

Western Washington University Western CEDAR

Salish Sea Ecosystem Conference

2018 Salish Sea Ecosystem Conference (Seattle, Wash.)

Apr 5th, 10:45 AM - 11:00 AM

If historic marine pollution ceases, will the natural intertidal community return? How exposure to and release from pollution disturbance shapes rocky intertidal communities in the Salish Sea

Shannon Bard Hemmera, Canada, sbard@hemmera.com

Aaron Eger Univ. of Victoria, Canada, aeger@uvic.ca

Julia Baum Univ. of Victoria, Canada, baum@uvictoria.ca

Bard, Shannon; Eger, Aaron; and Baum, Julia, "If historic marine pollution ceases, will the natural intertidal community return? How exposure to and release from pollution disturbance shapes rocky intertidal communities in the Salish Sea" (2018). *Salish Sea Ecosystem Conference*. 157. https://cedar.wwu.edu/ssec/2018ssec/allsessions/157

This Event is brought to you for free and open access by the Conferences and Events at Western CEDAR. It has been accepted for inclusion in Salish Sea Ecosystem Conference by an authorized administrator of Western CEDAR. For more information, please contact westerncedar@wwu.edu.

If historic marine pollution ceases, will the natural intertidal community return? How exposure to and release from pollution disturbance shapes rocky intertidal communities in BC

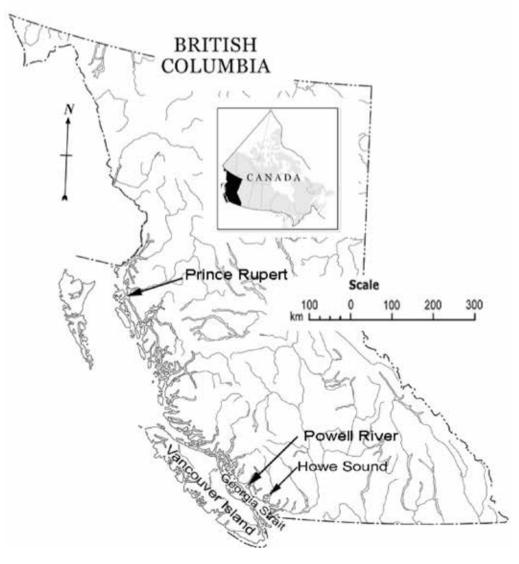

Dr. Shannon Mala Bard, Practice Leader, Biological Risk Assessment & Science and Innovation Hemmera, an Ausenco Company

Aaron Eger & Dr. Julia Baum, Department of Biology, University of Victoria

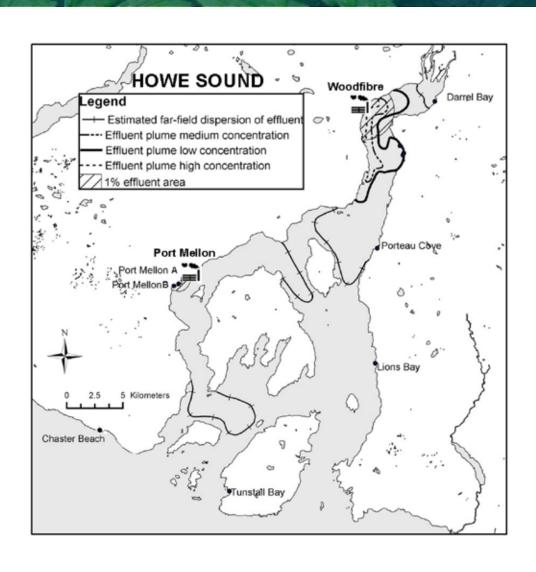

CSI Coastal Scene Investigation

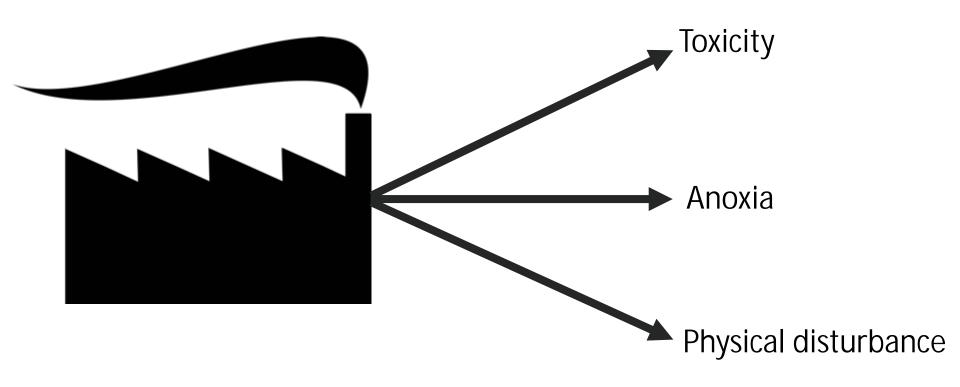

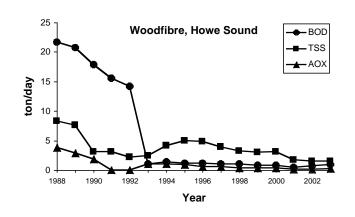

Sites selected along pollution gradient

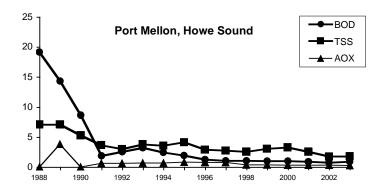

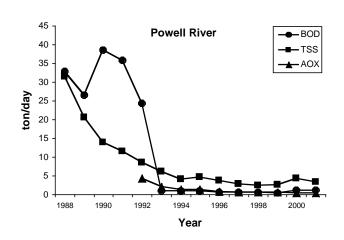

Pulp and paper pollution

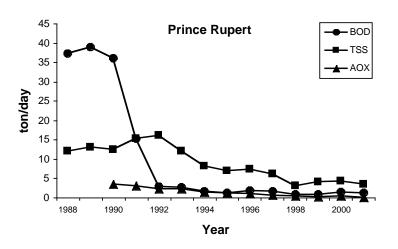

Improvements in Effluent Quality since EEM

Data kindly provided by Environment Canada and Hatfield Consultants, 2004

Economic shutdowns

- Prince Rupert mill closed 2001
- Woodfibre mill closed 2006
- Powell River, closure of 1 of 2 historic mills

Intertidal Quadrat Studies- faunal data

Percent (%) Cover

Under-rock Species Diversity

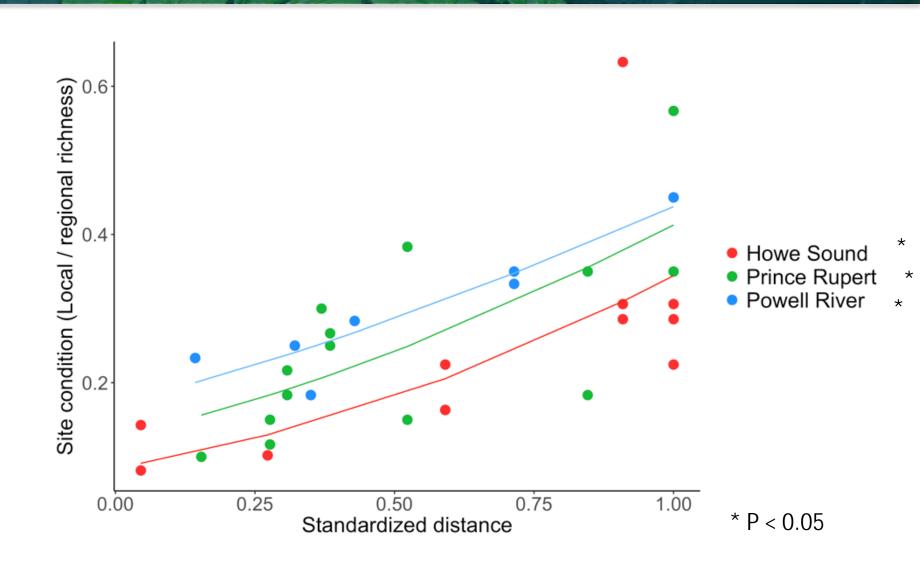

Questions

1) Were species impacted and how have they recovered?

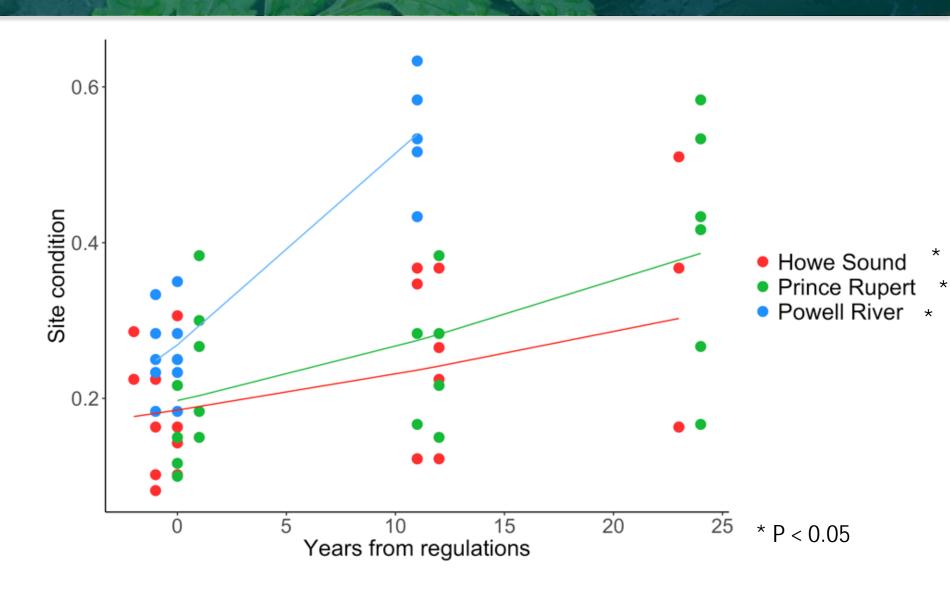

2) What species traits are selected for in polluted vs. unpolluted sites?

3) Can we assess the condition of a site based on the species present?

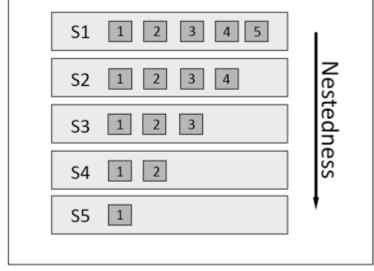

Q1: Initial impact - 1990s

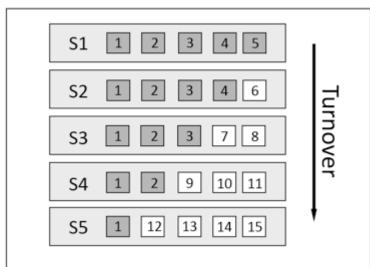

Q1: Species recovery post regulations

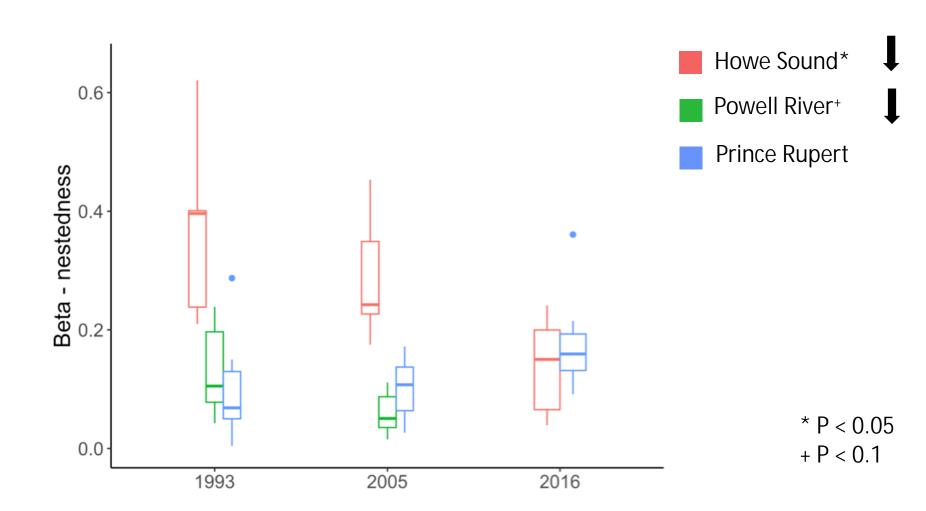

Q1: But how are they recovering?

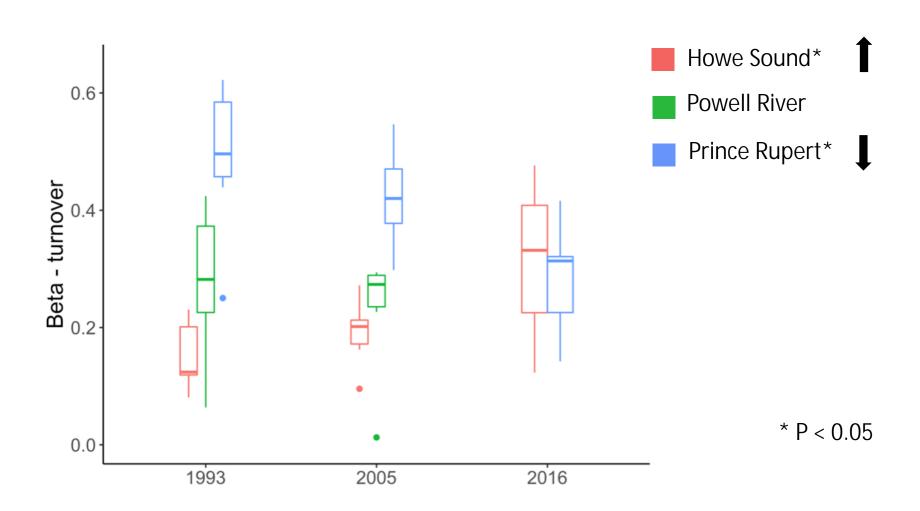

Adapted from Baselga 2009

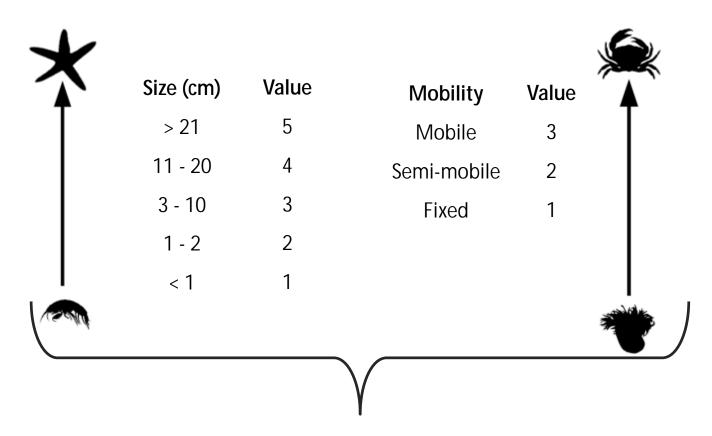

Q1: Species nestedness

Q1: Species turnover

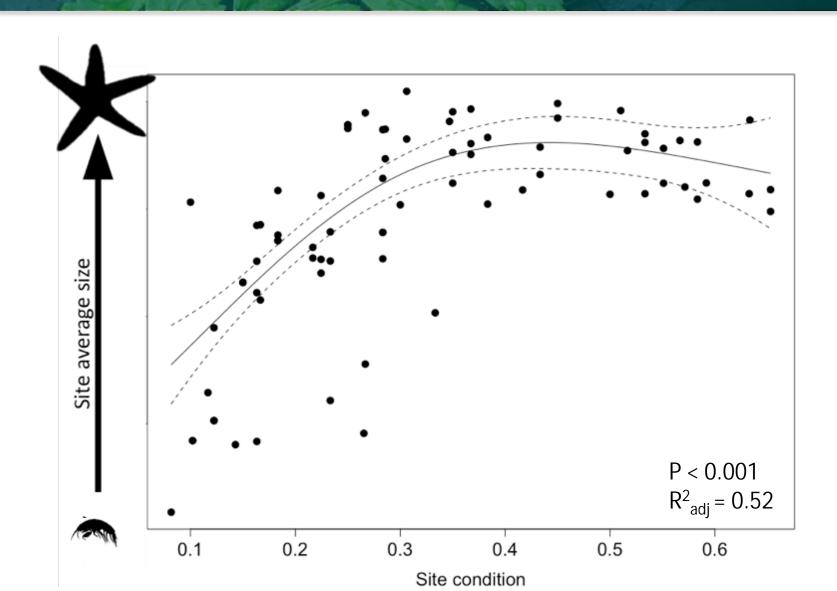

Q2: Trait assignment

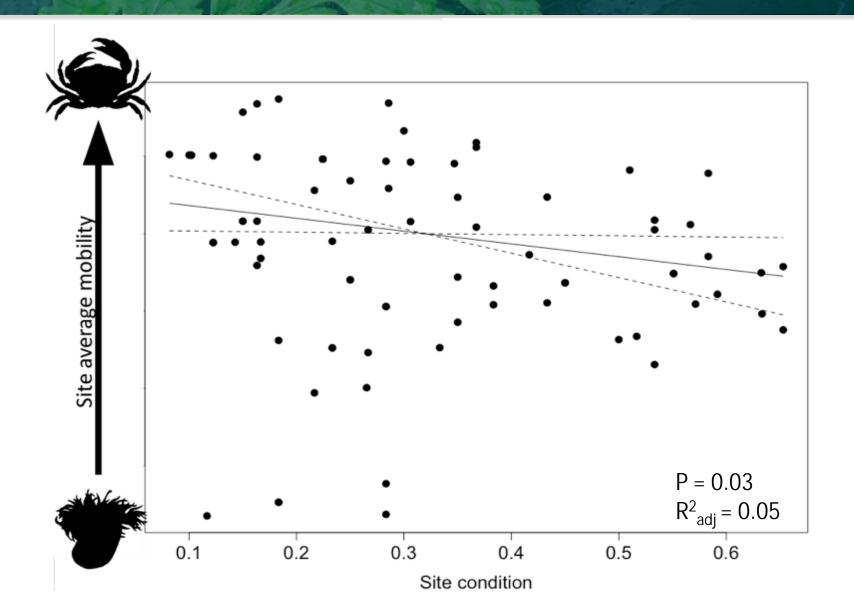

Community average trait value

Q2: Which traits thrive?

Q2: Which traits thrive?

Q2: Trait implications

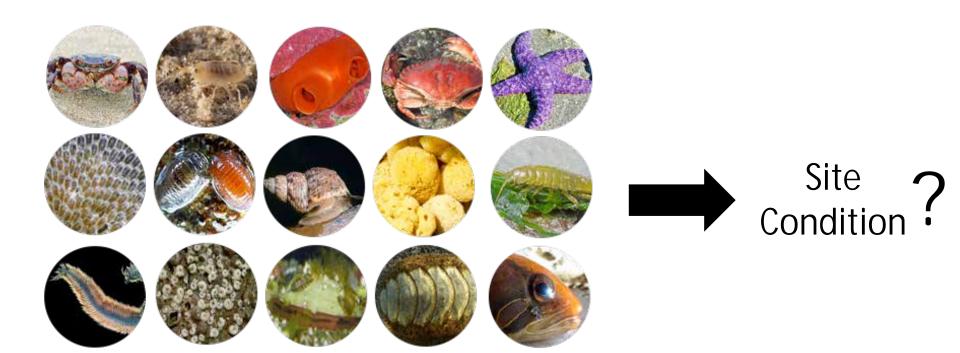

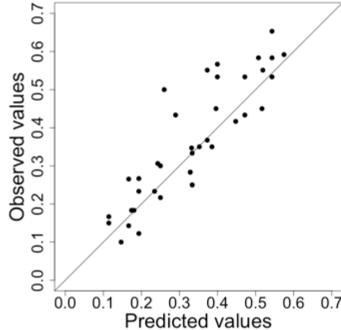

Q3: Indicator species

Presence-Absence of

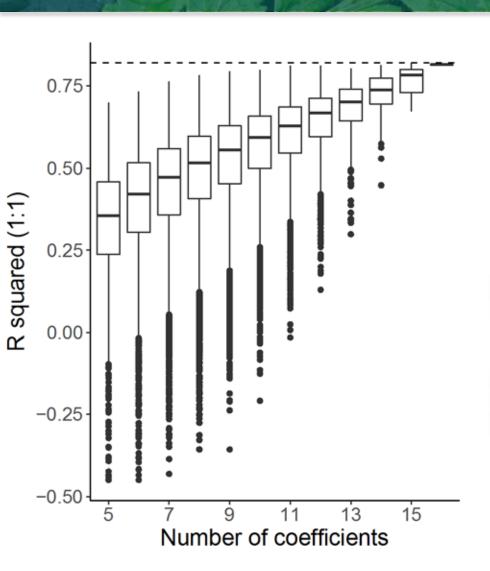

Q3: Determining indicator species

- 1) Split data into a)training set & b) test set
- 2) Build training models predicting condition with different combos of the 15 species as predictors
- 3) Assess predicted values against independent test data (R²)

Q3: How many species?

Most common species coefficients

73 % "accuracy"

Take aways

- 1) Mill pollution reduced species richness
- 2) Recovery can occur naturally
- Beta diversity provides additional insights
- 3) Pollution selects for smaller, mobile species
- 4) It is possible to assess the condition of a site based on a subset of species (with good accuracy)

Contaminated Sites Applications

- Use of community traits index more informative than presence/absence surveys- insight into community health
- Identify sites which are not recovering naturally, candidates for restoration efforts
- Shoreline Cleanup & Assessment Technique (SCAT)
 - Use indicator species survey technique for oil spill response baseline surveys - time restrictive, easily train volunteers
