Applying Research to Optimize Care®

# Analytic Approaches for Causal Inference with Complex Multi-Component Interventions

Glen Mays, PhD

Arnold Stromberg, PhD

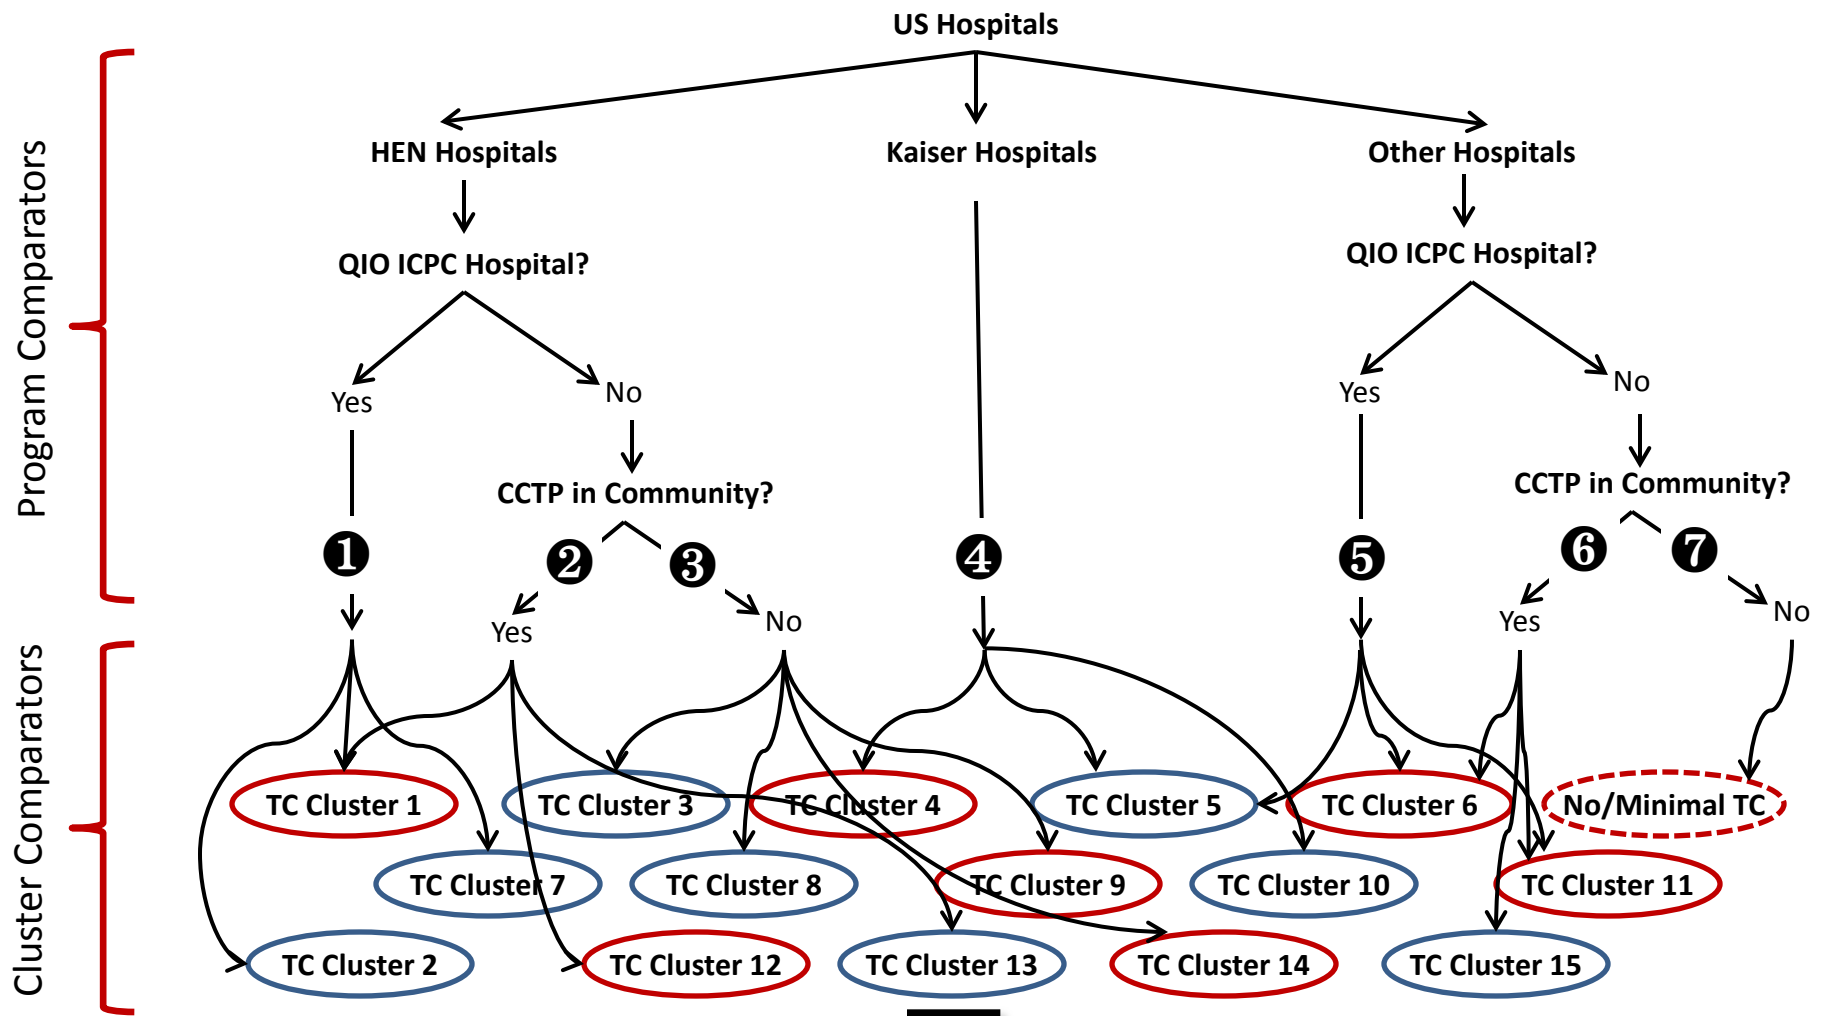

Jing Li, MD, MS

Mark V. Williams, MD

# ACHIEVE Quantitative Study Design

- **Hospital Adoption:** Survey hospitals to determine the scope and timing of transitional care components (TCC)
- **Cluster Identification:** Use qualitative and quantitative data to identify clusters of TCCs implemented together
- **Retrospective Analysis:** Use administrative data to:
  - Compare patterns of care and outcomes before vs. after adoption of TCC clusters
  - Detect changes in care and outcomes attributable to TCC implementation (2009-14)
- **Prospective Analysis:** Measure patient-centered care patterns, experiences, & outcomes across TCC clusters using an incomplete fractional factorial design

# Overview of ACHIEVE Quantitative Design

# Dealing with Complexity: Retrospective Analysis

- **Principal components analysis/factor analysis:** Identify clusters of TCCs commonly implemented together
- **Cluster analysis:** Identify comparison groups of hospitals/communities that use the same combinations of TCC clusters
- **Qualitative data:** Site visit and focus group findings inform TCC cluster and comparison group identification
- **Adoption/selection analysis:** Evaluate selection bias in hospital/community adoption of TCCs and the types of patients exposed
- **Interrupted time series analysis:** Estimate changes in patient care and outcomes attributable to TCC implementation
- **Hierarchical multivariate adjustment:** control for patient, hospital and community covariates, balance across TCCs/groups
- **Instrumental variables and person-centered effects:** control for unobserved confounding and estimate patient heterogeneity in treatment effects

# Dealing with Complexity: Prospective Analysis

- **Incomplete fractional factorial selection:** Screen and sample a subset of TCC clusters (factors) and types of care settings (levels) that provide contrasts for the fullest possible range of TCC, hospital, and community combinations
- **Care settings/levels:** A total of 40 care settings will be selected, balancing hospital and community characteristics (10 Kaiser settings).
- **Patient/caregiver sampling:** 300 patients from each setting surveyed within 45 days of discharge, plus 180 caregivers and 75 providers
- **Outcomes:** Comparison of patterns of care, experiences with care, and patient-centered outcomes across TCC clusters and settings
- **Hierarchical modeling & propensity score weighting:** balance and adjust for patient/hospital/community covariates across TCC clusters
- **Tree-based models:** identify interactions among patient subpopulations, patient/caregiver characteristics, and TCC clusters

# Dealing with Complexity: Prospective Analysis

Hospital/Community Care Setting Combinations	TCC Clusters							
	TCC 1	TCC 2	TCC 3	TCC 4	TCC 5	TCC 6	TCC 7	TCC 8
