# BRIEF COMMUNICATION

# On the classification of North American *Chelostoma* (Hymenoptera: Megachilidae)

Michael S. Engel<sup>1,2</sup> & Terry Griswold<sup>3</sup>

**Abstract.** A new subgenus of *Chelostoma* Latreille is established for the New World group historically placed in *Foveosmia* Warncke. These species, placed herein in *Neochelostoma* Engel & Griswold, new subgenus, are differentiated from the Palearctic *Foveosmia* and a modified key is provided to the subgenera of *Chelostoma*.

#### INTRODUCTION

The bee genus *Chelostoma* Latreille (Megachilinae: Osmiini) encompasses 56 species of slender bees distributed across the Holarctic region including the northern margins of Africa, but extending southward into the mountainous areas of tropical Asia (Michener, 2007). Species nest in pre-existing cavities in wood or stems, where females construct brood cells enclosed by mud or sand. With few exceptions, species are generally oligolectic, many in the Old World fauna on Campanulaceae or Ranunculaceae, while those of the New World are largely on Boraginaceae (*sensu* APG, 2016). Michener (2007) recognized six subgenera, two of which were considered to occur in North America: *Prochelostoma* Robertson, a monotypic subgenus endemic to eastern North America, and *Foveosmia* Warncke, a Holarctic group diverse in both western North America and the western Palearctic. Despite this arrangement, the New World *Foveosmia* are morphologically, behaviorally, and geographically distinct.

Indeed, phylogenetic work on *Chelostoma* has further demonstrated that the North American species of *Foveosmia* were ill-placed within this otherwise Palearctic clade, and in fact a more basal branch within the overall group, thereby properly restricting the subgenus to the Old World species visiting Campanulaceae (Sedivy *et al.*, 2008). Herein the group of New World species previously placed in *Foveosmia* are diagnosed and modified couplets provided to aid in their identification and distinction from the Old World fauna. Morphological terminology follows that used by Michener (2007).

#### **SYSTEMATICS**

## Genus Chelostoma Latreille

*Neochelostoma* Engel & Griswold, new subgenus ZooBank: urn:lsid:zoobank.org:act:E0CD23F8-5FD1-40A1-B6C6-926B341E1445

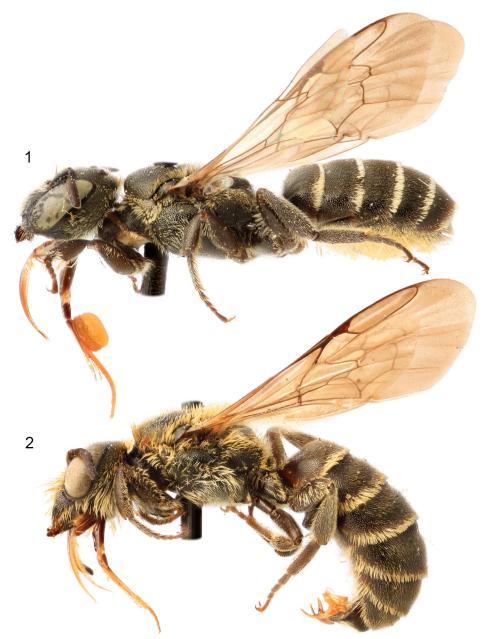

Type species: *Chelostoma californicum* Cresson, 1878 (Figs. 1, 2).

DIAGNOSIS: The subgenus can be most readily distinguished in males from Foveosmia proper by the presence of apicolateral processes on the seventh tergum (Fig. 5), in addition to the medial projections (sometimes joined apically to form a single projection; e.g., C. incisulum Michener), and in females by the simple setae on the outer surface of the probasitarsus (Fig. 3). In males of Foveosmia the lateral processes of the seventh tergum are lacking (Fig. 6), while in females the setae on the outer surface of the probasitarsus are pectinately branched to plumose (Fig. 4). Unlike species of Foveosmia which are oligoleges of Campanulaceae (Asterales), this clade of New World species includes primarily specialists of Hydrophylloideae [Boraginales: Boraginaceae: note that the most recent familial classification demotes Hydrophyllaceae within Boraginaceae (APG, 2016), but see Luebert *et al.* (2016) for an alternative arrangement] (Hurd & Michener, 1955; Michener, 2007), although C. tetramerum Michener appears oligolectic on Amaryllidaceae (Allium Linnaeus) and C. minutum Crawford is polylectic with preference for *Phacelia Juss.* and *Allium* (Sedivy et al., 2008). Female visitation by C. minutum supports this preference; of 152 specimens in the Pollinating Insects Research Unit collection with floral records, Phacelia accounts for 35% and Allium for 29%. Each of the 14 other genera account for <10%.

Etymology: The new subgeneric name is a combination of the Greek  $n\acute{e}os$  ( $ν\acute{e}o\varsigma$ ), meaning, "new", and the generic name *Chelostoma* [itself formed in Greek of  $kh\bar{e}l\acute{e}$  (χηλη)), meaning, "claw" and itself traditionally derived from  $kh\acute{e}m\bar{e}$  (χημη), meaning, "gape", and  $st\acute{o}ma$  ( $στ\acute{o}μα$ , genitive  $στ\acute{o}ματος$ ), meaning, "mouth"]. The gender of the name is neuter

Comments: In recent history this group of species has been treated as New World members of the subgenus *Foveosmia* (Griswold & Michener, 1998; Michener, 2007), but is clearly distinct both morphologically and in terms of its floral associations, as well as phylogenetically (Sedivy *et al.*, 2008). The two Nearctic subgenera are allopatric; *Neochelostoma* is western, *Prochelostoma* eastern.

Included species: Aside from the type species (*C. californicum*), the following species are also included in *Neochelostoma*: *C. bernardinum* Michener, *C. cockerelli* Michener, *C. incisulum* Michener, *C. marginatum* Michener, *C. minutum*, *C. phaceliae* Michener, *C. tetramerum*. The keys of Michener (1938) and Hurd & Michener (1955) are sufficient to identify the described species of this subgenus.

**Figures 1–2.** Lateral habitus of female and male *Chelostoma* (*Neochelostoma*) californicum Cresson. **1.** Female. **2.** Male.

Key to Subgenera of *Chelostoma* (modified from Griswold & Michener, 1998; Michener, 2007)

- -. Third labial palpomere not flattened, its axis directed laterally as in most

**Figures 3–4.** Female characters of *Neochelostoma*, new subgenus, and *Foveosmia* Warncke. **3.** Probasitarsus of *Chelostoma* (*Neochelostoma*) californicum Cresson. **4.** Probasitarsus of *C.* (*Foveosmia*) campanularum (Kirby).

- 3(2). Parapsidal line half as long as tegula or more; second metasomal sternum of male without sloping platform, or, *if* present, then not carinate; labrum of female less than twice as long as broad (longer in *C. isabellinum* Warncke) ..... 4

**Figures 5–6.** Male characters of *Neochelostoma*, new subgenus, and *Foveosmia* Warncke. **5.** Seventh tergum of *Chelostoma* (*Neochelostoma*) *tetramerum* Michener, arrows indicate lateral projections. **6.** Seventh tergum of *C.* (*Foveosmia*) *distinctum* (Stoeckhert).

- Male seventh metasomal tergum with lateral processes (Fig. 5); setae of outer surface of probasitarsus simple (Fig. 3) [Nearctic] .... Neochelostoma, n. subgen.

- First metasomal tergum shallowly concave on anterior surface; female mandible not elongate, tridentate; labrum not apically thickened [Himalayas to Thailand]
  Eochelostoma Griswold

#### **ACKNOWLEDGEMENTS**

We are thankful to three anonymous reviewers for their helpful input. This is a contribution of the Division of Entomology, University of Kansas Natural History Museum.

A Journal of Bee Biology, Ecology, Evolution, & Systematics

The *Journal of Melittology* is an international, open access journal that seeks to rapidly disseminate the results of research conducted on bees (Apoidea: Anthophila) in their broadest sense. Our mission is to promote the understanding and conservation of wild and managed bees and to facilitate communication and collaboration among researchers and the public worldwide. The *Journal* covers all aspects of bee research including but not limited to: anatomy, behavioral ecology, biodiversity, biogeography, chemical ecology, comparative morphology, conservation, cultural aspects, cytogenetics, ecology, ethnobiology, history, identification (keys), invasion ecology, management, melittopalynology, molecular ecology, neurobiology, occurrence data, paleontology, parasitism, phenology, phylogeny, physiology, pollination biology, sociobiology, systematics, and taxonomy.

The *Journal of Melittology* was established at the University of Kansas through the efforts of Michael S. Engel, Victor H. Gonzalez, Ismael A. Hinojosa-Díaz, and Charles D. Michener in 2013 and each article is published as its own number, with issues appearing online as soon as they are ready. Papers are composed using Microsoft Word® and Adobe InDesign® in Lawrence, Kansas, USA.
