INTRODUCTION

The use of safety belts and child safety seats is an effective means of reducing injuries to motor-vehicle occupants involved in a traffic accident. There have been efforts to increase safety belt and safety seat usage. In Kentucky, these efforts have usually involved public information campaigns. While most states have passed a statewide mandatory safety belt usage law, such a law has not been passed in Kentucky. In an attempt to increase usage of child safety seats, a law was enacted by the 1982 Kentucky General Assembly requiring use of a "child restraint system" for children 40 inches or less in height. The 1988 Kentucky General Assembly strengthened the child restraint law to include a \$50 fine for violation of the law. Also, local mandatory safety belt usage laws have been enacted in several local jurisdictions in Kentucky. The first such local law was enacted by the Lexington-Fayette Urban County Government with an effective date of July 1, 1990. The second local law was enacted by the city of Louisville with an effective date of July 1, 1991. Jefferson County later adopted such a law. Within the couple of years, local safety belt ordinances have been adopted by Murray, Bowling Green, Kenton County, Corbin, Bardstown, and Midway. The combined population of the counties and cities having a local ordinance represents approximately one-third of the statewide population.

Statewide observational surveys began in Kentucky in 1982 with data collected in 19 cities across the state. These surveys have been conducted annually (with the exception of 1987) to document safety belt and safety seat usage in Kentucky (1, 2, 3, 4, 5, 6, 7, 8, 9, 10). The number of sites was increased starting in 1990 in an attempt to obtain a more representative statewide sample (8).

Statewide usage of child safety seats or safety belts for children under 4 years of age increased from about 15 percent in 1982 before enactment of the mandatory child restraint law to about 30 percent in 1984 and stayed at this level in 1985 and 1986. This percentage increased to almost 50 percent in 1988 and 1989 and to 57 percent in 1990 and 1991 after a penalty was added to the law. The 1992 survey found a usage rate of 62 percent. Safety belt usage for the driver has increased each year of the survey. The statewide driver safety belt usage rate was only 4.2 percent in 1982 compared to 41 percent in 1992.

The objective of the survey summarized in this report is to establish statewide 1993 safety belt and child safety seat usage rates in Kentucky. These rates may be compared to those determined from previous surveys. Another objective of this study was to analyze accident data to evaluate the effectiveness of safety belts in reducing injuries to occupants of motor vehicles involved in traffic accidents.

PROCEDURE

DATA COLLECTION PROCEDURE

The data collection procedure used in the surveys was modified starting with the 1990 survey. The procedure used in the 1990 through 1992 surveys was again used in the 1993 survey. The procedure used for the first several surveys was changed in order to obtain a more representative statewide sample as well as to use a procedure that would be comparable to surveys taken in other states. The data collection form was changed as well as the site selection procedure.

The data collection form used in the survey is shown in Figure 1. Usage was recorded for drivers and front-seat passengers sitting in the outboard position. The exception was for children under four years of age for which data were collected for all positions in the front and the rear seats. Drivers were classified into three age categories and were classified by sex. Passengers were classified into several age categories. For drivers and front-seat passengers (over three years of age), usage was classified as either using a harness or belt or no restraint. For children one to three years of age, the categories included safety seat, booster seat, harness or belt, or no restraint. For children under one year of age, the categories were either safety seat or no restraint. When a safety seat was used, an attempt was made to determine if there was an obvious misuse.

Two additional types of information were obtained for the first time in the 1993 survey. Use of motorcycle helmets was noted. Also, at some of the locations, a separate usage rate was determined for minority drivers.

The following list of guidelines for data collection was given to each observer, and each data collector went through a training period.

- 1. Always include the driver so the number of vehicles included in the sample will be known.
- 2. Include all vehicles at low-volume locations. When taking data on a multi-lane road, generally include only vehicles in the curb or near lane unless the traffic volume and roadway geometrics allow data to be collected in the next lane.
- 3. Collect data on only one approach at the intersection.
- 4. If traffic volume is too heavy to collect data for all vehicles, record data for the next vehicle in view after recording data for the prior vehicle.

- 5. Obtain a random sample of vehicles independent of whether the occupants are wearing a safety belt. (Do not attempt to include all vehicles having an occupant wearing a safety belt at a location where all vehicles cannot be obtained.)
- 6. Attempt to include data for children under four years of age for any vehicle in the sample in which such a child is a passenger.
- 7. Only include vehicles either stopped or moving so slowly that occupants can be readily observed.
- 8. Excluding children under four years of age, collect data only for drivers and passengers in the right-front seat (exclude the center front and rear seating positions).
- 9. Do not include old passenger cars not equipped with a safety belt (those without a head rest).
- 10. Collect data during daylight hours on weekdays and weekends.
- 11. Collect data for four hours at each site.
- 12. Begin and end data collection at a specified time not considering whether the occupants are using a safety belt.
- 13. Collect data for cars, vans, and light trucks.
- 14. Do not include a vehicle in the count when use by the driver cannot be determined.

As noted, data were collected for four hours at each location. The decision was made to collect data for an equal time period for each location rather than attempt to collect a given sample size.

DATA COLLECTION LOCATIONS

Data for the surveys collected from 1982 through 1989 were conducted at 23 sites in 19 cities. The cities were selected so that they would be distributed across the state. These cities were also selected to represent a range of population categories to account for social and economic factors. In order to be able to relate the survey results to data taken in other states and to include all types of roadways, it was necessary to expand the number of sites to include data in rural locations and for interstates. The distribution of the sites was based on vehicle

miles travelled statewide for various categories of roads in counties of varying populations. The variables considered were the rural or urban designation of the road, the functional classification of the road, and the county population. This was done so that roads would be stratified to assure a proper representation of urban and rural areas and different road types. The percentages of vehicle miles travelled on various types of highways in counties within given population ranges are given in Table 1. These percentages represent the proportion of vehicle miles driven on roadways having the given characteristics of the total vehicle miles driven statewide. The data apply to roads for which a traffic volume was available (which is the state-maintained highway system of slightly over 27,000 miles). Local county and city roadways would not be included. The data shown in Table 1 were obtained using 1990 data. There would be little change in the distribution from year to year so the same percentages have continued to be used. This would allow the same locations to be used each year.

The decision was made to take survey data at 100 sites. The number of sites for any type of highway and county population category was equal to the percentage of vehicle miles travelled for the given type of highway and county population. For example, eight percent of all vehicle miles travelled was on rural arterial highways in counties having a population between 10,000 and 25,000 so eight sites were selected on highways meeting this criterion. A computer file was used to prepare a randomly selected list of sections of roadway for each of the categories given in Table 1. This list was used as a source for selecting sites. Data had been collected at 23 sites since 1982, and it was felt that it would be beneficial to maintain an historical record at these sites. Therefore, these sites were maintained. A list of the observation sites is presented in Table 2, and the 23 original sites are identified with an asterisk. Many of the other sites were obtained from the randomly selected list of highway sections.

The sites had to be selected at a location where traffic would stop. A list of all locations having a traffic signal was obtained and used in the selection of sites. Except for some interstate locations, all the sites are at an intersection. Most of the intersections are controlled by a traffic signal. The sites selected to obtain data for interstates were either at an exit ramp or at a rest area. This would be the only exception to the sites being at a typical intersection. Data at an exit ramp were taken for traffic exiting the interstate at the intersection with the ramp and intersecting roadway. Another variable which was considered was the geographical location of the sites. Sites were selected to assure that they were distributed across the state. Sites were selected in 62 of the 120 counties. The largest number in any one county was eight in Jefferson County. For each category, the county, location (road and intersecting road), and city (nearest city for rural locations) are given in Table 2.

SURVEY DATA ANALYSIS

Safety belt usage rates were obtained for the driver and for all front-seat occupants. Rates were also obtained by driver age and sex and by age of the front-seat occupant. Statewide rates were obtained by weighting the usage determined for a given type of highway and county population by the percentage of vehicle miles given in Table 1 and combining the percentages from the various categories. Confidence intervals for the statewide usage rates were calculated.

For children under four years of age, rates were obtained for both front and rear seating positions as well for combined seating positions. Rates were separated into safety seat, booster seat, and harness or belt.

The 1993 usage rates for the 19 cities previously surveyed were compared to results determined in prior years. The rates for the various types of highway and county population categories were compared. Rates were also compared by region of the state.

ACCIDENT ANALYSIS

The computer files containing all reported accidents in Kentucky (for the years 1988 through 1992) were analyzed to determine the effectiveness of wearing safety belts or riding in a safety seat. The percent reductions in injuries were computed, and statistical tests were conducted to determine if the reductions were significant. This type of analysis was performed for drivers, children age three and under, and front-and rear-seat passengers. The effectiveness of safety belts was related to several factors such as seating position, type of vehicle, and speed limit. The potential annual reduction in traffic accident fatalities and serious injuries and the accident savings from an increase in driver safety belt usage were estimated.

RESULTS

SURVEY DATA ANALYSIS

Driver usage rates for the various types of highways and county population categories are summarized in Table 3. The overall statewide rate, using the data collected at 100 sites and the weighting procedure described, was 42 percent. The sample size was 101,567 drivers. The confidence limits for a probability of 0.99 would be plus or minus 0.4 percent (11). For a given type of highway, the usage rate was higher for counties having larger populations. In several instances, there were large fluctuations in usage rates at survey sites within the same location and population category. While the data collection procedure changed in 1990, the usage rate may still be compared to the statewide rates from past years. The previous studies showed that driver usage rates statewide had steadily increased from 4.2 percent in 1982 to 41 percent in 1992. The 1992 survey shows that this increase has continued. The increase in the driver usage rate in 1993 compared to 1992, given the large sample size, was determined to be statistically significant (probability of 0.99) (11). However, the magnitude of the increase in 1993 of only one percentage point was the smallest since 1984. The data show that the increase in the driver usage rate has become smaller the past few years.

Usage rates for front-seat passengers for the various types of highways and county population categories are summarized in Tables 4 through 7 for the different age categories. Usage for children in the four to five years of age category was 37 percent plus or minus about 3 percent. This compares to 40 percent for the 1992 survey but this slight decrease was not statistically significant. For children in the 6 to 12 years of age category, the usage rate was 41 percent plus or minus about 2 percent. This compares to 37 percent in 1992 with this slight increase not being statistically significant. For the 13 to 19 years of age category, the usage rate was 37 percent plus or minus about 2 percent. This was an increase from 31 percent in 1992, and this increase was statistically significant. For the category of over 19 years of age, the usage rate was 40 percent plus or minus about two percent. This was a slight increase from 39 percent in 1992 with this slight increase not statistically significant.

Usage rates for children one through three years of age are given in Table 8 while rates for children under one year of age are given in Table 9. These rates are for children in both the front and the rear. The usage rate for children under one year of age (76 percent with a confidence limit of about three percent) was higher than that for children one to three years of age (56 percent with a confidence limit of about three percent). The usage rate for the combination of these categories or children under four years of age was 61 percent with confidence limits for a probability of 0.99 percent of about two percent. The sample size for children under four years of age was 6,505. This age category corresponds to the children for which the mandatory child restraint law would apply. This usage rate of 61 percent compares to 57 percent in 1990 and 1991 and 62 percent in 1992. This percentage was about 15 percent in 1982 before enactment of the child restraint law and increased to approximately 30 percent after enactment of the law having no penalty and increased again to almost 50 percent in 1988 after the addition of a dollar penalty to the child restraint law.

The usage rate for children under four was higher in the rear seat compared to the front seat. For children one to three years of age, the usage rate was 64 percent for the rear seat compared to 44 percent for the front seat. For children under one year old, the usage rate was 87 percent for the rear seat compared to 61 percent for the front seat. There was a higher percentage of children one to three years of age observed in the rear seat (61 percent) while the number in the front and rear seats was almost identical for children under one year old (53 percent in the rear seat).

Safety belt usage rates for drivers and front-seat passengers, by type of highway, are presented in Table 10. The highest usage rates were on interstates (both rural and urban). Urban interstates had the highest rate, and this would be related to data taken in Jefferson County where a safety belt law exists. The lowest usage rates were on rural, non-interstate highways. For drivers and front seat passengers, the highest rate was for urban interstates with the lowest rate on rural, local highways. There was a substantial variation between highway types. For drivers, the percentage using a safety belt varied from 25 percent on rural, local highways to 62 percent on urban interstates. For front-seat passengers, the percentage for those using a safety belt varied from 26 percent on rural, local highways to 56 percent on urban interstates. For children under four years of age, the percentage using a safety seat or safety belt varied from 49 percent on rural, arterial highways to 79 percent on urban interstates.

There was a variation in usage by the age and sex of the driver (Table 11). Females had a higher usage rate than males. The middle age category of 31 to 50 years of age had a slightly higher usage than the 16 to 30 and over 50 years of age categories.

The highest usage rate for front-seat passengers was for the under four years of age category (Table 12). This would be expected since the mandatory child restraint law would apply to this age category. The usage rate for the other age categories were similar as that for drivers.

The change in usage of safety belts by drivers in the 19 cities in which data have been collected since 1982 is presented in Table 13. The usage rate was higher in 1993 than in 1992 in 10 of the 19 cities with identical rates in one city. The largest increase was at the Hazard location where there has been a low rate over the past several years. The second largest increase was in Covington, and this finding would be related to the mandatory usage law in Kenton County. The usage rates in Lexington, Louisville, and Covington were higher than that in any other city. This shows the potential increase in usage which could be obtained with a mandatory belt law. The lowest rate (21 percent) was in Princeton with the other lowest rates occurring in the smallest cities. In 5 of the 19 cities, the rate has either increased or remained constant from one year to the next since the first survey in 1982. Using the procedure followed in the previous surveys in which data were taken only at sites in these 19 cities results in a statewide usage rate of 41 percent. This rate is almost identical to that determined using the revised procedure in which data are collected at 100 sites. The change in usage of safety seats or belts by children under 4 years of age in these 19 cities is presented in Table 14. The usage rate was higher in 1993 than in 1992 in 10 of the 19 cities. The highest usage rates were in Covington, Louisville and Lexington. The lowest usage was in Glasgow. The small sample sizes could result in substantial variations in usage rates. As with usage rates for drivers, the rate was related to city population with usage generally increasing as population increased. Using the procedure followed in the previous surveys in which data were taken only at sites in these 19 cities results in a statewide usage rate of 67 percent. This rate is higher than that determined using the revised procedure in which data are collected at 100 sites.

A summary of the data collected is given in the Appendix. For each of the 100 data sites, the usage rate and sample size are given for drivers, front-seat passengers (by age category for over four years of age), and children in the one to three years of age and under one year old age categories (both front and rear seat).

Obvious improper usage of safety seats had been estimated in previous surveys. However, improper usage could only be determined when there was a very obvious problem. Since the percentages were very low compared to studies dealing specifically with this subject, improper usage data were not obtained in this survey.

Helmet use by motorcyclists was noted during the survey. Kentucky has a statewide law requiring the use of a helmet by motorcyclists. The results confirm the expected high usage. All of the 405 observed motorcyclists were wearing a helmet.

Usage for minority drivers was obtained at the majority of the sites with a total sample of 3,403. However, since data were not taken at all locations and the sample was very low at many locations, a statewide percentage using the same methodology as previously described could not be obtained. Comparisons could be made for a few highway categories where data were collected at all sites. For rural interstates, the usage rate for minority drivers was 61 percent (sample of 299 drivers) compared to 56 percent for all drivers. For urban interstates, the usage rate for minority drivers was 62 percent (sample of 670 drivers) which was identical to that for all drivers. For rural local highways, the usage rate for minority drivers was 23 percent (sample of 102 drivers) compared to 25 percent for all drivers. The largest sample of minority drivers at any location was an urban arterial site was in Hopkinsville where the usage rate was 21 percent for minority drivers compared to 27 percent for all drivers. At the three sites (urban arterial) in Louisville were data have been collected for several years, the usage rate for minority drivers was 49 percent compared to 60 percent for all drivers. However, at rural arterial sites in Muldraugh (sample of 122 drivers) and West Point

(sample of 124 drivers) the usage rate for minority drivers was higher than for all drivers. The usage was 67 percent for minority drivers in Muldraugh compared to <u>61 percent for all drivers and, in West Point, the usage rate was 72 percent for</u> minority drivers compared to 60 percent for all drivers. There were three other non-interstate sites where a sample size of at least 100 minority drivers was obtained. At a rural arterial site near Hopkinsville, the usage rate was 24 percent for minority drivers and 27 percent for all drivers. At one urban arterial site in Lexington, the usage rate was 59 percent for minority drivers and 65 percent for all drivers. At an urban arterial site in Frankfort, the usage rate was 42 percent for minority drivers and 44 percent for all drivers.

A large sample of minority drivers was obtained as part of another study which included an extensive usage survey in Lexington. A sample of 3,612 minority drivers was obtained at 12 locations. These 12 locations were part of 24 locations at which data were collected. The usage rate for minority drivers at these 12 locations was 43 percent compared to an overall rate of 54 percent for all drivers. The overall rate at all 24 locations was 59 percent. These locations were typically urban arterial locations. The results of this survey were consistent with the difference noted at the three locations in Louisville which were part of the statewide survey.

ACCIDENT ANALYSIS

The number and percentage of all drivers involved in police-reported accidents sustaining a given injury as a function of safety belt usage are summarized in Table 15 (based on 1988 through 1992 accident data). By comparing the percentages, the percent reduction associated with safety belt usage could be calculated. The largest reduction was for a fatal injury (82 percent reduction) with the reduction decreasing for less severe injuries. For comparison, the reduction was 13 percent for the "possible injury" category. The reductions in the percentage of each of the types of injuries were determined to be statistically significant (probability of 0.99). In severe accidents, use of a safety belt would lessen, but not eliminate, the injury. This resulted in the smaller reductions in the less severe injury classifications. There was a 54 percent reduction in a driver sustaining a fatal or severe injury in a traffic accident if a safety belt was worn compared to not wearing a safety belt. This agrees with other research studies which report that lap and shoulder safety belts, when used, reduce the risk of fatal or serious occupant injuries by between 40 and 55 percent (13).

The effectiveness of safety belts in reducing driver injuries was related to several variables. In Table 16, the percentage of drivers sustaining either a fatal or severe injury who were wearing or not wearing a safety belt was related to type of vehicle, type of accident, and speed limit. There were reductions in the percentage of fatal or severe injuries for drivers of passenger cars, single-unit trucks, and combination trucks. The reduction was slightly higher for drivers of trucks. The severity of injuries to drivers of passenger cars was higher than for drivers of trucks. Safety belts also reduced the percentage for fatally or severely injured in various types of accidents. The types of accidents were chosen to represent the extremes of accidents in terms of severity. Reductions were noted for the relatively low severity rear-end accidents as well as the more severe fixed object, head-on, and "overturned" accidents. Safety belts also were determined to be effective in reducing fatal or severe injuries for accidents occurring on either 35-mph local streets or 55-mph high speed roadways.

The number and percentage of children age 3 and under sustaining a given injury as a function of using a safety seat or safety belt are summarized in Table 17. There were substantial reductions, higher for the most severe injury types, associated with both safety seats and safety belts. The reductions were fairly similar for use of either the safety seat or safety belt. The reductions for all injury categories, except fatalities, were statistically significant (probability of 0.99). Of 40 fatalities, 19 involved children not using a safety seat or safety belt. The percent reductions were generally higher than that for drivers (as given in Table 15). There was a 70 percent reduction in the chance of a child less than age 4 sustaining a fatal or severe injury if a safety seat was used compared to not using any restraining device. Also, as shown in Table 18, the reductions in injuries applied to both the rear-and front-seating positions. The data in Table 18 show that accident severity was less in the rear than in the front seat. Of the 40 fatalities, 23 involved a front-seat passenger.

The number and percentage of occupants other than drivers sustaining a given injury as a function of safety belt usage are listed in Table 19. As with drivers, there was a large reduction in the percent injured (all reductions were statistically significant with a probability of 0.99). Overall, these percent reductions were generally slightly higher than that for drivers. The chance of a vehicle occupant, other than the driver, sustaining a fatal or severe injury in a traffic accident was reduced by 55 percent if a safety belt was worn compared to not wearing a safety belt.

The accident severities associated with using a lap belt and/or shoulder harness for occupants other than the driver (by seating position in the front or rear seat) are listed in Table 20. Only a lap belt is available in the rear seat in the majority of vehicles involved in accidents in the time period studied. The use of a shoulder harness and/or lap belt in the front seat or a lap belt in the rear reduced injuries dramatically (all reductions were statistically significant with a probability of 0.99). Accident severity was less in the rear seat and the percent reduction in injuries was generally greater in the rear seat than the front seat. The use of primarily a lap belt in the rear seat has been effective with a reduction in fatal or incapacitating injuries of 64 percent. This finding should not be interpreted to suggest that it would not be preferable to have a combination lap belt/shoulder harness in the rear seat.

The potential annual reductions in traffic accident fatalities and accident savings from an increase in driver safety belt usage are presented in Table 21. The reduction in fatalities and associated accident cost savings were calculated using the reduction factors listed in Table 15, accident data for the years of 1988 through 1992, the 41 percent usage rate determined from the 1992 observational survey, and accident cost estimates recommended by the Federal Highway Administration (14).

SUMMARY

The methodology used to obtain statewide safety belt usage rates in 1993 was the same as that used for the 1990 through 1992 surveys. The data show that, while the usage rate for drivers in 1993 continued the increase that has been documented in previous years, the amount of the increase was less (Table 22). The statewide usage rate of safety belts by drivers was 42 percent. This compares to 41 percent in 1992. The usage rate varied by type of highway and type of area (rural or urban). The rate was generally higher in urban compared to rural areas. Rates were higher on interstate and arterial highways compared to collector or local streets. While Kentucky does not have a statewide mandatory usage law, local ordinances have been enacted in Fayette County (Lexington), Jefferson County (Louisville), Murray, Bowling Green, Kenton County, Corbin, Bardstown, and Midway. The effect of these laws was shown with the very high usage determined for the observation sites in Lexington, Louisville and Covington (Table 13).

The statewide usage rates for front-seat passengers were also obtained. Considering all passengers, the usage rate was 40 percent. Usage varied with age with the highest usage for the under four years of age category and the lowest usage for the 4 to 5 and 13 to 19 years of age categories.

Kentucky has a law requiring children under 40 inches in height to be placed in a child restraint. The statewide usage rate for children under the age of four (including both the front and rear seat) was determined to be 61 percent. This represents a very slight decrease from the 62 percent usage determined in the 1992 survey.

The compliance of motorcyclists with the requirement to wear a helmet was confirmed. All observed motorcyclists were wearing their helmet.

Considering all the various highway types, the differences between the usage rates for minority drivers and all drivers were not consistent. The data suggest, statewide, there is not a substantial difference between the usage rate of minority drivers and other drivers. Usage changed with such variables as type of highway and population of the area similarly for minority drivers as for all drivers. The highway type where the usage rate for minority appear to be substantially lower than other drivers is urban arterials. This was shown at the Louisville sites. This difference was also shown in data taken at a number of sites in Lexington as part of an extensive usage survey in that city.

The significant benefits, based upon the reduction of injuries, for occupants involved in a police-reported accident wearing a safety belt or in a safety seat were shown through the analysis of accident records. For example, one finding was that there was a 54-percent reduction in fatal or incapacitating injuries for drivers wearing a safety belt compared to those who were not. The benefit in terms of the reduction in injuries by wearing a safety belt in either the front or rear seat was documented. The potential savings in fatalities, serious injuries, and accident costs which could be obtained from an increase in the use of safety belts was shown.

RECOMMENDATIONS

While driver safety belt usage has been increasing in the past few years, statewide usage is only about 42 percent with much lower usage rates (as low as under 15 percent) determined for some small cities. While public information has resulted in increases, the method which has been shown to result in a dramatic increase in safety belt usage is enactment of a mandatory safety belt law. This has been demonstrated in Kentucky after enactment of ordinances in Fayette County and Louisville. This resulted in the usage rate almost doubling to a level of about 70 percent shortly after the ordinance was passed. A recent detailed survey in Lexington found a usage rate of 59 percent (15). Local ordinances have also been passed in Murray, Bowling Green, Kenton County, Corbin, and Bardstown with increased usage documented at survey sites in Covington, Bardstown and Bowling Green.

Statewide laws have been enacted in all but a few states. Past national surveys have shown usage rates of 30 percent in cities in states without a belt law compared to 50 percent in cities in states having a law (13). Belt use as high as 90 percent has been reported in other countries having belt laws and high levels of enforcement (16). A recent survey of licensed drivers revealed that the respondents were in favor (76 percent in favor statewide) of a statewide law requiring use of safety belts (17).

It has been estimated that at the current usage level of about 50 percent in states having belt laws, safety belts would have saved 4,700 lives if all states had belt laws in 1987 (13). An analysis of Kentucky accident records showed the safety benefits associated with safety belt usage and the potential annual reductions in traffic accident fatalities and accident savings from an increase in driver safety belt usage was estimated. For example, an increase in the driver usage rate up to 70 percent usage would result in a potential annual reduction of 168 fatalities and an annual accident savings from the reduction in fatalities and serious injuries of about 296 million dollars.

Therefore, a recommendation is that a statewide mandatory safety belt law should be enacted by the Kentucky General Assembly. In the event a statewide law is not enacted, additional local governments should consider passing mandatory safety belt laws.

Public information and education concerning the reasons to wear safety belts should continue. The survey shows that emphasis areas would be for the 13 to 19 years of age category and for rural areas.

TABLE 21. POTENTIAL ANNUAL REDUCTION IN TRAFFIC ACCIDENT FATALITIES AND ACCIDENT SAVINGS FROM INCREASE IN DRIVER SAFETY BELT USAGE*

* Based on increase from the 41 usage rate determined in the 1992 survey, the percent reductions listed in Table 15, and accident cost estimates recommended by the Federal Highway Administration (14). These costs are \$1,500,000 for a fatality and \$39,000 for an incapacitating injury.

** Serious injuries were defined as those listed as incapacitating on the accident report.

SUMMARY OF DATA

LIST OF SURVEY LOCATIONS

- Fayette, I64 at KY 859
- 2 Boyd, I64 at US 23
- 3 Christian, I24 at US 41A, Hopkinsville
- 4 Hardin, I65 at rest area, Sonora
- 5 Barren, I65 at KY 70, Cave City
- 6 Boone, I75 at rest area, Florence
- 7 Clark, I64 at KY 627, Winchester
- 8 Franklin, I64 at US 60, Frankfort
- 9 Laurel, I75 at KY 80, London
- 10 Henry, I71 at KY 153, Sligo
- 11 Rockcastle, I75 at US 25, Mt. Vernon
- 12 Scott, I75 at rest area, Georgetown
- 13 Shelby, I64 at KY 53, Shelbyville
- 14 Woodford, I64 at KY 341, Midway
- 15 Trigg, I24 at US 68, Cadiz
- 16 Pike, US 460 at KY 122, Shelbiana
- 17 Daviess, US 60 at KY 144, Owensboro
- 18 Hardin, US 31W at KY 835, West Point
- 19 Perry, KY 15X at KY 476, Hazard
- 20 Knox, US 25E at KY 225, Barbourville
- 21 Harlan, US 119 at KY 179, Cumberland
- 22 Floyd, KY 80 at US 23, Allen
- 23 Bullitt, US 31E at KY 44, Mt. Washington
- 24 Carter, KY 1 at I64, Grayson
- 25 Laurel, US 25 at KY 80, London
- 26 Mason, US 62 at KY 11, Maysville
- 27 Clay, US 421 at KY 80, Manchester
- 28 Bourbon, US68 at 5th St., Millersburg
- 29 Casey, US 127 at KY 70, Liberty
- 30 Meade, US 31W at KY 1638, Muldraugh
- 31 Lincoln, US127 at KY 78, Hustonville
- 32 Russell, US127 at KY80, Russell Sprgs.
- 33 Washington, US 150 at KY 55, Springfield
- 34 Cumberland, KY 90 at KY 61, Burkesville
- 35 Ballard, US 60 at KY 358, LaCenter
- 36 Fayette, KY 418 at I75, Lexington
- 37 Christian, US 41 at KY 1682, Hopkinsville
- 38 McCracken, US 62 at KY 68, Paducah
- 39 Madison, KY 52 at KY 876, Richmond
- 40 Barren, KY 255 at US 31W, Park City
- 41 Nelson, US 62 at KY 48, Bloomfield
- 42 Boone, KY 18 at KY 237, Burlington
- 43 Oldham, KY 146 at KY 393, Buckner
- 44 Knox, KY 11 at US 25E, Barbourville
- 45 Henderson, KY 145 at US 60, Corydon
- 46 Boyle, US 68 at US 150, Perryville
- 47 Greenup, KY 1 at US 23, Greenup
- 48 Caldwell,KY 139 at Jefferson, Princeton
- 49 Grayson, US 62 at KY 259, Leitchfield
- 50 Allen, US 231 at US 31E, Scottsville

- 51 Bath, US 60 at KY36, Owingsville
- 52 Larue, KY 84 at KY 61, Hodgenville
- 53 Scott, US 62 at I75, Georgetown
- 54 Anderson, US 127 at US 127B, Lawrenceburg
- 55 Breathitt, KY 30 at KY 15, Jackson
- 56 Webster, US 41 at KY 56, Sebree
- 57 Garrard, KY 39 at US 27, Lancaster
- 58 Carroll, US 42 at Highland, Carrollton
- 59 Elliott, KY 32 at KY 7, Sandy Hook
- 60 McCracken, KY 1286 at US 62, Paducah
- 61 Harlan, KY 413 at US 119, Loyall
- 62 Greenup, KY 7 at US 23, South Shore
- 63 Lewis, KY 10 at KY 57, Tollesboro
- 64 Simpson, KY 73 at KY 100, Franklin
- 65 Adair, KY 55 at KY 80, Columbia
- 66 Taylor, KY 208 at US 68, Campbellsville
- 67 Kenton, I275 at KY 17, Covington
- 68 Kenton, I75 at KY 371, Crescent Springs
- 69 Fayette, I75 at US 68, Lexington
- 70 Jefferson, I64 at KY 1747, Louisville
- 71 Jefferson, I65 at KY 1631, Louisville
- 72 Jefferson, I264 at US 31E, Louisville
- 73 Jefferson, I264 at US 42. Louisville
- 74 Jefferson, I264 at US 60, Louisville
- 74 Jenerson, 1204 at OS 00, Louisville
- 75 Warren, I65 at US 231, Bowling Green
- 76 Boone, I71 at KY 14, Verona
- 77 Jefferson, US 31W at Gagel, Louisville
- 78 Jefferson, KY 1447 at Hubbards, Louisville
- 79 Jefferson, KY 1703 at Trevillian, Louisville
- 80 Fayette, US 27 at KY 1683, Lexington
- 81 Fayette, Reynolds at Lansdowne, Lexington
