Patterns and drivers of particulate organic matter composition (POM) in the Salish Sea

Alex Lowe

AWE Galloway, JS Yeung, MN Dethier, DO Duggins

April 30, 2014

Why are we interested in particulate organic matter (POM)?

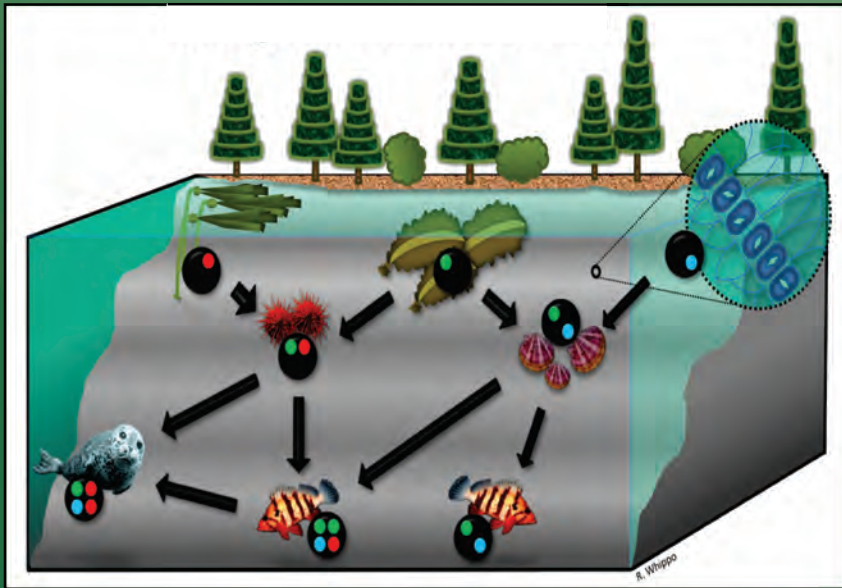

- Primary food of many consumers
 - Allochthonous vs autochthonous?
- Improved understanding of ecosystem dynamics
- Composition debated
 - What do biomarkers tell us?

Biomarkers

Biomarkers

- Multiple Stable Isotopes
 - $\delta^{13}\text{C}$, $\delta^{34}\text{S}$ \rightarrow Source indicators
 - $\delta^{15}\text{N}$ \rightarrow Nutrient/Trophic level indicator

- Fatty Acids
 - Synthesized by primary producers, bacteria, some consumers
 - Essential fatty acids (EFA) important for POM consumers

Research goals

1. Quantify spatial and seasonal variability of energy sources available in POM
2. Determine drivers of variability (composition and environmental factors)

Can we predict???

Study sites in the San Juans

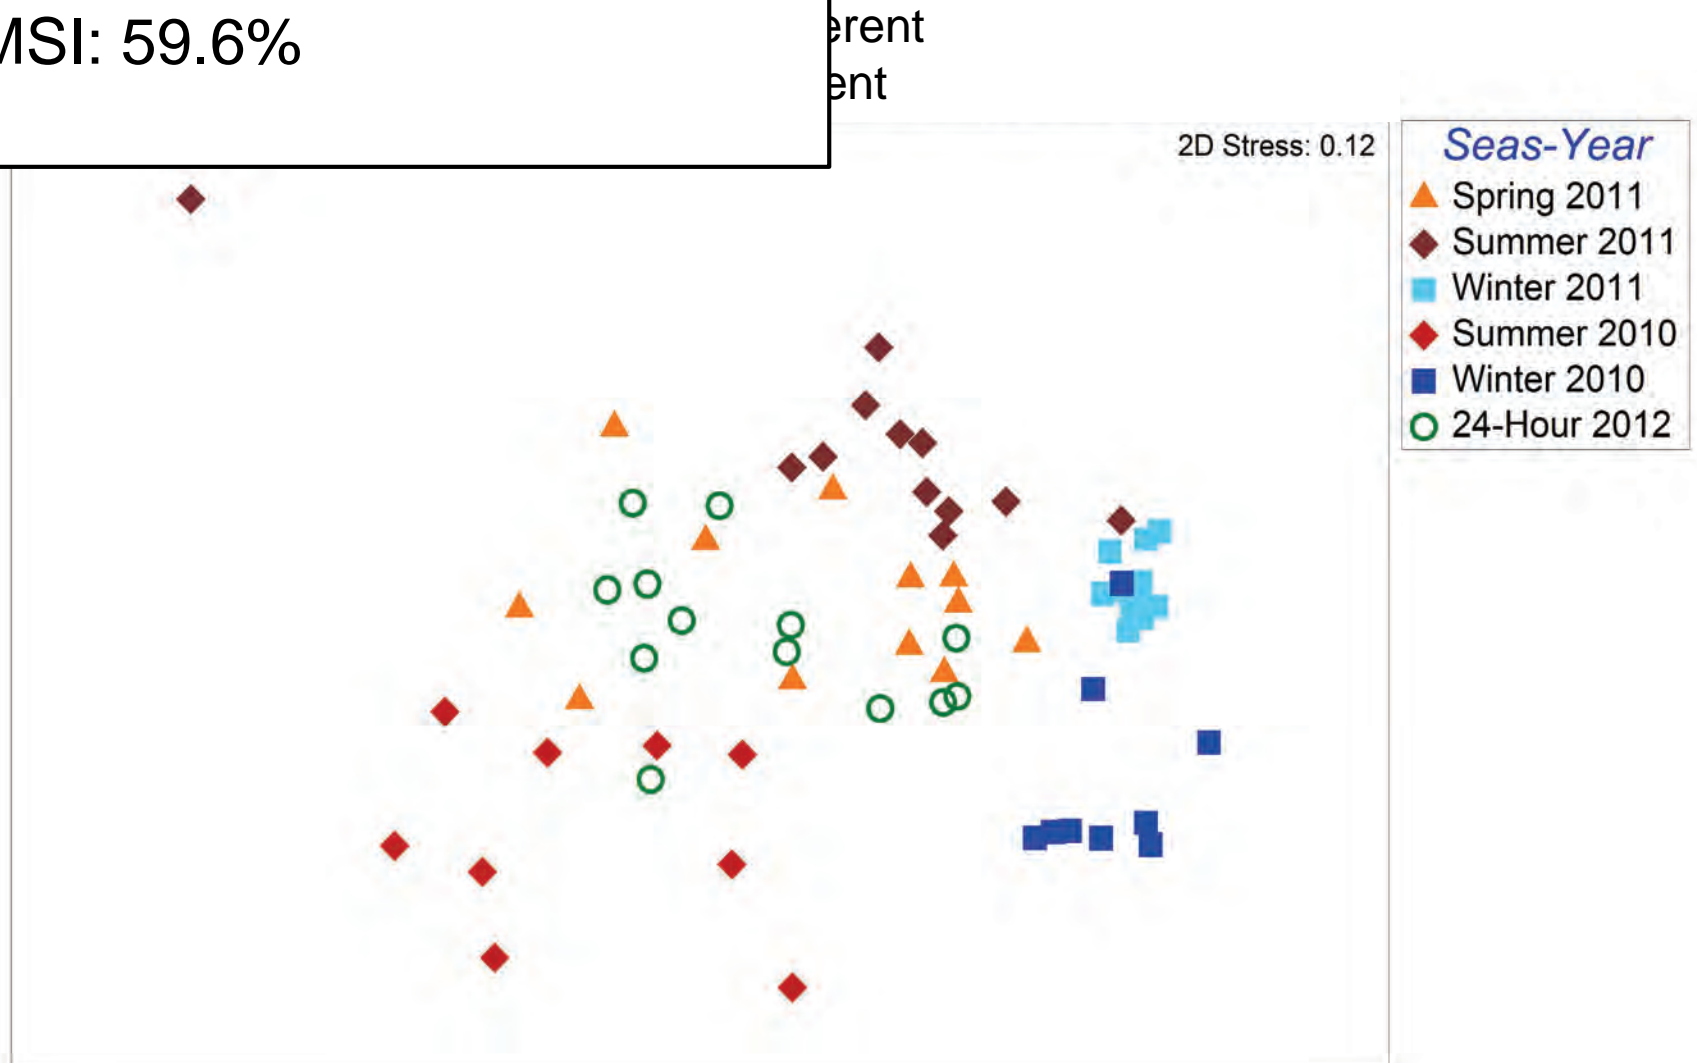

Capturing POM Dynamics

- Collect nearshore POM in 20 – 190 μm size fraction
- For each sample, quantify:
 - Percent bio-area of living and detrital groups
 - Stable isotopes of Carbon, Nitrogen and Sulfur
 - Fatty acids: taxon-specific and essential FA

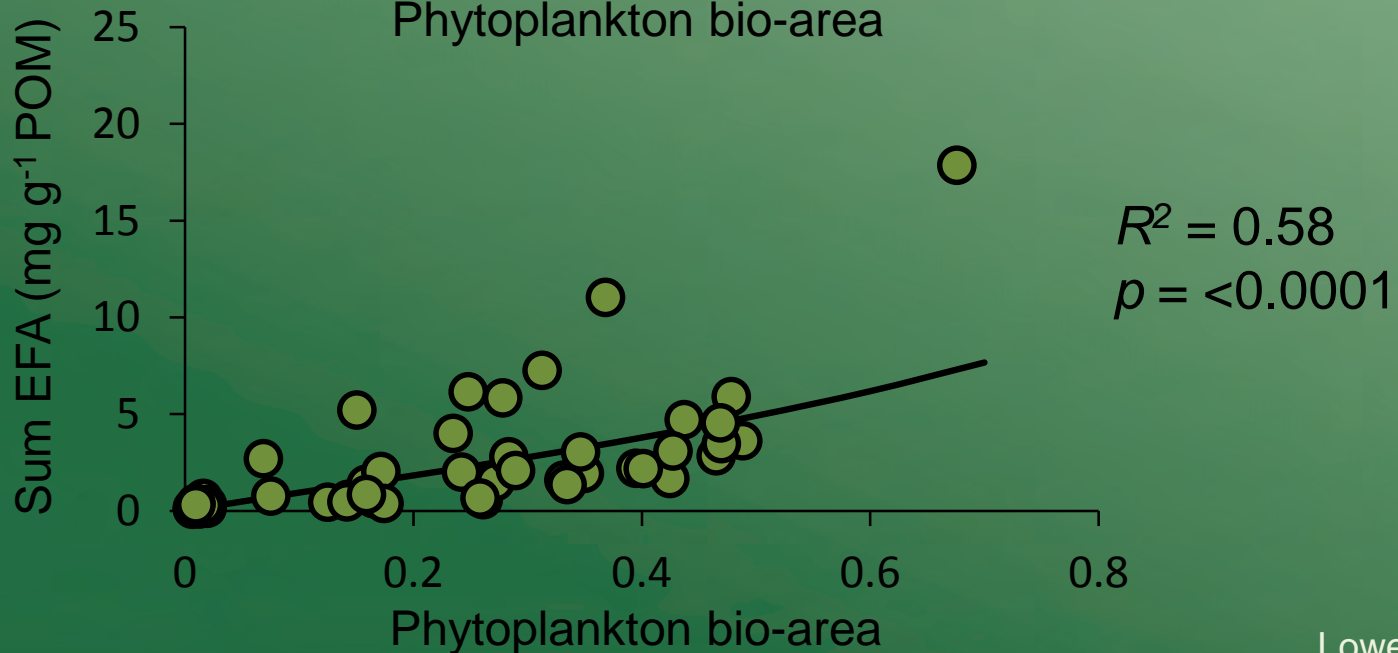

Variation in POM composition

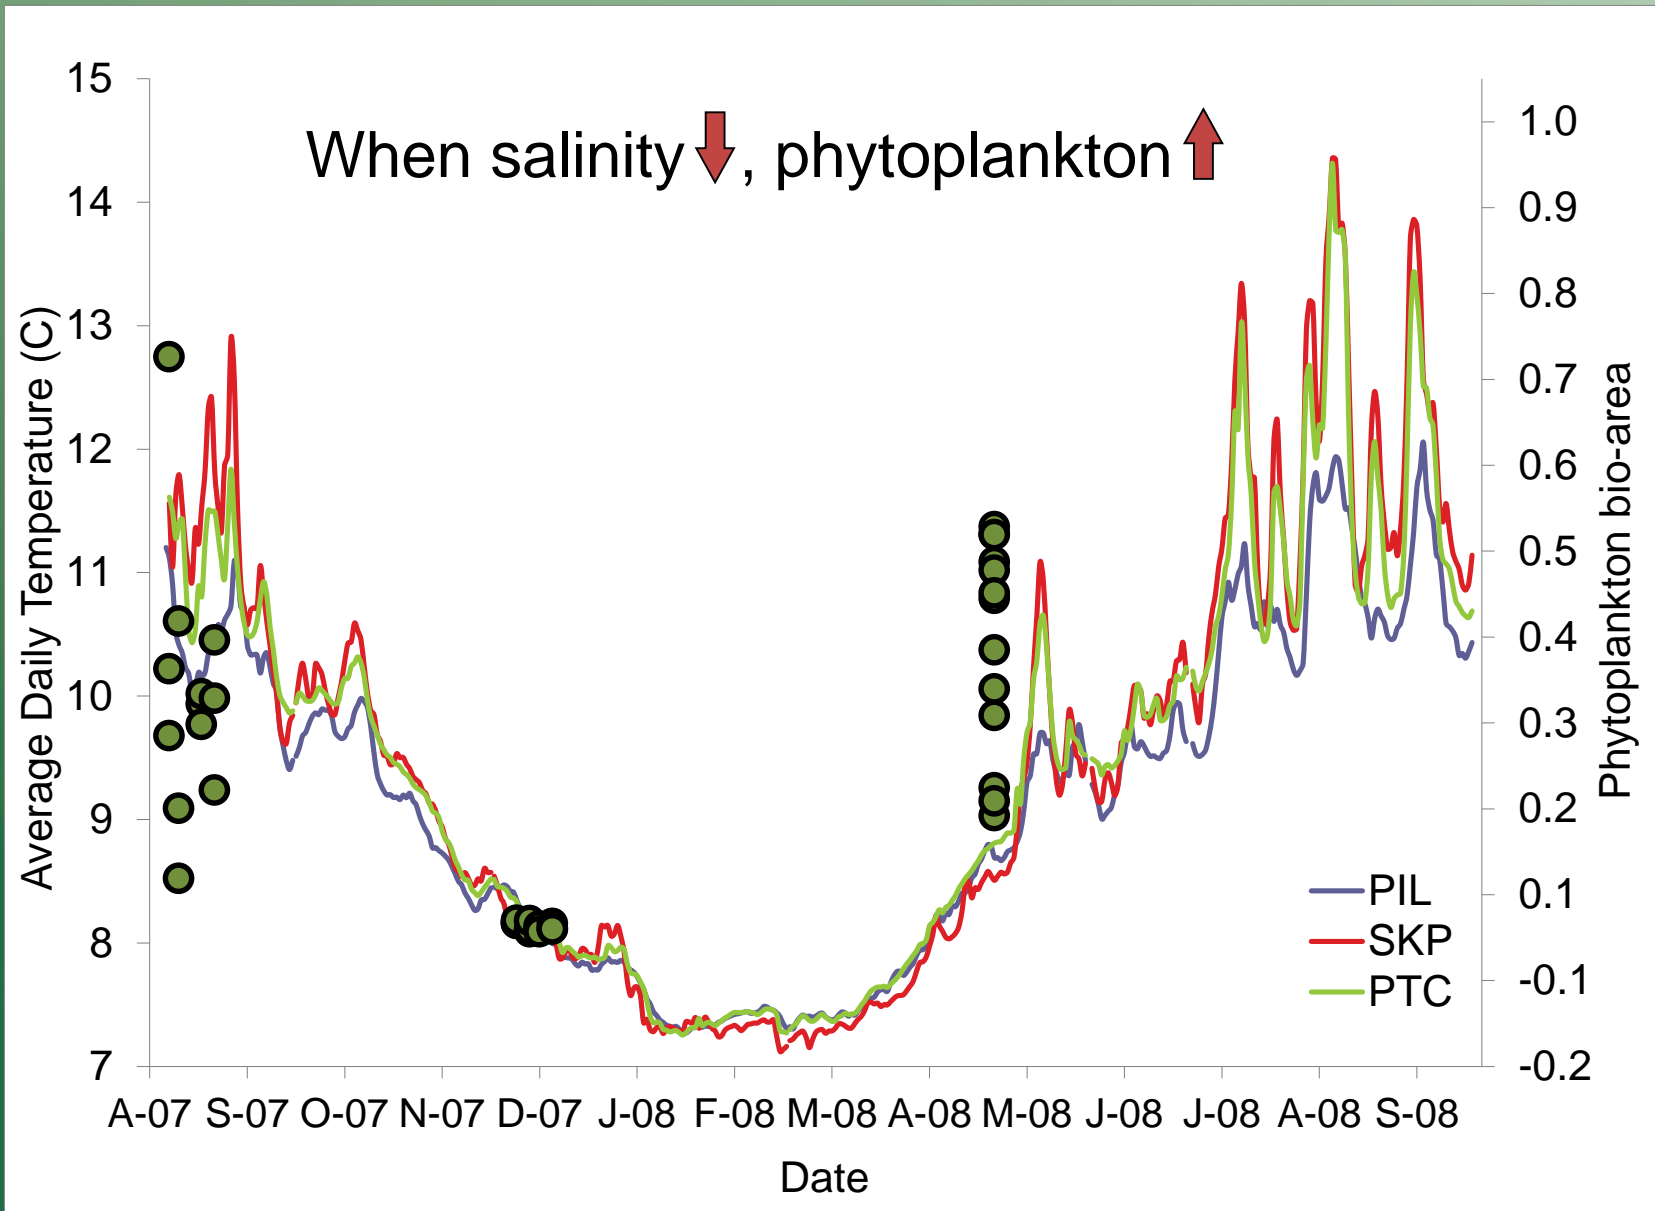

* Distance-based multivariate models:
- MSI: 59.6%

Influence of phytoplankton

Temporal phytoplankton variability

Conclusions

- Phytoplankton biomass drives variability in POM MSI and FA signatures
 - When biomass is high, species composition drives variation
 - When biomass is low (winter), resuspension of marine detritus
- Combination of MSI and FA can pick apart detritus
 - Often no single answer
