MEMO TO: T. H. Baker
Director of Construction

P. 3.2.

SUBJECT: Franklin-Woodford Counties
S-SG 155 (1)
P.C. Concrete Pavement

REFERENCE: 1. Your Letter, November 10, 1959
2. My Memo, February 15, 1960
3. My Memo, May 12, 1960
4. My Memo, June 17, 1960

Following our discussion of the above noted project in Mr. A. O. Neiser's office last month, we have made the inspection requested. Each pavement slab, crossover, and turnout or interchange has been surveyed as to number and type of defects.

The attached memo report by Mr. Milton Evans, Jr., Head of the Concrete Section, Research Division, contains the tabulated performance survey. Although 11,130 new defects have developed in the 1-year period, the average size of the soil or chert defect is considerably smaller than noted in our earlier surveys.

The pavement has served for two winter seasons and will, of course, be two years old later this year. The surveys (note Table VI) show that the soil and chert type foreign material in the pavement slabs are continuing to cause additional defects. It appears that as weathering has progressed, moisture in sufficient quantities to saturate the foreign material has through freezing action popped out their cover of concrete.

Before a decision is made regarding additional patching, etc., I suggest that you, Mr. Evans and I look at the areas of highest concentration of new defects. I believe that by doing so you can better interpret the tabulations.

W. B. Drake
Director of Research

P. 3.2

Memo. to: W. B. Drake
Director of Research

Subject: Investigation of Concrete Pavement
US-60 between Versailles and Frankfort
Project: Franklin-Woodford Counties S-SG 155(1)

A complete survey of the above project was made between April 27, and May 13, of this year to determine the condition of the pavement after the second winter of service. The data from this survey include all of the approximately ten miles of four-lane highway, Tables I and II; all of the cross-overs, Table III; and the ramps and connecting lanes in the interchanges, Tables IV and V. Table VI covers the areas where several surveys have been conducted and Table VII is a breakdown of the total defects by type for the whole project. These tables are summaries of the condition of each slab or area on the project at present, and can be compared to previously prepared tables in reports on the subject pavement dated February 15, 1960, May 12, 1960, and June 17, 1960.

An appreciable number of new defects have appeared as a result of additional service since June, 1960. These defects are of the same type as those reported before, chert popouts, soil holes, cracks, and trash imbedments. The greatest number of new failures have occurred in the sections of the project where the highest concentrations of defects were originally detected; i. e., sections between stations 69-94 WB, 203-281 WB, 336-395 WB, 6/50-16/50 EB and 61-74 EB.

It is important to note that the average size of the new defects is somewhat smaller than the average size of the defects originally counted. However, none of the defects just counted were smaller in diameter than one-half of an inch.

Table VII is provided to show that 13,547 or 39.49% of all the defects larger than 1/2 inch on the project have been patched, 300 or 0.87% are cracks, and 20,456 or 59.64% others still exist. Of these, approximately 11,130 have developed since the last survey. The 13,547 patches just counted represent 61.87% of the total defects recorded in the May 12, 1960, report. It is likely that the other 38.13% of the defects counted as of May, 1960, were not patched because they were widely separated and considered by the repair crew to be too small to require patching. If this is a valid criterion for a percentage of counted defects which need patching, it appears that 61.87% of the 11,130 new defects, or 6,886 defects, may now need repairing.

Station	Patched		Defects		Total Defects	
	Defects	Total	Crack	Other	Total	per ft.

The epoxy mortar patches which were placed during the summer of 1960, appear to be in excellent condition after their first winter. There are a few instances where, because of adverse conditions when the patches were placed, such as an undue delay between mixing the mortar and placing it, insufficient cleaning of a hole, or exceptionally large patches, small cracks have appeared in or around a patch. In these cases the hole should be recleaned and repatched, or if the cleaning was not the fault, then the patches should be primed with epoxy resin to seal them from any further weathering.

Generally the patches are performing very well and this kind of sealing treatment is probably not a necessity. However, if further patching is to be done, all of the patches should be noted by the repair crew and any touching up required should be done along with the regular procedure.

Milton Evans, Jr.
