As a result a number of beneficiary OVC were given counselling service that built their confidence to resume/continue their education. In addition OVC were given tutorial classes as well as school materials. These interventions not only improved the school attendance of OVC but rather boosted their performance and promotion to the next grade or even to university level according to the interviewed resource persons (two volunteers, a health office representative and a coalition representative). Documents to support this claim were not available however. Out of the planned 500 OVC 394 have received materials from OSSA. Of these 394 supported OVC, 50 good performing OVC have enrolled in university.

OSSA is currently exercising the technique of testing the immediate relatives of PLWHIV as the people willingly coming in for testing are mostly negative (they mostly come in because they are confident that they will be negative). However, it is very challenging to convince the relatives to test as they are afraid of the stigma that might follow. We observe that this may be a good way of identifying more PLWHIV for treatment but that OSSA is late in coming up with such a solution as it was only proposed in the phasing out proposal and OSSA has not handed over this system well.

The reason for the change in the needs of marginalized groups is a combination of actors and factors including the SPO but with Dutch funding. Cordaid's funds were used to do the assessment, organize forums and come up with an idea that better serves the issue at hand. Also the increased interest of the society to participate in these discussions, project designs and implementation helped in coming up with ideas (such as the saving association) that address the society's main problems. Since OSSA receives funds from different funders and allocates these funds to different projects, the MFSII contribution is difficult to pinpoint. MFS II funds were utilized in the doing the assessment and in the organisation of coffee ceremonies.

Score: +1

2.1.2 Involvement of target groups SPO

The level of participation of the beneficiaries of OSSA is high as they are involved in planning, implementation and evaluation. This does not mean all beneficiaries but rather representatives, like heads of the idir or clubs. They were part of the project implementation in 2012 and hence are more knowledgeable on which interventions work and which do not. They are part of the discussion on the planning of the project so as to identify and incorporate what the real needs in the community are. They are also involved in the implementation through for instance, the awareness creation CCs where they give testimonies to participants that HIV is not the end of the world and that PLWHIV can leave a normal happy life like any other person by getting treatment. They are also in the evaluation process as they along with other stakeholders discuss on the progress and strength and weakness in the implementation and ways forward. Here what is observed is more of a consistent way of doing things instead of a change since 2012.

Score: 0

2.1.3 Intensity of political engagement SPO

OSSA does not involve in any political activities as an NGO as this is not part of its directive to reaching its mission hence the score 0.

Score: 0

2.2 Level of Organisation

2.2.1 Relations with other organisations SPO

OSSA cooperates with other CSOs (NGOs, associations and CBOs like existing clubs and idirs through the coalition) in the area in order to avoid duplication of efforts. The cooperation with these CSOs has developed into a network and this network meets at least twice a year. In this regard, when one organisation selects beneficiaries the rest attend the meeting to align that they are indeed not supporting that person or the beneficiary receives a letter from the rest of the CSOs stating that he/she is not being supported by them. OSSA also interacts with PLWHIV associations and other CSOs working with community sex workers. Through this interaction duplication of efforts has been minimized which is an effort started before 2012 but has gotten more efficient now. This is an ongoing process since other CSOs are consulted whenever new beneficiaries are selected and through time stakeholders can correct previous mistakes and have an even better system. Due to their frequent interaction with other CSOs OSSA has become a steering committee member of CCRDA southern platform. OSSA is also a member of several networks like OVC task force and the WFP steering committee. No MFSII fund was used in this regard.

The CBOs (1 coalition, 6 girls clubs, mother support groups and volunteers) that are supported by OSSA also attend quarterly, semi-annual and annual meetings to report on the status of their tasks, challenges and best practices.

Score: +1

2.2.2 Frequency of dialogue with closest civil society organisation SPO

OSSA meets with the different networks (OVC network, CCRDA, WFP steering committee) mostly twice a year. These meetings take place either to discuss challenges and share experiences and come up with suitable solutions and cooperation system or to ensure that the beneficiaries that are being supported by one CSO is not also supported by the other so as to address the issue of duplication. The most frequent dialogues are once a month with a network with the WFP, the health office and other 6 NGOs addressing PLWHIV and OVC issues. The next is the OVC network with the Women and Children affairs office, Health office and around 10 NGOs meeting quarterly for one actor to present reports of what has been done in turn. OSSA is participating in both networks but there is no change in efficiency since 2012. This is not to say they are not efficient but they are functioning with a stable pace.

Score: 0

2.2.3 Defending the interests of marginalised groups SPO

The CSOs that defend the interests of the marginalized groups are the already existing community structures such as idirs and youth clubs. In OSSA's case the coalition also plays a role as it incorporates people who are volunteers and also idir leaders. This means, as this coalition is strengthened well then the 64 idirs that are member of the coalition are able to address the problems of the marginalized. NGOs may come and go but these community structures are structural. The government does its part but currently that is not much. There is a lot of ground to cover and the focus of the government is in specific issues like making ART freely available, free education to OVCs (as there is insignificant tuition this means no uniform requirement for the destitute students) as part of the MDG. CSOs can help bridge the gap between government efforts and the needs. The CSOs efforts of bridging the gap have not yet reached all targeted individuals but it is progressing from previous years since the number of beneficiaries reached has increased.

There are several incentives for voluntarism in Ethiopia. For the youth the sense of patriotism, optimism and drive for change contributes a lot in addition to the positive impact of doing extracurricular activities for employment. Another aspect is, as the people move into adulthood the religious factor plays a bigger role. Almost all Ethiopians are very religious on whichever belief they follow. Hence, the act of voluntarism is seen as a way to heaven which is the motivational contributor. Volunteers play a very significant role in home based care and support provided by OSSA. Clubs also depend on volunteers to do home based care and support. When seeing the effectiveness of these actors in terms of home based care it is observed that some volunteers stop the service putting in question their effectiveness. It is arguable as to what level should be seen as effective since these people are operating without any payment. However, the issue of their efficiency is not a matter of financial motivation (they don't expect to get money from it) since this was not why they joined the purpose in the first place. Still as any other person they should also earn a living for themselves and run their household which sometimes takes up all their time and as a result they quit the voluntarism. From the 10 volunteers financed by MFSII (60 trained by OSSA for MFSII and USAID projects) in Hawassa since joining in 2008 none quitted but 2 or 3 have not operated fully due to personal problems. Another reason may be that even if they are willing to dedicate their time and effort to helping the needy they may not be able/willing to spend their own money to do so since the allowance they get is too small to cover transportation cost of beneficiaries, some bills or food. Sometimes they even need to pay their own transport cost since they need to travel long distance sometimes. Such things are not taken into consideration when they are in their posts but running costs add up to a significant amount and hence affect the decisions of volunteers and effectiveness in terms of being able to support as many as they are willing to. This has an effect on motivation since volunteers are not able to perform as they would like to because they cannot move around freely in the community since the allowance does not cover their transportation costs nor the costs of the transportation of beneficiaries to health centres. Such things may be solved by incorporating the volunteers within the

coalition (which is involved in IGA). However, this system is not in place so far. In the case that volunteers quite, a system for recruitment and handing over of responsibilities should be in place. However, this required a good management/operational structure which is not really the case for OSSA volunteers but this is seen with other volunteer groups. There is a slight decline in beneficiaries reached in the period 2012-2014 even though most of the volunteers are functioning well in counselling and supporting between 4-7 PLWHIV and unknown numbers of OVC per volunteer. Still as mentioned above 3 of them have been partially or fully non-functional.

Score: -1

2.2.4 Composition financial resource base SPO

OSSA finances its workshops and meetings with different stakeholders using the funds it receives from various donors such as USAID and MFSII. It was observed that the activities done by the SPO are the same for different funds and only the beneficiaries and involved actors differ. The SPO mixes funds in the execution of some activities but in general all funds are used in each of the interventions done by the SPO.

The Financial Management Study (FMS) for OSSA was done in February 2012 that resulted to substantial areas for FM Improvement for OSSA. A first follow up visit was done in April 2013 to assess the status of its implementation and how this Financial Management Capacity Building (FMCB) has helped OSSA in its financial management and operations; and the results of this initial follow up visit, showed a 41.9% progress, i.e. 13 out of 31 action points have already been fully implemented. Still over spending on admin costs and under spending on operation was noticed in the reports from the SPO. Due to various reasons funds have declined from 2012 to 2014 but OSSA can still function without MFSII. The implication of stopping the MFSII fund is that the scale in which OSSA operates will decrease.

Three (3) days FM Training (FMT) was done in November 2012, as part of the FMCB process for all the partners of Cordaid that already went through the Financial Management Study. The primary objective of the FMT is to further strengthen the FMCB of Cordaid's partners like OSSA through letting the participants update their FMS Report with the new findings, learning, and recommendations or action points they encountered during the training; and which they also presented well to their Executive Director on the last day of FMT. This FMT is also a tool for the partners like OSSA to better understand the concepts behind sound Financial Management and to personally apply their learning through a more participative and workshop type of training and for them to also use later on when they're doing their own organisational improvements and monitoring the successful implementation.

From the rather big amount of questions asked in e-mail conversations between OSSA and the financial department of CORDAID on costs calculations and investments in the proposed budget in phase-out proposal for January-June 2014 it seems OSSA still struggles with financial management issues.

Score: 0

2.3 Practice of Values

2.3.1 Downward accountability SPO

According to the organisational structure OSSA has its own general assembly, steering committee, external auditor and board of directors. Therefore, the executive leaders are accountable to these entities and report biannually and annually. The general assembly has been revised after 2011 to incorporate representatives of beneficiaries- PLWHIV. The change has occurred due to this except improving the information flow from OSSA to beneficiaries and vis versa aside from having a close information source on the needs of beneficiaries. But no change is observed when comparing 2012 to 2014.

OSSA reports on its progress to its beneficiaries and other stakeholders including government offices that work with it via written reports (to government office such as health office) or in general

meetings held semi-annually and annually. However, it is the operations that get reported and not the financial status or utilization. This has been the practice for a long time hence no change has occurred regarding this.

Score: 0

2.3.2 Composition of social organs SPO

OSSA has representatives of marginalized target groups and CBOs it is working with in the mandatory social organs. It is said that 10% of the marginalized target groups are members of the mandatory social organs. This has also been the case on the baseline.

Score: 0

2.3.3 External financial auditing SPO

It is mandated by the government that any organisation has to report its financial flow on a yearly basis, where the budget year ends in June. In order to report on the financial activities of an organisation the company/institution/NGO must have a stamped audit report from an external auditor after thorough evaluation of the whole organisational activities. If interested the organisation can conduct an internal audit however times it sees fit but it would still need an external auditor to declare to the government. Accordingly, OSSA conducts this annual audit by an external body.

The external auditor is also entitled to ask for any financial documents for the annual audit since it is necessary to acquire the external audit paper to report to the government.

Score: 0

2.4 Perception of Impact

2.4.1 Client satisfaction SPO

The awareness level of the general community in the project area has increased through the interventions of the SPO via the idir coalition and youth clubs. These CBOs were involved in peer education through different methods to increase the awareness of people with regards to HIV, stigma and PMTCT (coalition). They co-operate on some activities like drama and poem presentation to get the message across. When there are persons who want to go for testing they refer them to OSSA or other testing centres. As these CBOs are approaching parts of the community that they relate to (the idir coalition address community members via idirs, the clubs are responsible for addressing the youth, and the PPTCT are responsible for addressing the OVC's) and they are also part of the community themselves it is easy for them to get the message across, making them the best approach to awareness creation. These CBOs have increased the area coverage within Hawassa and reached more people in terms of awareness creation and HIV testing since 2012.

For those beneficiaries that were identified and received ART treatment, but have very low income incapacitating them to sustain themselves and their families and also those OVCs with elder/destitute guardians, OSSA established, trained and given initial capital to saving associations. So far the effect of the saving associations is minimal since loans have not yet started. Beneficiaries have changed for the better after being involved in IGA. Those people who did not have anything to eat or wear in 2012 and before are now earning and supporting themselves gradually. The businesses of those involved in IGA are earning a subsistent income if not more since being given the initial capital in 2008. In 2013, over the four sites 200 PLWHIV and guardians of OVC are involved in IGA. The guardian club for instance is involved in small business activities preparing food and selling animal feed. They are also encouraging others as a witness to the change that can be found. However, 41% of the people planned to join IGA between 2012 and 2014 have not received initial capital due to the need to increase the amount of the start-up capital because of the high inflation rate.

OSSA furthermore covers medical expenses for PLWHIV and OVCs/children with HIV and provides school materials and uniform for the later. Volunteers that were recruited by the coalition and trained

by OSSA on issues like counselling, advising and health information visit households to counsel both adults and OVCs. They also provide support on household chores when necessary. There is a good relationship between beneficiaries and volunteers due to the nature of the support being provided. Of course, few volunteers are less attentive as observed from the minutes of the general meetings. Volunteers not only do support of household chores but solve family problems and give advices (for instance advising abused women to get legal support) as stated by OSSA, the volunteers and beneficiaries interviewed. Still it was the observation of the in-country research team that the fact that these volunteers are involved in wide range of activities may in a way hinder their efficiency when seeing their performance in only one topic/area.

Beneficiaries speak positively of OSSA due to the strong support they get from the organisation. Their views also stem from the fact that the organisation always responds fast to their needs in terms of, for instance, sending them to health centres and communicating with the centres in cases where the centres create inconvenience for the patients or when the children of the beneficiaries (who are also beneficiaries) get sick and need immediate attention then OSSA provides vehicle and covers the cost or reimburses it immediately. Such support gives the beneficiaries they feeling they can always rely on OSSA.

Score: +1

2.4.2 Civil society impact SPO

The CBOs supported by OSSA are expected to take over the care and support and awareness creation activities after the SPO phases out but it was observed that most of these CBOs specifically the coalition and most of the clubs are not strong enough to work with the intensity expected of them. With regards to awareness creation and referrals these CBOs will be able to execute the activities as they have built their capacity with the help of OSSA and others since 2012. They are already functioning with little or no supervision from OSSA. Awareness creation and referrals requires small finance and in the case of the coalition it is incorporated with the already existing community structure of idirs.

The care and support service however may be at risk since there doesn't seem to be a well-established platform or system for the volunteers and the coalition to communicate even though there are several coalition admins who are volunteers. When OSSA's project phases out, the idea is that the coalition takes over the managing of the volunteers and the provision of counselling service to the newly identified beneficiaries. At the moment of this end line study the coalition is not yet undertaking such efforts. This is not to say there is no relationship amongst the CBOs. As all the volunteers are idir members and hence participate in the CCs, they have access to information. The volunteers furthermore cooperate with the youth clubs in some awareness creation activities. However; the system is very informal and not strong enough and hence may not be as effective. MFSII funding was used for the facilitation of the capacitating and discussion meeting in these cases.

The coalition has been strengthened well in that it was able to send over 20 mothers for PMTCT check-up from one CC meeting as seen from its report to OSSA. The coalition is also mobilizing its own resources to execute its mission on a larger scale. So far the awareness creation activities being done can be said to be effective since many households are covered by the CC meetings conducted by the coalition in cooperation with the idirs. OSSA has also supported the girls clubs to create a coalition and they have got a licence from the regional justice office to work as a CSO. The OVC guardians and PLWHIV saving association were also established in collaboration with town small and micro association coordination office in 2013. These associations are saving consistently with few dropouts. The saving associations have a regulation that people can't borrow money before one year so they have not yet started lending but the plan is to enable the members to borrow money to expand their business after a year. Of course, this can raise the issue of effectiveness as there is high inflation in the country and after a year members are expected to borrow up to 1000br only.

Score: +1

2.4.3 Relation with public sector organisations SPO

OSSA works very closely with some government offices like the regional health office; the women, youth and children office; the finance and economic development office. It is essential to work with these bodies as the smooth implementation of interventions and activities of the SPO requires it. The necessary government offices have to be informed of the activities of any CSO as a procedure and a monitoring strategy on the side of the government. For instance, when one of the volunteers identified an abused girl she first brought her to OSSA for testing then OSSA and the volunteer take the case to the women and children's affairs. OSSA also worked with the health office in a referral system, although this practice has been exercised before 2012 now it has gotten stronger with the betterment of the practice through time.

The participation of public sector organisations in the planning, implementation, monitoring and evaluation of the project has increased significantly as compared to 2012. The relationship with these bodies is strong and positive as was observed during the study. The offices interviewed see OSSA as a supporting body of the government focus to alleviate essential problems within the community. Although some expect it to do more (which may not be possible due to budget and scale of the project) they have no complaints with the things done so far. These bodies get a regular report and communicate frequently with OSSA.

The Coalition is working together with the girls clubs and AACs in addressing the awareness creation among community in many topics including HIV, discrimination and stigma reduction. The girls clubs and AACs also interact with each other to see which areas they are both working in.

Although the influence of OSSA with regards to influencing the policies of the public sector is not visible due to the CSO law of the country, OSSA does invite representatives from the government offices it works with to participate in the general meetings it holds. The offices are aware of the activities done by the SPO and have a set way of operating (hospital sends a slip for the treatment done to referred individuals, OSSA settles invoices after treatment, OSSA reports to the health office and women and children affairs office) which is a change in the regulation or way of working of these bodies.

OSSA has also supported the girls clubs to create a coalition and they have got a licence from the regional justice office to work as a CSO. The OVC guardians and PLWHIV saving association were also established in collaboration with town small and micro association coordination office within the past year. These associations are saving consistently with few dropouts.

Score: +1

2.4.4 Relation with private sector agencies SPO

OSSA doesn't have that much of a relationship with private sector offices. Although some attempts have been done on the topic it is still at the infant stage. OSSA is attempting to work with private health centres and sponsors for the coalition.

Score: 0

2.4.5 Influence upon public policies, rules, regulations SPO

OSSA has not brought any changes on the policies of the public sector offices it is working with other than a change in practice.

Score: 0

2.4.6 Influence upon private sector agencies' policies, rules, regulations SPO

OSSA has not played any part in influencing the regulations and policies within the private sector as its communication with those in the private sector is very minimal.

Score: 0

2.5 Environment

2.5.1 Coping strategies

The new CSO law put in place by the government stating the spending of the funds CBOS receive should be 30% for administrative costs and 70 % for operation (issued in 2009 and implemented as of 2010) has negatively affected CSOs. They are constrained in terms of the man power they hire and the field visits they would conduct especially for M&E as all these are in the 30% limit. These organisations also have to relocate to cheaper offices, which consumes time. With this regard as there is a regulation of 30/70 allocation of fund to administrative and operational costs respectively all funds are allocated accordingly (the regulation was effective on 2010). Not compiling to the law leads to a termination of license. This may be one of the reasons why man power shortage is observed in the project site in Hawassa where the project manager is executing most of the activities. Records show however that the MFSII budget has been considerably overspent on salary, office and transportation costs and seems to have been under-spent on the activity side. OSSA replied that aggregation of the different projects budgets would make complying with the rules possible.

The global economic crisis also negatively affected the achievement of organisational objectives as most donor countries are in economic crisis hence less inclined to donate.

Another regulation affecting the CSO is the law stating that any CSO funded by foreign source cannot engage in lobby and advocacy or right issues. Being that OSSA works with children and marginalized groups it has to act with extra care not to involve in these issues, which makes its work difficult and less efficient than had it been able to lobby. Hence, the SPO is currently working with the public offices and making them part of the planning, implementation and evaluation so they can take their own measures after observing the progress.

Another issue affecting the efforts of OSSA is the high inflation rate which influences the IGA activities done by the saving association. There is high inflation in the country, mostly ranging between 35% and 40%, hence; the initial capital given to individuals is not enough to boost their economic security (income earning and increasing number of meals per day). In response to this, the SPO has increased the initial capital from 1500br to 2500br which in turn decreased the number of beneficiaries addressed.

Report CDI-15-019

The Centre for Development Innovation works on processes of innovation and change in the areas of food and nutrition security, adaptive agriculture, sustainable markets, ecosystem governance, and conflict, disaster and reconstruction. It is an interdisciplinary and internationally focused unit of Wageningen UR within the Social Sciences Group. Our work fosters collaboration between citizens, governments, businesses, NGOs, and the scientific community. Our worldwide network of partners and clients links with us to help facilitate innovation, create capacities for change and broker knowledge.

The mission of Wageningen UR (University & Research centre) is 'To explore the potential of nature to improve the quality of life'. Within Wageningen UR, nine specialised research institutes of the DLO Foundation have joined forces with Wageningen University to help answer the most important questions in the domain of healthy food and living environment. With approximately 30 locations, 6,000 members of staff and 9,000 students, Wageningen UR is one of the leading organisations in its domain worldwide. The integral approach to problems and the cooperation between the various disciplines are at the heart of the unique Wageningen Approach.

Report CDI-15-028

Klaver, D.C., Jacobs, J., Tefera, W., Getaw, H., Dereje Getu D., February 2015, *RiPPLE end line report; MFS II country evaluations, Civil Society component*, Centre for Development Innovation, Wageningen UR (University & Research centre) and International Food Policy Research Institute (IFPRI). Report CDI-15-028. Wageningen.

This report describes the findings of the end line assessment of the Research Inspired Policy and Practice Learning in Ethiopia and the Nile Region (RiPPLE) that is a partner of the WASH alliance.

The evaluation was commissioned by NWO-WOTRO, the Netherlands Organisation for Scientific Research in the Netherlands and is part of the programmatic evaluation of the Co-Financing System - MFS II financed by the Dutch Government, whose overall aim is to strengthen civil society in the South as a building block for structural poverty reduction. Apart from assessing impact on MDGs, the evaluation also assesses the contribution of the Dutch Co-Funding Agencies to strengthen the capacities of their Southern Partners, as well as the contribution of these partners towards building a vibrant civil society arena.

This report assesses RiPPLE's efforts towards strengthening Civil Society in Ethiopia and it used the CIVICUS analytical framework. It is a follow-up of a baseline study conducted in 2012. Key questions that are being answered comprise changes in the five CIVICUS dimensions to which RiPPLE contributed; the nature of its contribution; the relevance of the contribution made and an identification of factors that explain RiPPLE's role in civil society strengthening.

Keywords: Civil Society, CIVICUS, theory based evaluation, process-tracing

1 Introduction

This report presents the civil society end line findings of RiPPLE in Ethiopia which is a partner of WASTE, RAIN Foundation and ICCO under the Dutch WASH Alliance (DWA). It is a follow-up to the baseline assessment that was carried out in 2012. According to the information provided during the baseline study, RiPPLE is working on the theme/MDG 'Private Sector & Agriculture'.

The end-line assessment for RiPPLE, and in particular the implementation of the MFS II 'Linking sanitation and hygiene (urban waste management) to urban agriculture' project implemented with support of WASTE and ICCO did not take place as expected. Early 2013, WASTE and the RAIN Foundation, implementing another project with RiPPLE, decided to end their partnership with RiPPLE because of missing clarity about progress being made towards outcomes and finances. They asked for an external audit, which provided clarity on the remaining budget which was executed in the first semester of 2013.

As a consequence of the audit all WASH alliance partners seized their collaboration with RiPPLE. Only ICCO resumed its partnership with RiPPLE in the second semester of 2014.

Both internal factors within RiPPLE, such as high staff turnover including executive leaders; external factors such as the 30:70 regulation of the Ethiopian government which forced RiPPLE to considerably reduce its human resources; the mostly annual contracts with different partners of the Dutch WASH Alliance, implying high management costs, all explain the end of the partnership. Only ICCO resumed its activities with RiPPLE in the second semester of 2014.

For this reason no civil society evaluation was conducted for RiPPLE.

2 Context

The Ethiopian Government has enacted a five year Growth and Transformation Plan (GTP) to implement over the period of 2011-2015.¹ Two of the major objectives of the plan are to maintain at least an average real GDP growth rate of 11%, meet the Millennium Development goals, and expand and ensure the qualities of education and health services thereby achieving the MDGs in the social sectors (FDRE, 2010). The government acknowledged that NGO's and CSO have an important role to play in the implementation of this plan: According to the preamble of the new charities and societies proclamation NO. 621/2009 of Ethiopia, civil society's role is to help and facilitate in the overall development of the country.² This is manifested in the government's approach of participatory development planning procedures. For example, NGOs established a taskforce under the umbrella of the CCRDA to take part in the formulation of the country's first Poverty Reduction Strategy paper formulation. They were a major stakeholder in the planning process of the five year GTP plan. Despite fears that the NO. 621/2009 proclamation was thought to have negative impacts on Civil Society, the number of newly registered charities and societies have increased considerably. 800 new charities and civil societies were registered between 2010/11 and 2011/12 and as of February 2012, these were implementing over 113.916 projects in different social, economic and governance related sectors. Governance related projects comprise interventions in the area of democracy and good governance, peace and security, human rights, justice, and capacity building. The charities and societies are most engaged in the health sector (19.8%), followed by child affairs (11.9%), education (9.2%), governance (8.3%) and other social issues (7.8%). These figures are more or less similar to the pre-proclamation period, and would imply that new charities or societies have replaced foreign and Ethiopian charities that are not allowed to work on sectors related to governance and human rights.³ This might indicate that there might have been some flexibility in the interpretation of some of the provisions of the proclamation.

3 Description of RiPPLE and its contribution to civil society/policy changes

3.1 Background of the SPO

RiPPLE was established as a WASH research programme from 2006 to 2011 with funding from DFID and core partners including the Overseas Development Institute, IRC International Water and Sanitation Centre and several local Ethiopian organisations. As DFID funding ceased in mid-2011, RiPPLE developed several new funding partnerships including projects with members of the Dutch WASH Alliance, the Dutch Partners for Water Programme, the CGIAR Challenge Programme on Water and Food and a major new planned project with UNICEF amongst others. Since April 2012, RiPPLE became an independent NGO. A new governing body structure was established and Mister Deres Abdulkadir was appointed as the new Executive Director. Since 2012 RiPPLE has known a high turnover rate of staff and Mister Deres Abdulkadir was replaced by Mister Takele Kassa as Executive director from November 2013⁴.

RiPPLE evolved during the 2006-2012 period as a key actor and resource centre and knowledge management unit for WASH and related sectors, including rainwater harvesting and climate adaptation. The fact that RiPPLE is recognised as a key actor in the sector is reflected by the different steering committees RiPPLE sits in, in which RiPPLE represents the WASH sector (like PANE, Forum for Learning on Water & Sanitation, CCRDA's WASH Sector Forum (WSF), MoWR&E WASH inventory, DWA Steering Committee, Steering Committee of the Platform on Land & Water Management, Regional Learning & Practice Alliances, etc.).

RiPPLE's motto is:

Financing and delivery of Water, Sanitation and Hygiene (WASH) that is more equitable and sustainable will improve human security and contribute significantly to pro-poor growth through linkages to assets, income and health.

Vision:

The vision of RiPPLE is "to see all Ethiopians attain sustainable water & food security and live in a clean & healthful environment".

Mission:

The mission of RiPPLE is "promote/enhance learning on water & related sectors in Ethiopia and the Nile Region through action research, networking policy practice engagement, knowledge management and capacity building" "

⁴ Interview with Takele Kassa

Strategies:

Strategically, focus themes for RiPPLE are action research, capacity development, policy and practice engagement, networking and learning & sharing in related WASH sectors. It promotes multiple use of rainwater for the following purposes⁵:

- Domestic water use which includes sanitation & hygiene in rural and urban communities;
- Agriculture: small scale irrigation (SSI) for crop production, and livestock watering;
- Environment: water conservation practices in watersheds for use by trees and vegetation cover during drier periods, the recharge of groundwater to be year round/reliable source of water for springs/streams, and the control of erosion and flood hazards and silt deposition in low lying areas;
- Water uses other than domestic purposes such as industrial, commercial and public.

The ultimate beneficiaries of RiPPLE's work are user communities. Nevertheless owing to the nature of its promotional operations, the main direct beneficiaries of its endeavours are partner organizations such as local and central governments, TVETs, Students, and CSOs/NGOs in the sector whose ultimate objective is to benefit communities in need.

According to the information made available until so far, RiPPLE operates in Oromia, SNNPR, Amhara, Tigray, Afar, Dire Dawa Administrative Council, and Somali Region. With the ongoing decentralisation process, the regional Bureaux of Water Resources and Bureaux of Health became responsible for water supply and sanitation programmes and are therefore an important focus for RiPPLE. Apart from this regional focus, it works at federal and at district level. It has offices in Oromia (Hararghe), Tigray (Mekelle), Amhara (Bahir Dar), SNNPR (Hawassa), Harar and Addis Ababa.

Apart from an ongoing collaboration with ICCO of the Dutch WASH Alliance, RiPPLE receives funding from UNICEF and USAID.⁶

3.1 MFS II interventions related to Civil Society

3.1.1 Contracts with the Dutch water Alliance

According to the information made available to CDI, RiPPLE was working with three different members of the WASH Alliance as well as with one thematic partner and managed three different contracts.

1. A tripartite contract existed between WASTE (and RUAF), ICCO and RiPPLE for the project "Productive Use of WASTE and Waste Water linking with Urban Agriculture". (July 2011 – December 2012). This project was implemented in Oromia (5 districts), Afar (1 Zone), and Dire Dawa and national level. Its objectives are:
 - Empowered communities, in particular women and girls, will demand access to and use of safe water, improved sanitation and hygienic living conditions. (CIVICUS – civic engagement)
 - Relevant service providers in the business sector, public sector and civil society will co-operate to respond to need for sustainable, accessible, affordable and demand driven WASH services. One of the activities under this objective is subcontracted with META META (no details available). (CIVICUS, perception of impact)
 - Policy makers and key actors promote and enable the sustainable realization of the right to water and sanitation through their policies, programmes and budget allocations, and are held

⁵ RHCC progress report 2011

⁶ Interview with Takele Kassa, June 2014

accountable for their achievements in WASH (CIVICUS, perception of impact = policy influence)

- A stable, complementary, effective and accountable alliance (in North and South), in which participating actors feel ownership, share knowledge and coordinate work towards sustainable integration of WASH into policies, strategies and programmes, in order to increase the access to and use of WASH facilities. (CIVICUS, level of organisation).
2. A second relation with RAIN foundation which aims at setting up a Rainwater Harvesting Capacity Centre (RHCC) during a 5 year programme (2011 – 2015). According to WASTE this project has ended in the meanwhile. Expected result areas were:
- Action research, documentation, communication and dissemination of knowledge;
 - Strengthening and initiating partnerships and networking;
 - Policy, practice engagement and capacity building;
 - Monitoring and evaluation to ensure proper implementation of RWH projects;
 - Maintain optimal level of organisational capacity for RiPPLE's role as RHCC for the year (Mar. 2011 Feb. 2015).

Apart from the last two result areas, these results contain activities in the CIVICUS dimensions of 'civic engagement', 'level of organisation' and 'perception of impact'.

3. A third contract within the WASH programme was between RUAF and RiPPLE, which was (content wise), the extension of the 1st contract (see above).

3.1.2 Focus for the Civil Society evaluation component

CDI draw a sample during the baseline of Southern Partner Organisations in 2012, according to the most frequently mentioned MDGs or themes indicated in each country. The data base for Ethiopia classified RiPPLE under MDG 1, economic development. Of the three projects implemented with the Dutch Water Alliance, the 'Linking sanitation and hygiene (urban waste management) to urban agriculture' focused most on MDG 1, whereas the other two projects are related to MDG 7c: Access to water and sanitation. In 2012, a baseline assessment was done in Dire Dawa that focussed on urban waste management project that started in July 2011 until December 2012, were prolonged without an additional budget until June 2013. In the first semester of 2013, a net three year project proposals and agreement with the government was prepared but not signed.

⁷ Costs that relate to civil society development or policy influence are those costs that possibly contribute to the development of the CIVICUS dimensions, excluding coordination and office costs; staff costs and financial reserves.

4 Explaining factors

WASTE informed CDI in March 2014, at the start of the end-line assessment that the contracts between WASTE and RiPPLE were not renewed after December 2012 and that WASTE was in the process of rounding up all relations with RiPPLE. WASTE indicated that the evaluation process might be affected by this, since RiPPLE's motivation to cooperate could be minimal due to these developments.

The main reasons for WASTE to end their partnership with RiPPLE were unclear progress and financial reports, making it impossible to link project activities to outcomes⁸. WASTE asked for an external audit before entering into a new contract. Upon this request, the other WASH alliance members decided to postpone their contract renewals as well. Two external audits were conducted of which the first was rejected. The second external audit was carried out in 2013 and showed residual funds from the July 2011-December 2012 contract that were used to finish some of the outstanding activities for the WASTE-ICCO programme in the first semester of 2013. When the semester report of 2013 was again not up to standards according to WASTE, the CFA decided to not extend the contract. ICCO provided €30.000 to finalise ongoing activities and demanded a restructuring and reform programme in order to consider continuing the partnership.⁹ By June 2014 WASTE had already found other alternative partners in Ethiopia to run its programme.

The evaluation team was later informed that the RAIN Foundation terminated its intended five year contract regarding the Rainwater Harvesting Capacity Centre with RiPPLE as of April 2013 for similar reasons¹⁰. In the meanwhile RAIN Foundation opened its own office in Addis Ababa¹¹.

ICCO apparently entered into a new contract with RiPPLE after their restructuring efforts until the end of 2014, however CDI was not able to conduct an interview with them. RUAF, like WASTE, wanted to see some activities finalised in 2013 from the 2012 contract and did not extend their contract either.

4.1 Internal Factors

Since 2012, management turnover at RiPPLE has been high.¹² The first executive director turned RiPPLE into an independent organisation, but left very soon after its independence in 2011. Also his successor left the organisation very soon and the current director started working with RiPPLE since November 2013. As a result, oversight over the implementation of activities in relation to long-term strategies might be a problem.¹³ RiPPLE tried to tackle the problem by designing a new organisational strategy, which was scheduled to be ready by the end of March 2014 (but not finalised during a visit of CDI in June 2014).

⁸ Telephone call with Niels Lenderink (WASTE) on 17-3-2014

⁹ Interview Tekele Kassa on 25-6-2014

¹⁰ Interview with Sean Patrick (RAIN Foundation) on 24-3-2014

¹¹ Interview with Tekele Kassa on 25-6-2014

¹² Telephone call with Sean Patrick (RAIN Foundation) on 24-3-2014

¹³ Idem

The high staff turnover of executive leadership went together with highly professional staff leaving the organisation causing problems in terms of organisational capacity and financial oversight¹⁴¹⁵ . Managing three contracts with the WASH Alliance, the longest covering one and a half year, possibly also might have added to the missing financial oversight¹⁶ .

4.2 External Factors

RiPPLE faced problems with the government regarding the urban waste management project in Dire Dawa and East and West Hararghe, the main reason being that contracts were annual contracts. The Dutch partners (WASTE, ICCO and RUAF)¹⁷ in consequence agreed to formulate a three year programme proposal covering 2013 – 2015, which however did not materialise.

The yearly contracts also have negative implications for RiPPLE, giving it little flexibility to stick to the 30:70 regulation imposed by the government that limits administrative costs to a maximum of 30 % of project budgets. In consequence forcing RiPPLE to cut in their programme costs and to reduce the number of staff: When the new director joined RiPPLE in November 2013, RiPPLE had 42 employees, by the time of the interview in June 2014 this was only 29. This staff reduction has not been well coordinated with the donors and resulted in a delay of delivering and uncertainty about final products.¹⁸

4.3 Relations CFA-SPO

During the partner selection process, WASTE felt somewhat pressurized to act fast due to the MFS II funding deadline and because there had been staff changes in the responsibility for Ethiopia within WASTE.¹⁹ RiPPLE was chosen by WASTE as a partner because they worked on sanitation, urban waste, and agriculture. In hindsight WASTE acknowledges that RiPPLE may not have been the best partner for their programme which requires competencies in project management and to a lesser extent action research which is the core business of RiPPLE.²⁰ WASTE itself has also known high staff turnover rates in the past period, which also may have explained the difficulties arisen.

RiPPLE comments that the donors were late in showing their concerns as they could have also shared these concerns in earlier stages such as during planning or semi-annual reporting.²¹

Despite efforts made by CDI to contact ICCO Kampala to obtain other background information on their activities with RiPPLE and their relations, no answers were obtained and skype appointments were cancelled.

Similar attempts were made to establish contact with Rain Foundation, without any result.²²

²⁰ Interview with Niels Lenderink (WASTE) on 7-6-2014

²¹ Feedback from Takele Kassa

²² In the beginning of 2014 the Rain Foundation informed the evaluation team about their concerns regarding RiPPLE which are incorporated in this report (see footnote 12).

5 Conclusion

The end-line assessment for RiPPLE, and in particular the implementation of the MFS II 'Linking sanitation and hygiene (urban waste management) to urban agriculture' project implemented with support of WASTE and ICCO did not take place as expected. Early 2013, WASTE and the RAIN Foundation, implementing another project with RiPPLE, decided to end their partnership with RiPPLE because of missing clarity about progress being made towards outcomes and finances. They asked for an external audit, which provided clarity on the remaining budget which was executed in the first semester of 2013.

As a consequence of the audit all WASH alliance partners seized their collaboration with RiPPLE. Only ICCO resumed its partnership with RiPPLE in the second semester of 2014.

Both internal factors within RiPPLE, such as high staff turnover including executive leaders; external factors such as the 30:70 regulation of the Ethiopian government which forced RiPPLE to considerably reduce its human resources; the mostly annual contracts with different partners of the Dutch WASH Alliance, implying high management costs, all explain the end of the partnership. Only ICCO resumed its activities with RiPPLE in the second semester of 2014.

For this reason no civil society evaluation was conducted for RiPPLE.

Report CDI-15-028

The Centre for Development Innovation works on processes of innovation and change in the areas of food and nutrition security, adaptive agriculture, sustainable markets, ecosystem governance, and conflict, disaster and reconstruction. It is an interdisciplinary and internationally focused unit of Wageningen UR within the Social Sciences Group. Our work fosters collaboration between citizens, governments, businesses, NGOs, and the scientific community. Our worldwide network of partners and clients links with us to help facilitate innovation, create capacities for change and broker knowledge.

The mission of Wageningen UR (University & Research centre) is 'To explore the potential of nature to improve the quality of life'. Within Wageningen UR, nine specialised research institutes of the DLO Foundation have joined forces with Wageningen University to help answer the most important questions in the domain of healthy food and living environment. With approximately 30 locations, 6,000 members of staff and 9,000 students, Wageningen UR is one of the leading organisations in its domain worldwide. The integral approach to problems and the cooperation between the various disciplines are at the heart of the unique Wageningen Approach.
