²Pacific Biological Station

³Northwest Fisheries Science Center

Outline

Introduction

1. Importance of early marine growth
2. What is Insulin-like Growth Factor-1 (IGF-1)?
3. Use of IGF-1 as index of ocean growth
4. Areas of interest and sampling

Analysis and Results

1. Large scale regions
2. Small scale sub-regions
3. Inter-annual

What's next?

Early marine growth is positively correlated to adult survival

- Positive correlation between early marine growth and survival to reproductive age
- Understanding growth patterns at sea introduces means to understand mortality at sea

Growth

Marine Survival

Adult Return

Increases in IGF-1 are indicative of growth

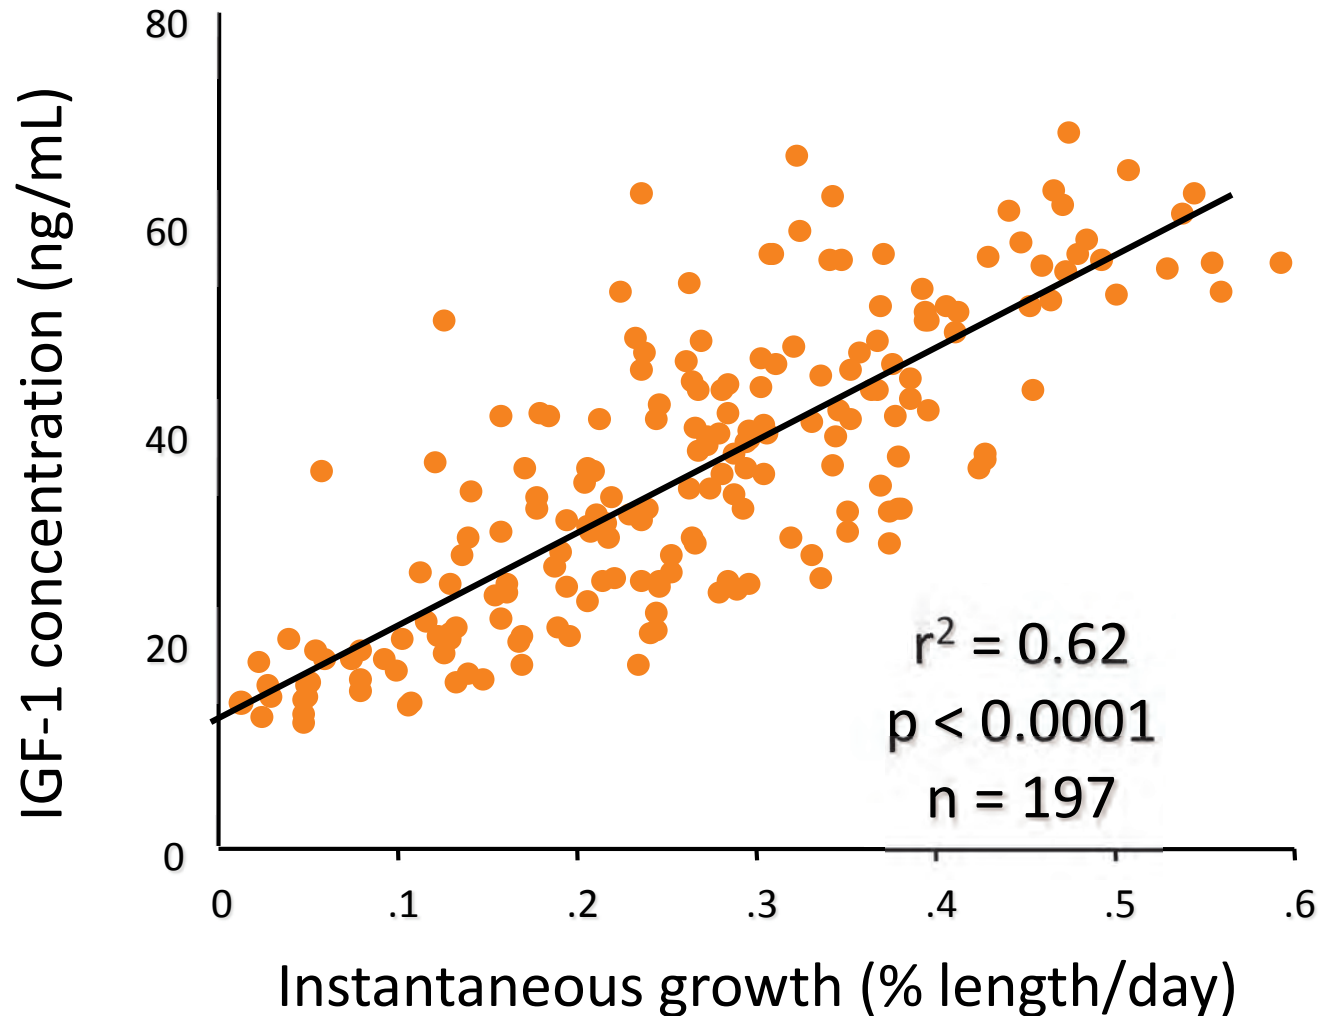

What is IGF-1?

- Insulin-like Growth Factor-1
- Hormone released from the liver
- IGF-1 travels to the tissue and stimulates body growth

Can IGF-1 be used as an ecological tool?

IGF-1 is positively correlated with instantaneous growth in juvenile salmon

IGF-1 can be used as an index of ocean growth in juvenile salmon

Juvenile salmon sampling occurs along marine migration routes

Juvenile salmon sampling in 2012 and 2013

2012: Juvenile Chinook, coho, chum, sockeye, and pink

2013: Juvenile Chinook, coho, and chum

1. Large scale region analysis: Coho and chum
2. Small scale sub-region analysis: Coho and chum
3. Inter-annual analysis: Chinook, coho, and chum

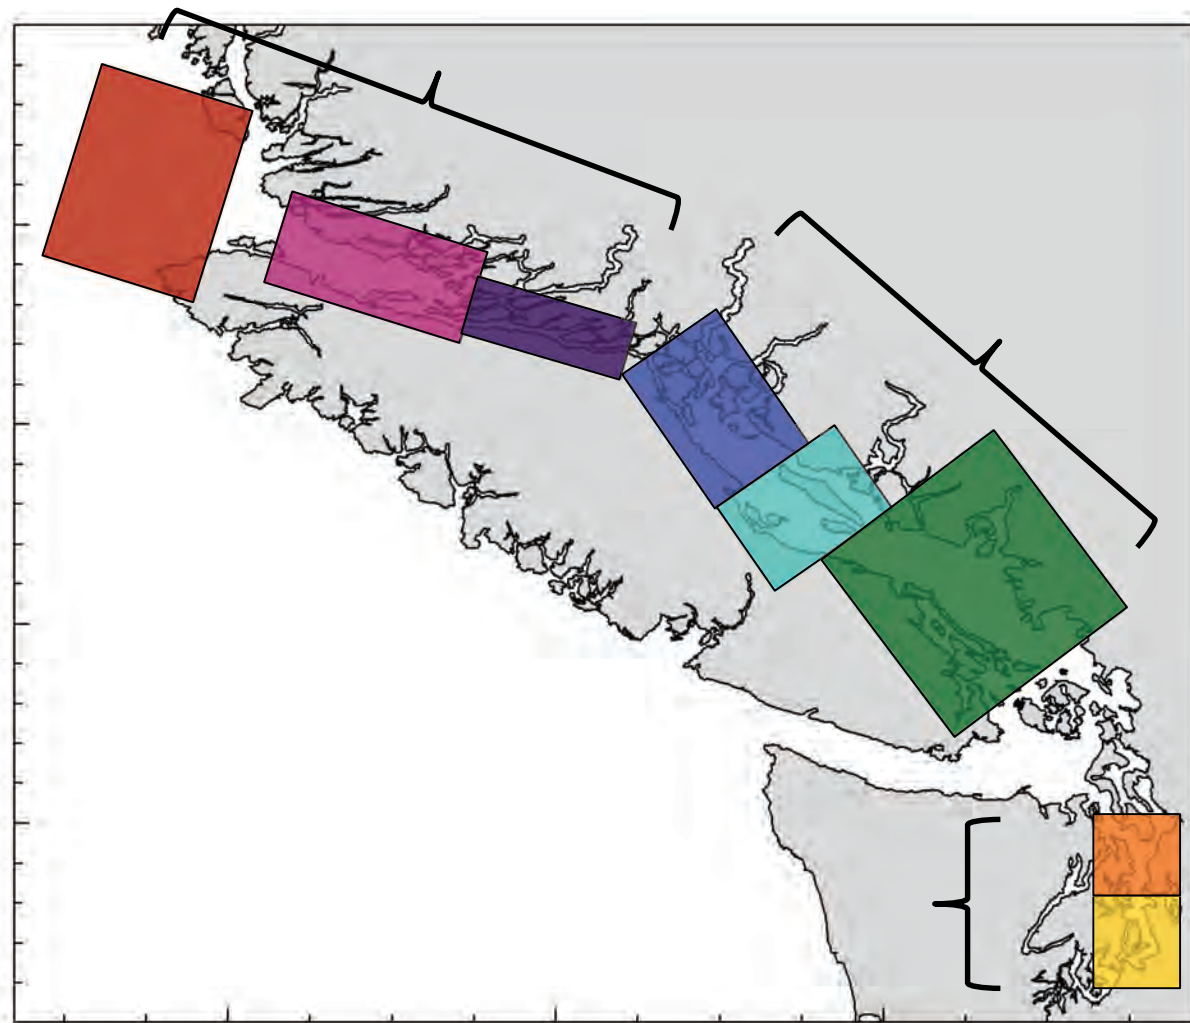

From north to south; large scale regions of interest

From north to south:

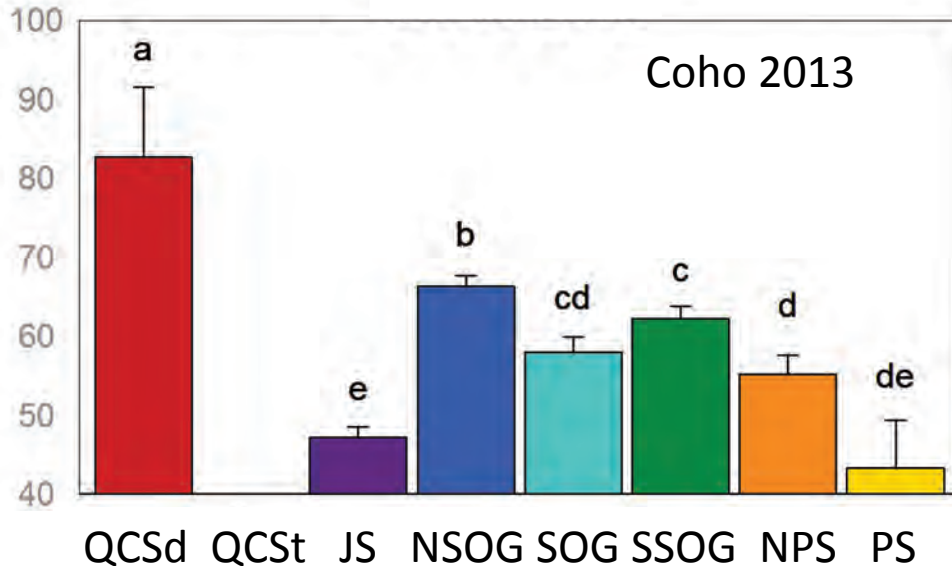

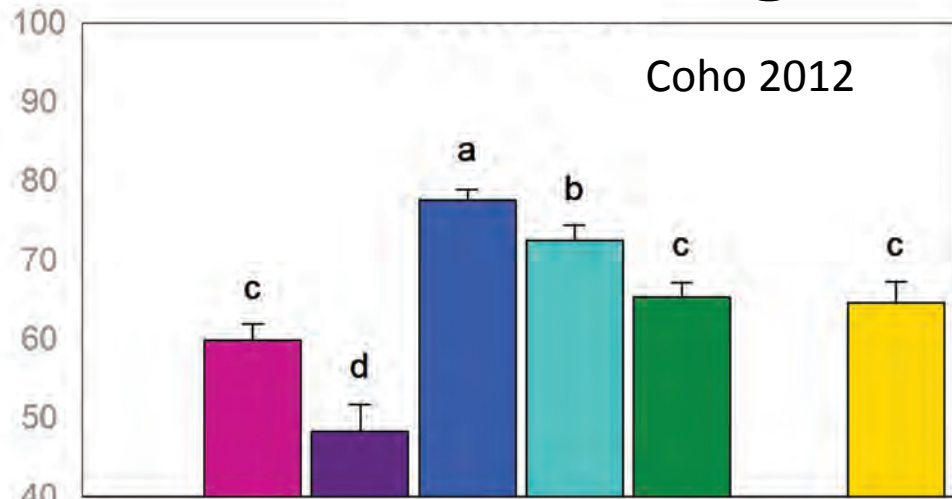

Queen Charlotte Sound
Queen Charlotte Strait
Johnstone Strait

North Strait of Georgia
Mid Strait of Georgia
South Strait of Georgia

North Puget Sound
Puget Sound

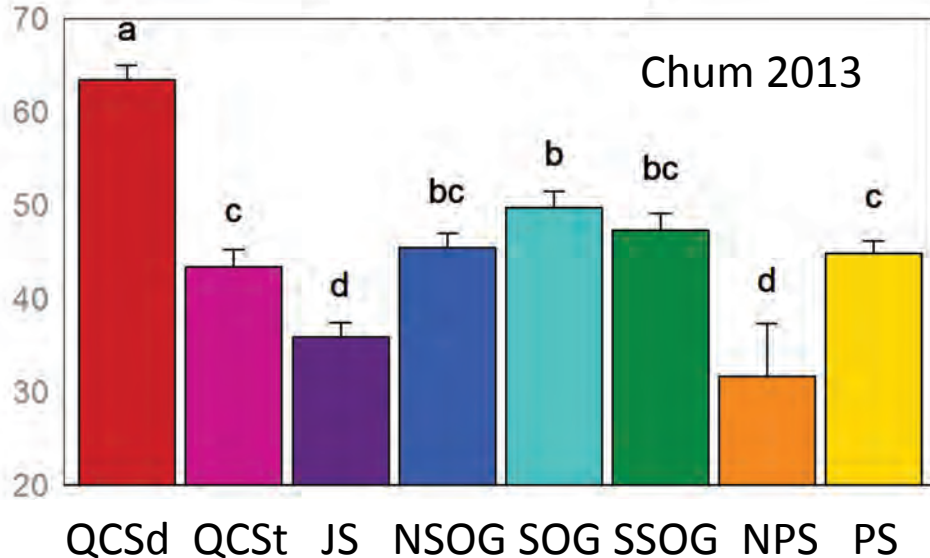

Coho salmon IGF-1 differs significantly across large scale regions

- 2012: **Low** in JS
High in NSOG and SOG
- 2013: **Low** in JS and Puget
High in QC Sound and NSOG

Chum salmon IGF-1 differs significantly across large scale regions

- 2012: **Low** in QCSt and JS
- 2013: **Low** in JS and N. Puget
High in QC Sound

IGF-1 levels differ from north to south when compared to the Strait of Georgia

	Coho 2012	Coho 2013	Chum 2012	Chum 2013
N	X	HIGH	X	HIGH
Queen Charlotte Sound				
Queen Charlotte Strait	LOW	X	LOW	AVERAGE
Johnstone Strait	LOW	LOW	LOW	LOW
Puget Sound	LOW	LOW	HIGH	AVERAGE
S				

IGF-1 levels also vary from north to south within the Strait of Georgia

- Species specific variation exists between north, mid, and south Strait of Georgia:
 - Coho 2012 and 2013 show **significant regional variation** in IGF-1 from north to south
 - Chum 2012 and 2013 show **no significant variation** in IGF-1 from north to south
- What are possible explanations for these species specific patterns?

Strait of Georgia: sub-regions of interest

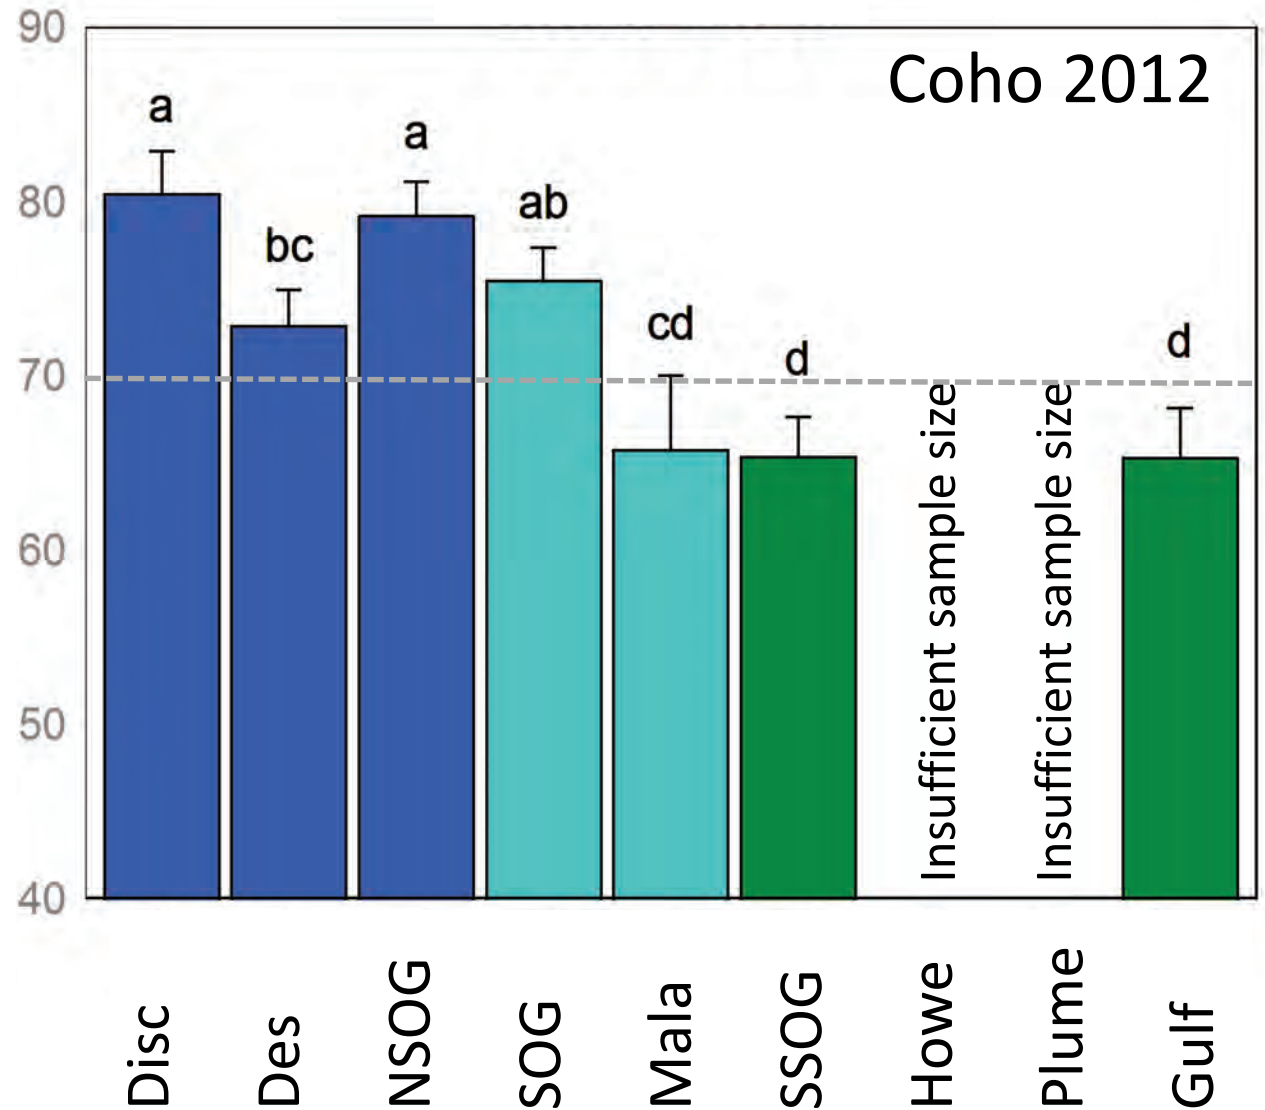

NSOG: Discovery Islands
Desolation Sound
North SOG

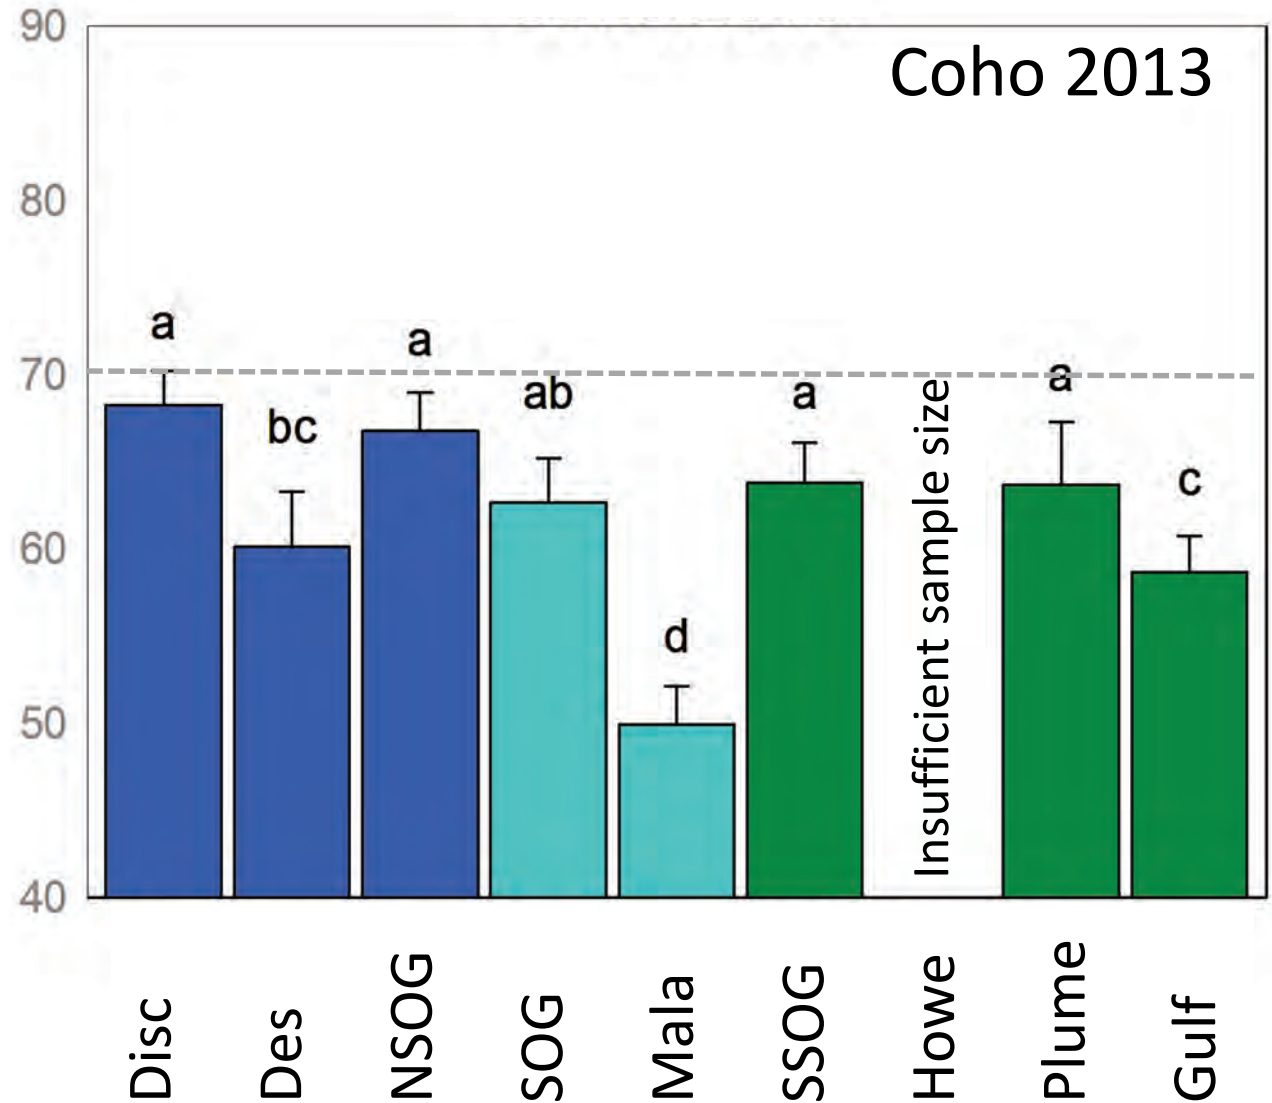

SOG: SOG
Malaspina

SSOG: South SOG
Howe Sound
Gulf Islands
Plume

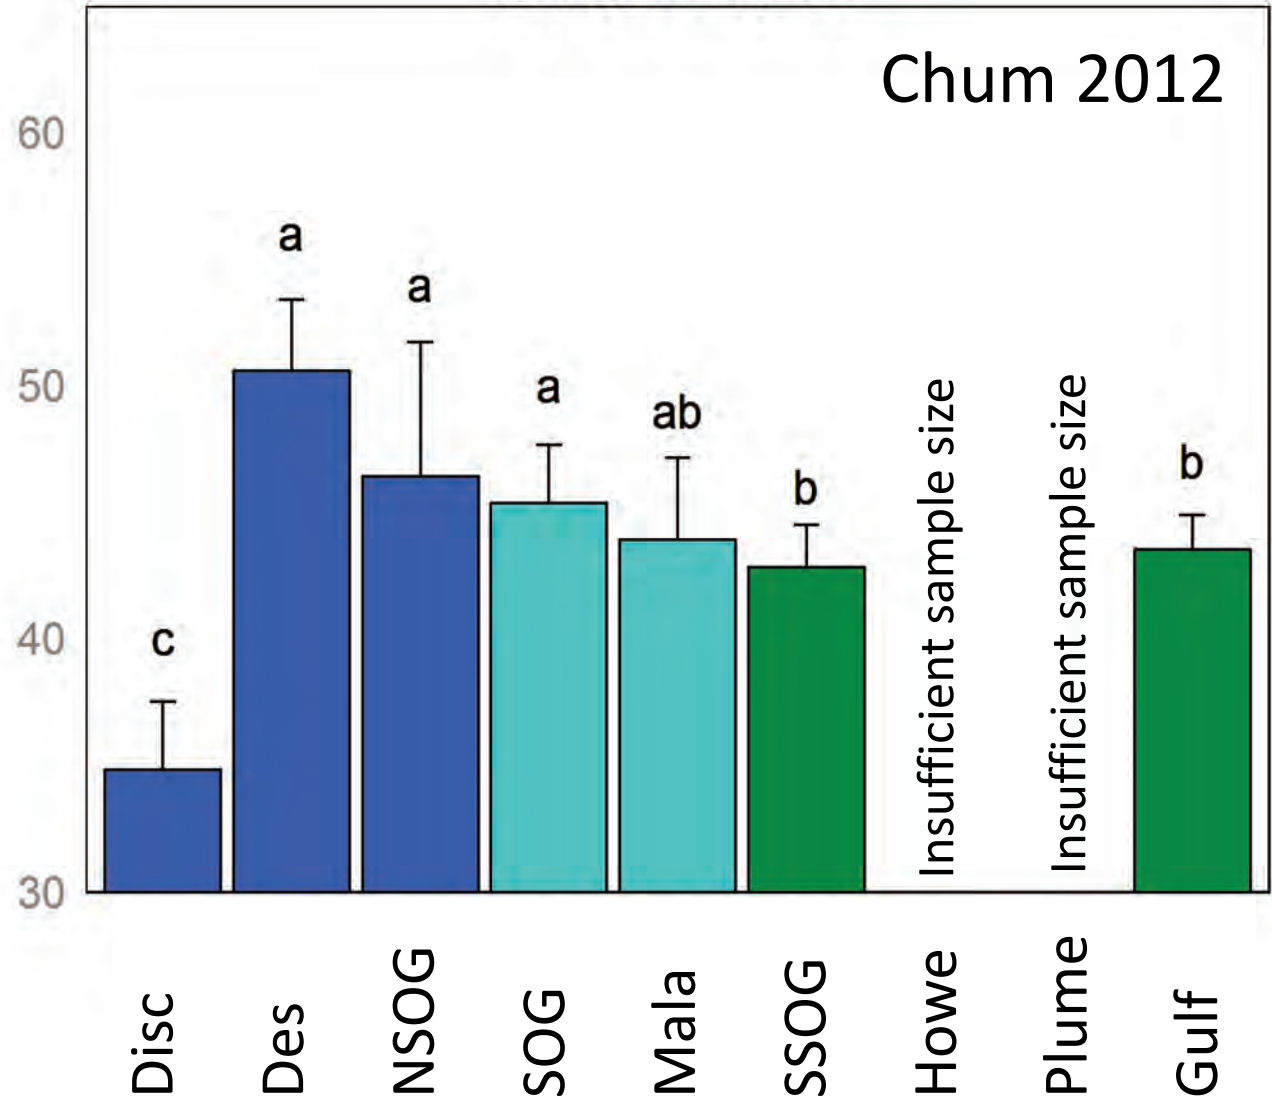

Coho IGF-1 variability increases with sub-regional analysis

Coho IGF-1 variability increases with sub-regional analysis

Chum IGF-1 variability increases with sub-regional analysis

Do geographic sub-region differences in IGF-1 depict tow-by-tow relationships?

Are these tow-by-tow relationships species specific?

IGF-1 levels vary from north to south within the Strait of Georgia

- Some regions within SOG appear to have more extreme IGF-1 deviations

- Discovery Islands

- Desolation Sound

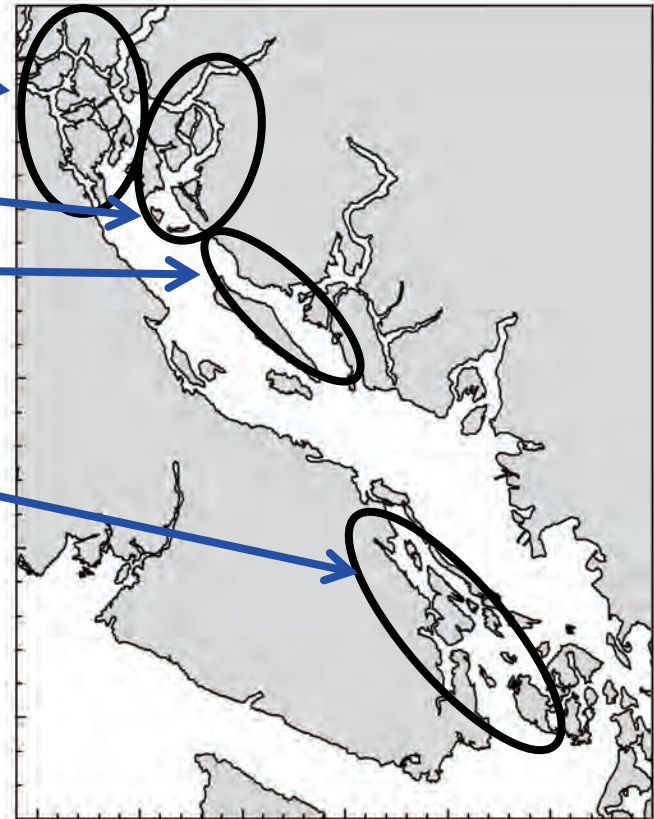

- Malaspina

- Gulf Islands

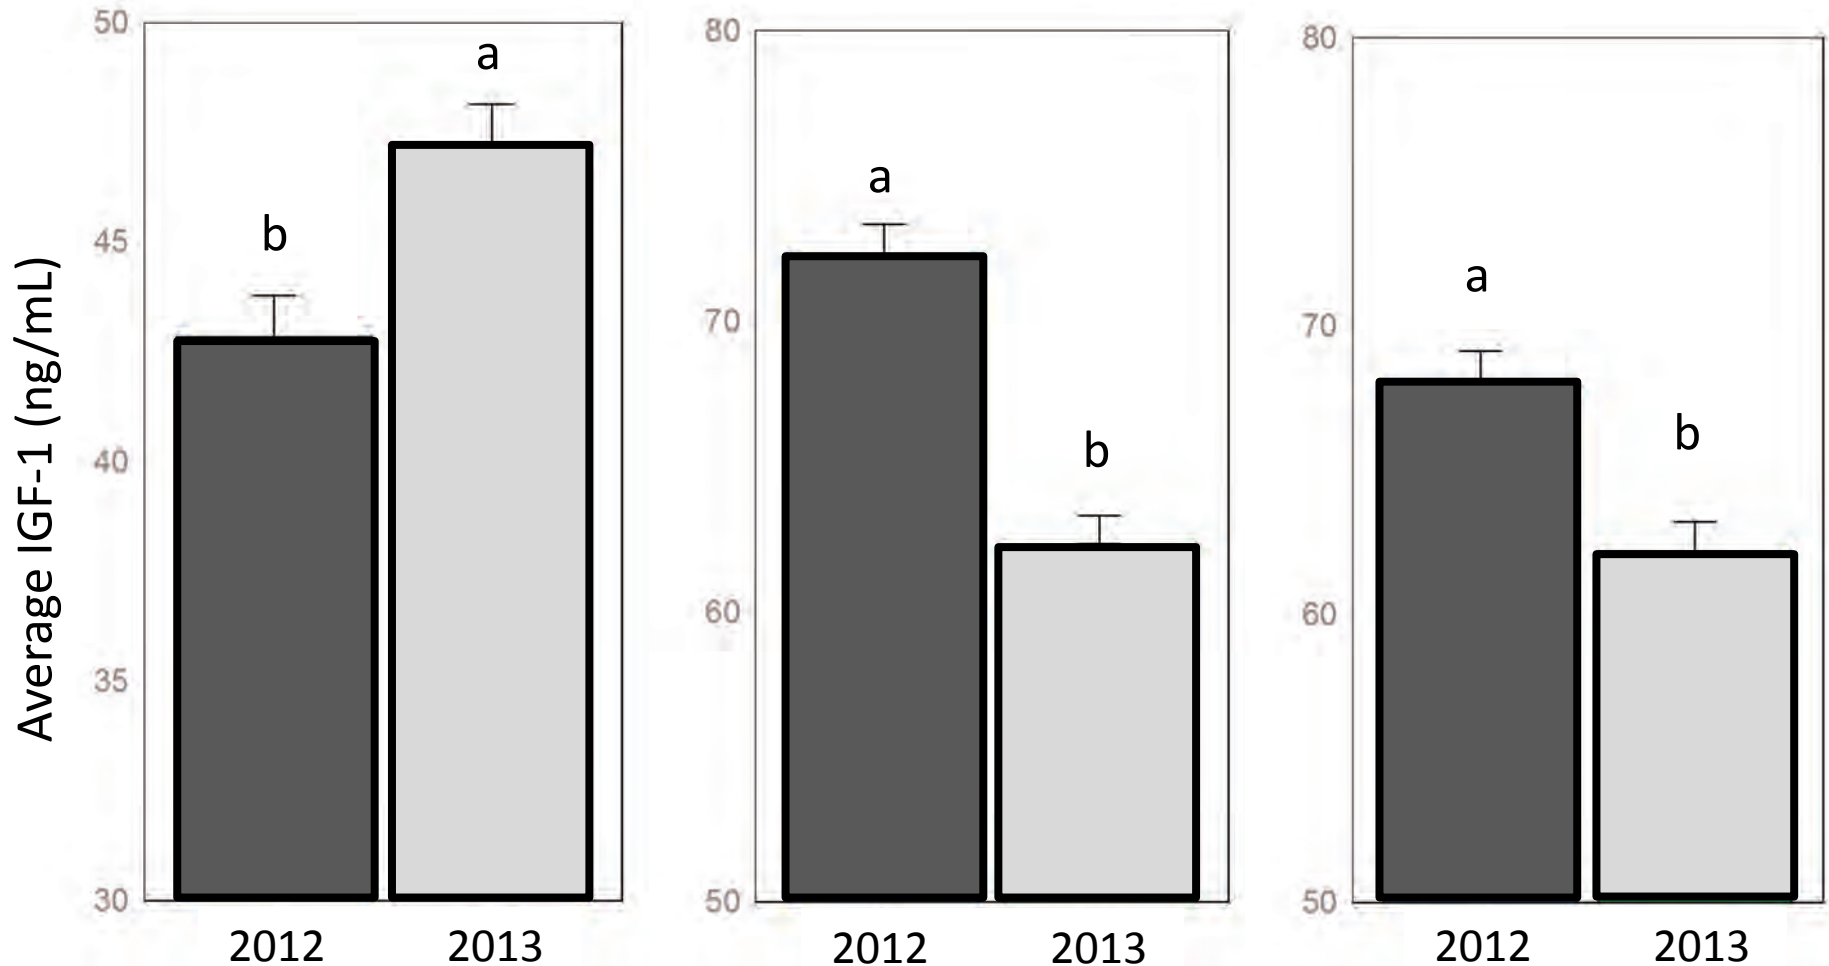

- Variation from north to south exists, but why?

- Geographic or biotic divisions?

- Species specific?

The implications of these patterns will become more apparent when adult return data are available.

IGF-1 offers a unique way to spatially and temporally assess growth

- The geographic scale used to assess growth is important
 - Large scale regions
 - Small scale sub-regions
 - Tow-by-tow
- Are there ecological processes at play within the Salish Sea driving these variations in growth?
 - Yes, but how do we identify these relationships?

Future sampling and analysis plans

- Sampling in 2014
 - Inter-annual comparisons over 3 years
 - Additional regional and sub-regional analysis
- Discriminate species specific patterns
 - Are regions consistent across a three year period?
 - Is there overlap between species?
 - Geographic delineations?
 - Biotic delineations?
