On leaving Hiro left the Kava roots behind him and told the old man to take care of them till his return. Ana asked, "Why do you do that?" "Oh, they can get some from up there now Moiri is slain; mine is for us two only."

When Tepouaru and people saw Hiro arriving with the pig dead, they became afraid, and wondered at the success of Hiro. He came up to where Tepouaru and his guest Raatapu were. Turning to the former, he said, "Here is your famous pig, Moiri; the Kava I have left at home for my own use; if you want any send your sons for it, for no one will hurt them up there." This was an insult to Tepouaru and sons. Hiro then left for his home. The feast ended at once, and Raatapu left, knowing that some trouble was soon to take place. On Hiro's arrival home he started to munch the Kava; this took him a long time to do, and by the time it was ready to drink it was evening. He gave old Ana the first cup, and began drinking himself. The old man kept saying, "Hiro, don't drink too much, for I am blind, and cannot watch for your enemies, for it is certain that my son Tepouaru will attempt your life." But the Kava could not make any effect on Hiro, whereas the old fellow got quite drunk. During the night men were sent to see how these two were getting on; these saw Ana drunk and took it for granted that Hiro was also in the same state; they quickly went back to report. Tepouaru's three sons left at once, saying, "Now is the time to kill our enemy." Arriving, Hiro pretended he was drunk, and these three men quarrelled as to who should give the blow to kill him. Hiro then got up and fought them, killing two; the third seeing this, ran down to his father's and Hiro after him. Tepouaru, hearing the voice of his son calling for

help, ran out to help; just as Hiro was dispatching him he aimed a blow at Hiro which wounded him. Hiro, however, turned and speared Tepouaru, and killed him. Faimano ran out, followed by her people, and when they saw Tepouaru dead and Hiro standing over him, she called to her warriors to protect him if Tepouaru's men should try to revenge their chief. These, however, thought that Hiro was Tepouaru's son, and the deeds performed by him during the day were such that they were proud of him, and proclaimed him as chief of Faaha. The place was called Vaitoto, bloody waters (and is shown to you to this day). Old Ana heard of these deaths and declared the act was done in self-defence. So Hiro commenced his rule with full approval of everyone. He ordered a new Marae to be built and called the Tau i Upolu (Time of Upolu). He could rest in peace, and called his mother to fulfil her promise and tell him who his father was. She told him. (T. Salmon n.d.: 8-16)

The corpus of recorded Maohi legends contains a few other episodes concerning parent-child relations, but those given above are fairly representative in terms of the dimensions herein discussed. These narrative fragments are far too few for statistical analysis but they do permit some general impressions about parent-child relations as represented in stories the Maohis found interesting enough—possibly even credible enough—to listen to and retell.

Both sons *and* daughters appear in the stories, although the former figure more frequently and more prominently. With respect to dyads, episodes involving sons and mothers are about as common as those involving sons and fathers, the least featured being relations between a father and his daughter.

Affection and altruism are the mode in most episodes, but conflict is highlighted in some, ranging from mild pique to deadly enmity, and resulting from many kinds of situations. In this connection, mothers are depicted in conflict with sons and with daughters, and fathers with sons but not with daughters—an interesting but not necessarily significant omission in this small sample.

Another noteworthy aspect of these fragments is that most of them concern natal parents. Moreover, in the one episode in which choice is made, the protagonist, Pai, rejects his divine foster parents in order to return to his natal mother. And finally, the alleged tolerance of Maohi husbands for their wives' bastard offspring is emphatically controverted, at least in the instance of Tepouaru and Hiro.

Evidence concerning parent-child relations is provided also by certain words such as the following from the LMS Dictionary: *ātama*, affection for a child; *anau*, grief of parents for their children, or of children for their parents; *mere*, the affectionate grief of a parent. These appear to apply distinctively to the relations under consideration, indicating verbal recognition of their special nature.²⁰ This is true also of *rorai*, a curse or imprecation of evil on children; more specifically, according to Henry, *rorai* means "a parent's curse," this being a common cause of illness (1928:210).

One finds in Morrison the puzzling statement that "A Child may Curse its Father, Mother, Uncle or Aunt but it would be Blasphemy for them to Curse it" (1935:184). Two factors may have been involved here: a belief that an adult's curse was more effective than a child's, and hence the necessity of avoiding unintended harm brought on by momentary anger; and a concern for family "honor" as embodied in the parental kin-Titles now held by the child in question. Concerning the second factor is a statement by Wilson about the causes of interfamily strife:

Such broils, indeed, are sometimes produced by what appears to us a very trifling matter; such as scurrilous words spoken against the heir of a large estate, or even of a small one; neglect of proper respect to a child, and other things as trivial; for instance, as the child from the moment of its birth becomes the head of the family, the boundaries of his land are new marked with rude images; and if this new-born infant be a tōwha, of ratirra, a number of little flags are set up in different parts of the boundary; to these all persons of inferior rank must uncover themselves as they pass, whether by day or by night; and should this mark of homage be contemptuously neglected, the mother flies to the shark's teeth and cuts herself, and the party must make his peace-offering with the plantain: should this be refused, the father and mother would tear off the clothes from his back, and well drub him into the bargain. The friends and relations on both sides sometimes arm, and fatal consequences follow. Even a chief has been known to be driven from his district on account of a dispute originating about a poor man's child supposed to be affronted by one of the same rank with himself. (1799:326)

This statement is confirmed by one of Morrison's, of which, indeed, it seems to be a paraphrase:

—any neglect or refusal of these Honors [i.e., paying respect to an estate's boundary markers] are the occasion of Disputes and often are the occasion of Wars or Houshold Broils between the partys—if the owner is a Minor, the affront is the greater, the Mother instantly applies the Sharks tooth to Her head in Grief that Her Child should be insulted, & the Father flies to strip by force those who have offended. If the offender makes a Concession by offering a Plantation leaf and declaring their Ignorance, the Matter is settled but if they continue obstinate Blows ensue which increase as the Friends of each party become acquainted with the affair, who repair Armd to the place and the Battle becomes general and often ends with the loss of some lives, and often involvs whole Districts in a War With each other, and a Chief and his people may be driven from the land through the means of a quarrel arising from the neglect or refusing to pay the proper Compliment to a poor Mans Child, tho the Father might have been beaten with impunity by one who might quarrel with Him, but no Man must presume to treat the Heirs of large estates with such contempt or neglect on pain of Death and such insults often end in the total extirpation of one of the Familys concernd, it being deemd Blasphemy to Call them by a Wrong Name. (1935:193)

Somewhat connected with these beliefs and practices was the procedure followed by some men in denying guilt; they called not only upon their tutelar spirit to witness their innocence, but upon their firstborn son as well

(Henry 1928:207). A son was also associated with higher authorities in connection with the distribution of food, or so is implied by the definition of *hi'irima*, the first fruit for the king, principal chief, or favorite son (LMS Dictionary). Recall the eating proscriptions noted earlier: "Nor may sons eat in the presence of their fathers, nor even of their uncles and kinsmen senior to them in age; for they regard it as [an act of] irreverance" (Corney 1915:258). In view of the timing of Title succession one cannot be certain whether the "irreverance" applied to son or father.

Eating restrictions also obtained between a mother and her children, although the timing and rationale were evidently different:

The Children eat with the Mother till their restrictions are taken off, tho she Cannot eat of the Food which is the Childs nor that it has touchd nor must the Childs provisions enter the House by the same entrance at which the Mothers come in at and in travelling they Must have separate Canoes for the Men & Weomens food, of which the Children may partake. (Morrison 1935:208)

The tie between father and son (and possibly also between mother and daughter) was in many instances reinforced through the latter's "inheritance" of the former's specialized occupation, usually through mundane on-the-job training but in some cases through more esoteric means as well, as in the situation described earlier in which a sage transmitted his "knowledge" to his heir through his dying breath.

Additional evidence for the bilaterality of Maohi conceptualization of consanguinity is contained in the word *ā'aupiti*, which the LMS Dictionary defines as a double mind (from *ā'au*, the bowels or intestines—*fig.* the heart or mind; the affections; the conscience; courage or spirit; and from *piti*, two); double minded, undecided; having two stems, as a plant or tree—*fig.* a person whose father belongs to one country and his mother to another is called *ta'ata ā'aupiti*.

The conventional disposal of children in the event of divorce might also be expected to provide some clues to Maohi conceptualization of parent-child relations, but the evidence is not altogether clear. As I noted earlier, Morrison wrote that when a couple separated boys remained with their father and girls with their mother (1935:185); but according to Moerenhout the disposition was made by name—that is, every child was at birth given a name either from the father's family or the mother's and was disposed of accordingly at the time of divorce (1837:II, 63-64). The two accounts are in agreement only if it turns out that boys received a paternal family name and girls a maternal one, which none of the sources states. In any case, however the disposition was determined, the accounts agree that both parents had rights (or obligations?) in their offspring.

I remind the reader of the parts played by parents in choosing marital

mates for their children: in families holding high-ranking Titles parental consent and even parental selection was the rule.²¹ In other cases parental consent was usually required mainly for legitimatizing offspring, which was desirable only if some consequential inheritance was at stake. Of course, even if Titles or inheritance were not involved, this did not stop some parents—particularly fathers—from selecting mates for their daughters.

Parental decision, however, did not always prevail, as witnessed in the following episode of a version of the legend of Honoura. The legend relates that a young *ari'i* from a small district met a princess in populous and powerful Puna'auia and decided to marry her. Returning home, he announced to his parents what he planned to do. His mother was distressed, and urged him:

"Oh! do not go, or your little dominion will be taken from you." But the son replied, "Am I a son that you have begotten that you should have authority over me? My parent is the god Raa-mau-riri, I shall not give heed to your words; I shall persist in going to take myself a wife." "Go then!" rejoined the man Teena to his son, whilst the mother wept. (Henry 1895:259)

The same kind of arrangements prevailed in connection with nuptial rites; when important inheritances were involved the families, especially the parents, of both principals played active roles.

Parent-child relations were also manifested on the occasion of death, but beyond a few generalities, such as "close relatives surrounded the corpse" or "female relatives bled themselves more copiously than males" or "relics of the deceased were worn by relatives," we are not informed about the specific parts played by parent or child, if indeed such parts were specifically prescribed.

Bougainville's statement that "the mourning for the fathers is very long..." (1772:270) only confirms what is already obvious, that men in general were more important, socially, than women or children (except in situations of early Title transfer). There is also an implication in a passage from Bligh that parents, in this case a father, were expected to manifest some "grief" upon the death of an offspring, even if the latter were an infant and not a firstborn. In this instance the child's mother, 'Itia, "attended" the corpse, but its father, Tina, appeared to Bligh to be "... not at all concerned at the loss of his child." But, Bligh added, "he would not however return with me to the Ship, for he seemed to consider it but decent to remain with Iddeah [his wife, 'Itia]." (1792:153-153b)

The greater concern toward a deceased child on the part of the mother is also shown in an episode reported by Rodriguez. In searching for medicinal plants for himself and his companions he discovered some purslane (*aturi: Portulaca lutea*) growing near a boy's grave. When he sought to obtain it, the boy's mother objected strenuously to the sacrilege, but was overruled by the boy's father. (Corney 1919:100)

One of the very few references to relations with collateral “parents” is found in Rodriguez’ journal and concerns the *ari’i* Vehiatua: “News reached Vehiatua that the *ari’i* Pahairo [brother of Vehiatua’s father] had died, which he lamented, but not very much” (Corney 1919:31). Another episode concerning a collateral “parent” occurred upon Mai’s [i.e., Omai] return to the Islands after his sojourn in England. Soon after landing his “... attention was drawn to an old Woman, the Sister of his Mother. She was already at his feet, and had bedewed them plentifully with tears of joy.” (Beaglehole 1967:188)

I described in chapter 13 the ceremony of “ghosts night” (*pō tupapa’u*), when the ghosts of relatives were welcomed back home a year after their death and thereby prevailed upon to remain benevolent. Assuming that such ghosts would also include those of parents and children, we may conclude that some of the affection or respect toward a parent or child became translated into fear after its death. This view is confirmed by another belief, described by Moerenhout, who stated that the Maohis feared most of all the ghosts of children deceased after the natal ceremony. These ghosts, although mainly angered at their mother (because of neglect?) would also take revenge upon all members of the family. Hence a woman used this belief to protect herself from ill treatment by her husband and others—threatening to curse the ghost and thereby bring vengeances upon all family members. In fact this fear of corporate punishment acted as chief sanction to enforce harmonious relations of all sorts. (Moerenhout 1837:I, 538)

I will summarize in more analytical terms the parent-child interactions revealed in the evidence just surveyed. I have already generalized about the terminological and temporal aspects of these relationships, but the other aspects merit some discussion.

It will be recalled that parents’ interaction with their *matahiapo* (usually but not invariably their firstborn son) differed somewhat, normatively, from interaction with their other children—in terms of locational intimacy, authority, inheritance, and deferential behavior. This difference prevailed especially in families of superior social position, but echoes of it probably occurred throughout the society. In the generalizations that follow I shall not specify this distinction, but it should nevertheless be kept in mind. Some observations by Bligh and Vancouver indicated that relations between a kin-Titleholder and his parents became less aloof and disdainful after the Title had devolved upon his successor. The relevant episodes concerned Hāpai, Pomare I (Hāpai’s son), and Tu (or Pomare II, the son of Pomare I):

Pomurrey’s father, who was formerly known by the name of *Happi*, now called *Taow*, had arrived from Morea, on Saturday the 7th [January 1792], and was on board the *Discovery*, where he desired to see me; on which, *Pomurrey* with *Urripiah* and *Whytooa*, his two next brothers, accompanied me to pay our

respects to their old sire, who had just arrived in a large canoe, laden with the productions of the country as a present. This interview was excessively affecting. It was with great satisfaction that I beheld the affectionate regard with which the three sons embraced their aged and venerable father; who, in acknowledging a grateful sense of their dutiful congratulations, exhibited feelings which drew tears from the whole party. When these filial effusions, which would have done credit to the sensibility of the most polished nations, had subsided, I presented *Taow* with a suitable return.... (Vancouver 1801:I, 270–271).

These “filial effusions” were also remarked upon by Bligh a few months later: “these old People [Hāpai and wife] are now infirm.... They are happy in their Children ... [whose] filial attention is such a blessing to the Old Pair as delights me on every occasion” (1792:171). No such effusions were forthcoming, however, when Hāpai’s grandson, the Titleholding Tu, appeared on the scene.

In terms of spatial arrangement, except possibly for high-ranking Titleholders, young children were (along with their mother) usually required to be *muri* (in back of) their father, but as boys grew older they joined their father *mua* (in front of). Beyond this, however, I can discover no evidence of other positional norms.

Turning to governance, evidence concerning parental authority over sons is somewhat ambiguous, but not enough to obscure the circumstance that the latter were permitted much freedom of action. With daughters, however, this was emphatically not the case.

Several types of transactions characterized the interactions described above. Unqualified altruism was apparent in some of the actions—for example, the father who transformed himself into a breadfruit tree can have expected no return save self-satisfaction (in Maohi ideology selfless acts toward other humans were not rewarded by spirits, either in the *pō* or in the *ao*). Some of the things done by parents for children (and by children for parents) might come under the heading of “long-term loans” (and deferred repayments), although I have not come across verbal formulation of such a norm. (Also, much of the evidence concerning treatment of the aged—including, presumably, aged parents—indicates that if such a norm did exist, it was not very persuasive!) In historical terms the variety of exchange I label “pooling-and-sharing” was probably the principal type of transaction in most households containing older children, but this preponderance is not reflected in ideology (perhaps because it was taken for granted). Nor is explicitly quid pro quo exchange between parent and child featured in the evidence I have assembled, but the reason for that is more likely to be that such exchange was in fact rare.

I come now to competition (non-reciprocated “taking”) as exemplified in Tane’s confrontation with Atea, when the former hurled this threat: “I have obtained the means to overcome you and to take over everything that

you possess" (adapted from Henry 1928:457). No other ideological evidence that I know of is so dramatically explicit on this aspect of father-son relations, but historical data show that such situations did in fact occur, as the mode of Title devolution would almost inevitably bring about.

The "emotion" dimension of parent-child interaction is rendered quite explicit, at least in some respects in the evidence bearing on ideology. Aside from the ceremonial deference which even parents accorded their successors in the case of high-ranking kin-Titles, words like *pā* and *patea* indicate that respect toward parents was at least prescribed, although in the stories reproduced above such prescriptions are sometimes ignored, especially with respect to the mother. See, for example, the following excerpt from Wilson:

When we had got within a short mile of the isthmus, in passing a few houses, an aged woman, mother to the young man who carried my linen, met us, and, to express her joy at seeing her son, struck herself several times on the head with a shark's tooth, till the blood flowed plentifully down her breast and shoulders, whilst the son beheld it with entire insensibility. I was not aware of this action to prevent it, but as she continued it without mercy on herself, I spoke to them angrily, and obliged her to desist. The son seeing that I was not pleased with what was done, observed coolly, that it was the custom of Otaheite. (1799:194)

Affection between parent and child is even more heavily featured in word and in story than is deference (toward the former), but some stories contain instances of repudiation and even murderous dislike as well. (One may recall the ambivalence toward deceased relatives, including parents and children; energetic mourning and touching memorializing were often blended with fearful avoidance.) Bligh provided an interesting example of what might be called "ritual ambivalence" in his report on a meeting between Pomare II and his mother, 'Itia, after a long absence. The boy was at the time about ten or eleven years old and had long since succeeded to his father's high-ranking kin-Titles. "I bantered Iddeeah with the indifference her Son shewed her after a long absence, which gave me a Novel sight, her taking him in her Arms (or rather on her Hip as they carry their Children) She was however obliged to be uncovered as they always are in the Boys presence." (1792:172b)

Finally, aside from general proscriptions upon sexual relations between "close" consanguines, I have not come across proscriptions specifically directed to parent and child.²² Nor does any story that I know of present this form of incest as a featured episode or an explicit moral. I feel sure that sexual relations did occasionally take place between some "fathers" and "daughters" and some "mothers" and "sons," including some very closely related ones. But that such predictably disturbing situations were not mythically chronicled or explicitly proscribed is a curious omission; or could it be that they simply did not survive censorship by the missionaries whom we have to thank for saving from oblivion so much other data?

SAME GENEALOGICAL LEVEL

The Maohi term having the widest set of “sibling” referents was *taea'e*, presumably used both for address and reference; yet, consider some “authoritative” definitions and translations of it:

a brother, cousin, any near relation; see also *vaitaea'e*, cousins, distant relations (LMS Dictionary).

frère, cousin, proche parent d'une même lignée (Jausen 1898:145).

all brothers, sisters, and first cousins (Handy 1930:23, from a list given by Marau).

brother (of a brother), sister (of a sister), cousin (of same sex) (Burbidge 1930:267).

“O taua tama'i no tatou nei, i te taea'e...” “As for conflict between us who are kinsfolk ...” [the speaker's listeners included his “father,” Te Tumu, other deities, a friend, and mankind in general] (Henry 1928:354).

“Ua ti'a roa ia ia'u e ta'u taea'e.” “I am quite willing, my brother” [said by Tane to fellow deity, Ta'ere-of-all-skill] (Henry 1928:456).

“... ia faite a'e i te poipoi, i te taea'e nei.” “... let it be reconciliation in the morning between kinsfolk” (Henry 1928:458).

“Fa'atura atu i to utuafare ito mau taea'e e ito mau tuahine” (E. Salmon 1937:23). “To your home and your brothers and your sisters you owe respect.” This is presumably addressed to a male. Note the contrast between *taea'e* (for “brother”) and *tuahine* (for “sister”). This translation is by Handy and is to be compared with his definition of *taea'e* given above.

It is no longer possible to decide which of these translations was the “correct” one; indeed consensus may have been lacking concerning “primary” and metaphoric usages.²³

Other Maohi same-genealogical-level terms are, as we shall see, somewhat more precise in their referents as regards, say, relative age or sex of speaker; but they all resemble *taea'e* in their imprecision regarding propinquity—that is, in their non-specificity concerning type of siblinghood (e.g., full, uterine, agnatic) or degree of collaterality.²⁴ This is not to imply, however, that the Maohis did not make such distinctions, or that they lacked other verbal ways for doing so.²⁵ If a direct question had been put to the more philosophical-minded Maohis about such matters it may have elicited generalizations to the effect that one *taea'e* is as close as another, or that one should behave with generosity and affection toward all *taea'e*. But aside from an occasional voicing of expressions such as these, when the situation demanded, most Maohis probably had the linguistic tools to indicate very precisely whether a *taea'e* was, say, a “full sibling” or a “fourth cousin.” Most Maohis probably also subscribed to behavioral standards which cut fine distinctions between such relatives, differentiated according to col-

lateral distance and sex of linking parent. I have come across no native aphorisms or explicitly formulated rules bearing directly on these kinds of distinctions, but what I have learned about common descent in general, and kin-Titles in particular, makes it highly likely that full brotherhood (or sisterhood) was regarded differently from, say, uterine brotherhood, or cousinhood. Perhaps such reported factors as the relatively large size of some Maohi households, the impermanence of many marriages, and the prevalence of fosterage did indeed serve to blur the boundaries of familial ties, including “siblinghood”; nevertheless, such factors as differences in descent-unit affiliation of half-siblings (or step-siblings or cousins) undoubtedly exercised their influence on people’s expectations about interpersonal relations as well. For example, as we shall see, one of the more recurrent legendary themes concerns strife between half brothers or stepbrothers or male cousins—usually in competition for property in which they have common but differential claims. Strife among full brothers is also thematic, particularly in legends involving elder brothers’ jealousy of a youngest brother’s superior natural abilities; but much more often the stories about full brothers which have been preserved for us (and hence those perhaps most congenial to their listeners’ preferences in human relations) are concerned with cooperation and with boundless loyalty.²⁶

Other maohi terms pertaining mainly to same-genealogical-level consanguines were *tua’ane*, *tuahine*, *tua’ana*, and *teina*. As I am unable to divine what the “correct” definitions of these terms were, I am obliged to list the more authoritative glosses. Generally speaking these terms comprise two contrasting sets:

tua’ane-tuahine

tuaane, a brother in relation to a sister; *tuahine*, a sister (LMS Dictionary).

tuane, frère (pour la soeur); *tuahine*, soeur (pour le frère) (Jaussen 1898:161).

tua’ane, brother (of a sister), male cousin (of a female); *tuahine*, sister (of a brother), female cousin (of a male) (Burbidge 1930:267).

tu’ane, brother, female speaking, or male first cousins belonging to branch of family of equal rank (if both *matahiapo*²⁷ or both *teina*);

tuehine, sister, male speaking. Or female first cousin belonging to branch of family of equal rank (see *tu’ane*) (Handy 1930:23, after Marau).

tua’ana - teina

tuaana, an elder brother, also a senior relation; *teina*, a younger brother or sister (LMS Dictionary).

tuaana, frère aîné pour les frères et soeur aînée pour les soeurs, cousin, ami; *teina*, frère cadet, soeur cadette (Jaussen 1898:160, 154).

tua'ana, elder brother of a brother, elder sister of a sister, cousin of same sex or of the same senior parent, both male, or both female (Burbidge 1930:267-268).

tua'ana, reverse of *teina*; *teina*, younger brother for male, younger sister for female. First cousins of younger rank. I am a *matahiapo*; all cousins not *matahiapo* are my *teina*. (See *matahiapo*) (Handy 1930:23, after Marau).

Overlooking some small omissions, all the authorities agree in attributing at least the following meanings to these terms: *tua'ane*, female speaking: brother; *tuahine*, male speaking: sister; *tua'ana*, female speaking: older sister; male speaking: older brother; *teina*, female speaking: younger sister; male speaking: younger brother. The sources differ markedly, however, with respect to range of meanings of these terms, and I am unable to decide with any sense of certainty which (if any) of the reported meanings were the correct ones. Because of what we know about other Maohi practices I feel fairly confident that, say, *tua'ane* and *tuahine* applied not only to siblings (full, uterine, agnatic, foster), but I am at a loss to decide what their full ranges of application were: "cousin," reports the Burbidge Dictionary, but "first cousin belonging to branch of family of equal rank," reports Handy.²⁸ Uncertainty is increased by the additional meanings attributed to *tua'ana*, a senior relation (LMS Dictionary); cousins of ... the same senior parent, both male, or both female (Burbidge Dictionary). And as for Handy's ambiguous comments about family "stocks" and "branches," and about equal and younger "ranks," I must confess utter perplexity and considerable frustration. As I noted earlier these carelessly introduced words raise some intriguing and crucial questions, for which however there are no reliable answers; and these questions have to do not only with the kinship terms under consideration but, more importantly, with behavior prescriptions associated with these terms.

For example, did a man address a cousin (say, a same-genealogical-level consanguine related through a common grandparent) on the basis of relative age (as with siblings) or of relative age of their linking parents? (And if the latter, how were the inevitable discrepancies between relative chronological age and, say, grade of kin-congregation offices resolved?)

With a little plausible coaxing and a few ethnographic analogies I could construct out of these "definitions" a compendious, logically consistent ramage-type model of a consanguineal terminology system. Alas, my aesthetic taste must bow to my historian's conscience.

Before considering some data about interaction among same-genealogical-level consanguines, I reproduce Bligh's contribution to this discussion of sibling terminology:

Tuanah Tuanee [*tu'ana tu'ane*], eldest Brother. Tuanah Tuheine [*tu'ana tuahine*],

Eldest Sister, but in general Tuanah [*tu'ana*] is only used unless it is not understood which is spoken of. Tinah Tuanee [*teina tu'ane*] is Brother. Tinah Tuheine [*teina tuahine*] is Sister. The Youngest children always called the eldest Brother and the eldest Sister Tuanah [*tu'ana*].

All the Younger Brothers call one another Tinah [*teina*] and their Younger Sisters Tuheine [*tuahine*]; but the Younger Sisters call one another Tinah [*teina*] as well as all their Brothers. What is remarkable [is] that the sisters should not call one another Tuheine [*tuahine*] (or Sister) as the Brothers call them.

First Cousins call one another as Brothers and Sisters do. (1789:II, 11)

The only new possibility to emerge out of this ambiguous statement is that relative age also figures, when necessary, in terms for siblings (and for first cousins) of opposite sex.

The sole general native precept that I can discover about relations among same-genealogical-level consanguines is the one previously quoted: "*Fa'atura atu i to utuafare ito mau taeae e ito mau tuahine.*" "To your home and your brothers and your sisters you owe respect." (E. Salmon 1937:23.) In addition to the linguistic peculiarity of this prescription, already noted, the remarkable thing about it is its usage of *fa'atura*; it is puzzling to find applied so indiscriminately this word which is defined by the LMS Dictionary as to honor, exalt, show respect, and is used consistently in this sense throughout the textual sources. If the LMS definition is "correct," this precept exhorts one to behave toward siblings and cousins, regardless of sex or relative age, with the same "respect" ordinarily reserved for persons holding high-ranking Titles, or for close relatives of Titleholders. An alternative interpretation, and probably the sounder one, is that the LMS Dictionary definition is perhaps "correct" as far as it goes, but that it does not go far enough.

Morrison's statement that "... The Child may not Curse its ... Brothers or Sisters ..." (1935:184) has already been commented upon, as has Banks' observation that "... they [the Maohis] seldom eat together the better sort hardly ever, even two brothers or sisters have each their respective baskets one of which contains victuals the other cocoa nut shells &c. for furniture of their separate tables" (Beaglehole 1962:I, 347).

I have come across no references to prescriptions or rituals involving joint actions on the part of same-genealogical-level consanguines in general. A statement from Morrison does, however, indicate belief in a very close "identity" of some kind between "brothers": "If a woman has (a) husband and he dies without Issue the Husbands Brother takes her; if He has no wife and should he have Issue by Her the Children are Calld by the Former Brothers Name, & take his estate ..." (1935:184-185). Legends constitute about the only evidence available concerning the way Maohis conceptualized the relations under consideration. Some legends provide accounts of interaction among brothers and male cousins.

Six "demigods," all named Maui, were born to Hihira (Sun-ray) and

his spouse Uahea (Bereavement). The youngest, it will be recalled, was a "clod" (i.e., an abortion) with eight heads, who was abandoned by his parents but subsequently rejoined his family and assisted them in their work of perfecting the universe. This Maui's most important accomplishment was the slowing down of his father, Sun-ray, in the latter's race through the heavens. The thing to be noted about this adventure is that it was the youngest Maui who undertook it, and expressly for the benefit of an elder brother: "He [the youngest Maui] was enraged also [at his father, Sun-ray] in finding that the work of his elder brother could not progress properly because of the shortness of the days" (Henry 1928:431). The elder brother in question was Maui the Priest, who even with all his powers and his status as firstborn was unable to accomplish what the youngest brother could and did do with, it should be added, the indispensable help of a noose made from his sister's hair.

The legendary trickster Hiro (a protégé of Hiro, god of thieves) was also a younger son more prodigiously endowed than were his older siblings, or, specifically, his agnatic half siblings. When all of them undertook a voyage overseas it was Hiro who captained the vessel. For a time he was able to ward off dangers from the deep by virtue of his superior strength and wisdom, but even he was unable to save them from supernatural vengeance when they committed a foolish sacrilege. (Henry 1928:539ff.) In a different version of the adventures of trickster Hiro, he is pitted against half brothers rather than united with them in a common enterprise; in this version Hiro not only kills them all, but their father (his stepfather) as well (T. Salmon n.d.: History).

The legend—or legends, there being many versions—of Tafa'i provides a more complex illustration. Tafa'i was an only son of a human, Hema,²⁹ and the latter's spirit wife. Hema's older brother had five offspring, all older than Tafa'i—that is, all were his *tua'ana*; but Tafa'i was superior in all respects among his cousins. The cousins played together constantly but Tafa'i always won at their competitive games. All but Arihi, the eldest among them, became so enraged by this that they tried many times to destroy Tafa'i, but to no avail. Despite this Tafa'i accompanied them, unasked, on an adventure and managed to restore them to life after they had been magically slain. Apparently convinced of the injustice (or lack of wisdom) in their jealous efforts to destroy Tafa'i, his cousins invited him to become their leader; but to this Tafa'i properly replied (and this is the second moral to the tale): "*No mua ra, ei mua ra, ei mua ia, e no muri ra e na muri iho ia.* Those born before must stand in-front-of; those born later must stand behind." (Leverd 1912:21.) This noble sentiment did not, however, dissuade Tafa'i from getting his revenge eventually, for with the exception of Arihi, who had all along befriended him, he finally caused all his cousins to be transformed into porpoises.

Another tale of fraternal strife was reported by Tati Salmon. However, I am not sure whether the legend came originally from Tahiti or Rarotonga.

From Tahiti went forth Taihia, the favourite of the people, followed by his elder brother—Chief Tutapu—with the pick of his warriors. Although the cause of his pursuit was but paltry jealousy, yet days, weeks, and even months passed without his relaxing his intention of killing Taihia. Even at the request of his men to give up the chase he refused. At last, when they met at sea, hundreds of miles from their home, Taihia ordered his war-canoe to be rowed near to his brother, and respectfully, according to the teaching of his youth, called to him:

“E tau arii, e tau arii, teie taua
Tei, teie uriuri, ua moe eana
Te mata o to taua aia here e
Aita ea, to riri, i maha?”

“My chief, my chief!
We are now on this briny sea
Out of sight of our dear home,
Your anger, is it not yet appeased?”

“No,” roughly answered the brother, “the battle must commence at once!” In spite of the fact that Taihia had only one war-canoe to the two against him, he was victorious and his brother was killed. The warriors of Tutapu then joined the victorious band and they all continued on to the next island, which is now Rarotonga, and Taihia made a history for himself. (1910:43-44)

I reproduce below the full text of the legend of Huriitemonoi, as presented in Henry. Miss Henry’s rendition of this delightful tale is filled with many romantic, un-Maohi, embellishments, but any resumé of it would sacrifice social-relational data of too great a rarity to be spared:

Mahu-tu-rua (Twin-cloud) was the king, Toae-hau (Oration-of-peace) was his queen, and there was born to them a princess, whom they prophetically named Huri-i-te-mono’i-a-’are-vahine (Pour-perfumed-oil-upon-the-woman’s-billow). Hiti-poto (Short-border, or Mangareva) was the land.

Hiti-roa (Long-border, or Tahiti) was the land, Manua (Hasty) was the king in the north, Ma-tu-tere (While-standing-to-sail) was his queen, and there was born to them Pua (Flower), a daughter, Me-to (Towed), a daughter, and Mua-va’a (Front-canoe), Roto-va’a (Inner-canoe), Oti-va’a (Last-canoe), and Tui-hani-potii (Invocation-of-girl-caressed), who were sons.

The fame of the beauty of the princess, Huri-i-te-mono’i (Pour-perfumed-oil), of Hiti-poto extended to all lands, and many high-born suitors set out to find that land and marry the princess; but they were lost in mid-ocean and were never heard of any more. At last the two Tahitian princesses, Pua and Me-to, said to their brothers:

“Prepare a ship and go to Hiti-poto for the beautiful princess and bring her here that she may become the spouse of whichever one of you may prove deserving of her.”

This proposal, approved of by the parents, pleased well the young men; but they feared to go, for, said they, “Many valiant suitors have gone forth to woo this beautiful maid, but they have perished at sea, been devoured probably by the guardian shark of her land or by other monsters around her shores.” The sisters

urged, and the brothers objected that storms would overtake them and high seas would engulf them; but the sisters continuing to press them at length prevailed upon them to make the attempt.

So a ship was built with four little thatched houses upon its deck for the princes and was laden with provisions and presents. They named the ship Uru-e-hau (Forest-of-food-and-peace), manned it with experienced navigators, and set out to sea with all the usual religious rites for the occasion and the good wishes and encouraging predictions of those they left behind. They sailed away with a fair wind, which soon wafted them without adventure towards the shores of the land they wished to visit. On the day they hove in sight, the princess was enjoying the gentle summer breezes at a pretty seaside residence facing the harbor on the leeward side of a promontory that obscured her parental home, attended only by a fair daughter of a retainer, Hina-te-pipiro (Gray-of-rank-odor). Having the gift of clairvoyance the princess foresaw that a ship was approaching with young suitors for her hand, and so she said to her maid:

"Remain here and watch for a ship that will soon arrive with princes from Hiti-roa, while I go into the woods over yonder for sweet-scented ferns and flowers with which to deck myself, and when you see the sail in the horizon come and notify me that I may be prepared to receive them."

So Huri-i-te-mono'i went her way, and shortly afterwards the looked-for sail appeared. But Hina-te-pipiro suddenly became ambitious to be herself the heroine of the romance that was to follow, and so she reflected:

"I must go and plunge in the royal bathing pool close by and then come and put on the royal apparel of my mistress, of which she has a supply in this house, and I'll wear her royal wreath of red and yellow and purple feathers and seat myself upon the royal mat for the reception of those princes, that they may believe me to be the princess." And immediately she began to put her plans into execution.

She bathed in the limpid cool waters of the pool sacred to royalty, but finding on coming out that her plebeian odor still remained with her, she again bathed, anointed herself with sweet-scented oil from an *aroro* (small gourd) of her mistress, and arrayed herself as a princess. Then she hastened to complete her preparations, and by the time all was ready the vessel had entered the spacious lagoon, unnoticed by the people, who were enjoying their noonday nap in their huts on the windward side of the headland.

It was decided that the three elder brothers should bear the message to the princess, while the youngest brother staid on board to mind the ship. So they landed, and as they approached the door of the house, the scheming girl seated upon the royal mat welcomed and greeted them in the usual way and bid them enter the dwelling. They greeted her as the princess and yet wondered to see her entirely unattended. But having no misgivings, they told her that their errand was to invite her in the name of their parents and sisters to go with them to Hiti-roa and make it her home. They then spread before her the presents of choice mats and tapa and feather ornaments they had brought for her and her parents, to whom they also wished to be presented.

According to the custom of those times, the visitors should have been escorted to the dwelling-place of the family and there made to feel at home. Then as soon as possible a feast should have been spread before them with an exchange of presents. Moreover, a princess should have been provided with presents and a chaperone and retainers to go to a strange land. But Hina-te-pipiro replied that she was highly gratified to go to Hiti-roa and cordially accepted the

presents on behalf of her parents as well as herself, and she added that she regretted much that she could not take them to her home or offer them hospitalities, as they must make all speed and bear her away before her numerous gods came to molest them and prevent her from leaving her land, which she said the princes would not mind as their errand was to fetch her. This answer sounded feasible, and feeling charmed with her readiness to accept their proposal they decided to do as she advised. So they quickly took in a new supply of water and coconuts, and one man carried her in regal style upon his shoulders to the ship. Then they sailed out of the harbor as quickly as they had come in and were out of sight of land just as the sun was setting.

While the real princess was gathering her flowers and weaving them with sweet-scented fronds and leaves into a wreath and garland, she heard spirit rappings and a low cry that was communicated to her from the seaside house through the ground to tell her all that was happening, and as soon as she completed her work and realized the import of the strange warnings she emerged from the woods and returned to the house just in time to see the strange vessel in full sail passing outside of the reef. She looked around in the house, and saw that her oil gourd, her choice apparel, her feather wreath and girdle, her mat, and other royal insignia were all gone, and then she knew that her plebeian maid had really usurped her place and fled. Impelled by her guardian spirits, she took a surf-board and prepared to launch out upon it in pursuit of the voyagers, singing as she did so in the following strain:

Hini riaria te tai o te atua,
 E hoho mai i ni'a.
 Tei po ta'u vana'a tue rire,
 Hini, hini e!

Terrific are the waves of the ocean of the
 gods,
 Roaring as they rise.
 Benighted is my oration,
 Impelled by the applauding terrific, terrific
 waves.

Then she launched out into the sea singing:

Tau 'aura'a tei tua; tei Hiti-roa e
 To ro'i ai'a e ri e,
 To ro'i ai'a e taa au ra
 Tei tua tei Hiti-roa e!

Thy swimming extends out to sea; to
 Hiti-roa far off
 Will thy bed of refuge lodge,
 Thy bed of refuge upon which I depart
 Away to sea, to Hiti-roa!

The wind lulled, and as Huri-i-te-mono'i swam out upon her surf-board she lost sight of the sail in the horizon, and when she reached the open ocean darkness surrounded her. But with one steady purpose she continued her course, guided by her ocean gods. All night and all day she swam, and after the second night, as day dawned, she saw the ship appear behind her and awaited its approach. Soon the navigators were gazing with amazement upon the beautiful woman, so much more beautiful than the one under their care, poised upon the swelling sea. The princess accosted them in a melodious voice, and said to the eldest prince, whose deck-house was foremost:

"O Mua-vaa, take me up into your ship!" But just as he was about to do so, the faithless maid on board, now desperately bold, warned him not to come in contact with her, saying that she was a fiendish phantom from the rocks beneath the ocean, intent on doing them harm, and so he pushed her away with a long pole.

Then Huri-i-te-mono'i turned to the second brother, Roto-va'a, whose house was in the center of the ship, and implored him to receive her; but his actions

were also overruled by Hina-te-pipiro. So also she appealed to the third brother, Oti-va'a, with the same result, and finally she implored the fourth and youngest brother, Tui-hani-potii, who was yet but a young lad, to receive her, and he heeded not the artful adventuress, but filled with pity he asked:

"Who are you?"

"I am Huri-i-te-mono'i-a-arua-hine, the true princess whom you came to seek. That woman you have with you is my servant maid," she replied.

In spite of all demonstrations from the other woman, the young man lowered a rope, which Huri-i-te-mono'i firmly grasped, and he soon aided her up into his house in the mizzen of the ship, which he placed at her disposal. She was exhausted, cold and hungry and thirsty, and he gave her dry clothes to wear, but when he went for food and water for her, Hina-te-pipiro induced his brothers to oppose him in doing so, saying that such a phantom of the deep did not require food but would shortly bring a dire calamity upon the ship, and they told him he must not allow her to come out of the house on pain of death and that she should not be cast overboard. But Tui-hani-potii stood firm in his deep sympathies for Huri-i-te-mono'i in whom he recognized the refinement of a princess, and he contrived later to procure her food and water, which she so much needed.

A great calm, caused by the gods in honor of the princess, ensued. Supposing the pretended princess was possessed of magical charms the brothers asked her to invoke the winds to blow, and as she bethought herself of the waistcloth of her mistress she consented to do so. Telling them to draw up the sails and tighten the ropes for the breeze, she went forwards to the bows of the vessel and waved the cloth vigorously in the air. But instead of a breeze, the ship was soon filled with a rank odor, so that all the men exclaimed:

"Oh, what can this odor be?" She replied:

"You see I came away from my land in haste and have taken away the waistcloth of my servant maid instead of my own." But as no breeze followed, the elder brother told the youngest brother to go and ask his guest to come and try her powers of bringing it, and so Huri-i-te-mono'i, after much persuasion from them all, went forward, and taking the same waistcloth waved it in the air as her maid had done, and soon a sweet odor pervaded the ship and the steady-blowing *maoa'e* (northeast trade wind), the royal wind of her land, came in obedience to her bidding.

The three elder brothers were amazed and began to suspect Hina-te-pipiro to be an imposter and Huri-i-te-mono'i to be the real princess, as the very elements obeyed her, while the youngest brother was delighted and upheld his protégée in whom his confidence had not been shaken. But the artful imposter, still equal to the emergency, exclaimed:

"That phantom woman is the demon Fe'e-matotiti (Octopus-of-the-rocks) of our reef, intent upon destroying us. Witness my sweet odor and my royal breeze that she has stolen from me! Let her not live."

Then were her adherents about to slay the princess, who besought them not to kill her, but to wait until they reached a confluent current in the sea, which they soon would pass, into which they could cast her. This to them was proof enough that she was the demoness, and they thought it would be prudent to allow her thus to disappear. Knowing that her hour soon must come, the princess, full of emotion, in the following strain invoked her ancestral fish gods to receive her:

Maoa'e maoa'e hia e,
Maoa'e ri'i mata ioio ra.
Te maoa'e hia e!

The trade wind has come
Trade wind with brilliant sea caps.
The trade wind has come!

Ia riro atu vau i ta'u tupuna,
O tonu ma vaha, te maoa'e
Ia Tonu-ma-vaha, nui ra.
Te maoa'e, maoa'e, maoa'e hia e!

Ia riro atu vau i ta'u tupuna,
Ia Roi, ia Roi matao matao ra;
Ia riro vau i ta'u tupuna ma'o,

Ia Tama-'opu-rua, te maoa'e e!

Let me go to my ancestor,
To Tonu-ma-vaha, O trade wind,
To Tonu-ma-vaha with great mouth.
The trade wind, trade wind, trade wind has
come!

Let me go to my ancestor,
To Roi (Black-fish), Roi so dark;
Let me go to my shark ancestor
To Tama-'opu-rua (Child-of-two-stomachs),
O trade wind!

A strong attachment had grown between the maiden and her young benefactor, and they felt that it would be hard thus to part forever, but as her antagonists were relentless they sorrowfully awaited her fate for two days and two nights, when they came to the confluent current. Then the wind suddenly ceased, and there approached the ship the great shark, Tama-'opu-rua, with the tiger fish (Tonu-ma-vaha) on one side and the black fish (Roi) on the other. Rising upon the crest of a towering wave the shark opened his great jaws and received the girl as she was thrown overboard by cruel hands, and she safely entered into an inner receptacle, where she was kept alive, and her fish ancestors bore her away as queen of the sea.

The trade wind sprang up again, and the following day the ship hove in sight of Tahiti. So preparations were made for the reception of the famous beauty of Hiti-poto. A royal mat was laid for her in a place of honor in the house, and little banners that were insignia of royalty were stood around the mat. But the banners would not remain stationary; they fell down in spite of care, which was an omen of something unusually wrong. Mats were laid from the royal dwelling down to the sea shore for her to walk upon, and the two sisters of the princes went forth to await her disembarkation. Forebodings came to those young women, and they exchanged thoughts concerning their guest just arriving and sang as they went:

Tau tapanu ua hara;
E ta'ata paha tei tai i hiti e.

A ti'a mai, a haere mai i uta nei e!

Thy banners are deviating;
Perhaps some person is at sea in the horizon.

Arise and come to this land!

They said: "We shall soon see if this is a princess by her actions: she will walk unhesitatingly upon the mats laid before her if she be royal; but she will not tread upon them if she be a plebeian."

Soon the vessel anchored, and arrayed in her mistress's clothes the pretended princess was borne on a man's shoulders to the shore. On arriving at the line of mats, where she was set down, she clumsily stepped aside and walked upon the ground on one side of them to the house, despite the demonstrations of the princesses, who walked alone upon the mats. On arriving at the entrance to the house and seeing the king and queen surrounded by other royal personages ready to receive her, she became completely disconcerted and shrank away outside of the house to conceal herself. In vain they bade her welcome and tried to reassure her in her supposed maidenly diffidences; but she would not accept the proffered honors.

On their arrival on the scene, the three admirers of Hina-te-pipiro were surprised to meet the family without the guest and went also to beg her to enter the house; but she persisted in remaining isolated in a shed outside, where she proposed holding her court with them. When they returned and told this to the family, the sisters asked all particulars concerning their meeting and bringing her away unattended from her home, in answer to which they related the circumstances of their

meeting at Hiti-poto and their hasty departure, omitting to record their adventures with the beautiful maid they had encountered at sea. But Tui-hani-potii, had a different story to tell, and his account as above described convinced his sisters that their forebodings were right and that the real princess had been cruelly wronged. Then the eldest sister, Pua, said to this brother:

"You and I must immediately go in search of Huri-i-te-mono'i of Hiti-poto." Notwithstanding his conviction that the attempt would be futile, she persisted, and excluding all others from the ship they two set sail, he at the helm guiding the ship and she seated in the center, amid a terrific trade-wind wafting them to the confluent current.

"*E ta'u Tuahine e ua pohe taua!*" (O Sister, we are lost!) exclaimed the brother. But she replied:

E utue, e parare ia.
Te ora iti a'e a te ora
Tereira ia.

'Aore paha ia'u nei, tei ia'na ra paha,
Mai to'na ui, mai to 'na ua,
Mai to'na patu tere i te moana,
E tere au i te moana.

The pledge of peace will disperse it.
A narrow escape of life
Will it be.

Not perhaps with me, it is perhaps with her,
In her season, in her rain.
As she propelled her course in the ocean,
So shall I move on in the ocean.

Soon they encountered a tempest and were surrounded with darkness so thick that they could not see each other; this indicated the presence of the god ancestor of Huri-i-te-mono'i, Roi, and the brother exclaimed:

"O Sister, we are lost!" She made the same reply and they sailed steadily on. The storm dispersed and light appeared, and a great wave came that raised them to the sky.

"O Sister, we are lost!" said the brother again; but she bravely replied:

"*Eiaha e meta'u!*" (Do not fear!) And on they went upon the billow until it passed and divided itself on either side of the ship. Then the sea became smooth, without a ripple, and they perceived red rocks in the depths below. This the sister said was the desired spot, and she directed her brother to spread a mat out upon the water and give her the princess's gourd of oil, which he soon did. She invoked the shark god to come forth and yield up the princess, while she poured the oil upon the mirror-like sea, and as its sweet odor descended into the depths they heard a rumbling sound and soon saw the shark come out of his cavern in the rocks and ascend towards them. When he arrived by the ship they presented acceptable presents to him, and Pua told him that she had brought her brother to recover the princess whom he so much loved and to take her as queen to his heart and home. The shark replied approvingly, opened his spacious mouth, and soon yielded up the beautiful maid, who had been cared for and fed in her strange fishy chamber and who was safely received in the mat and cleansed of the fishy slime with the oil upon the surface of the sea. Then the strong arms of her lover lifted her up into the vessel, and they returned triumphantly to Hiti-roa.

When the same preparations that had been made in Hiti-roa for the reception of the expected guest in the first place were made again, the princess Me-to noticed that everything was harmoniously accomplished, the royal insignia falling naturally into their places. As the guest was escorted to the house by her lover and Pua, she walked with a regal step upon the mats from the seashore and into the house and saluted with dignity the members of the royal family, accepting with grace their tokens of respect. A murmur of applause and admiration at last ran through the house with the exclamation:

"E ari'i mau teie vahine, e hau roa to'na nehenehe i to te ao nei!" (This is indeed a princess, whose beauty exceeds all other in this land!)

The three brothers who had cast away Huri-i-te-mono'i were now dismayed, and each in his turn afterwards strove to win over the beautiful girl. But she was firm in her attachment to her benefactor and became affianced to him, awaiting for their marriage the arrival of her parents, who were to be sent for in a befitting manner.

Although Hina-te-pihiro, for whom a separate house and a few attendants had been set apart, still exercised some influence with the three princes she had deceived, yet they envied their more fortunate brother and planned his destruction. They proposed a game at archery, hoping to pierce him through, and in order to facilitate their design they proposed to him to stand foremost in the game. But he deferentially declined, saying that as he was the youngest he must be last. His spear alone reached the target, and so he won the applause of the spectators. They took him fishing out to sea and there smote and threw him off the canoe as dead; but the waves bore him to the shore, and his sisters, who waylaid him by inspiration, restored him to life by massage and the application of sweet herbs, singing:

Tuia e, tuia hani potii nei!
E te va'a fau rua e, te ravaai nei!
 Tuia e, tuia!

Touched, touched by caressing girls!
Oh, the double canoe is fishing!
 Touched, touched!

Gradually life returned to the young man, and he opened his eyes and exclaimed:

"Oh, what delightful sleep I have had!" And he arose and returned home with his sisters. There they rejoined Huri-i-te-mono'i, and shortly afterwards the elder brothers arrived and were astonished and conscience-smitten to see the younger brother, whom they thought they had left dead in the open ocean, safe and well. Yet they still sought by various contrivances to get rid of their rival. But they utterly failed, and at last their sisters advised them to remain content as servants to their younger brother, who had won the fair princess and who would be appointed king over North Tahiti by their parents. To this they agreed, and domestic harmony in the family soon followed. Amid auspicious circumstance and in due time the marriage of the happy young pair took place.

Hina-te-pihiro, the heartless maid, became a prey to shame and chagrin, and at last, after a painful interview with her mistress, she died uttering her own dirge:

Te 'are o te tai, 'ore, 'ore tei po moe, moe,

The waves of the sea do not, do not at night
sleep, sleep,

Patua vau nei. E vaiiho
I te tane ari'i ei tapu,
 Ua mate au!

Which propelled me. I must leave
My princely suitors in retribution,
 I am dead!

And this was the last of Hina-te-pihiro, whom they quietly buried beneath the drooping boughs of a toa tree in North Tahiti. (Henry 1928:607-615)

It might appear from the foregoing that Maohi storytelling embodied more interest in undermining birth-order precedence than in reinforcing it,³⁰ but that was not always the case. With Honoura, for example, the storytellers were provided with a protagonist who was both firstborn and heroic. His brothers proudly honored his great strengths and willingly followed him on his adventures abroad. (Henry 1895:256 ff.)

Legends about sisters, or female cousins, are as rare as they are

uninformative. Only one, which I know of, features them in anything but the blandest of situations. The story, which was reproduced earlier in this chapter, concerns the two daughters of Hina. In it, the younger one was punished by gods when she deceitfully appropriated a coconut belonging to the elder.

Many legendary accounts feature relations between brothers and sisters. (I need not resort to the more general, and egregiously awkward, phrase "relations between opposite-sex consanguines of same-genealogical-level"; the legends about which I know concern only the narrower range of such relations.)

Ru and his sister, Hina, are the subject of two legends reproduced in Henry. One of these, "Ru and Hina Explore the Earth," was collected by Miss Henry in 1884. The noteworthy thing about these accounts is the companionship they depict between this sibling pair during their long voyages: "Rū sat astern with his great paddle for steering in sailing and a smaller paddle to use in calms or for plying against the tide in meeting with head winds; Hina sat in the bows of the canoe to watch for land, and thus they sailed away" (1928:459-460). To the question, Why a sister and not a wife? one might reply that a wife, having a role complementary to that of her husband (sexually and otherwise), would have been less able to play a male's role in this essentially male enterprise. Moreover, since the object of the journey seems to have been more for curiosity than for colonization, the sexual inaccessibility of a sister would have been no liability. However, lacking better data, such "explanations" as these deserve little credibility.

Another famous brother-sister voyage was depicted in the legend of Huriitemonoi, reproduced in full above. It will be recalled that it was the youngest brother's eldest sister, Pau, who moved him to go in search of the authentic "princess." Not only did she accompany him on the search but it was she who actually directed the search and urged him on when his own courage failed.

In the Henry version of the origin of the Arioi (see chap. 22, this work), it was 'Oro's sisters who sought out a human male for him and thus set in motion the event which culminated in the founding of this famous cult. They performed this task for him out of compassion for his loneliness, after he had ungraciously ousted his former wife and reduced her to a heap of sand (Henry 1928:231).

Another sister-brother pair was featured in an incident of the legend of Puna'auia, the main episode of which was the tragic love affair between the high-born Pereitai and her low-born lover. After the lover had been slain for his presumptiveness, the girl was taken by her family on a visit to the Leeward Islands, where she found consolation in the person of a young chief. In due course they were married and her parents re-

turned home, leaving with her her young brother, "... as a binding link between her and her own family circle in Tahiti" (Henry 1928:604). It will be recalled that subsequently this brother unwittingly subjected Pereitai to such painful embarrassment, by revealing her matronly status to the young unmarried girls whose company she had sought out, that she ran away to the *pō* in order to hide her shame. The faithful young brother followed her and remained with her until their spirit ancestors conducted them back to the *ao*.

Finally, I present a legend explaining the building of marae Nu'uruua (Varari, Mo'orea), which was perhaps the largest one in existence in Tahiti-Mo'orea up to the time of the building of Mahaiatea (Papara, Tahiti) in the 1760s. This legend was recorded by Marau and is reproduced in Emory's unpublished manuscript of Marae Traditions. The builder was a woman, Tefeao, who was evidently the firstborn offspring of a high-ranking Varari Titleholder. When Tefeao herself bore a son, he succeeded to the Title in question, thereby ruling out the heirs of Tefeao's younger and much loved brother, Punua:

The birth of Tefeao's son meant the exclusion of her brother's (Punua-te-rai-tua's) heirs; for according to the decree of the first Marama, only an elder could have a seat on the marae of Nuuruua and Tefano. But Tefeao's love for her brother was great. She obtained special permission from her husband to build him a marae, another Nuuruua, higher than the old—by order of Marama—in order to raise it to the distinction the other derived from its priority. Thereon he was consecrated and given a right to a seat on a Nuuruua, which he had lost through the birth of his sister's child. These two maraes are still there near each other. One is Nuuruua the elder, the other is Nuuruua the younger. On the day of the consecration, Tefeao spoke words that did her honor:

"By order of the gods, my brother, I had to be born your elder;
But you will ever be to me a bright star above my head.
Nuuruua, O my little brother, will be to the ages
The temple of the love of a sister for her brother."

The one legendary allusion to sexual relations between brother and sister that I have found is a very general statement in an account of the Deluge. The only humans to survive were a married couple, but on the morning after the storm the woman gave birth to twins, a boy and a girl. Then other offspring followed:

The woman was again delivered of children; one night would pass, and as the day came a child was born; the food had not yet grown when the children got matured. The shores became thickly populated with people not dressed! The elder child married the younger, and the younger child married the elder [O *te matahiapo ra, ua taoto ia i to'na muri a'e, e tei muri a'e, taoto atura ia i to'na mua*]. (Henry 1928:447)

To a methodological purist it might not seem appropriate to *infer* norms from actual interaction, but there is so little information concerning Maohi

brother-sister relations that I am disposed to present whatever I can find, whether explicitly normative or not. The sources contain many accounts of sisters' emotional reactions to a brother's return—for example, Rodriguez' description of the return home of his native companion, Pautu: "Pautu himself, who had gone ashore alone, having seen the weeping-match his sisters were putting up for him, felt some qualms about returning to the boat when we called him ..." (Corney 1919:10–11).

The next account is from Morrison's pen; it concerns an incident created by one of the *Bounty* mutineers, Thompson:

We had hitherto gone on with our Work without any thing to obstruct us except Rainy Weather but now an accident happend which put a Stop to it for some time—

The affair was this, Thompson who resided with Coleman at Point Venus had ill used a young Girl, for which her brother in revenge knock'd Him down, and Fled. (1935:87)

(The drubbing so angered Thompson that he subsequently shot and killed the first Maohis who did not jump to his commands.)

When Mai returned to Tahiti with Cook he was warmly greeted by some of his relatives, including (presumably) his sister, but the latter soon joined with her husband and a few others and "... ingross'd him intirely to themselves with no other view than to strip him of every thing he had got ..."—or such at least was Captain Cook's view of the situation (Beaglehole 1967:220).

Vancouver also witnessed an episode revealing this less accommodating side of a sister's relations with her brother:

Poatatou [Pohuetea], who was now called *Hidiea* [Hitiea], with his wife and sister, accompanied me on board. Amongst the valuables with which I presented my old acquaintance and friend, was an axe, of which his sister became so enamoured, claiming to herself a part of the present I had received, that *Hidiea* was under the necessity of using some force to prevent her wrenching it out of his hand; but, on my making a small addition to the articles she had received, the lady became reconciled. (1801:276)

A tantalizingly brief statement by Bligh indicates not only that brothers were sometimes at odds, which we have already seen in legends, but that such troubles sometimes were due to quarrels between their wives:

The two Cheifs told me that Tynah [Tina, i.e., Pomare I] and his Brother Oreepyah [Ari'ipaea] were on bad terms and that they would quarrel and fight as soon as I sailed. I have observed some coolness between them and knew they did not heartily like one the other, on every opportunity therefore I have endeavored to make them friends, but it has had no effect. This dislike has arisen from the disagreement of the Two Wives. (1789:I, 407)

The requirements of office affected relations between siblings no less than it affected those between a Titleholder and his ascendants, as shown

in this observation by Vancouver of the deferential behavior accorded young Pomare:

This mode of behaviour is, however, rather to be attributed to the force of education, than to a want of the proper sentiments of affection; as I perfectly recollect that, when I was here with Captain Cook, *Pomurrey* treated his brothers with the most cool indifference, although, on the present occasion, there are few examples of three brothers living in greater harmony, or regarding each other with more fraternal affection: it should therefore seem, that this sort of distant deportment is a necessary appendage to the high office of sovereign. (1801:272)

Finally, a very special form of sibling relationship is revealed in the following passage from Rodriguez:

It dawned clear and with the wind at S., fresh. I went to visit the invalid lady Oviriau, and found her as it were dazed, and her body much knocked about. This and similar sudden attacks of illness are attributed by the natives to the spirit or *evarua* (as they call it) of deceased persons whom they may be bewailing having taken possession of the mourners by entering into their bodies; and they were persuaded that this was the case now in regard to the spirit of the deceased *arii*, who was Oviriau's first cousin. It was not possible to disabuse them of this error, set afloat and upheld by their *tahuas*, to whose fables they yield implicit belief. (Corney 1919:193)

In view of the fragmentary, and in some respects contradictory, nature of these data, they hardly justify generalizations about the relationships under consideration, but a few points can be made.

Time. Congruent with the absence of explicit rules of marital residence there seems to have been a wide variety of interaction situations among siblings with respect to the frequency and duration of their interaction. I can discover no tendency, say, for all brothers to remain in close proximity and in frequent contact with one another throughout life, while their sisters dispersed—or vice versa—nor for patrilineal cousins to be together more frequently than matrilineal ones.

Fosterage had the effect of widening an individual's contacts with relatives outside his family of orientation and, of course, of limiting his contacts with his own brothers and sisters. But because of what appears to have been its rather haphazard nature, fosterage did not result in systematically increased contact with any particular sets of cousins, matrilineal or patrilineal. (There is a possibility, of course, that this appearance of haphazardness may be due mainly to a paucity of data.)

In some families of superior social position, interaction among siblings may have been inhibited, at least during the early years of life, by the practice of insulating young children in separate households of their own.

Space. The *mua-muri* (front-behind) opposition which characterized male-female relationships generally applied to brother-sister relations as well; but

it appears also to have been applied metaphorically among male siblings to distinguish the firstborn from the rest. It may also have had this usage among female siblings, but I can discover no evidence for this.

The most explicitly locational expression of sibling relations occurred in connection with marae stone uprights. In certain sets of marae stones the central upright facing the *ahu* was reserved for the firstborn, with the second-born to its right (facing the *ahu*), and third-born to its left (see chap. 16).

Spatial *distance* may also have been preserved to a greater degree around a firstborn than around his siblings, inasmuch as Titles, which tended to require some insulation for their incumbents, devolved more usually upon firstborns.

Governance. In Tafai's words, quoted earlier: "*No mua ra, ei mua ra, ei mua ia, e no muri ra e na muri iho ia.* Those born before must stand in-front-of; those born later must stand behind" (Leverd 1912:21). But, as was amply indicated, some legends that the Maohis found apposite enough to perpetuate identified initiative, decision making, and precedent as attributes of younger or even youngest siblings or cousins.

Transaction. Objects and services continually flowed between siblings in connection with ordinary household pooling-and-sharing. Moreover, older siblings, especially girls, provided services for younger ones, as nursemaids; and among boys, at least, younger ones did chores for older ones. On the other hand I can discover no evidence of any systematic, explicitly prescribed flow of goods among siblings or cousins as such, in addition to the goods owed to those who were at the same time heads of their common social groups. Ellis wrote: "It is reported that brothers, or members of the same family, sometimes exchanged their wives ..." (1829:II, 369), but his is the only statement to this effect that I have found.

Emotion. Affection may have been prescribed among siblings, and I have presented evidence that such sentiments were indeed expressed: in legendary accounts, in ritual self-bleeding, and in historical episodes. But evidence of enmity has also been provided, not only between cousins, and stepsiblings, but between full siblings as well. (I have come across no historical cases of such enmity having resulted in family-congregation fission, but I imagine that it was a fairly common occurrence. Indeed, I suspect that hostility between stepsiblings, especially, was one of the society's most divisive factors.)

Sexual avoidance was of course the most commonly stated norm between brothers and sisters, and between "close" cousins; but how far the norm was extended collaterally, we do not know. Conversely, the genealogies of some socially superior families contain instances of first-cousin marriage.

Aside from the precept exhorting siblings to behave with respect (*tura*) toward one another, and specifically not to curse one another, I have found no evidence of norms prescribing any systematic expression of “superiority” or “inferiority” among siblings—except, of course, when one of them held an office requiring such expression, as Vancouver perceptively recognized.

NONADJACENT GENEALOGICAL LEVELS

The terms listed for these relationships in our principal lexical sources were the following:

tupuna

an ancestor, a grandfather (LMS Dictionary).

ancêtre, grand-père (Jaussen 1898:163).

grandparents (*t. tane*, [grandfather], *t. vahine*, [grandmother]) (Handy 1930:23, after Marau).

Modern usage corresponds to Handy’s; *tupuna* refers to grandparent (or ancestor) regardless of sex, sex specification being supplied by the qualifying *tane* or *vahine*, respectively. On the other hand, the LMS and Jaussen entries indicate that *tupuna*, used without qualifier, referred specifically to male grandparent, and they imply that female grandparent required the qualifier *vahine*. In any case, whichever practice actually prevailed, in the absence of contrary evidence and in keeping with other Maohi terminological usage, it may be assumed that *tupuna* referred not only to lineal ascendants but to collaterals as well.³¹

mo’otua

a grandchild (LMS Dictionary).

petit-fils, petit-neveu, petite-fille (Jaussen 1898:120).

the children of first, second, or third cousins (Handy 1930:23, after Marau).

The Handy-Marau definition is puzzling, to say the least—especially since their own list does not include a term for a lineal descendant of nonadjacent genealogical level. The Jaussen definition is also puzzling, since it specifies “grandson” but not “granddaughter.” As for the LMS definition, its omission of collaterals was probably due more to oversight than to design, for, as in the case of *tupuna*, I am of the opinion that *mo’otua* applied to all consanguines of this genealogical level.

I do not know what to make of the separate LMS listing for *mootua*, which appears in the dictionary immediately after *mo’otua*, but is defined as a great-grandchild. This is the only one of the sources to draw this particular distinction.

Mo’otua was also used, in compound, for descendants of more widely separate genealogical levels for example:

mo'otuatini, a great-great-grandchild (LMS Dictionary).

mootuatinitini, a very distant progeny indefinitely known (LMS Dictionary);
arrière-petit-fils (Jaussen).

mootuatarau, same as *mootuatini* (LMS Dictionary).

mootuarau, same as *mootuatinitini* (Jaussen).

(If a choice had to be made between these somewhat conflicting definitions I would favor the LMS version.)

Finally, we find different versions of meanings attached to *hina* and its compounds:

hina

seed, posterity (see *hua'ai*) (LMS Dictionary).

posterité (Jaussen).

great-great-grandchildren (Handy 1930:23, after Marau).

*hinarere*³²

progeny, offspring, descendants; beginning with great-or great-great-grandchildren (see *hua'ai*) (LMS Dictionary).

descendants, arrière-petit-fils (Jaussen).

great-great-great-grandchildren (Handy 1930:23, after Marau).

hinatini

great-great-great-great-grandchildren (Handy 1930:23, after Marau).

The more recently compiled Burbidge grammar-dictionary adds *hina pa'arae*, great-great-great-grandchild; but this is the only instance of such usage that I have found (1930:269).

With such an irreconcilable array of "evidence" it is not possible to be dogmatic about specific terminological usages referring to widely separate genealogical levels of consanguines, but certain generalities do emerge.

Beginning with the second ascending genealogical level, all ascendants (lineal and collateral) are lumped together under the single term *tupuna*, ancestor. Descendants are considerably more differentiated according to genealogical level.³³

With the possible exception of *tupuna* (which may have specified males when used without a sex qualifier), the terms under consideration were used for both males and females. Despite contrary indications, which were likely due to oversight, these terms did not ordinarily distinguish lineal from collateral consanguines. Maohis had relatively short life spans, yet it seems likely that the early age at which couples produced offspring resulted in numerous instances of coexistence between individuals and their (lineal) grandparents, and even some cases of coexistence with lineal great-grandparents. Moreover, the inclusion of collaterals in these paired kin categories increased these instances manifold. In other words, such relationships deserve close study. But inasmuch as the sources devote so

little direct attention to them, I must resort to indirect evidence. Several contextual factors were likely to have influenced interaction between consanguines of nonadjacent genealogical levels:

The generally contemptuous attitude, already described, toward age-based decrepitude.

The timing of succession to kin-Titles—that is, during an individual's Title incumbency his grandparent had long since been superseded in *his* incumbency, thereby reducing causes for rivalry between them and also minimizing the bases for the older relative's authority over the younger.

The individual's relationship with his parents. Certainly, for some individuals, the freedom from harsh parental authority allegedly enjoyed by most Maohis may have obviated the kind of compensatory, affectionate, free-and-easy interaction with grandparents that has been reported from many societies; but instances of the reverse can also be found.

The extended-family composition of many households. Despite the paucity of information on household size and composition, it appears likely that many if not most households contained at least one "grandparent," and for most children some *tupuna* probably lived nearby.

The belief in the existence of ancestral ghosts, and, in many cases, the belief in their active intervention in descendants' affairs.

Direct testimony concerning the relationship under consideration is sparse indeed. The only general prescription I can find which bears directly on grandparent-grandchild relations is the statement by Morrison that "a Child may Curse its Father, Mother, Uncle or Aunt but it would be Blasphemy for them to Curse it. The Child may not Curse its Grand Father, Grandmother, Brothers or Sisters but the Grand Father or Grandmother may Curse their Grand Children with Impunity." (1935:184.) As I confessed earlier, I do not know what to make of this alleged rule, which seems at odds with other inferences about the relationships between grandparents and grandchildren.

Wilson stated that the reason the Maohis believed themselves unable to use sorcery against Europeans was that "... they knew not the names of our God and our grandfather, which is necessary" (1799:336).

The story told about the youthful Hiro's relationship with his mother's father was quoted in part above, but bears reproduction in full in the present context:

While yet a young lad, Hiro went to Tahiti and lived at 'Uporu (Ha'apape) with his maternal grandfather, named Ana (Cave), the senior teacher in the school called Tapu-ata-i-te-ra'i (Sacred-cloud-in-the-sky). There Hiro's four brothers had been placed as students, and while he was still too young to join them, he acquired a greater knowledge than they of the chants that he heard by listening from outside. Hiro grew so fast that he was soon the biggest youth in all 'Uporu, and one night

he stole up on to the ridgepole of the schoolhouse where his grandfather, who was blind, was teaching, and this he continued to do during six consecutive nights, at the end of which he had absorbed into his person all that was taught in the school. When he was admitted as a student he recited all the chants so well that the teachers were amazed, and his grandfather said that there was nothing more in the school for him to learn. It is said that Hiro's pastime at 'Uporu was to play with sand, which he easily heaped up into hillocks which are still standing along the shore.

When he became a man, he inquired of his grandfather what were the requirements of man. His grandfather replied:

"Provide yourself with a home, and marry a wife."

"If I do so," said Hiro, "what must I do with the wife?"

"Cherish and feed and clothe her," was the reply.

"That would be unprofitable," said Hiro, and so he went on disapproving of everything that Ana told him a man should do. Then he inquired what tricks man was capable of doing, and when Ana enumerated: lying, deceiving, and thieving, Hiro exclaimed:

"Yes, stealing is good; that is a profitable thing; it will be satisfying to a man."

So Hiro decided to become a thief under the protection of Hiro, god of thieves; and he commenced by stealing young breadfruit and coconut trees, taking the precaution not to do so from lands close by, and planting them upon his own grounds. He also acquired a great passion for navigation and visiting lands far away. He became skilled in hewing canoes out of solid logs and was the first builder of large canoes with planks sewn together, which he called *pahi* (ship). He was a great pig hunter. Early one morning Hiro told his grandfather that he was going far up inland to a sacred place called Ou-tupuna (Ancestor's-stronghold) for a branch of an ava tree named 'Ava-tupu-tahi (Solitary-ava), famed for its age and immense size, and his grandfather cautioned him to be careful not to desecrate the sacred grounds. So Hiro went, and on arriving there was greeted by two men who were keepers of the premises, named Taru'i-hau (Exceeding-darkness) and Te-rima-'aere (The-hand-in-space). They inquired of him his errand, for, said they, "No man dares enter here," and when Hiro told them what he wanted, they refused to allow him to break a branch or to approach the sacred ava. They yielded not to his entreaties and finally threatened to take his life if he would not depart.

Much vexed, Hiro struck off some branches from the ava tree with his spear but by enchantment the two keepers caused them to reunite and grow again in their places. Hiro also used enchantment, made the tree grow very high, again broke off its branches, which remained upon the ground unaffected by the further invocations of the keepers, and pulled the tree up by the roots. The keepers then called to their aid a boar named Mo'iri (Swallow-whole), of prodigious size and possessed by a man-devouring demon, so that it terrorized men who chanced to pass near the place. Soon it came and was rushing towards Hiro, when he met it with his spear, which he thrust through its open mouth, and killed it, consigning the evil spirit to the *pô* (darkness). Then the two men stepped forwards with their spears to fall upon Hiro, but warding off the spears he caught his assailants by the hair, beat their heads together, and killed them.

Finding himself master of the situation, Hiro tied the two men together by the hair of their heads and placed them thus across his spear with the great ava tree at one end and the pig, Mo'iri, tied by its four legs, at the other. Then he raised his spear upon his shoulders and carried home his burden as though it were nothing. On arriving home late in the afternoon, Hiro found his grandfather

sitting beneath a spreading breadfruit tree, and before him he threw down his load upon the ground with three tremendous thuds and a crash.

"What have you there, Hiro?" asked the old man.

"The pig, Mo'iri," was the answer.

"What is it that crashed?" he asked.

"The famous solitary ava," said Hiro.

"And what produced the other two heavy sounds?" asked the old man.

"The two men, Tauri-hau and Te-rima-'aere, whom I have slain."

"*Aue aue!* (Alas, alas!)" said Ana, sorely mortified. "You have committed a great crime!" But when Hiro explained everything to him his anger ceased.

Hiro buried the two men in his marae, after which he purified himself for domestic work by bathing in the sea. He made an oven in which he baked the great pig and some taro, and then he prepared the ava drink by chewing up the roots, according to custom, and in a few moments his work was done; he had filled forty 'umete (wooden trough) with pulp and poured on water and strained out the ava juice ready to drink. The old man was astonished when, on inquiring, he was told that forty 'umete of ava had been prepared so quickly and he asked to feel his grandson that he might form an idea of his size. So Hiro sat down while his grandfather stood up, and although Ana was a man of fine stature he found that his hands could reach up only below Hiro's shoulder blades, which caused him to exclaim:

"You are indeed an immense man, and your mouth must hold a great deal more than that of an ordinary person. It is not surprising then that you have masticated all the ava so soon."

They feasted on the famous pig and drank freely of the ava, which they found very good. Hiro ate three-fourths of the pig and drank thirty 'umete of the ava and was only moderately filled; his grandfather was amply satisfied with a hind leg of the pig and two 'umete of ava. From this event arose the saying, formerly common in Tahiti and the Tuamotus: "*Te pua'a o Mo'iri, e te 'Ava-tupu-tahi*" (The pig Mo'iri and the Ava-tupu-tahi).

A day came when Hiro conceived a strong desire to go and visit his parents in Ra'iatea, and his grandfather agreed to let him go. (Henry 1928:537-539)

In another version of the Hiro cycle, given earlier, Hiro was reared and protected by Ana, who was the father of his stepfather; the latter jealously resented Hiro's conception (by a visiting stranger) and begrudged him his strength and talents. Hiro's mother went to Ana's home to be delivered, and the old man named the child and predicted for him a notable career. In reaction to this, Hiro's stepfather left him with Ana: "As my father has given him a name, he can keep and take care of him." In due course Hiro was assisted by Ana in his contests with his stepbrothers (who were Ana's own son's son) and even in the final duel which ended in Hiro's slaying of his stepfather and stepbrothers.

Another mythical episode involving the relationships under discussion occurred in connection with the separation of Tahiti from Ra'iatea:

There was once a time of sacred restriction at Opoa, the home of the gods; there was hallowedness in Great-Havai'i, when no cock must crow, no dog must bark, no pig, no man must walk abroad. The wind blew not, and the sea was very still.

At last, one day during that time, a comely maid, named Tere-he (Wrong-errand), transgressed by stealing away to swim in the river near her home. This displeased the gods, so that they caused numbness to overcome Tere-he and she was drowned. Then there swam up an eel of wonderful size. Such a was never seen before or afterwards, from a great hole in the bed of the river, which swallowed her whole.

There was one person powerless to save, who saw all this; it was the aged grandmother of the girl, named Mou'aha'a (Low-hill), who, missing her at home, ventured out with fear of the god to find her; and she traced her to the river, where she arrived only to see her sink beneath the water and shortly afterwards taken by the great eel and swallowed whole. For this reason was the grandmother named Mavete'ai-tune (Expanding-eel-devourer). (Henry 1928:438)

Such fragments as these are slender evidence for generalizing how the Maohis conceptualized the relationships under consideration. The historical testimony is not any fuller; about the only accounts of this nature that can be found concern interaction between young Pomare II and his father's parents. The following report by Vancouver is typical:

Soon after our arrival at the encampment I witnessed a scene, very different from that which had been exhibited on board on the meeting of three sons with their venerable parent. It was shortly announced that *Otoo* was approaching. On this occasion, it became necessary that the grandfather should pay homage to his grandson. A pig and a plantain leaf were instantly procured, the good old man stripped to the waist, and when *Otoo* appeared in the front of the marquee, the aged parent, whose limbs were tottering with the decline of life, met his grandson, and on his knees acknowledged his own inferiority, by presenting this token of submission; which, so far as could be discovered, seemed offered with a mixture of profound respect, and parental regard. The ceremony seemed to have little effect on the young monarch, who appeared to notice the humiliating situation of his grandsire with the most perfect indifference and unconcern. This mode of behaviour is, however, rather to be attributed to the force of education, than to a want of the proper sentiments of affection; as I perfectly recollect that, when I was here with Captain Cook, Pomurrey treated his brothers with the most cool indifference, although, on the present occasion, there are few examples of three brothers living in greater harmony, or regarding each other with more fraternal affection: it should therefore seem, that this sort of distant deportment is a necessary appendage to the high office of sovereign. (1801:271-272)

Actual reports, or legendary accounts, about relationships with collateral *mo'otua*, or with lineal or collateral *hina*, and so forth, are entirely absent. In fact, the only inference I am able to draw about the latter is the one already noted, namely that social considerations, about which one can speculate but cannot document, led to a more minute concern with descendants than with ascendants, in terms of what genealogical level they occupied.³⁴

CHAPTER 18 *CLASS*

SOCIAL STRATIFICATION

One matter that all writers on the Maohis agree upon is that the society was stratified in terms of privileges and valued attributes of various kinds. Terms such as “the better sort,” “propertied class,” “nobility,” “servant class,” “commoners,” “upper level,” and “slaves” pervade the visitors’ descriptions; and these are paralleled by many Maohi labels of similar connotation. Unless indicated otherwise, the following definitions are from the LMS Dictionary:

hutehute, mean in rank, of low birth.

hotehote, small in quantity; also men of low birth, or diminutive in stature.

hū’ari, a person of a despicable birth.

papauri, a title given to inferiors.

te fanau’a oura ri’i, progeny of little shrimps; figuratively, people of little power. (Henry 1928:80)

ta’ata ri’i, little people; figuratively, people of little consequence. (Henry 1928:451)

tarihau, the populace, or lower rank of the people.

feiā mana, people [of] power, might, influence.

In the (unpublished) texts on the Arioi sect collected by Orsmond, a status opposition of similar kind is expressed by *iti* (little, “low” status) versus *rahi* (large, great, “upper” status). The text in question concerns a Ra’iatean man named Mahi who was engaged in trying to secure a foothold for the sect on Tahiti. Upon landing there he was at first befriended by a man of no particular importance; Mahi was pleased at his reception but in the interests of proselytization saw the need for a more influential sponsor: “Ua tupu atura te mana’o ia Mahi e taua iti noinoi tonu, e imi atu ai oia i te ravea e rahi ai.” “A thought occurred to Mahi that his friend was very *low*, therefore he sought means to obtain a *high* one.”

In addition to recognizing the existence of the kinds of status inequalities implied by these labels, most writers on the ancient Maohi attempted to specify the society’s strata in terms of “ranks,” “classes,” “castes,” and

so forth, and to apply native labels to these; but a perusal of figure 18-1 will indicate the wide disparity in the interpretations.

Some labels listed on the chart can be set aside, as being only indirectly connected with social stratification:

ta'ata'ino [Bougainville's *tataeinou*], literally, a person bad, evil, wicked, base, vile, sinful (LMS Dictionary); was, with *tapu*, the label applied to persons designated for human sacrifice. Such persons were described as having been "despised by all classes" (Handy 1930:44).

tītī, a captive in war, a slave, a refugee (LMS Dictionary). According to Ellis, *tītī* were included among the *manahune*, or those who had "lost their liberty in battle, or who, in consequence of the defeat of the chieftains to whom they were attached, had become the property of the conquerors" (1829:II, 342).

teuteu (plural, *teuteu*) ["*teou*," "*toutou*," "*towtow*"], an attendant on the chief, or principal man (LMS Dictionary). According to Handy, *teuteu* referred to "hereditary servitors of the *ari'i*," and the label "designated a function and not a class" (1930:44). Ellis stated that *teuteu* were included among the *manahune* (1829:II, 343), but this was contradicted in part by Morrison, who wrote "servants are calld Tewteu [*teuteu*] in General but those who wait on Weomen are Calld Tewty [*tītī*] by way of derision—tho it is not uncommon to find Young Men of the first Family and the Younger Brothers of Chiefs in the Service of the Fair Sex" (1935:167).

tatatoow. This rendition of Bligh's is uncertain. Possibly intended was *ta'atatufa'a*, an heir; one that has an inheritance or a portion (LMS Dictionary). More likely the word intended was *'iatoai* (see below).

tatama-auree. This listing of Bligh's is inexplicable.

tavana. This was, of course, derived from English "governor," and it referred to the officers, either hereditary or appointed, who administered district affairs after institution of the Pomare monarchy in 1815.

mattaeyna [*mataeina'a*]. Morrison's and Handy's use of this term as an alternative for *manahune* represents simply another application of this broadly used label, which (it will be recalled) was defined in the LMS Dictionary as the subjects of a chief; a certain tribe, clan, or subdivision of the inhabitants.

It will also be noted that there is some disagreement among the sources concerning the numbers of distinct categories, but all writers after Cook's last visit, in 1777, agreed upon a hierarchy of major categories consisting of *ari'i*, *ra'atira*, *manahune*; most writers also agreed upon a division of the first into *ari'i rahi* (or *nui*) and *ari'i ri'i* (usually including *'iatoai* or *to'ofa*). These later writers also agreed on including *teuteu*

and *tītī* among the *manahune*. What the sources do not agree upon, however, are the meanings attached to all three major category terms; more broadly, they did not agree upon the distinctive features of all three categories of persons, or upon the relations between them. Some writers emphasized governance as the criterion distinguishing these categories (e.g., the use of such words as “king,” “vassal,” “servant”); others indicated property (e.g., “landed proprietors,” “tenants”); others occupation (e.g., “yeoman,” “villain”); still others birth (e.g., “nobles,” “gentry”)—and some used two or more kinds of criteria in the same series.

Some of these attributes were evidently based on European visitors’ notions of how all proper societies were stratified (the feudal model having been especially favored), with only minimum attention given to the opinions of the Maohis or the facts of Maohi life. In other instances some observation and interviewing obviously went into the formulations—but with the imprecise and inconsistent interpretations we have just seen. Actually, although the Maohis undoubtedly viewed their society as being “stratified,” and although authority, property, occupation, and birth—separately and in combination—undoubtedly entered into their conceptions of social stratification, I suspect that the Maohis themselves were neither altogether clear nor of one mind as to where the boundaries between strata were or ought to be. (I imagine that not all Maohis would have agreed in all cases on whom to label *ari’i* or *ra’atira* or *manahune*.)

The following note from Cook’s journal of 1774 indicates how the Maohis sought to present themselves to the naïve European visitors:

We hardly ever met with a man of the least Note who did not call himself an Aree, nay even the very common fellows would now and then interduce themselves to us with this title. It gave them an air of importance, they could not have assum’d without, and was useful to them in many other respects. Our very best friends, would suffer us to be impos’d upon by any fellow who had address enough to do it—nay whatever the fellow said they would confirm. (Beaglehole 1961:394 n3)

In characterizing the “women of the lowest rank” who consorted with the European sailors, G. Forster wrote: “It was remarkable that they were not without some degree of vanity, as they never gave themselves any other name than that of *tedua* [*tetua*], (lady), which is the title of their female nobility, and which, by way of eminence, is particularly applied to the princesses of these islands” (G. Forster 1777:I, 403).

There is, however, one criterion on which a large degree of consensus would likely have prevailed, and that was marriageability; who could marry whom (consanguinity aside) seems to have been the most crucial factor in most Maohis’ definition of the boundaries separating the various strata of their society. Even in this respect consensus appears not to have been universal—neither about the weightiness of the criterion nor about the pre-

FIGURE 18-1. Interpretations of Class Structure

Author and approximate date of observation	SOCIAL STRATA (upper to lower, reading from left to right) = major division				= subdivision of stratum	
	"le roi et les grands"		TATAEINOU [ta 'ata ino] "les gens du peuple"		"esclaves et valets"	
Bougainville (1768)						
Cook (1769)	EARES "chiefs"		MANAHOONA'S "middling sort"		TOUTOU "lower class"	
Banks (1769)	EAREE RA HIE "king"	EAREE "baron"	ERATA "yeoman"	TOWHA "gentleman"	MANAHOUNI "vassel"	TOUTOU "villain"
G. Forster (1774)	EREE		MANAHOUNA "vassals, freeholders"		TOWTOW	
J. Forster (1774)	AREE RAHAI "great chief"	AREE "great chiefs, families"	MANAHOUNES "landed property owners"		TOUTOUS	
Cook (1777)	EREE DE HOI and family	ERRES "powerful chiefs"	MANAHOONE "vassals"		TEOU, TOUTOU "servants or slaves"	
Bligh (1789)	ERRERAHIGH "king or greatest chief"	EREE "lord or chief of district"	TATATOO-OW "barons"	TATAMA-AUREE "esquires"	RATEERAH or MANE-HOWNEE "citizens"	TOWTOW "servants"
Morrison (1790)	EAREERAHI or NOOE "king"	EAREE "chief of a district"	TOWHA "lord of the manor"	RATIRRA "esquire"	MANNAHOWNE or MATTAEYNA "tennants"	

Wilson (1798)	“king”	“district chiefs”	TOWHAS “near relations, younger brothers, Tayos, of chiefs”	RATIRRA “gentlemen”	MANAHOUNE “cottagers”	TOUTOU, TUTI “servants”
Ellis (ca. 1820)	HUI ARI'I “royal family, nobility, chiefs and their families”		BUE RAATIRA “higher, petty landed proprietors, or gentry and farmers”		MANA- HUNE “common people”	TEUTEU “servants of chief, landless, unskilled”
Henry (ca. 1825)	ARI'I, MARO URA “feather-girdle sovereign” HUI ARI'I	ARI'I RI'I “petty kings and queens”	HUI RA' ATIRA “gentry”		MANAHUNE “plebians, hereditary possessors of own land”	TEUTEU, TITI
Moerenhout (ca. 1840)	ARII “haute aristocratie”	“barons”	RATITAS “grands propriétaires terriens”			“classes inférieures, le peuple”
de Bovis (ca. 1845)	ARII “princes”	EIÉTOAI TUUNOU “nobles”	RAATIRA “petits chefs ou propriétaires fonciers”		MANAHUNE “gens du peuple, prolétaires”	MANAHUNE TEUTEU “hereditary servitors”
Handy (various sources 1767-1920)	ARII HUI ARI'I	ARII RII IATOAI	PUE RA' ATIRA “landed proprietors”		MANAHUNE “commoners with propriety”	TEUTEU “hereditary servitors” --- TITI

cise placing of all individuals in the strata, but it is the nearest thing I know of to a native operational procedure for defining the boundaries in question. It is for this reason that I label such strata *marriage classes*, or simply *classes*.

For the reader's convenience I repeat the components of Maohi "marriage": (1) it was a heterosexual relationship which, ideally, involved coitus, with open (in contrast to clandestine) coresidence, for a period of at least several weeks or months; (2) tacit agreement to regard as "legitimate," for purposes of inheritance, any surviving offspring of their intercourse; (3) tacit agreement to transfer to one another rights to certain other of one's services and objects; (4) and some degree of public recognition of and sanction for the relationship, usually (but not necessarily) validated in a "wedding" ceremony.

Of all these elements the second was perhaps the most crucial; at least it was certainly the most definitive with respect to membership in a class, as may be exemplified in a number of ways. First, the existence of certain highly explicit rules addressed mainly to the *ari'i* class and forbidding them to have progeny by a lower-class mate:

Whosoever resisted it [this rule] was condemned to social death and the loss of all hereditary rights, as stated in the family law, *ture feti'i*:^[1]

Go down to the depths of Toareva,

Thy bones shall be scattered over the long road of exile;

Forever shall thy face be covered with clouds of darkness;

Thine eyes shall nevermore look upon the light of day;

For you have tainted the blood of the gods.^[2]

Go! We know you no more. The mountains and the sea are now your legacy.

(Handy 1930:40, after Marau)

Second, there is the evidence derived from numerous acts of infanticide, several of which have already been described; the following excerpt from Wilson will serve as a reminder:

Pomārré intimating a wish to sleep on board, it was granted; he then asked leave for his wife and servant, which was also complied with. It may be proper to remark here, that Iddeah, though still considered as the wife of Pomārré, has not for a considerable time cohabited with him, but with one of her *tōūtous* (or servants), by whom she has had one child, and is again pregnant; her younger sister, Why 'reēde, next cohabited with the chief, but left him through dislike for one of far inferior rank; and his present wife is a very stout young woman, but of what condition we could not learn. However, it is evidently clear, that they hesitate little about mixing with the lower orders of the people; but if issue should be the consequence of these connexions, it is rarely the pride of rank suffers the poor infants to live an hour after they are born. (1799:73-74)

Other episodes taken from missionary journals exemplified the not uncommon circumstance that however "married" a cohabiting couple might have

wished themselves to be, they were discouraged from having progeny if they happened to be of different marriage classes. For example:

The people persist in infanticide in spite of all the missionaries' teaching. The people almost universally blame the king and principal chiefs for imposing such things upon them, [i.e., heathen practices generally] but in respect to infanticide they have not that pretence, the king and chiefs very seldom interfere at all in the business, it rests with the common people themselves. There is at present a woman, the wife of one of our nearest neighbours, (who is a petty ratera) big with child, and very near her time, she says, and also all the neighbours say the child is to be killed as soon as born, she has had one before who was killed in the same manner. She and also her husband say they want the child to be saved but the husband's father and mother are determined to have it killed, because the woman is reckoned of lower rank than their family. (Davies, Journal, 9 June 1808, LMS Archives)

A few days back a young woman was delivered of a child, which was immediately strangled by the relatives of the woman's husband. It is said that the cause of this barbarous act, (common in Tahaete), was, her being a common woman, that is, one of no rank, and inferior to her husband, who is the son of a neighbouring ratera. (LMS Transactions:IV, 188-189)

Third, it may be assumed that in many instances potential misalliances of this kind were blocked before cohabitation could begin. This was shown in the legend of Pereitai, whose infatuation with a lower-class youth, Temuri, was ended by the latter's murder. Henry told the story as follows, beginning with the point where the young lovers were about to elope, despite the urgings of both of their families to break off the affair:

... as the night advanced Pere-i-tai became so restless that she sent for her old nurse and second mother to come and sit by her. The good woman promptly obeyed the summons, and seeing her beloved young mistress toss uneasily upon her bed she stroked and rubbed her down, as she had often done in former times when she was a little infant entrusted to her care—a form of massage much practised among the Polynesians everywhere under like circumstances. At length Pere-i-tai could bear it no longer, and she unburdened her heart to the sympathizing Rohi-vahine, who replied:

"Oh, my child! Why did you not confide in me sooner? I, a plebeian, can feel for Te-muri as only a plebeian can, and I entreat you to release him of this intrigue. Your plan to ennoble him later might never be possible, and meanwhile he would be a fugitive, pursued and watched by some accomplice of your royal house and eventually slain and sacrificed to the gods, and then you would be brought home to mourn your loss, a reproach to your own people. It is only for deeds of valor and heroism, when royal personages have been rescued from outrage or death in some extraordinary way that kings and queens consent to raise people of our standing to their rank. This is what Te-muri's parents would undoubtedly say also to you and him were they consulted in the matter, for no plebeians could ever wish to bring down wrath upon themselves and even their district by forming such a union."

This matured reasoning caused the royal maiden to see for the first time the disadvantage of a misalliance and the serious evil to which it inevitably would have led; but not yet quite willing to be convinced of its utter folly she answered:

"Oh! Why indeed did I not confide in you before! It is too late now for me to retract, Te-muri must not be disappointed, and we will trust to the gods for future developments to save us from the evils you portray."

"No, my child, it is not too late! Now, while Te-muri finds his life in jeopardy is the best moment to break off this engagement. Let me go and reason with the poor misguided though brave young man, for his parents' and your sakes." A dead silence ensued, and Pere-i-tai wept with regret and relief combined, and at length she said:

"Yes, I agree to what you say, my dear second mother. Te-muri is probably waiting anxiously now for my return. Bear him my deep *'aroha* (affectionate regards) and tell him that I pray the gods to give him a handsome wife worthy of him and whom he must regard as my second self." As the nurse quietly glided away from the dwelling, the girl drew a long deep sigh, exclaiming, "Aue!" which, throughout Central Polynesia, from Hawaii to New Zealand, is a word used to express deep or undefined feelings. And now she grew calm and fell into a peaceful slumber, which she so much needed. All was quiet and peaceful in the king's premises, and Pere-i-tai's secret was safe in her plebeian friends' keeping.

The following day, as final preparations were being made for the trip to Taupiri, Pere-i-tai entered into them with a light heart. The evening approached, and the final meal was made ready before parents and child were to part for a season. They were just about to partake of it when the king, seeing the high priest enter the courtyard, went out to meet him and speak on private matters. At the same moment, the boy, Vaiiho, who had been sent out on an errand, approached looking much agitated, and as soon as he was able to speak, in a hoarse whisper he said:

"Have you heard the news?"

"What news?" asked the girls much surprised.

"Do you know where Te-muri is?"

"Has he not gone home to his parents?" asked the princess.

"Alas, alas, no!" replied the young man.

"Then where is Te-muri?" she gasped.

"Our good friend, Te-muri, whom you met last night, is with the gods in the marae."

"What is he doing with the gods there?"

"Ta'aroa in Hades only knows that!"

Not realizing what had happened, Pere-i-tai turned to her nurse, Rohivahine, who had also just come in, and asked her if she had met him to deliver her message. Her reply was in the negative, and she added that she had remained out by the canoe all night and had been on the alert to meet him all day, but had seen no signs of him. Now light began to dawn upon their minds, and just as Pere-i-tai was about to enquire again of Vaiiho what had really befallen Te-muri, her father returned from his interview with the priest, looking very grave, and he called her to him.

"Pere-i-tai," he said, "you have brought sorrow upon us and upon the house of your plebeian lover! We did not expect this of you. Te-muri is no more!"

Fully realizing the evil she had unwillingly caused and overwhelmed with sorrow and regret, she fell senseless upon the mat where she had stood with her father and was soon borne away in the arms of ready attendants to her bed, where she was gradually restored to consciousness; and she became a prey to deep and bitter remorse.

The cause of Te-muri's doom was that a priest who was out on duty for the night, seeking for omens and revelations from the gods, was led by the cry of the

cricket to the point where the young people were, and seeing them in earnest conversation on royal premises he felt it his duty to know who they were and ascertain the purport of their conversation. So he stealthily approached them in the thicket behind where they sat, the sound of the wind off the sea preventing them from noticing any rustle while it carried their voices distinctly to his ears in his place of concealment. He overheard all their plans and abided his time to frustrate their purposes. As the young girls disappeared, he saw the unsuspecting Te-muri kneel down upon the sand and address an invocation in a low tone to the gods of the sea to be by him and his ladylove in their hour of need and then lay himself out with his face down and chin resting upon the back of his hands (a favorite posture of repose among Polynesians), and now the decisive moment had come.

Noiselessly approaching him from behind, the priest raised a club, which he carried in his bosom when on duty, and with steady aim administered a heavy blow upon the nape of the young man's neck, which caused instantaneous death while it averted the spilling of blood and breaking of bones, circumstances that were carefully avoided by Tahitians in slaying victims for their gods. Filled with religious zeal, he picked up the corpse and threw it over his shoulders as though it were nothing—so strong were the heathen priests of Tahiti when executing the functions of their office. He then bore the body away over sandy, shaded shores and around bleak, woody bluffs, avoiding meeting stray wanderers, and at last he arrived at the grand marae. Here he presented his offering to the high priest, telling him all that had happened, who accepted it in the name of the god Cricket, to whom they offered invocations to secure the departed spirit as a new guard to the sacred grounds, rendered superlatively sacred by many human victims that from time to time were buried there. A grave was dug beneath a great tree, supposed to be inhabited by numerous spirits that were ever there to watch over the dreaded premises, and this was the end of Te-muri's young life.

Thus the evening so long looked for with conflicting hopes and fears, ended sadly for the royal house of Fa'a'a. Te-muri's parents watched expectantly for the arrival of their only son to his home, and as night advanced went to rest, supposing that he was safe with some of his friends on the seaside, yet with some misgiving, and they were troubled in their dreams about him. It was a sleepless night for Pere-i-tai and her parents. The child's sorrow was poignant and heartrending, and the parents were truly sorry for the sad termination of their friendship for Te-muri and his good parents, while the murder of the young gallant was a natural course of events under the circumstances in those times—regretted but not censured by the great, and mourned but not murmured at by the common people. The news broke the hearts of Te-muri's parents, who soon followed him to the other world. (1928:600-603)

The most noteworthy thing about this tale is not that the youth was slain—that, as the text put it, “was a natural course of events under the circumstances in those times”—but rather that the slaying was “mourned but not murmured at by the common people.”³

Adams described a similar situation (though with a less dramatic outcome), but one in which the class affiliations of the lovers were reversed:

Now that I am on the subject of family poetry, I must give here another song which was made by Taura atua i amo, and is still a favorite with the Tevas, the more because it is a love-song. The name of Tauraatua belongs to the little district of Amo, in Papara, and has been one of the family names for so many centuries that I cannot say which of the Tauras was the poet; but the motive of the

poem was probably common to all of them, for it was common enough throughout the world. The young chief was in love with a girl of lower rank, who lived at the Ruaroa, a cluster of houses near the beach, by the Marae of Mataoa at the western end of Papara. The paepae, as I have said, was the paved terrace before the house. He calls his mistress Marae-ura in the song. Illegitimate connections were common enough in all societies, but in one way Europe was less rigid than Tahiti in its rules, not of morals, but of marriage. Unequal marriages were not merely unusual; they were impossible. The family would not permit them even in the case of the most powerful chief that ever lived. Illegitimacy was common, but if there was danger that a low-born child should ever take inheritance in the family, the child was put to death. Even if the connection threatened to be inconvenient, the family or the Hiva would interpose and insist on the chief's return to his own place. This is the subject of Tauraatua's song. The messenger, called the bird Uriri, had come to the Ruaroa, where Taura was living with his mistress, and brought the order for him to return to Papara. The song begins by repeating the message, and closes by a verse in which the lover, who is obliged to leave his mistress, pushes aside the leaves to catch sight of her bathing on the beach.

LAMENT OF TAURAAUA.

Taura atua te noho maira i tona ra paepae i te paepaeroa
 E uriri iti au e rere i te Ruaroa
 E fenua Papara ite rai rumaruma
 E haere a i Teva tena teaia tei Papara to fenua ura e
 Moua tei nia Moua Tamaiti
 E Outu tei tai Outu manomano te faarii raa ia Teriirere i outu rau ma Tooarai
 E tii na vau e turai e atu i teniau para o te Ruaroa e
 Ia vai noa mai nau i puu rii o Maraеura tei tai e

"Taura atua lives at the Paepae of the Paepaeroa
 The little Uriri flies to the Ruaroa, for him the loved:
 'Come back to Papara, the heavy-leaved;
 Come back to Teva, your home, your Papara, the golden land;
 Your Moua, the Moua Tamaiti above;
 Your Outu, the Outu Manomano on the shore,
 The throne of Teriirere of Tooarai.'

Then let me go and bend aside the golden leaves of the Ruaroa
 That I may see those two buds of Maraе-ura on the shore."

(1901:36-37)

Misalliances did however occur, and resulted in progeny which occasionally were allowed to survive.

If a Man takes a Wife of inferior rank to himself and has a Child by her it is strangled immediately it is born to prevent its bringing disgrace on the Blood of His Family and tho he wishd to preserve its life himself his relations would oblige him to kill it or declare himself no longer of their Family—and it is the same if the Wife be superior in rank to the Husband both of which frequently happens. If the Child should chance to cry out in Coming into the World, or should the Mother Chance to see it before it is killd, Nature takes place of Custom and the Child is Saved. (Morrison 1935:235)

Later I shall consider the class status of such progeny; meanwhile enough has been reported to substantiate the existence of a castelike

boundary between the category of people labeled *ari'i* (chiefs) and all other persons. Some evidence for such a boundary between so-called *ra'atira* and *manahune* is also available, though not nearly so abundant; but whether this paucity reflects actual situations.... or the chroniclers' notorious inattention to the affairs of "commoners" and the "midling sort," is not possible to say.

We may next inquire whether the Maohis possessed a generic name for what I label a "marriage class." From its ubiquitous association with *ari'i*, one might suppose that the word *hui* had the meaning of "class," but in fact it was simply one form of what the LMS Dictionary describes as a plural or collective particle prefixed to various nouns, as *hui ari'i*, the royal party or family; *hui ra'atira*, the inferior chiefs collectively; *hui tupuna*, ancestors; *hui metua*, parents; *hui hoa*, friends; and so forth.⁴

A more plausible candidate is the word *nati*, defined in the LMS Dictionary as "a class, or distinction of men; *nati ari'i*, the class of superior chiefs; *nati ra'atira*, the class of inferior chiefs." (See also *natimo'e*, a family or kindred.) However, the only textual use I can find of anything resembling this word occurs in one of the "Precepts of Tetunae": "Let not your eyes turn away from the troubles of your own family line (*firi'a fēti'i*); may each help the other *in order of the rules of rank-distinction (i te 'ohipa natia)*" (E. Salmon 1937:29). On the other hand, this reference could be also to the grading or ranking of kin-Titles⁵ or to the grades of sibling seniority, rather than to level of marriage class.

Still another possibility is *nāna'i* (or *āna'i*), which the LMS Dictionary defines as a row, a number of things ranged in a line. The basis for this possible identification is an aphorism:

Na ana'i o te ta'ata e toru.

The types of men are three.

Faauhia nei i te uru. Paihi te iri, na ke [te] ta'ata.

Take a breadfruit. When it is cooked, take off the skin—that is for the people [middle class?].

E amu to io na te aarii.

The meat, that is eaten by the *ari'i*.

E tuu te hune na te manahune.

The core is given to the *manahune*.

(Handy 1930:42)

In any case, whether or not there was a standard generic term for what we call "class," there did exist various verbal means for generalizing about it. I will examine the class labels themselves.

ARI'I

The Maohi word *ari'i* had been a source of much ambiguity among writers attempting to describe and analyze Maohi social relations. The commonest translation in the literature is "chief," but one finds other renditions, such as "principal chief," "head chief," "prince," "king," "feudal lord."⁶

Ari'i is the Maohi variant of the Polynesia-wide word *ariki*, *aliki*, *ali'i*; but one would be injudicious to assume that all these cognates were precisely the same in meaning. The various local forms of the word did undoubtedly refer throughout much of Polynesia to statuses of command and privilege, but even hasty comparisons indicate important local differences. In the Society Islands the word seems to have been used in at least two somewhat different senses.

First, it was used as a term of address and reference for the sovereign ruler of each tribal unit, as for example: "O Maha'ena ia fenua.... O Ro'ure te ari'i." [Maha'ena is (the name of) the tribal-district. Ro'ura is its sovereign.] (Based on Henry 1928:72.) "E Pomare Ari'i i Taraho'i Teie mai nei to pu'e ta'ata o Te'aharua, e ono...." "O King Pomare of Taraho'i^[7] Here are thy people of the six districts in Te'aharua...." (Henry 1928:114)

Second, as we have seen, *ari'i* was used in a general way to identify persons holding high-grade offices (usually Titled) in certain kin-congregations.

During the eras under study, the kinds of units I call tribes were invariably larger than single kin-congregations, and while some tribes contained one or more kin-congregations with *ari'i*-type kin-Titles, there were other tribes containing no such kin-Titles at all. Hence, there were instances of tribal *ari'i* who also held *ari'i*-type kin-Titles, of tribal *ari'i* who did not hold *ari'i*-type kin-Titles, and of *ari'i*-type kin-Titleholders who were not also tribal *ari'i*.

The question, Who was an *ari'i*? is also complicated by the circumstance that the label designated not only incumbents of certain kin-Titles, but some members of their families as well; exactly which members, I am unable to discover. Some evidence from genealogies and legends implies that all recognized offspring of a duly married, kin-Title-type-*ari'i* couple were called *ari'i*.⁸ Moreover, the sources are entirely silent concerning any explicit rule or tacit practice whereby this kind of *ari'i*-hood diminished with collateral distance from a senior, *ari'i* kin-Titleholding line. I suspect that unless other factors served to keep *ari'i* reproductivity at a rate similar to or lower than that prevailing in the rest of Maohi society there were such rules and practices. Otherwise, Maohi society would have become more top-heavy with privileged consumers than even its considerable resources could have catered to. (The reader will undoubtedly have noted that I have offered no estimates regarding the numbers of people belonging to each class; the reason is that I simply do not know.)

The question of which kin-congregations—or, put in the idiom of consanguinity, which descent "lines"—contained *ari'i*-type kin-Titles, is partly answered, in mythical form, in the set of traditions about the ramifications

of the families originating in Opoa and Vaiari (summarized in chap. 16). These do not account for all such *ari'i*-type kin-Titles, but they include enough of them either to lend some historical credibility to the myths or to suggest that the mythical advocacy of Opoa and Vaiari was so influential that members of other family lines reshaped their "traditions" to show links with them.⁹

Returning for a moment to that other type of *ari'i*, the sovereign ruler of a tribe, I pose the question, Were members of his family also labeled *ari'i* if he (or they) did not hold *ari'i*-type kin-Titles? That is to say, was an achieved tribal *ari'i*-hood extended to the achiever's family mates or inherited by his descendants—thereby constituting a process, or perhaps even *the* process, by which all *ari'i*-hood had its inception? This important question will be discussed at greater length later on, but, to anticipate my findings, I can state that an unequivocal answer is not to be found in the sources.

In other words, in the case of both types of *ari'i*-hood, I can specify the prototypes of these statuses but am unable to discover the "lower" boundaries of the class they belong to, and this obscurity is darkened by some of the meanings attributed to *'iatoai* and *tooha*, or *to'ofa*.

'Iatoai is defined in the LMS Dictionary as the second class of the inferior chiefs, and it undoubtedly derives from *'iato*, the transverse beams which connect the outrigger to a canoe; that is, they were "supporters" or "stabilizers," in line with the Maohi metaphor identifying a district with a canoe (*va'a*), and its chief as a mast (*tira*). Thus, *'iatoai* would appear to have been an office, and most plausibly one connected with a tribe. It was so described by Adams:

... the messengers [sent by the ruler of the Papara tribe] were political personages They were under-chiefs—Iatoai. How many Iatoai formerly belonged to Papara I do not know; but in our day there are two subdistricts of Papara, Faina and Oropaa, and Faina has eight Iatoai; Oropaa has six. The whole body of Iatoai in each district are known as Hiva, and to any one who cares for the beginnings of things they are the most interesting part of our old society, for the Hiva of Papara might have been the source of all modern notions—Parliament, Civil Service, Army, Law Courts, Police, Aristocracy, Democracy, and Commune. The Iatoai were the chosen fighting chiefs or warriors, and they had, as a part of their functions, the duty of punishing or revenging insults offered to the head-chief; but they could also, and sometimes did, depose and exile a head-chief and name another or recall the old one. Their interference in this way makes one of the most dramatic motives in island history (1901:8)

Although none of the sources specifically so states, the office of *'iatoai* was probably a hereditary one; and it seems also to have occupied a place in the class hierarchy, but whether among the *ari'i*, or below them, is uncertain. Handy described *'iatoai* as "... the nobles, or younger branches or the Hui Ari'i" (1930:42); but de Bovis identified them as "un echelon inter-

mediare," which sprang from unions between *ari'i* and *ra'atira* and which consisted of persons "... qui n'étaient point egaux aux Arii, mais supérieurs aux petits chefs [i.e., *ra'atira*]." And, de Bovis went on to state, "... les grands Arii leur [*'iatoai*] donnaient volontiers une suprématie héréditaire ou temporaire sur certaines parties du pays où ils avaient de l'influence." (1909:18.) He also stated that the *'iatoai* did not, in his opinion, constitute a separate "caste"; but he did not indicate whether they (or their families) married "up" or "down."

Similar questions are raised by *to'oha*, or *to'ofa*, which is defined in the LMS Dictionary as a chief next in rank to *ari'i*. Banks identified "towha" as "Gentleman" and placed them between "Erata" [probably *ra'atira*] and "Manahouni"; but he explained: "as I was not acquainted with the existence of these classes [Erata and Towha] during our stay on the Island I know little of their real situation" (Beaglehole 1962:I, 385). Morrison identified "Towha" as "Lord of the Mannor," and placed them in a separate "class" between *ari'i* and *ra'atira* (1935:167). According to Wilson, "towhas" were "... the near relatives, or younger brothers, or tayos, of the chiefs"; they were of higher "rank" than *ra'atira*, but whether they were also called *ari'i* he did not state (1799:322-323).

Are we discussing two distinct statuses, or one only—with *'iatoai* being a metaphor for *to'ofa*? In support of the first possibility is the LMS Dictionary distinction; but in support of the second is the fact that no other source that I know of uses both terms in any sense that can be read as contrastive.¹⁰

Another kind of uncertainty is raised by distinctions made in the sources between "great *ari'i*" (*ari'i rahi*, or *ari'i nui*) and "petty *ari'i*" (*ari'i ri'i*), or between "great *ari'i*" and mere "*ari'i*." Figure 18-1 indicates the various meanings assigned to these labels, representing earnest but misguided efforts to supply European parallels for Maohi statuses that were at best only partly understood.

The label "great" (*rahi*, *nui*) appears to have been used to qualify both types of *ari'i*-hood; it applied to the highest-graded Titles of certain prestigious kin-congregation marae (regardless of the current "tribal" authority of its incumbent) and to certain tribal sovereigns ruling large or influential tribes (regardless of the grade or rank of their kin-Titles). It is even possible that some tribal chiefs, designated *ari'i rahi*, did not even hold an *ari'i*-type kin-Title, but we cannot be certain of this. On Tahiti itself there were at the time of "discovery" by Europeans some ten to fifteen individuals called *ari'i rahi*, including both types. The principal kin-Title of Farepua Marae (Vaiari District), Te *ari'i nui o Tahiti*, once stood above all the rest in terms of rank, despite the limited political influence of its incumbent at the time of early European contact. Politically, however, the three *ari'i rahi* of greatest, island-wide influence were the possessors of

kin-Titles which ranked not only below Farepua's, but below Puna'auia's and probably below Hitia'a's as well. On all the other islands there was at least one *ari'i rahi*, and in some places more.

While great *ari'i*-hood based mainly on tribal authority and influence undoubtedly waxed and waned with the fortunes of war, when identified with the principal kin-Titles of Opoa and Vaiari it seems to have remained ceremonially preeminent over a long period of time; but the relation between the two types of *ari'i*-hood was a very complex one, as later chapters will show.

An even more limited category of *ari'i*-hood was constituted by those entitled to don feather girdles at their investiture and on other occasions of religious import. In some instances feathered eyeshades were also donned in association with the feathered girdles (Morrison 1935:116), but the latter were always the principal objects in this ritual context. As we have seen, there were two kinds of such girdles (*maro*), one decorated mainly with red feathers (*maro 'ura*) and one with yellow (*maro te'a*).¹¹ Legend has it that the first such girdle was red—it having been the insignia of Title-holders of the kin-congregation of Vaearae marae (later Vaiotaha) in Opoa District, Ra'iatea. Yellow girdles were more closely identified with Porapora *ari'i*; one tradition states that this form of insignia was introduced by a Vaearae man who immigrated to Porapora, founded a new marae (Vaiotaha) and a new descent "line," and instituted the wearing of a yellow girdle to mark his "line's" (political) independence of the Opoan homeland. (See chap. 16.)

I have already described the association between feathers, especially red feathers, and spirits, including their connection with Ta'aroa¹² and 'Oro. I cannot account for their special identification with the Opoan kin-congregation, except through the latter's traditionally close connection with Ta'aroa and 'Oro: it was at Vaearae that Ta'aroa "first broke through the sky,"¹³ and according to some myths 'Oro not only became tutelary of Opoa but at one time actually made it his home. It should be recalled that the girdles used in investing a new incumbent with these highest-ranking kin-Titles contained some feathers taken from 'Oro's image, and that they were usually stored either inside the god's image or close by.

As for the girdle (*maro*) itself as an insignia of *ari'i*-hood, there may have been not only a "symbolic" association but a direct magical conjunction between it and the generative powers of the male loins and genitals, which it encloses, thereby featuring the wearer's function as perpetuator of a descent "line."¹⁴

While both red and yellow girdles served as insignia for this category of *ari'i*, the former appears to have been more prestigious. For example, in a "boasting contest" between inhabitants of Tahiti and Ra'iatea, the latter

flung at the former: "Yellow feathers may abound with you, But red feathers have we in abundance" (Henry 1928:436). Also, although individuals entitled to wear the *maro 'ura* were referred to as *ari'i maro 'ura*, I have come across no reference to *ari'i maro te'a*. (It is possible, however, that those entitled to wear the yellow girdle were also called *ari'i maro 'ura*.)

The most puzzling aspect of feather-girdle wearing is the basis on which the right was exercised. Right to don such insignia was acquired by inheritance, mainly primogenitural but evidently not exclusively so, and through females about as often as through males. On the other hand, it would appear that not everyone inheriting such a right actually exercised it. For example, in certain myths having the legitimacy of "official" charters, the principal kin-Titles of Farepua and of Puna'auia marae carried *maro 'ura* rights, but during the Early European Era none of the incumbents of these Titles is reported as having exercised that right. Conversely, the insignia was donned by certain individuals whose ascriptive rights to do so seem somewhat attenuated in terms of the usual primogenitural criteria. Indeed, this is a very complicated matter, and an explanation of it will have to await my description of tribal organization and intertribal politics.

Let us return to the castelike aspect of the phenomena under consideration. I have already described the rules and sanctions restricting an *ari'i's* marriage to a non-*ari'i*. It is also clear from numerous kinds of evidence that efforts were made to mate great *ari'i* and members of their immediate families with individuals of comparable status, and this was especially true of feather-girdle *ari'i*. For example, after the untimely death in 1806 of the wife of Pomare II, the missionaries concluded that his line was nearly extinct—his deceased wife having had no offspring by him. (All her other offspring had been sired by her commoner courtiers, and killed at birth.) "There is but one woman on the Island that the king can take to wife—so as to preserve issue—her name is vahaene [Vahine] *Moe ea* belonging to Tehohu's family of Hedeia [Hitia'a]—she it is said is bad—and it is likely that the king will not take her." (Davies, Youl et al., Journal, 21 July 1806, LMS Archives)

As we shall see, political considerations were very influential in many such matches. Maohi society had not proceeded nearly as far as Hawaiian society toward increasingly restricted endogamy at the summit, but a start had been made in that direction. Whatever else they were, the persons whom most Maohis labeled *ari'i* were set off from all others by explicit rules of marriage. As for the rest of the population, most of the sources divide it into two major categories: *ra'atira* and *manahune*, which, among other things, are described—or at least implied—to have been marriage castes. That is to say, we have found no rules that state explicitly that *ra'atira* should marry *ra'atira*, or that *manahune* marry only *manahune*, but norms prohibiting *ari'i* from marrying *ra'atira* (or *manahune*), and discouraging

ra'atira from marrying *manahune*, apparently exercised the same kind (if not the same degree) of constraint that explicit rules might have accomplished. So let us consider what other characteristics distinguished *ra'atira* and *manahune* from one another and from *ari'i*. I begin with *manahune*, since the data on *ra'atira* are more limited and more ambiguous.

MANAHUNE

Manahune is not even listed in the LMS Dictionary, but it is defined in Jaussen as "plébéien." Elsewhere in the sources the word is translated as "midling sort" (Cook), "vassel" (Banks and Cook), "vassels and freeholders" (G. Forster), "landed property owners" (J. Forster), "citizen" (Bligh, who includes them with *ra'atira*), "tennants" (Morrison), "cottagers" (Wilson), "common people" (Ellis), "gens du peuple, proletariens" (de Bovis), "classes inferieure de peuple" (Moerenhout), "plebians, hereditary possessors of own land" (Henry), and "commoners without property" (Handy). In addition to characterizing *manahune* in terms like these, some writers have gone a step further and distinguished them from *ari'i* in terms of ethnic and even racial differences. As for the Maohis themselves, while there is evidence for believing that *ari'i* used the term *manahune* as a label for individuals, I have come across no reference to anyone speaking of a *manahune* class, parallel to such collective expressions as *hui ari'i* and *hui* (or *pu'e*) *ra'atira*. Neither do I know whether a person called *manahune* by an *ari'i* (or *ra'atira*) classified himself as such, or was so classified by other *manahune*. In other words, whereas there is considerable positive evidence that some Maohis—perhaps all Maohis—"thought" about *ari'i* as constituting a collectivity of a special kind, *manahune*, on the other hand, may not have been viewed in the same light; but my uncertainty in this regard may be due more to the preoccupation of the sources with the "better sort" than with actual events.¹⁵

Emory asserted that *manahune* was the label applied distinctively to the populace of Tahiti and Mo'orea: "But *manahune*, unlike *raatira* and *arii*, is not a class name in Polynesian dialects outside of the Society Islands; the term, as a class name, seems to have been coined from the name of the people who supplied that class" (Marae Traditions). Against this interpretation, however, is the fact that by European times, *manahune* constituted an element of the population of all the Society Islands, and it is difficult to see how a purely local label could have become thus generalized.

Perhaps the most crucial question concerning the place of *manahune* in Maohi society has to do with their rights in territory. Handy epitomized *manahune* as "commoners without property" (in contrast to *ra'atira*, who were "landed proprietors"); this was also the expressed view of de Bovis (1909:22), and was implied by Morrison (1935:167). Directly contrary to this view was the one expressed by Henry, who said of *manahune* that

“they served as retainers and workers for the upper classes, but also enjoyed their own hereditary possessions” (1928:230). Views similar to Henry’s were expressed by the Forsters, who called *manahune* “freeholders” and owners of “landed property” (G. Forster 1777:II, 258-259; J. Forster 1778:355); but even if these characterizations happen to be more accurate than those of de Bovis they can hardly be accepted as good evidence, in view of their authors’ notoriously imperfect understanding of Maohi social relations.

How can one reconcile such contrary opinions? I believe the answer lies in the nature of Maohi land tenure, which differed so markedly from European concepts of “ownership” that these contrasting labels are not so much “right” or “wrong,” as inappropriate. I postpone until later the detailed consideration of this matter, but my views about the property rights of the *manahune* can be summarized here.

I believe that *all* Maohis had rights—including what might even be called “demand rights”—in some piece of territory, but that all such rights save those of the highest-grade kin-Titleholders were subject to occasional limitations exercised quite “legitimately” by other persons. (This was in addition to limitations sometimes imposed by means of coercive force.) In other words, undivided ownership was a very rare phenomenon in Maohi society. Most territory (terrestrial and marine) was held in divided ownership; and the demand rights of provisional ownership varied greatly in weightiness and in effectiveness. Indeed, some persons’ claims to specific territories appear to have been at times so outweighed by claims of others that they were, so to speak, relegated to a “waiting list”; but to call such persons “landless” is, I believe, a misnomer.

In this connection, I suspect that in some places many *manahune* may have been on “waiting lists,” but that this was not the case everywhere. In fact, Handy, while calling them “commoners without property” in one passage (1930:42), intimated (perhaps unwittingly) that they did own effective land rights in the islands’ interiors: “They had no individual land rights but were tenants or serfs of the land-owners [i.e., *ari’i* and *ra’atira*], or else they lived in the inner valleys or on the plateaus” (1930:7). Then, continuing with an excerpt from Marau, he wrote:

They were allowed to have a road to the seashore, so that they might fish; but they had to go direct to the reefs and back by the road allowed them. They were called “the dwellers in the far-away mountains and the *vao*, or depths of the valleys,” the *noho-vao*, an epithet still applied to their descendants. They were the wood-cutters for the royal family, the high-priest, and the warriors; they were the pickers of *taro* leaves, the fishers of eels and fresh-water fish. Their condition is referred to in the insult:

Go to the mountains where you belong,
Far, far away up there;
Far away where the red skies lie,

Away to the road of separation,
 Far away to the clustering yellow bamboos,
 Torch-fisher of the *nato* of *Motutu*,
 Picker of eels,
 Thou art the grandchild of the mountain,
 Thou slave of the *arii*!

(Marau, in Handy 1930:7-8)

Apart from the question of the credibility of this passage there is some ambiguity in it—that is, were *all manahune* “slaves” of the *arii* or “tenants or serfs of the land-owners,” or only those *manahune* living near the latter?

The location of lands on which *manahune* resided and subsisted is described in a chant: “On the seashore and inland were the lands of the plebeians bordering on the lands of the great” (Henry 1928:403). Aside from the question of its historical validity, this statement implies a recognition of *manahune* property rights in land, both near and away from the shore—rights that may of course have been subject to others’ overriding claims, and parcels that were not situated in the most favored places, but rights that were nevertheless proprietary and locations that were not invariably *noho-vao*.

Marau’s description of the *manahune* as “woodcutters,” “pickers of *taro* leaves,” and “fishers of eels and fresh-water fish,” implies that they worked mainly for their superiors and in relatively unskilled capacities. This opinion was voiced also by Handy, who wrote: “The crude labor in all work was, however, performed by *manahune*. They were the paddlers (*rao*) in the *Arii*’s canoes, and they rendered military service in war time.” (1930:43.) Wilson also wrote of them that they “cultivate the land, and most resemble our cottagers These hold under the *tōwhas* [*to’ofa*] and *ratīrras*, answer all their demands to the best of their ability, make cloth for them, build their houses, or assist in any laborious work required of them.” But then Wilson added: “yet their vassalage compels no constant service or residence: they may change chiefs, and go to another district.” (1799:324)

Undoubtedly, many *manahune* served their superiors either regularly, as domestics (*teuteu*), or occasionally, in response to special levies of labor or to general *corvées*. Also, they contributed food and other objects to their superiors, regularly and on special occasions, as members of kin-congregations and of tribes. But to depict all or even most of them as full-time servants, or to imply that they were severely restricted in the kinds of work they were allowed to do—and largely unskilled in the work they did do—is certainly not warranted.

Like the *arii* themselves, some *manahune* were occasionally “*ra’a*, or hallowed; and others common or unclean” (Wilson 1799:324). One would not expect to learn of a *manahune* playing a high-priest’s role in a tribal

or “international” marae, but many of them undoubtedly served priestly functions in such temples. Also, the head of a *manahune* kin-congregation was no less priest than the head of one composed mainly of *ari'i*—that is, the tutelary of the latter was undoubtedly more powerful and the ritual of communication more exacting and fateful, but the function of priesthood was the same in both cases.¹⁶ Moreover, as we shall see, *manahune* were not excluded from the prestigious Arioi sect, although they did not rise very high in its hierarchy. And finally, there is no evidence to suggest that *manahune* were discouraged from becoming shamans; on the contrary, there are indications that they were among the most successful practitioners of this occupation.

As mentioned previously, *teuteu* designated not a class but an occupation: the job, in many cases hereditary, of serving persons of high kin-title grade or extensive tribal authority. The services thus rendered are implied to have been “domestic,” but that probably covers a range of activities: counselor, wet nurse, entertainer, bearer, steward, cook, gardener, swineherd, and so forth. More will be said about this occupational category in chapter 21. Although many or most *teuteu* were probably classed as *manahune* in terms of their marriageability, as noted earlier “... it is not uncommon to find Young Men of the first Families and the Younger Brothers of Chiefs” working as servants, indeed, even “in the Service of the Fair Sex”; but, as Morrison pointed out regarding the latter, “by debasing themselves thus, they are rendered Incapable of assisting at any religious Ceremony” (1935:167).

Anderson wrote that “if a *Teou* [*teu*] be caught in an intrigue with a woman of the blood-royal, he is put to death” (Cook 1784:171). Presumably a *teu* of less than “first Family” position was implied; on the other hand, it was a well-reported fact that many *ari'i* women cohabited openly with what appear to have been *teuteu* of lower if not *manahune* class.

The class status of *titi* is somewhat more difficult to assign. Such individuals, it will be recalled, were “those who had lost their liberty in battle, or who, in consequence of the defeat of the chieftains to whom they were attached, had become the property of the conquerors” (Ellis 1829:II, 342). Handy identified *titi* as “certain of the *manahune* families whose members were for some reason condemned to furnish the victims for the human sacrifices on the chief’s marae” (1930:44). A statement by Henry, on the other hand, could be interpreted as distinguishing the two: “The victims for human sacrifices were always taken unawares, and were men chosen from among war captives, called *titi*, men of the lowest rank [*sic*], called *manahune*, and men of the middle classes who made themselves obnoxious to those in power” (1928:196).

Putting these and other references together, we seem to be discussing

three different statuses: war captives and their immediate descendants (*tītī*), potential sacrificial victims (*ta'ata tapu*, *ta'ata 'ino*), and members of the lowest marriage-class (*manahune*). *Ta'ata tapu* were not all chosen from *manahune*, and all *manahune* were not automatically relegated to the status of *ta'ata tapu*. Moreover, *ta'ata tapu* were not exclusively taken from among *tītī*. However, it is not at all clear whether all *tītī* were relegated to *ta'ata tapu* status. Neither is it clear whether only *manahune* became *tītī*, or whether, in terms of marriageability, all war captives (or refugees), regardless of previous class, became *manahune*. In any case, although *manahune* served as an epithet under certain circumstances, and persons called *manahune* were, as we shall see, treated usually with something short of respect, the *tītī* were the object of universal contempt.

RA'ATIRA

The *hui* (or *pu'e*) *ra'atira* were identified variously as: "yeomen" (Banks), "esquires" (Morrison), "gentlemen" (Wilson), "landed proprietors, or gentry and farmers" (Ellis), "a chief; the general title of the inferior chiefs" (LMS Dictionary),¹⁷ "petits chefs ou propriétaires foncieres" (de Bovis), "grandes propriétaires terrains" (Moerenhout), "gentry" (Henry), and "landed proprietors" (Handy). Nearly all identifications of *ra'atira* focus on their roles as landowners. For example:

... under them [the chiefs] are The Towha [*to'ofa*] & Ratirra each holding his land independant of the Other, any Ratirra can put a Raahoe [*rahui*] on his own division... (Morrison 1935:167).

The next rank [below *to'ofa*] is the *ratirra*, or gentlemen, who has one portion [of land] to the *tōwha*'s three. These smaller estates are called *rāhoe* [*rahui*], from the power the *ratirra* has to lay a prohibition on his own land, or on any particular sort of provision. (Wilson 1799:323)

They [*ra'atira*] were generally the proprietors and cultivators of the soil, and held their land, not from the gift of the king, but from their ancestors. The petty *raatiras* frequently possessed from 20 to 100 acres, and generally had more than their necessities required. They resided on their own lands, and enclosed so much as was necessary for their own support.

The higher class among the *raatiras* were those who possessed large tracts of land in one place, or a number of smaller sections in different parts. Some of them owned perhaps many hundred acres, parts of which were cultivated by those who lived in a state of dependence upon them, or by those petty *raatiras* who occupied their plantations on condition of rendering military service to the proprietors, and a portion of the produce. (Ellis 1829:II, 343-344)¹⁸

These persons [*ra'atira*] are the possessors of landed estates *in capite*. (Montgomery 1832:I, 152)¹⁹

The land and goods which the barons [*sic*] and inferior nobles owned were not considered as benefices granted by the prince [*ari'i*] and did not revert to him in case of disinheritance or during the minority of their holder; and he could not,

on some pretext, confiscate them to add them to his own lands. These properties were considered to be private and inviolate, even though a large proportion of their produce was always demanded or seized arbitrarily for the *ari'i*, whose incomes were not set and consisted of what they received from their subjects or what was gotten through seizure. (Moerenhout 1837:II, 11-12)

... they [*hui ra'atira*] were farmers on their own lands and trusted keepers of the lands of their sovereigns and chiefs. (Henry 1928:229)

Except for Ellis' category of "petty *ra'atira*" (who are described as resembling tenants), all these characterizations depict *ra'atira* as holding their lands in something approximating undivided ownership, subject only to confiscation by their superiors as result of lese majesty or default of taxes (and, of course, subject to capture in war). I suspect, however, that there were several degrees of such "ownership," parallel to the "owner's" position in kin-congregations and tribal hierarchies, so that the question of who was a *ra'atira* is not easily decided—at least at its lower hierarchical boundary. It is true that, except for Montgomery, early writers emphasized the hereditary derivation of the land rights which distinguish *ra'atira*-hood; but then heredity was the source of most land rights held by all Maohis. Also, much is made of the right of a *ra'atira* to impose a *rahui* upon the land "owned" by him; but again, just as that right was subject to preemption and overriding by the superiors of *ra'atira*, I imagine that even *manahune* were privileged to place restrictions over some of their goods, including perhaps modest portions of land.

In other words, neither the hereditary nature of a right in land, nor the privilege of *rahui* (which was nearly always limited) was in itself a criterion sharp enough to permit us to define the lower boundaries of *ra'atira*-hood. Indeed, I suspect that the Maohis differed not only among themselves in bestowing the *ra'atira* label, but, more crucially, that persons universally labeled *ra'atira* were not always in full agreement concerning the eligibility of some particular individual as a spouse for one of them.

This raises a question of identification of another kind: to what extent was the label, and associated marriage proscriptions, applied to persons other than the principal label-bearing *ra'atira*? Did it apply to all his (or her) progeny or only to his principal heir; to the progeny of parents both of whom were *ra'atira* or to those having only one *ra'atira* parent? Unfortunately, I am even more unsure of answers to these questions than I was to analogous questions about *ari'i*. The explorers and missionaries were more concerned with *ari'i*, and also the label *ari'i* was undoubtedly subject to much sharper definition by the Maohis themselves. The sources do indeed refer to *hui* (or *pu'e*) *ra'atira*, but it is not always clear whether such references are to a category consisting only of the "petty chiefs" themselves, or to a whole class consisting of "petty chiefs" and their families.

Most uses of the label *ra'atira* by Europeans appear to apply to the former, but I have no certain way of knowing whether that corresponded to native usage.²⁰

In any case, when the explorer and missionary writers characterized those whom they labeled *ra'atira*, they extolled their virtues. Compared with the *ari'i* (who were "overbearing," "indolent," "licentious," etc.) *ra'atira* were described as possessing many of the virtues considered attractive by the essentially middle-class missionary chroniclers:

These individuals were a valuable class in the community, and constituted the aristocracy of the country. They were in general more regular, temperate, and industrious in their habits, than the higher ranks, and, in all the measures of government, imposed a considerable restraint upon the extravagance or precipitancy of the king, who, without their co-operation, could carry but few of his measures. In their public national assemblies, the speakers often compared the nation to a ship, of which the king was the mast; and whenever this figure was used, the raatiras were always termed the shrouds, or ropes by which the mast is kept upright. Possessing at all times the most ample stores of native provisions, the number of their dependents, or retainers, was great. The destitute and thoughtless readily attached themselves to their establishments, for the purpose of securing the means of subsistence without care or apprehension of want.

The bue raatira were the middle class in society; forming the most important body in times of peace, and furnishing the strength of their armies in periods of war. Warriors were sometimes found among the attendants on the king or chief; but the principal dependence was upon the raatiras. These, influenced by the noble spirit of independence, accustomed to habits of personal labour, and capable of enduring the fatigues of war, were, probably from interest in the soil, moved by sentiments of patriotism more powerfully than any other portion of the people. (Ellis 1829:II, 344-345)

According to Morrison:

The Weomen of rank are Most remarkable for their licentious practices and Many of them have a Number of Favourites, in which they pride themselves, tho many of the lower Class are what may honestly be Calld Virtuous, never admitting a Second to share in their favours. (Morrison 1935:237)

It is not certain, however, whether Morrison was referring to *ra'atira* or *manahune*.

RECRUITMENT

"Membership in a marriage class was established mainly by descent." When I composed this statement it seemed to be accurate, adequate, and intelligible. Now, hundreds of study-hours later, its accuracy—such as it is—remains unchallengeable, but the statement is so inadequate as to be virtually unintelligible.

I have come to realize how complex a matter "descent" was among the Maohis. To be the "offspring" of a person in the fullest sense required not only parental recognition—tacit, in the case of the "mother," mani-

fest in the case of the “father”—but validation of that recognition by the parents’ families as well. Some of the force in this requirement was seen in the case of the cohabiting couple who wished to preserve (and presumably recognize) their offspring, but whose wish was opposed by the man’s family (to the point of attempted infanticide) on the grounds of the woman’s lower-class status. Presumably, such issues did not arise when both parents were of the same class; but I suspect that there were cases in which the class status of one of the parents was equivocal enough, or the intraclass distance between them wide enough, to give rise to disagreement. Indeed, I suspect that the actual marriage preferences and proscriptions were narrower and more specific than my proposed three-class schema indicates. This was certainly the case in the upper reaches of the *ari’i* class, and it may well have been so among the *ra’atira* and even the *manahune*. That is to say, a *ra’atira* of considerable affluence and influence and of respectable pedigree would have raised objections to his principal heir’s marriage into a *ra’atira* family of relatively small account. I cannot, however, document this opinion very persuasively, so I leave the three-class formulation as it stands.

As we have seen, the offspring of different-class parents often were slain at birth; but there is also substantial evidence that many such offspring were allowed to survive. The question then is, To which marriage class were such offspring assigned?

Handy, writing of *ari’i* misalliances, stated that parents and child were driven into exile, but other writers described less drastic outcomes. T. Salmon, for example, recorded the following episode in the pedigree of one of his *ari’i* “lines”: “Mehae takes to wife Tuterai-puni from Taipoto district, Marae Mataifare, born of them Terupe, boy; (2) Vaeruatua; (3) Vaeraauri; these two marry beneath them, and tutehia (set aside), meaning their heirs can never become chiefs” (n.d.:23). Henry described the outcome of such misalliances in more detail:

When a child of the royal family formed a misalliance which the parents did not wish to equalize, they refused to solemnize the marriage rites on their side, which lowered the erring one to the level of the inferior party, at whose home alone the marriage was performed. Such a person and the children of such a union, were called *tamari’i taahi hia* (children trodden down or degraded). In such cases, when they could gain popularity among the people, they sometimes asserted themselves and regained prestige as rival members of the family that had disowned them. (1928:284)

De Bovis was even more explicit, differentiating outcomes according to the sex of the erring upper-class mate:

If she [an *ari’i* woman] had a child by an unknown father, that child was considered just as royal as if it had counted a long line of kings in its pedigree. If the

father were known to have been a lower-class man, that affected somewhat the status of the child, but the latter remained nevertheless a prince.... But, it was not thus when an arii male had a misalliance. The offspring of such a union had neither rights nor privileges [in their father's family], nor had they the status of their father [in society at large] (1909:23)

These statements by de Bovis are puzzling on two counts. First, they constitute the only direct statement I can find that the offspring of an *ari'i* woman by an unknown genitor, or by a genitor known to be of a lower-class, were allowed to survive. Such situations probably did occur, but I have not come across any legendary or historical references to specific occurrences of this kind. (In this connection, the likelihood of a higher-class male siring offspring by a lower-class female was probably far greater than the reverse, as was the possibility of that kind of offspring's survival.)

But assuming the validity of both parts of de Bovis' statement, I must then try to explain the differences in outcomes of these contrasting kinds of misalliances—that is, why should the higher-class mother's offspring be assigned a class status higher than that assigned offspring of the higher-class father? Is this evidence of a concept that uterine descent was in general weightier than agnatic descent? Or were more practical considerations involved?

With respect to the former explanation, Gunson stated: "It would seem reasonable to assume that a royal chief of senior patrilineal descent would be forced to yield pre-eminence to a junior chief of the same lineage who was of superior status through his mother" (1964:55). If by this is meant that a "junior chief" whose mother was member of a *maro 'ura* kin-Titleholding family took precedence over a cousin whose father's Title was graded higher than the former's but whose mother was not of *maro 'ura* status, then this may well have been so—provided of course the higher-graded Title of the father was not itself of *maro 'ura* status. But such precedence was probably due to the preeminence of the *maro 'ura* factor, and not to the uterine link. It so happens that several preeminent Maohis, legendary and historical, owed the high rank of their Titles largely to uterine ties; but it does not follow from this that agnatic ties were not of equally, or even greater, weight.

With respect to the practical considerations contributing to the situations alleged by de Bovis, the very fact that kin-Titles did devolve more often through males than through females would have served to make the relatives of an *ari'i* male more circumspect about assigning upper-class statuses to the latter's half-caste offspring.

Elsewhere, de Bovis wrote that his so-called *échelon intermédiaire* consisting of *'iatoai* and *tuuhou* derived from "alliances" between *ari'i* and *ra'atira*—his wording seems to imply that the "alliances" in question were

actual “marriages”: “These alliances gave birth to people who were not at all equal to the Arii, but superior to the small chiefs. And the Great Arii gladly gave them an hereditary or temporary supremacy in certain parts of the country where they had influence.” (1909:18)

Henry wrote that *ari'i ri'i* (nobility, petty kings and queens) were “of part royal and part plebeian descent” (1928:229), but this disagrees with a passage cited elsewhere in Henry from the chant “Creation of Man”:

When Ti'i and Hina-maha'i-tua-mea (Hina-mitigator-of-many-things) begat children they became the high royal family of the 'ura girdle; they were descendents of the gods from darkness. When people stood forth conjured into being by Ti'i and Hina-maha'i-tua-mea, they became the common people, the plebians of the world. When the royal family espoused common people, they begat the gentry of the world. When the royal family espoused the gentry, they begat the nobility of the world. (1928:403)

What can be concluded from these various passages is that interclass matings did occur, even some “marriages,” and that any surviving offspring of such matings were assigned class statuses *somewhere* between those of their parents. That is not a very precise conclusion, but it is about as much as the differences in testimony will justify, ranging as it does from allegations about “exile” to assertions about “petty kings and queens.” Probably, there was an even greater variety of outcomes than the sources describe, depending not only upon distance separating the classes of the offsprings' parents, but upon numerous other familial and political factors, and upon the offsprings' birth order, sex, and personality. But concrete instances of such outcomes are not recorded.

The foregoing refers to the offspring of humans only. Occasionally, it was believed, a god cohabited with a human female and sired offspring by her; mention was made earlier, for example, of the eagerness of women to become impregnated by the god 'Oro, acting through one of his mediums.²¹ The best known “historical” case of an allegedly spirit-conceived individual was that of Pomare II. Morrison described the episode as follows:

The present Earee Nooi [*ari'i nui*] (or King) is the Son of Matte or O'Too [Tu, or Pomare I], his name is Toonooeayeteatooa [Tunuia'eiteatua] which may be thus translated, “Too, the Great begotten of God,” and his title Eatoa Raa [e Atua Ra'a] or Sacred God—which Sacraligious Name and title He obtained by His Mother declaring that the Deity (Taane) Cohabited with her in her Sleep and, proving Pregnant soon after, the Child was declared to be the Offspring of the Deity and is rever'd as something supernatural. (1935:166)

To those placing credence in this explanation of Pomare II's conception, the circumstance may have served somewhat to enhance the already very high rank of his Titles. The alternative explanation accepted by many was that the child was sired by one of the *manahune* gallants with whom his mother notoriously consorted—a circumstance which was used on one occa-

sion by his political rivals to deny him sovereignty over Tairapu. (Morrison 1935:96)

Another question left unanswered by our inadequate generalization about class status and “descent” has to do with ramification. The only specific reference in the sources to this aspect of the process is by Handy, who wrote: “There was a subdivision of the Hui Arii called by Marau the *ia-toai*, consisting of the families derived from the younger branches of the arii stock” (1930:42). The question is much more crucial than this meager reference intimates.

The occasional indistinctness of class boundary lines, combined with the operation of the seniority principle among siblings, lead me to believe that reduction in class-status level was a general and inevitable process in all but the lowest class. Unless other considerations intervened, the class-status distance between a *matahiapo*-line firstborn and the last-born offspring of a long line of last-born offspring must in many cases have become so great that the latter could no longer qualify as a member of the same class. There is no evidence concerning how wide that distance had to (or happened to) be and no reference to formal procedures serving to recognize or institutionalize such reductions; but, tacitly or otherwise, at some stage in their descent many lines must have become transformed from *ari'i* to *ra'atira*, and from *ra'atira* to *manahune*.

Further reading of the sources also raises the possibility that membership in a higher class was attainable by marriage. Principal evidence for this is found in statements by Ellis and Henry. The former wrote:

Whenever a matrimonial connexion took place between any one of the hui arii with an individual of an inferior order, unless a variety of ceremonies was performed at the temple, by which the inferiority was supposed to be removed, and the parties made equal in dignity, all the offspring of such a union was invariably destroyed, to preserve the distinction of the hui arii, or reigning families. (1829:II, 345–346)

In his comment on this statement, Handy wrote:

Ellis, doubtless basing his observations on the none too strict conformity of the Pomare family to the regulations of the Hui Arii to which it only half belonged, speaks of adjusting of differences in rank by ritual. Doubtless this was done with younger branches of the *ariii* families, but I doubt if it was permitted with the *matahiapo* of a ranking Arii, for the prestige of a ruling family depended wholly upon descent. (1930:27)

Whether Handy was correct in his stricture is impossible to discover. Emphasis upon “purity of line” undoubtedly increased in the upper ranks of *ari'i*-hood, but Handy—as a result of his reliance upon Marau, whose aristocratic (and anti-Pomare) biases were all too evident—may have been overengaged with this aspect of Maohi society.

According to Henry, the ceremonies in question consisted of the nuptial

rites themselves—provided, of course, that the family of the higher-class principal also took part in the ceremony. Henry stated that “Any differences of rank [i.e., marriage-class level] ... between the two families were forever annulled by these [wedding] ceremonies” (1928:284). Despite the ambiguities of this statement, I believe that the class elevation brought about by these ceremonies referred only to the spouse (and mainly for the purpose of assigning the higher-class status to his or her offspring); it is quite unlikely that the elevation included other relatives of the lower-class spouse—except perhaps in legend (see below, the Tuna of Vaihiria).

Another statement from Henry, quoted earlier, asserts that a partner to a union with a lower-class mate was “lowered ... to the level of the inferior party” if his or her family “refused to solemnize the marriage rites on their side” (1928:284). As reported earlier, Handy asserted that any *ari'i* who formed such a union was driven into exile, but Henry’s statement is the only one of which I know to allege an actual lowering of an individual’s class level (as opposed to the assigning of a lower level to his offspring) through a definite act.

A number of statements in the sources indicate that there were ways to elevate an individual’s marriage-class status by procedures other than nuptial rites. The missionaries Tyerman and Bennet reported having been shown a small marae on Huahine which they were told had been built “on the occasion of making an arii, that is adopting into the royal family a person of inferior birth.” However, besides noting that the ceremonies observed on such occasions were of a nature “which the worst words in our language would be abused in describing,” they offered no further explanation for these unusual events. (Montgomery 1832:I, 177.)²²

One means of elevation is described in the legend concerning the tragic love affair of “Princess” Pereitai, and the commoner, Temuri. In an effort to induce the maiden to break off the affair, her old nurse warned that the princess’ plan to ennoble her lover might never succeed, and he might always be a fugitive sought by her royal family and slain as a sacrifice to the gods. “It is only for deeds of valor and heroism, when royal personages have been rescued from outrage or death in some extraordinary way that kings and queens consent to raise people of our standing [plebeians] to their rank.” (Henry 1928:600) I have come across no legendary or historical incidents of an *ari'i*-hood having been conferred upon anyone for such “deeds of valor and heroism,” but I suppose that the possibility did exist.

Another reference to ennoblement is contained in the legend of the Tuna of Lake Vaihiria, in which, it may be recalled, another young “princess” ran away from home to avoid marriage with a giant eel. She finally found refuge with a widowed “woman of the people” and her two handsome sons, and to show her gratitude bestowed upon them “noble” names.

Perhaps the young woman had more than gratitude in mind, for she eventually married first one brother, and then (after the death of the first) the other.

De Bovis asserted that it was impossible for a *ra'atira* to become elevated to *ari'i*-hood, or for an *ari'i* to become a simple *ra'atira*:

He [a *ra'atira*] could, it is true, become Arioi and priest, but he maintained a position proportionately inferior, even though it elevated him substantially, at certain times, not only above his own [class], but even above the class immediately superior. He could also become *teuteu ari'i*, that is servant of an *ari'i*, and thus acquire great importance, but he was never more than a reflection of the power he served: he was able to command some respect and obedience only by acting on behalf of the revered Titleholder [he served]; there lay the limit of his nobleness, and it never went beyond this. (1909:22)

It was however possible, according to de Bovis, for a *manahune* to become a *ra'atira*, "... par un don définitif"; but he did not specify the circumstances in which this took place nor the way in which it was done. A hint of the procedure is found in a missionary journal entry. In 1808, after Pomare II had vanquished the Atehuruans and taken over control of their lands, he made a grant of one portion of it—or rather of this portion's produce—to King George III (as represented by the latter's subjects, the English missionaries, who lost no time in attempting to substantiate the arrangement:

Missionaries resolve to ask Pomare to give them a written statement of the grant of Outu Maro land to K. George, and to ask him whom they should place on the land as tenants, and whether they should make one man a *ratera* or head over the rest.

He [Pomare] advised that we should put in the land some of the poor people that formerly resided there and approved of making one a *ratera* over the rest, but did not name any person, only he intimated it should be some man from among the lower class. (Davies, Journal, 19-20 October 1807, LMS Archives)

Evidently, this usage of *ra'atira* referred to an administrative office, but the episode is nevertheless suggestive of the wider meaning which ought to be attached to the label.

ORIGINS OF CLASS STRATIFICATION

Some theories, including various explanations by the Maohis themselves, have already been touched upon concerning the origin of class differences in ancient Maohi society. (See chap. 16.) The most succinct of these is the one contained in the cosmogonic chant quoted on page 774.

The earliest European to record his own theory about the origin of Maohi classes was J. Forster, whose ponderous prose combined both "evolutionary" and "conquest" explanations:

If several families find the wisdom, experience, valour, and benevolence of one head of a family to be superior to those of the rest, they all look upon him as their common father, they submit to his advice as to injunctions, and

his councils become as sacred and inviolable as laws. This voluntary union into one great family, diffuses through them all that attachment, and benevolence, that spirit of order and regularity, which are the true promoters of morality, and universal happiness. If the son of this chief has skill, address and benevolence enough to tread in his fathers footsteps, he succeeds his father in authority, and thus a society gradually accustom themselves to look upon their chiefs with reverence, and accept the posterity of an equitable, benevolent leader, for their hereditary chief. As all the regulations for the weal of the society are chiefly issued by this ruler, as he is foremost in defending their liberty and property against any daring invader of their common right, as he decides between man and man in private disagreements, and punishes the wanton disturbers of public peace, all the authority of the whole community, centers in him; and as many advantages accrue to him on different occasions and opportunities offer of making acquisitions of property, either by the voluntary, general contributions, of all the inferior members of the community, or by the administration and distribution of the public property and wealth, it may be expected that he will become possessed of a greater share of wealth than any of the rest, which must gradually give him more influence and greater power: his family no doubt participate of this power, influence and wealth, and consequently form a class of people distinct from the commons.

If the society is attacked or injured by another society, and all unite to avert the injuries, to repel violence, and to retaliate upon the invaders and disturbers of the peace, the same wrongs which they intended to inflict; it is natural to suppose, that upon a very great provocation, and a consequently greater exertion of power, they may become victorious, which must, of course, make the condition of the vanquished tribe, inferior to that of the lowest of the victorious community, and create a new rank of people in their society. These seem to be the consequences of matrimonial union, of paternal authority, and the more general authority of a chief of a society, and the origin of ranks in O-Taheitee, the Society, and Friendly Isles. (1778:352-353)

The "conquest" theory was carried even further by de Bovis, who postulated three separate migrations to these Islands. First came the *manahune*, these were later overwhelmed by a wave of *ra'atira*, who in turn were overcome by invading *ari'i*. (1909:20-21)

The most comprehensive "conquest" theory is that of E.S.C. Handy, who epitomized his findings as follows: "... the native civilization of Tahiti at the time of its discovery was the product of the blending of an early tribal culture with that of an invading dynasty whose customs and traditions were of a wholly different order" (1930:7). According to Handy's interpretation the Hui Ari'i were a "maritime dynasty" who descended upon these Islands from the west in the late sixth or early seventh century A.D. They settled first upon Ra'iatea; then, after consolidating their power over the aboriginal, Maohi, population, spread to the other islands and imposed their rule everywhere.²³

I infer that this intermediate class, with land rights of its own, arose through a fusion of followers of the *ari'i* with the earlier population. Followers of the conquering *ari'i* would naturally have intermarried most with members of the families of the superior element of the old population—the *fatu toa* (war lords),

and others; and in the allotting of lands after the conquest, it is fair to assume that the followers of the *ari'i* were rewarded with estates. Thus, I infer, arose these "landed gentry" (*ra'atira*; Marquesan, 'anati'a, Maori, *rangatira*, Hawaiian, *lanakila*). The *ra'atira* owned large and small estates, both by the sea and inland, by right of inheritance. Such right could not be alienated even by the Arii except as a penalty for disregard of certain of the laws of the land, such as the *rahui*, for failure to render tribute or service to the Arii, rebellion, and inhospitality. Even then, according to Ellis ([1831] vol. 3, p. 120), the Arii could not confiscate land but only banish a man and name his successor. At times *ra'atira* would band together to defend the rights of one of their fellows whom they felt to have suffered injustice at the hands of the Arii, and on such occasions they were capable even of resorting to arms. Obviously this class had the power to check their overlord in any move, for the chief could undertake no large enterprise in peace or war without their support. It appears that even conquest of a district by an enemy Arii did not deprive the landed families of their title to land and other hereditary rights, though their members were slaughtered, their plantations destroyed, their pigs stolen, and their buildings and maraes razed. The *ra'atira* had in their service *manahune* who assisted them in planting and other labor. Over their own lands they had the right of *rahui*, a right, however, which the Arii had over them also. The *ra'atira* had their own family marae, for which a member of the family acted as priest, where remains of the dead and other sacred objects were left, and where the family ancestors were worshipped. According to Marau these marae were consecrated by the Arii under whose rule the family lived.

The third great class were the *manahune*, the subjugated and unassimilated bulk of the pre-*ari'i* population of "plebeian Tahiti." The *ari'i* appear to have had little to do with them directly, for to the *ari'i* service was rendered either by *ra'atira* with *manahune* as assistants, by their hereditary servitors (*teuteu*), or by their craftsmen (*tahu'a*). The crude labor in all work was, however, performed by *manahune*. They were the paddlers (*rao*) in the Arii's canoes, and they rendered military service in war time. It must certainly have been the inferior element in the early population that became the servile *manahune*, or serfs, of historic Tahiti, for it is quite beyond the range of possibility that the stock whose virile and independent descendants were the warlike 'enata of the Marquesas and *tangata* of New Zealand, could have been reduced to a condition of servitude. For the "war lords" of old Tahiti it is certain that there were open, when the Arii conquered their country, three alternatives: annihilation, emigration, and assimilation. Undoubtedly large numbers suffered annihilation; others, escaping this and preferring the dangers and hardships of exploration and pioneering, must have taken to the sea in *vaka*—often carrying their women and children with them—becoming the founders of warlike clans in the Marquesas, New Zealand, and elsewhere; while still others, perhaps less independent or more favored by circumstances, remained in Tahiti to play an honorable role under the new regime. (Handy 1930:43-44)

Handy's 1923 enquiries on Maupiti persuaded him that only two classes emerged on this small and isolated island as a result of the imposition of *ari'i* rule over the aboriginals: "The terms *manahune* and *raatira* were practically synonymous, signifying land-owning commoners. The class of *manahune* are spoken of collectively as the *hui raatira* or *taata rii* (little fellows)" (1930:103). Also there were, according to Handy, some distinctive local, Maupitian, usages regarding other class-connected labels:

On this island the term *iatoai* was applied not only to the children of the chief after the first-born (*matahiapo*), and to the first-born before he was consecrated (*faa tahinu*, annointed), but also to the prominent men (*taata rarahi*) of the island, including the war leaders (*aito*), the district subchiefs, and other "folk with mana" (*fei'a mana*), which presumably signifies the *tahua*, or masters of priestcraft and handcraft. In other words, *iatoai*, which was apparently not employed in Raiatea, was used in Maupiti but with a meaning quite different from that given in Tahiti." (1930:102-103)

Hui Ari'i tradition, as interpreted by Handy, Henry, Salmon, and Emory, represents Tahiti and Mo'orea as the last islands to have been occupied by the newcomers.²⁴ Handy's version is as follows:

Through most of Polynesia, war captives, dedicated as sacrifices to the gods, were figuratively referred to as fish. The phrase, "Tahiti, a fish," may therefore originally have meant, "Tahiti, a war prize." Henry gave a record of the conquest of Tahiti by those who in historic times were its overlords, the Hui Arii (group of chiefs). The reference to the separation of Tahiti from Raiatea and Tahaa, in this legend I interpret as a reminiscence, recounting in the figurative fashion typical of the native lore, the separation and departure for Tahiti of a branch of the Hui Arii then already established in control of Raiatea and Tahaa. The mythical "cutting of the sinews" of Tahiti I take to refer to its conquest.

According to the legend:

There was no *hui arii* family upon Tahiti, land of warriors. The warrior lords (*fatu toa*) who owned it and their clans controlled (*tiai*) the land. Because of this it was called Tahiti Manahune (Tahiti of the Plebeians).

This pre-*arii* Tahiti is also referred to as "Great Tahiti of Tu, Tahiti of Oropaa."

The legend under discussion, and the information given by Marau, both indicate that the penetration of the island was through the south and southeast, the most favorable region in which to gain a first foothold. According to Marau the first seat of the Hui Arii was at "Vaiari" (Papeari), the district immediately north of Taravao; while in the legend of "Tahiti the fish" the island is described as being "cut asunder" at Taravao by Tafai. Thus, according to the legend, were formed the inner Teva and the outer Teva, the two great divisions of southeast and south Tahiti. (The Teva originated six generations after the first *arii* of Tahiti according to Marau.) "So the cutting of the sinews of the fish was completed, and the land of Great Tahiti became stable."

It is noteworthy that in the chant no other section of Tahiti except that of the Teva is mentioned at this time.

The chant goes on to draw the picture of the penetration of the island by the new dynasty:

After the separation of Tahiti from Hawaii (Raiatea) came the gods of this land to goddess Tahiti-nui.... Swept over the bluffs of Taiarapu, the gods descended upon the left cheek of the fish. Then the people were terror stricken and fled from their presence.

Upon the winds did the gods fly to Tahiti.

The people fled away with terror

Into caves and ravines

Of the mountainous land,

And upon the mountain peaks ...

....

A dreaded rule was that of the gods with no interpreter!

....

The gods said:

'Give us

The heads of warrior men.'

And the people answered:

'We shall not go thither,

We are in dread of the reign of the gods!'

It is interesting to note that the gods were calling for heads, but not human sacrifices. These, I believe, belong to the later Taputapuatean phase.

The chant describes the penetration through the south.

Little Tahiti (Tahiti-iti, the southern peninsula), first alighted on by the gods,

Land upon which settled the *arii* Raapoto,

While Great Tahiti (North Tahiti) had no gods.

Aimeo (Moorea), the bed of peace for the warriors when closely pursued in Great Tahiti.

The gods descended into the great valley and upon the plains of Tautira, but the people approached them not; then they gradually dispersed and settled throughout the land of Great Tahiti, and the people of Tautira returned to their valley, having no more fear.

Soon the people of the long upper border (Tahiti and Moorea) erected temples and dedicated them to the gods....

Taaroa, with his artizan, Tu, and Tane, god of beauty, reigned supreme over all the earth at that time; they were above all the hosts of gods throughout the islands. Taaroa gave Tane his great power.

In other words, after the conquest of the country, Tu and Tane, gods of the ancient Tahitians, were recognized by the conquerors in the new regime established by the Hui Arii, as has ever been the case with the gods of conquered peoples. By recognizing him, Taaroa "gave Tane his great power." If, as seems certain, the Hui Arii contingent intermarried with the local chieftery, this acceptance of the gods of the land would have been inevitable. (Handy 1930:15-17)

According to this reconstruction, in due course many of the indigenous chieftains of Tahiti and Mo'orea married into *ari'i* families and thereby established local *ari'i* dynasties, which become "enriched" from time to time by new marriages with *ari'i* from Opoa itself.

The "conquest" theory of Maohi class formation has been widely influential among ethnologists, but it has also elicited some sharp opposition. Piddington, for example, stated:

There seems no reason to split up the culture of the Society Islands into that of the original inhabitants (surviving as the *manahune*) and a subsequent band of *arii* conquerors. Probably the "conquests" of Polynesian history usually occurred mainly between Islands of the same group, or within the individual islands, that is, conquerors and conquered possessed very much the same type of cultural organization. Of course, the fortunes of war produced a re-arrangement of groups

within this organization, for example in regard to land tenure and social status, but it seems probable that the forms of organization themselves were the product of the operation of internal factors.... (Williamson 1939:226)²⁵

Both Sahlins (1958) and Goldman (1960) also rejected the *ari'i*-conquest theory and explained Maohi class stratification as resulting from the operation of "internal" factors: Sahlins in terms of ecology as manifested in surplus food production, and Goldman in terms of "status rivalry." Because of the wide ramifications of these two important studies, I postpone a consideration of them to chapter 24, where I shall also give my own views concerning the origins of Maohi marriage classes.

ATTRIBUTES OF CLASS

I turn now to consideration of the attributes which were regarded as distinctive, more or less, of persons belonging to each marriage class; such attributes include characteristics of physique, of "psyche," occupations and preoccupations, privileges and restrictions, the special labels attached to each, and their actions.²⁶

Several observers were struck by the relatively larger size of most *ari'i*, both male and female,²⁷ although exceptions were noted in both highest and lowest classes. Some observers attributed this to differences in race (e.g., J. Forster 1778:229, 263-264, 358-359), but most concluded that these dissimilarities were due to the better diets and less trying occupations of the *ari'i*. In addition, Morrison (in a passage previously quoted) attributed some of the dissimilarity specifically to the greater length of time that upper-class children were subject to restrictions preceding the performance of their head freeing rites: "... [this custom] may in some measure account for the difference in stature between the Higher and lower Classes of People—the latter Class having sooner their liberty have earlier Connections with each other than the Higher and the Chiefs in particular are Mostly arrived at years of Maturity and Manhood before they Cohabit with their Weomen." (1935:187-188)

The most comprehensive explanation for the observed class differences in physique was offered by Ellis:

It is a singular fact in the physiology of the inhabitants of this part of the world, that the chiefs, and persons of hereditary rank and influence in the islands, are, almost without exception, as much superior to the peasantry or common people, in stateliness, dignified deportment, and physical strength, as they are in rank and circumstances; although they are not elected to their station on account of their personal endowments, but derive their rank and elevation from their ancestry. This is the case with most of the groups of the Pacific, but peculiarly so in Tahiti and the adjacent isles. The father of the late king was six feet four inches high; Pomare was six feet two. The present king of Raiatea is equally tall. Mahine, the king of Huahine, but for the effects of age, would appear little inferior. Their limbs are generally well formed, and the whole figure proportioned

to their height; which renders the difference between the rulers and their subjects so striking, that some have supposed they were a distinct race, the descendants of a superior people, who at a remote period had conquered the aborigines, and perpetuated their supremacy. It does not, however, appear necessary, in accounting for the fact, to resort to such a supposition; different treatment in infancy, superior food, and distinct habits of life, are quite sufficient. (1829 II:16-17)

Ari'i women were also noted as having been lighter than others in skin color, but this was attributed to their greater freedom from work requiring long exposure in the sun, and to deliberate efforts made to bleach their skins. With males, however, this difference seems not to have prevailed, or, at least, it was not deliberately striven for—except on certain occasions (see chap. 13).

Darkness of colour was generally considered an indication of strength; and fairness of complexion, the contrary. Hence, the men were not solicitous either to cover their persons, or avoid the sun's rays, from any apprehension of the effect it would produce on the skin. When they searched the field of battle for the bones of the slain, to use them in the manufacture of chisels, gimlets, or fish-hooks, they always selected those whose skins were dark, as they supposed their bones were strongest. When I have seen the natives looking at a very dark man, I have sometimes heard them say, "*Taata ra e, te ereere! ivi maitai tona:*" The man, how dark! good bones are his. A fair complexion was not an object of admiration or desire. They never considered the fairest European countenance seen among them, handsomer than their own; and sometimes, when a fine, tall, well-formed, and personable man has landed from a ship, they have remarked as he passed along, "A fine man that, if he were but a native." They formerly supposed the white colour of the European's skin to be the effect of illness, and hence beheld it with pity. (Ellis 1829:II, 18-19)

In the legend of Huriitemonoi, reproduced earlier, more fragrant body odor was attributed to *ari'i* females. It will be recalled, the princess' faithless maidservant had to bathe in a "royal" pool and anoint herself with her mistress' sweet-scented oil to dispel her "plebian odor," and even then it returned to bear witness to her imposture (Henry 1928:608-611).²⁸

Reference has been made in previous chapters to the relatively greater *mana* (power, influence) allegedly attributed to holders of high-ranking kin-Titles, especially those designated as *ari'i*. If one accepts the view of some writers that *mana* figured in (or derived from) the "purity of line" rationale for class-defining marriage proscriptions, it then follows that all members of the *ari'i* class had more *mana* than *ra'atira* had, and the latter had more than *manahune* had—although, as noted earlier, I am not certain just what this signifies over and beyond the obvious attribution of political power and influence, which seems to have been one, but not the only, ingredient of the Maohi concept of *mana*. Another point of uncertainty has to do with the locus of *mana* of Titleholding *ari'i*: Does it attach to the kin-Title itself or to *ari'i*-class members (as such), or to both? But again, it is of course quite possible that the distinction I draw had no parallel in Maohi thought.

Reference has also been made to the sacredness (*ra'a/mo'a*) of some *ari'i*: presumably those holding kin-Titles deriving from divine forebears, and possibly some others as well. For example: "Everyone is to treat with respect the *ari'i*, his descendants and his family; let the *ari'i* be divinely sacred [*mo'a*]: he is of divine descent [*e hua'ai 'oia na te atua*]" (E. Salmon 1937:29). But sacredness as such was of course not limited to such officials; even some *manahune* were (or could become) sacred in some respects. The question is, Were *ari'i*-class men, as such, eligible for more sacredness than lower-class men? I suppose that the answer is yes; but I have come across no Maohi formulation to that effect. As noted earlier, the disease *o'ovi ari'i* (chiefs' leprosy) was believed to have resulted when an individual desecrated certain marae—presumably those associated with "chiefs," but the mechanics of this effect are not specified (Henry 1928:149).

Most of the cosmogonic myths, genealogies, dynastic traditions, and lengthy legends that have been conserved for us were recorded from the lips of persons mainly of *ari'i*-class affiliation. Moreover, the only record that exists of organized schooling in such matters involved children of *ari'i*, *tamari'i a te hui ari'i* (Henry 1928:75)—which should occasion no surprise, inasmuch as such persons were the principal ones to benefit from the preservation of these kinds of lore.

On the other hand the priestly profession was not monopolized by the *ari'i*:

The Priests are of two Classes and are formed out of all ranks of People according to the Ability they Possess. They are the only People who have any knowledge and it is their business to keep the lower Classes in Ignorance; tho some are of the lowest Class themselves yet they gain Esteem according to their knowledge, or rather from their being lucky in the business they profess.

The first of These are Calld Tahowwa Morai and their business is to make the offerings at the Morai and have the Charge of the Holy place; their prayers or Hymns they Chant out in an unknown tongue which the Natives or at least such as are not of their profession do not understand nor do many of the Chiefs, tho they are all considered as Priests and they seldom Officiate but on particular occasions when they are forced to assist for want of others, but as they are Plenty they are seldom under such Necessity.

The others are Calld Tawra tooa and pretend to Devine Inspiration, and are Consulted on all Occasions, whether in War, Sickness or otherwise and through them the Will and Pleasure of the Deity is known; few of them pretend to be inspired by the same Deity and those who claim the Superior ones are Men of Great Art and address, and from their Skill in their Art make themselves of great Consequence. They never attempt to apply to their Deity, but when a Chief is taken sick, or to know the event of any War which they may have in hand and as they are well acquainted with most of the Circumstances before they begin they Can tell events of this kind to a Certainty. If their skill proves ineffectual in sickness they never fail to accuse the Friends and relations of the sick for their want of Relegion and Neglect of their Duty in the performance of it, but should he recover while under their care their

Charracter is firmly establishd, and tho' of the lowest Class become the Bosom friends of the Chief or Party in whose behalf they used their skill, and are sent for on all Occasions and Carress'd, even tho their skill should afterwards fail. (Morrison 1935:180-181)

In addition, there were several other vocations and avocations, requiring what Westerners would label "intelligence," that lower-class persons could and did make their marks in. Indeed, there is no evidence that the Maohis themselves considered wisdom and knowledge (*'atama, pa'ari*) to be limited by boundaries of class. When Bligh agreed to take one of his *ari'i* friend's servants back to England, he justified his choice as follows: "He is a Servant, and therefore a more elligible person for the purpose of learning than if he had been a Chief Such a towtow [*teuteu*] is more likely to benefit his Country than a Chief who would be only led into Idleness and Dissipation as soon as he arrived in Europe...." (1792:172) J. Forster accused "those in power" of utter laziness (1778:231), and Mühlmann asserted that the *ari'i* devalued manual work in gardens (1955:137). Forster, however, based his charge mainly on the observation that some upper-class persons were fed by others—which, as we have seen, was done for reasons of ritual restriction and not from indolence. As for Mühlmann, it may well have been that much of the manual labor for *ari'i* households was done by servants and other lower-class persons; on the other hand, there are accounts of *ari'i* men, including an *ari'i rahi*, joining with others in tasks involving vigorous manual labor. And *ari'i* women, like all other women, not only engaged in making bark cloth, but they took pains to excel in this laborious occupation:

They [*ari'i*] have in General a more serious and thoughtful turn and are more accomplished, they are always superior to them at all things either Labour or diversion, and the Earee weomen are by far the Best Clothmakers; in labour they are always first, it being no disgrace to know how, but a great one not to know how—and they always bear a part in the Cooking Provisions for their Guests. (Morrison 1935:169)

But there can be little doubt that members of the *ari'i* class devoted less time to subsistence activities than did their class inferiors, and this gave them more time for idle and play, at which they excelled: "The Chiefs are in general best at [surfing] as well as all other Diversions, nor are their Weomen behind hand at it. Eddea [*'Itia*, wife of Pomare I] is one of the Best among the Society Islands & able to hold it with the Best of the Men Swimmers." (Morrison 1935:227.) This same wife of Pomare I also excelled at wrestling: "At this Sport Eddea and her Sister are always first [among women wrestlers], and often come off with Victory and Eddia always directs the Ceremony & fixes the Number of falls that must be Wrestled" (Morrison 1935:222).

One sport, archery, was reserved mainly for the upper classes.²⁹ As

described earlier, it was carried out with elaborate ceremony and solemn consecration. Morrison interpreted its restriction to "those of rank" as due to the costliness of the sport's paraphernalia; that may have been a contributing factor to the restriction at one time but was not likely to have been the main reason for its continuance.

Mühlmann proposed an association between dance style and class:

Dances of an erotic character were engaged in by commoners and by members of the lower grades of the Arioi sect, whereas the more refined costume dances (and dramatic performances) were traditionally engaged in by members of the nobility (*Fürstenfamilien*), from which the members of the upper Arioi grades originated" (1955:189).

While it is true that upper-class maidens did take part in "the more refined" costume dances and dramas, and perhaps even to a more than proportionate degree (they probably had more opportunities for learning and practicing, and could better afford the costly costumes), they were not the only ones to do so. Moreover, some of these "refined" costume dances were not without eroticism. Banks, after describing the elaborate costumes of one such performance, wrote as follows:

In this dress they advanced sideways keeping excellent time to the drums which beat brisk and loud; they soon began to shake their hips giving the folds of cloth that lay upon them a very quick motion which was continued during the whole dance, they sometimes standing, sometimes sitting and sometimes resting on their knees and elbows and generally moving their fingers with a quickness scarce to be imagined. The chief entertainment of the spectators seemed however to arise from the Lascivious motions they often made use of which were highly so, more indeed than I shall attempt to describe. (Beaglehole 1962:I, 325-326)

Traits of personality and character valued generally throughout the society were said to have been especially evident among *ari'i*. Morrison said of them that "their only pride is Cleanliness and Generosity for which they are remarkable, and I may say they have no equals in these points" (1935:169). In the legend of Huriitemonoi, already cited, the true "princess" manifested her superior status, against the pretensions of her plebian-smelling, socially awkward maidservant, through her poise, beauty, and courtliness. "This one is a *true arii*," her hosts said of her, after comparing her appearance and behavior with her rival's (Henry 1928:614). Again, in the legend of Tuihiti and Hauvana'a, the young *ari'i* bride, who elected to follow her husband back to his distant homeland against the entreaties of her parents, was finally told by her father (in what can be taken as a mixture of pride and regret): "Go. You have a *royal will* [*mārō ari'i*]; you cannot be persuaded to stay." (Henry 1928:470)

Against these native assessments of *ari'i* character, one will recall the opinions of explorers and missionaries, including Ellis' approval of the

ra'atira, whom he described as being, "more regular, temperate, and industrious in their habits" (1829:II, 344).

The division of society into classes was also manifested in certain other labels and verbal expressions: for example, *tetua*, a girl or young woman; a title given to those of the chief families (LMS Dictionary). *Ari'i* were said to glide (*he'e*) or fly (*fana*), whereas others only walk (*haere*). Similar differences were expressed in greetings, and in references to death:

Maeva te arii: hail to the chief!

Ho mai, e haere mai: give way, come hither (to *ra'atira*, landowners).

A pae a'e i o: just to one side, just this way (to *manahune*).

Ua mate te arii: the chief is dead.

Ua mairi roa te tavana: the administrator is dead.

Ua pohe roa te manahune, e te puaa: the commoner, or pig, is dead.

(Handy 1930:38)

In addition to these general class-associated expressions there were many other euphemisms applied specifically to *ari'i* tribal chieftains (see chap. 23).

Class differences in clothing, in ornamentation, and in tattooing were referred to in chapter 6, however, I have found no evidence of any special sanctions serving to enforce such distinctions. I have also described in other contexts the greater degree of elaboration which characterized life crises rites of high-ranking kin-Titleholders, and I suppose that such differences accompanied class stratification in general.³⁰ In this connection, I recall a particularly suggestive observation of Morrison's referring to head-freeing rites:

Some of the Weomen are 16 or seventeen Years old before all their rites are performed, which makes them very cautious what house they go into or what things they touch—but the Men are Generally Made free as fast as the father can get it done which is sometimes by Six Years old and sometimes not till twelve; the Children of People of rank are generally longer before they have all their rites performed, then the lower sort as it has a Grander appearance by being long about & they always make large Feasts on these Occasions. (1935:187)

Class distinctions showed up most explicitly in connection with consumption rights. Most of the information on this subject relates only to *ari'i* privileges, so I cannot say whether in some instances the distinction was between *ari'i* and all other persons or was graded still further between *ra'atira* and *manahune*. Marau's "breadfruit" aphorism, quoted earlier, indicates a more comprehensive differentiation of consumption rights, but most of the sources tell only what "the principal people" could lay claim to.

In terms of food, the following observations are found in the sources; the first is probably an overstatement:

Those who fare best are the Caciques and headmen, for they possess pigs of

fair size, and also fowls; because (although we saw none) those who went round the island in the launch heard hens and cocks crow on two mornings, and they (the Chiefs) told us so too. Thus it is that the *arii* or Caciques are all stout, some of them to ungainliness, so that they have two Indians constantly kneading their legs and even then are scarcely able to stand upright.

The common people frequently suffer a dearth of food, and most of them support themselves on cockles, and some fish which they eat raw. The good and finer fish, of which there is great plenty in the sea, are (reserved) for the *arii* and principal persons. (Corney 1915:55)

Of animal food, a very small portion falls, at any time, to the share of the lower class of people; and then it is either fish, sea-eggs, or other marine productions; for they seldom or ever eat pork. The *Eree de hoi* alone, is able to furnish pork every day; and inferior Chiefs, according to their riches, once a week, fortnight, or month. Sometimes, they are not even allowed that; for, when the island is impoverished by war, or other causes, the Chief prohibits his subjects to kill any hogs; and this prohibition, we were told, is in force, sometimes, for several months, or even for a year or two. (Cook 1784:154)

The following precept is also relevant here, but is somewhat puzzling: "Let not one single thing which has been restricted for the *ari'i* alone be eaten. Like the Tortoise, the Cavally, and the larger fish of the sea and the lagoon, breast of pork and the (*popo'uru?*) of pork, and the new fruits of the land, these are all reserved foods, foods set aside. (E. Salmon 1937:31)

The question is, Were these food items restricted to each tribe's sovereign chieftain alone (as the precept appears to imply) or to all (male) *ari'i* class members (as certain other evidence seems to suggest)? The evidence is ambiguous in another respect on the matter of who ate turtle meat. The precept just quoted indicates that this delicacy was restricted to *ari'i*—either the *Ari'i* of a tribe, or all male members of the *ari'i* class. On the other hand, Ellis wrote that "This fish was formerly considered sacred, and was cooked within the precincts of the temple, part being offered to the gods, and the remainder eaten only by sacred persons." To this statement about pre-Christian times Ellis added, "It [turtle meat] is now [the 1820s] eaten indifferently by any one, though most of those caught by the people are taken as presents to the chiefs" (1829:II, 285).

G. Forster, in describing a meal provided for himself and his shipmates, related that when he and his companions passed out pork to the crowd of begging commoners who surrounded the dining Europeans and "Chiefs," the latter evidently disapproved of this generosity: "The eagerness with which [the commoners] repeated their importunities, as well as the envious looks of the chiefs, whenever we granted the request, convinced us, that the commonalty were in this island deprived of all sorts of luxuries and dainties" (1777:I, 405).

Ari'i undoubtedly had access to more food delicacies than other persons, and the excessively corpulent people noted in some of the sources

were in the main members of the *ari'i* class. For example, "The great profusion, and variety of choice fruit, delicious fish, and fine pork and dogs flesh, has likewise occasioned in the idle men belonging to the race of arees, a propensity to indulge themselves in the pleasures of the table beyond what is usual" (J. Forster 1778:414). But there were no restrictions that I know of which limited vegetable food consumption to them. In fact, in describing the seasonal custom of "breadfruit gluttony" Morrison commented:

The poorer people are not excluded from this Method of Feasting their Children tho they have not sufficient Bread for the Purpose, having nothing more to do but signify their intention to their Neighbours, who bring their proportions of Bread and Assist them to Collect Wood and Make their Oven; somtimes they Join two familys making one oven between them. (1935:214)

Kava was not proscribed for lower-class persons, but its relative scarcity probably had the practical effect of restricting heavy use of it to the more affluent *ra'atira* and *ari'i*. According to Morrison: "It [kava] is Common to all but is more used by the Chiefs & their Familys, Servants &c then by the common people. They prefer the method of Chewing it to any Other—it is in much request among people of rank but even some of them never tast it." (1935:151) Moreover, even in connection with general imbibing those of the superior class appear to have gotten the best of the brew:

This Ava is made from a Strong pungent Root which few Cheifs ever go without, it is chewed by their Servants in large mouthfulls at a time, which when it has collected a sufficiency of Saliva is taken and put into a Cocoa Nut Shell. This is repeated untill there is enough chewed, it is then squeezed and given to the principall Men, each of them taking nearly a pint wine measure. What remains is mixt with water and again squeezed and Strained, it is then delivered to the inferior Cheifs, or those of the highest class if they prefer it diluted, and it frequently undergoes a second and third mixture if there is not enough to supply every one. (Bligh 1789:382)³¹

In this connection, the Reverend Orsmond, writing in 1826, complained that religion in Tahiti "is too much an instrument of state and I had great opposition because I receive a few people of common rank [*sic*] to the Lord's Supper before the Royal Family" (Orsmond, Journal, 20 December 1826, LMS Archives).

Among those few European visitors who commented on the matter of shelter there was agreement that the dwellings of the "principal people" were somewhat larger and perhaps better constructed than those of other folk—but not outstandingly so. That is to say, these differences were of smaller magnitude than the observers might have expected, given the wide differences between "chiefs" and others that prevailed in terms, say, of ceremonial precedence or of food consumption rights. These domiciliary differences were also apparent in architectural style, according to Turnbull, who wrote that "The houses of the royal family and great chief

bear a near resemblance to an English cart-shed; they are usually of an oval shape, ..." (1813:355; also chap. 7, this work). However I suspect that such style differences are to be correlated more with size of building than with any normative connection with class.

As for class differences in the location of dwellings, I have, in the section on *manahune*, offered my opinion of the meaning to be assigned to the well-known cosmogonic formula regarding each class' domain.

A sharper class distinction appears to have been expressed in connection with boats:

The Chiefs and better sort of people generally go from one place of the Island to a nother in small double Canoes which carry a little moveable house.... (Beagle-hole 1955:I, 131)

On the top of [the stern of traveling canoes] are placed pieces of rude Carved Work of a Cilindrical form of two or three feet high; they are hollow and the Open work represents rude figures of Men Supporting each other on their hands forming several Teirs and have some resemblance of an old round tower; the size of these denote the quality of the Owners. (Morrison 1935:202)

I cannot be certain whom Morrison intended to include among his "Owners of quality," although I suppose he was referring at least to *ari'i*.

Class distinctions per se seem not to have been the most telling criteria for access to esoteric information, but when missionaries began to propound their new doctrines to mixed-class audiences they recorded that some of those present: "... put very pertinent questions; among others, doubting whether we would bestow aught that could be esteemed a benefit equally on all. They asked, whether the message of the British God was to the *toūtous* as well as to the king and chiefs?" (Wilson 1799:70; see also William Henry, Journal, 12 March 1797, LMS Archives)

The only evidence I have discovered that might be interpreted as constituting class differences in objects of worship is a tantalizingly brief and somewhat ambiguous passage in one of Cook's journals:

Soon after we had dined [ashore, on Ra'iatea] we set out for the Ship with the other Pig and a few races of Plantans which proved the sum total of our great expectations. Poor Odiddy had drank a little too freely either of the juice of peper or our Grog or both and was brought into the boat dead drunk. In our return to the Ship we put a Shore at a place where in a House we Saw four wooden Images standing upon a shelf each about 2 feet in length, they had Turbands about their heads in which were stuck some long feathers. A person in the house told us they were Fatua's no te Tou tou, that is the gods of the Common people, but this is by no means Sufficient to conclude that they worship them as such or that the Servants or Slaves are not allow'd the same Gods as those of a more elevated rank. I never heard that Tupia made any such distinction, besides these were the first wooden gods we had seen in any of the isles and all the authority we had of their being such was the bare word of, perhaps, a Superstitious person.^[32] (Beaglehole 1961:423-424)

Finally, in regard to privileges after death, it will be recalled that the sources are not in entire agreement concerning the kinds of persons and the kinds of behavior rewarded in afterlife, but by almost any criterion *ari'i* fared better than others.

They believe in a heaven and a hell, the first they call *Tairua l'orai* the other *Tiahoboo*. Heaven they describe as a place of Great happiness and hell is only a place enjoying less of the luxuries of life; to this they say that the souls of the inferior people go after death and those of the chiefs and rich men to the other. This is one of the strongest instances to shew that their religion is totally independent of Morality: no actions regarding their neighbours are supposed to come at all under the Cognizance of the Deity, a humble regard only is to be shewn him and his assistance asked on all occasions with much Ceremony and some sacrifice, from whence are derivd the Perquisites of the Preists. (Beaglehole 1962:I, 381)

These honours and gratifications were only for the privileged orders, the Areois, and the chiefs, who could afford to pay the priests for the passport thither: the charges were so great, that the common people seldom or never thought of attempting to procure it for their relatives; besides, it is probable that the high distinction kept up between the chiefs and people here, would be expected to exist in a future state, and to exclude every individual of the lower ranks, from the society of his superiors.

Those who had been kings or Areois in this world, were the same there for ever. They were supposed to be employed in a succession of amusements and indulgences similar to those to which they had been addicted on earth, often perpetrating the most unnatural crimes, which their tutelar gods were represented as sanctioning by their own example. (Ellis 1829:I, 327–328)³³

CLASS-BASED PATTERNS OF INTERACTION

I will now consider evidence bearing on interaction between persons as members of different marriage classes, with the observation, however, that it is largely impracticable to separate behavior referable to this kind of role from that of other role sets—from, say, interaction between a kin-congregation chief and a very junior consanguine, or between mistress and servant.

Terminology. Terms of reference for class membership have already been discussed. The extent to which *ari'i*, *ra'atira*, and *manahune* were also used for direct address is not reported, except for indications that *manahune* figured sometimes as an insult. For example, the political enemies of the Pomares used to point out that one of the line's ancestors was named Ta'arua-Manahune, in reference to his Tuamotuan, non-*ari'i* paternal forebears (Handy 1930:76). Also, when occasion demanded, Ra'iateans had a stock phrase for natives of Tahiti (and Mo'orea), calling them, "our fish, Tahiti torn-away; Tahiti-Manahune" (Henry 1928:436).³⁴

Time. According to Handy, *ari'i* had little to do directly with *manahune* (except servants): "for to the *ari'i* service was rendered either by *ra'atira*

with *manahune* as assistants, by their hereditary servitors (*teuteu*), or by their craftsmen (*tahu'a*)" (Handy 1930:43). On the other hand, Handy added that *manahune* did serve *ari'i* as paddlers (*rao*) in their canoes. Such may indeed have been the case, although the generalization is obviously based on inference and not on reports of direct observation or on any explicitly formulated norms. But see the following observation by Bligh: "Tynah [Tina—i.e., Pomare I, Ari'i Rahi of Pare-Arue] had a Visit to day from some of Tiarraboo People—they were of no consequence with respect to Rank, as is common, however, he found himself engaged for the day to direct proper supplies, and to amuse them" (1792:161).

Morrison reported that dancing was a leveler of "wealth," and perhaps, inferentially, of class as well: "Another Dance is the Ponnara which is performed almost evry evening in evry district through the Island. To this Dance the Weomen of evry age and discription resort to dance; young & old, Rich and Poor mix promiscuously, but no Men Join with them." (1935:225)

Space. The sources contain many statements regarding restrictions on direct or indirect physical contact between "chiefs" and other persons—for example, a low-class female's house was forever after interdicted to her after a "chief" had once entered it (Morrison 1935:168); a male commoner was prohibited from storing the fishnet of an *ari'i* in his own dwelling, which was a *fare noa* (Corney 1919:115); the commoner maid who attempted to usurp her *ari'i* mistress' role (in the legend of Huriitemonoi) was so thoroughly conditioned to her real class status that she was unable to walk upon the "royal" mats laid out for her (Henry 1928:612).³⁵ However, most of these incidents appear to refer to *ari'i* who were at the time tribal sovereigns rather than to members of the *ari'i* class in general. Notwithstanding, I suppose that some of the insulation surrounding the former was applicable to the latter as well.

In addition to such restrictions regarding spatial distance, it may be assumed that there prevailed some interclass norms relating to spatial arrangement, such as the rule against stepping over an *ari'i*, or passing something over his head. My favorite passage dealing with such matters comes from the journal of Tyerman and Bennet (which, incidentally, reveals as much about these worthies as it does about the Maohis themselves):

We also observe, with great satisfaction, that Christianity, so far from destroying those distinctions in social life, which a wise Providence has made so necessary to human happiness, that no barbarians are entirely without them, has both sanctioned and sanctified them here. The kings and chiefs were never held in higher esteem by their subjects and dependants than they are now; nor are the gradations of rank in any part of Europe more easily recognized than in these uttermost parts of the sea. High birth is observable, not only in the countenances, speech, and personal carriage of the *magnates*, but even in the manner,

or rather the order, in which they walk. Though a causeway has been made from the houses of the missionaries to the chapel, protected by cocoa-nut trees, laid along the sides, the middle part being covered with pebbles, and wide enough for several persons to walk abreast; yet the people continue one to follow another in line, as formerly, in the narrow tracks. If both be of the same rank, the wife comes after the husband; but if the wife be a woman of rank, and the husband of an inferior class, she goes first, and he, without ever imagining himself degraded, treads in her steps. (Montgomery 1832:I, 149)

Located as these islands were, along a roughly east-west axis, upwind-downwind were associated with sunrise-sunset, respectively; and a passage from Henry indicates that (for the residents of Tahiti, at least) these direction markers were metaphorically linked with differences in social status. Henry's text consists of a formal verbal exchange between Ra'iateans and Tahitians; after the former belittle the latter as being "commoners" (*manahune*) and people of generally unpleasant manners, the latter retorted as follows:

"Eaha ho'i to Tahiti e 'ino ai ai Ra'iatea? E topara'a mahana ho'i e te avae na matou o Ra'iatea. E fari'i pehu ho'i na matou o Ra'iatea. E hiti mai te mahana i Tahiti nei, e ma'iri atu i Ra'iatea na; e pai'uma te avae i Tahiti nei e ma'iri atu i raro na. Na te hiti'a-o-te-râ nei te 'otaha te ma'ue i te po'ipo'i, e ei Ra'iatea na i te ahiahi fa'atopa 'tu ai i to ratou huruhuru, e ho'i noa mai ai i Tahiti nei. O Tahiti o Hiti-ni'a, o Ra'iatea o Hiti-raro.

O raro ho'i outou i tō'o'a na, o ni'a matou i te hiti'a o te râ nei. Ia tae mai to Ra'iatea i Tahiti nei, te parau ra e te fa'atere nei i ni'a, e o ni'a mau à ia. Ia ho'i atu rà ratou i Ra'iatea, e na'o ia e, te fa'atere nei i raro, e o raro iho à ho'i o Ra'iatea no Tahiti."

"How can Tahiti be underrated by Ra'iatea? The setting place of our sun and moon is Ra'iatea. The recipient of our rubbish is Ra'iatea. The sun rises over Tahiti, and sets over Ra'iatea; the moon ascends over Tahiti and sets down there. The man-of-war-bird flies from the east here in the morning, and arrives at Ra'iatea to drop its feathers in the evening, and return free to Tahiti. Tahiti is Hiti-ni'a (Upper-border), Ra'iatea is Hiti-raro (Lower-border).

You are indeed below in the west, and we are above in the east here. When Ra'iateans come to Tahiti, they say they are sailing up, and it is really up. But when they return to Ra'iatea, they say they are sailing down, and Ra'iatea is really down from Tahiti." And so the dispute ended.

(1928:436)

Ideologically the seaward-landward contrast also had implications for class stratification, as expressed in the following excerpt, which though quoted previously is important enough to repeat:

The long capes were the inheritance of royalty and the nobility [*hui ari'i*]; there stood the great temples of the land which could not be hidden. Deep bays were the inheritance of the gentry [*hui ra'atira*]. As the land got thickly populated, the people spread everywhere. On the seashore and inland were the lands of the plebeians [*ta'ata ri'i*] bordering on the lands of the great. (Henry 1928:403)³⁶

Front-back (*mua-muri*) also contained implications of social status—for example in any aggregation involving men and women, men were positioned *mua* and women *muri*; and in formal assemblies of men those holding higher-ranking kin-Titles or those otherwise playing more important roles

sat *mua*. It is probably no mere coincidence that *mua-muri* also refers to temporal sequence of events in this society, where greater privilege attaches to firstborns, and where greater antiquity means closer identity with ancestral or creator deities.

There seems also to have been a general rule to the effect that persons should not stand or sit in places above (*i ni'a*) those holding higher-ranking kin-Titles, but this did not result in the extreme forms of obeisance which prevailed in some other Polynesian societies (for example, Tonga and Hawaii). In addition, there is some suggestion that the various "levels" of the sky were ranked in ascending order, through identification with hierarchically "higher" deities. It might also be argued that the very high headgear worn by some leaders in warfare was, among other things, directly emblematic of social height; such headgear certainly was not very well adapted to the business of fighting.

Governance. Especially with respect to this interaction dimension is it difficult to decide whether the sources refer to *ari'i* tribal sovereigns or to *ari'i*-class members in general when they refer to "chiefs," or to the "principal people." Undoubtedly, other things being equal, more weight was accorded decisions or commands made by *ari'i*-class members than those coming from *ra'atira* or *manahune* classes, but that ponderous banality is based on inference rather than direct report. It is only in regard to courtship that the sources are explicit on this point: "In those unsophisticated times," said the narrator of the legend of Pereitai, "the lady felt as free to make advances in love matters as the lover, and the princess could command in wooing a man of inferior rank to herself" (Henry 1928:597).

Transaction. *Ari'i* tribal sovereigns had the coercive power to levy taxes of their subjects, and to confiscate the latter's goods with or without cause. Also, it is safe to infer that most *ari'i*-class members were more privileged than were lower-class persons to call on a neighbor for services or objects.

Reversing the direction, several writers characterized *ari'i* as generous and hospitable (Morrison 1935:169; Handy 1930:41), but it is not clear whether this referred to *ari'i* in general, or only to *ari'i* tribal sovereigns. Nor is it clear whether such generosity was extended to members of all classes, or only to other *ari'i*. In support of the second interpretation, Morrison indicated that it was customary for travelers to be entertained by members of their own class. But he added:

If any person of whatever Class he may be should be travelling by land and Meets None who Invite him or should happen to be unacquainted in the District he is passing through and has occasion for provisions, he enquires the Name of the first Raturra and repairs to his house—on his entering he receives the usual Compliments and having made known his business, the Master of the House Im-

mediately orders provisions to be got ready for him, and the Mistress entertains his Wife in the same Manner & they enjoy a secret pleasure at having had the good fortune to have the Strangers come to their House and they are for ever after deemed friends tho they had never seen each other. (1935:190)

Balancing these two flows of goods, from and to *ari'i*, we are left with the impression that members of the *ari'i* class fared better than their class inferiors, both in terms of expressed norms and in fact; but I must emphasize that I am dealing here mainly with inference.

Emotion. Again, I infer that lower-class persons behaved "respectfully" toward their class superiors, but my inference rests mainly on reports of behavior toward *ari'i* kin-congregation chiefs or tribal sovereigns and not on prescriptions or observations about class members in general. We are informed that on occasion "chiefs" mixed with commoners, but formal friendship appears to have been kept mainly within class bounds.³⁷ Missionary Elder reported: "Otu [Tu, or Pomare II] asked for the welfare of his Majesty King George, and if he is an old man. He also asked our names and occupations, and said that all of us should be his friends [possibly *taio*], but that we must not be friends with any of the Common People." (Elder to Waugh, Tahiti, 23 July 1801, LMS Archives) Morrison also reported that "If any Person speaks disrespectfully of a Chief he is sure to suffer death." But disrespect was not easily tolerated by class equals either: "... should one Chief speak ill of another it would instantly bring on a War and this has been the occasion of several bloody battles" (1935:169).

On the other hand, there prevailed among "chiefs" a code of chivalry which went even further than the most magnanimous medieval specimen of which we know. The episode in question is a legendary account contained in Adams. It is long and involved, but since it refers to customs that I shall speak of in the next chapter I reproduce it in full, with all the noted historian's asides, and despite the liberties obviously taken by him with his informant's narrative:

About the year 1650, Tavi was chief of Tautira, and prided himself on being as generous as he was strong. All chiefs were obliged to be generous, or they lost the respect and regard of their people; but Tavi was the most generous of all the chiefs of Tahiti. He had a wife, Taurua of Hitiaa, the most beautiful woman of her time, and a son, Tavihauroa.

The chief of Papara and head of the Tevas at that time was Tuiteraï or Teu-raiteraï. Like Hurimaavehi of Papeari, Tuiteraï could not hear of a handsome woman without wanting her; but Tavi's wife was a person of too much consequence to be approached except in the forms of courtesy required between chiefs, and therefore Tuiteraï sent his messenger to Tavi to request the loan of his wife, with a formal pledge that she should be returned in seven days. In the Polynesian code of manners, such a request could not be refused without a quarrel. It could not even be evaded without creating ill-feeling that might end in

trouble. Had Tuiteraï asked for Tavi's child or anything else that he regarded as most precious, the gift would have to be made, subject of course to reciprocity, for every chief was bound to return as good a gift as he received. Tavi did not want to lend his wife, but his pride and perhaps his interest required the sacrifice, and with the best grace in the world, like the *grand seigneur* that he was, he sent her to Papara. Apparently she made no objection; if the husband was satisfied, the island code had nothing to say to the wife.

Taurua came to Papara, like a Polynesian queen of Sheba, and made her visit to Tuiteraï, who immediately fell madly in love with her, showing it by some acts that were amusing, and by others that were too serious for us to laugh at quite heartily even after eight generations. One of his amusing acts was to take the name Arorua (Aro, breast; rua, two) as a compliment to Taurua's charms, and Tuiteraï arorua he is called to this day. The more serious act was that, at the end of the week's visit, he broke his pledge to Tavi, and refused to return Tauroa to her husband. This was an outrage of the most grievous kind, such as he might perhaps have inflicted on a very low man—a man fit only for a human sacrifice—but not on a chief; least of all on a chief of equal rank with himself. It was a challenge of force; an act of war. Tuiteraï did not attempt to excuse it except on the plea of his infatuation. The Tevas still sing the song of Tuiteraï arorua replying to Tavi's messenger who came to demand Tauroa:

"Why should I give up Tauroa? I will not give her up—I, Tuiteraï of the six skies—her, who has become to me like the Ura to my eyes, brought from Raratoa—my dear treasure. I have treasured her, and I treasure her yet as the Uras of Faau, and I will not give her up now. No, I will not give her up. Why should I give her up?—I, Tuiteraï of the six skies—her, who has become like the Uras of Raratoa."

This song is a famous bit of Teva history and literature, and yet I am not sure either of its text or its exact translation. I have given it as it is often sung, but nothing is more difficult than to render the exact meaning of such a language. The song, as the Tevas sing it, is made up of two separate parts; the first is Teuraiteraï's refusal to surrender Taurua. The native text, with an attempt at literal translation, runs thus:

TEURAITERAI AND TAURUA.

E ore e pa iau. no fea e pa iau.

I will not give her up! Why should I give her up!

Teuraiteraï ono rai ono. e ura piria mai tau orio.

I, Teuraiteraï of the six skies! the Ura that clings to my eyes!

E ura ahua mai Raratoa mai e te ipo iti e.

The Ura, sunshine from Raratoa, my dear treasure.

E tahi arii haamoe ite ura here.

One king lulled to sleep his dear Ura.

Mai piti e mai faau. tau mate ono i aia.

Like two united. I should die without her.

Ruruu te rai ma fau hia

Tie up the heavens like a net.

Fau hia te rai mai ata. e ata pua e ata rai.

Tangle the clouds of the sky, the clouds of Pua.

Mahiti te pea ma te paora
Open the net, make me dry.

Paora te pa ma tuatini tuatini te pito i haafifi
Dry the thousand thousand bonds that unite us.

Anapea anapea ia mau maitai.
The net, the net holds well.

Poetry is not supposed in any language to have an exact equivalent in prose, and I do not pretend to give an English equivalent for anything Tahitian. Whatever these verses mean in prose, at all events they show that our great-ancestor Tuiteraï arorua was regarded as an uncommonly arbitrary chief even by his own people, much as they may have admired an act which appealed to the sympathy of every true South Sea islander. Fortunately this story, at least, is too modern to be suspected of being a myth. Taurua of Tautira and Helen of Troy belonged to the same society; Tavi and Menelaus were relatives; the coincidence runs through every island in the South Seas, where no traveler has been able to keep the *Odyssey* out of his mind whenever he has approached a native village; but the truth of the Trojan story might be proved by that of Papara; for no sooner did Tuiteraï's refusal reach Tautira than Tavi-Menelaus, acting up to his high reputation, summoned his warriors and sent them against Papara, with orders to destroy it and to kill its chief. Papara had no walls like those of Troy to stand a siege; its forces were beaten in battle. Tuiteraï was taken, and Taurua recovered.

Among the score of wars fought in early societies about women, and then made the subjects of poetry or legend, the Tahitian variety has a charm of its own because its interest does not end as most of such stories end, with the revenge of the injured party. It should have ended in the usual way, and Tavi had intended to do what any Greek or Norse chief would have done: kill his rival and sack his villages; but the affair took another turn. Tuiteraï was wounded, captured, and bound; but when his captors were about to kill him he remonstrated, not with any feeble appeal for mercy, but with the objection, much more forcible to a Polynesian, that a great chief like himself could not be put to death by an inferior. None but an equal could raise his hand against him. None but Tavi must kill Tuiteraï.

Tavi's warriors, in spite of their orders, felt the force of the objection, which was, no doubt, in reality an appeal to religious fears, for Tuiteraï, as head-chief of the Tevas, was a person of the most sacred character. They carried him, bound and blindfolded, along the shore, some thirty miles, to Tavi. The journey was long, and the wounded chief, feeling his strength fail, urged them on, and as they passed each stream he managed to dip his hand in the water to mark his progress, for he knew the touch of the water in every stream.

When Tavi learned that his warriors had brought Tuiteraï alive, he reproached them for disobeying his orders. Even he found it hard to live up to his reputation. The pride of generosity had cost him his wife and a war; and still he must forfeit his character if he put Tuiteraï to death with his own hand in his own house. The wars of Tahiti were as cruel and ferocious as the wars of any other early race, but such an act as this would have shocked Tahitian morality and decency. Tavi felt himself obliged to spare his rival's life, but between complete vengeance and complete mercy the law knew no interval. A chief spared was a guest and an equal. Tavi gave Tuiteraï his life and his freedom and Taurua besides. The legend repeats his words in a song which is still sung, like the answer of Tuiteraï to the demand for Taurua, as one of the best-known Teva ballads:

TAVI AND TEURAITERAI

A mau ra i te vahine ia Taurua.
 Tou hoa ite ee. e matatarai maua e.
 Taurua horo poipoi oe iau nei.
 To ai ai na pohe mai nei au ite ono.
 Nau hoi oe i teie nei ra.
 A mau ra ia Taurua tou hoa ite ee.
 Matatarai mauai maua e.

"Take, then, your wife! Taurua! my friend! we are separated, she and I! Taurua, the morning star to me. For her beauty I would die. You were mine, but now—take, then, Taurua! my friend! we are separated, she and I!" (1901:23-27)

Another example of an *ari'i* code of chivalry was reported by Adams in his account of the defeat and capture of the chieftain Niuhi:

Another curious custom of war was shown in this affair of Niuhi, who seems to have been the object of rather unusual hatred. Temana, having led the attack, was perhaps required by courtesy to share his victim with his allies. He invited them to exercise the right of offering the worst insult that could be inflicted on an Arii, of beating the back of the victim with their spears, as he lay bound. Namiro, who figured as the head of the cuttle-fish, was the first to strike. "I am a prisoner," said Niuhi, who could not see, and did not know his captors; "I am dishonored by any one who strikes me on the back; but still I have the right to ask who strikes me." "I am Namiro, the warrior of Ahurai," was the answer; "I beat you with my lance Tuahinearamarama." Niuhi was silent. Teruru of Pereaitu stepped forward next and struck. Niuhi repeated his question, and was told: "I am Teruru of Pereaitu. I strike you with my lance Teaho." Again Niuhi was silent. Tevavahiiterra struck next. "Who is that?" asked Niuhi; "what wood is your lance made of?" "It is the *apiri* of Tamahue," replied Tevava, with another insult, for the *apiri* is only a weed. "No!" said Niuhi; "the *apiri* would sting, and would make a singing in the air as it struck, while this falls on my back with a dull thud." "Know, then!" said Vavahiiterra, "that it is the Teae of Mouoe!" The *teae* was a hard wood growing only on the hills of Mahaena. "I know now that I am lost," said Niuhi, "for I am surrounded." (1901:83)

Notwithstanding the respect³⁸ normally shown *ari'i*—"chiefs"—by their class inferiors and by other *ari'i*, there were occasions on which even they were not privileged. For example, while the berserk-like mourning ceremony, the *taiha'a*, was in progress, the masked participants recognized no class rules. They roamed about, wounding or even killing:

... when any one sees them Coming they fly to the Morai, it being the only place where they can be safe, or Get refuge from the rage of the Mourners who pursue all that they see. The Morai alone they must (not) enter, and while this Ceremony lasts, which is sometimes 3 weeks or a month, they pay no respect to persons *nor are the Chiefs safe* from their fury unless they take sanctuary in the Morai; the Women and Children are forced to quit the place as they Cannot take refuge in the Morai. (Morrison 1935:233, italics added)

CHAPTER 19 *AFFINITY*

Any attempt to comprehend the kind (or kinds) of Maohi relationship I have dubbed “marriage” is immediately confronted with problems of definition, and not much clarification is obtainable from native terminology. As noted previously the following words occur textually to label situations which specify, or include, the relationship in question (definitions are from the LMS Dictionary):

ta’oto, to sleep, see *moe*; to lie down; to be cohabiting as man and wife; a dream; see *moemoe*.

moe, sleep; see *ta’oto*; to sleep, also to lie down; lost. (*moepo*, the first embrace; to keep close together, as a new married couple. *natimoe*, a family or kindred.)

momoa, to espouse, or contract marriage; to make sacred, put under a restriction.

fa’aipoipo, to marry. (*fa’aipoipo ra’a*, marriage. *ipo*, a darling, one made much of.)

To focus on the relationships under consideration we may recall that they invariably involved coition, or the intent (or appearance of intent) of coition. (In other words, although the rite establishing some friendship pacts between males may have in some respects closely resembled the one instituting a “marriage,” the resulting relationship differed in intent and in interaction. Although many males carried on homosexual practices, such partnerships were in other important respects unlike the relationship under consideration.)¹

It is also useful to distinguish, as the Maohis themselves probably did, between “marriage” and casual heterosexual affairs—but here we begin to encounter some taxonomic difficulties. In the first place, the Maohis undoubtedly distinguished between two modes of life which correspond, more or less, to the distinction made by them between *taure’are’a* (youth) and *pa’ari* (maturity). This correspondence, which though not exact but suggestively close, is epitomized in the organization and ethos of the libertinistic Arioi society—that is, any member who settled down into a long-lasting

heterosexual, domestic partnership was retired from full participation in the society's activities (see chap. 22). Another exemplification of this kind of distinction was seen in the legend of Pereitai, which revealed a deeply felt Maohi antithesis between married and unmarried females. Notwithstanding all this contrast between youthful or youthlike unattachment and more sober social attachment, the transition between the two modes was in many instances a gradual one, marked by no definable event, ritual or otherwise. In other words, in the absence of a wedding ceremony or of some other definite evidence of "in-law" recognition, it is difficult for us, as it may also have been for other Maohis, to perceive when a casual affair settled down into a "marriage."

Another circumstance which obscures the distinction (for us, at least) between Maohi "marriages" and their casual affairs was the occurrence of "casual" sexual encounters undertaken with what appears to have been entire willingness on the part of the male to sire acknowledgeable heirs. (It will be recalled that one of the most important diagnostics of what I chose to label "marriage" was the "agreement to regard as legitimate, for purposes of inheritance, any surviving offspring of [a couple's] intercourse." All casual encounters of this kind that I know about were legendary, and they involved visiting deities or heroes, but one cannot rule out the possibility of there having been similar episodes involving human sires; and in any case the very existence of this story theme suggests that the Maohi distinction between "casual" affair and "marriage" was a more complicated matter than I have been able to fathom.

In any event, if we could turn back the clock and revisit these islands during the latter half of the eighteenth century we would find large numbers of male-female couples residing together openly and for months or years at a time—sleeping together and cooperating in subsistence activities. Also, most such couples would be sharing in the nurturance of children—either their own or others'—and committed to passing on some or all of their own goods to those children at the appropriate time. And finally, these relationships and commitments would have been recognized with more or less approval by most relatives of the couple. In the course of our retrospective visit we would also find other couples, probably not so numerous, but numerous enough, whose relationships resembled those just described in some respects, though not in all; these also require discussion, but first I focus on the numerically preponderant kind of relationships that I, at least, label "marriage."

MARITAL RESIDENCE

There does not seem to be any explicit statement of Maohi opinion concerning where a married couple ought to reside, and a tally of residential situ-

ations, from legend and from real life, indicates that nearly every possible alternative occurred. However, it is possible to infer from these situations an implicit and fairly decisive preference for virilocality. Moerenhout wrote: "We have seen that the bridegroom used always to install his wife in his own father's household" (1837:II, 69). While this arrangement may have been the most usual one, to characterize it as invariable (i.e., *toujours*) is clearly inaccurate. The choice of virilocality is dramatically exemplified in the legend of Tuihiti and Hauvana'a:

Matamata-taua, a taua ia Tumu-nui i Tahiti-To'erau, e ei tamahine a'e o Hauvana'a.

Taoto a'era te Ari'i Tû-i-hiti ia Hauvana'a 'a'ore ra i piri. Toina atu ai te hana i te metua, fa'aora hia mai ai i rapae e te metua.

Ua puta atura te hani i roto i te 'a'au o te tamahine, ta'i atura ta'i atura i te Ari'i Tû-i-hiti.

Ua parau atura te metua;
"Ua piri to vahine." Haere atura oia i te vahine ra. Ua parau mai ra te vahine:

"I hea 'oe, e te Ari'i Tû-i-hiti? i oto noa na vau ia 'oe!" Ua parau atura te tane:

"No te aha 'oe i oto mai ai ia'u? Parahi ra'a roa to'u io 'oe nei, e 'a'ita 'oe i parau maitai mai ia'u, e inaha ua mauru te pae o to'u 'upo'o i to'u oto. Teie ra ta'u parau ia 'oe, e ta'u vahine, e poroi atu na vau ia 'oe, e haere au i to'u ra utu'afare i to'u ra fenua." Ua parau atura te vahine,

"Eiaha 'oe e fa'arue ia'u!" Ua parau te tane.

"A, tei ia 'oe iho, e ta'u vahine. Ua hina'aro 'oe i te haere 'atoa taua io'u ra e parahi ai?" Oto noa 'tura te vahine, nao atura:

"E, e poroi na ra vau i ta'u na metua."

Haere atura i te metua ra ma te oto, manao 'ino atura te metua tane e e mea taparahi hia oia e tana tane, ua ui mai ra; "E Hauvana'a, na vai 'oe i taparahi? E ari'i 'oe io'u nei, 'e'ita 'oe e aa hia e te ta'ata." Na o atura te tamahine:

Matamata-taua (Endless-strife) became the bosom friend (wife) of Tumu-nui (Great-foundation) of North-Tahiti, and Hauvana'a (Government-of-orators) was their daughter.

King Tû-i-hiti (Stability-of-the-border) took as his wife Hauvana'a, but she cared not for him. She turned away pining for her parents, and so the parents withdrew her from him.

Then love pierced the heart of the daughter, and she fretted for King Tû-i-hiti.

And the parents said to him:
"Your wife has become attached to you." And so he went to his wife. She enquired:

"Where have you been, King Tû-i-hiti? I have been weeping for you!" The husband replied:

"Why have you been weeping for me? I remained a long time with you, and you did not speak kindly to me, so that you see the hair of my head has partly fallen out from grief. Now this is what I wish to say to you, my wife, I am taking leave of you, and am returning to my home in my country." The wife replied:

"Do not forsake me!" The husband said:

"Ah, it rests with yourself, my wife. Do you wish to go with me to my home to dwell?" The wife wept freely, and she said:

"Yes, but I must first bid farewell to my parents."

So she went to her parents still in tears, and her father suspecting that her husband had beaten her, said:

"Hauvana'a, who has been beating you? You have been a princess with me, no one daring to assault you." The daughter replied:

"E'ere au i te mea taparahi hia." Fa'ai'te roa 'tura i te parau. Ma te nao e, e reva raua e te tane i to'na ra fenua i Hiti-au-reveva. Ua parau mai ra Tumu-nui:

"Te parau atu na vau ia 'oe e ta'u tamahine, eiaha 'oe e nonoa i to tane, e ari'i tena no Hiti e e fa'aho'i 'oe i tereira huru. E i teienei, e pau to va'a-mataeina'a i tena; e rave rahi te toa i te moana. Oia o Pu'a-tu-tahi, o Ahifa-tu-moana, o 'Are-mata-roa, o Are-mata-popoto, o Pahua-nui-api-taa-i-te-ra'i, o Anae-moe-oho, o Tupe-io-ahu, e o 'Otu'u-ha'a-mana-a-Ta'arua! E i teienei e ta'u tamahine, eiaha 'oe e haere; e fa'aea mai 'oe i onei, i to na metua nei." Nao atura te tamahine:

"E 'ore roa vau e parahi." Nao atura te metua tane:

"E'ita 'oe e oto ia'u e i to metua vahine?"

"E oto ho'i au, e hau ra to'u u oto I ta'u tane."

"A haere, E marò ari'i to oe; e'ita e fati ia tapea." Haere atura te tamahine i te tane ra, e ua parau mai ra taua ari'i ra:

"Ua ta'a maitai to manao e Hau-vana'a e e haere 'atoa 'oe i to'u ra fenua?"

"E haere 'atoa vau!" Nao atura rá te tane:

"Teie ra ta'u parau ia 'oe, e ta'u vahine. E parahi i te fenua nei, e hi'o i te metua e to 'oe va'a-mataeina'a, e to 'oe mou'a, e to 'oe umere." Ua parau mai ra te vahine:

"E'ita roa vau e parahi." Ua parau atura te tane: "Eiaha ra, e ta'u tuahine, e taoa ta'i te metua e te fenua ia moina a'e taua i te ahinavaira. Eiaha, e ta'u tuahine, e'ita ia e 'itea fa'ahou hia mai e te mata te fenua nei!"

"E haere atoa taua!"

Ua fa'ati'a mai ra te tane, ua parau mai ra:

"A rave mai i to taua a'ahu, e to taua ma'a moe'a."

"I have not been beaten." And she told them everything, stating that she and her husband were going away to his land, to Hiti-au-revareva (Border-of-passing clouds, Pitcairn Island). Tumu-nui replied:

"I told you, my daughter, not to spurn your husband, that he was a king from the Border and you might thus send him back there. Now, your countrymen would be lost in this voyage; many are the foes of the deep. There are, Pu'a-tû-tahi (Coral-rock-standing-alone), Ahifa-tu-moana (the Sea-serpent), 'Are-mata-roa (Long-wave), Are-mata-popoto (Short-wave), Pahua-nui-api-taa-i-te-ra'i, (Great-Tridacna-that-opens-against-the-sky), Anae-moe-oho (Shoal-of-monsters), Tupe-io-ahu (Beast-of-heated-flesh), and 'Otu'u-ha'a-mana-a-Ta'arua (Stork-exalted-by-Ta'arua)! And now, my daughter, do not go; stay here with us, your parents." The daughter answered:

"I shall by no means stay." The father said:

"Will you not weep for me and your mother?"

"I shall weep [she said], but I should weep more for my husband."

"Go" [said he]. "You have a royal will; you cannot be persuaded to stay." So the daughter went to her husband, and the king said [to her]:

"Have you properly considered the matter, Hau-vana'a, to go with me to my country?"

"I will go with you" [she said]. But the husband said:

"Here is what I would say to you, my wife. Stay here in your country, and behold your parents, your clan, your mountain, and hear your praises [in the chants]." The wife answered:

"I shall by no means stay." The husband continued:

"But no, my sister, parents and country would cause regret as soon as they became lost to you and me in the distant haze. No, my sister, your eyes then would not again see this land!"

"I will go with you!" [she said]. And so the husband consented, and he said [to her]:

"Put together our clothes and our bedding."

And King Tû-i-hiti went to prepare his canoe, which was a great double one, and to take in provisions for the voyage, while his wife made preparations at home to accompany him, amid the deep regrets of her parents and all their kin and people.

The canoe was named Are-mata-roroa (Long-Waves), and when everything was made ready, one morning King Tû-i-hiti and his queen, accompanied by their respective personal attendants, bade farewell to all in Tahiti and set sail for the far-off land. They sailed to the southeast, bearing up against a stiff breeze, and were soon out of sight of Tahiti. (Henry 1928:468-471)

After surviving many perils of the sea, the couple reached the husband's homeland, where "they lived long and happily together and had numerous issue. But they never returned to Tahiti." Meanwhile, Hauvana'a's father, regretting her absence, set out to visit the couple and try to persuade them to return to Tahiti, but en route he was swallowed by a Giant Tridacna. The efforts to recover his body form the basis of the epic of Rata, episodes from which are given elsewhere.

Distance ruled out the possibility of Hauvana'a's returning home to visit her own people, but in many other legendary and historical instances of virilocal residence, wives are described as visiting their natal families quite often and for long periods of time—and not only wives but in some cases their husbands as well. In fact, the extended duration of many such visits raises the question of whether these residential situations should not be labeled bilocal.

Although virilocality was probably the preferred and most common pattern of marital residence, there exist many references to couples residing in or near the household of the wife. (In several other instances a newlywed couple is described as dwelling with the bride's family for a while after marriage before moving to the groom's to stay; I refer here not to visiting but to more domiciliary-like residence at the wife's.) Some instances of uxorilocality involved husbands from places distant enough to discourage return home, but others involved men from nearby. (I have the impression that a man residing more or less permanently at or near his wife's family tended less frequently to visit his own home community, with or without his wife, than was the reverse case.)

No Maohi statements that I know of give reasons why virilocality was preferable to and more common than uxorilocality, but a plausible explanation is not difficult to deduce. Generally speaking, a male's choices were more decisive than a female's in Maohi society, and this was especially true of husbands vis-à-vis their wives. In other words, a couple usually resided where the husband chose to reside, which usually meant where his own interests were best served. (I recognize the ineptitude of "explaining" a particular case by means of a generalization consisting in part of that case, but I trust that the reader will tolerate this broad usage

of “explanation.”) Occasionally such interests may have been dominated by a wish to please a wife—uxoriousness was common enough among the Maohi to generate a distinctive word, *tite’amatahani*, and wives were commonly represented as preferring the familiarities of their childhood home. Also, in many instances a husband’s more self-centered interests were best served by residing at or near his wife’s home. In most instances, however, a husband stood to gain or maintain more by residing at his own family home; this was emphatically the case with kin-Titleholders, but true also of most other males, inasmuch as inheritance in general favored males over females.

A male’s self-centered interests would have been better served by residing at his wife’s family home in the case of a younger *ari’i-* or *ra’atira*-class son, whose family heritage was outweighed by that of a wife who was, say, the principal inheritor of her parents’ estates, or in the case of a drifting commoner whose paltry resources were fewer even than those of his mate’s.

But male self-interest was not conceived wholly in terms of material resources. In all likelihood some husbands settled down in their wives’ communities because of opportunities for more pleasurable employment, such as proximity to a tribal chieftain’s residence and its livelier diversions. We cannot discount the likelihood that some wives were forceful enough or sexually desirable enough to overrule their husbands’ inclinations to return home. Also, the frequent home-visiting indulged in by virilocally resident wives is testimony to women’s persuasiveness or freedom of action.

In the foregoing I have dealt with marital residence in the broad alternatives of husband’s versus wife’s “place,” without specifying what the residential units consisted of. I can say, however, with near certitude, that most newly married couples resided in the already established household of either spouse’s relatives. The basis for this statement is the well-authenticated observation that most Maohi households were populous, to which must be added the circumstance that no reference can be found to the setting up of independent households by or for newlyweds. We can also deduce that the relatives constituting the households in which the newlyweds resided usually included one spouse’s “parents”—natal, collateral, or foster. But this is about as far as the evidence will permit us to go.

Maohi households, like domestic establishments elsewhere, must have undergone “developmental cycles” of certain characteristic kinds, but we know more about what those patterns were not than what they specifically were. We can deduce for example, that wholly new households were not established lightly—their buildings and appurtenances having been laborious productions intended, evidently, for perpetual occupancy by one family-generation after another. Maohi household buildings were apparently not as large or elaborate as those of, say, Samoa, but most of them described in the sources, or revealed archaeologically, were of a size or degree of durability that bespeaks more than nuclear-family occupancy or one-generation

span. And, as stated above, there is no evidence that newly weds, as a matter of course, sought to begin life in households of their own. It goes without saying that new households were now and then established, including some for newly wedded couples, but it is my surmise that new ones were set up mainly for successors to high-ranking kin-Titles (including those newly wed), or by later-born, nonsuccessor sons of *ari'i* or *ra'atira* families, and after these had produced offspring of their own.

Residential separation of husband and wife was not unknown among the Maohis, but it occurred intentionally in only two highly special kinds of situations. One was that of certain female conveyors of very high-ranking kin-Titles. Some of these women, after bearing successors to their husband's kin-Titles (and possibly to their own), resided apart from their spouse, amicably or otherwise, and lived courtly lives of their own. The other such situation represented a step toward divorce, and will be described later on.

A final word on marital residence concerns locational factors influencing choice of mate. As pointed out earlier I have come across no explicitly formulated native statement about this matter, and there is no indication of any implicit preferences or prohibitions regarding where to find a mate. On the other hand, there is considerable evidence of marriage between *ari'i* of widely separate homelands, including different islands—a consequence of both class and political considerations. By the same token, in the absence of considerations encouraging choice of a mate from faraway, it is reasonable to conclude that commoners, and perhaps *ra'atira*, found mates much nearer home.

NUPTIAL RITES

To many Maohis, perhaps the most important aspects of marriage were a spouse's sexual accessibility and contribution to subsistence—public recognition and sanction of such unions having been taken for granted, and questions concerning legitimacy of offspring having been largely irrelevant, or resolved tacitly, in the absence of socially valuable heritages. At the other extreme, among people holding or controlling socially valuable heritages, legitimacy of offspring was the paramount aspect of a marital union and this was conventionally acknowledged by means of a bilaterally sponsored ceremony, which also served the purpose of securing supernatural approval for the covenant and widespread public attention to it—a most desirable objective in view of the political implications of such heritages.

I do not propose that nuptial ceremonies were usually dispensed with for unions involving no socially valuable heritage,² but only that they did not, or did not need to, perform the function of legitimizing the couple's offspring. (In many such cases, I suppose, the nuptial ceremony was looked upon as an opportunity for conspicuous consumption and a good time.) All the above functions of Maohi nuptial ceremonies seem straightforward

and self-evident, but the transactional dimension of a marriage's inception requires some additional examination, since the sources refer to three different types.³

First there were the "balanced" contributions made in connection with the more elaborate kind of ceremony in which the parties of both principals provided approximately equal amounts of food and other objects for the wedding feasts and for the couple's use. According to Henry there was an element of competition in some of these contributions, but the basic equation of them appears to have been symmetrical. "At the wedding feast, which lasted several days at the house of the bride, both families vied with each other in making a grand display of goods and food" (1928:284).⁴

The second type of transaction accompanying a wedding was described by Morrison, who wrote that in addition to the "Hogs, Cloth and Sundry Necessary Articles" presented to the couple by their "Freinds," the husband also "Claims his Wifes Possessions, which are delivered to him without reserve" (1935:185). Elsewhere Morrison said of this transaction, "The Father of the Bride then delivers her portion to Her husband" (p. 189). But, added Morrison, "Should they [subsequently] part, then the Wifes property returns to herself" (p. 185). The nature of this dowry—if such it was—is nowhere specified.

The third type of transaction, referred to by Anderson, implies that goods moved the other way also:

If a young man and woman, from mutual choice, cohabit, the man gives the father of the girl such things as are necessary in common life; as hogs, cloth, or canoes, in proportion to the time they are together; and if he thinks he has not been sufficiently paid for his daughter, he makes no scruple of forcing her to leave her friend, and to cohabit with another person who may be more liberal" (Cook 1784:157).

A similar kind of arrangement was described by Orsmond in his journal entry on March 9, 1827 (LMS Archives).

At first glance, it may appear that we have here not only three different types of transactions, but three distinctive types of "weddings" paralleling three equally distinctive kinds of "marriage." Actually, such an interpretation is probably not warranted; the three so-called types do indeed represent three distinctive kinds of circulation of goods in terms of direction of flow, but the end-uses of the goods seem not to have been the same. Type one appears to have consisted of things meant to be consumed by all participants in the wedding, or by the married couple. Type two on the other hand seems to have consisted of more durable objects, and possibly of use-rights in some kinds of estates, inasmuch as they were "returned to the wife" in the event of divorce. Type three is to be characterized less as a "dowry" than as a "gift" by a man to a girl's father (and consumed at least partly by the latter) to persuade him to agree to the marriage.

There is a possibility that some weddings involved all three types of transactions: suitor's gift, dowry, and bilaterally provided wedding feast and housekeeping donation; or that others involved only one such transaction, or two. The fact is that the sources may not be so much in contradiction on this matter as they are incomplete. Indeed it is possible that there were wedding transactions of types that I have not even listed—for example, one of Morrison's observations could imply that at certain weddings only the bridegroom's party supplied pork for the wedding feast: after the rites at the marae "The Company then return to the Bridgrooms house and he sends three or Four Hogs to his Father in law, who has them immediately kild, and a Feast Made of which all the Males of both Familys partake" (1935:188).

Yet, even granting the obvious shortcomings of the sources it seems quite possible that Maohi weddings were indeed of three distinct types in terms of social accounting: some consisted of a more or less balanced exchange of similar objects and use-rights; others can be interpreted as an exchange of a wife's sexual and reproductive services in return for a husband's objects; and still others may be viewed as exchange of a wife's objects (and possibly certain other estate use-rights) for a husband's superior social status. The first type is straightforward and fairly well documented; I surmise that it occurred principally in connection with intraclass marriages and was hence the most common mode. I suggest that the second occurred mainly in intraclass marriages between young wives and much older husbands, and the third in instances of husbands having somewhat higher class statuses than their wives. I cannot specifically document these suggestions, but I present them as informed impressions nevertheless.

Finally, I remind the reader that it is possible to distinguish several conventional and more or less explicitly avowed motives Maohis had for marrying (in addition to what were probably numerous private, situational ones too complex to discover). Sexual attraction (one-sided or mutual), material gain, status improvement, social obligation, desire for offspring, political advance—all these, singly or in combination, were probably recognized as good and sufficient reasons for marrying; and each of these reasons probably influenced in some degree the character of the resulting relationships, which I now undertake to describe.

HUSBAND-WIFE RELATIONS

"Domestic happiness," wrote Ellis, was "formerly unknown even in name," and "men were often cruel in their treatment of the women, and considered them as their slaves" (Ellis 1829:II, 572-573). But J. Forster saw the relationship in a somewhat different light:

The Taheiteans as individuals, not only have the several good qualities above

mentioned, of a domestic kind, but they are likewise sensible of the great advantages of a social or civil union: and as far as our imperfect knowledge of their language; our short stay amongst them, and the desultory instruction of *Maheine* and *O-Mai* would permit, I have reasons to think, that the beginning of their civil society is founded on paternal authority, and is of the patriarchal kind. The husband and the wife of his bosom, whom love unites by the silken ties of matrimony, form the first society. This union is, in these happy regions, first founded on the call of nature, in mutual assistance, and the sweet hopes of seeing themselves reproduced in a numerous offspring. In more degenerated nations, matrimonial union takes place from brutal appetite, is grounded upon the satisfaction of sensuality, the expectation of assistance from persons, whom oppression and custom has condemned to become drudges, and lastly the idea of gaining more strength and power from a numerous family of children. On the contrary, the mildness of the climate, the happiness of organization, and the kind and benevolent temper of this people, together with their more enlightened intellects, contribute very much to refine and to ennoble that soft passion which is the first beginning of this congenial harmony; and hence the brutish instincts, which were wants of the same low rank with hunger and thirst, are raised to a lasting, virtuous passion. This refinement of mutual love and matrimonial complacency, produces those tender regards with which this happy passion inspires its votaries for the beloved object; and it creates that mutual happiness, which is the result of all the more refined manners, and of their more polished behaviour towards one another. The offspring of such a happy couple early imbibe by the example of their parents, that kindness and benevolence, and those refined sentiments of love and happiness which contribute so much to confirm the felicity of their parents, and wish to reduce them to practice, as soon as they feel the call of nature and find a partner whose sentiments are in unison with their own; so that these simple, but more exalted ideas of matrimonial union, are thus propagated and perpetuated in the progeny of a virtuous and tender couple. (1778:349–351)

How either of these authorities formed his opinion I cannot divine, but I shall proceed as heretofore and assemble all the bits and pieces I have found about husband and wife interaction, whatever their source. The resulting miscellany is not likely to add up to any impressive generalizations, but it should indicate the wide range of behaviors comprising this relationship—or of the perceptions and prejudices of the Europeans who authored them!

Most of the source passages concern monogamous marriages, but there were many families that were polygynous, especially among the middle and lower classes, where the importance of one's heritage was less crucial. (See chap. 13, section on polygamy; and Ellis 1829:II, 571.)

Terminology. *Tane*, used both for reference and address, was the most common word for “husband,” as *vahine* was for “wife,” and both these words also had the more general meanings of (human) “male” and “female,” respectively. *Hoa* is translated in the LMS Dictionary as “friend” but is elsewhere defined also as “wife.”⁵ In addition to these terms for “wife” I have also come across *tau’a*, which more usually meant “friend” and “companion,” and *tuahine*, which usually meant (male-speaking) “sister” or “female cousin” (Henry 1928:468, 470).

In this connection, in a legend regarding the Deluge, there is a verbal distinction made between *fēti'i* and wives (*vahine*) in a query put to two humans by a demon:

Na ui maira taua tuputupua ra: "E fetii anei ta 'orua i uta na?"
 Then the monster asked: "Have you relatives inland?"
 [Upon being answered in the affirmative, the monster then asked]
 "E vahine anei ta 'orua i uta na?"
 "Have you wives inland [as well]?" (Henry 1928:449)

Time. Maohi married couples were accustomed to two forms of interruption to their interaction: to long periods of absence occasioned by either one's visits to relatives elsewhere or by the husband's wide-ranging travels; and to the shorter separations occasioned by their respective roles in domestic and community affairs.

With respect to the first, such absences were probably longer and more characteristic with upper-class couples: the parental homes of such spouses tended to be farther apart, and *ari'i* husbands were perhaps more given to traveling than were others.

The shorter separations referred to were occasioned by many kinds of rules and practices. Leaving aside the interruptions to domestic routine accompanying such special situations as births and deaths, a couple's interaction was regularly interrupted when they went about their subsistence jobs, most of which were spatially apart from one another. Even when both were at home they ate separately, and in larger households, at least, they appear to have spent most of their waking hours in the company of others of their own sex—the males conventionally *mua*, the females *muri*.

From the scanty evidence available it appears that a wife slept slightly apart from her husband during her menstrual periods, but unlike women in many societies elsewhere Maohi women seem not to have been strictly isolated at such times. On the other hand, when Maohi men were actually engaged in religious activities their segregation from all women was strictly prescribed.

Space. It will be recalled that at weddings the husband's party was figuratively referred to as the "upper rock" (*papa i ni'a*) in contrast to the "rock underneath" (*papa i raro*) consisting of the wife's party. Also, according to Morrison, during the wedding *āmo'a* rites at the marae, the groom sat to the right of the bride (1935:188). I imagine that when Maohi couples were actually together on more mundane occasions and able to conform to such standards certain other locational conventions were observed in addition to the *mua-muri* placement noted above; but the only specific references I can find to such matters concern the position of man and wife when walking together. In the legend of Tafai, mentioned previously, after the youth Hema had captured a beautiful fairy to be his bride, he followed his mother's

instructions by carrying her homeward over his shoulder. In an effort to escape, the fairy appealed to Hema's sense of propriety by urging, "O Hema, leave me, the man should go first and the woman follow after so that it be said that the young Hema has a wife." (Hema succumbed to this appeal the first time and his bride escaped, but after capturing her the second time he ignored her plea and carried her home.) (Leverd 1912:5-6)

But, as we saw in the previous chapter, considerations of class may on occasion have outweighed those of marriage: that is, "If both be of the same rank, the wife comes after the husband; but if the wife be a woman of rank, and the husband of an inferior class, she goes first, and he, without ever imagining himself degraded, treads in her steps" (Montgomery 1832:I, 149).

Finally, for whatever it may signify, the word *piri* meant both "narrow, confined, close together" and "to care for" or "have affection for," as appears in the legend of Tuihiti and Hauvana'a, wherein the bride Hauvana'a is described as at first "not caring for" her husband, "'a'ore ra i piri" (Henry 1928:468).

Transaction. "The men," wrote Ellis in a passage previously quoted, "were often cruel in their treatment of the women, and considered them as their slaves." If such had been the case it could mean that wives were usually the helpless drudges of household work. In actual fact, many wives may indeed have contributed more time than did their husbands to their joint subsistence and family concerns, but there is no evidence of which I know that women's work per se was characterized as "drudgery," and there are few indications that wives were helpless.⁶

In any case it is useful to particularize husband-wife transactions under four headings: exploitation, altruism, exchange, and pooling-and-sharing; but first I present a statement by Bligh: "The Woman who bears Children has greater priviledges than those who do not—they always abide by the property of the Husband, while the others have little or no share" (1792:152).

Exploitation. Some husbands probably did "exploit" their wives, in the sense of coercing them to do more than the conventionally accepted amount of household work expected of a wife; but the sources describe no specific instances of this sort, and Maohi oral literature contains no stereotype of the victimized wifely drudge. Of course, it could be argued that conventional Maohi expectations of wifely work constitute "exploitation" in the Western sense (this, at least, seems to have been Ellis' view), but that argument would be as difficult to define as it would be to document.

I cannot find any evidence of husbands expropriating objects from their wives against the latter's wishes and expectations, although of course there may have been such instances. As for a man coercing his wife into sexual

intercourse with his bond-friend or others, we have no way of knowing the extent to which such women may have been willing or even eager parties to those transactions; in any case, I refer to my opinion, expressed earlier, that sexual services were not valued very highly.

Though there were undoubtedly some exceptions in practice, the norm for marital transactions appears to have exemplified mutuality rather than exploitation—except possibly in terms of the more general prohibitions on females' consumption of certain food delicacies.⁷

Altruism. It is not possible to know whether Maohi norms recommended nonreciprocal giving between husband and wife, but there are some scattered indications that this kind of transaction did occasionally take place, or that it was regarded as a possibility. I have already mentioned the case of the selfless man who gave his life in order to provide food for his starving wife and children. A more trivial, but perhaps more revealing kind of story theme concerns husbands' actions in satisfying their wives' whims. One such action was referred to in the synopsis of the legend of Pai; the episode that now concerns us is as follows:

A long time ago, when King Ta'ihia (Wept-for) reigned in Tautira, there lived at Ata'aroa, adjoining his realm in the west, a chief named Rehia (Prize-won) and his wife named Huauri (Dark-fruit). They had goodly possessions and were distantly connected with the reigning family. Their house, named Fare-ti'a-tahi (House-standing-apart), stood on a point of land.

It happened one day that the wife, Huauri, heard the sound of a conch trumpet blast over the sea, and upon going out to see what it meant she saw a great canoe close by laden with food of all kinds going towards the settlement. So she told her husband, who according to the laws of Tahitian hospitality invited the people of the canoe to land and rest themselves, which they did.

"Whither are you bound with that food?" Rehia enquired.

"We are taking it for King Ta'ihia and for his father Ta'i-te-ari'i (Wept-for-the-king) and for Tû-tapu (Sacred-standing), the king's friend," was the reply.

Huauri saw fish and pigs, ripe bananas, and many things that tempted her appetite, and seeing that she was longing for them her fond husband proposed to buy all the food of the men.

"What goods have you to buy with?" said they.

"We have feather cloaks and ornaments, mats, and rolls of cloth," was the reply.

The bargain was struck, the food was placed in a great heap on shore and sold to Rehia, and the canoe returned whence it came to collect more food for the royal family. (Henry 1928:578-579)

The magnitude of this indulgence is seen in the reaction to it: some of King Ta'ihia's subjects were so outraged by this action of lese majesty that they eventually slew both Rehia and his baby daughter. (One cannot escape the conclusion that the inventors of this story must have assumed Rehia's knowledge of the risk he took to satisfy his wife's wishes.) The opportunity to kill Rehia occurred when he went in search of yams which his

pregnant wife longed for but which were not then in season. It was because of his digging for such yams that he met his death; but did he voice any recriminations against the fateful appetite of his spouse? Not at all; the faithful husband's last words were, "Ah, I shall not see my dear wife again, and she will not have the yams she longs for!" (Henry 1928:580)

Occasionally, even otherwise wicked husbands were imagined by the Maohis to indulge their wives. Such a man was a legendary "king" of Arue (North Tahiti), who used as a matter of course to kill persons whom he disliked. Among others, he did away with his wife's grandparents, but his wife traded on her husband's regard for her to obtain her revenge.

The king had a fine pet eel, which was bewitched by his evil genius and which he kept in Pû-'o'oro (Gurgling-pool), unapproachable to all the people. The queen, feigning sickness, assumed great fastidiousness, refusing to eat fish of all kinds, until at last she persuaded her husband to give her his pet eel, assuring him that she would enjoy it if he would allow it to be cooked for her.

This grieved the king sorely, and he went out for the day fishing so as not to see the eel killed. (Henry 1928:619)

Oddly enough the only evidence I have found of a wife's sacrifice on behalf of her husband is contained in the following passage:

When a man was knocked down for a sacrifice in the presence of his wife, which was not unfrequently the case, the assassins used to take great care to prevent the wife from touching the body, as in that case it would be of no use for sacrifice, as it would lose all its sacredness if touched by a woman. The wife used generally in such a case to make a sudden dash toward the body to fall upon or touch it to prevent its being carried away, that she might have the melancholy pleasure of burying it. (Henry to Burder, 21 May 1822, LMS Archives)⁸

The paucity of such evidence could signify perhaps that such transactions did not often take place, but it might also indicate that such sacrifices were so commonplace that they were not the subject of stories.

Exchange. The clearest manifestation of direct exchange between husband and wife involved one another's sexual services. This comes out clearly in instances of "jealousy," some of which will be described below, and which indicate not only some mutual attitude of proprietorship over the spouse's sexual resources (no matter how low a valuation such services may have had, *per se*) but a concern for reciprocity. Perhaps many other of the objects and services that passed between spouses were viewed by them as constituting direct exchange: "My X in return for your Y"; and this may have been especially true of childless couples living more or less alone.⁹

But probably most transactions involving spouses constituted pooling-and-sharing—that is, separate contributions of objects and services into a common pool for common consumption. I have described elsewhere the contributions to household subsistence made by individuals as "parents" or as "males" or "females," and the consumption rights of persons in

these various roles. Also I have discussed the parts played by parents in nurturing and socializing children, in representing family members to spirits, in celebrating marriages, in tending the sick, in mourning the dead, and so forth. In other words, I have already detailed the respective contributions by husband and wife to their joint family enterprise, and their respective withdrawals therefrom. Of course, the kinds and amounts of contributions and withdrawals must have varied widely indeed—in terms of size and composition of household, class of principals, and occupation of husband; but enough has been said to suggest what the influence of such parameters might have been.

Governance. In keeping with the more general norm which placed precedence and effective decision-making mainly in the hands of males, Maohi husbands were undoubtedly assigned such primacy over their wives. Moreover, most husbands probably exercised these privileges in some measure, even to the point, in some cases, of backing up their authority with blows, as Anderson recorded:

As in such a life, their women must contribute a very large share of its happiness, it is rather surprizing, besides the humiliating restraints they are laid under with regard to food, to find them often treated with a degree of harshness, or rather brutality, which one would scarcely suppose a man would bestow, on an object for whom he had the least affection. Nothing, however, is more common, than to see the men beat them without mercy.... (Cook 1784:160-161)

But as I remarked earlier, although subjected to occasional beatings, many Maohi wives were normally anything but a passive, deferential, submissive lot. A perusal even of Cook's journals will turn up many instances of wives asserting themselves most effectively in their relations with their husbands. Some examples of wifely assertiveness were given in my discussion of marital transactions; a few others are to be found in eyewitness accounts, as will be described in volume 3. There are also stories that describe husbands who placed great confidence in their wives' judgment (Henry 1928:625), or who followed their wives advice in moments of crisis (Henry 1928:445).

Most such accounts, both legendary and eyewitness, concern *ari'i* wives, and many *ari'i* women are known to have been laws unto themselves; but from this one should not conclude that wifely authority and assertiveness were limited to that social class.

Emotion. As revealed in legend, history, and vocabulary, the "feelings" expressed by husbands and wives ran the gamut, from self-sacrificing affection to murderous hate. At one extreme were such crystallized (but not wholly intelligible) expressions as *hina'aro* (love, desire, affection, choose) and *aroha* (compassion, pity, sympathy, love, affection); at the other were such expressions as *fa'anono'a* (to spurn with disgust, applied to husbands and wives who have an aversion to each other) and *fe'ume* (envy,

malice, settled hatred between persons). As heretofore, I shall exemplify this range of behavior by presenting synopses of situations or full accounts of episodes taken from both legend and history, in the belief that generalization without documentation would rob this work of its most useful asset.

Happily-ever-after marriage based on mutual love-at-first-sight romance is the theme of several stories, some of them enlivened by the overcoming of obstacles of one kind or another. An example is the legend of Taruia, evidently collected by Miss Henry herself and bearing her rhapsodical style:¹⁰

On the eastern side of the town of Pape'ete, the capital of Tahiti, is the beautiful valley of Fautau'a (Confederation), famous in Tahitian history and romance, with its rapid, winding stream, for miles along the banks of which are scattered elegant and humble dwellings of rich and poor. Far in back, at the head of the valley, stands in bold relief the circle of basaltic peaks called La Diadème, nature's royal insignia gracefully worn by the "Queen of the Pacific," peaks that form a background, perfect in its outlines, for other beautiful valleys that rise to this central point.

At the base of La Diadème is a tableland called Rupe (Mountain-pigeon), where in former times stood a little hamlet that was the birthplace of Taruia (Benighted), the hero of this story. He was the son of Hihimai-vaio (Sun-rays-of-the-recess), the chieftain and priest of the clan of that region, and his mother's name was Ra'i (Sky). He also had a younger brother whose name was Vini (Whistling-parrakeet). They lived at a time when the districts for Tahiti formed little independent kingdoms, over which reigned high chiefs and chiefesses, called *ari'i* (kings or queens).

With the youths of their clan the two lads grew up, accomplished in the use of bow and arrow, in hunting and in fishing, and in all the arts and sports of their time. Taruia was also taught the oral traditions of his country and all the mysteries of priestcraft by his father, whose double office of priest and chieftain he was to inherit. Light of foot, the young mountaineers scaled the heights up to their lofty peaks after pretty feather birds, which were used for ornaments in those times, and in their rambles they descended into the valleys, where they plunged or slid down over smooth slippery rocks of slanting cascades into deep pools of water, in which they rivalled the fishes in swimming and diving. They sometimes went down on to the plains and out into the sea to swim and ride upon the surf and to fish, where, it is said, Taruia and his brother were carefully guarded from harm by their great blue shark god, which was possessed with the spirit of one of their ancestors and made itself known to them by caressing movements against their persons, to the great dismay of their playmates.

The story opens in the beginning of the reign of Teri'i-tau-mata-tini (King-of-the-period-of-thousands), an ancestor of Paraita (Tattoo-marking), a chief who became regent under Queen Pomare and was a prominent figure in the history of his island.

It was at harvest time, the height of the breadfruit season and most other fruits, and, according to custom, after the people had offered the first fruits to their god at the national marae, a public festivity, called the feast of the *umu-'opi'o* (oven-long-cooking), was proclaimed. In an immense oven of heated stones were placed in a great heap hundreds of breadfruit in all stages of ripeness, whole and unpared. These were covered with banana, breadfruit, and purau leaves, hilled over with earth, and left thus for a couple of days, after which they were thoroughly cooked and most enjoyable to the taste. For the feast of the *unu-'opi'o*, food in various other

ways was prepared also, and great hogs were baked whole in ordinary ovens covered before daybreak and opened at noon.

On native festive occasions long sheds are erected upon a lawn, generally near the chief's house, covered with braided coconut fronds, and tastily decorated with green and yellow ti leaves, stripped into fringes, and garlands of flowers interwoven with sweet-scented fern fronds and herbs. Previous to the modern use of tables, chairs, and hardware, banana or other broad leaves were laid in a row upon the ground along the center of each shed and upon them were spread large purau leaves for tablecloths and plates, on either side of which the people sat. For each person was set a coconut-shell cup, containing sauce served from gourds, and within everybody's reach were bowls of gourd or coconut shell and wooden dishes, containing the steaming meats and various delicacies with an abundance of fresh coconut water, the natural wine of the country, and cool fresh water to drink. In olden times the people took their seats according to rank and clan, and the men and women had their feasts apart from each other, boys and girls uniting with fathers and mothers, respectively; but modern civilization has changed those restrictions.

On this special occasion, the strangers and sojourners in the land were to be the guests of the day, besides whom the young King Teri-'i-tau-mata-tini who dwelt at Taunoa (Alighting), a place on the sea side of the plains facing Fautau'a Valley, wished to have as his guest the handsomest man in his dominion, irrespective of nationality or rank. Accordingly, two days before the feast was to take place, messengers went forth to invite the guests. Two men who were considered good judges were sent to find the handsomest man, and after their search over the plains the first day they returned and told the king that they had only met ordinary-looking men. He bade them not be discouraged but to go again and search on the morrow, as it was then nightfall.

That night the king had a dream; he heard the voice of his great god Tipa (Healer) address him, and he answered promptly:

"E, teie au!" (Yes, here am I!) the god said:

"You will find a young man of perfect beauty in the clan of Rupe. Send for him to-morrow; his name is Taruia." But the king answered:

"I have never heard of Taruia and have never been to Rupe." After giving him the information concerning the young man that is mentioned above, the god said no more and left him sleeping soundly.

Very early in the morning, the king awoke, and thinking of his dream he told it to his wife, for whom he had a great regard and in whose judgment he always felt great confidence, asking her what she thought of it.

"You must be in favor with our great god," she replied. "You and the people have borne away the sins of our kingdom by offering him and his spirit guests the first fruits of our harvest, and now it is evident that he approves of the feast you are preparing for us mortals. Your dream can be no deception." The husband answered: "I believe you are right, my dear Miriama!" And he arose and went and sent the two messengers of the day before in search of Taruia in Fautau'a Valley.

The two men passed different hamlets, inquiring where the place called Rupe was, and were directed farther and farther, until at last they came to the rising ground. After reaching a considerable height above the level of the sea and the plains below had disappeared behind the towering mountains forming ravines and dales, they saw before them a stronghold enclosed in an amphitheatric range of mountains united away inland by La Diadème. At their feet lay a formidable precipice extending from one side of the valley to the other, down the center of which falls the sparkling water of a magnificent cascade 426 feet high. The water

descends into a great gorge, where it forms a pool and issuing thence in roaring and musical sounds among the boulders, it meets rivulets, great and small, on the way downward to the plains, where it forms rapids and pools—nature's bathing places, much frequented by the people—and thence flows onwards to the sea.

Following a footpath across a precipitous pass to the left, the messengers enter the amphitheater. Here they found some habitations, and inquiring of the people if that was the place they were seeking they were told it was not but that it was the settlement that they could see at the farthest end of the valley, beneath La Diadème. They went on their way rejoicing that they so soon would reach their goal.

As they were approaching Rupe, the priest, Hihi-mai-vao, received a communication from the god of the local marae, where he and his son, Taruia, were working, telling him of the arrival of the two men and of their errand and that he must conceal his son from them in the marae, which stood on a terrace on the side of the mountain. So the father immediately turned to the son and directed him what to do. They moved away a great slab that concealed a vault on the inner side, in which he entered and was closed in.

When the messengers arrived, they found the priest and his wife and younger son Vini sitting beneath a spreading tree in front of their house, and they were cordially greeted with:

"Manava, haere mai!" (Welcome, come hither!) The young men respectfully answered: *"E! Ia ora na 'outou i te atua"* (Aye, may you live in the gods).

A fara leaf mat was placed for the visitors under the tree, and when they were seated comfortably upon it the dignified host sat them at ease by opening the conversation, and saying:

"A great errand must have brought you to our inland clan." They answered:

"Yes, indeed, we have come on a great errand."

"Tell it!" expectantly replied the former.

"You know," said they, "that our harvest feast is to be tomorrow?"

"Yes."

"The king wishes to have as his special guest on that occasion the handsomest man in the land, and he has sent us here to invite your son, Taruia, to be that guest." The parents replied:

"Here is our son, but that is not his name, we called him Vini." But the messengers, prompted by their god said:

"We know that you have another son, and that you had hidden him away. Permit us to go and search for him."

Permission was granted, while the parents still denied having any other son. So the messengers went searching in likely and unlikely places until they arrived at the marae, and thinking he might be hidden somewhere within the structure they removed a slab or two on the outer side and at the ends, but finding no vault they replaced them and continued their search on the inner side, when lo! as they moved away a great central slab, they found the handsome young man, who met all their expectations, sitting within. Being inspired what to do, he welcomed his discoverers and went out with them after they had closed the vault as before.

The parents were much chagrined on seeing that their son, Taruia, was found by the strangers, but the father, recovering himself, said:

"It is well! I am persuaded that it is the will of the gods that my son should obey the summons of the king and go as his guest tomorrow. But the matter now rests with himself, ask him if he is willing to do so. Representatives of our clan will be there also."

Turning to Taruia, the messengers delivered the royal invitation and explained that it was by revelation that they had been directed to come to him. He answered that he accepted the invitation, highly gratified at such an honor. Elated at their success, the messengers wished to take him away at once to Taunoa; but he preferred going early in the morning, inviting them to tarry at his home with him until then. This they declined doing, and not even waiting to partake of food hospitably offered them, they took their leave and hurried home to inform the king of their happy success.

As the sun was declining towards the west, the two men arrived at Taunoa and found the young king and queen awaiting them with much interest to know the result of their errand. When they were told all the circumstances of their search and that the young man was coming early on the morrow, they were highly pleased and patiently waited for the time to come to see their handsome guest. Early in the morning, before the eastern sky was gilded with the rays of the rising sun, the drums of the various clans announced that the final preparations for the feast were being made. Men and women, old and young, were setting to work to accomplish their respective parts, while the children, in high glee, were everywhere rejoicing.

Faithful to his promise, Taruia left Fautau'a early on his way to Taunoa. As the heir to a chieftainship, he attired himself becomingly in a gay waist cloth of fine tapa and a richly fringed poncho of the same material, ornamented with rosettes studded with small red pipitio seeds, his clothing arranged so as to reveal elegant tattooing upon his bare limbs. Upon his head he wore a soft tapa turban, entwined with a garland of sweet-scented mountain ferns and flowers, and in his hand he carried, as an insignia of rank, his ancestral wooden spear, which was about six feet long and which served as a weapon of defense in cases of emergency and as a staff in going on a journey. Taking an early breakfast prepared by a retainer, Taruia took a lingering leave of his fond parents and set out on his journey, all feeling strange presentiments of something coming that the gods did not reveal to them.

On arriving half way down the valley at a picturesque little vale called Pure-ora (Prayer-for-life), where stood the home of the king's sister, Tui-hana-taha-te-ra (Evening prayer), enclosed in a high stone wall, where she lived with her adopted parents, he was invited in, his fame having preceded him, and the young girl's guardians proposed that they should all go to the king's house together in a little while, which Taruia agreed to do and sat down upon a proffered mat. The young princess was tall, fair, and comely, about sixteen years of age, with gentle manners, soft regular features, and a profusion of flowing raven hair, loosely looped up and interwoven with a wreath of white, starlike Tahitian gardenias. She was gracefully draped in soft, lightly printed white tapa, which was passed around her body and secured upon one shoulder with her arms exposed. Upon her tapering fingers, wrists, and ankles were beautifully tattooed circles resembling finger rings, bracelets, and anklets, and upon her feet were tattooings that much resembled elegant sandals. Other high-born ladies of the house were attired and tattooed in much the same fashion, the matrons wearing bright-colored flowers in their wreaths and garlands, only the maidens having the right in those days to wear the simple gardenia.

The princess was soon to marry a young prince who was heir to one of the neighboring kingdoms, and though she had no deep-seated affection for him she had been brought up to feel that such a union would be most suitable and proper. But now when the eyes of the fair young damsel and the elegant mountaineer met for the first time and they bashfully exchanged the friendly

greeting, "*Ia ora na*" (May you live), they at once felt a kindred attachment for each other, which they could not shake off.

In a little while, the sound of the drum summoned the clan to meet together on the assembly ground, which was some distance away and out of sight of the house, where they were to form in procession ready to proceed to Taunoa. Taruia was requested to remain on the road until the procession approached, when he was to join it also. The strictest etiquette was always observed by the natives in falling into line and presenting themselves before their chiefs; and every clan claimed a certain place in prestige that was always maintained and recognized by their rulers.

Just at the lower end of the stone wall at Pure-ora (Prayer-for-life) a little rivulet made its escape across the public pathway towards Fautau'a River, and upon the bank of this little stream, near the wall, was a spot saturated with gore, where hogs for the feast had lately been slaughtered. Not far from this spot was the road where Taruia stood, holding his spear by his side, nothing doubting, in readiness to join the procession.

Meanwhile, four of the royal retainers carried the news to the king that on this festive day a fierce young stranger was intent upon doing mischief wherever he could find opportunity, and that they last saw him close by the young princess's premises with his spear in his hand, after killing her and her chaperone while they were out alone, the evidences of which they had themselves seen. This story was corroborated by others who followed, each new party stating that they had seen the man at the place mentioned. Enraged, the king sent the four retainers armed with spears to seize him, whoever he might be, and carry him to the grand marae, there to be slain and offered to the gods and buried at once before the opening of the feast, as executions were not performed during such an occasion or just afterwards. So they sped up to Pure-ora and there saw the spot mentioned and Taruia not far off sitting upon a log, his spear held erect in his right hand, ready to rise as the procession approached.

In the minds of the men, this attitude confirmed the story they had told, and not giving him time to move, supposing that he was ready to spear them, they surrounded him and taking his staff said:

"Where is the king's sister?"

"Over there," he replied, pointing in the direction where the family had gone.

"What is that from?" they asked, looking at the stain.

"I do not know," he said, "I only arrived here this morning." Then they said:

"The king has heard that you have killed his sister and has sent us to arrest you and take you to the marae, where your doom awaits you." Inspired by the spirit of his ancestor of the shark god. Taruia replied: "If you slay me and bury me in the ground, I shall live again; but if you bind me and sink me in the sea, I shall surely die."

So saying, he feigned to fall in a swoon, from which they could not recover him, and binding him hand and foot, attached him to a pole, which was placed upon the shoulder of a man at each end, and they carried him to the marae, whence they sent to enquire of the king what should be done, after what Taruia had told them. The king answered:

"Take him far out into the sea, and invoke the great god, Rua-hatu (Source-of-fruitfulness), to keep his spirit from troubling us."

The men then fastened stone weights to Taruia's feet, as he lay motionless, placed him in a canoe, and took him through the passage of Pape'ete

Harbor. Outside of the reef, opposite the islet, they dropped him deep down among the wide, spreading branches of coral, one of the haunts of great, deep-ocean fishes, and while they were still committing his spirit to the ocean god, they saw the long, blue shark that Taruia knew, approaching him, as they thought to devour him. Thus leaving the young man in his watery bed, they hastened to return home to continue their festive duties.

On arriving at Taunoa they found that the king's sister and her clan had arrived at her brother's house safe and sound, and soon afterwards Taruia's clan arrived, expecting to be met and headed by their young chief in presenting themselves before the king and queen, who did not yet know that the supposed foe lying at the bottom of the sea was their intended guest whom they were expecting soon to see. When the king saw his sister, he enquired:

"*Mai hea mai 'oe?*" (Whence do you come?) Feeling surprised at his question, she replied:

"*Mai Pure-ora mai nei au*" (I have come from Pure-ora). But he told her he had been assured that she was dead and recounted all that had happened that morning. Soon all the people heard the sad story. There was a general wailing, and their gladness in coming together ended in bitter sorrow.

It was almost sunset when the young princess, recovering from the first terrible shock, begged to be taken out to see the place where the young victim had been dropped. As she was fixed in her determination to go, the men who had done the deed quickly bore her across the smooth, ebbing current to the spot, and looking down in the glimmering light, they saw the body of the young man lying upon his coral bed, his limbs unfastened and appearing as if asleep, with his guardian shark at his side. Sitting in the stern of the canoe, in the seat of honor, the young woman bade the men return home, and as they turned the canoe round to do so she suddenly plunged beneath the waves, out of their reach, and with the darkening waters separating them, she too soon lay beside her late acquaintance and the shark, leaving her attendants no alternative but to go and tell her brother of the sad event.

But the tragedy did not end there! The king had the men who had been the cause of Taruia's downfall slain and buried at the marae in his stead, as an example to all his subjects never again to circulate false reports. Thus the day of rejoicing was turned to one of mourning; and what became of the Umu-'opi'o no one ever sought to know.

But the two bodies left with the shark as dead were preserved alive by the ocean gods, and that night while the king's heart was sorest their faithful guardian bore them in his great jaws on to the sandy shore of Taunoa, where he resuscitated them, and knowing their affection for each other he told them that now was their opportunity to go and obtain permission from their king to be united in marriage. When they were seen approaching the royal dwelling early in the morning, they were regarded as specters from the sea, and the news spread everywhere that the ghosts of the two young people had returned among them. But their dripping, briny clothes gradually convinced the king and queen that they really saw their sister and her companion in the flesh. Moreover, they found also that their voices and actions were not supernatural, and soon they were received with open arms by the royal couple and people, and the glad tidings was carried to Taruia's parents, who joyfully went forth to meet and reclaim their son for whom they had mourned as dead.

Permission was obtained from all parties concerned for the marriage of the young people, the former lover of the princess magnanimously consenting to relinquish his rights to her hand in favor of the hero of the day. A marriage feast

was made ready, and escorted by their respective nearest relatives, the happy young pair met the high priest before the great altar of the royal marae and stood apart on either side of him. In solemn tones he addressed the bridegroom with the following question:

"Do you consent to take this woman as your wife, to remain with her until you die?" Taruia answered:

"Yes, I do." Then turning to the bride, he answered:

"Are you willing to be the wife of this man until you die?" She also answered in the affirmative. Then taking their left hands in his, the priest placed that of the bride in the bridegroom's, saying:

"It will be well with you if you thus keep your vows," and he dedicated them in wedlock to their god.

The royal nuptial feast lasted three days, and then the wedding party proceeded to the bridegroom's home, where in becoming pomp the marriage ceremony was repeated in the same manner by Taruia's father, the priest of Rupe. Here also the feast lasted three days, and there was great rejoicing among the mountain clans of Fautau'a.

This is how they say Taruia, a petty chieftain, became the husband of a princess of Pare. They lived long and happily together, dividing their time among their people in the highlands and lowlands, and were much beloved by them. It is well known that they became the ancestors of some of Tahiti's illustrious personages.

Vini, the younger brother, also grew up a handsome young man and married a fine young chiefess of his own rank in another clan, where they dwelt in harmony and also begat sons and daughters who became a credit to their race. (1928:623-632)

Another theme is exemplified in the legend of Tuihiti and Hauvana'a, reproduced earlier. In this account the young bride entered dutifully into marriage caring little for the groom, but after a while "love pierced her heart" (*ua puta atura te hani i roto i te a'au*, literally, was pierced then the affection inside the intestines) and, as we saw, the couple lived "happily ever after."

In the legend of Tafai, "death" itself was overcome by the young hero disconsolate at the loss of his wife (a noteworthy variant on the Orpheus theme):

Tafa'i married a fine young chiefess of North Tahiti, named Hina (Gray), famed for her beautiful raven hair, which when let loose flowed down in waves to her feet and covered her graceful, majestic form; and their attachment for each other was strong and lasting.

Tafa'i was prompt to go wherever duty called him in his own land and also in other lands and, as old records everywhere show, was beloved for his goodness and kind, generous deeds. On one occasion when he returned home from a long voyage he found to his great grief, that his wife was dead. She had just suddenly died, and her body, still warm, was lying in state upon an altar in the ancestral marae, guarded by the priest and elders of the family. Soon, in his sorrow, he determined to contend for her even with the gods! So he inquired of the priest whither her spirit had fled, and he told Tafa'i that it had left their sacred precincts and was now with the spirits of other departed ones at Tataa about twenty miles west of Uporu, which was their place of rendezvous in Tahiti before taking flight for Paradise or Hades in Ra'iatea.

Tafa'i lost no time in seizing his great paddle and launching out into the sea his single canoe (Niu); and then he swiftly darted over the smooth water within the friendly reef and arrived at Pa'ea just at dusk, the right time to meet the souls departing. There he found that his wife's spirit had left some time before for Mount Rotui (Soul-despatching) on Mo'orea, whither the spirits went to take their final departure for Te-mehani (The-heat) in Ra'iatea, which was the last place whence they could return to this world. Onwards he sped across the channel to Mount Rotui, towering steep and high up into the clouds, and soon he was upon its summit. But there too he found that his lost Hina had gone on some time before! With unshaken purpose, Tafa'i descended the mountain and again took to his canoe, and in the dim light of the waning moon, aided by a favorable breeze, he made his canoe almost fly across the wide channel that separates the windward islands from the leeward group. Then he took the shortest route up to Te-mehani, and he did not stop until he arrived at the spot on the mountain plateau where the roads radiated, one to the cliff on the right, called the "Stone of Life," from which spirits ascended to Rohutu-no'ano'a (Paradise-of-sweet-odor), somewhere up in cloudland above the highest mountains of Ra'iatea, and the other to the cone on the left, from which they descended down into the yawning crater of Te-mehani, which led to the Pô.

The moon was almost setting and the morning star was heralding the day when Tafa'i arrived at that place and was met by the god Tû-ta-horoa (Stand-to-permit), who guarded the roads. Tafa'i inquired if Hina, his wife, had passed by, and to his great relief the god replied that she had not yet come. But he told Tafa'i to be quick and conceal himself in the bushes in a precipitous nook close by and that he must rest to gain strength for his undertaking to capture her in her flight, as that was the last place whence spirits could be recalled to this world. Breathlessly Tafa'i seated himself in his hiding place, and just as he recovered breath from his late exertions he heard leaves rustling a little way off, and the god told him to be ready, as Hina had just arrived.

Soon Tafa'i perceived the tall, familiar form of his wife with her hair streaming down her back, and as she arrived upon the ridge of the rock by which he stood she drew back as she scented a human being. Just as she was about to ascend into the air to fly to the Stone of Life, where she would have escaped him, he made a desperate leap up onto the ledge and into the air and caught her by her flowing hair with his long fingernails. Hina struggled to be released, as she was intent on going to the happy spirit world, but her husband held her fast, and when Tû-ta-hora told her that her time had not yet come to leave this world she was prevailed upon to remain longer with her husband. So they returned to 'Uporu, and as soon as Hina reentered her body, which was still well preserved, and opened her mortal eyes, there was great rejoicing in their home and in all the district over the safe return of Tafa'i and his wife from the borders of the spirit world.

It is not recorded in Tahiti that Tafa'i ever again went away from his native land, but it is stated that he and his wife lived long and happy together and that of them was born a son whom they named Vahi-ê-roa (Place-entirely-strange), probably in commemoration of the long voyages of Tafa'i to strange lands. (Henry 1928:563-565)

But not all story marriages were happily-ever-after affairs. In some of them it was the husband whose ardor first cooled, in others the wife's, and in still others the coolness developed mutually. An example of the first theme is found in one episode in the interminable cycle of legends about Hiro:

At last Hiro went to his parents' abode and there dwelt a long time. Hitherto he had lived a bachelor life, indifferent to the fair sex; but in Ra'iatea he at last conceived a strong attachment for a most beautiful woman named Vai-tû-marie (Clear-still-water), who was the wife of a noted warrior named Tutae (Dung), and he determined to possess her himself. So he made advances to the man, sometimes feigning friendship and again aggravating him to hostility, until one day the warrior raised his spear to strike him, when Hiro caught him by the head and broke his neck. Thus freed of the husband, Hiro took possession of the wife, of whom he became very fond, and by her he had two children, a son, named Marama (Moon), and a daughter, named Pî-ho (Splash-and-shout), and everything went on harmoniously between them until the children had grown up.

It happened one day as Hiro and two artisans, named Topa (Fall) and Tovanā'a (Thy-herald), were building a canoe and the wife, Vai-tû-marie, and two companions were talking in a house close by, that the two artisans overheard them discussing the qualities of their husbands, and in an unguarded moment, Vai-tû-marie laughed concerning Hiro's strong odor while the other two women were boasting that it was not so with their husbands. This little episode the men repeated to Hiro, who had not heard it, and he became very angry and bided his time for revenge upon his wife. One day while he was alone, sewing on the planks of his canoe, his wife was passing by, and calling her to him he bade her aid him by getting into the canoe and drawing the sennit in while he drew it out. This the wife willingly did, but as she was not accustomed to such work Hiro contrived by jerking the sennit to make it hard for her to guide it, and in a little while she cried:

"O Hiro, my finger is pinched!"

"Which finger?" said he.

"My little finger," she replied. So he released her, and in a little while another finger got pinched and was freed, then another, and another in the same way, until at last her whole hand was caught. Then Hiro tightened the cord around her wrist and would not release his wife in spite of all her cries and entreaties, but taunted her by repeating what she had said and asking her if it was customary for women to depreciate their husbands in the eyes of others.

"O Hiro," exclaimed the poor woman writhing in agony, "I have not depreciated you, I have praised you to all my friends; regard not this passing remark as evil speaking, and let me go."

"No," said Hiro, "I will not let you go; you are tied with sennit, and you will be inclosed in a wall of shifting sand." Knowing then that he meant to kill her, she said:

"O Hiro, remember how you have loved me, witness my agony in this painful position, and consider yourself avenged for all my thoughtlessness. If I die, I shall belong to the gods, but spare my life now, O Hiro, and let me go." But Hiro got into the canoe and brutally kicked his poor victim to death. Then he dug a shallow grave in the sand beneath the chips of his canoe and there buried her.... (Henry 1928:543-544)

The adventurous Hiro was turned against his wife specifically because of injured pride, but as Adams wrote of another such disaffection "Men have in all times been ingenious in their reasons for deserting women when tired of them" (1901:13).

Reversing the situation, below is a lament credited to Moanarai, a man

of Ra'iatea, as he watched his faithless wife Aitofa sail away in a canoe toward Porapora:

Come back from Toa, O Aitofa,
 O my beautiful erring spouse!
 As the rapid flow of the current at Onoiau,
 And as the swollen torrent from the valley,
 So flows my yearning heart after thee.
 O Aitofa, have compassion on thy lover lest he die!
 The promontory of Tainuu has become beautified (by thee).
 The husband will fear, will shrink, will faint at the re-appearance,
 At the return of the love of the cherished wife,
 Of that face so bright and beautiful.
 Look whichever way he will, she seems to be still down there.

The moon sinking into the western shades is the image of the husband,
 The image of Moanarai at this moment.
 As a great cloud obscuring the sky is his grief,
 The grief of the husband mourning for his estranged wife,
 And like the sky darkened by its rising is my distress for her.

Alas for me! Alas for me! my little wife,
 My darling has gone astray!
 My little beautiful wayward spouse,
 My friend who made my heart brave,
 My friend in the storm has been stolen away.
 A wreath of the fara tree, a garland of Pandanus blossoms I have gathered for thee,
 O Aitofa, and lo! thou art flown.

Ah, woe is me! Is it thus that thou shouldst treat me?
 Lo, thou art drifting away over the ripples in the Aoa shallows,
 Thou art passing the fragrant vale of Vavaara,
 And leaving Mt. Rotui, the upper jaw of Hades, behind thee.
 Thou hast forsaken thy favourite bathing place with its clear water,
 And thy Tiare (Gardenia) bush that blossoms without ceasing.
 Alas for thee, Aitofa! Thou art a little toy canoe that the wind carries away.

Alas for my anguish and the rage of my heart!
 Ah me! I despair and think of suicide.
 I am possessed with frenzy. Alas for us both!
 The mind of the husband gives up the effort to win back thy love.

Alas for my darling! Thy fair face is lost from sight.
 There is no benefit from the home.
 A piercing thorn to me, a pretty thorn to me (art thou).
 What is my fault for which thou art vexed,
 For which thou hast disdained me?
 Why hast thou cut the cord of love, and deserted me?
 An evil-working woman.
 As a long continued storm is my anger,
 At the throbbing within, within me,
 My bowels yearn, my heart flows out after thee.
 I am chilled with lingering affection for thee, O Aitofa, return!

Here is a bunch of red feathers for thee,
 Here is a wreath of scarlet feathers for thee,
 Here is a necklace of beautiful pearls for thee,
 Here is thy home.
 I am Moanarai, thy husband.

(Alexander 1893:55-57)

Turning now to what purports to be a real-life episode, I remind the reader of the case of the Huahine maiden who obtained the marriage consent of a reluctant youth only after threatening suicide. But this marriage was of short duration. According to Ellis, "That attachment, which had been so ardent in the bosom of the young woman before marriage, was superseded by a dislike as powerful; and although I never heard the slightest charge of unkindness proffered against the husband, his wife not only treated him with insult, but finally left him" (1829:II, 567). And Ellis added, "Instances of such unhappy marriages ... were not unusual."

As was reported by Montgomery, and reproduced earlier, men also tired of their spouses, in real life as well as in story. Speaking of liaisons among "the higher orders"—or more specifically between a "chief" and what I take to be a young girl of lower class—it is stated that "In less time than the honeymoon requires to fill and empty her horn, the chief probably grew weary of his spouse"—and forthwith abandoned her (Montgomery 1832:I, 244).

Marital jealousy is the theme of many legends and real-life accounts. One such is the story of Tepua:

In the valley of Pape'iha, Hiti'a (East Tahiti), there once lived a beautiful maiden, named Te-pua-iti-i-te-rau-'onini (The-little-flower-in-budding-leaves), whom we shall call simply Tepua. She had many suitors, and at last she accepted as her husband a young man from Ra'iatea, named Ta'arei (Fall-on-nape-of-neck), who became greatly enamored by her. They lived happily together for some time, when finally Tepua met a new admirer from Papeari in South Tahiti, named Ma'irûrû (Trembling-sickness), who became their guest and completely won her affections from her husband. Soon being awakened to the fact, the husband became jealous and determined to have his revenge, contrary to the usage of hospitality of that time.

So he invited several friends to join him in fishing for 'o'opu, which have always been plentiful in the beautiful river of Pape'iha, and his wife and guest, quite naturally joined the party, having no suspicion of evil designs. They went out in the morning with line and hook and were soon busy ascending the valley along the river bank, drawing up 'o'opu from the pools. By noontime there was an abundance of the desired fish, and then the woman set out to gather wild taro *pota* (spinach) while the men went higher up the valley for *fe'i* (wild plantains). In a most natural way the two rivals found themselves alone together in a ravine, where there were many fine *fe'i*. Then the hour had come. While Ma'rûrû was intent on disentangling a fine bunch from vines overhead, Ta'arei stole up behind and slew him with a heavy pole, so that he fell backwards to the ground. Then Ta'arei mutilated his body with a bamboo knife and cut off a piece of his flesh,

which he wrapped in leaves and placed among his *fe'i*; and he took the body into a family marae, where he left it covered over with maire fronds, after which he returned home coolly with his load of *fe'i* and the secreted flesh.

All the company had returned to the house and were preparing the food to eat when Ta'arei arrived. The men had made an oven, and the women were wrapping the fish in the taro leaves, which in turn were enveloped in banana leaves to steam in the oven, when Tepua seeing her husband arrive enquired after their guest, he merely replied evasively, inferring that he thought he had already returned home. Then Ta'arei sat down and helped make up the bundles of fish and spinach, into one of which he slipped the piece of human flesh, taking care to mark the bundle apart from the rest. At length the food was all cooked, and as the shades of evening were falling it was brought out and served under a spreading tree. According to custom, they formed little groups of members of different families, uniting together at short distances from one another, and soon all were happily feasting.

Ta'arei opened the special bundle and placed it before his wife with *fe'i*, and he opened one of the other bundles for himself. Soon she was struck with the firmness of her supposed fish and enquired into the cause, as she commenced to bite it. After a few evasive remarks, he answered:

"That is a portion of thy heart's desire, is it not according to thy taste?" Then light began to dawn upon her mind, and she enquired where he had left Ma'irûrû. "In the presence of thy god," he said, "under fronds of the sacred maire fern."

Thus Tepua realized the painful fact of the tragedy committed by her spouse, and leaving her food uneaten she went away in bitter grief, girded on her tapa, braced herself with strong cords, and set out into the dark woods, improvising plaintive dirges for the lost Ma'irûrû.

All night long she wandered in the valley, and the following day she arrived at the marae, where she found the mutilated body, and with wonderful strength she raised it and strapped it to her back. Then she bore it out into the village, mourning for her dead, and adhering thus to her burden, refusing to give it up or to be comforted, for two days and two nights, as she bewailed him. (Henry 1928:589-591)

Shortly afterwards the unhappy Tepua gave way to melancholy and died. As for her husband, he returned to his home in Ra'iatea, finding life untenable in Tahiti, because—and this interests us as much as the slaying itself—"the sympathies of all the people of that time were turned in favor of Tepua" (not, perhaps, because of their acquiescence in the adultery or their disapproval of the slaying, but because Tepua was one of their own).

As noted earlier, there were several kinds of occasions when a husband tendered his wife's sexual services, mainly in connection with friendship pacts; but this tolerance seems not to have been extended to unauthorized affairs, for, "while their conduct with respect to the taio, &c. exhibits an insensibility to every feeling essential to conjugal happiness, the least familiarity with the wife, unauthorized by the husband, even a word or a look, from a stranger, if the husband was suspicious, or attributed it to improper motives, was followed by instant and deadly revenge" (Ellis 1829:II, 370).

What was true in Ellis' time was evidently also true during Morrison's a generation earlier:

If a Man finds his Neighbour, or one who is not his adopted Friend in

the Act of Adultry with his Wife he has the Law in His own Hands and may if He thinks proper put One or both of them to Death with impunity or punish His wife with Stripes, and Plunder the House of the Offender; the latter is the Most Common but I have known two Men killd, who were taken in the Fact, and no further enquirey made then the Acknowledgement of the partys present to Certify the Fact. (1935:185)

As we shall see, even an authorized relationship with a bond-friend caused some husbands distress, but the existence of a formal pact evidently denied public approval or tolerance of acts of jealous vengeance.

Records of instances of wifely jealousy exist, but are neither numerous nor detailed. For example, in one version of the legend of the founding of Marae Manunu (Huahine), it will be recalled, when the chief Hotuaitu paid court to the newly arrived Hotuhiva, his own wife left him in jealous anger. But in few of these legendary accounts of wifely jealousy, or in the fragmentary records of real-life parallels, did the wife attack her erring husband or his mistress with anything more injurious than words¹¹—one additional bit of evidence, perhaps, of males' greater authority and privilege in Maohi society.

But what, one may ask, was this "jealousy" that we have been discussing? And what occasioned it? These questions are especially relevant in a description of this society, where sexual interaction went on unconcernedly among the unmarried, and where marital sex exclusively was breachable by customs like friendship pacts.

The LMS dictionary contains several entries translated (among other things) as "jealousy"—*mi'imi'i*, *nanu*, *tapariri*; but the nearest one, semantically, to the expressive act now under consideration is *hae*, jealousy; wildness of beasts; to be jealous, as men and women; jealous; wild, as beasts; enraged; and *pohehae*, jealousy (evidently from *pohe*, to die; to be ill, hurt, or diseased; to be foiled in an argument, or affected with jealousy, and from *hae*). The inference possible to draw from these definitions is that we are discussing an emotion as wild and uncontrolled as that of an enraged animal, occasioned by being deprived of a sexual partner's services (and affection?). When applied to a married couple, however, the deprivation is still more serious in that it violates socially sanctioned rights—not necessarily to the spouse's "affection" perhaps, but at least to control over the spouse's sexual services. Moerenhout put the matter as follows:

The jealousy of a [husband] had more to do with his sense of violated authority than with any regard for virtue or honor. The thing that [husbands] insisted on was that they and not their wives exercised full control over the latter's sexual services, and they did not scruple to bestow those services upon a friend or a stranger, even to forcing [a wife] to accept the caresses of anyone at all in return for money, or some gift or hope of future gain. Exceptions to this practice did exist but were few in number. After tiring of their wives, sexually, they were interested only in maintaining authority over them. To share out their possession

was not the least bit repugnant to them and the ways in which they did so carried no implication for them of shamefulness or baseness.^[12]

And on their side, wives were far from being free from jealousy. Some of them tagged along with their husbands everywhere, never for a moment leaving them alone, and at any hint [of infidelity] they did weep and engage in such demonstrations as almost to convince one that they were based on a love and attachment most sincere. But the fact remains that very few of such wives apparently so deeply affected remained wholly faithful with the husband whose least deviation seemed to drive them to despair—even in some instances to the point of causing them to do themselves bodily harm if unable to discover the rival on whom to vent their wrath. Here, as in some other lands, injured vanity accounted for much jealousy of women. It was not their attachment to lover or husband, but the idea of there being a preferred rival, which led to their despair. I do not wish to imply that there were no exceptions, that there were not some women capable of sincere affection and attachments, but what I fear to be true is that no woman remained faithful of her own inclination. (1837:II, 64–65)

Thus both spouses were vested with rights in the sexual services of the other, but, as is evident in other aspects of the marital relationship, the husband's rights were not only more exclusive, he also had more coercive powers, physical and otherwise, to enforce them—as the rest of Moerenhout's discussion of this subject plainly indicates:

Actual marital separations scarcely ever took place as a result of mutual consent; on principle, the husband alone having the right of repudiation, he was entitled to bring back his wife by force if she left home without his consent. In fact it happened frequently that a wife would run away from her conjugal home and would then he brought back by force. Almost as often, spouses would resume living together after having been separated for some time, for until one of them contracted a new marriage they remained husband and wife. Deviations in [wifely] conduct only rarely led to separations; husbands usually meted out punishment by beating their wives over whom they had right of life and death, even to the point of actually killing them in some cases. There were few young wives who did not have their moments of infidelity, and though some of them may have been somewhat constrained before marriage, generally speaking they made up for lost time afterwards, and especially when their husbands were away, giving themselves over to licentious living the more willingly in the knowledge that such would not prejudice [their chances of remarriage], in as much as the most shameless of women succeeded no less than others in getting husbands.

All the above seems to demonstrate that in connection with their love making and other pleasures, excepting for a husband's right [over his wife's services] Tahitians in general recognized no distinction between good and bad conduct. (1837:II, 65–66)¹³

The above discussion of marital jealousy should not be taken to imply that *all* married couples reacted to trespass in this way. Most of the exceptions involved certain *ari'i* who appear to have been quite indifferent to their spouses' affairs. Typically, the unfaithful wife in question was one who herself held or conveyed a very high-ranking kin-Title; several such women,

after having borne a successor to their husbands' kin-Titles and their own, openly carried on affairs with no apparent objection from their spouses. And conversely, their husbands' affairs seem to have aroused no objection from them. Similar situations may have occurred at middle-or lower-class levels of society, but reports about them are largely lacking.

Symptoms of murderous hate did not usually appear between spouses unless incited by relations with in-laws, which we will examine after a word about co-wives.

The clearest general statement regarding the relationship between a polygynous man and his wives is the one by Ellis quoted earlier: "Many of the *raatiras*, or inferior chiefs, had two or three wives, who appeared to receive an equal degree of respect and support" (1829:II, 571). Ellis, like this author, distinguished between situations such as these, which constituted mutual marriage, and those involving men holding high-ranking kin-Titles, who were obliged to restrict their "official" siring to one wife of an appropriately superior social position:

With the higher chiefs, however, it was different; although they might ... keep a number of females, it was rather a system of concubinage, than a plurality of wives, that prevailed among them. The individual to whom the chief was first united in marriage, or whose rank was nearest his own, was generally considered as his wife, and, so long as she lived with her husband, the other females were considered as inferior. (1829:II, 571)

Henry concurred in this distinction:

Polygamy was much practised by these people, especially those of the *ra'atira* class, their plural wives standing on equality with each other. But a king had but one queen whose children could by right inherit the throne—his children by other women of high rank did not always enjoy the same privilege as those of the members of the legitimate circle. (1928:285)

Whether this statement should, however, be considered an independent observation by Orsmond, or merely Miss Henry's paraphrase of Ellis, is not clear.

Since the only specific case material recorded concerns higher chiefs, we have no way of knowing whether the actual co-wives described by Ellis as having "an equal amount of respect and support" were in fact treated in this way by their husbands. Nor do we know what their relations were among themselves, once they became established as co-wives. I suspect, however, that some such relations were anything but harmonious, judging by the prevalence of other manifestations of wifely jealousy described above.¹⁴

IN-LAWS

The Maohi lexicon contained only four relationship terms applied exclusively to in-laws: *ho'ovai*, *aupurua*, *tao'ete*, and *hunō'a*.

Ho'ovai was used with *metua* to specify "parent-in-law"—with the addition of *tane* and *vahine* to indicate male or female, respectively. It was undoubtedly used as a term of reference and may also have been used for address, although I can find no textual evidence for such usage. Also, I have come across no instances of *ho'ovai* used alone.

I confess to some puzzlement over the set of parent-in-law terms variously listed as *purua*, *apurua*, and *apuru'a*. The LMS Dictionary lists *purua* only (a father- or mother-in-law). Jaussen listed *purua* (beau-père, belle-mère) as well as *apurua* (a[djectif] parent par mariage), and *apuru'a* (s[ubstantif] les parents de deux mariés). And Handy listed only *apuru'a* (term applied to each other by married man or woman's mother and mother-in-law [1930:23]).¹⁵ Faced with this array of variants I am tempted to take part in this intriguing game of etymology by pointing out that *apu* has among other meanings that of 'family', and *rua* means 'two'.

Tao'ete appears in Jaussen but not in the LMS Dictionary.¹⁶ In the former it was entered as "s[ubstantif] beau-frère, belle-soeur," but usages in subsequent compilations indicate with near certainty that for the Maohis of the eras under study this word had the more specific meanings of "wife's brother" and "husband's sister." I can find no textual evidence to indicate whether *tao'ete* was used for address or reference or both, or whether it was used with the sexual qualifiers, *tane* or *vahine*.

As noted earlier, among their other meanings *tane* or *vahine* were terms of address and reference for "husband" and "wife," respectively. In addition, a female's husband's brother and her sister's husband were her *tane*, and a male's wife's sister and his brother's wife were his *vahine*.¹⁷

Hunō'a appears in the LMS Dictionary as "a son- or daughter-in-law"; whether it was formerly used for address or reference or both is not indicated. Presumably, in the event of its use for reference, *tane* or *vahine* were used when required. I have come across no information to indicate how far these terms were extended in a classificatory sense.

In view of the many things about Maohi life that conspired to bring about links of one kind or another between in-laws, it is surprising that so few generalizations have been recorded about such relationships. I list below the few such generalizations, or episodes, I have found that refer specifically to them.

Several references have been made to the parts played by many young couples' parents in arranging their marriages and in carrying out the nuptial rites. I called attention especially to the symmetry of events in such marriages, the principal exception thereto having been the competitive gift-giving engaged in by the respective families on some occasions. It is not unreasonable to assume that family units linked in this way continued to maintain the relationship in some more or less formalized manner, especially on occasions marking the life crises of offspring of the linking marriage. (The

existence of a special relationship term, *aupurua*, adds weight to this belief.) However, no references to such a continuing relationship are known to me.

In my description of the custom of *āmo'a*, I reproduced Morrison's statement that such rites had to be performed with reference to a girl after her marriage, in order to permit her husband to eat with her other male relatives (see chap. 13).

Passages have also been recorded concerning marriages arranged by a suitor and the family (mainly the father) of a young woman—it being stated or implied that the suitor's family had little or nothing to do with either arranging or celebrating the marriage. Also noted has been a typical sequel to many such arrangements, mainly, the tendency by the wife's family to repudiate the contract in time, in favor of a more profitable match.

In some cases similar to these the intervention of the wife's family had more tragic consequences, as shown in the following excerpt from the journal of the missionary Jefferson:

We have also been lately informed that the Otaheiteans are guilty of self-murder, generally on the following account. A man is upbraided by his wife and her family, because he does not make them presents, & is bid to be gone, & come no more near them. This sometimes makes so deep an impression upon the despised husband, that he is resolved to destroy himself, which he effects by casting himself from some rocky precipice or lofty cocoa nut tree. (18 October 1799, LMS Archives)

The legend of Tuihiti and his bride Hauvana'a, reproduced in the section of this chapter on marital residence, exemplifies not only the competing pulls of family and husband experienced by a young wife, but her father's protective attitude toward her—and perhaps also his injured pride.

The motive of the father-in-law in the following report by a Spanish padre seems to have been based less on protectiveness for his daughter than on outraged propriety. (I cannot even guess what the woman's motives may have been!)

Now I want to relate an affair that happened to this headman in the last days of February, before this. He was a married man; but did not live with his wife, as he had turned her out of his house. The woman was staying at her father's house, quite close to our Hospice, although the latter did not want her there, and was not giving her food. Notwithstanding this he (the husband) came after her to use her as his wife, when the father was absent; and the latter learnt from his daughter what I have just said. So, resenting this conduct on the part of his son-in-law, the father kept watch over his house to catch him inside having commerce with the daughter, and to take his life. He succeeded at last in catching him and attacked his son-in-law with a Flemish knife in hand to kill him, while the daughter helped him also with the same intent. But they were not able to finish with him; for, although badly wounded, he escaped from them and fled to our hospice. (Corney 1915:325)

One wife's reaction to "divided loyalty" is seen in Cook's account, quoted in chapter 17, of the treatment accorded Mai by his sister and

brother-in-law. The latter, it will be recalled, combined forces to relieve the unsuspecting Mai of his precious store of red feathers by feigning affection for him. (Beaglehole 1967:220)

In contrast, the following account by Marau (to Adams) indicates not only that brothers-in-law were capable of enmity, but it shows where one wife's loyalty lay when having to choose between husband and brother:

Taua-i-taata, or Tau, for short, Arii of Pare, married Taia, sister of Vanaama-i-terai, chief or Arii of Papenoo, the district beyond Haapape, some fourteen or fifteen miles to the east of Pare. They had two children, whose descendants, by the way, remain Arii of Papenoo down to the present day. That they are Arii of Papenoo and not of Pare was due to the feud told in the following legend.

Vanaa of Papenoo had two jesters, a class of men much petted and allowed many liberties by all Arii. Among other privileges, they were always in the habit of receiving some of the best shares in distributions of food by the Arii. Vanaa's two jesters were or thought themselves slighted in some such distribution and swore revenge. They asked permission to visit Tau at Pare, and on their arrival were received by Tau with the usual feast, for which fattened pigs were killed as an offering (Faaamua). When it was brought before them they turned to Tau and thanked him, remarking, with a laugh, that Vanaa had compared him with a pig. Of all the stock insults that are most resented throughout Polynesia, one of the worst is to call a man a pig. Such a man is, like a pig, fit only for sacrifice. Many a death and not a few wars have sprung from this word *puaa*. Naturally Tau felt himself mortally insulted by his brother-in-law, and lost no time in preparing his revenge.

Ordering a great feast to be made ready at the Marae of Raianaunau, Tau immediately bade his men bring out his canoes, while the two jesters, fearing the consequences of their act, especially to themselves, escaped to Papenoo. Tau's wife, Taia, noticing the preparations, asked her husband where he was going, and he merely replied, "I go to visit your brother." Very little time was needed for expeditions of this sort in the South Seas, unless some ceremony was to be performed or resistance was expected. A few hours would be enough for the insult, the passion, and the revenge. Tau started immediately, and his men soon paddled his canoes round the point at Matavai and abreast of the village of Papenoo, where they stopped and hailed, with the cry that it was Tauaitaata of Pare. The people of Papenoo gathered on the beach to receive him, but were surprised to find that no one came ashore. The Arii himself, Vanaamaiterai, then hailed the canoes and asked, "Why does not Tauaitaata land?" The reply came that the sea was, for the moment, too rough. Then Vanaa, in the courtesy of the chiefly relation, did what Tau intended him to do, he swam out, and on swimming alongside Tau's canoe he was quietly and instantly clubbed on the head and his body drawn into the canoe without betraying to the people on the shore a sign of what was happening. They were only somewhat surprised to see that after their chief had got aboard, alone, the canoes turned and paddled back toward Pare with Vanaa, but without a single attendant.

On arriving at Pare, Tau had the body of Vanaa carried to the Marae of Raianaunau, and without going to his house, followed the body to the Marae where the feast was already prepared. Of course Tau meant that the murder should be kept a secret from his wife until he should be ready to deal with her; but when the drums of the feast began beating for the dead, Taia, hearing them and not hearing of her husband's return, asked: "Why are the drums of Raianaunau beaten?" Her women answered that the Arii must have arrived; but she knew the

tones of the *pahu* too well to be deceived. She listened again, and cried: "That is not for an Arii's arrival; it is for an Arii dead! Who is dead? Not Tau, for I should have been told! Why am I not told?" She sent one of her women to ask, but the woman came back without an answer. Then Taia sent for her husband, Tau, who sent back word that he could not see her for three days, as his duties or ceremonies required.

This was enough to waken Taia's suspicions. She knew that Tau had abruptly started to visit her brother, and had returned without coming near her, and was making a feast over a dead Arii. She ordered one of her women to go out and look for the first person coming from Papenoo, to ask about Vanaa. Two days passed before the woman reported that she had just seen a man from Papenoo who told her that Vanaa had gone away with Tau, on his return to Pare. "I know now," she cried, "that my brother is dead"; and she ordered the man to be brought to her, to tell her all he could. Then she sent him back instantly to tell the people of Papenoo that their Arii was murdered, and they must send canoes immediately to rescue her. The same evening the boats arrived and she set out in them, taking with her, after much hesitation, her two children.

Then began the part of her activity which was most characteristic of the island society. Custom prescribed a regular course for women who sought justice or revenge. In the murder of Vanaa, Tau had outraged not only the district of Papenoo, of which Vanaa was Arii, but all the districts and Arii connected by political or social ties with Papenoo. The whole eastern coast of Tahiti beyond Pare Arue (Haapape, Papenoo, Tiarei, Mahaena, Hitiaa) formed one connected group known as Teaharoa. When united, the Aharoa were much stronger than the Purionuu, or Pare Arue, where Tau was Arii. To revenge her brother, Taia had to visit each of the Aharoa Arii in turn, and claim his assistance, which, in such cases, was seldom refused.

Accordingly Taia stopped first at Haapape and made her complaint. Then, continuing on her way eastward, she stopped abreast of her landing-place at Papenoo, where the beach was already crowded with people awaiting her; but she cried out: "I will not land! My orders are: Let no one pass through Papenoo! Bind the two jesters! Prepare for war! Wait my return! I go to tie our alliance of the six Teaharoas!" Going directly on to Tiarei and Mahaena, she ended her journey at Hitiaa, received everywhere with open arms and pledges of support. Returning to Papenoo, she put the two jesters to death and their bodies were taken to the Marae. This done, she waited the arrival of the other districts to make the attack on Pare.

Against such an attack the chief of Pare seems to have felt himself helpless, for when his feast was over, and he learned that his wife and children had fled, he knew what she would do to revenge her brother, and, without waiting for the invasion from Teaharoa, he escaped to Moorea.

With his departure, his line ceased to be Arii of Pare. He never appeared there again. His wife, afterward married Tevahitua i Patea, and from this marriage our Papara family is descended. (1901:78-81)

It would be unwarrantable to generalize about Maohi in-law relationships on the basis of these few episodes, but certain features of Maohi life cannot have helped but influence those relationships in many cases:

1. Extended family households inevitably brought some in-laws together into close, everyday interaction, resulting in situations of divided loyalty, split authority, diffuse affection, multiple sexual standards, sharpened aversions, and so on.

2. The potentiality for sexual relations between a man and his wife's sisters, as institutionalized occasionally in sororal polygyny, seems likely to have colored their relations even without their actual marriage; and in view of the institution of leviratic marriage, the same may be said of the relations between a woman and her husband's brothers. In other words, it is my surmise that many such relationships included casual sexual encounters, for example:

The Women have too great an intercourse with different Men. An Elder Brother has connection with another Brothers Wife, and the Younger Brothers with their different Brothers Wives whenever Opportunities offer without giving Offence, it is considered no infidelity, for I have known a Man to have done the Act in the presence of his own Wife, and it is a common thing for the Wife to assist the Husband in these Amours. But what is remarkable, it is not so among those who are not related to one another; it is then a violation if a married Couple err on either side, for if a Man finds another with his Wife he'll kill him if he can, and if the Woman discovers the infidelity of the Husband she will certainly take revenge on the Woman. (Bligh 1789:II, 78)

3. The timing of kin-Title transfer had well-recorded consequences upon parent-child (successor) relations, which probably extended to the latter's spouses.

4. In the case of a couple's respective families, one may suppose that their interests converged, when their kin-Titles or other properties devolved upon a single successor, as was often the case. On the other hand, instances of divorce, which were all too evident, probably led to conflict between the respective families as well.

I cannot spell out how these several features may have influenced relations between various pairs of in-laws—say, between a man and his wife's brother, a woman and her husband's mother—but it may be useful to remind the reader of the greater frequency of interaction between some of these pairings, brought about by the preponderance of virilocal residence. In other words a man was less likely to interact with, say, his sister's husband than he was with his brother's wife. I think it possible that such tendencies may have had institutionalized consequences of one kind or another, but I cannot discover what these were.

SEMI-MARRIAGE

I believe it possible and useful to distinguish four other kinds of regularized heterosexual union that occurred among the Maohis in addition to the one I call "marriage."¹⁸ These were unvalidated unions; unions of a man and a secondary wife; unions of a woman and a secondary husband; and unions with concubines or gallants (as distinguished from casual sexual encounters).

“Unvalidated unions” designates those characterized by all features of “marriage” except for the circumstance that one or both of the principals’ families deliberately withheld its recognition of the full family status of the union’s progeny. Many persons living far from their relatives undoubtedly entered into marriages without the latter’s knowledge, or concern, but at present I refer to unions toward which one or both of the principals’ families deliberately and openly withheld recognition. That such unions were not unusual has already been indicated. Most typically they involved couples of different class status from whom recognition was withheld by the family of the higher-class spouse. There may also have been cases of recognition withheld for other reasons—say, because of interfamily enmity—but records of such situations are lacking. Also, instances of two-sided family disapproval undoubtedly occurred, for example the story of the tragic love affair of “Princess” Pereitai and her lower-class lover, Te Muri, wherein it was naturally assumed that the latter’s parents would have disapproved of the match, “... for no plebeians could ever wish to bring down wrath upon themselves and even their district by forming such a union” (Henry 1928:600). However most of the information on the subject implies positive disavowal by only one side.

Some “unvalidated” couples were “driven into exile,” or “lived in disgrace,” according to some accounts, but many others probably lived fairly normal lives, incapacitated, if at all, only by the ambiguous status of their offspring.

Unions with “secondary wives” were probably numerous, especially among *ari’i*.¹⁹ As pointed out earlier, men with high-ranking kin-Titles usually had one “primary” wife, by whom succession was appropriately assured; in addition, some of them appear to have had a secondary wife or two, as well as regular concubines (and of course any number of casual sexual affairs). In some recorded instances the social position of the secondary wife was as high as that of the primary wife, the only difference having been the latter’s antecedence—indeed, in some instances such women were sisters, and the offspring of the secondary wives were likely to have been allowed to survive (Jefferson, Journal, 13 April 1800, LMS Archives). The offspring enjoyed all the prerogatives of their superior positions, including in some instances eligibility to their fathers’ kin-Title. (It also happened sometimes that a secondary wife superseded a primary one if the latter failed to produce a successor.)

Evidence regarding the relationship between a man’s primary and secondary wives is as scant as it is inconsistent. When the legendary maiden Hotuhiva landed on Huahine and moved directly into the affection (and presumably into the bed) of the reigning chief, the latter’s wife left him in anger (Ropiteau 1932:124-125). In contrast, relations between Po-

mare I's first (and principal) wife, 'Itia, and his third wife (or "semi-wife"), Pipiri, were evidently entirely congenial.

Like much else about Maohi social relations, generalizations on this subject are either rendered impracticable through flimsiness of data or overly complicated through differences of personnel and of context.

Many Maohi married women had more or less recognized lovers, as the following paragraphs will show; but the only specific cases of "polyandry" that I have come across occurred in legends, as for example in the one about Honoura. When this giant-hero arrived at Ra'iatea in the course of his adventurous travels, his brothers are described as having gone inland "to pay their addresses to the famous handsome woman Teura-tau-e-pa. And they obtained her as their wife" (*Riro atura taua vahine ra ia raua*). To this the translator, Miss Henry, added this prim note: "In olden times partnership in wives or husbands was not ill regarded." (Henry 1895:277, 293)

But to accept as an instance of "marriage" such a case as this may be reading too much into the story. (For example, the phrase *taua vahine*, which Henry translated "their wife," could also be translated "their mistress.") And the same holds for Ellis' general statement on the subject:

When the rank of the parties was equal, they often separated; the husband took other wives, and the wife other husbands; and if the rank of the wife was in any degree superior to that of her husband, she was at liberty to take as many husbands as she pleased, *although still nominally regarded as the wife of the individual to whom she had been first married.* (1829:II, 571, italics added)

Indeed the strength, persistence, and in some respects exclusiveness of a validated marital tie once established is revealed in Morrison's description of the levirate:

"If a woman has (a) husband and he dies without Issue the Husbands Brother takes her; if He has no wife and should be have Issue by Her the Children are Calld by the Former Brothers Name, & take his estate" (1935:184-185). (The rationale for this intriguing custom would be more apparent if the deceased had been the elder of the two brothers, but such is not specified in Morrison's passage.)

It is my belief that most if not all that has been labeled polyandry in ancient Maohi society was not "multiple marriage" at all but instances of husband surrogation or of overt and more or less regularized unions of married women with their lovers. As Ellis indicated in the passage quoted above, and as documented in several well-known cases, the latter kind of situation was a fairly common occurrence, mainly (if not entirely) with *ari'i*-class women. The best-known relationships of this kind were those of 'Itia, the "primary" wife of Pomare I. Bligh provided the following report

of her situation. (In 1788 when this observation was made 'Itia was about thirty years old and had eight years previously borne a successor to the high-ranking Title of her husband, and the latter had been relegated to the regency, which was shared in some measure by 'Itia.)

Tynah [Tina, i.e., Pomare I] as usual gave me his constant Company, and put me in mind that when I came here again I was not to forget the different things I had promised should be brought out to him. He left the Table soon after dinner, when Oreepyah (his Brother) and Odiddee told me a peice of Scandal I had never heard of with certainty before. This was that Iddeah, Tynahs Wife, kept a Gallant called Taerree, and that he was a towtow and the very person who had fed Tynah at dinner. They said also that Tynah knew it, and it was so far agreeable to both parties that both men cohabited with the Wife in the same hour, and in the presence of one another. As I appeared to doubt of the fact, they took several Opportunities to convince me in the course of the day by mentioning it to some others who all declared it was true, and I have no longer any doubt of it, not but I believe it is more or less the case as far as I can find throughout the whole Island. The Virtue and chastity of the cheif Women is by no means equal to what it has been represented, and it certainly is not a fact that they will not grant favors if opportunity and convenience offers. (1789:I, 399)

And Bligh further added:

The Peice of history of this Woman, Tynahs Wife, which I have already related concerning her having a Gallant, was to day most effectually confirmed to me by Odiddee, for her Husband leaving us after dinner, Odiddee opened the discourse to the Lady herself, and told her he had mentioned to me that Taerree was a particular friend of hers, and of the intimacy that subsisted between them, at which she laughed, but said he behaved ill for telling me of it. He seemed however not to have spoken any thing that was illiberal, for it was a matter that diverted them both for some time, and I beleive is very common in this country, without any disgrace to either party. (1789:I, 404)

Some fourteen years later the conduct of this same 'Itia, this time with a much more distinguished bedmate, was chronicled in Turnbull's journal:

About this time the king's mother, Edeah, appeared alongside, in a canoe, attended by her favourite, a chief of the island Huaheine, a man of a most savage figure and manners. This lady had been for some years separated from her husband Pomarre; but had not on this account suffered any diminution of power or respect in the country. These two personages came on board our ship with their characteristic frankness, and were treated by us with all possible attention, having learned from the gentlemen of the mission, that Edeah still enjoyed such influence in the state, that her favour might be essentially useful to us, as we had every thing to fear from her resentment. No pains, therefore, were spared to gain her good will; she and her favourite chief were conducted to the cabin, and there entertained with grog, tobacco, &c. &c. Several presents were offered her, on which she seemed to set very little value; but expressed great eagerness to possess a *poo puey*, or musket. This, however, we thought most prudent to withhold at present, as we were not as yet sufficiently acquainted with our company,

nor with the state of matters on shore. This queen dowager and her paramour, however, continued to drink, and interchange tobacco, till they were nearly incapable of leaving the ship, each appearing to be equally delighted with their entertainment. The attendant was so well pleased, that on taking leave, he urged the writer of this narrative to accept him as a *tayo*, or intimate friend, a civility he declined in the way least likely to give umbrage. (1813:134-135)

A few days later Turnbull received a return visit from the pair, and the episode that followed is revealing both of their relationship and of Tina's ('Itia's husband's) attitude toward her:

One day we had Edeah and her favourite chief to dine on board; not that they cared for our food dressed after our own manner, but because they knew that unless they ate with us, they could hope for none of our *ava* and tobacco, for which they both ardently longed. That we might not appear to be *perre perre*, niggardly and stingy, qualities they very artfully affect to abhor, they were suffered to indulge to their fullest wishes. After a very short interval, they renewed their calls for more; this was set before them, but the division of it had nearly occasioned a very serious quarrel between the lady and her attendant, who started up from table, and with the most savage fury swore in the language of the country, he would put an end to her existence for having, as he said, taken to herself a little more than her due share.

The effect of the liquor on the two guests was very different; for while the man became mad and furious, the poor queen dowager appeared silly and childish. She burst into tears and trembled with fear, as her companion grew outrageous and desperate. Just at this time Pomarre came on board to have some work done at our forge, and hearing the noise below, was touched with compassion for Edeah, his former consort; but unwilling personally to interfere, he beckoned to me to go down, and endeavour to arrange matters, without his appearing to know any thing of the business. This was done; but it was only by a promise of a little more spirits that peace could be restored, and the fury of the savage restrained from breaking out into some desperate act. Poor Edeah, however, still affirmed that he would take some other opportunity to reproach her for the imaginery offence. The glass again went round to the great satisfaction of our company, and we at length succeeded in getting the lady and her companion out of the ship; for which Pomarre afterwards repeatedly expressed his gratitude. (145-146)

In comparison with her son's wife's affairs, 'Itia's sexual behavior was restraint itself. According to Wilson, "The queen has had as yet no child, nor is it likely she should produce any, as, if the reports our missionaries have received are true, she is a perfect Messalina, and lives in a promiscuous intercourse with all her porters" (1799:322). As noted previously, the wife of a very high-ranking Titleholder, such as Pomare II's was, did not normally engage in extramarital affairs openly until after bearing a successor for her husband, but this wife's behavior may perhaps be accounted for by the notorious circumstance that her husband seems to have preferred the embraces of men.

Georg Forster witnessed a situation which could be interpreted as multiple marriage, or divorce and remarriage, but probably should be

viewed as the kind of arrangement under discussion. On one excursion this fastidious naturalist had occasion to stay overnight at Atehuru with a man named "Potatow [Pohuetea, tribal chief of Puna'auia], who had "parted with his wife *Polatehèra*, and taken a younger to his bed, while the lady had provided herself with a lover or a husband, and they all continued to live very peaceably in the same family." (1777:I, 359)

Perhaps not entirely peaceably, for elsewhere Forster indicated that *Polatehèra* seemed to have had some troubles with her gallant: "The young man had an affection for a Tahitian girl, and our ship was the place of their rendezvous. They did not however contrive their amours so well, as to remain undiscovered. The masculine *Polatehèra* caught them one morning, gave her rival many hearty boxes on the ear, and humbled the guilty lover with a severe reprimand." (1777:II, 94)

Enough instances of concubinage have already been listed to indicate the range of the occurrences of this kind of relationship. It was probably more common than *cicisbeism* and less limited to the upper class, but, beyond that, generalization is scarcely feasible. For one thing, from the scant information recorded, it is often impossible to know whether certain heterosexual relationships involved concubines or secondary wives; indeed some of these relationships probably were borderline cases. (But I persist in maintaining that the distinction is a genuine one, both by modern analytical standards and by Maohi classification.)

SEPARATION AND DIVORCE

As we have seen, separations between spouses were fairly common, but according to the definition of some writers—a definition I favor—divorce was not final until one of the couple remarried.²⁰

Several writers have expressed general opinions about the frequency, procedure, causes, and consequences of Maohis' separation/divorce. A passage from Ellis describes the marriage tie as one of the "most brittle" of Maohi relationships, and as having been terminated easily and on slightest cause (1829:II, 571). According to Moerenhout, "These marriages, so easily entered into, are terminated with what seems to be equal facility; for couples remain united only as long as it suits their mutual inclinations *se quittant dès qu'il leur en prenait envie* [lit., leaving each other whenever they feel so inclined]." (1837:II, 63; see also J. Forster 1778:424)

Moerenhout also voiced the opinion that divorce occurred most frequently during the period just after marriage. This may have been the case with lower-or middle-class couples, but I have the impression that when a high-ranking kin-Title was involved, separation (divorce itself having been rare) was most common after birth of a successor. Needless to say it is not possible to provide statistics to support either of these opinions. (In this

connection general statements about the prevalence of divorce have to be weighed with the possibility in mind that the observers' attentions were probably directed more to the wrecks of marriages than to instances of marital stability.)

Statements about the ease with which separation and divorce were effected are somewhat at variance with other observations, sometimes by the same writers, about the control many husbands exercised over their wives, including their ability in many instances to retrieve runaway wives by force. There must have been wide situational differences in this respect—depending upon the social position of the wife, the support given her by her own family, the personality and relative strengths of the spouses, and so forth—but in general the statement about ease of divorce probably ought to be qualified by “the husband permitting.” This does not mean, however, that I subscribe fully to the following statement by Morrison that “If a Man has a reason to part with his Wife he informs her of it to which she mostly agrees, deeming it reproachful to remain after such notice” (1935:185); for the first step toward separation or divorce was sometimes initiated by the wife.

As for the final step, while my belief about divorce being effected only by remarriage of one of the spouses may in general be valid, it is not unlikely that some instances were less clear-cut. What, for example, would the situation have been if a woman quit her husband, returned home, and then remarried—all with the support and approval of her own family, but against the wishes of her first husband and his family? Or, if a husband had cast off a wife to marry another, against the wishes of the former's influential family? Uncertainties and ambiguities like these serve to reinforce the conclusion that Maohi society, for all its size and interconnections, still lacked central institutions for interpreting and enforcing widely recognized but vaguely formulated norms.

In the same sense, in the absence of any central authority for legislating valid grounds for separation or divorce, the numerous admissible causes differed greatly in applicability and weight. In some instances, it appears, a husband chastised but held on to his wife despite her continued indolence or her habitual adulteries; while in others, he dismissed her on nothing more tangible than boredom with her presence. And on their side some women remained with their husbands despite hideous provocation,²¹ while others left them for no discernible reason at all. In other words the potential grounds for separation or divorce included anything that displeased one spouse about the other; what use was made of such grounds depended upon the choice of the defecting spouse and his or her—mainly *his*—ability to enforce that choice.

Turning now to the consequences of separation and divorce, I continue quoting Morrison's summary of arrangements:

"... he then Devides all His Goods and Chattles with her, and she leaves him and takes the Female Children with her leaving him the Males. If she lives single she always Claims the rights of a Wife, and tho they do not Cohabit, always look on each other as Friends and Apply to each other for any little property which at any Future period of their seperation they may stand in need of and each enjoys their own estate but should they Choose to live together after such seperation it lies at their own option and they may return to each other at any time. If the Woman takes an other husband she relinquishes all claim to her rights in her first Husband, and Can demand No More of Him but Her own estate and her part of the Goods as before discribed. (1935:185)

Morrison's distinction between separation and final divorce has already been included in my definitons, although his notion about the amiable relations between separated spouses is doubtless too inclusive and too cheery by far. His description of the property settlement is, moreover, far from clear.

The property transactions accompanying the inception of marriage were, it will be recalled, of several different kinds, depending upon the type of wedding, the spouses' social statuses—absolute and relative—their relative ages, the bride's previous marital history, and so forth. If by "Her own estate" Morrison referred to the divorced wife's rights in her own family lands, then it seems altogether plausible that her former husband's use-rights in that estate would have terminated with the divorce. But I cannot divine what Morrison intended by the husband's "Goods and Chattles," which were said to have been divided with the separated *and divorced* woman. Were these the durable objects constituting her former dowry? Objects produced by herself, or by their joint labor? Or even those objects produced or owned entirely by him? Lacking, as we do, any clear and full picture of the property aspects of the marriage contract itself, I am not in a position to describe what took place at the termination of the contract.

Finally, I am not at all disposed to accept, literally, Morrison's statement about disposal of a couple's offspring in the event of their divorce. Compare, for example, Moerenhout's account of such happenings:

If they separated, after having had children, as rarely happened, it was always arranged in such a way that there would be no argument [dispute]; for, from the moment of his birth, a child belonged, by virtue of a general covenant, either to his father or to his mother; and, in keeping with this covenant, followed one or the other, when they [happened to] separate. This covenant was based on the fact that at birth a child took the name of some member of his family, either on his father's or his mother's side, and belonged to the family from which he had received his name. (1837:II, 63-64)

If it were customary to bestow upon a male child some name derived from the father's relatives, and a name from the mother's relatives upon a female, then Morrison's statement might be brought into line with Moerenhout's; but I can find no other evidence that such a custom prevailed.

As for Moerenhout's other generalization, that a child was at birth assigned to only one parent's family, be it mother's or father's, this is so fundamentally at odds with all we know about Maohi consanguinity that I cannot understand how Moerenhout came to accept it. The physical location of children of divorced parents was probably determined by a number of factors—Title incumbency, age, even sex—but a newborn's consanguineal ties were based on descent, which in most instances was inclusively bilateral. Perhaps what Moerenhout had in mind was the popular (but not invariable) custom of assigning newborns to foster parents, including relatives of either father or mother.

CHAPTER 20 *FRIENDSHIP*

In a society so diffusely consanguineal and so pervasively hierarchical as that of the Maohis, most of an individual's day-to-day interactions probably took place with persons explicitly identified as consanguines (or affines) or as having more (or less) authority or privilege of some kind or another. But interaction did take place between persons not thus categorized, or between persons whose ties of kinship, superiority, or subordination were tenuous enough to ignore or override in favor of a more positive relationship of *friendship*.

The Dictionary of the London Missionary Society lists three Maohi words as having had the meaning of "friend": *hoa*, *taua* [*tau'a*] and *taio*. In the absence of adequate textual materials it is impossible to specify how these words overlapped or contrasted in meaning, but *taio* is certainly the one most frequently encountered in the sources, and it is the form used most often to refer to the more formalized friendship relationship founded on a definite contract, that is, on a friendship pact.¹

Friendship pacts varied rather widely in reference and overlapped with the relationship I label "fosterage." At one extreme such a pact seems to have been a formalized but rather casual way for two individuals to indicate peaceable intent toward one another—say a traveling chief with a dignitary met en route (Corney 1913:317).² In many cases the "contract" was probably short-lived and was concluded with nothing more than a temporary interchange of names and an exchange of presents. Some such encounters may in fact have dispensed with name interchange, as witness the following report:

We now took our leave of our freindly cheif and proceeded along shore for about a mile when we were met by a throng of people at the head of whom appeard another cheif. We had learn'd the ceremony we were to go through which was to receive the green bough which was always brough(t) to us at every fresh meeting and to ratifie the peace of which that was the emblem by laying our hands on our

The bulk of this chapter appeared originally in *Polynesian Culture History: Essays in Honor of Kenneth P. Emory*. Bernice P. Bishop Museum Special Publication 56, edited by G. A. Highland et al. (Honolulu: Bishop Museum Press, 1967).

breasts and saying Taio, which I imagine signifies friend. The bough was here offered and accepted and in return every one of us said Taio. (Beaglehole 1962:I, 254–255)

The visitors having been European may have colored somewhat the Maohis' view of the situation, but probably did not alter radically the ritual procedure. At the other extreme was the kind of "friend-adoption" described by Morrison (I reproduced the passage in chapter 13, in connection with my discussion of *āmo'a* but now do so again for the reader's convenience):

When a Man adopts a Friend for his Son the Ceremonie is the same [as a nuptial rite], only placing the Boy in the place of the Woman, the Ceremonie is ratified, and the boy & his friends exchange Names and are ever after lookd as one of the Family, the New Friend becoming the adopted son of the Boys Father—this Frindship is most religiously kept, and never dissolves till Death, tho they may separate, and make temporary Friends while absent, but when they meet they always acknowledge each other.

And should a Brother or one who is an adopted friend become poor or loose his land in War, he has nothing more to do but go to his Brother, or Friend, and live with him partaking of all he possesses as long as he lives & his wife and Family with him if he has any—or if any relation or Friend, tho not in immediate want, comes to the House of his Friend, he is always fed while he Stays and is Not only welcome to take away what he pleases but is loaded with presents. (1935:189)³

Motivations for this kind of contract must have differed rather widely, both in terms of public avowal and private design. One motive was described by Morrison:

If any Person wishes to have his son or Daughter instituted into the [Arioi] Society he procures an Areeuoy to be His Son or Daughters Friend and Adopts him for His Son by performing the Amoa ... towards Him and His Son or Daughter at the Morai and the Child is acknowledged an Areeuoy immediately the Ceremony is over, and May Continue to follow their Methods while He or she thinks Proper. (1935:235)

It goes without saying that friendly acquaintances developed among females as well as among males. If evidence were needed on this score there comes to mind a story about a young woman who gave her own life to save a female friend from the former's cannibal mother. They are described as "... loving one another like sisters with the same father and mother" (Ropiteau 1929:289). On the other hand, I have found no specific references to friendship pacts between Maohi females. Yet Turnbull did record that offers of *taio*-ship were made by many Maohis, including some females, to the Hawaiian mistress of an officer of a visiting ship (1813:267).

Friendship, quite apart from consanguinity, affinity, and casual sexual liaison, also occurred between females and males. When Europeans arrived on the scene some women actively made *taio* pacts with their visitors, evidently for political advantage or for a more dependable source of European objects; but whether such pacts had been entered into previously is not

certain. In this connection, Wilson wrote: "Lieutenant Corner also added, that a tayoship formed between different sexes put a most solemn barrier against all personal liberties. Our brethren [the London Missionaries] who are returned, however, think this not to be the case; or that they have, since his visit, degenerated." (1799:346)⁴ This "backsliding," if such it was, must, however, have begun much earlier, for in his journal of 1769 Molyneux wrote that "Individuals form Freindships with Individuals & every ... [European] has his Tayo (or Friend) this might be productive of good Consequences but the women begin to have a share in our Freindship which is by no means Platonick" (Beaglehole 1955:553).

Another passage from Wilson raises the possibility that women occasionally became *taio* of *mahu* (male transvestites): "These mawhoos, being only six or eight in number [on Tahiti?], are kept by the principal chiefs. So depraved are these poor heathens, that even their women do not despise those fellows, but form friendships with them. This one was tayo to Iddeah [‘Itia, wife of Pomare I]." (1799:198)

Mahu, who spent much of their lives living and working as females, undoubtedly formed "friendships" with some women, but whether they entered into formal *taio* pacts with them is not altogether sure. It is quite possible that Wilson's use of the word "tayo" to describe 'Itia's relationship with a *mahu* may have been based on his own incomplete understanding of the *taio* institution, and not as a result of hearing Maohis refer to the relationship as such.

Most of the friendship pacts reported in the sources were, however, between males, and usually, but not invariably, between those of approximately the same age and class; in these and other respects such relationships somewhat resembled brotherhood, but came even closer to approximating actual interchange of identity. Finney made the interesting but undocumented suggestion that "... all chiefly youths ordinarily took a bond-friend in the course of growing up" (1964a:435n).

In attempting to reconstruct the *taio* institution, we face the problem of deciding what aspects of it were pre-European. Most recorded instances of it had to do with pacts between native and European; and while much of the native institution probably carried over into the new manifestations, it may be assumed that some changes were thereby introduced—in motivation as well as in degree of commitment and pattern of interaction. For example, the case of Mai excepted (see below), it is unlikely that cynical self-interest was so prominent in pacts between Maohis as it was in some pacts initiated by Maohis with their unsuspecting European visitors.

Name exchange was a fundamental part of a friendship pact between Maohis, but I am uncertain about the details of the arrangement.⁵ It may occasionally have involved Titles, but perhaps more commonly it involved *personal* names. Also, although some name exchanges may have become

complete and “permanent,” others appear to have prevailed only when the principals were in each other’s presence or proximity. There is, however, a legendary account of a friendship pact between an island’s tribal chief and highest-ranking kin-Titleholder and one of his subjects which involved an exchange of names and which (for certain purposes at least) is described as having invested the latter with “regal authority.” This account concerns the spread of the Arioi sect from Ra’iatea to Tahiti and will be presented in chapter 22.

The extent of “identity interchange” involved in some friendship pacts is revealed in the following excerpt from a statement reproduced earlier:

When a Chief is present in any Company the Men strip their Bodys to the Waist not suffering any Covering on their Head or Shoulders in His Presence—and all the Weomen present uncover their Shoulders tucking their Cloth under armpits, to Cover their Breasts in token of obedience and respect, to his presence; the Men are not always particular in this point except Upon the Chiefs Hereditary land *or that of His adopted friend*, where any neglect would be deemd an Insult and punishd accordingly—(Morrison 1935:168, italics added)

The sources generally agree that a friendship pact had the effect of prohibiting sexual relations between a man and his *taio*’s sisters or daughters,⁶ (and presumably mothers): “... if a Man Makes a friend that Friend can never have any Connection with any female of the Family except His friends Wife, evry other becoming His relations which they hold an abomination to have any Conexion with, nor can they be perswaded to alter that Custom on any Consideration, detesting as much as we do to have their own relations as wives” (Morrison 1935:237). I have discovered no evidence of the extension of this prohibition to other consanguines of each *taio*. In fact, the question of how far a friendship pact involved relatives of the principals is unanswerable. Statements, such as the following, *imply* a rather wide extension of the pact’s undertakings—at least in terms of norms: “Otu [Tu] show such a friendly attachment towards me [Rodriguez] that in a little while he adopted me as his brother, and as a son to his own parents and other kinspeople; and he exchanged his name for mine, an act which, among these people, is the bond of highest favour” (Corney 1919:6). But we are provided with little evidence concerning the actual implementation of such promises. An episode recorded by the missionary Crook provides an example of the consequences of friendship combined with fosterage (presumably, the “friendship” in question was of the pact variety):⁷

Some unpleasant things happened today which evinced the ignorance, pride and duplicity of our judges. A widow woman has been excommunicated for crim. con. with a young man who is unbaptized. Her brother a chief of a district prevented their being married and therefore they ran into the mountains together. On Saturday last they were caught tied with ropes and used very cruelly by some of the inferior judges. Today the judges informed me that they were going to

bring them to trial. I told them to do so and then allow them to be married to prevent future mischief. They seemed to consent but took every indirect method to counteract my design. They sentenced the man to be banished and the woman to work altho three months gone with child. As the man was forcibly led away the woman followed him, but was dragged from him with many struggles. I remonstrated against their proceedings.

The chief judge a member of the church accused me with opposing the king and the laws and with opening a door for the commission of crime. After such an insult the people expected that we would leave them and were much alarmed. The chief of the district and a multitude of people thronged our house entreating that we would not leave them. The cause of the marriage being so much opposed is that the chief has adopted a boy who is a friend of the young man, and therefore the young man is his friend or son as well as the boy according to their old customs and therefore must not marry his aunt. (Crook, Journal, 10 April 1826, LMS Archives)

In striking contrast with these proscriptions, a friendship pact appears to have licensed and even encouraged sexual relations with a partner's wife, she having been considered "... a common property for the tayo" (Wilson 1799:346).⁸ According to Morrison, however, the woman herself had a choice in the matter: "... it is lookd upon (as) a piece of Great friendship for a Man to Cohabit with the Wife of His adopted freind if She is agreeable: the Adopted friend being always accounted as a brother" (1935:184).

In one version of the legend of Honoura, warrior-heroes (*aito*), as an occupational category, are also described as licensed to "take liberties" with one another's wives. In the episode in question, while traveling to his home, a young *ari'i* and his bride met two other warriors, who said to him: "Give us charge of our little lady for a short while, since you and we are warriors all." The husband consented and the warriors had their pleasure with the woman. (As the translator added in an editorial note, "Women in those days were very passive.") However, these privileges evidently had their limits. Not content with such temporary entertainment the two warriors made off with the woman, but they were overtaken by the irate husband and killed. (Henry 1928:519)

Several legendary accounts indicate that "hospitality" sometimes included access to the host's wife (e.g., Adams 1901; T. Salmon n.d.). Indeed, one may conclude from all such accounts that there prevailed a very general norm to the effect that whatever the intended degree of intimacy, the goods exchanged between males in the name of formal amicability quite often included access to one another's wife—but with varying degrees of access, ranging from tolerance of a one-time embrace to acquiescence in a continuing liaison, such as the *taio* pact is alleged to have entailed.⁹ Yet, in contrast to this norm, there is evidence that many husbands did not care for the arrangements when their own wives were involved; and this applied not only to absentee hosts but even to the case of close friends, as exemplified in the legend of Turi and Mahu:¹⁰

Turi was a [demi] god. He originated at Fa'aroa, Ra'iatea. Raure'a was his wife;^[11] Mahu was his friend. One day Mahu and Raure'a went inland in search of some bark of the breadfruit tree for making bark cloth. Turi remained at the shore and watched them go. When the couple arrived at a place called Puarairai, Mahu seduced Raure'a. Turi found out about this and was displeased. He dove into the sea and swam until he reached Papetaitai, which was a spring on Taha'a near which dwelt a beautiful virgin. She refused all Turi's advances [so] he took to the sea again and swam to the west coast of Taha'a where dwelt a woman named Farafara-ura. This one was receptive to him sexually, but when he ordered her to climb a palm and get some coconuts for him she refused him and went away.

Meanwhile Mahu left Turi's wife and went in search of his friend. He discovered the latter swimming through the reef towards Ra'iatea and followed after him so energetically that he caught up with him between Taha'a and Ra'iatea. When Turi spotted him he shouted out, "So, it's you, the wicked friend who has treated me so disloyally. Go on back to your woman." "No," said Mahu, "I won't return [to her]. I shall go with you wherever you go, for the rest of my days."

So the pair of them swam together out to sea [and thenceforth remained friends], but Turi retained his bitter feelings toward the wife whom he had lost. (Ahnne 1931b:168-169)

Hamilton, surgeon on the *Pandora*, gave this account of the practice of "wife-lending":

In becoming the Tyo, or friend of a man, it is expected you pay him a compliment, by cherishing his wife; but, being ignorant of that ceremony, I very innocently gave high offence to Matuara, the king of York Island [Mo'orea], to whom I was introduced as his friend: a shyness took place on the side of his Majesty, from my neglect to his wife; but, through the medium of Brown the interpreter, he put me in mind of my duty, and on my promising my endeavours, matters were for that time made up. It was to me, however, a very serious inauguration: I was, in the first place, not a young man, and had been on shore a whole week; the lady was a woman of rank, being sister to Ottoo [Tu], the king of Otaheitee, and had in her youth been beautiful, and named Peggy Ottoo. She is the right hand dancing figure so elegantly delineated in Cook's Voyages. But Peggy had seen much service, and bore away many honourable scars in the fields of Venus. However, his Majesty's service must be done, and Matuara and I were again friends. He was a domesticated man, and passionately fond of his wife and children, but now became pensive and melancholy, dreading the child should be Piebald; though the lady was six months advanced in her pregnancy before we came to the island. (Edwards and Hamilton 1915:109-110)

The passage from Morrison quoted near the beginning of this chapter provides some notion of the range and amounts of objects and services exchanged between the principals of a friendship pact. Morrison added the following important detail: "No Man ever Claims a right to any land but his own,^[12] or His adopted Freinds, which he may Use during his Friends life, and should his Friend die without any other Heir the Adopted friend is always considered as the right owner and no man disputes his right" (1935:194).

An example of this aspect of pact-friendship is provided in a traditional account of the establishment of the Pomare “line” on Tahiti:

Tu of Faarava, having undertaken a visit to the distant land of Tahiti, came in by the Taunoa opening, which is the eastern channel into what is now the harbor of Papeete. Landing at Taunoa a stranger, he was invited to be the guest of Mauai-hiti, who seems to have been a chief of Pare. Tu made himself so agreeable, or so useful to his host, that Mauai-hiti adopted him as *hoa*, or brother, with the formal ceremonies attached to this custom, which consist in a grand feast, and union of all the families, and offering of all the rights and honors which belong to the host. Tu accepted them, and at the death of Mauai-hiti he became heir and successor in the chief’s line. He gave up all idea of returning to the Paumotus, and devoted his energy to extending his connections in Tahiti. (Adams 1901:85)

According to one account, an individual’s “title” also could devolve upon his *taio*, but exactly what this “title” consisted of is not clear:

The force of friendship amongst those good creatures, will be more fully understood from the following circumstance: Churchill, the principal ringleader of the [*Bounty*] mutineers, on his landing, became the Tyo, or friend, of a great chief in the upper districts [i.e., Vehiatua III of Seaward Teva]. Some time after the chief happening to die without issue, his title and estate, agreeable to their law from Tyoship, devolved on Churchill, who having some dispute with one Thomson of the *Bounty*, was shot by him. The natives immediately rose, and revenged the death of Churchill their chief, by killing Thomson, whose skull was afterwards shown to us, which bore evident marks of fracture. (Edwards and Hamilton 1915:110)

Needless to say, this was an exceptional case, probably influenced by Churchill’s domineering personality and his possession of firearms. No other European that I know of was awarded a high-ranking kin-Title through this mechanism. (See, for example, Turnbull 1813:321)

Another statement by the missionary Crook indicates that six decades of European contact had altered only the sexual aspect of *taio* practices among the Maohis themselves:

... none of them know what it is to possess property in our sense of the word. If a native possess many articles of property, he must distribute and cannot withhold; all his friends have a kind of positive claim, and to refuse to give would be shocking. He would be a *taata hamani ino* [*ta’ata ha’amani ino*], literally a man that works evil. It is to be observed that friendship, from whatever mercenary cause it was entered into is inviolate and is a kind of real relation in Tahiti. The friend was a representative of the person, and partner in everything, the wife not excepted. Our people have of course done away with the sinful part of it, but they are shackled by what remains, and will be many years before they can advance much in civilized life. (Crook to Burder, 4 December 1824, LMS Archives)

Undoubtedly, underlying all such transactions was a tacit expectation of reciprocity—that is, the fundamental conception of the relationship was one of direct and equivalent exchange, even though each contribution may have been *phrased* as an act of altruism, a nonreciprocable “gift.” Indeed,

so seemingly sincere were many such “gifts” that Bligh took them to be gifts. (Although the pacts in question involved Maohis and Europeans, it is reasonable to assume that the transactions, in this respect at least, resembled those between Maohi pact-friends.)

As it is the custom among these people whenever a Ship comes here, to have their separate Friend or Tyo as he is called so it has been the case among my people and Officers. Great friendship and disinterestedness from the Natives have been the result of this connection, for those who could not get a Canoe to come off in, swam to the Ship with bunches of Coccoanuts without any view of reward. (Bligh 1789:II, 415)

Against this attribution of “disinterestedness” was Cook’s appraisal of the reception accorded Mai, when the latter returned to Tahiti after his visit to England:

When we first drew near the island, several Canoes came off to the Ships each conducted by two or three men, but as they were only common fellows Omai took no notice of them nor they of him, they did not even seem to perceive he was one of their Countrymen although they conversed with him for some time. At length a Chief whom I had known before named Ootie and Omai’s Brother in law, who chanced to be here, came on board, and three or four more, all of whom knew Omai before he embarked with Captain Furneaux; yet there was nothing either tender or striking in their meeting. On the contrary there seemed to be a perfect indifferency on both sides, till Omai asked his Brother down into the Cabbins, opened the drawer where he kept his red feathers and gave him a few. This being presently known to those on deck, the face of affairs were intirely turned and Ootie who would hardly speak to Omai before, now begged they might be Tyo’s and change names. Omai accepted of the honour and confirm’d it with a present of red feathers, and Ootie by way of return sent a shore for a hog but it was evident to every one that it was not the Man but his property they were in love with, for had he not shewed them his red feathers, which is the most Valuable thing that can be carried to the island, I question if they had given him a Coccoanut. Such was Omai’s first reception amongst his Countrymen and such as I always expected, but I expected, that with the property he was master of he would (have) had prudence enough to (have) made himself respected and even courted by the first persons in the island, but in stead of that he rejected the advice of those who wished him well and suffered himself to be duped by every designing knave. (Beaglehole 1967:I, 186)

A special kind of service exchanged between pact-friends was described by Morrison: “They take No Captives nor give any quarter, unless a man falls in with one who has formerly been His adopted friend, a breach of which they were never known to make ...” (1935:174). In contrast, however, is the following passage excerpted from a battle-exhortation of a *rauti*: “Let the warrior take hold [of his weapons] unsparingly/ let him take hold with closed eyes, that he perceive not a friend [*tau’al*]” (Henry 1928: 308).

There is a somewhat puzzling statement by Bligh in which he distinguished an individual’s *taiō* (friend) from his *ari’i* (champion, protector):

Every Person who comes among these people has or may have his Tyo or Friend, but the Commander or Erreerahigh (as he is called) has also his Erree [*ari'i*] (in this sense signifies a Champion). Now the Erreerahigh is beyond being an Erree to any one, and is only nominated a Tyo; it is therefore with me that Tynah is my Friend and Moannah my Erree, who is supposed to be determined to revenge any insult that may be given to me.

When Captain Cook was here he was in the same situation. Tynah was his Friend and Poeno his Erree, and it is from that circumstance that his Picture, which he gave to Otoo, now Tynah, is kept by Poeno, which I have been long in discovering the Cause of. Poeno is also my Tyo and in his own district by his people bears my Name and I his, but everywhere else I have the name of Tynah or Matte which are the two Names he has. (1789:II, 6)

The implications of this alleged distinction will be discussed in a later chapter.

The historian Gunson raised the possibility of homosexuality having been a factor in friendship pacts:

To what extent the sexual element was present [in friendship contracts] is not clear, but there is reason to believe that it was. High ranking chiefs very often married much later than was usual amongst the people. The concept of continence was unknown, and pederasty (as in Hawaii) and other forms of sexual irregularity was regarded as chiefly prerogatives. Friendship rites with such implications are known in other cultures, and the suggestion is made to emphasize the commitment of the two parties to the contract. (1964:66)

I doubt very much that friendship pacts were deliberately entered into for homosexual purposes, although some contract-friends may very well have engaged in such practices, as indeed did many other pairs of males.¹³

Finally, I draw attention to that unusual and unelucidated manifestation of the friendship pact described by Morrison, in which a warrior not only assumed the name of the individual killed by him in war, but "... adopts the Nearest relation of the Deceased as his Friend, and by bearing his Name [presumably in addition to the name of the slain] becomes one of the Family and is ever after Treated as such and is as much beloved in the Family as if he had been born in it." (1935:175)

The account of friendship pacts given in this chapter leaves unanswered many important questions such as, What proportion of the population entered into such pacts, and were the pacts ever terminated by a specific ritual act? It would be of particular interest to know whether they were ever concluded between consanguines, or between same-genealogical-level affines. (This latter situation would appear however to result in a status conflict vis-à-vis one another's sisters.) Unfortunately, as with so many other aspects of Maohi social structure, the available data cease to provide answers when the questions begin to become interesting.

CHAPTER 21 *OCCUPATION*

As we have seen, such factors as sex, age, consanguinity, affinity, and marriage class greatly influenced what activities Maohis engaged in or how they interacted; and the next chapters will describe the effects on individual behavior resulting mainly from three other factors: sect membership, residential contiguity, and coercive force. *Special occupation* must also be counted among such factors—"special" in the sense of not having been ascribed solely or mainly by one's age, class, and so on, and "occupation" in the sense of its having engaged significant amounts of the individual's time and energies. For example, every Maohi past infancy must have communicated from time to time with spirits; and for heads of households and larger kin-congregations such communication on behalf of their units was a regular part of their duties of office. Some men, however, made a special practice of priestcraft over and beyond the requirements of household headship, and it is these kinds of actions and interactions that concern us now. Most of the information relating to special occupations has already been presented, so that my task in this chapter will be to chronicle what social relationships arose from occupational specialization. The Maohi word most nearly equivalent to "occupation" was *tōro'a*, which is translated in the LMS Dictionary as business, office, occupation. But I cannot discover whether this word had a wider or a narrower meaning than the category of roles I now delimit.

It may be useful to point out a few more generalizations. First of all, I cannot ascertain fully which occupations the Maohis looked upon as involving evaluated and socially consequential differences in performance. For some activities—fighting, wrestling, making bark cloth—there are clear indications that such differences were recognized and appropriately rewarded (or penalized); but for such activities as cooking, swimming, or weather predicting, I do not know.

Second, I cannot discover how "specialized" an individual had to be, in terms of skill or amount of application, for him to be considered an "occupational specialist" by the Maohis themselves.

And third, unlike some students of Polynesia, I am far from certain that I comprehend Maohi views concerning the underlying bases of "skill."

Regarding the first of these points, I reproduce here an intriguing text collected by Orsmond concerning what some Maohi informants considered to be the principal “occupational” specializations—or at least those providing training in the skills required to carry out their respective functions:

E maha rehua [probably te hui] o te Tahiti.

There were four “kinds” of persons in Tahiti.

Na te arii, na te opunui, na te arioi, e na te ravaai.

The *ari'i*, the big-bellies [marae functionaries], the *Arioi*, and the fishermen.

E fa'a ui anae ia.

They were all trainers of youths.

E fa 'a'amu te arii i te ui, e riro atura ei teuteu arii.

The *ari'i* supported [trained] youths to become their servitors.

Fa'a'amu atura te opunui i te ui, e riro atura ei opunui, ei poro, ei hoho ei amo atua.

The big-bellies supported youths to become big-bellies; heralds, god-wakers, god [image]-bearers.

Fa 'a'amu i te Arioi i te reira ui, e pa 'ari atu, riro atura ia ei Arioi.

The *Arioi* supported youths, and when these were grown up they became *Arioi*.

Fa 'a'amu te Ravaai i te reira ui, e pa 'ari aera, riro atura ia ei ravaai.

The fishermen supported youths, and when these were grown up they became fishermen.

Tira ra ia rehui[te hui].

These were the [only? principal] “kinds” of persons. (Orsmond: *Arioi*)

FOOD PRODUCERS

For a society that subsisted mainly on plant-food it is curious how little has been recorded about the work and geography of plant-food production. Perhaps because most of the early European reporters were sailors or townsmen, but whatever the reasons, next to nothing was recorded about the practice or the practitioners of growing or collecting fruits and vegetables. It is quite clear that some adults, including some male adults, had little to do with this kind of work; at the other extreme it is likely that for some adults in most areas, and for most adults in other areas, such activity was the principal employment. When considered against a background of nearly universal similarity in consumption habits, these differences in productivity undoubtedly led to some plant-food circulation within regions; it may have resulted in some interregional circulation as well. The question then becomes, What were the social-relational aspects of these differences in the production and circulation of plant-food?

Turning first to the social status of the individual plant-food producer, I find it difficult to accept the inference that outstanding skill and productivity were not in some way recognized and praised; but the evidence of such

is lacking. There must have been master farmers, but either their social significance was wholly noninstitutionalized, which is unlikely, or, what seems more probable, their roles were so basic and mundane as to have escaped the Europeans' notice.

I suspect also that high productivity was an important factor in social influence. The individual capable of providing larger-than-average amounts of food—in the form of hospitality, "gifts," tax, et cetera—was undoubtedly compensated in social currency of one kind or another; but our information about such situations has to do with individuals exercising control over the circulation of such plant-food, and not with the individual producers themselves. In fact about the only concrete evidence available concerning the direct advantages accruing to the individual who produced plant-food in excess of ordinary domestic needs concerns the contracts some such individuals entered into with fishermen, for regular exchange of plant-food for fish.

Instances of regional specialization in plant-food production may have been more numerous than the records indicate, but not markedly so. (I refer here to the kind of specialization that produced a net annual surplus, and not to that resulting from regional seasonal differences in plant-food ripening, which was discussed in chapter 9.) This is not to deny the fact of regional differences in plant-food productivity, which was clearly in evidence, but these differences were more typically manifested in corresponding population densities than in interregional movement of goods.

The one well-documented exception to this generality was on Tetiaroa, the atoll whose small permanent population had to depend on Tahiti for most of its plant-food, which it received in exchange for fish—an arrangement characterized by one writer as having been deliberately fostered by Tetiaroa's Tahitian proprietors in order to keep these atoll dwellers dependent and loyal. (Morrison 1935:202; see also Bligh 1792:163b, and Wilson 1799:89.)

Kava was undoubtedly more bountiful in some areas than in others, and circulated widely in the form of gifts and tax. We are not certain which areas were most productive, or why they were so, but there is no indication of individual occupational specialization in such production, or of regularized interregional channels whereby it circulated.

What applied to food plants applied also to pigs. One writer asserted that only commoners raised them,¹ but this is difficult to accept. It may be that the actual job of tending the animals was turned over to the servants, but I would be surprised if middle-and upper-class families did not themselves raise pigs (in addition to the ones farmed out to their subordinates). Indeed, as was the case with food plants, it is my surmise that the actual raising of pigs was a standard practice employed by some individu-

als for gaining social influence, acquired through distributing the animals in the form of gifts and feasts. Specific evidence for this kind of specialized occupation is not recorded and the Maohi version of the familiar Oceanic “pig politics” institution pales in comparison with its Melanesian parallels, but I am confident that it was practiced.

Maohi fishing, however, is quite a different matter. The sources indicate not only that differences in skill were recognized and evaluated by the Maohis, but that fishing was a specialized employment for some individuals which eventuated in at least two distinctive types of social relationships: guilds and exchange contracts. These were in addition to the kind of relationship, described earlier, that prevailed between Tetiaroa and Tahiti, in which the inhabitants of the atoll supplied fish to their Tahitian superiors in return for plant-food.

As will be recalled, the Orsmond text reproduced above identified fishermen as one of the four categories of occupational specialists providing training in their required skills. Another text ascribed to Orsmond tells of local fishermen’s guilds, each having its own meeting house, called in the text a *ruahatu*, and characterized by courtyard fences made of “little sticks driven into the earth.” Bligh reported having seen a *ruahatu*, but he identified it as a marae dedicated to the successful operation of a fish weir (whether it was also associated with a fishermen’s guild is not stated):

I passed in my Walk to day a Morai which was called Rooahaddoo—it consisted of a few Stones about three feet square, pieces of plaited Cocoa Nutt leaves (called Tapaow) placed before it with some small pieces of Tarro and Cocoa Nutts.—the Evatah [*fata*] or Alter of offerings, was a Palm Stump with a small Stage on it, on which was a Cocoa Nutt Grater, and some Cocoa Nutts, Mahie and an empty Basket.—the whole was fenced in, and I found it was just erected to ensure success to a kind of Ware or Dam which Tynah [Pomare I] has made with Stones without Point Venus to catch Fish. Prayers have been performed, and the Deity supplicated by Persons of the Priesthood. (1792:159b)

Henry supplied more details about marae associated with fishermen’s guilds and provided an explanation for the label *ruahatu*:

The fishermen formed companies and built themselves marae (*marae o-te-feia-tai’a*) and dedicated them to the gods, the chief of which were: Rua-hatu-tini-rau (Source-of-fruitful-myrriads), the Neptune of the sea called in the story of the Deluge Rua-hatu-o-te-tai-euea (Source-of-fruitfulness-of-the-thrown-up-ocean), and Tino-rua (Body-of-two-natures) lord of the ocean, the merman who had the tail of a swordfish. The fisherman placed in their secret depositaries stone or wooden images of the fish gods and other sacred relics with birds’ feathers. (1928:148)

We are, however, not informed about the number, sizes, or composition of such units, nor about their internal or their external social relations. Handy asserted that Maohi fishermen (*feia taia*) were not regarded as a “distinct

professional class." According to Handy, "Different localities had their sacred places dedicated to the fishing gods, but these would appear to have been community shrines rather than sanctuaries belonging to a professional class, as in the case of the sacred precincts of Marquesan fishermen" (1932:69). It is undoubtedly correct to state that Maohi fishermen differed from Marquesan ones, insofar as the latter were "accorded an inferior position in the social scale" (Handy 1932:69), but we have it on the authority of Orsmond that Maohis who specialized in fishing were indeed considered to be a distinctive social category (Orsmond:Arioi). It would be extremely revealing of Maohi society's whole "evolutionary" direction to know, for example, whether such guilds cut across kin-congregation or tribal boundaries; or whether their officials were "elected" on the basis of kin seniority, or class status, or technical-managerial ability; or whether such guilds acted as units in tribal levies and councils.

The exchange contracts between fishermen and farmers, described earlier, are the only ones of this kind to be recorded. While the principals in any such exchange may in some cases have been consanguines—or affines, or "friends," or subject and chief—the transactions appear to have been motivated by complementary desires for the objects themselves. And although some such transactions may have been phrased in the idiom of consanguinity or friendship, the relationship so established appears to have been of less importance than the goods exchanged. Also such transactions differed from other exchange contracts in that they involved only objects, and not objects for services or services for services. And finally they differed from ordinary object-for-object barter, which was probably much more widespread than the sources report, in that the exchange included many transactions spanning a relatively long and evidently fixed period of time.

It appears that such contractual relationships had not become institutionalized into "permanent" trade partnerships, like those found in many other parts of Oceania (especially Melanesia), but they probably contributed to the development of occupational specialism, at least in the sphere of fishing.

Again, concerning the geographical aspect of such exchanges, while it is reasonable to assume that men specializing in saltwater fishing would not have resided miles inland, there is no evidence that the farming parties to the exchange were inlanders; and in any case, "inland" residence was rarely more than a mile or two distant from some shore.

CRAFT SPECIALISTS

Evidence for local specialization in the manufacture of objects is fragmentary, the following being the only passages I could find:

These happy isles have almost every article necessary for the supply of their

wants; nevertheless their manners are already so far polished, that they like to be possessed of some articles chiefly of ornaments and luxury, which they cannot meet with in their own isle, or at least, not in such plenty as in others situated in the neighbourhood. Bora-bora, and O-Tahaw, are both well provided with coco-nut-palms, from which they manufacture an oil, well known in the East Indies; the inhabitants of Taheitee and its neighbourhood, use this oil perfumed, by means of various odoriferous plants, and aromatic woods, as an article of luxury to stain and to perfume their cloth, and even their hair, and sometimes their bodies. As the coco-nut-trees are not so plentiful in O-Taheitee as to enable the inhabitants to prepare a quantity of oil, to satisfy the great demand for it, and as on the contrary, the natives of Bora-bora, and O-Tahaw, cannot manufacture such a profusion and variety of cloth as they do at O-Taheitee, where the paper-mulberry-tree is much cultivated; there are persons who every year undertake a voyage from Taheitee to Tahaw and Bora-bora, in order to barter great quantities of cloth, for joints of thick bamboo-reeds filled with coco-nut oil. (J. Forster 1778:365-366)

Maupiti is said to have been the source of a gray-black, very hard dolomite from which were made some particularly fine adzes, pestles, bowls, and seats, all of which were used widely throughout the Society Islands. Corney was probably right in supposing that many of these objects were made in situ—thereby implying a local craft specialization of some extent, but of what extent we do not know (1919:xxxiv, 156).

I have the impression that turtles were more plentiful at isolated Tupai and Mopelia where their visits ashore were subject to fewer interruptions by humans. Inasmuch as Leeward Islanders were the most frequent visitors to these places, it is reasonable to suppose that they more than others tended to specialize in the fashioning of turtle-shell objects. (LMS Transactions: vol. III, narrative 6)

As reported earlier, easternmost Me'etia Island engaged in a regular exchange with Tahiti's peninsula, sending pearls and pearl shells (probably from the Tuamotus), mats, bark cloth, oil, dog's hair,² pigs, and carved wooden objects in return (in later days) for objects of European make. We are not informed what went from Tahiti to Me'etia prior to 1767, but if the pre-European objects from Me'etia to Tahiti were about the same as reported by Morrison (1935:201) this would argue for some craft specialization in woodworking on Me'etia.

Expeditions went occasionally to Scilly Atoll (Fenua Ura) in search of red feathers:

The red feathers of parrots are employed in ornaments for their warriors, being fixed at the end of the tassels, which they wear like queues, and likewise in small bundles tied together with coco-nut-core, which they make use of in order to fix their attention during their prayers. The O-Taheitee parrot has but few and very dirty red feathers, but more to the West are islands, which have fine parroquets remarkable for beautiful red feathers. One of these isles is low, and destitute of inhabitants, at about ten days sail from O-Taheitee and is called WHENNUAOORA the *Land of red feathers*, to which the people from the Society-Isles sometimes re-

sort, in order to procure some of these red feathers, for they are the most valuable article of commerce, and there is nothing which a Taheitean would not give or grant in order to acquire some of these precious feathers. (J. Forster 1778:366-367)

As I reported in chapter 8, most of the composite plank boats (*pahi*) found in these islands were constructed on Ra'iatea, or by Ra'iatean-trained artisans working elsewhere. Such boats were evidently highly prized and in great demand, so that it is conceivable that whole communities on Ra'iatea may have specialized in this craft.

Bark cloth was manufactured everywhere, but a passage from Morrison already quoted suggests that there was some local specialization in terms of the quantities produced, in addition to the interisland differences noted above: "If a Man has occasion for more Cloth then he can procure from his neighbours, he takes a large hog or two, to the House of some of the People who Inhabit the Valleys and whose Chief Employment it is" (1935:165).

It is likely that there were other instances of localized craft specialization around these islands, but if so it was evidently on a scale small enough to have escaped notice. Also, the products of such enterprises probably circulated by means of numerous ad hoc transactions between kinsmen, neighbors, and friends, rather than through regular institutionalized channels such as formal exchange contracts or deliberate trade expeditions.

Evidence for the existence of individual artisan specialists is very specific, but probably incomplete. The sources refer explicitly to experts in boatbuilding (*tahu'a tarai va'a*, expert-shape-canoe) and marae building (*tahu'a marae*); some men, called simply "carpenters" in the sources, were also employed as expert housebuilders, but whether this represented a separate occupation, or was identical with the canoe experts' trade, is not clear (Morrison 1935:165). A more serious omission is the lack of information about the makers of such objects as stone tools and containers, high-relief images in wood and stone (*tahu'a tarai to'o*), ornamental headgear, gorgets, and the like. Anyone who has seen and handled such objects would agree that their manufacture required a considerable amount of skill, gained only through special training and long practice. Their manufacture probably did not occupy all the working hours of their makers, but these were not Everyman's avocations. Also, perhaps many such items circulated as contributions to kinfolk or gifts to friends or taxes to superiors; but it is my surmise that they were also involved in more commercialized exchange, and hence served to satisfy their makers' wants for other tangible goods.

With regard to bark-cloth making there were recognized individual differences in skill and in productivity, but probably all females past childhood (and many males) engaged in this craft, and for some women it appears to have been a nearly full-time occupation. In terms of social relations bark-

cloth making was relevant in at least two important respects: as a focus for group interaction and as a means of acquiring both intangible social “capital” and a variety of other tangible goods.

I noted earlier the presence of women’s bark-cloth-making groups, composed exclusively in some cases of either the married or the unmarried. We are not informed how common these groups were, but my surmise is that they were numerous and widespread. Neither have we any description of the organization of such groups; it is safe to assume that techniques of production shaped much of the members’ interactions, but considerations of consanguinity, class, age, and skill probably also intervened. Further, although there is no record of bark-cloth-makers’ marae, it may be taken for granted that well-established groups worked in places reserved for themselves. And, although I can find no mention of a specific deity of bark-cloth making, it is reasonable to suppose that many such groups had tutelars of their own.

Marae-building experts (*tahu’a marae*) were evidently highly specialized, but they cannot have spent much time in the actual practice of their profession. As noted in chapter 7, there is no record of their manner of compensation, but it may be assumed that they were at least well fed for their labors. There is no positive information concerning the social relations characteristic of such specialists. Morrison intimated that every occupation was organized into local chapters: “... evry profession or Calling [is] a distinct Society and all of the same profession are made Welcome by the rest all through these Islands” (1935:233). As we have seen, this was true of fishermen, in some places, and of boatbuilders; but I doubt very much that it was true of “every Calling”—for example, there is no evidence with respect to *tahu’a marae*. In fact, it seems unlikely that any one locality would have had more than one or two of these specialized but decidedly part-time craftsmen. Nor does it seem likely that even the most powerful and affluent chief would have had need for a staff *tahu’a marae* on a permanent basis. Though not mentioned in the sources, it seems reasonable to assume that in some instances individuals combined this profession with that of priestcraft.

Information is somewhat ambiguous about the role of “carpenters”—whether they constituted a distinct profession or were boatbuilders as well—but I imagine that all three types of specialists were to be found: boatbuilders, housebuilders, and combinations of the two.

Specialists were probably not required in the building of all houses; the following probably applied only to larger or more elaborate buildings: “Most of the natives are able to thatch a house, but covering in the ridge is more difficult, and is only understood by those who have been regularly trained for the work” (Ellis 1829:I, 386). However, individuals may have

availed themselves of such specialists for reasons other than their own lack of the requisite skill. Morrison provided an informative statement on this matter:

If a Man wants a house or a Canoe built, he employs one or more Carpenters, paying them before hand one half of what shall be Judged the Value of the Work they are to perform in Hogs, Cloth, Oil, Matting, &c—and finds them in provisions all the time they are at work and when the Work is Compleat he pays the remainder according to Agreement, but should he refuse or neglect and the Neighbours think the labour worth the stipulated agreement then they may plunder him of all that he is worth. (1935:165)

The principals in transactions like these would appear to have been of more or less identical class, and either *ra'atira* or *manahune* (otherwise the sanctions would have been either unnecessary or difficult to enforce).

When a house or public building for a chief was to be built, it was customary to employ labor *corvée* rather than commission the job to be done by some equal. For work like this the services of one or more specialists were probably essential for planning and supervision, and such services were probably compensated with extra portions of food and possibly also with bark cloth, mats, oil, and other goods. It is even possible that professionals of this type were more or less permanently attached to some chiefly households.

Specialists were also not needed in the construction of the most simple boats, but by now it should be abundantly clear that the construction of other types of boats called for high levels of skill and work organization. As we have seen, some of these "boat-shapers" worked on a contract basis, others probably worked for hire, and still others may have been attached to chiefly households on a more or less permanent basis. All boat-shapers probably had their spirit-familiars or tutelars, and the records state that in some localities they had their own marae, where, among other things, their tools were "empowered" (*mana*) before being used. Finally, although I can find no accounts of boat-shapers' guilds, inasmuch as there were marae and tutelars especially associated with this occupation it is reasonable to assume that the specialists of various locales made up groups, with more or less exclusive membership. Handy characterized boat-shapers as "highly respected and well to do," which was probably quite true; but there is to my knowledge no record of this or any other craft specialist being able to move into a higher marriage class, or into a position of tribal authority, by this route alone.

SERVICE SPECIALISTS

One of the larger social categories in Maohi society was that made up of *teuteu*, the servants attached to the households of persons of superior social

position or extensive authority. Most *teuteu* evidently worked as domestics, but some became valued companions and counselors of their masters and mistresses. Their compensation was mainly in the form of subsistence, but that could have represented a relatively high standard of living for those attached to affluent households. In many cases the attachment of *teuteu* to a particular family was inherited, but some *teuteu* apparently took up such positions voluntarily. There are no specific accounts of *teuteu* having terminated their relationships with patron families; such a move may have been difficult for practical reasons, but I have come across no evidence that it was impossible. In other words *teuteu* were dependent family retainers, not physically constrained slaves.

A somewhat different position appears to have been occupied by *tapairu*, which the LMS Dictionary defines as a young woman that lives delicately; a young woman that is an attendant on a chief woman. The *tapairu* has also been characterized as a "queen's waiting woman, selected for her beauty" (Alexander 1893:57n3). No further specific information is available concerning the origin, duties, compensations, or ultimate fates of *tapairu*, but some fairly plausible assumptions about these matters may be proposed.

Concerning their origins, it seems unlikely that *tapairu* were of the lower class; not only were lower-class maidens generally unable to afford the luxury of "living delicately," but upbringing in a lower-class household could hardly have prepared a girl for the refinements demanded of a "chief woman's" attendant.³ (And a "chief woman" would have had a wide choice of attendants from both the middle and upper classes.) Indeed, it seems likely that a "chief woman" would have appointed some of her own kinswomen to serve as her *tapairu*. As for the fate of *tapairu*, it is reasonable to suppose that they married and returned to more routine existences when they were no longer "young."

The duties of *tapairu* are not specifically described, but I suppose that they consisted mainly in serving as companions to their mistresses, and not as ordinary domestics. That "chief women" had such companions is well attested in eyewitness accounts. As for their compensation, they would have shared in the high standard of living of their mistresses, and they would have enjoyed the entertainments associated with chiefly life, including probably a wider assortment of lovers than would have been otherwise possible.

But my concern here is with occupational specialists, not with the general master-servant relationship itself. The information about the many kinds of special services performed by some Maohis for others is more detailed than that about the service specialists themselves. Those kinds of services distinctive enough to have received labels, or to have been remarked upon by the European visitors, were tattooing and supercising, embalming, domestic service, ghost guarding, prostitution, entertaining, teaching, communicating with spirits, healing, sorcery, and waging war.

There are a number of questions to be asked about the practitioners of each of the above-mentioned activities:

1. Were they recruited by descent, personal achievement, spirit selection, age or sex qualifications?
2. Were they distinguished by any special costume, insignia, or other visible signs?
3. Were they set off from others by any special behavioral prescriptions or proscriptions, including any associated with sacredness (*ra'a/mo'a*) or secularity (*noa*)?
4. What proportions of their time were spent in the activities in question?
5. How many practitioners were there?
6. What was distinctive about their social relationships: did they form guilds, work on commission, occupy staff positions?
7. Were they reimbursed for their services by subsistence support, fixed lump-sum payments, "gifts," anticipated reciprocation with food, tapa, praise, a share of spoils?
8. Were there any occupational hazards?
9. What effects did their occupational activities have on their class status, or on the class status of their families?
10. Which occupational roles were combinable?

Needless to say, this set of queries represents a counsel of unattainable perfection; not one of the occupations I have listed is described well enough to provide answers to all the questions, and about some of them we are left almost totally uninformed.

Tahu'a Tatau (Tatatau), Tahu'a Tehe

Morrison stated that both tattooing and supercision were performed "by a particular set of men who make it a Trade and subsist partly by it always getting well paid for their Work" (1935:220). Banks stated that only "priests" were allowed to perform such operations, in return for which "they are paid by every one according to his abilities in the same manner as weddings Christnings &c are paid for in Europe" (Beaglehole 1962:I, 382). Ellis called such practitioners "... professors of the art of tatauing, who were regularly employed to perform it, and received a regular remuneration" (1829:II, 463).

It is possible to infer from these and other statements that both *tatau* and *tehe* were performed by the same specialists. The little additional evidence we have concerning this occupation refers specifically only to *tatau*. There was a deity, Tohu, specially associated with this operation, and the operation was performed at the shrine of two other spirits, Matamataarahu and Turaipo, who invented the custom, and whose aid was solicited in performing the operation and in healing the punctures (Henry 1928:234, 287).

If more than one *tatau* specialist used the same shrine, which was probably the case, then they probably formed a local guild. Also, if, as is reported, all *tatau* specialists revered the same tutelars, it is possible that they shared archipelago-wide social bonds of some kind, manifested perhaps in reciprocal hospitality. It is unlikely that *ari'i* or affluent *ra'atira* would have engaged in this or any other personal-service occupation. The amount of skill required, for tattooing at least, argues for a long period of training and apprenticeship, and hence the likelihood of the craft having been learned from a close relative.

Tapua Miri

Embalming required much skill and involved considerable risk, both “physically” and “psychically” (although the Maohis themselves would probably not have made this kind of distinction). According to Henry, “Incurable blood poisoning in consequence of following this vocation sometimes ended the lives of *tapua miri*” (1928:296). Since the bodies of only high-ranking kin-Titleholders or powerful and affluent tribal leaders received the full embalming treatment, there cannot have been a large number of practitioners. (In giving the names of “the embalmers who were living when the Missionaries came to Tahiti,” Henry listed only three, suggesting that there may never have been many more.)

Teuteu

As stated previously, persons bearing this label, roughly classifying them as “domestic servitors,” served families of superior social position or extensive authority and affluence in such roles as wet nurse, bearer, steward, cook, swineherd, gardener, entertainer, jester,⁴ and even counselor. Probably most, but not all, *teuteu* were *manahune*.⁵ For many *teuteu* the occupation was hereditary, but some probably entered this employment by other routes. Any male servants who worked directly for females were of course *noa*—that is, “rendered Incapable of assisting at any religious Ceremony.” (Morrison 1935:167)

Compensation for all such servitors consisted of subsistence (probably more lavish than *manahune* could otherwise enjoy), and the various intangible benefits derived from living close to loci of power and entertainment. In some cases particularly clever or useful servitors may have received more tangible rewards, such as lucrative administrative posts or even grants of territory, leading eventually perhaps to higher class-status.

Ghost Guardians

Moerenhout's is the only reference to such a profession, but a variety of considerations argues for the reliability of his account, which characterizes ghost guardians as a hereditary function performed by some retainer

attached to each socially superior family (1837:I, 554-555). The kind of material compensation that went with this job is not specified, but Moerenhout asserted credibly that the secret knowledge possessed by such guardians gave them influence considerably beyond that normally associated with individuals of their social position and degree of tribal authority.

Prostitutes

The presence of Europeans turned many Maohi females to prostitution, but prior to that some leading chiefs evidently attached a few young women to their households for purveyance to distinguished visitors. Nothing further is known about these females, save that their mode of employment seems not to have prejudiced to any significant degree their eventual marriage. As for compensation, they probably received a comfortable keep along with some respite from work ordinarily expected of females of their social class.

The services provided by eminent women's gallants were "special" in a social-relational sense, but hardly so otherwise. Such men were evidently of lower-or middle-class origin, and were remunerated with an abundance of good food, a steady flow of presents, perhaps a certain amount of political influence, and release from other kinds of "work."

Enough has already been said about *mahu* to characterize clearly their occupational roles. Many questions about these transvestites remain unanswered, but we can be sure that their special qualifications were not inherited.

Entertainers

At some time or other every Maohi danced; and most males, at least, probably made music and play-acted for the entertainment of their fellows. Indeed it is difficult to draw the line between "amateur" and "professional" in these activities; for example, some of the most habitual and expert dancers were upper-class maidens who performed mainly for their own and their families' entertainment (Beaglehole 1961:421). These and many other "amateurs" performed on many kinds of occasions, before large and small audiences, and were customarily rewarded with presents of food, *tapa*, and generous applause. In addition, however, there were those who engaged in such activity as an occupation. The excerpts from Banks and Jefferson, quoted in chapter 10, clearly indicate the commercial motives of companies of "traveling musicians" or "strolling players," who, when they ended their tours, used to "divide the spoil" of the hogs, bark cloth, and so forth, with which they had been paid. Some of these companies were small and consisted only of the performers themselves, while others evidently were large and included the players' spouses and children. A passage from Jefferson implies that such companies were made up of a lower-class people—which may or may not have been so: "This

abominable pastime is much delighted in by all ranks, though the higher class profess to despise the actors and speak of them and their performing in a contemptuous manner" (Jefferson, Journal, 10 February 1801, LMS Archives). I shall have more to say about "strolling players" later on, in my discussion of the Arioi cult, whose members made of "entertaining" not just an occupation but a whole way of life, and whose membership included persons of the very highest class levels of society and who were anything but "contemptuous" of their own brand of histrionics.

Of traveling bards, Moerenhout said:

They had tales, just as they had all sorts of poetry, sad, horrifying or ludicrous. As for this last kind, strict decency was not always observed; but several (persons) knew how to tell tales charmingly, and make the audience, naturally gay by disposition, laugh until they cried. Men who were gifted with this talent were, like the poets, much sought-after. Such persons travelled frequently, and were not only welcomed but were invited to return again and again everywhere they went." (1837:II, 81; see also de Bovis 1909:34)

Athletes also served to entertain, those of various skills having practiced a great deal and competed publicly to the entertainment of large throngs. Champions' rewards came mainly in the form of praise. According to one account footracing champions received tangible prizes (Henry 1928:278), however, footracing could not have been an "occupation" without there having been some sort of subsidy, and I have found no evidence for that.

Teachers

The general term for "teaching" was *'orometua*, an instructor of any sort, either of religion, or of any art, or trade (LMS Dictionary). All *'orometua* may have received some tangible compensation for their labors, but only the two types to be discussed here seem to have made teaching their principal occupation.

A passage from Andía y Varela indicates that "The Kings and great personages each keep one of these dancing masters to teach their families, just as they keep *e pure* or master versed in law for their instruction in that" (Corney 1915:289). It seems likely that such "dancing masters" provided instruction in music and dramatics, although there may have been some who specialized in each form.

The *e pure* mentioned by Varela probably referred to *tahu'apure*, a priest officiating at the marae (LMS Dictionary). Some such priests may indeed have been attached to the households of "great personages," where they dispensed knowledge and precepts, but there appears also to have been a category of persons—mainly male, but some females as well—whose primary occupation it was to instruct the young in genealogical and other traditional lore. This group was known as *tahu'a parau*

tumu fenua, “experts in basic knowledge of the world.” (The fragmentary evidence seems to imply that only boys received such instruction, but if this were so, Where would the female teachers referred to by Henry have received their instruction?)

One teacher was Hiro’s maternal grandfather, Ana (Cave), who was “the senior teacher in the school called *Tapu-ata-i-te-ra’i*” at ‘Uporu (Ha’apape), Tahiti (Henry 1928:537). Henry had the following to say about the school:

At Uporu is the school of savants [*te ti’ara’a fare ‘aira’a upu ana-vaha-rau*, literally, the residence prayer cave-of-many-openings] of royal families [*hui ari’i*] named *Tapu-ata-i-te-ra’i* (Sacred-cloud-in-the-sky); there are the women teachers [*orometua vahine*], Toa-te-manava (Brave-hearted) of *Ra’iatea*, and *Mu-reo* (Murmur-of-voices), reciter of heraldry [*firifiri ‘aufau*, literally ancestry tracer, genealogist], of Papeari in Tahiti; there was the boy teacher [*orometua tamaiti*], Hiro (Jester), who knew the recitations from listening to them from outside of the house before he was admitted into the class of pupils [*pipi*, a disciple, learner, or pupil] in the school, when he became a scholar of the highest merit.

That school is attended by the children of the royal families of Tahiti and *Ra’iatea* and other kindred people; and to the school [*ha’api’ira’a*] of Opoa in *Ra’iatea* also go forth pupils of Tahiti to learn. (Henry 1928:74–75)

Henry also listed schools in the “districts” of *Hitia’a*, *Fa’a’a*, *Pare-Arue*, *Papara*, *Vairao*, *Mataoae*, and *Teahupo’o*. She stated that students in such schools “paid their teachers with the best of food, with birds’ feathers, images of wood and stone, rolls of tapa, choice mats, and every kind of wearing apparel and ornament of the time” (1928:154).

In addition to “schools” organized as was the one described by Henry, the passage from Andía y Varela quoted earlier indicates that one or more persons well versed in traditional knowledge and attached to *ari’i* households also served as teachers when required. And, of course, some of the more or less full-time priests attached to important *marae* undoubtedly instructed the more eminent members of their congregations from time to time.

G. Forster provided a useful account of one teacher-sage:

Among the natives of the Society Islands there are a few men who preserve the national traditions, together with all their ideas of mythology and astronomy. Mahine, whilst we were at sea, had frequently spoken of them as the most learned of his countrymen, and named them *Tata-o-Rerro*, which we would express by *teachers*. After much enquiry, we found a chief, named *Tootavaï*, in the district of *Hamaneno*, who was distinguished by this epithet. As our departure was so near at hand, we regretted that we had not known him sooner; but my father determined to employ his remaining time in making enquiries on a subject so interesting as the history of religious opinions.

Tootavaï was pleased with an opportunity of displaying his knowledge; he was flattered with the attention which we paid to his words, and therefore continued to converse on the same subject with much greater patience and perseverance, than we could have expected from a lively inhabitant of these is-

lands. (1777:II, 148-149) Besides the priests, there is also in every district one or two teachers, or *tata-o-rerro* like *Tootavaï*, who are skilled in theogony and cosmogony, and at certain times instruct the people in these things. The same persons likewise preserve the knowledge of geography, together with their ideas of astronomy and the division of time. (1777:II, 154-155)

Recruitment to the teaching profession was likely to have been mainly by inheritance, customarily from parent to child. Close association over a long period of time would have been required in order to commit to memory the large store of precisely worded information on which this profession was based. In this connection, it will also be recalled that some of this knowledge was supposedly transmitted from parent to child by more esoteric means.

The sources do not specify the class status of the *'orometua* we have been discussing, but my surmise is that they were mainly from the upper levels of society, or, if not from the upper levels to begin with, they were able to move upward as a result of the highly valued character of their skills and of the status of their clients.

As pointed out earlier, all Maohis interacted with spirits at some time or other, but for many it was a principal activity, by which they earned their subsistence and, in some cases, many privileges and considerable influence. Having already described the techniques followed by these specialists, and the rationales for their actions, I focus now on the social relations of these professions.

Taura, or Tahu'a Atua

Human oracles, shamans, "prophets," "*inspiré*"—these were to be found in all marriage classes, from lowest to highest. Tamatoa, the highest-ranking kin-Titleholder of the Leeward Islands and sovereign chief of Ra'iatea was a *Taura*, as were some *manahune* and, according to Ellis, all "idiots" as well (1829:II, 193; see also Adams 1901:61).

The Maohis believed that spirits themselves selected the individuals they wished to possess. All *taura* mentioned specifically in the sources were adult males, but I have come across no statements to the effect that only males were eligible. (While it is true that females were usually *noa*, and generally prohibited from contact with sacred entities, were they also ineligible for possession by female spirits?) Ellis' statement about "idiots" suggests that factors of personality deviance entered into the selection—although it may be that this kind of deviance was regarded as a manifestation of possession. I cannot discover any specific instance of inheritance of the *taura* role, except in the very general sense that an eminent "descendant" of a deity sometimes became possessed by that deity.

"It goes without saying that ... birth had nothing to do with spirit possession" (de Bovis 1909:51-52).

The sources describe *taura* as dressing themselves "in a fantastical form," decorated especially with red and black feathers, of which the spirits were "[m]oderately fond" (Morrison 1935:181). The behavior of a "possessed" *taura*, described earlier, may be characterized as "frenzied trance."⁶ While there is no reason for suspecting the authenticity of many such manifestations, a skeptical missionary proved to his own satisfaction that at least one "seizure" was faked:

They gave us a specimen of their conjurors in one of our visits to Temārre. A man presented himself in an old blue coat turned up with red, his head surrounded with numerous feathers, so as to hide his countenance entirely: he ran up to us with an unintelligible jargon, making a squeaking noise, and actions so wild, that we asked if the man was delirious. The natives not seeing us at all frightened, said it was Temarre's son, the *Etōoa ete [atua iti]*, the little god, which killed Omiah and many others. Having with us a great dog, he fell upon the priest, who fled; at which the natives seemed terrified, and said he would kill us. After a while, the priest returned with a club in his hand, driving like a fury before him, the women and children shrieking, and the natives trembling. On this one of the brethren jumped up to protect the dog, against whom his rage was directed, and wresting the club from him, turned up the feathered cap, and discovered a well-known countenance, who had run away from Matavāi after robbing Pyetea. We immediately charged him with the theft; on this he changed countenance, and shewed the greatest terror. The natives interposing in his behalf, while we were telling them of the man and his imposture, he gave us the slip, and fled; so we saw no more of him. (Wilson 1799:336-337)

When possessed (*uruhia*), a *taura* was of course "sacred," being in one sense himself a spirit. According to Ellis, an individual was actually called *atua* when possessed, "though at other times only denominated *taura*, or priest" (1829:II, 237). On the other hand this manifestation of sacredness seems not to have been so unapproachably dangerous as some others, since females were not apparently prohibited in the vicinity of one possessed; indeed, it was reported that individuals possessed by 'Oro were sought after by women for procreative purposes.

In some cases the *taura* was more or less continuously possessed, to the point of being "permanently" identified with the spirit in possession; in most cases, however, the possession was intermittent, for hours or days at a time. We are not informed whether an individual, once possessed, ever lost the capacity to become so. *Taura* cannot have been very numerous—at least there are not many actual exemplars of them recorded, and their behavior was peculiar enough to have attracted the attention of the most casual observers. Davies reported four of them in the vicinity of Fare (Huahine): two in the service of the god Tane, one of 'Oro, and one of a shark-god Tohu. Elsewhere there were reports of one or two nearby, but

seldom more. Of course, many individuals subject to only occasional possession, by minor spirits, may have escaped the visitors' notice, but by the same token such part-time activity was unlikely to have provided the individual with any sizeable amount of compensation, tangible or otherwise.

Regarding the social relations of *taura*, it should be noted first of all that a possessing spirit evidently did not limit its manifestations to a single human oracle; at least the major deities did not do so. (For example, two oracles of Tane were reported on Huahine by Davies.) Next, it appears that most *taura*, if not all, required an aide—usually a priest—to receive and interpret the messages transmitted by them; we are not informed, however, whether every *taura* had his own particular aide, or aides. As for relations between *taura* and other persons, *taura* were in general respected like the deity they sometimes embodied, at least when actually possessed. Some became the center of cultlike deference, and were able to pass between opposing armies without harm. One report states that they were obeyed immediately and without question, by chiefs and commoners alike, even to plunging a populace into unprovoked war; but this can only have been true of those who had demonstrated their *bona fides* by correct predictions or proven efficacy, or who had been eminent personages to begin with. Some appear to have acted independently and neutrally, while others were evidently leagued with tribal authorities. A passage from Ellis indicates how influential some *taura* were:

In the year 1808, during the civil war between the king and rebel chiefs, of whom Taute was the leader, the priest of Oro, who was known to be not only attached to the king's interests, but a personal friend of Pomare, left the royal camp, and went over to that of the enemy. Many of Pomare's friends endeavoured to persuade him to remain with them, but no one dared to use force, as it was supposed that he acted under the inspiration of the Oro. This circumstance greatly discouraged the king and his friends, and probably prepared the way for their discomfiture, and retreat from the island, as they supposed the god had forsaken them, and fought with their enemies. (1829:II, 236-237)

There are few references to tangible objects being handed over to *taura* specifically in return for their services,⁷ but it may be assumed that they consumed parts of the offerings made to the spirits at their behest. Also, it is most likely that a successful *taura* would have been abundantly supplied with whatever subsistence and comforts he demanded. In addition to these material things, an effective *taura* would have been rewarded with various kinds of privileges (including in some cases a choice of women's favors) and, as we have seen, a large amount of influence over community affairs; but whether success ever had the effect of raising the class status of a *taura* is not recorded.

The profession was not however without risks. A succession of prophecy failures, for example, not only reduced the credibility and in-

come of a *taura* but also likely endangered his life at the hands of disillusioned patrons or a deceived public.

Some individuals functioned professionally only as *taura*, while others combined this role with that of priest.

Priests

There were probably hundreds of marae throughout the Society Islands. We are not specifically informed how many of these, or which kinds of marae congregations, supported specialists in priestcraft, but it is my surmise that it was mainly some tribal and cult marae that did so. Also, among the priest-supporting marae were some that supported numerous individuals distinguished according to specialized function, and others that supported only one general priestly practitioner. I listed earlier the various specialized functions of high priest, ordinary priest, orators (*oreero*), "night-walkers," big-bellies, image-bearers, et cetera.

De Bovis' and Moerenhout's accounts of the office of high priest (*tahu'a rahi*, *tahu'a nui*) are the fullest available:

It was the high priest who played the supreme role in religious ceremonies. It may be that the marae's "owner," the king [i.e., tribal chief], was more important overall, but his role in religious ceremonies was purely passive, while the high priest, who mediated between king and deity, played a very active part in all religious events. In fact the white maro, which was his official insignia, served to confer upon him a statue of "religious royalty"—but only those attached to the most noble of the royal [i.e., *ari'i*] maraes were entitled to wear it. It was the high priest who opened all ceremonies [in his marae], who directed them and uttered the most important prayers, and who invested the king in office.... But his activities were not confined within the marae precincts; in other [secular] affairs as well he exercised immense influence, depending more or less on the character of the king (as is usually the case in such circumstances). It was the high priest who decided when the gods required a human sacrifice, which the king then selected. It was the high priest who ordained solemn prayer services on the spur of the moment, and who summoned the people to the marae on extraordinary occasions.

In fact, the high priest's jurisdiction resembled that of a bishop. It [usually] extended over all the maraes located in the territory ruled by his sovereign chief; but there were exceptions to such parallel jurisdictions.^[8] In some cases, for example, a chief had two or more high priests in his domain; in other cases a high priest's jurisdiction extended over two [independent] tribal domains. And finally, there were certain "international" maraes served by the most renowned high priest thereabouts [regardless of tribal domain].

High priests almost without exception were members of the most superior arii families. (de Bovis 1909:49–50)

The priesthood exercised very great powers; and although priests did not [customarily] sit in on [tribal] council meetings, nor take part in political discussions, they were no less feared than chiefs. And in view of the populace's attitude toward priests, and of priests' ability, in their professional capacity, to harm chiefs politically, the latter would not have dared to treat them with harshness. The

mere announcement of a baneful omen was enough to lead people to abandon some chiefly enterprise; in fact they had the power—acting willfully, covertly, and with no danger to themselves—to avenge themselves even against their tribal chiefs, including the power to destroy them. On the other hand, Oceanic history offers few examples of discord between high priesthood and tribal chiefs; more often than not the high priest was a brother or close kinsman of the chief, as a result of which the two worked together to maintain their mutual powers. In fact, it was not unusual for the same person to hold both priestly and administrative powers, thereby giving the government the character of a theocracy; such was usually the case when a deceased tribal chief was succeeded in office by a brother or some other close kinsman who already held the priestly office, and who continued to preside over the more important religious rites even after becoming tribal chief. (Moerenhout 1837:II, 10-11)

In view of the social importance of high priests one might expect to find their offices embodied in specific-status names, parallel to the kin-Titles of kin-congregation chiefs (indeed, some of the latter may have embodied the high-priestly office); however, I can find no explicit information to this effect. And, what is more surprising, in Henry's catalog of Tahiti's districts, in which she lists the names (or Titles?) of each district's chief and subchief, she also notes in many cases the names of each district's marae, school, school teacher, and Arioi leader, but *not* of its high priest as such.

Ordinary priests (*tahu'a pure*, specialists [in] praying) either officiated on their own, at less than "tribal" or "cult" marae, or served in these latter under a high priest. In the latter case, ordinary priests may have specialized somewhat in their jobs; otherwise their professional functions were the same as those of the high priests, except in scale. For example, only a high priest customarily officiated at the inauguration of a tribal chief (de Bovis 1909:50).

Priesthood is described in most sources as having been "hereditary," subject to certain limitations. Putting together information and inference, I surmise that the office was evolved and transmitted in the following way. When a kin-congregation reached the stage of growth at which it was no longer feasible for its chief to perform both secular and priestly roles, the job of priestcraft was delegated to a younger brother—conventionally to the one next in age and still in residence. Then, in the course of time the job became institutionalized into an office which was proudly and jealously "owned" by its separate "line" of incumbents. This (perhaps too tidy) explanation does not of course account for the proliferation of priests known to have taken place at some marae. It may be that all or most recruits were supplied by the established "priestly lines," but I imagine that in some cases candidates were selected for the offices on the basis of their interest, their physical attributes, and their technical competence. And, by the same token, some hereditary candidates were probably rejected because of deficiencies in these respects.

The ideal prerequisites for priesthood were described by Henry: "The men set apart for the priesthood were able-bodied and most of them were tall. They were free from personal defects, as the gods were supposed to reject a man with a blemish, such as having a hump back, bald head, blind eye, or eyes that squinted. They must also be deft of hand and sure-footed, so as not to be awkward in the service of the gods." (1928:154.) A man was also disqualified if he bore any scars made by a female—not an unusual blemish in view of the deep scratches said to have been inflicted by some women on their lovers during the frenzy of sexual intercourse.

Training for the priesthood must have varied widely in duration and intensity. We do not know the amount of training required of novices destined to officiate in the less important marae, but for those assigned to the more important ones there were regular clerical schools, *fare aira'a upu* (houses in which to absorb invocation). Teaching was carried out by older priests and consisted mainly of rote-memorization of several types of rites:

upu marae, marae prayers

tahu tumu, religious and political speeches for the public

upu ti'a rau ti, or *rau ti tama'i*, war songs and enchantments, with the ti leaf

hopu, the formulae used in suing for peace, or cutting short long prayers in emergencies

upu fa'auru i te mehoi o te atua, formulae to invoke a spirit to possess an image, and so forth

upu nanati 'aha, invocation for binding victims in sennit

upu auea, or *upu 'ai-apa*, formula for removal of sorcery

upu haere ru'i, night chants

upu rava'ai, fishing invocation and rules taught to fishermen

(Based on Henry 1928:155)

It is not clear whether all *tahu'a pure* were required to master all these types of rituals—I suppose not; but it is highly probable that every one of them known as such was in possession of a vast repertoire of verbal formulae.

According to Henry, "night invocations were taught in the dark or moonlight stillness upon the hills in the woods and upon the seashore, where the novice learned to observe omens and signs in the sky and upon the earth where he walked: the fall of meteors, the flight of clouds, the cry of birds and insects—all having forcible language to the scholars of those times, the study of which they never tired and frequently pursued until early morning" (1928:155).

The sound of these night-walkers (*haere po*, *oripo*) strolling within marae precincts and endlessly reciting their lessons was a familiar, and to

European ears, eerie, aspect of Maohi life. De Bovis wrote the following about these clerics:

Generally speaking, the *Oripo* were young men in training for the priesthood, who would eventually occupy positions in the priestly hierarchy in keeping partly with their competence but mainly with their social class. In ordinary marae activities they served in subordinate roles, as assistants to full-fledged priests, and like the latter they were under the supervision of a high priest. But in addition, they carried out a special function aptly described by their official label: Night-walkers, whose job it was to roam about at night as spies, through their own districts and through those of the enemy. Indeed, in time of war, the function just described was the principal one of these novices, and it was considered a most honorable profession, one that was held by individuals, some of whom eventually became great tribal chiefs (including Tapoa the Great). (1909:50-51)

A further statement by de Bovis reports that some individuals remained *oripo* throughout their lives.

As in the case of students in the less clerical schools mentioned earlier (i.e., *fare ha'api'ira'a*), they or their families compensated their teachers with food, bark cloth, mats, and feathers. The end of the training is described in another passage from Henry:

When the novice had acquired proficiency in his recitations, he was required to appear before the fraternity, called *autahua*, to display his eloquence, and if he broke down in any part of his speech he had to take up his lesson again and reappear later for examination. Upon graduating with honors, he was received by the body of priests as an *utu-pa'a* (lips-inured), and then he was ready for inauguration, called *amo'o-upu* (forerunner-of-prayers). This consisted of a good feast prepared by his family, for the priests exclusively, on the marae ground, and of it they solemnly partook after placing an appropriate share upon the altars for the gods. Then the new priest was established permanently as a member of the fraternity. If anyone questioned his right to his title he would proudly answer:

'E'ere au i te tipara, 'e'ere au i te aihamu! E upu Ta'ere au.

I am no beggar; I am no eater of scraps! An invoker from Ta'ere am I.

E purau ta'u i hopoi na te 'orometua; e i'a ta'u i tapupu na te 'orometua; e ahu vane ta'u i hopoi na te 'orometua; e pe'ue ta'u i hopoi na te 'orometua; e popoi ta'u i papahia na te 'orometua; e e pua'a feti'i ta'u i hopoi na te 'orometua.

Purau [bark] have I taken to the teachers; fish I have chopped for the teachers; finely braided clothes have I taken to the teachers; mats have I taken to the teachers; fruit batter have I pounded for the teachers; and family pigs have I taken to the teachers.

Then he would enumerate the schools he had attended, and the famous teachers and priests who had taught him, which always secured him his proper standing. His first official oration in public was called the *taura-ra'a-upu* (opening-invocation), or *vahi-a-piha* (breaking-from-the-room). (1928:155-156)

Another lengthy passage from Henry describes the procedures followed in readmitting a priest to his profession after a fall from grace:

The sins that were held as mortal sins (*pahara aiaai*) against the priests during religious solemnities were: *taute*, violation of sanctity by doing domestic work;

hara faiaia, irreverence in offering human victims; *hara i te fa'ahaerea*, clumsiness in processions or failing in religious recitals; *paoa pure*, hurrying over prayers to serve the food; *ai haruma i te omu pua'a*, greediness in eating the head of a pig; *ai haruma i te omu honu*, greediness in eating the head of a turtle.

For any of these offenses, sure judgment upon the priest, people, and the land was supposed to follow, and if confession and atonement were not quickly made the priest, it is said, would die in great agony by a curse from the gods. In that case the people made atonement with peace offerings at the marae. When a priest was seen committing such misdeeds during the sacred spell for which he had been purified, it behooved the witness of the act immediately to report him to the fraternity and all the community, who would hold a general meeting and suspend the offender from his sacred functions at that time. This was a great degradation, for he thus remained among the people divested of clerical honor. At length when the time for another festivity approached, one priest would propose to the others to pardon the offender and receive him again into favor. When all agreed to do so, they would make it known to the high priest and community, who after assembling and deliberating would agree also to the proposal. Then a priest of good standing was chosen to fetch the offender, who would come with a chicken and a sprig of miro (called *ava*) in his hand. If his offense had been domestic work, for example, he would say:

Teie au, teie te pinia moa, teie te rau
'ava, ei taraehara a'e i taua hara na'u
ra, i taute ai au. Fa'aora ia'u i taua
hapa ra.

Here am I, here is the chicken, here is
the *ava* sprig to atone for my sin, when I
did domestic work. Forgive me that trans-
gression.

The offering was accepted for the marae, and all present would respond:

A haere mai. Ia ora 'oe! A haere mai i te
'oro'a. A haere na ra e horoi i taua mahu-
ruru nau ra.

Come hither! May you live! Come to the
ordinance. But go first and be cleansed of
your debasement.

So the priest who had fetched him immersed him with the following prayer to accompany him to the sea and there the tutelar god:

Tahiti'a mai, e te Atua, tohiu maro e, i
tohiu tahu'a nei! Fa'atiama'i i to tahu'a i
hara nei, ia ma te taute i tai nui atea ia
moe i tai mauriuri; ia ma te mahuru huru,
te hara o to tahu'a nei. Fa'aho'i mai i te
moa nona, ia tarai fa'ahou 'oia i te urua ia
hi'i fa'ahou i te aitu, ia poro fa'ahou, ia ho,
ho fa'ahou, ia rutu fa'ahou i te pahu, e ia
naupa fa'ahou tana rau 'ava. Tahiti'a mai e
te Atua e!

Hearken, O god, inspirer through the loin
girdle, to thy body of priests! Cleanse thy
priest who has offended, that his domestic
defilement be cleansed in the trackless
ocean, be lost in the murmuring sea; that
the debasement, the sin of this thy priest be
cleansed. Restore him to holiness, that he
may again cut up cavalla fish, again nurse
the gods, again herald them, shout for them,
that he may again beat the drums and again
obtain the *ava* leaf. Hearken to us, O gods!

(1928:198-199)

Priests were evidently well compensated, in tangible goods and services as well as in respect. "Everyone is to treat with respect the tahu'a [pure] and also his directions; such are sacred with sacredness of divine origin. It is you who are to make his humble abodes and provide him with food and gifts of clothing" (E. Salmon 1937:II, 2). A passage from Morenhout (1837:I, 435), cited earlier, asserts that some priests received

large revenues from individuals who sought intercession on their behalf with spirits in order to insure places in paradise for themselves or deceased relatives. According to Henry, "When a body of priests near of kin to each other lived in one district they were called *pae-tau-aitu* (side-dwelling-with-the-gods) or *pae-mua-fare* (front-part-of-the-house) of that district, which they were deemed to render most respectable" (1928:154).

Some priests were able to use their authority in religious affairs to political advantage as well.⁹ But with all this, their jobs were no sinecures:

In view of the circumstance that all questions having to do with war or peace, all those having to do with government or the commonweal, and even all those having to do with an individual's actions, large or small, had to be submitted to the gods for their consideration and prior approval, the ceremonies and other activities carried out at the marae were of such burdensome frequency and length as to leave the officiants extremely fatigued. Consequently, the exercise of priestly offices came to be painfully onerous, despite the considerable privileges attached to such offices. Obligated as they were to serve everyone, without even being exempt from the perils of war, priests led lives of such hyperactivity, physically and mentally, as to cause them great discomfort in this enervating climate and easy-going society...." (Moerenhout 1837:I, 474-475)

Priests at the principal marae were assisted in their duties by lay marae attendants called big-bellies (*ōpū nui*, "august Stomachs" according to Henry's more elegant translation), who according to Henry were "... stalwart, hairy men of dark-brown complexion" (1928:151), probably meaning strong and unkempt commoners accustomed to work in the sun. The reason for calling these men big-bellies is unspecified, but it possibly reflected the circumstance that they lived well off the food levied for religious purposes. In fact, in many marae there was a special drum, a *pahu rutu m'a na te ōpū nui*, used for announcing general levies of food for marae attendants.

The regular duties of big-bellies included all the more menial tasks associated with priestcraft: keeping altars stocked with offerings and protecting the offerings from wandering dogs, manufacturing bark cloth and mats for covering images, and so forth. They were reported as having been "chosen by the priests from the laity" for these duties (Henry 1928:151)—on what basis is however not specified—and they served for limited periods, probably in shifts. While on duty they slept within the marae precincts and wore a special uniform. Presumably, although this is not reported, they had to undergo ritual deconsecration before returning to everyday life after completing their tours of duty. What compensation they received, in addition to the better-than-average food consumed while on duty, is not specified.¹⁰

It is likely that many priests were skilled also in the practice of sorcery—that is, in employing spirits linked to fetcher-images (*ti'i*) for generally destructive purposes. Attached to some marae, however, there were regular staff sorcerers, individuals whose main or only function was to protect their patrons or execute politically inspired attacks by means of their craft.

In addition to the above there were some individuals whose principal duty was to carry the deities' images in ceremonious processions. Because of their direct physical contact with spirits embodied in these images they remained in a particularly sacred state, at least during any particular ceremony, to the point of not being able to feed themselves; the food touched by their own hands was too sacred for their stomachs to tolerate. According to de Bovis the men who performed this service were usually commoners (1909:51), but it is not clear whether such men took up their duties only on occasion, or were a part of the full-time clergy.

Some sorcerers (*feiā tahutahu, nanati āha, orou, ta'ata ōpū tara*) were attached to the priestly staff of certain marae, but most of them worked on their own, either on behalf of their own enmities or as commissioned agents of others. Marae sorcerers probably received a share of food and goods contributed to the marae staff as a whole, and a sorcerer's clients undoubtedly paid for his services in the form of food and objects. For the successful sorcerer compensation was also forthcoming in the form of public respect, based in part on fear; but such a practitioner also ran the risk of antagonizing people who commanded enough physical force to end his career. On the spirit side, however, they were better protected, since counterattacks were usually aimed at the sorcerer's clients, rather than at the sorcerer himself—a nice instance of professional immunity, of institutionalized adroitness in the exercise of a profession!

There is no way of knowing the number of practicing sorcerers during the eras under study, or the extent to which sorcery constituted a full-time profession. As to recruitment, an individual evidently took this step on his own, or perhaps in some cases at the suggestion of some spirit, in a vision or dream. In some instances a sorcery practice may have been built around exclusive possession of trade secrets—of materials and techniques—which were usually inherited and which were jealously guarded. But this applied more particularly to physicians, *tahu'a ra'au* (herbalists). In any case such specialists were found in all marriage classes, from lowest to highest. Even some of the society's highest-ranking kin-Titleholders and most powerful tribal chiefs occasionally engaged in the practice in order to advance their ambitions. And it is not unlikely that for a man of middle-or even lower-class beginnings, a successful sorcery practice, exercised with political tact, would have brought material affluence, social influence, and possibly even a rise in class status.

I noted in chapter 13, section on curing, the proliferation of specialists connected with phases of curing: bone setters, surgeons, physicians, diagnosticians, dis-enchanters, et cetera. One or more of these specialties sometimes formed part of the repertory of priests or of shamans; in other instances the specialties were practiced by laypersons. In either case it is unlikely that any of these activities required, or permitted, full-time occupa-

tion, even though the rewards for such practices appear to have been fairly lucrative—at least in tangible objects and at least for some practitioners.

Certain of the staff specialists attached permanently to important marae or to chiefly households undoubtedly received regular retainer fees, or salaries, for their services. Such fees were in the form of subsistence allotments of food and clothing, as well as in occasional bonuses. These bonuses were realized in two ways: in the form of direct gift-payments to a practitioner after a successful treatment, and in the form of “sacrificial” goods presented to his marae spirits but consumed by the marae staff itself.

Free-lance practitioners were paid by the job, usually in the form of food, bark cloth, or mats. In fact it appears that most of them were paid before the job was begun and that their response to a call depended somewhat upon the fee offered; and if they were successful it is likely that they were given bonus payments as well. In obstinate cases physicians were probably like sorcerers in that they demanded extra payments while treatment was still going on (Moerenhout 1837:I, 540–541). Another tactic was described by Ellis:

There were persons among them celebrated as oculists, but their skill principally consisted in removing foreign substances from the eye; and when applied to for this purpose, they, as well as others, received the payment or fee before they commenced their operations; and if the present did not satisfy them, if they took one splinter, &c. out of the eye, to satisfy the employers, they left another in, that they might be sent for again. (1829:II, 275–276)

Confirmed by other statements to the effect that practitioners occasionally ate up a family’s pigs (Corney 1915:327) or stripped it of its possessions (Morrison 1935:182), we can assume that medical care was a costly matter for the ancient Maohis.

Fighters

I turn now to a wholly different kind of activity, which was engaged in occasionally by all Maohi men (and by some women), and which appears to have been a profession for some. As described in chapter 12, there were three types of war specialists: exhorters (*rauti*, leaf of the ti plant & a war song; to excite to courage and bravery, as in time of war; to cause a party to retire), battle-shapers (*tarai aro*; *tarai*, to shape [as a canoe]; *aro*, a battle), and warrior-champions (*‘aito*, a warrior, hero, conqueror, military man; or *toa*, a warrior, a valiant man). (LMS Dictionary)¹¹

As I noted above, the job of a *rauti* was to urge men to fight, before and during the battle. They were usually “men of commanding person and military prowess” (Ellis 1829:II, 487–488), who fought as they exhorted. There is no information concerning specifically how they were recruited, or how they were compensated, save the implication that they were highly

praised and cherished for their declamatory skill and endurance. Two statements from Henry also suggest that *rauti* had a special “sacred” status:

Indefatigable among the ranks during the deadly conflict were the *rauti* (stimulators), clad in ti-leaf petticoat, necktie, and turban, and waving in the hand a bunch of ti leaves, in the center of which they held a deadly weapon of the barbed and serrated tail bone of the sting ray. These men, who because of their weapons were supposed to be possessed with supernatural power, were of commanding appearance and dauntless aspect. (1928:306)

When a battle had continued for several consecutive days, the *rauti* sometimes collapsed from exhaustion, in which case they were stealthily removed at night to the *fare hua* so that the enemy might not exult over the misfortune or, still worse, obtain the sacred persons to slay and desecrate them. (1928:309-310)

Battle-shapers, whom Henry labeled “chiefs” of warriors, and whom Ellis called “the principal leaders” of fighting forces, were described as “marshalling the forces” for fighting. I have already cited Henry’s description of their sennit armor and elaborate gorgets and headdress—which served, among other things, to single them out for attack. A further statement from Henry leaves some ambiguity concerning the identity of these officials: “They [all members of a fighting force] were headed by the *ari’i* or chiefs of the districts from whence they came who were often themselves the *taraiaro* (warriors)” (1928:299). To’ofa, the so-called fleet “admiral” mentioned by Cook, was evidently both tribal chief and battle-shaper (Beaglehole 1961:405). This seems to suggest that the commander-in-chief of a force, its tribal *ari’i*, was usually—but not necessarily—its tactical field commander as well. If this were so then the question remains unanswered concerning recruitment of tactical commanders who were not also tribal sovereigns. It seems likely that some martial skill was required of all battle-shapers, *ari’i* or otherwise. The Maohis were too pragmatically inclined to place their fates entirely in the hands of proven incompetents; and it seems just as likely that few if any commoners would have been appointed to such commanding statuses. However, a battle-shaper who was not also a tribal sovereign probably would have been at least a *ra’atira*, or more likely a near relative of the sovereign himself.

Some battle-shapers may also have been *aito*, but the latter achieved their position by individual valor and fighting skill alone. As I quoted earlier: “This title [status name] was the result of achievements in battle; it was highly respected, and proportionably sought by the courageous and ambitious. It was not, like the chieftainship and other prevailing distinctions, confined to any class, but open to all; and many from the lower ranks have risen, as warriors, to a high station in the community.” (Ellis 1829:II, 496.)¹² Henry described *aito* as having been “... very highly esteemed by these people as protectors of their land, the renowned ones standing high among the princes of the realm” (1928:298).

We are not informed whether *'aito* wore any distinctive costume or insignia, in or out of battle, except for Henry's puzzling statement that "warriors next in grade [to that of the *tara'i aro*] wore their best clothes ... with or without armor, and the immense turban ..." (1928:299).¹³

There is no way of knowing the proportion of *'aito* to men in general, or to what extent an *'aito*'s status required, or privileged, him to devote more or less full time to his specialty. Some of the principal tribal sovereigns had men attached to their households as a kind of bodyguard, a fighting cadre, and as teachers of martial skills; and among these there may have been some *'aito*. There is some evidence to suggest that certain skilled fighters moved about as mercenaries. And finally, some of the most renowned *'aito* appear to have spent most of their time in peaceful pursuits, including managing households, carrying out administrative duties, or even serving as *Ariois* or priests.

I presented in chapter 20 the textual passage in which *'aito* were characterized as having constituted something of a "fraternity," resembling pact-friendship with respect to sexual access to each others' wives. Otherwise there is no evidence of unity among them—certainly not a universal one, and indeed not even any in terms of local or tribal "guilds" or congregations. On the other hand, those residing in the same community must have been together much of the time, perfecting their skills and competing in such sports as archery.

Compensation for *'aito* came in the form of subsistence support from their patrons and large shares of spoils of war, including even conquered, annexed territory. They experienced the pleasure of basking in public esteem, with attendant tangible and intangible advantages.¹⁴ Also, their high standing "among the princes of the realm" undoubtedly meant some influence over public affairs. And finally, there is strong likelihood that an *'aito* born as a commoner would have been able to marry into the *ra'atira* class without undue protest. As for a non-*ari'i* *'aito* marrying an *ari'i* woman, a passage in the legend of *Pereitai* suggests that such a possibility did exist, but I have come across no specific instances of it ever having taken place.

Experts in stone-slinging were a specialized part of any fighting force, and, as one writer noted, the best of them were "celebrated through the islands, as well as the most renowned among the warriors" (Ellis 1829:II, 490). These specialists also wore a distinctive fighting uniform, consisting only of *maro* and, perhaps, *tiputa*. But whether the best among them were also called *'aito*, or whether in native classification they constituted an entirely separate category of fighters, is not recorded. Neither do the sources distinguish between slingers and other warriors in discussions of the advantages accruing from successful practice of their skills.

This does not exhaust the catalog of occupational specialists reported for Maohi society, but it probably lists the main types—except for those associated more exclusively with tribal government and the Arioi sect, which will be discussed in the following chapters. The sources contain many more names for certain activities which might possibly be construed to constitute occupations, such as the paddlers of war canoes, or men specializing in particular kinds of divination, but it is my belief that such jobs were either only occasional pursuits or represented only special aspects of one of the professions already listed.

SKILL

How did the Maohis conceive of the skills which distinguished the successful occupational specialist from other individuals not so qualified?

The term *tahu'a mana* is defined in the LMS Dictionary as one skilled in the art he professes.¹⁵ This raises again the puzzling problem of the Maohi meaning of *mana*—that is, in the present context did the word signify “skilled,” in an adjectival sense, or something that brought about the skill? This distinction, so fundamental in English, may have been insignificant in the Maohi language, but I am attempting to explicate Maohi behavior in terms familiar to speakers of English, and hence will continue with an English-language approach and then attempt to translate my conclusions into Maohi concepts. (The limitations in the data rule out the converse approach.)

Skill in the occupations I have been describing consisted of one or more factors: social attributes that permitted the individual to engage in the occupation in question; motivation; a certain amount of “natural” talent: physical dexterity, coordination, quickness, strength, endurance, mental facility, memory, and adequate training. Taking these in order, it should be clear by now that most Maohi occupations were reserved for one sex or the other. A female could not have practiced priestcraft in an all-male marae regardless of her natural “talents”; nor would a male (unless a *mahu*) have regularly performed “female” dances. Again, it is extremely unlikely that a priest who began life as a *manahune* would ever have achieved the position of high priest in an important tribal marae. On the other hand, lower-class affiliation was not a bar to success and acclaim as, say, a shaman or boat-builder or fighter.

“Motivation” was probably supplied (or indeed compelled) in many instances by family tradition, but there was ample leeway for individuals to specialize in occupations of their own choosing, either to gain tangible rewards or to acquire command over persons and affairs or perhaps just to sense the pleasure afforded by the activity itself. (What supplied *these* kinds of motives is a question too complex for me to attempt to answer here.)

The third factor was as crucial in the Maohi conceptualization of "skill" as it was in the folklore of Western society, but the two modes of thought differ significantly with respect to the source of the specialist's talent. According to Maohi belief, the ultimate source of most specialists' skills, superseding in some cases—or even obviating—training, was spirit intervention of a direct or indirect kind. In the case of shamanism it was the spirit itself that performed the service, though embodied in a human vehicle of the spirit's own selecting. And for the priest and sorcerer, their very occupations consisted of maintaining cooperation with spirits. There is a possibility, even, that spirits may have been directly responsible for the mistakes made by some priests in carrying out the rites which helped to maintain that cooperation.

For the successful fisherman or artisan, spirits intervened in at least two ways: by "empowering" their tools; and by causing hands to be steady, fish to congregate, weather to be suitable, and so forth. In the case of *'aito*, not only did spirits fill them with courage and guide their spears, but spirits also warded off enemies' blows.

Less is known about the source of the skills of famed dancers or actors or athletes, but probably all of these had their activity tutelars or individual spirit-familiars who helped guide their movements or who gave them added strength, or perhaps weakened their rivals.

For skills that required verbal "knowledge" some individuals acquired that knowledge by inhaling the last breath of the expiring possessor, whose ghost was thereby enabled to visit the successor and teach him what the possessor had known (Henry 1928:290).

Even the requisite of superior social position, which governed who should be high priests, is to be accounted for in this way. That is to say, only the more godlike humans were fit to interact with the high gods, and hence high priests had to be from among those humans who were "closest" to those gods, in terms of "descent."

This focus upon spirits is not meant to imply that the Maohis did not recognize training as a necessary ingredient of most skills; a review of previous chapters would show that they did recognize it. Nevertheless, as I have reconstructed their beliefs, they held that no amount of training would have led to successful performance without the direct or indirect intervention of spirits of some sort.

CHAPTER 22 *CULTS*

As I noted earlier, it was a characteristic feature of Maohi society that nearly every social group of any temporal continuity—consanguineal, territorial, occupational—was at the same time a religious congregation. But there were some social units, both categories and groups, made up of persons whose only, or most notable, common attribute was their primary homage to a specific god; for want of any better term, I label these units *cults*. In such cases the god in question was usually also the tutelary of some smaller group within the larger cult unit; and, in the case of the cult dedicated to worship of the god 'Oro, there were a number of special cult subgroups, or *sects*, whose members, called Ariois, devoted major portions of their lives to 'Oro worship in general and to sect activities in particular.

The earliest recorded information available concerning Maohi cult units was supplied by the Forsters, writing about conditions as they were in 1774. Both father and son recorded the names of the "principal" gods worshipped at each of the several islands, as follows: Tahiti and Mo'orea: Ruahata; Mai'ao: Ta'aroa; Huahine: Tane; Ra'iatea: 'Oro; Taha'a: Ra; Porapora: Tautu; and Maupiti: Tu (G. Forster 1777:II, 150-151; J. Forster 1778:539). Anderson, writing three years later, described 'Oro as having been the principal deity of Tahiti Nui, Punua (?) and Fatutiri (?) of Tahiti Iti (Taiarapu), and Tane of Taha'a (Cook 1784:175); his list otherwise agrees with the Forsters'. Henry listed Tane (along with Ruahatu) for Tahiti-Mo'orea, Tane for Huahine, 'Oro and Ruahatu for Ra'iatea, 'Oro and Ra'a for Porapora, Ta'aroa for Mai'ao, and Tu and Ta'aroa for Maupiti (1928:128-129). De Bovis' list (1909:44) agrees in essentials with Henry's.¹

Some of the discrepancies among these lists may derive from each having referred to a different locality on an island—for example, Tane and Ra may have been worshipped on different parts of Taha'a. Still other discrepancies almost certainly derive from different dates of recording—for example, the cult of 'Oro is known to have superseded those of Tane and Ruahatu in many parts of Tahiti-Mo'orea during the latter third of the eighteenth century.

Another uncertainty about these lists has to do with the social units

with which some of the deities were associated. For example, in view of the fact that Mai'ao constituted a single group politically (actually, a subtribe, since the island was a dependency of Huahine), it is not possible to separate Mai'aoans' roles as fellow tribesmen from their roles as common devotees of Ta'aroa. In fact, most if not all of the deities listed above served as tutelars of political (i.e., tribal) groups, which in some instances comprised whole islands. However—and this is the important distinguishing feature of the units now under discussion—the cults of certain gods were supratribal in membership. Specifically, around the middle of the eighteenth century the deities most widely revered in these islands were Ta'aroa, Tane, and 'Oro.

TA'AROA

By the time Europeans arrived on the scene, Ta'aroa evidently was the principal focus of cult practice on the small and isolated island of Mai'ao only. On other islands this deity figured mainly as a kind of "grey eminence" in religious ritual, an awesome Being too indifferent to mortal's affairs to require or encourage interaction. At that same time, both Tane and 'Oro were worshipped directly and preeminently in many tribes, their respective devotees having been about equal in number.

Any number of explanations might be offered for this state of affairs depending upon the explanator's faith in this or that mythical tradition, or his espousal of this or that theory of Society Islands "history." Inasmuch as most of the cosmogonic myths that happened to be recorded portrayed Ta'aroa as the first god, the creator or ancestor of all others, including Tane and 'Oro, one might conclude that the cult of Ta'aroa had in fact been society-wide in the distant past, and that those of both Tane and 'Oro had sprung from it. (The conceptualization of Ta'aroa as otiose could then perhaps be seen as a projection of the fate of mortal progenitors after the birth of their successors.)

Or, if one entertains doubts about the representativeness of available cosmogonies, most of which feature the primacy of Ta'aroa, this raises the possibility that a wider sampling would have exposed rival claims on behalf of the primacy of Tane, thereby revealing the existence of rival cults of Tane and of Ta'aroa at some time in the past. This is a possibility suggested by Williamson, who proposed (on the basis of much positive evidence) that the cult of Ta'aroa was originally centered on Ra'iatea and Porapora, and (on the basis of ingenious but undocumentable speculation) that the cult of Tane was centered on Tahiti-Mo'orea (1924:218ff.). As a corollary to this reconstruction the cult of 'Oro is viewed as a recent successor (and not a rival) to that of Ta'aroa, and hence a rival to that of Tane.

Still other explanations might be offered, including the one that every

separate community, or every separate “wave” of immigrants, had “in the beginning” its own distinctive tutelary, which after a while lost out to proselytizing devotees of Ta’aroa, or of Tane, or others, a development eventually “legitimized” in myths. We shall never be able to reconstruct those more remote happenings; and, indeed, historical knowledge of them is not crucially important to our understanding of more recent events. On the other hand, credible information about certain aspects of more recent cult practices and history are indispensable to anyone attempting to understand political events in these Islands (and particularly in Tahiti-Mo’orea) during the second half of the eighteenth century.

Although Europeans identified Ta’aroa as having been “principal” deity only on tiny Mai’ao, nothing was reported concerning cult practices on that isolated island. During that period Ta’aroa was described as having been recipient of first fruits on Tahiti (LMS Dictionary, p. iii), and Ellis stated that Ta’aroa was invoked (along with ‘Oro) in some inaugural rites. Ellis also named Ta’aroa as recipient of some human offerings, specifically of the first enemy warrior captured in war, but both Henry and Moerenhout asserted that humans were not offered to this deity.² In fact, Moerenhout’s view of Ta’aroa’s position typified those of other writers as well:

... Ta’aroa was so far above the affairs of this world that he did not deign to concern himself with their governance, nor to interest himself in the fates of men. Moreover, since mortals expected nothing from Ta’aroa—neither benefits nor misfortune, neither punishment nor reward—they dedicated no temples to him and consecrated no altars. But even though few people actually worshipped this god, they all vied with one another in extolling his glory, his power, and his deeds. He was veritably the God of Epicures poetized by Lucretius. (1837:I, 439)

As noted earlier, Ta’aroa’s role had been a much more active one in the remote past, this deity having been primarily the principal tutelary—some traditions say actual ancestor—of the socially and politically elite kin-congregation centered at Opoa and of its several offshoots elsewhere, including such notable ones as those of Porapora, Farepua (Vaiari, Tahiti), and Puna’auia. In the context of this body of tradition, kin-Titles derived ultimately from the Opoan kin-congregation would have been preeminent wherever Ta’aroa himself was considered supreme—or so one can reasonably infer. Moreover, the highest-graded kin-Titles associated with or derived from Opoa are said to have been emblematically distinguished by feather-decorated girdles (*maro*), primarily red and secondarily yellow. The ritual association between Ta’aroa and such girdles would have been close.

It is possible to view certain legends as euphemistic accounts of the waning of active Ta’aroa worship; I refer to the Porapora chief’s “declaration of independence” of his source kin-congregation of Opoa and the supplantation of Farepua by Papara (see chap. 16), and to the “retirement”

of Ta'aroa in favor of his son, 'Oro, at Opoa. In the first two instances the new arrangements may be viewed as symbolized by adoption of a yellow (in place of the usual red) feather girdle as Title insignia. There is no suggestion in either of these instances that Ta'aroa himself was wholly abandoned for some other tutelary; it was more in the nature of removing him from direct association with kin-congregation events and Titles in Porapora and Papara. As for Opoa (as we shall see), the transition simply constituted a conventional Maohi episode wherein an office-holding father was succeeded by his principal successor—or so the legends imply. Later on I shall raise the possibility that the Opoan shift from Ta'aroa to 'Oro may in fact have been connected with a major dynastic change.

TANE

The god Tane figured in beliefs and religious practices throughout the Society Islands and was the focus of worship on Greater Huahine and in parts of Tahiti, Mo'orea, and Taha'a.³ Particularly on Huahine was Tane the most active and preeminent deity. According to Henry, Tane's cult on Huahine was established by Ruahatu Tinirau, the Maohi Neptune who swam around these Islands after a deluge, repairing old marae or setting up new ones. After calling at Ra'iatea, "Ruahatu then swam to Huahine-nui and opened two passages in the reef, named Apo'o-uhu (Aperture-of-the-parrot-fish) and Peihi (Prayer-for-fishing). There he stood upon the point named Manunu (Benumbed), and placed the corner-stones of the *marae* called Mata'i-rea (Breeze-of-space), which he dedicated to the god Tane (god of beauty)." (1913:25)

A wholly different version was provided by Davies:

The Rohu Atua gives the following account of the titular god and royal family of Huahine.

Tutapu and his wife dwelt on a land called Puatiriura. They had an only daughter, Hotuhiva. No husband was to be found for her on her own land. Her parents, however, were very anxious she should obtain one, and therefore put her in a drum, called Taihi, under the care of Tane and the god or idol Taputura, and sent her to sea. After sailing about for some time, they landed at Manunu on Huahine; which name signifies "cramped."

The spot was formerly called "Toerauroa."

Tane became the titular god of Huahine. The young lady, Hotuhiva, was married to a chief named Teonuimarua. They had two sons, Tina and Hena, and they are considered to be the ancestors of the present chiefs. (LMS Dictionary, p. iv)

Whatever its beginning may have been, the cult of Tane became so firmly established in northern Huahine that even the proselytizing zealots of 'Oro were not able to supplant it. The fullest description we have of this cult comes from the missionaries Tyerman and Bennet, who visited Huahine in 1821 to 1822, four years after the populace's "conversion"

to Christianity but early enough to find many remains and memories of the cult still extant. (I reproduce extensive portions of these observations, both for the information they contain about the cult of Tane and for the insight they provide into the problems of compiling an ethnography from the kinds of writings available.)

Jan. 4. The weather not permitting us to resume our journey, we made an excursion to the neighboring motu, to visit the marae of Tani, the chief god of Huahine in the age of idolatry. It stands about a hundred yards from the shore, embosomed among trees of many kinds, which wholly obscure the edifice till the spectator arrives upon the spot. Like most erections of the kind, it consists of two stories, of oblong shape; the lower, a hundred and twenty-four feet by sixteen, and the upper diminished proportionately, with a small wing at the back. The basement is about ten feet in height, and fronted with coral blocks, placed on their edges, some of which are as high as the story itself; these form the walls of an enclosure, which is filled up with earth. The superior but smaller part is faced with coral, and filled with earth, in like manner, but not more than three feet high, having at each end an upright stone of twice that elevation. In the centre of the principal front stands the *bed* of Tani, a stone-framed pile, eighteen inches above ground, but twenty-four feet long by thirteen wide! Hard by is another and lesser inclosure, not more than half the dimensions of Tani's bed, yet large enough to hold all the gods beside that belonged to this celebrated grove and temple. All these various structures were exceedingly rude, but massy, in materials and masonry. Not a tool seems to have been lifted up upon any of the stones, the angles are ill-formed, nor are the walls in right lines; but the whole *pandemonium* is in rare preservation, scarcely a block having been dislodged from its place. Trees of centuries, judging from their venerable and magnificent appearance, overshadow this "dark place," with meeting arms, and foliage "star-proof." One of these ancients measured fifteen yards in girth above the root. There is a tradition worthy of the superstition attached to this shrine of folly. Tani often wanted to fly away—from his bed here, we presume—but having a very long tail, like a boy's kite, that unlucky appendage always caught in the boughs of this sacred tree; by which he was instantly dragged down to earth again. However, he has now escaped—escaped for ever—though not by flight, but by fire, having been burnt (in effigy, of course) in his own house, called Taumatai, in the year 1817, by those resolute image-destroyers, Hautia and Tiramano, in their zeal for the Lord of Hosts. The idol, a huge, mis-shapen block of wood, was about the height and bulk of a very tall and stout man; but, like many of his fraternity here ("the gods made with hands"), by the bungling of the artist, he was one of those "whose heads do grow beneath their shoulders," there being no separation of those parts above; whilst below, the uncouth body terminated in a point (without legs) like a cone inverted. It had likewise the usual mockeries to represent eyes, ears, nose, mouth, and arms; but these were "most lame and impotent conclusions" of such matters. The whole was covered with cinet, or platted twine, made from the fibres of the cocoa-nut husk.

At this marae, once a year, when the kings and priests thought proper, there was what might be called a national assembly and festival held. Hither all the idols of Huahine were brought from their various temples to be clothed with new dresses and ornaments. On this occasion, Tani was laid on the middle of his bed, having the gods of four districts placed on his right hand, and the gods of four other districts, into which the island was divided, on his left. The chiefs

stood in rows opposite to their own divinities, and the priests round Tani, as lord over them all. Various antic ceremonies having been performed, and prayers offered, the images were stripped of their old vestments. Many of these wooden stocks, being hollow, were filled with beautiful feathers, and other precious trinkets, which were also brought out, and either renewed or replaced. None but men were allowed to attend this anniversary. One who had often been present assured us that, on these occasions, a quantity of *ava*, for the purpose of making a detestable intoxicating liquor, nearly as large as the marae itself in bulk, used to be collected, besides provisions in an immense quantity; eighty or a hundred hogs, also, were slaughtered and roasted to entertain the multitudes that were attracted hither by their devotion to the gods and their love of good cheer. The feast lasted three days, and was a season of gluttony, drunkenness, and debauchery of every kind. The priests themselves were often so intoxicated as to be unable to repeat their devotional addresses in the required posture; they would then grovel upon the ground, like swine, muttering and hiccuping their incantations. While this carnival lasted, no fire was allowed to be lighted, nor labor to be performed, throughout the island. At the close of the ceremonies, a particular god, called Maavai, was brought forth, stripped and gutted like the rest, when immediately, *they say*, it began to rain tremendously. This was the signal for the removal of all the new-clad idols to their respective maraes. No female was permitted to approach one of these sacred edifices on pain of death, which was instantly inflicted by whoever witnessed the sacrilege. Nay, such was the cruel and remorseless proscription of the sex from religious rites or privileges, that if the wives or children of the priests themselves came within a certain distance, while they were engaged in some particular services, they were murdered on the spot, even by their husbands and fathers, with the most desperate ferocity. (Montgomery 1832:I, 194-196)

This was evidently marae Manunu, which I mentioned in chapter 16 and which was located on the flat strip of land closing off Lake Maeva from the sea.

Shortly after visiting Manunu, Messrs. Tyerman and Bennet visited the main settlements and marae complexes along the southern border of Lake Maeva:

The great marae itself was dedicated to Tani, the father of the gods here; but the whole ground adjacent was marked with the vestiges of smaller maraes—private places for worship and family interment—while this was the capital of the island, and the head-quarters of royalty and idolatry. On the limbs of the tree already described, there is reason to believe that thousands of human sacrifices have been hung. One low bough, of great length and bulk, was pointed out to us, as having been the principal gibbet for such victims, century after century. The tree itself was sacred to Tani... (Montgomery 1832:I, 198-199)

Near the chapel there is a stone, on which the idol Tani was wont to be set down, that he might rest himself after the fatigue of being carried in a man's arms (whose peculiar office it was) down the steep hill adjacent, from his grand marae above, when, on certain extraordinary public occasions, it was necessary that he should be removed. The stone is a rough flag, as it was separated from the rock, four feet long, one and a half broad, and nine inches thick. It is placed horizontally on the edge of the lake, about half a mile from the sacred tree. (pp. 202-203)

Jan. 8. We visited several maraes, accompanied by Mr. Ellis and a native,

named Toumata, who formerly held the illustrious office of *te ama atua*, or bearer of the god Tani. He belonged to the order of priests, and was a personage of such superhuman sanctity that every thing which he touched became sacred; he was, therefore, not suffered to marry, as the honor of being his wife was too much for any mortal woman. But this was not all; he would himself be so defiled by such a connection that he would be disqualified for his office, and must immediately resign it; nay, if he did not repent, and return with a great peace-offering to Tani's house, he might expect to be first struck blind, and afterwards strangled in his sleep. He was not allowed to climb a cocoa tree, because, if he did, it would be so hallowed that nobody else durst afterwards ascend it. He was the only man living who had a right to handle the god Tani; and it was his special prerogative to carry the idol when it was annually removed to the neighboring motu to be stripped and new dressed, as already described; and though the latter ceremony was permitted to be performed by the priests, he alone could carry back the image to its marae on the mountain side. To do this, and re-instate it in its upper chamber, he had to climb a post of Tani's house, twenty-five feet high, with the unwieldy block on his shoulders. This office he voluntarily resigned, with all its privileges and emoluments, and embraced Christianity, on the day and at the place where Tani was burnt by Hautia and the zealous warriors who overthrew their country's idols with violence, but subdued their pagan adversaries with meekness, as stated in yesterday's journal. Toumata is a stout man, about thirty-five years of age, and very well versed in the traditions of his heathen forefathers, which enabled him to give us much information concerning the objects that attracted our curiosity in this day's excursion.

The first marae that we visited was the sepulchral one of the kings of Huahine, for many generations. It was an oblong inclosure, forty-five feet long by twenty broad, fenced with a strong stone wall. Here the bodies of the deceased, according to the manner of the country, being bound up, with the arms doubled to their shoulders, the legs bent under their thighs, and both forced upwards against the abdomen, were let down, without coffins, into a hole prepared for their reception, and just deep enough to allow the earth to cover their heads.

Close behind this was another inclosure, thrice the length and twice the width of this; the whole raised to the height of five feet above the ground; the walls of oblong, and the pavement of flat, stones, forming a pretty level platform. On this were held the national councils, when the kings, priests, chiefs, and land-owners assembled to determine questions respecting peace, war, or other great public concerns. On such occasions this stage was crowded with the great actors in those scenes of violence which used to convulse the island with civil strife; while thousands of the people, the sufferers in such tragedies, thronged around it, to hear the issue of consultations which were to relieve them from hostilities already raging, or to break tranquillity then reigning, by letting loose man against man, family against family, and district against district, till rapine, murder, and devastation had done all but their worst, by stopping short only of utter extermination in their progress. The political and priestly orators who were wont, at such times, to harangue the multitude, often displayed no mean powers of savage eloquence.

Close upon the margin of the lagoon, and under the shadow of the sacred tree, stands a marae, dedicated to the departed spirits of the kings whose bodies are interred in the adjacent one. This, like the rest, is composed of rough coral blocks for walls, and raised to a second story by small flags and stones. A third, belonging to a family of the Bue Raatera, built in like manner, is seen in the same vicinity. Others appear on the lower slope of the hill, which are respectively ded-

icated to Tani, Raa, and Oro, the principal idols of Huahine. Above these there has been constructed, at some barbarous period, a vast wall ten feet high and six thick. This rampart consists of rough masses of stone from the crags above, or coral-reef from the sea, piled and attached without cement, with great labor and no small art. It was raised for the purpose of obstructing the course of a pursuing or invading enemy up the steep side of the mountain, which it engirdles to the length of two miles, and only breaks off at points of interruption where the precipice itself precludes all possibility of assault. The upper regions of this acclivity were considered almost impregnable; and they not only afforded security to fugitives who gained them, but the fertility of the soil, which was thick-planted with cocoanut and bread-fruit trees, nearly to the top, and the perpetual springs of fresh water abounding there, furnished provision for the occupants as long as they were likely to be besieged by a baffled army below. Behind this fortified eminence, and with a small valley only between, the moua tabu, or Sacred Mountain, already described, rises about three thousand feet; from the summit of which, as a last retreat, defiance might be hurled, not in words only, but in the enormous missiles of disrupted rocks, and the smaller ammunition of loose stones, with which the surface was abundantly strewn.—On the lower mountain are many marae, of which particular notice is unnecessary. The whole hill and subjacent beach seem to have been holy ground, in the unhallowed sense in which men consecrate, upon the face of God's earth, temples and altars to idols and devils.—The great marae, so dedicated to Tani, stands superior among all these, being nearly a hundred feet by eighty in length and breadth, with walls in some parts nine feet thick. In the centre of this rude edifice, Tani's bed is seen, on which his idol was laid when prayers were offered to it, and near that another platform, which the dumb stock occupied on special occasions.

At the distance of thirty feet, in front of the marae, is the usual raised seat for the priest when he performed his devotions; and, near the same, what may be called the altar, consisting of a flat flag-stone and an upright one, on which the animals, offered in sacrifice, were formerly slaughtered; these were swine and fowls. But the altar on which the bodies of the victims, when slain, were presented, was a frame of wooden piles and planks, sixteen feet long, six wide, and ten high. On these occasions the fowls of the air had plenteous feasting. Near the spot were two large heaps of bones, principally the skulls of hogs. On the declivity, immediately below the marae, are two small terraces, raised to the height of twelve inches each from the ground, and on the lower side of these are stationed eight insulated stones, set up at some distance from one another, designating, by their position in reference to the temple, that part of it which particularly belonged to each of the eight districts of the island; and round which the inhabitants of the same, on public solemnities, congregated in tribes, as we were given to understand. On the north of the marae was Tani's house (now destroyed), a little wooden chamber, built on posts, twenty-five feet high, and to which there was no access except by climbing one of them. This was the sanctuary where the image was usually kept, and from and to which it was always carried by our companion, Toumata, till the day when the idol, the sanctuary, and the worship of Tani were destroyed. We are told that when the people saw the flames ascending from the pile on which Tani was laid, by Hautia and his Christian warriors, they were powerfully affected—some with joy, others with sorrow, and not a few with apprehension that the god would speedily arise and inflict summary vengeance on his enemies, if not destroy the whole island and its inhabitants, for the indignity offered to his wooden proxy. It ought to have been mentioned that on one side of Tani's house there is a remarkable stone, set on

end, which (like the tree on the motu, formerly mentioned) is said to have caught his long tail, when, from the top of it, he attempted to mount into the air on a journey of mischief. This tail, it seems, was a grievous drawback to Tani, and various trees, in the boughs of which it had been entangled when he was taking his flight, have become sacred in consequence of being touched by it, though to his own bitter disappointment, when they caught him and prevented his aerial flight. The old people say that meteors were formerly much oftener seen from these islands than they are now. These, as well as comets, they imagined to be the tails of the gods, and, therefore, when they saw them streaming through the atmosphere, they immediately threw off their upper garments and exclaimed, "a god! a god!" Tani's unlucky appendage, probably, was of celestial origin, in this respect; and, instead of being translated to the skies, like Berenice's locks, was attached to the popular image of his person, in commemoration of some magnificent meteor, whose train, in its flight, measured ninety or a hundred degrees. (pp. 204-207)

When living animals were brought to be sacrificed to Tani, no blood was shed. They were laid upon the stone, and most cruelly, because most clumsily, strangled by the pressure of their necks between two pieces of wood. Not hogs and fowls only, but fishes, fruits, and intoxicating spirits were offered at this altar. Of these good things—though presented on the frame, before described, for Tani to feast upon, or rather to be consumed by the birds or perish by putrefaction—it was shrewdly suspected that few were consumed by so slow a process, the priests having found a much more convenient way of disposing of them. It is remarkable that among the contributions to Tani's service were *first-fruits*, according to the season of the year; a poor person was expected to bring two of the earliest gathered, of whatever kind, a raatira ten, and the chiefs and princes more, according to their rank and riches. These were thrown down upon the ground, at the marae, with the expression, "Here, Tani, I have brought you something to eat." In general, when hogs were presented, the heads only were laid upon his altar, the remainder being baked and devoured by the worshippers and the priests. Many kinds of fish, but neither sharks nor turtles, were thus offered. Human sacrifices were never slain or exposed here; these were all gibeted at the enormous aoa tree, on the beach below. For Tani's bearer (our friend Toumata) there was set apart, out of these gifts, a certain portion of food, which even the kings dared not to take away or touch. At a marae, on the beach, we were shown a precious relic. This was said to be a fragment of Tani's canoe, which, though a stone, could swim as well as if it had been timber. To prove this a man threw it into the water, and it actually floated! The fact and the solution of the puzzle were equally apparent; it was a large piece of pumice-stone. Whence this specimen came the people could not inform us, but they said that there were more pieces of the same substance at other places on the island, which, according to an old tradition, had been collected by some devout person, formed into a canoe, and presented to Tani. The priests, no doubt, knew well how to avail themselves of a natural circumstance to hold an ignorant and credulous people in delusion by the semblance of a miracle. (pp. 208-209)

As we shall see in volume 3, Huahine had eventually become a unified tribe, under chieftainship of dynasties residing mainly at Maeva, where were located the principal marae of Tane just described. Thus, latterly at least, the cult of Tane on Huahine was coterminous with the island's tribal

unit (and congregation). On the other hand it is possible that many or most Huahineans were devotees of this god even before they became politically united. Moreover, as we saw earlier, Tane worship was also established on other islands which cannot be linked politically with Huahine and which appear not to have been interlinked by any evident kinship ties. Thus, I feel justified in describing Tane worship as an archipelago-wide, supratribal *cult*.

There is no evidence of special association between Tane and any particular unit of consanguines (as was the case with Ta'aroa, in spite of his "universality," and as was the case also with 'Oro). As might be expected, Huahine's principal chiefs played leading roles in Tane worship, but their connections with the deity were evidently not rationalized in terms of descent. Moreover, as far as I can discover, unlike Ta'aroa and 'Oro, Tane was not identified with any kin-congregation's Title-validating insignia, such as the feather girdles that linked Ta'aroa or 'Oro with Opoa and its offshoot kin-congregations. And in this connection, while images of Tane are well attested, I can find no evidence of "genealogical" connections among them, such as will be shown to have been the case with images of 'Oro.

'ORO

'Oro worship may at one time have been identified exclusively, or principally, with one kin-congregation, and then later with a single tribe; but during the era under study its devotees were drawn from several kin-congregations and tribes. And, as we shall see, the cult thus constituted became an important factor in dynastic and intertribal rivalries.

Myths of 'Oro

One version of the origin of 'Oro is given in a sonorous chant dictated to Orsmond in 1840 by Tamara (of Tahiti) and Pati'i (of Mo'orea):

A hee mai te tua, e ia papama'ehe no te tai a tau te pô.

E pô fanaura'a atua, o te pô Mua-Ta'aroa; o 'Oro-taua te atua i fanau mai i tereira pô; 'Oro atua o te Reva e te Fenua nei; 'Oro haia; 'Oro atua o te Arioi.

O Hina-tû-a-uta te metua vahine o 'Oro, i ha'amaru hia e Ta'aroa i raro a'e i te 'ama'a uru i fanau mai ai o 'Oro, ei tamaiti na Ta'aroa. I Opoa i te ao nei o 'Oro te fanau raa hia; O Tai-'au, te tane o Hina-tû-a-uta, te metua fa'a'amu a 'Oro.

The sea rolled, and the tides succeeded each other for a period of nights.

It was the birthnight of a god, it was the night Mua-Ta'aroa (First-severed); 'Oro-taua (Warrior-at-war) was the god born that night; 'Oro (Warrior), god of the air and earth; 'Oro, the manslayer; 'Oro, god of the comedians.

Hina-tu-a-uta (Hina-of-the-land) was the mother of 'Oro; she was overshadowed by Ta'aroa beneath a breadfruit branch, which caused the birth of 'Oro, the son of Ta'aroa. Opoa of this earth was the birthplace of 'Oro; Tai-'au (Sea-for-swimming), the husband of Hina-tu-a-uta, was the adoptive father of 'Oro.

(Henry 1928:374-375)

It should be noted that Henry subtitled this chant “Birth of More Gods” and placed it sequentially after several other chants describing Ta’aroa’s acts of deity creation, by sexual reproduction and otherwise.

Ellis’ version was evidently derived from sources similar to Orsmond’s:

Oro was the first of the fourth class, and seems to have been the medium of connexion between celestial and terrestrial beings. Taaroa was his father. The shadow of a bread-fruit leaf, shaken by the power of the arm of Taaroa, passed over Hina, and she afterwards became the mother of Oro. Hina, it is said, abode in Opoa at the time of his birth; hence that was honoured as the place of his nativity, and became celebrated for his worship. Taaroa afterwards created the wife of Oro, and their children were also gods.

After the birth of Oro, Taaroa had other sons, who were called brothers of Oro, among whom were the gods of the Areois. (1829:II, 194)

With these two versions may be contrasted the one collected by Lavaud in 1849 from Mare. My translation is from Lavaud’s French text (Roussier 1928:190-191), and hence two removes from the original native text, which is not available.

Ta’aroa then perceived that there were no inhabitants on earth. On looking down he saw Te-papa-rahahaha, who turned her eyes toward him and smiled. Whereupon he said to her: “Here are Ta’aroa’s genitals. Cast your eyes upon my Tumu. Stand up and gaze upon them. Insert them.” And to his genitals, named Teapoirahi, Ta’aroa said: “Descend upon Te-papa-rahahaha, who was created out of my own leg bone.” The female thereupon was known as Te-faimai-i-raro, because she was underneath, and Ta’aroa was known as Te-faimai-i-ni’a, because he was on top. From the union of these two were born, first, Redearth and then Whitesand, who became the soils so colored.^[4] After them was born ‘Oro, who became a god and lived in the sky. After ‘Oro were born several other males, all of whom were sky-dwelling gods: Tane, Teiri, Te Fatu, Moe, Ruanu’u, Tu, Toahiti, Tanuta, Temeharo, Tunuategatutiri. Then was born [of this union] a daughter named Hina-tutupo, whose job it was to make clothing for Ta’aroa and her divine brothers.

I do not know what significance, if any, to attach to the fact that the Mare and Henry-Ellis versions provide ‘Oro with different mothers. Perhaps, in this instance paternity figured more importantly than maternity in ‘Oro’s antecedents.

Several points are worth noting about these versions of the origin of ‘Oro:

1. The deity was unequivocally male.
2. He was created by sexual reproduction.

3. He was not the firstborn of his genitor, Ta’aroa,⁵ and, in the Mare version, not even his mother’s firstborn. In the Henry-Ellis versions his creation took place some time after Ta’aroa had created certain other deities—a consideration which led Ellis to place ‘Oro in the fourth and last category of “principal” divinities, after such gods as Ro’otane, Toahitu, Te Fatu, and others, including several gods of war (1829:II, 194).

The principal divinities were distinct from “the gods of particular localities or professions” and from an “intermediate class” who were “not supposed to have existed from the beginning, or to have been born of Night, i.e., Pō.” Ellis related that these “intermediate” divinities were often described as having been “renowned men, who after death were deified by their descendants” (pp. 194-195). Ellis seems also to have implied that the order in which a category of principal gods was created was reflected directly in their hierarchical positions, but this implication is not further documented. In any case, the eminence ultimately attained by ‘Oro evidently did not lead his devotees to mythicize that position wholly in the conventional terms of birth order.

4. In the Henry version, ‘Oro is represented as having been born out of wedlock: that is, his genitor, Ta’aroa, was not his mother’s “tane”—the latter having been Tai’au, who became ‘Oro’s “feeding-parent” (*metua fa’a’amu*). (The similarities between this version and the New Testament account of the origin of Christ would arouse stronger suspicion of borrowing were it not for the fact that this thematic situation is a common one in myths of unquestionably native authenticity.)

5. The Henry-Ellis versions specify Opoa as having been the birthplace of ‘Oro. Lavaud’s summary of Mare’s version does not specify ‘Oro’s birthplace, but does identify Opoa as the site of what one may infer to have been his first marae: “The marae of Oro, ... Taputapuataea, is located in Raiatea on land called Pupua. The southerly gales originating here are called ‘The Winds of Pupua.’” (Roussier 1928:192)

As I noted in chapter 16, Taputapuataea was not always so called; the name of its earliest component was Feoro.

When ‘Oro, god of war, was born of Ta’aroa and Hina-tu-a-uta, at Opoa, his father gave him Opoa with the marae, Feoro, as his home. So he soon waxed very great, and the people of all the land and beyond the shores of Havai’i acknowledged him as the supreme god of the earth and air. The name Feoro was changed to Vai-’otaha (Water-of-the-man-of-war-bird) which, in addition to their local names, became the clerical name of all marae dedicated to ‘Oro, because the man-of-war bird was ‘Oro’s shadow, and the water meant human blood. ‘Oro’s high priest at Opoa was named Tiri (Throw-out), meaning extension of power and also nurse of the god.

The image of ‘Oro in this marae was woven with fine sennit into the shape of a man, two or three feet long, and covered with red and yellow plumage. It wore a girdle of red feathers. The title ‘Oro-marō-’ura (Warrior-of-the-red-girdle) was given to it, associating ‘Oro in his earthly capacity with the highest royalty.

At the ancient royal marae of Fa’a-nui (Great-valley) in Porapora kings, called the *arii marotea* (royalty of the yellow girdle), received the *maro-tea* (yellow-girdle of parakeet feathers) instead of the *maro-ura* (red-feather-girdle) of the kings of Opoa. Another name for this marae, Vai-’Otaha, indicates that the royal scions of the house of Porapora, from Opoa, took their chief corner stone

from the parent marae while it was so named. Over it was placed Oro-marotea (Warrior-of-the-yellow-[or light colored]-girdle), his image being woven in the likeness of that at Opoa but covered with yellow feathers instead of red.

To Taputapu-atea, the national marae of Ra'iatea, were taken most of the heads of warriors, who were decapitated as they lay dead or wounded upon the battlefield. The heads were cleaned and closely stacked in rows in the crevices and nooks of the marae, where contrasted with the background of stones, they produced a terrifying sight. Bleached with age, these skulls lay sacred upon the marae. (Henry 1928:120-121)

In due course 'Oro-worship spread to other islands. Henry gave a version of its establishment upon Tahiti:

Since the legend of Tahiti being a fish from Ra'iatea was believed to be a historic fact (a belief that has not yet died out among the native people), the priests of Ra'iatea claimed Tahiti for 'Oro after he had been established at Opoa.

In the reign of Tamatoa I there came to Tahiti a high priest of 'Oro, named Tupua-nui-te-fa'aonoono (Persistent-great-growth), accompanied by his two brothers, Te-tupu-amiha (Steady-growth) and Te-haruru (The-noise), who were priests under him, and also a sister, Toa-te-manava (Brave-hearted), who was a learned scholar. They brought with them a stone from Taputapu'atea (Sacrifices-from-abroad) at Opoa, to set up in a marae in Tahiti. Their great canoe, Pa-tarava (Extended-fort), was built for the occasion on the builders' marae, named Tahiri-a-manu (Fanned-by-birds). It was well laced and ornamented with sacred sennit, so that it was said to be possessed with great power or magnetism (mana). The visitors also brought becoming gifts to present to the Tahitian gods and chiefs, such as *poe-mata-uiui* (pearls), *ahuara* (soft, fine mats), *'oro'oro huruhuru 'otaha* (bunches of man-of-war bird feathers), *'ura* (parrakeet's feathers), and fau fringe.

While they were preparing to take their presents for the gods to the marae, Tû-marama (Stability-of-the-moon), of the god Tû, represented by the meho birds, or rails, the marae that faced the passage of Pape'ete by which they had entered, the warriors of Te-oropa'a perceived the canoe moored out in the shoal and were about to seize it when the sister of the priest loudly invoked the aid of 'Oro to deliver them out of the warriors' hands. In an instant the canoe, with its owners, was caught up into the clouds and borne speedily by a strong wind to Opoa, where they told their story to the king, who went with them to the great marae and presented the offerings from the canoe to 'Oro in gratitude for the god's act of deliverance.

Finally 'Oro's zealots set out for Tahiti, and they went to Tai'arapu, the head of the fish, and landed at the point called Ta'ata-tua (Man-of-the-sea) at the marae called Te-ahu-o-rua-tama (Wall-of-the-source-of-fair-child), chief of the fire gods, and there they presented their gifts and religious homage. They were well received with all due ceremonies, and allowed to set up their cornerstone, called Tupu-i-mata-roa (Growth-of-long-face), for a home in the east for 'Oro. As all Tahiti and Mo'orea regarded this as a natural sequence in the history of Tahiti, the fish, they peacefully united in building a great national marae for 'Oro, which they named Taputapu-atea. The incarnation of the god in it was a small log of *toa* or *aito* (also meaning warrior), about six feet long, which was decked in sennit and red, yellow, and black feathers to give it all the original attributes of the terrible god. Soon, during the usual solemnities of the occasion, came a strong southwesterly wind, on which 'Oro rode with flashes of lightning. He entered into the image, which was then called 'Oro-rahi-to'o-toa (Great-'Oro-of-the-toa-image), and thus his hold on Tahiti commenced. (1928:129-130)

'Oro acquired spouses and reproduced offspring of his own. According to the Henry version the first of his spouses was Tufeufeumaitera'i, who was "conjured" (*rahu*) into being by Ta'aroa, and from this union came three goddesses: To'imata, 'Aitupuai, and Mahufaturau. "These goddesses, followed by a host of other goddesses, always accompanied 'Oro and his host of gods to battle, whither they never failed to go" (1928:375). Then followed the birth of Hoa-tapu Ho'ata-meamea Ho'ata-tino rau, "one god with three names, the last child and only son born of the wife Tu-feufeu-mai-te-ra'i" (Henry 1928:376).

Mare's version differs from the above: "'Oro took Hotupapa to wife and by her produced two sons, Hoatapuitera'i and Teritapotu, and three daughters, Te toimata a tuanuio oro, Vaeaituruoro, and Muri hea te pairu" (Roussier 1928:192).

The only obvious correspondences between these two versions consist of Hoatapu, a son, and To'imata, a daughter—both of whom appeared elsewhere as deities in accounts of Maohi pantheons. To'imata, especially, figured in beliefs and rituals concerned with warfare,⁶ and she was described by Henry as having been the recipient of human offerings: "Only male sacrifices, human or otherwise, were supposed to be acceptable to the gods, the sole exceptions to the rule being a woman or girl who died from the black art or was slain in war time, when she was offered to Toi-mata, daughter of 'Oro" (1928:198).

To 'Oro's second "marriage" was ascribed much greater cosmogonic importance, serving as it did to inaugurate the Ariois. The earliest printed version of this mythical episode appears in the first edition of Ellis' *Polyneesian Researches*, published in 1829. Ellis characterized this version as "one of the most regular accounts of the origin of the Arioi institution," and attributed the information on which he based his rendition to the Reverend Barff, of Huahine, who received it from Auna and Mahine (the latter a chief of Huahine):

Oro, the son of Taaroa, desired a wife from the daughters of Taata, the first man; he sent two of his brothers, Tufarapainuu and Tufarapairai, to seek among the daughters of man a suitable companion for him; they searched through the whole of the islands, from Tahiti to Borabora, but saw no one that they supposed fit to become the wife of Oro, till they came to Borabora. Here, residing near the foot of Mouatahuuura, *red-ridged mountain*, they saw Vairaumati. When they beheld her, they said one to the other, This is the excellent woman for our brother. Returning to the skies, they hastened to Oro, and informed him of their success; told him they had found among the daughters of man a wife for him, described the place of her abode, and represented her as a *vahine purotu aiai*, a female possessed of every charm. The god fixed the rainbow in the heavens, one end of it resting in the valley at the foot of the red-ridged mountain, the other penetrating the skies, and thus formed his pathway to the earth.

When he emerged from the vapour which, like a cloud, had encircled the

rainbow, he discovered the dwelling of Vairaumati, the fair mistress of the cottage, who became his wife. Every evening he descended on the rainbow, and returned by the same pathway on the following morning to the heavenly regions. His wife bore a son, whom he called *Hoa-tabu-i-te-rai*, friend, sacred to the heavens. This son became a powerful ruler among men.

The absence of Oro from his celestial companions, during the frequent visits he made to the cottage of Vairaumati in the valley of Borabora, induced two of his younger brothers, Orotetefa and Urutetefa, to leave their abode in the skies, and commence a search after him. Descending by the rainbow in the position in which he had placed it, they alighted on the world near the base of the red-ridged mountain, and soon perceived their brother and his wife in their terrestrial habitation. Ashamed to offer their salutations to him and his bride without a present, one of them was transformed on the spot into a pig, and a bunch of *uru*, or red feathers. These acceptable presents the other offered to the inmates of the dwelling, as a gift of congratulation. Oro and his wife expressed their satisfaction at the present; the pig and the feathers remained the same, but the brother of the god assumed his original form.

Such a mark of attention, on such an occasion, was considered by Oro to require some expression of his commendation. He accordingly made them gods, and constituted them Areois, saying, *Ei Areoi orua i ie ao nei, ia noaa ta orua tuhaa*: Be you two Areois in this world, that you may love your portion (in the government, &c.) In the commemoration of this ludicrous fable of the pig and the feathers, the Areois, in all the taupiti, and public festivals, carried a young pig to the temple & strangled it, bound it in the *ahu haio*, (a loose open kind of cloth,) and placed it on the altar. They also offered the red feathers, which they called the *uru maru no te Areoi*; the shadowy *uru* of the Areoi, or the red feathers of the party of the Areoi.

It has been already stated that the brothers, who were made gods and kings of the Areois, lived in celibacy; consequently they had no descendants. On this account, although they did not enjoin celibacy upon their devotees, they prohibited their having any offspring. Hence, one of the standing regulations of this institution was, the murder of their children. The first company, the legend states, were nominated, according to Oro's direction, by Urutetefa and Orotetefa, and comprised the following individuals: Huatua, of Tahiti; Tauraatua, of Moorea, or Eimeo; Temaiatea, of Sir Charles Sander's Island; Tetoa and Ataa, of Huahine; Taramanini and Airipa, of Raiatea; Mutahaa, of Tahaa; Bunaruu, of Borabora; and Marore, of Maurua. These individuals, selected from the different islands, constituted the first Areoi society. To them, also, the gods whom Oro had placed over them delegated authority, and gave permission to admit to their order all such as were desirous to unite with them, and consented to murder their infants.* These were always the names of the principal Areois in each of the islands; and were borne by them in the several islands at the time of their renouncing idolatry; when the Areois name, and Areois customs, were simultaneously discontinued.

*The above is one of the most regular accounts of the origin of the Areois institution, extant among the people. Mr. Barff, to whom I am indebted for it, received it from Auna, and Mahine the king of Huahine. (1829:I, 312-315)

Ellis has this to say about Orotetefa and his brother:

According to the traditions of the people, Taaroa created, and, by means of Hina, brought forth, when full-grown, Orotetefa and Urutetefa. They were not his sons;

oriori is the term employed by the people, which seems to mean *create*. They were called the brothers of Oro, and were numbered among the inferior divinities. They remained in a state of celibacy; and hence the devotees were required to destroy their offspring. (p. 312)

The next extensive version of this episode to appear in print was Morenhout's, in 1837; from other evidence it seems likely that it derived from informants living mainly on Tahiti:

'Oro, son of Ta'aroa the Creator, and next to the latter the most important of all gods,^[7] wishing to choose a mate from among mortals, descended from Te Ra'i tui tai, the highest level of Heaven, onto Mount Paia of Porapora, where dwelt his sisters, Te Uri and Oaaoa.^[8] 'Oro explained his mission to his sisters and asked them to accompany him to aid in his search for a mate worthy of himself. They descended by way of a rainbow mist placed there by the god, with one end resting upon the mountain summit and the other upon the ground, and disguised as mortals—'Oro himself in the form of a young warrior, his two sisters as maidens. They went from one island to another, putting on the kind of festival called *opera*, in which all women customarily took part; but it was all in vain. Among all the daughters of Man not one was seen that pleased the God. Becoming weary of the fruitlessness of their search the divinities were on the point of returning to their celestial home when finally at Vaitape on Porapora they came upon a maiden of outstanding beauty bathing in the small lake of Ovai aia. So charmed was 'Oro by the sight of her that he sent his sisters to visit her, while he himself returned to the summit of Mount Paia.

On approaching her the goddesses greeted her and praised her beauty, telling her that they were come from Avanau district of Porapora, and that their brother was desirous of mating with her. Vairaumati—for such was her name—looked them over carefully and replied, "You are not of Avanau, but it doesn't matter. If your brother is an ari'i, and young and handsome, he may come here and Vairaumati will mate with him."

Te Uri and Ha'oa'oa ascended to the summit of Mount Paia and reported to their brother the results of their mission, on hearing which Oro replaced the rainbow and descended by way of it to Vaitape. There he was received by his loved one, who had prepared for the occasion a table loaded with fruits and a bed made of fine tapa and mats.

Thereafter, delighted with his new wife, 'Oro spent the nights with her and the days on his mountain-top, travelling between there and Vairaumati by means of the rainbow. When his absence from his celestial home lengthened, his brothers—Orotetefa and Uretetefa—started out in search of him, finally finding him on Porapora, seated in the shade of a sacred tree with his loved one. So struck were they by the beauty of the maiden that they were ashamed to approach the couple empty-handed. Whereupon one of them transformed himself into a sow and the other into some red feathers. Then, separating their true selves from these objects and changing back into their own forms, they presented the objects to the couple. That very night the sow produced a litter of seven, which were distributed as follows:

pua'a te vaa pou
a pig to sacrifice to gods

pua'a maro ura te Arioi
a pig for *maro ura* Ariois

pua'a te haere roa
 a pig for visitors or companions [?]
 pua'a fature no te vahine
 a pig for festivals in honor of women [?]
 te vai pua'a
 two pigs for breeding
 tei te fatu pua'a aa iho
 a pig for the household, for eating.

In due time Vairaumati knew herself to be pregnant and so informed 'Oro. Upon learning this 'Oro immediately carried the *maro ura* pig to Ra'iatea, to the great marae of Vapoa [Opoa?]. There he found a man named Mahi, to whom he handed over the pig, saying: "Take over this pig and look out for it. It is a pig of the Arioi, a sacred (ra'a) pig, a pig for maro ura Arioi. I hereby make you an Arioi among mortals. I, having become a father, can no longer be an Arioi."

Mahi then called upon the chief of Ra'iatea and told him what had come to pass; and not being able to tend these sacred objects himself, unless he were a friend of a chief, he proposed to the other that they exchange names. The latter accepted, and they adopted in common the name Taramanini.

(At this point Moerenhout observed that there were several versions of this myth, but noted that all of them recognize Mahi as having been the founder of the Arioi sect, or the "mysteries of 'Oro.")

It is also said in this version of the myth that, upon returning to Vairaumati, 'Oro informed her that she would eventually give birth to a son, whose name would be Hoataputera'i (Sacred-friend-of-heaven), but that with respect to himself, 'Oro, the time had come for him to leave her. At this he transformed himself into an immense pillar of fire which rose majestically into the air over Pirepire, Porapora's highest mountain, and while his mate wept and the populace watched with amazement he disappeared from view. Finally, it is said that his son, Hoatapu, eventually became a great chief who did much good for his people and delivered them from many difficulties, with the help of his father and other gods; and also that after death he joined his father in Teraituitai, to which place 'Oro also elevated Vairaumati, who took her place among the goddesses. (Moerenhout 1837:I, 485-489)

The next published version of this mythical episode was Henry's; she described this version as having been received by Orsmond in 1840, from a Tahitian source:

'Oro and his wife, Tu-feufeu-mai-i-te-ra'i (Stand-to-unfold-the-sky), and their three daughters, To'i-mata (Axe-with-eyes), Ai-tupuai (Eater-of-summit), and Mahu-fatu-rau (Fog-of-many owners), and their only son, Hoa-tapu (Sworn-friend), dwelt with many gods in the firmament, where 'Oro reigned as king and from whence he one day ungraciously pushed his wife down to the earth, where she became a great heap of sand and so remained ever afterwards.

'Oro became lonely without his wife; and his sisters, Te-uri (Darkness) and Haoaooa (Grossness), compassionating him, said they would go down to the earth to find him a new spouse. So they descended to Tahiti clad in ti leaves, shredded into a fine plumelike fringe, each carrying in her hand a reed as a wand. Their lofty bearing instilled awe into the hearts of earthly beings, who soon obeyed their bidding to assemble all the beautiful women of the land before them that they might choose one as a wife for the god.

But all the women of Tahiti were too coarse and common for his divinity, and the sisters passed on to Huahine, then to Ra'iatea, Oro's native land, and on to Tahaa, only to meet with the same result as in Tahiti. At last, despairingly, they went to Porapora, and there were told of a royal maiden of surpassing beauty, named Vai-rau-mati (Water-of-Ficus-tinctoria). As she was too dainty to be brought out before them, they had to go to see her. They went to a princely house near Vai-otaha (Water-of-man-of-war-birds), 'Oro's marae, and found the maiden in her apartment, screened off with the richest *vane* (mats). Enchanted were they with her beauty! Her face was as the noontide light, and the luster of her dark eyes shone forth like stars from the deep-blue sky. She kindly welcomed them, and they greeted her as their *taua* (bosom friend), encompassing her with flashes of lightning, which made her divine like themselves, and she bade them be seated with her on her mat.

According to the usual custom, Vai-rau-mati, addressing her visitors said, "A great errand has brought you to me, O great goddesses?"

"Yes," was the answer, "we have indeed a great errand! We have come to ask you to become the wife of our brother 'Oro, god of the firmament."

"Is he handsome?" enquired the girl.

"Yes! He is handsomer than all the sons of men and is ever youthful," they replied.

So it was arranged that this lovely maid was to become the spouse of the great god 'Oro, and the sisters returned to the sky to tell of their success and to direct their brother where to find his bride. 'Oro was highly pleased at what his sisters told him, and early the following morning he descended in a cloud by a brilliant rainbow, which was his means of transit to the earth, and it conducted him to her home, where he found the princess all that even a god could wish.

Soon afterwards, their marriage took place, the bride having many valuable gifts for the occasion, while 'Oro, who had nothing terrestrial to present, was at a loss to know what to do to save himself from ridicule on such an occasion.

Then a new thought struck him, and he went up into the sky and said to his sisters, "Where are our two lads, Uru-te-tefa (Vain-head) and Oro-te-tefa (Vain-warrior)?"

"Over yonder, cooking our food," they replied. So he called them, and with willing steps they came running into his presence, when suddenly they were transformed into two fine hogs, a boar and a sow, such as had never been seen before. They were never to be killed, and he named them both 'Oro-i-te-pua'a-mahui (Oro-in-the-pig-revealing-secrets). "Now," said 'Oro triumphantly, "I have gifts worthy of presenting to my wife." And he led them down by the rainbow—while his sisters wept for their two attendants, whom they had regarded as brothers—and he presented them to his wife with a bunch of red feathers, which he called Uru-maru-no-te-arioi (Shady-grove-of-the arioi). These two pigs became gods of the *arioi*, retaining their names Uru-tetefa and Oro-tetefa.

The following night the sow produced a litter of five fine little male pigs. The first one was the first sacred pig of the *arioi*, yet to be organized, and it was

named Oro-i-te-tea-moe (Warrior-of-the-laid-down-spear); the second was sent into the sea and became a porpoise; the third was a pet for 'Oro's wife; the fourth was for sending to different lands; and fifth was sacred to the marae, marked with a ring of sacred sennit through its nose.

King Tamatoa I, as 'Oro's incarnation, was the first *arioi* on this earth, and he organized the first *arioi* society at Te-pori-a-tai (The-fullness-of-the-sea), a place near his residence at Opoa. 'Oro gave the *arioi* pig to King Tamatoa, as his representative in this world, and the king set in its nose to insure its life a ring of sacred sennit terminating with a tassel, and let it loose at Opoa. But the pig would not remain there, and so the king gave it in charge of a friend named Mahi (Fermented-breadfruit) to take to Tahiti, and there find a place for it. Thither Mahi went with the pig, but as it was a time of solemn restriction in the land he found no footing there and returned to Ra'iatea for a short season. He made the trip to Tahiti three times before he was hospitably received and found a home for the pig. The third time they landed at Afa'ahiti, bordering upon the Isthmus of Taravao, and Mahi was compassionated by a young woman named Taurua (Venus), who, seeing he was a friendless stranger, called the attention of her father, Hua-tua (Ocean-sprays), to him, and he was soon cordially welcomed to their home. Mahi told his errand, and Hua-tua received the wonderful pig, dedicated to Oro-i-te-tea-moa, after whom it was named, and set it free in the thickets of Taravao.

The two men became *taua*, in honor of which a feast was prepared. Great hogs were baked whole and presented to Mahi, who was highly gratified at his reception. In the name of the god he was serving, he divided one pig into four equal parts; one quarter he sent to Maro'ura (Red-girdle) of Hitia'a, one he sent to Mataa (Cheerfulness) of Papara, one to Taura'a-atua (Alighting-of-the-gods) of Papetoai in Mo'orea, and the fourth and last one he kept for Atea of Huahine, all of whom were great personages. Soon afterwards these men became chief comedians of the *arioi* society in their districts and aided Tamatoa in electing those of all the other islands in the group. The names of the chiefs descended to their successors in their respective districts until the *arioi* system ended.

According to the native custom, Mahi required presents to give as a requital of friendship to his new *taua*, and so he returned home to procure them. After arriving at Ra'iatea, and telling the king and Atea what he had done in Tahiti, he went to an islet off the coast of Taha'a, called Motu-torea (Islet-of-the-whistling-plover) and there raised pigs and made rolls of cloth and mats to take to his friend in Tahiti. But a thought occurred to him that he needed a more influential friend than Hua-tua to enable him to propagate the *arioi* society, and so he took the presents to his King Tamatoa and asked him to invest him with regal authority, that he might represent him worthily in Tahiti. To this the king readily agreed. He took him to Opoa, and there placed upon him a rich cape from the temple of Oro; he gave him a royal canoe named Hotu (Sea-swell), which they loaded with rolls of fine cloth and mats, sennit, coconut shell cups, and water bottles, cloth-beating mallets, capes, waist cloths, girdles, and feather ornaments for the head and neck. And they exchanged names, Mahi being called Tamatoa and the king naming himself Mahi.

Thus equipped, King Tamatoa's proxy went to Tahiti, attended by an *arioi* chief named Te-ra-maniou (The-declining-sun), of Ra'iatea, and a staff of *arioi*. They landed at Afa'ahiti and presented the gifts to the good friend Hua-tua (Ocean-spray), whom they created chief *arioi* of Afa'ahiti and who joined them in their errand. Then they all went from district to district, around Tahiti

and Mo'orea, their canoe gaily decorated with long pennants of many colors (*matiti*) and small circular mat sails (*mou*, meaning tops) attached to the tops of the masts, which were tipped with spreading bunches of cocktail feathers (*tefatefa*, this being the special rigging of the *arioi* canoe). The sound of their drums and flutes, accompanied with dancing, attracted much attention and curiosity among the crowds of people who went to meet them. They soon gained numerous adherents and thus made general their society over Tahiti and Mo'orea. Then every district in all the islands dedicated pigs to 'Oro, sacred to their society. The great body of *arioi* throughout the group was called "Te-papa nui arioi" (The great rock of *arioi*). Only well-developed persons of comely appearance, qualified as *feia purotu* (handsome people), were admitted into the society, and both sexes enjoyed the same ranks and privileges. (1928:231-234)⁹

Leaving aside for the moment the more noteworthy differences among these three versions, we have basically three mythical episodes in the establishment and spread of a "new," powerful, and eventually widespread sect. In keeping with the catholicity of Maohi religious beliefs it is likely that all Maohis acknowledged the existence of 'Oro as one of the more powerful gods in their pantheon. And for many, 'Oro came to be recognized as the principal "official" tutelar of their tribal congregations. But in addition, for some Maohis, namely the Ariois, 'Oro worship became a specialized occupation, a sectarian order.

The relationship between "official," tribal-wide 'Oro-worship and Ariothood is not altogether clear. Not all leaders of 'Oro-dedicated tribes were Ariois, and not all Ariois were members of 'Oro-dedicated tribes. And although the growth and spread of Ariothood undoubtedly served to disseminate 'Oro worship in general, it is not ascertainable what role Ariothood played in the earlier diffusion of 'Oro-cultism. Legendary evidence can be interpreted either way; on the one hand there is the statement that "there have always been Ariois" (Ellis 1829:I, 312), but on the other hand the myth reproduced earlier concerning the establishment of 'Oro-worship in Tahiti-Mo'orea makes no reference to Ariois. Some writers have attempted to specify actual dates for the origin and spread of one or both of these movements, and later on I shall present these writers' arguments, for whatever they may be worth; but, in the reconstruction that I now undertake, I shall treat the movements separately, first describing the tenets and practices of 'Oro-worship in general, before outlining those associated with Ariothood in particular.

'Oro Worship

As noted earlier, 'Oro was conceived of as having been male; and in his most important human guise he was youthful, handsome, and of the *ari'i* class. He is represented in myth as having been sexually active, moderately prolific, and even more undependable as a spouse than was the average human male.¹⁰ But what distinguished him from most other gods

was not so much his eagerness for warfare, perhaps his most publicized attribute, as his avidity for human lives.

‘Oro became manifest to mortals in a number of forms; for example, the yellow thrush (*‘omana ‘o-pua-fau*) was *ata* of the god in his yellow-girdle manifestation (*‘Oro-i-te-marō-tea*), while the green and yellow parakeet (*a‘a-taevao*) was his *ata* in his red-girdle manifestation (*‘Oro-i-te-marō-ura*) (Henry 1928:384–385). More important than these however was the man-of-war bird (*‘otaha*), which was *ata* of ‘Oro-the-dauntless-warrior (*Oro-pa‘a*). In addition, ‘Oro-at-war occasionally manifested himself in boars:

The boar was a shadow of ‘Oro-*tauà* (Warrior-at-war) as the man-slaying god; it was ‘Oro-pua‘a-mahui (‘Oro-the-pig-revealing-secrets). When a gentle, domesticated boar got possessed, it was known that ‘Oro was dwelling in him; that pig could devour a man. Pointing upwards to the sky was one jaw, and pointing downwards to the earth was the other jaw, which was the sign that the mouth of ‘Oro was open ready to consume the king and his clans. That pig became very fierce, a great power in itself in the land. (Henry 1928:383)

Like other deities ‘Oro sometimes entered into a human’s body, usually for the purpose of communicating with other humans. As we have seen, in some instances the god possessed (*uruhia*) some individuals sporadically and unexpectedly. In other instances individuals served as regular oracles (*taura*) for him, even to the point of being capable of inducing his presence when needed. And, in rare instances, ‘Oro possessed some individuals on a more or less permanent basis.¹¹ When possessed by ‘Oro a *taura* usually wore a strip of *tapa* wound around one hand. According to one missionary account however the practice was peculiar to the *taura* Metea:

When the god [‘Oro] comes to [Metea] he has his left hand always wrapped up in cloth & so continues till the spirit or inspiration is departed. The reason he assigns for covering his hand is that the gods hand is deformed. This custom appears to be peculiar to this prophet, we never observed it in any of the others, and now whenever the prophet is seen covering his hand the people are ready to tremble thinking there is some mischief coming. (Davies, Journal, 7 October 1807, LMS Archives)

It will also be recalled that individuals possessed by this god were sought after by women for procreative purposes.

Finally, ‘Oro regularly inhabited certain images, *to‘o*, partly as vehicles for issuing instructions and prophecies but mainly for the purpose of receiving worship and of validating certain events of great social importance. During the eras under study most of these ‘Oro images consisted of club-shaped pieces of ironwood (*Casuarina equisetifolia*: *‘aito*, *toa*) wholly or partially covered with sennit to which were attached feathers (figs. 22-1 and 22-2).

One exception was noted in a missionary journal of January 1801:

A large fleet of double-canoes arrived from Hapyano. One of the canoes was decorated with various apparatus of idolatry; such as the image of a bird, nearly as large as a goose, rudely formed, and covered with feathers of different colours, into which the poor natives boldly assert their god Ooro delights to enter; a small canopy, fixed over a little stool under this also they believe their god at times rests himself; the canopy is covered with feathers; a hollow cylinder, about ten feet long, and three feet round, covered with feathers, set upright on the stern of the canoe, which was very lofty—its use we know not;—and various other things. (LMS Transactions:I, 214)

'Oro images varied in length from about two to five or six feet, and to some of them were appliquéd additional strips of sennit representing anthropomorphic features.¹² It may be that some 'Oro images consisted, like some *ti'i*, of anthropomorphically carved wooden figures, with a hollowed repository for storing feathers (Kooijman 1964:115), but most known specimens were of the form just described.

FIGURE 22-1. Sennit staff god, length 1520 mm. British Museum.

FIGURE 22-2. Sennit god (*to'o*), length 640 mm. British Museum.

To Europeans accustomed to the convention of idols and images shaped anthropomorphically, the apparent "shapelessness" of these objects of Maohi veneration occasioned some astonishment, but as frames for attaching feathers, which was perhaps their principal purpose, they served just as well as anthropomorphic figures, especially when covered with sennit, which was itself an object extensively used in religious ritual and thereby imbued with qualities of "sacredness." Also, they may not have been as "shapeless" as some writers alleged. So important were the feathers associated with 'Oro images that human sacrifices were occasionally consecrated to feathers taken from and representing the image itself: "These red feath-

ers are as much honoured by the natives as if Oro's body—the shapeless log—was present" (Jefferson, Journal, 23 October 1804, LMS Archives).

Three reasons may be advanced for images having been made of ironwood. First, and most prosaically, objects made of this heavy and hard-grained wood were more indestructible. Second, although ironwood trees did not grow exclusively in marae precincts they were characteristic features of such places, and as such they possessed a special association with gods. And third, as I pointed out earlier, the native names for ironwood, *toa* and *'aito*, were applied also to warriors, perhaps because the latter's better clubs and spears were made of the wood. 'Oro was above all else the most powerful god of war. This association with war has led to speculation that 'Oro images of the *to'o* variety were in fact representations of weapons—clubs or spears.

In contrast to this last notion has been advanced the idea that 'Oro images were carved to represent a phallus—an interpretation strengthened by 'Oro's function as tutelary deity of the allegedly erotically inclined Ariois. (Kooijman 1964:122-123)

I know of no data capable of providing a wholly credible answer to questions concerning why 'Oro images were shaped as they were. Nor can I offer any documentable explanations for certain other aspects of 'Oro worship, such as the circumstance that certain kinds of bark cloth proffered to the god had to be manufactured at night (Jefferson, Journal, 24 December 1805, LMS Archives).

Museum and ethnohistorical research has turned up several images resembling those of 'Oro, including some described as "war gods," but actual images of 'Oro himself seem to have been few in number. A suggestion that perhaps no more than one or two existed on each island during the eras under study is rendered plausible by accounts of the intertribal struggles which took place in Tahiti to possess one located there. An account of these struggles will be presented in volume 3, but it will be useful to anticipate those episodes in order to list some facts and questions regarding the significance of these images.

According to the myths, Opoa was the birthplace of 'Oro and its marae complex the repository of an 'Oro image, presumably the first and principal one, which was named 'Oro-of-the-red-feather-girdle (*Oro-marō-ura*) (Henry 1928:121). At the same time, the principal (or only?) 'Oro image on Porapora was "woven in the likeness of that at Opoa," but it was covered with yellow feathers instead of red (as was the girdle identified officially with Porapora's highest ranking kin-Title), and was therefore named Yellow-girdled-'Oro (*'Oro-marō-te'a*). One of the myths relates that after some 'Oro zealots from Opoa had gained a foothold and built a marae for their god at Tautira (on Tahiti's peninsula, and with a cornerstone from Ra'iatea's

Taputapuatea marae) they placed in it an "incarnation" of their god, about six feet long and covered in red, yellow, and black feathers "to give it all the original attributes of the terrible god." Thereupon, "... during the usual solemnities of the occasion, came a strong southwesterly wind, on which 'Oro rode with flashes of lightning. He entered into the image, which was then called 'Oro-rahi-to'o-toa (Great-'Oro-of-the-toa-image), and thus his hold on Tahiti commenced."¹³

Later, this myth relates, some priests of 'Oro (inferentially, from the Tautira marae) set up in Atehuru a new marae called 'Utu-'ai-mahu-rau, and installed in it an image called 'Oro-hu'a-manu ('Oro-of-the-bird-feathered-body) which was "... woven the size of that at Opoa and covered with red, yellow, and black feathers from the image at Tautira." Then gradually "as the priests of the new order increased, new marae to 'Oro in the feather body were erected all around Tahiti, and finally [at] Pepeto'ai [Papeto'ai] in Mo'orea." (Henry 1928:130)

According to these traditions, then, there were two major offshoots of *to'o* derived from the 'Oro image installed at Opoa: a somewhat separate yellow-feather-girdled one on Porapora, and a whole "line" of red-feather-girdled ones on Tahiti and Mo'orea. Not much is reported concerning the social functions of the Porapora one, but it is clear from historic evidence that on Tahiti-Mo'orea during the eras under study no successor to one of the higher-grade kin-Titles derived ultimately from Opoa could obtain universal recognition of his right to bear that Title until performance of an investiture ceremony involving ritual use of red feathers derived, directly or indirectly, from the 'Oro image of Opoa. The fact of there having been several 'Oro images, each with a different name, again raises the question concerning the unity versus multiplicity of 'Oro, but even this last-mentioned evidence of "lineal" continuity cannot provide a satisfactory explanation.

Turning now to marae dedicated principally to 'Oro worship, we have seen that most of them were called Taputapuatea, or Vaiotaha, or both; and that all of these incorporated stones derived from Opoa itself, or from Opoa-derived marae.¹⁴ Most such marae seem at one time or another to have housed actual 'Oro images, but reliable accounts of actual events on Tahiti indicate that the island's principal image of 'Oro was moved about from one marae to another as a consequence of political change. There are also grounds for believing that *any* repository in which an 'Oro image happened to be (marae, ark, canoe platform) was called Taputapuatea. (Figs. 22-3 and 22-4.)

As noted elsewhere, most European observers characterized 'Oro as the most powerful god in the Maohi pantheon; this leads one to inquire into the Maohis' beliefs concerning 'Oro's relations with other gods.

Among 'Oro's close consanguines, his genitor, Ta'aroa, figured only

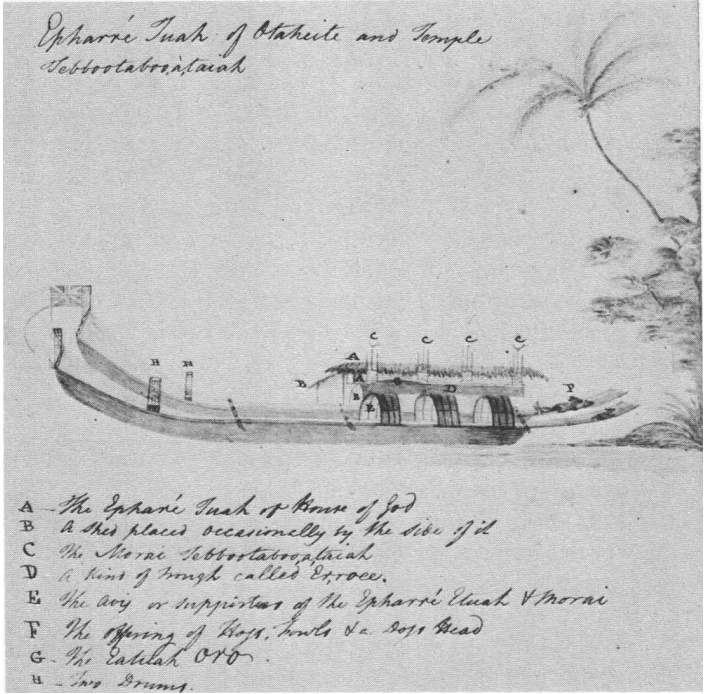

FIGURE 22-3. God house, Taputapuatea, mounted on double canoe. Sketch by W. Bligh. Mitchell Library, Sydney.

FIGURE 22-4. God house mounted on double canoe, with offerings. Watercolor by G. Tobin. Mitchell Library, Sydney.

minimally in other myths concerning 'Oro. (As for other mythical associations between 'Oro and any of his "mothers," I know of none at all.) Of his many siblings, listed in the Roussier text, several figured in his subsequent career. For example, Tane was described as Oro's principal rival in his successful "conquest" of Tahiti and Mo'orea (Henry 1928:129);¹⁵ and on Taha'a 'Oro is said to have replaced Tane in services conducted at marae Ahuroa (see chap. 16, and de Bovis 1909:42). The principal marae on Lesser Huahine was from its beginning dedicated to 'Oro (or so one myth goes), but Greater Huahine was dedicated principally to Tane. Tu, another "brother," may also have been a rival to 'Oro, inasmuch as some tribes previously dedicated to the former seem to have changed their allegiance, but evidence is lacking on actual confrontations between the two.

Rivalry between 'Oro and Hiro, god of thieves, seems to have been almost as active as that between 'Oro and Tane. In some places, "he [Hiro] was revered even above 'Oro, to whom he proved himself superior by throwing him down and lying upon him" (Montgomery 1832:I, 187). But in the end, we are told, Hiro also lost out to 'Oro nearly everywhere. (See above and Henry 1928:131.)

'Oro's relations with his mythical sisters were of a more peaceful nature. One of these, Hinatutupo, made clothing for him; and two others, Te Uri and Ha'oa'oa, assisted him in his search for a mate. (In the Ellis version of this episode, however, these two are described as "brothers.")

In connection with the Arioi phase of 'Oro worship, the two associated spirits figuring most actively were Orotetefa and Urutetefa, variously described as 'Oro's "younger brothers," "young boys" (*tamari'i*), and "household servants."¹⁶ It was these who, according to most accounts, were transformed into the pigs, or pig and feathers, which served to validate, transactionally, 'Oro's marriage to Vairaumati, as consequence of which they became tutelars of the Arioi sect second in importance only to 'Oro himself.

'Oro's principal son, Toatapu, figured occasionally in 'Oro worship, and some of his daughters came to be associated, as was their father, with warfare; also, one of them, To'imata, like her father was the recipient of human offerings, but only of females, of course.

More interesting perhaps than most of these associations were the instances of syncretism, or even assimilation, that appear to have occurred.¹⁷ One such took place in 1806, after Pomare II had gained possession of the great 'Oro image held previously in Atehuru. In depositing this image in the Taputapuata marae in Tautira he placed nearby it, but in subordinate positions, the images of five other deities, including one of Hiro, one of Tane, and one of Temeharo, who previously had been principal tular of the Pomare family.¹⁸ As Kooijman noted, this indicates that Temeharo had

been able, "albeit in the shadow of Oro, to maintain his position as the tutelary god of one of the leading families of the country" (1964:116).

That 'Oro was "believed in" by *all* Maohis goes without saying, and for many he was the principal focus of fear and worship.¹⁹ In addition, this god had special relationships with a number of individuals, such as those "possessed" by him (from single occasions to more or less continuous durations); those serving him as his priests or other clerics; and those holding kin-Titles derived from Opoa (Ra'iatea) and Vaitotaha (Porapora) marae. It should be noted that in some instances individuals held more than one of these roles. One such was an incumbent of the Opoan kin-Title of Tamatoa, in whom were combined all three; more about this extraordinary office will be said later on. Another special category of 'Oro associates was occupied by members of the Arioi sect, which will presently be described.

Some human associations with 'Oro were inherited and others came about through "appointment" by the god himself, but other humans desiring special ties with 'Oro were required to make offerings to him, sometimes on a competitive basis, as the following excerpt from Davies' history nicely exemplifies (this particular episode occurred in 1808 during a "rebellion" by natives of Matavai against Pomare II):

Had Pomare's plan been adopted of falling upon the Matavaians immediately, it is probable the rebellion would have been soon crushed; but so infatuated were the king's people, and so bound by their superstitions that they would not stir a step beyond the usual routine of prayers, sacrifices, &c. The priests went to their prayers, and sacrifices to engage Oro on their side, and a man was killed immediately to be a sacrifice to him, was put (in) a canoe in a haapora (basket) and sent by the way of Papara and the isthmus to Tautira. This delay afforded time for the disaffected to assemble together, and get the people of Hapaiano to join them, and also to send messengers to the Districts to the eastward. They also endeavoured to get Oro on their side, killed a man to be a sacrifice to him, and sent him to Tautira the eastern way. Each party appeared to be in earnest to get the god on their side. (Newbury 1961:117)

For the 'Oro congregation at Opoa (and possibly on Porapora as well) connections between the god and his devotees may have been so fundamental and stable that only perfunctory rites and offerings were required to maintain good relations, but elsewhere in the Society Islands 'Oro was a very jealous god, and relations with him were anything but stable. In fact, his favor (or absence of disfavor) could only be maintained through frequent offerings tendered with elaborate ritual procedure. From some accounts it would appear to have been believed that it was only, or mainly, those humans enjoying good relations with 'Oro who were guaranteed entry into paradise& but just how widespread such a belief actually was, or indeed just how much value was placed on entering paradise, is difficult to tell. If the

Maohis had in There may have been a time when fact been deeply preoccupied with their fates after death, and if veneration of 'Oro were universally believed to have been a prerequisite for postmortal bliss, then one need search no further for explanations of the spread of this cult. It is my impression, however, that neither of these conditions prevailed, though I cannot document this to any satisfactory extent.

As already noted, one of the most notable features of 'Oro worship on Tahiti-Mo'orea was human sacrifice. Human offerings were proffered to Tane, To'imata, and perhaps other deities as well; but on Tahiti-Mo'orea during the eras under study, 'Oro was the recipient of most such offerings by far.²⁰ Following is one mythical account of the origin of this custom:

Before the flood, when Maui the priest built marae and established priests in all regions, the world was luxuriant and the people were in favor with the gods, so that they had no need of human sacrifices. But there came a time when there was a great drought and excessive heat in Hava'i (Ra'iatea), so that the people exclaimed, "Ta'aroa, the Unique-foundation, whose curse is death, is angry; he is consuming us!" And the king, moved to pity for his people, told the priests to pray and present offerings to Ta'aroa that they might regain his favor and obtain rain from heaven to restore the land. The priests reflected and said, "We must have a *pa'i-atua* service," which was done with offerings of lean pigs, fish, and bird's feathers, having no fruit or other things to present with them. The bark of trees from which cloth was made and the leaves of *Pandanus*, from which mats were made, were dry and parched upon the trees. But that *pa'i-atua* did not produce any effect.

Then the king said, "We must humble ourselves before God; we must tremble with fear! Let us offer a man as a tapu (pledge or sacrifice) to atone for unintentional offenses and regain God's favor in this our great distress." So the priests slew a man and offered him at the shrine of Ta'aroa, and soon clouds gathered in the sky, and rain fell and restored the land to its former flourishing condition. Thus it was shown that the gods liked human flesh, which was called *te avae roroa* (Long-legged fish); and it remained the custom ever afterwards for the king or high priest to decide when such a sacrifice was required and for the priest to put his order into execution. But this happened very seldom until 'Oro, god of war, came into favor after the Flood, when he required many human sacrifices. (Henry 1928:196)

Later in this study I shall propose some explanations as to why gods in general, and 'Oro in particular, may have placed highest value on human offerings—"explanations," that is, in terms of other Maohi beliefs and associations. Also, I shall discuss the extent to which chiefs used human offerings—and especially offerings to 'Oro—to enforce their secular authority. In other words, here is a case par excellence wherein religious commitment and politics were mutually supportive, an ideal condition for aggrandizement by either one or both, which, as we shall see, did in fact take place. Myth aside, there is no way of reconstructing which factor was prior. By the time of the eras under study the former had become more the instrument of the latter, than vice versa. But let us return to our consideration of the cult itself.

There may have been a time when 'Oro's part in religious ritual was in many places limited to his specific role as a god of war, or to roles shared with other deities. However, as a result of his ascendancy in Tahiti-Mo'orea during the era under study most religious rites of tribal scope witnessed by the Europeans there featured 'Oro to an almost exclusive extent, hence it is not feasible to certify any other features of ritual as having been distinctive of 'Oro worship per se.

In view of the "erotic" character of some Arioi activities (see below) a case might be made for characterizing 'Oro worship in general in such terms, and this is strengthened by such reports as the following:

This forenoon, a strange heathish ceremony was performed on the beach. Their great god Oro was laid upon a long stool, covered with cloth, and the king with several of the Priests were sitting by, praying or chanting something to Oro, which we could not understand. They seemed to keep time with their drums, and conch shells. The natives stood, so as to form a circle round the idol, to which several of them were exposing themselves in the most shameful manner, and every now and then calling out "*Maeva arii.*" This continued for several hours, during which a native, who pretended to be inspired by Oro, was seen, with the most strained distortions of countenance, and limbs, giving them directions for their future proceedings. (Newbury 1961:45)

There is no way of knowing with any certainty whether such actions were distinctive of 'Oro worship in particular. Most of the larger ceremonies witnessed and described by Europeans were in fact focused upon 'Oro, and with few exceptions data recorded in interviews, usually conducted by missionaries using Christianized informants, were likely as not to have been bowdlerized in the process.

Cult of 'Oro

An account obtained by Henry and identified by her as having originated from an "old scholar," purports to describe, among other things, certain periodic meetings held at Opoa during pagan times, and attended by delegations from islands constituting a Friendly Alliance (*Fa'atau Aroha*), mainly for the purpose of rendering respect to 'Oro on his home soil. The assertion that delegations came not only from all islands in the Society Archipelago but from places as far away as Rotuma, the Australs, and New Zealand should stretch beyond breaking point the credibility of even the most uncritical romanticizer of Polynesian history. Nevertheless, I quote from part of it not as "history" but as evidence of the way some Maohis conceptualized the influence of the 'Oro cult and the mechanics of 'Oro worship. The so-called Friendly Alliance encompassed in these legendary events was described as having been formed by a Rotuman chief, Te Fatu, and his son (by a Poraporan wife), both of whom had traveled widely, "creating friendly feelings":

These allied island kingdoms formed a convention for their priests, scholars, and warriors to meet periodically at Opoa for great religious observances and international deliberations. The appointed time was exactly reckoned by numbering the year and naming the season, the lunar month, and the day of the month. Te-ao-uri chose a primate, called *a'o* (counsellor) or *ti'a* (intercessor), whom they named Pa'oa-uri (Dark-Turbo); and Te-ao-tea (Light-land) chose their primate, whom they named Pa'oa-tea (Light-Turbo). They were appointed guardians of the alliance, called Tia'i-hau-atea (Keepers-of-expanded-govemment), at Opoa, where they dwelt as guests of the royal family. Then the name of the marae became Tapu-tapu-atea (Sacrifices-from-abroad).

So it became the custom from a remote time until about the year 1350 (according to the calculations of S. Percy Smith), for these groups to send representatives with offerings to 'Oro in great double canoes, distinguished as *te-va'a-roa-o-te-mata'i* (the-long-canoes-in-the-wind), from which streamed long pennants of their respective colors, dark and light. Each had one or two great deep-toned drums, called *ta'i-moana* (sounding-at-sea), and a great conch-shell trumpet, called *pû-ta'i-i-te-aeha* (trumpet sounding over the sea from horizon to horizon), with which they kept track of each other at sea and signalled, and when approaching the sacred goal triumphantly announced themselves.

The time of such a gathering was one of awful solemnity to those on land and sea. The old and infirm, and women and children, with their domestic animals, retired to places far inland prepared for them; all was still along the shore, even the sea and elements, which, tradition states, were hushed in unison for the festivity of the gods.

Upon approaching the sacred passage of Te-ava-moa, just at daybreak, the canoes united in procession, and out from the horizon, as if by magic, they came in double file, each representing a separate kingdom. To the north were those of Te-ao-tea, to the south those of Te-ao-uri, approaching side by side, the measured strokes of the paddles harmonizing with the sound of the drum and occasional blasts of the trumpet. In grand array appeared the numerous voyagers of high degree according to their different ranks, all unarmed and unaccompanied by women or children.

Across the bows connecting each double canoe was a floor, covering the chambers containing idols, drums, trumpet shells, and other treasures for the gods and people of Ra'iatea; and upon the floor were placed in a row sacrifices from abroad, which consisted of human victims brought for that purpose and just slain, and great fishes newly caught from fishing grounds of the neighboring islands. There were placed upon the floor, parallel with the canoe, alternately a man and a cavalli fish, a man and a shark, a man and a turtle, and finally a man closed in the line. Behind this grim spectacle stood two or three priests in sacerdotal attire, which consisted of a plain loin girdle, a shoulder cape reaching down to the waist and tipped with fringe, wide or narrow according to their grades, and a circular cap fitting closely to the head—all made of finely braided purau bark bleached white. Seated at the paddles were the navigators and warrior chiefs in gay girdles and capes of tapa and helmets of various shapes, and wise men in plain girdles, capes, and turbans of brown or white tapa.

As this terribly earnest procession arrived, the canoes were quietly drawn up along the shore, and the guests were met at the receiving marae by an imposing procession of the dignitaries and warriors of the land grandly attired, and also unarmed, headed by the king, the two primates, Paoa-uri and Paoa-tea, and the priests of the realm, who greeted them in low, solemn tones. Then everybody alike set to work silently disposing of the sacrifices just arrived, combined

with others of the same mixed kind prepared by the inhabitants of the land. They strung them through the heads with sennit, an act called *tu'i-aha*, and then suspended them upon the boughs of the trees of the seaside and inwards, the fish diversifying the ghastly spectacle of the human bodies, a decoration called *ra'a nu'u a 'Oro-mata-'oa* (sacredness of the host of Warrior-of-long-face).

After this the priests of 'Oro chanted:

A 'ai ra i te ia vavae roroa na 'oe, e ta'u ari'i, e 'Oro-mata-'oa! A 'ai i te i'a o te tai na 'oe, e ta'u ari'i, e 'Oro-tauà! Manava 'outou e te nu'u atua, i te tairurura'a mai ia 'Oronei i to'na 'utuafare, ei 'utuafare no te mau atua ato'a. Maeva te atua!

Now eat of thy long-legged fish, 'Oro-mata-'oa! O my king. Eat of thy fish of the sea, my king, 'Oro-tauà (Fighting-warrior); Welcome to you, O host of gods, in coming here to 'Oro in his home; the home of all the gods. Hail to the gods!

Upon the road that led up to the inner marae were then laid as rollers, called *ra'o*, the bodies of slain men, and over them were drawn the canoes still containing idols and precious things, all present deeming it an honor to aid in the arduous work. Soon the canoes were systematically drawn up beneath the spreading trees, extending from shore to shore of the two bays, those of Te-ao-tea keeping northwards, and the others southwards of the point.

While the mystic rites were being performed that day by the priests at the marae at Opoa, no fire was kindled and no food was eaten. When all those who were not of the clergy had retired to the *fare-'opu-nui* (house-of-august-stomachs) and to the *fare-tara-'toa* (house-of-all-wisdom), the priests from abroad carefully took their idols, closely covered in choice tapa and gay feathers, with offerings for 'Oro in his home, and accompanied the priests of the land, also carrying gifts, up into the marae. The presiding high priest, the primates, and other high priests entered the inner sanctum; the greater body of priests took places according to their respective ranks upon the walls and outer borders of the marae. Then was performed the most sacred of all their sacerdotal rites, the *pai-atua* (assembly-of-gods), when it would have meant death for any of the laity to have approached or looked on.

After this exchange of civilities of the gods, the idols were again carefully covered and replaced in their respective chambers, the image of 'Oro being returned to the *fare-ia-manaha* (house-of-sacred-treasures), and then mortal beings could breathe freely at Taputapu-atea.

The clergy finally went into the front courtyard of the marae, where before daylight had been laid out upon the numerous altars the best food that land and sea could produce, and invoking all the gods visiting to partake of 'Oro's hospitality, they partook of the sacred repast with the utmost reverence and retired to join the other devotees, who in the same way broke their fast on sumptuous fare with their hosts, the *opu-nui*, outside of the sacred grounds. Then nightfall came and shrouded in darkness the scene, still terrible with the suspended and prostrate bodies of the dead, which were intended to be pleasing to the gods.

Early the following day, the "long-legged fish" of 'Oro, but not the sea fishes, were taken down and buried with the mutilated bodies that had served as rollers for the canoes; they were placed in sitting postures in their graves, beneath the trees, and were supposed to render more sacred the home of 'Oro. This ceremony was called *ha'apou* (getting down). The relatives of such victims were not allowed to reclaim their dead for home burial or to indulge in grief for them, as it was believed that such demonstrations would incur the great displeasure of 'Oro and bring down consuming vengeance upon them and all theirs. Thus were painfully marked the periods of religious and social gathering between those widespread insulars.

For some days the devotees remained upon the sacred grounds, acquiring and exchanging knowledge at the *fare-tara-'to'a* (house-of-all-wisdom), while observing the utmost decorum and retiring outside the marae grounds to eat their meals. Then they withdrew to the settlement of Opoa to enjoy respite and public feasting, giving and receiving presents. The people who had fled to the woods also returned home; and the visitors were hospitably entertained until they wished to take their departure, when sometimes they took with them from Ra'iatea some of their kinsfolk of either sex who wished to accompany them, there being no restrictions observed in going away. (Henry 1928:123-126)

(The Alliance broke up, according to the legend, as the result of a quarrel between chiefs.)

A particularly noteworthy aspect of this legendary account is not so much the focus upon 'Oro, but the absence of any explanation of that focus. One interpretation might be that personal commitment to 'Oro was strong and widespread enough to move his devotees to meet together for joint worship regardless of tribal boundaries. A second might be that 'Oro's ascendancy was so unchallenged and so nearly universal that any intertribal convocation, for whatever purpose, would quite naturally have taken place at this god's principal marae. And a third might be that the social eminence of Opoa's *hui ari'i* was such as to constitute them (and incidental thereto, their tutelary god) the hosts to intertribal assemblies of any kind. If it is not too implausible to impute motives to legendary (and probably fictitious) personages, I suggest that those behind the Friendly Alliance meetings would have been a combination of my second and third "interpretations." That is to say, powerful as was the hold over men's minds that 'Oro may have exercised, I cannot imagine that Maohi chiefs were so preoccupied with matters of religion per se as to ignore more practical political considerations.

We are dependent upon myth for clues concerning the motives and processes connected with earlier diffusion of 'Oro worship from Ra'iatea to Tahiti-Mo'orea, but we have many more or less reliable accounts, both eyewitness and hearsay, about the last, and perhaps greatest, efflorescence of this cult. (Details of these events will be given in volume 3, for they constitute a dominant aspect of political history throughout the period under study.)

I am struck, first of all, by the dominance gained by the cult of 'Oro in Tahiti-Mo'orea in what seems to have been a fairly short time. Other deities were still proffered offerings; yet in most eyewitness accounts of the period 'Oro was not just the "war god," or just "the most powerful god," but *the* God (*Te Atua*).

Second, this trend toward monolatry seems to have been paralleled by one toward mono-imagery; there may have been in existence several distinct *to'o* of 'Oro, but, in Tahiti-Mo'orea, at least, one of these so outweighed the others in importance that wars were fought to obtain or maintain posses-

sion of it. In this connection, while offerings appear to have been directed to 'Oro from several marae, including especially those dedicated principally to him, those made directly in the presence of his principal *to'o* were apparently considered most efficacious by far.

Third, while I recognize the hazards of imputing motives to individuals for acting as they did so long ago, it nevertheless appears that their main reasons for attempting to obtain or maintain possession of 'Oro's principal image were political. On the one hand they wished to secure the god's exclusive patronage in fighting wars; on the other hand they required the physical presence of the image to validate certain Opoan-derived kin-congregation Titles—that is, those high-ranking enough to legitimize and sanctify coercive power, however acquired. (This latter reason worked in two opposite ways: some individuals sought to possess the image in order to legitimize their own authority, while others, without themselves having pretensions to high authority, sought to possess the image in order to frustrate their rivals' pretensions.)

Finally, the ascendancy of the cult in general, and its focus upon a single image, is further exemplified in sacrificial procedures. During the period of the cult's efflorescence, wherever human offerings to 'Oro may have originated they were forwarded to the marae then tenanted by the god's principal image for ritual oblation and ultimate disposal—and this despite any political coolness that may have obtained between the chiefly proprietors of the respective marae.

ARIOI

Arioi was the name applied by the Maohis to specially selected and ceremonially initiated individuals who devoted themselves in large measure to activities connected with 'Oro worship. Such individuals thus constituted a *sect*, or a number of associated sects, within the larger cult of 'Oro.²¹ Because of the inadequacies of the sources, the relationships between roles in these two kinds of units cannot be made altogether clear, but some things about them will emerge in the description that follows.

Needless to say, recorded characterizations of this sect, or sects, vary with the understandings and biases of the observers. G. Forster described them as a society of warriors (1777:II, 128ff.); Cook and Anderson, as affluent young male libertines “of the better sort,” and likened them to freemasons (Beaglehole 1961:415; Cook 1784:157); Morrison, as a “set of young Men of Wild, Amorous & Volatile dispositions who from their Infancy devote the youthful part of their lives to Roving, Pleasure & Debauchery” (1935:234); and Ellis, as “a sort of strolling players” (1829:I, 315). Later writers, drawing on hearsay rather than actual observation, also differed in their characterizations: Orsmond called them “Players

... the most obsessed and wicked creatures conceivable" (Orsmond: Arioi); Henry, "a society of comedians" (1928:230); Tyerman and Bennet, "human harpies ... in whose character and habits all that is most loathsome—earthly, sensual, devilish—was combined" (Montgomery 1832:I, 186); de Bovis, "a non-political *pépinière* [nursery, training ground] of warriors" (1909:37); and Moerenhout, "a society concerned with propagation of the cult mysteries of 'Oro" (1837:I, 484). And finally, a century and more later, scholars continued to differ somewhat in their emphasis on the distinctive features of this institution: Williamson called it "an organization of professional entertainers" (1939:113); Handy, a sect of sacred dancers consecrated to the cult of fertility (1930:61); and Buck, an actors' guild organized to win converts to 'Oro (Mühlmann 1955:65).²² My own interpretations of the activities of the Ariois will be given later on, but first I must describe the activities of the sect members themselves.

How many Ariois there were at any one time is of course impossible to reconstruct. Mühlmann asserted that they constituted about one-fifth of the total population (1955:28), but he cited no evidence for his estimate. About all that one can say is that they were a numerous band: their numbers during the early 1770s probably reached into the thousands, according to statements by the Forsters and by Cook. Most Ariois were males, as the early observers recorded, but the sect also included some females; Tyerman and Bennet put the ratio at about five to one (Montgomery 1832:I, 239), which is not out of line with other evidence.

Most earlier writers identified the Ariois with the upper-class strata of society, and G. Forster, in describing an expedition of Ariois from Huahine to Ra'iatea, wrote that all of its members were "persons of some consequence, and of the race of chiefs" (1777:II, 128). Most later writers, however, agreed that among Ariois were persons from all classes; the reason for the earlier writers' opinions could perhaps have been that all Ariois received privileged treatment, on some occasions at least.

Some middle-aged and even elderly persons are reported as having belonged to the sect, but most of its members were handsome young men and comely young women.

As for the organization of this category of persons called Ariois, with some exceptions there appears to have been many local "lodges" of the sect, but these were all linked together, on some occasions and in certain respects, into a larger unity.

And finally, to complete this epitome, the overt activities of Ariois consisted mainly in traveling about from place to place (including island to island), performing ceremonies and entertainments in exchange for lavish hospitality and within the context, largely, of 'Oro worship.

Activities

Persons who were *Arioi* functioned mainly as such on their organized tours. The fullest description we possess of such tours is Henry's, which consists largely of an embellished translation of texts collected by Orsmond:

It took many days for the *arioi* to prepare for their trips among the districts, as they required the best of cloth mats, ornaments, and food to maintain their prestige among the people. When all was ready, their leaders took strips of *fa'aio* cloth, or pure white cloth, and an *arioi* pig to the marae of 'Oro, and tying the strips upon the *unu* (carved ornaments) of the marae, and upon the ti plants before the marae, the chief *arioi* invoked the gods, saying:

Ei onei 'oe, e te atua, e 'ite mai ia matou.
Teie te pua'a na 'oe; teie te 'ahu tavriviri
na 'oe, te 'ahu no te oroa no te mareva, no
te aha tatai; ta 'oe teie.

E aratai 'oe ia matou e i te fenua; homai
te tahi mata'i na matou, ei ahi na muri,
ia tere i te hinu ma te ro'i. Fano te aha
tatai nei, e te atua, e i te ava o te fenua e
haere hia nei. Eiaha matou ia pae e atu i te
moana e i te fenua; e 'aroha mai i to maru.

Eiaha 'oe e fa'arue mai ia matou; eiaha
to matou ia pee hia i te ro'o 'ino, e ua pohe
ia mareva! E tatai tau aha ei te ava i te ho'i
ra'a mai i te fenua nei.

Remain here, O god, who seest us. Here
is a pig for thee; here are strips of cloth
for thee; cloth for the ordinance of sailing
away for prayer to secure safety at sea;
these are for thee.

Lead thou us on to land; give us a breeze,
to encompass us from behind, that we may
sail as smoothly as upon a bed. Let this
prayer safely take us, O god, even into the
harbor of the land to which we are going. Let
us not beat up to other seas or lands; have
pity upon thy shadows.

Forsake us not; let us not be overtaken
with evil tidings that those sailing are lost!
Let this prayer to thee secure our safety to
the harbor even in returning to land.^[23]

Then they took a sacred marae stone and some 'ura feather amulets and placed them in the canoe of the chief *arioi* upon a small altar, which sufficed for the devotions of all the flotilla. In each canoe was placed a platform upon which the leaders sat or the dancers performed as they approached the shores in their travels. Their canoes were double or single, as they chose to have them. The *arioi* named their canoes *mareva* (flying) or *au-ono* (swimming-in-company).

They were frivolous people and did not commit the sacrilege of having a priest with them in their excursions of pleasure, but a member of their society, anointed with oil highly perfumed and decked in gay wreaths and garlands, represented the god of Paradise, Roma-tane, whose name he bore prefixed with the article *te* (the) Te-roma-tane. Near the *arioi* house he had a little marae about six feet long, made of stone, and complete in structure and appendages, in which was placed an image of the god. At this shrine he invoked the presence of Roma-tane, Hoa-tapu ('Oro's son), and Uru-tatefa and Oro-tetefa (the two lads that had been turned into *arioi* swine) to accompany the *arioi* in their expedition and to aid them in their performances. This completed their preparations, and then they took their departure.^[24]

On arriving at their destination, amid merrymaking on their canoes and applauding from the people in crowds along the shore, they were received by the local *arioi* and made to feel at home in the *arioi* house of the district. Immediately the leaders resorted to the marae of 'Oro, if one was there, or to the local marae of the god of the district, carrying their *maro-tai* (sea-voyage-offerings), which the chief *arioi* presented saying:

Tera te maro-tai na 'oe e te atua e!
O te vane, te 'ura te fa'aio, te pua'a, te
apaapa 'uru, e te rahiri; ta 'oe ia i to
matou tae ra'a mai i te tenua nei ma te
ora.

E 'aroha mai i to maru e te atua e, eiaha
te 'ino ia tupu ia matou i te fa'aea ra'a
i teie nei fenua, e tae noa tu i to matou
mareva ra'a tu. Tahi tia mai i ta matou aha
e te atua e!

There is the sea-voyage-offering for thee,
O god! A fine mat, 'ura feather arioi cloth, a
pig, half a breadfruit, and a bunch of braided
coconut leaves; they are for thee on our safe
arrival in this land.

Have compassion on thy shadows, O
god, let no harm befall any of us while
we remain in this land, even to when
we sail away. Harken to our petition, O
god!

When companies were combined, one presentation to the god at the marae was sufficient, and one spokesman officiated. After their invocation, the leaders returned to their encampment, free to refresh themselves by bathing and eating, which for fear of incurring his displeasure and bringing sudden death upon themselves, they dared not do before presenting an offering to the god. Their next duty was to take to the high chief handsome gifts, consisting of choice handiwork and a fine pig—a presentation called an *o* (fitter in); and an exchange of compliments beautifully worded followed. Then presents of all kinds and appropriate speeches between the visitors and the hosts were exchanged on a grand scale, those of the visitor being called an *o* and those of the hosts a *fa'a'amua* (feeding), because they were accompanied with a feast prepared for them, immense quantities of cloth called *ahu rao* (voyagers cloth) were wound by the hosts around some of the women guests, from their waists up to their necks and down to their feet, as they stood upon the *tavehea* (open space) of the floor in the house, until they looked like great balls of various colors; the women sometimes fainted from such close confinement. After accepting the present, the chief *arioi* unwound the cloth and distributed it among the other guests, reserving for themselves and the gods a share that grew into great heaps upon the mats spread out for the purpose, and resulted for the recipients in profits exceeding what they had lost in what they gave.

The distinguishing feature of the feast was an *arioi* pig, baked and pierced through lengthwise with a long slender pole and planted in the midst of the other food. It was exclusively for the chief *arioi*. No one else dared eat any of it from fear of strangulation by the gods; no thief was ever so bold as to steal such a pig. On the occasion of so great a gathering of *arioi*, impostors dressed like them came from other districts, intermingled with the assembly, partook of the feast, stole some of the property, and made their escape without being detected. But afterwards they boasted of their cunning tricks.

The amusements generally took place at night, when the great *arioi* house was illuminated with fires and candlenut tapers, so that it was called *rehu arui* (night daylight). On a high platform called a *raira'a-marō 'ura* (exalting-red-girdles), erected at one end of the house were placed high stools as seats for the chief *arioi* of both sexes. In the center of the building were the comedians, over whom presided the *arioi-hi'o-niao* (master-of-ceremonies). The royal family had their seats of honor, and within the building and outside upon the grass were the spectators. Even the crickets, it is said, cried with joy on these occasions.

When all were ready for the entertainment, the chief *arioi* came in singly, with a step like a strutting peacock, and crossing the arms over the breast, said—if of Haapape, for instance:

Ha, ha, ho'i! O vau, 'O Tiaau. E mou'a i
ni'a 'o 'Orohena i hau roa i n'ia i Tahiti nei!
E tahua i raro, 'o Fae-ria; e 'outu i tai, 'o

Ha, Ha, indeed! It is I, I stand. My
mountain above is 'Orehena, which is
above all in this Tahiti. The assembly

te Fau-roa; e vai, 'o Vai-popoo. 'O vau, 'o Tia-au, 'arioi i te fenua, otuituia i te 'ofai pupuhi.

ground below is Fae-ria; the cape seaward is Fau-roa; the river is the Vai-popoo. It is I, I stand comedian of the land that vibrates with the sound of the gun.*

*This last boastful attribute was added, of course, after the arrival of the early explorers, who generally anchored at Haapape near Cape Fau-roa, named Point Venus by Captain Cook.

After they had introduced themselves in this manner, Te-roma-tane opened the entertainment by taking a *rahiri* (bunch of braided coconut leaves) and casting it at the feet of the sovereign, saying as he did so:

Ena hoi te manava e manava o te ari'i! E manava mai ra oe, e te ari'i nui tua tinitini; e manava maira oe' e te ari'i manomano! I fano mai 'oe i te mahora o te ra'i; i fano mai 'oe i na va'a 'ura ma te heihei, ma te tarehu roto; i fano mai 'oe i na va'a muri; i fano mai 'oe i te va'a i te re'a, i te va'a 'ura ma te heihei, ma te tarehu moana. Manava te ari'i nui, tau aea!

Here is indeed the welcome, the welcome of the sovereign! Thou art welcoming us, O great sovereign of thousands of thousands! Thou art welcoming us. O great sovereign appearing from the sky [royal abode]! Thou hast flown hither to the lawn of the sky; thou hast flown to the foremost canoes; thou hast flown to the after canoes; of gaiety, to the canoes of red garlands from across the hazy deep. Welcome, O great sovereign, this introduction to thee!

Then the amusements and more feasting were indulged in till early morn when the *arioi* were glad to take rest. They slept most of the time during the day. These entertainments lasted many days, when the farmers' gardens were stripped of their produce and the district became so impoverished that it took long for it to regain its former state of prosperity.

In their plays the actors flattered or ridiculed with impunity people and even priests, from the greatest to the least, and they often did much good in thus causing faults to be corrected. They cannot, however, be placed upon a moral pedestal. From the testimony of their own members, a curtain must forever be dropped before many of their deeds on such occasions—deeds, which combined with the crime of infanticide, ended the career of the *arioi* society. After its members became more enlightened, many of them became faithful and zealous workers in the Christian cause.

On returning home in the name of 'Oro the *arioi* first made a bonfire of the clothes in which they had been acting, and when they reached home they took new offerings to their marae, the chief *arioi* presenting them to 'Oro and saying:

Teie matou e te Atua i fa'ahoi fa'ahou hia mai e te fenua, i tana tere ta matou i poroi ia 'oe ra. Teie matou tei te fenua ma te ora. Teie ta 'oe e pua'a e 'ahu e te 'ura. Ta matou teie maro-tai na 'oe, e te Atua e.

Here we are, O god, returned from the land whither we were bound when we took leave of thee. Here we are safely landed. These are for thee—a pig, cloth, and 'ura feathers. These are our sea-voyage-offerings to thee, O god.

After this they disbanded and went to their own homes, until new organizations were required. (1928:237-241)

This account of the *Arioi*'s most important activity requires some correction and amplification, which I shall now undertake, following as closely as possible the sequence of events set out in Henry's text.

First, concerning the outfitting of an Arioi expedition, the Henry account seems to imply that the work and expense fell to the Ariois themselves, but the translation accompanying the original Orsmond text indicates that contributions were made by the non-Arioi populace as well: "All the body of chiefs. And all the land beside prepared those things. Not the arioi merely" (Orsmond: Arioi).

As we shall see, Ariois did indeed hold privileged positions in Maohi society and, as de Bovis wrote, used to "assemble in front of their chiefs' houses in order to beg for bark cloth" (1909:37), for uses which probably included outfitting for tours; but to imply as de Bovis did that they engaged in begging only because they manufactured no bark cloth themselves cannot be true. Perhaps they spent less time at such domestic chores than did other persons, or perhaps their personal and ritual needs for bark cloth were greater than average, but according to Morrison they were "very excellent hands in evry branch of the work but especially at Dyeing & Painting" (1935:162). Morrison also wrote:

The Ora is a Grey strong Cloth made of the Bark of the Sloe tree—Large quantitys of these trees grow in the Mountains, particularly Near Vyeooredee, where there is a great lake which they Call Vye Heereea from a large kind of Eels which they say it produces as big round as a Man; to the Banks of this lake resort Numbers of the Areeuoy (Who are Generally good Cloth Makers tho it is Chiefly the Weomens employment) to make the Cloth, it being held in great esteem being the Strongest & Best for wear. They Generally stay some months on the Banks of this lake where they have plenty of Provisions. (1935:162)

The size of these expeditions must have varied considerably; the largest one actually reported was one which sailed from Huahine to Ra'iatea in 1774 and consisted of some sixty to seventy boats carrying some seven hundred persons.²⁵ According to surgeon Ellis, who accompanied Cook on his third and last South Seas voyage, such flotillas proceeded in squadrons of ten to twelve boats each (1782:I, 159), suggesting the likelihood that each "lodge" (the local chapter of each tribe or tribal subdivision) taking part in an expedition traveled as a unit.

The missionary Ellis' account of expedition preparation attests to more elaborate ceremony: "Great preparation was necessary before the *mareva*, or company, set out. Numbers of pigs were killed, and presented to Oro; large quantities of plantains and bananas, with other fruits, were also offered upon his altars" (1829:I, 316).

Turning now to the divine auspices under which these expeditions traveled, Henry's version implies a distinction between 'Oro, whose blessing for the travelers was requested but whose presence was meant to remain at the home marae, and certain other deities, whose presences were requested to accompany the travelers. (The only explanation I can suggest for this

distinction is the possible belief that 'Oro was too important a god to be expected to attach himself exclusively to any one party—but this is pure speculation.) Among the latter was Romatane; I have not come across any myths associating Romatane with the origins of the Ariois, but he appears in descriptions of the fate of Ariois in afterlife. As for Hoatapu, he will be remembered as having been 'Oro's son in some mythical versions, but as such had had much less to do with the beginnings of the Ariois than had Orotetefa and Urutetefa, whose transformed selves served to validate 'Oro's marriage to Vairaumati and who were parents of prototypes of the sect's principal animal offerings.

Concerning an expedition's arrival at its destination, Ellis provided a vivid description:

Sometimes they performed in their canoes, as they approached the shore; especially if they had the king of the island, or any principal chief, on board their fleet. When one of these companies thus advanced towards the land, with their streamers floating in the wind, their drums and flutes sounding, and the Areois, attended by their chief, who acted as their prompter, appeared on a stage erected for the purpose, with their wild distortions of person, antic gestures, painted bodies, and vociferated songs, mingling with the sound of the drum and the flute, the dashing of the sea, and the rolling and breaking of the surf, on the adjacent reef; the whole must have presented a ludicrous imposing spectacle, accompanied with a confusion of sight and sound, of which it is not very easy to form an adequate idea. (1829:I, 318–319; see also Moerenhout 1837:II, 133)

The *marotai*, religious offering made upon arrival, seems to have been the standard procedure followed at the conclusion of most sea voyages and was not peculiar to Arioi expeditions, except that the Ariois' *marotai* seem always to have been directed to 'Oro. Similarly, the genre of the ceremonial exchanges from guests to hosts (*o*), and from hosts to guests (*fa'a'amu'a*), accompanied all large-scale visiting, although the balance in this case was explicitly described as favoring the guest-recipients.

Turning now to Henry's reference to the "arioi pig," which was reserved exclusively for the chief Arioi and which constituted "the distinguishing feature of [this] feast" (1928:239), one will recall its prototype as having been one of the litter born on the occasion of 'Oro's mating with Vairaumati and having been designated "a pig for *maro 'ura* [i.e., a chief] Arioi." (Another of this litter was "a pig to sacrifice to gods"—that is, presumably the prototype of all pig offerings to 'Oro.)²⁶ Orsmond's Arioi text about "the sacred pig" is as follows (with translation by White):

E Buaa raa. E pau te fenua i te buaa raa, o ta te arioi ia toa here rahi, e taoa mana. Ia rave ra te hoe taata i te reira buaa e eu nana, e ore te buaa e vera, oia iho te pohe na. Na te atua ia e uumi. E pinia iti taua buaa ra, e uumi noa hia, e e faahume hia i te maro ura. E ia pohe

The sacred Hog. The land suffered a scarcity of hogs because of this; it was one of the players' favourite possessions, an object of strong magic. Should someone take one of *those* hogs and roast it for himself, it would not cook, but he himself would sicken and maybe die, strangled by

ra a faaite atu ai i te ioa o te avae parai nana te buaa e ia faaite raa hia ra e hopoi i mua ia Oro ra e [?] te mahana taupiti ra uumi ai.

the god. If it were a newborn pig, it would simply be strangled and girded with a red girdle. And when it was dead, the name of the chief player, for whom the pig was intended, would be announced and when he had received the pig, would be born before 'Oro, and for the festival day to be strangled.

Henry's interesting reference to "imposters," who went uninvited to feasts to partake unbidden of the largesse, provides additional evidence that ordinary religious and other sanctions were not sufficient to enforce unremitting social conformity in all members of society. In this instance an explicit sanction backed by 'Oro's divine aides seems to have been required to protect this Arioi prerogative—which conceivably was one of the circumstances that led to the invention of this episode of the Arioi myth of origin.

What Henry called the Arioi "amusements" constituted one of the sect's major activities, whether they occurred during regular Arioi expeditions or during meetings of other kinds. Several aspects of these "amusements," beginning with the buildings in which they took place, deserve attention.

A text from Orsmond distinguishes two kinds of "large" buildings built by public corvée (as distinguished from each Arioi's own private dwelling, which he probably built by himself):

The largest houses on Tahiti belonged to the Players and were equal in size to those of the Kings in magnitude. The players were men of superior strength in the execution of their work. The whole of the class built those great houses because they were for public exhibitions. They were one, two, three, and four umis long (10 fathoms is a umi). In those houses the players slept, resided, and exhibited their plays, and waited for the times of sports. They performed by night and by day, at one end, at the opposite end, and in the middle at the same time. But it was in the large houses of the Kings that visitors were presented with national offerings of all eatable. The houses of smaller size for the private use of the players, they built them selves, but those for public sports the chiefs prepared. (Orsmond:Arioi)

Presumably the "arioi houses" alluded to included what some writers called "theatres," along with others described as "hostels" (see above, chaps. 7 and 10), but if so they must have varied considerably in form and in internal arrangements. Elsewhere in Orsmond's texts, Arioi dwelling houses are described as having been "superior" (*maitatai*), "large" (30 fathoms long), and "surrounded by fences of breadfruit planks." But I take these to have been the privately built dwellings alluded to earlier. In any case, "arioi houses" appear in some way or another to have contained at least four functionally distinct parts: a high platform on which sat the highest-grade Arioi present; a space reserved for *ari'i* (including tribal chiefs); a place for performing *Ar-iouis*; and spaces for other spectators.

Elevated seats were one of the Ariois' hallmarks, serving to distinguish them from the rest of the populace:

E iri noho raa no te arioi. E papa noho raa no te arioi.

Ta ratou taoa. E tarai maite te mau iri rahi ra, ei noho raa no te arioi. E arioi noho papa tona ioa. E ore oia e noho noa i raro i te repo. E taoa rahi ia i te fare o te arioi.

The large stools seats for the players. That was the property they prized. They made them in great numbers for the arioi. A player that sits on the high stool was his name. He would not set down on the earth in the house of the Players the stools were numerous.

(Orsmond: Arioi)

Similarly, according to one source, Ariois also had a distinctive way of sitting:

The fraternity of Ariois had some customs and practices which they affected to reserve to themselves, and which it would have been at the peril of others to adopt. These were either exceedingly gross or exceedingly puerile. Of the latter we are assured that the following was a favorite one, which it might have been death for an uninitiated person to imitate. When they sat on the ground, or on a low stool, they put one foot on the other thigh, and continued giving the toes a particular motion, while in the one hand they waved at arm's length a fan, made of the white hairs of a dog's tail, to drive away the mosquitoes; and in the other held a nasal flute, on which they occasionally made a flourish of notes, by blowing into it through one of the nostrils. It is remarkable that this little musical pipe is shaped like a German flute or fife, and is sounded as above, through a hole in the side, near the upper end, which is plugged. (Montgomery 1832:I, 187)

The Henry account implies that the highest grade of Ariois, the so-called *Arioi maro 'ura*, occupied the "exalting" platform as spectators, during Arioi performances, but in Moerenhout's account (1837:II, 136) all those who did not actually take part in the performances—that is, *all* the higher grades of Ariois—occupied the platform. Information is lacking on this point, but it would be of interest to know whether this platform was reserved for the visiting Ariois only, or if it was shared by higher-graded members of the local lodge as well. (In other words, was *tribal* status maintained, or outweighed, in such gatherings?)

In the place reserved for what Henry labeled "the royal family" must have sat the local tribal chief and his nearest relatives, and probably other spectators of upper-class status. Again, it would be interesting to learn which place was occupied by upper-class persons who were also Ariois but not of the principal visiting contingent—that is, Was class status outweighed by Arioi status on such occasions?—but such information was not recorded.

The place set aside for the performing Ariois—presumably both the "stage" itself and the seats of performers awaiting their turn—was dominated by the raised seat of the master of ceremonies:

Their captain, on public occasions, was placed cross-legged on a stool seven feet

high, with a fan in his hand, in the midst of the circle of laughing or admiring auditors, whom he delighted with his drollery, or transported with his grimaces, being, in fact, the merry-andrew of the corps, who, like a wise fool, well knew how to turn his folly to the best account. (Montgomery 1832:I, 240)

According to Henry (1928:239) this individual was called *arioi-hi'o-niao* (Arioi Inspector).²⁷ Elsewhere reference is made to a "master of diversions" (*fatu no te upaupa*), who is described as "a kind of master-of-ceremonies, who presided at these exhibitions" (Moerenhout 1837:II, 140). We cannot discover whether these were separate offices, or one office having somewhat different characteristics. Nor can we discover to what grade of Arioihood, or what marriage class, such officers belonged.

Concerning the *rehu arui* (night into twilight?), the name given to the taper-lighted performances of the Ariois, Orsmond wrote:

The Nighttime Ashes. That, too, was one of the players' festivals. When night fell, pigs would be roasted and apparel cut. It was a musical gathering. The fires made the night like day. For which reason it was called Nighttime Ashes (or Twilight). Thieves would sit around waiting patiently, clothed like players. From time to time a breadfruit would disappear or a pig, and they would call out as though they were members of the gathering, if they were not reprimanded.... (Orsmond:Arioi)

The prologue to an Arioi performance served to emphasize the *tribal* identity of the performers in question. According to Henry, quoted earlier, it was the member of the performing unit (presumably the lodge's leader) who made this opening speech. Orsmond provided a number of examples of such speeches, one, in fact, for nearly every district lodge on Tahiti-Mo'orea. The example reproduced by Henry, that of Ha'apape, is evidently based on the Orsmond text, but leaves out some noteworthy words, including the name of the lodge's Arioi house (in this case, Te Atita, "agitation"?), and an opening phrase, *haha hoi* (which Orsmond translated, "the strutting of the cock by the hen," which was evidently the metaphor for the man's manner of entry on stage). Also, Henry's own phrasing of this speech does not indicate clearly enough that "I Stand" is in fact the distinctive official Title of this premier Arioi of Ha'apape; the Orsmond text shows that every such Arioi prologue contained the Title of the lodge's premier official along with a listing of the home district's highest mountain, assembly ground, cape, and so forth. In other words, a district's premier Arioi was ceremonially identified by a formula like that of its tribal chief—except that the formula applied to the former seems not to have included the name of the tribal marae, whereas the formula of the tribal chief did include the name of his district's Arioi house.

Much has been written about the "amusements" and "entertainments" of the Ariois, both the performances presented by them for public

consumption and the allegedly “sacred” activities engaged in by them exclusively. Concerning the first there is not much to be added to the general description of dancing, singing, play-acting, et cetera, given in chapter 10. It is undoubtedly true that such activities were a specialty, perhaps the main specialty, of Ariois. A text recorded by Orsmond, and translated by Ralph White, describes the penalties served upon inept Ariois: “[Concerning] the poor [inept] Arioi and the poor musical comedian and the poor acrobat: As for the inept Arioi who did not know how to dance and sing, he would be led outside, off grounds. No one would look at him. His rendering was slovenly and full of mistakes.” But Ariois were not the only persons to engage in such activities, or even to specialize in them. In fact, some of the troupes of “strolling players” described in the sources may not have been Ariois at all.²⁸ Nevertheless, the public performances put on by Ariois do appear to have represented in marked degree certain features of these activities, namely, their religious aspect, their employment of sexual and especially copulative imagery, and their uninhibited lampooning of prominent persons.

Concerning the religious emphasis of their performances, Moerenhout said: “... their exercises commence always with religious subjects. The description of the two principles, Taaroa and matter with which he joined himself, the creation of the universe, gods, the elements, spirits, plants and other productions of the earth ...” (Handy 1930:65, translated from Moerenhout 1837:II, 134).

The emphasis on sexuality in public performances of the Ariois is to be distinguished from the sexual promiscuity said to characterize their offstage lives. Like most writers on the ancient Maohis, Miss Henry “drops a curtain” before such goings-on. The missionaries Tyerman and Bennet imposed their own censorship:

The stories [performed by Ariois] were called *Aamu*, and were dramatic in form, so that several speakers might take their distinct parts, and not merely recite, but act them. These compositions, we are told, frequently did credit to the talents of the authors, while the accuracy and liveliness with which they were repeated, showed considerable powers of memory, as well as of imitation in the performances. But they were connected with unutterable abominations.... (Montgomery 1832:I, 69-70) On their lewdness we shall not dwell ... (Montgomery, p. 239).

Though not as descriptive as we would like, Moerenhout was more specific, and he posited a religious rationale for this on-stage aspect of Arioi sexuality:

Their performances were not limited to mythological and historical subjects. Some of them were even livelier and more bizarre. It was these in which their lower-class members presented without scruples the uninhibited representation of sensuality and love-making. And in connection with these latter performances

it was not unusual to see young men and young women actually offering their sacrifices to the goddess of love in public. Such scenes as these also commenced with chanting and dancing, the former having revolved around the delights of sensual pleasures, which were depicted with utmost candor and ardor, and in the most unequivocal terms. As for the dancing, it was entirely distinctive to these particular occasions, and was everything in the way of lasciviousness that their voluptuary geniuses could invent. Yet, notwithstanding the fact that such scenes would appear so scandalous to our [European] eyes, when looked at from *their* point of view they were anything but reprehensible or shocking. In my judgment, what is entailed in these scenes, as in mythological and other solemn performances carried out in connection with the Arioi, is nothing more or less than the living portrayal (in lieu of inanimate symbols) of the natural principle of sexual generation—no different from that symbolized by the Ancient Egyptian's *phallus* or the East Indian's *lingam*. (1837:II, 131–132)

I have described in chapter 10 the satirical character of some Maohi theatre. It is likely that this characteristic was not limited to Arioi performances, but I suppose that it was more prevalent in such performances—probably because Ariois were in general a highly privileged category of persons, more immune than many others from the application of certain social sanctions. In some descriptions of satirical performances the performers are not identified, but Ellis referred specifically to Ariois: “Their public entertainments frequently consisted in delivering speeches, accompanied by every variety of gesture and action; and their representations, on these occasions, assumed something of the histrionic character. The priests, and others, were fearlessly ridiculed in these performances, in which allusion was ludicrously made to public events.” (1829:I, 317)

One additional characteristic of the public performances put on by Ariois was their athletic exhibitions and contests. As we saw earlier most large-scale Maohi assemblies of any nature included athletic events of many kinds. But we are informed by Ellis that Ariois “sometimes engaged in wrestling, but never in boxing; that would have been considered too degrading for them” (1829:I, 317–318). Reasons for this attitude, if indeed it prevailed,²⁹ were undoubtedly complex but may well have been based on the high valuation placed by Ariois on physical perfection; and the bare-fisted, do-or-die character of Maohi boxing must have been very disfiguring. The statement by some observers that boxing was a “lower-class” sport could also help explain its alleged proscription among the socially elite persons comprising the Ariois—were it not for other claims that some “chiefs” were champion boxers!

Finally, a text recorded by Orsmond helps to lift the “veil” that most other writers insisted upon drawing over the off-stage “abominations” indulged in by Ariois during their tours. I reproduce the text itself and a translation worked out by White. As the reader will perceive, even so expert a Tahitianist as White is unable to deliver a wholly lucid rendition of these largely obsolete fragments. In the matter of translation, this and other ex-

amples of White's renditions do not always completely "make sense," but I greatly prefer his deliberate cautiousness to the more manufactured lucidity of some other translators.

E vahine roi na te arioi. Oia te mau vahine e pee ia ratou ra i to ratou ra mau tere. Ei pia ahu ana ia, e e ope(re) taoa na te arioi. E vaiho noa ia mau vahine. E taata e te haere e haere mai e taoto, e afai i te taoa na te arioi.

E vahine tãiato. E roi tãiato. Te mau tapairu e haere roto i te na hoa i te arioi ra ia, e te ma hina a te hui raatira ra; o ratou te riro ei vahine taiata. Ei te arui ra, e vahine tamahanahana na te arioi, ei te ao ra, e vahine taiato ra ia. E mea ê ra te mareva. Ia obua ra te arioi, e e taamu i te fenua, e haere atoa i a mau vahine taiato. E ia tae i te hoe faaea raa ra, i te vahi e faamu hia 'i ra, e noho tu i te fare, o te arioi o te vahi e noho hia ra, e na te hui taiata ra o te reira iho hoi e pii haere "Taiato, e ai o, e ai o, e ai o. E i roto roa i te fare. Tei hea te mau vahine taiato nei?"

No te mau arioi ra. Teie matou. Mai haere i o ae ra. Eiaha ei o nei i, e haere mai e ai. E taau, e taau, e taau i te taata. Too-pae, too-ono, too-hitu vahine. Aore taoa. E ai noa. Te ai atu, te pohe atu, Te ai atu, te pohe atu. Ei te ao anae ra e haere mai ai. E ore e haapao, e ore e haama, Ei reira iho i mua i te aro o te tane e o te vahine. Teie ra te tau maamaa rahi roa. Ua rahi roa te taiato i teie nei. Aita ra te vaha e pii, te mata ra te parau. E ia oti ratou i te faa amu hia ua haere atura i tetahi vahi iho, e o te peu noa iho a ia e ati noa ae Tahiti % E haere mai i tera bubu, e i tera bubu maitte, piiaraa, oetei vaha, e ai o, e ai o, e ai o, mai no te rauti, e te monoi, e te mati. Teie te arioi mau, o te mau tuta e auri nei e huru ê. Te mati anae te toe, e te mau inu raa ava ra, o te tãiato raa ia, o te ai raa ia.

Bed-mates for the players. These were the women who followed along after them in their travels. They were clothe-starchers, one and all, and gift distributors for the arioi. Those women would just leave them. A different person would come and come and sleep, and bear gifts for the 'arioi.

Whores. The lecher bed. The beautiful hand-maidens would go in as friends for the arioi, daughters of the local adult population; it was they who acted as whores. During the nighttime, they warmed the players, and during the daytime they were prostitutes. But the fleet was strange and different. Should the 'arioi decide to circumscribe the land, the whores would go along too. And when they came to a stopping over place, a place where they would be fed, they would stay in the house, the 'arioi of the place whereat they stayed, and the honorable group of whores of that very place would call out "Fornication, our wares are copulation. And right into the homes. Where are the whores?"

About the arioi. Here we are! Let's go off there. We had better not do our fornicating here. There were scores and scores and scores of men, and only five or six or seven women. No payment. Just copulation. Copulation to climax, one after another. But they would pursue their course only during the day. They were subject to neither restraint nor shame. Right there in front of husbands and wives. For this was the completely crazy age. Fornication had now increased tremendously. The mouth did not even have to call out, the eyes said all that was necessary. And when they had been fed, they would go on to a nearby place, and so on until they had made the circuit of Tahiti. They would come to this group and that group, their voices (mouths) calling out: Fornicating! Fornicating! Fornicating! with ti fronds and scented oil and crimson dye. These were the real players, the hardened reprobates ... a strange lot. Only the crimson dye remained, and drinking spirits, and dissipation, and fornication.

We now leave the "entertainments" provided by Ariois on their tours away from home to consider the more tangible goods that circulated in con-

nection with their visits. Included among these were offerings made by the touring Ariois to their tutelary deities, mainly 'Oro, for safe passage; gifts formally exchanged between the touring Ariois and their hosts; and food supplied by the hosts for daily provisioning of their Arioi guests.

I have already indicated my uncertainty regarding the source of the objects handed over by the touring Ariois to their tutelary deities and to their hosts—that is, I cannot discover whether these objects were the product of the Ariois' own husbandry or manufacture, or were supplied in part by their non-Arioi neighbors at home. However, no such uncertainty prevails concerning the source of objects provided by the hosts: several passages establish incontestably that the entire populace of the host district was required to contribute to these occasions, and if the extra amount needed was not obtainable through general levies then the tribal chief would bestir even himself to produce it. For example, under the date of October 16, 1806 there is the following entry in the LMS records: "The people of Hapaeno passed on to Pare with a great quantity of food, cloth, ava and Hogs which are intended for an Oroa that is to be held in a few days on account of the Areoes belonging to Raeatea and the other Islands to Leeward" (Youl, Bicknell et al., *Journal*; see also, Jefferson, *Journal*, 22 October 1800).

As for the degree of balance maintained between guests and hosts in the formal exchanges of objects, Henry's opinion was that the former gained more than they gave up, and this difference was even further widened by means of the daily provisioning supplied them by their hosts throughout their visits. To the best of my knowledge, rationalization of this discrepancy is nowhere explicitly voiced in statements attributable to the Maohis themselves, but I believe that its basis was implicitly recognized in acceptance of the specific principle that the entertainments provided by the visitors were fair exchange for the surplus in objects they received, and in acknowledgment of the general premise underlying "hospitality"—that is, the roles of host and guest might someday be reversed.

Another aspect of these transactions that has provoked most writers' comment is the extent to which such visits used up the resources of the host district and the manner in which these "costs" were apportioned and borne. Henry wrote of farmers' gardens being "stripped" and whole districts "impoverished" (1928:240). Further evidence of such consequences comes from Ellis, Bennet, and Wilson.

... in the constant repetition of ... often obscene exhibitions, [the Ariois] passed their lives, strolling from the habitation of one chief to that of another, or sailing among the different islands of the group. The farmers did not in general much respect them; but the chiefs, and those addicted to pleasure, held them in high estimation, furnishing them with liberal entertainment, and sparing no property to detain them. This often proved the cause of most unjust and cruel oppres-

sion to the poor cultivators. When a party of Areois arrived in a district, in order to provide a daily sumptuous entertainment for them, the chief would send his servants to the best plantations in the neighbourhood; and these grounds, without any ceremony, they plundered of whatever was fit for use. Such lawless acts of robbery were repeated every day, so long as the Areois continued in the district; and when they departed, the gardens often exhibited a scene of desolation and ruin, that, but for the influence of the chiefs, would have brought fearful vengeance upon those who had occasioned it. (Ellis 1829:I, 319)

Free from labour or care, they roved from island to island, supported by the chiefs and the priests; and were often feasted with provision plundered from the industrious husbandman, whose gardens were spoiled by the hands of lawless violence, to provide their entertainments, while his own family was not unfrequently deprived thereby, for a time, of the means of subsistence. (Ellis 1829:I, 325-326)

This rite, therefore, was followed by a *feeding* (as it was called), when fifty or sixty hogs, perhaps, and fruit in proportion, were presented to them, together with rolls of cloth, and every necessary for their personal accommodation. This "feeding" was not all consumed at once, nor upon the spot, but portions of it were set apart, and sent to their brethren in other islands by early canoes. Thus when they alighted, like a swarm of locusts, in a rich district, they were not, like locusts, contented with what they could devour themselves, but swept away from the miserable inhabitants whatever they could obtain, for the support of those of their order who were wallowing at their ease on dunghills of sloth, while these were laboring abroad in their vocation. (Montgomery 1832:I, 239; see also Wilson 1799:195)

I shall return to this topic in my general discussion of the position of Ariois vis-à-vis other members of Maohi society.

Henry's description, quoted earlier, of the concluding ritual of an Arioio tour requires no amplification, except to draw attention to the statement that the Ariois, upon reaching home, burned all clothes worn by them during their performances—an action presumably based on the same general premise underlying the disposition of the clothing of priests and others after ceremonies in a marae. The final sentence quoted from Henry does however require additional comment: I refer to her statement that "After this [i.e., the final offering to 'Oro upon the expedition's return home] they disbanded and went to their own homes, until new organizations were required" (1928:241). This assertion implies that Ariois did other things than engage in the kinds of activities just described. And it also raises questions concerning the frequency and timing of the tours themselves.

Some writers have characterized the Ariois as "eternally wandering, homeless vagabonds," thereby implying that they were continually on tour. The facts, as far as they can be gleaned, are that none of the Ariois were "homeless" and that their organized tours, at least, were rather infrequent. Although some Ariois were probably on hand at every large-scale gathering witnessed by European visitors, the only recorded instance we have of an actual large-scale Arioio tour in progress was the one witnessed by Cook and his crew in the Leeward Islands in 1774 and

mentioned above. The tour just mentioned took place in May, and in addition there is the testimony of missionaries cited earlier concerning preparations being made on Tahiti, in October, to receive a large fleet of Ariois from the Leeward Islands; but there is no direct evidence that either of these was a preferred time of year. In comparing such activity in these Islands with similar but more seasonal kinds elsewhere, Moerenhout wrote that “on Tahiti as in the other Society Islands, where natural abundance was always to be found, the Arioi festivals were practically continuous”—by which I interpret his meaning as not that they went on all the time in any one place but rather that they knew no seasons (1837:I, 501).

Organized touring may have been the most spectacular part of Arioi activities but it was not the only one. For example, they put on their performances on other festive occasions—familial, tribal, and intertribal. At nearly every large-scale gathering of people described in the sources mention is made of “entertainments” having been provided by Ariois; the latter were perhaps not the sole “entertainers” on such occasions but they were usually the most prominent ones. Like most Arioi “entertainments” these performances probably involved religious overtones, and this was emphatically so of performances accompanying individuals’ rites of passage.

I reproduce again Moerenhout’s general account of natal ceremonies, in which the part played by Ariois was particularly noted:

The most active [participants in these occasions] were always the Ariois. On arriving, with their bodies painted red and white, with feathers in their hair and decorated all over with flowers and ornaments, they chose for themselves one of the two lots of tapa [provided by the hosts], the chiefs taking what was left. Then, after the roast pork had been distributed the ceremony began. (1837:I, 536)

Thereupon, while the parents and close relatives of the newborn child repaired with it to the marae for performance of the rituals already described, the rest of the company remained at the parents’ household:

During the parents’ absence, and often throughout the rest of the day, the Ariois kept up their chants and dramatic acts concerning the actions of the deities. All of these ceremonies, both the ones at the marae and at the household, had no other purpose than to assure divine protection for the newborn. And the reason why the parents went to such expense in accommodating the Ariois is that since these latter were regarded as such favorites of the deities it was believed that their very presence would secure divine favor for the newborn (Moerenhout 1837:I, 537)

I have not come across any description of the part played by Ariois at weddings, but a reference to them in Ellis’ account of such occasions indicates that they were in attendance and implies that they participated to some extent: “The cloth used on these occasions [i.e., the nuptial rites at the marae], as well as the dress, was considered sacred, and was taken to the king, or appropriated to the use of the Areois” (1829:II, 570).

Ariois also took part in ceremonies of inauguration. In the one ascribed to the inauguration of an Opoan sovereign chief, Henry noted that Ariois were a distinctive element in the processional review:

Soon upon the sea and along the shore a semibarbarous pageantry took place. A long flotilla bearing nude men and women of the *arioi* and *hihomoa* fast element, headed by the new *anuanua* (rainbow) or sacred canoe of 'Oro, which was distinguished from all the rest by *tapaau* (coconut-leaf images), *viriviri* (braided coconut-leaf) chaplets suspended around its borders, and by the presence of *opunui* who named it, dressed in their best marae costumes, each carrying a *tapaau* on his left arm and wearing wreaths of coconut leaves. The canoe had a platform towards the center for 'Oro and the coming sovereign. (1928:190)

Then, near the conclusion of the ceremony, "The nude party, some of whom were mounted upon trees, hailed him as monarch of their persons, suiting actions to words in language too primitive to be repeated" (Henry 1928:195). Henry added that a "queen was happily exempted from this undignified greeting."

Ariois had, as we shall see, distinctive ways of solemnizing the death of one of their own members, but I can discover no evidence that they played special parts in connection with the death of nonmembers—except, according to the Orsmond text, that they alone of all persons were immune to the dangerous antics of the "ghost-masquers": "An Arioi would not run from the ghost-masquers. The former went his way, and the latter his." (Orsmond: Arioi)³⁰

The privileges accorded Ariois did not end with death, as the following description of their funerals and afterlife shows:

When an *arioi* died, the body lay in state for two or three days at the home of the deceased, where members of the society assembled to perform the funeral rites. Accompanied with loud lamentations, called an *otoha'a* or *ta'iha'a*, for the dead, they first brought presents to the family and made a feast, holding a wake at night time, when they called loudly to the spirit to return to its body. On the last day the corpse was taken to the marae of 'Oro, where the high priest met it and in a long prayer invoked 'Oro to bestow on the disembodied spirit all the mystic powers with which it had been supposed he had invested the *arioi* in life. Then the body was interred as that of an ordinary man within the precincts of the marae, after which, at the little shrine of Roma-tane, Te-roma-tane invoked the gods to receive the *arioi* soul into the full enjoyment of their paradise, where it was believed that no children existed to mar their pleasure. (Henry 1928:241)

Several accounts of the Ariois emphasize their roles as "warriors":

Wales described them as having had "a considerable share in the Management of their Military Affairs" (Beaglehole 1961:843).

"They were in general stout and well made, and all professed themselves warriors" (G. Forster 1777:II, 129).

"They were a chief's most faithful companions, and generally speaking

the bravest. Indeed, the sect was a veritable “nursery” (*pépinier*) of warriors....” (de Bovis 1909:37)

“They are generally distinguished for their prowess, valour, and activity in battle; and if any of them shew the least signs of cowardice, he is excluded the society; which is esteemed such a disgrace, that from that time he loses all his consequence, and nobody will associate with or speak to him” (Surgeon Ellis 1782:I, 160).

I suspect that the last statement, by the surgeon Ellis, is a somewhat exaggerated characterization of the military aspect of Arioi life, but it seems clear that able-bodied male Ariois did indeed number among any tribe’s better fighting men (despite Morrison’s cryptic statement that “They are Never Calld upon in War” [1935:235]). But they were certainly *not* the only fighting men, and perhaps not invariably the best fighters or the most effective war leaders.³¹ Moreover, when engaged in the religiously colored “entertainments,” which was perhaps the most distinctive side to their way of life, they put aside fighting altogether. In fact, warfare was delayed or interrupted in places where Arioi were engaged in their “entertainments.” For example:

... let them direct their course to whatever island they please, they are always certain of being well received; nay if they have even been at war but a few days before the visit, all animosity is laid aside, and they are as perfect friends as if nothing had happened. (Surgeon Ellis 1782:I, 159-160)

In times of war or other trouble, the *arioi* were never molested, and they sometimes safely entertained warriors at intervals of respite on the battleground. (Henry 1928:241)³²

During these [Arioi-featured] festivals all the populations [of these Islands], even the most savage ones, often suspended their almost constant warfare. (Moerenhout 1837:I, 502-503; see also Moerenhout:II, 402.)

(If this norm was in fact observed—regrettably we have no direct eyewitness evidence on this score—it would of course distinguish sharply between assemblies featuring Ariois and others, where, as we have seen, sport competitions quite typically ended in brawls. [See chap. 10.]

In this connection one will recall that ‘Oro, the Ariois’ principal tutelary, was above all else *the* God of War, who delighted in offerings consisting of warriors slain in battle. On the other hand, that capacity of ‘Oro most distinctively associated with the Arioi sect was ‘Oro *i te tea* [*te’ā?*] *moe*, “‘Oro-of-the-laid-down-spear.”³³ One explanation offered for this seeming paradox is that ‘Oro as *god* of war was consequently *master* of it³⁴—which *could* be the logic involved in this usage but is not necessarily so; indeed, for the Maohi it may have constituted no paradox at all.

I turn now to the “secret rites” alleged to have taken place among the Ariois.³⁵ Ariois were an *exclusive* category of persons—just how exclusive

is indicated in the following text collected by Orsmond and translated by White:

E bubu taata tino maitatai te mau arioi ra, e te taa â. Aita ta ratou ra oroa i taahi hia i te avae taata, aita hoi ta ratou amu raa e haere noa h hia 'tu r te taata 'toa. Te taata ra e haere noa i ta ratou amu raa maa, e i ta ratou oroa, e repo ia i ta ratou parau ra. Eiaha te taata e haere na roto, na vaho ê ra. E pohe, e tairi hia i te omore. E rohi i te oroa a te arioi, eiaha e repo. Tera te repo o te haru, e o te taata e haere na roto. Na te orõa, ua a, ua ama te buaa, ua motu te ahu, no te mea, aore i haere hia i te taata, e aore e haru. Ua ai ota teie nei buaa. Tera te ai ota o te taata, ua haere na roto te haru, ua tubu. Aore â te bubu arioi reporepo raa. Mai te Oro metua nei hoi te arioi. Te monoi, te tiare, te faio, ta ratou haa, e e ore tona tua ra e haere hia tu. E feia moa rahi.

The arioi were a company of fine bodied men, and separate (from them). Let not the foot of man tread their ceremonies. Not one of all went to their ceremony, and eating was filth in their estimation. Let not a person go in the midst, but outside. (If he went then he would be slain, stricken by the club.) Be on the alert, let not the ceremony of the arioi be defiled. A thing snatched away or a man going through was the defilement. Behold the feast it is consummate, the hog is done, the cloth is cut, because no man has snatched, no one has approached. Is raw (sodden) hog. That is the rawness, a man has gone through the ranges, a person has seized (his) past. The arioi have no filthy habits. Like the race of ministers were the arioi, scented oil, betties (flowers), scarlet dyed cloth was their work. His bed place must not be trodden on. They were sacred.

Thus, their separateness from the rest of the population is undeniable; the question, however, is whether they also engaged in activities that were kept hidden from non-Arioi and unrevealed to them. Evidence on this point is scarce and not very explicit:

They are amused with music and dances, which are said to be particularly lascivious at night, when no other spectators besides themselves are admitted. (G. Forster 1777:II, 130)

There are other dances usual in their nocturnal festivals with the Arreeoys, which, none of our ships company had an opportunity of seeing, and are according to the accounts of the natives extremely indecent and lascivious; these are called *t'eai-morodèe* [te ai moro iti? tāmure?], and the women exhibiting them, *Too-àha* [? tu'a'a, lewd, shameless, indecent, profane (LMS Dictionary)]. (J. Forster 1778:467)

The two Forster accounts, by son and father, respectively, and probably based on the same source of information, seem, however, to be contradictory; the first asserts that the night revels were both secret and exclusive, whereas the second seems to imply that they were perhaps secret but not altogether exclusive. Moerenhout's account, like that of G. Forster, emphasizes the exclusiveness of the Arioi's night meetings. But it should be recalled that Moerenhout's version was based on information collected many years after the events:

Their various poetic, musical, choreographic or gymnastic exercises often took place in the evening by torchlight, and these night scenes, in places where puerile superstition and fears scarcely allowed other people to leave their houses, added substantially

to the prestige of the [Arioi] and to the respect which they inspired; since, only they alone, under the gods' protection, would dare to face the spirits. (1837:II, 32)

Hawkesworth, drawing from the journals of various visitors to Tahiti, put together the following passage: "... the members have meetings, at which no other is present, where the men amuse themselves by wrestling, and the women, notwithstanding their occasional connection with different men, dance the Timorodee in all its latitude, as an incitement to desires which it is said are frequently gratified upon the spot." (1773:II, 207-208)

The only reference I have found to Arioi nuptial rites is the following: "Marriages of the *arioi* were always performed at a marae of 'Oro, the accredited founder of their society" (Henry 1928:284).

The funeral rites held for a deceased Arioi were, as we have seen, undoubtedly distinctive; they may have been somewhat exclusive as well.

The same characterization probably applies to the regular rites of worship which Ariois directed to 'Oro and to their other tutelars. Many such services may have been exclusive, and the rituals may in places have been replete with "unusual, symbolic, and obscure language,"³⁶ but the same may also be said of some of the religious services conducted by other types of congregations.

Before leaving the subject of Arioi activities which characterized, though not altogether distinctively, membership in this sect, I raise again the question, What proportion of their lives did Ariois devote to such activities? I have expounded my own opinion that they were not continuously "on tour" and I have implied that between tours—and when not engaged in performances for local birth ceremonies, and so forth—they lived much like their non-Arioi neighbors. Now, however, I must confess that certain passages from Wilson and Bligh raise the possibility that being an Arioi was more of a full-time occupation than I had earlier suggested:

We stopped at Papparā for the night in the house of my tayo Wyreede: as I had not seen her since my late arrival, she expressed much joy on the occasion, ordered a pig to be instantly dressed, and made me a present of several things; among others, a quantity of human hair made into fine sinnet. Here were a number of arreoies with their separate wives, who, by the attachment they shewed for their husbands, seemed to discountenance the assertion of promiscuous connexion, with which they are charged. Their great numbers made the house, which was one hundred and forty feet long, appear like a little village, where each claimed the place on which his mat was spread; and almost all were employed in making mats, sinnet, &c. As soon as it was dark they brought lights, and danced and sung till near midnight, and perhaps would have continued all the night, had I not begged my tayo to cause them to desist& for the drums appear not to disturb their sleep; but, when tired with dancing, they lie down, and a fresh party rises to the sport: and in this manner

the arreoies usually spend their nights, and thus they train the youths to the same irregular living. (Wilson 1799:206)

It appears however that the Erreeoys from leading an Idle and gay life have among them the finest Women of the Island. They have luxuriant and fine situations where they have their Meetings and live with all the disipation imaginable, and they vary the enjoyments of their lives with the Seasons of the Year. As for Example the Island of Teturoah, which is a few leagues to the Northward of this, they resort to in Crouds in the Season when the Fish is plenty, and at other times to some Charming places in the Mountains to enjoy other peculiar dainties. They are always in large Parties. Always drest with the greatest profusion of the best Cloth and are generally fat and Saucy. (Bligh 1789:II, 78)

Social Relations

A distinction can be drawn between *types* and *grades* of Ariois. I find it useful to distinguish the following types of (male) Ariois: "active," parentaged, "retired," nontattooed, inspector, decorated-sennit and edge-of-the-dress. In native use the word *arioi* used without qualifiers seems to have had the meaning of *active*. Active members—the term is mine—were separated into several grade levels, from "highest" to "lowest," each with its distinctive tattoo pattern and uniform and other insignia. Perhaps each grade was characterized by distinctive forms of rights and duties as well, although the sources provide such details for only the highest and lowest of the grades. I paraphrase below the characterization of each grade from highest to lowest as set forth in the Orsmond text, with interpolations taken mainly from Henry:

1. *Āvae Parai* (blotted-legs or, as most sources label them, black-legs): Members of this grade had their legs completely covered with tattoo marks, from foot to groin. Such were the "parents" (*metua*) of all other Ariois; they were the ones in highest authority, and were appointed to their office by the tribal *ari'i*. Black-legs were easy to distinguish because of their oil-glistening skin and hair, their *mati*-besmeared faces, and their ample bellies. No Ariois was as eminent as a black-leg; here are some of the privileges of such a one: he was the head of any group (?); he was the one who had the (sole?) right of dividing the bark cloth; the altar on which pigs were placed was his;³⁷ he alone wore a red loincloth, which led to his being also called *arioi maro 'ura*; he controlled the fleet of canoes (used in touring); he sat on the (highest) seat; it was he who stood on the high platform and called out the names of those receiving portions of the goods being distributed.

Note: Unless otherwise specified everything I say throughout this section refers to males, who constituted by far the largest and most important part of the membership of the sect, and to whom most of the data pertain.

2. *Harotea* (light-colored *haro* tattoo mark): According to Henry men

of this grade bore a tattoo pattern of “filigree bars crosswise on both sides of the body from the armpits downwards towards the front.” Henry also described their official insignia as consisting of skirt and shoulder garlands made of shredded ti leaves, and of wreaths over the brows. (1928:234)

3. *Taputu*, or *Ha’aputu* (gathered together): The tattoo pattern of this grade consisted of “diversified curves and lines radiating upwards towards the sides from the lower end of the dorsal column to the middle of the back” (Henry 1928:235). They wore skirt and shoulder garments like those of the *Harotea*, but made of shredded leaves of ginger (*opuhi*).

4. *Ōti’ore* (unfinished): Their tattoo pattern was light marks on knuckles and wrists and heavier ones on arms and shoulders. Their garments consisted of a yellow creeper plant (seaweed?).

5. *Hu’a* (small): Their tattoo pattern consisted of two or three small points on each shoulder; their overgarment was made of the fibrous covering of the young coconut leaf (*a’a ha’ari*), and their headdress was of the young coconut leaves themselves.

6. *Atoro* (? a fragrant herb, *Geniostemna rupestre*): Members of this grade had a single small tattoo stripe down the left side, and they decked themselves in yellow mountain-plantain (*fe’i*) leaves.

7. *Ohe mara* (seasoned bamboo): Members of this grade were tattooed with a circle round the ankle, and they decorated themselves with clubmoss (*mai’u’u tafai*).

8. *Tara tutu* (pointed thorn?), *Tara tihi* (?): Their tattoo mark consisted of small marks in the hollow behind the knees, and they wore bright flowers and a headdress of red and yellow *Barringtonia* leaves.

As Henry pointed out: “It is evident that as the comedians [Ariois] received promotion and underwent the operations necessary to raise them the tattooing of one order [grade] did not obstruct that of another.” In addition to these marks of grade membership, all Ariois put on other markings in connection with their performances: “Before acting, the chief comedians dyed their faces red with the sap of *mati* (*Ficus tinctoria*) and *tou* (*Cordia subcordata*) leaves. So also did all the other orders, in addition blackening themselves with soot from burnt *tutui* (candlenut), which some of the men, to create laughter in their plays, used for painting grotesque figures over their bare bodies and limbs.” (1928:235)

One other grade of active Ariothood was that of novice—made up of young males selected as candidates for membership in the sect and who were undergoing a period of instruction and probation. Novices were called by several names: *āvaeāvae* (footing?), *fa’a’are’are’a* (diversion-making?), or *po’o* (chest slappers, or flappers). In connection with flappers, it is explained that the principal activity of such individuals in public entertainments was to stand along the perimeter of the entertainers with

left arm bent, striking the elbow with right hand and flapping the left arm, like a bird flapping its wing, while chanting about their identity—that is, the geography of their home district, the mythical history of the sect, and so forth (Henry 1928:236). This is the same movement, it will be recalled, used by athletes in their challenges. It probably was meant to represent the bravado expressed by a cock before a cockfight, or in the presence of a hen.

As Mühlmann pointed out, there is some discrepancy between the accounts of Ellis and Moerenhout,³⁸ on the one hand, and Orsmond-Henry on the other, with respect to the number and names of the various grades (Mühlmann 1955:32). This could, of course, have come about through their having obtained their information from informants from different islands, which they probably did. I suspect, however, that the discrepancies are due mainly to Orsmond's better comprehension and reporting; in my judgment, cultural differences as fundamental as these are unlikely to have been maintained for long, in view of the constant interisland touring that went on.

But returning to the visible signs employed in distinguishing the various grades, the notion of progressive tattooing as a mark of advance through the grades strikes me as quite comprehensible; in view of the permanent nature of tattooing no other course would have been possible. On the other hand, I can offer no explanation for the types of patterns used, or for the order of their placement on the body.

As for the distinctions in other insignia, some of these are comprehensible but others are not. The most intelligible is, of course, the red-dyed bark-cloth girdle worn by members of the highest grade, the black-legs—who were in fact also called "red-girdle Ariois." Henry's statement that this *maro* was deliberately made to resemble the red-feather girdles that went with highest-ranking kin-Titles is probably correct, but whether this was done in the spirit of "burlesque," which she proposed, is open to question. Certainly, some of the entertainments put on by Ariois were designed to ridicule eminent persons, but black-leg Ariois were themselves anything but clowns, and their wearing of red-colored girdles could have been designed to indicate that their eminence was parallel to and nearly equal to that of red feather-girdled *ari'i*.

In connection with the *mono'i*, or sweet-scented oil, with which Ariois in general, and black-legs in particular, used to anoint themselves so liberally, one will recall that this kind of cosmetic was a hallmark of the youthfulness and festivity which characterized Ariothood in general, but it was also a specific attribute of Romatane, one of the sect's principal tutelars.³⁹

Some parallel with *ari'i*-hood may also have occurred respecting quality of garments—that is, those of the upper grades seem to have been costlier in terms of manufacture. I shall have more to say about attire in connection

with distinctions between *types* of Ariois, and between Ariois and non-Ariois, but with the few instances just noted I can discover no further symbolic parallels between insignia and grade level.

Distinctions between grade levels in terms of activity have also been noted, but only in general and somewhat ambiguous terms:

Their prostitution, dancing, and lewd performances were engaged in only by the lowest grade numbers. Upper grade Ariois were by contrast individuals of grave and reserved comportment. (Moerenhout 1837:I, 495)

All these dramatic performances and dances and sport contests were executed by the many subordinates [lower grades, or lowest grade?] Ariois, and by those who attach themselves to their company. [See below.] The principal persons, comprising the chiefs [chiefs of Arioi lodges? chiefs in general? or both?] and members of the six upper grades [including, or in addition to, the chief Arioi?] did nothing but preside over the festivals, dressed in their ceremonial costumes.... (Moerenhout 1837:II, 135)

On the appointed day they began their dramatic performances dances, over which presided the principal Ariois [*les premiers Areois*, i.e., chiefs of Arioi lodges? or members of the other higher grades as well?], who were grandly costumed but who merely occupied elevated seats, as spectators, not themselves taking part in the performances. (Moerenhout 1837:II, 133)

From these and other descriptive fragments it seems clear that certain higher-grade members took no active part in the sect's public performances (I shall return to the matter of prostitution later on), but as indicated by my interpolations I am not clear just where such lines were drawn. Particularly puzzling is Moerenhout's inclusion of all "six upper grades" among the spectators, since these constituted, according to his conception, all the fully initiated members of the sect, leaving only the "apprentices" (*po'o, fa'a'are'are'a*, novices) as performers.

A similar question is raised by Mühlmann's assertion that "only the higher grades were in possession of the [sect's] deepest religious secrets" (1955:34). Also, Mühlmann cited no direct evidence for his implication that upward progress in the sect also involved the learning of "secrets." But before continuing with this survey of Arioi grade levels let us look further into the matter of membership itself.

Active Ariois constituted a privileged category of persons and a fairly limited one in size. In other words, not every Maohi could qualify for membership (nor, probably, wished to do so). The various motives for joining will be examined shortly, but first an account of the three recorded routes to membership.

The best described and probably most usual route to membership was by self-indicated candidacy. Mühlmann's survey of this procedure draws on all the principal sources and embraces several essential points:

Whoever wished to become a member was required to demonstrate that he was possessed by the god Oro—such indeed served as prime proof of youthfulness. This qualification testing took place ideally during one of the Arioi public meetings. [On such occasions] an aspirant fastened about himself a girdle of yellow leaves, painted his face scarlet (with a sap from berries of *ficus tinctoria*), shaded his eyes with yellow leaves, and decorated his aromatically oiled coiffure with flowers: such was the traditional costume of members of the Sect's lower grade. By appearing thus costumed the candidate gave token of [his desire] for membership. And thus outfitted he assumed the behavior known as *nevaneva*—deranged, howling and raving about the house where Ariois were performing or dancing, and engaging furiously in their play-acting or dancing. In this way was an individual's desire for membership in the Sect clearly expressed. Thereupon, if [the active members] were convinced of the candidate's skills in dancing and play-acting, the highest grade one of them present called him by name in friendly fashion, tapped him on the shoulder, and said to him: "Manau, manau, haere mai (you are one of us, come hither). (1955:28–29)⁴⁰

Self-candidacy, then, was proof of an individual's own desire for membership, but acceptance evidently depended upon other factors as well.

First was approval by the sect's tutelary deity, as manifested in the candidate's state of possession (*nevaneva*). It is, of course, possible that by Maohi reasoning the candidate's own desire for membership came about as a result of initiative on the part of the god, and not vice versa, but I have no evidence to support either of these explanations.

A second factor was evidence of the candidate's aptitude for dancing, pantomime, and other performing. The sources also assert, with uncommon unanimity, that only those who were physically handsome (*feiā purotu*) could successfully qualify; and while age qualifications are not specified it seems obvious from several kinds of evidence that most candidates were in the *tau re'are'a* period of life—that is, past childhood (*tamari'ira'a*) but not yet fully settled down (*pa'aria'a*). Finally, although some of the earlier observers were of the opinion that only persons of highest class origins were eligible for membership, the accounts of later but better informed writers indicate clearly that candidates were accepted from all class strata.⁴¹

Before proceeding to outline a novice's progress toward active Arioihood, I must draw attention to references to two other ways in which individuals were selected for membership. The first is an all too brief passage in de Bovis that says in effect that the chief of an Arioi lodge had the prerogative of bestowing membership upon anyone "who pleased him," simply by girding that individual with his *maro* (1909:38). Although de Bovis does not so specify, from the context in which this sentence occurs one may infer that such an individual was thereby excused from the long novitiate which most other candidates were required to undergo.

The second reference to Arioi recruitment was quoted earlier, in connection with *āmo'a*:

If any Person wishes to have his son or Daughter instituted into the Society he procures an Areeuoy to be His Son or Daughters Friend and Adopts him for His Son by performing the Amoa (before described) towards Him and His Son or Daughter at the Morai and the Child is acknowledged an Areeuoy immediately the Ceremony is over, and May Continue to follow their Methods while He or she thinks Proper. (Morrison 1935:235)

This is the only reference that I can find to this intriguing mode of recruitment, and the only inference of general interest one can draw from it is that it provides still further evidence of the prevalence and versatility of “fosterage” as a technique for instituting social relationships of various kinds.

The next stage in the accepted candidates’ progress to full active membership was recounted by Henry:

If approved [as indicated above] they went through the novices’ initiation, which was to pledge themselves not to suffer their offspring to live if any came to them and to obey absolutely the orders of their *arioi* chief or chiefess, as the case for man or woman might be. They were then invested with the *maro pipi* (girdle of the native pea vine), which was their public uniform, being their insigne of attachment to the society, to which they became the humble servants, the men doing all the drudgery and the women lighter work required in their expeditions and at the princely homes of the chief *arioi*. Their novitiate lasted two or three years, or until they became accomplished in recitals of historic events, in music, dancing, and acting (chiefly in pantomime form)....

When the novices were considered accomplished enough to be admitted into the society, an assembly of *arioi* convened at the marae of ‘Oro for the purpose of receiving them. The *poo* were first privately invested by the *arioi maro ‘ura* with a loin girdle of white breadfruit tree bark, dyed lengthwise or crosswise with wide red bars, called a *fa’aio*, and with a fringed cape of the same material, called a *titi*, dyed to match the girdle, some capes having fantastic figures printed upon them. These insignia of their profession they wore only when performing in public, the women wearing their girdles as sashes over their wrappers.

The novices were then solemnly dedicated to ‘Oro-i-te-tea-moe, to whom was presented a *pua’a ra’a* (sacred pig), wrapped in *arioi* cloth of bright colors, called a *haio*. If the pig were presented alive, its ear was marked with the ‘*oro’oro*, and it was set free; but if baked, it was buried in the ground in front of the marae as a sweet offering to the god.

Finally, after being anointed with perfumed oil in honor of Roma-tane of their Paradise, upon whose stone image, which stood close by the marae, they placed garlands of flowers, they were led forth by their chiefs and chiefesses and introduced to the assembly by new names by which they were ever afterwards known to the society. After a cordial reception and kind greetings from the assembly, the ceremony ended in a feast provided by the relatives of the new members, then called *tara-tutu*, of the eighth or last order, and for them the tattoo printer soon afterwards made the marks of their order. (1928:236-237)

Several points in this account require elucidation: first, the novices’ pledge regarding future offspring. I join with Mühlmann in rejecting surgeon Ellis’ observation on this point:

It will here be necessary to observe, what it is that first constitutes a member, and some of the rights and privileges annexed to this society. It is in consequence of a most cruel and unhuman action: a man must connect himself with a girl, and the first child he has by her, must be strangled the instant it is born. At the next meeting they must bring witnesses to prove this horrid deed, after which they are admitted as members. (1782:I, 159)

I know of no other support for this improbable statement, and the missionaries would undoubtedly have noted and castigated such a practice if it had in fact existed. This of course does not preclude some candidates having practiced abortion and infanticide before seeking membership; in fact it is highly likely that many did so. My point is that proof of infanticide is not likely to have been a prerequisite for Arioi candidacy.

As Mühlmann pointed out, sources are not in agreement concerning the extent of the pledge regarding offspring. Ellis (1844:108) asserted that *all* active Ariois were required to obey it, whereas Henry stated: "Offspring of the lowest orders was not permitted to live, in consequence of which infanticide was a common practice among them. If any saved their babes they were dismissed in disgrace from the society. But children born in the highest ranks were regarded as descendants of gods, and were spared to inherit their parents' titles." (1928:235) Moerenhout was even more specific: "In the case of a member who happened to be an *ari'i*, his first son was permitted to survive whereas all his other offspring were destroyed at birth. But in the case of a member who was chief of a lodge, all his female offspring were destroyed along with his firstborn male offspring, whereas all other male offspring were spared." (1837:I, 495)

I must confess my inability to resolve these contradictions and ambiguities. Moerenhout's statement, if it is even partially correct, leaves unexplained what occurred in the case of a lodge chief who was also a member of the *ari'i* class—a circumstance which indeed was usually the case. Moreover, his statement seems to refer only to male sect members, although it is well established that the sect included not only female *ari'i* but had female lodge chiefs as well.

These uncertainties aside, however, the sources are practically unanimous with respect to the fate of those active members who broke the sect's rules regarding offspring—whatever those rules actually were. Such violators were labeled *fānaunau* (parentaged) and were thenceforth prohibited from taking active part in any of the sect's organized activities. Here is White's literal and vivid translation of Orsmond's text on the subject:

E arioi fanaunau, te hoe bubu arioi. Taa atura ia taa. Oia ra i fanaunau ra. Ua paari tana tamarii. Ua ino ia arioi-Eita e tuu hia i o i te arioi-avae parai ra, e o ra i te bubu fanaunau ra. E ore e tae faahou

Players who became parents was a distinct class of arioi. They were made distinct because they were parents and saved the lives of their progeny. Therefore they were disfranchised. They entered no more into the com-

i roto i te tavehea o te arioi ra. oia hoi te tabu raa ahu. Na te maitai mai nei oia i te haere, e naha ua ino! E ua matara tona maro ura e e tae faahou i te rai raa maro ura. E ia pa parau hia ra, eiaha e tae e oto ia, e tautau tona hupe, e haere i muri ma te haama, e hobu i te vai, e e notu noa i o te mau arioi fanaunau ra. Faaturi noa, e fanau noa, eiaha ra e faa-ora, e arioi a ia.

pany of black legs, but associated with those other arioi who had also become parents. They went no more into the space-of-the-head-players-in-which-the-cloth-and-were-divided. He had been in the high rank but was now defamed. His red loin girdle was taken away, the sacred pig. He went no more on the high scaffold from which was pronounced the names of those to whom severally belonged the sacred hog and loin girdle. On being told go no more up. He wept, the excrements streamed from his nose, he fell behind, ashamed, washed off his cented oil and red dye and went to dwell with players of old who had also been put out for having families. The Player may be a whore monger at pleasure and have many children, so long as he does not have one alive.

Some points in this text will be elucidated later on, and others must remain obscure,⁴² but it is well to note that although violators of the rule were expelled from active membership, they retained some status in the sect, as Arioi *fānaunau*. Blich commented on this point:

A man after being in the Society may marry and have Children, he therefore loses his priveleges, but having had the Honor of being of the Society, he retains the Name of Erreeoy affixing the name of married to it, so there are two set of Erreeoy, one called Erreeoy Nahnownow and another Erreeoyrahigh, the latter being the highest rank. Nahnownow signifies Married and [they] do not kill their Children." (1789:I, 420)

Having children was not the only grounds for "excommunication" from active Arioihood:

E arioi repo. Te arioi maua, e arioi api, e arioi ahi maa ore, Ua itea hoi tana hapa, ua repoaia. E arioi ino horovaru, e te haere aru. E ore e rave hia i tona rima, a viivii. E tapu hia ra i rapae au. E ore ra te mau arioi atoa e o i mua i te marae. E tapara mati ia. E ree hia te arioi ino.

Ia hamani ino ra te hoe arioi, a aore i oto atu, e aore i faa amu atu i te hoe tiao arioi, ua haere ra i te aehere e pupuri haere ra. E arioi iino ia e, e ree hia. E ore roa tu te hoe bubu arioi e ite ai iana, e ore e pa te maa nana. No te mea, e arioi ahi maa ore, E arioi utuafare ore, e te manava ore, mai i te mau arioi paari.

The filthy player. The awkward player, the inexperienced player, the player without cooking facilities. His mistakes found out, he was begrimed. An evil player—he was a bushwhacker. He would not be touched for fear of contamination. He would be excommunicated. There was not room for all the players before the temple-place. These poor players would be besmeared with scarlet dye and cast out.

Should a player do evil, be inhospitable and not feed a certain group of players, but instead went and hid in the bush, these were evil players and would be Not a single group of players would accept him, not would they share food with him, because he fired no oven of his own. He was a homeless player, with no amenities for entertaining established players.

Te horoi raa repo ra. E ere ra te repo i parai hia i nia iho iana. No roto ra iana taua repo ra. O tona hamani ino i te tiaa arioi ra. Ia ree hia ra oia, e imi oia i te manao a pa ia arioi, ua taora maira i te manava, ua eu i te buaa e ua tuu maira te peue, te ahu, te poe, e te tuu atu ra ia manahini mai maururu, e ma ia manahini mai maururu, e ma ia tona repo. Te horoi ra oia i te repo, E riro a oia ei arioi, e e horoa hia 'tu i tana tufaa.

Wiping off the dirt. But it was not the dirt which had been smeared on him; that dirt came from within the person in question—from doing evil to the whole player profession. When he was [excommunicated], he would seek an idea [to propitiate the arioi]—he would throw out greetings of welcome, he would roast pork and bring out mats, clothing, pudding [? pearls] and distribute them for the pleasure of the guests—thus his filth would be cleansed. If he took the trouble to wipe off the dirt, he would again become a player and given his share. (Orsmond: Arioi; translated by R. G. White)

And this leads me to introduce the interesting subject of Arioi *fau fenua*, which Henry unconvincingly translated as “Arioi-high-in-the-land.” Her text describing this type of membership follows: “When *arioi* retired from active life they became farmers and artisans for the society, called *arioi-fau-fenua* (arioi-high-in-the-land), and were still regarded as regular members; the women made cloth and did all the handiwork required by their sex” (1928:237). Judging from the rest of her account of Arioihood Henry probably drew her information mainly from Orsmond; but Orsmond himself made no reference to “retirement” in the text collected and translated by him:

E arioi faufenua. E ore ia arioi e hahaere. E ore e faatia i te tere. Ei te fenua nei e rave ai i tana peu. E tanu i te o, e faaai i te buaa, ato i te fare umi, e tarai i te vaa—E fatu i te taumi, e ia oti roa ra, e mareva taua, ei hoo i toua ra maro ura, e te monoi. E faatomo i te fare i te ruru. Ua oma te fare i te ruru, i te otaa, e i te monoi. Ei reira oia a haere ai.

The player who was always abode at home and cultivated the land was another class. They did not travel they did not join with voyagers, on shore they did their pleasures, they planted gardens, fed stock and built canoes. Made celebrated caps and on finishing a large fleet (mareva) for the players as a restitution for the honours of his loin girdle, he then filled his house with rolls of cloth till their weight and that of the scented oil tied on the rafters made the house sway down with load. Then he would also take a voyage. (Orsmond: Arioi)

Henry was probably correct in her interpretation, but on the basis of Orsmond’s text alone one could not know whether the Arioi *fau fenua* constituted retirees from active membership or an altogether separate auxiliary with a different method of recruitment. My reason for believing that Henry was correct is based on some recorded instances of individuals who had indeed “retired” from active membership to family domesticity (including having offspring) without suffering the kind of criticism leveled at “faithless” Arioi *fānaunau*. A statement from surgeon Ellis concerning such “normal” retirement might also be used to support this interpretation, but could refer just as well to Arioi *fānaunau*: “In general, they continue in this Society

to the age of thirty or thirty-five, when by suffering one of their children to survive, they debar themselves of the privileges of an arreo. Many remain members all their lives, and die in a most emaciated state, occasioned by their very debauched way of living." (1782:I, 160-161)

I now confront the complex question of why active members of this sect were required to dispense with some or all of their offspring—a question which since Cook's time has intrigued students of Maohi life.⁴³ The answers that have been proposed to this question may be treated under two partly separate headings: first, the reasons which, consciously or unconsciously, led the sect's founders to establish the sect (including its fundamental rule regarding members' offspring); and second, its members' reasons for continuing to accept—indeed, enthusiastically embrace—this rule. A passage from G. Forster exemplifies how some of the earlier visitors sought to account for the sect and its rules and privileges:

Two reasons seem to favour the existence of arreoys, and both are in some measure connected together. The first appears to be the necessity of entertaining a body of warriors, to defend their fellow-citizens from the invasions and depredations of enemies. This is confirmed by the circumstance, that all the arreoys are warriors; but as love might be supposed to enervate them, they were restrained to that celibacy, which they have since found it too difficult to observe. The second reason for the association of the arreoys, seems to be to prevent the too rapid propagation of the race of chiefs. An intelligent man, who perhaps was once the law-giver of Taheitee, might foresee, that the common people would at length groan under the yoke of this numerous and ever-multiplying breed of petty-tyrants. To oblige a part of them to a single life, was the shortest means of obtaining this end; but certain glaring advantages were to be held out, to make them submit without reluctance to such a restraint. From hence we may derive that high esteem with which the whole nation honours the order of arreo; and likewise account for their authority, and for their gluttony in eating, which has been the privilege of warriors in every country, before they became the tools of tyranny. When the arreoys had once so far departed from the laws of their first institution, as to admit the commerce with the sex, it is easy to conceive, that, by insensible degrees, they have almost wholly lost the original chaste and sober spirit of the order. (1777:II, 131-132)

Others have proposed that the sect was founded with some other major objectives in view, and the rule regarding offspring introduced as a means of insuring that members would not be distracted by domesticity from devoting their full energies to the main business of the sect. But let us list the separate kinds of "explanations" that have at one time or another been offered, and note hereto that most writers have acknowledged that a combination of such facts was probably involved:

1a. The sect was established in connection with 'Oro worship, and the offspring rule was deliberately imposed in order to disencumber members from time-consuming domesticity.

1b. It was established in connection with 'Oro worship, and its mem-

bers' actions in killing their offspring constituted a form of sacrifice to that sanguinary god.

2a. The sect was established as a deliberate means of general population control.

2b. It was established as a means of curbing the increase, specifically, of the upper-class stratum of the population, including especially the offspring of cadet siblings of kin-Titleholders.

3. The sect was in the first instance a company of warriors upon whom celibacy was enjoined in order to guard them against the enervating effects of sexuality. Later, however, when the "strong calls of nature" (J. Forster) proved to be undeniable, infanticide was introduced to spare members of the company from the encumbrances of parenthood.

(In connection with both the "population control" and "warrior celibacy" explanations it has been suggested that the various privileges accorded the sect's members were designed to compensate them for the celibacy that was originally enforced upon them.)

4. After the sect was established, for whatever reason, and in view of the sexual promiscuity that became in time a part of its way of life, abortion and infanticide were prescribed in order to avoid the survival of offspring of mixed-class descent—a strong possibility in view of the sect's multiclass composition.

It is evident that the writers proposing the various explanations set forth above do not all share the same assumptions regarding Maohi beliefs and values. In addition to the "original-cause" explanations just cited other reasons have been put forward for the willingness, indeed eagerness, with which individual members embraced this part of the sect's precepts. These reasons differ somewhat in expression but all are aspects of what is characterized as the high valuation placed by the Maohis on "youthfulness"—in body, in activities, and in prerogatives.

Youthfulness in body meant physical perfection as manifested in face and physique, in sexual energy, and in aesthetically perfected motion. In females, according to this line of reasoning, such youthfulness was marred by domesticity and the nursing of children, and in males by the kinds of manual labor required to support a family. By the same token, domesticity, including especially parenthood, left less time and opportunity for dancing, for unrestricted lovemaking, and for other forms of diversion. And finally, parenthood meant for many individuals the abdication of some of the privileges associated with kin-Titleholding.

In other words, the things about the sect that attracted and held members were not only the positive advantages of membership, which still have

to be described, but the institutionalized opportunity it provided for perpetuating "youthfulness" in all its gratifying aspects.⁴⁴

We shall later consider how these various explanations are reflected in the sect's myths of origin, but let us turn now to other aspects of becoming an Arioi.

According to Henry, candidates for Arioihood spent their time in learning to take part in Arioi entertainments and in doing all the work required "in their expeditions and at the princely homes of the chief *aroi*" (1928:236). They were under oath "to obey absolutely the orders of their *aroi* chief or chiefess, as the case for man or woman might be." They are also described as having been "humble servants" to "the society," but it is not made clear in this passage or in any other source known to me just who their masters or mistresses were: the master (or mistress) of their own lodge? all full active members of their own lodge? or all full and active Ariois anywhere?

In connection with the candidates' initiation into full membership, the offerings to 'Oro and Romatane are explicable in terms of the sect's cosmogonic and eschatological beliefs, the latter yet to be described.⁴⁵ On the other hand it is not clear what social unit Henry was referring to when she wrote of the initiates' having been "introduced to the assembly." Did she mean to other Ariois only or to the populace at large? (This bears on the broader question of the place occupied by the sect in Maohi society in general.) Ellis described the ceremony as having taken place "at some taupiti, or other great meeting of the body," and he wrote that the new member was presented "to the members who were convened in full assembly" (1829:I, 322). From this and other statements it seems fairly certain that initiation ceremonies were attended by Ariois from not only the initiates' own lodge but from other lodges near and far.

Although acceptance of a postulant's candidacy seems to have been on an individual basis, and on no set occasion, the phrasing of accounts by Henry and others leads me to believe that ceremonies of initiation involved several candidates at a time.

Another noteworthy point about the passage of Henry's quoted above is the statement that the feast terminating the initiation ceremony was "provided by the relatives of the new members." This raises crucial questions concerning the costs, in material terms, of sect membership—including, as we shall see, advancement within the sect itself.

Henry's terse statement regarding advancement within the sect is little more than suggestive: "The various orders [i.e., grades] were gradually promoted according to their merits by the society, but for the king [presumably, a tribe's sovereign chief] was reserved the right to bestow the order of the red girdle and black leg, when such a dignity was required in the community" (1928:237).

Ellis' lengthier text will serve to elaborate the first part of Henry's statement:

The lowest members [i.e., members of the lowest grade] of the society were the principal actors in all their exhibitions, and on them chiefly devolved the labour and drudgery of dancing and performing, for the amusement of the spectators. The superior classes led a life of dissipation and luxurious indolence. On this account, those who were novices continued a long time in the lower class; and were only admitted to the higher order, at the discretion of the leaders or grand masters.

The advancement of an Areoi from the lower classes, took place also at some public festival, when all the members of the fraternity in the island were expected to be present. Each individual appointed to receive this high honour, attended in the full costume of the order. The ceremonies were commenced by the principal Areoi, who arose, and uttered an invocation to *Te buaa ra*, (which, I presume, must mean the sacred pig,) to the sacred company of *Tabutabuatea*, (the name of all the principal national temples,) belonging to Taramanini, the chief Areoi of Raiatea. He then paused, and another exclaimed, Give us such an individual, or individuals, mentioning the names of the party nominated for the intended elevation.

When the gods had been thus required to sanction their advancement, they were taken to the temple. Here, in the presence of the gods, they were solemnly anointed, the forehead of each person being sprinkled with fragrant oil. The sacred pig, clothed or wrapped in the *haio* or cloth of the order, was next put into his hand, and offered to the god. Each individual was then declared, by the person officiating on the occasion, to be an Areoi of the order to which he was thus raised. If the pig wrapped in the sacred cloth was killed, which was sometimes done, it was buried in the temple; but if alive, its ears were ornamented with the *orooro*, or sacred braid and tassel, of cocoa-nut fibre. It was then liberated, and being regarded as sacred, or considered as belonging to the god to whom it had been offered, it was allowed to range the district uncontrolled till it died.

The artist or priest of the tatau was now employed to imprint, in his unfading marks, the distinctive badges of the rank or class to which the individuals had been raised. As this operation was attended with considerable suffering to the parties invested with these insignia of rank, it was usually deferred till the termination of the festival which followed the ceremony. This was generally furnished with an extravagant profusion: every kind of food was prepared, and large bales of native cloth were also provided, as presents to the Areois, among whom it was divided. The greatest peculiarity, however, connected with this entertainment was, that the restrictions of tabu, which prohibited females, on pain of death, from eating the flesh of the animals offered in sacrifice to the gods, were removed, and they partook, with the men, of the pigs, and other kinds of food considered sacred, which had been provided for the occasion. Music, dancing, and pantomime exhibitions, followed, and were sometimes continued for several days. (1829:I, 323-324)

This account brings out clearly the society-wide unity of the sect, as manifested in attendance at the promotion ceremony (i.e., "all members of the fraternity in the island") and in the invocation (see also Moerenhout 1837:I, 493-494). However, it does not answer the important question of who supplied the food for the feast or the bark cloth given to the Ariois. And it does not offer any rationale, native or otherwise, for the puzzling respite in eating restrictions. Nor does it indicate the bases on which promotions were made;

“according to [the members’] merits,” wrote Henry, but such merits are not specified. Moerenhout had the following to say on this point:

All candidates having pretensions to [higher grades in the sect] were first tested in public by the masters of the art. The smallest mistake, the slightest hesitation, led to their being disdainfully rejected and hooted down by their examiners and the people at large. In addition, perfect knowledge of these poems and sacred chants not only served to elevate the fortunate adept to places of honor among humans, but provided him with sacredness and made him a favorite of the gods. (1837:I, 501)

(Moerenhout’s reference to sacredness is too vague for us to pursue further, but the general meaning of this passage seems clear.)

Evidently the merits in question were ones which received divine approbation, and hence included expertise in the sect’s religious rituals. However, I suggest that such expertise was not sufficient to insure promotion into the higher grades of the sect. As will be presently indicated, class status figured importantly in fixing one’s grade level in the sect, but I suspect that such factors as personal forcefulness and political skill were also influential, as they were in the tribal hierarchies with which Arioi lodges were so closely intertwined.

As for each lodge’s highest *office*, the sources are quite explicit. As Henry stated in the passage quoted above, “for the king [i.e., tribal sovereign] was reserved the right to bestow the order of the red girdle and black leg, when such a dignitary was required in the community” (1928:237). A text collected by Orsmond is even more explicit on this point: The Ari’i created the Arioi Rahi, otherwise the latter would not become so. Only when agreed to by the Ari’i and the [other] chiefs did a person become Arioi Rahi... (adapted from Orsmond: Arioi).

As for the sect’s highest *grade*, that of black-legs, I must confess to some confusion despite the attention devoted to the subject by the sources. As I have indicated earlier I am uncertain concerning the distinction, if any, between a lodge’s highest official—its *’aito*, or red-girdled Arioi (or Arioi Rahi)—and the grade-level of black-legs. According to Henry the statuses were identical: that is, for each lodge there were only two active black-legs, the male and female red-girdled leaders of its respective male and female units. According to de Bovis however the statuses were separable: “The Ariois [presumably, each lodge] had [its own] red-girdled Ari’i, who was selected for that office from among their high-ranking, or rather *highest-ranking* members (1909:38, italics added).⁴⁶

In any case, from the evidence of both Henry and Orsmond it does seem quite clear that the appointment of a lodge’s two principal officials—male and female—was done by its members’ *tribal* chief, presumably in consultation with other tribal officials and with members of the lodge’s higher grades. Also, from this and other evidence it seems clear

that class status was an important, if not the most important, criterion taken into consideration in the selection of a lodge's principal officials, as well as for promotion into its higher grades generally. Regarding the latter, Moerenhout made the following comments:

The great principle of equality [i.e., the possibility that individuals of any class could become members] was however bent in favor of the leading chiefs or *arii*, who, upon wishing to join [the sect] were usually admitted and placed immediately in one of the higher grades (*aux premiers grades*), without ever being required to submit to the numerous trials through which other members were required to pass; but even though chiefs, here as elsewhere, did remain above rules and formulas, it was nevertheless possible for other individuals to achieve, in time, the same grades as they. (1837:I, 490-491)

I reserve some skepticism regarding the generality of Moerenhout's last phrase, but none of the sources deny that individuals of ability, regardless of class, could rise to some heights in an Arioi lodge.

Before attempting to summarize the relations among members of any lodge, we need to consider some bits of information concerning one other grade level of Arioihood, and a theory that has been propounded to explain it. I refer to the grade labeled *hu'a* (small), the one numbered 5 in the series recorded above, which was derived from Henry and, ultimately, Orsmond. Elsewhere in the Arioi texts collected by Orsmond, and translated by White, is the following:

<i>To te feia pipi ra.</i>	<i>E hu'a pipi.</i> ^[47]
Concerning the pupils.	They are fattened-youth pupils.

E te hee^[48] *nei, tera mai, tera mai.*
There they go [?], there they go.

E puroto, e te hee nei.
They [look] handsome in their going.

E umere te vivi, e umere te vava
Astonished [are] the locusts, astonished the grasshoppers

e puroto, te hee nei.
[at] the handsomes going by.

If Orsmond's description of the *feia pipi* (or *hu'a pipi*) is meant to refer to members of a specific grade level of active Ariois, then there is a possibility at least that at this stage in the members' advance from novice to black-leg they underwent systematic fattening—not just the kind of self-indulgent regime that many persons, especially Ariois, occasionally underwent, but fattening as a distinct step in the process of grade advancement.⁴⁹ However, on the basis of the evidence just quoted—the only evidence I can discover referring *directly* to the matter in hand—this is as far as I feel justified in carrying the argument.⁵⁰

There is not much that can be added to passages already quoted

concerning the governance of an Arioi lodge. Each segment, male and female, had its leader, whose authority was presumably far-reaching, and included the sole or overriding right to nominate new candidates, to expel sect rule violators, to promote members, and to decide other lodge matters. All novices were placed directly, wholly, and absolutely in their service. Information about the extent of their authority over full members of the lodge is not as explicit; I surmise that it was final in matters relating to Arioihood but that it did not extend so absolutely to other aspects of members' lives; it is my assumption that not all members devoted *all* of their lives to being Ariois.

As for the more material aspects of relations among lodge members, the sources contain the following:

The members or *Arioi* befriend each other sometimes with rolls of native cloth, or it may be pigs, or canoes, so that whenever an *Arioi* lets it be known that he needs one of these things, it has to be given. (Corney 1915:377)

They [Ariois] are united by the ties of reciprocal friendship, and exercise hospitality towards each other in its greatest latitude. As soon as an arroyo visits another, though he were unknown to him, he is sure to have his wants supplied, and his desires gratified; he is introduced to other members of the order, and they vie with each other in loading him with caresses and presents. (G. Forster 1777:II, 129)

Beyond this "mutuality" among lodge members there probably prevailed a general hierarchy of privilege based on grade level, but what these transactions consisted of we are not told. When referring to higher-grade Ariois (and particularly to those of *ari'i* class) a text collected by Orsmond reads as follows:

Na te arioi rarahi ra e tii atu i te tamarii mana, i to te hui raatira ra tamarii ei arioi, ei taetaeae arioi. Ei tii raa buaa na te arioi. E feia taoa rahi ia, e te maa rahi, e ore te mau tataeae ra e patoi i te feia tii i te buaa e te ahu.

The first rate arioi used to go for the primes and children of chiefs to te arioi or fraternity of players. By which means as occasioned may be, they could obtain hogs and cloth for the body of the arioi. A people possessing great property, abundance of food were the arioi. None of the fraternity would resist their request either for hogs or for cloth.

I cannot decide from this whether the objects supplied in response to requests of the high-grade Ariois came from the populace in general, or from lower-grade members of lodges.

The sources are somewhat more explicit about another aspect of intralodge transactions; I refer to the distribution of objects turned over to a lodge, whatever the occasion, by nonmembers. The places regularly set aside for such distributions (and perhaps the distributions themselves) were called *tavehea*, and there is no doubt that this type of distribution was presided over by a lodge's leader and participated in exclusively by active

Ariois—supposedly by active members of the lodge in question. One will recall in this connection that attribute of a black-leg quoted earlier: “It was he who stood on the high platform and called out the names of those receiving portions of the goods” (Orsmond: Arioi). Again, in describing the plight of an expelled member it was specified that he could “go no more into the *tavehea*” (Orsmond: Arioi).

Sex was another aspect of Arioi relations which has been referred to repeatedly in the sources; however, it is not always clear whether the references are to the sexual activities of Ariois in general, to sexual relations among Ariois generally, or to intercourse among members of particular lodges. Of course, recorded opinions about such matters have been widely disparate.

... more than half of the better sort of the inhabitants of the Island have like *Comus* in Milton enterd into a resolution of enjoying free liberty in love without a possibility of being troubled or disturbd by its consequences; these mix together with the utmost freedom seldom cohabiting together more than one or two days by which means they have fewer children than they would otherwise have, but those who are so unfortunate as to be thus begot are smotherd at the moment of their birth. Some of these people have been pointed out to me by name and on being askd have not denyd the fact, who have contracted intimacies and livd together for years and even now continue to do so, in the course of which 2, 3 or more children have been born and destroyd.

They are calld *Arreoy* and have meetings among themselves where the men amuse themselves with wrestling &c. and the women with dancing the indecent dances before mentiond, in the course of which they give full liberty to their desires but I beleive keep strictly up to the appearances of decency. I never was admitted to see them, one of our gentlemen saw part of one but I believe very little of their real behavior tho he saw enough to make him give credit to what we had been told. (Beaglehole 1962:I, 351-352)

They are at present, without doubt, the most luxurious set of people in the island & though I have not found the least reason to charge them with a refinement in voluptuousness, which is at once improbable, and inconsistent with the tenderness of the whole people. We have been told a wanton tale of promiscuous embraces, where every woman is common to every man: but when we enquired for a confirmation of this story from the natives, we were soon convinced that it must, like many others, be considered as the groundless invention of a traveller's gay fancy.

Some *arreoy*s are married to a woman, in the same manner as *Mahine* was to the daughter of *Toperree*; but others keep a temporary mistress. Many may perhaps revel in the arms of several prostitutes, which are to be met with in all the islands. This dissolute pleasure is however much more frequent in every civilized country of Europe. (G. Forster 1777:II, 132)

It appears however that the *Erreeoy*s from leading an Idle and gay life have among them the finest Women of the Island. They have luxuriant and fine situations where they have their Meetings and live with all the disipation imaginable. (Bligh 1789:II, 78)

Here [at *Papara*] were a number of *arreoy*ies with their separate wives, who, by

the attachment they shewed for their husbands, seemed to discountenance the assertion of promiscuous connexion, with which they are charged. (Wilson 1799:206)

The *Erreoes* are only those of the better sort, who, from their fickleness, and their possessing the means of purchasing a succession of fresh connections, are constantly roaming about; and, from having no particular attachment, seldom adopt the more settled method mentioned above. And so agreeable is this licentious plan of life to their disposition, that the most beautiful of both sexes thus commonly spend their youthful days, habituated to the practice of enormities which would disgrace the most savage tribes; but are peculiarly shocking amongst a people whose general character, in other respects, has evident traces of the prevalence of humane and tender feelings. When an *Erreoe* woman is delivered of a child, a piece of cloth, dipped in water, is applied to the mouth and nose, which suffocates it. (Anderson, in Cook 1784:157-159)

One of their privileges is to keep two, three, or more women at once, who however must be members. They always wear the best cloth the islands produce, and eat many peculiar things, which others, even if arees, are not permitted to do. They are generally distinguished for their prowess, valour, and activity in battle; and if any of them shew the least signs of cowardice, he is excluded the society; which is esteemed such a disgrace, that from that time he loses all his consequence, and nobody will associate with or speak to him. Their amusements during these meetings consist of boxing, wrestling, dancing, and making feasts and entertainments, at which crowds of female spectators attend, the fairest of whom are always made choice of by the conquerors. (Surgeon Ellis 1782:I, 160)

Although they were libertines in the extreme, yet an *arioi* husband was exceedingly jealous of his own wife, and improper conduct of one of their number towards her sometimes cost him his life. (Henry 1928:235)

In support of this statement of Henry's is another from the same source: "Marriages of the *arioi* were always performed at a marae of 'Oro, the accredited founder of their society" (p. 284).

In the journals of some of the early European visitors are also to be found references to specific upper-class couples who were well and truly "married" (according to my usage of the term) and one or sometimes both of whom were active Ariois in the sense set forth above. In fact each lodge of the sect is likely to have included among its active membership married couples, unmarried individuals, and individuals who were married to non-members. In addition, except perhaps for some of the Ariois couples, the other members are likely to have enjoyed more publicly sanctioned opportunities for extramarital intercourse, both at home and on tour, than were available to the populace at large.

Several times throughout this account I have alluded to female Ariois. The status itself is well attested by nearly all the sources, but specific references to their activities, as distinct from those of male Ariois, are practically nonexistent. As noted earlier, one account put their numbers, in proportion to male Ariois, as having been about one to five (Montgomery 1832:I, 239),

but this estimate was made long after the sect had largely disbanded and cannot be considered anything more than a responsible guess. A statement by Henry might appear to bear the stamp of authority: "Young girls who enlisted in the role, some of whom were the cherished daughters of the highest people of the land, were carefully guarded and chaperoned by the chief *arioi* woman, and their persons, being regarded as sacred, were respected by all the members of the society" (1928:236). But compare this with a text collected and translated by Orsmond (who, it will be recalled, was the source of most of Henry's information!):

E vahine avae parai. Ua parai atoa tona avae e, e tiaa rahi 'toa tana. Tei te mau vahi atoa ra, e noho ai te tane avae parai, e noho atoa tu ai te hoe avae parai vahine. E haere hoi te mau vahine arioi iana ra.

A female black leg. There were also females whose legs were blacked these were every place where the black legged gentlemen resided. They were a separate body for the wife of the head places. To her all actresses applied as the mates to the avae parai.

The fact of the matter is that next to nothing can be said with any assurance about this aspect of Arioihood.

I began this section by listing the several *types* of Arioi, namely, "active," parentaged, "retired," nontattooed, inspector, decorated-sennit and edge-of-the-dress. I have focused attention on the first three types, for, in fact, information about the other types is exceedingly scant. Henry (evidently drawing on Orsmond) provided a brief account of one of these latter, but the only reference to the remaining three types is in short texts collected by Orsmond. Henry's account concerns the *Papa te'a* (clear-bodied) Arioi, whom I label "nontattooed":

There was also an independent order of men *arioi*, called *papa-tea* (clear-bodies), who did not undergo the tattooing of the society. Neither did they bind themselves to any of its regulations, but rambled from district to district to meet the regular orders and aid in their performances and share their benefits. Without being reproached they settled in homes with families when they chose. (1928:237)

Orsmond's text, on which the Henry account may have been partially based, provides a less flattering view of these individuals, who appear to have indulged themselves in many of the pleasures of active Arioihood but were unwilling, or perhaps unable, to undergo the disciplines of the sect:

E arioi papatea. Te mau arioi nanao ore. E arioi fare ore, e te ori noa, o tona ia i ioa, e te ioa o tona tiaa o Papatea ia. Faarue ia tere, tei nia i tera tere, o tana a ia peu. Tei hea to tatou nei taata? Tera tei tiaa papatea i te oriori haere noa. E aha ra oe e ori papatea mau. E mea vahavaha ra na te vahine o Tahiti te papatea ra. Te tatau a te tatau, e tatau iti noinoino ra, aore

The white [clear] skinned players were a body that had no tatoo. They had no house, they were wanderers from place to place. Their name and the name of the party was white skins. They left this party and joined with that. That was their practice. Where is our man, he is there with the party of white skins, roving from place to place. Do not have [?] a white skin, it is contemptible

rea. Oia ra i oriori maro i tao hia tu ai e, e papa tea.

to the females of Tahiti to see a skin without tatoo. They had some very small marks, but very little, but because they wandered obstinately, therefore they were called white skins. (Orsmond: Arioi)

The other three types, if such they were, are described in the following texts:

E arioi hio niao. Na rapae au e ia arioi i te hio haere raa mai. Aita oia i popore mai i roto nei. E feia hiô tere ia. E hio ratou e ino taua tere ra, E riro a ia ei arioi rahi, e ore ra e ru i te avae parai ra.

The players of inspecting skill. Those were content with passing around on the extremities. They did not crave to be in the midst. They were persons who inspected narrowly the new come company, that they might find out the defects. They were sure to become first rate players, but they were in no haste to have their legs made black.

E arioi aha vai. Te tiaa i te ahavai, e mau arioi unauna rahi roa, e te fare rarahi roa, e aore roa o ratou reporepo raa, E mea anoano atoa e te arioi, e oia te taata e tae i to ratou fare. E rahi te avae parai, e rahi atoa hoi te ahavai. Eiaha te taata repoe eiaharteaataae maimai e tae i to ratou fare. E avau hia ia. E au ratou i te mau orometua papaa nei i te faaenaaaru.

The players called decorated senet was a very celebrated boy. They had very large houses and were removed from all filth. The arioi were grand, no persons entered their houses. The black legs were high but those were also high. Let not a filthy person nor a diseased person go to their house. He could be scolded away. Those called decorated senet were as the foreign Teachers for grandeur.

E arioi taratihi. E taratihi tona tiaa. Aore rea tatau. Tei te apoa avae te nanaô

The players called the edge of the dress was a distinct body. They had but very little tatooing what they had was behind in the hollow of the leg under the knee.

(Orsmond: Arioi)

It is of course possible that Arioi *hi'o niao* referred mainly to the duties regularly performed by some active Ariois, and not to a category distinct from active, retired, or other types. It is also possible that the label *ahavai* referred to some special function performed by an otherwise active Arioi, or to some specially privileged office among active Ariois. But lacking evidence of either of these possibilities, less violence is done to such information as there is by classifying Ariois as I have.

I must, however, acknowledge that I am not fully convinced of the accuracy of my overall classifications of Arioi types or grades. For example, in some of the exceedingly terse texts on Arioihood recorded by Orsmond, there is occasionally discernible a distinction between Arioi Rahi (including and even solely comprising black-legs) and another category made up of novices, active members of all lower grades, "retirees," and so forth. And somewhat parallel to this twofold division is one expressed by Morrison, who distinguished simply between "Old" and "younger":

The Old Members of this Society are distinguished by having a black Oval tattoo'd under their left Breast, one on the right side of the back below the

shoulder, their Legs & thighs entirely blackd from the Ancle to the short ribbs and their arms from the finger ends to the Shoulder—They are always well dressd, with the best Cloth that can be made, their hair Scented and Adorn'd with Various kinds of odoriferous flowers. The Younger Members, and indeed all in general being fond of variety, seldom remain any length of time with one Woman but are Constantly Changing. (1935:234)

Aside from novices, among all the so-called *types* and *grades* of Arioi I have sought to distinguish, the clearest distinction is between those who have abided by the sect's injunctions regarding offspring, and those who have not. I have already reproduced the Orsmond text telling how the latter, the parentaged (*fānaunau*), were deprived of their privileges of wearing red girdles, and so forth. A passage from Morrison also emphasizes this distinction, although the reference implied in the last sentence in the passage is not entirely clear:

If an Areeuoy preserves any of His Children (which they seldom do till they advance in Years & the Fire of their Youthful Passions is a little quenched) they are not treated with so much respect as when Batchelors & are then denominated Areeuoy fwhanownow or a Childbearing Areeuoy and are not entertaind at the feasts till after the Batchelors are served tho they are always lookd on as part of the Society and treated as such. They are Never Calld upon in War and May pass through the Countrys at war without Molestation, and be well received, tho part of them belong to the enemys District. (1935:234-235)

Another kind of evidence bearing on the distinction between these two categories of Arioi—the respected and privileged childless versus the discredited parentaged—is contained in G. Forster's journal:

The arreoyos enjoy several privileges, and are greatly respected throughout the Society Islands and Taheitee; nay, they claim a great share of honour from the very circumstance of being childless. Tupaya, when he heard that the king of England had a numerous offspring, declared he thought himself much greater, because he belonged to the arreoyos. In most other countries the name of a parent gives honour and respect; but when an arreoy, at Taheitee, emphatically bestows it, it is meant as a term of contempt and reproach." (1777:I, 130)

But perhaps most revealing of all is Bligh's account of his participation in a presentation to some (visiting?) Ariois.

After Dinner I ... walked with Otoo to see an offering of food to the Erreoyos. In this ceremony he made me the principal person. As soon as we had got to the spot where this offering was to be made whither I was carried up the River in a Canoe dragged by eight men, (round the Banks of which I had always walked before this time,) a large quantity of Bread fruit and some Hogs ready dressed were brought in baskets and some cloth. At about 40 Yards distant sat a Man who he said was an Erreeoy, and a lane being made by the Natives, he was addressed by one of Otoo's party in sight, (standing on a Canoe) in short sentences for a quarter of an hour. In the mean time a peice of Cloth was got ready about 6 Yds. long, (one end of which I held) and a small sucking Pig. Four Men were ordered to take four different baskets, and being desired to Walk, we proceeded to the

Erre-oy and laid the Offering on the ground. I now spoke several short sentences dictated to me by Otoo, which as I did not pronounce them very exact, created great mirth, and I retired.

The same ceremony was gone through three different times, and a fourth to another Man who had come from Ulietea.

Otoo had several times asked me how many children I had, and I told him four Girls, but not recollecting he asked me again, and said You must go with these things in favor of them. There remained now only 3 baskets of Bread fruit and a small Pig, which with another peice of cloth, assisted as before, I made this offering in favor of my children to the Man who was first honoured. No reply was made by him, and Otoo returned with me to the tent.

All that I could make out of this strange ceremony was, that the Erree-oyes were people highly respected that they had a claim to those marks of homage for their Valour or other causes, and that there was great trust and confidence reposed in them, but what my Children had to do with them I could not conceive, unless from a supposition that they might ever exist under their Government. (1789:I, 383)

On first reading this passage I, like Mühlmann, was deeply puzzled regarding its significance. In time, however, I have come to see it as a particular manifestation of relations between *childless* and *childed* Ariois. As Mühlmann pointed out (1955:102-104), because of Bligh's position it was perhaps inevitable that the Maohis would have identified him with their most privileged people, *ari'i* and Ariois. And Bligh, like other *childed* Ariois, was especially obligated to offer objects to the more highly respected *childless* members of the sect. Mühlmann may have been correct in characterizing Bligh's presentation as objects in lieu of services,⁵¹ but there is also a possibility that his donation was regarded by the Maohis as an expiatory offering as well.

Both myth and ritual served to link all Arioi lodges into a unified, hierarchically structured sect, and this unity was preserved—between lodges as such and between members acting individually—in times of relative peace. But as we shall see, in times of active intertribal hostilities, ties of tribe overrode those of sect.

All the mythical versions of Arioi origins place the institutional beginnings of the sect at Opoa, Ra'iatea, and accord priority and paramouncy to Opoa's Master Arioi, whose official sect-Title became Taramanini. (According to the Henry version it was this official who also established the local lodges elsewhere.) One will also recall that Taramanini's name was uttered in Arioi invocations generally, along with that of the sect's "sacred pig" and of the generic name of its principal 'Oro-dedicated marae, Taputapuatea.⁵² Presumably, Taramanini would have been shown a special degree of respect on encounters between his own lodge and others; on the other hand there is no evidence of any regular flow of objects parallel to this hierarchical flow of respect. Neither are there grounds

for believing that those lodges associated locally with *taputapuatea*-type marae enjoyed any special ritual or other advantages in their relationship with lodges elsewhere.

Moerenhout stated that the sect was in the beginning organized into twelve lodges, whose respective "grand masters" were called *ta'ata hoa arioi* (Arioi companions) and who bore the following sect-Titles (which continued to be borne by the heads of these lodges until the introduction of Christianity): Taramanini (Ra'iatea), Pouna roun [Puna rua] (Porapora), Alae (Huahine, Tauraa toua [tua] (Eimeo, Temaiatea (Mai'ao), Moutahaa [Mutaha'a] (Taha'a), and the following on Tahiti: Nouatoua [Nuatua], Mauroura, Tera'a roa, Maouaroa [Maua roa], Nita and Paa.⁵³ Moerenhout went on to state that "in addition to these twelve superior 'grades', associated respectively with the twelve principal lodges of the society, there were several other [grades] to which any member could aspire" (1837:I, 489-490).

Both Orsmond and Ellis provided lists of such lodge masters, which agree in some measure with Moerenhout's. According to Ellis these sect-Titles were originally the names of individuals who made up the first "company" of Ariois, and who "were nominated, according to 'Oro's direction, by Urutetefa and Orotetefa":

These individuals, selected from the different islands, constituted the first Areoi society. To them, also, the gods whom Oro had placed over them delegated authority, and gave permission to admit to their order all such as were desirous to unite with them, and consented to murder their infants. These were always the names of the principal Areois in each of the islands; and were borne by them in the several islands at the time of their renouncing idolatry; when the Areois name, and Areois customs, were simultaneously discontinued. (1829:I, 315)

Given the hierarchical nature of Maohi society generally, it would be surprising if the headships of certain local Arioi lodges were *not* differentially distinguished in terms of respect, but I can find no other kinds of evidence relating to this particular hierarchy.

According to de Bovis, when a new lodge master was appointed he visited the "principal" marae of all the islands, *se faire reconnaitre* ["to have himself recognized"] (1909:38). Unfortunately, this is the only reference I can discover to such a custom, so that I do not know what this recognition entailed.

The most direct evidence on interlodge relations is, of course, to be found in the accounts already given of organized Arioi tours. Another source of information is a journal entry by Bligh that seems to concern not an organized tour but a reception for local and other Ariois coming home from an extended "vacation" at Tetiaroa. To me the chief interest of this ceremony lies not so much in its details of procedure, some of which

I am unable to explain, but in its composite nature—that is, in the manner in which Arioi ritual was combined with official considerations of *tribe*:

Several Cannoes arrived at Matavai from Tetturoah, in these were a large tribe [*sic*] of the Erreeoys, and among them Huheine Moyere, the Wife of Oreepyah, who remained there after her husband left it. It is customary on these occasions for a ceremony to be performed called Hooepippee [*hu'a pipi*] which seems to be chiefly designed as a publick visit to all their friends at once, who are collected on the occasion, and I beleive it is confined to the Erreeoys.

Huheine Moyere is an Erreeoy Woman, she had two Women to attend her, who with Six Men made the principal part of the Group. The Women were dressed in a kind of short petticoat and a large quantity of very fine Cloth rolled round the Waist up to the Arms. The Men had only Marros with long peices of Varigated cloth hanging from them which nearly reached the ground, and in their hands a plantain leaf; their faces and parts of their body were Smeared with the beautiful red colour called Matte, but it is so carelessly laid on, as would lead one at first to imagine they were wounded in many places, and that the blood was issuing fresh from them.

They proceeded by pairs [to] where I was by appointment with Iddeeah to receive them. Here, walking with great pride and ostentation a few times before the House, I was presented with two peices of white Cloth, and they proceeded on to Oreepyahs. On their return they again Stopt at my Post and the Women began to undress, which before they could cleverly accomplish the Erreeoys who were not of the procession, which were a great many, began to plunder according to their accustomed right, so that all the cloth was soon divided among them.

Three large peices of Cloth with a large baked Hog and much Breadfruit were now brought to me from Iddeeah, who told me I must give that as my present, the Cloth to Huheine Moyere and the Hog to the Erreeoys, and each of us carrying the Cloth and her Servants the Hog and Breadfruit, I presented them to the parties as she directed me, amidst a great croud shouting and bellowing applause.

As a Number of people were here belonging to different districts, Iddeeah gave me dressed Hogs, &c. to present to them also, but this was done in honor of the principal Cheifs of the places they belonged to, none of them being here.

Soon after all these ceremonies had past, a Present from the Principal People was made to Otoo. It consisted of five Hogs and forty eight Baskets holding Cocoa Nuts, Breadfruit, Tarro and different kinds of Puddings. The Baskets were hung with Cloth Variously Stained with Red. Twenty four Men carried them on Poles across their Shoulders, so that each Man had two Baskets. It was first received by Iddeeah, Tynah being absent, and from thence it was sent to Otoo, the Erreerahigh, without any other ceremony. (Bligh 1789:II, 55-56)

Elsewhere in this chapter I have given evidence of the wide-ranging sentiment of mutuality that obtained among Ariois whatever their place of residence: between lodges on tour and among individual members wherever they happened to be. The very existence of such associations may indeed have served to mitigate somewhat the hostile rivalries among tribal chiefs, but when hostilities broke out sect membership was subordinated to the more impelling tie of tribal membership:

However, the idleness of the principal Areois did not continue beyond times of peace—otherwise it would be impossible to account for their privileges and their

persistence as a society. They were in fact a tribal chief's bravest and most faithful companions. The society was a veritable nursery of warriors, who recruited one another but who did not reproduce their kind.

The thing that accounts for the persistence and growth of the Areois, the thing that provided them with their most solid foundation, was that they never became a single *political* unit. Members never put aside their subordination to their respective tribal chiefs & they took part in the enterprises of the latter and [made no concessions] to fellow Areois who happened to be in the enemy camp. They were warriors who in times of peace retired to the delights of their way of life and shared them with one another without seeking any advantage other than pleasure and convenience. Theirs was an epicureanism pushed to its very limits.... (de Bovis 1909:37)

Position of Ariois in Maohi Society

In the discussion of occupational specialization, in chapter 21, I reproduced a text recorded by Orsmond concerning the four "principal kinds" (*te hui*) of persons—*ari'i*, big-bellies, Ariois, and fishermen. I would willingly exchange a whole volume of missionary homilies or ships captains' log-entries for some insight into the Maohi logic involved in this puzzling social classification; but lacking such data I must rest content with defining Ariois' position in Maohi society according to my self-devised role classification. But first some evidence, partly previously quoted, concerning Ariois' position in Maohi society at large.

I have already commented on the *exclusiveness* of the sect, as manifested in the insulation afforded some of its meetings, in the distinctiveness of its members' rites of passage, and so on. As Orsmond's anonymous informant asserted:

E pupu ta'ata tino maitatai te mau arioi ra, e te toa a.

A fine-bodied company of men were the Ariois, a company apart.

E ore tona tua ra e haere hia tu. E feia mo' a rahi.

The bed of an Arioi must not be trodden upon. They are a holy [sacred] people.
(Orsmond: Arioi)

Ariois were also a *highly privileged* segment of the population: "Wherever they go they exercise power to seize what they want from the inhabitants. They smite their hand on their breast, and say, 'Hārre, give,' whenever they covet any thing, and none dares deny them. They never work; live by plunder; yet are highly respected, as none but persons of rank are admitted among them." (Wilson 1799:172)

Material collected by Lavaud indicates that there were standard formulae sometimes used by Ariois in soliciting objects. The following text is titled "Formula or chant of Ariois when they went to demand tapa from the powerful children of ra'atira, that is to say, from persons of eminence."⁵⁴

Here is the way they begin:

"Lie down at nighttime; lie down in daytime.

Taiheritiriti is a god, Taiherarata is a god.

You people to eastwards and to westwards, arise;
 You are being awakened by the godly hosts.
 Arise. There is the star Feinui rising;
 There are the crickets chirping.
 We [animals] are chilled through and through."

Then they commence to play on their noseflutes and drums.

Here is their first chant:

'Seat yourselves behind the house, or in front of it;
 your little [animals] are very chilled."

It is amazing how successful they were in obtaining gifts by such means at places where they called. (Roussier 1928:197-198)

Another standard formula may be involved in the following episode, although what its "deeper meaning" may be I am unable to fathom:

The Areois were countenanced, not by the vulgar only, but by the kings and chiefs, who indulged them in all their licentious practices, and probably found them very convenient tools for the furtherance of their own purposes of fraud and oppression. Availing themselves of the influence which they thus possessed, these reprobates were guilty of the most cruel exactions wherever they went. One of them, for example, would enter the house of a poor man, and by certain ceremonies pretend to make his little boy, playing on the floor, a king; then, with mock homage, he would say, "I am come to the king's house; I want food, give me that pig; I want apparel, give me that piece of cloth." And the father of the new-made king seldom had the hardihood to refuse the boon so flatteringly demanded. If he did refuse, his visitor would threaten him with banishment or death; and such threats were not to be despised. (Montgomery 1832:I, 240)⁵⁵

In these pastimes, in their accompanying abominations, and the often-repeated practices of the most unrelenting, murderous cruelty, these wandering Areois passed their lives, esteemed by the people as a superior order of beings, closely allied to the gods, and deriving from them direct sanction, not only for their abominations, but even for their heartless murders. Free from labour or care, they roved from island to island, supported by the chiefs and the priests; and were often feasted with provision plundered from the industrious husbandman, whose gardens were spoiled by the hands of lawless violence, to provide their entertainments, while his own family was not unfrequently deprived thereby, for a time, of the means of subsistence. Such was their life of luxurious and licentious indolence and crime. (Ellis 1829:I, 325-326)

Wherever they travel they are fed by the Cheif of the district with abundance, who calls them his Man-nee-innees or Erreeoy Friends. (Bligh 1789:II, 78)

... the Erree-oys were people [so] highly respected that they had a claim to those marks of homage for their Valour or other causes, and that there was great trust and confidence reposed in them.... (Bligh 1789:I, 383)

They are continually going from one Island to another and from one District to

another in Companys of four or five Hundred together upon Partys of Pleasure, and as Nearly all the Chiefs are of this Society they ever Meet with the best entertainment from them all in their respective districts. So greatly are they indeed respected throughout all the Islands, that if any of the Members take a liking to the Cloaths which they see any person wearing they are never refused them or any thing else they may chuse to Demand, and are always sure to carry off the finest weomen in the Country. (Morrison 1935:234)

The reference to bark cloth in the last excerpt points to what appears to have been an especially characteristic, perhaps even a distinctive, privilege of Ariois: "The Erree-oys also began to play their part which was to rob every Woman of her Cloaths if it was worth taking. These people it seems have the Power and privilege whenever they are in want of Cloth to take it from any Woman they see." (Bligh 1789:I, 391.) Later on this occasion Bligh interceded to protect a young woman who evidently was not submitting willingly to being thus deprived. Mühlmann interpreted the woman's actions in this episode as being ritually feigned (1955:45-46), a part of an Ariois novice's initiation; to me the woman's struggle to retain her clothing is simply an indication that Ariois' "privileges," though widely enough recognized, were not invariably done so.

That the victims of Ariois' "bark-cloth snatching" were not always non-Ariois is shown in another passage from Bligh's journal; it occurred during the welcoming ceremony quoted earlier, and the deed was perpetrated by male Ariois upon female members of the sect: "... the [Ariois] Women began to undress, which before they could cleverly accomplish, the Erreoyoys who were not of the procession, which were a great many, began to plunder according to their accustomed right, so that all the cloth was soon divided among them" (1789:II, 55).

The characterizations made of all these privileged transactions, between Ariois and the rest of the population, have varied widely—from "ruthless plunder" and "heartless extortion" to joyfully given "hospitality" or fair compensation for highly valued services. As a matter of fact, if a wide enough range of such transactions could be examined it would probably be found to include examples of all of these, along with the finding that the same transaction was regarded by some as "hospitality" or "fair compensation" and by others as oppressive confiscation. But of course no such range of information is available, least of all in terms of individuals' opinions about such acts, so we are left with institutional modes. And in connection with these latter there is probably no better way to judge Ariois' privileges in the population at large than by the order of procedure in which they received their share of objects at public distributions—not during Ariois festivals as such but during the celebration of general religious rites. According to Moerenhout such distributions proceeded as follows: "The gods or the priests received their portion before all others;

then the Ariois; and then the chiefs, each of whom divided his portion among his subordinates" (1837:II, 140).

The privileges enjoyed by Ariois were also manifest in their immunity from the murderous attacks of ghost-masquers, and in their licensed, public lampooning of persons of eminence and authority. And finally, the privileges enjoyed by Ariois among their living contemporaries were conceived of as continuing after death:

And such was the character of their delusive system of superstition, that, for them, too, was reserved the Elysium which their fabulous mythology taught them to believe, was provided in a future state of existence, for those so preeminently favoured by the gods.

A number of singular ceremonies were, on this account, performed at the death of an Areoi. The *otohaa*, or general lamentation, was continued for two or three days. During this time the body remained at the place of its decease, surrounded by the relatives and friends of the departed. It was then taken by the Areois to the grand temple, where the bones of the kings were deposited. Soon after the body had been brought within the precincts of the marae, the priest of Oro came, and, standing over the corpse, offered a long prayer to his god. This prayer, and the ceremonies connected therewith, were designed to divest the body of all sacred and mysterious influence the individual was supposed to have received from the god, when, in the presence of the idol, the perfumed oil had been sprinkled upon him, and he had been raised to the order or rank in which he died. By this act it was imagined they were all returned to Oro, by whom they had been originally imparted. The body was then buried as the body of a common man, within the precincts of the temple, in which the bodies of chiefs were interred. This ceremony was not much unlike certain portions of the degrading rites performed on the person of a heretic, in connexion with an *auto de fé*, in the Romish church.

The resources of the Areois were ample. They were, therefore, always enabled to employ the priest of Romatane, who was supposed to have the keys of Rohutu noanoa, the Tahitian's paradise. This priest consequently succeeded the priest of Oro, in the funeral ceremonies: he stood by the dead body, and offered his petitions to Urutaetae, who was not altogether the Charon of their mythology, but the god whose office it was to conduct the spirits of Areois and others, for whom the priest of Romatane was employed, to the place of happiness.

This Rohutu noanoa, (literally, perfumed or fragrant Rohutu,) was altogether a Mahomedan paradise. It was supposed to be near a lofty and stupendous mountain in Raiatea, situated in the vicinity of Hamaniino harbour, and called *Temehani unauna*, splendid or glorious Temehani. It was, however, said to be invisible to mortal eyes, being in the *reva*, or aerial regions. The country was described as most lovely and enchanting in appearance, adorned with flowers of every form and hue, and perfumed with odours of every fragrance. The air was free from every noxious vapour, pure, and most salubrious. Every species of enjoyment, to which the Ariois and other favoured classes had been accustomed on earth, was to be participated there. Rich viands and delicious fruits were supposed to be furnished in abundance, for the frequent and sumptuous festivals celebrated there. Handsome youths and women, *purotu anae*, all perfection, thronged the place. These honours and gratifications were only for the privileged orders, the Areois, and the chiefs, who could afford to pay the priests for the passport thither: the charges were so great, that the common people seldom or never thought of attempting to procure it for their rela-

tives; besides, it is probable that the high distinction kept up between the chiefs and people here, would be expected to exist in a future state, and to exclude every individual of the lower ranks, from the society of his superiors.

Those who had been kings or Areois in this world, were the same there for ever. They were supposed to be employed in a succession of amusements and indulgences similar to those to which they had been addicted on earth, often perpetrating the most unnatural crimes, which their tutelary gods were represented as sanctioning by their own example. (Ellis 1829:I, 326–328)

I turn now to more specific indications of the Ariois' place in Maohi society—to their positions vis-à-vis statuses such as marriage class, occupation, and kin-congregation.

Several writers have asserted that Ariois were drawn entirely or mainly from the upper class. As stated earlier, I believe that not to have been the case, although in terms of the total number of persons in each class the proportion of *hui ari'i* joining the sect was perhaps greatest. Also, although the higher grades of the sect were not closed to members of lower-class origin, it seems to have been generally true that the higher grades were populated mainly by upper-class members.

As for relations between Ariois and other members of the major class strata of Maohi society, the opinions of some observers were that they were the pampered darlings of the *hui ari'i*, the admired models but ruthless exploiters of the commoners, and the privileged parasites of the *ra'atira* (Ellis 1829:I, 319).⁵⁶ Of course, no such simplistic characterizations are admissible when applied to so heterogeneous an institution as Arioihood. (I do not have to emphasize that most of these attributions were colored by the social perceptions of the observers.) There was, nevertheless, some basis for these opinions in fact. To the least affluent and least privileged members of society, Ariois must have appeared an unfettered, high-living, diverting lot; and the realization that membership in the sect was achievable even by themselves must have mitigated somewhat any deprivations suffered by them on behalf of sect members.⁵⁷ To the more affluent *ra'atira* on the other hand, the touring Ariois must have constituted an economic drain, since a large proportion of the food and goods provided the visitors probably came from this source. (I cannot, however, accept some missionary assertions that *ra'atira* "disapproved" of Arioi entertainments; certain of these observers were all too ready to impute sober, Calvinistic sentiments to what they considered the Maohi equivalent of England's middle class.) Of course there may also have been individuals of *hui ari'i* status to whom a touring swarm of Ariois was no more welcome than a plague, but such individuals were perhaps exceptional; and in any case the demands of hospitality, reinforced by sentiments of *noblesse oblige*, curtailed public expression of any such resentment (including the hosts' reactions to being lampooned by their visitors). On the positive side, we have the assurance of several writers that

much congeniality prevailed between *hui ari'i* and Ariois (many individuals having had both statuses). Two questions of relevance and importance that the sources do not answer, however, are, What kind of interaction prevailed between *ari'i* and those Ariois whose origins were lower class? And, if an Ariois of lower-class origin managed to achieve promotion to one of the sect's higher grades did this also raise his class status: did it render him (or her) eligible to marry an individual of higher class?

Connections between Ariois and *hui ari'i* are discernible in the official attire of lodge masters, whose red-colored girdles have been described as being imitations of those donned by the highest-grade kin-Titleholders of the more venerable kin-congregations. According to this same source, "other clothing used [by Ariois] in acting was also in burlesque imitation of royal apparel" (Henry 1928:234), but what such clothes were is not specified. Of course, there are at least two possible explanations for this "imitation." It may represent a deliberate effort on the part of Ariois to identify, sympathetically and pretentiously, with feather-girdled kin-Titleholders because of the latter's high rank in society at large. Or it may as Henry implied represent another way of expressing criticism of *ari'i* shortcomings, as some of the dramatic skits are said to have done. Or, what is quite likely, it may have been some of both.

Some writers have described Ariois in *occupational* terms, calling them "entertainers," or "players," or "warriors," or the like. "Players" they indeed were (at least the lower grades of the membership), but not all entertainers, traveling or otherwise, were Ariois. Most Ariois, probably, were also "warriors," but there is no evidence that all "warriors" were Ariois.

The connection between Ariothood and the priestly profession is a complex one. Certainly, many priests were Ariois, and it would be logical to infer, but impossible to document, that most priests attached to 'Oro-dedicated marae were Ariois.

Some writers have characterized Ariois as full-time drones, living off the toil and produce of others. Drones some of them undoubtedly were (leaving aside their services as ritualists and entertainers), but it is yet to be proved that this was true of all or even most Ariois. While on tour they could not have farmed had they wished, and they may even not have fished; but between tours it is probably safe to assume that some of them were no less industrious than their neighbors.

It is also implied in some sources that female members of the sect were in fact professional prostitutes. Information on this aspect of Ariothood is too scant and contradictory to warrant agreement or denial to this claim, but we are informed that much of the so-called prostitution that accompanied Ariois entertainments was provided by eager young non-Ariois maidens.

Regarding the kinship status of Ariois, Mühlman proposed that the male upper-class ones were in many cases younger siblings—a fact that

may be demonstrable in a few well-known instances, but cannot otherwise be proven;⁵⁸ and certainly, no native statements that I know of indicate any such predilection. This proposal is of course tied with the theory that one of the original purposes of the institution founders was to discourage younger siblings among the *hui ari'i* from procreation.

Another connection between kinship and Arioihood is implied in the mythical account of the sect's origin, specifically, in its link with the principal kin-congregation of Opoa; but by the time history had begun to emerge from the fogs of myth the Opoan lodge of Ariois was linked with the entire Ra'iatean *tribe*, and derivations from Opoa of the other lodges—if such had actually been the case—were acknowledged only in the invocation mentioned above.⁵⁹ Of more immediate relevance is the nature of the links between Arioi lodges and tribes. I shall list the various lodges here, but will postpone discussion of this matter until chapter 24.

The most authoritative list of Arioi "house" names (which in the absence of contrary evidence I equate with "lodges") is that contained in the Orsmond text.⁶⁰ Here is the list for Tahiti, by district, along with the title of the lodge's master Arioi (*'aito, maru 'ura*):

Tribal District	Arioi Houses	Arioi Lodge Masters
Pare-Arue (Te Porionu'u)	Nanu'u	Moua roa
Ha'apape	Te Atita	Tiaau
Ha'apaino'o	Te Ao e reva	Va'a iti ni'a
Tiarei	Matahira	Upaparu
Mahaena	Faretai	Raup'a'a
Hitia'a	Pereue	Maro ura
Afa'ahiti	Nanu'u	Hua atua
One uri (Pueu)	Taharoa	Tuturu ma'a
Tautira	Pararo	Te ra'a roa
Teahupo'o	(a) Te Pu'u maru (b) Tahuna Aharu	Te ra'a roa
Mataoae	(a) Pou Omata (b) Matiti	Heiva (upaupa) ino
Vaiuru-Vairao	Tava ni'a	Tu mata riri
Vaiari (Pape ari)	Fare ute	Mata'a
Vaiuriri	Araiteva	Tuturu rai
Atimaono	Te Hi ra'a rupo	Mata'a (Te rupo)
Papara	Te Rehe	Mata'a
Atehuru (Pa'ea)	Te Fare roa	Hita
Puna'auia	Te Tai tapu	Puahaha
Fa'a'a	Te Fare o Tau'a	Paa

The Orsmond text lists the lodge names and lodge masters titles for Mo'orea as follows:

Tribal District	Arioi Houses	Arioi Lodge Masters
Varari	Te Atae pua	Tohe ura
Afareaitu	Tau ma mata ura	Omaomao
Papetoai	Urimea	Taura'a atua

I do not know how to evaluate this Mo'orea list since it does not mention the important tribal-geographic units of Ha'apiti and Te Aha roa (to each of which Henry attributed a lodge).

Orsmond's list includes only Tahiti and Mo'orea; for all the other islands of the archipelago we must depend upon Henry and Ellis, whose attributions are as follows:

Island	Arioi Houses	Arioi Lodge Masters
Ra'iatea	Nanu'u	Teramanini
	Fare Ohe	Airiha
	Fare Meia	
	Tairoiru	
Taha'a	Tapu temu	Mutaha'a
	Tuaoteuira	
Huahine	Te rua o te mata'i	Atae
	Te Vau	
	Para ra'au	
Mai'ao	?	Temaiatea (after Ellis)
Porapora	Fare Rua	Puna ru'u
Maupiti	?	Marore (after Ellis)

CHAPTER 23 *PROXIMITY AND FORCE*

We have considered how the Maohis structured their relationships, conceptually and “historically,” according to such factors as sex, age, consanguinity, affinity, friendship, marriage class, occupation, and cult. Two other factors that powerfully affected how individuals interacted were *residential proximity* and relative strength of *coercive force*. Both these factors influenced somewhat the relations among, say, consanguines and affines, but we are concerned now with the part they played in reinforcing or overriding these other factors, or in shaping interaction between persons who were not consanguines, or affines, and so forth.

RESIDENTIAL PROXIMITY

The fact of where people resided in relation to one another exercised strong influence, historically, over their interpersonal behavior, although this distinct aspect of social structure was only weakly conceptualized—*distinct*, that is, from considerations of consanguinity, affinity, et cetera. For example, I have come across no aphorisms regarding “neighborliness,” and no explicitly stated preferences for spouses based on locale. There were several words serving to express the stereotyped contempt of the shore dweller for the inlander (see chap. 14), but these referred mainly to kind of locale, not relative distance. (However, the inlanders’ actual distance from the shore dwellers in question may have been a factor in the latter’s attitude of disdain. I can find no evidence that inlanders accepted this view of themselves.) Also, there were words contrasting a native with a nonnative of a place, and these expressions did convey something of an invidious attitude toward the latter (see chap. 20). But these few expressions are scant and pale compared with the wealth of normative assertions and legendary episodes concerning behavior between, say, father and son, or husband and wife, or *ari’i* and commoner.

Yet, as we shall see, where people resided in relation to one another evidently did strongly influence their mode of interaction.

TERRITORIAL UNITS

Households

The Maohis spent most of their lives in or around the buildings and areas making up their households—working, resting, playing, eating, and sleeping. One name for such units was *'utuāfare*, which appears to have labeled both the buildings and precincts making up the unit, and the people residing there.¹

The labels attributed to households by the officers of the *Duff* were “matteyna” (*mata'eina'a*) and tee (*ti'i*). The former was said to be

... a principal house, distinguished either by a degree of rank in its ancient or present owner, or by a portion of land being attached to it; and sometimes on account of its central situation to a few other houses: that the matteyna sets up a tee (or image) at the morai [marae], which entitles it to the liberty of worshipping there; and the other houses in the department of the matteyna claim a part in the same privilege, and are thence called tees (Wilson 1799: 184).

I cannot entirely discount these specific usages of *mata'eina'a* and *ti'i*, but should point out that they do not appear anywhere else in the sources that I know of.

The average size of households is given in a continuation of the *Duff* officers' statement:

... in some matteynas there are eight or nine persons in the family, in others but two or three; and ... it frequently happens, that a matteyna or a tee is totally deserted. Therefore, from this account, and what I afterwards saw of the thin population, I allow but six persons to each matteyna, and the same to a tee, as the latter is often occupied by a larger family than the former....

The observations (or estimates) on which this statement was based were made in 1797—that is, after three decades of European contact, during which time the population had been reduced, by conservative estimate, to about a quarter of its previous size.² This decrease could of course have effected reduction both in size of household and in number of households; it probably did both.

Certainly, the general impression I glean from most of the earlier sources is that nearly all Maohi households were larger than nuclear-family size, and some of them, particularly those of the “principal people,” were very populous indeed. Even two decades and more after the *Duff* officers made their estimates Ellis described some of the larger houses on Huahine; he appears not to have been referring to special guest houses but to regular dwellings as containing “... forty, fifty, or sixty sleeping places.”

One of the reasons which they gave why so many slept in a house, was, their constant apprehensions of evil spirits, which were supposed to wander about at night, and grasp or strangle those who were objects of their displeasure, and

whom they might find alone. Great numbers passing the night under the same roof, removed this fear, and inspired a confidence of security from the attacks their idolatrous absurdities led them to expect. (Ellis 1829:II, 67–68)

Generalizations about the composition of Maohi households, and about the social relations among members of most of them, can be inferred from earlier chapters, nevertheless I wish to emphasize some additional points. Although households were made up mainly of consanguines (“real” or foster), affines, and in some cases servants, some households did at times contain individuals not so categorized; and hence the social relations among members of households cannot be *entirely* inferred from generalizations about consanguines, and so on. Also, the fact of residing together must have shaped relations between individuals in ways not directly attributable to “consanguinity” or “affinity,” as normatively defined. In other words, coresidence itself must be reckoned to have been a more or less independent factor in shaping Maohi social relations. For example, siblings residing together interacted in some ways different from siblings living apart; and an individual shared certain life experiences with coresidents, including siblings and even nonkin, which he did not share with persons living elsewhere no matter what their consanguineal or other ties may have been. The distinctive life experiences of coresidents included not only more interaction, but somewhat differently patterned kinds of interaction—transactional, emotional, and so forth—deriving from the innumerable accommodations, small and large, required for living together. I cannot document this inference with particulars, and hope that readers will agree that I need not do so.

Neighborhoods

Preceding chapters have also established the existence in these Islands of what may be called *neighborhoods*—that is, although individual households were usually rather widely spaced,³ they did tend to form clusters. This tendency was observed by the missionaries as late as 1821:

This morning in company with Br Williams & Threkeld went to Tahaa to entreat the King & people to leave the various little districts & form a settlement on one side of the Island that [is] nearest Raiatea that they may be visited regularly & have a Missionary among them. They are deaf to entreaty. Their pride will not suffer them to come & settle on Raiatea & they say till a Missionary is come among them they will not move. They all seemed to spurn at our visit & solicitation. The people of the Islands are dispersed about 4 or 5 families in one place, 2 in another 1 only in another 6 or 7 perhaps just where the King resides. (Orsmond, Journal, 10 August 1820, LMS Archives)

Returning to the earlier observations and estimates of the *Duff* officers, in 1797, their statement, it will be recalled, included the following exchange between them and a native of the “district” of Whyripoo (de-

scribed as a “small district” between Matavai and Ha‘apaiano‘o [Vavau, Papeno‘o], about a mile along its northern, coastal border):

This man having a shrewd, intelligent countenance, I desired Peter [the Swedish beachcomber] to communicate to him the purpose of our journey, and to ask how many persons he thought usually resided in Whyripoo; assigning for our motive the wish of the earees of Prêtane [*ari'i* of Britain] to render them service according to their numbers: when he instantly suggested a mode, which I afterwards adopted. He said that in Whyripoo there were four matteynas, and to each matteyna there were ten tees; and by these he estimated the number of men, women, and children, to be about two hundred and fifty. I desired him to explain what a matteyna was, and what was a tee. [Whereupon were given the definitions quoted above.] (Wilson 1799:184)

What appears to be involved here is a neighborhood cluster of households consisting of one “principal” household and a number of others—all interconnected by worship at a common marae. Ignoring for the moment questions concerning the validity of this terminology, the reliability of this method of calculation, and the nature of the ties uniting the households making up “the department of [a] matteyna,” let us look at the numerical results of these officers’ survey. To begin with, they list the “districts” of Tahiti as having been forty-one in number, including two uninhabited ones. A few of these contained only one neighborhood each (i.e., a principal household and its associated households), but most contained several—the range having been from two to forty-two. For all of Tahiti there were 314 “matteynas” and 2,362 “tees” giving a range of two to twenty-two households per neighborhood, an average of eight or nine, and modes of nine to ten and thirteen to fourteen.⁴ There is no way of checking the reliability of these estimates, and their method of calculation was hardly such as to instill confidence; on the other hand there is nothing in the sources directly contrary to them.

But even if one accepts these figures, as I am inclined to do, the fact remains that they refer to 1797 and *not* to 1767, when the total population of Tahiti was possibly about four times as large. The question raised by this circumstance is, Was the decline manifested in a disappearance of some neighborhoods, a diminution in number of houses per neighborhood, a general decrease in household size, or some combination of all these? It is my surmise that all three processes took place, but that the sharpest decline was in household size and the next sharpest in neighborhood size. Except in cases where whole neighborhoods died out—a development which quite possibly took place—it seems to me unlikely that there would have been a general tendency on the part of diminishing neighborhoods to move and consolidate their remnants with other neighborhoods just to maintain some standard of what constituted an “appropriate” neighborhood size. (This was, of course, before the missionaries succeeded in persuading natives to move

their regular residences to central locations near the mission stations, a development which became quite general after 1815.)

The validity of labeling these neighborhoods *mata'eina'a* is impossible to confirm or deny. As I have noted in several places, the numerous referents in the sources to this word are so varied, and usually so obscure and ambiguous, that I feel obligated not to add to the confusion by proposing another "authoritative" one of my own.⁵ On the other hand, the alleged practice of referring to each household in a neighborhood as a *ti'i* is quite credible, as a metaphor for its representative membership in the neighborhood marae.

The question of nomenclature is further complicated by a passage from Morrison: "The Island of Taheite is divided into Seventeen Districts Calld Venooa [*fenua*] (or Lands) with the name of the Head Chief of each annex'd. These are again divided into Chiefs Shares (or Patdoo [*patu*] and these again into lesser Division calld Bahooe which are the Squires Shares and the Lord of the Mannor holds three Bahooe." (1935:165-166.)

Elsewhere Morrison equated the "Head Chief" with "earee" [*ari'i*], the "Lord of the Mannor" with "Towha" [*to'ofa*], and the "Squire" with "Ratirra" [*ra'atira*]. Morrison's "Venooa" [*fenua*] and "Patdoo" [*patu*] will be discussed below. His "Bahooe" is at first sight very puzzling, for none of the more obvious transcriptions—*pahoe*, *pahui*, *paii*, *paue*—seem to have any connection with the entity in question. The answer to the problem is probably supplied in *Voyage of the Duff* (i.e., Wilson 1799), whose compilers evidently depended upon Morrison's manuscript for much of their ethnographic generalities. After paraphrasing Morrison's statement about districts and *patu*, this source goes on to relate: "The next rank [after *te to'ofa*] is the ratirra, or gentlemen, who has one portion to the towha's three. These smaller estates are called rahoe [*rahui*], from the power the ratirra has to lay a prohibition on his own land, or on any particular sort of provision, as well as the towha on his portion, and the chief on the whole." (p. 323)

Morrison also lent credibility to this interpretation in a later passage which states: "... any Ratirra can put a Raahooe on his own division (which is so named from their power to prohibit the expenditure of any species of Provisions on his own land." (1935:167). From this and the passage from Wilson just quoted it seems clear to me that Morrison's "Bahooe" is an error due to faulty copying.

What then is the relationship between "neighborhoods" and Morrison's "Rahui"? On the basis of the accounts thus far cited, the former refers to a residential center of co-worshippers, the latter to a tract of land subject to some one individual's control. They might possibly represent two different labels for the same kind of unit, or different aspects of the same kind of unit. There is nothing in the sources to controvert this identification, and a good deal of analogy exists to confirm it, at least

with respect to some neighborhoods and some “Rahui.” On the other hand it seems quite possible that there were some tracts of land—*rahui*—containing no households, and some neighborhoods whose lands were not subject to unitary control. Because of these possibilities, and in the absence of positive identification, I believe it advisable to keep these categories distinct.

I take it for granted that members of most neighborhoods interacted in ways additional to co-worshipping, although the only explicit reference I can find to any such activity is Morrison’s description of cooperative *mahi* making, which I quoted in chapter 9.

As far as I have been able to determine, there were in pre-European times no household clusters in these Islands larger or denser than the “neighborhoods” just described. On the other hand, the distances between neighborhoods were shorter in some areas than in others—as, for example, around the southern borders of Lake Maeva (Huahine), and elsewhere on wide coastal plains adjacent to navigable passages in the reef. In addition, and a general tendency throughout these Islands, valley ridges served to separate the population into distinct clusters of neighborhoods.

Spatial proximity beyond the neighborhood “level” does not necessarily conduce social relations, but it seems to have done so in Maohi society; and in all cases that I can document the spatial clusters of neighborhoods just mentioned did in fact constitute discrete social units of some kind. The question is, What was the nature of the social relations within and between such larger units?

Larger Territorial Units

Some of the territorially based units I have labeled *neighborhoods* may have been more or less unattached, socially isolated, and “politically” autonomous, although for the eras under study I know specifically of none that so qualifies.⁶ But when it comes to specifying the composition and nature of those larger territorial units, the clusters of neighborhoods, the sources are far from agreement. Most writers label such units “districts,” but there is wide disagreement concerning the number and size of such “districts,” their degree of autonomy, and even the native term applicable to them. The matter is of sufficient importance to warrant reproducing all the more “authoritative” generalizations about it. Some of the offices labeled in the following passages as *ari’i rahi* or “king” refer to preeminence in the *rank* hierarchy—that is, to incumbency of feather-girdle kin-Titles—and not to (coercive) authority over supratribal units, as later sections will serve to elucidate.

In his journal of his first visit Cook wrote:

... this Island [Tahiti] is divided into two districts or Kingdoms which are frequently at war with each other as happend about twelve Months ago, and each

of these is again divided into smaller districts, *Whennuas* [*fenua*] as they Call them, over each of the Kingdoms is an *Eare dehi* [*ari'i rahi*] or head whom we call a King and in the *Whannuas* are *Eares* or Chiefs. The Kings power seems to be but very little, he may be revered as a father but he his [?] neither fear'd nor respected as a Monarch and the same may be said of the other Chiefs, however they have a preeminence over the rest of the people who pay them a kind of volantry obedience. (Beaglehole 1955:133-134)

Bank's account, written on the same visit, is more detailed:

The *Earee re hie* [*ari'i rahi*] is always the head of the Best family in the country; to him great respect is paid by all ranks but in Power he seemd to us inferior to several of the Principal *Earees*, nor indeed did he once appear in the transacting of any part of our business. Next to him in Rank are the *Earees*, each of whom hold one or more of the Districts into which the Island is divided (in Otahite there may be about 100 such districts); which are by the *Earees* parceld out to the *Manahounies* [*manahune*], who cultivate each his part and for the use of it owe their Cheif service when calld upon and provisions, especially when he travels, which he often does accompanied by many of his freinds and their families often amounting to near 100 principals besides their attendants....

The *Earees* or rather the districts which they Possess are obligd in time of a general attack to furnish each their Quota of soldiers for the service of the Publick. Those of the Principal districts which Tupia recolected when added together amounted to 6680 men to which army it is probable that the small Quotas of the rest would not make any great addition.

Besides these publick wars, which are to be headed by the *Earee ra hie*, any private difference between two *Earees* is decided by their own people without at all disturbing the tranquility of the Publick....

Otahite at the time of Our being there was divided into two Kingdoms, Oporenoo the larger and Tiarrebo the smaller. Each had its seperate king &c. &c. who were at Peace& the king of Oporeonoo however Calld himself king of both in just the Same manner as most European Monarchs usurp the Title of king over kingdoms over which they have not the least influence. (Beaglehole 1962:I, 384-386)

The next impressions recorded about Tahiti's larger territorial units were those of the Spaniards. Boenechea described the Island as being divided into eight districts, each governed by an *ari'i* (Corney 1913:I, 337). Bonacorsi was more specific:

There were observed in the island eight principal *arii*, and some others of inferior degree; and one who is the chief one of all, whom the rest recognise as their superior. Nevertheless, I do not think they render him much obedience, as each one rules his respective district. Some of the latter are at cross purposes with one another, and I believe that they even fight, at times, as do the natives of the neighbouring island called *Morea*. (Corney 1915:58)

According to Friar Amich:

The dwellers in this island are not fewer than eight thousand souls of all ages and sexes: there are ten or twelve Caciques, whom they call *Eries*, and each one rules over the people of his own District; but they all look up to the *arii*

Otu as the higher and paramount Chief, and acknowledge themselves his subjects. (Corney 1915:79)

Rodriguez' account contains many references to "districts" headed by *ari'i*, but it gives no actual count. The closest Rodriguez came to specifying territorial boundaries was his references to those between the respective realms of the two *ari'i*, Vehiatua and Tu. (Corney 1919:118, 126, 165)

During his second voyage Cook described Tahiti as being made up of two kingdoms, which he named Opoureonu [Poreonu'u] and Tiarabou [Tiarapu],⁷ and he added that the former contained twenty-four "districts," the latter nineteen. J. Forster's account, written during the same voyage, describes these Islands as having been organized on "a kind of feudal system":

The great chief or king, grants to the inferior chiefs, a district or province; under them, the rest of the Arees or chiefs have portions of land allotted to them; and the Manahounes, though not of the royal family, have likewise grants of land. The chiefs of the provinces, as well as the inferior Arees, have their demesnes cultivated by Toutous, who are obliged to raise fruits and roots, for the necessary food of their Aree; to fish, to build houses and canoes, to make cloth, to work their boats in war and peace, and to do every thing they bid them: and for this service they have the overplus of fruit and fish; which latter, the chief commonly distributes among all his vassals, very impartially, if they catch a considerable quantity at once. The Manahoune, his brethren, and offspring, cultivate the ground, which is granted to them; and I cannot say, that I ever observed Toutous attached to them. In war time, the great chief, with the advice of his relations, and of the chiefs of the provinces, who seem to have great influence in public affairs, orders an armament to be prepared; and as the shores only are inhabited, the attack commonly is made by sea: for that reason they have numbers of war-canoes, built and laid up under large sheds, which are immediately fitted out upon any such requisition, from the Lord Paramount; each inferior chief and Manahoune is again either master of such a war-canoe, or he does service on board of one of them, as a warrior, and the Toutous are employed in paddling and working them. The chiefs of provinces regulate every thing in their districts, and administer justice, their authority being as great as that of the king. On extraordinary occasions, however, the king interposes his authority: thus I heard Oree, king of Huaheine, order his *Hoa* (*Hoa* signifies a friend, or chief-attendant on the king, we should call him a *lord in waiting*, of which the king of Taheitee has a good number, doing duty in their turns) to go into a district of another chief, and bid him tell such were the words of the Aree-rahai; to apprehend the thieves, and seize the stolen goods, which he enumerated; the goods were in part restored the same day, and the next day he was ready to punish the thieves in our presence, had we not already been too far out at sea, and had we at first well understood his meaning. At O-Taheitee we saw the review of the naval armaments of two districts, which were destined to subdue a great revolted vassal, or feudal lord, on the isle of *Imeo*, in the district of *Morea*; and we were told, that every chief of a district must send his quota towards this expedition; and even the great chief of O-Taheitee-ete, or Tiarraboo, would join in it as his duty required. O-Too, perhaps, not being well enough skilled in the noble art of war, was not intended to command the fleet, and therefore gave the dignity of high-admiral to T-Owha, chief of Atahooroo; though he told us at the same time, that he would

likewise be in the fleet, in the quality of a warrior, or we might call it, of a *knight*. These circumstances sufficiently prove, that their government is a kind of feudal system; but it has much of that original patriarchal form, blended with it, which rectifies the many defects of the feudal government, and for that very reason is infinitely superior to it, being founded on principles of kindness and benevolence, and on that primitive simplicity, which bears always the stamp of perfect undegenerated nature. (1778:355–358)

The next substantive account of Tahiti's territorial organization came from Bligh, writing in 1788:

The Cheifs of all the districts have the common appellation of Erree, and one is independant of the other. Over these people the King has no power, they will either fight for, or against him, as their interest or inclination leads them, & this they do with impunity with respect to punishment by the transgression of a law of the Land. (1789:I, 396)

I reproduced above Morrison's summary statement regarding territorial division: "districts" (*fenua*), subdistricts ("Chiefs Shares," *patu*), and "lesser Divisions" ("Squires Shares," "Bahooe"—probably *rahui*). According to Morrison (writing between 1789 and 1791) Tahiti itself had seventeen districts at the time; these were united into two mutually supporting alliances, Te Porionu'u and Teva i uta, against which were the "rebellious" districts of Atehuru and Tetaha, and six districts of the peninsula. (See figs. 23-1 and 23-2.)

Hamilton, writing in 1791, added nothing to his predecessors save the statement that Tamari'i, "... a great chief in Papara, ... was the proper king of Otaheitee, the present family of Ottoo [Tu] being usurpers" (Edwards and Hamilton 1915:102).

During his return visit to Tahiti in 1792 Bligh recorded that Tahiti was divided into four "grand divisions" (or "Princedom") which were made up of a number of "counties" or "Governments" as follows: POREONU'U: Pare, Matavai, Ha'apaino, Tierai, Mahaena, Hitia'a; ATEHURU: Tetaha, Pa'ea, Patte-terre; TEVA I UTA (or "Otaiwyotah"): Papara, Atimaono, Vaiuriri, Vaiari; TEVA I TAI: the whole of the Peninsula, or Tairapoo ("counties" not specified). (Adapted from Bligh 1792:166.)

The "counties" or "Governments" were also subdivided, according to Bligh, into "districts" or "chiefdoms." Bligh shared Cook's opinion that the Island was once governed by one "king," but had subsequently been divided into the four divisions known to him, each division being "independent of the rest." To this observation Bligh added the following:

There are two Words which they attach to the different Subdivisions of the Island—one is Manno, and the other Matynah. Oparre & Attahooroo have each two Mannos, but all the others, even Tiarraboo they say are not Mannos but Matynahs. The People of Oporeeonoo are Matynahs no Tynah—those of Tiarraboo are the People (Manno) of Whaeaehtuah. Those of Terryoyotah are the People of Tomarre and those of Attahooroo of Tettowah and Poohaita-

FIGURE 23-1. Principal tribal boundaries of Tahiti.

FIGURE 23-2. Principal tribal loci of Mo'orea.

iah. Yet they say that the whole of them are Matynahs no Otoo. This certainly implies he is their king.

Matynah signifies a set of People belonging and governed by a Chief, but I am at a loss to know what Manno means, unless it is the place of resort or Palace of the King. (1792:166b-167)

"Matynah" is *mata'eina'a*; and "manno" (*mano*) means many or numerous,⁸ and was also included in the names of the two major subdivisions of Atehuru (or Te Oropa'a): *mano-tahi* (one thousand [?], i.e., Puna'auia) and *mano-rua* (two thousand [?], i.e., Pa'ea). In this connection, the territorial unit commonly labeled Pare also consisted, as Bligh noted, of two major subdivisions, Pare and Arue; I cannot, however, find any other evidence of these subdivisions having been called *mano*.

The next visitor to record his impression about the larger territorial units of these Islands was Vancouver, in 1792, who wrote (evidently based on information from Tu [Pomare I] himself!): "Otoo's authority is acknowledged in Otaheite, Morea [Mo'orea], Mattea [Makatea?], Tetero [Tetiaroa], Tupea-mannoo [Tupae-mano, Mai'ao], and Huaheine [but not, he added, in Ra'iatea-Taha'a] (1801:328).

Thereafter, the London Missionaries arrived on the scene and were administered daily lessons in the realities of Maohi political geography; yet even their most literate chronicler, William Ellis, drawing on nearly thirty years of missionary experience, including six years of his own, persisted in describing the pre-Christian polity in terms of kingdoms, viceroys, barons, and other faintly analogous but mischievously inappropriate Euro-

pean terms. Later writers or editors were either too far removed in time from the pre-European polity or too preoccupied with supposed European parallels, or both, so that their generalizations about the larger Maohi territorial units are of little use. Nevertheless, by reexamining the data contained in such sources as Henry, Montgomery, and the LMS Archives, along with opinions supplied by earlier writers, it is possible to put together a construct of Maohi territorial units that may be lacunary but at least is consistent.

Orders of Territorial-Unit Complexity

First-order tribes. Next to the household itself, the smallest territorial unit in these Islands was what I have called a *neighborhood*, consisting of one or more households. Evidence was presented earlier of Maohi beliefs relating to autonomous neighborhoods,⁹ and during the eras when these Islands were being populated there must have been many such. But as noted earlier, by the Late Indigenous Era there appear to have been no autonomous territorial units, or tribes,¹⁰ simpler than that of Tetaha, which consisted of several neighborhoods combined into at least two multineighborhood sub-units. Most of the tribes of that era were more complex than that, and even Tetaha was able to preserve its autonomy only by means of shifting alliances with its more complex and populous neighbors.

Second-order tribes. The simplest tribe larger than a single neighborhood would have been one composed of two or more neighborhoods differentiated only to the extent that the chief¹¹ of one of them exercised final authority over all of them in events involving all of them. (The events in question might have had to do with a whole range of activities, but were probably most definitively concerned with combined action against outsiders.) Most of the territories comprising such simple multineighborhood units were evidently contiguous, but there may have been some that were not so. For example, in their survey of Tahiti's peninsula, the *Duff* officers showed the "District" of "Ereemeoo," consisting of seven *mata'eina'a*, fifty-one *ti'i*, and under one chief, as divided into two geographic parts which were separated by the "District" of "Bobeourooh" (Wilson 1799:199). Although "Ereemeoo" may indeed have been autonomous in earlier eras, by the time of this survey it had long since become combined with others into larger units. Again, most such units acquired in time a common name, but that may not have always been the case. As for the source of the common name, in some instances the name of the principal neighborhood may have been extended to the whole unit, but I believe that in most instances a different name was invented, or borrowed, for the whole.

Third-order tribes. Next in order of complexity was a tribe composed of two or more multineighborhood units each with its own local chief but

all subject to the ultimate authority of one among them. On Tahiti itself, during the eras under study, this multi-multi neighborhood order of complexity seems to have been exemplified only by Fa'a'a (Tetaha, Te Fana i Ahurai).

Fourth-order tribes. More complex still was a type of tribe composed of two or more multi-multineighborhood units. On Tahiti one such unit was known as Te Porionu'u, made up of the multi-multineighborhood units of Pare and Arue, before their overall chief Pomare I succeeded in extending his sway elsewhere.

The native label *fenua* seems to have been applied to tribes of both the third and fourth orders of complexity; and if one follows Morrison's usage, the major subdivisions of both would have been *patu*—although, according to Bligh, Pare and Arue were also known as the two *mano* of Porionu'u. But again, some writers apply the labels *mata'eina'a* and *va'a mata'eina'a* to these territorial units and their inhabitants, respectively.

Fifth-order tribes. A fifth order of complexity was the type of unit latterly exemplified on Tahiti by Teva i uta and Teva i tai. As we saw, Bligh called such units "grand divisions" or "Princedom," and Morrison referred to them as "alliances." To the best of my knowledge there was no distinctive native label for this type of unit.

The units I have included in this fifth order of complexity, on Tahiti and elsewhere, differed markedly in degree of integration. Teva i uta (Landward Teva), for example, was an old and fairly stable unit; for a long time before 1767 its three eastern subdivisions (*fenua?*), Atimaono, Vaiuriri, and Vaiari, had been firmly dominated by the chiefly dynasty of its western division, Papara. And Teva i tai (Seaward Teva), composed of the several second-, third-, and fourth-order units comprising Tahiti's peninsula, had for some time been a stable union dominated by a single line of chiefs.

During the five decades after 1767 these and other Tahitian territorial units were linked to one another in various shifting combinations, and in the end all Tahiti (along with Mo'orea) was united into a single, sixth-order unit. But that is the subject of volume 3.

Throughout the foregoing I have written of distinct "orders of complexity," but now I feel it essential to issue a caveat. My classification may have a certain usefulness in calling attention to regional differences in Maohi territorial organization and to the general trend toward larger and more complex unities. On the other hand, that trend probably was a continuous process or a number of parallel continuous processes; and to describe the outcomes at any one point in history in terms of "orders of complexity," or some such metaphor, is to imply more of a notion of discontinuities than probably obtained.

The Nature of Territorial-Unit Interrelations

As postulated earlier, the very circumstance of residing together was an influential factor in shaping the relations among members of any household, whatever other bases for interaction there might have been. Residential contiguity also must have been an influential factor in shaping relations among members of neighboring households—providing opportunities, as it doubtless did, for frequent face-to-face encounters. But in addition, within the units I call neighborhoods the residents' face-to-face encounters in the ordinary course of everyday life were supplemented, we are informed, by their co-worship at a common marae, and by their common association with a "principal house," which was "distinguished either by a degree of rank [grade of kin-congregation office?] in its ancient or present owner, or by a portion of land being attached to it; and sometimes on account of its central situation to a few other houses" (Wilson 1799:184).

The last named basis for neighborhood unity cited by the *Duff* observers is one of spatial position alone, but all the others strongly suggest that the *Duff* officers' "mateynah"—and, by extension, my "neighborhoods"—were none other than the territorial aspect of the local kin-congregation units, which I described in chapter 16. The parallels are not complete: for example, the *Duff* officers made no mention of household (i.e., "family") marae in addition to the common "mateynah" (i.e., neighborhood) one; and they omitted references to kinship ties among their "mateynah's" households—but this is not surprising in view of their survey procedures and of their superficial acquaintance with Maohi kinship relations. In any case, if the *Duff* officers' "mateynahs" (and my "neighborhoods") were not kin-congregations, I cannot conceive of what other kind of unit they could have been!

Turning now to more complex orders of territorial-unit organization, it may be recalled at the outset that at the time of first European contact most Maohi tribes consisted of contiguous subdivisions, or, if they were not actually contiguous, they were at least near one another. Proximity plainly was a factor in the development of such units; but the "proximity" I speak of is not to be measured in terms of "crow-fly" distance, but rather in terms of relative physical access.

The effectiveness of mountains as barriers to social interaction is clearly evident in the location of territorial-unit boundaries. Conversely, the social distance between settlements tended to be greatly shortened when they fronted on leeward, protected lagoons. Yet, such natural features were not invariably determinative. For example, Tairapu's formidable mountains and dangerously exposed southwestern cape waters did not stop southern shoredwellers in Teahupo'o from seizing and maintaining control over people living on the transmontane, cape-separated side. Also, the settlements

facing each other across the narrow, lake-like lagoon which separated northern from southern Huahine seems for a long time to have been more divided than joined by the water. On balance, however, proximity between territorial units, measured in terms of physical accessibility, was an influential factor in uniting such units; but it was by no means the only factor, or perhaps even the most important one.

Kinship, as we have seen, was perhaps the most influential factor in integrating single neighborhoods—assuming, as I do, that such units corresponded to kin-congregations. Kinship was also an influential factor in the formation of territorial units of more complex orders of composition.

One process accounting for the tribal or subtribal unity of neighborhoods was the familiar one of kin-congregation ramification, which was described so fully in chapter 16 that I need not describe it again. There must have been many units of the second order of complexity (i.e., multineighborhood units); in fact some tribes or subtribes of third- and fourth-order complexity appear to have been formed around a set of kin-congregations connected in this way. In most such units the interrelated segments were probably spatially contiguous, but that was not always the case.

However, kin-congregation ramification did not invariably serve to extend tribal boundaries. As we have seen, spatially separate offshoots of the same “ancestral” marae (*marae tupuna*) were often integrated into distinct and even mutually hostile tribes; and the same may have been true of some segments that were spatially contiguous. Conversely, there were instances of alliances between distinct tribes based mainly on the presence within each of branches of a common kin-congregation.

Another kind of “kinship” process that served to bring about or to consolidate tribal accretions and intertribal alliances was marriage between members of the respective tribes’ chiefly families. An example of the former appears in Adams’ version of the union between Pare and ‘Arue. The story concerns the family line that culminated in the so-called Pomare dynasty of the Porionu’u:

Tu of Faarava, having undertaken a visit to the distant land of Tahiti, came in by the Taunoa opening, which is the eastern channel into what is now the harbor of Papeete. Landing at Taunoa a stranger, he was invited to be the guest of Mauai-hiti, who seems to have been a chief of Pare. Tu made himself so agreeable, or so useful to his host, that Mauai-hiti adopted him as *hoa*, or brother, with the formal ceremonies attached to this custom, which consist in a grand feast, and union of all the families, and offering of all the rights and honors which belong to the host. Tu accepted them, and at the death of Mauai-hiti he became heir and successor in the chief’s line. He gave up all idea of returning to the Paumotus, and devoted his energy to extending his connections in Tahiti. He himself married into the Arue family, which gave his son a claim to the joint chiefly of Pare Arue.... (1901:85)

Other examples of tribal accretion brought about by this means will be offered later on.¹²

There are also accounts of the consolidation of new tribal accretions by marriages, *after* the accretion itself had been effected by other means, mainly force. In fact, I suspect that some of the accounts of accretion-by-marriage were *ex post facto* rationalizations of forceful seizure.

The sources also contain legendary and semihistorical instances of intertribal alliances having followed from, or been consolidated by, marriage. Yet, many more instances could be cited wherein marriage between chiefly families *did not* result in fusion of the respective tribes, or even alliances between them. The individual offspring of such marriages may have been thereby entitled to places of honor in both tribes' marae, without any extension of such relationships to other members of the two tribes. Indeed, traditional instances can be cited of marriage, or at least of marriage failures, having led to open warfare between tribes.¹³

According to legend, some tribal chiefs acquired new adherents by voluntary action on the part of the latter. An example of this was provided by Adams in his legendary account of how a Marama, chief of Ha'apiti (Mo'orea), came to extend his domain over parts of Afareaitu:

Two under-chiefs of Afareaitu, called Tuhei and Matafaahira, built a Marae which was to bear the name Horora. They wished to dignify their Marae, and give it the rank of the Maraes of high chiefs, and they selected the chief of Nuurua as the one whose supremacy they preferred; for, whoever he might be, the chief who mounted their Marae made it and them sacred to himself,—became in fact the head of their family and the master of their power, much as a feudal lord became master of one who sought vassalage, except that the Tahitian head-chief was both spiritual, temporal and patriarchal head at once; and the chief of Nuurua seemed to be looked upon as the mildest and least aggressive of head-chiefs

Tuhei and Matafaahira went to Nuurua to see the chief, whose official name [was] Punua Teraitua.... Teraitua seems to have been the butt of Moorean satire, for the story says that when he heard that Tuhei and Matafaahira were coming, he hid himself that he might not be obliged to see them. The visitors were not to be got rid of in that manner, and as they insisted on seeing him, he had to receive them, which he did at last in the presence of the high-priest Te mooiapitia; but, instead of treating them with respect, he showed complete indifference to their request, declined to give a decided answer, and told them he would consider the matter.

The least civility he could offer was to give them the usual guest-pig, and the pig was ordered to be killed and cooked, but while the feast was preparing, the messengers arrived who had been sent by Tuhei and Matafaahira in advance, and had tarried on the road. To the astonishment of Temoo, the high priest, the messengers were received with more courtesy than had been shown to their masters, and to his still greater astonishment, at the feast the best part of the pig was given to the messengers while the intestines were passed to the masters. Temoo then said to the two under-chiefs: "You see how Teraitua has ridiculed your request and has shown his contempt by giving you the intestines of the pig. What more do you want? Return home, and mount your Marae of Horora yourselves". They said: "No! our people wait; all is ready; and our minds are made up, and declared to the peo-

ple, that our Marae of Horora shall be mounted by one higher than ourselves". "Then why not ask Marama?" said the high-priest; "He will receive you with more courtesy and treat you with less contempt."

So Tuhei and Matafaahira went on from Nuurua to Amehiti, and arrived there after Marama had gone to sleep under the effects of his kava. The natives still show the cave where Marama drank kava and where no sound was permitted; not even the crowing of a cock, that his repose should not be disturbed. The chief's person was sacred when under the influence of kava, and the man who dared to disturb him did so at the risk of his life. The two under-chiefs, who were in haste to get their ceremony at the Marae performed, could not wait, and went to the priest for advice. He told them to take the sleeping Marama on their backs, and risk the consequences of carrying him off. They followed the advice, and each taking one of Marama's legs, were carrying him off, when Marama awoke and asked who they were and what they wanted.

"We are Tuhei and Matafaahira", they answered.

"Welcome, then, to Amehiti", said Marama.

"We need welcome, for we come to beg a favor. Come with us to Afareaitu, and mount our Marae of Horora."

"Your request must wait till I can call my districts. Atituhau and Fanauaraa; Atitanei and Tefanaautaitahi; Rotu and Tefarerii; Porotonatoofa, Amehiti and Tupaururu. Marama cannot go alone without his two Vaa (canoes; i. e. districts)."

"We will be your Vaa", they replied: "We pray you to be satisfied with Amehiti and Tupaururu who are at hand."

Marama at last consented, and was carried over the mountains to Afareaitu, where he mounted the Marae of Horora. The third chief of Afareaitu, Tepauarii, who had not taken part in the proceeding, heard the drums, and asked what they meant. When he was told, he said: "Be it so! Marama is worthy, and I too bow my head to him."

Thus Marama was chosen chief of Afareaitu, and became head of that district as well as of those he had inherited and those he had conquered. In the meanwhile Terai tua of Nuurua becoming conscious of his mistake, had called his people to carry him to Afareaitu, but on the way learned that his place had been taken, and he too bowed his head to the choice. (1901:168-171)

Another process that *may* account for the tribal or subtribal unity of some territorial units was common commitment to a distinctive religious cult. In this connection, I have referred many times in previous chapters to traditions regarding the spread of 'Oro worship from Opoa (Ra'iatea) to other islands, culminating in the establishment of several 'Oro-dedicated marae. Through such measures, Opoa's influence was undoubtedly widened; and tribes containing such cult centers may thereby have become more well disposed toward one another in some instances. But I can discover no evidence, legendary or historical, that this kind of cult commitment alone ever resulted directly in the actual integration of separate tribes. Several instances can be found of a distinctive and more or less "religious" ideology having served as motive (or at least as the announced reason) for conquest by force.¹⁴ And several more can be cited in which commitment to some cult followed upon success in warfare, but not the other way around.

This brings us to consideration of *coercive force*, which more than

any other factor served to integrate and maintain the unity of tribes, at least of those beyond the second order of complexity—the so-called *simple multi-neighborhood* units.

TRIBES

Force

War is growth (extension) to the land,
 Establishment of rock strata (great men),
 Spreading out of land (population).
 Take the spade (war weapon).
 Dig the holes (drill the lines);
 War is fertile soil;
 Soil that will produce seeds (extension),
 Soil that will be verdant (produce power),
 Soil spread out,
 Soil for leaning slabs (increase of priests),
 Soil for pavings (for marae).

(Henry 1928:307)

Judging from many pieces of evidence in the sources, sentiments of kinship and common cult-commitment, even backed by awesome supernatural sanctions, were rarely sufficient to hold together indefinitely tribes of more than multineighborhood complexity; and only exceptionally were such sentiments directly effective enough to fuse such units into larger ones. At some point, coercive force, or the threat of such force, played a role both in forming the more complex tribes and in keeping them integrated. I shall describe the relation of force to maintaining tribal unity, but first let us consider it in relation to tribal expansion. As with other matters relating to the Maohi past, the evidence is a blend of legend and history—both being illuminating, although in somewhat different ways.

Whether or not it is “history,” Handy’s description of how Opoans came to rule all Ra’iatea reveals one Maohi version of this supposed chapter of their past:

The inmates of the marae dwelt in the great house, sleeping, eating, making their weapons and implements, and performing their rites there. Their women and children all lived *i uta* (inland or upland) for fear of being killed. The land on which the marae stood was called “Hiti Nia” (Upper Hiti), and the region about it was termed the “Po” (darkness, night). The rest of Raiatea was the “Ao” (light). Sacrifices brought to the marae were spoken of as being brought to Po, and its inmates were said to dwell in the Po. On the west boundary of the Po was marked by a stone named “Tuia” (tu’ia). The point of land on which the marae stands is “Matahiraterai” (Mata-hira-te-ra’i). The Po extended on the east to the border of the land “Matarepeta” where dwelt the people of Hotopu.

The warriors of the chief would go out, sometimes by canoe, sometimes by land, going to this or that house through the length and breadth of Raiatea. Coming to a house they would inquire, “Aita te hue parari?” (Is the gourd not broken?)

If an inmate replied, "No," the household was spared; but if the reply was, "Yes," the householder was thrust through with a spear and with all the members of his family, was taken back to the marae. Only adults were impaled; children had a spear thrust through one ear and were dragged in the water behind the canoe. Those that did not drown before they reached the Po were killed at the marae. The skulls of the sacrifices were thrown into the great box-like platform. The following was said to Oro when sacrifices were presented, and to the Arii when his food—never human flesh—was brought, or when he was called to come and eat:

Eat The-fish-with-long-legs (man)
 And The-fish-with-angry-fin (*urupiti*, or cavalla fish),
 And the fish-with-reddish-back (turtle).

"It is not to be inferred from this that human flesh was ever eaten by the inmates of Taputapuatea," said Roometua. The reference to long-legged fish was figurative, so far as the Arii was concerned.

It was at this time that Raiatea was divided into eight districts. The Arii at Opoa took his *urupiti* (cavalla fish, signifying Raiatea), cut it down the middle, and laid the two halves down side by side. Each side he divided into four *mataeinaa*. Hence the saying, "E vau Raiatea" (Raiatea the eight). Opoa was the head of the fish, the ninth part, hence "Opoa te iva" (Opoa the ninth). (1930:89-90)

Similar instances of one tribe's domination of a whole island were cited earlier, in reference to Huahine and Mo'orea, but without details (chap. 16).

When Europeans arrived on the scene all the "districts" of Tahiti's peninsula were united under the chieftainship of a holder of the Vehiatua Title, associated with Marae Matahihae of Teahupo'o "district" (see chap. 16).

The story of how part of this union came about is related by Ari'i Ta'ima'i, via Adams. After describing how Tavi the Tautira chief had vanquished Papara (but not seized it) in a dispute over his wife, Adams related that:

Tavi became by this triumph the most powerful chief in all Tahiti, and asserted his power by imposing a *rahui* for the benefit of his young son, Tavihauroa. A *rahui* was a great exercise of authority, and was more than royal in its claims. The *rahui*, which might last a year or more, was a sweeping order that everything produced during that time in the whole territory subject to the influence of the chief should be *tabu* or sacred to the young prince. Not a pig should be killed; not a *tapa* cloth or fine mat should be made; "not a cock should crow," except for the child; and at the end of the *rahui*, all was to belong to the infant.

Tavi's direct and full authority extended only over his own chiefly of Tautira, but by rank or courtesy, through his family connection or his influence, it extended over the whole island, and only Eimeo or Moorea was exempt. A *rahui* was a form of *corveé* to which other great chiefs seldom willingly submitted; but even if a chief were himself anxious to avoid a war, which was the penalty of breaking it, his wife or his sisters or his relations were always ready to urge him to conspire against it. Tavi's chief rival was Vehiatua, head-chief of Teahupoo, which backs against Tautira on the south. Vehiatua had a daughter who had mar-

ried the head-chief of Pare Arue, the district in the extreme north where the city of Papeete stands; and this daughter, Tetuaehuri, was about to give birth to a child.

... Tetuaehuri was with child, and her midwives or attendants, or, as we now say, her medical advisers, told her that she must eat pig every day. If Vehiatua was consulted he gave his assent, for Tetuaehuri broke the *rahui* and eat [*sic*] the pig. Tavi acted at once as though this were a declaration of war by her father; he crossed with his warriors into Teahupoo and was totally defeated by Vehiatua.

The quarrel must have been unusually bitter, for this was one of the few instances where a great family was driven fairly out of the island. Vehiatua did not imitate Tavi in generosity, but seized his land. Some say that Tavi went to the Paumotus, but certainly after the war of the *Rahui* he was never seen again or heard of in Tahiti. His son, Tavihauroa, the cause of the disaster, came back and was protected by his old neighbors and relations, the chiefs of Hitiaa, Mataoae and Vaiari. By giving him land and servants they made up a small district for him, the modern Afaahiti, five or six miles of the coast beyond the isthmus of Taravao. He had also the names of Territua in Hitiaa and Terii oiterai in Vaiarai.

One day the unfortunate young chief was flying or racing his kite, a common amusement in ancient times when the men made kites as big as a house, and raced them against each other. The strong southeast trade wind which blows across the isthmus of Taravao carried the kite some miles to the westward, and he pursued it until it lodged in a tree within the Marae of Farepua in Vaiari. The high-priest happened to be conducting some sacred caremony in the Marae, and at such a time the intrusion of a stranger was death. Terii oiterai climbed the tree to recover his kite, and was then and there instantly killed.

The extinction of this line must have been a serious matter for the island, because it gave to Vehiatua so great an increase of power as to make it a mere matter of time when he should do to Papara what Papara had done to Vaiari, and become the political head of the Tevas, and therefore the most powerful chief of the island. The Papara chief could escape danger only by an alliance with Vehiatua, and accordingly in the next generation Vehiatua had for a wife Teeva Pirioi, an elder sister of the Papara chiefs Aromaiterai and Tuitera. Papara managed to retain its supremacy for that generation, but the danger was always there.... (1901:27-30)

By genealogical reckoning these events took place only shortly before Wallis' arrival. Earlier, however, Teahupo'o had already seized a part of Tautira as the result of a boundary dispute. According to Henry, Teahupo'o district's former name was Matahihae:

The name Teahupo'o was derived from a wall of heads taken from people slain in a battle between the districts of North and South Tai'arapu. One party contended that the other did not observe the proper boundary line between Tautira and Matahihae. So when the matter was settled by strife and bloodshed, the victorious southern side decapitated their slain foes and at Râpa'e made a wall of their heads for the boundary line. (1928:86)

According to this same source, the nine territorial subdivisions of Tautira seized in this war were thereafter called "... Fenua-ai-hua-ra'au (Land-eating-small-wood), signifying that they were tributary to a conquering power ruling over them, a condition to which they were subjected after conquest by the chiefs of the South when they erected a wall of heads. Upon

these subdivisions were placed chiefs and marae from the south, according to the custom of conquerors." (p. 87)

The last sentence above describes one method used by victors in integrating conquered territories with their own. Another and less radical procedure was to retain a defeated chief or subchief in his office, and require him to render tribute. This compromise was most likely resorted to when a victory was less than absolute, but it was a dangerous gamble for the victor in view of the Maohis' penchant for revenge. In still other instances the victor's reason for waging war appears to have been satisfied with devastation of the opposing tribe's settlements, and so forth, without any subsequent assertion of authority over the conquered territory—but there is ample evidence that during the eras under study physical force, successfully deployed, was a common and favored method for tribal expansion.

Size

An important question raised by the foregoing concerns the sizes (and, by implication, the orders of complexity) which Maohi tribes tended to reach and maintain before European times. I do not propose anything here quite so static as an equilibrium model, but there are certain parallels. For example, although we have no way of knowing whether the population was stable or on the increase, the techniques and goals of food production seem to have become fairly fixed, as were other activities—such as therapeutic practices, warfare, and the division of labor along sexual lines—having to do directly with size of population and application of human resources. Of even more direct relevance is the historical circumstance that during the Late Indigenous Era there were no stable tribes less complex than multi-multineighborhoods, and none encompassing complexities greater than those characteristic of Tahiti's Seaward Teva.¹⁵ By that era, simple multineighborhood units had become integrated into larger ones, and recorded efforts to consolidate units larger than, say, Seaward Teva, either met with successful opposition (internal or external) or resulted only in unstable alliances.¹⁶

We have already seen what happened in certain cases when some tribe's chief sought to extend his *rahui* authority beyond his tribal boundaries. The best reported instance of this will be reproduced in volume 3. Another kind of evidence relating to "maximum" tribal size is contained in accounts of secessionist intratribal strife (as distinguished from revolution aimed at supplanting a tribe's ruler, which will also be discussed later on).

The reasons are more elusive for there having been no tribes extant during the Late Indigenous Era smaller or less complex than multi-multineighborhoods. Since most multineighborhood units were probably self-sufficient in the material necessities of life, the factor of "economic" interdependence cannot have figured very widely in tribal expansion or

fusion. And I am unaware of any other functional reason for all tribes having reached or passed the reported minimum. Hence, I can suggest only the phenomenon of personal motivation, that is, the desires of certain tribal chiefs to expand their domains and increase the number of their subjects as far as practicable. In other words, under such circumstances as these, any unit smaller than multi-multineighborhoods was probably not strong enough, militarily, to resist absorption by larger units. Moreover, units as small as these were probably headed by chiefs insufficiently influential (for one reason or another) to form alliances protective enough to resist such absorption.

Composition

Having touched upon tribe composition in terms of numerical size and constituent territorial units, I next inquire about individuals' requisites for membership in a tribe.

By definition, it would seem that everyone residing within the physical boundaries of a tribe was a member of that unit; and if coresidence had been the only common feature serving to categorize such persons I could leave the matter there. But that was not the case. The units I am now concerned with were made up of persons who were at the same time coresidents *and* subject to the authority of the same chief.¹⁷ The statement of that generality, however, does not exhaust the matter.

I have noted repeatedly that the Maohis moved about a great deal, and much of this movement was across tribal boundaries. Although, as noted earlier, the language contained words and phrases complimenting the natives of a place and disparaging the newcomer,¹⁸ there appear to have been no really potent norms, positive or negative, against changing tribal residence. We read of individual cases of homesickness (e.g., Adams 1901:35), and of a chief's complaint at having been forsaken by fickle subjects, but these were all individual grievances and not expressions of universal rules.

Again, there must have been many instances of individuals maintaining residences in two or more separate tribal territories, and I can discover no rules proscribing such behavior. Although the condition of "divided loyalty" (*a'aupiti*) was clearly recognized and verbalized, I have come across no explicit statements condemning the condition, and no rules for resolving it.

It appears to have been a common procedure for an individual to transfer primary loyalty to a chief other than his own in return for more effective championing of his causes, and this behavior was explicitly recognized in (some) Maohis' image of how their society worked: "This habit, that any one with a grievance could appeal before another Arii, made public law in Tahiti. Ariis rarely refused to take up such a quarrel, and sometimes ... risked their whole fortune to do it." (Adams 1901:82)

Needless to say, Adams (i.e., Ari'i Ta'ima'i) provided no statistical

documentation for this far-reaching assertion, and indeed would have been hard-pressed to do so. In fact, I would qualify the statement by adding that we are dealing here more with expediency than with an abstract principle of "justice," or of the conscious application of noblesse oblige. Moerenhout probably overstated the case in his reconstruction of such situations—both in terms of their generality and of chiefly restraint—but he did sound a more realistic note than did Adams:

It is noteworthy, that, despite their despotism, and perhaps even because of their despotism, the chiefs generally lost no opportunity to keep on friendly terms with their subjects, of whom they had such great need in their frequent wars. A native, unjustly treated by his chief could threaten to leave him, and it was rare that the latter did not seek to appease him and to retain him in his service. There is something almost touching in the threats of a simple Indian to his chief, which seems to prove that the latter was more father than despotic master of his subjects. "You are angry with me," said an Indian I know, an old man now, and from whom his chief had taken the little bit of land he owned. "Ah well! I will leave the land where my fathers died ... and I shall go away with my children to die among strangers, enemies of yours." His chief, moved, went away without answering; but the next day he returned to the Indian double the amount of land which he had taken, with other gifts. (1837:II, 19n)

In addition to these "voluntary" changes of residence or of loyalty, the sources provide numerous instances of refractory subjects having been expelled from a tribal territory by its chief, usually because of refusal to pay taxes, in objects or services. In this connection, however, I have not been able to establish whether the banishment applied only to the expellee himself or to his heirs as well.

Finally, statements specifying the members of any tribal unit must include the spirits associated more or less exclusively with it. Whatever their "original" association may have been, with particular kin-congregations or narrowly specific localities, certain deities came, in time, to be the tutelars of whole tribes and played all-important roles in the affairs of their tribal affiliates in both peacetime and war. In fact, their relevance to tribal fortunes was such as to lead one annalist to epitomize one stage in Island history in these terms: "Before 'Oro's forces in war, those of Tane and Hiro generally fell" (Henry 1928:131).

TRIBAL ACTIVITIES

Warring

The tribe was above all else a unit for waging war—not the *only* war-waging unit but certainly the most characteristic one. As we shall see, battles sometimes took place between subdivisions of a tribe, but unless these threatened the tribal chief's personal interests the latter did not usually intervene. Also there is a distinct possibility that some intertribal wars

were fought by subtribes (comparable, say, to California waging war against Japan, or Kyushu!). I have no direct, positive evidence that this ever took place, but also no assurance that it did *not* take place or that it was explicitly proscribed. Indeed, the indifference with which certain tribal chiefs sometimes regarded strife between subdivisions of their tribe suggests that they would not have prohibited one of their subtribal chiefs from engaging in intertribal military adventures unless it affected their own personal interests. (This supposition is very hypothetical, but I put it forward to emphasize my notion that Maohi tribes, for all their similarities to modern national states, also differed from the latter in some significant respects.)

Having already described in some detail the conventional techniques of deciding, conducting, and terminating warfare (see chap. 12), I now focus attention on social-relational aspects of this activity.

First, regarding the decision to engage in warfare against another tribe (if, that is, the decision were not inescapably forced by foreign attack), the sources emphasize what might appear to be contradictory views. On one side, one reads that the decision rested entirely, or mainly, with the tribal chief; on the other, some sources assert that if the majority of subtribal chiefs were opposed to a war they could force the tribal chief to give up his martial enterprise "however bellicose the general populous may have been" (Moerenhout 1837:II, 32). In connection with the second view, it is pointed out that no tribal chief possessed a personal force large enough to wage large-scale warfare, and hence he was dependent upon the active support of his subtribal chiefs for mobilizing enough manpower. But in connection with the second view, one reads that a tribal chief could usually depend upon his official priests to read omens in such a way as to secure supernatural support for his policy (Moerenhout 1837:II, 33). One source states that "official" shamans, speaking directly for deities, sometimes supplanted the priesthood in times of war, but it is not suggested that they were any less politically influenced than the official priests themselves. As for "unofficial" shamans—that is, individuals subject to spur-of-the-moment spirit possession—Moerenhout reported that although they were sometimes able to move ordinary people to rush off to fight someone or other, their influence was rarely strong enough to bring about wars, "even between petty chiefs" (1837:II, 48). (But see vol. 3 of this work.)

The truth of the matter undoubtedly lies somewhere in between these views. As with most momentous real-life situations in complex societies like this one, decisions to make or not to make war were subject to various influences. Among these the voice of a tribal chief was probably most influential. But then again, that voice was usually no stronger than the support he was able to elicit from his subtribal chiefs, by one or more means: identity of goal, political maneuver, evidence of supernatural support, and so forth.

Moerenhout implied that sometimes a tribal chief was confident enough of adequate support simply to announce his decision to his subtribal chiefs by means of a messenger (*ve'a*); in such cases those resolutely opposed were considered rebels and efforts were made to punish them accordingly. On other occasions the decision was "reached" in council made up of the tribal chief and his subtribal chiefs; but as I view the realities of Maohi society, this could not have been a straightforward matter of vote taking. In my opinion most chiefs would not have summoned war councils unless there were some assurance of favorable "decisions": that is, a sincere commitment to democratic procedure was neither a hallmark of tribal ideology nor of any other Maohi ideology for that matter.

The most noteworthy social-relational aspect of mobilization for warfare was the circumstance that each subtribal chief supplied not only a contingent of fighters but also their armament as well. In addition, subtribal chiefs were called upon to provide their tribal chief with the war canoes required by his personal fighting force, and with enough food, *tapa*, et cetera, to compensate the official tribal priests, shamans, and exhorters, for their services on behalf of the whole tribal cause.

Accounts concerning actual intertribal battles raise more questions than they answer regarding the social organization of fighting. First of all, reports suggest—but do not firmly establish—that the several subtribal contingents, except possibly slingers, fought separately. Second, while implying that the officials known as battle shapers (*āro tarai*) were called upon to plan broad strategies and even some detailed tactics, and that exhorters served to maintain fighting morale, neither these nor any other officials exercised overall command once the fighting had been joined. Third, while some subtribal and tribal chiefs did undoubtedly act as battle shapers, sometimes even playing heroic roles in actual combat, others—including some very prominent tribal chiefs—left most of the planning to experts and took little part in the fighting itself. And fourth, there is again the question of who actually did the fighting in intertribal wars. Although most accounts state outright, or at least imply, that *all* able-bodied youths and men of a tribe took more or less active parts in such fighting, a passage from one missionary's letter suggests that in some wars only the "professional" warriors, the *toa*, actively engaged in combat:

Upon the whole this short campaign through the mercy of God has tended very much to destroy the strength of the prevailing commotion. The two chiefs above named (one of whom is dead) ... may be considered as the life of the rebellion. Their fighting men remaining are but few, as for the body of the people (on both sides) they are always spectators, and prepared to fly or plunder, and exercise cruelties on those wounded or slain. (Jefferson to LMS, 8 July 1802, LMS Archives)

One other aspect of battle having social-relational significance was

the effect upon the combatants of injury suffered by a chief or warrior-champion. Sometimes when one such man was struck down it served to rally his companions or followers to furious aggressiveness, while on other occasions it demoralized them into general retreat; in either case the reaction was probably out of scale with the loss of the actual fighting contribution of the individual himself.

Still another social-relational aspect of Maohi battles was their ruthlessness. Unless stalemate forced a mutual withdrawal or a mutually acceptable truce, the killing went on without restraint, until abatement of the victor's "fury"—an emotional state considered by the Maohis to be natural to warfare and certain other expressions of anger, and one which subsided only with time.¹⁹

Finally, there is the particular application of the more general question concerning what parts spirits were believed to play in victory or defeat. Judging from the amount of religious activity that accompanied warfare, and the rewards earned by the victorious side's war-supporting priests and deities, one would be justified in believing that the latter's roles in warfare were important indeed. But whether that importance reached the degree of decisiveness, or was regarded merely as supplementary, is impossible for me to establish. I imagine that beliefs about these matters differed rather widely, both individually and situationally; however, I know of no instance of a tribal chief bent on making war having depended entirely on either human or superhuman support. (Although, as I shall describe in volume 3, some chiefs spent so much time in obtaining supernatural aid against their enemies that they lost the wars in question.)

Intertribal wars ended in one of three ways: by stalemate, followed by a pause for recovery and then resumed fighting; by draw, formalized in a mutually accepted peace treaty; or by total victory.²⁰ Stalemate requires no further comment, and the contractual nature of such peace treaties has already been described in chapter 12; the social-relational aspects of total victory deserve, however, some additional attention.

I have already noted the ruthlessness and destructiveness displayed by the victors against the opposing populace and its goods. Presumably some useful goods were spared from destruction and eventually distributed among the victors. Also, some enemy captives were evidently spared as well, either to be offered as thank-offerings to the victorious tribe's tutelars, or to become *titi*, or even to be released without further restrictions of status. The place of *titi* in Maohi society was described earlier and need not be discussed here. Some clues have also been offered concerning the kinds of captives that were freed and the circumstances surrounding such acts.²¹ But there remains to be considered the fate of the defeated tribe's territory and of its members who managed to escape capture until after the victors' battle anger had run its course.

In some cases, we are told, those defeated in intertribal warfare but still able to travel sought refuge with distant tribes or even on distant islands, and they lost all claims to their former lands. More typically, however, the survivors were eventually permitted to return to their homes—reportedly, only after performance of the ritual, described earlier, designed to restore the “health” of their territory, and presumably render it suitable for visits from their tutelars—and resume living much as before.

The various arrangements made by victors for dealing with conquered but still resident tribes differed widely in punishment and in the degree to which the conquered people and their territory were integrated into the victor’s tribal domain. At one extreme, members of the conquered tribe were left untouched in their lives and their possessions, their government having become integrated only to the extent of requiring their own chiefs to render occasional tribute and labor or fighting services to the victorious chief. Morenhout reported:

There are always 2 or 3 of these principal chiefs on an island; and even when they have all submitted to one of them, the government still preserves its aristocratic form, since [seeing that] it was invariably divided into [several] major districts each with its own chief, and only temporarily [intermittently?]^{*}—and at that not absolutely—subordinated to the chief of one of them. Moreover, it appears that each district’s own chief had more authority locally than did the chief whose overlordship had been established by conquest.* The overall power of the latter was so limited by the jealousy and unity of the former that he was never able to annex their districts to his own domain, because even if he dismissed from office the more obstinate and seditious members of the high aristocracy, he dared do so only with the individuals in question, the latter’s families having lost none of their power or rights, some other family member simply assumed the office. And even if it reached the point where *all* members of one of the “first families” were killed in warfare, their estates still did not pass to the king. There always turned up some distant relative, or some subordinate chief, to take over the title and office. Such was the state of affairs in the Society Islands, as well as in practically all other islands [of eastern Polynesia]. The “first families” were like so many sovereign “houses.” Some of them, it is true, sometimes found themselves by force of circumstance reduced to submission and forced to a position tributary to someone more powerful, but one never saw them dispossessed of all their rights or did they ever renounce all their power—except in later times, when the influence of foreigners caused them to give up their ancient custom, either by force or voluntarily. (1837:II, 8-9)

*All these local chiefs bore the same official title of Ari’i as the conquering chief himself, which goes to prove that they regarded themselves as his equals.

At the other extreme, the victorious chief replaced the conquered chief and subchiefs with individuals of his own choice²² and confiscated some of the defeated territory for his own personal use, under custodianship of a supporter whose job it became to send most of the territory’s produce to the chief’s household. Confiscation of this kind was, how-

ever, exceedingly rare. In some cases similar grants of *personal estates* were made by the victorious chiefs to their leading supporters, but such personal estates are to be distinguished from the territorial units associated with the administrative posts mentioned above. The residents of the latter supplied their administrative chief with objects and services from time to time; but the resources of an individual's personal estate were directly and entirely his own.

A victorious chief usually appointed only the most loyal of his supporters—typically, close consanguines—to administrative posts in the new domains. Loyal supporters were also rewarded with grants of personal estates, and in addition such grants were occasionally made for more obviously political and diplomatic purposes, for example to placate potential enemies and to line up influential allies for future enterprises.

I label this latter kind of arrangement an “extreme” one in the sense of its having been a logical extreme: on the basis of the Islands' political geography in 1767, one may postulate that such arrangements had been made in earlier eras, although we have no explicit accounts, legendary or semihistorical, of any such arrangement. In fact, the first documented report available concerning such an “extreme” had to do with the division of territories conquered by Pomare II in 1807, which will be described in the next volume.

Summarizing these findings on Maohi warfare—that most violent and final application of coercive force to achieve social ends—I can state that the “efficient” causes of intertribal warfare were almost as numerous as the varieties of interindividual conflict. Moreover, warfare represents a procedure for resolving social conflict that is entirely different, ideologically, from that associated normatively with relations among consanguines, and even affines. I am not suggesting that it was a relatively new procedure among the Maohis—a kind of social technique for resolving conflict invented after a “Golden Age of Kinship,” that is, of patriarchally or consensually maintained harmony. And, although this does not argue for its historicity in their remote past, warfare is a prominent theme in the Maohis' myths about the very beginnings of their universe.

In any case, however warfare may have been related, chronologically, to other methods of resolving social conflict, at the time of the eras under study it was a very widely approved method; and those skilled in its performance were correspondingly valued. (“To the Aito you owe respect: they are the protectors of the honor of the land” [E. Salmon 1937].) The individual who was an *'aito* and only an *'aito* was still not shown the social esteem enjoyed by the one holding an important kin-congregation Title; but the individual who combined both statuses, or the high-ranking kin-Titleholder who also commanded the services of skillful and successful war-makers, was esteemed above all other humans.

Intertribal Visting

Warfare was the principal activity engaged in by a tribe acting as a unit vis-à-vis other social units, but there were other intertribal activities, less sanguinary and at least ostensibly less competitive: namely, sports contests, hospitality exchanges, and reciprocal expressions of condolence or congratulation.

As described earlier, tribes sometimes engaged in sports contests with one another. More typically, these contests took place in connection with other intertribal events, but it is possible that such contests themselves were occasionally the principal purpose for intertribal meetings. Wrestling and boxing were the main sports in most such meetings, but archery and even cock fighting also figured. (See chap. 10.)

Intertribal wrestling matches resembled warfare in the fierce passions they sometimes aroused; indeed, they occasionally ended in open warfare.

It was today reported that a skirmish has lately taken place to the westward between the fleets of Attahooroo [Atehuru] & Papparra and the people of a small district called Fah-ah [Fa'a'a]. The occasion of it is said to be as follows. The people of Attahooroo and Papparra triumphed in wrestling over the people of Fah-ah, & from sporting went to slinging of stones and beating with sticks, which obliged the inhabitants of Fah-ah to fly towards Oparre while the others pursued them. The flying party in their flight were joined by the neighbours they past, and at last formed a body strong enough to beat back in return the people of Attahooroo and Papparra to their canoes. We hear not what mischief has been done on either side, or how it has ended; but as Otow and his brother Tearee-nava-roa are at the head of the fleets, we suppose they will take care it does not go too far. (Jefferson, Journal, 22 April 1801, LMS Archives)²³

Bligh provided an excellent account of the dangerous possibilities of intertribal wrestling. The events described took place in connection with a general assembly of natives from several of Tahiti's western tribes, to witness Bligh's investiture with an "honorary" Title. After the official ceremony,

The Men now divided, and there was a confused Wrestling Match, which soon after Old Otow, Tynahs Father, came and desired I would put a Stop to. The Sagacity of this Old Cheif did not counteract what I beleive he foresaw would happen in case they proceeded. There were many Strangers here, and not a particle of real friendship between them and [the] Oparre people. Otow was therefore Apprehensive they would quarrel, and it realy happened so, in an instant every Man was Armed and an Attack begun in a tumultuous manner. Tynah and Iddeah were absent, but as soon as they heard of it their first care was about me. Iddeeah came with much fear lest I might be absent from the Post; she had a double covering of Cloth over her and her waist was girded round with a large Rope. I desired her to Stay with me and I would defend her. No, she said, I am going to Tammy [*tama'i*, fight]; do you remain here and I will come to you as soon as all is over, and away she went.

As I was not certain how far I might be forced to have a hand in the business, I had all the party on shore, which were nine under Arms, and I had a Boat with

seven men under Arms lying at a Grapnel fronting the Post. I also sent off] Word for the Ship to be ready to assist us, and in the mean time to fire two Guns without Shot in order to disperse the Mob.

It however happened very happily that no Cheif was concerned, their endeavors therefore were to quell the tumult among their own people, and mine to keep my Post clear, which I effectually did, so that all combined to produce peace, which was the case in an hour.

The Guns had a good effect and Tynah and Iddeeah returning to me with the News that all was Settled, we went to some old relations of his that belonged to Attahooroo, and having quieted their minds we came on board to dinner. I told Tynah and the Cheifs that for the future I would not admitt any Wrestling near my Post, and desired they would inform the People of it, which they did. (1789:II, 37)

As Bligh perceptively observed, the reason why this incident did not deteriorate into actual fighting was that “no Cheif was concerned.”

In fact, wrestling was so widely recognized as a precipitant of fighting that visiting chiefs sometimes prohibited it in order to avoid unwanted warfare:

There seems to be much suspicion & mistrust between the Raeatean Chiefs & Arepaea, Edea & Puru yet they strive to make things agreeable to one another. (Davies, Journal, 27 February 1809, LMS Archives)

The whole of Huaheine brought food & presents for Tematoa & Tapoa, we were apprehensive that so many people coming together wd. cause some mischief to happen especially if the Raiateans & Huahineans went to wrestle together, however no wrestling took place, which was probably by orders of all the Chiefs & the people departed peaceably to their several homes. (28 February 1809)

In another account, Davies indicated that sports contests—in this case archery—were arranged as a pretext for warfare:

Brother Nott went down to Pare to see whether anything more could be found out concerning the war. In the evening he returned accompanied by the king and most of his men ... from a variety of circumstances it appeared as if the king came to Matavae with hostile intentions, tho' under the pretence of having a meeting for archery ... (6 October 1806)

With all these indications one might reasonably expect that a tribe's champion athletes occupied positions of honor, and indeed they did. But killing an actual enemy remained a much more prestigious activity than winning a sports contest against a potential one.

I described earlier the importance of “hospitality” in Maohi life. I confess to much uncertainty in this matter, but I can detect nothing in Maohi hospitality exchanges so directly and transparently competitive as potlatch. For all their seeming open-handedness, the lavish hospitality exchanges between chiefs of different tribes did contain elements of social contest, but seem to have been designed more to enhance the host's reputation

generally, than to defeat the guest specifically.²⁴ (This distinction may appear to be trivial, but I believe that it is important.) In any case, while such exchanges may have lacked institutionalized rivalry, they appear to have often included actual hostility barely held in check. General descriptions of official intertribal visits emphasize the lavish interchanges of goods and entertainments, the impressively elaborate etiquette, and the sonorous expressions of mutual esteem. But particular accounts by the more perceptive observers demonstrate beyond doubt that some visits were very tense, weapon-bristling affairs.

In some instances, of course, intertribal visting was deliberately undertaken as a means of asserting one tribe's superiority over, or at least equality with, another. I refer here, for example, to the visits undertaken by representatives of the chiefly families of Fa'a'a and Pare to Papara for the express purpose of forcing Papara's chiefess Porea to break the *rahui* she had imposed in an effort to assert her son's supremacy over all Tahiti. (See vol. 3.)

Effusive demonstrations of sympathy among tribal chiefs seem to have occupied much of their time. Large and costly expeditions to remote points were carried out, ostensibly in order to mourn for a deceased dignitary or to help celebrate some tribal rite. Many such visits were made in the name of kinship, but many others were carried out as visits between tribal heads of state (even though some of these latter may have been phrased in terms of kinship). Here again, however, no matter how ceremoniously tragic or joyful the occasion, such events were very often imbued with scarcely veiled hostility.

In summary, relations between tribes were characteristically hostile.²⁵ Intertribal alliances were occasionally entered into, but these were typically fragile and short-lived. A consequence of this state of affairs (or was it also a cause?) was to popularize a kind of social ethic and glorify a type of role quite different from those esteemed in the ideology of consanguinity.

The activities just described concerned the tribe's relations with other tribes. We turn now to activities *within* the tribe, to those things done among fellow tribesmen acting in their roles as such—to tribal work projects, to the sharing of objects and entertainment, to common worship of tribal deities, and to the celebration of chiefly rites.

Work Projects

The use of labor for coordinated tribal construction and production projects differed from its use for similar kin-congregation projects in method as well as scale.²⁶ The projects in question had to do with the construction and renovation of marae and other public buildings, the building of canoes, and the manufacture of fish nets and bark cloth.

The best description of construction of a tribal (i.e., "national") marae

appears in Henry, and was reproduced in chapter 7, this work. The aspects of that activity most salient to our present concern are:

1. The construction was preceded by a lengthy (“two or three years”) *rahui* period for the purpose of accumulating supplies needed to feed the marae builders, to sustain the rest of the populace during their enforced idleness while construction was in progress, and to provide food for the marae consecration ceremony.

2. “No able-bodied man of the realm was idle on such an occasion, for the chief and all classes deemed it an honor to aid in so sacred a work” (Henry 1928:131).

3. A *rahui* was imposed during construction upon all ordinary activities, including the lighting of fires.

4. The marae builders lived in a separate encampment while work was in progress, and the rest of the populace—women, children, and men unable to work—lived in temporary camps inland and far away from the construction site.

5. The workmen were divided into two major contingents: one for commissary purposes and the other for construction. In addition, the priests were occupied with their usual jobs, since every phase of the construction—before during, and after—was accompanied by intensive ritual activity aimed at securing the tutelars’ assistance and sanctification.

6. The actual work of construction was under the direct supervision of specialists, “marae shapers.”

Morrison’s description of marae construction differs from Henry’s in one significant respect.²⁷ While the labor of actual construction was reportedly carried out en masse, the stones used in the construction were collected beforehand, and by a kind of tax levy:

When a Morai is to be Built the Chief Gives Notice thereof by sending a piece of Cocoa Nut leaf to evry Man under him, with orders that at the time and place appointed he shall appear with a Stone of the dimentions that he shall find described by the Priests and they accordingly attend. If the Stones are not Judged sufficient the order is renewd. These leaves are Generally made up by the Priests with knots, tied in a Manner peculiar to themselves, and Contain the Dimentions of the Stones that each man may work without the assistance of another. When the stones are all collected, the Priests give notice that they are ready and a part of each day is set aside for the Work.... (Morrison 1935:180)

In all probability both of these types of work procedure were utilized, sometimes perhaps even on the same marae; but the difference between them contains important implications for our understanding of Maohi social relations, as will later on be discussed.

The sources contain numerous references to the building of “public”

houses by labor *corvée*, but few details concerning the actual organization of such work. One description containing a little more information than usual is Davies' account of the thatching of a missionary's house:

Pomare is come up [to Matavae] from Pare, it appears that he has now given orders to the Rateras of Matavae to prepare thatch for our house, the work is divided between the several subdivisions of the District. (6 August 1808)

The people began early to thatch the house, and finished it in the evening. The Society fed them according to the custom of the country, several hogs were killed and dressed for them. (Journal, 6 September 1808, LMS Archives)

Davies' account is not entirely clear on this point, but it appears that the thatch plates were prepared in advance, on a quota system (which possibly involved women from every neighborhood in Matavae), while the actual job of tying the thatch plates onto the house rafters was carried out by a number of workers, undoubtedly males. The latter were evidently compensated for their labors with food, "according to the custom of the country"; what compensation, if any, was received by the thatchmakers was not reported.

The fullest description available concerning actual construction work on a large "public" house also came from Davies' pen. Writing about Huahine in July 1809, he stated:

The people from different parts are assembling in our neighbourhood in order to thatch the big house called Nanu which is built at the public expense.

The people of both Huaheines are gathered together in our neighbourhood to thatch the large house they have brought their several divisions of thatch & also a great quantity of food for the Chiefs consisting of baked hogs, mahe, Yams, Taro, Coccoanuts, pia, plantains &c. There are in all about 120 Canoes come, each of which had with his division of food either a hog or baked fish, about 100 hogs of different sizes all baked were heaped up on the beach today with the baskets of Yams, Taro, Mahe &c delivered up to the Chiefs with great ceremony. The Chiefs after receiving them gave orders for the whole to be divided again & returned to the people particularly the workmen employed at the house reserving a part for themselves & another for the gods & priests & a small one for us consisting chiefly of Coccoanuts & Mahe.

The people as usual on these occasions are feasting, drumming, dancing, wrestling &c. Twice today they have been very near quarreling, they were divided into two parties, Huaheine rahe & Huaheine ete. The wrestlers of Huaheine rahe beat those of Huaheine ete & they in their turn got the better of Huaheine Rahe in kicking the foot ball but there was no fair play the Chiefs being in the party of Huaheine Rahe. The parties for a while were exasperated the one against the other, & were very near coming to blows, but it seems the quarrel was soon dropped & things were amicably settled.

Our neighbourhood, Puaoa & Maeva, brought their divisions of food today ... there were at least 43 hogs baked, & great quantity of Coccoanuts, Mahe, pea &c. this was divided among the people as before. Thus the profusion & wastage of food has been great these few days past notwithstanding the great scarcity.

Many of the people in our neighbourhood have gone to their several

homes having finished the thatching of the large house, but a good number remain to make a fence which will enclose the house & a large court all round it, this court & also the inside of the house is to [be] levelled & overlaid with a sort of grass called Nonoha which will appear clean & decent for a while. The house is about 180 ft. long & 25 broad is supported on the sides & ends by 89 strong pillars made of good Uru trees & there are 11 in a row inside which make 100 in all, the rafters are of strong Purau having their lower ends to a good way up covered with matting & Sinnet of various colours which make a pretty appearance. (Journal, 10 June 1809, LMS Archives)

The noteworthy aspects of this event are as follows:

1. The thatch plates were manufactured in advance on the basis of what seems to have been a tribe-wide quota system. (It would be most revealing to learn the basis on which the quotas were assigned to each subtribal chief, but we are not vouchsafed such information in connection with this or any other reported house thatching.)

2. Out of the very large crowd of people from all parts of the tribe that gathered for this occasion only a few were actually employed in the work.

3. In addition to thatch plates, those attending brought large quantities of food (probably also according to quotas), which were turned over to the "Chiefs" for redistribution, with special portions going to the workmen, the priests, and the chiefs themselves, and the remainder to the populace in general.

4. As with most large concourses, the main activity of the occasion was accompanied by sports and other festivities.

Individuals acquired boats in one of five ways: (1) by building them themselves (usually with the help of close relatives), (2) by commissioning expert boatbuilders to do the job in return for specified compensation, (3) by gift or barter, (4) by having one's own staff boatbuilders do the job, or (5) by ordering one's subjects to build them, as a form of tax. The first method was probably employed only by lower-class individuals, or by others with relatively few resources, or by individuals who were themselves especially skillful in boatbuilding. The second method was probably employed by individuals of all classes—that is, by anyone who possessed the resources for paying boatbuilders and who did not have staff boatbuilders of his own. Acquiring a boat by gift or barter was also open to anyone, but only those in positions of considerable authority or affluence were apt to receive large boats in this way. As for the fourth method, only persons of very high authority were able to maintain specialist boatbuilders on their domestic staffs, and the same was true of the ability to acquire boats in the form of tax.

For persons of high authority (and hence in a position to command

considerable wealth), all of the above methods for obtaining boats were available so that the method followed in any particular instance must have depended upon the chief's judgment concerning the degree to which the boat in question was to serve a "tribal," as opposed to a purely "personal" purpose. (I am convinced that this factor was a conscious one.) At one extreme was the chief who was strong enough, and willful enough, to demand "gifts" of boats from his subjects or to require them to build boats, for the more "personal" kind of use. But at the other extreme was the chief who mobilized tribal manpower and resources only to acquire boats for warfare or for use in connection with tribal tutelars. It is about the latter that Morrison wrote in an excerpt (1935:205-206) quoted earlier. We are not informed how other tribal boatbuilding corvées were organized, but the account by Morrison reveals what we have come to expect of such *tribal* projects—namely, that the boats were actually built by a few specialists. Any heavy carrying was done by the ordinary tribal members, but their principal contributions were in the form of objects, for feeding and otherwise compensating the specialists (including, undoubtedly, the officiating priests).²⁸

Some methods of fishing, such as lagoon fish-drives, required large numbers of persons, and it is reasonable to suppose that some of these activities would have been organized on a tribal basis, especially among smaller tribes such as Mai'ao and Maupiti. But the only evidence of an entire larger tribe's engagement in a fishing enterprise is to be found in Ellis' description of salmon fishing in Huahine;²⁹ and the cooperation was not in the fishing itself but in manufacture of the net.

Upea is the common name for net. The *upea ava*, or salmon net, is the longest and most important, and is seldom possessed by any but the principal chiefs; it is sometimes forty fathoms long, and twelve or more feet deep. One of this kind was made by Hautea, the governor of Huahine, soon after our arrival. Although the former pagan ceremonies, and the offerings at the marae, were discontinued, some of the ancient usages were observed, one of which appeared rather singular. As is customary on all occasions of public work, the proprietor of the net required the other chiefs to assist in its preparation. Before he began, two large pigs were killed and baked. When taken from the oven, they were cut up, and the governor's messenger sent with a piece to every chief; on delivery, the quantity was stated which each was desired to prepare towards the projected net. If the piece of pig was received, it was considered as an agreement to furnish it; but to return it, was, in effect, to refuse compliance with the requisition. At this time, however, no one returned the *tarahu*, or price, but all agreed to furnish one or two fathoms of the net. When any other chief wanted a net, he took the same course.

The cord was about a quarter of an inch in diameter, and made with the tough white bark of the mate, *ficus prolixa*, which, next to the romaha, or flax, is considered more durable than any other indigenous vegetable substance. The cord was twisted with the hand across the knee, in two or three strands or threads, and was even and firm. The meshes were about four inches square.

The servants of the chief furnished their quantity of netting, and the needle with which they wrought was not unlike that used by European workmen. As the other parties brought in their portions, the chief and his men joined them together. On entering the house of Hautea, I have found him in a profuse perspiration, toiling in the midst of his men at the manufacture of the net. (1829:II, 289–290)

The only other activity I know of which *may* have employed concerted labor on a tribe-wide scale was the making of bark cloth. Persons requiring bark cloth in large quantities, it will be recalled, could obtain it in the form of tax, by having their domestic servants or subjects manufacture it, or by contracting with others to make it in return, say, for pigs. The use of subjects to manufacture bark cloth is described in a passage from Morrison:

If a landed Man wants a large quantity of Cloth made at once, he informs his Tenants when he means to Cut his plants and on the Day appointed all the Weomen attend with each their Beam & Beetle and a proportion of Breadfruit being prepared they bring the Work together and some times to the Number of 200 strike off together, making as much noise as so many Coopers. The piece is finishd in one Day and is sometimes 40 or 50 fathoms long and 4 fathoms wide. (1935:161)

A labor force of two hundred women would have been about as large as some tribes could muster, so we may have in this activity yet another example of tribe-wide *corvée*. On the other hand, when the chiefs of the larger tribes needed to replenish supplies of bark cloth, they usually had to resort to all three methods of procurement. Among other things, a technical obstacle lay in the way of mustering bark-cloth-making *corvées* significantly larger than those described by Morrison: the saplings from which such bark cloth was usually made were probably produced in the employer's own gardens, and, as far as we know, not even the most affluent chiefs personally owned enough trees to require bark-cloth-making *corvées* of a very large size.

Summarizing these findings on coordinated tribal work projects, one can discern differences in labor use corresponding to size of social unit (in this case the tribe). In the case of a small tribe all the unit's manpower (or woman power) was more or less directly employed in some phases of the work activity, in addition to providing the food consumed, by themselves, the specialists, chiefs, priests, and tutelars, during and after the work. In the case of a large unit, however, most of the actual work on such projects was performed by specialists, the rest of the populace having made their contributions in the form of such items as materials for the construction or processing, food for everyone's consumption while the work was in progress, and—a new factor—objects with which to compensate the specialists for their extra services. In other words, as the labor force increased in size, contributions to joint work projects tended to polarize in kind: the specialists (artisans, priests, managers) did more of the actual work of building

and manufacturing, while the populace supplied more of the objects needed for the work.

There were at least two factors involved in this trend. The first was directly technological: Maohi techniques for building and manufacturing were suited mainly to work groups of small size, that is, only a limited number of persons could be directly engaged in making something simultaneously. The second factor was organizational: for some reason or other (possibly as a result of habituation to the techniques just mentioned) the Maohis were not accustomed to working together in large numbers in a precisely coordinated way (a combination, probably, of both managerial ineptness and worker inflexibility). With respect to large-scale activities in general the Maohis demonstrated their capacities for fine coordination in certain kinds of dancing and in their handling of boats, but, with the possible exception of making bark cloth, this seems not to have carried over into most construction or manufacturing activities (or for that matter into large-scale fighting).

Parallel with this trend in the organization of tribal work projects one can discern a correlative *decrease* in the number of such projects themselves, along with an *increase* of levies in the form of objects. In other words, as tribes grew larger and more complex in composition, objects tended to supplant direct services as means to support the cost of central government.

Levy of Objects

As just noted, in connection with some tribal work projects, many members made their contributions in the form of objects in lieu of services, the objects having been used to support the specialists actually engaged in the work at hand. In addition, there were many other occasions on which objects and not services were the intended objective of the contributions made by people as members of a tribe. Among such occasions were seasonal first-fruit rites, the ceremonious rendering of substantial or token "tribute" to tribal chiefs, contingent levies by the latter for specifically tribal or administrative purposes, and delivery—on "standing order"—to tribal chiefs of such luxuries as turtles, pearls, and most other objects considered by the Maohis to be of special interest and value.³⁰

First-fruit offerings were described earlier in connection with agricultural ripening-of-the-year rites, and it was indicated that most such offerings included a share for the social unit's administrative leaders as well.³¹ In addition, I included an account by Morrison of first-fruit offerings made principally to "chiefs"; the importance of this account to our present concerns is such that I refer the reader to it pp. (262-263).

There are several noteworthy things about the set of events described by Morrison:

The contributions appear to have been of two kinds: (1) a more symbolic

offering consisting of token amounts of objects purportedly designed to express the subjects' loyalty and affection for their chief; or (2) more substantial amounts of edibles designed for actual consumption by chiefs.

All contributions appear to have been *upwards*: that is, Morrison's account gives no indication of immediate redistribution.

The goods moved along regular tribal channels: "tenants" to *ra'atira* to sub-chief to chief, a procedure which was then repeated for each subtribal unit and sub-subunit.

Although identified by Morrison as an offering of first fruits, the instance described was more "secular" than were other levies identified by the sources as first-fruit offerings. In all probability most if not all tribe-wide collections of objects included portions both for tribal tutelars and for tribal chiefs (and, on some occasions, for Ariois), but in different proportions—or at least with differing ritual emphases—according to the avowed purpose of the occasion. The more "secular" of such levies were of three kinds: collections of comestibles and other objects delivered to a chief at his principal tribal marae by each subtribal unit and intended mainly for support of himself and his household; collections (mainly comestibles) delivered by subtribal units to their chief while he was on tour around his realm, for immediate consumption by himself and his retinue; and collections delivered to a chief for entertainment of dignitaries from other tribes.

On Tahiti and Mo'orea the first of these kinds of collections included one known as *tavaru* (usually contracted to *tavau*), which is defined in the LMS Dictionary as a fleet of canoes bringing food for the king or principal chief. The name is from *varu* meaning eight; a meeting of eight divisions of *mataeina'a*;³² a meeting of different districts, for business and feasting.

The fullest description extant concerning an actual *tavau* is contained in a document allegedly written about 1845 by the Maohi genealogist Mare, and describing the *tavau* rendered the Pomares after this line of Pare-Arue chiefs had extended its rule over all of Tahiti and Mo'orea (after 1815).³³ The document may contain elements of fiction, invented by Mare to authenticate the Pomares' political pretensions, but the general procedure described appears credible. And even though the specifics of individuals and Titles and places refer to a later era in the Islands' history, I reproduce this document because the forms of the transactions described in it seem indigenous enough to be applicable to the eras under study.

The first text concerns the *tavau* delivered, by the several tribes of Tahiti, to the ruling Pomare, at Tarahoi (his principal marae, which was in 'Arue and at which he bore the Title, Tu Nui eaa i te Atua):

Here are the procedures followed in connection with the Great Tavau.

The people constructed boats, manufactured large bundles of tapa [bark cloth] and mats, and fabricated *taurui* [ornamented breastplates] and *fau* [head-dresses]. They collected pigs, and prepared *māpura* [a prized variety of wild mountain-growing taro] and *uhi parai* [a variety of yam]. They carried all these things throughout the moonlit nights, which occur at the times appointed for a *tavau*. [The significance, if any, of this timing escapes me.]

There are eight districts in the Porionuu division itself, and these provide eight boats, eight bundles of tapa, along with breastplates, headdresses, and live pigs. Such are the objects loaded into the boats.

Together, the two major subdivisions of Te Oropaa, and the district of Tau-mata i te fana ia hurai [Fa'a'a] contribute three boats, three bundles of tapa, along with headdresses, breastplates, and live pigs.

The four districts comprising inland Teva [Papara, Atimaono, Papeare, Papeuriri] contribute four boats, four bundles of tapa, four breastplates, head-dresses and live pigs; and when all these things are loaded onto the boats they set out for Tarahoi.

The various kinds of comestibles—*mapua*, *poe*, *taioro*, *tuparu* [coconut, bananas, etc., pudding], arrowroot *poe*, *pēpē* [sweet, ripe breadfruit], and mountain plantain—are carried in a separate canoe in which the passengers beat on drums and *ihara* and dance en route.

The boats intended for the king do not carry comestibles, but are canopied with tapa stretched out on poles. In presenting these [boats? all the above items?] to the king one addresses him by his Title, Tu Nui eaa ite Atua, in the following words: "You [who are] over Tarahoi, here are we eight districts of Porionuu; the two major subdivisions of Oropaa and district of Tau-mata i te fana ia hurai, the peoples living between the Vainiania and Vaiovau rivers [i.e., the inland Teva]. Here are the seaward Teva as well.... Here is the *tavau* collected for you: the boats, tapa, breastplates, headdresses, boat canopies, pigs, *mapua*, and all kinds of fruits—all constituting a symbol of royal power [*mana ari'i?*]. (Rey-Lescure 1946:196-197)

The next text concerns the *tavau* rendered Pomare on Mo'orea, at marae Nu'uruu, where he bore the Title Punua te rai tua:

Mo'orea was composed of eight districts and correspondingly provided eight boats, eight bundles of tapa, breastplates, headdresses, live pigs and all the kinds of comestibles appropriate to a *tavau*, except for *mapua* and *paroi* yams, which do not grow on that island.

As with Tahiti, a special boat was reserved for transporting the comestibles, and on this the passengers danced and beat drums and *ihara*; but those boats making up part of the *tavau* itself were canopied with tapa, which constituted *tihī* [i.e., ceremonially given bark cloth].

In making the presentation the king is addressed thus: "Oh Punua te rai tua, [of Nuuruu?], here is the *tavau* furnished you by Mo'orea, [several words missing] as a symbol of your authority over the island." (p. 198)

According to another text included in this document (reportedly originating with some "chiefs" of Porapora), the custom of *tavau* was also practiced in the Leeward Islands, but there it was known as *mareva*.

For a *tavau* [*mareva*] in these islands all the population of an island comes together at the same place—men, women, and children.... When all the people were assembled for a *tavau* they readied all kinds of comestibles—pigs, bananas, breadfruit, taro, etcetera. They added to these some rolls of tapa, some mats, and some ponchos, and when everything was assembled in one place they presented these objects to the prince for whom the ceremony was arranged. (pp. 200-201)

In the Windward Islands, according to the document just quoted, *tavau* was rendered only to a sovereign chief by his subjects. The ceremony for honoring (and provisioning) a dignitary from another tribe differed in procedure and possibly also in tangible content: "When Tapoa ["King" of Porapora] and Tamatoa ["King" of Ra'iatea] visited Tahiti, they were not presented with *tavau*: instead, each district, one after the other, presented its presents of comestibles to the [visiting] king" (p. 200). If this report is accurate, then, such visitors received only, or mainly, comestibles, and the presentation lacked the explicit symbolic references to tribal unity and fealty implied in *tavau*.

Tavau differed also in procedure and in content from the presentation rendered a tribal chief on tour around his realm. The primary purpose of the latter was the immediate provisioning of the chief and his retinue. Most of this kind of provisioning was probably moderate and orderly, but, as I have indicated, some such tours were marked by impoverishing rapacity, mainly on the part of a chief's ruthless and insatiable servitors.

The sources have referred to many other kinds of occasions on which all or large parts of a tribe provided their chief with comestibles or other objects, in connection with an event either mainly religious or mainly secular, and with varying proportions of the total collections allotted to the chief's own use. I am unable to provide descriptive classifications for all such transactions, but it is possible to discern some interesting and perhaps highly significant differences among them—quite apart from differences in the degree of "secularity" of the occasion for the transaction.

TYPES OF OBJECTS

Certain varieties of plant-foods were reported to have been included in presentations only to "kings" (i.e., presumably to any tribe's sovereign ruler): *māpura*, a species of white taro that grows wild in the mountains; *pēpē*, a sweet, ripe breadfruit; and *uhi parai*, a species of yam. In contrast, it was said that certain other varieties were not good enough for "kings" but might be presented to other persons: for example, *pae'a*, an inferior species of breadfruit. (According to Rey-Lescure, however, although *pae'a* was given to "strangers," it was not given to traveling entertainers.) The logic behind this use of *māpura* may perhaps be based on its scarcity and the difficulty of obtaining it; as for *pae'a*, it would seem to be a simple

case of not giving an “inferior” food to a “superior” person. But how to explain *uhi parai* is not clear.

Certain other plant-food preparations—puddings (*poe*), baked plantains, *taioro* (a sauce made of scraped coconut, salt water, and shrimps)—were said *not* to have been included in presentations to “strangers”; but whether these were specifically reserved for presentations to “kings” is not clear. The explanation suggested by Rey-Lescure for these foods having been restricted is ingenious, and perhaps even correct: “Since these foods require prior preparation they ought not to be included among the presents offered spontaneously upon the [unexpected] arrival of a guest and given at the beginning of a meal.”

Cooked pork (and probably cooked dog flesh) formed part of many tribal presentations, from which the tribal chief received portions, but those presentations, such as *tavau*, intended mainly as manifestations of tribal fealty and for revenue usually included live animals as well. (In fact, on some such occasions the animals were turned back to the donors to keep and fatten until they were actually required by the chief.)

I have already noted that tortoise flesh was restricted to *ari'i* (but not perhaps only to those who were tribal chiefs); the same limitations appear to have applied to *i'a raararoa*. Rey-Lescure interpreted this to be “a type of shark with a greatly developed fin, or a large-fin fish,” but the closest LMS Dictionary form is *i'a ara roa*, a fish, a present of fish taken to a chief; used figuratively, it meant “a dead enemy carried to the marae for sacrificial offering” (Andrews and Andrews 1944: 69). Human beings intended for sacrifice were, of course, offered only on behalf of tribal chiefs—and only for a very limited number of these.

Turning now to noncomestibles, boats appear to have been included only or mainly in *tavau*-like presentations to tribal chiefs—for use by chiefs or in the service of their deities—and the same was probably true of red feathers. Gorgets and *fau* headdresses also constituted a kind of tribal revenue; they were worn mainly in warfare and by a tribe's leaders, and hence were required by a tribal chief for the proper uniforming of himself and his principal lieutenants. Mats and bark cloth figured in all kinds of transactions, but when presented to a tribal chief, on *tavau*-like occasions, they were usually given in the form of large bundles or long strips wrapped around some individual or the chief himself.

AMOUNT AND CONDITION OF OBJECTS

The amount of an object presented to a tribal chief varied widely. At one extreme were contributions of large amounts of things used by the chief to sustain himself and his retinue and to maintain or increase his power and influence. At the other extreme were contributions of token quantities,

more symbolic than substantial. In fact, in some of these latter instances the items were worse than useless in a practical sense; I refer here to the *ma'a opu roa*, comestibles spoiled as a result of long periods in transit and hence inferentially symbolic of the *extensiveness* of the chief's domain (Rey-Lescure 1946:199, 204).

It seems to have been of crucial importance that the objects originally destined for some chief should in fact reach their destination—not equivalent substitutes for those objects but the very objects themselves. In other words, even when the avowed purpose of a contribution was revenue, its initial consignment to some chief served to identify it specifically and exclusively with him. The penalty for interference with such a consignment was revealed in the legend of Pai, reproduced earlier, wherein the petty chief Rehia was slain by “King” Ta’ihia’s jealous supporters for daring to purchase a load of objects en route to the king.³⁴

The procedure followed in the first-fruit offerings described by Morrison, and quoted above, constitutes a fine example of this convention and differs significantly from the procedure, followed in many societies elsewhere, whereby goods move up composite social hierarchies in one movement, with portions being removed en route to provide for the various subunit chiefs. (Among other things, the Maohi variant strikes me as an effective measure for reinforcing centralized control over a whole tribal unit, against the centrifugal forces exerted by strong subtribal chiefs.)

PLACE AND MODE OF PRESENTATION

A presentation made to a tribal chief at his own marae seems to have contained stronger implications for tribal unity and fealty than one made to him elsewhere in his tribal domain. (And, of course, presentations made to him when he was traveling abroad usually implied only “amity” or at most “alliance.”)

It goes without saying that the procedures involved in members’ presentations to their tribal chief varied in ritual symbolism and in ceremonial elaboration. For example, the sound of a conch-shell trumpet (*pū*) was an unmistakable sign of the donee’s sovereign power, as was the feigned eating by him of a human offering’s eye. But our concern here is with differences in the social mechanics of such presentations, which appear to have followed three different patterns. In one of these a presiding priest presented to the chief his share of a larger collection only after handing over shares to spirits, and in some instances to priests as well. In other situations, whole presentations were made directly to the chief, but in subtribal “installments”: separate collections of objects were made by subtribal chiefs on separate occasions. The third pattern was the one followed in *tavau*, wherein all subtribal units brought together their respective, and equivalent, contributions and participated simultaneously in a joint presentation to their tribal chief.

The second of these patterns provided a clear indication of a subtribe's fealty, but the third can be interpreted as indicating tribal unity as well.

REDISTRIBUTION

Some of what tribal chiefs received from their subjects was ultimately "redistributed," but there were some widely and probably highly significant differences—in the proportions of a presentation redistributed, in modes of redistribution, and in the kinds and ratios of tribal members included in the redistribution. (I am concerned here with the redistribution of objects first presented to the tribal chief, and not with those allotted for redistribution on spirit-focused occasions, at which separate portions were *initially* allotted to spirits, Ariois, priests, chiefs, and other participants. On the latter occasions, a tribal chief in whose domain such ceremonies took place undoubtedly exercised some control over the proceedings, including the redistribution, but normatively the division of goods rested in the hands of spirit-serving priests.)

In some instances, most of what was presented to a tribal chief was immediately redistributed, in an orderly and comprehensively proportional way. That is to say, most of the objects—mainly comestibles—were immediately returned to the subchiefs, who then distributed them among their followers for on-the-spot consumption. In such instances, it was likely that most if not all of the original contributors received some share of the food.

In other instances of immediate redistribution, a smaller part of the presentation was returned to the donors, not, however, by orderly division but by recourse to "scrambling." Excerpts from missionary journals describe this custom:

We met the people with the food & cloth going to present it to Puru and were soon after informed that when the food was divided by Hitoti and a portion allotted to the Papas (Englishmen, ourselves) a number of people rushed in and scrambled for it (Crook, Journal, 25 October 1816, LMS Archives).

When the canoes were come to the place of landing, before they put on shore, a parley commenced, between Pomerre and certain of his orators, who were ranged in line on the sea beach, with the king's representative before them: and Teohu and his orators on board the canoes, in which were recapitulated certain articles of their superstitious belief—respecting the originality of their forefathers etc.—during the repetition of these things each party threw towards the other, some part of a cocoanut tree: perhaps as a token of the rectitude of their belief in the things related. After this ceremony was concluded, the canoes landed, and were hauled up on the strand then another ceremony commenced, of presenting cloth to the chief, very little of which came to his share, for as fast as bundles were brought to him, a band of persons laid hold of it and a furious struggle ensued in which the cloth was torn to pieces, and he thought himself highly favoured who could get a piece a foot or two in length. In this strange barbarous manner many fathoms of cloth that had cost some trouble in making were in a very short space

of time totally destroyed. (Jefferson, Journal, 2 April 1801, LMS Archives; see also Robert Thomson, "History of Tahiti," part 2, pp. 87-88, LMS Archives.)

In still other instances, however, there is reason to believe that no redistribution took place at all—at least none outside the chief's own domestic and official establishment. Or if it did take place, the objects in question found their way into a very limited number of hands.

However abundant the supplies might be which the king received, he was in general more necessitous than many of the chiefs. Applications for food, cloth, canoes, and every other valuable article which he received from the people, were so frequent and importunate, that more than was barely sufficient for his own use seldom remained long in his possession. A present of food was usually accompanied with several hundred yards of native cloth, and a number of fine large double canoes; yet every article was often distributed among the chiefs and favourites on the very day it arrived; and so urgent were the applicants, that they did not wait till the articles were brought, but often extorted from the king a promise that he would give them the first bale of cloth, or double canoe, he might receive. At times they went beyond this; and when a chief, who considered the king under obligations to him, knew that the inhabitants of a district were preparing a present for their sovereign, which would include any articles he wished to possess, he would go to the king, and *tapao*, mark or bespeak it, even before it was finished. A promise given under these circumstances was usually regarded as binding, though it often involved the king in the greatest difficulties, and kept him necessitous.

In the estimation of the people, one of the greatest virtues and highest excellencies of a king, was generosity; and one of the most unpopular dispositions he could cherish, was illiberality. In describing a good chief, or governor, they always spoke of him as one who distributed among his chiefs whatever he received, and never refused any thing for which they asked. (Ellis 1829:II, 373-374)

From one point of view, several of these variations in object transactions between members of a tribe and their chief seem to suggest a range of types of relationship. At one extreme was a relatively small tribe, knit together by close ties of kinship and by firm loyalties to a chief who was kinsman of many members of the tribe. Tribal presentations to the chief were more in the nature of shared bounteousness; the symbolic aspect of the transaction was that of commensality, and the religious side of such occasions was usually present, whether explicitly manifest or not.

At the other extreme was a very large tribe composed of historically distinct units held together mainly by force. In these, at least some tribal presentations to the chief were mainly for purposes of revenue; and although some of the symbolism of commensality was retained in such customs as "scrambling," the principal messages these transactions were intended to convey were those of "fealty" (however tentative) and of tribal "unity" (however fragile).

HOSPITALITY

One of the greatest demands upon a Maohi's resources was for the purpose of "hospitality," the implications of which I have already described. When

such outlays pertained to official visits by chiefs of other tribes, the inherent demands of hospitality were so amplified by considerations of intertribal politics that the whole tribe was usually involved in the transaction.

Throughout the archipelago the objects handed over to a visiting dignitary appear to have been presented in three or four installments: a small token amount of food given to the guest of honor as soon as he (or she) set foot ashore: this was sometimes called a *fa'ahopura'a vai*, literally, "the action of bathing someone in water"; a more substantial amount of food, and so forth, given to the visitor shortly after his arrival and upon his departure, known as *ma'a fa'a'amua*, a term also applied to some first-fruit offerings to deities;³⁵ the principal presentation, known variously as *mareva*, *poropae*, and so on.³⁶

According to the BSEO document on *tavau*, a *poropae* was carried out as follows on Porapora:³⁷

When a visitor calls upon the king [of Porapora], all Faanui [the king's home district] prepare comestibles and carry them along with tapa to the home of the king, and hand them over to him, for him to present to his visitor. This *poropae* is provided by all the districts of Faanui, and when the *poropae* and the *fa'amua* [*ma'a fa'a'amua*] have been completed, then one brings the *maa tumu uru* which is also given to the guest of the king.

But this [last item] is not provided by all Faanui; only the king and his own people [close relatives and retainers?] provide this, and this has been the case whenever comestibles have been provided the kings of other lands visiting here. Everyone assembled to present provisions to such a guest, but here such a practice is not labeled *tivau* [*tavau*] although it is the same thing. (Rey-Lescure 1946:201)

Elsewhere in the same document is a statement purportedly contrasting this mode of presentation with that practiced on Tahiti: "When, however, King Tapoa [of Porapora] and King Tamatoa [of Ra'iatea] betake themselves to Tahiti they are not [entertained in this way]. Each district [of Tahiti] simply presents its gift of comestibles to [the chiefly visitors] in succession" (p. 200).

Still another complication is added to this "explication" of *poropae* by the LMS Dictionary entry for *poropa*, a large and unsightly collection of food intended for visitors.³⁸

Cutting through the tangle of these and other accounts, I believe it possible to distinguish three kinds of procedures followed in making principal presentations to visiting tribal chiefs. In one, all the tribe-wide contributions were put together and turned over to the local tribal chief, who himself made the presentation to the honored guest. In another, each subtribe made its own presentation to the guest, successively. The third presentation was also handed over to the guest by the local chief, but it consisted of objects contributed only by the chief himself and his near relatives—the *ma'a tumu uru*.

Considerations of social class may have been behind the distinctiveness

of the third kind of presentation. As for the significance of the distinction between the first and second procedure, it might be argued that the unity of the host tribe (and the authority of its chief) would have been better expressed by the first procedure; but the data on which this inference is based are so slender, and ambiguous, that I attach little weight to them.

A question remaining to be answered about tribe-wide levies of objects is, How were they initiated and sustained? Presumably most first-fruit presentations took place periodically, upon ripening of the seasonal fruits, or upon the natural reappearance of certain schools of fish. But all other levies depended upon the plans and appetites of the tribal chief. Ellis described how a chief usually went about mobilizing his tribe's resources, in both services and objects:

Whenever a measure affecting the whole of the inhabitants was adopted, the king's *vea*, or messenger, was despatched with a bundle of *niaus*, or leaflets. On entering a district, he repaired to the habitation of the principal chiefs, and, presenting a cocoa-nut leaf, delivered the orders of the king. The acceptance of the leaf was a declaration of their compliance with the requisition, and to decline taking it was regarded as an intimation of their refusal to accede to the measure proposed. Hence the messenger or herald, when he had travelled round the island, reported to the king, who had received and who had refused the *niau*. When the chiefs approved of the message, they sent their own messengers to their respective tenants and dependants, with a cocoa-nut leaf for each, and the orders of the king.

The *niau*, or leaflets of the cocoa-nut tree, was the emblem of authority throughout the whole of the Georgian and Society Islands; and requisitions for property or labour, preparations for war, or the convocation of a national assembly, were formerly made by sending the cocoa-nut leaf to those whose services or attendance was required. To return or refuse the *niau* was to offer an insult to the king, and to resist his authority.

If the king felt himself strong enough, he would instantly banish such an individual, and send another to take possession of his lands, and occupy his station as chief of the district. Should the offender have been guilty of disobedience to the just demands of the king, though the lands might be his hereditary property, he must leave them, and become, as the people expressed it, a wanderer "upon the road;" but if the king's conduct was considered arbitrary, and the individual justified in his refusal by the other chiefs, they would *tapea*, or detain him, and protest to the king against his removal. The parties generally knew each other's strength and influence, and those who had little hopes of succeeding by an appeal to arms, usually conceded whatever was required. Personal security, and the rights of private property, were unknown; and the administration of justice by the chiefs in the several districts, and the king over the whole, was regulated more by the relative power and influence of the parties, than by the merits of their cause. (1829:II, 367-369)

This procedure was followed not only for such momentous objectives as mobilizing for war but also for such prosy purposes as the laying in of a supply of *mahi*:

"... if a Chief wants a Supply [of breadfruit] for the purpose of Making Mahee

he sends a Bit of Cocoa Nut leaf to all, or as Many of the Inhabitants of his district as he shall think proper, and on the appointed day they Bring each a load, which is generally accompanied with a hog by some and fish by others according to their several abilities, but this they have seldom occasion to do as they are always well supplyd and when supplies are raised this Way the people bring it in such a Manner as bespeaks at once their regard for their Chiefs & fear of displeasing them, always testifying their sorrow that he should be so far neglected as to have the trouble of sending for bread. (Morrison 1935:215–216)

Rodriguez provided a description of the consequences of noncompliance with a chief's levy of food supplies:

Vehiatua banished the Indians of the gully, for not having contributed the food supplies due from them; the number of those banished was very large.

When I arrived on shore with the working party I found all the Indians in a state of excitement, some fixing the cuddies on to their canoes, others arming themselves for battle; and, going up to Hinoy, whom I found wearing a tunic that Señor Don Raymundo had given him, I asked him what it all meant. He answered that the Indians of the gully whom Vehiatua had banished the day before had risen in revolt against him, in consequence of which that *arii* and all his party had gone to punish them for their hardihood; and that Otù had also gone with his own people in pursuit of them, to assist Vehiatua if necessary and, in case of being worsted, to rescue him and carry him off to *Opape*, one of his [Otù's] districts.

On learning this I went on board and reported it to the Comandante, who ordered me to return to the shore and keep myself informed of everything and see what the upshot would be; and at the same time he detailed an officer, with a serjeant, a corporal and squad, to protect the house and cover our own party at work there in the event of an assault of any kind. I myself went forward, accompanied by some natives, to where the combat was going on, and after walking rather more than half a league I came to where Otù was encamped with over four hundred Indians who were wrecking all the huts they found and looting everything they could lay hands on, for they destroyed even the seedling beds that had been made. I passed on until I met Vehiatua, whom I found with quite two hundred Indians carrying clubs, long spears, and slings, over and above those who had gone still farther ahead in pursuit of the fugitives. Presently one of his captains arrived with a good number of people bringing in one of the rebels a prisoner, and on coming up to Vehiatua the captain presented a small plantain shoot to him, together with the offender. Presuming that he would be punished I asked what the man's end would be, and was told that a tree they call *evizo* was to be his punishment. But nothing was done to the prisoner after all, as they interceded in his behalf and he was pardoned. (Corney 1919:27–28)

Worship

Joint worship was one of the most important activities engaged in by persons as members of the autonomous territorial units I label *tribes*. Ordinarily, only males participated directly in such worship, but females also were indirectly involved—in helping to supply food offerings,³⁹ in maintaining ritual restrictions, and in reaping the benefits or suffering the consequences of the worship.

For many members of any tribe the tribal tutelars thus worshipped were different spirits from those worshipped in a member's own kin-congregation marae. (As suggested earlier, there may have been a time when many distinct kin-congregations constituted wholly autonomous territorial units, or tribes, but during the eras under study all the tribes about which I know were made up of two or more kin-congregations, presumably worshipping distinct tutelars.) In most cases perhaps, the tutelar spirit of a tribe was the tutelar of its sovereign chief's own kin-congregation marae; but the exceptions to this generality, both evidential and conceivable, require discussion.

One such exception is indicated in a passage from Henry describing the ceremonies attending supercision of a successor to a tribal chieftainship: "For an heir apparent to the throne, one or more human sacrifices were offered by the priests at the national [tribal] marae, while this rite [supercision] was being performed at the [heir's] ancestral marae" (1928:188). It is of course possible that the same tutelar was worshipped at both of these marae, thereby leading to the credible conclusion that some tribal chiefs maintained two kin-congregation marae: one for large and public tribal worship, and another for intimate, familial rites. (The archaeologically attested evidence of small "shrines" in the vicinity of large marae—in many cases actually abutting them—lends some plausibility to this suggestion.) On the other hand, we cannot rule out the possibility that some principal, ancestral marae tutelars were wholly distinct from those of their tribal, "national" marae. Indeed, from what is recorded about the Maohi past, this possibility becomes a probability. My evidence for this conclusion is as follows:

Several accounts, more or less "historical," indicate that certain tribal chiefs replaced their established tutelar with a new one, accomplished either by construction of a new tribal marae or by installation of a new tutelar in the old marae. (This process undoubtedly exemplifies much of the diffusion of 'Oro worship, as described in the previous chapter.)

There are several other accounts, both legendary and "historical," of dynastic changes in tribal leadership, without any accompanying changes in tribal marae or in tribal tutelars.

In any case, however such associations may have come about, during the eras under study *all* tribal members were expected to venerate the tribal tutelars *in addition to* their own kin-congregation tutelars, if these happened not to be identical.

Tribal marae were in general larger and more complex structures than were ordinary kin-congregation ones. As already described, the whole tribe was involved in their construction, in some role or other, and their consecration was also a tribal affair:

The inauguration of the national marae was performed with great festivity; the clans of all the kingdom were represented, and a great feast was prepared on the assembly ground. On the appointed day all work was done in the morning, and in the afternoon amid impressive stillness the people in their best attire, followed the queen and chiefesses and other members of their families, gathered at the new marae, and took their stand at the place for the congregation in the rear. Then followed the ceremonies, which thrilled the hearts of all with joyous but silent religious enthusiasm. The first-born young virgins of the royal family of the kingdom represented their respective districts. They were arrayed in flowing white tapa and decked with wreaths and garlands of tiare (single *Gardenia*) blossoms, their emblem of purity. Carrying round green coconut-leaf baskets of these flowers in their hands, they led a procession formed by the clergy in sacerdotal array each of whom carried a miro branch in his hand. The king wore his royal feather clothes and the chiefs their regal raiment. The procession halted on reached one side of the marae, and then the young virgins walked around it, casting their flowers upon it as high as they could reach and upon the paving close by. The high priest followed calling upon the gods to fill the place with their presence.

This was called the *rao-marae* (setting of the marae). Then the young maidens returned to their post at the side, while the high priest, taking sea water in a gourd, went up into the marae and sprinkled it everywhere, as he called upon the tutelar god, whose name he repeated, to take possession of his new home, and to make welcome his guests, the hosts of gods. This was called the *hao-marae* (establishing the marae). After this part of the ceremony, the king ascended and crossed the middle of the structure, descended on the opposite side, and returned to his post. Following this act, called the *eera'a o te ari'i* (the mounting of the king), the high priest pronounced the marae *mo'a roa* (superlatively holy), and the procession again resumed order and repaired to the assembly ground. All the people that had been present followed, and the commonalty and women returned no more to that marae.

The division of food next took place. A portion of the best was presented by the orator to the priests for the gods, then a goodly portion was presented to the sovereign, the remainder was distributed among the different clans. The greatest propriety was observed by all parties concerned in the sacred marae inauguration feast, as it was believed that eating greedily or indulging in any excess of rioting would bring upon the offenders immediate calamity from the gods, such as choking while eating, strangulation, blindness, and many other troubles. (Henry 1928:137-138)

The religious rituals held at tribal marae pertained mainly to war and peace (including resanctification after defeat), to first-fruit and *tavau*-like levies, to visits of important officials, to great seasonal festivals, to tribal rites of thanksgiving and atonement, to resanctification of the marae tutelars, and to critical life-cycle events of the chief and his successor. All these ceremonies have been or will be described elsewhere. Of more immediate interest at present are the social relations between tribal and other tutelars, and between tribal tutelars and tribal members, as manifested in these tribal rites.

That a tribal tutelar was regarded as more effective than other tutelars within his domain is undoubtedly true, although I know of only one specific instance wherein such powers were explicitly compared.⁴⁰ Evidence for

the tribal tutelary's superior sacredness is expressed in unmistakable terms in an episode of that most awesome rite of *paiatua*, "the assembling and uncovering of the gods," namely, its culminating *taritoara'a atua*, or "god's exchange." This episode, it will be recalled, consisted of a refurbishing of the images of lesser tutelars—presumably those of the tribe's constituent kin-and occupational-congregations—with feathers taken from the image of the tribal tutelary itself: surely, one of the most unequivocal symbolic messages concerning religico-political integration ever designed.⁴¹

I have no explicit evidence concerning the kind of relationship that existed between a tribe's tutelary spirit and a member whose kin-congregation tutelary he happened not to be; but from other kinds of evidence I am led to believe that the relationship was not a direct one. Generally speaking, except for shamanistic episodes, a Maohi approached his tutelary spirits—as distinct from his spirit-familiars—"through channels"; and if this were true with kin-congregation tutelars, it was doubly so with those awesome spirit eminences, the tutelars of a whole tribe. To a people conditioned to ideas of social hierarchy and spirit truculence, a direct approach to a tribal deity would probably have been considered both impudent and dangerous. On the other hand, the Maohis were not beyond switching allegiance from one tutelary to another, if the old one did not act his part. And at the same time, Maohis were capable of allegiance to any number of tutelars, provided the latter were not at odds.

Fattening of Youths

I described in chapter 13 the custom of *ha'apori* (fattening) and the practice followed in some places whereby large numbers of youths went through the process together. The culmination of these events, it will be recalled, consisted of a public exhibition of the fattened youths, and their presentation to their tribal chief. If this institution contains meaning and functions other than such obvious ones as enhancement of physical well-being, of beauty, and possibly of virility, I am unable to document them.

One possible line of speculation is that the institution was a practical measure designed to improve a tribe's manpower resources—whether actually "true" or not, corpulence does seem to have been regarded as associated with physical strength, both phenotypically *and* genotypically, and perhaps with "psychic" strength as well. In any case, whatever deeper meanings may have been attached to this institution, it does appear to have been, in some places at least, a tribal affair.

Carnivals

Festive moods prevailed at most kinds of tribal assemblies, but there were two kinds of tribal assemblies that appear to have been primarily devoted

to entertainment—although religious rationales and religious rituals figured prominently in these as well. One of these, the so-called harvest festival celebrated at the height of the season of plant-food abundance, was described in chapter 9. Another, which sometimes accompanied other assemblies, but at times was celebrated alone, occurred during visits of large troupes of Ariois, and was described in the preceding chapter. These most brilliant of Maohi carnivals usually took place at the headquarters of tribal chiefs, and were usually joined in by all members of any tribe who could walk or be carried to the spot.

Rites for the Chief

A cursory reading of the sources might well create the impression that a very large proportion of the Maohis' actions were for the principal purpose of supporting and glorifying their chiefs. Much of this impression derives from bias in the sources themselves; as I noted earlier, the European chroniclers of Maohi life were habituated (and apparently not dissident) to aristocratic societies at home, and they saw nothing bizarre or repugnant in nonegalitarianism as an organizing principal of society. Moreover, for practical considerations, and probably by preference, they focused most of their attention upon events involving tribal chiefs.

But this impression cannot be attributed entirely to the chroniclers' biases. It is simply an undeniable fact of Maohi life that a very large proportion of social activity was indeed focused upon the persons and the actions of chiefs in general (whatever their social unit) and of tribal chiefs in particular. While this applies generally to nearly every aspect of a tribal chief's person and actions, it is especially applicable to his birth, head freeing, tattooing, supercision, marriage, office-taking, illness, and death. The only one of these events yet to be described is office-taking, which in many respects is the one most relevant to our present concern with tribal aspects of social relations. Accordingly, I shall reproduce the fullest available accounts of office-taking, before discussing some of the features of all such events which appear to bear on tribalism.

The fullest available accounts of tribal-chief office-taking, *fa'aari'ira'a* (literally, *ari'i*-making), are found in Henry, Ellis, Moerenhout, and Morrison. Unfortunately for our purposes, these relate only to the ceremonies attending the assumption of chieftainship over tribes of considerable complexity, and involving the incumbent of a feather-girdle kin-Title. While it is logical to suppose that chiefly investiture ceremonies of less complex tribes contained some of the same kinds of objects and actions, that must remain an undocumentable assumption.

Prior to any such investiture it was, of course, essential for the would-be chief to make certain of enough human and spirit support for his claims.

Unless elected or confirmed to the office by some prior action, heralds were sent around the region over which he claimed authority in order to assure himself of human support. According to Moerenhout these heralds carried two chiefly standards, flags or banners—one representing the former chief and one the new. These were shown to each subtribal chief, who either acknowledged them, thereby giving consent to the new chief's claims, or ignored and destroyed them, thereby refuting such claims. Some claimants thus challenged tested their strength in warfare, but others appear to have let the matter stand, reducing their claims accordingly, at least for the time being.

Morrison provided a first-hand account of one such episode, which will be reproduced in volume 3. To that description he added: "If a Man of Property is found Guilty of a Crime which deserves death he is punishd as well as the Poorest in the Island. An Instance of this we saw at the time the Young King was invested with the Royal Marro—one of the first Men in Morea being sacraficed for attempting to stop the Flag from Passing through his land on that Island." (1935:207)

To secure spirit support for a claim to tribal chiefly authority it was sometimes essential for the claimant to obtain priestly backing, especially when chieftainship over a more complex tribe was in question:

... as this elevation to supreme power was ordained by the gods, any chief who wished to obtain this honor for himself and his family first found it necessary to apply to the priests [for recognition] no matter how powerful he might have been [in terms of military strength]; because, even though he might have overcome all his rivals by force of arms, he could not gain recognition of his authority from them as long as the grand priest had not proclaimed it as divine will. This proclamation was made by sending a herald carrying a flag into every district, and if the chief in question was indeed powerful and also had the support of the high clergy, it was rare that the other chiefs dared to refuse him their homage. (Moerenhout 1837:II, 28)

The most detailed account we possess of chiefly office-taking is Henry's, which purported to describe specifically the procedures followed at Opoa in installing the sovereign chief of all Ra'iatea,⁴² but which seems to resemble closely the procedures followed elsewhere for installing chiefs of tribes of comparable complexity. In reproducing Henry's account, I append some notes designed not only to clarify but to expand Henry's treatment of certain episodes.

The ceremony for the inauguration of a king or queen (*fa'aari'ira'a*) of Ra'iatea was the same as that for all sovereigns of the group. It was a time of the greatest moment to the nation, and extensive preparations were made for several months. Food was cultivated for a great feast, to which were to be invited guests, representatives from neighboring kingdoms; the choicest materials for vestments, which were *ruru* (rolls of cloth), *tiputa*, capes of purau bark and of cloth, ornamented or plain, and also of 'ura or black feathers were made; and greatest of all the work was the con-

catenating of a new lappet to the *maro 'ura* ('*ura* feather girdle), the royal insignia in which the monarch of either sex was invested on the ascension day. The girdle derived superlative sacredness from some of the feathers, which were taken from the image of the tutelar god, who in later times in Ra'iatea, Tahiti, and Porapora was 'Oro, while Tane remained supreme in Huahine.

The royal girdle was an article of very skilful workmanship, which consisted of a close network of fine, strong threads of the *ro'a* bark (a kind of flax), and a background of choice *ora* (banyan cloth), closely perforated. In each little hole was set the stem of an '*ura* feather, which was caught in a lock stitch on the opposite side with a long polished needle of human bone, and set closely against the next one to imitate bird's plumage. Artistic patterns, mostly in squares, were thus formed by turning the feathers in different directions, answering nearest to hieroglyphics of anything in the handiwork of these islands. For they symbolize to the national chronicler the name, the character, and the acts of every monarch that reigned and the annals of the land which were faithfully recorded in chants and songs of those times.^[a]

The sacred needle was never taken out of the work, which was intended to continue forever, a new lappet being added for each successive reign. A human victim was sacrificed for the *mau raa titi* (perforating the cloth), for the *tuir'a'a o te au* (first putting in of the needle), and for the *piura'a o te maro* (completing of the maro), and during the performance of these cruel rites it is said that the gods manifested their approbation by sending flashes of lightning upon the scene with loud peals of thunder, even when the sky was unclouded. The royal red maro of the Tamatoa family of Ra'iatea being the most ancient in the group was the longest, measuring twenty-one feet in length and six inches in width.^[b]...

The canoe builders were busy choosing good timber and skillfully making a new canoe, called *te-va'a-roa-i-te-mata'i* (the-long-canoe-in-the-wind), for the god and paddles for it, called *mehine-i-te-ata* (moon-in-the-clouds), when using which the paddlers looked up into the sky. The discarded canoes were used for sacred fires at marae.

The priests had a marae weeding and *pa'i-atua* ceremonies, and they fasted much and prayed at the marae, invoking the favor of all the hosts of gods for the new king, that his sins of omission and commission might be forgiven and that his reign might be prosperous. These devotions were called *pure manava huihui na te tahu'a* (prayers with throbbing vitals of the priests), for they felt the solemnity of the occasion.

On the eve of the great day, at Ra'iatea, for instance, the clergy of the royal marae held sacred vigils throughout the night at Taputapuatea marae in Opoa, inviting all the hosts of gods to be present on the morrow, as for the *paiatua*.... This was called *pure toiaha, pure iri anu a te tahu'a* (weighty prayers, prayers with chilly skin of the priests,^[c] and as the morning was ushered in, the gods were said to be heard flying and whistling around the marae and all over Opoa.

a. This is the only reference I know of which proposes that the "designs" worked into a *maro* were "symbolic"; in the absence of supporting evidence I suggest that Miss Henry's proposal is unwarranted.

b. A note accompanying this text states that this *maro* was subsequently sent by the king, "in the early days of his conversion," to the LMS Museum in England, from which it later disappeared.

c. So-called because the officiants were required to carry out their duties in the chill of the night and without extra clothing. (See chap. 3, section on religious ritual.)

It was a most sacred spell, and another human victim was slain in honor of the gods before commencing the inauguration ceremonies for which all who were to take part had sanctified themselves. It was said that a root of the great banyan tree believed to have come from the moon, which struck out from a branch at the royal birth, on that morning reached the ground.^[d]

Soon upon the sea and along the shore a semibarbarous pageantry took place. A long flotilla bearing nude men and women of the *arioi* and *hihimoa* fast element,^[e] headed by the new *anuanua* (rainbow) or sacred canoe of 'Oro, which was distinguished from all the rest by *tapaau* (coconut-leaf images), *viriviri* (braided coconut-leaf) chaplets suspended around its borders, and by the presence of *opunui*^[f] who named it, dressed in their best marae costumes, each carrying a *tapaau* on his left arm and wearing wreaths of coconut leaves. The canoe had a platform towards the center for 'Oro and the coming sovereign. Inauguration ceremonies for either sex were the same rank, waiving restrictions on state occasions.^[g] The heralds, called *tama horo fetu pao* (sons running meteors), and people on shore contrasted favorably with those on the canoe, being arrayed in their gayest and best attire, decked in wreaths and garlands. Then came the solemn procession with shoulders bare heralded by blasts of 'Oro's trumpet, *pu-o-roroi-tau* (trumpet-of-ages), and his sacred marae drum, *pahu-rutu-roa* (long-beating-drum), from Taputapuatea inland to the great sacred white stone pillar, *te-papa-o-ruera* (the-rock-of- investment). The following order was observed: first the *tiri moa* (holy nurse of the god) bearing 'Oro's image exposed to view in all its brilliant 'ura feathers; next the new sovereign in a waist cloth of sacred marae tapa, accompanied by the chiefs of the realm, four of whom bore him upon their shoulders on a large wooden couch,^[h] and closing in the rear the high priest followed by the clergy of his marae.

As the procession passed, the spectators on either side gave it wide berth. 'Oro's image was carried on to the god's canoe, followed by all the priests except the high priest, who remained with the king or queen; and the sovereign, surrounded by chiefs, seated himself upon the throne placed near the seaside. Thence, the high priest and the king went into the sea, facing Te-ava-moa (The-sacred-harbor), where the king, keeping on his waistcloth, simply immersed himself, while the high priest with a miro twig in his hand sprayed water upon him, pronouncing him clean and chanting the *pure utuhi* (invocation for dipping).^[i]

PURE UTUHI

Fa'aatea no te ari'i e tae i Motu Tapu;

Make way for the king onwards to the
sacred Isle;

d. This refers to the 'aoa (banyan, *Ficus prolixa*?), which was believed to have set forth a new fibrous branch at the time of birth of a successor to a chiefly office; the branch finally reached the ground on the day of the successor's investiture in office. (Ellis 1829:II, 353-354.)

e. *Hihimoa*: I have come across no other references to such persons and am unable to clarify the etymology; *hihimoa*, "the feathers on the back of a fowl's neck," or *hihi* (rays of sun; whiskers of rat), *mo'a* (sacred)?

f. *Opū nui*, "big bellies"; marae attendants, (see chap. 21).

g. I take this somewhat obscure statement to mean that the ceremonies under consideration were performed in essentially the same manner whether the investee were male or female.

h. An accompanying footnote adds: "The couch was hewn out of solid miro wood. It had four legs, a raised piece forming a pillow, and carvings at each end. It was called the *parahiraa* or *nohoraa aru* (royal seat or throne)." (Henry 1928:190.)

i. According to Ellis, the purpose of this episode was "to purify the king from all mahuru huru, or defilement and guilt, which he might have contracted, according to their own expression, by his having seized any land, banished any people, committed murder &c" (1829:II, 357).

E papa e haruru te ra'i i ni'a e!
 I te maro 'ura e!
 Ua 'ura tini
 I te ahu taa
 I to maro 'ura na e tau ari'i e.
 Tuia te ra'i i ni'a e,
 E te ari'i nui ia 'Oro Toa,
 Te tupuai fa'aari'i o Ra'iatea,
 Rerea i te 'ura i Hauviri.
 Horo te arere te haha i ni'a ia 'Oro
 Ia hio mai ai ia Ra'iatea
 I mua i to maro 'ura na e!
 Tau ari'i o te ra'i e te maro 'ura e
 Ua 'ura tini
 I te ahu taa
 I to maro 'ura na e ta'u ari'i e
 Ei hea hume ai
 To maro 'ura na e ta'u ari'i e?
 Ei te tai tua mai o Taputapuatea.
 A tiu ta ria roohia
 Te pure ari'i i te utuhi
 Ua puni a'enei te uru o 'Oro
 I te rau o te 'ura
 Manu na te ra'i e!
 Manu tahi atua
 Te 'ura amo a'e
 I te pure i te rau ora

 Ua oti te maro o te ari'i
 Tatou e noho ai e
 Tui te noroa o maeva rua

 Na 'Oro te metua o 'oe.
 E ti'i i te 'ura tei Tahuea
 Raverave noa mai i te pua tiri
 O 'ura i te ara o Tane
 E noa'a i reira
 O te 'ura rau nui
 Ahiri ho'i e ora na o Tumaraa
 Eo Tevaitoa i te Rapatia
 Ei ono i to maro 'ura
 E ta'u ari'i e
 Te ra'i e te maro 'ura e!
 Te'ura tini
 O te ahu taa
 I to maro 'ura na, e tau ari'i e
 E ti'i i te 'ura ia tini
 Ia mano i anapanapa
 I te ahu taa ha'amana

Loud peals resound in the sky above, O!
 For the red girdle, O!
 Numerous are the 'ura feathers
 From the wall of jawbones^[j]
 In thy red girdle, O my king.
 The sky is reached above,
 By the great Warrior Sovereign 'Oro,
 The high investor of Ra'iatea's kings,
 Flying in the feathers of Hauviri.
 Let the herald run up fearlessly to 'Oro
 As he looks down to Ra'iatea
 Upon thy red girdle,^[k] O!
 O my king of the skies and the red girdle,
 Numerous are the 'ura feathers
 From the wall of jawbones.
 In thy red girdle, O my king,
 Where shall the girding on
 Of thy red girdle be, O my king?
 Upon the seaside of Taputapuatea.
 In a vision the king saw in
 His royal prayer for the immersion
 Enchantment of 'Oro secreted
 In the body of the 'ura (feathers)
 Of the heavenly birds, O!
 The unique birds of the gods
 The 'ura (feathers) carried.
 To the service upon the long sides (of
 the marae)
 Finished is the girdle of the king
 Which is why we are here, O!
 Strong are the prayers for the double
 greeting
 To 'Oro, the father, and to thee.
 Fetch 'ura (feathers) from Tahuea marae
 Bring forth flowers in profusion,
 'Ura (feathers) on the track of Tane
 Obtained from there,
 Great 'ura feathers.
 Behold then, awake are Tumaraa
 And Tevaitoa^[l] to brave vicissitudes,
 To stand by thy red girdle,
 O my king.
 The sky and the red girdle,
 Thousands be the 'ura feathers.^[m]
 From the wall of jawbones
 In thy red girdle, o my king,
 Fetch 'ura (feathers) in abundance.
 Let there be thousands resplendent
 At the wall of jawbones, which gave power

j. An accompanying footnote explains this as having reference to the walls of the marae, where skulls and jawbones of defeated enemies were sometimes kept.

k. A footnote points out that the 'ura girdle was also an emblem of the aurora.

l. Tumara'a and Tevaitoa were two of the nine subdivisions of Ra'iatea. (See chap. 25.)

m. Some of the feathers used in adding the lappet to the maro were from the reserve kept in the marae, and already charged with sacredness.

'Ura i tau rere
Iriti a te papa ia hute.

Te tapa ia i to maro 'ura na
E ta'u ari'i e!
Te ra'i e te maro 'ura e
Ia 'ura tini
I te ahu taa
I to maro 'ura na, e ta'u ari'i e.
Ta'u Ari'i 'oe, a ti'a i ni'a
I te tua o Marama;
E ti'a i ni'a
Ia Ra'iatea nui hau Marama
E to i te tini e to i te mano,

E to i te mata
O Ra'iatea nui e vau.
Tau Ari'i 'oe i te fa'anehenehe,
To roro una,
Hei atu a i Taputapuatea,
Te 'Oro matau tua, 'oe e ta'u ari'i e.

To the 'ura feathers that settled and flew
Were the rock^[n] taken up, glory would
depart.

That is the strength [*tapa*^o] of thy red girdle,
O my king!
The sky and the red girdle, O!
Thousands be the 'ura feathers
From the wall of jawbones
In thy red girdle, O my king.
My king, thou arise
From the Sea of the Moon,^[p]
Arise
To great Ra'iatea of the peaceful Moon
And draw the tens, and draw the thou-
sands,
And draw the whole
Of Ra'iatea of eight [districts].
My king thou, to be adorned,
Thy brain indeed shall be
Crowned by the god of Taputapuatea,
By 'Oro inured to the sea, O thou, my king.

Then the king stood up and faced the sacred passage, where it is said that he was approached by two deified sharks, Tuu-mao (Let-go-shark) and Ta-hui (By-the-clan), which were always the first to come and pay their respects to a legitimate heir to the throne, but kept out of sight of a usurper. They swam in joyously and rubbed caressingly against the royal person, who feared them not, and then returned to the open sea.^[q]

After his chant, the high priest conducted the king back to his seat, upon which the chiefs bore him reclining to the great stone pillar, at the foot of which were placed in readiness the royal insignia: the famous red maro, tipped with black feathers; a waist girdle; a red 'ura toque; a *tahiri* (fan), which was a waving cluster of tail feathers of the man-of-war bird and the tropic bird, attached to a long pole like a great duster and resembling the royal kahili of Hawaii; a long toa spear; and a miro walking stick. By the pillar the high priest performed the inauguration ceremony, called the *pure rahi o te atoreiau* (great invocation of inauguration):

The king, clad in a small dry maro cloth^[r] (loin girdle), stood in front of the pillar with his chiefs in the rear and on either side of him, and the high priest, introducing the royal symbols to him, explained their signification and disposed of them in their proper places.^[s] Pointing to the pillar, the priest said, "To *papa-ia-ruea*" (Thy rock-of-investment); pointing to the wooden pillow upon

n. Refers to the stone column of investment.

o. An inference that might be drawn from this is that the feathers in question were also "empowered" as a result of their association with the human remains reposing in the marae—that is, that at least some of a chief's *tapa* was derived from the enemies slain in tribal wars. Henry translated *tapa* as "strength," whereas the LMS Dictionary defines it as "the groin." I am not sure about either of these translations, but there is much in Maohi metaphoric imagery to support a linkage between the two.

p. Native name for the waters between Ra'iatea and Tahiti-Mo'orea.

q. An occurrence which was, of course, attested by impeccably reliable witnesses—or so claims a footnote!

r. Or, if the investee were a female, a footnote hastens to point out, she would have been more modestly attired, in *pareu* and cape.

s. Moerenhout described this episode as having taken place in the "sacred" canoe rather than at the marae.

the throne, he said, “*To rurua, o Fefeu*” (Thy pillow, Spread-out); presenting the *tahiri*, he said, “*To tahiri, o Nunaa-e-hau*” (Thy fan, Nation-of-peace), which the king passed into the hands of his senior chief, who held it upright upon the paving beside him, the plumes rising high above the King’s head, “*To taupo’o, te Ata-o-tu*” (Thy toque, the Cloud-of-Tu), he said, placing the toque upon the king’s head; “*To tatua, o Manava-taia*” (Thy waist girdle, Sensitive-conscience), adjusting it upon him; “*A rave i to omore ia Huia-i-te-Ra’i*” (Take thy spear, Family-of-the-sky), which the king received and passed on to the next high chief; “*A rave i to to’oto’o ia Paia-i-te-faurua*” (Take thy staff, Double-pure-descent), which he placed in the hands of a third chief; and finally the priest said, “*A maro i to maro, ia Te-ra’i-pua-tata*” (Gird on thy loin girdle, Sky-of-the aurora); and the most sacred of all the symbols was so placed upon the king as to have one end gracefully streaming before him, and the other behind. Then as he sat upon his throne bare-shouldered in that sacred locality, the chiefs raised him to view on top of the pillar by stepping upon stones placed to the right and left for that purpose, and there the people on land and sea held up their hands and greeted him deafeningly many times with “*Maeva Ari’i! maeva Ari’i!*” (Hail, King! hail, King!).

From the pillar the chiefs bore the king, still enthroned, to the sacred canoe and placed him side by side with the image of his spiritual father, ‘Oro, the high priest standing beside them. Then the steerman gave the signal for the flotilla to set out by striking the paddle against the side of the canoe, and immediately the trumpets blew and the drums beat and they went forwards, up into the bay of Toa-hiva and out to the sacred passage, the high priest pronouncing the *pure-fau-fenua* (invocation-for-highest chieftainship), declaring the king lord of the land and sea and all upon and within them, and invoking the hosts of gods, still supposed to be around them, to aid the new king in wisely governing his people, to be with him in peace or in war, to extend sway to the east and west, to the north and south, and to bring all other monarchs under his feet [italics added].

On landing on the shore whence they had departed they returned to the inner marae at Taputapuataea in the same manner as they had come out. The procession formed as before, except that the king, borne upon the shoulders of the four high chiefs of the royal house, reclined in royal array upon his throne. Following the priest carrying ‘Oro’s image they went up into the marae, where all took their respective places, the image being placed upon a mat in the *avaa*, the king by his leaning slab, the trumpeters by the drummers, and the priests and chiefs in the rear. Then the high priest concluded the inauguration ceremony by plucking out the eye of one more human victim and proffering it to the sovereign, who made a semblance to receive and swallow it, but in reality did not touch it. This was intended to give keen perception and farsightedness to the recipient and was called *pivai-ari’i* (apart-with-sovereign).^[t] The high priest then said:

A hi’o i to mou’a ia Te-a’e-tapu,

Behold the mountain Te-a’e-tapu (Pervading-sacredness).

A horo i to tahua, O Mata-tu-tahua-roa.

Run upon thine assembly ground, Mata-tu-tahua-roa.

A hopu i to vai, ia Via-tiare.

Bathe in thy water, Vai-tiare (Gardenia-pool [a small sacred pool]).

A ‘au i to vai, ia Ra’i-to-moana.

Swim in thy river, Ra’i-to-moana (Sky-drawing-the-ocean).

t. According to Moerenhout, the officiating priest extracted both eyes of the victim, offering the right one to the tutelar’s image and the left one to the investee (1837:II, 25).

Pau i to vai ia Vai-tara-toa.

Splash thy water, Vai-tara-toa (Water-of-sharp-rocks).

A hi'o i to 'outu, ia Mata-hira-i-te-ra'i.

Behold thy cape, Mata-hiri-i-te-ra'i (Face-flinching-at-the-sky).

They then took leave of 'Oro and the marae, ... the image was put to bed and carried home to the *fare-ia-manaha*, and after announcing to the public that the solemnity was ended and the festivity and gaieties were to begin, the trumpets and drums were also put away.

The priests put on fine ordinary clothing, the chiefs their official feather vestments with the gorgeous *taumi* upon their heads; and over the shoulders of the king, in his girdles and toque, was thrown a *tiputa* (poncho) of glossy black, red, and yellow feathers, finished around the neck with 'oro'oro (clusters of feathers) of the man-of-war bird, and extending down to his throne. Again, amidst the assembled throng, the air was rent with "Maeva ari'i!" accompanied with the raising of hands. The nude party, some of whom were mounted upon trees, hailed him as monarch of their persons, suiting actions to words in language too primitive to be repeated. A queen was happily exempted from this undignified greeting.^[u]

All the dignitaries of the land were dressed in official garb, and the king on his throne was finally borne on to a stone platform covered with mats laid upon long 'aretu (grass) and sheltered with an awning of coconut leaves, which was beautifully decorated with green and yellow coconut and ti leaves and flowers. Here, with the queen and royal household and his counsellors, he reviewed and received the loyal greetings of his chiefs and chiefesses, who headed long processions of the people of their districts. The people were assembled in proper order for the great feast that was to take place in long coconut-leaf sheds upon the assembly ground.

After the inauguration festivity, the king's 'ura feather maro, the most sacred of all his royal insignia, was carefully wrapped in tapa and a mat by itself, and the cape and toque were in like manner wrapped by themselves and put away in the *fare-ia-manaha*. The only other occasions on which he appeared in state were: at the marriage of an heir apparent; at a reception of the sovereign of another realm as a great guest; and when concluding peace after war. Without the other two appendages the king wore his maro for the *pa'i-atua* service, and it was spread out to view for the *pure ari'i* or prayer for the king before commencing war, as was seen by Captain Cook. (Henry 1928: 188-195)

As I noted above, Henry's account of chiefly office-taking, the fullest available, refers specifically to Ra'iatea. Ellis' account is less detailed and appears to refer more particularly to Tahiti, and the same is true of Moerenhout's.⁴³ Moreover, if one uses the Henry version as a base, those of Ellis and Moerenhout will be found to expand, omit, combine, or reverse the sequence of certain episodes. The expanded versions of episodes

u. Ellis wrote, "A veil must be thrown over the vices with which the ceremonies were concluded" (1829:II, 359). Moerenhout wrote, "... une scène qui devait en ravalant singulièrement la solennité, et dont le simple exposé ne pourra que blesser étrangement la délicatesse européenne." But, he went on to explain: "The chief or king, while reclining on a mat near the god's image, received what was termed the populace's *ultimate* mark of respect. This consisted of dances and gestures of shocking filthiness, of the grossest kind of obscenity, wherein stark naked men and women surrounded the king and attempted to touch him with various parts of their bodies—even including their urine and excrement." (1837:II, 27)

have been reported in my notes to the Henry text; as for the omissions, combinations, reversals, and so forth, I believe these to be of no great weight in terms of this important ceremony's overall social significance and symbolic messages, which I shall now attempt to elucidate.⁴⁴

First of all, with an exception to be noted below, there is nothing especially distinctive about the ritual idiom in which the ceremony was performed—at least not with respect to the symbolic referents of specific ritual objects and acts. (As will be pointed out, the ceremony's distinctiveness lies rather in the ways these ritual "phrases" were juxtaposed—i.e., in syntax rather than lexicon.) As with all Maohi ritual, spirits played indispensable roles; and the messages contained in the various objects—feathers, seawater, chiefly insignia, sacrificial victims; actions—spirit-validation, tribute rendering, commensal eating; and locations—land and sea settings—were fairly conventional and (hopefully, by now) not altogether obscure to the reader. (The symbolic referent of the number *four* is, however, not clear to me.)

Second, most of the secular, *political*, aspects of the ceremony are intelligible, and consistent with conventional expressions of social relations: I refer to the "tributary" contributions of subtribal chiefs, the tokens of recognition of chiefs of other tribes, the implication of universal tribal involvement contained in the redistribution and joint consumption of the collected foods, and so on. Also, the various acts of obeisance and acclamation are wholly consistent with conventional Maohi behavior toward persons in authority.

On the other hand, I must confess my perplexity concerning the "indignities" heaped upon the chief by the party of nude celebrants. If these gestures had only to do with sexuality, and if semen alone were applied to the chief's person, one could perhaps interpret this episode as a rite of fertility, a reference to beliefs in a chief's mystical association with tribal fertility, natural and human, which some writers on Polynesian chieftainship assert to have been widespread. However, the addition of urine and excrement to these "indignities" seems to me to imply another dimension. It is of course possible that urine and excrement had associations with sexuality; but I believe that not to be so, and that excrement, at least, was indeed associated with "indignity."⁴⁵ This being the case, the only explanation I can offer for subjecting the newly vested chief to so gross an indignity, in a context otherwise characterized by such heights of dignification, is to regard the behavior as a caveat: that is, "Eminent as you are, and powerful as you seem to be, you remain vulnerable to the moods of spirits and consequences of your actions with humans." Belief in the fickleness of spirits has already been documented, and later on I shall adduce evidence of the social constraints imposed upon even the most glorified of chiefs—so this interpretation is not altogether without basis.

But far more noteworthy than this ritual juxtaposition of glorification and debasement is the extent to which the ceremony combined recognition of what appear in Western eyes to be two contrasting bases for chiefly legitimation, that is, *descent* versus *coercive force*. On the one hand, the chief's authority was represented by several symbolic means as his by right of birth, ultimately by descent from the tutelar himself, thus explaining as well as legitimizing his exalted status. On the other hand, certain other expressions, verbal and otherwise, substantiated his status in terms of his martial successes. And though in one ritual episode the victorious chief was required to be expurgated of the mystically dangerous consequences of his aggressive use of force, another episode expressed the wish and intent for more of the same.

Of course, for any individual to attain chieftainship over tribal units as large and complex as those involved in the office-taking ceremonies now under consideration, both descent *and* coercive force were required to a degree that may not have obtained with chieftainship over less complex tribes. But one must also consider the possibility that what we view as contrasting bases of legitimation were not so regarded by the Maohis themselves. It may have been that descent and coercive force were inseparable and valid bases for tribal chieftainship, not only in the realities of Maohi history but in Maohi ideology as well. Indeed, in terms of Maohi history, the route to chieftainship of a complex tribe involved not only descent and coercive force, but other factors as well.

ROUTES TO TRIBAL CHIEFTAINSHIP

Previous chapters should have made abundantly clear the importance of descent in allocating statuses of many kinds, including establishment of eligibility to positions of privilege and authority in kin-congregations. Within this same ideological frame I also noted the social weight that was attached to birth-order and maleness, and I drew attention to the rather distinctive timing practiced by the Maohis in transferring a kin-Title to a successor. At the same time I took pains to point out that kin-Title succession did not inevitably conform to priorities established by birth-order and sex, and that verbal transfer of Title did not usually betoken simultaneous transfer of the secular authority that went with it. If these constraints applied to chieftainship in a kin-congregation, they were even more applicable to chieftainship of a tribe.

There is no question but that chieftainship of a tribe devolved most customarily upon an incumbent's eldest son. But exceptions to the mode of succession were frequent enough to require discussion. Occasionally a chief himself named someone other than his eldest son to be his successor. On other occasions, the more influential persons of the realm (including

powerful subtribal chiefs, priests, and other relatives of the former chief intervened to elect some more desirable candidate—"desirability" having been defined to suit various interests, as we shall see.⁴⁶

One such case of the latter was described by Adams and concerned the head chieftainship of Papara:

Aromaiterai and Tuiteraï were the names of Teriitahia's two sons, and, if our genealogies are right, they must have been born, as I have said, between 1690 and 1700. Aromaiterai was the elder, and naturally claimed his father's position as head-chief. Tuiteraï disputed the claim, and, if the family tradition is correct, his plea raised a question worth noticing in these days, when the study of primitive law has become a hobby.

Tuiteraï's plea or defence seems to have turned on the idea that the eldest child, whether male or female, was the only heir who could set up an indefeasible right to the succession, and since the eldest child in this case, being a woman, had married and gone off to Raiatea, all the younger children had equal rights, and might with equal justice claim the position of head-chief.

This was one of the cases in which the sub-chiefs or Hiva must have been the judges, and although we know nothing about the reasons for their action or even the time when they acted, we do know that at one time or for a certain period they decided to send Aromaiterai away—banish him, in fact—and that they did it. (1901:33)

According to T. Salmon's legendary account of Porapora's dynastic struggles, when some of the sovereign chief's rebellious subjects ended his austere reign by killing him in battle, and were unable to agree upon one of themselves as a successor, they settled upon the dead sovereign's own son, though requiring him to dissociate himself from the past by assuming a new dynastic Title and occupying a new marae (n.d.:29).

Another case of "election" to tribal chieftainship concerned succession to Huahine's "Queen" Maeva, which I described in chapter 16. On that occasion, it will be remembered, the chief electors were the queen's own eight sons. Unable to agree upon one of themselves, they divided their votes between two Ra'iateans, one of whom finally won the office by a military ruse.

Moerenhout described still another situation involving election to chiefly office:

... after long periods of warfare, when all combatants have begun to be weary of the violence, it sometimes transpires that priests will initiate a proposal to designate a chief to rule over both sides, in order to make an end to the bloodshed. It was customary to name some young chief to this office, someone agreeable to all parties, and to provide him with dictatorial powers to resolve the severe strife. In such cases the investiture ceremony was the same as in ordinary situations of chiefly office-taking, and it was always the religious functionaries to whom such chiefs owed their position and the respects paid to them. (1837:II, 28)

No record is available concerning the civil procedures followed in such

"elections." Some of the reasons behind some of the choices can be guessed at—for example, the logic of adhering as closely as feasible to normal criteria of kin-office succession, or, in situations of stalemate, of settling upon relatively nonpartisan candidates. In other instances the electors may have been influenced by statesmanlike concern for fair and effective leadership, but I suspect that concern for narrower self-interest also frequently prevailed.

The legend of Honoura tells us little about election procedures, but it does add something to our impressions about what the Maohis generally sought for in their chiefs. Honoura, it will be recalled, was born in the form of a shapeless abortion and was left in a cave to survive as best he could. Eventually, however, he grew up to be a giant of a man, whose prodigious strength and warrior skill were matched only by his valorous spirit and generous good will. After a series of successful adventures against his tribe's enemies, he and his shipmates finally returned home: "... and when the people of Tahiti knew of Honoura's valour [*puai*] they all came to the bluffs to present him with the kingdom [*E pupu atura nona te hau*], but he quietly remained under the government [*hau*] of [*Chief*] Ta'ihia, and he did not usurp the power [*ai te hau*; i.e., 'eat the *hau*'] over the land of Tahiti" (Henry 1895:276-277).⁴⁷

The role of spirits in chiefly elections is easy to discern but difficult to weigh. We read in Henry's and other versions of the office-taking ceremony how shark deities were thought to express their view of the legitimacy of a new chief's claims, but there is no evidence that a rebuff from such deities would have put an end to the ceremony. We also read in Moerenhout's account that it was essential for a candidate to obtain priestly backing for his claims, but it is not explained on what basis the priests themselves made their choices: by divination? concern for their profession? broad public interest? or narrow self-seeking? Judging by the faith individuals were accustomed to repose in proven tutelars in connection with war and other enterprises, one can be sure that they depended upon such spirits to support them in their bids for chiefly authority, but it is not at all clear how spirits intervened in the election process itself.

In some instances individuals became tribal chiefs by the process of "self-selection," that is, they attained the office by forceful seizure of one kind or another: by assassination, by force of arms, by guile, or by political maneuver.⁴⁸ Of course, no individual acting alone could attain tribal chieftainship. Some social support (with or without evidence of spirit support) was indispensable; however, it was possible for a determined man, with a loyal and equally determined following, to achieve this office even though his party was small in numbers. Well-documented instances of this form of succession are lacking, but inferences regarding its prevalence are contained in many passages of legend and "history"—at least with respect to the less complex tribes.

Later on I shall describe some other attributes considered by the Maohis to be desirable in individuals holding tribal chieftainship, but the factors just discussed were the ones most influential in any individual's attainment of the office.⁴⁹

OTHER TRIBAL OFFICES

There may have been a time in Maohi history when a tribe's chief was sole administrator, war leader, high priest, seer, principal orator, font of knowledge, and so on—with staff assistance, when needed, provided mainly by his close relatives. But by the time of the eras under study, tribal units had reached sizes and orders of complexity that permitted or required a number of officials to perform these various offices. We do not possess information on the numbers of such officials in any specific tribe: a regrettable omission, since such information would provide better bases for generalizing about social evolution, with regard to such matters as role differentiation, cost of government, et cetera. The sources do, however, provide some information concerning the kinds of such officials in general, along with accounts of certain individual office-holders in particular tribes.

In most tribes that we know anything about, the office of high officiating priest of the tribal marae was held by someone other than the tribal chief himself. Probably all tribal chiefs were regarded as being closely akin to their tribal tutelars, and most if not all of them may have been acknowledged as priests on occasion, but none that we know of officiated regularly at tribal services at the tribal marae.⁵⁰

I indicated in chapter 21 the influence some individual tribal high priests exercised over tribal secular affairs, but we are now concerned with their *office* and its distinctiveness from that of tribal chief.

Owing to the official character of a tribal marae, one would be justified in classing other functionaries of such marae as tribal associate priests—sorcerers, big-bellies, image bearers—but having described these offices previously, I shall not do so again. A more difficult classification problem is raised by the offices of sage and teacher: it is not always clear whether some such offices were primarily associated with tribal marae or with the domestic establishments of individual tribal chiefs. In other words, are such specialists to be regarded as *tribal* functionaries or as members of personal retinues of high-ranking kin-Titleholders who happened also to be tribal chiefs? (A similar question arises with respect to certain other offices to be listed below.)

At first glance this question might appear to be trivial and hair-splitting; a closer look reveals it to be significant. I am examining here a crucial aspect of the process of *social evolution*—the cumulative changes in social relations which usually (perhaps even necessarily) accompany increase of a social unit's size. As set forth earlier in this chapter, the

available data on Maohi society indicate an evolution in the size and in the nature of territorial units, from small units composed mainly of kinfolk to larger units composed of several of the smaller ones linked together in part by nonkinship ties. Accompanying this change there was a numerical increase in offices having to do with affairs involving, on occasion, all of the unit's expanding memberships: this I believe to have been not only historically but perhaps inevitably so. But there was much less inevitability about the ways such offices could have developed. At one logical extreme were offices concerned more or less impersonally and indiscriminately with the welfare, and so forth, of the whole tribal membership; at the other extreme were offices concerned primarily with the welfare of the tribal chief, and with the rest of the tribe only insofar as this concerned the chief's personal welfare. (For, as we shall see, the interest and welfare of the chief and of the tribe were not always identical, despite certain writers' imputation of mystical identity of the two.) Among the Maohis, as in perhaps all human societies undergoing increase in the size of their territorial units, both types of offices were to be found; but the important question is, Which type predominated during the eras now under study, and in which of these two possible directions did the society appear to be moving? In other words, was Maohi tribal government moving more in the direction of constitutionally based statuses administered and otherwise served by an impersonal, politically neutral bureaucracy, or in the direction of societies run principally for their rulers' own advantage by supporters committed to their rulers' personal causes? (There may be other possible directions open to societies like those of Polynesia prior to European contact, but these represent one pair of logical extremes.)

Returning now to the offices of sage and teacher, with which this excursus began, the information supplied concerning them is not sufficient to enable us to decide directly which type they exemplified. Moreover, the question is complicated by the possibility that a teacher, say, in one tribe fitted into the structure of his tribe in a way different from a teacher in another. It does appear, however, from the nature of most of the knowledge and skills which these officials professed, that they served principally the interests of the higher classes of society, including those of the tribal chiefs. But let us go on to other officials more or less tribal in scope.

Since coercive force was perhaps the principal factor in putting and holding together large and complex territorial units, the roles of military specialists may be regarded as mainly tribal in character. A tribe's sovereign was invariably commander-in-chief in wartime. Some tribal sovereigns also served as tactical field commanders, or battle shapers, but that was not always the case. The question is, Where did the loyalties of such nonsovereign field commanders mainly lie: with the tribal membership as a whole, or with the sovereign's own personal advantage? There is not much infor-

mation bearing on this question, but what there is indicates that there were both tribal and situational differences in this regard. Some field commanders appear to have been unfalteringly loyal to their sovereigns whatever the military cost, while a few acted independently, or even insubordinately. In most of the latter instances the field commander in question was chief of a powerful subtribe, whose "loyalty" to the tribal sovereign was tenuous at best. (Such situations seem to have posed a chronic problem to the sovereigns of most complex tribes: that is, internal cohesion and success against other tribes required the support and leadership skills of subtribal chiefs who often had diverse ambitions of their own.)

The sources do not indicate what positions battle exhorters (*rauti*) occupied in a tribe's normal hierarchic structure. They were described as having been "of commanding person and military prowess" (Ellis 1829:II, 487-488), and presumably they were drawn from any and all tribal subdivisions. But whether they served the sovereign in particular or the tribal force as a whole, or whether they acted more narrowly to stimulate the fury of their own subdivisions, is not reported. A passage in one exhortation suggests the former role for some of them (Henry 1928:306):

"There is a king above, who is the speaker of armies,
The roller of the skies.
Set about your errand, O warriors, O brave men.
Accomplish your errand,
O warriors, upon the flat mountain battlefield
Of Ta'aroa, whose curse is death!
From the will send out
An ocean storm battle.
Soon thy paving, O my king,
Will flow with the blood of the slain.

Another passage suggests tribal patriotism (p. 308):

As for 'Uporu it is the home of the gods.
But as for Havai'i (Ra'iatea)
It is strong rock
Of the night from whence sprang Vavau (Porapora).
Rouse up friends! Ye sons here,
Ye sons here, rouse up!
Rouse up adhering to your land;
Rouse up, rouse up, adhering
To your land peopled inland and coastward.
Fly up? Ah yes!
Simultaneously? Ah yes!
O generation of red (sunburned) backs,
Be ready for action,
Be troops to stand against,
To save, to break the storm (war),
To let the hurricane spend itself.

Still another passage indicates a concern for the population at large (p. 309):

Let them [the enemy] no longer persist
 In this bad play, fighting,
 Let their valiant men sue for peace,
 For a bed for their carcasses,
 That their children may live tranquilly upon the seashore.

On the other hand, most passages of war “exhortations” that have been translated (I find some of these to be quite “untranslatable”) have little or nothing to do with “loyalty” to any social entity—tribe, subtribe, or chief—but only with the fury and glory of combat.

A passage from the “Precepts of Tetunae” charges people to “bear respect toward the *‘aito*; they all protect *te tura o ta te fenua*.” *Fenua* refers literally to territory or to territorial social unit, and *tura* means “to be exalted, to be invested with power, to have honor,” and hence the phrase could signify “the power, honor, and prestige of the tribe.” On the other hand, in view of the Maohi penchant for this kind of metaphor, the phrase might well refer to the sovereign chief as embodiment of the tribe’s power. In any case, except possibly for those constituting a chief’s own bodyguard, on the evidence available I cannot justifiably identify the main loyalties of *‘aito* as either tribal (or subtribal) or personal. The probability is that there were some of each.

Turning now to those offices concerned with the administration of tribal affairs, it is necessary first of all to distinguish between *line* and *staff* offices: the former having been the chiefs of subdivisions of the tribe, the latter having been concerned with affairs of the tribe as a whole.

The relationship between a tribe’s sovereign chief and its subtribal chiefs (i.e., the chiefs of its major territorial subdivisions) was one of the most important but unstable and ill-defined in Maohi society. I shall have more to say about these relationships later on.

In some tribes the principal administrative officer presumably was the chief himself; in some others that function was performed by another official (or officials). A passage in the “Precepts of Tetunae” refers to such officials as *taumihau*:⁵¹ “The *taumihau* are to be held in respect by you, they are to be treated with respect; they are the administrators of the government [*te fa’atere i te hau*].” In other sources administrators were called *tu’aāu*, *tī’aāu*, or *ani* (LMS Dictionary; Henry 1928:116ff.; Rey-Lescure 1946:201).

Very little was recorded concerning the specific functions of such officials, but the text quoted earlier in this chapter regarding the custom of *tavau* contains an account of how such an official was invested in office:

When the people of Faanui [Porapora] wished to elevate a man to be their *tu’aāu*, they did so by handing over to him the reigns of government, signified by present-

ing to him a leg of pork [a portion usually reserved for *ari'i*]. In so doing the orator would say: "Here is the leg of pork we hand over to you [figuratively, with this you eat the *hau*—i.e., take over the government], along with the *mootara* [provisions carried on a shoulder stick], *ma'aopuroa* [provisions spoiled as the result of a long journey en route], some *ahia* leaves [a plant having medicinal properties, signifying that the new official must look out for the well-being of his people and improve the governing of them], a *ta'avai* [a stone worn smooth by rushing waters, signifying that the new official must wash wrongdoing from the land], and the water of *maehai nui* [?] to enable you to serve as tribal steersman. If after you have eaten the leg of pork [i.e., taken over the reigns of government], you then eat "leg of human" [promote warfare and the killing of men], and if you lead the tribe's canoe into the underworld [?], you will be banished." ... The method of investing a *tu'aāu* in office followed essentially the same procedures in all tribes, although the actual wording of the ceremony differed somewhat from place to place. (Rey-Lescure 1946:201)⁵²

Tu'aāu, *ti'aāu*, and *ani* appear to have been different local labels for the same office. It seems likely that *tauimihau* was another such label, although the precept refers to *tauimihau* in the plural, while the text just quoted implies that there was only one *tu'aāu* in a tribe.⁵³

Some tribal chiefs presumably "spoke for themselves" but others had staff orators (*orero*) to present their ceremonial greetings, public announcements, parliamentary exhortations, and so forth, for them. See for example the following excerpt from Jefferson's journal:

This afternoon the natives held a public meeting near the British house when the peace between Otoo, Pomerre, & this district was again ratified & confirmed. As all public business is transacted between persons called Taaoraro or orators, the speakers for Otoo & Pomerre were seated on the ground, opposite to each other, about 15 yards asunder, each having a bunch of green leaves in his hand, (perhaps) as tokens of peace; and there harangued upon the subject of their meeting. The spectators kept at a proper distance. Otoo was present, but did not seem to take much notice of what was doing. (19 March 1799, LMS Archives)

An impressive presence, a sonorous and tireless voice, mental agility, a memory full of striking imagery, a knowledge of social etiquette and political realities—all of these were essential to effective oratory in the domain of tribal affairs. It is no wonder then that some tribal chiefs could not, or wished not, to do their own speaking.⁵⁴ It is, however, far from clear just who such staff orators were. In view of their necessary qualifications it is not very likely that they were, like most ordinary servants, of lower-class origin. Perhaps they were recruited from the tribal chief's circle of close kinsmen or from among the petty chiefs of subdivisions of the tribal chief's own subtribal unit—but this is surmise. Nor is it clear how they were compensated for their labors, if indeed they were compensated directly in the form of deliberate payment for services.

A chief's messenger (*ve'a*) was sometimes much more than a mere bearer of messages. Within the tribal boundaries it was required that such

officials be treated with some of the respect due the chief himself; and abroad they often served as ambassadors, with considerable scope for initiative and negotiation. A passage from Ellis describes one function of the *ve'a*:

Whenever a measure affecting the whole of the inhabitants was adopted, the king's *vea*, or messenger, was despatched with a bundle of *niaus*, or leaflets. On entering a district, he repaired to the habitation of the principal chiefs, and, presenting a cocoa-nut leaf, delivered the orders of the king. The acceptance of the leaf was a declaration of their compliance with the requisition, and to decline taking it was regarded as an intimation of their refusal to accede to the measure proposed. Hence the messenger or herald, when he had travelled round the island, reported to the king, who had received and who had refused the *niau*. When the chiefs approved of the message, they sent their own messengers to their respective tenants and dependants, with a cocoa-nut leaf for each, and the orders of the king. (1829:II, 367-368)

There were undoubtedly wide differences in social import in the messages carried by *ve'a* and, accordingly, wide differences in the social positions of *ve'a*. Ordinary commoners were probably used on ordinary errands, but such occasions as tribal assemblies required *ve'a* of higher-class status, as reported by Adams:

Whenever Teriirere i Tooarai, the chief of Papara, sent his messengers to call the Teva districts together, the districts came; but the summons was so peculiar that it needs a whole volume of explanation.

In the first place, the messengers were political personages, such as I never heard of elsewhere. They were under-chiefs—Iatoai. How many Iatoai formerly belonged to Papara I do not know; but in our day there are two subdistricts of Papara, Faina and Oropaa, and Faina has eight Iatoai; Oropaa has six. The whole body of Iatoai in each district are known as Hiva, and to any one who cares for the beginnings of things they are the most interesting part of our old society, for the Hiva of Papara might have been the source of all modern notions—Parliament, Civil Service, Army, Law Courts, Police, Aristocracy, Democracy, and Commune. The Iatoai were the chosen fighting chiefs or warriors, and they had, as a part of their functions, the duty of punishing or revenging insults offered to the head-chief; but they could also, and sometimes did, depose and exile a head-chief and name another or recall the old one. Their interference in this way makes one of the most dramatic motives in island history.

The messengers whom Teriirere i Tooarai sent to summon the Tevas were Iatoais or under-chiefs of Papara, and of three kinds: one messenger for the home district, one for the inner Tevas, and one for the outer Tevas. They bore an official name while on service; they inherited the position, and the office might be filled by any member of the family to represent the actual head. (Adams 1901:8)

A passage from Cook refers to messengers as members of a chief's "Court":

The Eowa's [*e houa*] and Whanno's [*fana?*], we have sometimes seen covered before the King, but whether by courtesy or by Vertue of their office we never could learn; these men are the Principal persons about the King and form his Court and are generally, if not allways his relations. Tee whom I have so often mentioned was one of them; we have been told that the Eowas, who have the first rank at-

tend in their turns, a certain number each day, which occasioned us to call them Lords in waiting, but whether this was really so I cannot say, we seldom found Tee absent, indeed his attendance was necessary, as being the best able to negotiate matters between us and them, on which service he was always employed and which he executed, I have reason to think, to the satisfaction of both parties.... The Eowa's and Whanno's always eat with the king (Beaglehole 1961:410; see also G. Forster 1777:I, 346, and J. Forster 1778:357)

Houa is defined in the LMS Dictionary as to be in a state of perspiration; this is apparently a reference to such individuals' activities as messengers proceeding on their errands at great speed. *Fana* means an archer's bow, which could refer to these officials' speed in transmitting messages.

Handy listed the "guardians of the *rahui*" (*arata'i rahui* [*arata'i*, a leader, guide, conductor; to lead, guide, conduct—LMS Dictionary]) among those officials who were "attached to the Aarii" and "concerned with particular duties" (1930:47). But this is the only reference I can find to this duty having been invested in a distinctive office.

It could be inferred from some sources that the duty of executing a human victim required for sacrifice constituted a distinct tribal office, and some individual members of chiefly retinues may indeed have specialized in this activity; but I can discover no evidence that such an office, if it existed, was institutionalized in terms of insignia, succession, or order. More likely, the job was simply handed over to someone of proven loyalty to the chief in question—someone who was also "a stern-willed warrior" (Henry 1928:197).

Several of the sources refer to chiefly "councils." For example:

There was a consultation between the three principal councillors [of *Vehiatua*, high chief of Peninsular Tahiti], named Tetumanua, Teyeye, and Otitoi, which last (cannot be) less than seventy years of age, as to what should be done with the vessel sent over by the *arii* of *Orayetea* [Ra'iatea], and it was decided she should remain here to do battle against the people of the neighboring island of *Morea* [Mo'orea] (Corney 1919:189).

A passage from Cook describes in some detail a meeting between himself and the said *Vehiatua*, suggesting the influence exercised over the latter by his "counselors"; the occasion was Cook's arrival at Tautira, where the Spaniards had previously landed and made their claim to the whole island:

Presently the young Chief came attended by his Mother, and several person(s) of note, who all seated themselves facing us; then a man who sat by me made a speech part of which was dictated by those about him; he was answered by one near the Chief; Eтары spoke next, then Omai both of which were answered by the opposite party. These Oraisons were intirly about my arrival and connections with them, the last man that spoke told me a mongst other things, that the men of Rema, that is the Spaniards, had desired them not to suffer me to come into Oaitipeha bay, should I return any more to the island for that it belonged to

them, but that they were so far from paying any regard to it that he now made me a formal surrender of the Province and every thing in it the meaning of which I perfectly well understood. At length the young chief was ordered to come and embrace me and by way of confirming this treaty of Friendship we exchanged names. After the whole was over, the young chief and his friends accompanied me on board to dinner. (Beaglehole 1967:190)

From many bits of evidence it is fairly clear that a tribal chief's staff counselors included several kinds of officials: his chief administrative officer (or officers), principal messengers, and perhaps his tribe's chief priest as well. We also have evidence that a chief's close relatives (including in some instances his wife [Vancouver 1801:322]) were among those upon whom he depended for counsel, in addition to those relatives who occupied specific staff offices, as was often the case. And this circumstance points up another feature of Maohi tribal organization, namely the overlap in offices and in officeholding. Probably in no two tribes were tribal functions distinguished into offices in exactly the same way; and one can be quite certain that tribal offices were not distributed among the same number or kind of officeholders—relatives, neighbors, friends, heads of small subdivisions of the chief's own subtribal division, and even some members of the chief's own domestic establishment, to which I now return briefly.

Mention has been made in other contexts of the kinds of retainers found attached to the households of individuals of eminence and authority, including tribal chiefs: for example, carriers, domestics, male and female attendants, teachers, entertainers, "ghost guardians," along with others who can only be described as hangers-on. Most of these differed from the "tribal" officials listed earlier in being concerned with the welfare of the chiefly master himself—insofar as this can be distinguished from tribal welfare as a whole. As indicated earlier, it is not always possible to draw such a distinction, but passages such as the following indicate the feasibility of occasionally doing so: "The king and queen were always attended by a number of men, as carriers, domestics, or favourites, who were *rāa*, or sacred, living without families, and attending only on the royal pair; and a worse set of men the whole island does not afford for thievery, plunder, and impurity" (Wilson 1799:321-322).

Ellis enlarged considerably on this theme:

Notwithstanding this generosity on the part of the king, the conduct of the government was often most rapacious and unjust. The stated and regular supplies furnished by the inhabitants, were often inadequate to the maintenance of the numbers, who, attaching themselves to the king's household, passed their time in idleness, and were fed at his table. Whenever there was a deficiency of food for his ordinary followers, or a large party that had arrived as his guests, a number of his servants went out to the settlements of the *raatiras*, or farmers, and, sometimes without even asking, tied up the pigs that were fed near the dwelling, and

plundered the abode, ravaging, like a band of lawless robbers, the plantations or the gardens, and taking away every article of food the poor, oppressed people possessed. Sometimes they launched a fine canoe that might be lying near, and, loading it with their plunder, left the industrious proprietor destitute even of the means of subsistence; and, as they were the king's servants, he durst not complain.

When the king travelled, he was usually attended by a company of Areois, or a worthless train of idlers; and often when they entered a district that was perhaps well supplied with provisions for its inhabitants, if they remained any length of time, by their plundering and wanton destruction, it was often reduced to a state of desolation. Sometimes the king sent his servants to take what they wanted from the fields or gardens of the people; but often, unauthorized by him, they used his name to commit the most lawless and injurious depredations upon the property of the inhabitants; whose lives were endangered, if they offered the least resistance.

Mahamene, a native of Raiatea, gave, at a public meeting in that island, the following account of their lawless plunder. "These teuteu," (servants of the king,) said he, "would enter a house, and commit the greatest depredations. The master of the house would sit as a poor captive, and look on, without daring to say a word.—They would seize his bundle of cloth, kill his largest pigs, pluck the best bread-fruit, take the largest taro, (arum roots,) the finest sugar-cane, the ripest bananas, and even take the posts of his house for fuel to cook them with. Is there not a man present who actually buried his new canoe under the sand, to secure it from these desperate men?"

Nothing fostered tyranny and oppression in the rulers, and reduced the population to a state of wretchedness, so much as these unjust proceedings. Those who, by habits of industry, or desire of comfort for themselves and families, might be induced to cultivate more land than others, were, from this very circumstance, marked out for despoliation. They had no redress for these wrongs, and therefore, rather than expose themselves to the mortifying humiliation of seeing their fields plundered, and the fruits of their labour taken to feed a useless and insulting band that followed the movements of the king, they allowed their lands to remain untilled. They chose to procure a scanty means of subsistence from day to day, rather than suffer the insults to which even their industry exposed them. (1829:II, 374-376)

Again, it will be recalled that Ellis was referring to the later period when the authority of the "King" in question, Pomare II, was nearly absolute, and his subjects' recourse to self-defense was presumably more constrained; but there was apparently nothing new about the arrogance and predatory habits of chiefly retainers.

The stewards of chiefly family estates referred to earlier can also be counted among a chief's *personal*—as opposed to his tribal—government staff, although it is possible that some of the former also participated in tribal councils.

Many decisions respecting tribal affairs were undoubtedly made by the tribal chief, with or without advice. Others were made by him in consultation with members of his own staff: the counselors of one type or another discussed above. Still other decisions were made by the chief and his staff counselors in concert with other subtribal chiefs.⁵⁵

Apo'o, or *apo'ora'a*, was the general term for "council" or "meeting

for consultation" (LMS Dictionary), but there were no labels that I know of to refer to the kinds of councils distinguished here, although Handy inferred from the name of one such "staff" council, *tahuna i ahuru* (secret of ten) that its proceedings took place in private (1930:48). If such were the case, one would be justified in describing the other kind as "public"—for so did Ellis and other writers reveal them to be:

Their public measures were not distinguished by promptness or decision, excepting when they wreaked vengeance upon the poor and helpless victims of their displeasure. After a meeting of the chiefs had been summoned, it was a long time before all came together, and their meetings were often interrupted by adjournments.

Their councils were usually held in the open air, where the chiefs and others formed a circle, in which the orators of the different parties took their stations opposite to each other. These orators were the principal, but not the only speakers. The king often addressed the assembly. The warriors and the raatiras also delivered their sentiments with boldness and freedom. When a difference of opinion prevailed, and words ran high, the impetuosity of their passions broke through all restraint, and the council terminated in scenes of confusion and bloodshed; or if they ended without open hostility, the chieftains returned to their respective districts, to assemble their tenantry, and prepare for war. (Ellis 1829:II, 363-364)

The kinds of decisions made by each of these three bodies—the chief's staff council, the tribal council meeting in secret session, and the tribal public council—must have differed from tribe to tribe, and within any tribe from time to time, depending upon the will and personal style of the chief and upon the extent of his authority over tribal affairs.

The decision to make or not make war must occasionally have been decided, or at least confirmed, in public council, because only thereby could the tribal chief, in some cases, have assured himself of manpower enough to wage successful war. I quoted earlier some general descriptions of how such meetings were conducted; a further passage from Cook provides additional insight into the politics that often entered into such deliberations:

This being settled, we left Etary and his party to ruminate on their folly and attended Otoo to another place close by where we found the servants of a Chief whose name I forgot to ask, attending with a Hog, a Pig and a Dog as a present to Otoo; these were delivered with the usual ceremony and with a set speech in which the bearer in his Masters name, enquired after the health of Otoo and all the principal people about him. This compliment was echoed back in the name of Otoo by one of his Ministers and then the dispute with Eimeo was discussed with many arguments both for and against it. The Servants, or deputies of this Chief, were for procecuting the War with Vigour and advised Otoo to offer a human Sacrifice, on the other hand a chief who was continually about Otoo opposed it, seemingly with great strength of argument, this confirmed me in the opinion that Otoo never entered heartily into the spirit of this war; he receiv'd daily messages from Towha importunating him to hasten to his assistance, who we were told was surrounded by Maheines fleet, but neither the one nor the other durst hazard an engagement. (Beaglehole 1967:211-212)

Of course, it was not required in all cases that a tribe's subchiefs actually assemble to make decisions on weighty issues. In many instances an active tribal chief would have known fairly well the sentiments of his realm's subchiefs, and on such occasions an assembly mainly served the purpose of ceremonial ratification, including confirmation by spirits.

Assembled or otherwise, then, a tribe's chief, his staff counselors, and the chiefs of the tribe's major subdivisions constituted a decision-making body—in addition to the other functions they severally performed.⁵⁶ There may even have been a label for this whole body, although the information on the subject is somewhat ambiguous. The label in question is *hiva*, about which the "Precepts of Tetunae" demand: "The Hiva ... are to be held in respect by you, they are a group in authority [*e pupu mana ratou*]; they have been engaged to uphold the dignity of the Homeland [*te tura o te aia*]."⁵⁷ Adams identified the *hiva* as meaning, "the whole body of Iatoai [i.e., subchiefs] in each district" (1901:8).

But, however many other offices and officials a tribe may have comprised, and whatever actual situations may have constituted the realpolitik of a tribe, the office of sovereign chief was the *symbolic* focus of the tribe, to an almost exclusive degree.

SYMBOLS OF CHIEFTAINSHIP

In discussing the symbolic aspect of tribal chieftainship we again face the question of what was distinctively *tribal* about the office. The sources are replete with references to the innumerable kinds of privileges, insignia, metaphoric usages, et cetera, associated with "chiefs," *ari'i*, and "principal people," but it is not always clear as to the identity of the office referred to: chiefs of kin-congregations? members of the *ari'i* class in general? de facto leaders of complex territorial units? or territorial-unit leaders who also held kin-Titles of highest rank?

The question is also complicated by the changes in tribal organization that took place during the Early European Era, the one chronicled by most of the sources. During the period described in the earlier of these sources, Tahiti itself was divided into several separate tribes; but, by the time of Orsmond and Ellis, Tahiti and Mo'orea had a single "king," upon whom the entire symbolic apparatus was focused.⁵⁸ Even during the Late Indigenous and Early European eras of Maohi history, tribal leadership had become so intimately linked with *ari'i*-type kin-Titleholding that it is next to impossible to separate the two kinds of roles. That they were up to a point separable, however, is suggested by legendary but fairly credible accounts of tribes governed by individuals who became sovereign chiefs but who were not *ari'i* by descent.

But perhaps the question is problematic only in a short-term sense—that

is to say, it is raised only with respect to the individuals who reached tribal chieftainship via routes other than descent. Since such individuals tended to found dynasties, and since the Maohis were no less ingenious than the rest of mankind in adapting genealogy to politics, the successors to dynasty founders were probably *ari'i*, in both senses of the term.

With respect to the other face of the question, the one occasioned by differences in tribal size and order of complexity, I assume that there were *some* corresponding differences in the symbolism associated with the chiefs—for example, other things being equal, the ritual constraints surrounding the chief of a small tribe of third-order complexity were probably less stringent than those surrounding, say, the chief of Tahiti peninsula.

In any case, having called attention once again to these two aspects of the question, I shall proceed as if they did not exist. I begin by listing some of the tangible insignia of tribal chieftainship.

In Henry's version of the investiture of a tribal chief quoted above, the individual was presented with the following items: a wooden pillow (*rurua*), a feather fan or fly flap (*tahiri*), a helmet (*tāupo'o*), a waist band (*tatua*), a spear (*'omore*), a staff (*to'oto'o*), and a breechclout (*maro*). According to Handy a chief's "personal possessions and insignia, each of which had its own title," also included the following: residence (*fare*), throne (*papa*), dugout boat (*va'a*), plank-built boat (*pahi*), paddle (*hoe*), bailer (*tutua*), rope (*taura*), fishing net (*'upe'a*), bow (*pana*), arrows (*te'ā*), wreath (*hei*), food dish (*'umete*), cup (*ipu*), carrying pole (*amo*), and tapa beater (*'ie*). (See also Handy 1930:35.) As examples of the proper names given such items, Handy listed the following that were applied to those of Vaiari: the "royal seat" was named *papa o te toa o te tumu* (the stratum of the basic foundation), the rope was *firifiri tau* (braided by the age), the boat was *te anuanua* (the rainbow), and the food dish was *poria* (fat). (1930:18)⁵⁹

I noted earlier that each tribe, or large subtribe, was identified in formal speeches with certain specific features of the landscape: its most notable mountain (*mou'a*), its largest stream (*vai*), its most prominent cape (*'outu*), its place for tribal assemblies (*tahua*), and its tribal marae. Occasionally all of these features, or the marae alone, served as metaphors for the tribal chief as well. Another chiefly metaphor was *ihoari'i*, the dignity and office of a king or principal chief. *Iho* is described as having a variety of meanings: (1) *self*, an affix to pronouns, as *vau iho*, myself; (2) an affix to adverbs, to denote sameness or proximity; (3) the essence or nature of a thing or person; (4) applied to a person coming to himself, or recovering his intellectual faculties (LMS Dictionary).

Another metaphor for chief was *tira*, mast (of the tribal boat). Completing this metaphor, *'iatoai*, the term sometimes applied to subchiefs and other principal supporters, probably derived from *'iato*, outrigger; and it is

possible that *ra'atira* also meant rigging (Handy 1930:42). This equating of tribe and boat was a favorite Maohi figure of speech; for example, in addition to the above the sources contain such statements as: (address to a chief) "Your seat is on the prow of the great canoe" (Handy 1930:40).

The chief was also referred to as "holder of the weights of the fish-net," i.e., holder of the helm of state (Alexander 1893:58); *taurua*, the morning star (Handy 1930:40); and *ra'i*, the sky.

Ellis summarized admirably this aspect of chiefly preeminence (at least insofar as it applied to Pomare II, who held an Opoan-derived *maro 'ura* kin-Title, in addition to his office as chief of Pare-'Arue, and eventually of all Tahiti-Mo'orea):

The phraseology of the Tahitian court was in perfect accordance with the elevation, and sacred connexion with their divinities, which the binding on the red girdle was designed to recognize and ratify. The preposterous vanity and adulation in language, used in epithets bestowed upon the king of Tahiti and his establishment, fully equal those employed in the most gorgeous establishment of Eastern princes, or the seraglios of Turkish sultans.

It was not only declared that Oro was the father of the king, as was implied by the address of the priest when arraying him in the sacred girdle, and the station occupied by his throne, when placed in the temple by the side of the deities, but it pervaded the terms used in reference to his whole establishment. His houses were called the *aorai*, the clouds of heaven; *anuanua*, the rainbow, was the name of the canoe in which he voyaged; his voice was called thunder; the glare of the torches in his dwelling was denominated lightning; and when the people saw them in the evening, as they passed near his abode, instead of saying the torches were burning in the palace, they would observe that the lightning was flashing in the clouds of heavens. When he passed from one district to another on the shoulders of his bearers, instead of speaking of his travelling from one place to another, they always used the word *mahuta*, which signifies to fly; and hence described his journey by saying, that the king was flying from one district of the island to another. (1829:II, 359-360)

The preeminence of a tribal chief is attested not only through metaphor, but through numerous acts of adulation, deference, and interdiction:

Whenever the king appeared abroad, or the people approached his presence, this mark of reverence was required from all ranks; his own father and mother were not excepted, but were generally the first to uncover themselves when he approached. The people inhabiting the district through which he passed, uncovered as he approached; and those who sat in the houses by the road-side, as soon as they heard the cry of *te arii, te arii*, "the king, the king," stripped off their upper garments, and did not venture to replace them till he had passed. If by any accident he came upon them unexpectedly, the cloth they wore was instantly rent in pieces, and an atonement offered. Any individual whom he might pass on the road, should he hesitate to remove this part of his dress, would be in danger of losing his life on the spot, or of being marked as a victim of sacrifice to the gods. (Ellis 1829:II, 352)

In one known instance, at least, this particular sign of deference was accorded to siblings of the officeholder as well—that is, to siblings of

Pomare I, who at the time was holder of a *maro 'ura* kin-Title and was tribal chief of Pare-'Arue:

His sister Tedua-Towrai was on board the Resolution in the mean while, and all the women paid her the same respect by uncovering the shoulders, which the whole nation owes to the king. The active youth *T'-Aree Watow*, who was with the king his brother, had the same honours paid to him; and it appeared to us that the title *Aree*, though common to all the chiefs of districts, and the nobility in general, was yet applied by way of excellence to the persons of the royal family. (G. Forster 1777:I, 338; see also LMS Transactions:I, 101)

In this connection I call attention to the custom of *pi*, mentioned earlier, which was the prohibition of the use of some chiefs' names and of many words containing sound combinations more or less identical with such names.

The Maohi custom of *pi*⁶⁰ has long intrigued Westerners. The LMS Dictionary defines it as "the custom of prohibiting the use of a word, or syllable, which had become sacred by its having been adopted as the whole or part of the name of some chief, when another word or syllable was substituted in its place; as *ru* [*ru'i*] for *pō* and *hota* for *mare*, as these two words formed the name of the late King Pomare." The earliest detailed reference to this custom I can find is Anderson's, from 1777:

On some other occasions, they carry their veneration for his [a feather-girdled *ari'i*] very name, to an extravagant and very destructive pitch. For if, on his accession to the *maro*, any words in their language be found to have a resemblance to it in sound, they are changed for others; and if any man be bold enough not to comply, and continue to use those words, not only he, but all his relations, are immediately put to death. The same severity is exercised toward those who shall presume to apply this sacred name to any animal. And, agreeably to this custom of his countrymen, Omai used to express his indignation, that the English should give the names of prince or princess to their favourite horses or dogs. But while death is the punishment for making free with the name of their sovereign, if abuse be only levelled at his government, the offender escapes with the forfeiture of land and houses. (Cook 1784:170)

During his visit some fifteen years later Vancouver expanded upon Anderson's report:

The veneration these people entertain for the names of their sovereigns, has already been very justly related by Mr. Anderson. But no example, I believe, had then appeared to that judicious observer, of the extent to which this respect is carried. On *Otoo's* accession to the *Maro*, a very considerable alteration took place in their language, particularly in the proper names of all the chiefs, to which however it was not solely confined, but extended to no less than forty or fifty of the most common words which occur in conversation, and bearing not the least affinity whatever to the former expressions.

This new language every inhabitant is under the necessity of adopting; as any negligence or contempt of it is punished with the greatest severity. Their former expressions were, however, retained in their recollection; and for our better communication, were, I believe, permitted to be used in conversation with us, with-

out incurring displeasure. *Pomurrey* however would frequently correct me on my accidentally using the former mode of expression, saying, I knew it was wrong, and ought not to practise it. Were such a pernicious innovation to take place, generally, at the arbitrary will of the sovereigns throughout the South-Sea Islands, it would be attended with insurmountable difficulties to strangers; but it appears to be a new regulation, and as yet, confined to these islands... (1801:316)⁶¹

Bligh also referred to the custom of *pi* in the journal of his visit in 1792:

I asked Iddeeah to day if her Name was to be changed on account of her late Child dying, she said no as the name was given to the Childs Aunt, Wattourau, who in my last Voyage was called Towry.—It is very extraordinary the shifting of Names in this Country.—Upon the permission of the Erreeràhigh a Chief may take any Name he likes, and if it happens to be the name of any particular Article—of day—night, or any other known thing, another is thought of for it to be called by. Example—Pomorre, (the Name of Tynah & Iddeeah) is from Po, night, and morré the Name of the disease the Child died of—To make up for the loss of Po, in the language, Oo arroo, ee is substituted.—

Oreepyah has fancifully taken the name of Aलो—In the language it means To morrow, but it is very odd, that in supplying the want of this Word they have substituted ahnonnàhigh, which before, and does now mean yesterday.—

Since my last Voyage, Heivah, the common name for all their Dances, has been taken by Terrederrie, and it is now known by the term Oopeowpah.—

Tynah also took the name of Mattee, which signifies to kill, and Po, ee was ordered to be used instead of it, which was strictly attended to—I remember Iddeeah scolding at the People when they inadvertently made use of the word Mattee.—

I should imagine this mode of changing names must be attended with many disadvantages to the language.—the alteration in the course of a Century must be very great.—it makes it difficult to be understood.—(1792:157-157b)

Writing about the period between 1819 and 1821, the missionary Orsmond described the custom as follows: "... There is hateful pride among Barbarians, & to have a distinguished name was a very predominant feeling among the Tahitians. The name must stand alone, the *pii* enabled a chief to alter his name at pleasure, & to alter any word that contained a syllable like that which composed his name." (quoted by White 1967:326)

The discrepancy between Bligh's and Vancouver's accounts with respect to the enforcement of the *pi* taboo could probably be explained by the identity of the transgressors—that is, a person of consequence may have only been "scolded," whereas a nobody is likely to have been punished more severely. More puzzling is the discrepancy among the several accounts regarding which persons were entitled to exercise this form of privilege. Whereas Anderson and Vancouver seem to have implied that the privilege was restricted to feather-girdled *ari'i*, Bligh stated explicitly that it was extended to other "chiefs" as well. Bligh also stated that the latter had to obtain approval from the *ari'i rahi* (in this case, a Pomare) before exercising the privilege, but in the case of one of the examples cited by him—that is,

the substitution of *heiva* for *teri'irere*—I consider it unlikely that the person in question, who was himself the sovereign chief of Papara, would have deferred to anyone else in this matter.

Another question suggested by these reports, but not touched upon by them, concerns the territorial extent of a *pi* prohibition. In my opinion an honor of this kind would have been accorded its principal mainly within the territory against whose population he was able to apply coercive sanctions—although on occasion persons elsewhere may also have practiced the courtesy in the interests of diplomacy. As for the duration of any particular name taboo, we have Wilson's report that the taboo lapsed, officially, upon the person's death (1799:351); but after a very long usage of a substitute word it is reasonable to suppose that it stood a good chance of remaining in common usage.⁶²

The custom of *pi* has also attracted the attention of later students of ancient Maohi life, including Ahnne, Marau, Elbert, and White. Ahnne, for example, declared that the punishment meted out to anyone violating a name taboo was rectal impalement:

In those former times it was no trifling matter to violate a name taboo. Indeed, death was the invariable fate of anyone violating this taboo; as the saying went, "Te taata i hape i te reo ra. O ohure ura tona ioa. Tera te au raa o te ohure ura, e tabu ia." (Those who violate this taboo are called "red anus," which is to say that they became offerings to the gods.) (1926:6)

This statement by Ahnne drew forth a critical reply from M. T. Salmon:

This chastisement (impalement) was reserved especially for those vanquished in war The punishment inflicted for a *lapsus linguae* (slip of the tongue), as I understand the word, was the chastisement called the "hoi-pu" (ho'i-puu), which consisted of obliging him (the taboo breaker) to recite exactly a certain number of times, without making a mistake, a hundred or more times, the consecrated names. If he made a mistake in reciting the "hoi-pu," the transgressor was punished by having one eye removed, or both. The eyes of the victim were offered to the *arii* whose name had been harmed by the use of the forbidden syllables.

It is from this chastisement that the name "Aimata" (*'ai-mata*) comes, which means the right to eat the eye. (Salmon 1927, as translated by White 1967:324)

We are no longer in a position to evaluate these markedly different retrospective versions, and leave them in the limbo they now find themselves in, and perhaps deserve.⁶³

Turning now to other behaviors by or respecting tribal chiefs, I reproduce some excerpts from Ellis:

This distinguishing mark of respect was not only rendered at all times, and from every individual, to the person of the king, but even to his dwellings, wherever they might be. These houses were considered sacred, and were the only habitations, in any part of the island, where the king could alight, and take refreshment and repose. The ground, for a considerable space on both sides, was

in their estimation sacred. A *tii*, or carved image, fixed on a high pedestal, was placed by the roadside, at a short distance from the dwelling, and marked the boundary of the sacred soil. [See fig. 23-3.] All travellers passing these houses, on approaching the first image, stripped off the upper part of their dress, and, whether the king was residing there or not, walked uncovered to the image at the opposite boundary. After passing this, they replaced their poncho, or kind of mantle, and pursued their journey.

FIGURE 23-3. *Ti'i* image. Watercolor by G. Tobin.
Mitchell Library, Sydney

To refuse this homage would have been considered not only as an indication of disaffection towards the king, but as rebellion against the government, and impiety towards the gods, exposing the individuals to the vengeance of the supreme powers in the visible and invisible worlds. Such was the unapproachable elevation to which the superstitions of the people raised the rulers in the South Sea Islands, and such the marked distinction that prevailed between the king and people, from his birth, until he was superseded in title and rank by his own son. (1829:II, 353)

Every thing in the least degree connected with the king or queen—the cloth they wore, the houses in which they dwelt, the canoes in which they voyaged, the men by whom they were borne when they journeyed by land, be-

came sacred—and even the sounds in the language, composing their names, could no longer be appropriated to ordinary significations. Hence, the original names of most of the objects with which they were familiar, have from time to time undergone considerable alterations. The ground on which they trod, even accidentally, became sacred; and the dwelling under which they might enter, must for ever after be vacated by its proprietors, and could be appropriated only to the use of these sacred personages. No individual was allowed to touch the bodies of the king or queen; and every one who should stand over them, or pass the hand over their heads, would be liable to pay for the sacrilegious act with the forfeiture of his life. It was on account of this supposed sacredness of person that they could never enter any dwelling, excepting those that were specially dedicated to their use, and prohibited to all others; nor might they tread on the ground in any part of the island but their own hereditary districts. (1829:II, 348-349)

Morrison's account of the constraint on entering a house indicates less stringency:

If a Chief should enter or even touch the House of any Female of a lower Class, it is rendered sacred by his presence and She Can never eat in it any more (but any man may) and she must provide herself with a new house and new furniture—for this reason if the Chief should be caught in the rain, he must not take shelter till he comes to a mans house, or one of His own (of which He has several for that and such like purposes) tho He should be a mile from one, and for this reason also No woman except of equal rank, can eat on board a Ship after the Chief has been on board, under pain of severe punishment, which accounts for the Women Calling the provisions on board Maa Raa (Sacred food) every thing on board being made sacred by his presence, yet nevertheless when they were right Hungry would eat in private, tho even then they will hardly ever eat in company with other Weomen except they are well acquainted. (1935:168-169)

The difference between these accounts may be due either to source of information or to time of observation. Morrison undoubtedly witnessed the events he reported, while Ellis was probably reporting mainly from hearsay. On the other hand, Ellis' information came from a time somewhat later than Morrison's, after Pomare II had become sovereign of Tahiti and Mo'orea, with resulting magnification of his official trappings.

The custom of *amo*, referred to above, aroused much interest among Europeans:

The sovereign and his consort always appeared in public on men's shoulders, and travelled in this manner wherever they journeyed by land. They were seated on the neck or shoulders of their bearers, who were generally stout athletic men. The persons of the men, in consequence of their office, were regarded as sacred. The individuals thus elevated appeared to sit with ease and security, holding slightly by the head, while their feet hung down on the breast, and were clasped in the arms of the bearer. When they travelled, they proceeded at a tolerably rapid pace, frequently six miles within the hour. A number of attendants ran by the side of the bearers, or followed in their train; and when the men who carried the royal personages grew weary, they were relieved by others.

The king and queen were always accompanied by several pair of sacred men,

or bearers, and the transit from the shoulders of one to those of another, at the termination of an ordinary stage, was accompanied with much greater despatch than the horses of a mail-coach are changed, or an equestrian could alight and remount. On these occasions, their majesties never suffered their feet to touch the ground; but when they wished to change, what to them answered the purpose of horses, they called two of the men, who were running by their side; and while the man, on whose neck they were sitting, made little more than a momentary halt, the individuals who were to take them onward, fixed their hands upon their thighs, and bent their heads slightly forward: when they had assumed this position, the royal riders, with apparently but little effort, vaulted over the head of the man on whose neck they had been sitting, and alighting on the shoulders of his successor in office, proceeded on their journey with the shortest possible detention.

This mode of conveyance was called *amo* or *vaha*. It could not have been very comfortable even to the riders, while to the bearers it must have been exceedingly laborious. The men selected for this duty, which was considered the most honourable post next to that of bearers of the gods, were generally exempted from labour, and as they seldom did any thing else, were not perhaps much incommoded by their office; and although the seat occupied by those they bore was not perhaps the most easy, yet as it was a mark of the highest dignity in the nation, and as none but the king and queen, and occasionally their nearest relatives, were allowed the distinction it exhibited, they felt probably a corresponding satisfaction and complacency in thus appearing before their subjects, whenever they left their hereditary district. The effect must have been somewhat imposing, when, on public occasions, vast multitudes were assembled, and their sovereign, thus elevated above every individual appeared among them. (Ellis 1829:II, 349-350)⁶⁴

The individuals thus carried may, as Ellis speculated, have derived some "satisfaction and complacency" from the circumstances of being carried, but the main objective appears to have been to avoid the consequences of the chief's *touching* an estate not his own, which would have interdicted its use by others. Lest I create the impression that I fully comprehend the rationale of this custom, I hasten to add that such is not the case. Among other things, we do not know whether the custom applied specifically to all tribal chiefs, whatever their mode of recruitment, or only to those holding high-ranking kin-Titles, or perhaps to high-ranking kin-Titleholders whether or not they were also tribal chiefs.

But with all this, there were times when it would have been difficult to single out a tribal chief from his fellows:

The establishment and habits of the king often exhibited the most striking contrast; at one time he was seen surrounded by the priests, and invested with the insignia of royalty, and divinity itself; or appeared in public on the shoulders of his bearers, while the people expressed every indication of superstitious reverence and fear. At other times, he might be seen on terms of the greatest familiarity with his attendants and domestics.

He never wore a crown, or any badge of dignity, and, in general, there was no difference between his dress and that of the chiefs by whom he was surrounded, excepting that the fine cloth and matting, called *vane*, with which he was often arrayed, were more rare and valuable than the dress worn by others. His raiment

frequently consisted of the ordinary pareu, or ahu pu, in quality often inferior to that worn by some of the chiefs in attendance upon him. (Ellis 1829:II, 360-361)

The respect due a chief's houses and estates, noted by Ellis, extended, as I reported above, to other representatives of chiefly office: to a chief's messengers, to his boat (even when manned only by his servants (Bligh 1937:I, 419), and so forth; but the most conventional emblems of chiefly office were branches of the miro plant and of the coconut palm:

The other branches used in Ceremonies are the Rou avva and are Commissions borne by substitutes for Chiefs and evry person bearing one of them is treated in the same Manner as the Chief would be if he were present; these Commissions or Emblems of truth are Never Assumed by any unless on such occasions as they would suffer death for such fraud ... (Morrison 1935:237-238).

The *niau*, or leaflets of the cocoa-nut tree, was the emblem of authority throughout the whole of the Georgian and Society Islands; and requisitions for property or labour, preparations for war, or the convocation of a national assembly, were formerly made by sending the cocoa-nut leaf to those whose services or attendance was required. To return or refuse the niau was to offer an insult to the king, and to resist his authority. (Ellis 1829:II, 368)

Finally, the body of a chief continued to receive special ritual attention after death—not just in terms of respect for his former preeminence, but in view of the continuing connection believed to persist between him and his tribe. This belief was particularly manifest in the care taken to guard a chief's remains:

... these bodys, while they are whole, are liable to be taken in War and the Man who takes one of them gets the Name and honors as if He had killd a Warrior, and should the body of a Chief be Carried off in this Manner before an other was Named the District would fall to the conqueror as if he had killd him; for this reason they are always removed, having each a Steady Man to Carry them away into the Mountains if they should be in War ... (Morrison 1935:232-233)

"Blasphemy," that is, disrespect in almost any form, against a chief or his tutelar was subject to extreme sanctions, usually banishment or death. (In case of the latter the victim was usually sacrificed to the offended spirit or to the offended chief's tutelar.) According to Morrison, it was to escape this fate which led Mai to seek passage with Cook to England (1935:112). And known blasphemers, along with notorious thieves, constituted a reservoir which was tapped whenever a sacrificial victim was required for some ceremony (see below).

What was the rationale underlying the symbolic hyperbole associated with a tribal chief's office and person? Although the argument is circular, a certain amount of respectful deference is accountable in terms of what might be called the Maohis' traditional commitment to the principle of social hierarchy in general. And, in the case of tribal chiefs this commitment was

probably reinforced by awareness of the physical coercive sanctions controlled by the latter. But more than these factors were involved. A statement by Handy epitomizes many "explanations" of Polynesian chieftainship:

In considering the unity of the social order under the *arii* it must never be forgotten that the divine first-born (*mata-hiapo*), who was the Aarii, was regarded by the population over which he presided, as the sacred embodiment of the mana of the people and land as a whole. He was to them their *iho*, which means umbilicus, pith, core, and first-fruit, the medium through whom flowed fertility to the land, prosperity to the people in peace time, and power in war. Hence, the bond was one of the heart as well as of dependence and the rendering of service and tribute—which was paid all up the line, from *manahune* to small proprietors, to subchiefs, to chief—the people were not acting as mere puppets of an arbitrary system invented by despotic overlords, as has been frequently supposed by many uninformed writers; but they were obeying psychological, religious and social principles that were far older with the Polynesians than the Hui Aarii, in fact certainly older than the earliest Polynesian settlement, for they prevail throughout the region of Malaysia and southern Asia whence the ancestors of both *maori*-Tahitians and *arii* certainly came. (1930:46)

This statement probably underestimates the influence of coercive force and overestimates that of servile commitment to "age-old tradition"; and its characterization of the substance of that tradition, by reference to *mana*, is an example of "explanation by labeling." To summarize in the term *mana* all the native concepts that "explain" chieftainship may be valid for some Polynesian societies, but I am unable to locate a parallel usage in the sources on the Maohis. I do, however, discern two components of Handy's *mana* construct in Maohi thoughts about their chiefs. One is the belief that chiefs were in more intimate communication with spirits than were most other mortals. The other is the belief, or the hint of a belief, in some kind of mystical connection between a chief and the welfare of his tribe.

There are recorded instances of tribal chiefs having been treated like gods, not simply because that was the proper way to treat chiefs but because the chiefs in question *were* gods. However, not all gods in human bodies were treated like chiefs. (See chap. 3, section on human oracles.) The best reported example of a chief who was *fully* a god was Tamatoa, sovereign chief and high priest of Ra'iatea:

There were some circumstances in the life of this celebrated chieftain which, although a digression, may be introduced here with propriety. He was the patriarch of royalty in the Society Islands, his eldest daughter having the government of Huahine, and his grand-daughter being the present queen of Tahiti. He was a remarkably fine man, being six feet eleven inches in height. Respecting his Christian consistency different opinions have been expressed; but, for my own part, I confidently hope that he was a subject of Divine grace. I will, however, relate a few particulars of his history, and leave the reader to draw his own conclusion. In his heathen state he was worshipped as a god, and to him the eye of the human victim was presented before the body was carried to the marae. When

visited by the Deputation, Mr. Bennet requested me to ask him, which, of all the crimes he had committed, lay heaviest upon his mind; and, after some hesitation, he replied—that of allowing himself to be worshipped as a god, when he knew that he was but a man. Before he was brought under the influence of the Gospel, he was much addicted to the use of the intoxicating juice of the kava root, which appears to produce a narcotic effect, so peculiar that the slightest noise is exceedingly distracting to persons under its influence. Immediately it was known that the king had been drinking, the women ceased to beat their cloth, and all sounds in the immediate vicinity were to be hushed. Children also were carefully removed from the premises, lest he should be annoyed in the slumbering fit which had been induced by the stupifying draught. It appears that he was exceedingly desperate while in a state of intoxication, and that on the slightest disturbance he would seize a club, spear, or any other weapon, rush out of the house, and wreak his vengeance of friend or foe, man, woman, or child, whom he might happen to meet. In this way several persons had fallen victims to his ferocity. On such occasions his look and manner must indeed have been terrible. The flashing fury of his eye, the curl of his thick lip, the lowering aspect of his brow, together with the growling tone of his voice, and the violent gestures of his herculean fame, were calculated to strike the stoutest heart with terror. Once, when thus aroused, he rushed out of his dwelling, and not being able to find a weapon, he struck an unoffending person such a violent blow with his fist that he knocked his eye out, and mutilated his own hand so much that he lost, in consequence, the first and second bones of his forefinger. (Williams 1837:373–374)

In other instances some of the adulation, interdictions, et cetera, associated with the chief might be accounted for by beliefs that he was part divine—either by ultimate descent from some ancestral divinity (the rationale for the preeminence of the Opoa and Vairi descent lines), or by immediate descent from a divine parent (the claim made for Pomare II by his mother) (Morrison 1935:166). Still another possible basis for the treatment accorded chiefs was their more or less direct association with spirits: not only direct “physical” contact with spirit presences (in the chiefs’ roles as priests), but occasionally perhaps actual possession by some spirit (in roles like those of shamans).

Then there is the possibility of an even more general premise, that chiefs and gods, both having qualities that were exceptional when measured against other people and spirits, were simply different kinds of personification of the same type of being. (Nor were they so very different at that, as witnessed by the god-chief Tamatoa and by the concept of divine ancestry—including gods’ well-known practice of cohabitating with mortal women.) A corollary of this general premise might then be that a chief was believed to be a god because of his exceptional attributes and powers; and circularly, that a chief was exceptional because he *was* a god. I hasten to add, however, that attractive as this notion might appear as an explanation for these and other Maohi beliefs and practices, it is purely speculative on my part; I can find no verbalization of it in any of the primary sources.

Turning now to that other component of Handy's *mana* construct, to belief in a mystical connection between the chief and the welfare of his tribe, we find some elements of such a belief in at least two customs: in first-fruit offerings to a chief, and in the care exercised in safeguarding a chief's mortal remains from an enemy, particularly before a successor has been named to the office (see chaps. 13 and 21).

First-fruit offerings undoubtedly exemplified some other more mundane ideas about tribal hierarchy and revenue, but, as suggested earlier, it is also possible that they may have exemplified beliefs about connections between a tribal chief and the productivity of the tribe's natural resources. One may even contend that there was something in this connection, as suggested for example in the emphasis upon the breachclout as an insignia of chieftainship, and in the *youthfulness* of chiefly officeholders consequent upon (perhaps deliberately?) the timing of rites of succession. But this contention can be based on nothing firmer than possibilities; however closely Maohi customs may parallel those of other Polynesians in other regards, I can find no direct statements, verbal or ritual, attesting a sexually reproductive connection between a tribal chief's virility and the material welfare of the tribe's members. There is plenty of evidence for beliefs that spirits included a chief's mortal subjects when punishing him or rewarding him for something done or not done in his relations with themselves, but such may be explained as acts of redundancy and do not require a more profound mystical rationale, and particularly not one with sexual overtones.

HAU

And now I return again to the more secular aspect of tribal chieftainship, which seems to have been summarized symbolically in the native word *hau*. The LMS Dictionary lists three separate entries for *hau*: the dew that falls at night; peace, government, reign; more, or beyond, in comparing adjectives, greater, larger, longer, et cetera.

Comparative material raises the possibility that there may have been still other homonyms, or that we are encountering here *not* so many separate words but rather a set of semantic continuities. However, the paucity of Maohi texts employing these words is such that I cannot explore these avenues very far, except to note a possible overlap in meaning between the second and third definitions. In any case my present interest is focused on the second of the entries listed—*hau*, peace, government, reign,—which, parenthetically, is not quite so palpable as the innocently straightforward dictionary definition suggests.

The "peace" meaning of *hau* seems to emerge fairly unequivocally in the following text from Henry, in which the word is directly contrasted

with “war” (*tama’i*). (The passage is taken from a cosmogonic myth narrating Ta’aroa’s fashioning of the universe and describes specifically how he provided Atea [Space] with stars for eyes.)

Then Ta’aroa placed as a right eye for Atea, Ta’urua (Venus), who runs in the evening, and he said: “It is to be a light bending before the earth, to lead it, to give *great peace* [i.e., *hauhau*], *peace* to the inhabited world [i.e., *hau fenua noho*]; thy right eye is Ta’urua, O Atea.”

And Ta’aroa placed as left eye for Atea, Ta’ero (Mercury), and said: “Let anger be kindled, let *war* [*tama’i*] rage upon the earth; thy left eye is Ta’ero, O Atea.” (1928:417, italics added)

This referent of *hau* as “peace” also emerges in several other texts, adapted from Henry (1928, unless otherwise indicated). For example:

in a prayer accompanying resanctification of a community after its defeat and devastation in war:

Fano ei hau, e hau rahi. Ei hau hohonu, ei hau maoro, ei hau maitai roa.

Extend forth peace, great peace. Let it be deep peace, long peace, excellent peace. (p. 321)

in the speeches that accompanied truce negotiations (it will be recalled that a decision for peace was indicated by throwing a rock onto the ground):

Ter te toa o hau; e toa na te hui toa.

There is the rock for peace; the rocks of the body of warriors.

E toa fa’aroa i te ta’ata, ia ruperupe te fenua.

The rock for sparing men, that the land may flourish.

E ia maoro te aho ote arii i te fa’aeara’a mai i tana hau i te fenua nei.

And that long may be the life span and reigning of the *arii* in this land.

A tonoi te ‘orero ia fa’aite i te hau.

Send forth the heralds to proclaim peace.

Ei hau, ei hau maoro pu’upu’u’ore.

Let there be peace, long unbroken peace.

Ia atua te atua, ia tahu’a te tahu’a pure i te marae.

That the gods be gods, and the priests be priests in the marae.

Ia ari’i te ari’i e ia ra’atira te ra’atira.

That the *arii* be *arii*, and the *ra’atira* be *ra’atira*.

Ei hau te nohora’a o te ta’ata i to ratou mau mataeina’a.

Let peace be in the dwellings of the people in their districts. (pp. 318–319)

in such metaphoric expressions as:

‘Aimeo, the bed of peace (*te tua ro’i i te hau*) of warriors. (p. 436)

Great Taha’a of peaceful skies (*ra’i hau*). (p. 462)

It should be added that there was a spirit named Hau, identified as god of peace and characterized as a tutelary of medical specialists (*tahu’a*

ra'au, tahu'a mori) noted particularly for their healing powers by massage with coconut-oil ointment (p. 145). In addition, I note Henry's observation that the "shadow" (*ata*) of this tutelar was the surf duck (*toroā*) (p. 384), but I know of no basis for this association.

Hau meaning "government" and "reign" is considerably less intelligible than *hau* meaning "peace." Here are some examples; first, two phrases from a speech made by a visiting chief's orator in response to a welcoming speech by his hosts:

E te Tevahitua ari'i e, e To'ofa, te papa o teie nei hau ... O Ari'i Tevahitua, and you under-chief, who art supporter of this government ...

Behold, because of your liberal gifts [to us] of food and other goods of your land, we knew that what we had already heard was true, that your *mode of governing* (*fa'aterera'a hau*) was favorable for the prosperity of the land. (Henry 1928:244; *fa'aterera'a*, from *fa'atere*, to steer about, to guide or direct, to go on with a speech or oration [LMS Dictionary].)

The next examples are from the legend of Honoura. In one episode the people decided to reward the heroic Honoura by naming him their tribal chief:

They all came ... *to present him with the kingdom* (*e pupu atura no'na te hau*) [which offer he however declined, out of loyalty to the incumbent]. (Henry 1895:277)

In another episode, after conquering a legendary tribe of a far distant place called Hiva, Honoura presented the conquered domain to his own tribal chief, Ta'ihia, with these words:

There is your possession (*tera mai to oe hau*), O Ari'i Taihia; when you see it, take good care of your land. (1895:289)

Another example is taken from the prayer uttered by a priest when laying the foundation stone of a new tribal marae:

Harken unto us O God, in this prayer. Behold, *we the subdivisions of this tribe* (*na va'a mata'eina'a o teie nei hau*) present thee this land. (p. 132)

The next textual example is taken from a statement by the tribal chief Rata to two wood sprites who had built a fine boat for him:

Welcome to you both! May you live [fare well] in coming *to my kingdom* (*i to'u nei hau*). (p. 490)

We turn now to a similar usage of *hau*, as an element in names applied to forms of government. According to Chesneau's history of Huahine, during an earlier epoch, called the *Hau morere*, the island was divided into several independent, mutually hostile tribes each under the leadership of a warrior chief. Then, when the Maeva tribe conquered the rest of the island and united it under its own chiefly dynasty, this epoch was referred to as the

Hau Ari'i (1928). I can find no translation for *morere*, but *mo'o rere* could mean "progeny-flying" (translated by Henry as "Flying Scion"). In this connection, Henry's account of Huahine history differs somewhat from that of Chesneau, but that is not the point now under consideration.

In connection with *Hau Ari'i*, the LMS Dictionary contains the following entries: *Huari'i*, a kingly government. *Haumanahune*, a government of the common people; a democracy. *Haumāteata*, a government in the hand of a chief by blood, or hereditary descent.

As noted above, there is textual corroboration for *huari'i*, but *haumanahune*—democracy!—strikes me as suspiciously post-European. (See vol. 3.)

In Salmon's history of the Island of Borabora, quoted from earlier (chap. 16, section on Opoa cognatic stock), reference is made to a change of "government," which I interpret to be a translation of *hau*. (A Tahitian-language text of this piece may once have existed, but we know nothing of its present whereabouts.) The change was brought about by a successful rebellion against the island's sovereign chief, Teihotu, who was killed in the fighting. The victorious rebels, unable to find anyone among themselves of sufficiently high-ranking Title, selected Teihotu's own son as his successor, but instituted with him a new "government" called Tevaitapu, by investing him in office in a partly new tribal marae (built in part with stones from the former one) and by bestowing upon him a new Title.

According to Henry, during the first half of the nineteenth century an alliance was formed between the "kingdoms" of Tahiti, Huahine, Ra'iatea, and Maupiti, "... for aid in maintaining their independence when invaded by the warlike people of Porapora and other islands. On such occasions they adhered to this agreement. But in time of civil war [in any "kingdom"] no interference occurred, though sometimes help was received from personal relatives and friends among the allies. This alliance was called the *Hau-pahu-nui* (Government-of-the-great-drum), and it remained in full force until French rule was permanently established in Tahiti in 1847." (p. 128.) (Elsewhere in Henry [p. 122] a generic word for "alliance" is represented as *faatua* (from *fa'ataua*, to make a friend?).

In some of these usages *hau* appears to refer specifically to a tribe's (or tribal alliance's) government, in others to the *tribe* itself. It is of course quite possible that the word had both of these meanings, but it is also possible that neither of these two referents corresponds exactly to what the Maohis themselves meant by *hau*, and this possibility is increased when we add the referents which were tentatively translated above as "peace."

Even the adjectival entry of *hau* (more, or beyond, in comparing adjectives, greater, larger, longer, etc.) might be related to the substantival entries discussed. For example:

O Havai'i, i ae *hau* te amaama.

O Raiatea, that towers *exceedingly* in glory. (Adapted from Henry 1928:462)

E manu, rere hau e.

A bird, far soaring. (p. 504)

E ari'i mau teie vahine, e hau roa to'na nehenehe i to te ao nei!

This is indeed a princess, whose beauty exceeds all other in this land. (p. 614)

And finally, there is the even more suggestive line (p. 406) from the cosmogonic myth concerning some lesser gods' efforts to raise Atea, the sky:

The artisan, Rima-roa, with Fa'atae, hastened up to Atea, to the confined sky. But they did not reach their hands to touch him, they feared *the power* of King Atea (*i mata'ua'e i te hau o te ari'i o Atea.*)

I have engaged in this lengthy search for native meanings of *hau* not merely as a linguistic exercise but impelled by the hope that it would reveal something about the way Maohis' thought of the tribal aspect of their lives. Obviously, the textual material alone does not carry us very far in that direction, except to indicate some connection between a chief's authority and "peace" or "social order." So I turn to other kinds of information for more evidence concerning these important connections. First, I return again to an assertion made earlier to the indifference with which tribal chiefs seem sometimes to have regarded intratribal strife.

CHIEFS AND SOCIAL ORDER

In chapter 12, I remarked upon the indifference with which *tribal* chiefs sometimes seem to have regarded strife between subdivisions of their tribes, provided it did not affect their own positions of authority.⁶⁵ This raises the question, To what extent was a tribal chief concerned with maintaining orderly relations among his subjects, outside of enforcing compliance in matters affecting his own interests?

Throughout this and previous chapters I have presented whenever available descriptions of the kinds of reactions set in motion by people's breaches of more or less widely shared social-relational norms—of a spouse's unauthorized "adultery," of a couple's flouting of incest standards or class-based sexual prohibitions, of the failure of one party to live up to the terms of an exchange contract, of a subordinate's act of lese majesty, of a devotee's failure to fulfill obligations to his tutelary, and so on. The subject is a vast and complex one and does not permit facile generalization. One could, of course, attempt to classify breaches in terms of their appropriate sanctions—except that appropriateness varied rather widely with respect to a person's marriage class, and to elapsed time between the breach and punishment. Also there was considerable variation, situationally, with respect to "jurisdiction."⁶⁶ In some instances, for example, a wife's seducer

was killed on the spot by her husband, with no further repercussions, while at other times the wronged husband placed his complaint in the hands of his chief, who then imposed penalties varying from fines to banishment, depending upon factors of class, kinship, the chief's own concerns, et cetera. On one occasion, for example, a chief decided to banish not only the seducer himself but all the latter's near kin, including the mummifying remains of some of them!

At early dawn this morning the *tahua* or high-priest named Orae came to lay a complaint before Otù against an uncle of the latter who had been detected in adultery with his wife. Having listened to the complaint Otù promptly ordered that the uncle be notified of his sentence, which was banishment; the which, being taken with a bad grace by the parents and other relations of the said Otù, he got angry and extended the banishment to them all, without excepting his father and mother and even the dead (it being the custom among Chiefs to preserve their bodies dry, and keep them always near them at their homesteads or places belonging to each). (Corney 1919:201)

Indeed, with respect to relations among humans there seems to have been only two kinds of breaches that provided almost invariable and universally assentive sanctions, namely, theft from another Maohi, and offenses of almost any kind against the position, property, or person of a tribal chief.

Theft

I have frequent conversations with Tynah respecting the want of power or order in his government to prevent thieving. He has told me that only good people could be governed by advice, Townahs (or Rogues) he said would at all times when it was in their power, do mischief and commit Thefts, and could only be guarded against by strict Watch, and desired whenever we had it in our power to put them to death, that an example might be made to deter others. (Bligh 1792:150)

By conventional Western standards the Maohi attitude toward theft was somewhat ambivalent. On the one hand, a proven thief could usually be killed with impunity. Notwithstanding which, there appears to have existed a widely shared admiration for clever thievery, including some emulous veneration of Hiro, god of thievery. Although Hiro had devotees throughout these Islands, the principal center of his cult appears to have been in southern Huahine. Here are some passages from missionary accounts of this god:

Having frequent occasion to recur to the former state of society in these islands, we have just heard, that, among other idols, there was a god of thieves, held by his worshippers in the highest honor. He was called Hiro, and among his votaries were many of the cleverest men, not from the lower ranks only, but even some of the principal chiefs. The arts and contrivances which these resorted to, in order to obtain the property of their neighbors and strangers, proved that this strange representative of Satan was served with more than ordinary devotion. His rites were celebrated in darkness, at the change of the moon. While the husband prowled forth to rob, the wife went to the marae to pray for his success;

yet, if success were not always found, it would be with an ill grace if they should charge Hiro with bad faith towards his followers; for, faithful as *they* were in *making* vows, they were knavish enough in *performing* them; thus, if a hog had been stolen, an inch or two of the end of the tail was deemed a sufficient thank-offering to him. With this in his hand, the thief went to the marae, and, laying it down on the ground, he would say, cantingly, "Here, good Hiro, is a piece of the pig that I stole last night for you,—but don't you tell." Then he would slink away, persuading himself that, if he had wronged his neighbor, he had not wronged his god; though, to do his ingenuity justice, he had tied such a triple knot of villany, that it would be a nice point for a casuist to determine, whether he had cheated his neighbor, his god, or himself, the most. (Montgomery 1832:I, 67)

Auna, who was formerly one of his most zealous and favored votaries, informs us that *Hiro*, the patron divinity of thieves, was devoutly worshipped here and throughout these islands, though he was a god of but recent creation. He is said to have been a native of Raiatea, and so far from being born an immortal that (if the ambiguity may be allowed) he did not even die one—his skull having been preserved at Opoa, in that island, and seen by persons now living there, though it has recently disappeared with the other relics of idolatry. This Hiro was so subtle and audacious a robber that even the altars and maraes of the gods were not safe from his sacrilegious fingers. To his skill in thieving were added all those other accomplishments for which heathen deities in all countries, from Greece and Rome to Tahiti and Raiatea, have been celebrated,—lying, murder, debauchery, &c. &c. Nor was he less famous for managing a canoe, and playing the pirate by sea, than the burglar and bandit on shore. After his death, when enrolled among the gods for his atrocities, he was revered even above Oro, to whom he proved himself superior by throwing him down and lying upon him. His skull, as already mentioned, was deposited in a large marae, which he had himself erected, and his hair was put into the body of Oro's image and committed to the flames at Maeoa. The devotees of this idol were all persons of more than vulgar rank; our friend Auna, being of royal kindred, was admitted to that honor. Indeed, it was not to be expected, even in such a state of savage society as then existed, that any except the great should be permitted to seize their neighbors goods with impunity. (Montgomery 1832:I, 186-187)

Henry described how thieves made use of the services of Hiro:

The dragonfly was a shadow of Hiro, god of thieves. It was a god that flew and halted before and behind. It was carried by thieves in their clothes, so that when they entered the dwelling of those they wished to rob, they let the dragonfly go, and it dazed the inmates so that they did not notice that they were being robbed. (Henry 1928:391; see also Moerenhout 1837:I, 447-448)

Some of this ambivalence toward thievery might be resolved in terms of "localism" (or of ethnocentricity in the case of taking from Europeans—that is, the Maohis rarely passed up an opportunity to steal from Europeans and did so with an audacity and adroitness that moved their victims to grudging admiration).

I do not hesitate to say, that the whole island is but a den of thieves. European property they will possess by some means or other; and theft they consider

as the cheapest and easiest method of purchase. They will not hesitate even to waylay and rob a traveller! for one mode of theft is as palatable to them as another. Old Pomarre was as dextrous a thief as any amongst them, if borrowing, without any intention of repayment, merit this name. He would often request me to lend him a hog, for which, when once received, he never again thought of making any return. This could proceed from nothing more but mere avarice, for he could have had any number at a very easy rate. But theft, as I have observed, is a cheaper method of acquisition than purchase. (Turnbull 1813:282-283)

The Natives cannot withstand thieving even from the King to the Towtow or servants, great Numbers of them constantly coming on board & going about the Ship & riging they frequently steal things, & whenever caught or the thing lost found on them, we immediately sieze them up to the Shrouds & give them a dozen or two according to the nature of the Theft, without any respect to rank or distinction, & let them loose & flock them out of the Ship & make them swim on shore, as no Canoe takes in the Teeto or Thief—notwithstanding there is few of them can Avoid thieving when an opportunity offers (Clerke, in Beaglehole 1961:227).

But, whatever the full explanation of this seemingly double standard, the Maohi who stole from a fellow tribesman thereby placed himself in double jeopardy: in most cases his victim enjoyed the socially acknowledged right to kill him on the spot (see Moerenhout 1837:II, 18), or if he managed to escape that immediate execution he remained vulnerable to future execution in the form of human sacrifice on some occasion concerning his tribal chief or his tribe as a whole.

As just noted, the usual immediate punishment of a thief was death, ordinarily through drowning:

This offence [theft] is punishable among themselves by the death penalty: the victim's hands and feet being lashed up to his neck in a bunch, after which he is made fast to a large stone and thrown into the sea (Corney 1915:259).

Among themselves, if detected, the thief experienced no mercy, but was often murdered on the spot. If detected afterwards, he was sometimes dreadfully wounded or killed. Two very affecting instances of vengeance of this kind are recorded by the early Missionaries. I have also heard that they sometimes bound the thief hand and foot, and, putting him into an old rotten canoe, towed him out to sea, and there left him adrift, to sink in the ocean, or become a prey to the sharks. (Ellis 1829:II, 371)

Even the romantically sympathetic J. Forster confirmed this penalty to thieves: "... we were told that thieves were either hanged or drowned with a weight tied to their necks; in either kind of punishment are no vestiges of cruelty [!]" (1778:407).

The sources contain several other references to thieves having been punished with severe beatings or banishment, but as these concerned penalties imposed by chiefs upon individuals caught stealing from Europeans, one cannot confidently say that these penalties were typically Maohi.

Sometimes, however, the death penalty was commuted to some other form of punishment:

If any Man is Caught in the act of Theft and is immediately put to Death, the Person who killd him is brought to No account for it. But if the Thief escapes & the Property is afterwards found on Him the Person whose property it is, may plunder him of His Goods and Chattels which the Theif always submits to, the Owner leaving with Him the property which he stole and taking all the rest, but should he absent himself, and take His goods off His land, the Person Injured may oblige the Thiefs land lord to deliver to Him the House & land which the Thief did possess till the damage is made good or ransom it with Hogs to the full satisfaction of the Party injured. This latter Mode is mostly practised: as if the land was once put into possession, the Party so holding it could never be removed except by War, or the Commission of some Crime against the Chief; after such ransom is paid the Squire may if He pleases compromise Matters, with the Thief, and let him return, on Condition that He pays the Ransom or gets Friends to do it for him, or give it to some other who has been distressed by War and the Theif must go and live on His Friends. (Morrison 1935:192)

The *haru raa*, or seizing all the property of delinquents, was the most frequent retaliation, among the lower class, for this and other crimes. The servants of the chiefs, or injured party, went to the house of the offenders, and took by force whatever they found, carrying away every article worth possessing, and destroying the rest. If the inhabitants of the house received previous intimation of their purpose, they generally removed or secreted their most valuable property, but seldom attempted to resist the seizure, even though every article of food and clothing, and the mats on which they slept, should be taken away.

This mode of retaliation for theft, or other injury, was so generally recognized as just, that, although the party thus plundered might be more powerful than those who plundered them, they would not attempt to prevent the seizure: had they done so, the population of the district would have assisted those, who, according to established custom, were thus punishing the aggressors. Such was the usual method resorted to for punishing the petty thefts committed among themselves. They were generally satisfied with seizing whatever they could find in the houses, yards, or gardens of the offenders; but when it was practised by order of the king or chiefs, the culprit was banished from his house or lands, and reduced to a state of complete destitution. (Ellis 1829:II, 371-372)

As noted earlier, if for some reason or other a known thief managed to avoid direct retaliatory punishment, that did not remove him entirely from peril, since such individuals, along with "blasphemers," were generally considered to be the most suitable candidates for human sacrifice:

When Men are Wanted for Such Occasions the Chief assembles the Ratirras, at the Morai and a Feast is Made at which none must be present but those who are by birth intituled to give their Oppinion, he then informs them of the Business, which they however know beforehand. They then agree among themselves about the Fittest Man and if any have been Guilty of Blasphemy or has been a Most Notorious thief and has escaped punishment they fix on him and one of themselves undertakes to kill him and watches his Opportunity, the business being mostly kept a secret till he is killd, which is generally in the Night when the Man appointed to kill him, finding where he sleeps, knocks him in the Head with a Stone and gets his servants to make a large Basket of Cocoa Nut leaves into which they put the body and Convey it to the Canoe to be offered into which they

put it—they are careful not to disfigure the Face as that would make them unfit for an offering and an other must be got in stead, for which reason they mostly strike them on the back of the Head or Neck.... (Morrison 1935:206–207)

Further along in this passage Morrison added an observation which seems to underline the *judicial* nature of this process: "... and should any Man be killd without sufficient Cause (tho they Never admit them to be present at their Tryal) His Friends instantly make War on the Offenders, but if He is known to be guilty of the Crimes laid to his Charge No Notice is taken of it as evry one deems it right and the Man who kills him is Justified as having been the Executor of Justice."

The severity of this sanction was increased by the circumstance that death by sacrifice resulted in placing the victim's relatives in similar jeopardy.⁶⁷

A statement by Anderson asserted that there were some generally accepted associations between severity of penalty and value of stolen object:

... if any one be caught stealing, which is commonly done in the night, the proprietor of the goods may put the thief instantly to death; and if any one should inquire of him after the deceased, it is sufficient to acquit him, if he only inform them of the provocation he had to kill him. But so severe a punishment is seldom inflicted, unless the articles that are stolen be reckoned very valuable; such as breastplates, and plaited hair. If only cloth, or even hogs be stolen, and the thief escape, upon his being afterward discovered, if he promise to return the same number of pieces of cloth, or of hogs, no farther punishment is inflicted. Sometimes, after keeping out of the way for a few days, he is forgiven, or, at most, gets a slight beating. (Cook 1784:172)

The severity of a penalty seems also to have been influenced by the status of the principals:

This morning a barbarous murder was committed by one native on the body of another in a house a few yards distant from us. The murdered man it appears had been guilty of a very petty theft, and for which he lost his life. He was struck a dreadful blow on the nape of his neck with a Tommahawk that almost severed his head from his body & his right shoulder was horribly cut with repeated blows. The perpetrator of this savage act walked about afterward with the Tommahawk in his hand, with as much unconcern as if he had been splitting up fire wood, & behaved very insolently when spoke to about it. The person killed belongs to Paheete's jurisdiction, who is now in Oparre; but it is apprehended that no notice will be taken of the matter whether by him or Pomarre (to whom the other man belongs) as he was accounted a person but of little worth, & his murderer is a man of consequence. This same man who has so inhumanly destroyed his countryman for a mere trifle we have reason to suspect of having plundered us of various valuables. Towards evening Paheete arrived in the district. He made some inquiries concerning the above murder, and ordered the corpse which its murderer had buried to be digged up & to be placed within view of him in Edeea's house on the point where he is fled for refuge. It appears that this is held by the natives as a mark of abhorrence of the act, & what is very unpleasant to the guilty person. There is some talk

among our neighbours, that the inhabitants of this district & Hapyano will revenge the murder & even burn Edeea's dwelling in which the man has sheltered himself. If this shd. be done it will certainly produce a war. The servants of Edeea removed her property from the point into br. Nott's apartment for fear of the worst.

Nothing has this day been done towards avenging the murder. It is said that Pomarre has been made acquainted with it, and justified the deed, and has given directions that nothing be done to the man. (Jefferson, Journal, December 1802, LMS Archives)

But, however popular the approval may have been for punishment of known thieves, the matter was sometimes complicated if it touched upon the interests of a chief:

A native living near our four brethren's had stolen from him two bits of wood that he designed to make into combs. Having found the thief, a furious and long contest in words took place upon the occasion & the person from whom the wood had been taken several times lifted up a felling axe he had in his hand, threatening to dash to pieces therewith the transgressor's head. Fear kept him back from the action as the thief was a native of Oryatteea and under the protection of the king. Some of the brethren who were spectators of part of the contention laboured for peace between them when one of the Standers by gave them to understand, that if it was not for fear of Otoo they should see an Otaheitean custom, intimating thereby they would certainly kill the man. (Jefferson, Journal, 14 July 1799, LMS Archives)

Finally, chiefs themselves were not exempt from the common proclivity to thievery:

It is not always in the power of the chiefs to prevent robberies, they are frequently robbed themselves and complain of it as a great evil. Otoo left the most valuable thi(ng)s he had from me, in my possession till the day before we sailed and the reason he gave for it, was, that they were no where so safe. Since the bringing in of new riches among them, the inducements to robberies must have increased, the chiefs seem sencible of this and are now extremely desirous of Chests, a few that the Spaniards had left among them, they seemed to set much Value upon and were continually asking us for some. I had one made for Otoo according to his own dimensions, it was eight feet long five broad about three deep; locks and bolts were not a sufficient security, but it must be large (e)nough for two people to sleep upon by way of guard(ing) it in the night. (Beaglehole 1967:222)

Lese Majesty

Offenses against the position, property, or person of a tribal chief also resulted invariably in severe penalties, from temporary exile to death. When carried out at the behest of a tribal chief, a punitive slaying was even more harsh a measure than was usually the case, since nearly all such victims were disposed of as offerings to some tribal tutelard. For example, according to one source, whereas a person caught thieving from nonchiefs was simply killed, anyone caught thieving from a chief was sacrificed to a god (Corney

1919:155). This measure sometimes had the effect not only of placing the victim's near relations in peril of similar fates, but it reduced even further the inclination or the possibility of revenge: especially in cases where the offering was made to 'Oro, as it was deemed a sacrilege for anyone even to express grief for a victim offered to this god (Henry 1928:126). In fact, so powerful a sanction was human sacrifice, and so apparently *necessary* was it to chiefly authority, that some chiefs, upon being urged by Europeans to give up the practice, exclaimed, "If we do there will be no Chiefs" (Morrison 1935:207).⁶⁸

At this point a distinction must be drawn between two "official" roles played by a tribal chief in meting out the death penalty. In some situations he acted more or less impersonally, as tribal administrator; either on his own initiative or in response to priestly requisition, he called for some victim to fulfill a ritual need. In other situations, he ordered the execution of some specific individual who had offended his own person, property, or office; it is this role with which I am presently concerned. There is evidence that some tribal chiefs utilized valid or even trumped-up requisitions for sacrificial victims to punish enemies whose gratuitous slaying would otherwise have proved too unpopular—but tribal chiefs were perhaps not alone in playing this cynical game.

The other kinds of sanctions regularly employed by tribal chiefs toward offenders against themselves were whipping, banishment, and destruction of the malefactor's goods. One method of whipping was described by de Herve: "... when [a chief] wants to punish any persons of his District for an offence against his person, or otherwise, he orders them to be tied by the hands and beaten across the pit of the stomach with a stick; the severity of the punishment varying with the nature of the fault" (Corney 1913:356-357).

Banishment sometimes consisted merely of causing the malefactor to be "turned off his land" (Morrison 1935:110), but more often involved driving him outside the tribal territory or making it impossible for him to survive except on charity, by forbidding him to subsist on any other part of the tribe's land (Corney 1919:99). Most references to banishment imply only that the exile had to leave his tribal territory, but one source indicated that those banished from Teva i Tai were sent to Me'etia Island, which was a dependency of the Teva i Tai chief (Corney 1915:264). Destruction of a malefactor's goods (house, furnishings, gardens, groves) was also accomplished on occasion, either as the sole form of punishment or accompanying other penalties. Sometimes the moveable items were plundered instead of being destroyed (but, as will be explained, not ordinarily for use by the tribal chief himself).

Another typical feature of the punishment meted out by a tribal chief

was its occasional extension to members of the principal offender's family or neighborhood. The *ari'i* Vehiatua, for example, ordered the banishment of the principals responsible for robbing his friend Rodriguez, and in addition dispossessed the innocent relatives of the culprits of their land (Corney 1919:87).⁶⁹ On other occasions whole neighborhoods were laid waste as the result of the offense of one resident.

A review of reported cases of chiefly punishments reveals *some* measure of association between types of offense and of punishment—for example, default of "taxes" was punished by banishment, and "blasphemy" by death—but as much or more determinative were the chief's personality and coercive powers, and the social identity of the culprit. For example, when Pomare II was relatively secure politically he angrily ordered the death of a commoner who unwittingly awakened him from a kava stupor (Jefferson, Journal, 16 May 1799, LMS Archives): an extremist action which more benign chiefs, or those less powerful, would probably have hesitated to take. And, as we have seen, few tribal chiefs, however powerful, were able to punish with complete impunity the well-connected or more influential of their subjects. In other words, whereas a tribal chief could mete out punishment directly upon a more humble offender, he was obliged to accept a substitute when the culprit was of superior status, as witnessed in the following:

I was sorry to hear again of a human Sacrifice.—Iddeeah informed me that the Chiefs of Wa'annah (called Oha aine in C. Cooks Map) had sent one to Otoo—I found it wrapt up in a platted Cocoa Nutt branch and Slung to a Pole as usual—it stunk very much, and on that account was hung up among the Bushes a part from any dwelling.—The late disturbance and War between Matavai and Oparré People was the cause of this Sacrifice—the People of Wa'annah took part with Matavai, and the offence was not to be forgiven but by this melancholy claim.—The absence of Otoo prevents any thing being done untill his return, when the Eye will be presented, and the Etuah supplicated to continue the friendship between the two Districts.

I am now perfectly satisfied that Human Sacrifices are common and very frequent.—If a Chief or Powerfull Man seriously offends the Eneerahigh he is obliged to obtain forgiveness by this means.—It is not to be refused, so sacred is it as a pledge of faith and good will.—It is evidently not confined to making Peace or declaring War, or supplicating the Etuah on an emergency, or any general calamity. (Bligh 1792:162)

The question of constraints, or lack of constraints, upon chiefly authority will be discussed later on, after we have considered what roles chiefs played in adjudicating and punishing breaches of social norms other than those concerned mainly with their own persons, offices, and goods.

Social Justice

I cannot discover that they have any custon or law which inflict punishment for particular Crimes by Trial—The Strongest Man, or the most powerfull Chief decides

in his own cause, but there is an appeal from the inferior people of every District to their superior Chief who judges fairly of the matter in dispute. (Bligh 1792:150)

It appears that the chiefs, like the gods, were not concerned with protecting the innocent or with avenging crimes; in fact, it seems that the only advantage which people drew from their [tribal] government consisted in its actions of mobilizing and leading them to fight against common enemies. On all other occasions it was a case of might makes right.

There were, to be sure, some circumstances wherein complaints were taken to the chiefs; but it was rare that the latter championed justice to the extent of correcting wrongs or punishing wrongdoers, especially if it was a case of strong against weak—for, in this form of government the people at large were always oppressed. It can be stated as a general condition that the chiefs' judicial decisions were usually arbitrary; and, if they were indifferent [to the application of justice] among their subjects at large, they punished with fury and cruelty the least offense or mistake against themselves or their favorites.

In addition to their unconcern with dissension among [other] individuals, including even the most infamous actions and the most atrocious crimes, except when they were personally affected, the principal chiefs or *ari'i* intervened only rarely into the more serious quarrels of their tribal subchiefs, whom they allowed to war [against one another] for the most frivolous kinds of reasons. (Moerenhout 1837:II, 16-17)

As Bligh indicated, chiefs may have intervened occasionally in their subjects' disputes if asked to do so, but for all its bluntness, Moerenhout's statement seems to be essentially true in most other respects. A contrary view was expressed by Banks, whose statement, however, is in itself contradictory:

It is not to be expected that in a Government of this kind Justice can be strictly administered, we saw indeed no signs of Punishments during our stay. Tupia however always insisted upon it that Theft was punished with death and smaller crimes in proportion: in cases of Adultery the offenders were in the power of the offended party who if he takes them in the fact frequently kills them both. All punishments however were the business of the injured party, who if superior to him who commits the crime easily executes them by means of his more numerous attendants; equals seldom chuse to molest each other unless countenanced by their superior who assists them to defend their unjust acquisitions. The chiefs however to whom in reality all kinds of Property belong punish their dependants for crimes committed against each other, and the dependants of others if caught doing wrong within their districts. (Beaglehole 1962:I, 386)

The sources do not contain instances of, or general statements about, tribal chiefs intervening in the quarrels of their subjects, either unbidden or at the behest of one of the parties;⁷⁰ but nearly all such instances can be shown to have touched upon the chiefs' own interests. A chief did occasionally champion a subject in the latter's quarrels with members of other tribes; in fact, that was a standard strategy for gaining or maintaining adherents when such measures became politically expedient;⁷¹ but the picture of a tribal chief holding court to protect the weak from the strong, to

uphold justice for justice's sake, is quite alien to the Maohi scene as I have been able to reconstruct it. By this I do not mean to imply that the populace was universally and unceasingly "oppressed" (as Moerenhout would have us believe); under some tribal regimes this was undoubtedly the case, both by Western *and* Maohi standards, but it is unlikely that most Maohis would have characterized their normal situations in such terms. For, the behavior of tribal chiefs was of the *nature* of things.

According to Anderson, chiefs sometimes put a desire for goods above any feeling of responsibility for the welfare of their own immediate dependents:

If a *Manahoone* [vassel⁷²] kill the *Toutou*, or slave of a Chief, the latter sends people to take possession of the lands and house of the former, who flies either to some other part of the island, or to some of the neighbouring islands. After some months he returns, and finding his stock of hogs much increased, he offers a large present of these, with some red feathers, and other valuable articles, to the *Toutou's* master, who generally accepts the compensation, and permits him to repossess his house and lands. This practice is the height of venality and injustice; and the slayer of the slave seems to be under no farther necessity of absconding, than to impose upon the lower class of people who are the sufferers. For it does not appear, that the Chief has the least power to punish this *Manahoone*; but the whole management marks a collusion between him and his superior, to gratify the revenge of the former, and the avarice of the latter. (Cook 1784:173)

Anderson also wrote that when parties to a land dispute took the case to their tribal chief, the latter "... terminates the difference amicably," but de Bovis indicated that such appeals were avoided when possible:

When two raatiras, of same or different families, engaged in a dispute—a situation which ordinarily arose only in connection with differences regarding partitioning or sole ownership of land—the contestant who believed himself wronged had the "right" [i.e., could take recourse] to deed to the king or some other member of the royal family the disputed object, to which three-fourths of the time he himself had no just claims. (1909:21)

According to Morrison there was a little need for disputes to be referred to higher authority:

If any dispute should happen about the boundaries of their land, as they have No Records nor any deeds of Gift they always refer to the Neighbours for a decision, who new Mark the bounds of each Mans land, and None disproves of such decision, as they are very superstitious in religious rites they would rather submit to let the whole be Common to both, then either would undertake to Mark his own bounds, fearing that he should be punished with sickness or Disease if He inchoachd on the property of His Neighbour.

This and all other Disputes is settled by the Neighbours and the party who is declared to be in the wrong, almost always submits at the first word and making a Peace offering to the Man offended, declares himself in fault, and desires he may think no more of it. (1935:193-194)

But against this flattering characterization (a typically Morrisonian one) is de Bovis' view quoted above, along with much other evidence of the same kind. In other words, while it seems to have been generally true that a tribal chief seldom intervened to settle disputes or avenge misdeeds among his subjects, unless of course his own interests were at stake, this does not signify that all such disputes were amicably resolved, or that all such misdeeds were appropriately punished, among the subjects themselves. It signifies, rather, that Maohi social relations encompassed a great deal of unresolved conflict and unrequited wrongs: a situation which for one reason or another tribal chiefs were either unwilling or unable to reform.⁷³

Constraints on Chiefly Authority

In an earlier section I listed the various kinds of officials who supported a chief's authority over his tribe: priests, administrators, warriors, subtribal chiefs, and so forth. Looked at from another point of view, some of these officials can also be seen as having limited such authority.

The most powerful constraints on a tribal chief's authority were exercised by the chiefs of the subtribes making up his realm. To begin with, most evidence tends to confirm Ellis' (1829:II, 366) and Moerenhout's (1837:II, 8) dicta that the chief of a subtribe nearly always exercised weightier authority over his own subtribe than did the tribal leader himself. (It will be recalled, however, that most tribal chiefs also exercised *direct* authority over a particular subtribe as well.) As indicated earlier it was very rare indeed that a tribal chief had direct relations, especially on official matters, with ordinary members of subtribes other than his own. Nearly all commands and requisitions went through the subchiefs; if the latter approved or were unable to offer successful resistance at the time when such orders were usually executed, but that was not always the case:

The parties generally knew each other's strength and influence, and those who had little hopes of succeeding by an appeal to arms, usually conceded whatever was required. Personal security, and the rights of private property, were unknown; and the administration of justice by the chiefs in the several districts, and the king over the whole, was regulated more by the relative power and influence of the parties, than by the merits of their cause. (Ellis 1829:II, 368-369)

In this and the following statement, Ellis was evidently referring mainly to the polity after Tahiti and Mo'orea had become "unified" under Pomare II, when all subtribal chiefs had become known simply as "chiefs" or *ra'atira*. Writing in more general terms, Ellis stated:

Notwithstanding the many acts of homage paid to the head and other branches of the reigning family, and their imagined connexion with the gods, the actual influence of the king over the haughty and despotic district chieftains, was neither powerful nor permanent, and he could seldom confide in their fidelity in any project which would not advance their interests as well as his own. Every

measure was therefore planned with the most cautious deliberation, the approval and aid of a number of these nobility of the country being essential to carry it into effect; but when the interests of the reigning family and those of the chieftains were opposed, it produced no small embarrassment. (p. 367)

The sovereign was, therefore, more desirous to conciliate their esteem, and engage their co-operation, than to prejudice them against his person or measures. (p. 366)⁷⁴

Recorded instances of the relative independence of particular subtribal chiefs are numerous, and range from petulant obstructionism to rebellious disobedience. There were also institutionalized expressions of this latitude, for example, in the degree to which debate characterized tribal council meetings, and in the license enjoyed by subtribal chiefs in expiating their own acts of lese majesty by means of substitutes—that is, by sending a human sacrifice to the tribal chief in lieu of being punished themselves (Bligh 1792:162). These indications of the nature of the relationship between tribal chief and subtribal chief are sharpened by evidence that a tribal chief rarely took over personal possession of estates whose owners he had banished: “For treason, rebellion, or withholding supplies, individuals were liable to banishment, and confiscation of property. The king had the prerogative of nominating his successor, but could not appropriate the lands of the exile to his own use.” (Ellis 1829:II, 365)⁷⁵

The ultimate constraint exercised by subtribal chiefs upon their superior was to kill him or to remove him forcibly from office. Both measures are attested to in legend and in history. A legendary account of the killing of a chief by his disgruntled subjects was provided by Henry:

On one occasion, it happened that a king named Tai-è (Odd-cry), who was much hated by his people for his tyranny, went up with a party of his subjects determined to explore the crater and ascertain what kind of creature dwelt there. He had a long strong rope, and being the bravest man in the party, attached himself to one end of it, telling his men to hold the other and to pull him up quickly when he gave the signal by jerking a small rope attached to the upper end of the big one and hanging by his side.

With this understanding, while the men held on, the king descended and disappeared in the labyrinth below. Soon he violently jerked the signal rope, but no heed was paid, and he continued doing so for some time, till gradually the pulling ceased. After waiting still longer the treacherous attendants drew up their king, whom they found with his flesh devoured from his bones. They carried home what remained of him, saying as they did so, “*Ua ora râ te fenua i teie nei ari’i ino*” (The land is now free of this bad king), which was ever afterwards regarded as a terrible warning to other kings against despotism. (1928:98)

Rebellion sometimes accomplished the same end, as exemplified in the traditional story of the Poraporan chief Teihotu reproduced in chapter 16, section on Leeward Islands. Dissatisfaction with Teihotu’s rule derived partly from the “austerity”—probably the excessive prohibitions and demands for offerings—emanating from his “tribal” marae, Vaiotaha. In this

case the rebellion ended in the killing of Teihotu in battle, and the installation of his infant son as head of a new tribal regime controlled by the successful rebels.

I have come across no specific instance, legendary or historical, of a tribal chief having been removed from office by peaceable persuasion or mere threat of force, but such actions may well have taken place, as attested in Morrison's general statement that "... if the Chiefs should not act up to the Dignity of their Office they may be divested of their Office, but they are still Chiefs [members of the *ari'i* class?], and tho the King may be stripd of his Government he still retains his royalty ..." (1935:167)⁷⁶

According to Moerenhout:

Priestly power was extensive; and although priests did not sit in [tribal] councils, or take much part in political discussion, they were not therefore less respected than chiefs, because—regarded as priests were by the populace—chiefs would not have dared to mistreat them, since their offices provided them with a thousand ways to obstruct chiefly policies. Just their announcement of a direful omen usually had the effect of dissuading the populace from supporting the chief in some enterprise. Also they were in a position to punish or even destroy persons [in power], including the sovereign, without taking overt action and without thereby compromising themselves in any way. (1837:II, 10)

While most of the sources agree in general with Moerenhout's estimate of the reach of priestly influence, I have come across ample evidence that some priests *did* take part in tribal councils, either regularly or occasionally. Moreover, I suspect that some of them engaged regularly and heatedly in "political discussions." In other words, it is my conclusion that some priests exercised constraint upon a tribal chief's authority not only by doing priestly things, but also by means of secular, political tactics as well. For, it should not be forgotten that in some tribal congregations sacerdotal offices were *ari'i* family entitlements, and that such priestly dynasties were usually backed by extensive estates and numerous fighting forces of their own.

This conclusion is confirmed by a passage from de Bovis indicating that the high priest's activities were not confined within the marae precincts, but in secular affairs as well he exercised immense influence (1909:49-50). But, as de Bovis also pointed out, the extent of priestly influence upon secular affairs depended much upon the character of the tribal chief himself. In addition, it should not be forgotten that the interests of priests and chiefs probably more often than not ran parallel. In describing this situation Moerenhout noted that a tribe's high priest was usually a close relative of its chief (1837:II, 10). While this circumstance may sometimes have resulted in identity of interest between the two, it did not always or necessarily do so. In fact, what scattered evidence we have concerning actual—that is, "historical"—political events shows that although relatives did in some cases aid a chief in extending or

maintaining his tribal authority, there were several other instances when they managed to curb his ambitions or reduce his authority. Some of these instances have already been discussed—they involved not only collateral family lines but siblings and parent-child rivalries as well. I shall not attempt to “explain” all such rivalries, but one type merits some additional remarks.

In the case of kin-Titles also identified with tribal chieftainships, the transfer of such a Title to the new incumbent early in the latter’s life undoubtedly minimized chances of succession rivalry. On the other hand, the practice whereby effective tribal authority was transferred only piecemeal served to encourage conflict between old and new incumbents, who in most cases were father and son. And, since individual rivalries usually tended to involve other relatives and their adherents and allies, such situations typically culminated in civil or even intertribal wars, which occasionally may have served to increase the new incumbent’s authority but in other cases accomplished the very opposite effect.⁷⁷

Finally, we have to consider whether and how a tribe’s populace at large exercised effective constraint upon their chief’s authority: I raise this question because of the phrasing found in some of the sources that generalize about the limits to chiefly power. There is no reason for doubting the sources when they refer to “the people,” or “the populace,” or “the tribal members” as “grumbling about their tribal chief’s oppressiveness,” or “muttering thoughts of rebellion”; but I have come across no evidence that any such “popular” movement ever succeeded against a tribal sovereign without the leadership of some one or more subtribal chiefs. However, it was reported that individuals or whole families occasionally defected, that is, moved into some other tribal domain, when displeased with their own tribal chief (Moerenhout 1837:II, 19n2).

The knowledge, or anticipation, of a popular groundswell of discontent may in some cases have caused a tribe’s chief to exercise *self*-constraint, but, as I understand Maohi tribal politics, interpersonal limits on tribal chiefly authority originated mainly with priests and with other chiefs.

THE PRECEPTS OF TETUNAE

The sources contain many references, explicit and implicit, to Maohi ideals and expectations concerning tribal chieftainship. These references range from statements in, say, the legend of Rata (Henry 1928:478), to legendary and historical evidence regarding popular discontent with tribal government. But the most explicit by far of these data are a list of precepts, *ture*, said to have been “orally transmitted since the time of Tetunae, and taught to each succeeding generation of ruling arii” (Handy 1930:39).⁷⁸

1. You are like the Morning Star, Taurua. Your seat is at the prow of the great canoe. You will eat of the chest and filet of the boar.

2. The life and death of men is yours. Let not one support of the canoe outrigger be broken, lest its weight bear you to the ground. It [each outrigger support—principal supporter] is held in respect by the Farepuans.

3. Let not the blood of your parents be tainted by you; better were it for you to hide your shame in Toareva, the afterworld.

4. To your household and brothers and sisters you owe respect. They must not be defiled by you. Misdeeds against them will leave an ever-open wound.

5. Let not the bilge water of your household be carried and spilt on the wayside. It turns to stirred-up mud, which the *mamo* fish likes to eat.

6. Let not your eyes be blind to the errors of your relatives (*feti'i*). It [the errors?] will be like a blazing fire inside your household.

7. Let your eyes, not your ears, be open to the reports of mischievous persons. You will be the first to be harmed if you believe such, or are blind to such as those.

8. Let not your head to be stroked by the hands of a woman [of low birth?]. Your head is not for the likes of them.

9. Take care in choosing the polisher of your spear case.

10. Guard yourself against courtesans, who anoint themselves with sweet-scented oils in your household. They will be the cause of the drowning of your soul with the boasting pride that is the mark of the lowborn (*hunareho*).

11. Let not folded legs and the love of soft couches be known in your household. Such could be the cause of your ruin.

12. When you reign (eat the *hau*) remember that the people are servants (*titi*) of many masters (*fatu*); that their eyes are ever open to mistakes and verbal abuses; and that, when the *aau*['*au'a*, food bowl? or '*āu'a*, spirit?] is full, bundles [i.e., belongings] are quickly packed and faces turned to a new master.

13. Beware the woman who is footloose and fancy free, quick of tongue, prone to arguments. Arguments are not good; their tail end never fails to strike you.

14. Keep a ready ear open for the agitated cries of the *torea* [a night bird]. It is the herald of the warrior of death.

15. Let not your death sentences be too frequent, lest your own bones follow the road to death. It will be like having your own house torn down by the warrior at night, leaving you in total darkness, the enveloping darkness of your sin (*hara*).

16. Let not your breast be brushed by the butt (of the coconut frond) of the voice of contention, lest such weaken relationship bonds.

17. Let not your household be accused of hiding food. Let not your name be associated with hidden food or closely held belongings. The

hands of the *ari'i* must ever be open; on this rests his "prestige" [*hana-hana*: appears to be a biblically derived word⁷⁹].

18. The populace is like a crying child: easily coaxed with gentle words, easily enraged by ill treatment.

19. The "heart" [*a'au*, bowels, i.e., spirit, mind, etc.] of the *ari'i* must be equal to do good, never too weary to listen to his people's complaints, his ears and eyes ever open to the demands of the law(?) (*te ture ra mau faataa raa*).⁸⁰

20. Break the sudden rage that shakes your body, that beclouds your brow. Careful pondering is the wise way to proceed.

21. Be strong to kill the roots of trouble, the breeders of war.

22. Guard yourself against the revenge of a woman; it will pursue your footsteps. Her laugh will be like the wind, the scattering rain on Pou-ma-rorio (official name of the chief's house).

23. Never undertake small enterprises, nor encourage the soul of the shrimp or of *o'opu* [a small black fish]; their brains are but mire.

24. Ants can hide under leaves—but there are not enough leaves about to cover up your name.

25. Beware of the soft-voiced flatterer. Flattery is the commencement of deception.

26. Wisdom and *aau hau* [gentle heart? peaceful spirit?] are the best spear an *ari'i* can hold.

27. Your government (*hau*) must be stable. It must not be left to run itself, or allowed to be run in ignorance. It must be governed properly and honestly, and not be pushed aside. The *ari'i* who follows this rule displays great wisdom. Prosperity will follow him; his enterprises will be crowned with *hanahana* [prestige? glory?].

28. The head of the government (*upo'o o te hau*) should not be seen with grinding teeth, with lifted voice, with frowning brows, with emotion-shaken body, with a heart angrily beating like the liver of a tortoise—or like a commoner (*manahune*), from whom alone are such things expected.

29. What you have ejected from your mouth you cannot again swallow, for the wind has scattered it far and wide.

30. Never interrupt nor controvert the words of an orator while he is performing his proper function. Avoid impatience; be attentive [to his words] with open eyes and ready ears. His belly is full of *pa'ari* (wisdom, experience, sophistication).

31. Never give ear to the advice of a wanderer. He is but the semblance of a man; he is a fruit afloat, going on and on with no place to land and take root.

32. Let not your mouth breed food for the maggot. It must hold only *vai-anui* [a medicinal plant].

33. See to it that your chiefly residence, Ao ra'i, does not become the habitation of useless mourning and regret. For you cannot stop the coming of the sun god, Ra'a.

34. An *ari'i*'s anger must be like the *mara'amu* wind, not heard but felt. Let there be no lasting anger; it must be over quickly, like a gust of the west wind, Toerau.

35. Ponder your words before speaking. They are like flashes of lightning, as mighty as a clap of thunder; no amount of effort can recall them.

36. Be able to accept trouble of all kinds, as an *ari'i nūi*. Trouble must not find you fearful or shamefaced. You cannot stop the blowing of the boisterous *ha'apiti* wind, nor the call of Toareva (afterworld).

37. Let not unbecoming tears of irrational anger be seen with you. Night hides what cannot bear the light. The dew [tears?] falls, but the light of Ra'a, the sun god, dries it.

38. Watch your people. Arouse not that which will pain them—you might not be able to find the cure.

39. Your oath must be as respected as your person. Your word must be as dependable as the [daily] appearance of the Morning Star, as binding as the regulations emanating from Marae Farepua.

I need hardly point out that the principal message contained in this "Advice to Chiefs" (who are presumably of the *hui ari'i*) has to do with their own preservation. The desirability of their maintaining their class purity and family unity and welfare is phrased as moral absolutes; the admonitions concerning liberality, judiciousness, magnanimity, moderation, administrative attentiveness, and so forth, seem, however, to be directed more toward insuring a chief's authority and influence than his subjects' welfare. In some respects, of course, what was good for the former was good also for the latter. But, as I interpret these remarkable guidelines for tribal "good government," the "goodness" had to do mainly with benefits to the chief. This raises the question, What in fact were the benefits that accrued to ordinary people as members of one or another tribe?

ADVANTAGES OF TRIBAL MEMBERSHIP

During the era under study, most tribes appear to have been governed primarily for the benefit of their governors, including principally the tribal chief and his close relatives and counselors. Basis for this proposition is the fact that most interaction between governors and governed related to providing the former with objects and services, and not vice versa. For example, ordinary tribesmen contributed their military services in wars that served principally to maintain or extend their governors' own authority, and only rarely to defend themselves or improve their own lots. The objects and labor provided on other tribal occasions served largely to maintain or

enhance their governors' welfare—material, political, and spiritual.⁸¹ And most encounters between governors and governed were marked by the latter's expression of deference, without a balancing return of service on the part of governors, except perhaps in terms of priestly representation.

Support for this proposition is also provided by information concerning the measures which sometimes had to be taken to obtain a populace's contributions—that is, by means of physically coercive sanctions, or by threat of such sanctions, rather than by voluntary consent. The following passages from G. Forster indicate how subjects sometimes had to be "coerced" into behaving "respectfully" toward their chiefs:

The respect which was paid to the sovereign by all ranks of people, and which consisted in uncovering the shoulders in his presence, did not prevent them from thronging around us on all sides with the greatest eagerness of curiosity. The croud was beyond comparison more numerous than at our interview with Aheatua, and the king's attendants in different corners of the area were obliged to exert themselves in order to keep them within bounds. One in particular displayed his activity in a furious manner to clear the way for us, by beating them unmercifully, breaking several sticks on their heads, and no doubt breaking their heads too. (1777:325–326).

During this conference the croud, amounting at least to five hundred persons, was so excessively noisy, that it was impossible at times to distinguish a word; and on those occasions some of the king's attendants with a Stentor's voice called out *mamoò!* (be silent,) and enforced his command by dealing out hearty blows with a long stick. (p. 307)

But lest my evaluation seem too arbitrary let us examine some more appropriate stereotypes about the functions of Polynesian chiefs. I refer generally to the "noble savage" view which pervades so many writings about Polynesians, with especial emphasis upon the "benevolent paternalism" of their chiefs. This attitude also colored some writers' general accounts about Maohi society—particularly accounts written by visitors already imbued with the virtues of monarchical and aristocratic ways of life, or by writers whose information derived mainly from aristocratic sources, either from the aristocrats themselves or from traditions concerned mainly *with* aristocrats and preserved mainly *by* aristocrats. Fortunately, some balance to such views are provided by a few visitors and long-term residents who, unwittingly or not, managed to reveal much concerning the ways Maohis actually behaved.

Because of the summary nature of what follows I hope readers will agree with me that it is not necessary to provide specific references for either the stereotypes or for my own qualifying views. I turn first to those notions about the economic advantages gained by subjects from membership in tribes.

One common notion about tribal economics is its preponderance of *redistributive* type transactions, which are viewed as accomplishing a more

equitable distribution of goods—more equitable, that is, in the sense that more members of the tribe enjoyed larger portions of the tribe's total resources than would have otherwise been the case. As we have seen, some of the transactions between Maohi tribal chiefs and subjects can indeed be characterized as redistribution, but in most specific instances that I know about the goods that were left over from consumption by those at the top of the hierarchy were either appropriated by those *near* the top, or were further redistributed in only token amounts. Another common notion about redistribution, namely, that it served to make fuller use of "windfalls," by averting spoilage, cannot be applied to Maohi economics, except perhaps in connection with large hauls of fish.

Some writers characterized *rahui* or *rahui*-like prohibitions as *conservation* measures—deliberate acts on the part of wise administrators to permit the recovery of endangered sources of supply.⁸² Such indeed may have been the rationale, or the unwitting consequences, of some Maohi *rahui*, as for example in connection with seasonal fishing. Most *rahui*, however, were deliberately imposed for the benefit of the imposers—explicitly, perhaps, in preparation for some tribal event, but implicitly (in some instances) to assert their own political supremacy.

Another common notion about Polynesian societies is that the strongly authoritarian structure of their tribes resulted in a wider extension of social order than was achieved among peoples interrelated mainly by ties of kinship. Some social order, with attendant benefits, there indeed was among members of any Maohi tribe, and insofar as that order concerned relations between chief and subjects it was explicitly defined and effectively policed. In some respects social order was also well defined and effectively enforced among other members of any tribe, but not entirely or even principally due to the intercession of chiefs.⁸³ What tribal "law" there was applied mainly to relations between subject and chief—and in some respects only to a particular chief.⁸⁴

As an example of benefits accruing from the social orderliness just mentioned, it can be assumed that effective *popular* enforcement of norms against theft contributed to nearly everyone's material advantage; but this was offset in many instances by the impunity with which a chief or his minions could plunder an innocent's goods.

But what about the *psychological* advantages, if any, acquired by subjects from their membership in tribes? Leaving aside the satisfactions which some members undoubtedly derived from identification with a successful, splendor-auraed chief, and the more tangible pleasures many of them probably enjoyed at his official celebrations, it might be asserted that a chief's subjects obtained intangible benefits from evidence that he was maintaining proper relations with tribal tutelars. These benefits included both decrease

in anxieties about potential calamities and increase in convictions about possible successes. Some such benefits may indeed have come about now and then, but one will also recall the plaint raised against excessive, politically inspired religious demands: "Bowed down, forsooth! Crushed will be Tahiti before the marae!" (Henry 1928:131)

In proposing the above evaluation of Maohi tribal government I do not, of course, intend to imply that the Maohis themselves necessarily held such views. Some Maohis, especially subtribal chiefs, expressed desires for a return to an allegedly earlier situation of smaller (and presumably more kin-homogeneous) tribes. Ordinary tribal members may occasionally have viewed their own circumstances in the tribal system as inequitable, but it is unlikely that any ordinary (or rather *extraordinary*) Maohis viewed the whole chief-subject relationship in the objective (i.e., modern Western) light set forth above. Some "memory"—reliable or fictitious—of the kind of chief-subject relationship associated with membership in a kin-congregation may have served to sharpen individual dissatisfaction with particular tribal situations, but except for that pattern, which was itself anything but democratic and egalitarian, the Maohis knew of no other kind of system.

CHAPTER 24 *SUMMARY, SYNTHESIS, EVOLUTION*

In this final chapter of my attempted reconstruction of the Maohis' social relations as they were during the middle third of the eighteenth century, I propose to do four things:

- to review what I conceive to have been these Islanders' principal goals in life and the resources and behavioral means they used to reach them;
- to summarize the more widespread types of social units and categories that crystallized out of that behavior;
- to list the more evident kinds of connections that existed between different types of social units and categories, and between social units and socially valued goods; and
- (as an exercise in self-indulgence) to record some of my own pet notions about how Maohi society came to be what it was during this era.

I leave to others, better qualified, the task of making generalizations about the modal types of Maohi personality.¹ Much of the data I have adduced for my generalizations about "social relations" could also be utilized in generalizing about "personality," but with the use of somewhat different criteria of relevance and—I feel very strongly—of largely different techniques of analysis.

ENDS AND MEANS

Life Goals

There were probably times in the life of every Maohi when, say, desire to drink water, or to evacuate the bowels, or to assuage some particular pain dominated all other conscious goals, immediate or long-range; but in this section I shall be concerned with the Maohis' less minimally pan-human and less *directly* biological needs and drives—that is, with the wishes seemingly shared by some or most Maohis that served to distinguish them (in this respect at least, and in part) from, for example, the Muringin or the Siuai.² I am acutely aware of the methodological weakness involved in an exercise based on the kinds of fragmentary and archaeological data at

our disposal, but I believe that some statements on this important subject are called for, however unsystematic and impressionistic they may be.³

To begin with, it seems quite incontrovertible that eating was regarded by most or all Maohis as one of the supreme pleasures of life—and not just as a means of restoring energy or of warding off illness and assuaging the discomfort of hunger, but as a recurrent end in itself. Moreover, the consequences of what we would regard as dangerous *overeating*, as evidenced in obesity, were deliberately striven for through institutionalized means. Indeed, the high social value attributed to food and eating was made evident in numerous ways: in the connections between hierarchial status and consumption privilege, in the symbolic use of food in social ritual, and so on.

For some individuals, the drinking of kava, and its resulting state of mellow stupefaction, seem to have rivaled or even surpassed the pleasure experienced in eating, but these were but a small minority. (And although only the more affluent were able to indulge in heavy kava-drinking, the practice does not seem to have been a high-priority goal of the populace at large, or even of the affluent in general.)

Turning now to other aspects of physical well-being, I have the impression that “bodily comfort” was not very high on most Maohis’ conscious list of desirable end-states—at least not the sort of “bodily comfort” that Westerners measure in terms of soft places to recline, of situations involving no hard physical exertion, of body conditions free from aches and pains, et cetera. The Maohis evidently enjoyed resting and they slept probably as much as most other peoples, but they do not appear to have invested much thought or physical energy into “making better beds” for themselves (figuratively speaking), or into avoiding situations and circumstances known by them to involve physical strain and predictably large amounts of physical pain. It is, of course, true that some of the objects and services devoted to religious activities were for the deliberate purpose of avoiding bodily discomfort, in the form of spirit-induced illness and accidents; but perhaps the larger part of such goods were intended to secure spirit aid for enterprises not directly connected with “bodily comfort” per se. And to select one more argument from a number of possible ones, the Maohis’ apparent willingness to undergo tattooing suggests that certain other goals outweighed whatever general desire they may have had to avoid physical pain.

One such goal was self-beautification, which must be placed high in the Maohis’ hierarchy of end-states. Some of their behavior involved in grooming was undoubtedly looked upon as a means for winning sexual favors, but it seems to me that these Islanders also valued good-looking bodies per se, and expended many of their resources, in energy and objects, in making themselves attractive.

Among the several activities engaged in by the Maohis, one that ranked

near the top of their list of goals was sexual intercourse—not mainly as a necessary release of tension, but rather as an activity as highly pleasurable, in its way, as the eating of good food. Also, although the sexual services of most Maohi women may not have been valued very highly relative to certain other goods, the very frequency of their circulation stamped sexual intercourse as a most popular and recurrent social goal.

Other Maohi activities that ranked high in their hierarchy of ends were dancing, music, dramatics, and sports. Some writers asserted that fighting was also an important if not the *most* important goal of some Maohis, and so it may have been; I believe, however, that with respect to the majority, while fighting itself may have been an intoxicating experience at the time, and a memorable one in retrospect, it constituted mainly a means toward other ends rather than an end in itself.

It may be that some individuals considered their everyday labors to be pleasurable enough to list among primary goals for living, but the only such activities that seem to have thus qualified with large numbers of Maohis were certain types of fishing, for males, and perhaps group bark-cloth-making for females. Although most Maohis appear to have endowed much of their everyday work with jollity, and especially those jobs involving several persons, I do not find evidence of any widespread sentiment to the effect that work itself—or “a job well done”—constituted a high-priority goal.

Maohis’ goals respecting peoples’ relationships with information, with objects, and with other people may also be generalized. Some individuals may have valued *information* for its own sake: certainly many of the things they “knew” about their environment seem to have had little or no practical utility; but I have the impression that in most cases knowledge was regarded as a means toward other ends.

Moreover, I believe that a similar generalization may be made concerning the Maohis’ relationships with *objects*, although the exceptions were probably more numerous than was the case with knowledge. Reports of the avidity with which Maohis sought after European goods might seem to controvert this assertion, until one inquires into the fate of most such objects: that is, instead of preserving them for the sheer joy of counting and looking at them, the owners used them to improve their work efficiency, to beautify themselves, to attract sex partners, to gain political allies, to maintain safe relations with spirits, et cetera.⁴ I would even go as far as to propose that ownership of territory (in so far as it was defined as an object) was valued by most Maohis as means to other ends—for example, as a source of subsistence and of political power.⁵

I suggest that among the many goals striven for by Maohis in the conduct of their relationships with other Maohis the three that ranked highest in the hierarchy of ends were “satisfactory” relations with offspring, mentally supportive relations with one or two “friends,” and command over the

services of as many other persons as feasible. Evidently not every adult Maohi consciously strove toward all three goals (in some cases, in fact, such goals were in conflict), and individuals differed in their priority ordering of them with respect to each other and to all other goals, but generally speaking these three objectives were the paramount social-relational ones in Maohi society during the era now being discussed.

What I term "satisfactory" relations with one's offspring was a complex mental attitude involving a number of sentiments of varying strengths: parental affection, pride of parenthood, desire for lineal continuity, expectations of material support and of politically useful aid, and perhaps even hope for some ultimate intervention with spirits that would help assure one's ghost a better fate. (As I warned at the outset, my generalizations in this section are both impressionistic and unsystematic, as this and the following paragraphs all too obviously indicate!)

Much of the motivation for making and holding "friends" was undoubtedly aimed at other ends as well, but I believe that one can discern in some instances of friendship a disinterested satisfaction in the relationship itself.

I am not prepared to decide how widespread among the Maohis was a strong desire to control others' services (or to precede others in ritual or everyday events, which was in some sense the symbolic indication of such control), but in those individuals for whom it was a goal, it was evidently attractive enough, given the nature of other aspects of Maohi society, to keep large domains of social relations in states of continual (though quite patterned) flux. Nor, of course, am I in a position to decide what part of this desire was "instinctive" and what part conditioned by Maohi customs in general or by particular familial, or other, circumstances. It would be most useful in explaining Maohi behavior if I could assume, as some writers have done, a more or less universal human drive for social power. This I cannot honestly do in the form of an *assumption* about *all* Maohis; I can, however, put it in the form of a *finding* about many of them.

Next, we have to consider again how a pleasant fate after death figured in the Maohis' hierarchy of favored ends. As I have indicated several times throughout this study, the sources do not agree in this matter, and there may have been wide individual differences. Probably, if questioned, all Maohis would have expressed a strong desire to end up in the "paradise" sphere of *pō*; but I have the impression that this was not nearly so popular a preoccupation as, say, eating or having sexual relations or gaining social power in the here-and-now *ao*. Moreover, the social exclusiveness of "paradise" (according to some accounts) removed it from the expectations of many persons; and the very fortuity of getting there (according to other accounts) may have dissuaded some other persons from trying.

This brings us again to the question of why the Maohis devoted so

much energy to religious activities. I have already proposed that most of that energy (in the form of both objects and services) was expended in order to insure exemption from spirit-induced ills or to secure spirit aid for enterprises of various kinds. But was there in addition a conscious desire held by some persons that led them to strive for good relations with certain spirits as an end in itself? I suppose there may have been, but if so it was, evidently, neither widely diffuse throughout the population nor strongly impelling to those few for whom it was a goal.

Physical Resources

Having indicated what Maohis appear to have wanted most out of life, I next review briefly the physical resources available to them for getting what they most wanted. From evidence presented earlier in this study it seems quite clear that the natural resources of these Islands as a whole were more than sufficient to satisfy the principal wants of the population. There were, of course, some local disparities in terms of relationships between population and natural resources, but institutional means were available for offsetting most of these.

I employ the word "sufficient," not from the vantage point of Western science (with its more comprehensive knowledge of the Islands' natural resources, including knowledge of materials neither used by nor familiar to the Maohis), but from a comparison with the ecologies of some other societies,⁶ and from the evidence that large parts of Tahiti, Ra'iatea, and other islands were almost wholly unexploited even in terms of resources elsewhere utilized by the Maohis.

Labor

Looking at the Maohi population as labor with which to exploit the physical resources just mentioned, I have found evidence of relatively few natural constraints upon the employment of that labor. The Maohis suffered some disabilities from endemic diseases but were on the whole a strong, hardy, and fairly healthy lot.

"Arbitrary" cultural constraints, regarding who could and could not do what jobs, were very light in terms of age and in terms of which sex did which kind of productive job. On the other hand, if the sexual segregation that prevailed in eating carried through to food production as well, as some sources suggest, this could have imposed some heavy constraints upon the "rational" employment of labor in this domain. Also, the society as a whole was undoubtedly handicapped as the result of restrictions imposed upon females in matters of religion. Religion itself also served to remove some persons from productive work from time to time, but over the long run this may have been more than offset by the impetus that religion sometimes added to productivity.

In some societies customs associated with social stratification impose almost crippling constraints upon productivity, but that cannot be said of the Maohis, among whom even the very eminent would sometimes work at the most commonplace productive jobs.

Finally, it should be recalled that two other Maohi practices, infanticide and warfare, served (though possibly not deliberately) to maintain a favorable relation between population and natural resources—favorable, at least, with respect to the satisfaction of most high-priority Maohi goals that involved objects.

Technology

One can best epitomize Maohi primary tools as having been relatively simple in construction, versatile in employment, and made of materials readily available to almost anyone—that is, no large output of energy or goods was required to have in hand a “basic” kit of tools. Nearly the same may be said of the more complex tools required in productive activities, except perhaps in certain types of fishing.

Most productive techniques were also relatively simple, tradition bound, and within the capabilities of Everyman. And even those more specialized ones requiring long apprenticeships and, perhaps, nonuniversal talents were for the most part so constrained by tradition that they did not encourage improvements in productivity. (Technological innovation may not have been socially penalized, but neither does it appear to have been rewarded: for how could mere mortals improve on the inventions of gods and demigods?) Reinforcing the traditional basis of productive techniques was the tradition-based noninductive nature of *most* natural-historical knowledge—but not all; for within the limits set by the general conception of a spirit-dominated universe there was still room for some pragmatism, which served in time to provide Maohi technology with features not found elsewhere.

Social-relational Techniques

We turn now to the social-relational techniques utilized by Maohis in their attempts to achieve their goals—namely, to the conventional procedures followed by them in their interactions with one another, as sought-after ends and as means of reaching other ends. As I proposed earlier, one way of describing these interactional procedures consists of analyzing them in terms of what I label their various *dimensions*. Throughout the previous chapters I have sought to characterize various types of social relations in these dimensional terms; I now want to record some more general inferences about Maohi social interaction, as viewed in these same dimensional terms. But first, I wish to direct attention to some general features of Maohi social interaction by recalling the pleasure that many, perhaps most, of them derived from mimicry and play acting, and the skill with which they partic-

ipated in such things. These Islanders evidently possessed acute awareness of one another's behavioral characteristics, including foibles, and they were not inclined—except under coercion or in ritualistic contexts—to evaluate one another on the basis of the other's self-estimate. In other words, these Islanders impress me as having been, social-relationally, a very knowing, sophisticated lot.

Terminology. As noted earlier, the Maohis distinguished in practice, and perhaps lexically as well, between personal names (*i'oa pi'i noa?*), general-status names (including offices), and specific-status names, or Titles (*i'oa mau?*). All three types of names served useful social purposes, for identifying individuals and categories of persons, and so forth, but in terms of the society's more durable social relationships the third type was most important by far. With a few exceptions, general-status names were used as labels for such populous categories of persons that the attributes and social positioning of their referents were thereby only vaguely defined. Except perhaps for *ari'i*—the name used to address and refer to tribal chiefs and high-ranking kin-Titleholders—general-status names seem not to have been used very extensively. As for personal names, they seem in many instances to have been both casual and transient, and thus it is not surprising that no evidence has been uncovered attesting to some kind of mystical link between an individual and his personal name.⁷

In other words, in Maohi society, the more precise, fixed, constant loci pertaining to individuals were their specific-status names (if they had such), and of these the most important were kin-Titles. Individuals moved in and out of these Titles, but the Titles remained the same.⁸

Explanation for the situation just described may be sought in many directions. In my opinion, the Maohi emphasis on kin-Titles as terminological loci in the social network was influenced both by the importance of consanguinity in defining social relationships, and by the relatively narrow scope provided in this society for socially consequential individual diversity. Among the Maohis, conformance to traditional patterns of role behavior counted for more than did innovation.

Time. I trust that intervening chapters have provided ample documentation for my introductory opinion that temporal *sequence* was more important than temporal *duration* in Maohis' interactions and in their relative valuation of serial events (chap. 14). Also, with respect to sequence, the higher valuation placed on acting or being *mua* (first, before), as opposed to *muri* (afterwards, later on) is well documented, as exemplified in the sharp definition of *precedence* in many types of interaction, in the privileges ascribed to firstborns, in the consignment of first fruits to gods and chiefs, and so on. Notwithstanding the prevalence of both these orientations in many other so-

cieties, there is nothing "natural" about them; and hence one is led to ask why they prevailed in Maohi society.

Regarding the relative unimportance, socially, of temporal duration, there is not much explanation I can offer. Perhaps one factor was these Islanders' experience, and conceptualization, of the ways things change: more cyclically than cumulatively. (Possibly reinforcing, and being reinforced by, this was their relatively noninnovative technology, and the weight attached to birth in allocating social roles.) Also, it will be recalled that for most individuals the zenith of the good life was reached during the period of youthfulness; after that there were no comparable climaxes to look forward to, or status enhancements to achieve.

Regarding the higher valuation placed on *mua*, the rationale might be sought in the Maohis' preoccupation with pedigrees that led back to divine ancestors. Even if one accepted some writers' theories identifying *manahune* and *ari'i* with aborigines and more recent immigrants, respectively, this would not necessarily cancel out all advantages deriving from priority of settlement, or the Maohis' appreciation of such advantages.

Space. The several paired opposites used by the Maohis for verbalizing different aspects of spatial arrangement seem to have had quite different referents, denotatively, but they all carried an evaluational connotation: *tai* (seaward) was socially "better than" *uta* (landward), *i ni'a* (above, on top of, upwind) was better than *i raro* (below, underneath, downwind), *mua* (in front of, before) better than *muri* (in back of, behind), and *'atau* (righthand) better than *maui/ani* (lefthand).⁹

As we have seen, ideological identification of coastal areas with *hui ari'i* did not reflect residential facts in all cases, but there was some historical basis for the supposition. It is not difficult to see why seaward was associated with social advantages, in terms of valued natural resources, ease of communication, and heightened social activity generally; one does not have to invoke a conquest by confirmed "seafarers" to explain this association.

Nor is it difficult to fathom why "above" (*i ni'a*) was socially better than "below," as was expressed in many, many ways (including prescriptions about posture relative to rank, the association of sky "levels" with the hierarchy of gods, etc.¹⁰) I suspect that a pan-human value is here involved, possibly deriving from the concentration of human beings' sense organs in the head.¹¹ And in the case of the Maohis this value may have been reinforced by the male's upper position in the conventional posture of copulation, (although the sequence of reasoning may have been the reverse).

The extension of *i ni'a-i raro* to upwind-downwind (which most of the time also corresponded with east-west and sunrise-sunset) might conceivably derive from the parallel between the natural movements of objects

downwind and downward—and, of course, the rising and falling of the sun. A text previously quoted injects a value comparison into this opposition by associating downwind with rubbish-receiving. (This represented a Tahitian's jibe at Ra'iateans, and was opposed to a fairly widespread view of Ra'iatean superiority in matters of cult and kin-Title rank.)

The use of *mua-muri* for both temporal sequence and spatial arrangement has already been noted—although I cannot, of course, reconstruct which, if either, of these meanings developed first. Like *mua*'s meaning of "first" and "prior," its meaning of "in front of" and "before" was better than its opposite, *muri* (in back of, behind). I suspect that *mua* or *muri* uttered in a spatial context referred (as it probably also does in English) primarily to location with respect to socially valued activity, and only secondarily to fixed features of buildings and landscape. I suggest, therefore, that a more appropriate translation of this pair of opposites would be *center*, or *focus* (of some interest) versus *margin* of the same, but I shall continue to use the more common glosses of "in front of"-"in back of."

The conventional Maohi opposition of *'atau-maui/ani* (right-left) represents a local manifestation of a well-nigh pan-human way of conceptualizing the arrangement of entities in space. And like much of mankind the Maohis valued *right* over *left*,¹² as shown for example in the positioning of the groom vis-à-vis his bride during nuptials (Morrison 1935:188); in the disposition of a sacrificial victim's eyes (the right one going to the god, the left one to the chief [Moerenhout 1837:II, 25]); in the path taken by a soul after death (i.e., the righthand one leading to the *ao*, the lefthand one to the *pō* [Henry 1928:201]); and in the identification of right with the planet Venus, and peace, and left with Mercury and war (Henry 1928:417).¹³

Finally, I invite attention once more to the complex and far from comprehensible synthesis represented in the paired opposites, *pō-ao*, which, besides serving to distinguish night and darkness from daytime and light, contains implications for (cumulative, rather than cyclical) temporal sequence (long ago versus now), as well as for planes of existence (the domain of spirits versus the domain of mortals).

Governance. Every Maohi social group may be characterized in terms of its governance—that is, in terms of which members control the actions of the others, and of how this was done. In the case of certain kinds of minimum-size groups—say, two men linked in a friendship pact—decision making and initiative may have been fairly evenly exercised, but most other Maohi groups, including many two-member ones, were hierarchically organized in this respect.

Two other features about this dimension of Maohi social relationships strike me as being noteworthy. One concerns the upper-size limits of effec-

tively governed groups, the other the mode of governing that obtained in perhaps all but the smallest groups.

As I pointed out earlier, except in connection with large-scale dancing and the practice maneuvering of war fleets, where leadership was more in the nature of signaling to already practiced performers, the Maohis did not act together very coordinately in large groups. They turned out in huge gatherings to glimpse and deliver tribute or ceremonial respect to eminent personages, but their effectively governed units—those carrying out specific objectives in response to explicit exercise of leadership—were quite small. This does not mean that large-scale objectives were never pursued or accomplished, but rather that they were somewhat atypical and were characteristically carried out as delegated piecemeal. In other words, leadership tended to be direct and personal.

With respect to mode of governing, even within the characteristically small-scale limits in which leadership was most effectively exercised, giving orders tended to be curt and unmitigated, and compliance ungrudging but far from servile. In this socially stratified, aristocratically oriented society, subordination was not usually considered debasing: when the relationship between “governor” and “governed” was defined as such, there was evidently no necessity felt to maintain a polite fiction of “equality,” such as obtains in some societies wedged between egalitarian ideals and hierarchic reality.

Transaction. As far as I can discover, the goods that circulated among the Maohis were not categorized by them, explicitly, in any comprehensive, all-inclusive way—except possibly the one derived from the linguistic *o-a* contrasting device, which distinguished, respectively, between “inalienable” and “alienable” items. A classification of certain circulating objects into “natural” and “processed” categories is implied by a text from Morrison cited earlier (1935:191), but only a few kinds of objects are so identified, and in this case the list is only a partial one. I propose to inquire whether any more comprehensive, *implicit*, categorization of circulating goods may be inferred from their modes of circulation and from the identities of the parties to such circulation.

In the absence of any explicit, overall Maohi classification of modes of goods circulation, I propose one consisting of three broad types: nonreciprocal *giving*, nonreciprocated *taking*, and *exchange*; the last embraces two major subtypes, *equivalent exchange* and *pool sharing*.

By nonreciprocal giving (“pure” or altruistic gift giving) I refer to transactions wherein one party transfers some valued object, or performs some valued service, with no discernible expectation of or wish for a return.

By nonreciprocated taking I refer to transactions in which one party

deprives another of some valued object or attribute, with no discernible intent of making a “satisfactory” return.

Exchange, on the other hand, refers to two-way transfers of goods that are conventionally regarded as being “satisfactory” to all parties to the transactions. More specifically, direct exchange occurs when the transfer is directly between the parties and when the exchanged goods are more or less the same in value, whereas pool sharing occurs when the parties pool and then share the goods according to conventional definitions of their respective resources (including abilities) and needs.

It should be emphasized that these are my categories; there are no Maohi words known to me that seem to correspond exactly to any of these semantic domains. They may, in fact, correspond roughly to some implicit Maohi conceptual categories, but the available evidence does not permit the kind of ethno-scientific analysis, now being undertaken among contemporary peoples, which could test such a possibility.

Nonreciprocable giving seems to have been a rare phenomenon among the Maohis.¹⁴ Indeed, about the only type of relationship unambiguously characterized by this kind of transaction was that of parent and child, with the goods in question going from the former to the latter. Actually the only specific references I have found to such disinterested giving were legendary—I refer to the tales of parents who gave their lives to save their children (and in one case, a spouse)—but it is reasonable to assume that such giving (of objects and services) was inherent in real life as well, in the relationships between most parents and their infants and young children.

It is perhaps possible that nonreciprocable giving was also inherent in the ethic of hospitality, which constituted such a popular Maohi ideal—perhaps not with regard to processed objects, but at least with regard to such “natural” ones as plant-foods. This, however, cannot be learned from available evidence, but it is my impression (which is equally undocumentable!) that most so-called hospitality was provided with the expectation of ultimate return.

In contrast to disinterested giving, nonreciprocated taking can be copiously documented in Maohi affairs. People diminished one another’s resources not only with respect to objects (as witnessed by the prevalence of theft, plunder, expropriation, and damage), and not only with respect to their physical capabilities (as witnessed by the widespread occurrence of murder, assault and battery, and sorcery), but also with respect to their social positions (as witnessed by the popular addiction to slander, defamation, and such).¹⁵

But in terms of both frequency and variety, exchange-type transactions were more numerous by far. As specified above, I apply the label *exchange* to two-way transfers of goods that are regarded as being satisfactory to the

parties concerned—*satisfactory* being defined according to conventional, society-wide standards, and not necessarily according to the personal wishes of the parties involved in any particular transaction.

Direct exchange, the kind of transfer that took place directly between two parties, involved goods regarded as equivalent in value—services and services, objects and objects, or objects and services. In some instances such exchanges were explicitly “commercial”: objects were exchanged for objects, or services for objects, either simultaneously or within a contractually established period of time. However, most instances of direct exchange were conventionally phrased as *gift giving*, although implicitly embodying the obligation of eventual reciprocation.¹⁶

As the preceding chapters indicate, transactions that were unambiguously “commercial” in intent and method appear to have been very limited in kind and in frequency.¹⁷ There were the arrangements between farmers and fishermen for exchange of products over an agreed-upon time period, and there were canoe building and similar sorts of services performed by specialists for specified food and other objects; on the other hand there is little or no evidence for on-the-spot object bartering, or for commercial exchange of services for services. As we have seen, an important feature of these exchanges was the existence of certain sanctions against nonfulfillment; and while it was usually left to the injured party to apply the sanctions, his publicly acknowledged right to do so seems to have lent weight to such contracts and to have discouraged feuding.

For better comprehension of Maohi social relations it would be useful to learn more about the relationships of the parties to “commercial” exchange. In this respect, on the grounds of negative evidence and of inferences from evidence on other kinds of relationships, I conclude that such exchange occurred most commonly between persons who were otherwise not related—as close consanguines or affines, as subject and chief, as occupational guildmates, as fellow Ariois, as politically allied chiefs, or as formally linked “friends.” (Indeed, it is possible that one of the most common personal motives for entering into a friendship pact was to establish a more convenient and congenial exchange relationship.) In other words, there may be a direct functional connection between the widespread ramification of those ties of kinship, and so forth, and the relative infrequency of commercial exchange. (Of course, we cannot know with certainty which of these situations was the causal one, but my guess is that the latter was a consequence of the former.)

In this connection, I suggest that the absence in Maohi society of a general-purpose kind of value repository and exchange token—that is, “money”—may also be connected with these circumstances. It is true that bark cloth did serve some of the purposes generally attributed to

“money” in other societies, but to the best of my knowledge the Maohis used neither bark cloth nor any other kind of object for direct buying and selling of other objects or services.

Most descriptions available regarding “commercial” exchange involved Europeans, and I cannot be certain that the attitudes expressed in such exchanges were typical of commercial exchange between Maohi and Maohi. See, for example, the following from missionary records in the LMS Archives:

We have been endeavouring to bargain with some of the natives to put up a fence and enclose a little ground for us in consideration of receiving a few yards of India print. In our general intercourse with the natives we see little or nothing of the evil dispositions of the heart. They in a public way supply us with vegetable food, put up our buildings for us &c and in a private way they come to us in all their troubles of body & mind as Children to their parents. But when they sell us animal food or undertake any work in consideration of receiving European or Indian property then they show the evil dispositions of the heart, covetousness, envy discontent so that we need very great caution to deal with them. (Crook, Journal, 10 April 1817)

We are all in arrears with our servants & it seems that nothing is come to relieve our wants. I must I suppose go to Tahiti among the brethren & borrow Print, calico or any other species of cloth. It is our circulating medium. The Tahitian motto is “the price in the hand the work is done.” (Orsmond, Journal, 27 August 1827)

A very large proportion of Maohi transactions may be categorized as *gift exchange*—that is, transfers conventionally phrased as nonreciprocable giving, but consensually embodying the obligation of an eventual return.

One possible basis for the preponderance of gift exchange over commercial exchange may have been the nature of a large proportion of the items exchanged—namely, food items, subject to rapid spoilage. Anyone acquiring an immediate surplus of, say, fish or breadfruit or taro would have had to consume or otherwise dispose of it rapidly to avoid total waste. And in the absence of an active marketplace, or of an adequate number of trade partnerships (which I believe was *not* the case), it would have been impracticable to search out buyers on all such occasions. Gift exchange, with its flexibility concerning time of “payment,” coupled with the social obligation on the part of the donee to accept, was an ideal solution to this “ecological” problem. Of course, the same argument cannot be made with respect to such goods as bark cloth or mats, but perhaps these and other durable objects that entered into gift exchange were introduced into such transactions at a later time and accordingly were integrated into the pattern already established with respect to food. Such transactions varied widely, in terms of a number of features, for example: the degree of explicitness with which a return gift was specified; the lapse of time prescribed for the return; the amount of “interest” expected; the appropriate nature of the return “gift”; and, of course, the ceremonial techniques involved.

Much of the information concerning gift exchange comes from Europeans, to whom the practice was baffling, frustrating, and occasionally infuriating. Many of them were moved to comment upon the "cool indifference" with which costly European gifts were received (e.g., Vancouver 1801:257), and upon the absence of any expression of gratitude (e.g., Morrison 1935:191). Conversely, some Europeans were piqued at what they considered to be the materialistic spirit in which "gifts" were presented to them by the Maohis. For example, "It is customary for these people, when they make a present to let us know what they expect in return and we find it necessary to gratify them ..." (Beaglehole 1967:221).

Cook, like some other Europeans (for example, see Wales, in Beaglehole 1961:799), found gift exchange to be on the whole more costly and time-consuming than barter, and more likely to engender ill feelings. On the other hand he came to recognize the advantages inherent in gift exchange: "... in times of occasional scarcity which will sometimes happen, we can have recourse to our friends for a present, or supply, when we cannot get any by any other method [i.e., barter], so that upon the whole this way of traffick is full as advantagous to us as them" (Beaglehole 1967:221).

I have come across no instance of gift exchange between Maohi and Maohi in which expectation of a return was so explicitly specified—unlike Europeans, Maohis undertood the rules of this transactional game—but the expectation was nonetheless impelling. As Morrison put it, "... they all prefer the having to give then being forced to receive" (1935:174-175). Also, one will recall in this connection, the example of coercive gift exchanging related in the story of Hiro's building of his canoe (Henry 1928:547).

As for the nature of an appropriate counter-gift, the common expectation seems to have been a return in kind; that is to say, I have found no instances in which objects were reciprocated mainly in the form of services, or vice versa. Also, a gift of a "processed" object—say, bark cloth or boats—would not have been satisfied by a return gift consisting entirely of food. Besides these, however, the paucity of explicit formulations about such matters and the unmistakable evidence of there having been a good deal of dissatisfaction about gift exchanges indicates that there was no universal consensus about what were and were not appropriate returns. (This situation is undoubtedly connected with the lack of a comprehensive pricing system, whereby most kinds of objects and services might have been compared. However, there is no way of discovering which of these circumstances came first.)

About the only generalization I can offer concerning the time factor in gift exchange is that in general it appears to have been only very loosely defined, and characterized by little or no sense of urgency—another exem-

plification of the Maohis' unconcern with temporal *duration*. There were, of course, some conventional differences in this respect; for example, on certain kinds of intertribal visits, the exchanges between hosts and guests took place in regularly prescribed sequences. Yet, according to some stories, a generation or more seems not to have been considered excessive for the balancing of certain exchange accounts.

The question of gift-exchange "interest" is a refractory one. On the one hand, Maohis appear to have derived satisfaction from providing lavish hospitality—and without any evident contriving to embarrass the donees or to encourage a larger counter-gift. (As I suggested earlier, organized potlatching—competitive gift exchange for purposes of status enhancement—seems not to have prevailed on any large scale.) On the other hand, although coercive giving, or "baiting," appears not to have been engaged in to compel returns in the form of larger *quantities* of the goods first "given," it does seem to have served as a device for obtaining more highly valued *kinds* of goods. (See for example the Hiro legend referred to earlier.)

The last mentioned point brings us again to the purpose of gift exchange among the Maohis. Examples have been adduced of its deliberate use as a more convenient or more dependable or in some cases perhaps the only feasible means for obtaining desired goods; in other words, the relationship comprising the transaction was the means, and the goods thus obtained were the end. In many other instances, however, the purpose of the transaction was evidently the reverse—that is, the goods in question were exchanged to establish or maintain a relationship. And, of course, many such exchanges were probably engaged in with both purposes in mind.

In contrast to direct exchange, pool-sharing exchange occurred when the parties contributed goods to a common pool on the basis of their conventionally defined resources, and then took goods out of the pool on the basis of conventionally defined needs. The "resources" in question included services as well as objects, and the "needs" I refer to included not only such tangible items as food and other forms of nurturance but such intangible items as status-maintaining (or status-enhancing) praise.

As I conceptualize this type of transaction, it was best exemplified in the way most goods circulated among the members of a household, through the kinds of actions partly described under such labels as "division of labor" and "consumption rights." The notion of "equivalence" was implied here as in the case of direct exchange, but it was an equivalence in terms of the parties' respective resources and needs, rather than of the exchange values of the goods themselves. Pool sharing was also characteristic of many transactions among members of a kin-congregation, and indeed of any type of group, although in the larger types of groups, such as tribes, transactions between individual members were perhaps quite often also in the form of

direct exchange—which raises the possibility of there having been still another type of exchange, in addition to those already mentioned.

The sources contain few explicitly defined examples of *loans*, the transfer of a good from one person to another for use and then eventual return, but we are probably safe in assuming that many such loans were in fact made, especially between members of any household, kin-congregation, occupational group, Arioi lodge, or pair of friends. What we cannot discover, however, is whether such loans required rents or interest, or whether there were any standards regarding limits of time, or any external sanctions to enforce repayment.

It may be, however, that land was *lent* out to nonowners on occasion, and that “rent” therefor was paid in the form of a portion of the produce. In fact, it could be that some of the “tax” levied by chiefs upon some of their subjects should be classified as “rent”; but I think that such transactions were quite rare and were probably phrased in other terms.

I reproduce here a passage from Turnbull, which raises the possibility of there having been an additional kind of transaction: “Old Pomare was as dexterous a thief as any amongst them, if borrowing, without any intention of repayment, merit this name. He would often request me to lend him a hog, for which, when once received, he never again thought of making any return. This could proceed from nothing but mere avarice, for he could have any number at a very easy rate. But theft, as I have before observed, is a cheaper method of acquisition than purchase.” (1813:283.) Perhaps we have here two different “messages”: one public and explicit (i.e., *loan*), the other private and implicit (i.e., *taking*). As I pointed out earlier, a double message was probably also involved in most instances of gift exchange, that is, an intended exchange of equivalences in the public guise of nonreciprocable gift.

Here, then, were the major types of Maohi transactions that I can distinguish:

- I. Nonreciprocable *giving*: $A \rightarrow B0$
- II. Nonreciprocated *taking*: $A \leftarrow B$
- III. Exchange
 - 1. direct exchange $A \rightleftharpoons B$
 - a. gift exchange
 - b. loan
 - c. commercial exchange
 - 2. pool sharing $A \Leftarrow [AB] \rightleftharpoons B$

Later on I shall summarize the associations between these different patterns and those of other dimensions of interaction; but before leaving for the

moment the subject of circulation modes I return again to that of the circulating goods themselves.

As I indicated earlier, I am unable to discern any Maohi-formulated categorization of circulating goods that approaches all-inclusiveness. And although it would be possible (within limits) to derive a sort of categorization by listing all the myriad kinds of objects and services that circulated and assign them to their respective transaction circuits, such an exercise would be tedious—and I hope unnecessary. It may, however, be useful to recall one noteworthy point about such circuits, at least those comprising exchange—namely, their “openness” with respect to their goods, even in the absence of “money.”

As is well known, in some human societies exchanges take place within several types of discrete, “closed” circuits, each with its own distinctive kind of good or goods. (In most Western societies, for example, sexual services may normatively circulate only within very narrow and wholly closed circuits. And in the Trobriands certain shell necklaces may be exchanged only for certain shell armbands.)¹⁸ In many other societies are to be found numbers of exchange circuits that resemble those just mentioned in some respects but differ from them in being interconnectible by means of a multipurpose¹⁹ kind of exchange token, or “money.” The only object approaching such a kind of token in Maohi society was bark cloth, and even that entered into relatively few types of exchange circuits; yet, Maohi exchange circuits were for the most part relatively “open”: Maohi goods appear to have been *interconvertible* to a very marked degree. In fact, about the only wide-reaching example of nonconvertibility that I have discovered is the sentiment that in certain kinds of transactions perishable foodstuffs did not constitute appropriate equivalences for manufactured objects (chap. 14).

It may be that this quality of widespread interconvertibility characteristic of so many kinds of Maohi goods is one reason why a more multipurpose “money” did not evolve in this society; there was little need for it. Another reason, perhaps, was the relatively minor role played by large-scale accumulation of capital in the form of objects in determining one’s social status. Most high statuses were acquired by ascription; and even with those acquired by achievement, and by means of objects, the objects assembled for such purposes were not usually kept in the form of “wealth” but were fairly speedily used for “buying” services, immediate or deferred. A third possible reason for the absence of “money” in Maohi society was the preponderance of gift exchange over commercial exchange, in general, and the wide prevalence of “hospitality” in particular; that is to say, for goods exchanged in this fashion there was less of a requirement for exact equivalence, and hence less necessity for more precise markers of relative value.

Emotion. The conventionalized bodily behaviors of the Maohis that were tacitly meant to express their “emotions”—that is, to reflect their “internal states”—toward one another may be arranged along three major axes. (Again, as in the case of transactions I am left to devise my own commonsensical classification, as the Maohis themselves have provided us with none of their own making. The examples given in the following paragraphs include both particular behaviors and Maohi labels for whole sets of associated behaviors. I have not attempted to “morphemicize” these latter in any systematic way, but previous chapters do provide illustrations enough to enable the reader to visualize what is referred to, say, by the labels *ātama* or *toro’irirō*. [Definitions in this section are from the LMS Dictionary.]

Affection-hate. Along this continuum I place at one pole such Maohi expressions as *ātama* (affection for a child) and *aroha* (compassion, pity, sympathy, love, affection), at the other pole, *tiapou* (to strike one’s posterior and expose it as evidence of contempt) and *fe’ume* (envy, malice, settled hatred between persons), with *potaua* (a friend who has ceased to show kindness) and *airuma* (to eat sullenly and unsocially) in between.

Sexual attraction-sexual aversion. There are grounds for concluding that Maohis considered this axis of emotion to be independent of affection-hate, although in the case of young lovers, especially, sexual attraction and affection were undoubtedly linked. At one pole of this continuum are to be placed copulation itself and such verbalized expressions as *pupa* (to be desiring the other sex), at the other, *fa’anono’a* (to spurn with disgust, applied to husbands and wives who have an aversion to each other). These expressive behaviors apply mainly, of course, to relations between males and females, but may also have applied to relations between males and males, or females and females, quite apart from the institutionalized ones involving persons labeled *mahu*.

Dominance-subordination (or superiority-inferiority). At one end of this axis were behaviors verbalized by such expressions as *fa’ahepō* (to command, impel to action; to domineer, exert authority or power, to tyrannize others) and *’ahāhā* (to boast or vaunt; to exalt oneself), at the other, *fa’aatua* (to acknowledge, serve, or act toward some person or thing as a god) and *toro’irirō* (to be humbled or abashed before a superior; to humble oneself before a great man).

The examples just cited provide only a very small sample of the large and varied repertory of Maohi emotion-expressive behaviors, which range from direct verbal address to such indirect messages as fashioning of an enemy’s bones into fishhooks. Some such behaviors were evidently meant to express only one kind of emotion, while others seem to have expressed two: for example, while *fetafetau* (to quarrel, or combat in pairs) signi-

fied mainly a locus on the affection-hate axis, *fāiru* (to befoul a person in contempt) appears to signify both that and a position on the dominance-subordination axis as well.

In addition to all these refinements, the Maohis possessed symbolic means for expressing distinctions in terms of intensity of emotion, as exemplified in the custom of *pao*—lacerating the head with shark's teeth as evidence of very intensive feelings of "grief" or "joy," and shoulder baring as a mark of intensified humility.

In chapter 14 I drew attention to two general characteristics of Maohi emotions which struck Europeans as particularly alien—one, an "unseemly" habit of overexpressing some of their presumed feelings, and, second, a tendency to show little or no emotion in other situations where feeling would "naturally" be intense. Aside from the value judgment expressed in such comparisons they have a certain descriptive usefulness and lead me to propose a more structurally relevant comparison of my own—namely, that in comparison with parallel emotion-axes in Western societies, those of the Maohis tended to stress the polar extremes. That is to say, in connection with the affection-hate axis, those behaviors expressing "affection" and "hate" were more highly elaborated than those expressing "feelings" in between, and the same was true with the other axes as well.

In summary, despite the absence of indigenous systematics about the matter, the emotion dimension of Maohi interaction patterns seems susceptible to systematization in fairly commonsensical ways. But, before ending this discussion, I must confess to an uneasiness about it all. The early European visitors to these Islands had trouble even with, say, the palpable transactions of gift exchange, so how much more alien and obscure must have been to them some of the expressions of emotion they sought to interpret by use of superficially similar cues, and to describe in English-language terms. Even such relatively unambiguous behaviors as shedding tears posed the same interpretative difficulties to the early European visitors as they continue to pose to us today. And, when it comes to behaviors labeled *ha'amā* (shame?) and *mata'u* (fear?), neither they nor we can provide reliable translations. In other words, were the information fuller, and were there opportunity to test for semantic oppositions, and so forth, we might very well discover that there were more than three so-called emotion axes to reckon with—including, perhaps, an axis of familiarity-fear (independent of the one I have labeled dominance-subordination). But such questions are regrettably unanswerable, and, because of my commitment to the analytic canon of economy, I leave the axes at three.

SOCIAL UNITS AND ROLES

Having summarized the ways in which the Maohis carried on social interaction, I now offer some generalizations about the types of relationships

thereby constituted, including their more important extrapolatable roles. Insofar as possible my focus in this section will be on Maohi society as I think it was during the Late Indigenous Era. Discussion of the changes that took place in the society during the Early European Era will be the subject matter of volume 3 of this study.

Consanguinity

Since relationships based on common descent outweighed all others in influencing how the Maohis interacted, it is especially regrettable that so little is explicitly recorded about the rationale for this kind of connection. Nevertheless, I have attempted to reconstruct, from various kinds of evidence, what that rationale was.

Something from *both* biological parents was evidently believed to have gone into their offspring, and at least two kinds of elements were involved. One of these seems to have been mainly “physical”: I refer, among other kinds of evidence, to the interpretation that may plausibly be made from the practice by some women of copulating with large, stalwart men in order, reportedly, to enhance their own capacities for bearing such offspring—a Maohi manifestation of the widespread “folk-scientific” notion of telegony. The Maohi practice of distinguishing between “blood” (*toto*) and “adoptive” (*fa’atavae*) relations suggests that there might have been belief in the physical continuity of blood, as well, from parents to offspring. But lacking any other reference to this matter, I think it more likely that this expression was intended as metaphor.

The other and more important element believed involved in the composition of offspring may for lack of a more specific label be called “spiritual.”²⁰ As previously stated, I propose that this “spiritual” element consisted in part, at least, of a portion of some god, and I also drew some inferences about the changes it underwent in transmission, namely, that its “efficacy” (or whatever) remained “strongest” in a directly lineal way. In other words, as I reconstruct the process, the most efficacious part of any person’s “spiritual” inheritance was transmitted to his or her firstborn offspring (or firstborn male offspring?) at the time of conception; later-born offspring also received some of that element, but in attenuated measure, and possibly decreasing regularly with order of birth. Some grounds can also be found for concluding that this element decreased in efficacy with each generational remove from its divine ancestral procreator (or fabricator?).

Falling back on Western logic, one might also conclude that every individual embodied one such spiritual element for each of his ultimate ancestors; but whether the Maohis themselves so reasoned I do not know.

In any case, whatever that “spiritual element” was, and however many distinct units of it any individual may have embodied, certain instances of it were considered far superior to the rest (or more “efficacious”? or

more “god-like”? etc.). During the era now under study those instances generally considered to be most “superior” were the ones embodied in the principal members of the kin-congregation of Opoa. But it is reasonable to conclude that such rank-ordering, for all its alleged perpetuity, was subject to revisions as reflections of familial vicissitudes. In this case, at least, I acknowledge a firm commitment to the proposition that the changes in ideology were a reflection of historical events, and not the reverse.

The conceptualization of descent just referred to was epitomized by the Maohis in genealogies and in such verbal expressions as consanguineal “lines” (*firia*) and segmented cognatic stocks (*'ati*). Moreover, the most “efficacious” embodiments of the most “superior” (or whatever) of these lines were identified in specific-status names, or kin-Titles. And, finally, the Maohi conceptualization of descent served as the major principle of recruitment and organization of the social groupings I have labeled *kin-congregations*.

The type of group I have labeled *kin-congregation* consisted mainly of a set of persons interconnected by acknowledged, and fairly close, ties of common descent, who resided near one another and engaged all together in worship of commonly acknowledged spirit tutelars (including in many instances their divine or once-human progenitors). Focal to each kin-congregation was a marae, or temple, where its qualified members (mainly males past childhood) convened on occasion to communicate with the tutelars. Also, there was associated with each kin-congregation a well-defined tract of territory, which, though subdivided and assigned provisionally to individual members for everyday use, yet remained residually identified with the group as a whole—as manifested especially in the tutelars’ rights to the tract’s first fruits, and as attested by each member’s right to make use of some part of the tract for satisfaction of subsistence needs.

There is a possibility that the rights just mentioned were betokened in specific marae names—one for each member of the kin-congregation—but whether or not that was the case, it is practically certain that every such congregation disposed of certain offices having to do with the conduct of congregation activities, both religious and secular. It is not entirely clear whether all such offices of any kin-congregation were distinctly differentiated in terms of function, or whether they were all differentially graded in terms of rights, et cetera, but it is beyond doubt that for each kin-congregation one such office stood out from all the rest, in terms of rights and duties—this having been the one I label kin-congregation *chief*. In addition to the general-status names that appear to have been applied to the offices of some kin-congregations—for example “priest”—some offices of certain kin-congregations were also identified by specific kin-Titles which were not only *graded* within each congrega-

tion, but were also *ranked* on a more or less society-wide basis. And finally, within the marae of most kin-congregations were one or more stone uprights which were identified with certain of its offices, and which served as back rests or leaning posts for the respective incumbents on religious occasions.

Interaction among kin-congregation members, qua members, was largely of a religious nature. Included on the one hand were prayers and offerings to the tutelars, and messages from them, all mediated by the congregation chief, or by his delegated assistants. And included on the other hand were interactions between the chief and other members having to do directly with the above, or with maintaining the chief in his roles as mediator with the tutelars and as steward of the congregation’s tangible resources; these interactions can be summarized in so-called dimensional terms, as follows:

Dimension	Chiefs	Other Members
Space	{ <i>mua</i> } <i>ini'a</i>	{ <i>muri</i> } <i>i raro</i>
Governance	command	obey
Transaction (pool sharing)	special services occasional objects	↔ manual services ↔ periodic services
Emotion	dominance (softened by affection)	subordination/respect (mitigated by affection)

Some kin-congregations were entirely unattached, but many others were linked together by alleged ties of common descent. Many of these multicongregation units occupied adjoining territories and presumably came about as the result of gradual proliferation and fission. Others were made up of related but widely separated congregations, the outcome presumably of deliberate or accidental “colonization.” Evidence for such links was maintained symbolically in legends and genealogies, and by the practice of incorporating architectural elements from a source marae into its offshoot. In some cases offices in the source congregation, including Titled ones, accompanied the move to a new site, but the chiefly office of the older congregation usually remained at the source marae, and its incumbent continued to exercise some authority over the offshoot, through the latter’s own chief, and mainly in connection with religious matters involving the units’ common tutelars. Moreover, the religious matters in question often involved a levy of objects and services, for offerings to the common tular, for maintenance of the source marae, and occasionally for personal use of the source congregation’s chief.

The process of kin-congregation fission just mentioned can be only

partly reconstructed. General conditions, such as population pressure, were undoubtedly influential, but I have not been able to discover any widespread verbal sentiment either encouraging or discouraging fission on this or other general grounds; for example, I have come across no general norms about optimum household size or territorial intactness, and no explicitly voiced desire for either "individual independence" or "group solidarity." The dispersed nature of residential units may be taken as possible evidence of a universal desire for "independence," but that is about as far as I can go. In fact, the only factor I know of that may have encouraged fission generally was rivalry among brothers or male cousins, the widely prevalent situational outcome of clashes between norms favoring seniority on the one hand, and actual differences in individual capabilities on the other. Other situations, such as instances of uxori-local marriages and accidental colonization, accounted for some fission, but must be labeled special cases.

During the Late Indigenous Era a highly distinctive position was occupied by the multi-kin-congregation unit whose source marae was at Opoa, Ra'iatea. As I noted earlier, the "spiritual" elements embodied in the most directly lineal descendants of that congregation's divine and semidivine founders were generally considered to be "superior" to all others in Maohi society, a comparison which was manifested in the relatively highest rank accorded the kin-Titles held by such persons. Stories concerned directly or indirectly with the Opoan kin-congregation imply that in the course of its long (legendary) history it became divided and subdivided, locally and colonially, into numerous offshoot congregations, just as did other kin-congregations elsewhere. But more so than with any other kin-congregations, the specific kin-Titles associated with the Opoan kin-congregation attained a degree of social importance greater than, and indeed somewhat independent of, their congregational group. Also more than others, persons holding Opoan kin-Titles contracted marriages in places far from home, thereby associating their Titles with marae and congregations of non-Opoan derivation. In other words, we see here the institutionalization of certain "lines" of consanguines, somewhat distinct from the consanguineal groups—the kin-congregations themselves.

While growth and fission, or decrease and extinction, were the more common processes whereby kin-congregations underwent transformation, fusion of previously unrelated units also took place occasionally, usually to consolidate some new marital or political alliances.

Turning now from whole categories and actual groupings of consanguines to normatively and observationally defined consanguineal roles, I again invite attention to the three components which were most decisive in differentiating such roles: genealogical level (generation), sex, and birth-order among siblings.

The most noteworthy way in which differences in genealogical level influenced behavior among consanguines may be summarized by saying that those of the youngest level were the most privileged, at least in terms of rights associated with the "spiritual" element involved in "descent." Members of the older levels continued to exercise decision-making authority in everyday matters until the younger level members were more or less competent to do so—the society could not otherwise have survived—but in matters of ritual precedence and the like, older-level members abdicated their rights to their progeny upon the latter's birth.

As has been described, within certain class limits a Maohi's sex served importantly to define his (or her) rights and obligations, vis-à-vis every other Maohi, with respect to such things as division of labor, access to spirits, food consumption, spatial positioning, and decision making; but for the bilaterally minded Maohis the component of sex was of relatively little influence with respect to the "spiritual" element of descent. Remembered or fabricated "lines" of descent, and particularly those in which kin-Titles were transmitted, included names of many females. In fact, during the era under study, the circumstances that incumbents of some of the society's highest-ranking kin-Titles had received them from or through their mothers appears to have dulled their luster not at all. Nevertheless, males were favored over females in terms of succession to consanguineal offices. And in all but the highest class of society, where such proscriptions were outweighed by other considerations, consanguinity placed constraints on sexual intercourse in general and on marriage in particular.

The third differentiating component was order of birth among siblings, but, as noted earlier, I am not altogether certain how comprehensive this ordering principle actually was. In some instances both succession-order to offices and general hierarchies of authority and respect seem to have run parallel to order of birth, but in others only the firstborn (or firstborn male) was singled out from his siblings for special treatment. Again, while acknowledging some validity to Handy's distinction between collateral *matahiapo* (eldest) and *teina* (younger) "lines" (though with some uncertainty about what exactly he meant), such a distinction does not appear to have been comprehensively extended. That is to say, while all other "lines" of a putative cognatic stock, including collateral sets of same-genealogical-level "cousins," may have been *teina* to their *matahiapo* "line," they seem not to have been so ordered among themselves relative to the birth-order of their own respective eponyms—or at least I can find no evidence that such was the case. This same absence of comprehensive ordering in consanguineal terms also pertained, as we have seen, to relationships among kin-congregations of purportedly common descent. In other words, although status inequalities based on birth-order may have been the

basis of the inequalities which came to be institutionalized on the broader social stage, this “design” was not followed out in detail.²¹

Class

During the Late Indigenous Era the populations of every island (except possibly Maupiti [see Handy 1930:102-103]) seem to have been divided into three more or less endogamous categories, which were also differentiated with respect to a number of consumption rights and other attributes. Lacking an unambiguous native term for such categories I have called them *marriage classes* (or simply *classes*), because of what appears to have been their principal function; and by cutting through (perhaps too arbitrarily) the tangle of names applied by the sources to the society’s numerous hierarchical statuses, I have labeled these three classes *ari’i*, *ra’atira*, and *manahune*. At the same time, I have taken pains to point out that within the *ari’i* class some further differentiation was evident in the direction of narrowed choices of spouse, and the same may have been true of the *ra’atira* class as well; and that the distinctions between “lower” *ari’i* and “upper” *ra’atira*, and between “lower” *ra’atira* and *manahune*, seem to have been less than sharp, and subject to changes both situationally and over time.

I also pointed out that while marriage-class status was usually ascribed by descent, a few *ra’atira* seem to have become *ari’i*, and some *manahune* became *ra’atira*, through individual achievement of some kind. Similarly, it is not unlikely that some *ari’i* and *ra’atira* suffered down-classing as a result of defeat in warfare or economic disaster or, in the case of younger siblings, of attenuation of heritage. And finally, I reproduced, without valuation, the opinions of some of the sources about the existence of a “half-caste” category of persons intermediate between *ari’i* and *ra’atira*—allegedly the progeny of *ari’i* misalliances.

Subject to the vagueness and traversability of class boundaries, as described above, one can epitomize interclass relations as follows:

Dimension	Upper	Lower
Space	{ <i>mua</i> <i>i ni’a</i> <i>tai</i>	{ <i>muri</i> <i>i raro</i> <i>uta</i>
Governance	command	obey
Transaction	taking	. . .
Emotion	dominance	subordination/respect

Leaving aside for a while the larger question concerning the origin of social stratification in Maohi society, it may be useful here to inquire

why rules regarding choice of spouse were such an important facet of that stratification.²² In my opinion these rules derived from Maohi notions about procreation, namely, that the all-important “spiritual” elements which linked each human with his divine or semidivine ancestors were transmitted through genitor *and* mother, and that each parent owed it to his forebears and his descendants to insure that the quality, or degree, of divinity contained in his (or her) self would not be passed on to an offspring in reproductive association with an element of less divine quality. As previously acknowledged, I have been unable to discover any deeper rationale for this eugenical norm—no explicitly worded belief, for example, that the elements transmitted by one parent would have suffered some kind of diminution if mated to ones of inferior “efficacy” or whatever. But to a people so committed to the social system of aristocracy perhaps no deeper cognitive reinforcement was required.

Affinity

In addition to the ascriptive ties of consanguinity which served to link individuals of opposite sex, and in addition to their actual heterosexual encounters, most Maohis past childhood also entered into heterosexual unions which involved some duration and some fairly explicit mutual undertakings regarding matters other than copulation. Earlier in this study I attempted to describe the wide variations in such unions, under rubrics such as “marriage,” “semimarrriage,” “concubinage,” and so forth, but I now wish to summarize those data in somewhat more functional terms. That is to say, I suggest that all such relationships, which I call *conjugal unions*, served one or more of the following purposes:

1. to provide the partners with ready access and more or less exclusive rights to each other’s sexual services;
2. to provide the partners, complementarity, with goods required for subsistence;
3. to reproduce offspring by which to transmit valued statuses; and overlapping this,
4. to gain allies for political ends.

Despite the many reports of Maohis’ “free love,” sexually desirable young women were relatively scarce. Males of suitable class seem to have had little difficulty obtaining sexual favors on a temporary basis, either through mutual attraction or in exchange for something more tangible, but longer and more exclusive enjoyment of such pleasures must have been highly competitive and costly. (Such roles may have been reversed in the case of a few outstandingly handsome or socially preeminent men, but by and large the greater scarcity was of women.)

In connection with 2, Maohi conventions regarding the sexual division of labor required contributions from both male and female to provide for a fully satisfactory household economy,²³ and a conjugal-type union was admirably suited to this complementarity. However, not all men or women had to enter such unions in order to enjoy the benefits of household living, for as already noted, during the Late Indigenous Era most households were probably populous enough to accommodate unattached adults of either sex.

Neither was it essential in all cases that a Maohi enter into a conjugal union in order to sire or bear offspring, but such was the case for individuals of superior ascriptive status—that is, for those (and the close consanguines of those) holding high-grade kin-congregation offices.²⁴ For as we have seen, in keeping with the bilaterality of Maohi notions about descent, the procreation of suitable successors to either parent's kin-congregation status required that the other parent's status be of at least equivalent grade, a condition that required affirmation by consanguines (and tutelars) of both parties, conventionally expressed in ceremonious nuptials. In this connection, both the transactions accompanying these nuptials and the symbolic language of their ritual acts served to define such unions as contractual undertakings concerned mainly with reproduction (and, with respect to the *āmo'a* episodes of such rites, with physical intimacy in general). An exchange of some other services—sexual, domestic, protective—may also have been stipulated, or implied, in such contracts, but procreation of suitable successors was undoubtedly their principal concern.

Even the political purposes served by some Maohi conjugal unions seem to have been realized mainly through the spouses' reproductive success. Some mutual political advantages undoubtedly resulted from many such unions whether they were fruitful or not, but it was the uniting of thitherto separate entitlements in the persons of common consanguines that gave the most cohesion to marital alliances.

Such then were the several different purposes that conjugal union could serve, but as we have seen, unions differed in terms of the numbers of purposes they served. Some matches between highly placed young people served all four purposes, but other unions served only one or two, as exemplified by instances wherein an older man virtually purchased a young wife from her guardians mainly in order to enjoy her sexual favors, or wherein political alliances were cemented by nuptials which were followed by no further interaction between those so wed, or wherein older women were added to households mainly for their domestic services. In view of these variations one is not justified in generalizing about Maohi "marriage" in currently fashionable "communicational" terms; that is, while some unions may indeed have involved the "circulation of women" (or rather, the circulation of specific aspects of women), others were mutuality-marked alliances in a very literal sense.

These differences were also apparent in the variations that obtained regarding choice of spouse. That is to say, whereas the union of close consanguines was stringently proscribed in other instances, it was permitted and perhaps even encouraged when the principals were the holders or transmitters of very high-ranking kin-Titles. As previously acknowledged, I have not been able to fathom the "mystical" reasoning that led to (or served to rationalize?) the general incest rules, but whatever it was, the belief that close in-mating was generally deleterious was outweighed in some instances by a conflicting commitment to eugenical values based on notions about the "spiritual" component of descent.

One cannot, of course, recover the actual historical sequence between belief and practice in this set of behaviors, but one possibility lies in a correlation between choice of spouse and political structure (and perhaps ecology as well); this reconstruction goes something like this. Earlier in Maohi history, when political units were much smaller (and the population less numerous and more thinly distributed as well), the mystical rationale for marrying *out* was congruent with (and perhaps consequent upon) the political (and economic) advantages felt to result from connections with non-consanguines. In the course of time, perhaps, as tribal units became larger, and political considerations weightier, marrying out came to have even more importance as a means of forming or cementing intertribal alliances. Eventually, however, a turning point was reached; as tribal units decreased in number (and increased in size), the politically inspired marital choices of their principal people were correspondingly narrowed, a trend further reinforced by the social and mystical rationale of class. And finally, the trend toward political consolidation proceeded so far that, among the principal people at least, the policy of out-marrying for *building* new alliances was replaced by one of in-marrying for *maintenance* of existing ones.

In view of the wide variations in purpose that served to differentiate Maohi conjugal unions, one should expect differences in husband-wife interaction patterns as well—an expectation that is borne out by the reports and stories reproduced in earlier chapters. Although such interaction seems to have corresponded to general male-female formulae in the more ritualized dimension of spatial positioning (except, for example, when outweighed by considerations of class status) and in the sphere of sex-linked work habits, it varied widely in terms of emotion and probably of governance as well. (I refer here mainly to actual behavior, but it may well be that the norms for such behavior also varied.)

Friendship

The formal friendship pacts entered into by Maohi males²⁵ resembled conjugal unions in a very important respect: they provided an institutionalized means for acquiring durable and dependable extra-consanguineal sources

of objects and services. Moreover, the resemblance between the more formalized versions of these two kinds of union was evidently recognized, as indicated in their having been instituted and accompanied by fairly similar rites. On the other hand, whereas most conjugal unions involved an exchange of complementary objects and services, those exchanged between pact-friends were not only equivalent in value but were more or less similar in kind. And, as noted earlier, although the transactions between pact-friends balanced out over time, they were phrased as nonreciprocal giving.

Friendship pacts, like conjugal unions, also varied in kind and degree of association from a perfunctory exchange of names and presents to virtual interchange of social identity with respect to each partner's social statuses and goods.

Occupation

Some members of Maohi society practiced highly specialized occupations which comprised a number of kinds of social relationships and from which they received various kinds of rewards. I find it analytically convenient to summarize these occupations under three headings: those consisting of the production of objects for exchange that was mainly "commercial"; those consisting of the performance of specialized services more or less explicitly in return for some tangible compensation; and the very distinctive one of serving as medium for some spirit.²⁶

Under the first heading I place fishermen, gardeners, perhaps pig raisers, woodcarvers, bark-cloth makers, and workers in tortoise shell. Most of these specialists must also have produced their respective products for paying taxes, and so on, but what interests us at present is the circulation of those products in commercial exchange.

What led certain individuals to become such specialists is not directly reported. Family tradition probably played some part, particularly with respect to the crafts requiring extended apprenticeship; in the absence of organized training in, say, woodcarving, kinsmen would have been one's likeliest teachers. Also, place of residence may have been a factor in some cases; other things being equal, for example, the carving of stone bowls was probably more prevalent on Maupiti, where the best stone was found.

More important and less speculative a matter has to do with the kinds of social relationships involved in the production and circulation of such products.

I noted earlier the likelihood of there having been fishermen's guilds, with special marae dedicated to the tutelars of the occupation. No such guilds are reported for other kinds of specialists of this category, but one would be safe in assuming that most of these had their generic or specific tutelars, and quite possibly their distinctive shrines as well.

With regard to circulation in commercial exchange, we do not know how craft objects were bartered, but the report on fish-for-plant-food transactions, which might well have been the pattern for other kinds of barter, reveals a standardized, long-term contractual arrangement which involved clearly understood equivalences and mutually accepted sanctions against nonfulfillment. I suppose that some products of this nature circulated between kinsmen, or between pact friends, and in less explicitly "commercial" ways (say, by gift exchange); but the very presence, not to say prevalence, of this commercial-type exchange indicates to me that the existing networks of kinship or pact-friendship connections were neither extensive, reticulated, nor potent enough to serve all individuals' wants for objects they themselves did not produce.²⁷

Probably the principal advantage gained by the "commercial" -object specialists was the satisfaction of acquiring items they wanted but either could not or would not themselves produce. They may also have derived special pleasure from their activities, but there is no way of documenting that. Nor is there any evidence that their activities encouraged or allowed them to accumulate tangible, durable, socially useful objects—that is, "wealth." What does appear fairly clear is that however much "wealth" they may have thus accumulated, and however praised they may have been for their expertise, these considerations alone were not very influential in elevating their statuses in other social hierarchies.

The second category of specialists, those who exchanged their services for tangible compensation, included a wide variety: architects, carpenters and boatbuilders, experts in tattoo and supercision, entertainers, teachers, clerics, curers and sorcerers, warriors, domestics and retainers. As we have seen, some of these specialists owed their positions—or at least their eligibility for such positions—to their class status, and more specifically to family tradition; but for most of these occupations some training and some "natural" talent were also requisite. In connection with the latter, I reported how the Maohis sought to account for it in explicit spirit-associated terms (a fairly clear-cut explanation which some writers have tended to obscure by invoking the conveniently ambiguous concept of *mana*).

While we cannot discover how much of their time these specialists actively devoted to their occupations, or how many of them there were, their very existence provides another indication of the complexity of Maohi society, and is another measure of its affluence.

Morrison, it will be recalled, intimated that every specialized occupation was organized into local guilds (1935:233); this does indeed appear to have been the case with fishermen, and possibly also with carpenters and boatbuilders, but (as previously stated) I doubt that such was the case with the other occupations listed above. On the other hand, the camaraderie that

evidently prevailed among most men of the warrior profession (except when at war with one another!) may also have occurred among members of some other professions.

In the case of most builders, tattooers, professional entertainers, curers, and the like, their relations with their employers or clients were determinate and brief; but some of these, and most of the other specialists listed earlier, remained engaged with their employers or clients on long-term or even "permanent" bases. An important question has to do with the identity of such employers: while some functionaries may have served the whole kin-congregation or tribe to which they were attached, it is my impression that most such specialists were in the personal service of particular chiefs.

Another noteworthy thing about the social relations of specialists concerns the jurisdiction of certain high priests: while most of these were coterminous with tribal or subtribal boundaries, a few of them extended over two or more tribal domains (de Bovis 1909:49-50).

Rewards for proficiency in service occupations varied with the specialty. In most cases, perhaps, success was attended by occasional or continual consumption of luxury foods, and release from less desirable employments. Some specialists may also have earned tangible goods of more durable kinds, such as tools, ornaments, weapons, and bark cloth enough for social capital; but this aspect of Maohi economics was virtually unreported. Also, increased social influence undoubtedly attended the labors of some specialists such as teachers, great warriors, and successful physicians; and such influence was inherent in the positions of high priests, tribal functionaries, and chiefly retainers. In fact, certain of the latter, along with some warriors, succeeded in gaining not just influence but personal political power, and along with it, in some instances, an elevation in marriage-class status.

The third category of service specialists consisted of those very distinctive individuals, who served as mediums for spirits. As I reported, these *taura* included persons from all marriage-classes. There may have been some element of family tradition in their recruitment, but self-selection, involving variable proportions of psychological aberration and shrewd design, was probably most contributory (but phrased, of course, as selection by the spirit).

As we have seen, *taura* differed greatly in their periods of spirit-possession and length of tenure. Some appear to have served for one or two occasions only, while others remained in a continual state of "low intensity" possession over periods of years. Their relations with other *taura* were quite commonly competitive—consequent either upon their conflicting versions of the same spirit or upon their representations of rival spirits. And, as has been documented, the rewards they received varied widely. Some of them gained momentary success (as measured in affluence, in influence, and even in personal political power) followed by failures which led to so-

cial oblivion or even physical peril; others enjoyed longer and more even careers which placed them in positions or near loci of tribal authority.

Cult

As we have seen, co-members of all kin and tribal units, and of at least some occupational units and categories of specialists, were co-worshippers of one spirit or another. But in addition, many Maohis worshipped deities not directly associated with their kin, tribal, or occupational groups or categories. It is the social-relational aspects of these cults *in essentia* that I now summarize.

During the Late Indigenous Era the most active and widespread of such cults were those of Tane and 'Oro, whose devotees belonged to many separate and otherwise unrelated kin-congregations and tribes. (Of these two, the cult of 'Oro was the more active and popular even during this era, but did not become overwhelmingly so until later on.) Formerly, perhaps, the cults of these deities had been limited to single kin units, and then single tribes, but by the middle of the eighteenth century, or perhaps a little earlier, their memberships had been expanded by means of proselytization and voluntary initiation. These, at least, were the more immediate processes involved in the spread of these two cults. In neither case was cult membership deliberately limited to particular kin groups, classes, tribes, or occupational categories; but as was customary in Maohi society, the more active members were males, and those usually having most direct access to these awesome deities were persons occupying leading kin-congregation or tribal statuses—the rare exceptions having been those persons of otherwise little consequence who claimed to be possessed (usually for brief periods) by one of these gods. (An additional commentary upon the Maohi commitment to social hierarchy: only persons in otherwise superior statuses appear to have served as long-term mediums for either of these gods.)

Notwithstanding the wide *inclusiveness* of both of these deities' congregations, a highly privileged connection obtained between the god 'Oro and members and associates of the Opoan kin-congregation (whose particular tutelar 'Oro was)—that is, those persons holding the highest-grade Titles of this congregation (the feather-girdle ones) were the most acceptable (and in due course, the *only*) ones to officiate at human offerings to the god. (In this connection, during the Late Indigenous Era the cult's most outstanding member was the Ra'iatean, Tamatoa, who held the highest-grade feather-girdle Title of the Opoan kin-congregation and who was also the more or less permanent medium of one of 'Oro's manifestations.)

The privilege (and duty) of officiating at the worship of either of these gods was understandably reflected in the relations between such officials and the other local members of each cult, as manifested in such be-

haviors as deference, obedience, and donations of objects. And there is also evidence that certain of those officials were treated with more than usual ceremonial respect among cult members everywhere. Also, devotees everywhere were likely to have behaved respectfully, and perhaps even obediently, to any medium of either 'Oro or Tane in their midst. On the other hand, I can discover no other kinds of indications that the various local "chapters" of either of these two cults were linked together in any kind of coordinate activity or overall authority hierarchy.²⁸

I wrote above that the membership of the cults of Tane and 'Oro had been expanded beyond their narrower beginning by means of "proselytism and voluntary initiation"—or so I surmise. Actually, the only (circumstantial) evidence we have on this matter concerns the spread of 'Oro-ism, which included political events to be summarized in volume 3. I can however suggest that, in a society so constantly imperiled by war, to court the favor of the principal god of warfare must have appeared to most Maohis to be a highly rational course of action. And in addition, for large numbers of Maohis, the attractions of being an Arioi must have led them, concurrently, to worship 'Oro, the founder and tutelary of the sect. I do not assign much motivating influence to the alleged belief that worship of 'Oro insured one's place in the Maohi paradise. In the first place, I am not convinced that the belief was as explicit or widespread as represented, and, perhaps more important, I do not consider that the Maohis were deeply enough concerned with an after-life to lend much weight to such a belief.

Arioi

During the era now under consideration the numerically largest social group in Maohi society was the Arioi sect. Even if we do not accept some writers' estimates that Ariois constituted one-fifth of the population, there can be no doubt about the large size of this society-wide unit. Its membership was evidently drawn from all tribes and marriage classes, and included both males and females in the ratio of about five to one. Most of the active members were young unmarried adults, but a few individuals continued active membership into old age.

The principal sect activity of active Ariois consisted of large-scale tours, during which they entertained their hosts and themselves by performing as dancers, musicians, actors, and bards. While their performances contained much that was purposefully diverting, including some social satire, they were in some respects also religious, having been concerned, implicitly or explicitly, with the worship of 'Oro and other tutelarys of the sect. Even when not on tour Ariois performed their religiously colored entertainments at fellow tribesmen's festivals and rites of passage, and probably also among themselves, for their own diversion and spiritual welfare.

Some accounts emphasize the male Ariois' roles as warriors; in view of the youthful age and prime physical conditions of most of them it is not surprising that they were so characterized, but warfare was not their preoccupation, nor were they the only—or, in all cases, the principal—warriors of any tribe.

Another question concerning the activities of Ariois has to do with their lives at home between tours. Evidence on this matter is scanty, but my guess is that while some of them may have lived off the production of other persons, most of them engaged in at least some subsistence labors. Affluent as Maohi society undoubtedly was, I cannot accept the implication that it was rich enough to maintain such a large proportion of its most work-capable members in luxurious indolence.

To an extent less true of all worshippers of 'Oro or of Tane the Ariois of the Society Islands constituted a unified social group, a *sect*. Not only did all Ariois everywhere look upon one another as co-worshippers and as fraternal (or sororal) colleagues (except when killing one another in war!), but they all acknowledged with some deference the ceremonial preeminence of one of their number—that is, the Taramanini of Ra'iatea, the official head of the Opoan branch of the sect.²⁹ On the other hand, the more binding social ties among the Ariois were those uniting the members of each local lodge.

Generally speaking, each tribal district contained its own Arioi lodge (exceptions to this parallel will be discussed later, as they constitute very noteworthy social facts), and the active male members of each lodge were divided into a novitiate and seven or eight grades through which they could be promoted upon evidence of skill in performance of the sect's principal arts. Thus, in this otherwise prevasively ascriptive society, the Arioi sect provided a means for individuals to achieve valued statuses—up to a point: the highest grades tended to be reserved for upper-class persons, who in fact usually entered them upon initiation into the sect. And what is more, the head of each lodge, although presumably a highly experienced member as well, was appointed to his office by the local tribal chief.

We saw also that candidacy for active membership in the sect was based mainly on evidence of "seizure" by 'Oro, by the foreswearing of progeny, and then by proof of capability in mastering the sect's arts.

Whatever its origin may have been, the sect's rule regarding progeny served to maintain its active members' relative freedom from domestic concerns and their engagement in sect activities—in other words, to extend the attractive life-patterns of "youthfulness" into middle or even old age. And, as abundantly documented, the rule was applied by means of abortion and infanticide and not by celibacy, which, indeed, was emphatically contravened by the members' very active and unconstrained sexual habits. Breaking of the rule led in most instances to exclusion from most sect ac-

tivities, but in some other instances older members seem to have retired more or less deliberately and honorably from active membership to take up ordinary family life.

As described earlier, there existed certain other statuses associated with Arioihood, but I am not entirely clear about the nature and function of these.

Special tattoo patterns and costumes served to distinguish one grade of Ariois from another, and from the rest of the populace. On the other hand, the red-dyed bark cloth *maro* worn by the heads of lodges served, perhaps deliberately, to equate them with the holders of feather-girdled kin-titles, in terms of their preeminence in a hierarchy of almost comparable social value. Moreover, a similar construction may be put on the fact that lodge heads were called *'aito*, which, it will be recalled, was the label reserved for preeminence in the practice of warfare.³⁰

That the Ariois were an exclusive and privileged lot there can be no reasonable doubt (their ideology even provided them with a privileged fate in afterlife). But to balance the account, they served the rest of the populace as entertainers and as performers of ritual designed to court the favor of powerful *'Oro* and his divine associates.

Tribe

The factor of residential proximity served to influence people's interactions in intangible but weighty ways, reinforcing or overriding such other factors as consanguinity, sect membership, and class. In this connection, the Maohis resided in rather populous households and the latter were clustered into neighborhoods, each constituting a unit with respect to common worship and some common subsistence activity; but during the Late Indigenous Era the least complex residential unit possessing a large degree of political autonomy—that is, the smallest and simplest kind of *tribe*—consisted of two or more contiguous clusters of neighborhoods. And most tribes were larger and more complex than that, the extreme having been the stable Seaward Teva tribe of Tahiti's peninsula and the temporarily put-together unit of Porapora (and Maupiti)-Ra'iatea-Taha'a.

One kind of cement that served to connect neighborhoods into larger units was kinship: that is, connections deriving from common descent or marriage. But in the case of larger and more complex tribes the factor most responsible for constructing and maintaining unity was the exercise or threat of coercive physical force.

The exercise of coercive force among the Maohis was institutionalized in several ways: by the glorification of warfare, by the worship of war gods, by the praise and respect shown to warrior champions, and by the legitimation (although not necessarily the universal acceptance) that was accorded to seizure of territory and other goods by force. Although subdivisions of

the same tribe, and subdivisions of different tribes, sometimes fought one another, whole tribes were most usually the principal units for waging war. The dominance of coercive force over all other bases of hierarchy will be set forth in detail in volume 3. For the present it is perhaps sufficient to point out that the tribal chief of Porapora succeeded, by force of arms, in reducing to political impotence the tribal chief of Ra'iatea who was also the Islands' highest-ranking kin-Titleholder, highest-graded Arioi lodge master, and principal medium of 'Oro Himself!

In addition to cooperating in the waging of war, all or most members of any tribe—or their representatives—united occasionally to participate in intertribal visits, in large-scale work projects (usually on behalf of their tribal chief), in paying taxes in objects (also to the tribal chief), in worshipping the tribal tutelars (which were characteristically those of the chief's own kin-congregation), and in celebrating their chief's rites of passage. Various other sanctions helped to insure participation in all these activities—including well-enculturated attitudes toward social rank, fear of supernatural penalties, desire for largesse, and so on—but reinforcing all other sanctions was the chief's command over superior physical force.

Like succession to kin-congregation chieftainship (with which, indeed, the office was frequently identified), succession to tribal chieftainship was based most usually on descent, having passed from an incumbent to his eldest son. On the other hand, more so than with distinctively kin-congregational offices, the holders of tribal chieftainships were sometimes elected to office by the tribes' leading members—or some men even seized office by force. Also, compared with the chiefs of kin-congregations, the chiefs of tribes were less likely to have held office as the tribes' officiating high priests. And even though physical force was a tribal chief's principal resource, it sometimes happened that the chief himself was not a skillful warrior or combat leader, having relied instead on other measures to assemble a fighting force.

By the Late Indigenous Era, Maohi tribes were sufficiently large and complex as to require both staff and line offices to carry out tribal activities. Among the former were administrators, chief's spokesmen, and messenger-ambassadors (quite apart from the chief's own personal retinue); some such offices were held by the chief's close kinfolk, others were assigned on the basis of friendship or proven ability. Probably no two tribes were alike in the functional definition of all offices, or in the way such offices were allocated, or in the locus of its incumbent's loyalty—whether the tribe itself or the individual who was its chief.

The more important line offices in tribal organization were the chieftainships of a tribe's constituent subtribal units. In some cases the holders of these offices were appointed by the tribal chief from among

his kinsmen and friends. But in most cases, probably, the chiefs of subtribes succeeded their own kinsmen into office, and displayed varying degrees of independence of the tribe's sovereign chief. With respect to this last point, the most effective and ubiquitous constraints upon a tribal chief's authority were these subtribal chiefs, some of whom wielded enough coercive force themselves to constitute a continual challenge to the authority of the former.

For these and other reasons, few tribal chiefs displayed much interest in maintaining social order or social justice throughout the whole of their tribes. Indeed, most appear to have concerned themselves only with furthering their own personal interests. In other words, the conclusion is inescapable that, whatever advantages people may have derived from tribal membership, most Maohi tribes were governed mainly and deliberately for the benefit of the governors.

The benefits of governing a tribe were both tangible and intangible. Among the former were better food and clothing (but not significantly better housing), freedom from onerous labor, more diversions (including wider choice of sexual partners), and, through copious offerings, better relations with spirits. Among the latter was the satisfaction derived from commanding others' services (a sentiment which cannot be documented, but must, in my opinion, be acknowledged), along with that of being the cynosure of elaborate deference.

Sex and Age

Having summarized Maohi society's more specifically identifiable social units, relationships, and roles, I turn now to the more general categories of maleness-femaleness and relative age. Much has already been said about these categories in connection with my summaries of consanguinity, occupations, and so forth—for example, most Maohi ideas and practices relating to relationships between males and females pertained to relationships between male and female consanguines or affines—so there remains little left to summarize. Nevertheless, certain behavioral regularities appear to be assignable to sexual roles in general, quite apart from (or rather, basically constituent of) kinship roles.

In matters of descent the Maohis were less male-based than most other Pacific Islanders, but maleness was unquestionably favored in a number of ways:

Males were generally considered to possess *more* of the attributes that appear to have been valued by the Maohis—for example, greater physical strength, more "sacredness," more decision-making intelligence.

To males were assigned the more highly valued positional loci in interactions—*mua* (versus *muri*), *i ni'a* (versus *i raro*), and right-hand (versus left-hand). Also, decision-making and interactional initiation rested more

usually with males than with females. And judging by accepted equivalences, in transactions of exchange, males' services, time for time, were considered more valuable than those of females.

To males were allocated the more favored food delicacies.

And to males were assigned more of the most valued statuses including high-ranking kin-Titles, tribal chieftainships, and priesthoods.

In addition, there were more all-male social units than all-female ones; but it should be kept in mind that the exclusive, highly privileged Arioi sect contained some female members.

Explanation of the Maohi penchant for valuing males more than females may be sought in a number of directions—but satisfactorily found in none. One might assert that males were so esteemed because of the relatively higher valuation accorded the activities they engaged in, or the objects they produced, or the knowledge they professed, or their greater intimacy with spirits. But of course, such explanations are entirely circular; and the only way for breaking out of such circularity would involve knowledge of events in Maohi prehistory far beyond our capacity to reconstruct.

A more feasible quest would be for explanations as to why Maohi females were valued as highly as they were, relative to their statuses in many other Pacific Island societies. But even that would involve comparisons that I am not prepared to undertake.

Finally, in this summary of sex roles, a word should be said about the institutionalized ambiguity represented in the status of the *mahu*. In my view, the most noteworthy features of this intriguing phenomenon are twofold. On the one hand, the very existence of the status underlines how sharply some Maohi behaviors had been normatively allocated in terms of sex. Notwithstanding this, however, the degree to which *mahu* were socially tolerated, and even respected, suggests that the male-female opposition was a more technical than a value-laden one.

At this point one might be inclined to join with Bligh in asking how the practices associated with *mahu*—the “sensual and beastly acts of gratification” and particularly the transvestite elaboration thereof—came to be so highly institutionalized “... in so prolific a country as this?” Or, to rephrase the inquiry, The question is not how did homosexuality come to be practiced among the Maohis—there are probably few societies in the world where it is wholly absent—but rather, how did homosexuality develop in the way it did, and to the extent that it did, in this heterosexual Eden?

Attempts to explain phenomena like this are at best difficult, and are usually unrewarding as well; and when the institution in question is long since gone,³¹ and information about it to be found only in ancient books written by prejudiced observers, it would be pretentious indeed to specify this or that cause. On the other hand, one may be permitted to

suggest that there were certain other features of Maohi life which helped to shape that institution. First was the marked numerical preponderance of males. (This factor would not of course be relevant to the homosexual affairs of chiefly males, who usually had their choice of women.) Second, certain behavioral distinctions between male and female roles—that is, males unable or unwilling to play the physically demanding and often hazardous roles expected of Maohi men in climbing, canoeing, fighting, and so forth, were permitted and, perhaps, even encouraged or required to play female roles.³² Third, the wide degree of freedom permitted to individuals in connection with sexual behavior in general, coupled with frequent indulgence in sexual intercourse. (It is conceivable that some males became so satiated with heterosexual affairs at an early age that they turned to homosexuality for novelty.)³³

In addition to these general factors there are two of more special application. First, there is Hamilton's statement that certain boys were purposely groomed to serve the "abominable purposes" of upper-class men; it is reasonable to believe that such conditioning as this led some recruits into a lifetime of homosexuality. And second, it should be recognized that the role of male lover of an upper-class man carried with it many advantages, both tangible and intangible. In fact, it was one of the most rewarding of *achievable* careers in this society of largely *ascribed* statuses.

As a factor of social differentiation, *age*—both absolute and relative—was somewhat more ambiguous than *sex*, as the circumstances described below indicate.

Succession to kin-congregation offices took place shortly after the new incumbent's birth; and even though most of the powers of such offices were transferred only much later, the very fact of transfer of symbolic perquisites at so early an age implies an attitude sharply different from that held in many other societies, where the young are generally disesteemed. Also, parallel with this jural acknowledgment of the full humanness of the very young, many observers agree in stating that young children were an independent, undisciplined lot.

The period of youth (*taure'are'a*) was institutionally recognized as the most appropriate time for immersion in many activities valued highly by the society as a whole: in singing, dancing, touring, sporting, and in copulating without the aftermath of onerous parenthood. Also, for those holding highly graded (or highly ranked) kin-Titles, the period of their preconjugal youth was the prime one of their lives: by then they had acquired most of the authority that went with their offices, and being without recognized offspring they retained the symbolic perquisites of office as well.

For many females, especially, youth was a prime period of life: their sexual services were in lively demand, and without the encumbrance of offspring many of them appear to have been relatively free to indulge their wishes for diversion and courtship. On the other hand, for high-ranking Titleholding women, and for the wives and mothers of high-ranking Titleholding men, their period of maturity (*pa'arira'a*) was the prime time of life, in terms of the respect shown to them, the authority they wielded, and the freedoms they enjoyed. And except for those whom parenthood had divested of kin-Titles of high grade or rank, the same was true of many men.

Thus, there is some equivocalness in Maohi attitudes and practices regarding the relative valuation of youth and maturity. But regarding old age the situation is crystal clear.

Old age (*ruau-ra'a*), or rather physically and behaviorally defined senility, was comprehensively disvalued. Except for a few individuals of forceful personality (such, apparently, as were Vehiatua I and the Poraporan chief Puni), old people tended to be ignored, neglected, and depreciated.

How can we explain these Maohi attitudes and social practices concerning individuals' ages?

Perhaps technology, and ultimately ecology, may have been factors in the relatively high valuation assigned to most men, and to some women, in their period of maturity: effective performance in the business of getting a living, in conducting social-relational affairs, and in maintaining good relations with spirits required knowledge and skills that could only have been acquired over time—something *more* than the years reached by *taure'are'a*, and considerably *less* than those reached by *ruau*.

As for the seemingly contradictory high valuation assigned to males in their period of youth, it should be recalled that the value was placed mainly on those holding kin-Titles of high rank or grade, and may have derived from notions about the "spiritual" element involved in descent—that is, whatever it was that lent preeminence to a kin-Titleholder remained with the individual only until he begat a legitimate successor. On the other hand, the relatively privileged statuses enjoyed by most young females requires a less cryptic rationale: competition for the sexual services of these proficient and accessible young sex artists could quite well account for that.

And finally, the factors just listed that served to enhance individuals' social value during "youth" and "maturity" seem to have served, *per contra*, to have impaired their value during "old age." Nor were the Maohi aged left with any mitigating attributes, such as occurs in societies where the philosophical perspective gained from long life counts for more than rote-memory mental skills.

SYNTHESIS

Comparisons of Intrarelations of Social Groups

Having summarized the kinds of major social groupings and categories of which Maohi society was composed during the Late Indigenous Era, I turn now to the task of synthesis—first, to a comparison of certain of those groupings in so-called dimensional terms.

KIN-CONGREGATION AND TRIBE

Although the tribes extant during this era had long since expanded beyond the boundaries of single kin-congregations, or even single ramagees of kin-congregations, the social intrarelations among fellow tribesmen continued to resemble those of kin-congregation mates in many essentials, at least in a normative sense. In fact, with some of the smaller, less complex and more stable tribes, the social-relational resemblances with unitary kin-congregations may have been nearly exact. With larger tribes, however, some important differences were evident, particularly in terms of transactions and governance, and perhaps emotions as well.

While pool sharing was for tribes, as for kin-congregations, the dominant transactional norm, its practice in the two contexts was markedly dissimilar. Whereas the objects and services contributed by members of kin-congregations at the behest of their chiefs appear to have been “redistributed” in wide-reaching and equivalent returns, those going to most tribal chiefs were redistributed, if at all, in only token terms. In other words, such contributions constituted *tribute* rather than *tax*.

Although we know next to nothing about how kin-congregations were governed, I cannot imagine that their chiefs ruled with the same partiality and self-interest—or disinterest—displayed by some chiefs in their governing of tribes. And I believe that physical coercion—and human sacrifice, particularly—was not employed so characteristically as a sanction in the governing of kin-congregations as was the case in the governing of tribes.

And as for the emotional dimension of interaction between subjects and chief, although the resemblance between kin-congregation and tribe may have been close in terms of formalized patterns of obeisance and the like, I suspect that fear was much more evident in tribal contexts than among the consanguines who made up kin-congregations—and for very good cause!

KIN-CONGREGATION AND LODGE

Arioi lodges resembled kin-congregations, social-relationally, more closely than they did tribes, although their compositional boundaries were typically conterminous with tribes. Terminologically, for example, the relations among lodge members were sometimes phrased in kinship idiom; and the

pool sharing (and lending?) that characterized transactions among them were much nearer to kin-congregation patterns than to tribal ones. The parallel also extended, in respect to behavior at least, to a similarity between ramages of kin-congregations and the loose unity comprising the whole Arioi sect.

ALLIANCES

All the above-named social units were alike in having been structured hierarchically, and normatively, according to the principle of pool sharing. In contrast to them were various kinds of *alliance* units—friendship, barter, and reproductive (i.e., marital)—that were entered into by “contract” and structured in terms of equality and direct “equivalent” exchange.³⁴

If one wished to emphasize this way of looking at social relationships one might separate those of the Maohis into three major categories: one containing those deriving from *descent*, a second made up of those established by mutual *contract*, and a third containing those imposed by *force* of one sort or another. A reexamination of the data might turn up some other features shared distinctively by the kinds of relationships in each of these categories, and some probing into Maohi history might uncover, say, that contractual relationships increased relative to numerical size of population, and so forth. These are intriguing, highflown ideas to experiment with, but I leave further experimentation to others, and proceed upon a more pedestrian course.

Relative Positions of Boundaries of Social Groups

KIN-CONGREGATION AND TRIBE

During the era now under study, every tribe about which we have such information contained more than one kin-congregation, single or ramified; it is, however, possible that there was a tribe here and there that encompassed all of some kin-congregation—either a single unconnected one or all the branches of a ramified one. Conversely, it is well documented that some ramified kin-congregations contained branches located in two or more tribal territories, including noncontiguous ones, thereby constituting certain *supra-* (but not necessarily *inter-*) tribal connections, which, however, consisted mainly of common worship. I refer here to connections between whole groups of consanguines. In addition, there were of course innumerable kin networks that extended across tribal boundaries.

TRIBE AND LODGE

During the era now under study the cults of both Tane and ‘Oro were supratribal in distribution, but, aside from the mythical Friendly Alliance, and despite legendary assertions concerning “Oro’s forces in war” (Henry 1928:131), tribes co-worshipping either of these gods seem not thereby to

have become allied in any other respect. Common commitment to either of these gods did indeed occasionally bring together members of different tribes for religious services; but as often as not such common commitment led tribes to compete and even war with one another for their god's favor.

A much closer correspondence existed between the boundaries of sect lodges and tribes. As a basis for this discussion I refer the reader to the lists of Arioi "houses" and lodge masters given in chapter 22.

What is to be concluded from these lists? If they are indeed exhaustive, and fairly reliable, then by comparing them with the list of tribal unities one may conclude that for each relatively stable tribe or large subtribe there was a single lodge, except when tribal geography made it difficult for all local sect members to meet together regularly in the same place (as in Teahuupo'o, Mataovae,³⁵ Ra'iatea, Taha'a, and Huahine). A second general conclusion to be drawn from these lists is that trends toward larger political unities were also mirrored in sect organization, as manifested in the multilodge jurisdiction exercised by some lodge masters. This trend had not moved as far with sect organization as it had with tribal organization, but such a lag is perhaps expectable; and in any case it is another indication of the primacy of politics over sect as factors in Maohi social change.

A more interesting and perhaps more significant aspect of the list is the lack of correspondence in some cases between lodge and 'aito. Mataovae's two lodges apparently came under the authority of a single 'aito, which is perhaps understandable inasmuch as these two noncontiguous geographic areas did come within the jurisdiction of a single tribal chief. More interesting is the case of the jurisdiction of Mata'a, who was 'aito of Papara, Atimaono, and Vaiari, but *not* of Vaiuriri—in other words, of all Landward Teva except the last-named subtribe. Finally, in the case of Teahuupo'o, both its lodges, along with that of Tautira, came under the jurisdiction of one 'aito, Te Ra'a Roa, thereby corresponding to the political connections between these units, while the other subdivisions of Seaward Teva (Pueu, Afa'ahiti, and Vairao) each had its own lodge and lodge 'aito.

Another line of inquiry regarding relations between sect and tribe involves instances of identity, of the offices of tribal chief and lodge master. Actually, the only such instance that I can discover is that of the office label Taura'a atua of Mo'orea's Papetoai; we are not so informed, but it seems to me more likely than not that one individual occupied both offices. (I can find no evidence to support Mühlmann's contention that a similar situation prevailed in Afa'ahiti [1955:48].) On the other hand, the sources are quite explicit in stating that it was each tribe's sovereign chief who appointed the district's lodge master to his office.

Concerning connections between Arioihood and tribalism, one will recall de Bovis' statement, which is confirmed by much other evidence,

that, however friendly and hospitable may have been the relations between members of different lodges in times of peace, and despite their common acknowledgment of the primacy of the Taramanini (the office of the master of the Opoan lodge), when hostilities broke out between tribes the members of their respective lodges not only fought one another, but were typically the most fierce and loyal supporters of their respective tribal chiefs.

Consanguinity and Class

Since membership in a marriage class was mainly by descent, the question arises concerning the relationship between class and consanguinity—more specifically between membership in class and in kin-congregation or descent line.

While information about kin-congregation composition is quite unspecific, some plausible inferences may be drawn. The smaller “family”-size congregations would by definition have been class-homogeneous—all *ari'i* or all *ra'atira* or all *manahune*. Mahaetea marae (Papara), founded by *ari'i* parents for their kin-Title successor, Teri'irere, seems to have been mainly for an all-*ari'i* congregation, and there were probably others of the same kind. It is also safe to infer that there were large numbers of all-*manahune* and all-*ra'atira* kin-congregations: “The *ra'atira* had their own family marae, for which a member of the family acted as priest, where remains of the dead and other sacred objects were left, and where the family ancestors were worshipped” (Handy 1930:43).

At the other extreme (in terms of consanguineal span) were the many networks of kin-congregations of common derivation—both territorially contiguous and widely dispersed ones. Suprakin units, as large and widely subdivided as some of these, were likely to have contained two or even all three classes within their memberships, thereby confronting the integrative ideology of consanguinity with the more differentiating one of class. It would be most instructive to learn whether such oppositions were recognized and how they were dealt with, although it is quite possible that actual confrontations did not often occur, inasmuch as the more active participants in joint, suprakin assemblies were likely to have been the “principal people” of the constituent subdivisions, and hence all more or less of one class. (See chap. 16.)

As for the descent “lines” important enough to have been memorialized in lengthy genealogies, most of these were probably made up of putatively *ari'i* members; inclusion of a non-*ari'i* link would have depreciated the genealogy's value as evidence of social superiority, which was one of its principal functions. In this connection, I again call attention to the special position occupied by persons claiming descent from kin-Titlebearing forebears of Opoa: not only were most (or all?) such persons acknowledged

to be members of the *ari'i* class, but during the era now under discussion such persons appear to have constituted almost the entirety of that class.

Tribe and Class

Understanding of the connections between marriage class and tribe is obscured somewhat by the different explanations that have been offered concerning the origin of the upper (i.e., *ari'i*) class. If, as some writers proposed, this class was composed exclusively of persons claiming descent from kin-Titlebearing forebears of Opoa, then we have a very special and highly important exemplar of the supratribal kin ramage, mentioned earlier. Or if, as other writers held, Maohi class stratifications in general, and the “emergence” of the upper class in particular, came about everywhere as the result of such factors as kin-congregation ramification, differential distribution of resources, and so on, then we are seeing a quite different phenomenon—although during the Late Indigenous Era the marital connections among upper-class members were so encompassing as to render the differences between these two explanations of little social relevance. In any case, although the principal people of many tribes were able to assert kin ties with one another, this did not insure amicable relations among them—in fact, the contrary was often the case.

Statuses

Another measure of “social integration” may be exemplified, first, by the extent to which statuses in different kinds of social groupings and categories tended to correspond, and, second, by the frequency with which particular individuals held different statuses in any one group.

Considering the latter first, perhaps the most informative example of such in Maohi society was the dual status of secular ruler and officiating priest occupied by the chiefs of some kin-congregations. The office of kin-congregation chief included by definition the role of principal communicant with the unit's tutelars, but I refer here to the status of priestly officiant, which in many instances came to be held by some other member of a kin-congregation (typically, by a younger brother of the chief, or by the head of a collateral “younger brother” line).

Instances existed of an even more far-reaching example of coalescence of statuses—as occurred in the case of the Opoan Tamatoa IV, who was not only secular ruler of his kin-congregation, and its principal priestly officiant, but the frequent mediumistic vehicle for its major tular as well.

With respect to tribal groupings, although most typically a tribe's sovereign chief was at the same time the chief of its principal kin-congregation, that was not always the case. And although tribes were by character put and held together mainly by coercive physical force, the

chiefs of some tribes were not themselves warrior champions (*'aito*), or even fighters.

Turning now to correspondences between statuses in different kinds of social units, I point to the central part played by Opoan-derived *maro-'ura* kin-Titleholders in the supratribal 'Oro cult. But a more widespread correspondence was that between Arioi grade and marriage class, in terms of both membership and insignia. As for the label *'aito*, which was applied to the office of lodge chief, I suppose that this reflected the circumstance that most Ariois were active warriors when the time for fighting came.

As I noted earlier, it is also possible to discern some correspondences in the statuses of pact-friend, formally wedded spouse, and other contractual relationships, but I shall not attempt to itemize such correspondences here.

Symbols

The subject of the role played by Maohi words, gestures, objects, et cetera, in symbolizing social relationships is vast, complex, and largely obscure. It has been touched on at many points throughout this study—in connection with labels, emblems, interaction etiquette, and especially religious ritual. My concern here, however, is with only a small phase of the subject—namely, with the use made of verbal metaphors and ritual objects in symbolizing the interrelations of certain social units and statuses.

First of all, one recalls the popular Maohi metaphor that equated a tribe with a boat, its chief with the mast (*tira*), the latter's principal aides with the outrigger (*'iato*): a vivid expression of the way tribal officers were expected to relate to one another to make the "ship of state" go well.

Next, one may recall two especially expressive uses of ritual objects that served to symbolize resemblances between statuses in different kinds of social units: the red (bark-cloth) girdle of an Arioi lodge master and the red (feather) girdle of a high ranking kin-congregation Titleholder; and the use of ironwood (*toa*, *'aito*), the wood of weapons of warriors (also called *toa*, *'aito*), for the image (*to'o*) of 'Oro, the principal god of war.

One will also recall the figurative use of the octopus to represent the several geographic divisions, and by implication the constituent subunits, of a unified tribe. But, of all such symbols of integration, among any social unit's constituent parts none approached the powerful expressiveness of the *paiatua*, the awesomely solemn ceremony in which the image of each subunit's tutelary was reconsecrated with feathers taken from that of the tutelary of the whole unit (or of the whole unit's chief). I am not certain, however, whether the units in question were kin-congregational, tribal, or cults per se—the ritual language having been general enough for all three.

Finally, I should point out again that metaphor and ritual objects were also designed to symbolize instances of social *dis*-integration. With respect

to the former, one will recall the equating of Tahiti with a fish that detached itself from Ra'iatea and swam away—most probably a reference to legendary events of both political and religious character. With respect to the latter, the legend describing the “invention” of the *maro te'a* explains explicitly that it was done to signal the severance of a Poraporan branch from its source kin-congregation of Opoa. And I propose that the legendary introduction of the *maro te'a* into Tahiti was similarly meant to symbolize Papara's breakaway from the *maro ura* dynasty at Vaiari.

I wish to conclude my epitome of Maohi social-relations with some general references about the kinds of symbolic connections that existed between social units and socially valued goods.

Property

I find it necessary to employ some technical terms in discussing the highly complex subject of property—to begin with, the term *property* itself: entities in which particular social units are considered to have “quasi-exclusive and limiting connections” vis-à-vis other social units.³⁶ *Title* is shorthand for “quasi-exclusive and limiting connections vis-à-vis other social units”; and the full characterization of any particular title would include a description of the rights and duties of the titleholder(s) with respect to the property in question and in the context of the rights, and so forth, of others' titles to that property. Concerning the latter, a title may be either *undivided* or *divided*; and if divided, either *provisional* or *residual*.

With definitions as broad in scope as these one would need hundreds of pages to present a full and detailed description of this aspect of Maohi society—a task I shall not and need not undertake, since most if not all of the information required for such an undertaking has already been supplied. (A full treatment of just that part of the topic conventionally labeled “land tenure” would involve paraphrasing very large portions of volume 2.) In this brief “synthesis,” instead of reviewing, redundantly, the kinds of property associated with particular social units, and the nature of the titles thereto, I wish to record a few inferences about the topic as a whole.

First of all, I can point to the very wide range of entities that constituted *property* in Maohi society: single words (e.g., certain personal names, kin-Titles, etc.), verbal formulae (e.g., certain genealogies and verbal rites), material objects of innumerable kinds, territory (both terrestrial and marine), certain kinds of services of certain kinds of persons, and so on. Also, as the reader undoubtedly will have concluded, some of the comments made earlier about goods subject to transactions apply equally well to goods looked upon as property; but in addition, there were certain goods held as property which, normatively at least, did not circulate (e.g., marae associated with particular kin-congregations).

Next, I can offer three very broad generalizations about Maohi property-holding social units that differentiate them somewhat from those of, say, Western societies: Maohi society contained fewer one-person property-holding social units; specific entities of property tended to be "owned" by larger numbers of social units of different types; and in most multiperson social units the rights constituting their titles tended to be more widely differentiated. (In other words, the hierarchic principles which underlaid "governance" carried over, explicitly, to property rights as well.)

Finally, with respect to titles, perhaps the most noteworthy generalization to be made about them is the relative paucity of truly undivided ones. The titles to certain kin-congregation marae, and to the personal estates of certain politically powerful chiefs, seem to have been undivided, but titles to most other entities of Maohi property were either provisional or residual in nature, not only in terms of historical actualities but of norms and suppositions as well.

EVOLUTION OF MAOHI SOCIETY TO 1767

I now propose to set scholarly caution aside and for a few pages indulge in the popular pastime of speculating about the course and causes of changes in Maohi social relations until 1767. Some such speculation has crept into previous chapters of this work despite my emphasis on "fact"; some of it is stated here for the first time. I had best begin by recording my present conception of how and when these Islands were first settled, and of the structure of Maohi society "in the beginning."

The earliest datable evidence of human settlement in these Islands yet discovered consists of some burials uncovered on Maupiti. Along with sixteen skeletons the archaeologists uncovered some seventy artifacts (mainly fishhooks and ornaments), which have been dated between A.D. 860 (± 85) and 1190 (± 90) and which revealed close relationships with some of the earliest cultural remains found in New Zealand. Another site, at Afareaitu, Mo'orea, appears to have been occupied about A.D. 1000, but all other datable materials thus far discovered are considerably more recent.³⁷ Much more archaeological work needs to be done in these Islands before a persuasive reconstruction can be formulated, but the archaeological evidence, here and elsewhere in Polynesia, suggests the following sequence of early relationships between the Society Islands and other Polynesian archipelagos: a settlement of the Marquesas from West Polynesia, before about A.D. 300; a settlement in the Society (and Hawaiian) Islands from the Marquesas, before about A.D. 600; and a settlement in New Zealand from the Society Islands, about A.D. 750.

Linguistic and other ethnological evidence tends to support these conclusions and also to suggest some more frequent connections between

the Society Islands and certain of the Cook and Austral islands. And, of course, connections between the Society Islands and the Tuamotus were not only more frequent but more purposeful and institutionalized as well.³⁸

The picture I perceive from the foregoing is of numerous landings on the Society Islands throughout a millennium or more, from other archipelagos near and far, and ranging in size from a lone and near-dead survivor in a drifting canoe to a modest-sized fleet. Most newcomers would have added some new ideas and objects to the local cultural inventory, and during the earlier centuries some of the larger-scale immigrations were probably near-revolutionary in their influence. But as time passed and the local population made settlements on all islands of the archipelago, subsequent new arrivals, (say after about A.D. 1200), even large-scale ones, could not have been large enough, or culturally "superior" enough, to have effected radical changes in the technological and social patterns that had by then become fairly well consolidated. This raises the question, What were those patterns of about A.D. 1200?³⁹

In the domain of technology, I suggest that the tools, productive techniques, and so forth, of circa 1200 were not markedly different from those of 1767. Those of the later era were undoubtedly more refined in certain respects (say, in offshore fishing, and in stone masonry), but not comprehensively or significantly so.

As for social relations, I suggest that most of the differences between A.D. 1200 and 1767 are ultimately attributable to the latter era's larger population. I propose, for example, that tribes (i.e., politically autonomous territorially defined social units) were smaller and less complex in 1200, having consisted mainly of single kin-congregations or sets of contiguous kin-congregations, which were interrelated by ties of common descent. In such tribes the chief would have been both administrator and high priest, and succession to that office would have adhered more closely to male primogenitural norms.

In that earlier era, I picture conjugal unions as having been more universally "domestic" and less deliberately "political" than they later became. That is to say, even chiefs were concerned less with a spouse's ancestral lines or tribal affiliation than with her physical charms and household and reproductive capabilities. Moreover, I imagine that even chiefs were careful not to marry "close" consanguines.

Even at that earlier era there probably prevailed some marks of social stratification, at least to the extent that each tribe's chiefly family enjoyed special consumption rights, and other privileges; but I suggest that only two such strata were discernable, and that they had not yet become sharply separated by powerfully sanctioned norms against inter-marriage.

I suppose that even at that earlier date some occupational specialization

had developed; but I doubt that the earlier population was large enough to support the degree of specialization that prevailed in 1767. I suppose also that some more or less "autonomous" cult activity sprang up and spread about from time to time—probably as a consequence of some individuals' mystical experiences. I cannot, however, believe that anything so large scale and full time as Arioihood would have been possible in a population of much smaller size.

As for the factor of age, I imagine that while a successor to chiefly office was, even during the earlier era, a focus of ritual attention, such attention was less hyperbolic by far, and that for all other persons maturity was the prime time of life, not only in mundane affairs but in ritual ones as well.

Finally, with respect to the social-relational aspect of sex dichotomy, I believe that norms were the same in the earlier eras as they were in 1767 in terms of technology, religious ritual, and interaction. Moreover, I suggest that women of chiefly families—that is "upper-stratum" women—were not yet such pawns or performers in intertribal politics as they later became.

How, then, did the (hypothetical) society of A.D. 1200 just epitomized become transformed into the one I have reconstructed for 1767? What "causes," exogenous and endogenous, set changes in motion, and how did such initial changes influence the other parts of the society's structure? (In the following paragraphs I shall touch only on those changes of major social-relational significance—that is, those which *my* biases lead me to emphasize.)

As stated earlier, I believe that the principal influence upon social change in these Islands was population increase, and not so much by immigration as by steady internal increase. Moreover, inasmuch as this increase was not accompanied by any major changes in subsistence technology or in preferences regarding settlement patterns, it led people to spread out over all the Islands and, eventually, in some places (but not everywhere), to exert pressure upon the land—to compete for favorable territory, terrestrial and marine.

I suggest that the spreading of the population took place initially and mainly in the ways postulated in my treatment of kin-congregation ramification. That is to say, the spread was by gradual filling up of contiguous empty tracts or by more or less peaceful colonization. Endemically "structural" factors, such as sibling rivalry and the occasional emergence of strong and restless personalities,⁴⁰ undoubtedly initiated many such movements; there may also have been instances of warfare between unrelated kin-congregations, and even between branches of the same unit, but few if any cases of massive migration or preemptive conquest.

However, sooner or later, some neighboring and thitherto unrelated kin-congregations were united into larger tribes—either by force of arms, by marital alliances, or by both. In time these units came to be combined into still larger and more complex tribes, which served both to tie together unrelated kin-congregations and to separate consanguineally related ones.

I shall not endeavor to recapitulate here all the kinds of “causes” behind such developments; suffice it to say that they were many and varied. For example, although economic necessity may have helped to influence the inhabitants of small and relatively unfertile Porapora to invade richer Ra’iatea, such cannot have been a decisive factor in most of the tribal consolidation that took place on huge and sparsely populated Tahiti. And although calculated ambition to command the labor or ceremonial respect of more subjects may have led some individuals to undertake wars of conquest, many of the bloodiest encounters resulted from motives of pique or personal revenge.

Several features of Maohi multi-kin-congregation units serve to identify them with the ramage, said by Sahlins (1958) to be characteristic of Maohi society—but only insofar as concerns kinship ties. Unlike Sahlins’ hypothetical ramage, the Maohi kin units did not constitute autonomous, political—that is, tribal—groupings during the Late Indigenous Era, so that Sahlins’ theory about the ecological basis of their evolution is not entirely relevant to the Maohi case.

But even if the Maohi multi-kin-congregation units had been tribal, their internal structure cannot be accounted for in the way proposed. Very briefly stated, Sahlins holds that the several subunits of a ramage—the component kin-congregations of a multi-kin-congregation unit—owed the maintenance of their interconnections to the way in which subsistence resources were spatially distributed: that is, “... empirical evidence, (other factors being constant) should show ramified systems in islands in which there is a variety of scattered resource zones differentially exploited by families or small groups of families. Or, inversely, ramified systems would be expectable on those islands where a single patrilocal extended family could not efficiently exploit the total range of available resources on a high level.” (1958:203)

As I have endeavored to show in earlier chapters, Maohi subsistence resources were indeed “scattered,” but not to the degree suggested by Sahlins; except for the very special case of Tetiaroa, and possibly Mai’ao, on every island known to me, every major kind of “resource zone” used by the Maohis would have been well within the daily-use range of any household, both in terms of spatial distance and of right of access (see Finney 1966). Objects did circulate among interrelated kin-congregations, but such objects were of kinds commonly accessible to most or all households. In fact, a better argument could be made for the proposition that

the objects in question circulated, more or less ritually, *in order to* maintain the interrelationships, and not the reverse.

This is not to deny the existence of exchanges involving objects needed for themselves—for example, the kind that took place between an occupationally specialized fisherman and a man specializing in gardening, either as commercial transactions or in the form of gift exchange. And while many such exchanges undoubtedly took place between individuals who were also kinsmen, they were probably of only marginal importance in maintaining kin-congregation connections. And, even more directly relevant to the present discussion, the complementarity exemplified in such exchanges was based mainly on individual occupational specialization which had very little to do with differential access to diverse resource zones.

However it was that such tribal consolidations took place, it is evident that two different bases for interpersonal relations were involved in the developments leading up to them and in the resulting social hierarchies comprising the tribes. One was the norm for grading siblings by birth order and sex; the other was the recognition that was accorded coercion by physical force. The former became institutionalized in the hierarchic grading and ranking of kin-congregation offices; the latter became exemplified in numerous individuals of political authority who owed their position mainly to martial, political, or diplomatic skills. In some instances the highest tribal offices exemplified both these principles; in others, highest grade (or rank) was personified in one individual, political authority in another. In any case, the interplay of these two contrasting principles of hierarchy served further to complicate Maohi social relations—not only “horizontally” as it were, in intensifying “status rivalry” (see Goldman 1960), but “vertically” as well.

In addition, there were two other characteristics of Maohi society that contributed to maintaining the viability of both of these contrasting, and what might otherwise have become irreconcilable, principles. One of these was the tolerance toward bilaterality combined with a considerable degree of flexibility in allocation of kin-Titles: although male primogeniture was probably the ideal, the basis for succession was not dogmatically adhered to in the face of all other considerations.⁴¹ The second was the device commonly used to legitimize achieved political power, by reproductive alliance (“marriage”) of the achiever with a high-rank kin-Titleholding (or Title-conveying) woman, upon whose offspring would devolve both political power and high rank. As we shall see in volume 3, however, this latter measure was not always resorted to. Nor did high rank always insure political power, as attested by the state of political impotence to which the holders of Farepua kin-Titles eventually declined.

Accompanying the political developments just mentioned, Maohi soci-

ety was becoming more highly and more disjunctively stratified into three classes: *ari'i*, *ra'atira*, and *manahune*. Several different explanations have been offered for Maohi social stratification; some of them pertain to the increase in status "levels" in general, and others pertain to the three-level marriage-class system in particular. The most widely espoused explanation for the Maohi three-level class system has been the "conquest" theory, best epitomized by Handy. According to this writer a "maritime dynasty," possessing a markedly different and in many respects "superior" culture, descended upon these Islands from the west and established a beach-head settlement at Opoa, Ra'iatea, from which their descendants eventually spread out and overcame the Islands' original inhabitants.⁴² Needless to say, I reject this type of explanation as being overly simplistic, undocumented, and quite unnecessary.

Piddington also rejected the notion of outside conquests as a general explanation for social stratification in the Society Islands as a whole, but he did fall back on intra-and interisland conquests to account for the subordinate position occupied by the "vanquished" and "landless" *manahune* (Williamson 1939:225n). And although Piddington referred generally to other "internal factors" influencing social differentiation in Polynesian societies in general, he offered no explanation for the marital boundaries separating Maohi or other Polynesian social strata.

Among recent studies pertaining to the increase in Maohi status levels in general, perhaps the best known is the one advanced by Sahlins in his comparative study of the relationship between social structure and ecology throughout Polynesia, in which he concluded that social stratification varied "both in degree and form according to ecological conditions" (Sahlins 1958:ix).⁴³ Our present concern is with "degree of stratification."

Sahlins divided the Polynesian societies examined by him into four major categories in terms of "degree of stratification":

1. Hawaii, Tonga, Samoa, Tahiti ("structurally complex ranking systems, usually with three status levels");
2. Mangareva, Mangaia, Easter Island, Uvea ("two basic status levels with tendency to form third");
3. Marquesas, Tikopia, Futuna ("two status levels");
4. Pukapuka, Ontong Java, Tokelau ("two status levels; upper containing very few members").

He then undertook to demonstrate that degree of stratification in these societies ("other factors being constant") varied directly with productivity of foodstuffs—and succeeded to his own satisfaction in doing so, by means of the following method for estimating productivity.

Since few of the sources about pre-and early-European Polynesia provide quantitative data on food production, Sahlins fell back on the familiar

notion of *surplus*—"surplus increases as productivity increases." He proposed this statement to be valid for Polynesia because "first, as the cultures compared here are historically closely related and have more or less the same foods and types of distributional systems, it is unlikely that a serious discrepancy in producers' wants would arise from society to society; second, and more significant, the surpluses which are being considered are food surpluses, and any discrepancy in wants that might arise would a priori be small. Human beings can consume just so much or so little food; in contrast to many other goods, the potential range is relatively small." (1958:108)

Sahlins then distinguished two kinds of food surplus, *immediate* and *cyclic*: the former refers to "the ability of food producers to acquire, in a single exploitative activity, an amount of food beyond their immediate consumption needs, or an amount greater than would be needed before production is resumed again." Cyclic surplus, on the other hand, is "that food which the producer has left over after a full cycle, e.g., a year, of production." He considered immediate surplus to be particularly appropriate as a measure of productivity of Polynesian societies because, he claimed, "it is precisely those foods produced beyond the immediate needs of the producers which were collected by chiefs and then redistributed by the system operating in conjunction with religious feasts and other occasions" Therefore, other things being constant, "a fairly accurate indication of the ability to produce ... [immediate surplus] may be gained by considering the greatest number of people encompassed in a single [average] redistributive food network, and the frequency per annum of over-all redistribution in such a network." (1958:109.) For this proposition to be valid, Sahlins added, every consumer must receive a proportionate amount, or bit, of the food so distributed—a condition which he believed to be met throughout Polynesia.⁴⁴

In terms of immediate-surplus productivity, Sahlins ranked the Maohis third in his list of fourteen societies—after Hawaii and Tonga and before Samoa—which corresponds closely with the Maohis' position in his "degree of stratification" rank-order list. He based this rank-ordering on his estimate that the largest average redistributive networks of Maohi society included about 8,250 persons at the "district" level and about 68,000 persons at the "division" level, with a "frequency of redistribution" factor of three per annum (at least, for each "district").

I suppose that no student of Oceania would disagree with the placement of Maohi society among the most highly stratified ones of Polynesia. And no one familiar with descriptions of Maohi life could justifiably deny the existence from time to time of "immediate surpluses" of foodstuffs in the Society Islands. Moreover, I am disposed to expect some positive correlation between degree of stratification and immediate surplus—not necessarily in all human societies, but in enough of them to warrant

tests of the hypothesis. On the other hand, the particular test applied by Sahlins fails on two grounds with respect to the Maohis: first, on account of his misconceptions regarding Maohi "redistribution," and second, on account of the inaccuracy of the population estimates he utilized.

As I have abundantly indicated, Maohi tribal chiefs did collect foods from their subjects on occasion, and now and then some of this food was "redistributed" to some extent; but the only evidence bearing on how much of a producer's immediate surplus circulated in this way suggests that very little of it did so.⁴⁵ (Unless, of course, one were to label every household head a "chief," which Sahlins plainly did not imply.) Thus, in this sense, Maohi "redistribution" does not provide a very informative, or necessarily accurate, measure of Maohi productivity.

Indeed, even when "redistribution" did take place among the Maohis, it did not typically conform to the mode proposed by Sahlins when the larger social units—that is, "tribes"—were concerned. For example, on many occasions the bulk of the food so collected was consumed at or near the top of the hierarchies, or arrived there in a deliberately decayed state, or was "redistributed" in token and unequal amounts by "scrambling." And while this does not rule out the possibility that the size of the social unit involved in contributing on such occasions may have borne some (indirect) relation to stratification, it has little to do with "redistribution" itself.

One will recall that the food contributed by subjects to their tribal chief may have served to support the diplomatic and other public intents of the latter, but it did not ordinarily supply his domestic subsistence needs, which were usually met from his own estates. Also, as tribal units increased in size, some "taxes" changed in kind. (See chap. 23.)

Turning now to the population estimates utilized by Sahlins in calculating the size of his so-called "redistributive networks," I trust that no further documentation is needed to demonstrate how extravagantly inflated those statistics are. Also, I am unable to find reliable evidence for his conclusion that "redistribution" encompassing "districts" took place at the average rate of three per annum.

Thus, although Sahlins' characterization of Maohi society as having been, comparatively, both highly productive and complexly stratified is undoubtedly accurate, the method and the data utilized by him to calculate that productivity are irrelevant and inaccurate. Moreover, even if Maohi redistributive networks were of the type, size, and frequency posited by Sahlins, and even if (as he assumes) all or most surplus production was distributed from "central agencies," I fail to see how such facts could serve to explain, except tautologically, Maohi society's three-level stratification. And finally this theory offers no specific explanation for the marital boundaries known to have separated the Maohi classes.

In his comparative study of social evolution in Polynesia, Goldman placed the Maohis among his most “evolved,” highly stratified societies, and characterized the three Maohi strata in the following terms: “Tahiti had a class of chiefs, *arii*, who were the ruling aristocracy and a *raatira* middle class that was made up of lower-ranking “nobles” and of upward-moving plebians. Land ownership was prerequisite for *raatira* status. At the bottom of the social scale were the landless *manahune*, the commoners and the majority of the population.” (1960:698) And in another place he characterized the *manahune* as “not only landless but to all intents and purposes a caste” (p. 699). I cannot agree with Goldman’s characterization of *manahune* as “landless”; and although he acknowledged the marital barrier that separated them from *ari’i* and *ra’atira*, he did not attempt to explain it.

Goldman was concerned mainly with the interplay between hereditary rank and force-sanctioned authority, which I shall return to later on. Like myself, he looked upon sibling *grading* (by birth order and sex) and kin-congregation (“lineage”) *branching* as having provided an important structural basis for stratification. “Seniority ... defines the rank of individuals, which follows a fine gradation from highest ranking chief, the descendant of a line of first born males (the ideal of highest rank), to the lowest ranking ‘commoners,’ a descendant of junior lines” (1960:689). Thus Goldman characterized the “prototype form” of Polynesian societies generally—including Maohi.

Also, like myself, while he acknowledged the possible relevance of ecology to “social complexity,” in certain particular instances, he rejected it as an overall explanatory device. For example, “Among interactive factors must be included ecology. Polynesianists have always called attention to the fact that the more complex Polynesian societies were formed on the high volcanic islands and the simple ones on the low coral atolls. This generalization is, on the whole, valid. All the atolls were traditional societies [i.e., kinship dominated], while the high islands contained all three types [i.e., “traditional,” “open,” “stratified”], as one would expect from the common dictum that environment limits but does not create. We cannot accept blindly the time-honored assumption that “surplus” provides the necessary basis for continued political evolution.... In other words, it was the political incentive and the presence of a political organization that made public works possible rather than, as commonly believed, the other way around.” (Pp. 709–710.)

It now remains for me to offer my own explanations for the degree and kind of social stratification found on these islands in 1767. First, a word about its degree.

With the proliferation and ramification of kin-congregations an important change took place in their internal social relations, in addition to the complete fission which some of them doubtless underwent, and in addition to the changes accompanying their consolidation into more complex tribes. In other words, as kin-congregations ramified, the number of their offices—including Titled ones—also increased and became further differentiated, in the following ways. In keeping with the fundamental Maohi principle of grading siblings by birth-order and sex, the hierarchically differentiated statuses in each supra-kin-congregation came to be extended over a greater vertical range, which, among other things, greatly widened the social distances (in terms of differential privileges) between the statuses of “senior” branches and of the “junior” ones. Then, at some point in this process of differentiation the continuities of consanguinity linking all these statuses, from most senior to most junior, came to be interrupted by barriers of class and caste.

The crucial question is, What events or lines of reasoning served to restrict an individual’s choice of spouse (in addition to the restriction of marrying close consanguines) and thereby transformed status levels into castes? In my opinion a number of convergent developments may have been involved.

There is a strong likelihood that tendencies toward endogamy developed among the higher-graded members of suprapkin units as these latter differentiated in the ways just proposed. In other words, as social distances (in terms of privileges) increased between “senior” and “junior” members in such units, the former sought more deliberately to maintain the distances by devoting more attention to the eugenics of reproduction—that is, to insuring that the “spiritual” elements passed on to an offspring were bilaterally equivalent. (This type of “social eugenics” was probably conceptualized at a very early time in Maohi—or indeed in Polynesian—history, but I suggest that it became a decisive influence in spouse-choosing only after kin-congregation statuses had reached a certain point of “vertical” differentiation—which point, however, I am unable to specify.)

My further suggestion is that under the influence of this “eugenical” thinking two kinds of events occurred with increasing frequency. On the one hand, more and more marriages took place among senior co-members of kin units, even at the cost of overriding general society-wide proscriptions against marriages between “close” consanguines. And on the other hand, more and more marriages were contracted between senior members of different kin units. Needless to say, both these kinds of occurrences served to increase the social distances between “senior” and “junior” members of the kin units in question, and the inter-kin-unit marriages served also to extend these conditions society-wide.

As for the inter-kin-unit marriages just mentioned, many of them undoubtedly had political consequences as well. Indeed, it is possible that

marriages of this kind were occasionally contracted for mainly political purposes and before eugenics became such a decisive criterion. Or, what is even more likely, both eugenical *and* political motives entered into most such marriages during earlier eras of Maohi history, and with the passage of time they both became weightier through mutual reinforcement.

All the above happenings are of the nature of general societal developments. I look upon them as having taken place, potentially, any and everywhere in these islands. But I also admit the possibility that certain particular happenings may have had weighty influence upon the development of stratification in general, and of class endogamy in particular. What I am suggesting is that at some point or points in Maohi history certain "autonomous" kin-congregations came to be widely regarded as socially "superior" to all the rest. Whether this came about as a result, initially, of military superiority, or cult proselytism, or political maneuver, or a combination of such measures, I of course cannot say, but it is reasonable to expect that such "superiority" would carry over to those units' higher-grade members, thereby creating or reinforcing a society-wide system for comparing kin-congregation statuses—of rank, as contrasted with intracongregation grade—which served to widen even further the social distances between status extremes.

During the Late Indigenous Era the kin-congregations holding the society's highest-ranking kin-Titles were those of Opoa and of Vaiari, but that need not always have been the case; like social units everywhere, Maohi kin-congregations undoubtedly had their rises and falls, and like genealogical myths everywhere those of the Maohis were inevitably tailored to social change. In any case, whatever circumstance it was that started it on its rise, somewhere along the way the Opoan kin-congregation became specially (though not exclusively) associated with the god 'Oro; and thenceforth the prestige, and legitimation, of the two—Opoan kin-Titles and cult of 'Oro (including its Arioi sect)—increased even further by mutual enhancement.

Returning again to the question of the influence exerted by ecological factors upon social stratification, I acknowledge now as I did previously that such influence prevailed (and in fact was two-way). On the other hand, no formulae that I know about or can conceive of would serve to measure or explain the highly complex connections between these two sets of events. For example, whereas the low productivity of Porapora seems to have predisposed its inhabitants to the foreign conquests which led to their chiefs' political superiority over nearby lands, that of Tahiti's northeastern districts helped to keep their chiefs subordinate to Pare-Arue and Hitia'a. And the society-wide preeminence enjoyed for so long by the principal people of Fa'a'a (Tahiti) derived not from the meager economic resources of their small domain, but from their political and diplomatic skills.

When postulating the kinds of conjugal unions that prevailed among

the Maohis circa 1200, I pictured them as having been more “domestic” than “political” in their inception, and as having conformed more closely to the widespread Polynesian rule against marriage between “close” consanguines. Later on, the growing concern with social eugenics, coupled with political motives, led to marriages with closer consanguines (to first cousins, in some instances), and to marriages that were more in the nature of reproductive alliances than of sexual and domestic unions. I should point out, however, that these developments were probably restricted to the upper-class members of Maohi society; for most other persons, choice of mate and functions of union remained largely unchanged.

The only *general* explanation I can offer for the increase, during the period between 1200 and 1767, in total number of occupational specialists is the increase of the population as a whole. On the other hand, the relatively greater increases that characterized certain occupations may be accounted for in so-called “functional” terms, as may be exemplified in the case of more or less full-time warriors. That is to say, as coercive force came more and more to supersede high kin-Title rank as a basis for tribal authority and intertribal influence, so did warfare become a more specialized profession and warriors a more numerous and better rewarded lot. As another example, the rise in numbers of entertainers, and the polished refinements in the arts practiced by them, may be accounted for in large part by the growth of the cult of ‘Oro and of its Arioi sect. (More such examples could be cited,⁴⁶ but since the reader now has enough data to engage in this “functional” pastime on his own, I turn to changes that seem to have taken place, between 1200 and 1767, in the social-relational aspects of age and sex.)

With regard to age, it is of course obvious that the extravagant ritual cynosure enjoyed by youthful kin-Titleholders could have come about only after kin-congregations had become large and structurally complex enough to have indulged in the luxury of a figurehead chief. To the extent that society at large followed the same practice of extolling and indulging the very young, I imagine that this also was a latter-day development; I cannot believe that a pioneer, colonizing people could or would have done so.

Finally, with regard to sex dichotomy, I suggest that the prominent political roles played by upper-class women during the Late Indigenous Era may in a general way have been made possible by the larger populations and increased productivity that freed some women from domestic chores, but that the roles were more directly a consequence of the rise in the concern over social eugenics.

NOTES

CHAPTER 14

- 1 Some examples are the following LMS Dictionary entries: *taetaevao*, an inhabitant of the interior, a clown, one not accustomed to society (also, *taevao*); *ara'ara'aivao*, an inhabitant of the upper valleys; a wild or untamed animal; wild, untamed, unaccustomed to the seaside, as an inhabitant of the interior of the country.
- 2 The LMS Dictionary contains several terms for social units, such as *ti'a'a*, a company of people, a flock or herd of sheep, goats, etc.; and *pupu*, a company, party, or a class; however, I am unable to specify exact referents for them.
- 3 White (1967:328), drawing on textual material recorded by Orsmond, described personal names as “circumstantial”—“e i'oa pi'i noa: simply a name of address,” as distinguished from “grand names” (*i'oa mau*, name-true), or what I call *Titles*.
- 4 As far as I can discover, the various wind-directional compass points described in chapter 8 did not serve as a general locational reference system for entities other than the winds themselves.
- 5 White and Terupe 1958:57. I have not examined the older textual material with enough attention to this aspect to be able to list which items were “alienable” (incidental or transient) and which items “inalienable” (intimate, innate, or permanent), but a statement concerning such distinctions in twentieth-century Tahitian is probably applicable enough for present purposes: Perhaps the most confusing of all Tahitian idioms are the several distinctions in the use of the vowels *a* and *o* in *a*, *na*, *ta*, and *o*, *no*, *to*.

Rule: Use *o*, *no*, and *to* for: (1) All members of the body, and all that emanates from the bod[y] including one's thoughts expressed, but not one's words articulated, nor sins committed; (2) All that the body may enter; (3) An integral part or portion, or specific attribute, of anything, as one of several objects required to complete the whole; (4) The land of one's birth or origin, or permanent residence; (5) All attributes, qualities, and dispositions proper to the word modified; also all such in the abstract, as ideas; (6) All participial nouns used verbally where the thought dwells rather upon the action than upon the completed act; (7) And for one's own child, parent, or other relative, slave, servant, friend, etc., in a definite or specific form.

Rule: Use *a*, *na*, and *ta* in all cases not covered by the above. (Burbidge

- 1930:223–224.) See also Pukui and Elbert 1957:xix; H. W. Williams 1957: 1, 237.
- 6 According to one observer, *mata'u* carried an additional meaning. On one of those frequent occasions when some native stole a valued object from Europeans at Matavai, the characteristic reaction of the local chief, Pomare I, was to hide away in fear of reprisals: “The next day there was no trade carried on; but Tee [Tii, a subtribal chief] came on board again, desiring the captain [Cook] to visit the king [*sic*] at Parré, who was *matòw* [*mata'u*], an ambiguous court-phrase, expressing not only that he was afraid, but that he wished to be put into good humour with presents” (G. Forster 1777:II, 99–100).
 - 7 See LMS Dictionary: ‘*ā'au*, the bowels or intestines—*fig.* the heart or mind; the affections; the conscience; courage or spirit.
 - 8 In a poem reproduced in Alexander (1893:55–59), the deserted lover (husband?) describes himself as being *to'eto'e* (chilled) with lingering affection for his fickle lady love; but whether this is meant to be literally descriptive of an internal sensation, or merely metaphoric, is not known.
 - 9 See also the LMS Dictionary definition of *tumaoaoa*, “to be ashamed, as a person not taken notice of,” which is a perfectly straightforward expression of chagrin pertinent to a whole range of emotions.

CHAPTER 15

- 1 See, for example, the wholly benevolent role played by Hina, the lunar goddess, and the host of “old women goddesses” who became “... guardians of the world.” But note also that there were many malicious female spirits as well, including a goddess of “strife and cruelty.” (Henry 1928:180, 416, 417, 462–463)
- 2 One of the “Precepts of Tetunae” reads in part: “Guard yourself against the revenge of a woman. It will pursue your footsteps.” (Handy 1930:41)
- 3 For example, in the cosmogonic chant “Birth of More Gods,” it is recorded of the God ‘Oro’s three daughters: “These goddesses, followed by a host of other goddesses, always accompanied ‘Oro and his host of gods to battle, whither they never failed to go” (Henry 1928:375).
- 4 See, for example, the legend of Huri i te Monoī, about how a maiden who accompanied her brother on a long and dangerous voyage proved the more courageous and persistent of the two, sustaining him by her words and example in the face of numerous perils (Henry 1928:613–614).
- 5 Mühlmann (1955:190ff) proposed that the ritual restrictions on women came about as a consequence of the (alleged) history of the peopling of these islands, namely, as a result of the successful conquest of their aboriginal “Old Polynesian” inhabitants by a culturally superior wave of *ari'i* maritime adventurers. According to this explanation, *ari'i* women enjoyed favored positions in their own communities, but few of them accompanied the *ari'i* males on their journeys overseas, so that the latter had to mate with local “Old Polynesian” females in their overseas colonies in the Society Islands. And, inasmuch as they regarded “Old Polynesians” in general,

and their women in particular, with some contempt, they imposed upon the latter all manner of constraints, domestic and ritual. This ingenious reconstruction has the virtue of “explaining” a number of other features of Maohi society, including class stratification in general, but, like most ethnic-wave theories about Polynesian culture history, it is lacking in proof. For further discussion of it see chap. 18, this volume.

- 6 See also the ritual restrictions associated with head freeing (*āmō’a*), whether male or female (chap. 13).
- 7 Although in the legend of the Great Mo’o [lizard] of Fautaua a married couple went off together into the mountains in search of plantains during a period of famine (Henry 1928:621).
- 8 I have no way of knowing which of several different words found in the LMS Dictionary is intended here: *pu’a* (the coral rock; a disease accompanied with a swelling and an abscess; the name of a tree bearing fragrant yellow flowers, and the flowers thereof; to scour with coral; a person who scours), *puā* (the blossom of certain reeds etc.; to blossom), *puāā* (to be enlarged as the abdomen, either in health or by disease), etc.
- 9 The LMS Dictionary contains the entry *oeahōu*, a young comer; a young person just come to age, but provides no further details concerning this stage.
- 10 For a discussion of Mühlmann’s thesis regarding the “weibliche” symbolism implicit in the fattening of youths, see chap. 22, note 50.
- 11 I can, however, discover nothing in the sources relating to the formalized kinds of young men’s groups described for Samoa (Mead: 1930).
- 12 As will be discussed in chap. 22, one of the prime requisites for continued membership in the youth-oriented Arioi sect was submission to the rule of childlessness.

CHAPTER 16

- 1 Most usages of *huā’ai* seem to refer quite unambiguously to *descendant*, but *fēti’i* remains puzzling, especially when used in contrast with *huā’ai*, as for example in one of the “Precepts of Tetunae”: “*E fa’atura te ta’ata ato’a ite ari’i, i tāna huā’ai e tona fēti’i.*” Everyone is to treat with respect the *ari’i*, his *descendants* and his *fēti’i* [other relatives? collaterals? immediate family?] (E. Salmon 1937:29). It is noteworthy that *huā’ai* is qualified with the “impersonal,” or *a*, form of the pronominal (i.e., something acquired) and *fēti’i* with the “personal,” or *o*, form (i.e., something ascribed).
- 2 See also *firi*, to plait, as sennit, human hair, etc. (LMS Dictionary).
- 3 Also, the Maohis evidently distinguished between “close” and “distant” relatives (consanguines only? or consanguines and affines?): viz., *fēti’i piri noa mai*, close relatives (E. Salmon 1937:29); *vaia’a*, distant, applied to a relation (LMS Dictionary). However, I can find no clues as to where the line was drawn.
- 4 In his discussion of birth rites Morrison asserted that they took place at the “Family Morai (of Which evry Family have one)” (1935:186). However, he did not explain what he meant by “family.” Further on he qualified this

- statement somewhat and added an interesting note about marae size: "Of these [marae] evry family of note have one of proportionable size to the Wealth of the Owner..." (p. 197).
- 5 'Ai'a appears to be cognate with Tuamotuan *kāinga* ("a homeland, inherited land; Lit. a place of eating. A heritage" [Stimson 1964:186]), and with Maori *kainga* ("place where fire has burnt, hence place of abode, etc; unfortified place of residence; country; home" [H.W. Williams 1957:81]).
 - 6 See also T. Salmon 1910:39.
 - 7 This does not mean that alienation in such cases was never attempted, or accomplished; actually something of this sort was successfully achieved by Pomare II (see volume 3), although the association in question went beyond kin-congregation ties.
 - 8 Moerenhout was referring to the natal ceremonies which he described on pp. 535-538 (vol. I).
 - 9 For fuller discussion of *hau*, see chap. 23.
 - 10 In general, however, turtles were reserved only for chiefs who held high-ranking Titles.
 - 11 According to Baessler (1897:252) the name of the marae's *ahu* was in some cases also added to the Title. This may have been so, but it does not necessitate acceptance of the rest of Baessler's view of the functional distinction between *ahu* and *marae*. (See chap. 7, this work.)
 - 12 See particularly Henry 1928:182-188; Handy 1930:22; Morrison 1935:101, 187; Panoff 1965:83; also see this volume, p. 739.
 In this connection Handy voiced the following qualification: "The *matahiapo*, or male first-born, was honored as the scion of the sacred line. (In general *matahiapo* signified first born in any family. Here I am speaking of the *matahiapo arii*, the first-born of the reigning Arii.) A first-born female could not be the *matahiapo*; but if her first-born was a son, he would be *matahiapo*. Upon the birth of the *matahiapo*, he was immediately recognized as the head, spoken of as the *pa'arae* (frontal bone) of his family, and his parent or grandparent, head until then, fell into the position of regent." (1930:24)
 - 13 See *puita'ao*, a relic; one that remains of a family, and becomes the heir (LMS Dictionary). Cf. Bligh 1789:II, 76.
 - 14 See also Moerenhout 1837:II, 13-15; Henry 1928:480-481; Morrison 1935:169, 187.
 - 15 As noted earlier, we do not know for certain what the connection was between this feast and "head freeing" (*āmo'a*), but I assume that an *āmo'a* was held at this time.
 - 16 Henry 1928:188-195; Davies, Youl et al., 24 May, 1806, LMS Archives.
 - 17 Handy 1930:86; Emory, Marae Traditions. According to verbal accounts given to Handy on Maupiti in 1923, one of the flanking uprights in a local marae was called *'iato* rather than *tarahu* (1930:105).
 - 18 I assume that the "hereditary names" alluded to in Henry's account of congregation fission (1928:142) symbolized territory entitlement and not the functions of an office, as herein defined.
 - 19 See also *tamahaea*, a person of roving disposition; a family that is disunited;

- fa'atupui*, the remaining one of a family or race, who is to keep it from extinction by becoming the root of a future progeny (LMS Dictionary).
- 20 See the legend of Pai, Henry 1928:310, 578 ff.
 - 21 For archaeological evidence bearing on these interpretations see Green et al. 1967.
 - 22 I use “source” instead of “parental” or “ancestral” in order to avoid prejudging the question of whether or not the Maohis did in fact conceive of the relationship in terms of descent. The Maohi label, *marae tupuna*, which I call ‘kin-congregation marae’, did in fact have the literal meaning of ‘ancestral temple’, but more in the sense of it having been the very own kin-congregation marae of its members and their immediate forebears than of it being the one from which their own marae had derived.
 - 23 ‘*Aufau* (a tribute or tax; a contribution; to pay a tax or tribute; to contribute property for any purpose) comes nearer to what I wish to express by “tax” than any other Maohi word listed and defined in the LMS Dictionary, but I have come across no textual uses of it bearing directly on the kind of transaction now under discussion. Moreover, the LMS Dictionary definition implies that an ‘*aufau* included only objects, whereas I am referring to services as well.
 - 24 For a discussion of the calculations on which this average generation length was based, see Emory, Marae Traditions, and S. P. Smith 1910. Regarding the Teraivetea marae listed on Emory’s chart, the only thing he says is that it was established on the north shore of Opoa Bay with a stone from Vaearai.
 - 25 De Bovis claimed that Hoataatama was a son of Hiro, and that another son remained at Opoa and carried on the sovereignty there (1909:9).
 - 26 Henry 1928:99; Emory, Marae Traditions; de Bovis 1909:44.
 - 27 In his meticulous survey of Greater Huahine, Emory discovered and charted remains of twenty-six other marae that he identified as *marae tupuna* (ancestral, family marae), for which, however, little or no traditional information has been recorded.
 - 28 Another and more extensive list of *marae ari’i* is given in the *Bulletin de la Société d’études océaniques* 1, no. 6 (September 1922):47–48. On it the marae are listed “in order of importance,” evidently based on information received by the editor from Marau.
 - 29 By Salmon’s time—that is, the latter half of the nineteenth century—perhaps the Maohi custom of transferring a Title soon after birth of its new incumbent had given way to European ways; at least, this is the only explanation I can offer of this un-Maohi generalization.
 - 30 For one account of events leading up to this shift, see Adams 1901:18–21; also, T. Salmon 1910:42–43.
 - 31 Another Title closely linked with marae Matahihae was Te arii na Vahoroa (Henry 1928:86). In fact it is not clear whether it was another label for the same office, or a differently Titled office usually held by the same individual.
 - 32 Four, actually, including another more recent addition which Emory believed was built to accommodate the Pare chief Pomare I.
 - 33 “The name of Marama belongs to four *ari* families who are closely related

to each other and their heirs alone have the right to be called by it. They are Terii-o-Marama-i-te-tauro-te-rai of Marae Tefano (Moorea); Te-iviniui-o-Marama of Anini, Huahine; Marama-toa-o-fenua-ura of Marotetini, Poropora; and Marama-o-moua-roa of Ahuroa, Mataiea, Tahiti." (Handy 1930:81)

- 34 I am at a loss to explain why the Title of this dynasty at Nu'urua is given as Punua i te rai atua, and not as Marama, in both Henry's survey (Henry 1928:70 ff.) and in Gunson's list of *ari'i rahi* Titles (personal communication).

CHAPTER 17

- 1 This is one of the reasons I am unable to utilize Panoff's definition of current kin-term usage given in his most interesting article, "La terminologie de la paranté en Polynésie: Essai d'analyse formelle," in *L'homme*, vol. 3 no. 4 (1965) pp. 60-87. Another reason is that my own observations in contemporary Tahitian communities differ in some respects from Panoff's; indeed, I found some local and even individual differences with respect to the usage of certain terms, e.g., *tae'ae* and *hina*.
- 2 In the article mentioned in note 1, Panoff also listed lineality-collaterality as a component of three currently used terms: *tua'ana*, *teina*, and *tae'ae*; but his analysis rests on a translation for *tae'ae* which I do not find substantiated in the sources on the ancient Maohi. Actually, about the only explicit reference I have found to "collaterals" as a distinct category of kin is in Henry's account of mortuary practices. According to her the *heva tupapa'u* for "a member of the royal family" was performed by "... the young men and lads of the collateral lines and of the retainers" (1928:293), which may simply have been Henry's way of specifying all young men in the vicinity save members of the deceased's immediate family.
- 3 "Genealogical level" is more appropriate than "generation" since the latter also connotes biological coevality (see Needham: 1962a). Behavioral norms associated with the Maohi terms do seem to be formulated on the assumption that persons occupying the same genealogical level will be approximately alike in biological age, but actual incongruencies were probably so numerous that the two attributes should be distinguished.
- 4 In other words, I cannot offer the Maohi data as evidence for *either* Lounsbury's or Leach's (and Needham's, etc.) opposing views concerning the "primary function of kinship terminologies." The function is in Lounsbury's words: "... to delineate the relation of ego to the members of his personal bilateral kindred in such a way as to express some socially and legally important aspect of each of these relationships. From the kindred, these terms can be extended and reextended till they reach the sky." (Floyd Lounsbury, "A formal account of the Crow-and Omaha-type kinship terminologies," in *Explorations in Cultural Anthropology*, New York: McGraw-Hill, 1964, p. 382.) For opposing views, see E. R. Leach, *Rethinking Anthropology*, London School of Economics Monographs on Social Anthropology, no. 22, 1961; and Needham 1962b.
- 5 A rare exception occurs in a missionary journal in the LMS Archives (Crook,

- for 27 June 1820) describing the care given to a high-born infant, the son of “King” Pomare II: “The infant was most of the day at our house with Pomare vahine [i.e., “Queen” Pomare], who is his nurse. Our daughter Mary is denominated his mother being the friend of the Queen.... The child is also called Mrs. C[rook]’s son, because she has the principal charge of it.”
- 6 For a metaphoric usage, see the following Tetunae precept: “‘Ia tura ite ta’ata te ‘Ai’a, te metua i fanau iā ōtou” (E. Salmon 1937:29). May the Homeland [‘ai’a], the parent which gave birth to you, be respected by the populace.
 - 7 “*Pattèa* is properly a word of endearment, equivalent to our *mamma*. This last the Tahitians likewise make use of in the identical sense that we do.” (G. Forster 1777:II, 91n.)
 - 8 Except qualifiers like *pitoho’e*: persons of one fraternity (LMS Dictionary), literally, “navel-one,” i.e., probably, “uterine siblings.”
 - 9 By natal parent I mean the female who gave birth to the individual, or the male who accepted social “paternity” of it shortly after birth—regardless of his known or suspected biological role in conceiving it. For “foster” and “feeding” parents, see pp. 701–702, this work.
 - 10 With a little “functionalist”-inspired ingenuity one could, of course, enlarge this list almost indefinitely; but these appear to me to be the most influential general factors (leaving aside factors of individual idiosyncracies, which resist generalization but which cannot be ignored in many of the particular family situations about which we have information).
 - 11 See also note on conception prayers in Wilson 1799, p. 336.
 - 12 See also *metuatavai*, a parent that adopts a child; *tamaiti tavai*, an adopted son, *metua fa’a’ai*, a nursing parent; *metua fa’a’amu*, the same as *metua fa’a’ai* (LMS Dictionary).
 - 13 In the middle of this range of practices was one alluded to in a memoir of Tati Salmon describing the alleged last “ceremony of ordination” for an *ari’i rahi* to have been held in Tahiti: “As the time approached [for the Title successor to be born], representatives from the different members of the family began to arrive to adopt the expected child according to old custom.” (1910:41)
 - 14 For example, the young chief Tu (Pomare II) was described as having been “adopted” by his “cousin,” Temari’i (Teri’irere), who was only some ten years older than he. In this connection we are told, “Between his natural father, Pomare [I], and his adopted father, Temarii, the young Tu preferred the latter, and sooner or later everyone knew that Temarii would help Tu to emancipate himself and drive Pomare from the island” (Adams 1901:122–123; see chap. 22, this work).
Maohi were also described as having “adopted” Europeans (see, for example, Corney 1919:183), a practice which will be described in another context.
 - 15 It will also be recalled that Henry described sorcerers as “adopting” the spirits who served as their “fetchers”: “The magicians adopted them as sons and daughters, carefully observing the prestige of their different ages and addressing them accordingly” (1928:203).
The sorcerers were known as their fetchers’ *metua-tahutahu*, and addressed them as *ta’u tamari’i* (my children) (Henry 1928:204, 207).
 - 16 One of the few indications I have found that fosterage involved special behavior

is a passage in Orsmond's unpublished notes on the Arioi sect. The passage in question occurs in a section dealing with the special clothing worn by Ariois, and it describes one such costume worn by novices (in this case, *hua pipi*, fatted creatures) as the one having been given them by their *metua pori i fa'a'amu*, the parents who fed them to make them fat. (Orsmond: Arioi)

- 17 In his perceptive study of fosterage in a modern rural Tahitian community, the anthropologist-psychiatrist Levy has advanced beyond a suggestion originally made by Firth (1936), to the point of stating that "relationships between *all* parents and children are [seen by Tahitians to be] conditional," whether based on descent or fosterage (this is seen to be contrasted with the Western view that such relationships are "categorical"). In other words, it is the history of the relationship, and not an ideological generalization about the absolute rightness of the descent-based tie, that determines the quality of the specific "parent-child" relationship. (Levy 1970)

We have too little relevant data on the ancient Maohis to allow us to test this intriguing notion. My guess, however, is that if Levy's hypothesis were applicable, it would have been so among families of inferior social position. Among those of superior social position, where important goods were transmitted by "descent" and where much pride was manifested in pedigree, I suggest that "parent-child" relationships based on "descent" were viewed as being more "categorical." (This does not mean that such relationships were inevitably affectionate, but rather that they were not viewed indifferently.) In support of Levy's analysis of the modern Tahitian institution, it should be noted that the ancient Maohi preoccupation with Titles and pedigree has almost completely disappeared.
- 18 Again those readers who are skeptical of the relevance of myths to an understanding of how the Maohis conceptualized social relations should recall that, according to my formulation of "social structure," even if there were little or no congruence between myth and norm, or myth and current historical events, the very fact that myths were told and retold (the only way they were able to survive in this nonliterate society), and presumably believed in by some individuals, makes them a part of the society's concept of the possible. Actually, I suspect that the continuous retelling of a myth does usually indicate *some* congruence between it and actual practice, or between it and norm, either approbative or disapprobative—for example, a story about attempted patricide (of which there are several) may not by itself imply either approval or disapproval of the act, but it does at least imply an interest in the relationship so involved. In contrast, I know of no Maohi stories about attempts to kill, say, a mother's brother.
- 19 I shall not enter into a controversy concerning the precise nature of the relationship between Maui and the sun; suffice it to say that in this particular account the latter is referred to as "his parent" (*tona metua*).
- 20 *Ta'u tiare 'apetahi'oe*, which is defined by Henry (1928:61) as a term of endearment for "... a darling child or loved one," would appear to have a broader application.
- 21 De Bovis' statement implying that all marriages required also the approval of "the local chief" is probably too far-reaching (1909:32).

- 22 A historical exception was recorded in the case of the youth who was obliged to withdraw from his union with an “aunt”—i.e., a “mother.”
- 23 Some of the obscurity enveloping the term *taea'e* undoubtedly derives from its literary enshrinement in earliest translations of the Bible by missionaries who required a native term for the biblical “brethren.” After a generation or two of Bible reading it would have been surprising indeed to find any Maohis aware of all older meanings of the term. (See also Burbidge 1930:267)
- 24 See also a usage recorded by Orsmond (Arioi texts), *taetaea'e arioi*, which he or some subsequent editor translated as “the fraternity of Arioi.” But see Marau’s terms, under my discussion of *tua'ana*.
- 25 See, for example, *pito'ho'e* (*pito* the navel; the navel string), persons of one fraternity, i.e., uterine siblings (LMS Dictionary).
- 26 See, for example, Henry 1928:474.
- 27 Handy’s definition of *matahiapo* reads as follows: “first born, male or female. Also applied to all representatives of a family stock descended in the line of first-borns. Thus, if I belong to a *matahiapo* family it means that at least one parent was a first born right back to Taaroa. My first born will carry on the *matahiapo*. All others are *teina*.” (1930:23)
- 28 A character in the legend of Rata addresses his wife, who was not recorded as having been a consanguine as well, as “... my *tuahine*” (Henry 1928:470), but I believe this usage to have been uncommon and probably derivative.
- 29 This was the Hema who was also favored over his elder brother as a consequence of having deloused their mother, a chore which the elder brother disdained.
- 30 One possible “functional” explanation for this featuring of a younger sibling’s greater strength and skill might be put as follows: If Maohi descent-based kin-congregations had branched off in a consistently seniority-based manner, and had been intra-and inter-structured entirely on a seniority basis, then one would be inclined to expect an oral literature consistent in its preoccupation with strong, talented, and so forth, firstborns. Since, however, kin-congregations did *not* consistently branch in this manner, and were *not* always so structured—that is, since younger siblings were often in fact more enterprising and more influential than their elders—the oral literature served not only to reflect such circumstances, but to help institutionalize them as well.
- 31 According to Handy (after Marau) there were two other terms used for “grandparents”: *hanahana*, “the grandmother was *hanahana* of the child (used by Hui Arii only),” and *ti'itae*, “the grandfather was *ti'itae* of the child (Hui Arii)” (Handy 1930:23). The LMS Dictionary definitions of these words strongly indicate, however, that they were not kin terms as such: *hanahana*, splendour, glory, awfulness; *titae*, a parent, a term of endearment used by a child for his father or mother.
- 32 The LMS and Jaussen dictionaries have *hinerere*, which is incorrect.
- 33 See Panoff 1965. The LMS Dictionary entry, “*ruahine'aimamau* [literally, old woman-or goddess-food-abundance-of], a female ancestor of the third generation back, and who takes care of her posterity,” is found in no other source and is perhaps too specific to have been a general kin term.
- 34 I refer to the timing of kin-Title succession, whereby the society’s most honored

statuses were held by individuals of the younger genealogical levels. Something of the same notion was expressed by Panoff, who, however, emphasized the more tangible side of the transactions involved: “Autrement dit, la langue situe le sujet parlant, d’une part, en face de ‘vieux’ et, d’autre part, en face de personnes qui sont distinguées selon qu’elles sont des conjoints possibles ou interdits et qu’elles sont ou non des héritiers. *Tout se passe donc comme si les Polynésiens ne se préoccupaient des différents status que pour les transmettre à d’autres et non pour les acquérir eux-mêmes de ceux qui les détiennent.* Ce n’est sans doute pas par hasard que ces sociétés ont un terme spécifique pour désigner ceux de leurs membres qui, bien que considérés comme adultes (soit à partir de l’âge de 15 ans environ), n’exercent pas encore de responsabilités: les mots tahitien *taure’are’a* et futunien *tauleleka* s’appliquent aux hommes qui n’ont pas encore fondé de famille et ne sont donc des ‘vieux’ pour personne.” (1965:84, italics in original)

CHAPTER 18

- 1 According to the LMS Dictionary *ture* was derived (presumably, under the influence of the missionaries) from Hebrew *torah*.
- 2 The expression “tainted the blood” is, of course, a translation, and evidently a very loose one. We are not given the words used in the original Maohi text, but suspect that ‘taint’ is less appropriate a gloss than, say, ‘adulterate’. For “explanations” in physiological—or psychical, or mystical—terms of this proscription see chap. 13, section on conception.
- 3 In the legend of Taruia of Tahiti, translated into even more sugary prose, the handsome young hero wins the maiden’s affections and hand in marriage despite the seeming disparity in their family positions (she is the daughter of a “king,” and he the son of a petty chieftain), and in the face of a rival of “royal” status (Henry 1928:623–632). Evidently the disparity was less than would appear—or perhaps some European romanticism has crept into the retelling of the story.
- 4 *Pu’e* appears to have had the same usage as *hui*, although in modern Tahitian it is more conventional to speak of *hui ari’i* and *pu’e ra’atira*.
- 5 See chap. 16.
- 6 LMS Dictionary; Jaussen 1898:94; Handy 1930:7; Beaglehole 1955:134; etc. Adams, purportedly paraphrasing Ari’i Ta’ima’i, wrote: “We believe ourselves to belong to the great Aryan race—the race of Ari’i—and our chiefs were Ari’i, not kings” [!] (1901:7).
- 7 Taraho’i was the principal marae of Pomare’s home district of Arue.
- 8 For an account of the offspring of misalliances, see section on recruitment, this chapter.
- 9 See T. Salmon 1910.
- 10 De Bovis identified *‘iatoai* with “tuuhou,” stating that the former was the label used for these “nobles” in Tahiti and Mo’orea, and the latter in the Leewards (1909:18). If “tuuhou” was his rendition of *to’ofa*, then his explanation is made dubious by the circumstance that Morrison, whose ex-

- perience was on Tahiti, used only “towha.” Moreover, de Bovis’ “tuuhou” is suspiciously close to the LMS Dictionary entry, *tuhou*, a novice, a newcomer; young, inexperienced. See also Handy 1930:90.
- 11 *Te’a* (also *teatea*) is defined in the LMS Dictionary as “white.” In modern Tahitian, *te’a* covers a wide spectrum of colors from white to light yellow, as it probably did in the past; but since most of the sources translate it as “yellow,” I follow that convention here.
 - 12 See chap. 3, and Henry 1928:338. Also, according to Henry, “The ‘*ura* girdle was an emblem of the aurora in the sky” (1928:192).
 - 13 Handy 1930:85. See also Henry 1928:403.
 - 14 For example, the opening line of a prayer states: “Tahiti’a mai, e te Atua, tohiu maro e, i tohiu tahu’a nei. Hearken, O god, inspirer through the loin girdle, to thy body of priests!” (Henry 1928:199.) For parallels in other Polynesian societies, see E.S.C. Handy 1927:143ff.
 - 15 For an excellent Polynesia-wide study of this topic, see Luomala 1951.
 - 16 See Luomala 1951:55; de Bovis 1909:22.
 - 17 According to the LMS Dictionary a second meaning of *ra’atira* was an officer on board a ship; but this may be a post-European accretion.
 - 18 It is likely that Ellis’ acreage figures referred to the missionary period—that is, after 1798—by which time most surviving units’ landholdings had increased in size as a result of the radical depopulation that had taken place between 1767 and then.
 - 19 “Capite ... occurring in *tenere in capite* to hold (of the king) in chief; whence *tenant*, *tenure in capite*, and *capite* in Law Dicts, as the name of a tenure by which land was held immediately of the king or of the crown” *Shorter Oxford English Dictionary*.
 - 20 The problem of identifying the referents to this term is complicated by the fact that after 1815, when all of Tahiti and Mo’orea became subject to Pomare’s rule, it became fairly common to apply the label *ra’atira* to all other (subtribal) chiefs, on the basis that the only *Ari’i*—that is, *Te Ari’i*, *The Ari’i*—was the monarch himself (or, herself). At the same time, *hui ari’i* continued for a while to be applied to members of that hereditary class.
 - 21 Nothing is reported, however, of the class to which such ‘Oro progeny were assigned.
 - 22 In all specific evidence on formal “adoption” (*tavai*) that I have discovered, the foster parents and child were of the same class, and the same situation prevailed in most instances of bond-friendship.
 - 23 E.S.C. Handy’s comprehensive theory of Polynesian racial-cultural history was put forward in his *Polynesian Religion* (1927), which postulates an (Asiatic) Indian source for the first wave to populate these Islands, and a South China source for the Ta’aroa-worshipping, second-wave Hui Ari’i.
 - 24 See, Henry 1911; T. Salmon 1910; Emory, *Marae Traditions*.
 - 25 But, in a criticism of Handy’s specific interpretation, Piddington (in Williamson 1939) appears to have accepted a modified “conquest” theory to account for Ra’iatea’s so-called social superiority over Tahiti-Mo’orea. He stated that “There were, of course, recorded instances of successful invasion—for exam-

- ple, the conquest [?] of Tahiti by people from Ra'iatea" (p. 225). About the origin of the *manahune* he said, "It seems much more probable to the present writer that the Tahitian *manahune* were simply an accumulation of people vanquished in successive wars; flight to the mountainous interior was the obvious course for such unfortunates, while the visitors appropriated the more desirable land along the seashore" (p. 226n1).
- 26 I draw attention to a statement by Ellis quoted in chap. 16, this volume, that the custom of early succession to "titles and offices" was characteristic of members of both *ari'i* and *ra'atira* classes (Ellis 1829:II, 347).
- 27 For example: *tupuari'i* [*tupu*, to grow], a fine grown person (LMS Dictionary). "The Chiefs are in General taller, stouter and of a different appearance from the Common People and their Weomen are also larger and fairer then the lower Classes" (Morrison 1935:169). Cook, in writing of the Marquesans noted: "The men are in general tall, that is about 5 feet 10 inches or six feet, but I saw none that were fatt and lusty like the Arees of Otaheite" (Beaglehole 1961:374). And, with undoubted exaggeration, Bonocorsi wrote of *ari'i*, that they "are all stout, some to ungainliness, so that they have two Indians constantly kneading their legs and even then are scarcely able to stand upright" (Corney 1915:55).
- 28 There may indeed have been some basis to this alleged class difference in body odor—i.e., *ari'i* women were undoubtedly better able to avoid dirty and sweaty work and to indulge themselves in frequent bathing and fragrant cosmetics. See also the alleged social distinction attached to long fingernails: chap. 6; G. Forster 1777:I, 283; J. Forster 1778:271.
- 29 Moerenhout implied, and Rodriguez stated, that only *ari'i* practiced archery (Moerenhout 1837:II, 148-150; Corney 1919:45); but other reports imply that non-*ari'i* also participated (e.g., LMS Transactions).
- 30 See also Beaglehole 1962:I, 337, 338; Henry 1928:286-287; J. Forster 1778:415; Ellis 1829:II, 179-181; Bligh 1792:153.
- 31 See also Bligh 1792:156, 158, 159b, 160. Bligh's is the only description I have found concerning kava-drinking etiquette, which constituted important facets of social stratification in Samoa and Tonga.
- 32 A marginal supplement to this passage adds "... which we were likewise liable to misunderstand" (Beaglehole 1961:424n3).
- 33 Cf. Henry 1928:201: "Kings, noblemen, and plebeians, according to their capabilities, were food-gatherers, fishermen, planters, and menial servants to the gods."
- 34 The reference was to the legend which identified Tahiti-Mo'orea with a "fish," a part of Ra'iatea separated by an act of sacrilege, and on which no *ari'i* at first resided.
- 35 One of the preceptual admonitions addressed to an *ari'i* reads, "Eiaha te upoo ia taea i te horomiri *ate vahine Puti*, e oro to upoo e au i nia ia ratou" (E. Salmon 1937:23). Handy translated this, "Allow not your head to be touched [stroked] by the hands of *the woman of low birth*. Your head does not belong to them." (1930:41.) But I have found no other occurrence of *Puti*, for this or any other meaning.

- 36 I emphasize the ideological—"suppositional"—nature of this statement; in actuality—i.e., "historically"—it was only partially valid.
- 37 But see the exception reported in chap. 20; also in Morrison on visiting (1935:190).
- 38 I do not know whether respectful deference had anything to do with the matter, but an account of a football match between Greater Huahine and Lesser Huahine, in 1809, does imply that class differences in behavior carried over even into games. "The people as usual on these occasions [i.e., a large public-house thatching party] are feasting, drumming, dancing wrestling &c. Twice today they have been near quarreling, they were divided into two parties, Huaheine rahe & Huaheine ete. The wrestlers of Huaheine rahe beat those of Huaheine ete & they in their turn got the better of Huaheine Rahe in kicking the foot ball but there was no fair play the Chiefs being in the party of Huaheine Rahe." (Davies, Journal, 14 June 1809, LMS Archives)

CHAPTER 19

- 1 As far as I can discover, ancient Maohi society had not yet begun to harbor the kind of husband-"male wife" (*mahu*) domestic establishments to be found occasionally in modern Tahiti.
- 2 Although some of the sources do so imply (e.g., Morrison 1935:185& Bligh 1792:II, 152).
- 3 Also, although I have presented a hypothesis concerning the meaning of the *āmo'a* rite accompanying some (or all?) nuptials (see chap. 13), I cannot be certain that my hypotheses is the right one.
- 4 In this connection in Henry's version of the marriage of the god 'Oro to the Porapora maiden Vairaumati (an event that led to the founding of the Arioi sect, as will be discussed in chap. 22), the following passage appears: "Soon afterwards, their marriage took place, the bride having many valuable gifts for the occasion, while 'Oro, who had nothing terrestrial to present, was at a loss to know what to do to save himself from ridicule on such an occasion" (1928:232).
- 5 Rey-Lescure distinguished between *hoa* and *vahine*, the former being "wife" and the latter "concubine," or "woman, in general" (1947:286). This corresponds to "respectable" modern usage, but whether it prevailed among the ancient Maohis is not known to me.
- 6 See chap. 15. The only Maohi word or phrase I can find approaching English "drudgery" or "menial" was *haupau*, to toil, to work hard (LMS Dictionary), which does not appear to have carried the additional meaning of "ignoble." In terms of the *ra'a-noa* contrast, and of the generally higher social valuation accorded many exclusively male activities, it could be suggested, perhaps, that women's work was more "ignoble" than men's; but that kind of comparison requires a better knowledge of Maohi mental attitudes than I possess.
- 7 While de Bovis did not specifically characterize wives as "slaves" of their husbands, he did imply something of the same thing when describing their various jobs, eating arrangements, and ritual restrictions. By his own stan-

- dards such customs may have been considered to be “exploitation,” but it is questionable whether the Maohis in general, or even Maohi wives, considered them to be such.
- 8 Whatever the immediate motive for such wifely actions, saving the corpse from sacrifice did have the practical effect of sparing other family members, including the wife, from the threat of future sacrifice.
 - 9 The cases of so-called altruism described earlier may also be viewed as episodes in a chain of exchanges, although the narratives in question do not characterize them in these terms.
 - 10 In several of the stories that appear only as “translations” in her *Ancient Tahiti*, I suspect Miss Henry of having taken some rather over-romantic, un-Maohi liberties with the original text; but I reproduce them just the same for want of the original texts themselves.
 - 11 For example, Crook recorded in his journal of March 1824 that “The wife of our principal Chief has taken a fit of jealousy, causelessly as far as we can learn and has caused some disturbance. This we find has frequently been the case.” (20 March 1824, LMS Archives)
 - 12 See also the following observation by Bligh: “The infidelity of a Wife, any further than the husband permits or approves, is considered whoredom and punishable by himself; but while he approves of the Man she is connected with, they may Sleep under the same roof, so that it is not uncommon for a Husband with his three Wives to sleep on the same floor, and they with their Gallants” (1792:152).
 - 13 Moerenhout’s visits to Tahiti extended over the years 1828 to 1846, and one cannot always discern whether his generalizations referred to that era or to former times, or both. His reference to husbands prostituting their wives for money applied mainly to the Early European Era, but I am inclined to accept his major thesis as applicable to both. Leaving aside the chaste romanticism of some of Henry’s translations, Moerenhout’s unvarnished appraisal is confirmed by most of the earlier observations as well.
 - 14 See also Ropiteau (1932:124-125) concerning Hotuhiva, and the LMS Archives, Journal of Elder and Wilson for 10 July 1803 concerning a runaway wife.
 - 15 Andrew’s more recently compiled dictionary gives the following: ‘*aupuru*, parents of a married couple (‘*au*, plural; *purua*, parent); ‘*apuru’a*, parent by marriage, father- or mother-in-law; *purua*, parent-in-law (cf. *puru*, protect).
 - 16 Handy listed this as *tauete*, and *ho’ovai* as *ho’oai*, on the authority of Marau (1930:23).
 - 17 The Burbidge grammar-vocabulary also lists the following:
 - Man speaking: elder brother’s wife, *tua’ana vahine*.
 - Man speaking: younger brother’s wife, *teina vahine*.
 - Man speaking: sister’s husband, *tuahine tane*.
 - Woman speaking: brother’s wife, *tu’ane vahine*.
 - Woman speaking: elder sister’s husband, *tua’ana tane*.
 - Woman speaking: younger sister’s husband, *teina tane*. (1930:269-270)
 These are evidently modern usages; they may also have been current in

ancient times, but I have not come across them in texts originating in earlier eras.

- 18 Included under my unfelicitous label *semi-marriage* are those types of heterosexual union lacking one or more of the features by which I—and to a certain extent the Maohis themselves—have identified “marriage.” See definitions at beginning of this chapter.
- 19 The meaning assigned to *tiupoorua* (*ti upo’o rua*) is a *ti* root out of which grows two stems; *fig.* a person who has beside his wife, another secret one (LMS Dictionary). A union would not be a marriage (in the sense we use the term) if it were wholly secret, and hence this must refer either to a man with a secret mistress, or to one who had entered into two recognized marriages in places far enough apart to preclude such information from passing between them.
- 20 The LMS Dictionary translates *ha’apae*, to put off, lay aside; to divorce. Lacking textual examples I cannot, however, discover whether this meant mere separation, or final divorce, or both. More poetically, in his plaint at being deserted by his mistress (wife?) Moanarai refers to her as having “cut the umbilical cord” (Alexander 1893:56).
- 21 For example, the “queen” in the legend of the king’s favorite eel remained married to her wicked husband even after he had gratuitously slain her grandparents (Henry 1928:619).

CHAPTER 20

- 1 *Hoa* may have had the general, informal meaning of “companion,” inasmuch as it is used in modern Tahitian not only for friend, companion, even acquaintance, and (in church parlance) for spouse as well; but modern usage is no guarantee of pre-European meaning (Finney 1964a). G. Forster’s characterization of “king” Pomare I’s *hoa* evidently had reference to the latter’s personal retinue and not to the kind of friendship pact now under consideration: “The only person exempted from the general custom of uncovering the shoulder was the king’s *hoa*, one of his servants, whom we could not better compare than to the lord in waiting, and of whom we understood there were twelve who officiated by turns. Some of them were the same gentlemen who had displayed their dexterity before, by dealing out hearty blows to the crowd.” (G. Forster 1777:I, 328)

In a passage regarding a woman who saves a slain warrior from being used as a sacrificial victim, Henry wrote: “... the good woman who [thus] interposed became a *taua* (bosom friend) of all his family ever afterwards” (1928:311).

- 2 The ceremony of “friendship” observed by Bligh and labeled by him “Erow-wowah” (*rauava*—i.e., miro leaves; Bligh 1792:137b-138) seems to have been concerned more with intertribal alliances than with interpersonal friendship of the type now under consideration, although the two types of relationships did of course overlap. See chaps. 13 and 23.
- 3 Gunson (1964) distinguished dichotomously between *taio* pacts and what he

- labeled “friendship nuptials,” but I believe we are concerned here with a more or less continuous series of contractual relationships, with or without *āmo’a* rites, rather than with two contrasting types.
- 4 The Lieutenant Corner referred to had visited Tahiti in 1791 on the *Pandora*, to capture the *Bounty* mutineers.
 - 5 Parkinson 1773:68 and Corney 1919:6.
 - 6 The case of Stewart, one of the *Bounty* mutineers, may have been an exception to this, but the matter is not altogether clear. Stewart was “married” to the daughter of a man described as being “... of great possession in landed property, near Matavy Bay” (Edwards and Hamilton 1915:106). At some point Stewart and the man interchanged names, but whether before or after the “marriage” is not specified. It may be of course that this relationship was conceived less in terms of “friendship” than of “fosterage,” as was the case of Pomare II’s fosterage of a prospective son-in-law.
 - 7 The date of this incident was 1826—some eleven years after Tahiti’s “Christianization”—but I include it on the assumption that this kind of social relationship had not been radically changed as a result of European contact.
 - 8 See also Morrison 1935:237; Adams 1901:24; and Ellis 1829:II, 369.
 - 9 Ellis emphasized the privileged nature of the friendship pact in a passage on conjugal “jealousy” quoted in chap. 19.
 - 10 The original text of this version (which I cannot locate) was evidently recorded by Orsmond in 1830. My rendition is based on a French translation of Orsmond made by Ahnne.
 - 11 In her survey of Tahiti’s districts, Henry made the following reference to Raure’a: “Hina-rau-re’a was the most famous surf rider of [Mahaena]; she was the wife of Turi the demigod” (1928:72).
 - 12 This assertion, like many others made by Morrison is so very categorical that it can be taken, I suspect, as reflecting Maohi *norms* rather than invariable practice.
 - 13 This qualification was also expressed by Dr. Gunson in a personal communication to me.

CHAPTER 21

- 1 “All the trouble of breeding, bringing up, and fattening the hogs is allotted to the lowest class of people” (G. Forster 1777:I, 315).
- 2 “The Low-Islands have a race of dogs with long white hair, which the natives employ in fringing their breast-plates or war gorgets; and these low islanders cannot cultivate the mulberry-tree on their sandy, barren ledges of lands, which includes their salt lagoons; therefore these reciprocal wants, form a kind of commerce between the inhabitants of the high and low islands, and a mutual exchange of superfluities.” (J. Forster 1778:366.)
- 3 Also it is suggestive, although of course not decisive, that in another nearby Polynesian society *tapairu* designated females of high birth (Barthel 1961). In this connection, the wicked maid-servant in the legend of Huriitemonoi—the one who attempted to usurp her young mistress’s position—could not have been a *tapairu*, as I imagine the status to have been.

- 4 Adams described jesters as “a class of men much petted and allowed many liberties by all Arii. Among other privileges, they were always in the habit of receiving some of the best shares in distributions of food by the Arii.” (1901:78)
- 5 As noted earlier, it was not unusual to find young men of superior social position, even including “Young Brothers of Chiefs” (Morrison 1935:167) working as servants, but whether these also were labeled *teuteu* is not certain.
- 6 While too few manifestations of Maohi “trance” behavior have been recorded for comparison, there are nevertheless some suggestive similarities between it and certain other characteristic forms of dancing, anger and grief display, and even copulation—all of which contained elements of “frenzy.”
- 7 One exception is a passage in Davies’ journal, quoted earlier, in which the god Tane, speaking through a *taura*, admonished the chiefs “to leave this part of the Island [Huahine] with the Uru [breadfruit] &c. for the gods and the Priests” (13 January 1808, LMS Archives).
- 8 According to the Spaniard de Hervé, “Each District [of Tahiti] has but one *Pure* [*tahu’a pure*], and one *Eri* [*ari’i*] or Cacique” (Corney 1913:357), but this is obviously an oversimplification, based on slim information.
- 9 Turnbull 1813:365; see also Morrison 1935:180.
- 10 I cannot account for the fact that the Orsmond text quoted earlier singles out *ōpū nui* (rather than, say, priests in general) as one of the four categories of “specialists,” along with *ari’i*, Arioi, and fishermen.
- 11 In some contexts *’aito* and *toa* appear to be synonymous—both, in fact, being metaphors for the *’aito* (or *toa*) tree, the hardwood (casuarina) favored for weapons. In other contexts *toa* appears to refer to fighting men in general, and *’aito* to warrior-champions. For example: “*Tia maira te reira tau toa, mai tana raau, e haari ta te taata haere noa, e omore ta te taata aito ra.* And each of those warriors stood with his weapon of wood, the simple followers had coconut clubs, the heroes had spears.” (From the legend of Honoura, Henry 1895:283.) But against these alleged semantic differences are assertions, by Ahnne (1926:9) and M. Salmon (1927:264), that *’aito* was simply a substitution for *toa* (an example of the custom of *pi*) following upon Pomare I’s name change to Vaira’*atoa*.
- 12 A line in a *rauti* chant reproduced in Henry equates *’aito* with *ra’atira*: “*E pu’u te ’upo’o o taua fare ’aito ra.* Bumped will be the heads of the warriors of that [enemy] camp. *I te ’omore nei e tahe te roi mata o te ra’atira ra.* From these spears those gentlemen’s tears will flow.” (1928:309)
- 13 See also note 11, above, which reproduces the text describing common fighters as fighting only with coconut-wood weapons, and *’aito* with *’omore*.
- 14 Bligh reported having attended a *heiva* given at a chief’s direction to honor one of his warriors “that had been at Morea and was used ill, and which caused a battle between the parties concerned” (1789:II, 61). See also the following excerpt from a *rauti*’s battle chant extolling scars of battle: “*A motu na te ’iri, e tihī tau tana.* If the skin get cut, it is a professional ornament” (Henry 1928:307).
- 15 See also *pā’aiea*, mature, grown to perfection, as a plant; well informed or skilled, applied to a person. (LMS Dictionary)

CHAPTER 22

- 1 For additional references to these ascriptions, and for a general discussion of the Society Islands' pantheon, see Williamson 1937.
- 2 Henry 1912:xxx, 77; Moerenhout 1837:I, 257. See also Williamson 1937: 47-48.
- 3 See Williamson 1937:51-54, for a survey of beliefs and practices associated with Tane. Williamson proposed that Tane was tutelary of Tahiti's Teva (among other so-called clans), and his arguments are no more implausible than most such inferences drawn from Maohi myth (1924:218 ff.).
- 4 This is Lavaud's rendition; I do not know what the original was, but it is unlikely to have been a word meaning "color."
- 5 This is contrary to Mühlmann's curious conclusion (1955:169), which was based on the same versions cited here.
- 6 For example, see Henry 1928:304, 322.
- 7 It is interesting to note that Ta'aroa the Father is described in this and other cosmogonic myths as having continued to be "more important" than his offspring, contrary to Maohi notions about succession to human kin-Titles, wherein an heir to a Title superseded the parent-incumbent upon birth, at least in terms of ceremonial prerogatives.
- 8 Probably, Ha'oa'oa. These two also appear as 'Oro's sisters in the Orsmond-Henry version of 'Oro's birth, which may be explained by the fact that Tahiti was the source of both these accounts.
- 9 The original text from which Henry prepared this version has also been translated by Ralph White, who, characteristically, took fewer liberties with the text than was the practice of Miss Henry. If our interests here were mainly linguistic I would reproduce the White version, but since the narrative itself is what most concerns us now I choose Henry's. In any case, as White himself acknowledged (personal communication) so much of the original Orsmond-recorded text is in words long since forgotten, it is difficult to judge which of the alternative translations is more "accurate."
- 10 Attempts to etymologize 'Oro end up as indecisively as most such efforts involving unphonemicized and uncontextualized Polynesian words. See for example, Andrews and Andrews (1944), "'oro, a person, man; affection, desire; vibrate, shake; etc."; also Kooijman's proposal (based on Williams) of a correspondence between Maohi 'Oro and the Maori god, Koro, "who was the teacher of dancing and the god of desire" (1964:123). Handy identified 'Oro as "the god of fertility"—the Maohi equivalent of Rongo in New Zealand and Lono in Hawaii (1930:61)—while the missionary Davies identified him as a "deified man" (Newbury 1961:65).
- 11 Again, I call attention to the problem raised by Maohi beliefs regarding the phenomenon of a god's capability of being simultaneously in several places (e.g., in *ata*, in human oracles, in images). Are we dealing here with a single deity capable of omnipresence, or with a whole category of more or less identical deities or of the many attributes of a single god (as was the case, for example, with the Olympic pantheon)? Unfortunately, I know of no way of

answering this question in terms of Western logic; as for Maohi logic, there is no evidence that this question ever arose!

- 12 *To'o* of this general form varied in length from six to eight inches to as many feet (Ellis 1829:II, 220-221), but all those believed to have been identified with 'Oro himself were among the longest known. For a useful study of such images, including photographs and descriptions of most surviving specimens, see Kooijman 1964.
- 13 Some writers have proposed that 'Oro's first foothold in Tahiti was at Atehuru, and that the attribution of priority to Tautira was a device to strengthen one dynasty's claims to preeminence.
- 14 According to Henry, all marae dedicated to 'Oro had stones shaped into the likeness of turtles incorporated in their walls. Also, Green and Green (1968) suggested that their type III M marae were identified particularly with 'Oro; if so this would represent a most significant development, and perhaps not a unique one—i.e., the association between a new religious movement and an innovation in architecture.
- 15 An interesting example of the imputed rivalry between these two gods is found in Davies history, under the date of June 11, 1802: "News having been brought from Moorea, that war had commenced there, some of the people (*Teioinia [te i'o i ni'a]* that is of Afareaitu and neighbourhood) had rebelled against the king's government. In consequence of this, as well as the state of things at Tahiti, eupootami [*e upo'o tama'i*] or council of war was held when two men pretended to be inspired, one by Oro and the other by Tane, they disputed for some time, at last it was agreed to send over a party to Moorea to assist the king's friends. This was done, and tho' several had been killed, peace was soon restored there." (Newbury 1961:52)
- 16 According to de Bovis, Orotetefa, who was considered "the founder of the Arioi sect," was member of a *maro te'a* family (i.e., an *ari'i*) associated with Porapora's Vaiotaha marae. "It is said that he was a *varuaino* (wicked spirit), which is to say that he was an individual possessed by some god." (1909:36)
- 17 It is, of course, not unlikely that some of the imputed kin-relationships among gods that I have been listing represent syncretisms, in kinship idiom, of previously "unrelated" mythical personages. And it is possible that some of the attributes, functions, and manifestations imputed to 'Oro represent assimilation of attributes, etc., once associated with other gods. (See for example, Handy's notion about Ro'o having become 'Oro [1927:109].) I am concerned here, however, with more recent, better circumstantiated instances.
- 18 Williamson 1924:208; Lesson 1839:400.
- 19 Some skepticism undoubtedly prevailed in this society, and there were probably wide differences of opinion concerning the relative powers, etc., of individual spirits; but I hold it to be highly unlikely that any eighteenth-century Maohi questioned the existence of 'Oro. Indeed, events indicate that this god inspired more fear than most.
- 20 But see de Bovis on this subject: "Close by [some of] the principal marae associated with 'Oro worship were to be found ones of secondary importance

- consecrated to the god Tane, and it was to these latter that they carried the bodies of human sacrificial victims after these had been offered to 'Oro. I am even led to believe that every marae's charnel-house was specifically consecrated to Tane, who seems to have thrived on corpses." (1909:44)
- 21 In Orsmond's Arioi text they are referred to as a "fraternity," *taetaeae Arioi*.
 - 22 Many other visitors to the Society Islands, and several other ethnologists, have written descriptively or interpretatively about the Ariois—including Rivers, Bastien, Webster, Schurtz, von den Steinen, and Frazer. The monograph *Arioi und Mamaia*, by Mühlmann (1955) is by far the most comprehensive and detailed study to appear so far, and while I do not agree with all the author's interpretations I have leaned heavily on his work for many ideas and references. In this connection, however, Mühlmann's synthesis is disadvantaged somewhat by his lack of access to such works as Bligh's journal of his second "Breadfruit Voyage," Morrison's journal, and unpublished records of the London Missionary Society.
 - 23 Compare Miss Henry's rendition of this text with the following, which accompanies Orsmond's text itself: "O Fare, o God—be propitious to us, here is a pig for you, here is cloth, cloth for our festival of the comedians party. This is your share. Conduct us to the shore to which we are going, Give us a fair wind, a true East Wind. An impelling fire astern that we may sail with the softness of oil and the ease of a bed, Drive far away oh God the whistling in our senet. In to the harbour Farerea of Huahine, direct us, let us not stray away in the deep, but go fare to the land we purpose; compassionate your free adherents, but abandon us not, let no ill fame follow us."
 - 24 The text on which Henry based her account also contains a section which White (personal communication) has translated as follows: "And in the lands where there are no chief players, they [the offerings] are to be borne to the *ari'i's* marae. For every ten canoes there is to be one thank offering. The person to whom the fleet belongs is to bear the gift. The players accept gifts. Lone uninvited visitors who drop in must bear their own individual gifts to the marae. The person who came hither to that country was to be fed and food taken to him, and gifts too for the members of the fleet."
 - 25 See G. Forster 1777:II, 128; and Beaglehole 1961:415. In addition, Moerenhout reported: "According to tradition some of the expeditions originating in Ra'iatea, Huahine, etc. included as many as 150 boats, each carrying rarely less than 30-40 persons, and sometimes up to 100. Natives still recall festivals where more than 1000-1200 pigs were butchered." (1837:II, 132-133.) In contrast, Bligh reported seeing a group consisting of only fifteen who had traveled from Ra'iatea to Tahiti in one canoe (1792:175b).
 - 26 This derives from Moerenhout's version; in the Orsmond version of the myth these two were designated, respectively, "the sacred pig for the arioi" and "the pig brought from far distant places to 'Oro."
 - 27 *Hi'o niao*, to scrutinize to find defects (LMS Dictionary).
 - 28 In taking this position I differ from Mühlmann, who stated or implied that public entertainment was an almost exclusive specialty of the Ariois.
 - 29 An assertion by surgeon Ellis, quoted earlier, contradicts the missionary Ellis

- on this point: "Their [the Ariois'] amusements during these meetings consist of boxing, wrestling, dancing, and making feasts and entertainments ..." (1782:I, 160).
- 30 On the basis of a statement by Lesson, Mühlmann concluded that the "ghost-masquers" were themselves Ariois. The statement in question reads: "Dans les cérémonies funèbres, tous les habitants non initiés devaient se tenir cachés dans leurs maisons, ou du moins se tenir éloignés du lieu où les prêtres faisaient leurs prières" (Lesson 1839:406). Mühlmann based his inference on Lesson's reference to "non initiés," evidently reasoning—incorrectly, I believe—that Lesson was referring to "initiation" into the Arioi sect.
- 31 In this connection, a generic name applied to a lodge's chief Arioi was *'aito*, which, one will recall, was also the honorific label applied to champion fighters. Be that as it may, I do not subscribe to the idea that all such chief Ariois were also war heroes. Nor can I find any indication that each lodge fought together as a unit.
- 32 This means probably that they stepped out of their roles as fighters to become "entertainers," and not that they themselves never engaged in fighting. See Mühlmann (1955:142) on this point.
- 33 This is Henry's translation. Literally, *te'ā* means "arrow" (and not "spear"), but since arrows were not used in warfare (during the eras under study at least) "arrow" makes less sense than "spear" in this phrase, which appears to connote "truce" or "peace."
- 34 "Diese Tatsache verliert ihre Paradoxie, wenn man bedenkt, dass der Gott der kriegerischen Besessenheit eben auch *Herr* über die kriegerische Besessenheit" (Mühlmann 1955:168).
- 35 Some ethnologists have considered this aspect of Arioihood so characteristic that they have sought to link the sect, historically, with "secret societies" of Melanesia. See Rivers 1914, Webster 1908, and von den Steinen 1925-1928.
- 36 "... ungewöhnliche, symbolhafte und dunkle Sprache" (Mühlmann 1955:56). Reference has already been made to certain distinctive features of Ariois' worship—for example, the fact that their "sacred-pig" offering was wrapped in special "Arioi" bark cloth, the use of perfume in rites directed to Romatane, etc.
- 37 In connection with this somewhat puzzling statement are some found elsewhere asserting that one of the two pigs that figured in most Arioi ceremonies—namely, the pig-on-the-pole (*pua'a fata*)—was reserved for eating by the black-legs. (The second pig, wrapped in red bark cloth, was offered to 'Oro himself, and was never eaten by humans.)
- 38 Moerenhout 1837:I, 491-492; Ellis 1829:I, 320.
- 39 Thus, Ariois differed from (other?) priests, who were *not* permitted to anoint themselves with *mono'i* when performing their services. See chap. 3, section on priests.
- 40 Based on G. Forster 1777:II, 100; Montgomery 1832:I, 238 ff.; de Bovis 1909: 406; Moerenhout 1837:I, 492ff.; Ellis 1829:I, 322; Henry 1928:235-236.
- 41 See G. Forster 1777:II, 128; Wilson 1799:172; Ellis 1829:I, 321; Williamson 1939:116; Mühlmann 1955:28.

- 42 I refer mainly to the reference to red-girdled black-legs. It is possible to infer from the wording that the text concerns the fate of this highest grade of Ariois only.
- 43 For a comprehensive review of this subject see especially Mühlmann 1955.
- 44 Including (according to one report) freedom from offensive odors: Nordmann states that, among other reasons, Ariois did away with their offspring because they objected to the smell of the latter's urine in their lodge houses! (1943:342)
- 45 A detail of the initiation ceremony added by Ellis is also explicable in view of the use of this behavior ritual in all Arioi public performances; I refer to the requirement that the initiate go through the *po'o*, or "flapping" movement, while calling out his district's geographic features. However, another detail of the initiation ceremony added by Ellis is considerably less comprehensible: "[The initiate] was then commanded to seize the cloth worn by the chief woman present, and by this act he completed his initiation, and became a member" (1829:I, 323).
- 46 I believe de Bovis to be referring to holders of kin-Titles, and hence use "rank" in the technical sense defined in chap. 16.
- 47 One Orsmond text characterized nontattooed novices as "those who sit lazily covered with cloth," an obvious reference to fattening; but that is as far as it goes.
- 48 The LMS Dictionary gives these meanings of *he'e* as a verb: to purge or evacuate the body; to be swimming in the surf; to be in a discharged or banished condition, as one turned out of his place.
- 49 In a passage from Bligh, to be quoted later, *hu'a pipi* ("Hooepippee") is described as the name for the ceremony carried out among Ariois when visiting one another or upon returning home. In this instance the arrivees were returning from Tetiaroa, where presumably everyone had indulged in fattening, and hence *hu'a pipi* may refer specifically to the fattened individuals themselves; but this is a possibility I cannot further substantiate.
- Also see the following comment on skin-bleaching: "Personal endowments being in great esteem amongst them, they have recourse to several methods of improving them, according to their notions of beauty. In particular, it is a practice, especially amongst the *Erreoes*, or unmarried men of some consequence, to undergo a kind of physical operation to render them fair. This is done by remaining a month or two in the house; during which time they wear a great quantity of clothes, eat nothing but bread-fruit to which they ascribe a remarkable property in whitening them." (Anderson, in Cook 1784:147)
- 50 Not so Mühlmann, who, by analogy with some Melanesian societies, not only accepted the Arioi fattening period as fact, but saw it as evidence of a standard "weibliche" stage in the process of initiation into full active Arioi membership. Mühlmann's theory is one of the most ingeniously constructed ones I have encountered, but it is based on a whole set of unsupported assumptions—about fattening, the sexual division of labor, *mahu*, etc. (1955:36–46)
- 51 "Vornehm ist einer [Arioi] nur, solange er ohne Leibesperben ist. Hat er einen solchen oder gar mehrere Kinder, so ist er ein Abgedankter, ein alter Mann

- oder 'alter Herr.' Diese aber mussten ja für die aktiven Mitglieder den Boden bebauen und handwerkliche Arbeit leisten." (Mühlmann 1955:103-104)
- 52 See Moerenhout 1837:I, 494; and Ellis 1829:I, 323.
- 53 Henry stated that the chief Arioi of Porapora was Puna ru'u, whose Arioi house was on Farerua peninsula (1928:103); that the chief Arioi of Huahine was Atae (p. 101); Henry (p. 93) listed Taura'a atua as Arioi chief of Mo'orea's Papeto'ai district; Mutaha'a was attached to Taha'a's "national" marae, Apuroa (p. 99); "Nouatoua" (Nuatua), "Maouaroa" and Nita do not appear in Henry's list, but "Manoura (Mano'ura) is identified there as chief Arioi of Hitia'a, Tera'aroa as chief Arioi of Tautira and Teahupo'o, and Pa'a as chief Arioi of Fa'a'a. The other chief Ariois listed by Henry for Tahiti were Raupa'a (Mahaena), 'Upaparu (Tiarei), Va'a iti ma te toi i te piha ia teta (Papeno'o), Ti'a au (Ha'apape), Puahaha (Punaauia), Hita and Uri (Paea), Mata'a (Papara), Terupo (Atimaouo), Tiatia (Pape'uriri), Tiapou (Papeari), Tumatariri (Vairao), Heiva ino and Upa upa ino (Mataoae and Toahotu), Tuturumaa (Pue), and Huaatua (Afa'ahiti). (pp. 70-88)
- 54 At the time this text was recorded, between 1846 and 1850, there was only one *ari'i* in Tahiti, Queen Pomare herself; all other persons of eminence or power were labeled *ra'atira*.
- 55 Mühlmann's explanation for such procedures is as follows: "Auch hier ist die Logik vielleicht die: Wer jemanden zum 'König' macht, kann von dessen Vater als einem 'alten Herrn' eine Sonderabgabe verlangen. Vielleicht aber handelt es sich auch einfach um einen Heilssegens, den der Arioi einem Kinde spendet und der natürlich zu vergüten ist." (1955:105)
- 56 According to one missionary, "They are looked upon as gentlemen or noblemen are in England or Ireland, by the lower ranks of men there" (William Henry, Journal, "Early Days in Tahiti," 8 March 1797, LMS Archives).
- 57 For example: "The meeting of the arreos gave rise to these frequent dramatic entertainments; their presence seemed to enliven the whole country, and to inspire all the people with extraordinary cheerfulness" (G. Forster 1777:II, 142).
- 58 Except for such general statements as that put forward by G. Forster (as reported in Mühlmann 1955:48): "From every distinguished family one or more persons became Ariois."
- 59 Most myths connect the sect's founding with an early Tamatoa, the kin-Title borne by the individuals who were for some generations also sovereigns of the Ra'iatea tribe, which by genealogical reckoning would locate the event between the fifteenth and eighteenth centuries A.D.; but I leave such problems to specialists who apparently have more faith in such reconstructions than do I. See, for example, Mühlmann 1955; Newbury 1961: xxxvi; Williamson 1939.
- 60 Henry's list of Arioi lodges and masters is unlike Orsmond's in several respects (a puzzling situation, inasmuch as her data derived mainly from Orsmond). For example, she attributed three lodges each to Mahaena, Pa'ea, and Papara—but only one master for each district. Also, she and Orsmond disagree on the Title names of the masters for Atimaono, Vairuriri, and Tautira. Despite the insistence of Henry and others that every district had both a male

and female contingent of Ariois, headed up, respectively, by a lodge master and a lodge mistress, all the lists of such officials seem to pertain only to the former.

CHAPTER 23

- 1 The LMS Dictionary translates *'utuāfare* as a person's own home or house; also the family or household of a person. I may be reading too much into the phrasing of this definition, but I find in it an ambiguity that other textual examples (e.g., Henry 1928:450) do not clarify. Was the word applied to such units in general or to them only in reference to particular individuals? Did the Maohis speak of, say, X number of *'utuāfare* in such and such a place, or did they say that in such and such a place are the *'utuāfare* of A, of B, of C?
- 2 "Six is the largest Family of Children I have met with, and in common I have not found above three, but these Families are numerous" (Bligh 1789:II, 79).
- 3 See above, chap. 7; also, "They do not build them in villages or towns but separate each from the other according to the size of the estate the owner of the house possesses ..." (Beaglehole 1962:I, 339).
- 4 To translate these figures into individuals one can multiply the number of households by six or seven, according to the estimate of the *Duff* officers. This would result in an average of about fifty individuals per neighborhood, and two modes of around sixty and eighty-seven, respectively.
- 5 It may be that *mata'eina'a* was used in the same manner as is the Nuer word *cieng*: "The variations in the meaning of the word *cieng* are not due to the inconsistencies of language, but to the relativity of the group-values to which it refers ... A man is a member of a political group of any kind in virtue of his non-membership of other groups of the same kind. He sees them as groups and their members see him as a member of a group, and his relations with them are controlled by the structural distance between the groups concerned. But a man does not see himself as a member of that same group in so far as he is a member of a segment of it which stands outside of and is opposed to other segments of it. Hence a man can be a member of a group and yet not a member of it. This is a fundamental principle of Nuer political structure. Thus a man is a member of his tribe in its relation to other tribes, but he is not a member of his tribe in the relation of his segment of it to other segments of the same kind. Likewise a man is a member of his tribal segment in its relation to other segments, but he is not a member of it in the relation of his village to other villages of the same segment. A characteristic of any political group is hence its invariable tendency towards fission and the opposition of its segments, and another characteristic is its tendency towards fusion with other groups of its own order in opposition to political segments larger than itself." (E. E. Evans-Pritchard, *The Nuer: A Description of the Modes of Livelihood and Political Institutions of a Nilotic People* [New York: Oxford University Press, 1940], pp. 136-137).

- 6 In their list of Tahiti's "districts" the *Duff* officers recorded one, Wharoomy [Farumai?], as having contained only one *mata'eina'a*, and as having had its own "Presiding Chief"; all other sources, however, describe the territory (and population) corresponding to this "district" as having been part of a larger unit.
- 7 "This Island was formerly under one Kin[g]dom, how long sence it was formed into two I cannot say, but I believe not long" (Beaglehole 1961:409).
- 8 *Mano* also is defined as 10 *rau*, or hundreds, i.e., 1000.
- 9 See, for example, chap. 16, the Porapora colony.
- 10 I am most reluctant to utilize this overburdened term. As Fried said of it: "... If I had to select one word in the vocabulary of anthropology as the single most egregious case of meaninglessness, I would have to pass over "tribe" in favor of "race." I am sure, however, that "tribe" figures prominently on the list of putative technical terms ranked in order of degree of ambiguity as reflected in multifarious definitions." (1968:4-5.) On the other hand, I know of no better shorthand label for what I call an "autonomous territorial unit." I must regretfully concede that I am unable to formulate a concise definition of it at this stage—in fact, it will require the rest of this chapter to do so adequately.
- 11 Here and elsewhere in this book I use the word *chief* for that individual member of a social unit whose decisions about actions involving other members tended to be final.
- 12 Also, see chap. 19. I have searched the sources for instances of fusion of territorial units brought about by such quasikinship bonds as fosterage and bond-friendship, but without success.
- 13 In an editorial footnote about a martial episode in the legend of Honoura, in which the victor married the widow of his principal adversary, whom he had vanquished and slain, is the statement, "A marriage of that kind was considred a most honourable way of ending strife, as it made allies and not slaves of the conquered" (Henry 1895:293).
- 14 For example, the legendary conquest of Tahiti-the-Fish by priests from Opoa, Ra'iatea.
- 15 I would like, of course, to be able to write also in terms of numbers of persons; but, as the reader will recall, the available information concerning these Islands' pre-European populations is so inconsistent and unreliable that any estimate based thereon would be similarly suspect. In any case, if any reader cares to engage in this game he is referred to the figures presented in chapter 1, from which he can construct his own estimate.
- 16 The "unification" which Porapora's Puni imposed upon Ra'iatea and Taha'a in the 1760s probably comprised an even more complex organization, but it fell apart upon Puni's demise. See vol. 3 for further details.
- 17 As far as I can discover there was no general Maohi term for a social unit of this kind. *Nuna'atini*, for example, had the meaning of a concourse of people who follow a chief; and as for *va'a mata'eina'a*, I have already discussed its ambiguities.
- 18 For example: *anoanomatie*, a native of a place where his ancestors were before

- him; a wise person; *āvaetutu'eē*, a stranger from another country who is not interested in the welfare of the place of his residence (LMS Dictionary).
- 19 A specific instance of this kind of conventionalized "anger" was reported by Morrison in his account of the killing of the *Bounty* mutineer, Thompson. Patiri, one of the natives who killed him, did so to avenge Thompson's murder of another mutineer, Churchill, who was Patiri's friend. When Morrison later expostulated with Patiri "for taking justice into his own hands," and asked why he and his associates had not simply delivered Thompson to Matavai for judgment, he was told, "the distance is too great, and our anger would be gone before we could get there; and we should have let Him escape when we were could & our anger gone so that He would not have been punishd at all and the Blood of the Chief [i.e., Thompson] would have been on our heads." (1935:95)
 - 20 As Henry pointed out, nothing was gained by a losing party by suing for peace, because even if the winners accepted, "the same barbarities as just described were shown the surrendering warriors in their camp; and if there were no more home forces to resist, their land became tributary to the conquerors. Hence the unwillingness of a side to submit and preference to retreat" (1928:315).
 - 21 For example, see the gesture of noblesse oblige in the story related by Adams (1901:27).
 - 22 However, it will be recalled that the supplanted officials did not thereby forfeit any kin-congregation Titles they may have held, insofar as their ceremonial prerogatives were concerned. (See chap. 16.)
 - 23 See also Moerenhout 1837:II, 141-142.
 - 24 See, for example, a missionary's account of food contributions assembled in one Tahiti district for presentation to some distinguished visitors from Mo'orea: "A day of much noise and confusion about us. The people of this District brought here what they had prepared for their guests—it consisted of two lots of Ava each laid on a Pafatu or a frame made of large sticks and carried by 30 or 40 men (to make it appear heavy), of about 60 baked Hogs and great quantities of baked Uru. (Jefferson, Journal, 11 February 1806, LMS Archives)
 - 25 One of the few notable exceptions was the friendly relations that appear to have prevailed for several decades before and after 1767 between the Puna'auia and Pa'ea tribes of Tahiti. (See vol. 3).
 - 26 In addition to the example of *coordinated* tribal work projects to be discussed in this section, there were of course the *uncoordinated* work activities required of a tribe's membership when its chief called for objects of one kind or another. Such work may have been concentrated within a few days of intensive effort, or spread out over a year or more; but by the extent to which it exceeded ordinary work activity it should be counted as tribal work. And in this connection one might view some tribe-wide *rahui* as coordinated *inactivity*.
 - 27 Morrison's description also differs with respect to the intensity of the *rahui*, etc., but this may be more a reflection of differences in scale.
 - 28 See also Henry 1928:481-482.

- 29 Turnbull described a large-scale fish-seining episode on Tahiti which took place during festivities carried out to honor some members of the local chiefly family upon their return from a sojourn on Tetiaroa. How “tribal” the seining was we cannot discern, but Turnbull’s comments upon the distribution of the catch are particularly relevant: “This [the seine] is a net made of the leaves of the cocoa-nut tree, and extending full a quarter of a mile in length; it will sweep round a rock without much injury, and whatever fish may be adhering to its side, it will force from their holds without difficulty. Some of the king’s attendants are always in waiting upon these occasions, and seldom fail to seize upon two-thirds as the royal tribute. The king being thus served, the multitude are let loose upon what remains, a scene truly ludicrous: and a general scramble of men, women, and children, then ensues; the seine is torn to pieces in the contest, and every one decamps with what portion of the prize he can get.” (1813:288)
- 30 These included, in the early days of contact, most items of European origin, however incomprehensible or useless. In fact, in some places the chief made a practice of demanding *all* European objects obtained by his subjects. (Wilson 1799:194; J. Forster 1778:369–370)
- 31 One legend relates that after the chiefs of Maeva had conquered the other tribes of Huahine, the latter became known as “Places where the left-overs are eaten,” with reference to the fact that all the *first* food productions of such places went to Maeva (Chesneau 1928:60).
- 32 This definition indicates a metaphorical extension of the conventional eightfold division of every island—partly fictional and partly actual—to an assembly of all subunits of a tribe.
- 33 This interesting document was rescued from archival obscurity by the knowledgeable student of Maohi antiquities M. Rey-Lescure, and published in *Bulletin de la Société d’études océaniques* (June 1946). In reproducing it I interpose several explanatory notes, including some provided by Rey-Lescure. The original text was partly in Maohi and partly in English, but the published version is in French. In retranslating it into English we may be losing some of the original sense of the document, but the original version is not available to me.
- 34 A similar rule was in force respecting objects consigned to spirits, as witnessed in the legend of the revenge of Mara’a (Henry 1928:241 ff.), wherein two fishermen were slain for consuming a portion of the first large fish caught by them and dedicated by them to their tutelard.
- 35 It may be that *fa’a hopura’a vai* and *fa’a’amua* were simply local variants of the same transaction and not two separate transactions, but the sources are somewhat ambiguous on this point.
- 36 The LMS Dictionary defines *mareva* as a fleet of canoes with visitors, bringing presents from one island to another; but Rey-Lescure, in the document on *tavau*, assigned it the meaning given here.
- 37 Again I quote from the Mare document referred to earlier, which although having to do with events of a later era than the one now under study,

- seems to me to be *indigenous* enough to throw light on transactions of an earlier time.
- 38 That is, "unsightly" to the puritanical missionaries; in the eyes of the Maohis such a collection was presumably a highly gratifying sight!
 - 39 Actually I am not sure about this point. It may be that pigs, etc., which females had had a hand in raising, were thereby rendered unsuitable for offerings to most spirits, but I cannot find any evidence on this.
 - 40 I refer to the "rivalry" between 'Oro and Temeharo. See vol. 3.
 - 41 It may be, however, that *paiatua* rites were occasionally carried out on a *cult* as distinct from a *tribal* basis. We know, for example, that the cults of 'Oro and Tane included devotees from several distinct tribes (including tribes whose tribal tutelary either god happened to be). And there is evidence for concluding that tribes thus connected (in common worship of 'Oro and Tane) sometimes met together to have their own tutelary's images refurbished with feathers from an 'Oro or Tane image in the keeping of the chief of one such tribe, and with no implications therefrom concerning political connections.
 - 42 The sovereign chief of Ra'iatea, it will be recalled, was vested with a *maro 'ura* kin-Title of the Opoan kin-congregation. Unfortunately, we are provided with no description of the office-taking ceremony of a tribal chief of lower kin-Title rank, and hence I am not in a position to sort out those elements of the ceremony specifically referable to tribal chieftainship alone. Also, the central position occupied by 'Oro in Henry's account should not be seen as indicating that 'Oro played this role everywhere. For an eyewitness account of an inaugural ceremony, see Bligh 1792:138-138b.
 - 43 Morrison's account is based on his own observations of the investiture of Pomare II at Pare, in 1791, and hence has the weight of authenticity. While it does not contradict the summary accounts of Henry, Ellis, and Moerenhout, it does not add anything new except in a quantitative sense. For example, Morrison recorded that the human sacrifices offered at this investiture were thirty in number, "some of which had been Killd near a Month," and that the feast after the former lasted "some weeks." (1935:117)
 - 44 The only significant addition to be made to the accounts of chiefly office-taking recorded and described herein is a passage from a missionary's journal, which described how one tribal chief, Pomare II, underwent separate investment rites in each of the districts over which he had gained ascendancy (Youl et al. 24 May 1806, LMS Archives). Presumably such rites were carried out not only in connection with a chief's original investiture over a complex tribe, but also when a new territorial unit was added to his realm.
 - 45 See, for example, the contempt gesture involved in bearing one's buttocks toward someone (chap. 14). See also the legend of Tafa'i, in which the hero's father, Hema, underwent an extreme form of degradation by having been made into a repository for the excrement of his spirit-adversaries (Leverd 1912:10-11).
 - 46 I am concerned here with chieftainship of a tribe, not with the administrative office *ti'aāu*, for which see p. 1030.
 - 47 In another legend the hero Tafa'i was elected by his warrior companions to be their leader because of his strength, bravery, and generosity; but this office

- was not the same as a tribal chieftainship (Henry 1928:557; Leverd 1912:21).
- 48 Turnbull reported, "The power or ambition of an enterprising chief will indeed often disturb the regularity of succession; but the principle of hereditary government seems to be fundamental" (1813:358).
- 49 According to Handy, "In considering the unity of the social order under the *ari'i* it must never be forgotten that the divine first-born (*matahiapo*), who was the Arii, was regarded by the population over which he presided, as the sacred embodiment of the mana of the people and land as a whole" (1930:46). As noted previously, the available data on Maohi usages of this troublesome word *mana* are simply not adequate to confirm or refute statements such as the one just quoted.
- 50 Tamatoa, sovereign chief of Ra'iatea, is described in some sources as having been a "high priest" as well, but there is no indication that he was actively the principal officiant in tribal services. See also the case of Papara's chief Temari'i (Teri'irere), in vol. 3.
- 51 I can throw no light on the etymology of this word: possibly, *tau*, (?); *imi*, seek; *hau*, peace, order, etc.
- 52 In the interest of clarification, I have taken some liberties in translating this text, however, I am still uncertain about how this official was selected in the first place.
- 53 According to one source the label *ti'a'au* was also applied to the chief functionary of an Arioi lodge (Orsmond: Arioi).
- 54 See, for example, Vancouver 1801:256.
- 55 The writer of the following passage, written in 1927, was descended from the chiefly "line" of Papara, but one may legitimately question her reliability: "Some of the laws strike us as having been [unnecessarily] strict and quite arbitrary. They were in fact concerned mainly with the protection and preservation of private property and of titular prerogatives. One might think [for example] that nothing would have been easier than to change a name or modify a word. Yet, even such matters as these had to be brought up and discussed first of all in the royal family council in order to decide upon the appropriateness. Then such matters were passed on to a Supreme [tribal] Council composed of the tribal *ari'i*, the head of the tribal military force (who was usually an *ari'i* as well), and the High Priest (who [in one particular case] bore the official title of Teao [Light]). It was within the powers of the Council to either reject or confirm the proposal in question. If such a proposal were confirmed by it, the decision then had to be consecrated at the marae, with which it became binding upon the whole populace. Thus one sees that a strict formalism obtained with this institution and seemed to regulate it." (M. T. Salmon 1927:261)
- 56 See J. Forster 1778:362.
- 57 Handy (1930:42), however, referred to the *Hiva* of *Hoomatavana* as the "body-guard" of the chief of Vaiari, which in one sense it probably was.
- 58 Also most of the writers, from Wallis to Handy, described the chieftainship of only the largest, most complex tribes, so that we know next to nothing about chieftainship in such relatively small and less complex tribes as, say, Mai'ao.
- 59 See also the following passage from Jefferson's journal, 27 May 1799 (LMS

Archives): "... Notwithstanding in our opinion the king's habitation is a very humble one It appears that himself and countrymen have the most elevated ideas of it and of everything appertaining to the great chief, as the following specimen will show. The king's title is Otoo-nooey te Atooa—the meaning of which we do not clearly understand but as the word te Atooa is used to express the object of worship, it is doubtless as full of arrogancy and pride as is possible. His house is called yow-rye (clouds of heaven) his double canoe anooanooa (the rainbow) his manner of riding on the shoulders of an attendant mahowta (flying) his torch Ooweera (lightning) and a drum that is frequently beating for his amusement pateere (thunder)."

- 60 Not *pi'i* (as rendered by Ahnne 1926), which probably corresponds to forms of the LMS Dictionary entry *pīi*, to call upon a person or a thing; to shout, to raise up the voice. See White 1967:328.
- 61 Unknown to Vancouver the particular prohibition relating to Pomare's name seems also to have been prevalent in some of the western Tuamotu Islands, where this chief's influence was strong (White 1967:332).
- 62 What might have turned out to be temporary word changes (in the normal course of events) became permanent ones as a result of the missionaries' introduction of writing, and their publication of scripture in the native language.
- 63 For an incisive critique of these and other latter-day accounts of the custom of *pi*, see White 1967.
- 64 Another "imposing effect" must have been created by the numerous tapers that were burnt to illuminate a road over which one chiefly family sometimes traveled at night: "In the beginning of the Night Tarrah Hill was beautifully illuminated with Flambeaus to light Tynah over, who had stayed late at Oparré, perhaps a prettier sight was never seen than the effect it had upon the smooth Water about the Shore, for the lights were brilliant and numerous—When any of the Royal Family pass over the Hill they have it lighted, as the Road is bad and a fall likely to be attended with bad consequences." (Bligh 1792:151b-152)
- 65 "... the Society Islanders [were] almost continuously at war, either the principal chiefs of any island were fighting each other for sovereignty over the whole, or petty chiefs were fighting among themselves for the most frivolous reasons and without the principal chiefs themselves deigning to become involved" (Moerenhout 1837:II, 30-31).
- 66 The following passage by Anderson, included by Cook in his journal for 1777, evidently contains as much fiction as fact: "... long custom seems to secure property here as effectually, as the most severe laws do in other countries. In conformity also to ancient practice established amongst them, crimes of a less general nature are left to be punished by the sufferer, without referring them to a superior. In this case, they seem to think, that the injured person will judge as equitably as those who are totally unconcerned; and as long custom has allotted certain punishments for crimes of different sorts, he is allowed to inflict them, without being amenable to any other person" (Cook 1784:172).
- 67 There are some indications that known sorcerers, or at least individuals

widely believed to be such, could also be slain with impunity by their supposed victims (Elder & Wilson, Journal, 19 June 1804, LMS Archives), but I can find no evidence that sorcerers were also considered suitable candidates for human sacrifice.

- 68 See also Moerenhout: "The cruel custom of human sacrifice ... provided both basis and support of chiefly power. The gods, who were the terror of the populace, were always favorable to the chiefs; and when some unfortunate individual happened to displease the latter, he was certain to fall victim [to human sacrifice]." (1837:II, 6)
- 69 These sentences were however commuted, on Rodriguez's petition. See also, earlier in this chapter, concerning a Pomare's banishment of a whole family, including the mummified bodies of deceased members.
- 70 In the passage from Bligh, quoted at the beginning of this section on social justice, he evidently expressed a contrary view, but provided no example.
- 71 For a legendary account of one such episode see Adams 1901:163-168; see also Bligh's definition of *ari'i* as one's champion or protector (Bligh 1789:II, 6).
- 72 I pointed out in figure 18-1 that Cook in his 1777 listing of social classes translated "Manahoone" as "vassal," and incorrectly placed this class between "Erres," "powerful chiefs", and "Teou" and "Toutou," "servants or slaves."
- 73 See vol. 3 for an example of the anarchy that could be generated by a small band of troublemakers in a community lacking a strong chief.
- 74 In this connection Bligh wrote: "In the Districts of Oparre or Matavai Tynah [Pomare I] can take any thing he wants or has a liking to, but in other Parts, altho he is called their Erreerahigh and is considered as such, he can have nothing but with consent of the resident Cheif" (1789:II, 63; see also Bligh 1789:I, 375, 396).
- 75 See also Moerenhout's statement that a chief seldom confiscated for personal use any conquered territory (1837:II, 12n).
- 76 The measures regarding election and impeachment discussed earlier in this chapter concerned tribal administrators (*tu'a'āu*, *ti 'a'āu*, *ani*) rather than tribal chiefs. See also Moerenhout 1837:II, 9.
- 77 See especially Moerenhout 1837:II, 13-14.
- 78 These precepts were translated by Handy into English from an unpublished, and now unavailable, manuscript of the "Memoirs of Marau Ta'arua." They subsequently appeared, in Tahitian and French, in Ernest Salmon, "Les Maximes de Tetunae," *Revue de Folklore Français et de Folklore Colonial*, No. 1, 1937. The English version reproduced here is based on the Maohi text published in Salmon, and is a combination of Handy's translation and one produced by R. G. White. The Farerua referred to in the text is the marae of that name in Vaiari, Porapora (see chap. 16). Most metaphors in these *ture* seem sufficiently transparent to obviate explanation. The word *ture* is probably a slightly transformed version of Hebrew *torah*; we do not know what the Maohi word for such precepts might have been.
- 79 R. G. White: personal communication.

- 80 Note the gap between norm and practice in this respect; see earlier in this chapter, section on chiefs and social order.
- 81 Therein lies the irony contained in the speech quoted from Henry in which the spokesman for a visiting notable thanked their chiefly host for his gift of welcome, and accounted for its liberality as due to the latter's felicitous "mode of governing" (Henry 1928:244).
- 82 One of the few such episodes actually recorded had to do with pigs: "This afternoon I found a Stop was put to the Sale of Hogs in the district of Tettahah, we therefore can get no more Supplies from that quarter. Teppahoo told me there were now but few Hogs there, and that for a certain time, some Months, no person was allowed either to kill or sell, that they might have time to breed again." (Bligh 1789:II, 58-59)
- 83 Although, perhaps, the very presence of an active and firm-handed tribal chief served to inhibit disorder among tribal subjects—e.g., in describing the unruliness of Huahine natives G. Forster wrote: "This was the second time that our people were thus boldly attacked by the natives of Huahine, who seem, upon the whole, to be more licentious under the infirm government of old Oree, than those of Taheitee, and of the other Society Islands" (1777:II, 117; see also vol. 3, this work).
- 84 Some of the general disorder, both spontaneous and ritualized, which usually followed upon the death of a chief could be interpreted as deriving from a common attitude that some rules regarding orderly social interaction were invalidated when the chief himself ceased to live. In this connection, Orsmond reported much later, after the death of Pomare III, "It is a prevalent feeling among the lawless race that as the King is dead the law ought to die and be burried also" (Journal, 1 February 1827, LMS Archives). The law in question was an official, missionary-inspired code, but the attitude so expressed may have been an ancient one.

CHAPTER 24

- 1 See, for example, Levy 1968.
- 2 W. L. Warner, *A Black Civilization* (New York: Harper Bros., 1937); D. L. Oliver, *A Solomon Island Society* (Cambridge: Harvard University Press, 1955).
- 3 In the generalizations that follow I refer mainly, of course, to the goals of those Maohis who were past childhood in "life stage," and not yet in senile decline. I suppose that the pleasure of, say, eating began earlier and continued past that span, but the same can hardly be said, for example, of sexual relations.
- 4 As a small but perhaps not insignificant piece of confirmation for this thesis, I point out that *praise* (i.e., status enhancing service) rather than any kind of object was the prize in most kinds of competitive sports.
- 5 The territory comprising the childhood "home" (which usually included one's own marae) would have been stoutly defended, or deeply longed for from afar, by some (or most?) Maohis. In such cases, however, I believe

that the factor that made these territories so highly valued was the social relations mentally associated with them, and not the mere fact that they were of specific geographical extent. (Indeed, the very lack of any unit of land measure would seem to add some small weight to this conclusion.) I hold firmly to this belief despite such statements as the following: "Land constituted the principal—or better, the only real—form of wealth of these people." Moerenhout continued, "The amount of authority exercised by any chief depended upon the quantity and quality of his land, for the better able they were to provide food for people, the more certain they were of having [faithful] subjects." (1837:II, 12)

- 6 For example, on several atolls viable societies developed despite relatively much more unfavorable relationships between population and natural resources.
- 7 This of course does not eliminate the possibility of there having been sorcery procedures that utilized a victim's personal name as a means of attack, although I have come across no specific instances of such. And in this connection, although the custom of *pi* seems to have been applied to personal names more typically, perhaps, than to Titles, the prohibition was evidently backed by other than supernatural sanctions.
- 8 Despite the subordination, in many instances, of kin-congregation to tribe, kin-Titles retained their preponderant structural significance.

A contrast to Titles remaining the same would be provided by a society in which an individual's personal name never changed, and in which new status-names were invented ad hoc to reflect his achievements, etc., at any particular time. Another contrast is provided by the popular practice in American society of continuing to label an individual by the office-name once held: for example, calling an individual by his military title long after he has left military service.
- 9 "Better than" is, of course, our way of generalizing about the differences between the terms in each of these paired opposites. I know of no comparable Maohi word or phrase for expressing the same generalization; indeed, it is possible that the Maohis themselves did not recognize any common characteristic among these four sets.
- 10 The absence of live volcanoes in the Society Islands may account in part for the conceptual unimportance of "below" as a domain for the major deities.
- 11 Despite the Maohis' identification of the bowels as the principal seat of emotion, they continued to treat the head with greatest respect, ritually.
- 12 See Hertz 1960.
- 13 In addition to, or instead of, interpreting this as a general devaluation of war (which our evidence would hardly support), the LMS Dictionary definition given for *maui*, "to be in a pet, or fit of anger, on account of disappointment in food, etc.," suggests another possible basis of this identification of left with war. This assumes, of course, the words "left" and "fit of anger" were in fact phonemically identical, a matter we cannot be certain about in view of the absence of vowel-length markings in most of the early transcriptions.
- 14 Actually, it is probably a rare phenomenon in most human societies. Even in our own society, where altruism is asserted to be a popular ideal, the aphorism

- considered by most people to embody it—namely, “It is more blessed to give them to receive”—seems to imply that the givers will eventually receive their rewards in Heaven.
- 15 Including, for example, such vivid measures as fashioning the bones of one’s vanquished enemy into fishhooks, or wearing his body poncho-like in battle. Also, evidence that Maohis recognized the injury-dealing power of words can be seen in the following LMS Dictionary entries: *Ma’au*, blemish, injury, damage, hurt; to be injured or damaged; vile, slandered by accusation. *Tāora*, to throw a stone or other thing; to reflect, or make censuring remarks, on a person.
 - 16 It may be that the Maohi words *ho’o/taui* and *hōro’a* served to distinguish what I label “commercial exchange” and “gift giving”, respectively, but I cannot be certain of this: *Ho’o*, price, exchange, equivalent; to buy or sell, exchange property. (See also *tapiho’o*, to make an exchange.) *Tau*, a price, purchase, compensation; to exchange property, to buy. *Horo’a*, to give or bestow some good; the gift that is given; generous, liberal. (LMS Dictionary)
 - 17 “... the Ingenuity of these people is highly Conspicuous in evry article of their Manufacture, of which their Cloth Matting and oil are particular Articles of their Trafic, if it may be so Calld, but this is Generally carried on by making presents rather then by Exchange of Commoditys” (Morrison 1935: 160).
 - 18 See Bronislaw Malinowski, *Argonauts of the Western Pacific* (London: George Routledge and Sons, 1932). See also Paul Bohannan, “Some Principles of Exchange and Investment among the Tiv,” *American Anthropologist* 57 (1955):60–69, and R. F. Salisbury, *From Stone to Steel* (Victoria: Melbourne University Press, 1962).
 - 19 *Multipurpose*, not *all-purpose*; cynics to the contrary, I know of no human society possessing a really *all-purpose* kind of exchange token—that is, “There are some things even money can’t buy.”
 - 20 To identify it as *mana*, as some writers have done, is inappropriate on two grounds: first of all, there is no persuasive evidence that the Maohis themselves so labeled it; and second, in view of the impossibility of discovering the meaning of this word, our understanding of the “spiritual” element in question would not be advanced were we to assume that the Maohis labeled it *mana*.
 - 21 It would simplify my synthesis considerably (and render it more aesthetically pleasing!) if I had found evidence at different “levels” of social relations for the kind of structural replication of consanguineal role-networks that allegedly prevailed in some other Polynesian societies, but the data on Maohi society do not so permit.
 - 22 In many stratified societies, choice of spouse plays little part in maintaining the lines of stratification; while in many other nonstratified societies, choice of spouse is subject to very narrowing constraints.
 - 23 By a “fully satisfactory” household economy, I mean one in which the members were provided with adequate food, etc., without having to work unduly hard or at uncongenial tasks. As we have seen, except for a very few jobs

such as pelagic fishing or fine-plaiting, Maohi household tasks were not sex linked to an exclusive degree, so that a marked male-female disparity would not have resulted in intolerable hardship; but it would almost certainly have occasioned some discomfort and dissatisfaction.

- 24 Even in legend, the sexual encounters between deities and mortals (e.g., 'Oro and Vairamuti, Varimataaahoe and Hotutu) were more than one-night affairs, although it is true that some of these unions were "adulterous" by conventional Maohi standards.
- 25 As indicated in chap. 20, it is possible that formal friendship pacts were instituted between Maohi males and females, but most of them by far were between male and male.
- 26 As noted earlier, the only Maohi general classification I have uncovered of an "occupational" kind was the fourfold one of *ari'i*, Ariois, big-bellies, and fishermen (see chap. 21). Unfortunately, I do not comprehend the rationale for this intriguing classification.
- 27 This has some bearing on the thesis, referred to earlier, that complementary exchange was the factor most responsible for maintaining ties among consanguines scattered over varied "resource zones." Even granting some correlation between occupational specialization and resource accessibility—not a very high correlation but a positive one nevertheless—and even granting that some complementary exchange did flow along kinship channels, nevertheless, the prevalence of commercial-type arrangements reduces the explanatory power of that thesis.
- 28 Excepting of course the legendary Friendly Alliance, which may never have existed historically (as I pointed out in chap. 22, section on 'Oro cult), but whose mythical currency does indicate that the Maohi accepted the possibility of active intertribal relations based mainly on common religious commitment.
- 29 In addition, according to Moerenhout twelve of the branches (including the Opoan) were acknowledged as having been those originally and directly founded by the sect's tutelars, but there is no evidence that the heads of all these branches were accorded any special deference throughout the sect.
- 30 The fact that the focus in this summary statement is on male Ariois is a reflection of the circumstance that very little has been recorded about the female members of the sect.
- 31 Homosexuality, including transvestitism, is of course still to be found among modern Tahitians, and while it may resemble the older forms in many respects, it is also necessarily different in others, due to different social contexts and probably to new homosexual techniques as well.
- 32 Some women, notably high-ranking kin-Titleholders such as 'Itia, appear to have worked, fought, and played like men, and indeed to have looked very "masculine," but this did not seem to have led to their becoming *mahu*. The *mahu* transition was from "male" to "female," but not the reverse.
- 33 Danielsson offered the plausible suggestion that pair or group masturbation, which was practiced by young people in some parts of Polynesia, may have laid the foundation for homosexuality in such places (1956:151). Unfortu-

nately, there is too little reported about masturbation in Maohi society to adduce it as a factor in homosexuality there.

- 34 Equality except in the case of a married couple, whose “equality” was somewhat qualified by the circumstance of their differences in sex.

Too little is known about the structure of occupational guilds for us to be able to characterize them; my guess, however, is that they were moderately hierarchic in governance but that reciprocity marked co-members’ exchanges.

- 35 The case of Teahuupo’o is not readily explicable, except perhaps on the grounds of that district’s poor communications; but it will be recalled that the Mataovae tribe (or subtribe?) was itself made up of two noncontiguous subdivisions.

- 36 This definition is adapted from that of Hoebel (1949:94). It is not as precise as some readers might wish—e.g., “considered” by whom?—but is sharp enough for present purposes.

- 37 Garanger 1967. See also Emory and Sinoto 1964; Emory 1962; and Green et al. 1967.

- 38 Garanger 1967; Emory 1963; Green 1967.

- 39 By A.D. 1200 I simply refer to the time by which settlements had become established on all the islands; the actual date might have been any time from about 900 to 1500.

- 40 The presence of a few such individuals during the Early European Era (see vol. 3), and legendary accounts about earlier eras (including the evidently popular stories about heroes and demigods) lend support to this assumption.

- 41 This point was deservedly emphasized by Goldman for Polynesia in general. In this connection, even fosterage was resorted to in some instances, in order to insure suitable successors. And one will recall the story of the Maupiti delegation that went to Opoa to retrieve their marae’s “royal insignia” (chap. 16), and one of the claimants, a political “achiever,” was not required to prove his eligibility by reference to a particular pedigree, but merely by proof of membership in an Opoan-derived kin-congregation.

- 42 See chap. 16, this vol., and Handy 1930. For a fuller inventory of such theories see Williamson 1939:201ff.

- 43 “‘Degree of stratification’ refers to the complexity of the status system, i.e., the number of different kinds of ranks, and the extent to which they confer unequal privilege in economic, social and religious life. ‘Form of stratification’ refers to the social organization of the status system, that is, the sociological principles that determine rank differences.” (Sahlins 1958:x)

- 44 As an indicator of cyclic surplus Sahlins utilized the well-known measure of occupational specialization—i.e., the proportion of people in the population divorced from food production. He also brought in such formal criteria as relative number of food crops and efficiency of production techniques as supplementary checks on relative food productivity, but he placed heaviest reliance on the “immediate surplus” measure, which thus deserves our closest attention.

- 45 This is a far cry from the assumption made by Sahlins (and which constituted the principal rationale for associating immediate surplus with redistribution), namely, that “in Polynesia, surplus production was distributed from a central agency” (1958:129).

Although critical of Sahlin's treatment and interpretations of data on the Society Islands, I must add that I consider his larger effort (i.e., to offer another kind of theory to account for variations in Polynesian social structure) a noteworthy one—a refreshing and potentially more constructive approach than those based on hypothetical migrations. No one kind of theory will, however, suffice for such purposes. Nor are data on individual Polynesian societies likely ever to be sufficient or reliable enough to permit a comprehensive and wholly credible reconstruction.

- 46 See, for example, chap. 23, section on work projects, for a discussion of the relation between increasing size in tribal work force and occupational specialization. See also chap. 20 for a possible connection between population increase and contractual types of social bonds.

The Resolution and Adventure at Tahiti. Painting by W. Hodges, Cook's second voyage. National Maritime Museum, Greenwich, England.

VOLUME 3
RISE OF THE POMARES

CHAPTER 25 *TRIBAL POLITY AT
BEGINNING OF EARLY
EUROPEAN ERA*

[The] prime duty of the historian [is] a willingness to bestow infinite pains on discovering what actually happened. (Collingwood 1946:55)

Chapter 23 was concerned with Maohi social relations insofar as they were affected by considerations of residential proximity in combination with coercive force. The attempt was made to depict these kinds of social relations before they began to undergo radical change as a direct or indirect result of European influences.¹ Moreover, events were dealt with largely in terms of modes, and persons in terms of statuses; this course was followed partly by design, but it was also necessitated by the nature of the available data.

The present chapter will be concerned with the same kinds of social relations, but will focus upon the changes they underwent during the first five decades after Europeans appeared on the scene. The focus will be upon specific individuals and events rather than upon generalized statuses and typical occurrences. Such a reconstruction may serve to provide some corrective, and an additional footnote or two, to current notions about this minor but intriguing chapter of colonial history. But my main object is to add some flesh and movement to the skeleton of pre-European Maohi politics hitherto assembled; for, it is my firm opinion that although Europeans wrought radical changes in some phases of Maohi life — via their steel tools, their diseases, et cetera — and although European influence also had the effect of encouraging and facilitating certain developments in Maohi polity, the motives and instrumentalities of such developments remained basically Maohi, and hence directly relevant to my reconstruction of pre-European Maohi society.

The developments I refer to comprised the consolidation of coercive authority over all Tahiti and Mo'orea into the hands of one individual — or, in labels current to the era, the emergence of a “monarchy” out of what had been a number of more or less autonomous tribal chiefdoms. Besides the general ethnological and sociological interests attached to this topic, which I consider to be of major theoretical importance, it deserves

attention for some special, local reasons. To begin with, of all the matters touched upon in the journals and other writings of the early European visitors to these Islands it is the one they were most crucially concerned with, and about which they wrote most fully. Second, these developments encompassed more aspects of Maohi life than perhaps any other configuration of events. And finally, they have occasioned more scholarly controversy, perhaps, than any other aspect of Maohi life (except, possibly, for the question concerning the origins of stratification).

The differences among scholars who have concerned themselves with these matters have tended to polarize. At one extreme is the implication that indigenous Maohi society was fundamentally and immutably multi-tribal, and that the monarchy which emerged resulted solely or mainly from European influences (e.g., Handy 1930:77ff.). At the other extreme is the conclusion set forth by other scholars that the trend toward consolidation of political authority was intrinsic to Maohi society — that monarchy was undoubtedly hastened by European intervention but would in time have culminated even without that intervention (e.g., Newbury 1967a). The general theoretical implications of this issue, which reach far beyond the confines of Tahiti, or even of Polynesia, have been largely overlooked in most writings on the subject, or obscured by parochial advocacy of this or that competing dynastic claim (Gunson 1963). For example, one question that arises in regard to societies like this one has to do with the inevitability of political consolidation: inasmuch as most types of Maohi groups were pervasively hierarchical, and because in most such hierarchies there was only one status endowed with final decision-making authority, was it inevitable that the top status-holders of the various tribes would vie for overall supremacy when population increase, aided by ease of communication, brought them into more frequent interaction with one another? And if so, what were the other factors that served, in the long run, to promote or frustrate such consolidation? Because of the “exogenous” factors represented by the European presence, the events I am about to describe do not constitute a “pure” case study of this kind of development, but they nevertheless provide some suggestive clues.

There are undoubtedly many ways of looking at changes in a society’s administrative structure and politics. The present focus is on *tribal chiefly authority*, which I view mainly as command over certain kinds of services and certain material products of services. The nature of such services and objects will of course vary from society to society. I trust that the nature of services and objects comprising such authority in Maohi society has been described sufficiently in previous chapters, so that I now concentrate on the campaigns waged by certain chiefs to extend their domains of command. Assuming (justifiably, I believe) the absence of any significant regional dif-

ferences with respect to cognitive inventory and social values, I will devote most attention to the resources and strategies of the principal campaigners themselves.

TAHITI

When H.M.S. *Dolphin* anchored in Matavai Bay in 1767 the island of Tahiti appears to have been divided into several tribes, or closely knit tribal coalitions, of various orders of complexity:

Teva i tai (Seaward Teva), a unit of fifth-order complexity (see chap. 23) that made up the whole of the Tairapu Peninsula and numbered about 14,000 to 15,000 inhabitants.²

Teva i uta (Landward Teva), a unit of fifth-order complexity occupying the southern quarter of Greater Tahiti and numbering about 7,000 inhabitants.

Mano rua (or Pa'ea), a unit of fourth-order complexity.

Mano tahi (or Puna'auia), a unit of fourth-order complexity.

Throughout the era under study, and possibly for some decades prior thereto, these last two tribes (which I shall henceforth call by their more familiar territorial labels of Pa'ea and Puna'auia) were on many occasions so closely allied that their inhabitants and territories came to be known collectively as Te Oropa'a and Atehuru, respectively. This union, which had a population of about 2,100, was, however, an alliance of near-equals rather than one unified hierarchically to the degree that Seaward Teva was.

Te Fana, a unit of probable third-order complexity whose 1,000 or so inhabitants occupied an area known as Tetaha or Fa'a'a.³

Te Poreonu'u, a fourth-order unit of about 4,200 inhabitants that occupied the major territorial divisions of Pare and Arue as well as the atoll Tetiaroa (Wilson 1799:380).

Te Aharoa was the name applied collectively to the inhabitants of the five major territorial units of Tahiti's thinly populated northeastern side: Ha'apape (or Mahina), Ha'apaiano'o (or Papeno'o, or Vavau), Tiarei, Ma-haena, and Hitia'a. Little, however, is known about their interrelations beyond the fact that Hitia'a's principal people figured more prominently in events elsewhere on the island than did the chiefs of the other units. This may signify that Hitia'a's chief also exercised some authority — or at least weightier influence — over other Te Aharoa chiefs.⁴ But lacking evidence of such authority I tentatively classify these populations into five separate tribes of third- or fourth-order complexity. They numbered about 6,300 people.

Something has already been said of the topography and natural re-

sources of these various regions of Tahiti island, so I turn to the principal dramatis personae of the events about to be described.

Seaward Teva

By 1767 the Seaward Teva, comprising the population of Tahiti's Tairapu Peninsula, had become a relatively stable tribal unit, of fifth-order complexity, under the firmly entrenched and only occasionally challenged chieftainship of the members of a dynastic line whose official incumbent bore the Title of Vehiatua i te Mata'i (see fig. 25-1, foldout), traditionally associated with marae Matahihae of Teahupo'o, but later established also at marae Vaiotaha of Tautira, by virtue of Teahupo'o's defeat of Tautira in the Rahui War described earlier. After Tairapu was politically unified, Vaiotaha became its most important marae, and Tautira its main center of tribal activity, probably because of the localization there of the cult of 'Oro.

The first Vehiatua to "enter history" was the one seen by Cook during his circumnavigation of Tahiti in 1768. Cook met this Vehiatua briefly at Tautira; he labeled him "King," or "Ari'i Rahi of Tairapu," and described him as "a very old man with a white beard, not at all attended by a crowd of people." At the same time Cook encountered Vehiatua's elder son, Ta'ata Uraura, who was about thirteen at the time and who, according to Cook, "seem'd to have much influence." (Beaglehole 1955:108-109.) We learn from other sources that the spouse of Vehiatua was Purahi (or Pura'i?) or Te Vahine Moeatua,⁵ a firstborn child of a couple combining high-ranking Titles from Papara, Hitia'a, Vairao, and Ha'apape (Adams 1901:32). Cook's "Old King" Vehiatua died about 1771 and does not figure prominently in the visitors' accounts of this era; but the fierce old chief's violent attack against Mo'orea (described in chap. 12), left a residue of ill will there and among Mo'orean partisans on Tahiti, particularly in Poreonu'u. And as for his spouse, it is claimed that she was one of the principal instigators of the War of the Ahu Ra'a Reva, which served to curb the political pretensions of Papara, of which more anon. After the death of her husband, Te Vahine Moeatua took as her consort Ti'itorea of Mo'orea, whose kin-Title evidently ranked below that of his mate's. He served as "prime minister" to his mate's sons (Corney 1919:270) and was identified by Morrison as "Chief of Towtirra [Tautira]" (1935:93).⁶ It is not clear whether their relationship was ever institutionalized by a contractual rite of "marriage."

When the curtain of written history rises over Tairapu there is revealed an autonomous tribe, called the Seaward Teva, whose various subdivisions were more or less united under the political supremacy of the individuals named in figure 25-2. The numerals I, II, III are my notations for purposes of identification. The Maohis themselves did not use such notations as far as I know, and even the person designated as Vehiatua I was not the first to bear that Title.

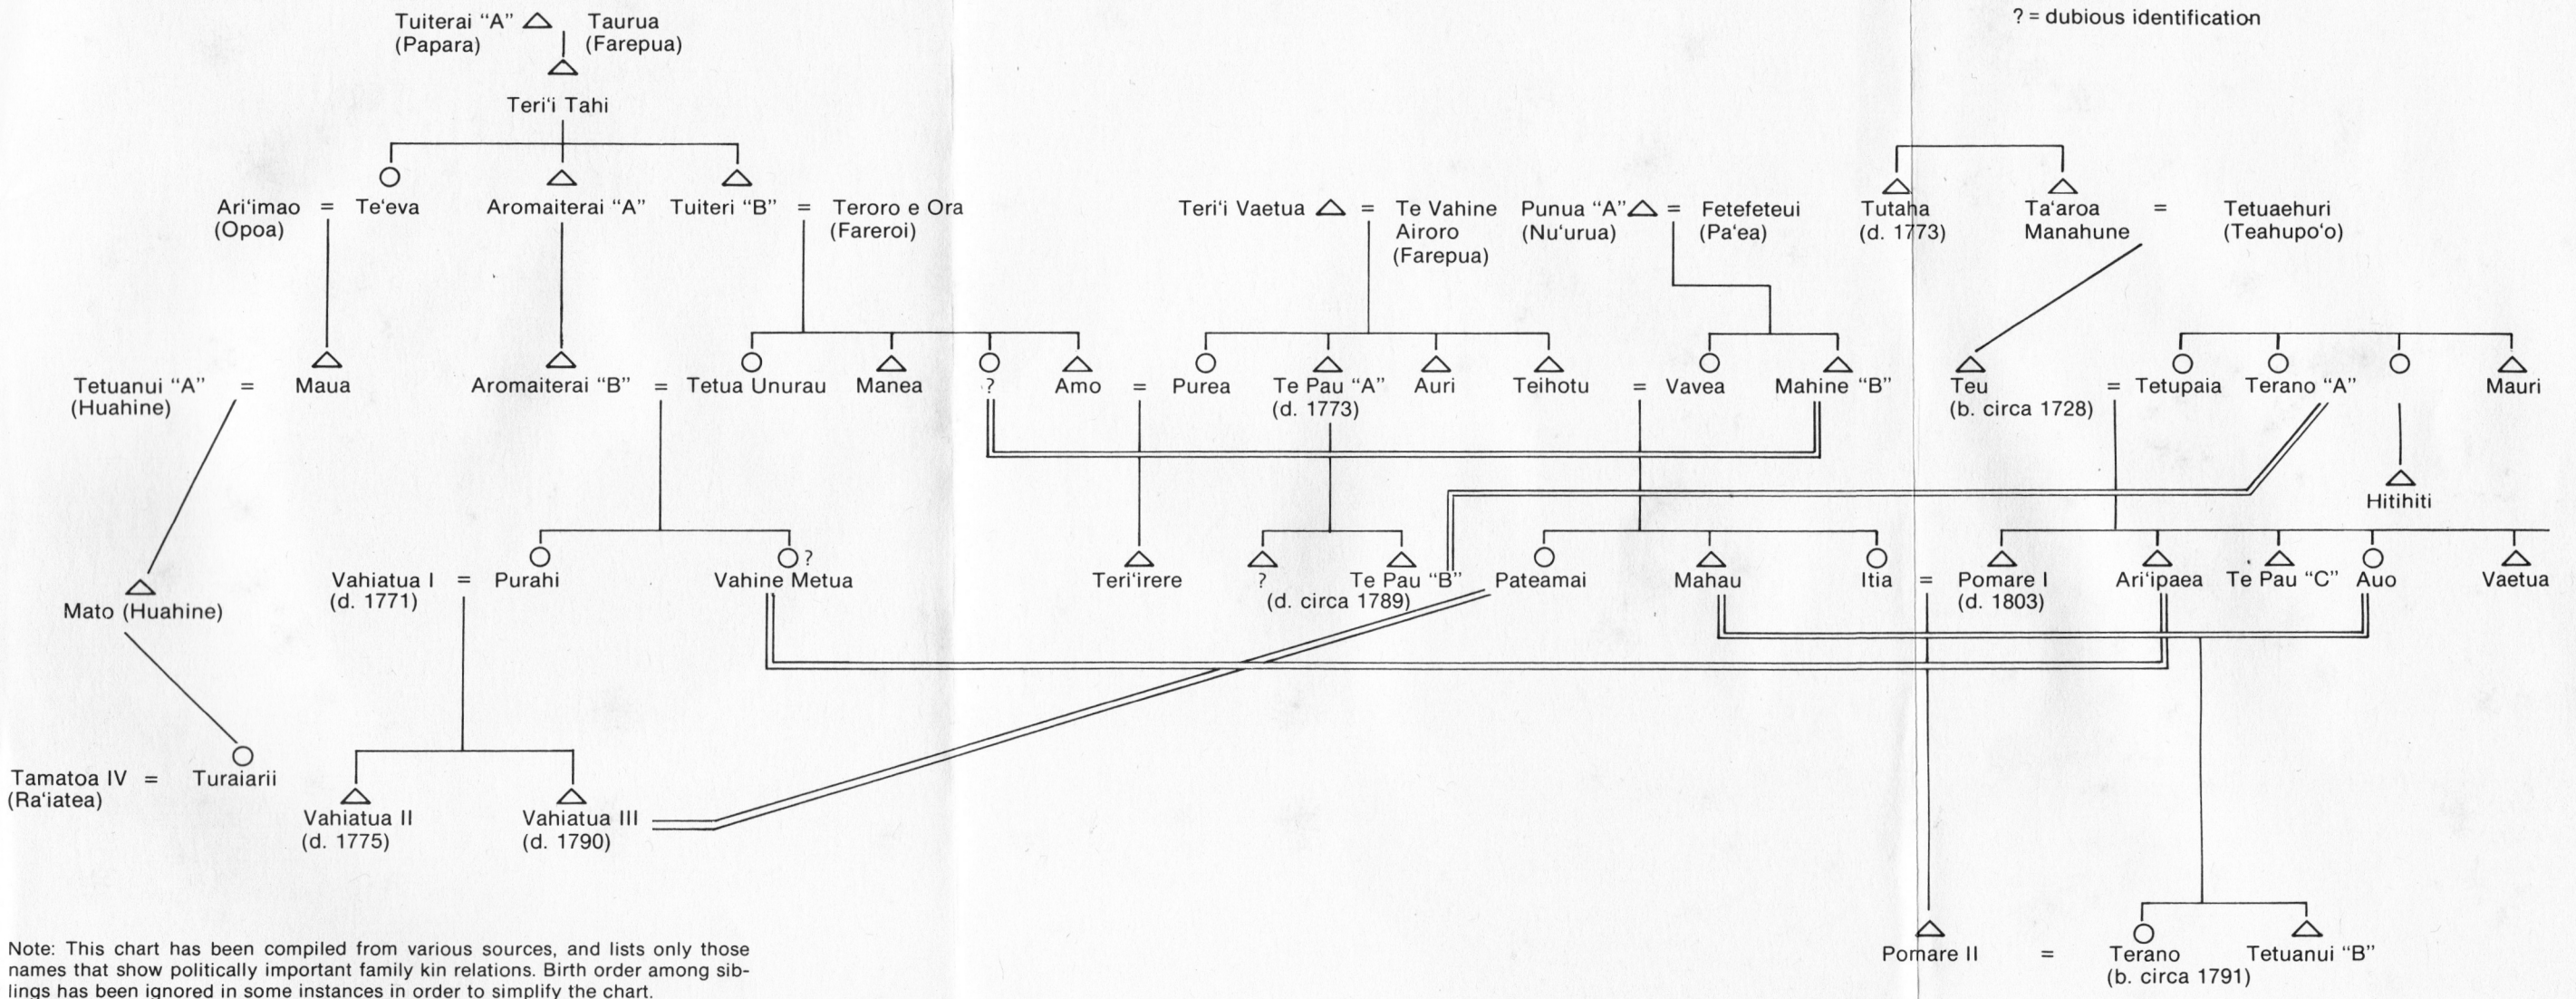

FIGURE 25-1. Kin relations among principals figuring in Early European Era political history of Tahiti-Moorea.

The relationships of these principals to others elsewhere will be described as the story unfolds; meanwhile it will be useful to reproduce some of what has been recorded about their personalities.

Figure 25-2. Kin relations among principals of Seaward Teva.

Vehiatua I, whom Cook and Banks met in 1769, had been in his prime a fierce and relentless warrior. An account of his war against Papetoai was reproduced in chapter 12; the same document provides an additional picture of his character in an account of his treatment of a "rebel" chief, Mae:

Vehiatua seeing Mae in the hands of a warrior and about to be slain, gave orders to spare, and secure him as a prisoner. According to usage a few captives were taken to be offered at the marae, these, with the captive chief, were marched to Taiarabu, the inferior prisoners were immediately offered in sacrifice to the gods. But Mae who was considered as a rebel was reserved for a more fearful end, as a warning to other chiefs on the peninsula. When this savage conqueror was surrounded by his warriors, he ordered the captive to be brought before him, pinioned his arms, ordered the scalp to be cut off, the eyes to be drawn from the head of the living victim and the body otherwise mutilated. During this diabolical process, the savage warriors ridiculed the agony and mimicked the contortion and dying struggles of the victim, and seemed to derive the greatest pleasure from the whole scene. To complete the disgusting tragedy the skull of the unhappy victim was carefully cut off, and made into a cup from which Vehiatua quaffed his frequent draughts of the inebriating ava, prepared by a process worthy of the cup from which he drank. (Thomson, *History*, pp. 24-25)

Vehiatua II, elder son and successor to Vehiatua I, was a wholly different kind of man; perhaps the clearest description of him is by G. Forster, who met him in 1773:

O-Aheatua, the king of O-Taheitee-eetee, (Little Taheitee) which is otherwise called Tiarraboo, was a youth of seventeen or eighteen years of age, well-made, about five feet six inches high, and likely to grow taller. His countenance was mild, but unmeaning; and rather expressed some signs of fear and distrust at our first meeting, which suited ill with the ideas of majesty, and yet are often the characteristics of lawless power. His colour was of the fairest of his people, and his lank hair of a light brown, turning into reddish at the tips, or being what is commonly called sandy. He wore at present no other dress than a white sash, (marro) round the waist to the knees, made of the best kind of cloth, and his head as well as all the rest of his body was uncovered. On both sides of him sat several chiefs and nobles, distinguishable by their superior stature, which is the natural effect of the immense quantity of food which they consume. One of them was punctured in a surprising

manner, which we had never seen before, large black blotches of various shapes, almost covering his arms, legs, and sides. This man, whose name was E-Tee, was also remarkable for his enormous corpulence, and for the deference which the aree (king) paid to him, consulting him almost upon every occasion. The king, during the time he sat on the stool, which was his throne, preserved a grave or rather stiff deportment, scarce to be expected at his years, though it seemed to be studied and assumed, only to make our meeting more solemn. (1777:I, 305-306)

The young chief was to die in 1775, after a lingering illness, which was described in almost daily reportorial detail by the Spaniard Rodriguez (Corney 1919).

Vehiatua III (also, Tetuaunumaona), younger brother of Vehiatua II, succeeded the latter to the office of chieftainship of Seaward Teva at the tender age of about seven and continued in office until his death some fifteen years later. I have found no direct description of his personality and only indirect and marginal references to his actions. In any case, he appears, like his brother before him, to have been strongly influenced if not actually dominated by his strong-willed mother, the famous Vahine Moeatua, or Purahi.

Hitia'a

As noted in chapter 3 the most outstanding Maohi of Hitia'a at the opening of this era was its tribal chief, *Reti*, who bore the kin-Title Teri'itua associated with marae Hitia'a. Reti is introduced to us in Bougainville's account of his short visit to Tahiti, specifically to Hitia'a, in April 1768. At that time Reti seems to have been in authority, but his father was still alive and active. Reti and his principal people conducted themselves hospitably toward the Europeans and were evidently pleased to have them there, after an understanding had been reached that the visit would be brief. From this and other evidence the impression we gain from this encounter is of a Maohi chief whose authority was benevolent and firmly established — that is, one who, unlike some other chiefs we shall meet, had no need or wish for European aid in maintaining or increasing his authority. According to the Spaniards who met Reti in 1774 he was at that time between forty-five and fifty years old. Gayangos described him as being "of good presence, full of humour active in body," adding that "he made himself more easily understood by all of us than did any other" (Corney 1915:133). To this evaluation Rodriguez added that Reti was "brown in hue, tall, very active, and has a large and deepish scar on the forehead; he is a man of proved bravery, and quick understanding" (Corney 1919:10). Even the more laconic English subscribed to this favorable evaluation:

Could I have prevailed on my self to have again altered My Conduct, and make choice of a Tyo [*taio*] or Friend, as is the Custom here, it should have been Ereti the Friend of *M. Bougainville*; not that he was less importunate & craving than

others; but because he was much more sensible and intelligent ... than any others were. (Wales, in Beaglehole 1961:799)

G. Forster wrote of him as follows:

O-Rettee was a fine grey-headed man, but very healthy and vigorous, as the old people of Taheitee in general seem to be; his countenance was the picture of a lively, chearful, and generous man. He told us he had been in many battles, and shewed us several wounds he had received, particularly a blow with a stone on his temple, which had left a deep scar. (1777:II, 85)

Boenechea's journal describes a meeting in 1774 with Teinui, a young man of eighteen or twenty, who was said to be the son of Reti (Corney 1913:314). Teinui also asserted that he himself was chief of Hitia'a, and, according to normal rules of succession, he may indeed have succeeded his father to kin-Titles and their ceremonial prerogatives. But the descriptions of his relations with his father indicate that the latter was at that time still very much the wielder of tribal political authority. According to Rodriguez, Reti also had daughters (Corney 1919:10); however, I have sought in vain for clues to Reti's other kin relations. Nor can I find any references to Teinui in accounts of subsequent events, or identify Teinui with any other name that appears later on. Reti himself was still alive during Cook's last visit, in 1777 (Beaglehole 1967:1344), but how much longer he survived I cannot discover.

In any case, Reti was at one time an ally of Tutaha, tribal chief of Pare-Arue, during the latter's war against the Seaward Teva in 1773. Earlier evidence of this relationship occurred during Bougainville's visit to Hitia'a, when Tutaha was afforded a friendly reception there (Bougainville 1772:229). And he seemed quite at home at Matavai at the time of Cook's last visit (G. Forster 1777:II, 85; Beaglehole 1967:1063). More puzzling is the connection between Reti and the Leeward Islands, for it was to the chief of Porapora (and conqueror of Ra'iatea) that Reti made a present of an anchor lost by one of Bougainville's ships off Hitia'a.⁷

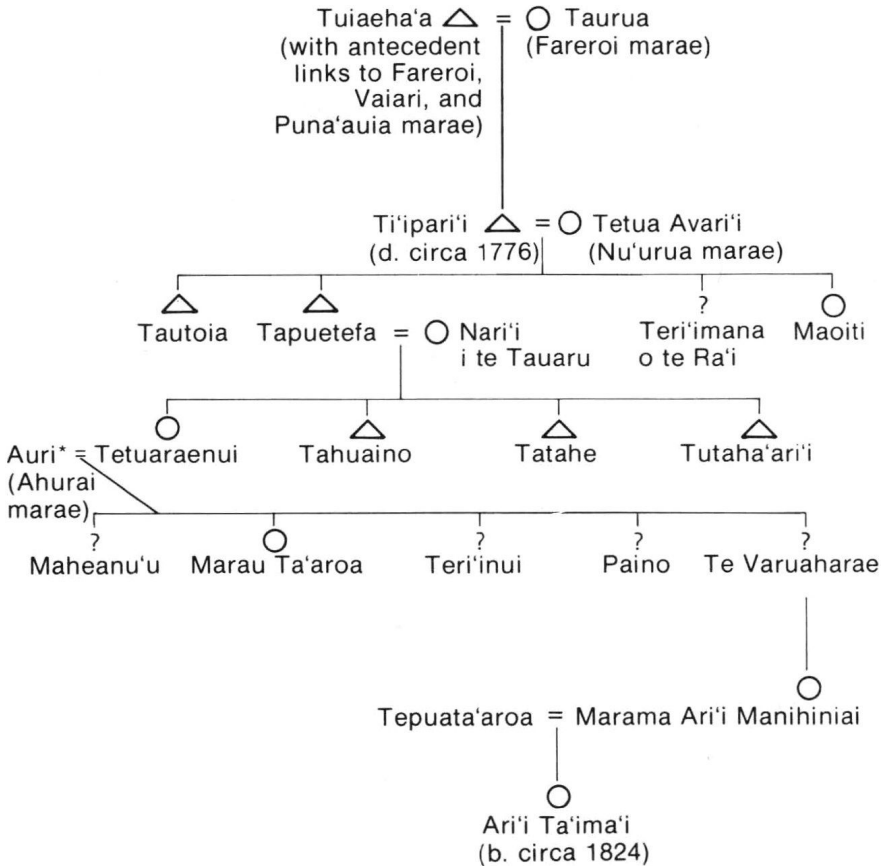

Writing in 1769, Cook described Hitia'a ("Whidea") as having two chiefs, Reti ("Orrette") and "Teemehinnee" (Te Mahinau?) (Beaglehole 1955:105); but I can find no other reference to the latter, or to "Fanaue," whom Henry identified as "under chief" of Hitia'a (1928:71). Names of still other Hitia'a "chiefs" are introduced into the historical cast by later writers (e.g., "Marre marre" and his son, "Oeehaitaih Otee" by Bligh in 1789, and "Teehu" by missionaries in 1801 through 1808),⁸ but I am unable to connect these with Reti or with anyone else.

Mahaena, Tiarei, Ha'apaiano'o, Ha'apape

No individuals from the tribal territories of Mahaena, Tiarei, and Ha'apaiano'o were prominent enough on Tahiti's political stage during the

first part of the “historical” era to draw Europeans’ attention; but some Ha’apape personages figured in the chronicles of that era. not only because European vessels made a practice of anchoring at Matavai Bay, but also because of the historical importance of certain individuals associated with Ha’apape’s marae Fareroi.

In Emory’s Ha’apape genealogy (reconstructed by him from notes of Brander⁹) the entries coming within the purview of this era are related, as shown in figure 25-3.

*Auri was brother of Porea and of Pomare I’s wife’s father.

FIGURE 25-3. Kin relations among principals of Fareroi.

Reckoning back from the approximately accurate birth date of Ari’i Ta’ima’i (the famous Papara dowager immortalized by Henry Adams), the Ti’ipari’i (“Little Ti’ipa”) here listed would have been born between 1700 and 1715, and his eldest son, Tautoia, between 1720 and 1735. (According

to Henry, Ti'ipa and Tuteia (Tautoia?) were names (or Titles?) of Ha'apape's high chief and underchief, respectively.) In 1774 Cook was met by a "chief" named "Tee," whom he described as an "Uncle to the King [i.e., Pomare I] and one of his prime ministers" (Beaglehole 1961:384).¹⁰ "Tee," who made himself helpful to Cook throughout this visit, was reportedly one of the "Principal People." Although "Tee" may have exercised some local influence he was clearly overshadowed by other notables from elsewhere who turned up at Matavai, and he seems not to have possessed the authority one might expect of the chief of an autonomous tribe, despite his distinguished connections.¹¹ "Tee" died some months before Cook's last visit, in 1777, when his preserved corpse was still on view (Beaglehole 1967:208).

The middle-aged woman who was seen in Matavai and whom Wallis took to be "Queen" of Tahiti was Porea — who was not "queen" of any place, and whose main connections with Ha'apape derived from the marriage of her brother Auri to Tetuaraenui (see fig. 25-2), and from her husband Amo's mother, Teroro e Ora. Porea's ancestral home was Fa'a'a, and she resided at Papara, the home of her husband; the respectful consideration shown to her at Matavai was based on these other connections, and probably also upon her notoriously imperious bearing in whatever company she happened to be.

When H.M.S. *Bounty* was at Matavai in 1788 the local chief was one called "Poen" ("Poenu," "Poe'eno"); such was also the case during Vancouver's visit (December 1791 to January 1792) and during Bligh's return visit some months later.¹² The nearest name to "Poen" I can find on the Ha'apape genealogy (fig. 25-2) is Paino, who would have been a great-grandson of Ti'ipari'i — a not impossible identification, if the genealogy may be trusted. In any event, by this late date Matavai, and possibly all Ha'apape, had become at least intermittently subordinate to Pare, whose situation we will consider.

Poreonu'u

By 1767 the inhabitants of Pare-Arue constituted a unified and fairly stable tribe known as Te Porionu'u. Inasmuch as it was the principal personages of this tribe who succeeded eventually in consolidating political authority over all Tahiti and Mo'orea, we need to look very closely into the genealogical connections on which their political pretensions were founded. It goes without saying that it is unrealistic to hope for historical reliability; Maohi genealogies were no less subject to manipulation than were other forms of verbal "documentation." The extent to which the genealogies in question were thus manipulated is evident in statements attributed to the two most "authoritative" Maohi historians of post-European times: Mare and "Queen" Marau. The former mobilized genealogical evidence reaching back to the Maohis' most venerable *ari'i* marae in order to "prove" the supremacy

in rank of the Poreonu'u chiefs' Titles over all others throughout the archipelago. In striking contrast, Marau (in the words of her amanuensis, Adams) characterized the Poreonu'u chiefs as having been "an inferior chiefdom" with their principal roots in the savage, "Manahune," Paumotus. (Handy 1930:79; Adams 1901:84.)¹³ With respect to their genealogical evidence, and insofar as that evidence is "authentic" (in terms of Maohi admissibility, which is the criterion most relevant to our present concerns), both these authorities were of course "right," for like most Maohi notables the Poreonu'u chiefs had antecedents reaching in all directions and back to the gods themselves. But rather than reproduce any of these genealogies in full, my present purposes will be amply served, first, by summarizing some fairly consensual traditions regarding the beginnings of this chiefly line in Pare-Arue, and, second, by identifying in detail the eighteenth-century representatives of that line.

According to Adams, Arue and Pare formerly constituted separate tribes (1901:77ff). There may have been other eras during which they were allied with one another, or even joined together into a single tribe, but some traditions have it that the unity manifested during the era now under study was established in consequence of the settlement there of a chiefly personage from Fakarava (Paumotu) named Tu. Here is the Ari'i Ta'ima'i-Adams version of this episode:

Aimata's son, Pomare V, the last king, wanting to establish his title to lands in the Paumotus, had naturally to acknowledge the connection and to prove his descent. The genealogy adopted for the occasion made the first Tu, who came from the Paumotus, grandfather to Taaroa manahune, who married Tetuaehuri i Taiarapu, as I have told in Chapter III. Tu of Faarava, having undertaken a visit to the distant land of Tahiti, came in by the Taunoa opening, which is the eastern channel into what is now the harbor of Papeete. Landing at Taunoa a stranger, he was invited to be the guest of Mauaihiti, who seems to have been a chief of Pare. Tu made himself so agreeable, or so useful to his host, that Mauaihiti adopted him as *hoa*, or brother, with the formal ceremonies attached to this custom, which consist in a grand feast, and union of all families, and offering of all the rights and honors which belong to the host. Tu accepted them, and at the death of Mauaihiti he became heir and successor in the chief's line. He gave up all idea of returning to the Paumotus, and devoted his energy to extending his connections in Tahiti. He himself married into the Arue family, which gave his son a claim to the joint chiefery of Pare Arue; and at last his grandson, or some later generation, obtained in marriage no less a personage than Tetuaehuri, daughter of Vehiatua of Taiarapu. The received genealogy represents the son of Taaroa manahune and Tetuaehuri as Teu, who was known as Hapai or Whappai to the English, and lived into this century, but Tahitian genealogies have a perplexing way of dropping persons who do not amuse them, and there may well be a leap of one or two generations in that of Pomare. (Adams 1901:85)

Another version, derived from Ari'i Ta'ima'i's daughter, Marau, exemplifies the last sentence in the above passage and also reverses the positions of Pare and Arue:

According to Marau, the Tu or Pomare family of Pare were descended from a Taumotuan chief name Tu who came from the atoll of Fakarava in the 17th century. Tu was adopted (*fa'a taua*) by an *iatoai* named Mauaihiti, in Arue. Later it is said, he married a daughter of the chief of Arue. Their son was Taaroa-Manahune, to whom this anomalous name, or nickname, came as a result of an insult sustained in reference to his Taumotuan derivation. Taaroa-Manahune married Tetua-e-huri, daughter of Vehiatua of Teahupoo. Their son was Teu, who was married in the middle of the eighteenth century to Te-tu-paia, chiefess of Opoa, Raiatea. The son of this marriage was Tu (Cook's "Otoo"), later known as Pomare I. (Handy 1930:76)

To further complicate matters, a reconstruction put together from various sources by Newbury and labeled "Origins and Genealogy of the Pomare Dynasty" derives the Paumotuan link from a marriage between a Pare chief and a Paumotuan woman in the latter part of the seventeenth century (1961: Appendix I). And the famous Puna'auia genealogy, the one publicly adopted by the Pomares themselves (Emory, Marae Traditions), traces the "official" Pomare line some forty generations back from Vaira'atoa, the first in the line to bear the name Pomare, showing links to the most venerable and highly respected marae of Tahiti and Mo'orea, and with no mention whatsoever of any Paumotuan forebear.

Without attempting to decide which, if any, of these accounts is the "true" one, we can rest assured that the enemies of this chieftainship selected the versions that imputed the most recent and socially inferior origins to it.

Be that as it may, the eighteenth-century representations of this chiefly line included some forebears of sufficiently high kin-titular rank to secure for them almost universal acknowledgment of their rights to certain preeminent ceremonial privileges. For purposes of this narrative I use the eighteenth-century phase of the "official" Puna'auia genealogy (Emory, Marae Traditions), beginning with a Tutaha (whom I shall designate "Old" Tutaha), who appears to have been born about 1680 and who is described as having resided both in Puna'auia and in Pare-Arue (near marae Tarahoi).

As several members of this set of kin played such key roles in the events we are concerned with, I should attempt to identify them; but this is easier said than done. Not only is identification obscured by Europeans' inconsistencies in transcribing Maohi names, and by individuals having had multiple names, but there are some significant differences among the various recorded family inventories with respect to numbers of offspring and (a crucially important factor) to order of birth.

"Old" Tutaha, who evidently died long before 1767, affects the story mainly in having provided his descendants with consanguineal links with Tarahoi, his primary ancestral marae in Pare-Arue, and also with important marae in Ha'apape, Fa'a'a, Afareitu (Mo'orea), Fa'ahiti, and so forth. To this array of potentially useful kin connections, his wife, Tera'iatua, added

her own immediate connections with marae Tepotuarai of Pappararau (Puna'auia).

Tutaha (m) married Tera'iatua, of Te Potuari
Born 1680 marae (Puna'auia)

offspring:

1. (m) Ta'aroa Manahune. Born circa 1705?
2. (m) Tutaha (Banks' "Hercules"). Born circa 1708?
3. (f) Te Vana'a o Tane.
4. (f) Te Reiatua.

Ta'aroa Manahune, married (first wife) Tetuaehuri of marae
(resided at Matahihae and Tarahoi) Matahihae (Teahupo'o)

offspring:

1. (m) Teihamoeroa i Matahihae (or Fa'atupuai i te Ra'i o Vehiatu i te Mata'i). Also called Teu and Hapai. Born circa 1728.
2. (m) Mauaroa (or Teri'i Hinoi Atua). Called "Mowroah" by Bligh, who viewed his corpse in 1792.
3. (f) Teri'i ae Atua.

(second wife) Tetua Umeretini
i Vairao (also called
Mataitatia) of marae Nu'utere.

offspring:

4. (m) Te Fana Mua i Tarahoi.
5. (f) Tetua Umeretini.
6. (f) Uratua.
7. (m) Te Aha Huri Fenua.

This couple's oldest child, Ta'aroa Manahune, who evidently also expired before 1767, extended the family connections to Teahupo'o and Vairao through his marriage to high-ranking women in these districts; but it is his younger brother, Tutaha, who engages our interest as a living participant in the events under study. Tutaha has also been identified as "brother" of Teu (see G. Forster 1777:II, 92 and Gunson 1964:68), but I am inclined to accept the Puna'auia genealogy in this particular, especially since it was confirmed by that punctilious investigator, Bligh (1789:II, 62).¹⁴

According to my calculations Tutaha ("Tootaha," "Tutuhah," "Tuteha," "Dootahah") was born about 1708; 'he died in battle in 1773. Banks dubbed him "Hercules," whom he seems to have resembled in physique (Beaglehole 1962:I, 258). Being only a second-born son, Tu-

taha's kin-Title evidently ranked lower than that of his elder brother, Ta'aroa Manahune (and of the latter's eldest son, Teu); but there is no question whatsoever that it was Tutaha who exercised the chiefly authority over Pare-Arue during Cook's first visit to Tahiti.

Of all these Courts Dootahah's [in Pare] was the most splendid, indeed we were almost inclined to believe that he acted as Locum tenens for *Otou* [Tu, Pomare I] the *Earee rahie* [*ari'i rahi*], his [great] nephew, as he lived upon an estate belonging to him and we never could hear that he had any other publick place of residence. (Beaglehole 1962:I, 385)

Indeed his influence was so powerful in that part of the island that in neighboring Ha'apape, through a grandparent's connections there, he was able to interdict the local residents' trade with Cook:

Early this Morning the Master went to the Eastward in the Pinnacle to try if he could not procure some Hogs and Fowls from that quarter, but he returned in the evening without success, he saw but a very few and those the Inhabitants pretended belonged to Tootaha: so great is this mans influence or authority over them that they dare part with nothing without his consent, or other wise they only make use of his name to excuse themselves from parting with the few they have, for it is very certain these things are in no great plenty with them. (Beaglehole 1955:92; see also Beaglehole 1962:I, 274.)

And his connections and influence in Fa'a'a and Puna'auia were such as to entitle him to receive the Europeans there with all the formality of a visit of State.¹⁵ In fact, so evident was this man's authority and influence that Cook described him as "the Chief man of the Island" (Beaglehole 1955:85).¹⁶ In any case, whatever the extent of his personal influence, or of his kinship connections, Tutaha's *tribal* domain was Pare-Arue, and his principal marae was Tarahoi, on Pare's Cape Utuhaihai (Cook's Marae Point).

By my calculations Teu (Hapai) was born about 1728; he lived until 1803, and although he was close to the events that shaped these Islands' political history, he seems to have played a relatively minor role in them. In fact, his most notable actions were his marriage to Tetupaia ("Ober-roah"), the eldest offspring of Tamatoa III, Ra'iatea's highest-ranking kin-Titleholder and sovereign chief, and his siring of Tu, or Pomare I. Cook and Banks do not even mention Teu during H.M.S. *Endeavour's* visit in 1769. In the journal of his second voyage Cook mentions him briefly, as Tu's father, and as having interdicted local trade with the English on one occasion; but that is all. Here is G. Forster's description of an encounter with Teu, in 1773:

As this visit was merely a visit of ceremony, we soon got up to return to our boat, but were detained a little longer by the arrival of E-Happai the father of the sovereign. He was a tall, thin man, with a grey beard and hair,

seemed to be of a great age, but was not yet entirely worn out. He received the presents which our captains made him, in a cold careless manner, which is natural to old people whose senses are considerably impaired. The accounts of former voyages had already apprised us of that strange constitution, by virtue of which the son assumes the sovereignty in his father's life time, but we could not without surprize, behold the aged Happai, naked to the waist in his son's presence, conform to the general custom. Thus the ideas universally annexed to consanguinity, are suppressed in order to give greater weight to the regal dignity, and I cannot help thinking that such a sacrifice to political authority, argues a greater degree of civilization than has been allowed to the Taheitians by our former navigators. However, though Happai was not invested with the supreme command, his birth and rank entitled him to deference from the common people, and to a proper support from the king. The province or district of O-Parre, was therefore under his immediate orders, and supplied not only his wants, but those also of his attendants. (1777:I, 330-331)

In 1788 Bligh described Teu as follows: "I found this Old Cheif, who I suppose is about 70 Years of Age, lying under a Small Shed ... He is a tall Man with weak Eyes and his Skin is much Shrivell'd and Dried by drinking of that punicious [pernicious] Root the Ava" (1789:I, 382).

In 1803, when Teu died, the Davies *History* described him as "probably the oldest man on the Island," and as having been for some time "quite childish" (Newbury 1961:59).

Most of Teu's offspring played key roles in the events herein chronicled. To begin with, however, we must attempt to resolve some discrepancies in the sources concerning the number and birth-order of these offspring. Putting together information from various sources (including eyewitness accounts by G. Forster and Bligh), I propose the following list in order of birth:¹⁷

1. Te Ari'i na Vaho Roa, also Tetua Nihura'i; a girl born circa 1749.
2. "Tedia Towrai" (Tetua te Ahurai?), also Ari'ipaea Vahine and Fataua; a girl born circa 1750.
3. Tu Nui e A'a i te Atua, also Vaira'atoa, Pomare I, and Tina; a boy born circa 1751.¹⁸
4. "Tedia Tehamai" (Tetua te Ahamai?); a girl born after Tu, died young.
5. Te Ari'i Fa'atou, also Ari'ipaea; a boy born circa 1758.
6. Te Tupuai e te Ra'i, also Vaetua, Maioro, and Paiti; a boy born circa 1763.
7. Auo, also "Erreretua"; a girl born circa 1768.
8. Te Pau; a boy born circa 1770.

Teu's eldest child, Te Ari'i na Vaho Roa, is something of a mystery. According to several sources she was married to Teri'irere, chief of Papara, who was some thirteen years younger than she; but she bore him no children. She died sometime prior to 1789 (according to Bligh) without having

actually figured in any way in the stormy events of the time. The obscurity surrounding the existence of this eldest member of an otherwise politically active set of siblings is particularly puzzling in view of the status of her next younger sister, Tetua (te Ahurai?), "Towrai," also called Fataua and Ari'ipaea Vahine.¹⁹ The latter, whom G. Forster described as having "almost as great authority among the women, as the King her brother [i.e., Pomare I] had in the whole Island" (1777:II, 96), removed to Ra'iatea at what must have been an early age (probably because of her mother's connections there). She does not enter the story until 1789, when she returned to Tahiti on a visit; on this occasion Morrison wrote of her as follows:

This woman being the first Born has the right of the Sovereignty of Taheite but having no Child she had Transferd the right to her Brother [i.e., Pomare I] during her Absence, and now Continues it to his son [Pomare II]; tho she is not out of Power herself by it when she visits Taheite, being always honor'd and respected.... (1935:101)

I am at a loss to explain Morrison's identification of her as "first Born" in the face of Forster's and others' assertions that that position belonged to Te Ari'i na Vaho Roa. However, Ari'ipaea Vahine was more politically active and influential than her elder sister.

This Homage [i.e., of being uncovered to] is due to Otoo [Tu, Pomare I] as Earee dehie of the isle, to Tarevatou [Te Ari'i Fa'atou] his Brother and [blank] his second sister, to the one as heir and to the other as heir apparent [blank] his eldest Sister being married, is not intitled to this Homage. (Beaglehole 1961:409-410)

According to Morrison's report, which is contradicted by no other that I know of, Ari'ipaea Vahine was childless. G. Forster, writing in 1774, described her as unmarried; whether she remained so thereafter cannot be ascertained, but the circumstance of childlessness and postponed marriage (or no marriage at all), when considered in connection with her activities and influence, suggests that she may have been a leading member of the Arioi — a status that may have outweighed the social superiority ascribed to her elder sister by birth.

The first son of Teu and Tetupaia is our principal character. Tu Nui e A'a i te Atua ("Tu," "Otu," "Otoo"), also known as Vaira'atoa, later became Pomare I, and — after this newly assumed Title passed to his son — ended his days mainly as Tina ("Tynan"). This individual, whom I shall continue to call Pomare I (for the sake of clarity, even though the Title Pomare was not assumed until his adult years, and even though he retired from that Title upon his son's succession), must have been born between 1748 and 1752; he died in 1803. I shall have much to say later on about his character and actions, but can point out now that he was a very large man (according to G. Forster, he was the tallest man on Tahiti [1777:I, 326]; see fig. 25-4). He may also have been physically powerful,

but his talents were better suited to political maneuver than to physical combat. He began his career as chief of the relatively small tribe of Poreonu'u (Pare-Arue), but possessed in addition the less tangible but immensely important asset represented by kin connections with several high-ranking and/or tribal chiefly persons elsewhere, including principally a link through his mother with Ra'iatea's highest-ranking dynasty.

FIGURE 25-4. Pomare I. "O Tu-Nui-e-A'a-i-Te-Atua, Lord Paramount of Tahiti (1747-1803)." Drawn from life by W. Hodges in 1773. Greenwich Hospital, Greenwich, England.

Of the number of women who shared Pomare I's sleeping mat from time to time,²⁰ there were three whose relations with him had some degree of institutionalized "permanence." One of these was his official "wife." Although I can find no account of the performance of their nuptials, I conclude that there must have been such, inasmuch as the offspring this woman bore Pomare I were generally recognized as his successors and heirs. (While recognizing the fact of their "marriage," some Tahitian factions did, however,

FIGURE 25-6. Some kin relations of 'Itia's mother.

This family was associated with Mo'orea's preeminent marae, Nu'uruua, and, as I shall show, 'Itia's uncle Mahine was Mo'orea's most powerful chief during the 1760s and 1770s. Through her maternal grandmother, Fetefeteui, 'Itia traced connections with high-ranking Titleholders of Pa'ea and elsewhere. Vancouver provided a description of her:

The queen-mother, although destitute of any pretensions to beauty, and having in her person a very masculine appearance, has yet, in her general deportment, something excessively pleasing and engaging; free from any austerity or pride, she is endued with a comparative elegance of manners, which plainly bespeaks her descent, and the high situation in which she is placed. Although her figure exhibited no external charms of feminine softness, yet great complacency and gentleness were always conspicuous; indicating, in the most unequivocal manner, a mind possessing, and alone actuated by those amiable qualities which most adorn the human race. All her actions seemed directed to those around her with an unalterable evenness of temper, and to be guided by a pure disinterested benevolence. Self, which on most occasions is the governing principle in the conduct of these islanders, with her was totally disregarded; and indeed, such was her very amiable disposition, that it counterbalanced any disadvantages she might labour under in a deficiency of personal attractions. (Vancouver 1801:320-321)²²

The second consort of Pomare I was, as noted above, a younger sister of 'Itia. In referring to this woman the sources apply three different names to her: Pateamai (Emory, Adams), Vaiareti/Vaieriti (Bligh's "Whyerredee," Vancouver's "Fier re te"), and Teano (Morrison); but putting together the circumstantial evidence provided by these sources, I am fairly certain that they all refer to the same person. Vaiareti (for so I shall call her) was first married to the sovereign chief of Tairapu, Tetua Ounumaona, the younger brother and successor of the Vehiatua who died in 1775, during the Spaniards' stay at Tautira. Tetua Ounumaona, who also bore the Title Vehiatua, died in 1790, without issue. Vaiareti, shortly after having been widowed, must have joined her elder sister, 'Itia, in Pomare I's household. This timing accords with Bligh's statement, in 1792, that he was "surprised ... to find Tynah [Pomare I] to have another Wife while Iddeah was living" (1792:130). In other words, when Bligh left Tahiti at the end of his previous visit, in 1789, the new "wife" was not yet in evidence. As we shall see, these connections provided additional rationale for the subsequent political union of Pare-Arue and Tairapu.

Apparently, the new arrangement was a congenial one all round. Bligh described Vaiareti as being “a Woman of Iddeah’s Stature, but [having] a much handsomer Countenance,” and he added that “the Women were on the best of terms with each other” (1792:130). Indeed, so close was their relationship that ‘Itia expected Vaiareti to look after her (‘Itia’s) own offspring:

Tynah and his Wives as usual dined with me to day. He took an opportunity to solicit the attendance of the Surgeon on his youngest Child Oro(a)oh, who he said was very ill. We found it under the care of an Old Man, for what is strange, Women are not permitted to be attendants on any of the Royal Family, so that Male or Female, the Children are unnaturally nursed by Men. The Complaints of the Child was said to be in his bowels, — the belly was much distended; but the Scorfula (?) seemed the most alarming symptom, for in one groin it had broke out, & in the other were swellings which convinced us of the deplorable state this poor infant was in. I told Iddeeah to take better care of her Child, and altho I disputed the propriety, she insisted that Whyerreddee’s attention should be engaged towards it & not particularly hers. (Bligh 1792:155b)

Vancouver, writing a few months earlier, provided a sharper contrast between the sisters, along with a description of their mutually shared position of privilege:

The portrait of *Fier re te* on canvas would most probably be generally thought intitled to a preference; yet she appeared by no means to possess either mental endowments, or other excellent qualities, in the same degree with the queen-mother; if she had them, they were latent, and required some particular exertion to bring them into action. Her softness and effeminacy afforded her some advantage over her sister; yet there was a shyness, want of confidence and manner in her general demeanor, that evinced her motives to be less disinterested. We were however led to believe, that she was not destitute of the amiable qualities, though to us they did not appear so conspicuous as in the character of the queen-mother. Of the two ladies, *Fier re te* was now the favorite of *Pomurrey*, at least we had every reason to think so by the general tenor of his conduct.^[23] Notwithstanding this preference, he was observed in several instances to abide implicitly by the advice and opinion of the queen-mother, and to treat her with great affection and regard; who in return never appeared jealous or dissatisfied at the marked attention, or evident partiality, with which her sister *Fier re te* was treated by *Pomurrey*. (1801:321-322)

The third woman to have had more than a casual connubial relationship with Pomare I was Pepiri (“Pepeere”), described by Turnbull in 1802 as one who “attended him [Pomare I] in the double capacity of mistress and servant” (1813:140). Pepiri was a daughter of Piha, a man of Vaiuriri, whose rank, or at least tribal authority, entitled him to a polite formal relationship with Pomare. In other words, Pepiri herself was of some social consequence; but there is no evidence that her connection with Pomare I was ever institutionalized by formal marriage rites. Nor does Pomare’s connection with her appear to have had any political intent; Pepiri’s father was a minor notable, at most, and he ended up among the enemies of Pomare I’s successor

and was slain and sacrificed by the latter's supporters in 1807 (Newbury 1961:99).

Vaiareti's incumbency seems to have been short lived; she was Pomare I's favorite during the early 1790s, but had dropped out of the picture by the time the missionaries arrived, in 1798. She was succeeded, it appears, by Pepiri. Of the three, 'Itia was most consequential by far. She bore all of Pomare I's acknowledged children, and she remained his ally and solicitous aide to the end of his days. Perhaps even before she bore him his last child she began to maintain her own separate establishment, which she shared with a succession of paramours, but this seems not to have affected her non-sexual relations with Pomare I.

The second son of Teu and Tetupaia was Ari'ipaea ("Oreepyah"), or Te Ari'i Fa'atou, who was born circa 1758 and who played a very active part in the events to be described.²⁴ As noted earlier, Ari'ipaea's wife was the famous Vahine Metua ("Inomedua," "Inna Madua"), or Teri'itua i Hitia'a. (She is not to be confused, however, with the Teri'itua i Hitia'a, or Reti, who was chief of Hitia'a.) I am at a loss to describe this woman's antecedents. Adams listed her as a daughter of Aromaiterai (of Papara and Mataoa) and of Tetua Unurau (sister of Papara's chief, Amo), and hence a sister of Te Vahine Moeatua, the widow of Tairapu's Vehiatua I (1901:32). This may be so, although as Gunson pointed out, it was unusual for uterine siblings to be so far apart in age — that is, Te Vahine Moeatua was born circa 1736 and Vahine Metua circa 1762 (1964:63). In any case, the younger woman's antecedents were superior enough to warrant her marriage to the high-ranking Ari'ipaea, and the position assured her by pedigree was reinforced by virtue of a strong personality.

The next offspring of Teu and Tetupaia was a son, Te Tupuai e te Rai, also known as Paiti (which I shall call him), Maioro, and Vaetua ("Why-dooah," "Whytooa," "Wyetua," "Widouah"). Paiti, who was described by Mortimer in 1789 as "a very impudent, dissolute young man," much addicted to kava (1791:45), also acquired a reputation as a bold warrior. He wielded great influence in Ha'apaiano'o, where he resided most of the time — why, I do not know, but possibly because of marital connections there (Bligh 1789:I, 411; Vancouver 1801:300ff). He was also given to homosexual practices, as witnessed by a missionary. According to Wilson, Paiti was an Arioi "of the first rank" (1799:179).

After Paiti was a daughter, born about 1768, named Auo ("Wowwo"), also called "Terreerree" (by Cook), "Erreretua (by G. Forster), and "Why-erreddee" (by Bligh). The Puna'auia genealogy places Auo *before* Paiti in birth order, but Bligh (1792:141), G. Forster (1777:II, 96), and Henry (1928:249) placed her after him, with which I am inclined to agree; in any case, the question is not structurally crucial, as is the one regarding

Ari'ipaea Vahine noted above. Auo's chief significance derived from her marriage to Metuaro Mahau (or Ta'aroari'i), a high-ranking kin-Titleholder and influential tribal chief of Mo'orea, of whom I shall say more later on.

The last-born child of Teu and Tetupaia was a son, Te Pau Ari'i i Tarahoi ("Teppahoo," "Tuppahoo," "Tepaow"), of whom Vancouver wrote the following in 1792, when this Te Pau (there were several of that name or Title) was about twenty-two years of age:

There is yet a fourth brother whose insignificance has hitherto precluded his name, which is *Tapahoo*, from appearing in any of our transactions with these worthy people. Although in the possession of a very considerable property, *Tapahoo* seems little regarded by his family, and less esteemed by his people. This want of respect is greatly, and possibly wholly, to be attributed to a natural imbecility of mind; as, to all appearance, he is a young man of an exceedingly weak and trifling character. (1801:325)

Evidently, however, his shortcomings did not stand in the way of his political advance, for he succeeded to the chieftainship of Fa'a'a upon the death of that tribe's chief, also named Te Pau. Bligh's explanation for this succession was that the elder Te Pau (i.e., Te Pau "B" in fig. 25-1) had married a sister of the younger Te Pau's (Te Pau "C") mother, Tetupaia (Bligh 1792:135). It is in fact possible that Te Pau "B" had no son of his own, and moreover that Te Pau "C" was his namesake, and perhaps even adopted son.

When the *Dolphin* anchored in Matavai Bay, Pomare I was between fifteen and nineteen years old, and his youngest sibling, Te Pau "C," was still unborn. Although Pomare I was accorded the deference due a successor to the de jure chieftainship of Pare-Arue, and the ceremonial respect to the incumbent (through his mother) of a *maro ura* kin-Title from Opoa, he was very decidedly under the de facto tribal authority of his great-uncle Tutaha. In fact he was so overshadowed by the latter that Wallis evidently did not even know about the young man's existence. Even Cook, writing in 1769, knew no more about him than that there was somewhere nearby a sovereign *ari' rahi* "which was not Tootaha from what we could learn, but some other person we had not seen, or like to do, for they say that he is no friend of ours and therefore will not come near us" (Beaglehole 1955:104). According to Banks, "The *Earee ra hie* [*ari' rahi*, i.e., Pomare I] is always the head of the Best family in the country; to him great respect is paid by all ranks but in Power he seemd to us inferior to several of the Principal *Earees*, nor indeed did he once appear in the transacting of any part of our business" (Beaglehole 1962:I, 384).

Fa'a'a (Te Fana)

The triangle-shaped area between Pare and Puna'auia known as Tetaha, or Fa'a'a, was occupied by a unified tribe known as Te Fana i

Ahurai — Ahurai having been the marae of the tribe's highest-ranking kin-Titleholders and tribal chiefs. Handy included this population among the Oropa'a, along with Puna'auia and Pa'ea (1930:71)²⁵ and such an alliance undoubtedly existed from time to time; but during parts of the Early European Era the chiefs of Te Fana acted independently, and entered into intertribal coalitions to suit their own purposes. Adams characterized this tribe's position in the following terms:

The district of Faaa, though it contained only about seven miles of seacoast, was for many reasons very important. It stood, as an independent little nation, between the great Teva alliance in the south, the Porionuu and te Aharoa in the east, and the large island of Eimeo or Moorea, some twelve miles to the west. As Tefana leaned toward Papara or against it, the chiefs of Papara were apt to be less anxious about their enemies or more anxious to win friends. (1901:41)

I listed, earlier in this chapter, the members of the leading family of Fa'a'a who were alive during the first years of the era now under study. Their various kin connections and ties of sentiment indicate how central was the part played by this small tribe in Tahitian-Mo'orean history. The senior member of the family, and its tribal chief, was Te Pau i Ahurai (also called Tupura'a i Tamaiti), who appears in the sources as "Toobouratomite," "Tipouro," "Teppahoo," and "Lycurgus."²⁶ During Cook's first visit, this chief, who was most hospitable and helpful to the visitors, appeared to be as much at home in Pare-Arue as in his own home district, and he was evidently on the best of terms with the Pare-Arue chief Tutaha. His younger brother, Teihotu, does not figure in the recorded events of that era; but, as we have already seen, the latter's wife, Vavea, was a member of Mo'orea's leading family, and his daughters married the chiefs of Pare-Arue and Taiarapu, respectively. Still another brother of Te Pau's, Auri, acquired affinal connections with leading families of Puna'auia and Vaiari; and a sister, Purea, was principal consort of the chief of Papara. Te Pau himself (Te Pau "A" in fig. 25-1) was killed in 1773, along with his ally Tutaha, in their joint expedition against the Seaward Teva. Thus, it is his successors who are of more direct relevance to subsequent events, but the identity of these successors is puzzling.

During Cook's second and third voyages, of all the individuals met by the captain and his aides, the one whose presence was most commanding, and whose influence and authority was most extensive in Tahiti's northwest quadrant, was one whose name was first recorded as "Towha" ("T'tewha," "Tettewah," "Tetewha," "Tewha," etc.). It was he who was "Admiral" of the impressive assembly of war canoes reviewed by Cook in 1774, who orated so eloquently and commandingly when occasion demanded, and who was in fact so superior to Pomare I — in probity, in courage, in qualities of leadership, and so forth — that even the Pomare-

serving English came in time to acknowledge the contrast. (Beaglehole 1961:389; Beaglehole 1967:219n)

"Towha" seems to have been equally at home in both Fa'a'a and Pa'ea. Adams identified him as having been leader of the "family" of Ahurai (1901:94), but his name does not appear on any Ahurai genealogy that I know of, and he was almost certainly not the titular successor to the Te Pau i Ahurai mentioned above, who died in 1773. Adams also stated that Towha's other name was "Tahua," but I can find no confirmation of this in any journal or genealogy. My own conclusion is that "Towha" is the Te To'ofa, whom Henry listed as having been an "underchief" of Pa'ea, the same Te To'ofa perhaps whose Title, Taura Atua i Patea, was associated with one of the three marae which made up that district's Maraeta'ata temple complex. This is confirmed by such statements as J. Forster's, naming him one of the two "joint-chiefs" of Atehuru (1778:354). Cook described "Tewha" as having been "Chief of the district of Tettaha" (Cook 1784:30),²⁷ and he undoubtedly wielded authority over that tribe, but his Ahurai kin-Title (if indeed he held one) ranked inferior to that of the titular successor of the Te Pau i Ahurai named Tupura'a i Tamaiti (Tepau "A") who ruled in Fa'a'a until 1773.

According to J. Forster the successor to the Te Pau i Ahurai kin-Title was "Toomataroa" (Tu Mataroa?). This distinction between the titular offices of "Towha" and "Toomataroa" is sharpened by the passage from J. Forster that specifies the former as having been a joint chief of Atehuru and the latter, chief of Fa'a'a (1778:354). In other words, the situation in Fa'a'a paralleled for a time the one in Pare-Arue, where the highest-ranking local kin-congregation Title was held by Teu (and subsequently by Pomare I), while tribal authority actually rested in the hands of a lower-ranking relative, Tutaha. "Toomataroa," who also held the Title Te Pau, was evidently so eclipsed by "Towha" that little is recorded about him save that he was married to "Terrano" (or "Tettoohow-deeah"), a sister of Teu's wife, Tetupaia; he was friendly toward Pomare I, and he died sometime between Bligh's visits of 1789 and 1792.²⁸ Having died childless, he was, as noted earlier, succeeded by his wife's sister's son (Pomare I's youngest brother), who then himself assumed the Title Te Pau (i.e., Te Pau "C").

Puna'auia (Mano Tahi)

Due to the proximity of Ha'apape, Pare-Arue, and Fa'a'a to the Europeans' ship anchorage in Matavai Bay we are relatively well informed about personalities and events of that region. And because of Paparan pride and its nineteenth-and twentieth-century historian champions, we have been provided with some fairly detailed — though not necessarily wholly accurate — accounts of leading personalities and important events in that

region. But written chronicles about the region between these two, generally known as Atehuru, are scant and confusing — due in part to the region's distance from Matavai and in part to its leaders' hostility to the European-backed Pare-Arue regime. Nevertheless, a few essentials of its political landscape may be reconstructed, including the circumstance that it consisted of two autonomous but fairly consistently allied tribes, Mano Tahī (or Puna'auia) in the north, and Mano Rua (or Pa'ea) in the south.

During the Early European Era politically significant ceremonial activities in Puna'auia took place mainly at a large coastal marae called Taputapuātea. The marae ruins in Puna'auia now called by that name are located on Puna'auia Point; assuming the two to be the same — a likely but not absolutely certain identification — the marae was founded, according to tradition, by Titihaui, a high-ranking kin-Titleholder of Opoa, to commemorate his marriage to the daughter of a Puna'auian chief (Emory, Marae Traditions). During the era now under study it was a major center of 'Oro worship, although of course not the only one; and, according to Rodríguez, it was the marae "whereat they swear [Pomare I] in as *arii*" (Corney 1919:170). Like other Taputapuātea marae — that is, those serving as repositories of an 'Oro image — it was the locale for human sacrifices to that god. (Rodríguez and his editor, Corney, appear to have assumed that *this* Taputapuātea was the "senior" one of its kind on the island [Corney 1919:155n], but it had not always been so, and would not so remain.) On the other hand, the district's most venerable marae was marae Tahiti (or Te Ara e Tahiti, or Puna'auia), a small, unpretentious structure located in the Punaru'u Valley about a mile inland. This marae was second only to Vaiari's Farepua in social preeminence, having been established (according to one tradition) by the fabled Puna'auia chief Te Manutunu and his Vaiari wife, Hotutu (see chap. 16). In 1797 marae Tahiti was also a repository of an 'Oro image and hence was a "Taputapuātea" — which seems not to have been the case during the 1760s and 1770s (Wilson 1799:208). The principal kin-Title associated with this marae was Tetuanui e Mania i Te Rai, one of Tahiti's highest-ranking ones, whose incumbent during the first part of this era was Puhuetea ("Potatow," "Pottatea," "Poatateu").²⁹ Puhuetea's main Title is said to have bestowed upon its bearer the right to don a *maro ura*; as far as I can discover (and for reasons I cannot fathom) Puhuetea did not assert this privilege for himself, but he did exercise extensive authority and influence, as chief of a populous and warlike tribe.

The first mention of Puhuetea in any of the sources occurs in Gayango's account of his circumnavigation of the island, in 1772 (Corney 1913:322-323). Cook first referred to him in the *Journal* of 1773, but he had evidently known Puhuetea during his earlier visit to Tahiti, for he refers to him as "my old friend Potattou the chief of that district [Atehuru]" (Beaglehole 1961:210-211). Puhuetea was described by Pickersgill as having

... carried great command over his territories and had allways a number of men exercising and seemingly kept stricktly to military Duty; he is one of the stoutest men I ever saw, his thigh would measure more round in the Middle then any part of my Body he is very proportionably made, and his natural Powers are so great that his vast bulk is no impediment to his agility. (Beaglehole 1961:769)

To this may be added G. Forster's comment:

... his features were so mild, comely, and at the same time majestic that Mr. Hodges immediately applied himself to copy from them, as from the noblest models of nature.... His ample garments, and his elegant white turban, set off his figure to the greatest advantage, and his noble deportment endeared him to us, as we naturally compared it with the diffidence of O-too. (1777:I, 360-361)

In 1773 Puhuetea was evidently one of Tahiti's most powerful tribal chiefs. He was also one of her most durable ones, politically, for Bligh was able to report, fifteen years later, that Puhuetea was one of the island's three greatest chiefs, along with Pomare I and Vehiatua III (1789:II, 77). Indeed, he was still alive and active in January 1792, when he visited Vancouver — having meanwhile assumed the new name of "Hidiea" (Hitiea?) (Vancouver 1801:275-276), but he died shortly thereafter, or so Bligh reported in June of 1792 (1792:165b).

Puhuetea was unquestionably a man with noble consanguineal antecedents, but what those were I am unable to discover. Individuals bearing the name (or Title?) Tetuanui e Marua i Te Rai appear in the Puna'auia genealogy, the more recent having been the great-grandfather (father's father's father) of Ta'aroa Manahune and Tutaha (Emory, Marae Traditions), but what Puhuetea's kin relationship was to that individual, if any, is not known to us.

We are provided with descriptions of Puhuetea's first wife, and of his subsequent marital arrangements, but no information about the genealogical connections of these women. The first wife was Purutihara ("Polatehara," "Polotheara") about whom G. Forster wrote:

Polatehara ... was so like [Puhuetea] in stature and bulk, that we unanimously looked upon her as the most extraordinary woman we had ever seen. Her appearance and her conduct were masculine in the highest degree, and strongly conveyed the idea of superiority and command. When the Endeavour bark lay here, she had distinguished herself by the name of captain Cook's sister (tuaheine no *Toote*;) and one day, being denied admittance into the fort on Point Venus, had knocked down the sentry who opposed her, and complained to her adopted brother of the indignity which had been offered to her. (1777:I, 361)

In due course Puhuetea and Purutihara separated and took new mates — the amicability of which arrangement was reported on earlier (chap. 19, section on semi-marriage).³⁰

According to Bligh, when Puhuetea died, in 1792, he left no child to succeed him, "... in consequence [of which] the present Minor Chief, some relation, is not firmly fixed in his Government" (1792:165b).

Pa'ea (Mano Rua)

Mano Rua, or Pa'ea,³¹ the district south of Puna'auia, was made up of three divisions, each with its own marae complex — namely A'ou'a (marae Maraeta'ata), Natu'oha (marae 'Utu'aimahurau), and Mara'a (marae Tuitui). These divisions were eventually under the same regime whose high chief and underchief bore the Titles Te Vahitua i Patea and Te To'ofa, respectively. (Henry 1928:78-79)

Only two of Pa'ea's marae complexes figure importantly in events of this era, but these two were very important indeed. One of these was Maraeta'ata, situated about 460 yards inland and consisting of four separate marae units, three enclosed and one detached rectangular platform.³² According to Adams (1901:75), Maraeta'ata had three "heads": "Pouira, the Tevahitua i Patea; Tetooha, the Taura Atua i Patea; and Punua'aitua." I interpret this to mean that each of the three enclosed units in this complex had its own proprietary kin-Title, as given. As noted above, Henry names only two chiefly Titles for this division of Pa'ea (and by direct implication, for the division marae); but her designations are otherwise the same as those of Adams.

Elsewhere Adams represented his informant, Ari'i Ta'ima'i, as asserting that Maraeta'ata "belonged to" Tutaha, the powerful Pare-Arue chief (1901:109); but I consider this wholly unlikely. Like most Maohis of his social status Tutaha could probably trace — or contrive — connections with any important marae, anywhere; and for someone of his great political authority such claims would probably have been acknowledged, willingly or under coercion, by all but his most active enemies. In fact, Tutaha could have made quite credible claims to Pa'ea connections, but to identify Maraeta'ata as "his own" marae, as Adams so stated, is an unwarranted assertion as far as I can tell — indeed, it stands in direct contradiction to another of Adams' statements, just quoted, naming "Tevahitua," "Tetooha," and "Punua'aitua" as "heads" of the marae. The importance of this point should become clear as I begin to chronicle the events of this era.

Marae 'Utu'aimahurau was situated directly on the lagoon shore and about five kilometers south of Maraeta'ata. After 150 years of neglect and dismemberment it is now no longer possible to identify its original form, but various descriptions of it during its heyday, including a sketch by Webber, indicate that it was a complex structure similar to Maraeta'ata,³³ and even more important in terms of politically significant ceremonials.

According to Henry, Tevahitua and Te To'ofa, two of the proprietary kin-Titles connected with Maraeta'ata, were the same in the case of 'Utu'aimahurau, and partial confirmation for this is found in a Pa'ea genealogy reproduced by Emory, which is labeled "Genealogy of Te-To'ofa, chief of Teoropaa. Outuai was his marae." (Marae Traditions.) I am led to

conclude that these two marae complexes were closely connected, ceremonially, by reason of common proprietorship. Under such circumstances, as loci for certain kin-specific ceremonies, they may well have been interchangeable, which may account in part for the confusion between them in some sources.³⁴ On the other hand, it appears that 'Utu'aimahurau was the preferred location for performance of those rites involving the presence of 'Oro. According to Thomson one of the principal images of this god was installed at 'Utu'aimahurau about the middle of the eighteenth century; the incident is described in a tradition recorded in Henry and said to have been taken from the priests Tamera and Pati'i. After establishing a foothold of 'Oro at Tautira, in the form of a marae and an image for that god,

... the priests of 'Oro went to the body of Tahiti, the fish, with a sacred stone from the marae they had just made. They landed at 'Utu-'ai-mahu-rau (Cape-eating-many-mists), at Pa'ea, then called Atahata or Ata-huru (Fleeing-clouds).

There they were allowed to take possession and were also aided in building their marae, which was called 'Utu-'ai-mahu-rau. 'Oro-hu'a-manu ('Oro-of-the-bird-feathered-body) became master there; the image was woven the size of that at Opoa and covered with red, yellow, and black feathers from the image at Tautira. (1928:130)³⁵

All three of the proprietors' names (or Titles?) listed by Adams (including the two chiefly Titles given by Henry) are to be found on a genealogy reproduced by Emory — that is, the one labeled "Genealogy of Te-To'ofa, chief of Teoropaa. Outuai was his marae."³⁶

I cannot discover who specifically bore the name or Title Tevahitua,³⁷ but, however senior that individual may have been in terms of kin-Title rank, he was clearly overshadowed in political authority and influence by the incumbent Te To'ofa. (It is, of course, possible that one individual held both Titles at some time or other, but based on a statement in Adams, which will be reproduced later on, I consider this to have been unlikely at this period.)

Te To'ofa, holder of the Title Taura Atua i Patea, is undoubtedly "Tewha," or Cook's "Admiral," et cetera, whom I have described above as having exercised chiefly authority, though holding a subordinate kin-Title, in Fa'a'a. As noted earlier, I have been unable to specify Te To'ofa's kin connections in Fa'a'a, and from the Paea genealogy he does not appear to have reached his position of tribal authority by primogenitary succession, but there can be no doubt whatsoever about the reality of that authority. Also, he seems to have been the close and consistent ally of Puna'auia's Pahuetea, and a relative of Papara's Teri'irere.³⁸

In February 1789 Bligh reported that he received a visit from the widow of "Old Admiral Tet-towah" and recorded that the latter had died "many Months before I arrived" (1789:II, 35). Thus, Te To'ofa evidently died about 1787 or 1788, leaving his son as his successor, under

the regency apparently of his widow, whom Bligh described as having been “considered a high personage.” Bligh gave the latter’s name as “Wanowoorah” (Fanau Ura?); I cannot identify this woman genealogically. Bligh had the opportunity of seeing this woman in company with Pomare I on two occasions. In 1789 he described their relationship as “affectionate”; in 1792 he wrote that “I found a shyness about our Friend Tynan [Pomare I] and his Wives to this Woman and her party” (Bligh 1792:166). Slender as this evidence is, it does suggest that Te To’ofa’s widow was a woman with very high-ranking kin connections, including probably some with Pomare I. In 1789 she was described as having been “old and infirm,” (Bligh 1789:II, 35) but this evidently had not discouraged her “remarriage,” to a man of unrecorded origins, named “Tewryighne” (Tauriaine?) (Bligh 1792:166). In addition, Bligh recorded during his next visit, in 1792, that she was assisted in her regency by “a very clever young fellow called Terraighterree — his official capacity is that of a Priest and had great weight among the People” (1792:165b).

As for Te To’ofa’s son and successor, in 1790 Morrison estimated his age to have been about twenty-two. This tall young man, who also bore the Title Te To’ofa, evidently proved to be a vigorous and politically consistent successor to his famous father, but his reign was brief, for he died (“of an ague”) even before Morrison’s departure, in 1791, and was succeeded by the son of his sister — subject to the latter’s “regency or Guardianship” — inasmuch as the successor was only four years old at the time. (1935:106, 107)

Landward Teva

The social unit called Landward Teva (Teva i Uta) consisted of four major subdivisions, which were (from east to west) Vaiari (or Papeari), Vaiuriri (or Papeuriri), Atimaono, and Papara. For several decades prior to this era the chiefs of Papara had dominated the whole unit in terms of coercive authority and persuasive influence — although their control over the three eastern divisions was largely indirect, and at times probably quite ineffectual. At one time in the traditional, far-distant past, ceremonial preeminence over all Landward Teva (based on kin-Title rank, and possibly also decisive coercive authority) rested with the high-ranking proprietors of marae Farepua, in Vaiari. Subsequently, however, that authority (such as it was) was seized by Paparan leaders; and by the opening of the Early European Era some of the ceremonial eminence attendant upon high rank had shifted to Paparans as well. Indeed, during the early years of this era, efforts were undertaken to assert the Paparan chiefs’ rank supremacy over all other Tahitian kin-Titleholders.

When H.M.S. *Dolphin* anchored in Matavai Bay the tribal chief of

Papara was Amo, or Tevahitua i Patea, a man of middle age. Few direct observations have been recorded about the personality of this man, even though he was at the center of the swirling political events of the 1760s and 1770s. The main reason for his historic obscurity probably lies in the distance of Papara from Matavai, but it may well be that Arno was in fact overshadowed, in terms of personal qualities, by such individuals as Tutaha, Te To'ofa, Pohuetea, "Old" Vehiatua, and Amo's own wife, Porea. It is also likely that Arno was deliberately discouraged from visiting the Europeans at Matavai, as was his son two decades later. Bligh wrote of the son: "I have sent a message to Tomârre, the Chief, that I shall be glad to see him. — he has hitherto been prevented from coming by a dread of my not treating him well, and I have not been able to do away his fear. I attribute it to some underhand Work of our Friends at this place, who would consider him as a Rival, and do not like him to partake of the benefits they derive from us." (1792:170b)

The fullest (though not necessarily the most accurate) genealogy I have found listing Amo's antecedents and collaterals is Emory's reconstruction (Marae Traditions) based on notes left by Tati Salmon; this takes us back only to Tavi Hau Roa of Tautira, whose estimated birth date is circa 1660. Tavi, it may be recalled, was the too-generous husband of beautiful Taurua, of Farepua marae, Vaiari. According to the traditional story, Tavi "lent" Taurua to a Paparan chief named Tuiteraï ("A"), and then wholly relinquished her to the latter even after defeating him in a battle fought over her.³⁹ The only issue of the mating of Tuiteraï and Taurua so recorded was a male, Teri'itahi, who eventually married Tau Vahine (or Tetua Umeretini) of marae Nu'utere, Vairao; the latter bore him three offspring, Te'eva Pirioi, Aromaiteraï, and Amo, whose lines thereafter separated but continued in some measure to influence each other's lives.

Te'eva Pirioi, the daughter and eldest child, is recorded as having married Ari'ïmao, a high-ranking kin-Titleholder of Opoa. This couple resided in Ra'iatea but their son and only child, Maua, is credited with the fateful act of having transferred to Papara, circa 1760, an image of 'Oro and the *maro ura* called Teraiputata, which embodied (among other things) symbolic connections between *ari'i* of Ra'iatea and Huahine.⁴⁰ Other descendants of Te'eva Pirioi played roles, and possibly leading ones, in the stormy political events of the Leeward Islands, but do not directly concern us here.

Teri'itahi's second child and elder son was Aromaiteraï ("A"), who, it will be recalled, was for reasons unstated denied the succession and exiled to Mataea. This occurred circa 1730, according to Adams (1901:37). He and his wife (a local woman named Terahi i Te Tua) had three offspring: Tetuanui (f), Vanu'u (m), and Mutuarea (m).⁴¹ Tetuanui married a Pa'ea man; their descendants were prominent in the affairs of Mo'orea and Tahiti,

but not enough so to require further description here.⁴² The names Vanu'u and Mutuarea drop out of sight, but another Aromaiterai (Aromaiterai "B" in fig. 25-1), which seems to be an alternate name for one of them (Adams 1901:38), appears in another genealogy as the husband of a sister of Amo, to whose branch of the family we now turn.

After his sister's removal to Ra'iatea and his elder brother's exile to Mataoa, Tuitera'i "B" (or Teri'i Tu A'a i te Ra'i, or Te Ura i te Ra'i) remained in undisturbed possession of the chieftainship of Papara, and he and his wife (Teroro e Ora of Fareroi marae, Ha'apape) are recorded as having had eleven offspring, only three of whom concern us here. The firstborn, a daughter, was Faretopa (also Teharetuanui), whose marriage to Tuva'a might have forged a useful link with Pa'ea had any offspring remained long enough alive. Tuitera'i's second-born, also a daughter, was Tetua Unurau, whose marriage to her father's brother's son, Aromaiterai "B" served to join these collateral lines, genealogically — but not politically, as we shall see. The Papara genealogy reproduced by Emory credits Tetua Unurau and Aromaiterai "B" with seven offspring, the ones of immediate concern to us being Te Vahine Moeatua (or Purai, or Purahi), the wife of Seaward Teva's "Old" Vehiatua, and Vahine Metua ("Inomedua"), also Teri'itua i Hitia'a, who was the wife of Pomare I's brother, Ari'ipaea.⁴³

Tuitera'i's third child, and first son, was Amo, who must have been born circa 1725. As noted above, few direct observations have been recorded about this chief's personality, and inferentially the sources provide almost diametrically opposite views of him; in some accounts he is represented as having been a shrewd and active aggrandizer, in others as the timid and somewhat reluctant cat's-paw of his wife, Porea.

Porea, or Aireoreatua i Ahurai i Farepua, was sister of the chief of Fa'a'a, named Te Pau i Ahurai ("A"), and could claim other kin connections reaching into some of Tahiti's and Moorea's highest-ranking and politically most powerful families. Along with these social-relational resources she possessed a forceful, imperious presence joined with great ambition. In introducing her to his readers Adams wrote, "If a family must be ruined by a woman, perhaps it may as well be ruined thoroughly and brilliantly by a woman who makes it famous" (1901:40).

Porea's entry into recorded history occurred in 1767, when she visited H.M.S. *Dolphin*: "At PM, the Gunner came off with a tall well looking Woman about forty five years old, she had a very Majestic Mein, & he seeing her paid Great respect by the Inhabitants, she being just come there, he made her some presents" (Wallis, Journal, 13 July, LMS Archives). Thereafter, Wallis referred to her as "Queen"; her manner was undoubtedly "queenly" wherever she happened to be, but what respect she commanded in Matavai derived mainly from her husband's maternal connections there (that is, Amo's mother, Teroro e Ora, was associated with Ha'apape's marae

Fareroi). Writing two years later, Banks described Purea as being "... about 40, tall and very lusty, her skin white and her eyes full of meaning, she might have been handsome when young but now few or no traces of it were left" (Beaglehole 1962:I, 266). And G. Forster, writing in 1774, said of her: "She appeared to be between forty and fifty; her person was tall, large, and fat, and her features, which seemed once to have been more agreeable, were now rather masculine. However something of her former greatness remained; she had 'an eye to threaten or command', and a free and noble deportment." (1777:II, 100-101)

Like many such couples of high rank and extensive political authority, Amo and Purea came in time to have separate households and sexual partners, but there were offspring of their union — at least one and possibly as many as nine.⁴⁴ In any case, all sources that I know of identify their first-born, a son, as having been Teri'irere, said to have been born about 1762. As successor to his father's kin-Titles, including two feather-girdled ones, and through his mother's family connections in Fa'a'a, Teri'irere's rank was among the highest in Tahiti-Mo'orea. And his parents' ambition to enhance his prestige even further was one of the principal motives behind events on Tahiti in the early years of this era. But before chronicling these events something more needs to be said about this notable, but as it turns out, hapless young man.

The first European to meet up with Teri'irere was Cook, in 1769:

This morning a Chief whose name is Oamo, and one we had not seen before, came to the Fort, there came with him a Boy about 7 years of Age and a young Woman about 18 or 20; at the time of their Coming Obarea and several others were in the Fort, they went out to meet them, having first uncover'd their heads and bodies as low as their waists and the same thing was done by all those that were on the out side of the Fort; as we looked upon this as a ceremonial Respect and had not seen it paid to any one before we thought that this Oamo must be some extraordinary person, and wonder'd to see so little notice taken of him after the Ceremony was over. The young Woman that came along with him Could not be prevaild upon to come into the Fort and the Boy was carried upon a Mans Back, altho he was as able to walk as the Man who carried him. This lead us to inquire who they were and we was inform'd that the Boy was Heir apparent to the Sovereignty of the Island and the young woman was his sister and as such the respect was paid them, which was due to no one else except the *Arreedehi* which was not Tootaha from what we could learn, but some other person who we had not seen, or like to do, for they say that he is no friend of ours and therefore will not come near us. The young Boy above mention'd is Son to Oamo by Obarea, but Oamo and Obarea did not at this time live together as man and wife he not being able to endure with her troublesome disposition. (Beaglehole 1955:103-104)

The "Boy" in this passage was successor not to the "Sovereignty of the Island" but to his father's kin-Titles and to his de facto chieftainship over Papara; and the "other person," still unseen by Cook, was Pomare I.

Several sources state that Teri'irere's wife was none other than Te Ari'i

na Vaho Roa, the firstborn child of Teu and Tetupaia, and hence Pomare I's eldest sibling. If so, the age of the spouses was discrepant even by Maohi standards, for according to the most plausible estimates I can arrive at, the wife would have been some thirteen years older than the husband. In any case she bore him no children that we know of, and according to Bligh she had died before the latter's visit of 1789 (1789:II, 62).

Another question regarding identity concerns Teri'irere himself. According to Adams' version, Teri'irere died very young and was succeeded by a half-brother, Temari'i (or Ari'ifa'ataia), who was ten years younger than Teri'irere, and was the son of Amo by another wife (a niece of Purea's, and also from Fa'a'a).⁴⁵ But according to another version, which I accept and which seems also to have been tacitly accepted by most primary sources, including the London missionaries, and Bligh (1792:157b, 166b), Temari'i was an alternative name for Teri'irere, and not a brother of the latter's (although the latter may well have had a brother, or half-brother as well). Morrison met "Temmaree" in 1791, and described him as "... a Handsom well made man of about 27 or 28 years old and about 6 feet high" (1935:114); in other words, the age of Temari'i would have been the same as Cook's Teri'irere, and not of the latter's half-brother, who by Adams' birth date estimate would have been less than twenty years old at the time of his meeting with Morrison.

In any case, Temari'i Ari'ifa'ataia (formerly Teri'irere, and eventually Ari'ipaea "B") lived on for another seven years after his encounter with Morrison, during which time he played a leading role in the island's political developments.⁴⁶

Finally, in my list of principal Paparans figuring prominently in the political history of the era, I must not overlook Tupaia, the remarkable man who accompanied Cook's first expedition homeward but who died in the Indies en route. Tupaia was first met by Wallis. At that time he was with "Queen" Purea on her visit to Matavai; he appeared to be her principal aide and advisor, but may also have been her current bedfellow as well. He was still attached to Purea during Cook's visit two years later, but left her service to accompany Cook (and more specifically, Banks) to England.

Tupaia appears to have been born circa 1725, in the northwestern region of Ra'iatea. Banks described him as "well born" (Beaglehole 1962:I, 312); but nowhere is the claim made that he was of the Hui Ari'i.⁴⁷ He was, however, trained in the priestly craft and was knowledgeable in many other fields, including particularly geography and navigation. After arriving on Tahiti — circa 1760, if he accompanied Maua and Manea, as one account implies — he joined Purea's establishment and served as her principal political advisor (and possible abettor); what his relations with Amo were, we are not informed.

Turning now to the other territorial divisions that, along with Papara, constituted Landward Teva, their populations were of course also caught up in the wars and other political maneuvers characteristic of Tahiti and Mo'orea. It is reasonable to suppose that some of their principal people were deeply and actively engaged in some of these events — but about this one can only speculate. For, either the roles of such personages were so secondary, or their distance from European observers so remote, that they figure hardly at all in the written accounts of the era. From the Europeans' vantage point of Matavai these Vaiarians, and others, were part of the Paparan hinterland, and to Europeans visiting at Tautira they were seen to be vaguely under the Vehiatuas' sway.

In fact, the political situation of these districts did probably correspond fairly closely to the Europeans' perspectives. That is to say, although their chiefs' traditional political loyalties were with Papara, the nearby presence of a strong and aggressive Vehiatua — or a display of overpretentiousness on the part of Papara's chiefs — probably encouraged a shift in alliance. One of the more notable aspects of this situation is of course the extent to which Vaiari itself seems to have become eclipsed. Not only had it become dispossessed of the political influence which it allegedly once exercised over all of Landward Teva, but even the ceremonial preeminence once accorded its highest-ranking Titles (of marae Farepua) seems to have shifted to kin-Titles elsewhere.

MO'OREA

If the political landscape of the island of Tahiti is in some places overclouded with uncertainty, that of Mo'orea is almost wholly fogbound. Except for a few forays, measured in hours or days, no noteworthy Europeans spent any time there during the first four decades after 1767. In fact, Cook himself did not learn until 1777 of the existence of its magnificent harbors: "It is a little extraordinary that I should have been thrice at Otaheite before and on(c)e sent a boat to this island and yet not know there was a harbour in it ..." (Beaglehole 1967:226). Except for traditional data collected decades after the era under study, most information we have about the island's territorial divisions and leadership was obtained by the Europeans from residents of Tahiti or political exiles from Mo'orea, who could hardly have been counted on for unbiased objectivity.

Handy (after Marau) asserted that the island "anciently" consisted of eight subdivisions, but Henry listed twelve so-called districts, ranging in complexity from one small single-neighborhood unit (i.e., 'Oi'o) to one comprising most of the island's populous northern half and itself subdivided into seven divisions of at least multi-neighborhood size and complexity. In choosing between these two authorities one should take into account the

possibility that Handy's version was influenced by the eight-tentacled octopus metaphor, which was used so commonly to refer to this island and others; whereas Henry's version lists for many of her "districts" the names of the conventional "tribal" designata, such as mountain, cape, marae, assembly ground, Arioi house, chiefly Title, and so forth.

The fish-anatomy names applied metaphorically to Mo'orea's various parts — The Fin in the South, The Upper Flesh of the Fish, et cetera — probably referred not to social divisions but to the island's outline and topography. Nor can I find any historical evidence of a persistent confederation of units corresponding to Handy's reported "The Four Above" (i.e., South) and "The Four Below" (i.e., North) (1930:79-80).

Traditions concerning the founding of Mo'orea's principal marae do not tell us much about tribal boundaries or political realities, nor do they indicate clearly where the island's highest-ranking kin-Titles were localized. According to these traditions, summarized in chapter 16, the four most famed marae were Nu'urua (at Varari), Te Fano (at Pape'are), Umarea (at Afareaitu), and Taputapuatea (at Papeto'ai).

During the eighteenth century the Titles (or were some of them personal names?) that figured most prominently in the accounts were Marama, Mahine, Punua Teraitua i Nu'urua, Teri'itapu nui, Tetuanuireia i te Ra'iatea, Pateamai, and Hamoa (or Ha'amo'a?). Henry listed numerous others (1928:89-94; but only the above, and certain personal names or subordinate Titles closely associated with them, play identifiable parts in the events we are considering.⁴⁸ It is important for my purposes to be able to match names, Titles, and places (including marae), but the extent to which I have failed to do so will be woefully apparent.

The Title Marama appears preeminently in traditions of Mo'orea's beginnings; according to the Handy-Marau version reproduced earlier it was a Marama (from the Leeward Islands) who first established Hui Ari'i rule at Mo'orea, with bases at Nu'urua and Te Fano marae. Later on, according to traditional accounts recorded in Adams, members of this dynastic line extended their authority or rank superiority, or both (the traditions are somewhat ambiguous), over most or all of Mo'orea (1901:161-171). However, during the five decades now under study, the holders of the Marama Title — Marama Ari'ihau and his daughter, Marama Ari'i Manihinihi — do no figure prominently in the recorded chronicles. Although according to Adams, the rank of their Title was supreme in Mo'orea, the tribe over which they ruled was less powerful, and less actively engaged in the wars of the era, than others on the island.

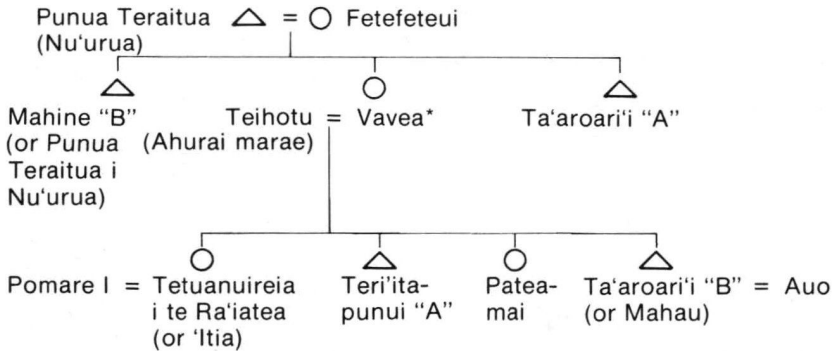

The Mahine who played so active a part in this half century's political events held the Title — he may also have held others — of Punua Teraitua (Te ra'i atua?) i Nu'urua (Adams 1901:95), but he was identified by

Adams as chief of Opunohu (p. 107), and not of Varari "district," where Nu'urua was situated; and it was in the Opunohu area that Cook encountered him in 1777 and described him as "The Cheif" (Beaglehole 1967:226). Henry also listed a Mahine as having been high chief of Atimaha (1928:94). In any case Cook described this Mahine as being between forty and fifty years old, and bald-headed.⁴⁹ Cook stated that Mahine's wife was the sister of Papara's Amo (Beaglehole 1967:226).⁵⁰ We learn elsewhere (Vancouver 1801:323) that Mahine was an Arioi, and childless, but Morrison credited him with an adopted son, "Tayreehamoedoo" (Tairihamoetua?) (1935:173).

In 1777 and for some years thereafter this Mahine (i.e., Mahine "A") was the most powerful and perhaps the most influential tribal chief on Mo'orea, but nowhere is the actual source or domain of his authority made explicit. Cook first called him "a popular Cheif of that Island" (Beaglehole 1967:198), and "This Cheif who with a few people has made himself independant of Otaheite" (p. 227); but this opinion was based on the notion, undoubtedly mistaken, that Mo'orea had at one time been a dependency of Tahiti. Vancouver described Mahine as "the usurping chief of Morea" (1801:319), and Morrison reported him as having seized the "Government" in a revolt against his "nephew" Metuaro, the "proper king of that Island" so-called (1935:172).

The exact identity of this Metuaro (also called Motuaria and Mahau) is difficult to pin down. A genealogy of Nu'urua marae (constructed by Emory from notes of Tati Salmon and Brander) lists Mahine's closest relatives (see fig. 25-7).

Assuming that Mahine's brother had no issue (the sources mention

*Gunson (1964:62) identified Vavea as husband (and hence Teihotu as wife), but this does not accord with versions by Emory or Henry, or with any other genealogy that I know of.

FIGURE 25-7. Some kin relations of Mahine.

none), the nephew in question must have been a son of Vavea; but this creates another problem, since according to both Adams and Emory, Vavea had two sons, Teri'itapunui and Ta'aroari'i ("B"). Vancouver identified Metuaro with the former:

Mahow I considered to be the same person mentioned by Captain Cook, under the name of Tiareetaboonooa; as, on our first arrival, he was introduced to me by the name of Areetaboonooa, which appellation was almost immediately dropped, and he was afterwards called Mahow; occasioned most likely by the recent alteration in their language, which has been stated to have taken place on the accession of the young king Otoo." (1801:322-323)

Adams made this same identification, at least on one genealogy; on another one Adams identified Metuaro with Ta'aroari'i ("B"), and provided a clue to the puzzle in another passage.

Vancouver sent a boat to Eimeo for Pomare, who came over January 2, 1792, bringing with him his brother-in-law Motuaria, or Metuaro, who was supposed by Vancouver to be the same Terii tapunui that was known to Cook and Forster as chief of Varari in Eimeo. He was called commonly Metuaro Mahau. According to our records, he was Taaro-arii, a younger brother of Cook's Terii tapunui, who was dead without issue, and left his name and property to Taaro-arii, who also had no male children. (1901:106)

In any case, the importance of the problem of one Teri'itapunui-Metuaro or two is diminished somewhat, structurally, inasmuch as the second of the candidates (if there were two) was sibling and successor to the first. (I sympathize with any reader who may have become impatient at my concern with these tedious details but wish to remind him that correct identification and genealogical placement of the *dramatis personae* is essential for understanding the political events of this era.)

Cook mentions a Teri'itapunui, in 1777, as having been Mahine's sister's son, chief of Varari and the "lawful heir" to the kingship of Mo'orea (Beaglehole 1967:198, 231). In 1789, Mortimer visited Varari and there met "King" Teri'itapunui, whom he described as "a tall, stout, good-looking man, speaks but little, and seemed to be of a timid disposition." According to Mortimer, Teri'itapunui received him in company with his wife, who was "a very agreeable, insinuating woman, with a great deal of natural politeness about her." (1791:38) If my identification is correct this woman was none other than the youngest sister of Pomare I, one named variously Vai'io, Auo, "Wowo," "Tirrayaydooa," and so forth; and some of her poise may be accounted for by the circumstance of her earlier familiarity with Europeans at Matavai and Pare. Vancouver had much more to say about Teri'itapunui-Mahau during his 1791-1792 visit, but these events will be described later on.

Tetuanui Rei i te Ra'iatea was, of course, the famous 'Itia, Pomare I's principal consort, whom I have already identified. I have also described

Pateamai (or Teano, or “Fier rete”), as having first married Vehiatua III and, after his death, as having for a time shared her sister’s connubial relationship with Pomare I.

LEEWARD ISLANDS

Tahiti and Mo’orea were closely linked with the Leeward Islands by ties of trade, cult, and kinship, some of which were of crucial importance to political developments on Tahiti-Mo’orea during the era now under study. Events on Tahiti-Mo’orea also had consequences upon those in the Leeward Islands during this era, although perhaps relatively less so until the very end of the era. In any case, interest throughout the remainder of this book will focus on Tahiti-Mo’orea; among other reasons for doing so is the fact that until about 1809 the information on the Leewards is mythical, indirect, or based on observations made during Europeans’ very brief visits there. I have elsewhere reproduced mythical evidence concerning some aspects of the “prehistory” of the Leeward Islands — evidence relating mainly to the origin and spread of Opoans and their institutions (including feather-girdled kinship Titles, the cult of ‘Oro, and the Arioi sect). The first recorded European visit to these islands was Cook’s; after leaving Tahiti in 1769 the *Endeavour* cruised and visited among them between July 16 and August 11. Cook made brief return visits in 1773 and 1774, and again in 1777; and the *Aguila* visited Ra’iatea for about two days in January 1775. H.M.S. *Pandora* called briefly at Huahine (fig. 25–8), Ra’iatea, and Porapora in May 1791 searching for *Bounty* mutineers. The next visit was a short one by Turnbull in 1801, when the ship barely escaped seizure by Ra’iateans. Missionaries began visiting the Leeward Islands in 1807, but it was not until 1818 that a permanent mission station was established there.

Ra’iatea resembled Tahiti’s fifth-order tribal units in territorial complexity. According to Henry it consisted of nine “districts” — Opoa (the district of the dynasty that traditionally supplied the island’s sovereign chief) and eight others, said by Handy to have been delimited by an Opoan chief after his supporters had conquered the rest of the island’s populations. (“The Arii at Opoa took his *urupiti* (cavalla fish, signifying Raiatea), cut it down the middle, and laid the two halves side by side. Each side he divided into four *mataeinaa*” [Handy 1930:90].) Nothing is reported in this or other accounts concerning the territorial organization of Ra’iatea prior to this legendary reorganization; nor can I discover any information about the orders of territorial complexity of the reorganized “districts.”

The sources agree that the Opoan chiefs did in fact exercise some tribal authority over the whole island, but the western “district” of Tevaitoa, which I mentioned in another context, in chapter 16, appears to have been somewhat more independent of Opoa than were the seven others.

In addition to the tribal authority exercised by Opoans, the kin-Titles

of its chiefly dynasties were, during the eras under study, ranked as high as or higher than those of any other kin-congregations in the Society Islands.

Henry designated Apu Roa as the “national marae” of Taha’a, thereby signifying that the island’s four “districts” constituted a larger territorial unit of some kind, but indications are that this larger unit itself did not remain autonomous, having become a “dependency” first of Ra’iatea then of Porapora before Europeans first touched ashore there. According to the summaries of Henry, Porapora consisted of eight so-called districts, but I am unable to specify their respective orders of complexity. From time to time all or most of the island seems to have been dominated by the chiefly dynasties of one or another of these districts; this was certainly the case during the sixth and seventh decades of the eighteenth century, but otherwise, dynastic rivalries appear to have kept the island in a fairly constant state of political instability.

FIGURE 25-8. “The harbour at Huahine.” Drawing by J. Webber. British Museum.

Maupiti resembled Ra’iatea in being divided into nine so-called districts — eight subordinate ones and that of the island’s “high chief.” From Handy’s account it appears that these “districts” became firmly united, but judging from the small size of the island and of its population, it seems unlikely that it had reached an order of complexity, in terms of territorial units, much beyond what for Tahiti I labeled *multi multi-neighborhoods*.

By European times the island of Maupiti is reported to have become

subordinate to chiefs of Porapora, but the precise nature of the relationship is not recorded.⁵¹

The territorial organization of Huahine differed somewhat from that of the other islands. By European times the island's two geographic divisions had become wholly subordinate to a chiefly dynasty residing near Lake Maeva in the north. Southern, or Little, Huahine was composed of four contiguous "districts" of unspecified complexity; before becoming subordinate to the Maeva overlords these four were united under the authority of the chief of one of them, but whether this same arrangement prevailed after Maeva domination is not recorded. As for the northern geographic division, Greater Huahine, Henry stated that it was divided into ten "districts," without specifying their nature. Other writers however listed only eight, and according to Handy these were not "districts" in the ordinary sense:

Maeva had eight sons, four by Tuaroanuihau (the last high priest of Huahine) whose ancestral marae, Orohaehaa, at Maeva, was named Tua-roa-nui-i-ae-pau and then four by Teroro Hiti, a warrior chief from Matahiva in the Tuamotus. The land at Maeva, called *aia tupuna o te ui* was divided into the eight mataeinaa, one for each son, and each land they had conquered outside Maeva was also divided among these eight sons to be added to their *mataeinaa* and to be a possession of their families and descendants. Thus Huahine, in patchwork fashion became entirely apportioned among the eight *mataeinaa*. Each *mataeinaa* was, in turn, divided into two parts, one for the *matahiapo* (senior branch), and the other for the *iato* (junior branch) of the family. (1930:96)

This Huahinean method of subdividing conquered territory was of course much more inclusive, but resembled somewhat one practiced elsewhere. I refer to the practice followed by some head chiefs of complex territorial units in acquiring and maintaining personal family estates in each of the major territorial subdivisions under their authority. Usually such chiefs established their own stewards in separate estates, and these were directly responsible to their master and not to the local chiefs in the territorial subdivisions in which the estates were located.

Little is recorded about Mai'ao's political situation, save that it was a "dependency" of Huahine (Teissier 1956:518), and that it was a refuge for survivors of canoes swept off course between Tahiti-Mo'orea and the Leeward Islands.

According to mythic evidence already cited, the various Leeward Islands were closely interlinked by numerous ties of kinship, reinforced by easy and frequent visiting, and evidently also by much intra-and interisland warfare. Opoa appears to have retained over a long period of time its cult primacy and its preeminence in terms of ranked kin-congregation kin-Titles; and inasmuch as statuses in these hierarchies sometimes, and in some respects, were backed by coercive sanctions, the principal chief of Opoa (and

hence of Ra'iatea) may be said to have exercised a kind of authority over all these islands from time to time. But, around 1750, under the leadership of a chief named Puni, Poraporans defeated most of their neighbors and imposed Puni's force-backed authority over them. Huahine evidently threw off the invaders after a while, but in 1769, the date of the first European visit, the other Leeward Islands were firmly under Puni's control. (Beaglehole 1955:153; 1962:I, 317-318)

Having heard much about this military conqueror, the English visitors were somewhat surprised at sight of the man himself:

In the evening we all went to see the great king and thank him for his civilities particularly of this morning. The King of the *Tata toas* or Club men who have conquerd this and are the terror of all other Islands we expected to see young lively handsome &c &c. but how were we disappointed when we were led to an old decrepid half blind man who seemd to have scarce reason enough left to send hogs, much less galantry enough to send ladies.^[52] (Beaglehole 1962:I, 327)

On this occasion Cook also referred to Puni as appearing to be "stupid" (Beaglehole 1955:150).

Four years later, on his second visit to Ra'iatea, Cook was able to report at greater length about the political situation in these islands:

Before I quit these isles it is necessary to mention all I know concerning the government of Ulietea and Otaha. Oreo, so often mentioned is a Native of Bola bola, but is possessed of Whenoa's or Lands at Ulietea, which I suppose he as well as many of his Country got at the conquest. He resides here as Opoonies Lieutenant, and seems to be vested with regal authority and to be the supreme Magistrate in the island, Oo-ooroo who is the Aree by hereditary right seems to have little more left him than the bare title and his own Whenoa or district in which I think he is sovereign. I have always seen Oreo pay him the respect due to his rank and was pleased when he saw me distinguish him from others. Otaha, so far as I can find is upon the very same footing, Boba and Ota are the two Chiefs, the latter I have not seen; Boba is a Stout well made young man and we are told is, after Opoone's death, to Marry his Daughter, by which Marriage he will become Vested with the same regal authority as Opoony has now, by which it should seem that tho a Woman may be vested with regal dignity she cannot have regal power. I cannot find that Opoony has got any thing to himself by the conquest of these isles any farther than providing for his Nobles who have siezed on best part of the lands; he seems to have no demand on them for any of the many articles they have had from us. Odiddy has several times enumerated to me all the Axes, Nails &c Opoony is possessed of which hardly amounts to so many as he had from me when I saw him in 1769. Old as this famous man is he seems not to spend his last days in indolence, when we first arrived here he was at Mau-raua, soon after he returned to Bolabola and we are now told he is gone to Tubi. (Beaglehole 1961:429-430)

Cook's "Oo-ooroo" [Uru], the *ari'i* of Ra'iatea "by hereditary right," was Vetea Uru, son of Tamatoa III by the latter's third wife, and thus half-brother to Pomare I's mother, Tetupaia, who was daughter of Tamatoa III by his first wife. Evidently Vetea Uru retained the tribal (now subtribal)

chieftainship of Opoa district, and continued to be recognized as Ra'iatea's highest-ranking resident Titleholder, but was subordinate to Puni's deputy, Oreo, in secular matters concerning Ra'iatea's other subtribal districts.

As for Popa and Ota, identified by Cook as Taha'a's two chiefs, I cannot further identify them, nor discover whether the former did subsequently marry Puni's daughter, as Cook was told would be the case. G. Forster described "Boba" as a relative of Puni's (1777:II, 391) — a likely but not very useful identification. Vancouver reported the presence of a man named Boba on Tahiti in 1792 (1801:307), but there is no evidence of his having been the same person.

The identity of Puni is certified by Emory as having been none other than the Teihotu Mataroa, son of Teihotu Matanevaneva, the Poraporan chief whose downfall and heroic but somewhat foolhardy death is described in a mythic account reproduced earlier. In that account, it will be recalled, after the latter had been killed by his rebellious subjects and political rivals, the victors elected his infant son to chieftainship of the new regime (Hau Teraitapu), therewith changing his name to Puni. (See chap. 16; and Emory, *Marae Traditions*.) According to Emory's calculation Puni was born circa 1700; in 1789 it was reported to Bligh that the great warrior had died some thirty months previously, that is, about 1786. It speaks much for Puni's reputation that one of the anchors lost by Bougainville off Hitia'a was subsequently sent to Puni, presumably as a respectful gift (Beaglehole 1967:252; Lesson 1839:450).

As noted earlier, Huahine was at one time attacked and occupied by Puni's forces, but the invaders were shortly thereafter driven away. In any case, when the *Endeavour* called there in 1769 the "King" of the island was reported to be a man named "Oree" (Ori) and relations with Porapora were described as hostile:

... the People of this Isld are remarkably Civel and Expres'd a great Desire of our going to kill the Bollobollo Men who are their Enemies and come every month or six weeks taking away their Things and Killing all that Oppose them. (Pickersgill, in Beaglehole 1955:143n)

This view was repeated to Cook in 1773, but was evidently not shared by Ori himself:

Oree probably heard of this [i.e., requests to Cook to attack Porapora] and took an opportunity when he was left aboard to disire that I would not, teling me that Opoone their King was his Friend, the Common people in general seem to bear an implacable hatred against the Bolabola men nor is this to be much wondred at sence they have made a conquest of most of the neighbouring iles, the little Island of Huaheine under the brave and wise conduct of Oree still preserves its independancy, not a Bolabola man have yet been able to get a footing there tho' we have been told some attempts have been made but of this we have no absolute certainty, from the great plenty of everything on the Isle one might conclude that it had injoyed the b(l)esings of Peace for many years.... (Beaglehole 1961:221)

As Cook subsequently learned, Ori may have possessed much authority in Huahine — or, at least, on the northern of the island’s two parts — but the highest-ranking kin-Titleholder at the time of Cook’s visits was a young lad named Teri’itaria, who had been born about 1763, the son of Mato and Fatuarai (Fatuareii?). In 1777 Cook found Ori to be no longer at Huahine, having removed to Ra’iatea. As for the current government of Huahine Cook wrote at the time:

Anarchy seemed to prevail more here than at any other place, the Earee rahie as I have before observed was but a Child and I did not find there was any one man or set of Men who managed the Government for him, so that when ever any misunderstanding happened between us I never knew whom to apply to to settle matters. The you(n)g Chiefs Mother would some times exert her self but I did not see she had greater authority than many others. (Beaglehole 1967:237)

As one example of this anarchy, Cook had some unhappy encounters with a Poraporan adventurer then on Huahine who had succeeded in collecting around him some other ruffians and who seemed to be a law unto himself (Beaglehole 1967:236-237).

Fatuarai, the young *ari’i rahi’s* mother, who was known also as Teha’apapa, was descended from high-ranking kin-Titleholders of Tahiti, Mo’orea, and Huahine (Henry 1928:257). Her father is described in one account as having been Huahine’s “principal warrior chief” and associated with marae Tiva (Chesneau 1928:81). Mato, the boy’s father (also known as Terii te Po Arei), was identified by Henry as “high priest of Opoa” (1928:257). His kinship with some other principal personages of the era is shown in figure 25-9.

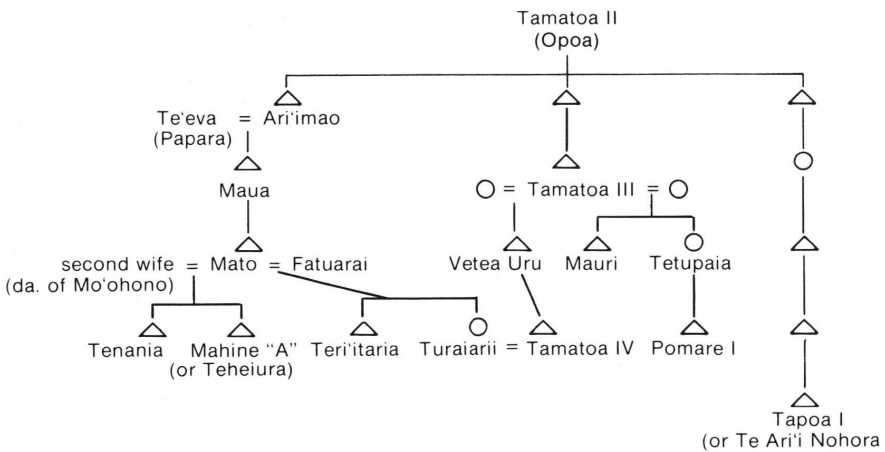

FIGURE 25-9. Some kin relations of Teri’itaria.

After siring Teri'itaria (about 1763) and Turaiarii, Mato left Fatuarai and married the daughter of Mo'ohono, identified by Chesneau as "grandpriest of Huahine" (1928:81). By this wife he sired three children, two of whom figure prominently in political developments, namely, Tenania (who "married" 'Itia after the latter separated from Pomare I) and Mahine ("A") (known also as Teheiura and Puru, who later became "king," or, with Tenania, "cooking," of Huahine). Mato was not in evidence during any of Cook's visits to Huahine; Chesneau reported that he was killed around 1775 in an interisland battle, but this date and the circumstances of this conflict are clouded with uncertainties.⁵³ All of this is of course most intriguing, and probably important; and I relegate discussion of the matter to a footnote only because of the paucity of data concerning it.

I shall take up the threads of this Leeward Islands history as events in Tahiti-Mo'orea warrant. Meanwhile, let us consider what ideas and objects of Leeward Island origin were exercising palpable influence upon the course of political history of Tahiti and Mo'orea at the beginning of the European era.

'ORO IMAGES AND FEATHER GIRDLES

In my accounts of myths having to do with the diffusions of 'Oro worship I reproduced (in chap. 22) one of Henry's, which described how some of the god's zealots had established the cult on Tahiti by building a marae called Taputapuatea on Tairapu and by installing in it an 'Oro image called 'Oro Rahi To'o Toa (Great-'Oro-of-toa-wood). The date of this event is not given, but the description of it implies that it was the first successful establishment of the cult on Tahiti.⁵⁴ The account then continues:

Thus encouraged, the priests of 'Oro went to the body of Tahiti, the fish, with a sacred stone from the marae they had just made. They landed at 'Utu-'ai-mahu-rau (Cape-eating-many-mists), at Pa'ea, then called Atahata or Ata-huru (Fleecy-clouds).

There they were allowed to take possession and were also aided in building their marae, which was called 'Utu-'ai-mahu-rau. 'Oro-hu'a-manu ('Oro-of-the-bird-feathered-body) became master there; the image was woven the size of that at Opoa and covered with red, yellow, and black feathers from the image at Tautira.

Gradually, as the priests of the new order increased, new marae to 'Oro in the feather body were erected all around Tahiti, and finally Pepeto'ai in Mo'orea had its Taputapu-atea, which was originally Te-pua-tea (White-flower). The change of the name was occasioned by a marriage which took place between a high chief of the Manea family in Papeto'ai and a princess of Opoa. The princess brought her marae stone from the original Taputapu-atea, and she and her husband named it Tura'a-ma-rafea (Kneeling [stone] of-two-meetings). This stone raised the marae from a social to a national grade, so that it became the Taputapu-atea of all Mo'orea. (1928:130-131)

This account does not indicate whether facsimile images of "'Oro in the feather body" were made and installed in the various marae erected

for this manifestation of the god, nor does it imply that a separate 'Oro image had been installed in the Taputapuatea built on Mo'orea. In fact, the only other evidence, mythical or otherwise, for the presence of any other 'Oro image on Tahiti-Moorea during the era under study derives from Thomson's *History*.

Shortly after [1730-1740] a quarrel took place between the two districts of Te oropa and Teva uta. A battle called *Ohure popoi hoa* (a name of filthy meaning) was fought at Papara in which the latter were beaten and dispersed. A party fled to the island of Raiatea, among whom were *Faanonou* the grandfather of Tati and *Teiva* [Te'eva Pirioi] a female who was soon afterwards married to Ariimao ancestor of Tamatoa and king of Raiatea, by whom [Ari'imao] she had a son called *Maua*. Faanonou became the friend of Maua, and when he resolved to return to Tahiti, through the influence of his friends, and his mother he obtained an idol made at the great marae of Oro at Opoa, and which had been consecrated by the priests there, and became a duplicate of their god. This new idol was deposited in the sacred canoe of Oro called *Te vaa roa i te matai* and committed to the care of Faanonou to be conveyed to Tahiti. The priest of Oro giving strict injunctions that it should be conveyed to his paternal marae at Papara with as little pomp and ceremony as possible. Faanonou accordingly sailed for Tahiti accompanied by Tupaia a priest of Oro and one or two canoes, arrived in safety at Papara, where in the small family marae adjoining the dwelling of the chief the god Oro found his first resting place on Tahiti probably about the year 1760. So quiet and unostentatious was the landing of Oro, that it was scarcely known for a considerable period, that such an arrival had taken place. When it at last became generally known throughout the island, he was at once adopted as the national god, the god of war, and the spirit of the new god seemed at once to have possessed the people. (Thomson, *History*, pp. 16-17)

Thus, we are provided with evidence — legendary but circumstantial — of the presence of *three* 'Oro images on Tahiti-Mo'orea during the eighteenth century: the Great-'Oro-of-toa-wood (at Taputapuatea, Tairapu); the 'Oro-of-the-bird-feathered-body (at marae 'Utu'aimahurau, Pa'ea); and the one installed by Maua and Tupaia at Papara (which I shall call the "Papara image," in the absence of its name being given in the sources). There may have been more, but these alone are specified in the accounts about which I know.

Indeed, the only one of these three images that I can actually account for in historically authenticated reports is the so-called Papara one, which, as we shall see, became a most important element in the political strife of the era.

Of parallel and indeed interdependent importance in the political history of the Early European Era were the feather girdles, which served to symbolize and legitimize certain of the very highest-ranking kin-Titles of Tahiti-Mo'orea. One of these was the red-feathered girdle (*maro ura*) reportedly introduced into Papara (along with the Papara image of 'Oro) as the result of Te'eva's marriage to Ari'imao. Another was the fabled yellow-

feathered girdle (*maro tea*) allegedly bestowed upon the first Te'eva by his genitor, Hotutu's shark-god lover from overseas. Thenceforth, after Te'eva moved from Vaiari and settled down at Papara, entitlement to this girdle was identified with the dynastic line holding the chieftainship of Papara's principal kin-congregation, and it was the only such yellow-feathered girdle recorded for Tahiti-Mo'orea.⁵⁵ Thus, during the era now under study, there were traditions extant concerning two distinct feather girdles associated with the chiefly kin-Titles of the principal Paparan kin-congregation (and derivatively, with chieftainship of the Papara tribe). Whether these traditions were substantialized in the existence of two actual girdles — a *maro tea* and a *maro ura*, or two *maro ura* — I cannot say.

The question is further complicated by references in the sources to what Adams called "a curious form of the Maro ura."

Besides the ura or red feathers, which were the exclusive signs of the Arii rahi, a curious form of the Maro ura had been made the symbol of supreme authority by Purea [the Fa'a'a woman married to Amo, chief of Papara]. This was the British pennant left flying at Matavai by Captain Wallis at his departure. Purea took it to her Marae of Mahiatea, and seems to have converted it into the Maro ura with which her son was to be invested. (1901:109)

This same girdle (which I shall call the "Wallis *maro*") was seen in 1777 by Cook, who described it as follows:

One of the bundles was now untied and it was found, as I have before observed, to contain the Maro with which they invest their Kings with Royalty. It was carefully taken out and spread out at full length on the ground before the Priests, it was about five yards long and fifteen inches broad, and composed of red and yellow feathers but mostly of the latter; the one end was bordered with eight pieces, each about the size and shape of [a] horse shoe, with their edges fringed with black pigeon feathers; the other end was forked and the ends not of the same length. The feathers were in square compartments ranged in two rows and otherways so disposed as to have a good effect being first paisted or fixed to their Country cloth and then the whole sewed to the upper end of the English Pendant, Captain Wallis displayed, and left flying a shore the first time he landed at Matavai, so at least we were told and we had no reason to doubt it as it was part of an English pendt. About six or eight inches square of the Maro was not compleat, that is there were no feathers upon it except a few that were sent by Waheatua as before mentioned. The Priests made a long Prayer over the Maro in different forms which, if I mistake not, they called the prayer of the Maro. When it was finished, the Maro was carefully foulded up put into the Cloth and laid upon the Morai. (Beaglehole 1967:202; see also Bligh 1792:138)

It would be useful to discover whether the British pennant in question was in fact added to one of the traditional Paparan *maro* — the ancient *maro tea* or the more recent *maro ura* introduced by Maua and Tupaiia — or whether the whole Wallis *maro* had been fabricated *de novo* by Amo and Purea. Unfortunately a positive answer to this question eludes

me — although I strongly suspect the first alternative to be the correct one. My interest in this question goes deeper than idle ethnographic curiosity. Such a development would carry important implications if it turned out that an entirely new *maro*, and one deriving its significance from the European presence, had been created as the symbol for Teri'irere's incumbency.

Another *maro* — this undoubtedly an ancient one — which figured importantly was the one usually deposited at Pare's Tarahoi marae and allegedly introduced by Tetupaia from Opoa, when she became the wife of Pare-Arue's chief Teu, circa 1740. (Tetupaia was the eldest child of Ra'iatea's sovereign chief, Tamatoa III.) (Henry 1928:249.) In February 1791 Morrison witnessed the investiture of Pomare II at Tarahoi with a *maro ura* that may plausibly be identified, in whole or in part, with the one introduced by Tetupaia:

This day the Ceremony of Investing the Young King with the Marro Oora or Royal Sash took place; the Sash is of fine Network on which Red and Yellow Feathers are made fast, so as to cover the netting; the sash is about three yards long, and each end is divided into six tassels of Red Black & Yellow feathers, for each of which they have a name of some Spirit or Guardian Angel, that watches over the Young Chief while the Marro is in his Possession and is never worn but one day by any one King; it is then put into the Sacred Box and with a Hat or Shade for the Eyes Made of Wicker & Covered with feathe(r)s of the same kind and never used but on the Same occasion it is delivered to the priests, who put it Carefully by in the Sacred House on the Morai, where no person must touch it. (Morrison 1935:116).

Two other *maro ura* figure in accounts of Tahiti-Mo'orea. One was the traditional entitlement to such associated with the principal kin-Title, Te Ari'i Nui o Tahiti, of Vaiari's Farepua marae, the other was the entitlement associated with the kin-Title, Te Atua Nui e Maru Ae i Te Rai, of Puna'auia's marae, Tahiti-Puna'auia. During this era both these kin-Titles were probably assigned: the former perhaps to a certain Maheanu'u (Henry 1928:83), and the latter quite possibly to Puna'auia's high chief, the genial giant, Pohuetea. However, there is no record that these individuals, or anyone else, ever asserted the right to wear a *maro ura* during this era, nor can I discover evidence that either of these legendary *maro ura* actually existed at the time. I shall try in due course to account for this circumstance, but with the stage thus peopled and provided with its most important props, I am now in a position to reconstruct and perhaps better illuminate the drama itself.

THE EMERGENCE OF THE POMARES

THE PAPARA DEBACLE

While H.M.S. *Dolphin* (fig. 26-1) was anchored in Matavai Bay in June and July 1767 its personnel were totally unaware of the drama that was unfolding at Papara, 40 kilometers along the coast to the south. This drama reached a climax in December 1768, and by the time H.M.S. *Endeavour* arrived four months later, this particular act had ended, and the principals were contemplating, and perhaps even then preparing for, the denouement.¹

The first recorded notice of these events appears in Bank's journal, on the date of 29 June 1769, during his and Cook's tour around the island. At Papara the visitors were much impressed both with the size of marae Mahaiatea and with the apparent decline of "Queen" Purea's fortunes, from the high point reported of them by Wallis two years previously. (See fig. 26-2)

The greatest pride of an inhabitant of Otaohite is to have a grand *Marai*, in this particular our freinds far exceed any one in the Island, and in the Dolphins time the first of them exceeded every one else in riches and respect as much. The reason of the difference of her present apearance from that I found by an accident which I now relate: in going too and coming home from the *Marai* our road lay by the sea side, and every where under our feet were numberless human bones chiefly ribbs and vertebrae. So singular a sight suprizd me much; I enquired the reason and was told that in the month calld by them *Owiráhew* last, which answers to our December 1768, the people of Tiarreboo made a descent here and killd a large number of people whose bones we now saw; that upon this Occasion Oborea and Oamo were obligd to fly for shelter to the mountains, that the Conquerors burnt all the houses which were very large and took away all the hoggs &c., that the turkey and goose which we had seen with Mathiabo were part of the spoils, as were the jaw bones which we saw hung up in his house; they had been carried away as trophies and are usd by the Indians here in exactly the same manner as the North Americans do scalps. (Beaglehole 1962:I, 304-305)

So much for the first recorded "facts" concerning this first major political upheaval of the European era. Subsequently recorded "facts" about this episode will agree with the bare statements set forth in Banks' report but add enough others to produce some wholly different versions of "what actually happened."

FIGURE 26-1. "A representation of the attack of Captain Wallis in the *Dolphin* by the natives of Otaheite." In Hawkesworth 1773, vol. 1.

FIGURE 26-2. "A representation of the surrender of the island of Otaheite to Captain Wallis by the supposed Queen Oberea." In Hawkesworth 1773, vol. 1.

The most detailed account is provided by Adams.² The whole debacle, this version implies, came about as the result of Amo's and Purea's — but mainly the latter's — obstinate desire to elevate even further their son, Teri'irere's, very high-ranking status (and derivatively, his political influence) over all Tahiti and Mo'orea. To accomplish this they undertook, according to Adams, "... what no other great chief had ever attempted":

They not only imposed a general *Rahui* for the child's benefit ... but they also began a new Marae for Teriirere, in which he was to wear the Maro, and they set their people to work on the enormous task of piling up the pyramid at Mahaiatea which was an exhibition of pride without a parallel in Polynesia. (1901:42)

The immediate consequence of these acts was a series of challenges. I reproduce the full account of this episode, however dubious or clearly inaccurate parts of it may be, because of its exemplification of what appears to have been a very characteristic tactic of social competition.

This was more than Purea's female relations could bear, and it set society in a ferment. The island custom provided more than one way of dealing with pride. Though Purea and Teriirere were admitted to be political superiors, they were socially no better than their cousins, and custom required that if during a *Rahui* any relative or guest of equal rank should come to visit the chief who had imposed it, the *Rahui* was broken, and the guest received by courtesy all that the *Rahui* had produced. Such an attempt to break the *Rahui* was of course an act which could not be ventured by any ordinary chief within the direct control of Papara; but Tefana i Ahurai was independent, and if Purea's own family chose to set up such a claim, Purea would resist it at her peril. Not even she could afford such a quarrel.

The first person who undertook to break the *Rahui* was probably Purea's sister-in-law, no doubt the wife or widow of Teihotu, on behalf of her son, Terii vaetua.^[3] She set out from Faaa in her double-canoe, with the house or tent, called *fare-oa*, in the prow, which only headchiefs could use; and a crew of fifty men or more paddled this barge of state, with all the show of a royal ceremony, along the coast to Papara, some twenty miles away, until, opposite to the Point of Mahaiatea, they turned in to an opening in the reef which had on some pretext become sacred, and was known as the sacred pass, through which only sacred chiefs might go. Purea was then living on the Point, and probably was superintending the work on her great Marae. She came out on the beach, and as the double canoe, with its royal tent, passed through the opening and drew towards the land she hailed it:

"Who dares venture through the sacred pass? Know they not that the Texas are under the sacred *Rahui* for Teriirere i Tooarai? Not even the cocks may crow or the ocean storm."

"It is Terii vaetua, Arii of Ahurai."

"How many more royal heads can there be? I know none but Teriirere i Tooarai. Down with your tent!"

The Ahurai chiefess wept and cut her head with the shark's tooth till blood flowed down her face, which was the custom of women in sign of great emotion, and meant in this instance revenge as well as grief; but Purea was inexorable, and Terii vaetua was obliged to turn round and go home like any ordinary stranger.

The quarrel, once begun, was extended by another of the Ahurai family, a woman who proved to be more than Purea's equal in most forms of energy. She

was Purea's niece, the daughter of Teihotu and sister of the insulted Terii vaetua. Her name was Tetuanui rea i te Raiatea, and she was or became the wife of Tunuieaiteatua i Tarahoi, Cook's friend Otoo, and the missionaries' friend Pomare. A very famous woman in Tahitian history, much talked about by Captain Bligh in 1788 and by the missionaries as Iddeah, Tetuanui i Nuurua was not even mentioned by Wallis or Cook, although the latter, in 1774, frequently mentions "Tarevato, the king's younger brother," whom I take to be Terii vaetua, the king's brother-in-law, who had begun the attempt to break the Rahui.^[4] Indeed, Cook never saw even Pomare until August, 1773, when Pomare was already thirty years old.

After the repulse of Terii vaetua, this sister undertook to pursue the quarrel. The matter had become uncommonly serious, for a feud between Papara and Ahurai might upset the whole island. Nothing more would then be needed to overthrow the Papara supremacy than the alliance of Ahurai and the Purionuu with Vehiatua, whose fortunes had been made a hundred years before by a similar combination to break a similar *Rahui*. Tradition has preserved the precise words used by the family to avert the peril into which Purea's pride and temper were pushing them.

Tetuanui in her turn made her appearance in the state canoe off the point of Mahaiatea, and as she approached the beach was received by Purea with the same order, "Down with your tent!" Tetuanui came ashore and sat on the beach and cut her head with the shark's tooth till the blood flowed down into a hole she dug to receive it. This was her protest in form; and appeal to blood. Unless it were wiped away it must be atoned by blood.

Then the high-priest Manea interposed. Manea was Amo's younger brother, from whom we are directly descended in the fourth generation, and probably we owe our existence in a double sense to him, for his act wiped out the blood-feud as far as his own descendants were concerned.

"Hush, Purea! Whence is the saying, 'The pahus (drums) of Matairea call Tetunai for a Maro-ura for Teriirere i Tooarai. Where wilt thou wear the Maro-ura? In Nuura and Ahurai. One end of the Maro holds the Purionuu; the other end the Tevas; the whole holds the Oropaa.'"^[5]

Manea quoted the maxim of family statecraft in vain. Purea replied only that she was going to allow no rivalry to her son. "I recognize no head here but that of Teriirere." Then Manea dried the blood of Tetuanui with a cloth, wiping away the feud as far as he was concerned; and so long are these things remembered that forty years afterwards, when the Purionuu savagely raided Papara, Manea's great-grandchildren were supposed to have been spared in memory of Manea's act. (1901:42-46)

Continuing the Adams version, the parents of Teri'irere persisted in their undertaking and assembled a large gathering to witness his investiture in the *maro* (which *maro* is not directly specified) and to partake of the feast that followed. Those invited to the occasion (Adams wrote "summoned") included Pohuetea of Puna'auia; Tepau "A" of Ahurai; Pomare I of Pare-Arue, designated "Terii maro ura" (the *maro*-wearing *ari'i*) of Tarahoi (Pare-Arue's principal marae); along with "the Island of Eimeo" (probably Mahine); Puni, chief of Porapora; Ra'a, chief of Maupiti and Tupai; and Teae of Ra'iatea. This version does not indicate which ones of these notables attended or whether the investiture actually took place, but proceeds to explain that the whole occasion was interrupted and brought

to a bloody conclusion by means of an armed attack of Seaward Tevans who (as Banks reported) killed a large number of people, burned houses, collected all moveable loot, and forced Amo, Porea, and Teri'irere to flee (Adams 1901:71; Beaglehole 1962:I, 305).

According to Adams' version, then, the immediate cause of this upheaval was Porea's overweening pride; but in the background certain other factors were involved — one of the weightiest having been the acts of Tutaha, great-uncle of Pomare I and tribal chieftain of Pare-Arue. (Tutaha himself was evidently content to wield the secular authority of the Pare-Arue chieftainship, leaving to his grandnephew the ceremonial honors attending high rank-status, to which indeed Tutaha himself was not even eligible.) Tutaha's part in the Papara affair was aimed immediately at elevating his grandnephew's rank-status even further, which could be done only by diminishing that of the latter's principal rank-status rival, Teri'irere. It is not stated what part Tutaha and his forces played in the actual fighting, if any, but his share of the spoils were described as follows:

While the Tairapu people carried off the heads and the property of the victims, Tutaha and the northwestern districts carried away the symbol of supremacy, the standard and feathered girdle, from the Marae of Tooarai and Mahaiatea, and placed it in the Marae of Maraetaata in the district of Paea in the Oropaa, or, as it was usually called by the English, Attahuru. Amo and Porea were forced to make what terms they could with Tutaha, and to recognize Otoo, as having a right to the dignity of the Maro-ura at Maraetata. (Adams 1901:74)

(As I noted earlier, I believe that these "symbols of supremacy" were taken not to Maraeta'ata but to Pa'ea's other principal marae, 'Utu'aimahurau; but that need not immediately concern us here.)

It is not clear from this version just what Tutaha's long-range goals were in this affair. An historian accustomed only to Western man's motives would probably conclude that Tutaha sought additional power and influence for himself; but Tutaha was a Maohi, and this version alone does not throw enough light on the man's deeds to permit such a straightforward ascription.

According to the Adams version another major factor involved in the Papara affair was active enmity between Papara and Tairapu. Some of this marked a continuation of the general, long-time antagonism between the respective leaders of the two tribal complexes.⁶ A more specific reason for this active enmity was the long-standing rivalry between the Aromaiterai and Tuiterau branches of Papara's leading family. This came about, it may be recalled, when Aromaiterai, the elder son of the Paparan chief, was passed over in the succession in favor of his younger brother, Tuiterau, and then sent into exile. Thus, when Purahi, the eldest grandchild of Aromaiterai, married Vehiatua I, the Tairapuan chief, she was thereby provided with the means for striking against Tuiterau's successor, his grandson and lineal successor, Teri'irere.

It is not clear from this version whether the Aromaiterai (in the person mainly of Purahi) had for a long time been eagerly awaiting a favorable opportunity for revenge, or whether Purahi was moved to reopen the rivalry as a result of Pura's pretensions. Nor is it clear whether she hoped to recapture Teri'irere's kin-Titles for her son, or merely to humble somewhat the Tuiterais. In any case, whatever her motives and expectations may have been, she was given full credit (or blame, depending upon the point of view) for the devastation wreaked upon the Paparans by her husband's forces.⁷ And although the Tuiterais were duly humbled by these measures, their losses, in terms of rank-status and political influence, accrued as gains not to the Aromaiterai in particular (or to the Tairapuans) but to Tutaha and Pomare I.

A second version of the Papara affair, which was quoted by Adams but not wholly integrated into the "Adams' version" of the affair, was supplied by Tupaia.⁸ The latter is reported as having roused the enmity of Tutaha, as the result of his association with Pura, whom Tutaha wished to supercede as "regent."

The better to effect it [this purpose] he [Tutaha] began to create divisions between the inhabitants of Otahitee-eta (Tairapu) [Lesser Tahiti] and of Otahiteenua [Greater Tahiti], which finally produced hostilities between them. At that time Tobia [Tupaia], who had great sagacity and judgment, having discovered Tutahaw's designs, advised the queen to procure his death privately, as the only expedient to restore peace and preserve her authority; but she, thinking his advice too cruel, refused, for the first time, to comply with it; and he, foreseeing the consequences, retired to the mountains, alleging that this retreat was necessary for the preservation of his life. Soon after, the inhabitants of Lesser Otahitee making frequent incursions into the greater division, and their numerous depredations having thrown the inhabitants of the latter into confusion, which Tutahaw artfully improving to his advantage, they at length offered him the regency, thinking their affairs too much embarrassed for the administration of a female; an agreement was therefore made between Oberea and Tutahaw, in which it was conditioned that she should preserve the title and state of queen, with a certain number of attendants, &c., and that the regency should devolve to Tutahaw; who, respecting Tobia's understanding and sacerdotal character, afterward permitted him to return from the mountains in safety; but he was so much displeased with this revolution that he embraced the opportunity of our departure to leave the island. (pp. 72-73)

The most interesting aspect of this version is its singling out of Tutaha as the prime, indeed the only noteworthy, mover in the affair. As for this account's reference to "the regency," it presumably applies to regency for Teri'irere, although no other version that I know of includes this as one of Tutaha's own objectives, or as one of his spoils of war.

Certain other accounts of the Paparan debacle are simply rehashes of some or all parts of the ones just reproduced,⁹ but there are two that cast different lights over the whole affair. The first of these is the version

recorded by the missionary Robert Thomson several decades after the events but based on information from Tahitians who were alive at the time or who had learned about the events from the participants. According to Thomson, the incident that initiated this chain of events was the introduction in Tahiti of the cult of 'Oro — specifically the establishment in Papara of an 'Oro image from Ra'iatea circa 1760. According to this unique reconstruction, which was quoted in chapter 25, after 'Oro's adoption as the god of all Tahiti the decision was reached to build a new marae to house his image, at Mahaiatea: "all the districts engaged to unite in forwarding this national work" (Thomson, History, pp. 26-27). Then, Thomson continued, after the marae was finished about eight years later, and after the god had begun to receive there the homage of all Tahiti, the chief of Papara developed pretensions of his own:

Amo feeling that his district had acquired a new and paramount importance in the island, began to think of dominion, and to devise the means by which he might accomplish this end; afraid to attempt it by war he had recourse to an expedient, probably suggested by Tupaea the priest of Oro who had accompanied the god from Raiatea, and who is reported by the people themselves, as well as by Cook to have been one of the cleverest men of the island. Amo suggested that the flag of Oro should be sent round the island, and each chief show his submission to the new god, by allowing the flag to pass in triumph through his district. The flag used on the occasion was not the one which Wallis had hoisted at Point Venus, but a flag or rather pendant made of some material and woven in the manner in which mats were made, and fringed with red feathers, this pendant was called a *vane*. It was accordingly sent round the island and each chief met it at his marae and allowed it a free passage thru his district. It passed thru all the districts on Tahiti without interruption, till it came to the territory of the haughty chief of Taiarabu, who when he saw it exclaimed, "who are the '*feia inro*' degraded people here who will allow this flag to pass thru the district," and seizing it, he tore it in pieces, and sent it back to Amo; who, much mortified at the failure of his scheme, resolved to avenge it, and declared war against Taiarabu.

His active enemy more prompt at war exploits than himself, did not leave him long time for preparation, he mustered his warriors, sent the portion of his fleet which was on that side of the isthmus to attack Papara, while he and most of his warriors marched by land. Amo in the meantime prepared to meet him, so sudden was the attack that he had not time to obtain the assistance of many allies; when the intelligence reached Teoropa and Purionuu, the chiefs with a few of their people immediately joined Amo, but not until the battle was begun. The conflict was not of long duration but was obstinate and bloody, many hundred were slain on both sides. Amo and his allies were defeated, but brought away with them the priest of Oro, who had charge of the sacred and royal girdle, and various other relics brought with the idol from Raiatea. These were safely deposited in the marae at Atehuru. Amo accompanied Teu to Pare and resided there with him for some time, until he could return in peace to his district. In giving an account of this sanguinary battle the old people say that the beach for a long extent, from the sea side up to the base of the hills was covered with the slain. Numbers too were killed in the canoes which met and fought inside the reef, the whole coast in that neighbourhood

was afterwards strewed with the bones and skulls of the killed, and numbers of the latter which were lying in the sea were taken possession of by the fishes, especially by the cuttle fish which lodged in the skull, projecting their long feelers thru the eyes and other holes in the skulls. And from this circumstance the engagement has derived the name of "The battle of *mata toroa*". Mai, the brother of Amo fell in this battle, and Vehiatua had the body cooked in an oven, but whether it was afterwards eaten, or not, never was known. After desolating the country, the Tairabu warriors returned home, And Amo and his friends were soon after taken back to Papara by his allies.

The chiefs of the northern and western districts having assisted Amo great offense was taken by Vehiatua, who preparing to attack them, when another circumstance diverted their attention, and suspended hostilities for a time. This was the arrival of another foreign ship. (pp. 38-40)

Not a word was written about Teri'irere in this version; and the ambitions which led to the debacle are represented as having been Amo's, not Porea's. Also, far from joining to defeat Amo (as in the Adams and other versions), the Porionu'u (i.e., Tutaha) and the Oropa'a are shown in this version to have been his tardy but loyal allies.

The version put forward by Moerenhout, writing a few years earlier than Thomson, and like Adams heavily dependent upon Paparan sources for his information, began with the assumption that Amo was "King" of the whole island. Translated very freely, Moerenhout's reconstruction is as follows:

Soon after the departures of Wallis and Bougainville, Amo, who until then had been king of the whole island, perceived that his influence had diminished relative to that of the chiefs who lived nearer the Europeans' anchorages. The latter had been the principal recipients of valuable gifts from European officers and had had their reputations enhanced and their causes supported through friendship pacts with Europeans. In addition, these chiefs were the ultimate recipients of the countless objects collected by their subjects from Europeans. In contrast, Amo and Porea profited from the European visits only to the extent of a few personal gifts, which went mainly to Porea; and their subjects gained nothing at all. Thus, as a result of the European visits, Amo fell behind other chiefs, in affluence and in prestige, to whom he had previously been superior. Then, on top of this, Amo's power and influence were further diminished as the result of his disastrous defeat at the hands of Vehiatua I.

Moerenhout's version of this final act in the Paparan downfall contains some novel points:

Bougainville became particularly attached to the family that resided near his vessels' anchorage, which resulted in the enhancement of its social position, thereby threatening the position of the family that had been supreme for so long [i.e., Amo's]. Thus, upon the departure of Bougainville, Amo, fearing opposition from other chiefs, but wishing to have his son recognized as *ari'i rahi* or king, sent his standard around the island to receive the sign of submission from other *ari'i* and from the nobility (*la haute aristocratie*). On the prompting of Tutaha (Bougainville's friend and protégé) Tairapu's chief, Vehiatua, not only refused to

honor the standard but went so far as to tear it up, an insult which could only be wiped out by war. Going even further, Vehiatua had the audacity to attack Amo near Papara itself, despite the fact that the people of Mo'orea fought on Amo's side. The resulting battle was a terrible one, lasting many hours. It is said that so many people were slain that Vehiatua was able to build a whole marae on Taiarapu entirely out of their skulls and named accordingly Tiahupo'o — certainly one of the most extraordinary temples ever raised to a god. (1837:II, 407-408)¹⁰

Several points in this reconstruction deserve comment. First of all, it should by now be clear that neither Amo nor any other chief was at that time *the* king of all Tahiti. Second, the prominence accorded Bougainville in this account looks suspiciously like an example of Moerenhout's Francophilia. Tutaha did visit Hitia'a briefly while Bougainville was there, but if Bougainville became "particularly attached" to anyone during his nine-day stay it was to the local chief, Reti; and it is difficult to see how this brief encounter could have shaken established hierarchies as violently as Moerenhout implied. Again, this view that Tutaha was largely responsible for Vehiatua's attack on Papara is incomplete, to say the least. While there is evidence from other sources attesting to bad blood between Taiarapu and at least some Mo'oreans, Moerenhout's is the only account that I know of which identifies Mo'orea as an ally — and indeed the only ally — of Papara in this particular conflict.

To the extent that these different versions were credibly delivered Maohi accounts, and not just Europeans' constructions, they are all revelatory of the mainsprings of Maohis' political actions. In terms of "history," however, we have no way of knowing which version most closely fits the actual events. Nevertheless, I believe that as a consequence of certain events approximating those just described, intertribal relations on Tahiti entered a different and perhaps entirely unprecedented phase. In the island's hierarchy of rank-statuses, preeminence began thereafter to be ascribed not to two individuals but to one. It required several years for this process to be completed, and many more to accomplish a parallel development in the sphere of coercively sanctioned tribal authority.

CONTEST BETWEEN NORTH AND SOUTH

After Papara had been laid low in the war of 1768, intertribal strife on Tahiti became polarized between north and south — or, more specifically, between the island's two most forceful and contentious tribal chiefs, Tutaha of Pare-Arue and Vehiatua I of Seaward Teva. It is difficult to say what led these two to their confrontations; to evoke some general psychological factor, like ambition for personal monopoly of power, may in fact be true, but cannot be specifically documented.

Cook and his *Endeavour* shipmates remained in the dark about the complex relationship between kin-Title rank-status and tribal authority, but

they were emphatic in characterizing Tutaha as the most powerful and influential chief in northwest Tahiti. The *Endeavour's* personnel had less opportunity for appraising Vehiatua's position at the time, but it is clear from other evidence that he was the unchallenged master of Seaward Teva, in terms both of active, effective leadership and of ascriptive paramountcy — that is, his incumbency of the region's highest-ranking kin-Title, *Vehiatua* (which, however, did not include the right to don a feather girdle). In the latter respect he possessed an advantage over Tutaha, whose kin-Title, if any, was that of a younger sibling; but perhaps Tutaha's regency over Pomare I's *maro ura* kin-Title served to lessen somewhat that advantage. Seaward Tevans seem not to have questioned the superiority of Pomare I's rank-status over that of their own chief, Vehiatua; this was revealed in their conversation with the Spaniards at Tautira in December 1772 (Corney 1913:307).

The most widely accepted account of the dual between Tutaha and Vehiatua I is G. Forster's, written in 1774:

Captain Cook found the government of Taheitee in the hands of Tootahah, when he arrived in the *Endeavour*. After his departure Tootahah, being greatly enriched by the presents he had obtained, persuaded the chiefs of O-Taheitee-nue, or the Great Peninsula, to go against Aheatua, whom he could not forgive on account of the insult shewn to his family.^[11] They equipped a fleet, and went to Tiarraboo where Aheatua was prepared to receive them. He was an old man, desirous to end his days in peace; and therefore sent to Tootahah, to assure him that he was his friend, and always intended to continue so; and that he desired him to return to his country, without attacking those who had an affection for him. Tootahah was not dissuaded from his purpose, but gave orders to engage. The loss on both sides was nearly equal, but Tootahah retired, in order to attack his enemy by land. Happai, with all his family, disapproved of this step, and remained at o-Parre; but Tootahah took o-Too with him, and marched to the isthmus between the two peninsulas. Here Aheatua met him, and a pitched battle ensued, which ended in the total dispersion of Tootahah's army. Tootahah himself was killed. Some told us he had been taken prisoner, and was put to death afterwards; but others, and among them o-Mai, asserted that he had been slain in the heat of the engagement. O-Too retired precipitately to the mountains with a few chosen friends, whilst Aheatua, with his victorious forces, immediately marched to Matavai and o-Parre. At his arrival Happai retired to the mountains, but Aheatua sent to assure him that he had no quarrel with him or his family, and that his wish had always been for peace. Those on the mountain enquired in their turn concerning the fate of Tootahah and o-Too; they heard that the former was killed, and that no body knew what was become of the other. Soon after o-Too arrived through many difficult passes, and over precipices, and coming down from the highest summits, joined his father, and all who were with him. A general peace was immediately concluded, after which O-Too assumed the reins of government himself, and the vast improvements in the country, which we noticed in eight months time,^[12] seem to prove that he is a very intelligent man, who promotes the general good of his subjects. Aheatua died soon after; and his son of the same name, whom we found at Aitepeha in August 1773, succeeded him. (1777:II, 94-96)

Some importance attaches to the dates of these alleged events. Forster's

wording locates them no more exactly than between Cook's two visits of August 1769 and August 1773, and implies that the war had been won, and Tutaha slain, some months before Vehiatua I himself died. Cook's own brief notice of these events places Tutaha's death about March 1773, a date also accepted by Adams (1901:91). Writing at Tautira in August 1773 Cook reported: "These people informed us that *Toutaha*, King of the greater Kingdom of Otaheite was kill'd in a Battle which happen'd between the two Kingdoms about five months ago" (Beaglehole 1961:202). A difficulty in the way of accepting this dating appears in Boenechea's account of his expedition's visit to Tahiti during November and December 1772. At that time the "cacique" at Tautira, where the frigate anchored, was Ti'itorea, whose spouse at the time "... was formerly the arii Taitoa's" [probably Vehiatua I] (Corney 1913:335).¹³ In other words, Tutaha's principal antagonist had by this evidence died much earlier, possibly even in 1771. This means, of course, that Vehiatua I had not lived to see his Seaward Tevans defeat Tutaha and his forces. Consequently, if this dating of events is correct, then one must impute to this conflict motives broader than the long-standing personal animosities of two contentious chiefs. A further point, not specified in Forster's version, but attested elsewhere, is the circumstance that Te Pau i Ahurai died along with his ally, Tutaha, in the war's culminating battle (Beaglehole 1961:202).

More important than the precise date of Tutaha's death is the question of the disposal of his corpse, but consideration of that will be postponed until I have reproduced a somewhat different version of this calamitous north-south conflict. This is the account recorded, and doubtless elaborated, by Moerenhout, writing many decades after the events themselves.

The results of this battle [the Papara debacle] changed the political shape of the island. Amo was no longer *ari'i rahi*, and nearly every chief went his own way, each one regarding himself as independent and free in his own district. Only Tutaha held on to his visions for the future. The others continued to recognize the son of Amo and Purea as heir presumptive, but Tutaha dreamt of supplanting the latter with young Tu, who was a member of his own family. In order to accomplish, this he set about organizing a campaign against the very individual who had contributed to his own rise [i.e., Vehiatua I]; with considerable shrewdness he even managed secretly to enlist Amo to lead the expedition. After extensive preparations their forces embarked in a fleet of several hundred canoes to attack Vehiatua, their most redoubtable rival. Despite the numerical inferiority of the latter's forces, this venerable chief, who was one of the island's most celebrated orators, managed so to inspire his followers that they defeated those of the allied chiefs in a battle in which Tutaha himself was slain, along with several members of his family, although young Tu managed to escape. After laying waste to part of the island, particularly Amo's own district, which was nearby, Vehiatua acceded to the pleas of friends of the vanquished and made peace with them. This chief, who after this great victory was in a position to rule the whole island, was however very old and preferred tranquility instead. Accordingly, he permitted the [chiefly] families he had conquered

to retain their former authorities and privileges — except for the family of Amo, which had lost so much in the recent conflicts that they could no longer be counted members of the high aristocracy. Some time after this Vehiatua died; Tu recovered all his former influence, and remained the sole rival of Amo's son, who although still too young to act for himself nevertheless continued to be regarded by most of the island's chiefs and populace as heir presumptive to the crown. (1837:II, 408-409)

A markedly different version of the same conflict was composed by the missionary Robert Thomson, whose stay on Tahiti overlapped Moerenhout's but began a few years later:

After the departure of Cook, the hostile feelings which Vehiatua entertained towards the chief and people of Purionuu broke out in an open war. The latter party were assisted by the chiefs and people of the eastern district, the first collision took place at Hidiaa, and is termed the battle of "Vaihee," another engagement soon took place in the same district called the battle of bu wue (?) but with no more definite results — if advantage leaned to either side it would seem to have favoured Purionuu, as Vehiatua immediately afterwards sailed for Raiatea, although the object of his visit is not now known. He enjoined the chiefs of the peninsula to carry on the war, which, after the usual rest of a few months and plenty of feasting, they did more vigorously than ever. It may not be improbable that Vehiatua's sail to Raiatea was a visit to Oro to propitiate his favour, as the image of that god which had been sent to Tahiti was now in the hands of his enemies.

In the course of the year 1770 a severe naval battle was fought a considerable distance from land off the coast of Teaharoa, between these two parties. The Purionuu warriors having recoiled a little when the first shower of stones fell upon their canoes, the circumstance has been recorded to their disadvantage in the name given to the engagement "The battle of *taora atahi*." This, and the following, seem to be among the most furious and savage of their wars. Each party being resolved on victory, and determined not to give way, they agreed to take their fleets a long distance out to sea, that no hope might remain for the disabled and shattered canoes of the conquered party being able to reach the land. Each canoe was secured in its position in the fleet, and when the hostile fleets met at sea, there were men appointed with ropes in their hands all ready to tie the contending fleets firmly together, and on this platform of canoes hand to hand with club and spear the warriors fought with desperation and thousands must have perished in these dreadful conflicts. From the description which the natives give of these two fleets, it is probable that upwards of 10,000 men were engaged in this battle, the greater part of whom perished; as the warriors fought until the shattered fleets would no longer hold together, but broke asunder and drifted away. Both parties had suffered so severely that neither was in a position to chase the other, and each made the best of their way to their respective districts, (pp. 45-46)

(There follows a lengthy passage, including excerpts from Cook's description of the famous naval review of 1774, attesting to the vast scale that characterized some naval engagements.)

From these statements of Cook, it is evident that Tahiti at that period possessed a respectable navy and fully justified the accounts which the natives give of the magnitude of their fleets and the bloody character of their wars. After the

great battle recorded above, the combatants rested some months, feasting with their friends, detailing their exploits, and repairing their shattered canoes; but both parties were mortified that they had not conquered, and resolved to continue the war. Several months afterwards or about 1771 the combatants having built several new canoes, renewed the war; many of Amo's people who had now forgotten their former defeat, joined the Tairabuans; and many from Teoropa assisted Teu and Tutaha the principle chiefs of Purionuu, with whom Teaharoa was still leagued. Having completed all their arrangements for this, the most memorable naval battle recorded in Tahiti history, to enflame their passions, and irritate the minds of their opponents, messengers were sent by both parties, to taunt them with cowardice in the last battle, and dare them to the fight. A day having been fixed, the Tairabu warriors came down to their enemies coast, and after some of the warriors had exerted all their powers of buffoonery in mockery of their enemies, they stood out two or three miles to sea. The Purionuu and Teaharoa fleet were soon in motion, and numbered two or three hundred sail. After the canoes had formed into divisions, and were secured to each other, the warrior, Paetia of Point Venus and ancestor of Taaiiriri, who took the chief command mounted the platform on the front of his canoe which was placed in the center, and haranged the warriors. He recounted the deeds of their ancestors, mentioned in chronological order all the battles in which they had engaged, eulogized the chiefs who had shown the greatest bravery, and concluded with a tirade against the enemy, in which no epithet was spared which might expose them to the contempt of the warriors. Two or three other chiefs spoke in a similar strain, exciting them to deeds of bravery. Having thus stimulated their own courage, and worked up their hatred of their enemies, to the highest point, the fleet put out to sea. And as these two fleets were the largest which the people had ever seen they must have carried many thousands of warriors. They met at Toahiro, and from the place where they fought the engagement is termed "*Te pau i Toahiro*," the destruction at Toahiro! Having made their arrangements as on former occasions, and firmly secured the contending fleets, the work of destruction began, and was carried on with fearful ferocity on both sides. In the heat of the engagement the canoe of the chief Teu in which was his son Tu, afterwards Pomare I, was cut away from the assigned position in the rear of the fleet, and the Royal party believing discretion to be the better part of valour, set their sail, left the combatants behind, and stood away for the little island of Tetiaroa. Whether the flight of their chief affected the spirits of the Purionuu warriors is uncertain, as it is what they had seen performed before, but they began to waver and fought with less bravery afterwards. Towards evening another circumstance happened to damp their spirits, and cheer and encourage their enemies. Vehiatua's war canoe was recognized returning from Raiatea, but before he could join in the battle, night separated the combatants now thinned by many hundred from the fierce engagement of the day. The fleets retired for a little distance and spent the night on the bosom of the deep. Having eaten a little and rested in the night, they began at daybreak to renew the struggle. The day before they had gone out, a good distance to sea, in hopes of a decisive engagement, and cutting off the retreat of the vanquished. But now their fierce passions were aroused, like the tiger which has tasted blood, they could not be restrained, and attacked each other, in the position where the breeze and the current had carried them, in the harbour of Matavai and not far from the shore. The Purionuu warriors felt that they were fighting on their own coast, in sight of their own friends, and fought with renewed valour. But the Tairabuans still more encouraged by the presence of their renowned chief fought with equal desperation. In close contact with club and

spear, no mercy was asked or shown, and death rapidly thinned the ranks of the assailants. The engagement of the preceding day, and the blood which had been so lavishly spilt had drawn hundreds of sharks to the spot, and now when a shattered canoe drifted away from the fleet, the sharks were seen to join in the dreadful havoc, and drag the wretched natives to the deep, who were clinging to the fragments of their wreck or who, in the violence of the struggle had been driven, from their standing, into the sea. It is in vain we try to estimate the numbers who fell, the best idea perhaps may be formed from the circumstance which has given a name to the battle. The whole neighbouring sea even to the beach was tinged with blood, and the engagement is termed "*Te tamai i tetai uteute,*" The battle of the red sea! During this bloody conflict the breeze had borne the fleets down upon the shores of Tetiaroa [?] where many of the warriors leaping on the shore the battle was continued for some time partially on land, but the Tairabuans had still the best of the battle, and pressed hard on their enemies, who feeling themselves giving way on their own soil soon became dispirited, broke and fled in confusion to the hills. The slain now strewn along the beach, were collected near Taunoa and piled up into a long and high pyramid, as an offering to the gods. This pile soon becoming putrid was taken possession of by thousands of rats, and is to this day spoken of as "*Te fare ione*" the house of rats! This horrible structure was said to be about sixty feet long, and upwards of twenty feet high! In addition to this mighty pile, the sea beach from Point Venus to Papeete was for many days thickly strewn with the dead cast ashore by the sea. Numbers had been devoured by the sharks, and those who fell on the first day at Toahiro perished too far out at sea ever again to be heard of! Such is the fearful account which the natives give of this dreadful battle. After desolating the coast, and sending an invitation to the refugees to return to their lands, Vehiatua and the Tairabu warriors went home laden with spoil. Some days after the battle Teu and Tu arrived at Moorea, and ascertaining that their people had come down from the mountains, they came across and again established themselves in Pare. Peace was not again broken for about two years, and during this period perhaps the most important event was the death of Vehiatua who died in peace at Tautira, but the remembrance of his cruelty to Mae was not permitted to rest in the same grave, Mae's son hearing the same name had vowed revenge, which was afterwards visited on the head of one of Vehiatua's descendants. Shortly after the death of this great warrior, Tutaha, uncle of Tu, and a more fiery spirit than his brother Teu the ruling chief of Purionuu, resolved on avenging the former disastrous defeat. In opposition to the wishes of his brother he collected the Purionuu warriors and placing himself and Tu at their head he marched against the Tairabuans, his old allies joining him as he passed through their districts. A battle was fought between these parties headed respectively by Tutaha, and Vehiatua son of the former chief of that name. The place where this battle was fought is variously stated some asserting that it was on Tairabu and others that it occurred at Afaira near Papara. Whether it happened the event was again disastrous to the people of Purionuu, who were again beaten and driven to the mountains. Tutaha was killed in the battle by a man called Tehoaraau, and his body having been brought to the marae at Bunaania it was disemboweled, as an expression of great contempt, and hung upon the branch of a breadfruit tree which still stands, immediately adjoining the French fort. When the warriors returned to Tairabu they carried the remains of Tutaha with them, to deposit on the marae at Tautira. This event was long remembered by the family and thirty years afterwards was avenged by Pomare II on a Tairabu chief. So deeply is the feeling of revenge seated in the bosom of the savage. (Thomson, pp. 48-52)

The naval engagements described in this version are mentioned in no other source that I know of, and I am at a loss regarding their credibility. Such episodes as Vehiatua's trip to Ra'iatea and Pomare's defection from battle give the account the ring of authenticity; but its details concerning the scale, tactics, and sanguinary nature of the encounters were probably characteristic narrative modes used to dramatize any such tale. What interests us more than these matters, however, is this account's different version of the immediate cause of the conflict, and of the line-up of its combatant tribes.

According to Thomson, the contest was initiated by Vehiatua I because of his "hostile feelings ... towards the chief and people of Porionuu" (p. 45). The basis of those hostile feelings is not specified, but in Thomson's version of the Papara debacle the Porionuu were allied with Amo against Vehiatua. As for the tribal line-up, note should be taken of the report that Papara's Amo was allied with Vehiatua, his recent assailant, against chiefs listed elsewhere by Thomson as having been his loyal friends.

I alluded earlier to the importance of the question concerning how and where Tutaha's corpse was disposed of after he was slain in battle against the Seaward Tevans. The answer to that question should indicate in an unmistakable way not only who Tutaha's allies were, and how he was regarded by his enemies, but should also throw some light upon the remaining mystery about his kin ties outside Pare-Arue.¹⁴

As just quoted, Thomson's answer to the question was that the Seaward Tevans disemboweled Tutaha's body at the marae at Puna'auia (presumably the famed 'Oro-dedicated Taputapuatea on Puna'auia Point) — "an expression of great contempt" — and then deposited it on the marae at Tautira, evidently as a more permanent offering to 'Oro's presence at this latter marae. In connection with this version it should be noted that, while the Tautira marae was within Seaward Teva, the one at Puna'auia was in the territory of the Oropa'a, whom Thomson listed as allies of Tutaha!

In September 1773, when discussing the events that had transpired at Tahiti since his first voyage, Cook wrote that his old friend, Tutaha, lay "entar'd in the family Marai at Oparre" (Beaglehole 1961:213), that is, at Tarahoi. Four years later however, when Cook visited the "Great Morai at Atehuru," which has recently been identified as 'Utu'aimahurau, in Pa'ea, he wrote as follows:

We were told that the late King Tootaha, Tebourai Tamaida, and a nother Chief who fell with them were brought to this Morai, their bowels cut out by the Priests before the great alter, and the bodies afterwards buried in three different places, which were pointed out to us in the great pile of stones which compose the most conspicuous part of this Morai. And the Common Men who fell also in this battle were all buried in one hole at the foot of the pile. This Omai, who was present,

told me was done the day after the Battle, with much Pomp and ceremony, and in the midst of a great Concourse of people, as a thanksgiving offering to the Eatua for the Victory they had obtained, while the vanquished had taken refuge in the Mountains, where they remain'd about a week or ten days till the fury of the Victors was over and a treaty set on foot that concluded with Otoo being invested with the Maro and made King which was done with great ceremony at the same Morai in the presence of all the principal men in the island. (Beaglehole 1967:205)

We cannot of course determine which of these versions is the "correct one" but again — as in the case of the discrepant versions of other "historical" episodes — we may infer something useful, however seemingly contradictory, from each of them.

It is interesting to note that 'Oro was looked upon as generally nonpartisan, evidently content to receive offerings from either side in a conflict. Whether Tutaha was disemboweled at Puna'auia's Taputapuatea or at Pa'ea's 'Utu'aimahurau, both these marae were situated in territory belonging to his allies in the war just concluded — which might indicate either that losers' marae were not sacrosanct, or that 'Oro-dedicated marae were not tribally exclusive, or both (or perhaps even that Tutaha's former allies were not unhappy to have him slain). And finally, it was evidently regarded as appropriate for this famed chief to be buried in his own kin-congregation marae, or alternatively just as appropriate to inter him in the principal marae of his victor.

In any case, whatever may have been the causes of this costly north-south conflict, and whatever may have been the actual battle line-ups or the fate of its casualties, Tahiti's political structure was markedly different at its end, both as a result of the conflict itself and of the natural processes of man's aging and dying.

NEW ALIGNMENTS

Seaward Teva held together after Vehiatua I's death, but his young successor, the elder of his two sons, did not seem actively inclined to war or other forms of intertribal politics. Indeed, he appeared to have been heavily dependent upon his mother and her new consort, Ti'itorea, for counsel and initiative.

After Tutaha's death whatever coalitions had been put together either fell apart or became inactive, so that by the time of Cook's visit in 1773 there were on Greater Tahiti several tribes of fairly equal political strength — namely, Hitia'a, Pare-Arue, Fa'a'a, Puna'auia, Pa'ea, and Papara — together with several others of secondary strength that were politically affiliated with their stronger neighbors.

Hitia'a's famed chief Reti sided with Tutaha in the war with Tairapu, and, although he is reported to have escaped Tutaha's fate, we cannot discover how long he lived thereafter. In any case, Hitia'a played little or

no part in the island's political maneuvers during the next three decades, either because of distance from the centers of European influence, or of disinterested leadership, or both.

After their defeat by Vehiatua's forces, Amo and Purea retired from active intertribal politics. Although their distance from Europeans based at Matavai might explain the obscurity surrounding their existence, that alone cannot wholly account for the lack of references to them. Their son, Teri'irere, apparently retained the ceremonial privileges associated with his high-ranking Teva kin-Title, including the *maro* — either *ura* or *tea* — linked with it, but the family's other *maro* — the one I have labeled "*maro* Wallis" — was, along with the so-called Paparan image of 'Oro, evidently removed by Tutaha during the Papara debacle and deposited in the 'Utu'aimahurau marae of Pa'ea.

It is not clear just what part the Oropa'a people played in the Papara or north-south conflicts just described, but whatever it was neither Pa'ea nor Puna'auia appears to have suffered any major losses from those events. Puna'auia's tribal chieftainship remained in the hands of the huge and genial Puhuatea. Pa'ea's most prominent chief, Te To'ofa, had not figured in Wallis' journal or in accounts of the *Endeavour's* 1769 visit, but on his subsequent voyages Cook came to regard him as the island's most impressive chief. Puhuatea and Te To'ofa were independent rulers of their respective tribes but were usually to be found in close alliance with each other in intertribal affairs.

Upon the death of Fa'a'a's chief, Te Pau "A", in the 1773 battle against Seaward Teva, his son, Te Pau "B", succeeded to his Title; but the most influential individual in Fa'a'a was Pa'ea's chief, Te To'ofa, whose unspecified kinship to Fa'a'a's principal family provided scope for his chiefly talents in this district as well as in Pa'ea.

While Tutaha lived, his grandnephew, Tu (Pomare I), had to rest content with the prerogatives attending his high rank-status, but upon the death of the former Pomare I began to exercise authority as Pare-Arue's tribal chief, de facto as well as de jure. As a tribe Pare-Arue was stronger in manpower than was Fa'a'a during the 1770s and 1780s. But even with the support of its semidependency, Ha'apape, Pare-Arue was inferior to Oropa'a both in numbers of warriors and in qualities of leadership — a circumstance that was undoubtedly well known to the whole populace of the island. Similar comparisons between Pare-Arue and Papara or Seaward Teva would probably reveal the same widely recognized disparities in tribal strength and leadership. In other words, in terms of both the tribe over which he ruled and of his qualities as a tribal ruler, other chiefs appear to have held Pomare I in rather low esteem during this part of the Early European Era. Nevertheless, despite his unimpressive reputation as a tribal leader, after the Papara debacle

Pomare I was universally acknowledged to be higher in rank-status than all other persons of Tahiti and Mo'orea.

First of all, through his maternal connection he was privileged to wear a feather girdle — the so-called Tetupaia *maro ura* — in his family marae of Tarahoi (although it seems quite clear that he could not, or so far as I know did not, wear this particular feather girdle elsewhere in Tahiti-Mo'orea). But in this respect he was no more highly privileged than Teri'irere, who exercised a similar right, with at least the Teva *maro*, in Papara. The titular prerogative which made Pomare I preeminent in Tahiti-Mo'orea derived from another rank-associated object, namely, the so-called Wallis *maro ura*, removed by Tutaha from Papara during the upheaval there and deposited in a Pa'ea marae, probably 'Utu'aimahurau. Why this *maro ura* was deposited in Pa'ea and not in Pare-Arue is difficult to explain. To begin with, although Tutaha probably had kin connections in Pa'ea his closest kin connections, and those of his grandnephew-protégé Pomare I, were with Pare-Arue's marae Tarahoi. One possible explanation is that the Oropa'a chiefs overruled Tarahoi as a depository, the price of their efforts in overcoming (or salvaging?) Amo.¹⁵ Another possibility is that Tutaha deliberately preferred a Pa'ea depository, intending thereby to provide his grandnephew with a new base, in this stronghold of potential opposition, for exercising the extraordinary rights associated with this *maro*. Or finally, it may be that 'Utu'aimahurau's *established* position as a center of 'Oro worship (the most important one outside of Seaward Teva) was the decisive factor in depositing the *maro* there. (To the best of my knowledge there was at that time no image of 'Oro at Tarahoi.) The rationale for this last possibility requires some additional comments.

At the beginning of their respective careers as objects of social significance, feather *maro* and 'Oro images are implied to have been associated, if at all, in only indirect ways. For example, in traditions about the Farepua or Teva *maro* no mention whatsoever is made of 'Oro. And, more "historically," in statements concerning the *maro ura* brought by Tetupaia from Ra'iatea to Pare in the mid-eighteenth century, nothing is said of any 'Oro image or even of the god himself.

Conversely, traditions relating to the diffusion of 'Oro worship from Ra'iatea to Tautira, and then on to 'Utu'aimahurau, and so forth, specify 'Oro images but not *maro*. In fact, the only reported instance I know of wherein a *maro ura* and an 'Oro image diffused together from Ra'iatea prior to the European era, was that in which Manea and Maua introduced these objects into Papara, accompanied by Tupaia, the famed 'Oro priest. Since this occurred as recently as about 1760, and since previous diffusions of feather *maro* and 'Oro images seem to have been separate events, I am inclined to believe that the close connection which these two kinds of objects

came to have in Tahiti-Mo'orea during the Early European Era derived from fairly recent developments, which I reconstruct as follows.

It is safe to assume that any person's investiture with a kin-Title required the "presence" of the congregation's principal tutelar; and if an image of the tutelar were on hand — a typical but perhaps not unexceptionable circumstance — that image constituted an important element in the ritual of investiture. In the case of feather-girdle kin-Titles such investitures also required the actual use of the *maro* itself, along with the "presence" of the tutelar. This much about kin-Title investiture seems reasonably certain.

Turning now to Opoan kin-Titles, and especially to feather-girdled ones associated with (or derived from) that congregation, although earlier investitures may have been sanctioned by the god Ta'aroa, by late indigenous times the god 'Oro had been assigned that role. Now, as noted above, no actual image of 'Oro seems to have been involved when Pomare I was invested in the feather-girdled Opoan kin-Title passed on to him through his mother, Tetupaia. On the other hand, his subsequent investiture with the so-called Wallis *maro* (and its associated kin-Title) evidently required the actual presence of the Paparan image (which had been taken to Pa'para along with what was probably the original section of the Wallis *maro*).

In other words, what previously seems to have been a general connection between all Opoan feather-girdled kin-Titles and the god 'Oro (in whichever of his manifestations locally prevailed) came to be superceded in social importance on Tahiti-Mo'orea by a specific connection between one such kin-Title (the Wallis *maro*) and one particular 'Oro image (the Papara *to'o*).

Newbury's statement that an 'Oro image "... was ceremonially essential for the investiture of Titles of Ra'iatean origin ..." (1961:xxxvi) would seem to apply, by implication, to all prominent Opoan Titles; this may have been so, but the only specifically reported examples that I know of were investitures involving the Wallis *maro* and the Papara *to'o*. Indeed, it is possible that the requirement may have been "invented" on Tahiti — done, say, by Amo, Porea, and Tupaia in order to intensify respect for the wearer of the *maro*.

Having departed thus far from documentable generalizations, I am tempted to push my speculations a step or two further, this time concerning the reasons for the connections between feather girdles and 'Oro. These reasons, I suggest, are to be sought in 'Oro's attribute as principal god of war and in his congruous preference for human offerings. My theory is correspondingly twofold.

First of all, a god of war is a singularly appropriate tutelar for a tribe (in contrast, say, to a kin-congregation), and especially for a tribe that is held together by coercive force and is reduced or enlarged through armed conflict. If there is any truth in the conjecture put forward earlier, concern-

ing the increasing role of warfare in the evolution of territorial units, then it is reasonable to assume a corresponding increase of attentiveness to the deities of war. In some instances the sequence may have been the reverse, with intertribal conflict incited by adoption of 'Oro worship; in fact, once started the two processes probably intensified each other — reinforced by 'Oro's reported desire for human offerings.

In my earlier discussions of human sacrifice I pointed out that 'Oro may not have been the only deity with this kind of preference, but during this era he was certainly the most demanding and insatiable one. Quite apart from any functional affinity between 'Oro's attributes as war god and as recipient of human offerings, for which a case could be made, I suggest that command over this explicitly ritual activity — in terms of when to sacrifice and whom — would have reinforced any chief's secular authority to a highly effective degree. (Since we do not know how a Maohi would have rated his own death by sacrifice as compared with other kinds of sanctions, I cannot of course characterize this sanction as the *ultimate* one in Maohi terms; but my hunch is that it was considered to be so.) Although many tribal chiefs probably had the power to execute fractious subjects from time to time, there were usually some implicit and fairly narrow restraints on the exercise of that power. How many fewer restraints there would have been, therefore, upon a chief who had not only the ideologically supported *right* to kill his own subjects, but the solemn *duty* to do so. Again, any tribal chief could and probably did on occasion rationalize an execution in these very terms, but all those phrased as offerings to 'Oro — that is, the majority of human offerings made during this era — required the ritual presence of an individual invested in a *maro* consecrated by 'Oro. Moreover, the individual so invested was ipso facto a prime vicar to the god, a kind of ritual *and* secular double (as contrasted with an oracle [*taura*] or a cleric [*tahu'a*]). As I indicated above, I am not entirely certain which ones of the *maro* and 'Oro images in Tahiti-Mo'orea bore the ritual human-offering function just described, but as time passed the Papara image (and in the beginning, its associated Wallis *maro*) came to be the only ones so endowed. This, then, may help to explain why Tutaha was at pains to obtain control over these "symbols of supremacy" during the Papara debacle, and why the image played such an important part in subsequent events.

CHAPTER 27 *TAHITI AND MO'OREA*

From the position of Pare-Arue, Fa'a'a, Puna'auia, or Pa'ea (that is, Tahiti's west coast), Mo'orea is closer, more accessible, and a great deal more palpable than, say, Seaward Teva. The two islands had been for centuries closely linked through numerous kinship ties, with their usual train of alliances and feuds. It was inevitable then that the smaller island would have become embroiled in the political contests taking place on the larger one during this era, and especially those of the latter's western shores.

At the beginning of this era two kinship links between the islands turned out to be most significant, politically: the wife of Mo'orea's principal chief, Mahine, was sister of Papara's chief, Amo; and Teihotu, the husband of Mahine's sister Vavea, was brother of Fa'a'a's chief, Te Pau "A".

Another factor influencing political relations between the two islands was a long-standing state of hostility between Seaward Teva's chiefs and some, at least, of the chieftains of Mo'orea. Evidence of the latter is provided in a number of passages. For example, when Don Domingo Boenechea visited Pare in 1772 on his circuit of the island he met there a chief of Mo'orea, who with

... an eager assertion, backed by gestures of the most vehement and animated kind, [claimed] that ... Titorea [a Tairapu chief] and all his pack were thieves and robbers who went over to raid his island, and that on that account a state of war existed between them. The *arii* Tomegeui [Tomaheui, a local Pare chief] bore out what the Morean Chief had said, protesting that he had right on his side. (Corney 1913:320)

Some women decked in quantities of native cloth presented themselves before the Chiefs in order to strip themselves and make an offering of the cloth to the said Chiefs, being left with only a *maro* on to cover their nakedness. They call this festival a *taurua*, and after it they prepare for a *paraparau*, which is like a *tertulia* or well ordered conversazione of which the main topic is the wars these natives engage in against those of *Morea*. The Chiefs called to me to know whether perchance I would assist them against the *Morea* people, if occasion should arise; and when I replied that I could not do so without superior orders, they seemed surprised. (Corney 1919:43-44)

There was a consultation between the three principal councillors [of Vehiatua II] ... as to what should be done with the vessel sent over by the *arii* of *Orayetea*

[Ra'iatea], and it was decided she should remain here [at Tautira] to do battle against the people of the neighboring Island of *Morea*. (Corney 1919:189)

A person arrived from the island of *Morea* with orders from his *arii* to pick a quarrel, but he got no response whatever from the natives here [in Tautira]. (Corney 1919:155)

On the other hand, the hostility does not appear to have been entirely general, or continuous. For example:

Some people of the Island of *Morea* who were on a jaunt came [to Tautira], and some glass beads were given to them. (Corney 1919:116)

The liegemen of this *arii* set out for *Guayotihī*, an islet apart, to offer up prayers to *Eatua*, their God. They told us that the *arii* of the neighbouring island of *Morea* had caused certain persons to be killed who had treacherously murdered a native of this island of *Otaihiti*, when it was not war time, and that he had sent the bodies over to Otu, in satisfaction, that he might offer them up in his principal *marae*. Let the truth bide its time. (Corney 1919:195-196)

Two versions exist concerning the immediate state of enmity between Mo'orea and Tairapu. One is found in Thomson's *History*, and concerns a raid allegedly carried out by Vehiatua I sometime between 1761 and 1766. I reproduced this account in chapter 12, because of the light it casts upon Maohi warfare in general; its present relevance is the information it provides concerning the enmity between Tairapuans and some Mo'oreans in particular, and concerning the character of Vehiatua I. With respect to the end of this account it should be noted that only part of Mo'orea was involved in this conflict, and further that Vehiatua had his enemies on Tahiti as well.

The second version concerning the immediate cause of the quarrel between Seaward Teva and Mo'orea was given by King, writing in 1777:

... the ground of the present quarrel between the two Islands is this; that some years back the brother of Wa'heeatooa [Vehiatua III] named Tei-a'ree-tetooa a onnona, having some lands at *Morea* came to settle here, or as some say was sent as a chief in opposition to Maheine, which brought on a battle, where he, many chiefs of Otaheite & relations of his were kill'd. The Otaheitiens enrag'd at this, set up Teree tapooe nooe [Teri'itapunui] against Maheine, although his own sisters son by one of the Eiree de hoi's [*ari'i rahi*; probably Pomare I] family.... (Beaglehole 1967:1382)

Cook's own, less detailed summary of what was probably the same informant's explanation is as follows:

On our enquiring into the cause of the War, we were told that some years ago a Brother of Waheatua of Tierraboo, (a boy), was sent to Eimeo at the request of Maheine, a popular Cheif of that island, to be their King, but he had not been there a week before Maheine caused him to be killed and set up for himself, in opposition to Tieratabunue [Teri'itapunui] his sisters Son who became the lawfull heir or else was set up by Otaheite upon the death of the other. (Beaglehole 1967:198)

Parts of this account appear also in other journals:

When they [the Seaward Teva] see a mist rising over against an island near-by, named *Morea*, they believe it means that Teatua [te atua, i.e., 'Oro] wishes them to go and make war on the people of it: they are their greatest enemies, through having killed an *arii* who had gone across to take possession of some lands in that island, that he had inherited.... (Written in 1775, by Don Blas de Barreda in a letter to the Duchess of Medina Sidonia. Corney 1915:472)

The sons [of Vehiatua I and Purahi] were Whaeaehtua [Vehiatua II], Tettua-ooaowna [Tetua uaona?] and Warrooary [Varuari?]. The first died [in 1775], the 2nd was killed in Battle with Morea, and the 3rd became Erreerahigh and was no longer called Warrooary but Whaeaehtua [Vehiatua III] and is the present reigning King. (BLIGH 1789:II, 63)¹

Despite these specific references, Seaward Teva's involvement in Tahiti-Mo'orea conflict has been subordinated to western Tahiti's in most accounts of it. One reason for this was of course the Europeans' closer connections with the western districts of the island, from their vantage point in Matavai. Another was Fa'a'a's (and later, Pare's) direct entanglement in Mo'orea's succession controversy.

THE MO'OREAN SUCCESSION WAR

At the beginning of this era, Mahine, the principal tribal chief of northern Mo'orea, seems to have been the island's most powerful and influential individual — but one without any offspring of his own to succeed him. Mahine was also an Arioi, but whether this was the main reason for his childlessness is not known. Mahine evidently sought to keep control of his offices by fostering a boy, Tairihamoetua (?), and naming him successor. (I cannot discover what, if any, were this boy's kinship connections with Mahine.) But for unspecified though transparent reasons some of Mahine's kinfolk wished to name one of his sister's sons to succeed him. A glance at the Mo'orean genealogy (fig. 25-7, p. 1205) will reveal how seriously political this issue was likely to be.

As noted above, Mahine's sister, Vavea, was married to Teihotu, who was a brother of Fa'a'a's ruling chief (and subsequently uncle to the latter's successor). Thus the son of Vavea and Teihotu, Teri'itapunui, better known as Mahau, would have had strong claims, backed by strong supporters, to succeed his mother's childless brother. In addition, Mahau's elder sister, 'Itia, was married to Pare's Pomare I, and his younger sister, Pateamai, to Seaward Teva's Vehiatua III.²

The earliest record we have of any large-scale hostilities connected with this war of succession appears in Cook's journal for April and May 1774. I reproduce his comments in full, as they touch on many aspects of Tahiti's politics during this period.

In the Morning I set out for Oparre accompanied by the two Mr Forsters and some of the officers to pay Otoo a formal Viset by appointment; as we approached Oparre we observed a number of large Canoes in Motion; but we were surprised when we got there to see upwards of three-hundred of them all ranged in good order for some distance along the Shore all Compleatly equip'd and Man'd, and a vast Crowd of Men on the Shore; So unexpected an Armament collected together in our Neighbourhood in the space of one night gave rise to various conjectures: we landed however and were received by a Vast Multitude some under Arms and some not, the cry of the latter was Tiyo no Otoo and the former Tiyo no Towha, this Cheif as we soon after learnt was General or Admiral of the fleet. I was met by him presently after we landed, he received me with great Courtsey and then took hold of my right hand. A Cheif whose name was Tee, Uncle to the King and one of his Prime Ministers, had hold of my left, thus I was draged along as it were between two parties, both declaring themselves our friends, the one wanted me to stay by the fleet and the other to go to the King, at last coming to the general place of Audience a Mat was spread on the ground for me to sit down upon and Tee went to bring the King, Towha was unwilling I should sit down but partly insisted on my going to the fleet but as I knew nothing of this Chief I did not comply; presently Tee return'd and wanted to conduct me to the King and took me by the hand for that purpose, this Towha opposed so that between the one party and the other I was like to have been torn to pieces and was obliged to disire Tee to desist, and to go with the Admiral and his party to the fleet. As soon as we came before the Admirals Vessel two lines of Arm'd Men were drawn up on the shore before her to keep of the Crowd and clear the way for me to go in, but as I was determined not to go (unless forced) I made the Water which was between me and the Canoe an excuse, this did not answer for a Man immidiately squated himself down at my feet and offered to carry me in and then I declar'd I would not go and that very moment Towha quited me without my seeing which way he went nor would any one inform me; I therefore turn'd back and inquired for the King, Tee who I beleive never lost sight of me, came and told me he was gone into the Country Mataou and advised me to go to my boat which we according did as soon as we got all together for Mr Edgcumb was the only gentleman that could keep with me, the others were jostled about in the crowd in the same Manner as we were. When we had got into our boat we took our time to view this fleet, the Vessels of War consisted of 160 large double Canoes, very well equip'd, Man'd and Arm'd, altho' I am not sure that they had on board either their full compliment of Fighting men or rowers, I rather think not. The Cheifs ie all those on the Fighting Stages were drist in their War habits, that is in a vast quantity of Cloth Turbands, breast Plates and Helmmets, some of the latter are of such a length as to greatly incumber the wearer, indeed their whole dress seem'd ill calculated for the day of Battle and seems to be design'd more for shew than use, be this as it may they certainly added grandure to the Propsect, as they were comlesant enough to Shew themselves to the best advantage, their Vessels were decorated with Flags, Streamers &ca so that the whole made a grand and Noble appearence such as was never seen before in this Sea, their implements of war were Clubs, pikes and Stones. These Canoes were ranged close along side each other with their heads a Shore and Sterns to the Sea, the Admirals Vesel was, as near as I could guess, in the center. Besides these Vesels of War there were 170 Sail of Smaller double Canoes, all with a little house upon them and rigg'd with Masts and sails which the others had not; These Canoes must be design'd for Transporte or Victulars or both and

to receive the wounded Men &c; in the War Canoes were no sort of Provisions whatever. In these 330 Canoes I judged there were no less than 7760 Men a number which appears incredible, especially as we were told that they all belonged to the districts of Attahourou and Ahopatea. (Beaglehole 1961:383-386.) [See frontispiece vol. 1, this work.]

When we got on board the Ship, we were told that this fleet was a part of the armament intended to go against Eimeo whose Chief had revolted from Otou his Lawfull Sovereign, (p. 387)

The King seem'd not only to pay the Admiral much respect himself but was desirous I should do the same, he was nevertheless certainly jealous of him, but on what account we knew not for it was but the day before he frankly told us the Admiral was not his friend. Both these Chiefs when on board to day Solicited me to assist them against the people of Tiarrabou altho at this time the two Kin[g]doms are at peace and we were told go with their joint force against Eimeo. To this request of theirs I made an evasive answer which I believe they understood was not favourable to their request. (p. 388)

We had no sooner dispatched our friends than we saw a Number of War Canoes coming round the point of Oparre.... This fleet consisted of Forty sail, were equiped in the same manner as those we had seen before and belonged to the little district of Tettaha and were come to Oparre to be reviewed before Otou as those we had seen before had done.... (pp. 400-401)

When I was last here I conceived but an indifferent Opinion of *Otou's* Talents as a King, but the improvements he has sence made in the isles has convince'd me of my Mistake and that he must be a Man of good parts, he has indeed some judicious, sensible men about him who I beleive have a great share in the Government. I was sorry to see a jealousy subsisting between him and other great Men, he publickly told us one day that neither Towha the Admiral nor Poatatou, two leading Chiefs, were not his friends, this Shews that there are Divisions amongst the great people in this state as well as in Most others, probably this jealousy arose from their great power for Otou on all occasions seem'd to pay them much respect and so far as we knew they raised by far the greatest Number of Boats and Men to go against Eimeo and were two of the Commanders on the expedition which we were told was to take place five days after we sail'd. Oheatoua of Tiarrabou was also to send a Fleet to join those of Otous to assist him in reducing to Obedience the Chief of Eimeo. One would think so small an Island would hardly attempt to make head against the United force of the two Kingdoms but endeavour to settle Matters by Negotiation, but we heard of no such thing, on the Contrary every one spoke of nothing but fighting. Towha told us more than once that he should die there which in some Measure shew'd what he thought of it. Odiddy told me the Battle would be fought at Sea, in which case they must have a Fleet nearly if not quite equal to the one going against them and as this is not probable it is more likely they will remain on shore upon the defensive as we have been told they once did when attack'd by the People of Tiarrabou whom they repulce'd. Five general officers were to command in this expedition of which number Otou was one and if they named them according to the Post they held he was only the 3rd in Command, this seems probable enough as being but a young man could not have the experience necessary to command such an Expedition where the greatest Skill and judgement is required, (pp. 404-405)

Cook's view of this whole episode was warped by two assumptions, both of them false and both probably deliberately implanted by Pomare I's partisans. One was the notion that the expedition was intended to put down Mahine's "rebellion" against Pomare I, "his Lawfull Sovereign." The other was the idea that navies of the several tribes had come to Pare to be "reviewed" by their "King" preparatory to battle. No additional remarks are needed to establish the fallacy of the first of these assumptions; as for the second, the main purpose behind the assembly seems to have been to rendezvous, at what was the most convenient port of disembarkation, and possibly also to use this show of strength in an effort to persuade the reluctant Pomare I to add his contingent to the expedition.

Fa'a'a's commitment to this cause is easy to account for: namely, its support for Mahau, whose father was a member of the district's principal family (see fig. 25-5, p. 1187). This same connection also probably explains Te To'ofa's part in the affair — another instance of the influence of ties of kinship upon intertribal relations — for I know of no other reason for Pa'ea's hostility toward Mahine. As for Puhetea's commitment of Puna'auia's forces to the expedition, again I know of no direct reason for his enmity with Mahine, and am left to conclude that it was based on his friendship with Te To'ofa and Te Pau, reinforced perhaps by his eagerness for a good fight and the possibility of spoils. I am similarly perplexed about the reasons for Ha'apape's (or, at least, Matavai's) participation in the preparations, and can offer no specific explanation.

By ordinary Maohi standards, Pomare I had a very good reason for taking part in the assault against Mahine — that is, he was either betrothed to, or actually married to, Mahau's sister, 'Itia. (He *may* also have had the additional reason of his sister Auo's betrothal or marriage to Mahau; but we cannot be certain when this connection was actually established.) Yet, there are grounds for concluding that Pomare I played little part in the campaign. Cook, it is true, stated that Pomare I would be "the 3rd in Command" of the forthcoming expedition, but no mention is made of any Pare forces. In fact, Adams went so far as to assert that Pomare I played no part at all in the expedition (1901:94), but this opinion may have been just another expression of Adams' systematic detraction of the Pomares.

Two explanations may be offered for Pomare I's conduct thus far outlined and for his role in events still to be described. One was the man's well-attested cowardice in the face of physical danger; even his greatest champions described him as "timorous" (Beaglehole 1961:206), "of fearful disposition" (G. Forster 1777:I, 327), et cetera — all confirmed by subsequent accounts of his reactions to threats and of his outright craven behavior in battle. The other explanation for Pomare I's conduct in this affair may have been his desire, based on his equally well-attested political

canniness, to avoid a situation in which he would inevitably have been dominated by the powerful figure of Te To'ofa, in terms both of his own tribe's indifferent military strength (despite its larger population!) and of his own personal shortcomings as a military leader. Attention should be drawn to the statement that "Oheatoua [Vehiatua II] of Tiarrabou was also to send a Fleet to join those of Otous to assist him in reducing to Obedience the Chief of Eimeo" (Beaglehole 1961:405). No specific mention is made of a Taiarapuan [Seaward Tevan] contingent in the naval "review" just described, and I can discover no *direct* evidence one way or another that such a contingent actually took part in the subsequent attack on Mahine; on the other hand, the Seaward Tevans in general, and their chief in particular, had ample grounds for joining in the campaign. However, it should be noted that the intended participation of Vehiatua II in the cause against Mahine evidently did not induce Pomare I or Te To'ofa to embrace the Seaward Tevans as friends.

The only contemporary report that I know of on the outcome of the Tahitians' descent upon Mahine came from Cook and his companions, writing in August 1777, after nearly three years' absence from the islands:

The difference which subsisted between the two islands in 1774 as mentioned in my last Voyage has partly subsisted ever since; the Armoment I saw at that time actually went against the Malecontents of Eimeo but returned without effecting much. (Beaglehole 1967:197)

We can only speculate about what went on between Mahine and his Tahitian adversaries during Cook's absence from the islands — at least, an uneasy truce seems to have prevailed; but when Cook reappeared on the scene the conflict became heated again. Shortly after the English arrived in Matavai in August 1777,

... some messengers arrived from Eimeo with an acco^t that the people in that island were in arms and that Otoos friends had been obliged to fly to the Mountains.... On the arrival of these messengers all the Chiefs that were at Matavai assembled at Otoo's house where I happened to be at the time. One of the messengers opened the assembly in a long and set speech, but little of which I understood any further than the general purport, he explained the situation of affairs in Eimeo and endeavoured to excite the assembly to arm on this occasion. After this there was great debates on both sides which were carried on with great order, no more than one man speaking at a time but at last they became very noisy and I expected it would have ended like a Polish Diet, but I found they cooled as fast as they heated and soon returned to order, at length it was resolved to send a strong force to assist their friends at Eimeo: but this resolution was not obtained without some opposition. Otoo was silent all the time except now and then speaking a word or two to the speakers. Those who were for procecuting the War asked for my assistance and all of them wanted to know what part I would take. Omai was sent for to be my interpreter, but as he was not to be found I was obliged to speak for my self and told them as well as I could that as I was not throughly acquainted with

the dispute and the people of Eimeo having never offended me I could take no part in it, with this declaration they either were or seemed satisfied. After this the assembly broke up, but before I left them Otoo desired I would come to him in the afternoon and bring Omai with me. Accordingly a party of us went, he carried us to his Father when the dispute with Eimeo was renewed. I wanted to have found out some method to have made up this breach and sounded the old gentleman on that head, but we found him deaf to any thing of that kind and fully determined to prosecute the war and wanted very much to prevail on me to give them my assistance. (Beaglehole 1967:197-198)

T'towha [Te To'ofa] one of the Chiefs of Attahourou and a man of much weight in the island happened not to be at Matavai at this time consequently not present at any of these consultations, it however appeared that he was no stranger to what had happened and entered with more spirit into the affair than any other chief, for early in the Morning of the 1st of Sepr he sent to acquaint Otoo that he had killed a Man to be sacrificed to the Eatua, to implore the assistance of the God against Eimeo. This was to be done at the great Morai at Attahourou, where on this occasion Otoo's presence was absolutely necessary. (Beaglehole 1967:198-199)³

The line-up appears to have been much the same as in 1774, with Te To'ofa and Pohuetea spoiling for a fight, and Pomare I no more eager to involve himself or his Pare force than before (even though by this time his wife 'Itia probably added her forceful voice to the others' on behalf of intervention). Pomare I did lend his essential presence to a human-sacrificial service to 'Oro, imploring the god's help against Mahine, but he appeared less than eager to join in the attack. In fact, as Cook perceived, sentiment was anything but unanimously in favor of war: "... I found there was three parties in the Island, one extremely Violent, one perfectly indifferent about the Matter and the third openly declaring themselves friends to Maheine and his party" (Beaglehole 1967:205-206).

Anderson's account provides a more connected summary of these events, including the differences of sentiment just noted:

We had enquired at Tiaraboo about the success of that expedition and were told that it prov'd fruitless, in so far that the inhabitants of Morea had retir'd to the mountains on the approach of the Ta'heiteans and the last returne'd without effecting what they intended. Since that time we were told they had been at peace, but to day some people arriv'd with an account of a disturbance that had happened there wherein some partizans of Otoo had been worsted and fled to the hills for security. Upon this several of the principal people met and consulted what should be done but did not seem unanimous, as the debates were carried on with some warmth, though it would seem they at last concluded on going over to fight them as they were urgent with Capt'n Cook to grant them some assistance or go there with the ships.

This news however seem'd only to affect the few chiefs whose business it was to prepare for war; for the populace paid so little attention to it that their usual mirth was not in the least interrupted. The women, who it might be suppos'd would feel most on the occasion, were if any thing less concern'd than the men; for in the evening a great many of them having collected together stood upon the side of a small river near the middle of the Bay and exhibited a sort of dance that

rather bespoke an excess of joy and licentiousness, though perhaps it might be their usual custom. (Beaglehole 1967:977-978)

The element of "indifference" extended to other domains of social relations, as Cook noted in a retrospective comment written while at Kauai (Hawaii):

There is something in the Police [civil polity] of these People wholly unintelligible to us — by their manner of talking I should suppose that Tu'mutta'ah'ra and Ta'ma'ha'no could not well meet without proceeding in some measure to hostilities, as they are doubtlessly now at open War with each other, but here I was mistaken. A circumstance of somewhat a similar Nature occur'd during our stay at Matavai: whilst Otu and many of the Arees of that part of Otaheite were at war with Imaio (as recorded in the Account of those times) many of the Imaio People would come to us and trade, the Otaheiteans would observe sometimes that they were ē'no (that is bad) but never offer'd to molest them in their business — though at Imaio old To'haw the Otaheitean Admiral with his Fleet were making all the devastation they possibly could. (Beaglehole 1967:579)⁴

These fragments bring into focus an aspect of Maohi society that receives little or no illumination in most of the sources. As I pointed out earlier, and as must be clearly evident to the reader by now, the Europeans who first recorded their observations about the islands concerned themselves almost wholly with the doings of "the Principal People," "the Better Sort." And for the most part this concern is true of the Maohis' own myths that survived long enough to be recorded: stories about gods, demigods, chiefs, heroes, and the like — and very little about the rest of the population. All this restricts us to a one-sided view of Maohi society, a shallow perspective, of course, but less shallow perhaps than would be the case of some society structured along less hierarchic, aristocratic lines. For, here in these islands the doings of "the Principal People" affected to a very decisive degree the fate of the populace at large. While recognizing this we should not, however, lose sight of that other part of the population, whose members provided the principal people with the resources for their political contests but who were most of the time individually unconcerned with their leaders' motives and social maneuvers.

Returning to the narrative, the supplicatory offering to 'Oro was carried out at 'Utu'aimahurau at the beginning of September. After that Pomare I returned to Pare, where discussions continued concerning the advisability of an expedition against Mahine. While these were still going on "T'towha, Potatow and another Chief were already gone with the Fleet of Attahourou, for a messenger arrived in the evening with an account of their arrival and that their had been some skrimishing without either loss or advantage on either side" (Beaglehole 1967:210). After this, wrote Cook, Pomare, "... who never entered heartily into the spirit of this war ... receiv'd daily messages from Towha importunating him to hasten to his assistance,

who we were told was surrounded by Maheines fleet, but neither the one nor the other durst hazard an engagement" (Beaglehole 1967:211-212).

But instead of joining his allies at Mo'orea, Pomare I led his forces in an impressive and colorful naval review at Pare. As one Englishman noted: "We have much parading with the war Canoes, and the Admiral (Toohaw) [Te To'ofa] is gone to Emio with 30 Sail of War Canoes, but Otoo does not seem disposed to fight nor does any of his brothers. — & many of the Chiefs say he is a Coward" (J. T. Bayly, p. 13, quoted in Beaglehole 1967:211n).

The "Paradings" were interrupted on September 22 by news from Mo'orea that Te To'ofa and his companions had concluded a peace with Mahine and had returned home: "Soon after we got their [to Pare] a Messenger arrived from Eimeo and related the terms of the Peace or rather a Truce for it was for a limited time. The terms were disadvantageous and all the blame fell upon Otoo for not going to assist Towha in time" (Beaglehole 1967:214).

No record remains of the actual fighting in Mo'orea, but from subsequent observations it appears that the Tahitians had moored their vessels off Opunohu for several days and had destroyed some of the nearby settlements, without, however, engaging Mahine's forces in a decisive battle of any kind. Later, when Cook himself visited this part of Mo'orea, and inflicted similar damages in a punitive effort, one of his men referred to the destruction as "... these Losses together with those they suffered by Admiral Tohaw, are very heavy ..." (Beaglehole 1967:232n).

A passage from King's journal records the immediate reaction to the news of the Mo'orea truce:

... upon this intelligence all warlike preparations [at Pare] ceas'd & the Canoes went away to the Etward. We however proceeded to Oparre, & found Otoo & the Royal family in Violent agitation on the late news; Otoo's Sister & Mother told Capt that Towha was so inrag'd at his conduct that he & the Tyarra'boo people^[5] were determine'd to wage war against him, & they appear'd much to dread this event, imploring our assistance. Otoo's father on the other side was as violent against the rash proceedings of Towha, foreseeing the advantages that woud have happen'd in their expeditions going seemingly under our protection; in the midst of these heats a Messenger came from Towha & laid a plantan branch at Otoo's feet, & repeat'd his message; which we understood was requiring Otoo to go & perform some ceremony at Attahooroo, at the Royal Marea, they call'd it Heeva E'ree ... (Beaglehole 1967:1377)

It is impossible to say whether Te To'ofa's irritation with Pomare I was due to the latter's nonfulfillment of a prior agreement or refusal of an emergency plea for aid, but it must have been a chief-size dudgeon! "The old Admiral [Te To'ofa] was Irritated to a Degree of Madness, he Abused him [Pomare I] Every where and was very glad to get any of

us to Listen to him He would Curse Ottou for an Hour to gether and Foam At the Mouth with rage" (Home, Otihiti, quoted in Beaglehole 1967:211-212n).

The terms of the truce were regarded as unfavorable to the Tahitian principals' interests, but there is no specific record of what those terms actually were.⁶ From subsequent events, however, and from the nature of the quarrel itself, we may conclude that Mahine permitted Mahau to continue his rule over Mo'orea's Varari district, while retaining authority over most of the rest of the island for himself and his protégé, Tairihamoetua (?). Later, when Cook arrived at Mo'orea and expressed the wish to see Mahine, "... it was not till after much invit'ing that he quid his Canoe & ventur'd on board, & then with evident mark's of fear; & mentioned immediately to the Capt'n that Otoo was his Chief to whom he would submit" (King, in Beaglehole 1967:1382). Like most other Maohis, Mahine probably acknowledged Pomare I's ceremonial preeminence, but his talk of "submitting" to Pomare I as "his Chief" was undoubtedly based on his fear of Cook's guns and knowledge of the latter's championing of Pomare I. In his subsequent conduct toward Pomare I, this independent-minded chief expressed anything but submission to the Pare *ari'i*.

The ceremony held at 'Utu'aimahurau to formalize the truce with Mahine was attended by Te To'ofa, Puhuetea, an unnamed Seaward Teva chief, a representative of Mahine (reputedly his brother), and Pomare I. Despite the contempt and bitterness the other Tahitian principals may have had for Pomare I, his presence at the ceremony was indispensable, inasmuch as validation of the truce, by 'Oro, required a human offering, over which only Pomare I, as wearer of the distinctive Wallis *maro*, could officiate. (It was for this specific purpose, I believe, that Te To'ofa, at the crest of his rage, sent a plantain leaf to Pomare I, and not as a sign of general reconciliation.) The ceremony itself was witnessed by King, in Cook's stead; in view of the fact that it included most of the principals of the war under consideration, and that it is one of the few records left us of a specific, as opposed to a generalized account of such a ceremony, I reproduce Lieutenant King's description in detail.

It was Sunset when we embarked in a Canoe and left Oparre, about 9 oclock we landed at Tettaha at that extremety which joins to Attahourou; before we landed the people called to us from the shore, probably to tell us that Towha was there. The meeting of Otoo and this Chief I expected to be curious and worth seeing; Otoo and his attendants went and seated themselves on the Sand close to the Canoe in which Towha was. On the Servants of this cheif wakening their master and mentioning Otoo's name, immediately a plantain tree and a Dog were laid at Otoo's feet, and many of Towha's people came and talked with him, as I conceived about their expedition to Eimeo. After I had remained for some time, seated close to Otoo, and not perceiving Towha to stir from his Canoe, nor hold any conversa-

tion with us, I went to him. He asked me if Tooti was angry with him, I told him no, that he was his Taio and that he ordered me to go to Attahourou to tell him so. Omai had a long conversation with this Chief, but I could gather no information of any kind from him. On my returning to Otoo, he seemed pressing that I should go to eat and then to sleep. Accordingly Omai and I left him. On questioning Omai, he said the reason of Towha's not stirring from his Canoe was his being lame, that presently Otoo and he would converse together in private, this seemed true, for in a little time those we left with Otoo came to us, and about ten minutes after Otoo himself came and we all went to sleep in his Canoe. The next morning the yava was in great plenty. One man drank so much that he lost his senses, I should have supposed him in a fit from the convulsions he was in; two men held him and kept plucking off his hair by the roots. I left this spectacle to see a nother more affecting, this was the meeting of Towha and his Wife and a young girl that I understood to be his Daughter; after the ceremony of cutting their heads and discharging a tolerable quantity of blood and tears, they washed, embraced the Chief and seemed unconcerned. But the young Maids punishment was not yet to an end, Terry Derry came and she went with great composure to perform the same ceremony to him she had to her Father. Towha had brought a large War Canoe from Eimeo, I enquired if he had killed the people belonging to her, and was told there was no men in her. We left Tettaha about ten or eleven and landed close to the Morai at Attahourou a little after noon. There were three Canoes hauled up opposite the Morai with three hogs exposed in each; the sheds had something under them which I could not discern. We expected the Ceremony to be performed the same afternoon but as neither Towha or Potatow came nothing was done.

A Chief from Eimeo came with a small pig and a Plantain tree and placed them at Otoo's feet, they talked some time together and the Eimeo chief often mentioning the words *Warry warry* ('false') I supposed that Otoo was relating to him what he had heard and that the other denied it. The next day (Wednesday) Towha Potatow and about eight large Canoes came and landed near the Morai, many plantain trees were brought on the part of different Chiefs to Otoo. Towha did not stir from his Canoe. The Ceremony began by the first Priest bringing out the Maro wrapt up, and a bundle shaped like a large fidd; these were placed at the head of what I understood to be a grave, then three Priests came and sat down opposite and at the other end of the grave, bringing with them a Plantain tree the branch of some other tree and the Sheath of the flower of the Cocoanut tree.

The Priests, with these things in their hands seperrately repeated some thing, and at times two and sometimes all three sung a Melancholy ditty little attended to by the people. This praying and Singing continued for an hour; then, after a short prayer, the high priest exposed the Maro and Otoo got up and wrapt it about him and held in his hand a Cap or Bonnet made of the red feathers of the Tail of the Tropic bird and other dark feathers. He stood in the Middle space facing the three Priests who continued their prayers for about ten minutes; when a man started from the Crowd, said something which ended with the word *Heiva* and was answered by the Crowd *Earee* three times, and this as I was told before, was the principal part of the ceremony. The Company now went to the opposite side of the great pile of stones, where is what they call the Kings Morai, which is not unlike a large grave. Here the same ceremony was performed over again and ended in three cheers, the Maro was now wrapt up and increased in richness by a small piece of red feathers which one of the priest(s) gave Otoo while he had it on and which he stuck into it. From this place the people went to a large hut close by the Morai, where they sat themselves down in much greater order than is usual among them. A Tierrabou man then made

an Oration of about ten Minutes, he was followed by an Attahourou man, afterward Potatow spoke with much greater fluency and grace than any of them, for in general they spoke in short broken sentences with rather an awkward motion of the hand; Tuteo Otoo's orator spoke next and after him a Man from Eimeo. Two or three more speeches were made but not much attended to. Omai said that the Speeches declared that they should not fight but be all friends. As many were warm it might possibly be some recriminations and protestations of their good intentions. In the Middle of their speaking an Attahourou man got up with a Sling fastened to his waist and a large stone held on his shoulders, with this he marched in the open space repeating something in a singing tone. After parading near a quarter of an hour he threw the stone down. This Stone and a Plantain tree that lay at Otoo's feet were, after the debates ended, carried to the Morai and one of the priests and Otoo with him said something on the occasion. On our return to Oparre the Sea breeze set in which Obliged us to land and we had a pleasant walk through almost the whole extend of Tettaha to Opere, a tree with two bundles of dried leaves suspended from it was the boundary of the two districts. The Man who had performed the Ceremony of the stone and sling came with us, with him Otoo's Father had a long conversation, he seemed very angry, I understood he was enraged at the part Towha had taken in the Eimeo business.

From what I can judge of this ceremony it had not been wholly a thanksgiving as Omai at first told us, but rather a solemn confirmation of the Treaty or Truce, or perhaps both. (Beaglehole 1967:215-218)

Thus ended the Mo'orean Succession War — for the moment, at least. For, as King reported in his description of the battle's aftermath, Te To'ofa and his allies rankled at Pomare I's dereliction and vowed publicly to punish him. Cook's version of this threat, and of his reaction to it, are worth reproducing; his own warning proved to be a potent factor in political events of the next few years:

The terms [of the truce] were disadvantageous and all the blame fell upon Otoo for not going to assist Towha in time. The current report was now, that Towha assisted by the forces of Waheatua would, as soon as I was gone, come and fall upon Otoo; this called upon me to support my friend by threatening to retaliate it upon all who came against him when I returned again to the island, if there was any truth in the report at first this had the desired effect, for we heard no more of it. (Beaglehole 1967:214)

Thus was formulated a more or less "official" English policy which was to have a very material influence upon the political developments of the next four decades. For, just as Wallis had made a "Queen" of Purea, and Cook a "King" of Tutaha, with the latter now dead the principal personage in the vicinity of Matavai, namely Pomare I, was duly given that label, and was courted with official courtesies and innumerable valuable gifts. In the person of Tutaha the visitors had a man of unmistakable coercive authority and wide political influence — a real "king" in the civil, temporal sense of the word. In the person of Pomare I they at first recognized his shortcomings and limitations in civil affairs, but acknowledged, as did most Maohis, the preeminence of his rank-status. But Cook, through his warning,

had managed to increase Pomare I's authority in civil affairs far beyond the point warranted by the latter's own resources. We cannot tell the extent to which Cook's promise of support, along with the other English attentions, served to enlarge Pomare's own ambitions, but these factors undoubtedly improved the chances of their ultimate realization. Some historians appear to imply that this "official" policy adopted by the English visitors came about unwittingly, almost wholly the result of the use of Matavai and Pare anchorages. This may indeed have been so in the beginning, but a case could be made that later voyagers (and even some of the earlier ones) fostered this policy deliberately and with eyes wide open.

To the ritual-minded Maohis the numerous courtesies extended to Pomare I by the English — including the daily associations, the meals on board, the royal salutes, et cetera — must have added some luster to his already preeminent rank-status. The large quantities of English gifts that passed through or ended up in Pomare I's hands, provided him with unmatched resources for rewarding supporters and for courting the loyalty, or at least the neutrality, of other chiefs. And, with Cook's promise of armed support, Pomare I was provided with the means of complementing his rank-status and gift-bribed cooperation with coercion-sanctioned *authority*.

Needless to say, the peers of Pomare I were unhappy about these goods in the hands of an individual whose personal qualities some of them held in contempt; but they were compelled by Cook's unequivocal warning to bide their time.

Cook's party left Matavai shortly after the truce ceremony just described and made their way to Mo'orea. There they met Mahine, as earlier described, and experienced anew the frustrations of trying to recover stolen property — in this case some goats. Cook himself became so deeply involved in this matter, and his temper so enflamed, that he had his men destroy numerous houses and canoes in an area already damaged during Te To'ofa's campaign. Eventually Mahine was prudent enough to see that the stolen property be returned, and he even voiced his intention to continue "submission" to Cook's protégé, Pomare I; but he too was simply biding his time.

TE TO'OFA'S REVENGE

Cook, of course, never returned to Tahiti. In fact no European vessel put in there for about eleven years,⁷ at which time Bligh, Christian, and the others of that famous crew turned up on H.M.S. *Bounty*, intent on collecting a cargo of breadfruit plants for Jamaica, where it was hoped they would answer the planters' need for a cheap staple for their slave labor. H.M.S. *Bounty* remained at Matavai from October 26, 1788 to April 4, 1789; during this time Bligh faithfully kept a journal whose usefulness is enhanced by

virtue of his prior experience on the island, gained in 1777 as master aboard Cook's *Resolution*.

The visitors found Pomare I in a sorry state. The *ari'i* was described as "... a Man only nominally possessed of power, or otherwise he has not abilities to govern, which may be the Case, as the Cheifs revile him upon all occasions" (Bligh 1789:I, 375). As for his formerly populous and prosperous district, Bligh reported:

The extensive Houses that we have seen before are no where to be found, and every habitation seems to have no more pains taken with it than to make it answer its use. They are nothing but small light sheds, the largest of which taken by the four corner supporters, might be taken away by four Men. Their large Cannoes also are gone except two or three, so that I imagine the injury these People have sustained is very great. (1789:I, 379)

What had happened was reported to Bligh by Pomare himself:

He said that after five Years and three Months, from the time of our sailing, counting 63 Months, the Imeo People joined with Tettowah, (the noted old Admiral called by Captain Cook Towah) and made a descent at Oparre ... that after some resistance by which many Men were killed, he and all his People fled to the Mountains. The People of Imeo and those of Atta-hooroo under Tettowah now being masters of all their property, destroyed every thing they could get hold of, among which were the Cattle, Sheep, Ducks, Geese, Turkeys and Peacocks left by Captain Cook in 1777. (p. 378)

Evidently Cook's warning had had its effect — for five years at least. Then Te To'ofa, probably concluding that Pomare I's friends would not return, descended upon Pare as he had threatened to do. Tairapu seems also to have joined in the attack, and although Fa'a'a and the northeastern districts are not specified as having participated in the actual fighting — indeed, their forces would have been superfluous — they certainly did not offer any comfort to Pomare I. (Bligh pp. 396-397)

We cannot be certain that Mahine's forces actually joined with Te To'ofa's in attacking Pomare I, but they played a major part in the latter's rout. Each of the chiefs had his own grievances against Pomare I, but it may seem surprising to see them as allies, in view of Te To'ofa's previous espousal of Mahau's claims against Mahine, and of his own earlier attack upon Mo'orea. Nevertheless, it appears that these two chiefs' shared antagonism against Pomare I overrode their differences regarding the Mo'orean succession. Te To'ofa's grievance is well documented: a general resolve to deflate Pomare I's unwarranted political pretensions, and a particular desire to punish the latter for his conduct during the earlier Mo'orean campaign. Through inaccurate but comprehensible reasoning Mahine probably blamed Pomare I for the destruction meted out by Cook on Mo'orea, in the episode of the stolen goats (Bligh 1789:I, 378). But in addition, Pomare I was doubly

identified with Mahine's rival, Mahau, by virtue of Pomare I's marriage to the latter's sister, 'Itia, and of Mahau's own marriage to Pomare I's sister, Auo — for both of these unions were evidently established by 1782, the approximate time of the attack upon Pare.

Although Mahine's (and Te To'ofa's) forces lay waste to Pare and forced Pomare and his family to flee, the Mo'orean chief himself was slain, reportedly by Pomare I's younger brother, Vaetua (who as a consequence was "esteemed as a great Warrior") (Bligh p. 411).⁸

Mahine was succeeded in his tribal chieftainship by his adopted son, Tairihamoetua (?); Mahau retained his office as chief of Varari, in northwest Mo'orea, and an uneasy peace prevailed between the two. Meanwhile, Pomare I's relationship with Tairihamoetua (?) was hostile but fairly quiet; when Bligh asked the former about this he was told that they were still at variance and that "... if an Otaheite Man went to Imeo he would be killed, and the same would be done at Otaheite [read, Pare] by a Man from Imeo" (1789:I, 378-379). As an indication of this relationship, Bligh attended a *heiva* performed at Pomare I's direction as "publick mark(s) of honor as a reward for publick or meritorious Services" in honor of a Pare warrior who had happened to be "ill used" while on a visit to Mo'orea (1789:II, 61).

Te To'ofa, Pomare I's other principal antagonist, evidently died shortly before Bligh's arrival, but his son and successor appears to have sustained the father's hostility toward the Pare *ari'i*.

According to Bligh, "The inhabitants also of Tiarraboo had made some attack on this devoted place [i.e., Pare] ..." (1789:I, 397); and from what Bligh could learn at Matavai their hostility had not abated — a somewhat surprising state of affairs inasmuch as 'Itia's (and Mahau's) sister, Pateamai,⁹ was probably by then married to Seaward Teva's *ari'i*, Vehiatua III.

Pohuetea, whom Bligh also characterized as one of the island's "great Personages," invited the English to visit Puna'auia but would not travel to Matavai, "such is the Mutual jealousy of these People" (1789:II, 77). Indeed, about the only influential chief on Tahiti not hostile to Pomare I at this period was Te Pau"B", of F'a'a'a, and even this relationship appeared threatened:

Tynah [Pomare I] was uneasy on account of Teppahoo being ill at Tettahah, who he esteems above all other of his friends. He tells me that when Teppahoo dies the district will then join with Attahooroo and fight against him, as the Erree then will be a Brother of Teppahoos, (he having no Children) who is a great enemy to him. (Bligh 1789:II, 48-49).¹⁰

During the five-months' visit of H.M.S. *Bounty*, Pomare I's many enemies carried out no overt attack against him (perhaps because of the

ship's presence at Matavai), and Pomare I did his best — or rather, Bligh's best — to conciliate them:

As I make it my study to do every thing for the good of our Friends here [i.e., Pomare I and his family], I have therefore to establish peace around them as I consider it their greatest blessing, given Tynah the power of making Friends if possible by presents. In consequence all his late powerful enemies have received presents, Saws, Shirts and many other things, this however I fear will but whet their inclinations for War as soon as I am gone; he is nevertheless apparently anxious to conciliate their regard, in which I am happy to assist. (Bligh 1789:II, 38)

There is no better way of summarizing Pomare I's political predicament than by quoting another statement of Bligh's, which, in addition, shows how faithfully the conscientious lieutenant continued to carry out the policy of "king making" so clearly enunciated by his former captain, James Cook:

There is a great deal due from England to this Man and his Family; by our connections with him and them we have brought him numberless Enemies. Their eligible situation for our Ships has brought us intimately connected with them, and by this perhaps we have not only sown the seeds of discord but of revolution. On one side he has Attahooroo disposed to attack him, and on the other Tiaraboo ready for a total extirpation of his Authority, while he has an Enemy equal to the other two in Imeo (or Morea) who will venture anything buoyed up by their former Successes. All those I am confident will on my leaving this Place make a joint Attack on this part of the Island, and these poor people will have no resource but to fly to the Mountains and defend themselves there. It will certainly be against them, my not taking vengeance on the Attahooroo and Morea people for taking the Cattle and destroying part of them, and was it not for the particular trust that is reposed in me to complete the Undertaking I am sent on, I would certainly adopt such means as to oblige those people to repent of their incursions.

I hope however, and have given Tynah and all the principal People reason to think, that they will never be forgot by us, because it will at any period or case be justifiable in England to support the Otow family, and they have shown that faith and Affection to the Erree no Pretanee, as their expression is, as demands all our Assistance and utmost efforts to defend them. If therefore these good and friendly people are to be destroyed from our intercourse with them, unless they have timely assistance, I think it is the business of any of his Majestys Ships that may come here to punish any such attempt. (1789:II, 28)

When H.M.S. *Bounty* arrived at Tahiti, Pomare I exercised secular authority over Pare-Arue, and at least western Ha'apape; but the label of *ari'i rahi*, and the prerogatives and duties associated with *maro ura* rank — presumably with both the Tetupaia and Wallis *maro*¹¹ — had already been transferred to his eldest son and successor, whom I shall call Pomare II.¹²

According to Bligh's account, 'Itia had borne five offspring to Pomare I. The first, a female, was slain at birth, Pomare I having been an active Arioi at the time (1789:II, 56; I, 387, 389). The second, a male born about 1783, was, as had been his father, generally called Tu (Pomare I having

relinquished this name and become Tina). The third, a female born about 1784, was named Teri'i na Vaho Roa. The fourth, a male born about 1786, was named Teri'i Tapanoai (?), and the fifth, a female born about 1787, was named "Tahamydooah" (Tahamitua?). During Bligh's *Bounty* sojourn these "royal" progeny dwelt with their attendants in a set of households apart:

I do not often speak of Otoo [O Tu, Pomare II], for his being a Child and kept out of our way we have of course no intercourse with him. I however see him perhaps once a Week and the other Children, but we never come nearer each other than 30 or 50 yards. At those times I carry them some little presents and by this Means they are always rejoiced to see me. The River separates their dwelling from the part we are at, and it would be considered as a great violation were we to cross it near their dwelling. There are two Brothers and two Sisters but they do not eat or sleep under the same Roof. On that account the Girls have a House about $\frac{1}{4}$ of a Mile from their Brothers. Each of them are situated on the side of a pretty River which has its source out of a Rock on the side of the Hill near Otoo's House. The Parents sleep every night at the Girls House, but are mostly absent from them in the day. (1789:II, 56)

With these children also lived the two offspring of Pomare I's sister, Auo, and the latter's husband, Mahau; and, according to Bligh, these latter "... have similar marks of Attention & respect paid to them" (p. 56).

Turning now to other members of what Bligh was pleased to call "the royal family," old Teu (Hapai) and his wife Tetupaia ("Oberreeroah") were still alive, but evidently wholly retired from engagement in political affairs. Of their three surviving daughters, the eldest, Te Ari'i na Vaho Roa (also called Tetua Nihura'i) still presents something of a mystery; I am fairly well convinced that she had married Teri'irere, *ari'i rahi* of Papara (now become Temari'i), but she evidently bore him no children and seems to have dropped out of sight by 1788, probably through death. The next eldest daughter, Ari'ipaea Vahine, resided in Ra'iatea and was not in evidence during Bligh's stay. The youngest daughter, Auo, who was married to Mahau of Mo'orea, seems to have divided her time between her husband's Varari district in Mo'orea, and Pare, where, as just noted, her children lived.

Of the four sons of Teu and Tetupaia, the condition of the eldest, Pomare I, is well documented. During Bligh's visit to Matavai, Pomare I's next younger brother, Ari'ipaea (Te Ari'i Fa'atou), was residing with his wife nearby; concerning the relations of these two brothers Bligh was informed that

... Tynah and his Brother Oreepyah were on bad terms and that they would quarrel and fight as soon as I sailed. I have observed some coolness between them and knew they did not heartily like one the other, on every opportunity therefore I had endeavored to make them friends, but it has had no effect. This dislike has arisen from the disagreement of the Two Wives. (1789:I, 407)

That the two wives in question had disagreements should occasion no surprise — both having been strong-minded, ambitious personalities, from families of divergent political interests.

Pomare I's next younger brother Vaetua (Te Tupai e te Ra'i, Maiore, Paiti), resided in Ha'apaino'o, but spent much time at Pare, where he seems to have distinguished himself to Bligh mainly through his steady consumption of kava. The youngest son, Te Pau "C", eventually succeeded to tribal chieftainship of Fa'a'a, but during *Bounty's* sojourn he remained little noticed by the English.

The newest person of note to appear on the Matavai scene during Bligh's visit was Ha'amanemane, also known as Tuteha. The first reference to this man, who was to play a very important role in Tahitian politics, appears in Bligh's journal under date of November 4, 1788: "A Cheif of much consequence and related to Tynah [i.e., Pomare I] has been here these two days from Ulietea [Ra'iatea]. He is called Toota-ah" (1789:I, 385). Ha'amanemane was also known as Mauri. About four months later Bligh described "Toota-ah" as being "... generally with Tynah, he is a Priest and considered to have great Knowledge" (1789:II, 45). Ha'amanemane was a brother of Pomare I's mother, Tetupaia, and was evidently forced to flee from Ra'iatea during that island's wars with Porapora. As we shall see he came to have a weighty influence over Tahitian affairs.

CHAPTER 28 *WARS OF THE BOUNTY MUTINEERS*

What happened to Lieutenant Bligh and H.M.S. *Bounty* after leaving Tahiti is of course widely known, but, as Adams put it:

What Bligh said to Christian, and what Christian said to Bligh, and what Peter Heywood said to both, and how Thursday October Christian made his dramatic appearance at Pitcairn Island, and a thousand other details of the picturesque story, have been told a hundred times, and always to interested audiences; but no one has taken the trouble to tell how great an influence Bligh and his mutineers exercised over the destinies of Tahiti, and especially of its old chiefs. (1901:98)

After setting Bligh and his closest supporters adrift in the ship's launch off Tonga, on April 28, 1789, the mutineers returned for a brief visit to Tahiti in June, to collect livestock and some Maohi companions, and then sailed for Tubuai where they hoped to settle.

The next European vessel to call at Tahiti was the Swedish brig *Mercury* (Captain Cox commanding), which remained at Matavai from August 12 to September 2, 1789. One of the *Mercury's* officers, Lieutenant George Mortimer, compiled an account which, while recording no change in the island's political situation, does supply some useful confirmatory details. He wrote, concerning Pomare I and some members of his family:

We remarked that his [Pomare I's] subjects paid him very little respect, and seemed under no kind of restraint in his presence, every dirty fellow entering freely into conversation with him; indeed, were it not for the distinction of being fed, and that the women sometimes uncover their shoulders in his presence, it would be difficult to tell him from any of his people. (1791:30)

Otoo [Tu, Pomare I] happening to see a pair of scissors, with a long chain suspended to them, given by our second mate to his [Pomare I's] wife, had a great desire to possess them, and demanded them of her; but she positively refused to give them up: upon which he fell a-crying, and was not to be pacified till he obtained a pair like them. After this, he gave us another proof of the childishness of his disposition, by employing a man for two or three hours in sewing additional buttons down the back and on the flaps of a coat Mr. Cox had given him. His wife Etea is a clever sensible woman, and the only one of her sex permitted to eat in the presence of the men: she makes use of a knife and fork nearly as well as an European; and she is fond of tea. Her Majesty is likewise an excellent shot, and hit our buoy the first time she fired, with a single ball, though it lay at a consid-

erable distance from the ship; she having first taken the musket from Otoo, who was afraid to discharge it. (pp. 31-32)

The men [of Mo'orea] made us a tender of their women, and seemed to think it a necessary proof of our friendship that we should accept their offer. The ladies on their part seemed to have no aversion to comply with the requests of their husbands and relations, not excepting her Majesty. This did not surprise us after what we had heard at Otaheite: for we were there informed that Otoo's wife made no scruple of granting her favours to some of the great chiefs; and that Otoo sometimes solaced himself with his brother Orepia's wife, which she acknowledged, and seemed to think an honour, (p. 44)

... we were frequently troubled with the company of a younger brother of the king's named Widouah [Vaetua], a very impudent, dissolute young man. (p. 45)

The principal matter of interest to us in this journal is an account of the officers' three-day excursion to Mo'orea. There they met Varan's chief, Te Ari'i Tapu Nui (i.e., Mahau) and his wife (presumably Auo, the younger sister of Pomare I), along with a boy identified as their son. Mahau himself was described as "... a tall, stout, good-looking man, speaks but little, and seemed to be of a timid disposition" (p. 38). Then, on the return trip they stopped at Opunohu Bay, where they witnessed a brief skirmish between some of Mahau's partisans and what I assume was a small force of Tairihamoetua's people. The whole incident attests to resumption, or continuation, on Mo'orea of the long-seated war of succession.

Later in September 1789, the *Bounty* mutineers returned to Tahiti after having met with a hostile reception at Tubuai, and then the ship sailed almost immediately again for what turned out to be Pitcairn Island; this time, however, sixteen of their number elected to remain at Tahiti. Until March 1791, when the survivors of those who remained on Tahiti were sent back to England on H.M.S. *Pandora*, the ship sent out to capture them, they played important, probably decisive roles in Tahiti's political affairs. Of great good fortune for the historian and student of Maohi society, one of the mutineers who survived was James Morrison,¹ who compiled an account of his stay on the island, along with a most valuable description of many other aspects of Maohi culture, from which earlier chapters in the present work have abundantly drawn.

The sixteen mutineers met with a very hospitable reception in Matavai and Pare, and at the beginning most of them elected to settle there. Soon, however, two of them responded to a general invitation from Vehiatua III and went to live in Tairarapu, and another moved to Papara at the invitation of Temari'i (the then current name of Teri'irere). Of those remaining in Matavai-Pare some embarked upon the difficult undertaking of building a schooner in which they hoped to reach Batavia, and thence find passage to England.

Throughout their stay the mutineers saw much of Brown, the seaman

left ashore by the *Matilda*, but most of them remained wary of him. Brown, however, proved far less troublesome to his compatriots, and to the Maohis, than did Churchill, the *Bounty's* master-at-arms, who, in fits of temper, killed or wounded several Maohis and who managed to become a "chief" for a brief period before he himself was murdered.

It is not possible to discover the whole range of relationships obtaining between this wide assortment of aliens and their Maohi hosts. Each of the former seems to have had close, *taio*-like, relations with one or more Maohis (usually with upper-class ones), and many of them also had Maohi mistresses. The fact that they were in general so hospitably and deferentially treated, despite their obvious weakness in numbers and armaments, is undoubtedly due to a number of reasons. Great value was evidently attached to their presumed knowledge and technical skills, particularly with respect to warfare. Moreover, the well-founded expectation that other European vessels would in time appear and revenge mistreatment of them probably exercised some constraint, but there seems also to have been other, less tangible factors at work. I have already pointed out how generally hospitable the Maohis were toward aliens who happened to land on their shores. Exceptions of course occurred, but by and large a stranger cast ashore on one of these islands stood a better chance to be fed and left unharmed than would have been the case in many other South Sea archipelagoes. And finally, in addition to the numerous instances of sincere friendships formed between individual Maohis and Europeans during this first quarter century of contacts, there seems to have developed a respect for certain Europeans, which in the case of James Cook reached the dimensions of cult veneration.² Whatever the reasons behind individual cases, some Maohi chiefs competed to secure the friendship and services of the European castaways — and well they should have, in view of subsequent events.

The first of these events took place in early March 1790, when Mahau set out from Mo'orea with canoe loads of hogs and tapa for the youthful Pomare II. When rumors circulated that a force of Oropa'a was planning to waylay the expedition, Morrison and some of his compatriots were sent for to frustrate the attack. Their appearance under arms had the desired effect and the attack never materialized (Morrison 1935:89); and thus it was that part of the mutineers became actively identified with Pare, and the ambitions of the Pomares.³ Others of the *Bounty* people, however, became associated with the Pomares' rivals in Seaward Teva.

Early in their stay, two of the mutineers, Churchill and Thompson, moved to Seaward Teva, where the former became *taio* and principal aide to Vehiatua III. In fact, the relationship was so close that when Vehiatua III died shortly thereafter, in mid-March 1790, and without issue, his supporters elected Churchill to succeed him; but this troublesome man did not live long to enjoy his position. Within a month he had quarrelled so vio-

lently with Thompson that the latter killed him — and was himself killed by Churchill's supporters to avenge the death of their new "chief." After this unsuccessful experiment the Seaward Tevans reverted to their usual practice and named a nephew of Vehiatua III to succeed him (the exact nature of the kinship tie is not reported). As the successor was only about four years old at the time, his father was appointed regent for him.

Meanwhile, it is interesting and somewhat surprising to learn that during all these proceedings, and for some months previously, Pomare I was living on the peninsula, in the district of Afa'ahiti (Morrison 1935:76, 96). According to the latter's reports to Morrison he was treated "very uncivil" by the people of Seaward Teva, but evidently not to the extent of making his life intolerable. The land on which he resided, described as "some possessions given to himself," is not further specified, but may well have been some estate inherited from his father's mother, Tetuahuri, who was the daughter of an earlier Vehiatua. Pomare I's major object in remaining in this uncongenial situation was, as he expressed it, his "... hopes of gaining a party in his Sons favour" (p. 96). In view of Vehiatua III's lack of issue, and of Pomare I's descent from the Vehiatuan Tetuahuri, his own son was undoubtedly eligible for consideration as a successor to Vehiatua III. The Tairapuans' general hostility toward Pare's principal family was probably responsible for their passing over Pomare II, but the reason they gave was that, in their belief, Pomare II was a bastard, having been sired by his mother's commoner paramour, and not by Pomare himself.

The next episode of political significance involving the mutineers occurred during the early part of April 1790:

In the Mean (time) the Morea People haiving rebell'd against Mottooarro, Chief of that Island & Brother-in-law to Matte, he sent to us to know if He should send his arms over to quell them, to which We agreed, but told Him to send His own people to use them; and Heete-heete being present was appointed to the Command. The Arms being brought to us we Cleand them and put them in order when they set off and Arriving at Moria soon brought them to subjection, Heete-heete having himself killd the Inspired Priest of the Rebels and their Chief, (the adopted Son of the late Maheine) Tayreehamoedooa, forced to fly to Attahooroo, leaving the Island in pession of Mottooarro whose right it was, but from which he had been kept by Maheine his Uncle and His party, till the Bounty had Sailed in April 89, when he having formed a strong party was Calld Home from Taheite where he then resided and having strengthend his party from Taheite was admitted as Joint Chief with Tayreehamoedooa who now became Jealous of His power, and had taken up arms to drive him out again, but the fire arms gave Mottooarro such strength that He was forced to relinquish all Claim & fly to Taheite for refuge. From Attahooroo he went to Papaara where Tommaree gave him land and where he now resides private with His Mother & Aunt (Wa Vaheine) who was the Wife of Maheine deceased. (Morrison 1935:92-93)

Thus in one brief action the seventeen-year-long Mo'orean Succession War was brought to a conclusion favorable to Mahau, and hence to the Pomares.

The mutineers' firearms were probably decisive factors in the conflict, but the hero of the action was Hitihiti, the well-known man who had accompanied Captain Cook on his southern swing in 1773 and 1774, and had since become principal aide to Pomare I. Hitihiti was also Pomare I's uncle-by-marriage, but whether this relationship preceded or followed his occupational attachment to Pomare I is not recorded. The skills and knowledge Hitihiti acquired during his seven-months' service with Cook probably account for his prominent position in Pomare I's entourage, because he does not appear to have been otherwise gifted.⁴

Tairihamoetua's (?) right to refuge in Papara evidently derived from his "aunt," Mahine's widow, who was the sister of Papara's Amo. From these circumstances it would seem likely that the principal people of Papara were maintaining their posture of hostility — or at least coolness — toward the Pomares, but such apparently was not the case. For example, under the date of March 1790, Morrison recorded that two of the mutineers had gone to Papara to live, and that Pomare I raised no objections to the arrangement, inasmuch as he was "in alliance" with Temari'i (Teri'irere), the Chief of Papara (p. 91). Elsewhere, Morrison recorded that Pomare I's brother, Ari'ipaea, was visiting Papara. This introduces a set of events not specifically reported by any contemporary, on-the-spot observer, but presented in Adams' history as reliable oral traditions of Papara's chiefly family.

The gist of Adams' account, abstracted from intricacies too confused, ill founded, and irrelevant to concern us here,⁵ is that the young Papara chief, Teri'irere-Tamari'i, became more sympathetic to the aspirations of the Pomares than his parents had been — more specifically, to those of the young Pomare II. Adams proposed that this change in sentiment was affected mainly by Pomare I's brother, Ari'ipaea, whose wife was Amo's niece.⁶ Ari'ipaea was undoubtedly friendly with Teri'irere-Temari'i, and may have contributed to the improved relations, but one will also recall that the latter's first wife was Pomare I's eldest sister, and his mother was 'Itia's father's sister. While ties of kinship were no warranty of amicable relationships, as must by now be clear, they cannot be dismissed as irrelevant.

However it came about, relations between Pare and Papara were such in mid-1790 that the warriors of these two districts fought more or less simultaneously to defeat a common enemy, even if they did not join together to fight as close allies. The next set of events in Tahiti's political history commenced in September 1790:

September 12th. this Day a Messenger arrived from the Young King desiring our Immediate Assistance to quell the People of the District of Tettahah who had rebelld, and made an inroad into Oparre, burning all before them; the Messenger also informd us that the Oparre people had repuls'd them forcing them to leave two of their Dead behind them which were brought to the Young Kings Morai, and that they were preparing for another attack, being set on by

the People of Attahooroo. — he told us also that areepaeaa-Waheine the Young Kings Aunt who had been at Ryeatea for some years, was arrived at Oparre with a Numerous Fleet which were all ready for War. (Morrison 1935:100)

The Ari'ipaea Vahine referred to in this passage was none other than Pomare I's elder sister. (Morrison elsewhere described her as Teu's and Tetupaia's eldest offspring.) I cannot discover what induced her to return to Tahiti — perhaps only to pay a visit to her family — but the presence of her entourage could not have been better timed.

More inexplicable is the fact of Tetaha's (Fa'a'a's) "rebellion" against Pare. To begin with, this small district on Pare's southern border could not have "rebelled" against the Pomares because it had not been under their domain. On the other hand, since the death of Te To'ofa some years earlier, Fa'a'a's relations with the Pare chiefs appear to have been more friendly than otherwise. The matter is complicated by the question of the identity of Fa'a'a's chief (or chiefs) at the time of this "rebellion." In March 1789, it will be recalled, Pomare I revealed to Bligh his uneasiness over the ill health of Fa'a'a's chief, and Pomare I's friend, Te Pau "B", stating that if the latter died he would be succeeded by his (Te Pau "B's") brother, who was an enemy of Pomare I. When Bligh returned, some three years later, he found Te Pau "B" to have died, and the chieftainship of Fa'a'a held by Pomare I's youngest brother, Te Pau "C" (1792:135). Another limiting date was provided by Morrison, who in a passage yet to be reproduced, reported that upon the defeat of the Fa'a'a "rebels," in September 1790, the Oropa'a victors appointed Mahau, then chief of Mo'orea, to the Fa'a'a chieftainship. In other words, unless Te Pau "B" had turned against his friend Pomare I, between March 1789 and September 1790, for which there is no evidence whatsoever, it appears likely that Te Pau "B" had died prior to the "rebellion," and that his place had been taken by someone hostile to the Pomares — probably the unnamed brother whose enmity Pomare I had earlier reported to Bligh.

Morrison's account of the next chapter in this conflict continued:

As we did not know that ever we should be able to effect our purpose, tho evry thing was getting forward, we found it necessary for our own sakes, to assist them, and therefore returnd for Answer that we should be at Oparre Next morning — and Armd Accordingly. On the 13th, leaving one to take Care of the Schooner, We marchd to Oparre, where Areepaeaa-Waheine received us, and a Dressd Hog was presented to us. — Byrn & Ellison being at Tetoora and Musprat on a Visit to Papaara with his Friend Areepaeaa, we were now only Eight in number, but were here Joind by Brown, who informd us that the Attahooroo people had made war on Tommaree; which was further Confirmd by a Letter from Burkett desiring our assistance. Having made our breakfast we proceeded to Tettahah Surrounded by a Multitude (with Poeno & Pyeteeaa two Chiefs at their head) from Maatavye.

Before that we had proceeded half a Mile We found the Marro Eatooa or Signal for War (which is several Fathoms of Cloth in one piece passd round several

Trees, crossing the path several times) and a Hog tied to each tree which the Marro passes round; this is generally Put up with some Ceremony, and the Enemy are defied to take it down.

On seeing this our party ran instantly and seized on the Marro & hogs, when the Enemy who lay conceald till now, made their appearance, and a Fray instantly commenced and Several heavy blows exchanged before We were observed by them — on our approach they Fled, but this Confused Method of engaging prevented us from knowing our own people, who were so scattered that we were not able at a Distance to tell them from the Enemy and we were therefore of No use but to look on while the Enemy retreated to the Mountains & our party returned with a deal of Plunder, & several Canoes which they had not been able to remove. We Now informd the Chiefs that they must alter their mode of Fighting, and bring their people under some Command, in Case they should have occasion to go to war again which they promised to do; and having Demanded Matts to make sails for the Schooner, we took our leave of Fatowwa, or Areepaeea Waheine, and returned to Maatavye. (1935:100-101)

About a week later the conflict started up again:

Mean while the Tettahah & Attahooroo people had united their forces & were began to Commit Hostilitys both on Papaara & Oparre, and on the 20th we were demanded to assist again, which for our Credit we could not refuse, nor was the Sails any excuse, as we were wanted on Shore, and the Enemy looking on our peaceable inclination as the effects of Fear, sent us word that they would Come to Maatavye & burn the Schooner and a Challenge sent to each Separately by their Warriors, who bid us defiance, telling us that each would have his man to Carry to the Morai, and much more such language. — they had also entered Oparre again burning and destroying all before them.

On the 21st early in the Morning, leaving one as before to take care of the Schooner, we got into our Canoes and paddled to the Lower end of Oparre. Here we were Met by Poeno, Tew, & Fatowwa, and almost all the Men of Maatavye with Pyeteea, & Mattaheyapo at their head who were both principal men & their head Warriors. We were now but Eight in Number, and having given the Chiefs such directions as we thought necessary, they promised to observe them, and being willing to take the Cool of the Morning, we set forward in Good order, surrounded by Multitudes of all ages from both Districts, but the Maatavye men kept Close to us, claiming the preeminence, and keeping the others in the rear. — on our approach the Enemy retreated to a high steep eminence in the Mountains, which Commanded a narrow pass, which was the only one by which they could be approachd, and as this place had resisted all Former attacks, they had got all their property to the place in readiness, & had formd an encampment of Huts ready to dispute the Pass; however we determined to proceed, as we could not hope for Peace without driving them from their strong hold: but it being some miles up in the Mountains, it was Noon before we got near enough to see the pass & the situation of the enemy, who we found well posted. The heat became so intense that we should have been in a bad plight had not our friends brought with them plenty of Cocoa Nuts which we found very refreshing and tho we had Marchd at a slow pace, we now stood in great need of — having halted a few minutes we proceeded to the Pass, which was along a Narrow ridge where two men could scarcely pass in safety. — the Taheiteans made a full stop when they came to the place but seeing us proceed they followed, and Pyeteea & Mattaheyapo came in the Van to be

our guides over. — in crossing the pass we found ourselves open to their Stones with which they plyed us briskly from the Eminence above our heads, where our Musquets would not reach to do execution — tho we were forced to walk over at an easy rate for one Hundred yards or more, none of us except Coleman was hurt, and he only received a blow of a Stone in the leg which did not disable him — however his Taheite friend received a blow between the Mouth & Nose that brought him down, & having English Cloaths on was Mistaken for one of Us and they gave us a loud Shout & redoubled their Vollies of Stones, by which upwards of twenty more we(re) wounded before we could fire a Shot. However we got over and with a warm fire advanced up the Hill; when they soon gave way. As soon as this was observed by our Party they rushd in, & three of the Enemies Head warriors having fallen by our shot they fled; and our party persued them down the other side of the Mountains. Mean time the Plunder of their Camp was seized by the Oparre Men, the Maatavye people being more intent on driving their Enemies; the Chief part of their Houses being burnt, and distroyd, we returned in the evening to Maatavye. The Number of Hogs taken here were incredible; several of the largest died with the fatigue of coming down, their own weight & fat being more then they Could support. (pp. 102-103)

I cannot identify the exact location of this battle, but infer from later events that it was in Fa'a'a, and that the defenders were largely Fa'a'a men. Also, it is reasonable to conclude that the Pare-Matavai forces would not have won the engagement without the firepower and leadership of the eight Englishmen. It remained to dispose of the larger forces of Puna'auia and Pa'ea:

... the Party in Attahooroo, being Yet in arms, the Young King was desirous that we should assist him to quell them, and force them to restore the Marro-Oora, or Royal sash, together with the Morai Tabbootaboatea, being the Movable place of sacrafice; — the Pehharaa or Sacred Chest wherin their Images are kept with the Valuables belonging to the Deitys; the Farre 'Atooa, or house of God, with several other things which belongd to them, which the Father of the Present T'towha Chief of Attahooroo had taken in war from o'Too or Matte and which had been kept in Attahooroo ever since, but we found it so fatiguing that we Got the Sails ready in Order to Shorten our marches. — We had by this time between 6 and 7 hundred weight of fine Pork Salted, & got it on board, and having bent the sails and Got our Amunition on board, on the 26th we saild for Oparre leaving the Houses in charge of the Natives with what things We did not want and leaving only Skinner in Maatavye who was bad with sore eyes which made our Number still but Eight. At Oparre we found Heete-heete who had come from Papaara where he had been with Burkett & Sumner Who with the Assistance of Muspratt, Brown & Himself had repulsed the Attahooroo & Tettahah people with a great slaughter but as they would not submit to Tom-maree, they Had Sent him to us to desire that We would keep them in play and appoint a day to let the Armies of Papaara & Tippirreonoo meet in the Center of Attahooroo. We kept Heete-heete and armd him with one of Matte's Musquets. — we found at Oparre a large Fleet assembled under the Chiefs of Tippirreonoo, who inform'd us that they waited our Orders. the Canoes with provisions being arrived from the different districts and the Morning of the 27th being Calm the Canoes drew up in a line and took the Schooner in tow. The line consisted of 40 Canoes paddling 50, or 60 hands; they had pieces of Painted Cloth

hoisted on the Sterns of each, & Drums beating & flutes playing made a very war like show the Warriors Cutting a Number of Capers on their Stages, being dressd with Featherd headdresses & all in their best Apparal, the smaller Canoes being kept at a Distance on each side the line began to move forwards within the reef towards Attahooroo. Mean time Multitudes Went a head by land, and the beach appeard Covered all the Way as we passd. As we entered the enemys Country, they fled to the Mountains, and our party on shore persued them, Burning the Houses, and destroying the Country where ever they Came by rooting up the Plantains & Tarro, and notching the bark round the Breadfruit Trees to stop their Growth, and laying all in ashes before them. About Noon we anchor'd at Taboona, part of Attahooroo, under Pohooataya, the Same known to Captain Cook by the Name of Potatow. The Canoes were here hauld up, and an encampment made with the roofs of the Houses, which had escaped the fire, or that had been spared for that purpose. We were now informd, that the Enemy had posted themselves in a Strong hold in the Mountains, and Could observe them with the glass going up in large bodys to the place where they intended to stand a Siege. — A Council of War was now held, and finding it would be difficult to approach them, it was agreed to send out several partys to burn the reeds on the Sides of the Hills to prevent them from approaching unseen, or laying in ambush for any Stragling party. Heete-heete was appointed to this business, and in the mean time Ambasadors were sent to demand a Surrender, and a White Flag was hung out on board the Schooner and an(other) sent to be stuck up at about 2 miles distant. During the time the Hills were burning several Skirmishes took place between our party & theirs; but Heete-heete having the Musquet with him always repulsed them, and they were forced to retire to their Strong hold, as we did not approve of their destroying the Trees the partys were Calld in and placed to look out and Heete-heete always caused one or More of His party to Cry out 'alls Well' in the best Manner they Could pronounce it every half Hour on Notice being given on board the Schooner, for which purpose, we fixed one of the Hoops of the Ships Anchor stock to serve as a Bell, striking it with a hammer, and this was repeated by all who happened to be awake in the Camp, which together with Continual fires which were kept burning all night, served to shew the Enemy that we were always prepared for them.

In the Afternoon of the 29th we observed a White Flag coming down the Hill, and orders was given not to Molest any who came with it, and before Sunset the Chief Pohooataya with his Wife, attended by a Priest bearing the Flag, came to the Camp. A Council was now held of the Chiefs & Principal Men; when it was determined that peace should be made, on Condition that evry thing should be restored to the Young King; and that the Chiefs of Attahooroo should acknowledge him as their Sovereign. To all which Pohooataya agreed, & with His Wife Came on board the Schooner as hostages for the performance of his part. — but as several of the things were in posession of the other Chief T'towha, messengers were sent to Him to demand them, with orders to tell him if they were not produced in 24 Hours that He might expect no quarter. In the Night Came Burkett from Papaara, and told us what dispositions were made there, and We informd him how we intended to proceed if Tetowha was obstinate and having appointed the time for storming him on both sides Burkett return'd to Papaara. He inform'd us that Te'towha had, in their attack, been forced into the Mountains & had several killd & wounded.

31st. This Morning we were informd that Te'towha had pass'd by in the Night, and was gone to Oparre with the Royal Marro which he intended to present to the Young King in person, and hoped to get Peace by it alone without surrender-

ing the Morai &c. — as soon as we knew this, a Double Canoe was got ready, and Millward was sent to bring Him to the Schooner, which he did in the evening. — the same Day passd by Areepaeaa and Muspratt, from Papaara, they Calld on board, and Areepaeaa made each a present of a Hog & a piece of Cloth, and set forward to Oparre to get ready for us. When T'towha came on board, he seemd apprehensive that we intended to kill him, and made his fears known to Pohooataya, who Cheerd him up, telling him that he knew the English better, and that for Captain Cooks sake they would not suffer either of them to be killd. When we knew his fears we told him He should not be Hurted, telling him that Englishmen never used those ill who the Chance of War made their Prisoners; at which he seem'd easy, and promised that evry thing in his posession should be restored, and that He would submit to evry thing we demanded in favour of the Young King. — T'towha's friends soon Came after him to the Schooner, and he gave them Orders to go and Bring evry thing that belonged to the Morai; which they Obeyd. (pp. 103-106)

Thus it was that the proud and fierce Oropa'a fell before the combined forces of the Porionu'u and the Paparans, and their English supporters. On the basis of Morrison's description of the battles, the only one we possess, I am bound to conclude that they would have ended either in stalemate or in a victory for the Oropa'a had the English not been engaged. In view of the nature of Maohi politics the verbal promises of submission exacted from the Oropa'a chiefs would probably have been no more durable than the length of the Englishmen's stay on the island, but their obligation to transfer the Wallis *maro* and the Papara 'Oro image and associated objects from 'Utu'aimahurau to Pare constituted decisively tangible evidence of a shift in political strength. Thenceforth, the young Pomare II would have in his immediate possession two of Tahiti-Mo'orea's three most potent emblems of preeminent rank-status — the Tetupaia and Wallis *maro*, along with the principal receptacle of the god 'Oro, whose avatar was essential for validating the wearing of the Wallis *maro* and for transmitting the human offerings required to gain that god's fullest support. (In other words, whereas Pomare II had previously been required to travel to 'Utu'aimahurau to exercise his exclusive right, and duty, to officiate at offerings of human victims to 'Oro, he now was able to do so at Tarahoi.⁷ The transfer was carried out in short order, as were some other political dispositions resulting from the war:

On the 1st of October the Canoe bearing the Morai, Ark &c. — was brought and deliverd into charge of the Priests of Maatavye and Oparre; who proceeded with her directly to Oparre, and Orders were now given for the Fleet and Army to return home, when they accompanied the Sacred Canoe escorting it Carefully to Oparre, and in the afternoon a breeze springing up we Weighd, having Poeno & the Two Attahooroo Chiefs, and run up to Tettahah where we anchord for the Night, and weighd at 9 Next Morning the 2nd. here we were Joind by Burkett and Oammo^[8] who came to assist at the Peace and Worked up to Toa Roa harbour where we anchord in the afternoon where we landed the Chiefs and Went with them to the Morai, where the Peace was Concluded, and by our advice they

were continued in possession of their Land; and Paa, and Old Chief who was out of Commission, was put into the District of Tettahah as a Substitute for Mottooarro to whom it was voted, the Attahooroo Chiefs promised on their parts that they would always honor the Young King as their Sovereign, and by way of strengthening the Peace each of them took one of us as his Friend. Great feasting now took place a Volley of Small arms was fired on the occasion and all the Chiefs of Taheite Nooe or Substitutes for them attended. Much feasting now took place, & on the 4th we weighd and workd up to Maatavye, where we arrived by Noon. (Morrison 1935:106)

We learn from a later passage that a new temple was built adjacent to those already constituting the Tarahoi marae complex at Pare, for accomodating the 'Oro image, and so forth, brought from 'Utu'aimahurau (p. 116).⁹

The fact that the Oropa's chiefs, Te To'ofa "B" and Pahuetea, received such leniency, with respect to their lives and their lands, may have been due to the mutineers' counsel to the victors, but I suspect that it was also in tacit recognition of the likelihood that Pare and Papara would not have prevailed without the mutineers' assistance. Now and then in Maohi was noblesse oblige may have served to temper a victor's treatment of his helpless adversary, but such niceties were not ordinarily observed when the stakes were as high as in the conflicts now under consideration. The likelihood of Pare and Papara maintaining their advantage over the Pa'ea part of the Oropa'a was improved shortly thereafter by the death of Te To'ofa "B"; as noted earlier, having no heirs of his own this young chief was succeeded by the four-year-old son of his sister, who was made regent for him (Morrison 1935:107).

Another item of considerable interest in the passage just reproduced is the one regarding the chieftainship of Fa'a'a — that is, the victors replaced the incumbent, whoever he was, with Mahau, now the unchallenged chief of most of Mo'orea, and named a "retired" minor chief, Pa'a, as Mahau's locum tenens. Mahau's appointment to this office was, of course, the result of his close ties of affinity and political alliance with the Pomares; his claims to the office derived from his consanguineal ties with Fa'a'a's chiefly family — his father having been a younger brother of Te Pau "A" and he himself thus first cousin to Te Pau "B", who had evidently succumbed by this time.

It should be noted that in the campaign just concluded, the victors had depended upon their handful of English friends not only for firepower but for tactics and combat leadership as well.

Now that the trappings of highest rank-status and the principal avatar of supernatural efficacy were concentrated at Pare, it remained to use them to consolidate and perhaps even extend the newly won political authority and influence. An opportunity for doing so was provided by the formal inaugural rites still to be held for the young Pomare II. As a pre-

liminary to the main ceremony, the standard (*vane*) of the young *ari'i* was carried around the island, in order that each tribe's chief pay ritual obeisance to it, thereby expressing recognition of the young *ari'i*'s supremacy. As I indicated earlier, I am not certain whether this type of formal recognition referred only to the *vane* owner's rank-status or to his political paramountcy as well. In the present instance it probably was intended to refer to both. Morrison was visiting in Papara when the flag reached there.

While I was here the Young Kings Flag arrived, and was received by Tommaree and Conducted to His Morai, but they kept by the Beach close down in the Surf till those who Carried it were abreast of the Morai, when they turned short round and proceeded to the Morai — as the Flag passed, the Inhabitants hid themselves, and all Fires were put out — we attended them to the Morai, where Tommaree's priests having set the Flag up, made the Usual peace Offering of a Hog and a Plantain tree, the Priests repeated it and several young Pigs & Plantain Trees were Offered with long Harrangues and Tommaree made a long speech declaring Toonooeiateatooa to be his Chief, and ordered a feast to be provided for those who bore the Flag — this Flag was the Union Jack which they had got from Captain Cox, and was Slung a Cross the Staff with a stick in the labeling as we sling a Pendant, it was decorated with Feathers Breast Plates Tassels &c. — as the Chief People of the District were present, we honored the Ceremony by firing our Musquets, — which was received as an honor, and some of those who were present interpreted this into a declaration on our part to support it in Circumventing the Island, as it was Composed of English Colours, and they made no scruple to say that War would be instantly made on those who should attempt to stop it.

It was kept one Night in the Morai, during which time prayers were Constantly saying by one or other of the Priests which attended it; and when it proceeded they returned to the Water Side, where they had before been, & proceeded along by the edge of the Surf towards Tyarraboo. (1935:114-115)

The Captain Cox here referred to was skipper of the brig *Mercury*, which had called at Matavai some sixteen months previously. I do not know whether the Union Jack in question had been incorporated into young Pomare II's *vane* with the deliberate intent of symbolizing English support for the Pomares' pretensions, but it evidently was so interpreted.

From Papara Morrison went on to Tairapu, where he visited Pomare I (now going under the name of Mate) at the latter's residence in Afa'ahiti:

He [Mate] now informed us that the people of Tyarraboo had used him very uncivil, altho the Flag had been received, and passed with all the Ceremonies; which he said was only for fear of us and not their regard to His son. He told us that we had yet a right to chastise them for Killing Thompson, and said that if we once made our appearance in Arms in Tyarraboo they would never make any resistance and he would be at the Expence of the Amunition, that his Son might be Sole King, he also told us that he had conversed with Tommaree who was ready to furnish Men & Canoes when ever we thought proper to take it in hand.

Having told him that we would Consider of the Matter we signified our intention to go homeward. (p. 115)

Back at Pare Morrison found large numbers of people assembled to attend the approaching ceremony, including Mahau (of Mo'orea) and, in Morrison's words, "all the principal Men of the Island." The rites took place on February 13, 1791. (I reproduced this passage earlier but do so again because of its direct relevance to the events now under discussion.)

This day the Ceremony of Investing the Young King with the Marro Oora or Royal Sash took place; the Sash is of fine Network on which Red and Yellow Feathers are made fast, so as to cover the netting; the sash is about three yards long, and each end is divided into six tassels of Red Black & Yellow feathers, for each of which they have a name of some Spirit or Guardian Angel, that watches over the Young Chief while the Marro is in his Possession and is never worn but one day by any one King; it is then put into the Sacred Box and with a Hat or Shade for the Eyes Made of Wicker & Covered with feathe(r)s of the same kind and never used but on the Same occasion it is delivered to the priests, who put it Carefully by in the Sacred House on the Morai, where no person must touch it. (p. 116)

This was evidently the *maro* whose original section, at least, was introduced into the Pomare family by Pomare I's Ra'iatean mother, Tetupaia. I cannot vouch for Morrison's interpretation of the significance of the tassels; nor is there any direct evidence that I know of to support Gunson's suggestion that each tassel stood for each district over which Pomare II exercised "spiritual hegemony" (1964:57). But, to return to the ceremony itself:

This Ceremony was performed at Oparre on the New Morai which was built for the reception of the Movable Morai &c. which we had brought from Attahooroo and where these things were now kept. The Chiefs (or their Substitutes) of Tipperroonoo and Morea attended, and Toonoeaiteatooa the Young King being placed on the Morai, a Priest making a long Prayer put the Sash round his Waist and the Hat or Bonnet on his head & hailed him King of Taheite. Mottooarro then began by His Orator making a long Speech and acknowledging him his King, when three Human Victims were brought in and offered for Morea, the Priest of Mottooarro placing them with their head towards the Young King and with a long speech over each, he offered 3 Young Plantain trees. He then took an Eye out of each, with a Piece of split bamboo, and placing them on a leaf took a Young Plantain tree in one Hand, and the Eyes in the Other Made a long speech holding them up to the Young King, who sat above him with his mouth open: after he had ended his Speech & laid the Plantain trees before the Young King the Bodys were removed & buried by his priests in the Morai, and the Eyes put up with the Plantain trees on the Altar — the rest of the Chiefs then brought in their Sacrifices in the Same Manner, going through the like Ceremony, some bringing one Victim & Some two according to the bigness or extent of their districts, after which large Doves of Hogs and an immense quantity of other Provisions such as bread, Yams, Tarro, Plantains, Cocoa nuts &ca. were brought and presented to the Young King. Several large Canoes were also hauld up near the Morai on the sacred ground; these were dressd with several hundred fathoms of Cloth, Red Feathers, Breast plates &c. — all which were secured by the priests & Young Kings attendants — the Marro being now removed and taken Care of by the Priests, they all repaired to feasts

prepared for them, which lasted some weeks, the Number of Hogs destroyed on this occasion were beyond all conception, besides Turtle, Fish &c. &c. —

I enquired the Cause of the Eye being offered, and was thus informed. The King is the Head of the People for which reason the Head is sacred; the Eye being the most valuable part is the fittest to be offered, and the reason that the King sits with his Mouth open, is to let the Soul of the Sacrifice enter into his Soul, that he may be strengthened thereby, or that He may receive more strength of discernment from it, and they think that His Tutelar Deity or Guardian Angel presides to receive the Soul of the Sacrifice.

Several Large Hogs were placed upon the Altar and the Human sacrifices offered this day were 30, some of which had been killed near a Month.

These were the First that had been offered since our coming to the Island. (pp. 116-117)

The question of attendance at the ceremony is important, but it is not one that can be conclusively answered. In one place Morrison recorded that "all the principal Men of the Island" were assembled, but a few passages later he reported that "None of the Chiefs of Tyarraboo had assisted at the Ceremony of investing the Young King with the Royal Sash" (p. 117). In his description of the ceremony itself he mentioned as having attended only "The Chiefs (or their Substitutes) of Tipperroonoo [Te Porionu'u] and Morea." In other words, no specific mention is made one way or the other of representatives of Pa'ea, Puna'auia, Papara, Hitia'a, and so on, whose presence one would expect but cannot confirm.

In any case, the all too evident absence of representatives of Seaward Teva was received as additional grounds for waging war against that tribe, and plans were formulated accordingly, with the English now clearly taking the initiative in the whole affair:

Feb. 20, 1791: Arrived Mill ward and McIntosh who having settled the Matter relative to the War, we determined to put it into execution, as None of the Chiefs of Tyarraboo had assisted at the Ceremony of investing the Young King with the Royal sash. Tommaree had proposed to Make a Grand Feast, under Cover of which he Could have his Men and Canoes collected before he told them what he wanted them for, and by that means would prevent it from being blazed about — the English were to be there as partakers of the Feast, and when we were ready to attack them we could be in their Country before they knew what we were at, and by this means make an easy conquest. This appearing to us a very good plan, we agreed to prepare for it as fast as possible, and began to get things in order for Launching the Schooner; but from the Number of Visitors which daily came to see us, owing to the Number collected together in the two districts, we were not able to make any Progress, and it was the 1st of March before we Got her Launched. We filld the Water for Ballast and Stowd the Casks with Stones and Wood, we also got the Pork on board, masted and rigg'd the Vessel, but still kept our intentions a secret. (Morrison 1935:117-118)

But this ambitious undertaking, which would probably have removed all effective opposition to the Pomares for a while, never took place. The day after most of the Englishmen arrived in Papara to put the plan into

operation, a messenger appeared and announced the arrival in Matavai of H.M.S. *Pandora*, which had been sent to capture the mutineers and return them to England for trial.

Pandora remained at Tahiti until May 8, and then sailed homeward with the fourteen surviving mutineers, and Brown. Records of the stay are contained in reports of her commander, Captain Edward Edwards, and in a journal kept by the ship's surgeon, George Hamilton. The former account is terse and matter-of-fact; the latter is more detailed and entertaining,¹⁰ although much of it deserving of little credibility.

The passages from Edwards' reports most relevant to our present interests have to do with relations between Teri'irere-Temari'i and the Pomares. In Morrison's journal these relations were seen to be friendly and mutually supportive, with Teri'irere-Temari'i actually acknowledging Pomare II's supremacy, as exemplified in his reception of the latter's *vane*. But note Edwards' view of their relationship:

The next morning Lt. Hayward was sent with a party in the pinnace to join the party in the launch at Papara. I found the Otoo ready to furnish me with guides and to give me any other assistance in his power, but he had very little authority or influence in that part of the island where the pirates had taken refuge, and even his right to the sovereignty of the eastern part of the island had been recently disputed by Tamarie, one of the royal family. Under these circumstances I conceived the taking of the Otoo and the other chiefs attached to his interest into custody would alarm the faithful part of his subjects and operate to our disadvantage. I therefore satisfied myself with the assistance he offered and had in his power to give me, and I found means at different times to send presents to Tamarie (and invited him to come on board, which he promised to do, but never fulfilled his promise), and convinced him I had it in my power to lay his country in waste, which I imagined would be sufficient at least to make him withhold that support he hitherto, through policy, had occasionally given to the pirates in order to draw them to his interest and to strengthen his own party against the Otoo. (Edwards and Hamilton 1915:32)

Edwards' grasp of the political geography and structure of the island was superficial, to say the least, but there must have been some evidence for his view that Teri'irere-Temari'i was not in Pomare II's pocket at the time. Also, his suggestion that the hospitality of the former to the mutineers was based in part on a desire to separate them from Pomare II is characteristic enough of Maohi political tactics to be quite credible. Some Paparan partisanship seems also to have rubbed off onto surgeon Hamilton, who described Teri'irere-Temari'i as "the proper king of Otaheitee, the present family of Otoo being usurpers" (p. 102). Hamilton also picked up from some source a report that Teri'irere-Temari'i was with the help of the mutineers planning to attack the Pomares, when *Pandora* arrived and so brought an end to the enterprise. Many high-ranking Paparans of that era probably did indeed consider the Pomares to be "usurpers" (as Paparans continued to do

for several generations thereafter); and the proposed attack against Seaward Teva may indeed have included some hidden objectives designed to strengthen Teri'irere-Temari'i's cause vis-à-vis that of Pomare II. But these considerations do not require me to revise my earlier estimate of the Pomares' political position in early 1791 — that is, they were *primi inter pares* of Mo'orea and of Tahiti's larger peninsula, the only serious challenge to their paramountcy having come from Seaward Teva.

CHAPTER 29 *RANK VERSUS POWER*

AGGRANDIZEMENT BY KINSHIP

The next few years were to see an increase in the Pomares' political *potential*, mainly through the forming of new ties of kinship and the wider deployment of old ones. (I italicize *potential* since some of the individual, *interpersonal* relationships in question remained to be tested in terms of actual *intertribal* alignments.) During this period several European vessels visited Tahiti. H.M.S. *Discovery* and H.M.S. *Chatham* (Captain George Vancouver commanding) anchored at Matavai from the end of December 1791 to January 24, 1792. Vancouver himself had accompanied Cook during the latter's second and third voyages, and had some familiarity with the local scene; he devoted many pages in his journal to Tahiti and his stay there.¹

During February 1792, a small British whaler, the *Matilda* (Captain Weatherhead commanding), called briefly at Matavai for refreshments; then, after the vessel was wrecked on a Tuamotuan reef, Weatherhead and his crew managed to make it back to Tahiti, where they were plundered of their possessions but otherwise hospitably received. As far as I know none of the *Matilda's* company left a written account of their adventures on Tahiti.

During March 1792 two other small vessels, *Prince William Henry* and *Jenny* spent a few days at the island and took off some of *Matilda's* men — others choosing to remain. Again, no records of the visit are known to have been preserved.²

The next vessels to call at Tahiti were *Providence* and *Assistant*, under the command of Bligh, whose mission it was to obtain a new load of breadfruit as replacement for the one lost with H.M.S. *Bounty*. This expedition remained at the island from April 7 to mid-July 1792 (figs. 29-1 through 29-5) and left with the remaining members of *Matilda's* company, except six who chose to remain. Bligh's account of this stay is rendered more useful due to the knowledge he had gained on previous visits, but he persisted in viewing the island's politics with a "king" Pomare bias.³

Finally, in February 1793, the British storeship *Daedalus* (Captain New commanding) paid a short visit; she took off one of the *Matilda* survivors upon departure, but left behind a crew member, "Peter the Swede,"

who became a lifetime fixture of mixed influence on the island. No other European vessel was to arrive until March 1797, when the ship *Duff* put in with its company of hopeful but sadly misinformed missionaries — but that begins a new chapter in this era, and a new section of this history of it.

Up to the time of Bligh's departure, in July 1792, the most lasting instance of consolidation of the Pomares' influence outside Pare was their connections with Mo'orea. Although Pomare I had been disastrously dilatory about supporting Mahau against Mahine in terms of military action, the mutineers' arms and Hitihiti's leadership ultimately defeated Mahine's successor;⁴ and Mahau remained attached to Pomare I by double affinal bonds. Moreover, Pomare I and his two wives, along with his father and mother, spent more time on Mo'orea than on Tahiti. Finally, the interests of the two familial domains — Parean and Mo'orean⁵ — became merged, literally, upon the death of Mahau, which occurred in January 1792 during Vancouver's visit.⁶ Thereupon, the succession to tribal chieftainship passed to Mahau's four-year-old son, Tetuanui, whose mother was Pomare I's sister Auo. In addition, at about this time the young Pomare II became betrothed to Tetuanui's younger sister, who was thus his own first cousin Tarovahine.⁷

When the *Pandora* arrived in Tahiti on March 23, 1791 to capture the *Bounty* mutineers, she interrupted preparations for an attack against Seaward Teva designed to overcome that tribe's opposition to Pomare II. A few months later, in January 1792, Vancouver wrote the following about

Pomare II's younger brother, Teri'itapunui (who was about four years old at the time): "The youth ... had taken the name of *Whyeadooa* [Vehiatua], in consequence of his being the acknowledged sovereign of *Tiarabou*, under his brother *Otoo* [Pomare II]" (1801:273). Elsewhere, Vancouver added:

At this time [i.e., the successful overthrow of the Mahine regime in Mo'orea] *Whyeadooa* the king of *Tiarabou* died, leaving only a very distant relation to assume his name and government; who was by *Pomurrey* and his adherents obliged to relinquish all pretensions to such honours, and with the people of *Tiarabou* to acknowledge *Pomurrey's* youngest son as their chief, under the supreme authority of his eldest son *Otoo* [Pomare II]; which on their assenting to, the youth assumed the name of *Whyeadooa* as a necessary appendage to the government....

Urripiah [Ari'ipaea], the next brother to *Pomurrey*, having acquired the reputation of a great warrior, has taken up his residence on the borders of *Tiarabou*, to watch the conduct of those people in their allegiance to his nephew *Whyeadooa*; and on the least appearance of disaffection or revolt, to be at hand for pursuing such measures as may be required to bring them back to their obedience. (pp. 324-325)

It should be noted that during Vancouver's visit the newest Vehiatua — the four-year-old Teri'itapunui — resided at Pare with his older brother, Pomare II, and their nurse-attendants.

Aside from his failure to mention Churchill's brief reign as successor to Vehiatua III, Vancouver's reference to the succession having gone to a "distant relation" agrees with Morrison's report. Bligh, writing on May 8, 1792, added some corroborative details, but neither his nor any other account that I know of describes how Pomare I's supporters persuaded the Tairapuans to acknowledge young Pomare II's legitimacy, and hence his fairly weighty claims upon the office:

In my last Voyage I have given a particular account of the Principal Families of this Island ... From a connection in the female line, the present Otows Grandmother being Sister to the then King of Tiarraboo, his grand child is now become Erree of that place, the Heirs of Whaeaahtuah in the male line being extinct. — The late Whaeaahtuah whose Wife Tynah is now connected with, died without any Children, and on his death (since my last Voyage) Terreetapanooai Tynahs second Son was sent to Tiarraboo to be elected, or more properly, acknowledged Erree of that part of the Island.

The Tiarraboo People always insisted that Whaeaahtuah was Errerahigh of that Country, & Otoo Ereerahigh of the Western part of the Island, but all the Otoo family & connections, say there is only one Errerahigh — their power however has not marked any superiority over the Tiarraboo People since our time, and the present Terreetapanooai, has taken the Name of Whaeaahtuah. — We may date the birth of this Boy in the Year 1787 and his being acknowledged as Erree in 1790. (1792:144)

With reference to Bligh's assertion that the Tairapuans had acknowledged Teri'itapunui to be their *ari'i* in 1790, it will be recalled that the principal people of the district had indeed "received" Pomare II's *vane* during January

1791, when it made its circuit of the island, but that they had subsequently failed to “assist” at the investiture ceremony that followed, thereby providing the Pomares’ supporters with a cause (or at least a pretext) for preparing an attack upon them.

Summarizing this phase of the Pomare expansion one can say, then, that sometime between March and December 1791, some of the leaders of Seaward Teva were persuaded to recognize the Pare family’s claims to the Vehiatua kin-Title and its tribal perquisites. That this recognition was not universal, or wholehearted, is indicated by the circumstance that a constant watch had to be maintained, by Ari’ipaea, against too disruptive dissent.

Another direction in which the Pomare family appears to have extended its influence, and perhaps even coercive authority, was the large northern district of Ha’apaino’o. Like other tribal districts of northeastern Tahiti, Ha’apaino’o seems to have been linked with Pare-Arue by ties of alliance over a long period of time. But a passage in Vancouver indicates that something more solid than alliance now joined the two tribes; Vancouver referred to Ha’apaino’o as “... one of the districts belonging to Whytooa [Vaetua]” (1801:305), who was Pomare I’s second brother — after Ari’ipaea, and before Te Pau. This attribution was later confirmed, in connection with Pomare I’s efforts to recover the goods taken from the *Matilda* crew. No clue, however, is provided as to how Vaetua came to occupy the office of chief of this tribe — a largely absentee official, it should be noted, since Vaetua appears to have resided mostly in Pare, where he was charged with safeguarding the interests of his young nephew, Pomare II — Pomare I meanwhile having retired to Mo’orea.

But the Pomare pretensions did not stop at the boundaries of Tahiti and Mo’orea. While Vancouver was at Matavai, he was informed that young Pomare II was “supreme sovereign” of Huahine, and that he would eventually succeed to such offices in Ra’iatea and Taha’a as well. These pretensions involved two men who were at Pare at the time, the one visiting and the other evidently there to stay; the former was called by Vancouver “Matuarro,” the latter “Mowree.”

The appearance in the sources of another Matuarro (i.e., Vancouver’s “Matuarro”) constitutes one of those situations capable of reducing the ethnohistorian to utter despair. Vancouver distinguished between “Matooara Mahow,” the Mo’orean chief whose funeral he witnessed, and “Matuarro,” whom he described as *ari’i rahi* of Huahine:

In consequence of *Pomurrey’s* [Pomare I] connexion with *Mahow’s* family [i.e., Pomare I’s wife ‘Itia having been sister of this Mahau], his son *Otoo* [Pomare II] in right of his mother [i.e., ‘Itia] was acknowledged as the supreme sovereign of Huaheine; and *Matuarro* the king of that island, had consented to the superiority of *Otoo* [Pomare II] over him, as ‘Aree Maro Eoora’ [*ari’i maro ura*]; but that he *Matuarro* was ‘Aree de Hoi’ [*ar’i rahi*]. (1801:326)

I take this passage to mean that Pomare II was acknowledged in some quarters (notably by Huahine's tribal chief, Matuaro) as "supreme sovereign" of Huahine, but I am uncertain as to what Vancouver meant by the rest of the sentence, or what he meant by "sovereign." If Vancouver intended to convey that Pomare II's alleged "sovereignty" over Huahine came to him through his mother's connections there, then I must confess that I can find no specific genealogical evidence for such a connection. If on the other hand the writer was referring to Pomare I's mother (and Pomare II's grandmother), Tetupaia, then some such connection can of course be traced — for example, Tetupaia was second cousin to Mato, a former chief of Huahine; but even so I fail to see why this would have qualified Pomare II for "supreme sovereignty" over Huahine. Indeed, I suspect that this was another example of a European's confusion between rank-status and tribal chieftainship, and of the Pomares' efforts to trade on such confusion — or even to convert the former into the latter. As for the visiting Matuaro, described by Vancouver as an Arioi, and *ari'i rahi* of Huahine (p. 258), I suppose that his alleged acknowledgment of Pomare II's "supremacy" referred mainly if not solely to the latter's rank-status as a twice-over *maro-ura*-wearing kin-Titleholder.⁸

Vancouver's "Mowree" [Mauri] was probably none other than Ha'amanemane, whom we have met with before. About him Vancouver wrote:

Excepting the daughter of *Opoone* [Puni], who reigned over Bolabola, and its two neighbouring isles, we had now the presence of all the sovereigns of this group of islands. *Opoone* had formerly conquered and annexed the islands of Ulietea and Otaha to the government of Bolabola; but, on his death, the sovereignty of these islands had, in right of natural, or original succession, fallen to a chief whose name was *Mowree*. He was a shrewd sensible fellow, affected to be well acquainted with the English language, and certainly had acquired some words which be pronounced so as to be understood. He was a brother of *Pomurrey's* mother, was on a visit to the royal family here, and was by them treated with much respect and attention. (1801:278)

In Henry's reproduction of Mare's genealogy of the Pomares' Ra'iatean antecedents (1928:247ff.), the offspring of Tamatoa III are listed as follows:

by his first wife, Mai-he'a

1. Te-tu-paia (f), who married Teu and mothered Pomare I
2. Teri'i-na-vaho-roa (m)
3. Teri'i-tari'a (m)
4. Hapai-taha'a (f)

by his second wife, Te-hani

1. Te-moe-ha'a (m)

2. Ara-po (m)
3. Te-ha'ame'ame'a (f)
4. Vetea-ra'i Uuru (m)

Elsewhere in the sources both Terano (wife of Te Pau "B") and Te Pau (wife of Hitihiti), have also been identified as siblings of Tetupaia; whether these are the same as or additional to either of the above females, I cannot say, and I am in a similar quandary respecting Mauri-Ha'amanemane. My guess is that the latter was the Teri'i na Vaho Roa in the Mare genealogy, as he is described by Vancouver as having succeeded to his office by right of "natural or original succession," and as Teri'i na Vaho Roa was the eldest of Tamatoa III's sons.

Otoo, in right of his grandmother by his father's side, on the death of *Mowree* will claim the sovereignty of Ulietea and Otaha. *Mowree*, who is brother to *Pomurrey's* mother, is an Ereeoe of an advanced age. He seemed extremely fond of *Otoo*, and proud of his succeeding him in the government of those islands; saying, that, at present, there were two sovereigns, that "*Maw ta Tarta*," but when he should die then there would be but one, meaning *Otoo*. This expression, in its literal signification, means "*to eat the Man*;" the idea, however, which in this sense it is intended to convey, is to point out those, whose rank and authority entitle them to preside at human sacrifices; a power which at present is possessed only by *Mowree* and *Otoo*. (Vancouver 1801:327)

Evidently, having been "an Ereeoe of an advanced age," Ha'amanemane had had no offspring of his own, so was in a position to foster or otherwise designate someone to succeed him in his office; in this instance that person appears to have been Pomare II. As for the nature of that office, Vancouver went on to say that "... it does not appear that even *Mowree* himself has much influence in those islands [Ra'iatea and Taha'a], notwithstanding that he is their acknowledged sovereign" (p. 328). In other words, Ha'amanemane's preeminence, which he shared with Pomare II, consisted mainly of "presiding at human sacrifices," — a function associated with the holding of an 'Oro-sanctioned, feather-girdled kin-Title, and being only indirectly related to tribal authority.

As I recorded earlier Ha'amanemane had arrived in Tahiti in 1788, during the *Bounty's* stay at Matavai, and Bligh remarked upon his social eminence, calling him Tutaha, which name he evidently went by at the time. By 1792 Tutaha (Ha'amanemane, Mauri) had made an important place for himself in Pare:

Tomorrow Morning I am to have a sight of it [the tabernacle of an 'Oro image], and to hear prayers performed by Tootaha the Priest — This Man is a great Orator among them, and highly respected for his abilities, as well as being a Chief of consequence — he has always been the Prime Minister of Tynah [Pomare I], is their Oracle, and Historian of this Country, and possesses a great fund of hu-

mour — he is now called Hammenemanné, but was spoken of in my last Voyage by the Name of Tootaha — He is remarkable for speaking English, and could he write is capable of forming a vocabulary of near a thousand English Words. (Bligh 1792:135)

Ha'amanemane was also a distinguished Arioi, but his relevance to our present concern has to do with his alleged introduction of yet another set of insignia of 'Oro-sanctioned rank. According to Mare, Ha'amanemane brought with him to Tahiti the following: the *maro ura* named Teraipu Tata, the sunbonnet (*taumata*) named Te Ata o Tu, the fan (*tairu*) named Hotu, and some priests of 'Oro (Newbury 1967a:14). Later, in the proceedings that were conducted by French officials with the evident hope of establishing Pomare, and hence French, claims to the Leeward Islands, witnesses implied that Ha'amanemane bequeathed these items (which constituted his Ra'iatean inheritance) to the young Pomare II, who was probably his grandnephew and whom he also "adopted."

I do not know what to make of this statement. For example, was this *maro ura* in addition to the one already introduced by Tetupaia decades earlier and, if so, what ritual use was made of it thereafter? And, if Ha'amanemane did in fact introduce another 'Oro tabernacle (and 'Oro image), what was its relation to the Papara image removed to Tarahoi after the mutineers' war against Atehuru, in September 1790?

In any case, even though I cannot confirm from eyewitness accounts the introduction of these ritually important items, Ha'amanemane himself was indisputably there at the time, and through him the Pomares' social ambitions toward the Leeward Islands were undoubtedly nourished. In fact, through their combination of preeminent rank-status, other distinguished kinship connections, death of rivals, mutineer-achieved military successes, and English advocacy, the Pomares' political ambitions reached what in Maohi thinking was probably an entirely new scale, as witnessed in the following passage from Vancouver:

In consequence of the extensive dominion that has devolved upon this young monarch, he is not now distinguished by the title of *Aree de Hoi*, but by one which is considerably more eminent and comprehensive; since they say there may be many *Arees de Hoi*, but there can be but one *Aree Maro Eoora*; which means the chief of the red feathered *Maro*; and under which title, *Otoo's* authority is acknowledged in Otaheite, Morea, Mattea, Tetero, Tupea-mannoo, and Huaheine. But the people of Ulietea and Otaha, seem much averse to this submission; and it does not appear, that even *Mowree* himself has much influence in those islands, notwithstanding that he is their acknowledged sovereign. Since the death of *Opoony*, the government of the islands under his late authority appears to have been ill administered; the inhabitants having been very turbulent and much disposed to anarchy: and in consequence of the disinclination which the people of these islands have manifestd to subscribe to the supreme authority of *Otoo*, an expedition was in contemplation from Otaheite, to enforce the power of the *Aree Maro Eoora* over them, and little doubt was entertained of its success. Another favorite object was the annexing to *Otoo's*

present dominions by conquest, (for no right was set up) the islands of Bolabola, Mowrooa, and Tapi, which, since the death of *Opoony*, had been governed by his daughter, and were said, in a great measure, to have lost their former high reputation as a martial and warlike nation.

Pomurrey and his brothers having procured from the vessels which had lately visited Otaheite, several muskets and pistols, they considered themselves invincible; and the acquiring of new possessions for *Otoo*, now seemed to occupy the whole of their study and attention. They were extremely solicitous that I should contribute to their success by augmenting their number of firearms, and adding to their stock of ammunition. Of the latter I gave *Pomurrey* a small quantity; but of the former I had none to dispose of, even if I had seen no impropriety in complying with his request. Finding there was no prospect of increasing their armory, they requested that I would have the goodness to conquer the territories on which they meditated a descent, and having so done, to deliver them up to *Otoo*; and as an excuse for their subjugation, insisted that it was highly essential to the comfort and happiness of the people at large, that over the whole group of these islands there should be only one sovereign. On satisfying them that the islands in question were quite out of my route, and that I had no leisure for such an enterprize, *Pomurrey*, in the most earnest manner requested, that on my return to England I would, in his name, solicit his Majesty to order a ship with proper force to be immediately sent out, with directions, that if all those islands were not subjected to his power before her arrival, she was to conquer them for *Otoo*; who, he observed, I well knew would ever be a steady friend to King George and the English. This request was frequently repeated, and he did not fail to urge it in the most pressing manner at our parting. (1801:327-330)

An opportunity to learn how the facts of everyday political life corresponded to those grandiose political pretensions is presented by the *Matilda* incident.

THE *Matilda* INCIDENT

In February 1792, the crew of the English whaler *Matilda* made it back to Tahiti after their ship was wrecked in the Tuamotus. The captain and part of the ship's company left Tahiti in March aboard the *Jenny* and *Prince William Henry*, but the rest of the survivors were still on the island when Bligh arrived on April 7. Bligh described the incident:

[After their wreck] They proceeded fortunately [in their boat] to Maitea [Me'etia], & after a Nights rest and kind treatment, they Sailed for Otaheite on the 5 March. — On the next Night, by bad Weather, the Boats were separated, two arrived at Matavai, one at Oaitepeah, and the other round by Attahooroo. The People of Oaitepeah were too hostile to induce the Boat to remain with them, she therefore proceeded to Matavai and joined the Party that had got there before them. — Afterwards, in the course of eight Days, the Men who had landed at Attahooroo also came to join their Companions. — It however appeared so much the opinion of the Captain that they should not all remain at one place, that some resided at Matavai, some at Oparré, and some at Attahooroo. — They were all dispossessed of their Cloaths & Articles they had with them; but the greatest prize fell in the hands of the Matavai People, under the command of Poeeno the Chief, and one Tabyroo a Person of some power. — The circumstances no sooner became

known than Otoo demanded the Articles taken at Matavai, consisting of Money & Arms, in behalf (as he asserts) of his Friends the English; but no restitution was made. — some deliberation immediately took place, result of which was, that on the 19th March, War was proclaimed, and the Oparré People came to Matavai destroying Houses, & all the provision kind they could lay their Hands on. — The Matavians made very considerable resistance; still retain their Booty, and at this instant the Parties are violently at War with each other.

Notwithstanding our Countrymen were robbed of their Cloaths, they were treated afterwards with much kindness & attention, it would however have been better, if the whole had gone to Oparré under the protection of Otoo, and as there were three, at this time absent with the Matavians; the first step I took was to order them to join their Ship Mates.

The War was interrupted by the arrival of a Schooner called the Jenny from Bristol burthen 90 Tons. — This Vessel remained here untill the 31st March, when she Sailed for the NW Coast of America and by this opportunity Capt. Weatherhead with Two Boys and One Man, had the means of returning home. — He had one passenger more than he expected, a Seaman secretted himself on board & sailed with them as it is supposed, for he has not been heard of since.

While the Jenny remained here the Second Mate, — Campbell undertook to go away in one of the Whale Boats for Port Jackson. — It was fitted up in a miserable manner with Mat Sails, and himself with two Men, Phillip Christall & Jn. Basster sailed the same day.

The Number of Men now remaining on the Island are 21 including the Convict who has absented himself. — Among them is the Chief Mate, Surgeon, Boatswain & Carpenter. — The whole of them I directed to stay at Oparré where they are well taken care of. (1792: 125-125b)

The next episode in this war between Matavai and the Pomares' supporters from Pare took place on April 11:

In our return to the Ship I saw a multitude of Men on the low land of Matavai all Armed, preparing for an Attack on the Matavians who they had already driven from the Spot, and burnt all their Houses. The Afternoon produced the result of their determination. — The Oparré people drove the others to the Mountains, killed one Man, & returned victorious. — I have been solicited very much to join Otoo's Army, but I only promised to interfere should the Matavians attempt to go near Oparre, in which case I assured them I would land a Party of Men & drive them back, which gave great pleasure to our Oparré Friends. — I also sent the Surgeon of the Matilda to Poeno and Tabyroo, to order them to return the Captains effects, if they ever wished to be on good terms with us, & he brought me back Word from them, that everything would be returned. — The Surgeon informed me that he was conducted through an immense number of Men armed with Spears, Clubs & Slings, who appeared extremely anxious to know the Message he had brought, & if I intended to act against them. — They behaved with much decorum and some attention to the Chief who went with him; for the front of each army was so near to each other as to use their Slings, — hostilities ceased during the parley. — There Men when heaped together in such numbers armed with Spears 12 or 14 feet long or more, have a tremendous appearance, they nevertheless do very little mischief to each other, for I believe they seldom come to a serious charge, but content themselves with the execution they are able to effect by Slinging Stones, by which means some Men are Maimed and sometimes killed. (pp. 126b-127)

In due course the Matavaians were driven into the mountains, and Bligh sent emissaries to their leaders:

At day dawn I sent away Mr. Norris Surgeon of the Matilda with a Message from me to Poeeno & Tabyroo for Mr. Weatherheads Money, & some other articles that were in their possession, particularly the Musquets. — After a troublesome Walk of Six Miles he found Poeeno & Tabyroo at Wapyhanoo. — They received him in a very friendly manner and promised that the Money should be returned as soon as it could be got from Teturoah where they had sent it for security. — They refused to give up the Musquets, unless by mutual consent all those that were on the Island were to be given to me; — in that case they had no objection to comply; but in their present situation they could not think of it, as it was necessary for them to preserve some Means to regain their property, or to establish themselves in another situation. — They would do any thing to serve me, and hoped I would not be angry with them — it was the Mob, they said, had taken away the peoples Cloaths, and hauled the Boats on Shore — they endeavoured to restrain them, but could not. — If I came after them, they said, all that could be done, was for them to fly farther. — They called Matavai my Country, and described that the People of Oparré had destroyed all their Houses, Barked their Trees, destroyed what I had left among them, and done the Country irreparable injury. (p. 128b)

Soon thereafter Pomare I returned to Pare from Mo'orea, where he was then residing, and attempted to persuade Bligh to intervene more actively against the Matavaians and others:

Poeeno & the Matavai People seem to be objects of great dislike to Tynah and his Father, they requested I would undertake the War with them to destroy those People, as well as the Inhabitants of Paparah & Oaitepeeah, who had a number of musquets. — they knew it was an object worth their most strenuous endeavours to persuade me to, but they had the good sense not to be seriously offended at my refusal, when I told them it would interfere with the busyness I was sent on. — I however still threatened the adverse Party unless they brought in the Arms & Money, (pp. 129b-130)

So much for the Pomares' "supreme sovereignty" over Papara and Tairapu — not to speak of nearby Matavai!

On April 26 Bligh was able to report an end to hostilities, temporarily, at least:

Peace is established — Poeeno and Tynah have had a meeting, and it is agreed that Poeeno shall live again at Matavai. — They have promised to return C. Weatherhead's Money, but I am in doubt about their sincerity — I however dare not involve myself in any trouble with these People to get either one part of his property or the other, altho I will do my utmost to regain it by every fair Means I am capable of. (1792:136)

On May 4, however, the "peace" was disrupted again:

An account was brought me to day, that Poeeno and all his adherents had left Matavai and fled to Itteeah, the cause of this was owing to an attempt of Wydooah (the younger Bror. of Tynah) to seize on the Musquets, which Tabyroo had the charge of, and kept at a distance from Matavai. (p. 141b)

Meanwhile, Tapiru and Poeno implemented the return of all the money they and their people still held, but refused to give up the arms — this, in view of their knowledge of the Pomares, one can put down to their realistic desire for self-survival. Further insight is derived from a passage of Bligh's regarding relations between Pare and Papara:

Oreepyah, with his Nephew Otoo, (the King) & Hammennémanné came to take their leave of me on their going to Paparah to see their Relation Tomaree the Chief of that place, who lies very Ill and is expected to die; But their principal object is to see what can be done, to take away some Musquets which the People of that District are in possession of from the Seamen of the Matilda's Boat who put in there. Nothing can equal the rage these people have after Arms — there is nothing they would not sacrifice to procure them, but the Parties who have them in possession I believe are too wise to part with them. Could the Otoo Family get Arms I have no doubt but they would govern the whole Country, — a Right which they say is inherent in themselves.

Before they sat out on their expedition it was necessary to consult me. — Tynah therefore came with the party to give his interest for them to be so equipped with presents of different kinds, as would insure them a welcome reception.

I indulged him in the most he asked for, and they left us with light hearts, — dressed in European Clothes, and a large quantity of Iron Work and Trinkets in their bundles. (p. 145b)

Another event connected with the Pare-Matavai war occurred on June 19:

I was sorry to hear again of a human Sacrifice. — Iddeeah informed me that the Chiefs of Waennah (called Ohaaine in C. Cooks Map) had sent one to Otoo — I found it wrapt up in a platted Cocoa Nutt branch and Slung to a Pole as usual — it stunk very much, and on that account was hung up among the Bushes a part from any dwelling. — The late disturbance and War between Matavai and Oparré People was the cause of this Sacrifice — the People of Waennah took part with Matavai, and the offence was not to be forgiven but by this melancholy claim. — The absence of Otoo prevents any thing being done untill his return, when the Eye will be presented, and the Etuah supplicated to continue the friendship between the two Districts. (Bligh 1792:162)⁹

Bligh sailed on July 18, with Tapiru and Poeno still beyond reach of the Pare forces and with the *Matilda* loot still unreturned. How the affair was finally settled — if it ever was — we shall never learn.

OTHER CHANGES IN MAOHI LIFE

My emphasis in the foregoing chapters of this volume has been on political developments; let us now look at some parallel (and in part interdependent) developments which occurred in other domains of Maohi life. I begin with a trivial but highly indicative example, that of personal attire:

The quantity of Old Cloaths that has been left among these People is considerable. Any article of Dress they set the highest Value on. — they wear such rags and dirty things as are truly disgusting, and deform themselves in a very great

degree. — It is a rare thing to see a person dressed with a neat piece of Cloath, which formerly they had in abundance and wore with much ellegance. — Their general habiliments are now a dirty Shirt, and Old Coat, Jacket or an Old Wais-coat, so that they are no longer the clean Otaheiteans, but in appearance a set of Raggamuffins with whom it is necessary to have great caution in any intercourse with them. (Bligh 1792:134b)

According to Bligh and Vancouver these substitutions had extended to their basic tools and manufacturing processes:

So important are the various European implements, and other commodities, now become to the happiness and comfort of these islanders, that I cannot avoid reflecting with Captain Cook on the very deplorable condition to which these good people on a certainty must be reduced, should their communication with Europeans be ever at an end. The knowledge they have now acquired of the superiority and the supply with which they have been furnished of the more useful implements, have rendered these, and other European commodities, not only essentially necessary to their common comforts, but have made them regardless of their former tools and manufactures, which are now growing fast out of use, and, I may add, equally out of remembrance. Of this we had convincing proof in the few of their bone, or stone tools, or utensils, that were seen amongst them; those offered for sale were of rude workmanship, and of an inferior kind, solely intended for our market, to be purchased by way of curiosity. I am likewise well convinced, that, by a very small addition to their present stock of European cloth, the culture of their cloth plant, which now seems much neglected, will be intirely disregarded, and they will rely upon the precarious supply which may be obtained from accidental visitors, for this and many others of the most important requisites of social life.

Under these painful considerations, it manifestly appears that Europeans are bound by all the laws of humanity, regularly to furnish those wants which they alone have created; and to afford the inhabitants from time to time supplies of such important useful articles as have been already introduced, and which having excluded their own native manufactures, are, in most respects, become indispensably necessary to their whole œconomy of life: in return for which a valuable consideration would be received in provisions and refreshments, highly beneficial to the traders who may vist the Pacific Ocean.

The various manufactures in iron and in cloth have become so essentially requisite to their common concerns, that instead of these commodities being reduced in their value by the frequent visits of Europeans, or their supplies of food and refreshments being less plentiful in return, we were served with every article in the greatest profusion. Six hogsheads of very fine pork were cured; and had we been better provided with salt, we might have secured ten times that quantity; and sailed with a large supply for present use, which comprehended as many live hogs and vegetables, as we could find room to dispose of; the whole procured at least 200 per cent. cheaper than on any of Captain Cook's visits, notwithstanding the recent departure of the Pandora. (Vancouver 1801:332-334)¹⁰

I have forgot if I have taken notice of the loss of originality in the use, Among these People in a great measure, of their implements. It is now a rare thing to see them use any other than Iron Tools. In their natural State they used a peice of Bamboo for a Knife, a hard black Stone brought to a blunt edge for an hatchet, and a Splintered peice of the same for a Drill, and their teeth were always sufficient to clear a Cocoa Nutt of its Rind to give them food and drink.

But now they will do nothing without a Knife and a Hatchet. It is however very extraordinary altho they see the valuable Use of a Saw that they do not take to the use of them. They prize Needles and Scissars and even Pins they make Hooks of to take small Fish. (Bligh 1789:II, 63-64)

Vancouver, a perceptive visitor, also noted a radical change in military tactics:

Great alteration has taken place in the military operations of these people. On our first discovery of these islands their wars were principally of a maritime nature; but at present it should seem they were conducted in a very different manner. For although some of our gentlemen extended their excursions to a considerable distance, not a single war canoe was seen belonging to Otaheite. I had much conversation with *Urripiah* on this subject; from whom I learned, that in their late contests they had found them so unmanageable, particularly when the wind blew at all strong, that they had intirely given them up, and now carried on their enterprizes by land, using the larger sort of their common canoes, when their wars were offensive, to convey them to the place of their destination, which was generally effected under cover of the night, or in dark rainy weather. (1801:334-335)

In this connection the radically new tactics that the mutineers introduced, and by which they were able to dislodge the Atehurans from their mountain fortress should be recalled. As for firearms, the consequences of their introduction should by now be crystal clear, as seen, for example, by the military advantage they bestowed upon their fortunate owners, and by the extremes to which individuals would resort in order to obtain them. With his usual attention to detail, Bligh endeavored to compile a list of all the firearms known to be on the island at the time:

From the most authentick account I can get, I find the Otaheiteans have got from different Ships, Musquets &c as follows. —

Belonging to Oparre —	Musquets 8 - Pistols 5
At Oaitepeha	55
At Itteah	10
Attahooroo	05
Matavai	50
Paparrah	86
[?] one Swivel	Total 2721
	(1792:131)

Central, of course, was the change in the number of people involved in the political developments under study. As I indicated in chapter 2 the only eyewitness estimate we have relevant to the time span just considered is Morrison’s guess, made between 1789 and 1791, of 30,000 (1935:171), which according to my own “calculations” (if so pretentious a label may be given to my method of inference) would represent a diminution of the island’s population by about 5,000 from its size in 1767. If credence may be given to Maohi opinion expressed to Bligh, an even greater decline took

place as the result of an epidemic introduced, presumably, by Vancouver's expedition in 1791-1792. We cannot identify the disease this visitation is believed to have introduced, but the extent of its fatal consequences evidently left a deep impression even upon these inured people.¹¹

Before commencing with the next chronicled chapter in the Pomares' political career, I reproduce a passage from Vancouver characterizing some changes remarked by him in the personality of our principal character:

I cannot take leave of my friend, for to such an epithet from me *Pomurrey's* conduct justly entitles him, without adverting to the alteration which seemed to have taken place in his character, since my former visits to this country. At that time, he was not only considered as a timid, but a very weak prince; on this occasion, however, he did not appear deficient either in discernment, or intrepidity; although it must be acknowledged his fears were exceedingly awakened at the display of our fire-works, and that he always appeared to regard fire-arms with a considerable degree of terror; which possibly might arise from his knowledge of their destructive powers, whilst at the same time he remained ignorant of the extent to which they were capable of doing execution; but this description of weapons out of the question, we had reason to believe his courage was equal to that of his neighbours, of which he certainly gave an undeniable proof by joining our party alone and unarmed at the encampment; in direct opposition to the counsel and apprehensions of his surrounding countrymen. On former occasions, I had also considered his general character to be haughty, austere, and combined with much low cunning. When he condescended to speak, or converse, which was not frequent, little or no information could be derived; whilst the questions he asked in return, did not tend to the acquisition of useful knowledge. His conduct and deportment on the present occasion, were extremely different; and, when compared with that of his associates, were marked with an evident superiority, expressive of the exalted situation he filled; and indicated that he possessed a just knowledge of himself, and an open generous, and feeling heart. In conversation, there were few from whom better information could be acquired; nor was he now deficient in directing his observations and enquiries to useful and important objects. For this purpose only, he would remain whole days in our working tents, observing with the strictest attention the different transactions going forward; and frequently interrupting the mechanics, to require explanations of their several operations. The whole tenor of his behaviour towards us was so uniformly correct and meritorious, that, on his taking leave, I could not resist making him, and his wives, such acknowledgments in useful articles, as he conceived they could have no possible claim to; and suspecting I was about to make some addition, he caught my arm, expressed how highly repaid and gratified they were with what they had received, and observed, as I was going to visit many other countries where such things would be equally valuable; I ought to be careful and œconomical. (1801:330-332)

CHAPTER 30 *THE* *MISSIONARIES ARRIVE*

THE POLITICAL SITUATION IN 1797

On March 4, 1797 the British ship *Duff* (Captain James Wilson commanding) arrived at Tahiti intent on landing eighteen Englishmen and the wives of five of them, for the purpose of establishing a Protestant mission. (In addition, the *Duff* carried eleven other missionaries to establish missions in the Marquesas and Tonga islands.) As one can imagine, this event marked a new and wholly different kind of relationship between Maohis and Europeans. These “visitors” were there to stay, and they cherished the hope of revolutionizing almost every aspect of Maohi life. (Figs. 30-1, 30-2.) In fact, so different was this new breed of visitors from their predecessors, and in so many respects, that — as their chroniclers put it — the Tahitians “... profess hardly to know what we are, and suspect we are not Englishmen, or like any others they have seen who have ever visited their island” (Wilson 1799:156). In the course of time the Maohis came to discover that some of this new breed did not differ from other, less Calvinistic Europeans in their reactions to nubile and half-naked young women; but the majority of the missionaries abided by their moral code. Cook and some other earlier visitors had declined personal invitations to sample the charms of Tahitian women, but no previous set of visitors had prescribed this and other tenets of Calvinism as official policy.¹

The full story of the English missionary enterprise on Tahiti deserves a separate volume, which would look beyond the tragi-comedy of this preposterous confrontation and provide a deep and comprehensive analysis of its effects upon Maohi life. But I leave this task to others, and limit myself to indicating, as explicitly as possible, how the missionary presence influenced political developments.² Needless to say, years passed before the missionaries began to comprehend those developments; as time went by they acquired, by bitter experience, a much deeper knowledge of Maohi political structure than Cook or Bligh ever achieved, but this did not lead them

Note: In this chapter, unless otherwise indicated, page number only refers to Wilson 1799 and volume and page number refer to the LMS Transactions.

to revise their belief in the desirability, the ultimate *rightness*, of a monarchical form of government.

Perhaps the most useful way to open this new chapter in Maohi political history is by summarizing the changes that had taken place since Bligh's last visit in the situations of the island's principal personages.

In 1797 the arrival of the *Duff* found Pomare I, now in his mid-forties, living with Pepiri, "a very stout young woman," the daughter of a Papeuriri subchief. His second connubial partner, Vaiariti, was no longer with him, having "left him through dislike[,] for one of far inferior rank." (p. 73.) Meanwhile, 'Itia had long since ceased to share Pomare I's sleeping mat, and was living openly with one of her lower-class paramours. And while she had her own domestic establishments and was in fact a chiefly person in her own right, she continued to ally herself faithfully and energetically with Pomare I against his many ill-wishers.

Pomare I's next younger brother, Ari'ipaea, died a year or so prior to arrival of the *Duff*; his widow, Vahine Metua, was described as "chief over all Hedeah [Hitia'a]" (p. 190), and she also held sway over a small subdistrict of Ha'apaino'o, called "Whyripoo," said to have been presented to her by Vaetua, her late husband's brother (p. 185).

Vaetua himself continued in active authority over Ha'apaino'o, and resided mainly there. As for Pomare I's youngest brother, Te Pau "C", earlier described as having succeeded to the chieftainship of Fa'a'a, I find no mention of him under any identifiable name in missionary accounts.

Pomare I had two surviving sisters. No mention of Ari'ipaea Vahine, whose timely home visit in 1790 had helped overcome the Oropa'a, appears in the first missionary chronicles, so she may be assumed to have returned to Ra'iatea, or to have died. The other sister, Auo, the widow of Mo'orea's chief, Mahau, was found to be married to Mauroa, a petty chief, characterized as "a man of good sense and great authority" (p. 151). Auo herself was described as "presiding over" Teahono'o, the eastern subdivision of Matavai (Ha'apape?), but she and her husband resided also in Pare (p. 183).

At the time of the *Duff's* arrival, Pomare II was about sixteen or seventeen years old and living at Pare with his wife, Tetuanui, daughter of Auo and Mahau (and hence his first cousin), of about the same age. Both Pomare II and his young wife traveled on the shoulders of bearers when away from their own estates.³ Wilson characterized the couple as follows:

Otoo, the present king, is about seventeen, and very large limbed, promising to be of a size like his father. Though he is absolute, he lives in the greatest familiarity with the lowest of his subjects. He is differently represented: some say he looks solid, and of a thoughtful aspect; whilst others call him stupid, and his countenance vacant. His queen, Tetua, daughter of Wyreede, relict of Motuaro, is about his own age, and rather the larger of the two. Her countenance is pleasing and open, but masculine, and widened by the usual method of pressure, called touroome. (p. 321)

The king and queen were always attended by a number of men, as carriers, domestics, or favourites, who were *rāa*, or sacred, living without families, and attending only on the royal pair; and a worse set of men the whole island does not afford for thievery, plunder, and impurity, (pp. 321-322)

Although cohabiting, Pomare II and his wife were already seeking some of their sexual partners elsewhere, Pomare II being described as “given up to unnatural affections” (LMS Transactions: I, 122), and Tetuanui as being “a perfect Messalina,” living in “a promiscuous intercourse with all her porters” (p. 322).

Though the dwelling of Pomare II in Pare was characterized as “a very humble one,” the labels applied to everything about his situation reflected the preeminence of his rank-status:

The king’s title is *Otoo-noo-ey-te-Atooa*; the meaning of which we do not clearly understand, but as the word *Atooa* is used to express the object of worship, it is doubtless as full of arrogancy and pride as is possible. His house is called *Yowrye*, (clouds of heaven); his double canoe *Anooanooa*, (the rainbow); his manner of riding on the shoulders of an attendant *Mahowta*, (flying); his torch *Ooweera*, (lightning); and a drum that is frequently beating for his amusement *Pateere*, (thunder). (LMS Transactions:I, 121)

Other aspects of the young chief’s behavior will be discussed later on.

Teri’i na Vaho Roa, the younger son of Pomare I and ‘Itia, was found by the missionaries to be residing in Seaward Teva, where he was called *ari rahi*, bearing the Title Vehiatua (“V”). His wife was Tupu, younger daughter of Auo and Mahau (and hence sister of Pomare II’s wife, Tetuanui). Vehiatua V and Tupu resided in “Matowee,” or “Mattahwey” (Mata’oae?); how much actual authority — as distinct from rank-status — he exercised over the rest of the Seaward Teva is hard to say. His parents, Pomare I and ‘Itia, resided occasionally in nearby Teahupo’o.

Turning now to Temari’i-Teri’irere,⁴ chief of Papara, this individual, now approaching forty years of age, was generally conceded by the missionaries to be the island’s second most important chief. His wife at this time was “Tayreede” (Tairiti?), daughter of the chief of Papeuriri. When Teri’irere-Temari’i first visited the missionaries he was described as a “chief priest,” and either an “*atua*” or “*ta’ata no te atua*” (a god, or a god’s human — i.e., a shaman subject to long periods of possession by some god). Some time previously he had “adopted” Pomare II and, as we shall see, was the latter’s close friend and ally. (pp. 161-162)

As we thus see, most of the individuals playing important roles in the political developments of this decade had undergone some changes in their situations since Bligh’s departure in 1792, but none so much as Ha’amanemane, the *ari’i* priest, who had sought refuge on Tahiti in November 1788, after suffering political reversals on his home island of Ra’iatea. Even during Bligh’s last visit this elderly man had become the

island's high priest of 'Oro and Pomare I's principal political aide; in addition he is said to have "adopted" Pomare II, and bequeathed to him the various insignia, and so forth, symbolizing his Ra'iatean kin-Titles. Now, some five years later, Ha'amanemane was found to be identified more closely with Pomare II than with the latter's father, and to be embarked on a political career of his own. While he plotted to retrieve his authority in Ra'iatea, he seemed no less intent upon gaining some in Tahiti as well. The missionaries were informed that his influence rested on his effectiveness as priest (and sorcerer?).

His own power seems to depend on his priesthood: the poor natives say, "If we deny him any thing, he will pray to the Eatooa, and we shall die." We often, as far as our knowledge of the language will admit, enter into conversation with him respecting his notions of religion, and find him very bigoted in his opinions, concerning the gods of Otaheite, but from no other authority than, as he says, "my grandfather told my father, and my father told me." (LMS Transactions:I, 12)

Not the least of the old priest's characteristics was his physical vitality:

Nov. 23d. — Mannemanne, who, though nearly blind with age, is as libidinous now, as when thirty years younger; and, in order to gratify his lust, has frequently upwards of a dozen females with him, some of them apparently not above twelve or thirteen years of age; had to-day two of his concubines eloped from him; a great stir was made upon the occasion, and about three in the afternoon, near two hundred men and boys, armed with spears, clubs, and sticks, issued forth into the neighbourhood, to beat the bushes in search of the two women, but without finding them. (I, 88)

Although Ari'ipaea's widow, Vahine Metua, was characterized by Wilson as "chief over all Hedeah [Hitia'a]" (p. 190), the person who seems to have exercised that authority was one Teohu, whose relationship to Vahine Metua (or to anyone else) I have not succeeded in tracing.

From these and other fragments of information it is possible to essay some kind of political geography of Tahiti at the end of the eighteenth century. It will be found to be incomplete and in part less than credible — that is, since most of the information was obtained from the Pomares, or from individuals allied with them, some of it will be biased, if not actually wrong — but worth the effort anyway. We can begin with Seaward Teva, which in the recent past, at least, constituted a fairly unified tribe under the chieftainship of its line of Vehiatuas. In 1797, as we have seen, the individual who bore that Title was Pomare I's youngest son, Teri'i na Vaho Roa, who resided on the peninsula, without reported opposition from any of his "subjects"; but this appraisal might of course reflect lack of information rather than lack of any such opposition. In any case, when Pomare I was engaged in collecting objects for a ceremony to be held at Papara, the missionaries reported having seen "most of the chiefs of Tiaraboo" assembled with their contributions. (pp. 198-199)

In their survey of the peninsula's population, the missionaries listed twenty-one territorial subdivisions (including an uninhabited one) and the "chief" of each; among the latter are included Pomare I, 'Itia, and Ha'amanemane; but the other names listed resist identification (p. 199).

According to the missionaries, the chief of Vaiari was "Maahehanoo" (Ma'ahehanu?), a girl of about fifteen, whom I cannot otherwise identify. The same account has her "betrothed" to a youth of the same age named "Towha" (Te To'ofa), identified as son of another "Towha," whose identity I am unsure of.⁵ This young couple was said to have been under guardianship of a man named "Tootahah" (Tutaha), described as "having descended from the earees," but he was not otherwise identified.⁶

The missionaries named "Tayredhy" (Tairiti?) as current chief of Vaiururi (Papeuriri, Mataiea) and Atimaono, succeeding her father. As she was at the time married to Teri'irere-Temari'i it may be assumed that the long-standing political connections between these districts and Papara were still extant. (The then current state of the similarly long-standing connection between Papara and Vaiari was not specifically reported, but in the absence of contrary evidence one may assume that it also was extant.)

Papara was, of course, under the chieftainship of Teri'irere-Temari'i. As for the Oropa'a, the missionaries stated that "Attahooroo is divided into two or three departments, over which chiefs subordinate to Temarre preside" (p. 207). While it is true that the warlike residents of this large region had been defeated by the mutineers and other forces aligned with Pomare I and Teri'irere-Temari'i, I very much doubt that they had remained "subordinate" to either of the latter in the sense that the missionaries attached to that term. Their lack of leaders such as the former Te To'ofa and Puhuetea undoubtedly served to weaken their independence, but much of the old spirit was still alive. By 1797 the famous "Papara" image of 'Oro, which had been taken to Pare after the mutineers' victory in 1790, was again housed at Pa'ea's marae 'Utu'aimahurau.⁷ When and how it came to be returned there from Pare we do not know; the only reference I find to the transfer occurs in the missionary Jefferson's journal under the date of April 20, 1801: "We also hear that the ground of the quarrel between Pomerre &c. and the district of Attahooroo is, because some persons belonging to that district stole some time ago from Oparre the image of their great god O'oro and have secreted it..." (Jefferson, Journal, LMS Archives). As we shall see, the efforts by Pomare II to recover this immensely important object were a central element in island politics during the next few years.

At the time of the missionaries' survey in July 1797, Fa'a'a was listed as being under the chieftainship of Pomare I (p. 210). Previous reports had named Pomare I's youngest brother, Te Pau "C", as chief of this unit, but what his role was in 1797 — if indeed he were still alive — is not reported.

Pare-Arue were of course still the headquarters and the principal base of the Pomares, father and son, and many of their nearest kin also resided there. Ha'apape was also under Pomare's overall authority, but had its local subtribal chiefs as well.

Ha'apaiano'o came under the chiefly authority of Pomare I's brother, Vaetua, and while the latter was not openly opposed to his elder brother's interests, neither was he obediently aligned with them at all times.

At this point in history Tiarei and Mahaena were as usual somewhat aloof from political developments elsewhere, probably the result of their inaccessible situations and their thin populations. On those few occasions when they were drawn into the island's larger political conflicts they seem to have followed the lead of their larger neighbor Hitia'a.

The identity of the tribal leadership of Hitia'a is a puzzle. In one context the missionaries attributed the office to Ari'ipaea's widow, Vahine Metua, whose father had previously held authority there. This forceful woman did indeed maintain a residence and a retinue there, but three years later, when a confrontation occurred between Pomare II and Hitia'a, the chief of the latter was a man named Teohu, whose antecedents I am unable to identify.

Turning now to Mo'orea, there is no indication of a change having taken place in the political geography or chieftainship of that Pomare refuge. The unity of the island is suggested by a brief passage in Wilson, describing a visit there by some of the ship's company. Upon arrival at Uponohu they found a *rahui* in effect:

This rahoo is laid on by the chiefs to repair the desolations their inordinate feastings make, and is always religiously observed by the people. It seems that the whole island of Eimeo was at this time under this injunction, but at Otaheite it is only imposed on a few districts at one time, during which none of the residents dare sell a pig, or kill one for their own use. However, they may take hogs from those districts that are free, and use them as they please. (p. 83)

From the fact that Pomare I and 'Itia spent much of their time there, one may assume that its chieftainship was still in the hands of Mahau's (and Auo's) son, and that the latter's uncle, Pomare I, continued to exert a large measure of authority, or at least influence, there. (Ha'amanemane seems also to have used Mo'orea as an occasional residence, but he, of course, was closely identified with both the Pomares at the time [pp. 58-59].)

Finally, any summary of these Islands' political geography in 1797 must mention the existence of its handful of beachcombers. The Swedish Andrew Lind, then about thirty years old and formerly a member of *Matilda's* crew, had been in Tahiti since 1792. A second Swede, Peter Haggerstein, then about forty years old, had been there since 1793, when he was left by *Daedalus*. A third Swede, "John," also from the *Matilda*, spent some of his time on Mo'orea, and was considered by his compatriots to be insane.

SON AGAINST FATHER

In addition to its other lacunae, the résumé just given leaves unspecified the most fateful element of all in the political geography of Tahiti and Mo'orea — namely, the developing rivalry between Pomare I and his son and successor, Pomare II. It is impossible to discover when that rivalry overtly began. Perhaps it was just one more example of an inevitable, even habitual, consequence of the Maohi mode of kin-Title succession, wherein the trappings of the office devolved upon a Titleholder's successor at an early and fixed time, while the substance of any associated authority was transferred sometime later, and usually in steps that varied in magnitude and in timing according to factors of personality and situation.⁸ It may be that most or all such authority transfers involved a type of rivalry, and that the one between the Pomares, father and son, has attracted attention mainly because of the size of the stakes, and of course the illumination cast upon it by the European spectators.

The missionaries were in Tahiti for one year before they began to acknowledge how things stood between Pomare I and his son, but the signs were there all along. In a word, Pomare II's close friendship with Papara's chief, Teri'irere-Temari'i, stood in sharp contrast to the latter's avowed hostility toward Pomare I. And although the Ra'iatean Ha'amanemane maintained in public a friendly and more or less respectful relationship with Pomare I, he sought to undermine him in private — in contrast to his identity with the interests of Pomare II. (pp. 61, 206.)

The first time the missionaries saw most of these principal personages together was at Papara, in August 1797, after the *Duff* had departed for England. The occasion for this meeting was a *taurua*, a large-scale assembly held at Papara which included a human offering and presentations of food and other objects by the host to certain of the guests. The missionaries' description of this event is so sketchy that I cannot identify it specifically with any of the distinguishable types of large-scale assemblies characterized in previous chapters. The first reference to the event occurs in the *Duff* officers' account of their meeting with Pomare on Tairapu during July 1797:

When I asked him [Pomare I] his reasons for not going to Matavai, he answered, that at present he could not possibly go, it being a very busy time with him, having to collect canoes, cloth, hogs, &c. to give away among the different chiefs and arreoies, who would attend him to the great feast at Papparā, which was to take place in a few days, and for which all the island was looking up to him. This excuse I had reason to believe, for public care seemed engraven on his countenance. (p. 198)

A month later some missionaries saw Pomare I just prior to the assembly at Papara, where he was again preparing objects for distribution:

When we arrived at the habitation of Pomere, we found him busily employed in

superintending his servants in dying of cloth, it being customary for him to make large presents to the chiefs and Areeoies at the annual feast, which is near at hand, for which he has been making provision some time past. (LMS Transactions:I, 6)

The description of the occasion as an "annual feast" is puzzling, inasmuch as its timing, in mid-August, seems to distinguish it from the great plant-food ceremonies, which usually took place at the beginning and climax of food ripening, in December through January and in April through May. Nor does this occasion correspond to the periodic "intertribal" assemblies at which the flow of goods was from subject to chief. Indeed, Pomare I, the host of this particular occasion, seems to have been the principal donor, and the political-diplomatic emphasis of the event was heightened by another aspect of it: "... at this feast it is also customary to offer human sacrifices, and distribute the limbs of the victims to the populace, in the same manner as they do the cloth, the heads being deposited on the Morai, and the eyes presented to the young king [Pomare II]" (I, 6).

Evidently, the affair was sponsored and largely provisioned by Pomare I, to maintain and revalidate the rank-status of his successor, Pomare II. Why it was held at Papara, and not at Pare (Pomare I's own marae) or at 'Utu'aimahurau (where the principal 'Oro image then was) is not explained, but I suggest that it may have been done deliberately as a means of demonstrating Pomare II's ascendancy in this rival center of rank-based pre-eminence and political influence. One of the passages quoted above seems to imply that all the island's principal chiefs assembled for this occasion, but the only ones specifically named were Pomare, father and son, Teri'i na Vaho Roa (Pomare I's youngest son, the current Vehiatua), Teri'irere-Temari'i, and Ha'amanemane (whose presence was required to help officiate at the human sacrifices).

The two missionaries who attended this occasion (mainly in order to protest the human offerings) did not see the religious ceremony or the distribution of objects, but, more relevant to our interests, they were witness to a clash between Pomare I and Teri'irere-Temari'i, which they described in the following words:

On our arrival [at Teri'irere-Temari'i's residence], we were informed of a very awful and affecting circumstance having taken place: viz, that the servants of Temaree had killed a man; on enquiry, they informed us, that the man was a thief, that they caught him robbing the plantations of Yavva, and stoned him to death. We were desirous of knowing, if they had offered the man as a sacrifice to their Eatooa; the replied, no: that they had buried him, and that thieves should be punished. To this we could make no reply, being unable to inform them (for want of knowing their language) how to proceed in such cases. In the afternoon, several men from Tiaraboo came to Temaree, and seemed much displeased, on account of the man's being killed. In the evening, the natives who came with us from Matavai, being alone with the writer, informed him that it was very bad of Temaree to kill the man, who was no thief, but only came to ask for (or demand) the Yavva, being

a principal servant of Pomere, but that they were afraid to say much for fear of the images, or gods, which Temaree had in his house, who would come at night, when they were asleep, and kill them. I endeavoured to convince them their fears were groundless, but to no purpose, they told me, I might ask Peter, or John the Swede, if what they told me was not true. It growing dark we took some refreshment, and the writer engaged in prayer, after which he retired to rest, leaving brother Main in conversation with Temaree. In a short time we were alarmed with the cry of Tamai! Tamai! i.e., War! War! occasioned by a report that the people of Tiaraboo intended to attack Temaree in the night. (LMS Transactions:I, 6-7)

... the alarm of war having in some measure abated, the natives were quiet, and turned their attention to the Yavva, the juice of which is an antidote to all their cares and complaints. After breakfast I went to Pomere's house, where I was surrounded by many natives, who, thinking I was a friend to Temaree, looked very sternly at me; having their war weapons in their hands, and their turbans on their heads, their appearance was truly formidable. I remained at the house the whole of the night, but had but little rest, being often disturbed with the cry of war! Pomere slept with a spear by his side, and had a musqueteer to guard him. Having been preserved from danger through the night, the next morning I set off for Matavai, with orders from Pomere to inform the brethren there would be no war. Pomere advised me to go over the Isthmus, to avoid any ill-designing men among the opposite party, and make the best of my way home. (I, 7-8)

On August 22, Brother Main returned to Matavai and reported that the difference between Pomare I and Temari'i had been "amicably settled" — or so it appeared at the time.

At this early stage the missionaries were so preoccupied with their own personal and domestic problems, and so ignorant about the workings of Maohi society, that they have left us only brief glimpses of native political activity. For example, they recorded their participation in a ceremony held at the huge Pare assembly house, Nanu, but, besides describing a ritual episode suggestive of peacemaking and noting that it was attended by large numbers of persons, including Ariois, their account is uninformative. In their journal record for January 31, 1798, after describing the day's prayer service and the progress made on a new building is the following sentence: "We have, in some measure, been the happy means of preventing Pomere from going to war with the Teeahroa" (I, 25). And that is the only reference to what was probably a most critical episode!

On March 6, 1798, there began a series of incidents that was to bring to a climax, and a resolution, the rivalry between Pomare I and his son. As the missionaries themselves were directly involved, their reports, as preserved in the LMS Transactions, are somewhat fuller and more intelligible. On the date in question there arrived at Matavai a small vessel out of Macao; the *Nautilus* (Captain Bishop commanding) was headed toward South America to pick up sealskins. The ship was badly in need of food supplies, but as it had only muskets and powder to barter the missionaries provided food from their own stocks in exchange for the understanding that

no guns or ammunition would be left with the Maohis — a hoped-for assist for peace and security, which however turned out to be quite the reverse.

Inevitably, knowledge of the missionaries' maneuver became public, and the chiefs who had hoped to replenish their arsenals were resentful. This appears to have been particularly so of Pomare II, whose feelings were probably intensified by his irritation at the favored treatment characteristically accorded his father by the missionaries. The resentment finally culminated in an attack made on some missionaries at the end of March 1798. One morning, as four of them were returning home from Pare, where they had sought the help of Pomare I, his son, and Teri'irere-Temari'i in recovering some *Nautilus* seamen who had jumped ship, they were manhandled and relieved of their clothes by a gang of natives. The reaction of Pomare I (and 'Itia) to the affair seems to have been one of genuine surprise, regret, and annoyance. Pomare II also expressed his concern, but in a manner hollow enough to raise doubts even among the credulous missionaries.

The effect of this encounter upon the missionaries was electric. After putting themselves in a "posture of defense" they solemnly voted (after prayer) "that from the recent occurrence, and present appearance of things, a removal of the Society off the island seemed necessary" (I, 37). Four days later the *Nautilus* departed for Australia, carrying all but five of the unmarried missionaries, and all the married ones save Brother Nott and his wife (the latter having been considered either too infirm for the voyage, or too elderly to invite molestation). Those left on the island turned over most of their remaining goods to Pomare and 'Itia in order to be relieved of the risk of further injury to themselves by covetous natives. Pomare I's reactions to the attack were more forceful: "March 30th. Heard this morning that Pomere was avenging our cause, on some of the people of Opore, and that he had killed two, who either were the principals, or assisted in stripping the four misisonaries" (I, 42).

Two weeks later, word reached the remaining missionaries that the neighbors and relatives of the men killed by Pomare were determined to avenge their death and had declared war against both Pomare I and his son. Aroused by this challenge to their authority (the declared enemies were residents of Pare itself), the two chiefs descended upon their adversaries and drove them into the mountains, meanwhile burning forty to fifty of their houses and killing ten men and two women. According to the missionaries' tally, as reported in the LMS Transactions: "... with the two men killed before, and one that died of his wounds, make fifteen lives lost since the brethren were stripped of their clothes at Opore, and which was the foundation of this slaughter. We have not heard of any of Otoo's party being slain." (I, 49)

Much was to happen between the clothes stripping incident and the

missionaries' retrospective comprehension of it; but this will be described later on.

In July the remaining missionaries recorded a rumor that Teri'irere-Temari'i was about to make war against Matavai, but shortly thereafter a report reached them that the threatened attack had been called off as a result of Pomare I having made an atonement offering (*tarae hara*) to Teri'irere-Temari'i in the form of a live pig and a young plantain tree: "The cause of Temaree's anger, it is said, originated from some unbecoming jest that had been put upon one of his family. As we do not hear that the offence was given by Pomere, we cannot tell how he came to atone for it." (I, 54-55.) No further explanation is to be found for this puzzling episode, but it does serve to confirm that relations between Teri'irere-Temari'i and Pomare I were anything but friendly. However, the unfriendliness of the former was not to last very long.

On August 30, the missionaries were asked to hurry to Pare and minister medically to a person injured in a gunpowder explosion. On arriving there they found the patient to be none other than Teri'irere-Temari'i, who had burned himself critically while testing the effectiveness of some gunpowder acquired from a visiting vessel. Brother Broomhall, the "surgeon" among them, applied medicine to the wounded man's skin and returned to Matavai. On visiting the patient the next morning he found him in a worse condition, his body covered with a paste made of the scrapings of yams. Having suffered much pain from the missionary's previous medication, Teri'irere-Temari'i and his associates, including Pomare II, were ominously angry. After a threatening encounter with Pomare II the missionaries managed to reach home in Matavai, where Bromhall summed up their thoughts in the following words:

I thought the scene of March 26th [the stripping incident] was again about to be acted, only in a more tragic manner; inasmuch as the natives' suspicions then were small when compared with the present. At that time they suspected we had prevented captains Bishop and Simpson, of the Nautilus, from bartering with them for musquets; but *now* they believed we had cursed the medicine, that it might kill the patient, and *that* the greatest man on the island, he being closely allied with Otoo against his father and mother. (I, 77-78)

Pomare I appealed to the missionaries to treat Teri'irere-Temari'i with medicine that would cause no pain, but, as that was impossible, nothing further was done by the missionaries, who described the situation in a statement notable for its increased understanding of Maohi politics:

The king, queen, Pomere, Edea, Mannemanne, are to the westward, anxiously waiting the issue of the late calamitous visitation. We have reason to believe Orepiah's death would be the cause of great secret rejoicing to Pomere, Edea, and others, who seem to stand in much dread from the close union subsisting between

Otoo and Orepiah: the latter being the uncle of the former, has acted as a kind of guardian to him during his youthful days. Though the wheels of political government are not so many in this as in our native island, yet they are more in number than any would conceive from the rude and barbarous state the nation is in. They have their plots and court intrigues, their parties and partisans, as well here as in England; and they are as important in their way as in the most refined court of Europe. (I, 78-79)⁹

Teri'irere-Temari'i finally expired. While embalming and funeral proceedings were in progress Pomare I found it convenient to withdraw to Tetiaroa, and it was announced (presumably by Pomare II) that the corpse would be sent on a tour of the island, to receive the expressions of respect traditionally accorded the remains of individuals of such high rank-status and political power. The response to this announcement from Matavai was admirably candid — but fatally foolhardy: according to the missionaries it consisted of "... some improper expressions said to be uttered by Pomere's [the father] orator and others, concerning the corpse of Orepiah [i.e., Temari'i]; namely, that the king [Pomare II] should not bring the corpse of Orepiah to Matavai, but throw it into the sea" (I, 84).

The reaction of Pomare II to this insult to his late friend (and undoubtedly to himself) was swift and deadly. His forces swept through Matavai, driving out most of its inhabitants and killing four of them. The missionaries were again spared of any molestation, but this encounter between Pomare II and his father's closest supporters opened missionary eyes still further to the real issues involved:

Pomere is at the Motoo [Motu, i.e., Tetiaroa], ignorant of the transactions of the day. We have more than once had occasion to notice a disunion between Otoo and his father, and a strong attachment between the former and the deceased chief Orepiah. The providential destruction of Orepiah, though it has deprived Otoo of a powerful ally, may have nothing lessened his disaffection to his father: indeed, the occurrences of this day seem to be a proof it has not, or we suppose he would never have treated his father's friends as he has done, for the imprudent speech of one or more persons. Edea is in Opore indisposed with the rheumatism: how far she approves of her son's conduct we know not. The chief of Tiaraboo (Otoo's younger brother) threatened some time ago to make war upon Otoo; and we have some reason to apprehend there is a league formed between him and his father Pomere, and his uncle Vitua, against Otoo. Thus we see men are the same in Otaheite as in Europe, and other parts of the world: "their feet are swift to shed blood: destruction and misery are in their ways, and the way of peace have they not known." The ties of consanguinity are no more binding here than any where else where men have not the fear of God before their eyes. (I, 84)¹⁰

Such then was the line-up. Pomare I, 'Itia, Vaetua, and Teri'i na Vahoroa (now Vehiatua)¹¹ against Pomare II and the latter's chief counselor, Ha'amanemane. With Pomare I absent and taking the "cure" on Tetiaroa, Pomare II and Ha'amanemane moved swiftly to exploit their advantages:

A little after morning service we heard, that Otoo and Manemanne had usurped the power over all the larger peninsula, and turned Pomere out from exercising authority in any part of the same. The districts of Opare, Tataha, Attahooroo, Pappara, &c. (all the lands to the westward, and running round to the isthmus on the south) have declared for Otoo. The land of this district, from the river before us, to the eastern boundary, Otoo has given to Mannemanne, reserving the westernmost part for himself. If the districts on this side of the island, to the isthmus, shall refuse to acknowledge the sovereignty of Otoo, we are informed, war will be declared against them, and their submission extorted by force of arms. Something like this we expected, but did not imagine it would be put into execution so soon, since Temaree, who appeared to be at the head of the faction, was so suddenly cut off. Pomere's absence proved a favourable opportunity, and the indiscreet expressions of some of the inhabitants of this district, respecting the corpse of Temaree, the cause of embracing it. Not long after our settling on the island, we were told of there being two parties, that were meditating the destruction of each other; hence arose the great eagerness of the chiefs to get musquets and ammunition into their hands, from every vessel that has touched here; as also the desire of encouraging seamen to quit their ships, and reside among them: knowing, by former experience, one musqueteer is sufficient to terrify many natives armed with clubs and spears. The Swede and seamen are on Otoo and Mannemanne's side; so that, judging after the manner of men, and forming our conjectures from human reason and probability, we suppose the king and his party will carry all before them. (I, 85)

Vaetua remained in Ha'apai'no'o in a state of siege, with too few forces to counter his nephew's moves:

The two brethren found Vitua encompassed with a few adherents, the greatest part of his people being fled beyond the reach of supposed danger. The chief behaved with his accustomed civility. Vitua appeared much incensed against Manemanne (perhaps he considers him as the principal instigator of the king to the present disturbance) and was preparing to send off a canoe to Tatoroa, to inform Pomere of all particulars, and excite him to come and revenge his cause. But, it is probable, Pomere will not do this; it is said, he is personally a great coward; and as Otoo and Manemanne have the three Europeans with musquets (the very sight of which strikes terror in every breast) on their side, it is likely he will quietly submit to what is done, till a more favourable opportunity occurs. (I, 87)

True to expectations, Pomare I sent word from Tetiaroa ceding authority over Matavai to Pomare II (including access to the goods which had been turned over to him by the missionaries), and even 'Itia appeared to reconcile herself with the new turn of events, and was "upon the whole ... sociable with her son" (I, 89). At the moment, then, peace seemed secured, with Pomare II and Ha'amanemane wholly successful.

But within the week rumors reached the missionaries that Tairapu, Ha'apai'ano'o, and rest of Aharoa were determined to war against Pomare II and Ha'amanemane — in the midst of which there came the news that Ha'amanemane himself had been slain. On the heels of this, 'Itia arrived at the missionary settlement to announce that the threatened war would not take place:

Edea came to brother Eyre's door (she had a cartouch box buckled round her waist, a musquet, she had been seen with in her hand a little before, was now laid aside) with a settled air of triumph on her brow, she shook hands in a friendly manner with the Swede, saying unto him, "It is all over"; meaning the war, and retired immediately to the point. (I, 90)

Two days later, the missionaries learned what had transpired:

Heard Edea was gone to Opare, upon the horrible business of sacrificing a relation of Mannemanne's to her devil god. The prevailing account of Mannemanne's death is this: Pomere sent word in a private manner, to Edea, to have him killed. Edea went twice or thrice to Otoo, to draw him to consent to his death; at first he was unwilling, but at length yielded, and assented to the desire of his father and mother. Early yesterday morning Mannemanne set off for Opare, and was followed by Fareroa, the man Edea cohabits with, and one of the Sandwich islanders; they overtook the old priest at the bottom of One-tree-hill, on the west side, and after a little conversation with him, Fare-roa smote him on the head with a stone. (I, 91-92)

The end of Ha'amanemane called forth from the missionaries a résumé of the island's recent political history, which deserves quotation in full:

Mannemanne was a native of Oryateea, of which island he was once chief, but his subjects revolting expelled him the island. He then sought shelter on Otaheite, and obtained it, and has here exercised the office of chief priest for many years; under this character he has been guilty of much slaughter, shedding torrents of human blood in sacrifice to abominable idols and devils. He was esteemed, by all ranks, as a man of great knowledge, so that it was thought he had not his equal on the island. It appears, a jealousy has long subsisted between the deceased and Edea and Pomere, upon what account we know not. Pomere seemed to stand in fear of the priest (who was related to him) and had a kind of persuasion respecting him, similar to that the king of Moab had of Balaam, namely 'Whom he blessed was blessed, and whom he cursed was cursed.' Many were led away with the delusion that Mannemanne had great influence with their gods. It is evident to us, the casting out Pomere from having any power, driving out the inhabitants of the district, and dividing it between Otoo and himself, were projected and chiefly effected through the instrumentality of the priest; and for which, some of us thought, he would draw upon himself what he really has. Mannemanne, though far advanced in years, and almost blind, was, notwithstanding, very active and full of animal spirits; he was always attended with many females, as before observed, who only stayed with him while he could gratify them with gifts. Whether Mannemanne had any foresight of the gathering storm, that was to crush him, and wanted to avoid it, or whether he thought he was now near the time of putting a long devised plan into execution, (and for which purpose, the obtaining of musquets, and making friends with Europeans, for their assistance, were his constant arms) for regaining the chiefship of his native country, we cannot tell, but a small vessel, of about twenty tons, was to be equipped with all expedition, with which he, and the three Europeans, were going with haste off the island. And early on last Sabbath morning, Mannemanne went into brother Eyre's apartment, as soon as he was up, to beg an axe; brother Eyre informed him it was our Sabbath, and that we did not meddle with such things on that day. With this reply he was satisfied, and said no more. He then groped his way to the bed (sister Eyre being asleep) and began to feel the curtains, and to measure them with his arms, in their length and

depth: brother Eyre observing him, conceived he wanted them for sails to his boat. Having satisfied his curiosity he retired from the room, and never entered it more. The old man's conduct toward us has always been friendly, and free from that deceit which others have practised, but he was a perpetual beggar. What may follow the late judgment we know not, every thing at present looks very dreary. (I, 92-93)

Their appraisal of Pomare II's role in the recent events was perhaps just as realistic:

The conduct of Otoo, in consenting to the death of Mannemanne, at the time he was in close alliance with him, opens the character of the man in a conspicuous manner, and confirms us in a suspicion we have long entertained, but knew not how to account for, concerning the stripping of brothers Broomhall, Jefferson, Main, and W. Puckey, at Opare. When that circumstance took place we seemed assured it was done by the king's authority, but when Otoo afterwards joined his father in punishing the poor people for the same, we could not readily reconcile his authorizing the action and then destroying those that did it. But we had seen so much of him since, that we believe he is capable of committing any wickedness the devil, his carnal mind, and blood-thirsty followers may excite him to, if God did not restrain him; we therefore think the true cause of that event was this, Temaree, the foster-father of Otoo, was in close connection with him, and clearly appeared to be meditating some great blow, by which they would exclude every other person from having authority on the island but themselves and followers. To effect this they were extremely desirous to get into their hands musquets and ammunition. When the bark *Nautilus* arrived, finding that she had a large quantity of these articles on board, but that they were deterred from obtaining them through our interference, they were offended, and determined to be revenged. Accordingly, when the *Nautilus* arrived the second time, and the two seamen escaped from her, and took refuge with Otoo, and the four brethren were dispatched with an endeavour to recover them, the king, thinking it a favourable opportunity to execute his revenge upon the society, secretly gave orders for their being plundered. Otoo and Temaree, though powerful, were not sufficiently strong at the time to oppose Pomere, who shewed displeasure at what was done; and though, no doubt, he was acquainted with the true authors of the action, yet from prudent motives, it may be, vented his anger upon the instruments rather than the movers of them; while Otoo and Temaree, to hide their crime, joined Pomere in so doing. What wicked policy! (I, 93)

The announcement of a peaceful settlement to this whole affair was, characteristically, quite premature. Pomare I and 'Itia appeared to remain reconciled to the new dispensation, and the inhabitants of Matavai returned home after due expression of subservience to Pomare II; but some local skirmishing continued between Tairapuans and Teri'irere-Temari'i's former supporters in Vaiari. Meanwhile, the whole area from Ha'apape to the isthmus served as a refuge for enemies of Pomare II, and reports reached the missionaries that Atehuru and even Papara were "... in great confusion among themselves." In fact, the situation reached a point so unsettled that the missionaries were moved to report: "It appears upon the whole, the inhabitants of the island do not know what they are doing, or what they would be at." (I, 95.)

Nothing however developed from these alarms — not immediately at least — and when Pomare I finally returned from Tetiaroa six months later the island was enjoying what the missionaries earlier called “a great degree of outward peace,” and father and son met with mutual displays of amity (I, 115, 123). Meanwhile Pomare II’s everyday behavior reached heights of arbitrary arrogance, which even the long-suffering missionaries remarked to be extreme.¹²

“DISAFFECTION OF THE COMMONALITY”

The reconciliation between Pomare II and his father was followed almost immediately by signs of hostility toward both of them. As usual, the center of opposition was Atehuru, where someone had burned the house of Peter the Swede, and thereby issued a challenge to the latter’s protectors, the Pomares, that they could not ignore. The cause of the impending war, as represented to the missionaries, was “... that the inhabitants of that district have resented the tyrannical and oppressive conduct of the chiefs [i.e., the Pomares], who exercise, with an high hand, their authority over those subject to their power.” (LMS Transactions:I, 143)

As an indispensable move in preparing for war the Pomares stepped up their human offerings to ‘Oro; the fact that the god’s principal image was in Atehuru (i.e., at ‘Utu’aimahurau, Pa’ea) seems to have induced the Pomares to offer an increased number of propitiating sacrifices to it:

Heard that five human sacrifices have, within a few days, been brought over from Eimeo, to this island — Also that many of the inhabitants of Opore (of the poorest sort), have fled to the mountains, to avoid being seized for human sacrifices ... It appears that these things are preparations for the proposed war, and that Pomere is doing what other blind heathens have done before him, labouring to bribe his idol-god to be propitious to him, and to forsake the district of Attahooroo. (I, 143)

Within a few days, the number of human offerings had exceeded ten, Pomare I having demanded some from each district believed to be loyal to him and his son (I, 145).

In the midst of these preparations the missionaries received assurances from Pomare I regarding their own safety; the direct bearing of this message on the subject of this chapter warrants quoting it:

Nov. 30th ... About noon, Michael Donald [a beached seaman in Pomare I’s retinue] came to us from Pomere, the purport of whose message was, that we should be under no fear of danger to our persons, that we should consider *him* as our protector, and that he considered *us*, by the property we had put into his hands, as his protector (that is, we apprehend, Pomere considers his power and authority, and consequently his safety, greatly augmented and established, by the vast addition of wealth he has derived from us). (I, 153)¹³

Meanwhile European vessels began to call at Tahiti (usually Matavai) with increasing frequency: the *Betsey* (and a Spanish prize) in December

1799 and the *Eliza* in January 1800. From these vessels the Pomares were able to add to their European manpower and to increase their arsenals, including an "eighteen pound carronade, ... several muskets, and a great deal of ammunition" (I, 169).

But Atehuru, and now Papara, continued to threaten the Pomares, and Hitia'a served as a base for the latter's enemies. Even within their own home district of Pare, Pomare I and 'Itia were, according to the missionaries, "... so much afraid as to have a guard around them at night" (I, 201). In October 1800, Pomare I summed up the current situation in a statement of remarkable candor:

To-day the chief, &c. visited us. In a conversation a brother had with Pomere, the chief gave him to understand, that there is a probability of war upon the island, but not directly. He did not seem to know who were his friends, or who his foes, but acknowledged the general desire of the people is a suppression of a monarchical form of Government, and the re-establishment of independency in each district. It was observed to him, that the arbitrary proceedings of Otoo, were probably the cause of the present discontent. He did not deny it. Pomere wished much for a ship of war to arrive, which he supposed, by an interference in his favour, would restore tranquility, and confirm his and his son's authority. Or if a number of Englishmen like ourselves were to join us, and continue their residence among them in the manner we have done, he said, he was sure there would be no war. (I, 202-203)

Similar sentiments were expressed by Pomare at the beginning of 1801 in a letter to Philip King, Governor of New South Wales:

May it please your Excellency,

Your letter and present I kindly accept. I love king George and his subjects, and will, while I live, be a protector to those of them who put themselves under my care; but I must tell your excellency, I at this time stand in fear of the commonality, many of them being disaffected towards me, and their disaffection, I fear, is encouraged by some seamen who are on the island; and therefore I wish your excellency to present me with a few fire-arms, whereby my authority may be maintained, and the peace of my kingdom preserved. (I, 213-214)

Despite all these preparations for war, formal visiting continued between the chiefly adversaries, including some solemn (and obviously hollow) peacemaking ceremonies. One such meeting was held at Pare during 1801, attended by all the island's principal chiefs and probably most of its fighting men as well. I cannot discover the declared purpose of this meeting, nor can I fathom the Pomares' private reasons for holding it and thereby bringing so many of their enemies to their own district. In any case, the meeting appears to have gone well for the Pomares, as the result of two episodes. The first was the arrival in June of the *Porpoise*, an armed vessel from Port Jackson, with gifts and a letter to Pomare I, which were presented with an impressive show of military ceremony and force.¹⁴ In commenting on this event the missionaries wrote:

By intelligence that we have received, it seems that the arrival of the Porpoise is a very providential interference, as the affairs of this country were brought to such a crisis, that a few days, if not hours, would have either dethroned Otoo, or established him in his authority; this could not have been done without much bloodshed, the effusion of which, we hope, is now stopped, and Otoo and family will be permitted to retain quiet possession of their dignity. The Lord does all things well. (I, 229n)

The second advantage secured to the Pomares during this lengthy meeting was the death, at Pare in August, of Teohu, chief of Hitia'a. Teohu had been the Pomares' most outspoken opponent, and his district had been a rallying place for dissidents from elsewhere. He had brought with him to the meeting a formidable force of his own, augmented by the fighting forces of Mahaena and Tiarei, who seem to have accepted his leadership. Teohu appears to have been sufficiently constrained by the show of English support for the Pomares to have concluded a peace settlement with the latter (the terms of which are, however, not clear), but he still constituted a threat. Recognizing this, the Pomares made plans to kill him immediately after the "peace" ceremony, but he saved them the trouble by dying of illness instead.

The Pomares' position received additional strengthening with the arrival, in July 1801, of another contingent of English missionaries together with another supply of goods which, in the nature of things, would eventually in large part find their way into the Pomares' hands (Newbury 1961:32ff.).

On December 12 of that year the climactic session of the greatly heralded meeting took place at Pare; unfortunately for the historian of that crucial period, the information about its proceedings is limited to the following terse entry in a missionary chronicle: "Decr 12th it was said the meeting was to commence five of the misss went down to Pare, to see how things were likely to turn out, and in the evening returned with the good news that the great meeting was likely to terminate peaceably" (Newbury 1961:41).¹⁵

Characteristically however, within a month a missionary historian had to report that war alarms had been renewed. The general cause of dissension continued to be the widespread hostility to the Pomares' arrogance and pretensions. And on their side, the Pomares — and particularly the son — continued to press the Oropa'a to give up the "Papara" image of 'Oro, which the latter had held on to, perhaps viewing it as the one remaining check to Pomare II's ambition for absolute power.

This raises again the question concerning the advantages accruing from actual physical possession of this particular image of 'Oro. Because of the deep and widespread faith that seems to have been entertained about 'Oro's decisive effectiveness in warfare, this issue evidently had immensely important political implications. Over the course of time it seems to have become

the principal, or perhaps even the *sole*, 'Oro image of Tahiti-Mo'orea into which the great god could be induced to enter — at least, for the purpose of receiving human offerings. Along with this, however, there appeared to be a generally accepted and widely honored agreement concerning the *supra-tribal* status of the god — that is, even in time of intertribal tensions the tribe within whose boundaries the image happened to be lodged usually permitted potential enemies access to it. On the other hand, in view of the efforts made to obtain, or maintain, physical possession of the image, one must infer that there were additional advantages in actually having it, either in terms of prestige, or easier physical access, or both. As we shall see, the Pomares were allowed access to it at 'Utu'aimahurau even during a period of extreme tension; perhaps their enemies suspected, with good grounds, that a similar right of access would not be extended to them if the image were in Pomare hands.

THE IMAGE OF 'ORO

In March 1802 the Pomares and a large force of their followers went to 'Utu'aimahurau, ostensibly to present human and other offerings to 'Oro, but evidently also to negotiate further concerning physical possession of the god's image. The missionaries who witnessed these events gave the following account of them:

Tuesday, March 30. Left Hafaena, and came on to Attāhooroo, near the place where the ceremony is held, which commenced this day. Passed the great Marrai: saw several large hogs upon the altar, and several human sacrifices hanging on the trees. When we arrived at the meeting the ceremony for the day was over. Pomarre was offering as a present five or six large hogs to their great god Ooro on board a sacred canoe on which the ark or residence of Ooro is placed. Informed Pomarre that Jehovah is the true God; and there is none else; that hogs are not acceptable to him, that he is offended at them for killing men, and that Jesus Christ is the only atonement for sin. He was also told that Christ would come to raise the dead, judge the world, and turn the disobedient into the fire. At first the Chief seemed rather unwilling to hear, but those around him continued the conversation by asking questions, and at length Pomarre said, that he would attend to our religion.

Wednesday, March 31. This forenoon a strange heathenish ceremony was performed on the beach. Their great god Ooro was laid upon a long stool covered with cloth, and the king, with several of the priests were sitting by, praying or chanting something to Ooro which we could not understand. They seemed to keep time with their drums and conck-shells. The natives stood so as to form a circle round the idol, to which several of them were exposing themselves in the most shameful manner, and every now and then calling out "Māévā-aré." This continued several hours, during which time a native, who pretended to be inspired by Ooro, was seen, with the most strained distortions of countenance and limbs, giving them directions for their future proceedings.

Thursday, April 1. This morning the fleet moved down to the Great Marrai, where several large canoes were hauled on shore with great quantities of cloth upon them for a present to Ooro. The fleet kept about one hundred yards from the

shore, while the priests were performing prayers in the Marrai, with the king and their god Ooro; the drums beating as yesterday. This continued some hours, and then orders being given, all the fleet shouted, saying, "Māévä-aré, Māévä-aré." After this, Ooro was carried upon mens' shoulders backwards and forwards along the beach, some of the natives running before the throng exposing themselves, and calling out as above, the fleet answering them in the same manner. After this a council was called, and Pomarre, with the king, and all the principal rātērā's met in the Marrai. The people of Attāhooroo sat on one side of the ring, and the king and Pomarre on the other, and the orators on each side spoke by turns. The purport of the meeting was to consult upon the manner how they should proceed in what they had to do. The king, after the people of Attāhooroo had refused to give up Ooro, who was in their possession, spoke himself, and demanded him. He was answered immediately by their orators in the negative. Pomarre then addressed himself to his son the king, in behalf of the Attāhooroo people, and requested him to yield to them, and suffer them to keep the god, as it seemed that they did not wish to keep him long, but only till a certain ceremony was performed. The king then directed his speech again to the Attāhooroo people and said, it should not be as his father had requested, and insisted upon their delivering up the god directly: But he was still refused. After asking a long time, he rose up in anger, and ordered all his party that were present to draw back. Immediately the cloth upon the canoes was plundered, and a number of the king's people took hold of Ooro and rescued him from the hands of the Attāhooroo people and ran to the sea side. It was then expected that the Attāhoorooans would pursue to take Ooro from them again, and so war thereby commence; the fleet, therefore, was commanded to advance towards the shore, and all the muskets were loaded. However, the Attāhooroo people were afraid and made their retreat into the valley. Orders were then given not to pursue them, and Pomarre, Edeā, with several of the principal men stood on the beach, charging the people to go to their canoes: but notwithstanding all that they could say, many pursued them inland, and dared them to return and fight; but they refused. Pomarre continued to send messengers to order his people to come back, which at length, through fear of offending, they did. He then directed the fleet to return to their quarters, which was complied with. Numbers of the people returned by land, and plundered the deserted huts as they went: all arrived at the place of rendezvous about sun-set. We were informed that the king as soon as their god Ooro was taken from the people of Attāhooroo, commanded a human sacrifice to be sought for, lest Ooro should be angry at such treatment. Accordingly one of his own servants was killed upon the beach soon after the fleet got on shore.

Friday, April 2. Quietness through the night. Early this morning the fleet sailed to Papparra on their route towards Towtērāin Tyarabboo, where the ceremony closes and where Ooro is to be deposited according (as they suppose) to his desire. Before the king's party sailed, they set fire to the temporary houses they had erected for their convenience during the continuance of the ceremony.

This day we came on to the west end of Oparre. Saw but few people they being gone with the fleet. (LMS Transactions:II, 63-65)¹⁶

The fleet's destination was Tautira's marae Taputapuatea, at which, according to one account recorded earlier, the cult of 'Oro had been first introduced to Tahiti.¹⁷ (I am not certain about Pomare II's reasons for depositing this image at Tautira, rather than at his own Tarahoi in Pare.) The passage just reproduced implies that the location was the god's

own choice — and perhaps that was indeed the politically disinterested revelation of some 'Oro priest on the Pomares' staff. But if political considerations did enter into the choice, as I firmly believe, Pomare II's interest would probably have been considered better served by this strengthening of his base of influence in distant and still uncertain Tairapu than by concentrating one more token of authority and influence in Pare itself. In other words (and I consider this to be a most important feature of Maohi politics in general), locational centralization had not yet become the dominant strategy for aggrandizement; the ambitious individual extended his authority and influence not solely by increasing the sanctions behind specific statuses, or by eliminating rival statuses, but also by occupying *more* statuses — *including especially those having territorial bases elsewhere*.

If any further evidence were needed on the degree to which the Maohis were influenced by their religious beliefs, as contrasted with an objective appraisal of physical strength and military skill, the Pomares' behavior during the ensuing weeks could provide it. While warning the missionaries that the Oropa'a would probably attack, to avenge their recent setback at 'Utu'aimahurau, the Pomares went on to Tautira and proceeded to install the 'Oro image there with ceremonies lasting several weeks, during which the Oropa'a were devastating Fa'a'a and Pare. (Even the force of several hundred Mo'oreans which the Pomares sent for could not withstand the Oropa'a attack.) After this the Oropa'a, joined by forces from Papara, Vaiari, and Vaiuriri, attacked Tautira itself, with such success that the Pomares and their supporters had to flee for their lives.¹⁸

At this juncture, the victors could probably have made an end to the Pomares with ease, but instead, quite characteristically, they tarried in Tairapu killing and pillaging, and then returned home, their fury evidently spent. Needless to say, they recaptured the 'Oro image and reinstalled it at 'Utu'aimahurau. (Newbury 1961:47-51)

Meanwhile the Pomares remained at Pare repairing their losses and girding for another attack. They even revived enough resolution and support to help put down a threatened "revolt" on Mo'orea; the precise nature of the issues involved in this "rebellion" are not reported, but its center was in Afareaitu and neighboring districts. (Thomson, History, p. 54)

On June 26 there arrived from New South Wales the *Nautilus* (Captain Simpson commanding), with news that other vessels were also en route. This appeared to instill new life into the Pomares and their supporters, and Pomare I renewed his pleas for armed support from his English friends, who were by now a sizeable community — including a Captain Bishop, left there by the ship *Venus* to salt pork (for transport to New South Wales); the captain and crew of the *Norfolk*, engaged in the same mission; and now the personnel of the *Nautilus*. To begin with, Pomare I

persuaded the captain of the *Nautilus* to send him with an armed escort to Pa'ea in order to make some offerings to 'Oro. This mission was peacefully accomplished, although the Oropa'a obliged Pomare I to make his offering to the god on the beach some distance from the marae.

Thus encouraged, Pomare I again asked his European friends for assistance in putting down the "rebellion," and this time his pleas were sympathetically received. In fact, as a result of the alarms experienced during his six months residence on the island, Captain Bishop urged his compatriots to put an end, once and for all, to the "rebels'" threats. His primary purpose was the security of the English community, and of the Pomares only insofar as this helped the English. After the missionaries themselves agreed upon the desirability of an end to the "rebellion," the project was launched, and on July 2, 1802, the expeditionary force embarked: "The number of Europeans with Capt. B[ishop] was 19 men well armed, a Boat with the first mate and four men from the *Nautilus*, a four pounder cannon, and all Pomare's forces. Mr. Elder also went to attend as surgeon. The king [i.e., Pomare II], his brother and a few servants staid at Matavai." (Newbury 1961:53)

The missionaries' report of this encounter follows:

The fleet landed in Attahooroo on Saturday, July 3d, at eleven A.M. a small party of the rebels saw their approach, and retired. The enemy was withdrawn to their strong holds, which, on reconnoitering, were found to be almost impregnable, the storming of which, however, must be attended with great loss. Capt. B. and men would have made the attempt; but Pomarre and men could not be brought to venture on so desperate an action. Several shots were fired, which in general fell harmless. One of Pomarre's men was wounded in the chin and throat, by a ball from the enemy; though they fired but few musquets, owing perhaps to their scantiness of ammunition; stones they slung in abundance, and rolled down some from a great height, of several hundred pounds weight. On the following morning, a party of Papparra people, marching to join the rebels, was intercepted by a party of the royalists. The leader of the party and his wife were slain; the rest made their escape. The bodies of the man and his wife were treated in a most inhuman manner. The rest of the day passed without any particular occurrence, till evening, when Capt. B. wearied with the inactivity, irresolution, and want of subordination, that pervaded Pomarre's camp, had actually re-embarked his men, to return to Mattavai. Pomarre also, who thought it not safe to remain there without the Englishmen, was re-embarking his people with all possible speed. The embarkation was nearly completed, and most of the canoes were moving off, when an unexpected event took place, which gave a new turn to affairs.

A young man who has been with the Society some years, and who had taken to himself the name of *To-morrow-Morning*, had shewn a most active and courageous spirit, and performed such feats of bravery as astonished our countrymen, and excited the admiration of his own. This young man at the time of embarking, was up with one more, at the enemy's entrenchments, braving them to appear and fight, and firing at them, as he saw opportunity. At this season a heavy shower of rain came from the mountains. The rebels deeming this a favourable time, seized,

as they thought, the golden moment, and, in great numbers rushed out, armed with musquets, spears, clubs, and slings, and chased *To-morrow-Morning* and the other down to the fleet; they at times firing upon him and he on them.

The noise of the musquets attracted the attention of the people embarked, and stopped their further proceedings. *To-morrow-Morning* came in sight, and gave notice that the enemy was come. In the twinkling of an eye, a few of Pomarre's musqueteers, not yet in their canoes, sprang forward to the combat. A successful discharge of their pieces obliged the rebels to turn their backs and fly. In the mean time the seamen and soldiers re-landed, and joined in the pursuit of the flying foe; who, in a very peculiar manner, after running some space, in a moment rallied, and faced their pursuers. Some of Capt. B.'s party were sufficiently near for the attack. The sight of the Europeans overpowered the rebels; their spirit failed them, and they now fled in different directions.

This circumstance proved highly advantageous for Pomarre, as God gave into his hands seventeen of the rebels, who were killed upon the spot; all fighting men, and among them one of the principal ringleaders of the rebellion. Many others were wounded, but escaped. Though we may be thankful to God for the subduing of those who delight in war, and are averse to peace, yet, we find much cause to lament the extreme depravity of man's nature, which admits no bounds to cruelty, when resentment is roused, and power obtained to execute it. Each of the seventeen bodies was treated in the most wantonly barbarous manner: — pierced with spears, beat with clubs, dashed with stones, derided, scoffed, and otherwise maltreated, as if now susceptible of pain, or affected by their taunts.

Pomarre thought the rebellion was crushed, and that he should have nothing more to do the next morning than to go and take possession of their strong holds, and wreak his un pitying anger on those who should fall into his hands. Captain Bishop seeing such a sudden change of circumstances determined to remain the night, and give the finishing blow to the war.

On Monday morning they marched up to the entrenchments, which are about four miles and a half from the beach; but how great was their surprize, when, instead of finding them abandoned, they saw every part as well manned as before. They could do no more than discharge several musquets upon them, and return to the fleet. A woman, an ambassadress, was permitted to pass between the parties. She carried an account to the rebels of those who had been killed, and how they were treated. They received the intelligence with seeming indifference; said that they did not know them; and as for the slain chief, they supposed that he had been carried away by the river, and not slain by the royalists. The surviving ringleader of the rebellion, a relation of Pomarre's, named Tahtahaee, bade the ambassadress acquaint Pomarre, that when they had done to him as they had done to Rooa (the name of the chief killed) then, and not till then, there would be peace in the land.

Capt. Bishop knowing that Capt. Simpson could not be detained longer from prosecuting his voyage, returned with the boat, leaving fifteen men with Pomarre. Brother Elder also returned. Pomarre has not lost in the expedition any man killed, and but four wounded: one of whom was by his own party, by mistake. On Tuesday Pomarre sent the Europeans home, and removed his fleet about twelve miles nearer Mattavai, and there encamped.

Upon the whole, this short campaign, through the mercy of God, has tended very much to destroy the strength of the prevailing commotion. The two chiefs above named (one of whom is dead) may be considered as the life of the rebellion. Their fighting men remaining are but few. As for the body of the people, on both

sides, they are always spectators; and prepared to fly, or plunder, and exercise cruelties on the wounded or slain. (LMS Transactions:II, 115-118)¹⁹

Thus were repeated the events of twelve years earlier, when a handful of Europeans armed with muskets and conditioned to military order won a victory for the Pomares over their traditional enemies, the Oropa'a, and thereby rescued the Pomares from political mediocrity or even physical extinction.

This chapter of Tahitian history ended fourteen months later when Pomare I died,²⁰ only a few months after the death of his aged father, Teu, and of his younger son, Teri'i na Vaho Roa, the Vehiatua of Seaward Teva. The character of this Pare *ari'i* was summarized in a passage written by the missionaries, who had every reason to know him well:

Sept. 10th. — It may perhaps be expected, that we give some account of Pomarre's character, so far as it came under our cognizance, which we shall do as follows: — Respecting his family, his father was an Otaheitean; but his mother a Ryatteen. He was born in the district of Oparre, where his corpse now is, and was by birth chief of that district, and none other. The notice of the English navigators laid the foundation for his future aggrandizement; and the runaway seamen, that from time to time quitted their vessels to sojourn in the island, especially that part of his Majesty's ship *Bounty's* crew, which resided here) were the instruments for gaining to Pomarre a greater extent of dominion and power, than any man ever had before in Otaheite.

We suppose the deceased chief to have been between fifty and sixty years of age. In person, he was the most respectable man we have seen since living here; tall, stout, well proportioned; grave in countenance, majestic in deportment, and affable in behaviour. As to his morals, he was a poor untaught heathen, under the dominion of a reprobate mind; and, according to his religion, nothing was sin with him but neglecting praying and sacrificing to his gods. In these things he was exemplary. Satan surely never had, (and we pray God he never again may have) another like him among these heathens who supported his interest with his whole power, and whose study, (from the servile fear of death) was to gain his favour, whatever it might cost. The marais built, and the altars reared at his command all over the island, are not a few, on which hogs and fish were profusely offered; and several hundreds of his subjects he has, in his time, caused to be murdered, and presented as costly sacrifices to the powers of darkness, besides the innumerable gifts of canoes, clothes, &c. &c.

As a governor, if we may judge by the complaints every where made, he was oppressive: but it is probable, that, with the Otaheiteans' present sentiments of right and wrong, those who have complained loudest of him, if in his situation, would not have been less oppressive. He was a peaceable man; and it is generally agreed, that the island has enjoyed a far greater degree of tranquillity, during his reign, than it had even while every district was an independent state. He was an active man. If every subordinate chief had followed his example in this respect, Otaheite would have exhibited a much more pleasing prospect than it now does. Erecting houses, building canoes, and cultivating ground, were employments in which Pomarre appeared to take great delight, and for which he deserves to be well spoken of. It is surprising, all things considered, how he was able to carry

on such works as he did; works, that an inconsiderate Englishman, accustomed to behold the labours of art of his own country, would look upon with contempt; but which, notwithstanding, are such as bespeak the greatness and power of an Otaheitean chief, beyond any of his predecessors, and which will perpetuate his memory to long succeeding times.

Pomarre always shewed a fondness for foreigners, especially Englishmen; so that he was sure to give encouragement to any seaman that would elope from his vessel; and he often inveigled them himself: but this proceeded from policy. He supposed that every Englishman was expert in the use of fire-arms, the engine of destruction that carries terror with it all over the island; and he hoped so to engage them on his side, as to have them at his command, to come, and go, and do as he desired. The characters that he has had to deal with (since we have been on the island) have been, generally, the most abandoned, and they have disappointed his hopes and expectations. But had it been otherwise, the chief was not a grateful man: he could forget the services of those who had obliged him, and take no farther notice of them.

His behaviour towards us has always been friendly; which, without doubt, was regulated in a very great measure, if not solely, by the pecuniary advantages he has derived from our residence on the island. The vast acquisition of wealth that he gained at our first coming, and at different periods since, served to bind him to us. But latterly he did not, we think, behave so well to us as he did before the arrival of the Royal Admiral. Perhaps, the great and unexpected calls that he has had upon his attention, by the confused state of his own affairs, and the frequent arrival of vessels, may be some reasons for this change. We have also, for many months past, been enabled to open our commission, and have given him and his countrymen to know the true reason why we quitted our relatives and friends, to come and live with them: and, as the Gospel is so inimical to Satan's kingdom, we are certain that the chief could be no friend to us on account of our religion; and that he ridiculed our preaching (though he would sometimes hear, and use his power to collect his people about him to hear) and counted it foolishness, is not unlikely; and we have heard that he did so.

Upon the whole, as the Otaheiteans in general conceive Pomarre to be the greatest king they ever had, so we believe that he has not left his equal on the island. We have cause to be thankful to God, for the peace we have enjoyed under him, and that he has never debarred us the privilege of endeavouring to plant the Gospel in this island, or in any other, within his jurisdiction. (II, 295-297)

CHAPTER 31 *FALL OF THE POMARES*

FRAGILE VICTORY

At the beginning of 1804, Pomare II was “King” of Tahiti-Mo’orea in fact as well as in name;¹ no effective opposition to him was anywhere evident, and he was again in physical possession of the principal image of ‘Oro (although the image itself was left at ‘Utu’aimahurau — apparently as a token compromise with the deep feelings expressed by the Oropa’a). But, only five and a half years later, he was forced to flee for his life to Mo’orea, with only a handful of supporters; even his faithful European friends, the English missionaries, had left the island fearing for their lives. What happened to bring about such a radical change in the position of this man?

First, I list the more palpable occurrences of this period, without attempting to explain them. In September 1803 the missionaries reported that Pomare II was residing near the ‘Utu’aimahurau marae, with an unidentified new “wife.” He seemed at the time “but little affected with his father’s decease,” his principal preoccupation having been fear of the latter’s ghost: “he was so terrified with the apprehension of his father’s apparition, that he called for an attendant to sleep by him.” (LMS Transactions:II, 294–295)

For a few months he remained mostly in Atehuru, carrying out unspecified rites involving use of the ‘Oro image, then in May he moved to Mo’orea — evidently to Varari — with the image and a number of hangers-on; the reason for his move is not known.

The next time we hear of Pomare II was in July 1804, when the missionaries reported a rumor that

... the people of Atehuru were coming to make war on the Districts of Matavai, by orders of the king, who was angry because some man of the District had cursed him. The miss. were alarmed, and kept a watch thro’ the night. Next day it was found the Raatiras had killed a man, as a sacrifice, to be conveyed to Eimeo to appease the anger of the king &c. (Newbury 1961:72)

A curious turn of events, with Atehuru acting for Pomare II against Matavai — but I very much doubt that any large segment of the Oropa’a was so engaged.

More interesting, politically, was another incident reported shortly thereafter:

There was a report of a war having been kindled in Moorea or Eimeo, on account of the people refusing to acknowledge the king's half-sister (daughter of Idia and Otihe [i.e., Tenania, the Huahine *ari'i*]) as their governor; several were killed and the muskets of the people in general were seized by the king's orders. Peace was however soon restored. (Newbury 1961:73)

The half-sister in question could not have been more than a young girl at the time, but that, of course, would not have disqualified her for a Title; and her parents or half-brother were entirely capable, and perhaps more than willing, to assume the "regency." But the affair does raise questions concerning the Mo'orean succession, and the relations between Tahiti-Mo'orea and Huahine at this time.²

Regarding the office of Mo'orean head chieftainship, I noted that upon the death of Mahau in 1792 the (tribal) office had devolved upon his son, Tetuanui (whose mother was Auo, sister of Pomare I). Twelve years later, assignment of the office to Pomare II's half-sister is reported, with no further information concerning the fate of Tetuanui. However, intriguing (and insoluble) as this question may be in terms of intrafamily arrangements, the events themselves had little apparent effect upon wider political developments; for, whoever may have occupied the *de jure* office of Mo'orean chieftainship, the Pomares firmly held onto *de facto* coercive authority over the island.

Of considerably more importance, politically, is the question this affair raises regarding relationships between Tahiti-Mo'orea and Huahine, as exemplified by the "marriage" between 'Itia and Tenania.

During Cook's last visit, in 1777, the person having the highest rank-status on Huahine was a youth named Teri'itaria, the son of Mato and Fatuarai. A quarter of a century later that preeminence seems to have rested with Mahine (also known as Teheiuira, or Puru) who was Tenania's younger brother (the two, it may be recalled, were Mato's sons by his second wife). The only explanation I have uncovered concerning the transfer of office from Teri'itaria to Tenania and Mahine is found in Chesneau-Marcantoni's circumstantial (but not necessarily accurate) reminiscences. After Mato had left Fatuarai, to marry the daughter of Mo'ohono ("high priest of Huahine"), and had by the latter sired Tenania and Mahine (and a daughter, Rereao), "Mo'ohono asked Tehaapapa (i.e., Fatuarai) to transfer to his grandsons, Tenania and Mahine, the "royalty" of Maiao [a dependency of Huahine]; upon her refusal to do so he attacked and defeated her forces, dethroned her, and transferred her royal office to his two grandsons." After Mo'ohono's death, Fatuarai made five unsuccessful attempts to win back the office for her son. Finally, this account continues, when Tenania went to

Tahiti and married 'Itia, he turned over to Mahine the office of tribal chieftainship of Huahine and Mai'ao. (Chesneau 1928:81-82)

No explanation is offered for the ultimate fate of the deposed Teri'itaria, but his sister, Turaiari'i, is recorded as having married the Ra'iatea-Porapora chieftain Tapoa.

Pomare II remained about nineteen months on Mo'orea, where two of the missionaries visited him and found him "... as much, if not more than ever given to the ava drinking & we add, perhaps to those vile affections & the commission of those things that are not seemly to mention." He also suffered from an unspecified disease which he would not discuss in public, "it being counted a reproach to be afflicted with any disorder." (Bicknell & Henry, Journal, 24 January 1805, LMS Archives)

In January 1806 Pomare II accompanied the 'Oro image back to Tahiti. The movement was marked by ceremonies involving throngs of people (including a large number of Ra'iateans [Jefferson, Journal, 20 January 1806, LMS Archives]) and huge collections of offerings to the god, including several humans. During the passage, and for some time thereafter, the channel between Mo'orea and Tahiti was prohibited to all canoes not connected with the official procession (Jefferson, Journal, 25 November 1806, LMS Archives). Three months later the 'Oro image was carried to Tautira and re-installed there; then, for some months thereafter, there took place an almost uninterrupted series of ceremonies which had the purpose of validating Pomare II's status as "King" of Tahiti³ — including the parallel supremacy of 'Oro, the god whose principal "seat" (*nohora'a*) — the *to'o* — was once again in Pomare II's physical possession. Before the *to'o* was transported to Tautira (in a canoe paddled mainly by Hawaiians left on the island by visiting ships) it was kept in Pomare II's own marae, Hetemahana, near Point Venus.⁴ At this new depository were enacted a "marae renewal" ceremony as well as the awesome *paiatua*, the refurbishing of 'Oro's image, and of other images with feathers from it — all accompanied by lavish expenditure of human offerings.

One of the more secular ceremonies enacted during this period was the presentation of tribute (i.e., food, bark cloth, human offerings) to Pomare II by various tribes and subtribes.⁵ Those from Aharoa traveled to Matavai to make their contributions, but Pomare II himself went to Pare and Atehuru for the presentations from those places. In connection with his visit to Atehuru he and his retinue went well armed, as acknowledgment of the hostility toward him still prevalent there. (Similar tribute-rendering ceremonies were later accorded Pomare II in Seaward Teva, but I can find no report of any such having been rendered by the Landward Teva — although their contributions may well have been made while Pomare II was receiving the tribute from Atehuru.)

Of even greater importance, symbolically, was the series of kin-Title-investiture ceremonies that culminated during this period. (Such ceremonies had apparently been going on for some time, but had escaped the notice or comprehension of the missionaries.)

Today the people of this District presented the king with 20 Hogs, some English and Taheitean cloth, two Breastplates &c. &c. It is part of an Oroa or ceremony called Bure toto or Fa Eree te Eree, that is, making the king chief of this District, by investing him with the ancient chiefs name of Teepa by certain prayers &c. — therefore it is said to be a confirming him king of Matavae. This Oroa is a part of the ceremony for the king, that has been performing for several years past, and is to be observed in most if not all the Districts in the Island — some have had it performed, in Pare he is called Tunue-ai-te-tua, in Faa he is called Te Eree vae-e-tua, in Attahuru he is called Te-vahe-atua, in Taearabu he is called T'Eree-navaho-roa, and in Eimeo he is called Punua-te-rae-e-tua. These names given to the King, signify his authority as being invested with that power, which in old times belonged to the several Chiefs who presided over the different Districts, and are used on particular occasions. (Davies, Youl et al., 24 May 1806, LMS Archives)

With the image of 'Oro were transported to Tautira the images of five other deities: Hiro, Tane, Temeharo, Ruahatu, and Huiima'o. (The last two were shark-gods, and Temeharo was the principal familial tutelard of the Pomares.) These other images evidently served as a kind of honor guard for 'Oro, as it was reported that they were to be returned to Mo'orea after 'Oro's image had been installed at Tautira (Jefferson, Journal, 28 January 1806, LMS Archives).

One should not conclude from my brief statements that the flow of goods between Pomare II and the populace was always in his direction. Some of the so-called tribute was evidently redistributed, either in the form of allotments to tribal chiefs and subchiefs or of free-for-all "scrambling." Also, on some occasions, Pomare II acknowledged, and thereby publicized the eminence of, the principal chiefs by making special gifts to them and calling out their names (or Titles?) (LMS Transactions:III, 172). And, following upon some human offerings he had small portions of the victims' bodies cut off and sent to the chiefs of some tribes as confirmation of friendship — a token which the missionaries described as having been received with much satisfaction (LMS Transactions:II, 322).

During September 1806, an especially large meeting, a *tavau*, was held in Pare which evidently included representatives from *all* the island's tribes. Food and other objects passed to and from Pomare II, and some ten days were spent in feasting and in making plans for a solemn ceremony scheduled to be held later on at Tautira. According to Davies' version the coming ceremony was to be a *pure ari'i*, or "worship for the king" (Newbury 1961:87),⁶ and it was to require five more human offerings: one each from Mo'orea, Aharoa, Seaward Teva, Landward Teva, and Atehuru — a most

telling indication of current political geography (Youl, Bicknell et al., *Journal*, 30 September 1806, LMS Archives). The absence of Porionu'u from this levy was probably due to its having been Pomare II's own tribal unit.⁷

At this same meeting a demand was voiced for a large tract of land to be set aside for the exclusive use of 'Oro:

One of their principal Prophets has for some time pretended at be inspired and says that Oro must have the land on the North and Eastern sides of Taearabu to himself, (which extends to the Isthmus from the Rocks, about 20 miles in length) and therefore all the people who reside in the several Districts within the said boundary, must leave their lands and houses, and go to the south side and dwell. The principal Chief of Taearabu asked the king leave for the people to continue on their land, but he gave no answer. And it is said that if they refuse to obey, they will incur the gods anger and may terminate in a war between them and the King. (Youl, Bicknell et al., *Journal*, 30 September 1806, LMS Archives)⁸

Before this meeting, Pomare II's wife died. Her written obituary is brief:

This morning about nine O Clock the Queen departed this life, she was (we suppose) about 23 or 24 years of age — her person was of the middle stature, of a delicate constitution — affable in her behaviour — She possessed little more than the name of queen, having no Authority. All the children she has had have been killed, as it is said, they were by common men, Owo her mother — Edea — Taepoto the chief of Aemeo and two other women according to the custom of Tahaite, cut their heads with sharks teeth, and lamented over the deceased; the King appeared affected, as also some of the people about him. (Davies, Youl et al., *Journal*, 21 July 1806, LMS Archives)

In late May 1807 the peace that had settled on Tahiti during several months past was suddenly broken by a fierce and unheralded attack upon Atehuru by Pomare II and his warriors. Eight or so persons were slain in the first assault and the rest driven into the mountains, where many more were also slain, including the two most "disaffected" subchiefs. The immediate cause of the assault was described as follows: "The cause of the offence it seems was the conduct of the people of Teoropa, in taking the bones of Mateha, a chief killed by them in the last war, and making fish hooks of them. This had been done as an expression of contempt for the king who was related to the late chief." (Thomson, quoted in Newbury 1961:97n; see also Adams 1901:149-150.)

When the Papanans and other Landward Teva people sought to aid the Oropa'a they too were attacked, their warriors driven into the mountains, their settlements plundered and burned, and their crops destroyed. (The Seaward Tevans showed an inclination to join with their neighbors against Pomare II, but were so impressed with the speed and ferocity of Pomare II's forces that they joined with the latter instead — though evidently not in time to win ultimate exemption for themselves.)

For several weeks thereafter Pomare II's forces ranged through the defeated areas searching for survivors to kill and property to seize or destroy. Some missionaries traveling through the area at this time on a mission of mercy found almost total desolation, and great numbers of corpses left to rot or destined for the Tautira marae. Throughout September the work of destruction was extended to Taiarapu and would probably have gone to the limits reached in Atehuru and Landward Teva but for an illness that overtook Pomare II.

Sometime during this war some prominent leaders, including Te To'ofa,⁹ surrendered to Pomare and were granted refuge by him, only to be eventually slain. Supposing his illness to be a supernatural visitation in consequence of this act of treachery, Pomare II ordered an end to the slaughter and declared a general amnesty.¹⁰

For the moment, then, all effective opposition to Pomare II was put down; but the "King" himself knew how temporary such victories tended to be and warned both his mother and the missionaries to be prepared to flee the island in case he should die.

In October another great meeting was held at Pare, reportedly "... for the purpose of dividing the lands of the conquered Districts viz. Atehuru &c. and appointing their respective chiefs" (Newbury 1961:104). The missionaries have provided a colorful account of the ceremonial proceedings of this event and of the clothing worn by the principals. They also reported at length on the fact that one small portion of Puna'auia land was granted to themselves — a tract called Outumaoro near Tata'a Point. But concerning the politically important aspects of this extraordinary event — the specific units into which the conquered territories were divided, and the identity of their new proprietors — not one word was reported! (Newbury 1961:104; Davies, Journal, 12 October 1807, LMS Archives)

Ten months passed without the occurrence of any major political upheaval, but there did take place events that had some bearing on the political situation. In March 1808 Pomare II lost another loyal supporter with the death of Auo, the last survivor of his father's siblings, and the mother of his own first wife. As wife of Mahau, Auo had played a prominent part in the Mo'orean Succession War, and latterly had been Pomare II's appointive chief of Ha'apaino'o. Then, in May, 'Itia and her husband Tenania removed to Huahine; 'Itia seems to have had less influence upon her son than she had had upon his father, but her absence certainly did not serve to strengthen Pomare II's cause.

Meanwhile, Pomare II made a lengthy visit to Mo'orea; when he returned to Pare in early May he was very ill and evidently very anxious about his political fortunes, not to say about his life. When an explanation was sought for the cause of his illness, the principal 'Oro *taura* there-

abouts, a man named Metea, could not (or would not) offer one. Instead, a *taura* inspired by Tēpa, the healing god, declared that it was Tēpa who had stricken Pomare II, in consequence of this god's having been ill-used some months previously. The report of that occurrence warrants reproduction on several counts:

Yesterday a man was killed in Pare for a sacrifice, and we find today that this was the real cause of Pomare's coming here, he had given orders for the man to be killed but did not like to be present at the time, at first we supposed it was a sacrifice to Oro on account of Pomare's late illness and recovery, but we were mistaken the cause of the sacrifice is said to be as follows; some years ago, when the people of Atahuru &c. had rebelled and made war upon the king and his Father, every method was then used by Pomare's party to make the gods propitious, as is common in such cases, but one of the gods, called *Tēpa*, did not display his power, nor do that for the protection of his votaries that was expected from him, this exasperated Paraha the late chief of Pare to such a degree, that he resolved to use the god in a similar manner to what some of the Negroes in Affrica are reported to do when their gods disappoint their expectations. Paraha took the Too or image representing Tēpa, broke it to pieces and put it in a basket called Habora, the same as those human sacrifices are put in, and then he took the Habora, and the broken image in it, to the Marae and offered it a Sacrifice to the god Oro. Thus was Oro magnified at the expence of poor Tēpa, however the despised god was (as the Taheeteans think) meditating a severe revenge for this spiteful way. Paraha was taken ill of the Dropsy, and died some months ago, and now Tēpa has inspired one of his worshippers who declared in the name of the god that Tēpa had already killed Paraha the chief of Pare and that he would also lay his hand upon the king, except his anger was quickly appeased by offering him a human sacrifice, and in consequence of this the man yesterday was killed and offered to Tēpa ... and some say that he must have more human victims. (Davies, Journal, 23 October 1808, LMS Archives)

According to the *taura*, Tēpa would withdraw Pomare II's illness only upon assurance of receiving some human offerings and a certain piece of land on which would be built a marae for him. Pomare II promised to do these things, so that his recovery, which occurred shortly thereafter, was attributed to these actions, thereby serving to rehabilitate the offended Tēpa to a position of near-rivalry to 'Oro himself.

QUALIFIED DEFEAT

In August 1808 there began the series of events that culminated in the defeat and temporary eclipse of Pomare II. The facts, as reported by the missionaries, were as follows:

On Sunday last a number of people from the District of Hedeā [Hita'a] arrived at Matavae, bringing with them some Cocoanut leaves, which they laid at Pomare's feet, these leaves were called Rahere, and the meaning of the Ceremony seems to be, an acknowledgement of Pomare's sovereignty over the Hedeans. This transaction gave a great offence to the people of Pare, they look upon it as an indignity to them to have the ceremony performed in Matavae instead of Pare

the king's own District. Today brothers Eyre and Scott went down to Pare ... they found almost all the people of Pare gathered together at the big house at Papaoa, dressed and armed for war, and talking about falling upon Matavae but they were waiting for one or two of their principal chiefs who were absent. The brethren therefore returned without having an opportunity of speaking to them. The people of Matavae are much alarmed today, they took a large hog as an atonement to the king, but they say they are innocent and that all the fault is the king's. The king sent several messengers to the people of Pare, and there is a probability that the affair will be amicably settled. (Davies, Journal, 9 August 1808, LMS Archives)

And so it seemed to be — for the moment, at least. But there was evidently more to the affair than the missionaries were aware of, for their Matavai neighbors voiced the suspicion that "... the king has some evil design against them, and that the occurrence mentioned was a preconceived scheme of his" (Davies, Journal, 13 August 1808). And on his part, Pomare II warned the missionaries to be on guard against the Matavaians, because of their talk of war against the missionaries and himself (Davies, Journal, 3 October 1808).

Like most other inhabitants of Tahiti, the Mahinans had ample grounds for their hostile feelings toward Pomare II — feelings that he was undoubtedly aware of — so they were probably correct in suspecting him of contriving a *casus belli*. In any case, although the Hitia'a affair was settled with a prompt *tarae hara*, the mutual bad feelings simmered on. The Matavaians were further incensed by Pomare II's taking of another human offering from among them, and Pomare II's feelings were inflamed by the revelation received from 'Oro, through the *taura* Metea, urging war on the Mahinans. Matters came to a head in November:

Novr 6th. About 11 at night some of the king's people alarmed the miss. with a report that a great number of the people of Matavai, were armed and assembled by the sea side at Hitimahana (less than a mile from the miss, residence) apparently with some hostile intention.

The king was then on board the brig drinking, and unacquainted with the state of affairs. Messengers were dispatched to tell him, and bring him on shore. In the meantime, the king's people gathered together and armed themselves, and went towards Hitimahana, but soon returned without doing anything.

The king came on shore drunk, and assembled his people near the large house of the miss. where they were for some time deliberating upon the measures they should pursue. The king wanted to go and fall immediately upon the Matavaians, but his uncle *Taipoto*, the chief of Eimeo, dissuaded him from it, representing the necessity of prayers &c first. But while they were thus deliberating, all the Matavaians fled over Tapahi to Paperipo, first the women and children, then the warriors. Not an individual was left behind, except the servants of the miss. and a few that lived by the sea side close to Pomare's people. Messengers were dispatched to bring up the people of Pare, and also those of Faaa &c to the westward. The people came up just as it was daylight and then they, and Pomare's servants, scattered themselves thro' the District, plundering and destroying, some few houses were burnt, all the canoes seized, and also all the hogs they could catch.

Had Pomare's plan been adopted of falling upon the Matavaians immediately, it is probable the rebellion would have been soon crushed; but so infatuated were the king's people, and so bound by their superstitions that they would not stir a step beyond the usual routine of prayers, sacrifices &c. The priests went to their prayers, and sacrifices to engage Oro on their side, and a man was killed immediately to be a sacrifice to him, was put [in] a canoe in a haapora (basket) and sent by the way of Papara and the isthmus to Tautira. This delay afforded time for the disaffected to assemble together, and get the people of Hapaiano to join them, and also to send messengers to the Districts to the eastward. They also endeavoured to get Oro on their side, killed a man to be a sacrifice to him, and sent him to Tautira the eastern way. Each party appeared to be in earnest to get the god on their side.

In the evening the miss. heard there was little doubt of all the eastern side of the island joining the rebels, the king had sent messengers to the chiefs on that side but had received no answer. This was perhaps the most gloomy Sabbath day ever spent by the miss. tho' they had been in very trying circumstances often before. They could hardly meet for public worship for noise and confusion about them, tho' they attempted to meet together for prayer &c.

Novr 7th. The miss. had had little sleep the past night most of them kept watch not knowing what might happen. They heard in the morning that the rebels were encamped in Hapaiano, waiting for those of the Districts to the eastward to come and join them.

Pomare sent a messenger to them to signify if they were for Peace, he was not for war, he also requested that two of the Raatiras, one belonging to Matavai, and the other to Hapaiano, would come to him.

By the time however that the king's messenger had reached the camp, Vaiturai, the young chief of Tiarei (the present Hitoti) with his party had arrived at the camp all talk of peace was therefore at an end. The two Raatiras sent for would not come to the king, and it was expected that in the afternoon, *Taute* the chief of Faena and all his people would come, as also Teohu the chief of Hitiaa. And it was expected *Taute* would head the whole party. The miss. dreaded this *Taute* more than any man on the island, as he was courageous and enterprising, and many instances of his treachery and cruelty had occurred. He had been called *Mr Pit* by foreigners and had been Pomare's chief counsellor, had lands given to him after the conclusion of the late war, and was under many obligations to Pomare, and yet it now appeared that he was the very soul of the rebellion.

The king also and his people, on learning how *Taute* was likely to act, and that he was apparently at the head of the rebellion, were much discouraged. Pomare observed to the miss. that *Taute* was a warrior, and knew how to act, he advised therefore that the wives and children of the miss. should by all means be sent on board the ship then in the harbour. As it was not at all improbable that *Taute* and warriors would come to Matavai that night. This was also their own opinion, they thought the party now under the conduct of *Taute* would come and attack the king and in that case they knew not what to expect. (Newbury 1961:116-118)

One circumstance that happened on the passed day (the 7th) deserves to be mentioned, as it had a great effect on the minds of both parties. *Meetia*, the prophet of the god Oro, was said to be inspired, at which time he happened to have a dispute with a prophet of *Tipa*, as they were disputing he suddenly started, and ran away over the rocks and precipices of the hill Tapahi towards the rebel camp at Hapaiano. Some of the king's people attempted to detain him, but in vain. He pro-

ceeded to the camp and joined the rebels. This discouraged Pomare's people very much, and as much elated the other party, for it was looked upon by both parties as the action of the *god* not of the *man*, who was well known as Pomare's friend. (Newbury 1961:118)

This threatening situation prompted the majority of the missionaries to leave the island, and they went aboard the brig in order to take passage to Huahine.¹¹ Their version of the war continues:

In the afternoon, there was a report there should be peace, and the king in public talked as if peace had been made, but called some of the miss. aside, and said secretly there was no real peace, that he was afraid of his own people, that the Porionuu or people of Pare upon whom he depended most, had already shown themselves inclinable to betray him. Teraehuatea their principal chief had secretly sent several messages to the rebels, and evidently intended to espouse their cause. (Newbury 1961:119-120)

In the afternoon [Nov. 9] at the request of Pomare, two of the miss. Messrs Nott and Scott went to Hapaiano to the rebel camp to speak to the disaffected chiefs, and endeavour to persuade them to come to Matavai and have an interview with Pomare. The chiefs received them in a friendly manner, said they were sorry for the miss. and inquired if it was true they were going away? Being answered in the affirmative they were earnest in persuading them not to go. And there was no doubt some of them had a friendly regard for the miss. though not on account of their religion; yet in case they should prevail against Pomare, they had no power to protect them against the wild rabble that followed them.

The miss. endeavoured to persuade Taute and the other chiefs to come and have an interview with Pomare. But to this they made many objections, mentioning several instances of treachery that had occurred during the late war, and saying they had apprehensions of being served in the same manner as others had been. A(t) last they agreed to come to Matavai with their men, and that Pomare also might bring his men, and that the warriors on both sides should remain behind their leaders at a distance, then the chiefs to advance to the middle, and meet Pomare there with as many of the miss. as would come. Mr S(cott) then returned to acquaint Pomare with these terms, leaving Mr N(ott) with the chiefs to conduct them to Pomare. The king being made acquainted with those agreed to them and advanced with his people to Hitimahana, thinking the others were coming. After the departure of Mr S(cott) the chiefs hesitated, and would not come that day, but sent to Pomare they would come the next. Mr N(ott) then returned to his brethren, and Pomare began now to hesitate about going in the ship, thinking if he left the island he would lose all at once, but by staying there might be a chance of recovering his affairs, but he said perhaps the people would cut off his head as the people of France had done with their king. (Newbury 1961:121)

Other sources provide somewhat different accounts of this episode:

The outrage of June, 1807, had exhausted the last remnants of patience in the islanders, and this time the whole island rose, determined to make clean work of Pomare and all his surroundings. For this purpose they needed a warrior, and as a warrior Opuhara had no superior. So Opuhara became chief of Papara, and soon afterward head chief of the island; for he and his army advanced to Papenoo in 1808, and there, on December 22, Pomare attacked them, and was totally defeated. Po-

mare and his household, and the whole missionary establishment, without waiting for further notice, abandoned the island, and fled to Eimeo. (Adams 1901:153)

Success had made the conquerors insolent; they indulged in unspeakable atrocities and cruelties, but all the more unbearable was that these (conquerors) for the most part were strangers from Huahine, Ra'iatea, Taha'a, etc., who came to the aid of Pomare and who made up a large part of his army.

Their imprudent conduct produced discontent, which despite the conquered being downtrodden, soon resulted in another war, which failed to remove Pomare's power permanently. This (war) broke out for such an unusual reason in this country, that it is worth describing.

Metouave, a common man but very courageous, had a wife renowned for her beauty and whom one of the principle officers of the king wished to have. The husband and the wife both rejected him. A few days later, she was wrested from her home by force. The husband, furious, ran to announce everywhere the violence of which he was the victim; and so by these speeches he shared his indignation with the people and stirred them up to revolt.

In a few days a large number of discontents met at Hirahouraia or Tire, under the orders of Pafai, who was still living, and at Oahouio. They marched against Pomare, who was at Papara, coming from the North, while the inhabitants of Papara and the Aroopas, who lived in the southeast, came from the other side. All the island rose up. No one remained loyal to the king except strangers, who, attacked from everywhere at once, had many losses and could not hold up. He himself was forced to leave the island and to retire to Eimeo with what was left of his army. (Moerenhout 1837:II, 447-448)

In the end, Pomare II remained at Matavai with four bachelor missionaries and his more loyal followers, while his adversaries continued at Ha'apaino'o; and such was the state of affairs when the brig sailed for Huahine taking the other missionaries along.

The following April (1809) two of the missionaries who had remained at Matavai made their way to Huahine with information about the state of affairs on Tahiti:

They reported, that there had been a cessation of hostilities between Pomarre and the rebels, from the departure of the Missionaries, in the Perseverance, to the 22d of December; on which day, Pomarre being infatuated by the predictions of the prophet Metea, rashly attacked the rebels in the district of Onowhea. The enemy had not only a superiority of numbers, but also greatly the advantage of ground. Pomarre's party was repulsed, and fled to Nanu, some of his principal men were killed, and many muskets fell into the hands of the rebels. The four Brethren, as soon as they heard of this defeat, sailed for Eimeo. In the meantime, the rebels overrun the district of Matavai, Pare, &c. and committed great devastations. The picture of King George, which was sent from England to Pomarre, was also taken by them to the Marao, and offered to Oro. Pomarre, after staying three weeks at Nanu, followed the Brethren to Eimeo, where Messrs. Scott and Wilson left him, with the Brethren Nott and Hayward. (LMS Transactions:IV, 335-336)

In September 1809 there occurred another event which signaled the end of this chapter in Tahiti's history. The first European ship to an-

chor at Matavai after departure of the *Perseverance* was the *Venus*, a twenty-ton schooner from Port Jackson. It was forthwith captured by some Tahitians, its mate killed, and its master and all the crew made prisoner. Forty years earlier the pioneer *Dolphin* had been attacked by Tahitians, and more recently the castaway company of the *Matilda* had been relieved of some of their property, but otherwise Europeans had suffered little more than thievery or ridicule from their Maohi hosts. And, to underscore the radical nature of this turn of political events, the hope and patience of the long-suffering missionaries finally ran out and most of them embarked for Port Jackson, believing their mission to have failed.

Some discussion is called for to review and try to explain the events that led to this radical change in the political fortunes of Pomare II, only a few years after he had reached the pinnacle of rank-status and of force-sanctioned authority. The measures used in reaching that pinnacle — mostly by Pomare II's father, by his great-great-uncle Tutaha, and only in small part by himself — were as follows:

- winning and maintaining European military support, both in terms of an almost complete monopoly of firearms and of active military aid;
- securing an almost monopolistic supply of other European objects and distributing them among other Maohis in return for political support;
- adding luster to their established rank-status preeminence through prestige-enhancing associations with European leaders;
- skillful use of established kinship connections, along with the formation of valuable new ones;
- and, gaining most influence with, and most direct access to, the island's most powerful god, 'Oro.

As we have seen, Pomare II continued to utilize these strategies, along with some new ones; so why, one may ask, were they less successful than before?

During the five-and-a-half-year period now under consideration twenty European vessels visited Tahiti, some more than once, and Pomare II continued his forebears' policy of courting the visiting Europeans¹² — but such efforts were nowhere near as rewarding as they had been in the past. For, by this time firearms were in the hands of nearly every one of the island's principal chiefs. Although many arms originally acquired by others eventually found their way into Pomare II's arsenal (LMS Transactions:III, 36), a large enough number was outstanding to render his advantage less overwhelming.

As for other objects of European origin, nearly everyone on the island now had some iron and some article of European dress, so that gifts of such items were no longer as productive of political advantage as they

once had been. Moreover, it appears that Pomare II, unlike his father, kept for himself most things received from Europeans. Despite his requests, during this period, Pomare II was never once successful in influencing Europeans to fight his battles. Besides, by this time, many Tahitians were themselves skilled in the use of firearms, and most of them had lost their awe of an armed European.

Nor was there much advantage to be gained, in tangible ways, from close association with Europeans. Many if not most Tahitians had come to harbor hostile feelings toward Europeans in general (though not apparently toward all European individuals) on account of the sicknesses that were so widespread — sicknesses that they almost universally, and bitterly, attributed to Europeans. (LMS Transactions:II, 328-330)

In other words, the awesome wonder that was formerly associated with everything European was most definitely a thing of the past, and the earlier advantage enjoyed by the Pomares as a consequence of such association became in some measure a liability.¹³

Another measure utilized by Pomare II's forebears in support of their aspirations was the exploitation of old kinship connections, and the establishment of new ones. Pomare II also utilized such measures, but to far less extent and to considerably less advantage. In terms of politically profitable alliances, Pomare II (probably through no will of his own) was married to his own first cousin, and his younger brother to the latter's sister; thus, considerations of rank-status eugenics were allowed to overrule those of political *alliance*. Actually, these considerations appear to have been pushed so far that, according to one presumably "official" view, after the death of Pomare II's first wife there remained but one female on Tahiti-Mo'orea of sufficiently high rank-status for him to marry, and even that union did not take place (LMS Transactions:IV, 185). Moreover, Pomare II failed to sire any offspring by his first wife and thereby lost the opportunity for acquiring the means of forming politically useful alliances through an offspring's marriage.

Pomare II did, it is true, attempt to exploit his kinship connections on two different occasions: once, when he forced the Mo'oreans to accept his infant half-sister as their ruler, and again, when he appointed his female cousin to the chieftainship of Ha'apaino'o. In both cases, however, he did so over the strenuous objections of the appointees' new subjects. In the case of Mo'orea he had to put down an armed opposition to gain his point; and in the case of Ha'apaino'o his appointee died soon thereafter, before the political objectives of his action could be achieved.¹⁴

In fact, there remained very few close kinfolk for Pomare II to lean upon, even had he been so inclined. All siblings of his mother were dead, and the last remaining sibling of his father died during this period; even

his mother, the once formidable 'Itia, left his side to go with her husband to Huahine.

So, instead of the kinfolk — who, despite temporary differences, had provided such political strength for his father's regime — Pomare II found himself surrounded and dependent upon a motley of parasites, including the mischief-making Metea (the principal 'Oro *taura*), and a crowd of Ra'iatean Ariois and bloodthirsty Hawaiian castaways, whose time (in the words of the missionaries) "... appeared to be taken up in feasting and merriment."¹⁵

As events were to demonstrate, support from persons like these tended to melt away in times of stress. And, although the preceding pages have made it abundantly clear that kinship among the Maohis was no warranty of loyalty, it did transcend ruthless self-interest more often than did other kinds of relationships known to them.

The most substantial, and eventually most effective, type of support courted by Pomare II was in the persons of chiefly Leeward Islanders. His mother's second husband, Tenania, was, as we have seen, a high-ranking Titleholder and co-chief of Huahine; and Pomare II was reported on one occasion to have organized an expedition to send presents to Ra'iatean chiefs (Youl, Bicknell et al., Journal, 20 August 1806, LMS Archives).¹⁶ His preference in that direction is also evident in his patronage of an immigrant Ra'iatean named Paraha,¹⁷ described in one report as "the most thriving man on the island"; "He [Paraha] has lately been made a *rattera* of Oparre & his favour is much courted in tht. district. If anything should happen to the king, he is likely to be made of much consequence. He is a distant relation of Pomerre's & is from Ryattea." (Jefferson, Journal, 24 January 1805, LMS Archives)

Pomare II also adopted his forebears' strategy for gaining and maintaining political power by the process of eliminating the opposition — and if anything he was more uncompromising in that than they. I need not repeat the passages describing his many ruthless military campaigns, or the instances of unprovoked and even treacherous murder carried out at his behest. Many of the killings ordered by him were phrased as offerings to the insatiable 'Oro, but the bitterness and vengefulness engendered by them were evidently no less intense. Even Pomare II himself appears to have recognized that he had overreached the limit in this regard, as witnessed by his self-acknowledged guilt in the treacherous slaying of the defeated chiefs who had sought refuge in his camp (Davies, Journal, 7-16 September 1807, LMS Archives).

But Pomare II did not restrict himself to physical measures in eliminating opposition. It is reported, for example, that on one occasion he brought about the death of a Mo'orean by prayer:

The story is thus told: Otoo was at his worship, and while employed, was disturbed by some one's beating a drum. He sent to order the person to desist; but his order was not obeyed, and the man continued beating; on which the king said, "Let him alone": and that same night the man expired. This is esteemed by the natives as an infallible proof of the power of their god Oro, and of their king Otoo. (LMS Transactions:II, 317-318)

Under Pomare II's regime some actions traditionally regarded as trivial errors, or no errors at all, came to be treated as crimes of lese majesty. For example, the chief of Tiarei was banished from his lands for eating part of a turtle, a delicacy which formerly had been accessible to any male tribal chief or high-ranking Titleholder (Jefferson, Journal, 28 February 1805, LMS Archives). Again, for garbling a message from Pomare II to some priests, an aged messenger was condemned to death (Davies, Journal, 29 July 1808, LMS Archives).

Indeed, so encompassing did the presence and will of Pomare II come to be that many reversals formerly put down to the vindictiveness of miscellaneous spirits came now to be attributed to acts (deliberate or otherwise) of lese majesty. For example:

Tuesday, 20. There have been for several weeks upwards of thirty sailing canoes, waiting for a favourable wind to go to Te-tea-roa; they have several times made the attempt, but have been compelled to return. The Taheiteans are easily made to believe that the cause of their miscarriages, in the general, is on account of the god' or the king's anger. The present disappointment, they say, is on account of the king being angry with them, and that while his anger remains, the wind will continue against them. They went to Edea for advice, which was, to take a *tara-ae-hara* to the king, to which they agreed, and yesterday they took a young pig for an atonement to the king, who is at Hapaeano. (LMS Transactions:IV, 183)

The severity with which Pomare II countered opposition, or even suspicion of opposition, may have served to secure immediate political objectives, but there is much evidence for concluding that it produced an almost universal residue of ill feeling toward him and his regime.

Like his father before him Pomare II also courted the favor and support of the god 'Oro for what appear to be political objectives. But unlike his father he went so far in this direction that his attentiveness to the god eventually worked against his political interests. Consider, for example, the numbers of persons slain to provide offerings to 'Oro. An exact count of such victims is impossible to make, but my estimate is that several scores met that fate during the period now under review — not including those slain in wars and afterward presented to the god. One does not have to fall back on "human nature" to explain attitudes of recrimination on the part of the victims' kin and friends. I give but two modest examples from the LMS Transactions:

May 1st. Hear that the inhabitants of Fwhaa were very near coming to blows with the king for the murder of the man for a sacrifice yesterday. They resented it because it was a young and useful man that was killed. (II, 304)

When we have endeavoured to persuade the people, in public and private, to turn from their vanities, and worship the true God, they have frequently replied, by asking, Whether any of the rulers have believed, and turned unto the Lord? They frequently mention Pomarre's killing men for sacrifices, and tell us to go and preach to the king and him. The generality of the people are dissatisfied with his conduct in this particular: and, in some, we have seen a disposition to retaliate. One man was heard to say that Pomarre came to his house seeking a sacrifice, and had his friend, who was sitting by him been killed, he had his spear by him, and would, be said, have killed the man who killed his friend, or Pomarre. (II, 327)

Dispossession of land for 'Oro worship was probably only slightly less popular a measure than loss of a kinsman or friend. There is no report of people having been dispossessed to make way for the uninhabited district dedicated to 'Oro on Mo'orea, but opposition is recorded to the proposal to set aside a twenty-mile stretch in Tairapu for that purpose (Youl, Bicknell et al., Journal, 30 September 1806, LMS Archives).

Pomare II's almost slavish dependency upon 'Oro was manifested in certain other ways that adversely affected his political fortunes. The extent of that dependency is attested in several passages in the missionaries' journals, such as the following:

Last night the Prophet that has been attending Pomare all the time since the commencement of the late war, came to him in a great fury, being inspired as he pretended by the god Oro, he declared in the name of the god that he had raised up Pomare from his late illness, blamed him for his remissness concerning certain prayers and sacrifices that he has not attended to as he ought to have done, as also his neglect of causing some houses to be built, he threatened to lay his hand upon Pomare again if he did not speedily observe those things. Pomare appeared alarmed, and it seems he has determined to comply, and for that reason will go down in a day or two to the District of Pare, and some say the god must have a human victim, perhaps more than one. (Davies, Journal, 7 October 1807, LMS Archives)

On some occasions Pomare II was persuaded by 'Oro *taura* to undertake irresponsible military adventures against recognized odds, and with disastrous consequences. (See for example the raid against the Oropa's in 1809.) And on other occasions military advantages derivable from prompt action were allowed to lapse while Pomare II was carrying out the ceremonial accompaniments of warfare dictated by 'Oro's clergy. (See for example the Oropa'a's devastation of Pare, while Pomare II and his forces were at Tautira.)

Finally, there is dramatic evidence that Pomare II and his associates had begun to recognize the disadvantages of their exclusive attentiveness to the one god, 'Oro. (I refer to the case of "Tepa's revenge" mentioned earlier.)

As we have seen, most measures undertaken by Pomare II to secure his political objectives were continuations, at intensified levels, of strategies followed by his father. In one respect, however, he went far enough beyond his father to give the appearance of innovation, and that was in his substitution of direct rule for indirect, in territories conquered by him.¹⁸

The principal action undertaken by Pomare II in this direction was the "division of lands" described earlier, and his appointment of new, and evidently nonlocal, individuals to preside over the conquered territories. As indicated earlier, except for the report that such land divisions and new appointments were made, we are provided with no further information about this momentous event, but it is probably safe to assume that the advantages gained by Pomare II in having his own appointees installed in these territories were more than likely offset by the local resentment engendered by such moves. Moreover, in at least one recorded instance, the appointee eventually turned on his patron and led a large-scale "rebellion" against him. (I refer to the famous Taute, Pomare II's former chief counselor [Newbury 1961:118]. Another action of Pomare II that may be regarded as a substitution of direct for indirect rule, was his personal assumption of several high-ranking kin-Titles traditionally associated with other tribal chieftainships. Multiple kin-Titleholding was of course not a new development in Maohi history, but in the past most such instances involved an individual's succession by purported descent, or by fosterage. It may be that Pomare II was able to justify some of the Title taking he engaged in by reference to legitimate or contrived kinship connections, but there is no evidence that that was attempted or even considered by him to have been necessary.

A question arising at this point has to do with the distinction to be drawn, in Maohi terms, between "ruling" and "governing." I referred to such a distinction when contrasting chieftainship of kin-congregations with that of tribes. As I indicated, I believe that popular expectations regarding such roles did in fact include some differences — although I acknowledged the methodological difficulty of deciding what those differences were. In any case, while I continue to recognize the difficulty in documenting such propositions, I believe that some of Pomare II's behavior did not conform to most Maohis' notions of what constituted a "good chief" or even a "great chief." In his disregard for the welfare of his ordinary subjects he certainly did not live up to what was expected of a chief by members of his own kin-congregation. And there is reason to believe that he exceeded even the broad limits of willfulness in a tribal chief tolerated by members of his tribal unit. I touched upon this matter in my discussion of human offerings, but there were other kinds of excesses as well — that is, actions which even this long-suffering populace considered to be "excessive" — for example:

Such is the rapaciousness of the king and chiefs, that the common people can keep nothing scarcely; for as soon as they know that they have any thing valuable, it is sent for; and if denied, taken by force: the consequence is, the people are discouraged, which would be prevented if a moderate share was left them, and be an additional comfort and reward for their labour. (LMS Transactions:IV, 184)

As I attempted to show in an earlier chapter, the image of a benevolent leader who spends his time maintaining equities and redressing wrongs among his subjects is hardly applicable to Maohi tribal chieftainship even in a normative sense. Nevertheless, Pomare II appears to have maintained an aloofness from such concerns to a degree that even some Maohis may have found unwarranted. I reproduce below a rambling but revealing account by one of the missionaries:

This morning a barbarous murder was committed by one native on the body of another in a house a few yards distant from us. The murdered man it appears had been guilty of a very petty theft, and for which he lost his life. He was struck a dreadful blow on the nape of his neck with a Tommahawk that almost severed his head from his body & his right shoulder was horribly cut with repeated blows. The perpetrator of this savage act walked about afterwards with the Tomahawk in his hand, with as much unconcern as if he had been splitting up fire wood, & behaved very insolently when spoke to about it. The person killed belongs to Paheete's jurisdiction, who is now in Oparre; but it is apprehended that no notice will be taken of the matter whether by him or Pomarre (to whom the other man belongs) as he was accounted a person but of little worth, & his murderer is a man of consequence. This same man who has so inhumanly destroyed his countryman for a mere trifle we have reason to suspect of having plundered us of various valuables. Towards evening Paheete arrived in the district. He made some enquiries concerning the above murder, and ordered the corpse which its murderer had buried to be dugged up & to be placed within view of him in Edeea's house on the point where he is fled for refuge. It appears that this is held by the natives as a mark of abhorrence of the act, & what is very unpleasant to the guilty person. There is some talk among our neighbours, that the inhabitants of this district & Hapyano will revenge the murder & even burn Edeea's dwelling in which the man has sheltered himself. If this shd. be done it will certainly produce a war. The servants of Edeea removed her property from the point into br. Nott's apartment for fear of the worst.

12.24: Nothing has this day been done towards avenging the murder. It is said that Pomarre has been made acquainted with it, and justifies the deed, and has given directions that nothing be done to the man.

12.25: Missionaries agree to ask Pomare to remove the murderer from the district, & to inform him of the law of civilized nations regarding such crimes.

12.27: Brs. Eyre & Elder ... found Pomarre in Nannoo bay and declared their message to him.... He directed them to Edeea, alledging that the man belonged to her, & therefore application shd. be made to her from his removal from Matavai. After some time the chief acknowledged that the man had been unjustly killed but either did not or would not understand that no one of his subjects had right to avenge himself after such a manner, & that it belonged to him as governour of the Island to judge between man & man & punish the guilty. Nor did he seem to take any notice when told that the law of God had been violated by cruelly shedding blood. Some of his attendants were more candid than Pomarre on the occasion & confessed that the crime was to insignificant for which the man had been killed & that the murderer deserved banishment & advised the chief to banish him. He said at length that he shd. be removed out of the district, but he spoke this so coolly that there is reason to doubt his word & also still recommended that appli-

cation should be made to Edeea. As Edeea is in Attahooroo the brethren did not think it meet to proceed without knowing the Society's mind, & the Society did not see it necessary to pursue the matter further at present. (Jefferson, Journal, 23-25, 27 December 1802, LMS Archives)

It might be argued that some of Pomare II's popularly adjudged excesses or shortcomings were offset by the attention he devoted to enhancing the trappings of high rank-status and great political power — for such he did to a surpassing degree, in the form of rituals and feasts and other assemblies of many kinds. In fact, an uninformed observer might have concluded that life in Tahiti consisted entirely of, and was about equally divided between, wars and ceremonies. Such of course was not the case, but under Pomare H's regime his activities (and inactivity) were ceremonialized considerably more than those of his father or other known forebears. The question becomes, Did this frequent and highly acclamatory *symbolic* acknowledgment of Pomare II's preeminence serve his more tangible political objectives?

The answer was eventually provided by events themselves, for when his enemies began to gather on Tahiti against Pomare II he was found to have no friends outside his home district of Pare. Evidently the dramatization of social rituals was no substitute for genuine personal loyalty, or even for effectively applied coercive force. The excitement and entertainment provided by festivals may have served momentarily to raise the spirits of these sick and generally dispirited people, but even that is likely to have been offset by the cost of the festivals, which as usual was borne mainly by the populace at large.

CHAPTER 32 *AND RISE AGAIN*

HAU MANAHUNE

The next five years of Tahiti-Mo'orea history have been labeled, quite inappropriately, the period of the *Hau Manahune* — government of commoners; as we shall see, there was not much "government" in evidence, and what there was was exercised by people of commoner origin only episodically. During this period Pomare II divided his time between Mo'orea, where as "King" he continued to be respected and in general obeyed, and Tahiti, where his presence was tolerated, but only as tribal chief of the district of Pare. Meanwhile, politically significant events in the two islands developed in markedly different ways.

The period began with an unsuccessful attempt by Pomare II to reestablish himself as Tahiti's "King." The occasion was the expedition from Mo'orea to Tahiti, by the captain of the brig *Hibernia*, to recapture the schooner *Venus*;¹ Pomare II joined forces with the Europeans, but whereas the latter succeeded in their mission, the former failed dismally. Here is the story of this enterprise, as it was reported by the missionaries still on Huahine:

... Pomare and party sailed from Aimeo for Taheete in company with Capt. C., [and] while the Capt. was endeavouring to retake the vessel, which they had towed to the isthmus in her way to Tearabu, Pomare and fleet made the District of Faena where the rebels had collected their forces and canoes, but being suddenly surprised by the unexpected arrival of Pomare they left their canoes by the sea side and fled up the valley. A party of Pomare's people, consisting chiefly of those from Huaheene, pursued them, the rebels rallied and faced the pursuers, trusting to a party that lay in ambush of which Pomare's people knew nothing till they were fired upon, the royalists were put in disorder and forced to retreat with the loss of 24 men, some of them noted warriors. The rebels pursued them in their turn to the sea side where P. and party saved themselves by getting on board their canoes. They, however, succeeded in seizing and taking away all the rebels' canoes. P. and fleet then sailed for the District of Pare, and Capt. C. having recovered the vessel and the men belonging to it sailed for Aimeo, and few days after for this harbour [i.e., Fare, Huahine]. From this account it is evident that the affairs of P. are as bad as ever; he is waiting with great anxiety the arrival of the chiefs from these islands [i.e., Huahine, Ra'iatea, Taha'a, Porapora], and apparently not able to act on

the offensive till then, and from their long delay it appears very doubtful whether they will give him any assistance before it be too late. Pomare and his people are forced by the famine in Aemeo to endeavour to keep their station at Pare in Taheete where there is at present abundance of food. (Im Thurn 1925:122-3)

The wonder is, of course, that Pomare was permitted even a foothold on Tahiti, but this he managed to maintain, perhaps because Tahiti itself remained as divided as it had been decades previously; and added to this were certain other circumstances that may have militated against vigorous common action against the self-styled "King" (Newbury 1961:135-136; Morenhout 1837:II, 449-50).

If one may place any confidence in missionary estimates, the population of Tahiti during this period probably numbered no more than 9,000, and possibly considerably less.² In other words, the population as a whole was still subject to the same kinds of influences that had brought it to that nadir during the preceding decade, including especially sicknesses that reduced fertility and cut off lives before they reached reproductive age. While we cannot assume that such a situation was socially "demoralizing" in any way (a condition as difficult to define as it would be to assess), one is certainly justified in assuming that the manpower available to Pomare II's principal chiefly adversaries was not sufficient to encourage them to undertake hazardous military adventures.

Another factor that might have contributed to the Tahitians' disinterest, in general, in uniting to drive Pomare II off the island again was the widespread addiction to the new (for Tahiti) kind of alcoholic beverage mentioned earlier:

Intemperance at this time prevailed to an awful and unprecedented degree. By the Sandwich Islanders, who had arrived some years before, the natives had been taught to distil ardent spirits from the saccharine *ti* root, which they now practised to a great extent, and exhibited, in a proportionate degree, all the demoralizing and debasing influence of drunkenness.

Whole districts frequently united, to erect what might be termed a public still. It was a rude, unsightly machine, yet it answered but too well the purpose for which it was made. It generally consisted of a large fragment of rock, hollowed in a rough manner, and fixed firmly upon a solid pile of stones, leaving a space underneath for a fire-place. The but-end of a large tree was then hollowed out, and placed upon the rough stone boiler for a cap. The baked *ti* root, *Dracanae terminalis*, macerated in water, and already in a state of fermentation, was then put into the hollow stone, and covered with the unwieldy cap. The fire was kindled underneath; a hole was made in the wooden cap of the still, into which a long, small, bamboo cane, placed in a trough of cold water, was inserted at one end, and, when the process of distillation was commenced, the spirit flowed from the other into a calabash, cocoa-nut shell, or other vessel, placed underneath to receive it.

When the materials were prepared, the men and boys of the district assembled in a kind of temporary house, erected over the still, in order to drink the *ava*, as they called the spirit. The first that issued from the still being the

strongest, they called the *ao*; it was carefully received, and given to the chief; that subsequently procured, was drunk by the people in general. In this employment they were sometimes engaged for several days together, drinking the spirit as it issued from the still, sinking into a state of indescribable wretchedness, and often practising the most ferocious barbarities.

Travellers among the natives experienced greater inconvenience from these district stills than from any other cause, for when the people were either preparing one, or engaged in drinking, it was impossible to obtain either their attention, or the common offices of hospitality. Under the unrestrained influence of their intoxicating draught, in their appearance and actions they resembled demons more than human beings.

Sometimes, in a deserted still-house might be seen the fragments of the rude boiler, and the other appendages of the still, scattered in confusion on the ground; and among them the dead and mangled bodies of those who had been murdered with axes or billets of wood in the quarrels that had terminated their dissipation. (Ellis 1829:I, 229-231)

While one need not subscribe fully to this missionary judgment concerning the prevalence and effects of *ti* drinking, the practice was, nevertheless, very widespread and undoubtedly quite deleterious in terms of the ordinary work of living and war making. A drunken mob might have been easily roused to rush into battle, but could hardly have sustained a lengthy campaign.

Still another factor — both symptom and cause — prevalent in the social disarray of this period had to do with peoples' relations with their gods. Although concrete evidence for this thesis is scattered and fragmentary, it seems quite clear that the more organized means of communicating with spirits, through "official" tribal or kin-congregation priests, was giving way increasingly to the revelations of *taura*. Moreover, there were signs in some quarters that belief in 'Oro was beginning to be complemented, or even superseded, by belief in Jehovah. (This last was firmly evident in Mo'orea, as we shall see; and it seems to have been occurring in Tahiti as well.)

Meanwhile, the political boundaries of Tahiti had been reconstituted to their locations of five decades earlier, that is, into the separate tribes or close tribal coalitions of Seaward Teva, Landward Teva, Oropa'a, Aharoa, Porionu'u, and possibly Fa'a'a.³ With the exception of Papara, where Tati and then his brother Opuhara ruled, there is little or no information available concerning the identity of the chiefs of these various tribes.⁴ In any case, none of them was of sufficiently high rank-status to exercise or even affect claims to *maro ura* associated rights.⁵ In other words, with the exception of Pomare II, there was during this period no other conspicuously eminent individual in terms of rank-status among Tahiti's several *ari'i*, and this seems to have been true of the political side of intertribal relations as well.

Indeed, according to one reconstruction of the history of this period, the actual tribal chiefs were partly eclipsed by certain *taura*:

There was at this time at Tahiti an unusual man, the prophet Tino who was called Tarama, when he was in his natural state, and Oro, when he claimed to be inspired by this god. Since, during Pomare's exile, there was no *ari'i rahi* at Tahiti, it was really he who ruled the island, not exactly as chief or king, but as prophet or rather as god. He had begun to play his role even before that year and his power extended because of the calamities of the island, into recent times. He lived in Southwest Tahiti at a point called Mara, in a marae where he was brought offerings and provisions from everywhere. His authority was despotic; he did almost anything he wanted, having been feared in such a way that his slightest threat was tantamount to the most positive order. Should he have to go somewhere? Everything was prepared to receive him; women gave lavishly of their favors to him. Perhaps there has never on earth been an individual so highly honored, so powerful; his slightest wishes were irrevocable laws; the chiefs themselves did not dare to resist him; but he did not directly interfere with warfare, since his good graces were solicited insofar as his displeasure was feared. His moments of inspiration were moments of triumph. Everyone trembled then. Each side dreaded some fatal prescription; and if he had cried "War!" all would arm themselves without question. (Moerenhout 1837:II, 450-451)⁶

Eventually Tino was superseded by another "prophet" who came to exercise an even more fateful influence upon events — but more about this later on.

REINFORCEMENTS

On Mo'orea, where Pomare II again resumed residence in July 1810, two developments of major political importance began to take shape. One was his "conversion" to Christianity, which reached the point of public profession in July 1812; the other was the build-up of his military forces, mainly through reinforcements from the Leeward Islands.

Previous to this Pomare II's links with the Leeward Islands were traced mainly through his father's mother, Tetupaia (who was the daughter of Opoa's *ari'i rahi*, Tamatoa III), and through his mother's recent marriage to Tenania of Huahine. Tenuous as these connections may seem, they were substantial enough to induce the Leeward Islands' most powerful chiefs to lead large contingents of reinforcements to Mo'orea and Tahiti to help restore Pomare II to power, or perhaps to fish in Tahiti's troubled waters.⁷

Among the first of the Leeward Island chiefs to arrive was Tamatoa IV, of Opoa (Ra'iatea), along with his second daughter, Terito o Te Ra'i (later, Tere Moemoe).

The first wife of Pomare II, it will be recalled, was his father's sister's daughter, who died leaving no offspring. Shortly thereafter, 'Itia appears to have undertaken negotiations for a new wife for her son (this may in fact have been the principal reason for her move to Huahine). The woman selected for this important role was Tamatoa IV's daughter, Teri'itaria, whom Davies described as having been "the proper chief (of) the whole Island" (Newbury 1961: 126). This arrangement, however, did not work

out. According to Davies, soon after Tamatoa IV and his second daughter, Terito, arrived on Mo'orea, the former proposed that Pomare II marry her instead; whereupon Pomare II "... ascertaining that she was both younger and more handsome than the sister who had been previously proposed at once consented, and she became his wife" (Newbury 1961:137). (Thus, Pomare II's personal, aesthetic preferences were permitted to overrule the usual requirement that a person of superior rank-status be mated with one as comparably high-ranking as possible.) Then, continued Davies, "to soften the disappointment of the elder sister, she was still allowed the name of Pomare vahine wh(ich) she retained for many years afterwards." (What rights, and so forth, this entailed I cannot say; but as will be seen, Pomare Vahine proved to be a most useful ally to the man whose name she bore but whose sleeping mat she evidently did not share.)

As a sign of further changes to come, the marriage between Pomare II and Terito evidently took place without any of the ceremony traditionally associated with the linking of kin-Titles as important as theirs.

Accompanying Tamatoa IV to Mo'orea-Tahiti was also a considerable force of fighting men, but, before discussing that aspect of the Leeward Island aid to the embattled Pomare II, let us examine the nature of the social reinforcement represented by his marriage to the daughter of Tamatoa IV. To begin with, who and what was Tamatoa IV in terms of Maohi social hierarchies?

In her versions of "Royal Tahitian Genealogies" Henry listed Tamatoa IV as the third offspring of Vete'a-Ra'i Uru by his second wife (his first wife having had seven offspring, and his third wife two); Vete'a-Ra'i Uru was identified by Cook as "Ooroo" [O Uru], who during Cook's visit to Ra'iatea was highest in rank-status,⁸ but who was politically subordinate to the Poraporan, Puni. Despite his birth-order position Tamatoa IV appears to have succeeded to his father's preeminent rank-status, but what that status carried in terms of coercive authority over all Ra'iatea is uncertain. Also, one will recall a statement by Vancouver reported earlier concerning Mauri (Ha'amanemane), the "high priest" expatriate from Opoa and brother to Tetupaia, who designated his grandnephew Pomare II as successor to his (Mauri's) Opoan Title, which was characterized as having been as high-ranking as Pomare's *maro ura* one (Vancouver 1801:327). Although Vancouver implied that Mauri himself enjoyed little influence at Ra'iatea, despite his high-ranking Title there, this does raise questions concerning the nature of that Title. In other words, according to one set of reports, the highest-ranking Opoan kin-Title passed from Tamatoa III to his son, Uru, and on to the latter's son, Tamatoa IV; while, according to another reconstruction, it passed from Tamatoa III to his son (and Uru's half-brother), Ha'amanemane, and then on to Pomare II. It may be, of course, that the

reports are of two separate Titles, or that Ha'amanemane had forfeited his claims to the Opoan kin-Title upon leaving Ra'iatea, or even that it was in active dispute. In any case, the marriage of Pomare II to Terito (along with the ambiguous link between him and Terito's elder sister) served to reinforce any claim to the Title that Pomare II may have acquired from Ha'amanemane. By his marriage to Terito, Pomare II also reinforced his connections with Huahine's chiefly family, since Terito's mother was a daughter of Mato and his first wife, Fatuarai (and hence half-sister of Tenania and Mahine).

Other Leeward Island chiefs who traveled to Mo'orea during this period were Mai, Tefa'aora, Fenua Peho, Mahine and his son Ta'aroanui, Tenania (with 'Itia), and Tapoa. Mai and Tefa'aora were associated with Porapora's famed Marotetini marae, and are shown on an Emory genealogy as having been first cousins; their relationship to Pomare II, if any, is not known to us. Tefa'aora was described simply as chief of Tana'a. Mahine was Tenania's brother, and co-chief of Huahine.

Tapoa (also Teri'i Noho Rai), the most formidable of this company, is also the most difficult to place.⁹ Among his antecedents were both Tamatoa II of Ra'iatea and Puni of Porapora, and his sister was the wife of Huahine's Mahine. In some accounts he is identified as chief of Ra'iatea, in others as chief of Porapora; both attributions were probably correct as far as they concerned kin-Titles, but whether he also exercised coercive chiefly authority over both islands at any time I cannot discover. (His main tribal base seems pretty clearly to have been Porapora, where his most serious political rival was Mai.)

In any case, even though Tapoa's kinship connections with Pomare II were quite remote — Tamatoa II having been their common great-great-great-grandfather — his presence in Pomare II's camp was considered the *sine qua non* for the latter's political (i.e., military) comeback.

Along with these Leeward Island chiefs went hundreds of their male subjects, but some of the actions of this impressively large force are more suggestive of peaceful pilgrims than of battle-eager warriors. For example, Davies reported that Tapoa (or was it Tamatoa?) brought with him from Opoa the sacred canoe of the Opoa 'Oro image, along with a "deputy" image made from the 'Oro image's bark cloth and feathers, and with these a company of priests. Then, "after many ceremonies at the principal maraes on Mo'orea it [the Opoa 'Oro objects] was sent to Tautira, calling on their passage at several maraes and offering many prayers" (Newbury 1961:137). Indeed, the whole expedition turned into something of a festival:

In January 1811 Pomare and the leeward islanders went over to Tahiti. But peace having been established they were well received by all. The rebels came to Papeete to meet Tapoa and prepared a great feast for the stranger the food

for wh(ich) was brought from every district on Tahiti. Previous to the arrival of this reinforcement the two hostile parties seem to have been of about equal strength and now that at least 700 more had joined Pomare it appears strange that no attempt was made to recover his lost kingdom. It was very generally supposed that Tapoa, although he had joined Pomare with many of his people, was yet not very hearty in the aid wh(ich) he had so tardily rendered, and this impression may have prevented Pomare from endangering a peace wh(ich) had secured to him one of the five districts of the island. Instead of fighting their time was spent in feasting and dissipation, and after a few months numbers returned to their own island. (Newbury 1961:138)

In fact, however, the very presence of this force probably served to discourage the enemies of Pomare II from attacking him again.

CONVERSION

The second development of major political importance to take place at this time was the "conversion" of Pomare II to Christianity. "In July 1812," Davies wrote, "King Pomare acquainted several of the brethren with his full determination to cast away his false gods, and former evil practices, and that it was his sincere desire henceforward to embrace the Christian Religion as the only true one; to receive Jehova as his God, and Jesus Christ as his only Saviour and atonement; and that if they thought proper, they might write down his name as a candidate for Baptism; he desired also they might pray for him" (Newbury 1961:153).

This was not the first intimation of the change in Pomare II's public attitude toward religious matters. I noted earlier the circumstance of his marriage to Terito having taken place without traditional religious practices. Somewhat later the death of the young daughter of 'Itia and Tenania brought forth an even more positive response. During the child's illness so many prayers and offerings were made to the native gods that her death moved some influential people to angry recriminations, and led Pomare II to announce his intent to forsake their "false and foolish" gods and thenceforth worship Jehova (Newbury 1961:138).

One could speculate endlessly, but still more or less fruitlessly, concerning the circumstances and motives behind this change in Pomare II's outward behavior. (I shall not even begin to conjecture about its sincerity and depth, mentally and affectively.) His bountiful train of human and other offerings to 'Oro may have accompanied some of his former successes, but had not saved him from disaster in the end. Also, one could not continue forever to ignore the reality and potency of a god (i.e., Jehovah) whose devotees were obviously so numerous, so knowledgeable, so affluent, and so militarily unconquerable. In any case, it is evident that when circumstances encouraged Pomare II to become more preoccupied with these misgivings and reasonings, the missionary Nott was there to reinforce them. (The missionaries began to arrive back in Mo'orea in 1811, but it was Nott who had

remained more closely and continuously associated with Pomare II during the Mo'orea "exile," when the latter's profession of belief took place.)

As one would expect, Pomare II's public declaration of belief in Jehovah led many other persons to profess, including some of the visiting chiefs. In addition, the missionaries reported signs of "conversion" among people who cannot be viewed as emulators of Pomare II. I shall not attempt to chronicle or explain at any length the tide of public "professions" that began to rise with that of Pomare II, in 1812, and ended some three to four years later by engulfing the whole population. Frustration with the old gods played a part, as did "miracles," missionary exhortation, genuine emulation, and, of course, political expediency. One of the most dramatic, and probably influential, episodes in this movement occurred at Papetoai, Mo'orea, in February 1815, when Pati'i, the local high priest of 'Oro, committed all the images in his care to flames.

The sincerity of most of the "conversions" did not entirely satisfy the missionaries' Calvinistic standards in terms of personal behavior,¹⁰ but the *pure-atua* (the pray-to-God people), as the converts came to be called, had by 1813 increased so much in number, and were so widespread, that they became a factor in intra-and intertribal politics. In some areas on Tahiti the *pure-atua* were threatened and attacked by pagan tribesmen, and thus they constituted a divisive element, locally. On Mo'orea and Pare, on the other hand, they became the official party; so the process of conversion became more or less identified with the movement to restore Pomare II's political fortunes.

Soon after he made his public profession of belief at Mo'orea, an emissary arrived from Tahiti inviting Pomare II to resume his residence there. The only report on this noteworthy event is contained in Davies' *History*: "Soon after the above circumstance [i.e., the public "profession"], some of the chiefs of Tahiti came over to fetch the King, professing their desire of restoring him to his government, at least to a part of it, and promising to use their endeavours for that purpose" (Newbury 1961:154). No single clue as to the identity of these chiefs is provided, and no word written as to the circumstances that led them to extend this fateful invitation.

Moerenhout, too, found this development puzzling: "... a démarche for which no reliable explanation has yet been discovered" (1837:II, 455). After canvassing the opinions of Tahitians, many years after the event, he reported as follows:

Some, jealous of Oupoufora [Opuhara], said that those who came to make these propositions to him were sincere, others pretended that this was only a trap; while an opinion more generally shared is that they wished to maintain the old religion, by preventing Pomare from becoming Christian....

Needless to say, Pomare II accepted the invitation, and with him went

to Tahiti his Leeward Island chiefly visitors and most of their men (whose numbers by this time had increased to almost a thousand). A little further along in Davies' *History* the report is amplified somewhat:

As to the natives, it has been already observed, that Pomare's government in Tahiti had not been restored. He had been invited over, by some of the chiefs, and the District of Matavai and some others were in a manner given up to him, but he had reason to suspect the sincerity of those concerned in the gift, and war was still agitated among the different chiefs. Pomare had been residing for some time on the little island at Papeete (or Wilks harbour) and was there by sufferance as it were for it does not appear the District of Pare was truly given to him. The strong party of the Leeward islanders that were with him, kept his enemies in awe and fear of attacking him; and on the other hand, he had some hope of regaining his authority without commencing hostilities. The former religious services, sacrifices to the gods &c had been entirely abandoned on Pomare's side, and though *Tapoa* and others of the Raiateans would have had recourse to their former heathen customs, they dared not set about it in present circumstances. (Newbury 1961:158)

The year 1813 passed without any new major political developments. Pomare II remained at Pare with some of the Leeward Islanders, while the rest of the Leeward Islanders remained on Mo'orea. Conversions continued apace at both locations, so much so that when an 'Oro *taura* of Tahiti visited Mo'orea he was met, according to Davies' *History*, "with unexpected ridicule and contempt everywhere" (Newbury 1961:156). Even where the *pure-atua* were in a small minority, the *History* continues, although "several of those things [i.e., pagan practices] were still kept up in some measure, tho' the circumstances of the Island at that time had greatly deranged the system. Many of the people everywhere seemed to doubt about the efficacy of their prayers and sacrifices,^[11] and the various [Christian] truths which had been so often and so long promulgated among them seemed at times to come to remembrance." (p. 158)

In October 1813 a *tavaru* was held at Pare. Since participation in such tribute rendering was indicative, traditionally, of the shape of political or at least rank-based hierarchic structures, it would be illuminating indeed to learn who attended and how the objects were transacted; but the only information recorded is that it was attended by the co-chiefs of Huahine with their people, along with 'Itia, and by most of the people then residing at Mo'orea (Newbury 1961:168).

In January 1814 'Itia died, and shortly thereafter her husband too; earlier this would have represented a significant political setback for Pomare II, but with his connections with Huahine now firmly established, these deaths were for him more of a personal than a political loss.

In July, Tamatoa, Fenuapeho, and most of the Ra'iateans (and presumably most Taha'ans) left Tahiti and Mo'orea for home.¹² Shortly thereafter Pomare II removed to Mo'orea, probably because of the insecurity of his position in Pare resulting from the departure of the main forces of Leeward

Islanders. In fact, despite steady increments to the ranks of the *pure-atua*, on the surface at least it appeared for a time that Pomare II's political fortunes were again in decline. Then there occurred one of those series of "accidents," so characteristic of Maohi political history, that wholly reversed the trend of events.

JEHOVAH VERSUS 'ORO

In May 1814 a flotilla of canoes arrived at Mo'orea bearing Pomare Vahine and a retinue of Huahine people. As eldest child of Tamatoa IV and as one-time consort-designate of Pomare II (whatever that signified!), her visit was of extraordinary ceremonial consequence. She and her following remained for a year on Mo'orea, where most of them became "converted," and then continued to Tahiti to carry out a grand tour. Less than two months later, the party hastily returned to Mo'orea, accompanied by many Tahitian *pure-atua*. The following weeks brought other canoe loads of refugee *pure-atua* from Tahiti, along with reports of conflict among the pagans themselves. The missionary version of these events was provided by Ellis. His account of the episode offsets reports of the glitter of Pomare Vahine's ceremonious tour of Tahiti:

When a present of food and cloth was brought to the visitors by some of the chiefs of Tahiti, the priests also attended, and, observing the party disinclined to acknowledge or render the customary homage to the gods, began to expatiate on the power of the gods, and, pointing to some bunches of *ura*, or red feathers, which were always considered emblematical of their deities, employed insulting language, and threatened with vengeance the queen's companions. One of Pomare-vahine's men, the individual who had offered their acknowledgments to God, on the presentation of food in Eimeo, hearing this, and pointing to the feathers, said, "Are those the mighty things you so extol, and with whose anger you threaten us? If so, I will soon convince you of their inability even to preserve themselves." Running at the same time to the spot where they were fixed, he seized the bunches of feathers, and cast them into a large fire close by, where they were instantly consumed. The people stood aghast, and uttered exclamations of horror at the sacrilegious deed; and it is probable that this act increased the hatred already rankling in the bosoms of the idolatrous party. (Ellis 1829:I, 237-238)

The man credited with this preposterous act (and with the unlikely phrases that accompanied it) was a recent convert of Poraporan origin. About him Ellis wrote (with an understatement that surely must constitute some kind of record): "He was a man of decision and daring enterprise; and though on the occasion in Tahiti above referred to, he may have acted with a degree of zeal somewhat imprudent, it was a zeal resulting, not from ignorant rashness, but enlightened principle, and holy indignation against the boasting threatenings and lying vanities of the priests of idolatry; to whose arts of deception he had formerly been no stranger" (1829:I, 239).

As Ellis would have put it, the idolatrous party continued to rankle,

and the chiefs of Pare, Mahine, and Ha'apaino'o formed a project to exterminate every *pure-atua* among them. Ellis continued:

The influence of the Bure Atua in the nation, from the rank many of them held, and the confidence with which they maintained the superiority of their religion, together with the accessions that were daily made to their numbers from various parts of the island, not only increased the latent enmity against Christianity which the idolaters had always cherished, but awakened the first emotion of apprehension lest this new word should ultimately prevail, and the gods, their temples, and their worship, be altogether disregarded. To avoid this, they determined on the destruction, the total annihilation, of every one in Tahiti who was known to pray to Jehovah.

A project was formed by the pagan chiefs of Pare, Matavai, and Hapaiano, to assassinate, in one night, every individual of the Bure Atua. The persecuted party was already formidable in point of numbers and rank, and the idolaters, in order to ensure success in their murderous design, invited the chiefs of Atehuru and Papara to join them. The time was fixed for the perpetration of this bloody deed. At the hour of midnight they were to be attacked, their property plundered, their houses burnt, and every prisoner secured, to be slaughtered on the spot. The parties, who for a long time had been inveterate enemies to each other, readily agreeing to the proposal, were made friends on the occasion, and cordially assented to the plan of destroying the Christians. The intended victims of this treachery were unconscious of their danger, until the evening of the 7th of July; when, a few hours only before the horrid massacre was to have commenced, they received secret intelligence of the ruin that was ready to burst upon them.

Circumstances, unforeseen and uncontrollable by their enemies, had prevented the different parties from arriving punctually at their respective points of rendezvous; otherwise, even now escape would have been impracticable, and destruction inevitable, as the Porionu, inhabitants of Pare, Matavai, and Hapaiano, would have been on the one side, and in their rear, and the party from Atehuru and Papara on the other. The delay in the arrival of some of these, afforded the only hope of deliverance.

At this remarkably critical period, the whole of the party having to attend a meeting either for public worship, or for some other general purpose, assembled in the evening near the sea. No time was to be lost. Their canoes were lying on the beach. They were instantly launched; and, hurrying away what few things they could take, they embarked soon after sunset, and reached Eimeo in safety on the following morning, grateful for the happy and surprising deliverance they had experienced. The different parties, as they arrived towards midnight, learned, with no ordinary remorse and disappointment, that their prey had been alarmed, and had escaped beyond their power.

A large body of armed and lawless warriors, belonging to different and rival chieftains, thus brought together under irritated feelings, and perhaps mutually accusing each other as the cause of their disappointment, were not long without a pretext for commencing the work of death among themselves. Ancient animosities, restrained only for the purpose of crushing what they considered a common enemy, were soon revived, and led to an open declaration of war between the tribes assembled. The inhabitants of Atehuru and Papara, who had been invited by the Porionu to join them in destroying the Bure Atua, attacked the Porionu; and, in the battle that followed, obtained a complete victory over them, killing one of their principal chiefs, and obliging the vanquished to seek their safety in flight.

After this affair, the people of Taiarabu joined the victors. The whole island

was again involved in war, and the conquering party scoured the coast from Atehuru to the eastern side of the isthmus, burning every house, destroying every plantation, plundering every article of property, and reducing the verdant and beautiful districts of Pare, Faaa, the romantic valleys of Hautaua, Matavai, and Hapaiano, and the whole of the north-eastern part of the island, to a state of barrenness and desolation.

Success did not bring peace or rest to the victorious party. Proud of their triumph, insolent in crime, and impatient of control, the Atehurians and natives of Papara quarrelled with the Tairabuans, who had joined them in destroying the Porionu. A battle followed. The natives of Tairabu were defeated, and fled to their fortresses in the mountains of their craggy peninsula, leaving the Oropaa masters of the island.

Numbers of the vanquished fled to Eimeo, where they were received by the king, or protected by the chiefs, who had taken no part whatever in the wars that were now desolating Tahiti, and who determined to observe the strictest neutrality; or, if they acted at all, to do so only on the defensive, should invasion be attempted, (pp. 239-242)

Moerenhout, drawing his information from Paparan sources some two decades after the fact, provided a different perspective on these events. He began with an account of the tour of Pomare Vahine:

She disembarked at Pare (or Papaoa) with a large entourage. She was greeted most respectfully and, as was customary, was presented with bark cloth and other gifts; however, one of her followers, a convert to Christianity, audaciously aroused the anger of a priest (and of the gods) by his insulting gesture of ripping off some of the red feathers that covered the images and throwing them into a brazier that had just been lit. The populace was surprised and horror stricken, and the humiliated priest cried out for revenge; thereupon commenced a conflict which one can label the *Religious War*, on account of the circumstance that an attempt was made, at the priest's instigation, to slay all the visitors. The chiefs of Matavai and the rest of northwestern Tahiti made up their minds to attack the *pure-atua* — the Christians — but in view of the limited number of the former they prevailed upon the Paparan chief, Opuhara, to join with them in the enterprise. Opuhara immediately set out with the warriors of Papara, along with those of Atehuru as well. With him he also took the well-known *taura* named Tarama, who up to that time had been a center of superstitious awe and who was a deadly enemy of the new [Christian] religion, having seen in it a threat to his own position of power (which, however, was already in something of a decline even before Christianity's rise in influence).

En route to battle it was noticed [among the pagans] that one of their number, a hitherto unknown commoner named Maro, displayed the usual signs of being possessed by a spirit, namely, a solemn expression on his face and a strip of bark cloth wrapped around one arm. Tarama indignantly accused him of imposture, whereupon the latter, instead of replying in words, fixed the former with such a ferocious stare that the frightened onlookers cried out in chorus, "He is possessed! He is possessed!" Opuhara alone seemed not to be taken in by the skillfully acted grimaces, et cetera; he silenced Tarama's objections and walked on, but somewhat apart from the others, for the first time giving evidence of some indecisiveness and lack of energy.

The agreed upon time for attacking the Christian party was midnight. Meanwhile, wholly ignorant of the fate planned for them, the latter remained calm and secure up to the time, at sunset, when a secret message arrived to warn them of their danger. In order to escape they would have to move immediately and in a

way calculated to arouse no alarm in the hostile Matavaians and Paparans, who were strong enough to destroy them and who were by then only a short distance away. This they succeeded in doing, having embarked in their canoes and stolen away without being discovered in the act. It is still not known for certain who it was who sent them the warning, but it is thought [by some] that Opuhara himself had done so; although this great, open-handed chief had been on occasion a rival of Pomare's, he would have been unwilling to take part in a conspiracy of this kind — especially one involving some chiefs whom he knew to be unfriendly toward him and whom he detested even more than he disliked Pomare himself.

In any case, it was Opuhara's tardiness in arriving that saved the Christian party. If he had led his men with his customary speed, he would have reached the environs of Papaoa before nightfall, and the Christians would not have been able to escape as they did, unseen. The new *taura*, Maro (or rather, Aretaminu — for so quickly had he taken on a new name), wished to join immediately in pursuit in order to attack Pomare Vahine and her party, promising victory and annihilation of all the Christians; but Opuhara refused to do so, as did the Chief of Puna'auia, thereby indicating that [even the pagan] Tahitians had begun to lose some of their superstitious awe for *taura*. Thus, the queen's canoes were able to make for Mo'orea that very night; in pointing this out, Maro accused the chief [Opuhara] of negligence and threatened him with the wrath of his gods. Opuhara, however, seems not to have been moved by this threat, stating that he had no ill will toward [Pomare Vahine] or her people, and that instead he would turn his attack against his ancient enemies, the Poreonu'u. This he did, having proceeded immediately to Papaoa, chasing after the enemy and killing one of their chiefs. The Poreonu'u retired to Matavai and sent forth an envoy to ask for peace. Maro agreed to their proposal on condition that they would send him a Christian for sacrifice to 'Oro (by whom Maro himself was possessed). The terrified Poreonu'u hastened to comply by killing a young convert and sending his trussed body to Maro at Papaoa. The latter, however, replaced the corpse in the canoe, ordered it to be returned to Matavai, and advised the envoy that if the chiefs of Matavai would set fire to their Arioi lodge house the sight of the blaze would serve as a signal for the Oropa'an army to return home. When the envoy reached Matavai with the sacrificial victim and informed the anxiously waiting chiefs of the wishes of the *taura* they hastened to comply. But then, when Maro saw the flames rising he immediately cried out, "Victory! Victory!" and, explaining the fire signal as a sign of triumph, he urged Opuhara to proceed to Matavai [to finish off the enemy]. Then, as Opuhara and his attacking force drew near them, the Poreonu'u took flight and abandoned everything in their rush to reach their fort in Ha'apaiano'o. Thereupon, the victors laid waste to the district, burning all the houses and massacring all those whose age or infirmities hindered their escape. From there they proceeded to Ha'apaino'o where they remained for four days encamped on the coastal plain. On the fifth day Maro announced that it would be necessary to attack the fort itself, which was situated some distance in the interior. However, the besieged force was so panic stricken that they were almost incapable of resistance, and after a light skirmish they fled into the mountains upon the first attack of the Oropa'a. All told, only a dozen or so people were killed.

The Oropa'a took over the fort and were joined there by the Seaward Tevans, with whom they were then at peace. When the Tevans arrived, Maro was sitting on a high spot of ground close to Opuhara and the other chiefs. As usual he was in a somber mood, seemingly lost in deep thoughts, and appeared not to have seen the Tevans for a while; but then he raised his head and demanded to know who the newcomers were. When told that they were "friends, from Tairapu," he

cried out, "Friends nothing! They are our enemies, and we must attack them forthwith." The chiefs, however, refused to do so, but some of them sought to appease him. Meanwhile, after learning what the *taura* had urged, the Seaward Tevans desired to leave, and despite all Opuhara's reassurances they kept to themselves and on guard. Nothing happened, however, so that they all found courage again and rallied their forces in order to take after the unfortunates who had sought refuge in the mountains. Then, after two days, the victorious forces departed from Ha'apaino'o and went to Papetoare, where they carried the corpses of their slain enemies around the marae, and — on orders from Maro — returned to their homes in Papara and Puna'auia, lest their continued absence encourage the Mo'oreans to go there and attack their women and children.

Scarcely had they arrived at Afaina [?] when many of them, believing peace to have been restored, took off for the mountains in search of the friends and relatives who had sought refuge there during the absence of their chiefs and fighting men. Then, while persuading the refugees to return to their homes they received news that the *taura* Tino (or Taramea), the one who had played such an influential role in former years but who was now eclipsed by Maro, had joined with the Seaward Tevans and they were marching to attack Papara. The only force left [in Papara] to oppose this attack consisted of Opuhara and some thirty of his subjects, plus the *taura* Maro. The chief wanted to retreat before the enemy's superior 200-300 man force, but Maro, on hearing that his archrival was with the enemy, ordered the Paparans to stand fast, telling them that Taramea no longer had any power and that the god 'Oro would fight on their side. And so it happened that Maro, whether out of hatred toward his rival or out of pure enthusiasm, marched at the head of this little troop against the Tevans, even after having been abandoned by Opuhara, who was highly skeptical of his prediction. Whereupon the Paparans actually routed the Seaward Tevans, Maro having killed five or six by his own hands. The rest of the Seaward Tevans managed to escape, and many of them, fearful of further pursuit by the Paparans, went over to Mo'orea to join up with Pomare. (II, 458-464)

In December of 1814 Pomare returned to Tahiti accompanied by his supporters and most of the fugitives from the recent Tahitian wars. I reproduce two versions of the episode, not only because of the climacterical importance of the events themselves but because of the contrasting perspectives on them served up in these different versions. First, the missionary version, as set forth in the Davies' *History*, presents a touching picture of a peace-loving Pomare II returning home merely to carry out his official duties:

After this [the defeat of Tairapu by Papara] there was a prospect of peace being established; and the people, who on account of religion, had fled to Eimeo to save their lives, were invited to return to Tahiti, and take repossession of their respective lands. This made it necessary for the King and his people, and most of the people about us to go over to Tahiti in company with the different parties of the refugees, and according to an ancient custom of the country, to reinstate them in a formal manner in their old possessions.

On the arrival of the king and those who followed him, at Tahiti, the idolatrous party appeared on the beach, in a hostile manner; seemed determined to oppose the king's landing and soon fired on his party; but by the king's strict order the fire was not returned, and at last apparently issued in peace and reconciliation.

In consequence of this, several of the people returned peaceably to their different lands; but still fears and jealousies existed on both sides. This state of things continued till Sabbath day Novr 12th 1815 when the heathen party, taking advantage of the day, and of the time, when the king and all the people were assembled for worship, made a furious, sudden, and unexpected assault, thinking they could at such a time easily throw the whole into confusion. They approached with confidence, their Prophet having assured them of an easy victory. In this however they were mistaken. It happened that we had warned our people before they went to Tahiti, of the probability of such a stratagem being practiced should war take place; in consequence of which they attended worship under arms; and tho' at first they were thrown into some confusion, they soon formed for repelling the assailants; the engagement became (warm) and furious, and several fell on both sides.

In the king's party there were many of the refugees from the several parties who had not yet embraced Christianity; but our people not depending upon them took the lead in facing the enemy, and as they were not all engaged at once, being among bushes and trees, those who had a few minutes respite, fell on their knees, crying to Jehova for mercy and protection, and that he would be pleased to support His cause against the idolatry of the heathen. Soon after the commencement of the engagement, *Upufara* the chief of Papara was killed, this when known threw the whole of his party into confusion and Pomare's party quickly obtained complete victory. (Newbury 1961:191-192)¹³

Moerenhout's version was written from the vantage point of Papara:

Those last conflicts, which were more destructive to property than to life, resulted again in bringing all of Tahiti under Opuhara's sway. But in doing so they made a near-desert out of the island and left the conqueror with only a small force of warriors, most of the defeated ones having escaped to Mo'orea and joined forces with Pomare. As for the latter, when he saw his forces thus augmented day by day, he began to entertain the ambition of conquering Tahiti itself. Meanwhile Opuhara, with what remained of his forces from Papara and Atehuru, made ready the foodstuffs and bark cloth for a *puriri* ceremony (a rite of thanksgiving), or *Te Deum ...*; it was during these preparations at the Tairapu marae [the Taputapuatea marae at Atutira?] that he learned of Pomare's arrival at Pape'ete, on the northeastern coast of Tahiti Nui. At this news the *taura* Maro became highly excited and mobilized the warriors; in a state of possession he predicted the wholesale destruction of the party of Christian converts. Opuhara, similarly aroused by his enmity for his old rival, set forth to battle with all his own warriors and with those recently united to his cause.

Despite their lack of intrinsic interest I have been at pains to record the details of all these petty wars because it was through them that was brought about such a total change in the life of these Islanders, namely, the successful introduction of a wholly new religion. In taking refuge with Pomare on Mo'orea, those defeated in these wars served not only to augment his fighting strength but also swelled the ranks of converts to the new religion — encouraged, as they were, by the example of their new chief and reinforced in their change by their belief that their former gods had forsaken them.

Thus, the army with which Pomare returned to Tahiti was in large measure one of Christians; that is to say, like Pomare himself this army placed its trust in a god said to be more potent than 'Oro or any other gods known to them (whose existences, by the way, the missionaries did not deny, but rather lumped them with their *varua ino* — evil spirits or demons — and in opposition to the True God).

On a Sunday in December [*sic*] ... Pomare arrived from Mo'orea, accompanied by about a thousand people, and he betook himself to services in the chapel constructed at Nari'i, in WSW Tahiti. Scarcely had the services begun when gunshots were heard, announcing the approach of the enemy, who at the very same moment came into view as they rounded a point of land some distance away — all of which set forth cries of "War! War!" Fortunately, the Christians had armed themselves — although the enemy had planned the attack for that day [i.e., the Sabbath] in the belief that they would have found them to be without arms or other means of defense (or so Maro had predicted). As soon as the enemy came into view most of the Christians became eager to rush into battle but Pomare held them in check, telling them that the prayer services must first be completed — for, the whole outcome would depend on the backing given their side by God. (In this respect, evidently, Pomare had not changed his views: as he had in the past done with 'Oro, he now put all hope and faith in the protective powers of Jehovah.) When their prayer service was finished the Christians drew up in battle formation: the more zealous ones in the front lines, the recent [Tahitian] refugees (whose loyalties were more uncertain) in the center, and the Mo'oreans in the rear.

The enemy advanced to attack in full cry, under the leadership of the courageous Opuhara and urged on by the *taura* Maro, who assured them a certain and easy victory. Some of the attackers wavered when shots from a cannon [of Pomare's], mounted on a small boat and fired by a European, killed a few of them, but their leader brought them back into order, saying: "Those of you who have been killed brought it onto themselves. Can't you see that the enemy's shots usually go either too high or too low? If they fire too high you must lower yourselves, and if too low simply leap into the air. Just look at me in front of you all; they will not hit me."

The heathens attacked recklessly, and for a time Pomare's forces seemed in danger of losing the fight. The latter fought with unusual bravery, but they lost large numbers of men and gave up much ground, so that it appeared [for a while] that the victory would go to Opuhara. This chief continued to stay out front and to lead the attack, thereby inspiring his troops by example and going to their assistance when needed — until, that is, he himself was felled by a bullet. Opuhara did not succumb immediately, and raised himself enough so that he continued to face the other side. On seeing him struck down several of his companions rallied round him to carry him to safety, but realizing that his wound was mortal he ordered them in a voice still firm with command: "Leave me here; instead, fight on and avenge my death. Over there is the one who has slain your chief," he added, pointing to one of Pomare's men. At this, his companions rushed into the attack — a handful of men against a whole formation of Pomare's best fighters....

Despite the loss of Opuhara his troops continued to fight with great ardor — indeed, the condition of their chief seemed to inspire them to even greater efforts. Meanwhile, however, Pomare's forces were encouraged [by the felling of Opuhara] and held tenaciously to their ground. [From then on] the heathens lost more and more of their leaders on account of the Christians' greater number of firearms; particularly deadly was the firepower directed at them from several boats that were under Pomare's personal command and that struck them on their [seaward] flanks. Finally, the heathens had to give way; and with this their ranks broke in disorder and they turned and fled. Such was the sight that met the eyes of the fallen Opuhara as he breathed his last breath. (II, 464-468)

Considering their reinforcements (from Mo'orea and the Leeward

Islands) and the greater number of firearms in their hands, it is not surprising that the Pomare forces finally prevailed. What is surprising, however — and not only to the student of Maohi society, but, evidently, to most Maohis of that period as well — is the fact that Pomare II held back his followers from completing their destruction:

Flushed with success, in the moment of victory, the king's warriors were, according to former usage, preparing to pursue the flying enemy. Pomare approached, and exclaimed, *Atira!* It is enough! — and strictly prohibited any one of his warriors from pursuing those who had fled from the field of battle; forbidding them also to repair to the villages of the vanquished, to plunder their property, or murder their helpless wives and children. (Ellis 1829:I, 252)

The final events in this fateful episode are described in the missionary *History*, under the date of November 17, 1815:

Many people returned these days from Tahiti, and brought news that the *Teva i uta* and the *Oropaa* viz those of Atehuru, Papara &c who had fled, were come to Pomare and had delivered up their muskets, and that it was said all these were resolved to embrace the new Religion. Pomare had sent people to destroy the maraes and altars and fetch Oro from Tautira, that he also might undergo the same fate. [Fig. 32-1]

Some days after this the king wrote to the miss, if they could make it convenient, it would be well if two could come over to Tahiti to instruct the people how to proceed in the present new state of things. (Newbury 1961:193-195)

“NEW STATE OF THINGS”

With the battle of Fei Pi all effective political opposition to Pomare II was extinguished in Tahiti and Mo'orea. The monarchy therewith established

FIGURE 32-1. From *Missionary Sketches*, July 1819. London Missionary Society.

was preeminent in terms of both coercive authority *and* rank-status, and in addition the monarch became head of the official Christian (Protestant) Church.

In 1843 French colonial rule superseded the monarchy's coercive, governmental authority, but the Pomare Dynasty was permitted to retain its ceremonial prerogatives for another four decades. — But that is another story, better told elsewhere.

NOTES

CHAPTER 25

- 1 As I acknowledged previously, I am conscious of the difficulties of such an undertaking and am not altogether confident that I have succeeded in carrying it out.
- 2 Population figures in this section are derived from the Tupaia-based estimates (see chap. 2), and thus are subject to innumerable qualifications.
- 3 “Tetahah” appears on Cook’s map of 1769, and later it was used interchangeably with “Fa’a’a” to refer to the territory between Puna’auia and Pare. It may possibly represent a misreading of “Te Fana,” as Newbury implied (1961:xxxv).
- 4 See chap. 16, section on Tahiti-Mo’orea. According to Rodriguez, Reti’s domain extended only *up to* Mahaena on the north (Corney 1919:165).
- 5 Emory’s Papara genealogy, however, equates Te Vahine Moeatua with Purai, and lists Purahi as a younger sister of the latter (Marae Traditions).
- 6 Morrison identified Ti’itorea as “uncle” of the younger Vehiatua, but the genealogical basis for this is unrecorded.
- 7 According to Corney’s note Bougainville lost six anchors and kedges during his brief stay at Hitia’a: “The anchor recovered by the natives weighed 700 lbs., and was given to Puni, the noted Chief of Porapora who subjugated the greater part of Ra’iatea” (1919:136n).
- 8 See, for example, Jefferson, Journal, 24 January 1806, LMS Archives.
- 9 Captain Winnifred Brander, “Society Island Genealogies,” manuscript, Bernice P. Bishop Museum, Honolulu, Hawaii.
- 10 This “Tee” (i.e., Ti’ipari’i) was probably the individual identified as Toppere by J. Forster, who described him as having “the direction of Matavai” (1778:354).
- 11 Another name prominent in the earliest accounts of Matavai and its vicinity was Robertson’s and Cook’s “Owhaa” (Robertson 1948:169–175; Beaglehole 1955:75n) and Thomson’s “Ofa’a” (Thomson, History, p. 36). Henry transcribed this name as O Hau, which raises the possibility of its having been an official designation for Ti’ipari’i — i.e., as *hau* of this tribe. However, I consider this an unlikely transcription and settle for Thomson’s identification of “Ofa’a” as a landed proprietor of Point Venus — in other words, a *ra’atira* of only local consequence.
- 12 Bligh 1789:I, 372; Vancouver 1801:262, 285; Bligh 1792:125a. It was Poeno

who was custodian of Webber's portrait of Cook, the back of which served as a ship's register for a while.

- 13 The bases for these conflicting interpretations, which were touched upon earlier, are set forth in Gunson 1963 and Newbury 1961.
- 14 In his journal of his voyage of 1792, under the date of 29 April, Bligh identified Tutaha as "uncle" of Tu (Pomare I), but his journal of 1789 indicates that he probably intended "great uncle." See also Beaglehole 1955:clxxxii.
- 15 Beaglehole 1955:95-96; Beaglehole 1962:I, 280-282. It will also be recalled that Tutaha's relations with Hitia'a's chief, Reti, were such that he was able to visit Bougainville there.
- 16 Tutaha evidently had some proprietary rights in the important Pa'ea marae, Maraeta'ata, but I cannot discover the basis for these rights, except possibly from "Old" Tutaha's mother, who is given in Emory's Tarahoi genealogy as having been a To'ofa, the Title usually associated with that marae.
- 17 While this list is of Teu's offspring, there is some question as to whether the mother of all of them was in fact Tetupaia. For example, Adams stated that Ari'ipaea (Te Ari'i Fa'atou) was son of another of Teu's consorts (1901:100).
- 18 My bases for setting the birth years of these first three offspring of Teu and Tetupaia are as follows. Most writers (correctly, I think) identify Te Ari'i na Vaho Roa as the young woman seen by Cook et al. in 1769 in company with Papara's young *ari'i*, Teri'irere (and who was at the time either his wife or his wife-to-be). On that occasion Cook estimated her age at about 18 or 20, and Banks estimated it at 16 (Beaglehole 1955:103; Beaglehole 1962:293), which would put her birth between 1749 and 1753. In December 1772 Boenechea guessed Pomare I to be 20 to 22 years old (Corney 1913:319), and writing in August 1773 G. Forster put his age at 24 or 25 (1777:I, 326). These estimates would locate the young *ari'i*'s birth date between 1748 and 1752. Adams put the date at about 1743 (1901:88) but on what evidence I cannot discover. I have found no observer's estimate of the age of Ari'ipaea Vahine, but, if she was in fact born after Te Ari'i na Vaho Roa and before Pomare I, her birth date must have been as given in my list.
- 19 Gunson — mistakenly, I believe — identified Morrison's Ari'ipaea Vahine with "Ine Metua" (i.e., Vahine Metua) (1964:64), another famous Tahitian woman whom I shall identify further. Vahine Metua was wife of Teu's second son, Ari'ipaea (Te Ari'i Fa'atou).
- 20 Pomare I shared his sleeping mat with a number of males as well (Jefferson, Journal, 8 June 1799, LMS Archives).
- 21 Gunson identified Vavea as 'Itia's father (1964:62), in opposition to the identifications made by Henry (1928:268) and Emory (Marae Traditions).
- 22 See also Turnbull 1813:280.
- 23 "Tynan with his Wives, Father and Brothers dine with me every Day. A Cannoe with a Party came over from Moreah to see the Ship, there were some Friends of Whyerreddee for whom Tynah had recourse to my lockers, to satisfy with presents. Tynah is a perfect Fool to this Woman. She rules him as she pleases, while Iddeeah quietly submits, and is contented with a moderate share of influence." (Bligh 1792:133b).

- 24 In describing Teu's offspring G. Forster listed as number five "T'-aree-Watow [who] appeared to be about sixteen years of age [in 1776]; he told us he had another name but which I have forgotten, from whence I conclude that this which I have mentioned is only his title" (1777:II, 96). Other attempts to transcribe Te Ari'i Fa'atou were "Tarevatee" and "Tarevatou."
- Adams identified Ari'ipaea as half-brother of Pomare I (1901:100, 111, 113) but this is confirmed by no other primary source that I know of.
- 25 In 1792 Bligh also included Tetaha (along with Pa'ea, his "Taaigh," and Puna'auia, his "Paterre") within the "land Division" of Atehuru (1792:166).
- 26 "Lycurgus" was the nickname given to Tupura'a i Tamaiti by Banks, in admiration for the effective manner in which he recovered and restored some objects stolen by his subjects from the Europeans (Beaglehole 1962:I, 255-258).
- 27 The Beaglehole edition reads, "... one of the Chiefs of Attahourou" (1967:198), which may be accounted for by some writers' inclusion of Fa'a'a in Atehuru.
- 28 Bligh 1789:II, 48-49; Bligh 1792:126b, 135.
- 29 Pohuetea, through this or some other Title, may also have been associated directly with the Puna'auia Point Taputapuatea marae just described, but that is not clear. In any case, his principal household was some miles away from both marae — or so one may infer from the fact that it took Rodriguez several hours by canoe to travel from one place to the other (Corney 1919:171). Anderson, writing in 1777, described Pohuetea as residing near 'Utu'aimahurau (Beaglehole 1967:979) — a somewhat puzzling circumstance inasmuch as this would have placed this Puna'auian chief's residence deep within Pa'ea.
- 30 It was this same Purutihara, it will be recalled, who offered her sexual favors to Cook in exchange for some red feathers — presumably before she became his "sister"!
- 31 Called also "Paterre." In some contexts the name Atehuru was used by Europeans to designate Pa'ea specifically, rather than Pa'ea *and* Puna'auia; but whether this was also a Maohi usage is not clear.
- 32 According to Emory's classification two of the enclosed units corresponded to his "inland" type and the third to his "coastal" type (1933:67-69). For a more analytical classification see Green et al. 1967.
- 33 In earlier writings Emory identified the marae complex described by Cook et al. and sketched by Webber as Maraeta'ata (1931; 1933; Marae Traditions); but later he joined Beaglehole (1967:198n) and Green (Green and Green 1968) and myself in identifying it as 'Utu'aimahurau. This correction has an important bearing on our understanding of Tahitian political history, and is not mentioned merely for the sake of technical accuracy.
- 34 Adams' designation of proprietorship referred specifically only to Maraeta'ata. But then, Adams did not even mention the name 'Utu'aimahurau, not even in his long list of marae, consequential and otherwise. From this I am led to conclude either that Ari'i Ta'ima'i was ignorant of its existence (which seems unlikely), or that she confused or lumped together the two marae (or, of course, that Adams himself misinterpreted the old matriarch's recollections).
- 35 There would seem to be two possible and equally plausible explanations for the close connection between Maraeta'ata and 'Utu'aimahurau marae.

First, one of them might have been a direct offshoot of the other — say, 'Utu'aimahurau from Maraeta'ata— with the 'Oro cult having been added to the latter's other functions and buildings over the course of time. Or second, 'Utu'aimahurau could have been constructed *de novo*, as the tradition vaguely implies, and its proprietorship taken over (or indeed sponsored) by the chiefly dynasty already established at Maraeta'ata.

- 36 "*E parau tupuna no Te-toofa arii no Teoropaa: Outuai te marae.*" (Transcribed by Emory from the Pomare genealogies.)
- 37 Tevahitua was a fairly common name, separately or as part of a Title — as for example, of Papara's Amo. Patea was recorded by Adams as having been connected with Fa'atoai's (Mo'orea) marae Taputapuatea (1901:38).
- 38 My basis for this opinion is the display of affection between Teri'irere and Te To'ofa's wife and daughter, witnessed in 1777 by Lieutenant King (Beaglehole 1967:1378-1379).
- 39 Explanatory notes with this genealogy add that the only offspring of Tavi and Taurua died without issue, and that Tuitera'i was Tavi's "younger brother or cousin" — whatever that might signify.
- 40 The note recording this event, as reproduced in Emory (Marae Traditions), reads: "Maua came to Papara bringing Oro and the Maro Ura, Teraipuatata, connecting Raiatea and Atupii (Huahine)." The significance (and possible historicity) of this event will be discussed later on.
- 41 One of the sons was also called Aromaitera'i, said Adams (1901:38).
- 42 For example, a great-granddaughter was Ari'i Ta'ima'i, the source of Adams' *History*.
- 43 As noted above (p. 1190) there is some question about this identification — with implications which will be discussed later on.
- 44 Henry's Papara genealogy lists only one, Teri'irere (or Temari'i) (1928:270); but Emory (based on notes from Tati Salmon) listed nine (Marae Traditions).
- 45 In line with this version, of the nine offspring of Amo listed in the Papara genealogy reproduced in Emory's "Marae Traditions," only Teri'irere was borne by Porea. (Adams 1901:110)
- 46 Teri'irere-Temari'i was hardly the "bachelor" that Henry described him as having been, but as I noted already, he produced no publicly acknowledged progeny, and his kin-Titles and tribal office eventually passed to a collateral. According to Adams, *his* Temari'i Ari'ifa'ataia was at one time married to a daughter of the chief of Matarea (1901:122), a union which could not, however, have added much luster to Temari'i's own glittering kin-Titles, or much political strength to his tribal office.
- 47 He was a rare exception among Ra'iatean emigrees in Tahiti, for most Ra'iateans on Tahiti who are mentioned in the pages of the sources were alleged to be "princes" or "princesses" from Opoa.
- 48 The name Metuaro (or Motuaria, or Mahau) also figures importantly in these accounts but appears to be an alternative personal name for a holder of one of the Titles just listed.
- 49 "[Baldness] ... a thing rather uncommon in these islands at that age, he wore a kind of Turban and seem'd ashamed to shew his head, but whether a bald head is a Mark of disgrace with them or they thought it was so with

us I cannot say; we judged it was the latter, as we had shaved the head of a Indian we had caught Stealing." (Beaglehole 1967:227)

- 50 In a footnote to this passage Beaglehole registered some skepticism, saying, "Mahine's lady *may* have been Amo's sister, but there is no trace of a sister in the genealogies I have seen" (1967:226n3). Evidently Dr. Beaglehole had not seen the Papara genealogy reconstructed by Emory, for this shows Amo to have had ten siblings, including four positively identified as females, and five others not identified as to sex. Also, one will recall the name of another of Amo's sisters, Tetua Unurau, who was mother of the famed Purahi.
- 51 According to a missionary survey published in 1818, the (usually uninhabited) islet Tupai was also "subservient" to Porapora, but who its proprietors were in 1767 I am unable to discover (*Narrative of the Mission at Otaheite* [London: London Missionary Society, 1818] p. 7).
- 52 The reference is to hogs sent by Puni to the ship, and to three young women who evidently visited the ship at Puni's command.
- 53 Chesneau labeled it the Battle of Ho'oroto (Ra'iatea), and asserted that it came about as the result of Mo'ohono's efforts to have his grandsons, Tenania and Mahine, vested with "sacred kingship" at Opoa's Taputapuatea marae (i.e., probably meaning, invested with a *maro ura* kin-Title associated with this marae). At this period the principal, locally held *maro ura* kin-Title of this marae was evidently that of Mato's second cousin, Vetea Uru. It is reasonable to suppose that Mato might have claimed it also, on the basis of his grandfather Ari'ima'o's primogenitary rights over those of Vetea Uru. (The latter's incumbency probably derived from his father.) In any case, the question of succession was evidently open enough to encourage counterclaims.
- 54 The account states that the location of this site on Tairapu was near Point Ta'atua at a previously built marae called Te ahu rua tama. I am, however, unable to locate any point or marae so named. As for Taputapuatea, the name of the marae built to house the image, there was a well-known marae of that name at Tautira, which later became (or resumed being?) the principal 'Oro image depository for the whole island — but, of course, *all* marae serving that function were so named.
- 55 I called attention earlier to the peculiar discrepancy between two versions of this story. In Adams' version, which was based on Ari'i Ta'ima'i's account but translated by her daughter Marau, the lover was a shark-god of "the race of arii rani," and the girdle in question was a *maro tea* (1901:12-14). In the Handy version, however, which the author reportedly obtained from Marau herself, several decades later and after the death of Ari'i Ta'ima'i, the lover is specifically identified as an Opoan chief (though also a fish god), and the girdle was of red feathers — i.e., a *maro ura* (1930:68).

CHAPTER 26

- 1 The personnel of Bougainville's expedition, which anchored off Hitia'a in April 1768, were similarly unaware of what was then taking place at Papara, 25 kilometers to the west.
- 2 This version, which I shall label the "Adams' version," is really a hodge-

podge of “facts” put together (and without entire consistency) from Georg Forster’s journal, Wilson’s “Missionary Narrative,” etc., and from oral traditions said to have been transmitted — twelve decades after the events — by Ari’i Ta’ima’i herself.

- 3 According to the Emory genealogies, Teihotu’s wife was Vavea, and this couple had only three offspring: ‘Itia (principal consort of Pomare I), Pateamai (first married to Vehiatua III, later to Pomare I), and Mahau, the embattled claimant to Mo’orea’s principal chieftainship. Teri’i Vaetua was one name of Teihotu’s father, and may have been an alternative name for some other member of the Ahurai family, possibly for Te Pau “B” (fig. 25-1), but I can find no confirmation of this on any genealogy known to me.
- 4 Cook’s “Tarevato” was indeed Pomare I’s brother (or half-brother), Te Ari’i Fa’atou, and not Teri’i Vaetua.
- 5 Undoubtedly, a great deal of politically relevant information is encapsulated in this cryptic formula, but I shall resist the temptation to try my hand at interpreting it.
- 6 Beyond pointing to some traditional conflicts, such as the one between Tavi and Tuitera (Adams 1901:22ff), I cannot account for this antagonism in specific terms. Perhaps we see here a predictable process in Maohi-like societies — namely, the typical (but not inevitable) development of friction between two more or less evenly matched tribes having a common boundary. This is, of course, far too large a matter to consign to a note, and I do so only to call attention to the question.
- 7 Adams quoted a dramatic song which was said to have been composed by Paparans in memory of this blow to their tribe and which identifies Purahi as the principal mover of it (1901:57-59).
- 8 *Journal of a Voyage round the World in H.M.S.’s Ship Endeavour* (Dublin, 1772) pp. 93-95. Beaglehole referred to Tupaia’s intrigues against Tutaha, but provided no reference for this information (1955:117n).
- 9 Wilson 1799:xii-xiii; d’Urville 1834-1835:I, 544.
- 10 This is only one of several *totally different* versions for the origin of marae Teahupo’o.
- 11 This seems to refer to Vehiatua’s part in the Papara debacle. G. Forster’s error in having Tutaha view this as an insult to his family was based on his mistaken notion that Tutaha and Amo (and Teu) were brothers.
- 12 This refers to the time since their departure at the end of the first visit of the second voyage.
- 13 It will be recalled that Vehiatua I’s spouse, the famous Purahi, did in fact “marry” a man named Ti’itorea after her husband’s death, and that her new partner became “prime minister” to her elder son, Vehiatua II.
- 14 I refer here to the statement in Adams linking Tutaha with Maraeta’ata in Pa’ea (1901:74).
- 15 On this point Adams stated: “... Otoo was not allowed to wear the Maro without a protest. In order to receive full recognition, he was obliged to take a seat and wear the Maro-ura in the great Marae of Maraetaata in Paea. This Marae had three heads: (1) Pouira, the Tevahitua i Patea; (2) Tetooha, the

Taura atua i Patea; and (3) Punuaaitua. Tevahitua protested, and refused to allow Otoo to take his seat and wear the Maroura on his part of the Marae. The other two made no objection, and the reason was characteristic of Tahitian society. Otoo's great-grandmother, Te-fete-fete-ui, was the daughter of Tevarua hoiatua, a chieftess of Ahurai and Punaauia, and as such had the right to a seat in Marae Maraetaata." (1901:75)

CHAPTER 27

- 1 In a footnote commentary on King's statement above, Beaglehole wrote: "This is not a very intelligible account. The name of the brother of Vehiatua here referred to seems to be an attempt at Teri'itetua-ounu-maona; but this person was himself Vehiatua 1775-90, and was the boy whom King has already mentioned (17 August). He never settled on Moorea. There seems to be no other reference to such a battle." (Beaglehole 1967:1382n1.) Evidently, Beaglehole missed de Barreda's and Bligh's references to "such a battle," as well as Bligh's reference to a third brother.
- 2 Although the actual nuptial rites formalizing these two marriages may not have been finalized for some time after the beginning of this era, the understandings regarding the alliances were probably already in effect by the time of Cook's second voyage, when the succession issue came to a head. The link between Vehiatua III and Pateamai (and hence between Vehiatua III and Mahau) is likely to have reinforced Seaward Teva's hostility toward Mahine, and was conceivably formed with that in mind.
- 3 See also Beaglehole 1967:977, 1064-1065, 1315-1316, 1376.
- 4 The situation described earlier concerning the nonhostile reception accorded some visiting Mo'oreans at Tautira could count as another example of this "Police" — although it is of course possible that the visitors in question were not from Mahine's territory. (See Corney 1919:116.)
- 5 See also Beaglehole 1967:214. This would appear to indicate that a Seaward Teva contingent, possibly under Vehiatua III, accompanied Te To'ofa's and Pohuetea's in the expedition against Mo'orea. This accounts for the reference to "another Chief" in Cook's passage about the expedition (p. 210), and for the reported presence of a Seaward Teva chief at the "peace" ceremony yet to be described.
- 6 In blaming Te To'ofa for the stalemate, Old Teu, Pomare I's father, was giving vent to a narrowly partisan sentiment, but the very exiguity of his view might indicate that his own family's interests were particularly damaged by terms of the truce. Among other things, he seems to have assumed that had Te To'ofa waited a while to attack Mahine, Cook himself might have been persuaded to intervene on the side of the Tahitians.
- 7 Except for the *Lady Penrhyn* (Lieutenant Watts, commanding), which anchored at Matavai for a fortnight during July 1788, en route to Australia.
- 8 According to Vancouver, Mahine was killed during the Battle of Atehuru, but this conflict took place in September 1791, three years after Bligh wrote of Mahine's death in the earlier campaign, a fact also overlooked by Adams (1901:102).

- 9 This young woman, who was also called “Alredy” (Ariti?), was estimated to be about sixteen years old in 1791, and thus born circa 1775 (Edwards and Hamilton 1915:103).
- 10 I am somewhat puzzled by this so-called friendship between Pomare I and Te Pau “B”, since Fa’a’a appears not to have aided Pomare I during the attacks of Te To’ofa, Mahine, and Vehiatua III. Actually, this seems to confirm a situation noted earlier — i.e., although Te Pau “B” had succeeded to his father’s Title, de facto tribal authority had rested in the hands of Te To’ofa. Of course, with Te To’ofa dead, the friendship between Te Pau “B” and Pomare I could blossom, for the moment at least.
- 11 However, the Wallis *maro* seems to have been still at ‘Utu’aimahurau marae at this time.
- 12 This individual was only about seven years old at the time of Bligh’s *Bounty* visit, and he did not assume the Title of Pomare “II” for some time to come; but I shall refer to him throughout by this label in order to spare the reader some of the confusion involved in trying to keep track of Maohis’ name changes.

CHAPTER 28

- 1 Strictly speaking Morrison was not one of the *Bounty* “mutineers,” as he was subsequently cleared of culpability in the mutiny, but I shall continue to refer to him and all his companions by this term.
- 2 For example, in February 1790, Morrison witnessed a solemn ceremony at which offerings were made and shoulders bared to a portrait of Captain Cook, just as to a living sovereign (1935:85–86). One will also recall the use made of the *Dolphin’s* pennant in the Wallis *maro*.
- 3 Henceforth for convenience I shall refer to the immediate family of Pomare I and II as the Pomares, although the Title applied only to the incumbents themselves.
- 4 Hitihiti’s (“Odiddy,” “Oedideede,” “Hedeede”) native hearth was Porapora and he claimed kinship with that island’s famous old chief Puni. In 1773 and 1774 his age was put at seventeen or eighteen, and he was a useful and universally liked member of Cook’s crew. After that expedition he settled at Pare in the service of Pomare I. Cook met him there in 1777, but this time he was described as “foolish,” “clumsy,” and kava-addicted, but evidently still skillful enough with firearms to make himself a valuable ally. According to G. Forster his original name was Mahine, but this was exchanged with a Mo’orean chief when the two became friends. As for the report that he was married to Tetupaia’s sister, Te Pau, I find no such sister listed in the genealogies to which I have access, but that does not necessarily discredit this attribution. (Beaglehole 1961:lxiii, 426n; 1967:1375, 1058–1059; Bligh 1789:II, 68.)
- 5 Adams reconstruction is vitiated in part by his assumptions that Temari’i and Teri’irere were half-brothers, and not alternative names for the same individual, and that Temari’i — the one under discussion — had been born about 1772

(whereas Morrison judged him to be twenty-seven or twenty-eight years old in 1791). Moerenhout also offered a reconstruction of this complex of relationships, but it is even more ill informed and confused than Adams', and does not warrant further consideration here.

- 6 Adams claimed that Ari'ipaea was also Temari'i's "guardian," having been made so upon the death of Amo; but Temari'i was already about twenty-five years old when these events took place, and, as we shall see, Arno was still alive (1901:110ff.). According to Moerenhout, Ari'ipaea "betrayed his trust" as guardian to Temari'i by turning over his seat in the Papara marae to Pomare, which was tantamount to transferring the sovereignty to all Papara (1837:II, 417ff.). This account was accepted as factual by Adams, who, however, added that the transaction took place without the consent of Temari'i or the people of Papara, and was never considered by them to be binding (p. 114). I am unable to accept or reject these reconstructions written so many decades after the events they are supposed to describe, and by such partisan chroniclers.
- 7 As we saw previously, although Pomare II, and before him his father, had been permitted access to the Wallis *maro* and the Paparan image while they had been deposited at 'Utu'aimahurau, he did so only with the consent of that marae's proprietors, and subject to constraints that he evidently considered to be distasteful.
- 8 Thus, Arno was still alive in October 1790, contrary to Adams information (1901:111).
- 9 For a description of marae Tarahoi, including its new addition, see Green and Green 1968.
- 10 As an example, I refer the reader to Hamilton's account of his encounters with the custom of "wife-hospitality," which provides, among other things, a somewhat different view of the character of two of our leading personalities, Mahau, principal chief of Mo'orea, and his wife, Auo, who was sister of Pomare I. (Edwards and Hamilton 1915:109-110)

CHAPTER 29

- 1 Some idea of the nature of this expedition's relations with their hosts (and hostesses) may be gained from the information, as reported by Vancouver, that only one member of the entire company of both ships was a married man!
- 2 In telling Bligh about one of these vessels, in July 1792, a native informant described it as "... a Miserable vessel and the Commander as a great Rascal" (1792:168b).
- 3 Other members of this expedition who left accounts of some value were Tobin, Portlock, and Flinders; Tobin particularly deserves credit for the series of watercolors he produced (figs. 29-1 through 29-5).
- 4 See chapter 28. According to Vancouver this expedition was carried out by the mutineers themselves (1801:323-324), but if one accepts Morrison's on-the-spot report, the trip to Mo'orea by some mutineers took place *after* Hitihihi's successful campaign, and was merely a peaceful sight-seeing tour. Vancouver

- also recorded, mistakenly I believe, that Mahine was killed in the battle of Ate-huru, whereas other evidence places his death sometime earlier.
- 5 As I observed concerning an earlier period of this era, I am not entirely certain about the political geography of Mo'orea, or about the degree of authority exercised by its successive chiefs. Although Mahau may not have exercised the same amount of control over all parts of the island, since the defeat of Tairihamoetua (?), in 1790, Mahau and his immediate successors were undoubtedly the island's most powerful and influential tribal chiefs.
 - 6 Vancouver's detailed account of this event, which occurred during Mahau's visit to Pare, is one of the best descriptions we possess of an actual Maohi funeral. As most of the generalities obtainable from it have already been set forth in chapter 3, I shall not reproduce it again. The particularity about it of most present interest is the fact that Mahau's embalmed corpse, after remaining a month in state in Pare, was carried on a tour of Seaward Teva and "some of the Western districts," before being returned home to Mo'orea (Vancouver 1801:297). Another point of interest is the location of the principal funeral rites, which were at Pare's Tarahoi; in fact, no mention is made by Vancouver of Mahau's father's marae, Ahurai, although this principal Fa'a'a marae may have been included in the corpse's itinerary through "the western districts."
 - 7 This is in disagreement with Vancouver's version, which reads as follows: "On the late decease of *Mahow*, his daughter by *Pomurrey's* sister succeeded to the sovereignty of Morea, under the supreme authority of her cousin *Otoo* [Pomare II]. To this young princess *Pomurrey* [Pomare I] became regent, and in course, the inhabitants of Morea were intirely at his command" (1801: 325-326). I am inclined to accept Bligh's version of this succession; not only was Tetuanui male, and older than his sister, but Vancouver's opinion, which was formed within days of Mahau's death, was superseded by Bligh's by several months' time. Bligh also introduced an interesting complication of this episode, in his reference to a Matuarro, which will be discussed later on.
 - 8 I cannot definitely identify this "Matuarro" with any individual appearing on the Huahine genealogies available to us. The most likely candidate is Teri'itaria, the young boy who was *ari'i rahi* in Huahine during Cook's visit in 1777 (Beaglehole 1967:233), and who was the son of "Queen" Tehepapa and of either her first husband, Rohianuu, or of her second husband (and Rohianuu's brother), Mato.
 - 9 For a description of the conclusion of this ceremony see Bligh 1792:173, which is one of the most detailed eyewitness accounts available of an actual ceremony involving a human offering. To this account Bligh also added the interesting observation that a *maro ura* (probably the Wallis *maro*) had been added to, since he last saw it, with hair from one of the mutineers — "an ostentatious mark of their connections with the English, and not of respect to the Person it belonged to."
 - 10 Even their livestock underwent change: "It is remarkable how the Otaheite breed of Hogs is effectually destroyed. We meet with none but of the European Kind, owing to the Natives preferring them to their own, which were of

the China sort, and another of an inferior kind because they are of a larger size." (Bligh 1789:I, 376)

- 11 For references to diseases allegedly introduced into these Islands during the Early European Era see the following: Beaglehole 1955:98-99; Beaglehole 1961:215; Beaglehole 1962:I, 374; J. Forster 1778:488; G. Forster 1777:I, 370-371; Bligh 1789:I, 388-389, 398, 409, 421; II, 10, 30-31, 60; Corney 1915:51; Corney 1919:30; Morrison 1935:228-230; Vancouver 1801:337; Ellis 1829:II, 272.

CHAPTER 30

- 1 The Spanish friars who had spent a year at Tautira had moral codes and objectives somewhat similar to those of the English missionaries, but they insulated themselves so effectively from Maohi society that they could not have produced much of an impression of any kind on their native neighbors.
- 2 The accounts of this encounter, mostly written by the missionaries themselves, are in places so unconsciously ironic — or poignant, or incredibly naïve, or downright hilarious — that I am often tempted to include them, if for no other reason than to lighten my own exposition; but I refrain from doing so in the interests of space. I do, however, recommend the account of the first meeting between this solemn band and a mob of Arioi on the decks of the *Duff*, in which the former responded to an especially lusty greeting by the untrammelled Arioi with a few tunes by Brother Bowel on the German flute (Wilson 1799:73).
- 3 This ritual condition of Pomare II was also mirrored in the behavior of his father, Pomare I, who at this time was still constrained from feeding himself (Wilson 1799:75).
- 4 Temari'i also bore the name Ari'ipaea (the missionaries' "Orypaih" or "Ori-paia"), which Adams claimed was bestowed upon him as the result of his "adoption" by the late Ari'ipaea, brother of Pomare I.
- 5 It will be recalled that Cook's "Towha" (Te To'ofa), the great chief of Pa'ea, left as his successor his own son, who died in 1791, and that the latter was succeeded by his sister's son, whose age was about four at the time; thus he was ten or eleven in 1797, and possibly the individual in question.
- 6 Tutaha was an alternate name of Ha'amanemane, but appears not to be the one here mentioned.
- 7 The missionaries reported that Pare's principal marae, Tarahoi, was (again) "inferior" to 'Utu'aimahurau (Wilson 1799:211). During their tour of the island in 1797, the *Duff's* officers visited Puna'auia's marae Tahiti and reported the presence there of a small "ark" containing a god's image (pp. 208-209); the identity of the god is not given, and, although it may have been 'Oro, the image itself was evidently of less importance than the one then deposited at 'Utu'aimahurau.
- 8 One cannot overlook, as a contributory factor, the extent to which a successor to an important kin-Title was insulated from his parents, and particularly from his father, throughout infancy and childhood. That is to say, the lack of nurturant interaction during those formative years need not have fostered *hostility*

- between parent and child but by the same token cannot be expected to have fostered much *affection* either.
- 9 Further insight into Maohi social relations is provided by the fact that five other (presumably lower-class) persons were also badly burned by the gunpowder explosion, and that the missionaries were not even informed of their painful plight when first asked to treat Teri'irere-Temari'i. In fact, three of the five were not even given native medication. (LMS Transactions:I, 76-77)
 - 10 The events were, however, not without some hopeful expectations on the part of the missionaries: "This shaking of the nation may be only plowing up the fallow ground for the better sowing the seed of eternal life: though many may fall, yet we trust the gospel will not be removed off the island, till thousands have felt it to be the power of God and the wisdom of God for their souls' salvation" (LMS Transactions:I, 84-85).
 - 11 According to one missionary historian a contributing factor to Pomare II's hostility toward his father was the latter's action in naming his youngest son, Teri'i na Vaho Roa, to the local chieftainship of the tribal subdivision comprising Point Venus — an estate which Pomare II coveted for himself. (Thomson, History, p. 27)
 - 12 See, for example, LMS Transactions:I, 11, 115, 120, 124.
 - 13 The occasion of the message was the suicide — or possibly murder — of Lewis, who had been a missionary prior to his "excommunication" from the group (on account of his living with a Tahitian woman). This episode contains a world of poignant human interest, and the almost daily interchange between Lewis and the other missionaries, couched in turgidly biblical prose, reveals much about the Europeans involved. The occurrence constituted such a major pre-occupation for the missionaries during so many weeks that their journal for the period contains little else.
 - 14 In describing these events in the LMS Transactions, the missionaries provided an interesting sidelight on the degree to which Pomare I had become reconciled to his role vis à vis his son: "Pomere and Edea having been made fully sensible, that the presents sent by Governor King are for them, and Otoo not considered, began to express their fears, lest Otoo (who, by the custom of the country, is held superior in dignity to his father and mother) should take offence thereat, they expressed a wish that the scarlet dress should be given to Otoo, in preference to Pomere. Capt. Scott being informed of this, consented that it should be so, and, in order to make all things agreeable, employed his tailor to make a scarlet dress for Pomere, and another for his youngest son Teare-navo-roa; and also appointed a white shirt for each of the two chief women, Tatooa-noce, and Tooboo-iote-rye." (I, 229)
 - 15 The missionaries' journal of the period August to January is not extant.
 - 16 In the interest of brevity I offer no comments on the ritual aspects of this important event, and call attention only to one other feature — the fact that Pomare II had now gone beyond his father in sheer ruthlessness.
 - 17 According to my reconstruction the image we are now concerned with was the one originally established at Papara, then taken to 'Utu'aimahurau by Tutaha et al. in 1768, to Pare in 1792, then back to 'Utu'aimahurau. What had

happened meanwhile to the image called 'Oro Rahi To'o toa, the one said originally to have been at Tautira, I cannot fathom.

- 18 One person on the Pomares' side who was slain in Tairapu was Mateha, a brother of Ra'iatea's chief, Tamatoa IV.
- 19 See also Thomson, *History*, p. 57.
- 20 According to one interpretation, Pomare I was killed by the god 'Oro to punish him for the sacrilege involved in the forceful removal of the god's image from 'Utu'aimahurau (LMS Transactions:II, 342).

CHAPTER 31

- 1 In their journal entry of December 10, 1806, the missionaries requested: "If the Directors should write again to Pomare, we beg them to address him *King Pomare*, or *Pomare King of Taheite*, &c &c; and not *chief*, as it is likely to give offence, if continued." (LMS Transactions:IV, 19)
- 2 The reference also raises interesting questions concerning Maohi "marriage" — in this case, the nature of the relationship between 'Itia and Tenania. As we have seen, 'Itia was a loyal and helpful supporter of Pomare I to the end of his days, although she had long since had paramours, perhaps even while sharing Pomare I's mat. Tenania, however, was a somewhat different matter. Whereas 'Itia's early lovers had been *toutou*, Tenania held a very high-ranking Title; and his daughter by 'Itia was evidently considered of superior enough status to qualify her for the Mo'orean office of "governor." That is to say, the relationship between 'Itia and Tenania was a "marriage" in the fullest Maohi sense, and it was in effect long before Pomare I died. (See Turnbull 1813:134, 145-146.) In other words, in view of 'Itia's continuing alliance with Pomare I, and in the absence of any indications of a formal separation between the two, we are confronted in this case with still another example of the flexibility with which the Maohis defined relationships of affinity.
- 3 Pomare II wished himself to be called "King," but this does not imply any identity between his concept of kingship and the English one which served as his model. Nor does it imply that other Tahitians held him to be "King."
- 4 We do not know when or why Pomare II chose to set up a marae for himself separate from the traditional family one of Tarahoi; perhaps this had been another move in his previous effort to make himself independent of his father's control.
- 5 Perhaps the clearest ritual indication of the extent to which the interests of Pomare II and 'Oro had come to coincide is to be found in the account of a *maeae* in June 1806: "Today there was an Oroa at Pare called Ma-e-ae, this ceremony consists in offering to the god Oro Cloth, Hogs, Ava &c. which are brought from every district in the Island. After a certain part is divided out for this purpose, the priests on the canoe (designed to carry the dedicated food &c. to Oro who is at the Marae at Toutera) blow the conch shell, crying out at intervals Teie te ma e ae na Oro here is food for Oro to eat — supposing that the god comes and eats the spirit of the food &c. The greater part

of the presents brought are the Kings which he disposes of at pleasure.” (Davies, Youl et al., Journal, 20 June 1806, LMS Archives)

- 6 A marginal comment by the missionary Nott on this passage in Davies’ manuscript described the ceremony as “A kind of investing of their god oro with the royal authority, or making him their king by putting on him the royal *maro ura*, for which ceremony the bure is performed. *Not for King Pomare.*” (Newbury 1961:87n2.) If Nott’s identification were true — and he was undoubtedly more fluent in the language than were the other missionaries — this would constitute a most intriguing reversal of ritual roles between human *ari’i* and deity.
- 7 Fa’a’a was rarely singled out as a separate political unit in this or in other accounts of this period. Earlier it was sometimes included with Atehuru, but in later years it was included in Porionu’u.
- 8 According to Adams, although the land in question was in fact dedicated to ‘Oro and his priests, some of its inhabitants refused to leave, thereby giving Pomare II another pretext for his next attack on the south (1901:149-150).
- 9 This individual is not specifically identified as a leader, but he was possibly the tribal chief of Pa’ea.
- 10 According to Adams the attack upon Atehuru, Papara, etc., was simply a continuation of the old feud between Porea and ‘Itia which had culminated in the Papara debacle of 1768. Specifically, Pomare II’s attack was viewed as a measure for wiping out the insult offered to ‘Itia by Porea when the former tried to put an end to the *rahui* imposed by Porea on behalf of her son, Teri’irere. (1901:152.) As Adams noted, this is a “more picturesque” version of the war than others that might occur to the reader, but it is not altogether credible. For one thing, why would Pomare II include Oropa’a in his offensive action?
- 11 Reinforcing the missionaries’ decision to withdraw was the lack of any evident sign of success in their mission, and the absence of any communication from the London Missionary Society’s directors for some *six years!* (Newbury 1961:116)
- 12 Pomare II even engaged in pimping in order to obtain gunpowder: “In the evening Pomare sent 8 women to the ship to prostitute themselves to the seamen, giving them charge to get powder to bring it to him” (Jefferson, Journal, 8 April 1803, LMS Archives). This was certainly not a new tactic with the Maohis, but there is no previous record of it having been organized on this large a scale.
- 13 This disenchantment applied especially to the missionaries, who had few objects to give away, who had shown themselves unwilling to engage in military adventures, and whose ideology was still generally considered to be ridiculous, if not insane.
- 14 Newbury 1961:73; Jefferson, Journal, 12-22 September 1804; LMS Transactions:III, 43.
- 15 This merriment included the manufacture and drinking of an intoxicating beverage made from the root of the ti plant — an innovation introduced by the Hawaiians.

- 16 Some of these chiefs may have been kinsmen, related to him through his paternal grandmother, Tetupaia, but one has the impression that Pomare II's solicitude toward those distant individuals was based more on their chieftainship than on their consanguineal ties to him.
- 17 One will recall in this connection that other Ra'iatean immigrant, Ha'amane-mane, who made such an important place for himself in Tahitian politics.
- 18 I do not propose that this was a wholly new kind of development in Maohi history. In fact, similar measures seem to have been imposed shortly before this in the Leeward Islands, in connection with Poraporan conquests there, and it is likely that the same kind of development had taken place in the past on Tahiti and Mo'orea — but probably on a much smaller scale.

CHAPTER 32

- 1 *Venus* was the small schooner captured by Matavaians in September 1809. See pages 1324-1325.
- 2 See the strictures on missionary "censuses" in chapter 2.
- 3 I am not entirely sure whether Fa'a'a was an autonomous unit during this period, or was allied with Puna'auia and Pa'ea.
- 4 Tati and Opuhara were grandsons of Amo's younger brother, Manea, and thus legitimate successors of Teri'irere-Temari'i, who left no heirs.
 With no missionaries stationed on the island during this period, such information that was recorded about events and personalities outside Pare was sparse and secondhand. However, had any of the tribal chiefs made much of a political stir, the missionaries would likely have heard of and dutifully recorded it.
- 5 Although humans continued to be offered to 'Oro and perhaps to other deities during this period, the sacrificial rituals evidently took place without benefit of a feather-girdle *ari'i*.
- 6 These developments may perhaps represent a local manifestation of a much more generic phenomenon in Polynesian societies: that is, the ascendancy of shamanism over priestcraft in times of social disorganization.
- 7 It is, of course, impossible to divine all the actual motives that moved these important leaders to travel with scores and even hundreds of their followers to Mo'orea and Tahiti, and to spend so much time there. Aid to Pomare II, the announced reason, was possibly also a sincere one, but political adventuring probably figured, along with an expectation of loot. Nor should one underestimate a desire for the novelty and excitement of travel, so apparent in other situations in Maohi life.
- 8 Technically, inasmuch as this Uru had already sired a successor before 1777, it was the latter who held the highest-ranking Opoan kin-Titles at the time of Cook's visit — or so I assume from practices elsewhere.
- 9 One cause of this difficulty is Davies' apparent confusion in some passages between Tapoa and Tamatoa. For example, see Newbury 1961:137.
- 10 For one thing, although I do not suggest any causal connection between the two, the turn to Christianity took place simultaneously with the widespread consumption of ti-root alcohol. And Pomare II, the missionaries' premier

convert and their proudest evidence of success, was described by some observers as having been drunk most of the time.

- 11 An interesting sidelight on the changes then taking place is revealed in the fact that pagan Maohis had begun to refer to their gods collectively as *Tatani* (Satan). (Newbury 1961:168)
- 12 In May of 1814 the missionaries received reports that a war had commenced in the Leeward Islands; no details were offered concerning the combatants or causes, but it is likely that this conflict was largely responsible for the return home of the Ra'iateans and Tana'ans.
- 13 In his more detailed (and doubtless more imaginative) account of the battle Ellis indicated that the most active leaders on the Pomare side were Mahine, "king" of Huahine, and Pomare Vahine herself — Pomare II, characteristically, having viewed the battle from the comparative safety of a canoe (1829:I, 248-249).

BIBLIOGRAPHY

This bibliography contains only those items actually cited in the text. For a more comprehensive, and probably well-nigh complete, bibliography on ancient Tahiti, the reader is advised to consult the extraordinary *Bibliographie de Tahiti et de la Polynésie française*, critically and painstakingly compiled by Patrick O'Reilly and Édouard Reitman — perhaps the finest bibliography of its kind I have ever encountered, and one that would have shortened my labors by a year or more had it been available ten years earlier.

In addition to published works cited in the bibliography much use was made of unpublished documents and manuscripts. Text and bibliographic references should aid the researcher in the use of this material which may be found in the following places:

INDEXES

For purposes of alphabetizing, the glottal stop at the beginning of a word has been ignored.

Some Tahitian words are indexed under both old-style spellings (as found in the extracts) and their modern equivalents.

The Place and Name indexes do not contain the detail found in the Subject Index, which we consider of greater importance, given the emphasis of this work.

SUBJECT INDEX

- Abortion, 63, 412, 617, 713, 730, 939, 943, 1026, 1107; methods of, 411, 550. *See also* Contraception; Infanticide
- Above-below contrast. *See* Upper-lower contrast
- Actors, 327, 342-343, 936, 945; recruitment of, 914, 937, 945, 1106; training given, 864, 938. *See also* Drama; Theaters
- Adoption, 230, 374, 411, 444, 455, 554, 622, 660, 691, 692, 701, 850, 890, 1143, 1191; rights received through, 619, 625, 626, 639, 660, 776, 1191. *See also* Fetchers, adoption of; Fosterage
- Adzes, 135, 137, 138, 199, 255, 536, 856
- Afterlife, 353, 409, 1077; activities in the, 64-65, 521-528, 820-821, 1082; for Ariois, 262, 525-526, 527, 791, 907-908, 919, 929, 960-961, 1106, 1108; nature of the, 361, 486, 557, 791, 960-961. *See also* Paradise; Purgatory
- Age, social differentiation by, 337, 359-360, 458-459, 607-615, 689, 1110, 1112-1113, 1123, 1132. *See also* Aged, the; Old age
- Aged, the, 387, 607, 1177, 1184; treatment of, 614-615, 724, 745. *See also* Age, social differentiation by; Old age
- Agriculture, 44, 45, 46, 143, 149, 162, 174, 175, 234, 236, 248-259, 272, 281, 430, 541, 586, 852-855; labor used in, 125, 586, 602, 971, 972; seasonal variation in, 221-222, 240-244, 245, 259-270, 305-308, 388, 541, 811-812, 853, 1148. *See also* Animal husbandry
- Ahi* nuts, 242
- Ahu*, 85, 97-100, 116, 118, 178, 191, 192, 647, 668; construction of, 97-99, 177, 187, 538; names of, 1136. *See also* Marae
- 'Aito* (Arioi). *See* Arioi sect, lodge masters of
- 'Aito* (tree). *See* *Casuarina*
- 'Aito* (warrior). *See* Warrior-champions

ABOUT THE AUTHOR

DOUGLAS L. OLIVER is emeritus professor of anthropology, Harvard University, and presently occupies the Pacific Islands Chair in Anthropology, University of Hawaii. He obtained the degree of Ph.D. in Ethnology from the University of Vienna in 1935, and subsequently held a number of positions, both academic and governmental. He was a consultant on Pacific island affairs for the Department of State from 1948 to 1951 and for the United Nations in 1949. He has, during his career, carried out a number of ethnographic field studies, including one of Bougainville in the Solomon Islands and two of the Society Islands. He also planned and directed the postwar Economic Survey of Micronesia for the Naval Military Government to provide for rehabilitating the native economy in the Trust Territory of the Pacific Islands.

As a scholar on the Pacific islands, Professor Oliver is among the most distinguished. His writings are numerous, and include the following books: *A Solomon Island Society* (1955), *The Pacific Islands* (1951, revised ed., 1962) a classic in its field, *Invitation to Anthropology* (1964), and *Bougainville: A Personal History* (1973). He edited *Planning Micronesia's Future* (1951, reprinted 1971).
