PREFATORY REMARKS AND ACKNOWLEDGMENTS

I began this book about twenty years ago. Having decided to carry out a field study of a contemporary Society Islands community — for contrast with a study done in Melanesia some fifteen years earlier — I set aside a summer to prepare an ethnographic reconstruction of pre-European Tahiti in order to see how much of the past had survived into the present. As one “specialist,” who shall be nameless, advised me, “... it shouldn’t be much of a job, since most of the information is already recorded and digested in a handful of books.”

The incredibility of that advice turned out to be exceeded only by the naïveté of my credulity. By the end of that summer I had indeed read the “handful of books” alluded to, but in doing so I had accumulated many more questions than answers. For example, it had become clear to me that many of the generalizations then current about ancient Tahitian social relations (the focus of my inquiries) were in reality scholars’ inventions that had come to acquire “authenticity” more through reassertion than through retesting with primary sources. Also, during that frustrating summer I discovered the existence of masses of unpublished primary sources that had hitherto been either untapped or tapped only piecemeal.

Finally however, after some fifteen years and many interruptions, including two periods of fieldwork in the Society Islands and resumption of research in Melanesia, the goal was approached as near as I have the knowledge, or more decisively the will, to reach it. In proceeding thus far — which I readily acknowledge is not far enough — I have become heavily indebted for help received from many individuals and institutions. It is now my pleasure to list them.

First, for the financial support that helped to provide me with free time, travel, research assistance, typing, and so forth, I am indebted to the Anthropology Department of Harvard University, the East-West Center at the University of Hawaii, the National Science Foundation, and the Tri-Institutional Pacific Program.

The libraries and librarians who were most useful and helpful were Harvard’s Peabody Museum Library (and Margaret Currier), the Bishop

Museum Library (and Margaret Titcomb), the University of Hawaii Pacific Collection (presided over by Janet Bell and Renée Heyum), and the Mitchell Library of the Library of New South Wales.

A book describing *ancient* Tahiti must of course include extensive quotes and paraphrases from primary sources, published and unpublished. For permission to use such material grateful acknowledgment is made to the following publishers and archives: the Bishop Museum, the London Missionary Society Corporation, the Hakluyt Society, Cambridge University Press, the Golden Cockerel Press, the Polynesian Society, Société des études océaniques, the National Library of Australia, the Mitchell Library, and Angus and Robertson, Ltd. Less extensive but very useful material was quoted from copyrighted publications of the University of Washington Press, Columbia University Press, and the Franz Steiner Verlag of Wiesbaden.

The illustrations which, I hope, help to expand and enliven the text derive from many collections, and have been provided through the services of many generous custodians. In the first rank are the British Museum (the Trustees thereof in general, and B.A.L. Cranstone and Edward Telesford in particular), the London Missionary Society Corporation (especially Irene Fletcher and E.H.G. Blacklock), the Mitchell Library (especially Suzanne Mourot), and the Bishop Museum (particularly Roland Force, Kenneth Emory, and especially Yosihiko Sinoto, who generously supplied photographs of several of the ancient stone structures he and his associates have studied and in part reconstructed). Other institutions and individuals that have generously contributed illustrations are The Art Institute of Chicago, Mr. and Mrs. Henri Kamer, Raymond Wielgus, the Bernisches Historisches Museum, the British Museum of Natural History, Cambridge University Museum (especially Robert Macle hose), the Field Museum of Natural History (especially Donald Collier), The Museum of Primitive Art (New York), the National Library of Australia, the National Maritime Museum (Greenwich, England), the Peabody Museum of Harvard University, the Peabody Museum (Salem, Massachusetts), The University Museum of the University of Pennsylvania, Admiralty House (London), and the Etnografiska Museet (Stockholm). In addition, the illustrations include copies of several previously published photographs and drawings of objects found in the following collections: the British Museum, the Hunterian Museum of the University of Glasgow, the National Museum of Ireland, the Pitt-Rivers Museum (Oxford), the Cambridge University Museum, Greenwich Hospital (Greenwich, England), the Mitchell Library (Sydney), the Institut für Völkerkunde (Göttingen), Peabody Museum (Salem), American Museum of Natural History (New York), Museum für Natur- und Völkerkunde (Basel), Museum für Völkerkunde (Vienna), National Museum (Washington), and the Honolulu Academy of Arts. I have also to thank the four

skillful artists who prepared illustrations for this book, either drawing the objects themselves or copying illustrations of them: Niel Crozier, who drew the maps used in these volumes, A. Smith-Brunet, G. C. Smith, and George Sasaku.

The selection and documentation of most of these illustrations was the work of Roger Rose, now curator at the Bishop Museum. I am deeply indebted to Dr. Rose for his invaluable assistance and eagerly look forward to the publication of his comprehensive manuscript on the material culture of ancient Tahiti.

A work of this size and length of gestation embodies the assistance and encouragement of many persons in addition to the kinds of contributions heretofore acknowledged. Chief among those who directly and materially aided in the research were Robin Hooper, Nan Gaynor, Ann Jay, Robert Jay, Joy Rabin, and Marguerite Robinson. I have also profited greatly from the knowledge and insights provided by several of my colleagues, some of them former students, and all of them specialists in various aspects of Polynesian history or anthropology: Eugene Anderson, the late John Beaglehole, Bengt Danielsson, Greg Denning, Kenneth Emory, Ben Finney, Raymond Firth, Derek Freeman, Irving Goldman, Roger Green, Neil Gunson, E.S.C. Handy, Antony Hooper, Paul Kay, Robert Levy, Harry Maude, Richard Moench, Colin Newbury, H. René Papy, Marshall Sahlins, and Yosihiko Sinoto.

Harking back to the eras under scrutiny, I wish to pay special tribute to the ethnographic reporting of four of the early visitors to Tahiti: Bligh, Morrison, Orsmond, and Rodriguez. (The missionary Knott may have been better informed about Tahitian life than any of these four, but his knowledge is recorded mainly in the writings of others.)

It is also fitting to acknowledge here the great service rendered to Tahitian studies by Patrick O'Reilly and Édouard Reitman, in their monumental *Bibliographie de Tahiti et de la Polynésie française* (1967). Unfortunately for me, this work appeared after completion of my manuscript; had it been available a few years earlier it would have reduced my own labors immeasurably.

In addition to the above, I wish to thank several persons for their help in connection with my field studies in contemporary Tahiti — studies which, though not the basis of the present book, may have helped some in the attempt to comprehend life in Tahiti in earlier eras. Chief among these are Dr. and Mrs. Bengt Danielsson, Jean Guiart, Henri Jacquier, Mr. and Mrs. M. R. Kellam, J. Laguesse, Emile Massal, and Aurora Natua. Above all, I am deeply indebted to R. G. White, who shared with me his profound knowledge of the Tahitian language during my fieldwork in Tahiti and during the preparation of this work. In this connection, I am also moved to acknowledge gratefully the assistance, deliberate or otherwise, provided me by the Polynesian residents of Huahine and Mo'orea, the sites of my field studies.

Although themselves unaware, they undoubtedly exemplified many continuities with that long-forgotten past, which they labeled, doubtless with some mixed feelings, the "Heathen Era" (*tau etene*).

Last but (as the saying goes) certainly not least, I wish to acknowledge with gratitude the services of the two persons most largely and directly responsible for the book in this final form: to my wife, Ann R. Oliver, who bore with me helpfully and patiently during the years it took to write it, and to my editor, Iris M. Wiley, who helped me recast it in a more comprehensible form.

Now, a word about the book's dedication. Each of the three scholars to whom this work is dedicated has been preeminent in his respective field in the recent revival of scholarly interest in pre-European Polynesia. With regard to Tahiti particularly, however, the names of F. Garanger, Roger Green, and Yosihiko Sinoto must be added to the list of scholars who have made very important contributions to the prehistory of that archipelago. Robert Levy's recent report (*Tahitians: Mind and Experience in the Society Islands* [Chicago & London: University of Chicago Press, 1973]) on the thought processes and emotional organization of contemporary Tahitians also signals a revival of competent scholarship on this aspect of ancient Polynesian life. Though the individuals he observed were living nearly two centuries later than those seen by Cook and Bligh, it would be surprising indeed if *none* of their mental and emotional behaviors were survivals of a pre-European past. Similarly, recent descriptions of contemporary Tahitian communities and customs (e.g., by B. Finney, A. Hooper, M. Jullien, P. Kay, A. Lavondes, Y. Lemaitre, M. Panoff, Fr. Ravault, G. Ringon, and Cl. Robineau) undoubtedly contain ancient continuities, which more probing and comparison will someday reveal.

Turning now to some aspects of the text itself, the reader will undoubtedly note many inconsistencies in the spellings of Tahitian words — a fault that I am painfully conscious of but have been unable to correct. The problem derives from several circumstances. First of all, during the eras under study, the recordings we have of Tahitian words and texts were done by Europeans wholly unsophisticated in linguistic science in general and in phonetics and phonemics in particular. Consequently, not only did these writers perceive and record native words in different ways, but most of them did not even grasp the phonemic significance of such fundamental features of Tahitian as vowel length and the glottal consonant. Of course, if the words in question were still current today, and demonstrably unchanged in meanings, it would be a simple matter to go back over the old texts and "correct" the spellings, including insertion of glottals and of diacritics for vowel length.

Unfortunately, the language *has* changed, and changed *very* much — in lexical inventory and semantics, and possibly in syntax and morphology as well. (For example, in an unsystematic but suggestive exercise, I read

aloud to a group of four adults, all past forty, a list of about five hundred words from randomly selected pages of the Davies' (i.e., LMS) dictionary, which was published in 1851. From this list my informants recognized less than one hundred, and reached consensus of meanings for only about half of these.) As it has not been possible to "correct" the old recordings with a high enough degree of certainty, I decided to leave most of them as originally written, simplifying spellings and adding glottals and vowel length macrons only in exceptional cases.

I also made no effort to "correct" misspellings and other errors in the quoted English texts, mainly to preserve the antique flavor of the various writers' styles. In at least one case, however, "correction" was dispensed with because I simply did not understand the writer's intended sense. I refer to some of William Orsmond's "translations," and particularly those describing the Arioi. Some of these native texts, along with their "translations," have been included for purposes of documentation; but not even a linguist as expert as R. G. White has been able to make much sense of some of the passages' obsolete words.

Finally, with respect to the French and German language materials quoted or paraphrased in the text, all translations are mine unless otherwise noted.

VOLUME 1
ETHNOGRAPHY

CHAPTER 1 *INTRODUCTION*

‘Tahiti is far famed yet too little known.’ Thus wrote J.M. Orsmond in 1848 (Henry 1928:1), and the same assertion can be made in 1972. Thousands of pages had been published about Tahiti and its neighboring islands when Orsmond uttered his judgment, and tens of thousands have been published since that time, but a unified, comprehensive, and detailed description of the pre-European ways of life of the inhabitants of those Islands is yet to appear in print. The present work, lengthy as it is, makes no such claim to comprehensiveness; rather, it is concerned mainly with the social relations of those inhabitants, and it serves up only enough about their technology, their religion, their aesthetic expressions, and so forth, to place descriptions of their social relations in context and render them more comprehensible.

I began this work many years ago, mainly to provide me and my coresearchers with a background — an ethnographic base line — or anthropological studies I was carrying out in some present-day communities in the Society Islands. As our library endeavors progressed, however, I became convinced that a study of the kind and scope now being presented would be a useful thing in itself for several reasons.

First, the picture that began to take shape was of a way of life of surprising richness, complexity, vitality, and sophistication. The institutions of this society invite comparison less with most Pacific island societies that I know about, from personal observation and from reading, than with societies that historians have come to call “civilizations.” It seemed to me then, as it continues to do so now, that so populous and variegated a society as this once was deserves, and even demands, scholarly reconstruction quite apart from any scientific purposes that might therewith be served. For modern man, living in a world trending toward uniformity, some humanistic interests might be aroused and gratified by contemplation of this ancient Tahitian way of life.

Moreover, another inducement is added to the humanistic reasons for this reconstruction by the very fact that the subject is Tahiti. Ever since the *Dolphin*, *Endeavour*, and *Boudeuse* returned to Europe from these Islands two centuries ago, Tahiti has captured and held the interest of the Western

world, serving variously as a model for philosophers, an image for poets, and a mecca for romantics.¹

The scientific purposes that may be served by my reconstruction derive mainly from Tahiti's ethnological situation — that is, membership in a large "genus" of Pacific island societies demonstrably interrelated historically, and probably "genetically," by many linguistic and other cultural ties. This situation, therefore, permits and encourages comparative study aimed at understanding how and why variations came about in customs that were once alike. Needless to say, scholars have grasped this opportunity with eagerness, and scores of studies comparing everything from tools and crafts to social stratification and cosmology have been published. All this would be very fine for the science of man provided the "facts" on which such comparisons were made were true.

When the comparisons I speak of have to do with such tangible, durable objects as stone tools and reconstructable temple pyramids, all well and good. But when scholars seek to compare such intangibles as "chieftainship" or "social stratification" or "sacredness," the results can be no more credible than the information and interpretations thereof on which they are based. As a result of my long and near-exhaustive study of primary materials on ancient Tahiti, I have come to doubt or discredit much of the "information" about Tahiti used in such comparisons.

One explanation for the shortcomings of many comparisons lies in the nature of the materials used by their authors — that is, almost wholly published and largely secondary materials. "Comparativists" cannot reasonably be expected to carry out the immense amount of pioneer archival research or the detailed sorting of published primary sources required for all societies in their comparisons; they should, however, be expected to exercise critical judgment about the interpretations formed in the sources they do use. It was the errors perpetrated in these latter interpretations that have led astray so many authors of comparative studies involving ancient Tahiti. Moreover, many errors have, through time and frequent repetition, acquired the respectability and unassailability of scientific dogma.

(A conclusion I have arrived at as a result of the situation just described is the desirability of postponing further comparisons until each society to be compared has been exhaustively studied; although I do not for a moment expect that a suggestion as radical as that will be accepted!)

Another explanation for the shortcomings of many comparative studies of Polynesia-wide scope is to be found in the tendency of writers to impute identical meanings to behaviors or objects of different societies because they look or sound alike. It may, of course, turn out that some things are identical in all significant respects, but that must be demonstrated and cannot safely be assumed, particularly in Polynesian societies, which share such large numbers of entities that look or sound alike.

A third reason for compiling this study has been the growing interest of historians in Tahiti and its neighbors. Most of this interest has focused, appropriately, on post-European developments there, but understanding of those developments requires some knowledge of the indigenous form of society on which the European influences played. No scholar trained mainly in the historian's craft could or should be expected to double as ethnographer (whose craft is as specialized as the historian's).

Finally, I address this study to those present-day Tahitians who would like to cut through the innumerable myths that now befog their view of their own past. Unless Tahiti proves to be different from most Pacific island polities, its indigenous peoples will eventually come to have more desire to manage their own lives and more eagerness to learn about their past.

The first Europeans known to have set eyes on Tahiti were Captain Samuel Wallis and the crew of H.M.S. *Dolphin*. The *Dolphin* reached the Islands on June 19, 1767 and remained among them until July 28; thereafter these Islands were visited by European vessels in the following order:

Boudeuse (and storeship *Étoile*), Louis de Bougainville commanding: remained at Hitia'a, Tahiti April 2 to 14, 1768.

H.M. Bark *Endeavour*, James Cook commanding: anchored at Matavai, Tahiti April 12 to July 12, 1769; brief visits to Huahine and Ra'iatea.

Aguila (Spanish), Don Domingo Boenechea commanding: anchored off Tai'arapu, Tahiti November 8 to December 20, 1772.

H.M.S. *Resolution*, James Cook commanding (accompanied by H.M.S. *Adventure*, Tobias Furneaux commanding): visited Tai'arapu and Hitia'a, Tahiti August 15 to 24, 1773; anchored at Matavai August 15 to September 1, 1773. In 1774 Cook returned to Tahiti and anchored at Matavai from April 22 to May 14. Thereafter brief visits to Huahine and Ra'iatea-Taha'a.

Aguila and *Jupiter*, Don Domingo Boenechea commanding: remained off Tai'arapu November 15, 1774 to January 28, 1775, except for a brief visit to Ra'iatea. Upon departure for home four Spaniards—two priests and two attendants—were left to establish a Catholic mission. On October 30, 1775, *Aguila* returned, spent another twelve days at Tai'arapu, and left for home with the mission party aboard.

H.M.S. *Resolution*, James Cook commanding (accompanied by H.M.S. *Discovery*, Charles Clerke commanding): anchored off Tai'arapu August 13 to 23, 1777, and at Matavai August 24 to September 29; brief visits to Mo'orea, Huahine, Ra'iatea, Taha'a, and Porapora.

H.M.S. *Lady Penrhyn*, Lieutenant John Watts commanding: anchored at Matavai July 10 to 24, 1788; brief visit to Huahine.

H.M.S. *Bounty*, William Bligh commanding: anchored at Matavai October

26, 1788, to collect breadfruit plantings. En route home the vessel was captured by part of its crew, and Bligh and some of his supporters were set adrift in a boat. On June 6, 1789 *Bounty* returned to Tahiti but left for Tubuai on June 23. The vessel returned on September 22, left ashore sixteen of its crew, and departed immediately for what turned out to be Pitcairn. Those “mutineers” left ashore then remained on Tahiti until captured and taken home on the H.M.S. *Pandora*.

Mercury, John Henry Cox commanding: anchored at Matavai August 13 to September 2, 1789; brief visit to Tetiaroa.

H.M.S. *Pandora*, Edward Edwards commanding: anchored at Matavai March 23 to May 8, 1791.

H.M.S. *Discovery*, George Vancouver commanding (accompanied by *Chatham*, Lieutenant William R. Broughton commanding): anchored at Matavai December 27–30, 1791 to January 24, 1792.

Whaleship *Matilda*, Matthew Weatherhead commanding: anchored briefly at Matavai in February 1792. Shortly afterwards *Matilda* was wrecked in the Tuamotus, but her captain and crew returned safely to Tahiti in small boats and remained there until taken off by subsequent vessels.

Schooner *Jenny*, Captain Baker commanding: anchored at Matavai March 25 to 31, 1792.

Prince William Henry, (captain unknown): anchored at Matavai March 26 to 29, 1792.

H.M.S. *Providence*, William Bligh commanding (accompanied by *Assistant*, Lieutenant Nathaniel Portlock commanding): anchored at Matavai April 7 to July 19, 1792, to collect a new load of breadfruit plantings.

Daedalus (storeship for *Discovery* and *Chatham*), Thomas New commanding: anchored at Matavai briefly in February 1793.

During the first quarter-century of European visits to these Islands, the persons involved were in fact visitors and little more, except for the lengthier stays of the Spanish mission group and the *Bounty* “mutineers,” and of a small handful of beachcombers. The arrival of the *Duff* on March 4, 1797, however, marked the beginning of a new kind of contact between the Islanders and Europeans, for this vessel landed a band of Protestant missionaries, whose purpose was to remain and win converts. Thereafter, European (and later, Australian and American) vessels visited the Islands with increasing frequency. By 1815 the effects, direct and indirect, of all these alien contacts had become potent enough to bring about radical changes in the Islanders’ political system and in many of their religious ideas.

In line with the events just outlined, volumes 1 and 2 of this work are a reconstruction of these Islanders’ way of life as I believe it to have been just before it began to be transformed by European influence—a

period I label the *Late Indigenous Era*. Volume 3 covers events in Tahiti and Mo'orea from about 1767 to 1815—a period I label the *Early European Era*.

Inasmuch as these Islanders had no system of writing, obtaining reliable information about the Late Indigenous Era poses something of a problem, to say the least. Aside from certain tangible objects, the only kinds of traits undeniably ascribable to that era are those seen and reported by the very first Europeans to visit the Islands. These visits themselves, however, started the process of radical change, and the visitors were poorly qualified to perceive or describe the indigenous customs they encountered. Subsequent visitors, such as Morrison and Bligh, and later on such missionaries as Davies, Orsmond, and Ellis, recorded, at the time of their respective visits, large quantities of what appear to be reliable data about or from the Islanders; but the question that arises is whether these data can be ascribed to the Late Indigenous Era as well. I cannot suggest any simple formula for answering this question and have had to rely on my own informed guesswork, the credibility of which the reader will have to decide.

Included in the general question just touched on are some more specific, but equally perplexing, questions having to do with linguistic data. It was not until about 1800 that any systematic and at least partly competent attempts were made to study and record the native language. Thus we are deprived of what could have been a very valuable source of information about many customs that had by that time changed. The systems of orthography in the pioneer attempts took little or no account of two important phonemic features of the indigenous language, namely, vowel length (long and short) and the glottal-stop consonant. Consequently, when having to work with untranslated native texts it is often impossible to know which of several possible references was originally meant. Adding further to the difficulties of translating many of the texts recorded a century or more ago is the fact that the indigenous language has in the interim undergone extensive changes, not only in terms of word loss but, evidently, word meanings as well.

Finally, something must be said about the main subject matter of this book—that is, ancient Tahitian society. By “ancient” I mean the eras already referred to: Late Indigenous and Early European. By “society” I refer to the kind of aggregate formerly constituted by all the inhabitants of what has come to be labeled the “Society Islands,” the archipelago that extends from Maupiti at the northwest to Me'etia at the southeast. Although communication between some of the islands was in ancient times rendered difficult by stretches of empty and perilous sea, none of them was as isolated, socially, from the rest as were all of them from other archipelagoes. Accompanying this social unity was a cultural one. As James Morrison wrote from Tahiti in 1789 or 1790:

The Manners and Customs of the other Islands [besides Tahiti] are as Near the same as those of Different Countys in the Same Kingdom, and their produce nearly the Same & the Inhabitants of all the Society Isles are one and the same people—Taheite is by Much the largest and most powerful when the Strength of the Island is united, and is therefore acknowledged Mistress Paramount of the whole. They all distinguish their Language, Customs &c. by the Name of Taheite as well at home as when they are at Taheite and there are but few Men of Property who do not visit Taheite once in their lifetime and many visit it frequently. (1935:238)

By “Mistress Paramount” Morrison was evidently referring to Tahiti’s greater size and larger population, and not to any actual or asserted political paramountcy, which he well knew did not obtain.

Morrison’s statement also provides an ethnographic rationale for the title I have given to this book—that is, *Ancient Tahitian Society*. But having thus used the term *Tahitian* for the book’s title I shall not use it in this sense again. Instead, for the sake of economy and precision, I shall henceforth use the word *Maohi* to refer to the people and customs of the archipelago in general, and reserve the words *Tahiti* and *Tahitian* (or *Mo’orean*, *Ra’iatean*, etc.) for use when specifying the inhabitants and culture of any one island. *Maohi* (phonemically, *mā’ohi*) was these Islanders’ word for persons, customs, objects, and so forth, native to their archipelago, as distinct from those of elsewhere (see LMS Dictionary). In time the word came to include other Polynesian-speaking islanders, as distinct from Europeans; but during the Late Indigenous Era, and at least the early years of the Early European Era, *Maohi* seems to have referred specifically to the indigenous inhabitants and culture of this one archipelago.

CHAPTER 2 *GEOGRAPHY AND POPULATION*

THE PRE-MAOHI SETTING

The main islands of the Society archipelago extend for approximately 480 km along a northwest to southeast axis, the center being located at latitude 17° south and longitude 152° 30' west.¹ The widest break in this chain of islands is only 120 km, separating Tahiti from Me'etia, whereas all the islands are separated from neighboring archipelagoes by distances of 200 km or more. Even Tahiti and Me'etia are within sight of each other, from their heights. (See figs. 2-1 and 2-2, p. 9.)

By modern convention the archipelago is divided into an eastern (or Windward) sector and a western (or Leeward) sector, but this division now has more administrative than geographic rationale.

Tetiaroa and Tupai (Motu Iti) are atolls, low islands; the other eight islands are volcanic (nonactive), high islands—although Mai'ao, the one nearest the center, rises only 185 meters above its wide atoll-like lagoons. Tahiti itself is the largest of the Society Islands; it measures 52 km along its northwest-southeast axis and 30 km across its greatest breadth. Second largest is Ra'iatea-Taha'a, actually two distinct islands encircled by the same barrier reef. (Figs. 2-3 through 2-12, maps of the islands, are found on pp. 10-14.) Topographical data for these and the six other high islands making up the Society archipelago (from northwest to southeast) are presented in Table 1.

These figures on island areas are somewhat misleading on two counts: being only two-dimensional they understate considerably the sloping surfaces of these mountainous islands; and they do not include the extensive lagoon areas within the barrier reefs that surround most of the islands.

Topography

The Society Islands are the remnants of cones raised by successive extrusions of lava from the ocean floor, and many of the physical differences among them are to be accounted for by their differences in geologic age. Oldest of all are the atolls, Motu Iti (Tupai) and Tetiaroa. Next oldest is Mai'ao, whose central volcanic cone has been reduced to a low rounded

TABLE 1 Topographical Data for High Islands of Society Archipelago

Island	Highest Elevation (meters)	Area (square km)
Maupiti (Maurua)	213	12
Porapora (Vavau)	725	38
Ra'iatea (Havai'i)	1,033	238
Taha'a (Uporu)	549	82
Huahine	680	74
Mai'ao (Tupuae Manu, Sir Charles Saunders Island)	185	8.9*
Mo'orea (Aimeo, York Island)	1,212	132.5
Tahiti (King Georges Island)	2,237	1,040
Me'etia (Osnaburg Island)	455	2.33

* Finney 1964:21. All other elevation and area figures in this list are from Papy 1954, vol. I.

hill by eons of erosion and subsidence. The remaining islands appear to be members of a more recent arc of volcanic activity, which took place during Pliocene and early Pleistocene times, with successive mountainous eruptions from northwest to southeast. Thus, Maupiti, at the northwestern end of this arc, appears oldest, and Me'etia, at the southeastern end, most recent. Generally speaking the older the island the more eroded its mountains and the more extensively developed its reefs—both fringing and barrier. The factor of relative age shows up also in differences in soil composition and in vegetation. The nature of all these differences, and their relevance to the structure of the native society, will be set forth in due course.

Tahiti rests near the southeastern, or youngest, end of the more recent arc. It consists of two massifs joined by a low narrow isthmus. The larger and nearly rhomboid part of the island (*Tahiti Nui* 'Greater Tahiti') averages about 30 km in diameter and reaches an altitude of 2,237 meters; the smaller, lozenge-shaped part (*Tahiti Iti* 'Lesser Tahiti', or Tai'arapu) is about onethird as large in area and its highest peak reaches 1,323 meters above sea level. Pictures can describe far better than words the general shape of Tahiti, but some topographic features need to be specified.

The 3,000-meter volcanic cone which once comprised Greater Tahiti has been lowered and truncated some 800 meters by subsidence and erosion, and its flanks have been cut into by water and wind. The winds that prevail throughout most of the year in these latitudes, the well-known southeast trades (which, however, vary in direction from north-northeast

to southeast), have had the indirect effect of aggrading the leeward slopes and of widening the flat coastal belt at their base. At the same time the heavier seas along the windward coasts have somewhat inhibited the development of coral, in contrast to the more protected leeward shores, which are bordered by almost continuous barrier and fringe reefs. Similar general considerations apply to Lesser Tahiti.

As already implied, the flanks of Tahiti's two central massifs are indented with scores of more or less radial valleys. Most of these valleys are shallow, narrow, and steep-sided; and their streams, which vary greatly in depth from time to time, debouch directly and rapidly into swamp, lagoon, or sea. In the case of some deeper valleys, their floors level out farther inland and their streams back up behind bars of sand and coral rubble, forming relatively wide estuarial plains. Viewed from some distance at sea, some of the lower flanks of the massifs appear gently sloping and even, but closer inspection reveals most of these to be cut into sharp interfluvial ridges, with the notable exception of the wide saddle formed by the Isthmus of Taravao, which links Greater and Lesser Tahiti. Tahiti's mountainous interior is broken by two large plateaus, of 400 and 700 meters altitude respectively, but their inaccessibility has rendered them unimportant in human terms.

Marine topography was almost as important as that of the land to the amphibious Maohis, and it varies greatly from place to place. At one extreme is the coast at the southeastern tip of Lesser Tahiti, where steep headlands plunge straight into deep water and where oceanic waves and swells break with great force directly against the cliffs. At the other topographic extreme is the protected southern coastline of the isthmus, with its flat swampy shores and broad, shallow, muddy lagoon and bays. The broken line of barrier reef off the northeastern and eastern coasts protects only about half the shore from the steady onshore winds and waves, and the few lagoons are deep and relatively turbulent. In contrast, the western and southern coasts, protected by an almost continuous line of barrier reef, are bordered by lagoons of medium depths, clear waters, and surfaces which are ordinarily calm.

Turning now to the other high islands of the archipelago, various local peculiarities of size, position, and geology—as well as the factor of relative age—have led to the development of many distinct landscapes.

Mai'ao (Tupuae Manu, Sir Charles Saunders Island), the oldest—relic of an earlier volcanic chain—consists of a low, centrally located hill surrounded by wide flat plains and broad, shallow, landlocked lagoons.

Maupiti (Maurua), the westernmost and oldest of the principal chain of islands, has a higher and more rugged central core and a deeper moat or lagoon to which there is a deep but narrow pass through the surrounding reef.

Next in age and location is Porapora, much like Maupiti in conformation but more than twice the latter's diameter overall. (Fig. 2-13.)

Southeast of Porapora and only 17 km distant are Taha'a and Ra'iatea, enclosed within a common barrier reef and separated by a mere 4 km of shallow lagoon. Ra'iatea approaches Tahiti in the height of its mountains, and both Ra'iatea and Taha'a are indented by several deep bays.

Huahine is like Ra'iatea-Taha'a in form but is much smaller in size, and the gap between its two islands narrows to a few meters in places. Also, the large lagoon at its northern end, so-called Lake Maeva, is landlocked save for a very long narrow tidal channel. (Fig. 2-14.)

Mo'orea's (Eimeo, Aimeo) most distinctive geographic feature is its vast central bowl-like valley, which opens out into two deep bays of the northern coast (fig. 2-15).

Finally, the characteristics which distinguish Me'etia, the youngest and smallest island of the archipelago, are its reef-free shores, steep flanks, and generally rugged terrain.

Climate

Since meteorological statistics seldom convey whole impressions, it should be stated at the outset that the climate of Tahiti and its neighboring islands strikes many visitors from Europe and America as paradisaical:

Note: Most of the statistics in this section are from Papy 1954, vol. I.

FIGURE 2-14. View of northern end of Huahine, with remnants of temple (at Paepae Ofata, Maeva) in foreground.

FIGURE 2-15. View of Opunohu Bay and Valley, Mo'orea. Photo by Y. Sinoto, Bishop Museum.

semitropical warmth tempered by nearly year-round ocean breezes or cooling rain. Without subscribing entirely to this view (and without implying a personal desire to dwell in Paradise!), it is nevertheless true that these Islands are favored with an absence of climatic excesses. Residents now distinguish between a hot season, from about November to April, and a cool season, from about May to October. The latter marks the period of the steadier southeasterly trade winds and is relatively dry, while the former is characterized by change-ability in wind direction, more rainfall, and higher humidity. The contrast is not quite so sharp as this may seem to indicate, for even during the so-called hot and wet season the average monthly maximum temperature of 31.6° C is only 2.2° C higher than that of the cool season, and the precipitation averages only about double. Also, local variations in climate are sharper and perhaps more pertinent to our subject matter. For example, the three or so meters of rain which annually falls on Tahiti's exposed isthmus is more than one-and-one-half times the annual precipitation at Pape'ete, on the protected northwest coast; and places can be found, say along Tahiti's western shore, which differ even more from the isthmus not only in precipitation but in temperature and insolation as well. More will be indicated about these differences when I attempt to classify natural areas, but a word should first be said about the winds, which have had such far-reaching effects on human activities in these Islands.

The prevailing surface winds of this region of the Pacific vary in direction and in velocity. Unless deflected they tend to blow from the north-northeast during January and February, then veer toward the southeast through August or September, and then veer back again. It is during the southeast phase that they blow with greatest strength and regularity, usually ranging between 20 and 40 km an hour over the surface of the open sea. This is a time of clear sunny days and cool nights. But it is only at sea or along unobstructed windward coasts that such clear-cut conditions prevail. Apart from the varied and highly distinctive wind patterns to be found in deep valleys and on mountain slopes, at many places along the coasts—particularly the leeward ones—mountains, capes, and nearby islands serve to deflect the prevailing winds into patterns quite at variance with the one just described.

At times during each year strong rain-laden winds from the west (north-northwest to south-southwest) take over from the trades for days at a time. These counter-trades blow most steadily and frequently from January through March, but occur at other times of the year as well. In addition to these more or less steady winds of widespread occurrence, many places on the larger islands are subjected to a cool thermally produced breeze off the mountains at night which gives way to a brisk onshore breeze during the day.

Finally, there are the cyclonic storms. These Islands lie outside the so-called typhoon zones, but they do occasionally receive winds of devastat-

ing force. According to one record, for the years 1819 through 1906 there occurred only ten storms of hurricane strength—in comparison with Fiji, where during an eighty-three-year period there was an average of two hurricanes a year. During the period 1940 through 1950 the three worst winds experienced on Tahiti attained recorded velocities of 72, 85, and 95 km per hour; they uprooted coastal trees, ruined gardens, and destroyed many buildings. The high waters which accompany such winds have their force lessened somewhat by barrier reefs, and, in any case, by going a little way inland one can usually escape both high water and wind.

Tides

One of the most noteworthy features of the physical environment of these Islands is the meagerness of their tides. The average amplitude is about 40 cm during spring tides and almost nil at neap tides.²

Soils

The soils of the high islands derive mainly from decomposition of their basaltic foundations and their vegetation, mixed here and there with calcareous sand and larger coralline fragments.³

The land surfaces of the atoll islands consist of fine calcareous sand mixed with coralline debris and in a few places with guano and thin layers of humus. Similar soils occur on the islets dotting the offshore reefs of the high islands and also make up the mainland beaches along some shores well protected by barrier reefs. In contrast, many beaches along unprotected shores are composed wholly of fine black sand derived from decomposition of basaltic rock. There are still some beaches made up of mixtures of basaltic sand, calcareous sand, and coralline debris.

A second major category of soils includes those covering the coastal plains and the lower and middle reaches of valley floors. These are more or less black in color and embody large proportions of lateritic clays, but in addition they contain many mineral elements along with organic matter. Farther inland on the fern-covered and wooded lower slopes are found red lateritic soils which are somewhat dryer and poorer in mineral and organic content than are those of the coastal plains. Still higher up the mountain flanks are found nearly unmixed lateritic clays, terminating in the mountain tops or in naked basaltic peaks and cliffs. But neither these nor the highly distinctive soils found in high-altitude depressions are directly pertinent to our concerns.

Though hardly to be classed with soils, mention should be made of two other kinds of ground surfaces which were relevant to Maohi life, namely, the extensive beds of basaltic rocks and boulders spread over the estuaries of the larger streams, and the more or less exposed deposits of reef limestone fringing the shores at many places.

Phytogeography

Vegetation provides the most comprehensive means for classifying natural zones—especially when dealing with the habitat of a people so heavily dependent upon plants as the Maohis were.

The two atoll complexes within the living area of at least some of the ancient Maohis were Tetiaroa, 41 km north of Tahiti, and Tupai (Motu Iti), about 12 km north of Porapora. Consider what potentialities these atolls possessed in terms of human utilization. First of all they were dry land, providing more or less safe haven from the dangers of the sea; although more exposed to the high winds and waves than most parts of the high islands, there is no legendary or historical record of their having been wholly devastated by cyclone or tidal wave. Second, potable fresh water was obtainable there by rain catchment and, on Tetiaroa, from a spring on one of the islets. Third, great quantities of fish and other marine foods were available in their lagoons. But what about food plants?

The native vegetation of both atolls was relatively poor—richer perhaps than that of Central Pacific atolls, such as Canton and Phoenix, but sparser than any permanently inhabited self-subsistent atoll of Polynesia. The indigenous vegetation consisted of grasses, ferns, shrubs, and a few trees and coconut palms. Only the latter, and the small edible nut of the heliotrope (*Cordia subcordata*), or *tou*, were used for food, although nearly every species present had other uses: for dye, construction, and so forth. On the face of it, then, these atoll complexes were not richly enough endowed in natural resources to encourage permanent self-subsistent occupation, although we know from historical evidence that they did serve special purposes, which will be described later on. But these purposes did not depend upon any distinctive feature of the atolls' vegetation; every kind of plant found growing on the atolls grew also along the coasts of the high islands, whose several prehuman "natural zones" may now be considered.

By the time Europeans first sighted these Islands the Maohis and their ancestors had already transformed the plant cover of large parts of them by clearing areas for cultivation and settlement, by accidental firing, by use of the primitive vegetation for food and building materials, and by introduction of new plants. Later on I shall describe the Islands' vegetation during the latter part of the eighteenth century, but first let us consider what it was like when the Maohis' ancestors first arrived about a millennium before then.

According to H. René Papy's invaluable monograph (1954), the most authoritative reconstruction of the Islands' plant life, the indigenous prehuman landscape was divided into three major vegetation zones: coastal, mesotropical, and wet-tropical.⁴ While I use the past tense throughout this

chapter in writing about the prehuman landscape, some of the description of course applies equally well to later eras.

COASTAL

This zone extended from the foot of the mountain flanks to the lagoon or ocean, and included the floors of valleys in their lower reaches. It varied greatly in width from a few meters to several kilometers. It consisted typically of a so-called adlittoral plain, composed mainly of decomposed basalt more or less mixed with alluvia; a line of beach, composed of basaltic or coralline sand, pure or mixed; and a narrow transition area between the two. In places the muddy estuaries of streams varied this pattern, and, along stretches of coast unprotected by reef, the beaches abutted directly against the flanks of the hills. Along indentations of some of the well-protected shores were also to be found swampy mud flats, but these were usually quite narrow, partly as a result of the slight variation in tide levels. Salty air affected the vegetation of this coastal belt to some distance inland, but subsoil water remained fresh up to the ocean's edge.

The principal associations of indigenous plants found in the coastal zone before human agents, including the ancient Maohis, began to transform it were the following:⁵

Submangrove. The "true" mangrove tree (*Rhizophora*) typical of so many Pacific shores was either absent from or exceedingly rare in the Society Islands. In the kind of settings where mangrove elsewhere thrives—muddy flats along protected coasts and estuaries—there grew the following plants: a fern (*Acrostichum*) which appears to inhibit the growth of "true" mangrove; certain grasses (*Lepturus*, *Paspalum*); and five economically noteworthy trees—*Hibiscus*, *Thespesia*, *Barringtonia*, *Calophyllum*, and *Hernandia*. Each of these trees proved to be useful to the colonizing Maohis, and all but one of them grew in other settings as well.

Littoral. (In this narrow, saline-dominated strip of shoreline were found all the typical submangrove trees except *Hernandia*, which may, however, have occurred on Maupiti, and all the so-called atoll trees except *Guettarda*; in addition there were stands of Tahitian chestnut (*Inocarpus*), ironwood (*Casuarina*), and *Ximenia*. Growing in the coral sand and debris of this subzone were the seaside purslane (*Sesuvium*), a white-flowered shrub (*Scaevola*), the large sea bean (*Mucuna*), and two other leguminous plants, *Sophora* and *Canavalia*.)

Generally speaking, the black-sand beaches were poorer in vegetation than the coralline ones, having normally produced only sedges (Cyperaceae) and *Aeschynomene*.

Adlittoral plain. This most extensive part of the coastal zone, extending from the littoral to the bottom of the slopes and into the valleys, is the "coconut zone" of today. Human occupation has transformed it more than any other part of these Islands so that the listing of its virgin vegetation involves some speculative reconstruction, although the identity of the principal forms seems based on reliable evidence.

Some of the trees typical of the littoral—*Hibiscus*, *Calophyllum*, *Incarpus*, and *Barringtonia*—grew here also. In addition, we meet for the first time in our survey two species of the well-known screw pine (*Pandanus tectorius* and *P. tahitensis*), the medicinally important *Morinda*, the fragrant butterfly pandanus (*Freycinetia victoriperrea*), the tall slender *Neonauclea*, and the small banyan (*Ficus prolixa*). The last three thrive best in wetter ground. Clinging to some of these trees and the bases of cliffs there are today (and probably were in earliest Maohi times) thick growths of a convolvulus vine (*Ipomea peltata*).

Shrubby and herbaceous plants were said by Papy to have been represented by few species not found also in other subzones (1954:II, 194). In general, sedges and ferns were more common in the wetter parts, grasses and legumes in the dryer parts. Several other species of small trees, shrubs, herbs, creepers, and the like—including vervens, spurges, euphorbias, lindens, and nightshades—inhabited this subzone; and many of them were utilized by the Maohis as medicinals and incidental foods.

Summarizing the botanical features of this adlittoral part of the coastal zone, Papy wrote:

It seems reasonable to conclude that prior to the arrival of the Polynesians, the dryer parts of this zone were dominated by stands of *Hibiscus tiliaceus* and *Pandanus*, in which were perhaps found a few scattered coconut palms. Also abundant were certain plants that have since then nearly or wholly disappeared from this zone—i.e., *Calophyllum inophyllum*, *Thespesia populnea*, *Cordia subcordata*, *Ficus prolixa*, *Erythrina indica*, and *Dodonea viscosa*—as well as certain others now limited to the mesotropical belt.

At that same time the [rainier] windward parts of the adlittoral zone were characterized by analogous but higher and denser stands of *Barringtonia speciosa* [a myrtle; the Maohis' *hutu*]. (1954:II, 196-197)

MESOTROPICAL

With respect to Tahiti itself this undifferentiated zone is limited to the sunny slopes behind the western and northwestern coasts (Point Mara'a to Point Tahara'a), and from the adlittoral zone to an altitude of about 300 meters. Elsewhere it is confined to the lower slopes of the northern ends of Ra'iatea and Tana'a, to the steeper leeward flanks of Porapora and Maupiti, and to the central plateau of Maupiti and possibly Mai'ao. In other words, this zone has a climate characterized by intense sunshine and by moderate rainfall

and humidity—somewhat less than the coastal plains and considerably less than higher altitudes.⁶ But, as Papy emphasized, in the Society Islands this zone is not as sharply differentiated, in climate or, as we shall see, in vegetation, from neighboring zones as is the case in the Hawaiian Islands.

The dominant tree of the mesotropical zone was at one time the large acacia (*Serianthes*), a favorite wood for canoes. In addition, several shrubs and subfrutescent plants, including *Planchonella*, *Abrus*, *Buettneria*, *Timonius*, *Wikstroemia*, *Glochidion*, and *Alphitonia*, grew sporadically throughout the zone. The last four of these grew in the neighboring wet-tropical zone also, and *Timonius* grew on the atolls as well.

The ground cover of this mesotropical zone consisted of several species of legumes, grasses, compositae, woody herbs, a widely distributed fern (*Gleichenia*), and club moss (*Lycopodium*).

Of special ethnological interest is the "native cotton" (*Gossypium purpurascens*), or *vavai*, which is no longer found in these Islands but which is said to have once been abundant, presumably in this mesotropical zone.

WET-TROPICAL

Following Papy, this zone may be divided into four more or less distinctive natural areas: lower reaches of valleys, plateaus and middle slopes of mountains, rain forests, and mountain summits.

Lower reaches of valleys (subzone 1). This type of natural area occurs in the following locations:

Tahiti—the valleys separating the mesotropical slopes, i.e., the western and northwestern sides of the island from Point Mara'a to Point Tahara'a.

Mo'orea and elsewhere on Tahiti—those valleys and slopes from sea level to 300 through 500 meters in altitude, having relatively wet climates, i.e., all those of Mo'orea, those on the eastern side of Tahiti from Point Tahara'a to Tautira, and those on the southern side of Tahiti from Point Mara'a to Teahupo'o.

Ra'iatea—valleys and slopes up to 300 meters on the eastern side, and those extending from 50 through 300 meters in altitude at the northern end. On the southern and western sides of the island the upper boundaries of this type of area are much lower in altitude.

Huahine, almost all of the inland, most of Taha'a, and the eastern side of Me'etia—in these places one also found some vegetation elsewhere more characteristic of subzone 2 (see below).

Maupiti and inland Porapora—the intermixture of vegetation elsewhere characteristic of subzones 1 and 2 is complete and ubiquitous.

Indigenous species truly distinctive of this subzone were not numerous,

the most characteristic having been the Tahitian mango (*Spondias*), or *vi*, the smaller *reva* tree (*Cerbera*), the ritually important ti plant (*Taetsia*), and the "native ginger" (*Amomum*). Among the other plants characteristic of the subzone, though not distinctively so, were *Hibiscus*, *Melastoma*, and *Aleurites* (candlenut).

Plateaus and middle slopes of mountains (subzone 2). Papy distinguished three types of vegetative landscapes in this subzone: myrtle forests, moors and pseudosavannahs, and steep high slopes, (a) Myrtle forests. The myrtle trees (*Metrosideros*) characteristic of this type of landscape reached heights of 7 to 8 meters, (b) Moors and pseudosavannahs. This type of landscape developed in the same middle altitudes as the myrtle forests, but in places where myrtle forests did not develop or were extinguished as the result of soil impoverishment or, later on, brush burning. Its distinctive feature is its thick covering of the *anuhe* fern (*Gleichenia*), in which were occasional stands of *Lycopodium*. In a few places the fern cover was broken by growth of grasses and sedges, and by clumps of the ubiquitous *Hibiscus*, *Pandanus*, *Melastoma*, *Decaspermum*, and *Casuarina*. (c) Steep high slopes. On Tahiti, at altitudes of 700 through 1,000 meters the fissures in the bare basalt slopes were often populated by plants of myrtle forest type.

Rain forests (subzone 3). This subzone does not occur on Me'etia, Porapora, Maupiti, or Mai'ao; on Tana'a and Huahine small patches of it occur at the heads of the larger valleys on the windward side. Elsewhere it is represented in sunless places subject to heavy precipitation:

Tahiti—the cloud-covered slopes 900 through 1,500 meters in altitude; parts of the larger valleys (above 600 meters on the dry side, above 300 meters in the moderately wet areas, and above 20 meters in the very wet areas); the southeastern coast and the northeastern-central areas of the peninsula.

Mo'orea—less well drained parts of the eastern and southern slopes and valleys; the comparable valley depths elsewhere.

Ra'iatea—rain-drenched slopes and valleys of the southern two-thirds of the islands up to altitudes of about 600 meters.

The most characteristically distinctive plants of this subzone were the mountain fern tree and the butterfly pandanus. Other pandanus plants found here in quantity occurred also in other zones.

Among the thick tangled vegetation of the rain forests were numerous species of large and small trees, shrubs, creepers, ferns, epiphytes, and so forth. Some were found elsewhere, and some were distinctive of this zone.

Mountain summits of Tahiti and Ra'iatea (subzone 4). The most plentiful

plants found at these high altitudes were myrtle (*Metrosideros*), saxifrage (*Weinmannia*), ferns, epiphytes, and lycopodes.

Particularly relevant to our concerns because of their importance in Maohi technology are three plant members of the wet-tropical zone; these are giant bamboo, mountain plantain, and Tahitian chestnut. The latter was certainly growing in these Islands prior to human occupation; concerning the origin of the others, expert opinion is divided (Papy 1954:II, 222ff).

Giant bamboo ('*ofe*: *Schizostachyum glaucifolium*) occurs in almost pure groves of different dimensions on the windward slopes and wet valley bottoms. Mountain plantains (*fe'i*: *Musa fehi*), of which there are many varieties, once grew plentifully in large thickets high up the mountain slopes at 600 to 900 meters. After generations of collecting, these original stands became quite depleted, and the Maohis turned more to cultivating plantains nearer to their dwellings. Tahitian chestnuts (*māpē*: *Inocarpus edulis*), another important Maohi food, continue to grow in almost pure groves in the lower and middle reaches of wet valleys, as well as in comparably moist protected parts of the coastal plains.

Some seaweeds were occasionally used by the Maohis as a food supplement; otherwise marine vegetation was not an important factor in Maohi life and hence is not directly relevant to my description.

Fauna

The prehuman terrestrial and freshwater fauna of these Islands was characterized by poverty in number of species. As far as one can determine there were no mammals at all, and reptiles were represented only by the blue skink (*Lygosima cyanurum*) and three species of geckos. Perhaps the most noteworthy freshwater fish were perches (*Kuhlia marginato*), gobies (*Eleotris fusca*), a pipefish (*Syngnathus conspicillatos*), and three species of eel (*Anguilla megastoma*, *A. mauritania*, *A. ossura*). Land and freshwater molluscs were more varied, but crustaceans limited to these habitats were numerous in numbers but few in species, notably, land crabs and freshwater prawns. The saltwater fauna was abundant and heterogeneous. The central importance of this fauna in native thought and activities will be related in succeeding chapters.

When Europeans arrived they found centipedes, scorpions, spiders, house flies, and two kinds of mosquitos—the *Culex fatigaus*, and the filaria-bearing *Ardes polynesiensis*—but it is not certain which of these predated humans on these Islands.

Note: The principal reference for this section has been Seurat 1934.

The more noteworthy groups of native birds that inhabited these Islands prior to human occupation included frigate birds, tropic birds, boobies, ducks, terns, sandpipers, curlews, pigeons, parakeets, cuckoos, kingfishers, shrikes, and Old World warblers. Some of these were to figure importantly in Maohi life.

Summary

Such then was the natural setting comprising these Islands when humans first set foot on them—or, at least, so that setting would have been perceived by a Western-trained naturalist. How the Islands looked to the first human settlers is of course impossible to reconstruct, for, by the time Europeans arrived some ten or more centuries later to record their observations, the inhabitants had already transformed parts of that setting and perhaps their own perceptions of it as well. Two factors do, however, seem credible. First of all, except for those arriving directly from generation-long residence on atolls, these landfalls did not present the arriving canoe passengers with much that was strikingly new and different—topographically, botanically, or zoologically. In other words, the new settlers were presented with physical resources which they were already prepared to exploit, in terms of prior knowledge and well-tested techniques. Second, although some of the canoes that ended up on these shores may have arrived with nothing more than a few starving survivors, over the course of centuries there evidently came other canoes bearing exogenous plants and animals, which eventually helped serve to transform large portions of the virgin setting into the landscape seen by Wallis, Cook, Bougainville, and other explorers. But before attempting to reconstruct that more recent landscape, let us see what can be concluded about the size and composition of the human population living in that landscape in 1767.

POPULATION

The Island [of Tahiti] will have about 10,000 inhabitants at the lowest computation (formed during the launch's journey all round it). (From Don Domingo Boenechea, *Journal*, 1772, in Corney 1913:329)

... the whole Island [of Tahiti] cannot contain less than two hundred and four thousand inhabitants. (From James Cook, *Journal*, May 1774, in Beaglehole 1961:409)

... with which authoritative and quite typical discrepancy one confronts the task of trying to discover how many people were living on these Islands at the time Europeans first arrived, to minister to their decimation.⁷

Numbers

The first "official" census of Tahiti Island's native population was carried out by English missionaries in 1829. It is unlikely that these scrupulous

men, who knew the geography and the people so well, committed any large errors of omission or double-counting. The number arrived at was 8,674.⁸ But, between the first European guess, made in 1767 by Robertson—"... upward of a hundred thousand Men Women and Children," (Robertson 1948:234)—and the missionaries' conscientious tally, a number of other European visitors engaged in this pastime, with the results shown in Table 2.

Robertson's guess was made solely on the basis of estimates of the numbers of natives who had swarmed to Matavai Bay to see the first Europeans to reach their shores. From this kind of extrapolation it is only surprising that his guess was not higher.

The source of Cook's 1769 figure was the Ra'iatean priest, Tupaia, who sailed on the homeward voyage of the *Endeavour*, as far as Batavia, where he died. Tupaia was a highly intelligent man who served the leaders of Tahiti's Papara tribe as high priest and counselor and was thus in a good position to know of what he spoke:

Tupia informs us that the whole Island can Muster 6780 Fighting Men by which some Judgment may be form'd of the number of inhabitants, each district furnishes a certain number which the Chief is obliged to bring into the Field when Summons'd by the Eare de hi [*ari'i rahi*] or King of the Island either to make War or repell an invation. (Beaglehole 1955:120nl)

As we shall see, Cook's comprehension of the island's political organization, including his notions about its having a "king," was faulty on many counts. He may also have garbled Tupaia's estimate of "Fighting Men"—but probably not overly much.

Tupaia's estimate was also reported by Cook's shipmate, Sir Joseph Banks:

The districts which [an *ari'i*] Possess are obligd in time of a general attack to furnish each their Quota of soldiers for the service of the Publick. Those of the Principal districts which Tupia recolected when added together amounted to 6680 men to which army it is probable that the small Quotas of the rest would not make any great addition. (Beaglehole 1962:I, 385)

As Beaglehole pointed out, however, Banks' figure of 6,680 is inconsistent with another entry in his diary which lists the respective quotas of fourteen "districts" as follows:

Forces of Otahite 6780

Oteihouroo [Atehuru]	400
Parapara [Papara]	900 [?]
Wyuridde [Vaiuriri]	300
Opora [Poreonu'u:Pare-Arue?]	800
O'whaa [Mahaena?]	200

Tettahu [Tetaha; Fa'a'a]	200
Mattavii [Matavai]	200
Whapiano [Ha'apaino'o]	200
Whidia [Hitia'a]	600
Whahite [Afa'ahiti]	400 [?]
Tiarreboo [Tai'arapu]	1800
Wyourou [Vairao]	200
Matawii [Mata'oe]	400
Wyaru [Vaiari]	180

The numbers with question marks are so badly written as to be questionable, but were interpreted by McArthur as given above (1968:237).

The identification of Banks' district names also involves some uncertainties. I have placed in brackets the identifications proposed by McArthur; all but two of these seem to be fairly straightforward, and even these two, Opora and O'whaa, seem to be indicated by the process of elimination.⁹ The listing of Afa'ahiti, Vairao, and Mata'oe in addition to Tai'arapu is somewhat puzzling inasmuch as all these and other peninsula districts were usually lumped together under Tai'arapu, but in this context the latter name evidently indicates only Tautira and Teahupo'o.

A somewhat more serious uncertainty concerns the so-called districts which figured in many early European accounts but which are not included in Banks' list, namely, Tiarei, Pueu Toahotu, and Atimaono. Either Banks (*ex* Tupaia) deliberately excluded these four sparsely populated territories from his principal districts, or they were included in the figures for Mahaena, Afa'ahiti, Vairao, and Papaia, respectively, as suggested by McArthur (1968:239). I shall return to this important Tupaia-Banks list later, but first let us consider the other eighteenth-century estimates of Tahiti's population.

Boenechea's figure derived mainly from an estimate provided by some of his crew who circumnavigated the island in a launch, mapping harbors and headlands, and touching ashore here and there. Rodriguez arrived at his estimate on the basis of his ten-and-a-half-months' residence on the island, spent mostly at Tautira, on the Tai'arapu peninsula, but including many overland visits to neighboring regions and two trips around Greater Tahiti, partly overland and partly in canoes skirting the shore. The only recorded evidence of any count having been made by him was one that took place in Mata'oe, where the crowd that greeted him was so great "... I thought I would like to see how many of them there were, as nearly as might be; so I desired the people to arrange themselves on a piece of open ground, and they did accordingly, with much merriment. I made them out to number rather more than a thousand souls." (Corney 1919:52)

TABLE 2 Estimates of Early Population

Year	Authority	Number	Reference
1767	Robertson	100,000	Robertson 1948:234
1769	Cook, from Tupaia	6,780 fighting men	Beaglehole 1955:120n
1769	Banks, from Tupaia	6,280-7,280 fighting men	Beaglehole 1961:385-386n
1772	Boenechea	10,000+	Corney 1913:329
1774	Cook	204,000+	Beaglehole 1961:409
1774	G. Forster	120,000+	G. Forster 1777:11, 66
1774	J.R. Forster	121,500+	J.R. Forster 1778:217-222
1775	Rodriguez	15,000+	Corney 1913:16-17
1778-1791	Morrison	30,000	Morrison 1935:171
1797	Missionaries	20,000-50,000	Wilson 1799:165
1797	Wilson	16,050	Wilson 1799:212
1802	Jefferson-Scott	7,000	LMS Transactions:II, 129
1803	Elder-Wilson	5,400	LMS Archives
1830	Davies	8,674	LMS Archives

The Spanish padres for whom Rodriguez acted as interpreter guessed on one occasion the island's population to be over 8,000, and on another occasion over 12,000 (Corney 1915:79, 203). Concerning their guesses it was reported by Don Manuel de Amat, Viceroy of Peru: "This interpreter [Rodriguez] assured me that the place is thickly peopled, and was of opinion that the inhabitants exceed fifteen thousand persons. The Missionary *Padres* can give no estimate with any sort of accuracy, as they never went beyond the immediate precincts of their hospice." (Corney 1913:16-17)

Cook's 1774 estimate was derived by multiplying by three (his guess concerning the ratio of warriors to total population) the number of fighting men the island could muster, this latter figure having been arrived at partly by observation and partly by multiplication. In April and May 1774, a large number of canoes paraded near Matavai, purportedly in preparation for an attack on nearby Mo'orea. On April 26, Cook wrote of having seen 160 large war canoes and 170 smaller supporting vessels; these he reported as having belonged to the districts of Attahouru and Ahopatea, and to have been commanded by a chiefly admiral named Towha [Te To'ofa]. At that time his estimate of the complement of each war and supporting canoe was forty and eight men respectively, or a total of 7,760 men, which, however, he considered an underestimate. Next, he reported having seen on April 30 a fleet of ten or more war canoes, this time from the "district" of Matavai [a division of Ha'apape]; these he claimed were "... thinly manned ... the most being not above thirty and the least Sixteen or Eighteen." At last, on May 14 he reported having seen a fleet of forty war canoes belonging to the "district" of Tettaha [Fa'a'a]. Taking Tettaha ("... one of the smallest districts") as a safe average, he then went on to estimate the total island population by multiplying the number of Tettaha's war canoes by the number of "districts" (according to Cook, 24 on Greater Tahiti, 19 on the peninsula)—that is, "If we allow forty men to each Canoe according to my former computation it will require Sixty eight Thousand able bodied men and as these cannot amount to One third part the number of both Sex the whole Island cannot contain less than two hundred and four thousand inhabitants." In addition, he added that this estimate did not take into account the men required to man the escort vessels, "... which cannot require less than two thousand," nor the possibility that the peninsula contained as many people as did the mainland. (Beaglehole 1961:390, 409)¹⁰

G. Forster's estimate was based on the same naval review as was Cook's, and on the same false assumptions about Tahiti's political geography.

The number of districts in both peninsulas amounts to forty-three; we assumed at a medium, that each could equip only twenty war-canoes, and we supposed each of these to be manned only with thirty-five men. The sum of men employed in the fleet, exclusive of the attending boats, would then be no less

than thirty thousand; and these we assume as the fourth part of the whole nation. What makes this computation still more moderate is, that we suppose these thirty thousand to be the whole number of persons capable of bearing arms, or fit for service; and that the common proportion of these men, to the rest of the people, is much smaller than one fourth, in all the countries of Europe. (G. Forster 1777:II, 66)

J.R. Forster, father of George, based his estimate on the aforesaid naval review also, and on the same incorrect notion about the island's political geography; but his calculations were more tortuous and were "supported" by estimates of the island's population-supporting power in terms of its supposed economic resources (J. Forster 1778:217ff).

Aside from the tally made by him at Mata'oe we are not informed how Morrison calculated his figure, but judging from other parts of his ethnographic description he had opportunity to arrive at an approximation more credible than those of 1774 by Cook and the Forsters.

Shortly after arriving at Tahiti in 1797, three of the English missionaries traveled about Greater Tahiti for a fortnight to look over the scene of their labors. Their report stated: "The accounts of former navigators as to the populousness of the country are greatly exaggerated. We think that not a fourth part so many will be found as Captain Cook supposes, perhaps not a tenth" (Wilson 1799:165). No details are given concerning the method by which they arrived at this estimate, but much of the way they were accompanied by a prominent chief, who, while possibly having had political reasons for underrating the numbers of followers of his potential enemies, could scarcely have gone traveling abroad without attracting considerable attention.

But even their modest estimate was considered excessive by the ship's chief officer, William Wilson, who traveled around the island in order to "... try some method of estimating the number of people in each district" (Wilson 1799:179). He employed a Swedish beachcomber, Peter, as interpreter and hence was not altogether insulated by ignorance; moreover, his "method" was rigidly systematic. According to a Tahitian informant, a man "... having a shrewd, intelligent countenance," met at the beginning of their tour; each "district" [*fenua*] was composed of a number of "matteynas" [*mata'eina'a*] and "tees" [*ti'i*].

[The former was] ... a principal house, distinguished either by a degree of rank in its ancient or present owner, or by a portion of land being attached to it; and sometimes on account of its central situation to a few other houses: that the matteyna sets up a tee (or image) at the morai [marae], which entitles it to the liberty of worshipping there; and the other houses in the department of the matteyna claim a part in the same privilege, and are thence called tees: that in some matteynas there are eight or nine persons in the family, in others but two or three; and that it frequently happens, that a matteyna or a tee is totally deserted. Therefore, from this account, and what I afterwards saw of the thin population, I allow but six persons to each matteyna, and the same to a tee, as the latter is often oc-

cupied by a larger family than the former, and as both terms do sometimes apply to the same house; consequently, as often as this occurs, there will be an error of six in excess. (Wilson 1799:184)

Wilson's information about the numbers of *mata'eina'a* and *ti'i* in each "district" was obtained by questioning prominent local natives—a practice perhaps as short in reliability as his method of calculation was short in validity—but he at least saw large portions of the coastal area and hence was able to obtain impressionistic confirmation of some of the figures given him.

What of substance may be salvaged from these various estimates? In my opinion the only ones that warrant serious consideration are Tupaia's 1769 figures on fighting men, Cook's 1774 count of naval vessels, Wilson's 1797 survey, and the missionary estimates of 1802 and 1803.

Banks' version of Tupaia's figures on fighting men deserves special attention. As principal adviser to the leaders of Papara, and thus deeply immersed in the intertribal politics of that era, Tupaia would have had a fairly realistic notion of the fighting strength of the various contending parties. The figures in question are, of course, too rounded to be credible, but the tribal percentages are not excessively inconsistent with those of later censuses. There is an exception with respect to the peninsula, which according to Tupaia's count mustered a fighting force approximating 40 percent of the whole island's total, as compared with later censuses which attribute to the peninsula only about 20 to 25 percent of the island's total population. On the other hand, Tupaia's total figure for all the island's fighting men is at sharp variance with Cook's count at the famous naval review of 1774 provided, that is, that Cook's "fleet" did indeed derive solely from Atehuru.

The war canoes Cook saw—and presumably counted—on April 26, 1774, carried an estimated 7,760 men. Cook identified this fleet as that of the districts of Attahuru [Atehuru] and Ahopatea. From evidence on Cook's map, and from later more authoritative evidence, Ahopatea was merely a section of the tribal district of Pa'ea, which along with Puna'auia, made up Atehuru. But, inasmuch as this fleet was commanded mainly by an "admiral" named Te To'ofa, it is likely that it also included vessels from Fa'a'a, whose most prominent tribal chief Te To'ofa was. (Except for Cook's implication, there is nothing to gainsay the possibility that the Fa'a'a fleet of forty canoes seen on May 14 had also been part of the April 26 assembly.)

As for the fleet of ten war canoes seen by Cook on April 30, and identified by him as belong to Matavai, that is, Ha'apape, these were "thinly manned," and according to his estimates contained about 200 to 250 men.

In other words, Cook's fleet figure for Ha'apape is nearly identical with Tupaia's 1769 estimate concerning that district's fighting men; but his fleet figure for Atehuru (plus Fa'a'a) exceeds Tupaia's by 7,160! Sev-

eral explanations may be offered for this discrepancy; the one I consider most likely is that the fleet Cook saw contained contingents not only from Atehuru and Fa'a'a but also from most other tribes of Tahiti—Landward Teva (Papara, Vaiari, Vaiuriri), Seaward Teva (Tautira, Teahupo'o, Vairao, Mata'oe, Afa'ahiti, Pueu), Hitia'a, Tierai, Mahaena, and Ha'apaino'o. For one thing, the figure of 7,760 or so men contained in this fleet is not greatly different from that of 5,780 listed for those districts by Tupaia. And perhaps of more weight, there is some evidence that all or most of Tahiti's tribal districts were indeed united in the attack upon Mo'orea, for which the fleet review was a prologue.

In any case, for lack of any better information, I accept a figure of about 9,000 for the number of Tahiti's fighting men—my estimate being a compromise between Tupaia's all-too-approximate one and Cook's fairly reliable but probably incorrectly attributed count. Having taken this position, I am still left with the question of what proportion of the island's total population was constituted by those fighting men. As we saw above, Cook put the proportion at less than one-third, and G. Forster at "the fourth part of the whole nation." Morrison also put the proportion at "near one third," but there is a possibility that his figure was derived from Cook's published account as much as from his own observations. In view of many kinds of evidence, which will be scattered throughout the remainder of this work, I am inclined to accept Forster's figure, which, when combined with Tupaia's, would result in the approximations for Tahiti's population from about 1767 to 1774 shown in Table 3.

No reader could be more conscious than I of the imperfections, in data and in assumptions, of these figures, but they are the best I can produce. It may be said in defense of them that they are not contradicted by other data—archaeological, ethnographic, or historical—of which I know. Moreover, allowing for the well-documented decrease due to introduced disease in the intervening years, my figure of 35,000 for 1767 through 1774 is not greatly at variance with Morrison's "Near 30,000" for 1788 through 1791.

I turn now to Wilson's figure of 16,050, which, it will be recalled, was compiled during a tour of the island in 1797 and was based on a rough household count. I present also in Table 3 the results of this census. We cannot be sure that the so-called district names therein listed refer to exactly the same territorial units in all cases. Moreover, I leave for later any discussion of the significance of this comparison, and of the details regarding the missionary censuses listed in Table 2.

When we turn from Tahiti to the other islands of the Society archipelago in our effort to determine their pre-European population numbers, we move

from fantasy, wild guesses, and conflicting evidence to no early evidence at all—except in the case of Me’etia, the small steep rock of an island at the extreme southeastern end of the chain. When the Spaniards called there in 1772 some of them walked over most of the island and evidently saw most of its inhabitants, whom they reported to number about 200 (Corney 1913:296).¹¹

TABLE 3 Population Estimates of Island of Tahiti

District	Wilson (1797)	Oliver, based on Tupaia (1767-1774)
Atehuru	1,608	2,088
Fa’a’a	852	1,044
Pare-Arue	1,290	4,176
Ha’apape	822	1,044
Ha’apaino’o	1,860	1,044
Mahaena-Tierei	990	1,044
Hitia’a	1,254	3,132
Afa’ahiti-Pueu	618	2,088
Tautira-Teahupo’o	2,760	9,396
Vairao-Taohotu	360	1,044
Mata’oe	270	2,088
Vaiari	444	940
Vaiuriri	1,044	1,553
Papara-Atimaono	1,878	4,685
TOTAL	16,050	35,366

The estimates of population up to 1825 that I have found for other islands of the archipelago are listed in Table 4. I have included some post-1815 figures because they provide a basis better than guesswork for estimating the size of population of the Late Indigenous Era.

Mo’orea. J. Forster’s estimate is pure fantasy:

Imeo [Aimeo, Eimeo, Mo’orea] is a little, but well-cultivated isle, subject to the king of T-Obreonoo [Te Poreonu’u]. According to the accounts of the Taheiteans, it opposed and beat off the whole force of Te-Arraboo [Taiarapu]; and the great armaments we observed going forward in T-Obreonoo [i.e., the naval assembly seen by Cook, and mentioned above], for the reduction of Imeo, prove that they have no mean idea of their strength; notwithstanding this, we shall allow them no more than one fourth of the population of T-Obreonoo, i.e. 20,250.... (1778:221-222)

In 1802 and 1803, two missionaries walked around Mo'orea preaching to all who would listen and probably formed a fairly realistic impression of the island's total population (Jefferson, Journal, 1 December 1802, LMS Archives). I have found no record of their estimate, but their colleague Jefferson, writing some months later, and probably drawing on information obtained from them, put the island's population at "not more than 2000 people" (Jefferson to LMS, 29 August 1803, LMS Archives). Gyles, an expert sent by the LMS directors to develop the Islands' sugar production, formed his estimate of Mo'orea's population during his brief residence there. There is no evidence that it was based on any kind of systematic count. (Newbury 1961:222-223)

Tetiara. These atoll islets, directly under the control of the ruling dynasty of Pare, served as a resort for members of that family and their retinue, who went there from time to time to convalesce from illness and from kava ('ava) debilitation, or to escape from the pressures of politics at home. The permanent population appears to have been very small, and it is likely to have included some Tuamotuan castaways. Wilson's estimate of the population was based on hearsay and is clearly inaccurate:

Towards evening we saw Tethurōa, low land, about twenty-four miles from Otaheite. It consists of six or seven islets very near each other, not many feet above the level of the sea, covered with cocoa-nuts, but no bread-fruit, which they are not allowed to cultivate. It belongs to the King [Pomare II], but Mānne Manne claims it. The natives, about three thousand, are employed in fishing for the chiefs at Otaheite, and bring back bread-fruit and other things in exchange. (Wilson 1799:89)

In August 1803, the missionaries Elder and Wilson visited the atoll and made a more realistic estimate; since they were well aware of the atoll's nature as a resort, and specifically wrote "inhabitants," we are probably justified in concluding that these latter were more or less permanent residents of the place:

There are five Islands of the group called Tatoroa inhabited: Rayona the southernmost & the highest land, is abt. 2 miles in circumference, & contains 28 inhabitants: perhaps this Isld. may be 12 or 14 feet above the level of the sea. Rematoo lies about a mile to the northward of the above; is 3 miles in circumference, & contains between 20 & 30 inhabitants. Two miles northwest of Rematoo is Onehoa; it is about 2 miles round. Two miles to the Eastward of the last mentioned is Motooroa: this & Onehoa contains 35 inhabitants. To the eastward of Motooroa lies Horoa-terra: it is abt. 6 miles round & contains 50 people. Besides these there are 6 uninhabited islands, the largest of which does not appear to be a mile round. These Islands form a circle: there is a reef round them, but no good entrance through it: within the reef is deep water, sufficient for a ship to lie at anchor in. The produce of these Islands are cocoanuts & a few bushes & short grass, the soil is sandy & does not appear worth cultivating. The generality of the people who live on them, belong to Otaheite, very few are natives of the place; from what we could learn there never

TABLE 4 Population Estimates of All Islands of the Society Archipelago (except Tahiti)

Island	Year	Number	Source*
Mo'orea	1774	20,250	J. R. Forster 1778:221-222
	1803	2,000	Jefferson to LMS, 29 August
	1819	800+	Gyles, Journal, 14 July
Tetiaroa	1797	3,000	Wilson 1799:89
	1803	133-143	Elder and Wilson, Journal, 31 August
	1803	100	Jefferson to LMS, 29 August
Mai'ao	1803	300	Turnbull 1813:335
	1819	300	Gyles, Journal, 14 July
	1822	not over 200	Barff, Journal, 19 March
	1825	208 [baptized]	Barff to LMS, 21 September
Huahine	1819	2,000	Gyles, Journal, 14 July
	1825	1,800	Bourne to Burder, 20 January
Ra'iatea	1818	2,000	Threlkeld and Williams to LMS, 30 October
	1819	1,200	Gyles, Journal, 14 July

Taha'a	1819	1,000	Gyles, Journal, 14 July
	1825	700	Bourne to Burder, 20 January
Porapora	1819	1,500	Gyles, Journal, 14 July
	1821	836	Orsmond. Newbury 1961:312
	1825	1,000	Bourne to Burder, 20 January
Maupiti	1821	373	Orsmond. Newbury 1961:312
	1825	300	Bourne to Burder, 20 January
Tupai	1769	3 families	Beaglehole 1955:146
"Societies"	1819-1820	30,000	Hayward to LMS, Answers to Queries re South Sea Mission
Ra'iatea			
Porapora			
Taha'a	1820	3,000	Threlkeld to LMS, 1 June
Maupiti			
Total "Societies"	1820	12,000	Threlkeld to LMS, 1 June
Leewards and Mai'ao	1820	4,000+	Williams to LMS, 7 June

*Unless indicated by a publication date source material is in the LMS Archives.

did many people live there, they say, that some are dead, & others drowned in coming to Otaheite. (Elder and Wilson, Journal, 18–31 August 1803, LMS Archives)

The estimates of Jefferson and Turnbull are less reliable, having been based on hearsay. Turnbull's, especially, is rather curiously inconsistent, since it was based on information obtained from Elder and Wilson. Turnbull wrote: "Mr. Elder and Mr. Wilson had just returned from the Mottos [*motu*, islet], whither they had been conveyed by our boat on the 18th of August. They reported that the population did not exceed three hundred." (1813:335)

Mai'ao. I cannot discover the basis of Gyles' estimate. Barff's 1822 estimate was based on a visit to the island, as were his estimates of 1825.

Huahine. Again, I do not know the source of Gyles' estimate, but Bourne was stationed in the Leeward Islands and presumably had a fair notion of the populations thereabout. In July 1820, the missionaries Davies, Ellis, and Barff reported from Huahine:

The preaching of the word has been chiefly at our place of residence near Fare harbour, ... the number of the hearers has often been from 1200 to 1600, most of the people of Maeva and Huahine iti having removed to this neighbourhood, it supersedes the necessity of visiting those places, and in like manner the schools also at those places have been suspended for the present. (Davies, Ellis, and Barff to Burder, 15 July 1820, LMS Archives)

The inference that may be drawn from this passage is that the "hearers" included most of the adults on the island, but how many children were among these "hearers" is impossible to say.

Ra'iatea. The estimate of Threlkeld and Williams, contained in their report of 30 October 1818, was based on local residence and an ardent search for people to convert. The search, it may be added, had been largely unsuccessful up to that point: "No one is yet baptized save 2 or 3 hundred who were baptized one day at Eimeo by a Drunken Sailor" (Threlkeld and Williams to LMS, 30 October 1818, LMS Archives).

Taha'a. Bourne's 1825 estimate for Tana'a was based on his residence there and hence is probably fairly reliable.

Porapora and *Maupiti*. Both of these islands were under Orsmond's charge, and his estimates of their populations are about as reliable as one is likely to get for communities such as these.

Tupai, or *Motu Iti*, was subsequently deserted, but in 1769 Cook described it in the following terms:

Between 5 and 6 o'clock PM as we were standing to the Northward we discover'd

a Small low Island lying NBW or NNW distant 4 or 5 Leagues from Bolabola, this Island is call'd *Tubai*. Tupia says that it produceth nothing but a few Cocoa-nuts; that there are only three Families live upon it, but that the people from these Islands resort thither to catch fish. (Beaglehole 1955:146)

There was considerable going and coming between Mo'orea and Tahiti, between Mo'orea and the Leeward Islands in general, and among the Leeward Islands themselves. It is impossible to establish the extent to which this movement was recognized in the forming of various population estimates, but my guess is that the later missionary censuses would have excluded any large influxes of visitors.

More critical is the question of the relationship between these later figures and the populations of 1767. Mo'orea was closely involved in Tahiti's devastating wars and probably suffered just as directly and heavily from European-introduced disease. The other islands may have suffered somewhat less from introduced disease but were racked by many large-scale wars of their own. On balance, however, my guess is that the Leeward populations suffered less of a decline, during the five decades after 1767, than did those of Tahiti and Mo'orea.

For most of the Leeward Islands this guess is supported in part by geographic circumstances; that is, except for Ra'iatea, these islands could not have supported vastly larger populations than those living there—certainly not eight times as many (the most plausible estimate for Tahiti), and perhaps not even twice as many. Ra'iatea is, however, puzzling in this respect. It is by far the largest of the Leeward Islands and could conceivably have supported a population many times larger than the "less than 2000" reported by Threlkeld and Wilson in 1818; yet there is no positive evidence that such was ever the case.¹²

Composition

In view of the state of our knowledge about these Islands' population size in 1767, it is not surprising that there is little or no firm evidence concerning the composition of that population. Captain Wilson asserted that there was a numerical preponderance of males but provided no numbers and no basis for his estimate: "... both parties do oftener make up their minds to save the male than the female, which partiality accounts for the disproportion of the sexes, ..." (1799:192). More specific estimates place the proportion of males to females at one to three, or one to four, or even one to ten—but these relate to a much later time and are, in any case, highly impressionistic. In describing Mo'orea in 1818, one member of the LMS mission wrote: "The females are very few, I suppose not one to three males" (Gyles to Sleight, 23 November 1818, LMS Archives). In a general survey of this mission field in 1819-1820, Hayward wrote: "... the pro-

portion of the sexes [is] one woman to 3 or 4 men ..." (Hayward to LMS, Answers to Queries re South Sea Mission, 1819 or 1820, LMS Archives).

Data on age composition are virtually nonexistent. Orsmond, writing in 1821, reported that the Porapora population consisted of 545 "adults" and 291 "children," but that is about all we have to go on. Data on mortality and longevity are not much better, being limited to casual remarks about the high prevalence of infant death or to statements like the following: "Many were alive in 1791 who remembered the loss of one of Roggewein's squadron at an island [Makatea?] north of Otaheite, in 1722." (Wilson 1799:328).

In this connection, Morrison's statement that "... it appears to me that they live to a Good old age ..." (1935:231) may be contrasted with Varela's, that "... they are not long-lived, for we saw very few old people" (Corney 1915:289).

Physical Characteristics

Captain Cook's matter-of-fact description of the Maohis is as good as any:

With respect to their persons the men in general are tall, strong limb'd and well shaped, one of the tallest we saw measured Six feet 3 Inches and a half,^[13] the superior women are in every respect as large as Europeans but the inferior sort are in general small owing possibly to their early amours which they are more addicted to than their superiors. They are of various colours, those of the inferior sort who are obliged to be much exposed to the sun and air are of a very dark brown, the Superiors again who spend most of their time in thier Houses or under shelter are not browner than people who are born or reside long in the West Indias nay some of the women are almost as fair as Europeans. Their hair is almost universaly black thick and strong.... They have all fine white teeth and for the most part short flat noses and thick lips, yet their features are agreeable and their gate gracefull.... (Beaglehole 1955:123-124)

Other early voyagers were less stinting, some even rapturous, in their admiration of the physiques and countenances of the Maohis; even the staid chroniclers of the first missionary band found them not wholly unpleasing in their ways.

The natural colour of the inhabitants is olive, inclining to copper. Some are very dark, as the fishermen, who are most exposed to the sun and sea; but the women, who carefully clothe themselves, and avoid the sun-beams, are but a shade or two darker than an European brunette. Their eyes are black and sparkling; their teeth white and even; their skin soft and delicate; their limbs finely turned; their hair jetty, perfumed, and ornamented with flowers; but we did not think their features beautiful, as, by continual pressure from infancy, which they call *touroome*, they widen the face with their hands, distend the mouth, and flatten the nose and forehead, which gives them a too masculine look; and they are in general large, and wide over the shoulders; we were therefore disappointed in the judgment we had formed from the report of preceding visitors; and though here and there was to be seen a young person who might be esteemed comely, we saw few who, in fact,

could be called beauties; yet they possess eminent feminine graces: their faces are never darkened with a scowl, or covered with a cloud of sullenness or suspicion. (Wilson 1799:327)

Another impression was provided by William Wales who accompanied Cook on his second voyage.

With regard to the Personal Beauties of the Otahitean Ladies, I believe it would be most prudent to remain entirely silent; since by a contrary procedure I must expose in the grossest manner my own want of tast, or that of those Gentlemen who have asserted that 'they may vie with the greatest beauties of Europe', and that 'the English Women appeared Verry ordinery on their first arrival there' from this celebrated Cythera: but it is no new thing for the itch of writing to get the better of prudence; it will not therefore be wondered at if I run all risks of this kind to have the pleasure of describing their persons; at least, so far as there appears to be any national characteristic in it. In the first place then, their stature is very small, and their features although rather regular have a masculine turn. Their Complexion is a light Olive, or rather a deadish Yellow; their hair is of a glossy black and cut short in the bowl-dish fashion of the Country People in England; but had here, I think, a pretty effect, as it corresponded more with the simplicity of their Dress than any other form would. Their Eyes are exceeding black and lively but rather too prominent for my liking. Their noses are flat especially towards the lower end and their nostrils in consequence wide, as are also their mouths. Their lips are rather thick than otherwise; but their teeth are remarkable close, white, and even. The Breasts of the young ones before they have had Children are very round and beautiful, but those of the old ones hang down to their Navals. I have no occasion to call in the Aids of Imagination to describe every part of them, down to their very toes, as there were plenty of them who were not solicitous to hide any of their beauties from our Eyes; but it may be best to stop here, and proceed to say a little in defence of their Characters, which have, in my opinion, been as much depreciated as their beauties have been Magnified. (Beaglehole 1961:796)¹⁴

Some of the early visitors commented upon the obesity of many Maohis, male and female, including one man who measured 54 inches around the waist, and 31¾ inches around the thigh (G. Forster 1777:I, 390-391). As we shall see, there were institutionalized measures undertaken to fatten people, as a means of enhancing their comeliness; but quite apart from that, the usual diet and activity regimes of many Maohis seem to have produced nearly the same results.

One of the most vividly expressed impressions of Maohi physique is Anderson's contrast between them and the Friendly Islanders, Tongans, whom he and his shipmates had visited en route to Tahiti:

Nothing could make a stronger impression, at first sight, on our arrival here [Tahiti], than the remarkable contrast between the robust make and dark colour of the people of Tongataboo, and a sort of delicacy and whiteness, which distinguish the inhabitants of Otaheite. It was even some time before that difference could preponderate in favour of the Otaheiteans; and then only, perhaps, because we became accustomed to them, the marks which had recommended the others began

to be forgotten. Their women, however, struck us as superior in every respect; and as possessing all those delicate characteristics, which distinguish them from the other sex in many countries. The beard which the men here wear long, and the hair which is not cut so short, as is the fashion at Tongataboo, made also a great difference; and we could not help thinking, that, on every occasion, they shewed a greater degree of timidity and fickleness. The muscular appearance, so common amongst the Friendly Islanders, and which seems a consequence of their being accustomed to much action, is lost here, where the superior fertility of their country enables the inhabitants to lead a more indolent life; and its place is supplied by a plumpness and smoothness of the skin; which, though, perhaps, more consonant with our ideas of beauty, is no real advantage; as it seems attended with a kind of languor in all their motions, not observable in the others. This observation is fully verified, in their boxing and wrestling, which may be called little better than the feeble efforts of children, if compared to the vigour with which these exercises are performed at the Friendly Islands. (Cook 1784:146-147)

Various physical anomalies were also noted by early visitors, including occurrences of albinism, and of dwarfism:

During our stay in these Islands I saw some not more than 5 or 6 who were a total exception to all I have said before. They were whiter even than us but of a dead Colour like that of the nose of a white horse; their eyes hair eyebrows and beards were also white; they were universally short sighted and lookd always unwholesome, their skins scurfy and scaly and eyes often full of Rheum. As they had no two of them any connexions with one another I conclude that the difference of colour &c. was totaly accidental and did not at all run in families. (Beaglehole 1962:I, 335)¹⁵

They brought before me [Rodriguez] a dwarf, whom I measured and found a bare *vara* [a Spanish measure: .836 meters] in height, three *cuartas* [*cuarta*, i.e., one quarter of a *vara*] in girth round the belly, a *geme* [span: about 8 inches] the legs, the head very large, and a gruff voice, the entire body hairy, and scarcely able to walk for weariness. His father measures five *cuartas* in height, and, by his looks, is now forty years of age, a little more or less. I set the son down at fourteen to sixteen years, although the natives say that his beard will soon appear, and he will then grow no more. The mother is dead& they say she was about the same size as the son, and for this reason they declare that he will not grow any taller. (Corney 1919:90)

I saw a Dwarf about Eight Years old—the Boys head was very large, the body tolerably proportioned, but the thighs, and Legs particularly were very short. His Height was 31 Inches, and all the People agreed that he would never be any taller. His name was Tommah, but he was commonly called Hai'ah, (or Dwarf.) He was without four of the upper fore teeth all the rest were perfect. (Bligh 1792:142b)

THE SETTING IN 1767

Seen from a distance at sea these Islands must have looked much the same to the European “discoverers” in 1767 as they did to their Polynesian discoverers a millennium or so earlier. A few scattered houses and stone structures, together with many more coconut palms, were visible along the shores, but, by looking inland from the decks of their ships, Wallis and Cook

and Bougainville would have seen much the same kind of landscapes that greeted the first Polynesian settlers. Closer observation ashore, however, would have revealed some rather extensive changes, at least in the adlittoral and lower-valley parts of the coastal zone, the lower slopes of the dry-tropical zone, and the lower reaches of valleys in the wet-tropical zone.

First, many areas of the adlittoral and lower-valley subzones had been cleared of their primitive vegetation and replaced with houses, religious centers, and groves and gardens of introduced plants—mainly breadfruit, taro, tarua (*Xanthosoma sagittifolium*), sweet potato, yam, arrowroot, sugarcane, paper mulberry, “bitter taro” (*Alocasia macrorrhiza*: ‘ape), and “giant taro” (*Cyrtosperma nadeaudianum*: ‘ape veo). Some of these new plants, notably breadfruit and ‘ape, had “escaped” from gardens and groves and had become established in other settings.

Second, several kinds of useful indigenous plants had been encouraged to proliferate by deliberate planting and protection, mainly in the coastal and lower-valley areas. The principal ones of these were the coconut palm, mountain plantain, banana, kava, ti, and turmeric.

Third, considerable inroads had been made into natural growth of certain plants, for food, construction, and other purposes. For example, natural stands of mountain plantain were drawn upon heavily and probably reduced in numbers. Also, men had to go farther and farther inland in search of suitable trees for canoe hulls and probably for ordinary house timbers as well.

Fourth, the pigs introduced by the Polynesians, and particularly the feral ones, had succeeded in destroying some of the original plants in some areas, but much more destructive in this respect were the bush fires set by humans, accidentally or in connection with pig hunting, garden clearing, and warfare. The sources contain some vivid descriptions of such fires.

There has been a large fire in the mountains opposite Pare since Thursday last, yesterday evening it reached a large plantation of cocoanut trees, that were planted by the kings father about 17 years ago—there were some hundreds much damaged and the greater part of which perhaps will never grow again. (Youl et al., Journal 11 October 1806, LMS Archives)

For several days and nights past there has been a strong great fire in the lower hills of Matavae, which consumed almost every tree and shrub before it, a plantation of cocoa nuts upon one of the hills, planted about three or four years ago by some of the brethren is supposed to be entirely consumed. (Davies, Journal, 27 August 1807, LMS Archives)

In some cases the original plants of fire-devastated areas were able to reestablish themselves; such was the case with the *Gleichenia* fern cover over much of the dry-tropical zone slopes. Elsewhere, in burnt-out portions of the wet-tropical zone (particularly on the middle slopes) myrtle (*Metrosideros*), melastomas, and dodoneas moved in.¹⁶

In summary, by the time Europeans began to arrive on the scene, the

Maohis had, deliberately or otherwise, brought about extensive changes in certain parts of the Islands—mainly in the adlittoral parts of the coastal zone, the lower slopes of the dry-tropical zone, and the lower parts of the wet-tropical zone—areas which European visitors were to describe as park-like, even reminiscent of “the Elysium fields” (Bougainville 1772:38). In Banks’ words:

No country can boast such delightfull walks as this, the whole plains where the people live are coverd with groves of Breadfruit and cocoa nut trees without underwood; these are intersected in all directions by the paths which go from one house to the other, so the whole country is a shade than which nothing can be more gratefull in a climate where the sun has so powerfull an influence. (Beaglehole 1962:I, 340)

On the other hand, they effected few or no changes in submangrove areas or on atolls or atoll-like offshore islets; neither had their colonization resulted in any extensive changes in areas directly bordering sea and lagoon. The extensive rain forests had been altered slightly by Maohis foraging for mountain plantains and timber, but most of the mountainous interiors remained unvisited and unchanged. In other words, only about one-fifth of the Islands’ land areas had been more or less affected by Maohi settlement.

The early European visitors to the Islands found the indigenes dwelling in “households” scattered mainly about the coastal plain and the lower and middle reaches of the valleys. Such households typically consisted of a single sleeping house along with a separate cookhouse, although a few also included an extra shelter or two for sleeping, working, or entertaining. In addition, in many if not most cases the structures making up a household unit included a marae, a place set aside and specially constructed for worship. Nearly all these households were separated from one another by gardens and orchards. Some, in fact, stood hundreds of yards distant from all other dwellings; but most individual households were clustered, spatially and socially, into “neighborhoods” each consisting of from two to ten or so households.

The larger-than-average establishments of certain socially prominent persons, containing extra quarters for servants and hangers-on, were described by some Europeans as “villages,” but they were in actuality merely enlarged single households. In certain areas of high-yield economic resources the households and neighborhoods were clustered closely enough together to warrant, perhaps, labeling them “villages”; but such aggregates were the rare exception and not the rule.

In addition to the household buildings just mentioned, and the gardens and groves associated with them, the early European visitors to these Islands found numerous other structures located apart from households, or in some cases spatially separated even from neighborhoods. These included archery platforms and an occasional more or less secular meetinghouse, but usually such structures were marae, serving congregations of larger-than-neighborhood size.

The earliest European visitors have left no maps and few verbal descriptions of actual settlements and only the most general indications of population densities:

The most thickly populated localities are the District of *Papala* [Papara], the District of *Tallarabu* [Tairapu], and the western side where the *arii* Otu resides [i.e., Pare]. (Corney 1915:79)

9th day [9 July 1775]:—It broke clear and calm. I started off by land, with all the *arii* and their kinfolk, it being the custom to go as far as or beyond the confines of their district, in order to renew there the guest's supplies and take leave of him, with much weeping, which was done accordingly; and thus, as I passed through it by land, I saw the whole of *Opare*, which is a very populous and smiling district. Better houses were met with than elsewhere in the island; the land is of good quality, and very wide extent, for it includes well-peopled valleys stocked on their lower slopes with good-sized plantations, though the hills are not so thickly wooded as those belonging to Vehiatua in his part of the country. (Corney 1919:169)

I started for the district of Papara, which adjoins that of *Atehuru*. This last is the largest district of all in the island and is pretty densely peopled.... (Corney 1919:172)

... [Taravao Isthmus] is only thinly peopled, because the natives declare that they constantly see the *Tupapau* or Evil One there. (Corney 1919:49)

The extent of valley settlement is indicated in the following:

Fr. Geronimo went with the Interpreter up the *Ohatutira* [Tautira] gully, where a great many people live, but in scattered fashion. (Corney 1915:321)

This district of *Apayano* [Papeno'o, consisting mainly of the valley of that name] is large and populous; and its coast line not bad, on the whole, but it has not the protection of an outer reef. (Corney 1919:167)

We proceeded about [six miles up the valley of the Matavai River] and had houses pretty plentifully on each side the river, the vally being all this way 3 or 400 yards across. We were now shewn a house which we were told would be the last we should see. (Beaglehole 1962:I, 307)

The only specific reference I can find to an inland hillside residence is Bligh's description of that of the *ari'i* Tynah [Tina]:

This afternoon I took a Walk with Tynah to the Hills where his Country residence is to sow Indian Corn. It may very properly be called his Seat, for he has a neat House and a Plantation of all the produce of the Country. Ground provisions such as Yams and sweet Potatoes were in great abundance, but they had not yet began to flower, and of course not in season, however he directed a few Potatoes to be dug for me. A Great many Cocoa Nutt Trees which he has planted within these five Years from the Nutt in Rows, are in great perfection, and he has very fine Clusters of Breadfruit Trees also of his own planting. The Situation is delightfull with a fine View of Oparre and Matavai. Tetturoah [the atoll Tetiaroa, some 41 km north of the coast at this point] can also be seen. The soil is exceedingly rich and good so that every thing grows luxuriantly. (Bligh 1789:II, 40)

On smaller islands, with narrower coastal plains and only shallow

steep-sided valleys, the populations had to thin out extensively and use higher ground for growing food crops:

The Island of Huheine is Hilly and very uneven, with several curious projecting Rocks about the summits of some of the Hills. It is surrounded by flat Land which abounds with Cocoa Nutts and Breadfruit, and is also cultivated on the rising Grounds. (Bligh 1789:II, 84)

Forster explained "... the superior affluence and luxury of the Tahitians," in comparison with natives of Huahine, as due to the inferiority of Huahine's natural resources, "... where the ambient plain is so narrow and inconsiderable, that the natives are obliged to cultivate the hills" (1777:II, 119).

The earliest and most authoritative figures available concerning the spatial distribution of Tahiti's population were given in Table 3. Another account of population distribution was recorded by missionaries in 1797, during their circuit of Tahiti, but the value of this estimate is limited in two ways. In the first place, the count was by district only, and, in most cases, was based on hearsay. Second, it was taken thirty years after Wallis' visit, by which time the island's total population had been reduced to an estimated 16,050. Later descriptions of actual settlements are not applicable to the era under study because they involve radical changes wrought by the missionaries, who successfully undertook to concentrate the remnants of the natives into neighborhoods around the mission stations.

In fact, archaeology provides the best evidence available about the actual distribution of the pre-European Maohis; and even this is evidence of an indirect kind. Stone remains of structures have been found throughout the adlittoral zone—the farthest inland reported to be about 15 km from the coast near the head of the Papeno'o Valley. They have been found also along the water's edge, and a few on hillsides and plateaus outside the adlittoral zone; but most of these latter relate to nonresidential structures: to temples, council platforms, archery ranges, and fortresses, many of which may well have been purposely distant from places of residence. A few stone remains, particularly the stone curbing of round-ended houses, may have been either residences or public buildings; but these are also limited to the adlittoral zone.

CHAPTER 3 *COSMOLOGY*

This account of Maohi life begins with descriptions and behavioral exemplifications of these Islanders' beliefs about the nature of their universe and their positions in it. To those readers who on theoretical grounds might favor some other order of ethnographic presentation—say, the explication of technology prior to that of cosmography—I say that in my own opinion the beliefs people entertain about themselves and their environment at any one moment are the most decisive factor in determining how they act toward that environment at that time. This is not to assert that exogenous factors have not helped change, over time, the beliefs held by the Maohis, for they have undoubtedly done so; but when attempting to portray and comprehend how the Maohis of 1767 caught fish (or contracted marriages, or dealt with biological death, etc.), their perceptions about the gods of fishing (or about social stratification, or ghosts) provide more immediately relevant keys to our understanding than does information about natural or technological factors that in the past may have helped to shape those perceptions and practices concerning fishing (or marriage, or funerals).

SOCIAL ENTITIES

Cosmogony

What were the Maohis' pre-European beliefs concerning the beginnings of their universe?

Anyone attempting to answer this question is confronted with problems of authenticity and variability. Allegedly "authentic" data on such beliefs were collected over a period of at least a century. In fact, "native" and, supposedly, pre-European beliefs are still being recorded today. (Compare such statements as, "The following myth was told by old X who learned it from his grandfather, the last sage of the district.") Some of these myths are so patently Bible-inspired as to present no problem regarding derivation, but in other cases, especially myths about floods and about strife in heaven, it is next to impossible to decide whether biblical similarities are remarkable convergences or disguised borrowings. One possible way out of this dilemma would be to utilize only those accounts collected before the

missionaries began active proselytism, about 1800; but one must consider that, with the possible exception of accounts by Rodriguez and Morrison, only after 1800 were any accounts collected by Europeans familiar enough with the language to record or translate these interviews to any reliable degree. Moreover, by utilizing only the premissionary data one would have to depend upon brief fragments and ignore the large corpus of materials recorded much later by such missionaries as Jefferson, Knott, Davies, and Ellis, and by such laymen as Moerenhout and de Bovis.

My criteria for authenticity are quite simpleminded. I place heaviest reliance upon the writers just mentioned because I believe them to have been conversant enough with European ideas, including biblical themes, to recognize them as such, and intellectually honest enough to so identify them. Also, comparison with data from other Polynesian societies can provide some indirect corroboration for what is or is not pre-European. (In the present context I am concerned only with beliefs authentically pre-European, since I am trying to reconstruct Maohi suppositions about their society before these began to be altered by contact with aliens. A Christianized Maohi's formulation about the Genesis is no less "authentic" and ethnographically useful—but for other purposes.)

The problem of variability is quite different. Different versions of particular subjects vary so widely, from place to place and from informant to informant, that one might question the feasibility of trying to reconstruct *the* Maohi cosmogony and cosmology.¹ The answer to this is that such variation, within certain limits of course, was the hallmark of Maohi beliefs, in terms of place and time. Even within the brief period that I have tapped for reconstruction there seem to have been local changes in some beliefs quite apart from those induced by the presence of Europeans.

All this conflicts with a view many Europeans have entertained about ancient Polynesia which envisaged each society as having a more or less official corpus of sacred lore that was faithfully preserved from generation to generation by priests and sages skilled in memorization. Rote memorization was a deliberately fostered and highly valued skill in some Polynesian societies, including Maohi society, and this did indeed serve to protect some traditions and formulae from rapid change.² Moreover, some versions of myths were "official," but "official" with respect to this or that social unit, and not to Maohi society as a whole.

Some Polynesian cosmogonies are said to picture the universe developing out of nothingness by a kind of self-generating evolutionary process. There may be fragments of such a view in Maohi beliefs,³ but by far the most frequent and best developed Maohi cosmogonic theme concerns a primal spirit, Ta'aroa, who initiated the known universe by incantation (*rahu*) or by personification of his own attributes or by sexual reproduction with beings created by him.⁴

A creation chant dictated to Orsmond in 1822 on Porapora, and later heard also at Mo'orea, combines many characteristic themes. I summarize below the action described in the chant, freely paraphrased and severely abbreviated from Henry (1928:336-338).⁵

In the beginning there was only Ta'aroa, who had no forebears, who created himself and all other first beings and things. For countless ages Ta'aroa existed alone, floating in space (*'aere*) and darkness (*pō*) within egglike shells. Finally wearying of his solitude, Ta'aroa broke out of his shells. One of these shells was Rumia, which became his house (*fare*), the dome of the gods' sky which enclosed the world (*ao*), then vegetatively growing. The other shell became the world's great foundation (*tumu*), consisting of stratum rock (*papa*) and soil (*repo*). Within Ta'aroa were several personlike attributes: memory (*mehara*), thought (*mana'o*), steadfast gaze (*tutonu*), and observation (*hi'ohi'o*).

Ta'aroa then caused the land's Great Foundation to become husband (*tane*) and its Stratum Rock to become wife (*vahine*), and he placed his spirit (*vārua*), his very essence (*meho'i nona iho*), inside Foundation and hailed him as *ari'i*. Ta'aroa then bade Foundation and Stratum Rock to go to each other and cohabit, but they refused. Ta'aroa continued for eons to dwell in the enclosed dark sky and conjured forth (*rahu*) many other gods (*atua*); it was only later that he made man (*ta'ata*), with the help of his artisan-god, Tu. Ta'aroa shook off the red and yellow feathers growing from his own body and these became plants growing on the land. Meanwhile the octopus, Foundation of Earthly Heaven, held the sky close to the earth, keeping out all light.

Another version relates that Ta'aroa had a consort, Ofeufeumaitera'i, who like himself emerged unassisted out of the *pō*, and from whom he begat 'Oro. 'Oro then begat two sons of his own from another *atua* of unspecified origin, and these six "... constituted the whole of their highest rank of divinities, according to the traditions of the priests of Tahiti."⁶

Still another version relates that Ta'aroa's first act was to create a daughter, Hina, with whom he subsequently begat (*fānau*) 'Oro, after she had assisted him in making the heavens, earth, sea, and many other *atua*.

One could go on at some length repeating, and attempting to analyze, the many variations among the recorded versions of Creation⁷—an intriguing study in itself, but one too specialized for this book's objectives. Instead, I shall be content to emphasize that such variations existed (and probably much more so than the surviving documents indicate) and to point out, though not very systematically, some of the more obvious themes that are directly related to our interests.

In most versions of the Creation, mankind (*ta'ata*) appears rather late, after numerous other entities—major and minor gods, meteorological phenomena, physiographic features, flora, fauna, and so forth—had been formed. Out of the innumerable chants and narrative accounts describing these events it is possible to distinguish seven formative processes:

1. Incantation (*rahu*). By this means, Ta'aroa called into being many

kinds of entities, including lesser gods, some of whom also possessed and occasionally made use of this kind of creative power.

2. Fabrication (*rave, hamani*). By this means some entities were made out of others. For example, Ta'aroa fabricated many gods out of the parts of his own body or out of some of his own attributes, and these in turn fabricated other entities.

3. Sexual reproduction (*fānau*). Ta'aroa cohabited with his own creation, Stratum Rock, and from this union was born Hina, the Moon Goddess. Again, Ta'aroa caused the shadow of a breadfruit tree—one of his numerous manifestations—to pass over his offspring Hina, and the god 'Oro was thus born. (One noteworthy feature of many of these accounts is the prevalence of what the ancient Maohis themselves regarded as “incest”; male spirits cohabit with their own sisters, daughters, granddaughters, and even mothers.)

4. Division. For example, some gods in a fit of anger broke up the land into many islands.

5. Fishing up islands from the sea. This kind of action was usually attributed to the demigod Maui. In a variant of this theme, islands are described simply as having been “cast up” by the sea.

6. Growth (*tupu*) from other entities. Thus, the staple plants grew out of the body of a man; or Ti'i and Hina are said to have caused-to-grow (*tupu*) common people for the earth (Henry 1928:403).

7. Transformation. For example, one married couple gave birth to a head, which turned into the first coconut; or, during a time of famine, a man converted himself into a breadfruit tree to save his wife and children from starvation.

Finally, some entities are said merely to have arrived or appeared, without indication of how or whence.⁸

Events involving formation of the major gods or categories of gods, the principal natural phenomena, the larger land features, the main classes of animals, plants, and so forth, were implied to have taken place in the remote past. On the other hand, many other acts of creation or of transformation were believed to be ongoing, including, of course, the seasonal reappearance of many food plants and animals, which was in no sense a wholly “automatic” process.

But creation was not enough; entities had to be brought into proper relationships, a process that is described in several myths. One of these concerns strife between Darkness, Famine, Sleep, on one side, and Light, Plenty, Wakefulness, on the other, with the latter prevailing and introducing a general reconciliation. (It is possible but I believe not probable that this may have been based on a biblical theme.) Another recurrent myth theme concerns the firm fixing in place of the land by means of the growth of

roots, termed *ari'i* in this context—a metaphor having interesting social implications, which are discussed below. Still another theme concerns snaring the sun for the purpose of lengthening the day. Of all myth themes one of the most frequently recorded concerns the separation of Sky from Earth, sometimes imagined to be a couple in embrace, but more often described as being held together by an octopus. When this mighty feat of separation was accomplished light replaced darkness between Sky and Earth, and pillars (*pou*) were erected to hold Sky aloft.

Finally, I reproduce in its entirety a text recorded by Orsmond and titled (by him, probably) “Order Finally Established.” The purpose in including such a lengthy, detailed text in what is otherwise intended as an epitome of Maohi cosmogonic beliefs is twofold. First, I wish to suggest how comprehensive such beliefs were; and second, I offer this example to indicate how detailed were the Maohis’ perceptions of their physical surroundings, including items that seem to have played no part, useful or otherwise, in the “practical” business of maintaining life.⁹

The presence of Tane among the gods (*atua*) introduces some uncertainty concerning beliefs about the origin of mankind, since *tane* is used most commonly to label the male human being. Also, some writers refer to Tane as a demigod (*atua-ta'ata*). Nevertheless, the more explicit accounts of mankind’s origin concern a being named Ti'i. A myth dictated to Orsmond in 1822 and again in 1833 by informants from Mai'ao and Tahiti combines several of the more characteristic themes on this subject.

CREATION OF MAN

Te mata o Tù ma Ta'arua i nana i raro i te piha taata. Ua apo'opo'o a'era raua:

“Ua tupu te fenua, ua tupu te ra'i, e ua tupu te moana; ua i ana'a ia i te mea oraora. Ua api te piha atua i te atua, na hea rà te piha taata e au ai?”

“E hamani rà i te taata!” A rahu ra Ta'arua i raro i te aro o ha'eha'a, tu maira o Ti'i ho'e roa ra taata. O te taata matamua roa 'ino ia i te ao nei. O Ti'i ahu one. Ti'i ma'a-ra'a uta. Ti'i ma'ara'a i tai, Ti'i haamou-huna, Ti'i fa'aina toi. E 'ao 'uo te Ti'i, e 'Ao fa'auru i te pô e te ao i ta Ti'i e fa'aeue atu.

O Na-pô-titî e o Na-po-tàtà te rahua mai e Ta'arua ei hoa varua ino na Ti'i i te pô, ape'e mai nei i te ao nei.

The eyes of Tù (Stability) with Ta'arua (The-unique-one) looked down into the room for man. They consulted together:

“Land has grown, the sky has grown, and the ocean has grown; all these are filled with living creatures. The room for gods is filled with gods, and now what shall be done for the room for man?”

“We must now make man” [was the decision].

So Ta'arua conjured up from below, and there stood forth Ti'i (Fetcher), only one man. He was the very first man in this world. He was Ti'i, clothed in sand, Ti'i the propagator inland; Ti'i, the propagator seaward; Ti'i, secret destroyer; Ti'i, the axe sharpener. Ti'i had a white heron, that bewitched by day and by night all whom he bid it enter.

Na-po-titi (Lingering-night) and Na-po-tata (Retarded-night) were conjured forth by the Ta'arua as demon friends for Ti'i in darkness, and they followed him into this world.

A noho Te-fatu i te vahine, ia Faahotu, fanau mai ra o Hina-te-'u'uti-maha'i-tua-mea, O Hina ai tua, Hina ai aro; e mata i mua e e mata i muri to Hina, atua vahine fanau taata matamua roa i te ao nei.

A noho tamahine o Ti'i-ia Hina te-'u'uti-mahai-tua-mea, oia o te 'ai tua e te 'ai aro, fanau a'era ta raua, o Uru-o-te-oa-ti'a; hee te tua, o Hina-'ere'ere-manua, muri iho o Hina-nui-fa'ahara-ma'au, o Rua-faa-ra'i maira. I amui te hua'ai o Ti'i e o Hina i te hua'ai o te nu'u atua ei tane e ei vahine i teireira tau, i te pô ra.

O Ti'i e o Hina, i tu ra'i piri, na fariua i te ao ei tata'u no te ao, ei tupuraa taata rii ia no te ao, i te piha taata. Ua api a'era te piha taata i te taata, a ite Ta'arua a faarire.

I te rahiraa o te taata, fanau maira te pe'ape'a; fanau ta te pe'apea, o te pa'ara; fanau ta te pa'ari, o te tau, fanau a'era ta te tau, o te tahitohito.

A fanau mai ta Ti'i e ta Hina-maha'i-tua-mea tamarii, te ari'i nui maro 'ura; e hua'ai na te atua mai te pô mai. A tû mai te taata i rahua e Ti'i ma Hina-maha'i-tua-mea, oia te taata ri'i, te manahune o te ao nei. A noho te ari'i nui i te taata ri'i, fanau maira te hui-ra'atira o te ao nei. A noho te hui ari'i i te hui-ra'atira fanau maira te ari'i ri'i o te ao nei.

O te outu rorao te 'ai'a fenua o te hui ari'i; tei reira te marae nui o te fenua, e 'ore e mo'e. O te 'o'o'a hohonu te 'ai'a fenua o te hui raatira. A í te fenua i te taata ràrà i te mau vahi ato'a. Tei tai e tei uta te fenua o te taata ri'i, e piri haere ia fenua i to te feia mana.

Te-fatu (The-lord) dwelt with his wife, Faahotu (Be-fruitful), and they begat Hina-te-u'uti-maha'i-tua-mea (Gray-to-extract-and-mitigate-many-things), Hina who ate from before and from behind; a front face and a back face had Hina the goddess, who was the first woman born in this world.

Ti'i took to wife in her girlhood, Hina-te-'u'uti-mahai-tua-mea, she who ate from before and from behind, and they begat Uru-o-te-oa-ti'a (Inspired-of-the-house-of-high-chiefs); there followed Hina-'ere'ere-manua (Hina-black-and-hasty-tempered); next came Hina-nui-faahara-ma'au (Hina-the-great-and-sulky), and then was born Raa-faa-ra'i (Source-of-kings). The children of Ti'i and Hina intermarried with the gods at that period, in darkness.

When Ti'i and Hina stood in the close sky, and turned to the earth to call to the world, it was to create common people for the world, in the department of man. Thus the room for man was filled with people, and Ta'arua saw it and applauded.

When people multiplied, trouble was produced; trouble begat wisdom; wisdom begat cunning; cunning begat mockery.

When Ti'i and Hina-maha'i-tua-mea (Hina-mitigator-of-many-things) begat children they became the high royal family of the 'ura girdle; they were descendants of the gods from darkness. When people stood forth conjured into being by Ti'i and Hina-maha'i-tua-mea, they became the common people, the plebians of the world. When the royal family espoused common people, they begat the gentry of the world. When the royal family espoused the gentry, they begat the nobility of the world.

The long capes were the inheritance of royalty and the nobility; there stood the great temples of the land which could not be hidden. Deep bays were the inheritance of the gentry. As the land got thickly populated, the people spread everywhere. On the seashore and inland were the lands of the plebeians bordering on the lands of the great.

(Henry 1928:402-403)

Maohi cynicism is revealed in the lines about mankind, trouble, wisdom, cunning, and mockery, but for our purposes the point of central interest in this myth is its explanation of marriage-class differences.

De Bovis also referred to the misalliance theme of human origin: "As for man (kind), it is universally believed that they had been engendered by

gods who mated beneath themselves and thereby the race degenerated" (1909:45-46); but he added no details. In other versions, by Ellis (1829:I, 113) and d'Urville (1834:I, 564), Ta'aroa and Hina begat Ti'i and Hinaereeremonoi, who in turn begat Ta'ata. Ta'ata and his grandmother Hina then begat Ouru and Fana, the progenitors of humanity.

Still other versions similar to this one specify Opoa, on Ra'iatea, as the place where human beings first appeared—a theme related to the widespread belief in the primacy of Opoa, as the main center of 'Oro worship and the ancestral home (*ai'a tupuna*) of some of the archipelago's highest-ranking kin-Titles.¹⁰ Parallel to this belief is an account of the growing (*tupu*) of other islands out of Havai'i (an ancient name for Ra'iatea): first Vavau (Porapora), then Tupai, then Maurua (Maupiti), then Mapiha'a, and so on.¹¹ In this connection it is noteworthy that Tahiti, largest by far of the Society Islands, appeared late on the scene; originally a part of land connecting Ra'iatea and Taha'a, it moved southeastward in the form of a fish. Neither *ari'i* nor gods accompanied the "warriors" (*toa*, *'aito*) who remained on the fish-island and formed its population. After many generations the warrior chiefs tried to cut the sinews of their fish-island to stabilize it, but having no gods to assist them they failed. They called out for gods but none responded. Then they sailed to Tubuai and obtained an axe dedicated to a sea god, and being possessed (*uru*) by the latter's powers the axe cut the sinews.

Supplementing this account, Miss Henry wrote that warrior chiefs became warrior kings over plebeian Tahiti, and gradually their families intermarried and became one with the royal [red-girdle *ari'i*] family of Opoa in the motherland. They landed at Mo'orea and at Tahiti's southern peninsula (Lesser Tahiti) but not in Greater Tahiti itself, whose populace called angrily for them to come. At length the gods swept over all Tahiti, whose people fled in terror and hid in caves and ravines. For a while the gods terrorized the populace, demanding the heads of the slain warriors. In the midst of their fear the people prayed and then they raised their voices beseeching the gods not to destroy them. They repented for having called angrily upon the gods to come. Then the multitudes of gods had compassion upon these mortal beings and did them no harm. Soon the people of Tahiti and Mo'orea erected temples and dedicated them to the gods, and they felt themselves protected by the spirit world as in ancient times in Havai'i. (Henry 1928:443-444)

If the indigenous authenticity of this account can be accepted in spite of its biblical phrasing, then we have here a highly suggestive version of the relations between gods and at least the lower classes of mankind.

Gods created many of mankind's customs, and men themselves invented some of their most important and useful ones, such as making fire by friction. But perhaps most inventive and venturesome of all were such

demigods as Maui, Hiro, Honoura, and Rata. Some of the longest accounts recorded tell the adventures of these Beings—their travels to far islands, their contests with gods and other spirits, their miraculous feats of strength and craftsmanship. The very fact of their part-humanity seems to have engaged the sympathy and stimulated the fantasy of the Maohis.

As stated earlier, this cosmogonic epitome is a composite one, put together from a number of myths, cult dogmas, and so forth. It is unlikely that any one Maohi could have reproduced all the ideas summarized, or would have put them together in just this form. There were, however, a number of individuals, male and female, who made a specialty of learning and teaching large portions of the society's accumulated ideas about the universe; these were the *tahu'a parau tumu fenua* (experts in knowledge about the origin of the earth), or *vaha rau* (cave of many openings), or, as I shall label them, "sages."

Sages are said to have learned their store of information in schools (*fare hapi'ira'a* 'houses of learning'), which were established in several places throughout the Islands. Learning was by rote memory, usually in chant form, and the subjects taught included myths, "history," genealogy, calendar, geography, astronomy, and enigmas and similes. Extensive knowledge of the kind just listed had usually to be learned through hard and persistent effort, but there was a shortcut:

When a very learned man was about to expire and wished to transmit his knowledge to his son, even though the son was very young, he would say, "My son, stay by me and draw my last breath into thy mouth and swallow it that my learning may become thine." So when the moment came, the son would open his mouth over his father's and receive his last breath. It was affirmed that this means never failed to produce the precious knowledge. A scholar of this kind was called *atiti-pau* or *ae-pau* (all knowledge absorbed). It is said that he thus came in touch with the spirit of his deceased father, which visited and taught him all his knowledge, in deep sleep sometimes bordering upon trances. (Henry 1928:290)

I turn now to a more detailed description of the principal entities believed by the Maohis to make up their universe.

Principles of Classification

There is evidence aplenty that some Maohis were keen observers of their physical surroundings, and that at least some of them engaged more than casually in speculation and generalization about their universe.¹² In fact, sages occupied positions of honor and privilege, and it may well be that there were native Aristotles, or at least Linnaeuses, among them. But it is extremely unlikely that the doctrines of any individual or any one "school" would have enjoyed universal currency, for detailed uniformity of belief was not a prominent feature of Maohi life and bigotry about such matters was practically nonexistent.

Lacking explicit and comprehensive statements on these matters, I am left with the task of constructing them from inference, using for this purpose a wide range of behavioral and textual data.

To begin with, in my judgment the Society Islands data do not support E.S.C. Handy's thesis that these Polynesians regarded the universe as a psychic dynamism manifesting itself physically, that all objective phenomena of nature had their origin in the psychic dynamism, that concrete nature in all its parts was also in a sense regarded as a reservoir of dynamic power, and that its different parts were the mediums of transmission of this force. Handy informed us that "The most conclusive evidence of the existence in the native mind of the idea of the psychic dynamism of nature lies in the *mana* concept itself" (1927:26). As in the case of the postulated World Soul concept (see note 4, this chapter), no recorded texts or accounts of behavior that I know of provide evidence that the Maohis entertained such a generalized, all-embracing, energetic, animatistic view of their universe. Building stones for such a metaphysic may perhaps be inferred from some of their beliefs and actions, including some recorded usages of the word *mana*, but I believe that the highly refined comprehensive view enunciated above is the construct of the philosophically minded ethnologist and not, even implicitly, of the Maohis themselves. It may well be that some remote cultural ancestors of the Maohis shared such a metaphysic, but the data collected on the Maohis during the eras I am describing do not permit such a reconstruction.

This is not to say that the Maohis did not intellectually analyze and, up to a point, synthesize the manifold phenomena around and within them; for this they did to a considerable degree. But rather than attempt a full treatment of this matter, which would be a major task requiring a lengthy volume, I shall present here an outline of Maohi classifications more or less directly relevant to my concern with social relations.¹³

Rather than being "... a psychic dynamism manifesting itself physically," nature for the ancient Maohis consisted of innumerable individual entities, some of which were intrinsically animate and some intrinsically inanimate but capable of animation. What constituted an individual entity is not entirely clear. The great primal Stratum Rock was in itself an entity—in fact, an important spirit—and certain individual rocks and rocky outcrops were made animate by spirits, but it is not clear how large or distinctive a rock had to be to become individually animated in this way. The same uncertainty prevails with respect to soil, sand, water, wind, plants, and the like. It is fairly certain, however, that every animal being exhibiting movement of its own was considered to be a separate and obviously animate entity. Thus, although the individual entities in the universe may be said to have been intrinsically either animate or inanimate this classification does not

correspond altogether with Western organic-inorganic or with plant-animal categories. There was on the one hand a general distinction drawn between man or man-like beings and all other animals—at least in terms of certain distinctive names for some body parts (e.g., head, brain, lungs, penis). On the other hand, myths record several instances of more or less permanent transformation of one of these contrasting entities into the other, and of descent of one from the other.

Much more explicit was the distinction between mortal mankind (*ta'ata*) and all kinds of “spirits”—gods, ghosts, and demigods; each is, for example, said to occupy different rooms (*piha*) of the universe. In the beginning some *ta'ata* were ‘conjured into being’ (*rahu*) and others were born (*fānuā*) by means of sexual reproduction among spirits, but in time most *ta'ata* came to be born of other *ta'ata*. Some spirits were and continued to be born of other spirits, but many others originated or continued to originate in other ways: by conjuring, by transformation of the souls of deceased *ta'ata*, and so on. As we shall see, the soul (*vārua*) of a living *ta'ata* was capable of extracorporeal movement, but there is no doubt that “spirits” were in general capable of greater and more varied kinds of activities than were *ta'ata*. Finally, the bodies (*tino*) of all *ta'ata* were believed to be destined to expire and disintegrate; this may also have been the fate of some souls. Even some spirits, such as those slain, and presumably extinguished, by the demigod Rata, could die (Henry 1928:481ff); but most spirits were potentially immortal.

Spirits

In some texts the word *atua* appears to have the general meaning of spirit, as contrasted with *ta'ata*, or human; but other usages permit a classification of spirits into *atua* (god) and ‘*oromātua* (ghost), plus an intermediate category, *atua-ta'ata* (demigod).¹⁴ I can perceive no absolute distinctions between, say, *atua* and ‘*oromātua* as a group in terms of power, but some *atua* are more powerful than any ‘*oromātua* (or *atua-ta'ata*).

By far the most powerful and versatile of *atua* was Ta'aroa. In most cosmogonic accounts (but not in all), he was the primal, first individualized entity, the being without parents, the creator of most other categories of entities. He made many other *atua* out of his own attributes (*huru*) or out of parts of his shells; he conjured others into being, and then mated with some of these to produce still others. Many other parts of the universe, not themselves *atua*, were created directly or indirectly by Ta'aroa. He—this *atua* is usually implied to be male—did not create all things or all orderly relationships among things, but he did begin these processes; and he created the other *atua* who carried on the acts of creation.

After Ta'aroa, among the myriads of other *atua* they believed in, the Maohis implicitly or explicitly distinguished several ranks and categories, according to function or effectiveness or relationship with Ta'aroa.

First and literally highest—they occupied the topmost levels of the heavens¹⁵—were such *atua* as Tu, Tane, 'Oro, and Atea, including presumably some of Ta'aroa's own personified attributes.¹⁶ Tu stood above the hosts of such gods because he served as hands for Ta'aroa ("*O te atua ia i hau a'e i te nu'u atua, no te mea ei rima 'oia no Ta'aroa*" [Henry 1928:355]); that is, he was Ta'aroa's chief artisan in the fashioning of many primal entities. Tane also was accorded very high standing among Ta'aroa's creations—even higher than that accorded exalted Tumu (Foundation): "Tumu had little temples [marae]; [Ta'aroa saw to it that] Tane had great ones. Tumu had a few priests; Tane had many priests" (Henry 1928:398). Some writers viewed Tane and Ta'aroa as having been equals, as supreme deities of separate cults, comprising older or more recent immigrant populations, respectively. Even were this the case, however, the evidence at our disposal indicates far-reaching syncretism, with Ta'aroa accorded primal position.

'Oro, whose cult was dominant during the era under study, played a lesser role during the great epoch of creation than did many other *atua*, and he owes his subsequent exalted position to his identity with the Arioi sect and his close connections with Ra'iatea, the purported source of the highest-ranking kin-Titles held by humans.

After these deities somewhat weaker in effectiveness and usually more specialized in function, were innumerable *atua*, such as Hina (goddess of the moon as well as sometime spouse of Ta'aroa), Ro'o (fame, prestige, principal messenger of Tane), Hiro (god of thieves), Tipa (principal god of healing), and Ti'i (progenitor of mankind and principal god of sorcery).

Still less effective, and even more highly specialized, were the innumerable minor *atua*¹⁷ that rendered *pō*, the spirits' room (*piha*) of the universe, far more populous than *ao*, the room of mankind.¹⁸ These included localized spirits holding sway over specific areas of land and sea; tutelars of specific social units—territorial, kin, occupational, and so forth; familiars of individuals; patrons of events and of activities (e.g., childbearing, voyaging, tapa making, archery); and others.

In what shape or character, did the Maohis conceive of their *atua*? The answer to this intricate question is obscured by the nature of the evidence, which consists mainly of texts and of generalizations by ethnographically naïve or linguistically incompetent observers. With respect to textual evidence the universal problem of translation is complicated, in this case, by the terseness of expression and by the multiple references carried by some of the key words—all of which allow the translator wide latitude for felicitous phrasing, often at the expense of analysis. Consider, for example, the characterization of Ta'aroa given in one of the creation chants (dictated to Orsmond in 1822 and presumably translated by him):

Ta'aroa's natures were myriads; he was Ta'aroa above, Ta'aroa below,

Ta'aroa in stone. Ta'aroa was a god's house; his backbone was the ridgepole, his ribs were the supporters. These were Ta'aroa's (attributes):

Great-Ta'aroa, the Truth, Turner-of-the-earth, the Great-Ta'aroa who ended sins and evil, the Great-Ta'aroa Foundation, the Great-Ta'aroa of boundless glory, Ta'aroa of sure bidding, Ta'aroa of the clear sky, Ta'aroa who propagated, Ta'aroa who stood over the passage of the reef, Ta'aroa the extirpator, the great Ta'aroa whose curse was death. (Henry 1928:336)

On the basis of attributions such as the above (which are fairly typical of those recorded for other major deities), could one characterize the Maohi concept of this *atua* as "substantial" or "unsubstantial," as "spiritual" or "material"? With respect to mankind, the words *tino* and *vārua* corresponded fairly closely with the English words 'body' and 'soul', used contrastively. After death the *vārua* usually survived to become an individualized spirit called an *'oromātua*. Moreover, texts occasionally contain references to the acts of "good" or of "bad" *vārua*, and in some instances *atua* are described as having *vārua* of their own, but there is no evidence pointing to a belief that *atua* were in general like or identical with *vārua*-stuff.

In any event, all *atua* possessed (or consisted of) *mana* (power, might, influence [LMS Dictionary]) in large measure, along with the attribute of *ra'a* (sacredness):

E mana nui roa to te nu'u atua, E mata ra'a to te atua, E hou'u te ta'ata, e fatiou te mau ra'au, e oriorio, e mahe'ahē'a roa, e mimi'o ino to te fenua e to te moana i te mana o to'na rima, i te aho o to'na paoa ihu.

All the hosts of gods had great power. Their glance was holy. Man crouched, trees bent down, all on land and in the sea withered, grew pale, and shrank under the power of their hands, before the breath of their nostrils.

(Henry 1928:394)

However vague their conceptions may have been regarding the shape or matter of *atua* in their "natural" state, the Maohis entertained fairly clear-cut notions about how such spirits looked and acted when they were communicating with humans.

First and most directly, some *atua* seem to have been conceived of as existing "naturally" in some specific and visible form: for example, a shark, a giant eel, a large octopus, a huge rock. Second, some *atua* occasionally transformed themselves into certain characteristic forms—usually but not always zoomorphic. And third, all or most *atua* had the ability to possess (*uru i roto*, 'enter into') some object or animate being, including humans, and communicate with humans through the voices of mediums, or some other characteristic behavior.

In summary, there appear to have been three types of *atua* manifestations: say, permanent shark-gods, gods occasionally changed into sharks, and gods entered into sharks; this is one possible interpretation. In actuality, the Maohis themselves may have entertained less clear-cut distinctions than those I here propose. Linguistically, for example, they

have distinguished specifically two kinds of *atua* manifestations, *to'o* and *ata*. In addition, the term *nohora'a* (the sitting, seat) was also applied generally to places or objects where spirits occasionally stayed. *To'o* was the generic name for a type of fabricated and more or less anthropomorphic "image" into which an *atua*'s presence (*mehoi*) was occasionally invoked when it became necessary to communicate with it. In contrast, an *ata* was a natural object or being. The LMS Dictionary defines *ata* as "a cloud, a shadow"; according to Henry, however, the term also signified anything animate or inanimate that was regarded as "... an incarnation of a god that had been duly invoked to enter it" (1928:392). But Henry did not indicate who or what does the invoking; and the list of *ata* given by her includes all three of the types of *atua*-manifestations distinguished above—that is, *atua* in their "natural" forms, occasional *atua* transformations, and *atua* mediums—as well as ghosts.

In any case, it may be useful to list a few *ata* (out of the scores recorded in Henry's volume alone) that were regarded as embodiments of *atua*; such a list will provide more evidence of the extraordinary proliferation of Maohi "polytheism." I will begin with birds, listing first their names, then the *atua* associated with them, and then the special meaning, if any, attributed to their behavior:

Domestic rooster (*moa oni*), *ata* of Ruaitefa'atoa (Source-of-warriors). His voice crying from a valley was an ominous sign to warriors.

Light-yellow thrush (*'omama 'o-pua-fau*), *ata* of 'Oroitemarotea ('Oro in his manifestation of Warrior-of-the-yellow-girdle).

Darker-colored thrush (*'omana'o-uri*), *ata* of Tamatea (Blond-child), the god of salamanders.

Red-feathered duck (*mo'ora-ura*), *ata* of 'Orovehi'ura ('Oro in his manifestation of Red-feather-covered).

Wild duck (*mo'ora-ōviri*), *ata* of "sylvan elves."

Surf duck (*toroa*), *ata* of Hau, god of peace.

Vari-colored parakeet (*tāvae*), *ata* of Tu, god of stability.

Black parakeet (*tētē*, named for its cry, "tete"), *ata* of "artisan elves" of hills, which was its habitat.

Long-tailed, variegated parakeet (*tarara*, also named for its cry), *ata* of "artistic" sylvan elves.

Bird of paradise (*arevareva*), *ata* of Ta'aroa. When it cried "*oti'i, oti'i*," near people's houses, those who heard it would say, "*ta rua, ta rua*" (repeat, repeat), and if it did not do so, it was a sign that Ta'aroa was angry, and that the sick of the family would surely die. This bird is heard most often in rainy weather, and its cry prolonged thus, "*oti'i, oti'i, ti'i, ti'i, ti'i, ti'i*," is always indicative of the approach of rain.

Woodpecker (*ruro*), *ata* of Ra'a, god of sacredness in his manifestation

of Being-angry. Its typical behavior was to rob fowls of their feathers for its nest.

Black-feathered swallow (*'ope'a*), *ata* of the female *atua* of the air.

Reef egret (*'ōtu'u*), *ata* of Ru'anu'u (Source-of-armies). When anyone offended this bird, people's necks got twisted around so that the face looked behind.

Black-and-white speckled rail (*oā*), *ata* of Oāhivari (Blackness-fishing-in-mud), god of quagmire.

Tahitian rail (*meho*, hiding-in-bush), *ata* of Tu in his manifestation of moonlit sky. The *meho's* cry is "ho," which is the characteristic sound made by Tu.

Gray plover (*'uriti*), a denizen of river banks, *ata* of water gods.

"Whistling" plover (*torea*), *ata* of Temeharo, god of strangulation.

Common albatross (*putu, ruru*), an *ata* of Ta'aroa, especially on atolls. This bird was appealed to when canoes became swamped at sea.

Sooty albatross (*putu-minamu*), *ata* of Bordering-rock-of-canoes. It lived on dangerous reefs and warned canoes away from them.

White sea swallow (*pira'e-te'a*) *ata* of Tane-in-light. It protected people from accidents by, say, breaking their fall from trees. Also served as a messenger of peace.

Booby (*'euao*), *ata* of Tu in his manifestation of Smiter-of-the-sea. When this bird sat on a turbulent sea the waters became calm.

(Adapted from Henry 1928:384ff)

Thus every type of bird distinguished by the Maohis was the *ata* of some one or more *atua*. Similar kinds of association were attributed to nearly all other animate beings distinguished by the Maohis, and to many inanimate objects as well. In some cases the logic behind the association seems clear: for example, the rail that inhabited a swamp with the *atua* of that swamp; the booby seen resting on a calm sea surface with the *atua* who calmed the sea; the great spotted octopus (*fe'e*) with the *atua* who once held heaven and earth together; and the red-feathered bird with red-favoring 'Oro. In other cases however the data are insufficient or the logic behind the association is no longer clear—clear, that is, according to any principle of classification for which we now have the key. In some instances, all the individuals of an *ata*"species" seem to have been considered potential or actual embodiments of its *atua*, whereas in other instances only certain ones so qualified—for example, not *all* crabs but only those inhabiting marae (Henry 1928:392).

When an *ata* was believed to be in the state of actually embodying an *atua* it was of course accorded the attention and respect normally due the *atua*, regardless of the treatment ordinarily shown the *ata*. For example, the domesticated male pig was ordinarily shown anything but respect, but when one of them became possessed by 'Oro in the latter's man-slaying

role, a characteristic manifestation, people trembled and expected disaster to strike the land (Henry 1928:383). There were, however, certain *ata* accorded respect even when not so possessed; for example, such was the great spotted octopus, the *ata* of Tumu, although it may well be that this and similar *ata* were more or less permanently possessed by their *atua* or were their “natural” embodiments.

Some *ata*, like the *atua* they embodied, were accorded recognition, attention, and respect by people everywhere—for example, the frigate bird (*‘otaha*), *ata* of warrior ‘Oro. Others were sacrosanct, more or less, only to particular aggregates of people having special ties to the *atua* thus embodied; dragonflies, for example, were *ata* of Hiro, god of thieves, and when a thief entered a house for robbery he released a dragonfly which dazed the victims; or, in places where the purple cockles served to embody locally affiliated *atua*, people there avoided eating them for fear of death.¹⁹ Finally, some animals or objects served regularly to embody an individual’s own spirit-familiar, and usually the individual “... did not let another know what he or she had chosen as a medium of communication with a patron spirit, while the object chosen [the *ata*] became a sacred incumbrance to its worshipper” (Henry 1928:392).

The second major category of spirits consisted of ghosts (*‘oromātua*),²⁰ the active souls of deceased humans. (I am unable to discover whether the belief existed that animals, other than humans, ever survived in ghost form.) As we shall see, every human had a soul (*vārua*), which survived its body’s physical death at least for a time. But not all souls survived indefinitely; some were destroyed sooner or later after death. Of those that did survive indefinitely, some continued to exist in other realms and some reentered the realm of the living as ghosts.

In one passage, Henry wrote that souls released from “purgatory” became one of three types of ghosts: “good ghosts” that reentered their own skulls and watched continuously over the welfare of their surviving kin; “rambling ghosts” that took only occasional interest in the affairs of their surviving kin; and fierce “long-toothed ghosts” that were consistently malignant toward humans, kinsmen or otherwise (1928:201–202). In other contexts this same writer reported beliefs to the effect that some souls were transformed after death or entered into certain animals (also called *ata*); for example, persons drowned at sea, into sharks or dolphins, infants, into periwinkles. It is not clear, however, whether we are dealing here with different species of ghosts or with different kinds of classification—the latter based on form of ghostly embodiment and the former on mode of behavior.

Also, as in the case of *atua*, the distinction between ghost-become-animal (or other object), ghost-transformed (occasionally)-into-animal (or object), and ghost-entered (occasionally)-into-animal (or object), is not al-

ways clear; but as suggested earlier this kind of distinction may have been irrelevant, or at least unimportant, to the Maohis themselves.

In any case, ghosts were active participants in humans' lives. Generally speaking, they were less powerful and less versatile than gods, although there were certain 'oromātua more powerful than many of the lesser *atua*. Also, in general, ghosts tended more than gods to be directly concerned with everyday human affairs—for example, as tutelars of specific families, vengeful hunters of particular locales, or familiars of individual magicians. As family tutelars they often occupied their own skulls, which were kept by relatives after disposing of the rest of the body. As sorcerers' familiars they were induced to occupy small wooden or stone images called *tī'i* (fetcher; as distinct from *to'o*, the image-seat of a god).

Finally, I draw attention to the third major category of spirits recognized by the Maohis, the demigods (*atua-ta'ata*), to distinguish them from sky gods (*atua i te ra'i*). These popular myth personalities differed from sky *atua* in having been born mainly of human parents and in having lived their marvelous lives as humans, although they possessed many of the attributes of *atua*; characteristically, they won their most spectacular successes against sky *atua*. Some of them entered ultimately the pantheon of still-active *atua*, while others seem to have been regarded as beings only of the past.

Humans

With experience gained from the practice of embalming and from dismembering the bodies of sacrificial victims and slain enemies, the Maohis evidently possessed fairly detailed knowledge of human anatomy; but this did not extend to physiology. I have already noted their distinction between body (*tino*) and soul (*vārua*): the former invariably disintegrated after "death," the latter usually survived the body and unless specifically extirpated could go on existing forever. Most accounts placed the soul within the body during the waking state—dreams having constituted the experiences of the soul's wandering outside the body during sleep and trance. A contrary view, placing the soul normally outside the body, which it visited only during dreaming, is recorded in only one account (LMS Transactions: II, 126). Outside the body, the soul ordinarily assumed the appearance of its affiliated body, but it is not clear what it looked like or where it resided when within the body. It is recorded that the soul left the body by way of the cranium (Henry 1928:291), and some association with breath is indicated by a belief that the soul left the dying body through the mouth. Taken with the belief that the heir of a dying person could acquire some of the latter's knowledge by inhaling his expiring breath,²¹ this could signify either that knowledge was considered to be an attribute of the soul or that it was an independent entity.

In common with most other Polynesians, the Maohis treated the head

with much respect, but I am unable to find an explicitly stated rationale for this in Maohi terms. Certainly, the head was not the site of thought (*mana'o*) or emotions (*horuhoru*), both of which were located in the stomach (*ōpū*) and intestines (*'ā'au*) or, in a more general sense, in the vitals (*manava*).²²

A more puzzling problem is presented by the concept of *iho*, generally translated as the essence or nature of a thing or person (LMS Dictionary). For example, in connection with exuviae sorcery, the *tupu*, the tangible part of the victim's body—hair, nail parings, and the like—used by the sorcerer to lead his spirit accomplice to the victim, is said to contain some of the latter's *iho*. In various other usages *iho* can be translated as a general term for the reflexive: Teuru *iho* (Teuru himself); or for proximity: *piha iho* (beside, next to), *iho nei* (just now, lately); as well as “prime characteristic”: *iho ari'i* (the dignity and office of an *ari'i*); and even “individuality” or “soul”: in the myth of Fa'ahoutu recorded by Orsmond (Henry 1928:373) the *iho* of that deity's deceased infants reentered her womb in order to be reborn. Here, as in many other instances, the available evidence on Maohi beliefs does not permit us to distinguish between concrete reference and poetic metaphor.

The Maohis doubtless had suppositions about reproduction and physiology, but I can discover few explicit formulations about such matters. Verbally, *ōra* (life, health, to live) was used in opposition to *pohe* and *mate* (death, dead, sickness, injury); I suspect that the difference between these states was not merely a question of the presence or absence of the soul, but I am unable to find just what the difference was conceived to be.

Conception was believed to result mainly from sexual intercourse, but there is little information available concerning Maohi theories about the substances or processes involved, except possibly the notion about *iho* just described. Abortion was so widely practiced that the Maohis must have possessed fairly detailed knowledge of fetal anatomy, but no such information is recorded. Also, inasmuch as some prematurely born infants were considered to have had souls, it may be that the soul was believed to be present in the infant's body before birth; but ideas about the source of the soul and the time of its entry or development are not recorded. Complicating this issue is a puzzling statement from Henry, relating that a newborn infant “... was allowed to cry long and breathe freely so as to receive full life (*iho*) from its mother ...” before its cord was severed (1928:183). Moreover, in connection with infanticide, which was frequently practiced, if the infant “... survived until it had properly drawn its breath and opened its eyes, its life was spared, as it was then regarded as having its own *iho* (personality) and as having a claim on this life” (Henry 1928:275).

Whatever the nature and source of the individual's *vārua* and *iho*, once

these entities or attributes are present and the umbilicus severed the individual human is complete, although the cord and placenta, carefully hidden in the family marae, were believed to contain at least some of the individual's "essence" (Henry 1928:184).

Following birth, the infant and its mother were secluded, for reasons which will be discussed later. In any case, the restrictions surrounding a newborn child, and one or both of its parents, could be removed only by successive performances of a certain kind of rite, called *āmo'a*. In some instances these rites were concluded, and the principals thereby freed of ritual constraints, within a few months or years; in other instances the final freeing was deliberately postponed for many years.

Explicit Maohi formulations about the physical process of nurturance and maturation are nowhere recorded in the primary sources. Both sexes were tattooed, and boys were supercised at a time Westerners might associate with puberty, but I have failed to find any specifically Maohi explanations for this concurrence. In fact, I can discover little evidence of native statements regarding the course of life, except that in time people, like plants, simply fade and wither (*ōriorio*), unless spirits intervene.

Death (*pohe, mate*) was the condition characterized by the permanent departure of the soul and the rotting away of the softer parts of the body. Once the decay began it was believed that the process could never be reversed, although it was temporarily arrested in exceptional circumstances when the soul was allowed by spirits to return to the body. As long as there was any body remaining, however, there continued to be a link between it and the soul—for example, the skull became a "natural" medium for the soul when it returned to its earthly haunts; and, if an enemy obtained any portion of the bodily remains, he could use it to secure control over the departed soul, just as the sorcerer used exuviae to destroy a living victim. For these, reasons, together, possibly, with fear of "contamination," it was necessary to bury or hide the bodily remains out of the reach of malicious persons, and this included clothing and other things which were in close contact with the deceased. Some corpses were embalmed and thus preserved for a few months, but this I infer was done out of respect for the soul hovering nearby and not with any hope of preserving the vitality of the decaying body.

Spirits were capable of injuring or destroying humans either by damaging their bodies or by capturing or destroying their souls. A soul could be captured while it wandered outside the body during sleep; or it could be kidnapped from the body. To harm the body a spirit could enter it and damage its vitals by eating or piercing them; or a spirit could cause an accident or help guide an enemy's weapons.

Beliefs about the fate of a human's soul were exceedingly varied, but most of them revolved around a central set of themes in which the soul

journeyed to one of two kinds of afterworlds—a paradise or a limbo (via a purgatory). After a period in either of these places most souls became free to return on occasion to their mortal haunts, many of them to exercise influence, as ghosts (*'oromātua*), over human lives, especially over the lives of their surviving kinfolk.

Before leaving the topic of Maohi conceptions regarding the nature of mankind, I must underline once again the matter of the central importance of social cosmography, namely, the several points of similarity of identity between humans and spirits. While in the foregoing I have emphasized differences between the two species of beings, one should not lose sight of their many resemblances, not only in behavior but in their beginnings and endings as well. For example, in some myths the pedigrees of Maohi mankind as a whole, or of particular genetic lines, lead back uninterrupted to spirits. And many or most human souls become spirits after “death.” Moreover, the various kinds of social units into which the Maohis conceptually divided their society were composed of humans *and* spirits.

Social Groups

I noted in my preliminary remarks on Maohi settlement patterns the existence of households and neighborhoods, which constituted the most visible palpable kinds of enduring social groupings in the Islands. It can be said that the Maohis themselves accorded conceptual reality to households and neighborhood groupings—less perhaps to the former than to the latter—in terms not only of their living human members but of their spirit tutelars as well. In addition, the Maohis viewed themselves as belonging to several other kinds of social units—descent lines, kin-congregations, marriage classes, guilds, tribes, and less secular cults and sects.

There is evidence that the Maohis conceived of themselves, the indigenes of this archipelago, as constituting a distinctive segment of humanity. It is an open question how far beyond their own Islands they believed humanity to have extended, but certainly beyond the Western Tuamotus. The Maohis, who had fairly frequent contact with the inhabitants of the Western Tuamotus, considered themselves, as a people, distinctively superior to the latter in many ways. For example, in writing about some Tuamotuan castaways on Tahiti, Rodriguez noted: “They appear a somewhat timorous people, for they showed a lack of spirit even in their dances, and are not so animated as our natives, who therefore made fun of them and were for mimicking their slowness” (Corney 1919:134).

RELATIONS BETWEEN SPIRITS AND HUMANS

In the very vague sense in which the terms were used, it may be said that humans and spirits normally existed in different spheres, or “rooms”

(*piha*), of the universe—the former in the *pō*, the latter in the *ao*. Interaction between spirits and humans was however fairly frequent, and, in the suppositions of the Maohis both spirits and humans were members of the same society. One basic assumption underlying this interaction was that spirits and humans were impelled by the same appetites and guided by the same motives. Complicating this, however, was another equally basic assumption that spirits were more versatile, more mobile, and in general more powerful than humans and that they were (or possessed) more *ra'a*.

Sacredness and Similar Concepts

The differences between spirits and humans were perhaps best epitomized, conceptually, in the words *ra'a*, *mo'a*, *noa*, and *tapu*. To anyone versed in Polynesian ethnography these words or their near cognates will be familiar, and perhaps in connection with some Polynesian societies perfectly intelligible.²³ Unfortunately, their precise meanings in the language used by the Maohis cannot be reconstructed from the texts and translations now available. Having already noted the hazards involved in attempting to illuminate Maohi obscurities with data from, say, New Zealand or Hawaii or Rarotonga, I shall have to do what I can with these terms on the basis of the available local data and leave to others the pleasures of grander interpretations.

Mo'a and *ra'a* are used almost interchangeably in the sources in ways that imply both holy and sacred, although a small case might be made for *mo'a* being somewhat closer to holy in certain contexts.²⁴ In any case, in view of the well-nigh impossibility of separating and assigning meanings to *ra'a* and *mo'a* with any sharp degree of accuracy, throughout this book they will both be translated as *sacred*.

In this broad sense all spirits were sacred, as was everything in more or less direct association with spirits: the precincts and paraphernalia of marae,²⁵ all persons engaging in prayer and sacrifice, the cast-off trappings of *to'o*, the persons and names of holders of high-ranking kin-Titles (in view, probably, of their being in a more direct line of descent from the gods), and so forth. Spirits varied as widely in their degrees of sacredness as they did in their power, and so, respectively, did the things associated with spirits. For example, the god 'Oro (and his marae, rituals, images, etc.) was incomparably more sacred than any commoner's household tutelary spirit; the head of a kin-Titleholder's firstborn son was more sacred than that of a second-born. It may even be that the bodies of the incumbents of some high-ranking kin-Titles were more sacred than some lesser gods and ghosts, but in general spirits were more sacred than humans.

Due to unspecified mechanisms, it was generally dangerous for a human to be too near an entity having more sacredness (or being more sacred) than himself. It is not clear just how such effects were believed to

have been brought about, but it would be reasonable to assume some kind of direct spirit intervention. The belief, said to prevail in some Polynesian societies, that the sacred entities were imbued with a kind of pervasive supernatural “electricity” that in itself damaged less heavily “charged” individuals is an intriguing one to search for,²⁶ but I have found no reliable evidence for it in the sources on the Maohis.

By reason of the fact that entities were sacred and dangerous, they were also *tapu*, that is, restricted, dedicated to use in sacred ritual, set aside from normal uses. These glosses of *tapu* closely parallel meanings of the term in other Polynesian societies, but the Maohis used *tapu* in some other senses as well.²⁷ Moreover, they used another word, *rahui*, to denote the restrictions, usually spirit sanctioned, periodically laid on hogs, fruit, fish, and so forth, for conservation and other purposes. Because of the specific nature of these meanings, my practice throughout this book will be to use *tapu* and *rahui*, instead of attempting to translate them.

Entities lacking sacredness were *noa*—that is common, profane, or, as the term will be translated hereafter, secular. For example, women were secular to the extent that they were not allowed to enter enclosures of most marae. An exception was sometimes made in the case of women holding kin-Titles of very high rank. Also, during marriage ceremonies at family marae women were present but kept from direct contact with the marae’s courtyard by means of mats spread upon the ground. Most men were also in a condition of secularity most of the time, but could with appropriate ritual preparation enter sacred precincts and engage in sacred activities, at the conclusion of which it was sometimes necessary for them to divest themselves of sacredness before resuming normal occupations.

Some aspects of the distinction made by the Maohis between sacred and secular are indicated in a text describing the concluding episode of a major marae rite, wherein the presiding priest addressed the attending spirits in these words:

Dismissal! Grand dismissal to make ordinary [*noa*]!

Let sacredness [*tapu*] remain here [in the temple], that we become ordinary [*noa*].

Let holiness [*ra’a*] be thine, O god, let the priesthood hold the sanctification [*mo’a*] of the sovereign and congregation. We are now retiring to use our hands and become vile [*ha’aha’a*]: we shall do domestic work, wear flowers, paint ourselves yellow with *mati*, blow fire, curse, give each other blows, practise black art [sorcery], caress [make love], put on unconsecrated clothes [*ahu noa*], eat pork, cavalla fish, shark, bananas; and drink *ava*; look not upon us in anger for this, O god!

Remain thou here, in this holy place [*vahi mo’a*], turn thy face to Pô, look not upon the deeds of men. (Henry, 1928:172)

As noted above, it is clear from many conventions that sacredness was dangerous to persons in a state of secularity; food prepared in a marae was

unsafe for women, and a person engaged in sacred activities had to be fed by another lest the sacredness adhering to his hands render the food too sacred for his stomach. Conversely, secularity seems in some situations to have impaired sacredness; for example, if a woman touched a corpse destined for sacrifice to a god, the corpse was thereby rendered unsuitable for sacrifice.

Further examples of the conceptual antithesis, sacred (*ra'a/mo'a/tapu*)-secular (*noa*), will be given throughout this book, but now let us turn to some other words used by the Maohis in their references to spirit-human interaction. First, the word *mana* the LMS Dictionary translates quite straightforwardly as power, might, influence; powerful, mighty, affluent; to be in power, possess influence; but some other writers expand it into a major cosmological concept. Words approximating *mana*, which appear in many Oceanic languages, have proved to be among the most troublesome to translate. As Raymond Firth noted in his study of the word's meaning on Tikopia, some writers have lifted it out of its ethnographic context and transformed it into a "... technical term describing a specialized abstraction of the theoretical anthropologist," with little or no reference to its various native meanings (1940:487). Still other writers have extended its purported meaning in one native language to its occurrences in other languages, on the unproven assumption that it had much the same meaning elsewhere. Firth's compilation of the various generic translations indicates the range (1940:484):

The following selection from the various meanings (not all exclusive) that have been attributed to *mana* shows the confusion; it also illustrates the theoretical preconceptions of the various authors. *Mana* has been translated as:

- Supernatural power; influence (Codrington).
- Magical power; psychic force (Marett).
- Impersonal religious force; totemic principle (Durkheim).
- Divine force (Handy).
- Effective; miracle; authority; prestige, etc. (Tregear).
- True (Hocart).

I would not be so seriously concerned with this matter were it not for the practice of some writers on the Maohis to impute to their usages of *mana* meanings derived from other languages or from philosophical invention, even to the extent of employing such meanings as an explanatory principle for larger realms of belief and practice.

In actual practice, the word *mana* occurs infrequently in utterances attributable to the Maohis themselves. One of the few textual occurrences of the word that I can find is a precept which adjures the populace to treat their tribal council (*hiva*) with respect—its members being *e pupu mana*, that is, a group having legitimate authority, positive power, and so on (E. Salmon 1937:29). Somewhat similar in meaning (to me, at least) is the gen-

eral reference to rulers as *feia* (people) *mana*. Both these applications of *mana* to persons could imply political power or supernatural power or both. When used with reference to objects, however, the supernatural aspect of the word is more evident; for example, in a traditional account of an expedition from Ra'iatea to Tahiti, the canoe is described as having been "well laced and ornamented with sacred sennit [coconut fiber cordage], so that it was said to be possessed with great power or magnetism (*mana*)" (Henry 1928:129). Again, in a chant aimed at consecrating an adze prior to its fashioning a canoe hull, the canoe builders' tutelary spirits were asked to make the adze light in weight, to consecrate (*taputapu*) it, to impel (*tuitui*) it, to complete (*fa'aoti*) it, and to give power (*mana*) to it (Henry 1928:147).

I shall later say more about *mana*, particularly in connection with occupational skill, but I must confess here and now that my data are not sufficient to permit me to carry out the kind of analysis that Firth did on Tikopia, which alone can lead to credible translations of this intriguing set of cognates.

Still other Maohi words concerning interaction between spirits and humans are *repo* and *hara*. Tentatively they may be glossed as dirt/defilement, and error, respectively; but, as later passages will indicate, I have found it impossible to reach any credible precision in my translations of these words.

Omens, Auguries, and Dreams

Spirits communicated with humans in various ways: by their recognized effects upon events in general, through omens, through the winds rustling the leaves of certain trees, through the actions of their *ata*, through divinatory signs, through dreams, and through human mediums. Consideration of these various ways should throw light not only upon how spirits "spoke" to humans but also upon the question of how spirits required humans to behave.

First, spirits communicated with humans through means of their recognized effects upon events in general. Bodily injury or illness was almost invariably interpreted as a sign that spirits were displeased with the victims; and similarly with crop failures, storm damage, defeat in warfare, and so forth. In fact, nearly all of life's failures—and conversely, its successes—were influenced by spirits and signified either their disapproval or approval of human actions or omissions.

Some omens explicitly constituted messages from spirits to humans. As Henry (1928) showed, for example: "A comet was supposed to be a god forerunning war or sickness" (p. 227); "Heavy rain [during a certain ceremony] was supposed to show displeasure of that god [Ra'a], and no rain was considered ominous of some approaching evil, which in either case, the priests endeavored to ward off by prayer" (p. 160). Henry

recorded numerous other “omens” which related to interactions of men, although one may assume that the “messages” in question were transmitted by spirits, for example: “If a man was caught in a whirlwind, it showed that the king had sealed his fate for [sacrifice]” (p. 227); and “A cold hand or nose was an omen of approaching war” (p. 227).

Trees especially favored by spirits for communicating with humans were the *tamanu* (*Calophyllum inophyllum*), *miro* (*Thespesia populnea*), and ‘*aito* (*Casuarina equisetifolia*). These trees grew in many settings and were used for a number of ordinary, secular purposes; but those mainly regarded as spirit-mediums were the ones growing within marae precincts. When the leaves of the latter were heard to rustle, it was taken as a sign that one or more spirits were present, but it is not clear from the evidence available whether such rustling was interpreted as assent or dissent to questions asked the spirits, or as auspicious or unfavorable omens for events to come.

Spirits embodied in their *ata* communicated with humans by sounds or other movements characteristic of the creature or object in its natural form. Presumably any human was capable of hearing or seeing these messages, although special knowledge was required to interpret their meanings.

Interpreting the messages of spirits through what might be called experimental divination also required specialized knowledge. Animals were killed for this purpose and messages were interpreted from their manner of dying or from their appearance immediately after death. In the case of a pig, for example, the Maohi considered it an ill-omen if its backbone were found to be defective or if its ears stood up straight (de Bovis 1909:55). Divining by means of an animal’s entrails was more complicated:

By this time, the pig, that had been killed, was cleaned, and the entrails taken out. These happened to have a considerable share of those convulsive motions, which often appear, in different parts, after an animal is killed; and this was considered by the spectators as a very favourable omen to the expedition, on account of which the sacrifices had been offered. After being exposed for some time, that those who chose, might examine their appearances, the entrails were carried to the priests, and laid down before them. While one of their number prayed, another inspected the entrails more narrowly, and kept turning them gently with a stick. When they had been sufficiently examined, they were thrown into the fire and left to consume. (Cook 1784:38)

De Bovis asserted that animals used for divining were afterwards thrown away outside the marae as rubbish, but this is unlikely on grounds of their sacredness, and is moreover denied in reports by other writers.

Human offerings also served for divinatory purposes, but nothing is reported concerning the signs interpreted.

Another method of experimental divination reported in the sources concerned coconuts:

They had also a singular method of cutting a cocoa-nut, and, by minutely examin-

ing its parts, of ascertaining their portentous indications. These ceremonies were generally practised in the temple.

There were others, however, performed elsewhere, as the *patu*, which consisted in dividing a ripe cocoa-nut into two equal parts, taking the half opposite to that to which the stalk was attached, and proceeding with it in a canoe to some distance from the shore; here the priest offered his prayers; and then placing the cocoa-nut in the sea, continuing his prayers, and narrowly watching its descent, he thereby pretended to ascertain the result of any measures in which those by whom he was employed were interested. The *patu* was frequently resorted to while negotiations for peace were carried on between parties who had been engaged in war. Divination was employed to discover the cause or author of sickness, or to ascertain the fate of a fleet or a canoe that might have commenced a distant or hazardous voyage. (Ellis 1829:II, 239-240)²⁸

Spirits communicated with humans in dreams by revealing their wishes or information to a sleeper's conscious soul while the soul was either stationary, in the sleeper's body, or wandering around outside it. At times the revelation was deliberately sought after by the human, at other times it came about unsolicited and unexpectedly. Any individual was capable of receiving such dream-revelations, but there were a few for whom serving one or several spirits was a regular profession:

... they have an equal confidence in dreams, which they suppose to be communications either from their God, or from the spirits of their departed friends, enabling those favoured with them to foretell future events; but this kind of knowledge is confined to particular people.... Amongst them, however, the dreamers possess a reputation little inferior to that of their inspired priests and priestesses.... (Cook 1784:166)

There were several different ways by which the gods communicated their answers [to humans' questions] or their wishes, but the most common way was in the form of dreams experienced [by humans] while asleep in *marae*. (Moerenhout 1837:I, 513)

Images and Talismans

The "images" through which spirits interacted with humans were of two fairly distinct types. *Ti'i* (fetcher) was the usual label for those in which spirits sojourned more or less continuously to perform services for their human patrons, whereas *to'o* were those into which spirits were occasionally invoked for purposes of more general worship; insofar as the former spirits were mainly ghosts and the latter mainly gods this distinction also applies to *ti'i* and *to'o* respectively, although there were exceptions.²⁹

Ti'i spirits served mainly as agents for sorcerers or diviners, or as protectors of their human associates. An individual desiring the services of a *ti'i* spirit first carved, or commissioned the carving of, an anthropomorphic image in wood or stone, and then by verbal petition and tangible offering, persuaded a spirit to enter it (figs 3-1 through 3-3). In some cases the receptacle used for this purpose was the skull of the spirit (ghost) thus invoked. The relationship established consisted of an exchange of goods: the spirit carried

out instructions from the human in return for tangible offerings, respectful handling, and periodic refurbishing, and remained in service as long as these were forthcoming. Moreover, not only could humans institute and maintain this kind of relationship with a spirit but they could also terminate the relationship on their own initiative by disposing of the image (or skull).

Sorcery was the principal kind of service performed by *ti'i* spirits, and the most common techniques used by them in such undertakings was to capture the intended victim's soul or to enter his body and destroy his vitals. Some forms of blame-fixing divination were also carried out by means of *ti'i* spirits, who were commissioned to capture and reveal to the diviner the identity of the culprit. In addition, many *ti'i* spirits had "standing orders" to protect their human associates' property and persons, usually by harming any malefactor. Noteworthy in this regard were the *ti'i* spirits sojourning in single or multiple images set up along territorial boundaries or near the residences of eminent persons.

*To'o*³⁰ were in general larger than *ti'i*. They were made of wood or stone or wickerwork, and, although most of them appear to have been anthropomorphic or zoomorphic, a few—including some of those harboring principal gods—were mere cylinders of wood or wickerwork. Henry implied a terminological distinction between wooden statues, *to'o*, and those made of wickerwork, *huamanu* (1928:153); but the LMS Dictionary translated *huamanu* as "a bunch of red feathers taken to an artificer when a canoe was to be built." In this connection, Cook described a figure seen by him which *may* have been a god-image but seems also to have been used as a representation in connection with more secular dramatic performances: "From hence we proceeded farther and met with a very extraordinary curiosity call'd Mahuwe and said by the Natives to be used in their Heiva's or publick entertainments, probably as punch is in a Puppet Show. It was the figure of a man...." (Beaglehole 1955:111-112.) Banks, in describing this same figure, wrote that "... it was the only one of the kind in Otahite" (Beaglehole 1962:I, 302).

A prominent, even indispensable, part of the equipment of a *to'o* consisted of red and yellow feathers. The feathers were either attached to the exterior of the *to'o* or kept in recesses inside. According to Moerenhout the reason *to'o* were less realistically anthropomorphic—in fact, in some instances, not even intended to be anthropomorphic—is that it was the feathers attached to such *to'o* and not the *to'o* themselves that served as "the true emblems of divinity" (1837:I, 471). In April 1792 Bligh witnessed a sacrifice dedicated to the god 'Oro and utilizing an "image" of that god: "The Red Bundle [embodying] their Etuah [*atua*] (which they called Oro) was nothing more than a number of Yellow and Red feathers, and four rolls about 18 inches long platted over with Cocoa Nutt fibres, to which they gave the Name of some inferior Deities" (1792:138). One meaning that may be

inferred from this somewhat obscure passage is that the 'Oro "image" in question consisted entirely of feathers. Feathers were also attached to *ti'i* images, or used independently of images. In fact, so important were feathers in spirit-human interaction that they require additional comment.

The red head-feathers of the green parakeet (*Cyanoramphus zealandicus*) (Beaglehole 1961:411) and, to a slightly less degree, certain yellow feathers were the most highly treasured objects in use among the ancient Maohis. Some indication of the demand for them is contained in the journals of early European visitors:

When we were at Amsterdam [Tongatapu Island, Tonga], among other Curiosities we Collected some red Parrot Feathers which were highly Valued by these people; When this came to be known in the isle [of Tahiti] all the Principal people of both Sex endeavour'd by every means in their power to Ingratiate themselves into our favour in order to obtain these Valuable Jewels by bring(ing) us Hogs and every other thing the Island produced, and generally for Tiyo (Friendship) but they always took care to let us know that Oora (red Feathers) were to be a part of the return we were to make. (Beaglehole 1961:382-383)

So very solicitous & zealously desirous are our good friends here for the attaining of these red Feathers and so thoroughly convinc'd of their efficacy with their Sovereign Deities that they will very cheerfully oblige us in good natur'd but rather unhallow'd rites for the possession of them to render back religious Ceremonies by way of Propitiation to their Jolly Gods. (Clerke, in Beaglehole 1961:383n)³¹

Feathers were used in a variety of ways, which will in due course be listed, but underlying all these uses was the belief that feathers were highly valued by the spirits themselves. Why they were so highly regarded is not entirely clear, but it is at least suggestive that Ta'aroa himself was originally covered with feathers, which he used for clothing the newly made earth in trees, shrubs, and creepers (Henry 1928:339). Indeed, it might almost seem that feathers independently, inherently partook of some of the attribute of sacredness; but Moerenhout asserted that they first had to be consecrated by gods in marae rites (1837:I, 472-473).

Once consecrated, feathers were an almost invariable item in the equipment needed for prayer. In one respect it appears that they were considered the principal means for attracting the attention of spirits to the business at hand. This was accomplished by holding up the feathers in full view. In another respect they served to transmit, by contact, some of the spirits' sacredness to entities requiring consecration. Either a single feather was used for these purposes, or a bunch of them bound together by sennit, or clusters tied to sticks of wood (Bligh 1792:173). When not in use, such feathers were ordinarily kept in bamboo containers. Moerenhout and Cook wrote as follows concerning some of their uses:

These feathers they make up in little bunches consisting of eight or ten and fix them to the end of a small cord about three or four Inches long, which is made of the strong out side fibers of the Cooanut, twisted so hard that it is like a piece

of twisted wire and serves as a handle to the bunch. Thus prepared they are used as Symbols of the Eatua's [*atua*] or Divinities in all their religious ceremonies. I have very often seen them hold one of these bunches and some times only two or three feathers between the fore finger and thumb and say a prayer, not one word of which I could ever understand. (Beaglehole 1961:411)

... threatened by danger of some kind they hasten to seek them, believing that their presence would suffice as a guarantee of the aid; and at sea, when a storm is approaching, they hold them toward the horizon from which the storm is coming, and order it to retire, either in the name of these emblems, or in the name of the divinities which they represent. (Moerenhout 1837:I, 474, as translated by E.S.C. Handy 1927:126)

The greatest concentration of sacred feathers was in the form of feather girdles (*maro*), consisting of long belts of thread-strengthened tapa to which were attached hundreds of feathers. The largest girdle reported in the sources was twenty-one feet long and six inches wide, and probably contained thousands of rare feathers (Henry 1928:189). Such girdles were owned by chiefly dynasties and were emblematic of the society's highest-ranking kin-Titles, whose incumbents were thus nearly godlike in sacredness.

It must be left to imagination to reconstruct how the hundreds of *to'o* came to be created, for evidence in this matter is slim. Presumably the fabrication and consecration of socially important *to'o* for the major gods were commissioned by individuals holding high-ranking kin-Titles who were desirous of gaining additional spirit reinforcements. In other cases the *to'o* of a minor spirit (and of a politically unimportant social unit) would have waxed in ritual importance along with the political fortunes of its congregation, and thereby required a more imposing shell and outer trappings. A third type of development, reported by Ellis (1829:II, 205-206), was that followed by some owners of sacred feathers who, if the spirit (or spirits) invoked by their feathers were consistent in responding favorably to their prayers, honored the spirit by providing a *to'o* to encase the feathers—and perhaps even a small god house for the *to'o* as well.

Ellis also provided a revealing account of his conversations with a *to'o* carver (*tahu'a tarai to'o*):

I had repeated conversations with a *tahua-tarai-too*, a maker of gods, whom I met with on a visit to Raiatea. As he appeared a serious inquirer after truth, and I could place some confidence in what he related. I was anxious to know his own opinion as to the idols it had been his business to make,—whether he really believed they were the powerful beings which the natives supposed; and if so, what constituted their great power over the other parts of the tree from which they were hewn? He assured me, that although at times he thought it was all deception, and only practised his trade to obtain the property he received for his work; yet at other times he really thought the gods he himself had made, were powerful beings. It was not, he said, from the alteration his tools had effected in the appearance of the wood, or the carving with which they were ornamented, but because they had been taken to the temple, and were filled with the *atua*, that they became so powerful. (1829:II, 204)

Some *to'o* were kept in dwellings but most of them (in contrast to *ti'i*) were deposited in marae, where they were stored in shelters (*fare ia manaha* 'house of sacred treasures')³² along with other sacred paraphernalia, such as drums and conches. Marae attendants occasionally slept in these shelters. Important *to'o* were kept within these shelters in small god houses (*fare atua*) of their own:

Ta'aroa made the first *fare-atua* (god's house or ark) out of his own body, which he easily replaced with another body for himself. This *fare-atua* was supposed to have been the model for the house of a god for all time. It was a neat little ark made of sacred polished wood, with arched roof covered with *fara* [pandanus] thatch, square at each end and having a level floor. Its dimensions were about four feet long, two and a half feet wide, and three feet high, varying in size according to the form of the god that was placed in it. One end was closed. The other end had a circular entrance for the god, with a close-fitting stopper of sacred cloth. To this ark were attached cords of sacred sennit, which were passed under it to either side, forming a loop at each corner, through which polished poles of miro wood were passed that extended far enough for two men at each end to bear upon their shoulders. The ark containing the god rested between. In the same manner, the Israelites carried their Ark of the Covenant. This little house was placed in a recess in the *fare-ia-manaha* upon a stand about four feet high, supported with four curved and nicely carved, polished legs, forming two arches. (Henry 1928:136)

Henry went on to say that each god house was named after some attribute of its *to'o*'s god: for example, the Bed of the Lord Ta'aroa, the Bed of Tane in Bird's Down (1928:136).

On occasions when the *to'o* of a major god was transported away from its home marae, to participate in a grand ceremony or to reinforce its devotees in battle, it was placed in its god house on its own specially built and consecrated canoe, *va'a-roa-i-te-mata'i* (long-canoe-in-the-wind). Such canoes usually had elevated prows and sterns decorated with high-relief *ti'i* figures (receptacles, probably, for guard-of-honor spirits) and were otherwise embellished and supernaturally strengthened with feathers and pennants.

There were several methods used for inducing a god to enter its *to'o*. One was to summon it verbally, usually by means of a series of loud cries: *ho! ho! ho! ho!* Since spirits often traveled on winds, another method was to fan the air vigorously. But for more formal occasions involving major gods the usual practice was to send spirit messengers to invite them. For every major god there was one or more of such messengers (*arere*), and the important marae usually contained a number of statues, *to'o* or *ti'i*, where such messengers sojourned. In addition, the inducement to any such summons was occasionally enhanced by offerings of pigs, dogs, fish, or best of all a human; the ghost of the sacrificed creature was thereby commissioned to invite the gods to enter their *to'o* and partake of the feast provided by the creature's own body.

According to Moerenhout, on occasions like the ones just described,

the most usual forms in which gods voiced their responses to humans' queries were by the cries of the birds and by the wind's rustling of leaves (1837:I, 513–514).

In the case of the major gods, when their immediate collaboration was no longer required it was necessary to dismiss them, in order to free (*fa'anoa* 'render secular') a place and its people from the dangers and restrictions resulting from such close proximity with the gods' sacredness (*ra'a*).

In order to maintain *to'o* (and possibly some *ti'i* as well) as suitable habitations for their spirit sojourners it was essential that they be reconsecrated periodically in special ceremonies, called *paiatua*, which will be described below.

Finally, as in the case of *ti'i*, it was possible to dissociate oneself from an unsatisfactory god, by discarding its *to'o*:

When members of a family were stricken with long, protracted illness and with death and the prayers for their recovery to the gods (or goddesses) of their ancestral marae proved ineffectual, the family would hold counsel together and say, "This god is no longer helping us; he is a man-devouring god. Let us cast him off and seek the favor of another deity!"

Then the officiating family priest or head of the family, as the case might have been, according to the rank of the family, would go to the marae to cast off the god (*pô'ara'a tu i te atua*), saying:

Tera te po'a, te po'a tu nei au ia 'oe!
Eiaha 'oe e uru fa'ahou mai i roto iau nei;
eiaha vau ei nohora'a fa'ahou no 'oe; eiaha
vau e 'ite fa'ahou ia 'oe; eiaha 'oe e 'ite
fa'ahou mai iau. E haere 'oe e 'imi e atu i te
tahi taura no 'oe, i te tahi utu'afare e atu.
Eiaha vau eiaha roa! Ua poihi vau ia 'oe—ua
ri'ari'a a'era vau ia 'oe! Te va atu nei au ia
'oe. E haere roa 'oe i te Vai-tu-pô, i te aro o
Ta'arua, to 'oe na metua, Ta'arua te metua
o te mau atua 'atoa. Eiaha 'oe e ho'i fa'ahou
mai iau nei. Inaha te huia, te pohepohe nei i
te ma'i; te rave hia nei e 'oe, e atua ri'ari'a
roa 'oe e te 'ai ta'ata!

There is casting off, I am casting thee
off! Do not come in to possess me again;
let me not be a seat for thee again! let me
not know thee again; do thou not know me
again. Go and seek some other medium for
thyself in another home. Let it not be me,
not at all! I am wearied of thee—I am terri-
fied with thee! I am expelling thee. Go even
to the Vai-tu-po (River-in-darkness), into the
presence of Ta'arua, thy father, Ta'arua, the
father of all gods. Return not again to me.
Behold the family, they are stricken with
sickness; thou art taking them, thou art a
terrible man-devouring god!

After this proceeding, another god was chosen to take his place, and so on, until the evil in the family ceased. A new image to represent the new god was made and inaugurated at the first *pa'i-atua* that followed the event. If the priest or family imagined themselves haunted by the discarded god, in dreams or otherwise, the image was removed from its grave to a new one and if necessary moved again and again until the minds of those interested were set at rest. (Henry 1928:178)

Human Oracles

The inspiration of prophets is the main pillar of religion; if this were overthrown the whole system would fall. (Davies, Journal, 10 December 1808, LMS Archives).

Perhaps the most direct procedure used by spirits to communicate with

humans was that of possession (*uruhia*), that is, actually entering into a human's body and speaking with his voice. Such spirit-possession varied greatly in duration and in degree of involvement. At one extreme was the momentary visitation manifested by the involuntary shout of some individual at, say, a wake or a marae ritual. At the other extreme was the example provided by a few individuals who were so frequently and exclusively possessed by some spirit or another as to be identified continuously with the spirit itself; such a one was Etari, whom Cook described as follows:

After the Ship was Moored Omai and I went a Shore to pay a visit to a man which he said was the God of Bolabola [Porapora]: we found him seated under one of those small Awnings they carry in their traveling Canoes; he was an elderly man and had lost the use of his legs so that he was carried from place to place on a ha(n)d barrow. Some call'd him Olla, the same name as the God of Bolabola, but his proper name was Etary. From Omai's account of this Man I expected to have seen him adored as a God, but excepting some young Plantain trees laying before him and upon the Awning, I saw nothing by which he might be distinguished from other Chiefs. Omai presented him with a small tuft of red feathers tied to the end of a small stick and after a little conversation on indifferent matters, Omiais attention was drawn to an old Woman the Sister of his Mother (Beaglehole 1967:188).

According to Moerenhout there were several individuals identified with spirits:

There were always in all these islands certain individuals who represented or personified the gods. In some instances it was a leading chief, or even the paramount himself who acted as such, but more usually it was a priest or a sub-chief, or even a person of little consequence—for social status did not have much bearing on who should be a [god's oracle]. (Moerenhout 1837:I, 479)

Ellis, in a brief statement, claimed that idiots "... were always considered as inspired" (1829:II, 193), but this is the only direct reference I have been able to discover to this identification.

In between these extremes there were numerous individuals—mainly males, but some females as well—who became possessed often enough to serve as professional oracles, or *taura*. These specialists were known also as *tahu'a atua* to differentiate them from *tahu'a pure* (prayer specialists). Morrison gave a vivid account of the behavior of a *taura* asked to divine some spirit's knowledge, advice, or prediction:

When they are Consulted with respect to the Event of War &c. they dress themselves in a fantastical form and decorate themselves with Red and Black Feathers, of which they suppose the Deity to be imoderately fond as he always makes use of Birds when he decends on earth and having his Head bound with Rowavva [*rau'ava*, kava leaves] he goes into a close place screend in near the Morai for that purpose, or into some thick bush where he remains a few Minutes, and comes out sneezing two or three times, when he begins to look wild, his eyes staring, and his

body distorted into many forms and in a moment he seems to have undergone a most amazing Change—these postures they attribute to the contest between their own soul, and that of the Deity endeavoring to take its habitation which it at last effects and they appear as if stupid and do not know any person. His Colleague, who is Generally a Tahowwa [*tahu'a*, or probably *tahu'a pure*], then Compliments him by the Name of the Deity which he professes to be inspired with, and asks him such questions as he or the party Concerned wish to have Answered & he returns him answers in a low squeaking tone of voice and makes large demands of the Party Concerned but should he be questioned while struggling with the Deity he sometimes utters half sentences in a Curious Manner as if both souls endeavoured to speak at the same time and sometimes speaks with his natural, and sometimes in a Squeaking Voice—When the Spirit leaves him he begins to Gape and Yawn and often falls backward with a loud shriek and lays speechless some Minutes, when he awakes as if from a sleep and his body being reoccupied by his own Soul He resumes his own voice, and seems to know nothing of what has passed, he Generally times it at the flight of one of the Birds from the Morai and his Colleague does not forget to inform him of what Demands the Deity has made & those Concerned seldom fail to furnish him with every thing he required, if they have it, or Can by any Means get it. (Morrison 1935:181-182)

The “large demands” made by the *taura* of his client evidently referred to offerings to be made to the spirit—including, probably, some compensation for the *taura* himself.

Ellis, writing decades later (and in less picturesque English) corroborated Morrison’s account and added some details:

As soon as the god was supposed to have entered the priest, the latter became violently agitated, and worked himself up to the highest pitch of apparent frenzy, the muscles of the limbs seemed convulsed, the body swelled, the countenance became terrific, the features distorted, and the eyes wild and strained. In this state he often rolled on the earth, foaming at the mouth, as if labouring under the influence of the divinity by whom he was possessed, and, in shrill cries, and violent and often indistinct sounds, revealed the will of the god. The priests, who were attending, and versed in the mysteries, received, and reported to the people, the declarations which had been thus received.

When the priest had uttered the response of the oracle, the violent paroxysm gradually subsided, and comparative composure ensued. The god did not, however, always leave him as soon as the communication had been made. Sometimes the same *taura*, or priest, continued for two or three days possessed by the spirit or deity; a piece of peculiar native cloth, worn round one arm, was an indication of inspiration, or of the indwelling of the god in the individual who wore it.^[33] The acts of the man during this period were considered as those of the god, and hence the greatest attention was paid to his expressions, and the whole of his deportment. (Ellis 1829:II, 235-236)

Another account, by the missionary Davies, writing about Huahine, reveals the material side of a “prophet’s” message:

Two canoes ... from Raiatea ... In one of them there is a Prophet of the god Tane, in the course of the day he was inspired, ran to the Sea, & sat down in the Water some distance from the Shore, where he declared to the peo-

ple, who assembled on the Shore in great numbers, that he was going to Taheete. (Journal, 3 December 1808, LMS Archives)

The house of the god Hoata which is to be built in a marae close by us is going on & the work stopped of ours. In the evening there were prayers in the Marae & offerings made to Oro, Tane &c & the prophet of Tane mentioned Dec 3rd was again inspired, he said, speaking in the name of Tane, that he had been at Taheete & that there was War there. Pomare being so apprehensive of danger that he went on board the boat out at sea to sleep every night, in the day returning on shore. How far the god is telling the truth remains to be proved, he has been absent near a week most of which time he spent as it is supposed at Taheete viewing the state of affairs there. (9 December 1808)

... The people here are more superstitious than the Taheiteans and more exact in the observance of religious ceremonies, & the injunctions of the prophets. Four at least of these are present in our neighborhood, Viz. 2 of Tane, 1 of Oro who has his hand wrapt in cloth, like Metea in Taheite whenever he pretends to inspiration, & another prophet of Tohu a shark god. This morning most of the people of the island were assembled at a Marae near our dwelling making prayers and offerings to the god. Arepaea gave 2 large hogs to a prophet of Tane, who is also a priest in order that he might pray for his recovery, & that the god might make known by the prophet the crime for which he is affected. The other prophet of Tane & the prophet of Oro were inspired in the course of the day, the contents of their Oracles were that more offerings are to be made to the gods, canoes & houses built, crimes atoned for by offerings of hogs, cloth &c &c. The people seem to exult in the multitude of their Prophets & the certainty they have of knowing the will of their gods. (10 December 1808)

Ariipaea [a prominent chief] taken ill again, from drinking new spirits made from the Ti root. He knows it makes him ill, but persists in drinking it, & has had a quantity made here two or three times by means of a worm & pot he and Edea brought from Tanete. Arapaes's illness as usual set the priest to Work, many prayers were made to Oro, Tane, Tapa &c. many plantains were placed about the house where he lay, & others were carried about by the Priests some were taken to the Marae & also 2 or 3 pigs who were made to squeal loudly that the attention of the gods if possible might be attracted, the sacred Drums were also beating at the same time. While these things were transacting the prophet of Tane mentioned Dec. 3 was inspired he was first seized with strange convulsions, he trembled greatly shook himself, ran out of the house where Arepaea was, stooped to the ground put his head & shoulders under the end of a small Canoe that was near at hand rising it up & shaking it and at the same time grunting and groaning with all his might, after remaining so for a while he came out from under the Canoe took his right hand & struck vehemently upon his breast several times, then did the same with his left, he then fell to the ground tore it with his hands taking up handfuls of earth & throwing them down again. All this while he did not speak one articulate word, but at last he became more composed & the Oracle came out, he spoke in the name of Tane & as Tane himself, mentioned Arepaeas illness called him an ungovernable son blamed his conduct in several instances, particularly his not being so generous & liberal as he ought in giving hogs &c for the gods & the delay that had occurred in building the gods house, & in ambiguous terms said what was looked upon as a promise of his recovery, however

he admonished him & the other Chiefs to be more punctual in the performance of prayers, offerings & other religious ceremonies, & to leave this part of the island with the Uru &c. for the gods & the Priests. Soon after another Prophet was inspired but the particulars we have not learned. (13 January 1809)

According to Henry and Moerenhout, individuals so possessed manifested some remarkable changes in their own behavior:

Under the influence of spirits they delivered messages to the people (most of which were so ambiguous that they could be understood in diverse ways) and became so strong that they could do things impossible to them at other times. During these spells they wore a strip of sacred cloth round the left arm, as a sign that they must not be disturbed. Kings Pomare II and Tamatoa III and the early missionaries testified to having seen priests while possessed in this way thrust hand and arm up to the shoulder, without injury, into the solid ground of hardtrodden pathways. They foamed at the mouth, had their eyeballs distorted and their limbs convulsed, and uttered hideous shrieks and ejaculations. Captain Henry once saw a priest, after making such a display take hold of a great canoe, which ordinarily required three or four men to launch, push it into the water, and set it adrift with great ease. The man then plunged into the sea, held his head under water for a long time, and then sat up among the waves and delivered his prophecies. While under a spell the priest could ask for whatever he wished and obtain it, even to the wife of the king, as it was a god that was supposed to speak. When thus possessed, the priest was said to be *auti*he. (Henry 1928:152-153)

Many instances could be cited of individuals who behaved most extraordinarily when so possessed—individuals who though having previously shown neither talent nor eloquence, spoke forth during their seizures with relevance and spontaneity and about the most crucial of matters. Moreover, the things they spoke about included topics of great delicacy and difficulty, such as one would suppose to be totally strange to them; and their manner of speaking on such occasions was not only often fluent, but was also usually couched in the kind of figurative and hyperbolic style normally used only by chiefs and orators who had practiced it since infancy.

But then, immediately upon their release from the seizures which occasioned these extraordinary displays of eloquence, etc., the latter also ceased. Thus, if we may believe several eye-witnesses of such episodes, those individuals who while “possessed” and in battle had carried out great feats of bravery or wisdom or eloquence seemed to lose such abilities quite suddenly upon coming out of their seizures, and thereafter gave no evidence of possessing them until “possessed” again. I leave it to the physiologists to try to explain this strange anomaly—although I very much doubt that the state of their science is advanced enough to permit them to give a satisfactory explanation. (Moerenhout 1837:I, 483-484)

However Moerenhout’s “physiologists” might have explained this phenomenon, it seems quite clear, from an abundance of evidence, that the messages of many *taura* were accorded the credibility appropriate to the pronouncements of the spirits themselves—varying of course with the status of the spirit:

... some [*taura*] pretend to belong to the particular deity, others to many: such as claim acquaintance with the three superior eatōoas [*atua*] are the most conse-

quential, and procure high reverence from the part they presume to act; indeed they do it with so much cunning and address, that the Swedes whom we found on the island, as well as the mariners who preceded them, really believed the appearances supernatural, and that the devil actually was the agent. (Wilson 1799:337)

When the spirit was a powerful one, then:

Whatever order was given, it was obeyed almost always in the field, without anyone, even the chiefs, daring to oppose it. At the request of the gods the people were seen running spontaneously to arms, setting the pace for the rulers in spite of them, waging war against some district without the slightest provocation, and committing on the enemy territory excesses which could not be justified by the rules of war, believing in all good faith, to be obeying the Divinity, which quite probably was only a blind instrument of the animosity and the vengeance of the priests or the inspired one. (Moerenhout 1837:I, 483)

With all its powers and privileges, however, the professional practice of a *taura* was not without its risks—especially those deriving from repeated failure of prophecy, or from oracular statements unfavorable to more powerful individuals. It appears however that the more durable *taura* were able to rationalize their occasional failures in one of two ways: by subsequently “discovering” that the god in question had changed his mind, or by expressing the message in terms ambiguous enough to permit a variety of interpretations.³⁴

In all the foregoing, emphasis has been on how spirits communicated with humans. Some indication has also been given concerning what was communicated, for example, information concerning future events and indication that certain past actions had been wrong. This raises still other questions concerning the relationship between spirits and humans: for example, To what degree were spirits omniscient? To what extent were events, including human actions, controlled by spirits?

The evidence on these large questions is fragmentary and inconsistent. It can be said at the outset that the above questions cannot be answered on the basis of available data; for one thing, they are greatly complicated by the issue of magic, which will be discussed later on. Somewhat more manageable are the corollary questions: What behavior did spirits require of humans and how were such norms made known? By what means did spirits enforce behavior desired by them? Some of the situations and procedures just listed provide evidence bearing on these questions, and more will be presented in the pages to follow; but next will be described the procedures whereby humans communicated their thoughts and wishes to spirits.

Prayer and Offering

Communications from humans to spirits consisted mainly of asking for something. Even rites of thanksgiving were conducted in a spirit of payment for past services, and of insurance for future ones. Having asserted that,

however, the question should again be raised concerning the mechanism of such communications—that is, what proportion, if any, of these acts were conceived of as coercing spirits to react in desired ways, in contrast to requesting them to do so. Requesting seems to have been inherent in most of these acts, as evidenced by their constituent offerings, words of praise, signs of deference, etcetera; in these cases such labels as *prayer* and *offering* are clearly appropriate. But, when, for example, a man at sea holds up his tuft of red feathers and asks an approaching storm to retire, his action might be interpreted either as a request (a prayer) to the spirit behind the wind, backed up by a gratifying glimpse of feathers (an offering), or it could be interpreted as a magically coercive action made effective by some inherent powers of the word and feathers, in which case labels such as *spell* and *charm* would be more appropriate. Unfortunately (at least, for the sake of analytical tidiness), such ambiguity applies to descriptions of most of the ritual actions of the Maohis, but lacking neutral words to label these I propose, *caveat lector*, to describe the ritual as if all such acts were requests directed to spirits. This is not to say, however, that “magic” per se did not exist in these Islands—as witness the following passage from Henry:

In the pit of the ancestral marae families of all ranks were careful to bury all personal effects, which were regarded as the *iho* (essence) of the body, for safe keeping in charge of the gods. Following are injunctions given by priests:

Eiaha te rouru paoti hia e tahu hia i te auahi, a pahure te upo’o o te ta’ata no’na te rouru. Eiaha te mai-u’u ta’ata i ‘o’oti hia ra, eiaha te a’ahu ri’i piro, te fenu ri’i peue e te ma’a tapa no te ro’i ia tahu hia i te auahi; e iho ia no te tino ta’ata, e humehume hia te iri e e po te mata o te ta’ata no’na tana mau mea ra ia tutui hia i te auahi; e tanu ra i taua mau mea ra i roto i te apo’o, i te tiria-pera, e ‘aore ia e ha’amo’e roa i te tai hohonu.

Let not the cuttings of the human hair be burned with fire, lest the owner of the hair become bald. Let not the nail prunings of a person, or the worn out clothes, or shredded mats or tapa from the bedding be burned with fire; these are the essence of the person, and there would follow moles upon the skin and blindness to the owner if they burned them; but bury those things in the hole, *tiria-pera*, or drop them into the deep sea.

(1928:143)

Communications from humans to spirits ranged all the way from perfunctory wordless offerings of tiny morsels of food before a meal, to week-long ceremonies involving numerous officiants and vast offerings, including human sacrifice.³⁵ According to Ellis there was a “religious” rite connected with almost every act of life: “An *ubu* [*upu*] or prayer was offered before they ate their food, when they tilled their ground, planted their gardens, built their houses, launched their canoes, cast their nets, and commenced or concluded a journey” (1829:II, 216).

Prayers were uttered under all kinds of conditions and in all types of places, but the sources provide detailed descriptions only of those uttered with strict formality in marae.³⁶ Under such conditions, the petitioner, sitting

cross-legged or crouching on his heels or, more typically, kneeling on the right knee addressed the spirits. He did so on a broad flat stone near the center of a marae court, and often while leaning against an upright basaltic column (*fao'a tu marae*). Usually he faced the marae's stone platform (*ahu*), in front of which the tutelary spirits' *to'o* were customarily placed during services. According to one observer a petitioner bowed his head while praying, purportedly to avoid distracting his memory, but most other reports indicate that petitioners usually looked upward while praying. In any case, most petitioners bared their bodies to the waist while praying—a conventional mark of respect. Also, it was reported that a petitioner usually threw a branch of *miro* onto the ground before beginning his prayers; *miro*, it will be recalled, was one of the trees usually found growing within or near marae precincts, and spirits spoke through the sound of its rustling leaves. The *miro* was an *ata* of the god Ro'o, who served among other things to inspire priests at their devotions.

According to Henry, priestly apparel "... retained no warmth but conveyed cold to the body during night vigils in prayer upon the marae, producing a sensation called *iri-anu* (chilled-skin) or *hau-mariri* (dewy-chills) which was considered most pleasing to the gods" (1928:152).

Some prayers to minor spirits are said to have been uttered in hisses, but usually prayers were delivered verbally in shrill tones, described as having been "chantlike," "tremulous," and "unpleasant" (Ellis 1829:II, 209). When they were very lengthy, which was often the case, the petitioner bolstered his memory by means of a tally consisting of a bundle of sticks or a frond of coconut, although, it should be added, the repetitious nature of many prayers served to reduce the difficulties of memorization. As Bligh noted on one occasion, "Hammennemanne [a priest] now began another Prayer, it was very long, but had many repetitions in it, so that it is not so extraordinary, as Strangers imagine, the retentiveness of the Mans Memory" (1792:137a).

See also the following passage from Davies' journal describing a ceremony consecrating a new god house:

... the drums continued beating incessantly & the people in the house priests, chiefs &c then joined in chanting a number of Ubus or prayers repeating the same form of words hundreds of times over, thus it continued all night without interruption, except for 2 or 3 minutes when they gave over the repetition of one Ubu in order to begin another. Many of these Ubus were nonsensical sentences not in the form of addresses to their gods, but a repetition of their names & having sometimes some obscure allusions to some ancient transactions or traditions concerning the ancestors of the islanders, others had something of the form of prayers containing invocations to the gods, a declaration of their power &c. (14 January 1809, in Newbury 1961:127n2)

Several European visitors attested to the solemnity and the profundity of feeling with which formal prayers were sometimes delivered. (This was

in contrast, I should add, to the mood of frivolity that sometimes prevailed among those less directly participant in such ceremonies.) Thus, Ellis described a visit to an abandoned marae in the company of a Christian convert who had once been a priest:

After examining its ruins, we requested him to recite, simply for our information relative to the nature of the former worship, one of the prayers he had been accustomed to offer there. After great persuasion, he consented, and, assuming the crouching position, or sitting as it were on his heels, he commenced, in a shrill, tremulous tone, to repeat the names of the gods, &c, but he was soon seized with a violent trembling and evident alarm, and declared he durst not, he could not proceed. (Ellis 1829:II, 210)

European observers also attested to the requirement that prayer utterance be letter perfect& the slightest mistake or hesitation necessitated recommencement of the prayer or even abandonment of the whole ceremony. (In connection with the question of the mechanism of prayer, this requirement could of course be interpreted either as evidence of spirits' demands that they be addressed correctly or as confirmation that magical words must be uttered exactly, in order to be effective.) Errors in prayer delivery were, according to Henry, considered a "mortal sin" (1928:198). For example, a disturbance of a marae ceremony occasioned by the intrusion of a child was described in the following terms: "... *ua fifi te aha atua*," literally, is entangled the cord of the gods, or freely, "the thread of the prayers to the gods is entangled" (Henry 1928:169).

Some impression of the form and content of prayers may be gained from two short examples: the first an invocation (*upu tarotaro*) preliminary to a long marae ceremony, and the second a benediction (*upu fa'atonu*) terminating the same ceremony:

E te atua e! e aroha mai i to taura tahu'a nei. E fare nohora'a to te 'opu-nui, e to te mau uru, e pure 'iri anu ra matou, e 'ore e ta'oto, i teie 'aru'i, e rari i te hau, eiaha rà ia rari i te ua e te atua e!

O gods! Have mercy upon your body of priests here (present). The 'opu-nui and the possessed images have a house, but we shall be praying chilly, without sleep, this night; we shall be wet with dew, but let us not be wet with rain, O gods!

(Henry 1928:162)

Tahiti'a mai e te atua e! Tena tini atua, tena mano atua, a fariu mai, a fan'i i ta matou nei upu! I ora te fa'ao ta'ata o teie nei fenua, ia ora te huia, ia ora i te atua. Ia ora te mua fare ta'ata. E ara i te ta'ata papari'a taratara, i te ta'ata papari'a hoai, i te hufapapai, i te maro ta'iri i te hauroa mua. E tu'u ana'e ia na vaho roa. Ia ora matou, te ta'ata nei, e te nu'u atua e!

Hearken unto us, O gods!
Those numerous gods, those thousands of gods, turn unto us, accept of our petitions!
Preserve the population of this land; preserve the generation; may they live in the gods. Preserve the frontiers of the people's habitations. Watch against the man with rough cheeks, the man with angry looks, against the incendiary, against him who lets fly the ends of his loin girdle. Put all those things entirely away. Preserve us human beings, O host of gods!

(Henry 1928:171)

Some accounts state that the language of prayer was esoteric, incomprehensible to all but the priests. It did indeed contain many archaisms and vague metaphors, understood only by specialists (and perhaps not even by them), but the principal source of its obscurity probably lay in its manner of delivery.

Within some marae there were certain low stone uprights against which were kept human effigies of 'braided coconut leaves' (*tapa'u*), representing priests in continuous prayer. According to Henry these uprights, with their effigies, were called the 'life of the marae' (*aho*), and the stone columns themselves were called 'holder-of-the-*tapa'au*' (*vaira'a tapa'au*) (1928:134). The uprights symbolized the marae's main function, providing a place for humans to pray to spirits.

Davies observed a ceremony in which *tapa'u* were placed on top of a god's house which was being consecrated (Journal, 14 January 1809, LMS Archives).

Formal prayers, delivered in connection with protracted marae rites, were customarily accompanied by or alternated with the beating of marae drums, of which there were several varieties. These served both to provide breathing spells for petitioners and to intensify the awesome solemnity of the occasion.

Few if any prayers were directed to spirits unless attended by offerings of tangible objects.³⁷ Fine mats, *tapa*, and other manufactures were occasionally proffered, but food of all kinds—plantains, coconuts, root vegetables, kava roots, fish, fowl, dog, pig—was the usual offering (fig. 3-4). Sometimes it was presented raw, sometimes it was cooked beforehand; the significance of the difference will be explored later on. In informal situations, such as an ordinary meal on land or sea, a sacrificial morsel of food was simply thrown onto the ground or into the water. According to Corney, if there was no marae nearby, some individuals placed their daily food offerings on their house roof (1915:259). Offerings made at domestic or "public" marae were usually placed on an altar.³⁸

The altars of smaller, usually "domestic," marae were small square wicker structures, while those at the larger, more "public" marae were high platforms supported by carved and polished wooden posts and on occasion ornamented with tasseled leaves or plant fibers (Ellis 1829:II, 211). (See figs. 3-5, 3-6, 3-7.) In other instances offerings were hung from trees (Beaglehole 1961:797-798).

Uncooked pigs were offered up in one of two ways. They were sometimes strangled during the offering prayer by means of two sticks pressed together against the throat, thereby avoiding any disfigurement of the animal. At other times they were bled to death and their blood smeared over their bodies. Davies recorded in his journal that on one occasion witnessed by him the sacrificial pigs were made to squeal loudly "that the attention

of the gods if possible might be attracted" (Davies, Journal, 13 January 1809, LMS Archives). (The same procedures may also have applied to dogs, although the sources do not specify so.) If animals were presented to a marae's tutelary spirits in excess of current needs they were branded with a *tapu* mark and allowed to run free until required, and the same fate awaited all animals that happened to stray into marae precincts.

Henry provided an example of a prayer used in connection with an offering—this one a pig put to death by strangling:

Tahiti'a, mai, te atua e, i ta matou nei
fei'ai! Teie te pua'a taraehara^[39] na 'oe, e
pua'a tapena, e pua'a porao ore.

Hearken O god, to our petition with
food! Here is the sacrificial pig for thee, a sa-
cred pig, a pig without a blemish.

(1928:168)

Offerings placed upon an altar remained there until they decomposed or were eaten by birds, the assumption having been that the spirit recipient, present either in the form of the birds, or invisible, consumed or otherwise used up the essence (*iho*) of the objects (Cook 1784:43; Bligh 1789:II, 25). This serves to account for the fetid air often reported of marae which may indeed have represented one component of the complex attribute of sacredness. In this connection it is also suggestive that officiants at formal marae services were not allowed to wear flowers or anoint themselves with aromatic oil. After decomposition—but usually not until the altar had to be emptied and refurbished for another service—the remains of most offerings were thrown into the marae's refuse heap (*turuma*) or pit (*tiriapera*), along with all other used items left over from the activities in the marae, including priests' vestments, decayed wood and thatch from marae buildings, moss scraped from marae stones, grass collected from weeding, and so forth⁴⁰—all things having been too saturated with sacredness for disposal outside the marae grounds.

On occasions, some of which will be described later on, part of the food contributed for "religious" uses was eaten by officiants at the marae, or even taken home to be eaten (Henry 1928:177). One rationale for this practice was undoubtedly recompense for services performed on behalf of the marae's congregation. There may have been other reasons or imagined effects as well; but, as pointed out by Handy, there is no evidence to support a theory to the effect that this practice represented a conscious performance of "communal sacrament" (1927:189-190).

A human being was the most acceptable offering to the gods—principally to 'Oro in his various manifestations.⁴¹ (Figs. 3-8, 3-9.) The rationale for this preference was probably complex. In the first place, the god 'Oro delighted in warfare, so it is reasonable to assume that the Maohis conceived of him as delighting also in human death. Second, although the sources are not explicit on this point, it may well have been believed that the god in question nourished himself by actually eating the

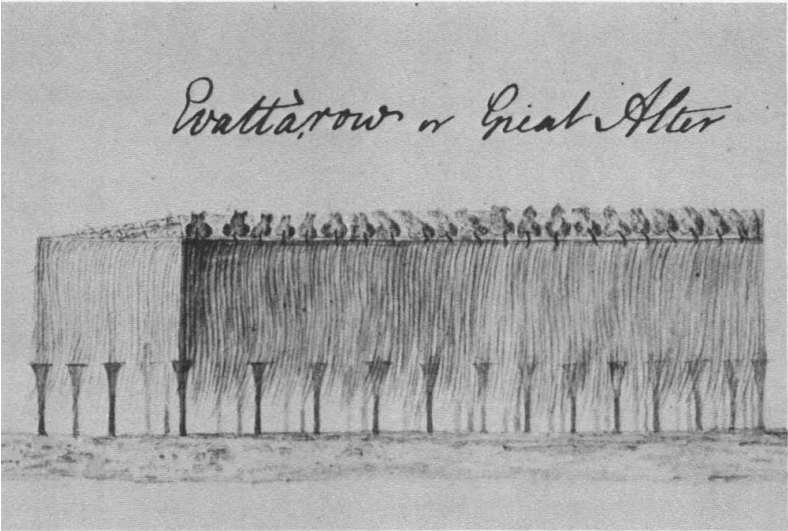

FIGURE 3-9. The great altar at marae Utuhaihai, Pare, Tahiti. Drawing by W. Bligh. Mitchell Library, Sydney.

essence of the human offering; such was the case with other edible offerings, and in one widely current version of the fate of souls, gods are imagined as eating them. Third, it would be consistent with other manifestations of Maohi beliefs to infer that the victim's spirit or ghost, released by his sacrifice, would be imagined as hovering around the marae in question thereby augmenting the sacredness of the place (and of course awe of its tutelar god and human proprietor); but this takes us out of the realm of theology and into that of politics.

Actual selection of a human victim involved both punitive and political considerations, which will be described in other chapters. In terms of ritual, the victim in most instances had to be a male and was preferably an old one. In times of war captured and often badly maimed victims were offered, but in times of peace the victim was required to be physically unblemished, without crippled limbs or disfiguring scars—particularly scars produced by a woman. Because of this the victim was customarily killed by striking his head with a stone.

After having been killed, the victim, conventionally referred to as a "fish" or "man-long banana," was encased in a plait coconut-leaf basket and carried to a marae for formal presentation to the god. Sacrifices to 'Oro, at least, were smeared with their own blood to render them more acceptable. Except for the skull, which was sometimes displayed above ground at the marae, the corpse was eventually buried under a special pavement stone. On certain occasions an eye was removed and presented to the incumbent of the marae's highest-ranking kin-Title, who pretended to eat it.⁴² This was the usual procedure, but there were several variations to fit special circumstances. For example, when a god's house was to be consecrated human victims were sometimes deposited at the base of its principal supporting posts; or, when the canoe of a powerful god was launched or beached, human victims were occasionally used for rollers.

Only at the most venerated of marae were human offerings made to the spirits; these were mainly marae dedicated to 'Oro, although the god Tane was also occasionally honored in this way (de Bovis 1909:55).

Special behavior was required of officiants, spectators, and the community as a whole while major religious rituals were in progress. Primary officiants were obliged to withdraw from secular activities before and during the ceremonies at the marae and then to undergo specific deconsecration rites at their conclusion and before resuming everyday life. Henry's description of their preparations, the fullest available, will be reproduced later. Other officiants, including otherwise important spectators, also had to undergo some restrictions, at least during the ceremonies; but these were of less severity.

The garments worn by officiants during a marae ceremony became so infused with sacredness that they could not be used outside; consequently

they were generally stored in the *fare ia manaha* when not in use (Morrison 1935:179).

In some instances deconsecration consisted of a verbal prayer; on other occasions, bathing in water served the same end.

During major marae ceremonies restrictions were imposed upon the community at large. In their most severe form no ordinary work could be performed; no fires could be lighted (hence no food cooked), and no noise of any kind made. Women and children remained at home, and no traveling on land or sea was permitted. All this served, of course, to heighten the sounds coming from the marae—especially the dread tones of the *to'ere* drum announcing a human sacrifice.

Dancing and Prodigious Acts

There remain to be considered certain other forms of action which might be viewed as special means of communication between spirits and humans. First are the kind of public performances which took place in connection with major religious ceremonies, although not within marae precincts. Notable among these were the public spectacles—pantomime, choral antiphonal chanting, and dancing—performed in connection with the annual first-fruit festivals, and those performed at other times to dramatize myths. (Detailed descriptions of these performances will be presented in later chapters.) All these performances seemed to entertain the populace and might also have had the purpose of entertaining the assembled spirits as well. The question, however, is whether the actions performed had the additional purpose of influencing, magically, either the spirits themselves or the “forces of nature,” if there were any independent of spirit control (which I believe *not* to have been the case), to ensure a continuation of the growth of plants and animals and the replenishment of human society. The dancing, whose “erotic” qualities will be described in another place, had been claimed especially to influence the procreative forces of nature:

The erotic dancing of the tropical islands of Polynesia, which was in its origin a form of worship, was designed to stimulate and bring into action the mana of the gods who were believed to be animated by the same emotions as men and on whose procreative activities the fecundity of human beings, the earth, and sea depended. These rites have been characterized as “mysteries” but I see no reason to call them such. The gods, man-like in their nature, were present at the feasts. The dancing roused their passions, and they sought the satisfaction of their desire with their female mates. The nature father—Tane in New Zealand, Taaroa in Tahiti, Atea in the Marquesas—would enjoy with the mothers of fruits, as men enjoyed with the mothers of men, the orgy of sexual indulgence in which such feasts always culminated. There would be many children of the nature father—many breadfruit, taro, bananas, potatoes, many fish—and there would be many human children, both because the procreative power seated in the human fathers was released and freely spent, and because

the nature father, from whom or through whom this power came to men, was aroused to impregnate the mothers in nature. (E.S.C. Handy 1927:210-211)

This is an intriguing theory, and one which might be pertinent as well, but like other aspects of the prayer-versus-spell problem of Maohi ritual, it can neither be confirmed nor denied by the Maohi evidence available.

A second form of action implicating communication between spirits and humans involved certain prodigious feats performed by the latter when purportedly possessed, or otherwise influenced, by the former. One of the most spectacular of these was rock climbing. According to an account given to de Bovis, individuals adept in this practice were able to climb high, perpendicular, smooth-faced cliffs by means of "invocations" and small wands of ironwood held against the face of the rock (1909:52). Another kind of spectacle was the well-known 'fire-walking ceremony' (*umu ti*), in which several devotees walked over a pit of white-hot stones without apparent injury; it so happens, however, that I can find no references to such ceremonies in eighteenth-or early nineteenth-century accounts, and if the early European visitors had seen or heard about such prodigies they would assuredly have mentioned them. In fact the only detailed descriptions of fire-walking ceremonies that I know about referred to some witnessed on Ra'iatea in 1885 and thereafter.⁴³ Although these latter-day ceremonies seem to have been thoroughly "pagan" in inspiration and performance, and specifically Tahitian (or actually, Ra'iatean) in cosmographic reference, this does not necessarily prove that the custom prevailed in the Society Islands in pre-European times. Fire walking is attested to in other Polynesian archipelagoes and might well have been introduced (or reintroduced) into the Society Islands from elsewhere during the nineteenth century.

Priests

Every Maohi man (and probably also every Maohi woman) communicated with spirits from time to time, and most Maohis probably served occasionally as vehicles for spirits' communications with others. But, in addition, there were certain individuals who specialized in such practices, even to the point of making a full-time profession of them. I have already mentioned two such specialties, those of human oracle (*taura* 'shaman') and sorcerer. I now turn to the specialty of priest (*tahu'a pure* 'one-skilled-in-praying').

The distinction between shaman and priest is quite clear-cut; the former served as a medium through which a spirit addressed humans, while the latter addressed spirits as a representative of humans. (In terms of this distinction, the sorcerer was a kind of priest who exercised a relatively strong control over the particular spirit who served as his fetcher-familiar.) It should be noted, however, that the distinction just made refers primarily to roles. That is to say, while it is not unlikely that some religious prac-

tioners (part- or full-time) may have been shamans exclusively, it is also likely that all professional priests (i.e., not just individuals such as household patriarchs who now and then carried out priestly functions) served occasionally as professional shamans as well. Here, however, we are concerned with the priestly role of the religious professional.

The main activity of priests was to receive and interpret spirits' messages to humans and to persuade spirits to comply with humans' wishes. As we have seen, this usually required inducing the spirits in question to embody themselves nearby (in some image or other "seat") and listen to verbal supplications backed up with offerings of objects or services considered pleasing to the spirits. In many—perhaps most—marae all the various jobs comprising this activity were probably carried out by one all-around priest, either part- or full-time; but in marae associated with the more socially important congregations, such as whole tribes or supratribal cults, the jobs were distributed among several specialist priests, including an officiating "high priest," marae attendants (*ōpū nui* 'big bellies'), image-bearers, novices, and so on.

The offices of the high priest and of some other prayer specialists were usually hereditary, but most incumbents underwent arduous training. After their formal consecration such officeholders were usually subject to punishment by spirits and fellow priests for committing errors in the technical procedures of priestcraft.

In brief, priesthood was a popular profession whose members were well compensated, materially and socially, in return for their onerous duties and dangerous risks.

Marae

Marae were the sanctity and glory of the land; they were the pride of the people of these islands. The ornaments of the land were the marae, they were the palaces presented to the gods. (Henry 1928:150)

In the myths of creation epitomized earlier in this chapter, it will be recalled that even after Ta'aroa had brought the universe into being, and even after it had begun to be populated with gods, humans, and demigods, disorder and chaos continued to reign. Darkness (*pō*) prevailed everywhere and entities were not fixed in their proper places. A number of actions contributed to bringing order out of chaos, including the raising of the sky off the earth and the slowing down of the sun in his daily sweep across the heavens; but order was not fully established until relations between spirits and humans became regularized, and for this it was necessary to establish marae, where humans could "receive the gods in a befitting manner" (Henry 1928:429), with prayers and offerings presented through properly qualified intermediaries, mainly priests.

As we have seen, mortal humans' souls sometimes entered the sphere

of spirits while asleep or entranced, and spirits visited mortals in many guises and in many kinds of settings; but the marae were the edifices where most of the interaction between spirits and humans took place. There are some grounds for concluding that Maohis considered marae to be outposts of *pō* (spirits' sphere, or "room," of the universe) within the *ao* (mortals' sphere), but this contrast cannot be pushed too far, because of lack of explicit native verbalizations on this matter. Also, in most cases about which such information is available, each marae was primarily devoted to interaction between a specific group or category of humans and a particular set of spirits (Henry 1928:132, 453). That is to say, no marae known to me served as an all-inclusive meeting place between humans and spirits in general—or rather, no edifice that I propose to call a marae served as such.

In the absence of the kind of linguistic evidence essential for authentic semantics, I can only guess at what the Maohis themselves felt to be the primary, as distinct from derivative, references of their very common word *marae*. For example, the miniature houses in which the images of some of the more powerful *atua* were kept, called *fare atua* by the Maohis, and "arks" by some of the European visitors, were also referred to as *marae*, as were the parts of the boats on which such images and their houses were transported (Morrison 1935:179). *Marae* seems also to have referred to some places set aside for burial—including one for dogs (Beaglehole 1961:419). In certain circumstances, as set forth in a chant reproduced in Henry, the sea itself was called a *marae*:

E pure tei te nu'u tai mimiha;
 (There was prayer in the moving rolling ocean;)
 o te moana te marae nui o te ao nei.
 (the sea was the great temple of the [human] world.) (1928:356)

And not just metaphorically for, as Henry explained elsewhere: "On the sea-side the wanderer or exile who owned no land [i.e., had access to no specific place of worship] worshipped his god. There he presented his son or daughter in marriage, there he offered his newborn child to his tutelary god, and there he presented himself or members of his family when sick or dying to the healing gods, and to Ta'aroa" (1928:144).

In any case, for my present purposes I shall use the word *marae* to refer primarily to any man-made structure consisting minimally of a discrete area of ground containing fixed places for interaction between humans and spirits. Specifically, the fixed places included at least some locus for one or more spirits and for one or more humans. Many marae also contained one or more of the following fixed elements: altars, graves, et cetera, for offerings to spirits; shelters used for storing paraphernalia not in actual use; pits or piles for disposing of ritual objects no longer subject to use; graves for temporary burial of certain deceased members of the

marae's congregation; and loci for investing humans in certain marae-associated offices. Finally, in some locations several more or less discrete marae (each containing one or more of the above fixed elements) were spatially and ritually combined into marae complexes. (Figs. 3-10 through 3-12.)

Perhaps the most succinct contemporary description of marae functions and architecture is that of the missionary Jefferson:

Morai, in the language of the country, signifies a place appropriated to the worship of Eatooa, or deity. As the Otaheiteans have a plurality of deities, so they have many *morais*. They are temporary or permanent. Temporary *morais* are erected before the corpse of the dead agreeable to the fancy of the erector, and (from what I have hitherto seen) are commonly small altars, variously decorated, with leaves and the fruit of palm tree, that grows in abundance, and upon which are placed divers offerings of food. Permanent *morais* are numerous and divers: they are usually enclosed spots of ground surrounded with trees of different kinds, and having in them sundry small pavements of stone: at the head of each stands a stone of larger size, and at the back of the stone is generally fixed a board five or six feet long, with a little rude carving on it; the top divided into five parts, or slits, to represent the fingers of a hand: sometimes the board has the figure of a man or bird carved on its top. At the foot of this pavement the priest worships, with his face directed towards the headstone and plank, and throws his offering, consisting of a young plantain-tree root, green leaves, or the leaf of a cocoa-nut twisted in a peculiar form, upon the pavement. Besides these kinds of oratories within the enclosure, there are altars, on which meat offerings are placed, and before which prayers are made. Altars for the like purpose are scattered up and down the country where there is no *morai*. At one permanent place of worship, there are frequently a plurality of *morais* dedicated to different deities: thus the one I now visited, had in it two others dedicated to as many false gods. (LMS Transactions:I, 98)

This much is known, or can be credibly inferred, about the major functional components of marae. In addition, it is possible in some instances to identify certain functional components with specific architectural elements, to which I now turn.⁴⁴

The "discrete areas of ground," which I propose were a feature of every structure I call a marae, varied greatly in area; some were no larger than a few square meters, while others comprised areas of several thousand meters. Most of these areas were floored with flagstones, river boulders, or pebbles, in whole or in part. Usually marae were laid out on naturally level ground, with pavements flush with ground level or raised somewhat to form a low platform. In uneven locations attempts appear to have been made to level their floors by means of excavations and terracing (sometimes built out into the lagoon), occasionally resulting in floors at two or more levels. The larger marae were roughly rectangular in outline and usually bounded by continuous stone walls of heights ranging from less than a meter to two or more.

A prominent feature of most of the larger marae was the *ahu*, a more or less rectangular platform built of stones and located adjacent to one of

FIGURE 3-10. Marae plan. Unsigned drawing. Cook's first voyage. British Museum.

FIGURE 3-11. Marae plan. Unsigned drawing. Cook's first voyage. British Museum.

FIGURE 3-12. Marae Taputapuatea, Tahiti. Drawing by W. Bligh. Mitchell Library, Sydney. (Top right, library identification stamp.)

the marae's shorter boundaries—either separated from or continuous with the marae walls. Many *ahu* consisted of only a rough pile of boulders three to four meters long and one or more meters wide. Others were constructed of carefully worked stone put together to form a single or multilevel platform.⁴⁵ The largest was the ten-step pyramid of Mahaitea marae (Papara, Tahiti), which was about 81 by 24 meters broad at the base and 14 meters high.⁴⁶

An *ahu* was the place on or near which the congregation's tutelary spirits mainly stayed when they visited the marae. Having few reliable first-hand accounts of actual marae rituals,⁴⁷ I am not able to describe specifically and comprehensively what uses were made of *ahu*, but I can state in a general way what these elements were not. For one thing, they did not serve primarily as altars for offerings to spirits. One eyewitness drawing shows human skulls resting on an *ahu* (Beaglehole 1967:224-225); these were the remains presumably either of human sacrifices or of enemies slain in battle, but the food offerings to spirits that formed a regular part of marae rituals were placed elsewhere. Also, although marae functionaries may occasionally have climbed onto *ahu* for some purpose or other,

when rituals were in progress and spirits were actually present, they and not humans usually occupied these platforms.

As indicated above, not every structure I label marae contained an *ahu*, but every marae did contain a fixed element, usually one or more stone uprights that served as a principal locus for visiting spirits; and like *ahu* these were invariably located near one end of the marae. In addition, in many cases stone uprights, usually consisting of worked slabs of limestone or of columns of basalt, were fixed into the tops of *ahu* or set into the ground against the side of the *ahu* facing the marae court. In some instances there was only one such upright, but the usual number was three.

Another architectural element reserved mainly for spirits was the *ava'a*, 'gods' bed', found in some marae. It consisted of a small stone platform immediately adjacent to the *ahu*. It served principally as a place for resting the images of the marae's tutelars during the rituals, and as such was considered to be the 'most sacred place' (*te vahi mo'a roa*) in the marae; but in some cases it served also as the place on which an individual stood when being invested with the highest-ranking Title associated with the marae in question.⁴⁸ Some *ava'a* are said to have covered a cist in which were deposited the images' discarded coverings.

Most marae contained stone uprights in addition to those mentioned above. Some of these were broad limestone slabs, others were basalt columns; their height above ground ranged from thirty or forty cm to two or more meters. The numbers of these uprights varied considerably, as did their arrangements. In many cases there was a group of three of them set close to and in front of the *ahu*, and another one or two set near the center of the marae court. In some marae these were the only uprights present, in others there were additional ones facing either the *ahu* or the center of the courtyard. And in some marae there were no such uprights at all.

Interpretations differ concerning the function of these courtyard uprights. According to various reports they were leaning posts for officiating priests, backrests for the highest-ranking Titleholders of the congregation, resting places for visiting spirits, memorial stones for departed chiefs, and presumably resting places for the latter's visiting ghosts (Emory 1933:16-17). The possibility, or even probability, is that in some marae there were uprights for all these purposes (with considerable variation as to which was which), while in others some uprights served more than one purpose, according to circumstances.

In this connection, one will recall that *tapa'u*, priests' effigies fashioned out of braided coconut leaves, were sometimes attached to certain stone uprights to represent—and presumably to substantiate—continuous prayer, even when rites were not being conducted.

Some drawings of marae made by visiting Europeans show numbers

of *unu* set up in the courtyard and on top of the *ahu*. These were wooden boards a meter or more high, variously carved and painted (usually with red ochre), and sometimes hung with feathers and strips of tapa and matting. Some *unu* were crudely anthropomorphic, others zoomorphic, but most were in the shapes shown in figures 3-8, 3-9, and 3-12. The sources differ concerning their function. One claims that they were erected to commemorate a human sacrifice, but as Emory pointed out they were also found at marae where human sacrifice did not take place (1933:15). Another account identifies them as memorial posts for local chiefs whose bones had been deposited in the marae, but in Henry's view they served mainly as racks for the objects that were presented to the gods (1928:134). As pointed out by Emory, the fact that they were characteristically set up on *ahu* whose tops lacked stone uprights suggests that some may have been substitutes for the latter (1933:16).

In describing 'gods' beds' (*ava'a*) I noted that under some of them were cists said to have contained the discarded trappings of *to'o* (god-images)—that is, items that were too dangerously "sacred" for disposal elsewhere. Stone cists have been found by archaeologists in several marae—in walls, courtyards, and even in *ahu*. Some of them were found to contain human bones, but others were found to contain nothing but soil and rubble. What purpose, or purposes, such cists served is not entirely clear, but there are suggestions in the sources that some of them were used as temporary burial chambers for a marae congregation's most distinguished members, prior to final deposit of the skeleton—or at least the skull—in more secret and secure places elsewhere.

In some of the few marae courtyards that have been excavated were found ordinary noncist burials containing complete or incomplete human skeletons. Some of these may be the remains of members of the marae's own congregation, but there are good grounds for concluding that most are remains of offerings, either victims that were deliberately sacrificed to the marae's tutelars, or enemies slain in battle and brought home as trophies.

As noted above, some offerings to a marae's tutelars may occasionally have been placed upon its *ahu* or walls, or buried in its courtyard; but most offerings, and particularly foodstuffs and tapa, were placed on the specially constructed altars (*fata*) already described.

Many marae contained special houses (*fare ia manaha* 'house of treasure') where images, drums, priests' vestments, and so forth, were stored, and where priests and attendants sometimes slept. These were in addition to the "moveable marae," or "arks" or gods' houses (*fare atua*, fig. 3-13) described earlier, which were seen on some marae by visitors. Also associated with some marae were special sheds (*va'a ti'i*, *fareva'a a te atua*) that served to shelter the canoes used to transport the tutelal images when it was necessary for them to travel. Because the "sacredness" of objects used

in marae rituals made them too “dangerous” to dispose of elsewhere, special refuse pits and heaps (*tiriapera*, *turuma*) were an architectural feature of most marae.

Finally, a requisite feature of most marae was the “sacred” trees, already listed, which grew either within marae boundaries or nearby. Ellis provided a vivid word image of these trees and of the general atmosphere of marae precincts:

FIGURE 3-13. Wood god's house, length 87 cm. British Museum.

These were, excepting the casuarina-trees, of large foliage and exuberant growth, their interwoven and dark umbrageous branches frequently excluded the rays of the sun; and the contrast between the bright glare of a tropical day, and the sombre gloom in the depths of these groves, was peculiarly striking. The fantastic contortions in the trunks and tortuous branches of the aged trees, the plaintive and moaning sound of the wind passing through the leaves of the casuarina, often resembling the wild notes of the Eolian harp—and the dark walls of the temple, with the grotesque and horrific appearance of the idols—combined to inspire extraordinary emotions of superstitious terror, and to nurture that deep feeling of dread which characterized the worshippers of Tahiti's sanguinary deities. (1829:II, 208)

How “sacred” these marae trees were can be inferred from a passage from Bligh's journal:

In the Morning one of my Officers on shore having plucked a branch of a Tree called Tu tuee [tutu'i] or Tee ighree [ti'a'iri] that bears the Oil Nut, which was growing at a Morai, and accidentally bringing it into the dwelling where my people are at, all the Natives both Men and Women suddenly left it. When I came on shore I found a branch of this Tree tyed to one of the Posts, altho they saw the effect it had of keeping the Natives from the House, and notwithstanding I ordered it away no one would come near the place. They said the House was tabooed and that no one could come there untill the Taboo was taken off and that must be done by Tynan; he therefore from my Application promised to take it

away in the After Noon. Any thing taken away from a Morai is said to give great Offence to the Eatua, no one will therefore come near the place where such an Article has been deposited untill they are satisfied that through prayer their God is no longer displeased. (1789:II, 13-14)

Until now I have discussed the structures I call marae as if they had all served the same general purposes, although noting that some were more elaborate architecturally than others. This of course is an oversimplification, and later chapters will reveal that in some instances differences in marae architecture were reflections of specialization in marae functions; (I believe that this and not the reverse was the causal sequence). Nevertheless, all the marae heretofore discussed were alike in being what might be called primary religious edifices—in contrast to those that might be labeled subsidiary ones. The latter were usually located close to, or in some instances directly adjacent to, primary marae; but they seem to have been so physically separated from the latter and so functionally highly specialized as to warrant separate treatment. There may have been several types of such subsidiary marae, but the only type that can be archaeologically identified is the one archaeologists call “shrine” (Green et al. 1967:141).

In most cases shrines were, literally, adjacent to the walls of primary marae. Nearly every edifice so far identified as a shrine contained the same features: three columnar stone uprights near one end with a stone slab backrest in front of and facing them. In addition, in many shrines have been found small anthropomorphic stone images set into the ground between backrest and uprights. It is reasonable to suppose that such images, before they were removed by latter-day curio hunters, were a characteristic feature of many shrines.

The sources are virtually silent concerning the specific functions, distinct from conventional primary-marae ritual, served by these shrines. From their small size and limited architectural elements, however, it is tempting to identify them as places where individual priests—or individuals acting as priests—addressed prayers and queries to spirits concerning matters of less public importance than those transacted in the primary marae itself. In this respect, shrines were practically identical with some of the smaller, discrete primary marae located in large marae complexes. On the other hand, the presence of a stone image on many shrines suggests a somewhat more specialized function—that of protecting the primary marae from hostile spirits by means of a fetcher-type spirit familiar (*ti'i*) embodied in the *ti'i*-like image (Beaglehole 1962:I, 303). The sources refer to sorcerers (*tahutahu*), attached to some of the larger primary marae, whose office was “... to avenge the king and chiefs on their enemies, to annihilate offending *tahutahu* of an inferior order, to destroy a national foe, and to aid the warrior by performing deadly rites upon slain or captured chiefs in time of war” (Henry 1928:206).

Maohi marae were located in a variety of settings: on the shore itself (sometimes even built out into the lagoon), on the flat coastal plains or on valley floors, and on the sides or summits of hills. According to Emory the builders seem to have followed no consistent rules of orientation either with regard to loci on the horizon or to the slope of the land (1933:26, 31).

Some marae were unitary, others were parts of complexes which included one or more principal "primary" edifices, a number of small lesser ones, shrines, an open courtyard for "secular" meetings, and occasionally an archery platform (figs. 10-1, 10-2, 10-3). A few of the smaller edifices were located near what appear to have been dwelling sites; these were probably what Henry called "family" or "ancestral" marae (1928:119). The ones associated with larger social units and more widely venerated gods probably were well isolated from dwellings, because—among other factors—of the mutual necessity of separating them from the usual haunts of females.

The basic function of marae was everywhere the same—to provide humans with fixed places and appropriate appurtenances for communicating with the gods "... in a befitting manner" (Henry 1928:429). Also, each marae had its own more or less exclusive congregation; but the character of such congregations greatly differed, as did the particular purposes which each marae served. These matters, which concern in large measure the very structure of Maohi society, will be discussed in later chapters; but I will list here the types of social units which comprised congregations: kin groups of various sizes and spans, occupational "guilds," tribes, and supratribal cults.

In the foregoing it has been made evident that females were generally excluded from most marae. Some sources imply, however, that they were admitted to services at their own family's domestic place of worship. There were occasions, such as the inauguration of a chiefess or the marriage of an upper-class couple, when the female principals were admitted within the precincts of larger and more public marae, but at such times elaborate steps were taken to insulate the marae from the women's ritual-nullifying "secularity" and to protect the women in question from the marae's dangerous "sacredness." This, however, does not mean that females did not "belong" to marae congregations or that they remained in social and religious limbo in this regard. All it does mean is that they were not active participants in marae rituals; in this respect males were their representatives and acted on their behalf.

The concept of "congregation" also requires broadening in another respect. While it is true that each marae was associated more or less exclusively with a single social unit, whatever its nature or scale, there may have been occasions when exclusiveness did not prevail, for example:

Their *morais* are a kind of refuge for criminals of every kind; they fly to them when in any imminent danger, and, according to the custom of the country, must not be taken from thence (Turnbull 1813:366).

The sacred ground around the *morais* affords a sanctuary for criminals. Thither, on any apprehension of danger, they flee, especially when numerous sacrifices are expected, and cannot thence be taken by force, though they are sometimes seduced to quit their asylum. (Wilson 1799:339)

Interpreted broadly this could indicate that fugitives in general, (but not, evidently, intended victims for sacrifice) might find refuge in any *marae* (and not just those with which they were somehow affiliated). A text in Henry about these intended victims notes: "... fugitives that were chased by warriors, conspirators and captives who were chased to be slain, would run to the front of the *marae* and were saved. But persons destined to be sacrificed, found no place of refuge in all the land. When they ran before the *marae*, they were slain there, that was their proper place" (1928:150). Unfortunately, the evidence available permits me neither to confirm nor deny the possible generality of this statement, with its potentially far-reaching social implications. In this connection I note a passage from Henry regarding the extension of the notion of *marae* sanctity: "The house of a great man [*ta'ata mana*] became his *marae*; persons escaped being slain when they ran into his home, except those appointed for sacrifices" (1928:150-151).

I reproduce a chant, published in Henry and collected by Orsmond from the high priests Tamera and Pati'i. Some of its passages and references will already be familiar to the reader; others will become clearer as this description proceeds. It indicates, better than any other native text I have discovered, the central importance possessed by these edifices in the thoughts and activities of the Maohi:

O te *marae* nei te mo'a e te hana-hana o te fenua; 'o te teoteora'a ia o te ta'ata no teie mau fenua. O' to te fenua ia unuana te *marae*; a aora'i ia i pupu hia na te atua.

A'ore e ta'ata i ta'ahi noa i to te tahi e ra *marae*, i ha'apao ra i to ratou iho. No te *marae* tupuna nei i tao hia ai e e ai'a fenua to te ta'ata.

E vahi hahano rahi e te hau rahi te *marae*; ei tere pure to te ta'ata i tae atu ai i reira a'ore atu e tere e, A'ore te atua i vare. Ia tae te ta'ata i te vahi *marae* ra, e nao e atu ia te haere, e tu'u i te ahu i raro mai te taponu e tae atu i te papa, e mau raro hia te hipoia i te rima, e ia moe atu taua *marae* ra.

Marae were the sanctity and glory of the land; they were the pride of the people of these islands. The ornaments of the land were the *marae*, they were the palaces presented to the gods.

People did not intrude upon others' *marae*, but they adhered to their own. It was owing to the ancestral *marae* that people could say they had an inheritance.

A place of dread and of great silence was the *marae*; a person's errand must be to pray in going there, but for no other purpose. The gods could not be deceived. When persons approached a place where stood a *marae*, they gave it wide berth, they lowered their clothes from their shoulders down to their waists, and carried low their burdens in their hands, until they got out of sight of it.

Ei te otue toro i tai ra te marae ari'i; ei te ooa ra ta marae o te ra'atira; 'o uta ra na te mau poti'i ia, oia te manahune.

E vahi ra'a te marae, e vahi hahano; e fa'atupura'a manava hirahira, e vahi iriha te marae.

E mea ri'ari'a roa te marae o te hui ari'i; te marae tupuna e te marae o te fenua! E vahi turuma ta'a e roa, e vahi amiami e te hauriria; e vahi mamae no te tahu'a e te fatu, e na te mau ta'ata ato'a. E mea mamae te patu marae; ia hape noa te pua'a i te patu marua ra, e'ore roa te fatu pua'a e'ite fa'ahou atu, mo'a ihora ia na te atua. Te va'a e hoe na tahatai ra e fa'a'ateatea roa ia tae i te otue marae ari'i ra, e tu'u te ahu o te ta'ata i raro, e hoe maru noa e ia ta'a e atu taua vahi ra.

E mana to te tihī marae; te ta'ata e a'ua'u hia e te 'aito ra, te orure hau e te titi, ia a'ua'u hia e tupai ra, e horo i mua i te marae e ora ia. Area ra te ta'ata i ha'apaohia ei tapu ra, 'a'ore a'na e vahi oraora i te fenua nei. Ia horo oia i mua i te marae ra, o te ha'apohe ra'a 'tu ia, o te vaira'a mau ia.

I riro te fare o te ta'ata mana ei marae no'na; e ora te ta'ata ia horo iroto i taua fare ra, eiaha te feia i ha'apaohia ei tapu. No reira te parau i nao hia nei e: "E are 'oe i te iriaputa mua o to'u fare; o ta'u marae hoi to'u fare, o te āhu mua tei to'u iriaputa mua."

E mea poiiri rumaruma i te ra'au nui o taua mau marae ra; e o te hau roa i te ra'a o te miro ia, oia te amara; E ta'ere tera no te 'oro'a; E ta'ere tera no te Ari'i; E fa'a'ara i te atua; E ha'amau i te maro o te Ari'i.

Upon the prominent points were the royal marae; in the bays were the gentlemen's marae; and behind them were the marae of the girls, that is, the common people.

A holy place was the marae, an awe-inspiring place; it was a place that awakened conscience, a dreaded place.

Terrible were the marae of the royal line; their ancestral and national marae! They were places of stupendous silence, terrifying and awe-inspiring; places of pain to the priests, to the owners, and to all the people. The walls of these marae were repelling; when a pig chanced to stray upon a wall fallen down, its owners never saw it again, it became sacred to the gods. When a canoe passed along the shore, it withdrew far off as it approached the point where stood the royal marae, the people lowered their clothes, and paddled lightly until they passed the place.

Potent were the horns of the marae; fugitives that were chased by warriors, conspirators and captives who were chased to be slain, would run to the front of the marae and were saved. But persons destined to be sacrificed, found no place of refuge in all the land. When they ran before the marae, they were slain there, that was their proper place.

The house of a great man became his marae; persons escaped being slain when they ran into his home, except those appointed for sacrifices. From this circumstance arose these words: "Beware of the front door of my house; my house is my marae, the front door has the front step."

It was dark and shadowy among the great trees of those marae; and the most sacred of them all was the *miro* which was the sanctifier. That was the basis of the ordinances;

It was the basis of royalty;

It awakened the gods;

It fixed the 'uru girdle of sovereigns.

(Henry 1928:150-151)

Religious Ritual

Nothing is so fruitless as academic argument over how terms ought to be defined, and this applies especially to *religion* and *ritual*. But rather than introduce new terms as means of avoiding such argument, I am going to use the familiar ones in their following meanings:

Ritual: behavior that is normatively defined and precisely conventionalized.

Religious: objects and actions (including mental actions) that have to do with relations between spirits and humans.

Putting these terms together provides us with a definition of religious ritual, Maohi manifestations of which I will now summarize.

In line with a currently fashionable urge for analytic elegance, it may be possible to view Maohi religious ritual as a distinct language; this parallel cannot be pushed too far, but religious rites did indeed consist of a finite number of objects and actions which had explicit meanings and which were put together in different ways for different objectives.

First of all, included in the repertory of Maohi religious ritual was a number of natural objects; the most frequently used were feathers, blood, plantain shoots, rosewood leaves and branches, the ti plant, and sea water.

Feathers. A description and at least partial explanation of these *most* effective of all ritual objects were given earlier.

Blood. Human blood figured in religious ritual in a number of ways. It was smeared over the bodies of human sacrifices in offerings to 'Oro, presumably to make them more acceptable to that sanguinary god. It was shed by individuals through self-inflicted wounds to express both sorrow and joy; and when the blood of two persons was mixed, it served as a solemn pledge of social alliance. One seeks in vain for distinctively Maohi rationales for these meanings; perhaps they are nothing more than local variations of obvious and near-universal ones. However, it is tempting to link the redness of blood with that of certain feathers, although these two things were not apparently substituted for one another in ritual and there are no clues as to which derived its ritual importance from the other.

Plantain (met'a). Young shoots of this valued food plant are described in the sources as possessing three ritual "meanings"—having served as tokens of peace, as marks of deference, and as substitutes for humans in ritual situations.⁴⁹ Cook described the first two:

The Plantain tree so often mentioned is always the first thing interduced, not only in all thier Ceremonies but in all their debates, whether of a publick or private nature, it is also used on other occasions, perhaps many more than we know of. While Towha was at Eimeo one or more Messengers came from him to Otoo every day, the Messenger always came with a young Plantain tree in his hand which he laid down at Otoos feet before he spoke one word, then sat himself down before him and related what he was charged with. I have seen two men in such high dispute that I have expected they would come to blows yet on one laying a plantain tree before the other they have become cool and carried on the argument with calmness. In short it is upon all Occasions the Olive branch of these people. (Beaglehole 1967:218)

Cook's examples were taken from nonreligious situations, but the plantain was used with similar meanings in religious ritual as well. As examples

of the third kind of usage, such shoots, called ‘man-long plantains’ (*ta’ata met’a roa*), were used to represent or substitute for a human in connection with offerings, divination, sorcery, and scapegoating. The first two usages could be seen as linked; so might indeed the third as well, but that must remain speculative.

A cylindrical piece from the heart of a plantain-tree stem was rolled over the skin of certain infants, to “purify” them, but it is not clear what the plant’s properties were that led to this use of it other than the fact that it was in this context called “plantain of the gods” (Henry 1928:183).

Tahitian Rosewood (*Thespesia populnea: miro, amae*). This was a favored tree of the god Ro’oteroro’o, and presumably of other gods as well, inasmuch as some of them commonly communicated with humans by means of the rustling of its leaves. It was found growing within the precincts of many marae. Out of its durable and strikingly colored wood were carved some spirit images and ceremonial thrones (Henry 1928:190n), and twigs of it formed part of the shelter set up in marae to celebrate natal rites of offspring of high-ranking kin-Titleholders. Its leaves were offered to the gods as a substitute for kava (Henry 1928:161), and sprigs of it were held by priests as they prayed.

The various religious uses of rosewood are comprehensible in view of its association with Ro’o the Prayer Chanter, Tane’s messenger and patron god of the priestly occupation of praying. But how this association came about in the first place is not explained in any myth known to me; nor is it clear historically whether this tree derived its religious associations from a natural proliferation at sites favored for marae, from the sculptural properties of its wood, or from some simile of name or of attribute.

Ti (*Cordyline terminalis*). The long glossy leaves and stem of this characteristically Polynesian plant served a variety of purposes, religious and otherwise. According to Henry, of the thirteen varieties of the plant distinguished by the Maohi, *ti’uti* was most favored for religious uses, and it was cultivated at marae (1928:37). In connection with religious ritual the ti plant was used to validate a marital agreement (Henry 1928:281); to inspire war orators (who were in fact called *rau-ti* ‘ti leaf’); to protect ritual firewalkers from burns; and so forth. Some beliefs served to interlink and validate ritual uses of ti—for example, the patron goddess of firewalking wore ti-leaf skirts (Henry 1928:214); but I can discover no Maohi myths that “explain” such uses. Nor can I perceive how any natural attributes of the plant, except possibly its convenience in carrying, might have led to its ritual uses in the first place.

Water. Seawater, especially, had a number of ritual uses—serving mainly as a means (through sprinkling, bathing, or immersion) of investing some

person or thing with sacredness, or of removing both sacredness and ritual contamination. Beyond the obvious everyday Maohi uses of water for cleansing purposes, I can discover no specific rationale—mythical or otherwise—for this Maohi version of a near-universal type of ritual practice. In this connection, I should mention the occasional ritual use of coral or sea moss as substitutes for seawater.

Several other plants were used in connection with religious ritual, but with less generality and frequency. Among these were ironwood, sugarcane and its juice, sandlewood oil, turmeric, *maire* fern fronds, coconut-palm flowers, cream of the coconut itself, and breadfruit. However, aside from certain valued physical attributes of these plants and plant products (e.g., hardness, sweetness, aroma, color, consistency, taste), I can find no specific mythical charters for their ritual employment.

To the list of ritual objects must be added human skulls, which served as “vehicles” for spirits. Also should be added the plants and animals regularly used as offerings to the spirits: kava, vegetable foods of several kinds, pigs, dogs, chickens, fish, turtles, and of course humans.

Besides the natural objects just listed there were several fabricated ones used regularly in ritual. Chief among these were the images (*to’o*, *ti’i*), prayer surrogates (*tapa’u*), and prayer tallies (*viriviri*) already mentioned, and also sennit (rope made out of coconut husk fiber), bark cloth (*tapa*), mats, and spears.

All the above-mentioned natural and fabricated ritual objects figured in more than one kind of rite, but most of them retained more or less the same “meaning” in all or nearly all the rites. Again, the “messages” of some of the ritual objects, such as plantain shoots and rosewood branches, were expressed simply by placing the objects in view, but in other cases it was necessary to handle the object with some conventional ritual action. I have already described some kinds of ritual actions: petitioning with words, offering objects, shoulder baring, drum beating, and (possibly) dancing. Some other of the more frequently employed ones are as follows:

Prostration. Ordinarily, respect for most manifestations of powerful spirits (and for humans holding very high-ranking kin-Titles) was expressed by shoulder baring or crouching, but in the immediate presence of such a god as ‘Oro, men (women were not usually permitted so close) wholly prostrated themselves.

Self-offering. As a final appeal to a god on behalf of some ailing kinsman or superior, individuals sometimes tied cords around their necks and had themselves presented to the god as one would offer a pig for sacrifice—an expression of humility, it would seem, but not one to be accepted literally.

Self-bleeding. Few customs of the Maohi so amazed and puzzled their European visitors as self-bleeding.

When a woman takes a husband, she immediately provides herself with a shark's tooth, which is fixed with the bread-fruit gum on an instrument that leaves about a quarter of an inch of the tooth bare, for the purpose of wounding the head, like a lancet. Some of these have two or three teeth, and struck forcibly they bring blood in copious streams; according to the love they bear the party, and the violence of their grief, the strokes are repeated on the head; and this has been known to bring on fever, and terminate in madness. If any accident happens to the husband, his relations or friends, or their child, the shark's tooth goes to work; and even if the child only fall down and hurt itself, the blood and tears mingle together. (Wilson 1799:340)

Women also used this means to express (or at least display) great joy, as upon the occasion of the return of a close relative after a long or dangerous absence. The custom was practiced more often to express "grief" resulting from bereavement, and as such it had both social and religious rationales. In connection with the latter, which is our present concern, it will be recalled that blood constituted a highly acceptable offering to 'Oro; and while a similar appetite need not be imputed to all spirits, it is not unreasonable to suppose that the ghosts of individuals being grieved for found satisfaction in this painful sacrifice of their survivors' precious blood. There were other highly conventionalized ways of displaying bereavement, including both wet-and dry-eyed weeping, but none apparently so telling as self-wounding and the copious flow of blood.

Conjoining. Blood also served ritually to symbolize marriage, but a more common way of ritualizing alliance—marital or political, or rather marital-political—consisted of placing together two pieces of tapa. Conversely, *disjoining* was ritualized by tearing apart some token of unity. While both of these ritual actions directly involved relations between human social units, they presumably involved the spirit members of these social units as well.

Burying. Burying an object had the effect of confining its associated spirit to the immediate area. One manifestation of this was the practice of interring human sacrifices within marae precincts; another was the practice of burying the image of an unwanted tutelary spirit in some remote spot. Still another was the custom of filling in the hole containing a corpse's "sins."

Scapegoating. This also was employed as a special means of removing an unwanted spirit-associated object, often by sending it off to sea in an unmanned canoe.

Burning. In this connection it is noteworthy that burying and scapegoating were practiced far more frequently than burning as a means of dissociating unwanted spirits from humans. The assumption perhaps was that total

destruction of an object-medium merely released its associated spirit, and nearby, at that.

From an observer's perspective the rationale for most Maohi ritual actions lies in metaphor, but whether the Maohi themselves regarded their actions in this light is a question that cannot be answered because of lack of myths or other evidence concerning their invention.

While all ritual objects and ritual acts had fairly explicit "meanings," they were employed to achieve various kinds of objectives by putting them together in various permutations. Self-bleeding, for example, could be employed either to turn aside the recriminations of a kinsman's ghost or to enlist a spirit's aid in revenging a political humiliation depending upon what other kinds of prayers and offerings went with it. Some of these combinations will be listed when I describe particular rites, but first it will be useful to list the more common, explicit and public, general objectives for which rites were performed. (I shall also leave for later discussion the "implicit" or "esoteric" or "underlying" objectives which some writers believe they can perceive in some Maohi rites. It was as true of the Maohis as of all other humans that they often performed rites for private, individual reasons which were in addition to or even contradictory to the rites' conventional purposes.) Some of these objectives were:

- a. to invest with a spirit's presence a place, an object, or a person, in order to communicate with that spirit;
- b. to dispossess a place, object, or person of a spirit's constraining presence;
- c. to secure spirit validation for some social relationship: a marriage, a friendship, a political alliance, et cetera;
- d. to enlist a spirit's aid in some specific, stated enterprise, such as causing crops to grow, fish to bite, tools to work, weapons to strike; or injuring or destroying an enemy, through sorcery; or protecting oneself, one's possessions, or one's enterprises;
- e. to insure spirits' continued assistance in maintaining success and well-being;
- f. to persuade a spirit to nullify the consequences of past errors; and, more rarely,
- g. to render thanks to a spirit for past assistance.

In some cases a rite (*oro'a*, either a single integral ritual action or a whole series of partial constituent ones) had only one such "public" objective, but most Maohi rites had two or even more.

Most Maohi religious rites were so inextricably implanted in what Westerners would call the secular activities of life that they will be described in those contexts in chapters to follow. Here, however, I will

describe two kinds of rites which had to do with ritual itself—the first with maintaining the prerequisites for it, the second with saving humans from the consequences of having performed it incorrectly, or too infrequently.

Paiatua. This grandest of all the Maohi religious rites was performed only at the so-called national (i.e., tribal) marae.⁵⁰ According to Moerenhout, it took place every three months, at the beginning of each “season”: beginning of “spring,” in early October; beginning of “summer,” late December or early January; beginning of “autumn,” March or April; beginning of “winter,” in June (“the season of mourning [for] the departure of the gods”) (1837:I, 515).

In Henry’s view, on the other hand, *paiatua* was performed as a part of or a prelude to other important rites marking, for example, the inauguration of a chieftain, or his prolonged illness, the cornerstone laying of a new marae, or the rehabilitation of a district after some great calamity. I prefer Henry’s point of view over Moerenhout’s because the latter appears to have confused *paiatua* with certain other rites, and to have exaggerated the importance, or indeed fabricated the very existence, of a Maohi four-season calendar. Another basic reason I prefer Henry’s view to that of Moerenhout is that the former, working mainly from Orsmond’s notes, was in a position to be far better informed about Maohi customs in general, and about Maohi religious ritual in particular.

Paiatua required three days to perform, preceded by a considerable period of preparation and followed by a day or more of feasting and other diversions. All members of a marae’s congregation took part in the rite, although women and children were as usual only remotely and indirectly involved.

Three things had to be done in preparation for a *paiatua*, as well as for any other important public marae rite: a large supply of foodstuffs had to be collected and made ready for offering and feasting; the principal ritual officiants had to prepare themselves “spiritually” for their duties; and the marae appurtenances had to be put in order. Specific information about the first of these activities would be invaluable for an understanding of Maohi social relations and economics, but such information is unfortunately scant. A general account of priestly self-preparation was given earlier in this chapter. The activity of putting in order the marae’s appurtenances (and ritual objects) must have preceded the rite itself by many days and even weeks, since it included painting or replacing the tutelary god’s official canoe, and the manufacture of a large supply of fine white tapa by the marae’s staff of big-bellies.

After everything was ready, and during the two days before the main program of the rite, messengers of the marae’s principal proprietor went through his realm bearing the following proclamation:

E fati 'ava, e fati 'ava!
 Auanei e fati ai!
 Te ara i te tai e taimara hia,
 No te va'a hoehoe a te atua,
 Eiaha te va'a ta'ata ia fa'afarerei.
 Eara i te 'e'a i uta, na te ari'i,
 E ara, aua'a e haerea
 Te ara nui e te ara ri'i!
 Aua'a ana'e ia!
 Ei ahi tapo'i;
 Eiaha ei turama, a mahuta te atua;
 Te ra'a no te atua e purara.
 E vaere'a marae apopo;
 Ei a'ahiata apopo atu,
 E fa'arara'a,
 E fa'aaraara'a i te atua.
 A ara o taura tahu'a,
 A ara mai apopo!
 E hopu i te vai,
 Mirimiri i te mata,
 E hume i te maro 'uo,
 E noho i ni'a i te mahora
 E noho e upu i te ahoa
 No te vaere'a marae.
 O te ara o te ari'i,
 Te ara o te ta'ata,
 To ara o na hui tapairu,

 E e'e i te papa.

 E ra'a apopo,
 E vaere'a marae.
 Ei te a'ahiata nui atu
 E fa'arara'a atua.
 O te atua i ni'a, te atua i raro;
 Te atua i tae, te atua i uta;

 Te atua i roto, te atua i vaho:
 E tae ana'e mai i teienei oroa.
 E ra'a, mo'a!

The ava breaking, the ava breaking!
 It is soon to break!
 Avoid the sea restricted,
 For the god's canoe for errands,
 The people's canoes must not meet it.
 Avoid the roads on shore, for the king,
 Take heed and pass not
 The highway and bypaths!
 Avoid them all!
 The fires must be extinguished;
 Burn no light, lest the gods take flight;
 Sacredness of the gods will pervade.
 Weeding of the marae tomorrow;
 The following morning early,
 The awakening,
 The awakening of the gods.
 Awake, O body of priests,
 Awake and come tomorrow!
 Bathe yourselves,
 Feel your faces,
 Draw on the white girdle,
 And sit upon the lawn
 To recite the *ahoa* (life giving)
 For weeding the marae.
 'Tis the awakening of the king,
 The awakening of the people,
 The awakening of the waiting maids
 (lay worshippers),
 Who will alight upon the stones
 (marae).
 Sacredness tomorrow,
 Weeding of the marae.
 And in the early morning following
 Awakening of the gods.
 The gods above, the gods below;
 The gods of the ocean, the gods of
 the land;
 The gods within, the gods without;
 They will all come to the ordinance.
 'Tis sacredness, holiness!

(Henry 1928:158-159)

The rite itself was ushered in at nightfall by the beating of the marae's great drum, thereby announcing the prohibition of all ordinary activities, such as burning lights, cooking food, farming, traveling, and fishing. "No living being must roam about, no dog must bark, no cock must crow, and no pig must grunt or squeal; only the occasional sound of the marae drum should break the silence" (Henry 1928:159).

Early the next morning the principal men of the realm repaired to the marae and proceeded with the formal work of cleaning it; this *vaere'a marae* consisted of scraping accumulated moss from marae stones and of weeding and sweeping the courtyard. The principal laymen worked at their job

from west to east and deposited in the marae's refuse pit all the trash they collected— "... blindness or death from the gods being the supposed sure consequence if they scattered it to the winds" (Henry 1928:159).

While this work was taking place the marae's priests sat to one side and chanted an *ahoa* (breath-giving chant), with repetitions and permutations of the following kinds of phrases:

It is marae weeding!
 The scraping of moss for [the god] Ro'o-te-ro-ro'o
 And for the host of gods.
 The moss will be scraped.
 The grass will be pulled up
 And swept will be the ground
 To render the marae attractive
 To Ro'o-te-ro-ro'o and to all the host of gods.

(Adapted from Henry 1928:159-160)

Meanwhile the marae's attendants, the big-bellies, made new coconut-leaf prayer surrogates and prayer tallies, hung new strips of tapa and matting on *unu* boards, and erected posts to serve as perches for visiting gods in their bird incarnations. They also cleared and refurbished the altars, laying out miro leaves for the gods as substitute for kava—a leaf for each principal god invited to the rite, with some extra leaves for whole classes of gods, collectively, in order to avoid slighting any of them and thereby incurring their displeasure and attendant penalties.

As night approached the priests proceeded to the marae to summon the gods by means of the messenger gods (*'arere*), whose images they set up and bathed, symbolically but not actually, in a basin of water formed out of a large leaf of bitter taro (*'ape: Alocasia macrorrhiza*), after first having consecrated the leaf and water to the purpose, and after repeating in unison two prayer-chants. The first chant was 'Maui's marae and altar blessing':

Ia ora te fenua! Ua ora te ma'i o te
 marae, ua vaere hia, ua ioio. Ua ora te ma'i
 o te unu.

Ua ora te ma'i o te fata rau.

Ua ora te ma'i o te 'utuafare o te atua.
 E haere ana'e mai te atua, e û ma te uri.

May the land live! The marae is restored, it is weeded and become handsome. The carved ornaments are renewed. The altars are renewed. The home of the gods is renewed. The gods will come, and gather in the darkness.

(Henry 1928:162)

Then it was followed by the 'preliminary invocation' (*tarotaro*):

E te atua e! e aroha mai i to taura
 tahu'a nei. E fare nohora'a to te 'opu-nui,
 e to te mau uru, e pure 'iri anu ra matou,
 e 'ore e ta'oto, i teie 'aru'i, e rari i te hau,
 eiaha rà ia rari i te ua e te atua e!

O gods! Have mercy upon your body of priests here (present). The *'opu-nui* and the possessed images have a house, but we shall be praying chilly, without sleep, this night; we shall be wet with dew, but let us not be wet with rain, O gods!

(Henry 1928:162)

This second chant refers to the ritual requirement that priests say their prayers in some physical discomfort—for example, wearing thin and cold-conducting garments in the chill night air. But, they plead, “do not add to our misery by causing rain to fall as well!”

Then the spirit messengers were sent forth by the priests with an injunction called ‘sending-off-of-messengers’ (*tu’utu’ura’a ‘arere*), which in the case, for example, of ‘Oro’s marae of Opoa, (Ra’iatea) began as follows:

O Ti’a-o-atea, messenger of the gods, arise and feel thy face, bathe in the water, draw on thy loin-girdle, put on thine official clothing, take a great walking stick, and run to Red-Mountain in Tana’a, for Tane and his host of gods to come to Opoa, as gods for this rite.

There is prayer in this world, in the home of Warrior ‘Oro.

O Rei-tu, messenger of the gods, arise, and feel thy face, bathe in the water ...

and so on, thus sending off each messenger by name to invite some specific god, and ending with a general invitation:

Arise and run, O messengers here present, to those gods, and they will bid the numerous gods, the thousands of gods, the gods above, the gods below, the gods of the sea, the gods of the land, the gods without, the gods within, the gods of darkness, the gods of light, to come as gods for this rite.

There is prayer in this world, the messengers are dispatched! (Adapted from Henry 1928:162-163)

Continuing in this vein, the high priest “reported” the arrival and favorable reception of each messenger at his destination and then “announced” his return with the god thus summoned—a lengthy repetitious exercise which took many hours to perform and ended with a dawn-greeting chant whose poetry even the purported “translation” cannot entirely spoil:

Ua taha te ata i te ra’i,	The clouds are bordering the sky,
Ua ara te ata!	The clouds are awake!
Enà te ata e hiti	There are the rising clouds
E hiti i te po’ipo’i;	That ascend in the morning,
E ata i puia—	Clouds that are wafted—
Puia ia ata poiri,	Wafted are those dark clouds,
I oti matietie,	Made perfect,
E mara’ara’a mai ‘Oro-pa’à,	And lifted from ‘Oro-pa’à,
Te fatu moana, mai.	Lord of the ocean.
O maru i te pô	In the shades of night
A taha te ata e hiti,	The clouds that rise embank,
O te ata e taupape,	The clouds condense, and
E fana ‘tu i te rà.	Form an archway for the sun.
I puia ia ata,	The clouds are wafted,
Aua’a i oti matietie,	Perfected betimes,
E mara’ara’a mai ‘Oro-pa’à,	And lifted from ‘Oro-pa’à,
Te fatu moana mai.	The lord of the ocean.
O maru i te pô	In the shades of night
A taha, a ohiti te ata,	The clouds do rise, and part,
E tautape, e tatapa	Condense, and reunite
E fana ‘tu ia ata ‘ura’ura,	Into an arch of red clouds,

No te râ e hiti mai
Mai 'Oro-pa'à o te moana mai.

Ua ao, e ti'i ra tatou i te atua, ia oti
te pai atua, o te ro'o noa hia mai ho'i e
te ta'ata e pohe atu i tona aro.

For the sun as it rises
From 'Oro-pa'à of the ocean.

It is daytime, let us now fetch the gods,
that we may get through the assembling of
them before people come and die in their presence.

(Henry 1928:165)

The third and climactic day of *paiatua* began with a procession to the *ahu* of the marae led by the presiding priest. First in line were four “nurses” carrying the ark containing the image of the marae’s tutelary god and shouting the god-calling “*ho, ho, ho.*” Behind them walked priests bearing images of the marae’s subordinate gods, and priestly representatives of all other marae in the district—familial, guild, and so forth—each carrying his congregation’s god-image wrapped in its usual coverings. Last of all were the district’s sorcerers with their fetcher-images. Only these and the marae’s own clerical staff and official pray-ers (*opure*) were present at the marae on this awesome occasion; all others had to wait outside.

When the ark containing the tutelary image was deposited on the *ava'a* before the *ahu* the climax of the rite began to unfold. With everyone seated the presiding priest took out the tutelary god’s image from the ark and removed its wrappings. Then, while the wrappings were being removed from all the other assembled images, he intoned a prayer-chant, calling upon the god to restrain his devastating power while the image was thus exposed to public view. Thereupon, all present prostrated themselves and greeted the god, who replied (through the presiding priest) with a warning against thwarting him in any way.

Next came the *taritoara'a atua* (the god’s exchange).⁵¹ Each image-bearer presented his exposed image before that of the uncovered tutelary god. In doing so he handed the tutelary’s priestly guardian some new red feathers, and he received in exchange some of those that had formed the covering or had been stored inside the tutelary’s own image. This action was, according to Henry, “... supposed to add new power from the greater god to the lesser ones” (1928:167). In other words, it was an act of central importance in Maohi religion and, as we will see, in Maohi politics as well.

Occasionally, reported Henry, an exchange was made on behalf of an old and desecrated image, one whose feathers had been stripped by an enemy in time of war—a predicament described as ludicrous to the gods and mirth-provoking to humans. Newly made images were also presented before the tutelary’s image, whose priest provided them with consecrated feathers to the accompaniment of these words to his god: “Here is the image, here are the feathers; the image with feathers represent thee, O god: My invocation will enter over there; it will hold over there.” (Henry 1928:168)

Last in turn were the sorcerers with their fetcher-images, and after this a 'sacred male pig' (*pua'a tapena*) was offered to the tutelary god, along with a prayer of atonement ("to set free sinful man"). Then, all the images were covered in new wrappings, drums announced to the populace the completion of the episode made so dangerous by concentration and exposure of much sacredness. Outside the marae, restrictions on ordinary activities ended with this announcement, but inside the rite proceeded, with 'praise of the people' (*umere a te ta'ata*), in which the chief and other notables joined with the clergy in shouting "*ho ho ho*," in hand clapping, and in chants of praise and of petition, ending with a 'saving invocation' (*upu fa'atonu*), which went as follows:

Hearken unto us, O gods!

Those numerous gods, those thousands of gods, turn unto us, accept our petitions!

Preserve the population of this land; preserve the generation; may they live in the gods. Preserve the frontiers of the people's habitations. Watch against the man with rough cheeks, the man with angry looks, against the incendiary, against him who lets fly the ends of his loin-girdle [one so fleet of foot—intent on evil—that the ends of his girdle flew as he ran]. Put all those things entirely away. Preserve us human beings, O host of gods! (Henry 1928:171)

While this was going on more offerings were presented to the gods: pigs, dogs, and a long plantain shoot, in lieu of a human sacrifice.

Then the 'grand dismissal' (*parima nui*), quoted on p. 67, was chanted; the prayer called upon the gods to release the lay participants from the restrictions of sacredness. This was followed by a prayer from the presiding priest:

Ua ora te ma'i o te marae, ua vaere'a
ua ahoa hia! Ua ora te mai o te ari'i e o
te va'amata-eina'a; ua tui roto hia, ua pe'e
te hara; ua pure hopu hia, e ua ma. Teie te
'ura, teie te hauniu, teie te ta'ata o mei'a
roa; te omi'i ma te avae, te avae ma te omi'i,
ei utu i to riri hotua nui, e te Atua; no te
hara nui, no te tu'utu'u, no te tae reo, no
te atua i ma'au hia, no te rimu o te marae i
va'u hia i hara hia, no te mimiro 'oau, no te
mata matae'a, no te tuhi, no te ahua, no te
fa'atomo i te varua ino ia vetahi e. Tei reira
te hara e uri mai ai 'oe, e te Atua?

E tara mai, e homai ia meia roa nei, e
huri i tai nui atea, ia ora to maru. E te Atua
e a parima mai i to pu'e 'opure nei, ua mo'a.

The evil of the marae is repaired, it has
been weeded, accompanied with the chant!
The evil of the sovereign and of the clans
is ended; the inner service has wiped out
sin, the closing prayer is finished, and all
is clean. Here are the 'ura feathers, here is
the peace token of coconut flowers, here is
thy man, long banana, from his head down
to his feet, his feet to his head, to arrest
thine anger of great growth, O god; for great
crimes, for family discord, for hasty words,
for irreverence to the gods, for imperfectly
scraping off the moss of the marae, for
rankling rage concealed, for mutual es-
trangement (of friends), for cursing, for an-
nihilating by sorcery, for sending evil spirits
into others. They are the sins which dis-
please thee, O god?

Undo them, place them upon long ba-
nana here present, cast them into the track-
less ocean, that thy devotees may be saved.
O god, dismiss these thy worshipers for they
are holy.

(Henry 1928:172-173)

After the lay participants had departed, the clerical staff of the marae terminated the main body of the rite with a special 'leave-taking' (*ripoa, turue*) prayer, while placing their prayer surrogates against the uprights before the *ahu*:

E Ta'arua-nui tahi Tumu, e tena ati tama aitu e! Ei onei 'oe ei roto i te reva o teie nei vahi a oa ia te ta'ata nei. Ua api roa ia 'oe. Ei raro matou te ta'ata nei, e taahi noa i i te repo fenua o te ao nei. E te ati matua manua mai te Pô mai, ei ona 'oe i roto i te reva o te vahi moa ia te ta'ata nei; ei raro matou e ta'ahi noa i i te repo fenua o te ao nei. E te matua maitatai o te Pô, ei ona 'oe ei roto i te marama o te ao i teie nei vahi moa ia te ta'ata nei, ei raro matou e ta'ahi noa i i te repo fenua o te ao nei.

Tapu atua na, noa mai nei! Tera te aho o te marae, to tapa'au ra'a mata, to pu'e tahu'a, o Anà-ni'a, o Anà-mua, o Anà-roto, o Anà-muri, o Anà-tipu, o Anà-heuheu, o Anà-tahu'a-ta'ata-metua, o Anà-tahu'a-vahine, e o Anà-iva: Te maro tahu'a ia'na, to tuturi ia'na, te pure ia'na, te aro tahuia ia'na. Parima mai i to pue tahuia nei!

O hi'i rà ma tau epa,
Tau epa e toro e!
Tau epa rima, rima,
Tau epa rima hi'i!
E tû, tû a o tai tua,
Tau a 'ie,
O tai tovarovaro.
Tara papa,
Tara tava;
O hahu ma te maru,
O ha'apa'a tauai a maro
Oi re, oi re, oi re
I roo e,
A taviri ai ai i taha ruru e!
Ua hi'i ma epa, epa!

O, great Ta'arua, the unique Tumu, and thy great family of gods! Remain here, in the air of this place sacred to man. It is filled with your presence. We mortals shall remain below, treading the soil of this earth. O hosts of malignant spirits from Pô, remain there in the air of this place sacred to man; we mortals shall remain below, treading the soil of this earth.

O host of good spirits from Pô remain there in the height of the world, in this place sacred to man; we mortals shall remain below treading the soil of this earth.

Let sacredness remain here, and let us become ordinary! There is the life of the marae [pointing to the *tapa'au* upon the slabs], thy sacred *tapa'au* with masks, the body of priests, Polaris, Antares, Regulus, Zubeneschamali, Dubhe, Alphard, Arcturus, Procyon, and Betelgeuse. [Then speaking of the *tapa'au* in the singular number]: Thy sacerdotal loin girdle is with him, thy leaning slab is with him, his are the prayers, he has the face of the priest. Dismiss thy priests here present!

Now, this is nursing thee to rest,
Thine outstretched resting place!
Thy resting place of arms, arms,
Thy resting place of nursing arms!
The ocean will ever exist, exist,
Sails will ever alight,
Upon the vibrating seas.
Enchantment on the [cloth] board,
Enchantment on the bark [cloth];
Made smooth and soft.
The sweet-scented cloth put out to dry.
Well nigh defeat, defeat, defeat,
Overtook [me], O,
As I rolled up the cloth outspread!
Nursed and rest, rest [thou]!

(Henry 1928:173-174)

Meanwhile the populace had brought to the marae quantities of baked hogs, fish, turtles, and vegetables, from which the priests selected some to place on the altars and some for their own use. In addition to the food, the populace brought mats, tapa, and feathers, for use in marae services. Presumably these offerings were supplied

through means of a general levy on the marae's entire congregation; Henry stated only that it came "from all classes." Presentation was made by an individual described as "the people's orator":

E utu o ari Po ari ao. Pana hiti pana toa, e na Atua e; afa'i e atu i te 'ino, ia 'ore i te ao nei! A fariu mai i to aro ma te aroha ia matou, te ta'ata hara nei! E tapena pua'a, e tapena 'uri, e tapena moa, e tapena ro-roi; teie te meia, teie te mau maa ato'a o te fenua, a fari'i mai, e te Atua e. Euru pani hia te uru o te mai; e rau hihi; e rau avari. Fa'aaroha mai to maru, e te Atua, tahiti'a mai.

Here are peace offerings to the depth of Hades, to the extremities of the world. Push from the east and from the west, O gods; remove all evil from this world. [Behold these peace offerings to ward off your anger, O gods], turn your faces with favor upon us sinful people. Here are hogs consecrated, dogs consecrated, fowls consecrated, coconuts consecrated; here are bananas, here are all the fruits of the land; turn to us, O gods. Effective prayer will be offered for the sick possessed; many spirits will flee away; many people will recover. Have pity in mercy on us, O gods, hearken unto us.

(Henry 1928:175)

The presiding priest responded as follows:

Na ho'i te ma, e ma no te aia'ai; a ma i uta, a ma i tai, a ma i ni'a a ma i raro: a ma te Pô, a ma te ao, a ma te marae, a ma te opure, a ma te feia noa, a ma te huia ato'a. Homai i te 'ai o te fenua, homai i te 'ai o tai, homai i te hua'ai o te ta'ata ia rahi e te Atua e. Te haere ana'e nei ra te va'a mataeina'a i te 'utuafare, e ai mai te ai haere e ai 'ino, e 'ai i te atea; eiaha e hi'o atu, e te atua e! Area matou, e 'ai'ai mai te horuhoru i mua i to aro. E te atua e, aroha mai ia 'ore ia tupu te 'ino. Tahiti'a mai, e te atua e!

Behold the cleansing, cleansing from sin; clean inland, clean seaward, clean above, clean below, Po is clean, the world is clean, the marae is clean [and then he enumerated everything upon it as clean]. The worshipers are clean, the people ordinary are clean, the families are clean. Give us food in the land, give us food in the sea, give us numerous offspring, O gods, Now all the clans are going home, to eat moving about, to eat without order, to eat abroad; look not at them, O gods! But as for us, thy body of priests, we shall eat here in awe in your presence. O gods, have pity upon us that no evil befall us. O gods, hearken unto us!

(Henry 1928:175)

With this, the assembly again separated—the laymen to enjoy their feasting away from the marae precincts, and the clerical staff to remain at the marae to eat, with prescribed constraint and dignity, their portions of food near the place the gods were believed to be partaking of theirs.

Paiatua was then concluded with a final prayer:

Tapu atu na noa mai nei, e tena nu'u atua tena mano atua, te ho'i ne matou i to matou mau 'utu'afare, e tomo i te anu mo'a, e tauteute, e hani-hani, e fa'aapu e fa'anoa noa. Eiaha e mata roa mai, eiaha e taria roa mai ia matou. Fariu i to mata i te po e fariu i to tau i te ao. Te vaiho atu nei matou i te ra'a ei ona te mo'a, e te Atua e!

Let sacredness remain here that we may become ordinary, O host of gods, those thousands of gods! We are returning to our homes to put on unconsecrated clothes, to do domestic work, caress, farm and become ordinary. Be not farsighted, be not farhearing to us. Turn your faces to darkness and turn your back to the light. We are leaving sacredness, let holiness be there [with you], O gods!

(Henry 1928:176-177)

After this prayer the priests and their assistants returned to their homes and ordinary lives, but they left little prayer surrogates behind in the marae to continue their dialogues with the gods.

Taraehara. A large proportion of the religious rites performed by the Maohis had as one of its purposes—or even its main purpose—the “untying” of *hara*, or *taraehara*. To begin with, there were certain kinds of actions which, when committed by priests during religious solemnities, were regarded as ‘mortal sins’ (*pāhara aiaai*) and required *taraehara*: e.g., *taute*, doing domestic work; *hara faiaia*, irreverence in offering human victims; *hara i te fa-‘ahaere’a*, clumsiness in processions or failures in recitations; *paoa*, hurrying over prayers to serve the food; *ai haruma i te omu pu’ua* (or *honu*), greediness in eating the head of a pig (or turtle). “For any of these offenses, sure judgement upon the [guilty] priest, people, and the land was supposed to follow, and if confession and atonement were not quickly made the priest, it is said, would die in great agony by a curse from the gods” (Henry 1928:198-199). In such cases, it was reported, the “people” (the whole congregation) atoned for the “sin” by offerings to the offended gods, while the offending priest was suspended from all clerical duties and privileges until he had personally atoned with an offering of his own.

Elsewhere, Henry reported that there were two kinds of offerings made to the spirits as *taraehara*: *ta’ata o mei’a roa* (man-long plantain), offered as a substitute for a man; and *fei ‘ai* (petition with food), a pig or dog besmeared in its own blood, offered as a “national” [i.e., tribal] atonement (1928:198).

From these fragments it would appear that *hara* were (or included) certain errors made in the performances of religious ritual, and as such they required atonement in the form of another religious ritual, namely, *taraehara*. However, two other usages of *taraehara* serve to complicate its meaning or, at least, our comprehension of its meaning. One is the kind of *hara* that required, or could be nullified by, “untying”; the other is the mechanics of “untying.”

The LMS Dictionary defines *hara* as sin, transgression, crime, guilt; unequal, not hitting the mark; to be unequal, to be deviating from a line or rule; to be in a transgression. As just noted, from the examples given above the kind of *hara* requiring religious atonement would appear to include errors committed by humans with respect to their relations with the spirits, but Henry implied the recognition of other kinds of *hara*, in her listing of the following additional types of *taraehara*: *tai fenua* (crying for homeland, homesickness), food and other objects presented to a chief by persons wishing to regain his favor in order to return home after banishment; and *faitera’a tau’a* (reconciliation of *tau’a*), objects exchanged between friends

in order to resume friendship. Thus it would appear that acts of disobedience to one's chief and unfriendly acts between friends were also classed as *hara*, and as such were susceptible to "untying" by means of an exchange between the interested (human) parties.

Hara, then, would appear to signify errors committed by humans with respect to both spirits and other humans—which should not be surprising inasmuch as the Maohis believed, or at least acted as if they believed, that the boundaries of their society included both humans and spirits. On the other hand I have found no instance in which *hara* applied to error of a non-social-relational kind, such as a mistake made in making a mat or in casting a net. More crucial, however, is the question of what kinds of human-to-human *hara* were considered of sufficient interest to spirits to require "untying" not only by human-to-human exchanges but also by human-to-spirit petitions and offerings. In other words, how far did spirits concern themselves with relations between humans? I must postpone consideration of this question, so relevant and important for an understanding of social relations, but I note in passing that it is often complicated by those not unusual instances in which humans came to be identified with spirits in one way or another—for example, when a district's highest-ranking Titleholder "became" its tutelary god.

The second obscurity in the concept and action of *taraehara* derives from the question of what was "untied," and how the "untying" was brought about. The Maohi language was rich in metaphoric usages, but certain mortuary practices, which will be described later, imply that at least some kinds of *hara* committed by an individual produced in his body a dangerously infectious deposit which had to be drained off and buried after his death lest it infect others as well. Added to this was the example of a type of scapegoating ritual, called *ahuātai*, defined by the LMS Dictionary as a certain prayer and ceremony formerly used when war and sickness prevailed; a model of a canoe was made, fitted up, and sent to sea with the supposed sins and sickness on board. Putting together these and other fragments (some of which will be listed in following chapters), one gains an impression that the Maohis placed credence in an actual guilt-substance, also called *hara*, which attached itself to people, and through them to objects and places, as a result of their having done or not done certain acts. Moreover, such guilt-substance was dangerous to the health and well-being of the infected individual; but ordinarily it could be removed by performance of certain ritual action (*taraehara*), thereby rendering the person and thing and place clean (*mā*) and healthy (*ora*). It is not entirely clear whether this type of guilt-substance owed its efficacy to an intrinsic power of destruction or to the attraction it offered to destructive spirits. In conformance with the general shape of Maohi thinking it was more likely the latter.

Nor is it clear whether all "errors" classed as *hara*, or only those connected with human-spirit relations, resulted in deposit of guilt-substance.

Thus, many uncertainties cloud our understanding of Maohi suppositions concerning their universe, especially those regarding relations between humans and spirits. The sources contain a wealth of detail about religious belief and ritual, but they are not complete enough to provide answers to some of the more basic questions. Whether this is due to inadequate reporting or to my own failure in comprehension is not clear. It could even be that the Maohis did not address themselves to the basic questions or, if they did, that they were unable to formulate any consistent and universally accepted answers. I hope, however, enough of their ideas have been presented to provide more understanding of the descriptions that follow than would have resulted from presentation of a mere catalog of activities.

CHAPTER 4 *THE DAILY CYCLE*

DAILY ROUTINE

To some of the early European visitors the life of the Maohis appeared to consist mainly, and by preference, of long periods of idleness and repose: "The usual times for eating are the morning, and before sunset in the evening. They devote all the rest of the day to lying stretched in the shade like beasts of the field, with the exception of a few who, being obliged by their lords to do so, go out to fish or attend to other jobs" (Corney 1915:28). If this was not true of everyone, it was said to be so at least of those who were free to do as they wished: "... the better sort [of middle-aged people] seem to spend most of their time in eating and sleeping" (Beaglehole 1955: 126). Another observer put it somewhat differently: "It is not that they are indolent; they are in fact never still, always moving about. What distinguishes them, however, is that their comings and goings are pointless, unimportant, often childish, and are engaged in in a spirit of light-hearted play." (Freely translated and abridged from Moerenhout 1837:II, 74, 77)

Sleep and play the Maohis of course did, and often at times that were considered to be unconventional by their routine-bound, toil-hardened visitors. They appear also to have derived amusement from some otherwise laborious occupations. The fact remains, however, that they did manage to survive and multiply, and even to fashion for themselves a way of life far more refined and a society considerably larger and more complex than was achieved by many other peoples constrained by a neolithic technology and a formidable insularity. But I leave to others the more theoretically rewarding task of evaluation by comparison, and I limit myself to description.

Most Maohis awoke and arose shortly after dawn, proceeded directly to a nearby stream or beach for ablutions, and to some naturally screened area for elimination. Returning to their homes they then rolled up their sleeping mats, partook of a light breakfast of leftovers, and set about their main tasks of the day—fishing, farming, collecting food, making bark cloth, constructing buildings, conferring, performing rites—or simply amusing themselves. The principal meal of the day was eaten in the early or late afternoon, de-

pending upon the circumstance, and was generally followed by an hour or two of repose. After that there was more work for some persons, but most spent the remaining daylight hours chatting, playing, visiting, or preparing implements for the following day's work. Then, they had another bath and sometimes a light supper. By nightfall, which arrives fairly suddenly in this latitude, most people were usually inside their houses for more talk, work, and eventually sleep.

Such was the average sequence of events, day after day and year after year, but it was subject to a wide range of variations. Periodically, for example, the occupations of many individuals varied with day of lunar month and season of year; in addition, some changes in weather served to influence the activities of many people. Daily routine also varied with an individual's age, sex, special occupation, and inclination. And finally, contingent situations, such as wars and illness in the household, served to disrupt everyday life to a radical degree.

Unless some special enterprise required a particularly early start, the Maohis appear not to have bestirred themselves before daylight, regardless of seasonal and locational differences in daylight's arrival. That is to say, at the latitude of these Islands the length of the astronomical day is more than two hours longer in December than in June (Papy 1954:I, 70); and daylight appears considerably earlier at exposed settlements on the eastern sides of islands than it does elsewhere. The Maohis were evidently aware of annual variation in lengths of daylight and darkness, but there is no evidence that they adjusted their time of arising accordingly.

When certain rites were in progress at a marae the arrival of day was sometimes heralded with special prayers, but that does not seem to have been the case in most households.

A morning bath appears to have been regular and universal, not just a perfunctory, sleep-chasing douse, but an all-over affair in the ocean or preferably in a stream, with vigorous rubbing and splashing, and rinsing out of the mouth. Even the youngest infants were subjected to this treatment, which must have been very painful indeed in some fresh mountain streams. Nor did invalids spare themselves from the shock (and probably unfavorable consequences) if they were at all able to move about.

All this, according to Moerenhout, took place in an atmosphere of friendly sociability. People trooped off together to the morning bath, and although carefully keeping their genitals covered through skillful manipulation of clothing, they bathed near one another and kept up a steady flow of generally cheerful talk. (1837:II, 75)

At some point in these proceedings individuals managed to void their bladder and bowels, but aside from the European visitors' approving statements to the effect that elimination was invariably carried out in privacy and

with nice modesty, there are few indications how that was managed. From common modern practice and from a passage in Rodriguez' diary (Corney 1919:180), his editor inferred that one preferred method was to betake oneself to a foliage-screened spot on the beach at low tide; scavenging fish then moved in with the tide to keep the spot clean.

Early morning domestic chores involved little more than rolling up mats, sometimes after sunning them, and storing them in the house rafters. Some individuals used separate bedcovers of tapa, which had also to be stored away; but for many others this tapa cover became the ordinary garment for everyday wear.

Breakfast was seldom a substantial meal in Maohi households. It usually consisted of leftovers from the previous day; to my knowledge no firsthand account contains a reference to the cooking of food for breakfast. The fact that morning was usually the period of hardest physical labor for most Maohis did not lead them to eat heartily beforehand, despite what may have been either actual hunger or anticipation of it.¹

If an individual wanted to work, or had to do so, the usual time for it was between breakfast and what Westerners would call early afternoon. However, there was not to my knowledge any stated norm to the effect that this was the more appropriate time for work.² Fishing activities, particularly, could not be confined to morningtime; indeed some fishing could only be pursued at night. Nor could the mountain-plantain collector always be home by early afternoon. On the other hand, the morning and early afternoon was the period during which, for example, most buildings were constructed, canoes worked on, textiles manufactured, crops cultivated, and food collected. It was the normal practice to collect most of the food on the day it was to be eaten; this meant collecting during the morning, since the main meal was usually early- or mid-afternoon. Exceptions to this same-day food collecting included: fish, caught the previous night; mountain plantains, which did not have to be cooked the day of picking; coconuts; and baked or fermented breadfruit. Several visitors commented upon the numerous signs of industry, which distinguished morning from other times of day, including the almost continuous sounds of mallets beating out tapa on wooden boards.

According to Moerenhout, if a household included any "prisoners" (i.e., *titi* 'war captives')³ among its members, it was these who did the harder work of collecting firewood and foods and preparing meals, while the "free" men of such households spent their time manufacturing weapons, fishnets and canoes, building houses, practicing martial exercises, or performing rites at the marae (1837:II, 77-78).

But Maohis did not "work" because of any notion that it was in itself a good thing. Many individuals able to command the services of others did little or no work of a materially productive kind; and many others—perhaps

all others—often chose to spend their mornings unashamedly in what their visitors would undoubtedly have called idle chatter:

If they had nothing pressing to do, including any essential work activity (a circumstance that now and then occurred), everyone would lounge around in the open in front of the houses or under some trees, males and females together. On some such occasions they amused themselves at some game or other, but more often they did nothing but talk—for, conversation was their forte, and everyone, without exception, loved to chatter. And among these folk, who in this respect were perhaps unique, such chatter among women contained not a trace of slander, of biting criticism, or of malice.^[4] (Moerenhout 1837:II, 76)

The main meal of the day usually consisted of food freshly baked in an earth oven. The technological and social-relational details of this prosaic but pivotal event will be set forth in a later chapter, but it should be noted in passing that baking was a slow process. Some member of the household had to begin preparations for it hours in advance, which in turn necessitated an even earlier beginning to collect and prepare the food for cooking, since most of the items that went into an oven were—either by necessity or convention—picked, cleaned, scraped, and so forth, just prior to baking.

The early European visitors to these Islands differed widely in their estimates of this or that trait of the inhabitants' behavior, but no one to my knowledge characterized them as insomniacs. Nights, as we shall see, were sometimes enlivened with work, and with talk and other diversions long after dark,⁵ but the hour or two after the day's main meal was nearly always devoted to sleep. For one thing, this was usually the warmest period of the day; in addition, the impressive quantities of food ingested by most Maohis at this meal was undoubtedly immobilizing. In any case, while the digestive juices proceeded with their formidable task the people slept, sometimes in houses but more typically outside in some shady, breeze-cooled spot; another characteristic of these hearty eaters was their ability to sleep in almost any position, however hard or uneven the surface upon which they reposed.

After a lengthy siesta some adults may have resumed "work," or at least some productive activity that could be engaged in near home; but for most people the late afternoons appear to have been devoted to diversions of one kind or another, including visiting and lovemaking. Expressed in the lilting prose of the romantic younger Forster, "After their meals they resume their domestic amusements, during which the flame of mutual affection spreads in every heart, and unites the rising generation with new and tender ties." (G. Forster 1777:II, 111). Before nightfall the Maohis had another bath and perhaps a light supper of leftovers, and by dark everything was again quiet outside, except perhaps on the lagoon or reefs where fishermen might have been active, or at some marae where priests occupied themselves with preparations for rites or novices strolled about memorizing chants.

Bright moonlight sometimes encouraged people to sit outside, but otherwise they usually sat or stretched out inside their houses, preferably in company, as a result of what seems to have been a sincere fear of the spirits believed to be more active during darkness, as was audibly manifest in the squeaks of rats and cries of night birds. The belief that some of these spirits were ghosts of relatives seems not to have been wholly reassuring. While some individuals slept, others talked or told stories or made music, in light provided by candlenut tapers. Some observers characterized the Maohis as having been livelier at night than during the day: "... and thus they continue [chatting and singing] nearly the whole of the night, making so much noise that no one can sleep among them.^[6] It may here be observed that in day time they frequently lay down and sleep. They appear throughout the day to be exceedingly troubled with Enui." (Threlkeld to Burder, 29 September 1818, LMS Archives)

According to Moerenhout, a prayer was usually said (presumably by the household's male head) before the household settled down for the night:

Save me! Save me! It is the night of the gods. Watch close to me, my God! Close to me, O my Lord! Protect me from enchantments, sudden death, evil conduct, from slandering or being slandered, from intrigue, and from quarrels concerning the limits of land. Let peace reign about us, O my god! Protect me from the furious warrior, who spreads terror, whose hair bristles! May I and my spirit live and rest in peace this night, O my god. (E.S.C. Handy's translation [1927:201] of Moerenhout [1837:II, 81-82])

Perhaps such a ritual did in fact take place in some households, although none of the earlier visitors mentioned it. Moerenhout's stay in Tahiti took place during the 1830s, long after the missionaries had introduced the custom of Christian household prayer services, morning and night; and although the above prayer is pre-Christian in content it is quite Christian in tone, and it might possibly represent some informant's imaginary reconstruction.

In general, the daily routines of most Maohis followed the sequence of activities just set forth, with the following exceptions and qualifications. Warfare, natural and social calamities, and large festivities changed routine living radically, as will in due course be described. In addition, certain regular changes in the physical environment were conventionally adjusted to in ways that influenced daily routines. One such change was connected with the phasing of the moon, which affected—or at least was believed to influence—the habits of marine life, and hence of nighttime fishing. Marine life was also subject to longer, annual cycles of variation, which were reflected importantly in the daily activities of the master fishermen.

Inclement weather appears to have discouraged outside activity of all sorts; people tended to remain inside their houses, lolling about and sleeping, and subsisting on foods near at hand: "This [visiting the Spanish ships in inclement weather] was quite opposed to their usual habit, as they them-

selves told us, of not going outside their houses on wet or misty days, even to look for food" (Corney 1915:141).⁷

Finally, the daily lives of the Maohis were adjusted to the annual natural cycle insofar as this affected the growth of their staple plants, particularly breadfruit. Details of these regular monthly and seasonal changes in food supply, along with their associated activities and systems of reckoning time, will be given in later chapters, but now I return to the daily cycle itself, to inquire how, if at all, it was conceptualized by the Maohis themselves.

DIURNAL TIME RECKONING

The Maohis had no distinctive word for the time unit called by Westerners a day (or, technically, a solar day)—that period defined by one complete revolution of the earth on its axis. They did, it is true, enumerate complete diurnal cycles in terms of *ru'i* (an alternative for *pō* 'night'), but *ru'i* appears not to have had the double usage that day has in English—that is, applicability both to a part of the diurnal cycle and to the whole cycle as well. Hence, when referring to a diurnal cycle in the description that follows, solar day will have to serve in default of a native term for this period of time.⁸

The Maohis had two ways of specifying solar-day time: by designating events which marked its course, and by defining its component periods. The principal event-markers were sun, stars, tides, and clouds; and the periods were defined mainly by sunlight or the absence of it.

Following are the expressions used for indicating sun-time points. Though sequence is implied in the listing (adapted from Henry 1928:327-330), some of the expressions clearly represent alternative ways of describing the same event:

Bordering sun rays.

The sun is inflated.

The sun is mostly revealed.

The sun is revealed just above the horizon.

The sun's rays are spreading.

The whole of the sun is visible.

The sun's rays are shooting forth.

The sun's reflection is glaring upon the sea.

The sun's rays sparkle upon the sea.

The sun has quite risen.

The sun is quite suspended.

The sun's warmth is spreading (about half an hour high).

The sun is reflected on the sea (about 7 A.M.).

The sun's rays come from its disk (about 8 A.M.).

The sun is spreading its rays everywhere (about 9 A.M.).

The sun is producing waves.

The sun has waxed strong (about 10 A.M.).

The sun sits at an angle (about 11 A.M.).

The sun is over the crown of the head.

The sun points its rays evenly.

The sun shines with no shadows.

The sun has passed the meridian.

The sun is slanting.

The declining of the sun.

The sun is shortening its course.

The sun is taking its departure.

The sun is descending.

The sun's rays are as the *fara* roots [i.e., pandanus roots, which are very slanting].

The sun is speedily going down.

The setting of the sun.

The sun's course is shortened.

The sun has burst the surface of the sea.

The sun is going majestically to the rocks of the deep.

The sun has sunk below the surface of the sea.

The sun darts its rays upwards.

The sun has dropped.

Twilight (*te vai mārerehu rā*).

Indistinctness (*te vai aroaroa rā*).

Clouds were used for time-marking as they relate to the sun—that is, just before sunrise: The clouds are parting asunder; The red clouds have risen; The masses of dense clouds precede the sun; The dispersion of the clouds; Drifting off of red clouds; and just after sunset: The great disk of the sun has deserted the fleecy clouds.

Light, and specifically sunlight, also figured in two other time-marker expressions, referring in these instances to the beginnings of visibility before sunrise: The Great Star has risen; it is morning, Ta'urua has risen.⁹

It will be noted that several expressions in the Henry list of diurnal events refer to the tides—for example, “*ua nano te tai*, the tide has reached its highest” and “*te pahe’era’a o te tat*, the sea is receding.” If the tides of these Islands had indeed occurred with the fixed regularity that some older writers claimed, then we would have to recognize these expressions as having been correspondingly precise. As it is, however, their sequence in this particular list of diurnal events must be regarded as accurate for only certain phases of the tidal cycle, and hence not a fixed element in a standard diurnal schedule of events. This does not mean of course that tides, meager as they were, played no part in Maohi life; they probably played their part, for example, in connection with the collection of molluscs on reefs, but not with the fixed regularity they were earlier supposed to have had.

The only other natural events which served as timemarkers (according to Henry) were the opening of the *tiare* blossoms, which occurred regularly about noon (i.e., “the *Gardenia tahitensis* flowers are fully open”); the singing of the thrush (*oma’oma’o*) shortly before sunrise; and the crowing of cocks, also before sunrise, in this sequence: It is the first cockcrow; It is the middle cockcrow; It is the last cockcrow; Cockcrowing is general.

Turning next to the ways in which the Maohis verbalized component periods of the solar day, the major division was between *ao* and *pō*,¹⁰ which in this context can be translated as ‘day’ and ‘night’, or ‘day-lightness’ and ‘night-darkness’.

In Henry’s sequence, *ao* “began” as soon as there was sunlight enough to distinguish a man’s face (or to see flies flying) and lasted until all such light had disappeared (i.e., *poiri roa* ‘very dark’), which approximately marked the beginning of *pō*. However, it will be recalled that in these latitudes sunrise was an hour and five minutes earlier (and sunset an hour and five minutes later) in late December than in late June.

Other divisions of the solar day were *po’ipo’i* ‘morning’, *avatea* ‘mid-day’, *ahiahi* ‘evening’, and *pō* ‘night’. According to the sequential arrangement of Henry’s list, *po’ipo’i* began with the rising of the “great star,” just before daylight, and it ended with *avatea*, at some imprecisely identified time before midday. In turn, *avatea* passed into *ahiahi* around midafternoon, and *ahiahi* lasted until darkness (*poiri*, *pō*). The periods of dim light immediately before *po’ipo’i* and after *ahiahi* were labeled *rehurehu*. Banks wrote that “every [solar day] has its respective name and is again subdivided into 12 parts containing about 2 hours each, 6 for the day and 6 for the night, each of which has likewise its respective name; in the day time they guess the divisions of these parts very well, but in the night tho they have the same number of divisions as in the day seem very little able to tell at any time which of them it then is, except the cleverer among them who know the stars” (Beaglehole 1962:I, 369).

Clearly, the sun was by far the most decisive factor in Maohi solar-day time reckoning. Not only did it provide a regularly recurrent reference point, but it was the source of the kind of light considered indispensable for most Maohi materially productive activities. Some things could be done and were done by moonlight or starlight or candlelight, or even in total darkness, but sunlight was the conventional illumination for gardening, collecting plant-food, preparing meals, manufacturing objects, constructing buildings, setting out on journeys, waging warfare, and for conducting most religious rites. The strength of this convention was conceptualized and reinforced in myth—specifically in myths dealing with the raising of the Sky and the snaring of the Sun.

For a while after their creation, humans lived in total darkness and confusion in the narrowly confined space between Earth and Sky. Then, the myths relate, Tane and his spirit helpers succeeded in raising the Sky off the Earth, thus admitting Sun, Moon, and Stars into the space between. But, even after these gods had been set in their proper courses;

There was but one drawback to this world, no work could be properly accomplished because the sun rose and set too soon. When an oven was heated in the morning and the food was placed in it, the victuals were not cooked when nightfall came; when the food was cooked and the oven was opened, people had not properly partaken of their meal when it was night again! So they ate rare food from the oven, in those short days, and their lips became swollen from irritation in eating ape (*Alocasia macrorrhiza* [bitter taro]) only half cooked.

The sun was just rising when Mâ-û-i set out on his journey to visit all lands, to build temples upon new lands, and to establish there the priesthood which he had trained. It was during the period of Antares (in Scorpio) and he had a fleet ... pressing on behind. They had no sooner got out to sea when they were benighted. When daylight came, Mâ-û-i fished up land that was jambed beneath the sea, and they were again benighted!

At length they reached an island named Fa'ana (Pacify), and they were erecting a temple—Apo'ô-'ao (Heron-pit) was the name of that temple—and only one stone, the chief cornerstone, was laid that day when night came. The following morning they resumed their work, and they were making the wall of the temple when the sun began to decline.

When Mâ-û-i saw that, he counted the rays of the sun and there were ten. Then he took ten ropes with which he firmly secured the rays of the sun, and he tied them to a rock so that they could not be shaken. The sun was thus fixed, and the people built the walls of the temple and completed it that day. And when all was finished, Mâ-û-i let go the rays, and the sun continued its course in the same manner as before.

But Mâ-û-i ended his work there; he left priests with the new temple named 'Apoô-'ao, and returned to Hawai'i [Ra'iatea] with his fleets to consult with the gods and people what to do to prolong the day. (Henry 1928:429-430)¹¹

Finally, this expediency of detaining the Sun long enough to complete particular enterprises was replaced by permanent measures: Maui's

younger brother, Maui i upo'o varu, became angered with his father the sun because his mother had to eat half-cooked food and his older brother could not complete his projects, so he set about to capture the Sun once and for all, using—among other kinds of cordage—a braid of hair of his sister Hina. He succeeded finally in noosing his father the Sun (chiefly with the braid of his sister's hair), and when his father demanded to be let free, he replied:

"You will not escape! Had you gone slowly, my mother's food would have got cooked, and my brother would not have had to hold you in doing his work. But you have been going fast."

The sun said: "If I die, you cannot find food, there will be no light by which to build temples, all will be in darkness. But let me go, and I will cause your work to prosper well."

Then Mâ-û-i said: "Will you not deceive me?"

"I will not deceive you," replied the sun, "but unfasten this very painful rope!"

Then Mâ-û-i stamped upon the disk of the sun so that it got cracked and weakened, and he unfastened the rope of hair. The sun then went slowly, and never again hastened its course in the sky.

So the world became perfect, two ovens of food were cooked in a day, and people were satisfied with properly prepared victuals. Work was then done with system. Mâ-û-i was pleased with his father, the sun, and all the world was also pleased with him. (Henry 1928: 432)

In summary, *ao*, the period of sunlight, was the time for doing the things that were done outside, while *pō*, the period of darkness, was the time usually for being inside. During *ao* the world outside was peopled with humans moving about and doing things; during *pō* humans remained inside and spirits haunted the world outside: "*Ei te nu'u atua te pō, ei te ta'ata te ao*. The night was for the gods, and the day was for man" (Henry 1928:412).¹² It should be recalled that *ao* was the term used for the room (*piha*) of the universe occupied by living humans in contrast to *pō*, the room where spirits usually resided.

However, beyond this broad concurrence of *pō-ao* with inside-outside and spirits-humans, there was only the most general kind of coincidence between periods of *ao* and types of daytime activity. The brief transition intervals between darkness and light were denoted with much more detail than was the long day itself. On the one hand, the boundaries between the day periods—*po'ipo'i*, *avatea*, *ahiahi*—were anything but sharp; and on the other hand the schedules of people's activities during the day differed considerably, from individual to individual and from day to day. Which circumstance was prior, the Maohis' imprecision in marking time or the variations in their daily routine, can only be guessed at, but during the era under study these circumstances probably interacted so as to foster even further the Maohis' inattention to punctuality or, for that matter, what Europeans would judge to be their relative unconcern with the whole dimension of time in human affairs.

CHAPTER 5 *PRIMARY TOOLS AND CRAFTS*

PRIMARY TOOLS

Having described in general terms some of the basic ideas whereby the Maohis adjusted themselves to their physical surroundings, I turn to the more tangible implements with which they managed to survive and indeed prosper—that is, to the nature of their primary “tools” and the ways they used them.

First of all, something needs to be noted in a preliminary way about how the Maohis employed their own bodies as implements—not as machines for driving other tools, but as tools themselves.

Human Body as a Tool

The Maohis used their hands and arms, directly, for a wide variety of purposes, including eating, measuring, boxing, catching fish, drumming, et cetera. They were depicted as having been strong in hand and arm and generally unconstrained in their use of them. (Except for certain temporary ritual constraints upon self-feeding, there is little evidence suggestive of a possible devaluation of manual labor.) Judging by the visible products of much of their handwork, however, they appear to have devoted less attention to delicate, fine-grained, detailed execution than did, say, the New Zealand Maori or the Mangaianans.

To Westerners the facility with which Maohis used their toes, to grasp and pick up objects, would have been unusual, as would the whole variety of objects on which they used their teeth, for tearing, softening, and cutting. For example, “... their teeth were always sufficient to clear a Cocoa Nutt of its Rind to give them food and drink” (Bligh 1789:II, 63).

For carrying heavy objects, males used their shoulders extensively, over which carrying sticks were balanced fore and aft, but heads were never used for this purpose, because of the ritual attitudes toward the head.

Some impression of the Maohis’ abilities as walkers and climbers may be gained from G. Forster’s description of an excursion inland:

From hence we proceeded up the valley, which having no rivulet in its middle, began to rise in proportion as we advanced. We resolved therefore to go upon the

steep hill on our left, and with much difficulty accomplished our plan. Our Tahitian friend laughed at us, when he saw us faint with fatigue, and sitting down every moment to recover our breath. We heard him blow or breathe slowly but very hard, with open mouth, as he walked behind us; we therefore tried the same experiment, which nature had probably taught him, and found it answered much better than our short panting, which always deprived us of breath. (1777:I, 348-349)

Forster noted also that the Maohis customarily exercised the precaution of drinking only sparingly when overheated after great physical exertion (1777:I, 351).

Other Europeans recorded their impressions of Maohi body-use habits in more general terms, for example: "It is common with the Otaheiteans to begin their labours with a great deal of alacrity and earnestness, but as sloth and fickleness are predominant passions in their characters, they soon tire and grow indifferent, unless their activity is kept alive with constant feasting" (LMS Transactions:I, 204).

The following chapters will provide detailed examples of the Maohis' use of their own bodies—for traveling overland, for swimming, carrying, and performing other tasks—and of the constraints imposed upon body-use as a consequence of sex, age, religious belief, notions of personal beauty, and so on. But enough has been said to indicate that their conventional uses of their bodies differed in some respects significantly from those customarily employed by Westerners.

"Natural" Objects as Tools

The Maohis utilized numerous kinds of "natural" objects as tools without first modifying them essentially. They used "naturally" shaped stones for much of their hammering and pecking (fig. 5-1), and flakes of basalt rock for cutting shell, for drilling holes and for scraping. In fighting they used uniformly sized but unmodified stones for slinging, and heavy boulders for rolling down mountain slopes.

Unworked wood was used in numerous ways: as levers for moving heavy objects; as rollers for pulling boats overland; as carrying sticks, hammers, spears, and so forth.

Coral, both block and branch, served as an abrasive, as did sea urchin spines and the skin of stingrays and sharks (figs. 5-2, 5-3). Unworked shell was used for scraping, and both shell and splits of bamboo were used for cutting. For piercing holes some bone and teeth were probably used in their natural states, but others were first modified by sharpening (fig. 5-4). Smoothing and polishing were accomplished with sand and coconut husks or pumice. "All their [wood] work however acquires a certain neatness in the finishing for they polish every thing, even the side of a canoe or a Post of a house, with Coral sand rubbd on in the outer husk of a Cocoa nut and rays skin, which makes them very smooth and neat" (Beaglehole 1962:I, 364).

FIGURE 5-3. Rasp, wood covered with sharkskin, length 27 cm. National Museum of Ireland.

FIGURE 5-4. Bone awl, length 14.2 cm. Bishop Museum.

These are only a few examples, but they will indicate how the Maohis made very direct use of their physical resources in some respects.

Fabricated Primary Tools

In their carpenters, joiners and stone cutters work &c. they are almost as little obliged to the use of tools as in making these [fish] hooks: an axe of Stone in the shape of an adze, a chisel or gouge made of a human bone, a file or rasp of Coral, skin of Sting rays, and coral sand to polish with, are a sufficient set of tools for building a house and furnishing it with boats, as well as for quarrying and squaring stones for the pavement of any thing which may require it in the neighbourhood. (Beaglehole 1962: I, 363)

One of the most noteworthy characteristics of the Maohis' primary fabricated tools was the limited variety of types coupled with their wide variety of uses.¹ A long hardwood stick, sharpened or flattened at one end, served as an all-purpose hole digger and soil loosener. A shorter stick, stuck into the ground, served to husk coconuts.

As noted above, strips of bamboo and unmodified shells were used to cut some substances, but the Maohi's principal woodcutting tool was an adze blade hafted to a wooden handle by means of gum adhesives and cordage. (Figs. 5-5 through 5-7) Most adze blades were of basalt, shaped by flaking, pecking, and grinding, but some were fashioned out of *Tridacna* shell. According to Banks, their stone adzes were "not very hard but tolera-

FIGURE 5-5. Stone adze on wooden handle. Etnografiska Museet, Stockholm.

bly tough,” and they varied in weight and size from a few ounces to three or four pounds. Concerning their use, Banks added:

Whatever these tools want in goodness is made up by the industry of the people who use them. Felling a tree is their greatest labour, a large one requires many hands to assist and some days before it can be finishd, but when once it is down they manage it with far greater dexterity than is credible to an Europaeen. (Beaglehole 1962:I, 363)

Banks and Wallis, also provided us with good descriptions of Maohi plank making:

If [a log] is to be made into boards they put wedges into it and drive them with such dexterity (as they have told me—for I never saw it) that they divide it into slabs of 3 or 4 inches in thickness, seldom meeting with an accident if the tree is good. These slabs they very soon dubb down with their axes to any given thinness; in this work they certainly excell; indeed their tools are better adaptd for it than any other performance; I have seen them dubb of the first rough coat of a plank at least as fast as one of our carpenters could have done it; and in hollowing, where they have liberty to raise large floors of the wood, they certainly work quicker, owing to the weight of their tools: those who are masters of this business, will take of a surprizing thin coat from a whole plank, without missing a stroke; they can also work upon a peice of wood of any shape as well as they can upon a flat one, for in making their canoes every peice is formd first into its proper shape, bilging or flat: for as they never bend a Plank all the bilging peices must be shap'd by hand which is done intirely with axes. (Beaglehole 1962:I, 363-364)

They cut the tree down with large Hatchetts, and afterwards into Junks of such Sizes as they have occasion for, then they beat the end of it, 'till it begins to crack and split—after which they make use of Wedges made of hard Wood & soon split them into pieces the breadth of the tree, so that some of their plank is near two feet broad, but the generality about one foot (Wallis 1767:55)

Concerning Maohi use of adzes for carving, Banks had the following to say: “They have small axes for carving also but all their carved work was so bad and in so very mean a taste that it scarce deserved that name.” Workmanship which Banks implied to have been crude was more likely, of course, to have been a matter of conventional “art” style. Other fabricated cutting tools used in woodworking were chisels made from basalt, and gouges made from shell (Green et al. 1967:198-199).

Many scraping and grating processes were carried out with unmodified shells, but in other instances deliberately sharpened shells were used. Similarly, while hole piercing was in many instances done with whatever bits of unworked bone or wood or stone there happened to be around, some holes were carved with awls or needles shaped deliberately out of these materials. Bone, particularly human bone, was also a favored material for splitting, chiseling, and gouging objects softer than wood. (Figs. 5-8 through 5-12.)

Joining was accomplished mainly by tying, either with “natural”

FIGURE 5-8. Shell chisel, length 10.8 cm. Bishop Museum.

unmodified fibers (as mentioned above) or with sennit. In the case of some objects (for example, adze blades and boat planks) the elements to be joined were rendered more adhesive with resinous gum.

Fire must also be listed as one of the Maohis' primary tools; it was used not only for cooking, heating, illumination, lime making, and land clearing, but also for hollowing out logs for boats.

Of the raw materials comprising the fabricated and "natural" tools just listed, perhaps only basalt and pearl shell were "scarce," in the sense of having had geographically limited supply sources. According to some writers, the best basalt for making adzes and chisels was at Maupiti; I do not know however the extent to which Maupiti basalt figured in adzes used elsewhere—either as raw material or as products finished at Maupiti. More archaeology should be able to provide some evidence concerning the location, at least, of manufacturing centers. Pearl shell is believed to have been rare in the waters around the Society Islands (Green et al. 1967:185); and it is reported to have been traded from the Tuamotus.

One is probably safe in assuming that there was some specialization, both local and individual, in the fabrication of stone adzes, although there is little evidence for such now available;² but most of the kinds of primary

tools listed above were simple enough and consisted of materials common enough to have been fabricated nearly everywhere and by nearly everyone past childhood.

Another noteworthy aspect of the Maohis' inventory of fabricated "primary" tools is the apparent scantiness of nonutilitarian embellishment. Except for the lashings used in adze hafting,³ the manufacturers of these primary tools seem to have been unconcerned with making their products aesthetically pleasing—at least not in terms of any ordinary Western criteria of "aesthetic." This is not to say that the Maohis themselves did not derive some nonutilitarian satisfactions from the shapes and appearance of such tools.

I again touch upon the concept of mana as it referred to certain properties of tools; the inference has been drawn by some writers on the Maohis that their tools tended to acquire mana (effectiveness of a more or less supernatural kind) the longer they were used successfully, or, alternatively, that certain tools *were* mana (through spirit association) and hence of more than ordinary effectiveness.⁴ As I noted earlier, this is a complex question of interpretation which I am unable to answer on the basis of available evidence. Neither am I able to offer a full and documentable rationale for the practice, followed on occasion, of using bone from a former enemy in fabricating primary tools and fishhooks. (Does this imply, among other things, a view of tool-using activity as having been somehow disvalued?)

CORDAGE

The simplest kind of cordage made by the Maohis consisted of strips of bark, most commonly hibiscus, peeled off a tree trunk or branch and used as is. Otherwise cordage was made by twisting or plaiting various kinds of fibers, the principal of which were coconut husk, hibiscus bark, the inner bark of the flaxlike *piripiri* (*Cenchrus echinatus*), roa stalk (*Urtica argentea*), and human hair.

The sources contain such scant information concerning cord making by the ancient Maohis that we must depend upon more recent accounts of this craft, justified, perhaps, by the assumption that technical habits so "basic" as these are less likely to have changed than are most others. (I fully realize the vulnerability of such a sweeping statement, and cannot support it with anything stronger than personal opinion. In any case, the issue is not crucial to the main subject matter of this book.) Accordingly, in presenting the following accounts of cord making and plaiting I draw mainly from the excellent study of W.C. Handy which was based on field observations carried out in the 1920s.

According to W.C. Handy, "No material used for cords has such a grand old tradition as coconut fiber Its strength and durability have

impressed visitors from the time of Wallace [Wallis] to the present day." It was used for a wide variety of cordage, including ropes of different dimensions, lacings, and thin decorative threads. Handy's description of the way fibers are (and presumably used to be) prepared for making cord follows:

Both the preparation and the manufacture of this material has always been the work of men. They select coconuts known as *omoto*, a term referring to that stage of growth where the meat of the nut is about half an inch thick. They split (*e ò*) the husks from the hard inner shells of the nuts, dextrously jaming them down upon the pointed end of a stick planted solidly in the ground, and rip off the outer covering in segments. Tying these sections of husk in bunches and fastening them conveniently to the shore, they leave them to soak in the sea for two months. Thus softened, the worker undertakes to beat them into shreds. Holding a piece of husk in his left hand and swinging the heavy stone pounder known as a *penu* in his right, he beats the soaking mass until it is dry and the tough fibers separate. He then picks up a bunch of loose fibers in his left hand and combs the tangled mass with his fingers. The small combings he saves for making the twisted cord known as *anave*; the long strong fibers he ties in bundles to be plaited into *nape*. (1927:105)

I next reproduce Handy's graphic account of the manufacture of coconut-fiber cordage, both twisted and plaited. The episode she described was a twentieth-century one, but the techniques employed are implied to have been of ancient origin:

The honor of making cords, ropes and nets, still belongs to the men folk of the Society Islands, whenever they care to avail themselves of the privilege. The manufacture of some cord still involves the use of several materials—coconut fiber, and the barks of the purau, piripiri, and mulberry trees—but inasmuch as an "odor of sanctity" hangs about the use of the coconut fiber, more of the traditional method of manufacture persists in its use. The chief of Maupiti gave me a very complete demonstration of this time honored industry.

He sorted out the soft combings from the fibers beaten from the coconut husks, with the intention of making first a twisted two-ply cord, an *anave* of two *ave* (strands). He used the method common throughout Polynesia, twisting the fibers together by rubbing them between his hand and his thigh. This process included the continual lengthening of each strand by rubbing together short overlapping fibers, and the twisting together of the two ply. Laying the fibers across his naked right thigh in two parallel strands he held them apart with his left hand, while he pressed the palm of his right hand down and rubbed first the near ply, then the far ply, across his thigh in the following way. He drew the near ply towards him and pushed it away with a smooth, flowing movement. He rubbed the far ply towards him, then away from him, and then, without interruption of the smooth stroke, rubbed it again towards him, carrying it this time over the near ply and rubbing the two towards him together. Just as a loose twist was beginning to form in the two ply, he reversed his movement and rubbed the two together away from him down his thigh all the way to the knee.

Lifting up the section thus manipulated, he exhibited a firmly twisted two-ply cord, the common form of *anave puru haari*. A three-ply cord of coconut fiber is now uncommonly made.

Having used up the pile of combings in twisted cord, the chief turned

with satisfaction to the longer, stronger fibers, of which plaited cord is made. It was clear that he followed a method prescribed from generation to generation, as he gathered up a thick bundle of fibers, which had been tied in the middle for orderly keeping, and placed one end of it under his left thigh as he sat on a stool. His weight kept the bunch in place, so that he could pull out two or three fibers at a time without disturbing the others. In such small installments he pulled them out with his right hand and placed them crosswise in his mouth, the ends hanging from either side. It seemed to be the sense of bulk between his lips which advised him when he had selected enough fibers for the plait.

Holding the ends, then, in his mouth, he started a three-ply plait of the ordinary style, adding fibers as they were needed, always transferring them from the bunch under his leg to his mouth before working them in. When the plait was long enough, he tied one end to the end of a three-foot stick, indicating, however, that it was also permissible to tie it to his big toe. The stick method he preferred, for, shoving the free end under his right thigh to hold it firmly, he used it both as a stationary anchor for his work and, soon, as a spool on which to wind it as he finished the plait. This he accomplished by plaiting towards him for the length of the stick, then by pulling the finished plait tightly over the near end of the stick and turning it about so as to plait it again towards him along its length. Thus he wound length after length from end to end about his stick. When he had manufactured as much *nape* as he desired, he withdrew the stick very carefully, so as not to disturb the wound plait, and secured it by wrapping the bundle from end to end with the loose end of the plaited cord.

The tight, cigar-shaped bundle, in which form *nape* is usually kept, was thus secured. (W.C. Handy 1927:108-109)

The following description of sennit making comes from Orsmond's definition of *aha firi tuatua*, described by him as "Senet made from the stoutest fibres of cocoa nut husks."

In making [this kind of] Cenet, [the artisan] sits, ties the end to his great toe, while he plaits, and at about ever eighteen inches he has occasion to fasten it a new to his toe. He holds in his mouth several of the large fibres, which are from 8 to 10 inches long. The twisting is done by the thumbs and forefingers, and a dextrous hand will make 10 fathoms in a day. Every time he adds to the strands he lets the extreme ends stick up as bristles, so that on looking on it, the Senet seems to be lost in its bristles and is as unsightly as a web of new cloth before it is sheared. This extreme roughness is the tuatua of it and is removed either by a muscle shell, or a sharp knife.

Those fibres are obtained first, by burrying the whole of the husks mud and water, or in the sea, until greatly decomposed; they are then taken, and on a block either of wood or stone so beaten by a iron wood cudgel that the large strong fibres separate from the mass and are easily drawn out and tied in bundles as are coblers bristles. (Orsmond: Dictionary Notes)

My main reason for devoting so much space to this essentially technological matter in a book concerned mainly with social relations stems from my impression that this type of cordage making constituted a major activity for many Maohi males, and an almost constant preoccupation for some. Also, such cordage was evidently produced in huge quantities to sat-

isfy numerous kinds of socially relevant needs.⁵ Moreover, cordage in general, and sennit in particular, is noteworthy in having served as metaphor for numerous socially relevant phenomena, for example, *aha mata rau* ("sennet that has scarcely two parts in it alike. Thick here, thin there, smooth here, rough there, dyed of various hues") was applied figuratively to an individual who was "a breeder of disturbances; a refractory fellow"; *aha vai* (sennit made from barks steeped in water, i.e., very stringy) was applied frequently to a champion boxer, a man of tireless industry. (Orsmond: Dictionary Notes)

After coconut-husk fiber, the bark of the hibiscus tree was perhaps the next most common material used for cordage. For many purposes of ordinary tying, strips of the cut bark, unmodified, evidently sufficed; but for a more lasting cordage the inner-bark fibers (*more*) of the tree were used. According to W.C. Handy, "March, April, and May are still the months when the young shoots of the purau tree are cut for the making of *more*" (1927:9), and it is reasonable to suppose that seasonally in the processing of *more* was also the case long ago.

The first stage in preparing *more* consisted of soaking the young shoots of hibiscus in water for several days, after which the outer bark was removed and the white inner bark flattened out and left to dry. An even finer cordage than *more* was made from the inner bark of *piripiri* 'flax', following the same methods and quite likely, the same seasonal timing. (W.C. Handy 1927:8-9, 107)

According to Banks, the strongest of all Maohi cordage was made from the fibers of the *roa* shrub:

But of all the strings that they make none are so excellent as the fishing lines &c. which are made of the bark of a kind of frutescent nettle call'd by them *Erowa* (*Urtica argentea*) which grows in the mountains and is consequently rather scarce& of this they make the lines which are employ'd to take the briskest and most active fish as bonetos, Albcores &c. As I never made experiments with it I can only ascertain its strength by saying that it was infinitely stronger than silk lines which I had on board made by the best fishing shops in London, tho not so thick by almost half. (Beaglehole 1962:I, 361)

Here is W.C. Handy's description of the manufacture of *roa* cordage:

In the old days, the preparation for the making of *anave roa* (twisted *roa* cord) was begun in October, cutting down the *roa* bushes at that time, so that new shoots might spring up and be ready for the cutting the following July. In July then, might have been seen the young, green sticks or *roa* heaped under a purau tree on the beach perhaps, ready for the stripping which was to leave them clean and greenish after the removal of the outer skin. For several nights they were spread upon the grass in the dew, soaking and bleaching to snowy whiteness. And finally came the combing of the fibers into fine threads with the aid of a thorn from an orange tree, a painstaking but sociable occupation. Such were the *roa* fibers which were twisted by the process known as *nino* into cords for fish lines and nets. (1927:107)

How far back Handy's "old days" refer to is not specified, but they may possibly have extended to pre-European times.

Cordage made of braided human hair was highly valued, mainly for ornamental attire. According to various accounts, such braids were six to nine hairs thick, and some were scores of fathoms long. Banks reported having seen some specimens that were "... platted, scarce thicker than common thread, of this I may easily affirm that I have peices above a mile in lenght worked upon an end without a single Knot" (Beaglehole 1962:I, 339).

I shall not list the many other kinds of cordage materials and products used by Maohis, but it should not be forgotten how important such cordage was among these Islanders, who did not know of nails. Cordage was important in ways not only practical but social-relational as well, as later chapters will indicate.

BARK CLOTH

The textile used for most garments, turbans, and bed covers was made of the inner bark of several kinds of trees, principally of the Chinese mulberry (*Broussonetia papyrifera*: 'aute), a variety of breadfruit called *pu'upu'u* (*Artocarpus altilis*), and a figlike tree (*Ficus prolixa*: āoa). The first of these, the most widely used, was cultivated mainly on plantations near residences; one of these plantations was seen and described by G. Forster:

The next day we took a walk up one of the hills, which is every where planted with bread-trees, pepper and mulberry-trees, yams and eddoes. The mulberry or cloth-trees were cultivated with particular attention; the ground between them was carefully weeded, and manured with broken decayed shells and coral, and the whole plantation surrounded with a deep furrow or channel, in order to drain it. In many places they had burnt away ferns and various shrubs, in order to prepare the ground for future plantations. (G. Forster 1777:I, 118-119)

Cloth made from these trees differed in strength, texture, and color, but the method of manufacture was about the same. Only young saplings were utilized, and the stems of the young plants had to be kept free of branches to insure that the bark would not be punctured. After the bark was peeled off the straight and unmarred young saplings or limbs, it was soaked in water, the rough outer layer was scraped off, and the inner bark was placed on a flat board and beaten thin with a wooden mallet (figs. 5-13 through 5-16). The width of the strips was increased several times by beating; to make them longer and still wider numbers of strips were felted together by further beating, helped by the resinous substance in the bark. Or, to thicken or repair the cloth separate layers were pasted and beaten together. Morrison gave the best account of the manufacturing process:

FIGURE 5-13. "A Girl Scraping the Bark to Make Cloth." Sketch by S. Parkinson. British Museum.

FIGURE 5-14. "Girls beating out the Bark with their Cloth beaters." Sketch by S. Parkinson. British Museum.

FIGURE 5-15. Bark-cloth beater. Etnografiska Museet, Stockholm.

FIGURE 5-16. Bark-cloth beater and adze. Drawing by J. F. Miller, British Museum.

Their Cloth, of which the General Names is Ahhoo, is of Different sorts and made from the Bark of different trees but the process of all is the Same. The Best and finest white Cloth Calld Hoboo or Parrawye is made from the Yowte or Cloth Plant and is made thus—The plants having to their proper length (10 or 12 feet) are cut by the Men and brought in by them which is their part of the work, the Weomen then Strip off the bark by entering a pointed Stick between the bark and the Plant and ripping it the whole length on one Side, & the Bark peels off. After they have Stripd all the Plants they take the Bark to the Water where they wash it, [and] spreading it on a board for the Purpose Scrape it Clean, taking off the Outside rind with a large Cockle shell and having freed it from the Sap and Slime it is wrapd in plantain leaves and covered with Grass, where it remains for two three or four days when it becomes Clammy and glutinous, & is then fit for working, it is then spread of a regular thickness of several strips forming a band of 7 or 8 inches broad and of what length the piece is intended to be and the Ground where they intend to work is spread with plantain leaves to keep it from the dirt—the Beans are then placed at equal distances about 6 feet asunder & at each of them two weomen work, having the Piece between them, beating it with square beetles to its proper breadth; this they perform by a Song given by one & Chorus'd by the rest and keep regular time and Shifting the Piece backwards and forwards till it is all beat out to a regular Breadth and thickness—it is then spread in the sun to Dry for one Day, after which it is bleachd in the Morning Dew till it is perfectly white, being kept from the sun till it is sufficiently bleachd, and then it is spread one or two days in the Sun to dry it and put up for Store or Use.

They make another sort of several Thicknesses which are not placed regular or above half beaten, this is Calld Marro; of this they make their Upper Garments by Striping from one part and pasting on to another till they bring it to a regular breadth & thickness and trim the Fragments off with a piece of split bamboo which answers the purpose of a knife—(Morrison 1935:160-161).

The only indications I can find that there might have been any seasonality in the production of bark cloth occurs in a freely translated story reproduced in Henry. The reference in question reads as follows: "When the child was about six months old, the season for beating out tapa cloth arrived and all the women of the land were busy in the pleasant work" (1928:604).

Some bark cloths were only sun bleached before use, others were soaked in or painted with dyes. (Figs. 5-17, 5-18.) A favorite red dye was made from the berry of the *mati* (*Ficus tinctoria*) and the leaf of the *tou* (*Cordia subcordata*), but several other plants were also used for decorating this popular cloth.⁶ Yellow dyes were produced from the root bark of *nono* (*Morinda citrifolia*) and from the fruit of the *tamanu* (*Calophyllum*). Some of the bark cloths were naturally brown, but a brown color was also produced from the root of the *tou*. Black cloths were achieved by soaking the cloth in certain swampy spots, or by using the sap of the mountain plantain.

Most observers pointed out that the dyes applied to bark cloth were not fast, and indeed that bark cloth itself was short-lived. For example, Ellis wrote:

The ahu, or cloth made with the bark of a tree, although exceedingly perishable when compared with European woven cloth, yet furnished, while it lasted, a light and loose dress, adapted to the climate, and the habits of the people. The duration of a Tahitian dress depended upon the materials with which it was made, the aoa being considered the strongest. Only the highly varnished kinds were proof against wet. The beauty of the various kinds of painted cloth was soon marred, and the texture destroyed, by the rain, as they were kept together simply by the adhesion of the interwoven fibres of the bark. Notwithstanding this, a tiputa, or a good strong pareu, when preserved from wet, would last several months. (1829:II, 178-179)

'Ahu was the name for garments in general, as well as the general name for bark cloth; the different varieties of bark cloth also had more specific names.

Bark cloth not intended for immediate use was rolled up and kept suspended from house rafters. Some strips were dozens of yards long; one observer reported there having been some that measured four yards in width and two hundred yards long, and he added that "the wealth of a chief is sometimes estimated by the number of these covered bales which he possesses." (Ellis 1829:II, 174)

Every household evidently produced some bark cloth—probably enough for the immediate consumption needs of its members—but when additional amounts were needed, say, for taxation or gift-exchange, they were either secured from elsewhere (in ways that I will describe in later chapters) or manufactured *in situ* by means such as those described by Morrison:

FIGURE 5-17. Bark cloth showing designs. Peabody Museum. Salem.

FIGURE 5-18. Bark cloth showing designs. British Museum.

If a landed Man wants a large quantity of Cloth made at once, he informs his Tenants when he means to Cut his plants and on the Day appointed all the Weomen attend with each their Beam & Beetle and a proportion of Breadfruit being prepared they bring the Work together and some times to the Number of 200 strike off together, making as much noise as so many Coopers. The piece is finishd in one Day and is sometimes 40 or 50 fathoms long and 4 fathoms wide. (1935:161)

In view of the many uses of bark cloth, and of the constant need to replace or mend the rather flimsy everyday garments made out of it, its manufacture and repair must have consumed a large part of the Maohis' working time. In fact, one of the characteristic features of residential settlements was the continual sound of beating mallets. According to Ellis most of this work was done by women, but men occasionally lent a hand, especially in the preparation of the large quantities needed for ceremonious visits. "There were some kinds [of bark cloth] used in the temples, in the service of the idols, which were made by men, and which it was necessary, according to the declarations of the priest, should be beaten during the night." (1829:II, 179).⁷ According to Banks, it was "... the business of the mistress of the family and principal women of it," to keep the householders' bark cloth garments in good repair, and in doing so "... seem to amuse themselves as our English women do in making Caps, ruffles, &c; and in this they spend the greatest part of their time" (Beaglehole 1962:I, 355-356). Evidently, social value was attached to well-made bark cloth:

As the wives or daughters of the chiefs take a pride in manufacturing superior cloth, the queen would often have felt it derogatory to her rank, if any other females in the island could have finished a piece of cloth better than herself. I remember in the island of Huahine, when a native once passed by, wearing a beautiful ahu-fara, hearing one native woman remark to another—What a finely printed shawl that is! The figures on it are like the work, or the marking, of the queen! This desire, among persons in high stations, to excel in departments of labour, is what we have always admired. (Ellis 1829:II, 178)

The sources also report that bark cloth manufacture was usually a sociable affair. One such event described by Ellis, though written of a time decades after Wallis' visit, seems also typical of the earlier era:

In the manufacture of cloth, the females of all ranks were employed; and the queen, and wives of the chiefs of the highest rank, strove to excel in some department—in the elegance of the pattern, or the brilliancy of the colour. They are fond of society, and worked in large parties, in open and temporary houses erected for the purpose. Visiting one of these house at Eimeo, I saw sixteen or twenty females all employed. The queen sat in the midst, surrounded by several chief women, each with a mallet in her hand, beating the bark that was spread before her. The queen worked as diligently and cheerfully as any present. (1829:II, 177)

Thus, Maohi bark cloth was a product of great social importance. Its manufacture consumed large proportions of the Maohis' time; it constituted a major item in their social transactions and was thus looked upon as a principal repository of social affluence.

PLAITWARE AND NETTING

After bark cloth, the Maohis' next most common textile was plaitware, of numerous kinds of raw materials, plaitwork patterns, element thickness, overall shape and size, form of decoration, and of course use. (Figs. 5-19, 5-20) The principal raw materials used for plaitware were the inner bark of purau (i.e., *more*); stalks of bamboo, arrowroot, and *ā'eho* grass (*Erianthus floridulus*); midribs or stems of certain ferns; and leaves of coconut and pandanus. Although some plants used in plaitware may not have grown everywhere, most of the principal ones were probably widespread enough to permit nearly archipelago-wide collection.

A passage from Ellis states that "some kinds [of pandanus] grow spontaneously, others are cultivated for their leaves" (1829:II, 180). I have come across no references in other sources that some pandanus was in fact planted and tended for this purpose, but the circumstance that certain plants were cultivated for bark cloth provides reasonable evidence that such was the case with pandanus as well.

Plaitwork patterns, diameter of plaiting elements, and, of course, raw materials varied with the type of product. For example, for the fine plaitwork constituting the wraparounds (*vane*) and ponchos (*tiputa*) worn by certain of the "Principal People," thin bleached strips of hibiscus inner bark were used; Ellis described them as having been "light ... elegant and ... remarkably durable" (1829:II, 180). Some of the articles must have taken weeks or even months of daily work to complete,⁸ and they undoubtedly required a specialist's skill. In contrast, a serviceable basket could have been plaited out of coconut leaves in a few minutes time, and probably by almost any Maohi past early childhood.

In addition to the objects just specified, plaitware constituted certain other articles of attire, floor and bed matting, "room" partitions, boat sails, and numerous shapes and sizes of containers. Much less has been written about its manufacture and utilization than was the case with bark cloth, but the more specialized phases of its fabrication (for example, the making of fine hibiscus-bark garments) were evidently the work of women. (Ellis 1829:II, 179)

According to Ellis, ordinary (floor) mats were not more than six feet wide by nine to twelve feet long, but occasionally a very much larger one was made, some twelve feet wide by sixty to one hundred yards long. "Mats of this size," he noted, "are only made for high chiefs, and in the preparation, perhaps, the females of several districts have been employed." Such mats were usually kept rolled up and suspended from the rafters of the owner's house—"more for the purpose of displaying his wealth, and the number of his dependents [or, perhaps, subjects], than for actual use." (1829:II, 181)⁹

FIGURE 5-19. Plaitwork. Etnografiska Museet, Stockholm.

FIGURE 5-20. Plaitwork. Bernisches Historisches Museum, Bern.

Like bark cloth, fine mats figured frequently in gift-exchange and possibly in taxation as well. There is, however, no evidence that I know of that it also figured in more “commercial” transactions, such as direct barter or manufacture on paid commission. Ellis described a trade link with the Tuamotus which involved plaitware from the latter, but I cannot say whether or not this was a pre-European occurrence:

The inhabitants of the Palliser Islands, to the eastward of Tahiti, exceed the Society Islanders in the quality of their mats, which are made of a tough white rush or grass, exceedingly fine and beautiful. They frequently manufacture a sort of girdle, called *Tiheri*, six inches in width, and sometimes twenty yards in length, but remarkably fine and even, being woven by the hand, but with a degree of regularity rivalling the productions of the loom. They are highly valued by the Tahitians, and are a principal article of commerce between the inhabitants of the different islands. (Ellis 1829:II, 180)

Plaitware decoration—mainly of certain garments—consisted of interwoven fibers, free-hanging fringes, brightly colored seeds, shells, and feathers. The latter, especially, added great social value to the article of wear.

I know from several sources that the Maohis made fishnets with some of their cordage, and I may safely assume that netting techniques were employed in fabricating some carrying bags; but in neither case can I reconstruct how such articles were made.¹⁰

CHAPTER 6 *GROOMING*

The Maohis can be characterized as having shown a significantly strong interest in the external condition and appearance of their bodies, as attested in the amount of time and scrupulous attention they devoted to their clothing and toilette.

EVERYDAY CLOTHING

Maohi children went naked until they were about five or six years of age—by European reckoning (see Morrison 1935:220); we are not informed how the Maohis judged when a child should don clothes. Thereafter, both males and females were accustomed to wearing clothes at all times except when asleep or on a few ceremonious occasions, which will be specified in later chapters.

The basic garment for males was a breech clout (*maro*), for females a short underskirt (*pareu*). Over these, both sexes wore a wraparound (also called *pareu*) which extended from waist to knee on males and from above the breast to below the knee on females. In addition both sexes sometimes wore a long, open-sided poncholike garment (*tiputo*) belted around the waist with a long girdle (*tatua*), and on top of these garments women occasionally donned a loose cloak (*'āhu*). (Fig. 6-1.) The garments themselves were made of bark cloth or plaited leaves, and the girdle occasionally was made of plaited hair. According to Banks, plaitwork clothing was favored in rainy weather because of its greater durability (Beaglehole 1962:I, 338).

Once bark cloth or mats had been fabricated, fashioning them into garments appears to have been a simple and extemporary job, as is seen for example in Robertson's account of his visit to a "royal" household:

I went to take my Leave of the Queen and the old Lady but they oblidged me to sit doun again and the Queen cut me out a Sute of the country cloath, and wanted me to throw of my own, but I declined that and put them on over my own, She wanted me to put on a Secant pece, but I refused that and pointed to the Youn Gentn [one of the ship's junior officers], and she put that on him, their was no great trouble in making this Sute. She only cut of about ten foot of the pece of Cloath, which was about five foot wide—and cut a hole in the Middle, throw which hole I put my head, and she then tyed it round my west with a Sash of

mutch finer cloath, then made a Short Speech to her people who all seemd very happy And gave me a pece of very fine cloath made up snug it was about sixteen yards long and three Broad. (1948:214)

When engaged in strenuous physical activity—say, in fishing—men dressed only in the breech clout, and women in an underskirt.

Once having started to wear clothes, except on certain ritual occasions, both males and females were careful about keeping their genitals covered,¹ and they were reported to have been skillful in changing their garments without uncovering:

FIGURE 6-1. Outer garments: *a*, male's; *b*, female's. Sketches by S. Parkinson. British Museum.

The Single Young Men have also dances wherein they shew many indecent Gestures which would be reproachable among themselves at any other time but at the dance, it being deemd shameful for either Sex to expose themselves Naked even to each other and they are more remarkable for hiding their Nakedness in Bathing then many Europeans, always supplying the place of Cloaths with leaves at going in and coming out of the Water.... (Morrison 1935:225)

Morrison also stated that "... Weomen Never uncover their Breasts ..." except when bathing, but this was contradicted in part by Banks: "The

women at sun set always bard their bodys down to the navel, which seemd to be a kind of easy undress to them as to our ladyes to pull off any finery that has been usd during the course of the day, and change it for a loose gown and capachin" (Beaglehole 1962:I, 338).

One of the sources states outright, and most of them at least imply, that the "principal people" tended to wear more clothes than the "common sort." "... the rich seem to shew their greatest pride in wearing a large quantity of cloth.... The poorer sort have only a small allowance of cloth given them from the tribes or families to which they belong, and must use that to the best advantage.... it was no uncommon thing for the richest of the men to come to see us with a large quantity of cloth rolld round their loins, ... sufficient to have clothed a dozn people." (Beaglehole 1962: I, 338) The bases of this difference will be examined in another context, but it should occasion no surprise in view of the labor required in the manufacture of bark cloth and fine matting. Moreover, we know from many reports that bark cloth, especially, was a regular item in gift-exchange and tribute.

Four kinds of headwear were worn by the Maohis: bark cloth turbans (*tāumi upo'o*), caps (*taupo'o*), braided head bands (*tamou*), and wreaths (*hei*) of many shapes. Warriors wore simple head wrappers of heavier cloth to protect their heads in battle, but lighter turbans were also worn for protection against the sun, and for show. Some of these latter, worn by men of social importance, were elaborate things built on a wicker frame and decorated with feathers, and so forth:

The most showy headdress worn officially by the king and princes and high chiefs was the *taumi*, a superb helmet made of clusters of crimson feathers of the *moora 'ura* (red-feathered duck), set upon a light framework and covering the head like a bird, with a glossy terminal behind of outspreading red, black, and white feathers tastily mixed together. This helmet, standing out from a closely fitting band round the head and towering high above, seeming to yield or bend with every movement, presented a formidable appearance. On public occasions, when meeting a man held in high esteem by his countrymen for valuable services, a king wearing a *taumi* would pass it on to his head as a mark of appreciation. After courteously receiving it the hero would return it to the king amid admiring acclamations. (Henry 1928:286)

In the sources there are many hints and a few explicit assertions that specific kinds of headwear served as insignia for certain high offices, but I am unable to go beyond that general statement.

The Maohis' only kind of footwear consisted of sandals made of bark cordage and worn usually for protection against the sharp coral and shell of reefs. Another protective device, occasionally worn by both males and females, were sunshades for eyes and face; usually these were plaited from coconut leaves each time they were needed and then thrown away. (Beaglehole 1962:I, 338)

Other special items of dress, worn at times of mourning, fighting, dancing, and playacting, will be described later on.

TOILETTE

Children's hair was usually cropped close, with a shark's tooth, according to Ellis, who added that "this operation was frequently repeated during their juvenile years" (1829:II, 115). Most women wore their hair fairly close-cropped also, although one reads of some females having had long flowing manes (e.g., see G. Forster 1777:I, 402). Men cut and wore their hair in various ways, for example:

The men wore theirs in every diversity of form—sometimes half the head almost shaved, the hair being cut short, and the other half covered with long hair—sometimes the crown cut, and the edges left the original length. Frequently, it was plaited in a broad kind of tail behind, or wound up in a knot on the crown of the head, or in two smaller ones above each ear. (Ellis 1829:II, 115)

According to Cook, differences in class and occupation were reflected in men's hair styles:

... the better sort [of man] let it grow long and sometimes tying it up on the top of their heads or letting it hang loose over their shoulders but many of the inferiors and such w(h)o in the excersi(se) of their profession fishing &ca are obliged to be much upon or in the water wear it cropt short like the women. (Beaglehole 1955: 123-124)

Individuals of both sexes used implements of bamboo for combing their hair² and perfumed coconut oil (*mono'i*) as a pomade. Sandalwood was the chief source of perfumery, but G. Forster reported that some thirteen other plants were so used, "... which shews how remarkably fond these people are of fine smells" (1777:II, 83). Morrison provided the following description of the manufacture of *mono'i*:

Their method of making Oil is this—The Cocoa Nuts being full grown, are Gatherd in and freed from the Husk. They are then Broke in halves and the Milk which is then sour is thrown away and the Inside of the Nut grated into a Trough made for the Purpose—a piece of Coral tyed on a kind of Horse on which they sit to steady it serves for a Grater. The Nuts being all grated, the trough is hung up, or fixd on a stand and the stuff left to dissolve, and in a few days the Oil begins to run, then [they] Grate into it Sandal wood and mix into it the Dust from the palm blossoms and other sweet flowers herbs &c—and when all is disolvd they strain it off, and put into Bamboos for Use, the Oil retaining the Scent while it is kept Close stoppd—this Process of making it takes up near three Weeks, during which time they mostly turn it over and Mix it evry day—Another Method is by placing the Nuts in the sun to melt, which is done in a few days, but the Oil thus made is always rank—The Cocoa Nut is the only oil they make and the Chief use of it is for Dressing their Hair or Anointing their Bodys where they Chance to be sunburnt—it is Calld Monnoe. (1935:164)

They decked their coiffures with flowers, shells, feathers, leaves, and colored seeds. Women, especially, spent hours at this pastime, usually in company with others.

Many men kept their faces fairly free of hair by means of razors or tweezers of shell, fish scales, or shark's teeth; but certain men—"chiefs" in particular, according to G. Forster (1777:II, 111)—allowed some facial hair to grow, leaving, according to Bligh, a long tuft of chin whiskers, a narrow jaw bone rim, and a thin mustache (1789:I, 404), and producing an effect such that "... a painter might take an excellent copy of a Hector or an Achilles" (Morrison 1935:170).

In addition, most adults, of both sexes, made a practice of trimming their eyelashes and eyebrows and of plucking out all other body hair—mainly, it is reported, for reasons of hygiene. "They adjust their brows and eyelashes, clipping them if too long, and forming the eyebrows into regular arches." Even hair growing in the nostrils was plucked out ... "to prevent its harbouring any dust or foulness." (Wilson 1799:343.) According to this same source a black coconut shell filled with water served as a looking glass before Europeans introduced mirrors; "nor are the men less attentive [than the women] to their persons, and will sit at the glass dressing with the greatest complacency."

Available descriptions of the ancient Maohis all agree on their body cleanliness. As noted earlier, the morning usually began with a bath—an occasion for socializing, according to Moerenhout (1837:II, 75); and this was followed by other baths during the day. Fresh water was greatly preferred for bathing, and fishermen, after day-long immersion in salt water, customarily bathed in a freshwater stream. So addicted were these Islanders to bathing that it sometimes led to their undoing; no matter what the kind or stage of their infirmities the sick or wounded made every effort to bathe in fresh flowing water, which in many instances undoubtedly exacerbated their maladies (see Corney 1915:141). The Maohis were also scrupulous about keeping their garments as clean as their activities would permit. In fact, in comparing the odors of European and Maohi crowds, Banks and others commented favorably on the inoffensiveness of the latter. In this respect the only thing found offensive by the Europeans was the rancid odor of the Maohis hair after applications of their coconut-oil pomade.

Yet, despite all this attentiveness to their toilette, the Maohis were not able to keep themselves entirely free of lice.

Another custom they have that is disagreeable to Europeans which is eating lice a pretty good stock of which they generally carry about them; however this Custom is not universal for I seldom saw it done but among children and common people and I am persuaded that had they the means they would keep themselves as free from lice as we do, but the want of Combs in a hot climate makes this hardly possible. (Beaglehole 1955:124; see also Beaglehole 1962:I, 337)

Many persons carried fly flaps and used them continually to keep off the myriads of flies and other insects that swarmed around, particularly at mealtime (figs. 6-2 through 6-5).

According to one visitor long fingernails were highly regarded as a mark of social distinction "... since only such persons, as had no occasion to work, could suffer them to grow to that length" (G. Forster 1777:II, 283). But this opinion was apparently based on a single reported observation, and the rationale given for it may have been influenced by the Chinese practice, offered as an analogy.

Turning now to the materials used by the Maohis to embellish their attire, there is no more succinct way to describe it than to reproduce Bank's observation:

Ornaments they have very few, they are very fond of earrings but wear them only in one ear.^[3] When we came they had them of their own, made of Shell, stone, berries, red pease, and some small pearls which they wore 3 tied together; but our beads very quickly supplyd their place; they also are very fond of flowers, especialy of the Cape Jasmine [*Gardenia taitensis*; *tiare*] of which they have great plenty planted near their houses; these they stick into the holes of their ears, and into their hair, if they have enough of them which is but seldom.^[4] The men wear feathers often the tails of tropick birds stuck upright in their hair, they have also a kind of wiggs made upon one string of the hair of men, dogs, or Cocoa nut strings, which they tie under their hair upon the back of their heads; I have seen them also wear whimsical garlands made of a variety of flowers stuck into a peice of the rind of plantain, or of scarlet pease stuck upon a peice of wood with gum, but these are not common. Their great pride of Dress seems to be centered almost in what they call *Tamou*, which is human hair platted, scarce thicker than common thread, of this I may easily affirm that I have peices above a mile in lenght worked upon an end without a single Knot, and I have seen 5 or 6 of such peices wound round the head of one woman, the effect of which if done with taste was most becoming. (Beaglehole 1962:I, 338-339)

To this can be added some interesting details reported in the *Duff* chronicle:

The tamōu is made from the hair of their departed relatives, and held in the highest estimation; ... They sometimes dress with a garland of cocoa-nut fibres, ornamented with bits of pearl-shell, and the nails of the thumb and fingers of their deceased relations: these they use as mourning, and consider as very precious relics. (Wilson 1799:329)

FATTENING AND SKIN BLEACHING

Further evidence of the attention devoted by the Maohis to "beautifying" their bodies may be found in their practices of head molding, "forced" fattening, and skin bleaching. I mentioned earlier the care taken to shape the head and facial features of infants into the desired form, and I shall provide more details on this matter in my discussion of child care. Also, I postpone until later, because of its wider significances, a fuller discussion of the Maohis' remarkable custom of *ha'apori* (to make fat and delicate,

by eating and keeping out of the sun [LMS Dictionary]), which also had the effect—evidently intended—of rendering skins whiter.⁵ I should, however, indicate now that many Maohis spent extended periods of their lives more or less immobile, shielded from sunlight, and gorging themselves with fattening foods. While the purposes of such acts were not entirely self-beautification, this reason was a strong one. The Maohi custom of body massage, which will be described later on, also indicates the attentiveness devoted to the body’s well-being, but it had to do more with physical therapy than with beautification.

TATTOO AND SUPERCISION

Most if not all Maohis past childhood underwent tattooing; and while self-beautification was not the only reason for doing this, and perhaps not even the most important one (as later chapters will describe), it did play some part, as is revealed for example in the following: “... for this Custom they give no reason but that they were taught it by their forefathers the doing it is attended with considerable pain yet so Essential is it esteemd to beauty and so disgraceful is the want of it that every one submits to it ...” (Beaglehole 1962:II, 332). And according to Moerenhout, young girls submitted to tattooing “solely in order to enhance their beauty” (1837:II, 122).⁶

The technique employed in Maohi tattoo was described by Banks:

Their method of doing it I will now describe. The colour they use is lamp black wich they prepare from the smoak [i.e., ash] of a kind of oily nutts used by them instead of candles [i.e., candlenut, *Aleurites moluccana*]; this is kept in cocoa nut shells and mixt with water occasionaly for use. Their instruments for pricking this under the skin are made of Bone or shell, flat, the lower part of this is cut into sharp teeth from 3 to 20 according to the purposes it is to be used for and the upper fastned to a handle [fig. 6-6]. These teeth are dippd into the black liquor and then drove by quick sharp blows struck upon the handle with a stick for that purpose into the skin so deep that every stroke is followed by a

FIGURE 6-6. Two tattoo needles, bone blade lashed to wood hafts with coir fibers. Cambridge University Museum.

small quantity of Blood, or serum at least, and the part so markd remains sore for many days before it heals. (Beaglehole 1962:I, 336)

Usually the perforations healed in a month or so, but infection sometimes developed, culminating occasionally in death.⁷

We are indebted to Banks for the earliest detailed description of the Maohis' tattoo designs also:

... every one is markd thus in different parts of his body according may be to his humour or different circumstances of his life. Some have ill designd figures of men, birds or dogs, but they more generally have this figure Z either simply, as the women are generally markd with it, on every Joint of their fingers and toes and often round the outside of their feet, or in different figures of it as square, circles, crescents &c. which both sexes have on their arms and legs; in short they have an infinite diversity of figures in which they place this mark and some of them we were told had significations but this we never learnt to our satisfaction. Their faces are in general left without any marks, I did not see more than one instance to the contrary.^[8]

Tho they are so various in the application of the figures I have mentiond that both the quantity and situation of them seems to depend intirely upon the humour of each individual, yet all the Islanders I have seen (except those of Ohiteroa [Rurutu]) agree in having all their buttocks coverd with a deep black; over this most have arches drawn one over another as high as their short ribs, which are often $\frac{1}{4}$ of an inch broad and neatly workd on their edges with indentations &c. These arches are their great pride [fig. 6-7]: both men and women shew them with great pleasure whether as a beauty or a proof of their perseverance and resolution in bearing pain I can not tell, as the pain of doing this is almost intolerable especialy the arches upon the loins which are so much more susceptible of pain than the fleshy buttocks. (Beaglehole 1962:I, 335-336)

FIGURE 6-7. Tattoo designs. From a manuscript in the British Museum.

As we shall see, the nature and distribution of tattoo marks did not depend altogether on "the humour of each individual"& nevertheless there appears to have been wide latitude for individual choice in the matter, and this circumstance was later exemplified in the practice of the many individuals who covered their bodies with European-inspired designs ranging from ship's anchors to muskets.

In addition to becoming tattooed, most Maohi boys were circumcised, or, rather, *supercised*, since the operation was limited to slitting rather than removing the foreskin. The slit was made in the upper part of the foreskin by means of a shark-tooth knife, and ashes were applied to the wound to stop the flow of blood. Although the operation is said to have made the male more "attractive," the rationale for it was more than aesthetic, as will be described in chapter 13.

Finally, in listing the attributes which the Maohis appear to have included in their notions about "physical perfection," I must specify unblemished skins and undeformed bodies. Except, of course, for tattoo marks and probably for battle scars, skins disfigured by the ravages of disease or by ordinary vicissitudes of living were in some measure socially devalued. The same was most emphatically true of deformed bodies, including albinism. In these respects, at least, the Maohis wasted no sympathy on the physically (and, I believe, "aesthetically") handicapped.

CHAPTER 7 *BUILDINGS*

DWELLINGS

The Maohis built numerous kinds of structures: dwellings, work sheds, canoe sheds, marae, theaters, forts, and so on. In this chapter I will describe how they built them and where they built them in relation to other structures and to the natural setting; details concerning their uses will be presented in later chapters.

Some legendary stories tell of individuals now and then residing in caves, but I have come across no actual instance of this in accounts describing life during the eras under study. A typical residential unit consisted of one or more dwellings (*fare ta'oto* 'house sleep') and one or more cookhouses (*fare tūtu*), and was surrounded by a low fence or by clearings or gardens. Nearby was usually a small "domestic" marae either identified exclusively with members of the residential unit or shared by them with members of neighboring residential units. The residential units of some persons also included a large separate house that was used mainly for accommodating visitors (*fare manihini*, *fare manuhiri*, *fare arioi*). (Figs. 7-1 through 7-5.)

Dwellings varied considerably in size and shape. According to some estimates they averaged about twenty-four feet long by ten feet wide, but there were some that were much smaller and others that were very much larger. A flat-ended and generally smaller type (*fare haupape*) was somewhat more characteristic of the eastern islands, while an arch-ended type (*fare taupe'e*) was more common in the west; but these distributions were not exclusive. In addition, a generally larger, apse-ended type (*fare pote'e*) was to be found sporadically but widely distributed.

All dwellings were built directly on the ground or, in the case of those located on slopes, on terraces just high enough to provide even floors. Some of them were enclosed by low curbing of logs, stones, or coral, and a few had "front-porch" terraces usually paved with stones.¹ Floors were of bare earth, stone, or coral rubble over which *aretu* grass (*Andropogon*) was spread, creating a softer but in time damp and vermin-infested carpeting.

The sides of dwellings were open, or enclosed with wide-spaced latticed walls; low-hanging eaves and plaited screens provided additional shelter

from the elements. Walled-in houses probably had at least two doorways (*amuna*), and even open-sided houses probably had two or more regular places of entry. The sources do not describe this feature of dwellings, but a paragraph in Wilson permits such an inference: "If a woman has a child, the provisions for it must not come in at the same door with the mother's; ..." (1799:351). Instead of permanent partitions, bark-cloth and mat hangings were occasionally used to screen off some parts of a house.

The trees which provided the principal timbers for houses were the coconut, breadfruit, rosewood (*miro*), *tou* (*Cordia subcordata*), mountain apple ('*ahi'a*: *Eugenia malaccensis*), *mara* (*Nuclea Fosteri*), and ironwood. Hibiscus wood and bamboo served for plates, rafters, struts, and rods, and for walling where that occurred. Roofs were thatched with coconut or pandanus leaves or, occasionally, with *aretu* grass, and the whole was lashed together with cordage made out of hibiscus bark and bast, and sennit. A pandanus roof took more time to make but lasted seven to eight years, about twice as long as one of coconut leaves. In this connection, it was by no means unusual for houses to be dismantled, in whole or in part, and moved to other sites, or for still sound parts of old houses to be salvaged and used in the construction of new ones.

Structural ornamentation was not very common and was limited mainly to elaborate lashings and well-joined thatching; in addition some houses were decorated with bark cloth, frayed-end cords, or finely fringed mats.

Dwelling-house furniture was exceedingly scant. People usually sat cross-legged on mats, but some houses contained one or more wooden stools. Mats also served as beds, and sheets of bark cloth served as covers. For pillows people used either bundles of bark cloth or blocks of wood, some

of the latter having been small replicas of stools. When not in use most bedding, along with tools, weapons, clothing, and fishing gear, were kept inside the house, either hung from the rafters and beams or from a special rack (*fata*) inside, or just outside, the house.

There is a description in one account of wooden images kept in a dwelling, (Bougainville 1772:221-222) and hints in several others that skulls and other relics of deceased relatives were so kept, but it appears more usual for "religious" objects to have been kept in separate marae.

I will reproduce some eyewitness accounts of actual dwellings and their utilization. A lengthy quotation from Ellis provides both a detailed description of a house and the method of its construction. The house in question was one destined for the missionary, but according to him was built in the same way as other good-quality Maohi dwellings:

The timber being prepared, they planted the square posts which support the ridge-pole about three feet deep. The piece forming the ridge was nearly triangular, flat underneath, but raised along the centre on the upper side, and about nine inches wide; the joints were accurately fitted, and square mortises were made, to receive the tenons formed on the top of the posts. As soon as these were firmly secured, it was raised by ropes, and fixed in its proper place. The side-posts were next planted, about three or four feet apart; these were square, and nearly nine inches wide. In the top of each post, a groove, about six inches deep and an inch and a half wide, was cut; in this was fixed a strong board, eight or nine inches broad, bevelled on the upper edge, forming a kind of wall-plate along the side of the house. The rafters, which they call *aho*, were put on next; they are usually straight branches of the *purau*, hibiscus tileaceus, an exceedingly useful tree, growing luxuriantly in every part of the islands. The poles used for rafters are about four inches in diameter at the largest end. As soon as they are cut, the bark is stripped off, and used in the manufacture of cordage, lines, &c. The rafters are then deposited in a stream of water for a number of days, in order to extract the juices with which they are impregnated, and which, the natives suppose, attract a number of insects, that soon destroy them. When taken out, the poles are dried, and considered fit for use. The wood is remarkably light, its growth is rapid, and though the old parts of the tree are exceedingly tough, the young branches or poles, used for rafters and other purposes, are soft and brittle, resembling the texture and strength of branches of the English willow. The foot of the rafter is partially sharpened, and about eighteen inches from the end a deep notch is cut, which receives the bevelled edge of the *ra-pe*, or wall-plate, while the upper extremity rests upon the ridge. The rafters are generally ranged along on one side, three feet apart, with parallel rafters on the opposite side, which cross each other at the top of the ridge, where they are firmly tied together with cinet, or the strong fibres of the *ieie*, a remarkably tough mountain plant. A pole is then fixed along, above the junction of the opposite rafters, and the whole tied down to pegs fastened in the piece of timber forming the ridge. The large wood used in building is of a fine yellow colour, the rafters are beautifully white & and as the house is often left some days in frame, its appearance is at once novel and agreeable.

The buildings are thatched with *rau fara*, (the leaves of the pandanus,) which are prepared with great care. When first gathered from the trees, they are soaked three or four days in the sea, or a stream of water. The sound leaves are then selected, and each leaf, after having been stretched singly on a stiff stick

fixed in the ground, is coiled up with the concave side outwards. In this state they remain till they are perfectly flat, when each leaf is doubled about one-third of the way from the stalk, over a strong reed or cane six feet long, and the folded leaf laced together with the stiff stalks of the cocoa-nut leaflets. The thatch, thus prepared, is taken to the building, and a number of lines of cinet are extended above the rafters, and in each of the spaces between, from the lower edge to the ridge. The thatchers now take a reed of leaves, and fasten it to the lower ends of the rafters at the left extremity of the roof, and, placing another reed about an inch above it, pierce the leaves with a long wooden needle, and sew it to the lines fixed on the outer side of the rafters and in the space between them: when six or eight reeds are thus fixed, they pass the cord with which they are sewn two or three times round each of the three rafters over which the reed extends. Placing every successive reed about an inch above the last, they proceed until they reach the ridge. The workmen now descend, and carry up another course of thatch, in the same way inserting the ends of the reeds of the fresh course into the bent part of the leaves on the former, it is singular to see a number of men working underneath the rafters, in thatching a house.

When the roof is finished, the points only of the long palm-leaves are seen hanging on the outside; and the appearance within, from the shining brown colour of the leaves bent over the reeds, and the whiteness of the rafters, is exceedingly neat and ingenious. The inside of the rafters of the chiefs' houses, or public buildings, is frequently ornamented with braided cords of various colours, or finely-fringed white or chequered matting. These are bound or wrapped round the rafters, and the extremities sometimes hanging down twelve or thirteen inches, give to their roof or ceiling a light and elegant appearance. Most of the natives are able to thatch a house, but covering in the ridge is more difficult, and is only understood by those who have been regularly trained for the work. A quantity of large cocoa-nut, or fern leaves, is first laid on the upper part of the thatch, and afterwards a species of long grass, called *aretu*, is curiously fixed or woven from one end to the other, so as to remain attached to the thatch, and yet cover the ridge of the house.

The roof being finished, they generally level the ground within, and enclose the sides. In the erection of my house, this part was allotted to the king's servants. About thirty of them came one morning with a number of bundles of large white purau poles, from two to three inches in diameter. After levelling the floor, they dug a trench a foot deep round the outside, and then, cutting the poles to a proper length, planted them an inch and a half or two inches apart, until the building was completely enclosed, excepting the space left for a door in the front and opposite sides. In order to keep the poles in their proper place, two or three light sticks, called *tea*, were tied horizontally along the outside. Partitions were then erected in the same manner, as we were desirous, contrary to the native practice, to have more than one room. The house was now finished, and in structure resembled a large birdcage.

The houses of the natives, although varying in size and shape, were all built with the same kind of materials, and in a similar manner. (Ellis 1829:I, 384-388)

The durability of a house depended upon the thatching: "If there is much space between the reeds, it soon decays; but if they are placed close together, it will last five or seven years without admitting the rain" (Ellis 1829:I, 388).

Ellis, writing in the 1820s, also described doors: "Their door was

an ingenious contrivance, being usually a light trellis-frame of bamboo-cane, suspended by a number of braided thongs, and attached to a long cane in the upper part of the inside of the wall-plate—the thongs sliding backwards and forwards like the rings of a curtain, whenever it was open or closed” (1829:I, 389). It is however possible that doors—as contrasted with openings—were a European-inspired trait.

Finally, Ellis took pains to point out that not all native dwellings were of the quality of the one just described:

... although all were capable of building good native houses, and many erected comfortable dwellings, yet great numbers, from indolence or want of tools, reared only temporary and wretched huts, as unsightly in the midst of the beautiful landscape, as they were unwholesome and comfortless to their abject inhabitants. (1829:I, 390)

Some observers commented upon the floor covering of dwellings. The Spaniard Varela wrote:

They cover the ground inside their houses with dry grass; and they are so particular that they even part this grass aside when they want to spit, and cover over the expectoration with it afterwards. They do not allow any one to come in with dirty feet, lest the mats they sit upon, and even the grass itself, be soiled: consequently they make no use of brooms, for with all this nicety they have no need for them. (Corney 1915:278)

This enthusiasm for the natives’ “nicety” was not shared by Morrison or Ellis, who must have had to spend many a night trying to sleep inside their acquaintances’ houses:

... but in fine weather they prefer the Open Air, as the Grass with which the floors are Covered, if not frequently removed, produced abundance of Fleas for which reason they sleep out of Doors to avoid these disagreeable companions (Morrison 1935:198)

The floor of their dwellings was covered with long dried grass, which, although comfortable when first laid down, was not often changed, and, from the moisture occasioned by the water spilled at meals and other times, was frequently much worse than the naked sand or soil would have been. (Ellis 1829:I, 389)

We are indebted to Ellis for detailed descriptions of house furnishings also:

Next to a sleeping mat, a pillow was considered essential. This was of hard wood, and often exceedingly rude, though sometimes ingeniously wrought, resembling a short low stool, nine inches or a foot in length, and four or five inches high. The upper side was curved, to admit the head; the whole pillow, which they call *tuaurua*, is cut out of a single piece. Upon the bare wood they reclined their heads at night, and slept as soundly as the inhabitants of more civilized parts would do on the softest down. [Fig. 7-6.]

In general, they sat cross-legged on mats spread on the floor; but occasionally used a stool, which they called *iri* or *nohooa* [fig. 7-7]. This resembled the pillow in shape, and, though much larger, was made out of a single piece of wood.

FIGURE 7-6. Wood headrest, length 235 mm. Field Museum of Natural History, Chicago (from photo in British Museum).

FIGURE 7-7. Wood seat, length 570 mm. Etnografiska Museet, Stockholm.

The tamanu, or *callophyllum*, was usually selected, and immense trees must have been cut down for this purpose. I have seen iris four or five feet long, three feet wide, and at each end three feet six inches high; yet the whole cut out of one solid piece of timber. The upper part was curved, and the extremes being highest, the seat resembled the concave side of a crescent, so that, however large it might be, only one sat on it at a time. The iri was finely polished, and the wood, in its grain and colour resembling the best kinds of mahogany, rendered it, although destitute of carving or other ornament, a handsome piece of furniture in a chieftain's dwelling. The rank of the host was often indicated by the size of this seat, which was used on public occasions, or for the accommodation of a distinguished guest. Those in more ordinary use were low, and less curved, but always made out of a single piece of wood.

Next to these, their weapons, drums, and other musical instruments, were their most important furniture; a great portion, however, of what might be called their household furniture, was appropriated to the preparation or preservation of their food.

The *umete*, or dish, was the principal. Sometimes it was exceedingly large, resembling a canoe or boat more than a dish for food. It was frequently made with the wood of the tamanu, exceedingly well polished; some were six or eight feet long, a foot and a half wide, and twelve inches deep, these belonged only to the chiefs, and were used for the preparation of arrow-root, cocoa-nut milk, &c. on occasions of public festivity. The *umetes* in ordinary use were oval, about two or three feet long, eighteen inches wide, and of varied depth. They were supported by four feet, cut out of the same piece of wood, and serve not only for the preparation of their food, but as dishes, upon which it is placed when taken from the oven.

The *papahia* is extensively used. It is a low solid block or stool, supported by four short legs, and smoothly polished on the top. It is cut out of one piece of wood, and is used instead of a mortar for pounding bread-fruit, plantains, or bruising taro; which is done by placing these upon the *papahia*, and beating them with a short stone pestle called a *penu*. This is usually made with a black sort of basalt, found chiefly in the island of Maurua, the most western of the group. The *penu* is sometimes constructed from a species of porous coral.

The water used for washing their feet is kept in bottles called *aano*, made from the shells of large and full-grown cocoa-nuts. That which they drink is contained in calabashes, which are much larger than any I ever saw used for the same purpose in the Sandwich Islands, but destitute of ornament. They are kept in nets of cinet, and suspended from some part of the dwelling.

The drinking cups are made with the cocoa-nut shell after it is full grown, but before it is perfectly ripe. The shell is then soft, and is scraped until much thinner than a saucer, and frequently transparent. They are of a yellow colour, and plain, though the cups formerly used for drinking *ava* were carved. These are the principal utensils in the preparation of their food; they are kept remarkably clean, and, when not in use, suspended from some part of the dwelling, or hung upon a stand.

The *fata*, or stand, is a single light post planted in the floor, with one or two projections, and a notch on the top, from which the calabashes of water, baskets of food, *umetes*, &c. are suspended. Great labour was formerly bestowed on this piece of furniture, and the *fata pua* was considered an ornament to the house in which it was erected. About a foot from the ground, a projection extended six or eight inches wide, completely round, flat on the top, but concave on the under side, in order to prevent rats or mice from ascending and gaining access to the food. Their only knife was a piece of bamboo-cane, with which they would cut up a pig, dog, or fish, with great facility. (1829:II, 181-184)

In addition to the furnishings just described, most houses would have contained a special place for standing the wooden sticks on which candlenuts were skewered and lighted for illumination.²

The early observers agreed that the dwellings of "chiefs" were usually larger and in general better constructed than those of the rest of the populace,³ but it is not clear from some descriptions of very large houses—some of which were from one hundred to three hundred feet long—whether their owners regularly slept in them or used them mainly to house retainers and visitors. Some, at least, of the very large houses seen by Europeans resembled hostels in function. G. Forster described a house seen on Apotopoto Bay (Taha'a) as "One of the largest houses in all the Society [i.e., Leeward] Isles.... It was full of inhabitants, many of whom lodged with their families in different parts of it; the whole appearing to be rather a public building, erected for the casual shelter of travellers, like the carvansaras of the East, than a private dwelling-house." (1777:I, 416.) Cook also remarked upon the presence of large houses:

Besides these common houses [i.e., "private" dwellings] there are others much larger 200 feet long and upwards 30 broad and 20 in height. There are

generally two or three of these in every district and seem'd not only built for the accommodation of the principal people but common to all the inhabitants of that district and raised and kept up by their joint labour; these are always without walls and have generally a large area on one side neatly inclosed with low palisades & ca. (Beaglehole 1955:129. See also Beaglehole 1962:I, 341)

The missionaries identified one such house as having belonged to a chiefess, but described it as having served as a kind of hostel: "We stopped at Pappara for the night in the house of my tayo [*taio*, 'friend'] Wyreede.... Here were a number of [visitors whose] great numbers made the house, wick was one hundred and forty feet long, appear like a little village, where each claimed the place on which his mat was spread." (Wilson 1799:206)

Ellis described the larger houses as having been erected "only for the leading chiefs":

The chiefs seem always to have been attended by a numerous retinue of dependants, or Areois, and other idlers. The unemployed inhabitants of the districts where they might be staying, were also accustomed to attend the entertainments given for the amusement of the chiefs, and this probably induced the people to erect such capacious buildings for their accommodation. (1829:I, 388)

What in fact were the purposes served by these large buildings? Were they free hostels for travelers in general, public centers for district gatherings, private dormitories and guesthouses of prominent individuals, or special lodgings for visiting Ariois? Actually, most of the very large houses which so impressed the Europeans probably served two or more of these purposes. In keeping with other aspects of Maohi society, it is logical to conclude that the leader of each political unit would have possessed a larger-than-average dwelling for the accommodation of visitors, including especially the Ariois—those most habitual and privileged travelers. Moreover, in the general scheme of things, such houses would have been built by *corvée* labor, who in addition to doing the actual construction work would have furnished the materials used.

Ellis was one of the few writers who described Maohi sleeping arrangements:

In the drier parts of the house, along each side, the inmates slept at night. However large the building might be, there were no partitions or skreens. Some of their houses were two hundred feet long, and on the floor, hundreds have, at times, lain down promiscuously to sleep. They slept on mats manufactured with palm-leaves, spread on the ground. These mats were generally rolled up like a sailor's hammock in the morning, and spread out at night. The chief and his wife usually slept at one end of the house, without the least partition between them and the other inmates of their dwelling. Instead of a single mat, three or four, or even ten, were sometimes spread one upon the other, to give elevation and softness; and this, with the finer texture of the mats, was the only difference be-

tween the bed of the chief, and that on which the meanest of his dependents slept. Instead of being spread on the floor, the mats were sometimes spread on a low bedstead, raised nine or twelve inches above the floor. The sides and bottom of this bedstead were made with the boards of the breadfruit-tree. Next to the chief, the members of his own family spread their mats on the floor, and then the friends and attendants—the females nearest the chief, the men towards the opposite end of the building.

I have sometimes entered the large houses in Huahine, soon after our arrival there, and have seen, I think, forty, fifty, or sixty sleeping places of this kind, in one house, consisting of a mat spread on the ground, a wooden pillow or bolster, in the shape of a low stool, next the side or wall; and a large thick piece of cloth, like a counterpane or shawl, which they call *ahu taoto*, sleeping-cloth, and which is their only covering, lying in the middle of each mat. There was no division or skreen between the sleeping places, but the whole ranged along in parallel lines from one end of the house to the other. What the state of morals must necessarily be among such a community, it is unnecessary to shew; yet such were the modes of life that prevailed among many, even after they had renounced idolatry. Such we found society in Huahine, and such our friends in Raiatea found it there. One of the reasons which they gave why so many slept in a house, was, their constant apprehensions of evil spirits, which were supposed to wander about at night, and grasp or strangle those who were objects of their displeasure, and whom they might find alone. Great numbers passing the night under the same roof, removed this fear, and inspired a confidence of security from the attacks their idolatrous absurdities led them to expect. (Ellis 1829:II 66–68)

But so few specific examples of actual sleeping arrangements are to be found in the sources that I include the following observation made by Mortimer in 1789 while visiting Mo'orea: "The house in which we slept was full of people, men and women, who all laid upon the ground on mats, except the mistress of the house, who had an elevated bed-place" (Mortimer 1791:39).

When the weather was fair the main meal of the day was usually eaten outside in some shady spot; otherwise the Maohis ate inside their dwellings, where, however, strict segregation along sexual lines was customarily preserved. In the smaller households of socially unimportant people it appears that both males and females usually ate under the same roof, although spatially separate. But for larger households, and particularly those of upper-class persons, it seems to have been customary to have two dwellings, thus making it possible for men and women to eat separately; and in such cases, according to Morrison, "The unmarried Weomen generally Sleep Near the Parents [in one house] and the Unmarried Men and Servants generally sleep in the Weomens eating house...." (1935:198) Eating arrangements were even further complicated in the case of individuals holding very high-ranking kin-Titles, as will be described later on.

In a cosmogonic myth, "Birth of Heavenly Bodies," Henry indicated that the principal pillars of some houses were designated by functional labels, such as "the pillar to elocute by," "the pillar to tattoo by," "the pillar

to stand by," and "cave interior (*ana roto*) pillar," which Henry identified as having been "where young maidens were held sacred from molestation" (1928:361). This is the only reference I have found to a custom of allocating house parts for special purposes; it is a credible enough phenomenon, and I am surprised to find no references to it in other sources.

As one might expect of these seasoned travelers, many of the more influential and affluent ones possessed small portable houses (*fare o'a*), which could be set up on canoes or on shore. Afloat they served both as sleeping cabins and as protection from the sun; ashore they provided couples with privacy and with retreats from the noise and heat of crowded dwellings. (Beaglehole 1955:129; 1962:I, 341)

Cookhouses usually consisted of mere sheds, protecting the household's earth ovens and its attendants from inclement weather. They varied greatly in size and in quality of construction.

Larger, finer canoes were protected from sun and rain by being kept in special canoe sheds (*fare va'a*) built near the shore and constructed quite differently from most other buildings (fig. 7-8):

For the convenience of keeping these *Paheis* [*pahi* 'plank boat'] dry we saw in the Islands where they use a peculiar sort of houses which were built on purpose for their reception, and put to no use but that; they are built of Poles stuck upright

FIGURE 7-8. Canoe shed, Leeward Islands. Unsigned drawing attributed to J. Cook, after similar drawing by S. Parkinson. British Museum.

in the ground and tied together at the top so that they make a kind of Gothick arch; the sides of these are compleatly coverd with Thatch down to the ground but the ends are left open. One of these I measurd, 50 paces in length, 10 in breadth and 24 feet high, and this was of the midling size. (Beaglehole 1962:I, 368)

In addition to all these more or less durable buildings, the Maohis were accustomed to erect temporary sheds (*fare rau*) for encampments (*pūfara*, *pūhapa*) during warfare or journeys (Ellis 1829:I, 389).

One would be safe in assuming that many of the more or less “permanent” buildings, and especially the larger residences and “public” houses of important individuals, were built to the accompaniment of religious ritual and probably of some feasting as well; unfortunately the sources provide scant information on this score.

As previously noted, “public” buildings were usually erected by *corvée* labor, as was probably the case with the private buildings of chiefs. It is also likely that kinsmen and neighbors assisted one another with house building, but Morrison provided evidence of paid construction work as well:

If a man wants a house or a Canoe built, he employs one or more Carpenters, paying them before hand one half of what shall be Judged the Value of the Work they are to perform in Hogs, Cloth, Oil, Matting &c—and finds them in provisions all the time they are at work and when the Work is Compleat he pays the remainder according to Agreement, but should he refuse or neglect and the Neighbours think the labour worth the stipulated agreement then they may plunder him of all that he is worth. (1935:165)

European visitors to the Islands recorded varying impressions concerning household precincts. Bligh, for example, was not favorably impressed:

They have as little neatness about their Dwellings [as about their gardens and groves]—an Otaheite Village, if their mixt Dwellings may be so called, is the dirtiest place immaginable, every thing is thrown before and around the House, even if they fix their Sheds upon the Sea side they will not take the trouble to throw the filth into the Sea, if they have ten yards to carry it—yet no People in the World are cleaner in their Persons. So much sloth and indolence may be attributed to the vast support that all bountifull nature has given to them in the use of the most valuable of all Fruits of the Earth, the Bread Fruit and Cocoa Nutt. (1792:157)

Vancouver, on the other hand, was very favorably impressed with the household complex of the chiefly Whytooa [Vaetua]:

They found [Vaetua’s habitation] situated on the verge of the sea shore. In the front of it was an *ava* plantation, interspersed with sugar cane, and bananas; near the house was a small shrubbery, of native ornamental plants. The whole surrounded by a well constructed fence of bamboo, neatly intersected with clean paths, that led in different directions, produced an effect that was extremely pleasing, and redounded much to the credit and ingenuity of the proprietor. *Whytooa* had taken very effectual means to provide for their entertainment; for a large hog had been committed to the oven, and was nearly ready for the table, with an abundance of other refreshments. The mansion was large and airy. By lines stretched across,

they had quiet possession of one half of the building; and this partition prevented the idle curiosity of the assembled natives from interrupting the comfort of their repast. (1801:283-284)

I turn now to the location of Maohi residence units—first in relation to the natural physical setting and then in relation to each other.

As previously noted, most Maohi dwellings were located in what has been defined, in European terms, as the adlittoral portions of the coastal zone and in the lower reaches of the valleys in the wet-tropical zone. Continuing our reconnaissance from this European-oriented perspective, several things about these locations appear relevant. To begin with most of them were within reasonable walking distance of the sea. Second, they were within easy reach of fresh water. Third, they were so placed as to be near groves and gardens of principal food crops.⁴ And fourth, they were located so as to be protected from harsher moods of the weather—out of the direct path of high winds and waves, and at a safe distance above ground subject to flooding. With a few possible exceptions residence sites do not appear to have been selected in order to provide commanding views; nor does defensibility from armed attack seem to have been a decisive criterion, except perhaps in the case of some isolated valley settlement, such as Papeno'o and Tautira, whose residents, it has been suggested, were in the main refugees from elsewhere.

In addition to these more general factors of location there appear to have been some others, such as the adjacency of a broad stretch of sheltered lagoon and proximity to a navigable reef-opening, which offered special encouragement to settlement. Houses were so concentrated around Huahine's saltwater lake, Fahune Nui (Maeva district), with its unusual tidal inflow of fish, that it came to resemble the European notion of a "village." G. Forster reported that he observed few houses on the banks of the lagoon (1777:II, 117), but he must have been referring to the shorelines themselves, since other visitors and numerous archaeological remains of marae, and so forth, attest to there having been a larger than average population concentration nearby.

As for the location of Maohi residences in relation to each other, eyewitness reports agree that they were, with some exceptions (e.g., Maeva), usually widely spaced:

They do not observe any regularity or method of alignment with their houses, for they are dotted about as if at haphazard all through the habitable tract of the Island, and they remove them with ease from one site to another. (Corney 1913:337)

The houses or rather dwellings of these people are admirably calculated for the continual warmth of their climate. They do not build them in villages or towns but separate each from the other according to the size of the estate the owner of the house possesses; they are always in the woods and no more ground is cleared away for each house than is just sufficient to hinder the Dropping of the branches

from rotting the thatch with which they are covered, so that you step from the house immediately under shade and that the most beautiful imaginable. (Beaglehole 1962:1, 339-340)

Even in such populous places as Matavai and lake-side Maeva, individual residential units were relatively far apart.

But what about residential location from the Maohi point of view? In the absence of contrary evidence it is not unreasonable to assume that the geographic criteria listed earlier were in fact consciously and deliberately applied by the Maohis themselves when locating their dwellings, although it is most unlikely that they perceived of their environment, by botanically defined "zones" and "subzones," in the systematic way that Western scientists have done.

As is to be expected, the Maohis had labels for numerous aspects of the geographic environment—for example, for a large and small mountain, cliff, pass, valley, stream, beach, cape, lagoon, reef, et cetera. The only verbalizations I can find expressing how they "thought about" that environment in more general taxonomic terms are those used by orators on public occasions to identify tribes or subtribes, that is, in terms of the specific place name of its associated territory's highest mountain (*mou'a i ni'a*), "floor" (*tahua i rare*), principal cape (*'outu i tai*), and largest freshwater stream (*vai*). The sources contain no further explication of this formula, but a present-day expert in modern Tahitian has provided the following commentary (which, though of course speculative insofar as it refers to the pre-European Maohis, is as credible as we are ever likely to find):

These [the four place terms just listed] are [were] the keypoints of the *mata'eina'a* [tribal district], primarily from the *'aito's* [champion warrior, Arioi lodge leader] point of view—and, more or less artistically, from the point of view of the general populace. However, they are also key points to the livelihood of the community. As such, the terms *mou'a* and *tahua* should be taken in their broadest senses: *mou'a* would thus include valleys (*fa'a* and *peho*), and *tahua* would cover the whole area which was level and had been cleared of major obstructions to movement (that is, habitation, cultivation, meeting grounds, etc.). Of course, the *'outu* is the center of fishing activities; and *vai*, I suppose, essential for drinking and bathing and carrying on certain minor domestic industries such as felting, cleaning fibrous materials, bathing, preparing food, etc., and of course for drinking. (R.G. White: personal communication)

Turning now to the social aspects of residence location, the question arises, How did it happen that a people reportedly so gregarious as these came to locate their residences so far apart? The distribution of natural resources certainly did not dictate the kind of residential dispersion that actually obtained, so that other factors must have been involved. But this is a complex matter, and consideration of it will be postponed to volume 2. Here I merely raise the question to indicate that it is crucial and anything but simple to answer.

MARAE

I have already described the key importance of marae in Maohi religious activity, and the functionally specific architectural features that comprised them. In a later chapter attention will be devoted to their relevance to social relations, but now my concern will be with how they were built and maintained.

Although all Maohi marae shared certain basic functional features (a tautology, of course, since I have defined marae in these very terms), they varied greatly in overall size, in the way these features were combined and, indeed, in size and shape of the features themselves. Above all, they involved stones, and in all but the simplest and smallest of them, stone masonry as well.

Stonework figured in several kinds of complex construction: walls and fish weirs, house and terrace platforms. For such work basalt, tuff, coral limestone, and pumice stone were used for facings; and the same materials, plus earth, were used for fill. Emory distinguished several kinds of facings:

Rough. Walls and terraces carelessly faced with rough stones of all types.

Simple flat. More or less carefully fitted basalt stones of varied sizes with smooth flat faces showing in the wall. Courses were not parallel. Sometimes finished off at the top with a coping of horizontal slabs or of flat, water-worn, oval stones.

Horizontal slab. Slabs (mainly of limestone) laid horizontally on a first vertical course with a flat side exposed in the wall.

Vertical slab. A first (and only, in some cases,) course consisting of large slabs, sometimes of basalt but more usually limestone, planted on edge or on end, flat side out. The largest of these slabs, which formed the facings of certain Leeward Island marae platforms (*ahu*), were of limestone and ranged from eight to thirteen feet in height above ground, up to eleven feet in width, and two and a half feet in thickness.

Curb. A one-course curb made by laying on edge (not on end) unworked roundstones of uniform size.

Unworked curb and roundstone. A first course of unworked curbstones under upper courses of unworked roundstones of uniform size.

Curb and block. Squared coral blocks only, or a combination of squared slab curb and upper courses of squared blocks (red tuff, white coral limestone, black pumice stone).

Worked curb and roundstone. A first course of coral tuff and basalt, and upper courses of round tuff and basalt stones of even size arranged in even rows. In most of these the stones were dressed top, bottom, and sides, in wedgelike shapes, for closer fitting, with the front face left smoothly convex.

Coral veneer. An outer veneer of thin coral slabs placed against basic basalt facing.⁵

Coral, tuff, and pumice stones were probably squared with blunt stone adzes, while the harder roundstones were probably shaped by hammering and pecking techniques.

Little or nothing is known about the quarrying of the huge slabs of coral limestone used in some constructions, but they were very probably transported from quarry to building site by canoe or raft, and overland on log rollers. Emory (1933:6-7) suggested that quarrying methods probably resembled those of Tonga, which were described by McKern as follows:

Living informants give the following account, remembered from the testimony of the preceding generation, of how stones were taken from one island to another:

The boats, at first the *tungiaki* and later the *kalia*, were large double-hulled sailing vessels, bridged with spacious decks, quite capable of carrying heavy loads. The vessel was brought as near to the shore as possible without running the risk of grounding, and there anchored to stakes set up on the shore. The anchoring place was usually at the very edge of a coral shelf, extending outward from the main shoreline, which was submerged at high tide and comparatively dry at low tide. The stone was dragged over skids to the edge of this coral shelf. Heavy wooden poles were then placed each with one end on the deck of the vessel and the other end crossing the abrupt edge of the coral shelf. These served as skids over which the stone was dragged onto the deck, where it was carefully adjusted and balanced, then tied by many ropes radiating from the stone to various parts of the vessel. In removing the stone from the vessel the reverse order was used. Some of the smaller stones were carried by groups of men, selected for their great strength, who placed the stones on the decks of the vessels without the aid of skids. [McKern 1929:6]

Common to all structures thus far identified by archaeologists as marae was a rectangular courtyard, usually paved with flagstones or stream boulders. Some effort seems to have been made in most cases to build marae on level ground or to obtain level courtyards by terracing. Also common to most marae were stone uprights set in the courtyards. (Figs. 7-9 through 7-21) In other architectural respects the marae so far discovered have been classified by archaeologists into a number of types according to such criteria as presence or absence of wall and type of wall construction; presence or absence of *ahu* and type of *ahu* construction; position of *ahu* in relation to wall; size of *ahu* and of overall structure; and so forth.⁶ Some of the architecturally simpler types were common to all the Society Islands and thus presumed to be "ancestral" to the larger and more elaborate ones. In connection with these latter, certain regional differences tended to develop and become very marked in time; for example, whereas the natives of Tahiti and Mo'orea built larger and larger multisteped platform *ahu* out of numerous courses of smaller matched stones, natives of the Leeward Islands built one- or two-level *ahu* of huge coral slabs set vertically and on

end. With few exceptions (e.g., an intermediate-size Windward Islands-type marae found on Huahine), these regional differences were sharp and exclusive—interesting testimony to the strength of local tradition, in view of the frequent coming and going between leeward and windward groups—but whether due solely to architectural and ritual influences, is not at all clear. In both island groups the largest and best-built marae were located near the coast, and this led Emory to label them “coastal,” as distinguished from small and relatively simple “inland,” or from “intermediate,” types. There may be some grounds for Emory’s arrangement of these “types” in simple-to-complex developmental sequences.⁷ But the labels given them are not altogether apposite, inasmuch as “coastal-type” marae have in fact been found considerably inland, and small “inland” types have been found near the coast as well (Green 1961). The development of larger and more complex “coastal” types did not end the building of simpler “inland” ones, for one finds them existing side by side, with evidence, even, that some of them were actually constructed more or less contemporaneously.

The general stated reason for building marae was, as previously noted, to provide places where humans could “... receive the gods in a befitting manner” (Henry 1928:429). But within this general intent several special kinds of more or less overt religious purposes operated, for example: to ensure success in some enterprise (e.g., in the productivity of a new fishing site); to celebrate a successful outcome (e.g., of a battle, a hazardous voyage, a bout of illness, or of affairs in general); to mark the birth or inauguration of a chief (Adams 1901:42), or the joining of two dynasties by marriage (Henry 1928:122); to honor a particular god and thereby extend his earthly influence (e.g., see Henry 1928:128–129); to establish a kin-unit’s title to a particular tract of land (Henry 1928:141).

Along with and reinforcing these overt purposes several more private, covert motives for building marae operated, such as: to enhance the prestige, and hence the political influence, of a particular individual or dynasty (e.g., “The greatest pride of an inhabitant of Otahite is to have a grand *Marai*....” [Beaglehole 1962:I, 304]); to extend political control by means of religious proselytization; to legitimize political separation of a branch kin-unit from its parent unit.

These various reasons, public and private, religious and political, will be exemplified in the chapters that follow. From the great number of marae found in every part of the archipelago it is obvious that such reasons were impelling enough to move the Maohis to expend large amounts of time and energy in the building and maintenance of marae.

At this remove in time from the people who actually built the marae we cannot discover directly the factors that entered into the placement of them, but it is possible to make some plausible inferences.

To begin with, a text from Henry has been used by some scholars to imply in a general way a relation between location and type of marae:

The long capes were the inheritance of royalty and the nobility; there stood the great temples of the land which could not be hidden. Deep bays were the inheritance of the gentry [*ra'atira*]. As the land got thickly populated, the people spread everywhere. On the seashore and inland were the lands of the plebeians (*ta'ata ri'i*) bordering on the lands of the great (*feia mana*). (1928:403)

The inference that has been drawn from this text is that, for social reasons, the size and elaboration of a marae increased with its proximity to the shore (Emory 1933:28). This correlation was indeed borne out in a general way by Emory's admirably energetic but admittedly partial pioneer survey of stone remains; but more recent and intensive surveys have demonstrated, in two populous regions at least, that large and elaborate "coastal-type" marae were also built miles inland (Green et al. 1967), and Emory himself pointed out that some small "inland-type" marae were built near the shore. As will be pointed out in a later chapter, size and elaboration of marae may in fact be correlated with the kin-Titular rank and political power of the proprietors.

Turning now to more particular locational factors, it does indeed appear that one of the places most favored for building large marae (or such as were built by people powerful enough to gain control of these favored places) was on capes extending into lagoon waters and opposite navigable passes in the barrier reef. The strategic advantages of such locations are obvious, but whether they were also favored on account of their conspicuousness is not quite certain. In this connection, although some of the marae at water's edge could be seen from far at sea, those farther inland seem not to have been located in order to command wide views.

Other locational factors that seem to have been considered favorable for such sites were standing groves of characteristic marae trees (e.g., ironwoods, rosewoods), good drainage, and proximity to fresh water. In the case of the larger slab-faced *ahu* of the Leeward Islands, proximity to a suitable source of limestone may also have been a factor: transporting some of these enormous slabs on rafts or canoes may have been relatively easy, but moving them overland could not have been so.

In the case of certain smaller marae dedicated to specific activities—for example, to fishing in a particular lagoon deep, or to growing taro in a particular valley—the marae in question was of course located near the site of the activity. Also, the so-called "family" or "ancestral" marae, which was usually small and narrowly exclusive, seems to have been located near the residences of its congregation members. As stated earlier, the larger "public" marae were probably located at some distance from ordinary living areas.

Next, in the case of marae built to establish a social unit's title to a particular tract of land, some of them appear to have been located near the tract's most important social boundary, as a kind of "guardian of the threshold." For example, in describing marae locations in the populous inland valley of Tautira district, Tahiti, an archaeologist declared: "It also appears that marae played somewhat the role of 'guardian of the threshold', inasmuch as they were built at the boundaries of each settled area, at the confluence of the valley's main stream and its tributaries" (Garanger 1964:10).

The locations of some marae were influenced by considerations of religious belief and practice. For one example among many, the venerable Vaearau marae of Ra'iatea is said to have been built to consecrate the spot where Ta'aroa first "... broke through the sky" and placed his foot on the island: however, there is a strong possibility in such cases that the myth was "invented" subsequently to "explain" the location of the marae (Handy 1930:84). Also it is consistent with other and better documented aspects of Maohi life to suppose that augury may sometimes have been consulted when seeking locations for marae, at least for locating some of the larger ones.

Finally, it is abundantly clear from archaeology that the Maohis were given to building new marae near and sometimes directly adjacent to existing ones. In some cases, in fact, there is evidence that a new marae was built on the very site occupied by an older one, even to the extent of cannibalizing the older structure for building stones for the new.

The building of smaller marae would have required little or no craftsmanship and energy beyond that of any ordinary man or small group of men. On the other hand, the building of the larger, carefully-faced walls and *ahu* called for considerable architectural and supervisory skills, as well as large levies of labor. There were, in fact, certain men (*tahu'a marae*) who made a specialty (presumably part time) of planning and supervising marae construction.

In planning new marae the *tahu'a marae* were probably constrained by their clients' wishes as to overall size; and they were obviously influenced by local architectural tradition—"obvious" inasmuch as such regional styles did in fact develop. But in view of the wide variation (in size and placement of *ahu*, etc.) a *tahu'a marae* may also have exercised considerable individual choice in planning the work for which he was commissioned. In all likelihood, the same specialists planned the marae and supervised its actual construction. We are not informed how they were compensated for their skills and labors, but it is reasonable to assume that they were compensated fairly generously.

A brief general account of the building of a marae appears in Morrison's journal:

When a Morai is to be Built the Chief Gives Notice thereof by sending a piece of Cocoa Nut leaf to evry Man under him, with orders that at the time and place appointed he shall appear with a Stone of the dimentions that he shall find described

by the Priests and they accordingly attend. If the Stones are not Judged sufficient the order is renewed. These leaves are Generally made up by the Priests with knots, tied in a Manner peculiar to themselves, and Contain the Dimensions of the Stones that each man may work without the assistance of another. When the stones are all collected, the Priests give notice that they are ready and a part of each day is set aside for the Work—a sacrifice is then made, and they proceed in their work during which time no fire must be lighted in the District till they leave off Work each Day—after the work is finished and the Alter erected, they expend two or three days in the Consecration of it, which is done by making many Sacrifices, Human & Common, with prayers & feasts and during the time the religious part of the rites are performing no fire must be lighted, and this is observed in all rites wherein the Generality of the People are Concerned. (1935:180)

Henry provided some additional generalities regarding both the actual construction and its accompanying ritual:

When a national or royal marae was to be built in a district, a branch of ti was taken and planted upon the assembly ground of the royal house, *ti patia* (ti stuck in), to show that religious restrictions were put upon pigs and fowls and all the produce of the land and upon the fishing grounds. The best of everything was to be cultivated and mature for the time of building, and the restriction lasted for two or three years. When the time to work arrived, the people entered a most solemn period. A *puhapara'a*, or encampment, was made in the woods for the laborers, who withdrew from their families to consecrate themselves to their work; and other encampments, called *fare-hua*, were made far inland for the old and infirm, for the women and children, and for domestic animals, so that their voices could not reach the appointed place, and that they might enjoy freedom. No living creature was allowed to approach the new site, no fires were kindled along the neighboring shores, where people even spoke in hushed voices.

No able-bodied man of the realm was idle on such an occasion, for the chief and all classes deemed it an honor to aid in so sacred a work. Some were food providers and cooks for the respective encampments, which were well looked after. Others collected stones from land and sea according to the directions of an artisan, who was called the *tahu'a-marae*, and they shaped the irregular stones into blocks and slabs with hard stone implements, leaving the round stones in their natural state to fit in between the others. This work took many months, and relatives or friends of the sovereign from other little kingdoms sometimes lent their aid. Marae dedicated to the god 'Oro were distinguished from all others by stones that were shaped like turtles' heads and set at regular distances along the sides of the construction.

When all the stones were collected, the ground for the marae was cleared and then sprinkled well by the priests with sea water to make it holy. A long stone was taken from some other grand marae, as the '*ofa'i-faoa* (chief-corner-stone), a man was slain and placed in the hole dug to receive the stone—his spirit supposedly remaining to guard the marae—and the erect stone was planted firmly upon the corpse, while the priest prayed to the tutelar god in the following manner:

Tahi t'ia mai e te atua e, i ta matou nei
pure!

Inaha, te pūpū hia 'tu nei e matou, na
va'a mataeina'a o teie nei hau, i teie fenua,
ei vahi mo'a na 'oe, ei ti'ara'a marae e ei
ti'ara'a fare no 'oe.

Hearken unto us O god, in this our
prayer!

Behold we the clans of this kingdom^[8]
present to thee this land, to become sacred
to thee, upon which to build a temple and
houses for thee.

Teie te 'ta'ata ei tapu ha'amo'a na matou i mua i to'oe ei aro, e te Atua e, teie te 'Ofa'i-faoa mo'a no te 'utuafare ta matou e ha'a no 'oe e no te nu'u atua e haere mai ia 'oe nei ei manihini na 'oe, e te atua e! 'O ta matou teie pure, a tahiti'a mai e te Atua e!

Here is a man as a pledge of consecration from us in thy presence, O god, here is the sacred 'Ofa'i-faoa (chief-corner-stone) of the home we shall make for thee and the host of gods who will come to visit thee as thy guests, O god! This is our prayer, hear-ken unto us, O god!

Another corresponding stone, which was called the *ti'a-va* (stand-towering) was placed at the opposite corner, and these two stones were called the *tihimarae* (horns of the marae), which answered the same purpose as the horns of the Jewish temple [*sic*].

After the performance of the terrible consecration ceremony by moonlight, the people silently carried out the stones collected and reverently placed them in heaps around the place prepared, according to the directions of the presiding artisan. Some immense pieces of stratified rock, twelve to eighteen inches thick, about twelve feet long, and nine feet broad were used, as well as large rocks of other kinds, which the priests and workmen declared were made light in their hands by the gods, so great was their enthusiasm in the work. (1928:131-132)

Any attempt on my part to calculate precisely the amount of labor required for constructing one of the larger marae would be complicated by so many unknown factors—for example, time required to find and work a stream boulder or to quarry and transport a limestone slab—that my estimations would be largely factitious, but it is my guess that such an enterprise would not have unduly strained the manpower resources readily available to most “district” chiefs. The Maohis may have found their religion sometimes burdensome, as the following lament implies:

Toti, Tota! E papahia Tahiti i mua i te marae!

Bowed down, forsooth! Crushed will be Tahiti before the marae!

(Henry 1928:131)

But this burden was more likely occasioned by the many restrictions on normal activities which accompanied marae ritual and by the large levies of goods required for marae offerings, rather than by the actual work of building a marae.

Of direct social-relational relevance is Henry's reference to the '*ofa'i fao'a*, the so-called 'chief cornerstone' or, better, 'marae founding stone', which according to Henry was "... a long stone taken from some other marae" (1928:132). There are many references in the sources to this custom. For example, marae Vaiotaha of Tautira district (Tahiti) is said to have been founded with a stone brought from a marae of the same name on Porapora (Corney 1915:127), and marae Fare Hau on Porapora was founded with a stone from marae Vaerai of Ra'iatea. In fact it would appear that the custom was general and universal, that is, nearly every marae was an offshoot of some earlier one,⁹ forming a continuity which was substantialized in the founding stone. This important concept will be considered in

later chapters, but it will be useful at this point to quote from Henry regarding the role of the founding stone in the establishment of a “family” or “ancestral” marae—a pattern which might conceivably be the mode for all founding-stone customs:

Whenever it was necessary for the land of a household to be divided into shares, each portion was nicely measured off by the *etaeta* (fathom), and the boundaries were marked with stones. Then the people who were leaving the old home took a stone from their marae, suitable for a chief cornerstone (*‘ofa’i haoa*) for a new marae upon their respective shares. When this was laid, they collected stones unconsecrated, to complete the structure. In their turn and in due form these stones were also consecrated. The sacred stone obtained from the original marae was replaced by a new stone taken and consecrated to the tutelar god or goddess with prayers and sprinkling with sea water. With the stone taken from the old marae were also taken the hereditary names, which had been bestowed upon the new proprietor, and from that time forward the other marae holders were disintitled to them. The new temple was dedicated to the same tutelar deity as the old one, who was considered the great friend of the family. The opening was celebrated with an inauguration feast called the *faato’moraa* (entering). (1928:142)

In this connection it can be shown by archaeology that many marae were constructed largely with stones taken from older marae.¹⁰ In fact, archaeologists have come across the remains of several marae that have obviously been depleted this way, not in terms of a few symbolically significant “cornerstones,” but of ordinary building material. The implications of this kind of measure, as evidence of changes in social relations and religious commitment, are as intriguing as they are obscure, and what little information there is available about them will be considered later.

According to Henry’s general account (1928:137-138), the dedication of a “national” marae consisted of three ritual episodes:

Rao-marae (setting of the marae). All members of the marae congregation, including females, assembled at the marae, where young women threw *tiare* blossoms upon *ahu* and pavement, and priests called upon the gods to fill the place with their presence.

Hao-marae (establishing the marae). The principal priest sprinkled sea water over all parts of the marae and called upon its tutelar god “... to take possession of his new home, and to make welcome his guests, the hosts of gods.”

Eera’a o te ari’i (the mounting of the *ari’i*). The principal proprietor of the marae walked across the middle of it, whereupon the priest pronounced the marae to be *mo’a roa* (superlatively holy).

Upon the conclusion of these rites all the food levied for the occasion was divided—part going to the priests for the gods (and for themselves),

part to the *ari'i* proprietor, and the remainder to other members of the congregation and guests, who ate it forthwith, but preserved great propriety in doing so:

The greatest propriety was observed by all parties concerned in the sacred marae inauguration feast, as it was believed that eating greedily or indulging in any excess of rioting would bring upon the offenders immediate calamity from the gods, such as choking while eating, strangulation, blindness, and many other troubles (Henry 1928:138).

This appears to have been the general pattern for marae dedication rites, although the scale of such events must have varied considerably. As was noted earlier, individuals and families sometimes vied with one another in having larger and more impressive marae. Such rivalry also appeared in connection with dedication ceremonies:

Many of the wealthy gentry of the land built their ancestral marae in pyramidal form [i.e., *ahu*] and inaugurated them with great pomp. They aspired to the honor of having their king or high chief perform the *eera'a* ceremony, feeling this the highest temporal dignity that could be bestowed by man. But the chief never again returned to it. (Henry 1928:139)

Rites also accompanied the construction and consecration of marae appurtenances, as exemplified in the following account of the consecration of a new "house-of-treasures" on Huahine. This account from Davies journal is quoted at length mainly because it represents one of the few eyewitness reports of an actual Maohi rite; most rituals described in the sources are generalized versions and hence removed one step at least from actual events.

The god's house being finished yesterday its consecration began in the evening & was as follows; a number of Priests & old men assembled at the house, also all the chiefs, men & women, Arepaea who is sick & Edea excepted, then the sacred drums began to beat & prayers commenced in the marae where the house stands, the priests then entered the house & sat down in different parts of it, the chiefs also, men & women sat by them, a great number of people gathered about the house & a number of the men entered but no women of the common people, it was then beginning to be very dark, the drums continued beating incessantly & the people in the house priests, chiefs &c then joined in chanting a number of Ubus (*upu*) or prayers repeating the same form of words hundreds of times over, thus it continued all night without interruption, except for 2 or 3 minutes when they gave over the repetition of one Ubu in order to begin another. Many of these Ubus were nonsensical sentences not in the form of addresses to their gods, but a repetition of their names & having sometimes some obscure allusions to some ancient transactions or traditions concerning the ancestors of the islanders, others had something of the form of prayers containing invocation to the gods, a declaration of their power &c. When daylight came everybody went out of the house, the drums ceased beating, 2 or 3 prayers were said by the Priests sitting by the side of the house, these were not chanted like the others. After this the gods were brought out from an old adjoining house & laid down by the

Priests seated on little stools, the gods were 5 in number viz Hoata the largest and for whom the house is more particularly built, Oro, Tane, Teare & Manutahe, one of the Priests gave orders for a cocoanut branch to be brought, this being done a number of the leaves were platted into small bunches, these are called Tapau & were in number 5 according to the number of the gods, a Priest then gave orders to a young man to climb to the top of the house & put the tapaus on the ridge outside where the end & middle posts were standing. This being done a boy & a young man were ordered to take up the gods with their stools in their hands & to walk round the house & two other men to follow them carrying the sacred drums, this procession went round 3 times, & then stood by a Priest that was saying a prayer, the prayer being ended the drums were laid down & the gods were taken into the house & laid down by the 2 posts over which the tapaus were placed outside on the house top, one of the gods viz Manutahe who was very small was taken back into the old house & so the ceremonies ended & the people departed to their several houses. One man was ordered to sail for Raiatea immediately taking with him some palm leaves to put in a Marae there & to acquaint the Priests &c that the house of the gods in this island had been finished & also its consecration. The things called after the names of their gods & (which) were placed in the house are only little bits of wood wrapt up in cloth & a number of feathers of various colours chiefly red fastened to them. The house of the gods is according to the fashion of the country an elegant and costly one, it is what is called a Fare pota having round ends, the length is about 56 ft. & width about 28 it is supported by 32 strong pillars or posts well wrought two or three of the middle ones which support the Tahuhu or main beam that has the upper end of the rafters resting upon (it) are curiously wrapt round with matting & sinnet of various colours, also most of the rafters are wrapt round nearly to the top with the same, the making of this matting & sinnet has been chiefly the work of the women & it has cost them much time. Journal, 1 January 1808-24 February 1810. (Newbury 1961:127-128)

Once built and consecrated, marae had to be maintained, physically preserved against weather and encroaching vegetation, and thereby spiritually sustained as suitable visiting places for the gods. In fact, before any great rite could be performed at a public marae the place had to undergo formal "weeding" (*vaerea marae*). It is reasonable to suppose that some ritual also accompanied the tidying up of smaller domestic and occupational marae, but the sources do not report it.

Marae weeding was thus a solemn affair, but it would appear that it was only performed preparatory to other solemn rites at the marae and not as a regular, periodic act in itself. This is a significant example of Maohi "economics": labor was rarely expended for purposes of simple "maintenance" but, usually, only for the purpose of securing an increment or making up a loss. Marae reconstruction, on the other hand, constituted the principal episode in rites designed to "purify the land," to make it habitable again after it had been ravaged in war and its gods and marae defamed. A description of these rites is given in chapter 12.

CHAPTER 8 *BOATS AND TRAVEL*

As we have seen, the population of these rugged and widely separated islands resided in small scattered settlements, and it was socially divided into numerous political divisions as well. Comparable conditions in many other parts of the Pacific (for example, in Melanesia) were allied with cultural, social, and genetic distinctiveness; the fact that such fragmentation did not develop in the Society archipelago was made possible by the means the Maohis had for communicating with one another and by the use they made of such means.

Maohis traveled by both land and sea. Except for short stretches of some windward shorelines, the coastal belts afforded fairly easy walking, either through the parklike littoral zones or along the sandy beaches. In places where valleys cut deep into the islands' interiors people crossed from one side to another over well-traveled passes—except during rainy spells, when passage was rendered more difficult than even these sure-footed walkers were able to negotiate.¹ At such times and at other times as well, the Maohis usually took to their canoes in order to reach distant destinations.

BOATS

The Polynesians traditions ... prove that voyages were made from the Society Islands to the very limits of Polynesia: to Hawaii, Rapa, and New Zealand. (Handy 1932:64)

At this time [after being regaled by a European about the latter's wide travels around the world] Pomarre and his retinue particularly regretted their want of ships, and knowledge to conduct them to foreign countries; and, addressing himself to me, said, in a tone of concern, that they were able to go no further than Ulietea [Ra'iatea] or Huaheine; and that at the risk of being driven they knew not whither, to perish" (Wilson 1799:200)

However maritime a people the Maohis may have been previously, at the point in their history when they were first sighted by Europeans they undertook deliberate round-trip voyages little farther than the limits of their archipelago, except for occasional voyages to and from the nearer Tuamotu atolls. But this did not diminish the immense influence of boats and boat travel upon the internal structure of their society. (Fig. 8-1.)

The Maohis constructed three types of boats: small dugouts (*pu ho'e*), larger dugouts with built-up sides (*va'a*), and composite-plank keeled craft (*pahi*). In addition to these specific labels, however, all three types were called *va'a*.²

A *pu ho'e* consisted of a single hollowed-out log hull capped occasionally with thin gunwale strips. Such boats were round on the bottom, with a convex cutwater and slightly raised bow, and with a slightly raised and pointed stern. No visitor troubled to measure these small canoes, which were used mainly for inshore fishing, but it is unlikely that they were over fifteen to twenty feet in length.

The hull of a *va'a* was much like that of the *pu ho'e* in shape, but the larger ones—Banks measured one seventy-two feet long (Beaglehole 1962:I, 365)—were built on two or more dugout bottoms fitted together; and their afterpart was somewhat wider than the forward. They had long flat bow-pieces and high upward-curving sterns.

Pahi differed from *va'a* and *pu ho'e* in shape and in construction. They had definite keels and rounded sides, and were elevated at both bow and stern. The keel was fashioned out of one or more hollowed-out logs, and the sides out of several planks. According to various accounts, *pahi* ranged in length from thirty to a hundred or more feet. One of average size measured

FIGURE 8-1. "In the district of Tetaha, Island of O'tahyetye." Watercolor by G. Tobin. Mitchell Library, Sydney.

by Banks was fifty-one feet long, gunwale breadth varied from fourteen to eighteen feet, bilge width from thirty-two to thirty-five inches, and depth amidships was three feet four inches. Like the *va'a*, the *pahi* stern consisted of a high curved piece topped with a carved figure, but the *pahi* also carried a figure on its raised bow piece (fig. 8-2 through 8-6).

The *pu ho'e* was always stabilized by means of an outrigger float, whereas the *pahi* usually consisted of a pair of hulls joined together to form a "double canoe." *Va'a* were sometimes stabilized by outriggers or by means of double hulls.

FIGURE 8-2. Hull of Ra'iatean *pahi*. Drawing by S. Parkinson. British Museum.

All these types of boats were propelled by pole, paddle, or sail—or by two sails, one stepped in each hull of double canoes. Steering was by means of paddles or larger paddle-shaped rudders. For sailing, a balancing board was usually lashed across the gunwales so as to extend several feet beyond the hull opposite the outrigger; by moving along this board crewmen were thus able to keep the vessel on a more even keel. Washboards were often added for travel in rough waters, and wooden bailing-scoops (fig. 8-7) were necessary at all times because of invariable leakage and water taken in over the sides.

The larger canoes were usually fitted with additional structural features for special uses. When traveling long distances it was customary to lash boards across the gunwales to form a wide platform upon which to sit and sleep, or even cook. For additional protection against sun and weather some boats carried mat-work canopies or portable cuddies, which also served as shelter for the travelers ashore. In the case of *va'a* outfitted for war, raised platforms were built over the bows to accommodate the fighting men.

In fact hulls of the larger boats, *va'a* and *pahi*, were put together and supplemented in various ways to suit various purposes. A favorite adaptation for traveling near shore, with or without sails, was made of twin hulls of medium size; larger double canoes were also used for fighting and for stately travel. For deep-sea fishing and interisland travel the single hull, with outrigger, was probably faster and safer. It was a simple matter to right

an overturned outrigger canoe, but if a twin-hulled one ever broke apart at sea there was nothing to do but hold onto one of its parts and drift.

The hulls themselves were not decorated, but upturned bows and sterns were in many cases carved and ornamented, and topped with figures of birds and humanlike beings. Also, long streamers trailed from the tops of some masts; and on special occasions canoes were ornamented in very colorful ways.

The preferred woods for hulls were *'ati*, or *tamanu* (*Calophyllum inophyllum*), and *mara* (*Nauclea forsteriana*). Other more easily worked and often used trees included the breadfruit, *tou* (*Cordia subcordata*), mango, coconut palm, *hutu* (*Barringtonia*), and *purau* (*Hibiscus tiliaceus*). All these trees, be it noted, flourished in zones on or near the coasts, although the flawless great hardwoods preferred for the hulls of the largest boats were in time to be found only in more remote inland areas, in rain forests and on the lower slopes. When the latter were felled the timbers were trimmed and roughed out before they were dragged to places near the shore where they were customarily finished.

The boards of the hull were fitted edge-to-edge and then sewn together with sennit passed through holes drilled near the edges.³ Joints and holes were caulked with coconut-husk fiber and breadfruit-gum pitch; these had to be frequently renewed and, even so, did not render the vessels entirely watertight.

Fire was sometimes resorted to for hollowing out boat hulls, but most dubbing and thinning was accomplished with stone adzes of various sizes. Planks were obtained by splitting straight-grained timbers by means of heat and wedges. Chiseling, gouging, and drilling were done with bone tools; finishing, with coral rock and sand. No guidelines were used in boat construction save the practiced eye of the builder: "They have no rule for Building but the Eye, and have no Idea of working by a line; yet nevertheless some of them are built with as much exactness, as if they had been pland by able builders and according to the oppinion of some good Workmen they are well finishd" (Morrison 1935:205).

There is no recorded evidence concerning the number of man-hours required in the construction of Maohi boats and no reliable method for estimating such time. Nowadays it takes about forty hours for an expert

to hollow out and finish a sixteen-foot hull, but the job is done with metal tools, which are of course more efficient in use and require far less frequent sharpening. A large *va'a* hull must have required many more man-hours, and a *pahi* still more—even without the additional time which had to be devoted to the ritual practices accompanying the construction of such boats.

Woods used for other parts of the boats—masts, outrigger attachments and floats, decking, paddles, bailers, et cetera—were easily obtainable, mainly from the coastal belt. Sennit and hibiscus bark were used for lines and lashings, and sails consisted of pandanus matting.

The smaller dugouts (*pu ho'e*) were made and used throughout the archipelago, but, for reasons not entirely clear, the more seaworthy boats, the *pahi*, were constructed mainly in the Leeward Islands, particularly on Ra'iatea. Handy argued that this was due in part to the unavailability there of trees large enough for *va'a* hulls and in part to the superior boat building skills of the Leeward Islanders.⁴ The second point seems valid enough, but the first is questionable in view of Ra'iatea's extensive forests.

According to Ellis:

Most of the natives can hollow out a buhoe [*pu ho'e*], but it is only those who have been regularly trained to the work, that can build a large canoe, and in this there is a considerable division of labour,—some laying down the keel and building the hull, some making and fixing the sails, and others fastening the outriggers, or adding the ornaments. The principal chiefs usually kept canoe-builders attached to their establishments, but the inferior chiefs generally hired workmen, paying them a given number of pigs, or fathoms of cloth, for a canoe, and finding them in provision while they are employed. (1829:1, 175; see also Morrison 1935:165)

It is not clear whether Ellis was writing about conditions obtaining during his visit (1818-1824) or about the pre-European era, but in any case his remarks about specialization would apply even more pointedly and restrictedly to the earlier era, before iron tools had simplified the craft of boatbuilding.

Another point of uncertainty about Ellis' statement is his references to the division of labor: that is, was there an institutionalized division of specialization among the expert boatbuilders into hull makers, outrigger attachers, and so forth, or were actual work assignments made on an ad hoc basis, with all workers more or less competent in all branches of the craft?

Specialist boatbuilders were called *tahu'a tarai va'a* (or *pahi*). Handy described such craftsmen in these words: "The canoe-building craft in the old days was in the hands of a class of highly respected and well-to-do professional builders—who constituted a sort of guild having its own regulations, rites, and places of worship. The chiefs had *tahu'a* attached to their establishments, and there were other artisans who worked for hire." (1932:59.) This statement deserves closer attention, because of its direct relevance to our concern with social relations.

In the first place, there is no evidence to indicate where a line might be drawn between Everyman's boatbuilding capability and the *tahua's* skill, or what proportion of the population was recognized as so skilled. Just as crucial, no records that I am aware of provide estimates of the time such specialists devoted to boatbuilding in comparison with time devoted to other kinds of productive work. That such craftsmen were "highly respected" may well have been true—at least, there is no evidence that they were not—but precisely which level they occupied in the hierarchy of "respected" professions we are not informed. Neither Handy nor any other writer provides evidence concerning the relative affluence of boatbuilders.

The question of boatbuilders "guilds" is also relevant. According to Henry there were special "canoe builders' marae" (1928:146), and it may well have been that the expert boatbuilders of various tribal districts had their cooperative work relationships so institutionalized, but nothing is recorded concerning the organization of any such groups, nor is there any evidence to indicate that such ties extended beyond a district's boundaries.

Morrison's account of the procedures followed by an individual in commissioning carpenters to build a boat (or a house) for his private uses was quoted above; the carpenters' services, commissioned by means of a verbal contract which involved coercive sanctions for nonfulfillment, were exchanged for such items as pigs, mats, bark cloth, and oil. We are also indebted to Morrison for a condensed account of the organization, work procedures, and religious ritual attending the construction of a large "official" boat.

The War Canoes (and those Made presents to the Deity which are occasionally Used for that purpose, and are in fact built for it only by the Contrivance of the Priests who are in the interest of the King and tells the other Chiefs that the Deity wants Such a Number of Canoes of Such a Size & they set about building them Immediately) are Built by levying Contributions and are done thus—Each Chief who has one to build Calls the Towhas & Ratirras together to a Feast and informs them of the Request of the Deity and desires them to Collect Hogs, Cloth, Oil &c. to pay the Carpenters, to which they readily agree and the Carpenters are Employd who go into the Mountains and Mark their Trees, the Ratirra on whose land the Trees happen to be sends hands to assist in Cutting them down, and hewing out the peices in the rough according to the Carpenters directions, that it may be the easier brought down, as they form each part out of a Solid Tree, and often at some Miles distance in the Hills.

When they have Sufficient Collected to Make a beginning they fix a day to fetch them down and a house is erected to build the Canoe in. When the timber is brought down a Feast is made and an Offering of a Hog to the Deity to prosper the Work, a Feast is also made for the Workmen. At evry Piece they make Fast and when the Bottom is Completed a Grand Feast and Offering is Made, which is repeated at the Finishing of evry Streak till the Whole is Compleat, when a greater Feast is Made, and the Canoes being Dressd with Cloth, Breast plates, Red and Black Feathers, Fine Matting &c.—they are Brought to the Grand Morai, and a Man is killd and put on board and Offered as a Sacrifice, when the Ca-

noes are hauld up near the Morai where she is Covered with Thatch till Wanted, the Priests securing the Feathers for the Deity and the other Decorations for the King, to whom they are presented in Form, as before, the Eye of each Sacrifice being presented before him and the Body interd in the Morai. The War Canoes are Offered in like Manner but Hogs serve instead of Men. (1935:205-206)⁵

The organization and economics of this boatbuilding project resembled other “public works” enterprises in that it was financed by means of a general levy of objects and services, while the carpenters themselves, that is, the individuals who devoted more skill and effort to the project than anyone else, appear to have received extra compensation for their extra work (Henry 1928:481). Another noteworthy aspect of this particular kind of project is the collusive religious support provided by priests on behalf of their rulers’ social and political objectives.

As far as one can infer from eyewitness reports, all specialist boat-builders were male, and presumably only males had any direct hand in the construction of boats intended for service to gods. On the other hand, women were observed assisting in the building of some small, ordinary-purpose boats, at least to the extent of helping a male in lacing together the boards with sennit. (Handy 1932:50; Montgomery 1832:I, 53-54)

The elaborate religious ritual involved in the building and launching of large, publicly important boats is described in detail in the following excerpts:

In the evening of the last night of the moon, a canoe builder of either of the two classes would take his axe and place it for the night in a recess of the marae, an act called *ha’amoe ra’a to’i* (putting the hatchet to sleep), at the same time invoking the presiding gods, Tane, Ta’ere, Te-fatu, and Ta’aroa, in chanting the following song:

A ti’i a naonao i te to’i,	Go and take hold of the axe,
I te rua to’i i Havai’i;	In the aperture in Havai’i;
E naoa, e iritia ururu hia,	Hold, that it be taken out enchanted,
E pepepe hia, ia hoa hia	Made light; that it may produce sparks
I te ha’a tua mea.	In doing varied work.
I fa’aina hia i te one mata huahua;	It is whetted with fine sand;
I tavai hia i te one mata ri’i;	Made smooth with loose-grained sand;
I tapiri hia i te miro moa ma fau tu,	It is set in a firm handle of sacred miro,
E faua i te aha mata tini a Tane.	United with many-stranded sennit of Tane.
E raa te to’i	The axe will become sacred
I te aha mata ioio a te tahua,	In the brilliant sennit of the artisan,
E u e mau	Which touches and holds
Ei maro no te to’i,	As a girdle for the axe,
Ei fafau no te to’i,	For the handle of the axe,
Te tua no te to’i,	The back of the axe,
Ei ‘o’iri no te to’i;	To make one the axe and the handle,
Ei mama no te to’i,	To make light the axe,
Ei taputapu no te to’i,	To consecrate the axe,
Ei tuitui no te to’i,	To impel the axe,
Ei fa’aoti no te to’i,	To complete the axe,
Ei ta mana no te to’i.	To give power to the axe.

Upon the marae ground, they prepared a feast called the *'aira'a tahua ohipa* (artisans' feast), which was sacred to themselves. They killed a fatted pig, and as they wet it with water and steamed it over the fire to loosen the scarfskin, they took off handfuls of the hair and placed them on one side for Tane, saying: "*Ei mata ora te ha'a, ei to'i horo*" (Work with wakeful eyes, and with expeditious axes), which was the motto for all who worked for the god Tane. When the pig was cooked, they cut off the tail, which they took with the hair they had saved to their shrine and dedicated them specially to the god Tane, while they presented *'ura* feathers to all the gods of the marae collectively.

They then partook of their feast, and feeling strong from it, retired to rest until the early dawn of day, when each man took his respective axe to awaken it in the sea with the following invocation:

E fa'arara'a no te to'i!
Ta'ai atu na i te to'i,
Pupu, e aro, e ra'ai.

The awakening of the axe!
Let it travel a little seaward,
Present it (there), let it fight and
attack.

Fa'atae atu i te to'i i mua i te 'au,
E rahiri i te maro rere,
E ara no Tane,
Atua tahu'a nui;
E ara no Ta'ere ma opoopo,
E ara no Te-Fatu nu'u,
E ara no Ta'arua,
Metua a te nu'u atua.

Let the axe go against the spray
Inaugurating its flying girdle,
Awake for Tane,
Great god of artisans;
Awake for Ta'ere of all skill,
Awake for Te-fatu of hosts,
Awake for Ta'arua,
Father of all the gods.

After this ceremony, before the sun had risen, the artisans put on their working *maro* (loin-girdles) and went, axe in hand, to cut and trim off suitable wood for their canoe, which they brought to their shed to make. They labored assiduously throughout the work, closely observing every sign of an omen. (Henry 1928:146-147)

When the canoe or ship was finished, great importance was placed in the setting of the rollers over which it was to be drawn into the sea, the builders chanting in the following manner as they set them:

E rao tu'ua
E rao mua i Atea
Fa'arotu u mata'i.
E matafa, manu aitu,
A fa'auru ra!
E rao tu'ua,
E rao i roto Atea,
E rao fa'arotu mata'i;
E rua tufa a te manu aitu,
E rao tu'ua,
E rao peho Atea,
E rao o te vahine metua.

A roller is laid
A front roller for Atea
To cause commotion against the wind.
Far-seeing god bird,
Now enchant it!
A roller is laid,
An inner roller for Atea,
A roller to contend with the wind;
Twice served is the god bird.
A roller is laid,
A roller for the valley of Atea,
A roller for the motherly woman
[Hina].

Nau te tu'i, e tu'i no te aha?
E tu'i mai mua.
Ei mahu no te aha?
E uru hia e Tane;
E Tane, a fa'auru ra!
E rao tu'ua na Ro'o te ro'oro'o.
E rao na Ta'arua-Metua,

Mine it is to strike, to strike what?
To strike before.
To make spray for what?
For the enchantment of Tane;
O Tane, now enchant it!
A roller is placed for Ro'o the famous.
A roller for Father Ta'arua,

E rao na Te-Fatu nu'u,
 E rao na Ta'ere ma oopopo,
 E rao na Toa-hiti mata nui;

E Tane fa'auru ra!
 Tu'ua te rao muri
 Te rao na Tu pa nui
 I fa'atu i te ra'i;
 E Tane, fa'auru ra;
 Toro ra, fa'auru,
 E Tane aitū!
 Nau te tu'i, e tu'i no te aha?
 E tu'i no te taruarua nui,
 Na Tane te 'opiri napenapea,
 E tu'i mai roto,
 E tu'i mai muri,
 E tu'i tana aha mua.

E Tane e, fa'auru ra,
 Tane turu rao,
 Fa'auru ra!

A roller for Te-fatu of hosts,
 A roller for Ta'ere of all skill,
 A roller for Toa-hiti (Bordering-rock)
 of great eyes;
 O Tane, now enchant them!
 The hindermost roller is laid,
 The roller for Tū, the great father
 Who made stable the sky;
 O Tane, now enchant it;
 Now extend enchantment,
 O god Tane!
 Mine it is to strike, to strike what?
 To strike the great rolling waves,
 Tane will quickly turn them,
 When they strike the midships,
 When they strike behind,
 When they strike his sennit in the
 bows.
 O Tane, now enchant,
 Tane, supporter of the rollers,
 Now enchant them!

As they continued to place the rollers and until they reached the border of the shore, the artisans repeated this song, the burden of it implying that the canoe would be enchanted by the rollers. The day before launching, the canoe was drawn out of the shed onto the rollers and there propped up and rigged and decorated with pennants and garlands; and close by it the builders gave a feast at which great hogs were baked whole. They invited as guests men of the same profession as themselves, to whom they made liberal presents of baked pigs and cloth to take home. In the evenings, the hatchets were again "put to sleep" in the marae for the night. A piece of sennit about a foot long was taken and passed under the foremost end of the outrigger of the canoe and laid down to sleep also; it was placed flat upon the marae ground beneath a flagstone to obtain an augury from the gods. Early in the morning, the axe was "awakened" as before, and the flagstone was carefully lifted off the piece of sennit, which the artisans examined with great interest. If it was quite straight it indicated that the canoe had fine prospects before it, if tortuous, the canoe would be beset with dangers, but escape safely, and if the sennit had become twisted or turned over, the canoe would be in danger of being lost at sea. Then to ensure safety for the canoe at all hazards, a piece of the hull of an old marae canoe was "put to sleep" in the marae, there to remain untouched as long as the canoe lasted.

Soon the people assembled to see the launching and baptism of the canoe, which was performed with great solemnity, superintended by their sovereign, or the representative (always a man), who laid his hand upon one side of the canoe, saying: "A to! A to! A to!" (Draw! Draw! Draw!) Then it was launched into the sea gracefully, with little labor, amid the admiration and loud applause of the spectators, which was called *umere*. After this it was immersed, bows first and up again, which was called *fa'ainuraa i te va'a* (making the canoe drink), as the chief artisan said:

Fano ta'u va'a nei,
 I te 'are miti fati,
 Ei na raro mai,
 Ei na ni'a 'tu ta'u va'a,
 E Tane aitū e!
 Fano ta'u va'a nei,

If I sail my canoe,
 Through the breaking waves,
 Let them pass under,
 Let my canoe pass over,
 O god Tane!
 If I sail my canoe,

Na te tai vave'a,
 Ei na raro mai,
 Ei na ni'a 'tu ta'u va'a,
 E Tane aitu e!

Through the towering waves,
 Let them pass under,
 Let my canoe pass over,
 O god Tane!

And so the artisan continued, improvising his words to suit the occasion, until the baptism was finished. The *ahi-tu* were also called *te-varu* (scrapers) because they did much scraping in polishing their work to a superfine degree. Their marae and working shed were consecrated entirely to the building of sacred canoes, which were those made for the national marae and for war. During the period of their work, their persons being regarded as sacred to the gods, they were fed on the fat of the land, and restrictions upon food were disregarded with impunity by those who required it in preparing their meals.

After a war canoe was launched, the *ahi-tû* and priests inaugurated it by paddling about the harbor, chanting prayers, finally ending by suspending their paddles in the passage abreast of the harbor. While the high priest broke open an *opa'a* (matured coconut) and carefully sank the two halves in the sea with the hollow side turned upwards. If they went down steadily, maintaining their position, it indicated that the land would be prosperous under long peace. If one-half turned over in going down, it foretold war in the indefinite future. If both halves turned over, imminent war was anticipated. Then they returned to the shore and drew the canoe up on to the place allotted to war canoes, apart from all others. (Henry 1928:180-182)

According to Ellis every boat, of any size, was given a distinct name

[which was] ... always arbitrary, but frequently descriptive of some real or imaginary excellence in the canoe, or in memory of some event connected with it. Neither the names of any of their gods, or chiefs, were ever given to their vessels; such an act, instead of being considered an honour, would have been deemed the greatest insult that could have been offered. The names of canoes, in some instances, appear to have been perpetuated, as the king's state canoe was always called Anuanua, or the rainbow. (Ellis 1829:I, 169-170)

No evidence known to me can provide reliable estimates concerning the useful life of Maohi boats, although efforts were undoubtedly made to insure longevity: through choice of durable woods; through constant repair, periodic overhaul, and protection against undue sun drying (Beaglehole 1962:I, 368); and, of course, through seeking supernatural aid. Ordinary wear and tear of everyday use probably accounted for most deterioration, but in times of war an enemy's boats (along with his houses) were favorite targets of destruction.

There is no reliable method for estimating with any precision the number of boats in commission during the eras under study. It would probably be safe to conclude that nearly every household possessed at least one seaworthy *pu ho'e* during periods of social tranquility, but the numbers of larger craft must have varied greatly from time to time, according to political events. The threat of war undoubtedly brought about an increase in construction, and war itself resulted in much destruction. Attention has been drawn to the immense fleet of fighting boats and smaller supply vessels seen

by Cook on the eve of a planned attack by some Tahitians against Mo'orea: 160 large war canoes and 170 smaller supporting vessels on one occasion. But, as I noted in my discussion of this fleet, we cannot be certain what proportion of the total number of such boats was on hand—perhaps nearly all. Although boats built specifically for travel are said to have differed somewhat in construction from those designed for naval warfare (Morrison 1935:202), I believe it is safe to assume that the invasion fleet seen by Cook would have included nearly all seagoing vessels available, including “traveling” boats adapted to fighting or supply purposes for this occasion.

In any case, boating and boatbuilding soon declined from their peaks of that period and probably never again reached such levels. Morrison had this to say about the fighting boats available to one of the principal chiefs of Tahiti in 1788 to 1791:

Their Chief Strength consisted formerly in their Naval force, which at present is but trifling, their Navy being put on a very indifferent footing, oToo [the “king”] thinking it better to keep peace then make war. At present his whole Naval force does not exceed 20 sail of War Canoes & for the most part of these he is beholden to his Sister Areepaeoa Waheine who brought them from Ryeataya—but he stands in no need at present of large Canoes as Morea [Mo'orea] is now under him, Mottooarro having adopted His Son to be Heir to Morea. (1935:171)

And Wilson, writing about the period 1797 to 1798, declared that there were only five large war canoes at Tahiti (1799:376). However, he did not explain how he arrived at this figure, and his statement did not pertain to travel canoes, which were probably far more numerous.

Turning now to the actual distribution of Maohi boats, individual and regional, I have already recorded my own opinion that, except for periods of social upheaval, nearly every household had its own *pu ho'e*; on the other hand the distribution of larger boats was probably quite uneven, in view of the resources required to build and maintain them and of the uses made of them. Precise inventories are of course not available but passages such as the following one from Ellis provide a general picture of the situation:

The most general and useful kind of canoe is the tipairua, or common double canoe, usually from twenty to thirty feet long, strong and capacious, with a projection from the stem, and a low shield-shaped stern. These are very valuable, and usually form the mode of conveyance for every chief of respectability or influence, in the island. They are also used to transport provisions, or other goods, from one place to another. (1829:I, 170)

Unfortunately we are left in the dark regarding the hierarchical positions or the relative numbers of Ellis' “chiefs of respectability or influence,” but it seems clear from his statement that possession of a *tipaerua* was essential to such individuals for the purpose both of conducting their practical affairs and asserting their dignity. With respect to the former, while chiefly status was not, ideally, an outgrowth of commercial activity, a chief's ability

to transport goods and people undoubtedly affected his status, particularly when it came to warfare. In the second sense, Ellis added the following: "The rank or dignity of a chief was supposed, in some degree, to be indicated by the size of his canoe, the carving and ornaments with which it was embellished, and the number of his rowers." (1829:I, 167) Confirmation of this generalization is provided by numerous passages in the earlier writings, giving eyewitness reports of stately processions in boats, whose large dimensions and elaborate decorations must have served mainly to show off their owners' titular rank, affluence, or political authority.

There were, then, individual differences in the kinds and numbers of boats owned, and these differences served both to influence and to symbolize individual differences in social status. But what about regional differences in boat ownership?

Mention was made above of the Ra'iateans' superiority in constructing composite plank-built boats (*pahi*); it is quite probable that there were more of these boats in Ra'iatea too. Whether this was due more to regional differences in technological tradition and skill or to local differences in availability of suitable woods is not altogether clear. It is evident that the huge trees required in the construction of large *va'a*-type boats were found in greater abundance on Tahiti than elsewhere and that less forested islands, such as Porapora and Mai'ao, were considerably handicapped in this regard. This circumstance does not, however, appear to have discouraged the Poraporans, particularly, from active seafaring; indeed it may have supplied a powerful motive for their forays against other islands.

BOAT TRAVEL

Performance quality of Maohi boats has been a subject of much discussion. The small *pu ho'e* appear to have been wonderfully adapted to movement in relatively quiet waters and easily righted after swamping or capsizing. Without question, nearly every Maohi male past early childhood, and probably many females as well, handled these tricky but versatile little craft with finesse. The paddling qualities, and the quality of paddling, of the larger boats were also admired by European observers, most of whom, it should be recalled, were themselves seasoned mariners. Also, the high sterns of some of the larger boats were well adapted to heavy seas. For example, Cook described them as "... the best calculated for landing in a Surf of any Vessels I ever saw, their high round sterns recives the force of the Sea in Such a manner that none ever enters the Vessel" (Beaglehole 1961:408). It was the performance of Maohi boats under sail that led many competent observers to less enthusiastic evaluations:

In fine weather, and with a fair wind, they are tolerably safe and comfortable; but when the weather is rough, and the wind contrary, they are miserable sea-boats, and are tossed about completely at the mercy of the winds. Many of the natives

that have set out on voyages from one island to another have been carried from the group altogether, and have either perished at sea, or drifted to some distant island. (Ellis 1829:I, 176)

Under sail, boats with outriggers were probably somewhat faster and more maneuverable than those with twin hulls, and they were more easily righted after capsizing:

They have No Method of reducing their Sails but by Casting off the lower part and rolling it up and should that not answer, as it frequently will not, they must take their Chance and as they Cannot reduce the sail at Head but by Casting it off entirely, for which purpose a man must go to the Mast head, and it would be next to impossible to get them up again from the quick Motion of the Canoe, for which reason they let them stand at all events and had rather Overset, or loose the Mast, then Strike the Sail, and in Squally weather both these Accidents often happen, but they are so accustomed to them that they think nothing of either, tho by being dismasted they are frequently blown off and heard of no more—When they are taken in a Squall they luff Head to it and shake it out, but should the squall Continue too long & the Vessel is like to fall off they all hands Jump overboard & hang her head to windward till the Squall is over, when they get in & steer their Course, but should they not be able to hold her on and she gets overset their First Care is to secure evry thing, and Make their Fish Cloth, Paddles &c. fast and when the squall is past they tow the Canoe round with the Mast head to Windward and making a line fast to the upper part of the Spreet all hands get on the Out rigger, and hauling the head of the Spreet out of the Water and the Wind getting under the Sail lifts it, when they all swing off with their whole weight together [and] right her. Some hands then keep her head to windward till the others free her of the Water and then get in and proceed on their Voyage—this frequently happens on their return from Fishing, when they endeavour to out carry each other till they are overpowered by the Wind & get overset—of this they think the danger so little that they never require any Assistance except to take in their Cloth, or such things as may receive damage by being long wet, but they frequently loose so much ground as to be forced to run for Morea and somtimes for Hooaheine and Ryeatea and We have known some of them who being dismasted have been 9, 12 and 15 days at sea with scarce a Mouthful of Provisions and No Water, as they seldom Carry more then a Few Cocoanuts and a bread fruit or two Sufficient to Serve as long as they intend to Stay out, and trust to providence for a Fish—(Morrison 1935:204–205)

In comparison, double-hulled boats were steadier in the water and could carry relatively more passengers and cargo.

Both types sailed fast and steady before the wind.⁶ As just noted the outriggered boat was subject to capsizing, and the double-hulled one to excessive drag and dangerous—sometimes fatal—structural strain. Two passages by eyewitnesses will provide some flavor of the hazards of Maohi sailing:

An instance of this kind occurred a few years ago, when a number of chiefs and people, all together thirty two, were passing from one island to another, in a large double canoe. They were overtaken by a severe tempest, the violence of which tore their canoes asunder, and separated them from the hor-

izontal spars by which they were united. It was in vain for them to endeavour to place them upright, or empty out the water, for they could not keep them in an erect position, nor prevent their incessant overturning. As their only resource, they collected the scattered spars and boards, and constructed a raft, on which they hoped they might drift to land. The weight of the whole number, who were now collected on the raft, was so great as to sink it so far below the surface, that they sometimes stood above their knees in water. They made very little progress, and soon became exhausted by fatigue and hunger. In this condition they were attacked by a number of sharks. Destitute of a knife, or any other weapon of defence, they fell an easy prey to these rapacious monsters. One after another was seized and devoured, or carried away by them; and the survivors, who with dreadful anguish beheld their companions thus destroyed, saw the number of assailants apparently increasing, as each body was carried away, until only two or three remained. The raft, thus lightened of its load, rose to the surface of the water, and placed them beyond the reach of the voracious jaws of their relentless destroyers. The voyage on which they had set out, was only from one of the Society Islands to another, consequently they were not very far from land. The tide and the current now carried them to the shore, where they landed, to tell the melancholy fate of their fellow-voyagers. (Ellis 1829:I, 177-178)

Several Cannoes and Men and Women have been lost since we have been here in their excursions to Tetturaoh [Tetiaraoh]. Their being overset in their Cannoes is not the least risk they have to run, as the Sharks frequently make a meal of them, and indeed were I to credit the accounts they are much more plenty than on the Coast of Africa. I am told likewise there are a kind of Sword fish that as they vault along on the Water the(y) peirce many people through the Body and kill them. They speak also of a kind of Fish like Bavia coota [barracuda] and attribute to them the same propensity, that of seizing the privacies of Men, as they are said to have in the West Indies. (Bligh 1789:II, 44)

Despite their weaknesses of design and construction, and their lack of deep keels, Maohi boats were believed to have been able to sail within sixty to eighty degrees of the direction of the wind, which, as one modern expert has pointed out, compares not unfavorably with America's famous clipper ships (Bechtol 1962).

Every large boat had paddlers, one or more steersmen and bailers, and a captain (who might also serve as steersman) overall. When sailing a large boat with outrigger, one or two men were usually assigned the task of moving along the balancing spar to maintain an even keel. Morrison reported that some canoes occasionally employed more than a hundred paddlers and up to six bailers. J. Forster reported having seen one double war canoe, "which required 144 paddles, and eight or ten steersmen to move it forward" (1778:457). The records are silent on this point, but it seems reasonable to assume that the jobs of paddling, steering, balancing, bailing, and sail handling were assigned according to strength and skill; demonstrated skill was probably required of boat captains as well, but factors of titular rank or political authority may also have figured in assignment of this job.

The method of paddling Maohi boats, which was described by Ellis

for the period 1816 through 1822, probably did not differ markedly from the way it had been conducted fifty years previously:

The rowers appeared to labour hard. Their paddles, being made of the tough wood of the hibiscus, were not heavy; yet, having no pins in the sides of the canoe, against which the handles of the paddles could bear, but leaning the whole body over the canoe, first on one side, and then on the other, and working the paddle with one hand near the blade, and the other at the upper end of the handle, and shovelling as it were the water, appeared a great waste of strength. They often, however, paddle for a time with remarkable swiftness, keeping time with the greatest regularity. The steersman stands or sits in the stern, with a large paddle; the rowers sit in each canoe two or three feet apart, the leader sits next, the steersman gives the signal to start, by striking his paddle violently against the side of the canoe, every paddle is then put in and taken out of the water with every stroke at the same moment; and after they have thus continued on one side for five or six minutes, the leader strikes his paddle, and the rowers instantly and simultaneously turn to the other side, and thus alternately working on each side of the canoe, they go along at a considerable rate. There is generally a good deal of striking the paddle when a chief leaves or approaches the shore, and the effect pretty much resembles that of the smacking of the whip, or sounding of the horn, at the starting or arrival of a coach. (1829:I, 166)

From this it may be surmised that the propulsion of a large war canoe with its hundred and more paddlers represented a noteworthy example of precisely coordinated effort, containing important implications for one's understanding of Maohi social relations and social control. Even more impressive in this connection was the conduct of fleet maneuvers observed by Cook on the occasion of the naval assembly noted in chapter 2:

... we saw a Number of War Canoes coming round the point of Oparre [Pare], being desirous to have a nearer view of them I hastned down to Oparre (accompanied by some of the officers &ca) which we reached before the Canoes were all landed and had an opportunity to see in what manner they approached the shore which was in divisions consisting of three or four or more [boats] lashed close a long side each other, such a division one would think must be very unwieldy, yet it was a pleasure to see how well they were conducted, they Paddled in for the Shore with all their might conducted in so judicious a manner that they closed the line a Shore to an inch.... (Beaglehole 1961:401)

The rowers were encouraged to exert their strength by their leaders on the stages, and directed by a man who stood with a wand in his hand in the fore part of the middlemost Vessel, this man by words and actions directed the paddlers when all should paddle when either the one side or the other should cease &ca for the steering paddles alone were not sufficient to direct them: all these motions they observed with such quickness as clearly shewed that they were expert in their business. (401n)

In connection with travel by boat, mention should be made of the portage track across the narrowest part of the Isthmus of Taravao, where the main mass of Tahiti is joined to its southern peninsula. Canoes traveling between the island's southwestern and eastern coasts were regularly trans-

ported across the isthmus to save time and effort, and particularly to avoid the hazardous passage around the peninsula's southernmost point, Te Pari, where the Pacific swells crash directly against the steep cliffs and rocky shores.

At day break we got up and while the boat was getting ready, I took a walk into the Country which I found here to be a low neck of land with a chain of morasses over which they track their canoes across the (Island) which may be about 2 Miles or more (Beaglehole 1955:107).

Clues to the length of the track and to the method and organization of portage are to be found in a statement from Rodriguez:

The *arii* of the district of *Afaaiti*, who was near there with a lot of his people, came to haul the canoe across by land& and in a short time they launched her from the beach (at the opposite side of the isthmus), more than thirty men having lent a hand in the job. On my wishing to reward them with some glass beads for ear-drops, they would not accept them; but said they had done no more than their duty. (Corney 1919: 113)

After another such portage Rodriguez described the porters as having shown "... great zeal over the manoeuvre," and having been "highly pleased" and "happy" to carry it out (Corney 1919:124).

... we soon reached the place where canoes are hauled overland for a little more than half a league from the one side of the island to the other in order to shorten the journey, which is where the people were to be called up to transport ours. I landed, together with the henchman whom Vehiatua had given me for this purpose, and on notifying the head men of the locality they cheerfully complied, and collected all their people, so that by the time the sun was setting we were already on the opposite coast.... (Corney 1919:127)

They make use of skids for this job, both that the canoes may run the more easily and to save them from damage, although the track is a good one. (Corney 1919:54)

Wilson stated that canoes were hauled across the isthmus "... on rollers and by ropes." (1799:316)

It appears from these excerpts that local natives, particularly the residents of the district of Afa'ahiti, were somehow obligated to assist with the portage without direct compensation—at least if the canoe were engaged on a trip sanctioned by the peninsula's paramount chief (in this case, Vehiatua). How other travelers may have fared can only be surmised; presumably they either carried their canoes themselves or compensated the local porters in some way.

Comparative research has established beyond any reasonable doubt that the Maohis of the Society Islands bore very close biological and cultural resemblances to populations as far flung as those of Hawaii and New Zealand; it is even supposed by some scholars that two-way communication, infrequent perhaps but nonetheless deliberate, was kept up between the

Maohis and those distant cousins of theirs long after dispersion from common homelands.⁷ It is also confidently claimed by some writers—and just as positively disputed, in whole or in part, by others—that individual Maohis known to Cook and other early European visitors were aware of the existence and the general location of such distant places as the Marquesas, Samoa, Tonga, Fiji, and Tubuai.⁸

Upon close examination, much of the allegedly pre-European knowledge may be found to be based on inaccurate etymologizing or false identification on the part of Europeans; Polynesians, like the rest of mankind, tended to carry along and perpetuate some of their stock place names wherever they colonized. Also, some of the places thus listed were doubtlessly added to their store of information as a result of early post-European accretions: for example, a lengthy list of “Islands known to the Tahitians,” collected by the Spaniards in 1775, was recorded some months after the return home of a Maohi taken by Cook on one leg of the voyage of the *Resolution*. But even granting that the Maohis possessed a fairly extensive knowledge of the existence and general direction of islands many hundreds of miles away,⁹ such knowledge need not have been acquired by means of deliberate voyages to these islands and back, for, as Cook (or Anderson) came to recognize, much of it could and did derive, directly or indirectly, from natives of those islands more or less accidentally cast up on the Society Islands or on intervening islands:

The knowledge they have of other distant islands [i.e., other than the western Tuamotus] is, no doubt, traditional; and has been communicated to them by the natives of those islands, driven accidentally upon their coasts, who, besides giving them the names, could easily inform them of the direction in which the places lie from whence they came, and of the number of days they had been upon the sea.... We may thus account for that extensive knowledge attributed ... to Tupia [Tupaea, see note 8, above], in such matters. And, with all due deference to his veracity, I presume that it was, by the same means of information, that he was able to direct the ship to Oheteroa [Rurutu], without having ever been there himself, as he pretended; which, on many accounts, is very improbable. (Cook 1784:177-178)¹⁰

Be that as it may, by Cook's time the Maohis themselves were engaged in more or less deliberate voyaging only within their own archipelago or to the nearest of the nearby Tuamotus—that is, over open-sea distances of no more than 280 to 330 km. Within these limits deliberate travel between Tahiti and Mo'orea, between Maupiti, Porapora and Motu Iti, between Ra'iatea and Tana'a, and between Huahine and Mai'ao was commonplace and year round, weather permitting. Banks' strictures on the possibilities of very long overseas voyages would not, of course, apply to any of these relatively short trips: “They cannot however remain at sea above a fortnight or 20 days tho they live as sparingly as possible, for want of proper provisions

and places to put them in safe, as well as water of which however they carry a tolerable stock in hollow Bamboes" (Beaglehole 1962:I, 366).

The other standard tracks, more or less frequently traveled were as follows:

Between Tahiti and Tetiaroa. The ten islands comprising Tetiaroa Atoll are located about 50 km north of Tahiti's northwestern point.

They are all low and for the Most part Covered with Cocoa nut trees which is all they Produce; they are the Property of o Toos [Tu] Family who keeps the Inhabitants in subjection by keeping them from Planting the Breadfruit or other Trees and suffers nothing to grow there except a few Tarro for His own use under the Charge of one of His favourites—and as these Islands cannot be Approachd by large Canoes He makes them His Magazine for all His riches; a Number of Canoes are kept there for Fishery and Near 40 Sail of small sailing Canoes which they Haul over the reef are kept constantly plying between them & Taheite; they bring Fish for the Kings houshold, and return loaded with provisions—and besides these the Dolphin Canoes trade there when the Dolphin Fishery is over, Carrying Provisions and Returning With Oil which they Make in large quantities, a Variety of Fine Fish and a Sauce Made of Ripe Cocoa Nuts Calld Tyeyro [*taioro*], the Nuts being gathered before they are too old and Grated in the same Manner as for Oil, which being Mixed with Shri(m)ps and left a day or two to ripen becomes like Curds and is excellent sause for Fish, Pork or Fowle. (Morrison 1935:201–202)

In addition, relatives and retainers of the Pare dynasty used to repair to Tetiaroa for "vacations" to rest, amuse, and fatten themselves, and to recover health after heavy bouts of kava drinking.

As indicated, traffic between Tahiti and Tetiaroa was frequent. Bligh, writing in June 1792, stated that fleets of ten to fifteen canoes used to ply the route at intervals of ten to fourteen days (Bligh 1792:163b). Under normal wind conditions this travel presented few difficulties; but, even so, canoes were occasionally lost at sea.

Between Tahiti and Me'etia. Me'etia was under the suzerainty of chiefs of Tahiti's peninsula, and the open-sea distance between these two points—some 110 km—was traveled two or three or more times a year, subject to winds (i.e., the trip to Me'etia having been made during the occasional, and mainly summer, westerlies, and the trip westward having been made with the help of the tradewinds:

The Chief of Tyarrabboo [Taiarapu] keeps one of [his large sailing canoes] constantly plying between Taheite and Myetoo or Myetea, Calld by us Osnaburgh Island, 27 leages S.E. of Taheite, which is Subject to Him, and in her, he sends Iron Work and What European Commoditys he Can raise as presents to the Chiefs, who in return send back Pearls, Pearl Shells, Stools for Seats, Pillows & Pudding Stools Made of Tommanoo [*tamanu: Calophyllum inophyllum*], with Dishes & Trays of the same wood, Matting, Cloth, Oil, Hogs &c. &c.—and she seldom returns without a Cargo. (Morrison 1935:201)

What the Tahiti end of this trade contributed to the exchange before Europeans introduced iron is not specified. Perhaps there was a basic inequality in the exchange, because of Me'etia's political subordination, and hence obligation to render "tribute."

The occasional travel between Tahiti-Mo'orea and the nearest of the Tuamotuan atolls followed three routes: via Me'etia, via Makatea, or direct. Of the first of these connections, Morrison reported the following: "By means of [Me'etia] they have Communication with several others to the N.E. of Taheite and taking advantage of the Northerly Wind reach Myetoo [Me'etia] where they watch Wind shifting to stretch to the Northward to a Group of small Islands, the Capital of which is Calld Tapoohoe [Tapuhoe, or Ana'a] (1935:201).¹¹

Most of the pearls and pearl shell reaching Tahiti from Me'etia presumably originated in the Tuamotus. The sources contain several legendary stories of voyages to the Tuamotus by Maohis in search of red feathers, but no authentic account of any such expedition was recorded by European visitors. On the other hand, Cook provided a report, from hearsay, about an expedition of some forty Poraporans who "... incited by curiosity, had roamed as far as Mataeewa [i.e., Matahiva, 250 km north-east of Porapora] ..." (Cook 1784:176-177). Actually, most of the travel between the Society Islands and the Tuamotus was carried out by the Tuamotuans, in their very seaworthy *pahi*. Some of this was deliberate voyaging, for trade or for political asylum; but the sources contain several references to the presence of Tuamotuans on Tahiti who drifted there as a result of mishaps at sea.¹²

Between Tahiti-Mo'orea and Huahine-Ra'iatea-Taha'a. Boats covered the 140 to 170 km of this stretch of open water in two, three, or four days of easy sailing, when the winds were right. People deliberately traveled this route for trade, pleasure, and affairs of kinship and state. There is no record of large-scale military-attack expeditions as such between the two groups of islands, but boatloads of warriors often made the trip to join warring allies. As an example of the close communications between Windwards and Leewards, it is recorded that an official delegation from Ra'iatea arrived at Tahiti to present condolences within nine days of the death of a Tahitian chief (Corney 1919:188).

Less frequently, Maohis visited isolated Mopelia Atoll, some 200 km west of Maupiti. In the list of islands reported by Don Thomas Gayangos as being known to the Maohis—information said to have been obtained at Tahiti, from "... the most trustworthy Indians of eminence in the Island" —Mopelia (Mopiha) was described, from this hearsay evidence, as follows:

Of middling size and low, with a reef. Produces coco-nuts and pearls, but is not inhabited. They say there are birds of large size there in great plenty, which do not fly [i.e., boobies and noddies]; and they visit the island to catch them for eating, as they are very fine-flavoured. Canoes from *Maurua* [Maupiti] take two days to reach it. (Corney 1915:193)

On the other hand, Cook reported that "... it is reckoned a sort of prodigy, that a canoe, once driven by a storm from Otaheite, should have fallen in with Mopeeha [Mopelia], or Howe's Island, though so near, and directly to leeward"—and had managed to return (Cook 1784:177).

NAVIGATION

It may be noted that such voyages as those described were well within the navigational competence of the Maohis of the era under study—even according to the most unflattering estimates of their abilities in this field. To begin with, it should be recalled that most of the Maohis' common destinations were islands of considerable altitude and hence usually visible (by light from sun, moon, or stars) from long distances at sea. Thus, during clear-weather voyages between Windward and Leeward islands, perhaps only one-third of the distance would have to be covered completely out of sight of land. It has been reported for other archipelagoes in the Pacific that embarking travelers set their initial courses to known destinations by lining up standard landmarks behind them (e.g., see Hilder 1962). There are no specific reports in the sources that the Maohis followed this procedure, but it is reasonable to assume that they did so. In sailing to low islands, if the voyagers had managed to steer within a few miles of them by dead reckoning, they were probably assisted in locating them by such phenomena as the flight of homing birds, the scent of vegetation, and the color of clouds (e.g., the greenish tint of shallow lagoon waters is sometimes reflected against the undersurface of clouds).

It may be assumed that voyagers to nonvisible destinations knew the directions in which they lay—at least, from fixed points of reference. According to Varela the horizon was divided into sixteen parts, based on cardinal points at which the sun rose and set (Corney 1915:284-285).¹³ Of the sixteen allegedly "directional" terms given Varela and recorded by him, only about half are recognizable. J. Forster recorded terms for only the cardinal points (i.e., east, *te hiti o te rā* [border, extremity of the sun]; west, *topa te rā* [it falls the sun]; north, *to'erau*; south, *toa*) but surmised that there were twelve horizon divisions in all (1778:503). By comparing the so-called directional terms listed by these and other writers with the names for winds recorded in several other sources (e.g., Henry 1928:459; Cook 1784:143), it appears that many terms for directions serve also as terms for winds; but the coincidence is not complete. By comparing all the lists, one with

another, it is unmistakably clear that some wide divergences exist: for example, *to'erau* was defined by Varela as "the west," by J. Forster as "the north," by Marau as "northerly wind," and by the LMS Dictionary as "west-erly, or northwesterly wind." Some of these discrepancies may be based on differences in ethnographic skill among the observers. But it is also possible, indeed likely, that there were some local variations in the meanings given to some of the terms; one factor behind such differences may have come about through local differences in the wind patterns themselves.

In any event, the Maohis did divide the horizon into several directional or wind-direction sections, which they used—along with other phenomena—for navigational purposes (and possibly other purposes as well).

The most detailed account left us concerning the Maohis' methods of navigation is Andía y Varela's:

When setting out from port the helmsman reckons with the horizon thus partitioned counting from E, or the point where the sun rises; he knows the direction in which his destination bears: he sees, also, whether he has the wind aft, or on one or other beam, or on the quarter, or is close-hauled: he knows, further, whether there is a following sea, a head sea, a beam sea, or if it is on the bow or the quarter. He proceeds out of port with a knowledge of these (conditions), heads his vessel according to his calculation, and aided by the signs the sea and wind afford him, does his best to keep steadily on his course. (Corney 1915:285-286)

So far, so good—at least on the relatively short voyages to prominent destinations, which constituted most Maohi overseas travel. That is to say, the factor of unrecognizable displacement and slippage through current and changes in wind, which rendered instrumentless long distance navigation next to impossible, would not have been so critical on the usual Maohi short trips, although countless vessels must have been lost even in these familiar seas. But to continue with Varela: "This task becomes more difficult if the day be cloudy, because of having no mark to count from for dividing out the horizon." One can only assume that in such a situation no one set out on a long overseas voyage to a difficult destination unless compelled to do so. Even more difficult would have been the attempt to navigate on cloudy nights, but Varela's description of their procedure for doing so raises more questions than it answers:

Should the night be cloudy as well, they regulate their course by the same signs; and, since the wind is apt to vary in direction more than the swell does, they have their pennants, (made) of feathers and palmetto bark, to watch its changes by and trim sail, always taking their cue for a knowledge of the course from the indication the sea affords them.

Finally, Varela had the following to say about astral navigation:

When the night is a clear one they steer by the stars; and this is the easiest navigation for them because, these being many (in number), not only do they note by them the bearings on which the several islands with which they are in touch lie, but

also the harbours in them, so that they make straight for the entrance by following the rhumb of the particular star that rises or sets over it; and they hit it off with as much precision as the most expert navigator of civilized nation could achieve.

They distinguish the planets from the fixed stars, by their movements; and give them separate names. To the stars they make use of in going from one island to another they attach the name of the island, so that the one which serves for sailing from Otahiti to *Oriayatea* [Ra'iatea] has those same names, and the same occurs with those that serve them for making the harbours in those islands.

Were this the case of course natives of, say, Mo'orea, Huahine, and Porapora would have applied the name *Ra'iatea* to different stars. None of the sources specifically recognizes or documents this point.

As critics of the theory of long-distance, deliberate, Polynesian voyaging have pointed out, the problems encountered in astral navigation are considerably more difficult than Varela's terse statement would indicate; but these would not have been so insurmountable in the Maohi case, since most of their long overseas voyages were generally to east or west, and were short enough to require something less than pinpoint navigation.

As often noted throughout this book, many aspects of the Maohis' lives were crucially affected by direction and velocity of wind, and this was especially true of their comings and goings by sea. Their vocabulary contained numerous words for patterns of the sea's surface shaped by the wind. It is no wonder, then, that this population of sailors and fishermen associated winds with spirits, as the following excerpts from Henry indicate:

Winds were potent agents of the gods, murmuring mysteries and warnings to men.

The Mauriuri-pe'e-va'a (Cry-that-detached-canoes [authorities]) was a wind full of the sound of the cricket's cry. That wind was the soul of the land, and when the sound of it was heard, evil was approaching the place, war was soon to rage.

Moe-rehu-turituri-roroa-no-Perete'i (Lost-in-haze-of-distant-distracting-sounds-of-the-cricket) was also a great wind of Tû-o-te-to'i-oi (Stability-of-the-sharp-axe). Its cry was deafening in the land, it was the upholder of kingly power. That wind drove away invading armies, who, when they heard it, would decide not to fight and would precipitate themselves into the sea to evade contact with the enemy. The sea and wind had ears to obey the cricket, Tû-o-te-to'i-oi.

The Tui-hana (Soul-reposing-prayer) wind, from the rocks of Fenua-iti of the leeward islands, was a messenger of the gods; they brought it. It was a soothing wind, and the land was hallowed by it.

The Atoatoa (Contrary-wind), which blows very hard, was brought by the gods at times to destroy the land because of the sins of the people. That wind represented the gods themselves. As it approaches the seashore it resounds; it dashes upon the shore. The sky darkens until the sun cannot penetrate it. This wind has great force, and with it the gods destroyed the land, which could not escape it.

The Moana-roa-no-Tane (Distant-depths-of-Tane [god of beauty]) was a good wind indicating peace. When it was blowing, the sky was deep-blue and cloudless, and canoes sailed without harm to and fro at sea and among the islands.

The Paetahi (One-sided), a wind of the coast, was the wind of Punua-pae-vai (Side-pool-of-the-river-bank). It came from one side only, along the coast.

The Huatau (North-wind) was from Ta'arua, the Great-foundation.

The Mara'amu-moana (Trade-wind) came from the gods as a messenger of peace in the land; people dwelt in safety at those times.

The Mara'ai-pupua (Southerly-gale) was 'Oro's; it brought forth war.

The Rapati'a (Westerly-wind), from Vai'otaha, Porapora, was of the god Ra'a (Sacredness), and it produced destruction; it indicated the anger of Sacredness.

The Mata'i-fe'etietie (Cooling-wind), from the south, which caused the fleets to be frequently mended, came from the god Heima (Winter).^[14] It was a peaceful wind that came in gusts.

The Fa'arua, or Tumurua (Two-blendings, or Two-sources), joint-workers from the north, a stormy wind in its season, came from Te-fatu-tiri (The-lord-of-thunder). Coming from two directions it meets with heavy clouds producing thunder and breaks down the trees of the shores and the masts of the ships at sea. It prevents people at sea from coming to land, sending them far out of their course.

The To'erau (North-westerly) wind brought rain from the god Tumu-rupe-rupe (Cause-of-verdure); it was for times of peace.

The Hinu-taia (Smoothed-calmness), a stifled wind, caused excessive calmness; the shoals receded; there were no waves, no breakers upon the reef, and no ripples along the shore. It was ominous of death to the land. (Henry 1928:392-394)

METEOROLOGY

For sailors and fishermen, livelihood and even survival sometimes depended upon ability to predict the weather, a skill which, some observers such as Banks claimed, the Maohis had in considerable measure:

The people excell much in predicting the weather, a circumstance of great use to them in their short voyages from Island to Island. They have many various ways of doing this but one only that I know of which I never heard of being practis'd by Europaeans, that is foretelling the quarter of the heavens from whence the wind shall blow by observing the Milky Way, which is generally bent in an arch either one way or the other: this arch they conceive as already acted upon by the wind, which is the cause of its curving, and say that if the same curve continues a whole night the wind predicted by it seldom fails to come some time in the next day; and in this as well as their other predictions we found them indeed not infallible but far more clever than Europaeans. (Beaglehole 1962:I, 368)

Banks' high opinion of Maohi weather prediction was not however shared by Cook, who, after describing the more common local changes in wind direction and velocity, wrote, "The natives seem not to have a very accurate knowledge of these changes..." (Cook 1784:143).

TRAVEL RITUAL

Notwithstanding all their meteorological knowledge and their skills in building, sailing, and navigating their boats, the Maohis took measures to insure that the spirits would help them reach their destinations in safety and speed. These measures were not only against the usual hazards of wind and wave but also against the many malevolent spirits that inhabited the ocean in the form of large sharks, mantas, and the like.

On setting out on any journey, travelers usually invoked their tutelary spirits to grant them a safe voyage and return, but the rites for an overseas journey were of a particular kind. Most of the following is based on Henry (1928:178-180); in all likelihood the ritual that accompanied so important an activity as overseas voyaging was more elaborate and varied than this version indicates, but Henry is the only source that provides much detail.

Before setting out the travelers and their kinfolk visited their marae and presented to the priest a length of sennit which had first been placed under their canoe's outrigger.

The priest placed it [a piece of sennit] straight and flat beneath a sacred slab, committing those who were about to depart to the care of Tane, god of beauty and fine weather, and also invoking all the sea gods to watch over them and guide the canoe safely away and back again.

This sennit, called *'aha moa* (sleeping sennit), was left at the marae until it was time for the voyagers to arrive at their destination. Then those at home went to the priest requesting him to uncover it to see how it lay. If they found it lying quite straight, it was a sign that the canoe had arrived safely before a fine wind. If a little crooked, the canoe had met with contrary winds, yet was still safe. But if the sennit was twisted over, it was a sign that the canoe had upset and probably all those on board were lost. Then there was weeping and great anxiety until they received tidings of their absent ones or saw them again. If the omen proved to be a false alarm, the priest claimed that a lying spirit had deceived them. (Henry 1928:179)

If threatened by dangers at sea—say, by becalming or storm or following sharks—it may be assumed that someone aboard requested spirit aid by means of prayer, red feathers, and even object sacrifice. The spirits thus invoked probably varied with circumstances: sometimes it may have been the voyagers' tutelary deities; at other times the spirits inhabiting that particular area of ocean; and on occasion even Temariotu'u, god of navigation, himself.

Upon reaching their destination the voyagers presented thank-offerings to their kin-group's tutelary spirits, if there happened to be a marae dedicated to such spirits at that place, or if not to the sea gods themselves. The offerings so presented consisted of feather amulets and chunks of coral.

One can turn to myth and legend for further evidence of the important place overseas voyaging occupied in Maohi beliefs and aspirations. I cannot reproduce in this summary description the many long, drawn-out Odysseys of such gods and demigods as Tane, Maui, Hina, Rata, Honoura, and so forth, but I can at least point to them as indicating how deeply intrigued the Maohis were by overseas voyaging. Sea voyaging was undoubtedly a means to other ends for the Maohis, and there is some reason to believe that it was considered by many as an end in itself.

But whatever the motives and the means behind the Maohis' comings and goings by sea, the interactions resulting from that movement knit together all the islands of the archipelago into a single discrete and distinctive society.

CHAPTER 9 *FOOD*

EATING AND COOKING

There is no better way to introduce the topic of Maohi food than with a description written by Banks, himself a gourmet:

I will describe the manner in which one of their principal people is servd; they commonly eat alone unless some stranger makes a second in their mess.

He settis commonly under the shade of the next tree or on the shady side of the house; a large quantity of leaves either of Bread fruit or Banana are neatly spread before him which serves instead of a table cloth, a basket is then set by him which contains his provisions and two cocoa nut shells, one full of fresh water the other of salt. He begins by washing his hands and mouth thoroughly with the fresh water which he repeats almost continually throughout the whole meal. He then takes part of his provision from the basket. Suppose (as it often did) it consisted of 2 or 3 bread fruits 1 or 2 small fish about as big as a perch in England, 14 or 15 ripe bananas or half as many apples:^[1] he takes half a breadfruit, peels of the rind and takes out the core with his nails; he then crams his mouth as full with it as it can possibly hold, and while he chews that unlaps the fish from the leaves in which they remain tied up since they were dressd and breaks one of them into the salt water; the rest as well as the remains of the bread fruit lay before him upon the leaves. He generally gives a fish or part of one to some one of his dependants, many of whom set round him, and then takes up a very small peice of that that he has broke into the salt water in the ends of all the fingers of one hand and sucks it into his mouth to get with it as much salt water as possible, every now and then taking a small sup of it either out of the palm of his hand or the cocoa nut shell. In the mean time one of the Standers by has prepard a young cocoa nut by peeling of the outer rind with his teeth (an operation which at first appears very surprizing to Europeans but depends so much upon a sl[e]ight that before we left the Islands many of us were ourselves able to do it, even myself who can scarce crack a nut) which when he chuses to drink he takes from him and boring a hole through the shell with his finger or breaking the nut with a stone drinks or sucks out the water. When he has eat his bread fruit and fish he begins with his plantains, one of which makes no more than a mouthful if they are as big as black puddings; if he has apples a shell is nescessary to peel them, one is pickd of the ground where they are always plenty and tossd to him, with this he scrapes or cutts off the skin rather awkwardly as he wastes almost half the apple in doing it. If he has any tough kind of meat instead of fish he must have a knife, for which purpose a peice of Bamboo is tossd him of which he in a moment makes one by splitting it transversly with his nail, with which he can cut

tough meat or tendons at least as readily as we can with a common knife. All this time one of his people has been employd with a stone pestle and a block of wood beating breadfruit which by much beating and sprinkling with water he Reduces to the consistence of soft paste; he then takes a vessel made like a butchers tray and in it he lays his paste mixing it with either bananas sour paste or making it up alone according to the taste of his master; to this he adds water pouring it on by degrees and squeezing it often through his hand till it comes to the consistence of thick custard; a large cocoa nut shell full of this he then sets before his master who supps it down as we would do a custard if we had not a spoon to eat it with; and his dinner is then finishd by washing his hands and mouth, cleaning the cocoa nut shells and putting any thing that may be left into the basket again.

It may be thought that I have given rather too large a quantity of provision to my eater when I say he has eat 3 bread fruits each bigger than two fists, 2 or 3 fish and 14 or 15 plantains or Bananas, each if they are large 6 or 7 inches long and 4 or 5 round, and conclude his dinner with about a quart of a food as substantial as the thickest unbaked custard; but this I do affirm that it is but few of the many of them I was acquainted with that eat less and many a great deal more. But I shall not insist that any man who may read this should beleive it as an article of faith; I shall be content if politeness makes him think as Joe Millers freind said, "Well Sir as you say so I beleive it but by g—d had I seen it myself I should have doubted it excedingly". (Beaglehole 1962:I, 346-347)

As Banks wrote there were many among the Maohis who were accustomed to eating "... a great deal more"—such was a man described by G. Forster:

Our walk continued along the shore beyond another marai, much like the first, to a neat house, where a very fat man, who seemed to be a chief of the district, was lolling on his wooden pillow. Before him two servants were preparing his desert, by beating up with water some bread-fruit and bananas, in a large wooden bowl, and mixing with it a quantity of the fermented sour paste of bread-fruit, (called *maheî*). The consistence of this mixture was such, that it could properly be called a drink, and the instrument with which they made it, was a pestle of a black polished stone, which appeared to be a kind of basalt. While this was doing, a woman who sat down near him, crammed down his throat by handfuls the remains of a large baked fish, and several bread-fruits, which he swallowed with a voracious appetite. His countenance was the picture of phlegmatic insensibility, and seemed to witness that all his thoughts centred in the care of his paunch. He scarce deigned to look at us, and a few monosyllables which he uttered, were only directed to remind his feeders of their duty, when we attracted their attention. (1777:I, 295-296)

In fact, there were times when the whole populace ate gluttonously, as in connection with the mass-bakings (*ōpi'o*) of breadfruit when that staple was most plentiful. During these affairs, people "... seldom quit the house, and continue wrapped up in cloth: and it is surprising to see them in a month or so become so fair and fat, that they can scarcely breathe: the children afterwards grow amazingly" (Wilson 1779:358). Ellis reported the following about mass-bakings:

... they were usually attended with debauchery and excess, highly injurious to

the health, and debasing to the morals of the people, who generally relinquished their ordinary employment, and devoted their nights and days to mere animal existence, of the lowest kind—rioting, feasting, and sleeping, until the opio was consumed. (1829:I, 356)

Jefferson commented also on this point:

Some of the great epicures of the country (and they abound) will at those seasons of the year when the breadfruit is in perfection (as it has been now for many weeks past) bake large quantities in a lot, sufficient to last some scores of men for many days and then they will sit and eat from morning to night without much interval of rest. This the Otaheiteans esteem as delicate living. This binds them to think well of this world & to hear our message with great indifferency. (Journal, 13 March 1803, LMS Archives)

At other times individuals or groups retired from normal occupations for weeks or months to undergo deliberate fattening (*ha'apori*).

Another practice which led European visitors to charge the Maohis with gluttony was the manner and speed with which they could on occasion consume large quantities of food.

The following excerpt from the adventures of the demigod Honoura indicates the admiration expressed by the Maohis for trenchermen; the episode relates one of a series of trials he was forced to undergo:

All Tahiti was filling the affluents, Vai-te-piha-rahi and Vai-te-piha-iti, with food to present to the young man Honoura, and challenge him to eat it.

And they went for Honoura to come and eat the food, and the young man came.

He prostrated himself in the river, lowered one jaw down in the water, raised the other jaw up towards the sky, then all the food glided in. All Tahiti applauded him. The contents of Vai-te-piha-iti were consumed, and he turned his head to Vai-te-piha-rahi, and opened his mouth for the food there; all that was therein flowed into the great man until everything was quite gone—the food, the water, and the little stones even had disappeared! The young man was again applauded, and he laid himself down in the river-bed satisfied with the food. (Henry 1895:271)

Some of these practices can be “explained” in one way or another. For example, the gorging in times of plenty is a reasonable adjustment to seasonal variation in food supply. Also, the gormandizing that went on at some feasts becomes more comprehensible when it is pointed out that many such feasts were preceded by days or weeks of “officially” curtailed consumption.

... when they are from home, and Numbers are Met in one District, Provisions grow scarce from the Rahoee [*rahui* ‘restrictions on consumption’] before describd and (they) are sometimes whole days without any and when they Get any they Eat so large a quantity as would readily give a Stranger an Idea that they were mere Gluttons and it would Certainly Appear more so to those who were perhaps Sated with the abundance of Good Provisions around them (Morri-son 1935:209)

Even their manner of eating may be somewhat absolved, as Morrison sought to do: "In general they Cannot be Calld ... immoderate eaters tho their Method of Stuffing their Mouths as full as they Can hold, has the appearance of it" (1935:210). As will be seen, eating greedily and with unseemly haste was particularly reprehensible during religious ceremonies.²

Nevertheless, the fact remains that the Maohis considered eating to be a great pleasure, and a great appetite a feat; and they ate, when they could, in a manner that many Europeans labeled gormandizing. It is unlikely, however, that "the poorer set" fared as well as the "principal people" pictured by Banks and Forster. Note, for example, the following passage from Bligh:

... Animal Food is so rarely made use of by the general run of the People here, that it may be said it is not eat by them at all, and I firmly beleive that the greatest Cheifs do not touch it one day out of ten through out the Year. Fish however falls generally to the lot of the Cheifs every day, but it is here in very Small quantities, and among the inferior order very small indeed, so much so that I have many times seen a peice divided into a dozen parts, each of which was not more than a Square Inch, and with these Morsels they would with a quantity of Breadfruit make their meal with the greatest chearfulness and content. (Bligh 1789:II, 31)

But there are indications that Morrison's description of eating habits applied equally well to households at all levels of society:

They sit Cross leggd and having a place spread with leaves (often under the shade of a Tree in fine Weather) for a Table Cloth and sit at a distance to prevent offending each other by Flapping the Flies away which are often troublesome, always swarming where any provisions are, especially Fish, which draws whole swarms about them, and having some Clean leaves laid for Plater & dishes the Provisions are set before them & They Cut their Meat or Fish with a piece of Bamboo or knife, and put it into a Cocoa Nut Shell with Salt water, and the Sause before Discribed and having washd their Hands in another shell they proceed, sucking the flesh or fish & repeatedly dipping it in the sause, eating large quantities of Bread fruit or Tarrow, drinking Clean water or Cocoa Nut Milk and after their Pork or Fish is done they have a sort of Pudding made of Bread fruit Calld Popoe of which each has a Shell which when they have eaten finishes this and they then Wash their hands and Mouths, Using a Piece of the Husk of the Young Cocoa Nut to Clean their teeth, of which they are particularly Careful. (1935:210)

From this and other accounts of eating, it appears that certain practices were followed, or at least held to be desirable, in all households. In connection with the menu, a full and balanced meal required a vegetable staple, a morsel of flesh or fish, a piquant sauce, a beverage of water or coconut liquid, and a more or less liquid vegetable or fruit "pudding." There were, however, numerous and varying restrictions concerning who could eat which of these foods. In connection with the act of eating, the Maohis were at pains to insure that the food that went into their bellies had not previously been in physical contact with certain "harmful" objects. And in connection

with the social relations involved in eating, there were several evidently effective norms concerning who could eat with whom.

Now let us examine some of these considerations in more detail. Maohi eating habits were shaped by several considerations: by standards regarding food "hygiene"; by preferences concerning quantity of food and make-up of menu; by differing restrictions concerning who could eat what; by beliefs concerning sorcery; by conventions concerning where individuals ate in relation to each other; and by differences in productivity and in command over food resources.

From a Western point of view Maohi notions concerning food "hygiene" involved both "natural" and "supernatural" elements; it may be that a similar distinction was perceived by the Maohis themselves, although such a conclusion could not be readily proved:

They always wash themselves before, and after they eat, and should a Dead lizard, Mouse or rat touch them they would wash before they handled any Food and should they happen to find one in or near their oven or touch any of their Culinary Utensils they would use them No More.^[3] Notwithstanding which the(y) will eat a Hog which has died if they know of No disorder which might be the Occasion of his Death.

If any person touches a dead body except of those killed by War, or for Sacrifice, is rendered unclean and can touch no provisions with their hands for one Month, during which time they must be fed by another. (Morrison 1935:184)

Food preferences and eating-habit norms appear to have been fairly uniform. The LMS Dictionary contains words indicating that selfish eating, at the expense of other rightful claimants, was conventionally condemned, and "voracious" eating was under certain conditions regarded as unseemly, but, as noted above large appetites, as such, were admired.

Access to various foods did however vary—by virtue of sex, "ritual status," and kin-Title rank or chiefly authority. For example, females were permitted pork only if the animal in question were their own personal possession and had been raised by them from produce of their own land. (Dog flesh may have been in the same category, but evidence for such is lacking.) According to Morrison:

It has been supposed by Most Former Voyagers that they were also forbidden to eat Pork but in this they were most certainly Mistaken, for if any Woman has an Inclination to keep her Hogs Pennd up and prevent them from feeding on any other ground then their own they may eat pork, but as this is troublesom (and should the hogs get loose, and run on the land of their Male relations they become unfit for them to eat, or should any of their Male relations or the Chiefs touch the Hogs it is the same) and attended with difficulty, they seldom attempt it as they have the Greatest Variety and abundance of fine Fish yet nevertheless they often kill and eat pork under that denomination, taking Care to keep such Men as are not of their retinue out of the Secret, their Servants always agreeing on this score are sure not to want for part of what the Mistress possesses. (1935:208)

It is also suggested in some sources that women could eat only that fish caught by females or by certain males who were disqualified from the ritual status of full maleness, but there is uncertainty on this point. Nor, report some visitors, could women eat fermented breadfruit (*mahi*) except that taken from females' trees and prepared in females' pits.

In fact, it is implied that women were not permitted to eat any food touched directly or indirectly by males other than the ritually "unmale" ones just specified, but how far this distinction was carried in actuality is impossible to discover. It is recorded that "unmale" retainers were attached to the households of certain "principal" women, but does this mean that all other women could eat only that food produced, collected, cooked, and served by themselves? If this were the case most women would have been denied such staples as mountain plantains, because normally only men collected this fruit. Also, thoroughgoing food segregation on sexual lines would have imposed great hardships on small, "commoner" households with meager resources. Of course, "hardship" is a relative term, and there is little evidence on which to define its limits from the Maohi point of view. On the whole, however, I have an impression—from long-time immersion in the sources—that the ancient Maohis were not inclined to push ritual considerations to the point of continually painful deprivation. There is the possibility that this particular ritual consideration—the denial of male-touched food to women—was linked to, and directly correlated with, considerations of class and political power. And, as will become abundantly clear, most of the Europeans' informants were upper-class members and chiefs.

As for the reverse, males were not in general denied food touched by women:

The Men may partake of any of the Weomens Food but must not touch any but what is given them and tho they enter the eating house of their Wives they must not touch any of Her Culinary Utensils, otherwise she must not use them again but He may apply them to his own Use and she must provide herself with a New set or as many as he has touchd. (Morrison 1935:208-209)

In addition to the food denied to women by virtue of its having been in physical contact with males, certain foods were denied them on principle, namely, the flesh of turtle, shark, porpoise, albacore, and dolphin. According to Morrison, these were regarded as "sacred," and even if caught by "unmale" fishermen they could not be eaten by women. A statement from Wilson implies that these prohibitions did not apply to certain women—that is, "The women who are not of the blood royal, or married to such, are forbidden to eat turtle, whale, porpoise, shark, albicore, and dolphin" (Wilson 1799:368). Bonito, the other pelagic fish most commonly caught, was not included in this list, whether by the writer's oversight or intent is not known.

Turtle flesh was ordinarily denied not only to females but to all but

the holders of highest-ranking kin-Titles, and the most politically powerful chiefs. In this connection, it should be pointed out that turtle flesh was also considered a most appropriate food for the gods.

The rule prohibiting women from eating male-touched food was, however, strongly reinforced when that food was also butchered or cooked within marae precincts—that is, when it was “touched” by spirits as well. Yet, if we can credit information provided by Henry, even this double-sanctioned rule was on occasion relaxed:

Pork and turtle and the flesh of great white fish were publicly withheld from women and children as too sacred for them to eat, but by special dispensation the priests allowed their wives and children to partake at home with them of such meats, barring the heads, even when they had been offered to the gods. On favorable opportunities other men also secretly indulged their wives and children in these forbidden meats. (1928:177)

Ellis gave this description of a particular kind of Arioi ceremony:

The greatest peculiarity, however, connected with this entertainment was, that the restrictions of tabu, which prohibited females, on pain of death, from eating the flesh of the animals offered in sacrifice to the gods, were removed, and they partook, with the men, of the pigs, and other kinds of food considered sacred, which had been provided for the occasion. (1829:I, 324)

G. Forster described a meal served him and his companions by a “chief” as follows:

Our host now desired us to help ourselves, and in a short time we had cut the two hogs in pieces. All the women, and the common sort of people, applied to us with a begging tone for portions, and what we distributed was handed from our neighbours, to the remotest persons in the croud. The men consumed their share with every mark of a good appetite, but the women carefully wrapped theirs up, and preserved it till they should be alone. (G. Forster 1777:I, 405)

In addition to these general food prohibitions based overtly on sex, titular rank, and political authority, there were some special ones applicable to certain kinfolk of young Maohis during the latter's ritual status of “infancy” and “childhood”—an obscure set of conventions which will be described in a later chapter. Finally, certain food restrictions were laid upon individuals in mourning, when spirit-possessed, or under general economic or ritual prohibitions.

Another consideration which influenced Maohi eating habits was a belief in the efficacy of sorcery, specifically, in that technique whereby an individual's food exuviae, including food leavings, were used as a vehicle for attacking him. Thus, persons knowingly subject to the malice of others tended to be careful that leftovers of their meal (along with other kinds of their exuviae) did not fall into unfriendly hands. For example, “... the custom of the Tahitians in scrupulously burning or burying the hair when

cut off, and also furnishing to each individual his distinct basket for food, originated in their dread of sorcery by any of these means." (Ellis 1829:II, 229)

Segregated eating was another common feature of Maohi life. Segregation based on sex has already been noted: "The Men and Weomen eat seperate, and for this reason each Family has two houses except a Man Chooses to reside in his Wifes house and then each take one end ..." (Morrison 1935:208). Particularly stringent was this rule in the case of men who held high-ranking kin-Titles:

No Woman Can eat in a house where a Chief has been, unless she is of the same rank and authority with Him and then she may Eat in his presence and if any Woman of Inferior rank should trespass in eating in any House, Canoe or Ship where a Chief Had been they would not only be severely striped but loose their possessions, for which reason they are Careful how they (infringe) these laws, as they know that few are given to keep a secret for which reason they always refused to eat when invited before Men, but would take the Food offered them and give to their relations; this may also account for a Number of the Chief Weomen who refuse to Dine at Table yet eat Hearty with the Servants. (Morrison 1935:209)

But mealtime separation went even further:

I have said that they seldom eat together the better sort hardly ever, even two brothers or sisters have each their respective baskets one of which contains victuals the other cocoa nut shells &c. for furniture of their seperate tables. These were brought every day to our tents to those of our freinds who having come from a distance chose to spend the whole day or sometimes 2 or 3 in our company& these two relations would go out and setting down upon the ground within a few yards of each other turn their faces different ways and make their meals without saying a word to each other. (Beaglehole 1962:I, 347-348)

Nor may sons eat in the presence of their fathers, nor even of their uncles and kinsmen senior to them in age; for they regard it as irreverence. (Corney 1915:258)

All these conventions greatly puzzled most observers, especially the sociable Banks: "What can be the motive for so unsocial a custom I cannot in any shape guess, especaly as they are a people in every other instance fond of society and very much so of their women" (Beaglehole 1962:I, 348).

One observer suggested that the habit of each individual sitting physically separated from all others was due, in part, to the presence of the cloud of flies which swarmed around the food, especially fish, or more specifically to the desire to avoid hitting others with the fly-flap continually at use during meals. Such may indeed have been a factor, but there were other factors as well, which later chapters will attempt to explain.

Finally, Maohi eating habits were shaped in part by individuals' differing capacities to produce food, or to dispose of the food produced by others. With respect to the first, the means of production—rights to land, to fishing grounds, to food-bearing trees, large seine nets, and so forth—were distrib-

uted quite unevenly, as, apparently, were the skills and incentives to use them. With respect to disposal of food in this hierarchically organized society, one of the main prerogatives attached to superior status was choice food in the form either of volunteered "gift" or levied "tax." I shall summarize the various ways that food items circulated, between producer and final consumer—but first, I provide a listing of the Maohis' ways of processing their food.

The Maohis ate mangoes and custard apples raw, and they chewed raw sugarcane for its juice. They also ate uncooked meat of young and mature coconuts, often as a between-meals snack. Otherwise, however, most of the plant-food* eaten by them was cooked. The flesh of pigs, dogs, domestic fowls, and wild birds was always cooked before eating. Fish too was usually cooked or marinated before eating, although small fry and cockles and the like were sometimes eaten raw. Roasting, over an open fire or in hot ashes, was resorted to when circumstances demanded, but the most common method of cooking was by means of the earth oven (*umu*).

The Maohi oven (for the average size household) was a simple but highly effective affair, which consisted of a pit about one to two feet deep and five to six feet across. To prepare an oven, layers of firewood and stones were stacked in the pit and the wood burned to ash. One layer of hot stones was then left on the bottom of the pit and covered with leaves. On this was placed the food to be cooked, another layer of leaves, and the whole thing covered with ash, dirt, and sometimes more leaves. Such was the most common practice; in some instances, however, the food was placed directly on the hot stones. Unprocessed breadfruit, tubers, and roots were usually placed in the oven without additional wrappings, as were large cuts of pork and dog flesh, but fish, fowl, and vegetable puddings were usually baked in leaf wrappings, and other more liquid foods were baked in halves of coconut shell. Some oven pits were dug to dimensions required for the occasion, but in addition every household had one or more permanent ovens.

Different baking times were required for different items, and the Europeans who shared Maohi meals did not often complain, in writing at least, about overdone or underdone food; but it is not recorded how Maohi cooks actually "timed" their ordinary, everyday baking. However, it is reported that on occasion pig was deliberately undercooked: "... when they dress a large Hog for a Small Company they never dress it thoroughly that the Visitors may not have it spoild for a second dressing, as they always take away whatever has been provided for them" (Morrison 1935:213).

The stones used in native ovens were in ample supply, but whether such

* Plant-foods are the products of food plants.

was the case with fuel is not entirely clear. According to Bligh: "... anything that will take fire and give a proper degree of heat to their Ovens is sufficient for all their culinary purposes, they are therefore abundantly supplied by the Cocoa nut shells and branches, underwood and Herbaceous plants" (1789:I, 408).

Some sources contain direct and indirect references to laborious firewood collecting trips into the hills and valleys, and Morrison stated that firewood was in short supply: "Water is plenty all over the Island but Wood for Fuel is not, as there are few other trees in the lowland except the Breadfruit & Cocoa Nut, with which it is Covered; but evry tree has its owner, & must be either purchased or leave obtained to Cut of the Natives" (1935:141).

Besides roasting or baking their comestibles the Maohis also occasionally cooked some of their puddings by "stone boiling"—that is, by dropping heated stones into a wooden trough containing the raw pudding mixture.

The so-called puddings of the Maohis varied both in terms of ingredients and consistency. The most common of them contained coconut cream mixed either with grated taro, mashed breadfruit, or grated arrowroot. Some puddings remained edible for days or even weeks. Softer puddings were made by mixing water or coconut juice with baked plantain or breadfruit (either plain or fermented); the whole was then drunk as a kind of gruel.

Greens were cooked either separately in coconut cream or as ingredients of puddings.

Both coconut juice and water were drunk at meals, the latter having served also as a sauce. Another common sauce, *mitiero*, was made by dissolving soft immature coconut meat in salt water; additional pungency was achieved by adding raw, and even nearly rotten, crustaceans to the mixture.

CIRCULATION OF FOOD

Some food went directly from the producer's hands, so to speak, into his mouth; but most of it was involved in intermediate transactions, some of which have already been described. Without attempting to be exhaustive let us list some of the many ways in which food "changed hands."⁴

Most food was consumed by members of a producer's own household. The little direct evidence we have on this subject, plus a large measure of inference, seems to indicate that the food economy of most Maohi households operated on the principle of pooling and sharing: "from each according to his (productive) ability to each according to his (consumption) rights and needs"—bearing in mind, of course, that "abilities" and "needs" were defined according to Maohi cultural standards and not in terms of "objective" criteria of relative physical strength or nutritional requirements. Some of these standards will be discussed in chapters that follow; only a few of them will be indicated here, for reasons of emphasis.

First, there was the common practice of sharing a token part of a household meal with its members' tutelary spirits. How widespread and invariable a practice this was is by no means clear; nor is it clear just who performed this perfunctory rite, whether the head of the household alone, or all individual members acting for themselves. But it was undoubtedly performed, and on a regular daily basis in some households; in addition it was institutionalized in an elaborate annual ceremony, a 'ghosts' night feast' (*pō tupapa'u*), which will be described later. Although listed here in connection with ordinary intrahousehold food-sharing, this ritual offering might alternatively be defined as an exchange—that is, a payment for services rendered, rather than a share of common resources regardless of past or expected contribution. Unfortunately, too little is known of Maohi motivation, either public or private, to interpret such acts with confidence.

The second intrahousehold food-sharing convention deserving emphasis has to do with the sex-linked segregation of food. Attention has already been drawn to the complexities resulting from this set of norms and to the unanswered questions concerning their application. The only other point about it that I wish to make here is that despite their very considerable freedoms in other phases of life, from a Western point of view Maohi females were distinctly underprivileged with respect to their consumption of household food.

Another practice bearing directly upon household food transactions was fosterage, which, significantly, was termed 'feeding'. The LMS Dictionary distinguishes fosterage (*fa'a'ai*, to feed, nurse)⁵ from adoption (*fa'atāvai*, to adopt another's child); it is not clear whether these distinctive terms were in fact applied to comparably distinctive practices, but in any case it appears to have been quite common for households to take in "outsiders" for extended periods of time and to treat them as full-fledged members, at least with regard to food economy.

Visitors,⁶ on the other hand, were on principle accorded different treatment: "... nothing can give them more satisfaction than to see a Stranger ... [eat heartily] when they invite them to eat, which they are ever ready to do, always parting what they have Cheerfully, be it little or much ..." (Morrison 1935:209). In fact, Morrison went on to say that the Maohis were accustomed to stinting themselves in order to supply visitors with the best. A common practice was to supply the visitor not only with all he could eat at the time, but to send him on his way with the food left over from the meal cooked on his behalf.

Maohi hospitality (*'arōa*, kind, hospitable to visitors [LMS Dictionary]) varied in elaboration, from the spontaneous offer of a meal to a passing stranger to the lavish and ceremonial reception attending an official visit of an influential ally or rival. The underlying motives of individuals

providing the hospitality varied—for example, expectations of reciprocal hospitality, desire to gain prestige, and even the wish to embarrass the guest with unreciprocable largess—but the practice was usually the same, namely, that visitors must be fed with the best the household could provide, without implying the expectation of return, except perhaps in the form of a token “guest’s present,” or *ō*: “It has always been a custom to give presents and a feast called a *fa’a’amu’a* (feeding) to guests from another place on their first arrival among their friends; and the guests requite the presents with another, called an *ō* (welcomer)” (Henry 1928:177).

There is evidence even that hospitality was the law of the land; at least one finds the following decrees incorporated in the *ture* (rules, precepts) allegedly formulated by Tetunae, a legendary chief said to have ruled in southwestern Tahiti centuries before European contact:⁷

Do not just glance at the people going by your house, not calling out to them stop by and dine. In the matter of food, do not slight your near neighbors. Do not ill regard the stranger passing by the house, call out to him to stop by, butcher your pig, that the mortar may be rich with food filled for him. Everyone who does not respect these orders is to be taken to an open place and put to shame so that such offense be not removed from notice. It will be quite correct for the *ari’i* to absorb his land in punishment.

Tetunae’s *ture* also contained words of advice to *ari’i* about hospitality:

Your household must not be accused of food hiding. Let not your name be associated with hidden food or hidden goods. The hands of the *Arii* must be always open; on these two things rest your prestige.

Long-term visiting, between relatives and friends, was also a common feature of Maohi household life. Such visitors were supplied with food as were other members of the household, but the extent to which they were expected to contribute to the hosts’ food supply must have varied widely. As we shall see, one implicit assumption underlying much of this kind of visiting was the expectation, or at least possibility, of eventual return visits, but this did not always operate to the host’s satisfaction as witnessed by the currency of such words as *’aihāmumu* [*’ai hamu mā’ā*], a person who continually imposes upon another by eating his food, et cetera (LMS Dictionary).

Other words, as translated by Davies for the LMS Dictionary, also reveal the prevalence of the practice by some individuals of sponging off other households for food: for example, *anavenave* [*’ānavenave*], addicted to getting food at another person’s house; *tutaraai* [probably, *tūtā va’a ’ai*], a person who goes from place to place to eat what he can get; and, although not directly related to household economy, *hamu*, to go to a feast whenever one occurs. Thus, although the Maohis publicly professed hospitality—giving food to visitors without expectation of return—the actual

transactions were oftentimes hedged about with many qualifications, or were undertaken with other purposes in mind.

The principle of food generosity was apparently so widely prevalent—ideologically, at least, if not in actual practice—that there may have been occasions on which food circulated in this manner outside the contexts of hospitality, that is, to persons from elsewhere not physically present in the donor's own household (or home district, or whatever larger place of reference happened to be relevant). On the other hand, most acts of food generosity described in the sources seem to have involved a more or less explicit expectation of return, whether in the form of a conventionally defined and immediately presented counter-gift or of some unspecified present to be made in the indefinite future. How the Maohis themselves distinguished between hospitality and this other form of food "generosity" is admirably illustrated in a passage from the journal of the perspicacious Banks:

The wrestling over the gentlemen informd me that they understood that 2 hogs and a large quantity of Bread fruit &c. was cooking for our dinners, news which pleasd me very well as my stomach was by this time sufficiently prepard for the repast. I went out and saw the ovens in which they were now buried, these the Indians readily shewd me telling me at the same time that they would soon be ready and how good a dinner we should have. In about half an hour all was taken up but now Dootahah began to repent of his intended generosity^[8] he thought I suppose that a hog would be lookd upon as no more than a dinner and consequently no present made in return, he therefore changd his mind and ordering one of the pigs into the boat sent for us who soon collected together and getting our Knives prepard to fall too, saying that it was civil of the old gentleman to bring the provisions into the boat where we could with ease keep the people at a proper distance, who in the house would have crowd'd us almost to death. His intention was however very different from ours for instead of asking us to eat he ask'd to go on board of the ship, a measure we were forc'd to comply with and row 4 miles with the pig growing cold under our noses before he would give it to us. Aboard however we dind upon this same pig and his majesty eat very heartily with us. After dinner we went ashore, the sight of Dootahah reconcild to us acted like a charm upon the people and before night bread fruit and cocoa nuts were brought to sell in tolerable plenty. (Beaglehole 1962:I, 273)

Up to a point, the Maohis also distinguished between the two kinds of food transactions just described and those we may label commercial. As far as I can discover the Maohis had no localized marketplaces, where food was exchanged regularly for food or other objects.⁹ There is evidence, however, that food was occasionally used in barter transactions, as for example in payment for bark cloth manufactured on commission, and in Wilson's description of a man "... by trade a fisherman, who supplied his neighbors with fish, and received from them canoes, hogs, fruit, roots and cloth" (1799:190). Morrison provides a fine account of a regularized barter arrangement, of pigs for fish:

If a Man wants to be Constantly Supplied with Fish He takes a Hog to a Fisherman and according to the size He agrees with the Fisherman to supply Him with Fish for one or more months, which they seldom fail to perform, Weather permitting for the stated time. What they look upon as fulfilling the Agreement is bringing as much Fish evry day as the Family can Eat, and for Failure of Promise they may be Plundered as before.^[10] Sometimes they agree for a supply evry other day and when the Fisherman fulfils His promise well they make Him a Feast—and the Fish they bring are sometimes equal to ten times the price at a Fair exchange. (1935:165)

The last sentence in this excerpt raises the interesting possibility that there were two kinds of barter arrangements in operation: one a strictly “commercial,” impersonal one, involving more or less fixed exchange rates (or possibly even “pure” market-price situations influenced by supply and demand); and a second, less impersonal kind of arrangement, such as the one just described, involving contractual relationships wherein values were influenced also by some of the considerations characteristic of gift exchange. In his reference to “price at a Fair exchange,” Morrison may of course have been referring to the somewhat alien aspect of barter occasioned by trade with Europeans, but coexistence of the two kinds of native barter arrangements would not be inconsistent with other aspects of pre-European Maohi life. Or rather, what probably existed was a continuum—or part of one, at least—with “pure” market barter at one end grading into gift exchange at the other, the point on the continuum exemplified by any particular exchange transaction having depended on such factors as kinship, friendship, Title rank, and residential proximity.¹¹ In fact, it is reasonable to suppose that factors of relative rank of kin-Title or type of kinship tie may not have been wholly determinative and that individuals may have been left with a degree of freedom in choosing the kind of transaction to engage in, according to the kind of advantage desired at the time. So a passage from Cook seems to suggest:

I have occasionally mentioned receiving considerable presents from Otoo and the rest of the family, without saying what return I made. It is customary for these people, when they make a present to let us know what they expect in return and we find it necessary to gratify them; so that whatever we get as presents comes dearer than by barter, but in times of occasional scarcity which will sometimes happen, we can have recourse to our friends for a present, or supply, when we cannot get any by any other method, so that upon the whole this way of traffick is full as advantageous to us as them. (Beaglehole 1967:221)

There is very little information available concerning exchange values of food items among the Maohis themselves, and in view of the situational variables just mentioned it is not possible in any case to speak with confidence about *the* exchange value of any food item. Morrison reported that natives were accustomed to barter a one-hundred-pound pig for one frigate

bird whose feathers they valued, but that is about the only data available concerning specific values in native "commercial" trade.¹²

Evidence will be cited later on for some exchange of breadfruit from areas of plenty to areas of scarcity; but whether this exchange was of the nature of barter, or constituted some kind of gift exchange between kinsmen or friends, cannot be learned.

There are numerous references to the use of food as payment for services: to "carpenters" for help in building houses, to specialists in diagnosing and curing ailments, to priests in conducting rites, et cetera. In fact, it is likely that most of the food and other offerings made to spirits were explicitly on the basis of *quid pro quo*. This raises questions concerning the rationale underlying the several kinds of food transactions between "inferiors" and "superiors," and between humans and spirits. Several of these transactions have already been mentioned, and many others will be listed in later chapters, for food figured very prominently in most such transactions.

Now I turn to accounts of the ways employed by the Maohis to produce the foods whose consumption and circulation I have just described.

FOOD PLANTS

Breadfruit

The staple food of the Maohis was undoubtedly breadfruit (*Artocarpus incisa*: 'uru; fig. 9-1). It was either baked whole in an earth oven and eaten in chunks or mashed and mixed with other vegetables into puddings. The productive breadfruit tree with its large foliage and spherical fruit was undoubtedly introduced into these Islands by the Maohis and in time came to occupy, along with coconut palms, very extensive portions of the coastal plains and adjacent lower hill slopes, that is mainly the adlittoral and lower-slope parts of the mesotropical zone. The high, shady canopy and parklike settlement clearings provided by these picturesque trees charmed even the more hardbitten of the European visitors, and the quantity and richness of their fruit became proverbial:

In the article of food these happy people may almost be said to be exempt from the curse of our forefather; scarcely can it be said that they earn their bread with the sweat of their brow when their cheifest sustenance Bread fruit is procurd with no more trouble than that of climbing a tree and pulling it down. Not that the trees grow here spontaneously but if a man should in the course of his life time plant 10 such trees, which if well done might take the labour of an hour or thereabouts, he would as compleatly fulfill his duty to his own as well as future generations as we natives of less temperate climates can do by toiling in the cold of winter to sow and in the heat of summer to reap the annual produce of our soil (Beaglehole 1962:I, 341)

In addition to supplying the Maohis with their most important food

the breadfruit tree had many other uses. Its trunk and larger branches provided the heavier timbers used in house construction; and, while not the best for the purpose, the trunk was used also for canoe hulls. The inner bark of its smaller branches was made into bark cloth, and its highly viscid resin served to close canoe seams and to trap small birds. Even its broad leaves were utilized, to wrap foods and to cover ovens.

FIGURE 9-1. Breadfruit. Drawing by S. Parkinson.
British Museum of Natural History.

There was a time, according to one legend, when the Mahois had no breadfruit.¹³

A long time ago the land was smitten by famine, and the populace had nothing to eat but pandanus flour, *teve* [an acrid-tasting plant root] bitter-backed land crabs—and red clay. At that time a couple took their four starving children into the mountains to collect edible ferns. There, out of pity for his wife and children the husband transformed himself into a breadfruit tree loaded with fruit—and this was the origin of the tree. When some of the fruit was sent as a first-fruit offering to the local chief, the latter liked it so well that he confiscated the tree itself. In time however, shoots from it were propagated elsewhere, so that breadfruit became widely distributed among humans. (Adapted from Henry 1928:423-426)

A fully grown breadfruit weighs from two to five or ten pounds and

consists of a core of fibrous, starchy, white pulp and a thin, rough-surfaced rind. The pulp contains some 17 percent starch, and although it serves to satisfy hunger it is not nourishing by modern nutritional standards. The Maohis picked the fruit at two different stages of growth: first, when its rind was yellow-green and the pulp firm, and when cooked it had the slightly sweet flavor and consistency of a baked yam; and later, when its rind was completely yellow and the pulp softer and sweeter.

To augment their supply of breadfruit the Maohis had only to plant cuttings—roots or young shoots—and protect them from destruction until they reached bearing age, some five or six years later.¹⁴ Even so, there must have been a considerable amount of technical lore and technical procedural detail connected with the cultivation of this most important food staple, but the only information recorded on this score concerns varieties recognized by the Maohis. Henry listed forty varieties (1928:40-41); Ellis asserted that he and his fellow missionaries were acquainted with “nearly fifty varieties” (1829:I, 357), but he did not list them.

Harvesting was an easy job, even for one person, but it was done more expeditiously by two—one person to twist loose the fruit by hand or by stick, another to catch it or break its fall to keep it from bursting.

The fruit was prepared for eating in several different ways. The simplest method, resorted to when traveling, was to roast it whole and then scrape off the charred rind. Usually, however, the fruit was baked in an earth oven, as has been described. Most commonly the fruit was picked at its first stage of ripening and baked, either whole and in its rind or with rind and core removed and cut in large chunks. The rind was removed with a sharp-edged bivalve, and the pulpy fruit cut up with a special wooden splitter. (Figs. 9-2 through 9-6.)

When breadfruit was in plentiful supply it was baked or rebaked every day: “For the chiefs, it is usually dressed two or three times a day; but the peasantry, &c. seldom prepare more than one oven during the same period& and frequently *tihana*, or bake it again, on the second day.” (Ellis 1829:I, 355)

The mass-bakings (*ōpi’o*) already referred to were undertaken at the height of the breadfruit season. Large pits, ten or so feet in diameter, were made and scores of whole ripe fruit were baked in them. After three or four days of baking, the fruit was taken out as needed, scraped, and eaten until consumed. According to Ellis, fruit baked in this manner will remain edible for “several weeks” (1829:I, 355). It “... has a very agreeable tast and the Collour is Changed to brown throughout” (Morrison 1935:214).

I have already described the consumption of breadfruit prepared by mass baking; some aspects of its preparation are no less interesting and are directly relevant to our purposes:

When a Chief or Raturra [*ra'atira*] wants one of these Ovens of Bread made, they inform their Tennants who go in a Body and bring Wood from the Mountains, while others Collect the Stones and while the fire is Burning evry Man brings his load of Bread which is put into the Oven whole and without further preparation and being Covered with leaves thatchd over with Grass & the Earth thrown up over it an do not open it for three or four days, when they take it out for use evry day as it is wanted, keeping it covered till the Whole is expended, and this they repeat evry harvest.

The poorer people are not excluded from the Method of Feasting their Children tho they have not sufficient Bread for the Purpose, having nothing more to do but signify their intention to their Neighbours, who bring their proportions of Bread and Assist them to Collect Wood and Make their Oven; somtimes they Join two famyls making one oven between them. (Morrison 1935:214)

Another method of preserving the fruit was to remove the rind, throw the pulp into a heap and allow it to ferment for three or four days, then store it in a leaf-lined, earth-and stone-covered pit, where it continued to soften and ferment for some months. Fermentation was hastened by adding a few overripe fruit to the heap, or by leaving in the cores. The paste (*mahi*) was taken out as needed and baked, either by itself or mixed with other ingredients.

Large quantities of breadfruit of precisely the right stage of ripeness were required in the making of *mahi*. Since few households possessed so much at any one time measures were taken to make up the difference:

If the Crop on any individuals land should run short of His expectation and He has not sufficient to make as much Mahee as he wants or thinks will serve He makes a Number of Garlands of a shrubb Calld Pirrepirre and takes One to evry House or as Many as he thinks proper and throws them in without saying any thing except to tell the day he intends to send for it or have it brought home, evry one knowing what is Meant by the Garland. If He has hands sufficient to Scrape the whole at once it is brought home to the House, each Man bringing the Garland left at his house as full of Bread as it Can be Made fast and laying it down at the Door returns without any further Ceremony then bidding God bless his Work; if He has not sufficient help to take the whole in hand at once he makes it known and either goes himself for it when he wants it or has it brought at the time he nominates to those who supply him, who are ever ready to assist evry Man according to his Abilitys. If he goes for it himself he always finds the Garlands ready filld at the appointed time—By this Method of assisting each other they never feel the least Inconvenience from having a Scanty Crop and if a Chief wants a Supply for the purpose of Making Mahee he sends a Bit of Cocoa Nut leaf to all, or as Many of the Inhabitants of his district as he shall think proper, and on the appointed day they Bring each a load, which is generally accompanied with a hog by some and fish by others according to their several abilitys, but this they have seldom occasion to do as they are always well supplyd and when supplys are raised this Way the people bring it in such a Manner as bespeaks at once their regard for their Chiefs & fear of displeasing them, always testifying their sorrow that he should be so far neglected as to have the trouble of sending for bread. (Morrison 1935:215-216)

Two wholly different kinds of transactions are indicated: the first is a "gift" between households of more or less equivalent social position, with implicit expectations of reciprocation; and the second is a levy of "tribute" by a chief upon his subordinates. In connection with the second, one is impressed, particularly, with Morrison's acuity in noting how the principals' manner of presenting their goods to their chief "bespeaks at once their regard for Chiefs & fear of displeasing them...."

In my preliminary statement about eating, I noted that there were many restrictions concerning who could eat what and who could eat with whom. The making of *mahi* is a case in point:

... the men and Weomen having each their own trees have also their own Mahee and should a Man who is not the Servant of a Woman touch even the Covering of the Womans Mahee it is rendered unfit for Her Use, which at once accounts for Sir Joseph Banks's having spoild a quantity which belongd to a Woman by his being desirous to see the nature of the Process of making it and examining the Contents of the pit—which was not only rendered of no use to the Woman but the place in which it was underwent the same fate and no woman Could ever use it afterwards. (Morrison 1935:215)

The reference to Banks concerns this episode reported in the latter's journal:

As the whole making of this *Mahai* as they call it depends upon fermentation I suppose it does not always succeed. It is done at least always by the old women who make a kind of superstitious mystery of it. No one except the people employed by them is allowd to come even into that part of the house where it is; I myself spoild a large heap of it only by inadvertently touching some leaves that lay upon it as I walkd by the outside of the house where it was. The old directress of it told me that from the circumstance it most certainly would fail and immediately pulld it down before my face.... (Beaglehole 1962:I, 345)

There is no question that men and women ate separately, but the reference in the above to men and women "... having each their own trees" is difficult to assess. It may well have been so with respect to fruit used for *mahi*, although one wonders in this connection how women managed to assemble enough female-owned fruit to prepare their own *mahi*. The reverse of the problem apparently did not occur, since men were not ordinarily restricted from eating food supplied or cooked by women. Also, it was everyday practice in some households to cook men's and women's food in separate ovens; but whether this was the case in all households, and how thoroughgoing a physical separation was made between men's and women's food at all stages of production, processing, and consumption will be evident later on.

As noted earlier, some breadfruit grew on the lower slopes of the mesotropical zone, but it flourished mainly in adlittoral portions of the coastal zone; consequently, places with wide adlittorals tended to be more

abundantly supplied—a circumstance which was reflected somewhat in the distribution of population. Even with this fitting of population to environment some parts of islands appear to have produced more breadfruit per capita than did others, which raises the important question as to whether there was any regular trade in this vital food based on local differences in overall annual supply.

There certainly was circulation of breadfruit, for example, as “tribute” within political units, but the only documented instance that it moved long distances as a result of local differences in overall annual supply was traffic between Tahiti’s Pare district and the Tetiaroa Atoll. As previously reported, Tetiaroa was part of the personal domain of Pare’s principal chiefs, who, in order to “prevent the inhabitants from casting off [their] authority,” are said not to have permitted breadfruit or other vegetables to grow there; an exception was coconuts and possibly taro, “for the convenience of the chiefs who go there on a visit” (Wilson 1799:380).

Somewhat better documented is the trade in breadfruit resulting from local differences, not in overall annual supply but rather in times of fruiting. Breadfruit ripens seasonally, but times of ripening are not the same everywhere in these Islands. Two of the three modern botanists writing on this subject asserted that there are three crops a year, during March, July, and November, the best and largest being in March, and on into April (Wilder 1928:9; Chabouis 1954:I, 71). The third botanist speaks of “... an abundant crop from November to April, and a smaller one in July–August” (Papy 1954:II, 262), but this might be taken to mean that the long November-to-April season consists of two peak fruitings with a slackening off, but not a completely barren, period in between. (It is likely that these writers were referring mainly to conditions on Tahiti itself, and possibly to those obtaining near its northern and western shores.)

Earlier observers, writing in general terms, also noted three, or even four, fruitings a year,¹⁵ and some of them specified local differences in times of fruiting, for example:

The seasons differ much on the opposite sides of this Island, partly owing to the Island of Morea or Eymayo lying in a N. & S. direction a cross the west part of it and while the Trade wind blows on the North side the West wind blows fresh on the South, but when the Wind gets to the Southward of S.E. it prevails against the West wind and then the south side is deluged with rain from the Clouds which settle on the Mountains of Tyarraboo while the N side enjoys fine pleasant weather with scarce a shower of rain for 6 Months—this makes a material difference in the Bread-fruit Harvest, which generally begins on the N side about November and is over by January; but on the S. side it is sometimes over by November at one Season and does not begin till January at another. (Morrison 1935:142)

When the trade wind gets far to the south, and blows fresh, it generally rains on the south side of the island [of Tahiti], bringing the clouds from the moun-

tains of Tiaraboo, and emptying their contents at Papparā and the adjacent districts [on the south side of Greater Tahiti]. This occasions a great difference in the bread-fruit season between the north and south sides of the island; as on the north the rain is less frequent and less violent, and the trade wind constantly blows, except when the sun is vertical. Hence the great bread-fruit harvest commences on the northern side about November, and continues till the end of January; whilst on the south side, in some parts, it begins in January, and continues in different districts till November. But though this is the case with the general harvest on both sides the island, there are some kinds of bread-fruit, though scarce, in season all the year, especially in the district of Attahooroo [west coast]. (Wilson 1799:316)¹⁶

Apart from these general statements there are fifty-three observations contained in the LMS records—spanning forty-five years—concerning breadfruit seasonality, mainly for the island of Tahiti. In Matavai subdistrict, to which half of the observations appertained, the season of greatest plenty usually lasted from about the end of December to about the beginning or middle of May, with a smaller crop in August and September. These observations were not systematic, however; they consisted mainly of statements to the effect that, for example, “all the breadfruit is gone from the trees,” or “the fruit is not yet ripe,” or “there is a rich harvest this year.” At Atehuru, on the other hand, about 15 km south and west of Matavai, the principal season began (during the year of recording, at least) in mid-February and lasted until June. Data from other districts of Tahiti, and from the other islands, are very fragmentary, but taken all together they confirm in general my impression that there was a considerable amount of variability in breadfruit ripening throughout the archipelago due mainly to the following factors:

Location, with respect to normal climate. On the exposed, dryer northern parts of Tahiti the main fruiting season began earlier than it did in the rainier south; within this general pattern there were even more localized variations associated with the island’s many smaller pockets of “micro-climates.” As for the other islands, in consequence of their smaller sizes and more uniform climatic patterns there was probably less local variability than on Tahiti, but there is no positive evidence available on this score.

Varietal differences. Several writers¹⁷ claimed that there were some varietal differences in fruiting times, but they provided no substantiation.

Altitude. A passage from Banks indicates that, in some places at least, breadfruit growing on the lower slopes had somewhat different fruiting times from those growing on the flat, but whether this was the direct result of differences in location, or of differences in variety, or of both, is not clear:

This morn [3 July 1769] Mr Monkhouse and myself set out, resolving to follow the cour(s)e of the valley down which our river comes in order to see how far up it was inhabited &c. &c. When we had got about 2 miles up it we

met several of our neighbours coming down with loads of breadfruit upon their backs. We had often wondered from whence the small supply of breadfruit we had came, as there was none to be seen upon the flats, but they soon explained the mystery, shewing us breadfruit trees planted on the sides of the hills and telling us at the same time that when the fruit in the flats failed this became ready for use, which had been by them planted upon the hills to preserve the succession. The quantity was they informed us much less than was in the low land and not sufficient by any means to supply all the interval of scarcity & when this was exhausted they must live upon *ahee* (ahi) nuts, Plantains, and *Vae* (fe'i), a wild plantain which grows very high up in the mountains. (Beaglehole 1962:I, 306)

Weather. Some observations in the LMS Archives provide proof that the droughts which occurred in some years, especially in northern Tahiti, had the effect of slowing up breadfruit ripening and in reducing the size of the crop—sometimes to near-famine proportions (see Jefferson, Journal, 19 July, 19 August 1799). Of course, hurricanes and tidal waves are known on occasion to have destroyed growing or ripe fruit, or even whole groves of trees. But natural disaster was, perhaps, not as destructive as warfare, during which the opposing sides sometimes cut down or ring-barked each other's breadfruit and other fruit-and nut-bearing trees.

As Banks was helpful enough to observe, some households were able to bridge parts of the time gaps between main fruiting seasons by recourse to trees of their own deliberately planted in areas of later fruiting. There is also evidence, from journals in the LMS Archives, that the different fruiting times led to interdistrict exchange and to seasonal changes of residence, for example:

The King sent the [Missionary] Society a quantity of good Uru—it was brought from Atahuru at which place the Uru is in season, while here [in Matavai] and most of the other parts of the Island it is scarce (Davies, Youl et al., Journal, Tahiti, 3 June 1806).

Great scarcity of uru in Matavae and Pare, some has been fetched from Faa and Atahuru several times the past fortnight (Davies, Journal, Tahiti, 18 May 1808).

... most of the men were at Mape after Uru ... in the [Avea, Parea & Mahoute] districts they have no Uru, but what is fetched from some other place ... (Elder & Wilson, Journal round Huahine, 27 April 1809).

The uru begins to be scarce in Matavae. In Atahuru it is still in great abundance, and for that reason several of our neighbours are gone to reside there for the present (Davies, Journal, Tahiti, 24 March 1807).

There is a great scarcity at present of breadfruit, Taro &c. and many of the people are scattered over the island for the purpose of procuring food (Davies, Journal, 4 September 1818).

The possible implications of these movements, of breadfruit itself and of people to breadfruit, will be examined in another place, but first some other ramifications of the seasonality of this important staple.

In the first place, there is ample evidence that the Maohis made deliberate efforts to extend the supply of breadfruit by planting trees on hillsides (see Beaglehole 1962:I, 306) and by preserving fruit in the form of *mahi*. “A great quantity of bread-fruit was brought today to make mahie, as the time approaches when the ripe fruit will be scarce in the district for two months” (Wilson 1799:175). Also, the Maohis were able to retard for a few days the rotting of ripe uncooked fruit by keeping it buried in sand.

Our boys went to Tapaeaeue about 8 Miles distant for Breadfruit, there being none in this district. In order to keep it, they bury it in the sand, by which means it will continue good four or five days. If it is not buried or put in water as soon as plucked it gets soft and sweet, in less than 36 hours, and only fit to make Mahhe of. (Youl, Bicknell et al., Journal, 5 September 1806, LMS Archives)

However, it appears that none of these measures, including importing from places with different fruiting cycles, succeeded in providing a constant, year-round supply—not for ordinary individuals nor even for the “Principal People.”¹⁸ In a word, the supply of this principal staple remained seasonal. The LMS Archives record numerous references to periods of general food scarcity, which occurred mainly in breadfruit off-seasons.¹⁹ Some accounts link such food shortages with epidemics, for example:

Several of the natives have been afflicted with a bad swelling (which in the general, is a little below the groin) as also with very bad Boils in other parts of the leg. The swelling is attended with excruciating pain, and in general after a time breaks into a running sore. It is thought to originate from the much wet weather ... and it is observed that many more of the natives are sick and die in the scarce season, than at other times, owing much perhaps for the want of proper food. (Davies, Youl et al., Journal, 28 May 1806)

However, the only “eyewitness” statement that I can find which attributes death to seasonal scarcity is the missionary Bicknell’s, written in January 1800: “The Natives have died with hunger in the scarce season which lasted 4 months this last year” (Bicknell to Callard, 14 January). While I acknowledge that seasonal food scarcities may have contributed to illness which terminated in death, I am inclined not to accept this statement literally—that is, I very much doubt that any significant number of Maohis past infancy ever died directly of seasonally-induced starvation. Anderson, also, asserted that “a famine frequently happens in which, it is said, many perish” (Cook 1784:153-154), but provided nothing more solid to document this broad statement than the usual “it is said.” For famines resulting from the deliberate destruction of warfare, see p. 256.

One adjustment made by the Maohis to this fairly regular natural cycle was to consume as much of the fruit as possible as soon as it ripened—and mainly in the form of *ōpi’o*, already described.

Another way the Maohis adjusted to the periodic scarcity of their prin-

cipal food was to utilize other foods nearer at hand, such as sweet potatoes, pandanus, and 'ape, or to betake themselves to the mountains and valley fastnesses in search of plantains and other wild fruits and vegetables.

Finally, the seasonality of breadfruit helped to provide them with a schedule for activities not directly or physically connected with subsistence—religious ritual, social life in general, and concepts concerning the rhythms of the spirit side of their universe.

Coconuts

No plant of the Maohis had a wider variety of uses than the coconut (*Cocos nucifera*: *niu*, *tumu ha'ari*). To name the more important uses: the trunk was used for house and fence posts and for spears; the leaves for thatch, screens, baskets, and ornaments; the dried husk of the coconut for cordage, calking, sandals, and tinder; the shell for bottles and bowls, and for surgical trepanning; the liquid inside the green nut for a beverage; the meat of the nut or its extracted cream for food; and the oil derived from the cream for liniments and aromatic ointments. (Henry 1928:43–45)

The palm begins to produce nuts about five years after taking root and continues to produce for fifty to sixty years. Under favorable conditions the fallen nut will propagate unaided, but its survival and growth are better assured by planting. Palms were probably already growing in these Islands when the first Maohis arrived; nuts remain viable even after long immersion in salt water, but humans undoubtedly fostered their increase. When Europeans first arrived, palms were flourishing in large numbers on the atolls and off-island motus, as well as throughout the adlittoral zone. Small stands of isolated palms also were growing in altitudes up to 300 meters. (Papy 1954:II, 248)

No thorough scientific study has been published on palm varieties in these Islands, but the Maohis are said to have named about sixteen types, distinguished according to peculiarities of husk, nut, palm height, and so forth (Henry 1928:41).

To obtain an immature nut, for drinking, it had to be cut or twisted loose from the palm; this was done by hand, usually by a boy or youth who climbed the palm with the help of a coil of cordage stretched between his feet to aid in gripping the trunk. Such nuts were then husked and pierced, and the liquid drunk directly from the shell. The usual method of husking was to pry off the fibrous husk with the help of a pointed stick stuck in the ground, but people also used their teeth to tear away the fiber.

Needless to say, the Maohis were accustomed to recognizing and labeling several stages in the maturation of the coconut, and it is likely that most Maohis past early childhood could tell when a growing nut was at the best stage for drinking.

As the coconut matures, its liquid is absorbed in an oily white solid, or "meat," that lines the inner surface of the shell. This meat was sometimes eaten when it was not yet entirely firm and dry. Perhaps more often, however, the meat was used only after it had become fully firm and dry, at which time it was scraped out of its shell by means of a shredding tool (*'ana*)—a serrated blade of shell or coral, usually attached to a wooden stand. The shredded meat was then placed in a skein of plant fibers which when twisted squeezed out the coconut cream. When nuts reach this stage of maturity they ordinarily fall from the palm, so that they need only to be collected from the ground. Banks reported having seen many such nuts tied onto the trunks of palms "that they might dry a little and be prepared for making *poe*" (Beaglehole 1962:I, 319).

Beyond the convention (but not, perhaps, the norm) that boys and young men were usually the ones to climb palms for immature nuts, there is no evidence of any customary division of labor connected with use of the palm or its products, except of course for such general practices as heavy construction, which was a male's job regardless of type of wood, or fine plait work, which was customarily allocated to females regardless of type of fiber.

Nut ripening was continuous and fairly even throughout the year. This, added to the circumstance that every household appears to have had access to enough palms for its own subsistence, indicates—what the early descriptions confirm—that there was no regular exchange involving products of the palm. Nuts, thatch, and other products did indeed circulate, but for purposes other than daily food needs.

Wild Food Plants

The mature Tahitian chestnut (*Inocarpus edulis*: *māpē*, *rātā*) is flat, kidney-shaped, about three inches long, and similar in consistency and in flavor to the common European chestnut. When roasted or baked it was much esteemed as a food by the Maohis; since, however, it ripened only once a year, in October through November, and evidently was not long preserved, it could not have been an important food staple. Yet, although unreported, there may have been some small-scale extrahousehold circulation of ripe nuts, since groves of the self-propagating trees were found only along certain streambeds and in other wet soils. There is no record of these trees having been purposely planted nor of any socially relevant practices concerning harvesting or preparation of the nuts.

Another self-propagating tree bearing fruit much eaten by the Maohis was the native mango (*Spondias dulcis*: *vī*; fig. 9-7), which grew at altitudes up to 600 meters in valleys, themselves fairly wet but located within the drier mesotropical zone. During its annual (summertime) ripening, the fruit, about the size of an orange and similar to a plum in flavor, was eaten raw

in large quantities, but only as a supplement to ordinary cooked foods. On the smaller islands mango trees were within easy access of anyone; and although on the larger islands their locations were more unevenly distributed there is no evidence, direct or indirect, that this circumstance led to any regular extrahousehold circulation of the fruit.

Numerous other wild plants were collected by the Maohis for food; the more important of these having been the following:

The Malay apple (*Eugenia malaccensis*: 'ahi'a) flourished within the mesotropical zone and fruited but once a year, in summer. "The fine Apple called the Vee are now just in season, there must be however other seasons for this fruit, either from situation or habit, for when I first arrived we had great numbers of them. This is not the Case with the other Apple called the Ay-yah, the season for it being only once a Year" (Bligh 1789:II, 59). Because of its similarity to the common apple the European visitors appreciated its flavor, more so, apparently than the Maohis did.

FIGURE 9-7. Tahitian mango (*Spondias dulcis*). Drawing by S. Parkinson. British Museum of Natural History.

The root of the ti plant (*Taetsia fruticosa*; also known as *Cordyline terminalis*, or *Dracaena*) was prepared by baking; favorite varieties grew mainly in wet valley pockets within the mesotropical zone. Henry has provided us with a description of a large-scale ti-root baking based evidently on late

nineteenth-century observations, but presumably similar enough to earlier procedures to warrant quoting here:

The *ti*-leaf in the Society Group, was supposed to possess great magical power, and was much used for wands, or as garlands, by warriors or priests, and was also said to have enabled fugitives—by waving the branches before them—to fly over precipices and ravines away from their pursuers in troublous times. The yellow leaves are very much used in decorations, and have a sweet smell. It is stated that the *ti*-plant has been held in high esteem also by the Hawaiians, and is still supposed to possess great virtue.

The *ti*-root is frequently two feet long, and varies from six to ten inches in diameter. It has something of the texture of sugar-cane and its thick juice is very sweet and nourishing, but it requires to be well baked before eating.

The *ti*-ovens are frequently thirty feet in diameter, and the large stones, heaped upon small logs of wood, take about twenty-four hours to get properly heated. They are flattened down, by means of long green poles, and the trunks of a few banana trees are stripped up and strewn over them to cause steam. The *ti*-roots are then thrown in whole, accompanied by short pieces of *ape*-root (*Arum costatum*) that are not quite so thick as the *ti*, but grow to the length of six feet and more. The oven is then covered over with large leaves and soil, and left so for about three days, when the *ti* and *ape* are taken out well cooked, and of a rich, light brown colour. The *ape* prevents the *ti* from getting too dry in the oven. (Henry 1893:105-106)

Such ovens were also the sites of the “fire-walking” ceremonies, mentioned in chapter 3, partly perhaps because of their suitably large diameters but also because of the direct availability of the ritually necessary *ti* leaves.

Of the many varieties of pandanus (*fara*) which grew wild in these Islands only those along the coast were occasionally used for food. The parts mainly eaten by the Maohis were the endosperms attached to the large strobile heads.

The small tree fern (*Angiopteris evecta: nahe*) supplied a root which was occasionally eaten, particularly by Maohis on hunting or fishing expeditions inland.

The “custard apple” tree (*Morinda citrifolia: nono*), which flourished especially in the adlittoral zone, near the sea, provided a small edible fruit, but was valued more for its leaves, which were used to wrap fish for cooking.

A variety of morning glory (*Convolvulus brasiliensis: pohue*) had stalks which were occasionally eaten.

According to Ellis, *nahe*, *nono*, and *pohue* served as famine foods, when more favored foods were not available (1829:I, 363-364). As Banks put it, these foods (plus the root of the *teve* [*Amorphophallum campanulatus*], which had to be treated like arrowroot) “... are eat only by the poorer sort of people in times of scarcity” (Beaglehole 1962:I, 343).

Another plant, the mountain plantain (*Musa fehi: fe'i*) far surpassed the others in alimentary importance. Ellis asserted that on several islands, “... the fei is the principal support of the inhabitants” (1829:I, 373-374);

but he did not develop this potentially significant statement. (He elsewhere referred to breadfruit as "... the principal article of diet ..." [1829:355]); so one cannot be sure of the literalness of his reference to *fe'i*.) These plantains grew mainly on high ridges and in valley recesses, often at altitudes of 600 to 900 meters; collecting them was a hazardous chore which taxed a man's skill and strength. Banks has left a description of the kind of terrain that had to be traversed to bring down the heavy bunches of *fe'i*:

At length we arrivd at a place where the river was bankd on each side with steep rocks, and a caskade which fell from them made a pool so deep that the Indians said we could not go beyond it, they never did, their business lay upon the rocks on each side of the plains above which grew plenty of *Vae* [*fe'i*]. The avenues to these were truly dreadfull, the rocks were nearly perpendicular, one near 100 feet in hight, the face of it constantly wet and slippery with the water of numberless springs; directly up the face even of this was a road, or rather a succession of long peices of the bark of *Hibiscus tiliaceus* which servd them as a rope to take hold of and scramble up from ledge to ledge, tho upon those very ledges none but a goat or an Indian [i.e., Maohi] could have stood. One of these ropes was near 30 feet in lengh. (Beaglehole 1962:I, 307)

Turnbull wrote, at the beginning of the nineteenth century, that "the Otaheiteans, indeed, have the mountain plantain at all seasons of the year; but they have a great dislike to climb the mountains after it, being much afraid of the wild hogs, which are very fierce. It is moreover a two-days journey, and therefore is an object of terror to the indolent inhabitants." (1813:351-352) But so highly favored was baked *fe'i* that large quantities were collected and consumed.²⁰ This fact, together with the circumstance that some settlements were nearer than others to the sources of supply, may have resulted in some local variation in quantities collected and hence in some exchange with less favored locales, although there is no direct evidence on this point. According to missionary reports there was relatively little *fe'i* on either Huahine or Mo'orea.²¹ It was reported that in some settlements people were successful in cultivating *fe'i*—a measure that may have served to obviate the necessity for exchange; although Corney asserted that *fe'i* did not thrive in the lowlands even when cultivated (1915:271n).

Cultivated Food Plants

Their Cultivation does not extend to any great degree; the Chief Articles of it are the Cloth Plant, Yava, Tarro & Sweet potatoes and some times they plant Cocoa Nuts & Plantains but these plantations are generally the labour of the Chiefs and if they make one in their lifetimes they sufficiently do their duty—they seldom plant any Breadfruit trees as they grow up wherever the root is Seperated, by the Hogs or otherwise and they have often to root the young ones out, to Clear the ground of them, but the Plantains want Planting sometimes after the Westerly winds which if they are not secured are often blown down and these are the only things they take any pains with, nor can this be said to Cost them either Labour or

Toil and as evry part of the Island produces food without the help of Man, it may of this Country be said that the Curse of Eden has not reachd it, no man having his bread to get by the Sweat of his Brow nor has he Thorns in his path. (Morrison 1935:152)

Morrison was a perceptive observer, and although his statement requires some correction and amplification it is in some respects confirmed by the reports of other early visitors to these Islands.

Certainly, taro (*Colocasia antiquorum*, *C. esculenta*) was the principal cultivated food plant of the Maohis, and it was in all likelihood introduced to the Islands by them. It must be grown in well-watered soil; some early observers noted the existence of extensive irrigated patches: "From thence we descended into a fertile valley, where a fine rivulet, which we were obliged to cross several times, ran towards the sea. The natives had placed several stone weirs across this rivulet, in order to raise the water, which might by that means be introduced into their plantations of the tarro, or eddy-root (*arum esculentum*) that requires a very marshy, and sometimes an inundated soil." (G. Forster 1777:I, 341-342; see also Pickersgill's Journal, reproduced in Beaglehole 1961:773.) The use of irrigation is confirmed in part by archaeological remains of terracing along the sides of stream beds.²² When mature, the tuberous root is ten to twelve inches long and contains about 50 percent starch; baked, it was a highly favored food, eaten by itself or mixed into puddings. Tender young leaves and stems of the plant, having a flavor like spinach, were also eaten. After the larger part of the tuber had been cut off the leaf stem for eating, the latter was replanted. In some cases, new plantings were started with small shoots growing around the main tuber. I cannot discover any early accounts of significant fluctuations in ripening, although the plant presumably did grow faster during the hotter and wetter "summer" months.

Gardening in general was the work of males; for lack of contrary evidence I assume that this generality applied also to cultivation and harvesting of taro. The early accounts do not refer specifically to the work of taro gardening—to the amount of time it consumed, to its organization, its ritual, and so on—except for such statements as "... its culture receives a considerable share of their attention" (Ellis 1829:I, 357).

Botanically related to taro and also utilized by the Maohis were *taru'a* and *'ape*. The root of *taru'a* (probably *Xanthosoma atrovirens* [Papy 1951:368]), resembling taro in flavor and consistency but smaller in size, was also extensively cultivated. *'Ape* (*Alocasia macrorrhiza*) produces a much larger root which remains edible for months after reaching maturity, but it is coarser fibered and requires longer baking to render it edible. It was occasionally cultivated, in a drier soil, but grew also in a wild state and was eaten by the Maohis mainly in times when more favored foods were in short supply.

Ellis and Davies added the following details concerning taro and taro-like plants:

Next to the bread-fruit, the *taro*, or *arum*, is the most serviceable article of food the natives possess, and its culture receives a considerable share of their attention. It has a large, solid, tuberous root, of an oblong shape, sometimes nine or twelve inches in length, and five or six in diameter. The plant has no stalk; the broad heart-shaped leaves rise from the upper end of the root, and the flower is contained in a sheath or spathe. There are several varieties; for thirty-three of which the natives have distinct names; and it is cultivated in low marshy parts, as the plant is found to thrive best in moist situations. A large kind, called ape, *arum costatum*, which is frequently planted in the dry grounds, is also used in some seasons, but is considered inferior to the taro.

All the varieties are so exceedingly acid and pungent in their raw state, as to cause the greatest pain, if not excoriation, should they be applied to the tongue or palate. They are always baked in the same manner as bread-fruit is dressed; the rind, or skin, being first scraped off with a shell. The roots are solid, and generally of a mottled green or gray colour; and when baked, are palatable, farinaceous, and nutritive, resembling the Irish potato more than any other root in the islands.

The different varieties of arum are propagated either by transplanting the small tubers, which they call *pohiri*, that grow round the principal root, or setting the top or crown of those roots used for food. When destitute of foreign supplies, we have attempted to make flour with both the bread-fruit and the taro, by employing the natives to scrape the root and fruit into a kind of pulpy paste, then drying it in the sun, and grinding it in a hand-mill. The taro in this state was sometimes rather improved, but the bread-fruit seldom is so good as when dressed immediately after it has been gathered. (Ellis 1829:I, 357-358)

The Ape is a specie of the Taro it grows in the mountains in most places and is sometimes planted in the low marshy ground, there are several sorts, three or four of which if well baked have a good taste and are not disagreeable in the eating, but will, if a considerable quantity be taken, cause a heat in the bowels and a very disagreeable itching of the anus. There are two or three other sorts, that baking will not qualify for use, for let it be ever so well baked, and tho' the taste be ever so agreeable in a minute or two after it is tasted and swallowed it will cause a burning and intolerable itching in the tongue and throat. This plant has very large leaves, and the root when in good ground near running water and sheltered from the sun, will grow very large frequently near two feet long and a foot in circumference and sometimes much larger, but will take considerable time to come to that size. (Davies, Journal, 19 December 1807, LMS Archives)

The sweet potato (*Ipomoea batatas*: 'umara) was cultivated by the Maohis,²³ but, according to Ellis:

In the Sandwich Islands, the sweet potato is one of the principal means of subsistence; here [in the Society Islands] it is only partially cultivated, and is greatly inferior to those grown in the northern islands, probably from the difference of soil and climate.... The umara is very sweet, seldom mealy, and sometimes quite soft, and altogether less palatable than the taro or the yam. It is dressed by the natives in their stone ovens, and is only used when the bread-fruit is scarce. (1829:I, 360)

Perhaps its method of cultivation may have contributed to its relative unpopularity; considerable labor must have been involved in building up the three-foot-high mounds of humus-rich earth in which these tubers were planted.

Yams (*Dioscorea alata: uhi*) were also cultivated by the Maohis. Somewhat puzzling is Morrison's statement that yams—he did not identify them further—were *not* cultivated: "Yams, Calld here Oowhi—these Grow wild in the Mountains, and are from one to six feet in length but not more then five or Six inches round, they are very good but as they take Much trouble to dig them out they are seldom sought after, except when the Bread fruit is Scarce, they never take the Pains to Cultivate them" (1935:143). But, according to Ellis, yams were cultivated "... to no great extent, on account of the labour and attention required," and perhaps also on account of food preferences. Papy noted that yams are eaten in modern times only when other foods are scarce (1951:99). Ellis continued:

The yam is one of the best flavoured and most nutritive roots which the islands produce. The natives usually bake them; they are, however, equally good when boiled; and, as they may be preserved longer out of the ground than any other, they are the most valuable seastock to be procured; and it is to be regretted that they are not more generally cultivated. Few are reared in the Georgian Islands [i.e., Tahiti and Mo'orea]; more perhaps in the Society cluster [Leeward Islands]; but Sir Charles Sander's Island [Mai'ao] is more celebrated for its yams than any other of the group. (1829:I, 360)

In this connection, however, there is no evidence that yams from Mai'ao circulated to other islands.

Early accounts list "wild yams"—*hoi*, *pātara*, and *pā'auara*—as having been occasionally collected by the Maohis in times of scarcity.²⁴ Henry described *pātara* as "... a wild species of yam producing a mealy tuber not so sweet as the 'umara; it is a native of the valleys" (1928:38). But it appears not to have been highly favored: "... I never saw one, for it is not cultivated, and but seldom sought, as the tuberous root is small, and more than two are seldom found attached to the same vine or stalk" (Ellis 1829:I, 361).

Ellis had this to say about *hoi*:

But though they have not rice, they have a plant which they call *hoi*, the shape and growth of which resembles the Patara; but in taste and appearance it is so much like rice, that the natives call the latter by the native designation of the former. It is very insipid, and only sought in seasons of scarcity. (1829:I, 361)

Pā'auara is described in the LMS Dictionary as an excellent root like a potato, but has a vine like the yam.

Most writers described these plants as having grown in the valleys—in

the lower valleys of the wet-tropical zone, according to Papy (1951:99)—although the LMS Dictionary describes *pātara* as “... a good edible root, which grows in the mountains.”²⁵

In my discussion of *fe'i* I noted that, although this highly favored plantain was occasionally cultivated, it was mainly collected from wild-growing stands located high in the mountains. In contrast, from among the many varieties of bananas and lowland plantains (*Musa paradisiaca: mei'a*) that grew in these Islands most of those consumed by the Maohis were cultivated by them in groves near their houses; but not in the orderly manner that Bligh had witnessed elsewhere: “I never saw a regular Plantain Walk in Otaheite—a few Trees are stuck in about their Houses, and others are dispersed around the Hills in the same manner—this is all the trouble taken with them ...” (Bligh 1792:157). According to modern observations the cultivated varieties produce fruit year-round, although something of a peak is reached during the “summer” months.

Ellis provided some details concerning the “forced-ripening” of bananas:

The fruit is not often allowed to ripen on the trees, but it is generally cut down as soon as it has reached its full size, and while yet green; the bunch is then hung up in the native houses to ripen, and eaten as each turns yellow. When they wish to accelerate their ripeness for a public entertainment, they cut them down green, wrap them in leaves, and bury them thirty-six or forty-eight hours in the earth, and on taking them out they are quite soft, and apparently ripe, but much more insipid than those which had gradually ripened on the tree, or even in the house. (1829:I, 373)

Arrowroot (*Tacca pinnatifida: pia*; fig. 9–8) was probably introduced into these Islands by the Maohis. And the starch made from its root, by grating, water-settling, and drying, served as an ingredient in some of their finer puddings. According to Ellis the plant was sometimes cultivated, but it also grew spontaneously in sandy soils near the sea or on dry slopes. Though evidently—to Ellis at least—a food of superior quality “... and capable of being procured in any quantity, it requires some labour to render it fit for food, and on this account was not extensively used by the natives, but formed rather a variety in their dishes at public feastings, than an article of general consumption.” (1829:II, 361)

Sugarcane (*Saccharum officinarum: tō*) grew wild in the coastal belt but some small patches were cultivated by the Maohis near their houses. The stalk was chewed between meals, and it was particularly favored as sustenance on journeys.

Although Wales described the Maohis' gardens as having been “their chief care” (Beaglehole 1961:798)—a judgment, by the way, not shared by many other European visitors—the layout of their cultivations did not correspond to the notions about gardening held, for example, by Bligh, who

wrote that “cleaning and keeping their Grounds neat and free from Weeds is beneath the care of an Otaheitean.” The reason therefore being, according to Bligh: “So much sloth and indolence may be attributed to the vast support that all bountifull nature has given to them in the use of the most valuable of all Fruits of the Earth, the Bread Fruit and Cocoa Nutt.” (1792:157)²⁶

All this, of course, is not meant to imply that Maohi horticulture was in fact slipshod. While the layout of their gardens may not have conformed to the Europeans’ tastes in such matters, that in itself cannot be used as evidence that Maohi horticultural practices were inefficient. The truth of the matter is that what little information I can discover about those practices is not sufficient for making a judgment.

FIGURE 9-8. Arrowroot (*Tacca pinnatifida*). Drawing by S. Parkinson. British Museum of Natural History.

PLANT-FOOD DISTRIBUTION

From the foregoing it appears that these Islands were large enough, and fruitful enough most of the time, to provide adequate plant-food for their populations.²⁷ There were certain geographically conditioned regional differences in overall productivity and in type of product, as, for example, on Mo’orea, where missionaries made the following kinds of observations:

"Oteha is a small place & has but few bread fruit trees but some good ground for tarro, of which they have a large quantity growing" (Elder & Wilson, Journal, 10 February 1804, LMS Archives). "Farrearee is a large district, contains a considerable number of breadfruit trees: the land is tolerably good" (16 February 1804). "Teavaroo is a small district & not many breadfruit trees ... Puppeare is a small district but little good land & few breadfruit & coconut trees. The soil of the Island is not so good as Otaheite & the breadfruit trees are smaller." (20 February 1804)

These differences were reflected in population densities, in everyday activities, and even in social relations. There were also occasional natural disasters—principally hurricanes and droughts—which brought hunger in their train, but recovery from them was usually rapid. Thus, in terms of Maohi technology and food habits the physical environment of these Islands imposed no serious restraints on Maohi subsistence. But what about the social distribution of horticultural resources—land, trees, tools, and labor?

Treatment of the complex subject of Maohi land tenure will be discussed in several following chapters and summarized in chapter 24, but here are some generalizations about it that have to do directly with horticulture.

Residual title to or realistic control over most land, including that capable of food production, rested ultimately in the hands of a district's sovereign chief. Nevertheless, with a few possible exceptions (particularly on Tetiaroa, where few food plants would grow), every household had, through exercise of some sort of claim, use of as much food-producing land as it required—not always of the types suited to growing all plants in the proportions desired, but probably enough to satisfy biological needs. In this respect at least, there was not only enough horticultural land to support the whole population, but also social-relational norms varied and flexible enough to ensure practically everyone an adequate access to that land.

As for food-producing trees, on many Pacific islands it was not uncommon for valued trees to be owned separately from the land on which they grew. Similar usages probably obtained among the Maohis, although there is only one indirect evidence that such was the case. In any event, there was considerable freedom—among kin and neighbors, at least, except in periods of general shortage—to take fruit from one another's trees, as witnessed by missionary reports:

Since the islands became Christian, neither the Missionaries, nor the Natives in general can do now as formerly they did; with respect to pulling the bread fruit, cocoa nuts or mountain Plantains. Neither we nor they are at liberty to pull for our use but such as grow within our Gardens, or near our dwellings, without permission from the owner or proprietor of the land whereon these fruits grow. This is an entirely new regulation among them since they became Christian, and they conceive it to be equitable, and no way inconsistent with their profession. They

are aware that this is the law of Britain and other civilized parts of the world. (Hayward to LMS, London 1819 or 1820, LMS Archives)

There is nothing in the sources to suggest that anyone went hungry during normal times for lack of planting stock or agricultural tools—adzes, digging sticks, and so forth. But what about labor?

The early observers may have exaggerated somewhat the physical ease with which most Maohis obtained what they considered to be an adequate supply of plant-food, but my impression is that arboriculture and tillage were certainly less time-consuming here than in many other Oceanic societies; there is no precise evidence concerning actual amounts of time spent in such work. Neither is there evidence that such work required a high degree of specialized knowledge and skill. Whereas there were specialists (*tahu'a*) in fishing, canoe building, religious ritual, and fighting, there is no specific mention of any specialists in connection with horticulture.

Men, in general, did most of the work of producing and collecting plant-foods, but women seem not to have been excluded from such kinds of work by any inviolable restrictions, nor were there any limits placed on such labor due to age or class. In fact, in connection with the latter the sources contain several references to upper-class men who joined energetically with their subjects in setting out new plantings of breadfruit and coconuts.

In summary, none of the factors just listed—proscriptive labor norms, lack of tools or planting stock, or availability of land—exercised any serious restraints upon plant-food production. In fact, what restraints there were derived mainly from other considerations.

Demand for tribute undoubtedly operated as an incentive for “surplus” agricultural production; but it also served to restrain production, as the missionaries discovered when they sought to induce their converts to grow more food:

When we exhort them to labour, and shew them the advantages of civilization; they acknowledge it is all very good, very delightful. They confess their inferiority & say it be well for them to do so. But they immediately ask us Of what use is it? Soon as we have got these things about us the King's people will come & say, give us this for the King, give me the other for the King....” (Platt to Burder, 12 November 1818, LMS Archives)

In other cases such demands had the effect of increasing the amount of labor spent in meeting the farmers' own subsistence needs:

From the centre hills towards the sea, for a little distance up, the hills abounded with cocoa-nuts and bread-fruit, and the more interior parts with mountain plantain, tarro, and a variety of other things, which they have recourse to when the low land cannot supply all their wants. Asking Peter what reasons they gave for not cultivating more of those articles on the low ground, as it was evident they would grow as well, or better, there, he said it was on account of the havoc made

by the arreoies, and those who accompany Otoo (Tu) in his feastings round the island; at which times, though they only stay two or three days in a district, they consume and wantonly destroy all the produce, and often the young plants, leaving nothing for the settled inhabitants of the place to subsist on, but what they derive from the mountains: on this account they submit to the trouble of climbing almost inaccessible places, rather than expose much of the produce of their labour to their privileged robbers. (Wilson 1799:194-195)

Warfare was another activity that served to restrain agricultural production. Not only did invading forces destroy gardens and cut down or ring-bark food-bearing trees,²⁸ but consequently during unsettled times people were reluctant to plant new gardens or set out new trees, as will be described in chapter 12.

KAVA

The only intoxicant or narcotic imbibed by the Maohis was an infusion made from the root of the pepper shrub (*Piper methysticum*: 'ava), a plant which was found occasionally growing wild but which came mainly from gardens that, in their tidiness and layout, were quite uncharacteristic of the Maohis.

Here [near a dwelling] I thought I got a sight of an European garden; the plats of ava-ground were laid out in such nice order: each bed formed regular parallelograms, trenched two feet deep, and disposed with a great degree of taste; the whole enclosed with a fence of bamboo. (Wilson 1799:193)

The cloth plant, which is raised by seeds brought from the mountains, and the *ava*, or intoxicating pepper, which they defend from the sun when very young, by covering them with leaves of the bread-fruit-tree, are almost the only things to which they seem to pay any attention; and these they keep very clean. (Anderson, in Cook 1784:145)

The beverage appears to have been made in two different ways. According to some accounts pieces of the root were chewed (by "servants" say some reports; by "young women" says another) and spit into a wooden bowl. To this was added some water or coconut juice, along with some crushed leaves of the pepper plant. After mixing the concoction the root fibers and leaves were removed with a strainer and the drink was ready. When the first brew was nearly consumed more liquid was poured over the masticated roots again and again, until the brew had no more efficacy. For example, Bligh's report begins: "It is drank four or five times a day, and the operation of making it, is as filthy as the Use of it is punicious." He continued: "This Ava is made from a Strong pungent Root which few Cheifs ever go without, it is chewed by their Servants in large mouthfulls at a time, which when it has collected a sufficiency of Saliva is taken and put into a Cocoa Nut Shell. This is repeated untill there is enough

chewed, it is then squeezed and given to the principall Men...." (Bligh 1789:I, 382; see also G. Forster 1777:I, 406)

Anderson, however, described a very different kind of process: "But this beverage is prepared somewhat differently, from that which we saw so much of at the Friendly Islands. For they pour a very small quantity of water upon the root here; and sometimes roast or bake, and bruise the stalks, without chewing it previously to its infusion" (Cook 1784:155).²⁹ Anderson's statement appears to have had reference to the Society Islands in general, or at least to Tahiti, but a passage quoted by Beaglehole and attributed to Williamson, who was also on Cook's final visit to these Islands, implies that nonmastication of kava was distinctive of Ra'iatea:

The Yava which I have before mention'd is drank at all these islands, but at Ulietea only clean and decent, in stead of that filthy manner of making their slaves first chew it, it is put into plantain leaves & baked, the moisture of the leaves softening it, as if it was boil'd, it is then braised in a wooden bowl mix'd with water, strain'd, & then served out to the guests. (Williamson, in Beaglehole 1967:252n)

The effect, all observers reported, was befuddlement leading usually to sleep. According to some accounts the drink immobilized the limbs, especially the legs, but heightened mental activity for a while, before sleep or stupefaction set in. The capacity to arouse oneself to action quickly out of a kava-induced stupor was regarded as an attribute of "heroes" (Adams 1901:19-20).

For maximum effect kava had to be drunk before and with meals. One such effect was observed by Cook: "The next morning the yava was in great plenty. One man drank so much that he lost his senses, I should have supposed him in a fit from the convulsions he was in; two men held him and kept plucking off his hair by the roots" (Beaglehole 1967:215-216). Drunk on a full stomach it produced only mild stupefaction. All observers agreed that excessive imbibing—that is, four to five times a day for weeks at a time—so reduced the appetite for food that the person became thin and drawn, and his skin scurfy: "... the skin begins to be covered with a whitish scurf, like the leprosy...: the eyes grow red and inflamed; and the soles of the feet parched and cracked into deep chaps, as some lips in winter." But upon discontinuance of the practice, we are informed, "... the skin soon becomes smooth and clean, and they grow fat..." (Wilson 1799:375). In fact, one visitor reported that if imbibed with regularity, though not to excess, it had the effect of warding off other bodily afflictions and thus lengthening one's life.

After about a fortnights Constant use the Skin comes all over with a white scurf like the land scurvy and the Eyes grow red & firey and the Body lean and Meagre but on being left off for a few days the Scales fall off the Skin then be-

comes clear & smooth and they soon grow fat & wholsom to view—this gives me reason to think that this nausious draught must be very wholesom as those who use it are Seldom afflicted with disorders of any kind and those who use it regularly are some of the oldest men in the Country (Morrison 1935:151).³⁰

In contrast with Tonga, where the making and drinking of kava provided the activity whereby a large-scale assembly was ceremonialized, the making and drinking of it by the Maohis was done—according to one European visitor, who knew both archipelagoes—“... in an unsocial manner, by one, two, or three at a time” (Wilson 1799:191). “Large companies do not assemble to drink it, in that sociable way which is practiced at Tongataboo” (Anderson, in Cook 1784:155). I should point out also that I have come across no mention of the occurrence of kava drinking as part of religious ritual. Indeed, a passage from Henry seems to imply that kava imbibing was a specifically secular (*noa*) activity, to be kept apart from things and events that were sacred (*ra’a*). The passage in question is part of a chant uttered by the laity when taking leave of the marae at the conclusion of a large-scale and long-lasting religious ceremony:

We are now retiring to use our hands and become vile [*ha’a ha’a*]: we shall do domestic work, wear flowers, paint ourselves yellow with *mati* [a dye made from berries of *Ficus tinctoria*], blow [make] fire, curse, give each other blows, practise black art [sorcery], caress, put on unconsecrated [*noa*] clothes, eat pork, cavalla fish, shark, bananas; and drink ‘ava; look not upon us in anger for this, O god! (1928:172)

Some observers reported that in the Society Islands only the “principal people” imbibed kava with any regularity, so that the physical signs of excessive imbibing served somewhat as “... a badge of nobility” (Wilson 1799:375). Or, as one missionary observed: “This extremely odious appearance of the skin is looked upon as a badge of honour by the Tahaitians, when a man from his circumstances can afford, or from strength of constitution can bear to drink sufficient quantities as to affect him in this manner.” (Warner, Medical & Surgical Journal, Tahiti, 9 May 1808, LMS Archives)

Scarcity of the pepper plants rather than any general explicit social prohibition was probably responsible for the sporadic consumption of the beverage (Corney 1915:472). “It [kava imbibing] is Common to all but is more used by the Chiefs & their Familys, Servants &c than by the common people. They prefer the method of Chewing it to any Other—it is in much request among people of rank but even some of them never tast it.” (Morrison 1935:151)³¹

For some reasons difficult to fathom, pepper plants appear to have grown better in certain districts than in others, and in some not at all (Corney 1919: 52; Wilson 1799:192); hence, it served as a greatly appreciated gift when people visited each other. It also seems to have flourished more

on some islands than on others: for example, when a Spanish vessel made a trip from Tahiti to Ra'iatea two Maohis were sent along by their chiefs for the purpose of bringing back a supply of the roots. But aside from occasional transactions of opportunity like these, it is not known whether kava, in the form of gift exchange, tribute, or barter, circulated with any regularity.

FOOD-PLANT RITUAL

For a people so dependent upon spirits for their personal welfare and for the success of such enterprises as boatbuilding, fishing, and warfare, it might be assumed with some justification that the Maohis took parallel ritual measures to ensure good harvests of food plants. But the only records we possess concerning these measures have to do with large-scale public ceremonies; to the best of my knowledge the sources contain no mention of specifically horticultural rites—consecrating planting stock, encouraging tree growth, et cetera—so prevalent in many other societies of the Pacific islands. What evidence we have on this score is indirect and concerns *ti'i*, those images that fetcher spirits occupied while serving the interests of their human associates. The archaeological recovery of some of these images from spots that appear to have been sites of gardens suggests that they were placed there for purposes of stimulating crop growth, or of protecting the growing crop from destruction, or both.

The large-scale public festivals associated with food-plant production were of two types: one celebrating the beginnings of the season of greatest plant-food abundance (*tau 'auhune*) and the other, some months later, signalling its climax and approaching end.

The festival of the ripening-of-the-year (*parara'a* [or *maoara'a*] *matahiti*) took place at the beginning of the year's most plentiful breadfruit harvest, which usually occurred within a few weeks after the summer solstice (although it appears that the festival itself was scheduled according to the time of fruit ripening and not according to any recognized point in the solar, or sidereal, cycle). According to Ellis, the ceremony of ripening-of-the-year was, on Huahine at least, "... regulated by the blossoming of reeds"; but he does not specify exactly when that took place or what the reeds in question were (1829:218). Though certain other food plants, notably taro and bananas (*mei'a*), fruited more or less year-round they also ripened most abundantly during the summer months; in any case breadfruit was in most places the prime staple and its ripening was the event that mattered most. This meant of course that the ceremony itself took place at different times from one place to another, in line with regular climatic differences, and possibly also at somewhat different times of the year in any one place, because of rainfall irregularities.

Ripening-of-the-year consisted primarily of a public offering of food

and other valuables to the communities' tutelary spirits and sovereign chiefs, followed by days of feasting, sports, and other diversions. Several writers mentioned this festival, but only fragmentarily or in the most general terms.³²

The first question that arises concerning this festival has to do with the nature of the social units involved.

On such an occasion, the chiefs and people of the districts brought to the capital contributions of food, which they placed upon the assembly ground in an immense heap, called a *poropa*, and systematically divided a liberal part into shares. With appropriate speeches by the official orators they presented these to the gods and keepers of the royal marae, to the royal family, and to the clergy, reserving the rest for themselves. (Henry 1928:177)

Moerenhout was similarly vague, in speaking about an assembly of "... the whole population of the districts," under the general command of the "*ari'irahi*", or "superior chief" (1837:I, 519). For a small and more or less politically unified island such as Huahine this question is not difficult to answer: presumably the whole populace assembled at one place for the festival. On most other islands the social composition of such festive-making units must have varied greatly from place to place and from time to time, sometimes comprising a small compact and more or less autonomous tribal district, at other times and places a whole loose confederation of large districts. In this connection it would be interesting to know—but it is impossible to discover—what occurred in a political unit large enough to incorporate places with somewhat different fruit-ripening times. In any event, the accounts are in agreement that whole populations turned out for these occasions, and while women could not of course have witnessed the religious rites in the marae precincts, they presumably did partake of the feasts and join in the general revelry outside. It is also reported that while such festivities were in progress all hostilities ceased—at least among those social units joining in any one festival (Moerenhout 1837:I, 518). E.S.C. Handy implied that warfare was taboo during the entire "season of abundance"—from December through January to March through April (1927:301); if such were the case, however, it was a frequently dishonored truce.

A second question concerns the nature of the "offerings" involved in ripening-of-the-year. The breadfruit and bananas brought to the assembly were indeed "first fruits": supposedly they were the first fruits to ripen of each seasonal crop—*te mau mā'a hou ote fenua* 'the new fruits of the land' (E. Salmon 1937:30), and prior to the ceremony it was forbidden to anyone to eat any part of the new crops. In addition, people brought to the assembly coconuts and other food plants which ripen year-round, along with pigs, dogs, tapa, mats, and even canoes built especially for the occasion. In fact, according to Moerenhout, the several social units joining together in one of these festivals attempted to outdo one another in the value of their contributions, "... in order to win most favor with the gods."

(1837:I, 518) In describing food brought as “gifts” or “tribute” to large public ceremonies the missionaries remarked that “... These presents of Fish, Plantains, Uru, Coconuts, &c are generally more for shew than anything else. The Uru is commonly fit [only] for Hogs, and the Fish, Taiero &c kept so long before ...” [page missing] (Davies, Youl et al., Journal, 29 March 1806, LMS Archives).

The ceremony itself has been described in some detail by Moerenhout. He could not himself have witnessed any such events and did not indicate the source of his information, but since his is the only reasonably full account of the proceedings I reproduce it in full, for whatever it may be worth:

This kind of festival always took place near an island’s principal marae.^[33] Those from a distance made sure of arriving on time for it, but not before the day the ceremony was to begin.

It must have been a magnificent sight: with so many canoes arriving from far and wide, all in full sail and fully laden with the people and their chiefs robed in rich and impressive attire. Each [tribal] district sent four newly made canoes as an offering& these preceded the main fleets and carried in them many objects destined for the gods. On landing, these canoes were ceremonially received by the [hosts’] priests, who performed several preliminary ceremonies, following which the chiefs and his subjects were permitted to disembark. Thereupon, the new canoes along with their cargoes were presented to the host, the *Ari’i Rahi*, who assumed custody over them but left them [for the moment] untouched.

After all the guests had arrived they and the host and his subjects assembled, by tribal contingents, and the local High Priest stepped forth and gave the command for all to proceed with the offerings to the marae, the High Priest then led the parade, accompanied closely by the priests of the visiting tribes, all garbed in their clerical garments—that is to say, enclosed in fine mats that reached up to their waists. Thus clothed they marched in line, blowing their bamboo-lipped conch-shell trumpets, with the kinds of sounds, more loud than musical, that accompanied all such processions associated with religious festivals or war ceremonials.

Upon arrival at the marae all the objects brought along were placed inside its enclosing walls and the priests began the services, which consisted of thanksgivings and of other long prayers, Then, the *tāu pure* [invocation pray-er], the local sacrificer, placed upon the altar a small amount of the received fruits and other comestibles, as offerings to the gods, and designated the remainder for the host chief.

On hearing this announcement the throngs crowded around the marae shouted out a demand for the food thus specified and a deputation from them presented their request to the host-chief, who, as was usual, made them a present of all the things not specifically reserved for the gods and the clerical personnel, or not required by the chief himself and his companions. When the chiefs’ messages made this known to the crowds outside they rushed into the enclosure and set upon the vegetables, pigs, chickens, and so forth, so designated—fighting and grabbing and pulling them in a howling and savage *melée*, which, notwithstanding, usually ended up without any fatalities or serious casualties.

This mode of distribution was without doubt inequitable, but it may well have been a survival of [former, more barbarous days]. And in any case, when the [ritualistic] snatching *melée* was over, the goods themselves were then distributed quite equitably among all the participants.

The ceremonies just described were always followed by a general feast, and

in view of the large quantities of provisions usually assembled on such occasions, the feasting ordinarily continued for several days. All this might seem quite alien to a so-called religious event, for with the exception of the "religious" chants that always preceded the Ariois' performances [which usually accompanied these affairs], the whole time was spent in feasting, dancing, racing, mock-fighting, boxing and wrestling, and so on; and such activities did not terminate until the food ran out. (Moerenhout 1837:I, 518-521)

According to Henry, the principal spirit honored at ripening-of-the-year rites was the god Romatane, who was special patron of the Arioi paradise; this god was invited "... to come with the spirits of [the offerers'] deceased friends to share their pleasures." Henry added that "... some families, especially in Huahine, spread out upon lines in their houses tapa, which they placed at the disposal of those spiritual guests" (1928:177).

Ellis characterized these rites as follows:

When the prayers were finished at the marae, and the banquet ended, a usage prevailed much resembling the popish custom of mass for souls in purgatory. Each individual returned to his home, or to his family marae, there to offer special prayers for the spirits of departed relatives, that they might be liberated from the *po*, or state of night, and ascend to *rohutunoanoa*, the mount Meru of Polynesia, or return to this world, by entering into the body of some inhabitant of earth.

They did not suppose, according to the generally received doctrine of transmigration, that the spirits who entered the body of some dweller upon earth, would permanently remain there, but only come and inspire the person to declare future events, or execute any other commission from the supernatural beings on whom they imagined they were constantly dependent." (1829:II, 218)

Morrison described two kinds of first-fruits offerings—one principally to spirits, the other principally to "chiefs":

The first Fruits of all kinds are offered to the Deity, next to the Chief and to the Lord of the Mannor before they eat any themselves, and the Fish in like Manner; if a Man has a Fishing Seine to Wet or a New Canoe to launch he makes a Feast on the Morai for the Priests, who offer up Plantain trees and prayers for their success, and the First fish always goes to the Morai where the priest offers it with prayers, The Next to the Priests, the 3rd to the Chief and the 4th to the Lord of the Mannor or landlord; and till all these are served they never taste the Fruits of their labour.

The first pig is always offered at 8 or ten Days old and a Chicken of the Brood is also offered, and for their Children they always make an offering according to their ability and is either a Pig or a Fowle. (Morrison 1935:183)

They Make an Offering of their First fruits to the Chiefs besides those Made to the Deity. This Ceremony is Calld Eehee Aree and is thus performd—the Fruits being ripe the Towha or Lord of the Mannor informs the Ratirra or Squires that on such a Day the Offering is to be made & it is Proclaimed through the District by a Cryer to inform their respective Tennants, the Mattaeynas or Man-nahoune's, who on the day appointed each gather some of evry species and having put them into a Basket, which is hung round with a piece of Cloth, [it] is tied to a pole, which is ballanced on their Shoulder by a sucking pig hung by

one foot to the other end, and repair to the House of their respective Ratirra who then heads his own people and proceeds to the House of The Towha, who with His priest and Orator heads the Whole and the procession proceeds to [the] House of the Chief, somtimes four or five Hundred in a body, where being arrived the Towha by Means of His Priest and Orator (who always attend on such occasions) makes a Peace offering of [a] Young Pig, a Plantain tree & a small tuft of red Feathers; these the Priest offers as usual and the Orator makes a long speech in behalf of the Towha & Ratirras expressing their loyalty and the love they have for their Chief. The Ratirras having by Means of their Priests (each Family having One or More in or depending on it) made their Peace Offering, the Fruits are deposited before the Chief and they retire and return home. When this Ceremony is performd to the King the Chiefs of the District always head the procession.

This Ceremony is then performd by the Ratirras to their respective Towha and afterwards by the Tennants to their Ratirras, after which they Carry in as Much Bread as they think will be sufficient, putting it in large Baskets made of Cocoa Nut leaves which when filld are as Much as two Men Can Carry—with each of which they send a small Fish, intimating that they do not offer bread alone, with this a Baked hog and several small baskets of Bread, Tarro, Cocoa Nuts With the Husks peeld off, Plantains &c. are Carried to the House of the Chief, Towha or Ratirra each in their due proportion. (Morrison 1935:216)

The second of these offerings will be described in chapters 16 and 23. Meanwhile, it is noteworthy that neither of Morrison's accounts mentions redistribution& whether this betokens an oversight on his part, or an actual difference in custom, is not clear. The same uncertainty holds for Morrison's omission of reference to spirits' shares of the contribution to the chiefs, but I very much doubt that any large-scale transactions of this kind ever took place without *some* part going to spirits.

The second great festival associated with plant-food seasonality took place at the time when such foods were most abundant—usually during March and April by Western reckoning, but varying in keeping with local differences in times of fruiting. It was in this sense, therefore, a harvest ceremony, and was accordingly a festive occasion. But while celebrating the height of the season of abundance, it was also (in these Islands where plant-foods were only partially preservable) the prelude to the season of greatest plant-food scarcity, and hence, according to one interpretation, was celebrated with dolorous overtones.

Little else has been written about these harvest festivals themselves except that they were "brillant" affairs, attended by multitudes of people dressed in their best attire, and consisting of some marae rites, dancing, games, competitive sports, and general revelry; a last grand fling, it is implied, before months of privation to come (Moerenhout 1837:I, 502). Immediately thereafter, each priestly representative returned to his own marae, public or domestic, and besought whatever spirit to which he prayed to return in due time from the realm of darkness (*pō*), where spirits were believed to remain during the season of scarcity. Thereafter, and until the

next season of plenty, according to Moerenhout's account, rites continued to be held at marae throughout the land, to encourage the spirits to cause plant-foods to ripen again.³⁴

The ceremonies at the marae had no other object but to secure fertility and abundance from the gods during the seasons of slow growth and scarcity. Dealing with their gods as they had so often to deal with one another, they sought to gain their favor by appealing to their personal interests. "Oh Gods!" they would say from time to time, when delivering at the marae such offerings as unripe plant-foods and other comestibles of inferior quality, "Gods! This is all we have to offer you at present. But if you will hasten the ripening of our plant foods, and provide us with an abundant harvest, we shall bring to you the first fruits and all that is best thereof. (1837:I, 523)

ANNUAL-CYCLE TIME RECKONING

The relation between the great festivals and the seasonal ripening of staple plant-foods directs our attention again to Maohi time reckoning.

The Maohis perceived several of what Westerners would call natural cycles:

1. a diurnal rising and sinking of the sun (which has already been described);
2. a lunar month (*marama*) of twenty-nine days, or rather "nights";
3. an annual (*matahiti*) cycle of twelve to thirteen lunar months;
4. an annual cycle mainly in terms of the ripening of different breadfruit varieties;
5. a seasonal (*tau*) cycle based on visibility or nonvisibility of the Pleiades;
6. an annual cycle based on weather conditions at sea and on other conditions having to do with fishing.

The succession of nights making up the lunar month will be discussed in connection with fishing, with which it was mainly concerned. The earliest detailed statement concerning the annual cycle made up of the lunar months themselves came from Banks:

For their Method of dividing time I was not able to get a compleat Idea of it, I shall however set down what little I know. In speaking of Time either past or to come they never use any term but Moons, of which they count 13 and then begin again: this of itself sufficiently shews that they have an Idea of the Solar year but how they manage to make their 13 months agree with it I never could find out: that they do however I beleive because in mentioning the names of months they very frequently told us the fruits that would be in season in each of them, the sort of weather that was usual in them &c. They have also a name for the 13 months collectively but they never use it in speaking of time, they use it only in explaining the mysteries of their religion: in their metaphorical way they say that the Year *Tettowmatatayo* was the daughter of their cheif Divinity *Taroatai-hetoomoo*^[35] and that she in process of time brought forth the months, who in

their turn produc'd the days, of which they count 29 in every month including one on which the moon is invisible. (Beaglehole 1962:I, 368-369)

Thereafter, lists of lunar months were recorded by J. Forster, Bligh, and several of the London missionaries. All these lists contain many of the same names, which follow one another in about the same order. Yet, according to the English calendar with which each of them has been brought into correspondence, some of the same months occur on different lists as much as three or four months apart. Also, some lists contain twelve and others thirteen month-names& according to Bligh the twelve-month calendar was most current on Tahiti, the thirteen-month one on Ra'iatea (1789:II, 45-46). The sources differ somewhat concerning where to place the beginning of each yearly cycle of lunar months.³⁶ However, I am inclined to agree with Bligh that the Maohis probably had no conception of a beginning of the lunar-month cycle before Europeans began to inquire about the matter.

The second of these discrepancies is not easily explained. In the face of it, neither a twelve-lunar-month cycle (i.e., 348 days) nor one of thirteen months (i.e., 377 days) can be harmonized with the 365-day solar cycle, with which it was evidently geared, without recourse to some system of intercalation. Bligh suggested that there was a special intercalary "month" called *Tawa* which somehow served the purpose, but the uncertainty remains to this very day.

As for the first of the discrepancies, a readier explanation is at hand. As we shall see, the names of most of the lunar months listed refer directly or indirectly to seasonal fluctuations in the supply of plant-foods, mainly breadfruit. In view of the local variations in the time of breadfruit ripening, it seems clear that the Maohis adjusted their month-names to their food supply. As examples of two of these calendars I reproduce below two lists reported in Henry—a thirteen-month one said to have been supplied by Pomare II in 1818, and a twelve-month one based on information from the Papara (Tahiti) chiefess Ari'i Ta'imai in 1891. References to English names of months clearly identify these texts as post-European, but there is no reason to suppose that these Maohi names, or their order of occurrence, had been adapted to European ideas:

Teie te piti o te tai'o i te tau; e na ni'a i te ava'e:

Here is the second way of counting the seasons; it is by the moons:

YEAR OF THIRTEEN MOONS

1. O Rehu (Varehu, Arehu), te haere mai nei te 'ahune; ia Titema e Tenuare ia tau. I te tua o Rehu, o

Rehu (Levelling) is when harvest is coming in; this period arrives between December and January. On the back of Rehu comes

2. Fa'ahu-nui, te tamoe no te 'ahune; ia Tenuare e Fepuare. I te tua o Fa'ahu, o

Fa'ahu-nui (Great-repose), the sound sleep of plenty; between January and February. On the back of Fa'ahu comes

3. Pipiri, te 'ore ra te ma'a; ia Fepuare e Mâti. I te tua o Pipiri, o

4. Ta'a-oa, te 'ore ra te 'uru; ia Mâti e Eperera. O te tua o Ta'a-oa, o

5. Au-unuunu, ua unuunu ia te hœe o te rava'ai, e anotau vero; ia Eperera e Mê. I te tua o Au-unuunu, o

6. 'Apa'apa, te pou no te tau o'e, te parara'a o te ra'o'ere ra'au e ma'iri atu ai; ia Mê e Tiunu. I te tua o 'Apa'apa, o

7. Paroro-mua, pohera'a o te re'a ia Tiunu e Tiurai. I te tua o Paroromua, o

8. Paroro-muri, e tau o'e; ia Tiurai e Atete. I te tua o Paroro-muri, o

9. Muri-aha; ia Atete e Tetepa. I te tua o Muri-aha, o

10. Hia'ia, te pou ra'a 'tu i raro roa i te o'e; ia Tetepa e Atopa. I te tua o Hia'ia, o

11. Te-mâ, o te mâ rea 'tu ia o te ma'a tahito, e tupura'a o te ma'a api, o te tau ia e tanu ai i te ma'a; ei Atopa e Novema. I te tua o Te-mâ, o

12. Te-'eri, ia Novema. Ei reira e 'oteo mai ai te 'uru api. I te tua o Te-'eri, o

13. Te-ta'i, Te-ta-ai-nui-ia-tuma, ia Titema. Te tupu ra te uru; te ta ai ra ia i te hui ma'a o te taevao i tai.

Pipiri (Parsimony), the time when scarcity begins; between February and March. On the back of Pipiri comes

Ta'a-oa (Departing-joy); breadfruit is scarce. On the back of Ta'a-oa comes

Au-unuunu (Suspension); the fisherman's paddles are then put away, it is a stormy period; between April and May. On the back of Au-unuunu comes

'Apa'apa (Severed-in-twain), descent into the time of scarcity of food; the leaves of plants then yellow and fall off; between May and June. On the back of 'Apa'apa comes

Paroro-mua (First-fall). Turmeric and wild ginger then die out; between June and July. On the back of Paroro-mua comes

Paroro-muri (After-fall), the last of the fruit season; between July and August. On the back of Paroro-muri comes

Muri-aha (Prayer-behind); between August and September. On the back of Muri-aha comes

Hia'ia (Cravings), descent into the greatest scarcity of food; between September and October. On the back of Hia'ia comes

Te-ma (The-clearing), when the old crops are clean gone and new crops are developing, which is the season for planting food; between October and November. On the back of Te-ma comes

Te-'eri (Scarcity), most of November. Then the inflorescence of the breadfruit begins. On the back of Te-'eri comes

Te-ta'i (The-cry), Te-ta-ai-nui-ia-tuma (The epicure's-great-forage for food), in December. The breadfruit is developing; then wild foods of all kinds are brought out to eat.

On different islands and in different districts, the seasons vary in their time of coming, according to the wet and dry weather, and in this way the people had an irregular method of reckoning the year, each little kingdom following its own course. But they were all agreed in the length of time that the year lasted, being guided by the lunar month. Sometimes when there were only twelve complete developments of the moon's phases in the rotation of the seasons, whatever month did not agree in the conjuncture would be skipped:

YEAR OF TWELVE MOONS

Teie te i'oa o te mau ava'e o te matahiti e ta ratou mau vahine:

1. Paroro-mua, ei Eperera; o Mara'amua te vahine.

2. Paroro-muri, o Mê; o To'erau te vahine.

These are the names of the months of the year and of their wives:

Paroro-mua (First-fall), in April; Mara'amua (Trade-wind) is the wife.

Paroro-muri (After-fall), in May; To'erau (North-wind) is the wife.

3. Muri-’aha, ia Tiunu; e parara’ a no te ra’au, o Te-’ura te vahine.

4. Hia’ia, ia Tiura’i; ua pohe te re’a; o Tura’i-re’a te vahine.

5. Ta’a-’oa, ia Atete, o Te-rere-’oa’oa te vahine. Ofaara’a o te honu e te upoa.

6. Huri-ama, ia Tetepa, o Te-mata-tau-roroa te vahine. Ua vehe te tau, o te ro-roara’a ia o te mahana.

7. Te’eri, ia Atopa, o Te-ha’amoe-’apa’apa te vahine. Ava’e ua.

8. Te-ta’i, ia Novema, o Te-hei-fa-’ataha te vahine. Te uaara’a ia o te pua, o te rave hia ma te ha’apae i te hei ‘i’ino.

9. Varehu, ia Titema, o Oteatea te vahine.

10. Faahu, ia Tenuare, o Pahunui-atou-tere-i-te-ta-moe te vahine. E ava’e ‘ahune ia.

11. Pipiri, ia Fepuare o Pipirima’a-i-fenua te vahine. “E ‘ai atu te hoa i te tara fare, e ‘ore e ‘ite mai e, o te hoa here ‘oe”, e parau tahito ia. Utautara’a o honu ri’i e te upoa i tua.

12. A-unuunu, ia Mati, Ua-unuunu-ma-te-tai te vahine. E anoutau vero.

Muri-’aha (Prayer-behind), in June; leaves turn yellow; Te-’ura (Gorgeousness) is the wife.

Hia’ia (Longings), in July; wild ginger and Turmeric die out; Tura’i-re’a (Battering-down-of-re’a) is the wife.

Ta’a-’oa (Departed-joy), in August; Te-rere-’oa’oa (Flight-of-joy) is the wife. The turtle and the upoa bird then lay their eggs.

Huri-ama (Turned-outrigger), in September; Te-mata-tau-roroa (Face-longstanding) is the wife. Time is balancing, the days are lengthening.

Te’eri (Development of spring) in October; Te-ha’amoe-’apa’apa (Persistence) is the wife. It is a rainy month.

Te-ta’i (The-cry) in November; Te-hei-fa-’ataha (Wreaths-worn-jauntily) is the wife. It is the season for the *Besleria laurifolia* flower, which is preferred to common wreaths.

Varehu (Spring-advanced), in December; Oteatea (Inflorescence-of-bananas) is the wife.

Faahu (Restfulness), in January; Pahunui-atou-tere-i-te-ta-moe (Great-drum-extending-ripeness-with-sound-sleep) is the wife.

Pipiri (Parsimony), in February; Pipirima’a-i-fenua (Stinginess-of-food-in-the-land) is the wife. “The friend will eat then in the house corner, and ignore thee as a dear friend,” is an old saying. The turtle and the upoa bird take their young out to sea at that time.

A-unuunu (Withdrawal), in March; Ua-unuunu-ma-te-tai (Withdrawal-from-the-sea) is the wife. It is a stormy period.

(Henry 1928:332-334)

Several features of these lists are noteworthy, particularly the aforementioned associations with plant-foods and related human activities, and the reference to weather in conjugal metaphor; but they also raise some interesting questions. When persons from different calendar areas were faced with the necessity of referring to a date of mutual interest—say, for a proposed rendezvous—how did they do so? Or, when a chief of one calendar area extended his power over areas with different seasonal cycles, did his own home-area calendar become official in the latter? (In other words, did the facts of politics take precedence over those of ecology even in this technologically simple society?) In this connection, the so-called Pomare II thirteen-month version corresponds fairly closely to the one recorded in 1789 by Bligh and identified by him as Ra’iatean, whereas the Ta’imai or

Papara (Tahiti) twelve-month list was nearer to Bligh’s so-called Tahiti version. Pomare II certainly cherished his social ties with Ra’iatea, just as he considered Papara leaders among his (intermittent) rivals, but from this it cannot be assumed that the unsuitable Ra’iatean calendar was foisted upon Pomare’s home districts.

Such questions as these are unanswerable, but perhaps they are trivial as well, for as Bligh suggested in the following prelude to the lunar-month lists collected by him, such calendrical reckoning may have been more of a specialty of savants than a common usage of ordinary men:

To get a certain Knowledge of their division of time has given me much trouble, for altho many people pretend to know it, Yet I have found them so contradictory in their Accounts as convinced me they were not acquainted with the particulars of it. Tynah assured me only a few Old People could give me any information and that he knew it but very imperfectly himself, he however has always referred me to Toota-ah or his Uncle Mowworroah. (Bligh 1789:II, 45)

In addition to the indirect implication of breadfruit seasonality in names of months of the lunar calendar, this staple also figured as a direct timemarker on its own: “They have ... criterions to judge of the particular times of the Year by the different kinds of Breadfruit coming into Season, and according to Toota-ah they have it divided under six General heads governed by the Name of that Fruit which is then fit for eating....” Bligh then went on to list the breadfruit varieties in question, and to indicate how the times of their ripening corresponded with the Ra’iatean lunar-month calendar referred to above:

Ooroo-aowne	To the Month of Sept. or Weeree-areearee
Do.	of Oct. or Weereeamah
Tappeppee	of Nov. or Tearee
Do.	of Dec. or Tetta-igh
Aieiotah	of Jan. or Worraihoo
Do.	of Feb. or Wahahoo Tawa
Evynooah	of March or Peepeeree
Do.	of April or Ahoonoonu
Tee-evveerah	of May or Parroromoh
Do.	of June or Parroromure
Rowrow-we	of July or Mooree-yaah
Do.	of August or Ee-ahheeya

Now in this division Toota-ah placed Tawa between Feb. and March, which was interval, he said, where no Breadfruit were to be had, that as they were never used by them for the Trees were never bare all the Year round: but just at this time they were not in such perfection. (1789:II, 46)

Stars figured in Maohi calendrical reckoning in the following way:

Teie te tau ari'i ma te tai'o na to Tahiti nei, 'oia o Matari'i-i-ni'a e o Matari'i-i-raro. O Mata-ri'i e pura na i te ata i te pae ra'i o na Hui-tarava ia Mere ra i te arehurehura'a o te ahiahi, i te Ava'e o Temâ ra, 'oia ia Novema 20, o te avei'a ia o te tau 'ahune O Matari'i-i-ni'a ia tau, e topa noa 'tu ia fetu ri'i raro a'e i te pae ra'i i te arehurehura'a o te ahiahi, i te ava'e o Au-unuunu ra, 'oia ia te 20 no Mê. O te upo'o ia o te tau 'ahune.

O Matari'i-i-raro te tau i ha'amata i te ava'e o Au-unuunu ra (ia Mê) ia mo'e ae ia fetu ri'i i raro i te pae ra'i i te arehurehura'a o te ahiahi ra, e tae noa 'tu i te pura fa'ahou ra'a mai ini'a i te pae ra'i i te arehurehura'a i te ava'e o Tema ra (ia Novema). O te tau ia o te o'e.

A tahi matahiti, e rua tau i teie tai'o.

These are the kingly periods observed by Tahitians. They are Matari'i-i-ni'a (Pleiades-above) and Matari'i-i-raro (Pleiades-below). When the Pleiades first sparkles in the horizon towards the constellation of Orion's belt in the twilight of the evening, in the month of Temâ (The-clearing), on November 20th, they are the forerunners of the season for plenty. Matari'i-i-ni'a is then the season, until these little stars descend below the horizon in the twilight of the evening, in the month of Au-unuunu (Suspension), on the 20th of May. That is the ending of the season of plenty.

Matari'i-i-raro is the season beginning in the month of Au-unuunu (Suspension) in May, when those little stars disappear below the horizon in the twilight of evening, until they sparkle again above the horizon, in the twilight of the month of Temâ in November. This is the season of scarcity.

One year has two seasons according to this reckoning.

(Henry 1928:332)

According to Henry, this account was provided by Pomare II in 1818, five decades after first European contact. Quite apart from its inclusion of the English words Mê (May) and Novema (November), it is clear, from other evidence, that the precise calendrical dates given in this text for the appearance and disappearance of the Pleiades either derived from European influence or were privileged information held only by certain leaders and sages. The evidence in question is contained in a passage from a journal in the LMS Archives:

Last evening, hearing much noise and shouting among the King's people towards the sea side, and enquiring of the cause, were informed that it was on account of the *Mata-ree* which is the Taheitean name for the constellation of Pleiades—for some months back they had had much disputing when the Mata-ree would set before dark, or, to use their phrase, when it would fall, and go to bathe in the sea—one party would have it to be before the death of the last moon, others not, and now knowing that the moon had changed and seen the Mata-ree still above the horizon—they shouted and triumphed over the other party ... though the Taheiteans are no great astronomers—and will not scarcely ever give themselves the trouble of thinking, how the revolutions of the heavenly bodies are performed ... and tho' they have no word in their language to signify a year or compleate revolution of the earth or sun; yet the periodical return of seasons, appearance of the planets, and other remarkable stars is noticed, and pretty exactly known by some few. (Davies, Youl et al., 19 April 1806)

The remaining two kinds of time reckoning followed by the Maohis (a lunar month of twenty-nine nights and an annual cycle based on weather conditions and other conditions affecting fishing) will be described later on; for the moment I return to a question about solar time reckoning that has important implications for ritual.

The Maohis undoubtedly perceived the annual movement of the sun between summer and winter solstices, and they probably noted the associated differences in length of daylight; but how far they went in institutionalizing such observations is open to question. In Moerenhout's view they went quite far.

Evidently impressed with Hellenic parallels, and with alleged parallels in the Marquesas, Moerenhout identified the harvest festival mentioned earlier as year-end or year-closing rite, a farewell to the spirits, or more specifically a farewell to the sun as it began its solstitial descent into the *pō* (1837:I, 518, 523). I noted above that, according to Moerenhout, priests returned to their own marae after the harvest festival and addressed offerings and prayers to spirits, for their eventual fructifying return.³⁷ In addition, he asserted in the same passage that the members of the Arioi cult—considered by Moerenhout to be worshippers of the sun—actually went into mourning during this period, "... suspending all their cult activities and returning to their own places to grieve for the absence of the gods."

One may not be able to go all the way in accepting Moerenhout's specific identification of these events, but the fact remains that the harvest festival as described was followed by a season of relative scarcity, which in many places did correspond by solar reckoning to winter.

On the other hand, and despite many instances of plant-food scarcities during the wintertime in these Islands, public activities by no means came to a halt, as witnessed by accounts of large-scale food-using assemblies during winter, breadfruit-scarce months.³⁸ It is true that the Maohis were farmers and plant-food collectors heavily influenced by seasonal fluctuations in the supply of their staple plant-foods; but it should not be forgotten that they were also animal raisers and, above all, highly skilled fishermen.

DOMESTIC ANIMALS

Pigs

The high value placed by the Maohis upon their pigs is revealed in part in the following legend, recorded by Orsmond in 1825:

Havai'i (Ra'iatea) was really a land for strange things! It was people of that land who produced turtles, fowls, and pigs, all in one family. Those people, a man and his wife, were named Tū-moana-urifa (Dweller-in-sea-of-rank odor) and Rifarifa (Scarred)....

Tū-moana-urifa and Rifarifa had one child who was born a human being, a

son whom they prophetically named Metua-puaa (Pig-parent), and when he had grown up they took him to Porapora, where he married a girl to whom he had long been affianced.

The young couple were very happy together for some time, when one day the young wife teased her husband on having no property in Porapora. So he went to his mother and told her of his grievance, and she replied: "Is that all that troubles you, my son? Do not grieve, but go early in the morning into the woods, and there open wide your mouth, and out of it will rush a multitude of small animals which will be called *pua'a maohi* (pigs; literally, native beasts). Secure them with cord, and proceed at once to make a large pen and a large shed for them. Before nightfall, your work will be done and your pigs will have grown to their full size. Place them in the pen, then go and fetch your wife to see them, and present them to her.

So the son obeyed his mother the following day, and to his great joy he realized all his expectations, and his wife and all her family were delighted with the new animals, never suspecting whence they had sprung. From that litter were propagated all other pigs upon this earth, and they became good food for gods and men. (Henry 1928:380-382)

The Maohis made tools out of pig bones, but their principal use of pigs was for food. The native (pre-European) pig (*pua'a*) of these Islands was described by one early European visitor as being, "... a chaines [Chinese] breed, non of them above Eighty or a hundred pound weight" (Robertson 1948:179). In the opinion of Andia y Varela it was "... a very small breed [but] plump and well flavored" (Corney 1915:272).

Breeding stock introduced by the early European visitors appears to have become quickly dominant, for by 1797 the missionaries were able to obtain a dressed hog weighing 340 pounds exclusive of head and entrails (Wilson 1799:60). By Ellis' time (1817-1823) the native pig had been almost entirely displaced by, or interbred with, European breeds, but, from hearsay evidence, he described the native breed in these terms:

Those originally found there differed considerably from the present breed, which is a mixture of English and Spanish. They are described as having been smaller than the generality of hogs now are, with long legs, long noses, curly or almost wooly hair, and short erect ears. An animal of this kind is now and then seen, and the people say such were the only hogs formerly in Tahiti. It was also said, that they, unlike all other swine, were wholly averse to the mire.... (1829:I, 349)

The native pigs lived entirely on a vegetable and fruit diet; some of their food was obtained through foraging for roots and fallen fruit and nuts, but they were also regularly fed by their keepers. Beyond these few indications there is little known of their regime. Ellis described the habits of the mixed breed hogs of his time in these words: "The hogs now reared are large, and often well fed; they are never confined in sties, but range about in search of food. Those that feed in the heads of the valleys live chiefly upon fruit, while those kept about the houses of the natives are fed occasionally with bread-fruit or cocoa-nuts." (1829:I, 350.) The missionary

Crook recorded in March of 1821 that “King” Pomare had ordered some of his subjects to round up all pigs “that run in the mountain & whose owners are unknown” (Journal, 15 March 1821, LMS Archives)—and hence it would appear possible to distinguish three kinds of pigs: domesticated ones with known owners, semidomesticated ones of unknown ownership, and wild, feral ones. G. Forster provided some additional details:

On this walk we saw great numbers of hogs, dogs, and fowls. The last roamed about at pleasure through the woods, and roosted on fruit-trees; the hogs were likewise allowed to run about, but received regular portions of food, which were commonly distributed by old women. We observed one of them in particular, feeding a little pig with the sour fermented bread-fruit paste, called *mahei* (*mahi*); she held the pig with one hand, and offered it a tough pork’s skin, but as soon as it opened the mouth to snap at it, she contrived to throw a handful of the sour paste in, which the little animal would not take without this stratagem. (1777:I, 377)

On this same excursion G. Forster witnessed a puppy being suckled by a woman:

We were witnesses of a remarkable instance of kindness, when we saw a middle aged woman, whose breasts were full of milk, offering them to a little puppy which had been trained up to suck them. We were so much surprised at this sight, that we could not help expressing our dislike of it; but she smiled at our observation, and added, that she suffered little pigs to do the same service. Upon enquiry however, we found that she had lost her child, and did her the justice amongst ourselves to acknowledge that this expedient was very innocent and formerly practiced in Europe. (1777:I, 378)

According to Ellis, unless the pigs of his era were well fed they could be very destructive to native gardens. Sometimes owners broke their pigs’ teeth to keep them from biting through fences; another method for keeping them out of fenced-in areas was to yoke them:

... sometimes the natives ... put a kind of yoke upon them; which, in some of the islands of the Pacific, is rather a singular one. A circular piece, as large as a shilling or a half-crown, is cut out of each ear, and when the wound has healed, a single stick, eighteen inches or two feet long, is passed through the apertures. This wooden bar lies horizontally across the upper part of the pig’s head, and, coming in contact with the upright sticks of a fence, arrests his progress, even when he has succeeded in forcing his head through. (1829:I, 350)

It is not wholly clear from this passage whether the custom here described was actually practiced by the Maohis. For that matter, neither can one be certain whether the conditions described by Ellis obtained in pre-European times as well.

There is some evidence for supposing that as elsewhere in Oceania the native domestic pig was a more docile, stay-at-home breed, and that its tendency and ability to roam widely and break into fenced gardens was increased only through the addition of larger European strains. The

following text suggests that the Maohi pig was not always docile, but it also indicates that recalcitrance was an unusual occurrence, requiring special explanation:

The boar was a shadow of 'Oro-tauà (Warrior-at-war) as the man-slaying god;^[39] it was 'Oro-pua'a-mahui ('Oro-the pig-revealing-secrets). When a gentle, domesticated boar got possessed, it was known that 'Oro was dwelling in him; that pig could devour a man. Pointing upwards to the sky was one jaw, and pointing downwards to the earth was the other jaw, which was the sign that the mouth of 'Oro was open ready to consume the king and his clans. That pig became very fierce, a great power in itself in the land. (Henry 1928:383)

I cannot imagine that even a most tractable animal would pass up an opportunity to root in an accessible planting of taro or potatoes or yams, and this raises a question that is familiar to students of Pacific island societies: Why do some peoples fence in their gardens, others fence in their pigs, and still others do neither? An answer to this question with respect to the Maohis would provide some valuable clues concerning their "economics" in a very broadly defined sense. Unfortunately, such an answer is not forthcoming, for we have very little data on either Maohi fencing or on the habits or management of their pigs, except that on occasion they treated them as pets.

In any case, despite a report of "... multitudes of hogs, which breed rapidly ...,"⁴⁰ the demand for pigs usually far exceeded the supply—a fact all too evident to the European captains, who were at pains to obtain pork for their meat-starved crews:

Tho they seem to esteem flesh very highly yet in all the Islands I have seen the quantity they have of it is very unequal to the number of their people, it is therefore seldom used among them. Even their most principal people have it not every day or even week...." (Beaglehole 1962:I, 343)

They kill their hogs very seldom, perhaps only on certain solemn occasions; but at those times the chiefs eat pork with the same unbounded greediness, with which certain sets of men are reproached at the turtle-feasts in England; while the common sort rarely, if ever taste a little bit, which is always held as a great dainty among them. (G. Forster 1777:I, 315)

In view of the Islands' year-round abundance of the kinds of food eaten by pigs, this degree of scarcity is somewhat puzzling. One factor may have been the wars and forays so particularly prevalent during the Early European Era, for fighting was nearly always accompanied by destruction and looting. On the other hand there are suggestions of remarkably speedy recovery, in terms of numbers of pigs as well as of other necessities and luxuries of life.⁴¹

The methods of owning and rearing pigs reported by G. Forster and by Banks are particularly relevant to our concerns, although such reports are undoubtedly oversimplified and somewhat ambiguous:

Notwithstanding this [the fact that only “chiefs” enjoy the privilege of eating pork with any frequency], all the trouble of breeding, bringing up, and fattening the hogs is allotted to the lowest class of people. (G. Forster 1777:I, 315)

... some of them [their “most principal people”] had piggs that we saw quarterd upon different Estates as we send Cocks to walk’s in England; when any of these kill a hog it seems to be divided almost equally among all his dependands himself taking little more than the rest. (Beaglehole 1962:I, 343–344)

I hope to render these fragmentary passages more intelligible in the course of presenting generalizations about Maohi society.

Cook’s account of the butchering and baking of a pig is the best available:

One of the Hogs I order’d to be immediatly Kill’d and dress’d for dinner, and attended my self to the whole operation which I shall discribe; the first thing was to Strangle the Hog which was the work of 3 men, the Hog being placed upon his back two of them laid a pretty strong Stick a cross his throat and press’d on each end with their whole weight, the third Man held his hind legs kept him on his back and plug’d up his backside with grass, in this Manner they held him for at least 10 minutes before he was quite dead and in the mean time some hands were Employ’d making a fire to heat the oven, which was close by; as soon as the Hog was quite dead they laid it on the fire and Burnt or singed the hair so that it came off with almost the same ease as if it had been scalded, as they got the hair off one part a nother was applied to the fire &c till the whole was done, but not so clean but that another operation was necessary, which was to carry it to the Water side and scrub it well [with] Sand and Sandy stones, this took off the Scurf &c which this Operation at the fire wou’d not& as soon as this was done and all the Sand and dirt wash’d clean off in the Water it was brought again to the first place and their laid on Clean green leaves in order to be opened; they first riped up the skin of the belly only and seperated the skin from the fatt which lies between it and the inside flesh which they took out, that is that fatt which covers the belly and is in general as soft as the lard, this was laid on a clean leafe, they than riped open the belly and took out the Entrails which were put into a basket and carried away so that I know not what became of them, but am certain they were not thrown away. The Blood was now all taken out and put into a large leafe, then the Lard which was put to the other fat, the Hog was now washed clean both inside and out with fresh Water, Several Hot stones were put into his belly which was afterwards cram’d full with clean green leaves; by this time, or perhaps before, the Oven was sufficiently heated, what fire remain’d was taken away, together with some of the Hot stones, the rest were left in the bottom of the hole or Oven which was now covered with green leaves on which the hog was laid on his belly, the lard and fatt, after undergoing some washings with fresh Water was put in a Vessel made just then of the bark of Plantain tree, two or three hot stones being put in along with the fat, it was tied up and put in the Oven by the hog as was the blood also prepared in the same manner, round the whole were laid to Bake Plantains, Bread fruit &c then the whole covered with green leaves on which were placed the remainder of the Hot stones and over them more leaves and then any sort of rubbage they could lay their hands upon and lastly finishd the operation by well covering the whole with earth, here it laid two hours and Ten Minutes, then the Oven was opened, the Hog as well as all the other victuals were taken out and laid on green leaves already spread for the purpose on the floor at the one end of a large boat house, such of the Na-

tives who dined with us set down by themselves and we by our selves, that is they were at the one end of the Table and we at the other& the Hog was plac'd before us and the fat and blood before them, which they chiefly if not wholly dined off and said it was *Mona-mona ta*, that is very good and we not only said but really thought the same by the Pork. The Hog weighed about fifty pound, some parts about the Ribs I thought rather over done, but the more thicker parts were excellent, and the Skin which by our way of drissing is generally either hard or tough had by this method a flavour superior to any thing I ever tasted. I have now only to add that during the whole process nothing could be done with more cleanliness. (Beaglehole 1961:422-423)

As noted earlier, pork was in chronically short supply and consequently eaten with some regularity only by certain individuals—that is, by those privileged enough to receive it as “gifts” or tax, or powerful enough to require subordinates to raise pigs for them. But pork consumption was limited also by considerations less directly “economic”—namely, it was eaten mainly by males.

Some writers asserted that pork was forbidden to females in principle, but Morrison’s explanation probably comes nearer the truth (1935:208; quoted earlier in this chapter.) In other words, the point here is an elaboration of the theme mentioned earlier, that women ought not to eat certain foods that have been in physical contact with males—that is, with males who are not members of the females’ own retinue. Morrison’s statement, if interpreted literally, might also be taken to mean that the males whose contact with the pork was to be avoided included only the women’s “male relatives or the Chiefs”; but evidence elsewhere in the sources suggests that the interdiction was broader than that. But even this restriction was on occasion set aside: “Some share of the pork was given to Orea’s wife and daughter, who carefully wrapped it up, in order to eat it apart. Thus it seems, that though the hog was wholly dressed, prepared, and distributed by men, yet this did not make it improper for the women to partake of it.” (G. Forster 1777:II, 145) In this case, moreover, there was no suggestion of the hog having been prepared by men belonging to Orea’s wife’s “retinue.”

Also, many of the women who visited the ships of the Europeans were anything but reluctant to eat the pork offered them, taking care only to insure that their actions were not widely publicized (for example, see Bligh 1789:II, 8). In fact, from such relaxations and “exceptions” as these, the possibility arises that rules restricting women from eating pork may have derived mainly from overall scarcities, with the addition of religiously colored ideas concerning maleness versus femaleness, or sacredness versus secularity, added mainly for purposes of sanction. There is, of course, no conceivable way to prove an historical hypothesis like this, but the fact remains that the most highly esteemed kinds of food generally forbidden to women—pigs, dogs, turtles, albacore, shark, dolphin, whale, porpoise—were among those shortest in supply, either seasonally or year round.

Dogs

Dogs were kept and fattened by the Maohis mainly as a luxury food, for themselves and their gods. In G. Forster's words, the local breed were "... short, and their sizes vary from that of a lap-dog to the largest spaniel. Their head is broad, the snout pointed, the eyes very small, the ears upright, and their hair rather long, lank, hard, and of different colors, but most commonly white and brown. They seldom if ever barked, but howled sometimes, and were shy of strangers to a degree of aversion." (1777:I, 378; see also Corney 1915:287) Maohi dogs are described elsewhere as having been "... the ugliest & most stupid of all the Canine tribe, ..." (Beaglehole 1962:I, 108), and Ellis added that they were "... by no means ferocious; and excepting their shape and habits, they have few characteristics of the English dog: this probably arises from their different food ..." that is, vegetables, coconuts, and fruits (Ellis 1829:I, 351).

The more experimental European visitors found baked dog flesh excellent fare, something like lamb; it was apparently greatly esteemed by the Maohis also, but so scarce as to be reserved for privileged individuals (males, of course) and special occasions. According to the passage from Ellis cited above, "... dogs do not appear to have been reared for food so generally as among the Sandwich Islanders; here they were fed rather as an article of luxury, and principally eaten by the chiefs."

Banks' journal provides the fullest available description of the Maohi manner of cooking dog flesh, which differed in no important respect from the baking of pork (Beaglehole 1962:I, 292-293).

The tail hair of dogs was used in making wigs and ceremonial breastplates (*taūmi 'gorget'*). Dog bones were made into tools, and dog teeth into fishhooks.

There is no evidence that dogs were used in hunting, and there is only one reference to their "service" to men: The dog was the shadow (*ata*) of the spirit, To'a-hiti. The sound (*'aoa*) made by the dog was helpful; it provided [warning] protection to man (adapted from Henry 1928:383).⁴²

The dog-loving Englishmen were greatly puzzled by what they considered the Maohis' ambivalent treatment of their dogs. On the one hand the natives ate them, apparently without regret, and kept them hobbled in what certainly must have been a most painful fashion, with one front leg tied over the back of the neck. (Wallis, in Hawkesworth 1773:I, 231). On the other hand they treated them as beloved pets, as the following fragments indicate:

The dogs in spite of their stupidity, were in high favour with all the women, who could not have nursed them with a more ridiculous affection, if they had really been ladies of fashion in Europe. (G. Forster 1777:I, 377-378)⁴³

We are at present surrounded with a great number of useless mischievous dogs, which the natives kiss and hug as much as they do their children, and call them good property and good food. (Jefferson, Journal, 4 March 1800, LMS Archives)

Lost a young kid last night by a neighboring dog that has done much mischief in destroying the goats ... This morning he [Br. Nott] & br. Eyre went to the house and spoke to the woman that the dog belonged to, informing her (as she had been informed before) the mischief it kept doing, and insisting it be killed. It was a long time before she consented to it, and wept, bewailed, hugged & kissed it as if it had been an only child. However, at last she agreed to its death, and some of the family killed it, but in a very strange & singular manner, the brethren believe, for they would not let them see how it was done, tho' they saw it dead. The woman talked of placing it upon a bier close by the corpse of her husband, after the country manner of burying those they love. (Jefferson, Journal, 6 February 1801)

In connection with the last kind of incident, Forster reported having seen a marae for dogs, which he took to be a special burial place for those animals (Beaglehole 1961:419).

Chickens

The Maohis reared fowls in what Ellis called "great numbers" (1829:I, 351)—the hens mainly for eating, the cocks for sport-fighting. Some Europeans found the former tougher and inferior in flavor to English fowl, but there is little information about the practices of rearing or about the actual numbers and distribution of such fowl. Henry provided a detailed statement about the rearing of fighting cocks which I quote in chapter 10.

Of direct relevance to our interest is the following legendary episode collected by Orsmond in 1825 from a priest of Porapora; the part of the legend concerning pigs was quoted earlier, so I give here only the part dealing with chickens and turtles:

While they [the legendary couple Tumoanaurifa and Rifarifa] were on a visit at the Island of Pupua (Honden Island, Tuamotus), turtles were born to them and went out to sea; and in due time those turtles propagated their young throughout the groups, frequenting sandy, low islands, in preference to others for laying their eggs. When Tû-moana-urifa and his wife returned home to Havai'i, they produced a family of chickens, which prospered and were let to go into the woods, and from them the wild fowls of all the islands are descended.

It happened when the world was new, that a turtle and a fowl had a dispute, one contending for the prestige above the other, when the turtle said to the fowl: "You are common, you will be eaten by women and children, but I shall be sacred to the gods, I shall leap into the god's house." The fowl answered scornfully, "How can you leap into the god's dwelling? You will yourself be eaten by women and children, but I shall dive into the depths of the sea and escape from their hands."

Just then the turtle was picked up by a strong man and taken to the king, who was so pleased with it that he sent it to the marae for the gods, and thus the turtle was ever afterwards held sacred for the gods and was only eaten by kings, priests, and marae keepers. But as the fowl tried to dive into the sea for safety, it only succeeded in getting its head under water, when a party of women and children passing by went and seized it and took it home. So the fowl became a domestic animal and was eaten by women and children. Only white fowls were

offered to the gods at the marae, because all white birds were regarded as sacred. (Henry 1928:380-381)

Rats

The native rat (*'iore mā'ohi: Rattus exulans*) was a small brown animal that lived mainly on fruits and vegetables. By all accounts these animals, quite tame and imperturbable, infested the Maohis' settlements in swarms. The Maohis, just as imperturbably, protected their edibles from rats by means of baffles but seemingly made no effort to destroy the rats or drive them away. Unlike some Polynesians, Maohis are said to have abhorred the very idea of eating rats.⁴⁴

No specific reason has been offered for the Maohis' abstention from eating rats, or for Maohi tolerance of the evidently troublesome presence of rats; perhaps it derived in part from their belief that the animals were "shadows" (*ata*) of ghosts:

When it visited people at night and uttered strange sounds with its tongue or scratched the thatch inside the roof of the house until daybreak, it was communicating mysteries and reminiscences of war and times of peace from dead warriors to living men. But when it approached a sick bed articulating strange sounds, it was the shadow of a devouring ghost announcing the near approach of death to the patient. (Henry 1928:383)

HUNTING

Ellis said of the Maohis that "Their country was little adapted for hunting, and the only quadrupeds they ever pursued were the wild hogs in the mountains ..." (1829:II, 291).

After Europeans arrived on the scene some Maohi chiefs sent their subjects into the mountains to kill or capture wild pigs for barter with the visitors. Prior to that pigs were hunted, but perhaps as much for sport as for food, plus, of course, the occasional killing of marauding semi-wild pigs by irate gardeners. An example of hunting pig for sport, or as a feat of strength and courage and skill, is seen in the legend of Rata, whose chiefess mother hit upon a boar hunt as a way of selecting men to take part in a dangerous mission overseas:

Now this is what I have to say: because our land is replenished with people, let us have a boar chase, dividing the clans, having Hiti-uta and Hiti-tai on one side and Pe'eai and Papa-honu on the other. Then you will chase the boars, and we shall thus test the courage of the men of the different clans, so as to choose those who will be capable of action in going to the islands of Pu'a-tû-tahi, Hiti-tautau-mai, Hiti-poto, Hiti-tautau-atu, and Hiti-au-revareva that rises to the sky. Such men can lay hold of the foes in the ocean, and even on the demons of the island of Hiti-marama. But if there be no capable men, we shall remain in this land and abandon the project of going. (Henry 1928:477)

Birds were hunted both for feathers and, occasionally, for food. Morrison provided a vivid description of one kind of situation in which they were deliberately hunted for food:

When they Go into the Mountains, which they often do in Companys to Cut Timber, Gather Herbs & sandal wood for their Oil, Cut rafters for their Houses, Paddles for Canoes, &c. and for the Purpose of dying Cloth which takes them up several days, they subsist themselves on Birds, fish &c. Using the Mountain Plantain and Wild Roots for Bread, the land producing plenty of Birds and the Springs plenty of Fish& they catch the birds by fixing the Gum of the bread fruit on long Bamboos, and setting them up, take the Birds which perch on them as we do with Birdlime; others who are used to this Method of living can with much exactness knock them down with a stone which they throw by hand, pointing at the Bird with the fore finger of the left hand, as it were to take Aim while the Stone is prepared in Right and if the Birds are sitting they seldom fail to bring it down but cannot bring one off the Wing—and when a party go into the Mountains on any of the aforesaid occasions their first Care is to send a party in Search of Provisions (as they never Carry any with them) while others erect huts for their lodgings made of reeds and Covered with the leaves of the Tee and others procure fire and fuel—as they seldom take the trouble to Make an Oven they roast their roots & Plantains and dress their fish or Birds in Peices of Green Bamboos. The provisions, being put into the Bamboo and stopd up with leaves, is laid on the fire and kept turning round like a spit till the Contents are sufficiently dresd, the Moisture inside keeping the bamboo Wet it keeps its form tho burnt nearly to peices—In this Manner they live when on these excursions and tho they have hard labour in hand they turn the work into pleasure, and taking no thought for tomorrow they leave off & return when they think Proper. (Morrison 1935:217)

In another account, by the Spaniard Gayangos, some inhabitants of Maupiti are said to have traveled occasionally to uninhabited Mopelia Atoll—a two-day trip—to capture (flightless) boobies and noddies for food (Corney 1915:193). Another fragment of evidence that the Maohis occasionally hunted birds for food is found in the following passage:

Beneath [the shelter of a fern called *fare-rupe* 'mountain-pigeon-house'] the hunters of the *rupe* (mountain-pigeon) used to conceal themselves, holding to view a tame *rupe* and imitating its cry, like a man shouting, "Ho! ho!" Then the wild bird would gradually approach the tame one, until it came into the range of the man's hand and was caught. (Henry 1928:64-65)

Inasmuch as the feathers of the bird in question are not reported to have been especially valued, one is perhaps justified in assuming that the bird was hunted mainly for food. Thus the Maohis did indubitably eat wild birds on occasion, but most of their bird hunting was for feathers.

The tail feathers of the tropic bird, so highly valued for decoration, were sometimes found in the mountains on the ground under trees, where these birds rested at night (G. Forster 1777:II, 91-92), but most of these feathers were obtained by capturing the birds themselves:

As they are very fond of the Tail feathers of the *Tropic* Birds which they esteem for dressing their Parais or Mourning dress they go two together to Hunt for them and as the birds build in the Face of the highest Cliffs they are at Much trouble to get them. Their Method is this—the Bird catchers are provided each with 10 or 12 fathoms of Rope of sufficient strength to bear His own Weight, & having fixd their place of abode near the Clift, where provisions are in the greatest plenty they proceed together to the top of the Cliff, where bending their ropes together they make fast a stick of 18 or 20 inches long by the Middle and lower it over the face of the Cliff having a Stake fixd to Make it fast to on the top; if a Tree is Not Convenient, one hand then stays by the rope to haul up or lower down as the other shall order who goes down & seating himself on the Cross stick, swings from hole to hole in search of the Birds, holding on by the points of the stones which project or the shrubbs which grow among the fisures of the Cliff—when he catches a Bird, he hauls out the Tail feathers which he secures in a Bamboo which he carries for the purpose, and lets the Bird fly—having examined all the holes within his reach or is tired in the search he goes up and either shifts the rope to another part or attends it for his partner who takes a spell. This tho it may appear Dangerous to us is no more to them then Amusement, and seldom attended with any Accident tho they hang some hours in this manner, sometimes 20, 30 or 40 fathoms from the top & often four times that from the Bottom and perhaps do not get a single feather in a whole days search. (Morrison 1935:217-218)

We are also indebted to Morrison for a vivid description of the Maohis' method of obtaining the prized feathers of the man-o'-war bird:

The Shining Black feathers of the Men of War Birds they also hold in high Esteem, for which reason they always watch their Coming as they Seldom Visit this Island except when the Westerly Winds and thick Weather prevail—they afford diversion for Numbers as they are only to be caught at the Beach, or When it happens to fall Calm when they perch on the Cocoa Nut trees, and are Caught[t] by a snare fixd to the end of a long stick with which a man goes up and puts the Noose over the Birds Neck while it is asleep, which is in a few Minutes after it lights, and letting the stick go, it brings the Bird to the ground—While they keep on the Wing they entice them down by a Fish into which they thrust a piece of Poorow to float it, and throw it into the Water keeping it within reach of their Wands, of which each Man has one of 14 or 16 feet long; as soon as the Birds observe the Fish they instantly make towards it, sometimes 8 or 10 together, and the Men stand by and knock them down as they attempt to seize the fish, which they all attempt to do. If they do not receive a Blow before they get near enough, these Birds always seize their prey in their Claws, which are long and sharp and Webbd only to the first Joint—they are Inhabitants of the low Uninhabited Islands in the Neighbourhood of the Society Islands, and never come from home but in thick weather, their Feathers are held in Such Esteem that the Natives will give a hog of 100 Weight for one of them for Making their War & Heiva dresses &c. tho they never eat the bird—during our time we shot several which were deemd grand presents, but We thought the Powder of More Value and therefore made but little Waste of it for that use and seldom took that expence diversion—the Cock Birds are the Most Valuable and the Back feathers are those they prize highest for their Beautiful shining Black. (1935:218-219)

Still another method of catching birds (either for feathers or for food) was by smearing a viscid gum onto the limbs of trees where they ordinarily perched.⁴⁵ Also, as noted above, some individuals were capable of bringing birds down from their perches with a well-aimed stone. In addition, there is a single report, by Friar Joseph Amisch, that birds were shot with bow and arrow: "... when in pursuit of birds they use very slender little arrows fashioned of reeds and tipped with hard-wood points (Corney 1915:81)."

Finally, the Maohis obtained some of the rarer and most highly valued feathers used in their religious rituals either by trade from the atolls to the northeast or by actual expeditions to these islands. I can find no historically validated account of any such expedition, but legendary accounts of them are numerous.

In closing this section on bird hunting, I wish to draw attention again to a matter mentioned before, namely, to the widespread intellectual interest in their natural environment shown by the Maohis, quite apart from any tangible utilitarian element present in that environment. Despite the fact that they utilized only a few of the available species of birds for food or feathers (or for navigation and, as we shall see, for aid in fishing), their acquaintance with the kinds and habits of their Islands' bird populations was exhaustive and extraordinarily detailed.

FISHING

Anyone reading the early descriptions of these Islands almost inevitably acquires the impression that the Maohis were rather indifferent farmers and swineherds but ardent and skillful fishermen. Some of this impression may derive from the bias of the European observers—most of them sailors—or from the greater excitement inherent in some types of fishing or from the exotic techniques often employed. (See figs. 9-9, 8-1 and 8-6.) But even discounting these and other extraneous factors, and recognizing that most Maohis may have spent more time cultivating and collecting plant-foods, the probability yet remains that fishing was the most technically developed of their subsistence activities.

In all likelihood it was also one in which they took most pleasure. Indeed, fishing was for them nearer to our Western category of "sport" than to our "toil"—even with all its seeming "drudgery" and strain, and even with, or perhaps because of, its physical hazards:

This kind of fishing was followed not only as a means of procuring food, but as an amusement. The chiefs were exceedingly fond of it, and often strove to excel. Hautea was celebrated for his skill and strength in taking some kinds of fish. Their country was little adapted for hunting, and the only quadrupeds they ever pursued were the wild hogs in the mountains; but the smoothness and transparency of the sea within the reefs, favoured their aquatic sports; and a chief and his men,

FIGURE 9-9. "In the district of Whapiāno (Ha'apaino'o), Island of O'tahyety—Looking toward Matāvai." Watercolor by G. Tobin. Mitchell Library, Sydney.

furnished with their spears, &c. often set out on their fishing excursions with an exhilaration of spirits equal to that with which a European nobleman pursues the adventures of the chase. The more daring of the young chiefs were generally among the foremost in pursuing the shark, or other dauntless fish; while others, more advanced in years, remained in their canoes at a distance, gratified to behold the sport, and share in some degree the excitement it produced. (Ellis 1829:II, 290-291)

Fishing, in general, was also a kind of amusement or recreation for them, whether they fished with a line at high tide, with a net in the lakes or bays, or with spear on the reefs. Nothing was more animated than the departure for one of these excursions by a chief armed with spears and harpoons, accompanied by a number of his subjects, all of which took place amidst a din of noise from the crowd. The chiefs hardly ever went except when fishing was plentiful; likewise, upon their return, each one sought his equal share, and these fishing days were just as much feast days. (Moerenhout 1837:II, 108)

The food resources sought after by Maohi fishermen were extraordinarily varied, and in some instances as plentiful as the seas are broad.

Edible tortoise (*Chelonia mydas: honu*)⁴⁶ frequented the beaches of the motus and atolls. Crustaceans of dietary importance included fresh-water shrimps (malacostracan decapod, 'oura pape), large reef langoustes (*Panulirus penicillatus: 'oura miti*); sand langoustes (*Parribacus antarcticus: ti'ane'e*), marine hermit crabs (*u'a*); numerous other species of crabs; sea centipedes (*Pseudosquilla ciliata: varo*); and sand "beetles" (*Hippa: popoti*). As for the multitudes of echinoderms inhabiting the reefs and lagoons, the Maohis used only urchins for food. Much more widely eaten were the

Islands' molluscs: mussels ('*u'u*), oysters (*tio*), cockles ('*ahi*), and the giant tridacna clam (*pahua*). The reefs and lagoons abounded in gastropods, whose shells were used by the Maohis for numerous other purposes, but of these only turbos (*mao'a*) and vermetos (*ua'o*) were regularly eaten. The most noteworthy of the cephalopods found in these waters were octopuses, which were highly esteemed as food.

Among the mammals frequenting these waters, porpoises ('*ou'a*) were a prized food, as was meat from reef-stranded whales.

But of all the marine animals which the Maohis ate, fish were by far the most important—in quantities eaten and in number of species utilized. In Maohi practice the type of fishing—lake, stream, reef-lagoon, open sea—provided a more relevant classification, but needless to say it is not possible at this late date to subject the surviving data to the kind of investigation that could lead to an "ethnoscience" analysis of this important realm of Maohi cognition. The saltwater fish most generally used were as follows (arranged according to Western taxonomy):

Elasmobranchii: sharks (*ma'o*) and rays (*fai*)

Dipneustii: not represented, or at least not extensively utilized

Actinopterygii: of this large subclass only the teleosts (i.e., fish with bony skeletons) were important. The several orders which figured prominently in Maohi diet were:

Apodes: eels (*puhi*, *āti'i*)

Percesoces: mullets (*aua*, *āha*, *nape*); beloniforms: needlefish (*āāvere*) and flying fish (*mārara*, *manana*, *pai ata'i*)

Catosteomes: "flute-snout" (*aupapa*)

Heterosomes: flatfish (*pati'i*)

Percomorphs: Serranidae (rock cod, *tarāo*; *Lutianus*: *to'au*, *ta'ape*); Mullidae (*āti'ati'a*, *ouma*); Scaridae ("parrot-fish," *pa'ati*); Holocentridae (*ī'ihī*, *araoe*, *apa'i*); Chaetodontidae ("flat-fish," *paraha*, *paraha pe'ue*, *panapana*); Acanthuridae ("surgeon-fish," *maito*, *ume*); Thunnidae (red tuna, '*ahi*; bonito, *atu*; small barracuda, *ti'atao*); Carangidae (*pai here*, *orare/ature*, *ore/ihe rahe*); Scorpaenidae (*nohu tarao*, *nohu pu'a*, *tatareihau*)

Plectognaths ("spring fish"): "hedgehog" fish (*oiri*); 'checker fish' (*mo-moa*); "globe-fish" (*huehue*); "porcupine fish" (*totara*).

The freshwater fish that figured most importantly in Maohi diet were perch (*nato*), eleotrid (*o'opu*), and eel (*puhi pape*).

Factors of wind, rainfall, moonphase, and so forth, along with the reproductive cycles of the marine fauna, influenced the time, place, technique, and size of catch of Maohi fishing; but before discussing these let us itemize the more commonly used fishing techniques.

Fishing Techniques

It is an everlasting pity that there did not happen to be a perceptive and literate fisherman among the early European visitors to these Islands, one able to do full justice to the extraordinary technology and skills developed by the Maohis in exploiting their rich marine resources. Such a man, Charles Nordhoff, appeared on the scene very late, and the description he left of one branch of modern Tahitian fishing is a minor masterpiece, ethnographically and artistically; compared with his account those written about fishing during the era now under study are for the most part superficial and flat. But even from these latter accounts one is struck by the multiplicity of Maohi fishing techniques and by the way many techniques had been adapted to highly particular, localized conditions.⁴⁷

Small nets, sticks, or bare hands were used for collecting crustaceans, urchins, molluscs, and gastropods; and both males and females, walking along the reefs or in the shallow waters of the lagoons, joined in this occupation. Crustaceans, both the small-clawed South Seas lobster and freshwater prawns, were also caught by spearing and trapping. According to Ellis, the Maohis avoided oyster beds in order to prevent cutting their feet on the sharp shells; and they did not eat oysters; but whether due to the hazards of collecting them is not explained (1829:II, 284). The only report that I can find that the Maohis collected and ate sea slugs (*bêche de mer*) is contained in the journal of Tyerman and Bennet, who wrote that it was "... regarded as a great delicacy by the natives" (Montgomery 1832:II, 135). This was recorded in 1822, so it may conceivably have been a recently acquired taste.

Poisoning fish was sometimes resorted to in quiet waters. The bruised leaves of several plants—for example *Tephrosia piscatoria*, *Daphne foetida*, *Lepidium piscidium*—when mixed with bait and scattered over the surface so stunned the fish that they could be collected by hand. Another effective fish poison was the fruit of the *Barringtonia*.

Some men were skillful enough to catch free-swimming fish by hand, particularly the porcupine fish:

They ... are excellent hands at diving after [rock fish] and I have seen a Diver in Clear Water and Calm weather pursue a Fish from one hole in the rocks to another without coming up to breath; but in rough weather they cannot see to follow them, the bottom being darken'd by the ripple on the Surface—the most curious part of this fishery is that of taking the Hedge hog fish and Sea Cat—the one being so full of prickles that they can take hold no where but by the Eyes, which is the Method by which they get them as very few are caught any other way—and the others adhere so close to the rocks, that it is as much as two men can do at times to haul them off and I have seen them in 3 or 4 fathom forced to quit them and come up several times before they could accomplish their end; if a Stone lies handy below they kill the fish there, & then they get it off easy. This may seem an odd Method of Fishing but I have seen it attended with good

Success and the Divers return in a few hours with large Strings of fine Fish. (Morrison 1935:155)

Ellis provided an account of the Maohi version of the widespread South Seas method of capturing octopus by means of lures:

They have a curious contrivance for taking several kinds of ray and cuttle-fish, which resort to the holes of the coral rocks, and protrude the arms or feet for the bait, but remain themselves firm within the retreat. The instrument they employ, consists of a straight piece of hard wood, a foot long, round and polished, and not half an inch in diameter. Near one end of this, a number of the most beautiful pieces of the cowrie or tiger-shell are fastened one over another, like the scales of a fish or the plates of a piece of armour, until it is about the size of a turkey's egg, and resembles the cowrie. It is suspended in an horizontal position, by a strong line, and lowered by the fisherman from a small canoe, until it nearly reaches the bottom. The fisherman then gently jerks the line, causing the shell to move as if inhabited by a fish. This jerking motion is called *tootoofe* [*to'oto'o fe'e*], the name of the singular contrivance.

The cuttle-fish, attracted, it is supposed, by the appearance of the cowrie, (for no bait is used,) darts out one of its arms or rays, which it winds around the shell, and fastens among the openings between the plates. The fisherman continues jerking the line, and the fish puts forth another and another arm or ray, till it has quite fastened itself to the shells, when it is drawn up into the canoe, and secured. (1829:II, 292-293)⁴⁸

Eels inhabited streams, lakes, and sea, and figured prominently in Maohi folklore and myth. Some at least were taken at night, by torchlight and spear; other specific techniques, if any, for taking them were not reported, but Morrison did provide an interesting example of the way in which people allowed their appetite for this delicacy to overcome the hazard involved in eating it:

Among the Fish there Is a kind of Conger Eel of a Brownish Collour with a Green border round the Fins from Head to tail. They are Caught about the reefs and are of different sizes from one to Six feet long; these Fish are of a Poisonous Nature to some and if eaten gives the most excruciating pain while others who eat of it feel no effects nor do the Natives know who will be affected by it, till they have eaten it. As they have a remedy for it they take no account of the matter and eat them at a venture. I partook of one of these Fish without feeling the smallest effects from its poison, while another who eat of the same Fish was almost raving mad, His Body and limbs swelled to a very extraordinary degree and Covered with red blotches and at the same time the Hands & feet itching in Such a Manner as to be unsufferable and burning as if on fire, the Eyes swelled and fired and to appearance fit to start from the Sockets, this Continued with short intermissions for Eight Days but in the Course of a Week more by the assistance of some of the Priests who procured Medicines he got quite well, but often found a great itching in the Palms of the Hands & hollow of the feet—These Fish are Called by the Natives Puhhe Pirrerowtee [*puhi ai roto*] and as they dont know the Good from the Bad they are loth to throw them away and therefore eat them to make sure of them—(1935:159)

In this connection, Ellis described a curious custom of eel “domestication”:

Eels are great favourites, and are tamed, and fed till they attain an enormous size. Taaroarii had several in different parts of the island. These pets were kept in large holes, two or three feet deep, partially filled with water. On the sides of these pits, the eels formed or found an aperture in a horizontal direction, in which they generally remained, excepting when called by the person who fed them. I have been several times with the young chief, when he has sat down by the side of the hole, and by giving a shrill sort of whistle has brought out an enormous eel, which has moved about the surface of the water, and eaten with confidence out of his master’s hand. (pp. 285–286)

No explanation was offered concerning whether the ultimate end of such eels was as food, as pets, or as creatures in which to embody a spirit-familiar.

Turtles were occasionally found in the lagoons of the high islands but inhabited mainly the waters around the isolated western atolls. According to Nordhoff, they were “formerly” taken on a hook with a bait of seaweed (1930*b*:223); how else they might have been caught we cannot say. Turtle shell was used for making fishhooks and ornaments, and turtle flesh was considered a great delicacy. Ellis stated that turtles were considered “sacred” and that their flesh was cooked only within marae precincts (p. 285). Such flesh was reserved for certain “principal people” as was indicated in the legend of the turtle and the fowl, reproduced earlier in this chapter.

Whales were not hunted at sea, but when one became stranded in shoal waters or on a reef men went out in canoes and killed it—a dangerous adventure inasmuch as “... they sometimes get their Canoes dashed to pieces” in doing so (Morrison 1935:159).

Before proceeding to describe the more conventional fishing methods employed by the Maohis, I reproduce Ellis’ account of catching needlefish on Huahine’s large saltwater lake—another example of a highly specialized technique based on local conditions and on sound knowledge of the prey’s characteristic behavior:

They have a singular mode of taking a remarkably timorous fish, which is called *au* or needle, on account of its long sharp head. The fishermen build a number of rafts, which they call *motoi*; each raft is about fifteen or twenty feet long, by six or eight wide, and it is made with the light branches of the hibiscus or purau. At one edge a kind of fence or skreen is raised four or five feet, by fixing the hibiscus poles horizontally, one above the other, and fastening them to upright sticks, placed at short distances along the raft. Twenty or thirty of these rafts are often employed at the same time, the men on the raft go out at a distance from each other, enclosing a large space of water, having the raised part or frame on the outside. They gradually approach each other till the rafts join, and form a connected circle in some shallow part of the lake. One or two persons then go in a small canoe towards the centre of the enclosed space, with long white sticks, which they strike in the water with a great noise, and by this means

drive the fish towards the rafts. On approaching these, the fish dart out of the water, and in attempting to spring over the raft, strike against the raised fence on the outer side, and fall on the surface of the horizontal part, when they are gathered into baskets, or canoes, on the outside. In this manner, great numbers of these and other kinds of fish, that are accustomed to spring out of the water when alarmed or pursued, are taken with great facility. (pp. 287-288)

The Maohis were expert in the manufacture and use of nets of many sizes, shapes, and uses. Their small hand scoop nets have already been mentioned. Ellis provided a brief account of the use of cast nets: "Their light casting-nets were neatly made, and used with great dexterity, generally as they walked along the beach. When a shoal of small fish appeared, they would throw the net with the right-hand, and enclose sometimes the greater part of them." (p. 288) Such nets were either square or round, and were usually made of line, having meshes of various dimensions. The small fry thus netted was sometimes eaten, but it more usually served as bait.

In his study of modern Tahitian fishing, Handy reported having seen deep two-man bag nets used for fishing along the reefs, and small shallow landing nets of various sizes, shapes, and purposes (1932:84ff); and, while the older accounts provide no details about such implements, it is highly likely that similar forms of nets (but not similar materials) were made and used in pre-European times.

To European observers the most impressive of Maohi nets were the large seines, some of them thirty to forty fathoms long and twelve fathoms deep. The cord of the best of these was made of *Ficus prolixa* bark and had meshes about four inches square. The bottom edges of such nets were weighted with stones wrapped in coconut fibers, while the top edges were held afloat with short pieces of dry hibiscus wood. (Ellis: pp 289-290) Ellis also provided an account of the manufacture of such a net. While the event witnessed by him took place after the "official" capitulation of "paganism," and hence was devoid of the more public incidents of native religious ritual, the rest of the episode has the marks of pre-Christian authenticity:

Upea [*upea*] is the common name for net. The *upea ava*, or salmon net, is the longest and most important, and is seldom possessed by any but the principal chiefs; it is sometimes forty fathoms long, and twelve or more feet deep. One of this kind was made by Hautea, the governor of Huahine, soon after our arrival. Although the former pagan ceremonies, and the offerings at the marae, were discontinued, some of the ancient usages were observed, one of which appeared rather singular. As is customary on all occasions of public work, the proprietor of the net required the other chiefs to assist in its preparation. Before he began, two large pigs were killed and baked. When taken from the oven, they were cut up, and the governor's messenger sent with a piece to every chief; on delivery, the quantity was stated which each was desired to prepare towards the projected net. If the piece of pig was received, it was considered as an agreement to furnish it; but to return it, was, in effect, to refuse compliance with the requisition. At this time, however, no

one returned the *tarahu*, or price, but all agreed to furnish one or two fathoms of the net. When any other chief wanted a net, he took the same course. (p. 289)

Seining was carried out mainly in the shallow waters of lagoons. In some instances men working from canoes enveloped the prey by dragging together the wings of the net. In other instances the seine nets were fixed in a wide V—with or without a bag left in the inner angle—and the fish were driven into the narrow end by swimmers or by men in canoes who beat the waters with long sticks or with heavy stones. (See Bouge 1928; Beaglehole 1955:133)

Once trapped within the closed nets the fish were taken either by hand or by hand net or by spear. Here is Morrison's description of such events:

These large ones [seines] have a bag or Cod in the Middle and when they haul them in Deep Bays they never land them till they are done fishing, but cast off the Cod on the outside of the surf, and bring the Fish on Shore in their Canoes when they haul the Sein into a Canoe and having laced on the Cod Shoot it afresh; in this Manner they Catch a great Number of fine fish and some turtle. While they are fishing in this manner the Net is always surrounded by Swimmers who dive down and secure such fish as are like to escape and tho the Sharks often attend them yet they seldom interrupt their work and if they Catch the Sharks in the Surf they Surround them and force them on shore, which is so far from being deemd dangerous that it is Counted fine Sport—the Sharks here are not very large seldom exceeding five or Six feet in length—with their Small Seines they Catch the Flying fish having Small Canoes for that purpose which will Carry two men; the seines for this purpose are 15 or 20 fathom long, and 9 feet deep; these they Shoot amongst the Fish and Splashing the water about with their paddles frighten the Fish till they dart into the Net and Mash themselves, they then haul in their net and take out the fish, and following the School shoot it afresh; as they fish for them for Bait for the Dolphin they frequently take the Night for it and Choose the Dark in preference to the Moon light when the fish cannot see to avoid the Nets—in Calm Weather they follow the School with a number of Canoes and Surround them with their Nets in a Circle and having drawn them into a small Compass make the Canoes fast to the Nets and Jump overboard, diving under the Nets and Seizing what fish they Can by hand and frequently bring up one in each hand besides what get Mash'd in the Nets, the fish being prevented from rising by the Sight of the Canoes, and keeping Close together never attempt to escape till the men come among them. (1935:154-155)

Some indication of the size of catch obtained by use of nets was given by Rodriguez:

In the afternoon I went out in quest of fish, and they gave me more than an *arroba* weight of scad, which is the most plentiful kind of fish in the harbour without going outside the reef; for, in three casts of the net, which is a very large one, they got more than sixteen *arrobas* of scad, insomuch that ten men did not suffice, between them, to haul in the purse. (Corney 1919:101)⁴⁹

Morrison described a kind of drag fishing carried out in the shallower waters of lagoons:

.... when the Fish comes into the Shoal water to spawn they get a quantity of Cocoa nut leaves from which they take the Stems and tying them together, twist them the inside forming a kind of rope with the leaves all round it this they Call Row [*rau*, leaf] and with this they Sweep the reefs & Shoal Water and bring whole Schools of Fish to the Beach where they apply their small Seins and lade Nets to land them. (1935:155)

Handy (1932:106-107) provided a detailed description of modern drag fishing (*rau ere*) which appears to be identical to the type described by Morrison. Morrison also provided a description of drag fishing in streams:

In the rainy season they Catch large quantities of Small Fry at the Mouths of the rivers by means of a large bag made of the Membranous Stratum of the Cocoa Nut tree sewed together, the Mouth of the bag being made with two Wings to Spread the river; they place it and lay stones on the lower part to keep it down, they then sweep the river with a Row and bring all the Fry into the Bag; and in this Manner get several Bushells at a haul, in the Mean time the Weomen have their part of the Fishery and each being equipt with a bag & a Basket, form themselves into three or four lines across the river up to their Middle, and keeping the lower part down with their feet hold the upper part in their hands alternately searching it and putting the Fish into their Baskets till they are either tired or Satisfied, when they leave off and go home to Dress them. It is No disgrace for any woman to be thus Employd and if the Queen is present she generally makes one and they are Generally paid for their labour with Good Sport and plenty of Fish. (pp. 155-156)

Some nets represented immense amounts of work and, with patching, lasted for years. Others were put together quickly for a season's use, such as the net roughly made out of hibiscus bark, designed to catch '*operu* (*Decapterus pinnulatus*) during their seasonal visits inshore. The meshes were wide enough for these small fish to swim through, and served mainly to herd them together until they could be taken by net or spear.

Weirs were constructed with stones, coral, wood, leaves, nets, or combinations of these. Some of them were permanent structures erected at strategic positions in the lagoons; others were put up for seasonal use at stream mouths or in stream beds. The most notable weir of the Islands was at Maeva, in northern Huahine, where a shallow salt lake is joined to the sea by a long and narrow lagoon entrance (fig. 9-10). There the Maohis built a series of stone and coral weir traps so arranged as to trap the fish carried in or out of the lake by tides and winds. It was undoubtedly this circumstance—of a nearly automatic, regular, and abundant food supply—that served to make this place the largest population aggregation and major political center of all Huahine.

According to Handy, the only structures that might be called "fish ponds" (*āva i'a*) were a few temporary enclosures, made mainly of wooden stakes and used for containing '*operu* when they were caught in large numbers, and the small stone rectangular enclosures built along the lake shore at Maeva to hold fish taken from the stone weirs there (1932:93-94).

FIGURE 9-10. Stone fish trap at Maeva, Huahine. Photo by Y. Sinoto, Bishop Museum.

A wide variety of spears, varying in length, weight, and type of point, was used by the Maohis for catching fish. Some points consisted only of the sharpened end of the shaft itself; in other cases separate wooden (or bone) spearheads—from two to twelve or so, the number varying with intended use—were attached to the shaft.

Some spears were designed for jabbing while swimming, others were thrown from canoes, or hurled while the spearmen were standing in the water or on the reef or on shore. One very difficult but occasionally very rewarding technique was for the spearman to stand on the outer edge of a barrier reef and aim for the large fish brought in by the breaking waves. As there was no cord attachment, spearmen had to retrieve their spears by swimming after them. Moerenhout related that the Maohis took great delight in spearfishing and were continually practicing to improve their skills in order to surpass each other (1837:II, 105).

According to Ellis, some spearmen threw with great accuracy while others were very awkward at it (a useful observation to counter widespread beliefs that all Polynesians were by nature adept in all their arts). We are also indebted to Ellis for a vivid description of fishing by torchlight:

... a variety of ... methods of fishing, are pursued by day-light; but many kinds of fish are taken by night: sometimes the fishery is carried on by moon-light, occasionally in the dark, but fishing by torch-light is the most picturesque. The torches are bunches of dried reeds firmly tied together. Sometimes they pursue their nocturnal sport on the reef, and hunt the *totara*, or hedge-hog fish. Large parties often go

out to the reef; and it is a beautiful sight to behold a long line of rocks illuminated by the flaring torches. These the fishermen hold in one hand, and stand with the poised spear in the other, ready to strike as soon as the fish appears.

In the rivers they also fish by torch-light, especially for eels; and though the scene is different, its impression is not inferior. I have often been struck with the effect of a band of natives walking along the shallow parts of the rocky sides of a river, elevating a torch with one hand, and perhaps a spear in the other; while the glare of their torches was thrown upon the overhanging boughs, and reflected from the agitated surface of the stream. Their own bronze-coloured and lightly clothed forms, partially illuminated, standing like figures in relief; while the whole scene has appeared in bright contrast with the dark and almost midnight gloom that enveloped every other subject (1829:II, 297-298)

Hook-and-line fishing was carried on both inside the lagoons and in the open sea. (Figs. 9-11 through 9-16) One procedure involved a long bamboo rod and a hook (of unspecified nature) baited with breadfruit; the fisherman stood in the water up to his neck to cast. Lagoon fishing was sometimes done with rod and line from the inner margins of the barrier reefs, or with handlines from stationary or moving canoes. But of all their methods of fishing the Maohis were at their best, at least with respect to individual skill, in the vigorous and often dangerous art of offshore fishing. In their quest for albacore, bonito, dolphin, shark, swordfish, and other pelagic fish they worked singly or in groups, sometimes staying out for days at a time.

The offshore fishing of latter-day Tahitians found a worthy reporter in the person of Charles Nordhoff, one of the fictionalizers of the *Bounty* mutiny and himself a knowledgeable and enthusiastic fisherman. The events described by Nordhoff occurred in the 1920s, but in many respects resemble so closely those recorded a century and more earlier that one may perhaps be forgiven for referring to them, to enliven the accounts of the earlier chroniclers. The durability of so many of these fishing practices through a century and a half of radical change in so many other areas of Maohi life might move one to marvel, until the thought occurs that the Maohi methods may indeed have reached perfection and the fishing techniques worked out over centuries of experimentation with the complexities and local particularities involved in these fisheries had demonstrated that they could not be improved upon.⁵⁰

The pelagic fish most pursued by the Maohis were dolphin, albacore, and bonito. Others, such as cavally, swordfish, and shark, were also caught and gladly eaten; but one gets the impression that catching the latter was somewhat incidental to fishing for the former—possibly because bonito, dolphin, and albacore swam in larger schools and thus when located offered the opportunity for bigger catches.

The dolphin of these waters are of two kinds, *Coryphaena equisetus* (*mahimahi tari'a*) and *Coryphaena hippurus* (*mahimahi*). The latter runs

much larger—one hundred pounds or more—and was the kind systematically fished for. Morrison described this fishery as follows:

They always fish for Dolphins four or five leagues from the land in sailing Canoes plying to windward—when they reach their distance they Bait with Flying Fish, and are very fond of Iron hooks;^[51] their lines for these Fish are generally two strands and of a Good length, some of them Measure 100 fathoms. They Choose the two Strand lines as they are less apt to get foul by Twisting then those of three and as the Dolphin Jumps and twists about when hookd they are not so ready to breake and easier Cleard after running out; they never wet their lines till they see a Fish and then they make sure of it, tho they are often deceived; as the Fish will sometimes leave part of their Jaws behind them if too Suddenly Stopd in their Car-reer, they are forced to play them some time before they haul them alongside to get them in, which they always do by laying hold of the tail part with one hand & the line in the Other; the Canoe being low for that Purpose—These fish Follow the Sun and are therefore most plenty when the Sun is to the Southward of the Equator, during which season there are Not less than Sixty sail of Canoes from Maatavye only, employed in the Fishery—the Fish Spawn about March after which they seldom look for them.... (Morrison 1935:157-158)

I will expand somewhat upon this terse statement, with information taken mainly from Nordhoff and Ellis. The canoes used in this fishery were of medium size and outfitted with sail. Fishing was by handline baited with crayfish or flying fish. The line most preferred for this and all other fishing where strength was required was made of swordgrass cordage. Some of the native dolphin hooks were made of wood, about which Ellis wrote as follows:

The wooden hooks were never barbed, but simply pointed, usually curved inwards at the point, but sometimes standing out very wide, occasionally armed at the point with a piece of bone. The best were hooks ingeniously made with the small roots of the aito tree, casuarina, or iron wood. In selecting a root for this purpose, they chose one partially exposed, and growing by the side of a bank, preferring such as were free from knots and other excrecences. The root was twisted into the shape they wished the future hook to assume, and allowed to grow till it had reached a size large enough to allow of the outside or soft parts being removed, and a sufficiency remaining to make the hook (1829:II, 294)

Of hooks in general, and their method of employment, Nordhoff provided this confirmatory note:

In one respect the use of all these in-curved or angular native hooks differs from that of ours. When the fisherman using a European hook “gets a bite,” he strikes to set the point and barb in the fish’s mouth. With the native hook, on the other hand, one must never strike; a steady gentle tension is kept on the line and the fish allowed to hook itself. The pull of the line, leading from the *inner* head of the shank and causing the hook to revolve, sets the point deeper and deeper in the fish’s jaw. (1930a:156)

According to Nordhoff, dolphin fishing was more prevalent off the windward coasts of the islands, some miles offshore. Morrison’s report that

dolphins were fished for only during the summer months is to be qualified somewhat by Nordhoff's statement that "Only a score of years ago, I am told, half-a-dozen dolphin-canoes were to be seen on any favourable day, tacking back and forth a few miles off Papeete (1930a:167).

As for the actual fishing, I can do no better than to reproduce Nordhoff's reconstruction of what it must have been like in the early years of the nineteenth century. Any attempt on my part to summarize this account would sacrifice much about Maohi fishing that is most valuable to know:

I have had many a yarn with former dolphin-fishermen, and in order to make clear how the fishing was carried on, I shall try to reconstruct in imagination a morning in a Tahitian dolphin-canoe, twenty-five years ago:

The bait of flying-fish has been obtained, probably at the morning market in Papeete, and the little vessel is headed offshore, close-hauled on the starboard tack. The *maoa'e* is blowing, the fresh northeasterly breeze fishermen love, and the outrigger, on the lee side, is buried in foam. The old man, who handles the heavy steering paddle aft, gazes ahead from time to time, shading his eyes with his hand. He and the two younger men with him wear *taumata*, little bonnets of plaited coconut-leaflet. The others are busily arranging their fishing-gear and baiting several hooks, each of which is fast to a short trace of line, ending in a loop. This is essential in dolphin-fishing, for clubbing will not kill the fish at once, and a single slap of its tail is often enough to send it leaping back into the sea. When a dolphin is hauled aboard, the hook is left in its mouth, the bowline with which the line is made fast to the loop in the trace cast off, a hitch taken about the "small" of the fish's tail, head and tail pulled close together, and the trace made fast in that position, which ends the dolphin's struggles at once. The old man glances back toward the land, now five or six miles astern; the white line of breakers on the reef is no longer visible—*ua moe te a'au*, as they say. At this distance from land dolphin may be met at any time.

Aft in the canoe, propped against the flexible after-crossboom where it crosses the gunwales, are three fishingrods, equipped with lines and pearl-shell hooks. Two of them, about fifteen feet long, are for bonito-catching in case of sighting the fish; the other, six feet shorter and of enormous strength, is of a woody, short-jointed bamboo introduced to the islands in recent times; it carries a heavy line of native manufacture and a single huge pearl-shell hook for *to-heveri*—the full-grown bonito of forty or fifty pounds weight. The dolphin-canoes never put out without bonito-tackle.

A word from the old man makes the others glance up from their work of arranging an entire flying-fish on each hook. Nearly a mile off and dead to windward a cloud of birds is hovering over the sea. The keen eyes of the fishermen appraise the situation at a glance. "*E ere te auhopu*" ("Not bonito") says one of the young men, and at the words a series of golden flashes in the sunlight prove that the fish are albacore. The old man shrugs his shoulders and does not alter the course of the canoe; the actions of the birds have long since told him that the fish will not bite, and the leaping of the albacore has confirmed an opinion already formed. When albacore and bonito leap freely from the sea, exposing their whole bodies, they rarely take the hook.

An hour passes; the island of Moorea is abeam, eight or ten miles to leeward, when one of the young men, stationed at the bow, sings out: "*Mahimahi, paha!*" ("Dolphin perhaps!"). His eye has caught the glint of a white wing in the sunlight to leeward; the canoe bears off while the sheet is slacked away. Before long

two of the small white terns called *itata'e* (*Leucanous albus pacificus*) are clearly visible. They fly together low and erratically over the sea, stopping to circle at times and very obviously watching and following fish. These are the birds which indicate the presence of dolphin; one, two, or three of them flying as above described, are an indication of either dolphin or large solitary albacore. The natives believe that if the birds in their excitement as they circle give their little grating cry, it is a sure sign of dolphin below; if there are more than three of the terns together, it is doubtful if dolphin are about. The helmsman's ears are dulled by age, but as the canoe sweeps down on the birds, one of his companions shouts: "*Ua ta'i te manu!*" ("The birds are crying!"). The dolphin, unlike bonito and albacore, practically never surfaces.

Close-hauled once more, the canoe is now footing it just to windward, keeping the weather-gauge on the birds. They are very close and the three fishermen spring into action at last. The old man is flinging bits of cut flying-fish into the sea, and suddenly his eye catches a flash of blue and gold. "*A tu'u!*" he orders sharply, and a baited hook goes overboard at the word, at the end of twenty yards of line. The other young man stands with set lips and gleaming eyes, his own line ready in his hand. The canoe luffs more and more, slackening speed as the sail begins to shiver.

A shout goes up: "*Mau! Mau!*" ("Fast! Fast!"). The trolled line has straightened with a snap and is now running through the young man's fingers, while the sea blazes with the colours of the big struggling fish. It fights on the surface, unlike the albacore, in showy runs and leaps, but it is soon worn out by the steady tension and struggles weakly close alongside the canoe. "*A tu'u*" orders the old man once more. The canoe is now hove-to, and held so with powerful sweeps of the steering-paddle; the second flying-fish is whirled about the young man's head and flung well away, while his companion snubs the hooked fish not ten yards down. To take the hooked dolphin aboard before another one was fast would probably spoil the morning's sport, for at the disappearance of their companion, the other members of the little band would leave the canoe. But the natives believe, and I think with reason, that as long as one of these fish is held captive in the sea, its "friends" will stand by.

A moment later there is another shout of "*Mau!*" The old man nods to the holder of the first fish and ceases to *paru* (scatter chum) while he helps to secure the living rainbow now hauled aboard. In half a minute the fish is triced up and helpless; doubled in a circle it lies in the bilges, showing only by movements of the gills and a shuddering blaze of colour that it is still alive. The second fish is now alongside and another baited hook is cast out while the old man flings overboard a double handful of chum. The dolphin come aboard—*fairae* and *a'o* (male and female, only applied to dolphin)—until eight of them lie in the canoe and none are left in the sea. (1930a:170-172)

The albacore of these waters were of several varieties (and probably several species as well), the most commonplace having been *Germo germo* and *Thynnus macropterus*. The Maohis' generic name for these fish was '*a'ahi*', but there were also distinctive names given to different varieties, based, among other things, on color and behavior, and on stages in growth. Nordhoff's account of these distinctions provides further evidence of the Tahitians' (and inferentially, the ancient Maohis') intimate knowledge of this domain of their natural environment:

The small ones, which appear in large schools at the first of the season, and average six to eight pounds in weight, are called *aahi tau*, or *aahi perepererau*. The next size, believed at that stage to have a particularly white belly, is called *aahi 'opu tea*; and the next, thought to have dark-coloured pectoral fins, is known as *aahi tari'a uri*. The *aahi mapepe*, which comes next, will average about forty pounds, and *aahi tatumu* is the name of the fish when considered full grown. At this stage the albacore weighs from eighty to one hundred and fifty pounds. *Aahi araroa* is the name of the enormous two, three, or four-hundred-pound fish which roams the sea alone, or with one companion at most. The word *araroa*, by the way, means also: "The first hog taken to the king on removing a restriction," and "the first fish caught by a new fishing-canoe." This first fish was always given to the chief....

There are other names for the albacore, based on character. The *vere* may not be of the largest size, but it is particularly strong. Of the *vere* it was said: [native text omitted] "An albacore stronger (than usual is) the *vere*; the *purau* snaps; the line quickly breaks." The *hae* is the fierce, hungry fish which seizes the bait without hesitation; the *tau maueue* is the wary albacore which tries the fisherman's patience by refusing the bait. The *teamu* is the fish that feeds freely on the live bait thrown out of the canoe, but will not seize the hook. The *tia matau* is the albacore which, having felt the hook and escaped, has learned to avoid the bait.... (1930a:141-142)

A peculiar characteristic of albacore is that they congregate in certain fairly sharply defined areas of the sea, called "holes"—although such holes have little to do with the conformation of the sea bottom:

Though fairly close to the reefs, all the holes are "off soundings," and the presence of the fish probably has nothing to do with the bottom, far below. The most reasonable explanation I have heard was offered by an old fisherman. "An albacore-hole," he said, "is a place in the sea where conflicting currents set up a condition like the *nini* (the "cowlick") on the back of your head. The small fry, moving with the currents, are swept into such places from all sides, and the albacore wait there for their food." Whatever the cause, it is a fact that albacore frequent these places, and strange as it may seem, I can vouch for the truth of the native belief that schools of albacore, after a day of roaming the open sea, return to their holes to "sleep" at night. (Nordhoff 1930a:143)

Such "holes" were found mainly in relatively calm waters off the leeward coasts of islands. Nordhoff estimated that there were only about a dozen off Tahiti; they all had names and they were probably included within the adjoining land and lagoon estates—obviously a valuable asset to their owners.

Three methods were used to catch albacore. Smaller ones were often caught with pearl-shell hooks in connection with bonito fishing. A second method, usually employed by a single fisherman in a small canoe, involved deep-line fishing in an albacore "hole," using stones to sink the long lines, baited hooks, and chum. The third was by means of a *tira*, which Ellis described as follows:

The most ingenious methods, however, of taking these large fish is by means of what is termed a *tira*, or mast. A pair of ordinarily sized canoes is usually selected,

with a kind of basket-work fixed between them, to contain the fish. To the forepart of the canoes a long curved pole is fastened, branching in opposite directions at the outer end; the foot of this is fixed in a kind of socket, between the two canoes. From each of the projecting branches, lines with pearl-shell hooks are attached, so adjusted as to be kept near the surface of the water. To that part of the pole which is divided into two branches, strong ropes are attached; these extend to the stern of the canoe, where they are held by persons watching the seizure of the hook. The *tira*, or mast, projects a considerable distance beyond the stem of the canoe, and bunches of feathers are fastened to its extremities. This is done to resemble the aquatic birds which follow the course of the small fish, and often pounce down and divide the prey which the large ones pursue. As it is supposed that the bonitos follow the course of the birds, as much as that of the fishes, when the fishermen perceive the birds, they proceed to the place, and usually find the fish. The undulation of the waves occasions the canoe to rise and sink as they proceed, and this produces a corresponding motion in the hook suspended from the mast; and so complete is the deception, that if the fish once perceives the pearl-shell hook, it seldom fails to dart after it; and if it misses the first time, is almost sure to be caught the second. As soon as the fish is fast, the men in the canoe, by drawing the cord, hoist up the *tira*, and drag in the fish, suspended as it were from a kind of crane. When the fish is removed, the crane is lowered; and as it projects over the stem of the canoe, the rowers hasten after the shoal with all possible celerity. (1829:II, 295-296)

Tira fishing was highly productive and much more efficient, apparently, than ordinary rod or hand-line trolling, for the large fish were landed more easily and more quickly by means of the *tira* device. On occasion an individual deep-line fisherman might get a large catch for himself, but on the average the cooperative *tira*-fishing crew probably brought in better shares all around. Also, deep-line fishing in the albacore "holes" was believed to have diminished opportunities for *tira* surface fishing, since it accustomed the fish to bait at various depths below the surface. In any case, Nordhoff considered—with plausible reasoning—that deep-line fishing for albacore was, in his day, held in public disrepute. He cited linguistic evidence to support his opinion: the word *puaro*, which was applied to this method of fishing, was applied also to "an underhand blow among boxers." Similarly, he pointed out that the word *mafera* had two usages: "to take advantage of a person of the other sex when asleep" and "to fish for the *aahi* at night"—presumably the time chosen by a lone deep-line fisherman to avoid public exposure. (Nordhoff 1930a:155)

In pursuing the bonito (*atu*, *auhopu*),⁵² the Maohi fisherman reached an acme in craft refinement and individual skill. The problem facing him was described by Nordhoff in the following words:

The schools of bonito, under their clouds of birds, move rapidly here and there as they seek their food, chasing the small fry at a pace often times too fast for a canoe, or gobbling up entire schools and rushing off at even greater speed to seek new victims. The result is that the fishermen, after sighting the fish, often paddle at top speed for hours before they are able to drive their canoe into the midst of the school. When that time comes, they know that it will be only a mat-

ter of minutes before they are left behind. Half the battle is won when the fish are breaking water about the canoe; the second half consists of landing in the shortest possible time the greatest possible number of fish. (1930b:235)

The requirements set by these conditions include knowledge enough to spot schools of the fish from the particular behavior of the birds that regularly feed on them, stamina enough to reach a school before it moves to another feeding ground, gear devised to lure and loose the fish easily, and skill enough to land them quickly.

First, let us examine the nature lore required in this demanding occupation. The following account, by Nordhoff, is based on observations made by him, but there is good reason to suppose that his description would have applied just as well to catching bonito two centuries earlier:

Boobies, when in large flocks and unaccompanied by other birds, are apt to be over a school of albacore or porpoise; or ordinary bonito travelling too fast for a canoe to come up with them. When the birds of such a flock dive repeatedly, but level off just before touching the water, they are following a school of flying-fish. When boobies are feeding close to a flock of feeding terns, but separate from them, the former are probably accompanying albacore, the latter bonito. Boobies and terns mixed and feeding eagerly, with cries of excitement, mean bonito which will take the hook and not travel too fast. A cloud of small white terns (*itata'e*) moving high and slowly above the sea, is an indication of albacore too big to take on bonito-tackle. One, two, or three white terns, circling rapidly, indicate dolphin (*mahimahi*). A cloud of small dark terns with white caps (*'oio*) unaccompanied by other birds, means very small bonito, not apt to take the hook. The presence of frigate-birds above the boobies is a sign of good fishing, but an indication of bad weather on the way. When tropic-birds are diving among other kinds, it is a sign that the small fry are too small to resemble a bonito-hook. And so on *ad infinitum*.

In addition to the bird-lore suggested above, the old fishermen have a truly profound knowledge of weather and winds. Though I have never been able to learn how they go about it, it is a fact that such men can predict the weather with an accuracy the meteorological department of any government might envy. The winds unfavourable for off-shore fishing are the boisterous southerlies called *maramu* (*mar'ai*), and the variable easterlies which come with heavy clouds, rainbows, and alternate calms and furious squalls. These variable winds, which blow from east to almost northeast, are called *haapiti* (*faarua*). The favourite wind of the bonito-fisherman is the *maoa'e*—the light northerly to north-easterly breeze which blows warm and steady all day long. The *to'erau*—the northwest wind which raises a great swell and comes with blackened skies and heavy rain-squalls—is considered good by the hardier and younger men. (Nordhoff 1930b:249-250)

Bonito fishing was a seasonal occupation, beginning in November or December, with the appearance of the fry on which the bonito mainly fed,⁵³ until early June, when these fry either disappeared or grew past favored sizes. As the appearance of this bonito fare regularly coincided with the flowering of swordgrass, this latter event also served to alert bonito fishermen to prepare their canoes and gear.

In Nordhoff's day bonito-fishing gear consisted of a rod of strong bam-

boo, fourteen to eighteen or more feet long, a line of tough *Pipturus argentens* fiber slightly longer than the rod, and a two-piece baitless hook of what might appear to be simple but is in fact a most ingeniously complex design. In the first place, such a hook had to be so shaped and colored that bonito, chasing furiously after elusive small fry, would take it as bait. And second, the hook's point had to be so constructed that it could hold the fish during landing and then be freed without unhooking:

If the shanks of the hooks are not of the precise shade suited to the conditions, the fish will not strike. If the fish strike freely and the points are not cunningly designed for their work, bonito will be lost, or required to be unhooked when landed. When the man whose pearl-shell is of the proper colour, whose points are set at just the right angle and are of just the proper degree of bluntness, and who possesses the skill (comparable to that of an expert tennis player) necessary to handle a bonito-rod, will slam the fish in horizontally like sling-stones, almost as fast as the eye can follow the operation. It is said of a good man that he will sometimes have two fish in the air at once, and the feat may be possible. True adepts are rare and probably always have been. (Nordhoff 1930b:235)

Figure 9-16 illustrates one of these wonderful implements. The shank, which is at the same time the lure, is ground out of pearl shell; the barbless point is of bone.⁵⁴ The hackle, formerly made of fiber or pig bristle, was added to help attract the fish and to keep the point upright. And finally, the line was attached in such a manner that it spared the rather fragile shaft lure from the full pull of a hooked fish, for the shaft was the most crucial component of this ingenious apparatus.

The bonito hook shafts seen by Nordhoff were made from the black-lipped pearl-oyster shell, of which there are many local varieties differing from one another in color, luster, and so forth. Every expert bonito fisherman owned a number of such hooks of several different kinds. It was the general belief that a fisherman's success in attracting a fish depended upon his using a shank whose lustrous under-surface closely resembled—from the vantage point of the bonito, that is—the small fry on which the fish were feeding. Thus, choice of a shank depended not only upon the kind of small fry on which the bonito was feeding, but also upon such color-affecting variables as time of day, degree of cloudiness, and type of wave. To be successful a fisherman had to have the knowledge to size up conditions quickly, for slow experimentation meant loss of catch in this fast-moving fishery. Also, of course, he had to own a wide variety of hook shanks.

Such shanks were among the most prized possessions of fishermen known to Nordhoff; and their value appears to have increased with success. Each stretch of coast on each island produced a characteristic and distinctively named variety of shell; Nordhoff listed fifteen for Tahiti alone, and he stated that an expert bonito fisherman could recognize and name nearly all

of them at a glance. In addition, each successful shank was given an individual name by its proud owner:

To illustrate the use of shell-names, let us suppose that two canoes are in the midst of a school of fish, and that one fisherman is taking bonito rapidly, while the other is getting no strikes. "What shell are you using?" the unlucky man might sing out. If the lucky fisherman felt well-disposed toward the other, the reply might be: "*O Patiri*" (Thunderbolt). Then if the other man came from a distant village and his blank expression showed that the specific name of the hook meant nothing to him, the lucky fisherman might enlighten him by continuing: "*E rauoro, iri ahi'a*" (A pink *rauoro*). These words inform the inquirer that the successful hook was a shank of shell from Maupiti, in the Leeward Islands, of a peculiar satin-like texture, and tinged with a rosy flush. (1930b:241)

Regarding the point of the fishhook, Nordhoff had the following to say:

The point of a bonito-hook is designed with considerable science for its special use. In fishing, the tip of the rod is held just high enough to give a little support to the forward end of the shank, so that it skips over the surface of the water like a tiny hydroplane. The bonito seizes it from behind and below, and it is obvious that out of a hundred fish, ninety-nine will be hooked in the upper jaw. As the upper jaw of the bonito is shorter than the lower one, the sharpened point of the hook (*mata*) must be higher than anything aft of it, for if the *pafao* bends to run parallel with the shank, or has the slightest incurve, its point may scratch the fish's upper jaw, but is apt to slip forward and out, without taking hold. Many of the bonito-hooks to be seen in museums would be worthless, for this reason, in actual fishing; and the shanks I have seen in the hands of collectors were equally worthless. A first-class bonito-hook is neither given away nor sold; in my experience such a hook can only be acquired by theft.

The skill of a bonito-fisherman may be judged from an inspection of his hooks. A green hand uses long points, very sharp, to insure landing every fish that strikes. The expert uses short, blunt points, just sharp enough to lift the fish out of the water before they drop out of the jaw. While the beginner is landing a dozen bonito, many of which must be disengaged from the hook by hand, the adept will have pulled out of the water fifty fish and landed forty-five of them without touching a hook. (1930b:245)⁵⁵

Finally, we turn again to Nordhoff for a vivid reconstruction of a bonito expedition; the time setting was that of the 1920s but in most essentials it would probably pertain just as faithfully to two centuries before:

Let us suppose that the *maoa'e* is blowing and that our man is preparing to go out. His canoe lies in the shallows before his house, and the hour is about two in the afternoon, for fish caught in the evening will be good for to-morrow morning's market. (Morning fishing is usually of a different kind, which I shall mention later on.)

A sturdy young man of twenty is arranging the gear in the canoe; the fishermen always go out in couples, and the forward paddler is usually an apprentice who does no fishing unless the canoe is loaded and the adept in a good humour, when he may suggest an exchange of seats.

Resting on the cross-booms of the outrigger are three or four bonito-rods, completely rigged, with hibiscus-leaves (*rau fau*) carefully tied over the hooks, which lose their lustre when over-exposed to the sun. (A *parau pohe* is a shank which has "died" in this way.) The men wear cotton undervests and dungaree trousers cut off at the knee; under their hats of pandanus they have placed fresh green leaves to protect their heads from the sun. In addition to paddles and fishing-tackle, they carry a bottle of water and a short club of 'aito wood (*casuarina*) to kill the fish.

A few women from neighbouring houses stand about, enjoying an exchange of banter, some of it rather broad to European ears.

"And if we hook a fish in the lower jaw," shouts the apprentice, as the canoe glides away from the beach, "I shall know what I have suspected for some time!"

A girl on the beach looks up with a malicious smile. "Paoa!" (Jonah) she sings out. "You'll never hook a fish at all! And if you did hook one in the lower jaw! What of it—eh?" A titter goes up.

In former times the sweethearts, wives, and daughters of bonito-fishermen were enjoined to strict chastity during the absence of the canoes at sea. A breach of this rule was believed to bring bad luck and even disaster to the fishermen. And when a bonito was hooked in the lower jaw—an unusual occurrence, as noted above—it was a sign that someone ashore was not playing the game. This belief is fully alive to-day, and it is also thought that if a man disputes with his wife before putting out to sea, he will catch no fish. And if an enemy, jealous of a fisherman's success, spits on his canoe as it lies hauled up on the beach, making some contemptuous remark as he does so, it is thought that the canoe's *mana* is seriously impaired.

As the canoe puts out through the passage in the reef, the old fisherman steers without hesitation toward a certain region, about six miles off-shore and to the north, where he knows fish are apt to be found at this time of year. A knowledge of such places, determined by cross bearings, and of the seasons when they are frequented by bonito, is part of the fisherman's stock-in-trade. It seems to be a fact, as the natives believe, that these "crossroads of the sea" exist, and that schools of fish, approaching from various directions, meet and linger there.

The two paddlers sit close together amidships, which leaves the ends of the canoe light, as they should be to ride the waves off-shore. Pipes are lighted when they reach their fishing-grounds, toward half past three; the old man takes it easy astern, while his apprentice, standing and shading his eyes, keeps a ceaseless watch on the horizon. He sights birds from time to time, and at a word from him the old fisherman rises for a look. A shake of the head indicates that the kinds of birds and their behaviour are unfavourable. Out of six or eight flocks sighted, there may be only one worth following; to recognize this flock, thus avoiding miles of useless paddling, is half the secret of success. Finally the old man gives the signal; a few boobies have been circling and diving about a mile away; terns and more boobies have joined them, and as the canoe approaches at top speed, the apprentice shouts "*Ua apu!*" *Apu* means the dart and plunge of fish feeding at the surface. A quarter of an acre of sea, under the birds, is whitened by spray as the school of bonito "surfaces."

The word for a school of bonito or albacore is *iri*, and when the school halts to feed, the natives say "*Ua ea te iri.*" At such times they try to fish on the edges so as not to split the school; it is believed that the fish on the rear edge will strike more eagerly than those ahead. If the bonito begin to jump clean out of the water, showing their tails, it is thought that they will not take the hook freely. Such

jumping fish, when caught and examined, nearly always have empty stomachs, and are called *auhopu ma'i* (sick bonito). If in the midst of a halted school, the fishermen perceive a large shark or a collection of floating rubbish, it is a sign that the canoes will soon be loaded.

Twenty yards from the feeding school the old man drops his paddle, swings about to face the stern, takes up a rod from the cross-booms and tears away the leaves covering the hooks. The apprentice, now paddling alone, is putting all his strength into the work. The fisherman unhooks a choice lure and flips it overboard, holding the rod—at an angle of about thirty degrees with the horizon—with his right hand, a yard above the butt. The butt itself is socketed in the muscles of his right groin, and his left hand is free. As the hook skitters on the surface in the wake of the canoe, he moves the tip of his rod back and forth laterally, causing the hook to follow a zigzag course. This increases its speed through the water and is believed to be tempting to the fish. A bonito makes the water boil a foot behind the shell, but refuses to take hold. Up comes the rod, the hook is made fast to the netting, and another one goes overboard. A moment, in the midst of the fish, suffices to try each shell, and no time must be lost. Sometimes when only an occasional bonito will strike, the expert hastily opens the fish he has caught, in search of roe. If roe is found, he compares its colour with his hooks until he finds one of precisely the same shade. Such a bit of shell, it is thought, will be seized without hesitation.

Finally, after three or four minutes of hasty trials, the right hook goes overboard, and a fish seizes it with a headlong rush. "*Mau!*" (fast) shouts the old man, as the line snaps taut and the stiff rod bends. He is a master of what is called *ue*—the violent, semi-circular wrench on the rod, which pulls the fish from the water and brings it flying aboard as though shot from a catapult. It is the fastest way of taking bonito, and as the tip of the rod is not brought up to a vertical position, the fishermen in other canoes, unless very close, cannot tell whether or not a man fishing in the *ue* manner is catching fish. This enables him to enjoy his sport undisturbed.

The first fish of the day leaves the water and flies in to strike the fisherman's chest or to be knocked into the bilges by his free left hand. But the hook has dropped out of its mouth halfway to the canoe, and an instant later another fish is on the way. They are striking freely now, and the old man is enjoying the *oaoia*—the unabated pleasure of a fisherman. The apprentice glances back with a grin, shaking the sweat from his eyes; as the fish continue to come thumping in to drum with their companions in the bilges, the old man shouts exultantly: "*E au i te ueueraa mape!*" (Like the shaking of the chestnut tree). This is a common exclamation at such a time, and means that the fish are dropping like Pacific chestnuts from the shaken tree. Twenty, thirty, and even fifty or more bonito are often taken in an afternoon.

To fish successfully in the *ue* manner requires powerful muscles, and a training of hand and eye comparable to that of a real expert at tennis or golf. There are only two men in Tahiti and one in Moorea (so far as I know) who are acknowledged masters of the game; such virtuosos were probably equally rare in the past. (Nordhoff 1930b:250-254)

Seasonal Factors in Fishing

It is evident from the foregoing section that there are (and were) both temporal and regional differences in the supply of marine products, and it is reasonable to propose that such differences were reflected in social relations.

First of all, there was the annual cycle of seasons. Seasonal variations in temperature, rainfall, and wind affected the supply of fish in several ways. During the so-called rainy season, from November to March or April, the flooded streams disgorged increased quantities of food—plant-foods, insects, tiny molluscs, and fish—into the sea; this served to attract into the lagoons or around the passes in the reefs larger fish, which were either caught and eaten or used as bait for still larger, pelagic species. Certain winds also tended to increase this congregation of small fry near shore, and with it the larger varieties which fed on them:

Winds and currents not only directly affect the runs of certain fish, but occasionally appear entirely to control their movements. At Papara the following signs predict the appearance of the tiny *inaa* (*ina'a*, "white bait"). From March to July, when a red cloud is seen in the south, it is known that the *maraamu* (southeast trade) wind, which bears obliquely on the coast here, will shortly blow. Then there will be no *inaa*. On the other hand, from September to January a red cloud seen in the northwest is the forerunner of the *toerau* (north or northwest) wind. With this wind will come the run of the *inaa*. It is not the run of the *inaa* in itself that interests the fishermen, but the fact that when the *inaa* swarm near the mouth of the streams certain other fish which are among the best for eating (the *aehaere*, *paehaere*, *omuri*, *uruati* or *urupiti*, anciently *urua*), and others follow them and can be caught in the lagoon. Thus the effect, direct and indirect, of winds; and also the way in which a run of small fish attract the larger varieties that feed on them, are indications or signs. (Handy 1932:79)⁵⁶

Seasonal variations also affected the Maohis' ability to fish. No offshore fishing was possible during storms, and even lagoon fishing was difficult at such times. And while it was true that summer was the season of most storms, it was also the time of the lengthy calms, which many kinds of fishing required. Storms were infrequent during the winter season, but the trades which blew continuously during these months built up ocean swells of a magnitude unfavorable to fishing except in the more protected waters. Thus, the summer months were known as the season of *te tai* 'the (open) sea', when seafood was not only more abundant but also more easily procured.

In discussing dolphin, Morrison asserted that they "... Spawn about March after which [the Maohis] seldom look for them, but get ready for the Albicore & Bonnetta fishery that then Commences and the Sailing Canoes ply between Taheite & Tettooroa [Tetiarioa] for them Fish which are caught in great quantities about the reefs of Teetooroa." (1935:158) It may be that there was some trolling for albacore and bonito during the winter months, but the main season for catching these pelagic fish, by *tira* and open-sea trolling, seems to have been summer, for reasons given above.

In addition, the spawning of certain fish had direct bearing on fishing activities—not only as a result of the presence near shore of the small fry,

which in turn attracted the larger fish and was used to bait them, but also in connection with the spawning habits of some larger fish themselves:

The *tarao* (rock cod) come from their holes three times a year to spawn. When they make their appearance they are speared in great numbers. At other times they are caught only occasionally in the lagoon with the hook and line, or net. Another fish whose habits are closely watched is the small *fao* that lives in the lagoon. Every three months, on the night “when the moon and morning star rise together,” the *fao* go over the barrier reef into deep water to spawn, and three days later they return in the same way. It is said that they make their way over the reef even if there is only a film of water over it. When such a condition prevails, natives stand on the reef with sticks and kill them as they scramble over the coral. (Handy 1932:79)

As revealed in the excerpt just quoted, the Maohis believed that the habits of certain fish were associated with the phases of the moon—directly, or as a result of association between moon phase and wind direction.

I reproduce below Stimson’s version of the names and prevailing conditions of the Maohi “Nights of the Moon”:⁵⁷

This is a record for fishermen, recounting the ni for fishermen, recounting the nights when the fish run, this kind and that kind, and the seasons when these fish run, this month and that month, and the days which are favourable for planting food-plants.

1. *Tireo*

The radiations of the moon have become visible, it (is) a new moon, and the moon rests upon the horizon; the fish have risen, all species of fish; the *ihi* have commenced to run on this night; the method of fishing is with a net, but the opening of the trap-pocket should face the shallows; this (is) a night of very many fish.

2. *Hiro-hiti*

The moon has risen, she has revealed her form; the fish have also come in from the sea, and all species have risen and are moving about; the *manini* run on this night; the method of fishing is with hook and line. This is the night when Hiro was born.

3. *Hōata*

The moon has appeared, thereafter she is visible, and she has shed her light; creatures of the sea propelled by their tails, those having hard shells, and also those that crawl, move about on this night; the method of fishing is with hook and line, and also by torchlight on the deep sea for the *paoe*, the *orare*, the *maunauna*, the *vau*, and the *omuri*.

4. *Hamiamu-mua*

The fish make their appearance in wide curves, they swim in separate schools, this (is) a most favourable night for finding fish; the method of fishing is by torchlight, moving along from within the reef outward (and) fishing by torchlight from the canoe; the torch is then a cocoanut leaf.

5. *Hamiamu-roto*

Again the fish make their appearance in wide curves, they swim in separate schools, this (is) another most favourable night for finding fish; the method of fishing is by torchlight, but one should wait until the moon has set, that is to say, until it becomes dark, and then one should commence to fish by torchlight (walking) upon the reef; the sea creatures found are the rock lob-

ster and (a species of) the sea-eel; the *uhu* and the *tarao* are also fished for on this night.

6. *Hamiamama-muri*

Again the fish make their appearance in wide curves, and they swim in separate schools; this (is) another most favourable night for finding fish; the method of fishing is by torchlight, but again one should wait until the moon has set (then) fishing by torchlight from the canoe; the fish found on this night are the *mu*, the *vete*, the *ume*, and some others; one should seek in the crevices of the little channel-like openings of the reef.

7. *'Ore'ore-mua*

This is a night when the fish disappear, they will seldom be found; from *Ore'ore-mua* to *Tama-tea* are the nights of which it is said that (these) are the nights when the fish copulate; nevertheless, the *mu* run on this night when October has come; a net (is) then the fishing method; the opening of the trap-pocket should face the shallows, and when the sun has nearly set the net should be set low down in the sea while waiting for the flow of the tide.

8. *'Ore'ore-muri*

This is also a night when the fish disappear; they will then seldom be found; it (is) a night of northerly gales in the months when they blow, and therefore it (is) a fishless night, however, the *mu* run again on this night; a net (is) again the fishing method.

9. *Tamatea*

The moon has begun to shine brightly, the great fish have come in from the deep sea upon the sand shallows; the *toau*, the *taea*, the *maene*, the *auhupu*, and also all species of fish have come in from the sea on this night; a net is still again the fishing method; the opening of the trap-pocket should face the shallows, and again, when the sun has nearly set, the net should be set low down.

10. *Huna*

The eyes of the fish are hidden (closed), they are asleep; this (is) a very fishless night, do not go fishing on this night lest you meet with disaster from fatigue.

11. *Rapu*

The roe of the fishes has become fully mature; this (is) a fishless night, however, it (is) a very good night for the *maene*; also, a net is the fishing method; when the sun commences to decline go and set down the net (and) turn the opening of the trap-pocket toward the shallows.

12. *Maharu*

The fish are seeking some place to deposit their spawn; this (is) a very fishless night; do not go fishing on this night lest you meet disaster from fatigue; this is the time when the spawn of all fish here mentioned is deposited in abundance.

13. *Hu'a*

All species of fish are found, the fish swim in schools in the months when they run; this (is) a night of very many fish in those months; the *mu* and the *tuhara* run on this night; a net (is) the fishing method, the opening of the trap-pocket of the net should still face the shallows; the *mu* (appear) in the evening, the *tuhara* at break of day.

14. *Maitu*

The *maito*, the *oturi*, the *parai*, and all kinds of red fish run at break of day when the months have come when (they) run; a net (is) then the method of fishing for these fish; the following morning is a (good) time for planting food-plants.

15. *Hotu*
The moon has increased and reached her full development; before the sun has set the moon has risen; this is the (most) favourable night for planting all kinds of food-plants on the morning after, and it (is) also (a time) when large-eyed children are born; all kinds of fish run on this night; a net is the fishing method, but the opening of the trap-pocket should face toward the deep sea. This is the night when sea-crabs become soft-shelled.
16. *Māra'i*
This is the third (consecutive) night when food-plants should be planted on the forenoon following; this is the night of which it is said, "*Through the shadow's treading upon the moon therefore she wanes;*" as the sun sets the moon rises; this (is) a night of very many fish, a net (is) still the fishing method on this night, the opening of the trap-pocket should still face downward toward the deep sea, or else (as the case may be) should face the shallows. This is another night when sea-crabs become soft-shelled.
17. *Turu*
Beautiful children are conceived on this night; all the sea-creatures having hard shells, the sea-crabs, the spiny sea-shells, the one-sided sea shells, the *maoa*, and the land-crabs as well, have come together in the act of fecundation; do not any under circumstances go fishing on this night lest you meet disaster from fatigue.
18. *Arā'āu-mua*
From *Araau-mua* till the third *Araau* are the (three) nights when the fish run through the passageways of the reef, the great fish, the turtles, the *urua*, and the rest. When northerly gales blow the *uhu* come into the passageways of the reef, the *paauara* in advance. This is the night of which it is said that (it was) a (time of) roaming about of ghosts and of the risen dead in ancient days; (it is the night when we sanctified the altars of the temples which were worshipped in ancient times to protect us [from evil powers]); furthermore, do not go fishing on this night, for those dead will trouble the fishing; this (is) a rather short and fishless night.
19. *Arā'āu-roto*
This (is) also a night of the dead (in the days when they were propitiated); those dead bodies would indeed return that they might be lamented by the living; this night is also entirely without fish; do not under any circumstances whatsoever go fishing on this night.
20. *Arā'āu-muri*
This (is) a fishless night, nevertheless *ihi* run in great numbers on this night when the months have come when they deposit their spawn; a net (is) the fishing method of this night, the opening of the trap-pocket should still face the shallows.
21. *'Ore'ore-mua*
From *Oreore-mua* till *Oreore-muri* are the nights when the great fish have disappeared, (they) have returned to the deep sea. This is the night (when) fish scales are shed; this (is) indeed a fishless night, (for) no fish whatsoever are found on this night, and verily what fishing method could be proper to it?
22. *'Ore'ore-roto*
This (is) a very fishless night.
23. *'Ore'ore-muri*
This (is) a fishless night, it is the night of which they say that the fish merely follow along behind the hook, but will never bite.

24. *Ta'āroa-mua*
From *Taaroa-mua* till the third *Taaroa* are the nights when long-snouted fish run, the *ono*, the *haura*, the *aavere*, and all similar fishes; this (is) a night when *Taaroa* remains awake, it (is) a night of very many fish, the net will be encumbered with *araoe*, a net (is) the fishing method on this night, the opening of the trap-pocket should again face the shallows.
25. *Ta'āroa-roto*
This (is) again a night of fish in the seasons when they run; a net is still the fishing method; the *aahi* and *auhopu* copulate on this night.
26. *Ta'āroa-muri*
This (is) still again a night of fish in the seasons when the fish run; a net (is) still the fishing method, the opening of the trap-pocket should again face the shallows.
27. *Tāne*
Tane is the night; it is a time when man embraces woman. It (is) also a favourable night for planting sweet potatoes and all other kinds of food-plants which fructuate in the soil; it (is) a night of fish.
28. *Ro'ō-nui*
Roo-nui is the night; a great run of all fish of all species then occurs. This is also a favourable night for planting sweet potatoes and all kinds of food-plants which fructuate in the soil.
29. *Ro'ō-māuri*
The fish have disappeared, the moon has nearly set, nevertheless the *tehu* and the *nape* run in the months when (they) run; a net is still the fishing method, the opening of the trap-pocket of the net should still face the shallows, and when the sun has nearly set (the net) should be set low down; this (is) indeed a night of many fish in those months when they surely run.
30. *Māuri-matē*
Daylight has trodden upon the moon, the moon has set; the fish, too, have gone to sleep; this (is) a very fishless night; this is the night said to be the extinction of the moon's light.

Mutu is the night, *Māuri-matē* is the day, *Tireo* is the evening (following); concluded also is (this) account (of the nights of the moon) from the rising of the new moon until the setting. (Stimson 1928:326-337)

Nordhoff had the following to add concerning a tie-in between moon phase and bonito fishing:

The Society Islanders believe that the moon has a great influence on the habits and behaviour of fish, and that bonito are no exception to the rule. The week of the new moon is believed to be a particularly favourable time for bonito-fishing, and two of the "nights of the moon"—*Tamatea* and *Ta'arua tahi*, or *Mua Ta'arua*—are recommended as well. Of *Tamatea*, the ninth night (and day, of course) of the lunar month, it was said: "Bonito are the fish at sea," and of *Mua Ta'arua*, the twenty-fourth: "An auspicious night for love-making; women give birth to red-haired children on this night; crabs and cray-fish shed their shells; albacore and bonito are the fish at sea. (1930b:254)

Locational Factors in Fishing

In addition to these temporal changes affecting the supply and pursuit of fish, there was a host of locational factors—some of them exaggerating,

some neutralizing the seasonal variations. It goes without saying that calm leeward waters are better than rough seas for, say, underwater spearing and pelagic trolling. In fact, judging by today's conditions, there must have been a considerable amount of local specialization in fishing, based directly on difference in supply and on fishing conditions. For example, the sheltered shallow lagoons off Tahiti's southern shore are far richer in crustaceans than are the wind-tossed waters off the east coast.

Even excepting such obvious cases as *Maeva* (see p. 289), it is reasonable to suppose that access to good fishing, like availability of productive land, was a determining element in population distribution; compare, for example, Tahiti's thinly populated windward side with the populous leeward western districts. But local differences in the kind and quantity of fish supply apparently did not lead to any regular far-away movement of people and goods. With respect to people, fishermen undoubtedly roved widely offshore in their canoes in search of deep-water fish, but there is no evidence that they made a regular practice of fishing in foreign streams, lagoons, or "holes." With respect to goods, there are indications of a fair amount of circulation of fish, in the form of gift, tax, and even barter, but mainly within narrow territorial limits. Spoilage may have been a factor here, although the availability of live-fish containers would have served to keep smaller fish alive almost indefinitely.

Social Factors in Fishing

Within the limits set by seasonal and local variation, access to fishing was of course conditioned by ownership of equipment and fishing grounds. Regarding the former, most items—including canoes used in fishing, hooks and lines, and small nets—were probably within every Maohi man's reach (most men having made their own, in fact); it was only with respect to the large nets and the right to command the services required to man these and other large-scale fishing enterprises that individual differences became important. Consideration of this complex matter of "ownership" must await the more general discussion in later chapters, but it may be useful to anticipate that discussion and to record my opinion that the particulars of fishing-ground ownership were not of a kind to necessitate or encourage regular exchange of fishing products between "shore-dwellers" and "inlanders." Within any one political unit—and every one of these included fishing grounds—every resident probably enjoyed some fishing rights. This is not to deny that some individuals, and not necessarily those living on the shore, fished more often than others. It merely means that within any one political unit differences in proximity to fishing resources cannot have had a very decisive influence upon social relations—though the reverse may well have occurred.

The same general considerations apply to the raw materials used in fishing. Fibers used for making lines and nets; shell, bone, and wood used

for hooks; bamboo for poles and containers; plants for poison—all of these were widely enough distributed about the Islands to render them accessible, physically and presumably also optionally, to all individuals. Wood for the larger fishing canoes was scarcer, but here the factor of labor was perhaps more crucial than the tree; and in any case most fishing canoes were probably made of plentifully and universally available trees. In other words, local differences in raw materials supply could not have been crucial enough to stimulate an active trade in such materials.

Within society at large the major division of labor in fishing was along sexual lines, but the evidence in the matter is unclear. According to Moerenhout, “fishing was an occupation carried out almost entirely by males ...” (1837:II, 108). But exactly what is implied by this is rather obscure: just what types of fishing were carried out by women, permissively or exclusively, and was the sexual division of labor based mainly on relative strength, or on extrinsic rules, or both? Handy’s statement is somewhat more specific:

Consecration of canoes, nets, spears, lines, and hooks was an essential element in the success of fishing, for fish and fishermen, like all else, were under the control of tapu and *mana atua* [the *mana* of deities]. This explains why women in former days never, and now rarely, went out in the fishing canoes. The women being common (*noa*) would have neutralized the tapu of the craft, gear, and fishermen. (1932:73–74)

But this cannot mean that all of the items of fishing equipment were so consecrated and hence forbidden to female use. Handy himself mentioned some fishing by women—for example, by use of bag nets, and in drag fishing with *rau* (1932:91, 106). It is not clear whether a canoe once consecrated for fishing was forever after forbidden to women, or forbidden only on the occasion following the consecration.

It is quite certain that most or all deep-sea fishing was carried out by men, but beyond that the facts and the rationale of the sexual division of labor in fishing are unclear. Complicating the matter are the circumstances that Maohi women were a robust lot and that, compared with some other Polynesians, the Maohis appear—to me at least—to have been quite pragmatic in their conduct of subsistence activities.

Aside from these differences in engagement in fishing based on sex, the activity was followed as a specialized occupation by some individuals, as a later chapter will describe.

Fishing Ritual

Religious belief and ritual figured prominently in fishing—in the making of fishing equipment, in efforts to control and conserve supplies, in the catching of fish, and in reinforcing differences in consumption rights.

Only the vaguest of references have been recorded concerning religious aspects of the manufacturing of fishing equipment. For example, it will be recalled that in the excerpt about net making taken from Ellis and repro-

duced above, reference was made to “former pagan ceremonies, and the offerings at the marae” which accompanied the manufacture of a large *upe’a ava*, or salmon seine net. Also, Ellis recorded that “The first wetting of a new net was formerly attended with a number of prayers, offerings, &c. at the temple, and on the beach” (1829:II, 290). And according to this same source there was a special patron deity of net makers, Matatine by name (p. 288). The manufacture of canoes, including those used in fishing, was attended with much ritual, as was described earlier, but the only other reference I can discover concerning the ritualization of the manufacture of fishing implements is Nordhoff’s suggestion: “It is probable that in the Society Islands in former times, the assembly of a bonito-hook was performed with the ceremonial which still persists in the Samoan and Ellice Groups, though no traces of such ceremonial are to be found to-day.” (1930b:240)

Limitations were placed on fishing activities in two respects. First, it was the prerogative of the principal proprietor of any specific fishing place—say, an albacore “hole,” or a rock-cod “deep,” or even a whole stretch of reef or lagoon—to impose a *rahui*, or restriction, on fishing activities there for as long as he wished. This was done (among possibly other ways) by planting a pole on the reef or shore with a bunch of bamboo leaves fastened to it. (Ellis 1829:II, 286.) Details are lacking concerning the application of such a *rahui* and the sanctions behind it, but it is likely that there were some local differences in both respects. In some cases the *rahui* was probably general, including even the principal proprietor himself; while in some cases it excluded only outsiders, or it might be ignored by individuals upon receipt of permission from the proprietor. As for sanctions, in some instances the personal influence or coercive physical power of the proprietor may have sufficed to insure compliance, but it is highly likely, though not specifically so recorded, that the aid of the proprietor’s spirit-familiar or tutelary was ritually invoked as well.

A second respect in which limitations were placed upon fishing had to do with the more general *rahui* imposed throughout whole districts on certain contingent occasions or during certain periodic times of the year. An example of the former was the general restriction placed on practically all subsistence activity, including fishing, during mourning ceremonies for persons of high status. The most notable specimen of the latter was the prohibition placed on general bonito and albacore fishing, at the beginning of the open-sea season, until certain ceremonies had been performed. Sanctions behind both these general restrictions were of a political and religious nature.

Another kind of control over fishing involved use of a *punai’a*,⁵⁸ a *ti’i*-image inhabited by a spirit capable of controlling the movements of fish. Such *ti’i* were usually made of stone, and shaped like fish. *Puna* were still in use in Tahiti as recently as the 1920s:

It is not easy to get information about *puna*, for the natives speak of them with reluctance and put one off by feigning ignorance. The following is what I have been able to learn; it may be inaccurate and is certainly incomplete. At one time there were *puna* for almost every kind of fish—sharks, parrot-fish, scad, bonito, albacore, etc. Nowadays the albacore *puna* are the only ones in use in Tahiti. Each district once had its *puna* for every kind of fish. Every *puna* had its owner, who had acquired it from his ancestors. It would be useless to make a *puna* now, for there would be no *mana* in it. When the fishermen return with their catch they must not neglect to give the owner of the *puna* a generous share. If he is well treated and feels friendly toward the fishermen, the owner of the albacore *puna* keeps the head of his image turned toward the mountain (*i uta*), which causes the albacore to stay in their "hole" close to the reef. If the owner's share is skimped or forgotten, he retaliates by turning the head of the image toward the sea (*i tai*), and the fishermen are soon brought to their senses by finding that there are no more albacore in the hole—like the image, they have turned their heads away from the land. The owner of the *puna* may still be placated with gifts, and cozened into turning the image's head *i uta* (inland), when the albacore will be found in their hole once more; but if the man be deeply incensed, he will go secretly at night to where he keeps his *puna*, make sure that its head points out to sea, and cover it with a thick black cloth. Not even a stray albacore will then take the hook. Once or twice in the past *puna* have been stolen by foolish men, but in each case the thief fell ill or was pursued by bad luck, and the hiding-place of the image was revealed to its true owner by an appearance of blue fire, seen at night. Nothing is stranger about *puna* (the natives say) than the way they are well known to grow—increasing slowly and steadily in size as the years pass. (Handy 1930a:159)

Handy also wrote about *puna*, but those he knew about on Tahiti operated directly opposite to the procedure described by Nordhoff: that is, "When the figure was placed so that it faced the sea, *aahi* would be caught in large numbers; but if its face were turned inland, then no *aahi* would be caught" (Handy 1932:71). Handy also described from hearsay a Ra'iatean *puna* which brought about a plentiful catch of '*a'ahi* only if stood upright on its small stone platform. Certain *puna* on Maupiti were placed in stone cists which flooded regularly at high tides (Handy 1932:72), but most of those written about were kept on dry land adjoining the fishing places under their supposed influence.

In addition to the several measures taken to insure the availability of fish, there were others of a religious nature designed to aid in catching fish. Among these were the rituals, already mentioned, whereby new fishing implements were consecrated to their tasks, and the use of red feathers to calm stormy waters. Of the same general nature was a small marae described by Bligh as having been built to insure success for a newly built fish weir:

I passed in my Walk to day a Morai which was called Rooahadoo—it consisted of a few Stones about three feet square, pieces of plaited Cocoa Nutt leaves (called Tapaou) placed before it with some small pieces of Tarro and Cocoa Nutts. The Evàtah or Alter of Offerings, was a Palm Stump with a small Stage on it, on which was a Cocoa Nutt grater, and some Cocoa Nutt, Mahie and an empty

Basket. The whole was fenced in, and I found it was just erected to ensure success to a kind of Ware or Dam which Tynah has made with Stones without Point Venus to catch Fish. Prayers have been performed, and the Deity supplicated by Persons of the Priesthood. (Bligh 1792:159b)

It is reasonable to suppose that all fishing structures built with an eye to permanence would have had attached to them some marae, however small and simple.

There were many other little rites performed before, during, and after any fishing expedition—rites to preserve lines from breaking, to keep away sharks, to guide spears, to lure octopus, and so forth—but the sources are almost silent on this score. Instead, we are provided with a general statement by Ellis to the effect that “the favour of the gods was formerly considered essential to success in fishing” (1829:II, 288) and with Bligh’s following observation:

Whenever there is a Show of Fish a large Fleet of Cannoes proceed to Sea. Sometimes they pray to the Eatua for their success, but at all times they carry in each Cannoe a Basket with some Cocoa Nuts, Breadfruit and Plantains as an offering to him. The Basket is Square, made of Reeds and has a place Sacred to it in the Cannoe. (1789:II, 26)

Henry furnished a more specific statement concerning the religious practices of fishermen’s guilds:

The fishermen formed companies and built themselves marae (*marae o-te-feia-tai’a*) and dedicated them to the gods, the chief of which were: Rua-hatu-tinirau (Source-of-fruitful-myriads), the Neptune of the sea called in the story of the Deluge Rua-hatu-o-te-tai-euea (Source-of-fruitfulness-of-the-thrown-up-ocean), and Tino-rua (Body-of-two-natures) lord of the ocean, the merman who had the tail of a swordfish. The fisherman placed in their secret depositaries stone or wooden images of the fish gods and other sacred relics with birds’ feathers. (1928:148)⁵⁹

It is possible that the special gods of fishing named in the above passages from Henry were peculiar to only certain districts of the islands, since Ellis reported that “The gods of fishermen were numerous, though Tahuura and Teraimateti were the principal” (Ellis 1829:II, 288).⁶⁰

The following excerpt from the journal of Tyerman and Bennet was recorded in 1821, based on hearsay, and deserves neither more nor less credibility than many of the other “facts” reported in these mission-inspectors’ journal:

Sharks are numerous about this coast [Huahine], and they were formerly worshipped from fear; undeed, the fear that hath torment was the mother of devotion here, as it is in every other heathen land. Large oblations were frequently offered to them by the priests who served at their altars. We are assured that numbers of these ravenous animals were so far tamed in this bay, that they came regularly to the beach to be fed with fish and pork, which were provided for them in large quantities. This marae being situated very near the lagoon, a shark once

worked his way through the sand, and took personal possession of his temple, the water flowing in with him; whereupon, the reservoir thus formed being properly dammed up, and from time to time replenished, he luxuriated in his sanctuary, and daily received his food from the devotees who flocked thither. Whenever the natives, in their canoes encountered a shark at sea, they endeavored to propitiate him by throwing out some of the fish which they might have caught; and such offerings were so acceptable to these divinities, that the latter would follow the boats to the shore, and gradually became familiar enough to wait till their portion was dealt forth to them. Nevertheless, the ungrateful sharks, having a god of their own—"their belly"—never failed to sacrifice even their worshippers to *that* idol, when they could catch a stray man, woman or child, in the water, or on the beach, near enough to be seized and carried into the deep. (Montgomery 1832:I, 180-181)

Finally, there were rituals, having both religious and political aspects, associated with the consumption of fish. The most notable of these was the "first-fruit" rites at the beginning of the albacore and bonito season:

When in the months of November and December, which were called *te tai* (season of the outside or of the sea), the bonito or scomber fishery opened, but a single canoe was allowed to go out to fish, and its entire catch was dedicated to the gods. This day was also tapu, that is to say, sacred. No one was allowed to approach the seashore, to make fire, to cook food, nor to partake of food before sunset. Nor could canoes or houses be built, or cloth manufactured, or mats or nets woven. In a word, all work was prohibited, and it was a day of silence and devotion.

While the fishers were away, the preists applied themselves to praying at the temples; and their assistants were busy, in the principal marae, in cleaning it up, decorating it with green branches, in dressing an altar to receive the first fish caught. When the canoe returned in the evening, it lay in the water near the beach, awaiting the arrival of the priests. After some prayers and other ceremonial these allowed the fishermen to land and to bring them the days catch, which, whatever it was, had to be carried in *toto* to the marae. There, after more prayers, two or three of the largest fish were placed on the altar, and the others were entirely consumed (burned?) on a fire that burned before the altar.

This first day's catch was for the gods; that of the second day was for the Arii, or chief; and it was only on the third day that the fishing was open to everyone, and anyone who desired could go fishing. (Moerenhout 1837:I, 516-517, as translated by Handy 1932:78)

Such rites were probably held at several places throughout the Islands, and the deities thus honored are unlikely to have been everywhere the same.

In addition to these large-scale ceremonies, it is reasonable to suppose that every catch of any consequence was shared, at least in token degree, with one or more of the fisherman's tutelar spirits and, in many cases, with his immediate social (or political) superior as well.⁶¹

CHAPTER 10 *DIVERSIONS*

I have already painted these islanders as being great conversationalists, lively, animated, and fond of company. They sought after and found distractions and occasions for merrymaking even in those of their tasks which seemed most laborious; therefore one can almost say, in its ordinary course, their (day to day) life was nothing but a holiday. (Moerenhout 1837:II, 125)

Granted that lightheartedness and playfulness colored much of Maohi life, including even moments devoted to backbreaking labors and perilous missions, one may nevertheless single out certain of their activities as having been undertaken primarily for what Westerners call “amusement”—leaving aside the question of the additional special motives of individuals taking part in those activities.¹

GAMES AND SPORTS

Children spent much if not most of their time at play. Some of their more specific activities were cats’ cradle, jumping rope, blind-man’s buff, hide-and-peek, a kind of jackstones, swinging, sliding, stilt walking, and kite flying.² Other children’s pastimes were imitative of adults—for example, sailing toy boats and “sacrificing” make-believe victims in small replicas of marae. We are not informed about sex lines, if any, that obtained in such play, or about the stage of life when children ordinarily abandoned such pastimes for more adult pleasures.

Children began at a very early age to swim and dive, and they soon developed skills that were the wonder of the European visitors. There is no record of how fast or how far they could swim, but their endurance and versatility in the water were quite remarkable. Swimming, or at least surfing, continued to be a favorite pastime with adults. For surfing they used a canoe paddle or more commonly a board; some experts were able to stand erect on a board while surging before a large wave. Both sexes engaged in this sport; in fact, some of its more skillful devotees were women. (For a full account of Maohi surfing see Finney 1959.) Here is Bligh’s description of the activity:

The heavy surf which has run on the shore for a few days past has given

great amusement to many of the Natives, but is such as one would suppose would drown any European. The general plan of this diversion is for a number of them to advance with their paddles to where the Sea begins to break and placing the broad part under the Belly holding the other end with their Arms extended at full length, they turn themselves to the surge and balancing themselves on the Paddles are carried to the shore with the greatest rapidity. As several seas follow each other they have those to encounter on their return, which they do by diving under them with great ease and cleverness.

The delight they take in this amusement is beyond anything, and is of the most essential good for them, for even in their largest and best Cannoes they are so subject to accidents of being overturned that their lives depend on their swimming and habituing themselves to remain long in the Water. (Bligh 1789:I, 408-409)

Surf-riding in boats was also a favorite sport, and it had the additional, though possibly unintentional, value of providing practice for the serious and often dangerous action of landing boats through heavy seas.

Competitive athletic sports included footracing, boat racing, boxing, and wrestling—the last having been the most popular and highly elaborated of the four. Wrestling was based more on brute strength than on skill. After witnessing some matches Bligh wrote:

Upon the Whole this performance gave me a poor opinion of these people. They have strength enough but they are very deficient in skill and equally so in courage. (1789:I, 391)

A fair fall like as it is in England is to be thrown on the back, but if they fall to the ground any way the trial for that time is over. They grapple by the Hair, Legs or any part they can lay hold of, however they have the art of the Cross buttock as in Cornwall, but the Man who takes that method is generally thrown or Obligated to quit it, if the opponent is stronger than himself. (Bligh 1789:I, 412)

Bligh's description and opinion were confirmed by most of the Europeans who left eyewitness reports of Maohi wrestling matches (e.g., Beaglehole 1955:91). Ellis, writing decades later, also described the unorthodoxy (in Western eyes) of Maohi wrestling tactics:

They grasped each other by the shoulders, and exerted all their strength and art, each to throw his rival; this was all that was requisite; and although they generally grappled with each other, this was not necessary according to the rules of the game. Mape, a stout, and rather active, though not a large man, who was often in my house at Eimeo, was a famous wrestler. He was seen in the ring once, with a remarkably tall heavy man, who was his antagonist; they had grappled and separated, when Mape walked carelessly towards his rival, and on approaching him, instead of stretching out his arms as was expected, he ran the crown of his head with all his might against the temple of his antagonist, and laid him flat on the earth. (1829:I, 289-290)

While the actual wrestling may have lacked finesse, its social-ceremonial setting was highly elaborated. Matches were held during nearly every large peaceful gathering of people, whatever the primary occasion. Informal matches often took place among residents of the same neighborhood or

district, but climaxes of public interest occurred during matches between the champions of different districts; such bouts were witnessed by hundreds and even thousands of people.

Despite its ambiguities a statement by Ellis indicates that wrestling involved more than individual skill and strength:

In this, as in most of their public proceedings, the gods presided. Before wrestling commenced, each party repaired to the marae of the idols of which they were the devotees. Here they presented a young plantain-tree, which was frequently a substitute for a more valuable offering, and having invoked aid of the tutelar deity of the game, they repaired to the spot where the multitude had assembled (1829:I, 288).³

Matches took place in a ring formed by the onlookers. In some cases challenges were issued in advance and the principal rivals began their bouts without further ado. Otherwise a champion from each side initiated the proceedings with a challenge, by walking around the ring, the left arm bent and hand on breast, while striking the right hand loudly against the left arm. According to Ellis, "The strokes on the arm were sometimes so violent, as not only to bruise the flesh, but to cause the blood to gush out" (1829:I, 289).

As soon as the challenge was accepted the rivals closed and kept at it until one of them was thrown. The victor had the choice then of retiring, with honor, or issuing another challenge. Sometimes several pairs wrestled simultaneously, and serious injuries were not uncommon. It was customary for some chiefly person to act as referee, to terminate stalemates or to award a decision when an outcome was not clearly decisive. The crowds remained silent during a match, but broke out in partisan furor when it ended decisively:

The most unbroken silence and attention was manifested during the struggle; but as soon as one was thrown, the scene was instantly changed; the vanquished was scarcely stretched on the sand, when a shout of exultation burst from the victor's friends. Their drums struck up; the women rose, and danced in triumph over the fallen wrestler, and sung in defiance to the opposite party. These were neither silent nor unmoved spectators, but immediately commenced a most deafening noise, partly in honour of their own clan or tribe, but principally to mar and neutralize the triumph of the victors. It is not easy to imagine the scenes that must often have been presented at one of their taupitis, or great wrestling matches, when not less than four or five thousand persons, dressed in their best apparel, and exhibiting every variety of costume and brilliancy of colour, were under the influence of excitement. One party was drumming, dancing, and singing, in the pride of victory, and the menace of defiance; while, to increase the din and confusion, the other party were equally vociferous in reciting the achievements of the vanquished, or predicting the shortness of his rival's triumph. (Ellis 1829:I, 290-291)

Controlled and good-natured rivalry seems to have characterized most matches, for the principals as well as for their supporters. "The greatest good humour is carried through the whole, and the Man that is thrown

laughs at his overthrow as much as the other does at his success" (Bligh 1789:I, 412). "The conqueror never exulted over the Conquer'd, neither did the Conquer'd ever repine at his ill luck, but the whole was carried on with great good humour. Notwithstanding during the Combat their countenances appear'd to express as much fury as if they had been really in earnest." (Beaglehole 1955:91.) Matches occasionally, however, did end in general brawls and even open warfare.⁴ A passage from Moerenhout indicates that a series of reversals had the effect of fanning tempers to a dangerous heat: "If it should happen that one side is beaten in match after match it usually ends up in real warfare" (1837:II, 141-142).

Champion wrestlers were loudly applauded and highly esteemed, but it is not reported whether they received any other rewards for their prowess. Some of them were individuals of upper-class status, but the sport was open to all—including women, some of whom wrestled publicly not only among themselves but also with men. "Persons in the highest rank sometimes engaged in the sport; and the sister of the queen has been seen wearing nearly the same clothing as the wrestlers wore, covered all over with sand, and wrestling with a young chief, in the midst of a ring, around which thousands of the people were assembled" (Ellis 1829:I, 292). According to Bligh (1789:II, 39), women's wrestling was if anything more savage than men's and included such tactics as gouging eyes (see also Morrison 1935:222). Turnbull witnessed one such *melée*:

Nor were these sports confined solely to the men; the women were equally emulous to signalize themselves, and their feats of pugilism were equally honourable to their courage. They fought with equal resolution and dexterity, hanging on each other's necks like bull-dogs, tearing their hair, bumping the stomach of each other, both with their heads and feet; in a word, neglecting no means of victory. Their husbands and relations were spectators of their efforts, and encouraged them to continue them; upon one or the other of them receiving a fall, the affair was terminated, and the parties, after adjusting their hair, would tenderly embrace, and be as good friends as ever. (1813:286)

Boxing matches were conducted similarly to wrestling matches:

The challenge was given in the same way as in wrestling; but when the combatants engaged, the combat was much sooner ended, and no time was spent in sparring or parrying the blows. These were generally straight forward, severe, and heavy; usually aimed at the head. They fought with the naked fist, and the whole skin of the forehead has been at times torn or driven off at a blow. No one interfered with the combatants while engaged; but as soon as either of them fell, or stooped, or shunned his antagonist, he was considered vanquished, the battle closed, and was instantly succeeded by the shouts and dances of triumph. (Ellis 1829:I, 292)

On the other hand, when one of the boxers was badly injured or killed, the spectators "... wildly dispersed, while friends uncomplainingly bore away the unfortunate champion." In Henry's opinion boxing was the most

“barbarous” of all Maohi sports, and its champions “... were proud to boast of the number of men they had maimed or killed.” (Henry 1928:277)

Boxing seems to have been more favored in the Leeward Islands than in Tahiti, and according to Ellis it was practiced mainly by “... the lower classes.” But he added: “These barabarous sports [wrestling and boxing], though generally followed by the common people, were not confined to them; other classes sometimes engaged; chiefs and priests were often among the most famous boxers and wrestlers.” (1829:I, 292-293)

Footracing was mainly a contest among young men (Ellis 1829:I, 293); Henry stated that a winner was awarded a prize, but she gave no further details (1928:278). Boat-paddling races were usually held in the protected waters of lagoons; they were described as affording “... a high degree of satisfaction” (Ellis 1829:I, 294), but no further information was recorded about their organization or ceremonial contexts.

In addition to these competitive athletic sports the Maohis played several varieties of ball games, all consisting of propelling a ball past a goal mark at the rivals’ end of the playing field. ‘Football’ (*tu’era’a pōpō*) was played by men or women and involved kicking a ball made of the dried fibers of plantain stalks. ‘Seizing-the-ball’ (*harura’a pu’u*) was mainly a game for women, who ran with the ball or threw it towards the goal; it was played on the beach, in and out of the water, and usually resulted in some rough bruising scrambles. ‘Hockey’ (*āpai, paipai*) was played by men,⁵ who used sticks to drive a small ball made of tightly wound strips of bark cloth.

Sportive combat with weapons was another favored Maohi pastime, and seems to have been practiced specifically with martial purposes in view. Such combat, with spears and clubs, is described in chapter 12.

The Maohis also held contests of skill in sling shooting, javelin throwing, and archery.

Sling shooting was used in warfare but also served as a favorite amusement in times of peace. An account from Wilson describes this activity:

They practise the sling for amusement, as well as to employ it in battle, and throw a stone with great force and tolerable exactness. Their slings are made from the plaited fibres of the cocoa-nut husk, having a broader part to receive the stone: at one end is a loop for the hand, in order to keep the sling fast when they discharge the stone. In charging the sling they hold it round their shoulders, keeping the stone fast in it with their left thumb, and jumping, swing the sling three times round their heads, holding the left hand grasped on the wrist of the right, and thus discharge the stone with a force sufficient to enter the bark of a tree at two hundred yards distance; the stone flying at an equal distance from the ground, like a bullet, all the way. (1799:354)

The light javelins used for sporting contests—but not, reportedly, for war (Bligh 1789:I, 412)—were thrown at fixed marks, usually stems of plantain trees, some thirty to forty yards distant. Both males and females

engaged in this sport, and some were expert at hitting the mark; but not those witnessed on one occasion by Banks: "In coming down again we saw the game that the Indians call *Erowhaw*, which is no more than pitching a kind of light lances headed with hard wood at a mark: of this amusement they seem to be very fond but none that we saw now excelled in doing it, not above one in 12 striking the mark which was the bole of a plantain tree about 20 yards distant" (Beaglehole 1962:I, 326-327). In view of the expert marksmanship of many individuals, it is curious that such weapons and tactics were not used more commonly in fighting.

Archery, as practiced by the Maohis, is even more puzzling in this regard: it was a favorite pastime with many individuals and was surrounded with elaborate ritual, but, although occasionally used in hunting, bows and arrows were not employed in war—at least not during the eras now under study.

Bows were made of *pūrau* wood; they were about five feet long, strung with fiber of the *Pipturus argenteus*, and occasionally decorated with sennet or strings of human hair. Arrows were of bamboo, about two and a half to three feet long, unfeathered, and tipped with hard ironwood points; they were kept in decorated bamboo quivers. In shooting, the archer knelt on one knee, drew back the arrow to its point, and let go the bow as soon as the arrow was fired. Distance rather than marksmanship was the objective, and our sources reported shots of three hundred yards. The shooting was done from special stone platforms, three or four feet high and triangular in shape with one side of the angle convex (figs. 10-1, 10-2, 10-3). Arrow spotters were posted in the general area aimed at, and they signaled back to the contestants whether a shot went farther or fell short of the preceding best mark.

FIGURE 10-1. Archery platform.

According to Henry, archery was "... the most refined of the native athletic sports, and was a favorite amusement of the upper classes" (1928:276). The special garments of the archers, along with the bows and arrows, were

FIGURE 10-2. Remnants of archery platform near marae Afaveaito at Opunoho, Mo'orea. Reconstruction and photo by Y. Sinoto, Bishop Museum.

kept in a separate house in the local marae of Paruatetava'e, the tutelar deity of the sport. There the archers dressed and prayed before a match, and there they had to bathe away the aura of sacredness after a match, and before returning to normal pursuits.⁶

Morrison asserted that women also engaged in archery (1935:223)—but presumably wholly separately from men and with less religious implication or ritual elaboration.

To the wonderment of Europeans, in none of the competitive sports I have been describing, except possibly in footracing, were the victors directly rewarded with anything more tangible than public acclaim, and such was also the case with the owners of victorious fighting cocks.

Cockfighting, according to Ellis, was a universally followed sport (1829:I, 303), but it was mainly pursued by younger men. Henry added:

In every district were young men who trained fowls for this purpose. They made house pets of them, fed them well, and taught them to open their mouths to receive food and water from their master's hand; in warm weather they were sprinkled with water to refresh them. The plumage of these fowls was never trimmed, the young men preferring to see them in all their natural beauty, and no artificial spurs were applied. (1928:277-278)

Fighting usually took place in the cool of the early morning, before the birds could be slowed down by the sun's heat. As soon as one bird tried to avoid the other he was considered beaten and the two were separated (Ellis 1829:I, 303; Henry 1928:278). Occasionally the cock fanciers of one district would join to challenge those of another, and the ensuing bouts would go on for days at a time, with the hosts—the challengers—providing hospitality in the form of food. As stated above, no wagering accompanied the cockfighting; the rewards were presumably in the form of praise for the victorious side, and in the case of the victorious birds' owners, of "... the gratification they derived from beholding [their birds] destroy each other" (Ellis 1829:I, 302).

It is astonishing how great is their pleasure in this diversion, which appears to be unconnected with any other considerations of personal interest; but there is little in their lives for which they have such passionate concern. No warrior takes such fierce pride in his acts of bravery as do the owners of fighting cocks in theirs. (Moerenhout 1837:II, 146-147).

Although Moerenhout seems to have been describing more specifically the situation that obtained in his day (i.e., in the 1830s), his remarks could well have applied to earlier days. In practically every house, he continued, there was at least one fighting cock, and their owners used to spend hours in stroking them, feeding them, and even just gazing at them. In fact, according to him, the owners of such cocks displayed toward them "... an affection seldom manifested for any other being, even including their own children."

STORIES, RIDDLES, AND JESTS

What Westerners would call “idle chatter” was evidently one of the Maohis’ most pleasurable pastimes:

If, as sometimes happened, there were no jobs that had to be done and nothing else of a pressing nature to occupy them, everyone—both males and females—would lounge about in the open, in front of their houses or under the trees, and amuse themselves with some game or other or, more usually, simply conversing. Indeed, conversation was their strong point and chatter was everyone’s pleasure—something which they never let up with. (Moerenhout 1837:II, 76)

As for more formal (or more “structured”) utterance, not only was “good speech” a prerequisite for some kinds of social distinction, but it was a highly developed art.

Eloquence was as much esteemed by these islanders as by any other people in the world. They had their masters of rhetoric and their schools where the art of speaking was taught; and it seemed eloquence was so necessary to the chiefs that to lack it was to lack the ability to rule; even today, when they speak of certain ancient chiefs, it is rarely that you hear: “That was a powerful man, a great warrior”; but, putting aside all he had done and only seeing in him the renowned orator, they say emphatically: “Ta’ata paraparau maitai! There was a man who spoke well!” (Moerenhout 1837:I, 411)

By Western criteria, Maohi formal utterances may be assigned to several distinct types, such as prayers, elegiac ballads, panegyrics, greetings and dismissals, public “debates,” battle harangues, maxims, proverbs, love lyrics, genealogy, “true” stories—both “mythical” and historical—deliberate fiction, riddles and other enigmas, and jokes.⁷ Some types of utterances have already been touched upon (e.g., prayers and myths) and others will be described in their appropriate contexts. Here I wish to single out some types that were engaged in by people mainly for amusement—namely, fiction, enigmas, and jokes.

One gains the impression that riddles and other enigmas (*parau piri*) were a favorite diversion of the Maohis, but the only recorded examples of pre-European riddles that I could find are the following:

E fenua tu’u piri o Hitia’a; teie te ve-tahi tau piri: —

A tahi, a rua te marama i ha’aputupu; a toru, a maha marama i ha’aputupu; a pae a ono marama i ha’aputupu; a hitu, a varu te marama i ha’aputupu; a iva e ahuru te marama i ha’aputupu; a tû mai, a fa’ati’ati’a, a vaiiho i vaho!

(1) ‘O vai ia?

E te Tumu-nui e, o te tamari’i o te vahine matamua ‘o te Tumu e to’na hua’ai, i fanau mai i te ao nei.

Hitia’a was a land of riddles; here are some of the riddles: —

One, two moons have supervened; three, four moons have supervened; five, six moons have supervened; seven, eight moons have supervened; nine and ten moons have supervened; come forth, be propped, remain outside!

(1) Who are they?

O Tumu-nui, they are the children of Tumu’s first woman and her posterity, born into the world.

(2) Eaha te faofao ata?
 'O te repo fenua ia 'aore i î; e o te moana atea ia.

(3) Eaha te ra'au e peha te tumu e peha te 'ama'a, e peha te ohui, e peha te rau, e peha te 'iri, e peha te maea?

O te vahine ia fanautama.

(4) 'Eaha te tahu'a 'e tâtà i te riu o Ha'apaiano'o?

'O te Maa'a'e e o te Papaite ia.

(2) What are the clouds' reservoirs?

They are the ground which is never full; and the vast ocean.

(3) What tree is it that duplicates its trunk, duplicates its branches, duplicates its shoots, duplicates its leaves, duplicates its outer bark and inner bark?

It is a woman bearing children.

(4) Who are the workers that bail up the waters of Ha'apaiano'o (Confluent-water)?

They are Maa'a'e (northeast wind) and Papaite (northwest wind).

(Henry 1928:71)

Without raising the highly complicated (and, in my view, unanswerable) question of the Maohis' belief in the "truth" of other kinds of stories about the past, there were some stories told by them, evidently for amusement alone, that appear to have been quite deliberately fictional. Among such fiction was the tall tale reported by G. Forster:

The chief Orea had dined on board with captain Cook during our absence, and had drunk about a bottle of wine, without appearing in the least intoxicated. He had however, as usual, been extremely facetious, and had conversed chiefly of the countries which we had lately visited, and of which he had received an account from his countryman Mahine. After being satisfied in regard to many particulars, he said, that though we had seen a great deal, he would tell us of an island which we had not met with in our voyages. "It lies," said he, "but a few days sail from hence, but it is inhabited by a monstrous race of giants, as tall as the main-mast, and as thick about the middle as the drum-head of the capstan. They are very good-natured people, but if they are ever incensed against any body, they take him up, and throw him as far into the sea as I would throw a stone. If you should happen to come there with your ship, they would perhaps wade up to it, and carry it ashore on their backs." He added several other ludicrous circumstances, and concluded with telling us the name of the island, Mirro-mirro, in order to give greater weight to his assertion. It appeared evidently to us, that his whole story was a fine piece of irony, directed against those parts of our narrative which he did not believe, and of which he could have no conception. We admired the witty humour which was so conspicuous in this little flight of fancy, and with M. de Bougainville looked up to its great source, the affluence of the country, which produces contentment and pleasure. (1777:II, 139-140)

Some fictional stories invented by the Maohis were evidently meant to horrify, to scandalize, to arouse tears of compassion, and so forth, but many others were probably told to evoke mirth, which leads us to what I have labeled "jesting."

Jesting (*hiro*, *hō'ata*), a much favored mode of Maohi speech, was in the form of word labels applied to individuals or places, of informal gossip and badinage, or of dramatic travesty. Ellis provided post-European, but probably characteristically indigenous, examples of the first:

The inhabitants of one of the Leeward Islands, Tahaa, I believe, even to the present time furnish matter for mirthful jest to the natives of the other islands of the group, from the circumstance of one of their people, the first time she saw a foreigner who wore boots, exclaiming, with astonishment, that the individual had *iron legs*. It is also said, that among the first scissors possessed by the Huahineans, one pair became exceedingly dull, and the simple-hearted people, not knowing how to remedy this defect, tried several experiments, and at length *baked the scissors* in a native oven, for the purpose of sharpening them. Hence the people of Huahine are often spoken of in jest by the Tahitians, as the *feia eu paoti*, or people that baked the scissors. (1829:II, 24-25)

Ellis remarked that "They do not appear to delight in provoking one another, but are far more accustomed to jesting, mirth, and humour, than irritating or reproachful language." In this evaluation Ellis was joined by Moerenhout:

They liked to banter words about to provoke laughter, even at the expense of others, whether their targets were present or not. On the other hand they were unaccustomed to satire, never using this means to injure one another. Epigrams, and often quite sharp ones, were commonly on their lips—but only for the purpose of producing good humor, and innocent, nonmalicious good humor at that. (1837:II, 76)

I cannot agree with this last assertion of Moerenhout's, but malicious or not, most evidence that we have on Maohi jesting is that it was delivered as if in joke. But however amiable some Europeans may have judged Maohi joking to be, they did not always approve of the style of that humor:

Their humour and their jests were, however, but rarely what might be termed innocent sallies of wit, and were in general low and immoral to a disgusting degree. Their common conversation, when engaged in their ordinary avocations, was often such as the ear could not listen to without pollution, presenting images, and conveying sentiments, whose most fleeting passage through the mind left contamination. Awfully dark, indeed, was their moral character, and notwithstanding the apparent mildness of their disposition, and the cheerful vivacity of their conversation, no portion of the human race was ever perhaps sunk lower in brutal licentiousness and moral degradation, than this isolated people. (Ellis 1829:II, 25)⁸

I must leave to others the specialized task of analyzing Maohi oral literature and formalized utterances. A few starts have already been made in that direction,⁹ but a major work on the subject remains to be done. I can, however, call attention to two stylistic (as opposed to thematic) features of the kinds of utterances just described that seem to me to be particularly relevant to social relations. First of all, in lengthy stories, about both humans and spirits, incidents tended to be strung together genealogically rather than by any development of converging themes perceptible to me. The protagonist first to appear in the narrative lives out his life of adventures and dies (or otherwise disappears from the scene), and then his son does likewise, and so on—with no discernible master plot or final resolution comprehending any time span longer than each protagonist's life.¹⁰

In connection with the more “public,” formalized examples of jesting, the directness and pithiness that seem to have been so typical of informal conversation were not replaced by the kind of circuitous euphemism that characterized so many other types of Maohi public utterance. In other words, jesting, as a genre, appears to have been widely recognized as a licensed kind of free speech. Even men of great power and irritability, as we shall see, were required by convention to submit to such jesting now and then.

MUSIC

If one may say that eloquence was *honored* by [certain Pacific islanders], then one should add that poetry was a *passion* with them, and especially was this true of the Society Islanders, who were the least barbaric of all of them and the most inclined towards all forms of amusement. These latter made use of [poetry] in all their festivals and religious ceremonies, mainly in the persons of bards and traveling minstrels who enlivened such occasions with their [poetic] performances, their music, and their dancing. For the subject matter of their chants these latter dealt not only with the adventures of the gods and heroes, with the wars and great deeds of their reigning chief, and with the physical perfections or other virtues of other persons present, but even more often they concerned themselves with the delights of lovemaking, a subject about which they were able to produce improvisations with outstanding facility. (Moerenhout 1837:I, 411-412)

Many of the more stylized utterances listed in the preceding section—prayers, genealogies, ceremonial salutes, harangues, laments, love lyrics—approached singing in their delivery; but in addition there were others that the European visitors unequivocally called “songs” or “ditties.” Both *pehe* and *ūtē* are given as the Maohi terms for such songs, but it is not clear whether they both refer to songs in general or to distinctive types of songs.¹¹ Banks described the *pehe* as consisting of “... two lines affecting a coarse metre and generally in Rhime” (Beaglehole 1962:I, 349); such was a popular style of song, rendered either with or without accompaniment, and either in ceremonial chorus or by an individual idling away his time in solitary contentedness. Banks added: “At any time of the day when they are lazy they amuse themselves by singing these couplets but especially after dark” (p. 350). Ellis translated *pehe* as song, but used the word *upu* for what he called their “historical ballads,” although it is not clear whether he meant to imply that all their songs were “historical ballads,” or that such ballads comprise only one type of song (1829:I, 285). In this connection, the LMS Dictionary translates *upu* as prayer.

Some observers described much Maohi singing as having been in the form of recitative: *pehepupite*, to sing alternately, as two persons, or parties (LMS Dictionary). But further details on song lyrics are lacking, except for a description of a kind of choral accompaniment, by males, to certain forms of dancing:

Dancing [is sometimes accompanied by] a choir of males arranged in one or more rows and usually seated. The part played by such a group is to provide a choral background, consisting of guttural and inarticulate sounds uttered in unison, to a soloist who sings in a clear falsetto voice. Usually, the latter also serves as choir leader, and the members of the choir respond to his leads in howling and powerfully sounded cadence accompanied by bizarre gestures, and all carried out in remarkably precise unison. (de Bovis 1909:34)

The following passage, from a missionary journal of 1801, concerns performances put on by groups of “traveling players”—quite possibly members of the Arioi sect:

Arrived at Edea’s house a company of travelling players, who go from one district to another to exhibit their truly savage performances. They generally travel in large companies, with a manager at their head. Their manner of performing is thus:—The actors place themselves in a ring on the ground, the manager stands in the middle, and begins with a prologue, which he delivers with much vehemency, and wild gesticulation of his arms, fingers and feet; then a signal is given to the actors, who all break out into a most singular and barbarous noise, which can be compared to nothing better than a herd of swine, grunting in concert, at the same time they keep working their hands and thighs as they sit cross-legged, like so many lunaticks, and thus they continue till they are obliged to stop for breath; a repetition of this continues about three quarters of an hour. During the whole of the performance the manager keeps his place, and plays his antics; a drum is also kept beating, to which they grunt in tune. This abominable pastime is much delighted in by all ranks, though the higher class profess to despise the actors, and speak of them and their performances in a contemptuous manner. Upon what is termed grand occasions, the spectators who come from far and near, appear in their best apparel. (LMS Transactions:I, 216-217)

The subject matter of Maohi song lyrics varied widely. Many of them had to do with events that were either legendary or more credibly historical: the exploits of gods and heroes, the tribulations of all manner of individuals, the occurrence of noteworthy happenings, and so forth.

They were often, when recited on public occasions, accompanied with gestures and actions corresponding to the events, or scenes described, and assumed in this respect a histrionic character. In some cases, and on public occasions, the action presented a kind of pantomime. They had one song for the fisherman, another for the canoe-builder, a song for cutting down the tree, a song for launching the canoe. But they were, with few exceptions, either idolatrous or impure; and were, consequently, abandoned when the people renounced their pagan worship. (Ellis 1829:I, 285-286)

Some songs may have been of considerable antiquity, other songs were quite obviously of recent vintage or were observed to have been improvised on the spot and either forgotten immediately after delivery or stored up in the popular repertory. In any case, once widely known and firmly established, a song had what Ellis called “... a kind of standard, or classical authority, to which they referred, for the purpose of determining any disputed fact in their history.”

The fidelity of public recitals referring to former events, was sometimes questioned by the orators or chroniclers of the party opposed to that by whom the recital had been made. The disputes which followed, were often carried on with great pertinacity and determination. As they had no records to which they could at such times refer, they could only oppose one oral tradition to another, which unavoidably involved the parties in protracted, and often obstinate debates. At such times, a reference to some distich, in any of their popular and historic songs, often set the matter in dispute at rest. On a recent occasion, two parties were disputing in reference to an event which occurred in the bay of Papara during the time Captain Bligh remained there in the *Bounty*, in 1788 or 1789. The fact questioned was the loss of the buoy of his anchor: after disputing it for some time without convincing his opponent, the individual who had stated the fact referred to the following line in one of their ballads, relating to that event.

'O mea ei'a e Tareu ei'a
Ei'a te poito a Bligh.

Such an one a thief, and Tareu a thief,
Thieved (or stole) the buoy of Bligh.

The song was one well known to most, and the existence of this fact, among the others that had taken place, and the remembrance of which the ballad was designed to preserve, was conclusive, and appeared to satisfy the parties by whom it had been questioned. Most of their historical events were thus preserved. These songs were exceedingly popular for a time. The facts on which they were grounded became thus generally known; and they were, undoubtedly, one of the most effectual means they had of preserving the knowledge of the leading events of former times. (Ellis 1829:I, 286-287)

Singing, especially on public occasions,¹² was nearly always accompanied by a kind of male chorus, already described; or by musical instruments or gestures or dancing; or by combinations of these.

The Maohis' musical instruments were drums (figs. 10-4, 10-5), shell trumpets (fig. 10-6), gongs, flutes (fig. 10-7), castanets, and dance rattles. Their drums (*pahu*) were made of a sharkskin head fastened over the hollowed-out end of a section of tree trunk. *Pu'a* (*Fragraea berteriana*) and *reva* (*Cerbera manghas*) were the favorite woods used, because of their durability and close grains (Ellis 1829:I, 282). The sharkskin head was stretched tightly over the opening by means of sennit cords attached to the solid foot of the drum. Drums varied in length from one to several feet and in diameter from one to two feet.

The Music was performed on three Drums of different Tones, arising from their different magnitudes & form. The Base, or deepest toned one, was about 12 or 14 Inches high, and perhaps as much in diameter: The Middle one was about 2½ feet high and about 10 Inches diameter; and that which had the highest tone, might be near 3½ feet high and about 7 or 8 Inches Diameter. Their Heads were made of Shark's Skin and braced much in the same Manner as ours are, only without the slides which ours have for bracing and unbracing.... (Beaglehole 1961:804)

The larger ones were usually beaten with sticks, two in number; the smaller

ones by hand. When beaten they were fixed upright upon the ground and consequently, according to one report, "... produced no very musical effect" (Ellis 1829:I, 283). According to Banks, the Maohi drums were beaten so as to "... accompany the flute but not disagreeably"; and, he added, "... they know also how to tune two drums of Different notes into concord which they do nicely enough" (Beaglehole 1962:I, 350).

There is little useful information available concerning the Maohis' repertory of drum rhythms, except for Banks' suggestive—but likely underestimating—assertion that their drums could make out only "5 or 6 tunes."

In general, the larger drums were kept in the marae and were sounded on such solemn occasions as sacrifices or the illness or death of an important person.

Ellis described the shell trumpet (*pū*) in the following terms:

The sound of the trumpet, or shell, a species of murex used by the priests in the temple, and also by the herald, and others on board their fleets, was more horrific than that of the drum. The largest shells were usually selected for this purpose, and were sometimes above a foot in length, and seven or eight inches in diameter at the mouth. In order to facilitate the blowing of this trumpet, they made a perforation, about an inch in diameter, near the apex of the shell. Into this they inserted a bamboo cane, about three feet in length, which was secured by binding it to the shell with finely-braided cinet [sennit]; the aperture was rendered air-tight by cementing the outsides of it with a resinous gum from the bread-fruit tree. These shells were blown when any procession marched to the temple, at the inauguration of the king, during the worship at the temple, or when a tabu, or restriction [i.e., a *rahui*], was imposed in the name of the gods. We have sometimes heard them blown. The sound is extremely loud, but the most monotonous and dismal that it is possible to imagine. (1829:I, 283-284)

The same author described the gong (*ihara*) as follows: "... formed from the single joint of a large bamboo cane, cut off a short distance beyond the two ends or joints. In the centre, a long aperture was made from one joint towards the other. The ihara, when used, was placed horizontally on the ground, and beaten with sticks." (p. 284) According to Henry the aperture was kept open by inserting a stick under the strips of bamboo (1928:275).

The nose flute (*vivo*) was described by Henry as producing "... a soft, sensitive, and plaintive sound" (1928:276). It consisted of a joint of bamboo a foot or so long and up to an inch in diameter. It had four or five holes on one side and one on the other, and it was sometimes ornamented by burnt-in designs or with wound-about strings of hair and sennit. Ellis described the method for playing it: "It was not blown from the mouth, but the nostril. The performer usually placed the thumb of the right hand upon the right nostril, applied the aperture of the flute, which he held with the fingers of his right hand, to the other nostril, and, moving his fingers on the holes, produced his music." (p. 285)

According to Banks: "They also tune their flutes if two play upon flutes which are not in unison, the short one is leng(t)hned by adding a small roll of leaf which is tied round the end of it and movd up and down till their ears (which are certainly very nice) are satisfied" (Beaglehole 1962: I, 350).

Flutes were sometimes played alone but were more frequently played to accompany singing, at least on public occasions. The sound of flute and voice drew the following commentary from one eyewitness:

One of the young men had a flute made of a bamboo, which had but three holes;

he blew it with his nostrils, whilst another accompanied him with the voice. The whole music, both vocal and instrumental, consisted of three or four notes, which were between half and quarter notes, being neither whole tones nor semi-tones. The effect of these notes, without variety or order, was only a kind of drowsy hum, which could not indeed hurt the ear by its discordant sounds, but made no pleasing impression on our minds. It is surprising that the taste for music should be so general all over the world, when the ideas of harmony among different nations are so distinct! (G. Forster 1777:291-292)

In practice, drums, gongs, and flutes—singly or in combination—served usually to accompany both singing and dancing.

Bligh provided the following description of castanets:

This Hevah [*heiva*] was different from any we have yet seen. The performers were eleven Men habited in that singular dress called Parry. They were placed in three files, and each Man had two Mother of Pearl shells in his hand, which by the Manner they were Strung on a peice of cord, and about an Inch asunder, with a small notion of the fingers made a clinking kind of Noise. (Bligh 1789:I, 422)

Anderson believed that the Maohis' fondness for music was related to their feelings, "which, though lively, seem in no case permanent":

Such a disposition, leads them to direct all their aims only to what can give them pleasure and ease. Their amusements all tend to excite and continue their amorous passions; and their songs, of which they are immoderately fond, answer the same purpose. But as a constant succession of sensual enjoyments must cloy, we found, that they frequently varied them to more refined subjects, and had much pleasure in chanting their triumphs in war, and their occupations in peace; their travels to other islands, and adventures there; and the peculiar beauties, and superior advantages of their own island over the rest, or of different parts of it over other less favourite districts. This marks, that they receive great delight from music; and though they rather expressed a dislike to our complicated compositions, yet were they always delighted with the more melodious sounds produced singly on our instruments, as approaching nearer to the simplicity of their own. (Cook 1784:149-150)

Finally, I quote some passages describing the companies of "traveling musicians" that made at least a part-time profession of these arts:

The drums are chiefly used at their *Heivas* which are a set of musicians 2 or 3 drums for instance as many fluits and singers, which go about from house to house and play and are always received and rewarded by the Master of the family who gives them a peice of Cloth or what ever he can spare, for which they will stay three or four hours during which time his house will be crowded full for the people are extravagantly fond of this diversion. (Beaglehole 1955:127)

In my mornings walk today I met a company of traveling musicians; they told me where they should be at night so after supper we all repaired to the place. There was a large concourse of people round this band, which consisted of 2 flutes and three drums, the drummers accompanying their musick with their voices; they sung many songs generally in praise of us, for these gentlemen like Homer of old must be poets as well as musicians. The Indians seeing us entertained with their musick, asked us to sing them an English song, which we most

readily agreed to and received much applause, so much so that one of the musicians became desirous of going to England to learn to sing. These people by what we can learn go about from house to house, the master of the house and the audience paying them for their musick in cloth, meat, beads or any thing else which the one wants and the other can spare. (Beaglehole 1962:I, 290)

DANCE

Any little melody played on their nose flutes, or even the muted sounds from their drums, was enough to set them in movement; and as soon as one of their favorite tunes was heard to the accompaniment of these instruments, their faces and bodies became animated, moving in rhythm and showing the pleasure given them. This type of dance involved two or four individuals who were usually clothed from the waist down. In some other types however some spectators, unable to contain their excitement and imitating the movements of the principals, leapt one after the other into the dance. And on such occasions all clothing became superfluous, and everyone performed entirely nude. At this point performers and spectators alike seemed to lose themselves in a mad frenzy, and not infrequently (as in the case of the Arioi) would perform actions of such depravity as to prohibit our description of them. Their dance movements alternated with gestures of hands and arms. The rhythmic beat of the men's voices formed a background to the women's singing, and all to the accompaniment of flute and drum. (Morerhout 1837:II, 127)

Not all Maohi dancing began or ended in just this way, but the above passage does provide some sense of the mood, the social communion, and the deep absorption of these Islanders when circumstances moved them to dance.

Countless words have been written about ancient Maohi dancing, and from such descriptions one can glean many different impressions of their dance movements: for example, that they were sometimes slow and regular, sometimes rapid and wild; that at times they involved all the body, at times only the arms and shoulders. (Figs. 10-8, 10-9.) Furthermore, although many of the Europeans found some Maohi dance movements so "lascivious" or "obscene" as to elude description or demand reticence, others of their dances were innocent enough to please all but the most straitlaced prude. But for all this spate of words there has not survived any passage detailed enough to provide us with a precise account of the eurythmics of any of what must have been several different forms of Maohi dance. Perhaps the clearest account available is that of J. Forster:

... they by no means think the excellence of the performance to consist in the graceful motion of the feet, as they carefully cover them; but in the motion of their hands and fingers, they shew in my opinion, the greatest dexterity and elegance. They have generally long well shaped fingers, which are wonderfully pliant, so that they can with ease bend them so far back as to form with the rest of the hand a segment of a circle, and in this attitude they move them with an astonishing agility. This dance is called *Heèva he-oòra*, and the motion of the fingers *Eòree*. But beside this, they shake their hips in a rotatory motion, both

when they are standing and when they are leaning prostrate on their knees and elbows, with a velocity which excited our astonishment, and this is named *òne-òne*. There are other dances wherein they use measured steps, hold another by the hands and clap with them; which is called *pa-àta*. During the various kinds of dances, they never fail to make wry mouths, which, in our opinion, were the most extravagant and disgracing distortions, instead of being capable of giving the spectator ideas of gracefulness and harmony: habit has taught them to screw the mouth into an obliquely slanting direction by a kind of sudden convulsive mo-

FIGURE 10-9. Tahitian dancing. Drawing by J. Webber. British Museum.

tion of the lips, and custom only has made the sight of so unnatural and offensive a grimace a performance which pleases and merits applause. This distortion is called *ootoo-ròà* (large lips). [Fig. 10-10.] There are other dances usual in their nocturnal festivals with the *Arreeoys*, which, none of our ships company had an opportunity of seeing, and are according to the accounts of the natives extremely indecent and lascivious; these are called *t'eài-mordée*, and the women exhibiting them *Too-àha*. The exercise of the common dramatic dances is very violent, the motion of the hands elegant, that of the feet not to be seen, that of the hips somewhat strange, and according to our notions indelicate; and lastly, that of the mouth horrid and disagreeable. The women when performing were always attended by a man, who accompanied the drums with a kind of song; and by some loud spoken words or the clapping of hands, directed their motions; which, in my opinion seems to intimate that they have a kind of plan in their dances, and that the transitions from the oblique steps, to the motion of the fingers and agitation of the hips, is in some measure connected with the words spoken by the master of the ballet. (1778:466-467)

FIGURE 10-10. "Distortions of the Mouth used in Dancing." Sketches by S. Parkinson. British Museum.

The general terms for dancing were '*ori* and '*upa*. Some writers gave terms for different forms of dance, but none of these accounts is exhaustive or unambiguous, and no two of them are identical.¹³

The *hura* was described by Henry as having been danced "... only by women of [high] rank, the queen often taking the lead" (1928:275). Moerenhout described it in these terms:

The *ehoura* [*hura*] is a form of production in which the actors perform behind a railing. The actors open the scene by repeated summons to the actresses, who soon thereafter arrive elegantly dressed and with their tresses oiled, perfumed, and decorated with flowers. The actresses enter and leave the stage continually, to the incessant invitations of the actors, whose gestures, movements, and words express their impatient longings, and who appear to shudder with delight at the very sight of their ladyloves. (1837:II, 128)

Morrison, on the other hand, identified the “hewra” [*hura*] as “... the Dance performd by the relations of Warriors Slain in Battle when they make friends with the Man who killd Him or them” (1935:224-225; see also Henry 1928:319). Morrison did not actually describe the dance itself, but his identification hardly accords with the one given by Moerenhout.

The descriptions given of the *ponara* are in better agreement:

Another Dance is the Ponnara which is performed almost evry evening in evry district through the Island. To this Dance the Weomen of evry age and discription resort to dance; young & old, Rich and Poor mix promiscuously, but no Men Join with them—when they attend the Ponnara they are always Neat and dressd in their best, their Heads decorated with Garlands of sweet scented Flowers. Having fixd on the Ground they devide themselves in two partys and sepearate at 30 or 40 Yards from each other, when one of the Best players having provided a small green Bread fruit for a Ball with which she runs out about half way between the two kicks the Ball with as Much force as she is able, striking it with the upper part of the foot near the instep; if she sends the Ball through the other party or past them so none can stop it till it stops itself then the Opposite or Her party strike up a Song & Dance, beating time to it with hands & feet with much exactness and regularity—after they have finnishd their dance, which lasts about 5 or 6 Minutes, the Other Party kick the Ball which if it Passes they who kick it Dance, but if it is stopt by them who Danced first then they dance again, Mean time the Others Stand still—after they have Playd at this for some Hours they Kick the Ball to one side and both Partys strike up together, when each, to draw the Spectators to their exhibition, produce two or three Young Wantons, who stripping of their lower Garments Cover them selves with a loose piece of Cloth and at particular parts of the Song they throw Open their Cloth and dance with their fore part Naked to the Company making many lewd gestures—however these are not merely the effects of Wantoness but Custom, and those who perform thus in Publick are Shy and Bashful in private, and seldom suffer any freedom to be taken by the Men on that account. (Morrison 1935:225)

The Women divide into parties about 30 or 40 Yards apart and perform a kind of recitative accompanied with a Stamping of the feet and claping the hands with many wanton odd motions. A Breadfruit is then taken by a person of one party, and being placed on the foot is thrown over to the others. If it is caught, that party performs the dance and the others look on, but if it is not caught, the Party who threw it has the dance in token of the Victory, and the ball is thrown by turns from side to side. (Bligh 1789:I, 412)

Some other forms of dance identified in the sources include: *ōte’a*, “men’s dance with spurt” (Henry 1928:275); *oupépéhe* (*‘upa-pehe?*), “a dance accompanied by drums and the singing of a male and a female. The dancers themselves, all females and all completely nude, make a hissing sound as they dance”; and *mamaha*, “A dance by men and women together, all completely nude and accompanied by drums” (Moerenhout 1837:II, 127-128).

In addition, a number of other dances were described simply as being “indecent” or “obscene”: for example, the *mamua*, the *maupepe*, and the

po'opa'otati. Cook described one such dance, called by him the "timorodee"—a rendering which Beaglehole transcribed (not altogether persuasively) as *te ai moro iti*, pseudo-copulation:

The young girls when ever they can collect 8 or 10 together dance a very indecent dance which they call *Timorodee* singing most indecent songs and using most indecent actions in the practice of which they are brought up from their earliest Childhood, in doing this they keep time to a great nicety; this exercise is however generally left of as soon as they arrive at years of maturity for as soon as they have form'd a connection with man they are expected to leave of dancing *Timorodee*. (Beaglehole 1955:127)

Anderson provided an even more detailed description of a "lascivious," woman's dance:

... in the evening a great many of them [women] having collected together stood upon the side of a small river near the middle of the Bay and exhibited a sort of dance that rather bespoke an excess of joy and licentiousness, though perhaps it might be their usual custom. Most of these were young women, who put themselves into several lascivious postures, clapp'd their hands and repeated a kind of Stanzas which every now and then began afresh. At certain parts they put their garments aside and exposd with seemingly very little sense of shame those parts which most nations have thought it modest to conceal, but in particular a woman more advanc'd in years who stood in front & might properly be calld the tutoress or prompter of the rest, held her cloaths continually up with one hand and dancd with uncommon vigour and effrontery, as if to raise in the spectators the most libidinous desires and incite her pupils to emulation in such a wanton exercise. The men flockd eagerly round them in great numbers to see their performance and express'd the most anxious curiosity to see that part just mentioned, at which they seem'd to feel a sort of rapture that could only be express'd by the extreme joy that appear'd in their countenances. (Beaglehole 1967:977-978)

Rather than pursue further the complicated and probably fruitless exercise of trying to reconstruct Maohi categories for their dance forms,¹⁴ let us turn to more Western ways of classifying them.

First, the Maohis danced on all occasions, from carefree informal gatherings of a handful of people to solemn assemblies of thousands. They danced at welcomings and departings; at births and deaths; before, during, and after battles; as preludes, interludes, and postludes to contests, theatricals, and religious services.

Second, their manifest purposes in dancing were exceedingly varied. They danced for sheer pleasure or to give vent to rage, to express happiness or display grief, to invite or to defy, to entertain or to terrify. Dancing was an essential ingredient of many kinds of religious worship. It was also, occasionally, used as an instrument of politics: districts challenged one another to dancing contests, with victory, and praise, going to the side that displayed more agility and grace.

Districts contested with each other even in the form of dance and drama

competitions. These [like athletic matches] involved formal challenges, and they took place in the presence of chiefs and numerous other spectators. And while their dancing in general may be characterized as having been more or less lascivious, those performed on the occasion of these competitions tended to be less so, the outcome having been decided more on the basis of agility and grace. (Morenhout 1837:II, 129)

Third, the personnel of dancing varied from occasion to occasion from single performers dancing to the accompaniment of a single instrument—or with no accompaniment at all—to large troupes of males or females, or both males and females, with full accompaniment of flutes, drums, gongs, and chorus under the direction of expert prompters (*pāta'u*). For example, one writer witnessed a combination of three males and two females, and so on. As noted earlier, some of the dances may by name have been identified with one or both sexes and with a small or large number of dancers—as, for example, the *ponara*; but the sources are not explicit enough for more precise specification—or, what was more likely, Maohi conventions were not very specific in this regard. Andia y Varela witnessed on one occasion a dance performed by boys dressed as girls (Corney 1915:289).

Age was undoubtedly an indirect factor in dancing, that is, most dances required a suppleness and endurance which ruled out people past a certain stage of physical development or decline. There are numerous reports about very young dancers (especially females), but no eyewitness report that I know of concerning public dancing by elderly people.¹⁵ In fact, as will be noted in my description of the Arioi sect (chapter 22), in the public performances put on by these bands of cultist-entertainers, most accounts assert that only the novices and members of the lower hierarchic grades—that is, usually the younger members—actually danced or acted. In this connection, as noted earlier, certain of the more obviously copulatory dance movements of females—for example, Banks' and Cook's "Timorodee"—appear to have been danced exclusively by young women before marriage.

On the other hand, there was no restrictive connection between dancing and social (i.e., marriage) class, at least with respect to women:

The professors of these arts [dance, music, poetry] are so far from being degraded by them, that even the Princesses of the blood Royal think it not derogatory to their rank to exhibit their skill in dancing before a crowded audience of their father's or brother's subjects; and the actors were some of the *Hoas* or attendants upon the King (J. Forster 1778:475-476).¹⁶

There may have existed some relation between social class and specific form of dance, as recorded for example in Henry's statement that the *hura* was danced "... only by women of rank" (1928:275), but there is a good possibility that some such relation, if any, may have come about indirectly. The cost of certain dance costumes or of the expert instruction and the leisure needed for perfecting certain dance movements could normally have been

better borne by people of affluence,¹⁷ as shown, for example, by the statement in Wilson regarding participation in a *heiva*: "Any number of women may perform at once; but as the dress is very expensive, seldom more than two or four dance; and when this is done before the chief, the dresses are presented to him after the *heiva* is finished; and these contain thirty or forty yards of cloth, from one to four yards wide" (1799:355).

Next—and a matter already touched upon—one should, technically be able to classify Maohi dances according to the actual movements of the dancers: the parts of the body moved and the nature of the movements, the rhythms, the spatial patterns traced by their movements over the ground, the vocal sounds of the dancers, the symbols expressed by the movements, and so forth. We do, it is true, possess such statements as the following:

Their movements were generally slow, but remarkably regular and exact; the arms, during their dances, were exercised as much as their feet. (Ellis 1829:I, 298)

... they advanced sideways keeping excellent time to the drums which beat brisk and loud; they soon began to shake their hips giving the folds of cloth that lay upon them a very quick motion which was continued during the whole dance, they sometimes standing, sometimes sitting and sometimes resting on their knees and elbows and generally moving their fingers with a quickness scarce to be imagined. The chief entertainment of the spectators seemed however to arise from the Lascivious motions they often made use of which were highly so, more indeed than I shall attempt to describe. (Beaglehole 1962:I, 325-326)

These passages, as well as the excerpts from J. Forster and from Wales quoted earlier, provide useful general impressions of Maohi dancing, but they do not add up to a systematic classification of Maohi eurhythmics.

Several writers reported that complete or partial nudity went with sexually expressive dance movements. Also, we are given fairly detailed descriptions of the elaborate garments worn by women during the *hura*, as, for example, in a statement by Banks:

The women had on their heads a quantity of *tamou* or plaited hair which was rolled and between the interstices of it flowers of *Gardenia* were stuck making a head dress truly Elegant. Their shoulders arms and breasts as low as their arms were bare, below this they were covered with black cloth and under each shoulder was placed a bunch of black feathers much as our ladies nosegays or Bouquets. On their hips rested a quantity of cloth pleated very full which reached almost up to their arms and fell down below into long petticoats reaching below their feet, which they managed with as much dexterity as our opera dancers could have done; these pleats were brown and white alternately but the petticoats were all white. (Beaglehole 1962:I, 325)

Otherwise the sources tell us little about the connections between costume and dance form—if indeed there were any beyond the few examples just listed.

Before proceeding we should take note of a spectacle witnessed by

Bligh, and described by him as being "... of all things that was ever beheld ... the most uncommon and detestable."

They suddenly took off what cloathing they had about their Hips and appeared quite Naked. One of the Men was prepared for his part, for the whole business now became the power and capability of distorting the Penis and Testicles, making at the same time wanton and lascivious motions. The Person who was ready to begin had his Penis swelled and distorted out into an erection by having a severe twine ligature close up to the Os Pubis applied so tight that the Penis was apparently almost cut through. The Second brought his Stones to the head of his Penis and with a small cloth bandage he wrapt them round and round, up to-wards the Belly, stretching them at the same time very violently untill they were near a foot in length, which the bandage kept them erect at, the two stones and the head of the Penis being like three small Balls at the extremity. The Third person was more horrible than the other two, for with both hand seizing the extremity of the Scrotum he pulled it out with such force, that the penis went in totally out of sight and the Scrotum became Shockingly distended. In this Manner they danced about the Ring for a few minutes when I desired them to desist and the Heivah ended, it however afforded much laughter among the Spectators. (Bligh 1789:II, 35)

The best of the dancers presumably had their natural talents and basic training refined and elaborated by older experts in the art; and there are scattered references to such teachers, who attached themselves to socially prominent households or who traveled about the islands giving lessons. On the other hand, knowledge of ordinary movements was so widespread that most dancers probably learned the basics of the art through imitation and through instruction from relatives and friends.

Finally, before turning to other diversions of the Maohis it should be added that for dancing, as for all other socially important activities of these Islanders, there were believed to be special tutelary deities, who presided over the art and its more expert performers.¹⁸ Indeed, as noted earlier, some writers considered Maohi dancing to have had some deliberate, specifically religio-magical purposes.

DRAMA

On Tahiti, and on the neighboring islands, what the natives are most fond of doing in all the world is to dance and sing and playact (Moerenhout 1837:II, 126-127).

Maohis' playacting was in some particulars hardly to be distinguished from their dancing; or, rather, much of what Westerners would classify as dancing was pantomimic storytelling, and much of their playacting included dancing, and singing as well. These points should be kept firmly in mind as I describe the more specifically storytelling parts of their entertainments.

Maohi dramas were given at different times and in different settings. Sometimes they took place on a temporary stage of mats outside some house where a troupe of players happened to call on their tour around an

island. If the residents so desired, the troupe would entertain for an hour or two before resuming their tour; these tours took place at any hour of the night or day. Other times, a host would arrange an impromptu performance for an unexpected guest, using what local talent he could summon. At the other extreme were those ceremonious performances which took place at large public festivals and state visits; these were usually staged in specially constructed theaters and involved more elaborate costuming. On such occasions the actual dramas served either as featured events or as minor interludes between exhibitions of dancing or singing. (Beaglehole 1962:I, 328)

One Maohi drama setting was described by G. Forster, who witnessed a performance:

The place where it was performed was an area, about twenty-five yards long and ten wide, enclosed between two houses which stood parallel to each other. The one was a spacious building, capable of containing a great multitude of spectators; but the other was only a narrow hut, which was supported on a row of posts, and open towards the area, but perfectly closed up with reeds and mats on the opposite sides; one corner of it was matted on all sides, and this was the dressing-room of the performers. The whole area was spread with three large mats of the best workmanship, striped with black on the edges. In the open part of the smaller hut we saw three drums.... (G. Forster 1777:I, 398-399)

The themes of Maohi dramas varied widely, but most of those actually described by European witnesses appear to have been carried out in tones of satire (in contrast to the alleged absence of satire in jesting) and buffoonery—although it must be reported that the sense of some of the performances so witnessed wholly escaped their European audiences.¹⁹

Some writers implied that the Maohis' productions included "mythological" as well as "historical" themes;²⁰ this may indeed have been so, although the plays of this general type that were actually reported in the sources were more strictly "historical" (in the European sense) than "mythical." In fact, a large proportion of them were pointedly concerned with contemporary local situations—namely, with the deeds, and misdeeds, of their fellows, including their most feared and respected superiors:

When the Weomen [dancers, at certain performances] retire to take breath their place is supplyd by the Music and singers which is no way disagreeable when understood being soft and pleasing—at other times a set of Actors supplys their place—the principal part of which the(y) perform is Satyr, which is often directed at their Chiefs, and they never fail to expose such Charracters as draw their attention and tho they treat thier Chiefs with great freedom they incur no displeasure so long as they keep to the truth—by this Method they rebuke them for their faults in Publick, having first diverted them to draw their attention—this is done in a kind of Pantomime at which they are so good that any person who knows the Man they mean to represent may easily perceive who they are making the subject of their sport. (Morrison 1935:224)

After Dinner Tynah desired I would attend at a Heivah that was to be per-

formed on account of a Warrior of Oporeeonnee that had been at Morea and was used ill, and which caused a battle between the parties concerned.

This Heivah was performed in honor of the Warrior, by Tynahs direction, by which it appears he is of such high power as to distribute publick marks of honor as a reward for publick or meritorious Services. (Bligh 1789:II, 61)

The timeliness of some of their plays is further indicated by the frequent references in them to the European visitors, as for example those witnessed by Cook and his companions on Ra'iatea: "... we well know they can add to or diminish their plays at pleasure; we, our Ship and our Country they have frequently brought on the Stage ..." (Beaglehole 1961:421).

Another play, witnessed on Huahine, indicates not only timeliness of theme, but also the social uses to which such presentations were now and then put; I reproduce the whole account of it, including the observer-writer's detailed, if rather sententious, analysis of it:

"... the little extempore farce seen by some of our friends at Huaheine, ... seemed to be levelled at a girl, a native of *O-Raiedea*, who came with us from Taheitee in order to return to her parents, from whom she had eloped some months before with a young *Arreo*. Though the piece was but rudely performed, it however put the girl to shame, and drew tears from her eyes, which naturally must have a good tendency, especially with such persons of her sex as might be tempted to follow her example. Upon the whole, this circumstance gives us a very good idea of the nation in every respect: If we consider the poor girl, who was thus exposed, her bashful behaviour and her tears are certainly irrefragable proofs of her modesty and repentance. In a genial climate, with a warm constitution, a feeling heart, and an education which made her acquainted with all the mysterious parts of love, even though she should not chuse to put them in practice, it was no wonder she yielded to the tender solicitations of a youthful and vigorous lover, when her own age and the natural levity of the whole nation, contributed to lessen the crime of her inconsiderate step, and still more so, the possibility of obtaining a husband without hurting her character. On the other hand, there is something so generous in her behaviour that I cannot help taking notice of it. She became the object of indelicate, but sharp and salutary satire, and gave by her tears ample testimony of the immorality of her behaviour, and that she felt herself aggrieved under self-condemnation, and was not unwilling to become a fair warning to a whole croud of young persons of her own sex. If again we consider the actors who took the opportunity of exposing immorality for the instruction of the rising generation; they must be thought highly commendable for having dared to lay aside for so salutary a purpose, the respect due to a lady and a stranger. She was under the protection of a set of foreigners, whose fire-arms indeed commanded respect; but these censors were not to be browbeaten by power, or awed to silence by wealth, as is too often the case in Europe; they failed not to point the shafts of their satire at an object deserving censure, without regarding the consequences which might accrue to themselves from thence, being fully convinced of the rectitude of their action, and the salutary effects that might be derived for the benefit of the rising generation. Lastly the whole audience deserved in my opinion, likewise to be commended; for when the witty sarcasms were falling from the lips of their theatrical heroes, they laughed at their jokes; but when they observed that these shafts of satire were not discharged at ran-

dom, but made the person smart who was the object of their instructive irony, when they saw the marks of returning modesty, of repentance and self-condemnation, in the attempts to hide her shame, and in the copious tears of the poor girl; many an eye was moistened, and many a heart sympathized with her; lastly, when the dramatic performance was over, every one was eager to give her the most unfeigned and unsolicited marks of his esteem and friendship, to comfort her in her distress and affliction, to countenance her modesty and return to her duty; and in a manner to thank her for having contributed to the innocent mirth, as well as to the instruction and the warning of her country women. If we reflect upon the want of feeling in the frequenters of our theatres, their indolence and inattention, and I may add their shameless effrontery, we must give the palm to to the O-Taheiteans, who, like the true children of nature, have a sympathizing tear, and unrestrained feelings, the tribute and glory of humanity, in readiness on all proper occasions.

- - - - *Mollissima corda*
Humano generi dare se natura fatetur,
Quae lacrymas dedit: haec nostri pars optima sensus.

JUVENALIS.
(J. Forster 1778:472-457)

Other plays staged by the Maohis had more timeless, more general themes: what J. Forster called “simple representations of the common occurrences of life.” For example, one play witnessed by him had the following plot: “A man entrusts his servants with the care of his goods, they fall asleep, and though they are lying on their masters property, the thieves are subtle enough to steal them away from under the persons who were appointed to watch them; sometimes the thieves are detected and severely beaten, and sometimes they return the blows” (1778:471).

The most fully reported play seen by the early European visitors was one which took place on Ra’iatea and, although it may have contained a moral of sorts, seems to have been staged mainly for amusement:

In another farce, a man has a daughter, who has a lover; the father dislikes him and refuses his daughter, and being afraid of being deceived he watches her closely, but in the dead of the night, the lover meets the fair one and persuades her to run away with him; the consequence of this affair is the birth of a fine boy; the lady is in labour on the theatre and at last a large boy is exhibited, who immediately runs about the stage with the *placenta* and long *funis umbilicalis*; which is here not considered as indelicate, because every body is acquainted with the incident, the children of four or five years not excepted; and the oddity that the new-born child runs about and escapes the midwife, whose business it is to catch him, causes an universal and loud peal of laughter. The girls father upon seeing the cleverness of his grand-son, is at last reconciled to his son-in-law. (J. Forster 1778:471-472)²¹

The generalizations made above about Maohi dancers can be extended to actors; indeed, they were in many cases probably the same individuals. They included both males and females, and they tended to be young. On the other hand, the more featured roles in dancing appear to have been

performed by females, while most of the dramatic roles were performed by males. It was not however true, as asserted by J. Forster, that females were not permitted to act. Although there are reports of males having played the parts of females, there are no reports that I know of where females played the parts of males. What was said of the connection between dancing and social status probably also applies to playacting: that is, women of even the uppermost class performed as dancers, although such was not evident in the case of men.

Expert actors and actresses, like many expert dancers and musicians, seem to have been compensated for their services, not only with praise but with more tangible goods as well.

Finally, I draw attention to one other feature of Maohi playacting: the fact that such drama provides additional evidence of these people's fine perceptiveness about social behavior in general and social role playing in particular. Accounts of their dramatic performances strongly confirm the evidence from more everyday situations that the Maohis were keenly interested in both the norms and the actualities of social interaction and that they demonstrated considerable skill, and took a certain waggish delight, in acting out (and thereby publicizing) the foibles of their fellows. Some of their dramas were evidently stiltedly formal affairs of a religious nature, but most of the others appear to have been concerned with various aspects of the Maohis' views of the "human comedy."

TOURING AND VISITING

It should now be clear that the Maohis possessed the means for traveling about their archipelago; and all the sources indicate that they made extensive use of those means. It is, of course, impossible to construct a credible flow map of all these movements in terms of numbers of individuals and of the frequencies of their comings and goings, but the impression is inescapable that traveling about and visiting was a main feature of Maohi life. One has only to peruse the journals of Rodriguez and Morrison to confirm this; in the course of their own travels about Tahiti, when they themselves were no longer the focus of the natives' curiosity, they visited places which were surging with crowds on some occasions and almost deserted on others.

Among the many motives which induced the Maohis to move about so extensively must be emphasized the pleasure they obviously derived from touring and visiting, including their desire to visit relatives and friends, and their curiosity to see new places and people and to witness unusual events. Sometimes pleasure-bent individuals moved about on individual and personal missions, as was the case with Cook's friend, Hitihiti: "Heete-heete, who is a native of Bolabola, had arrived in Otaheite, about three months before, with no other intention, that we could learn, than to gratify his cu-

riosity, or, perhaps, some other favourite passion; which are, very often, the only objects of the pursuit of other travelling gentlemen" (Cook 1784:26).

More typically, travelers' missions were shared, as in Banks' amusing description of a visiting expedition:

... their visits are made with the utmost familiarity a family for instance when the weather is fine set out together to visit their neighbour and after staying a day tis ten to one but they join together and go to a third who with them goes on to a fourth who now gets notices of the number of Guests he is to expect and provides accordingly in this manner I have been in Company with above 30 Canoes whose crews were receivd with as much readiness and Ease as one could have been in these excursions they give loose to all kinds of Jollity Dancing singing publick wrestling and plenty of musick which as the professors of it get their livelihood by traveling from place to place never fail to attend on these occasions. (Beagle-hole 1962:II, 333-334)

Turnbull provided some observations about large-scale touring:

When any of the greater chiefs return [to Tahiti] from the Mottos [motu, i.e., probably Tetiaroa], as they are called, they never fail to make the circuit of the whole island. Their retinue is numerous, for, though simple their life, they are not without a taste for pomp. Their followers consist of all the strangers from the Mottos, and the same merriment and diversion continue wherever they stop: add to this, they are every-where loaded with presents; so that by the time they have made the circuit of the island, a peregrination which usually occupies them three months, their canoes return as rich as a fleet of galleons. Their connection with the royal family renders the people more than ordinarily liberal; it is moreover the custom of the country, on such occasions, to hold no bounds to their generosity.

These excursions to the Mottos, or royal progresses, have doubtless no other purpose, than of extorting from the liberality of the people these voluntary taxes. Nothing indeed can exceed the prodigality of the people, except it be the avidity of the chiefs. (1813:289)

They are better at the projection than in the execution of any enterprise, and with them a very trifling excursion is thus denominated. A journey to the Mottos, about twenty miles distance, is a grand undertaking, a tour of vast magnitude, and occupies their thoughts and conversation for many months. Edeah had been upwards of a year in preparation for a tour to the leeward islands (p. 346)

I am indebted to Morrison for a lengthy and detailed description of the treatment of visitors. The references to such social-status categories as "rank," "class," et cetera, is explicated in following chapters, my main concern here being with the technicalities of "visiting."

People of Note always travel by Water about their own Island, and as there is a number of Houses Built by the Chiefs of each district for the reception of strangers, they are never at a loss for an Inn; some of these Houses are 150 feet long 50 or 60 wide, and 30 or 35 high. As soon as they land they Haul up their Canoes, Near their Inn and send Notice to the Nearest of the same Rank, who repair to the place Immediately with provisions for them—and if they stay long enough evry one of the same Class in the District supplys them with one days

provisions for all their Company—In fine Weather they put up any where, and erect temporary sheds in the Most convenient place.

If any person of whatever Class he may be should be travelling by land and Meets None who Invite him or should happen to be unacquainted in the District he is passing through and has occasion for provisions, he enquires the Name of the first Ratirra^[22] and repairs to his house—on his entring he receives the usual Compliments and having made known his business, the Master of the House Immediately orders provisions to be got ready for him, and the Mistress entertains his Wife in the same Manner & they enjoy a secret pleasure at having had the good fortune to have the Strangers come to their House and they are for ever after deemd friends tho they had never seen each other.

When a Chief or Stranger of rank from other Islands Visits them they perform a Ceremony Calld Ootdoo which is a Peace offering, which is done thus—the Chief or Stranger having taken up his residence in One of the Houses built for the reception of Strangers (of which there are several at convenient places in evry district) the Chiefs and people of the District Assemble near the spot with their presents, each Chief being attended by a Priest with Young Plantain trees & Pigs, they then take their places opposite the Stranger about 30 or 40 yards from Him, and the Priest of the First Chief begins by tying a Young Pig and a small bunch of Red Feathers to a young Plantain Tree, makes a long speech, welcomes the Stranger in the Name of His Master and the People, and then lays the Plantain & Pig down at the Strangers feet who takes the red feathers and sticks them in his Ear or hair. A Number of Hogs Cloth &c. are then brought in and presented to Him by the Chiefs Men—and the inferior Chiefs and landed Men go through the same Ceremony, each presenting him with a pig or Fowle with a Plantain tree, which is the Emblem of Peace on all occasions, and used in all civil and religious Ceremonies and their present of Hogs & Cloth and when the Whole have made their offering and presents the Stranger is invited to a Feast prepared for Him of Baked Hogs Breadfruit &c. &c.—of which none but himself and his retinue partakes. I have seen at one of these Feasts 50 Hogs Baked and as much provisions as one Hundred Men could Carry prepared for a Stranger of Quality for one Day; and repeated for several days in the same District, each Person of the same rank providing one Days food.

But nevertheless it is better to visit in quality of a private Gentleman then of a Chief; tho both fare sumptuously yet the gentlemen are the Most Numerous and they may expend more time in One District in a Continual feast somtimes they make a Months stay in one District but seldom Hurry when they are on a Visit.

The lower Classes always entertain those of their Class or Society in the same Manner, according to their Abilitys but they Mostly prefer the Method of Visiting in the retinue of Cheifs and Gentlemen and this Method of living draws many Young People into the roving Society of the Areeuoy, which shall be discribed in turn, and as they always find plenty of Food, and raiment without Much trouble they Never think of Settling till they Arrive at Mans estate, if they do then.

When People of equal rank visit each other in their own or other Districts they are always made welcome by Greetings as soon as they enter the House as before discribed^[23] and as soon as they are Seated, the Master of the House orders a feast to be prepared for them, and enquires the Cause of their Visit, What they want &c. to all which they Answer without hesitation or Preface and their Wants being made known they are instantly promised to be supplyd if the other has it in His power and in the Meantime they are presented with a piece or two of Cloth and one or more live Hogs by way [of] earnest of their being supply'd; and

if the Man of the House has not what his Visitors Want, He begs them to stay at His House till He can procure sufficient to supply their Wants among his Neighbours.

All the Provisions dressd for the Visitors they Must take with them, it being accounted no treat if any of the Family partake with them. Nor do they Call any thing a present which Nature produces, except accompanied by somthing which is procured by the Assistance of labour or the Art of Man; for which reason they always give Cloth or some thing else with their Gifts, Provisions being held of No value being produced by Nature, and they think it not proper to make store of them.

They never return thanks, but by deed, having no Word in their language expressive of it and when they part they always use Compliments—they always beg their Visitors to remain with them till they are perfectly well satisfied with their treatment for should any depart unsatisfied they would get a bad Name, those who are not Well treated never failing to declare how they have been used and in this Manner they frequently make a Visit of several Months getting a little from one, and a little from another till they get what they want before they return Home. (Morrison 1935:189-192)

Several points in this passage require emphasis and elaboration: first of all, who visits whom? In general it seems quite clear (and consistent with other aspects of Maohi life) that visits took place largely within “class” boundaries, or at least the principal member of any party of visitors was received “officially” by a host of approximately equal class status. The major exception to this norm concerned travelers without local connections; whatever their class, Morrison said, complete strangers sought out the nearest *ra’atira* for refreshment. This is shown in a statement by a missionary on tour: “We got in again and proceeded to Maraa the southern extremity of Atehuru and here we were met with a Southerly wind with cold driving rain so that we were obliged to put ashore & pulled up our boat. We entered the first house according to the custom of the country....” (Crook, Journal, 23 July 1820, LMS Archives.) This general practice (if indeed it were as general as Morrison indicated) does not, however, necessarily imply that a traveler of lower-class status received the full honors of hospitality from the first *ra’atira* household he visited; it could have been merely a matter of an alien registering his presence in a foreign district and, upon doing so, being fed. In the journal of his *Bounty* visit Bligh wrote of Tina (i.e., Pomare I, chief of Pare-Arue) as follows:

I have before mentioned that all principal strangers come under Tynahs hospitality. I have now many instances of it, and scarce a day passes but he tells me he is obliged to quit me for a little to send provisions to some Friend or other. It is however all done without any ostentation, like a man actuated solely with a desire to do good, and altho he has no pomp, yet his good nature and manners rise him above the level of all the Cheifs I have yet seen. (Bligh 1789: II, 38)

“Tynah had a Visit today from some of Tiarraboo People. They were of no consequence with respect to Rank, as is common, however, he

found himself engaged for the day to direct proper supplies, and to amuse them." (Bligh 1792:161). (This Tina was either an abnormally generous, hospitable chief, ruled by motives of pure altruism (which is unlikely), or one who availed himself of such opportunities to forward his political ambitions.)

Individual travelers, or small parties, seem to have sojourned in the ordinary sleeping-houses of their hosts—men with men, and women (and children) with women; but larger parties of visitors were more likely accommodated in the large guesthouses (*fare manihini*) which were to be found in most districts associated with the residential establishments of chiefly persons. Also, it will be recalled that some travelers, of authority or influence or affluence, took along their own sleeping quarters, in the form of the small shelters that were mounted on canoes or set up ashore, as occasion demanded.

Another feature of Maohi visiting that needs clarification is the convention regarding length of stay. Some statements by Morrison, which are confirmed by Ellis, lead one to the conclusion that norms for hospitality obligated a host to entertain a guest for no longer than one day.²⁴ On the other hand, the sources contain many accounts of actual visits having lasted much longer; and Morrison himself, in the last paragraph of the passage reproduced previously, implied that such was the case. It is safe to assume that there was considerable variation in this regard, depending upon the visitors' missions and their relationships to their hosts.

Turning now to the heart of the matter—the nature of the "hospitality" purveyed—I have already described the central importance of food in these transactions—including that meant to be eaten by the guests on the spot and that meant to be carried away by them. Many other accounts could be added to Morrison's to indicate how open-handed and lavish the hosts usually were on such occasions—so much so that missionaries condemned visiting in general as a sin:

I have requested the people to do away with the silly, sinful, gluttonous practice of feeding visitors & they have Kings, Chiefs & all agreed to it in a public way. When persons visit, ten, fourteen & twenty hogs are roasted all at once; Rolls of cloth, and a variety of other things collected and taken at one time to the visitors, Who eat more like ferocious lions than men. (Orsmond, Journal, 5 February, 1821, LMS Archives)

The worthy Orsmond was, of course, fighting a losing battle with Maohi custom despite the people's "public agreement" to end the practice.

Particular interest attaches to Morrison's statement concerning the necessity to accompany food ("which Nature produces") with gifts of objects ("procured by the Assistance of labour or the Art of Man").

Of all these products of "the Art of Man" bark cloth was perhaps the most usual one given to visitors, and it was presented either in sin-

gle pieces or long rolls. The most ceremonious method of presentation was that whereby a long roll was presented wound round one of the donor's people (usually a young woman): after placing the free end in the guest's hands the bark-cloth-laden agent of the donor then turned round and round until the strip was completely unrolled, leaving her completely nude. It may easily be imagined how charmed were the European visitors—at least the nonclerical ones—by this display of liberality and finesse.²⁵

The ritual aspect of hospitality was also exemplified in the “peace-offering” act of *utu*, described by Morrison. *Utu*, a present to visitors as a token of peace (LMS Dictionary), is the ceremonial presentation of pigs, plantain shoots, and red feathers to important visitors from other (and, presumably, potentially hostile) districts.²⁶

Services, as well as food and manufactured objects, formed part of a visitor's due. At the least these included the “compliments” paid him upon arrival and departure. In many cases they included a massage as well, if the visitor had traveled overland. Judging by some legends and the personal experiences of some Europeans, bed companions were on occasion provided; but in the case of this kind of service perhaps more commercial motives were also involved.

The question that now arises is what moved hosts to expend so many objects and attentions upon guests, many of whom were strangers and even potentially hostile?

It is undoubtedly true that liberal hospitality was a widely avowed norm.²⁷ No matter what the individual motives behind particular acts of hospitality, the norm itself was publicly affirmed and in some cases perhaps even privately cherished. The plaint of a missionary that “... we could find but little disinterested hospitality among them ...” could, I suppose, indicate that some was in fact found. In any event, sanctions existed to ensure performance, that is, public censure (“a bad Name”), according to Morrison; or (in the case of lower-class individuals) enforced public shaming and land confiscation, according to the “Maxims of Tetunae” quoted in chapter 9.

The Maohi norm regarding hospitality was undoubtedly selective, as witness the reported treatment of Tuamotuan castaways and of Europeans. Regarding the former, in some cases they received humane, even supererogatory treatment; in other cases they were tolerated and subsisted, but barely so; and in still other cases they were looted and driven away.²⁸ Aside from personality differences among Maohi hosts—an “explanatory” principle of doubtful value in a book devoted to social relations—the only factor I can discern that influenced such wide differences in behavior on the part of the hosts was their relative social statuses: that is, persons holding high-rank-

ing kin-Titles or political positions of considerable authority were more given to disinterested hospitality than were others.

I refer the reader to volume 3 for discussion of the complex question of Maohi treatment of Europeans.

In addition, many individuals were probably motivated to provide generally for certain of their guests in payment for past, or in anticipation of future, hospitality from these same individuals. "In connexion with this [matter of hospitality], it should be recollected, that for every such entertainment, the individual expects to be reimbursed in kind, whenever he may visit the abode of his guest" (Ellis 1829:II, 23). Some individuals—either ambitious or politically insecure, or both—undoubtedly purveyed liberal hospitality for political purposes: to win loyal supporters (or at least political debtors), or to enhance their public reputation for generosity.

But, whatever the motives behind individual acts of hospitality, travel in general and visiting in particular were more often than not welcome and frequently undertaken diversions from the routines of everyday life.

No description of major Maohi "diversions" would be complete without some account of their sexual activities; but so important a part did such activities play in their lives that I had best devote a separate chapter to them.

The great plenty of good and nourishing food, together with the fine climate, the beauty and unreserved behaviour of their females, invite them powerfully to the enjoyments and pleasures of love. They begin very early to abandon themselves to the most libidinous scenes. (J. Forster 1778:231)

For deception, lasciviousness, fawning eulogy, shameless familiarity with men, and artful concealment of adulterers, I suppose no country can surpass Tahiti. She is the filthy Sodom of the South Seas. On her shores chastity, and virtue find no place. The predominant theme of conversation from youth to old age is the filthy coition of the sexes. From the King and Queen to the lowest grade, all are alike guilty, and if secrecy can be obtained, a very small reward will seduce any female. (From "The Old Orsmond Manuscript", p. 2, LMS Archives)¹

It will come as no surprise to readers familiar with accounts of Polynesia to be informed that the Maohis apparently looked upon coitus not as a necessary evil nor as a spouse's solemn obligation, but rather as one of the most pleasurable of all their activities, as "natural" and perhaps almost as essential to well-being as eating and sleeping. Moreover, the Maohis evidently did not deem it necessary to hide or disguise their interest in sexual intercourse; indeed, it appeared prominently and unequivocally in their everyday talk, their dance, their graphic art, their secular oral "literature," and in their religious beliefs and rituals.

COITUS

In the light of the above, it is particularly regrettable that we have been left so little explicit information about the sexual act itself—about the physical techniques employed, about the Maohis' "understanding" of that act, and so forth. In fact, the European chroniclers on Maohi life have left us with fuller accounts on, say, the manufacture of bark cloth than on the conventional modes of coitus. We are informed again and again, with amusement or repugnance, about the tender ages at which such practices began, but the authors invariably drew the well-known veil of reticent respectability around the practices themselves. Under these circumstances, and mindful of the symbolic importance of coitus in Maohi life, one might be tempted by plausibility to pull in data from other histor-

ically related societies of the South Seas; but there are obvious dangers in such a procedure, so that in the reconstruction that now follows I shall draw on the comparative materials only to aid in formulating queries and in indicating gaps in the records on the Maohis.²

In view of the Maohis' deep and wide-ranging interest in sexuality and of the apparent absence of any reluctance on their part to talk about it, the paucity of specific words for the genital organs and for coitus may seem somewhat surprising. Specific words have been recorded for such undifferentiated major referents as human penis (as distinct from an animal's), semen, testicles, vulva, and human copulation, but records of unassailable pre-European authenticity contain little linguistic evidence that the Maohis possessed a technical vocabulary to match the fine distinctions they appear to have drawn, in actual behavior, in this domain. One explanation for this is that the early European visitors were not sufficiently fluent in the local language to grasp such distinctions. Another is that the visitors' scruples were such that they did not record what they learned. Or, of course, *the* explanation might be that the Maohis themselves made no such fine distinctions, verbally, despite the interest and activity they devoted to the subject.

In any case, the relative paucity of this list of specific words for genital anatomy and coital action, even if real and not just apparent, cannot be taken to demonstrate that Maohi thoughts were vague about such matters, and the list could be lengthened considerably if one were to add the many words and phrases commonly used as metaphors for genitalia and coitus. For example, the penis (*ure*) is also referred to as '*aero* (the tail of quadrupeds, or of the sting-ray and some other fishes; the after part of some business or conversation); *patia* (a spear); *tara* (a thorn or sharp point; a cock's spur); *taharahara* (to befoul, daub, or smear).³ However, it is probably safe to say that these Islanders' extensive use of metaphor was in this context influenced more by canons of rhetoric than by any standards of pudency.

I have been unable to find any accounts concerning the actual physical techniques of the act of coitus employed among the Maohis, although there are bases for drawing a few plausible inferences. Many of the early European visitors had sexual intercourse with native females, and some undoubtedly witnessed sexual intercourse between natives. The fact that no details were recorded about any such event indicates, in a negative way, at least, that the techniques experienced or witnessed were not markedly different from those to which the Europeans were accustomed. Some weight is lent to this conclusion through the circumstance that these same Europeans were quick to notice and faithful to record examples of other "curious" native customs, including sexual ones.

In view of the direct, unequivocally expressive connection between certain dance movements and coitus, it is not unlikely that intercourse was

characteristically accompanied by the same kinds of movement, that is, by rapid, vigorous "rotatory" motions on the part of both male and female. It is also safe to emphasize the strenuousness of such movements inasmuch as the average Maohi female was not much less robust than the average Maohi male.

The reference cited in chapter 3 to a man's body having been unacceptable as a sacrificial offering if it were disfigured with scars produced by a woman, pertains mainly to the scratch marks made by a woman during sexual intercourse, suggesting that a woman's emotions on such occasions were sometimes aroused to the height of frenzy. But coitus cannot always have taken place with such active and presumably noisy movement; otherwise it could not have been accomplished (as it undoubtedly was) with any measure of secrecy in populous and unpartitioned Maohi houses.

The absence of contrary evidence also at least suggests that coitus was not preceded by any appreciable amount of foreplay, or by any lingering contact after the act; in a sense, of course, the kind of dancing which often preceded copulation probably had some of the same stimulating effects as physical foreplay, but this is a very obscure matter.

On the basis of many kinds of data about the brusque attitudes and behavior of Maohi males, it is reasonable to assume that they at least usually achieved orgasm in their sexual encounters. As for women, the evidence is less clear; their vigorous participation could indicate simultaneous release; on the other hand inconsiderate brusqueness on the part of their partners may have frustrated release now and then.

Adding all these inferences together we are still left with a very sketchy image of how the Maohis actually carried out the act which was so much a focus of their lives. It may be that I should admit evidence from later epochs,⁴ on a common "scientific" assumption that anything as basic as sex practices are less subject to change. But opposing this assumption is the assertion by well-informed scholars in this field to the effect that Polynesian sexual practices have indeed greatly changed.⁵

In view of the Maohis' elaborated interest in coitus one might perhaps expect them to have held some fairly specific ideas about the mechanics of the act and beliefs about the nature and effects of semen. Unfortunately, I can find no record in the sources of any ideas about the "chemical" properties of semen—nothing to indicate that it was thought to be, for example, like salty water, or like the soft "meat" of an immature coconut (which it resembles in appearance). Furthermore, I have discovered no references to certain foods (e.g., oysters or soft coconut meat) having been eaten in order to replenish one's supply of semen.

Regarding other properties of semen, I shall later reproduce one European's commentary on the Maohi homosexual practice of fellatio,

wherein the commentator proposes (within the safe respectability of Latin) that the active partner acted so (partly) in order to obtain some of the other's "robur et vim" (vigor and force). I can find no Maohi's commentary on the practice, so we must rest content with this one. Nor can I find an explicitly Maohi explanation for another, equally suggestive, practice involving semen—namely, the practice by some women, usually upper-class ones, of copulating with tall and well-built males to help ensure that the offspring they subsequently bore (and not necessarily those sired by the males in question) would also be tall and well built. This idea is closely akin to the concept of telegony formerly followed by many European stock breeders in improving their herds:

Les femmes différent entre'elles par les charmes de la figure, comme dans les autres contrées; la taille, souvent au-dessous de la médiocre dans les femmes d'une classe commune, semble se relever avec avantage dans celle d'un rang supérieur. L'élévation de la taille est ce que les Dames Otahitiennes cherchent à conserver dans leur famille avec le plus grand soin. Ce n'est pas une chose rare parmi les dames les plus qualifiées de l'île, de faire partager quelquefois leur couche à celui de leurs valets qui est le plus grand et le mieux proportionné, tant il est à craindre que les enfan[t]s ne dégènerent de la taille noble et majestueuse qui faisoit la gloire de la famille. Autrement elles sont très-scrupuleuses sur le choix de leurs amants. (Mühlmann 1955:41)⁶

Maohi views of the reproductive aspect of semen will be discussed in other chapters, but I will anticipate this discussion by noting that semen was evidently believed to play an important part in reproduction, although not inevitably so and not always necessarily so (e.g., spirits occasionally sired offspring of mortal women by, say, merely hovering over them).

The sources provide even fewer insights into the beliefs held by the Maohis concerning the nature and effects of a female's substances emitted during sexual intercourse. As will be documented in another context, the ghost of a man was believed to escape certain indignities in after-life if he had abstained from sexual intercourse for a certain period prior to his death, but there is no indication that this "state of grace" derived from lack of contact with the woman herself, her genitalia, her sexual "fluids," or from the man's full reservoir of semen, or whatever. The larger question of the connection, if any, between a woman's sexual organs or emissions or menstrual blood and her generic "psychic" condition of *noa*, which disqualified her from certain religious ritual activity, will be considered in another chapter.

Nor can I uncover any information relating to tangible—as distinct from magical—aphrodisiacs, for either sex. I am inclined to believe that there were some in use, because of the great pleasure and pride evidently derived from frequent sexual intercourse, but recorded evidence is unknown.

Information on the social aspects of coitus is somewhat fuller. Nearly

every source contains assertions about how early in life many Maohi girls began the practice—not just in the form of simulative play but of actual intercourse with virile males. Bligh, for example, stated that “lower class” girls in particular began the practice at an early age, some starting “... even at the Age of 7 Years” (1789:II, 78). Since the Maohis themselves did not reckon age in years, such statements as Bligh’s can be considered only estimates. Other witnesses put the age for girls’ initiation to intercourse a year or two later, but even the sedate elder Forster was moved to state that “The young females of O-Taheitee and its neighborhood are not over scrupulous in admitting some lovers to their embrace before marriage” (J. Forster 1778:432).

This aspect of Maohi life understandably attracted the attention and disapprobation of the missionaries, and while the following statements of Osmond’s concern a later era they could probably apply to the era under study: “Little girls about 11 to 13. One boasts of having had 11 men, another nine, two five each ...” (Journal, 22 November 1826, LMS Archives); “Little children hardly ever live to the age of seven ere they are deflowered.” (Journal, 24 October 1827). As for young boys, while they could not have achieved orgasm until the age of eleven or twelve it is quite certain that they too began to attempt coitus at younger ages.

In the absence of contrary information it is reasonable to assume that the Maohis, both males and females, continued to practice sexual intercourse as long as opportunities offered and their physical powers lasted. At least I can discover no kinds of shared norms which specifically restricted coitus because of increasing age.

“PROMISCUITY”

The evidence is somewhat misleading regarding the restrictive effects of marriage and class status on females’ sexual activities; the only social restriction on extramarital sexuality seems to have been a jealous spouse.

What is misleading about the evidence is that most of it derives from the Europeans’ own experiences with Maohi women, and not from observations on the relations of Maohi to Maohi. The situation created by the presence of shiploads of Europeans can by no definition be regarded as normal.

There was the added incentive provided by European goods—nails, cloth, mirrors, scissors, hatchets, and all the other wondrous things which by their novelty or superior utility delighted the Maohis. It is probably safe to say that most of the sexual encounters experienced by the European visitors had to be purchased at what came to be standard market prices, which, however, were subject to considerable fluctuation. This is not to say that sexual services circulated among Moahis themselves without regard to “price”; what is implied is that the commercial aspect became more

explicit when Europeans were involved. The most sought after item in this commerce was not European at all, but red feathers obtained by the astute Europeans from other South Seas islands. To acquire these, we are told, even the most powerful Maohi chiefs were willing to offer their own wives:

So very solicitous & zealously desirous are our good friends here for the attaining of these red Feathers and so thoroughly convinc'd of their efficacy with their Sovereign Deities that they will very chearfully oblige us in good natur'd but rather unhallow'd rites for the possession of them to render back religious Ceremonies by way of Propitiation to their Jolly Gods. (Clerke, in Beaglehole 1961:383n2)

On one occasion, for example, a very important chief appeared with his wife before Cook and tendered her sexual services to him in return for some red feathers:

Besides [another] instance of the immorality and selfishness of the great, I can add another; *Wainee-òu* and *Potatou* her husband, were so greedy after the possession of red parrots feathers, that having sold all the hogs, which they possibly could spare, together with a fine helmet, several breast-plates, and a mourning dress, they agreed to prostitute *Wainee-òu*, and she in consequence offered herself to Captain Cook, and appeared as a ready victim.

— — — *Tunica velata recincta.*

I must confess, having received a favourable and great idea of *Potatou's* character, this transaction made me ashamed of him; and being before elated with the thought of having found a nation, where one might at least find to the honour of humanity, less degeneracy joined to an aimable innocence and primitive simplicity, my spirits were damped by this unexpected scene of immorality and selfishness, in a family where I least expected to hear of it. (J. Forster 1778: 391-392)⁷

In extenuation of such events Morrison added the following philosophical note:

Their Actions might possibly be for the sake of Gain—brought to a stile of what we call indecency, but where are the Countrys that do not produce Weomen of the Same discription—Iron is to them More Valuable then Gold to us, for the possession of which some of our own Country weomen would not stick at acts of indecency nor even horrid Crimes which these People would tremble to think of. Nay, they Challenge us with the Verry Crime and say we are ashamed of Nothing, using these things which we knew they were fond of to perswade them to commit such acts as their innocence had taught them to be ashamed of. If they can purchase Iron at the expence of their Beauty, or are able to get it by theft, they will. Neither of which Methods I hold to be a Crime in them. They know its Value and think no price to(o) great for it.

Gold is preferd in Other Countrys and some, as fine Weomen as any in Europe, are said to prefer it to Virtue yet we upbraid these untaught and uncontrolld people with such actions as we ourselves help them to Commit. (1935:236)

Be it noted, however, that in the opinion of, and to the approval of, the fastidious younger Forster, not even these rare inducements were sufficient to buy every woman's favors—not immediately, that is. He described an occasion of a visit to the ship of three young women:

They seemed never to have been aboard of a ship before, so much were they struck with admiration on beholding its variety of objects. They did not content themselves with looking around the deck, but descended into the officers cabins, whither a gentleman conducted them, and curiously examined every part. Marorai took a particular fancy to a pair of sheets which she saw spread upon one of the beds, and made a number of fruitless attempts to obtain them from her conductor. He proposed a special favour as the condition; she hesitated some time, and at last with seeming reluctance consented; but when the victim was just led to the altar of Hymen, the ship struck violently on the reef, and interrupted the solemnity. The affrighted lover, more sensible of the danger than his fair mistress, flew in haste upon deck, whither all the rest of our people crowded from their several occupations. (G. Forster 1777:II, 260)

A third basis for inferences regarding the local sexual habits was the European visitors' direct encounter with an institution resembling Europe's prostitution. It is probably safe to conclude that Maohi women were, by and large, easier marks than any other females the visitors had met with at home or on their travels. In addition to the majority of females, for whom sexual intercourse was an avocation, there were a few for whom it approached a profession even prior to the arrival of the Europeans. There is little on record about this profession, and while prostitutes were probably not numerous, there were, nevertheless, companies of young women attached to the households of some chiefly persons for the pleasure of the court members and distinguished guests. When Europeans arrived, the services of these young ladies of pleasure were not infrequently exchanged by their masters (or mistresses) for hard goods or diplomatic advantage. For example:

The Famous Queen Pbooraya being herself an Areeuoy [Arioi], it is not to be wondered at that every licentious practice was carried on by her followers and Attendants, her Court being filled with such as preferred the Rites of Venus to those of Mars and as she saw that they were also more agreeable to her Visitors (the general Case with Sailors after a long Voyage) they were no doubt practised and carried to the utmost verge of their latitude, it being in all Countries the Case that those in power always lead the fashions, let them be good or evil. (Morrison 1935:237)

Also, with the appearance of Europeans, in addition to the numerous females who utilized such opportunities as were presented to satisfy their curiosities and acquire a nail or a shirt, there were some who made it a regular trade—sometimes on their own initiative but usually at the instigation of a male (including, we are informed, even fathers and husbands):

They tendered their women to us quite freely, and showed much surprise at our non-acceptance of such offers. The latter were also wont to make advances themselves, but with some show of coyness. (Corney 1913:333)

Those who Make a Trade of Beauty know how to value it, and when they come on board bring with them their Pimps or Procurers under the denomination of relations to receive and secure the Price and these ladies are as well qualified to Act their part as any of their profession in other Countries and are no ways bashful in making their Demands—(Morrison 1935:237)

Their general idleness is never interrupted but on the arrival of a ship. Every thing then is bustle and activity; they are then as busy as pedlars in fair time; every one has something to exchange in traffic; the husband not unfrequently brings his wife to market. Pomarre himself was as great a factor as any of them in the article of Otaheitean beauty. In one of my evening walks, I found him accompanying ten or twelve young women to the beach, commanding them to go on board a certain ship at that time lying in the bay, and not to fail in bringing him plenty of powder in the morning. They all willingly obeyed his orders, for the thing is so common, that it has become a constant and familiar practice. (Turnbull 1813:374)

But about such practices, the sympathetic Morrison added: "However the ladies who act these parts are not to be taken as a standard for the Whole no more then the Nymphs of the Thames or Syrens of Spithead are to be taken as Samples of our own fair Country Weomen" (1935:237).

As a result of their individually differing experiences and their generally distorted and out-of-focus views of Maohi sexuality, it is not surprising that the Europeans did not agree about the social boundaries of promiscuity. There is fairly close agreement that married women were less available to Europeans, and presumably to Maohi males as well, than were the unmarried ones.⁸ However, opinions differed markedly concerning which social class of women was more sexually unrestrained. At one extreme was Cook, who wrote that "... none but common women would yeild to the embraces of our people; not one of the gentlemen were able to obtain such favours from any women of distinction, though several attempts were made, but they were always jilted in the end" (Beaglehole 1961:236). Cook apparently chose to pass over the attempt of Potatau's wife to seduce him. Also, one might infer from a statement in Henry's account of a large ceremony that some upper-class girls remained chaste until marriage, namely: "The first-born young virgins of the royal family of the kingdom represented their respective districts. They were arrayed in flowing white tapa and decked with wreaths and garlands of tiare (single *Gardenia*) blossoms, their emblem of purity." (1928:137)⁹

At the other extreme was the opinion of Morrison:

The Weomen of rank are Most remarkable for their licentious practices and Many of them have a Number of Favourites, in which they pride themselves, tho many of the lower Class are what may honestly be Calld Virtuous, never admitting a Second to share in their favours. (1935:237)

J. Forster concluded:

... we are now certain, that there is hardly a country to be found, where the young unmarried females are allowed such a latitude as at O-Taheitee and its neighbourhood in admitting a variety of young males, and abandoning themselves to various embraces without derogating from their character. Women of all ranks follow these practices from the earliest time, and after having passed through the embraces of hundreds, are married to the first people of the isle. (1778:491-492)

My own view of the matter, based on an assessment of all the above authorities and taking into account the many actual cases of sexual relationships reported throughout the sources, is that both marriage and upper-class status tended to restrict, up to a point, a woman's sexual liberty.

The Maohis of old (like those of today) took huge delight in reports of husbands ingeniously cuckolded—until such affairs reached too near home—but public opinion tended to censure the wife who adventured without her husband's consent. As for social class, the parents of unmarried upper-class girls evidently restricted their daughters' sexual activities more so than did parents of lower-class girls. Also, I suspect that most married women of upper-class status were less promiscuous than lower-class women. On the other hand, incumbency of kin-Titles of very high rank entitled women to such freedom of action in all spheres of social life that some of them lived separate from their husbands and openly consorted with one or more lovers.

But all these inferences concern averages and do not take into account other variables which probably operated to encourage some females to live more libertine lives than did others; such influences were size of family, order of birth, occupation of father, and perhaps even place of residence. The early observers may have made mental notes of such factors, but unfortunately they did not bother to record them.

CHOOSING A PARTNER

I turn next to a consideration of what characteristics of an individual the Maohis found to be particularly attractive when selecting a partner for sexual intercourse. According to legend, when the emissaries of the god 'Oro descended to Earth to seek a sexual partner for him, they searched far and wide before finding a suitable candidate. Upon discovering on Porapora a maid of surpassing beauty they informed her of their mission and asked her consent. "Is he handsome?" enquired the girl.

'Yes! He is handsomer than all the sons of men and is ever youthful,' they replied." (Henry 1928:231) Whereupon the maid readily consented and the intercourse was initiated.

This about sums up the quality most Maohis seem to have considered of prime importance when choosing a partner for sexual intercourse—not, perhaps, the only quality but certainly the most decisive. But, throughout the world's societies "beautiful" and "handsome" are of course defined in widely differing ways.

According to Henry, "... stoutness was a mark of beauty and characteristic of royal personages ... thin people were thought to be sick" (1928:274). There is no question that the Maohis admired corpulence in both males and females, and it is a well-established fact that they went

to considerable pains to become corpulent. Presumably this general predilection carried over to choosing a sexual partner, but just how corpulent it was considered desirable for a lover or mistress to be is nowhere reported.

In the legend of Honoura is an episode concerning two women who travel in search of husbands. Upon arrival at Tahiti they are seen and welcomed by a friend and aide of the local chief who, upon learning of their mission, made the following proposal to his superior: "The well-favored (*puoto*) one will be for you; the thin (*rairai noa*) one for me." (Henry 1894:258-259)

One may infer from the efforts some Maohi females made to bleach their skins and protect their bodies from strong sunlight that lightness of skin was also considered a desirable trait in a lover or mistress.¹⁰

Other physical features esteemed by the Maohis were a flat broad nose (in females) and a flat-backed head (in males); it was noted above that adults sought to mold infants into these desired shapes. As for size and shape of a woman's breasts, I can find no evidence of what was considered most attractive, except for the general preference for corpulence.

It is well known that some Polynesian peoples considered a large clitoris an aid to heightened sexual pleasure and hence a desirable trait in a mistress, and in some societies attempts were made to enlarge the organ by regular manipulation during childhood (cf. Marshall 1961). Such is said to have been the case, for example, in the Marquesas, but I can discover no credible evidence of any such practices among the Maohis. There is however one piece of evidence which suggests that some importance was attached to a man's having a plastic, versatile penis; that evidence is the exhibition of genital acrobatics, described in chapter 10, this volume.

Crippled limbs, bald-headedness, disfiguring scars (with the possible exception of battle scars)—these were considered to be serious physical defects; persons so afflicted aroused more contempt than sympathy and were undoubtedly handicapped in competition for sexual partners.

Strength in a man may also have helped his cause with women, but since physical weaklings were a rare exception among Maohi men, it is not clear whether physical strength itself constituted an attraction distinct from, and in addition to, other criteria of male physical beauty.

It is not clear just how much added attraction accrued to the expert dancer or the expert lover or, for that matter, the expert in anything. The only direct evidence I have found on this matter are some lines in a text on "How to Seduce" (which are quoted on pp. 364-365, below), but this is hardly enough data on which to conclude whether behavioral traits were considered important enough in the diversion of sexual activity to augment or override physical traits?

Somewhat the same question arises with respect to age as a criterion of sexual attractiveness; it is not clear to us whether most Mahois' preference

for young lovers or mistresses was because of the latters' chronological age or because of their possession of physical traits generally associated with people young in years.

The missionary Orsmond, writing in 1832, noted that some young women preferred much older men at that time, but whether that was the case in pre- and early-Europe an times is not indicated:

A native who belongs to this part of Tairabu is just come from Raiatea He went down to amuse himself in the late war, is said to have shot six men & has come with a little girl almost as high as his navel for his wife. He is a man of about 48 his former wives are dead & he has a family of children. In all Tahitians as well as officers who come in ships there is a cry for little girls, those on the contrary generally to appear womanish crave full grown men. (Journal, 1 September 1832, LMS Archives)

Social class was a factor of overriding importance in choice of spouse, and it may also have figured in choice of a sexual partner for even the most casual of encounters. As we shall see in a later chapter, in selecting a spouse it was essential that he or she be of the same class—among other reasons, to avoid having offspring of mixed-class heritage. Since contraception was not practiced, the possibility that a casual sexual encounter could result in conception might well have induced some Maohis to remain within class bounds. Nevertheless, a sexual adventure with a person of higher social class must have had its attractions. In other words, although it is manifoldly clear from the sources that sexual encounters crossed class lines, it is not clear whether social class had more positive or negative influence in the pairing of lovers.

Unlike class, kinship exercised decidedly restrictive influence on choice of sexual partners, but I shall postpone discussion of this topic until a fuller description has been given of the subject of Maohi consanguinity.

A passage from Moerenhout indicates yet another factor which influenced Maohi females in their choice of a sexual partner:

As soon as an Indian [i.e., Maohi] found himself in that state (inspired by 'Oro, God of War), he usually wrapped his arm in cloth, in an unusual and recognizable way, a sign that gave him the right to women's favors. He could have up to twelve [women], the same number granted to the priests [*sic*] These women stayed with him as long as he remained in this frenzied state and gave themselves with ardor to his embraces, accepting them as being from the inspiring god himself. Also this kind of feminine *cicisbeism* was sought after even by upper-class women; but all left him as soon as he became himself again, and the spirit of the god was supposed to have left him. (1837:II, 48)

Finally, among the traits which appear to have rendered Maohi males and females sexually attractive to one another, body grooming must be rated very high: a clean and sweet-smelling body, a shiny, flower-decked head of hair, unsoiled garments, and all the other refinements mentioned

in the description of grooming in chapter 6. It is not unlikely that extensive designs of tattoo were among the traits considered sexually attractive, but this was not the sole reason for submitting to such painful operations.

Supercision was so universal that it is unlikely to have figured very importantly as a trait of sexual attraction; although an unsuperced man, if there were any, would probably have been thereby handicapped.

TIMES AND PLACES

From some of the opinions set down by the early European visitors to these Islands one could gain the impression that the inhabitants spent most of their time arranging, preparing for, and engaging in copulation. There was, of course, no Kinsey among the visitors, no one who recorded when and how often the Islanders engaged in sexual intercourse, but from many kinds of evidence it is abundantly clear that the Maohis generally made use of opportunities for amours whenever they occurred.

There were, nevertheless, certain times when copulation was proscribed, either through individual decision or universal rule; generally speaking, these times for a man were when he was in more or less direct communication with major spirits (i.e., *'atua* 'gods').¹¹ Such is the general impression, although I would be hard put to provide detailed documentation. The matter is complicated by the circumstance that many of the festivals that accompanied large-scale marae ceremonies—that is, those that seem also to have contained religiously-colored ritual—included a considerable amount of actual or symbolic copulation. Nevertheless, men actively engaged in rites at a marae do appear to have been constrained from sexual intercourse throughout the entire duration of those rites, as witnessed by a phrase in the formula terminating such rites, which said, in effect, that now that these rites are finished we can return to our everyday, secular (*noa*) pursuits, including domestic labor and caressing (*hanihani*) (Henry 1928:172). Also, a passage from Anderson could be interpreted as implying an incompatibility between copulation and becoming a spirit (or at least a ghost):

They have no idea of any permanent punishment after death, for crimes that they have committed on earth; for the souls of good and of bad men are eat indiscriminately by God. But they certainly consider this coalition with the Deity as a kind of purification necessary to be undergone before they enter a state of bliss. For, according to their doctrine, if a man refrain from all connection with women some months before death, he passes immediately into his eternal mansion, without such a previous union; as if already, by this abstinence, he were pure enough to be exempted from the general lot. (Cook 1784:164)

Between some husbands and wives sexual intercourse appears to have been interrupted during the latters' menstrual periods:

The separation of the women from their husbands on a particular occasion, Dr. Gillham had once the opportunity of remarking. Going into the hut of his tayo,

named Poppo, very early, he observed him laid alone on the bedstead, and his wife lying on the floor. Inquiring the reason, Poppo informed him, it was because she was at present under the Otaheitean feminine infirmity. (Wilson 1799:340-341)

But whether such abnegation was a matter of mere individual preference or of society-wide proscription, and whether it was based on notions of aesthetics and hygiene alone or on fundamental religious ideas of, say, sacredness versus secularity, we are unable to learn.

As stated earlier, the Maohis tended to make use of opportunities for their amours whenever and wherever such opportunities occurred. Beach, grove, forest, dry stream bed—no kind of physical terrain seems to have been discountenanced as site for a sex tryst. In addition, the Maohis made frequent use of their dwellings for this purpose, in spite of the presence of others. Even the elder Forster, who was usually at pains to present a sympathetic picture of the Maohis, recognized that their standards of privacy and delicacy in sexual matters were different from those of Europeans:

... it is necessary to observe that a nation still enjoying that just and noble simplicity of manners, living in large houses with several families together, in the midst of their children, cannot conceal certain actions, which none of our Europeans, who have feelings and breeding, wished to commit in so great companies; this naturally makes all their children acquainted with transactions of which some European matrons perhaps may have no ideas, nor has love, and all its concomitant, and most mysterious endearments, enjoyments, and consequences, ever been stamped in these happy isles with a notion of turpitude. (J. Forster 1778:392)

Some writers even implied that Maohis preferred an audience for their sexual activities:

Our people were daily walking in the isle without arms, either quite alone, or in little companies. They were invited to enter the houses, where the people gave them to eat; nor did the civility of their landlords stop at a slight collation, they offered them young girls; the hut was immediately filled with a curious croud of men and women, who made a circle round the guest, and the young victim of hospitality. The ground was spread with leaves and flowers, and their musicians sung an hymeneal song to the tune of their flutes. Here Venus is the goddess of hospitality, her worship does not admit of any mysteries, and every tribute paid to her is a feast for the whole nation. They were surprised at the confusion which our people appeared to be in, as our customs do not admit of these public proceedings. However, I would not answer for it, that every one of our men had found it impossible to conquer his repugnance, and conform to the customs of the country. (Bougainville 1772:230)

A similar incident, but with native principals, was witnessed by Cook and his companions:

... this day closed with an odd Scene at the Gate of the Fort where a young fellow above 6 feet high lay with a little Girl about 10 or 12 years of age publicly before several of our people and a number of the Natives. What makes me mention this, is because, it appear'd to be done more from Custom than Lewdness, for there were several women present particularly Obarea and several others of the

better sort and these were so far from showing the least disapprobation that they instructed the girl how she should act her part, who young as she was, did not seem to want it. (Beaglehole 1955:93-94)

According to Wales, who accompanied Cook on his second voyage, this incident involved factors not suspected by Cook:

... I have been informed from the authority of a gentleman who was in the Endeavour, and saw the transaction here alluded to, that it is very imperfectly, and in some measure erroneously, related ...[by Cook]. Oberea [whom Wales describes as "an old demirep of quality"] *obliged* the two persons to *attempt* what is there said to have been done, but they were exceedingly terrified, and by no means able to perform it. The same authority adds, that most of the natives reprobated Oberea in very severe terms for the part which she had in it. (Wales quoted in Beaglehole 1955:94n1)

Danielsson's judgment about these and similar acts of public copulation probably was most accurate:

Bougainville's and many other explorers' narratives certainly contain reports of unembarrassed sexual intercourse between native women and European sailors, but these cases were doubtless due to the Polynesians' curiosity and, like all instances of sexual intercourse in public, must be regarded as a special form of entertainment. (Danielsson 1956:64)

Although there is some justice in Wilson's charge about Europeans' connivance, in the following he undoubtedly overstated the case for Maohi "delicacy":

They have no partitions in their houses; but, it may be affirmed, they have in many instances more refined ideas of decency than ourselves; and one, long a resident, scruples not to declare, that he never saw any appetite, hunger and thirst excepted, gratified in public. It is too true, that for the sake of gaining our extraordinary curiosities, and to please our brutes, they have appeared immodest in the extreme. Yet they lay the charge wholly at our door, and say that Englishmen are ashamed of nothing, and that we have led them to public acts of indecency never before practised among themselves. Iron here, more precious than gold, bears down every barrier of restraint: honesty and modesty yield to the force of temptation. (Wilson 1799:332)

There were occasions such as Arioi meetings and other large public festivals when sexual intercourse did assume something of a crowd activity; some of these occasions have already been or will be described, but we should also inquire whether the Maohis practiced on a recurrent basis anything reminiscent of the mass "rapes," or the periods of general sexual license, met with in some societies.

So-called mass rapes were reported as having taken place in some Polynesian societies, and it is my belief, based on field investigations, that they occur among present-day Tahitians—with either "willing," "semi-willing,"¹² or unwilling victims. I cannot of course urge that such evidence is sufficient to establish that the practice existed among the pre-European

Maohis, but these considerations, along with other known aspects of Maohi sexuality, do persuade me that it did.

As for periods of special sexual license, in addition to the festivals mentioned, I do not know of any institutionalized occasions when the usual constraints were lifted, certainly not during, say, periods of mourning, or in connection with wars. The practice described by surgeon Ellis in the following passage about Arioi meetings should not perhaps be classed as "general sexual license" because of the limited category of persons participating: "Their amusements during these meetings consist of boxing, wrestling, dancing, and making feasts and entertainments, at which crowds of female spectators attend, the fairest of whom are always made choice of the conquerors" (1782:I, 160). Some of the most solemn (and inevitably "religious") rites of chiefly investiture and the like, were accompanied by dances, and so forth, described by Europeans as "lascivious," but these are not to be identified with actual sexual license.

"SEDUCTION"

In a statement delicately titled "Moyens de Séduction" (How to Seduce),¹³ attributed to a chief of Porapora, is the following sage advice:

Woman must be sought after like a prize before she accedes to man's desire. A man must overlook nothing in his hunt for little ways by which he can succeed in his conquest.

The libertine, the man whose every thought is about Women, searches carefully for ways to gain her good graces.

Woman is a fish without bones; Woman is a banana tree planted so [shallow] it will fall if a lizard pushes it.

Here are the little ruses by which a woman may easily be conquered: with gentle proposals, with little jokes. Awaken her and call her outside during the night; slip close to her while she is sound asleep; a murmur, a little stone or fruit thrown at her when she goes by or is bathing. These are the baits to catch the fish.

There are still others; a leaf-wrapped packet of well-roasted fish; a basketful of half-opened tiare flowers; a packet of very sweet poi; a piece of raw tuna; some ripe breadfruit; a piece of pork cooked in leaves and a cluster of coconuts to drink; a half-coconut full of pudding made with mountain plantain and perfumed oil; an oven-cooked breadfruit or a cake of *mahi*; a gourd of sweet coconut cream.^[14]

A pair of scissors,^[15] a knife, some earrings, a ring, a piece of foreign cloth, a large mat, some bits of shiny money.

Here (lies) Life's Happiness for the Tahitian; there is nothing else; afterwards it is night. And the libertine cries to himself, "Come, let's enjoy life as long as life lasts!"

Tobacco and pipe are very effective methods of seduction.

Here are the kinds of men who are successful in their pursuit of women:

Note: I am not certain how to title this section. By dictionary definition the activities I wish to describe conform entirely neither to *seduction*, "the action of inducing [a woman] to surrender her chastity," nor to *courtship*, "the paying of court to a woman with a view to marriage" (Shorter Oxford English Dictionary).

The man who beats the drum well (women will pursue him);
 The one who plays the nose-flute well (they will take him forcibly);
 He who leads the dance well;
 He who energetically intones the chant to launch the canoe or to beach it;
 He who composes pretty love songs and utters them with a tender voice,
 tender as the taro leaf softened by the evening breeze;
 The handsome-faced Arioi who bathes early in the morning;
 The renowned wrestler who has eaten the pork which will make him al-
 ways win;
 The warrior who has fought in many battles and whose head has never
 been struck by his enemy's club;
 The artisan who builds a beautiful canoe;
 The man who makes a fine orator's cap; and
 He who builds a handsome house.

Mai's mention of taking advantage of a woman when she sleeps refers to the custom of *mafera*. We are not told what refinements the Maohis practiced in connection with this delicate and sometimes hazardous undertaking; elsewhere in Polynesia the male visitor sometimes greased his body with oil so as to elude capture if he had the bad fortune to be discovered by his mistress' relatives. One should add that women as well as men engaged in *mafera*, as attested by the sad, sad tale of an unnamed pillar of the missionary church:

On Monday night last a vile plot was executed for the seduction of a steady & long since well behaved man. Two women of the basest sort came about midnight nearly or quite nakd into a small house where the man was contentedly asleep. They awoke him & by fairness of speech persuaded him he sinned & was judged yesterday for his crime. He has paid property equal to five fathoms of English print to the man whose wife the woman is. Beside that he has 30 fathoms of the most laborious fencing to do for the King. (Orsmond, Journal, 31 October 1827, LMS Archives)¹⁶

Many conventional signs were in use by the Maohis to proposition the opposite sex. The startled, and delighted, European seamen were extended invitations in the form of "wanton and lascivious motions." Similarly unequivocal signs were also issued by native women to native men, sometimes as an invitation, sometimes perhaps as direct challenges; in fact, some forms of dancing undoubtedly had this rationale. But there were other more subtle ways of making known one's intentions: "In the shaking of hands, in presenting one thing to another, especially by the eyes, and the toes, are signs ceaselessly given indicative of a desire for copulation" (Old Orsmond Manuscript: p. 2, LMS Archives).

Robertson reported receiving a proposition in the following form: "... she heald up her right hand and first finger of the right hand streight, then laid hould of her right wrist with the left hand, and heald the Right hand and first finger up streight and smiled then crooked all her fingers and kept playing with them and Laughed very hearty...."

(1948:184). The puzzled Englishmen concluded that she was asking for an especially long nail in return for the services she undoubtedly was offering.

In 1822 a missionary deputation had this to report about lovers' signs:

Flowers and scents, indeed, in their days of profligacy, were much used among them to attract favor; the latter are now regarded with aversion, and the former have lost their hieroglyphic meanings. When presented by persons of different sexes, according as they were accepted, rejected, or interchanged, the parties understood each others' minds. When the blossom was torn in two by a lover and his mistress, and each retained one half, it was a pledge of reciprocal fidelity till these parts should unite again—an impossible conjunction of the petals, signifying an impossible separation of their hearts. (Montgomery 1832:II, 135-136)

As time was to show, the reverend gentlemen were overoptimistic in their diagnosis of this particular facet of culture change. In fact a little further along they reported how a missionary introduction, the art of writing, came to replace old Maohi techniques but not old Maohi activities:

Marriage [*sic*] compacts are easily arranged, and the overture may be made by either party, the woman as well as the man, and, according to ancient usage, as often by the former as the latter. A message of affection, with the request of a return in kind, is sent by a friend, or a note is written on a plantain-leaf with the point of a stick. The answer is generally as prompt as the proposal is direct—either *aita*, no, or *ua tia*, it is agreed.... (Montgomery 1832:II, 157)

Another method used by lovers to communicate their sentiments was reported by a merchant, Lucett, who resided in these Islands during the 1840s. The custom he described might be a later invention or borrowing, but I shall record it here on the chance that it could also have derived from the era of this study:

The unmarried girls have a custom of conversing with flowers not unlike the Orientals. If a coolness has sprung up between a young pair, the female will separate a flower partially down the centre. One half of the split flower is intended to represent the man, and the other half the woman; and it is meant typically to imply that, though separate bodies, they are joined together at the heart. If the lover puts the flower in his hair, it is a sign that he wishes to preserve her favour; but if he tears it asunder, it is a token that he has lost his regard for her, and wishes to be entirely separated. (Lucett 1851:I, 230)

A very direct technique used by women to indicate their choice of lovers was described by de Bovis:

Here and there around the Islands are to be seen many colorful things. For example, while watching a band of youths disporting themselves in one of the shaded and enchanting river pools to be found hereabouts, one now and then sees something thrown at them from a nearby thicket—something which will turn out to be a fruit called a *nono*, which makes a swift and quite harmless missile. When this occurs the youths raise a shout, for it is a stroke of good

luck for the one hit by the *nono*. The lucky youth quickly scrambles out of the water and runs towards the place whence the *nono* was thrown, in pursuit of the Galatea who threw it, and who, by custom, will not seek too hard to avoid capture. Sometimes, however, the youth so singled out will pursue his quest obediently but with considerable reluctance, when it is known to him that the *nono*-thrower in question is [not a desirable young maiden] but some middle-aged woman of chiefly status. In such instances, it is not passion that impells him, but obedience to a more or less "official" summons. But even in such instances, the youth will be repaid somewhat in the form of the honor thus bestowed upon him of having been favored by a woman of social importance; and such episodes lead to more of the same.

It is from this customary method [of initiating nonformalized sexual relationships] that illegitimate children (and especially those conceived in adultery) are labeled *Taora nono* (to throw the *nono*). (de Bovis 1909:33)

The following commentary by Moerenhout referred to the 1830s but describes what may well have been a continuation of earlier practices:

There is a practice still generally observed at O-taiti that the women go into the water completely nude, and that, often, in the places where there is scarcely a half-foot, there, if they don't uncover themselves completely, at least they take great care to show that they wash all parts of their bodies. They are always seen chosing, to perform their ablutions, the spots where many strangers pass by. I lived for a long time in a place where I could see this maneuver; and I am convinced that there is not at O'taiti, a young girl so modest, so religious, that she would not use this sort of coquetry. (Moerenhout 1837:I, 219)

Earlier in this chapter, I recorded my opinion that "mass rapes" did in fact occur among the Maohis; I now raise the related question as to whether or not "rape" constituted a "customary" (even though perhaps unusual) technique used occasionally by an individual in satisfying his sexual desires. I raise the question but must confess my inability to answer it. By some European standards, the Maohi techniques of copulation were undoubtedly rather aggressive and violent, but unless it can be demonstrated that the woman in question was unambivalently unwilling, I fail to see how such an episode can be labeled rape.¹⁷ In this sense, the only occurrences of actual rape that we have come across in our sources are those perpetrated in warfare by the more frenzied victors upon the defeated side's women.

Finally, I call attention to what little information I have found concerning the use of "magic" for purposes of winning, or rewinning, sexual acquiescence:

Among the several types of "sorcerers" was one consisting of practioners who were benevolent in intent and innocent of fraud. Among these latter were included those whose specialty was to renew lost affections and discourage fickleness. Such specialists, who were called *orou* [*oru*?] were a busy lot. Their procedure resembled ordinary sorcery in that they worked through some object associated with the [person whose affection was to be captured or retrieved]. (Moerenhout 1837:I, 541n)

SEX TRAINING

As we have seen, preparation for an active career of sexual engagements began at an early age; and it was encouraged by many features of Maohi life. To begin with, children cannot have missed witnessing some of the acts of copulation which took place in their populous and unpartitioned houses. While the sources make no specific mention of this, it is reasonable to assume from present-day circumstances, that the Maohi children of old were also encouraged by the example of their adults to take ribald delight in watching animals copulate. Also, children lived with older people who conversed openly, unashamedly, and noneuphemistically about sexual matters. The evidence on this point is unmistakable, for example:

Both sexes express the most indecent ideas in conversation without the least emotion and they delight in such conversation behind any other. (Beaglehole 1955:128)

Virtuous women hear a joke without emotion, wick amongst us might perhaps put some men to the blush. (J. Forster 1777:I, 393)

One thing that especially struck me ... was the shameless, uninhibited nature of their conversation, on any and all occasions, and with women as well as men. For, these people give everything its right name and have none of the polite circumlocutions which exist in our civilized communities, where people employ allusions, obscure phrases or accepted terms when talking of matters which, if frankly discussed, would be offensive and cause scandal. (Moerenhout 1837:I, 229; this translation taken partly from Danielsson 1956:59)

Nor, as pointed out earlier, was any mystery made of the human body. Children went mostly naked until they were six or seven years old, and after that they had ample opportunity to acquaint themselves with the genital anatomy of both sexes.

Another feature of Maohi life which served to encourage children toward early sexual engagement was the general attitude described by the Spaniard Blas de Barreda: "They think meanly of being virgins, and resent being twitted with it" (Corney 1915:471).

As for specific measures taken to predispose and prepare children for love making, I can discover nothing analogous to certain practices reported from some other Polynesian societies: namely, no direct evidence of stimulation of their genitals by older relatives, of regular sexual initiation of youths and girls by older persons, et cetera. (See Danielsson 1956.) Such practices may well have existed, but the early European observers were either unaware of them or unwilling to write about them.

Much of the general cultural setting of Maohi heterosexuality should now be clear; its place in everyday conversation and play, its simulation in drama and dance, its metaphoric application and its thematic occurrence in "oral literature",¹⁸ and its symbolic representation in both religious and secular ceremony. And one has only to glance at examples of Maohi

anthropomorphic sculpture to perceive how prominently genital anatomy figures in this form of "art." If there were any utility and validity to characterizing whole ways of life in terms of "themes" or "focuses" or "basic orientations," one would have to feature sexuality when describing that of the Maohi.

HOMOSEXUALITY

In the light of the foregoing one might expect that Maohi society, least of all, would harbor homosexuality. The fact that it did so greatly aroused the interest, and the distaste, of the early European visitors. Bligh was the first to inquire into the matter, and his account is as good an introduction as any:

On my Visit this Morning to Tynah and his Wife, I found with her a person, who altho I was certain was a Man, had great marks of effeminacy about him and created in me certain notions which I wished to find out if there were any foundations for. On asking Iddeeah who he was, she without any hesitation told me he was a friend of hers, and of a class of people common in Otaheite called Mahoo. That the Men had frequent connections with him and that he lived, observed the same ceremonies, and eat as the Women did. The Effeminacy of this persons speech induced me to think he had suffered castration, and that other unnatural and shocking things were done by him, and particularly as I had myself some Idea that it was common in this sea. I was however mistaken in all my conjectures except that things equally disgusting were committed. Determined as I was either to clear these people of such crimes being committed among them, or to prove that they were so, I requested Tynah to inform me, which as soon as I had requested it, a dozen people and even the Person himself answered all my questions without reserve, and gave me this Account of the Mahoos.

These people, says Tynah, are particularly selected when Boys and kept with the Women solely for the caresses of the men, here the Young Man took his Hahow or Mantle off which he had about him to show me the connection. He had the appearance of a Woman, his Yard & Testicles being so drawn in under him, having the Art from custom of keeping them in this position; those who are connected with him have their beastly pleasures gratified between his thighs, but are no farther Sodomites as they all positively deny the Crime. On examining his privacies I found them both very small and the Testicles remarkably so, being not larger than a boys of 5 or 6 Years old, and very soft as if in a State of decay or a total incapacity of being larger, so that in either case he appeared to me [as] effectually a Eunuch as if his stones were away. The Women treat him as one of their Sex, and he observed evry restriction that they do, and is equally respected and esteemed.

It is strange that in so prolific a country as this, Men should be led into such sensual and beastly acts of gratification, but perhaps no place in the World are they so common or so extraordinary as in this Island. Even the mouths of Women are not exempt from the pollution, and many other as uncommon ways have they of gratifying their beastly inclinations. (Bligh 1789:II, 16-17)

Many other European visitors touched on this subject in their journals. Mortimer had the following to report:

Now I am upon the subject of these kind of entertainments, I cannot help relating a very droll occurrence that happened in consequence of one of their nocturnal Heivas. Attracted by the sound of drums, and a great quantity of lights, I went on shore one night with two of our mates to one of these exhibitions. We seated ourselves among some of our friends, whom we found there; when one of the gentlemen who accompanied me on shore took it into his head to be very much smitten with a dancing girl, as he thought her; went up to her, made her a present of some beads and other trifles, and rather interrupted the performance by his attentions; but what was his surprize when the performance ended, and after he had been endeavouring to persuade her to go with him on board our ship, which she assented to, to find this supposed damsel, when stripped of her theatrical paraphernalia, a smart dapper lad. The Otaheiteans on their part enjoyed this mistake so much, that they followed us to the beach with shouts and repeated peals of laughter; and I dare say this event has served as a fine subject for one of their comedies. (Mortimer 1791:47)

In view of the mystery and contradictions now obscuring this unusual feature of Maohi society it will be useful to reproduce the more informative journal passages in full.

Besides the different Classes & Societys already discribed they have a Set of Men Calld Mahoo. These Men are in some respects like the Eunuchs in India but are Not Casterated. They Never Cohabit with weomen but live as they do; they pick their Beards out & dress as weomen, dance and sing with them & and are as effeminate in their Voice; they are generally excellent hands at Making and painting of Cloth, Making Matts and evry other Womans employment. They are esteemed Valuable friends in that way and it is said, tho I never saw an instance of it, that they Converse with Men as familiar as weomen do—this however I do not aver as a fact as I never found any who did not detest the thought. (Morrison 1935:238)

To this island ... [Tetiaroa] they also send boys for the same reason [i.e., to “become fair by living on fish, and low diet”] whom they keep for abominable purposes. (Edwards and Hamilton 1915:113)

Something that was seen among the people today shews us these heathens, like the heathens of old, are given up to vile affections; the men leaving the natural use of the woman, burn in their lusts one towards another, men with men working that which is unseemly. Indeed it is said that Otoo [Tu] never cohabits with his wife but has a number of boys with whom he satiates his passion. (Jefferson, Journal, 8 June 1799, LMS Archives)

In various districts of the island there are men who dress as women; work with them at the cloth; are confined to the same provisions and rule of eating and dressing; may not eat with the men, or of their food, but have separate plantations for their peculiar use. (Wilson 1799:156)

As I fixed my eyes upon the fellow [the mahu], he hid his face: this I at first construed into shame, but found it afterwards to be a womanish trick.

These mawhoos chuse this vile way of life when young: putting on the dress of a woman, they follow the same employments, are under the same prohibitions with respect to food, &c. and seek the courtship of men the same as women do, nay, are more jealous of the men who cohabit with them, and always refuse to sleep with women. We are obliged here to draw a veil over other practices too

horrible to mention. These mawhoos, being only six or eight in number, are kept by the principal chiefs. So depraved are these poor heathens, that even their women do not despise those fellows, but form friendships with them. This one was tayo to Iddeah. (Wilson 1799:198)

Still more details, including a statement contradictory to Bligh's, appear in the following excerpt from the journal of the missionary Jefferson (his entry for 22 August 1800, LMS Archives):

Several women from Oriatteea arrived in the district. Some of them gained admittance into br. Henry's apartment, to see it; among them Was a man, no otherwise to be distinguished from the women but by a little coarser features & rougher voice: this man keeps himself for the abominable sin of sodomy. We have lately learnt it is usual for some persons from their youth to set themselves apart for this base purpose. They go among the women, observe all their customs, eat & drink & sleep with them & do all the offices of females in making cloth &c. and prostitute their bodies to men for the above sin. They never cohabit with women, but only with men. They are not paid by men, but pay men for sinning with them. Some of them are so effeminated as not to be distinguished by their countenances, voices or manners from the women. They are, when spoken to, called by the same name of endearment that men use to women, & women to women, Pattaa ... as also for the sin of bestiality (which the Otahiteans are guilty of with dogs),^[19] they seem surprised. Besides these sodomites, who are common in the land, the society of areeoies, have generally when they travel about in companies, one woman for the whole company.

A few months later the same Jefferson recorded in his journal another homosexual episode:

February 12, 1801: The chief of Hapyano was detected committing an act of bestiality with another man, which perhaps had not existence even in Sodom and Gomorrha. While the brethren were engaged at an exercise of the language in one of br. Henry's apartments the chief and two or three others were present. For a little time the chief laid himself down in the room upon one of his attendant's cloth as if to sleep. After we had concluded our exercise we went out, and br. Henry unwilling to disturb Paeete [the chief of Hapyano] left him and his man in his room by themselves. Not long after having the occasion to go back for something and entering suddenly, he saw sufficient to assure him a most singular and horrible species of bestiality was committing; the chief having in his mouth the other's ____. The most unnatural lusts are indulged by the Otaheiteans perhaps to as great an excess as in any nation under the sun.

Additional information on fellatio is contained in a postscript commentary to Turnbull's account, in which he described *mahu* as "... a set of men ... whose open profession is of such abomination, that the laudable delicacy of our language will not admit it to be mentioned" (1813:382). Subsequently Turnbull was prevailed upon to overcome his scruples, with the result that the "abomination" in question was briefly described in print: "They put the penis into the unfortunate's mouth, and go on to emit the semin, which the wretch eagerly swallows down as if (it) were the

vigor and the force of the other; thinking no doubt thus to restore himself greater strength (or manhood)."²⁰

In discussing this practice, Bouge offered the suggestion that it was something more than a simple act of sexual inversion, and, by extension, that the *mahu* was not a mere invert. In brief, he argues that the participants in fellatio were perhaps accustomed to reversing their roles, to mutual advantage. Further, he likened the practice to the kind of cannibalism that follows wars in some societies, the kind whereby the victors acquire some of the qualities of strength of their enemies by actually eating parts of them. In the case of Maohi fellatio, Bouge went on to say, the thing so ingested, the semen, was particularly important inasmuch as semen was the very source of life. And as for the *mahu*, who were the "specialists" most accustomed to this practice, they were well suited to their calling, on two grounds. They were themselves well-built and robust fellows; and behaving, as they did, like women they emphasized the roles they played in maintaining the continuity of human kind. (Bouge 1955:148)

As some polite but skeptical critic might put it, Bouge perhaps stretches credulity to the boundaries of disbelief, but his ingenious interpretation does nevertheless deserve recording.

The prominent chief Pomare II was much addicted to homosexual practices, his favorite having been an individual (perhaps a *mahu*) named Toetoe, with whom, according to the Reverend Crook, he once "lived in a horrid manner at Matavai" (Journal, 2 March 1821, LMS Archives). During that period the missionaries were obliged to pursue their objectives under circumstances that truly outraged their notions of decency. For example:

At dinner ... [Pomare's] detestable pander sat along side of him on a low seat. The King cut some meat put it in a plate & gave it him & he took it back & eat it. [Presumably, back to the eating place reserved for women.] Afterwards he came to the table again, the King poured him out spirits which he drank at the table. Br Nott reports that when he has gone to the King to translate the Scripture, this vile fellow has lain asleep & when the King awoke him at one time he was offended and cried like a child. The King then coaxed him and made it up with him. Br Nott also informed the brethren Bourne Darling & myself this day that he is very near to the Kings person who cannot bear him out of his sight for a minute and that when he is translating the Scriptures with the King, he (Br N) on one couch & the King on another this detestible wretch is frequently between them, and he is obliged to turn his head from them to his book to avoid seeing what passes and still gets his ears shocked with what he hears. The King as we may expect pays no attention to his wife & seems to have no concern at all about his infant son, who was at our house most of the day, but the king made no inquiry after him. It is not to be wondered at therefore that he catches at every thing that seems to favour Antinomian principles. (Crook, Journal, 6 February 1821, LMS Archives)

I will now attempt to summarize, or to reconcile, all these accounts: first of all, the types of practices engaged in.

According to Bligh's account, the *mahu* played what was a woman's usual role in coitus—that is, "... those who are connected with him have their beastly pleasures gratified between his thighs..." But, he adds, they all deny the "Crime of Sodomy" (i.e., probably anal coitus). The missionary Jefferson, writing a decade later, does however describe the practice as "sodomy." If "sodomy" did in fact mean anal coitus to both Bligh and Jefferson, its practice at the later date, as averred by Jefferson, could of course have been learned from some of the European visitors. In addition, the episode of male fellatio witnessed by Jefferson may well have been a general practice (cf. Bouge 1955).

As for other kinds of "aberrant" sexual practices, we have Bligh's statement that there were "... many other as uncommon ways they have of gratifying their beastly inclinations"; but the sources specify no types involving homosexuality other than those described above.

Turning now to the personnel involved in homosexual practices, most of the evidence indicates that they were mainly males. Bligh's remark that "even the mouths of women are not exempt from this pollution," could signify of course cunnilingus between females, but could also refer to a heterosexual mode. In any event, if female homosexuality was actually practiced, it was probably less common, or at least considerably less institutionalized, than that of males.

As for the types and numbers of males involved in homosexual practices, the evidence is somewhat unclear. There is no uncertainty about the existence of an out-and-out transvestite, *mahu*, although the sources differ concerning their number. Apparently, such "unmales" cohabited only with males and, it would seem, mainly with non-*mahu* males of upper-class status. Turnbull wrote: "I add, with some satisfaction, that the encouragement of this abomination is almost solely confined to the chiefs" (1813:382). In addition, however, one can infer from some sources that there were numbers of males—mainly youths—who were used as catamites, to "sate the passions" of older and usually upper-class males, but who were not fully transvestite.²¹ Also, there is evidence that males in general indulged occasionally in homosexual practices including mutual masturbation and other unspecified acts, in response to needs that cannot all be attributed to a chronic shortage of females.

"In these Islands all persons seem to think of scarcely anything but adultery and fornication. Little children hardly ever live to the age of seven ere they are deflowered. Children with children, often boys with boys. They are often on the mountains playing in wickeness together all the day long" (Orsmond, Journal, 24 October 1827, LMS Archives). Though written in 1827, I suspect that such practices were current in earlier times as well. Save for Morrison's opinion, cited earlier, that most

Maohis “detested the thought” of homosexuality, the sources indicate that such practices were not socially disapproved of by the populace in general, although those males who regularly lived or cohabited as females were identified with females in connection with religious ritual, eating, and other sex-linked customs. In fact, the true transvestite *mahu* were, we are told, “esteemed Valuable friends” especially by the women with whom they resided and worked.²²

Some transvestites appear to have formed long-lasting sexual and domestic relationships with their male partners, but there is no evidence that any such relationships achieved the institutional status of “marriage,” for example, with respect to exchanges of goods. Nor is there any record of child adoption by such a “couple” as occurs occasionally in modern-day Tahiti.

In some cases the male-acting partner in a homosexual relationship rewarded his female-acting mate with objects of value, but according to Jefferson, in a passage cited earlier, the reverse also took place.

CHAPTER 12 *WARFARE*

Among the Society Islanders, in consequence of the influence of the climate, luxurious mode of living, and effeminacy of character, induced thereby, the obstinacy and the continuance of actual combat were not equal to that which obtained in other tribes; yet we learn from the frequency of its occurrence, and the deadly hatred which was cherished, that the passion for war was not less powerful with them than with the New Zealander or the Marquesian; and its consequent cruelties and demoralization were perhaps unequalled in any other part of the world. Their wars were most merciless and destructive. Invention itself was tortured to find out new or varied modes of inflicting suffering; and the total extermination of their enemies, with the desolation of a country, was often the avowed object of the war. This design, horrid as it is, has been [on occasion] literally accomplished: every inhabitant of an island, excepting the few that may have escaped by flight in their canoes, has been slaughtered; the bread-fruit trees have been cut down, and left to rot; the cocoa-nut trees have been killed by cutting off their tops or crown, and leaving the stems in desolate leafless ranks, as if they had been shivered by the lightning. (Ellis 1829:II, 494)

Warfare¹ does indeed appear to have been a major preoccupation of the Maohis, involving social interactions of a most crucial nature and bringing about extensive changes in social relations. There may have been periods in Maohi prehistory when warfare served to maintain existing social relations, but during the era immediately before and after first European contact it was revolutionary in its social consequences and, quite possibly, in its conduct.

Full explication of the various causes of warfare must be postponed to later chapters, but it may be useful to list a few of the more immediate ones here.

Some writers, such as Moerenhout (1837:II, 31) and Andía y Varela (Corney 1915:271), included "economic" factors among the several causes of war: the desire, for example, for better land or for certain food when local resources were in short supply. In connection with the latter, Moerenhout asserted that when their own supplies gave out people living high up the valleys often attempted, sometimes by force, to obtain breadfruit from the longer-producing plains areas, and reciprocally that plainsmen would raid inland areas for plantains and other wild foods. Such forays, Moerenhout added, were generally on a small scale, usually having involved only

"*chefs subalternes*" of the same tribal district, and thus were of no real concern to the districts' sovereign chiefs. Some subsistence inequities may have occurred and have resulted in instances of localized raiding, but such conflict cannot have been very general or frequent, for, as noted in chapter 7, most Maohis resided in or had easy access to the same type of resource zone. Moreover, there is no record of any specific conflict of this nature developing into one large enough to figure in Maohi verbal traditions or European written records. Similarly, with respect to warfare resulting directly from desires for territory with richer economic resources, instances of such may indeed have taken place, but they were neither frequent enough nor large-scale enough to have been chronicled. Numerous boundary disputes are recorded as having developed into major armed conflicts, and, although "economic" factors may have underlain many of these, their more immediate causes were usually of a different nature.

Andía y Varela listed the capture of women as having been one of the main causes of warfare (Corney 1915:271), and oral tradition contains episodes of this kind. It is probably true that males outnumbered females somewhat, but in view of Maohi women's relatively unfettered existences, except in certain dietary and ritual matters, it is unlikely that there was much widespread "capture" of them. Women undoubtedly figured among the causes of warfare, but not as mere pawns.

As already mentioned, disputes over boundaries are recorded as having developed into large-scale armed conflict (e.g., see Morrison 1935:173 ff.), and some of these were probably based on contention over economic resources. More often, however, boundary warfare resulted when one of the parties disregarded another's frontiers as a gesture of political affront. As later chapters will describe, ambitions to extend or efforts to curb political power probably accounted for most of the larger, more devastating armed conflicts of the eras under study. Even gratuitous acts of cruelty and predation did not usually lead to large-scale warfare unless the political interests of socially important individuals became involved; and this was also true of instances of sacrilege, whether committed purposefully or otherwise.

But it will be more sensible to discuss these matters after some basis has been provided for an understanding of Maohi social relations, so I proceed now with a description of the more technical aspects of Maohi warfare.

WEAPONS AND UNIFORMS

The principal weapons of the Maohis were spears, clubs, rasps, and stones. In addition, warriors sometimes carried "battleaxes" of pearl shell, but these were used more for dismembering fallen foe than for actual fighting. The Maohis also made bows and arrows, as noted above, but these were, inexplicably, used only for sport and hunting.² (Figs. 12-1 through 12-6.)

FIGURE 12-6. Sling and stone. Bernisches Historisches Museum, Berne.

What most observers called "spears" were used for throwing, thrusting, and even clubbing and parrying. One type (*pātia, tao*), made of such hardwoods as ironwood, *Alphitonia (toi)*, or coconut, was from twelve to eighteen feet long, about one and one-half to two inches in thickest diameter, and tapered to a pointed end. As was the case with other Maohi wooden weapons it was polished smooth but was not carved. Another type of spear differed from the *pātia* in being generally shorter and more slender, and in having a flat-bladed, lozenge-shaped fighting end. In some of these the butt end was rounded, in others pointed. A third type of spear (*hoto ihe, maehae*) was even shorter and had barbs of fishbones. Some flat-bladed spears were used also as clubs, but there were true clubs (*omore*), varying from long flat-bladed types to short bludgeons. Ellis reported that the handles of spears and clubs were covered, for surer gripping, with the resinous gum of the breadfruit tree (1829:II, 479).

Some fighting was done with the natural rasp provided by the serrated backbone of the stingray (*aero fai*) drawn across a foe's body. Another fighting rasp consisted of a single or forked stick edged with sharks' teeth (*paeho*).

Stones were hurled in battle, both by hand and by sling, with what has been described as great force and deadly accuracy (Ellis 1829:II, 490; Wilson 1799:364).

In addition to all these fighting implements the Maohis fashioned long spears out of hibiscus wood (*pūrau*), but these were used only for sport.

Ellis gave the following account of the offensive employment of spears and clubs:

The combatants did not use much science in the action, nor scarcely aim to parry their enemy's weapons; they used no shield or target, and, believing the gods directed and sped their weapons with more than human force upon their assailants, they depended on strength more than art for success. Their clubs were invariably aimed at the head, and often, with the lozenge-shaped weapon, they would *tapai*, or cleave, the skulls of their opponents. Their spears they directed against the body, and the *maui* was often a deadly thrust, piercing through the heart. (1829:II, 489)

Cook, in describing a sham battle, praised the Maohis' defensive skills especially:

Otou [Tu] who was present caused some of the Troops to go through with their exercise on Shore, Two parties first began with Clubs, but this was so soon over that I had no time to make observations upon it, they then went to Single Combat and went thro' the Various Methods of fighting with great alertness and parried off the blows, pushed &c^a each combatant intended the other with great dexterity; their Arms were Clubs and Spears which they also used as darts. In fighting with the Clubs, I observed all side-blows were parried with the Club except those intended the legs which were evaded by leaping over them, a downright blow on the head they evaded by couching a little and leaping on one side, thus the blow

would fall to the ground: they parried off the Spear or dart by fixing the point of their spear in the ground and holding of it before them in an inclined position more or less elevated, according to the part of the body they saw their antagonist intended to make a push or throw his dart, and by turning their hand a little to the right or left turn off either the one or the other. (Beaglehole 1961:401-402)

Cook however was less impressed than Ellis was with the Maohis' offensive tactics:

I thought that when one combatant had parried the blows &c^a of the other, he did not take all the advantages which seem'd to me to accrue, as for instance, after he had parried of a dart he still stood on the defensive and suffered his Antagonist to take up another, when I thought there was time enough to have run him thro' the body, but by such a step they might have exposed themselves to more danger than I could see or be aware of. (Beaglehole 1961:401-402)

According to Varela they handled their "cudgels" with "astonishing dexterity," having been able to "... defend themselves against a sword without their opponent being able to get a cut in, skilful fencer though he be. I speak from the experience of a friendly trial which took place between Titorea ... and a member of the storeship's crew—a smart enough adept in fencing with the Spanish sword." (Corney 1915:267)

A slingsman went to battle dressed only in loincloth (*maro*) and, sometimes, poncho (*tiputa*), but most other fighters wore one or more other items of body covering or headwear. Maohi "armor" consisted of a network of senit cords wound around body and limbs "... so tight, as merely to allow of the unencumbered exercise of the legs and arms, and not to impede the circulation of the blood" (Ellis 1829:II, 500). This covering may have served somewhat to lessen blows of clubs and stones but did not defend much against a spear. Fine mats or sheets of bark cloth in place of armor were often worn in battle. Some men were so thickly girded with the latter that they were perceptibly impeded in their movements. "The very best things they possessed they always put on to go to war" (Orsmond, Notes on War). A most singular item of battle dress, and one having great exchange value, was the *taūmi*, or demi-gorget, a wickerwork breast covering decorated with shell, sharks' teeth, and feathers (fig. 12-7).

Some fighters wore only a strip of bark cloth around their temples, others protected their heads with huge turbans of the same material, still others decorated their heads with showy feather headgear, and a few made themselves conspicuous to both friend and foe by wearing an imposing *fau*, described by Ellis as

... a cap fitted closely to the head, surrounded by a cylindrical structure of cane-work, ornamented with the dark glossy feathers of aquatic birds. The hollow crown frequently towered two or three feet above the head, and, being curved at the top, appeared to nod or bend with every movement of the wearer.

FIGURE 12-7. Gorgets: *a*, Bernisches Historisches Museum, Berne; *b*, British Museum.

This was a head-dress in high esteem, and worn only by distinguished men, who were generally sought out by the warriors in the opposing army. To subdue or kill a man who wore a *fau*, was one of the greatest feats. I have been often told, by a gigantic man who resided some time in my house, and was one of the warriors of Eimeo, that when the army of the enemy has come in sight, they used to look out for the *fau* rising above the rest of the army, and when they have seen one, pointing to it, animate each other by the exclamation, "The man with the *fau*; ha! whoever shall obtain him, it will be enough." But, however imposing in appearance these high helmets may have been, they afforded no defence; and although formed only of cane-work and feathers, must have been cumbersome. (1829:II, 499-500).

The relevance of the foregoing to social relations lies mainly in the relationship of weapons and battle attire to class status, a matter that will be discussed later on; but one may draw attention here to the unsuitability of some aspects of battle attire to the business of fighting. Armor and thick turbans undoubtedly served to reduce the effects of blows. Thick layers of body wrapping had the same effect but must have encumbered offensive fighting considerably. And as for the elaborate ornamental headgear, it could only have been a hindrance to fighting and surviving.

TRAINING

The normal everyday activities of most Maohi males served to keep them in excellent physical trim for fighting, on land or on sea. Also, many of them engaged in sports which had the effect—and evidently even the avowed purpose—of preparing them for battle:

Their martial games were numerous; and to those preparatory sports, the youth paid great attention. The *moto*, or boxing, and the *maona*, or wrestling, were regarded as a sort of military drilling; but the *vero patia*, throwing the spear or javelin, and the practice of throwing stones from a sling, were the principal military games. (Ellis 1829:I, 294)³

But in addition, larger groups of males also occasionally engaged in practice maneuvers and sham fighting, probably more in preparation for specific engagements than as part of a peacetime policy of readiness.

Drilling was a standardized activity, as detailed in the following:

Standing upon an open field the drilling master said:

Toto'o i te tahua ia mata tahua roa.	March out upon the long course.
Toto'o i te tahua ia mata tahua poto.	March out upon the short course.
Tahi pae ia rupe-a-nu'u.	One side for mountain-pigeon inland.
Tahi pae i tai ia rupe-i-tai.	One side for mountain-pigeon coastwise.
E 'ori tatavi e ha'a ta te va.	Emotion will dance, the waves [people] will work.
E mataitai ta pua i te fau.	Fau flower will look on.
E 'ori te heiva ia orea.	Drilling will be the lively game.
Na atua i uta e, a haere mai!	O gods inland, come forth!
Na atua i tai e, a haere mai!	O gods coastwise, come forth!
Na atua i ni'a e a haere mai!	O gods above, come forth!
Na atua i raro e, a haere mai!	O gods below, come forth!
A haere mai ei atua a'e i ta tatou	Come as gods in our amusement,
Ei ha'api'i i teienei mau pipi	To teach these pupils
I te tia raau.	The use of wood weapons.
E moe i te Fatu,	Rest in the lord,
E moe i te Fatu, Ta'arua,	Rest in the lord, Ta'arua,
E tata te tapua ra'au,	The user of the wood must strike,
E ta i te vai o Tu'.	Must strike the waters of stability (war).
I noaa tana i'a,	That he may obtain his fish,
E vaevae roroa.	Long legs (slain men).
Tana tiea e 'ura!	This club is red!

Then they would drill first with the club in six movements.

(1) E 'ura teo; (2) e 'ura teni;	(1) Exaltation red; (2) boastful red;
(3) E 'ura teo; (4) e 'ura teni;	(3) Exaltation red; (4) boastful red;
(5) E 'ura pitara; (6) e 'ura faau.	(5) Raising red; (6) striking red.
E fa'a'a, e hoa ia Tane	Suit it, O friends, to Tane,
Atua o te mau mea purotu,	God of beauty,
Ia riro te hui ra'atira	That the people may
Ei papa rahi,	Become a great rock,
Ei tahe vai pue i te 'ite;	A freshet in dexterity,
Ei ueue a vi	Become subduers,
Ei manuu a horo;	Become fast runners;
Ia poiri i vaho,	That darkness be [thrown] out,
Ia marama i roto.	That the light be let in.

They went through all their drilling thoroughly on land and sea. (Henry 1928:300)⁴

Cook described one episode of sham naval fighting, this one specifically arranged on his account:

I looked upon this to be a good opportunity to get some insight into their Manner of fighting and desired Otoo to order some of them to go through the necessary manoeuvres. Two were accordingly ordered off, in one of them Otoo Mr King and my self went and Omai in the other. After we were out in the bay, we faced, and advanced upon each other and retreated by turns, as quick as the paddlers could

move them; during this the warriors on the Stages flourished their weapons and played a hundred Antick tricks which could answer no other end than that I could see than to work up their passions for fighting. Otoo stood by the side of the Stage and gave the necessary orders when to advance and when to retreat, in this great judgement and a quick eye combined together seemed necessary to seize every advantage that might offer and to avoid giving advantage. At last after advancing and retreating, to and from each other at least a dozen times, the two canoes closed, head to head, or stage to stage and after a short conflict, the troops on our Stage were supposed to be killed and we were board[ed] by Omai and his associates, and that very instant Otoo and all the paddlers leaped over board to save their lives by swimming. (Beaglehole 1967:I, 212-213)

The Spaniard Andía y Varela also described a sham naval fight which took place on the occasion of the visit of one chiefly personage to another. Because of a food scarcity in the host's district, the guest of honor ordered supplies to be sent from his home district. When provisions arrived, carried by over two hundred canoes, some of them were left in the canoes to serve as a prize in a mock battle between local people and visitors—presumably a conventional kind of sportive encounter. In the foray which followed, "... many blows and hard knocks were dealt on either side." The winner in this game was the side that ended up with the most booty. (Corney 1915:269)

MOBILIZATION

Some large-scale armed conflicts commenced with stealthily executed attacks against unsuspecting enemies, but most Maohi warfare which the early Europeans chronicled began only after what amounted to public declaration and lengthy prologue, with the foe well warned if not well prepared. Mobilization involved both political and religious acts; in most instances the principal adversary on each side had to take steps to secure both human and supernatural assistance. Few leaders commanded enough wholly reliable manpower to be able to engage in large-scale battles without first taking steps to rally local support and secure allies. It seems to have been generally believed that no amount of human effort could achieve a victory without supernatural concurrence and assistance. Although it is impossible to learn, from available evidence, the relative decisiveness of these two factors in the thinking of most Maohis, some suggestive passages relating to this question will be quoted below. As a matter of fact, the political and religious steps toward mobilization were simultaneously pursued.

Even the most powerful tribal chiefs apparently felt it necessary to consult their principal supporters before committing themselves to full-scale war. This was usually done by convening a council of war,⁵ to decide whether to go to war and, if so, to apportion contributions in manpower and materials. Here is Henry's account of the physical arrangements of such a meeting:

When at last the council met, the speakers sat in a central group, the sovereign and counselors sitting in a row at one end facing them and the chiefs and priests in a row to the right and to the left of the orators. The lower end of the two lines remained open for ingress and egress; but no one dared to cross the space between the sovereign and the orators, on pain of death. Outside of this official assembly sat an audience of the people, who had no voice in the meeting but felt a lively interest in what the orators said and were generally greatly impressed with their eloquence—the deliberations sometimes lasting over a day. (Henry 1928:297)

A passage from Moerenhout indicates that such meetings were no mere formalities:

These assemblies usually took place out of doors. The participating chiefs wore a special council-meeting garment (*auhaana*), a mat of fine quality which extended to the knees. The *ra'atira*, those proprietors of large estates, whom I have already mentioned, were seated there with their superiors; and knowing full well that the latter depended upon their assistance they did not hesitate to express their own opinions. Usually both the pros and the cons were discussed in such meetings with clarity, emotion and eloquence. And, however bellicose the general populace may have been, the counsel of the majority of inferior chiefs sometimes forced the *arii* to give up his martial enterprises. (Moerenhout 1837:II, 32–33)

According to Ellis, the harangues of the orators, presumably both for and against war, were specimens of "... the most impassioned natural eloquence, bold and varied in its figures, and impressive in its effects." Ellis continued:

I never had an opportunity of attending one of their national councils when the question of war was debated, under all the imposing influence imparted by their mythology, whereby they imagined the contention between the gods of the rivals was as great as that sustained by the parties themselves. A number of the figures and expressions used on these occasions are familiar, but, detached and translated, they lose their force. From what I have beheld in their public speeches, in force of sentiment, beauty of metaphor, and effect of action, I can imagine that the impression of an eloquent harangue, delivered by an ardent warrior, armed perhaps for combat, and aided by the influence of highly excited feeling, could produce no ordinary effect; and I have repeatedly heard Mr. Nott [another missionary] declare (and no one can better appreciate native eloquence), he would at any time go thirty miles to listen to an address impassioned as those he has sometimes heard on these occasions. (1829:II, 479–480)

As noted above, while the question of war and peace was being argued among political personages, priests sought signs from the spirits:

If in starting out to seek omens, the priests met with derision from a thoughtless group, it was regarded as a sign that defeat awaited the warriors, and that sufficed to cause abandonment of the project. If in seeking omens at night a priest chanced to touch something soft and pleasant with his toes, he said that the army would be victorious; but if his whole foot went in he said that the army would lose. If his face got covered with a spider's web in the bushes he returned home feeling that he was not inspired and advised the sovereign not to venture in the

project. If he paddled out in a canoe at night and a school of fishes jumped into his canoe, he said the enemy would thus fall into their hands. (Henry 1928:297)

In addition to such informal actions as these, more organized measures were undertaken to prognosticate and to secure the active assistance of friendly spirits by scrupulous performance of certain rituals and by gifts.

There may have been times in Maohi prehistory when each warring unit enjoyed the more or less exclusive support of this or that tutelary spirit, whose goodwill had to be continually courted, and perhaps, but not usually, competed for. Some of the armed conflicts of the eras under study may also have taken place under that kind of fixed supernatural auspices, but by then many other of the large-scale conflicts appear to have involved adversaries seeking approval and assistance from the same spirit, or set of spirits, and this of course required the offering of competitively attractive gifts.⁶ In fact, during the second half of the eighteenth century, the god 'Oro appears to have achieved the status of a universal war god, whose favors were everywhere courted in connection with warfare. While most other spirits may have once been satisfied to receive offerings of pigs, dogs, fish, fine mats, and the like, 'Oro preferred human beings; and his preference appears to have begun to be shared by several other spirits courted specifically for war. In any case, in the fullest descriptions that have survived concerning the ceremonial aspect of warfare, human sacrifice was a recurrent theme.

In one version (Ellis 1829:II, 478-479) a full-scale program of prebattle religious ceremonies lasted several days. The first three episodes of these events took place in conjunction with political meetings: (1) *matea* (awaken): a human sacrifice was offered to 'Oro to "awaken" this deity and invite his presence and assistance; (2) *maui fa'atere* (the throwing, or darting): another human sacrifice was offered (to 'Oro also?), which served as a public declaration of war; (3) *haea mati* (tearing the peace-treaty emblem): still another human sacrifice was offered, figuratively representing the breaking off of any treaty relations that might have formerly bound the adversaries in a peace pact.

During these ceremonies priests continued to look for signs of the spirits' attitudes toward the proposed war, as indicated, for example, by movements of the victims' muscles. In the views of some writers these signs of a spirit's attitude were regarded by the general populace as completely reliable and utterly decisive, when in fact they were not infrequently mere "juggling and contrivance" designed only to "... deceive the people into a persuasion that the god sanctioned the views of the king and government" (Ellis 1829:II, 503). As Moerenhout observed:

These oracles, however, almost always conformed to the politics of the chief; and it was especially on these occasions that the latter needed (the) priests. Though some, in fact, opposed the *ra'atiras'* making war, it was rare that they resisted

the gods' will and no one would have refused to march when the sacrificers had promised victory. (1837:II, 33)

In this sense it was asserted by Moerenhout that the priests were masters of equivocation, having been cautious, for one reason or another, to interpret the signs in terms broad enough to accommodate to the shifting of political winds and even to the possibility of unfavorable military outcome.

Not so the shamans. When some spirit declared itself for war or peace through the instrument of a credible *taura*, its words were positive and usually decisive—which does not, of course, rule out the possibility that the behavior of some *taura* was, like that of the priests, influenced by politics. In any case, during the era under study the rise to influence of the war god 'Oro was accompanied by a proliferation of shamans serving more or less exclusively as that god's vehicle, and some of these achieved institutionalized positions of considerable influence over secular affairs. There is evidence for believing that when one of these shamans spoke out for peace or war even the most powerful secular leaders were swayed.

However the decision was arrived at, when war was decreed, there was set in motion another series of events, practical and ceremonial. Messengers were sent about the countryside announcing the decision to fight and calling upon the loyal leaders to mobilize their forces. In many cases mobilization required no longer than was necessary for the warriors to pick up their weapons and proceed to the assembly place; accounts speak of the continual state of readiness in which many men kept their weapons and battle dress. In other cases, however, there must have occurred long periods of preparation, especially when boats had to be built or converted to martial use. And during these proceedings steps were sometimes taken to remove the noncombatants—women, children, and the aged—to safer places.

Upon reaching the assembly place each leader and his immediate adherents encamped together and apparently retained their separateness as long as possible thereafter. If the force included the units of allies and not just members of a single tribe—and this was the case with most large-scale armed conflicts—the principal leaders of the separate units took the precaution of meeting together, in advance of their armies, to exchange compliments and each to assure the other of his intent. (Moerenhout 1837:II, 36)

Meanwhile another set of ceremonies took place, consisting of presentation by the secular leaders of valued objects—bark cloth, fine mats, pigs—to the priests, to compensate them for their unremitting efforts in securing the active assistance of spirits, including even winning over to their side the tutelars of the enemies (Ellis 1829:II, 481–482).

Following this was another set of ceremonies, often involving human sacrifice, in which the images of the supporting spirits were installed in temporary abodes as near to the actual fighting as possible, mainly in small

marae erected on special canoes accompanying the fleet into battle. This was a most practical measure, since much large-scale combat usually took place at sea or near the shore. Also during some of these final prebattle ceremonies large quantities of food were consumed by the warriors, to sustain them during the ensuing fighting.⁷ These preliminaries completed, the forces then marched or paddled off to battle.

Before describing Maohi battle there remains the question of who actually took part in the battles and how often they occurred.

FIGHTING PERSONNEL

Most sources agree that every able-bodied male capable of bearing arms was expected to join in the fighting;⁸ this presumably excluded the decrepitly aged and the very young (see Corney 1915:267), although there is no information available concerning the stage of development—in terms of physical aging or instrumental skills—considered minimal for joining in organized fighting. Cook and others held the opinion that roughly one-third of the total population of any community served as fighters in time of war, but this figure cannot throw much light on the question of the age limits of soldiering, because of uncertainties regarding the age and sex composition of the Maohi population as a whole. As noted in chapter 2, it was the impression of some writers that males outnumbered females in the total population, but none of the early observers troubled to make an exact count. In this connection, however, it is important to recall Ellis' statement that the marked preponderance of males over females came about as a result of deliberate selection—that is, when parents were deciding which of their infants to allow to live they favored boys over girls mainly because of the former's potential in warfare (1829:II, 495–496).⁹

But women were not necessarily prohibited from organized fighting:

When the men went to battle, the women generally remained; but some of them fearlessly attended their husbands to the field, and either followed in the rear, or fought in the midst of the ranks. They carried the same kind of weapons as the men, but frequently used only their nails and their hands. Many were slain in the field, or during the retreat. (Ellis 1829:II, 485)

Instances were also recorded of upper-class women actually leading troops into battle.

FREQUENCY OF WARFARE

Turning now to the question of how often wars occurred, one finds in the sources such generalizations as, for example, that of Ellis, who stated that during the period 1797 to 1825 there were ten wars on Tahiti alone (1829:II, 477). By combining various chronicles of the period 1767 to 1814 (when Christianity itself became a major factor in inciting warfare), it is possible

to distinguish for Tahiti and Mo'orea some 15 large-scale battles involving at least hundreds of warriors and having clearly discernible beginnings and more or less decisive outcomes—admittedly not a very precise method for defining the phenomena under study, but the best I can do with the data available. And lest this estimate be accorded more accuracy than it deserves, it should be added that during the period encompassing these so-called battles a far greater number of smaller engagements—skirmishes, raids, and so forth—took place. In fact throughout this whole period, states of war, if not actual combat, prevailed more persistently than states of peace.

But it should also be recalled that the state of affairs existing on Tahiti after at least Cook's first visit (1768) cannot be held typical of the preceding era, before the presence of European persons and implements began to influence Maohi polity and martial practice. And about that earlier era there has come down to us little information save ambiguous legend and biased chronicle.

One would like to learn whether there was some rhythm in Maohi warfare and some relation between climaxes of armed conflict and, say, the occurrence of seasons or the maturing of new generations. It seems obvious—and correspondingly tautological—that no political unit would have been in a position to wage Maohi-style warfare without certain minimum quantities of personnel and provisions, including goods for sacrifice. There are recorded instances of destitute and undermanned units striking out in desperation against more powerful adversaries, but most instances of the kind of deliberate warfare I have been describing seem not to have been undertaken without practical assurances of success. In view of the devastating nature of most Maohi warfare—a generalization that will be documented below—one might be led to conclude that a political unit decisively defeated in one battle would have to wait years before recovering enough strength to engage in another. This may indeed have been true in some cases, but there are other recorded instances of remarkably speedy comebacks, accomplished through industrious husbandry and shrewd diplomacy, as Cook remarked, after one eight-month absence from Tahiti:

I have already mentioned the improvements we found in the Plains of Oparre and Matavai: the same was observed in every other part into which we came, it seem'd to us allmost incredible that so many large Canoes and Houses could be built in so short a space of time as Eight Months, the tools which they got from the English and other Nations who have touched here have no doubt greatly accelerated the work and according to the old Proverb many hands make light work, for I shall soon make it appear there are no want of these; the Number of Hoggs too was a nother thing which struck our attention, but this is more easy accounted for, they might and certainly had a good many when we were here before but not chusing to part with any had conve(ye)d them out of our Sight, be this as it will, we now got (not only) as many as we could consume during our Stay, but some to take to Sea with us. (Beaglehole 1961:404)

And there are well-attested instances of chiefs, after having been soundly defeated in one devastating battle, being able to assemble a new and victorious alliance within a matter of months.

In other words, from this limited sample of history, Maohi material resources seem to have been abundant enough, and Maohi society populous and complex enough, to preclude any simple direct relation between large-scale armed conflicts and the passage of time—except in relation to the celebration of the annual first-fruit and harvest festivals, during which active hostilities are said to have ceased.

FIGHTING ON LAND

Most wars of any duration involved both land and sea engagements, although it now and then happened that an invasion from another island was entirely defeated and turned back at sea. I will begin with a description of fighting on land.

When preparations were going on for the kind of fighting on land that I have been describing, neither side appears to have been able to preserve much secrecy about its plans and arrangements. There was inevitably some movement across the frontiers, and a continual spreading of alarms. (For one thing, kinship ties invariably crossed and reduced the sharpness of political boundaries.) Also, there was posting of sentries—human *and* supernatural. In connection with the latter Henry reported the following:

When an invasion was expected, the priests went forth to the boundaries of their frontiers where the enemy would enter, and there dug little holes in which they placed 'ura [feather] amulets as *marua* (breakers), or merely prayed, which was called *maunu* (entrancing), considering these acts potent means of weakening the power of the enemy, who on their side were on the lookout for disturbed-looking ground, guarding against such *hui marei* (hosts of entangling demons). (1928:304)

Most large-scale land battles took place near the shore and in more or less open country, although ambushade was sometimes practiced (e.g., see Ellis 1829:II, 486). The two armies usually approached each other to the accompaniment of beating drums and trumpeting conch shells. If the force was composed of allied units it was customary for their respective leaders to march toward the battleground arm-in-arm (*pito*), as a sign of their union. Similarly, the leader of each army subunit marched in *pito* with his principal supporters, who also remained with him in battle; and the same was the case with sets of close relatives and friends. (Henry 1928:304; Ellis 1829:II, 492)

According to Henry, each army was grouped into three segments—front ranks (*virī aro*), second ranks (*āpo'a virī*, or *hotuoa*) and rear guards (*taponu virī*)—but it is not clear how this division related to an army made up of allied forces: that is, did each principal ally's force keep together in the

same *viri*, or was each force broken up into separate *viri* and thus combined with analogous segments of the other allied forces? (Though this question may seem to involve a mere technicality, its answer—unfortunately lacking—would provide useful data concerning the evolution of Maohi political relations.) Similar uncertainties obscure the reconstruction one is able to piece together concerning other aspects of army organization.

Men going into battle were differentiated according to function and social class. Certain men served as ‘battle shapers’ (*tārai-aro*), others as ‘priests’ (*tahu’a*), still others as official ‘exhorters’ (*rauti*), and among the fighters there were specialist slingsmen as well as recognized ‘champions’ of close combat fighting (*āito*). Individuals from all classes of society—from highest to lowest—took an active part in fighting.

Battle shapers (*tārai-aro*), termed by Henry as “leaders” and “chiefs of the body of warriors,” were said by Ellis to marshal the forces for fighting (1829:II, 486). The battle attire and weapons of such “leaders” were described in detail:

The *tārai-aro* wore over an armor (*haana-tama’i*) of closely braided coconut husk his best clothes, girded round the waist with sennit, the arms bare, and around the neck an elegant gorget of pearl shell mixed with various colored feathers and fringed with dog’s hair, upon his head he wore the towering black feathered *fau* (helmet) and upon his broad shoulder he proudly carried the *tao* [long spear]. (Henry 1928:299)

Their precise roles in combat—other than “marshalling the forces”—is nowhere described; nor is it clear whether only *tārai-aro* were attired with armor, gorget, and *fau*.

Priests were indispensable participants in battle. Some of them worked at soliciting supernatural assistance (*tahu’a-pure*, *haere pō*), others prepared victims for sacrifice (*’upo’o ’aha*), still others ministered to the wounded (*tahu’a ra’au*). They went to battle dressed in their official garb, but in addition to carrying out their specialized jobs they also bore weapons and fought like the others.

The job of exhorters (*rauti*) was described in some detail by Ellis:

The din and clamour of the deadly fury were greatly augmented by the efforts of the Rauti. These were the orators of battle. They were usually men of commanding person and military prowess, arrayed only in a girdle of the leaves of the ti-plant round their waist; sometimes carrying a light spear in the left, but always a small bunch of green ti-leaves in the right hand. In this bunch of leaves the principal weapon, a small, sharp, serrated, and barbed *airo fai* (bone of the sting-ray), was concealed, which they were reported to use dexterously when in contact with the enemy. The principal object of these Rautis was, to animate the troops by recounting the deeds of their forefathers, the fame of their tribe or island, and the interests involved in the contest. In the discharge of their duties they were indefatigable, and by night and day went through the camp rousing the ardour of the warriors. On the day of battle they marched with the army to the onset, mingled in the

fury, and hurried to and fro among the combatants, cheering them with the recital of heroic deeds, or stimulating them to achievements of daring and valour.

Any attempt at translating their expressions would convey so inadequate an idea of their original force, as to destroy their effect. "Roll onward like the billows—break on them with *te haruru o te tai*, the ocean's foam and roar when bursting on the reefs—hang on them as *te uira mau tai*, the forked lightning plays above the frothing surf—give out the vigilance, give out the strength, give out the anger, the anger of the devouring wild dog,—till their line is broken, till they flow back like the receding tide." These were the expressions sometimes used, and the recollection of their spirit-stirring harangues is still vivid in the recollection of many who, when any thing is forcibly urged upon them, often involuntarily exclaim, "*Tini Rauti teia*," this is equal to a Rauti.

If the battle continued for several successive days, the labours of the Rautis were so incessant by night through the camp, and by day amid the ranks in the field, that they have been known to expire from exhaustion and fatigue. (Ellis 1829:II, 487-489)¹⁰

I reproduce here a specimen of *rauti* chants, this one transcribed originally by Orsmond and possibly also translated by him, but evidently put in more polished (if less than faithful) form by Henry.

E ari'i tei nia o te ueue a nu'u,	There is a king above, who is the speaker of armies,
O tapota a ra'i.	The roller of the skies.
A fanoi te tere, e te toa, e te auta'ata.	Set about your errand, O warriors, O brave men.
A ha'apu i te tere,	Accomplish your errand,
E te toa, i ni'a ia Mou'a-raha	O warriors, upon the flat mountain battlefield
A Ta'arua, tuhi mate!	Of Ta'arua, whose curse is death!
Auanei e huri ai	From the will send out
I te vero moana.	An ocean storm battle.
Auanei to paepae, e tau ari'i,	Soon thy paving, O my king,
E hi hee ai i te toto o te a'e.	Will flow with the blood of the slain.
Ei tao mato te nu'u,	Let the army be as a cleft in the rock
E mo'o puapua tini tei roto;	Issuing out innumerable lizards;
Ei ava afa te nu'u	Let the army be an open passage
E mao avai ava tei roto.	Within which is a furious shark.
Horo i mua na te riri.	Rush forwards enraged.
Te fetoitai maira te au.	The current rage begins to swell.
Taua e oua i roto	Let us leap into
I te ripo o te au.	The vortex of the current (heat of warfare).
Auanei e potu mai ai	Soon will burst forth
Te mata'i ia Raa-mau-riri,	The wind waging war of Raa-mau-riri (Sacredness-holding-anger),
E tiu ma te toa,	A descriptive south wind,
E parapu huri fenua.	Which ravages and devastates countries.
E uira tutui ra'i,	Lightning anger setting fire to the skies,
E uira rapa ni'a,	With lightning flashes above,
Te tua o te uira	Upon the back of the lightning
E vero tei muri,	Will come the storm battle,
E vero 'ino, e mata'i ho'i ri'a.	An evil storm, an angry storm.
A puta na te mata, a iriti;	If the eye get pricked, relieve it;
A puta na te 'ouma, a ha'amahu;	If the breast get wounded, wear it;
A pee atu te ofai a ha'amahu;	If a stone strike you, bear it;

A motu na te 'iri, e tihī tau tana;

E 'ava ia na te taure'are'a;

E 'ava pua; e 'ava re'a;

E 'ava te aninia;

E 'ava te tuiaroha;

E 'ava matapoiri;

E 'ava mau, te riri aitu;

E vahi iti e puta a'e ai te ao,

E ta maa 'ai te niu i

E hopoi ia taua i te Po,

E fa'aea i raro i te tumu o te niu.

If the skin get cut, it is a professional ornament;

These are opiates for the valiant;

Opiates fizzing and gay;

Opiates that make dizzy;

Opiates that make faint;

Opiates that obscure the eyes;

Opiates indeed, the anger of the gods;

A little more and day (victory) will dawn,

When we shall dine on coconuts

Take war to Hades,

And dwell beneath the coconut trees.

(Henry 1928:306-307)¹¹

Turning now to slingsmen, I noted earlier that these specialists wore only a breechclout and, perhaps, a poncho when fighting. Ellis has this to say about their employment in battle:

During the engagement, the parties often retreated, so that there was a considerable space between the ranks in these seasons, as when advancing to the onset. The slingers were then employed, and they often advanced in front of the ranks to which they belonged, and with boasting threats warned their enemies to fly or fall....

The most expert slingers were celebrated through the islands, as well as the most renowned among the warriors; and when one of these presented himself, a cry ran through the opposite ranks. Beware, or be vigilant, *e ofai mau o mea*—an adhering stone is such a one; or *e ofai tano e ofai buai*—a sure or a powerful stone is such an one.... The slingers were powerful and expert marksmen. (1829:II, 490-491)

According to Ellis every male capable of bearing arms did so, but there were among these

... a number of men celebrated for their valour, strength, or address in war, who were called *aito*, fighting-men or warriors. This title was the result of achievements in battle; it was highly respected, and proportionably sought by the courageous and ambitious. It was not, like the chieftainship and other prevailing distinctions, confined to any class, but open to all; and many from the lower ranks have risen, as warriors, to a high station in the community. (1829:II, 496)

Although the sources are not very explicit on this point, '*aito* appear to have been specialists in hand-to-hand combat, probably with spear and club.¹²

As noted above, persons from every social class engaged in fighting, but except for statements quoted above concerning the unimportance of social class in determining *aito* status, there are no data directly relating social class with combat specialty, battle priestcraft, or "exhorting." The following statement by Henry is ambiguous, to say the least: "The warriors next in grade [to that of *tārai-aro*] wore their best clothes in the same manner, with or without armor, and the immense turban, which the terrible '*omore* [club] sometimes penetrated to the skull of the wearer; and they carried *tiora* and other spears according to their ranks" (1928:299).

Even more puzzling is the relation between combat specialty, social class, and command hierarchy. While the battle shapers acted to “marshall the forces” before battle, we are not informed about the number of them in relation to the entire force, nor about their actual roles, if any, once fighting had begun. Also, although it is plausible to infer from numerous observations that mobilization was accomplished under the direct supervision of each territorial unit’s “chief,” no such inferences can be drawn concerning the maintenance of that hierarchy in actual battle.

Several accounts also speak of armies having had a “general”—sometimes in the person of the unit’s tribal chief, or highest-ranking kin-Titleholder, but in some instances a noted warrior was assigned to that position by the latter. Presumably it was such men who “shaped the battle” (*tārai aro*) and gave the signals for the commencement of hostilities. But whether and how they continued to direct operations during actual fighting is not reported.

As a matter of fact, the whole question of “command” becomes rather pointless in view of the Maohis’ methods of fighting. According to Ellis, “The modes of attack and defence were various, and regulated by circumstances: there was either the *aro* [battle] *virī*, skirmishing of advanced portions of each army, or an *arota*, close engagement, when they fought hand to hand.” Ellis added that “Sometimes their attacks were made by night, but then they generally bore a *rama*, or torch. To ambuscades they seldom had recourse, though they occasionally adopted what was called the *aro nee*, or attack by stealth.” (1829:II, 486.) Henry and Moerenhout provided fuller descriptions; that of the former is, however, somewhat ambiguous in parts:

The chief modes of attack were: the *fa’atia*, in which two armies advanced for action face to face; the *tu’umata*, in which all aimed one way; the *marua* in which picked men united and forced their way into the fiercest of the enemy’s ranks, to throw them into confusion and rout them; the *aro nee*, in which only a small portion of the army was open to view and the greater part stooped low or crept along in the bushes; the *moo’hono* (jointless backbone), in which the different ranks held fast together; the *aro-ro* (ant-fight), in which a line behind relieved the one before as it was getting worsted by the enemy; the *pu-toa*, in which the army stood in a body as a rock to resist the foe; the *rapa-tahi*, in which they aimed singly at the chiefs (1928:305-306).

As soon as the enemy armies met each other the troops took position and everyone, except the chiefs and commanders, sat on the ground. It should be noted that they knew how to form columns, keeping battle lines and maintaining reserve corps. Harangues were used by all these islanders. Each head chief, before giving the signal for battle, usually addressed to his warriors eloquent discourse appropriate to the circumstances, and almost always dwelling on the harm that the enemy had done previously, be it to them or to their relatives, as the best means of awakening in them the spirit of vengeance, so violent in all these savages. They did not fail either

to arouse their courage, by reminding them of their lofty deeds in previous battles. (Moerenhout 1837:II, 37)

Actual accounts of battles do not confirm an impression of precise military tactics and disciplined command control which one might infer from these texts. Consider, for example, the manner in which a general engagement usually developed. Ellis' description is as good as any:

When their modes of attack were deliberate, the celebrated warriors of each army marched forward beyond the first line of the body to which they belonged, and, on approaching the ranks of the enemy, sat down on the sand or the grass. Two or three from one of these parties would then rise, and advancing a few yards towards their opponents, boastfully challenge them to the combat. When the challenge was accepted, which was often with the utmost promptitude, the combatants advanced with intimidating menaces.

These often addressed each other by recounting their names, the names and deeds of their ancestors, their own achievements in combat, the prowess of their arms, and the augmented fame they should acquire by the addition of their present foes to the number of those they had already slain; in conclusion, inviting them to advance, that they might be devoted to their god, who was hovering by to receive the sacrifice. With taunting scorn the antagonist would reply much in the same strain, sometimes mingling affected pity with his denunciations. When they had finished their harangue, the *omoreaa*, club of insult, or insulting spear, was raised, and the onset commenced. Sometimes it was a single combat, fought in the space between two armies, and in sight of both.

At other times, several men engaged on both sides, when those not engaged, though fully armed and equipped, kept their seat on the ground. If a single combat, when one was disabled or slain, the victor would challenge another; and seldom thought of retreating, so long as one remained. When a number were engaged, and one fell, a warrior from his own party rose, and maintained the struggle; when either party retreated, the ranks of the army to which it belonged rushed forward to sustain it; this brought the opposing army on, and from a single combat or a skirmish, it became a general engagement. The conflict was carried on with the most savage fury, such as barbarous warriors might be expected to evince—who imagined the gods, on whom their destinies depended, had actually entered into their weapons, giving precision and force to their blows, direction to their missiles, and imparting to the whole a supernatural fatality. (Ellis 1829:II, 486–487)

There appear to have been episodes in such battles when several men banded together for concerted action, as in the following:

When a distinguished chief or warrior fell, the party, to which he belonged, retired a short distance, collected some of their bravest men, and then, in a body, with fury and revenge rushed upon their antagonists, to *vare toto*, clear away the blood. The shock was terrific when they met the opposing ranks, and numbers frequently fell on both sides. (Ellis 1829:II, 490)

In addition, there were quite common reactions (if not concerted actions) as, for example, when whole armies broke and ran when one of their leading champions or chiefs was killed, or rallied when such a casualty was

on the other side. Also, it appears that exhorters sometimes managed to revive the flagging spirits of whole armies, and the same may have been occasionally true of priests when they reported omens favorable to victory. In general, however, it was a matter of man-to-man, everyone for himself (or perhaps also for his companion or chief)—a fierce, surging, mass of individuals advancing or retreating in very small segments of the army as a whole, and quite out of touch with any overall tactical commanders, if such there were.

When the battle was fully joined,¹³ ferocity and savagery were the order of the day. A sample of conventional behavior may indicate the spirit in which the fighting was conducted. Sometimes when a warrior felled his opponent he would beat the body to a flat pulp, cut a slit through it large enough for his own head to pass through, and then wear it, poncho fashion, as a triumphant taunt (albeit a rather cumbersome trophy); or, not content with merely putting enemies out of commission, their subjugators would disembowel them, hack them to pieces, and collect their skulls or lower jaws as trophies.

Sometimes a disabled man succeeded in having his life spared, by supplicating his captor in remembrance of some previous relationship or by invoking the name of the captor's chief; but usually no quarter was given and no captives taken alive. In fact, the harangues of the exhorters urged explicitly against sparing any member of the enemy force just because he was a kinsmen or friend. For example, one war song urged: "Let the warrior's weapons clash together; Be courageous, brave men. Let the warrior take hold unsparingly; Let him take hold with closed eyes; That he perceive not a friend" (Henry 1928:308).

Often, if the victim happened to be an *'aito* or influential chief he was delivered to priests for divination and sacrifice. In some cases the corpse was treated to the dread fate of sennit-binding: the entire body, contracted, was wound about with sennit and placed in the victors' marae as an offering to their deity.

A man thus bound was called an *'aha-ta'ata* (man-sennit). It is affirmed that if he had children they had no issue after this and that all his family soon became extinct under the curse, a survivor merely existing as one doomed soon to die and if he endeavored to assert himself was exposed to taunts from his enemies as a remnant of the house of the *'aha-ta'ata*.... [This fate] was regarded as far-reaching, as it was supposed to affect the man even when he was borne away by his own party.... (Henry 1928:310)

From these and other indications one may conclude that the "religious" part of fighting was carried out in a more concerted manner than was the tactical military part. Priests did engage in fighting, but their main job was to keep watch for signs of victory or defeat and to do all in their power, through sacrifice and prayer, to maintain or win over supernatural

assistance for their side. In this connection, the Maohis' conception of the relation between themselves and their tutelar spirits in time of war is suggestively indicated by the following passage from Henry:

When one army felt that it was losing, the priest and one or two chosen men took valuable presents, called *hiamoea* (forget not), as near to the camp of the enemy as possible, and addressing their host of gods, who they supposed were forsaking them for that side, would lay the offerings upon the ground, enumerating each object and saying pathetically:

O gods, forsake us not, go not away!
Behold, here we are also, take us to be
your servants, O host of gods!

Sometimes they would find presents already spread out for their gods by the enemy, and if they were more valuable than their own they would return to camp dispirited, feeling that their gods were favoring the richer side. (1928:311-312)

Before proceeding to a discussion of the ways hostilities were terminated, I must mention how frequently and ingeniously the Maohis made use of guile in warfare. Later chapters will provide examples of such episodes from both "history" and legend; I wish now only to note that, while such measures as sneak attacks and the like were sometimes perpetrated with extraordinary treachery, they were nevertheless conventional strategies. They may have aroused the most violent anger among the victims, but I find no evidence of any general attitude to the effect that such measures were beyond the limits of admissible social activities.

PEACEMAKING

Sometimes a battle ended in a draw. If this occurred the two sides either withdrew to regroup and begin again—days, weeks, or months later—or their leaders agreed to make peace. In view of the crucial relevance of such actions to an understanding of Maohi social relations I quote in full Ellis' account of peacemaking:

If the conquered party surrendered at discretion, their land and property were divided by the conquerors, and the captives either murdered, reduced to slavery, or reserved for sacrifices when the gods required human victims. The bodies of such as were killed in their forts, were treated with the same indignity as those slain in the field; part of the bodies was *eaten* by the priests, the rest piled up in heaps on the sea-coast, where the effects of decomposition have been so offensive, that the people have forborne to fish in the adjacent parts of the sea. On the contrary, when neither party had been subdued, and, by intimation from the gods or any other cause, one party desired peace, an ambassador was sent with a flag of truce, which was usually of native cloth, a bunch of the sacred mero, &c. and proposals of peace. If the other party were favourable, an interview followed between the leaders, attended by the priests and national orators.

They usually sat in council on the ground, either under a shady grove, or on the sandy beach. The orators of those who had sent the proposals made the

first harangue& this was followed by a reply from the orator of the other party, who was sitting on the ground opposite, and ten or twenty yards distant. Each held in his hand a bunch of the sacred mero. The king or chiefs sat beside them, while the people stood around, at some distance. When the terms were agreed upon, the wreath of peace was woven with two or three green boughs, furnished by each, as the *manufaiti*, the bond of reconciliation. Two young dogs were then exchanged by the respective parties, and the *apa pia* brought; it was a long strip of *apa*, or cloth, white on one side, and red on the other; the materials were furnished, and the cloth was joined together, by both parties, in token of their union, and imprecations were invoked on those who should *hae*, or rend, the *apa pia*, or band of peace. The *apa pia* and the green boughs were then offered to the gods, and they were called upon to avenge the treachery of those who should rend the band, or break the wreath. Divinations were also sometimes used, to know whether it would be of a long or a short continuance.

Feasting followed the ceremony, together with the usual native games; besides which, religious rites were performed. The first was the *maioi*, when vast quantities of food were taken to the king, and large offerings to the gods, together with prayers for the establishment and prosperity of the reign. Another was called the *oburoa na te arii*, and consisted also in offerings to the gods, with prayers for their support, and a large present of food to the principal warrior chief, under the king, as an acknowledgment of his important service in the recent struggles, and his influence in establishing the king in his government.

But the most important ceremony, in connexion with the ratification of peace, was the *upoofaataa*, &c. It was commemorative of the establishment of the new government, and designed to secure its perpetuity, and the happiness of the community. A leading raatira was usually the chief proprietor of the entertainment, and master of the ceremonies. The festival was convivial and religious. Food and fruits, in the greatest profusion, were furnished for the altars of the gods, and the banquet of the king.

A *heiva*, or grand dance, formed a part of this ceremony. It was called the dance of peace, and was performed in the presence of the king, who, surrounded by a number of chiefs and warriors, sat at one end of the large house in which it took place. A number of men, and sometimes women, fantastically dressed, danced to the beating of the drum and the warbling of the *vivo*, or flute& and though the king was surrounded by a number of attendants as body-guards, towards the close of the exhibition the men sought to approach the king's person, and kiss his hand, or the females to salute his face; when one or the other succeeded in this, the *heiva*, or dance, was complete, and the performance discontinued.

This, however, was only part of the ceremony, for while they were thus employed, the priests were engaged in supplicating the gods that these amusements might be continued, and their enjoyments in feasting, dancing, and the pursuits connected with them, might not be again suspended or disturbed by war. Peace was now considered as established, the club and the spear were cleaned, varnished, and hung up in their dwellings; and the festive entertainments, pagan rites, and ordinary avocations of life, resumed, till some fresh quarrel required an appeal to their weapons, and led them to the field of plunder and of death. (1829:II, 514-517)

There were other times when overtures for peace were turned down, resulting usually in resumption of hostilities; or, there may have been occasions when the winning side agreed to call off the battle in return for limited

indemnities, although the sources are not very explicit on this point. On the other hand, most fully engaged battles involving large forces seem to have ended in total victory (however temporary) for one of the sides.

After such a victory—after the “breaking” and the “flying” of one of the armies—the victors pursued the vanquished and slaughtered every one whom they could overtake. The few captives who were taken were usually reserved for eventual sacrifice. Sometimes some of the defeated succeeded in reaching fortresses previously set up in the interior; others escaped to neutral or friendly districts or to other islands. Meanwhile the victors swept through the communities of the defeated—burning, pillaging, destroying gardens and groves, and slaughtering everyone they could find. To illustrate the mood of the conquerors, infants were sometimes transfixed to their mothers, or pierced through the head and strung on cords; or, women were treated with various “indignities” after which they were disemboweled and derisively displayed. And men were sometimes beaten flat with clubs and left to dogs and pigs, or lined up to serve as rollers for beaching or launching the victors’ canoes. Efforts were made to retain as trophies the whole bodies or skulls or jawbones of the more prominent of the foe, and these were often deposited in the victors’ marae; but most of the slain were left near where they fell. Observers commented on the intolerable stench which pervaded defeated districts for long periods after battle.¹⁴

The religious instruments of the vanquished did not escape destruction either: marae were sometimes dismantled and their stones used for ovens, priests were slain as were all other enemies, and god-images were confiscated or robbed of their feathers (Henry 1928:313).

Typical celebrations following a major victory included one or more of the following aspects and episodes:¹⁵

1. Ceremonial contempt for the vanquished foe by means of indignities inflicted on the corpses of their most influential people;
2. Honorable burial of the victors’ battle casualties;
3. Dismissal of the spirits of war to *pō* (world of darkness) and recall of peace to *ao* (world of light);
4. Restoration of the victors’ god-images to their marae, and thanksgiving services for victory;
5. Hailing of the secured or expanded power of the victorious chiefs;
6. Dismemberment and distribution, among the victorious chiefs, of the corpse of the most distinguished captive for deposit on the chiefs’ marae;
7. Collection and redistribution of food and other valuables—to the tutelary spirits (as sacrifices) and leading chiefs of the victors, to the successful battle shapers, and to the general populace—for daylong feasting and revelry;
8. Distribution of the newly won land among the victorious chiefs.

(Adapted from Henry 1928:314–315)

Wholly different kinds of ceremony had to be performed by the survivors on the defeated side. Before setting out to reoccupy their devastated territory—if they were permitted to do so by the victors—the survivors' religious practitioners had to remove the sickness (*ma'i*) believed to infect a place devastated by war. Corpses were buried, marae were rebuilt and resanctified, god-images were restored to their places, sacrifices (including human) were rendered to the tutelary spirits, and a canoe loaded with supplies and manned by an effigy crew was sent into the sea bearing the "sins" (*hara*) of the place. (Henry 1928:320-321)

Another version of such ceremonies was provided by Ellis:

In addition to the rites connected with actual war there were two that followed its termination. The principal of these, *Rau ma ta vehi raa*, was designed to purify the land from the defilement occasioned by the incursions or devastations of an enemy, who had perhaps ravaged the country, demolished the temples, destroyed or mutilated the idols, broken down the altars, and used as fuel the *unus*, or curiously carved pieces of wood, marking the sacred places of interment, and emblematical of their *tii's* or spirits. Preparatory to this ceremony, the temples were rebuilt, new altars reared, new images, inspired or inhabited by the gods, placed in the marae, and fresh *unus* erected.

At the close of the rites in the new temples, the parties repaired to the sea-beach, where the chief priest offered a short prayer, and the people dragged a small net of cocoa-nut leaves through a shallow part of the sea, and usually detached small fragments of coral from the bottom, which were brought to the shore. These were denominated fish, and were delivered to the priest, who conveyed them to the temple, and deposited them on the altar, offering at the same time an *ubu* or prayer, to induce the gods to cleanse the land from pollution, that it might be pure as the coral fresh from the sea. It was now supposed safe to abide on the soil, and appropriate its produce to the purposes of support; but had not this ceremony been performed, death would have been anticipated.

The *maui fata*, altar-raising, was connected with the preceding rites. No human victim was slain, but numbers of pigs, with abundance of plantains, &c. were placed upon the altars, which were newly ornamented with branches of the sacred mero, and yellow leaves of the cocoa-nut tree. These rites extended to every marae in the island, and were designed to secure rain and fertility for the country gained by conquest, or recovered from invasion. (Ellis 1829:II, 214-215)

Mention was made above of "fortresses" to which survivors of a defeated army sometimes managed to escape. Such places have been described as "... rocky fortresses improved by art—narrow defiles or valleys sheltered by projecting eminences—passes among the mountains, difficult of access, yet allowing their inmates a secure and extensive range, and an unobstructed passage to some spring or stream." (Ellis 1829:II, 511)

Improvements to these natural refuges consisted of walled-up entrances and built-up platforms which overlooked the approaches and from which the defenders hurled down stones. If well provisioned, some of the more secure of these fortresses—for example, the famous Pare of the Atehuru district of Tahiti and Maeva on Huahine—held out against

the longest of sieges, which were never of very long duration, in view of the characteristic impatience of most besieging forces. Various strategies, military and religious, were employed to breach the defenses & when these succeeded the victors simply repeated the carnage already described. On the other hand, some sieges ended in truce or in withdrawal of the besiegers. In the latter event it is likely that the survivors sometimes drifted back to their old homes, after the fever of war had subsided. But there are other instances of people, freed of besiegers but not of the fear of destruction, remaining in hiding far in the interior for years.

The LMS Transactions contain an account of one method utilized for maintaining peace between neighboring tribes that had formerly been at war:

On the top of a hill, that separates Matava and Hapyano, [Messrs. Jefferson and Nott] saw a pole set up in the ground, upon which were fastened a dead dog, and a young plantain tree. On enquiring the cause of this, of the chief Vitua, they were given to understand it was the king's standard, by which the people of Hapyano were to take notice there is peace between him and them; and that they should not pass that pole, &c. to make war on Matavai, and that he would not pass into Hapyano to injure them. If any was to break down the pole, &c. it would be looked upon as a declaration of war. If it should fall by any casualty, the king must be made acquainted with the same, and a declaration made of its not being intentionally done. (LMS Transactions I, 87)

FIGHTING AT SEA

According to Moerenhout, before the arrival of Europeans naval battles were more frequent, more politically decisive, and on a larger scale than those on land (1837:II, 40). Perhaps they were. There are certain logical reasons for that having been the case—for example, except for enemies with common land frontiers, one side's movements must on many occasions have been at least partly by sea. Actually, most extended wars, and many battles, were fought on land *and* sea, as later chapters of this book confirm.

A fleet prepared for a war expedition contained fighting boats, supply boats, and a few "floating marae" (boats outfitted with a small shelter under which the force's tutelary god-images were installed). The supply boats were small-to medium-sized ordinary transport canoes, usually with sails & they did not normally engage in fighting.

Descriptions of Maohi fighting boats vary somewhat, as did the boats themselves; but essentially they were twin-hulled vessels with up-curved sterns. Upon the fore part of each of them was built a raised stage or fighting platform. According to Samwell, "the Canoe which has the highest stage has greatly the advantage over the other as they always come to close Quarters where the hardest blows carry the day" (Beaglehole 1967:1064). Canoes were propelled by paddlers who sat behind and underneath the platforms. They varied widely in length, one of them measured by Cook was 108

feet long. Some writers called them *pahi*, indicating that they were of plank-built construction, but it is likely that some of them were put together with *va'a* (built-up dugout) hulls. In fact it is reasonable to assume that every sizable fleet contained an assortment of fighting boats, of many shapes and sizes, including some built specifically for fighting and others temporarily converted from ordinary transport and travel.

The manning of these naval vessels also varied, certainly in numbers and probably also in detail. Morrison, an eyewitness, asserted that some of them were capable of carrying as many as 300 men each (1935:175); while Cook, from his observations of the prebattle naval review, noted in chapter 2, estimated that they averaged about 40 men each, including fighters and paddlers. Writing much later and on hearsay evidence, Morenhout described them as capable of carrying 150 to 300 “fighters” each (1837:II, 40).

Every boat had its complement of “paddlers” and “fighters”—including specialists in hand-to-hand combat and, perhaps, slingsmen. The proportions between these types may have varied considerably from boat to boat, although the question probably became academic at the height of battle. Every fighting boat also carried a commander or battle shaper (*tārai-aro*), along with one or two exhorters (*rauti*) (Henry 1928:316).¹⁶

FIGURE 12-8. War Canoes, Tahiti. Drawing by W. Hodges. British Museum.

The largest fleet actually encountered by Europeans was the one assembled for a naval review at northwestern Tahiti on the eve of an expedition to Mo'orea (fig. 12-8). As noted above, Cook estimated this fleet to consist of 160 large double war canoes, carrying an average of 40 men each, and 170 smaller supply craft, carrying about 8 men each. (But of this large assembly, be it noted, many of the vessels did not actually participate in the expedition which followed.) Ellis wrote, from hearsay, about another large fleet consisting of 90 “war-canoes, each about one hundred feet long, filled with men” (1829:II, 484). This assembly of boats was involved in a war between Huahine and Ra'iatea and their respective allies, but it is not entirely clear from Ellis' statement whether he meant the number for the Huahine

contingent alone or for all the boats engaged. In support of the latter inference is the consideration that a force of 9000 men (90 boats × 100 men each) would imply a total Huahine population of some 27,000—a figure far in excess of any sensible estimate for that era. At the other extreme, Cook mentioned one naval campaign in the Leeward Islands which was won by a fleet consisting of only 10 boats (1784:132); and the secretly executed sea raids which helped establish a Porapora chief's suzerainty over most of the Leeward Islands were carried out with fleets probably not much larger than that.

In addition to each fighting boat having its own commander, fleets were also under the general command of so-called admirals (Cook's term; I cannot discover a Tahitian term for this office). According to Ellis, the whole Huahine force mentioned above was under the command of one man, who was at the time "king" of that island. But the fleet intended for the Mo'orean expedition seems to have consisted of five separate contingents, each under its own commander (Beaglehole 1961:405).

According to Henry (1928:316), the same kinds of ceremonies preceded both sea and land campaigns, with the exception, of course, of the customary naval review which, in Cook's view, was a commendable device for acquainting the commanders with the state of the whole fleet (Beaglehole 1961:408).

Most naval battles seem to have taken place near shore and even inside the barrier reefs. Since the defending side was nearly always forewarned of large-scale attacks through ordinary comings-and-goings and the posting of sentinels, their own vessels were usually prepared for the ensuing action. Rather inexplicably, they did not normally attempt to dispute the invaders' fleet in the narrow reef openings, where the advantage would have been on their side, but waited with their boats drawn up along the shore.

Naval fighting was usually preceded by verbal battles, to work up passions. Then the warriors "... fastened their canoes end to end, tied their two contending lines side by side, and completed the battle in terrible hand-to-hand fighting resulting in great slaughter on both sides until one became victorious (Henry 1928:317). Ellis gave a fuller description of this tactic:

When the engagement took place within the reefs, the canoes were often lashed together in a line, the stem of one being fastened to the stern of the other before it. This they called *api*, and adopted it to prevent the breaking of their line, or retreat from the combat. The opposing fleet was, perhaps, lashed or fastened in the same way; and thus the two fleets, presenting one continued line of canoes, with the *revas* or streamers flying, were paddled out to sea, the warriors occupying the platform raised for their defence, and enabling them to command each part of the canoe.

At a distance, stones were slung; on a nearer approach, light spears or javelins were hurled, until they came close alongside of each other, when, under the influence of rage, infatuation, ambition, or despair, they fought with the most obstinate and desperate fury.

It is not easy to imagine a conflict more sanguinary and horrid than theirs

must have been. Although the victors, when *faatini'd* or supplicated, sometimes spared the fallen, it was rarely they gave any quarter. Retreat there was none—and, knowing that death or conquest must end the fray, they fought under the power of desperation.

At times, both fleets retired, ... but when victory was evidently in favour of one, the warriors in that fleet sometimes swept through the other, slaughtering all who did not leap into the sea, and swim toward the canoe of some friend in the opposing fleet. I have been informed by some of the chiefs of Huahine, who have been in their battles, that they have seen a fleet towed to the shore by the victors, filled with the wounded and the dead—the few that survived being inadequate to its management.

When the canoes of a fleet were not fastened together, as soon as the combatants perceived they were overpowered, they sought safety in flight, and, if pursued, abandoned their canoes on reaching the shore, and hastened to their fortress in the mountains. (1829:II, 509-510)

Moerenhout's version differs somewhat from that of Ellis:

In naval combat, which usually took place in the large bays, inside the reefs, it was customary for the defenders to line up their boats in three lines. In the bow of each frontline canoe there stood a warrior armed with rope, while those armed with slingshots, spears, and clubs were positioned in the hull and on the fighting platform.

The attacking fleet (organized, equipped, and armed in exactly the same way) would then enter the pass—usually without contest, although it would have been easy enough in most instances for the defenders to have done so. Once inside the reef the attackers would then form three lines of their own, and the front lines of each would move together, boat against boat. As soon as the prows of two opposing boats touched, the individuals in the bows lashed them together with their ropes in such a way that they could be separated only with the greatest difficulty. This done, the warriors hurled themselves at each other with do or die spirit.

The courage needed for combat like this may best be imagined if one recalls that retreat from this kind of engagement was quite out of the question. That is to say, the only recourse for the defeated crew was to jump into the sea, where, however, they were totally defenseless against the enemy's spears. But even for the victors this kind of conflict proved very costly; it was unusual for more than a quarter of them to survive the battle or the wounds received in it. (Adapted from Moerenhout 1837:II, 41-42)

Moerenhout went on to say that the outcome of the encounter between the opposing frontline boats was usually accepted by the reserves as the signal for victory or defeat. Thus, if the attackers' first line was overcome, their comrades-in-arms usually retreated toward the open sea—a dangerous maneuver because of the narrowness of the passage through which their boats had to go. Sometimes the attackers were able to effect their retreat in good order and safety, but more often they rushed out in panic and disorder and then became easy marks for their pursuers, who compounded their victory by massacring those they caught.

If on the other hand, the first success went to the attackers, the rest

of the defenders were in a better position to survive, by landing and either fighting on shore or escaping into the hinterland.

It sometimes occurred that the reserves did not break and run, but went to the rescue of their distressed comrades. When this happened—that is, when all of the opposing forces became engaged—the battle would occasionally last for several hours, with only a fourth or so of the warriors coming out alive. It was understood that no prisoners were to be taken. Moerenhout noted also that the champion warriors (*'aito*) were invariably placed in the frontline boats, thereby lending some rationale to the significance which the initial encounter had for the reserves.

In some wars the tactics involved a mixture of fragmented land encounters and sea combat, instead of mass frontal encounters either at sea or on land. In such wars the fighting would go on for several days and would end in victory for neither side, creating a state of continuing hostility (Moerenhout 1837:II, 42–45).

One should recall that all of these accounts were secondhand, having been written after the cessation of large-scale, purely indigenous, naval warfare. Actually, the nearest thing we have to a contemporary description of naval battles is by Cook, who did not witness an actual battle but did observe naval reviews and practice maneuvers:

I took some pains to inform my Self in what manner they joined Battle and fought at Sea, but knowing but little of their Language and they none of ours, the account I got must be very imperfect, it however gave me a tolerable Idea of it, which I shall endeavour to convey to the reader. I have before said that all their Vesels of War have a raised platform or Stage at the very fore part of them which will contain Eight or Ten Men, these are the Tata otai's or fighting Men. In forming the line of battle they draw up a breast of each other with their heads to the Enimy and as I understood in divisions as when they land, for the more readier closing the line when the action begins:^a the enimies fleet being drawn up in like manner, they rush with all their might upon each other, the Attack is first begun with Stones, but as soon as they Close they take to their other weapons for the stages of the one fleet will be as it were joind to those of the other; it seems that general Ship is here very necessary,^b to take the advantages of winds, currents and various other circumstances which may accrue, and may make it necessary to put in practise other Manoeuvres besides these just mentioned, but their Manner of fighting must however be the same.^c I have said that each fighting stage will contain Eight or ten Men but we cannot suppose this to be the Number of Troops in each Cannoe, but even this number cannot act on the stage at once,^d on the Contrary I think we understood clearly from Tupia who made a drawing of one of these Vessels^e that no more than one or at the Most two Fought at the same time and as they were Kill'd or wounded were relieved by others.^f (Beaglehole 1961:406–407)*

* Beaglehole added these footnotes: (a) ... and to add greater weight to the whole; (b) *very necessary*: as necessary, as in the conducting of one of our large fleets; (c) *and may ... same*: I know not if the whole fleet joins battle at once, I rather think not and that a part lies out of the line in order to be ready to assist and support such as may be in danger of being over powered, for as they have niether Masts nor Sails but are Navigated by paddles

Cook's account also provided a description of a combat-landing operation:

Their Manner of landing in An Enimies Country must be in divisions in the same Manner as we saw them land at Oparre, these divisions must be formed with out the reach of the Enimies Stones, from what I have seen a division consists of no fixed number, if the shore is straight the divisions may be large, if Crooked they must be Small, otherways all cannot get close to the Shore; when the divisions and a resolution taken begin the attack they pull in for the shore, not directly in a line a breast, but each division upon the quarter of the other, in order the more readier to Close or form a line a Shore, at least it was something in this Manner they did it at Oparre; at this time the Padles exerted all their strength being encouraged by thier leaders on the Stage and directed by a Man who stood with a wand in his hand at the fore part of the divisions, this Man by words and actions directed the Paddlers when all should paddle, when either the one side or the other should cease &c^a, for the Steering Paddles a lone are not sufficient, all these Motions they observe'd with such quickness as shewed they were very expert in their business; the very Instant the division touches the ground all the rowers jump out and drag it on the Shore till it is fast grounded, thus they form a line abreast all along the Shore not only of Vessels but arm'd men also, for the troops being mounted on the Stages are ready to land in an Instant, if the enemy give them so much time, if not they are ready to force a landing. We have been told that the Enimy some times meet them up to the Middle in Water but they must be a Strong boddy of Men that can support themselves against the weight of one of these heavy divisions. I never thought to ask how the Paddlers were employ'd after the Troops were landed or in an Engagement at Sea when the fleet had grapple'd each other, but I believe they do nothing but attend their paddles. This is the best account I can give of the Management and use of these Vessels of War on which the Strength and Power of these isles in a great measure depends: it was by these Opoone the King of Bolabola was inabled to conqur most of the neighbouring isles. (Beaglehole 1961: 407-408)

Not all naval battles were as sanguinary as the above excerpts may imply; even the huge expedition to Mo'orea alluded to above ended in truce, when after a few skirmishes neither side appeared willing to risk a general engagement.

In any case, by the turn of the century naval warfare had been superseded almost entirely by large-scale combat on land (see Vancouver 1801:334). As already mentioned in chapter 8, the *Duff* chronicler, writing about the years 1796 through 1798, knew of the existence of only five war canoes in all Tahiti.

VEHIATUA'S WAR

Until now I have limited my description to the more deliberate, two-sided type of Maohi warfare. Pages could be written about other types

only, this may easily be done; this may however in some measure depend on the conduct and judgement of the leaders and the Nature and situation of the place; (d) ... for want of room; (e) ... with the warriors in her ...; (f) ... how far this may be true I will not pretend to say, but it seems to me to be too deliberate a way of fighting for people whose passions are Violent and are said to fight with great obstinacy; certain it is that the contest is never long and that a single battle desides the fate of the Nation for that time.

of armed conflict: of boundary disputes developing directly and without ceremonial preliminaries into large-scale battles, of stealthily conceived and highly destructive forays, and many others. In fact, a very large volume could be compiled just describing the many conventional aspects of Maohi armed conflict, for no other concerted activity seems to have so preoccupied the thoughts and the physical actions of the Maohis during the eras under study. But enough has been presented to provide a background for our main concern with social relations, so I shall proceed to a description of other kinds of Maohi activity. But before doing so I reproduce here in its entirety a lengthy account of a war alleged to have taken place just prior to the arrival of Europeans. The account is quoted from Robert Thomson's unpublished "History of Tahiti." The document, in the LMS Archives, was compiled by the missionary Thomson after 1835, and is perhaps to be considered part "legend" and part "fact." I reproduce it here because it exemplifies so well many of the aspects of Maohi warfare just described.

Vehiatua chief of Tairarabu, [Tahiti's southern peninsula] and a renowned warrior, having taken offence at something done by the people of Moorea declared war against that island and prepared his fleet for immediate attack. The fleet of Tairarabu consisted of about 150 large double war canoes, each carrying from 40 to 50 warriors, and accompanied by a host of smaller canoes carrying food and other necessaries. A messenger having been despatched to their enemies to inform them of their intentions, and to dare them to put to sea, the Tairabu fleet set sail and with a fair wind bore down on the coast of Moorea; abreast of Paopao bay, better known among foreigners as Cook's harbour, they encountered the Moorea fleet as numerous and well manned as their own. The Moorea canoes having formed in a long unbroken line, each canoe was firmly fastened by ropes to the one adjoining, that the warriors might better sustain each other in the hours of conflict, and also to prevent any who might become faint hearted from deserting their post. The Tairabuans formed their canoes in several divisions each canoe being well secured to the division to which it belonged. All arrangements being complete the spear men took their position in lines along the front of the platform which was laid over the double canoes, the slingers behind them each with his heap of stones and bore down before the wind upon the enemies line; as they approached the slingers began the action on both sides and stones of considerable weight were hurled with great power upon the canoes of the warriors. The Tairabuans having the advantage of a good breeze soon broke the line of the Moorea fleet, killed numbers in the violence of the first furious attack, and soon compelled the Mooreans to cut the lashings of their canoes and retreat towards their own land. The retreat, soon became a confused rout, the Tairabuans chased them into the harbour of Papetoai, destroyed many canoes and drove others on the reef where many perished in the heavy breakers. No mercy was shown by the conquerors and hundreds were slain. The captured canoes were taken to the beach, all on board were detained as prisoners, others who had swam ashore were captured as they landed, and many of the aged, and infirm who had remained on their houses, being unable to flee to the mountains fell into the hands of the conquerors. These unhappy victims, with all the prisoners and the wounded, amounting to several hundred, were destined for the triumphal procession of the conquerors to the great marae of Moorea. Tied hand and foot these poor wretches spent the night on the sea shore, while those

who had escaped, with all the women and children, and those who had not been engaged in the war fled to the mountains and sought a refuge in the most inaccessible steep. Next day the warriors prepared for the procession. All the canoes were dressed with white and yellow streamers, the captives with cords round their necks were thrown into the sea, and towed at the stern of the canoes to the great marae called Tiahura a distance of 4 or 5 miles; and there before the altar which their own hands had reared these miserable creatures were offered up in sacrifice to their own idol god! The distinguishing feature connected with this battle was the treatment of the captives; and from the circumstances of their being towed by the necks at the sterns of the war canoes, the battle is chronicled in Tahitian history, as *Te taoro ta-ata i Tiahura* [the strung-together people at Tiahura].

This last triumph over their enemies, satiated the rage of their conquerors, who returned to Papetoai to feast on the good things of the land the fruits of their victory. Vehiatua sent a messenger to the mountains where the mass of the people had fled with offers of reconciliation, inviting them to return in peace to their homes; after the interchange of several messages the proposal was accepted and the fugitives returned to their homes. The victors in the meantime pillaged the land, and consumed whatever produce came within their reach, when they had destroyed all in the vicinity and were in want of provisions, the Moorea chiefs convened a meeting of all the people, and *Paepae* one of their number who had been most obsequious to their conquerors, and thus allayed every thing like suspicion; as the friend of the Tairabuans, addressed his countrymen, Friends, slaves of the mighty conquerors, the great Vehiatua and his renowned warriors have beaten us in battle, they drove us to the hills, but they did not leave us there; they had compassion upon us, and our wives, and children, they brought us again to our homes, and now, see! they are living in the land without food while plenty is in the country. Friends let your legs be firm, and your backs and arms strong, that we may go and seize all the pigs and kill them, strip the breadfruits of all fruits, and the vallies of all plantains, and bring plenty of food, to feast those generous warriors; and let those who stay at home prepare the ovens and collect the leaves. This speech delivered in presence of the Tairabuans was received by both parties as the speaker intended, the one anticipated a grand feast, while the other heard only of a conspiracy for the destruction of their enemies!

The Mooreans immediately went off and soon returned with plenty of provisions, in the meanwhile, the ovens had been prepared and plenty of leaves collected, and that the vicinity of the houses might be neat and clean all the dead leaves and rubbish had been collected and piled in little heaps. Early next morning all was activity in Papetoai, the Tairabu sentinels and others who happened to be awake, saw the Mooreans lighting their fires, congratulated themselves on the expected feast, and again lay down till sunrise. The wily Mooreans instead of kindling fires in the ovens which they had prepared, put the fires underneath the heaps of dead leaves and rubbish, these piles soon sent up volumes of thick smoke and filled the whole neighborhood, when all was ready at a preconcerted signal they rushed upon their sleeping enemies, and massacred numbers, the alarm was given the rest seized their arms, but enveloped in smoke they knew not where to move unable to combine or resolve upon any plan of defence they fell an easy prey into the hands of their late captives. Guided by the roaring of the surf upon the reef, those who could rushed to the beach, reached their canoes and put to sea, numbers less fortunate perished, and during the few days which had passed since Vehiatua sailed from Tairabu upwards of a thousand lives had been destroyed. *O te turai uru* [the cut-down breadfruit] is the name under which this event has been handed down to present times.

Vehiatua's canoe was among the last to push off from the beach, in their passage across to Tahiti they encountered a strong head wind, which drove their canoe down the passage between the two islands, and ultimately compelled them to put in at Afareaitu. Not knowing of the tragedy which had just taken place at the other side of the island, the people received Vehiatua and party as warriors returning from a victory, and hailed his approach with the flattering title of "The rising sun!" A chief of Tahiti called Auri, then on a visit at Afareaitu, gave the warrior chief a less cordial welcome. Observing that the Chief's canoe was alone, he suggested this as a favourable opportunity of putting to death this scourge of his country, he urged the subject warmly on the chief of Afareaitu, and that too even in the hearing of Vehiatua himself. The chief was unwilling to comply, and the Tairabuans seeing their danger; thought it prudent to depart and were allowed quietly to proceed on their journey; as Vehiatua stepped into his canoe, his eye fell upon Auri, he gave him a glance which told more than the words he uttered, and exclaiming "Auri we two shall meet again", he pushed off and pursued his voyage to Tahiti.

CHAPTER 13 *THE INDIVIDUAL:
FROM CONCEPTION
TO AFTERLIFE*

In this chapter, I will describe the various kinds of Maohi activities that had to do more or less directly with each individual's (qua individual) membership in Maohi society—his "birth" (biological and social), nurturance, education, "head freeing," marriage, aging, biological death, and afterlife. I know of no word or phrase, in the Maohi language or in English, that precisely summarizes how the Maohis viewed—or implied that they viewed—an individual's passage through life. No notion of "cycling" or "progress" seems to have been involved. Perhaps "trajectory" would more closely approximate the native view, but that I shall leave to the reader to decide.

CONCEPTION

It will be recalled that a human being (*ta'ata*) was believed to consist of a corporeal body (*tino*) that ultimately disintegrates at biological 'death' (*pohe*), along with a soul (*vārua*) that is present in the body even before parturition and that usually survives death of the *tino*—for a while at least. In addition, some sources state or imply that every human was believed to be endowed with something called an *iho*, which *may* have been present in the fetus but which became a significant entity only after the neonate began visibly to draw breath, to cry, and to open its eyes; for want of anything better I shall translate *iho* as 'essence'.

The Maohis recognized that sexual intercourse was the usual prerequisite for reproduction, but precise details of their theories of conception are lacking. Several Maohi myths contain episodes wherein a male spirit caused some human female to conceive by means of actions described as, say, "passing over" her, but judging from the general reaction to Bligh's description of the virgin birth of Jesus, most Maohis evidently considered that human reproduction required something approximating sexual intercourse, however indirect it might be. Bligh reported as follows:

This brought on a religious conversation, and having told me their Great God was called Oro and that they had many others of less consequence, they asked me if I had any God. Having replied of course in the Affirmative, I was asked if he had

a Son and who his Wife was. I told them he had a Son but no Wife. Who was his Father and Mother then? was the next question. I said he never had either Father or Mother. At this they laughed exceedingly. You have a God then who never had a Father or Mother and has a Child without a Wife, Aymah timoradei huheine arrami no Mydiddee. i.e. did he not lie with a Woman to get him? I said no. Who was then before Your God and where is he? Is he in the Winds or in the Sun? (Bligh 1789:I, 390)

Among precise details lacking are, for example, how many male ejaculations were believed necessary to initiate reproduction or whether it was believed possible for reproduction to be initiated, or contributed to, by more than one genitor. In connection with the latter, however, there are some bits of evidence that suggest that, while perhaps only one male served to initiate reproduction and to contribute the principal male-derived entities or attributes that went into the composition of the child, it was possible for other male sex-partners of a woman to contribute something to her child's makeup—as witnessed, for example, in the notion of telegony referred to in chapter 11.

We are indebted to George Hamilton, surgeon of H.M.S. *Pandora*, for another bit of evidence that might bear on this subject. After telling that he had enjoyed the sexual favors of a chief's wife, upon invitation of her husband, Hamilton added that the latter "... was a domesticated man, and passionately fond of his wife and children; but now became pensive and melancholy, dreading the child should be Piebald; though the lady was six months advanced in her pregnancy before we came to the island" (Edwards and Hamilton 1915:110).

Another very important question concerning Maohi theories of conception has to do with the nature of the entities or attributes passed on to the child by its mother and its principal genitor. As for the mother, she was acknowledged to provide at least the necessary receptacle for the child, as expressed in the following portion of a "creation chant" quoted from Henry:

To te tane nei 'apu, o te vahine ia, no
te mea na rei ra mai 'oia i te ao nei; e to te
vahine nei 'apu, o te vahine ia, no te mea na
te vahine 'oia i fanau.

Man's *shell* is woman because it is by
her that he comes into the world [i.e., *ao*];
and woman's shell is woman because she is
born of woman.

(1928:340, italics added)

In view of efforts made to fatten some young women prior to their marriage (and hence childbearing), it is probably safe to assume the existence of a belief that some of a mother's physical attributes were transmitted to her offspring,¹ but I can find no further data regarding the supposed mechanics of that process.²

As for a child's principal genitor, I have already referred to the belief that some of a genitor's or, in this case, the cogenitors' physical attributes were transmitted to an offspring. A similar conclusion may be deduced from the stated belief that a child generally "resembled" his genitor in physical

appearance.³ In neither case, however, are we apprised of the supposed mechanics of this transmission process.

On linguistic grounds one might conclude that both mother and genitor contributed some of their own blood to their offspring; I refer to the verbal distinction between 'blood relatives' (*toto fēti'i*) and 'relatives by adoption' (*fēti'i fa'atāvai hia*). But, as I shall explain later on, I cannot be certain whether this was only metaphor or expressed a belief that blood was in fact transmitted from both parents to their offspring.

Turning now to Maohi beliefs concerning the more intangible entities, I can say without hesitation that something was transmitted from both parents in the reproductive process—something "psychic" or "spiritual" or the like. I base my conclusion on the whole panoply of beliefs and practices centering on the immense social-relational importance of descent, including the high value attached to "purity of line." Also, in view of the social weight accorded primogeniture, it is necessary to assume that whatever the "psychic something" that was transmitted by reproduction it must have diminished somewhat in efficacy with each new conception. There are certain clues as to the nature of this particular entity, but I must postpone consideration of them for a while. Meanwhile, I should point out that there may have been still other kinds of "psychic" entities that were thought to be transmitted from parent to child—for example, the one referred to in the belief that the fate suffered by a father was transmitted in some measure to his offspring.⁴

In a negative sense, however, I can point to instances in which important personal attributes were believed explicitly *not* to have been transmitted by sexual reproduction. I refer to the qualities thought essential for the practice of certain types of priestcraft and punditry—qualities in addition to training, experience, and good memory; qualities which, according to Moerenhout, were bestowed by the gods (1837:I, 507). The qualities in question could only be transmitted by the skilled practitioner through his last *breath*, which was infused in his successor.

The social-relational implications of Maohi theories, and lack of theories, about conception will be considered later on. Now let us turn for a moment to measures taken by the Maohis either to supplement coitus in order to insure conception, or to counteract coitus in order to prevent conception.

The *Duff* chronicler stated that Maohi priests "affect to possess extraordinary powers, to promote conception or abortion ..." (Wilson 1799:336), but he did not explain how either practice was carried out. In fact the only other reference I can find to any supplementary measures aimed at promoting conception or, at least, reproduction is a portion of a prayer uttered by a priest during the closing rites of a large-scale religious ceremony. Between requests to the gods for continuing supplies of food, and so forth, is the phrase: "homai i te hua'ai o te ta'ata ia rahi ..." "give us numerous offspring" (Henry 1928:175).

The only analogous measure used to prevent conception that I can find is identified (but not further described) in the LMS Dictionary, namely, *pāva*, a ceremony and prayer to prevent further childbearing. Except for this, as far as I can discover, the Maohis took no practical measures—nor indeed did they entertain thoughts about any such measures, practical or otherwise—to prevent coitus from resulting in conception. This total absence of contraceptive devices is quite surprising in a people who were so evidently casual about coitus but who subscribed to such stringent class-based eugenical norms; but none of the sources describes or even alludes to such near-universal human practices as coitus interruptus or prophylaxis—mechanical, chemical, or magical. Instead, the Maohis appear to have depended upon abortion and infanticide to avoid raising unwanted offspring.

Thyes Natives have a Most Dreadfull Costom, of which they are often guilty, Viz. the killing the Infant in the whomb, which they do by taking a grass stalk having a hard white stem which they cause to pass to the embryo, which kills it; this they say, they can do if the woman is not gon above 4 months, if she exceeds 4 months it is partty shure to kill her, some have expired through it. (Hassall to LMS, 11 November 1797, LMS Archives)⁵

It could be affirmed that of three young women pregnant for the first time, at least one made herself abort. There were women who were very adept at this kind of medical practice and the pressed sap of certain combined herbs quickly brought about the sought-for accident. (de Bovis 1909:33)⁶

As is to be expected, the Maohi practice of abortion was much less apparent to the chroniclers than was infanticide. In fact, the above excerpts summarize about all that I have found concerning the techniques, prevalence, and consequences of abortion in Maohi society.

Regarding the technique employed in abortion, there is however a somewhat ambiguous statement from another missionary, who reported having been told by one woman that she had "... strangled in [her] womb 5 children" (Orsmond, Journal, 10 January 1821, LMS Archives). What was meant by "strangled" is not clear.

There are legendary accounts of living beings who began life as aborted or miscarried fetuses, that is, as "shapeless clods." Inasmuch as some of these "clods" lived to become heroic demigods (e.g., Honoura, Maui), the social-relational implications thereof are important and will be discussed later on.

Even discounting the greater notoriety accorded infanticide in the sources, the likelihood is that it was in fact practiced more frequently than abortion, quietly possibly because of women's well-founded fears for their own health.

The only specific reference to pregnancy taboos I have discovered is a passage from Henry relative to spirits' *ata* (shadows): "The *u'a-miti* (hermit crab of the sea) was a god to some persons. It was supposed that to

eat it under such circumstances would cause swollen glands, sometimes ending in death, and that a child born of a mother so afflicted came into the world with swollen glands" (1928:392).

BIRTH

No where are children brought into the world with less pain or danger: the women submit to little or no confinement within doors, but rise and go about as usual. (Wilson 1799:330)

The sources contain several references to women going about their everyday activities up to the very beginning of labor, and being up and around again within a day or two of parturition.⁷ There are also reports of difficult and protracted births, of still births, and of mothers dying in childbirth.⁸ However, it is probably accurate to say that for most Maohi women childbirth was expeditious, safe, and relatively painless.

I can, however, find no references in the sources to Maohi reactions to caul or breech births, or to prenatal manipulation of the fetus to insure against breech birth.

We are indebted to Bligh for the earliest account of the physical techniques of childbirth:

Ideeah, Tynah's Wife began a Strange conversation, which was how the Women of England were delivered of their Children, and as I complied readily with the knowledge I had of the matter, I was led to the same curiosity with respect to the Otaheite Women. In this particular I was fully satisfied, and Id-deeah represented the Woman in Labour. One of her attendants seated himself in the Tent where we were and Opening his knees took her between them in a sitting posture with her legs under so as to rest upon her heels. His arms were brought round under hers, and his hands spread over the Upper part of the Belly, which they described were occasionally as the pains came on pressed downwards, and in this Manner the Mother was held until the efforts of nature delivered her. I asked if no person came to assist in delivery. She said no, that was not proper, or indeed from her representation is it at all necessary for after a few distortions of the Countenance and trifling complaints the Infant was represented to be born. From her enquiries she found our English Women suffered much and had Assistance in the moment of labour, at which she laughed heartily. "Here," she said (placing herself in the posture already described) "let them do this & not fear and the Child will be safe." I was now asked if our Women had more than one Child at a birth, I told her frequently two, and sometimes three; three she said was *eeno* or bad, that some Otaheite Women had three Children, but that the Woman generally died and some of the infants. (1789:II, 387-388)

Decades later the missionary Crook witnessed and described an actual childbirth episode wherein the techniques were not unlike those simulated for Bligh. The woman had been two days in labor when he first saw her:

She was seated on a flat stone two or three inches thick placed on the ground. A woman sat behind her crosslegged between the woman in labour & the wall to

support her back and loins. A woman also sat before her one at each foot which they well supported in the time of a pang. This is the general posture of women in time of parturition. As the case was lingering the women were changed several times and sometimes men took their place the husband brother &c. During several hours they kept pouring water upon her head & body without ceasing five minutes at one time. The poor creature seemed to enjoy this & would frequently call for it. As night advanced, they lighted a string of tiaire nuts, the King having prohibited oil. Finding the case matured & progressive I ventured out to prognosticate that she would be delivered before the string was burnt out. This was accordingly the case. After prayer & supper I lay down on one of the besteads. The young woman lay on the ground very faint & feverish, her mother sat at her head for some hours applying a little cold water to her head & breast very frequently. She took nothing but a little cocoanut liquor once. Toward morning they all fell asleep with their clothes drawn over their heads as well as bodies. When it was day I found the young woman entirely free from fever and cheerful. (Crook, Journal, 24 April 1821, LMS Archives)

This episode occurred in 1821, six years after the “official” capitulation of paganism and its attendant taboos, so that the fact of its having taken place inside an ordinary family dwelling may have exemplified a change in Maohi customs, since the older, pre-Christian accounts indicate that childbirth usually took place outside, or at least in a shelter constructed specially for the purpose.⁹ But at this point in our consideration of Maohi childbirth practices it becomes necessary to specify the social (i.e., marriage) class of the principals, for although a common thread runs through all such practices—in cases where the child is allowed to live, that is—there were some marked differences in procedure according to the child’s social class.

The most elaborate birth practices attended those of the successor to a politically important district’s highest-ranking kin-Title. Here is Henry’s description of such practices:

When a queen was about to be delivered of her first child,^[10] called the *matahiapo*, a restriction proclamation was immediately issued similar to that of the *pa’i-atua*. All on land and sea along the coast throughout the realm must be silenced so that sacredness might reign until the fifth or sixth day after the birth of the child. Except the members of the royal family and their attendants, all the inhabitants retired into the mountain recesses, where they built huts and were at liberty to make fires and live comfortably until the restrictions were over,^[11] but not without anxiety for some. For an offering of a human sacrifice must close the sacred spell, and the crafty manslayer, unsuspected, already lurked among them.

A fence was erected and shaped upon sacred ground behind the ancestral marae, the two angles being turned outwards. In the outer space between the angles was erected the *fare-rau-maire* (maire-fern house), in which the queen was to be delivered of her child; in the inner space on one side was the *fare-hua* (house-of-the-weak), into which mother and child were to be taken; and in the space on the other side was the *fare-noa* (ordinary house), where the attendants, a chosen few of near relatives and retainers, were to stay.

While awaiting the birth of the child, the *paia* (royal family doctor) and many others chanted *upu* (prayers) for the queen’s safe delivery, improvising cheering

words, according to the circumstances of the case, and appropriating parts of the chant of Ro'o, the famous messenger of the god Tane. When the child was born, the *paia* said, "*Ua muhuta mai nei te atua*" (The god has flown hither) and all present extended happy greetings.

The infant was allowed to cry long and breathe freely so as to receive full life (*iho*) from its mother, after which it was severed with the razor-like outside edge of a piece of bamboo that had grown upon the premises. On such occasions the plant used was said to leap with joy out of the mound to meet the *paia* as he approached to take it. In the following chant the *paia* suited his actions to his words:

E ha'apa i te pito o te tama,
Te pito tapu
O te aitu o mahuta mai nei.
Ia roa, ei pito aho roa;
E taaai i te taura ia mau;
Tapu ai i te pito o te tama aitu
I te tipi moa o te ofe rare,
Hui i te pito, te pito rearea,
Ia mama te pito aitu.

Lay hold of the cord of the child,
The sacred cord
Of the god that has flown hither.
Let it be long a cord of life;
Tie it firmly with thread;
Then sever the cord of the child god
With the sacred knife of the flying bamboo,
Perforate the cord, the vigorous cord
That the godly cord be light.

The *paia* then took a cylindrical piece from the heart of the stem of a banana tree from the sacred ground and rolled it over the skin of the child, whom he then anointed well with sandalwood oil. Again he suited his actions to his chant:

Te tama teu, o te puo mei'a
Te mei'a o te aitu.
Ei horoi i te 'iri manina
Te 'iri paruparu o te tama
E tavai i te monoi
I te tino o te tama aitu
Ia maru, ia hinuhinu
I te monoi moa o te aitu
E nenei maro, e tamara
I te pito, ia maru, ia maro.
Ei hai i te 'a'i o te tama aitu;
Haati i te 'a'i i te pito
Ei hei, ei tapu aho roa,
No te tama aitu nei.

This is the purifier, the heart of the banana,
Banana [tree] of the gods.
To pass over the smooth skin,
The tender skin of the child.
Anoint with oil or sweet odor
The body of this child god
That it be soft, that it be glossy
With the sacred oil of the gods.
Squeeze dry, and saturate with oil
The cord that is flexible, be dry,
For a garland for the neck of the child
Encircle the neck with the cord
As a garland a pledge of long life,
For the child god here present.

Soon the babe was wrapped in soft tapa, and after short preparations mother and child were moved into the *fare-hua*, there to remain for five or six days, during which time oil was frequently used on the child. Everything that they left in the fern house was at once carefully buried close by, with appropriate invocations to render new sacredness to the ancestral center of royalty.

While in the *fare-hua* the queen's attendants conveyed her food and coconut water to her mourn. The attendants and the nurses of the day wore special clothes in which they never ate or drank for fear of bringing upon themselves king's evil.^[12] When off duty they changed clothes in the *fare-noa* (ordinary house), and they washed or bathed themselves before taking their meals. The father of the child was not admitted into the *fare-hua* until the last day of its stay there.

When the day arrived for the child to be bathed, the detached cord was carefully wrapped in scented cloth and placed by the *paia* in a little box formed of one end of a bamboo joint fitted into another, serving as a cover, and hidden away

in the little chamber for that purpose in the ancestral marae. Such a relic was regarded as the essence of the child.

In the middle of this marae were stacked cratelike for the occasion the family war weapons as emblems of greatness, and in the hollow center of the pile was placed a great leaf of the ape (*Alocasia macrorrhiza*), forming the basin, which was filled with holy water. Thither the child was taken accompanied by the parents and other elder members of the family, called the *hui metua* (parental clan), and placed in the arms of the *paia*, who washed it with the water (*uhi-a-iri*), while chanting in the following manner:

Te uhi-a-iri o te tama o te aitu,
 Te uhi-a-iri i te vai ora o Tane.
 Fa'aro'oro'o o te mata'i moa o te aitu
 Te mata'i maru o hiti
 E ouhia mai nei
 Ia manihinihi te 'iri o te tama.
 A ti'a Ta'arua, a ti'a Atea, a ti'a Tane
 A ti'a e tena mano atua!
 E ha'apa te tama nei i te meho tua
 E ha'apa i te meho aro
 O pa i ni'a ma te ho-ra'i,
 E aitu e, e toa riro!

Bathing the skin of the child of the gods,
 Bathing it in the living water of Tane.
 Listen to the wind hallowed of the gods,
 The gentle zephyr from the east
 Which is blown this way,
 To render sensitive the skin of the child.
 Arise Ta'arua, arise Atea, arise Tane!
 Arise, O host of gods!
 This child will lay hold of fugitives behind
 And lay hold of fugitives before
 The fort above, mid heavenly shouts,
 O gods, a warrior accomplished (is this)!

As a sign of affection the *hui metua* then punctured their foreheads, and each mingled the purple drops that fell with a mixture of the juice of sugar-cane and milk expressed from grated coconut upon a miro leaf, which they held over their heads, and with a parent leading, they approached in turn the babe, still in the arms of the *paia*, and touched its cheek with the leaf, but not the mixture, signifying the union of blood. The father then received his child thus initiated into the family circle and embraced it tenderly, conferring upon it a royal name which had been duly and appropriately chosen beforehand, after which he was the first to pay it homage by embracing its feet and saluting it as a member of the royal house and heir to the throne.

This was, strictly speaking, a familial ceremony. Following it the principals congregated at the tribal marae (called, by Henry, "national" marae) to validate the new successor's tribal status:

After the *hui-a-iri* ceremony the royal party proceeded to the national marae, where they were received by the high priest and his assistants in full array, who for the occasion were called *ti'a-ra'i* (stand-by-sovereign). The family assembled in the courtyard, and the babe was passed into the arms of the high priest, who followed by the father and other priests carried it to the *avaa* of the marae, within which was erected for the concluding religious rite a little awning called a *fare'ura* ('ura feather house), made of *apaa* (sweet-scented cloth) from the *fare-ia-manaha*. The awning was spread over a dome formed of miro sprigs against the stones of the wall and was bestrewn with 'ura feathers attached to it with paste. Upon the paving were spread fine mats, in the same manner as for receiving the image of the tutelary god, and upon the mats the high priest appropriately chanting a prayer placed the child and finally said "'Ura epaepa! 'Ura huhu! 'Ura moemoe!" ('Ura unapproachable! 'Ura nurturing! 'Ura reposing!) This simple ceremony was to assert the rank of the child god above all there.

From the national marae the babe was taken to a comfortable home, called the *fare aua teni* (house with exalted walls), which was enclosed within high fences or stone walls one within another, accessible only by stiles, and which was guarded by stalwart men armed with clubs and spears, who were ready to slay any daring intruder. There the royal mother and infant remained for about fourteen months or until the child could run about and was ready to be presented to the public. During that time the mother was free to stroll out of the *aua teni*, leaving the child in charge of some near and trusted relative.

On the same day that the marae ceremonies were performed, messengers, called *arere* or *ti'ati'a-vea*, were dispatched in opposite directions to officially announce the birth and well-being of the child. Each messenger bore high above his head a flag, generally torn off from red marae cloth, called *reva hahae* (flags torn), in honor of which when they were leaving, a human sacrifice called *e ia no te turu i te reva o te ari'i* (a fish to prop the flags of the prince or princess), was offered and buried at the national marae.

The flag was set upon the assembly ground of each district of the kingdom as the messenger passed, and there the people were summoned from their retreat by the blowing of a trumpet or the beating of a drum, by persons appointed for the purpose, to hear the message.

When the news was well received by the people they allowed the flag to stand until taken by the messenger, to whom they showed hospitality; but when the news was displeasing, the flag was torn down by order of the chief and gentry, the pole to which it was attached was broken, and the messenger was returned to his master with a challenge to settle the matter in war—a circumstance that sometimes happened in newly conquered possessions, when the people still hoped to recover their liberty.

After the messengers had passed the districts, the restrictions were removed, and it was a time of general rejoicing. Within a few days, great offerings of food, called *ma'a-faiere* (maternity-food) were brought in and presented to the royal family by representatives from all the districts of the realm, headed by chiefs and chosen orators. Etiquette in regard to precedence was strictly observed, those of most anciently established dignity coming first and those of newly acquired territory coming last. Besides food were presents of *'ura* feather wreaths and capes, called *'ura-moemoe* (*'ura*-reposing), specially made by the women of distinction of the realm for the queen and child. Such demonstrations showed loyalty to the royal family and created kindly feelings throughout the land, and the exchange of courteous speeches between the orators of the people and the royal spokesman would have done honor to any people. This pretty custom lasted throughout the Society Islands until annexation to France took place.

When the royal child was taken from the *aua teni*, a ceremony was performed called *vahi apa* (breaking the barrier). To give this sacredness, a human victim was offered at the marae. The royal parents and child borne upon men's shoulders then went forth with an imposing pageantry to meet a great throng of loyal subjects, foremost among whom were the chiefs and other dignitaries of the land, who gathered on the assembly ground to pay them homage and who as the royal herald cried "*Te Ari'i, te Ari'i*" (The Sovereigns! the Sovereigns!), bared their bodies down to the waist and cried "*Maeva to Ari'i*" (Hail Sovereigns). With courteous greetings and exchange of speeches between the two parties, were presented to the young heir gifts of all the produce of the land and sea. After this introduction the child was taken to the royal abode, called the *Ao-ra'i* (Sky-house, or place), to dwell. (Henry 1928:182-188)

At this point it may be useful to recapitulate the main stages in the events just described:

1. Prebirth imposition of restrictions.
2. Delivery, including first cutting of the umbilical cord, at the *fare-rau-maire*.
3. *Uhi-a-iri* ceremony at the family marae.
4. Status validation ceremony at the principal tribal marae, accompanied by loyalty ceremonies throughout the successor's tribal realm.
5. Occupancy of *fare aua teni* for about fourteen months by mother and child heir.
6. *Vahi apa* ceremony, marking transfer of child heir to its "royal" abode.

In the case of a successor to a very high-ranking kin-Title there followed, in due course, a number of other ceremonies which marked his (or her) coming-of-age, assumption of political authority, marriage, and so forth; these will be described later on, but for the moment let us consider how other children were received into Maohi society.

According to Henry the birth of subsequent offspring of a district's couple of highest-ranking kin-Titles was treated like that of the firstborn, except for the absence of a *human* sacrificial victim. "But if the first-born child died, the same honors were bestowed upon the next one to make it the heir, and so on with every heir apparent" (Henry 1928:187). As for all others:

The under chiefs, gentry, and people rendered also for their firstborn, all the dignity and honors they could muster without restrictions at their respective marae, all performing the *uhi-a-iri* ceremony. The firstborn children of the under chiefs were also entitled to the chieftain honors at the hands of the priests in their own local marae, where they erected an awning covered with sacred *apaa*, without feathers, called the *fare apaa*, where the priest invoked upon the children the blessing of the tutelar god. They were also entitled to the use of the sacred flag within their own districts and without human sacrifices. Their subjects brought presents of food, mats, and feather ornaments; but they had no *aua teni* house.

Exiles in the land performed their ceremonies as they chose along the seashore, erecting upon some rock within the shoal a *fare apaa* and planting in the sand their banners, if they were people of rank. (Henry 1928:187)

There are many versions of the ritual events marking the receiving of neonates (*'aru'aru*) into Maohi society. Henry's is the longest and most detailed available, but it omits some features described in other versions, and it is concerned preponderately with individuals of upper-class status. Believing as I do that this set of events constitutes a highly significant aspect of Maohi social relations, I now propose to reproduce as many primary-source

versions as I have been able to discover—not only to fill gaps in Henry’s version but to support my supposition that there may well have been variations in procedure based not only on differences in class but also on differences in locale. Complicating this matter is that the observers themselves differed widely in what they saw and felt worth recording, as is shown in a statement by the otherwise observant J. Forster: “After the *birth of a child*, they do not observe any ceremonies whatever, excepting that of depressing in some degree its nose, and giving it a name from some object or other which is nearest at hand, or which from some circumstance becomes remarkable” (1778:556).

A greatly simplified procedure marked the birth episode witnessed by the missionary Hassall in 1798:

About 7 o’clock this morning ... there came an old man up to me and I enquired where he was going. He told me for the priest ... his Master’s granddaughter was now in labour, and that he was going for him to offer this Child to his god. I Requested the Old Man to call for me when the p. was come, accordingly in about half an Hour he came, and we went together toward the house. When we came within 100 yards of the house I saw the woman under a large BreadFruit tree in the midst of the long grass in greate pains without help, and in the open air, you must needs think, that I was Much affected at the sight. I requested that she might be taken into the house, to which they repleyed that their costoms would not admit it, the house being sacred and if the woman was to go in before the expiration of ten days the House must be Burnt down. After the Child was Born I went towards her and found the Child lying in the grass, with a cut all across the Cheek, But a fine boy. I asked them to take him into the house and wash him &c. But they answered, the Child is unclain and will be till it be given to the god twice, after it might go in the house and not till then, upon which they brought the child to the P. [at the marae]. (Hassall to LMS, 28 January 1798, LMS Archives)

While recognizing that many aspects of this event may have escaped the missionary’s attention or sense of relevance, his account does establish the fact that some women gave birth out-of-doors (which is also confirmed in other eyewitness accounts). It also suggests that in some instances the ceremony at the family marae took place very soon after birth, which is likewise confirmed in other accounts. (See, e.g., Morrison 1935:186.)

Morrison added the following observation concerning the employment of specialists during a woman’s labor:

... such is ... [a Maohi’s belief in the efficacy of *tahu’a*], that they think if one of them is present, and not applied to, that the Mother would never be delivered—but instead of one they have somtimes half a Dozen who facilitate the Birth of the Child by their prayers and offerings, and in return Strip [the expectant parents] of Half they possess without giving them any other Assistance. (1935:182)

In Henry’s account no mention was made of the mother’s post-parturient bathing; according to Ellis (and others) mothers were induced to sweat

shortly after giving birth, followed by bathing in the sea.¹³ The process was described by the missionary Crook:

When a woman has born a child it is usual for her to walk or to be led into the sea, here she presses or as it were kneads the abdomen and washes herself clean, after which she retires to her house. [To which has been added the note: "I find it is more common for her husband or some man of her acquaintance to take her by the hands when in the sea and press one foot repeatedly against the abdomen of the woman."] About the second day a temporary house or tent is made into which a number of hot stones are rolled. A quantity of leaves are put on the stones upon [which] the woman is seated and the entrance closed. After some time the woman comes out streaming with perspiration and bathes in the fresh water or has it poured or sprinkled upon her after which she bathes in the sea. This is intended to strengthen her or to remove any pains she may have in her limbs. (Crook, Journal, 4 March 1817, LMS Archives; see also Wilson 1799:341)

According to Ellis, "... the infant was taken to the water almost as soon as it entered the world" (1829:I, 342), whereas Henry implied that this occurred several days after birth. This seeming contradiction may derive from differences in the class status of the principals; otherwise, its significance escapes me.

Much more significant than any of these variations, at least in terms of social relations, were differences in the natal ceremonies performed at the "family" marae. In Henry's account of such rites, reproduced above, four episodes stand out:

1. Deposit of the child's umbilical cord at the marae.¹⁴
2. Bathing of the child in "holy water."
3. Touching of the child with the mingled blood drawn from both paternal and maternal relatives.
4. Acknowledgement of the child's titular legitimacy by its father.

In another detailed description of natal ceremonies recorded in the sources, the author implied that the *uhi-a-iri* episode usually took place some six to eight weeks after birth. In view of this and other differences between this account and Henry's, it will be useful to present it in its entirety:

There was, at the birth of a child, first of all a kind of taboo or restriction on the parents. A small shelter was built a short distance from the house. The mother withdrew there with her child, and no one but she and her husband could enter; if some close [female] relative wanted to see the child, she could only come into the hut if she completely disrobed at the door. During the time that the mother nursed her baby in this hut, she herself wore nursing clothing, which she had to leave if she went out and put on again when she reentered. She could neither touch anything nor use her hands except to give her child the necessary care. Other women came regularly to feed her, putting the food into her mouth just as they did with small children. This restriction lasted from six weeks to two months, until the performance of another ceremony, called *aroa*, which took place in the following manner for all [social] classes:

The parents in advance laid in a supply of a quantity of tapa (the cloth of the country) and a good number of pigs. With this done, they set the day for the ceremony and invited the Arioi, the chiefs of the district, and the latter's close relatives. When the day arrived, the pigs were killed, a meal was served and the cloth was laid out in two equal parts in the house.... On their arrival the guests found everything prepared for the intended fête.

The Arioi were always most impressive. They came with their faces painted red and white, feathers atop their heads, covered with flowers and ornaments, and chose one of the two lots of cloth; after the Arioi came the chiefs, who took the remaining cloth. Then the roast pigs were brought and a good meal began the ceremony.

As soon as the mother and father saw the Arioi and other guests arrive, they took a large piece of cloth, some leaves of *miro* (*Thespesia populnea*), and a shark's tooth and they left with their child for the marae.

Coming near to the enclosure, the husband placed the piece of cloth inside so that his wife could walk on it, lest she should taint the ground of this sacred place. They came together, walking on the cloth, approaching the inner altar, where a priest awaited them; and, as soon as they were seated with their child, the priest began in a loud voice to invoke the gods. In the midst of these prayers, at a given signal, the mother, holding up her son in one hand, struck her head with the shark's tooth held in the other hand, until blood ran copiously from her wounds onto the *miro* leaves. Then handing the child and the murderous tooth to her husband, he did as she had. The priest then came to take the bloody leaves and deposited them on the altar before the god-images, and the ceremony ended with this offering and some short prayers. Returning to their home with the child, the parents left at the marae the piece of cloth, and this was burned or destroyed in fear that some woman might touch the side which had been in contact with the sacred ground. (Moerenhout 1837:I, 535-537)

In comparing the two accounts it will be noted that Moerenhout made no mention of disposal of the umbilical cord (probably a lacuna in Moerenhout's information rather than a variation in the events themselves); omitted any reference to ceremonial bathing of the child at the marae¹⁵ (again, this may have been due to a lacuna in his information); specified only the child's father and mother (in addition to the priest) as having taken part in the marae ceremonies, including the symbolically charged rite with blood, omitted Henry's episode of paternal recognition (it is unlikely that this part of Moerenhout's version involves merely a difference in symbolic reference); and emphasized the role of the Arioi in connection with the ceremony. (In explanation, one might suggest that in the case of such upper-class principals as those involved in Henry's account there would have been no need to issue special invitations or commissions to people, including the Arioi, to attend and participate.)

Morrison's version of natal ceremonies is brief, ambiguous, and in many respects incomplete,¹⁶ but it also adds some interesting details concerning treatment of the neonate's umbilical cord, and, more important, it places natal ceremonies within the wider context of *āmo'a*, which—it will be recalled (see chapter 3)—was a connected series of rites

performed at certain times in an individual's life to remove, by degrees, the special kind of ritual constraints imposed upon him and some of his close associates at the time of his birth.

When a Child is born whether Male or Female it is taken to the Family Morai (of Which evry Family have one) by a Person who is employd to attend it while the Mother Goes into a Warm Bath—and the Father and Priests repair to the Morai and offer a Young Pig or a Fowle or two to the Deity, and a Priest, who is well paid for His trouble, Cuts off the Childs Navel String within Six or eight inches of the Belly with (a) piece of split Bamboo and while the others are praying buries it in the Morai.^[17] A Temporary hut is then prepared Near the Morai to which the Mother repairs, and the Child is brought to her by the servant appointed to attend it and who must remain there with the Mother & Child till the rest of the Navel string drops off, which may be either kept in a house Sacred to the Child, or buried in the Morai. If the Child is Male, they May bury the Navel string as soon as it Comes off, which may be Six or Eight days but if Female it is sometimes kept a Fortnight or Three Weeks, during which time the Mother touches no kind of Provisions herself, but is fed by another person, and whosoever else touches the Child must undergo the Same restriction till an Amoa is performed to take it off, previous to which an offering Must be Made of a Plantain tree and a Young Pig, or a Fowle or two for the Mother, which is done as soon as the Navel string is buried or the time fulfilld for the removal of the Child from the Morai nearer the Fathers House which is built for and sacred to the Childs use, but still they Can not enter that House nor touch the Child with the same Cloths on which they wear when they (eat) their own provisions—to take off which from the Father & Uncles, a Second Amoa must be performed and from the Mother & Aunts, a Third before the Child may Come into a House where its Father and Uncles Eat, a Fourth and for the Mother & Aunts a Fifth.

If the Child is Male there is one More which is performd when He adopts a Friend, which is the whole required to make his head Free, evry thing he touches being in his Minority or Sacred State is made Sacred by his touch and rendered useless to any other. If the Child is Female there are two others, one when she gets a husband that Her Male relations may Eat of the Provisions which he has touchd, and another that they may eat out of the same Dish and then her Head becomes Free also but she is generally free before these two except her head should touch any thing.

These Ceremonies when performed for the Males are Calld Amoa only, but for the Females they add Fwhatoe [*fa'atoa*], signifying something more, as they have one more than the Males—for the Males Hogs or Fowles and Cloth are always (presented) but for the Females if they can not raise them, a Fish will do—but however this is seldom the Case, and they are No way sparing in the performance of these rights and much Feasting then takes place.

Evry thing the Children happen to touch before these rites are all performd is rendered sacred and thrown in a place adjoining to the House in which they live, and raild in for that purpose; they are always Careful how they go about and should a Childs Head touch a Tree by the Carelessness of the attendant, the Tree tho ever so valuable is Cut down and destroyed root and branch, and if it should break a limb of another or bruise the Bark in its fall that tree Must be destroyed also; nor must they use the timber for fuel. Some of the Weomen are 16 or seventeen Years old before all their rites are performd, which makes them

very cautious what house they go into or what things they touch—but the Men are Generally Made free as fast as the father can get it done which is sometimes by Six Years old and sometimes not till twelve; the Children of People of rank are generally longer before they have all their rites performed, then the lower sort as it has a Grander appearance by being long about & they always make large Feasts on these Occasions. (Morrison 1935:186-187)

Bligh provided us with another version of birth practices, and with it a clear account of certain of their ramifications:

Tynah as usual dined with me, and this is always a convenient Opportunity to make enquiries; it was particularly apropos to the subject I was on, and have long been endeavoring to get a certain knowledge of, the reason of his not feeding himself.

This circumstance is not confined to the Erree rahigh [*ari'i rahi*, the holder of a very high-ranking kin-Title, or the sovereign chief of an important district], but is common among all Cheifs who are married and have Children. When the Mother is delivered, the Father, who is always present, has the New born infant given to him before any other person but the Midwife touches it. As soon as he is satisfied with viewing the Child he returns it to the Mother, and from that moment untill the Child is grown up and considered a Man, he never tastes any food or nourishment but what is put into his Mouth by another person.

It is the same with Iddeeah, Tynahs Wife, for about ten Months, when she performs a ceremony Aammo-Aammo [*amo'a*], which is presenting some Cocoa Nutt, Sugar Cane and a Small bough of a Shrub called Errow-woah in each hand held to her forehead to the Child; this being done she is at liberty to feed herself.

It is the same with the Cheifs of Districts, but the Aammo is performed in a shorter space of time; some people tell me that both the Father and Mother are at liberty to feed themselves in ten Months after the Child is born.

I have mentioned in a former part of the Log that the Son of Marrémarré Cheif of Itteeah [Hitia'a], called Poohaitaiah Otee, was fed at my table the same as Tynah, and I now find without a doubt that it was from the same Cause.

No Common people are suffered to be present at the delivery of the Child [presumably, of an upper-class couple], or rather at the receiving it, for Nature itself is allowed to do all, as I have before Shown. Sometimes a Man and sometimes a Woman receives the Child, but they are always near of Kin or particular friends. They are however not brought under the penance of being fed.

If a Cheif has a Child by a Mana-howne [*manahune*] or Common Woman it is always killed as soon as Born.

I imagine that the reason of Cheifs not feeding themselves at the Friendly Islands [Tonga] is from the same cause.

This never happens with the Mana-howhes [*manahune*] or Towtows [*toutou*]." (1789:II, 43)

More about the rituals referred to in these excerpts will be presented presently, but one further food restriction should be mentioned in this context:

If a woman has a child, the provisions for it must not come in at the same door with the mother's; but there is an opening like a window, through which they are received; and it would be reckoned beastly in the highest degree for her to eat

whilst she is suckling her child. When they travel, their provisions must be carried in separate canoes. (Wilson 1799:351)

Finally, I call attention to the fact that every child was given a *personal* name at birth, and in addition some children were appointed to kin-Titles. In view of the complexities attached to these practices, I reserve discussion of them for later chapters.

INFANTICIDE

Before describing the practical ways whereby the Maohis nurtured their offspring and prepared them for life in their society, I will describe how they destroyed those they did not wish to have survive; which ones they chose for destruction, and why, will be reported in other contexts.

Needless to say, no behavior of the Maohis so horrified the early European visitors as the frequent, systematic, and socially sanctioned practice of infanticide. Ellis summarized these reactions to what he termed, "... the most revolting and unnatural crime that prevails...."

When the Missionaries arrived in the Duff, this was one of the first and most affecting appendages of idolatry that awakened their sympathies, and called forth their expostulation and interference. Adult murder sometimes occurred; many were slain in war; and during the first years of their residence in Tahiti, human victims were frequently immolated. Yet the amount of all these and other murders did not equal that of infanticide alone. No sense of irresolution or horror appeared to exist in the bosoms of those parents who deliberately resolved on the deed before the child was born. They often visited the dwellings of the foreigners, and spoke with perfect complacency of their cruel purpose. On these occasions, the Missionaries employed every inducement to dissuade them from executing their intention, warning them, in the name of the living God, urging them also by every consideration of maternal tenderness, and always offering to provide the little stranger with a home, and the means of education. The only answer they generally received was, that it was the custom of the country; and the only result of their efforts, was the distressing conviction of the inefficacy of their humane endeavours. The murderous parents often came to their houses almost before their hands were cleansed from their children's blood, and spoke of the deed with worse than brutal insensibility, or with vaunting satisfaction at the triumph of their customs over the persuasions of their teachers. (1829:I, 332-334)

Recorded estimates of the numbers of infants destroyed range from three-fourths to two-thirds of all those born. The higher estimate was reported by the mission inspectors Tyerman and Bennet:

While going to Mr. Wilson's, in the morning, we conversed with Mr. Nott, who has resided here from the commencement of the mission, on the subject of infanticide, and learned, with horror, that it had been practised to an extent incredible except on such testimony and evidence as he, and the brethren on other stations, have had the means of accumulating. He assured us, that *three fourths* of the children were wont to be murdered as soon as they were born, by

one or other of the unnatural parents, or by some person employed for that purpose—wretches being found who might be called infant-assassins by trade. He mentioned having met a woman, soon after the abolition of the diabolical practice, to whom he said, “How many children have you?” “This one, in my arms,” was her answer, “And how many did you kill?” She replied, “*Eight!*” Another woman, to whom the same questions were put, confessed that she had destroyed *seventeen!* Nor were these solitary cases. (Montgomery 1832:I, 53)

Ellis’ lower estimate is probably more credible, based as it was on a wider sampling of opinions:

In point of number, the disproportion between the infants spared and those destroyed, was truly distressing. It was not easy to learn exactly what this disproportion was; but the first Missionaries published it as their opinion, that not less than two-thirds of the children were murdered by their own parents. Subsequent intercourse with the people, and the affecting details many have given since their reception of Christianity, authorize the adoption of the opinion as correct. (1829:I, 334)

The numbers of infants slain varied widely from parent to parent, such differences having resulted from factors of social class, sect membership, personal predilection, and so forth—all of which will in due course be discussed; but I have the impression that there was hardly a “married” woman alive who had not lost at least one offspring in this manner.¹⁸ In addition to the cases described above in an excerpt from Montgomery, there are instances recorded of some women having lost all the children borne by them—including a woman who was reported to have lost sixteen (J. Williams 1837:560).

Even allowing for some exaggeration on the part of observers desirous of emphasizing the magnitude of the pagan immoralities they had to contend with, and hence the glorious dimensions of their conversions, there can be no doubt that a very large percentage of Maohi infants were deliberately slain. The methods of slaying were many. Of these, suffocation, strangulation, and neck breaking were perhaps most frequently employed.

“When an Erreoe [Arioi] woman is delivered of a child, a piece of cloth, dipped in water, is applied to the mouth and nose, which suffocates it” (Anderson, in Cook 1784:158-159). Although Anderson specified this method as applying to infants of Arioi women, it was also used for others. A native’s statement recorded in a missionary journal may be taken to imply that some infants had once been suffocated in placental material; Orsmond was told in 1827 by one of his congregation that “We do not [i.e., no longer] strangle our infants as soon as born by putting the placenta on the face” (Orsmond, Journal, 21 September 1827, LMS Archives).

“... they pinched their little throats until they expired” (J. Williams 1837:565). “The infant is strangled by the person who receives it the moment it is born, and from their representing the Act, it appears to me they

break its Neck by a twist as is the Common Way of Killing a Fowl" (Bligh 1789:II, 79).

Other methods used included stabbing the infant with a sharp-pointed piece of bamboo or bone, treading or stamping out its life, breaking its bones, or dashing it to the ground.¹⁹ J. Williams' description of one of these (if true!) is as appalling to imagine as it is difficult to interpret:

The moment the child was born, they broke the first joints of its fingers and toes, and then the second. If the infant survived this agonizing process, they dislocated its ankles and the wrists; and if the powers of endurance still continued, the knee and elbow joints were then broken. This would generally terminate the tortures of the little sufferer; but if not, they would resort to the ... method of strangulation. (1837:565-566)

All the sources agree that when infants were killed the act took place within minutes of delivery. The exact timing of the deed is nowhere specified, nor is the rationale for the timing; possibly it took place before the infant had been "... allowed to cry long and breathe freely so as to receive full life (*ihō*) from its mother ..." (Henry 1928:183), but that is mere conjecture on my part. In any case, once the infant was considered to have entered fully into living—by some criteria I have been unable to discover—its life was invariably spared, however strongly some persons may have desired its death:

The horrid act, if not committed at the time the infant entered the world, was not perpetrated at any subsequent period. Whether this was a kind of law among the people, or whether it was the power of paternal affection, by which they were influenced, it is not necessary now to inquire; but the fact is consolatory. If the little stranger was, from irresolution, the mingled emotions that struggled for mastery in its mother's bosom, or any other cause, suffered to live ten minutes or half an hour, it was safe; instead of a monster's grasp, it received a mother's caresses, and a mother's smile, and was afterwards treated with the greatest tenderness. (Ellis 1829:I, 337-338)

As to who perpetrated infanticide, though some evidence exists of there having been persons (male and female) who specialized in the act, there is also ample proof of its having been carried out by the infant's own mother or father—sometimes in common agreement, but perhaps not infrequently against the will of one of them.²⁰

When all the principals were agreed upon the desirability of killing an infant, the deed was carried out privately and quietly. The Maohi native Mai reportedly told Georg Forster that infanticide took place in secret "... so that it would not lead to obligatory vengeance" (Mühlmann 1955:116). I am inclined to agree with Mühlmann's view regarding the credibility of this statement of Maj's, namely, that it is a *schwindel*! But disagreement did occasionally occur, as will later on be described.

NURTURANCE AND SOCIALIZATION

It must be noted that there is little evidence of Maohi methods of nurturing and socializing children—certainly nothing approaching the detailed observations essential for valid generalization. Nevertheless, the few scraps of information and inference found scattered throughout the sources will be recorded here on the chance that they may prove suggestive.

I have discovered no general native beliefs about the process of physical nurturance analogous to those underlying the *āmo'a* rituals mentioned earlier, that is, no verbal formulations concerning the relation between nutrition, growth, and physical development during early childhood. On the other hand it is manifoldly evident that fatness in a child (as contrasted, for example, with physical mobility) was highly valued and actively nurtured. Babies were of course breast-fed, but for how long is not reported. I can find neither references to the presence or absence of wet nurses (although my supposition is that there were some) nor to the practices adopted in weaning. In this connection, it may be recalled that some women who had lost children made it a practice to drain their breasts by suckling small dogs and pigs. Very early in life babies were started on *poipoi*, a soft puddinglike mixture of mashed breadfruit and coconut cream, which was evidently very fattening. This was not so much as preparation for early weaning as encouragement of corpulence; and later in childhood Maohis were deliberately fattened.

Most accounts of Maohi nurturance practices have to do with the physical shaping of the child's body:

Great care has always been bestowed by the natives upon the development of an infant. It soon becomes hardy, being lightly clad, and being cleansed generally by lightly washing at first, and soon by bathing in cold water. For the first three or four months, when in bed,^[21] the child is kept lying on its back with a very low pillow slightly pushed up on either side, not only to flatten the back of the head and keep it from becoming lopsided but also to keep the back straight and allow freedom of motion for the limbs. Prominent bumps on the head are gradually leveled down by frequent rubbing with the finger tips; and a prominent forehead is also ameliorated by gentle pressure with the palm of the hand. Sweet-scented oil, generally of sandal-wood or *tiare*, keeps the scalp in a healthy condition. It is also applied to the body and limbs when massage is required to rectify defect. For girls, the eye-lashes are bitten short to make them grow long, and the finger tips are rolled between the thumb and finger to make them taper.

The nurses are careful not to strain the spine of the infant. After three or four months, as it gets strong, it is kept much of the time upon a mat on the floor instead of the bed, and then it soon turns and learns to crawl. When the child is first carried in a sitting posture the nurse carefully props its back with one hand, called *fa'ati'ati'a* (raising), and continues to do so until the child can sit up alone. When it can crawl and walk it is carried sitting astride upon the hip of the nurse, who passes one arm under the child's arm and around its waist to hold it in position, a mode called *tuta*. (Henry 1928:274)

An excerpt from Ellis adds further details:

... [infants] were never confined in bandages, or wrapped in tight clothing, but though remarkably plump and healthy in appearance, they were generally very weak until nearly twelve months old.

The Tahitian parents and nurses were careful in observing the features of the countenance, and the shape of the child's head, during the period of infancy, and often pressed or spread out the nostrils of the females, as a flat nose was considered by them a mark of beauty. The forehead and the back of the head, of the boys, were pressed upwards, so that the upper part of the skull appeared in the shape of a wedge. This, they said, was done, to add to the terror of their aspect, when they should become warriors. They were very careful to *haune*, or shave, the child's head with a shark's tooth. This must have been a tedious, and sometimes a painful operation, yet it was frequently repeated.... (1829:I, 343)

According to Moerenhout: "In the case of the son of a chief, the top of his head was pressed in an effort to give him a prominent forehead, narrow at the top; but in all other instances, regardless of its sex or rank, they flattened the back of the head and the nose, for a flat nose was considered a trait of perfection and beauty on a female" (1837:II, 59).

Even from these scant reports some tentative inferences may be drawn: the Maohis appear to have considered the early months of a child's life crucial for its physical development; physical perfection in an "aesthetic" sense was an important, if not the most important, goal of the adults in tending their infants; little or no effort was made to hasten the infant's behavioral development. Although many persons may have shared in nurturing a young child, it is said to have been primarily the responsibility of its mother (Wilson 1799:328).

Moerenhout characterized the task of nurturing children as follows:

There [in the Society Islands] as in all countries (mothers' main job was to take care of their children) but in that felicitous climate, lying naked and uncovered on the grass or on mats, children are less trouble to their mothers than elsewhere, where constantly changing temperatures and harsh winters require that closest attention be paid to insure good health. We saw above ... the troublesome restrictions imposed upon a mother during the weeks immediately after birth-giving, but that was only a temporary ordeal. An abundance of good milk and of fruits and vegetables (which when made into soft, almost liquid pastes provide a most convenient and healthful food suitable even for the youngest infants) greatly facilitates the task of raising children, in comparison with the time and effort that has to be expended elsewhere under the regime of different customs. (1837:II, 58-59)

Another detail of child-feeding practices was described by Mortimer:

I could not help remarking a custom among the Otaheitean matrons in feeding their children, that seemed to be very extraordinary: this was, after they had given them a certain portion of bread-fruit or other food, they would scoop up two or three handfuls of salt water and pour down their throats, which they would repeat several times in the course of a meal; and however nauseous and

disgusting such a beverage might seem to us, the little infants used to swallow it with great relish: perhaps this may account for the Otaheiteans being so fond of dipping their meat in salt water, when grown up to maturity; for I observed they preferred it to our dry salt. (1791:48-49)

We turn again to Moerenhout for a general description of the further socialization and training of Maohi children:

Children of both sexes begin at a very early age to [learn] the various occupations inside and outside the household which constitute their "industrial" life.

Without ever being forced to do so, girls nevertheless take pleasure in [accompanying] their mothers in order to learn how to process the bark ... from which fabrics and mats are made. Some girls are reared with great care and with strictest [chaperonage] by their relatives, who do everything possible to improve upon the advantages bestowed by nature. Such girls are kept out of the sun, even when bathing. They leave their fathers and mothers only upon marriage—which, in such cases, rarely takes place at an early age, and then only with someone chosen by their relatives—from which circumstances we might be led to believe the islanders were motivated by some sense of [sexual] propriety; but they themselves attach no importance to this [motive], being moved only by the desire to improve or conserve the beauty of their daughters. (1837:II, 59-61)

Some of the customs described by Moerenhout call for comment and elaboration. His statement about the careful solicitude and surveillance afforded "some" young girls is confirmed in other accounts, but he does not inform us who those "some" were. It would be plausible to assume that treatment of this kind would apply mainly to girls of upper-class status—the "better sort," as some writers liked to put it. As was noted in our discussion of sexual behavior, there were large numbers of girls, of unspecified class, who were anything but chaperoned or protected in the manner described by Moerenhout.

Class status also played a part in the training of boys, at least in formal instruction concerning what Moerenhout termed "religious ceremonies at marae." According to Henry's account, in certain districts there were schools (*fare'aira'a upu* 'houses for assimilating prayers and chants') presided over by teachers (*'orometua*) and attended by upper-class boys from near and far.²² One of these schools was at Opoa (Ra'iatea) and another was at Ha'apape (Tahiti) (Henry 1928:74-75). Henry provided some insights about the latter in the recorded legend of Hiro the Trickster, who was the giant-sized son of a Ra'iatean chief, and who subsequently became a devotee of Hiro, god of thieves:

While yet a young lad, Hiro went to Tahiti and lived at 'Uporu (Ha'apape) with his maternal grandfather, named Ana (Cave), the senior teacher in the school called Tapu-ata-i-te-ra'i (sacred-cloud-in-the-sky). There Hiro's four brothers had been placed as students, and while he was still too young to join them, he acquired a greater knowledge than they of the chants that he heard by lis-

tening from outside. Hiro grew so fast that he was soon the biggest youth in all 'Uporu, and one night he stole up on to the ridgepole of the schoolhouse where his grandfather, who was blind, was teaching, and this he continued to do during six consecutive nights, at the end of which he had absorbed into his person all that was taught in the school. When he was admitted as a student he recited all the chants so well that the teachers were amazed, and his grandfather said that there was nothing more in the school for him to learn. It is said that Hiro's pastime at 'Uporu was to play with sand, which he easily heaped up into hillocks which are still standing along the shore. (Henry 1928:537)

I have already devoted some pages to children's games and to the ways in which boys and girls learned to sing and dance and play their roles in sexual relations; and I have given some observations about boys' training for war. As for technical training in subsistence activities, J. Forster had the following to say—based perhaps as much on a Rousseauian ideal as on actual observation, but probably not far from the truth, except for the last assertion:

The first notions necessary for the way of life now in use in these islands, are instilled into the tender minds of the children by their parents: these notions may be divided into various branches, as varied as the objects are to which they relate; the more universally necessary objects of all nations, are food, raiment, and shelter against the inclemencies of the weather; the operations therefore relative to food, dress, and habitation are the first, which are taught the children by their parents. As these nations have not yet a multiplicity of artificial wants, and as their time is not yet taken up with any business more material than the three enumerated articles, their manufactures are in consequence very simple, and undivided in many branches; nay, they are all thought necessary for every individual in these isles, and for that reason every child is instructed in the best methods of cultivating the bread-fruit tree, the plantane-stalks, the roots of yams, and other eatable roots; the most expeditious ways for catching fish, the proper season and bait for each kind, and the places which they haunt and resort to, are told to their children; nay, all the fishes, shells, and blubbers, which in any ways may with safety be eaten, are named and shewed to them, together with their nature, food, haunts, and qualities; the devices for catching birds, for rearing dogs, swine, and fowls, and all the names of spontaneous eatable plants are communicated to their youths, together with their seasons and qualities; so that there is hardly a boy of 10 or 12 years old, who is not perfectly well acquainted with these articles. But as the bark of the mulberry tree, requisite for raiment, must be cultivated with a great deal of care and application, their youths are well instructed in the methods necessary for that purpose: and every young woman is early instructed in all the operations requisite for manufacturing and dyeing their cloth, and likewise in those of making mats, and other parts of their dress. The wood which is best calculated for building a house, a canoe, or other utensils, together with every operation for erecting a habitation, for making the various parts of a boat, and for navigating it by paddles or sails, are understood by every person, from the last toutou to the first chief of the land. In short, there is not one mechanical operation, which they do not teach to every youth, and which, after some time, he is not capable of executing with as much adroitness and skill as the best and oldest man in the nation. (1778:439-441)

This same writer also commented on a kind of “technical” training undergone by girls:

In O-Taheitee, and its neighbourhood, the women are possessed of a delicate organization, a sprightly turn of mind, a lively, fanciful imagination, a wonderful quickness of parts and sensibility, a sweetness of temper, and a desire to please; all which, when found connected with primitive simplicity of manners, when accompanied with a charming frankness, a beautifully proportioned shape, an irresistible smile, and eyes full of sweetness and sparkling with fire, contribute to captivate the hearts of their men, and to secure to them a just and moderate influence in domestic and even public affairs. We find the women esteemed at O-Taheitee, and its neighbourhood; they mix in all societies, and are allowed to converse freely with every body without restriction, which enables them to cultivate their minds, and to acquire the polish, which afterwards contributes to improve the manners of their young men; for, as it is one of the chief points of female education, in these happy isles, to learn the great art to please, they are instructed in all the means of gaining the affection of the males, of studying every winning art, and of habituating themselves to that sweetness of temper which never fails to merit the return of attachment, of friendship and love. (J. Forster 1778:422)

Turning now to the family setting in which Maohi children acquired their attitudes and skills, a statement by Ellis typifies the opinion of most observers that “In general, they are too tender towards their children, and do not exercise that discipline and control over them which the well-being of the child, and the happiness of the parent, requires” (1829:I, 341).

In contrast with this view, however, is one described by J. Forster:

... before [children] attain [the] age of discretion and maturity, the fond parents take peculiar care of their education: they frequently check the wild flights of their unruly passions, and instill order, moderate industry, and the principles of benevolence and gratitude into their tender minds. I have seen mothers punishing obstinacy and disobedience, and though extremely fond of their children, they nevertheless are sensible enough thus far to do violence to their own feelings, that their children may not acquire a habit of ingratitude, obstinacy, and immorality; I have likewise heard them expostulating with their unruly little ones, and expressing their displeasure at their conduct; all which proves that they have ideas of moral rectitude, of order and filial subordination, and of the necessity of instilling these principles early into the minds of their children. (1778:351)

I shall reconsider this topic of parent-child relations in other chapters, but now I shall discuss the less mundane, more ritualized events undergone by individual Maohis during their early years of life.

MATURATION RITES

Tattoo

All, or nearly all, young Maohis submitted to the tattoo (*tatau*) needle during the early years of their lives. Boys began being tattooed at age thirteen to fourteen, as judged by most of the Europeans, although Ellis said it was

much earlier in some, unspecified cases: "They usually began to impress these unfading marks upon their persons at an early age, frequently before they had reached the seventh or eighth year" (1829:II, 464). On the average, tattooing of girls began somewhat earlier than did tattooing of boys. According to Moerenhout girls began being tattooed at 8 to 10 years of age, at which time they also began to wear clothes (1837:II, 122). Robertson stated that boys began being tattooed at sixteen, girls before they were twelve or thirteen, after which, "I suppose they look upon themselves as men and Women" (Robertson 1948:211). J. Forster added the interesting (but nowhere else confirmed) statement: "As soon as they [marks of puberty] appear, the young women are obliged to [be tattooed]" (J. Forster 1778:434).

I quoted in chapter 6 a passage from Banks describing the technique. Here is Morrison's general description of the operation:

The Tattowing is performd at the pleasure of the Partys who have it done and will not suffer the performer to leave off while they can bear a stroke, tho they make such a lamentation while they endure the pain that a stranger would suppose it was doing against their will and that they were forced to suffer it contrary to their Inclination. The young females are more remarkable for bearing it then the Males tho they cannot suffer more than one side to be done at a time and the other may remain perhaps for a Twelvemonth after before it is finishd, till which time they never Conceive themselves Company for Weoman—being only Counted as Children till they have their Tattowing done—While the Girls are having it done they are always attended by some of their female relations who hold them while they struggle with the Pain and keep their Cloaths from being kikk off and should they from their tears draw pity on themselves and the person who holds them should perswade them to leave of(f) they are often in such a passion as to strike even their Mother if she should happen to be performing that office, which she must not return on pain of Death—they often suffer so much to be done at once (through their Pride it being a disgrace to give out till one side is finishd) as throws them into a fever. (1935:221-222)

Banks' account of a tattooing episode he witnessed gives a somewhat different picture of who constrains whom in order to complete the operation. (Neither Banks' nor any other account throws light on Morrison's intriguing statement about a mother being prohibited from striking back at her daughter "... on pain of Death").

This morn I saw the operation of *Tattowing* the buttocks performd upon a girl of about 12 years old, it provd as I have always suspected a most painfull one. It was done with a large instrument about 2 inches long containing about 30 teeth, every stroke of this hundreds of which were made in a minnute drew blood. The patient bore this for about ¼ of an hour with most stoical resolution; by that time however the pain began to operate too stron(g)ly to be peacably endurd, she began to complain and soon burst out into loud lamentations and would fain have persuaded the operator to cease; she was however held down by two women who sometimes scolded, sometimes beat, and at others coaxd her. I was setting in the adjacent house with Tomio for an hour, all which time it lasted and was not finishd when I went away tho very near. This was one side only of

her buttocks for the other had been done some time before. The arches upon the loins upon which they value themselves much were not yet done, the doing of which they told caused more pain than what I had seen. (Beaglehole 1962:I, 309)

Tattooing required special skill and was practiced by specialists (*tahu'a tatau*), who were paid well for their services—precisely how much we are not told, but enough so that some were able to “... make it a Trade and subsist partly by it” (Morrison 1935:220). The operation was carried out at shrines dedicated to the supernatural inventors of the practice, whose aid was thereby invoked. Henry offered two versions of the origins of the practice:

In the genealogy of the gods, Tohu was named as the god of tattooing. He was supposed to have painted the fishes in beautiful colors and patterns, which human beings imitated upon themselves, and so men who made tattooing their profession invoked Tohu to aid them in their work. They were called *ta-tatau* [*tā-tatau*] (tattoo-adepts). (1928:234)

According to Tahitian folklore, tattooing originated among the gods, in the *pō* (dark period), and was considered highly ornamental and pleasing to themselves and to man. It was invented by Matamata-arahu (Printer-in-charcoal), who was aided by Tu-ra'i-po (Stander-in-dark-sky) or Ti'iti'i-po (Fetcher-in-darkness)—two gods who were of the body of artisans of Ta'ere, god of all skill,—and Hina-'ere'ere-manu'a (Gray-the-hasty-tempered), eldest daughter of the first man and woman, Ti'i and Hina, whom they succeeded in abducting from an enclosure where she had been closely kept by her parents by exhibiting the patterns upon themselves to her great admiration and selfforgetfulness.

At the shrine of Matamata-arahu and Tu-rai-po the *tatatau* or *tahu'atatau* (tattoo artist) always performed his work, invoking their aid in its execution and the healing of the perforations. His art was most remunerative, as people in days of yore thought such marks set off their beauty and dress. (1928:287)

There are no reported instances of collective tattooing, although Ellis stated that tattooing was accompanied by “idolatrour ceremonies” which included “the practice of abominable vices”; he did not specify what these latter were. (They were “abominable” enough, however, to incur the strong opposition of the missionaries, who placed the whole practice of tattooing high on the list of prohibited heathen customs.) One indication of the ritual aspect of tattooing lies in the fact that “the tools used for the first time on a Chief or the heir of a large family must be destroyed as soon as they are done with, and deposited in the Morai ...” (Morrison 1935:221).

Part of the rationale for tattooing was undoubtedly aesthetic, as some statements in the above excerpts plainly reveal; but the tattoo evidently served also to signal an important change in the individual's “social maturation”—for example, see Morrison's statement just quoted regarding the necessity for girls to be marked in order to be considered “Company for Weomen.”

Finally, in addition to this general relation between tattooing and social maturation, one particular kind of tattoo sign served to mark progress in

completion of the head-freeing rites, mentioned earlier, at least in the case of "Chiefs or the heir of a large family":

... when all the Amoas (except those of Marriage or freindship) are performd they receive a small spot [i.e., tattoo mark] on inside of each Arm Just above the bend of the Elbow which signifies that they are free to eat and drink of their parents food & that Contrary their parents may eat of theirs; this Mark they Never receive till these rites are performd, nor is it always done, at the time of the last being performd. (Morrison 1935:221)

Supercision

In addition to being tattooed, boys were subjected to circumcison, or rather supercision (*tehe*), the operation having been limited to slitting rather than removing the foreskin. The slit was made in the upper part of the foreskin by means of a shark's-tooth knife, and ashes were applied to the wound to stop the flow of blood.

Morrison reported that the operation was performed on boys of about thirteen to fourteen years of age (Henry said fifteen to sixteen), and that, like tattooing, it was "... at their own option"—with the qualification that "... a person who is deficient of either is reproachd and told of it in Public and it is as bad to want these marks [tattoo and supercision] as it would be among us not to be Christened or to go Naked, tho some want both" (1935:220).²³

As were tattooing experts, those who specialized in supercision (*tahu'a tehe*) were remunerated for their services.²⁴ Morrison asserted that both tattooing and supercision were carried out by the same specialists, and that the latter was performed "... not from any religious Custom but from a Notion of Cleanlyness." Banks evidently held the same view, but neither he nor Morrison offered evidence that this explanation was a native one.

Whether or not supercision was a "religious Custom," it undoubtedly took place in a ritual setting:

... it was formerly a religious rite accompanied with prayer at the ancestral marae, at which the father and other male relatives of the lad assisted, sympathetically puncturing themselves freely with weapons of shark's teeth and causing the blood to flow.

For an heir apparent to the throne, one or more human sacrifices were offered by the priests at the national marae, while this rite was being performed at the ancestral marae. Several human victims were suspended with sennit strings strung through the ears, as "Oro's fish," as they were hung upon the toa tree around Tarahoi for Pomare II, under the direction of the high priest Tua-roa. (Henry 1928:188)

Fattening

Mention has already been made of the Maohi practice of fattening (*ha'apori*). The process of forced fattening here described was usually accompanied by skin bleaching, both deliberate and coincidental; except, however, for the aesthetic value associated with light pigmentation, the

fattening aspect of this activity seems to have been more important. Individuals went through these regimens at various times of life, according to inclination and material means; not everyone, perhaps, could have afforded the luxury of weeks of unproductive leisure and continuous gluttony. For example, in discussing the atoll, Tetiaroa, Ellis described it as

a kind of watering-place for the royal family [i.e., the chiefly dynasty of Tahiti's northwestern districts], and a frequent resort for what might be called the fashionable and gay of Tahiti.—Hither the areois, dancers, and singers, were accustomed to repair, together with those whose lives were professedly devoted to indolent pleasures. It was also frequented by the females of the higher class, for the purposes of *ha'apori*, increasing the corpulency of their persons, and removing, by luxurious ease under the embowering shade of the cocoa-nut groves, the dark tinge which the vertical sun of Tahiti might have burnt upon the complexions. (1829:I, 173; see also Henry 1928:76)

The period of their teens (according to the European system of age reckoning) seems to have been the one especially devoted to fattening—indeed it is possible that such forced fattening constituted a more or less universal and ritualized episode in the maturation process. As I will describe later, it is also possible that such forced fattening constituted, more specifically, a step in a member's advance through the grades of the Arioi sect, but I refer now to the possibility of the activity having had more general, society-wide applicability. Both young men and girls were systematically fattened, presumably separately, but the best available account of such activities involved only young men:

In the morning there came a large number of youths, of good parts, to present themselves before their *arii* Vehiatua in accordance with a certain usage and custom they have. This custom is that at certain times, or Moons, the youths of each district meet together and repair to one of the large sheds they have for keeping their big canoes under, such as they employ when they go to war with another island. On being ensconced therein, and provided with their eatables, they lay themselves down in the dry grass spread for the purpose, and a wrap that each one brings serves him for pillow and covering.... They do not get up except for their bodily necessities; they eat and sleep as much as they can. An old man serves them with meals: they go on in this way for the space and time of one moon in order to grow fat and lusty and high-spirited.

When the period of fattening is completed they get up and anoint their bodies all over with coco-nut oil; and fix plaits of palm leaves on to their heads which, when placed above the forehead, keeps their faces shaded from the sun when it shines on them. They furthermore gird themselves about with a long strip of native cloth of various colours, over the breech-clout. Got up in this guise they march to the *arii's* house, on nearing which, but before reaching it, one of them who acts as their leader takes up a position in front of the fattened ones and gives utterance to loud yells until they all arrive opposite to the doorway of the house. The leader enters alone, to report to the *arii* and render an account of all the fattened ones, whom at the same time he announces as having come to make their obeisance before him, naming each one separately by his name and the district

he comes from. He then immediately delivers to the *arii* the wraps of bark-cloth that the fattened ones present to him; while the bystanders rush forward with a lot of clatter and yelling and rip off the parti-coloured girdles, leaving the fattened ones with only their breech-clouts on. (Corney 1915:329-330)

Some additional details regarding this episode are contained in the journal of Rodriguez, who also witnessed it:

They lie there enveloped in wraps of native cloth, their waists unconfined by any girdle, until called up by their *arii*, when they put it on and say this word *Ehuapipi*, which is the day for this function ... (Corney 1919:135).

There was a great gathering of people in connection with the function of presenting the fattened up youths before him [the *ari'i* Vehiatua], which they call *Ehuapipi*, as was said before (pp. 155-156).

Huapipi, according to the LMS Dictionary, is the term applied to "the youth called *pori* [fat], who were fed for some time to make them fair and delicate," and not to the presentation occasion itself. The same dictionary offers as one meaning of *pipi*, "a disciple, a learner, or pupil," which is suggestive, but this possible and very interesting indication of the role of the youths during their fattening is not augmented by any other information that I know of.²⁵

While references to the forced fattening of females occur in several of the older sources, the most detailed account of the practice was written by Moerenhout, in 1832:

Today going by the house which [Queen Pomare IV] occupies with her women and servants, I saw several large poles erected and festooned with plantains. On inquiry about their use, I was told that they were intended for fattening up the queen and her companions.

According to an old custom in these isles, plumpness was considered a mark of aristocratic beauty. To accomplish this women were fed *popoi*: fruits, bananas, and mashed breadfruit mixed with water and made into a semiliquid. During this time, all exercise was interdicted; they were allowed only to walk to bathe themselves in the river. Before appearing again in public it was customary for them to undress and be inspected by men; after which they became the object of admiration by young men, and were sought after more than ever. I cannot say whether nowadays their movements are subject to such strict control as formerly ...; but as regards the other aspects of the custom, I believe everything is carried on just about as in olden times. (1837:I, 286-287)

The Maohi custom of *ha'apori* provides a fertile field for speculation, and one that has been well sown. Perhaps the most ingenious explanation for the custom is that of Mühlmann, who suggested that with respect to young males it represents a ritual simulation of "femaleness." Another possible, but less imaginative, explanation of the forced fattening of young individuals, both males and females, is that it embodied the Maohis' Lamarckian theories of reproduction and served to implement their eu-

genic ideals. Still another possibility (but in my opinion, not a probability) is that it constituted a manifestation of material affluence, a characteristically Maohi expression of conspicuous consumption. But whatever other purpose—sectarian, eugenic, social—the custom may have served, it was also quite directly and overtly cosmetic; plumpness of body (and lightness of complexion) was aesthetically valued and, in the young, at least, sexually relished.

Coming-of-Age

In addition to the foregoing “maturation” rites (which probably all or most young Maohis underwent), Henry described another one evidently performed only for the successors to high-ranking kin-Titles or to other heritable statuses of social importance:

When the young heir apparent became of age a feast, called the *fa'atoira'a* (becoming-of-age), was given at which he or she for the first time appeared officially among the dignitaries of the land. On this occasion was offered a human sacrifice called an *amo'a-tapu* (putting aside of restriction). For the firstborn of under chiefs there was also a *fa'atoira'a*, and their *amo'a-tapu* consisted of a fine hog offered at the local marae of their district.

As the Tahitians had no method for recording the years, coming of age depended upon the maturing of the child. (1928:188)

Here again in this passage is reference to the custom of *āmo'a*, which was mentioned earlier but which I will now discuss more fully.

Āmo'a

In my account of the rituals accompanying birth and early childhood, I included some descriptions of *āmo'a*, which I identified as “a connected series of rites performed at certain times in an individual’s life to remove, by degrees, the special kind of ritual constraints imposed upon him and some of his close associates at the time of his birth.” I will review and supplement those descriptions, and attempt to explain them.

The most explicit reference to *āmo'a* is contained in Morrison’s journal, where, it will be recalled, several such rites were listed: six for males and seven for females, the first five of these being about the same both for males and females.

The first *āmo'a* was performed upon disposal (by burial or deposit in a “sacred house”) of the umbilical cord that was left attached to the child after its original severance. In the case of boys this remnant was disposed of as soon as it dropped off, i.e., about six to eight days after birth; but in the case of girls it was disposed of seven to fourteen days after it dropped off. After performance of this *āmo'a* the child and its mother moved from the temporary shelter erected for them near the marae (Henry’s *fare hua*)

into the more permanent house built for them—"nearer the Father's House" (Henry's *fare aua teni*).

Prior to performance of this first (according to Morrison's listing) *āmo'a*, the child's mother "toutes no kind of Provisions herself, but is fed by another person and whoseever else touches the Child must undergo the Same restriction ..." (Morrison 1935:186). From this account one might conclude that after this *āmo'a* had been performed the child's mother, at least, was not required to be fed by others, but Bligh reported that in the case of one woman, herself the transmitter of a very high-ranking kin-Title, this self-feeding restriction was lifted by an *āmo'a* performed some ten months after the birth of her child.

Henry's description supplements this one of Morrison's with the information that the attendants serving the mother and child on such occasions had to bathe and change into other clothes before they themselves could eat or drink, in order to avoid contracting the scrofulous disease, called *o'ovi ari'i*. Also, the child's father was not admitted into the *fare hua* "until the last day of its stay there" (1928:184)—until he formally "received" the child in the course of the ceremony terminating this stay in the *fare hua*.

Moerenhout's account has the child's mother *and father* attending it during this period, but he may have been referring to families of less social eminence, with whom the ritual constraints were customarily less severe. Also, it should be recognized that Moerenhout's account of the rituals under discussion is less detailed, and probably more indirectly transmitted, than the others drawn upon here.

By Morrison's account the second, third, fourth, and fifth *āmo'a* rites, for both males and females, were performed during the infant's occupancy of the house built for it near its father's household (the one we believe to be Henry's *fare aua teni*); an occupancy that Henry said lasted about fourteen months.

Throughout this period, it appears that certain of the child's kinfolk (mother, father, "uncles," and "aunts") were allowed access to the house but were constrained from entering it (and from touching the child) while wearing clothes in which they were accustomed to eat. Thus, to remove this constraint two other *āmo'a* were performed: the first to free the child's father and "uncles," the second to free its mother and "aunts." Meanwhile, "... the mother was free to stroll out of the *aua teni*, leaving the child in charge of some near and trusted relative" (Henry 1928:185).

The child was not permitted access to other sleeping (and eating) house-units of the familial household until two other *āmo'a* had been performed: one to permit it to enter the house reserved mainly for the males, and the second to permit it access to the house reserved mainly for females.

Henry reported that a ceremony called *vahi apa* ('breaking the barrier') was performed at the time a "royal" child was moved—permanently, we assume—from the *fare aua teni* into the regular family household (1928:187). I am not sure whether this ceremony may be considered identical with, or in addition to, the "house-entering" *āmo'a* rites just listed. In any case, the latter two rites do seem to be the ones referred to by the missionary Hassall, quoted earlier, who was told that a newborn infant was "unclain" and hence unable to be taken into its parents' house "till it had been given to the god twice."

Before discussing the next *āmo'a* rites listed by Morrison I wish to examine another aspect of *āmo'a* customs, namely, the self-feeding prohibition that was imposed upon the fathers of certain children during the latters' early lives. Among the several sources that refer to this prohibition Bligh's is most explicit, but even his account concerns only "cheifs," so that we do not know whether they alone, or all fathers, were thus constrained.²⁶ Neither do we know for certain whether the prohibition was imposed with respect to all of a man's recognized offspring, or only to the first (or first male). In any case, however universal in applicability the prohibition may have been, its application evidently varied widely, both in terms of the relative rank of the principals' kin-Titles and of the fathers' ambitions to enhance their successors' social positions. According to Bligh, *ari'i rahi* ('great chiefs') observed the prohibition "untill the Child is grown up and considered a Man," whereas mere "Cheifs of Districts" ended the prohibition by performing an *āmo'a* about ten months after the child was born. I cannot discover what constituted the prohibition-lifting rite in the case of the *ari'i rahi*, but I assume that one of the *āmo'a* listed by Morrison (possibly the second) served the purpose in the case of other fathers.

Continuing now with Morrison's description of the *āmo'a* series of rites, it will be recalled that the sixth (and last) one said to have been performed for a male was "when He adopts a Friend, which is the whole required to make his head Free, evry thing he touches [prior thereto] being in his Minority or Sacred State is made Sacred by his touch and rendered useless to any other" (1935:186).

The terminal *āmo'a* rites for a young girl were performed on the occasion of her marriage. This *āmo'a* served specifically to enable her male kinsmen to eat food touched by her husband and "that they may eat out of the same Dish...." While recognizing its ambiguity, I take "they" to mean the young woman and her husband.

In addition to these *āmo'a* rites specified by Morrison there appear to have been others performed on behalf of individuals holding certain very high-ranking kin-Titles—including the one carried out during the coming-of-age ceremony described earlier and one (if it was in fact separate)

performed to relieve certain incumbents of the necessity of having to be carried over land not exclusively their own. But enough has been presented to permit us to proceed with a general discussion of these puzzling rites.

Three crucial questions arise from what appears to be this interconnected series of rites:

1. What attribute was attached to the child at birth that served to place the child in a special condition and that could be neutralized, by degrees, by certain rites?

2. What effects did this special condition of the child have on his own and others' behavior?

3. What was the nature of the rites that served to neutralize or remove the attributes in question?

Let us take up the second question first, inasmuch as the sources provide more specific answers to it. Morrison, in the last paragraph of his description of natal and other rites (reproduced on p. 422, above), provided a clue that is both succinct and comprehensive.

Ignoring for the moment the last portion of this informative statement, we are left with the information that while in this condition the child's body in general, and its head in particular, contained *something* that was somewhat dangerous to other people with whom it happened to have direct or indirect contact. Moreover, while the *something* produced its harmful effects over any and all parts of the contacted person's body, the victim's digestive organs were particularly vulnerable, as witnessed by the emphasis on food and feeding in the prohibitions associated with this condition. Perhaps the relevant factor here was not the stomach and intestines in their function in digestion but rather their proximity or identity with the seat of the soul.

How indirect the contact could be and still be effectively dangerous seems to be exemplified in one of the final rites for a girl which, it will be recalled, made it safely possible for her male relatives to eat food touched by her new husband, who, because of his intimate sexual contact with her might otherwise have conducted some of her dangerous *something* to them. This is the most plausible explanation I can offer for this curious custom. Her female relatives would not have been concerned, since ordinarily they would not have partaken of the same lot of food as did her husband.

By the same line of reasoning, I suggest that the performance of an *āmo'a* rite upon the occasion of a boy entering into a formal "friendship pact" was necessitated by the circumstance that the two would thereafter share food and other possessions in ways that involved direct and frequent physical contact.

Two other problems raised by the foregoing are less amenable to explanation. One has to do with the consequences of bringing into contact

two individuals in the same danger-laden condition—say, two lads of comparable social position and ritual experience: Would contact of such a pair have produced any mutual effects? The only evidence I can discern on this point has to do with the separate common households that were set up for the exclusive rearing of certain sets of siblings who were the progeny of socially prominent couples. While still in the ritual condition under review, such sets of siblings evidently played together and may have eaten together as well.

The second problem has to do with the possible two-way effects of contact between two persons, only one of whose “head was free.” Having established that the one whose “head was free” suffered some ill effects from such an encounter, is there any evidence that the reverse also took place? Something of the sort probably was thought to occur in somewhat analogous ritual situations (see chap. 3, section on sacredness), but I can find no evidence of such in the kind of encounter now being described.

I turn now to the first of the three crucial questions posed earlier: What was the nature of the attribute that served to place the child (or *some* children, at least) in the ritual condition we have been describing?

It seems clear to me that we have here an entity that was, in Western terms, more “mystical” than “physical.” (As I understand Maohi “thought” categories to have been, these too included such a distinction, although the boundary was not so sharply drawn.) Moreover, in reviewing the whole range of Maohi “mystical” beliefs and practices, I suggest that there were two kinds of attributes that might have been involved in the condition now being discussed; a *something* that was polluting, derived mainly from the mother, and a *something* that was sanctifying (but equally dangerous to others), derived from either or both parents, or from some other source.

The possibility that beliefs about mother-derived pollution may have figured in some *āmo’a* rites is suggested by other Maohi beliefs and practices (and by analogies from other Oceanic societies which I shall not document here). I refer to all females’ generic ritual condition of “secularity” (*noa*) discussed in chapter 3 and to certain specific ritual acts discussed above, such as the mother’s bathing after parturition and the neonate’s “purification” with the heart of the “sacred” banana tree, both of which seem to have been aimed at removing menstrual and allied matter.²⁷ The ceremonial bathing of the skin (*uhi-a-iri*) also could be viewed as a “purificatory” rite, although the ritual formula describes it as “rendering sensitive (*manihinihi*) the skin of the child” (Henry 1928:184).²⁸

The other kind of entity or attribute that might have been involved was that of *ra’a* or *mo’a*, which I gloss as ‘sacredness’ (in opposition to ‘secularity’, or *noa*). In this sense, the *āmo’a* rites could be viewed as measures for reducing by degrees the amount (or intensity, it is not clear

how the Maohis conceived of this process) of sacredness present in the neonate at birth, so as to render the young person free to engage in the ordinary, everyday—secular—activities of life, without thereby endangering other persons. How such sacredness became attached to the child is suggested in the following passage from Morrison:

The reason for all these Ceremonies are that as soon as a Child is born it being the Fruit of the Father and Mother is superior to either, as Much as the Fruit is to the Tree for food, for which reason the Child is as soon as born the Head of the Family and the Honor and Dignity of the Father is transferd to the first born Child whether Male or Female, and before all these rites are performd the Parents are not thought worthy to partake of its Food, but as they have always a sufficient provision for themselves and have the ruling for their Children those of High Rank defer the performance under Collour of its being Grand to have their Children longer in a Sacred State, tho in fact it is that they may Continue longer in Power, but those of low degree have no intrest in it and therefore get it done sooner, and as soon as the Childs head is free it then becomes perfectly its own Master and May act for it self—Where this uncommon Custom, so contrary to Nature, took its rise we could never learn, it having been with them from time immemorial.... (1935:187)²⁹

Thus, the something in the child that rendered it “sacred” and socially “superior” to both its parents was in fact derived from them and in a combinational way.

Moreover, there are clues as to what that something was—at least, in the offspring of parents holding high-ranking kin-Titles. I refer in part to phrases used in certain of the birth rituals in which the child is addressed or referred to as “child god” (*tama aitu*) or as “child of the god” (*te tama o te aitu*). This usage of course could be merely eulogistically metaphoric, but there is a good possibility that it is more than that. There is evidence of a belief that certain children—namely, the firstborn offspring of parents holding very high-ranking kin-Titles—were in fact sired by some god. Bligh reported:

I have had many conversations with Tynah and many of the principal people but it requires a length of time before one can take up a thing with clearness and precision. A Strange circumstance however has long been my enquiry, and I have now no reason to doubt of the Peoples beleif of the Assertion, and that is, that the Queen, whoever she is, has her first Born Son, or the one that becomes the Heir to the Crown, through the inspiration of the Eatua. Nay more than that, they assert that while the Woman is asleep and the Husband by her, the Eatua hovers over her, and literally explaining their expression, says he has connection with her & she conceives, but that all the other children are begot by the Husband. Yet they imply nothing more than that it was their God that gave them a King, without whose assistance they would have been without one. (1789:II, 24)

If *amo'a* rites were performed only for such god-sired offspring as these, one would need to search no further for the rationale behind them; but the

fact is that they were carried out for many other offspring who were viewed as having been sired specifically by the mother's human mate. From these considerations (and from certain cosmogonic and sociogenetic beliefs) I am led to the conclusion that the something, which was transmitted to offspring by their parents, that necessitated the performance of *āmo'a* rites was not just a quality of sacredness (*ra'a*) derived from association with a spirit (in this case, a god), but a portion of some god himself. Thus, the *āmo'a* rites, strictly speaking, may be viewed as either neutralizing or reducing the divinity in the child.

I wrote *āmo'a* rites "strictly speaking" because I believe that some of the rites I have been discussing—in particular, some parts of the earlier ones—had to do also with purification (specifically, with the ridding of entities associated with menses); but the other components of the ritual condition of the child (and the constraints upon others resulting from it) I believe to have derived, ideologically, from the divinity incorporated in the child at conception.

As we have seen, the offspring of parents holding high-ranking kin-Titles remained in the condition under discussion longer than did children of parents holding Titles of lower rank, partly through the common logic of kin-Title ranking (see chap. 16), and (according to Morrison) partly by "voluntary" design, but by design that sometimes sought its charter in "self-appraised" rank. I cannot discover how far down the social scale *āmo'a* rites were deemed necessary, but according to Bligh, the associated prohibition on a father's self-feeding obtained only at the top level. It should be recalled that however male-biased Maohi social relations may have been in some respects, in the case of *āmo'a* some girls remained thus distinguished from the rest of the population as long as or longer than boys of otherwise comparable social position.

I will now consider the mechanics of the *āmo'a* rites, to try to learn how their various objects and actions were supposed to neutralize (or to reduce) the divinity present in the child whose "head was not yet free." But my efforts are frustrated at the outset by uncertainty concerning what those rites actually were.

Morrison, who designated the head-freeing rites as *āmo'a*, for males, and "Fwhatoe" (*fa'atoi*), for females, actually described only two of them: one performed at a marriage ceremony, and one performed "When a Man adopts a Friend for his Son":

The Amoa we saw thus performed at a Marriage Ceremony, and differs very little from that performed through the different degrees of Childhood—The Friends of Both parties being assembled at the Morai the Young Man and his Wife were placed on a large quantity of Cloth spread for the Purpose Near the

Morai alongside of each other, the Man on the right of His Wife—opposite them at the Distance of 30 or 40 Yards and at the other end of the Cloth sat the Father, Mother, Uncles & Aunts of the Bride, a Priest then having Furnishd the Mother with several pieces of Sugar Cane and some leaves from the Rowavva (or Sacred Tree)^[30] she takes a sharks tooth and Cutting Her head on the Fore part, lets a Drop of Blood fall on each piece of the Sugar Cane and placing a peice on a leaf give(s) two to the Father and each of the Uncles & Aunts and keeps two for herself, these they place on the Palms of their hands and holding them up to their Foreheads rise up and proceed slowly along the Cloth till they arrive where the Young Couple sit, keeping their bodys half bent all the way; and having deposited the leaves and Sugar Cane at the feet of the Young Pair they retire without speaking in the same Manner to their Seats. The Priest then advances with a Branch of the Rowavva in his hand and Makes a long Prayer; which having finishd, He goes to the Young Couple and biding “God bless them in their Union” (or as they express it in their Sleeping together) he takes up the leaves and pieces of Sugar Cane and proceeds to the Morai, where he burys them with prayers and makes an Offering to the Deity of a Hog &c. and in the Meantime the Couple rise and go to their Parents and they Embrace them and bestow their blessings on them. The Cloth is then gathered up, and Presented to the Son in law, who generally throws part of it out for the Young People present to scramble for, and they are proud that can get a Narrow Strip of it to put on in Honor to the rite and wear it till it is expended telling all they know how they obtaind it—the Company then return to the Bridgrooms house and he sends three or Four Hogs to his Father in law, who has them immediately killd, and a Feast Made of which all the Males of both Familys partake& a Feast is also prepared for the Weomen and all partake of the Festivity.

The Father of the Bride then delivers her portion to Her Husband as before describ'd and an exchange of Names takes place.

When a Man adopts a Friend for his Son the Ceremonie is the same, only placing the Boy in the place of the Woman, the Ceremonie is ratified, and the boy & his friends exchange Names and are ever after lookd as one of the Family, the New Friend becoming the adopted son of the Boys Father—(1935:188-189)

The first question we might ask is: What features of the rites performed at a marriage ceremony pertained to head freeing, and what features were related specifically to marriage? A similar question arises with respect to the adoption ceremony, which Morrison characterized as being “the same” (as the marriage ceremony). Moreover, the obscurity is further deepened by Morrison’s statement that the *āmo’a* rites performed on these two occasions “differ(s) very little from that performd through the different degrees of Childhood.” However, he did not describe the latter, except to list the objects that served as offering on such occasions: “... for the Males Hogs or Fowles and Cloth are always (presented) but for the Females if they can not raise them, a Fish will do—but however this is seldom the Case, and they are No way sparing in the performance of these rights and much Feasting then takes place” (1935:187).

Perhaps the best clue to an answer to the question posed above is provided by Bligh, who, it will be recalled, described the “Aammo-Aammo” ceremony performed by the chiefess ‘Itia, in order that she be “at liberty to

feed herself" (that is, the *āmo'a* rite listed by Morrison as "first"). This involved "presenting some Cocoa Nutt, Sugar Cane and a Small bough of a Shrub called Errow-woah [*rauava*] in each hand held to her forehead to the Child" (Bligh 1789:II, 43).

A similar complex of ritual objects and actions is evident in Henry's description of an episode of the *uhi-a-iri* ceremony, quoted on page 416, above. And finally, we have Moerenhout's description (see p. 421, above) of a ceremony approximating Morrison's "first *āmo'a*," Bligh's "Aammo-Aammo," and the episode just described from Henry's *uhi-a-iri*.

Thus, the elements common to all these ritual episodes (or, at least, to the available descriptions of them—which may or may not be equally exhaustive) are the presentation by a "parent" to the subject child or young person of a token amount of the former's self-induced blood deposited on a leaf of miro. In the earlier rites, the "parent" in question was the child's own mother, or mother and father, whereas in the later ones (according to Morrison) "uncles" and "aunts" were also involved. An understanding of the implications of this aspect of the rites depends upon the exploration of this wider categorization of "parenthood" (see chap. 17); but we can now at least recall that miro (Tahitian rosewood: *Thespesia populnea*) was of all the plants the one most highly favored as a vehicle for communications between humans and spirits³¹ and that self-bleeding (whatever else it may have signified) served on many different kinds of occasions to express intensity of feeling, either "joy" or "grief" (see chap. 3).

I suggested earlier the possible connection between 'sugarcane' (*tō*) and conception (*tō*); and I now call attention to the regularity with which these rites focus on the principals' heads. But I am not prepared to go beyond pointing out these other glosses of the various objects and actions combined in this intriguing ritual. A number of obvious alternative interpretations suggest themselves to me—as they undoubtedly have to some readers of this study; but in view of my own misgivings about the value of such speculation, I shall leave this game for others to play.

CONNUBIALITY

"Marriage"

The Europeans who visited Tahiti came onto the scene with predetermined and highly specific ideas about "kingship," "individual rights," "sexual decency," and also about "marriage." Their notions about "marriage" undoubtedly varied in some respects: those of, say, the urbane Sir Joseph Banks did not entirely agree with those of the Reverend John Mugridge Orsmond; but common to all of them was a core of ideas—norms, memories, expectations—which shaped their observations and their generalizations about Maohi behavior. The fact that Maohis did enter into

relationships resembling some features of European "marriage" served to complicate matters (at least for those like myself who attempt to reconstruct the actual lineaments of Maohi society), inasmuch as the European observers, in blandly assuming the local existence of "marriage," either did not perceive or did not trouble to record enough case histories to provide us with an adequate understanding of these relationships. What we are informed of is this: At some point or points in their lives nearly every Maohi (except for transvestites [*mahu*] and for some lifelong Ariois [see chap. 22]) entered into a relationship with one of the opposite sex. According to the *Duff* chronicler, the alleged paucity of women (the result, it was claimed, of a higher rate of female infanticide) deprived some men of an opportunity to marry: "... for the men that are not wealthy in cloth, hogs, or English articles, wherewith to purchase a wife, must go without one ..." (Wilson 1799:192). As we have seen, most of the sources agree that the population contained more males than females, but I am not convinced of the reliability of the extreme disproportions put forth in some of these accounts. And, quite apart from my objections to the flat statement about wife "purchase," I cannot believe that a large proportion of Maohis went through life without entering, even for a relatively short period, a relationship which involved the following: coitus, with open (in contrast to clandestine) coresidence, for a period of at least several weeks or months; tacit agreement to regard as "legitimate" (i.e., for purposes of inheritance) any surviving offspring of their intercourse; tacit agreement to exchange certain other services and objects; and some degree of public recognition of and sanction for the relationship, usually but not necessarily validated in a "wedding" ceremony.

For purposes of convenience I propose tentatively to call this kind of relationship *marriage*, but I caution the reader from reading into this label more than I here specify.³² In this section I will describe the practices which led up to and validated this relationship; other aspects of it will be described in following chapters.

It is, of course, impossible to discover the full range or the mode of the reasons which led individual Maohis to marry. To say that they did so because it was customary is not entirely adequate; no less a personage than the legendary Hiro rejected this reason.

When he [Hiro] became a man, he inquired of his grandfather what were the requirements of man. His grandfather replied:

"Provide yourself with a home, and marry a wife."

"If I do so," said Hiro, "what must I do with the wife?"

"Cherish and feed and clothe her," was the reply.

"That would be unprofitable," said Hiro, and so he went on disapproving of everything that Ana told him a man should do. Then he inquired what tricks man was capable of doing, and when Ana enumerated: lying, deceiving, and thieving, Hiro exclaimed:

“Yes, stealing is good; that is a profitable thing; it will be satisfying to a man.”
So Hiro decided to become a thief.... (Henry 1928:537)

Some Maohis may have sought out and formally married a person in order to enjoy more or less unrestricted sexual intercourse with that person, but the review of sexual behavior given earlier makes it clear that marriage was certainly not the sole avenue to sexual enjoyment.

“Economic” reasons were undoubtedly influential in some cases, but not in all or even most. In the light of the traditional division of labor, anyone’s comfortable subsistence normally required contributions from the opposite sex, and there may have been cases of individuals reduced to dependence upon the contributions of a spouse. On the other hand, most households included enough males *and* females to provide a balanced standard of living without the need for every adult to marry.

Immediate “political” reasons also operated in some instances, but usually where the gains mutually realized by a marriage pact were substantial—that is, only when they involved high-ranking kin-Titles or politically powerful authority.³³

The desire for “legitimate” offspring undoubtedly was also influential. This reason operated potently in cases where succession to high-ranking kin-Titles was at stake, and it probably prevailed in other instances as well, where one or both parents were interested in passing on their heritage to their own offspring.

Nuptials

In any event, it is my conclusion that most Maohis did “marry,” at least once and in many cases several times; so I will now examine the procedures followed in marrying. Perhaps the most illustrative beginning will be to reproduce some detailed descriptions of the marriage ceremonies for couples of upper-class status:

As the time for a marriage (*fa’aipoipora’a*) of importance approached, great preparations were made for the event by the families of the father and of the mother of both parties. Food in abundance was cultivated, fatted pigs and fowls were collected for the feast, and cloth and wearing apparel and feather ornaments were manufactured and kept in readiness for the occasion.

On the eve of the wedding ceremonies, all the relatives and friends of each party assembled at the respective homes of the young people, and members of the *arioi* society also came to them with music, singing, and dancing. On the morrow representatives of the household of the bridegroom, who was then called the *papa-i-ni’a* (upper rock), came to escort the bride, called the *papa-i raro* (lower rock), to his home for the first wedding ceremonies, called *oro’ā-ai-huno’a* (ceremony of feasting the son-in-law). With them they brought appropriate presents called the *o*.

Then the bride’s party, including all those just mentioned, set out in a grand parade by land if not far to walk, and in new canoes made for the occasion if they had a long way to go, no old canoes being used for weddings.

Following them in canoes were their presents, or *o* (welcome insurer), which consisted of everything that had been prepared for the wedding, in two equal divisions, one from the side of the father and the other from the side of the mother. On arriving at the bridegroom's home, they were welcomed by a great party assembled in the same order as their own and the food and livestock they brought were presented and received in due form by the family. In the house a large mat was laid out, and upon it the father and mother of the bridegroom each spread a new sheet of white tapa, one overlapping the other, as an emblem of their two families, and there the young pair were seated. To the right and left of them were placed the rolls of cloth, mats, capes, and feather wreaths, those on one side being presented by the father and the others by the mother of the bride to the bridegroom in the name of their daughter. At the end of the performance the mothers and aunts of the young couple, called the *hui-metua-vahine*, class of mothers, punctured their heads and faces causing the blood to flow, as a manifestation of love and union of blood.

Then was given a great feast in honor of the bride, at which the bridegroom and other men sat apart from the women, as at all ordinary feasts, and the *arioi* danced and made merry. When night came, the bride, still in charge of her parents, remained with the other guests at the house of the bridegroom to await further ceremonies on the morrow. In the morning, the bride and bridegroom, dressed in beautiful fresh white tapa, which was prettily relieved with patterns of delicate fern fronds, and accompanied by all the relatives, went to perform the religious rites at the ancestral marae of the *papa-i-ni'a*, where were exposed for the occasion the skulls of ancestors with other fetiches.

A priest attired in the habiliments of his office met them upon the pavement at the closure of the marae, where sometimes an awning covered with green coconut leaves or green fei (wild plantain) leaves was erected for the wedding. The bridegroom took his station at one corner and the bride at the other, and before each of them assembled their respective relatives. The priest, approaching the young couple, then said, first to the bridegroom, "*E'ita anei 'oe a fa'arue i te 'oe vahine?*" (Wilt thou not forsake thy wife?), to which the bridegroom replied, "*E'ita!*" (No!). The same question was put to the wife respecting her husband, and she also responded in the negative. Then the priest answered, "*E maitai ia mai te nua ra e e na reira 'orua*" (It will be well if thus it be with you), and he admonished them after the manner of the sages of old and concluded with prayer to the gods to bless their union and keep them in the bonds of affection one to the other.

The father and mother of the bridegroom then came forward, each with a white sheet, called a *vauvau* (underspread), and placed them upon the closure of the marae in the same way and for the same reasons as on the previous day. There the young couple were seated, one holding the other's hand, and by them, keeping on their own sides, sat the relatives, both sexes puncturing themselves and causing the blood to drop on to the sheet, thus further blending family ties. The groom's parents then placed the juice of a young coconut leaf and of sugar-cane mixed in a coconut shell, upon a miro leaf, and held it first on their son's head then on the head of their daughter-in-law, after which they placed it beside the one as a pledge of unity, which they sealed with blood by puncturing themselves in the presence of all the company, each one causing some drops to fall upon a miro leaf which was placed upon the back stones of the marae. Then the bridegroom's parents joined their family and all the company on both sides arose. Another sheet, called the *tapoi*, was spread over the young couple who were still sitting, and under it they remained a few seconds and received the first wedding greetings. When it was taken off they also arose. Then the sheets of the *vauvau* were torn in halves, and the two

sides that were stained with the blood of the relatives were folded together, enveloping the mixture on the leaf, and buried near the marae; the other two pieces of cloth were also folded together and were given with the oversheet and the wedding clothes and change for others to the *arioi* for their religious pantomimes. Thus ended the first part of the marriage.

The double party then proceeded to the house of the bride, the parents of the bridegroom taking presents as their *o* equal to those that had been brought by the bride's parents, and also another great supply of things in readiness for the wedding feast. On arriving at their destination, the same reception and presentations as before were repeated on behalf of the *papa-i-ni'a*; and on the following day the bride and bridegroom, attired in new wedding clothes, went through the same religious ceremonies at the marae of the *papa-i-raro* and with the same termination as on the previous occasion. Handsome presents were always given to the priests who performed the marriage rites. Sojourners used the seashore in place of a marae.

Any differences of rank that may have existed between the two families were forever annulled by these ceremonies.

At the wedding feast, which lasted several days at the house of the bride, both families vied with each other in making a grand display of goods and food. Eloquent speeches were exchanged. To the young couple they gave a name which it had been previously agreed that they should bear, a custom still existing among the native people of the present time. If one side gave less than the other, it was at once noticed and recorded in song by the merrymaking *arioi*.

As royal marriages were national celebrations they were performed at the national maraes of the contracting parties; they were free from human sacrifices. (Henry 1928:282-284)

Several features of this version of Maohi nuptial ceremonies invite comment. First, there is what might be called the principle of kin bilaterality, which influenced the organization of the events. With reference to the bride and the groom, separately, this was expressed in the separate but more or less equal roles played by each one's relatives acting as a unit. (It might perhaps be argued that the groom's party enjoyed an added prerogative inasmuch as the ceremonies—according to this version, at least—began on their home ground; but against this it could equally well be argued that the ceremonies culminated on the bridal party's ground.) Bilaterality also shows up in the deliberate reciprocity involved in the *o* gift exchange between the two parties; although it should be noted that the parties tried to outgive one another in connection with the final feast.

Second, although it would be inappropriate to distinguish "secular" from "religious" aspects of these ceremonies, or of any other Maohi ceremonies for that matter, the events can be characterized as having more or less distinctive "domestic" and "churchly" settings, emphasizing, respectively but not exclusively, relations with living and deceased kinfolk. And in this connection it is noteworthy that the ceremonies (aside from the suspiciously apocryphal priest-led "vows" of mutual affection) tended more to validate the union there and then rather than insure its permanence.

Finally, the symbolic acts combined in these ceremonies "said" not

only that the union would be effectively important and socially valid (for example, some of the episodes involving bleeding and the blending of blood), and that sexual intercourse would figure centrally in its constitution (for example, the episode of “covering” the couple), but also (for example, the blood on miro leaf episode) marked another stage in the individual’s head-freeing progression.³⁴

Ellis’ description of the more ceremonious weddings, those presumably of persons of upper-class status (1829:II, 568–570), is less detailed than, but generally, resembles, Henry’s—as indeed might be expected, since much of Ellis’ information came from the same source. However, they differ in important respects. In Ellis’ version the domestic rites took place only at the bride’s home; “... when the parties were connected with the reigning family,” the “churchly” episodes of the ceremony usually took place at the “national” marae of ‘Oro or Tane; and certain “ancestral relics” (skulls, bones, etc.) were brought out for the occasion, to witness and sanction the union.

Ellis’ description of the head-freeing episode also differs somewhat from Henry’s, but the significance, if any, of this difference is not clear:

The relatives of the bride then took a piece of sugar-cane, and, wrapping it in a branch of the sacred mero, placed it on the head of the bridegroom, while the new-married pair stood holding each other’s hands. Having placed the sacred branch on the bridegroom’s head, they laid it down between them. The husband’s relatives then performed the same ceremony towards the bride. (1829:II, 569)

One cannot be certain whether the differences between these versions—and among these and other versions that will be described—are to be ascribed to differences in reporting or differences in the events reported; and with reference to the latter, whether the differences in the actual events were based on factors of locality or social class or particular circumstance. But let us consider another version.

Concerning weddings in general, Morrison said that unless the woman is a virgin [by which he perhaps meant that she had not previously been married³⁵] their nuptials consist of only an exchange of names—the groom with his father-in-law, the bride with her mother-in-law—and of presents. If on the other hand the woman is a virgin her friends must perform an *āmo’ā*. (1935:185)

Bligh’s account of nuptial rites closely parallels that of Morrison:

I have endeavored by every means to get a knowledge whether Marriage has any common and general ceremony attending it, to give legallity to the Man and Woman living together, and I find from the best collected accounts among those People who are capable of giving me information, that any ceremony attending Marriage is not general. The Women are solicited for their consent, and untill they give it the Man dares not to take the Woman away. When the Parents approve of the Match, there is a ceremony of Prayer at a Morai, and The Parents

perform Oamo to the married Couple. (This Oammo or Oammoah [*āmoʻa*], as it is called, is a Ceremony performed by Parents to their Children when they are supposed to be able to look out, and take care of themselves.)

It is remarkable that the ceremony of Prayer is only performed to the first Woman, and might reason from thence that the others were Concubines and not Wives. (1792:152)

Ignoring the ambiguities in Morrison's version, and comparing it with those of Henry and Ellis, one is struck mainly by its omissions. For example, only the marae is specified as setting for the rituals, and while "... The Friends of Both parties" are said to assemble for the occasion, the featured ritual social interaction takes place between groom and relatives of the bride, and not bilaterally. But even more puzzling in Morrison's version is what it tells, or omits, about the transactions in tangibles accompanying the rites. We are informed, for example, that the couple's "Friends" present them with "... Hogs, Cloth and Sundry Necessary Articles," but we are not told which party supplied the items offered to the spirit by the officiating priest. Then there is the implication that the groom alone supplied the meat consumed at the wedding feast. But most puzzling of all is Morrison's assertion that the handing over of a dowry constituted an essential episode of the wedding ceremony, accompanying the exchange of names: "The Father of the Bride then delivers her portion to Her Husband ..." or, as he stated elsewhere, "The Husband then Claims his Wife's Possessions, which are delivered to him without reserve...." We shall return to this important question of dowry, but first let us turn to still another version of a Maohi wedding.

The most detailed account of the actual wedding of an upper-class couple was supplied by the missionary Jefferson:

March 6, 1799: A great concourse of natives about us who are passing their time in eating, drinking, wrestling, drumbeating, singing, hallooing, throwing their arms & legs about in a frantic manner and such like revellings, the most part acting as if they were demoniacs. This assembly is owing to a marriage ceremony that is about to be performed, between a chief of Oryateea named Matteah and a young woman the daughter of the deceased chief of this district named Maheianoo. She and Matteah are both branches of Pomerre's family, and chiefs by birth; so that if there should be any offspring it is probable it may live. Matteah has been living some months in connection with Maheianoo who it is said has conceived seed by him. When the Spanish prize arrived here the Oryateean chief went early on board and offered his wife for prostitution.

March 7. Early this morning began the marriage ceremony between Matteah and Maheianoo. As the habitation of the parties is but a few yards from our dwellings, some of the brethren went down to be spectators. The mother & uncles of Maheianoo were employed in giving cloth to various of their friends, who were met upon the occasion. Under one of the houses was a kind of altar erected, covered with a piece of white cloth. On it was placed some old cloth, which had lately en-

closed the tomb of the deceased father of the bride. After they had distributed their various gifts of cloth, the parties went to the family's merrai, where the ceremony commenced with spreading a large piece of white cloth across the pavement; this done the bride and bridegroom each changed their dress, after which the mother of Maheianoo with two or three female relations, having taken a sugar cane and broken it into small pieces, laid the same upon the leaves of a tree called Amai,^[36] the mother & female assistants then perforated their heads with shark's teeth, and caught the blood upon the leaves on which were placed the broken sugar cane, and afterwards male & female relatives presented the leaves, sugar cane and blood to Matteah and Maheianoo who were seated, the man on one side of the morai & the woman on the other, about 6 yards apart. The whole was then offered up to the supposed god of the family, and laid upon the family altar.

These strange proceedings were conducted with that levity and thoughtlessness, which characterize in a peculiar manner the Otaheiteans. The mother of the bride appeared a little more thoughtful, being a woman advanced in years, and increased the superstition & wickedness of the ceremony, by producing the skulls of her deceased husband and elder brother, which, according to the custom of the country, she had preserved and anointed with cocoa-nut oil. These skulls were held before the leaves, sugar cane and blood, at the time of presentation to the parties. These things being finished, the cloth spread upon the morai, are deemed sacred, and not to be worn in common. Notwithstanding all this abominable idolatry, the marriage tie is no more binding than if it had never been performed; so that if the man thinks proper, he may put away his new wife tomorrow, and be united to another in the like manner on the next day. (Journal, 6 and 7 March 1799, LMS Archives)

This account is interesting mainly because, like Morrison's, it suggests that the near-perfect duplication of rites described in the Henry version, first at the groom's and then at the bride's, was more of an ideal than an invariable happening. Morrison did not tell us why the wedding he witnessed had the bride's home for its domestic setting, but in the case of the wedding witnessed by Jefferson its setting at the bride's home can be explained by the circumstance that the groom had come from distant Ra'iatea.³⁷ Perhaps the duplication of events described by Henry occurred only when bride and groom resided within the same or in neighboring districts. In 1822 the politically important wedding between Aimata, only daughter of Tahiti's King Pomare II, and the high chief of Taha'a took place on middle ground, at Huahine (Ellis 1829:II, 559).

All or most of the nuptial ceremonies so far described involved principals of upper-class status. It is a reasonable inference that ceremonies as elaborate as these were reserved especially for such a couple's, or at least for the bride's, first marriage. The other extreme was represented by the kind of situation described by Anderson:

If a young man and woman, from mutual choice, cohabit, the man gives the father of the girl such things as are necessary in common life; as hogs, cloth, or canoes, in proportion to the time they are together; and if he thinks that he has not been sufficiently paid for his daughter, he makes no scruple of forcing her to leave her friend, and to cohabit with another person who may be more liberal. The man, on his part, is always at liberty to make a new choice; but, should his

consort become pregnant, he may kill the child; and, after that, either continue his connection with the mother, or leave her. But if he should adopt the child, and suffer it to live, the parties are then considered as in the married state, and they commonly live together ever after. However, it is thought no crime in the man to join a more youthful partner to his first wife, and to live with both. The custom of changing their connections is, however, much more general than this last; and it is a thing so common, that they speak of it with great indifference. (Cook 1784:157)³⁸

In between these extremes there must have been many gradations in ceremonial elaboration, but the sources offer little information concerning this subject, other than such generalities as those of Bligh, quoted earlier, or of Tyerman and Bennet: "The marriages of the common people, in former days, were simple compacts between the parties to live together as long as it suited their convenience or their caprice. But the *feia maua* [probably *mana*], the order of kings and head chiefs, celebrated their nuptials with extraordinary rites" (Montgomery 1832:II, 147).

Moerenhout's account of "weddings" provides more details, but he erred by implying that the pattern described by him typified all Maohi weddings:

Both sexes were married young, that is, generally between 12 and 16 years of age. It was a noticeable peculiarity, in this country where every action however slight in importance was ritualized, that only marriage was devoid of religious sanction. It was only a convention between the intended mother and father. When a young man appeared to ask for a young girl in marriage, he brought several gifts, hogs, cloth, etc. If he was pleasing and his courtship agreed on, a bed was then made up and he spent that very night with his would-be bride. Early the next day the hogs were killed and some friends and neighbors were invited to a small family celebration. The young couple usually stayed in the girl's parents' house for two or three days; then the husband led his wife from her father's (house) where another feast or meal took place; and that was all. (1837:II, 62-63)

Arranging Marriages

Having reproduced the principal available accounts of the practices which served to validate a couple's marriage, I turn now to a consideration of the kinds of events which led up to them. To begin with, it will be useful to distinguish between marriages by choice and marriages by arrangement.³⁹

Scattered bits of evidence suggest that many marriages were instituted solely by choice of the spouses themselves, and with little or no regard for the wishes (if any) of their parents. This is to be expected, from the widespread freedom which prevailed in choosing partners for sexual affairs and from the circumstance that "marriage" developed quite commonly out of such affairs. With respect to such unions, Ellis stated: "It is only among the middle and lower ranks of society, that the contract is made by the parties themselves" (1829:II, 567). It is also evident that many other marriages were instituted solely by arrangement between parents, with little or no regard for the wishes of the couple. The LMS Dictionary gives the

term *fa'atina*, to propose or appoint marriage connections, as parents often do. Ellis' statement continues: "Among the higher ranks, the individuals themselves were usually passive, and the arrangements were made by their respective friends." With respect, however, to their validation most marriages probably fell between these extremes, having involved varying degrees of both personal choice and parental arrangement, or at least parental consent.

Reports like Cook's, cited above, indicate that some men married off their daughters or sisters in exchange for objects—a kind of pimping for immediate material returns. On the other hand, two-sided parental⁴⁰ arrangement of marriages most typically occurred when socially important kin-titles were at stake and when the advantages thereby realized were in the form of more intangible goods such as ceremonial prerogatives and political support. In this connection it would probably be safe to conclude that the higher the class-status the more decisive the parental voice tended to be.

The distinction between personal choice and parental arrangement becomes especially evident when inquiring about the Maohis' criteria for selecting a spouse. To begin with, however, there was one criterion that influenced nearly everyone's decision concerning whom to marry, and that, briefly stated, was that one's spouse should not be a "close" consanguineal relative. An exception to this proscription prevailed in the case of certain upper-class individuals who, for reasons that will be discussed later, married consanguines as close as first cousins. But having said this there is not much more of a positive nature that one can say beyond recalling that ties of consanguinity were bilaterally reckoned, with about equal weight on the mother's and father's sides. The question is how far most Maohis considered it necessary to extend, bilaterally, the boundaries of prohibited marriage.

Unfortunately, none of the primary sources contains a comprehensive *native* statement regarding the prohibited degree of consanguinity, although several writers expressed what they interpreted the native view to be. Bligh, for example, wrote that "... it would be doing these People great injustice to say, that Sister and Brother had ever connection together in Marriage, and I declare it as an absolute fact that they would abhor an intercourse of this kind equal to a Briton" (1789:II, 63). And from Moerenhout came the statement that "... marriages between brother and sister or other close [*proches*] relatives were uncommon, having been considered repugnant by the Islanders, and undertaken only when political considerations absolutely demanded such" (1837:II, 67).⁴¹ De Bovis, writing around 1855, was somewhat more explicit; according to him the prohibited degree of consanguinity extended "even beyond" that established by the French Civil Code.⁴² And, he added, "One cannot imagine with what horror they regard marriage between close relatives" (de Bovis 1909:32). Unfortunately, de Bovis did not document his statement, nor is it clear what was intended by his phrase "even beyond."

Another approach to answering the question concerning kin proscriptions in marriage lies in case studies of kin marriages that actually occurred and of marriage attempts that were forestalled on grounds of incest prohibitions. But again, the sources are not very useful. With respect to the first, the only relevant genealogical records are those of certain upper-class kin-Titleholding "lines." After combing through all those known to me, I succeeded in turning up only half a dozen or so instances of marriage between consanguines reputed to have been linked by ties of tertiary or closer degree.⁴³

With respect to the second type of case—of forestalled attempts to marry kin—I have discovered only the following cases:

The Spaniard Rodriguez noted in his journal that after having lived with a mistress for some time, the Ari'i Vehiatua, holder of the highest ranking kin-Titles on Tahiti's peninsula, was induced to separate from her, because "... they were first cousins, and neither Vehiatua's mother nor her own relations approved of the alliance" (Corney 1919:111).

The missionary Crook reported in his journal for March 1826, that relatives tried to block the marriage between a chief's widowed sister and a young man who happened to be the bond-friendship "brother" (*taiō*) of the chief's foster son—that is, the woman was considered to be the young man's "aunt." (10 April 1826, LMS Archives)

About all one can conclude from these small scraps of evidence is that the Maohis disapproved of marriages between "close" consanguineous kin⁴⁴ but that the boundaries of prohibitive proximity remained fairly open and verbally undefined, at least in terms of explicit and universally accepted norms. Moreover, even after an assiduous search I have been unable to turn up any information explicitly formulating a "biological" or "mystical" rationale for this proscription; neither have I discovered any sanctions, other than here-and-now social ones, that served to maintain this proscription.

In contrast to the negative effect of consanguinity upon choice of mate, the influence of affinity was directly positive:

When they Marry they Never Join with their Blood relations but a Man May take two Sisters, and a Woman two Brothers at the same time if they are all agreeable, and it is looked upon (as) a piece of Great friendship for a Man to Co-habit with the Wife of His Adopted freind if She is agreeable: the Adopted friend being always accounted as a brother.

If a woman has (a) husband and he dies without Issue the Husbands Brother takes her; if He has no wife and should he have Issue by Her the Children are Calld by the Former Brothers Name, & take his estate; but should he have a Wife he keeps her at his house till she gets a husband and she is still acknowledged as one of the Family. (Morrison 1935:184-185)

Other evidence supports Morrison's assertion that a man sometimes took as an additional spouse, or at least lived openly with, a sister of his

own wife (e.g., Jefferson, Journal, 13 April 1800, LMS Archives). And, although not stated by Morrison, it is highly likely that widowers sometimes married a deceased wife's sister. We are not informed how the Maohis themselves justified such marriages, but one can see that they contained certain advantages to both parties in terms of co-wife harmony, established familiarity, mother-stepchild affection, and so forth.⁴⁵ There is also evidence to confirm Morrison's identification of the levirate; indeed it was probably the basis for a number of marriages.

A second major criterion for selecting a spouse was social class. There was a universally applicable norm—dogmatically insisted upon by members of the upper classes and apparently accepted by all others—that marriages should take place only between members of the same class.⁴⁶ This is a most complex matter, including such basic questions as where class boundaries were drawn, which will be discussed in later chapters. Having already indicated the effects of social class upon nuptial ceremonies and upon the extent to which marriages were arranged, I am concerned here only with those aspects of social class that bear directly on choice of spouse.

It should be recalled that the universal norm against interclass marriage did not presuppose an identical one against interclass sexual affairs. There were, it is true, rules and sanctions aimed at guarding upper-class unmarried girls from sexual contact with men of lower-class status (and with all other men, in the case of girls already betrothed); but older women of the upper class were restricted, practically, in their extramarital affairs only by rules against adultery, if that. And as for males, although fears of reprisals may have made them cautious about affairs with girls of a higher class than themselves, they were in no social ways constrained in their sexual relations with women of lower social class. Thus, it would appear that the principal consideration against interclass marriage (in contrast to interclass casual sexual liaisons) was to insure that no offspring would survive to degrade, by virtue of his own hybrid status, the lineal descendants of the higher-class spouse. There were undoubtedly other factors involved, such as politics, property, and family pride, but considerations regarding lineal continuity were probably the most weighty in maintaining this norm. In fact, it could be argued that the central purpose of nuptial ceremonies, and the symbolic message of much of their ritual, was neither to validate the couple's cohabitation nor the union of their families, but to legitimize the class status of their offspring, and thereby maintain or improve the hierarchic position of family kin-Titles.

But effective as this norm was, it did not always prevail. The sources contain many bits of evidence, direct and indirect, mythical, legendary, and historical, of marriage across class lines. Although impossible to document, I have the impression that men married *down* more often than did women.

In addition, there are reported instances of the killing, on class grounds,

of the offspring of a “married” couple upon the insistence of the relatives of *one* of its parents. This is, to be sure, not clear evidence of interclass “marriage” in the fullest sense, since by my definition the action by the higher-class relatives would imply that they had not validated the union to begin with. In fact, situations like these—and there were probably many of them—might justify setting up another relational category,⁴⁷ *semi-marriage*, about which more anon.

But there is another kind of evidence for interclass marriage which demonstrates not only that it occasionally occurred but that its occurrence was widely recognized and institutionally provided for. I allude to two kinds of generalization recorded in the sources. First, the statement by Henry that “Any differences of rank [i.e., social class] that may have existed between the two families [of bride and groom] were forever annulled by these [marriage] ceremonies” (1928:284). This refers, of course, to ceremonies in which both the bride’s and groom’s families took active parts; and in the absence of contrary evidence one can only assume that the “annulment of rank differences” applied only to the offspring of the unions, which were thereby placed in the social class of their higher-class parent. In this connection, Henry has the following to report about unions that were *not* validated by both sides—an instance of “semi-marriage”:

When a child of the royal family formed a misalliance which the parents did not wish to equalize, they refused to solemnize the marriage rites on their side, which lowered the erring one to the level of the inferior party, at whose home alone the marriage was performed. Such a person and the children of such a union, were called *tamari’i ta’ahi hia* (children trodden down or degraded). In such cases, when they could gain popularity among the people, they sometimes asserted themselves and regained prestige as rival members of the family that had disowned them. (Henry 1928:284)

The second way in which interclass marriage may possibly have been legitimized is recorded in legends. For example, in the legend of Punaauia an upper-class maiden, who plans to elope with her lower-class lover, confides in her elderly, lower-class nurse that she hoped eventually to “legitimize” the union in the eyes of his parents by “ennobling” the young man. To which the nurse replied:

Oh, my child! Why did you not confide in me sooner? I, a plebeian, can feel for Te-muri [the lover] as only a plebeian can, and I entreat you to release him of this intrigue. Your plan to ennoble him later might never be possible, and meanwhile he would be a fugitive, pursued and watched by some accomplice of your royal house, and eventually slain and sacrificed to the gods, and then you would be brought home to mourn your loss, a reproach to your own people. It is only for deeds of valor and heroism, when royal personages have been rescued from outrage or death in some extra-ordinary way that kings and queens consent to raise people of our standing to their rank. This is what Te-muri’s parents would

undoubtedly say also to you and him were they consulted in the matter, for no plebeians could ever wish to bring down wrath upon themselves and even their district by forming such a union. (Henry 1928:600)

Other legendary instances that suggest the possibility of “ennoblement” for marriage purposes will be given in other chapters.

When left to their own choice in selecting a spouse, the Maohis appear to have looked for the same attributes valued in selecting a mistress or lover, sometimes to the extent of overriding the proscriptive factors of kinship and social class. Indeed, for most young people not entirely constrained by parental authority the two roles—lover and spouse—were not sharply distinguished. For older persons considerations of subsistence skill and industriousness may also have been crucial, although the sources are singularly silent on this point. We are not specifically informed one way or another about the influence of place of residence as a conscious factor in selecting a mate, although on the basis of many reported cases there does not seem to have been any effective opposition to marrying an individual from another tribal district or even another island.

The factor of relative age is more complicated. On the one hand it cannot be separated from the factor of “good looks”—and in this respect older men showed a preference for younger girls, and older women (when they were in a position to exercise choice) were evidently attracted to younger men. On the other hand, although it may be assumed that young girls were attracted to young men, they were also reported at times to have favored much older men as well. Some cases involving young girls and older men were not entirely of the girls’ choosing, as exemplified in the following excerpt from Orsmond’s journal. (The date of this entry is 1827, but the attitudes expressed were probably not greatly different from those of an earlier time.)

At our meeting this afternoon (March 1827) I undertook to combat a vile practice that exists among the people almost without exception till the present time. Three days ago I married very much against my inclination and Judgment two persons the man was about 5'6". The little girl about up to his 3 rib. The parents were urgent & all the Governors Judges &c commanded that the couple should be married. It has ever been a custom in these Islands for the man who has a Daughter to look out for some young, able young man & who has property. To him the father usually and without ceremony would say There is a good little wife for you, my daughter. The brutal feelings of the human creature would of course be roused to momentary pleasure. He would be profuse in his presents to his newly acquired father in law. As soon however as all his pigs had been roasted, and all other property obtained by the father through the medium of the daughter, the father would tell the husband to go about his business but he must of course leave his daughter behind. For whom in the same way the father would soon find another husband, so that some have had 3 - 4 - 6 or 12 husbands in three or four years. This I believed to be the case in the present instance. The poor old man who is unable now to climb a coaconut tree, but who nevertheless has sucking babes about him!!! (1827, LMS Archives)

Another excerpt from Osmond's journal, for 1832, indicates that age discrepancy may also have been a matter of personal choice:

A native who belongs to this part of Tairarabu is just come from Raiatea He went down to amuse himself in the late war, is said to have shot six men & has come with a little girl almost as high as his navel for his wife. He is a man of about 48 his former wives are dead & he has a family of children. In all Tahitians as well as officers who come in ships there is a cry for little girls, those on the contrary generally to appear womanish crave full grown men. (1 September 1832)

The missionaries, who were most scandalized by such situations, have provided us with enough data on age-discrepant marriages to indicate that there were no effective norms respecting the proper relative ages of spouses—that is, none in addition to the aesthetic ones influencing otherwise unconstrained choice.

In Maohi society the routes leading to marriage were many and varied. I have already noted how typical it was for sexual affairs to develop into "marriage," gradually and perhaps imperceptibly. "Courtship," in such cases, was no different from that involved in initiating sexual affairs in general. In somewhat similar circumstances of mutual choice the developments occasionally took place more rapidly, as for example in the instance reported by Tyerman and Bennet: "A wedding was solemnized here this afternoon. The parties had met, been mutually pleased, and agreed to live with one another, after a few hours of well-spent acquaintance" (Montgomery 1832:II, 156). Although this particular event occurred in 1823 and involved a regular Christian wedding, the situation exemplified may have been typical of earlier eras as well. In fact, the "love-at-first-sight" theme is a frequent one in Maohi narratives.

The most detailed reports of courtship available to us concerned episodes occurring in the early 1820s, and although by this time the missionaries had partly succeeded in replacing indigenous forms of weddings with "proper" Christian ones, the events leading up to many such marriages probably remained unchanged; and hence it will not be inappropriate to reproduce two such episodes here. The first concerned a canoe load of men, en route from Tahiti to Porapora, who stopped off on Huahine for a while as the guests of a local man named Taraimano. Ellis continued with this story:

During this period, a young woman, one of the belles of the island, belonging to the household of their hostess, became exceedingly fond of the society of one of the young men, and it was soon intimated to him that she wished to become his companion for life. The intimation, however, was disregarded by the young man, who expressed his intention to prosecute his voyage. The young woman became unhappy, and made no secret of the cause of her distress. She was assiduous in redoubling her efforts to please the individual whose affection she was desirous to obtain. At this period I never saw him either in the house of his friend, or walking abroad, without the young woman by his side.

Finding the object of her attachment, who was probably about eighteen

years of age, unmoved by her attentions, she not only became exceedingly unhappy, but declared, that if she continued to receive the same indifference and neglect, she would either strangle or drown herself. Her friends endeavoured to dissuade her from her purpose; but, as she expressed her determination to be unaltered, they used their endeavours with the stranger who afterwards returned the attentions he had received, and the parties were married at Huahine.

And so ends the story, or so it might have ended in some societies, but with the Maohis there was little approaching finality about weddings:

His companions pursued their voyage to Borabora, and afterwards returned to Tahiti, while the new-married couple continued to reside with Taraimano. Their happiness was of short duration; not that death dissolved their union, but that attachment, which had been so ardent in the bosom of the young woman before marriage, was superseded by a dislike as powerful; and although I never heard the slightest charge of unkindness preferred against the husband, his wife not only treated him with insult, but finally left him. Instances of such unhappy marriages, though not unusual formerly, are now of rare occurrence. (1829:II, 567)

We are indebted to Ellis for another detailed eyewitness account of a courtship—this one involving individuals of relatively high class status:

The period of courtship was seldom protracted among any class of the people; yet all the incident and romantic adventure that was to be expected in a community in which a high degree of sentimentality prevailed, was occasionally exhibited, and the disappointed, perhaps, led to the commission of suicide, under the influence of revenge and despair. Unaccustomed to disguise either their motives or their wishes, they generally spoke and acted without hesitation; hence, whatever barriers might oppose the union of the parties, whether it was the reluctance of either of the individuals, or of their respective families, the means used for their removal were adopted with much less ceremony than is usually observed in more civilized society. Several instances of this kind occurred during our residence in Huahine: one regarded a chief of Eimeo, attached to Taaroarii the king's son. His figure was tall and gigantic, his countenance and manners not unpleasing, and his disposition mild and humane. He was upwards of twenty years of age. Some time after our arrival in Huahine, he became attached to the niece of the principal raatira in the island, and tendered proposals of marriage. Her family admitted his visits, and favoured his design, but the object of his choice declined every proposal he made. No means to gain her consent were left untried, but all proved unavailing. He discontinued his ordinary occupations, left the establishment of the young chief who had selected him for his friend, and repaired to the habitation of the individual whose favour he was so anxious to obtain. Here he appeared the subject of deepest melancholy, and, leaving the other members of the family to follow their regular pursuits, from morning to night, day after day he attended his mistress, performing, with apparent satisfaction, offices of humiliating servitude, and constantly following in her train whenever she appeared abroad. (1829:II, 565-566)

His friends interested themselves in his behalf, and the disappointment, of which he was the subject, became for a time the topic of general conversation in the settlement. At length she was induced to accept his offer; they were publicly married, and lived very comfortably together. Their happiness, however, was but

of short duration, for his wife, for whom he appeared to cherish the most ardent affection, died a very few months afterwards. (Ellis 1829: II, 566)

The melancholy of the young chief reported above was not so deep, however, as that to which some hopelessly enamoured swains are reported to have sunk:

A Towtow [*toutou*—Slave or Servant—in this Country can never get permission to be connected with a Woman who is above him in situation, & to live publicly as Man & Wife. There are many however who fall in love desperately where they can never expect any return to their affections, not even the inclination of the Woman bears the least in his favor, yet he will wander about and meet her at every turning in a disconsolate manner. At last comfortless he is left without any resource except an unnatural one which suggests itself—the beastly Swain follows the Lady and deprives the earth of that which she meant to be deposited in it. Of this strange and unnatural liking I never heard before. (Bligh 1792:151b)

Mention has already been made of the kind of “arranged” marriage negotiated by parents for immediate, material gains. A somewhat different practice, described by Tyerman and Bennet but based on hearsay, may have been similarly motivated, however for future rather than for more immediate gains. I present this report in full, because in addition to its description of a type of betrothal practice it also provides an account of a form of wedding ceremony which has not been described in any other source:

Marriages among the higher orders were often contracted in the following manner. A person who had a beautiful daughter brought her, while yet a child, to a chief, saying, with the utmost frankness, “Here is a wife for you!” If the great man liked the girl’s appearance, he took her off her father’s hands, and placed her with some trusty dependant, to be trained and fattened, like a calf for the slaughter, till she had attained a suitable age. When her master chose to take her for his wife, the betrothed and their friends met at the marae. The girl appeared there with a cord about her neck, supported by one of her nearest kin, and accompanied by a man holding some leaves of sweet-smelling fern in each of his hands, which he pressed on either side of his head, above the ears. When the procession reached the altar, these leaves were cast upon the ground. The priest, having muttered his prayers, took up one of the sprigs of fern, and, while each of the dead ancestors of the bride (so far back as they were remembered) was named, he doubled down or tore off one of the side leaflets. Then, while the names of her living relatives were mentioned in due order, one of the remaining leaflets was successively pointed out as the number of each. When that which represented the nearest in blood of those who were at hand occurred, that kinsman stepped forth, loosed the rope from the bride’s neck, and delivered her to her husband. The friends on both sides then presented the couple with hogs, bundles of cloth, wooden dishes, canoes, &c., &c., according to their rank and ability. In less time than the honeymoon requires to fill and empty her horn, the chief probably grew weary of his spouse, and said to her, *Atira* (it is enough), *haere e jo* (go away). The woman was then abandoned, and what often became of her may be easily guessed. In this manner the great people took and put away as many wives as they pleased, or could get. (Montgomery 1832:I, 243-244)

If this version of a wedding ceremony is indeed credible—and I am not entirely convinced that it is—the use of a cord about the bride’s neck suggests (and the account also implies) that the class of the bride was inferior to that of the groom. As for the other unfamiliar aspects of the wedding ceremony, I can offer no explanation.

We must turn again to Ellis for an account of childhood betrothal. Prefacing his description with, “It is only among the middle and lower ranks [i.e., social classes] of society, that the contract [to marry] is made by the parties themselves,” Ellis stated:

Among the higher ranks, the individuals themselves were usually passive, and the arrangements were made by their respective friends. They were usually betrothed to each other during their childhood, and the female thus betrothed was called a *vahine pahio*. As she grew up, a small platform, of considerable elevation, was erected for her abode, within the dwelling of her parents. Here she slept, and spent the whole of the time she passed within doors. Her parents, or some member of the family, attended her by night and by day, supplied her with every necessary, and accompanied her whenever she left the house. (1829:II, 567-568)

Occasionally young people took matters into their own hands and married *against* the wishes of their parents. In chapter 10 I described one such episode—the case of the young Ra’iatean woman who eloped with an Arioi to Tahiti and the public reprimand meted out to her through means of a satirical drama. That such elopement was not entirely unusual is also indicated by the nature of a farce staged on that same occasion—the story of a couple who married against the wishes of the girl’s father and how the latter finally became reconciled to the marriage.⁴⁸

Besides instances of women having been taken as booty in time of war and incorporated into the households of their captors, there is no evidence of “marriage by capture”—either as an expediency or as a standardized ritual.⁴⁹ I have not come across any instances of the kind of situation reported from some other Polynesian societies, wherein a young swain deliberately sought consent for his marriage to his mistress by permitting himself to be caught in the act of fornicating with her in her family’s home.

The preceding pages contain ample evidence that Maohi marriages were often brief and were easily dissolved. As Ellis wrote:

Notwithstanding all this ceremony and form in entering into the engagement, the marriage tie was probably one of the weakest and most brittle that existed among them; neither party felt themselves bound to abide by it any longer than it suited their inclinations and their convenience. The slightest cause was often sufficient to occasion or to justify their separation, though among the higher classes the relation was nominally continued long after it had actually ceased. (1829:II, 570-571)

But I postpone to later chapters further discussion of this subject.

Polygamy

Comparison of the many reports about polygamy in these Islands might persuade the reader that the authors could not all have been writing about the same place. At one pole is J. Forster's statement that polygamy did not exist (1778:424); at the other is Tyerman's statement which alleged not only that it was fairly general but, for example, that one man (a prominent priest) had "... upwards of thirty" wives (Montgomery 1832:II, 148). Among the other writers, some described the practice as "common," others as "rare."⁵⁰ Some of these seeming contradictions may be assigned to errors of observation, but others probably arose out of confusions in terms (a point previously made by Williamson [1939:181]). The clearest statement, and perhaps the best informed, came from Ellis:

Polygamy was practised more extensively by the Tahitians than by the inhabitants of the Sandwich Islands, and probably prevailed to as great an extent among them as among any of the Polynesian tribes. Many of the raatiras, or inferior chiefs, had two or three wives, who appeared to receive an equal degree of respect and support. With the higher chiefs, however, it was different; although they might ... keep a number of females, it was rather a system of concubinage, than a plurality of wives, that prevailed among them. The individual to whom the chief was first united in marriage, or whose rank was nearest his own, was generally considered as his wife, and, so long as she lived with her husband, the other females were considered as inferior. When the rank of the parties was equal, they often separated; the husband took other wives, and the wife other husbands; and if the rank of the wife was in any degree superior to that of her husband, she was at liberty to take as many husbands as she pleased, although still nominally regarded as the wife of the individual to whom she had been first married. (1829:II, 571)

Elaborating, and drawing on other evidence, direct and indirect, my interpretation of the fragmentary available data regarding polygyny is as follows (the converse situation, polyandry, will be mentioned later). There was no general, universal norm prescribing how many wives a man could have (and by "wife" I continue to refer to the woman a man has "married," in the sense explained above), although there were undoubtedly many wives who for personal reasons felt that their own husbands should have only one wife.

On the other hand, the incumbents and other stewards of a high-ranking kin-Title (by "stewards" I mean those consanguines interested in maintaining the rank of that Title) were at pains to insure, first, that the heir to the Title be mothered by a woman with an equivalent or even higher-ranking Title, and second (but less crucial) that there be no conflict about succession to the Title. The operation of this set of "special-interest" norms resulted in the situation, reported by Ellis, that the holders of high-ranking kin-Titles had only one "wife" at a time—that is, only one of

the women such a man consorted with was at any one time regarded as the actual or prospective mother of his principal heir.

But many such men consorted openly with other women of titular status nearly as high as that of the wife just described—women who might take over the latter's special position in the event that she produced no heir. Following Williamson, I propose to call these potential heir-mothers *secondary mates*, to distinguish them not only from the actual heir-mother, or *primary mate*, but from *concubines* as well (for, there is evidence that the households of some men included all three).

In the case of those Ellis called "inferior chiefs" the kin-Titles were not important enough to require grading of their several consorts, who were presumably all of about equal status, and hence they all "... appeared to receive an equal degree of respect and support."

As for persons of lower-class status, in cases of men materially affluent enough to consort with more than one woman, the question of succession assumed little or no importance, and co-wives were probably socially graded (if at all) in terms of individual attributes and special circumstances.

One answer to the question of why some Maohi men had more than one mate at a time, might well be, "Why not?" (There is nothing more "natural" about monogamy than about polygyny, for the human species at least.) In some societies the ratio of women to men might serve as a partial constraint, but this could not be said of Maohi society, where men outnumbered women to some degree.⁵¹ Nor can one be satisfied with an answer framed in broad functional terms, such as, polygyny tends to be prevalent in societies, like that of the Maohis, having class stratification. This level of generalizing is a valid exercise, but it still does not provide specific enough explanations for particular societal cases. In Maohi society there were a number of factors that resulted in some families having been polygynous and others monogamous.

Sexual appetite undoubtedly moved some men more powerfully than others. And although extramarital sexual enjoyment was usually easy to secure, and a change of wives not difficult to accomplish, to have at one's continuous disposal an extra female or two was undoubtedly an attractive convenience. And as one grew older, and one's wife "older" still, the incentive to acquire a younger alternate probably increased—particularly in these Islands, where sexual activity was not considered to be unrespectable or ludicrous for older men. (There is no evidence that a woman was prohibited from having sexual intercourse during her pregnancy; hence this rationale cannot be adduced as an additional incentive for having more than one wife.)

But, economic factors would not have permitted all men desiring extra wives to realize their ambitions. The cost of supporting a wife was probably

no barrier (indeed, perhaps in most cases a woman carried at least her own weight in domestic subsistence), but the cost of acquiring an extra, younger wife and of insuring that she and her guardians remained content with the arrangement, must have proved unobtainable for many, many men—especially in view of the reported scarcity of women.

Another general factor which must have operated differentially, in some instances encouraging polygyny, in other instances discouraging it, was the attitude of a man's established wife. There is not a great deal of evidence to draw on, but enough to indicate that not all women were equally enthusiastic or tolerant or submissive about sharing a husband.

"Social status" and "political" incentives for polygyny were influential in only a few special kinds of situations: when it became necessary to supercede an infertile wife with a fertile one in order to obtain an heir to an important heritage, or when it became expedient to acquire political and military allies in the guise of new affines. Other special incentives for polygyny were inherent in the characteristics attributed to certain religious specialists: to some so-called "high priests" who, for reasons unspecified, are described as having been "allowed" five wives apiece, and to some shamans believed possessed by the god 'Oro.

Finally, the institution of the levirate, already described, provided ready-made polygyny in the case of men already married.

There is no question but that many Maohi women changed spouses frequently and that some women cohabited openly with one or more men in addition to, and even with the tacit consent of, a duly married husband. But I will postpone for a while investigation of the complex subject of Maohi polyandry.

FORMAL FRIENDSHIP

In discussing childhood head-freeing rites I quoted a statement by Morrison, which began: "If the Child is Male there is one More [*āmo'a* rite] which is performed when He adopts a Friend, which is the whole [i.e., the final rite] required to make his head Free, ..." (1935:186).

The sources contain numerous references to more or less formal parts of "friendship" among the Maohis, incorporating a variety of rights and obligations. The term *taiō* was used most frequently to label the partners in such a relationship, but *taua* and *hoa* were used as well. I postpone to chapter 20 the full discussion of this relationship; here it will suffice to record that during the course of their lives many Maohis (probably more males than females) entered such pacts, which had the effect of assimilating their social identity with that of some other individual in many socially significant respects.

OLD AGE AND INFIRMITY

They always Venerate the Grey heads... (Morrison 1935:184).

Old age was seldom treated with respect, often with contempt and cruelty (Ellis 1829:II, 281).

Except for the fact that most other available evidence tends to confirm Ellis' opinion, one might be inclined to accept Morrison's direct eyewitness judgment about the treatment of the aged more readily than Ellis' somewhat secondhand reconstruction.⁵²

We have already seen how parents' kin-Titles devolved upon children early in life—at least with respect to the ceremonial prerogatives. Moreover, we saw above how the type of sacredness associated with children at birth made them the object of still another set of ritual attentions, until removed through a series of head-freeing rites. In certain ritual respects, then, early infancy was the climax of some individuals' lives; no comparable climax of a ritual nature took place in later years, with the possible exception of the "inauguration" rites for the incumbent of a politically important kin-Title. However, in the practical world of earning a living and of exerting influence over others, the climax of a Maohi's life occurred much later. Exactly when (in terms of the European way of reckoning age) men and women reached their "prime" in these respects is not clear. Actually, I here refer to different kinds of "primes": men may have achieved renown, say, as warriors at one point in their lives, as skilled craftsmen or influential leaders and counselors at another. As for women, they appear to have attained one kind of social advantage during those years when they were in greatest sexual demand and another kind later on, but before their offspring shook off parental control.

In any case, whenever such primes may have been reached—and individuals probably varied widely in this respect—by the time most Maohis had reached the stage of life that the Europeans characterized as "old age" they were past all socially recognized primes; and from the best available evidence such people were in general treated with neither respect nor compassion. What the European observers meant by "old age" is of course not entirely clear, but it is likely that physical decrepitude was the principal criterion. In Tahitian there were also words (such as *ruau*) that have been translated as *aged*, but one cannot now learn what precise meanings, in terms of physical condition or behaviors, were attached to them.⁵³ It would not be appropriate to rely on meanings now attached to those terms, in view of the extensive changes that the Maohi language has undergone since the days of first European contact. Nevertheless, the dictionary glosses, crude as they may be, do indicate that physical decrepitude was also regarded as the central component of old age.⁵⁴ In this connection, the LMS Dictionary definition of *āhina*, "a grey head; a contemptuous name for a greyheaded

person," provides not only another criterion for old age but also indicates something about the popular attitude concerning this stage of life.

But we do not have to depend upon dictionaries for clues concerning the popular attitude toward the aged:

Among the most uncommon customs, we may add the dishonour and disrespect paid to old age. The advanced in years are thrust aside, and receive little or no attention. Even ... [the former high chief, and now grandfather of the reigning high chief, Pomare] was scarcely noticed by them: they would hardly permit him to enter the cabin when on board [the Duff]; and unless the captain expressly called to him, they kept him alongside in his canoe. One of our old seamen was often the object of their ridicule. In discourse, when any thing refuse was mentioned, they called it "old man." At Tongataboo we noticed the very reverse: in the presence of the aged the younger persons observed a most respectful silence. (Wilson 1799:348)

Another example was provided by Pickersgill. When he and some other members of Cook's expedition went in pursuit of the culprits who had made off with some of their trade goods, their move quickly frightened all other Maohis nearby.

... the Peple all fled as fast as they could with their Effects to the Mountains—we divided our forces and leaveing one half with one of the Mates to take care of the Boats, with the other we persued the Inhabitants who by this time had tolerably well cleared the Houses of their Effects and there was hardly a man to be seen, in this manner we follow'd for about 2 Miles where we over took a fat Chief whose Body was so unweildy that he could not move off fast enough, him we took who promise'd to bring back the things stolen from us, provided we would let him go which we did after taking most part of his Effects as a security for his return with which we march'd down to the Boats. Two Objects here struck me much, they were an extream old Man and Woman who thro' age and infirmities could scarce move and not being able to get away with the rest were left in the Woods, and with their utmost exersion crawled to wards us, each with a Dog in their Arms as an offering at the same time with the utmost dejection imploring their forgiveness—in so pityable a manner, as was truly affecting; we received their Dogs; afterwards letting them loose and gave the Old People each a large Nail with the utmost assurances of their Safty, telling them we did not come to hurt the good people, but to punish the Theivs who had Stole our property, with this they seem'd tolerably satisfied and retired to their Hut. (Beaglehole 1961:773)

In some respects, the attitude toward old age was similar to the one generally shown toward the physically handicapped and invalids:

The condition of the blind, when suffered to live, must, under the reign of idolatry, have been truly lamentable—they were generally objects of derision and neglect, if not of wanton cruelty. (Ellis 1829:II, 274)

In seasons of illness, especially if protracted, the common people, and the aged, received but little attention. If the malady was not soon relieved by the prayers of the priest, and the remedies he administered, the sufferer was abandoned. Sometimes he was allowed to remain in the house of those with whom he was connected.—But, in general, a small temporary hut was erected with a few

cocoa-nut leaves, either near a stream, or at a short distance from the dwelling. Into this, as to the condemned cell, the sick person was removed. For a time, the children or friends would supply a scanty portion of food, but they often grew weary of sending this small alleviation; and it is believed that many have died, as much from hunger, as from disease.

This process was sometimes too slow for those who were connected with the sick, and who desired to share any property they might possess. If they thought there was but little prospect of recovery, they would determine to destroy them at once. Murder was at times perpetrated under these circumstances, with the most heartless and wanton barbarity. The spear or the club was employed, to effect what disease had been too tardy in accomplishing. All the persons in the house when these deeds of horror were performed, were called out; and the friends or companions of the sufferer, armed with spears, prepared for their savage work. It was in vain that the helpless man cried for mercy; instead of attending to his cry, they "would amuse themselves in trying which could take best aim" with the spear they threw; or, rushing upon him with spear in hand, they would exclaim, *Tui i vaho*, pierce through, and thus transfix him to the couch on which he was lying.

Sometimes they buried the sick alive. When this was designed, they dug a pit, and then, perhaps, proposed to the invalid to bathe, offering to carry him to the water, either in their arms, or placed on a board; but, instead of conveying him to the place of bathing, they would carry him to the pit, and throw him in. Here if any cries were made, they threw down large stones in order to stifle his voice, filled up the grave with earth, and then returned to their dwellings. (Ellis 1829:II, 281-282; see also LMS Transactions III, 168)

We could reasonably object that such general accounts as these might have been fabricated by urbane informants for the pleasure of horrifying the good Reverend Ellis—Maohis were (and still are) quite capable of such tall tales, in the interests of a good joke—but Ellis recorded cases which, for him at least, had the ring of reliability.⁵⁵

The natives once gave me an account of an unhappy sufferer, whom they were conveying to the grave; he perceived it at a short distance before they approached, and, influenced by fear, sprang from the board, and endeavoured to escape. He was pursued, and crippled by a large stone, and thus secured by the murderers. I was acquainted with two persons, who were sawyers, and resided some time in the island of Huahine, who had both been engaged in burying one of their companions, merely because they felt the few attentions required, a burden. One of them, whose name was Papehara, is dead; the other is still living. (Ellis 1829:II, 282-283)

Important chiefs were usually accorded the most elaborate of services when they were ill, except if they happened also to be of advanced age, when they were treated with something amounting to disinterest and neglect. For example: "The interest manifested in the recovery of their chief would depend much upon his age. If advanced in years, comparatively little concern would be felt for his restoration" (p. 281).

Finally, we draw attention to a reported attitude that could be interpreted as evidence of a very important phenomenon: we refer to some scattered reports on the embarrassment experienced by certain high chiefs on being ill and their efforts to hide their infirmities from the general pop-

ulace. For example, when the missionaries Bicknell and Henry asked about the health of Pomare II, the latter replied that he was well “(which according to the report of the natives was false) but did not shew us the part diseased, & seemed desirous to wave the conversation about it; perhaps being ashamed, there being several persons present, & it being here a reproach to be afflicted with any disorder.” (Bicknell & Henry, Journal, 24 January 1805, LMS Archives) If this could have been a general occurrence, and not just concern on the part of one or two chiefs to put up a strong front in time of peril, the attitude could (as I am proposing) betoken a general belief linking the physical well-being of a chief with the physical and spiritual well-being of his tribe.

Unlike the attitude shown toward the physically handicapped was the treatment of the insane:

Insanity prevailed in a slight degree, but individuals under its influence met with a very different kind of treatment. They were supposed to be inspired or possessed by some god, whom the natives imagined had entered every one suffering under mental aberrations. On this account no control was exercised, but the highest respect was shewn them. They were, however, generally avoided, and their actions were considered as the deeds of the god, rather than the man. Under these circumstances, when the poor wretch became his own destroyer, it was not regarded as an event to be deplored. (Ellis 1829:II, 274)

SICKNESS AND DEATH

After the god Ruatupuanui (Source-of-great-growth) had conjured to final death the Great Octopus that was holding sky close to earth, and thereby confining all other spirits within the narrow-spaced darkness between, the goddess Hina commanded Rua: “Do not insist upon conjuring man to death but only cause him to fade, and I will resuscitate him” (Henry 1928:405).

So it was that unless some spirit intervened to shorten it, a human’s life as such ended at a predestined time by simply withering away. At least this is the best summary interpretation I can put together from the innumerable bits of evidence for Maohi beliefs about what Europeans call “death.”

It goes without saying that what evidence there remains in native statements about such beliefs is no better than the translations of a century and a half ago—and that is hardly a satisfactory basis for understanding such an exotic set of ideas about so deep a subject. Consider, for example, the LMS Dictionary definitions of the following most relevant words:

ora, life, salvation, health; a Saviour, deliverer; to live, to be healed; to be saved, or delivered; live, or alive, in opposition to *pohe*, dead.

pohe, death; also hurt, injury, sickness, see *mate*; to die, to be ill, or diseased, to be hurt; to be foiled in an argument, see *mate*; to perish, or to be punished for ever; to be affected with jealousy.

mate, death, illness, hurt, injury; to die, to be ill, sick, or hurt
ma'i, disease, sickness; any bodily disorder.

In addition, each of these words had a number of “metaphoric” usages; and this raises a problem in semantics. For example, the most authoritative dictionary definitions of *ora* and *ma'i* are those just given, but one also comes across these words in such texts as the following prayer, chanted after a marae had been repaired and weeded for an important ceremony:

<p><i>Ia ora te fenua!</i> [May live the land.] <i>Ua ora te ma'i o te marae, ua vaere hia, ua ioio.</i> [Is cured the sickness of the marae, is weeded, is made handsome.]</p>	<p>May the land live! The marae is restored, it is weeded and become handsome. (Henry 1928:162)</p>
---	---

The question here seems to be, Is one justified in distinguishing between “basic” and “metaphoric” usages of these words, or were their “basic” meanings broad enough to include both the conditions of humans and of places and objects? And, of course, with this is the even more fundamental question concerning the connection of language with “thought.” In other words, if for example *ma'i* was in fact used by the Maohis literally and non-metaphorically with respect to disorders of both places and humans, does this mean that they “thought” of places and humans as subject to the same kind of disorder? Intriguing as these questions are, they cannot be answered at this great remove in time from the events in question.

Leaving aside, then, these broader problems and focusing again on man alone, several fundamental cognitive propositions seem to have underlain Maohi behavior regarding what we call *injury*, *sickness*, and *death*:

1. An individual remains alive (*ora*) so long as his soul (*vārua*) resides more or less permanently inside his body (*tino*). The soul may wander sometimes outside the body (e.g., dreaming), or it may be forced outside for a while by a malevolent agent; but if its absence is not too prolonged—how long is not clear—the individual will remain alive.
2. When the soul’s absence is too prolonged the soft parts of the body begin to rot away, and once this decay begins the process cannot be reversed—although it may be temporarily arrested in exceptional circumstances if the soul returns to the body.⁵⁶ As long as there is any body remaining, however, there continues to be a link between it and the soul; for example, the skull may become an abode for the soul when it returns to its earthly haunts, and if an enemy obtains any portion of the bodily remains he can use it to secure control over the departed soul, just as the sorcerer uses *exuvia* to destroy a living victim.
3. As noted before, unless some outside agent intervenes, the soul will *usually* continue to reside mainly in the body until a predestined time (*poi*), presumably set by some spirit and marked by the body’s general, progres-

sive decrepitude (*ōriorio*). Whether the *soul*, also, weakens or fades through aging is not clear.

4. The outside agents which intervene to hasten a soul's permanent departure from the body are *usually* spirits—but spirits of many kinds, which either capture the soul or damage the body so badly that it is no longer fit for harboring the soul.⁵⁷ (The kind and extent of such damage is not, however, specified.)

In terms of these general propositions the translations of the various words listed above appear less ambiguous: like the ideas assumed to underlie them, they express *degrees* of living or dying rather than polarized extremes.

But now let us return to beliefs about the various ways in which spirits acted to destroy a human's well-being. These may be categorized as follows (i.e., according to European logic—Maohi categories, if any, were not reported):

By capturing the soul itself, either directly from the body or during one of its normal absences from the body (e.g., during dreaming).

By damaging or destroying the body (and soul?), which could be accomplished by: causing an accident to occur (e.g., a limb to break while climbing, a tree to fall on one, a shark to bite one, or a centipede to sting); guiding an enemy's weapon to a vulnerable spot (e.g., during battle); legitimatizing the execution of an individual believed to have violated a spirit-sanctioned rule of conduct (e.g., the killing by a priest of an unauthorized onlooker at a restricted marae ceremony, or "execution" of a victim required for sacrifice);⁵⁸ destroying the vitals through sorcery (i.e., through spirit agents acting under instruction of a human sorcerer); afflicting the body (or soul?) directly with a sickness, without a human agent as intermediary.

Some of the sources contain blanket statements to the effect that *all* human injuries and ailments were believed to have come about through spirit intervention, one way or another;⁵⁹ but judging from the reported treatment accorded some cases this factor must have been considerably minor in them. In any event, whether or not there was a place for true accident (i.e., in the European sense) in Maohi reasoning—and this I cannot verify—there was probably a considerable range of differences among individuals as to estimates of where to draw the line between spirit intervention and "pure accident" as cause for injury and sickness.⁶⁰

Warfare was, as we saw, the principal occasion for enlisting spirit aid in damaging one's enemies, and the practices through which this was accomplished have already been described in chapter 12.⁶¹ Nor does any more need to be written here about killing or injuring being carried out in execution of "official" orders. Instead, I turn now to a discussion of sorcery, which,

according to some writers, was believed to be one of the major causes of sickness and death before European-introduced ailments became predominant.

Harming

One of the most common techniques employed by Maohis to harm one another was through the agency of fetchers (*ti'i*). Certain people (possibly men only) specialized in this practice, usually for hire; they were designated *feia tahutahu* (persons-kindlers; from *tahu*, to kindle a fire); but they were also known as *nanati aha* (to bind with sennit), *ta'ata opū tara* (incantation-stomach), and so forth (Henry 1928:203–204). Some persons may have practiced this technique rarely, surreptitiously, and for their own purposes, but there were others whose identities and reputations were well known; in fact, kindlers were present among the official staffs of some marae.

Fetchers (*ti'i*), which acted as agents of the kindlers, consisted in the main of small anthropomorphic images of wood or stone invested with the presence (*mehoi*) of malevolent spirits—either *'oromatua-ai-arū* (devouring ghosts of darkness), *'oromātua-niho-roroa* (ghosts of long teeth), *vārua 'ino* (evil spirits) (Henry 1928:203). According to Henry, in some instances the skulls of certain famous rulers and warriors served as fetcher-receptacles for their own ghosts (1928:206). The kindler is described as “invoking” a spirit to enter into his service, although exactly why particular spirits came to serve any particular human in the first place is not explained. One account has it that when the children of a kindler died their ghosts regularly served as fetchers (Elder & Wilson, Journal, 19 June 1804, LMS Archives); and it is logical to assume that among any kindler's fetchers would have been some of his own ancestral ghosts.

According to Henry (1928:203–204), kindlers used to “adopt” their fetchers as sons and daughters and thus became known as their “parent-kindlers” (*metua tahutahu*). Parent-kindlers installed their fetchers in a special little house built high off the ground. There, on occasion, the kindler used to sleep, to feed his fetcher-children, bathe and anoint them, and hold “mysterious night festivities” with them. Fetchers communicated with their parent-kindler through the murmuring sounds of certain seashells, also kept in these houses. (See also, chap. 3, section on humans.)

If for any reason a kindler wished to disassociate himself from one of his fetchers he secretly buried its receptacle (image or skull) in a deep hole dug in unfrequented ground (Henry 1928:208).

A kindler usually carried out his work in the following manner: In the presence of his fetchers, he placed some object which had been in contact with the intended victim—some of his saliva, a hair from his head, a nail paring, food leavings, a bit of clothing or sleeping mat—into a tight container and conjured the fetchers to enter and destroy the victim's body through the link provided by the exuvial object (*tupu*), which contained

some of the victim's *iho*. This part of the performance was called the *tara*; containers [*fari'i tupu*] were either stone bowls or baskets, with tight covers.⁶²

Fetchers approached their victims by walking either on or through the ground. Once inside the body, they attacked the vitals in numerous ways—piercing them, crushing them, and so forth, with such devastating effects that the victim became feverish, writhed in agony, and foamed at the mouth;⁶³ he soon expired unless the process was checked. *Pifau* (subtle-hooker) was the word applied to this set of symptoms, as well as to this whole kind of sorcery.

The usual purpose of *pifau* was to destroy the victim's body and force his soul to vacate—and, according to one account, even to harass the soul into the *pō* (Ellis 1829:II, 231). On occasion, however, the kindler sought mainly to hypnotize the victim in order to force him to divulge secrets or betray relatives and friends (Henry 1928:205).

In addition to practicing *pifau*, some kindlers used a technique known as *tuno'o*, whereby they introduced their fetchers into the victim's body by means of his food or drink. Following this principle it was possible to destroy a whole household by implanting fetchers in its earth oven (Henry 1928:208; Davies Journal, 27 March 1809, LMS Archives).

Kindlers were usually paid handsomely for their services, some of them even collecting their payments before, during, and after their operations (Moerenhout 1837:I, 540–541). Moreover, some of them were universally feared and respected, depending mainly upon the proven efficiency of their fetchers, but occasionally upon their wild looks and manners. On the other hand it is reported that they sometimes went too far in their actions and pretensions and provoked their victims' relatives and friends to kill them or drive them away.

There is ample evidence that some Maohis actually practiced the arts of sorcery just described, and unquestionable indications that innumerable natives died of what they and others considered to be the effects of sorcery.⁶⁴ Whether individual kindlers believed in their own personal powers is of course impossible to discover, but there are indications that some of them were just dubious enough of their own powers to supplement their magical acts by hiding genuine poisons in the food of intended victims.⁶⁵

Somewhat similar to sorcery in its instigation was a request uttered by a human asking some spirit to harm another human. Some of these requests were in the form of more or less ad hoc prayers to specific spirits (and accompanied with sacrificial gifts)—for example, a chief's prayer to 'Oro which resulted in the death of a potential political rival (Jefferson, Journal, 18 August 1799, LMS Archives); others, however, appear to have been standard imprecations—*tuhi*, *ahua*, *rorai*—the latter being specifically aimed by parents at their children!

In still other instances direct attacks by spirits against humans were

thought to have come about through the sheer malignancy of some of the former—especially of long-toothed ghosts and devouring ghosts, the spirits that also served as fetchers for sorcerers. Of course, even these spirits may have acted only against individuals considered by them to have broken some rule, but what may have distinguished such situations was the circumstance that the rules in question were unusually arbitrary, and perhaps esoteric as well, at least as far as the particular victim was concerned.

Much more common were injuries and ailments visited upon humans by spirits as punishment for the infraction of some widely recognized and generally unchallenged rule ranging from deliberate and massive acts of sacrilege to unwitting omissions of ritual detail. Many types of spirits participated in these transactions, from mighty 'Oro to the ghosts of infants just slain. In this connection, the majority of all cases of sickness suffered by the Maohis were, according to one writer, those instigated by ghosts upon their descendants, as punishment for family strife (Moerenhout 1837:I, 543).

The sources contain symptomatic descriptions of many native-defined maladies, including the punitive ones now under consideration, and these will be listed later on. But, in contrast to the highly specific methods ascribed to sorcerers, there are few indications of the actual techniques utilized by spirits in causing such maladies—except for statements like “so and so was *seized* (or *strangled*) by the spirit.” (Ellis 1829:II, 275)

Maladies deriving from contact with sacredness (*ra'a*, *mo'a*) are especially intriguing, and correspondingly puzzling. The sources abound with descriptions of behavior constrained by considerations of sacredness. As noted above, certain persons, places, objects, even words, were regarded as “sacred” (e.g., the heads of certain chiefs, and of certain children not yet desanctified by *āmo'a* rites) to an extent that anyone else touching them, nearing them, or even calling their names was stricken with illness, or worse. Finally, it should be recalled that the concept of *hara*, infectious guilt-substance, was applied to people as well as to places and things (see pp. 120-122, this work).

Curing

The Maohis took many measures to avoid the bodily afflictions we have just discussed. For example, to guard against “accidents” they were accustomed to offer prayers and sacrifices to appropriate spirits before setting out on some hazardous enterprise. Before battle, priests led the forces in mass petitions to their tribal deities for protection against the enemy weapons. Against the possibility of sorcery, vulnerable people, especially influential ones, took care to see that their nail parings, hair cuttings, food leavings, cast-off clothing, and so forth, were placed out of the reach of enemies, and they were cautious about the source of their food. In a

more general way, it may be stated with fair justification that most of the Maohis' regular, periodic prayers and sacrifices were carried out more in the spirit of prophylaxis than of gratitude; and this included maintaining fetchers and other spirits not only to assist in carrying out various enterprises but also as defense against potentially hostile spirits.

It appears in some cases that the alleged cause of an ailment was so obvious from its symptoms that no further action was necessary before proceeding to its treatment; all that was required was to call in the appropriate specialist. According to Ellis, when sorcery was suspected, a specialist known as a *fa'atere* (causing to move or glide) was brought in (1829:II, 233); in other instances people called in either a regular marae priest or a physician (*tahu'a ra'au*, *ta'ata rapa'au*), whichever was indicated. Ellis did not say how the Maohis decided which of these two professionals to summon, but in case it was the latter it was usual to call in someone whose medicines (*ra'au*) were known to be efficacious in treating the ailment in question (1829:II, 272).

A *tahu'a tutera*, as described by Moerenhout, was both diagnostician and adviser. Upon arriving at the home of the stricken person he acted as if possessed, presumably by his spirit-familiar, and proceeded to announce the cause of the ailment and the identity of the individuals responsible for it:

In this state, he often accused the father, the mother, or other members of the family of having caused the malady through their dissensions or by their negligence toward the gods. He ordered them to pray and to make offerings at the marae; sometimes he prescribed remedies; he had great power over the spirit of those ill; but, in grave cases, as for example a case of a dangerous illness or of a death attributed to some enemy, gifts were given to the *tehoua toutera* [*tahu'a tutera*] in order to discover who was guilty. The *tehoua toutera* then set about reciting prayers and walking about near the house, where the spirit of the deceased appeared to him; and after his appeal, judged whether it was the gods or some enemy who had made him die. In the latter case, there were other ceremonies, after which, claiming to be inspired, he named, in the midst of delirium and excitement, the real or pretended author of the death (1837:I, 542-543)

In contrast to Moerenhout's shamanistic *tahu'a tutera*, the specialist described by Henry functioned more as a priest:

People that were supposed to be under a curse of the gods of the *feia-tahutahu*, both men and women were taken to a prayer-healing priest of the regular clergy, called the *apa* (disenchanter), *ha'a-tupu* (growth-combater), or *tao-ti'i* (rebuker-of-fetchers), whose marae was dedicated to the god *Ro'o-teroro'o*, and who was at all times a defier of magicians and evil spirits, being in favor with all the gods of the higher classes. (1928:209)

The diagnostic procedure of an *āpa* was simplicity itself; he merely questioned the patient or his relatives about the cause of the ailment: "What

complaint is ailing thee? Is it a curse, an error, or pride? ... What then is it? A parent's curse? ... An imprecation? Sacredness violated? ... A sacred wall pushed down? ... Is it a burdened soul, estranged, accused, that afflicts thee? ... Art thou possessed with witchcraft?" (Henry 1928:210) Having thus learned the cause of the malady he proceeded to apply the appropriate cure.

The seeming contradictions in these accounts (and they could be multiplied by excerpting from other sources) may derive in part from misinterpretations by the different writers or from gaps in their information; but they may just as well be a true reflection of the complexities of the situations they purport to describe. For, as nonliterate societies go, that of the Maohis was large and complex, with many types and degrees of occupational specialization. And among those who dealt with human ailments there was wide variation both in fundamental approach and in procedural detail. Some specialists acted primarily as priests, others as shamans, others as magicians, and still others as physicians or surgeons or bone setters, with only slight dependence upon spirit aid. Moreover, within each of these "specialties" there had developed individualized techniques and skills, and there were probably many practitioners who combined, in varying proportions, the elements of several specialties. It is more than likely that in addition to the presence of such specialists in this society, every man and woman was something of a practitioner himself, with his own little stock of remedies and skills.

Hence, rather than attempt to discuss Maohi therapy in terms of the practices of an *āpa* or a *tahu'a tūtera* or a *fa'atere*, it will be less confusing and more realistic to describe the techniques themselves, disregarding the identities of the practitioners who used them.

One possible method of classifying Maohi methods for dealing with sickness and injury would be to rank them according to their dependence upon spirit agencies. In this sense the splinting of a broken arm or the attempted draining of a victim of drowning would lie at one extreme, while the exorcising of a victim of sorcery would lie at the other. Supporting this method is the fact that the sources do contain accounts of therapies that make no mention of spirit involvement: that is, direct, common-sensical physical procedures for treating obvious physical disorders such as insect bites, dislocations, and open wounds. While there may have been a tacit assumption that spirits "caused" many accidents and would in the course of events be petitioned to prevent recurrence, spirits were not reported as having been significantly involved in treating the disorder. And yet, if we place reliance upon reports that *all* injuries and ailments that befell Maohis were believed by them to result from spirit intervention, then, granting the Maohis' rationality, we are led to conclude that all their therapies must have included some effort to actuate spirits. The absence of reference to spirits in the ther-

apies just mentioned may be ascribed to incomplete reporting rather than to the realities of Maohi life.

In view of these uncertainties about the data, and being unable to discover any comprehensive native classification of therapies, I can offer only a random listing of them. Ellis had the following to say about their methods for dealing with breaks and dislocations:

A fractured limb they set without much trouble: applying splinters of bamboo-cane to the sides, and binding it up till it was healed. A dislocation they usually succeeded in reducing; but the other parts of their surgical practice were marked by a rude promptness, temerity, and barbarism, almost incredible. A man one day fell from a tree, and dislocated some part of his neck. His companions, on perceiving it, instantly took him up: one of them placed his head between his own knees, and held it firmly; while the others, taking hold of his body, twisted the joint into its proper place.

On another occasion, a number of young men, in the district of Fare, were carrying large stones, suspended from each end of a pole across their shoulders, their usual mode of carrying a burden: one of them so injured the vertebrae, as to be almost unable to move; he had, as they expressed it, *fati te tua*, broken the back. His fellow-workmen laid him flat on his face on the grass; one grasped and pulled his shoulders, and the other his legs, while a third actually pressed with both knees his whole weight upon the back, where the bones appeared displaced. It was not far from Mr. Barff's house [a missionary] where the accident occurred, and, observing the people assembled, he went to inquire the cause, and saw them thus engaged. On his asking what they were doing, they coolly replied, that they were only straightening the man's back, which had been broken in with carrying stones. The vertebrae appeared to be replaced; they bound a long girdle repeatedly round his body, led him home, and, without any other treatment, he was in a short time able to resume his employment. (1829:II, 276-277)

Other writers reported the Maohi's surgical methods and skills:

... in surgery they are excellent and make surprizing Cures—We have been Eye witness to some—one of which was from a Musquet ball which a Man received in his Breast and passd through the Shoulder blade, another with his arm broke by a ball, a third having a Ball through his thigh & a fourth received one through His Thigh while stooping, which passd under his ribbs and out by the Collar bone, with several others Wounded with Stones, all of which were perfectly cured within two Months—among those wounded with Stones was one who had all his Upper Jaw stove in and 6 or 7 teeth knockt out; several splinters of the bone were extracted and the Juice of herbs with Clean water was the only remedy ever we saw used. They cannot bear their wounds bound up and are Constantly Washing them to keep them from smelling; for this reason should they get a leg broke it is certain Death as they Cannot be kept from the Water tho they know the Consequence, always flying to the water as soon as the smell becomes disagreeable, and often grate sandal wood on the part to take away the Smell. For Splints they use bamboo and often repair broken Arms whether gotten by War on Accident. (Morrison 1935:228)

That they have skillfull Chirurgeons among them we easily gatherd from the dreadful scars of wounds which we frequently saw that had been cur'd, some of which were far greater than any I have seen any where else, and these were made by stones which these people know how to throw with slings with great

dexterity and force. One man I particularly recolect whose face was almost intirely destroyed, his nose one cheek and one eye being beat in and all the bones there flatted down so that the hollow would receive a mans fist, yet this dreadfull wound was heald clean without any ulcer remaining, Tupia who has had several wound(s) has had one made by a spear of his countrey headed with the bone of a stingrays tail which had peircd quite through his body, entering at his back and coming out just under his breast, yet this has been so well curd that the remain(in)g scar is as smooth and as small as any I have seen from the cures of our best European surgeons.

Vulnerary herbs they have many, nor do they seem at all nice in the choice of them so they have plenty of such herbaceous plants as yeild mild juices devoid of all acridity, such as chickweed groundsell &c. in England. With these they make fomentations which they frquently apply to the wound, taking care to cleanse it as often as possible, the patient all the time observing great abstinence& by this method if they have told us true their wounds are curd in a very short time. (Beaglehole 1962:I, 375-376)

The operation of trepanning they sometimes attempted, and say they have practised with success. It is reported that there are persons living in the island of Borabora on whom it has been performed, or at least an operation very much resembling it: the bones of the skull having been fractured in battle, they have cleared away the skin and coverings, and, having removed the fractured piece of bone, have carefully fitted in a piece of cocoa-nut shell, and replaced the covering and skin; on the healing of which, the man has recovered. I never saw any individual who had undergone this operation, but, from the concurrent testimony of the people, I have no doubt they have performed it. (Ellis 1829:II, 277)

This afternoon a few Young Men were wrestling when one of them having an untoward fall his Arm was put out of joint at the Elbow. As instantly as the accident happened three Stout Men took hold of the Man by the wrist and placing their feet against his Ribs they put it in again. My Boat being waiting I sent her off for the Surgeon but before he returned all was well, except a Swelling of the muscles from the Strain which he prevented from getting to a greater height. I was alarmed lest the Arm might be broke for they were wrestling to entertain me, but they all laughed heartily at it, and told me [that if it] was they could mend it again, and got a number of Sticks and placed round the arm and bound it with Cord to show me how it would be done. Many accidents of the kind they said happened at their Wrestling Heivahs, and I have no doubt of it as I have seen many deformed arms; that they have a skill in Surgery is therefore no longer a doubt, and I have already given an instance of seeing an amputated Arm perfectly healed and apparently performed with a great degree of skill. (Bligh 1789:II, 30)

Anderson was more skeptical and qualified in his judgments of their surgical skills:

Their arts are few and simple; yet, if we may credit them, they perform cures in surgery, which our extensive knowledge in that branch has not, as yet, enabled us to imitate. In simple fractures, they bind them up with splints; but if part of the substance of the bone be lost, they insert a piece of wood, between the fractured ends, made hollow like the deficient part. In five or six days, the *rapao*, or surgeon, inspects the wound, and finds the wood partly covered with the growing flesh. In as many more days, it is generally entirely covered; after which, when the patient has acquired some strength, he bathes in the water, and recovers. We

know that wounds will heal over leaden bullets; and sometimes, though rarely, over other extraneous bodies. But what makes me entertain some doubt of the truth of so extraordinary skill, as in the above instance is, that in other cases which fell under my own observation, they are far from being so dexterous. I have seen the stump of an arm, which was taken off, after being shattered by a fall from a tree, that bore no marks of skilful operation, though some allowance be made for their defective instruments. And I met with a man going about with a dislocated shoulder, some months after the accident, from their being ignorant of a method to reduce it; though this be considered as one of the simplest operations of our surgery. (Cook 1784:152-153)

The “vulnerary herbs” mentioned in Banks’ account may indeed have been many in kind, but only a few have so far been identified. For example, pain from centipede stings, we are told, was quickly relieved with applications of chewed kava leaf in coconut oil (Crook, Journal, 3 July 1817, LMS Archives); cuts were closed by drawing together the edges and applying the caustic juice of the *Arum costatum* (Ellis 1829:II, 276); and sore limbs were rubbed down with “the juice of an herb” (Wilson 1799:165). Another account of external application of plant remedies is given in the following missionary journal entry, which referred to a “curious epidemic” that had recently killed several people:

It did not appear contagious, yet nine or ten were seized in a day. They were almost immediately seized with a locked jaw and the fists clenched. The people were confounded at its first appearance, but they hit upon a good expedient. As soon as they had collected their roots &c they beat it up ready and always kept it ready at hand. Their method was, as soon as ever a person was seized, they immediately heated stones to warm the medicine. In the meantime several strong men were treading the arms and opening the hands rubbing and chafing them with all their might as soon as the medicines were heated they poured upon the patient. In many cases it succeeded effectually the arms became supple and the jaw unlocked, the patient was [cured]. (Platt to Burder, 28 February 1827, LMS Archives)

Plants were also given externally, for a variety of aches and pains. For example, “The chief of [Ha’apaiano’o] district is ill& his complaint is violent pains in the temples of his head, thighs, and legs; by which he is disabled from walking alone. His remedy is drinking plenty of yavva, and sacrificing, with much prayer to his god. The [dis]order is prevalent ...” (Jefferson, Journal, 10 February 1800, LMS Archives).

According to Ellis, no animal or mineral substances were included in their pharmacopoeia: “... vegetable substances alone were used, and these simply pulverized, infused, heated on the fire, or with red-hot stones, and often fermented (1829:II, 271).

There may have been some medicines whose ingredients were widely known, but the identities of many others were professional secrets. Sometimes the specialist sent his patient’s relatives to collect the various roots, leaves, and so on, used in his remedies; in other instances he collected them himself:

... the priest usually went himself to compound the *raau* [ra’au] or medicine: a

considerable degree of mystery was attached to their proceedings, and the physicians appeared unwilling that others should know of what their preparations consisted. They pretended to be instructed by their god, as to the herbs they should select, and the manner of combining them. Different *raaus*, or medicines, were used for different diseases; and although they kept the composition of their nostrums a secret, they were not unwilling that the report of their efficacy might be known, in order to their being employed by others. Hence, when a person was afflicted with any particular disease, and the inquiry made as to who should be sent for, it was not unusual to hear it said—“*O ta mea te raau maitai no ia mai,*”—such a one has a good medicine for this disease. (Ellis 1829:II, 271–272)

There may well have been some general theories, both “magical” and “scientific,” underlying the Maohi pharmacopoeia—something more than just an assortment of unconnected experiences and ideas—but they are not spelled out in the sources. However, there are such fragments as the following:

The Indian who had undertaken to finish the fence came to us wounded and slashed about by his father-in-law, as he told us, begging us very earnestly to treat him; and, on our desiring him to show us two wounds that he had bound up, we saw that they were dressed with herbs. He declared, however, that those herbs would be very good and would heal him quickly if the wounds had been (caused) by a stone or stick of Otahiti, but that, having been (inflicted) by a knife from Lima, it was necessary, for their speedy cure, to employ dressings from Lima in treating them. (Corney 1919:94–95)

We do learn from the sources that experiment was continual, but as the following excerpt indicates, the intrinsic qualities of the medicine may not have been the only thing tested:

Frequently, when some medicines were about to be administered, the friends and relatives of the patient were sent for, that they might be at hand, should the effect be unfavourable. They often expected it would either save or destroy the patient. A number of ceremonies were connected with every remedy applied; and much greater dependence was placed on the efficacy of the prayers, than on the effect of the medicine. (Ellis 1829:II, 271)

We shall return to the implications of this last point in a moment, but let us first consider a few other aspects of Maohi therapeutics.

As attested by grateful Europeans, many Maohis were expert at massage (*rumirumi*), which was successfully applied not only to relax tired legs but to reduce more general muscular pains as well.⁶⁶

Forced sweating was occasionally resorted to, especially after a difficult childbirth, but the usual physical method of dealing with a fever in a patient was to help him to cool himself by lying in breezy locations or immersing in running water.

For this reason, and for other reasons as well, some importance was attached to geographic setting as a factor in the treatment of lingering illness. In fact there are several accounts of stricken individuals, mainly important chiefs, being moved from one spot to another in search of a more salubrious

clime—salubrious, that is, as much or more in terms of spirit benevolence than of healthful air (Corney 1919:175).

Turning now to Maohi techniques for engaging spirits to help mend their injuries and cure their ills, it should be recalled that these were not merely supplementary to the more “physical” measures just noted but that they complemented them, activated them, or in some cases superseded them.

It sometimes happened that spirits intervened without having been petitioned to do so; this was particularly true of the spirit Tama. Writing in his journal about a captured warrior, the missionary Davies reported:

... the man from Teauru was taken away today, and will probably be put to death when he arrives in the Camp. He had been shot through the body in two different places, at the time of taking the fortress of Atahuru, and was now completely recovered, his recovery from such dangerous wounds, makes the people suppose him to be a peculiar favourite of the god *Tama*, whether this will have any significance with the king to spare his life is not yet known. The god Tama like Aesculapius the son of Apollo, in all probability was a man, famous in his day for his skill in curing wounds and diseases ... Whenever any of the Taheeteans escapes imminent danger of falling from a tree or a precipice, or when an unexpected recovery takes place from bruises, wounds, or any dangerous diseases, they commonly ascribe it to the good will and power of the god Tama. (27 August 1807, LMS Archives)

When it was determined, through questioning or through diagnosis from the symptoms, that an individual’s illness was due to sorcery, prayers and sacrifices were sometimes offered to the god Ro’oteroro’o to turn away the fetchers destroying the victim. According to Henry, the specialist who brought this about was an *āpa*, a priestly devotee of Ro’o. The exorcism took place in the patient’s house, where gifts were laid out for Ro’o, in the person of the *āpa*. The latter, holding in his hand a banana shoot to represent the sorcerer, addressed a prayer to Ro’o asking him to spare the victim (“who faithfully provides the God with pigs and red feathers”) and transfer the “evil” to the sorcerer, represented by the banana shoot, so that the latter will himself be destroyed (i.e., his soul will be grated for food for the gods in the *pō*). It is not clear from the prayer itself what is meant by the “evil” (*te ‘ino*), but, from further statements in Henry, it could be interpreted as implying that the action taken by Ro’o consisted in forcing the attacking fetchers to leave the victim and turn on their own keeper, their parent-kindler, destroying him and his family, and then disappearing from the world of light (*ao*). (1928:210–212)

In other instances it was necessary to learn the identity of the sorcerer or his client or both, before attempting to save the victim. A specialist was needed to perform this service—usually the same specialist who exorcised the attacking fetchers. The sources do not describe how this was accomplished, but presumably the specialist’s own spirit-familiar was involved in the denouement.⁶⁷

One method of counterattack involved engaging a specialist to employ his own spirit-familiars to attack the sorcerer (and possibly his client), "... and if the demon employed by [the patient and his relatives] was equally powerful with that employed by the first, and their presents more valuable, it was generally supposed that they were successful" (Ellis 1829:II, 233). But, according to Moerenhout, any such counterattack had to be aimed at the sorcerer's client, the sorcerer himself having been protected by his fetchers (1837:I, 541-542). Still another method of saving the life of a victim of sorcery consisted of bribing the sorcerer: an arrangement, according to Moerenhout, which was eminently satisfactory to the latter, not only because of the additional fee but because it provided him with a dignified excuse should the original sorcery have failed.

When it was suspected that an illness was due to spirits acting on their own initiative, or in response to a curse, the procedure was to induce them to desist by means of expiatory prayers and sacrifices. In some cases this had to be preceded by open confession on the part of the individual whose curse had activated the offending spirit, or whose acts of familial dissent or of sacrilege or of impious neglect had aroused some spirit's anger. (However, it should be emphasized that individuals were often thought to have been stricken because of the actions of others.) The prayers and sacrifices offered under these circumstances varied according to the social status of the stricken person and the duration of the illness. In simplest form they consisted of a brief rite at the family marae, with a perfunctory prayer and a small offering of food. A slight variation on this basic pattern was described by Banks:

I never hapned to be present when their preists performd their ceremonies for the cure of sick people, but one of our gentlemen who was informed me that it consisted in nothing but the preist repeating certain fixd sentences during which time he platted the leaves of the Cocoa nut tree into different figures, neat enough, some of which he fas(t)ned to the fingers and toes of the sick man, who (was during) the time uncoverd as in respect to the prayers, the whole ceremony almost exactly resembling their method of praying at the *Marai's* ... (Beaglehole: 1962:I, 374)

At the other extreme, for the critical, obstinate illness of a chiefly personage, many of the resources of his realm were applied to his cure. Priests kept up continual prayer services at his ancestral and district marae, which were often refurbished for the occasion. Much of his subjects' wealth in pigs and fine textiles were sacrificed; and if this had no apparent effect humans as well were sometimes sacrificed. If the vengeful spirits paid no heed to all this, priests ran about the countryside summoning them in frenzied cries, and the patient was vigorously fanned, on the supposition that spirits characteristically rode on whirlwinds. Meanwhile music described by Europeans as "doleful" was played on flutes and drums—whether to attract the spirits or simply to advertise the occasion's solemnity is not entirely clear.⁶⁸

The propitiatory prayers were sometimes uttered in a most dramatic fashion. If, for example, it was determined that some other individual—say, the patient’s father—was responsible for the illness, the culprit would announce his confession by proceeding to the marae with a cord tied around his neck. A priest would then hold the cord and address the spirits: “Here is the father to atone for the patient.” And the father would add: “Yes, here is your human pig; cease to be angry.”⁶⁹ Moerenhout’s description of such an episode is fuller:

When it was discovered that an action by some member of the patient’s family was responsible for the latter’s illness ... the lamentations of the culprit were intense: he wept and prayed night and day, offering to sacrifice all that he possessed; and it was not unusual for him to betake himself to the marae, with a cord around his neck, throw himself to the ground before the images of the gods, and cry out: “O gods! Take me as a token of my repentance; and restore the health and happiness of my family.” If the culprit was a female, then she made her prayers outside the marae. (1837:I, 543-544)

If the patient happened to be an important personage, then in place of his relatives a band of strong men presented themselves as atonements, but, according to Henry, none of these was actually sacrificed (1928:290).

Another kind of action which accompanied some illnesses was in the form of ceremonial weeping beside the patient; but it is not clear whether the participants did so to reassure the patient of their sympathy (and loyalty) or to dramatize the occasion and thereby help induce the spirits to intervene. In either event (and perhaps both motives were present), the weepers crowded around the patient and stained pieces of bark cloth brought for the occasion (*‘ahu ‘oto* ‘weeping cloth’) with their tears or with blood produced by gashing themselves.⁷⁰ For example, when Pomare II was ill

Many companies of people from various parts have come to testify their concern for the King. They come in procession bearing a very long piece of cloth which they call *ahu oto* or weeping cloth. This is received of them by the King’s attendants, when they assemble themselves around the King’s bed and weep, the tears gushing from their eyes, and being wrung from their noses, but without much noise. After about 10 minutes they cease weeping and the King desires them to withdraw. (Crook, Journal, 3 December 1821, LMS Archives)

Moerenhout offered the opinion that these dolorous ceremonies, far from comforting most patients, served mainly to increase their anxieties and thereby aggravate their illnesses. (1837:I, 544-545)

Finally, if all else failed to move a spirit to overcome or withdraw the cause of an illness, the patient and his supporters occasionally went so far as to repudiate it (*fa’arue atua* ‘cast away the god’) and induce another one to take its place. Conversely, when a patient recovered from a bad illness it was customary to offer thanks in prayers and sacrifices and, in the case of important personages, to serenade the convalescent with music and dancing (Corney 1915:329).

Having discussed Maohi maladies in terms of general considerations of cause, diagnosis, and treatment, it may be useful to provide a list of the more common maladies.⁷¹ First are those believed to have been of pre-European incidence or prevalence:

Muteness: several cases, but no reported instances of deafness.

Blindness: also several cases. In addition, there are reports of sties and what appears to have been ophthalmia.

Rupture: said to have been "Very common, frequently Swelling to a Prodigious size, these are perhaps occasioned by too great an exertion of Strength when Wrestling, which however we were not able to persuade them to believe ..." (Morrison 1935:230).

Broken bones: frequent.

Rheumatism: said to be a common complaint, possibly seasonal. Bligh described some people as being "old and rheumatic."

Gout: several reports of a disorder similar to gout.

Humpback:

Among the most prevalent and obstinate diseases to which, as a nation, they are exposed, is one which terminates in a permanent affection of the spine; it usually appears in early life, commencing in the form of an intermittent and remittent. The body is reduced almost to a skeleton; and the disease terminates in death, or a large curvature of the spine, so as considerably to diminish the height of the individual, and cause a very unsightly protrusion of the spine between the shoulders, or a curvature inwards, causing the breast-bones to appear unusually prominent. Multitudes in every one of the Society Islands are to be seen deformed by this disease, which the natives call *tuapu*, literally, projecting; or as we should say, humped-back. (Ellis 1829:II, 272-273)

Insanity: several forms of behavioral abnormality are specified in the sources, including violent fits, temporary insanity, and conditions of more or less permanent fixation. I wrote briefly in an earlier chapter of the last-named state. Concerning temporary insanity Morrison wrote:

The Insanity is only temporary, and perhaps may proceed from too great a flow of Blood & spirits and a Want of Exercise, as it generally Commences when the Bread begins to be ripe—at which Season others are troubled with Boils on their legs and thighs, this being the Wet Season and the Sun over head when they are More Confined to their houses by the rain; this generally leaves them when the Sun returns to the Northward, and it is Not Common for a Man or Woman to have it return, tho during its stay with them they are very Mischevious and go quite Naked. With some it stays longer than others & they have it in different degrees from a heavy dull Melancholy to raving Mad. They never bind them but let them run and some travel all round the Island Naked in the time of their Madness and none interrupts them unless they do some Mischief as they suppose them possesd with some evil spirit. This is Common to Weomen as well as Men, who are not restrained but sufferd to take their own Course till the spirit leaves them when they return home and wear their Cloaths as usual. (1935:228-229)

Other ailments described as having been seasonally epidemic are stomachache and fish poisoning. Rodriguez mentioned a case of what might have been ptomaine poisoning, and the LMS Archives record instances of lockjaw. Rodriguez also reported the case of “A Chief lady” who was “seized with an oppression or pain at the heart.” Coughs and colds were evidently quite common.⁷²

There are additional diseases mentioned in the sources.⁷³ Bligh described two persons as having died of “consumption.” The LMS Dictionary lists a native term, *tūto’o*, lasting cough, asthma, which later became identified with tuberculosis. There was also the term *hotate*, a fever or ague attended with wasting.

Dropsy: reported by J. Forster.

Elephantiasis (*fe’efe’e*): reported for both limbs and testicles.

I have already described some of the observed effects of excessive imbibing of kava. What may have been a form of ringworm was also reported. But the most problematic disease suffered by the Maohis, other than coral sores, which must have been widely prevalent, was body ulcers. Many observers were uncertain as to whether they were seeing a native form of yaws or the European-introduced venereal diseases.⁷⁴

Another somewhat problematic pair of diseases that confused early writers on the Maohis was “Chief’s leprosy” (*ō’ovi ari’i*) and true leprosy. The former was defined as a certain scrofulous disorder (LMS Dictionary); (*scrofula* is described in the *Shorter Oxford English Dictionary* as a constitutional disease characterized ... by chronic enlargement and degeneration of the lymphatic glands. Also called *King’s Evil* and *Strumma*.)

The earlier European visitors disagreed in their appraisals of the general health situation. Against Morrison’s statement that the Maohis were “vigorous and healthy” (1935:230), one finds Bligh’s statement:

... I do not beleive that they have superior blessings with respect to health; we already see them with dreadful Cancers, Consumptions, Fevers, Fits and the Scropula in a Shocking degree, and we may infer many incidental diseases besides. The fertile Country and delightfull Climate of the Society Islands does not therefore exempt its Inhabitants from the attendant miseries of ill health. (1789:II, 31)

But none of their bodily afflictions prepared them for the diseases—including gonorrhoea, syphilis, influenza, true leprosy, dysentery—unwittingly introduced by Europeans. The cumulative effects of these served nearly to decimate the native population within four decades after the first Europeans stepped ashore.

Death

It is astonishing with what indifference these People speak of Death—it has even appeared to me that they cared little how short their existence was, they are

nevertheless afraid of the final stroke, when by War or accident they have reason to expect it; while in disease they are patient and not alarmed. (Bligh 1792:169b)

The only crimes for which one was punished, in this world or the other, were for not observing sacred rites, negligence and disrespect for the gods and altars. Men who felt they were guilty of these faults, rarely neglected to try to appease the gods during their lifetimes, otherwise, if they unexpectedly became ill, they attributed it to the wrath of the gods. They almost always succumbed to their fears and agonies, persuaded that the gods awaited them, just as we believe the devil does, impatient to *ounouhi te varoua* ('tear the soul from the body'), they lamented, prayed, sought refuge at the foot of the altar, sending offerings, and dying, generally presented to their family and their friends the horrible spectacle of the last moments of those unhappy ones to whom an overexcited imagination, or true remorse fortold eternal torment after their death. These circumstances were rare, but horrifying, the dying calling the priests with great shrieks, since these were, as everywhere, the only ones who could save the guilty, by pacifying the gods; and they, as everywhere, received, most often, from the hands of the sufferer, all his goods and those of his family, for the mere promise of pardon for his sins and exemption from terrible punishment. (Moerenhout 1837:I, 433-434)

Insofar as one can reconstruct Maohi beliefs at this remove in time, the transition between *ora* and *pohe* (or *mate*) was considerably less abrupt than that formulated by modern-day science. Except, perhaps, for cases of unexpected death: "Sudden death was also attributed to ... [direct power of the god]—and an attack so terminating, was called *rīma atua*: "hand of god." Those who died thus were also said to be *haruhia e te atua*, or *uumehia e te atua*: "seized by the god, or strangled by the god" (Ellis 1829:II, 274-275). Even as late as 1827 people still clung to the belief that under certain circumstances a corpse could be revived, by inducing its departed soul to reoccupy it:

Last evening the people were crowding past my door. On enquiry I found that they were going to be present while a certain person was to return the departing soul into the body [of a dead child] and cause it to reoccupy its habitation. The person to whose house they were going belongs to our church. I immediately wrote to him & requested that he would make himself so foolish as to suffer the wicked man to try to keep back the soul of the child but send them all home directly. This he did, & the circumstance died away. (Orsmond, Journal, 15 October 1827, LMS Archives)

A favorite legend that seems to have been widely believed concerned an upper-class young woman of Huahine, named Ariipaeavahine, whom the gods brought back to "life" by revivifying her decaying body by reuniting it with her wandering soul. That she had truly "died," in terms of the usual criteria, was attested by the fact that her revived body continued to bear the mottled markings of fleshly decay (Henry 1928:220-223; also Ahnne 1925). Grounds for such beliefs can be seen in the following episode reported in the missionary journal for 1805:

We have still to lament that the natives continue to show as much backwardness to hear the gospel, and as little inclination to obey it, as they did three years ago. They are deeply rooted in their prejudices against the truth, and in their love for their own delusions. They eagerly grasp at every occurring incident that tends to harden them in their infidelity, and with great greediness, embrace any lie that is proposed to them. A few days back the wife of a priest in Opeimanno was given out to be dead, and so continued two days; when, to the surprise of her husband and neighbours, she unexpectedly revived again. She has given a long and nonsensical account of the Po, or other world; which, notwithstanding its absurdity, her deluded countrymen seem to receive with a strong persuasion of its reality. Many, from all parts of the district, have gone to gaze on this supposed wonderful personage, and to hear her story. About eight months back a similar matter was transacted in Fwhaa, by the wife of a great priest there. Stupid old women pretend to be inspired by their gods, and utter their oracles with all the fantastical foolery a besotted heathen is capable of. One of this description has lately been running up and down Taue-Valley, in Oparre. (LMS Transactions:III, 51)

Notwithstanding these ambiguities, the state of "dying" was usually recognizable, and the social recognition accorded it seemed to legitimize the transfer of tangibles: "If a man bequeaths his property to another on his death-bed, no person disputes the bequest, as there are always witnesses abundant to the gift, if the heir is not present" (Wilson 1799:325-326). In addition, the process of dying was invested with special significance for the transfer of knowledge as well, as was exemplified in a passage quoted earlier concerning the "inheritance" of a sage's knowledge by his heir (Henry 1928:290).

During recognizable states of dying, measures were taken to facilitate the exit of the soul and to protect it from hostile spirits. Someone, usually a priest, formed a little container out of leaves and placed it near the invalid's head, into which the soul might enter when leaving the body through the head, as it always did. A passage from Bligh describes this practice, as well as the continuing efforts that were made to maintain "life" even after most signs indicated "death":

This afternoon a Youth who lived near our Post died of a Consumption. As the Surgeon visited him from time to time, we knew of his death as soon as it took place. I therefore went to the House where were collected a few friends of the deceased. The Father was seated on the ground by his son with his legs across his thighs squeezing and pressing them, called Roomee [*rumirumi*]. Frequently he prest the eyelids over the Eyes and at times fanning away the flies, the Mother was seated on the opposite side driving a Sharks tooth into her head by which the blood run in Streams to the ground. No greif could appear more affecting than it did in these poor unhappy Parents, its violence however, or perhaps from some other cause, created intermissions which were more lasting than I expected. The Corps was stretched on the ground upon a Matt, and at the head was placed some twisted Cocoa Nutt leaves and some others with a few peices of Breadfruit. A bunch of the Cocoa Nut leaves were tyed up as a Nosegay is, and this they called the Morai of the deceased. (1789:II, 50)

According to Henry the maire fern was sometimes used in place of coconut leaves (1928:291).

It is likely that several different kinds of measures were undertaken to protect the departing soul from hostile spirits. One of these was to provide food offerings for them, to deflect them from consuming the soul itself. The only other measure specifically reported consisted of attaching red or yellow feathers to the dying person's little fingers (Henry 1928:291; Corney 1919:93).

The missionaries encountered particularly stormy opposition to the Christian doctrines of Resurrection:

They offered only two reasons why the dead will not be raised again. 1. Many have been dead several thousands of years, & still are not raised. Hence they infer, that there be no resurrection. 2. They are rotten & become dirt; therefore they affirm it is impossible ... They strengthen their unbelief in the resurrection by their own traditions. They say, that it was through the first woman, whom they call Hyena, that the moon, apples, turmeric &c. was put into that state, to die & live again in their season& and if she had got her will, man would have been so too, but the first man, whose name was Tee, wd. not agree to her proposal, & therefore man will never live again. (Elder & Wilson, Journal, 5 July 1803, LMS Archives)

If, finally, all measures failed to retain or bring back the soul to the body, before it suffered too much decay, the end was conventionally pronounced with the statement: "The spirit is drawn out by the gods" (Henry 1928:291), and with this began a series of events which will now be recounted.⁷⁵

For the following few days the corpse was kept at home, usually inside the house, and laid out on a sleeping mat. (In the case of Vehiatua, high chief of Tahiti's peninsula, his body was taken outside his house on occasion to enable the throngs of his mourning subjects to see him [Corney 1915:344].) During this period one or more of several kinds of events took place: the corpse was bathed, oiled, and dressed; the cause of death was sought; soul-reposing prayers were uttered; and the survivors indulged in conventionalized expressions of grief.

In addition to being bathed the corpse was rubbed over with scented oil to overcome the fast-developing odor of decay, and sweet-scented leaves and flowers were spread around the body and throughout the house for the same reason. Henry reported that it was "relatives and friends" who prepared the body (1928:291), but neither hers nor any other account specifies which relatives or friends these were. Exactly who performed this most intimate of services may of course have been of little or no significance, but in some Oceanic societies the allocation of this duty—also regarded as a rare privilege—had important social implications.

Divining the cause of death (which was not done invariably) was usually

left to a specialist, who was remunerated for his services. According to Henry this was a *tahu'a tutera*, some of whose functions were described earlier in connection with divining the cause of sickness—which, after all, differed from “death” only in degree of finality. Henry’s account of this specialist’s procedure follows:

... a *tahu'a tutera* went out in a canoe, paddling slowly along the coast facing the house of the deceased, to find out the cause of the death by watching the flight of the spirit, which it was believed, would approach him with an emblem revealing the cause. If the spirit appeared to him in a flame of fire, it was a sign that the deceased had been a victim of the black art, fire being used by sorcerers in their incantations. If the spirit came out with a feather amulet in his hand, it showed that some one had used it to bring down the displeasure of the gods upon the deceased. If it looked dejected, some personal matter had been the trouble; but if it looked happy, all concluded that it had been the proper time for the deceased to go. (1928:291)

Henry’s version differs from that of Ellis: “If he had been cursed by the gods, the spirit would appear with a flame, fire being the agent employed in the incantation of the sorcerers; if *pifaod*, or killed, by the bribe of some enemy, given to the gods, the spirit would appear with a red feather, the emblem or sign of evil spirits having entered his food” (Ellis 1829:I, 518). Henry’s version is somewhat more consistent with other known facts, although, as has been previously pointed out, Maohi society incorporated many procedural variations. On the other hand, Henry did not explain what a “personal matter” might have been, nor how it could have resulted in death; and the notion of a “happy”-looking spirit pleased to pass on because of its “proper time” smacks of an eschatology not wholly Maohi.

Next, according to Henry, if the death was discovered to have come about through “illness”⁷⁶—whether from sorcery or curse or *hara* is not specified—it was necessary to calm or dispel the deceased’s ghost by means of a soul-reposing prayer (*tui fa'arairai* or *tui hana*), usually performed by the presiding priest (*tahu'a fa'atere*). Ellis placed the soul-reposing episode after embalming (1829:I, 522). While this was in progress

... a straight branch of the *ti*, which has broad, spreading leaves and was supposed to be full of magical power, was stood erect by the corpse to conduct the soul to the spirit world. Breadfruit flower spikes and the tips of the stems of banana leaves, each one representing a member of the household of the deceased, were placed under the arms of the corpse while an address suited to the circumstances was made in the following manner:

Here is thy father; here is thy mother; here is thy wife (or husband); here is thy son; here is thy daughter; here are thy relatives (and so on). Turn thy face to Hades; look not back to this world. Let sickness end with thee.

If after this *tui* the family had no more sickness and saw no signs of a ghost hovering around them, they said, “*E tui hana maitai roa teia*” (This is a very good soul-reposing prayer). But if the illness followed, they called the prayer a *tui pee* (prayer that missed) and sought the aid of another priest to obtain the desired

effect. All the household and relatives contributed towards paying the priests well, so as to secure their good will; their displeasure was carefully avoided by the people, who believed that their curse could bring sickness and death. (Henry 1928:291-292)

At a wake witnessed by Rodriguez the body was taken to a marae for prayers and then returned home (Corney 1919:34). Banks, on the other hand, stated that the priest presiding on this occasion carried out part of his ritual at the seaside:

The preists office now begins; he prays over the body, repeating his sentences, and orders it to be carried down to the sea side; here his prayers are renewed, the Corps is brought down near the waters edge and he sprinkles water towards but not upon it, it is then removed 40 or 50 yards from the sea and soon after brought back and this ceremony repeated which is done several times. (Beagle-hole 1962:I, 376; see also J. Forster 1778:559)

Aside from the circumstance that seawater served in general as a purifying agent, I can suggest no explanation for this ritual episode.

Meanwhile the house was the scene of mourning (*'otoha'a, taiha'a*) in which grief, real or simulated, was expressed in several customary ways. Real or forced tears mingled with repeated interjections of *ae! ae!* flowed from nearly everyone present (Corney 1915:338; Jefferson, Journal, 3 July 1799, LMS Archives). Some mourners (only women, reported Henry and Morrison; both sexes, according to Ellis) gashed their heads and breasts with a shark's tooth instrument and caught the blood on pieces of bark cloth, which they left with the family of the deceased. This was in order to "strengthen the psychic bond with the deceased relative's soul" (E.S.C. Handy 1927:292).

Visitors to the wake brought condolence gifts of mats and bark cloth, along with red feathers if the deceased were socially important.

When any great personage such as a member of the R¹ family, or a high Chief among subjects, dies, the King and all the great folk comprised in that family, and the District head Chiefs and deputies, assemble together. Each one carries a piece of new cloth to the deceased, and a small plantain shoot. They all form into two lines and walk in a procession towards the deceased's house, preceded by two of his female relatives distinguished from the rest by wearing small mat vestments of very fine quality which they call *ahuaras* [*ahu fara* pandanus mats], without any protection of cloth at all, excepting a strip they carry in the hand to receive the blood that they draw from their heads by means of a shark's tooth with which they scarify themselves in token of grief; which action they accompany by various lamentations. As each mourner arrives in rotation before the deceased he places the piece of cloth he is carrying at the feet (of the corpse), and lays down the plantain sucker in front of the widow, who occupies a seat near the deceased; and each one offers her at the same time some words of condolence. (Corney 1915:261-262)

While it is certain that such visits did not always follow a procedure as formal and well regulated as this, this description is indicative not only

of the solemnity which imbued the wakes of great personages but also of the importance of the gift of bark cloth and mats, which is confirmed in an excerpt from the journal of a missionary: "July 3, 1799. Brs. Nott & Jefferson went to Oparre with a design of seeing how the natives treated the corpse of Vareede, but they were debarred from having their design fulfilled, as the place where the body was lodged was prohibited to all, except they brought a gift of a peculiar kind of cloth" (Jefferson, Journal, LMS Archives). The relatives of the deceased took considerable pride in the quantity of cloth brought to a funeral and preserved it as a tangible sign of the deceased's acknowledged position and prestige.⁷⁷

The crying and the wailing were periodically interrupted with eulogistic speeches and elegies, of which Ellis provided a sample:

Thickly falls the small rain on the face of the sea,
Not rain, but the weeping it is of 'Oro.
[recited on behalf of an only son]

The pride of Atiapii [Huahine] sleeps in the cavern;
Departed has its glory, or its brightness.
[recited on behalf of the heir to the chieftainship of Huahine] (1829:I, 531)

Longer dirges were composed for some occasions, as for example the one in honor of Moehonu, a Ra'iatean chief who had fallen in battle:

A row of stars, a mountain that stands
 apart inland, leading to Aihi.
The chief from the rising of the sun,
The dear warrior, handsome in death,
 has become like a bird!
Kingly body of Ahuroa, thou art overthrown!
My sky is darkened to me now!
True ancestor of Tapoa,
The warrior who made Borabora great,
Glide down thither dead, O my chief,
By the slippery mountain.
Blow (wind) around the Mehani.
The god of the darkness (Hades) will
 praise (him),
The overthrown one who is dead.
What can quiet (Grief for the) dear face
 so pallid!
At the altar stone 'tis done!
A strange kind of wind is this, O woman of peace,
Moehonu is separated to the cold bed
 (of death), alas!
His axe sleeps at Borabora,
It lies at Vaitaha.
What art thou lamenting, O Tefaaroa?

Dead is Tepeete.

He was the man who held the helm of state (lit. weights of
the fish-net),

So that Faanui is saved.

A person beloved at the fort Patahi.

Yonder is Moehonu, far away,

Inside of the turning place (Tioi)

(While) Remembered by the widowed

one!

(Alexander 1893:58)⁷⁸

Relatives of the deceased also cut their hair as a sign of mourning:

When any person dies the relations flock to the House in numbers making much lamentation and the Weomen cut their heads with sharks teeth; both sexes cut their hair off different parts of their heads, sometimes Cutting all of but a lock over one Ear, sometimes over both & the rest Close cut or shaven.

For the loss of a relation they Cut a square place bare on the fore part of their head which they keep bare for 6 Moons or longer, according to the love they bear the deceased; but for a favourite Child they wear it so for two or 3 Years and all the hair they Cut off is either thrown into the Sacred Ground or Carried to the Morai. (Morrison 1935:231)

As could be expected, the initial mourning for socially important persons was extended beyond the bounds of kinship. For several days after the death of such a person a general mourning restriction (*ta'imara*, *mo'e*) was enforced, prohibiting the kindling of fires, the use of canoes for fishing, and even the taking of food during daylight hours.⁷⁹

Questions concerning the fervor and "sincerity" of Maohi mourning behavior are directly relevant to our concern with social relations. Here are several reports on this matter indicating the range of variations that obtained (both in the events themselves and in interpretations of them). First, I quote a general statement made by Ellis:

Almost every native custom connected with the death of relations or friends, was singular, and none perhaps more so than the *otohaa*, which, though not confined to instances of death, was then most violent. It consisted in the most frantic expressions of grief, under which individuals acted as if bereft of reason. It commenced when the sick person appeared to be dying; the wailing then was often most distressing, but as soon as the spirit had departed, the individuals became quite ungovernable.

They not only wailed in the loudest and most affecting tone, but tore their hair, rent their garments, and cut themselves with shark's teeth or knives in a most shocking manner....

... they cut themselves unmercifully, striking the head, temples, cheek, and breast, till the blood flowed profusely from the wounds. At the same time they uttered the most deafening and agonizing cries; and the distortion of their countenances, their torn and dishevelled hair, the mingled tears and blood that covered their bodies, their wild gestures and unruly conduct, often gave them a frightful and almost inhuman appearance. This cruelty was principally performed by the females, but not by them only; the men committed on these occasions the same enormities, and not only cut themselves, but came armed with clubs and other deadly weapons. (1829:I, 526-527)

The observant Banks questioned the depth of all this display of feeling:

As soon as any one is dead the House is immediately filld with their relations who bewail their Loss with Loud lamentations, especialy those who are the farthest removd in blood from or who profess the least greif for the deceas'd; the nearer relations and those who are really affected spend their time in more silent sorrow, while the rest join in Chorus's of Greif at certain intervals between which they laugh, talk and gossip as if totally unconcern'd.... (Beaglehole 1962:I, 376)

To this can be added the observations of Rodriguez and of Vancouver:

From the neighbouring settlements and valleys an immense concourse of people collected to bemoorn the death of the *arii*, the Chiefly ladies bleeding themselves more as a matter of form than from grief or real sentiment, inasmuch as they drifted after a little while into busy conversations about their private affairs. (Corney 1919:186)

The grief of these good people is of two descriptions, natural and artificial; it is excessive on the first impulse, but soon moderates and wears away. (Vancouver 1801:296)

Much evidence suggests that the grief felt by a woman upon the death of her children was most profound. For example: "The Weomen often Cut themselves on these occasions till they bring on a fever and I have known a Woman Cut herself for the loss of a Child till a delirium was brought on which ended in the total loss of her reason" (Morrison 1935:231).⁸⁰ Yet, note Bligh's experience:

In my way back I was suddenly surprized at a violent degree of distress by some one at a little distance off, where I saw a Toopapow [ghosthouse]. As I expressed a desire to see the distressed person, Tynah took me to the place, but we no sooner came in sight than the Mourner burst into a fit of laughter at seeing me. This person was the Mother of a Young female Child that lay dead. Several Young Women were with her, but they all resumed a degree of cheerfulness, and the tears were immediately dried up. I told Tynah the Woman had no sorrow for her Child, as her greif could not so easily have subsided if it was the case that she regretted the loss of it. When with some humour, he told her to cry again; however we left her without any visible marks of its return. These are nevertheless funeral rites which are paid to the deceased at certain times after his death, but it is extraordinary that the great degree of sorrow and distress that these people are susceptible of can be changed in an instant to an opposite extreme, and unless it can be proved, that as impressions are most violent they are the least lasting, I see no way of accounting for it, as they are fond Parents and in general affectionate and friendly to one another in the highest degree. (1789:II, 18)

To this can be added an observation of the missionaries: "July 4, 1803: There was a young woman in the house abt. 13 years of age just in the agonies of death ... None of the people present, not her father, mother, nor sisters, seemed at all affected with the solemn sight of a soul departing into eternity ..." (Elder & Wilson, Journal, LMS Archives)

In this connection, a statement by Bougainville is interesting, if not altogether credible: "The mourning for the fathers is very long. The women

mourn for their husbands; but the latter do not do the same for them" (1772:270). The first part of this statement is probably correct, the second part is demonstrably incorrect—although it is probably true that men did not engage in public display of their grief as violently as did women.

As could be expected, the greatest public outpourings of grief were reserved for tribal chiefs and for the incumbents of high-ranking kin-Titles:

I am not prepared to say that the same enormities were practised here as in the Sandwich Islands at these times, but on the death of a king or principal chief the scenes exhibited in and around the house were in appearance demoniacal. The relatives and members of the household began; the other chiefs of the island and their relatives came to sympathize with the survivors, and, on reaching the place, joined in the infuriated conduct of the bereaved; the tenantry of the chiefs also came, and, giving themselves up to all the savage infatuation which the conduct of their associates or the influence of their superstitions inspired, they not only tore their hair, and lacerated their bodies till they were covered with blood, but often fought with clubs and stones till murder followed.

... I cannot conceive of a spectacle more appalling, than that which the infuriated rabble, smeared with their own blood, presenting every frightful distortion in feature, and frantic madness in action, must often have exhibited. This scene was sometimes continued for two or three successive days, or longer, on the death of a person of distinction. (Ellis 1829:I, 528)

Ellis, writing several years after this form of mourning had been outlawed, asked his informants for the reasons behind such violent displays:

I have often conversed with the people on their reasons for this strange procedure, and have asked them if it was not exceedingly painful to them to cut themselves as they were accustomed to do. They have always answered that it was very painful in some parts of the face—that the upper-lip, or the space between the upper-lip and the nostril, was the most tender, and a stroke there was always attended with the greatest pain—that it was their custom, and therefore considered indispensable, as it was designed to express the depth of their sorrow—that any one who should not do so, would be considered deficient in respect for the deceased, and also as insulting to his family. The acts of violence committed, they added, were the effects of the paroxysms of their sorrow, which made them *neneva*, or insensible. They continued till their grief was *ua maha*, or satisfied, which often was not the case till they had received several severe blows upon the tender part above mentioned. (1829:I, 528–529)

After the events just described, the corpse was removed from the dwelling and either buried immediately or placed inside a ghosthouse (*fare tupapa'u*) for several weeks or months (figs. 13-1, 13-2). But in either case, everything, such as bedding, mats, clothing, that had been in physical contact with the deceased during illness and after death had to be burned. This was done in purifying fire (*auahi tutae'e*), after which the presiding priest pronounced a closed-by-burning (*pani tutui*) benediction, which stated that the pollution (*māhuruhuru*) was thereby disposed of. Following this it was

FIGURE 13-1. A ghosthouse (*fare tupapa'u*), with costumed chief mourner in foreground. Unsigned drawing. British Museum.

safe to reoccupy the dwelling (Henry 1928:293; Morrison 1935:231). The exact nature, or cause, of this particular species of “contamination” is not clear. Morrison referred to it as the “disorder” which brought about the death, Ellis as “the guilt of the crime for which the deceased had died.” According to the latter, all persons who had touched the body or the garments of the deceased were also required to purify themselves by bathing in the sea and casting into the sea their own garments worn while in contact with the corpse (1829:I, 523).

Fear of contamination was probably not the only motive for destroying, or safeguarding, the deceased’s personal effects:

All the articles that the queen used and supposed to have had a particular regard too, which was not otherwise disposed of during her life, have been put in the Marae where she is put up—and to prevent them being taken away and used, they are broken to peices or otherwise spoiled, such as her cups she ate out of, Umette [*umete* ‘wooden bowl’], combs, and a Tommahawk—Baskets also all her cloth was put about the body ... (Davies, Youl et al., 1 August 1806, LMS Archives)

It is plausible to suppose that among the reasons for destroying or safeguarding a deceased’s personal effects was also the desire to insure that such things could not be used as *tupu*, exuviae, by some hostile person waiting to gain control of the deceased’s ghost through sorcery.

It is not altogether clear why some bodies were buried directly after the household wake, and some exposed in a ghosthouse for a further period of mourning. The nature and cause of the fatal illness or injury was relevant, according to Morrison, who wrote, “... those who die without disease are either laid on a beir or embalmed” (1935:231). But, Morrison did not explain what he meant by “disease,” and there are reported instances of preservation in ghosthouses, including embalming, of persons who have died after lengthy illnesses. It is logical to assume, and probably accurate, that most important personages were thus exposed for an additional period of mourning, but there is evidence of relatively unimportant persons as well having been accorded this treatment (Bligh 1789:II, 44). Neither sex nor age appears to have been an absolute criterion in this respect, although there were proportionately fewer females or very young persons among the preserved bodies actually seen and reported on by the early Europeans. During troubled times, when deaths were numerous, it would have been physically difficult to handle many corpses in this way. Certainly during the almost continuously troubled final quarter of the century, when more devastating warfare and many introduced diseases took an increasingly large toll, the practice of exposing corpses in ghosthouses simply became a practical impossibility in most instances. Under normal circumstances, therefore, practical considerations must also have been influential: if the deceased’s relatives and friends were able to do so, and strongly enough motivated, then they arranged for the body to remain in view to receive further expressions of grief.

Banks provided a good description of the complex of structures which included the ghosthouse:

During our absence at Imao [Eimeo] an old woman of some consequence, a relation of Tamio, was dead and was plac'd not far from the fort to rot above ground as is the custom of the Island. I went this morn to see her. A small square was neatly raild in with Bamboe and in the midst of it a Canoe awning set up upon two posts, in this the body was laid coverd with fine cloth. Near this was laid fish &c. meat for the gods not for the decaasd, but to satisfie the hunger of the de-ity least they shoud eat the body, which Tubourae told us they would certainly do if this ceremony was neglected. In the front of the square was a kind of stile or place lower than the rest, where the relations of the decaasd stood when they cry'd or bled themselves, and under the awning were numberless rags containing the blood and tears they had shed. Within a few yards were two occasional houses& in one of them some of the relations constantly remaind generally a good many; in the other the cheif male mourner resided and kept a very remarkable Dress in which he performd a ceremony, [i.e., a *heiva*] ... (Beaglehole 1962:I, 286)

The first detailed description of a ghosthouse appeared in the *Endeavour* journal of Captain Cook:

April 21, 1769: Yesterday as Mr Green and Dr Munkhouse were taking a Walk they happen'd to meet with the Body of the Man we had Shot, as the Natives by signs made them fully understand, the manner in which the body was enterr'd being a little extraordinary I went to day with some others to see it. Close by the House wherein he resided when living was built a small Shade [shed], but whether for the purpose or no I cannot say for it was in all respects like some of the Shades or house's they live in. This Shade was about 14 or 16 feet long, 10 or 12 broad and of a proportional height, one end was wholly open the other end [and] the two sides were partly inclosed with a kind of wicker'd work. In this shade lay the Corps upon a Bier or frame of wood with a Matted bottom like a Cot frame use'd at sea, and supported by 4 posts about 5 feet from the Ground, the Body was cover'd with a Mat and over that a white Cloth, along side of the Body lay a wooden Club, one of their weaphons of warr. The head of the Corps lay next the close end of the Shad[e], and at this end lay 2 Cocoa-nut Shells such as they some times use to carry water in. At the other end of the Shade was a bunch of Green leaves with some dry'd twigs tied all together and stuck in the ground and a stone lying by them about as big as a Cocoa-nut, near to these lay a young Plantain tree, such as they use as Emblems of Peace, and by it lay a stone Axe; at the open end of the Shade was hung in several Strings a great number of Palm nuts. Without the Shad[e] was Stuck upright in the ground the Stem of a Plantain tree about 5 feet high on the Top of which stud a Cocoa-nut shell full of fresh water, and on the side of the Post hung a small Bag wherein were a few peices of Bread fruit roasted ready for eating some of the peices were fresh and others stale. The Natives did not seem to like that we should go near the Body and stud at a little distance themselves while we examine'd these matters and appear'd to be please'd when we came away. It certainly was no very agreeable place for it Stunk intollerably and yet it was not above 10 yards from the Huts wherein several of the Living resided. (Beaglehole 1955:83)

Some of the leaves noted by Cook probably served as deodorants (see Morrison 1935:232); the plantain tree, here as in most other ritual contexts,

served as an emblem of peace. The presence of food, including water and coconuts, in this context has been given two interpretations. According to Banks, it was designed to appease other spirits (Beaglehole 1962:I, 286, 377). Wilson, on the other hand, provided an indication that at least some of the food offerings were meant for the ghost of the deceased: "On the way we visited the tupapow of Orapia; he is in a sitting posture, clothed in red cloth, under a shed; a native attending day and night, and offering provisions to the mouth of the dead corpse, which not being received, he eats them himself" (Wilson 1799:161; see also Ellis 1829:I, 524).

Ghosthouses were usually built at or near the deceased's family marae, which meant that in such cases they were not prohibited to close female relatives. According to Ellis ghosthouses and more permanent sepulchers were invested with a fearsome type of contagious influence, called *aumiha*, which caused them to be generally avoided (1829:I, 524). It is undoubtedly true that the Maohis believed such places to be spirit-ridden, and hence fearsome, but whether the *aumiha* of Ellis' report was in addition to the influence of heightened activity by the spirits that normally hovered around such places is not clear, as no other source contains any reference to *aumiha*. The LMS Dictionary defines '*aumihi*, grief, pity, compassion, but does not list *aumiha*.

Bodies were left to repose on the bier in the ghosthouse for varying lengths of time, after which they were buried or otherwise disposed of. There is no information regarding the lower limits of this interval, but some bodies are reported to have been left for over four months. While a body rested in the ghosthouse one or more things were done in relation to it: efforts were made to postpone its physical decay; measures were undertaken to dispose of the "sins" that in some cases were thought to have hastened its demise; objects and prayers were offered to insure the departed spirit's vitality and benignancy; and conventionalized practices were carried out to honor the deceased and to demonstrate high regard for his survivors.

It appears that all bodies kept for any length of time in a ghosthouse were subject to some preservative treatment. At the very least they were cleaned, their skin rubbed with oil, and their body fluids allowed to drain. In some cases they were actually "embalmed," a difficult operation which required the services of an expensive specialist, a *tapua miri*,⁸¹ and which consequently was reserved for the socially important. As Bligh pointed out, if every deceased person had been so preserved, "... the whole country would become covered with Dead bodies which is not the case" (1789:I, 404).

The embalmer first disembowelled the corpse, using two fingers of one hand to pull the viscera out through the anus; then he is described as having "sucked" out the decaying brain through the nostrils—how this was done

was not explained. Brain and viscera were then buried in a marae. The disembowelment was carried out in great secrecy and with all due solemnity, because, suggested Vancouver, of their conception of the bowels as the seat of what Europeans call thinking and feeling (1801:293). The body fluids were made to drain into a pit dug underneath the bier, and after the body cavity was emptied it was filled with bark cloth soaked in scented oil. Then the limbs were kept pliant by moving them, the skin was toughened by rubbing with oil and frequent sunning, and falling hair was glued back on—altogether a laborious process requiring considerable skill and what must have been considered onerous and spiritually dangerous work. And while it was a far cry from the effective embalming performed say in Egypt, it succeeded, despite these Islands' tropical humidity, in preserving the external form of some cadavers for many months. For example, after viewing one embalmed corpse, Cook reported:

When we first went the body was under cover and wrapped up in cloth in the Tupapow, but at my desire the Man who had the care of it, brought it out and laid it upon a kind of beir or bed place, in such a manner that we had as full a view of it as we could wish, but we were not allowed to go within the railing that inclosed the Tupapow. After he had placed the Corse, he hung the place with Mats and cloth in such order as to have a very good effect. This Man had been dead above four months, and the body was so effectually preserved from putrefaction that there was not the least disagreeable smell about it. How this was performed I could not learn any more than what Omai told me, he said they mad(e) use of the juice of a plant which grows in the Mountains, Cocomat Oil and frequent washing in the Sea. I was told that they preserve the bodies of all the great men who die a natural death in this manner, and expose them to public view for a very considerable time after. At first they are laid out every day when it does not rain, afterwards the intervals become greater and greater and at last are seldom to be seen. (Beaglehole 1967:208-209)

Earlier in this journal Cook reported having visited the ghosthouse in which the remains of the great chief Vehiatua were still being kept, some twenty months after the latter's decease; but Cook did not comment on the state of the body.⁸²

As far as one can reasonably infer, while a corpse reposed in a ghosthouse it was constantly attended by an adult or two, whose job it was to keep the corpse clean, supple, and dry; to offer it food and drink; to alleviate the odor of decay with fragrant plants; to keep out unwelcome intruders; and to dress the corpse, usually in a sitting posture, when mourners arrive to view it. Henry reported that the attendants were either an elder member of the family or a priest; in the case of embalmed corpses the embalmer himself may have continued to attend the body (Henry 1928:296). G. Forster reported having seen a woman in attendance at a female corpse's ghosthouse (1777:I, 294).

Because of an attendant's physical contact with a corpse one might

suppose that his hands would be so "contaminated" that he would have been unable to convey food to his own mouth (see, e.g., Ellis 1829:I, 521ff.). Yet one visitor observed an attendant at a ghosthouse who offered "... provisions to the mouth of the dead corpse, which not being received, he eats them himself" (Wilson 1799:160). Perhaps this feeding episode took place after the corpse's contaminating features had been disposed of.

Mention was made in chapter 3 of the Tahitian word *hara*, a term which appears to have been used both for a person's wrongful acts and for the substance deposited in the person's body as result of such acts—an infectious substance made dangerous either through its own intrinsic malignancy or through its attraction to malign spirits.

Again, the tentativeness of this interpretation requires underlining—a tentativeness that will have to remain until some more plausible interpretation is offered, since it is unlikely that any additional Maohi data will turn up to throw more light on the matter. This, of course, is regrettable because if my interpretation is near correct the concept would have considerable importance for an understanding of Maohi social behavior, including behavior vis à vis spirits.

However the Maohis may have conceived the *hara* substance to look or to operate, from some accounts it appears to have been present in the substance that was drained from the body during embalming or, in other cases, to have left the body while it underwent natural decomposition on the ghosthouse bier. As previously noted, this substance was made to drain into a pit dug for the purpose under the bier. When it was all collected there, a small pillar or post of wood, said to represent the corpse, was placed in the hole, which was then filled with dirt, to the accompaniment of the following words: "With you let the *hara* now remain," "*Ei ia oe na te hara e vai ai*" (Ellis 1829:I, 522). According to Ellis the *hara* would thereafter remain attached to the buried pillar personifying the corpse, and hence would be less contagious. Perhaps this was the source of the *amihā*, or fearsome "contagious influence" noted by Ellis and reported above.

Ellis also stated that the general decontamination practices mentioned above took place after the *hara*-burying episode just described, but his account is somewhat inconsistent, in relating that the decontaminated persons returned to the house where the deceased had died and there addressed the dead body, saying, "With you may the *mahuruhuru*, or pollution, be" (1829:I, 523). Since the *hara*-burying episode took place at the ghosthouse, the corpse would have been there and not at the house where the person had died. Elsewhere I have noted the variation that there was in Maohi ritual practice, but I believe that here we have an example of uncertainties in the minds of the observers.

I noted above the offerings of food and drink made to a corpse reposing

in its ghosthouse. According to Henry it was a daily chore for the deceased's family to keep the corpse supplied with "... flowers, food dry and crisp, and fresh fruit, from which it was supposed to absorb the essence" (1928:296). De Barreda wrote of one high-chief's ghosthouse: "He had a table on which they place his food every day, in the belief that his spirit comes down to partake of it. On the opposite side was an ... [altar], whereon those who come to visit him deposit sundry fruits and fish" (Corney 1915:470; see also Ellis 1829:I, 524). In the case of this high chief (Vehiatua of Tairapu), a human sacrifice was offered to the gods (at a marae, not at his ghosthouse) on his behalf after his death, in addition to those offered before he died (Corney 1915:347; 1919:178). Similar mortuary sacrifices were reported on behalf of chiefs of Pare-Arue, and presumably were standard practice after the deaths of most great chiefs.

Actions carried on at the ghosthouse to honor the deceased and to express high regard for his survivors included one or more of several practices: repetitions of the conventionalized weeping (*'otoha'a*) carried out earlier at the house of death, mock combat, and "mourners' masque"; in addition, when a reigning high-chief died it was in some instances customary to carry his corpse around his whole realm before final interment.

In discussing the public outpourings of grief which usually followed the death of an important chief, I presented an excerpt from Ellis describing how many people flocked to the scene and "... joined in infuriated conduct," including fighting among themselves "... with clubs and stones till murder followed." In addition to displays like these, on such occasions a more formalized type of mock combat sometimes took place:

The same day as the body [of a "chief"] was placed on the fata, the enclosure was surrounded by people from his house or the district where he had lived, all well armed. A little later, the people of the closest neighboring district came (these were allies and friends), likewise armed, and those designated as *eotahaas* [*'otoha'a*] or weepers. Upon coming within hearing distance of the corpse's guardians they requested to be permitted to mourn their chief, a favor which was always refused them. Thereupon a battle ensued in which several warriors were usually wounded or killed. If the *eotahaas* won, (as they always seemed to do in this battle, although it often cost the life of a certain number of individuals, despite its being only a sham), the sides reunited and by agreement recommenced the bloody scenes already described. (Moerenhout 1837:I, 551)

E.S.C. Handy interpreted this practice as having been undertaken "... to free the environs of a house or community of lingering evil" (1927:252). This may indeed have been one "magical" dimension of the custom, although its symbolism is not altogether clear or demonstrable; but it is also possible to view such events as imbued with political meaning as well, as is indicated in the following eyewitness account of an episode during mourning for the great chief Vehiatua:

About midday the heathen from the district of *Ahuy* [Ahui] arrived, armed with sticks, and proclaiming war against those of *Ohatutira* [Tautira], with loud shouts: while they rushed at a great rate towards the awning under which the body of the deceased *arii* was lying. The people who composed the circle and were watching over the deceased heard the other's yells, and seeing that they came armed, forsook their station and dashed over to the other side of the river to fetch their own weapons. But the Chief of the others, who happened to be present, did not move, and seeing that his people were coming armed to make war on those of *Ohatutira*, he walked forward to meet them with a plantain sucker in his hand (which is their sign that they do not want war, but are asking for peace); and with that they halted awhile to listen to their Chief who told them that those of *Ohatutira* were not for fighting. Thereupon they resumed their route, shouting and running until they reached the spot where the deceased was, and after having proceeded three times round it at a run they stopped still and all uttered together one single word at the top of their voices. We did not catch the meaning of the word, but we at once concluded that it was to proclaim peace, because the *Ohatutira* people, and the rest (assembled) from other districts, immediately recrossed the stream and joined the party from *Ahuy*. We were unable to make out the reason these latter had for declaring war against the others. [The diary then goes on to describe a similar encounter on the following day, between the men from Tautira and an armed contingent from Tairapu.] (Corney 1915:345-346)

A "political" interpretation of this custom will be offered later on, but now I will describe a "mourners' masque"⁸³—another conventional way in which the Maohis occasionally marked the demise of persons of social importance. Few native practices so intrigued early European visitors to these Islands as did the antics of masked mourners. Morrison's version of this custom can serve as a basis for discussing it:

Besides the Weeping and Cutting their Heads they have another Mourning Ceremony wherin they wear the *Pari* or Mourning Dress described by Captain Cook.—This is Mostly worn by two or three of the Nearest Male relations each of which are Armd with a Weapon Calld *Paaeho*, edged with a row of sharks teeth for three feet or four of its length, the Upper part forming a blade like that of a Gardners knife. They are attended by forty or fifty Young Men & Weomen who disguise themselves by blacking their bodys and faces with Charcoal, and spotting them with pipe Clay; these seldom wear any other Cloths but a *Marro* and each is armd with a *Spear* or *Club* and parade about the district like *Madmen* and will beat Cut or even kill any person who offers to stand in their Way—therefore when any one sees them Coming they fly to the *Morai*, it being the only place where they can be safe, or Get refuge from the rage of the Mourners who persue all that they see. The *Morai* alone they must [not] enter, and while this Ceremony lasts, which is sometimes 3 weeks or a month, they pay no respect to persons nor are the Chiefs safe from their fury unless they take sanctuary in the *Morai*; the Weomen and Children are forced to quit the place as they Cannot take refuge in the *Morai*.

Should any person be stubborn or foolish enough to stop one of the Mourners or Not get out of their way and they should be killd no law can be obtaind nor any blamed but himself, as the Mourners are look'd on as lunaticks, driven Mad through Grief for the Death of their relations therefore none attempt to obstruct them but fly at their approach. This Ceremony is also Calld *Tyehaa* or

Mourning, the Performers are Calld Nayneva [*neneva*], Madmen Hevva [*heva*] tyehaa—Mourning Spirits, Gosts, or Spectres. (1935:233)

Nearly all the principal sources contain descriptions of this institution but the various versions differ somewhat in details, due in part no doubt to the probable circumstance that the events themselves involved a fairly wide range of variation. To begin with, the several versions do not all agree about the identity of the participants. In the version just quoted, the principals (the wearers of the elaborate masks) were described as “two or three of the Nearest Male relations,” and their attendants as “forty or fifty Young men and Weomen,” whose relationships to the deceased are not specified. Other writers gave somewhat different versions:

principal mourner: “nearest relations,” who take turns, and “priests” (J. Forster 1778:560-561, 563);

principal mourner: a man for a deceased woman, a woman for a deceased man (G. Forster 1777:II, 75);

principal mourner: usually a man; attendants: three or four, males and females, including close relatives of the deceased (Banks, in Beaglehole 1962:I, 286-289);

principal mourner: “priest” or “relative,” male; attendants: “men and boys” (Ellis 1829:I, 532-533);

principal mourner: “a professional mourner”; attendants: “a crowd of small boys” (Moerenhout 1837:I, 547-549);

principal mourner: “a priest of the gods of mourning”; attendants: “young men and lads of the [deceased’s] collateral lines and [of his] retainers” (Henry 1928:293).

The probability was that among those surviving families who were sufficiently motivated to sponsor this special form of mourning ceremony, some could only rely on the services of “nearest relatives”—for it was a costly exercise, as we shall see. But for those who could afford it, priests who specialized in mourning were probably called in.

A major item in the staging of a mourners’ masque was the costume worn by the principal mourner (fig. 13-3). Henry described it as having consisted of the following:

... a petticoat of *purau* [pandanus leaf] fringe, called *tihī-parau*, a waist girdle, called a *moeho*, and a head gear, or *fa’aupo’o*. The *fa’aupo’o* consisted of a close turban of cloth, above which diverged like rays beautiful, snowy red-tipped tail feathers of the tropic bird, and a *parae*, or mask, of bright pearl shell. From the mask was suspended over the chest with the corners turned upwards a bright crescent-shaped board about a foot deep covered with a brilliant network of thin chips of mother-of-pearl about one inch long and a quarter of an inch wide. These were threaded together through little perforations at each end and bordered with a fringe of rich black feathers of the man-of-war-bird, terminating at each corner

with a bunch and a tassel exquisitely made of the same feathers. This ornament, called *ahu-parau* (pearl-cloth) was considered very sacred. From it hung a drapery of pieces of yellow and black cloth, called a *pautu* (mourning cloth), attached behind and meeting the spreading fronds of the fare-rupe fern (*Pteris milneana*) set in the girdle against the back. But when the deceased was not of the highest rank the priest wore the fringy petticoat, girdle, and the fern frond, without the headdress and other paraphernalia. (1928:293-294)

(The last sentence is only partially correct, for the wearing of headdresses was not limited to mourning for "sovereigns or heir apparents.") From all accounts these headdresses and gorgets were rare and among the most highly valued possessions of the Maohis; it is unfortunate that so little is known about their ownership, or the conditions under which they were acquired, transferred, or "rented" for use by nonowners (if such were the case). (See Plischke 1931, and Mühlmann 1939.)

FIGURE 13-3. Mourners' costumes. *a*, British Museum; *b*, "Dress of Chief Mourner." Drawing attributed to H. D. Spöring, Cook's first voyage. British Museum.

The material value of a *parae* is indicated by the following episode reported by Rodriguez: "I went out with the *arii* and his house-party in quest of mother-of-pearl shells for making up a *parae*, or very intricate shell mask; a chattel much valued among them, for they are fain to ask a hog (in exchange) for each shell" (Corney 1919:205).

The principal mourner also carried with him a shark's-tooth weapon (*paeho*) and a pearl-shell clapper, which he used as a warning signal as he and his attendants made their rounds.

Otoo and Tatooa-noce, and many of their attendants paraded about our dwelling, according to their custom. Sometimes the king and three of his principal attendants carried in their right hands a sort of clapper, made of two pearl oyster shells, so fastened, back to back, as that they could strike them one against another, by a gentle movement of their thumbs; these they kept clapping as they walked, keeping time together. This childish noise is a ceremony in honour of Orepiah, whose remains are at the Nānu. (LMS Transactions:I, 86)

The attendants, both male and female, wore only loincloths and improvised headdresses; they were blackened all over with candlenut soot, over which were painted red and white stripes and circles. They carried clubs and spears with which to threaten or actually wound hapless persons not quick enough to keep out of their way—except for Arioi, who, according to Orsmond, were not molested.

At the beginning the band of masked mourners probably made their rounds every day, starting and ending with obsequies at the ghosthouse, and scoured the countryside for about an hour or so. In time, the ceremony was repeated less and less frequently until, after a few weeks or months, it was abandoned. In some cases it was terminated at the behest of the deceased's family, for reasons of economy. But in instances involving very important persons, "political" factors were probably more involved:

This reign of terror lasted an indefinite period, the moon coming in, waxing, waning, and passing on some occasions when great love for their lost ruler was being expressed. When people of other districts thought it had lasted long enough, they would come to calm their zest by overpowering them. This was called *fa'atohaehae i te heva* (aggravating the mourners). A hand to hand fight followed, which became serious when allied parties joined in. Sometimes whole districts were involved, many being killed before the chiefs interposed. When the priest changed his dress it was the sign that the *heva* was *marau* (faded or ended) and then tranquility was re-established in the land. (Henry 1928:294)

This same writer also provided a vivid description of the antics of the masked mourners and hinted of an additional function served by the ceremony:

The sound of the *tete* [the pearlshell clapper] and the appearance of these persons as they approached terrified the community. The priest sometimes struck the side of a house menacingly with his scythe, while the inmates remained in breathless silence. Some of the people out-of-doors had time to flee to the local marae where they were secure from molestation; but others, particularly if they were not in favor with the terrible party, were either caught and mercilessly beaten with a club, or in fleeing were liable to be hit by scythe, spear, or stone. (p. 294)

While engaged in masked mourning the participants are reported as having been amply fed by the sponsors of the ceremony.⁸⁴ This need not have been a burden when the mummers were close relatives, and hence themselves sponsors; but to feed a large troupe for several months, along with the additional remuneration probably paid to the specialists among

them, would have required material resources available only to a few of the society's highest-placed families. What then was the meaning attached to this bizarrerie? And what were its sponsors' purposes?

According to Moerenhout the principal mourner was thought of as "representing" the spirit of the deceased, but he was not believed to have been "inspired" (*inspiré*) by the latter. Moerenhout implied that the whole troupe acted as if maddened by grief. Ellis, on the other hand, wrote of the mummers that "... they appeared and acted as if they were deranged, and were supposed to be inspired by the spirit of the deceased, to revenge any injury he might have received, or to punish those who had not shewn due respect to his remains" (1829:I, 534).

Moerenhout also offered an explanation of the purpose of the masque: "The ceremony, whose only object was to honor the dead, lasted as long as the relatives wanted to pay and feed the official (mourner) and his retinue. They believed or pretended to believe that the longer the thing lasted, the more pleased with them the deceased would be." (1837:I, 550)

These two sets of interpretations and explanations are perhaps more complementary than contradictory; in any case, neither is inconsistent with other known facts about Maohi society.

The perceptive (or imaginative) Bougainville suggested one other possible motivation, if not for sponsoring, then at least for engaging in a mourners' masque:

When the people in mourning go out of their house, they are preceded by several slaves [*sic*], who beat the castanets in a certain cadence; their doleful sound gives every body notice to clear the way, whether out of respect for the grief of the persons in mourning, or because meeting them is feared as an unlucky and ominous accident. However at Taiti, as in every other part of the world, the most respectable customs are abused; Aotourou told me, that this practice of mourning was favourable to the private meetings; doubtless, as I believe, of lovers with wives, whose husbands are not very complaisant. The instrument, whose sound disperses every body, and the veil which covers the face, secure to the lovers both secrecy and impunity. (1772:270-271)

During the extended mourning period for the great chief Vehiatua, one observer reported witnessing dancing in his honor:

Before going on board again they let us see a very doleful dance, which they were performing out of sorrow for the death of their *arii*. They wore garments interwoven with feathers of very gloomy shades, with head-dresses to match, and masks of mother-of-pearl shell; and they held castanets of the same with which they clacked a mournful measure to the accompaniment of a drum, executing, as they danced, many gestures and weird grimaces. (Corney 1915:471)

One other mortuary practice reserved for important chiefs had an obvious political significance:

When Chiefs or People of rank die their bodies are Embalmed and they are Carried round the Island to every part where they have any Possessions, in each of which the Tyehaa or Weeping Ceremony is renewed; and after a Journey of 6 or 8 Months returns to their own estate where they are kept till the Body decays when the bones are interred. (Morrison 1935:232)⁸⁵

Body Disposal

As reported earlier, some bodies were disposed of immediately following a two- or three-day wake, others only after a more or less extended stay in a ghosthouse. With respect to the latter, the length of time a corpse was maintained in the ghosthouse undoubtedly depended largely upon the deceased's kinship and political status; for example, the corpse of Vehiatua, the reigning chief of Tahiti's peninsula, was still being tended twenty-two months after death. But the moist tropical climate eventually took its toll, no matter how carefully a body was tended, and the bones were then put away. The most detailed (but not necessarily the most accurate) statement on interment was made by Henry:

In the upper classes, when the time for burial of the dead (*hunara'a tu-papa'u*) [literally "the hiding of the corpse"] arrived, the body was wrapped in sweet-scented tapa, placed in a coffin hewn from the trunk of a tree, and secretly placed in a marae vault, later being removed to a mountain cave by the family priest and a chosen few. People of low degree also made coffins or simply wrapped their dead in tapa, scented or otherwise, and then in a mat, placing the corpse in a cave or burying it in their marae with or without a priest officiating. Some of the bodies were interred in a sitting posture, three or four feet deep, and at the present time skeletons are occasionally unearthed in that position. The skull of a parent or other revered relative was sometimes retained by the family, by whom it was cleaned, saturated with sweet-scented oil, and aired many days in the sun. Then after invoking to it the spirit of the departed one, it became enshrined among the household fetiches. The finger nails were plucked from corpses, polished, threaded together, and worn in the hair by young girls as charms. (1928:295)

The likelihood is great that the use of wooden coffins reported by Henry was a custom borrowed from Europeans. Bligh wrote that "Iddeeah and several others say they took the Idea of making a Coffin from us, but many others say it is customary in Otaheite. I am nevertheless enclined to believe Iddeeahs account, as in former Voyages no such thing was ever seen or heard of." (1789:II, 44)

Most eyewitness accounts agree that skulls were usually separated from trunk and limbs, the latter having been buried underground or hidden away in a cave and the skull kept either in house or marae. Morrison asserted that no bodies were buried in marae except "... those Killed in War, or for Sacrifice or the Children of Chiefs who have been Strangled at their birth" (1935:232). Ellis, however, reported otherwise: "The family, district, or royal maraes were the general depositories of the bones of the departed,

whose bodies had been embalmed, and whose skulls were sometimes preserved in the dwelling of the survivors" (1829:I, 524; see also Moerenhout 1837:I, 554). J. Forster stated that "chiefs" only were buried within marae enclosures (1778:561); and Banks' statement implies the same: "The body is then taken down from the *ewhatta* [*fata*], the bones washd and scrapd very clean, and buried according to the rank of the person either within or without some one of their *Marais* or places of publick worship" (Beaglehole 1962:I, 378).

Many, but not all, bodies were buried with the bones bound together in a sitting posture; the reason for this was not reported.⁸⁶ The only writer to report on the matter wrote that graves were oriented east and west (Bligh 1789:I, 418). It is quite likely that most bodies were, as Henry stated, wrapped in bark cloth or mats or both, for burial, and that the ground on top was left loose; at least this is an inference that may be drawn from a statement in the journal of Don Thomas Gayanjos: [After observing how the Spaniards buried one of their own number] "The Indians found much matter for remark in the interment; and they viewed our method of burying the dead very unfavourably, observing that to shovel earth in atop of the body, and then stamp it down (with the feet), was an act of disrespect to the departed" (Corney 1915:136).

As reported by Henry, some skulls were kept at home by the family of the deceased; others were deposited in marae (Bligh 1792:153), while still others were hidden away in caves. According to J. Forster, the skull of a chief was wrapped in bark cloth and kept in a wooden box, an 'ancestral ghost's house' (*fare no te 'oromātua*) (1778:561). Hair was also sometimes preserved by the family survivors:

A very Old Man paid me a Visit to day who is an Uncle to Tubai, the person Captn. Cook carried with him in the Endeavor to Batavia, where he died. He was first said to be Tubai's Father, because they called him Medooah, but it signifies an Uncle as well as a parent, and happend to be so in this instance. He is about 65 Years Old, and a person much esteemed. At this moment he seemed to mourn for the loss of his Nephew, and requested when I came here again that I would bring him his Hair. This perhaps is the greatest satisfaction these people can have after the death of a Friend, and is kept as a most sacred relic. When Tynah talked of going with me to England, about which he is still very anxious, I stated the chance of his dying, and in such a case I told him perhaps his friends would never wish to see me again, but he assured me that if he did die, I only had to cut his Hair off and bring it to Otaheite, and they would all be perfectly satisfied. It is a common custom among themselves, for after a certain time that the body has been carried to the Toopa-how, the Hair is cut off and hung up in their house made into the Mountains if they should be in War ... (1935:232-233)

The evidence from archaeology can serve to confirm all of these reports. Partial and whole skeletons have been uncovered within marae enclosures (in vaults, underneath pavements, in simple graves) and outside in various kinds of locations. In addition, many caves, some nearly inaccessible, have

been discovered to contain skulls and other human bones, and, on Mo'orea, Green and his associates found in a coastal midden a canoe that had evidently served as a coffin (Green et al. 1967:183).

The main reason for burying bodies in marae was given by Ellis:

The marae or temple being sacred, and the bodies being under the guardianship of the gods, were in general considered secure when deposited there. This was not, however, always the case; and in times of war, the victors sometimes, not only despoiled the temples of the vanquished, and bore away their idol, but robbed the sacred enclosure of the bones of celebrated individuals. These spoils were appropriated to what the nation considered the lowest degradation, by being converted into chisels or borers, for the builders of canoes and houses, or transformed into fishing-hooks. In order to avoid this, they carried the bones of their chiefs, and even the recently deceased corpse, and deposited them in the caverns of some of the most inaccessible rocks in the lofty and fearful precipices of the mountain defiles. (1829:I, 524-525)

To this should be added Morrison's report:

... these bodys, while they are whole, are liable to be taken in War and the Man who takes one of them gets the Name and honors as if He had killd a Warrior, and should the body of a Chief be Carried off in this Manner before an other was Named the District would fall to the Conqueror as if he had killd him; for this reason they are always removed, having each a Steady Man to Carry them away into the Mountains if they should be in war ... (1935:232-233)

Moerenhout described the role of an "ancestor-guard," not found in detail in other accounts:

Usually only the trunk and limbs were interred at the marae. After a period of time, when, in spite of all the precautions taken, the body began to decay, the head was separated from it; and after new prayers and new ceremonies,^[87] (the head) was carried into secret, inaccessible caves, called *anaa*, high up in the mountains; then the body was buried in the marae. Sometimes, however (and this took place especially in the case of chiefs and principal families), the rest of the body, well wrapped in bark cloth, was carried whole into these sepulchers, where they were sheltered from every affront, the situation of the family *anaa* being only known to the head of the family and to its ancestor-guard. The ancestor-guard fulfilled for each principal family a very important hereditary function. He was charged with watching out for the preservation of the remains interred at the marae; and, furthermore, since he alone knew the location of the funerary cave which held the heads of all the family dead, he was as guardian and protector of the shades of the gods feared by all this family and the chiefs. The least insult made to him or to his children, by some member of the family he served, could bring upon (the family) illness or other evils. Thus, superstition itself often prevented the great from doing wrong, or at least made them fearful lest they should be exposed to divine prosecution or to the secret intrigues of their enemies. It is true, on the other hand, that they had, proportionate to their rank, resources and means denied to the common people, to avert human vengeance or to exorcise the anger of gods. (1837:I, 554-555)

There is little information available concerning the disposal of the bodies of persons who died while away from home—except in the case of

warriors slain and left on foreign soil. There are reports of the bodies of certain socially important persons having been returned to their own domains for burial, and presumably this was also done for others whenever possible. On the other hand, when some castaways from the Tuamotus died on Tahiti their bodies were either "... thrown into the sea, on the sandbanks or on an old marae, where they have been soon devoured by dogs and pigs" (Davies, Journal, 28 December 1807, LMS Archives).

Finally, I present de Bovis' account of the way in which the bodies of courageous warriors were sometimes disposed of:

There was also another singular practice concerning cadavers consecrated to the divinity. When a celebrated man of proven valor died, he was not interred like others. The great marae which was the closest claimed his mortal remains, this being a great honor for his family. The body was hoisted to the top of an ironwood tree which shaded the enclosure or its vicinity;—the body was attached as high and as solidly as possible. It stayed there indefinitely until through decomposition, it disappeared in shreds. But this process was sometimes very slow if the body had been exposed to a strong sun in the dry season, and it was not rare for the grove surrounding the great maraes to display a dozen or even more of these singular ornaments. (1909:56)

In a general sociological sense,⁸⁸ aside from the question of their "function," several more or less conscious motives have been proposed to account for conventionalized Maohi mourning behavior: the survivors' sincere desire to express grief, honest regard for the welfare of the deceased's departed soul (now a ghost) tinged with fear of its anger if not adequately mourned, feigned or unfeigned exigency for demonstrating maintenance of relationship with the survivors, and so on. Some or all of these motives continued to operate after the principal mourning period had ended—that is, after the bones had been disposed of in one way or another. A kind of climax to "post-burial" mourning occurred about a year after death, on the occasion of 'ghost's night' (*po tupapa'u*); this event will be described presently, but, before doing so and before listing the various standard beliefs regarding the final or interim fate of the released soul, I will indicate the ways in which some of the deceased's close relatives continued to express their real or feigned grief. According to Banks:

The ceremonies however are far from Ceasing ... [with burial]. Frequent prayers are to be said by the preist and frequent offerings made for the benefit of the deceasd, or more properly for that of the Preists who are well paid for their prayers by the surviving relations. During this ceremony Emblematical devices are made use of: a young plantain tree signifies the Deceasd and a bunch of feathers the Deity invokd; opposite to this the preist places himself often attended by relations of the deceasd and always furnish'd with a small offering of some kind of Eatables intended for the God; he begins by adressing the God by a set form of sentences and during the time he repeats them employs himself in weaving Co-coa nut leaves into different forms, all which he disposes upon the Grave where

the bones have been deposited; the Deity is then addressed by a shrill scritch used only on that occasion and the offering presented to his representative, the little tuft of feathers, which after this is removed and every thing else left in statu quo, to the no small Emolument of the Rats who quickly devour the offering. (Beaglehole 1962:I, 378-379; see also J. Forster 1778:562-563)

A more common practice, perhaps, was bloodletting: "The mourning then ceases [i.e., after disposal of the bones] unless some of the women who find themselves more than commonly afflicted by the Loss repeat the ceremony of *Poopooing* [*pupu*⁸⁹] or bleeding themselves in the head, which they do at any time or in any place where they happen to be when the whim takes them" (Beaglehole 1962:I, 378). Two actual instances of this practice are reported in the sources:

On the 27th, we saw a very odd ceremony performed; Tiropoa, one of Tubora Tumaida's wives, after weeping, and expressing some emotions of sorrow, took a shark's tooth from under her cloaths, and struck it against her head several times, which produced a copious discharge of blood; then, lamenting most bitterly, she articulated some words in a mournful tone, and covered the blood with some pieces of cloth; and, having bled about a pint, she gathered up as much of it as she could, threw it into the sea, and then assumed a cheerful countenance, as if nothing had happened. This, it seems, is a ceremony generally performed by widowers after the decease of their husbands. (Parkinson 1773:21)

This morning [9 March 1797] also Inna Madūa, the widow of Oreepīah (brother to Pomāre), lately deceased, paid us a visit, accompanied by two chief women. Oreepīah was much attached to the English; and his widow, supposing us sorry for his loss, on entering the cabin burst into tears, and continued this expression of grief till we all sympathized with her. However, this did not last long; for they soon became cheerful, breakfasted, and dined on board.... (Wilson 1799:67)

It should be recalled that people continued to show respect, or at least fear, for the deceased long after burial, in the form of the circumspection with which they approached burial places, evidently in the belief that the ghost of the deceased—along with other spirits, perhaps—continued to haunt such places.

Case Studies: The Deaths of Vehiatua II and of Mahau

To add substance to the generalizations about death presented above, I will reproduce extracts from the sources concerning the deaths and funerals of two socially important individuals: Vehiatua II, sovereign chief of Tahiti's Tairapu peninsula, and "Mahow" [Mahau], a prominent Mo'orean chief linked by affinal ties to the Pomare dynasty of Tahiti. The former died in his own realm in 1775 and his demise was recorded in almost reportorial detail by the Spanish visitors. The latter died in 1791, while on a visit to Tahiti, where Vancouver witnessed his last days and the succeeding mortuary activities. The account of Vehiatua's illness, death, and the

events following it is taken from the diary of Maximo Rodriguez (Corney 1919) with footnote additions from the diaries of the padres who were with him. The reports of this episode began in April 1775:

April 5: I ... begged *Padre* Geronimo to give me leave to go to the district of *Gua-yari* [Vaiari], in order to visit Vehiatua who was lying sick unto death there, with all the Chiefs of the island about him. (p. 107)

April 6: I found Vehiatua reclining in the laps of his relations, with a great display before him of the objects he had acquired from ships that had visited his, as well as other, territories in the island, looking like a stock-in-trade of shop wares; and on my asking what the idea of that was they answered me that Vehiatua had made an offering of all that he possessed to his God named *Eatua*. I endeavoured to console him, and he was much affected as soon as he saw me. Meanwhile, I noticed that one of the Indians within the house was dealing himself lusty thwacks, and in some alarm I enquired what it meant. They told me that what he was doing, and giving utterance to, signified that their God *Eatua* had descended, and that this man's body was possessed, thereby causing him to behave in this manner; and that the words he uttered were inspired by the said *Eatua*. Presently he quietened down somewhat and began to strip the cloth wraps that appeared to him the best ones from the people who were in the house, but those that he got from Vehiatua were only the poorer sort; and then, keeping for his own profit the wraps he fancied most, he directed the others to be distributed to whomsoever he pleased. The people gratified him in all that he did or desired, because, they said, he was under the influence of their Divinity.

I quitted the house, bewildered by the throng of people and the hubbub. I went over to where the other Chiefs at present staying in this district had their quarters; but the day was too short to allow of my being greeted by them all, for each one wanted to claim me as his guest. This being got through, I returned in the evening to Vehiatua and found him somewhat easier, and I tried to persuade him to come back with me, telling him he should be supplied with everything there was for his recovery; but he said he feared to come to *Ohatutira* for love of us, because he was aware of the sacrilege we had wrought in the cemetery or *marae* by taking stones from it to pave our house with, and he also cited the squabbles that had arisen with his followers when he was at *Ohatutira*. It was therefore his intention not to return to where we were until the frigate should arrive. (pp. 108-109)

[Vehiatua recovered somewhat from this spell of illness, but by May 10 was critically ill again.]

May 10: When we reached *Ayautea* the people greeted Vehiatua with much weeping at seeing him so prostrated, for he could not stand up. Then the *tahua* or priests of the place came to offer their *opure* or prayer in the *marae* where they worship, and the day and night were consequently passed without any fire being lit to cook with, as is the custom until the ceremony in the *marae* is concluded.

The rest of our people arrived in the evening from *Mataoa*, and the night was passed without incident, though there was much noise of drums in the *marae*, which is their way of invoking their God *Eatua*.

May 11: ... Vehiatua was in rather a bad way, wherefore their *tahua* offered up a prayer in the sea, for his recovery, and deposited a number of plantain shoots all round his hut. He felt somewhat relieved later, as I succeeded in inducing a

perspiration, though not without some opposition on the part of his attendants, because they say that in order to procure a descent of their God named *Eatua*, it is imperative that the fanning should go on in the house.

May 12: ... I proposed to Vehiatua that he should set out with me for *Ohatutira*, as it was already noonday. He seemed troubled at my coming, and told me that his *tahuas* or priests would not let him go, because his God *Eatua* had not appeared, in spite of some of their number having gone forth into other districts to invoke him until they should find him; and I was unable to gain him round from his error however much I tried to undeceive him. (pp. 136-137)

June 1: ... it was not permitted to kindle fire while ... [prayers for Vehiatua] were going on in the *marae* or cemetery that exists in this islet, devoted to his God called *Eatua*.

Not one woman was met with in the precincts, for they have no place in these functions nor is their presence tolerated at them; but all the Chiefs of the provinces pertaining to Vehiatua were there.

... I, meanwhile, had remained with Vehiatua discussing the continual *opures* or prayers that were being offered up in his several districts; and when I pointed out that the only result of it all was that the *tahua* or priests were using up his pigs, yet that no improvement in his condition was observable, he seemed to ponder over this and said he would presently come to *Ohatutira*. Just then the inspired person came on the scene in a passionately excited state and they immediately provided a seat for him, that he might blurt out the tomfooleries that came into his head, before Vehiatua; for to the natives these were as an oracle. Vehiatua told me that this man became very terrible while the God continued in his body, and that no matter what he asked for, or did, it was all good, because inspired; and that therefore if any one opposed him such a person would die of some serious illness by the will of his God. I told Vehiatua he should soon see how much power he had, and on my calling out in a loud voice to them to bring me the musket, the inspired one made signs to me not to kill him: and on that I asked him where his power lay! But the others then begged me not to say anything more to him, lest it should cause Vehiatua's ills to become aggravated; and rather than displease them I desisted.

We then took our departure, not desiring to witness any more barbarisms, and passed over to the mainland.... (pp. 148-149)

June 5: ... In the evening Vehiatua arrived with his people, from the district of *Ayautea*, though we had not expected him for three days yet, according to information supplied to us by some of those who were in attendance on him. We went down to the beach to welcome him, where we found him in a considerable fever, on account of which we at once arranged for him to be carried in his own canoe-cuddy to a spacious and sheltered hut he owned close to our house, pending a further arrangement of things on the morrow. He let himself be accommodated thus, and we saw that the cough he had was severe, for it gave him no rest, so that the natives proved somewhat undesirable neighbours. I turned out in the middle of the night to go and see him, and I found him with two coconut shells full of a food they call *popoy*, which is very indigestible stuff. They tried to hide it from me, but in the end I undeceived them as to the harm they were doing, and they agreed to act in whatever way I might advise them. I called their attention to the many hogs that had been relegated to the *tahua* or priests, and the absence of any visible improvement in Vehiatua's condition; but they contented themselves with saying that their God *Eatua* was not relieving him. (p. 151)

[Shortly thereafter, the chief experienced a slight recovery and the assembled subchiefs, and so forth, returned to their respective homes.]

June 20: ... When I got there I was welcomed by the two *arii* of the districts of *Guayuriri* and *Atimaono*, who had come with a number of canoes in their convoy to visit Vehiatua, and to do honour to his recovery, of which they had heard, with a dancing festival.

June 22: ... A large number of people from the *Guayuriri* district arrived to entertain Vehiatua with sports, as a consequence of which there was a great riot and turmoil, and we were obliged to keep in-doors on our guard against anything that might happen. Vehiatua's mother came to us in tears begging me to get her son away out of the uproar, which I succeeded in doing. (pp. 160-161)

[Shortly thereafter, Rodriguez embarked upon a tour circuit of Tahiti; upon his return to Tautira he found Vehiatua in a worsened condition.]

July 18: ... Here [in Tautira] I heard the noise of drums in the *marae* that is Vehiatua's, meaning that prayers were being offered up to their God *Eatua* for the alleviation of the Chief's illness.

July 21: ... They came from the *Ohitia* district to wail and scarify themselves, on account of Vehiatua's illness.

July 22: ... In the afternoon I stepped over to see Vehiatua and found him very ill. At night a flute concert and also *opure* or prayers were conducted in his house, while *Teatua* at the same time inspired them with his frenzied ranting ...

July 23: Vehiatua was alarmingly ill, so that they collected many pigs and plantain shoots to take to the *marae* as offerings to their God *Eatua*, everything being in confusion through the general weeping they were all giving way to. I stepped over to see him and found him in a critical condition; his mother came to us in tears, begging that we would once more take his case in hand, and promising us everything her son possessed, to which we replied that we valued nothing so much as a pure friendship.

July 24: ... Vehiatua felt somewhat better; but in the afternoon he relapsed again, and their God *Teatua* having entered into him at a moment of yawning this gave rise to a great stir among the natives, for they declared it was the God of an uncle of his who had died some time ago, and had now come to visit him, whereby the Chief would be on his feet again in ten days' time and able to walk without any infirmity whatever: which falsehood we looked to to disabuse them of their error.

July 25: ... Vehiatua's folk have found a key to the origin of his illness, but will soon discover their mistake, for they have assured him that he will be able to walk within five days from now.

July 27: ... The mother came in tears and saying her son was going to die. I went over to see him, and found him stretched on a platform of boards outside his house, and I told those who were present to take him inside again. We got word by one of the natives that five of Vehiatua's partisans had gone forth during the past night to kill three men to be offered up to their God *Eatua*, as a shrift by virtue of which Vehiatua might recover from his illness. So as soon as we learnt this we counselled them to desist from doing it, although they had not been able to get hold of anybody. Vehiatua's mother afterwards came beseeching us to take

the treatment of her son in hand; but although *Padre* Narciso was willing to oblige her *Padre* Geronimo was of the contrary mind, being afraid that the Chief would die, because he had lost so much flesh. At mid-day we heard that two of Vehiatua's lieges had gone out into the gorge, with some people accompanying them in quest of three men to be killed as a sacrifice, and on this account we got our arms in readiness for whatever might happen.

July 28: ... I got word from the natives that one of the people of the gorge had been killed during the night, and that he had at once been carried off, with two hogs, to be offered up to their God *Teatua* in the *Atehuru* district; and that some other leading men, of the district of *Ohitia*, had afterwards sallied forth in that territory, to kill four men who were still wanted, as they had not been able to furnish the required offering in our parts because all the people had fled into the hills.

August 1: ... A little before sundown, learning for certain that two persons belonging to the neighbouring district of *Ohitia* had been slain as a sacrifice to *Eatua* and brought here, I went out, with *Padre* Narciso for greater safety, and, guided by a secret path on account of the marked aversion I betokened when it came to my knowledge, we saw the bodies in actual being. They were father and son; and the former had suffered this misfortune through trying to save his son at the moment when all the people fled in a general scatter. The bodies had been laid in baskets of plaited palm-leaf slung on a pole and hitched across from one tree to the next. The son was about twelve years of age. As soon as the *tahua* perceived us in this *marae* "Guayotaha" they insisted on our withdrawing immediately.

August 2: ... I was informed that the bodies had been conveyed to the district of ... [Atehuru or Punaauia], a part of the *arii* Otu's dominions, where the principal temple of all is, named *Tuputupuatea*: there was now only one victim wanting to complete the offering as ordained by the *tahuas*.

August 6: ... At midnight we heard unmeasured cries and wailing, and as they caused us alarm, we put sleep aside and kept within our enclosure in some fear; but towards daybreak one of the Chiefs came to call me, on the side where my bedroom faces, to hasten across to his *arii*, who was wishing to see me for the last time. Despite this request, which appealed to our compassion, we first held a brief consultation, being filled with apprehension. I resolved to go, and the *Padres* hastily shut the door. Once outside, I was more scared than ever, for the darkness seemed to me intense, and the natives were all in confusion, some in the temples beating their prayer drums, (which are different from those used for merry-making), others grabbing any odd pigs they met to offer them up to their Gods, with everywhere turmoil and wailing. They had a canoe in waiting to ferry me across the stream that flows between his dwelling and our own. When I arrived they broke out into still louder cries, and hung about my neck, hustling me along to the no small discomposure of the women, who were seated almost on top of one another. I approached the *arii* and, taking hold of his pulse, I recognised that he was at his last breath, so that in a little less than a quarter of an hour he expired. The mother and the most important personages were supporting him in their laps, not omitting any part of his frame. In front of him lay displayed all his most cherished treasures, those emanating from the country itself as well as those that he had acquired from our own monarchy and from the English and French.

Unspeakable were the mother's moans in the abandonment of grief: she who was so wrapped with affection for her son, whom she had brought up in all the pride and luxury his sovereign rank made possible. (pp. 175-183)

[At this point Rodriguez wrote: "I omit the many mourning ceremonies of these natives, which I will relate in a separate description." That description has never been found.]

August 7: ... I went across to find the deceased *arii's* mother, and those in her company begged me to try and retrieve her from the grimy condition she had got herself into in the middle of the night, for they, seeing her in so unbridled a mood, could not make up their minds to attempt it, because they were afraid of her anger.

I approached this task during the time they were preparing a position in the form of a small open space for the accommodation of the persons appointed to remain in attendance by the corpse, as will be explained in due course. Accompanied by a few others I found the mourner so changed in countenance from the loss of blood that she was continually letting from her head and body that I was quite alarmed. Notwithstanding the petulance she evinced on seeing us, by abusing those who came to show me the way, I set about soothing her and at the same time tendering excuses for them. My counsel to her to be patient and resigned met with much resistance on her part. In her utter despair she wished only for death. To this moment she had not tasted one drop of water; It was a great consolation to those around us to see her softening down towards me, and they made signs to me not to leave her by herself, for they feared she would collapse altogether. I stayed with her as long as I could. From the neighbouring settlements and valleys an immense concourse of people collected to bemoan the death of the *arii*, the Chiefly ladies bleeding themselves more as a matter of form than from grief or real sentiment, inasmuch as they drifted after a little while into busy conversations about their private affairs.

In the afternoon the corpse was carried to the *marae*, that it might sleep amidst the continual prayers of the *tehuas*. The prohibition against fishing and kindling fire was observed; and the entire population hereabouts still bore itself in the deepest silence.

August 8: ... I noticed that no fire was yet lit, nor did anyone go a-fishing except to supply some very urgent requirement; and then only in the most secret manner, in order not to be observed. The beating of drums continued in the *maraes*.

August 9: ... The same mourning ceremonies continued to be observed as before.

August 10: ... There was a great gathering of the clansmen from *Oayautea*, the most gainful of all these Islanders and in their wars the foremost in renown, so that they stand high in the good opinion of their Chiefs. They brought a very handsome contribution of their produce and food-stuffs to the deceased *arii's* brother. This is the successor to the late one, and they call him Tetuaunouna, or Guatupua, a boy who looks to be six years of age, of good mien, and a fair liking towards us, according to the measure of our conduct.

August 11: ... the Papara people were proposing to offer a human sacrifice in the principal temple *Tuputupuatea* in memory of their Chief, Vehiatua.

August 13: ... They [natives from Mataoae district] presented a contribution of food-stuffs to the boy *arii* elect. The *Ohitia* people came to offer their condolences to the mother *arii*.

August 14: ... In the afternoon the clansmen of *Guayari* arrived to bemoan the death of their deceased *arii*, and the Chiefs' ladies presented their wraps of native cloth to the corpse with a very liberal hand.

August 15: ... The Chiefs from most of the districts belonging to this Government made a great noise, continuing the wailing and blood-letting.

August 19: ... Information reached us that one of the natives of the district of *Guayari* had been killed as a victim for sacrifice.

August 21: ... A Chief of the people of the *Atehuru* district came with many others to bemoan the death of Vehiatua, wearing a shell affair of mother-of-pearl, that they call *parae*. Some ladies came in his company and besmeared themselves with blood: the gathering was very numerous.

August 30: ... There was a great gathering of the *Guayautea* people, who had recently come to bemoan the death of their *arii*, and they presented their rolls of drapery.

September 5: ... The people of *Matabay* [Matavai], ... in the dominions of Otu, came to offer their condolences to the *arii* Opo.

September 7: ... I went to visit the invalid lady Oviriau, and found her as it were dazed, and her body much knocked about. This and similar sudden attacks of illness are attributed by the natives to the spirit or *evarua* (as they call it) of deceased persons whom they may be bewailing having taken possession of the mourners by entering into their bodies; and they were persuaded that this was the case now in regard to the spirit of the deceased *arii*, who was Oviriau's first cousin. It was not possible to disabuse them of this error, set afloat and upheld by their *tahuas*, to whose fables they yield implicit belief. (pp. 183-193)

October 17: ... To-day a number of people came from the neighbouring district called *Ahui* to present hogs and rolls of cloth to the *arii* Tetuaounoona, the morrow being the day for his public acclamation or induction to official power by the Chiefs of the *Tayarapu* province.

October 18: ... There was a further gathering (of the clans) for the induction already announced, which commenced with *opure* or prayers offered up by the *tahua* or priests in a cemetery or *marae* named *Guayotaha* to Teatua their God, called Opunua. The length of time these natives allot for mourning the death of the predecessor of the *arii*, before celebrating the new one's instalment is remarkable. (pp. 204-205)

Here ends Rodriguez' account of the episode. The embalmed corpse of Vehiatua II reposed on the ghosthouse bier, where Cook was to view it some twenty months after Vehiatua's death (fig. 13-4).

Vancouver's first mention of Mahau's decline is recorded in his journal for January 1792:

January 2: ... Towards noon Mr. Mudge returned with my old friend *Pomurrey*, who was saluted, previously to his coming on board, with four guns from each vessel, which gratified him extremely. With him came *Matooara Mahow*, commonly called *Mahow*; the reigning prince, under *Otoo*, of Morea. There was however little probability of his long enjoying this honorable station, as he appeared to be in the last stage of a deep and rapid decline; his person was reduced to a mere skeleton, which he was not able to raise without great assistance. He was hoisted on board in a chair, and supported by six people down to the cabin, where, unable to sit up, or to stand, a bed was prepared for him on the lockers. The

reasons that could induce a man in his deplorable condition to undertake such a visit, must, without doubt, be not less curious than extraordinary! (1801:260-261)

January 4: ... *Mahow*, though extremely feeble, paid us a visit on shore; being unable to walk, he was carried about in a kind of litter. (p. 267)

[The ailing Mahau expired on January 13.]

January 14: Little concern could possibly be felt on this occasion. *Mahow's* relief from the wretched condition in which he existed, was directed by humanity to be esteemed a most happy event; particularly when the very singular treatment is considered, which this poor being endured whilst in our neighbourhood. Almost every evening, and sometimes twice in the night, he was brought in the litter from the royal habitation near the point, and placed in some one of our tents for a short time, and then carried back again. In the day-time he was either visiting the encampment, or, in the heat of the sun, or in the midst of rain was rowed round the ships, and insisted one evening on sleeping on board the *Chatham*. He was very fond of tea, and extremely desirous that whatever nourishment he took, should be dressed in the English fashion. The conduct observed towards this dying man, seemed calculated, if not intended, to hasten his dissolution. This however, was not to be reconciled with the general deportment of the whole royal party, and especially with that of *Pomurrey*, who appeared to regard him with great tenderness and affection. I was particularly inquisitive why he was so harrassed about; and they all agreed it was in consequence of his own desire, which, so far as could be learned, seemed dictated by superstitious notions.

January 15: I desired the messenger to inform *Pomurrey*, that I would attend the funeral solemnities of the deceased the next day. On Sunday morning he again returned with a request from *Pomurrey*, that I would not visit Oparre until Tuesday, when the religious interdiction under which that district had been laid would be at

an end, no communication at present being permitted between the inhabitants of Oparre and those of the other parts of the island. This was made generally known by the display of flags in the several path-ways; not a canoe was suffered to move along the shores; nor was a fire allowed to be made; which produced a degree of solemnity, that was very expressive of the concern felt for the death of this chief, and of his consequence and respectability. Numerous fires had been observed the preceding day all over the district of Oparre. These, we were given to understand, were ceremonies of a religious nature consequent on the demise of *Mahow*; and it is reasonable to suppose that the mourners took advantage of this ordinance to cook sufficient provisions for the time of the interdiction. (pp. 280-282)

January 16: The next morning, they [some members of Vancouver's crew] were ... honored by a visit from *Otoo* and several of the chiefs, in their way to the morai. Soon after, a canoe covered with an awning was seen coming from the westward, paddling in a slow and solemn manner towards the morai, in which was the corpse of the deceased chief. On their expressing great anxiety to see *Pomurrey* for the purpose of obtaining permission to attend the burial ceremony, they were informed that he was gone to the morai, but would have no objection to their being present. They proceeded; and, near the rivulet that flows by *Urripiah's* house, they saw the queen-mother, *Fier re te*, and the widow of the deceased *Mahow*, sitting all in tears; and in the paroxysms of their affliction, wounding their heads with the shark's teeth they had prepared the preceding evening. The widow had a small spot shaved on the crown of her head, which was bloody, and bore other evident marks of having frequently undergone the cruel effect of her despair. Being apprehensive that the presence of strangers might be unwelcome, they took leave, and repaired to the morai, where the priests had already begun their funeral solemnities. *Pomurrey*, *Urripiah*, and others, silently assenting, they moved quietly through the assembly, and were seated with as little interruption to the duties, as on entering a church in England after the service is commenced. Five priests were seated before *Pomurrey*, chanting a prayer, with their faces towards *Otoo*, who sat on a man's lap. About ten yards from him was held a bundle of cloth, which contained emblematically the *Eatooa*; a general name for their deities. The body of *Mahow*, wrapped in English red cloth, was deposited under an awning in a canoe, whose bow was drawn up a little way on the beach near the morai, and was attended by one man only at her stern up to his middle in water, to prevent her driving from the spot. The priests continued chanting their prayers, frequently exalting their voices, until they ended in a very shrill tone. He who, on this occasion, performed the office of chief priest, was discovered to be our friend *Mowree*, whose prayer was equally fervent, and continued nearly half an hour longer than the rest; during which he was occasionally joined by another priest in a very shrill tone of voice. This prayer of *Mowree's* seemed at intervals, like an expostulation with the Divinity, by adverting to the different productions of the island remaining, and still flourishing in the greatest plenty, and yet *Ma-tooara Mahow* was suffered to die.

The address being ended they all rose up, and proceeded westward along the shore, followed by the canoe in which was the corpse, to the mouth of the rivulet, where the three royal ladies still continued to indulge their excessive grief; and who, on perceiving the canoe, burst forth into a loud yell of lamentation, which was accompanied by an accelerated application of the shark's teeth, until the blood very freely following, mingled with their tears. The canoe entered the brook, and proceeded towards another morai at the foot of the mountains, where the ceremonies to be performed on the body of the deceased required such secrecy, that, on no ac-

count, could our gentlemen be permitted to attend, although it was most earnestly requested. As some alleviation to this disappointment, *Pomurrey* promised they should see the manner in which the remains would be deposited the next day, and earnestly intreated they would desist from following the procession any further on the present occasion. As it was generally suspected that the body was now to undergo the process of embalming, the party much lamented *Pomurrey's* interdiction, as it deprived them of the only opportunity that possibly might ever occur of becoming acquainted with the nature of this operation; whence might be derived not only curious, but useful anatomical information. This prompted Mr. Menzies to renew his solicitations to *Pomurrey* to be admitted alone; but as these were attended with no better success they determined to abandon these melancholy solemnities, ... (pp. 286-289)

[Returning to their ship after their excursion the aforesaid members of Vancouver's crew passed near the path leading to the marae where Mahau's corpse was being embalmed.]

January 15: They had not proceeded far when a general solitary gloom prevailed; all the houses were deserted, and not a living creature, excepting two or three dogs, were to be seen until they arrived near the morai; where, in a small house, three men were observed, who, most probably, were the centinels of the sacred place. These questioned the guide in a very particular manner, and then acquainted him, that the body of *Mahow* had been removed to the morai, where it had stopped the day before; and that *Pomurrey* was there also. They now took a cursory view of the holy spot, which afforded little worthy of notice. It was terminated by high perpendicular rocks, whence issued several streams of water, whose continued murmurs, assisted by the wild and gloomy situation of the morai, gave an awful solemnity to the place, and fitted it to the mournful, sacred purpose, for which it is designed. (pp. 291-292)

January 17: A message was received from *Pomurrey*, requesting my attendance at Oparre, to "*tiehah*," that is, to mourn for the death of *Mahow*. It was understood to be much wished, that we should be provided to fire some vollies; and that I should present, on this occasion, a piece of red cloth as an offering to the deceased. I was informed also that most of the neighbouring chiefs were to pay their last tribute of respect to the remains of *Mahow*, and that the ceremony would consequently be attended with many formalities; but on our arrival at Oparre there did not appear the least foundation for any such report. Mr. Broughton and Mr. Whidbey accompanied me. On our landing, we were conducted to a temporary habitation of *Pomurrey*, where we found him, his wives, and sisters, in readiness to receive us. Some little concern was certainly apparent for the loss of their friend and relation; though very unequal to the affliction I expected to have witnessed, from the great care, and tender regard, manifested to *Mahow* by the whole party when alive. The grief of these people is of two descriptions, natural and artificial; it is excessive on the first impulse, but soon moderates and wears away.

The corpse was laid on the tapapaoo, which seemed to have been erected for the express purpose about a quarter of a mile to the eastward of the grand morai; (or as it is called, "tapootapootatea") and appeared to be then undergoing the latter part of the embalming process, in the same manner as described by Captain Cook in the instance of *Tee*. The body was exposed to the sun; and, on our approach, the covering was taken off, which exhibited the corpse in a very advanced state of putrefaction. The skin shone very bright with the cocoa-nut oil, with which it had been anointed, and which, we understood, was highly impregnated with "*aehigh*,"

or sweet-scented wood. One of the arms and a leg being moved, the joints appeared perfectly flexible. The extremely offensive exhalations that were emitted, rendered it natural to conclude, that the whole mass would soon be completely decomposed; but, if credit may be given to their assertions, which were indubitably confirmed by the remains of *Tee*, and to which I could myself bear testimony, this will not be the case. *Pomurrey* informed us, the corpse was to remain a month in this place; then a month was to be employed in its visiting some of the western districts; after which it was to be removed to *Tiaraboo* for another month; whence it was to be carried to *Morea*, and there finally deposited with his forefathers in the morai of the family. In the course of a few months after its arrival there, it would gradually begin to moulder away, but by such very slow degrees, that several months would elapse before the body would be entirely consumed.

This method of embalming, or rather of preserving human bodies, is certainly an object of great curiosity; particularly, when it is considered that it is performed under the influence of a vertical sun; sometimes in the rainy season; and that the operators are totally ignorant of the properties of spices, salts, &c. &c. as antiseptics. Whether their preparations be simple or compounded, or what may be the peculiarities observed in the process, remains, I believe, intirely unknown to Europeans& and it is much to be regretted, that their religious interddictions precluded our attending the whole of these mysterious obsequies, as many vessels may visit this country without meeting so favorable an opportunity, with persons on board qualified and inclined to direct such enquires into effect.

The boat's crew were ranged before the paling that encompassed the *tapaoo*; the piece of red cloth was given to the widow, who spread it over the dead body; some vollies were then fired, and I was directed to pronounce "*Tera no oea Mahow*," that is, For you *Mahow*. On some rain falling, the body was taken under cover, and carefully wrapped up. We had but a few yards to retire to *Pomurrey's* habitation, where himself and family had taken up a temporary abode for this occasion; but the exceedingly offensive smell of the corpse obliged us to [move away]. (pp. 295-298)

Shortly thereafter the corpse of *Mahau* was sent forth on the tour described above, and life evidently returned to normal in the neighborhood where the events just reported took place. (Fig. 13-5)

JOURNEY OF THE SOUL

No domain of *Maohi* beliefs contained so many variations, and contradictions, as that concerned with the fate of a human's soul after the final and irreversible "death" of his body.⁹⁰ Even granting the unreliability of some of the reports on this subject, and the invalidity of some of the reporters' interpretations,⁹¹ there remains a large number of inconsistencies which cannot be resolved—and indeed will not be attempted here. Along with persistent variations of a localized nature, the corpus of *Maohi* beliefs on this subject was being continually augmented and diversified through dreaming and trance, either sincere or feigned. One should not lose sight of the absence in this society of any comprehensive social relationships requiring or even encouraging universal conformance to any "official" doctrine, except possibly the dogmas which members of the *Arioi* sects and other 'Oro

FIGURE 13-5. A ghosthouse with the exposed body of the *ari'i* Mahau. Watercolor by G. Tobin, painted more than four months after Mahau's death. Mitchell Library, Sydney.

worshippers were engaged in disseminating. In addition to variation of beliefs between localities, and among individuals in the same locality, it is not unlikely that often an individual held comfortably to beliefs that a Western observer would find quite contradictory.

Notwithstanding this, it is possible to single out a number of beliefs and to group them around a central set of themes, which I shall call "the journey of the soul." The only evidence we have concerning conformity to this doctrine lies in the circumstance that it is reported in many of the sources. The thread of this thematic complex runs as follows: when the soul leaves the body it is escorted by spirits, whose special function that is, to a place in or west of Ra'iatea and along an established and hazardous route. Near the end of its journey—if it has managed to survive that far—it undergoes a judgment to determine which of two (or three) places it will then proceed to. Borrowing Western analogies, one of these is a paradise, one a purgatory, and one a kind of limbo for purged sinners and for others not qualified to enter paradise. In due course many souls are released from limbo and allowed to revisit their earthly homes, while a fortunate few, presumably those mainly in paradise, become apotheosized.⁹²

Souls originating on Tahiti assembled at Tata'a Hill (Puna'auia district) before starting out in convoy on the overseas journey. The takeoff place on Mo'orea was Mt. Rotui, and presumably for every other inhabited island there was such a place.⁹³ Many souls eventually arrived at Mt. Temehani on Ra'iatea, but not all souls survived to reach that point.

At Tata'a Hill (Tahiti) there were two stones, one of *life* and one of *death*; if the soul happened to touch the former it was able to continue its journey, if the latter it was annihilated (de Bovis 1909:39). In Henry's version, "If it alighted ... upon the ... stone-of-life it could return by powerful attraction to its body; but if it went on to the ... stone-of-death it was forever severed from its mortal remains" (1928:200). The utter fortuitousness and the seeming triviality of the event behind this fateful outcome is emphasized by the fact that the unknowing soul was also blind. De Bovis recorded another episode of fortuitous fatefulness in the belief that souls *en route* amused themselves along the way by picking *tiare* flowers, some of which were fatal; and if a soul happened by chance to pick any of these latter it was thereupon annihilated, or so these reports imply. It could well be that deeper enquiry would have turned up a belief that even consequences as seemingly accidental as these were decided by higher spirits on one basis or another. But like the question concerning Maohi beliefs in the possibility of free will, this one is now beyond answering.

Another kind of hazard along the soul's route was in the form of malicious spirits which sought to destroy it; measures taken to protect the soul from this danger were noted above.

According to Henry's version, the most detailed available, at Mt. Temehani on Ra'iatea the route branched:

At the point of deviation stood the god, Tu-ta-horoa (Stand-to-permit), and when the spirit coming from the stone of life at Tataa hill met him he would under certain conditions tell it to return to its body to remain a while longer in this life. But generally he merely pointed to one of the two roads, which the spirit silently took. When allowed to go to the right, it flew on to Pu-o-roo-i-te-ao and there met Roma-tane (Voluptuous-man) who received the 'ura feather amulets as peace offerings, whereupon the spirit was safely ushered into the desired Paradise, called Rohutu-noanoa (Rohutu-of-sweet-odor). But when directed to the left by Tu-ta-horoa the spirit had no alternative but to obey and fly up on to Pu-o-roo-i-te-Pô, whence it flew down into the crater of Temehani and was soon ushered into the presence of Ta'aroa-nui-tuhi-mate (Great-Ta'aroa-whose-curse-was-death). In this region the rank of mortal beings was not respected, but all were treated alike. Kings, noblemen, and plebeians, according to their capabilities, were food-gathers, fishermen, planters, and menial servants to the gods; queens and all classes of women served the goddesses, for, as the legends of old Tafai and the goddess Pere show, regions like those above ground and the same kind of life were supposed to exist below. When their work was done these captive spirits had to sit about in the region of utter darkness—which to the gods was not obscure—by the ever-rushing river where Ta'aroa and his coadjutor Rua-tupua-nui liked to dwell; and when it pleased Ta'aroa, his cooks scraped the spirits into a pulp with the shell of the *tupere* (cockle) as sweetening for his *pota* (taro-leaf spinach). But this process did not annihilate them, and they came again to be at Ta'aroa's disposal.

After remaining about a year in this purgatory, the spirits looking miserable, would be sitting with recent arrivals around Ta'aroa, who at last moved to pity would ask if they were not happy, and on being answered in the negative, he

would ask what they desired. They would say they were homesick and would like to be released to visit the upper world. Then Ta'aroa, after enquiring about their homes and relatives, showing great interest in all their answers, would tell them they were free to go for a visit. (1928:201)

Purification through being eaten—by a spirit bird, a spirit sea slug, the ghosts of relatives, or by one of the major deities—is an episode found in several versions of this thematic complex. One account, for example, reports that the souls of premature infants went to Ta'aroa's pools in the *pō*, where they entered into periwinkles (*hihi*) and gobies (*Electrisfusca, o'opu*), and whenever one of these was eaten by a god it slipped into another periwinkle or goby. "Babes that had not seen the light from other causes were permitted to enter into the same kind of fishes in rivers on the earth." (Henry 1928:200) Another version asserts that a son's soul was eaten by his father's ghost—or vice versa, depending upon which one had died first. Henry in a more general statement said that "Children in the dependent state went to their ancestors" (1928:200). Still another account states that certain souls eaten by gods became assimilated into the latter's being (de Bovis 1909:40). According to Anderson, social relations in the afterlife were about the same as before death:

They are ... far from entertaining those sublime conceptions of happiness, which our religion, and, indeed, reason, gives us room to expect hereafter. The only great privilege they seem to think they shall acquire by death, is immortality; for they speak of spirits being, in some measure, not totally divested of those passions which actuated them when combined with material vehicles. Thus, if souls, who were formerly enemies, should meet, they have many conflicts; though, it should seem, to no purpose, as they are accounted invulnerable in this invisible state. There is a similar reasoning with regard to the meeting of man and wife. If the husband dies first, the soul of his wife is known to him on its arrival in the land of spirits. They resume their former acquaintance, in a spacious house, called *Tourooa*, where the souls of the deceased assemble to recreate themselves with the Gods. She then retires with him to his separate habitation, where they remain for ever, and have an offspring; which, however, is entirely spiritual; as they are neither married, nor are their embraces supposed to be the same as with corporeal beings. (Cook 1784:164-165)⁹⁴

Anderson added the following somewhat puzzling statement, which is confirmed in no other source that I know of:

... they consider [being eaten by a deity] a kind of purification necessary to be undergone, before they enter a state of bliss. For, according to their doctrine, if a man refrain from all connection with women some months before death, he passes immediately into his eternal mansion, without such a previous union, as if already, by this abstinence, he were pure enough to be exempted from the general lot.

A different version of the soul's journey, reported by de Bovis, specified Tupai as the purgatory for souls not admitted to paradise. Tupai, an atoll about ten miles north of Porapora, had no permanent settlement but was vis-

ited occasionally by fishermen—but only in parties, because natives feared the ghosts too much to visit alone or to reside there (de Bovis 1909:40).⁹⁵

In Moerenhout's version the fateful branching of the route occurred at the soul's takeoff place on an island. On arriving there, if the soul perched on the right-hand stone, that in itself was proof of its innocence of punishable misdeeds and it was ushered into the limbolike *pō*; but if it perched on the left-hand stone, that was a sign of guilt, and it was taken to a purgatory where it was punished and purged and then admitted into *pō*.⁹⁶ But, continued Moerenhout, the actual numbers of those dying in fear of such punishment were few because, in the first place, most Maohis were careful not to commit punishable misdeeds(!), and secondly, those who did so usually took pains to expiate, with prayer and sacrifice.

Paradise, that is "Fragrant Rohutu," was according to some accounts conceived of as being on the north side of Ra'iatea, an elysium of a place, "... where the air was remarkably salubrious, flowers abundant, highly odoriferous, and in perpetual blossom. Here the Areois, and others raised to this [privileged situation], followed all the amusements and pursuits to which they had been accustomed in the world, without intermission or end. Here was food in abundance, and every indulgence." (Ellis 1829:I, 517.) And here there was no sickness and no aging, and all women remained eternally beautiful (Moerenhout 1837:I, 434). Altogether, a highly suggestive commentary on Maohis' life goals.

But even more significant are their beliefs about the manner of person admitted to that eternity of sensual bliss. First and foremost, the Maohi paradise was reserved for the souls of members of the Arioi sect. When one of these latter died his body was eventually interred within the precincts of a marae dedicated to the god 'Oro, where a priest invoked the god to "... bestow on the disembodied spirit all the mystic powers with which it had been supposed he had invested the *arioi* in life ... [and] to receive the *arioi* soul into the full enjoyment of their paradise, where it was believed that no children existed to mar their pleasure" (Henry 1928:241).

In addition, entry into paradise could be attained by the souls of all persons who, in de Bovis' words, "... had lived in an appropriate manner *vis à vis* priests and marae" (1909:41).

Moerenhout put the matter somewhat differently. In his version, in addition to the Ariois, paradise was accessible also

... to the friends of chiefs and to other such individuals affluent enough to provide the gods with enough sacrifices, and the priests with enough gifts, to induce the latter to pray so as to bring about, eventually, the transfer of the donors' souls from Po, the dwelling-place of shadows, to Rohutu noanoa, abode of light and pleasure. However, this required so much wealth that most people entertained no hope of

ever tasting the delights of the heavenly abode. In the case of individuals who had left accumulations of wealth [but who had evidently not given enough to gods and priests while alive] their ghosts sometimes returned to their relatives and heirs and ordered them to donate that wealth to the priests and gods, so that they could gain admission to heaven. The prospect of this heaven, and the fear of the painful alternative, served to bring in immense revenues to the priests; hence, a large part of some people's wealth passed into or through the priests' hands. (1837:I, 435)

Combining these several versions of the soul's journey—which may well be a factitious exercise on my part⁹⁷—there appear to have been three kinds of fates in store for souls: a paradise for all those who had lived lives of lavish supererogation vis à vis the deities and their priestly representatives, or whose resources were so used after their deaths; a purgatory for those who still bore the guilt of unexpiated sins; and a limbo for those whose sins had either been expiated before dying, or who had been purged in purgatory.⁹⁸ And in addition to these, there was, of course, the fate of annihilation which some souls suffered before reaching purgatory or limbo; presumably, no soul bound directly for paradise met such a fate, since they were conducted thither by the god Uretaetae (de Bovis 1909:41).⁹⁹

It would appear therefore that, in terms of the themes expressed in the journey of the soul, one's fate after death depended almost entirely upon conduct vis à vis spirits, rather than upon one's relations with humans. But that is perhaps too narrow a view, for it will be recalled (from Moerenhout's version) that the surviving kinsmen and friends of the deceased could insure the soul's avoidance of or release from purgatory by making large offerings to the gods through their priestly intermediaries, thereby favoring persons of social importance and affluence, but implying also that social morality and ethics may after all influence the soul's fate. Unless fear of a vengeful ghost were the only motive behind such mortuary offerings, the unloved and unlamented person would presumably have inspired less generosity among the survivors than would the more considerate and better loved. Also relevant is Henry's statement regarding the annual feast to departed souls, designed, according to other accounts, to obtain their goodwill through facilitating their release from purgatory:

During the year when the soul was supposed to be safe with Ta'aroa in the Pō, all the family and near and distant relatives planted food and fattened live stock. When all their plans were matured, at about the anniversary of the death, they made a feast in the home of the deceased, of which they partook in the night, *pō-tupapa'u* called (ghosts's night), when they invoked the presence of their lost relative, bidding him or her welcome home. This practice, they said, insured the continued good-will of the deceased, who then never haunted them.

After this [release from purgatory] they became inferior gods, called 'oromatua, that were composed of three classes: 'oromatua maitatai (good 'oromatua) who entered into their own skulls as family gods or guardian spirits; 'oromatua 'ori'ori noa (rambling 'oromatua), who sometimes appeared to members of their family

to direct them in their worldly affairs or warn them of coming dangers; and 'oromatua nihoniho-roroa or 'oromatua-ia-arua ('oromatua with long teeth or people in the woods). The first class were always benevolent; the second class were kind when well treated, but abandoned those whom they would befriend; and the third class, when vexed, strangled and devoured people, even their relatives and friends and were invoked to do so by the sorcerers in their black art. (1928:201-202)

None of the sources provides a general comprehensive statement explaining why any particular soul assumed, or was made to assume, one or the other type of ghost role, but there are fragmentary bits scattered throughout the literature on the Maohis to indicate that an individual's preoccupations and temperament while living were in some degree maintained in the ghostly state; for example: Arioi remained devotees of pleasure, the most innocent of babes were transformed into the most harmless of animals, the souls of people committing suicide for reasons of unrequited love continued to hover near the loved one (Henry 1928:200), and warriors slain in battle became even more ferocious—wounds gaping, these latter were a deadly threat to any mortal brash or unwitting enough to go near the fatal battlefield (de Bovis 1909:40). In this connection, the view that many ghosts, presumably the more benevolent ones, materialized in the form of the type of animal or bird that had previously served to embody its spirit-familiar, is also a "reasonable" conclusion (e.g., Moerenhout 1837:I, 457). But it does not thereby warrant describing the Maohis as "totemistic." On the other hand, Henry's statement about victims of infanticide does seem rather paradoxical: "Little babies murdered at birth (*puaru*) become house guardians of their parents, who sometimes fancied they heard their cries at night" (1928:200); but the paradox might perhaps derive from Henry's neglect to specify the kind of guardian meant.

In any case, the fate of a victim of infanticide does not present the only paradox or inconsistency in Maohi eschatology. There are other themes more or less in conflict with the journey-of-the-soul complex. "It was supposed that when people died violent deaths their spirits did not go the same way as those of people who died from natural causes, but that they remained at the places where the fatal accidents occurred, rendering these places sacred or dreaded" (Henry 1928:200); that is, such souls did not pass through purgatory or limbo. But what is meant here by "violent" death: death in battle? death from sorcery?

All souls whose bodies were not accorded a proper funeral remained near the place of death. All souls whose drowned bodies remained unrecovered from the sea lived forever after in a kind of paradise in the depth of the sea (e.g., see Cook 1784:165). "... if a man ate the head of a hog at the marae instead of giving it to the gods on such an occasion, his soul would enter into a hog after death; or into a fish if he ate the head of a fish" (Henry 1928:176).

But far more important than any of these is the theme of apotheosis, which has a direct bearing upon our understanding of Maohis' valuation of mankind (i.e., is man a potential *major* god?) and of their kinship ideology. I shall take up the latter matter in other chapters, and here only present some evidence regarding the presence, or absence, of the belief.¹⁰⁰

Moerenhout, speaking of major *atua* (*dieux du premier ordre*) gave as his own judgment that "apotheosis, if it took place at all, was very rare" (1837:I, 445). He noted that none of the most celebrated (historical) chieftains of the previous four or five generations was included in any list of gods (*dieux*). Presumably he was referring to an active belief in the process of apotheosis and not to the historicity of the process itself.

I have found no evidence of a doctrine of reincarnation and no belief that the soul of one deceased human ever reentered the sphere of humanity as permanent soul of another.¹⁰¹ In this respect, at least, every Maohi was unique.

CHAPTER 2

- 1 West of Maupiti, 180 and more km, lie the atolls Mopilia, Scilly, and Bellinghausen, which the geographers now include in the Society archipelago. The ancient Maohi knew of these atolls, but there were no permanent settlements on them.
- 2 Gougenheim 1956:40. According to several older accounts these Islands have also been represented as evidencing little or no variation in tide time, highs having been alleged to occur regularly near noonday and midnight, and lows near 6:00 A.M. and 6:00 P.M. As Gougenheim demonstrated, careful measurements have shown these other accounts to be inaccurate; the actual amplitudes of high tides are seen as varying between 10:00 A.M. and 3:00 P.M., and between 10:00 P.M. and 3:00 A.M.
- 3 Taxonomies given in this chapter are of course modern "scientific" ones; some parallel Maohi taxonomies will be presented in later chapters.
- 4 Mesotropical and hygrotropical correspond, respectively, to the zerotropical and pluviotropical zones distinguished in the Hawaiian Islands (Egler 1941); but in this connection Papy points out that the climatic differences are less clear-cut on Tahiti than on Oahu (1954:II, 176).
- 5 Based mainly on Papy 1954, supplemented by Henry 1928. In this and other lists of plants given in this chapter only the generic name is listed in the text (except when it is necessary to distinguish species of the same genus).
- 6 Papy characterized this zone as having a climate of B1 A' a' w according to Thornthwaite's formula, i.e., a humidity index of 22.3; a very high evaporation potential (over 114 cm), less than half of which occurs during the summer months; and a slight deficiency of precipitation during the winter months (1954:I, 120; and Thornthwaite 1948).
- 7 This chapter was first written prior to publication of Norma McArthur's book on *Island Populations of the Pacific* (1968), which includes a lengthy section on the population of the Society Islands during the eras now under study. Dr. McArthur's treatment of the few eyewitness estimates of these Islands' population in most respects is so detailed and authoritative that I am left

- with little more to do than echo her findings. In this connection I wish also to acknowledge Beaglehole's useful study of the same subject (Beaglehole 1955:clxxiv-clxxvii), and to thank R.G. Schmitt for his most helpful critique of an earlier draft of this chapter.
- 8 See Davies to Orme, 9 December 1830, LMS Archives. But see Schmitt's strictures concerning the reliability of all the early missionary censuses, as well as some of those conducted later. (Schmitt 1967).
 - 9 The identification of Banks' O'whaa with Mahaena is rendered more credible by the circumstance that this district's principal river is named Fa'a (Henry 1928:72). Oapora is inscribed on Cook's map of 1769 between Oparre and Tetta-hah.
 - 10 In this connection, shortly after Cook's return to Tahiti in 1793 one of his officers, Lt. Pickersgill, reported having landed at Hitia'a "amidst the acclamations of at least 5000 People" (Beaglehole 1961:768).
 - 11 Father Joseph Amich, who remained on board the frigate during the party's reconnaissance ashore, wrote of having learned from the shore party that the island "was peopled by some 150 persons of all ages and sexes" (Corney 1915:73). This is further confirmation of Don Amat's reservations about the padre's reporting and of Schmitt's despair over the garbling of population estimates, both cited previously.
 - 12 Cook, Banks, and other early visitors made no mention of throngs comparable to those experienced on Tahiti. And the paramount tribal chieftain of Ra'iatea, for all his social preeminence, apparently could not muster enough power to escape conquest by Poraporans.
 - 13 During his second voyage Cook reported having seen a young man 6 feet 4.6 inches tall, who was accompanied by his "sister" who was herself 5 feet 10.5 inches in height (Beaglehole 1961:424).
 - 14 Recent anthropological description of Tahitians is more precise by far than the impressions recorded by the earlier visitors, but it is in some respects less "authentic," in view of the increments of alien genes that are almost certainly contained in many of the individuals measured. See Shapiro 1930 and 1943; Marshall and Snow 1956.
 - 15 See also Beaglehole 1961:769; Corney 1913:329-330; Corney 1915:80; Bligh 1789:I, 409.
 - 16 Papy 1954:II, 266-267. Other plants that moved into these clearings were *Urena lobata* (*piripiri*), *Triumfetta procumbens* (*urio*), *Adenostemma viscosum* (*vaianu*), *Gossypium tahitense* (*vavai*), *Ocimum gratissimum* (*miri*)—in other words, indigenous species and not introduced by the Maohis.

CHAPTER 3

- 1 "We have heard other traditions on the same subject; little dependence can be placed on any as being universal; one was believed here, and another there, and they had only one common quality—that of being equally preposterous in mass and abominable in detail" (Montgomery, quoted by Mühlmann 1955:168). I am concerned here of course with the *fact* of vari-

ability, and not with the so-called infrastructures revealed by comparing different versions of the same myth, as defined in Lévi-Strauss, 1960.

- 2 I am not able to document or explain the several factors that contributed to change in this sphere of Maohi life, but certainly one of the most important of them must have been dreams.
- 3 See, for example, de Bovis 1909:45.
- 4 According to E.S.C. Handy, "The ancient esoteric teaching in [Polynesian] cosmology postulated the preexistence of a self-created World Soul which evolved the world and the universe out of itself, and called manifest existence out of nothingness by the power of the Word" (1927:9). Handy went on to state that the only direct evidence we have of such a belief is from New Zealand and the Society Islands. The reasons why other Polynesian creation accounts make no mention of this World Soul are that the informants either did not know them or dared not reveal such esoteric knowledge.
I leave to others an analysis of the New Zealand evidence cited by Handy. As for his Society Island evidence, I fail to discover any credible basis for his postulation of a "World Soul." Neither of the brief and almost identical native texts he paraphrases—nor even the much expanded versions recorded in Henry—contains words or phrases which would permit any such interpretation. If, in defense, the emphasis is placed on "postulation" rather than "translation" then I must retire from this fascinating but fruitless pastime.
- 5 If admirers of Polynesian verbal arts object to the liberties I take with what in many instances are gems of sonorous and metaphor-studded expression, I offer as my excuse that I am interested in such matters only as they have a more or less direct bearing on the main subjects of interest.
- 6 Ellis 1829:II, 192; see also Moerenhout 1837:I, 442ff. Ellis added that one of the missionaries was told of the existence of still another god "... superior to them all, whose name was Rumia; he did not however, meet with any of their priests or bards who knew anything about him." According to the LMS Dictionary, Rumia was "... something like an egg floating in the abyss, or expanse, out of which came the materials of heaven and earth." See also Henry 1928:339ff.
- 7 For example, Emory 1928, Jacolliot 1954, Lavaud 1928, Roussier 1928.
- 8 In one passage Ellis asserted that "... Ta'aroa *oriori*, or created, the gods" (Ellis 1829:II, 193), but he did not specify the precise meaning of this term. In fact, the LMS Dictionary defines *oriori*, to shake, or dance repeatedly, to gad about.
- 9 The popularity of recent works such as *La Pensée Sauvage*, by Claude Lévi-Strauss, suggests that many persons still need to be convinced that all human beings, everywhere, display evidence of intellectual curiosity and skills going beyond the bare necessities of living.
- 10 Specific status names are referred to as Titles.
- 11 Recorded by Orsmond at Ra'iatea in 1817 (Henry 1928:399ff).
- 12 I emphasize that there were individual differences in this regard among the Maohis, as are to be found in all human societies. For example, individuals could be found capable of explaining a moon eclipse: "they suppose ...

that an eclipse [of the moon] is a prodigy that portends war, the death of a Chief or some such thing.... They say the moon in the time of Eclipse is pressed out and squeezed by some god and in danger of being devoured" (Davies, Journal, 10 May 1808, LMS Archives). Others among them appeared to be wholly disinterested in the phenomenon: "We do not find that the natives took any particular notice of the eclipse last night, which, considering the superstition of the islanders, is somewhat remarkable" (LMS Transactions:I, 218).

- 13 Throughout this and succeeding chapters I shall make extensive use of Maohi linguistic data for labeling and classifying such things as roles, activities, and the like. Unfortunately, however, no competent linguist has yet published the type of descriptive grammar of Maohi speech which would provide us with the kind of comprehensive "ethnotaxonomy" which only language can provide.
- 14 Throughout this book, "god," "ghost," and "demigod" will be used when the reference is clearly so intended, but otherwise the English term "spirit," for which, however, there is no exact Maohi equivalent, will be used—i.e., when the meaning is not sufficiently specific or when more than one type is intended.
- 15 Data on such "levels" are scant, imprecise, and conflicting, suggesting either that the concept may have been unimportant or that the European chroniclers were unobservant. The numbers of such levels vary in the accounts from seven to ten and more.
- 16 Moerenhout wrote that some of the Maohis' own deified chiefs were ranked among these principal gods (1837:I, 444).
- 17 The classification given here (i.e., into major and minor spirits) is largely my own, although supported in part by the taxonomic attempts of such writers as Ellis (1829:II, 191ff), Henry (1928:221), and Moerenhout (1837:I, 442ff). The Maohis did label some of their *atua* as *ri'i* (lesser, minor), and described some as having been more exalted than others, but I very much doubt that there was any consistent, comprehensive classification subscribed to on a universal society-wide basis. Individuals probably differed considerably in their rank-ordering of spirits according to personal, local, or cult ties with particular ones. Also, such rank-ordering was undoubtedly subject to change—as witness the rise in popularity of 'Oro during the second half of the eighteenth century (see chap. 12, this work).
- 18 "Like the Ancient Greeks, the Tahitians had their Oréades, their Maiades, their Dryades, their Sylvains, and their Faunes; but the Tahitians even outdid the Greeks in this regard" (Moerenhout 1837:I, 451).
- 19 See, for example, G. Forster 1777:I, 379, 394; Beaglehole 1961:424.
- 20 The LMS Dictionary implies that *'oromātua* applied only to malevolent ghosts; but this is contrary to Henry's more general usage. The LMS Dictionary likewise states that *tupapa'u*, the term used for "corpse" (and for the bier on which a corpse was laid out), was used also for "ghost."
- 21 See quotation from Henry, page 54 above; also Moerenhout 1837:I, 507.
- 22 The LMS Dictionary gives the following definitions of these terms: *mana'o*,

thought, idea, meaning, conception; to think, muse, reflect; *horuhoru*, to be agitated, troubled in mind; *manava*, stomach, belly, interior man. See also Henry 1928:367. A passage from one of the Forsters, who accompanied Cook, provides a highly specific account of all these matters, asserting that feeling and thinking were the function of a separate being, a tee or teehee (i.e., *ti'i*), inside an individual; but in my judgment this version is less acceptable than those of better informed and less pretentious observers.

23 See, for example, Luomala 1940.

24 "*Holy* usually implies some quality or some attribute in the thing itself which makes it either suitable for use in worship or an object of veneration.... *Sacred* ... differs chiefly from *holy* in implying a character given to a thing by blessing, dedication, consecration to religion or worship or to the uses of religion or worship, or by its being devoted wholly to such ends or uses; the term therefore usually suggests an opposition to that which is profane or which exists for profane uses;" *Webster's Dictionary of Synonyms*, 1951.

In some unpublished notes of Orsmond there seems to be a suggestion that *mo'a* was simply a substitute for *ra'a*, brought about by operation of the Maohi custom of *pi* (word replacement), but this has not been substantiated (White 1967:326). Also, there is a god named Ra'a but none, as far as I can discover, named Mo'a.

25 See, for example, Morrison: "If any thing touches the Alter, or even the Sacred Ground about the Morai, let the Value be ever so great it is deemed Sacred, and for that reason can never be brought into unhallow'd ground, or touch'd but by the Priests & should a Hog or Dog &c. run into any of the Sacred Grounds they are kill'd for sacrifice" (1935:183).

26 See, for example, E.S.C. Handy 1927:28-29.

27 The LMS Dictionary gives the following meanings for *tapu*: (1) a restriction & the word is obsolete in Tahiti, though much used in some islands. (2) sacred, devoted, but this sense is nearly obsolete in Tahiti, although retained in other dialects. (3) an oath or a certain solemn engagement to perform, or not to perform certain things. This is called *parau mate tapu*. (4) to bind one's self, or another person, with an oath to do, or not to do a thing; to adjure. (5) a sacrifice to the god Oro, commonly a man killed for the purpose, but this *tapu*, or *taputapu*, was generally called *ia* or fish.

28 See also Henry 1928:182. Sennit was used in certain kinds of divination, as will be described in due course.

29 Peter Buck put forward the idea that in the Society Islands the more anthropomorphic *ti'i* were the older form of god-image, having been superseded by the less anthropomorphic *to'o* forms as god-images though surviving as repositories for sorcerers' familiars (Buck 1944:469). It is difficult to see how this interesting theory could be tested, archaeologically or otherwise.

30 E.S.C. Handy drew attention to the interesting parallel provided by the *toko* (probably equalling Maohi *to'o*), the sticks of wood which in New Zealand and the Marquesas represented the major deities, "... as supporters of the heavenly realm in its relationship to the earth" (1927:121).

- 31 Clerke's reference here is to the offer by a chief and his spouse of the latter's sexual services. Cook, be it known, did not accept the proffered exchange! See also G. Forster 1777:II, 70-71.
- 32 Henry 1928:136. The LMS Dictionary, however, restricts the meaning of *manaha* to the name of a house sacred to 'Oro.
- 33 Although phrased in general terms, Ellis was writing here mainly of 'Oro-possessed "priests," i.e., oracles.
- 34 See, for example, Davies, Journal, 17 September 1807, LMS Archives.
- 35 The LMS Dictionary defines *ha'a mori*, to worship a Deity, to perform religious services; and *pure*, prayer, to pray, worship, to worship. The general term for a religious ceremony was *oro'a*, and for prayer *upu*.
- 36 See, for example, Moerenhout 1837:I, 504ff; Ellis 1829:II, 209ff; Henry 1928:157ff.
- 37 See Ellis 1829:II, 211ff; Morrison 1935:182ff. The term *fei'ai* specifically signified "prayer accompanying a sacrifice," but in fact nearly all prayers delivered at a marae, or elsewhere, were accompanied by offerings in some form.
- 38 There appears to have been no word for altar other than *fata*, which also referred to bier, or any kind of detached platform, scaffold, or rack.
- 39 The use of *taraehara* (guilt-untying) indicates that this referred to an expiatory sacrifice. See p. 120, this volume.
- 40 Except for used wrappings of the marae's tutelary gods, which were buried under the *ava'a*, having been too sacred even for disposal with other used items.
- 41 Morrison 1935:206-207; Moerenhout 1837:I, 508ff; Henry 1928:196-198; de Bovis 1909:55-56.
- 42 Some writers accept this as evidence of a holdover from cannibalism. Although cannibalism did prevail in some Polynesian-speaking societies, this symbolic simulated eye-eating of the Maohis need not be so explained.
- 43 Henry 1893:105ff; Henry 1928:214; Huguenin 1902:141ff; Young 1925:214ff; Sasportas 1926:269ff.
- 44 Contemporary data about Maohi marae are anything but satisfactory: a few pictures showing parts of some larger ones; partial word descriptions of some of them—either largely impressionistic or emphasizing only their most dramatic features; some general accounts of ceremonies, which however seldom refer action to particular settings; etc. In fact, the best information available about marae comes from archaeology, which of course is limited to those stone remains that have withstood the ravages of flood, silt, destructive vegetation, and human depredation. All less durable marae features have long since disappeared; and even many of the surviving stone structures are now unidentifiable with respect to name and function. For archaeological studies of marae see Emory 1933, Garanger 1964, Green et al. 1967, and Green and Green 1968. The best data available on specific marae have been brought together by Green and Green, drawing on eyewitness descriptions, drawings, and analogous archaeological remains; the marae in question are located in Pare and Atehuru districts of Tahiti.
- 45 Cook and Banks reported having seen a "pyramid," about five feet high,

- “covered” with (or “adorned” with) pandanus and crataeva nuts (Beaglehole 1955:111; Beaglehole 1962:I, 302-303); but from their statements it is not clear whether the pyramid itself was constructed of such nuts.
- 46 I give only approximate dimensions, in view of the fact that observers differed in their estimates. See Emory 1933:72.
 - 47 The best accounts are those of Cook and Bligh, which have been brought together by Green and Green (1968) and carefully related to architectural features of specific marae.
 - 48 In marae Taputapuatea of Opoa (Ra’iatea) there was a separate stone column, the 2.8 meter high “Column of Investiture,” which served this function (Emory 1933:146). Special columns or platforms may have served this function in other marae but are no longer identifiable as such.
 - 49 For these and other ritual uses of plants see Rey-Lescure 1951.
 - 50 Principal sources on this rite are Henry (1928:157-177), Ellis (1829:II, 217), and Moerenhout (1837:I, 514ff). Henry translated *paiatua* as “an assembling and uncovering of the gods”; Moerenhout (who incorrectly wrote it *paa atua*) as “the renewal of the shell or body covering of gods.” The LMS Dictionary describes it as an idolatrous ceremony on the new decoration of the *too* or image of a god. *Atua*, of course, can be translated “god(s),” but *pai* has a variety of meanings, none of which appears relevant; in any event, etymologizing Maohi words of that far-gone era is in most instances a fruitless task.
 - 51 So Henry translated it; in the LMS Dictionary *taritoo* is defined as family, or personal gods; a certain amulet to protect a person from witchcraft, etc.

CHAPTER 4

- 1 A present-day long-time resident of Tahiti commented: “I suspect that [the Maohis] ate food with high sugar content for breakfast. When the [modern Tahitians] couldn’t get sugar during the war they substituted mangoes and ti [i.e., roots] for highly sugared coffee.” (R.G. White: personal communication)
- 2 It is not at all certain that the Maohis distinguished between “work” and “play” (in the Western sense). The LMS Dictionary does define the word *ohipa* as “work, employment; to work, labour, toil,” but one cannot be sure that the missionary lexicographers were not influenced by their own conceptions when seeking equivalents for Maohi words.
- 3 See section on social stratification, chap. 18 this work.
- 4 If this appraisal of Moerenhout’s is indeed correct (which I very much doubt) things have certainly changed from his day to ours!
- 5 See Wilson 1799:206.
- 6 “No Europeans” was probably meant; present-day Tahitians, and probably their ancestors as well, seem to be able to drop off to sleep despite any amount of din.
- 7 See also Corney 1919:57. In this connection, during my sojourns in present-day Tahitian villages I was struck with the degree to which this habit had survived. “We are morose on dreary days,” I was told. “We think about all our relatives who have died.”

- 8 The LMS Dictionary translates *mahana* as the sun, also a day; but I am not certain how it was used in Maohi speech.
- 9 Ta'urua, without an attribute, was the name given to both Venus and Mars, but in this context it referred probably to Venus (R.G. White: personal communication).
- 10 In some texts *ru'i* is substituted for *pō* (in contrast to *ao*), but this was probably a late and local development—i.e., a case of *pi*, or word *tapu*. See chap. 23, section on symbols of chieftainship.
- 11 On the basis of his comparative study of Maui mythology, the linguist R.G. White has suggested that this particular version is more Tuamotuan than Maohi, and that it reflects some tinkering on the part of latter-day European “experts” (personal communication).
- 12 The Maohi rationale was perhaps that humans moved inside largely because spirits took over outside; although what the actual historical sequence may have been will, of course, never be discovered.

CHAPTER 5

- 1 Special-purpose tools, such as tattoo hammers and tapa mallets, will be discussed elsewhere, along with their relevant activities.
- 2 More archaeological investigations such as those described in Green et al. 1967 (see especially pp. 124 ff.), coupled with petrological studies, could provide at least a partial answer to this question.
- 3 Orsmond defined *aha-mata-ioio* as “pretily prepared Senet [which was] used by the artizans to bind the Stone adzes to the helve. It is singularly beautiful to see how many shapes the Senet is made to assume in binding the helve and adze together. Therefore called *aha mata ioio*, Senet of handsome faces.” (Orsmond: Dictionary Notes)
- 4 Bearing on this point is a continuation of the Orsmond note on *aha mata ioio* quoted in note 3 “[Such an adze] will be sacred [*ra'a*] by the Senet of the artizan so pretily prepared; it will be secured by the devious coloured Senet of Tane the god of beauty, It sounds as it is drawn it is firm. It is a head dress for the adze, a back support for the adze, To give it lightness, to give it the keenness, the glossy polish of *oiri* (a fish renowned) and to finish the adze.” This text raises again the question of magic: What was it that rendered such an adze sacred? Was it the very fact of its having been securely and “beautifully” hafted and thus metaphorically associated with Tane, god of “beauty”; or was it directly consecrated to Tane, and thereby personally “empowered” by that god, through having been fabricated, deliberately, as it were? Or both?
- 5 There were many varieties of sennit, differing according to grade of raw fiber, number of strands, diameter, etc. For example, there was *aha pahu*, sennit for drums, i.e., cordage for binding the sharkskin head to the drum; *aha pāpā*, “a very fine, flatly mate senet, of the finest cocoa nut fibres ... used ... to ornament the end, of the bow—of the club and of the lance.” (Orsmond: Dictionary Notes)
- 6 For example, red fig (*tahinu: Tournefortia argentea*), strand-creeper vine

(*pohue: Ipomoea pes-caprae*), and a shrub (*pua: Solanum repandum*). Beaglehole 1962:I, 358-359)

- 7 See also Henry 1928:151. In addition, G. Forster reported having seen a man preparing a red dye, which was then used by women on bark cloth (1777:I, 354).
- 8 Estimate is based on known parallels from places such as Samoa. According to Turnbull some mats required nine months of a woman's time (1813:345), but he did not specify what proportion of the plaiter's time would have been thus spent, nor did he explain how he arrived at this figure.
- 9 In this passage Ellis appears to have been writing specifically about the period of his stay in the Islands, i.e., from 1817 to 1824, but I am inclined to believe that the customs described by him were survivals of earlier decades.
- 10 For a description of more recent techniques see W.C. Handy 1927:110-115.

CHAPTER 6

- 1 In the legend of Honoura the demigod of that name refused to stand up and reveal himself to the populace until he had been given a loincloth (Henry 1895:263). And in the legend of Pai the young hero's entry into the company of his divine foster parents was signaled by his donning a loincloth, before which he wept unconsolably at his nakedness and lack of a name (Henry 1928:581).
- 2 Cook and Banks, however, implied that the Maohis had no combs of their own (Beaglehole 1955:124; Beaglehole 1962:337).
- 3 It was customary to pierce the earlobes of both sexes, presumably in childhood.
- 4 According to Henry, the *tiare* "... only decked the maiden's brow" (1928:287); from this it is not clear whether the "maiden" refers to virginity or to momentary unattachment, but probably the latter.
- 5 According to a visitor to Tahiti in 1832, many native women at that time "whiten their skin with the juice of the *papa*, an indigenous plant, and avoid the sun to improve their complexions" (Foltz 1835:543). If the "papa" referred to was *papai* (*Carica papaya*), this plant was a new one for the Maohis, having been introduced by Europeans. I cannot discover whether any native plants were used for skin bleaching in pre-European times.
- 6 See also Henry 1928:628. Ellis wrote of "the fondness of the Tahitians for these ornaments, as they considered the marks thus impressed" (1829:II, 463).
- 7 Henry 1928:287; Moerenhout 1837:II, 123; Ellis 1829:II, 466; Morrison 1935: 221. For technical details on Maohi tattooing see Roth 1905; Moschner 1955; Söderstrom 1939; Plischke 1931; P. Ahnne 1930; Rey-Lescure 1946.
- 8 See also Beaglehole 1955:125.

CHAPTER 7

- 1 For architectural differences based on resident's occupation or hierarchical position, see below.
- 2 See, for example, Beaglehole 1955:127. I can find no evidence of pre-European use of wick-in-oil lamps.

- 3 See Corney 1913:337; Morrison 1935:198.
- 4 See, for example, G. Forster 1777:I, 341-342.
- 5 Emory 1933:6-12. Roger Green (personal communication) has drawn attention to another feature of some Maohi masonry, namely, the incorporation of single courses of horizontally laid dike-stone in walls and *ahu* facings.
- 6 See especially Emory 1933; Green 1961; Green et al. 1967.
- 7 Emory went a step further in proposing that “The council platforms of the Leeward Islands are perhaps the original ‘maraes’ of the Society Islands, for as meeting and council places they fulfil the function of the New Zealand marae. The shrines today called ‘maraes’ were probably anciently called ‘*ahu*’, for numerous maraes in the Society Islands have ‘*ahu*’ in their names....” (1933:41)
- 8 “... *na va’a mataeina’a o teie nei hau*”: for explication see chap. 23, section on *hau*.
- 9 A word in the LMS Dictionary, *ahutapae*, is defined as one who is a newcomer, not belonging to the place; one who joins in a work after it is partly done; a new marae derived from an old one.
- 10 Roger Green: personal communication.

CHAPTER 8

- 1 Morrison 1935:141; Wilson 1799:316.
- 2 G. Forster reported having seen an outriggerless boat: “After a short stay [ashore, near Matavai] ... I returned to our trading place, but finding all our [ship’s] boats gone off, ventured to embark in a single canoe, without an outrigger, and was safely brought on board the Resolution for a single bead ...” (1777:I, 284-285). This is the only reference I have found to this type of boat, and I cannot explain it further.

Earlier I mentioned the possibility that rafts were used in transporting large stones for marae construction. In a missionary journal for 1806 is the following reference to use of rafts for transport: “Several more people arrived ... with large Pafata’s or rafts loaded with food for the king” (Youl, Bicknell et al., Journal, 16 September 1806, LMS Archives). I cannot, however, find any description of the size or method of construction of such rafts. In an undocumented footnote commentary to the journal of Don Domingo Boenechea, the editor stated, “Kites have even been used for towing rafts of timber and bamboos at this part of the [Tahitian] coast—Mataiea and Papeari” (Corney 1913:324). It is not clear from this whether Corney was referring to ancient or recent times.

Nor is there agreement among the sources concerning the Maohi name for “raft”; for example, Handy identified it as *reho* (1932:39), which the LMS Dictionary translates as “a tiger shell, cut for the purpose of scraping the rind of the breadfruit.” Jaussen (1898) listed three terms for *radeau*: *afata* [box], *pafata* [cage], and *paepae* [platform].

- 3 The term for this operation was *ahatātā’i*, which Orsmond defined: “Literally drawing tight the senet as in lacing a canoe, or on the outside of rafters at the time of thatching, or in lacing on the drum head.

- “Morally. A mutual agreement, or combination of a party, or engagement for a journey or for work. (1) The work they are performing in their ahatatai. (2) The party of which he is one is his ahatatai. (3) The journey he intends from Island to Island is his ahatai. (4) A pending ceremony of which he has to take a part is his ahatai.” (Dictionary Notes)
- 4 “The *pahi* was a wholly different style of boat, and was, I am convinced, introduced by an experienced boat-building and seafaring group of immigrants” (Handy 1932:45). This statement refers to Handy’s well-known thesis regarding earlier and later waves of Maohi immigrants.
 - 5 See also Henry 1928:481ff for the detailed legendary account of the building of a boat for the hero Rata.
 - 6 Wilson reported a speed of “seldom—above five or six knots an hour’ (1799:379), but he did not specify how such speed was measured.
 - 7 The arguments in this controversy are set forth—but I suspect, by no means disposed of—by Andrew Sharp (1963) and in Golson (1962). I find Sharp’s arguments *against* deliberate, two-way, long-distance (i.e., over 300 to 400 miles by open sea) voyaging very persuasive. In any event, Sharp’s skeptical approach to the question has cleared away a great deal of romantic legend about the Polynesians’ own romantic legends on this subject of two-way voyaging, and has served to emphasize that in future any positive advance in knowledge about Polynesian culture history is more likely to come from professional archaeological and linguistic research than from amateur etymologizing or from armchair navigation.
 - 8 The principal source for most claims about the Maohis’ very extensive geographical knowledge was the Ra’iatean, Tupaia. See G.M. Dening 1962.
 - 9 See, for example, G. Forster 1777:I, 397; see also Morrison 1935:72–74 for an account of a Maohi canoe accidentally swept to Tubuai.
 - 10 As regards Henry’s native text, “Tahitian Circuit of Navigation” (1928:464), which listed Samoa, Hawaii, and New Zealand among the places alleged to have been visited by a legendary flotilla of Maohi canoes, it is enough to add that the “information” was first reported in 1854!
 - 11 According to this same report by Morrison, the first iron ever to reach Tahiti came from *African Galley*, one of Roggeveen’s West India Company squadron which was wrecked at Ana’a in 1722.
 - 12 For a description of nondeliberate “voyaging” within the Society archipelago, see pp. 208–209. Also, early European voyagers found on islands to the west—i.e., leeward—of the Societies several Maohis who had landed there after having been driven off course during voyages in home waters; indeed, such episodes probably account for many of the similarities between the Maohis and populations to the west of them.
 - 13 Neither this source nor any other notes whether any adjustment was made to what was commonly recognized as the seasonal north-south shift in position along the horizon of points of sunrise and sunset.
 - 14 The god Heima, Winter, is obviously a European contribution: *eheima*, Greek ‘winter’. Like many other texts in Henry this one was recorded many decades after first European contact.

CHAPTER 9

- 1 Probably the native mango (*Spondias dulcis*).
- 2 Note such words as *'ai'aiha'a*, to be of an ungovernable appetite; to covet everything; to eat voraciously (LMS Dictionary).
- 3 "Close by their dwellings they stick up certain straight posts terminating in four forks or branchlets from which they suspend their eatables in baskets or small frails, to be safe from rats, for which they employ the artifice of a shield or guard fixed below round the middle of the post" (Corney 1913:337).
- 4 This listing does not correspond strictly to either Maohi verbal categories or to analytic, anthropological ones, but will serve our purposes for the present.
- 5 Also, a fosterer, a nurse, a feeder. See also *fa'a'amu*, to feed, supply with food (LMS Dictionary).
- 6 *Tuhau*, a visitor from another place; *tuihau*, a visitor or guest (LMS Dictionary).
- 7 "Les Maximes de Tetunae," by Ernest Salmon, 1937. This article contains the Maohi text of these *ture* along with Salmon's translation into French. The first paragraph herein was translated into English by Ralph White, working directly with the Maohi text. The second paragraph was translated in E.S.C. Handy (1930:41). According to White (personal communication) the original Maohi text of this particular *ture* has features that are suspiciously biblical in inspiration.
- 8 Dootahah refers to Tutaha, a very powerful and influential tribal chief of north-western Tahiti. It may be objected that this episode is not strictly relevant, since it does not concern relations among the natives themselves, but I cannot believe that Tutaha behaved toward Europeans in ways that did not have some basis in his behavior toward his Maohi peers.
- 9 When such marketplaces were established by the European visitors, the Maohis fell into the practice easily. Also, it was noted by Banks that "... we have always found the people readyer to part with at their houses and selling cheaper than at the market" (Beaglehole 1962:I, 325).
- 10 That is "... should the Undertaker not fulfil His agreement, ... the other may if He is able plunder his house as for a theft" (Morrison 1935:165).
- 11 For a more analytical treatment of such transactions see chap. 24.
- 12 The logs and journals of the European sailors and missionaries contain rich information concerning prices paid by them for native produce, and a study of these transactions and of their changing social contexts will be published elsewhere.
- 13 The legend, which is summarized here, was recorded by a Tahitian schoolmaster at Ra'iatea in 1887, and thus it is not demonstrably pre-European in wording, or even in conception. For another and even more palpably post-European version see Malardé 1930.
- 14 Although all but one of the present varieties appear to be seedless, Papy suggested that the varieties introduced to these Islands may have had seeds, it being unlikely, he reasoned, that such indifferent gardeners as the Maohis would have been capable or provident enough to have preserved viable cuttings during their long canoe voyages en route (1954:II, 248).
- 15 Ellis 1829:I, 356; Henry 1928:40; Beaglehole 1962:I, 344.

- 16 See also Ellis 1829:I, 357; Beaglehole 1955:114.
- 17 Henry 1928:40; Ellis 1829:I, 357; Wilson 1799:316.
- 18 Wilson wrote otherwise: "It is truly wonderful to see how Providence has furnished this place [Matavai]: as soon as the breadfruit fails in this district it is ripe in another, so that we never want" (1799:175). But this buoyant generalization is not confirmed by the journal entries of individual missionaries, on which it was presumably based.
- 19 LMS Archives: Elder & Youl, Journal, 29 October 1805; Bicknell & Wilson, Journal, 20 November 1805.
- 20 See Cuzent 1860. Corney stated that *fe'i* will keep fifty to sixty days (1915:271).
- 21 LMS Archives: Davies, Journal, 23 February 1809; Gyles to Burder, 21 November 1818.
- 22 According to R. Green (personal communication), archaeological investigation in the Opunohu Valley of Mo'orea revealed lands of "agricultural terrain": irrigated, run-off, and dry.
- 23 According to Henry, the sweet potato "... does not produce tubers when left to run wild" (1928:38n).
- 24 Papy identified *hoi* and *pa'auara* as *Dioscorea bulbifera* (1954:II, 366). The Andrews dictionary also identifies *hoi* as *D. bulbifera*, but it identifies *pātara* as *D. pentaphylla*; it contains no entry for *pā'auara*.
- 25 In 1960 the author witnessed what was evidently an annual event in the village of Ha'apu, Huahine, namely a public exhibition of the largest yams harvested at that time, with prizes going to the gardeners producing the heaviest and largest ones. I can find no evidence of such competition in reports on the ancient Maohis, and the custom might well be a recent one, introduced, perhaps, by some enterprising agricultural officer.
- 26 Contact with Europeans did not serve to change their habits in this respect—e.g., "They are slovenly gardeners however and regard no order in laying out their ground" (Crook to Burder, 4 December 1824, LMS Archives).
- 27 "Adequate" in terms of the Maohis' own ideas about diet, which appear to have been the principal incentive for the work that they engaged in. There were of course other incentives created by demands for hospitality, for feast-giving, for sacrifice, and for "tribute," but with the available data it is not possible to measure the quantities of food so required.
- 28 Bligh provided evidence that efforts were made to save some trees damaged in this manner: "... a great deal of injury is done to the finest of the Trees—numbers of them are barked all round and are in a dying state, but others have been considered of such Value, the Natives have endeavored to save them by laying on a bandage or plaster of clayish kind of soil round the Wound, and wrapping it carefully over with leaves" (1792:146).
- 29 According to some opinions, the technique of premastication produced a more potent beverage, pharmacologically, than the one described by Cook.
- 30 See also Beaglehole 1967:1384; G. Forster 1777:II, 118, 407; J. Forster 1778: 481, 485; Bligh 1789:I, 373, 382.
- 31 There are few reports of women drinking kava, but whether this sex-linked difference was based on any explicit prohibition is not known.

- 32 Ellis 1829:II, 217-218; Henry 1928:177; Moerenhout 1837:I, 517ff.
- 33 This statement of Moerenhout's should be amended to read "near *some* very important marae," since on some islands no one marae was "principal" for all the inhabitants over any extended period of time.
- 34 As some readers will note, there is an inconsistency between spirits remaining in *pō* and being prayed to at the same time; as I pointed out earlier, it is my interpretation of Maohi prayer and offering that the recipient spirits had to be close at hand. I cannot resolve this inconsistency, which of course may only *appear* to be such in terms of Western logic.
- 35 Beaglehole's rendering of the names of these two gods is *Te tau mata a Te a-Io* (the time of the first origin of things) and *Ta'aroa tahi tumu* (Ta'aroa the unique source), respectively; of these the second rendering is probably correct and appropriate, but the first is open to question.
- 36 Cf. Beaglehole 1955:259.
- 37 See also Ellis' characterization (p. 262, this vol.) of religious rites following the ripening-of-the-year festival as intended to liberate spirits from the *pō*, where they had supposedly remained during the season of scarcity.
- 38 A few examples from the LMS Archives are: a large collection of foodstuffs in mid-June 1799, to celebrate the return home of the district's tribal sovereign (Jefferson, Journal, 17 June 1799); a great *Tavao* festival held during August-September 1806 (Youl, Bicknell et al., Journal, 21 August 1806); a large-scale collection of foodstuffs held in October 1806 in honor of a visiting delegation of Arioi (Youl, Bicknell et al., Journal, 16 October 1806).
- 39 For the concept of "shadow," or *ata*, see chap. 3, this volume.
- 40 This statement, contained in the missionary chronicles of 1797 (Wilson 1799:356) does not necessarily apply to the pre-European era, for by the time it was written, the new European breeds may have served to increase the numbers as well as the size of local pigs.
- 41 See chap. 12; and Beaglehole 1961:404.
- 42 See also Titcomb 1969:30. The LMS Dictionary translates 'aoa, to bark or howl, as a dog; the howling of dogs.
- 43 See also G. Forster's description, quoted above, of a dog being suckled; and see Turnbull 1813:281-282. In this connection, I can discover no parallel with the Hawaiian practice, reported in Titcomb 1969, of breast-fed dogs having been ruled out as food for humans.
- 44 Ellis 1829:I, 351; Corney 1913:328; Corney 1915:85; Beaglehole 1955:559; G. Forster 1777:I, 280. The native rat was replaced in time by European breeds, but even as early as 1788 most of them appear to have been exterminated by cats introduced by European ships (Bligh 1789:I, 413).
- 45 The gums most commonly used were from the *pua rata* (*Metrosideros*) and the *puruhi* (*Pisonia grandis*). With respect to the latter, *puruhi* was also the label applied to a cowardly [fighting] cock, or faint hearted warrior (LMS Dictionary)—i.e., a warrior "glued to the spot."
- 46 Zoological identifications are based on L. and F. Chabouis 1954, vol. II.
- 47 The main references used in compiling this summary are Ellis 1829:II, 284-298 and Morrison 1935:153-160, with a few fragments taken from J. Forster

- 1778:461-463, G. Forster 1777:I, 347, Beaglehole 1955:133, and Beaglehole 1962:I, 361-363.
- 48 See also Rey-Lescure 1936.
- 49 An *arroba* is a Spanish weight equal to about twenty-five pounds. Although the translation reads "casts of the net" the reference is obviously not to "casting" in the sense of throwing a cast net, but rather to the operation of closing a large seine net—three separate times, in this instance.
- 50 See Anderson 1963.
- 51 Obtained, of course, from Europeans, and supplanting hooks of native materials.
- 52 Technically speaking, *auhupu* is the name now applied to this fish only when it is at the growth stage of from four to eight pounds in weight; for names at other growth stages see Nordhoff 1930a:236.
- 53 The bonito's favorite food seems to be *'ouma* and *ature*, names applied to *Mulloides auriflamma* and *Trachurops crumenophthalma*, respectively, at certain stages of their growth. *'Ouma*, particularly, was the fisherman's favorite "... because of their abundance, their slow swimming, and the fact that bonito feeding on them will seize the hook without hesitation" (Nordhoff 1930b:237).
- 54 Including human bone. In former times, according to Nordhoff, the victors used to search among the dead for men with particularly dark skins and curly hair, in the belief that their bones were more than ordinarily hard and thus ideal for fish hooks. (1930b:244)
- 55 For a description of some pre-European Maohi hooks, see Green et al. 1967, especially p. 184ff.
- 56 Handy was writing of conditions as they were in the 1920s, but many of his statements probably apply to the eighteenth century as well.
- 57 I reproduce here only Stimson's translation. The Maohi text, along with information concerning its source, can be found in Stimson 1928. See also Henry 1928:331, and Handy's commentary thereon (1932:81).
- 58 This interesting term applied also to the places where fish tended to congregate—e.g., the so-called albacore "holes." According to the LMS Dictionary, another meaning of *puna* was prolific, as a female.
- 59 In his commentary on this statement of Henry's, Handy drew attention to the fact that *tinirau* finds its counterpart in *Tini-rau*, the New Zealand tutelary deity of fishes, and son of Tangarua, Lord of Ocean. And further, that Tino-rua occurs in the name of the third night of the new moon: "The inference would appear justified that the name of the deity Tino rua has reference to the appearance of the moon in this phase; and this leads to the suggestion that the moon itself was venerated at some former time as a fishing deity. In these islands where the run of the fish is so obviously influenced by the phase of the moon, of which fact the natives were fully conscious, it would seem almost inevitable that the moon should be associated with the deity venerated as patron of fishing." (Handy 1932:72-73)
- 60 As Handy pointed out (1932:73), Ellis probably referred here to Huahine, where he spent the most time.
- 61 See, for example, Morrison 1935:183; Henry 1928:241.

CHAPTER 10

1 When presenting data under such headings as farming or fishing or eating, the student of the ancient Maohis is on fairly safe ground. These English labels and their respective referents correspond closely enough to Maohi usage to render translation feasible. Such, however, is not the case with the data brought together in this chapter. The Maohis did, it is true, have the word *heiva*, which writers have variously translated as diversion, hobby, avocation, etc., and which included some (but only some) of the activities described in this chapter, although the sources are not in close accord on this point. For example, the LMS Dictionary defines *heiva* as “a dance, an assembly for dancing,” and assigns to *upaupa* the fuller meaning, “a play, diversion, music and dancing; any game or amusement.” According to Bligh, however, *heiva* was the older form, which was changed to *upaupa* after utterance of the word *heiva* became tabooed (1792:142). See below, chapter 23, section on symbols of chieftainship.

The Maohis might indeed have mentally lumped dancing with, say, cockfighting and archery, in contrast to fighting, or to fishing; but reliable evidence for this is now lacking, as indeed it is for reconstruction of practically every ancient Maohi cognitive domain. Extant dictionaries and translations provide nothing approaching the detailed contrastive and contextual matter now recognized as essential for credible cognitive mapping. So, in paging through this chapter the reader should keep in mind that the uniformities implied among its several topics reflect the author’s mode of classification, and not necessarily that of the ancient Maohis themselves.

- 2 Also engaged in by men, according to Henry, who provided a good description of this and other children’s pastimes (1928:279). See also Rey-Lescure 1955.
- 3 But did each district contingent have its own wrestling deity, or was there one such divine patron for all Maohi wrestlers? To what extent was victory due to divine intervention? These and other questions remain unanswerable.
- 4 See Bligh 1789:II, 37; Jefferson, Journal, 22 April 1801, LMS Archives.
- 5 Ellis 1829:I, 296–298; Moerenhout 1837:II, 152–153. The latter would seem to have disagreed with other writers in implying that all three varieties of ball play were strictly female games. Henry (1928:278) described *āpai*, or *paipai*, as a game much resembling cricket, while the LMS Dictionary defines *apai*, to play with bat and ball.
- 6 Several writers on ancient Polynesia have sought to explain why the Maohis were not utilizing bows and arrows in warfare during the eras immediately before and after first European contact. (I have been unable to find reference to their use as weapons in stories about earlier eras.) Fascinating as such a guessing game may be, I see no reason for joining it.
- 7 For a description of elegiac ballads and other forms of “lyrical” utterances see Chadourne, 1922. See also E. Salmon 1937; Ahnne 1932b; Alexander 1893.
- 8 See also LMS Transactions:I, 174.
- 9 See for example Rey-Lescure 1944:431–441; Draper 1959; Beckwith 1944.
- 10 Except perhaps for the story of Rata (Henry 1928:468ff.), which includes an episode bridging two generations.

- 11 Chadourne characterized the *ūtē* as intermediate in mood between the melancholy *anau*, or lament, and the lively dance-song, *pā ta'u ta'u*: "... [a] little song more hummed than sung, improvised more than composed; with the *ūtē* the tender bud fostered in each Tahitian heart blossoms forth. Furtive desires, the petty joys of daily life, feelings of pity, fleeting sadness, anxiety for one's hopes, meaningless pleasures, fondness for the familiar path or for the land of birth, customary objects, and the gaiety occasioned by a new face—it is of limitless range; a fragrance is wafted [on the breeze], an animal frolics, a cloud breaks off, an *ūtē* is born." (1922:67)
- 12 Cook distinguished between "private" and "public" performances, but the basis for his distinction was, as far as I can discover, Cook's and not a native one; on one occasion Cook seems to have called the performance he witnessed "private" because it was held in a private dwelling and was viewed by relatively few persons (1784:48).
- 13 Cf., for example, Rey-Lescure 1946:192–193.
- 14 The LMS Dictionary contains several other entries translated in such general terms as "a kind of dance," but with no specifying details.
- 15 Not even as burlesque, which one occasionally sees in present-day Tahiti.
- 16 See also Cook 1784:48, and the case of the special performances commanded for Cook and his associates on Ra'iatea in which the star performer was the accomplished little daughter of the local chief (Beaglehole 1961:421).
- 17 This did not, of course, apply to members of the Arioi sect.
- 18 Rey-Lescure (1946:193) asserted that Urataetae was the god who presided over dancing, but I suspect that numbers of others were also so engaged.
- 19 For example, see Beaglehole 1961:421.
- 20 For example, Moerenhout 1837:II, 131. However, it is not entirely clear whether Moerenhout was referring here to dramatic productions in particular or to productions (i.e., "representations") including dancing and singing.
- 21 See also G. Forster 1777:138; Beaglehole 1961:420, 842.
- 22 "Ratirra" (*ra'atira*): see chap. 18 for a full discussion of this term. For present purposes it may be glossed as 'member of middle class', 'principal proprietor of a sizable land estate', or 'petty chief'.
- 23 "They are ever Courteous to the Stranger and Hospitable to the Wayfaring Man and what they have is always at the service of their Visitors—and when a Stranger enters a House he is Saluted by the Master and perhaps all the Family With Mannowa (Welcome) Yowrye t'Eatooa te' Narria mye (God save you in your Coming) & Yowrrana te Tirre raa (God save you in Your Journey) and the like Compliments at parting." (Morrison 1935:189)
- 24 See, for example, the account of Pomare's visit to Tautira during which he and his retinue were supplied mainly with food brought by special supply expeditions from his home district of Pare (Corney 1919:44).
- 25 Henry 1928:239; Beaglehole 1962:I, 275–276.
- 26 The ritual aspect of "hospitality" varied considerably in terms of the avowed purpose of the visit, the status of the principal visitors, etc.; details will be provided in later chapters. See also G. Forster 1777:I, 375–376.
- 27 The "laws" of hospitality are said (on one occasion, at least) to have provided a continuing sanctuary for the guest in question. I refer to an episode in the

legend of the trance of Ari'i paea Vahine, wherein the sisters of a male spirit were constrained from doing away with the latter's mortal mistress, whom they disliked, because "she had become sacred to the household by the treatment of her by their brother" (Henry 1928:221). On the other hand, the annals of Maohi history—pre- and post-1767—are liberally sprinkled with accounts of hosts turning on their guests (and vice versa), sometimes in the most treacherous manner imaginable.

28 See Corney 1919:134; Bligh 1789:II, 45.

CHAPTER 11

- 1 Although missionary Orsmond's angry denunciation was written decades after Forster's bland appraisal, there is reason to believe that the Maohis had not in the interim appreciably changed in their preoccupation with sex.
- 2 See, for example, E. and P. Beaglehole 1938; Danielsson 1956; Firth 1936; D.S. Marshall 1961; Mead 1928.
- 3 These translations are from the LMS Dictionary. I am well aware of the difficulty—given the limitations of the data—of determining which of several synonyms was primary and which metaphoric, and I do not contend that I have succeeded in doing so here.
- 4 As for example, the statement of Paul Gauguin writing in the 1890s that "... all the women want to be taken in the Maori [Maohi] manner (*mau*, to seize), silently and brutally; they all more or less want to be raped." (*NoaNoa* [Paris: Les Editions G. Cres et Cie.], 1929). In another statement, Bengt Danielsson wrote that the ideal male partner is one who is "... able to achieve and evoke several orgasms at short intervals" (1956:78).
- 5 Cf., for example, Marshall 1961 and B. Danielsson, 1956. In this connection the latter writes: "As far as can be judged skill and refinement [in the techniques of sexual intercourse] were infinitely greater in former times; this was due principally to the thorough instruction in sexual technique and the regular demonstrations of intercourse. On their conversion to Christianity the Polynesians were naturally compelled to abandon such heathenish practices, and since then they have gradually become more and more awkward and incompetent in sex matters as well as in other things, without, fortunately, having yet sunk to our own low level." (1956:78-79)
- 6 This passage, quoted by Mühlmann, was taken from an anonymous publication (*Journal du second voyage du Capitaine Cook sur les vaisseaux La Résolution et L'Aventure, enterpris dans les années 1774, 1775*. Amsterdam and Paris: 1777) to which I have not been able to refer. I have left this excerpt in the original French, because of its importance, but offer my own translation: "Women differ from each other by their charms and face, as in other countries; their stature, often less than mediocre in the women of the ordinary class, seems to be greater among the upper class. Tallness is what the Otaheitean ladies seek to conserve in their family with the greatest care. It is not unusual among the most distinguished ladies of the island to share their couch sometimes with whichever of their servants is the tallest and best proportioned, as they fear lest the children should lose the

- noble and majestic build which is the glory of the family. Otherwise they are very scrupulous in the choice of their lovers.”
- 7 The famed navigator did not accept the offer!
 - 8 See Corney 1915:263; Beaglehole 1961:236; Wales, in Beaglehole 1961:796, 839; and J. Forster 1778:392.
 - 9 For further references to such practices see chap. 13, this volume, and Ellis 1829:II, 567–568.
 - 10 All these physical criteria of beauty were shared by the Maohis with certain other Polynesian peoples. For an admirable summary of the subject, see Danielsson 1956.
 - 11 Since females rarely communicated with gods, for them the proscription did not arise.
 - 12 Including, nowadays, some who are either too intoxicated to be aware or to resist successfully.
 - 13 The Tahitian original was *aeari'i fa'aturi*, literally, 'object-of-pursuit', 'fornication'. This instructive little piece appears in *Bulletin de la Société des Études Océaniques*, vol. 4 no. 37, 1930 and is identified as having been uttered in 1824 by Mai, principal chief of Porapora, recorded in Tahitian by J.M. Orsmond, and translated by him into English. The original Tahitian text and Orsmond's translation is not available to me, so in composing my free translation I have had to make use of the French version, thereby doubling the possibility of semantic error, which is however reduced somewhat by the circumstance that the published translation does contain some explanatory notes that give the Tahitian originals of some of the words.
 - 14 The flow of tangible inducements was of course not only from male to female. G. Forster, for example recorded an instance of the reverse, of a man having received several pieces of fine bark cloth from his sometime mistress (1777:II, 103). The man in question was young and of lower-class status, and the woman an older and evidently unbeauteous member of the upper class which would seem to account for the transaction, but it is highly likely that such exchanges also took place between partners more evenly matched in social class, age, and physical charms.
 - 15 As this bit of advice was voiced as late as 1824, the informant was compelled to add some European goods to the list of enticements.
 - 16 This event occurred in 1827, but it is likely that the two seductresses were following ancient practice.
 - 17 See also Danielsson 1956:153–154 for a sensible commentary on this matter.
 - 18 Moerenhout's generalization on this score is, of course, overstated but probably contains a modicum of validity: "Relationships exist between the language and customs of the inhabitants of the different Pacific islands, as exemplified in the character of their poetry and their songs. Thus the cannibals of New Zealand only chant of war and vengeance; their music, always set in a mode of terror, expresses only carnage and battles, while the voluptuous inhabitants of O'taiti and other Society Islands chant only of pleasure and love. There is a gentleness, a touching simplicity in the delicate poetry of the latter." (Moerenhout 1837:I, 412)

- 19 The only other reference I can find to bestiality is an entry in Jefferson's journal of 1803: "In the womb of a sow purchased and killed yesterday ... was found the embryo of a monster ... Some of the natives who saw it supposed that a man had had carnal connections with the beast. This crime, horrible as it is, it is to be believed that Otaheiteans are addicted to." (24 March, LMS Archives)
- 20 Bouge rescued this excerpt and its accompanying correspondence from ancient English literary periodicals, which are identified in the article cited (1955).
The original, Latin version read as follows: "Injicunt penem in orem infausti, atque emittunt semen, quod sceleratus avide deglutit tanquam robur et vim alterius; putans scilicet se ita fortiorem reddi." This translation was done by Brendan O. Hehir for Robert Levy, who kindly provided me with a copy.
- 21 See Gunson 1964:58.
- 22 As far as I can determine the term *mahu* referred specifically to transvestites, and only coincidentally to homosexuals.
As Gunson has pointed out (1964:58) it is quite possible that some *mahu* were "deliberately emasculated or 'degraded' to the position of women" not primarily for homosexual purposes but in order to serve as domestics, etc., for upper-class women, who, it will be recalled, were particularly constrained in their eating habits—i.e., they were proscribed any food prepared by "true" males. In this connection, however, there appears to have been some males who entered into the domestic service of certain upper-class women without having become truly transvestite in the process. While so employed these were of course rendered ritually *noa* (and thus unqualified to participate in marae services with other males), but upon termination of employment—I suggest, but cannot prove—such men were probably able to resume the full ritual prerogatives of other males.

CHAPTER 12

- 1 *Warfare* is used here to mean armed conflict, including feud, involving more than a handful of participants and having purposes more deadly than sport. Maohi warfare was on certain occasions conducted like a sporting event, with mutually acceptable, self-restrictive conventions, but the parallels cease there.
- 2 The only reference I have found to the use of bows and arrows for human combat occurs in the legend of Pai, wherein the hero had to prove himself in a deadly contest with rivals (Henry 1928:587-588).
- 3 The Pape'ete Museum contains a large stone, called *ānave* (breath; a line, cord, thread; perseverance; longevity [LMS Dictionary], said to have been found in Tahiti's Papeno'o Valley, where it formerly served as a test of strength for "warriors," who attempted to raise its 87.5 kilograms to their shoulders on certain public and ceremonious occasions. The ability to lift this stone to one's shoulders was considered to be a great feat, an important way of testing a warrior's strength. (Leverd 1918:146-147)
- 4 I reproduce this somewhat obscure text, without pretending wholly to understand it, mainly because it is the only native text I can find on the subject.

- 5 Such a council of war should probably be distinguished from the kind of festive gathering described by Rodriguez, at which martial events provided the major topic of conversation, but not, it seems, the main purpose for the meeting (Corney 1919:43).
- 6 According to a missionary source, if side A presented to its tutelar an offering that was subsequently stolen or destroyed by side B, the tutelar in question would engage even more energetically in bringing about the defeat of side B (Hayward et al., Journal, 8 December 1808, LMS Archives).
- 7 In a footnote commentary to the legend of Honoura it was stated that "pork, with very little vegetable food, was eaten by warriors engaging in battle" (Henry 1895:293).
- 8 For exceptions see chap. 23.
- 9 For a contrary view concerning the reasons for the alleged favoring of males over females at birth, see chap. 11, this volume; and Gunson 1964:58.
- 10 See also Moerenhout 1837:II, 40.
- 11 The Mitchell Library collection of Orsmond manuscript notes contains several other *rauti* texts, most of them untranslated and probably now untranslatable. Along with them is a commentary, evidently by Orsmond, which calls attention to the rich and powerful metaphors used in these and in other Maohi poems and chants connected with warfare. Introducing the subject is the following statement: "There is nothing more difficult than to make a foreigner see the force and beauty of the Tahitian war language. The Battles themselves considered apart were contemptible, but the power of imagination and the fire of speech were amazing." And, "To understand the war speech of Tahiti, it is essential to possess a very general and a particular knowledge of everything that relates to Tahiti."
- 12 *Toa* appears to have been the more general term for 'warrior', with '*aito*' being reserved specifically for 'champion warriors'; but the two were in many contexts used quite synonymously. *Toa* (or '*aito*'), it will be recalled, was also the native name for the ironwood tree (*Casuarina*), from whose hard and heavy wood many weapons were fabricated. According to one tradition, these trees were originally fashioned out of the bodies of warriors: their sap from warriors' blood and their leaves from the latter's hair (Henry 1928:420).
- 13 Which, however, according to Bligh, was not always the case: "There [their] Men when heaped together in such numbers armed with Spears 12 or 14 feet long or more, have a tremendous appearance, they nevertheless do very little mischief to each other, for I believe they seldom come to a serious charge, but content themselves with the execution they are able to effect by Slinging Stones, by which means some Men are Maimed and sometimes killed" (1792:127).
- 14 This lent some material basis for subsequent ceremonies aimed at cleansing-purifying such places.
- 15 Discussion of the varied implications of some of these episodes will have to be postponed to later chapters, my present purpose being merely to provide a summary description of warfare in terms of its having been an elaborate, complex, time-consuming set of activities of the Maohis.

- 16 Henry implied that a much larger number of battle shapers and exhorters took part in naval warfare than was the case with land warfare, but this discrepancy is probably due to incorrect or incomplete reporting and not to the actual circumstances of Maohi warfare.

CHAPTER 13

- 1 This is not meant to imply that ideas about reproduction were the only ones involved in such premarital fattening; for one thing, aesthetic considerations were evidently also involved.
- 2 The LMS Dictionary word for conceive (applied only to females) is *tō*, which incidentally is also the word for wrestle and sugarcane.
- 3 See, e.g., the legend of Mo'o Tua Raha (Henry 1928:622–623), which is reproduced in chap. 16, this work.
- 4 See, for example, chap. 12 and Henry 1928:310, on the fate of sennit-bound war captives.
- 5 Presumably the writer was alluding to lunar months, but he did not describe how women determined the onset of pregnancy.
- 6 According to Nordmann the following plants were used to induce abortion: *Hibiscus tiliaceus*, *Gossypium religiosum*, *Polygonum imberbe*, *Gardenia pretna*, and unripe pineapple—the last named being a post-European introduction (1943:343).
- 7 See, e.g., Hassall to LMS, 31 January 1797, LMS Archives; Crook, Journal, 3–4 March 1817, LMS Archives; Wilson 1799:155.
- 8 See, e.g., from the LMS Archives, Crook, Journal, 3–4 March 1817; 24 April 1821; 24 May 1823; Davies et al., Journal, 22 May 1817. The following, though written in 1825, gives some indication of the problem: “No small portion of my time is taken up in administrating medicine &c. and also in attending native females in difficult and bad cases of labour” (Henry to Burder, 3 February 1825).
- 9 See, e.g., Hassall to LMS, 28 January 1798, LMS Archives & Threlkeld to Burder, 29 September 1818, LMS Archives.
- 10 Presumably her first child actually born, and not necessarily the first in utero.
- 11 According to one account these restrictions continued in force until the umbilical cord, still attached to the child, dried up and dropped off (Jefferson, Journal, 29 July 1799, LMS Archives).
- 12 “King’s evil” (*‘o’ovi ari’i*, scrofula): a disease characterized mainly by enlargement of lymphatic glands.
- 13 See Ellis 1829:I, 342; Moerenhout 1837:II, 59; Morrison 1935:186.
- 14 I am unable to explain the significance of the coconut cream used in this rite, but the use of the juice of the sugarcane (*tō*) might possibly have been based on its metaphoric connection with conception (*tō*). In this connection, none of the sources mentions the significance or treatment or ultimate disposal of the after-birth in general or of the placenta in particular.
- 15 Elsewhere, however, Moerenhout did assert that infants were bathed in cold water soon after birth (1837:II, 59); but this may have been more for hygienic than for ritual purposes.

- 16 Wilson's account of natal ceremonies (1799:341-342) merely paraphrases that of Morrison.
- 17 But see the following: "*Pito roa* (Navel-string long) ... refers to a custom of cutting the navel string down to the placenta that the child may be long winded and live to an old age. When it was cut the native doctor used to pierce it I believe the thumb and fingers press the liquid substance out of it and hang it over the infant's neck. After it fell from the belly it was preserved with sacred care." (Orsmund to Hankey, 20 September 1827, LMS Archives)
- 18 See, e.g., J. Williams 1837:560; Ellis 1829:I, 336.
- 19 Ellis 1829:I, 337; Nordmann 1943:342; Lesson provided a gruesome, and not altogether credible, account of the slaying of children, but more in the nature of human offerings to the gods than as instances of the kind of infanticide I am discussing (1839:I, 403-404).
- 20 Montgomery 1832:I, 53; Ellis 1829:I, 338; Williams 1837:563-564, 566.
- 21 The reference to a bed indicates, of course, that this account was compiled many decades after first European contact, when some natives had begun to acquire articles of European furniture for their houses. Nevertheless, there is a strong possibility that the rest of this description was also applicable to pre-European methods of caring for infants' bodies.
- 22 See also J. Forster 1778:529. A statement by Bligh tends to discount somewhat the educational privileges alleged by Henry to be enjoyed only by upper-class youths: "The School is common to all in this Country. There is no knowledge to be gained in the History of the Country but by tradition, and the only education being the Company of the Chiefs and old People of distinction; wherever nature has planted good sense and a quick conception, the Individual whether Chief or Towtow, becomes informed and well educated." (Bligh 1792:172)
- 23 This statement raises the question whether there were in fact any unsupervised adult males, or some individuals who went through life untattooed? Neither Morrison nor any other writer provided a categorical answer to this question, although J. Forster's statement quoted in the preceding section implies a negative answer, at least with respect to females.
- 24 See Morrison 1935:220; Beaglehole 1962:I, 382.
- 25 But see also chap. 22, for reference to *huapipi* in connection with Ariois.
- 26 Bligh's statement that "This never happens with the Mana-howhes [*manahune* 'commoner', member of lower social (marriage) class] or Towtows [*toutou* 'servants']" (1789:II, 43) could be taken to mean that fathers belonging to these categories did not undergo the self-feeding prohibition, even to a perfunctory degree.
- 27 "Purify, to rid of impurity or polluting matter" (*Webster's New World Dictionary, Colledge Edition*). The first line of the formula for "purification" of a neonate is: "Te tama teu, o te puo mei'a." Henry translated this as "This is the purifier, the heart of the banana" (1928:183). Although *te puo mei'a* can indeed be glossed 'heart [of] banana', *te tama teu* could be either *te tāmā teu*, to cleanse of menses (LMS Dictionary), or *te tama teu*, the child (of) menses. See also one missionary's use of the word "unclain" to de-

scribe the infant's condition, "... till it be given to the god twice" (p. 419, this volume). In this connection, the part played by semen in certain religious rituals argues against its having been considered a polluting entity.

- 28 Puzzlement over the obscurity of the word *manihinihi* is deepened even further by the LMS Dictionary definition: *manihinihi*, uneasiness; to be heavy, to feel lassitude, as in the commencement of a disease; to feel uneasiness of mind; to sympathize with the distress of others.

The *Duff* chronicler describes the earlier *āmo'a* rites as measures for ending the mother's segregation on account of her "uncleanness" (Wilson 1799:341), but since this description is evidently a paraphrase of Morrison's, which does not mention "uncleanness," I conclude that this, like so much of the descriptive portion of *First Missionary Voyage*, was incorrectly paraphrased.

- 29 This astute observer also saw in these customs the explanation for the alleged differences in physique between upper and lower classes: "[This custom] ... may in some measure account for the difference in stature between the Higher and lower Classes of People—the latter Class having sooner their liberty have earlier Connections with each other than the Higher and the Chiefs in particular are Mostly arrived at years of Maturity and Manhood before they Cohabit with their Weomen" (Morrison 1935:187-188).
- 30 "Rowavva (or Sacred Tree)" is undoubtedly *rauava*, the miro or 'amae leaves used in the marae for various sacred purposes (LMS Dictionary).
- 31 I should point out that *mo'a*, in addition to being a synonym for *ra'a* (sacred), was also the name for a branch of miro leaves used in the marae (LMS Dictionary). And while speculating (fruitlessly, I concede!) about Maohi etymologies, I draw attention to the fact that *momo'a* is translated in the LMS Dictionary in two ways: to espouse [i.e., to become betrothed], or contract marriage; and, to make sacred, put under a restriction. There is a possibility that the first syllable of this word—which receives two listings in the LMS Dictionary—was of different vowel lengths for each meaning; such at least is indicated in the copy annotated by Louis Drollet now in possession of the Tahiti Mission of the Church of Jesus Christ of Latter Day Saints. But that aside, it is tempting to propose (without however any further linguistic rationale) that *āmo'a* may be directly contrasted with *momo'a* (viz., *mo'a*, sacred; *momo'a*, to make sacred); and thus *āmo'a*, to make *unsacred* (*de-sacrify*). Fortunately, my interpretation of the *significance* of the rite does not have to derive its validity from my excursion into etymology!
- 32 The LMS Dictionary supplies the native terms, *fa'aipoipo*, to marry and *fa'aipoipo ra'a*, marriage, from *ipo*, a darling, one made much of; but that is no guarantee of exact semantic equivalence. The same dictionary translates *ta'oto*, to sleep, see *moe*; to lie down; to be cohabiting as man and wife; a dream. Moreover, the words *ta'oto* and *moe* occur most often in myth and other native texts as terms for sexual and even longer residential cohabitation, thus raising the suspicion that the missionaries themselves may have encouraged use of the more respectably romantic *fa'aipoipo*. (See also Henry 1895:282.) I wish to emphasize the *tentative* nature of this operational definition—for reasons that will be set forth in chap. 19.

- 33 But see also the following editorial comment upon an episode in the legend of Honoura, wherein the chief of a victorious tribe married the widow of the chief of the vanquished, who was slain in the battle; "A marriage of that kind was considered a most honourable way of ending strife, as it made allies and not slaves of the conquered" (Henry 1895:293).
- 34 In the legend of Honoura, *āmo'ara'a* ("āmo'a-ing") appears as the term for nuptial ceremony (Henry 1895:260).
- 35 There were however certain young women, presumably upper-class ones, who were, in Moerenhout's words, "reared with great care and with the strictest chaperonage" (1837:II, 60; see also Henry 1928:236 and Ellis 1829:II, 567-568), which included not only some systematic forced fattening, but also, in some cases, the narrow confinement of the girl in her parents' house, and hence enforced chastity. The native term for virginity was *pirimomano*, to be in a virgin state, but it is interesting to note that the label usually applied to such carefully chaperoned girls was *vahine paheo*, a lazy, lounging [female] who spends [her] time uselessly; indulged, as a spoiled child" (LMS Dictionary).
- 36 "Amāi" [*amae*] is another name for *miro*, thereby identifying this episode as an *āmo'a*.
- 37 The legend of Honoura provides a somewhat similar example of a wedding having taken place at the bride's home, where the groom happened to be on a visit. Later, however, the groom returned with his bride to his home district, where the marriage ceremony was carried out again. (Henry 1895:261)
- 38 A similar arrangement was described by the Reverend Orsmond, writing in his journal on 9 March 1827 (LMS Archives).
- 39 *Momo'a*, to espouse, or contract marriage (LMS Dictionary). In one marginally annotated copy of the dictionary, someone (probably the Tahitian expert Louis Drollet) added "to be engaged to marry before marriage."
- 40 In this context I use "parental" in a broad sense, including all relatives and counselors of an individual who had a voice in the choosing of his or her spouse. See for example Moerenhout: "We have already seen how the son, even as a child, succeeded to the father's authority; also it was the brothers who arranged matters for their sisters, and it was they rather than their father and mother to whom one looked to gain a girl's hand in marriage" (1837:II, 69).
- 41 The sentence immediately preceding this is the curiously contradictory statement that "It happened quite frequently that marriages took place between a brother and sister, just to avoid misalliances [in terms of social class]." It is not clear, however, whether Moerenhout was specifically referring to the Maohis, or to Polynesians in general (including Hawaiians, who were known by Moerenhout to practice brother-sister marriage on occasion). In any case, neither Moerenhout nor any other of the sources provides evidence of any actual, historical instances of brother-sister marriage among the Maohis.
- 42 "Art. 161. En ligne directe, le mariage est prohibé entre tous les ascendants et descendants légitimes ou naturels, et les alliés dans la même ligne.
"Art. 162. En ligne collaterale, le mariage est prohibé entre le frère et la soeur légitimes ou naturels et les alliés au même degré.

“Art. 163. Le Mariage est encore prohibé, entre l’oncle et la nièce, la tante et le neveu.” (Code Civil 1816)

- 43 Ego’s *primary* consanguines comprise his father, mother, siblings, sons, daughters; his *secondary* consanguines comprise those other relatives who are the primary consanguines of his own primary consanguines—e.g., mother’s brother, son’s daughter. See Murdock 1949:94–95.
- 44 For information on the effects produced upon these norms by adoption, see chap. 20.
- 45 Granting that we do not possess a very clear picture of the more tangible aspects of the marital exchange, it is probably correct to say that such considerations did not enter importantly into the marriage of a man to his deceased wife’s sister—i.e., as far as I can discover, a woman’s family was not obligated to provide a substitute for her in the event of her death. But this is a domain of Maohi life about which little has been recorded, and about which little more can be safely inferred.
- 46 My statement that marriages took place, ideally, only within classes is in some respects tautological, since, as will be seen, I define “class” chiefly by the criterion of marriage. However, the statement is informative enough for present purposes.
- 47 Even at the risk of being accused of taxonomic “butterfly-collecting”! See Leach 1961:2.
- 48 For further examples of “elopement” see Crook, Journal, 10 April 1826, LMS Archives.
- 49 As, for example, on Tikopia (see Firth 1936). The legendary instances of woman-stealing, such as the one recounted in the *Memoirs of Ari’i Taimai E* (Adams 1901:19), did not usually eventuate in “marriage,” as I here use the term.
- 50 Cf. Henry 1928:285; Ellis 1829:II, 571; Bougainville 1772:256; Moerenhout 1837:II, 67; Corney 1913:357; Corney 1915:57, 85, 263, 271; de Bovis 1909:32.
- 51 See section on population, in chapter 2. This preponderance of males over females may have been offset somewhat by the earlier marriage age of females—but not much, since Maohi males tended to marry almost as young as females.
- 52 Also, in view of Morrison’s statement elsewhere extolling the “virtue” of Maohi women, one may justifiably conclude that Morrison sometimes tempered his objectivity with a desire to defend his Maohi hosts from the unsympathetic criticism of other Europeans. For other evidence supporting Ellis’ view see Wilson 1799:348, and Turnbull 1813:335.
- 53 Menopause seems to have been recognized, as witness the LMS Dictionary definition of *aua*, ceased to bear offspring; a woman or an animal that has ceased to bear offspring. But there is no evidence that this physical state was regarded as the principal, or even an important, criterion of *ruau*-hood.
- 54 For example: *ruau*, old, stricken in years; *rauhurupe*, an old banana; an old decrepit person, a grandfather; *ôriorio*, to fade, wither, or shrivel, as a plant; to wither, as a person by old age. (LMS Dictionary)
- 55 See, from the LMS Archives, Bicknell & Henry, Journal, 2 February 1805,

- 5 December 1805; Bicknell & Tessier, Journal, 6 June 1820; also Edwards & Hamilton 1915:117.
- 56 See pp. 486–487, this work.
- 57 I wrote *usually*, in paragraphs 3 and 4, because of an uncertainty on my part—i.e., in most cases of sickness and death on which the sources expatiate, the reported cause of sickness and “premature” death is laid to spirits, but there remain some accounts of instances of injury and death which seem to leave the question open.
- 58 I can find no positive statements in the sources to this effect, but it could be reasonably argued that infanticide also came under this heading, i.e., it was executed under standing instructions of ancestral spirits. Or, in another sense, inasmuch as those killed had not yet fully received their *iho*, they were not truly “human.”
- 59 See Morrison 1935:230; Wilson 1799:333; Ellis 1829:I, 515, II, 280.
- 60 Moerenhout appears to have recognized the *possibility* of pure “accident,” but I may be misinterpreting his intent: “There were no natural deaths except those resulting from true accident or warfare—and even those were often attributed to spirits” (1837:I, 539).
- 61 See also Ellis 1829:I, 515–516: “Those who were killed in battle were also supposed to die from the influence of the gods, who, they fancied, had actually entered the weapons of their murderers.”
- 62 Moerenhout stated that the kindler placed both exuviae and fetchers into a pit, where they remained while the latter worked on their victim (1837:I, 540).
- 63 Other symptoms included a swollen scrotum or crippled limbs (Corney 1919:33).
- 64 According to Moerenhout (1837:I, 541) some victims may actually have died of fright upon learning that they were being sorcerized. Be that as it may—and such statements cannot be tested—sorcery symptoms in any individual could undoubtedly have been accounted for, to the satisfaction of all concerned, as resulting from some action on the part of the victim. In this connection, even the missionaries believed to some extent in the actuality of sorcery.
- 65 For example, in 1822, the missionary Darling reported about one native convert: “He is one of those that used to deceive the people by pretending that the Gods used to inspire him so that he used to kill many pretending that it was the evil spirit that had done it. He yesterday confessed and told that the truth was that he used to get a poison out of certain fish, & mix it in food or (drink) & so affect the individuals that he was offended with, this he says & in no other way had he power over many that he had killed.” (Darling to Directors, 25 July 1822, LMS Archives.) According to Ellis, however, “The natives acknowledged that they possessed articles of poison, which, when taken in the food, would produce convulsions and death, but those effects they considered more the result of the god’s displeasure, operating by means of these substances, than the effects of the poisons themselves.” (1829:I, 515; see also vol. II, 231–232)
- 66 Corney 1919:61; Beaglehole 1967:214–215; J. Forster 1778:417; Vancouver 1801:368.
- 67 According to Moerenhout if a victim of sorcery actually succumbed, the diviner

- became entranced and called upon the victim's ghost to reveal the identity of the individual who commissioned the sorcery (1837:I, 542-543). In the somewhat analogous situation of discovering the author of a theft, the thief's spirit was brought to the diviner by the latter's fetchers and caused to appear reflected in a spirit-reflector; a water-filled hole or bowl (Henry 1928:206-207).
- 68 See, e.g., Corney 1915:334, 339; 1919:176.
- 69 Adapted from Henry 1928:289; see also Davies, Journal, 8 September 1807, LMS Archives.
- 70 E.g., see Moerenhout 1837:I, 544; Orsmond, Journal, 24 January 1827.
- 71 Maladies were described by Morrison 1935:228-230; Bligh 1789:I, 409 and II, 41, 51, 54; J. Forster 1778:493, 484; G. Forster 1777:I, 373 and II, 102; Beaglehole 1967:113n, 926.
- 72 See Bligh 1789:II, 62; G. Forster 1777:II, 89; Corney 1919:92, 192; Gregory Warner, Medical & Surgical Journal, 14 March 1808; Platt to Burder, 28 February 1827, LMS Archives; Morrison 1935:228-230.
- 73 See, from LMS Archives, Elder & Wilson, Journal, 21 February 1804; Davies, Journal, 15 September 1807; Youl, Bicknell et al., Journal, 13 November 1806. See also, Morrison 1935: 228-230; Bligh 1789:II, 43, 50; J. Forster 1778:484, 487, 493; Beaglehole 1967:927-928; G. Forster 1777:I, 370-371.
- 74 See Beaglehole 1955:98-100; 1962:I, 374; Bligh 1789:I, 388-389, 398, 421:II, 10, 24, 30-31, 60; G. Forster 1777:I, 370-371; Morrison 1935:228-230; Vancouver 1801:337.
- 75 When describing this and other Maohi ritual procedures Henry wrote as if her version were the only one, the standard practice for everyone, everywhere. This we know was not the case; and wherever alternative versions are known I have reported them; but this is the only version of this particular episode that I can discover.
- 76 Wilson wrote "infectious disorder" (1799:349).
- 77 See, e.g., Orsmond, Journal, 24 January 1827.
- 78 See also Chadourne 1922.
- 79 Henry 1928:292; Moerenhout 1837:I, 550; Corney 1919:185; Vancouver 1801:290; Davies, Youl et al., Journal, 23 July 1806, LMS Archives.
- 80 For the moving account of the behavior of Vehiatua's mother on the occasion of his sickness and decease see Corney 1919:184.
- 81 *Tahu'a miri* or, according to Bligh, "meereeteeappapow" [*miri tupapa'u*] (1792:153b).
- 82 For other references to embalming, see Henry 1928:295-296; Vancouver 1801:293; Bligh 1789:I, 404; 1792:153b.
- 83 Also known as 'ghosts' masque' (*heva-tupapa'u*) (Henry 1928:293).
- 84 Moerenhout 1837:I, 550; Henry 1928:293. Parkinson stated that the principal mourner also served full time as attendant at the ghosthouse, setting out sacrifices and strewing the body and the environs with fragrant plants (1773:70-71).
- 85 Such bodies were usually transported in specially rigged canoes. See also Wilson 1799:349; Vancouver 1801:287-288.
- 86 "April 9th [1804]—the native that died on Friday night, was to-day buried not far from our dwelling. The corpse was wrapt up in cloth and laid in

the grave dug for it, with the face downwards: over it was placed, on pillars, a small house, such as those in which they usually lay their dead. The reason of his being buried, and with the face downwards, was because of some superstitious notions that his friends have among themselves." (LMS Transactions:II, 302)

- 87 The details of such ceremonies are nowhere reported.
- 88 Reference here is to generalizations regarding, say, the extent to which mourning practices serve to restore equilibrium in interaction systems disturbed by the absence of a key member, etc.
- 89 The action referred to, i.e., self-bleeding, is elsewhere labeled *pao*; I can find no reference in the LMS Dictionary to *pupu* being used in this sense.
- 90 For a more detailed study see Williamson 1933, vol. 1, where the older published sources have been reproduced and summarized.
- 91 See, for example, "They have no Idea of a future State, but fall into a degree of nothingness without reward or punishment after Life" (Bligh 1792:169b).
- 92 This composite summary has been assembled from accounts of Henry 1928; de Bovis 1909:39–41; Moerenhout 1837:429–436; and Ellis 1829:I, 516–518.
- 93 In Henry's and de Bovis' versions the route from Tahiti also went via Rotui.
- 94 In evaluating the reliability of Anderson's statements about this elusively profound subject it should be recalled that he could not have been very proficient in the native language.
- 95 See also Ellis 1829:I, 516 and Moerenhout 1837:I, 432–434. In an excerpt from Cook, quoted in chap. 2 (Beaglehole 1955:146), is the statement that three families lived at the time on Tupai, but most other accounts describe this atoll as having been usually uninhabited.
- 96 See p. 486 for Moerenhout's definition of "punishable misdeeds."
- 97 There is no way of knowing whether any one individual held any such combination of beliefs. In fact, it is likely that even any priest's store of eschatological doctrines was less comprehensive than the synthesis put together here. For additional versions, which however express only slight differences from the ones recorded above, see Beaglehole 1962:I, 381; J. Forster 1778:554; Ellis 1829:I, 327.
- 98 Moerenhout explicitly distinguished between a purgatory and a limbo, and his version has some souls going directly to limbo and others first to purgatory before proceeding to limbo. Henry's version, in contrast, appears to imply that all souls not destined for paradise pass through a purgatorial stage. If I am not reading too much into these constructions the differences between these two versions reflect important native disagreements with respect to man's relation to his gods.
- 99 *Uretaetae*, i.e., *ure*, penis; *taetae*, sharp thorns or prickles on the tail of fishes (LMS Dictionary)!
- 100 Henry referred to a certain "deified family hero" (1928:144), but the spirit in question was only of local importance.
- 101 The only possible exception I have found is in the myth about Fa'ahoutu, referred to in chapter 3, in which the *iho* of that deity's deceased infants reentered her womb in order to be reborn (Henry 1928:373).

Mitchell Library, Sydney.

VOLUME 2
SOCIAL RELATIONS

CHAPTER 14 *INTRODUCTION* *TO SOCIAL RELATIONS*

Many of the actions and beliefs that determined the social relationships that prevailed among the Maohis just before alien influences brought about radical changes in them have been noted in my descriptions of food production, recreation, warfare, weddings, and so forth. Now, however, these and other data on social relationships will be presented in more explicitly *interactional* terms.

As I interpret the evidence, the most important attributes recognized by the Maohis in their interactions with other Maohis were sex, relative age, consanguinity, affinity, class stratum, formalized “friendship,” occupation, Ariothood, residential proximity, and a combination of the latter with the common, coercively backed submissiveness to some particular leader that I label “tribalism.” Lexical distinctions indicate that people living in the more thickly populated areas nearer the coast were somewhat contemptuous of more rustic inland types,¹ but this contrast was not further institutionalized as far as I have been able to discover. In addition, as in all human societies individual attributes of one kind or another (in terms of local definitions of “beauty,” “strength,” “temperament,”) served to differentiate people in their everyday interactions, but among the Maohis such attributes were less important as social-relational criteria than were the ones listed above, which, accordingly, form the basis for the several chapters that follow.

Before plunging into this lengthy exercise I must digress to explain what I choose to convey by such overworked terms as *social relationship*, *social groups*, and certain other words that I propose to use in the interest of greater precision and more valid comparison. But let the reader be warned: the meanings I attach to these words are not exactly like those of any other writer that I know of—a regrettable but hopefully not obfuscating circumstance. It should be noted that the “persons” referred to in the following definitions can be either humans or humanlike beings, for reasons that will become clear.

Social relationship is my term for the kind of connection existing between persons who engage in social interaction—that is, in mutually

adjustive behavior. If two or more persons live on the same island, or are of about the same age or height, or enjoy membership in the same class stratum—all these may be said to constitute connections of common categoryness between them; but they are not the type of connections I call a *social relationship*, which is a type that is constituted by social interaction. (It would make my task tidier in some respects if I were to declare how much social interaction should take place between specified persons in order to qualify their connection as a *social relationship*; but, for several reasons, to determine that would be both impossible and undesirable. I leave the definition as it stands, my primary purpose being to assemble and interpret data on Maohi society and not to refine a set of analytical terms.)

Another term I propose to use in a technical sense is *group*, a general label to designate specific persons who on occasion interact with one another more or less exclusively. In this sense a *group* differs from a *category* of persons, such as males, females, fishermen, or priests. But if, say, all the priests of Huahine interacted with one another on occasion, and more or less exclusively, they would of course also constitute a *group*. In this sense, a *group* also differs from an adventitious *gathering*, such as a meeting together of a person's assorted kinfolk and neighbors at his funeral. (The distinction I draw between *group* and *gathering* is less precise than that between *group* and *category*, but it is adequate for present purposes.)²

Maohi groups ranged in size from two persons (e.g., a two-member household, a pair of lovers, a sorcerer and his spirit-familiar) to many thousands of persons (e.g., a tribe's whole fighting force assembled). In this sense, a married couple, or married couple with their children, living together and interacting in a household also containing other persons constituted a *subgroup*—provided, of course, they themselves on occasion interacted with one another more or less exclusively of those other members of the household. Here again, I acknowledge the ambiguity in my technical terms but believe that they are discriminative enough for the uses I shall make of them. It is hoped that the definitions will become clearer as the account unfolds.

DIMENSIONS OF INTERACTION

Returning now to the type of interpersonal connection that I label a *social relationship*, I find it useful for purposes of comparison to describe such relationships in terms of several aspects, or dimensions, namely:

- terminology*: the names or other kinds of labels the interactors call or use to refer to each other or that others use to refer to them, within the context of the particular interaction episode;
- time*: when and for how long the persons interact;

space: the locations of the interacting persons, relative to one another and to the spatial setting;

governance: which person controls the responses of the others;

transaction: what “goods” (objects and services—or *disservices*) circulate between the interactors; and finally

emotion: utterances or other discernible bodily behaviors which accompany interaction and which the observer infers to be expressive of internal states.

Before examining specific social relationships among Maohis it may be useful to record, in these dimensional terms, some more-general impressions about Maohi social relationships.

Terminology

In analyzing Maohi social relationships from a Western point of view, I have found it useful to distinguish personal names (e.g., John, Mary), general status names (e.g., father, prince), and specific status names (e.g., Mary Smith’s father, the Prince of Wales). Throughout this account personal names will be referred to as such, general status names as *statuses* or *offices*, and specific status names as *Titles* (thus reserving the uncapitalized form, *title*, to refer to anyone’s claim on some object, service, or prerogative—which may or may not be labeled with a distinctive office name or *Title*).

The Maohi word *i’oa* undoubtedly stood for ‘personal name’, but whether it stood for ‘Title’ as well is not entirely clear.³ (I have not discovered any general Maohi word for the English *status* or *office*, although the word *toro’a*, business, office, occupation [LMS Dictionary], covered at least some of that meaning.)

Each child was given a personal name at birth. Some individuals were undoubtedly named after living or deceased relatives, presumably from either parent’s kin; I can discover no fixed patterning in this regard, except for Moerenhout’s curious and ambiguous statement: “A child is given a personal name at birth deriving from either maternal or paternal family. Later, if its parents separate the child goes with the parent whose family name it bears.” (1837:II, 63–64.) Whether or not such a custom did prevail, it seems likely that a higher than average association may have developed between certain personal names and certain descent lines; but, except as will be noted below, there is no evidence of any exclusive ownership of such names. Some personal names were bestowed as is; others were specifically adapted to the recipient, as for example in the case of the Spaniard Maximo Rodriguez, who was named ‘Oro Iti Mahe’ahe’a (Little ‘Oro, after a friend’s ancestor, fair skin): Little-‘Oro-of-fair-skin (Corney 1919:183).

In other instances infants were given personal names “invented” for

the occasion as a result of some peculiar circumstance attending birth: "After the *birth of a child*, they ... [give] it a name from some object or other which is nearest at hand, or which from some circumstance becomes remarkable" (J. Forster 1778:556). In such instances one is justified in searching for the meaning of the name, but in the case of most "inherited" names it is my opinion that the Maohis did not "translate" them any more than English speakers nowadays imagine a worker in metals when they think of Smith. A statement in Davies' journal for 1818 might be interpreted either way: "It was also inquired whether it was not wrong to retain the names of things indecent as the proper names of men and women, this was answered in the affirmative, and it appears that many such names, had been lately put aside, tho' some are still retained." (4 May 1818, LMS Archives.) Either the "indecent" personal names had been adopted because of their connections, or wholly independent of them. (The persons referred to were evidently new converts to Christianity.)

A possible exception to this situation occurred in the case of office labels used as personal names, such as *Te Fatu*, in the legendary story given by Henry: "Some time after ... there came to Porapora (Vavau) ... a prince named Te-fatu (The-lord), a god's name, which only the highest of Polynesians ever dared assume, and which brought this prince great authority upon land from the god Te-fatu, lord of the ocean" (1928:122).

It is conceivable that some families holding high-ranking kin-congregation Titles also entertained exclusive proprietary sentiments toward certain of their ancestors' personal names, thereby constituting an exception to the tendency described earlier; but I can find no specific evidence bearing on this point. Some personal names were invariably sex-linked, many others were not. Among the former were the names of major gods, all of whom were either male *or* female.

There were no beliefs attesting to a direct mystical connection between an individual's personal name and his soul. For one thing, individuals changed their personal names or added new ones almost at will, ordinarily to commemorate an unusual event.

The People here as well as in England have several Names, and being differently used, it is frequently perplexing when the same person is spoke of, to know who is meant. Every Cheif has perhaps a dozen Names in the course of 30 Years, so the Man or Woman that has been spoken of by one Navigator under a particular name, will not be known by another, unless other causes lead to a Discovery. (Bligh 1789:I, 384)

One prominent man known to the early English visitors changed his personal name to Winker (*'Amo*) because of his infant son's habit of winking. Another individual became Convulsion after a kinsman had died during a convulsive seizure (Baessler 1900:126). According to Bligh this was in fact

a general practice: “Whenever a Child dies the Parents or relation take the Name of the disease; if a dozen Children die of different diseases, the Parents have as many different Names, (or give them to their Relations) and may be called by either, but commonly by the last” (1792:131b).

Another kind of circumstance was reported by Wilson:

Ahēine Eno [Vahine ‘Ino], the name this man at present went by, means a bad woman; it seems that his mistress Inna Madūa [Vahine Metua] was a character of this kind, and had got this name from the natives; but not liking it, transferred the name (through not the odium) to her servant [who, incidentally, was also her paramour]. (1799:185)

The custom of *pi* is defined in the LMS Dictionary as the custom of prohibiting the use of a word, or syllable, which had become sacred by its having been adopted as the whole or part of the name of some chief, when another word or syllable was substituted in its place. Since this custom had to do mainly with the personal names of chiefs (and possibly with some high-ranking Titles) I shall postpone discussion of it to chapter 22.

General status names, *statuses* or *offices*, included some terms used exclusively for address (e.g., *pa*, a term of reverence answering to father, and commonly used by children in addressing their father, and common people their chief [LMS Dictionary]); some used exclusively for reference (e.g., *metua tane*, male parent); and some used both for address and reference (e.g., *ari’i*, a person holding a high-ranking kin-congregation Title or exercising authority as a tribal chief). Statuses and offices will be listed in due course in connection with descriptions of their relevant social relationships.

Time

Few European observers bothered to record how often specific Maohis interacted, or how long such interaction lasted; but even if such information were available in numerous precisely recorded instances, generalizations drawn from it would not necessarily be significant in native terms. Consideration has already been given to Maohi ways of marking the passage of time or, rather, their ways of identifying and responding to the cyclical occurrence of certain natural events. It is quite unlikely that they conceived of time as something that “passed.”

Time (in the Western sense) also entered Maohi consciousness in the form of verb tense, but with a noteworthy peculiarity. By the use of qualifying particles added to action words it was possible to distinguish present (or ongoing) action from completed action and from action in the future, but the particles for present and past also carried meanings of spatial proximity and distantness, respectively (Burbidge 1930:168-170).

In addition to these more or less conventionalized indicators, I offer—for whatever they may be worth—other impressions gleaned from

the sources about Maohi behavior with respect to what Europeans call "time." Although precise timing was the hallmark of such skilled activities as angling and weapons play and group dancing, there seems to have been a universal unconcern with precision in the appointing of times for events; or, if times were appointed for events to take place they were set within very broad margins, and punctuality was usually neither striven for nor expected.

In yet another sense a rather low valuation seems to have been placed on the durational aspect of time in terms of services, as contrasted with objects. To the extent that exchange equivalences can be calculated, labor time entered into "price" to a lesser extent than did materials. Also, judging by the general absence of hurry in connection with most activities, and by the great amount of relaxed waiting that seems to have prevailed—waiting for events to begin, for weather to change, for crises to pass—individual Maohis did not, it seems, respond to the acknowledged limits of their own life spans with any sense of urgency. In this connection, however, they should be characterized as a-temporal rather than patient.

The relevance that all these highly impressionistic statements have to our present concern is that duration of interaction is less important in considering Maohi social relations than the Western observer might expect, at least with respect to Maohi thinking about interaction. Of course, the fact that any two persons interacted for several hours daily, rather than for a few minutes monthly, is to anthropologists a matter of considerable significance. But it would signify much more were we dealing with the kind of society whose members consciously "spend time" with one another.

Temporal sequence was expressed in the contrast *mua-muri* (before-after, earlier-later) and in such ordinals as *i matamua* (first). Compared with temporal duration, sequence received much more emphasis in Maohi interaction: for example, precedence was usually quite sharply defined.

Space

This dimension figured in Maohi interaction in terms of both arrangement and distance. The prime referents of arrangement were *tai-uta*, *i ni'a-i raro*, *mua-muri*, *'atau-maui* or *'atau-aui*, and *mai-atu*.

The *tai-uta* (seaward-landward) contrast was a fundamental one to these land-dwelling but sea-going Islanders, and it served to locate objects and other people wherever they were: one thing was nearly always recognizably closer to the sea or to land than another ("You there seaward, hand me that adze lying on your landward side"). *I ni'a-i raro* signified both above-below (or on top of-underneath) and upwind-downwind (i.e., toward or away from the prevailing easterly trades). And in connection with the latter, since these islands were located along a (roughly) east-west axis, *i ni'a-i raro* were also associated with sunrise-sunset, respectively.⁴

As I pointed out above, *mua-muri* referred in some contexts to the temporal sequence before-after (or earlier-later); in other contexts, however, this contrast signified what may be translated as in front of-in back of (or before-behind). *'Atau-maui* (or *'atau-aui*) seems to have signified quite unambiguously the body-oriented spatial-arrangement contrast right-left.

Finally, spatial arrangement was expressed by means of the contrasting particles *mai* (direction toward the speaker) and *atu* (direction away from the speaker) (Burbidge 1930:164, 167-168).

Turning now to measurement of spatial distance, the conventional length of a span (*etaeta*) served to indicate the length of canoes, of house beams, of dimensions, and so forth, but not, apparently, to describe absolute distances between persons or places or objects. Bligh wrote: "I now have no cause to doubt but that these people have no knowledge of the System of the Habitable Globe. Comparative distances must be explained to them by certain spaces of time which either would take up to perform according to their rate of travelling, and when this happens to be many Months, they are lost in a Maze." (1789:II, 38) Instead of terms of absolute distance, there were in use several terms to describe relative distances: *fatata* (near), *atea* (distant or extensive), *roa* and *maoro* (long), *poto* and *mure* (short)—all of which can apply to time as well as space. Words also existed for 'close to' in a temporal sense (*piha iho*), 'near together' with respect to several entities (*piri*), and 'far apart' (*ae hai*). The tolerance for "crowding" that most Maohis sometimes manifested was balanced by an evident preference for keeping their residences fairly far apart. Also, in some instances spatial distance between persons was complicated by considerations of sacredness (*ra'a, mo'a*); persons not possessing such attributes had in general to keep somewhat apart from those, both humans and spirits, who did.

Finally, one will recall that the oppositions expressed by *pō* (night, spirits' world) and *ao* (daytime, humans' world) also contain some implications of time—that is, primeval versus present era.

Governance

With apologies, but for lack of something better, I apply this awkward label to that dimension of a social relationship having to do with which of its parties controls the responses of the other, or others, and with the ways in which this is done. In more expansive terms, governance concerns the making and executing of decisions, chains of command, power and authority, dominance and submission, and the like. As befits its importance relative to other social-relational dimensions I shall feature governance in characterizations of specific types of relationships in the chapters that follow, but first I offer a few general impressions about the conditions in which governance was exercised.

To begin with, Maohis sometimes met together in fairly large numbers—in scores, hundreds, and even thousands of persons; but most instances of coordinated interaction involved fairly small numbers. Agriculture, for example, was mainly carried out by groups of only household size, and the same was probably true of most subsistence activities, except for the infrequent occurrences of *tira* angling and sweep-net fishing. Large numbers of persons occasionally worked together to build a chief's house or a marae, but most building and manufacturing appears to have been carried out by groups of usually no more than five or ten persons.

Some ceremonies did indeed include multitudes of persons, but usually the active participants in such events—those whose actions required a certain amount of coordination—were few in number; most other persons simply looked on. Again, although certain large-scale festivals involved the bringing together of vast quantities of foodstuffs, contributed by scores of households, the assembling of such objects was performed as numerous small-group actions, and not as an overall coordinated and finely timed mass enterprise.

Even land warfare, which occasionally involved thousands of combatants, was characteristically an every-man-for-himself affair—or at most a matter of very small groups clinging together and fighting around a personal leader.

I recognize the data to be woefully inadequate on these matters, but I have the impression that the only kinds of collective activities engaged in by the Maohis in large groupings and with fine coordination were dancing and canoe handling. Of these, dancing undoubtedly involved a great deal of training, but dance leaders were more signalers than anything else. Good canoe handling also required much practice and probably some specific training as well, but it also required leadership able to size up unusual situations, devise plans of action, and see that these were carried out. And not only did such leadership operate effectively over canoe crews numbering up to a hundred or more men, but occasionally it embraced whole fleets of canoes.

Outside their canoes, however, the Maohis do not appear to have been comfortable or very effective as members of large, closely coordinated groups. Illustrations of this general attribute will show up particularly when I discuss territorial groupings.

Transaction

Transaction is that dimension of interaction having to do with the circulation of goods. The goods to which I allude include both objects and services: not only objects themselves but various kinds of use-rights and disposal-rights over objects; and not only services themselves, and rights to services, but *disservices* as well—for example, diminishing others' capacities to act by killing, wounding, exiling, bespelling, or defaming them.

It would not be practicable to draw up an exhaustive list of the innumerable types of goods that circulated among the Maohis. Even formulating a list of the principal categories of such goods raises methodological problems that I am unable to solve. For example, there is no native verbal classification of objects into categories comparable to the *tonga-oloa* classification of Samoa (Mead 1930:62ff); neither does the Maohi language contain all-inclusive grammatical noun classes such as occur in some Oceanic languages. The language does, however, contain the widespread Polynesian *o-a* contrast, the so-called markers of alienability which occur as parts of most possessives.⁵ Briefly stated, *o* is used for possession which is intimate, innate or permanent, while *a* is used for possession which is incidental or transient.

In addition there appears to have been a general distinction drawn between manufactured objects (e.g., bark cloth) and provisions (e.g., plant-foods, fish)—at least for purposes of gift giving (i.e., reciprocity, either explicit or implicit).

Nor do they Call any thing a present which Nature produces, except accompanied by something which is procured by the Assistance of labour or the Art of Man; for which reason they always give Cloth or some thing else with their Gifts, Provisions being held of No value being produced by Nature, and they think it not proper to make store of them. (Morrison 1935:191)

In the absence of any explicit overall indigenous scheme of classifying circulating goods, I could perhaps attempt to introduce one of my own devising, in which case a number of possibilities come to mind. I might, for example, categorize them in terms of relative scarcity or relative value (not necessarily synonymous), or of relative tangibility, or of substitutability, or of “ends” versus “means.” Some information bearing on these criteria has already been presented, but much more will be given in due course, so rather than prematurely attempt a brief summary, I shall treat the goods as they appear contextually in my descriptions of social relationships.

Turning now to the ways goods circulated among the Maohis, I can begin by noting how profuse their language was with respect to words relating to transactions. Here are some examples taken from the first few pages of the LMS Dictionary:

‘aihu‘ara‘au, to possess land taken by conquest.

‘ainanu, displeasure caused by not receiving proper share, etc.

‘aita‘a, a man of another district or country, who by marriage becomes an inheritor of land.

‘aitaha, to eat fish without paying the usual tribute.

‘aitārahu, a debtor [nonpayer of compensation, wages].

ānavenave, addicted to get[ting] food at another person’s house.

ani, to ask, beg, beggar.

This dictionary contains hundreds of words for transactions (e.g., con-

fiscate, steal, feed, give, bribe, assist) and for individuals' predispositions regarding transactions (e.g., hospitable, covetous, niggardly), but the language itself does not provide any comprehensive lexical classification of transactions.

Before leaving this subject for the moment, I call attention to two general features of Maohi transactions. The first is the preponderance of terms having to do with generosity and stinginess, with sponging on others, with begging, and so forth, in contrast with the paucity of terms having to do with buying-selling, wages, rent, and other forms of barter or "commercial" exchange. And second, it should be pointed out that I have found no evidence of any Maohi aphorisms expressing generalizations about how all social units—individuals, both human and spirit; groups—transact or ought to transact. Aside from some general precepts in favor of food hospitality, there is nothing comparable in universal applicability to such Western ones as *it is more blessed to give than to receive*, or *competition is the rule of life*, or *share and share alike*.

Finally, I should point out the widespread practice of validating agreements by means of an exchange of objects, usually bark cloth. (Fig.

FIGURE 14-1. Tahitian girl bringing a gift of bark cloth and two gorgets. Drawing by J. Webber. British Museum.

14-1.) That is to say, although the rites used in such agreements varied widely, according to the nature of the thing agreed upon, they were nearly always reinforced by an exchange transaction. Thus, one may infer a general Maohi proposition to the effect that while words were undoubtedly potent bearers of one's intentions they required the addition of valued objects to render them fully effective.

Emotion

My usage of the term *emotion* corresponds in part to what some writers call affect or expressive behavior; but I also use this term as a label for those utterances, gestures, and other bodily signs meant, for example, to express the interactor's feelings of inferiority to his betters, equality with his peers, affection toward friends, distance from mere acquaintances, anger toward enemies, and so on. (Ritual by very definition involves deliberate statement, even overstatement, of this dimension of interaction.) To avoid misunderstanding, I emphasize that *emotion*, as I use the term, does not purport to describe the internal states themselves but only label those observable, conventional, learned, and socially shared bodily behaviors tacitly understood to express internal states.

The Maohi language contains numerous interjections presumably meant to express internal states. The following examples are from the LMS Dictionary:

a'a'a'a, laughter or ridicule.

'ae, surprise or disappointment; alas!

'aeo, contempt or disgust; ah!

'aha'a, fondness on meeting a friend.

auē, grief, ... sometimes an exclamation of wonder or surprise.

The language also contains scores of words labeling expressive behavior patterns. Some of these were of more or less "direct" reference, for example:

ai, to copulate, applied to both sexes.

'avau, to scold, reprove; use ill language.

fa'anonoa, to spurn with disgust

There were numerous conventional nonverbal behaviors, including some which struck the European visitors as highly bizarre, such as the custom of *pao* (striking and lacerating the head with sharks teeth, as evidence of strong feelings of either grief or joy) and that of *tiapou* (striking one's posterior and exposing it as evidence of contempt for someone). Wilson noted: "Their mode of salutation is very different from ours: they touch noses; and wonder that we can express affection by wetting one another's faces with our lips" (1799:348; see also Bligh 1789:I, 373).

Ancient Maohi contained many words for the internal states themselves, for example the following from the LMS Dictionary:

‘a‘aia, pleasurable sensations of the heart.

‘a‘ataina, the strong desire or longing of the heart.

anau, grief of parents for their children, or of children for their parents.

atatū, the state of being agitated.

ātohatoha, a pleasing or satisfactory feeling of the mind.

faaeo, to be so affected with grief or love as to lose the appetite.

fe‘ume, envy, malice, settled hatred between persons.

hae, jealousy; wildness of beasts.

hōioio, diffidence, fear of a superior.

mata‘u, fear, dread; to fear; to be in terror, or dread.⁶

mateono, a strong affectionate desire.

In view of the well-documented fact that the Maohis considered the more important internal states—thinking, feeling, and so on—to be centered in the *‘ā‘au*, or bowels, references to “heart” and “mind” in the above definitions are plainly figurative.⁷ Aside from their acknowledgment that even the most impelling feelings of anger lost force with the passage of time, I can discover no detailed evidence of Maohi beliefs concerning the physiology of emotions.⁸ Nor can I discover any linguistic or other clues concerning how the Maohis themselves categorized these numerous “internal states” and the even more numerous conventionalized behavioral expressions concerning them; I do not know, for example, which of their terms for emotions were regarded as contrastive, which were entirely synonymous, or which were identical save for differences in intensity.

With respect to emotion in general, many European visitors were struck with two aspects of it which appeared to them to be contradictory. On the one hand the Maohis’ ways of expressing joy or grief or anger seemed ridiculously overdramatic to the more stolid of the Europeans; to others, like the Forsters, such behavior was indicative of “excellence of heart” and of “generous and exalted sentiments” (G. Forster 1777:I, 386). Yet on the other hand the Maohis submitted to physically painful situations with remarkable stoicism (see, for example, Bligh 1792:148). One pattern of expression which struck the more forthright English visitors not only as overacting but as a case of barefaced hypocrisy was the violent but evidently simulated display of grief on occasions such as deaths, illnesses, or even mere partings. An example is the following observation by Mortimer: “The king’s mother cried much at parting with us, but in such an affected manner that it was almost impossible to refrain from laughing” (Mortimer 1791:48).

The Maohi lexicon contained numerous words connoting (and implicitly censuring) the dissimulation of emotion. These were words such as the following from the LMS Dictionary:

'*arufa'ahema*, deception by fair words, while a plot of destruction has been planned.

'*arufa' aīpaea*, words of conciliation, without sincerity.

aureva, to impose upon a person under the appearance of friendship.

But certain highly dramatic expressions of emotion, such as those just mentioned, were evidently regarded by the Maohis themselves as admissible or even unimpeachable.

As was the case with transactions, I have found no aphorisms of general, society-wide application, such as *love thy neighbor as thyself*.

KINDS OF INTERACTION

The preceding sections regarding dimensions of interaction apply to three kinds of interaction: normative, historical, and suppositional. (Tedious as such technicalities may be to most readers, I regard it as essential to concern ourselves with such distinctions.)

I apply the label *normative* to subjects' opinions, expressed or implied, about how persons ought to act when interacting. I call interaction *historical* when there is reliable evidence that it actually took place, and in the manner observed or reported. And I call interaction *suppositional* if its historicity is presumably believed in by the persons under study, without, however, sufficiently reliable evidence that such interaction actually did or does take place.

Some historical interactions may in fact conform to most of our subjects' opinions about what they ought to be and to their beliefs about what they are, but such conformance is a matter for investigation. Whether conformance does or does not occur, data about all three kinds of interaction are relevant to a formulation of any society's social structure.

Having said so much, however, I must acknowledge the difficulty of applying this three-way distinction to the data available about ancient Maohi society. When the eminently reliable Captain Cook reported in his journal that he observed two men butchering a pig, we are probably justified in accepting that as history. And when a native 'Oro-worshipper related that his cult's founder was begotten by Ta'aroa's overshadowing of Hinatuauta in the form of a breadfruit branch (Henry 1928:375), we are equally justified in regarding that as a supposition (assuming, for the sake of argument, that the fellow actually believed the story). But there are countless other recorded instances of social interaction wherein such distinctions are by no means so clear-cut. Particularly, is it difficult to discern the normative bias in many native narratives: for example, does the recurrent theme of the cuckolded husband indicate general approval for such goings-on or merely acceptance that such things, regrettably, did (and do) occur? And, of course, in connection with a great deal of native "tradition" it is next to impossible

to discover where myth (i.e., supposition) ends and history begins. For some purposes such a distinction may be unimportant; if a myth has currency as a charter for some contemporary situation it may not matter whether its events did or did not actually take place. Yet there is usefulness to be gained from reliable information that such and such did or did not take place.

In this connection, Maohis' accounts of past events are not easily classifiable into such conventional Western categories as myth, legend, folklore, and so on; I could not discover any evidence of an analogous vernacular classification. Furthermore, while one may use Western criteria with some validity to arrange most Maohis' accounts in terms of a kind of chronological sequence—say, a cosmogonic era, a middle era of dynastic origins and of demigod adventures, and a more uniformly recent era of quasi-historical events—these different eras are not altogether mutually exclusive. That is to say, "creation" continued into the middle era, and even into recent times; and the origins of some dynasties may well have taken place much later than their genealogical charters imply. In view of these uncertainties it may appear unreasonable to attempt to separate the actual history of Maohi social relationships from natives' rules and unverifiable suppositions about them, but an attempt will nevertheless be made.

Throughout the following chapters, to build up characterizations about social relationships I draw also on fictional material—that is, on stories told by Maohis mainly for entertainment, and not necessarily believed by them as having actually occurred. Thus, fictions are to be distinguished from suppositions and are relevant in at least two respects. First of all, the Maohi fictional stories that have managed to survive long enough to have been recorded are a prominent part of Maohi arts, and are thus intrinsically important (see chapter 10, on diversions). Second, although they do not constitute direct evidence of Maohi beliefs about the actual nature of social relationships, they do at least provide testimony concerning what features of social relationships the Maohis found interesting enough to tell about and to listen to.

SANCTIONS

The subject of sanctions is of course vast and diffuse, and I will not even attempt to trace its many ramifications in any systematic, analytical manner. However, I will indicate what mechanisms there were for assuring, or at least encouraging, compliance with social-relational norms. I have no data on Maohi generalizations indicating how they categorized or ordered according to strength what Westerners call sanctions. Instead, I shall give here a few impressions of the wide range of sanctions (in terms of common English usage), and place in the contexts of specific sets of social relationships other examples that the sources provide.

Turning first to those negative sanctions that reinforced conformity to social-relational norms, one of the most direct of these was the implicit threat that the dissatisfied party could sever active relations. This obtained not only between more or less equals—between siblings or friends or partners-in-trade—but may have served somewhat to curb a husband's power over his wife, a father's over his children, or a chief's over his subjects; divorce by wives, change of residence by offspring, and transfer of allegiance by subjects could and did occur. Also, occasionally individuals resorted to suicide when frustrated, in one way or another, or in response to social embarrassment. A few examples of actual and threatened suicide will be found throughout the descriptive portion of the present work; however, there are too few cases to warrant further discussion.

As we shall see, certain kinds of contractual agreements involving long-term exchanges of objects appear to have contained (implicit) clauses regarding penalties for nonperformance; these clauses usually recognized the right of the aggrieved party to destroy some of the other's property in the event of nonperformance.

Superior physical force may not have been the most effective sanction in the minds of the Maohis themselves, but it was certainly one of the most widely exercised, both to enforce general rules of conduct and to settle interpersonal conflicts. Moreover, once physical force was brought into play against a particular individual in such situations, the tendency was to apply it to the limit—that is, not simply to maim the victim or to cause him pain, but to kill him; or, in some cases, to kill not only the victim himself but his parents, spouse, and offspring as well. There were however some alternative outcomes: in some instances transgressors were allowed to live but were exiled, or their goods either appropriated or destroyed. Physical force was also utilized in a more extensive way, but with what seems to have been rather indifferent effects. Some officials wielded clubs to clear paths through crowds for their superiors. In this connection I reproduce a statement from Turnbull which, however, I cannot further document: "Their *morais* are a kind of refuge for criminals of every kind; they fly to them when in any imminent danger, and according to the custom of the country, must not be taken from thence" (1813:366).

For a Maohi, to whom a spirit may have been just as physical (tangible, palpable) and in some respects a great deal more forceful than the rule-enforcers of his chief, our distinction between supernatural sanction and physical force would not perhaps have been very meaningful, but for Westerners it remains a useful one. Indeed, using present-day semantics, it is possible to distinguish two, or perhaps three, kinds of negative supernatural sanctions that served to ensure compliance, more or less, with many social-relational norms.

One of these was direct, purposeful, explicit action by a spirit to punish someone who had broken a rule sanctioned by that spirit or to punish noncompliance with a spirit-sanctioned oath. In connection with the latter is G. Forster's account of one such occasion:

The next morning at parting Potatow promised to accompany Mr. Pickersgill to Matavai, in order to visit captain Cook, provided he might be sure of good treatment. Mr. Pickersgill assured him of the best reception; but the chief, for greater safety, produced a few small yellow feathers, tied together into a little tuft, which he desired Mr. Pickersgill to hold, whilst he repeated his promise, "that *Toôte* (captain Cook) would be the friend of Potatow." This done, he carefully wrapped the feathers into a bit of Indian cloth, and put it in his turban. We knew, from former accounts, that red and yellow feathers were employed by the inhabitants of this island to fix their attention while they prayed to the Deity; but this ceremony conveyed an idea of a solemn affirmation or oath, which was quite new to us. Potatow was so well satisfied of the integrity of his friends, after this ceremony, that he and his wives, and several of their attendants, carrying with them two hogs and abundance of cloth, marched towards the boat, amidst an immense croud of people. (G. Forster 1777:I, 359-360)

Another kind of supernatural sanction was sorcery, through which humans manipulated spirits to punish other humans for private or public wrongs. As I indicated earlier, there may have been still another distinctive kind of supernatural sanction in operation, namely, an "automatic," "magical" process more or less independent of individual spirits and one which damaged the breakers of certain types of rules; but the evidence on this belief among the Maohis is not entirely clear. In any case, whatever the mechanism, most punishments involving negative supernatural sanctions consisted of some form of bodily ailment, including death, although infertility, property destruction, or enterprise failure were sometimes employed.

Compliance with social-relational norms was also sanctioned by various expressions of censure. The Maohis appear to have been especially sensitive to verbal censure, but individuals' reactions to it ranged from suicide to violent counterattack (including warfare), depending on many complex factors.

In discussing the difficulties experienced by Europeans in communicating with Maohis, Vancouver added the following:

These perplexities and disadvantages were also materially increased, by the difficulty of obtaining the truth from a race who have a constant desire to avoid, in the slightest degree, giving offence; insomuch, that, on the least appearance of displeasure, even in conversation; to disengage themselves from any such inconvenience, they would often, by that extensive and specious comprehension, which their language admits of, seemingly so qualify, what they before had asserted, as to contradict, according to our acceptation, a positive matter of fact; or, what amounted to nearly the same thing, a completely different construction was by us a very frequently put on a second conversation, from that which we had conceived from, or had attributed to, the first. (1801:317-318)

Censure, it will be recalled, was also expressed in the form of dramatic skits. In one of the few episodes actually recorded, the reproof seems to have been most effective. But as for the "Satyrs" [satires] described by Morrison as having been "... directed at their Chiefs," although such criticism may have been licensed by the latter ("so long as they keep to the truth"), we are not informed how efficacious it was (1935:224).

We must face the question concerning the nature and potency of internalized sanctions, in addition to those reinforced by dislike of censure and anxiety about damage to self, to relatives, or to property. In this connection I believe it fairly safe to assume that even in the face of some conflict of ideologies, which I shall attempt to delineate, and even in the situational differences in child-rearing, which I am convinced did obtain, socialization was uniform enough and efficacious enough to ensure that most social-relational norms required no additional external reinforcements. For example, an individual's respect for his kin-congregation chief was in many instances spontaneous enough not to necessitate a fear of the latter's clubs or guardian spirits. It might be suggested, of course, that *hara* (error, defilement, guilt-substance) constituted an internalized sanction, a kind of substantialized metaphor for feelings of guilt; but such an interpretation cannot be soundly documented.

Finally, is the question of what meaning to attach to the intriguing word, *ha'amā*. The LMS Dictionary provides these glosses for the word: shame, remorse, to be ashamed, shameful, indecent; and for its factitive compound, *fa'aha'amā*, to put to shame, or make ashamed, to put on shame, to act as one abashed or shamed, the person or circumstance that makes another ashamed. Except for the gloss 'indecent', which in missionary terms may have referred to sexual misbehavior, the definition itself provides no clue as to the kinds of situations which brought on such *ha'amā*. The sources do not contain enough examples to permit insight into the word's interesting, and probably quite important, social-relational implications.⁹

Positive sanctions supporting social-relational norms are even harder to identify, since they reach even further into the *terra incognita* of Maohi psychology. I do, however, have a few impressionistic notions about the employment and efficacy of some of the more obvious ones. Verbal praise was frequently utilized, but I have the impression that in the situations in which it was most often uttered—that is, in extolling chiefs—it had reached a point of such stylized adulation that only the omission of it was seriously heeded. Such a word as *tavaimanino*, flattery (literally, smooth speech [LMS Dictionary]) indicates a general awareness of this circumstance, and this is confirmed by one of the "Precepts of Tetunae": "*E ara i te reo aeae o te faahau ia oe, o te matamehai te reira o te fa'ahemara'a ia oe*. Beware of the soft-voiced flatterer. Flattery is the commencement of deception." (Handy 1930:41)

Ordinarily, it appears, in conforming to social-relational norms the Maohis were encouraged by anticipation of rewards more tangible than verbal praise—rewards in the form of objects, or of more substantial services such as labor and martial support. Yet, verbal praise and not tangible prizes were the more usual rewards for victory in competitive sports. Most positions in Maohi society (and the rewards for behaving properly in them) were ascribed by birth or age or sex, or a combination of these; but there were, as we shall see, many that could be achieved through effort and skills—physical, mental, and social-relational. Achieved positions of social influence—that is control over people’s services—were usually attained by making objects and services available to them; and maintenance of that control depended, ultimately, on continuation of such outlays. In other words, while some individuals were able to maintain desired relations with others by use of negative sanctions, including physical force and publicly applied censure, others had to depend upon positive sanctions, in the form of objects and services, to maintain relations desired by themselves.

It is my impression that supernatural sanctions operated mainly in the negative sense noted above. I can find little evidence of belief that if one behaved properly one would be rewarded by some spirit or other. Rather, the common assumption seems to have been that if one behaved improperly (and this mainly with respect to relations with spirits) one would be punished by spirits.

As for internalized sanctions of a positive kind, I have come across no evidence, aphoristic or otherwise, embodying such sentiments as *a job worth doing at all is worth doing well*, or *satisfaction in a job well done*, or *satisfaction from service is its own reward*. I do not suggest that the Maohis did not experience such satisfactions from conformance to social-relational norms, but they apparently did not find it necessary to announce such satisfactions in verbal form.

CHAPTER 15 *SEX AND AGE*

MALENESS AND FEMALENESS

In general the Maohis conceived of *te huru tane* ('human maleness') and *te huru vahine* ('human femaleness') in terms of sharply contrasting characteristics, both anatomical-physiological and behavioral. Social rewards in the form of approbation, as well as more tangible benefits, accrued to persons heavily endowed with certain aspects of this maleness or femaleness. Yet, a high degree of institutionalized tolerance was accorded anatomical males who for one reason or another opted for female behavioral roles—that is, the previously described *mahu*.

However, we are faced with a problem in interpretation: in reconstructing Maohi concepts of maleness and femaleness, whose opinions are to be invoked? In all likelihood, for example, young maidens' criteria for perfect maleness differed in some respects from those of mature men, and perhaps from those of mature women as well. In fact, differences of this kind were displayed in high relief in stories of former times: for example, equally praiseworthy, it seems, were heroic demigods of huge size and harsh insensitive manners, and diffident youths of moderate size and gentle, considerate conduct. Here we have not only the intrinsic difficulty of "role separation" but also the circumstance that Maohi society was complex and heterogeneous in this as in other respects. Nevertheless, an attempt will be made to present some evidence about human maleness and femaleness, as distinct from other Maohi social roles.

In terms of body anatomy the typical as well as the ideal male adult was taller and larger-limbed than the female. He was also more muscular, or at least physically stronger; large, prominent musculature was of itself not especially valued in males, particularly if it tended to knottiness. Females were praised for their soft, regular features, but for males also it was deemed appropriate to be smooth and rounded in body contours. And as already reported, the attribute of portliness was esteemed in both sexes.

A full head of hair was deemed desirable for both males and females. Other anatomical features favored in females were tapering fingers and a flat, wide nose. I described how nurses of infant girls encouraged these

developments by manipulation; but whether this served to enhance the subjects' basic femaleness, or should be regarded merely as supplementary cosmetic conditioning, is, for reasons stated earlier, impossible to decide. This can be said also for the practice of flattening an infant male's occiput and molding his cranium into a peak.

The sources provide little information about how the Maohis conceived of sex differences in terms of the more common body attitudes or motor habits. It seems likely from present-day Tahitian custom, that females were conditioned to sit and squat with knees together, in a manner different from males, and the sleeping posture may have differed too. But there is nothing to indicate that females were expected, or taught, distinctive ways of walking, running, swimming, and so forth—except that males were probably expected to exercise more speed and endurance in such movements. There is no evidence of sex differences in the manner of chopping, cutting, throwing, and paddling, although males were undoubtedly expected to be better in such actions, both through greater basic strength and through practice. In connection with carrying, however, the distinction was quite clear-cut. There was perhaps no clearer mark of a male's maleness than his ability to carry huge bunches of wild plantains down long and steep descents from their mountain groves. These and other heavy burdens males characteristically balanced on their shoulders, while females carried their typically lighter loads by arm and hand.

As with the rest of humanity, Maohi males' voices were undoubtedly pitched lower than females', but there is nothing to suggest that the Maohis considered this attribute to be a significant mark of sexual dichotomy.

By inference, from sex-linked differences in the conventionalized expressive behavior patterns I label "emotions," it would appear that females were attributed with stronger and more sensitive "internal" reactions to felicity and tragedy than were males. Maohi males were much freer with their tears and raptures than were the stolid European visitors, but they rarely were so demonstrative as Maohi females. Men, for example, sometimes gashed themselves in a show of overpowering "grief" (Henry 1928:579-580), but with women the shark's-tooth immolation tool was a common accessory. In Maohi tales, fainting—usually in reaction to tragedy—is also more typical of women than of men; and in such stories it is more often women than men who display forgiveness, compassion, and similar signs of "tender-heartedness."¹

However, Maohi males were provided with more violent and picturesque conventions for expressing "anger" and "rage" than were the females—particularly in the form of challenges and insults hurled in connection with warfare; and one cannot ignore the fact that most of the killing of other humans, along with other ravages accompanying hostilities or reli-

gious ceremonies, was conventionally carried out by males. If, however, the rivalry was in the form of a sporting event, male combatants were described as having been good-natured whatever the outcome—except for wrestling matches between members of separate tribes, which often ended in pitched battles. Female rivals characteristically, and presumably conventionally, lost with what Europeans would call very bad grace.²

It is next to impossible to generalize about Maohi courage. Some European observers found the Maohis sorely wanting in what Westerners usually signify by the term, but the matter is not quite so simple as might appear. The kinds of situations provoking fear cannot have been altogether like those producing what Europeans understand as fear. To a European, running away from battle—which Maohis often did—appeared timorous and “unmanly,” to say the least. On the other hand, perhaps few Europeans would have had the courage to scale cliffs or swim in murky depths or brave high seas in fragile canoes or converse with spirits—all as everyday matters. This is not to say that European-style battlefield courage was not esteemed by the Maohis; it not only was, but it won high rewards for those who displayed it. Yet a man without such courage appears not to have been considered less of a male.

As for Maohi women, they were not expected to scale cliffs, or fish in the deeper waters, or fight battles (although some of them did, with great ferocity³); but they did accompany their men on difficult treks overland or on perilous ocean voyages, and there is no indication that they were permitted conventionally any more display of fear than were males.⁴

Sexual differences in stoicism are only slightly less difficult to assess. From one account (Morrison 1935:221), previously quoted, girls reacted to tattooing with more fortitude than did boys, but suggestive as this is it does not warrant a general statement to the effect that stoicism regarding physical pain was considered by the Maohis to be more characteristic of females than of males. And as regards Maohi stoicism in the face of life’s more psychic hardships, this is a question I cannot even adequately formulate, much less answer.

I am on surer ground when attempting to generalize about maleness-femaleness in regard to sexual passion itself. As the reader will recall, Maohis in general appear to have considered it true and appropriate that both males and females be endowed with strong sexual appetites. It was considered somewhat more fitting that males exercise the initiative in sexual encounters, but during the encounters themselves it was neither anticipated nor preferred that the female be any less active than the male.

With respect to male or female superiority in “intelligence,” the following should be recalled. Perhaps the most highly valued kind of knowledge consisted of prayers, chants, and socially important genealogies; such know-

ledge was usually acquired by rote memory training, although some Maohis were believed to have acquired it by “infusion”—by breathing in the expiring breath of a dying savant. In any case, most such training and transfusing involved males; in fact, some of the more esoteric bits of knowledge were probably deliberately concealed from females.

The most highly valued kind of information was believed to have come not from humans themselves but from spirits communicating through humans. Some mediums for this information were females, but most were males. And so it was with most other kinds of highly valued knowledge and information—including craft specialties, therapeutics, seamanship, and statecraft—most of which were the concern mainly of men. This is not to imply that women were not knowledgeable or well informed about a variety of things (including political relations), but what they usually knew counted for less, explicitly, in Maohi terms.

But what about those other elements of the European-defined attribute of intelligence, such as general analytical ability and problem solving? Did such aptitudes count for much among the Maohis; and if so how were they considered to be distributed between the sexes?

The most suggestive Maohi words I can find with direct bearing on these elements are the following from the LMS Dictionary:

mana’o, thought, idea, meaning, conception; to think, muse, reflect.

feruri, to ponder, reason, muse, consult.

pa’ari, wisdom, knowledge, skill, cunning; mature, old, ripe, hard.

’atama, wisdom, intelligence; an intelligent person.

hōhonu, deep, profound.

Compare these with their opposites:

matapō, blind, also ignorant.

ma’ama’a, a fool, an idiot; also a vain thoughtless person.

The dual meanings of *pa’ari*—dual, that is, in the European sense—indicate that this attribute increased with age and experience. Other words suggest some acknowledgment by Maohis of the fact that individuals differed considerably in their capacities for everyday problem solving, quite apart from their age and perhaps apart from their sex as well. In any case, there is only scattered evidence that such aptitudes were highly regarded, so we are left with the proposition that no matter how intelligent Maohi females may have been vis à vis males, the uses they conventionally made of their intelligence counted for less. In this connection, in the legend of the discovery of fire this great invention was credited to the joint ingenuity of a man and his wife (Henry 1928:427ff).

The attribute—or contrasting pair of attributes—defined by *ra’a/mo’a-*

noa, which I have translated (inadequately perhaps, but conventionally) as sacred/secular, was of far greater importance in differentiating males from females than was intelligence. Recapitulating briefly, *ra'a/mo'a* applied to spirits and everything in association with spirits, that is, images, marae, priests formally engaging in worship; *noa* applied to entities lacking *ra'a/mo'a*. *Ra'a/mo'a* was dangerous to persons in a state of *noa*; conversely, persons in a state of *noa* impaired *ra'a/mo'a*. Generally speaking, in everyday life humans were normally *noa*, but most males could by ritual means become *ra'a/mo'a*, temporarily, in order to associate with spirits safely and effectively. Most females on the other hand (and male domestics of females) were always *noa*, never permitted direct association with beings or things or places that were *ra'a/mo'a*.

By what reasoning did the Maohis come to ascribe, or to rationalize, this kind of difference between male and female? The primary sources do not provide explicit and direct answers to this question. It is tempting to refer to parallels in other Polynesian societies, where some at least of the ritual restrictions imposed upon women were explained as due to the magically contaminating effects of their menstrual flows. That may indeed have been an original "cause" for the Maohi attitude as well, but there is no direct evidence that such an explanation persisted into the eras under study. Also, the Maohis of those eras seem to have been quite casual about the process of menstruation.

One might also seek functional explanations in other Maohi beliefs and practices—for example, the belief that most deities were males, the fact that most Titles devolved upon males—but the causal sequence might well be reversed; and hence we must content ourselves with noting the contrast and with describing, if not its cause, then its ramifications.

Directly connected with, although not necessarily derived from, females' attribute of *noa* was the general restriction on their ritual activities: as previously noted, except for very rare circumstances they were not permitted entry into public marae nor contact with the paraphernalia of worship. Presumably, they had access to their so-called family marae, and they joined in worshipping family tutelars. Scattered throughout the sources are references to women having their own marae, but no details about the location or constitution of women's cults. Insofar as religious activities were public and large-scale, Maohi females were excluded from them.⁵

The *ra'a/mo'a-noa* contrast may also have been responsible for the Maohis' rules of sex segregation in activities relating to food—although again the causal sequence may have been the other way around. It will be recalled that men and women usually ate separately. The only women excepted from this rule—and that only occasionally—were those holding very high-ranking kin-congregation Titles (Turnbull 1813:338).⁶

Men could eat food prepared by women, but women were denied food prepared by males—except by women's own male domestics, who were themselves ineligible for sacred activities. These restrictions could be interpreted as having been in the interests of women, as devices to protect them from the dangerous contagion of males' potential sacredness; but the specific food restrictions—pork, dog flesh, certain choice fish—imposed on females look suspiciously like male oppressiveness, however they may have been rationalized. In this connection, I have come across no assertion that females were explicitly forbidden to partake of kava, but it was evidently drunk mainly by males—to such an extent, moreover, that later English visitors were led to surprised comment when they observed women imbibing it (Morrison 1935:210).

The male-female distinction shows up very clearly, for obviously more practical reasons, in many productive activities. As previously noted, some activities were carried out only by males; these included pelagic fishing, the collection of mountain plantain,⁷ house building (and, of course, temple construction), canoe making, and pig hunting. Warfare also was the domain of males, but occasionally some females took part. The sources are vague about the division of labor in gardening, but it seems reasonable to assume that most heavy clearing was the work of males. Fishing by females was confined mainly to collecting molluscs, crustaceans, and fry in shallow waters, but there is nothing to indicate that a woman could not fish from a canoe, or that a man was prohibited from picking up molluscs in the shallows. Making sennit was conventionally the work of males, and making mats and bark cloth that of females—although men (and even very important men) occasionally joined in the manufacture of bark cloth when large quantities were required.

In other words, the Maohis appear to have been pragmatists with regard to most of their productive activities, adjusting their work conventions to the physical capabilities of the workers rather than to any arbitrary and inflexible notions of what individuals should do in terms of their sex.

"Natural capability" (if that is the right term) shows up in distinctions between some male and female diversions—for example, in the mock combat and foot races of males. In connection with dancing, many of the distinctive movements assigned respectively to males and to females were imitative of each sex's conventionalized body movements in copulation. But in diversions, such as traveling, swimming, and surfing, in which physical differences were not crucial, both males and females took part. The goddess Hina, for example, was a great traveler, sometimes going alone and sometimes accompanying her brother, Ru (Henry 1928:463, 459).

As elsewhere in the world, the male-female contrast was conventionally expressed by differences in attire, in coiffure, in body ornamentation, and in tattoo.

Having described how the Maohis conceived of the contrasting attributes of maleness-femaleness, I will summarize how they conceptualized the social relations between persons thus contrasted. Much interaction among Maohis took place only (or mainly) between members of the same sex, as for example eating, pelagic fishing, house building, fighting, public worship, and mat and tapa manufacturing. In addition there were some other kinds of activity, including certain forms of singing and dancing, which conventionally required interaction between males and females. Females appear to have been more skilled in the practice of *rumirumi* (body massage), and for the most part their willing patients seem to have been males. Courtship and sexual intercourse was, of course, mainly heterosexual, but, as I have pointed out in chapter 11, some homosexuality did take place between males, and with little or no show of furtiveness.

Beyond these kinds of interaction involving one sex exclusively, or both sexes preferably, there were many others wherein sexual roles were less crucial. Undoubtedly, most Maohis spent much of their lives in company which included members of the opposite sex: working, resting, traveling, conversing, celebrating, mourning, and so forth. Unfortunately for our purposes, however, there is very little information available about these commonplace, everyday events of Maohi life. What can be gleaned may be summarized in a "dimensional" paradigm as follows:

Terminology. *Tane-vahine* served both for address and reference: generally, as terms for human (and spirit) maleness and femaleness, and also specifically, for husband and wife. (But, as we shall see, there were some other terms also used for "spouse.") As for personal names, I have already noted that some were applied only to males, others only to females (usually these included names identified with gods, which were either male or female). In this connection, I can discover no instance of the custom of *pi* having operated with respect to any woman's name.

Time. Data on this aspect of any social relationship, at least for purposes of Western-oriented description, should ideally be expressed in quantitative terms, with respect to the frequency and the duration of interaction episodes. (That such quantities were not necessarily significant criteria for the Maohis themselves, has already been indicated.) Needless to say the worthy sailor and missionary observers engaged no more in clocking or counting interactions than did the Maohi moralists or storytellers, and hence with regard to this dimension of male-female relations I can deal only in impressionistic generalities. One generality is that conventions regarding individual's interactions with members of the opposite sex varied, quantitatively, with "age."

Space. It is probably safe to say that in most interaction contexts it was conventional for persons of opposite sex, whatever their age, to remain at

greater distances from each other than was the case between persons of the same sex. Another pertinent Maohi spatial convention was the *mua-muri* (front-behind) contrast mentioned earlier; in many regularized situations involving male and female participants the former usually occupied places “in front” and the latter “behind.” *I ni’a-i raro* (on top-underneath) was another figurative convention for contrasting male and female, with respect to married couples at least. In Henry’s account of nuptial rites the groom’s party was called *papa-i-ni’a* (upper rock), and that of the bride *papa-i raro* (lower rock) (Henry 1928:282). This was a reference perhaps to a couple’s positions in sexual intercourse, and to the cosmogonic identification of the original “husband” and “wife” created by Ta’aroa, who were known as Great Foundation Rock and Stratum Rock, respectively. (See chap. 3, this work; and Roussier 1928:191)

Governance. Maohi norms undoubtedly placed authority—that is, effective decision making—mainly in the hands of males, but a careful reading of the sources leaves one with the impression that many Maohi women were in actuality (“historically,” in Western terms) anything but a passive, deferential, submissive lot: certainly not in domestic matters and often not in larger “public” affairs either. Backing up males’ decisions were the sanctions of ideology, precedent, and (usually) greater coercive strength, but women also possessed sanctions, including sharp tongues, considerable freedom of movement, and, often, the physical strength and will to strike back.

According to one observer, “We noted many strange customs during the time of our stay which must make their [Maohis’] lives pretty uncomfortable; especially for the women, whom they treat with disdain” (Corney 1915:471). But the only documentation supplied by Corney was the eating segregation, which probably had little or nothing to do with “disdain.”

One practice that may have led some observers to infer that females were generally disdained was the control some fathers (or other male guardians) exercised over their daughters’ sexual services (or husbands over those of their wives), proffering them to the Western visitors in return for tangible goods. Episodes of this nature undoubtedly occurred, but one cannot rule out the possibility that the females in question were themselves eager parties to the exchange. (A similar interpretation is possible in the conventional wife-lending exchange that constituted one aspect of “hospitality,” or one component of the *taiō*, bond-friendship, relationship between men.) Another factor in such episodes was the circumstance that sexual services were not themselves accorded less value, relative to other goods, as they are in most Western societies.

Again, as in most other social-relational matters, the fact of rank served to color interactions between males and females. Some women holding or transmitting high-ranking kin-congregation Titles, entered ag-

gressively into political maneuvers and were laws unto themselves, as I shall describe in other contexts. Some of these women kept their own courts and were more active influences than were their husbands (or brothers or sons or nephews) in keeping alive the society's pervasive dynastic rivalries—although they themselves rarely occupied the Titles of highest social rank.

Transaction. In most transactions between males and females the principals were acting in more specific roles as lovers, spouses, parent-child, or other kin relationship, so that the general male or female component of the interchange eludes identification. However, it is my impression that in most such transactions the goods derived from males were likely to be in the form of objects while those from females were services of one kind or another. Needless to say, no such general proposition is to be found among the Maohis' own explicit norms or suppositions.

Emotion. Although in relation to males, females may have eaten and worshipped separately, sat "behind," been overruled or even not consulted in many decisions, and been forced to yield on occasion to males' superior physical strength, there is little to indicate, differences in titular rank aside, that females conducted themselves with any marked show of respect toward males as males; nor can I discover any evidence of norms requiring females to behave deferentially to males *qua* males. Moreover, although some degree of modesty obtained between the sexes with respect to exposure of genitalia, few or no constraints were imposed on male-female verbal interchange. There is not any evidence for believing that either sex was expected to curb "anger," or was licensed to any one-sided display of it, in interaction with the other.

The relations in general between Maohi males and females, both in conceptualization and in historical actuality, may not have been so idyllic as J. Forster eulogized them in the statement reproduced below, but he was probably closer to the mark than the previously quoted Corney, who saw women's lot as being held only in disdain:

In O-Taheitee, and its neighbourhood, the women are possessed of a delicate organization, a sprightly turn of mind, a lively, fanciful imagination, a wonderful quickness of parts and sensibility, a sweetness of temper, and a desire to please; all which, when found connected with primitive simplicity of manners, when accompanied with a charming frankness, a beautifully proportioned shape, and irresistible smile, and eyes full of sweetness and sparkling with fire, contribute to captivate the hearts of their men, and to secure to them a just and moderate influence in domestic and even public affairs. We find the women esteemed at O-Taheitee, and its neighbourhood; they mix in all societies, and are allowed to converse freely with every body without restriction, which enables them to cultivate their minds, and to acquire that polish, which afterwards contributes to improve the manners of their young men; for, as it is one of the chief points of female education, in these happy isles, to learn the great art to please, they are instructed in all the means of gaining

the affection of the males, of studying every winning art, and of habituating themselves to that sweetness of temper which never fails to merit the return of attachment, of friendship and love. Their frequent songs, their dances, their innocent laughter, and humorous mirth, all conspire to make the most lasting impressions upon the youths of the other sex, and to cement an union which is dissolved only by death. (1778:422)

From all the foregoing we may conclude that the Maohis, like most of mankind, valued males more highly than females: for example, males enjoyed more intimate relations with deities, engaged in more prestigious activities, were subject to fewer food restrictions, occupied higher-ranking Titles, and were allowed to survive at birth more frequently than females.

Several of the sources attest to this sex disparity in infanticide.

It appears, that a far greater number of females than males fall a victim to this national depravity. This may be imputed to two causes: in the first place, it has been invariably so practised by their ancestors; and secondly, the greater difficulty and restrictions which are required in bringing up a female than a male. (Turnbull 1813:363)

In the perpetration of the unnatural crime of infanticide, boys were more frequently spared than female children, solely with a view to their becoming warriors. In all our schools, we were surprised at the disproportion between the boys and the girls that attended, and at the small number of women in the adult population; and on inquiring the cause, were invariably told that more girls than boys were destroyed, because they would, if spared, be comparatively useless in war. (Ellis 1829:II, 495-496)

Turnbull's assertion about the greater difficulties required in bringing up a female, referred mainly to those derived from food taboos, which, it will be recalled, involved not only separate eating but in some cases even separate production and preparation. As implied earlier, we do not know how far down the class scale these taboos obtained, but they were undoubtedly applicable at the top. Gunson proposed that they were more or less minimal: "in the Tahitian family, only the mother could gather food for the daughters and this labour could not commence until after midday" (1964:58). The Reverend James Elder, who was the missionary surgeon at Tahiti, stated that the rearing of a female child often put an end to the mother's social life because of the "inexpressible burden" placed upon her. This, he believed, explained the high rate of female infanticide.

There was not any temptation to destroy a Male Child, as the father could provide him with food. There was an exception to this, rigid, and inhuman Custom. Some few Men, consented or were compelled, to be degraded, to provide food for such females as were of the Royal Family, but this was the only exception. (Elder to Waugh, Australian Letters 10 March 1824, LMS Archives)

The statement about "degraded" men referred to the males who served as domestics for *ari'i* women and who were thereby rendered *noa* in terms of religious ritual.

In spite of the above, however, females were in no sense of the word regarded as “chattels”; in many instances they, or their sexual, reproductive, and domestic services, were deliberately “circulated” more often than males, but one has the impression that most Maohi women enjoyed a large amount of freedom, both in choice of mate and in license to disengage from an onerous marriage. In this connection, the LMS Dictionary contains words which may be glossed as ‘rape’, but I can find no evidence of its widespread practice: *‘u’umi*, to strangle; to force a woman against her will, stopping her mouth; *māfera*, to take advantage of a person of the other sex when asleep.

This summary of Maohi beliefs and rules regarding male-female attributes, and relations between males and females, would be incomplete without recalling the ambiguous role categories of *mahu* and of females’ male domestics. The former were outright and presumably permanent transvestites in nearly all behavioral respects. The latter may have included some true *mahu*, as well as some individuals only temporarily in the domestic employ of highly placed women, and as such too *noa* for religious activities but otherwise dressing and acting like ordinary males; the sources are somewhat unclear on this point. In any case, the very existence in Maohi society of these sexually ambiguous roles, and of the seeming tolerance and even respect for individuals occupying them, is a structural feature to be noted and to be looked for in other sets of social relationships.

AGE

In attempting to reconstruct Maohi concepts regarding the attributes associated with aging, I face the same difficulty met when generalizing about maleness-femaleness: namely, whose opinions are to be invoked? Presumably not all old people looked upon themselves as doddering nuisances, and not all youths considered themselves to be foolhardy irresponsibles; but widely voiced stereotypes of this kind did undoubtedly color many self-views.

As previously noted, the Maohis did not measure the human life span in terms of years or other cyclic periods. They undoubtedly gauged an individual’s aging by means of innumerable maturational changes, both anatomical and behavioral, most of which seem to have occurred quite gradually. For females, even so delicate a sign of maturation as the onset of menstruation does not appear to have elicited special social recognition, although the appearance of pubic hair was accepted as readiness for reproduction:

When we were the second time at *O-Raiede*, the chief of *O-Tahà*, called *Bobà*, came frequently to visit us; one day being on board, he saw his sisters coming towards the ship in a canoe, and pointing to his younger sister, desired me as soon as she came on deck, to say to her, *Veheina-poowa* [*vahine pua*⁸]; I did so, not knowing what would be the consequence, and her elder sister immediately

lifted up the garments of the younger, shewing that she had the marks of puberty. When she had done this two or three times, she refused to go through the same ceremony again. I then enquired more carefully into the meaning of this transaction, and learnt, that in these isles, it is a kind of reproach, or want of dignity not to be of age and to be destitute of the marks of puberty. As soon as they appear, the young women are obliged to undergo a very painful operation, viz. to have large arched stripes punctured on their buttocks: these curious marks are reputed honourable, and it is thought a mark of pre-eminence to be capable of bearing children. If therefore a man should reproach the person with the deficiency of these marks, she cannot in honour avoid refuting it by ocular demonstration. The origin of these strange customs, it was not in my power to investigate. I contented myself therefore with collecting and recording the fact. (J. Forster 1778:433-434)

In the case of males, supercision and most tattooing did take place after the early years of childhood and before full attainment of physical maturity, but neither set of operations was precisely timed to coincide with any visible or conceptualized point in physical maturation. As for the rites of *āmo'a*, head freeing, these began during infancy but were not completed until marriage in some instances; and in any case, the various episodes of progressive head freeing were not timed to coincide with, or to mark off, socially recognized stages of the physical life cycle, although they did of course constitute steps in a ritual progression, whose meaning we may not have fully penetrated.

One obvious source of information about Maohi age classification consists of the following definitions recorded in the LMS Dictionary:

'aiū, [*'ai*, to eat, and *ū*, milk] a sucking child; an affectionate term for a young person.

tama, a child, male or female.

taure'are'a, the young, healthy, and vigorous of the people.

pa'ari, mature, old, ripe, hard; wise, knowing, skillful, cunning.

ru'au, old, stricken in years; an old man or woman.

'Aiū appears to be the fairly unambiguous term for a definitely recognized stage of life, as does *ru'au*. In present-day Tahitian usage *tamari'ira'a*, *taure'are'a*, and *pa'arira'a* can be translated 'childhood', 'youth', and 'maturity', respectively, and it is tempting to assume that these words carried those same successive life-stage meanings two centuries ago, but the sources contain no positive evidence that they did so. The only concrete verbal evidence I can find bearing on this question is a textual passage concerning a physical struggle between the God Atea and his son Tane; when Tane challenged Atea the latter replied: E Tane e, e hia Atea ia 'oe? (O Tane, can Atea fall by thee?) E *tama'iti* Tane, e *matuatua* ovau. (Thou [Tane] art but a *lad*, but I, Atea, am a *vigorous elder*.) (Henry 1928:455, italics added)

With or without lexical confirmation, it is my impression that the Maohis

did divide the life span, conceptually, into five stages, which we can call infancy, childhood, youth, maturity, and old age.

Infancy

The prevalence of infanticide among the Maohis is well established, but, as I have shown, those infants permitted to live were objects of careful nurturance and physical conditioning, warm familial affection, and ritual attention. Even the hypercritical missionaries recorded few instances of outright neglect.

I have already described the pains taken by parents or nurses to mold an infant's head, nose, and fingers into desirable shapes—for reasons of cosmetics and general physical welfare. Whatever may have been their indifference to human life in general, and however superficial may have been the "emotions" so expressed, most Maohis appear to have taken delight in fondling babies. And the ritual attention accorded infants has been noted in connection with restraints surrounding some young Maohis prior to completion of their head-freeing rites. In this connection, as will be described later, kin-congregation Titles devolved upon successors shortly after their birth, and even though the actual authority inherent in such Titles remained for some time with the former incumbents, the ritual prerogatives associated with them were transferred on that occasion to the new Titleholder.

Childhood

By literal definition Maohi infancy (breast-feeding) would have ended when the child was weaned, but we have no way of knowing when weaning took place or how it was brought about. In any case, once they had become independent of the breast and able to move about, Maohi children appear to have been left much to their own devices. Perhaps this occurred in many instances because of parental preoccupation with a new baby, but whatever the reason, children past infancy were by some accounts wide-ranging little creatures with minds, wills, and diversions of their own. Exceptions were successors to high-ranking kin-congregation Titles (and in some known instances their siblings); such children were subject to many restraints on their physical movements.

As I noted earlier, some writers described Maohi children as having been utterly undisciplined—the latter due mainly to the circumstance of early kin-Title transfer; but such an explanation could apply only to bearers of kin-Titles of relatively great social consequence. As for Maohi children having been unconstrained, there is ample evidence that much of the time most of them were left free to roam about and play (including sexual play), but some places (such as marae) and some occasions (such as council meetings) were clearly out-of-bounds to most of them. Also, though none of the

sources specifically described such practices, I am quite sure that some of the energies of most children must have gone into acquiring, through imitation and practice if not through specific instruction, the fundamentals of many work skills. (That is to say, I simply cannot accept the proposition that in a subsistence economy like this one, children took *no* part in subsistence activities. And it is reasonably certain that older siblings were required to look after younger ones, especially when new babies arrived to engross their mothers' attentions.)

In terms of their movements, it will be recalled that many Maohi children were transferred from their natal families and attached to other families, for varying periods of time and degrees of jural finality; but this does not mean that life in the new setting was necessarily any different for the child.

With no explicit Maohi statements to draw upon concerning the attributes of childhood, one can only make inferences from the kinds of evidence summarized above, and that is not easy to do. From the degree of freedom allowed children one might infer that their elders regarded them not as helpless little pathetics wholly dependent upon others for welfare and guidance, but as competent though incomplete humans who would in due course, and by one means or another, manage to become complete. On the other hand, the fact that children were generally classed with females in matters concerning religious ritual might imply a social appraisal not only of "incompleteness" but of a more basic inconsequentially as well—against which, however, is the conceptualization of their greater sacredness as implied in the necessity for head freeing.

Youth⁹

For girls the transition from childhood to young womanhood was fairly sharply defined. To recall a statement of Morrison's,

The young females are more remarkable for bearing [tattooing] than the Males tho they cannot suffer more then one side to be done at a time and the other may remain perhaps for a Twelvemonth after before it is finishd, till which time they never Conceive themselves Company for Weomen—being only Counted as Children till they have their Tattowing done (Morrison 1935:221).

As I recorded earlier, estimates varied concerning the age at which a girl's tattooing was begun, but J. Forster was likely correct in his statement already quoted, that the operation was started "... as soon as they [i.e., "the marks of puberty"—presumably the appearance of pubic hair] appear." In this connection one also recalls Morrison's observation that "in these isles, it is a kind of reproach, or want of dignity not to be of age, and to be destitute of the marks of puberty" (1935:433-34).

For boys the transition from childhood to youth also coincided with tattooing and with supercision, but the tattooing process was typically spread

over a considerable period, and neither operation seems to have been synchronized directly with the appearance of any physical "marks of puberty." (It should be recalled that Maohi norms did not require young people to postpone sexual activity until after tattooing or tattooing and supercision. Exceptions occurred in the case of girls of certain Title-holding families, whose sexual activity was proscribed until marriage, which presumably occurred some time after tattooing in most instances.)

The "public reproach" reported by Morrison to have been leveled at the untattooed or unsupercised male presumably referred to males who were otherwise considered to be past childhood—however "otherwise" may have been defined.

The process of fattening (*ha'apori*), and of the usually attendant skin bleaching, was as already noted a regimen practiced by persons of all ages, but it was particularly characteristic of youth, when it served, among other things, to enhance the subjects' sexual attractiveness.¹⁰

In fact, all three of these practices—tattooing, supercision, fattening—suggest that the Maohis considered heightened sexual activity to be prime attributes of youth: qualities not only inevitable but appropriate and desirable.

Youth was also considered to be the ideal time for participating in other diversions as well—singing, dancing, athletic contests, touring, adventuring; in fact the literal meaning of *taure'are'a* (which the LMS Dictionary defines as the young, healthy, and vigorous of the people) seems to be *tau*, season; *re'are'a*, joy, gayety, mirth.

On the other hand there are numerous indications that young people were expected to work, and to work hard, although many of the tasks they engaged in, such as collecting wild plantains or bird feathers, group seining, and bark-cloth making, were conducted more in the mood of adventure and congenial sociability than of onerous toil. The legend of Punaauia contains an episode bearing directly on the segregation of work groups made up of young unmarried women and married matrons.¹¹ The story concerns the tribulations of a beautiful young Tahitian "princess," Pereitai, who was sent to Ra'iatea to forget an unhappy love affair—that is, one with a commoner, who was slain for his presumptiveness in courting an *ari'i* maiden. At Ra'iatea, Pereitai was consoled somewhat by marriage to a young "high chief" and by giving birth to a daughter. Miss Henry's romantic and perhaps somewhat too free translation continues the story:

When the child was about six months old, the season for beating out tapa cloth arrived and all the women of the land were busy in the pleasant work. It was the custom for matrons to form groups for such work apart from the young maids, and the song of the tapa [bark cloth] mallet was everywhere heard in the cool morning hours. The Tahitian princess had not yet joined any of these parties, but one day seeing some young women, who had newly come from a neighboring island, hap-

pily working in a shady nook by a rippling stream, she decided to get some cloth bark and join them. They were all unmarried girls, and seeing her young like themselves approaching them, they very readily made room for her, and she united with them in work and song; and so moments flew, until they beat out long sheets of beautiful tapa from their tapa boards and spread them out in the sun to dry.

The following morning, leaving her child with her nurse as she had done the day before, Pere-i-tai again went to work with her new and congenial friends. But meanwhile, the child, who had been sleeping, awoke and cried inconsolably, so that the faithful Rohi-vahine, sent Pere-i-tai's brother, Mata'irua-puna to fetch her home, which he did promptly. Pere-i-tai had been informed that her companions were all single girls, but not wishing to break the circle in the morning's work she chose to remain and finish her part with them, intending to retire from their midst gracefully and not return again. During an interval when the mallets ceased to beat and the song had also ended, Pere-i-tai distinctly heard the voice of her brother shouting:

'Pere-i-tai, ua ara o aiu!' (O Pere-i-tai, the child is awake!) Hoping that he might not find her, she kept quiet and soon resumed her work, which would shortly have been finished.

The brother passed different groups of tapa beaters but not seeing his sister, he went on his way, continuing to call, until at last he perceived her in the distance and ran up to her quite unconscious of being indiscreet. As he did so, all the young maidens looked up in astonishment, first at the lad and then at their beautiful companion, who in her confusion was speechless. Mortified in the extreme, Pere-i-tai abandoned her work and the group with whom she had been so happy and went her way shedding tears from chagrin at being thus exposed to the ridicule of strangers, her brother following her astonished at her emotion, and not understanding it.

She went home, quieted her child, and leaving her once more to the care of her nurse she went to Fa'aroa (Long-valley), not far off, and sat weeping upon a great stone at the point called Te'ora'a-otaha (Digging-of-the-man-of-war-bird), and numerous white spots upon that stone are known to this day as Pere-i-tai's tears. Thither also her brother followed her, and avoiding him she arose and is said to have plunged into a dark hole at the side of the river, which led down to the netherland, where some of her ancestors dwelt. (Henry 1928:604-605)

After a year in the netherland, she and her brother returned to their original home in Tahiti, where her husband and child subsequently joined her to live "happily ever after" (in the inevitable happy-ending style of such Maohi stories), for under no consideration could she be persuaded to return to Ra'iatea, "*... where she had met with such humiliation.*" (Henry 1928:607, italics added)

This episode provides interesting documentation of the existence of age- (or, rather, life-stage) segregated work groups, but it is the only indication that I can find that such segregation was so strict as to move an individual to near-suicidal humiliation at having been discovered working with an inappropriate group; in fact, this aspect of the episode raises intriguing questions for which I can supply no satisfactory answers.

Training in specialized skills may in many instances have begun during childhood, but was probably more characteristic of youth; this might be

taken to imply that in Maohi ideology educability was a distinguishing attribute of this stage of life.

Maturity

Marriage undoubtedly constituted some kind of change in most individuals' activities, but it was probably only the first step in a very gradual transition from youth to the next stage of life, which I have labeled maturity. More likely, individuals did not complete the transition until after the birth (and survival) of a child or two, when the undertaking of marriage and the responsibilities of parenthood must have discouraged youthful ways.¹² Eventually, of course, the inevitable decrease in physical exuberance and in sexual attractiveness would of itself have brought about a retirement from "youthing," but dependent offspring probably hastened the transition.

Females reached a high point in their lives during their youth, when their favors were courted by many males; but most males probably reached their prime only after youth and before old age. I refer here to climaxes in technical skills and social influence, not to focus of ritual attention. The several but related meanings expressed in the word *pa'ari* testify to the belief that wisdom and knowledge and cunning were in part a function of age—at least until offset by senility.

Old Age

To Maohis, physical decrepitude was the principal mark of old age; associated with it was the disappearance of most of the more valued attributes, including those entailing respect, authority, and even physical care. Some old people managed to maintain a degree of social influence through continuing success in some profession—priestly, shamanistic, craftwork—or by sheer force of personality; but for most the final stage of life was, by all the evidence I can piece together, a painful anticlimax.

From these and other data I can draw several inferences about how the Maohis conceptualized and actualized social relations between persons in terms of their equivalent or disparate ages.

Terminology. In addition to the terms for life-stage already given, the only Maohi words I know of referring directly to the contrast older-younger were those applied in the case of siblings of the same sex. (See chapter 16.)

Time. Disregarding infancy, when babies of both sexes necessarily spent most of their time with females (i.e., female relatives), during the period of childhood (*tamari'ira'a*) boys and girls spent many of their waking hours playing in each others' company, and this was presumably regarded by their elders as normal and appropriate. Later, however, during youth

(*taure'are'a*), there was a much greater degree of sex segregation. Young men spent most of the daylight hours in the company of each other or of other men; and young women did likewise. Young males and females met together on occasion to dally and dance (work habits did not ordinarily combine both sexes at this stage of life), but it was generally assumed that deliberate encounters between a young man and a young woman could only be for purposes of fornication (I exclude of course encounters between siblings or other "close" relatives on domestic business). Still later in life, during maturity (*pa'arira'a*), interaction between nonkin males and females was perhaps even less frequent: daily occupations did not ordinarily bring them together and opportunities for joint, public diversions were exceptional. Finally however, there were apparently no public restraints upon old men and old women spending their declining years gossiping and reminiscing in each others' company, but whether they actually did so is not reported.

Space. Aside from the examples just noted, indicating that coevals tended to congregate more closely than persons of different life stages, I can find little evidence of any general supposition or norm about specific age-determined spatial positioning among interactors. Infants and children were classed with women as *muri* (behind) in relation to older males as *mua* (in front), so that this form of positioning had to do with age *and* sex.

Governance. Rules regarding succession-order to Titles exemplify the general notion that older should take precedence over younger in terms of ritual acts and of the exercise of authority, and this general proposition prevailed not only regarding authority among siblings but probably extended to older members of most groups of coevals. In fact, until senility claimed a person, and made age become more of a liability than an asset, the principle of seniority shaped most social relationships unless overruled by considerations of Titleholding.

Transactions. Within particular social units—families, households, neighborhoods of kinfolk—opinions undoubtedly prevailed to the effect that all members ought to succor the infants and helpless children, and perhaps to some extent even the aged members as well. Otherwise, one can infer from numerous kinds of evidence that transactions between younger persons and those considerably older conformed to a general formula of relatively unskilled services in exchange for objects or more skilled services. I suspect, but have no basis for asserting, that in any such exchange the younger party had the conventional expectation of receiving less than he contributed.

Emotion. Factors of kinship, Title rank, and so forth, served to complicate this matter intricately, but there appear to have been widespread expectations that the very young were to be tolerated affectionately, and the very

old to be dismissed with disrespect bordering on contempt. I suspect also that children and young persons were expected to behave with some deference to their nonsenile elders, as inferiors to superiors, but I cannot find explicit evidence, linguistic or otherwise, on this point. In fact what impressed (and scandalized) most observers was the unruliness of children, including many instances of disrespect for their parents, but perhaps such behavior did not actually extend to elders in general.

I have already noted several instances of the sanctions that served to reinforce norms for age-linked behavior; these ranged from the "public reproach" leveled at untattooed or unsuperficial youths to the death meted out to the lad who interrupted a marae ceremony. And conversely, I will draw attention to the preoccupation of many older persons with "youthfulness," as exemplified among the Arioi, and to the disesteem shown toward the aged because of their decrepitude. Yet, I have found no evidence that individuals were either rewarded or penalized for acquiring and practicing skills normally associated with persons older than themselves. And, in the few stories describing such encounters, there was no action taken one way or the other on the basis of age differences alone to requite youths challenging elders, or vice versa.

CHAPTER 16 *CONSANGUINITY:
COMMON-DESCENT
UNITS*

COMMON DESCENT

No constituents of Maohi social structure are more preponderant, and certainly none more baffling, than the kinds of relationships approximating Western concepts of “kinship.” The sources contain some data about specific dyadic relationships—for example, “brothers,” “sisters,” “brother and sister,” “parent and child”—but information about relationships of more remote “kinfolk,” and about larger aggregates of “kinfolk,” remains largely inferential and obscured in the sources by undefined or inconsistent use of such terms as “relation,” “family,” and “clan.” Presumably authoritative (LMS Dictionary) definitions of native terminology do not help to clarify kin relationships. For example:

‘abu [apu], the shell of a nut, gourd, or fish; a concave or hollow, as *abu rima*, hollow of the hand, *abu roro* or *abu upoo*, the skull; a fraternity or family, as *abu arii*, the royal family, *abu atua*, the race of gods.

fēti’i, a family; the relations of a person; to tie or bind; a binding or knot.

hiva, a clan, the company in a canoe.

natimo’e, a family or kindred. (Cf. *nati*, a class, or distinction of men, as *nati arii*, the class of superior chiefs; *moe*, sleep; to sleep, also to lie down. [Hence, people who sleep together(?).])

pirita’a, a relation by consanguinity, or by affinity.

hui metua, [literally, a set of parents] elder members of the family, parental clan (Henry 1928:184).

Of course, these terms may have had more specific referents which the missionary lexicographers simply did not understand, but these referents now remain beyond discovery. We cannot confidently rely on modern usage in a search for pre-European meanings—particularly with respect to kin relationships, which have been under such powerful alien pressures to

change. One thing does, however, emerge from the available data, and that is the crucial importance of descent.

The Maohis in general may have been quite casual about sexual intercourse, and unable (or unwilling) to guard against conception during coition, but reproduction was to them a matter of great consequence, and the social ties resulting from it, or modeled upon it, surpassed all others in jural weight. Moreover, the Maohis understood enough about the physiology of reproduction to realize that it required both female *and* male to produce a child; and parallel with this knowledge was the practice (whenever possible) of according social recognition to ties with and through both a female parent *and* a male parent, although not necessarily with the child's own (supposed) genitor. In other words, the bilaterality of descent was socially recognized; descent itself, however, was subject in part to social definition.

In the first place, if a child's genetrix did not want it to survive and be a descendant (*huā'ai*),¹ she either aborted it or killed it immediately after birth, with or without the consent of its supposed genitor. If the child's supposed genitor did not want it, it was usually within his rights and power to kill it at birth. In some instances the killing of a child was decided upon by kinfolk of either or both parents, and against the wishes of the latter, but the result was the same. Interested third parties occasionally made efforts to prohibit coitus between individuals in order to guard against progeny unwanted for some reason or other; as previously noted, however, during coitus itself the principals appear not to have taken measures to avoid conception. Underlying infanticide, which was a common occurrence among the Maohis, there appears to have been both a proposition regarding descent and a norm regarding parental duty. The proposition which seems to me implicit in these customs is a belief in the "reality" of biological reproduction—that is, *something* of each parent was believed to have gone into the composition of a child, something of each of what Westerners would call "physical" and "spiritual" (or "mental," or "psychic"). (See chap. 13, section on conception.) The norm associated with this proposition is equally inexplicit, but putting together a number of observations and inferences, particularly with regard to the rationale of infanticide, I think we can discern a moral imperative to the effect that any and every child allowed to survive had some claim, in terms of objects and services, upon its biological parents. The weight accorded these claims varied widely—with respect to the offspring's sex, birth order, class—and occasionally some fathers may have explicitly disavowed such claims; but even the disavowal in a sense constituted acknowledgment of the general validity of the norm. I have come across no instance of a woman refusing to "acknowledge" one of her progeny, although there are legendary accounts of a mother (and a father) discarding an offspring born in the form of a "shapeless

clod”—which, significantly, survives and becomes a heroic figure (see the legend of Honoura and Maui). I do not of course suggest that all Maohis were conscientious about fulfilling their parental duties, the nature of which will be described later on, but I am now discussing not performance but a norm.

In stating that some fathers may have disavowed their progeny's claims, I refer mainly to the possibility of this having occurred. Actually the only recorded example that I know of is legendary, as set forth in the story of Mo'otuaraha:

There was once a bachelor chief in Papeno'o whose name was Pai-ti'a (Correct-judgment). He went with some of his people into the valley for timber for a canoe. They chopped down a fine tree and prepared it for further work, when evening came and the men dispersed to return to it on the morrow.

It happened that in descending into a ravine on his way home, the chief lost sight of his men, and suddenly he saw across his path a great lizard, of which he had never heard, named Mo'o-tua-raha (Lizard-with-broad-back). It was a monster of the feminine gender, begotten of human beings, and becoming enamored with the chief she charmed him so that he became spellbound and seemed to live long in bliss with a beautiful being, although in reality it was only for an hour before nightfall. When he came to himself, Mo'o-tua-raha was gone. Pai-ti'a went his way bewildered, not remembering his first encounter with the strange creature.

The canoe was completed, and the lizard, living in strict seclusion, gave birth to a son, who became the exact image of Pai-ti'a, whose name she gave him and whom she taught to call father, for she could act and speak like a human being. When he was about fifteen years of age there was a great feast in the land, and the different clans went in procession to present themselves before their chief, mentioning their pedigree. Being taught by his mother what to say, the lad went also, elegantly dressed, wearing a girdle of the smooth, glossy skin from off the under side of his mother, and presented himself, saying,

"I am Pai-ti'a, your son." This caused the chief and all the assembly to look amazed, and the chief replied:

"I have no son. Whence do you come?" The boy said:

"Do you not remember what happened in the valley when you were making a canoe?"

"No," replied the chief. "I have no wife and you are not my son." Then the people exclaimed:

"He must be your son, O our chief; for see how he resembles you!" And what was the man's humiliation when the boy added:

"I am your son by Mo'o-tua-raha, whom you met in the ravine when you were returning home from your work at the canoe."

Light then flashed across the chief's mind, and he almost sank to the ground with mortification at this revelation before all his people, especially the nobility, who prided themselves in their unbroken aristocratic lineage. This blighted the festivity; the chief could not give the son of a lizard a place in his family, nor would his subjects have recognized such as a chief to rule over them. So the poor lad, dejected, returned to his mother and told her all that had happened.

Very soon after this commotion, Pai-ti'a, feeling his humiliation, went away to Tetiaroa, the favorite watering place of the royal family and the poor lizard, hearing of it and still wishing to obtain favor for her son, swam across the ocean to go and plead his cause. But when the chief saw her approaching the reef-bound

coast of the atoll, horrified, he sent his attendants to kill her where she was; and just as she was grappling the rocks to get up, she received a death blow upon her head with a stone. There she lay, her skeleton remaining long afterwards close against the shore of Tetiaroa.

It is said that descendants of the despised son of Mo'o-tua-raha are still living, although now they cannot well be traced. (Henry 1928:622-623)

There are of course many recorded instances of men denying paternity, but that is a different matter altogether. I cite Morrison to support my own conclusion that a child of unspecified paternity would have been socially disadvantaged in this bilaterally oriented society, no matter how well he was treated by maternal or foster relatives:

... as it is deemed highly reproachful for a Child not to know who his Father is ... when they are Pregnant with a Child of which they know not the true Father, to prevent its being treated with Indignity in its passage through Life (and as it could have no inheritance without a Father) it is no sooner born then some one strangles the little innocent and burys it. (Morrison 1935:234)

Morrison was referring specifically to Ariois, but his conclusion regarding the disability of being "fatherless" was probably applicable generally. In case it may be objected that this conclusion does not accord with the following statement by de Bovis, I point out that the latter was describing performance and not jural principles. Also, de Bovis' statement seems to refer more specifically to the 1830s, by which time the indigenous social structure embodying the jural principles I speak of had greatly changed:

Illegitimate children or those of adulterous unions were never the objects of baneful prejudice, having been welcomed as fully as all others. A husband may have been so jealously enraged by his wife's infidelity as to kill her; nevertheless, once children were born most husbands tended to treat them with care and affection even if they knew them to be not their own. And while one can find exceptions to this tendency, one can also cite cases in which the offspring of notoriously adulterous unions have been treated [by the mother's husband?] with lavish attention. It is fortunate that such was the case; for if a child's "legitimacy" had been viewed as we in our civilization view it, the unbridled sexual license which prevailed among these people would have resulted in an incalculable amount of misfortune and bad feelings. (de Bovis 1909:32)

As we shall see, adoption (*fa'atāvai*) served to invest the adoptee with most of the rights and duties normally accruing to known (in the case of the mother, supposed and acknowledged in the case of the father) biological offspring, but it is clear that the Maohis distinguished between the two, as is expressed in the following: "Eiaha roa 'ia 'mo'e iā 'oe te *toto* fēti'i ho'e, e tō fēti'i *fa'atāvai* hia. Do not lose from view your *blood* relatives, nor your relatives by *adoption*." (E. Salmon 1937:29)

The gaps in our information about Maohi notions of conception make it impossible to decide whether this reference to "blood relatives" was merely metaphoric or based on an explicit idea that the blood of a fetus was actu-

ally derived, in whole or in part, from its parents. In any case, the reference to “blood” just cited—whether or not it is metaphoric—prompts me to label such relatives *consanguines* (in contrast to *adopted kin*, and to *affines*). The parallel usage in common, nontechnical English also contains elements of metaphor and of folk-science.)

As we shall see, in general more social weight was accorded patrilineal ties than matrilineal ones, but the Maohis were less extreme than many other peoples in weighting one parental link over the other. In fact, there is evidence for a very widespread belief that *all* persons related to someone by ties of descent—lineal or collateral—that is, all *consanguines*, constituted with respect to that person a kind of social category for which the expression *te mau fēti’i* [the (plural) relations] of such-and-such a person or set of full siblings’ may have applied. (Henceforth, *descent*, *son*, *daughter*, and so forth, will stand for *socially* recognized relations unless specifically qualified by the adjective *biological*.) But probably never did all or even most of the members of any such category interact as a separate group, or enjoy joint ownership in any particular property, or function in any other way as a unit. Events such as births, marriages, or deaths mobilized numbers of the principals’ consanguines (along with affines and nonkin neighbors), and at marriages some consanguines of the bride and some of the groom functioned ad hoc as distinct social units; but there is no information concerning the social boundaries of such units.

The phrase, *firifiri’aufau*, to trace [*aufau*] a person’s ancestry (LMS Dictionary),² implies a concept of “lines” of consanguines, and this is amply exemplified in genealogies, which constituted such important verbal documents to the Maohis. A passage from the “Precepts of Tetunae” suggests that the verbal root *firi* may have had a somewhat broader meaning: “Eiaha ho’i tō’oe mata ‘ia fāriu ‘ē ite ‘ati o tō’oe *firi’a feti’i*. Let not your eyes turn away from the troubles of your ‘line of relatives.’” (E. Salmon 1937:29)

Other manifestations of the conceptualization of lineal descent are exemplified in the words

te iho ari’i, which Emory translated “the chiefly line” (Emory, Marae Traditions).

ta’ahiaufau, to treat with contempt any one’s ancestry, or fraternity (LMS Dictionary).

titoropa’ahoi, to heap upon a man the various crimes of his ancestors (LMS Dictionary).

Also, the “lines” comprising the incumbents of certain high-ranking kin-Titles were symbolized in the form of feather girdles (*maro ura* and *maro tea*)—that is, a new lappet was added to the girdle upon the investiture of each new incumbent (Henry 1928:189).

There is also lexical evidence (LMS Dictionary) for conceptualization

of a kind of social category made up of all persons descended from some particular ancestor (i.e., a cognatic stock):

huia, the suckers of the *pia* plant [arrowroot]; a parent with his descendants.
 ‘*ati*, a *patronymic prefix* pointing out the name of the parent or ancestor with the descendants, as *Ati Iuda*, the descendants of (their father) Judah.

Other words listed in the LMS Dictionary suggest the conceptualization of segmentary units of consanguines. For example:

aveavefēti’i, the several branches of a family.

aveave, the long feelers of the *fee[fe’e]* or cuttle fish; a tassel or ornament appended to a bow; the tail or train of a gown.

aveaverau, a speech that has many bearings.

pao’aora, applied to a family when the different branches of it are all alive.

pao’apohe, a family that becomes extinct in its several branches.

(Assuming these to be compound words, *ora* [life, health; to live, to be healed] is quite clear, as is *pohe* [death; to die], but *pao’a* is puzzling.)

pirifetau, a stranger or alien; an outer branch, not rising out of the proper trunk.

Unfortunately I have not come across any evidence, textual or otherwise, that indicates precisely the kinds of units these terms may have referred to—if indeed they had precise referents, which may not have been the case.

A statement by Handy, based on information received by him from “Queen” Marau, implies that the Maohis distinguished between senior (*matahiapo*) and cadet (*teina*) branches of any common-descent unit: “*Matahiapo*: first born, male or female. Also applied to all representatives of a family stock descended in the line of first-borns. Thus, if I belong to a *matahiapo* family it means that at least one parent was a first born right back to Taaroa. My first born will carry on the *matahiapo*. All others are *teina*.” (1930:23.) Handy did not, however, explain what he meant by “family” or “stock,” and the ambiguity is increased by his definition of *teina*: “*Teina*: younger brother for male, younger sister for female. First cousins of younger rank. I am a *matahiapo*; all cousins not *matahiapo* are my *teina*.” (1930:23)

Some confirmation of this kind of segmentation is provided by a traditional account of the structure of Huahine society, which will be reproduced later on, but from these sparse references the distinction seems to have been only between the senior-line segment and all other segments, and not between any two of the latter relative to the birth order of their respective sibling eponyms.

In addition to these meanings of “firstborn” and “younger” (or “later-

born"), respectively, *matahiapo* and *teina* undoubtedly had other referents, and it is reasonable to assume that they may have served to distinguish between senior and cadet segments of any common-descent unit; but it is not at all clear what the composition of such segments was conceived to be. Did a *matahiapo* segment, for example, consist only of the sons and daughters of a parent who himself (or herself) was the eldest offspring of a line of eldest offspring leading "right back to Ta'aroa?" Or did the term include all offspring of all the offspring of an eponymous eldest sibling, and so on? The first case concerns in part the concept of "lines" noted above; the second case concerns a far more inclusive kind of segment, that is, a cognatic stock.

As with analysis of any society's structure, one can discuss bounded social units in terms of membership and structure, or one can take a hypothetical individual as a starting point and attempt to describe how he (or she) relates to all other individuals in his social universe. One strategy may be better than the other for particular purposes, but neither is necessarily "truer" to Maohi thought. In connection with consanguinity I believe that the Maohis thought about their relationships in both ways.

I do not know what part (strictly) genealogically defined units or sub-units were conceived as playing in Maohi life. Were they *groups*, whose members interacted periodically and exclusively? Or property-owning units? Or both? Or were they mere conceptual categories of consanguines without further attributions? From the evidence available it is not possible to answer these questions. On the other hand there is ample evidence that the Maohis not only conceptualized but also actually banded together in social units of co-worshippers, consisting of a core of consanguines and their spouses, along with individuals adopted into the units.

KIN-CONGREGATIONS

When "thinking" in terms of consanguinity most Maohis undoubtedly "related" themselves to numerous specific individuals, to own or distant "father," to some "mother's" own father or some "father's" own mother, and so forth. In addition, many Maohis appear to have conceptualized this aspect of their society in terms of numerous categories of consanguines—including narrow descent "lines" reaching back many generations into the mythical past, and segmented common-descent networks varying widely in span, in genealogical depth, and in size.³ Genealogy, remembered or fabricated, provided the framework for these categories, but the thing that did most to make cohesive groups out of any of them was common association with some "family" marae.

As I noted earlier, marae were structures set up "... to receive the gods in a befitting manner" (Henry 1928:429): they were places set

aside for more or less periodic and formal interaction between humans and spirits. As such it is possible to classify them according to their size, architecture, and spirit affiliation; in line with our present interest it is also possible to classify them according to the kinds of social units that comprised their regular congregations. It was a characteristic feature of Maohi society that nearly every social group of any permanence was at the same time a congregation, with its own tutelary and marae. But the only "social-unit" classification of marae I can discover is that of Henry, who typed them as follows:

Domestic: family, or ancestral [*marae tupuna*]; social [*marae o te va'a mataeina'a*]; doctors' [*marae tahu'a ra'au*]; canoe-builders' [*marae tarai va'a?*]; fishermen's [*marae o te feia tai'a*].

Those of *public* importance: local [*marae mataeina'a*]; national; international. (1928:119)

I am not at all convinced that this is an exhaustive or accurate classification in terms of Maohi thinking, nor is it entirely intelligible in terms of my analytical notions about Maohi society. That occupational specialists often had marae of their own is fairly certain and wholly comprehensible, but why Henry should label these "domestic" is unclear. Also, it is undoubtedly true that some marae were more "public" or more generally "important" than others, but Henry's sharply drawn distinction between "family or ancestral" and "social" marae is less understandable, as is her distinction between "local" and "national." The case for her "international" type of marae is clearer, as I shall later indicate.

To leave unstated a number of assumptions, to anticipate subject matter that will be discussed later on, and (an ethnographic heresy!) to ignore for the moment Henry's alleged native labels—I find it analytically useful to classify marae according to whether membership in their congregations was based primarily on kinship, or on tribal affiliation, or on cult commitment, or on occupational specialization. (Note the qualifying word *primarily*, since none of these categories is entirely exclusive.)

I classify under the label of *kinship* those congregations made up primarily of individuals interrelated by close ties of consanguinity or of affinity. Such congregations ranged in size from nuclear or small composite families occupying single households to populous units comprising several households (along with some close consanguines who for one reason or another resided elsewhere). In this chapter I will be concerned mainly with *kinship* congregations, but to sharpen the distinctiveness of this category I will characterize the other three.

A *tribal* marae had for its congregation all the residents of a particular territory, or better, all the subjects of a territorial (i.e., *tribal*) chief. Usually such a congregation was formed around some one kinship unit, but it con-

tained some members who had no recognized kinship ties with it or whose membership was based more on their place of residence than on the nature of their kinship tie.

An *occupational* marae had for its congregation one or more craftsmen who conducted activities there for the specific purpose of achieving success in their particular occupations—fishing, canoe building, healing, and so on. The members of such a congregation were usually neighbors, and in many cases were probably kinsmen, but most of their activities at their marae had to do with pursuit of their occupations.

A *cult* marae had for its congregation devotees of some god not exclusively associated with any particular kin or tribal unit or with any specific occupation.

Composition

Focusing on kinship congregations, we see a continuous series of units, exemplifying the continuous developmental process whereby families formed, proliferated, and segmented. During the earlier—that is, developmentally prior—stages of this process the relationship between the kin-congregation and its marae was probably like that described by Henry in connection with the “family, or ancestral” marae (*marae tupuna*).

In such a marae, the head of the household offered family prayers at sunrise and sunset; there, confession of sins was made, and private petitions to the gods were offered by any member of the family; there, marriage ceremonies were performed; there, prayers were offered for the safe delivery of a woman in childbirth, and the child dedicated to the gods when it came into the world; there, also invocations for the sick and the dying were made. A man went into the front part to offer his prayers and gifts, but a woman offered hers at the back part; she was considered insane if she ventured forward.

When a woman was about to be delivered of her child, a small house was erected for her behind the marae, which was thatched with the maire. (1928:143)

I also quote some other remarks by Henry concerning this type of marae and its congregations (including some puzzling statements about “hereditary names,” which I will discuss in the next section):

The family or ancestral temple, called *marae tupuna*, the god of which was always a family secret, was erected upon every portion of land that a person owned [?]. To the marae were attached the hereditary names of the family, without which they could give no proof of their ownership of the land, so that to this day the memory of this class of marae does not cease to be of importance to the heirs of those families, for it is necessary when dealing with land to state their title name is from the marae named so-and-so, from most of which a few uneven heaps of stones still remain. They have transmitted to memory and to writing, in these later times, their genealogies on both parents’ sides, which they carefully conceal from others who might wish to dispute their rights to lands, and would-be claimants are put to confusion and shame when they cannot promptly answer these assertions with equally good records.

Every foot of ground in these islands was owned by some one, and if a person encroached upon a neighbor's land by moving a boundary stone or erecting a marae upon its borders, it was considered a disgraceful way of claiming it. Such an act was called *ai-fenua* (eating land), and it was seldom attempted because of the odium it would produce.

Children of adoption in a family were made legitimate heirs to land by receiving a name from the marae, which was called the *vauvau i'oa* (name container), and it was considered an injustice to such children not to have them so admitted into the family. Hence it is that so much stress is laid upon a name in land controversies, and although the natives often give themselves other names, they lay them aside at pleasure, but jealously claim and guard their hereditary names from encroachers. (1928:141-142)

The kind of congregation implied by these remarks would appear to be a "family," ranging in size from a narrowly nuclear one (husband, wife, offspring) to a fairly large composite one consisting of a set of consanguines and their spouses.⁴ In view of the Maohis' rather flexible marriage proscriptions, and in the absence of rigid rules of marital residence (see below), the composition of such units must have been both varied and variable; but I suppose that a pattern made up mainly of an elder man and his wife, their married sons, and the latter's wives and children was a fairly common occurrence. In any case, the distinctive features of such congregations were twofold: membership in them was based mainly on kinship, that is, close ties of consanguinity and adoption, or direct ties of affinity; and they were of a size small enough so that every member could be personally involved in marae activities. Even women and small children took part directly or through direct representation.

Their Women bear no part in their religious rites, and neither they nor their Male servants ever partake of these Ceremonies; they have no place of worship for themselves, nor do they ever enter one but at their Birth, but any priest may Officiate for them when any thing ails them, and they are no less in the Eyes of the Deity than those who are admitted to be partakers of religious rites. (Morrison 1935:178)

While true of the marae of larger kin-congregations (and of tribes, etc.), I believe, based on other evidence, that women were not categorically excluded from marae of small kin-congregations.

Henry's remarks about land tenure suggest still another characteristic of these congregations. Although the members may have become too numerous and too segmented to engage in joint subsistence activity, they were still cohesive enough to hold joint, corporate ownership in the lands comprising their residences, gardens, groves, and common collecting and fishing areas. And, according to Henry, such rights were manifested by possession of one of the marae's "hereditary names."

In the characterizations that follow I shall be referring to the whole range of sizes of kin-congregations, but my remarks will apply most directly

to those near the larger end of the range, for it is these that most of the information seems to concern.

But before proceeding, it will be necessary to inquire what name, if any, Maohis applied to the social unit that I have labeled "kin-congregation." The most likely terms that come to mind are *'ai'a*, a country or place where one makes his abode; an inheritance or portion of land; *mataeina'a*, the subjects of a chief; a certain tribe, clan, or sub-division of the inhabitants (LMS Dictionary).

In support of *'ai'a* is its denotation of land ownership, a basic feature of kin-congregation membership. Also, when combined with *tupuna* (i.e., *'ai'a tupuna*, ancestral home), as appears several times in texts, the term denotes another feature of kin-congregation membership: land acquired by inheritance from grandparents and other ancestors, and/or the abode of one's ancestors.⁵ On the other hand, the term obviously refers more to territory than to people.

In contrast, the primary reference of *mataeina'a* is people; but one complication in the way of accepting it as a label for "kin-congregation" is the wider connotations contained in the above definition. Another is the meaning attached to it in a passage from Wilson (1799:184) quoted in chapter 2 in connection with the report of the London missionaries' first census of Tahiti.

In view of these uncertainties I shall continue to refer to the units under consideration with the English label of "kin-congregation."

Marae-Names and Offices

One of the passages from Henry quoted above indicates that every member of a kin-congregation received at birth or adoption a "hereditary name" which served thenceforth as proof of entitlement to land identified with the congregation's marae. The same passage also distinguishes between these "hereditary names," which the incumbents "jealously claim and guard ... from encroachers," and "other names," which they may "lay ... aside at pleasure" (1928:142). In other words there is a distinction between personal names and a certain kind of specific-status name, or, as I label the latter, *Marae-names*.

The literature on the ancient Maohis abounds with references to what the various writers call "Titles"; usually the reference is to a small number of highly privileged offices associated with the most prestigious marae. Assuming Henry's statement to be true, a question immediately arises as to the relationship between Marae-names and such "Titles": do these labels refer to distinct types of statuses, or merely to graded differences in rights (and in duties)? And if distinct types, was a Titleholder the incumbent also of a Marae-name?

Most regrettably the evidence provides no answers to these questions. Neither can we answer related questions, such as how many Marae-names were “contained” in each marae: Enough for each member to have one of his own? Or did some members share a Marae-name? As stated above, I assume that every member of a kin-congregation occupied a Marae-name, which gave him (or her) certain demand-rights over territory associated with the marae in question. And in due course I shall have much to say about certain Titles identified with certain socially important marae. But we cannot assume, on available evidence, that every kin-congregation marae had such a Title identified with it.

On the other hand, we can assume that every kin-congregation was for certain purposes hierarchically organized—that is, that its offices were graded in terms of differences in rights and obligations vis-à-vis the congregation’s spirit tutelars, its living members, and its associated resources.

Kin-congregations differed widely with respect to numbers and kinds of offices, and not necessarily in correlation with numbers of members. Some of the larger ones may have contained only a single office, combining all sacerdotal, executive, judicial, and similar functions; while some of the smaller (and probably older) ones are known to have contained several. Again, although succession to most kin-congregation offices was probably by descent, some may have been occupied by either long-term or short-term appointees or electees. And finally, although there may have been general-status names for all kin-congregation offices—for example, priest (*tahu’a pure*) and messenger (*ve’a*)—only a few offices in only a few congregations appear to have been designated with specific-status names, or kin-Titles.

But however many offices a kin-congregation may have contained, and whether or not any of these was designated by a Title, one office always stood far above the rest, in terms of rights and responsibilities; and succession to this highest-grade office was usually by descent. There being no native label inclusive enough for this office, I have chosen to call it *kin-congregation chief*.

Chiefs and Tutelars

The chief of any kin-congregation was no mere *primus inter pares*; he was, among other things, that crucially important kind of Maohi official, the principal link between a congregation’s living members and its tutelar spirits. I use the term *tutelar* for a spirit associated with a whole social unit larger than a single individual, and reserve the term *familiar* for any spirit associated more or less exclusively with an individual. I make this distinction only for the sake of convenience; as far as I can discover the Maohis themselves made no such distinction, verbally or otherwise. In terms of my classification of Maohi spirits (see chap. 3) there were

three types that served as kin-congregation tutelars: major nonancestral gods (*atua*), who either created a congregation's human progenitor (by invocation or fabrication, but not by sexual reproduction) or who became associated with a kin-congregation already in existence; minor nonancestral spirits, both *atua* and *'oromātua*, identified with kin-congregations through having served as familiars of deceased human members; and ghost-spirits of former members, either *atua* or *'oromātua*. In addition, the spirit-familiars of individuals and the spirit-tutelars of individual families also were to be found in the vicinity of their human associates' kin-congregation marae, even though they may not have been associated with the congregation as a whole.

According to Henry, the members of a kin-congregation kept secret the identity of their "god" or "goddess" "... for fear of being betrayed by enemies or supplanted by them in the good graces of the deity" (Henry 1928:142).⁶ This may indeed have been the case with some units of recent establishment and uncertain reputation, but it was certainly not so with most of the older ones containing widely renowned Titles. Indeed, the identity of the tutelars of these latter was publicly proclaimed and, probably, universally known; in such cases, perhaps, any effort to alienate the tute lar would have led to countermeasures, including warfare.⁷ There is no explicit information about this matter, but we can guess that the conventional way for one kin-congregation to possess itself of another's tute lar was through prevailing upon it to change affiliation by means of larger offerings of objects and services.

A kin-congregation could also disaffiliate a tute lar spirit (*po'ara'a tu i te atua*) and install another one in its place if the spirit continually ignored requests; whether this could be done with all types of tutelars, or only with minor nonancestral ones, is not recorded. Nor is there recorded any instance of a tute lar voluntarily dissociating itself from its kin-congregation, although such a move would not be inconsistent with the way Maohis conceptualized spirits' behavior.

Like all other social interactions, relations between kin-congregation members and their tutelars can be characterized in dimensional terms.

Time. Interaction between a kin-congregation and its tutelars took place on numerous occasions, both in connection with events in the lives of individual members and with circumstances affecting the membership as a whole—that is, with events such as birth, marriage, illness, and death; with regular offerings of first fruits as well as with occasional offerings of thanksgiving or expiation; and with the kin ceremony par excellence, the *pō tupapa'u*, or annual night of returning ghosts.

Space. Interaction between humans and their tutelars usually required the actual presence of the latter near the human communicant; prayers did not

usually travel long distances, and the essence of food offerings was ordinarily consumed on the spot. Sometimes the tutelary remained more or less continually in the vicinity of the marae, in other cases it had to be sent for by spirit messengers. Moreover, mutually satisfactory relations required rather frequent or at least regularly periodic interaction—from short prayers and token offerings made daily, to elaborate and costly ceremonies carried out annually.

Governance. Humans nearly always had to take the first step in establishing interaction with tutelaries, but the latter reserved the privilege of intervening in human affairs whenever and however they liked, and unless restrained by stronger spirits they almost invariably were able to impose their wills on humans.

Transaction. Some kinds of events, such as first-fruit offerings, imply a notion of *pooling and sharing* between kin-congregation members and their tutelaries. The periodic fruiting of nature could be viewed as a communal enterprise, requiring both the services of humans and of spirits, and hence it was only proper that spirits should receive their share of the produce. (The same interpretation may be applied to many other kinds of offerings made by humans to tutelaries.) There was also an element of *exchange* of objects (from humans) for services (from tutelaries), and this became increasingly evident in situations involving occasional (in contrast with regularly periodic) enterprises and the welfare and success of individual members. In these cases the offering was presented either before the event, as a more or less coercive inducement, or after the event, as a kind of payment; and in these and other instances the presentation of the offering admitted of varying degrees of ceremonial elaboration.

Expiatory sacrifice requires a somewhat different interpretation, being in the nature of a penalty for objects not offered or services not rendered as due. There is even a suggestion of exploitation in some of the transactions between humans and their kin-congregation tutelaries, but ideas of altruism—of selfless anonymous giving without expectation of return—are scarcely if at all discernible in any of the data of which I know.

From tutelaries to humans the flow of goods was mainly in the form of services: helping plants to grow, fish to multiply, women to conceive, human and spirit enemies to weaken, tools to be effective, hands to be skillful, memories to be retentive, winds and waves to quieten, and so forth. From humans to tutelaries flowed objects (food, fine mats, rare ornaments) and services of a more tangible kind (the construction and maintenance of marae, the performance of pleasing ceremonies and entertainments, frequent assertion in word and in gesture of the superiority of the spirit).

It is not entirely clear why tutelaries needed or wanted such objects and

services, but there is some indication that their very survival in the *pō*, and not only their status among other spirits, was dependent in large measure upon objects and services rendered by their human associates in the *ao*. This was certainly the case with the ghosts of recently deceased members, and it may have been the case even with major gods. The nature of the sins (*hara*) which most displeased the tutelars and brought about reprisals from them is not inconsistent with this interpretation, for in the main these had to do with lapses on the part of humans in carrying out their obligations to the spirits, and only rarely with relations among humans themselves. The major exception to this is one described by Moerenhout:

These people had, in general, a great fear of spirits, and they greatly dreaded vengeance from the Dead, who, they were convinced, could do much harm. Those who were feared the most were children who died after the ceremony which I have just described.^[8] It was feared above all that angered with their mother they would seek vengeance against the whole family; and women, cleverly applying such presumptions in their own defense as soon as they felt themselves mistreated either by their husband or by their other children, threatened them with insulting the spirit of the dead child which spared them much bad treatment; because the effect of those threats could endanger the whole family, usually all its members interceded to reestablish peace in the household. The same procedure brought about the same results in the quarrels of all the other relations; at the least dispute, the slightest word [could] be enough to make a person fall out of the Oromatouas' or domestic gods' good graces and to bring down on him and on all his relations illnesses and other misfortunes. Consequently there were only a few quarrels among them, and generally they treated each other with kindness and courtesy, so that this useful belief in the Oromatouas, which was nothing else but worship of the Dead, made up for, in some way, among these people otherwise so barbaric, their absolute lack of feeling and affectionate sentiments. (Moerenhout 1837:I, 538-539)

In this connection it is, however, interesting to recall that humans were not entirely at the mercy of all spirits, at least not of their kin-congregation tutelars. They were vulnerable to attack by the latter, but only up to a point, for, by casting off their tutelar, humans could terminate the contract implicit in the relationship and seek protection from the vindictiveness of the cast-off spirit by attaching some other spirit to their cause. At least this was the case with some tutelars; whether it was possible to become dissociated from an ancestral ghost is not known. A parallel to this freedom of action existed in the political sphere, as we shall see. As was the case with other supernatural sanctions, the threat posed by a displeased kin-congregation tutelar was usually in the form of bodily harm, although there is some evidence that a vengeful tutelar also punished by means of destruction of property, or infertility, or failure of enterprise.

In all the foregoing description of relations between humans and their kin-congregation tutelars I have written in collective terms, but it is important to specify that in events involving the congregation as a whole

it was a unit's chief, or someone acting on this official's behalf, who directed or even played the principal role in the interaction. Along with much other evidence for this role assignment Henry stated: "Taruia was also taught the oral traditions of his country and all the mysteries of priestcraft by his father, whose double office of priest and chieftain he was to inherit" (1928:624).

One possible rationale for this assignment is not difficult to deduce: in conformity with the emphasis upon lineality and primogeniture, which served to structure consanguineal relations in general, and succession to kin-congregation chieftainship in particular, the kin-congregation chief was the closest human consanguine of his unit's founders, and thus of its ancestral tutelar spirits or of the tutelars' chosen human associates. Unquestionably, the Maohis attributed a large degree of sacredness to certain of their chiefs: "Everyone is to treat with respect the *ari'i*, his descendants and his *feti'i*; let the *ari'i* be sacred (*mo'a*): he is a descendant of the gods" (E. Salmon 1937:29). Some writers on the Maohis go even further and impute "divinity" to certain kin-congregation chiefs—as manifested in their mana, an attribute which (according to such interpretations) varied in its degree of "divinity" in proportion to the "purity" of the incumbent's descent lines, reaching back to their founding deities. In the case of those kin-congregation chiefs entitled to the designation *ari'i*, Handy wrote: "... the divine first-born (*matahiapo*), who was the [congregation's] Arii, was regarded by the population over which he presided, as the embodiment of the mana of the people and land as a whole" (Handy 1930:46).

Such interpretative statements as the above are attractive in their simplicity and coherence. They may even be true; some of the Maohi data could be made to fit quite nicely into a general belief system of this kind. On the other hand, many of the pieces necessary for constructing such a system are missing, and I am unwilling, for reasons previously stated, to supply those pieces by so-called logical deduction or by borrowings from Polynesian belief systems elsewhere.

In any case, whatever may have been the rationale behind the kin-congregation chief's priestly role, in numbers of cases the priestly job of a kin-congregation was delegated to some other member (conventionally to a younger brother); this occurred so frequently that the priestly function, sometimes symbolized in a separate Title, became identified with a separate (and usually collateral) "line." Ideally, however, the function remained a delegated one.

Finally, there is the important question of the locus of punishment (and hence, presumably, the locus of responsibility) for acts or omissions displeasing to a kin-congregation's tutelars. Inasmuch as most acts or omissions involved interaction between congregation and tutelar—for example,

sacrifices or prayers—and inasmuch as such interaction was conducted by the congregation's chief, or by priests deputized by him, these officials were, one might suppose, most vulnerable to supernatural ire; yet the sources are ambiguous on this point. On the one hand there are recorded instances of a tutelar concentrating punishment on the individual malefactor; on the other hand there are accounts of a wrathful spirit destroying everybody and everything around, regardless of whom Westerners would identify as technically culpable.

Emotion. There is more evidence of respect (*tura*) and fear (*mehameha*) than of *aroha* (affection, compassion) in the behavior of humans toward their tutelars; on their part the tutelars were either inimical, indifferent, or sympathetic—usually according to value received.

Chiefs and Other Members

The main element in the office of a kin-congregation's chief was his relationship with the unit's tutelar spirits, and this was manifested in his responsibility for the priestly function of officiating between living members and tutelars. But he also carried out more secular functions as chief steward and administrator of the congregation's resources and as principal link with other congregations, especially "genealogically" related ones.

Among the most important of the secular functions of a congregation's chief was that of *rahui*. *Rahui* was mentioned previously, where it was shown to be the term for the placing of restrictions on fishing activities. Actually, *rahui* was the general term applied to the placing of restrictions of several kinds: upon productive activity in general or, in terms of specific products, upon consumption of specified foods, upon construction work, upon engaging in diversions, and so forth. The LMS Dictionary gives the following definitions:

rahu, a certain prayer, or incantation used in laying a restriction on fruit, etc.

rahuii, a prohibition or restriction laid on hogs, fruit, etc. by the king, or chief.

rahui, to lay on such a *rahui*; in some of the islands it is called *tapu*.

rahuiopotuara'a, the great or universal restriction by the chiefs.

Rahui was imposed by means of a prayer, which presumably invoked supernatural sanctions upon anyone violating the restriction; but it was backed by more tangible sanctions as well, since the right to impose such restrictions over a particular area of land or sea rested ideally only with the persons capable of enforcing them, physically, and such a person was, in the ideology of consanguinity, the kin-congregation's chief.

They have a Ceremony Calld Raahooe which is a Kind of Jubilee but have No fixd time allotted for keeping it—It is a Prohibition or Embargo laid on the Provisions, & Stock, in Whole or in Part; in any one or More Districts to prevent a Decrease by consuming the Provisions or Stock in or transporting them out of the Districts so Raahooe'd, which they are forced to observe under pain of being driven from their land. (Morrison 1935:194)

Along with his proscriptive right of *rahui*, a kin-congregation's chief also owned the positive right to allocate use of his congregation's natural resources—soil, wild foods, fishing grounds—among fellow members, although ideally that right was exercised only when rival claims were disputed, and it was in any case constrained by the weighty convention that any member's long-term use of some portion of the common territory constituted a preemptive claim. As for the chief's right to reserve choice use-rights to himself, that of course was possible, but normatively such a right was at least partially limited by his obligation to behave generously toward fellow members, like the consanguine that he was.

As for the chief's right to expel members from kin-congregation territory, I noted this possibility in a previous section but ventured my opinion that such expulsions, though quite within the bounds of the ideology of consanguinity, applied only to the expellee himself and not to his descendants. In any case, as I conceive consanguineal ideology to have been, it did not justify a kin-congregation's chief confiscating for personal use the land formerly occupied by an expelled member. (Whether this norm was actually effective I cannot say.)

The foregoing statements concerning rights to territory (land and lagoon) apply specifically to territory identified with kin-congregations as corporate units. In addition, some Maohis appear to have held more or less exclusive and undivided rights to territorial "estates" of their own. (This is a highly important aspect of Maohi social relations, about which, unfortunately, very little has been recorded, and hence very little of a factual nature can be reported; but the matter is of such importance that I am prompted to supply some deductions about it.)

In the sense that any kin-congregation member's long-term use of some portion of the common territory constituted a preemptive claim, all "owned" territory in these Islands (by which I mean *all* territory) would have approached the status of an inviolable personal estate to the extent to which its owner was independent of governance by others and its produce not subject to taxation. In other words, the only territories that were estates in the fullest sense were those individual-or family-owned ones whose owners were sovereign tribal chiefs. There were, evidently, many other portions of territory whose long-term association with tribal subchiefs or with close relatives of sovereign chiefs, served to place them in the same category

for most purposes, but in Maohi society (unlike in some Western ones) the hierarchial principles manifested in interpersonal relations applied to command over objects and territory as well.

And now let us summarize the various rights and obligations between a kin-congregation's chief and its other members. The distinction between "rights" and "obligations" is, of course, my own. I can discover no Maohi words corresponding closely to this distinction in English, but I presume that some such distinction was in fact conceptualized. It would be valuable indeed to know just how the Maohis distinguished between "rights" and "obligations," but that information is beyond our reach. Most of what follows is mainly about norms inasmuch as data on actual performance, on credibly validated historical happenings, are very sparse in this domain.

Terminology. In addition to the Title borne by chiefs of some kin-congregations, many also bore such general-status names as *pa*, *ari'i*, *'iatoa'i*, or *ra'atira*—all of which will be discussed below.

Time. I cannot discover any evidence bearing directly on this dimension of interaction between a kin-congregation's chief and its other members, but the inference seems warranted that, in at least the ideology of consanguinity, a chief was expected to be easily and continually accessible to his people—even though that interaction may on occasion have been constrained by other considerations.

Space. I noted earlier the general rules regarding positioning of individuals: certain ones were conventionally in front of (versus in back of), and upper (versus lower) in ritual contexts. These rules applied particularly to interaction among kin-congregation members; indeed, the more general practice was possibly modeled upon the applicability of such rules among consanguines. It may also be that in some kin-congregations the chiefs' residences were in locations nearest the sea, but this does not appear to have resulted in any convention regarding such positioning of kin-congregation members during interaction.

Governance. During the era under study many kin-congregation chiefs were also leaders of tribal units which encompassed other kin-congregations not genealogically related to their own, and it is not a simple matter to discover which aspects of their roles derived from considerations of "consanguinity," as opposed to those of "tribal" authority—an uncertainty which applies especially to the dimension at issue. As I remarked earlier, this whole attempt to sort out separate "ideologies" referable to different role networks (e.g., relative age, maleness versus femaleness, consanguinity, class) is highly subjective when studying a living society, and when working with the kinds of documents at our disposal the element of subjectivity is increased manifold.

In any case, it is my impression—it would be inaccurate to call

these inferences anything else—that a double standard of behavior was expected of a kin-congregation's chief with respect to governance. In everyday interaction with congregation mates, including ordinary work activities, the chief was expected to participate on a par with other members, initiating and responding as the work technique required, and leaving direction, if required, in the hands of the technically best qualified person (who was not necessarily himself). On more formal occasions, such as those requiring the making of important decisions affecting the whole congregation, the chief was required to be final arbiter, the sole initiator. Others could debate issues but he decided them.

Another facet of the chief's hierarchical position is revealed in the term *haumāteata*, defined in the LMS Dictionary as a government in the hand of a chief by blood, or hereditary descent. The interesting word *hau* is defined in the LMS Dictionary as peace, government, reign. This and textual occurrences of *hau* indicate that the term referred as much to the presence of social order as to the active exercise of authority; and while I would be among the first to urge the futility of speculation about the etymology of Polynesian words, it might be held that the harmony-maintaining function of a kin-congregation's chief was considered to be among the most important of his duties.⁹

More will be said about chiefly authority when I discuss relations based on tribalism, and some of the attributions to be made in that context undoubtedly apply to the authority of kin-congregation chiefs; but as noted above, with the data available, it is next to impossible to identify behavior patterns distinctively attributable to the latter.

Transaction. Following is a list of the kinds of contributions the members of a kin-congregation were expected to make to their unit's chief:

1. Periodic contributions of the first fruits of collecting, gardening, and fishing.
2. Solicited contributions of food, textiles, building materials, and other objects for the chief's own use.
3. Unsolicited contributions of token amounts of food, from the members' own celebrations.
4. Unsolicited but "on order" contributions of such special objects as fine mats and turtles¹⁰ (and of course European goods).
5. Specified fines for wrongdoing, in the form of food, mats, and other goods.
6. Solicited contributions of labor services for communal enterprises—construction, transportation, entertainment, perhaps even fighting.
7. Solicited contributions of services for the chief's own uses.

It is possible that a kin-congregation's chief also enjoyed a recognized

right to exact of any member the supreme form of service, that is, to use him as a sacrifice to the unit's tutelary spirit; but for reasons stated earlier such a right would have been somewhat inconsistent with other components of what I propose was a consistent "ideology of consanguinity."

Following are the kinds of goods that a kin-congregation's chief was expected to supply to his fellow members: Objects, especially food, solicited by members in dire need; Objects derived from members' contributions but surplus to the chief's own "official" and domestic needs, that is, redistribution; and Services of various types: priestly, administrative, adjudicative, defensive. In connection with the last, the priestly obligations of a congregation's chief were clear-cut and comprehensive: he (or someone deputized by him) was the most "direct" link between congregation members and their common tutelars and thus was the most appropriate person to maintain ritual relationships with them. Also, his responsibilities were undivided insofar as they concerned the administration of communal secular enterprises and the allocation or security of commonly owned goods (and presumably this included the defense of other members' persons against outsiders). Finally, his adjudicative responsibility was suggested in his role as controller of *hau*.

How may we categorize these normative transactions in more general terms? They certainly do not constitute self-seeking actions on the part of the chief or his fellow members to deprive one another of goods. Neither do they seem to have been conducted in the spirit of voluntary gift giving, devoid of any wish or expectation of return. Indeed, they appear to constitute various sorts of "exchange." We are concerned here of course with the public, overt conception of these transactions. In many actual historical instances of transactions among kin-congregation members, the parties, while conforming publicly to the ethos of exchange, may have been privately motivated by more selfish, or more selfless, objectives.

But "exchange" is a very comprehensive category, including transactions ranging all the way from barter, with hard bargaining, to the kind of pooling and sharing, with little or no explicit "bookkeeping," which, ideally at least, characterizes interaction among family members in many Western societies. It is not altogether clear just where in this continuum to place the transactions under consideration, except to state that they cluster around pooling and sharing, with more conscious "bookkeeping" than occurs, ideally, in Western families but with less punitive sanctions than those usually accompanying institutionalized reciprocity. Three general principles seem to have governed such exchange between a kin-congregation's chief and all other members: the former should retain for his personal use only a modest proportion of the goods contributed to him—for example, "When any of the Chiefs kill a Hog it seems to

be almost equally divided among all his dependants and as these are generally very numerous it is but a little that comes to each persons share ..." (Beaglehole 1955:122); the latter need not deprive themselves unduly in order to contribute to the former's personal well-being; and the former should be impartial when distributing, or redistributing, his goods among other members. Unfortunately, I cannot define "modest" or "unduly" in any quantitative way, but this need not render the formulation useless—especially when one contrasts it with certain other kinds of principles which seem to have governed interclass relations. Impartiality seems to have been expected of chiefs in general (Henry 1928:478), but it is logical to assume that it was particularly enjoined upon a kin-congregation's chief in his dealings with the congregation's members.

Under the general subject of pooling and sharing I cannot resist the temptation of reproducing, for the reader's delectation, J. Forster's Rousseauian appraisal of the Maohis in this regard:

The happiness resulting from the fertile climate, and from a profusion of fine vegetable productions, raised by the industry of the Manahounes and Toutous in Taheitee, and its neighbourhood; the very moderate and mild servitude of their Toutous, the order and regulation in their domestic societies, the benevolent and paternal affection of their chiefs, their association for the security of property and liberty, their commerce, wealth, and enjoyments, give us the best idea of the more refined and exalted situation of the inhabitants of Taheitee, and the Society-islands, above all the rest of the nations we visited in the course of our voyage. Convinced of the rectitude of order, and justice, as far as they relate to human societies; sensible of the pleasure arising from each common act of benevolence, and fired with the generous spirit of communicating happiness to as many as are willing to form with them the same society; they are likewise capable of that noble and disinterested desire to work for the common weal as much as lies in their power, which we call *public spirit* or *true patriotism*, and what is still better, they actually shew it on many occasions. I have seen a man eating a small proportion of bread-fruit, or other food, and nevertheless sharing this trifle out amongst several of his brethren, whilst it would admit of division. The solicitude of their chiefs, to strike a good bargain for their subjects, when they brought fruit, fish, or hogs to market, is likewise another proof of this assertion; nor can I omit the assistance they generally gave to one another; the detestation in which the better sort of people held all the thieves and robbers; the striking increase of happiness we observed in O-Taheitee, were, at our second arrival, after an absence of eight months, owing to the encouragement and minute inspection of the situation of every individual family under *O-Tu*, the resignation of the command of the fleet to T-Owha, made by O-Tu, and the readiness of T-Owha to undertake that expedition, though ill of the gout; the wisdom and public spirit with which they politely declined the assistance offered them by Capt. Cook for conquering the revolted island of Imeo. All these particulars give me the highest opinion of their *true patriotism*, and noble attachment to the weal of their country. This great maxim is the first germ of all noble social feelings and sentiments: it assigns to the various relations of man their true valour, and bids him act in consequence of each of them; it prescribes the simplicity and unity of principles, and the harmony of means for acting upon these principles. It teaches individ-

uals to scorn to enjoy advantages which cannot become universal, or must be purchased at the expense of the happiness of the community, and makes of every individual a hero; who, if he lived in countries, where poets, orators, and authors, for gold lavish their incense, would have such monuments of eloquence raised to his memory, as are but too common in our adulatory age; and had he been born with those noble sentiments at Athens or Rome, he would have deserved to rank with Aristides, Agesilaus, Leonidas, Fabius, Africanus, Cato, and the sacred bands, who fill the temples of Grecian and Roman patriotism. (1778:376-378)

Emotion. One can characterize the normative interaction between a kin-congregation's chief and his fellow members, or between any members of a kin-congregation, with labels like "amity" or "affection." This is not, of course, meant to imply that such individuals usually "felt" amicably or affectionately disposed toward one another, nor even that they usually acted as if they so felt. I mean to assert only that between kin-congregation mates in general, and between the chief and other members in particular, interaction was ideally expected to consist of those vocal or gestural conventions that I have labeled "amity" and "affection." Historically, as we shall see, in many situations interaction among kin-congregation mates was anything but amicable.

In terms of those emotion-expressing conventions we may label "sexual," interaction among kin-congregation mates was normatively defined only in certain special instances. There may have been general proscriptions against marriage—including copulation—between "close" consanguines, but the span of collaterality was broad enough in many kin-congregations to permit some members to intermarry. Moreover, in the interest of status consolidation, even those general proscriptions were overruled in the case of some closely related congregation mates of superior social position, including the units' chiefs. On the other hand, considerations to be discussed in chapter 18 proscribed marriage between a kin-congregation's chief and a person of inferior social class whatever her kin-congregation affiliations or degree of consanguinity may have been.

Turning now to behaviors expressing differences in precedence, I can summarize my inferences by stating that as a minimum a kin-congregation's chief was normatively accorded respectful deference by his fellow members, especially on ceremonious occasions, while he in turn treated them with somewhat lofty benevolence. In this regard acknowledgment of the chief's "dominance superiority" was tempered by the circumstance of his consanguinity. But that was "as a minimum," applicable mainly to the smaller, less class-stratified kin-congregations. Even normatively the chiefs of certain venerable congregations were accorded a degree of respect approaching reverential obeisance, not only by their fellow members but by the populace at large. Respect for such exalted personages was expressed most visibly by keeping one's head lower than theirs and by baring one's

shoulders when in their presence. Here are some eyewitness accounts of the operation of these rules:

When a Chief is present in any Company the Men strip their Bodys to the Waist not suffering any Covering on their Head or Shoulders in His Presence—and all the Weomen present uncover their Shoulders tucking their Cloth under their armpits, to Cover their Breasts in token of obedience and respect, to his presence; the Men are not always particular in this point except Upon the Chiefs Hereditary land or that of His adopted friend, where any neglect would be deemd an Insult and punishd accordingly—but in presence of the King the Chiefs themselves must strip—Nor do they stop to see him first if they Have Notice of His approach either by land or in a Canoe, Nor must any person pass his land by walking over it or Sailing by it without paying the Compliment. (Morrison 1935:168)

They Have Carved Wooden Images of Men which they call Etee [*ti'i*] set up as boundaries of their Estates, not to pay devotion to but to remind passengers below & of equal rank to the Possessor and owner of that land, to strip the Cloths off their shoulders & heads, as they pass by in Compliment to the Owner—All ranks of People must pay this Homage as they Pass the land belonging to the Earee da hye [*Ari'i rahi*] or King—The Etee or Image denoting the Kings land is remarkably larger then the Common size, and the Towhas or Ratirras [*ra'atira*] land is known by a Number of little White Flags being fixed in different parts beside the Etee—(Morrison 1935:192-193)

His subjects not only uncover to him, when present, down to the waist; but if he be at any particular place, a pole, having a piece of cloth tied to it, is set up somewhere near, to which they pay the same honours. (Cook 1784:170)

A question that must be raised is, What sanctions were in force to back up all these norms for interactions between a kin-congregation's chief and its other members? But here again we face the difficulty of distinguishing between this and other forms of "chieftainship." The sources are replete with observations about the relations between "chiefs" and other Maohis, for no other subject was so crucial to the European visitors' purposes and welfare. So far, however, in my inferences about kin-congregation "chieftainship" I have dealt only sparingly with the subject—not because richer details are lacking but because I have gone about as far as one conscionably can go in selecting data about this particular aspect of differential privilege and power—further, perhaps, than some readers feel is warranted. In fact, despite my best efforts, there remain some fundamental weaknesses in these attempts to separate various role behaviors and assign them to distinct ideological systems.

The negative sanctions behind chiefly authority took many forms; in fact "chiefs" were effective beyond other humans in employing or directing all forms of negative sanction: social isolation, physical coercion, public censure, and supernatural punishment. However, according to my inferences about Maohi consanguinity, which involve certain assumptions about ideological con-

sistency, I believe that the chief of a kin-congregation would, or at least should, have tended to refrain from physical coercion and imposition of exile, and would have reinforced his authority when necessary by use of publicly aired censure and of supernatural punishment.

Inasmuch as the status of a kin-congregation's chief was an ascribed one, presumably reinforced by weighty and deeply internalized norms regarding consanguinity and birth order, these officials may not have had to resort to other kinds of positive sanction to maintain proper relations with congregation mates—provided of course such chiefs carried out their end of the exchanges which helped to define these relations.

Kin-Congregation Titles and Marae Stones

As noted previously, the hereditary and highly privileged offices associated with certain socially important kin-congregations bore individual identifying labels, which I call kin-congregation Titles. Such Titles were in the form of proper names. Some were quite short (e.g., Te Fatu, Teri'i), others were long and studded with metaphors (e.g., Aromaitera'i, War-from-the-sky; Tunuia'eiteatua, Stability-greater-than-the-gods [?]). The principal (i.e., highest-graded) Title of any kin-congregation marae often consisted of a name, like the above, combined with the name of the marae itself (e.g., Teri'irere i To'oara'i, Flying [or Leaping]-ari'i-of-To'oara'i [marae]), or the Titleholder in question was simply referred to by the name of the marae itself.¹¹

Unlike the Marae-names mentioned by Henry, kin-congregation Titles were not "carefully concealed"; in fact, they were often publicly proclaimed and presumably universally known. In the "official" genealogies that figured so importantly in Maohi ceremony, some of the constituent labels for individuals were kin-Titles, but most of them were personal names—as indeed they would have had to be in order to render them informative.

Traditional accounts of the genesis of particular kin-congregation Titles, or simply kin-Titles as I shall henceforth refer to them, usually involve incumbents already holding one or more of them. For example, when for some reason or other a kin-Titleholder moved away from his home marae he could, without necessarily vacating his former kin-Title, create a new marae for his family and a new kin-Title for himself and his successors in the new home. Or, it was not unusual for particularly solicitous kin-Titleholding parents to build a new marae and create a new kin-Title for their successor, in addition to passing on to him their own respective kin-Titles. But I can discover no traditions relating how non-Titled offices first evolved into Titled ones. I can, however, suggest how some such developments may have taken place.

If, say, in the course of time a family became numerous and affluent, while remaining spatially united and socially cohesive, several things seem to have occurred:

1. The various collective-action functions—policy-making, administrative, sacerdotal, and so on—would have become embodied in a number of explicitly defined offices.

2. In time one or more of these offices would have become labeled with the personal name of the current incumbent or with some descriptive or panegyric name invented for the occasion, and the office in question would thenceforth devolve with its distinctive new label, or Title.

3. Thereafter, if the congregation continued to prosper and become widely known, the kin-Title held by the congregation's chief member would have become more specifically identified by addition of the local marae's name.

4. Meanwhile, all such Titles (like kin-congregation offices in general) were graded within each kin-congregation and between interrelated congregations, in terms of rights and obligations vis-à-vis the congregations' tutelars, its living members, and its associated resources.

In any case, whether or not kin-Titles actually evolved in the manner just suggested, they devolved, normatively, from parent to (socially recognized) child. What I say here about succession to kin-Titles may well have applied to other hereditary offices as well, although the sources have little to say about the latter. (Note that the present discussion of succession concerns kin-Title, and not chiefly authority, which in many instances were separate attributes not only in actual practice but perhaps even in conceptualization as well.)

All writers who concerned themselves with this subject seem to have accepted the general proposition that "primogeniture" governed which child ought to inherit the parent's Title, although there is some uncertainty about what type of "primogeniture" was held to be most desirable in terms of the ideology of consanguinity I am now describing: the firstborn child regardless of sex, or the firstborn male child. Some sources state or imply that the first rule prevailed.¹² Others vouch for the second. On this matter, Moerenhout wrote:

Despite the disrespect generally shown for females, the nobility was so infatuated with its superiority that if it happened that a daughter was the sole scion of a noble family that daughter would inherit the sovereignty, for the purpose of keeping it going. In due course she would marry, but without her husband taking the Title of Ari'i or any of the authority thereof, at least if he himself were not the son of a principal chief. If and when a son issued from such a marriage, he would take the Title of Ari'i. If the father was only an inferior chief, and the mother a member of the high aristocracy, then she would reign (or be regent). (1837:II, 11n)

It is my conclusion that the second rule was the one more often followed in practice, although in many instances considerations other than sex or birth-order entered into choice of successor. After having made a painstaking

ing study of all available genealogies, published and in manuscript, Emory found that “the genealogies frequently show a succession [to important kin-Titles] through children other than the first-born” (Marae Traditions).

These alternatives also obtained in the event of a kin-Titleholder without offspring—that is, the kin-Title could and usually did pass to the male child next in birth-order, but it also could and sometimes did pass to a female child if she were eldest among her surviving siblings.¹³ In any case, I can find little evidence for the rule of succession having been formulated exclusively on sexual lines, that is, *all* males in birth-order before *any* females.

In my discussion of “consanguinity” I noted the Maohi belief that “something” of each parent went into the composition of a child. Maohi norms about succession-order suggest a corollary belief that whatever that “something” was it diminished with order of birth (in addition to whatever difference may have resulted from the sex of the child)—but it is only a suggestion. I have searched in vain for explicit formulations which might throw some light on this matter, so I am unable to join with some other specialists on Polynesia who write with such assurance and plausibility about “primogeniture” and *mana* and such.

Much about consanguinity-based succession-order appears reasonably certain, but some amplification is called for. First, it can be noted that by norms of consanguinity a kin-Title passed only to an incumbent’s own (socially recognized) child; that is to say, in polygynous families, regardless of birth-order, a wife’s own kin-Title (if she had one) was passed only to her own offspring and not to the offspring of some other wife of her husband. As for the polygynous husband’s own kin-Title, it was usually (and probably normatively) passed to an offspring borne by the first woman to whom he became officially “married”—who, as we shall see, was required to be of the same “class” as himself.

But I reiterate that these statements about succession-order apply to only one set of Maohi norms—that is, “ideology of consanguinity.” In some situations this set of norms was overruled by sets appertaining to different and in some respects conflicting ideologies, such as that relating to membership in a tribe, so that considerations of sex and birth-order gave way to those of, say, competence or dynastic rivalry, as later chapters will indicate. In fact, in connection with some of the highest kin-Titles, a claimant’s eligibility, based on birth-order, seems normatively to have required validation in the form of some sign of supernatural approval, as manifested, for example, in a test in which the claimant entered the sea; if the family’s shark-god tutelary approached the candidate in a friendly manner, then that was proof of acceptability (Henry 1928:192).

The timing of succession to a kin-Title occasioned much surprised comment among the early European visitors, principally because most of them

tended to identify Title with authority. The correct interpretation would appear to be contained in the detailed account of natal ceremonies described by Henry and quoted earlier:

[On the occasion of the *uhi-a-iri* ceremony, which took place a short time after birth of the successor to a high-grade kin-Title] ... The father ... received his child thus initiated into the family circle and embraced it tenderly, conferring upon it a royal name which had been duly and appropriately chosen beforehand, after which he was the first to pay it homage by embracing its feet and saluting it as a member of the royal house and heir to the throne. But the reigning father or mother did not abdicate their power and proclaim the young heir sovereign of the realm, as some writers have stated, for inauguration ceremonies must be performed before the people recognized a new ruler. (1928:185)

As Wilson wrote: "A chief is always a chief; and though expelled from his command, losing his district, or having his honours transferred to his child, he continues noble and respected" (1799:325).¹⁴

Assuming the "royal name" to be a kin-Title, it appears that although the label of such a Title, along with certain "honours" associated with it, passed to the successor in a ceremony shortly after his birth, most of the more secular rights and obligations represented by that label were transferred piecemeal, over a long period of time, and culminating with the *fa'atoira'a* feast, celebrating the final removal of childhood restrictions, which was held—according to Henry's imprecise phrasing—"... upon the maturing of the child" (1928:188).¹⁵ In fact, in the case of very high-grade *ari'i* Titles the transfer of all the duties and privileges pertaining to them was not completed until a still later ceremony, that of inauguration (*fa'aari'ira'a*).¹⁶

Most generalizations in the sources about the timing of succession to hereditary kin-congregation offices refer to kin-Titles, but it is not unlikely that much the same kind of arrangement was applied to other offices as well—although the less consequential the office the less formal would have been the ritual actions signaling its transfer.

Another general description of this matter was supplied by Ellis:

The most singular usage, however, connected with the established law of primogeniture, which obtained in the islands, was the father's abdication of the throne on the birth of his son. This was an invariable, and appears to have been an ancient practice. If the rank of the mother was inferior to that of the father, the children, whether male or female, were destroyed; but if the mother originally belonged to the *hui arii*, or had been raised to that elevation on her marriage with the king, she was regarded as the queen of the nation. Whatever might be the age of the king, his influence in the state, or the political aspect of affairs in reference to other tribes, as soon as a son was born, the monarch became a subject—and the infant was at once proclaimed the sovereign of the people. The royal name was conferred upon him, and his father was the first to do him homage, by saluting his feet, and declaring him king. The herald of the nation was then despatched round

the island with the flag of the infant king. The banner was unfurled, and the young sovereign's name proclaimed in every district. If respected, and allowed to pass, it was considered an acknowledgment by the raatiras and chiefs, of his succession to the government; but if broken, it was regarded as an act of rebellion, or an open declaration of war. Numerous ceremonies were performed at the marae, a splendid establishment was forthwith formed for the young king, and a large train of attendants accompanied him to whatever place he was conveyed.

Every affair important to the internal welfare of the nation, or its foreign relations, continued to be transacted by the father, and those whom he had formerly associated as his counsellors; but every edict was issued in the name and on the behalf of the young ruler; and though the whole of the executive government might remain in the hands of the father, he only acted as regent for his son, and was regarded as such by the nation. The insignia of regal authority, and the homage which the father had been accustomed to receive from the people, were at once transferred to his successor. The lands, and other sources of the king's support, were appropriated to the maintenance of the household establishment of the infant ruler; and the father rendered him those demonstrations of inferiority, which he himself had heretofore required from the people. (1829:II, 346-347)

Ellis was writing at a time when Tahiti-Mo'orea were united under the sovereignty of a single tribal chieftain—"King" (and later, "Queen") Pomare—but his description evidently refers to earlier times. Also, he noted specifically that the custom of early succession to office was not limited to tribal chieftainship: "This remarkable custom was not confined to the family of the sovereign, but prevailed among the hui arii and the raatiras. In both these classes, the eldest son immediately at his birth received the honours and titles which his father had hitherto borne" (p. 347). This statement of Ellis' would also appear to support the notion expressed earlier that kin-Titles were fairly numerous and widespread.

The early and fairly automatic designation of a kin-Title successor undoubtedly served to reduce somewhat the element of sibling rivalry so characteristic of succession in many other societies, but the piecemeal transfer of powers seems to have introduced other opportunities for contention, as will be described in later chapters. Nevertheless, enough powers were transferred to persons of tender age, including whatever ceremonial deference was due the Titleholder, to produce a general effect on social relations between persons of different age, as indicated in chapters 13 and 15. What I am suggesting here is that the ideology of consanguinity, with its emphasis on the kind of "purity of line" concept crystallized in primogeniture and early succession, was in a causal sense prior to Maohi children's reported freedom of action, rather than the reverse. However, I have no means of proving this point.

As I have already indicated, the ideology of consanguinity probably favored male succession to kin-Titles, but it was flexible enough to permit females to hold them—not only in the absence of male offspring but occa-

sionally even in preference to males. Actual instances of this kind will be described later; I introduce the subject here to indicate how such occurrences affected kinship-Titleholding in general.

First of all, the fact of kin-Titleholding by females resulted in certain individuals holding more than one Title—that is, a Title of the father *and* of the mother, and even in some cases including separate Titles inherited by the father from *his* mother, the mother from *her* mother, and so on. Inasmuch as choice of spouse was not limited by kin-congregation membership per se (i.e., marriage was generally proscribed only between “close” consanguines), it was normatively possible either for all one’s Titles to be identified with one congregation, or alternatively distributed among several. In the first case if an individual happened to hold more than one kin-Title associated with a single congregation, this undoubtedly served to enhance his privileges locally and his reputation abroad; although, cumulatively, two or more middle-grade kin-Titles probably did not raise their incumbent’s status to the level of the congregation’s highest-graded Titleholder. In the second case an individual holding kin-Titles in more than one congregation usually made his (or her) permanent residence in one place, but now and then visited his other congregation, where he was accorded the privileges appropriate to his local kin-Title, which in some instances may have been higher-graded than all other local Titles. Some narratives indicate that a stranger sometimes turned up to claim possession of a long-vacant kin-Title and ended up either winning acceptance, by authenticating his claims genealogically, or endangering his life by inability to do so.

A further complication is introduced by the circumstance that some kin-Titles could be and were transferred from one kin-congregation to another (see p. 660).

A particularly puzzling aspect of kin-Titleholding is presented in the case of the immediate families of individuals holding very high-graded Titles in certain of the more venerable kin-congregations. In such families, in addition to the privileged status enjoyed by the official successor to the parent’s (or parents’) most imposing kin-Title (or Titles), it seems quite clear that all other recognized offspring of the parents enjoyed positions of some privilege. Among the records kept by the Spaniards, there is an intriguing and suggestive observation concerning the younger brother and successor of a recently deceased incumbent of the very high-graded (and high-ranking) kin-Title, Vehiatua:

After having paid this visit [to view the corpse] we went back to his mother’s house, where we met his brother; and we noticed that he had his lower lip blue [i.e., tattooed] (the same was the case with the deceased, and they told us it was the caste mark of the Vehiatuas). (Corney 1915:471. See also Bligh 1789:II, 56; Vancouver 1801:273)

The problem is, Were the favored positions of recognized offspring merely the result of their “close” links with the principal Titleholder? Or were their privileges derived from distinct but unreported kin-Titles separately inherited?

I can find no evidence indicating that all of a parent’s kin-Titles necessarily devolved upon a single successor; on the other hand, in the scant documentation available I have not come across any actual case of splitting of a parent’s kin-Titles among two or more offspring—nor a case of one spouse’s Title devolving upon one of their common offspring and the other’s upon another offspring. But recall Moerenhout’s curious and ambiguous statement reported earlier: “A child is given a personal name, at birth, deriving from either maternal or paternal family. Later, if its parents separate, the child goes with the parent whose family name it bears” (1837:II, 63-64). Even if such processes did take place, this cannot account for all or even most of the privileged positions enjoyed by the siblings and other “close” relatives of certain Titleholders. For example, the “Precepts of Tetunae” exhorted everyone to “... treat with respect the ari’i, his descendants [*huā’ai*], and his ‘relatives’ [*fēti’i*].” Evidently, this is an implicit Maohi proposition to the effect that *all* offspring of any individual, and not just his (or her) “successor”—firstborn or otherwise—share some rights accruing to that individual’s status in relation to other consanguines.

Now the question to be faced is, How many Titles were there in existence throughout Maohi society? Assuming Henry to be correct, every Maohi was given a Marae-name, which entitled him to use some of the territory associated with his kin-congregation marae and, presumably, also entitled him to be represented to the marae’s tutelars. On the other hand we have no sure way of knowing, even approximately, how many kin-Titles were in existence at any point in time. It is my guess that not everyone had one—at least as I construe such statuses to have been. And it is also my guess that there were more of them in existence than the few score that have been recorded, either in European accounts or in the handful of native traditions that have managed to escape oblivion. But guesses are shaky foundations for building theories about a society’s structure. In the matter of kin-Titles, as in many other aspects of Maohi social relations, we are provided with some fairly rich data about the uppermost levels of society, and next to nothing about the rest. Moreover, we cannot even assume with any confidence that propositions worked out for the upper levels may be applicable for the rest; Maohi society was far too complex to permit that comfortable step to be taken.

As described in chapter 7, one of the characteristic features of most Maohi marae, including especially kin-congregation marae, was one or more stone

slabs or columns set upright in the court. They have been identified variously: as leaning posts for priests engaged in prayer or perches for priest-manikins (*aho tapa'u*), as backrests for principal worshippers, as resting places for visiting tutelars, and as memorial stones for deceased "chiefs" (and hence resting places for their visting ghosts). Some marae contained only one such stone; most had several. In the larger marae each stone may have had a special function, but in the smaller marae it is more likely that one stone served several purposes; and archaeology cannot, and contemporary accounts do not, inform us about which stones served which purposes in specific marae. In any case, our present interest in such stones is limited to the more or less permanent associations some of them are known to have had with particular members, or with particular hereditary offices, of kin-congregations.

A feature typical of many marae was a row of three uprights located in front of the *ahu*; Emory's inference is that these were "seats of honor" for the highest-"ranking" members of the congregation: a central upright (*ha'ai*) flanked by a *tarahu* (or *terahu*) on both sides (1933:17-18). According to Emory the *ha'ai* was for the "first-born," the right-hand *tarahu* (facing the *ahu*) was for the "second-born," and the left-hand one for the "third-born." In a marae of five such uprights the same birth-order pattern is said to have prevailed.¹⁷

Whether or not these particular uprights had precisely those associations, it appears fairly certain that some uprights on some kin-congregation marae were associated with individuals holding important congregation offices, including Titled ones, that were not exclusively sacerdotal in function. Moreover, some of these uprights are known to have had individual, "proper" names in addition to their generic ones, but as far as I can ascertain a distinction was drawn between the name of an individual's upright and that of his kin-Title (if he had one).

Other evidence concerning the kinds of uprights under discussion comes from numerous accounts, both general and specific, relating how some individual removed his upright from his "ancestral" marae and planted it in another one, usually in a new and distant marae established by himself, but occasionally in an already established one to which he had acquired membership by marriage or by some form of "adoption."

Putting these indications together provides some general conclusions about congregation colonizing and about individual members' peregrinations, and these will be discussed in another section; but they raise some puzzling questions about the matter at hand.

If an upright were in fact identified with a particular congregation office, whether Titled or non-Titled, it is incomprehensible how it could be moved from one marae to another without transferring the office as well.¹⁸

And if the office in question consisted of functions specific to its “ancestral” congregation, it is difficult to see how those functions could continue to be exercised in the “ancestral” congregation, or become applicable to the new one.

The answer probably is that the only uprights that were moved from one marae to another were those associated with offices having only general functions, such as assisting in worship or work or warfare. In this sense, I would be greatly surprised to come across evidence that a congregation’s chief removed his upright to some new marae unless accompanied by most or all of his fellow members.

Indeed, most of the kind of uprights under consideration remained *in situ*, even though the individuals associated with them moved about or resided elsewhere. This was particularly the case when the individual in question held an important kin-Title (and an associated upright) in two or more congregations, as was described above. It also transpired that an upright’s associate sometimes moved elsewhere, leaving his stone in place and no successor to claim it—until one of his descendants would someday return “home” and do so. Some uprights (i.e., the so-called memorial stones) were apparently left vacant for all time through lack of all possible successors, although they continued to serve as resting places for the visiting ghosts of previous associates.

CHANGES IN KIN-CONGREGATION STRUCTURE

At several points in the foregoing, reference has been made to locational changes—of whole kin-congregation marae or parts thereof, and of the stone uprights, “hereditary names” (Marae-names), offices (both Titled and non-Titled), and living associates of those marae. This is one of the most crucial aspects of Maohi social structure, and one of the least understood. First let us consider the marae themselves.

I have already recorded how the Maohis conceived of the beginnings of the first marae to be established in these islands: as founded either by the first priest-god, Maui, in many different places and for the use of mankind in general, or by certain other gods or demigods for the use of their own descendants and worshippers. In both instances these “original” marae seem to correspond to what later generations called *marae tupuna* (ancestral kin-congregation marae). In any case in whatever manner such marae may have been “created” or “invented” or introduced in these islands, they were—according to a variety of native traditions, pieced together with other kinds of evidence—subject thereafter to several kinds of change.

In some instances whole kin-congregations appear to have died or been wiped out or scattered and their marae abandoned—as witnessed by the LMS Dictionary definition of *mo’opō*, to be lost, or be extinct, as a family; to

be erased, or lost,¹⁹ and by the presence of numerous nameless marae ruins for which no traditions whatsoever have been uncovered. The causes, mythical and historical, were various. Native traditions charge some of these extinctions to warfare or extirpative chastisement, and recorded history confirms that such catastrophes did now and then occur. The practice some chiefs had of selecting human sacrificial victims from certain families would, if carried far enough, have had the same consequences.²⁰ Sickness may also have extinguished entire congregations, in historical fact as well as in native beliefs—that is, the beliefs that some sorcerers cast their nets over whole families and that vengeful spirits sometimes did the same.

In other cases the only transformation experienced by an autonomous kin-congregation and its marae was to grow older and perhaps to change tutelars from time to time. Individual members of such congregations may have gone elsewhere to reside, but without carrying along stones or Titles wherewith to maintain more ineffaceable connections with the ancestral home. One would expect to find more communities of this kind in regions of small isolated settlements, as along much of Tahiti's eastern coast.

Another kind of change undergone by some kin-congregations consisted of a wholesale move to another location. According to one tradition this occurred in the case of an illustrious kin-unit living a mile or so inland in Opoa Valley on Ra'iatea. When this family increased and prospered (the account implies), it abandoned its original tutelar-established marae of Vaearai and moved to a more favorable spot near the coast. Native traditions mention a few other moves of this kind, and I suspect that many more of them occurred, not only to accommodate an increasing membership but perhaps in some cases to flee from an actual epidemic or an imagined scourge, or to escape from an area subject to constant warfare or to the rapacity of a neighboring chief.

Much more complex, structurally, were the consequences of the kind of change involved in the partition of a congregation, as set forth in the passage from Henry I have several times referred to (1928:142). Probably behind most such changes were overall population increase and a general tendency toward autonomy on the part of the congregation's constituent families, although the precipitating reasons were undoubtedly varied (e.g., cumbersome organization, interfamily tension, and unpopular leadership). As Henry stated, the change consisted of a formal partition of the congregation's territory indicated by construction of a new marae to which was transferred the separatists' Marae-names (their "deeds" to the plots thus detached) and presumably any Titles and marae uprights they may have possessed. Also the connection of the new marae with the old one was visibly expressed by incorporating a stone from the latter into the former; this not only conduced continuity with the ancestral

marae itself but served more specifically to maintain ties with the congregation’s common tutelars. According to Moerenhout (1837:II, 12), there was strong sentiment against fractionating land, but I can find no tangible evidence elsewhere for such a sentiment.

The location of the new marae may have had considerable significance. In some cases it was constructed at a distance from the old one, in the midst of the detached plots of land. In other cases it was built directly adjacent to the old one: a more or less private family “chapel” attached to the larger “church” it came to be more and more autonomous in terms of its associates’ property rights and joint activities, including direct interaction with tutelars.²¹

Using Western logic one might be inclined to see in these differences in spatial separation of offshoot from ancestral marae a corresponding difference in social separation in terms of the latter’s tribal and religious autonomy; but we cannot be sure that Maohi logic operated in this way. Henry’s account implies that the inauguration feast (*fa’atomora’a*, entering) which “opened” the offshoot marae served also to signalize the offshoot congregation’s tribal and religious autonomy, but I suspect that the process of fission was in general a more gradual one, especially in cases of partition. Moreover, some adjacent offshoots may have been more autonomous than were spatially distant ones, which brings us to the important question concerning the kinds of social relations that prevailed, normatively, between kin-congregations arising out of the type of fission under discussion.

In order to broaden the discussion, I base it on the schema represented in the following diagram—a fictitious but not unrealistic set of “genealogical” connections between marae.

Let us suppose that all four units are subdivisions of what was formerly a single kin-congregation, whose ancestral “temple” was marae A. In the

course of time one part of the congregation—say, a set of siblings and their spouses and offspring—separated from the rest and set up their own marae, B. Somewhat later, another group did the same and set up C. And finally a part of the congregation at B did likewise and set up D. (Events considerably more complex than this probably occurred, but this schema is intricate enough for present purposes.) I wish to inquire how the Maohis conceptualized relationships deriving from these events: with respect to the marae themselves, to the separate congregations as whole units, and to the more important officeholders of the separate congregations (especially the chiefs). Since this is a “descent” type schema, we are particularly interested in learning whether the resulting relationships were conceptualized in terms of consanguineal relations among individuals, thereby exemplifying the well-known phenomenon of “pattern replication,” which anthropologists nowadays are acknowledging to be so widespread.

In many instances Maohi traditions do explicitly relate how certain marae were founded by members of, and with founding stones from, older marae; and in several such instances the older, source marae does indeed seem to have been regarded with more “reverence” than the younger offshoot.²²

Although all marae of common derivation may have been recognized as such, there is no evidence that such connections were conceptualized in a broader “consanguineal” sense: that is, B and C were indeed regarded as direct offshoots of A (as was D of B); but there is nothing to indicate, say, that C was regarded as “brother” to B or as “father” (i.e., father’s brother) to D. Nor so far as I can discover were all such interrelated marae ordered in a more comprehensive sense: for example, C marae was not entitled to more reverence than D. In this connection Vaearai, on Ra’iatea, the marae traditionally held to have been the one from which all the most widely revered marae of the Leeward Islands ultimately derived, appears to have been abandoned and allowed to disintegrate when its congregation moved to the coast.

Turning now to whole kin-congregations attached to marae of common derivation (i.e., to the groups of members themselves, rather than to their marae), the only suggestion that their interrelations were conceptualized in consanguineal terms is in Handy’s reference to *matahiapo* (firstborn) and *teina* (younger sibling of same sex) “family stocks” (1930:23). Whether the members as a whole of a *matahiapo* congregation were privileged in any way vis-à-vis the whole memberships of congregations *teina* to themselves is a question I shall have to postpone for later discussion.

Finally, I turn to relations among the various offices attached to marae of common derivation. To begin with, I have found no evidence that such relations were conceptualized in consanguineal terms—that is, the chief himself of congregation A was not labeled, or otherwise implied to be, “fa-

ther" or "elder brother" to the chiefs or other officials of congregations B, C, and D. On the other hand, the chief of A did enjoy a measure of authority and precedence over the chiefs of B, C, and D in connection with matters, mainly religious, involving all of them. This probably held also for the chief of B in his relations with the chief of D—but not, evidently, for relations between C and B, or C and D. In other words, relations between the chiefs of kin-congregations of commonly derived marae were graded, but not comprehensively, and not in explicitly consanguineal terms.

I wrote earlier of *rahui*, the custom of placing restrictions upon specified kinds of activities in specific places, and I described it as having been one of the rights owned and exercised by any kin-congregation's chief over all the territory identified with its marae. The next question is, To what extent did the normative right to *rahui* enter into the relations between congregations connected as were those under discussion? This question is of prime importance; unfortunately the answers I am able to provide are incomplete and not very conclusive.

In the first place, I believe that the chief of kin-congregation A would have had the right of *rahui* over B, C, and D as well. Also, I am inclined to believe, but am by no means certain, that in terms of the ideology of consanguinity this right of *rahui* was normatively executed through "channels," that is, when imposing a general *rahui* the chief of A included B by asking the latter's chief to impose it, and not by direct order to B's whole congregation. In addition, although it might be consistent to assume that a *rahui* command by A's chief to D's should have been channeled through the chief of B, I can discover little evidence concerning this possibility.

In the second place, I believe that while *rahui* rights may have extended to offshoot territories they did not parallel consanguineal relationships in any broader sense: that is, the chief of B could *rahui* its offshoot D but *not* C, even though B's own eponymous ancestor may have been an "elder brother" of C's—a status which among individual consanguines would have embodied some authority over a "younger brother."

Turning from *rahui* to tax, from an imposing of restrictions to a levying of goods, I believe that the chief of any kin-congregation would indeed have had the right to receive objects and services from its offshoot congregations, either by explicit levy or by regular periodic flow.²³ Evidence is firmer than was the case with *rahui* that such objects were normatively required to flow through channels—for example, from the chief of D to the chief of B and thence to the chief of A. But as with *rahui*, there is no evidence that such levies of goods were required to be passed between units linked by what I have diagramed to look like sibling or collateral ties.

The same kinds of stricture applied to goods moving downwards; the

chief of a "source" congregation was required to provide some services and objects to offshoot units but not, I believe, to "sibling" or "collateral" ones. The services in question were probably in the form of priestly representation and martial support, while the objects consisted mainly of contributions originally from those offshoot units but in excess of the source unit's needs, that is, redistribution. Passages from Henry and Handy-Marau raise the possibility that one of the services performed by the chief of a source kin-congregation for offshoot congregations was to consecrate the marae of the latter:

Many of the wealthy gentry of the land built their ancestral marae in pyramidal form and inaugurated them with great pomp. They aspired to the honor of having their king or high chief perform the *eera'a* ceremony, feeling this the highest temporal dignity that could be bestowed by man. But the chief never again returned to it. (Henry 1928:139)

According to Marau these [*ra'atira*, family] marae were consecrated by the Arii under whose rule the family lived. (Handy 1930:43)

The question raised by these passages is whether they were referring to relationships based on kinship or on kinship *and* common tribe.

Finally, the several offices associated with any set of marae of common derivation do not appear to have been arranged in any conventional sequence in terms of succession; if the chiefly office of A became vacant, with no direct descendants or siblings of the previous incumbent to fill it, the office did not devolve automatically upon the chief of B, then of C, and so on.

Yet, despite all the negative conclusions proposed in the foregoing, another statement from Henry suggests that in some places the various neighboring offshoots of a source kin-congregation did maintain active ties in addition to their common involvement in *rahui* and taxation:

The social temple (*marae-o-te-va'a-mataeina'a*) of the clan was of considerable importance to the people, as it distinguished them as a community. It was made after the manner of the family marae, presided over by a priest in patriarchal form, and dedicated to a god of the first class. There the men of the clan assembled to present petitions and oblations for their little community in times of rejoicing or sickness; and there the priest received offerings to the gods from persons going away or upon their return home, and offered appropriate prayers on their behalf. There also in like manner he bid the stranger welcome. (1928:144)

When this passage was written, or edited, the word "clan" undoubtedly carried some meaning of "kinship," as it does today; with this in mind, it is entirely possible that where a number of kin-congregations of common derivation were located contiguously they were united into a larger unity, which was also localized in its own special marae. Henry's statement that it was "the men of the clan" who assembled for services at this kind of marae suggests that the wives and children of most of these

men had no direct access to it, as they had to their respective kin marae, where matters of importance to particular families continued to be conducted. On the other hand, we are not informed whether the marae of the larger unit was one set up separately from the marae of its constituent kin-congregations, including its source marae, or whether it *was* in fact the source marae. In the latter case, which seems to me to be the more likely possibility, there is a further unanswerable question: Did the source (now “supra-kin”) marae continue to serve the more personal, “domestic” needs of all the individuals whose kin marae it originally was?

Equally puzzling is the native label said by Henry to be attached to the unit she describes, that is, *va'a mataeina'a*. *Va'a* was the general term for *canoe*, as well as for a special kind of canoe, (see chap. 8). As for *mataeina'a*, the LMS Dictionary defines it as the subjects of a chief; a certain tribe, clan, or subdivision of the inhabitants. This is not much more helpful to our present inquiry than is the same source's definition of the composite word, *va'amataeina'a*, a division of the land owners. I shall consider this puzzling term later on in other contexts, but I must acknowledge that it does not help one way or another to throw light on the questions now concerning us.

Far more important than what label was attached to such supra-kin-congregations is the question of the social relations among their constituent branches—or perhaps more precisely, among the representatives of those branches. We are informed by Henry that they “assembled” on certain occasions; but we are not specifically told about the order of precedence that prevailed among them on such occasions. In fact, the only direct clue to the religious aspect of social relations among members of this supra-kin-congregation is Henry's statement that its marae was “presided over by a priest in *patriarchal* form” (1928:144 [italics added]). I take this to mean that this office was none other than chief of the source unit of the several kin-congregations represented, whose rights and duties I have previously discussed.

More light is cast on this supra-kin-unit by a passage from de Bovis, which I reproduce in full:

Religious neutrality [*le culte neutre*] was a peculiar custom which serves to demonstrate that the natives of this archipelago were at a level of civilization far superior to that met with among any of the savage peoples one meets with, from the western part of the Americas to New South Wales.

We have already pointed out that the marae was a type of family property, and that its king [*roi*] oftentimes bore the title of tribal chief [*chef de race*]. When he was absent his brother or his son or some other close relative substituted for him, and even the most remote [*éloignés*, space or kinship?] members of the family were accustomed to speaking of it as “our marae.” Now if it transpired that the brother of a reigning prince married someone far away and became chief or

king in a different district or even in another island, he would nevertheless continue thereafter to call it "our marae," when referring to the marae where his father ruled, and he never failed to return there to worship whenever circumstances so permitted and when certain ceremonies took place. He would have grieved not to have been able to do so. When he died his son inherited the right of sitting in the marae side by side with the reigning king, and on a basis of near equality with the latter.

Thus it came about that two or three families, scattered about in districts as far apart as the outer limits of the archipelago but more typically living on neighboring islands or on the same island, were in possession of equal rights in one and the same marae, where they convened to worship on certain occasions. This circumstance did not stop such princes of common origin from making war on one another; it merely resulted in hostilities being suspended at certain times. And when such enemies met together in this common marae, neither party attempted to take advantage of the temporary armistice. Many maraes occupied positions like the one just described. (1909:57-58)

Without subscribing to de Bovis' use of labels like "king" and "prince," or to his flattering evaluation of Maohi "civilization," his generalization otherwise strikes me as being highly plausible, even in its emphasis on the offices he labels "kings" and "princes." For it is my opinion that an individual Maohi's view of his membership in kin-congregations differed, probably, according to his status in his own local kin-congregation—that is, it was only those individuals who held higher-grade offices (and perhaps other members of their immediate families) who remained aware of and occasionally made use of the wider ramifications of their kin-congregational ties. In other words, for most members of any kin-congregation their local unit was their whole church; only a few saw or treated their local unit as a branch of a larger unity.

Finally, at this point one might be led to inquire about the connection between kin-congregations and the cognatic stocks I discussed earlier. At first appraisal these two kinds of social units and their various subunits would seem to be merely two different ways of looking at the same thing, and perhaps some Maohis also viewed them in this way. But what I wish to make clear is that we cannot be certain that this was the view of all or even most Maohis, and our concern at present is with the way the Maohis themselves viewed their society. Even most of the individuals holding kin-congregation offices—who were as a rule well informed about their ancestral "lines," both in terms of individual ascendants, historical and mythical, and of source marae—even these were not likely to have looked upon remote, "collaterally" related congregations as being populated by relatives of such and such degrees of consanguinity.

Still another kind of locational change undergone by kin marae and their human associates may be labeled *colonization*, to distinguish it from the process of *partition* just considered. In what I call *colonization*,

one or more members moved entirely beyond the congregation's territorial boundaries and staked off territory elsewhere, formalized by establishment of a new marae whose derivation from the source one was substantiated by incorporating within the former a stone from the latter. But the accounts are somewhat ambiguous. Some of them state or imply that these "founding stones" were taken from the walls of the source marae and were embodied in the offshoots as "cornerstones." According to other accounts the new marae were usually "founded" with colonizers' uprights (i.e., backrests) taken from the old marae and presumably used as uprights, and not as "cornerstones," in the new one. The ambiguity derives from the fact that in some accounts no distinction is made between construction stones, which symbolized a whole marae, and uprights, which usually symbolized kin-Titles or other marae offices. In some cases the two may have been synonymous, but not in all.

I shall not even attempt to reconstruct the myriad private motives which led individuals to leave their home kin-congregations, eventually to establish new homes (and new kin-congregations) elsewhere; for present purposes it is sufficient to distinguish between deliberate and accidental colonization.

Deliberate colonization was not unusual even during the Late Indigenous Era, and it must have been a common solution to overcrowding during the eras before most parts of the Islands became inhabited and staked out. In the later era, after all areas had been claimed by some unit or another, members of some kin-congregations continued to try to carve out new domains elsewhere—to escape troubles at home, to better themselves socially or materially, to extend the home congregation's political influence, or even in a spirit of adventure and discovery. In some of the less politically motivated instances it may be that the new colony made no effort at all to maintain connections with the home congregation, but such episodes are of course unrecorded. In any case, our present concern is with colonies that deliberately maintained a symbolic link with the home congregation, by incorporating a stone from the source marae into their new one.

It is likely that some colonization also resulted from accidents—say, by a canoe load of congregation mates being stranded on a foreign shore and then deciding to stay; or, probably now and then, a canoe load made up of members of two or more different, and even "unrelated," kin-congregations combined forces on some foreign shore to establish a common marae which thereafter served as the temple of the "kin"-congregation made up of their immediate descendants. Although unable in such cases to embody a stone from the source marae in their new edifice, it would have been possible to maintain continuity with the home congregation by other means, including commitment to the same tutelary, active genealogical recall, and deliberate social interaction—which raises the question of the kinds of social

interaction that took place between a source congregation and its colonial offshoots. I shall summarize below some traditional evidence dealing specifically with some ramifications of the famous Opoa source congregation. The only general statements I have found that might possibly concern relations between far-flung colonial offshoots of common derivation are from de Bovis just given, and from Henry which I quote below.

It will be recalled that the LMS Dictionary definition of *'ati* clearly referred to a category made up of members of common descent: a *patronymic prefix* pointing out the name of the parent or ancestor with the descendants, as *Ati Iuda*, the descendants of (their father) Judah. In contrast, Henry's *'ati* (which she translates both as tribe and as denomination) seems to refer more to the devotees of a particular deity, and not just those descended from him:

The clans were thus classified into denominations which never displayed bigotry toward each other, as the gods belonged to one common category. The clans whose god was Ta'aroa were called 'Ati Ta'aroa, meaning "tribes of Ta'aroa"; those of Tane were called 'Ati Tane; of Ra'a, 'Ati Ra'a; of 'Oro, 'Ati 'Oro; of Hau, 'Ati Hau; of Tû, 'Ati Tû; and so on. Many gods were thus enshrined.

Strangers from other lands were cordially received at the social [i.e., "clan" or supra-kin] marae if they were of the same denomination as the people of the clan. So when they came and wished to offer gifts and thanks to their god for their safe arrival, they would enquire of the clan, "*E 'ati ha 'outou?*" (Of what tribe are you?) If the answer was favorable, they would say, "*Oia 'toa matou*" (That is the same as ourselves), and they were at once received with open arms; the priest officiated for them, and they were no longer considered strangers. (Henry 1928:144-145)

In other words, although it is possible that the Maohis recognized a larger unit, an *'ati*, composed of dispersed kin-and supra-kin-congregations of common derivation, it is also possible that membership in an *'ati* had to do more with common worship than with common derivation.

Then, of course, there is a third possibility—namely, that by Maohi reasoning the two kinds of unit were necessarily, or at least very probably, the same. With no system of writing available to help freeze tradition and inhibit invention, it would have been natural enough to broaden the assumption that "most kin-congregation tutelars were ancestors," into "all worshippers of the same deity were that deity's descendants."

Until now in this discussion of partition and colonization I have sought evidence of continuing connections between source units and their offshoots. It must also be noted that in some instances a deliberate severing of connections may have taken place. Despite Henry's statement that, "clans" of the same denomination "... never displayed bigotry toward each other," there is clear evidence that quarreling and open warfare among consanguines were deemed wrongful only in the most utopian of ideological terms.

In volume 3 I shall reproduce native traditions regarding such strife; at the moment I draw attention only to some slender but picturesque evidence of the act of severance. A passage from Henry (1928:122) relates how a famous Porapora "Prince," Te Fatu, traveled to neighboring islands dispersing valuable objects and customs of many kinds (e.g., sea urchins, athletes, lasting luxuriance). To Porapora itself he gave the sea snail, the sea cucumber, and "the mussel to cut off the end of the house of Havai'i" ("*... e u'u e 'oti'oti i te tara fare o Havai'i*"), which signified severing connections between Porapora's principal kin-congregation and its source congregation of Opoa (Ra'iatea).

Finally, another kind of locational change involving all or parts of the associates of kin marae was fusion whereby two previously distinct units were joined together. In some instances this may have been accomplished by adding one unit's marae onto the other's; more typically it appears to have been effected by construction of a new and separate marae. Also, while it is conceivable that fusion may have been brought about by an alliance between friends, and while there is a tradition of its having been forced upon a defeated dynasty by the victors (T. Salmon n.d.), it was more typically effected by marriage—in which case a new marae was usually constructed either to substantiate the alliance of two important kin-Titles or to provide a more impressive structure for the heir in whom the two Titles were combined.

I write of fusion as if it involved a combination of entire kin-congregations. Actually the little evidence we have on this matter does not indicate whether whole congregations were so combined, or only some of the principal people from each. Nor do the sources indicate what happened with the old units upon establishment of a new, combined, marae: Were the old marae abandoned altogether or did they continue to serve some distinctive purposes of the allied but still partly separate congregations? The state of disrepair of some marae seems to indicate that most of their stones had been taken by the Maohis themselves to build new marae nearby. (As with other aspects of Maohi consanguinity, the data at our disposal provide more questions than answers.)

I turn now to consideration of locational changes of stone uprights, those slabs or columns set up in a kin-marae court and associated with congregational offices, either Titled or non-Titled. There are several references in the sources to such stones having been moved from one marae to another; I wish to inquire what this signified in terms of social-relational changes. But first, a few words concerning the beginnings and the ends of such stones, as objects of social interest.

I have come across no references to the initial establishment of a new stone upright, but suppose that there was nothing particularly intricate

or esoteric about the process. In my opinion, during the formative stage of a kin-congregation, stones were set up as needed, to accommodate the separation of offices, especially those assigned to new sons of the congregation chief. As noted earlier, the total number of uprights ranged from one to many. We have no way of knowing, however, which ones of these were associated with particular congregational offices. Sets of three or five seem to have been particularly common—for what social, aesthetic, or metaphysical reasons I do not know.

We are somewhat better informed concerning the ultimate fate of stone uprights. When the particular office associated with an upright became vacant—typically through death of an incumbent without successors—the upright seems to have become a ‘memorial stone’ (*ofa’i manava*) and served thenceforth as the resting place for the visiting ghost of some former incumbent (whether of the last incumbent, or the most famous one, or even of the ghosts of all past incumbents is not clear). In this connection, it is possible that some uprights may have been deliberately left vacant, as permanent memorials to especially revered officeholders, with new uprights having been set up to accommodate their successors in office.

There are also some clues concerning the uprights left vacant through the peregrinations of the human associates of the stones. The sources indicate that the officeholder in question was entitled to resume his association however long he remained away—or in the event of his death, that a lineal descendant of his could do so upon satisfactory demonstration of his pedigree. There may also have been situations in which an office, and its upright, was subject to conflicting claims, by a local incumbent and by a claimant from abroad; but I have no information about this or about the principles or processes by which such issues were decided. It is even conceivable that “memorial-stone” uprights may accordingly have been “reclassified” to accommodate a claimant from abroad, or even to serve a new office; but no accounts of such happenings are known to me.

When whole marae were moved from one location to another the uprights were probably moved with them, but that situation has already been discussed. Our present concern is with the upright moved to a different marae. Except in cases of fusion it is likely that the only uprights that were so moved were those associated with offices having only general functions. Such moving usually took place when a kin-congregation was subdivided, or when a colony was established elsewhere—situations which have already been discussed and which entail no particular incomprehensibility, except the ambiguity, noted above, regarding the type of stone that constituted the “foundation stone” of new marae. What is puzzling, however, is the situation resulting from transfer of an upright from one kin-congregation marae to another, already-established one.

I have already recorded my notions concerning the creation of kin-Ti-

titles, that special kind of kin-congregation office embodied in a proper name. I suppose also that many Titles must have passed into limbo for lack of qualified successors, although the possibility of reincumbency by claimants from elsewhere appears to have been generally recognized and sometimes realized. I have described situations in which the kin-Title itself remained in its own marae while its incumbent resided elsewhere. This occurred mainly with individuals holding two or more kin-Titles in as many different kin-congregations. In such cases as these it was customary for the incumbent to be invested in each Title, separately, in its own marae. The sources are not explicit on this point, but it is quite possible that an incumbent was expected to validate each Titleholding by means of occasional visits to each Title-containing marae.

But what about special moves, not of Titleholders but of Titles themselves? In moves involving whole kin-congregations the Titles, of course, also moved. In the process of partition some kin-Titles probably accompanied the separatist group; and with colonization this was demonstrably the case. As for fusion, although kin-Titles themselves could not have become merged so long as they remained associated with separate marae, there is a distinct possibility that in some instances of marae fusion some kin-Titles of each constituent were combined—not in the sense of being held by the same individual but of becoming actually merged into a new unitary marae. This may also have occurred in the case of non-Titled kin-congregation offices, although I have found no specific evidence on this point.

The kind of kin-Title transfer that appears to have taken place occasionally, and that is most difficult to comprehend, is the one wherein a kin-Title was installed in an established marae having no apparent “genealogical” connection with its former “container.” One possible explanation for this “anomaly” lies in the versatility of the Maohi custom of “adoption,” and in the frequency of its occurrence. Adoption of individuals into family congregations appears to have been a common practice, as a passage from Henry attests; if such an adoptee happened to have a kin-Title it is possible that the Title may also have moved. Another possible explanation for such a move lies in the importance which some Titlebearing descent lines seem to have achieved, almost to the point of being semi-autonomous social entities, enhanced more by the individuals holding them than by their association with specific marae.

THE OPOA COGNATIC STOCK

Leeward Islands

Traditions regarding the founding of specific kin-congregation marae are almost wholly limited to those identified with a few families who enjoyed highly privileged social positions during the eras under study.

By the time Europeans came onto the scene most of these marae had become “tribal” in character (or, in Henry’s terms, “national”). As for most other kin marae (and there must have been hundreds), accounts of their origins and derivations have been lost forever—either through political eclipse of their associated Titles, or extinction or dispersal of their congregations, or lack of European interest. For example, virtually nothing is known about the marae traditions, or anything else, of the Maohis living on Greater Tahiti’s eastern coast. Except for a brief stay by Bougainville’s ships and an occasional visit by reconnoitering ships’ officers and missionaries, few facts were collected about this extensive area. And while it was undoubtedly less densely populated than some other parts of the island, the role in island affairs played by its principal kin-congregations cannot have been so inconsequential throughout history as the blank record might imply.

By the middle of the eighteenth century there had crystallized a body of tradition which attributed social preeminence and highest antiquity to an interrelated set of marae established on Ra’iatea but with offshoots on nearly every other island in the archipelago. Indeed, according to Emory, “The whole of [traditional] Leeward Island history is built on [these marae]” (Marae Traditions). Accounts of this set of marae and of its associated Titles and Titleholders were set forth in numerous myths, genealogies, and “family chronicles.” Nowadays, most anthropologists have given up trying to read “real history” into such data (not only as a hopeless task but as an inappropriate kind of exercise), and the accounts I am discussing are characterized by so many inconsistencies that it is difficult to distill from them even a common thread of fiction. Such efforts have been made, however, and I present in figure 16-1 and table 5 information based on the most ambitious synthesis attempted to date, that of K. P. Emory (Marae Traditions).

In presenting this version I do not imply that it is the “correct” one, historically, but it does have the virtue of a certain amount of chronological consistency. In any case, to avoid the appearance of dogma, I intersperse a few versions markedly different from the ones accepted in Emory’s synthesis.

I devote considerable space to these traditions because they are virtually the only data we have bearing on how the Maohis conceptualized connections between marae and kin-congregations of allegedly common derivation. As the reader will see, some of the passages quoted throughout the rest of this chapter contain references to subjects not yet touched upon in this work, and hence somewhat incomprehensible at this stage of my exposition. But rather than pause to explain such matters at this time, I shall return to them in later chapters, and I request that the rest of this chapter be read only for what light it can throw on the topic now under consid-

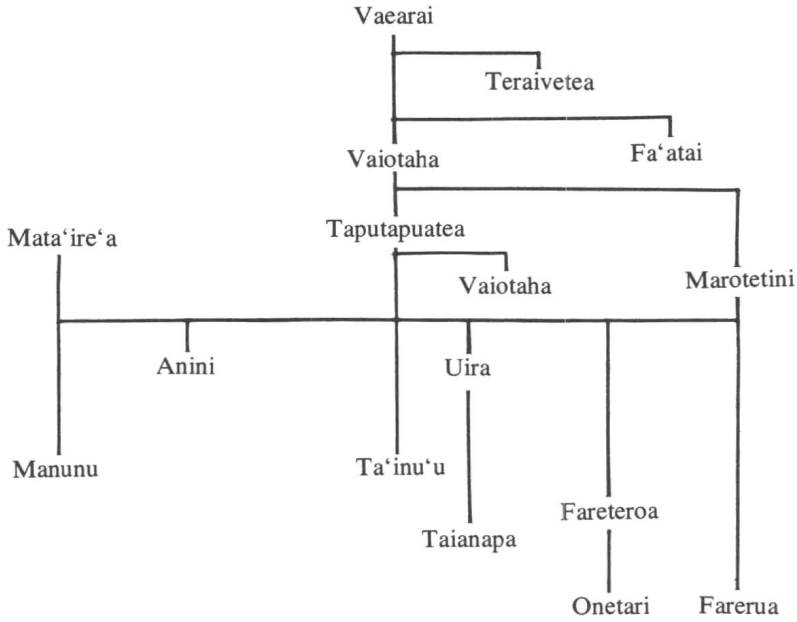

FIGURE 16-1. Traditional relationships of certain Leeward Island marae (according to Emory).

eration—namely, on the “mythical charters” that had been formulated to “explain,” and doubtless lend weight to, the society-wide prestige enjoyed by a set of kin-Titles allegedly derived from Opoa.

VAEARAI (RA'IA TEA)

Different traditions attribute the founding of marae Vaearai to 'Oro (a son of the god Ta'aroa), or to Ta'aroa himself: Ta'aroa first broke through the sky here and placed his foot upon Vaearai (Handy 1930:84).

Vaearai was situated in Opoa Valley, Ra'iatea, about a mile inland. According to Emory's calculations it was founded about forty, twenty-five-year generations, or one thousand years, before 1900. Some eleven generations later its kin-congregation abandoned this site and moved nearer the coast and constructed new marae with stones from Vaearai.²⁴ One of these, Fa'atai (called also Afa'atai), does not figure importantly in recorded tradition; the other, Vaioletaha, built on Matahira Point, achieved far-reaching fame.

VAIOTAHA (RA'IA TEA)

This marae is said by some accounts to have been founded by a grandfather of Hiro of the Vaearai family (see below), and it had for its major

TABLE 5. Traditional chronology of certain Leeward Island marae (according to Emory).

Marae	Location	Generations before		Comments
		A.D. 1900*		
Vaearai	Ra'iatea	40		
Teraivetea	Ra'iatea	—		
Vaiotaha	Ra'iatea	29		Founded in the time of Hiro's father.
Fa'atai	Ra'iatea	—		Founded about the same time as Vaiotaha at Opoa.
Taputapuatea	Ra'iatea	26		The name was in existence at least two generations after Hiro, for, according to Rarotongan genealogies, one of his grandsons bears the name. Taputapuatea is a name taken on by Vaiotaha marae when it became the center of an international alliance. It may have been rebuilt at the time, by Hiro.
Mata'ire'a	Huahine	—		An ancient marae, which was probably converted into a marae of the Hui Arii when they first succeeded in establishing themselves on Huahine Nui.
Vaiotaha	Porapora	25		Founded or created a royal marae by Hoataatama, great-grandson of Hiro.
Marotetini	Porapora	20+		Founded by a chief from Vaearai marae. Was in existence in the time of Unutea.
Anini	Huahine	—		Established after the time of Hiro and by one of his descendants. Hiro was venerated at this marae.
Uira	Taha'a	—		
Ta'inu'u	Ra'iatea	20		Erected after the time of Hiro.
Manunu	Huahine	15		Seems to have been built in honor of Hotohiva, daughter of a Ra'iatean high chief.
Taianapa	Taha'a	20		Founded by Unutea.
Fareteroa	Taha'a	—		
Onetari	Taha'a	13		Its ancient name was O'omo'o.
Farerua	Porapora	13		Was erected by Tefatuiarua, and seems to have become the representative of Marotetini marae, which it is sometimes called.

*Dates are reckoned on the basis of twenty-five years to a generation.

tutelar the sanguinary god 'Oro. By this time the principal people of Vaio-taha had begun the practice of wearing girdles decorated mainly with red feathers, the famous *maro 'ura*, as distinctive emblems of their kin-Titles. Also, according to the accounts on which Emory's synthesis was based, the entire kin-congregation of Vaearai-Vaiotaha, or at least its principal families, were known as *ari'i—te fēti'i ari'i*, 'the *ari'i* kinfolk', one of three meanings imputed to this term by some students of Maohi society.

After about three generations, according to Emory's reconstruction, Vaio-taha was enlarged and its name changed to Taputapuatea, in line with its change of character from a narrowly "family"-associated marae to one of "tribal" or even "supratribal" affiliation. (The semantic logic of this name change is not explained.)

Henry provided an entirely different version of the antecedents of Vaio-taha:

At a very remote period, before 'Oro was born at Opoa, it [Vaio-taha] was the national marae of Hava'i (Ra'iatea), named in full, Tini-rau-hui-mata-te-papa-o-Feoro (Fruitful-myriads-who-engraved-the-rocks-of-Feoro), but it was briefly called Feoro, and to it were attached eight memorial stones which represented eight kings who had reigned over the land, and which became eight symbols of the royal insignia of the kings and queens in long succession afterwards. The stones were named, Te-iva (Somberness), Feufeu (Reserve), Nuna'a-e-hau (Peaceful-multitude), Te-ata-o-Tu (The-cloud-of-Stability), Manava-taia (Conscience), Huia-i-te-ra'i (Piercer-of-the-sky), Paie-o-te-fau-rua (Supporter-of-twice-chief), and Tera'i-pua-tata (The-sky-with aurora).

When 'Oro, god of war, was born of Ta'aroa and Hina-tu-a-uta, at Opoa, his father gave him Opoa with the marae, Feoro, as his home. So he soon waxed very great, and the people of all the land and beyond the shores of Havai'i acknowledged him as the supreme god of the earth and air. The name Feoro was changed to Vai-'otaha (Water-of-the-man-of-war-bird) which, in addition to their local names, became the clerical name of all marae dedicated to 'Oro, because the man-of-war bird was 'Oro's shadow [*ata*], and the water meant human blood. 'Oro's high priest at Opoa was named Tiri (Throw-out), meaning extension of power and also nurse of the god.

The image of 'Oro in this marae was woven with fine sennit into the shape of a man, two or three feet long, and covered with red and yellow plumage. It wore a girdle of red feathers. The title 'Oro-marō-'ura (Warrior-of-the-red-girdle) was given to it, associating 'Oro in his earthly capacity with the highest royalty. (1928:120-121)

TAPUTAPUATEA (RA'IA TEA)

According to de Bovis, this great complex of temples was founded by Hiro, who came in time to be one of its major tutelars. (This same Hiro was honored elsewhere as the special tutelar of thieves.) Emory reconstructed its lay-out as shown in figure 16-2.

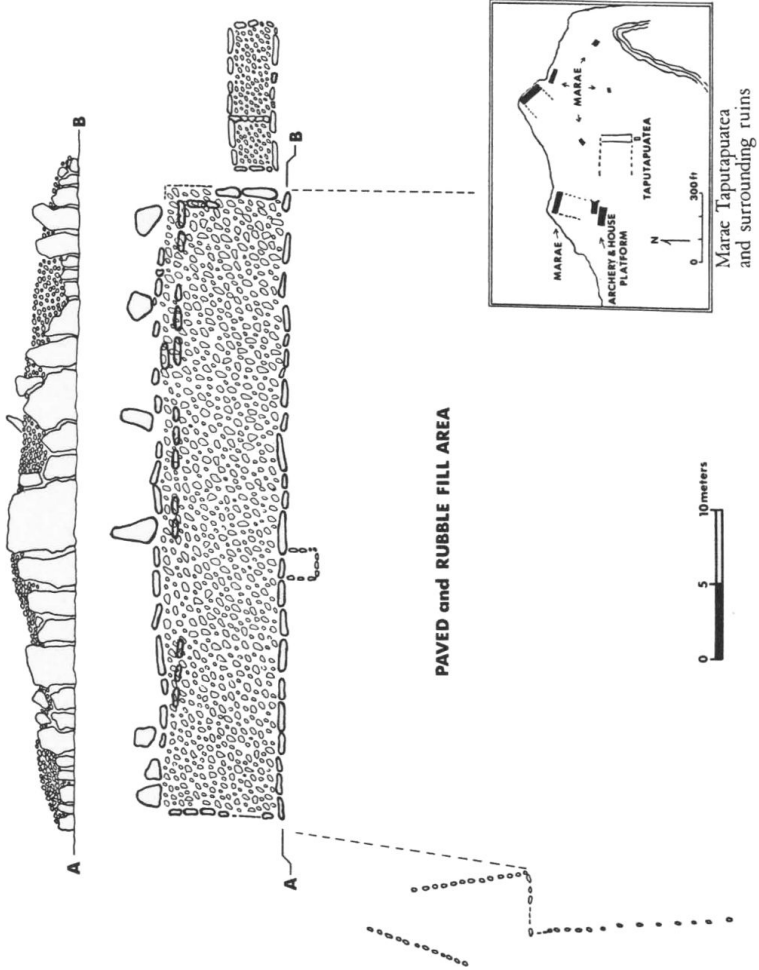

FIGURE 16-2. Marae Taputapuātea, Opoa, Ra'iātea.

Here is how an early visitor described this awesome place:

We have just returned from a visit to Opoa, the metropolis of idolatry, not in Raiatea only, but throughout all the South Pacific Islands, within a compass of five hundred miles. Hither, from every shore, human victims, ready slain, were sent to be offered on the altar of Oro, the god of war, whose principal image was worshipped here, with the most bloody and detestable rites. To describe the various maraes and their appurtenances, the priests and their sorceries, the sacrifices, feastings, and fightings of the votaries, at this hideous rendezvous, would only be to exhibit, in aggravated language, scenes of disgusting horror, similar to those which have, too frequently perhaps, already occupied our pages. Opoa was also the residence of the kings of this island, who, beside the prerogatives of royalty, enjoyed divine honors, and were in fact living idols among the dead ones, being deified at the time of their accession to political supremacy here. In the latter character, we presume, it was, that these sovereigns (who always took the name of Tamatoa) were wont to receive presents from the kings and chiefs of adjacent and distant islands, whose gods were all considered tributary to the Oro of Raiatea, and their princes owing homage to its monarch, who was Oro's hereditary high-priest, as well as an independent divinity himself. Happily nothing but the ruins of maraes remain, and Opoa, flourishing in all the unpruned luxuriance of tropical vegetation, is one of the loveliest and most peaceful spots in all these regions of beauty and fertility. (Montgomery 1832:II, 126-127)

As indicated in this passage, Taputapuatea came in time to have several separate but interrelated functions:

1. It, or at least some parts of it, remained the kin-congregation marae of one of the Vaearai-Vaiotaha descent "lines" whose principal Title eventually became Tamatoa.
2. It became the principal marae of the whole tribe ruled over by chiefs in the Tamatoa line; that is, its congregation probably came in time to include many individuals not descended from Vaearai-Vaiotaha families.
3. It served as source marae for descendants of the Vaearai-Vaiotaha people who had left Opoa and settled elsewhere. Presumably some of these latter returned there occasionally, to worship together, but not, as far as I can discover from recorded traditions, to render obeisance and tribute to the current Tamatoa.
4. According to certain traditions, it also served as an assembly place for the periodic meetings of an intertribal alliance devoted, among other things, to the worship of 'Oro.
5. It became the principal cult center of the Arioi sect.

Even before Vaiotaha grew into Taputapuatea, some members of the Vaearai-Vaiotaha families—"junior chiefs" said Emory—moved to other islands and established offshoot marae: Marotetini and another Vaiotaha on Porapora, and Mata'ire'a on Huahine. Thereafter these three, with Taputapuatea, "... became the head Maraes [of the Leeward

Islands; see fig. 16-3] ... chiefs whose genealogies started from these taking always first rank" (T. Salmon n.d.: 4).

VAIOTAHA (PORAPORA)

This marae was, according to Emory, founded with a stone from Vaearai and by a man named Hoataatama, who instituted the wearing of a yellow, instead of a red, feather girdle as emblem of his line, to show his independence of Opoa.²⁵ Still another account of the founding of the Porapora Vaiotaha describes the event as having taken place, during the time of the gods, to honor the birth of the first *ari'i* on that island, one Tiria mata o Vavau, who was the offspring of a stone and a cliff (T. Salmon n.d.).

MAROTETINI, OR FARERUA (MAUTAU POINT, PORAPORA)

According to one tradition reported in Emory, Marotetini was founded with a stone from the Opoa Vaiotaha—its founder, one Mara'a-ari'i, having left Ra'iatea after a quarrel over use, or misuse, of "royal" insignia. The derivation of Marotetini from the Ra'iatean marae was believed by Emory to be

FIGURE 16-3. Principal marae of Leeward Islands.

confirmed by the fact that both of them have an *ahu* of exactly the same length and lie in the same north-south axis "... in a region where orientation of maraes is not a practice" (Emory, Marae Traditions). Emory believed that Marotetini was the principal marae on Mautau Point and Farerua was its offshoot, but in time the two structures were combined into a single marae complex.

Differing stories about the founding of Farerua itself provide a good example of the variability of Maohi traditions: (1) Two brothers worshiped at Marotetini. The elder stayed at Marotetini while the younger pulled up his stone, went to the point, built Farerua, and there started a new kin-congregation, called Pa, whose special tutelary was the god Ra'a; (2) It was founded by Te Pevaari'i of Marotetini marae who gave it the name Farerua because of the two houses (*fare rua*) built nearby for his two wives; (3) It was founded to celebrate a new family alliance (and a new descent "line") established through the marriage of a Poraporan "princess" and a "prince" from Rotuma (not, said Emory, the Rotuma west of Fiji but a forgotten name of one of the Cook or Austral islands). The marae was called Two-houses because of the two families thus united.

The subsequent "history" of these important Porapora marae reveals something of the interplay between "consanguineal" and "tribal" ideologies. I reproduce below an excerpt from T. Salmon's "The History of the Island of Borabora, and Genealogy of our Family from Marae Vaiotaha," but postpone discussion of this matter until later. The hero of the piece, Teihotu, was the highest-graded Titleholder of Marae Vaiotaha (Porapora), and the events set down are calculated to have taken place during the early years of the eighteenth century:

In Teihotu's reign happened one of the greatest events in the Government of Borabora, he having been obliged to absent himself from his island to fight and keep his possessions in peace; his people were jealous, and those who represented him at home created a new state of affairs, the principal ones being to cut down the austereness of everything concerned with Marae Vaiotaha. The Talmas [obviously a typographical error, for *tahu'a*] of Marae Farerua claimed to be of the same rank as those of Vaiotaha. They waited for Teihotu's departure, and at once started the revolt. The precincts of Vaiotahu could not protect any one. [Its nature as a sanctuary was violated.] Before the messengers could reach Teihotu, who was fighting at Teraitoa at the time, the rebels had gained the victory. He, however, returned, and on arrival found an army ready to give him battle at Faanui, the principal stronghold of the insurgents. He arrived at home at night, bringing only a few of his warriors; the enemy next morning marched against him. Teihotu made his preparations on his arrival and arranged at early morn he would make his attack. He said, "The sunrise on Mount Para must not hide the heads of my spears from my enemies." Before starting he took his son from his mother's arms, and held him to his men, saying, "My men of Vaitape and Vaiotaha, here is your chief; look at him well, for you will have occasion to remember, I go to fight for the glory of Vaitoha." His warriors requested him to fight in the

rear ranks. "No," he replied, "Teihotu has only one place in battle, and that leading." He gave the word to march and kissed his son. He led his men so fast that but few could keep up; over the hill he went just as the sun was rising over Mount Para. His enemies were ready for him; knowing his recklessness they had laid an ambush, only one chief showing himself; he taunted him to come on and fight a single combat; this chief's name was Taeaetua. Teihotu accepted at once and ordered his men not to advance any further and follow him. He came on, Taeaetua backing all the time till he got him well amongst the ambushed warriors; these surrounded him. Teihotu fought as no other chief of that time, and killed several before he received his death wound. His men were doing their best, but their enemies were so superior in numbers that all were killed. They called the dead chief Teihotu matanevaneva, glancing eyes. They took his body to the beach, where it was exposed. His boy and girl were sent to Fahaa. The revolt was then complete, and the Marae Farerua became first Marae of the Tevaitapu Government. To do this, however, they took the principal stones from Vaiotaha and reconstructed Marae Farerua. These stones were, the one representing the head or eldest family; it is a stone of 6 feet by 4 feet, standing (for these stones still exist) on the right and left, two stones each, in all five. There are five families from which head chiefs sprung and directed the Government. The rebels, when they elected the head chiefs, could not find a single member of these families amongst them, for all of age had gone with Teihotu to fight at Rarateam [*sic*], some having stopped behind fighting when he returned.

Taeaetua, the usurping chief, proposed himself, saying, "I killed Teihotu; mine is the place." The Tahu'as disputed this, and by underhand means ordered his death. The men of Faanui then made a proposal that if Teihotu's son would come back they would accept him, only he must take the name of Puni—and this name was the head name for Marae Farerua—and govern under Teraitapu rule. After long discussions, and to prevent civil war, the young chief was counselled to accept. The Taiateans were at the bottom of the whole affair. The young chief returned and was crowned, not at Vaiotaha as of old, but at Farerua.

Teihotu mataroa, or Puni, took to wife Tetuanui, Borabora; born of them, Tetuanui marua ite rai. The name of the island was changed from this time, as well as the Government and name of governing chief. It became [respectively] Borabora, Puni, and Teraitapu Government. For the birth of the first chief under the Teraitapu Government they built the Marae Marotitini, and declared that only the first-born of the eldest branch could be crowned in it; the second branch taking the place of the first in case of no representative, and so on through the five branches. (T. Salmon n.d.: 25-29)

Two other Porapora marae listed in Emory's "Marae Traditions" are Nonohaura and Faretai. There exists a genealogy for the former going back nineteen generations (before 1900), but it does not appear to be connected, genealogically, with the Vaearai-Vaiotaha set. Faretai marae has completely disappeared, and no genealogies have been discovered to connect it with known marae or family lines, but one account claims for it an antiquity as great as that of Vaiotaha (Porapora).

Of the thirty-five or so marae on Maupiti (Emory 1933:167) only two are the subject of recorded traditions which might possibly link them with the Vaearai-Vaiotaha set. One of these, Teparoa, was said to be the oldest, and appears to have been the kin-congregation marae identified with the

Title Tu-Nui-Paia-i-Teparoa, whose incumbent is characterized by Handy as an *ari'i* (1930:108). According to information collected by Handy from informants in 1923, Marae Teparoa was founded sixty-two generations previously by the god Te Tumu O Te Papa (The-foundation-of-the-rock) (1930:108).

The other such marae on Maupiti was Vaiahu, the island's only "national" one, where "tribal" ceremonies took place (Handy 1930:108). (Actually, Teparoa and Vaiahu were only about one hundred yards apart, and probably parts of the same complex.) I can discover no specific traditions concerning Vaiahu's founding, but it, along with Teparoa, was regarded as having had connections with Vaearai-Vaiotaha, or so a legend collected by Ropiteau would appear to imply. I quote only the most immediately relevant part of this "Story of the Rock Called Tatuapuha":

A king [*roi*] of Maupiti happened to wed a woman not of "royal" blood [i.e., not an *ari'i*]; the populace, angered by this act, thereupon sent the "royal insignia"—what these were is not specified—to Opoa (Ra'iatea). Later on, tiring of being without a king, the populace sent a delegation to Opoa to retrieve the royal insignia. Arriving there, one of its members, Hataiaiu, was interrogated in the following way by Tu, the King of Ra'iatea: "Where do you come from?" "From Maupiti," responded Hataiaiu. "But are you really from Maupiti?" Tu asked. "Yes," said Hataiaiu. "Then what is the name of your marae?" Tu inquired. "It is Vaiahu," Hataiaiu replied; whereupon Tu realized that he was indeed of "royal blood," so helped him to procure the royal insignia for Vaiahu marae, thereby saving it from being captured by members of the delegation who wanted it for other Maupiti marae. (Ropiteau 1932:128-129)

By European times Maupiti had become politically subordinate to chiefs of Porapora, but there is no recorded tradition of which I know that bases this relationship on consanguineal ties.

To return to Ra'iatea, Emory also placed marae Ta'inu'u on his chart, indicating it to be linked with the Vaearai-Vaiotaha set. Ta'inu'u, the largest recorded marae on Ra'iatea, is at Tevaitoa, on the island's west coast. Handy asserted that this was the only district on Ra'iatea besides Opoa that was "ruled by an Ari'i family. I have never been able to find out," Handy continued, "just what was the relationship between the family here and that at Opoa, beyond the fact that Tevaitoa was autonomous. The Tevaitoa family was related in some way to Rarotonga." (1930:91)

Henry was more explicit about Ta'inu'u—perhaps too explicit to be entirely credible:

Rarotonga is an offshoot of Tahiti, and intercourse between the two peoples has always existed. When the royal family of Rarotonga became numerous, they decided to strengthen their ties with the royal house of Opoa. So a prince named Poiriri (Shades-of-night) took a marae stone and accompanied by two princesses, Te-unu-tai-ahu (The-image-on-walled-sea), and Te-unu-tai-marae (The-image-on-marae-sea), and a retinue becoming their rank, sailed

to the southwestern coast of Hava'i [Ra'iatea]. They landed at a point named Tai-nu'u (Moving-sea), where they were kindly received and allowed to establish themselves and build their marae. These high personages intermarried with the royal family of Opoa and thus consolidated forever the relationship between the royal houses of Rarotonga and the Society Islands. Since then other matrimonial ties have been formed. (1928:121-122)

During the eighteenth century the three most important marae on Taha'a were Taianapa, Onetari, and Ahuroa. According to Handy, Onetari was the "original" marae of this island, having been founded as an offshoot of Vaearai (1930:93). In Emory's reconstruction, however, Onetari was established only some thirteen generations before 1900, but was a continuation of an older marae named Fareteroa, or O'omo'o, whose connections, if any, with Vaearai-Vaiotaha are not recorded. Taianapa was also linked to Vaearai-Vaiotaha, having been founded by Unutea, a famous "princess," some seven generations after Hiro, that is, after the traditional date of the transformation of Vaiotaha to Taputapuatea. Notwithstanding the asserted Vaearai-Vaiotaha links of Onetari and Taianapa, it was Ahuroa that was the "national" (i.e., principal "tribal") marae of Taha'a. According to Henry, Ahuroa was consecrated to the god Tane, but Emory and de Bovis stated that 'Oro worship was subsequently established there.²⁶

Extensive traditions have been recorded for only two of the numerous marae on Greater Huahine:²⁷ Mata'ire'a, located on a hill overlooking the central part of Maeva settlement, and Manunu, located on the narrow peninsula north of the lagoon around which Maeva settlement was built. By the eighteenth century both had become "tribal" in character, but are traditionally associated with families whose genealogies lead back to Vaearai. According to one account Manunu was built in the eighteenth century, and Mata'ire'a shortly thereafter (Chesneau 1928), but all other accounts accord them much greater antiquity and give priority to Mata'ire'a. According to Salmon, Mata'ire'a was one of the original offshoots of Vaearai-Vaiotaha (along with Vaiotaha and Marotetini on Porapora), and, as stated above, hence one of the four most venerable marae of the Leeward Islands, ... "Chiefs whose genealogies start from there taking always first rank." Emory, on the other hand, concluded that it was founded even before Vaearai-Vaiotaha people had reached Huahine, and that these latter took it over upon arrival.

The founding of Manunu provides another useful example of the variability of Maohis' suppositions about their own past. The first version I quote appears in the introduction to the LMS Dictionary:

The Rohu Atua [history of gods] gives the following account of the titular god and royal family of Huahine.

Tutapu and his wife dwelt on a land called Puatiriura. They had an only daughter, Hotuhiva. No husband was to be found for her on her own land. Her

parents, however, were very anxious she should obtain one, and therefore put her in a drum, called Taihi, under the care of Tane and the god or idol Taputura, and sent her to sea. After sailing about for some time, they landed at Manunu on Huahine; which name signifies "cramped."

The spot was formerly called "Toerauroa."

Tane became the titular god of Huahine. The young lady, Hotuhiva, was married to a chief named Teanuimarua. They had two sons, Tina, and Hena, and they are considered to be the ancestors of the present chiefs." (p. iv)

The next version is taken from Henry:

Tû-tapu (Stand-to-pledge), a king of Ra'iatea at a very remote period, had a daughter named Hutu-hiva (Splash-of-clans [!]), who as a result of inspirational revelation was sent on a voyage in a great sacred drum to meet her future husband at Huahine. She traveled safely, coiled up uncomfortably in this way, and was borne upon the crest of a wave on to the shore of To'erau-roa (Distant-north), where stands the warriors' marae of that name. As she emerged from the drum she found herself crippled with numbness in all her limbs, for which reason the point was afterwards called Manunu (Benumbed).

It was not long before two warrior princes, named Tû (Stability) and Teao-nui-marua (The-great-world-overshadowed), approached her from the marae and bore her kindly across the lagoon to their home at Maeva; and in due time, she became the wife of Te-ao-nui-marua, of the first dynasty that reigned in Huahine, called Te-pà'u-i-hau-roa (The-excellent-waist-cloth).

She bore him ten sons, after whom the ten districts of Huahine-nui are named (1928:100)

Emory's version came from one of his own informants:

A chiefess, Hotuhiva, set out for Papenoo, Tahiti. Being badly received, called a *manahune* [commoner], she returned, landing upon Manunu Point. She then ordered her company to beat their drums. This attracted the chief and people of Maeva Village. When the chief saw her he had presents of food sent for her. Subsequently he built Manunu marae in her honor. (Marae Traditions)

The next version is a summary made by Emory from notes of Tati Salmon:

The wife of Tutapu was Tehaamahea, and their children were Hotuhiva, the older, and Roo and Tane. Hotuhiva was carried off and made to sleep with Manuarii i Vaiotaha. She was put into the drum Ipuipu-i-te-rai, with her brothers and set adrift to return to Matairea. When far out to sea, they were blown on to their land. The servants of Teanuimarua informed him of the arrival of Hotuhiva. He deserted his wife, Hotuaito, for her.... The two brothers who were put to sea became the gods Tane and Roo. (Marae Traditions)

According to a version collected by Ropiteau, the heroine of this tradition, Hotuhiva, was a native of Maupiti. She voyaged to Mata'ire'a, Huahine, riding on her drum, Taimoana. As she was arriving there (the actual spot where she landed was Paorie), Teanuimarua, the "king" of Maeva, who lived at Aiatupuna [ancestral source] with his pregnant wife, Hotuaitu, dreamed that someone was being carried by sea to Maeva. Un-

able to sleep after that, the “king” went to Paorie early in the morning and saw Hotuhiva sitting in the shade and somewhat wearied by her sea voyage. He took her and carried her inland and ordered his people to make a marae there for her. When it was completed he placed her on the marae, which he named Manunu. Upon hearing of this the “king’s” first wife became angry and left him, and he kept Hotuhiva as his principal wife. (This Ropiteauan version of the Hotuhiva legend will be taken up again in another context.)

Finally, there is a wholly different version recorded in Chesneau. During the years of the eighteenth century, after all Huahine had been brought under control of a single chiefly line there lived at Maeva a famous woman of that name who was sovereign of the whole island. From her marriage with Tuaroanuihau she bore four sons: Horohaehaa, Maruahitu, Matatoerau, and Tiriarii. After the disappearance of Tuaroanuihau the four children built a marae on Point Mata Toerau and consecrated it to the god Ta’aroa and his subordinates, Tane and Hiro. Since her “widowhood” weighed heavily upon their mother, Maeva, her sons named the marae Weariness (Manunu). Later on Maeva came across a large drum washed ashore near Manunu and a man who had arrived with it. This man was Terorohiti, a warrior chief of Matahiva (Tuamotu). Much taken with the new arrival, Maeva settled down with him and bore four more sons. (Chesneau 1928:60ff)

The most imposing marae of Huahine Iti (i.e., southern Huahine) was Anini, located at Tiva Point, the southern extremity of the island. Its principal tutelars were ‘Oro and Hiro. Handy stated that Anini served for the worship of ‘Oro and Hiro, and that it was an offshoot of Opoa. Handy also asserted that Little Huahine was “independent” (politically) until brought under the sway of the chiefs at Maeva. (1930:98)

Mai’ao island is described as having been a “dependency” of Huahine (de Bovis 1909:61), and one of its marae, Nu’utapu, has been labeled a *marae ari’i* (Verin 1962a:43); but I can discover no recorded traditions regarding its founding.

Traditions about events on Huahine subsequent to the founding of its principal marae will be summarized in a later chapter, but I reproduce here one recorded episode because of its reference to connections between Huahine and Opoa’s Taputapuatea.

According to some accounts (traditional, historical, and anecdotal, recorded by Chesneau from 1907 to 1914 and based largely on information from Marcantoni), all Huahine was, during the seventeenth century, under the sovereignty of the “Queen” Maeva (Maeva Vahine) noted above. After her death her eight sons—the four from her first husband, Tuaroanuihau, and the four from her second husband, the warrior-chief from Matahiva—claimed the right to succeed. They held innumerable

meetings but were still unable to decide upon a successor, so they agreed to go together to Opoa "... to request the *maro'ura* (red-feather girdle) of the High Priest of 'Oro." After building a canoe for the journey they obtained eight human victims, one from each of their districts, and traveled to Taputapuatea. On their arrival they presented the victims to the High Priest as an offering to 'Oro, who acceded to their request for some red feathers. (This account describes these feathers, synonymously, as *mana ura*, red power.)

Had the tokens been entrusted to one of the sons, as a way of selecting the one to be sovereign, the whole episode would be somewhat more comprehensible; but that was not the outcome at all. Instead, the eight claimants returned to Huahine, taking with them two newly acquired friends (*tau'a*)—presumably junior members of Taputapuatea gentry—who were of the 'Oro family," and they tried again to agree among themselves upon a successor. After months of stalemate they reached the compromise of offering the sovereignty to one of their new friends, but still they could not agree upon which one to offer the office. Finally, the more enterprising of the Ra'iatean visitors took matters in his own hands and seized power, through a combination of trickery and fighting. Thus, the token of connection with Opoa was arranged by "treaty" (actually, "bought" with human sacrifice), but social links themselves between Huahine and Opoa were established (or reestablished) by "friendship" pact and a combination of election and physical seizure of power. How such a connection was subsequently manifested is, however, not described.

Tahiti-Mo'orea

Emory revealed his interpretation of marae traditions on Tahiti-Mo'orea in the following straightforward statement:

The building of maraes of cut stone in contrast to selected water-shaped boulders on the points and along the shores of the Bays of Tahiti and Mo'orea, was the work of the ruling families of chiefs who styled themselves Hui Arii (the chiefly class), or Opu Arii (chiefs from the royal womb). Traditions point out and genealogies prove that these Hui Arii of the Windward Islands are the descendants of invaders who married with the local people and set up the dynasties ruling when the Europeans came upon the scene. (Marae Traditions)

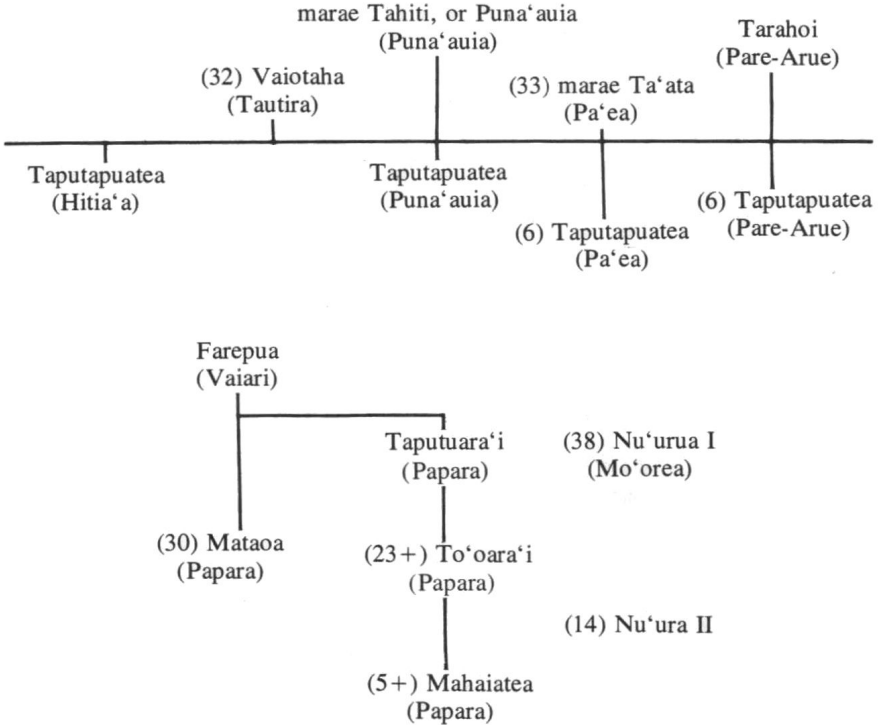

According to this interpretation there were numerous "pre-*ari'i*" marae on these islands, some of them of considerable antiquity and associated with families of great strength and influence, but in the course of time the more important of these acquired Opoa connections through marriage of one of their members to an Opoan. Other Tahitian and Mo'orean marae labeled by Emory as having been "most important" were founded directly by "colonists" from Opoa itself. (The list of "most important" Tahitian marae given by Adams and Baessler agrees closely with Emory's; this should not

occasion surprise, since the ultimate source of information of all three of them was the same Papara family of Ari'i Ta'ima'i, Marau, and Tati.)²⁸

I reproduce in figure 16-4 Emory's diagram illustrating his reconstruction of connections between these "most important" marae, the locations of which are shown in figure 16-5.

Other marae, apparently belonging in the formative period of the Hui Ari'i, were Ahurai (Fa'a'a), Hitia'a (Hitia'a), Fareroi (Ha'apape), Utuai (Pa'ea), and Umarea and marae Tefano (Mo'orea).

Most accounts agree in calling Farepua, of Vaiari district, the oldest, most revered marae of Tahiti-Mo'orea. With its principal Title, Te ari'i nui o Tahiti, went the privilege of wearing the *maro 'ura*. According to information supplied by Marau to Handy, the founder of the line of Vaiari chiefs (and presumably of their marae, Farepua and closely connected marae Tahiti) was Tetunae, who was a great-grandson of the (star) god Venus (*Taurua horo po'ipo'i*) and his mate, a daughter of Ta'aroa. (Tetu-

Note: Figures enclosed in brackets represent number of generations before A.D. 1900.

FIGURE 16-4. Traditional relationships of some important marae of Tahiti and Mo'orea

FIGURE 16-5. Principal marae of Tahiti-Mo'orea.

nae's connections with Opoa are not explicitly mentioned but are strongly implied.) During the next five or six generations after Tetunae, other individuals—*ari'i*—with Opoan antecedents are said to have spread through Tahiti and set up several other "royal" [*ari'i*] marae. (Emory, Marae Traditions)

Adams pointed out that the Title Te *ari'i nui o Tahiti* (The Great *Ari'i* of Tahiti) did not proclaim its holder to be the sovereign of all the island (1901:16). Handy appeared to imply in one place that Tetunae, or rather his descendants, acting in council, were in a position to govern all Tahiti (1930:70); but even the possibility that the island was ever subject to unified control in pre-European times is not recognized in any other "traditions" of which I know.

The only other Tahitian marae of that earlier era having a *maro 'ura* Title (*Te atua nui e maru ae i te ra'i*) was Tahiti-Puna'auia, in the Punaru'u valley on Tahiti's western coast. Traditionally this was a populous and politically strong area prior to the alleged "*ari'i* invasion." The presence of a *maro 'ura* kin-Title here, before the legendary spread of Opoan *ari'i* just mentioned, suggests either an earlier connection with Opoa, or the possibility that this emblem of exalted prestige was not the exclusive prerogative of the Opoa line of chiefs. Or, since the marae itself is said to have been founded by Te Manutunu, a Puna'auian chief, and his wife, Hotutu, a member of the Farepua (Vaiari) family, one might explain the marae's *maro 'ura* prerogative by this connection. Handy gave a different account of the founding of marae Tahiti-Puna'auia: "I understand from Marau that the first marae *arii* of Punaauia was that named 'Tahiti', founded by Tetunae sixty generations ago in honor of his granddaughter, Nuutea, who married the chief Nuu of Punaauia" (1930:72). It is not surprising to discover two entirely different versions of the same legendary episode, but it is curious that they derive from the same source, the omniscient Marau. Also, one should note in this version another example of the tendency to build the legendary Tetunae into larger and larger culture-hero proportions. In any case, this marriage served to connect (or reconnect) the Vaiari and Puna'auia congregations; meanwhile a new family connection with the prestigious Leeward Islands was being made. Henry Adams paraphrased the story he was told by *Ari'i Ta'ima'i-Marau*:

Many generations ago a chief of Punaauia, named Te manutunuu, married a chiefess of Vaiari, named Hototu, and had a son, Terii te moanarau. At the birth of the child, the father, Te manutunuu, set out in his boat for the Paumotu islands to obtain red feathers (Ura) to make the royal Maro for the young prince.

So the story begins by taking for granted that before the first Teva existed, Punaauia and Vaiari had already their own chiefs and Maraes. The legend is clear in adding that the Marae of Punaauia was founded for this same young prince, Terii te moanarau, by his father, Te manutunuu, in order that he might wear in his own Marae the Maro-ura which was made of the

feathers collected in this voyage to the Paumotus. The name Punaauia is said to have come from the killing of a relation whose body had been rolled up as fish were rolled. The legend starts by assuming that Vaiari was the oldest family, with its Maraes, and that Punaauia was later in seniority and rank.

While Te manutunuu was absent on his long voyage to the Paumotus, which required several months, a visitor appeared at Vaiari and of course had to be entertained by the chiefess. This visitor, our first ancestor, was what Europeans call a demi-god; he was only half human; the other half was fish, or shark-god; and he swam from the ocean, through the reef, into the Vaihiria river, where he came ashore, and introduced himself as Vari mataauhoe. The chiefess received him with the hospitality which was common to the legends of most oriental races, and Vari mataauhoe took up his residence with Hototu; but after their intimacy had lasted some time, one day, when they were together, Hototu's dog came into the house and showed his affection for his mistress by licking her face, or, as we should now say, kissing her, although in those days the word was unknown, for Polynesians never kissed each other, but only touched noses as an affectionate greeting. At this, the man-shark fell into a mood of reflection, and, after turning the subject in his mind, decided that the fault was so grave as to require him, as a person of refinement, to abandon Hototu: "You have been untrue to your husband with me," he told her; "you may be untrue to me with the dog."

Men have in all times been ingenious in their reasons for deserting women when tired of them, but, even in the South Seas and at that early day, this pretext must have been thought at least unusual, since it was preserved in legend. Unusual or not, it was enough for the man-shark, who walked off to the river, and turning into a fish again, swam out to sea. As he went on his way, or wherever he belonged, he met the canoe of the husband, Te manutunuu, returning from the Paumotus, and stopped for a conversation with him. Te manutunuu, regretting to have lost the pleasure of a visit from so distinguished a guest, and obeying the rules of the somewhat excessive generosity which marked the island manners, invited Vari mataauhoe to return, but the man-shark civilly declined, giving as his excuse the reason that Hototu was too fond of dogs.

Perhaps this legend is as old as India and belongs to the common stock of world-myths; but, whatever its origin, its form seems to show that the natives looked on Vaiari as the source of their aristocracy. Not only did the Maraes and Maro-ura of Punaauia claim descent from Vaiari, but Papara also followed closely, for when Vari mataauhoe was about leaving Hototu, he said to her: "You will bear me a child; if a girl, she will belong to you and take your name; but if a boy, you are to call him Teva; rain and wind will accompany his birth, and to whatever spot he goes, rain and wind will always foretell his coming. He is of the race of Arii rahi, and you are to build him a Maraes which you are to call Mataoa (the two eyes of Tahiti), and there he is to wear the Marotea, and he must be known as the child of Ahurei (the wind that blows from Tairarapu)."

A boy was born, and, as foretold, in rain and wind. The name of Teva was given to him; and Mataoa was built; and there Teva wore the Marotea. The Teva name came from this boy; but when or how it was given to the clan is unknown. Only we know that it must have been given by the Arii of Papara or Vaiari. To this day the Tevas seldom travel without rain and wind, so that they use the term Teva rarirari—Teva wet always and everywhere.

Apart from these facts in regard to Teva's father and mother, little is known about him, but he must have been a very distinguished person, if the Vaiari peo-

ple are to be believed, for they still point out the place where he lived as a child, his first bathing-place, and the different waters he fished as he came on his way toward Papara, and would feel insulted if any one should express a doubt of Teva's being a Vaiarian. In our family, we all admit not only that Teva was a branch of the Vaiari family, but that he wore the Maro-tea by right of that descent, and set up his Marae at Mataoa by transferring his stone seat or throne from the Marae of Farepua. (1901:12-14)

The *maro te'ā*, it will be recalled, was traditionally associated with an Opoan branch on Porapora; unless the "shark god" Vari Mataauhoe was also a Poraporan, the appearance of the *maro te'ā*, at Vaiari is not otherwise explained. However, as I shall later on propose, there may be a more explicitly "structural" explanation for adoption of this *maro te'ā*.

The above accounts of marae Farepua and marae Tahiti-Puna'auia are based mostly on information from Papara informants but "interpreted" so as to emphasize Opoan sources of Tahiti's so-called *ari'i* kin-Titles. Another version, also provided by a Paparan—Tati Salmon, who was head chief of the district in the late 1800s and brother of Marau—did not deny ultimate Opoan connections but emphasized local origin of Tahiti's so-called family of *ari'i*:

The meaning of the word "Arii" in Tahiti and the islands of the Society Group is "chief," and of "Arii nui," "great" or "head chief." In Tahiti, all those who trace the origin of their family to the "Maraes" (temples) of Farepua at Vaiari, now Papeari District, or Puanaauia at Punaauia District, of the West and Southwest Coast of Tahiti, belong to the Opu-huiarii or family of Ari'is. The eldest representative was known as "matahiapo." This person, whether male or female, was called the "paarae," meaning "frontal part of the head," that is the "Great Chief."

The institution of the Opu-huiarii was of divine origin, and the distinction of the Arii-rahi was made by Taaroa, the god creator. Socially and politically the Arii-rahi was head of the family. The prerogatives of the title were unlimited. Socially, the paarae, as head of the Opu-huiarii, remained as such till death,^[29] but as political head he could be superceded by a member of his family.

The laws that governed the acts of the Ariis, both socially and politically, are too many to enumerate in this paper. I will, however, quote from traditions and attempt to give some proofs of the foregoing statements.

The District of Vaiari, or Papeari, as it is now commonly called, has the honour of being the "tumu," or foundation, of Tahiti. There exists to this day the "foundation stone," if I may call it so, "Hiti," from which the name of Tahiti was taken. Whether it meant "east" and "ta" "the lesser," or if we take the whole word "Tahiti," in its meaning as "transplanted," no one can tell now. One thing, however, seems clear. The god creator, Taaroa, decided that Nuutea Tepurotu, "fairest of the fair," chiefess of Vaiari, was to be the first possessor of the first temple.

The place chosen by the god creator for the building of this temple was on a piece of flat land facing the sea as well as the valley. The builders were the "Fanau-po." The word means "born of darkness," understood by us as the creatures of the gods, therefore priests. The orders they received for the building of this temple were that it should be beautiful and all decorated with "uras," "decorative feath-

ers," and that it should be called "Farepua," meaning "house of whiteness." The old words concerning this temple are still remembered and sung by our natives.

Farepua ua raaraahia i te ura
 E ura te tuturi e ura te paepae
 E ura te fata e ura anae a
 Tena Marae o Farepua

Farepua, raised on pillars of ura,
 The kneeling stones of uras,
 The paving stones of uras,
 All of that temple of uras.

When the temple was finished the ordination of the first head chief—chiefess Nuutea—was ordered and the name "Te rii nui o Tahiti" was given to her, and to this day her descendants are the only ones who can take the name and be the social head of the family Huiariis. After the naming of the chief, the creator ordered that the ordination of the high priest should take place and that he should always bear the name "Teao"—the "light of day" or "the wise." The temple, therefore, was to possess a head chief and a head high priest....

The chiefess Nuutea then took for her husband the chief of Punaauia, named Nuu, and thus the family of the Opu-arii or Huiariis was constituted.

For the two following generations, the chief of Vaiari remained both socially and politically the head of Tahiti. In the third generation, however, was born a second child of the Vaiari—a boy—under very peculiar circumstances, for the legend declares his father to have been a shark god. This boy was named Teva. The meaning of this word has altogether been lost in Tahiti, but it is hoped that from elsewhere some knowledge of its history may be acquired.

Teva was a restless boy and declared that the little district of Vaiari was too small for himself and his elder brother, Terii Temoanarii, who naturally was the high chief. So he travelled down the coast lazily, fishing for a pastime, and on arriving at Paparia, about eleven miles distant, chose a place which he called Mataoa, to have built for himself a temple, which had for its foundation his stone from the temple of Vaiari to commemorate his ancestry.

Ua hume ihora Teva
 I tana Maro i nia i Mataoa
 E ua tao ihora e
 Ei marotea, tau e hume
 I nia, i tau na vaa mataeinaa
 Ia Faina, te horo ia paepae uriri
 Oropaa toa, i fenua ura.

Then Teva said:

"I will use on Mataoa, my temple,
 My girdle of yellow feathers,
 And over my people of Faina,
 And the warriors of Oropaa."

From that day the clan took the name of 'Teva', and their gathering (clan) call was:—

Teva te ua, Teva te matai,
 Teva te mamari, E mamari iti,
 Au na Ahurei!

Teva is the rain, Teva is the wind,
 Teva is as the roe of fish,
 The roe loved by Ahurei!

(T. Salmon 1910:39-40, 41-42)

In any case Mataoa was not the first “important” marae in Papara; it was preceded by Taputara’i, which, wrote Adams, “was the original marae in the territory now known as Papara [located in] the small subdistrict called Amo, a mile from the sea and close under the mountains.” Subsequently a stone was taken from this marae to found marae To’ora’i, nearer the shore. Still later (1767-1768) To’ora’i’s chief and his wife, Porea, of historic fame, combined their ambitions and built the impressive marae of Mahaiatea nearby, as a place in which their son could parade his Titles, including the one from Taputuara’i (Tui te ra’i i Taputuara’i), the one from To’ora’i (Aromaitera’i i outa rau ma To’ora’i), and the one presumably created for the occasion (Teri’irere i Mahaiatea). (Adams 1901:16)

During these pre-European eras the whole southern part of Greater Tahiti, from present-day Pa’ea to Hitia’a, is said to have consisted of an entity labeled Inner Teva (*Teva i uta*)—a single “clan,” said Adams; but what is meant by that is not clear, except that Farepua-Tahiti marae were at one time considered by all the populace of this area as the center of spiritual and political authority. In time the center of political power of Inner Teva shifted to Papara,³⁰ but Farepua remained the religious center to such an extent that “it was always necessary, that the chief of Papara, as [political] head of Teva, should be consecrated on that marae in Vaiari” (Handy 1930:69).

Some writers maintained, that the whole of Tahiti’s peninsula (that is, Seaward, or Outer Teva: *Teva i tai*) was also a part of the Teva “clan.” The basis for this “clanship” is not explained, but according to Adams it was manifested on certain occasions in the form of meetings (at least when the parties were not at war with one another):

The distinguishing mark of the Tevas was their clanship. They alone in the islands looked on themselves as a clan, and had a sort of union, weak at all times, but still real enough to make them unpopular outside their own limits. The eight Teva districts recognized Teriirere or Temarii of Papara as their political head, although Teriinui o Tahiti, the Vaiari chief, was socially the superior, and Vehiatua of Taiarapu was sometimes politically the stronger. Whenever Teriirere i Tooarai, the chief of Papara, sent his messengers to call the Teva districts together, the districts came; but the summons was so peculiar that it needs a whole volume of explanation.

The messengers whom Teriirere i Tooarai sent to summon the Tevas were Iatoais or under-chiefs of Papara, and of three kinds: one messenger for the home district,

one for the inner Tevas, and one for the outer Tevas. They bore an official name while on service; they inherited the position, and the office might be filled by any member of the family to represent the actual head.

The messenger that summoned the inner Tevas went to Vaiari, or, as it is commonly called, Papeari (Vai and Pape both mean water), to the head-chief Teriinui o Tahiti, who wore the Maro-ura, the girdle of red feathers, and was the older and socially superior branch of the Tevas. The messenger delivered his message not to Teriinui o Tahiti, but to Maheanuu i Farepua, the same man or woman under another title. Maheanuu then came to Papara with Teihotua of Mataiea and Teriifaatau of Atimaono, and these three chiefs, with Teriirere, made the four heads of the inner Tevas.

The third messenger went to Vehiatua i te Matai of Hui and Tairapu, and Vehiatua called for the chiefs of the outer Tevas. In calling out the clans the names of the districts were rarely used; the official names of the head-chiefs alone were enough, but these names were really titles of rank, and sound quite unpronounceable to any but a native. In Tairapu, for example, the head-chiefs of the district first called (Vairao and Toahotu, next the isthmus) were Teahahurifenua and Moeterauri; the head-chief of Tautira was Tetuanui haamarurai; of Pueu, the title was Tetuanui Maraetata; of Afaahiti, it was Tetuanui Moearu. These chiefs or chiefesses represented the four outer Tevas, and came to Papara when summoned by Teriirere i Toarai. (Adams 1901:8-9)

As this and other accounts indicate, at the time of these (relatively recent) happenings the sovereign chief of Outer Teva bore the Title Vehiatua i te mata'i, which was "originally" associated with marae Matahihae³¹ in the district of Teahupo'o but also established at marae Vaiotaha, Tautira, by force of arms—the Vaiotaha family having been defeated in battle by a Vehiatua, and either killed or driven off the island (see Adams 1901:27-29).

According to Henry this important Tautira marae was "originally" consecrated to Ta'aroa and was called Pureora, but its name was changed to Vaiotaha (or Taputapuatea) when a high priest of 'Oro, named Tupui mataroa, installed in it a stone from Opoa's Taputapuatea, thereby consecrating it to 'Oro. Or it may be that the new marae dedicated to 'Oro was set up apart from the original one, and came in time to supersede it—but I shall not pursue any further this puzzle lest I succumb to the intriguing but fruitless pastime of attempting to "make sense," historically, out of Maohi legend. Later on, still another connection with the Leeward Islands was formed when a stone from Porapora was brought to the Tautiran Vaiotaha by the famed navigator Ra'amauriri (Corney 1915:127; Emory, *Marae Traditions*). This may have been more religious proselytization, or political aggrandizement, or both, than family colonization (if such distinctions are indeed appropriate), but the consequences for "consanguinity" were probably much the same.

Some episodes in these legendary epics will be referred to again in other contexts, but let me now continue with Emory's synthesis, to see what

light it and other accounts of marae on Tahiti-Mo'orea can shed on how the Maohis conceived of the nature of relationships that prevailed between kin-congregations connected by "consanguineal" ties.

Nu'utere was the principal marae of Tahiti's Vairoa district, and its principal Title was Te aha huri fenua. Adams asserted that its Title was Tetuau meretini (1901:17), but I can find no confirmation of this. Geographically, it was included in Outer Teva, hence its chiefs were "politically" subordinate to Vehiatua-Titled chiefs (for some periods at least); but whether this relationship was based on consanguineal ties, or on physical force, or both, is not revealed.

The two "important" marae of Hitia'a district were Hitia'a and Taputapuatea. Te ari'i atua (Teri'itua) was the principal Title associated with the former; if there was a separate Title attached to the latter we do not know it. From its name it is assumed that Taputapuatea was consecrated to the god 'Oro, and derived either from Vaiotaha-Taputapuatea in Tautira, or perhaps directly from Opoa itself; but no tradition of which I know reveals anything further of its nature or relationships. And traditions do not account for the beginning of Hitia'a marae. It may originally have been pre-*ari'i* (adopting the idiom of the *ari'i* invasion proponents); and it seems not to have been included in the Teva domain, although a puzzling passage from Handy might appear to suggest otherwise:

According to Marau, three generations after the death of Teva a council of the descendants of Tetunae was held at Vaiari at which it was decided that Punaauia and Hitiaa had a right, the former by reason of the marae Tahiti, the latter by reason of the fact that its chief was a matahiapo [firstborn] of Vaiari, to rank their marae and titles with those of Papara, the head of Teva. At this time the chief of Hitiaa was made Arii Nui of Mahaena, Tiarei, Papenoo, Matavavi [Ha'apape], and Porionuu [districts]; these, with Hitiaa, were termed "Te Ono" (The Six), or "Te Aha-roa" (The Long-cord). (1930:70-71)

Nothing is known about the connections and congregations of marae in the districts of Mahaena and Ti'arei. If the small and isolated kin-congregations of this rugged area had consanguineal links with any elsewhere (which seems likely), they have not been recorded.

The northern district of Ha'apaiano'o (called also Papeno'o, and formerly Vavau), with its great bowl-like valley, Te piha ia teta (Room of Refuge), contains the ruins of many marae, but none that I know of is traditionally linked with any elsewhere. Henry stated that the principal Title of Ha'apaiano'o was Tupua'i o te rai, one of the most prestigious on Tahiti, according to some accounts; but I have uncovered no traditions regarding its origin or connections.

The district of Ha'apape, or Mahina (formerly also Uporu), is again in the more populous part of Tahiti, and the part better known to Europeans

and hence better memorialized. Emory listed one of its principal marae, Fareroi, as belonging to the "formative period of hui arii," thereby implying a connection with Opoa. Ha'apape was the site at which an 'Oro zealot is said to have "established a school for the aristocracy of Tahiti and taught them the folklore of the mother land, Raiatea" (Emory, *Marae Traditions*; Henry 1928:130).

Arue and Pare, the two districts on Tahiti's northwestern side, were separate in pre-*ari'i* times. Arue's principal marae was Tarahoi, Pare's, Raiamanu. In due course the two districts were united (possibly by conquest) into a single tribe called Te Porionu'u, with Tarahoi its principal marae, and its chiefly kin-Title Tu nui ae i te atua. By European times the family in possession of this Title had managed to increase very substantially its influence over districts to the east through marriages with women of Title-holding families elsewhere—including one whose mother was a Vehiatua of Seaward Teva and whose father was a sovereign chief of Opoa. In fact, the principal Titleholders of Tarahoi marae even succeeded in convincing the monarchy-minded Europeans whose ships anchored nearby that they were Tahiti's "kings." The realities of this situation will be described in volume 3.

The principal marae of the small district of Fa'a'a (or Te fana i Ahurai, Tetaha), comprising part of modern Pape'ete, was Ahurai, and its chiefly *ari'i* Title was Te ari'i Vaetua. The earlier connections of Fa'a'a chiefs are not recorded but during the eighteenth century one of them married a member of the Vaiari family, marae Farepua, and the issue of this marriage played fateful roles in the last chapter of "native" Tahitian history.

The large and populous western side of Tahiti, between Fa'a'a on the north and the Papara district of Landward Teva on the south is a section of broad central plains and deep valleys. It was called Atehuru and its inhabitants Te Oropa'a; but it was divided into several separate and occasionally mutually hostile units.

In the north was Manotahi district, whose "original" marae was at one time great Tahiti-Puna'auia; it will be recalled that with its chiefly Title, Te atua nui e maru ae i te rai, went the privilege of wearing the *maro'ura*. Marae Taputapuatea, on Puna'auia point, was founded much later than marae Tahiti-Puna'auia, reportedly to commemorate a marriage between an Opoan chief, Titihauri, and a chiefess of Puna'auia. By European times this marae, along with the Taputapuatea of Tautira and of Manorua, had become main centers of 'Oro worship on the island, but the nature of its connection with the older Tahiti-Puna'auia marae is not known.

Finally in the southern part of Atehuru is the district of Manorua (Pa'ea). One of the two principal marae of this district was Maraeta'ata, said to have been founded some thirty-three generations before 1900 (Emory, *Marae Traditions*). Actually, the marae consisted of separate "chapels"³² indicating

to Emory that it was associated with three separate branches of the kin-congregation associated with it. The principal Title of Maraeta'ata was Te Vahitua i Patea, and was of *ari'i* grade. Its connections, if any, with Opoa or Vaiari are not specified.

The other principal marae of Pa'ea during the eighteenth century was Utuaimahurao, which according to one tradition was established by proselytizing priests of 'Oro from Opoa and Tautira (see chapter 22). It came eventually to be associated with principal Titleholders of Pa'ea.

Three of Mo'orea's many marae were listed by Emory among those of the "formative period" of Hui Ari'i colonization in the Windward Islands—namely, Nu'urua of Varari; Umarea of Afareaitu; and Marae te Fano of Pape'are (anciently a district between Afareaitu and Teavaro). According to Handy's information (from Marau) the Hui Ari'i arrived on Mo'orea at about the same time as they reached Tahiti, the principal colonizer having been the bearer of the Opoan-derived kin-Title, Terii o Marama i te tauo o te ra.³³ This Marama is said to have "placed on the land of Eimeo, one foot resting on the marae of Tefano, the other on the marae, Nuurua" (Handy 1930:81). Thereafter, and until European times, Maramas continued to be important personages in the southern parts of the island.³⁴

Another far-famed marae of Mo'orea was the Taputapuatea at Papeto'ai, the island's main center of 'Oro worship. In a passage already quoted Henry stated that the former name of this marae was Te Puatea, and it was changed to Taputapuatea on the occasion of marriage between a local chief and a "princess" of Opoa, who installed there her stone from Opoa's Taputapuatea and thereby "raised the marae from a social [i.e., supra-kin-congregation] to a national grade, so that it became the Taputapu-atea of all Mo'orea" (Henry 1928:130-131).

A fuller interpretation, along with some explanation, of the mass of traditional lore discussed above will be attempted later. This lore serves to provide a charter for the social preeminence enjoyed by a number of Maohi kin-Titleholding families by reference to their consanguineal connections, ultimately, with principal members of a kin-congregation originally situated in Opoa (Ra'iatea), and in part secondarily situated in Vaiari (Tahiti). We are concerned here not with whole kin-congregations—not with the kind of "supra-kin" units made up of whole kin-congregations, which Henry labeled "clans"—but rather with disparate "lines" of consanguines all tracing descent from certain principal members of the Opoan and Vaiarian kin-congregations. In this connection, it should be especially noted that these "lines" contained female links as well as male, and that collaterality, in this wider context, appears to have carried with it no prescriptions enjoining "amity," and so forth, among the individuals thus connected.

RANK

Before leaving the subject of kin-congregation offices and turning to explicitly “consanguineal” aspects of Maohi relationships, it will be useful to indicate how office-holding in any particular kin-congregation influenced an incumbent’s social position in society at large, a positioning that I characterize with the general label *rank* (to distinguish it from the previously introduced positioning label *grade*).

Earlier in this chapter, on the basis of a few fragments of explicit information, along with some plausible inferences, I suggested the possibility that in addition to their differences of function, all the offices of each (localized) kin-congregation were comprehensively graded, in terms of authority and precedence in religious events, and perhaps in secular events involving the kin-congregation members as well. But whereas I suggest this as a possibility, I propose with near certainty that in every kin-congregation one office, that of the “chief,” stood out from all the others, in terms of authority, and so on. I also propose as a strong probability that in many kin-congregations one or more of the nonchiefly offices were also thus graded higher than the rest.

I use the word *grading* also to characterize the social positioning among offices attached to kin-congregation marae linked together by imputed ties of common descent. As we saw, in terms of formalized procedures, in both religious and secular contexts, the evidence indicates that the only offices explicitly subject to such grading were those of the chiefs of the component congregations. On the other hand, I have no doubt whatsoever that the holder of a higher-than-average grade of office in one kin-congregation would have been accorded higher-than-average respect, on informal occasions at least, by members of kin-connected congregations; and this leads into the positioning phenomenon I label *rank*.

The highest-graded offices of certain Maohi kin-congregations tended to be ranked with respect to each other on a comprehensive, society-wide basis. These offices were invariably Titled ones; and during the eras under study there were probably fewer than a hundred such offices of sufficient society-wide significance to become involved in such ranking.

This over-all society-wide ranking of kin-Titles undoubtedly changed from time to time, and there were evidently some differences of opinion regarding the rank-order of particular Titles, at any one time. Historically, the ranking was probably based on the respective kin-congregations’ relative sizes or political power, or on their order of settlement on a particular island, or perhaps on the extent to which any one’s own tutelary deity became the focus of worship by persons belonging to kin-congregations having other tutelars. It appears, however, that there was some time lag in this connection—that is a Title seems to have retained its society-

wide rank-order for some time after the situation responsible for its rank no longer prevailed—a circumstance that appears to apply to titled aristocracies nearly everywhere. During the era under study, such criteria continued to influence the ranking, but those Titles generally conceded to be highest in rank were the ones involving the following connections and special functions: current association with or recent “descent” from the kin-congregation at Opoa; frequent interaction with and receptive reaction by the god ‘Oro; the right to don a feather girdle, primarily red and secondarily yellow; the right to receive human offerings on behalf of some deity.

Finally, I wish to introduce still another technical term to accommodate to the circumstance that some individuals held two or more kin-Titles from as many different kin-congregations. To compare the social positions of such individuals I shall use the term *rank-status*. As later chapters will reveal, if the several kin-Titles of two individuals were about the same *rank*, it appears that the one who held the larger number of such Titles was generally esteemed to be of higher *rank-status*.

In later chapters we shall see how the various criteria for Title-ranking entered specifically into the ranking of certain kin-Titles and individual statuses on Tahiti and Mo‘orea, and how such rank-orders were manifested in political offices. But it is important to emphasize that *rank*, as I here define it, is to be distinguished from *political authority* and *political influence*. The full meaning of this distinction will require several chapters to elucidate, but I can explain at the outset that an individual may have held one or more very high-ranking kin-Titles, and thus have enjoyed a relatively high rank-status, while exercising little political authority or influence. Conversely, some of the society’s most powerful and influential tribal leaders held single kin-Titles of only medium rank, and on a few critical occasions great political power and influence were wielded by individuals holding no kin-Titles at all.

CHAPTER 17 *CONSANGUINEAL ROLES*

To round out our understanding of the ways in which the Maohis conceptualized and engaged in relationships based on common descent I now shift my view away from relationships between officials and other members of kin-congregations and look at our subjects as “fathers,” “cousins,” and so forth.

This is not an easy thing to do, for at least two reasons. In the first place, the early explorers and missionaries were more interested in relations between “chiefs” and “commoners,” or “husbands” and “wives,” than between, say, “cousins” or between “uncles” and “nephews,” so that data about the latter are scanty, to say the least. And second, in their descriptions or translations the early visitors to these Islands used English kin terms for Maohi relationships which were at very best only partly analogous. But they should not be blamed for such errors (many trained anthropologists are still making them!); this aspect of Maohi society is difficult to comprehend despite its paucity of native “kin” terms—or perhaps partly because of it. The Tahitian language contains among the smallest number of referentially used “kin” terms of any language known.

Why, then, concern ourselves at all with the terms for consanguines? Social scientists have long since discarded the notion that humans in general, and “natives” in particular, always suit their actions (including their “mental actions”) to their words, or vice versa, in the domain of kinship relations: an anthropologist working anywhere would be more surprised than otherwise to discover that all X’s treated or thought about all their Y’s exactly alike. On the other hand, data from all over the world support the assumption that there is some correspondence between relationship term and the interpersonal behavior normatively associated with it. Moreover, any society’s system of “kinship” terms constitutes in itself a noteworthy ethnographic datum. It may not reveal too accurately how the native speakers themselves consciously “think about” that system, analytically, but it is nevertheless a product of historical processes that have some connection with native “thought” about social relations.

The principal sources of information on Maohi kin terms are lexicons

of one sort or another, which, however, leave much to be desired in precision and comprehensiveness. All sources agree on the English (or French) equivalences of certain terms; but there is some difference about the range of equivalences of other ones, and flat disagreement about the meanings of still others. Moreover, there is not enough textual material to make up for these deficiencies or to indicate the extent to which terms were used mainly for address, or mainly for reference, or for both.

It is not entirely safe to rely on modern usage, on the comfortable assumption that habits as "basic" as kin-term usage tend to change very slowly.¹

With all these lacunae it would be inappropriate to attempt a rigorous formal analysis of ancient Maohi kin terms; nevertheless, certain more obvious components of these terms do warrant listing: consanguinity (versus affinity); generation; sex (of person referred to with respect to sex of speaker, or of person referred to regardless of sex of speaker, or of person constituting the link between referent and speaker); relative age.² Relative age is a component, terminologically, only of terms for consanguines of the same sex and generation (but of which degree of genealogical proximity is not certain), while male-female and consanguinity-affinity are components of most kin terms. But generation—or better, genealogical level³—is implicit in all the terms insofar as I have been able to identify their denotata, so I shall follow this kind of classification in presenting descriptions of Maohi consanguineal relationships.

There is fairly good evidence that the Maohis themselves conceptualized the notion of genealogical levels; for example, according to the LMS Dictionary the word *u'i* may have had as some of its meanings an age, season, generation. A similar inference could be drawn from the following passage from Henry: "A tū maoro te fenua; a fanau te u'i apī i te fenua.... The land had been long standing; new generations were born in the land ..." (1928:440). The word *a'a* is similarly translated in another passage from Henry: "O tahi nei *a'a* a fanau, o papa tau'a ti'a ia. The first *generation of growth* was born, it was affinity rocks" (p. 340). But a third passage from Henry provides a somewhat different translation: "*A'ore a'a ri'i i itea noa iho.... There were no roots to be found*" (p. 447). (Italics added.) And this is also one meaning given the term in the LMS Dictionary: the root or roots of any tree or plant; hold, right, support; footing or settlement in a country.

In any case, lacking contrary evidence, I shall proceed on the assumption that the Maohis did in fact conceptualize "genealogical level"; but just how they determined the genealogical level of distant collateral kin is not clear. It may be that they "placed" such relatives by counting back to (or from) a known common ancestor. It is also possible that they manipulated

genealogy to adjust to the facts of biological age, or in order to establish a level of relationship appropriate to some desired pattern of behavior. But all these remain only possibilities; I cannot discover how often any of these devices were actually employed.

Before presenting what I have found about dyadic relations among consanguines, let us inquire whether the Maohis formulated any norms embracing consanguines in general, regardless of any more specific statuses they occupied vis-à-vis one another. It is perhaps significant that I have succeeded in turning up only two formulations which may have been of this kind, and these have already been noted. One of these is the precept which declared: "Let not your eyes turn away from the troubles of your *firia fēti'i* ..." [consanguines in general? "line" of consanguines?]. The other was recorded in connection with my discussion of marriage proscriptions in chapter 13: "'Close' consanguines ought not to marry one another."

Except for such general precepts as these, relations among consanguines were more typically described or conceptualized either in terms of comembership in the same kin-congregations or in dyadic terms.

ADJACENT GENEALOGICAL LEVELS

What can be said about the terminological dimension of relations between consanguines of adjacent genealogical levels?

A familiar, commonsensical way to begin would be to state that Maohis referred to an individual's father (or him whom an English-speaker would call "father") as *metua tane* (parent-male), and to an individual's mother as *metua vahine* (parent-female), and that these same terms were extended to all consanguines of the same genealogical level as the referent (as well as to the latter's same-genealogical-level affines).

The above statement might appear straightforward, adequate, and unexceptionable—yet it is anything but that. For one thing it incorporates some wholly unwarranted assumptions about word meanings; in addition it implies a course of etymological evolution, or a pattern of language learning, that cannot possibly be documented in the case of the Maohis. And finally, it goes beyond available evidence in defining the boundaries for this category of denotata.

Another way to approach the matter would be to state that the Maohis referred to an individual's consanguines (and to the latter's same-genealogical-level affines) in the genealogical level immediately ascendent to his (or hers)—including those whom English-speakers would call "father" or "mother"—as *metua tane* (if male) or *metua vahine* (if female).

This statement is somewhat less exceptionable than the first one in that it involves no assumptions about "original" meanings of the terms. On the other hand it involves some unwarranted assumptions about the boundaries of the category *metua*.

The fact is that we have no reliable way of knowing how inclusive the category of *metua* actually was, or was normatively intended to be. That it was widely inclusive is attested by such statements from Henry as the following: "The word *metua* is applied to real and adoptive parents, to uncles and aunts, to first cousins in relation to their cousins first removed, to bosom friends of parents, and even to children's nurses" (1928:494n). "A parent's friend is regarded as a relative also of a child" (p. 521n). (It should be noted, however, that these statements appear in footnotes to *Ancient Tahiti*, and seem to refer to the era in which the volume was edited, between about 1890 and 1915.)

On the other hand, it is well to state at the outset of our discussion of kin terminology that as far as I can discern the Maohis did not follow the practice of some societies of extending a particular kin term to all members of some group containing a distant but crucial kinsman. For example, a man having a genealogically distant but socially intimate *metua* in some faraway community did not call the latter's community-mates *metua*.

Moreover, my second statement uses "genealogical level" with an appearance of certainty which the scant information does not wholly justify. For example, one might reasonably assume that one way in which a Maohi contrasted the female who gave birth to him (his natal mother) with a female borne by her, was that they were, obviously and demonstrably, of separate (and adjacent) genealogical levels. But even if this were so, we have no sure way of knowing what criteria led to classifying other females with the former. Because of "same genealogical level?" If so, how was this determined, practically, in the case of distant collaterals? Because of their coequality? If so, in the absence of chronological age-reckoning, how was coequality determined? Or, if both these criteria were applicable, how were discrepancies between genealogical level and biological age reconciled? For such discrepancies are inevitable in every society.

But one is not even warranted, from available Maohi data, in assuming that an individual's natal mother, or socially acknowledged father, served as the main points of reference for the classification of other *metua*.⁴

Had some observer lived among the ancient Maohis and recorded their conversations with and about their consanguines and kept records of their use of *metua* in the course of their chatting, working, quarreling, praying, and especially in their meetings with thitherto unacquainted and "unplaced" consanguines, then we might today be able to answer some of these questions.⁵ Failing that however, my generalizations must remain limited by the gaps and ambiguities in the sources. If the resulting exposition seems more European than Maohi, that is because our view of Maohi "kinship" relations comes to us through uncompromisingly European eyes.

Here are some other LMS Dictionary definitions of *metua* which will give some impression of the wide range of references of the word.⁶

metuahoovai [*metua ho'ovai*], a parent-in-law.

metuatavai [*metua tavai*], a parent that adopts a child.

metuafaai [*metua fa'a'ai*, parent to feed or nurse], a nursing parent.

metuafaaamu [*metua fa'a'amu*, parent to feed or supply with food], the same as *metuafaai*. [According to Rey-Lescure (1947:284) the former is a more recent variant.]

metuapuru, a parent that caresses his children.

In addition, the LMS Dictionary lists the following terms, mainly of address:

pā, a term of reverence answering to father, and commonly used by children in addressing their father, and common people their chief.

pa'ino, a familiar term of endearment used by a child in addressing his father.

patea, a term of respect addressed to a mother or a woman of rank.

pateaino, a term of respect addressed by children to their mother as *pa'ino* is to their father.⁷

titae [ti'itae], a parent, a term of endearment used by a child for his father or mother.

The imputed meanings of these terms have obvious implications for interaction norms; at the same time they indicate some conceptual parallels between "parenthood" and "higher grade." (Indeed, it is possible to extend this parallel even further to include the normative relationship between "younger" and "older" consanguines—but more of this anon.)

Turning now to the other role in the dyad, I list the various glosses found in the LMS Dictionary approximating the English word "child" (including kin of first descending genealogical level):

tama, a child, male or female.

tamāhine, a daughter, or female *tama*.

tamaiti, a son; a little *tama*.

tamaitiiti, a little son.

tamarii, children.

tamāroa, a boy, a male.

poti'i, a girl.

hunō'a, a son- or daughter-in-law.

Lacking textual material I cannot be certain about the precise meanings of these terms (although the definitions give by Jaussen are practically identical), but on the basis of these glosses they appear to be classifiable as follows:

a category referring to young people in general: *tama* (singular), *tamari'i* (plural); *tamāroa* (male); *poti'i*, *tamāhine* (female);

a category referring contrastively to certain kin of the speaker's first descending genealogical level: *tamaiti* (son), *tamāhine* (daughter, but also means girl), *hunō'a*, spouse of son or daughter.

What these glosses do not indicate is whether or not all the terms in the first category (and not just *tamāhine*) referred also to denotata of the second category. And, much more important, neither these particular glosses nor any other lexical or textual sources that I know of indicate the limits of applicability of the terms of the second category.

With respect to *tamaiti* and *tamāhine*, modern usage (e.g., Panoff 1965) and implied ancient usage (e.g., Handy 1930) list both "nephew" and "son" as denotata for the first, and both "niece" and "daughter" for the second. It seems to be the assumption underlying these and most other writings about the Society Islands, ancient and modern, that these terms refer to all consanguines of a speaker's first descending genealogical level. It is the assumption I also make—but for negative, not positive reasons: I do not know what degrees of collaterality were actually referred to by these terms, but at the same time I know of no other terms in the language that might have served to limit their degree of collaterality.⁸ (Similar questions arise concerning the meaning of *hunō'a*, but these will be discussed in chapter 19.)

Despite the many intimations these linguistic fragments may contain concerning the Maohis' broad conceptualization of "parenthood" and "progenyhood," the solid information we can retrieve having to do with their interactions concerns almost entirely an individual and his parents—natal, feeding, or foster.⁹ The only direct statements I can find about action involving whole sets of "parents" occurred during ceremonies described by Henry and reported earlier. The first concerned a nuptial ceremony:

At the end of the performance [i.e., a presentation of valuables to the groom by the bride's natal parents] the mothers and aunts of the young couple, called the *hui-metua-vahine*, class of mothers, punctured their heads and faces causing the blood to flow, as a manifestation of love and union of blood. (1928:282)

The second concerned a natal ceremony:

Thither [an "ancestral" marae] the child was taken accompanied by the parents and other elder members of the family, called the *hui metua* (parental clan) [sic]...."

As a sign of affection the *hui metua* then punctured their foreheads, and each mingled the purple drops that fell with a mixture of the juice of sugar-cane and milk expressed from grated coconut upon a miro leaf, which they held over their heads, and with a parent leading, they approached in turn the babe, still in the arms of the *paia* [royal family doctor], and touched its cheek with the leaf, but not the mixture, signifying the union of blood. (1928:184-185)

Before considering how the Maohis conceptualized and engaged in "parent-child" relations in dimensions other than terminological, I will list

some situational factors that might be expected to have influenced these relationships:

The size, composition, and location of households: typically they were large and comprised more than one nuclear family, and although more often scattered than grouped together, they were distantly isolated from one another in only a few regions.

The frequency and extended duration of visiting.

The impermanence of many marital unions, and the existence of some polygyny.

The bilaterality of descent-reckoning: although more recognition was accorded patrilineal ties, those through the mother were frequently and heavily weighted.

The varied nature of marital residence: virilocality may have been preponderant, but not markedly so; and there was a goodly amount of ambilocality.

The weightiness of hierarchic ordering, by sex and birth order, with respect to authority and privilege. These considerations were especially influential in families of superior social position, but were probably also operative in some degree throughout the society.

Beliefs and practices associated with the above and having to do with "purity of line"—that is, "class endogamy," the slaying or nonrecognition of "mixed-class" infants.

The timing of succession to Titles: early in the successor's life.

The governance evident in families' "congregational" activities (and presumably in many ordinary "domestic" activities as well), wherein authority was often vested in a male other than a child's natal father.

The prevalence of fosterage.

The separation of females from (at least older) males, in connection with eating and with most subsistence activities, including the learning of technical skills.

The delegation of some infant and child care to older siblings.

Norms defining "incest": with some notable exceptions, sexual relations with "close" consanguines were proscribed.

Beliefs concerning the "psychic" state of individuals prior to complete head freeing (*āmo'a*).

Beliefs concerning the prevalence and characteristics of ghosts.¹⁰

On the basis of what has already been reported about these several factors one could arrive at some fairly plausible-sounding inferences about parent-child relations in Maohi society; and the paucity of data having to do directly with parent-child interaction prompts me to do so, but the reader is now in a position to do the same (and hopefully with simi-

lar results). Instead of spelling out the obvious or speculating about the probable, I present what little direct information there is.

I turn first to the famous "Precepts of Tetunae" where, if anywhere, one might expect to find Maohi canons about parents' relations with their children.

Actually, the only precepts conceivably related to the tie under consideration are the following:

'Ia tura ite ta'atoa te toto o te metua, e ara 'a hara 'otou ite reira. [May the blood of the parents be respected by you one and all, beware lest you offend in this matter.]

"E fa'atura tu i tō matahiapo ta'ata, 'o tō 'oe ia pa'arae." [Respect your firstborn, he is the bone of your foreheads.] (E. Salmon 1937:29)

I present the first because of its allusion to *metua*, but I confess that I cannot divine the intended meaning of the statement. Is one exhorted to act with "respect" toward the parents themselves? (And exactly which parents?) Or is this a metaphoric reference to the rule of incest? Or does it refer to rules regarding purity of line?

The second statement could be an exhortation to parents to "respect" their own firstborn offspring, but it was more likely addressed to people in general, exhorting them to respect the "firstborn" chief of their kin-congregation—or so I interpret it.

Acts of infanticide provide some indications of parents' attitudes toward children; these were certainly not uniform.¹¹ As we saw earlier the deed was carried out privately—sometimes by the mother herself—when all parties agreed upon its desirability; but cases of disagreement did occur, as exemplified in the following episode witnessed by the missionary Davies in 1808:

As one of the brethren was going to bathe in the River, he observed among the bushes at some distance from the pathway, a number of people apparently watching something ... the woman above mentioned was there, either delivered or about being delivered of a child, and that the husband's father and mother, and some others were waiting in order to kill the infant as soon as it should be taken from the mother. Seeing things in this state he resolved to see the end and do all he could to save the infant, he spoke to the husband's father and mother, upon the horrid cruelty of their intended action, and then proceeded to the woman tho' opposed by several who wanted to keep him at a distance till the affair was over, he found the child had been just born, a fine boy and that a young man a brother to the woman was intent to do all he could to save the infant, the mother was also desirous to have it saved. The husband kept out of the way, and also the old man his father who notwithstanding was fully determined to have the infant murdered and for this purpose had sent a man there to bring it to him, either dead or alive. By this time people were crowding there from all parts, but not one either male or female offered to do the smallest thing to save the infant, the mother's brother excepted who with our brother did all he could to keep off the man

who was in the greatest fury and rage fully bent upon murdering the infant, the man was kept from approaching the woman and her infant for sometime partly by persuasion and partly by force, our brother dispatched a messenger for some of the brethren to come to his assistance, but the people kept back the messenger so that he could not go, he then sent another who proceeded on, in the mean while he and the young man above mentioned struggled with the murderer keeping him off from the infant, but notwithstanding he once got so near that he snatched the head of the infant, intending to turn his neck, which he could not affect, being dragged back again, and the woman also doing what she could to defend her infant, however he gave some scratches about the head. Soon after this came a message from the father saying, let the infant alone if it is a boy let it be saved, the man that came there to murder it then made off as fast as he could, and a little while after Sister Henry came there and by the consent of the mother and also the father who then came to the place, she took the infant home with her, the mother also sometime after followed that she might sleep at brother Henry's.

The woman and her infant mentioned on Saturday were till this morning in brother Henry's apartment. Today she went home with her babe, it is probable that all danger is now over, at least it is so according to the usual custom of the country, the husband appears to be fond of his child as well as the mother and it is reported that the king has threatened the old people for their attempt to kill the child and told the husbands father that if he had been in England he should have been hanged. This we know is only a sham, the natives understood one another well enough, had they thought the king would have been really displeased, they would not have acted as they did. (Journal, 18 June 1808, LMS Archives)

Analogy with Western attitudes leads one to expect that in these situations the mother was usually in favor of sparing the child. That in fact is my expectation, but there is no direct evidence to support it, while there is a good deal of indirect evidence that many young women were as eager to avoid parenthood, as were many young men. Moreover, Maohi motives to avoid parenthood were undoubtedly different in some respects from those prevailing in Western society.

Birth rites are also informative in that they indicate some jural expression of parental attitudes. When they did take place (which was probably not always, and certainly not always in the same manner, that is, they differed in ceremonial elaboration with respect to the social position of the infant's family and with respect to the sex and birth order of the infant) no act was deemed necessary or, at least, none was performed to express the mother's own relation with the infant, as occurred in the case of the father, but members of the mother's family joined with those of the father, thereby symbolizing the bilateral nature of the ties.

Another whole set of beliefs and interaction patterns involving parent-child relations is included in the ritual acts and abstentions of head freeing, *āmo'a*. These, it will be recalled, placed constraints upon parents' interaction with their offspring—constraints which in some cases lasted until after an offspring's marriage, and which reportedly involved "aunts" and "uncles" as well as parents (see chap. 13). Particularly noteworthy in this connection

was the distance maintained between a Titleholding father and his successor during the latter's early years. In fact, although highly born infants remained with their mothers during the first year or so of life, some of them were thereafter secluded from both parents for many years in entirely separate court-households of their own. Indeed, the constraints laid upon interaction between some parents and their successors were so formidable that one can hardly speak of interaction at all. These, and the restrictions against parental self-feeding during the offspring's pre-"head-free" years must have colored attitudes, mutually, even after some of the constraints had been removed. And one does not have to resort entirely to speculation concerning some possible sequels to these constraints, as my account of the Pomare family conflicts will exemplify (see vol. 3).

It is happily different with the lower order of the People—The Father and Mother have mostly their flock of little Children about them, they nurse them with great care and tenderness, and receive returns of Affection and respect—In short no Parents can regard or attend on their Children more than they do, and but few more engaging and pretty Children are to met with, could we divest ourselves of the dislike to the Colour. (Bligh 1792:155b)

So let us see what evidence there is for everyday interactions between parents and children not subject to the extreme forms of such constraints. To begin with, although there is no explicit verbal evidence concerning how long such children were expected to stay at home with parents, and how dependent they were upon the latter, there is a word in the LMS Dictionary that appears to imply some disparagement of too long and too close a dependency: *'aimāmā*, to eat food chewed by the mother; a person who always remains at home and lived with his or her parents to adult age. Other kinds of evidence on this point are more ambiguous. On the one hand fosterage, dispersed kinfolk, and early marriage (with residential change) provided young people with ample opportunity for reducing everyday contacts with their natal parents. On the other hand, I know of no ideological factors that encouraged young people, single or married, to "be on their own." And if they happened to leave the household of their natal parents it is likely that they usually moved into households where other "mothers" or "fathers" were to be found. In this connection, a statement by Varela is ambiguous and, in the extent to which it implies neolocality of residence pattern, probably overdrawn: "As a rule, children only live with their parents while they are quite young; but, when they grow up, those of either sex part company and withdraw to live by themselves" (Corney 1915:258).

Two other conventions served to reduce interaction between parents and their children: the delegation of child care to older siblings, and the ganging together of children in play worlds of their own. But in most cases interaction between children and their natal parents did take place over a

long period of time. In the early years interaction was more with the mother than with the father, not only in connection with the child's feeding but also with its general welfare, as is indicated in the following:

As wives, in private life, they are affectionate, tender, and obedient to their husbands, and uncommonly fond of their children: they nurse them with the utmost care, and are particularly attentive to keep the infant's limbs supple and straight. A cripple is hardly ever seen among them in early life. A rickety child is never known; any thing resembling it would reflect the highest disgrace on the mother. If an utter stranger discovers the least defect in a child, he makes no scruple to blame the mother, and imputes it to her want of sense and experience in nursing: so that if the child is not born radically defective, which is seldom the case, they will mould it into a proper shape. (Wilson 1799:328)

At an age not specifically indicated, but probably in most cases not later than six or seven, boys tended to spend more time with their father and other older male relatives, when not sporting about with other boys, and this tendency increased with youth and early adulthood, as we saw above. The parallel tendency prevailed with most girls, who seem to have spent less and less time in the company of their fathers and older male relatives as they grew older. In this connection, one should recall the exceptional circumstances surrounding those girls of superior family position who were betrothed very early in life. These *pahio*, as they were called, were kept secluded at home until marriage, and presumably in closer than usual contact with their parents.

Within these temporal limits of parent-child interaction what do the sources report concerning the actual nature of that interaction? Moerenhout's assertion, quoted earlier, that children were in general self-willed and subject to few parental restraints (except for the strictly supervised daughters of high-ranking Titleholding parents), is confirmed by statements of other writers:

They lay no restraint on their Children because they are the Head of the Family and therefore do as they please; having no law nor Custom to prevent them they have a Number of Amusements which would not suit the Idea of Europeans, which however are dropd as they Grow up, when they become ashamed of these Childish sports but are not Compelld unless they think proper themselves.... (Morrison 1935:236)

The first sentence in the above excerpt refers to the early transfer of kin-Titles discussed earlier, but the statement is somewhat puzzling in its intimation that all children became "Head of the Family." It may be that the pattern set by Title transfer to the appropriate successor, including the accompanying behavioral manifestations, was extended to other children in families with Titles, but I very much doubt that the latter also became "Head of the Family" in any jural sense.

This excerpt again raises the structurally important question concerning

family offices. That is to say, one might assume that, normatively, in every family there was one person who in some measure occupied a recognized position of authority over other members. As we have seen, in cases where these socially recognized positions—offices—were embodied in kin-Titles, the Titles themselves and some of their accompanying prerogatives, were transferred to the appropriate successors very early in the latter's lives. The question now is, did the same thing take place when no kin-Title, as such, was involved? Surely, this is one of the most crucial questions facing anyone concerned with understanding Maohi society, but unfortunately no decisive answer is possible. The above excerpt from Morrison, as well as other eyewitness reports, attest to the light-handedness of parental authority in general. Yet, I cannot believe, based on "common sense" and on much other evidence about Maohi life, that all or even most Maohi parents abdicated all their powers of decision-making and enforcement, in favor of one or more of their puerile offspring. A certain amount of indulgence, yes, but crucial authority, no. A society could not operate even moderately successfully under such circumstances. The practice of early kin-Title-succession, which prevailed at the "top" of society, may have influenced parent-child relations generally (or it may have been the other way round), but I cannot believe it to have been much more than that. But let us leave speculation and return to some other firsthand observations—remembering that the observers in question were men inculcated in the norms of a Western society where parental authority was close to absolute:

The natives are sinfully & very injuriously indulgent to their offspring now. I have often seen a child cast stones at his parents while they only laughed at it. (Orsmond, Journal, 22 November 1826)

In general, they are too tender towards their children, and do not exercise that discipline and control over them which the well-being of the child, and the happiness of the parent, requires. (Ellis 1829:I, 341)

Their children [are] under no restraint from their parents: and are allowed to gratify every appetite without leave of any person. (Gyles to Sleight, 23 November 1818, LMS Archives)

Br[other] Broomhall's attempt to instruct the young chief of Tearay to read, does not succeed. Savage ignorance and brutal freedom are their delights. The children cannot bear to have their desires crossed, their actions prohibited & their wild ramblings controuled. Learning requires application, to which they are not only strangers but averse. (Jefferson, Journal, 23 April 1799, LMS Archives)

The parents have not energy to back our instructions. We appoint constables to collect & bring the children to school but some will slip way to the mountains or to their canoes, and they are all their own masters at a very early age. We may reprove the parents and punish the children, the parents being called to witness & approve, but they have not the energy to do these things themselves.... (Crook to Burder, 4 December 1824, LMS Archives)

They [Maohi boys] are more mannish here at 14 than boys in England at 17 or 19 & therefore the less docile, the more impatient of restraint ... I think I can say that there is not a little native creature who has reached his seventh year, but who knows more of human nature than I did at 28 years. (Orsmond to LMS, 8 March 1829, LMS Archives)

For a contrary appraisal I offer the following statement by J. Forster, whose romantic, rosy-tinted perception of Maohi social relations was matched only by the floridity of his prose:

This refinement of mutual love and matrimonial complacency, produces those tender regards with which this happy passion inspires its votaries for the beloved object; and it creates that mutual happiness, which is the result of all the more refined manners, and of their more polished behaviour towards one another. The offspring of such a happy couple early imbibe by the example of their parents, that kindness and benevolence, and those refined sentiments of love and happiness which contribute so much to confirm the felicity of their parents, and wish to reduce them to practice, as soon as they feel the call of nature and find a partner whose sentiments are in unison with their own; so that these simple, but more exalted ideas of matrimonial union, are thus propagated and perpetuated in the progeny of a virtuous and tender couple. But before they attain that age of discretion and maturity, the fond parents take peculiar care of their education: they frequently check the wild flights of their unruly passions, and instill order, moderate industry, and the principles of benevolence and gratitude into their tender minds. I have seen mothers punishing obstinacy and disobedience, and though extremely fond of their children, they nevertheless are sensible enough thus far to do violence to their own feelings, that their children may not acquire a habit of ingratitude, obstinacy, and immorality; I have likewise heard them expostulating with their unruly little ones, and expressing their displeasure at their conduct; all which proves that they have ideas of moral rectitude, of order and filial subordination, and of the necessity of instilling these principles early into the minds of their children. Nor is this careful education without the good effects, which ought to be the consequence of it: for we saw many a family, where every individual belonging to it, gave strong marks of an attachment to the rest of the family, and evident proofs of those ties of benevolence which united them all. The younger part of them shewed reverence and respect to the older individuals, and at the least and most distant danger were alarmed and anxious for the welfare and safety of their parents. The injunctions of the parents were executed, with a readiness and truly exemplary affection. The father seemed to be the soul which animated the whole body of the family by his superior wisdom, benevolence and experience; in a word, they all assist one another, and contribute their share of offices and labour, towards the support, security and happiness of the whole family. (1778:350–352)

Many theories may be offered to account for the state of affairs described in these excerpts. The early transfer of parental Titles, just mentioned, was perhaps one influential factor; the availability to a child of several “fathers” and “mothers,” symbolized in terminology and probably reinforced in normative statements was another. This however is just an assumption; I have not come across any statements explicitly exhorting children, say, to act alike to all parents, except for the statement by Armitage quoted below. Ofttimes these coparents lived in the child’s own house-

hold, or at least nearby, and played very active, daily roles in bringing him up—sometimes reinforcing but presumably also occasionally counteracting his natal parents' authority. In other cases the child's coparents lived just far enough away to provide him with a convenient escape from natal parental discipline, if the need for such an escape arose.

In this connection, the alternatives open to a child were not limited to his "fathers" and "mothers"; another characteristic of Maohi society was the ease and the apparent frequency with which children moved into kinfolks' households, to be fed and generally cared for, for long or short periods of time. In addition, the parents of a child sometimes formally engaged other persons to act as coparents:

One heathenish custom still exists which in my opinion lies in the way lik[e] an impenetrable barrier to benifiting the young persons among the natives it is this When a child is born & some times before the birth of the Child persons are applied to to act as Parents to there children two or three Fathers & as many Mothers are fixed on they very seldom refuse & the engagement is a sacred one the Child is taught to regard them equal to his own parents shoud the first parents offend this child (of whatever sex) he or she leave there home & if not satisfied there they try another &c untill they meet with one that comes nearest there vews of Good by this means all parental restraint is frustrated entirly. (Armitage to LMS, 25 March 1836, LMS Archives)

This brings us again to the set of practices usually labeled "adoption" or "fosterage," of which the custom just described was one variety. I indicated earlier the distinction made in the LMS Dictionary between *tavai*, adoption of another's child, and *fa'a'amu*, to feed, supply with food, (or *fa'a'ai*, to feed, nurse).¹² On this evidence it might seem warranted to distinguish rather sharply between "adoption" and "feeding," the former involving a decisive, jural, change in the child's consanguineal status, the latter merely a temporary or occasional dependency. Indeed, we were provided an example of the former in the passage from Henry regarding the giving of a "marae name," with accompanying land-use rights, to an individual "adopted" into a family congregation (Henry 1928:141-142). However, other references indicate a wide range of practices rather than a sharply distinguishable dichotomy. At one extreme was the action taken by a childless Titleholder designating some young person—usually a consanguine—to be his "son" or "daughter," and hence his successor. At the other extreme was the mutual but casual arrangement whereby a child lived for varying periods of time with some relative, without, however, being invested with any new demand rights in its "feeding parents' "descent-derived goods."¹³ Inasmuch as the two variables, degree of everyday dependency and formal transfer of property rights, appear not to have been related—that is, some designated "sons" did not reside with their new "parents," and vice versa—it is tempting to take this as addi-

tional evidence for a native lexically formulated distinction between *tavai* (adoption) and *fa'a'ai-fa'a'amu* (feeding). Unfortunately I cannot assume that to have been the case. For one thing, although the LMS Dictionary makes a (suspiciously!) clear-cut distinction between adoption and feeding, such writers as Henry (and presumably Orsmond) used adoption for the whole range of practices under consideration. To avoid such ambiguity I prefer to label all such arrangements "fosterage," except when a native text explicitly labels it either *tavai* or *fa'a'ai* (or *fa'a'amu*).

In any case, in terms of patterns of interaction, our present concern, the practices under consideration served to provide children with "parents" (and adults with "sons" and "daughters") beyond those provided by descent; but, as I noted above, the range of situations embraced by such practices was very wide indeed.¹⁴ Even the high gods occasionally fostered humans, as for example, Ta'aroa did with the youth Pai, whose mother entrusted him to the spirits in order to save him from sharing the sacrificial victim's fate to which other members of his family had been doomed (Henry 1928:584).¹⁵

Probably the most common form of fosterage was that described by Henry:

Tahitians have always been fond of children, those having none adopting some, and parents with large families adopting others while giving away some of their own, adoption being a bond of love and union between relatives and dear friends. Such children frequently divide their time happily between their two homes. Offspring is well received under any circumstances. (1928:274)

I have already spoken of the action taken by some individuals to acquire successors for their Titles. The following represents a variation on that practice—but with a grim twist. In the legend of Pai, referred to above, the events which led to his family's downfall was his father, Rehia's, lese majesty of acquiring for a beloved wife (wherein lies another story) a shipment of food intended for the tribal chief. Upon learning this some of the chief's subjects, "some warriors of an inland clan," took it upon themselves to revenge the crime, and an opportunity presented itself soon thereafter, when Rehia's wife, Huauri, gave birth to a daughter:

... when the hostile warriors heard of [the birth] one of their number ... said to the orator ...:

"Go and ask for the little babe, and give her the name Hina-ari'i (Gray-queen), and tell them we wish to adopt her as our chiefess, as we are only plebeians here."

So the man went and was welcomed by Rehia and his wife, who were much pleased with the message brought to them, and they agreed to let the inland clan thus adopt their little daughter, who would be given into their hands when old enough to be separated from her mother. Accordingly, after a year had elapsed the orator returned with nurses to claim the child, and she was given over in a regal manner, with clothes and feather ornaments befitting a child of high rank,

the parents feeling the parting much and comforting themselves that it was for the benefit of their daughter, whom they could visit frequently. With affectionate leave-taking they parted. But when the party with the child arrived midway between sea and mountain regions the orator dashed out her brains against the trunk of a fei tree, which became blood stained—ever since then the sap of the fei plant has remained purple—and then they went and buried her body in their marae. (Henry 1928:579)

Fosterage was used also as a means of cementing peaceful relations after a war:

The amusements [accompanying the peace pact] ended with the *hura* danced by young girls, in which a daughter of a slain chief or warrior would take up a wand and verge out from the floor towards the slayer of her father, if he was known, and touch him with it, after which he assumed the role of father to her in place of the deceased, an adoption which was regarded as a most touching and sacred tie between them. (Henry 1928:319)

Morrison provided a fuller and somewhat different version:

... after the Peace is made [following warfare] the relations of the Deceased Warriors soon find out the Men who killd them and each Family send a present to the Man by Who their Freind or Relation was killd & hire a Set of Urre Heiva or a Sort of People somthing similar to our Morris Dancers and a Principal part is acted by the Daughter or Nearest Female relation of the Deceased Warrior in a Dance at the House of the Man who killd him. The Dance being Finished the Cloth, Matting & Dresses are all presented to Him and He Now entertains all the Deceaseds Relations, sumptuously for Several days and they Declare that they (do not) Owe him any Grudge or animosity for killing their Relation and their Sorrow is now turnd to Joy and evry thing is most amicably Settled and the Conqueror, to Make the Friendship more Firm on his part, adopts the Nearest relation of the Deceased as his Friend, and by bearing his Name becomes one of the Family and is ever after Treated as such and is as much beloved in the Family as if he had been born in it. (1935:175-176)

These two practices, the one described by Henry and the one described by Morrison, had the same rationale, that is, to make “consanguines” out of former enemies and thereby, ideally, create a basis for amicable relations. (It is highly significant, I believe, that with all the alternative models which might have been utilized for establishing such relations—affinity, neighborliness, tribal or cult comembership, etc.—consanguinity remained for the Maohis the most appropriate one.) The fact that the Henry version concerns “fosterage” and the Morrison one “siblinghood,” is an unimportant consideration under the circumstances.

Ideologically, the parent-child relations consequent upon fosterage probably differed little if at all from those based on descent; actually (i.e., historically) the range of degree of intimacy was probably just as wide. Adams’ statement (1901:123) that “adoption was rather stronger in the South Seas [i.e., Tahiti] than the tie of natural parentage” is suggestive but

undocumented except in a few highly special cases, where political rivalry with a parent was involved.

A comprehensive study of Maohi fosterage would include many questions that we cannot hope to answer—questions concerning the prior relationships of the principals, the individual and professed motives involved, the extent to which the fosteree's new ties were extended to the fosterer's kin and vice versa.¹⁶ For example, I suspect that in some cases the foster child served mainly and deliberately as a means of strengthening relations between families, but I have found no cases to support such speculations. And one of only a few bits of evidence of the extension of fosterage ties concerns the rather ambiguous case of the Spaniard Rodriguez. Having been "given an ancestral name" identified with the Vehiatua line of chiefs, he was required to show appropriate expressions of grief when a member of the family died, "... because I was related to the deceased *arii*, inasmuch as he was related to all the Chiefs" (Corney 1919:31).¹⁷

Let us return to the sources and search out evidence of a suppositional nature bearing on relations between "parents" and "children." Appropriately, I begin with an account, which was probably chanted, telling how Ta'aroa exalted Tane over Great Tumu, the Foundation; the latter was, like other gods, created by Ta'aroa, but Tane was Ta'aroa's biological son (*te fanau'a o Ta'aroa*).¹⁸

This is what Ta'aroa did for the god Tane, the handsome offspring of Ta'aroa:

Tumu had little temples; Tane had great ones. Tumu had a few priests; Tane had many priests. Tumu had small drums; Tane had big drums. Tumu had a few altars for his temple; Tane had many altars. Tumu had gods in sennit with a few red feathers; Tane had gods in sennit with many red feathers. The enclosure of the temple of Tumu had a small rear entrance; the enclosure of Tane's temple had a broad rear entrance. The temple of Tumu had a small sacred enclosure within; that of Tane had a spacious one.

Tumu had a few stone slabs to lean against for prayers; Tane had many leaning slabs. Tumu had a few stone pillars, upon which the coconut-leaf images to represent the priests were placed, in his temple; Tane had many pillars. Tumu had a few coconut-leaf images to represent his priests in his temple; Tane had many in his. Tumu had a few coconut-leaf rosaries in his temple; but Tane had many in his. Tumu had a few paddles (poles) erected (by which the sacred birds descended into the temple); Tane had many paddles. Tumu had a few masts upon which the sacred birds alighted in the temple; Tane had many masts in his temple. Tumu had a low sacred wall to his temple; Tane had a high wall to his temple.

If a small sea bird alighted upon the temple of Tumu, a surf-duck settled upon Tane's temple. If a surf-duck alighted upon the temple of Tumu, an albatross descended upon Tane's temple.

When Tumu had a little religious ceremony; Tane had a great one.

This then was Tane; he was a very great god. Ta'aroa made him great, and all his greatness emanated from Ta'aroa. All Tane's work was beautiful. He did not slay men in former times; it was only very recently, long after the

Deluge, that he received the homage of human sacrifices, but they were not numerous. (Henry 398-399)

Ta'aroa, it will be recalled, also worked with and for his daughters when between them they constructed out of Ta'aroa's own body the first god house for mankind's use (Henry 1928:426). But affection and altruism did not always prevail between divine parents and their children; see, for example, the account of how Maui noosed his "father," the sun (Henry 1928:431-432).¹⁹ A parallel case is found in the story of Tane's struggle with Atea, the god-dome of the sky, whose enveloping presence placed limits on Tane's peregrinations. Frustrated and angry, Tane demanded passage, threatening Atea with the force of the winds. To this Atea replied:

O Tane, can Atea fall by thee? Thou art but a lad, but I, Atea, am a vigorous elder; it was I who begat thee, Tane! [*na'u 'oe i fanau e Tane!*] But by what force can Atea fall by thee?

Unable to move Atea, Tane travelled to Ta'ere-of-all-skill, learned from him all his wisdom (pa'ari), then returned to Atea to slay him and take all his possessions for himself. And again Atea chided Tane:

Atea will not die by thee, O Tane! Thou art but a child, Atea is a parent [*e tamaiti e 'oe, e ta'ata metua Atea*]; it was he [Atea] who begat thee!

Note that Atea refers to himself not as *thy* parent, but as *a* parent—that is, a member of the parental genealogical level.

To make a long and rich story short, none of Tane's efforts prevailed, and finally, his anger appeased, he went away and sent back a peace offering and token of deference to the invincible Atea. And the encounter ended with this conciliatory speech by Tane to Atea:

When strife arises in the morning, let it be peace in the evening; when contention arises in the evening let it be reconciliation in the morning between kinsfolk [*taea'e*]. (Henry 1928:455-458)

Tane's speech is interesting enough as an exhortation for kin-folk—*taea'e*, in this passage—to keep their (inevitable) conflicts short lived. However, is one also justified in seeing in this whole story a more specific theme?—an allegorical expression of youth's inevitable striving to break through constraints imposed by, or at least represented by, their elders, their "parents," and of their equally inevitable inability to do so? Such an interpretation is of course possible, but I leave to others the task of discovering deeper messages in Maohi myths, and content myself with some of the more obvious meanings to be inferred from them.

Turning to stories involving humans, albeit legendary ones, we recall the story summarized earlier on the origin of breadfruit, in which Ruata'ata so pitied his starving wife and children that he transformed himself into a

breadfruit tree, to provide them with food (Henry 1928:423-424). A reversal of this theme is found in the following story about the origin of coconuts:

A very long time ago, there was such a famine in Tahiti that people stripped the land of all that was eatable and were reduced to eating red clay. Children wept with hunger which could not be satisfied, their parents wept in despair for them, and many families died of starvation.

At that time there was a man named Piti-iri (Husky-chestnut), and his wife, whose name was Pito-ura (Red-umbilicus), who had three small children, Pa-rapu (Fort-in-perplexity) and Toerau-roa (Continual-north-wind), two sons, and the third a daughter, named Ha-muri (Final-prayer). The mother died in her efforts to provide for her children, not taking nourishment herself, and the sorrow-stricken father took his motherless children into the interior of the island to a table-land called Oro-fero (Tied-oro-fern), where he made a comfortable hut to reside in. Then bidding the eldest son take care of the two younger children he left them and went in search of food.

He went up into the recesses of the valleys, only to find that others had been there before him and taken all available food. Then he was benighted, and on the following day he climbed the great mountain sides in search of *fei* (plantain). He continued his search for two days to no purpose, but on the third day his eyes, which had become dim with tears and hunger, were gladdened by the sight of a cluster of the desired trees laden with ripe fruit growing at the base of a towering peak. He soon possessed himself of a load of *fei*, ate some not cooked, and hastened to return to his children, whom he could not reach until the following day, the fourth since he had left them. When he arrived, he found them dead, where they had huddled together outside of the hut awaiting him. On approaching them, he found that their heads were growing, and soon he perceived they were producing plants that he had never seen before. As he buried each child, he carefully placed the heads so as to allow the plants to continue growing. They matured into three coconut trees and yielded fruit in a few days, and they were the first trees of their kind that ever grew in these islands. (Henry 1928:422-423)

In the legend of Tafa'i this young hero's father became so aggrieved at the unkind treatment accorded Tafa'i by his envious cousins that he "... took leave of this world and went down to the *pō* (darkness), to live." (Suicide or withdrawal was not an uncommon reaction to aggrievement.)

Reversing the roles, the young prodigy Pai (who it will be recalled was fostered by Ta'aroa himself, to save him from death at the hands of his father's slayers) so longed for his natal mother that he returned to the *ao*, to comfort her and restore the family's good name (Henry 1928:585-586).

Examples of fatherly affection are provided in Henry and in Adams.

... a man named Rahute (Abundant), of the household of Chief Moe, once left his district in a quarrel and went to Mataiea. He soon longed to see his little son whom he had left at home; and one day as he was fishing he met the family shark, told it his trouble, and asked it to go and bring him his dear child. The shark went its way. It hovered around the shores of Mata'oe, until one day as the boy was playing near the seaside upon the bank of the river, Vavī (Rashness), it decoyed him into the sea, caught him in its jaws, and bore him away to Mataiea. The father was awaiting him at a passage on the reef, and when he saw the shark

approach he swam onto a great wave and received his son, who was placed unharmed in his arms. (Henry 1928:389-390)

... Niuhi [a chief of Pare] ... was the subject of another tragedy caused by his killing the two sons of a man named Tetohu of Faaa, and placing their bodies on the Marae of Raianaunau. When the father heard of their death he called his daughter Terero and said to her: "I have just heard that my sons are put to death by Niuhi, and I am going to Raianaunau to mourn for them." She remonstrated: "Do not go! You will be killed." "I will go!" he replied; "but I wish you to wait three days, and if I do not return I shall be dead." ... After giving these instructions to his daughter [concerning how he was to be avenged], Tetohu bade her farewell and started for Marae Raianaunau, where he arrived the same evening, and found the bodies of his sons on the Marae, tied together and covered with a cloth of tapa. He uncovered and separated them, and then lay down between them, with their heads on his arms, and there he lay till, in the morning, the Tahua or priest, coming to the Marae to prepare the sacrifice, was surprised to see six legs instead of four under the tapa covering. Lifting it, he saw Tetohu, and was so deeply touched by his mournful face, with the dead sons lying in his arms, that he had not the heart to call the alarm, which must be the signal for the death of the father. "Get up and fly while there is yet time," he said to Tetohu. "Do you not know that it is death to interfere with Niuhi's vengeance and mount his Marae of Raianaunau?" Tetohu answered: "I have come to follow the fate of my sons, sure that my revenge is close at hand." The Tahua had then no choice for his own life but to report the event to Niuhi, who instantly ordered Tetohu to be killed. (Adams 1901:81-82)

There are also legendary accounts of services performed by parents for their children, as in the legend of Tumoanaurifa and Rifarifa reproduced in chapter 9.

Another extract from Henry touches on a father's affection—but one which had to give way to religious duty:

So sacred was the *pa'i-atua* regarded that were a stray man to appear upon the scene, whatever his rank or station, he was immediately seized and slain as a sacrifice to the gods and buried near the marae to add to its sacredness. And even if a little boy chanced to break away from home and go to his father at the marae, the father would say resignedly to the high-priest:

"Take this child and slay him for the gods! Behold the order of the marae is disturbed by him, the thread of the prayers to the gods is entangled. He is my son, I begat him, but I must not regret (losing him), because he has erred in coming here to the assembly of the gods."

Then the high priest approvingly would have the child sacrificed in the manner just described—as he would his own child. (1928:169)

But all was not affection and altruism in these stories about parent and child. For example, in the story of Mo'o-tua-raha reproduced earlier the factor of class overrode a father's expectable pleasure in having a son. In one of the numerous Maui legends, a maiden was so pressed by her parents into an unwelcome marriage with an eel-demon that she fled from home and never returned.

There was once a beautiful young princess of Papeuriri, Tahiti, of the highest lineage, whose celestial patrons, the sun and moon, had named her Hina (Gray). When this young girl had reached the stature of womanhood and was becoming much admired for her beauty—flashes of light emanating from her person restricted her to a very select circle—the sun and moon espoused her to the king of Lake Vaihiria, before she had any personal acquaintance with him or her even seen him. The king's name was Fa'arava'ai-anu (Cause-to-fish-in-the-cold), and as her parents agreed to the marriage Hina felt no doubt of the suitability of the match and entered happily into all the preparations for her wedding. Hina chose for her maids of honor, two childhood companions, named Varua (Spirit) and Terroro (Brain), and when at last the marriage day arrived they were attractively dressed in white tapa gracefully wound around their persons, with garlands of maire fern interwoven with red *fara* strobile tips and snow-white *tiare*, and in their flowing raven hair they entwined similar wreaths. The bride also wore, in token of her rank, a necklet and girdle of rich red and yellow *'ura* (parakeet feathers).

At length the bridal party set out to meet the bridegroom, accompanied with the measured beat of the drum and the soft notes of the bamboo flute and other primitive musical instruments, and they had gone half way up the valley to Lake Vaihiria, when, lo, the bridegroom was seen descending the declivity to meet them. And there in the distance Hina saw to her great horror, an immense eel, as great and long as the trunk of a tall coconut tree; this was Fa'arava'aianu, king of Lake Vaihiria, the intended bridegroom for the beautiful Hina!

Terror-stricken, she turned to her parents and exclaimed: "It is indeed this, O my parents? Do you wish me to be wedded to a monster and not a person? O how cruel of you! And now I shall seek my own salvation!" And she fled out of the valley to her home.

On arriving there, the people were surprised to see her and enquired what had happened. On knowing her grief and disappointment, sorrow and sympathy filled their hearts towards her.

"And now," she said, "farewell. I must seek my salvation quickly away from here. If all be well, I shall return again; but meanwhile, my dear friends, I entrust all my treasures to your care. If I live, I shall return to my own district, to be with you, my dearly loved ones."

Willing hands quickly prepared a swift canoe, and just as the moon was rising in its full glory, Hina, with trusted retainers, set off for Vaiaro, Tairapu, to seek the aid and protection of the great Mâ-û-i who had noosed and controlled the sun, and there they arrived just before daybreak.

On entering his cave, Hina found Mâ-û-i was out, but she was kindly received by his wife. Shortly afterwards he came in and enquired of his wife what caused the brilliant flashes of light in their dark abode, and she replied:

"This is Hina of the *'ura* girdle, Hina of lightning flashes in the east, Hina, child of the sun and moon; her wind is the northeast trade wind."

Then Mâ-û-i welcomed Hina, and kindly addressed her saying, "O Hina, beloved daughter of Mataiea, what is your errand, my Princess?"

"O Mâ-û-i," she exclaimed, "save me from the hideous monster, the king of Vaihiria, who will be coming here to claim me as his wife! Have pity on me, behold now outside, and what is the wind? It is possessed, darkness is overshadowing the land, and the sea is foaming so that the ocean beyond cannot be seen?" And then, while Hina told her sad story, they saw the eel king breaking an entrance passage in the reef.

Mâ-û-i was horrified, and he hastened to place his two stone gods upon the cliffs and to sharpen his axe and make ready his fishhook for action. Then, as the eel was approaching the shore, Mâ-û-i placed some tempting bait upon the fishhook and secured it with Hina's hair.

As soon as the eel saw him, he roared out in a thundering voice, "Mâ-û-i, deliver me my bride!"

And Mâ-û-i cast his fishhook into the sea, saying, "This is I, Mâ-û-i the brave! No king can escape me here in my heritage; he will become food for my images."

Then the eel perceiving the food, opened wide his mouth and swallowed the fishhook and bait, and soon Mâ-û-i drew him up on to the shore. He chopped off his great head, which he wrapped in tapa, and presented it to Hina, saying:

"Hold this, and put it not down an instant until you arrive home; then take and plant it in the center of your marae ground. This eel's head contains for you great treasures; from it you will have material to build and complete your house, besides food to eat and water to drink. But remember my warning, that you lose not your valuable property by putting it down before you reach home. Then you will ever be remembered as Hina-vahine-e-anapa-te-uira-i-te-Hiti'a-o-te-ra (Hina-of-lightning-flashes-in-the-east)."

So Hina took the great bundle, which became light by magic, and sending on her canoe along the coast, she and an attendant maid preferred walking a few miles. So they went on their way rejoicing, and arrived at a place called Pani (To-close), where they saw a nice deep stream of water, at which they stopped to drink. In doing this, Hina thoughtlessly put down her bundle. Soon the two girls made up their minds to take a bath. So in they plunged and dove first upwards in the stream and then downwards, when Hina all at once remembered her eel's head and left the water quickly to go and take it up again. But lo, as she approached it, she found the tapa removed, and there the head stood erect, rooted to the ground and sprouting! It had become a young coconut tree. Then Hina saw and understood why Mâ-û-i had told her only to put it down at her own marae, and she wept bitterly.

Just then a woman of the people, but of good standing in the land, came along and enquired of the girl her trouble, and when Hina told her, the woman whose name was Rû-roa (Great-haste), said comfortingly:

"Be not troubled for this land is ours; come and sojourn with me so as to watch the growth of your new tree, which shall always be yours."

Hina, comforted, accepted the woman's kind invitation, and after sending her companion on to the canoe with word for her people to return home, she committed herself to the care of her new friend, who soon made her very comfortable in her home not far off.

After partaking of a hearty breakfast, Hina threw herself down upon a mat, and fell asleep, which rest she needed, and towards evening as she awoke, she heard voices outside not far from the house. Looking out she perceived two handsome young men, sons of Rû-roa, who had been out fishing; and she heard them enquire of their mother as to the cause of flashes of lightning that they saw coming out of their dwelling, to which she replied:

"It is Hina, princess of Papeuriri, and child of the sun and moon. She has a young coconut tree growing yonder, which she is staying here to watch until it matures."

Awe-struck, the young men would not enter the house but remained outside. The younger brother went to see the new tree, and found it loaded with coconuts. So he picked one and husked it and took it to his mother and brother, and while

they were examining and admiring it, Hina, wishing to place them all at ease in her presence, called to them to come in. She said to the elder brother:

"Your name must be Mahana-e-anapa-i-te-po'ipo'i" (Sun-that-flashes-in-the-morning). And to the younger brother she said: "You must be called Ava'e-e-hiti-i-te-ahiahi" (Moon-that-rises-in-the-evening).

By giving them these names, which plebeians never dared to adopt in times of yore, she created them nobles, an act which also gave rank to their mother. Thus united in bonds of friendship, they all lived happily together, the family being charmed with the beautiful and affable Hina, and they enjoyed eating the coconuts, which had become the admiration of all Tai'arapu.

Hina and Mahana-e-anapa-i-te-po'ipo'i became much attached to each other and they were married, and in due time she had a daughter whom they named Te-ipo-o-te-marama (Pet-of-the moon). But to her great sorrow Hina's husband soon died. She afterwards married the younger brother, who reminded her much of her deceased husband, and by him she had another daughter, whom they named Te-ipo-o-te-here (Pet-who-loved).

One day, as each child held a matured coconut in her hand, they were caught up by the gods on to a rainbow, by which they were conducted to Taka-horo, in the atoll of Ana (Chain Island), in the Tuamotus. The younger sister, finding that her coconut was without water, changed it for that of her elder sister, unbeknown to her, which displeased the gods; and causing her to drop the coconut, which was sprouting, they carried her away in the clouds, and she was never seen again. So Te-ipo-o-te-marama became the sole owner of this, the first coconut tree that grew at Ana, from which were produced all the coconut trees that have spread throughout the group and have developed into many varieties. The tree stood, towering high above all other trees of the group, until the cyclone of February 8, 1906, broke it off in three pieces, which were washed away by the sea.

Hina lived long and happily with her husband, sometimes in Tai'arapu, sometimes in Pape'uriri, and she had numerous issue. (Henry 1928:615-619)

An episode in the story of Rata tells much about the expected behavior of a chief, and this will be referred to in another chapter, but it also provides some insights into Maohi norms for relations between mother and son. The main theme of this lengthy epic concerns the efforts of relatives to avenge the death and recover the bodies of a chief and his followers who had been slain by a giant tridacna clam. For a time the chief's widow acted as regent on behalf of her son, Rata, but when the latter had matured and acquired prodigious strength he was made chief, and his mother began preparations for an expedition of vengeance. To select the hardiest companions she decreed a contest in the form of a wild boar chase:

The giant king, Rata, entered enthusiastically into his mother's plans, wishing also to accompany her on her voyage. Wild boars with long tusks were caught and kept in readiness, and the day was fixed for the sport, after which a prolonged feast was to be held in honor of the king's coming into power. The regent decided to go herself as umpire, and she told her son that as king he should not take part in the chase but that he should preside over it with her, and this he agreed to do. But she was careful in cautioning him to exercise self control, as she feared he would become excited and side with one party against the other.

This might end tragically, for, she said, he would thus be drawn to interfere with the hunters, and as he was so strong, one blow of his hand would fell a man to the ground and disable him, and he would thus lose caste as king in the land. But Rata assured his mother that he loved his people impartially and would control his feelings as umpire with her. So her mind was set at rest.

The day arrived, and in the cool of the morning the young men of Hiti-uta and Hiti-tai coasts ranged themselves along on one side of the assembly ground and those of Pe'eai and Papahonu on the other side. The king and his mother, as umpires, took their seats in the rear, and one of the boars was let loose in the center of the assembly ground. At first the boar stood bewildered in his strange position, but soon endeavored to make its escape by running inland.

The rival parties kept their respective sides as they chased the pig and closed in the road he was taking. The Hiti-uta and Hiti-tai side almost caught him, but he slipped out of their hands and was escaping into the woods, when the king, growing interested in the chase and forgetting his place as umpire, shouted:

"A rohi, e Hiti-uta e Hiti-tai!" (Be sharp, Hiti-uta and Hiti-tai). This fired them with new zeal. The king's mother reminded him that he should keep calm and be silent; yet he could not contain himself.

Soon the hunters, each party keeping its own side, had overtaken the pig inland and turned his course out of the woods into the scrub upon the sands of the coast, and just as the people of Pe'eai and Papahonu were about to catch him, he disappeared in the sea; but he was again nearly in their hands as he emerged and was swimming away.

Now Rata lost all control of himself, and shouted to the other side to push into the rival ranks and outdo them, saying:

"Na onei mai, na onei mai!" (Come this way, come this way!). The mother in vain exclaiming:

"E Rata, eiaha 'oe e parau atu i ta vera haru ra'a pua'a! E ari'i 'oe, parahi noa oe i to parahira'a mataeina'a e a vai iho noa 'tu ia vera!" (Rata, do not interfere with their pig catching! You are the king, sit still in your official place, and leave them alone!)

But all system and order were now forgotten by the king in his excitement. He heeded not his mother's words and joined the party, felling to the ground those he sided against, as they laid their hands upon the pig, now slippery from being wet and endeavoring to run out through the crowd. Some of those Rata struck with his heavy fist died instantaneously; others were stunned and carried away. Thus tragically was the people's sport ended, while the persecuted pig slipped away unobserved to its home in the woods.

All attention was then directed to the injured and dead. The king stood aghast, overwhelmed with shame and remorse, as the people of Pe'eai and Papahonu turned to his mother and said with bitter sarcasm:

E te Ari'i Maemae-a-rohi vahine e, tera iho te ta'ata o Peeai e o Papahonu, i ha'apori hia ei ta'ata no te tere, ei fa'a'ite ra'a ui i te tere o te Ari-i-vahine o Maemae-a-rohi!

O Princess Maemae-a-rohi, these are the people of Pe'eai and Papahonu, fattened for their journey, as an illustration to generations of the travels of the Princess Maemae-a-rohi!

Stung with poignant sorrow, her tears mingled freely with those of the people, who bewailed the day's adventures, and she retired to her home much mortified with her son's conduct. For two days and two nights she upbraided him in the following scathing manner:

Eaha 'oe i taparahi ai i te ta'ata? Ta 'oe ia i na o mai e, 'e'ita 'oe e rave noa a'e i ta vera harura'a pua'a? E ari'i maitai 'oe? Inaha, to pue metua o tei pohe i te toa o te moana, te mau ari'i ia i ha'apao hia ei ari'i no te fenua, 'a'ita i taparahi i te ta'ata; e tae mai nei ia 'oe, o'oe atura e taparahi i te ta'ata i fa'aea noa i ni'a te fenua nei! Eaha 'oe i rave nunui ai i te ta'ata? E ho'ona ho'i te taua ia 'oe, e tena ta'ata ino? Ahiri ho'i 'oe e ta'ata maitai, e 'ai 'oe i te pua'a o to 'oe na'u metua, ta'ata ino pai 'oe. Haere pai 'oe e'ai i te huehue ia pohe vave atu i tena na mahana. 'Aore 'oe a pohe i reira, a haere a amu i te tutae. Eiaha 'oe e amu i te ma'a maumau, te ma'a o te fenua nei a pau i te manumanu ia 'oe, tena na ta'ata 'ino!

Rata's heart, already heavy, was sorely pricked with his mother's reproaches, his head was bowed down with true contrition, and his loud wailing was heard far away, so that all the people pitied him. At length he said:

E ta'u metua vahine, e te Ari'i Maemae-a-rohi vahine e, mea ra te toetoe o to'u 'a'au ê! Ahiri 'oe i tu mai e taparahi ia'u, mahana-hana ai to'u 'a'au. Eiaha e atu ia, ahiri 'oe i fa'ae i te ta'ata o te va'-amataeina'a e tu mai e tata ia'u i te ra'au, 'e'ita roa vau e mamae i tereira! 'A'ita 'tu e ra'au mamae rahi, maori ra o te reo i avau mai nei, e te amuamu; toetoe maite atura to'u 'a'au! Na vai teie, mai te po'ipo'i mai a e a pō maite, e ao a'era e a pō ho'i teie ra, te avau noa mai nei a 'oe! Ta 'oe e parau mai nei e ta'u metua vahine, e Maemae-a-rohi, taria-pu tena parau no'u.

Teie ra ta'u parau, e ta'u metua vahine, E hoe atu taua i to 'oe tere. E roa'a ia'u te mata taua; pohe ana'e ia mau toa ia'u. Ahiri e mai te fenua tuati ra e tae noa ia haere, teienei ia mahana e pau ai ia mau toa ia 'u. Napehea rā, inaha e tai tua. E'ita atura e noa'a i teienei!

A rave ra vau e tarai i ta'u pahi, e ia oti, taua 'toa te haere i to tere taua. Fa'aho'i ra i to va'a a'era i roto i te farau, e hoe a'e o taua tere, 'e'ita ia 'oe e pohe.

Why did you murder the people? Was that keeping your promise not to interfere with their boar seizing? Are you a good king? Behold, your father and uncles, who were slain by their foes of the ocean, were worthy princes of the land; they did not slay men; and now you have arisen, you have killed inoffensive people of the land! Why did you lay a heavy hand upon them? Can you recover friendship, O man of evil? Were you a worthy person, you might eat pork as did you fathers, but you are unworthy. Go then and eat globe-fish, that you may die today. And if you do not die of that, go and eat dung. Eat not the food of the brave, lest the ailments of the land become blighted by you, unworthy man!

O my mother, Princess Maemae-a-rohi, how chilled now is my heart! Oh, that you would come and beat me so as to warm my heart. And if not this, were you to order the people of the clans to come and smite me with rods, I should not feel pain from them! There is no rod that hurts so badly as the voice of reproach and derision that reaches me; it has chilled my heart! What manner of doing is this, from morning till night from day until now it is night again, you are still upbraiding me! What you say to me, O my mother, Maemae-a-rohi, your words my ears retain.

And now here is what I wish to say, O my mother. Let me go with you on your voyage. I am capable of waging war; all those foes I can slay. Were it land joining this, upon which I could go, this day would I consume all those foes. But what can be done when there is the open sea? They cannot now be reached!

Then let me make my ship, and when it is finished allow me to accompany you on your long journey. Have your canoe now replaced in its shed, and let us both go together, so that you may not die.

But the mother was so sorely displeased that she refused to wait for her son to build his ship and made preparations to go on her long journey without him. In vain Rata entreated her to let him accompany her; his waywardness, which had brought death and sorrow to his people, had broken her confidence in him. She

refused to accept his services but chose rather to entrust herself to the care of her older tried friends and retainers. (Henry 1928:478-480)

The prodigious Honoura also enjoyed less than felicitous relations with his parents, but he can hardly be blamed for his pique, for when born, in the form of a shapeless clod, that is, an abortion, his parents abandoned him in a cave. In time Honoura grew to enormous size, and was rediscovered by his family. Once when his mother and brothers went to visit him he was at first considerate of his mother's comfort; then for reasons not given

... the anger of Honoura was kindled against his mother, and he took her and wrestled with her. The night was far advanced as they did so, and the sea was ebbing while they continued so, and the early dawn came, they still continuing, daybreak came, and they wrestled on, the sun arose they the while continuing, the sun was high in the heavens, and still they wrestled on!

When the brothers saw (the wrestling) they said (to Honoura): "Friend, you are an unkind man to our dear mother!" They tried to throw him down, but did not succeed. And when the wrestling was over the son let himself down, and the mother stood up like a little fowl that had been dipped in water. (Henry 1895:269)

After that Honoura's family attempted to kill him, without avail, and eventually peace was made.

Another episode, in the meandering legend of Tafa'i, indicates that favoritism was a recognized circumstance in Maohi ideas about parent-child relations:

In course of time, Hina who married her protector and deliverer, gave birth to a son, who was named Pū-a'a-ri'i-tahi (Cluster-of-first-small-roots). Another son, named Hema (Deceived), followed and she had no more children. The two boys became fine young men, and they were adepts in Surfing. One day as they were preparing to go out for their sport, the mother asked the elder son, Pu-a'a-ri'i tahi, to dress her hair. But he did not comply, and she said,

"Ah, your wife will not be a woman of distinction." Then, as Hema came by, she asked him to dress her hair, which he readily did. As he combed out her long glossy locks and braided them, he discovered a louse and taking it out he showed it to her. She said:

"Your wife will be a notable woman." (Henry 1928:555)

In due course Hina helped her favored son to obtain a goddess for a wife, who in turn gave birth to the heroic Tafa'i.

Earlier in the legend of Tafa'i his grandmother, Hina, was less fortunate in her family relations. Hina's own mother, Nona, was "... an elegantly formed woman of high rank," but these attractions were offset by her appetite for human flesh. The story is worth reproducing in full, since it involves a family triangle of a most unusual kind.

[Forsaken by her husband, Nona] lived alone in her home shaded with coconut trees on her own hereditary land near the sea. There she gave birth to a beautiful little girl, whom she named Hina (Gray) and whom she brought up

tenderly, as befitted her rank, concealing from the child the human prey which she procured for herself.

At the foot of the great projecting cliff of Tahara'a (Barrenness), conspicuous for its red clay, is a great cave bordering on the sea, forming a tunnel open at each end, through which pedestrians can pass at low tide so as to save going round the hill, and it is famed to this day as No-na's hiding place, where she waylaid passers-by and slew them to eat, sometimes cooking and sometimes devouring them still warm and sanglant.

In the days of No-na, people gradually became very scarce in that region, and homes lay mysteriously desolate. But a handsome young man, named Mono'i-here (Favorite-perfumed-oil), had escaped the wily woman, and he had become much attached to her daughter Hina, whose affections he won as she verged to beautiful womanhood. They clandestinely met at a cool sequestered spot, called Oro-fara (Fara-fern), where there is a spring, called Rati (Splash), which watered Hina's bathing pool—still called Te-hopura'a-vai-o-Hina (The bathing pool of Hina)—and close by a cave, which in their time it is said, was not known to exist, as at their bidding it opened and closed in the solid rock.

Protecting the Bay of Matavai (Face-of-water) is a broken line of reefs, called the Chain-of-to'a-tea (Light-rocks), and thither No-na, who was an expert fisherwoman, frequently went to obtain fish for herself and her child. While she was thus employed the two young people, Mono'i-here and Hina, met, feeling safe and free. Hina had the habit of carrying a basket of food to her lover when he was concealed in the cave, and in approaching him they would exchange the following passwords:

Hina. Mono'i-here te tane, Hina te vahine!

Mono'i-here. Teihea to metua vahine niho roroa, o No-na?

Hina. Tei te a'au roroa, tei te a'au popoto, te ravaa'i ra i te i'a na taua, ta'u hoo tane. Te tumu o te papa e vahia!

Hina. Mono'i-here is the man, Hina is the woman!

Mono'i-here. Where is thy mother, No-na, with long teeth?

Hina. She is on the long reef, on the short reef, catching fish for us, my lover. Oh foundation of rock, break open!

Then the rock would burst open and out would come the lover, and they would pleasantly while the hours away until the time approached for No-na to return home, when Mono'i-here would either return to the cave or go to his home in the distance, as circumstances guided, always cautiously avoiding an encounter with her.

But there came a time when the mother began to miss the food and so wondered how her daughter could consume so much in her absence, and she determined to solve the mystery. So one day, after cooking their usual supply of food, she feigned indisposition and went to bed, then she snored deeply and appeared to be in the soundest sleep. Finally No-na saw her daughter stealthily approach the food, take out choice morsels, place them in a basket, and go noiselessly out. When No-na saw the course the girl was taking she took a short cut, halting here and there to keep sight of her, until she turned up into the shady nook; then No-na, arriving before her, ascended into a pua tree, where she could see and hear unobserved. As No-na had never known of the existence of the closed-in-cave, she was soon astonished at what she witnessed, and she repeated to herself the passwords, so as to remember them, as she kept motionless until the lovers had held their interview and parted, when she quickly descended from the tree and returned to her bed at home, while her unsuspecting daughter leisurely followed and found things there just as she had left them.

The following day, after partaking of food and putting some by, No-na took

leave of her child, saying she was going to prepare torches for night fishing. But she quickly went to the lovers' haunt, and standing by the cave she spoke, imitating Hina's tone as nearly as she could. But Mono'i-here, detecting the fraud, replied:

"E'ere oe o Hina, o te vahine nihoniho roroa ra 'oe, o No-na!" (You are not Hina, but you are No-na the woman with long teeth!) But she had learned the magical words, and fiendishly said:

"Te tumu o te papa e, vahia!" (Oh foundation of rock, break open!)

Then the cave opened. She entered quickly, seized the hapless young man, and killed and feasted on him. She looked for his heart but could not find it, and leaving his bones and vitals thrown together she left the cave, which closed after her, and returned to prepare her torches as she had planned.

Meanwhile, Hina went with her basket to the cave and was surprised when no response came to her from within, and as the rock opened at her bidding she encountered the ghastly spectacle in the cave. What remained of Mono'i-here was still warm, and Hina at once sought for and found the heart, which was still pulsating. This she placed next to her own heart and guided by it went home to act. In the absence of her mother she got the trunk of a banana tree and laid it in her bed to counterfeit her body, and to simulate a head upon her pillow at one end of it she placed an *'a'ano* (coconut-water-bottle). Then she covered all up in her tapa sheet and fled in fear from the home of her childhood, until she arrived at the adjoining district of 'Uporu (Ha'apape or Point Venus). Still guided by the pulsating heart of her lost lover she stopped at the house of a fine young chief, named No'a (Sweet-odor), who was famed for his hairy though handsome person and who with all his household received her cordially, and she was at rest.

When No-na returned home with her torches she prepared supper, and thinking Hina was having a nap in her bed she called her; but no voice came. After calling several times, No-na became enraged and threatened to eat her daughter. But as there was still no response she furiously exclaimed:

"Tera mai au, e Hina, ua pau oe ia 'u!" (There I come, O Hina; you will be devoured by me!) So saying, she rushed to the bed, laid hold of the banana effigy of her daughter, and bit into it through the sheet, when, to her great surprise, she found that the girl had outwitted her, and she exclaimed:

"A ua ora 'oe!" (Ah, you have escaped!)

Early on the following day, No-na set out to recover her daughter, and ascertaining the course she had taken she went on and on enquiring for Hina until she also arrived at the house of the hairy chief, No'a. When she saw Hina, she made a rush to seize her, but the chief seeing how terror stricken the girl was, and hearing her say that No-na was a savage woman and would kill her he intercepted her grasp. Then with muscular strength, No-na grappled to strangle him; but he overpowered and strangled her and so ended the life of the famous No-na of the cave of Tahara'a. (Henry 1928:552-555)

The fabulous Hiro figures in many legendary episodes, only one of which concerns us here. This has to do with his strained relations with his son, occasioned by his slaying of his wife, the latter's mother (out of anger for her having jokingly alluded to his strong odor).

[After he had brutally kicked her to death,] ... he dug a shallow grave in the sand beneath the chips of his canoe and there buried her, thinking that no one had witnessed the scene; but a man who was passing by heard her cries and, com-

passionating her, saw all by peeping into the shed from the outside, at the risk of losing his own life and quite powerless to save hers.

While this tragedy was taking place, their son Marama was out surf riding, which was his favorite diversion. When he returned home, not finding his mother and seeing a mat that she had been making lying with the strands scattered around as if left for a short time, he went to the canoe shed and inquired of his father where she was. But Hiro, fearing his son, replied:

"A'ita vau i 'ite" (I do not know).

Then feeling impelled by an invisible power, Marama went towards the spot where his mother lay, and moving the sand away he found her calm and beautiful in death. He bore her body away and buried it in sacred ground in her marae, and then he went to a distant point and sat alone on the seaside, mourning deeply for her and refusing to take nourishment or receive comfort from anybody. His father did not dare approach him. As days thus passed, and Marama neither ate nor drank, feeling anxious for him Hiro sent his daughter Pî'ho, to try to console her brother and bring him home, which after great difficulty she at last succeeded in doing. Hiro felt himself condemned in the eyes of his son and avoided falling into his hands by taking frequent long voyages, fearing that he might avenge the death of his mother upon him. But, not being of the fierce nature of his father, Marama sought not his life. (Henry 1928:544-545)

Thereafter they continued to reside together for a while, but Hiro seemed intent upon rousing his son's ire, for reasons that are not explained:

Hiro prided himself on doing things that other men could not do. At the request of his son, he made fire by friction, using toa for the upper attrition and a stone for the under attrition, instead of pliant wood for both. Then Hiro told his son to wield on a hillside, without missing, an immense heap of stones of all shapes and sizes, instead of pebbles, in a game of *timo*, which Hiro was accustomed to doing with his great hands without difficulty. His son complied with the request and succeeded well until he came to the last stone, which as he was about to take it up Hiro kicked away and caused Marama to stumble. This enraged Marama; he struck the hill with his fist and caused a landslide, which left steep, bare rocks. Hence the ever-standing epithet relating to the hill, *"Te mou'a ta Marama i po'ara"* (The mountain which Marama boxed). (Henry 1928:545)

A final legendary example concerns relations between Hiro and the husband of his mother, Faimano. Hiro himself was sired by a chiefly visitor, who enjoyed the lady's favors while her husband, Tepouaru, was away on a lengthy expedition (a recurrent situation in Maohi stories). This part of the Hiro cycle concerns other kinship relations, which will be discussed later on.

At his departure he said to her, "I know you are pregnant from me, and I wish to tell you if the child is a boy you will name him Aru mearau; he will be a great warrior. Your husband will be jealous and will endeavour to do his best for the death of the child; be fonder of bonitas and Aahi, and I will work on the Tahuas of Marae Vaiotaha to bring him contrary winds and keep him at sea longer. He will not dare use open means to hurt the child, so be prepared. It will be better for you to go and live at old Ana's, he can protect the child better

than you." He wished her good-bye, and left. As he was being rowed out in his war canoe, Tepouatere ia Hotu, he met Tepouaru, coming in from his fishing. This chief was much troubled in seeing this war canoe coming out from his landing-place, and asked of his men whom it could be; coming closer these saw who it was; why, it is Moeterauri on his canoe Tepouatere ia Hotu; Tepouaru saluted, as is usual, his speaker, and invited him to return to Faaha and accept the hospitality of Tepouaru. The reply came, "Many thanks, I have been enjoying it for three days." Tepouaru was very jealous and hastened his men to get in as quickly as possible.

Faaha is a bay on the Island of Upolu of Tahaa, about two miles in depth and a mile wide; the valley is large and fertile; it is said that it was well cultivated with umaras, yams, taro and kava, the usual cultivation of those days. This was done by old blind Ana, Tepouaru's father; although old and blind he was a wise man and famed for his good government, so that in his valley was always plenty; at times of scarcity of food many went there to get food. The old fellow had arranged for the yam and umara plantations to be protected from thieves by two warriors, Tanihaa and Tanivaere by name, and the kava, the most precious, by the man-eater pig Moiri, so no one went into these without authority. Tepouaru had deprived his father of all government authority and he lived away from him.

On Tepouaru's arrival, he at once made enquiries of the doings during his absence, and of the reception given to the departed guest; he was told that they had been different to the usual feasts given to high placed chiefs, who often came to Faaha. He suspected the infidelity of his wife, and watched her closely, intending all the time to kill her if a child was born. He made his plans early to prevent failure. Faimano saw all this and kept her own people closer around her for protection if necessary.

The time of birth arrived, and happened on the second night of the new moon, a night known as Hirohiti. Tepouaru had left for fishing the day before, and Faimano had gone to old blind Ana's house; there she gave birth to a fine boy; the old man hearing it was a boy, asked if anything strange about it could be observed. The midwife reported that the child had a strange red eye and the navel stood straight up. The old man then predicted that he would be a fearless boy and would become noted; and gave him the name of Hiro. On Tepouaru's return he looked at the boy, and said, "As my father has given him a name, he can keep and take care of him."

As he grew up the old man taught him the art of club-fighting and wrestling; so strong was he that no one of his age could match him. He returned the love of the old man. He was also taught the movements of the stars and navigation; he excelled in all of the sports of those days. Faumana had three boys by Tepouaru and these became very jealous of their younger brother. Whilst canoe-racing they became so furious when Hiro had beaten theirs that they suddenly fell upon him to kill him; they got him down stunned, and put a large flat stone on his body and left him for dead. Hiro, however, got up from under the stone and went up the valley to old Ana. (The stone still exists at Faaha; I saw it in 1901, as also the lands where yams, &c., &c., were planted. Moiri's cave exists still, and so also the paepae or platform where Tanihaa and Tanivaere lived.) When Hiro arrived at manhood he began asking his mother about his father, "for," he said, "you cannot make me believe that I am the son of Tepouaru, for he shows his hate plainly. Tell me the name of my father"; his mother always replied to this, "When you have done some warrior's deed I will do so." For this Hiro learned the art of fighting.

One day there arrived a chief, Raatapu, from Havai (Raiatea) with his canoes

and men. Tepouaru made preparations to receive such a noble guest, food was collected and pigs roasted. At the morning meal of the second day this chief asked for Kava, the famous umaras and yams. Tepouaru could not refuse, and thinking of this chance to get rid of Hiro sent for him, and before his guest told him of what was wanted. He said, "Hiro, our guest wants to see the umaras and yams of Faarahi, and after that, get the Kava of Puroa." "All right," Hiro replied, and started. As he passed by old Ana, the old man called, "Where are you going?" Hiro told him. The old man then explained about Tanihaa and Tanivaere and warned him to strike from left to right, and call Tanihaa first, that the other was a sleepy head, and he could have time to kill Tanihaa before the other could come up. Hiro was on no account to go at once for the Kava, but to return with the umaras and yams. Hiro went, followed the old man's instructions, and returned victorious. Having killed the two warriors, he brought the umaras and yams to old Ana, who told him to take them to Tepouaru and return to him, and not to tell that he had killed the two keepers. Hiro did this. Tepouaru, being furious, said, "Where is the Kava?" Hiro replied, "I go now to get it." He went, and again called to see old Ana, who told him that when he arrived at the place to be sure and make as much noise as possible, and to throw branches of Kava plant in the cave to enrage the man-eater out of his hole, and if Moiri did not come out, he must not attempt to go in to drive him out for there was no room inside for fighting. Hiro followed again the instructions of the old man. When he arrived at the place, and after making as much noise as possible, he heard the great pig grunt, but he would not come out. Hiro then threw in branches of the Kava; this enraged the pig so much he made a rush outside, then Hiro sent his spear through the pig, giving a death wound. He picked up the pig still sticking on his spear, rooted up the Kava, tied it on the other side to balance the weight, and started for the feasting-place. Old Ana was anxiously waiting; when he heard Hiro arriving he called out, "Welcome, for I was afraid Moiri would get you."
