In the field of atomic energy a special problem exists because of the activity of the federal government. The Atomic Energy Commission actively engages in the production and marketing of radioactive by-product materials, and the United States is the exclusive owner of special nuclear material.[27] Furthermore, under contract arrangements the AEC may supply research facilities, possible designs, and fuel refabrication services. As a supplier of goods, is the United States liable for negligent acts on the same basis as private suppliers? Since the government can be held liable only to the extent of the waiver of its immunity from suit, the answer lies in the applicable provisions of the Federal Tort Claims Act.[28] Generally, if injury results from the performance of other than a discretionary act upon the part of government officials and employees, the government has waived its immunity. Therefore, it would appear that if the AEC supplies a negligently mislabeled radioisotope, the government may be held liable. However, if the negligence consists of improperly licensing an unqualified person, the government probably cannot be held liable because of the discretionary nature of the

[27] Section 53e of the Atomic Energy Act of 1954, as amended in 1957, requires that special nuclear licenses be subject to the condition that the licensee "hold the United States and the Commission harmless from any damages resulting from the use or possession of special nuclear material by the licensee" except to the extent that the indemnification and limitation of liability provisions of the act apply.

[28] 28 U.S.C. §§1346(b), 2680(a) (1950).

negligent act.[29] An additional question is whether governmental liability under the Federal Tort Claims Act can be based solely upon ownership of special nuclear material, absent any showing of negligence.[30] In the Texas City litigation, the Supreme Court answered this question negatively:

> . . . [T]he statute requires a negligent act. So it is our judgment that liability does not arise by virtue either of United States ownership of an "inherently dangerous commodity" or property, or of engaging in an "extra-hazardous" activity.[31]

d. To Whom Is the Duty Owed?

When the courts in the last century required privity as a condition to recovery for injuries occasioned by negligence in supplying a chattel, the purchaser could, of course, fulfill that requirement in an action against his immediate supplier. However, in the *MacPherson* case an ultimate purchaser was allowed to recover from a remote vendor, and since the date of that case the principle of liability for negligence has been gradually extended to cover members of the purchaser's family,[32] the purchaser's employees, other users of the product,[33] casual by-standers, and even second-hand purchasers of the product.[34] However, not every jurisdiction has had occasion to consider the extension of negligence doctrines to include non-users of a product, so some doubt exists as to the exact legal situation now prevailing. For example, the Washington court has declined to hold a repairman liable to a guest-passenger for negligence in the repair of an automobile,[35] but the Kentucky and Wisconsin courts have reached an opposite result.[36] The trend appears to be to enlarge the class to whom the duty is owing and thereby to broaden the liability based on negligence doctrines.

Moreover, both the direct purchaser and in some cases the ultimate purchaser may also be able to recover on the basis of either express or

[29] For a discussion of the nature of discretionary acts, see Dalehite et al. v. United States, 346 U.S. 15, 73 S.Ct. 956 (1953).

implied warranties. Recovery under warranty doctrines is based upon a contractual type of liability and, as such, results in the impostion of a kind of strict liability, as contrasted with negligence. Recovery on warranty theories will be discussed later in this chapter. The fact that a purchaser may in some cases recover under either doctrine (negligence or warranty) has resulted in confusion in the cases. In any event, suppliers of chattels in atomic energy industry must take account of both doctrines in ascertaining the potential scope of their liability and in devising methods of providing protection, either by limiting the basis for recovery in warranty through contract terms or by seeking adequate insurance coverage.

Because of the unusual nature of radiation, the most difficult question confronting suppliers of chattels in atomic energy industry is whether the duty is owed to remote non-users. Normally, a supplier whose negligence causes an accident can expect relatively few persons in areas immediately adjacent to the chattel to be injured. But this may not be the case in respect to defective chattels supplied in connection with operations creating radiation hazards. For example, if the negligence of a manufacturer of a reactor control mechanism causes the reactor to melt-down and release radiation into the atmosphere, personal and property damage of outsiders may be measured in millions of dollars. Moreover remote and unexpected injuries may ensue, as for example if a supplier's negligence causes injury to a person who eats fruit covered by radioactive wastes released several miles away.

Under ordinary negligence doctrines the duty to the remotely injured person is resolved on the basis of foreseeability. It would appear that once recovery based upon negligence is permitted, the same tests of foreseeability should be employed in the atomic energy product liability cases as used in other negligence cases. However, the Restatement of the Law of Torts and Dean Prosser depart from the usual foreseeability concepts employed in discussing negligence when they describe the liability of suppliers of chattels to third persons. Both express the liability of the supplier in terms of persons who may be expected to be "in the vicinity of the chattel's probable use." [87] A literal application of these statements of the rule may suggest a more restrictive scope of liability for suppliers of products in atomic energy cases involving radiation injuries suffered in places far removed from the location of the chattel.

[87] Prosser, Torts §84, p. 497 (2d ed., West Pub. Co., 1955). As expressed in the Restatement, Torts §388 (1934), the supplier's liability is "to those whom the supplier should expect to use the chattel with the consent of the other or to be in the vicinity of its probable use."

On the other hand, use of this statement of the rule may result in even greater liabilities because the statement takes no account of the device employed in ordinary negligence cases of finding no duty in respect to the "unforeseen" injured person.[38]

It is doubtful whether any distinction can be justified between the tests of duty in pure negligence cases and those applied to product liability cases. For example, in *Margulies et al.* v. *Denner et al.*[39] the owner, the agent of the owner, the supplier of the product, the trucking company, and the truck driver were held jointly liable to a group of persons who, while subway passengers, inhaled chlorine gas escaping from a defective tank in a truck when the driver, upon noticing the escape of gas, stopped near a subway grating. It is difficult to conclude that the subway passengers were in the vicinity of the probable use of the chlorine gas; nonetheless the court found a duty on the part of the supplier to the passengers, apparently on the basis of ordinary foreseeability tests.

As we shall see, the dangerousness of the product also plays a role in determining the existence and nature of the duty.[40] Accordingly, it can be expected that a supplier of radioisotopes who ships them in a defective container will be held liable to persons exposed along the shipping route. Moreover, all persons who may foreseeably be injured by radiation exposures caused by defective chattels will, in all probability, be found to be among the class of persons to whom a duty is owed, no matter how remote from the source of injury both in space and in time.[41]

e. The Dangerous Nature of the Product

In the *MacPherson* case Justice Cardozo indicated that liability for injuries to third persons, not in privity, would be imposed if the manufacturer knew or should have known that the product was a "thing of danger." A thing of danger was defined as a product which is "reasonably certain to place life and limb in peril when negligently made."[42] Other cases[43] have also expressed the opinion that manufacturers would

[38] See discussion of duty cases, *supra* Chapter III.

[39] 185 Misc. 139, 56 N.Y.S.2d 856 (1945), *aff'd* 271 App. Div. 827, 65 N.Y.S.2d 441 (1946), *aff'd* 297 N.Y. 562, 74 N.E.2d 481 (1947).

[40] See Restatement, Torts §293 (1934).

[41] Although some courts apparently attempted at one time to confine liability of suppliers to personal injury cases, today similar rules are followed whether the damage consists of injury to the person or to property. See Todd Shipyards Corp. v. United States et al., 69 F. Supp. 609 (1947).

[42] See quotes from the MacPherson case, *supra* at note 9.

[43] See, *e.g.*, Huset v. J. I. Case Threshing Machine Co., 120 Fed. 865 (1903).

be held liable in the absence of privity if the product is "imminently dangerous" or "reasonably certain to place life and limb in peril." [44] Similar language is often used by the courts today where the rules of ordinary negligence have not been extended to the product liability field.[45] In some of these opinions there apparently is an intimation that more than a simple breach of a reasonable standard of conduct is essential to establish liability of product suppliers. The dangerous nature of a product, of course, aids in the establishment of whatever greater breach of the standard of conduct may be required by the courts.

Because of the unusual dangers involved in radiation hazards, it appears that certain products, such as radioisotopes, containers for radioactive materials, reactor fuel elements, and reactor control systems, meet the "imminently dangerous" tests. On the other hand, such products as electronic tubes, gears, bolts, pins, etc., which may be incorporated into a reactor do not seem to meet the tests. However, there have been several decisions which have held similarly apparently innocuous articles to be "imminently dangerous," even including such normally innocent items as shoes, bar stools, and children's toys.[46] These cases represent the trend toward the application of ordinary negligence doctrines throughout the field of product liability although the courts still are basing their decisions on an exception to the old no-liability rule as stated in the *MacPherson* and other similar cases. In any event, it would seem that where the courts still employ the exceptions, as distinguished from ordinary negligence concepts, many of the products employed in atomic energy industry would appear to fall within the exceptions, and therefore it is doubtful if the suppliers can expect to avoid liability.

The dangerous nature of a product may have yet another effect on the duty owed. The burden may be imposed upon the product manufacturer to discover the possible dangers, and this duty may greatly increase the standard of reasonable care applicable in respect to dangerous products. For example, in *Chapman Chemical Co.* v. *Taylor, et al.*,[47] a manufacturer of 2-4-D weedkiller was held liable to a person whose cotton crop, which was located three-quarters of a mile from the place of spray-

[47] 215 Ark. 630, 222 S.W.2d 820 (1949).

ing by aircraft, was injured when wind caused the chemical to drift and settle thereon. At the time, the manufacturer knew of the danger of the chemical to certain crops but neither it nor other manufacturers apparently knew of the tendency of 2-4-D to drift farther than other types of agricultural chemicals. Nonetheless, the Arkansas Supreme Court approved the following instruction by the trial court to the jury:

> It was the duty of the defendant Chapman Chemical Company before putting an inherently dangerous product on the market to make tests to determine whether or not it would damage crops of others; if you believe from a preponderance of the evidence in this case that the 2-4-D dust applied . . . [by the purchaser] . . . was an inherently dangerous product liable to damage property of others, and that such tests were not made, then you are told that the defendant Chapman Chemical Company is negligent.[48]

It is apparent that the court felt there was a duty to make more complete tests in respect to "inherently dangerous" articles. By its very nature, the additional duty, in effect, established a higher standard of care in dealing with the dangerous product. That the standard of care may be affected by the dangerous nature of a product is also indicated by the Restatement's conclusion that a supplier who knows that a product is unlikely to be made reasonably safe before being used is liable to users and others in the vicinity of use even though the supplier has informed the purchaser of its dangerous character.[49]

For those products in the atomic energy field that can be described as "inherently dangerous," it appears that additional duties and higher standards of care will be imposed by the courts. Which products may be so classified by the courts is a doubtful matter. As we have seen, some rather commonplace products have been so classified in certain instances. Radioactive materials having intermediate half-lives and emitting the more dangerous gamma rays will probably be classified as "inherently dangerous." Perhaps short-lived isotopes or those emitting alpha and beta radiation only may not be so considered. Possibly distinctions may

[48] *Id.* at 642.

[49] Restatement, Torts §389 (1934). The section reads as follows:

One who supplies directly or through a third person a chattel for another's use knowing that the chattel is unlikely to be made reasonably safe before being put to a use which the supplier should expect it to be put, is subject to liability for bodily harm caused by such use to those whom the supplier should expect to use the chattel or to be in the vicinity of its probable use and who are ignorant of the dangerous character of the chattel or whose knowledge thereof does not make them contributorily negligent, although the supplier has informed the other for whose use the chattel is supplied of its dangerous character.

be drawn by the courts on the basis of the likelihood of ingestion of the particular material if it is harmful as an internal source of radiation. A radiation detection device may be classified as inherently dangerous or not, possibly depending on whether the supplier knows that failure of the device may lead to harmful exposure of employees and others to radiation. The lines will be drawn by the courts, often on the basis of whether the supplier is more capable of bearing the economic loss caused by the injury. However, this concept is seldom mentioned in the opinions although it is recognized as being a very material factor by most legal scholars. One statement may be made with some assurance; namely, although the dangerous nature of the product will have a material effect upon the standard of care required of product manufacturers, there is as yet no certainty about the extent to which it will affect suppliers of the various kinds of products used in atomic devices. The law on this subject will be shaped by future decisions.

f. Warnings of Danger and Assurances of Safety

There are a number of devices and products utilized in atomic industry which have dangerous aspects that are known to the supplier. For example, a processor of radioisotopes may supply tracers, some of which may be safely used for diagnosis and treatment of humans but others, harmful to humans, may be useful only in conjunction with insecticides. Similarly, a supplier of reactor components may produce a device which is suitable for thermal reactors but unworkable if used with fast breeder reactors. Suppliers of radiation detection instruments may know that certain devices may not be satisfactory for protecting personnel of the purchaser from certain types of harmful radiation. Moreover, because many aspects of atomic energy technology and the nature of injury to humans remain unknown, though knowledge is constantly expanding, and because the theories of atomic structure still are in a continuous state of evolution, suppliers of atomic energy products must necessarily rely on knowledge currently existing although it may be assumed to be incomplete. Since the suppliers may be held liable for their negligent acts, among the most crucial questions to be answered are: What warning must be given to the purchaser and user of atomic energy products? What liabilities may result from a failure to warn? What liabilities may result from giving assurances of safety when supplying an atomic energy product? What liabilities may result even though warnings are given to the purchaser? It should be noted that these questions involve the possibility of liability of a supplier in some

cases even though no negligence can be shown in respect to the design or manufacture of the product.

The importance of the necessity of providing warnings is indicated by the Restatement's general rule governing liability of suppliers:

> One who supplies directly or through a third person a chattel for another to use, is subject to liability to those whom the supplier should expect to use the chattel with the consent of the other or to be in the vicinity of its probable use, for bodily harm caused by the use of the chattel in the manner for which and by a person for whose use it is supplied, if the supplier
>
> (a) knows, or from the facts known to him should realize, that the chattel is or is likely to be dangerous for the use for which it is supplied;
>
> (b) and has no reason to believe that those for whose use the chattel is supplied will realize its dangerous condition; and
>
> (c) *fails to exercise reasonable care to inform them of its dangerous condition or of the facts which make it likely to be so.* [Emphasis added.] [50]

Illustrative of the liability that may be imposed in conjunction with an inherently dangerous product where no notice of danger is supplied is the case of *Noone* v. *Fred Perlberg, Inc.*[51] In that case the manufacturer of a dress which was sized with an inflammable material was held liable, the court stating the rule to be applied as follows:

> The rule in this State is now settled that when a manufacturer sells an inherently dangerous article for use in its existing state, the danger not being known to the purchaser and not patent, *and notice is not given of the danger or it cannot be discovered by reasonable inspection,* the manufacturer is legally liable for personal injuries received by one who uses the manufactured article in the ordinary and expected manner. [Emphasis added.] [52]

In *Ebers* v. *General Chemical Company*[53] the defendant manufactured and marketed a new insecticide which the U. S. Department of Agriculture had tested in several states successfully. In its advertising, after giving directions for the use of the insecticide which was sold under the trade name E-D-E, the manufacturer supplied the following statement:

> The foregoing information is supplied by us gratuitously and is believed to be reliable and of value, but is in no way

[50] Restatement, Torts §388 (1934).

[51] 268 App. Div. 149, 49 N.Y.S.2d 460 (1944), *aff'd* 294 N.Y. 680, 60 N.E.2d 839 (1945).

[52] *Id.* at 152.

[53] 310 Mich. 261, 17 N.W.2d 176 (1945).

> guaranteed. The use of this material being beyond our knowledge and control and involving elements of risk to vegetation, we do not make any warranty, express or implied, as to the effects of such use, whether or not in accordance with directions or claimed so to be." [54]

The plaintiff applied the insecticide as directed but nearly one-fourth of his orchard trees died. Evidence was introduced by the plaintiff showing that in the following year both the defendant and the United States Department of Agriculture had changed their directions for use to include a warning that the product should not be sprayed on the tree trunks. The directions supplied to the plaintiff had recommended that some of the chemical be sprayed on the trunk. Despite the disclaimer the court held that the plaintiff has shown sufficient evidence of either a failure to make satisfactory tests or a failure to provide adequate directions for use to warrant submission of the case to the jury. In reversing the lower court's ruling directing a verdict for the manufacturer, the court stated:

> . . . . If it was negligent in placing such product on the market in Michigan without proper field tests to determine its effect on peach trees in this State, or if it gave improper direction for the use and application of the product, it cannot escape responsibility for such negligence merely by adding a disclaimer of warranty to its representation of safety.[55]

Both of these cases demonstrate the necessity of giving warning or adequate directions for use to purchasers of products. The adequacy of the warning or direction is, of course, a jury question, but it is clear that the adequacy will be determined on the basis of knowledge which should have been known.[56] In the *General Chemical Co.* case, the court infers that this knowledge should have been derived by tests in Michigan because of different climatic and soil conditions even though the product had been tested in a number of other states by the Department of Agriculture.

In addition, in *McClanahan* v. *California Spray-Chemical Corp.*,[57] the Virginia Supreme Court seems to have concluded that, even where the directions for use of a fungicide were not followed, the manufacturer had a duty to provide warnings concerning the possible damages in ad-

[54] *Id.* at 268.

[55] *Id.* at 274-275. See also E. I. DuPont de Nemours & Co., v. Baridon, 73 F.2d 26 (1934).

[56] See Hopkins v. E. I. DuPont de Nemours & Co., 199 F.2d 930 (1952).

[57] 194 Va. 842, 75 S.E.2d 712 (1953).

dition to supplying directions for safe usage. A pamphlet supplied by the defendant stated that the chemical was not to be used later than two weeks following petal fall, but the label on the container cautioned against use "later than petal fall." However, in both instances the directions inferred that the reason for the warning was "a possibility of residue remaining at harvest." In reversing the trial court, which had set aside the jury verdict for the plaintiff, the court stated, in part:

> It follows then, that a manufacturer of an economic poison in giving direction for use is fulfilling only a part of his obligation to the purchaser. He is saying simply "Here is a way to use this product which we guarantee will kill the weeds infesting your lawn or the scab infecting your orchard." Of course, that way must be a safe way. The manufacturer by instructing how to use is not necessarily saying, nor is he understood by the purchasing public to say, "This is the only safe way to use our product." [58]

Two justices dissented vigorously, stating:

> The prohibition as to application "later than petal fall" was positive, simple and direct. It could serve no purpose other than to warn of danger upon violation, a warning with special meaning to experienced orchardists who know the condition of the foliage on their trees at the time of petal fall. No additional warning was necessary under the statutes. To say that there should have been added a statement "Use only as directed, and not otherwise or damage may result," is a reflection upon the intelligence of the plaintiffs.
>
> * * * * *
>
> . . . It having been established that no injury would have been incurred by plaintiffs had they observed the directions and caution statement on the label . . . and the accompanying pamphlet, it must logically follow that their default was a proximate cause of the damage occasioned them. There is a question of wisdom and fairness of subjecting defendant to liability for damages under such circumstances. The majority opinion fashions a broad, new law of negligence in conflict with that which we have followed for many years,—one apt to cause embarrassment in the future.[59]

The applicability of these cases to atomic energy entrepreneurs is readily seen. The supplier of a radioactive sterilizer or food preserver must

[58] *Id.* at 862. The McClanahan case and several others concerning the duty to warn are ably discussed by Dillard and Hart, "Product Liability: Directions for Use and the Duty to Warn," 41 Va. L. Rev. 145 (1955).

[59] *Id.* at 870-871.

not only provide directions for safe usage, but he may also be required to warn against a possible dangerous usage, even though the Atomic Energy Commission may have conducted experiments and even issued statements concerning proper usage of the same or substantially similar radiation sources.

A failure to give proper warning to the purchaser may also be the basis for liability to third persons even if there is no evidence that the manufacturer should have known of the danger at the time of the purchase of the product, provided he becomes aware of the danger at a later time. In *DeVito* v. *United Air Lines, Inc.*[60] the plaintiff obtained a judgment for wrongful death against the purchaser and manufacturer of an aircraft, alleging negligence against the manufacturer for failure to warn the purchaser that carbon dioxide may enter the cockpit of the aircraft, thereby suffocating the pilots. The planes were purchased in the spring of 1947 and the evidence of the carbon dioxide danger did not come to the attention of the manufacturer until January 1948. The manufacturer thereafter conducted tests but failed to tell the purchaser of the potential danger and of the precautions to be taken to avoid suffocation.

Suppliers of products either directly or indirectly employed in conjunction with radiation sources may be subject to the extraordinary duty, therefore, to keep abreast of the almost daily new technological and theoretical developments in order to inform past as well as future purchasers of their products whenever evidence of danger is known to exist or should have been known to exist.[61] The question of precisely when a manufacturer may be charged with foreseeing harm so that he has a duty to warn cannot be definitively answered. However, the courts do not appear to have had too much difficulty in finding the duty where the facts involved "inherently dangerous" articles, of which there are many in the atomic energy industry. The burden placed upon manufacturers of new products in respect to the duty to warn and fulfilling that duty is not an easy one, especially with respect to prior purchasers. As stated in Dillard and Hart:

> In cases involving *new* products, it is thus clear that a duty to warn will depend on the extent to which knowledge of the danger should reasonably be attributed to the manufacturer. If the product is launched prior to "adequate" testing, to at-

[60] 98 F. Supp. 88 (1951).

[61] Thornbill v. Carpenter-Morton Co., 220 Mass. 593, 108 N.E. 474 (1915), holding the defendant liable although he had no knowledge of the dangerous character of the product since he did not manufacture the article but sold it under his name.

> tribute knowledge would seem reasonable. Furthermore, if products like drugs are launched while still in such a clinical stage that the manufacturer cannot be sure of their effects, a warning of that danger would also seem necessary. Paradoxically, the manufacturer should then be required to give warning of what he does not know. The paradox is an apparent one only, since he does or should know that, in general, the product is capable of harm.
>
> Clearly, we have here an area in which "law," "scientific knowledge," and the demands and price of "progress" sharply react upon one another. They do so in a way which makes rational reconciliation of conflicting interests unusually difficult. . . . [I]t would seem that the point at which the benefits of experimentation should be permitted to outweigh the rights of an injured plaintiff should be decided, not by a judicial balancing of interests, but by a common-sense jury determination of what was reasonably to be expected in view of the nature of the commodity and its foreseeable use." [62]

The full extension of this duty remains to be worked out in future decisions by the courts.

Even when warnings are given to the purchaser, or when warnings would be unnecessary because of actual knowledge of the danger on the part of the purchaser, the supplier may be held liable for failure to warn actual users of the product, including secondhand purchasers.[63] For example, in *Tomao* v. *A. P. De Sanno & Son,*[64] a manufacturer of a grinding wheel was held liable for injuries sustained as a result of his failure to indicate the maximum speed at which the wheel could be operated even though the defendant contended that the wheel was sold originally to the United States government. The court merely stated that it was foreseeable that the wheel might be acquired from the government by third persons. Similarly, in *Beadles* v. *Servel, Inc.,*[65] the secondhand purchaser of a gas refrigerator was allowed to recover for injuries because the manufacturer failed to provide notice of the necessity of cleaning certain component parts that had a tendency to clog after a lengthy period of operation. Where the warning has been given to the purchaser, but not to the actual user of the product, liability has also resulted. For example, in *Rosebrock* v. *General Electric Company,*[66] the manufacturer provided a warning on the bill of shipment,

[62] Dillard and Hart, *supra* note 58 at 159-160.

[63] For a recent case indicating the difficulties encountered by a court in determining the adequacy of a warning, see Jamieson v. Woodward & Lothrop, 247 F.2d 23 (1957).

[64] 209 F.2d 544 (1954).

[65] 344 Ill. App. 133, 100 N.E.2d 405 (1951).

[66] 236 N.Y. 227, 140 N.E. 571 (1923).

but failed to place a warning tag on the container to the effect that certain blocks placed in a transformer for shipment should be removed before use. The warning on the bill of shipment was filed by clerks and did not reach the personnel engaged in the unpacking and installation. The manufacturer was held liable for his negligence in not giving warning suitable for those persons who actually engaged in the installation process.[67]

Because of the dangerous nature of radioactive materials and devices using radiation, these cases demonstrate the probable high degree of care that must be used in giving warnings to purchasers and others who may come into contact with the products. Certain symbols and color schemes to denote radiation hazards have generally been adopted. Following the standards of the industry will undoubtedly be essential, but even these may not provide the kind of warning required to avoid liability. Adequacy of the warning is usually a jury question, with the results in specific cases always in doubt, especially because the standards imposed may be relatively high since radiation is not capable of detection by the human senses.[68]

If the manufacturer gives assurances of the safety of a product for the use intended, this fact alone makes it easier for injured persons to show negligence in fulfilling the duty to warn.[69] Thus, even where a warning was attempted to be given by directions concerning the use of an inherently dangerous product, other statements assuring or even intimating assurance of safety have made it difficult for the supplier to show the exercise of reasonable care.[70] Moreover, providing assurances of safety may give rise to a type of strict liability under theories of

[67] See also Gall v. Union Ice Company, 108 Cal. App.2d 303, 239 P.2d 48 (1951). In that case there was evidence that a letter had been sent to purchasers of the product four years before the injury to the third party plaintiff warning of the danger. It also appeared that several lots of the same article had previously been acquired by the same purchaser and that the defendant had made a practice of attaching warning labels. However, in this instance, the defendant was held liable since there was no specific evidence that the particular article had a warning label.

[68] See Farley v. Edward Tower Co., 271 Mass. 230, 171 N.E. 639 (1930), and Maize v. Atlantic Refining Co., 352 Pa. 51, 41 A.2d 850 (1945), as examples of cases showing the high standard of conduct for warnings that may be required and the dangers involved in advertising which may detract from the warning.

[69] See Tingey v. E. F. Houghton & Co., 30 Cal.2d 97, 179 P.2d 807 (1947), in which the court upheld a verdict of liability of the defendant manufacturer to users for failure to warn. The court stated at 103: "There is a particular need for a sufficient warning where, as here, there is a representation that the product is not dangerous.

[70] See *e.g.*, Ebers v. General Chemical Co., *supra* note 53; E. I. DuPont de Nemours & Co., v. Baridon, *supra* note 55; and McClanahan v. California Spray-Chemical Corp., *supra* note 57

express or implied warranty which will be discussed below. Furthermore, certain statements of assurance of safety may occasion liability in a tort action on the theory of deceit.[71] The courts have allowed recovery under theories of deceit even though an intent to deceive was not proved to exist.[72] The classification of the cases as deceit, negligence, or warranty is often extremely difficult because there is an overlapping of theories of liability.

Representative of cases in which it is difficult to ascertain the precise theory of liability is the case of *Baxter* v. *Ford Motor Co.*[73] There the manufacturer had distributed to automobile dealers catalogues and printed matter containing representations that the car windshields were made of non-shatterable glass. The plaintiff was injured when a pebble thrown by a passing car struck the windshield causing a piece of the windshield to strike the plaintiff's eye. The court, holding the defendant liable, stated that the plaintiff "had a right to rely upon the representations" even though there was no privity of contract, suggesting a theory of liability based upon misrepresentation. However, at the same time the court cited a number of cases holding suppliers of chattels liable in the absence of privity because of the "inherently dangerous" quality of the product.[74]

In *Wennerholm* v. *Stanford University School of Medicine,*[75] the California Supreme Court upheld, as sufficient to state a cause of action, an allegation of fraud by the plaintiff who suffered blindness as a result of taking drugs manufactured by the defendant even though the drug was taken in accordance with a physician's prescription. The allegation of fraud was that the defendant had by publication in newspapers, circulars, and elsewhere represented that the drug was harmless, that the defendant knew that the drug was inherently dangerous and liable to cause blindness, and that the plaintiff had relied on the representations. The court stated:

> The intent to deceive sufficiently appears . . . by the facts alleged, from which it may be inferred that the alleged false statements were made with the intention of inducing the public to purchase the drug.[76]

[72] 1 Harper and James, Law of Torts c. VII (1956).

[73] 168 Wash. 456, 12 P.2d 409 (1932).

[74] In a substantially similar case, the Michigan court founded liability on the basis of warranty where plaintiff alleged deceit and fraud, negligence, and breach of warranty. Bahlman v. Hudson Motor Car Co., 290 Mich. 683, 288 N.W. 309 (1939).

[75] 20 Cal.2d 713, 128 P.2d 522 (1942).

[76] *Id.* at 716.

Cases are relatively rare, however, holding defendants liable to remote purchasers of chattels on theories of misrepresentation or deceit. The bases for liability of suppliers usually employed are either negligence or warranty,[77] with the misrepresentation playing an important role in showing the breach of the standard of conduct required or in establishing the warranty. Theories of misrepresentation or deceit are used, however, to establish liability to a purchaser when the product will not serve the purpose for which it was purchased. For example, in *Horrell* v. *Santa Fe Tank and Tower Company*[78] the supplier was held liable for damages on the basis of a representation that his atmospheric-type cooling tower would cool the volume of water necessary for the purchaser's refrigeration processes.[79] Liability of this type also holds warnings for suppliers to atomic energy industry because the unique technological problems involved may lead to representations of the suitability of a product which proves to be false. For example, an ordinary valve may be perfectly satisfactory for general industrial application, but because of susceptibility to corrosion it may be entirely unsatisfactory for use in conjunction with radioactive materials. Therefore, suppliers of standard products should exercise extreme caution in making representations concerning applications of their products in atomic energy operations.

It may be safely concluded that the duty to warn may be onerous for suppliers of articles which either employ radiation sources or are used in connection with nuclear processes. If the product is inherently dangerous, the cases seem to require a high standard of care in fulfilling the duty imposed. Moreover, we have also seen that the supplier may be held liable to third parties even if he has provided warnings to the purchaser. The extent of potential damage that may be caused by a defective component incorporated into a reactor is far greater than that encountered in more usual types of industrial pursuits, so suppliers to atomic industry should avoid unusual risks by exercising a very high degree of care in giving adequate warning to purchasers and so far as possible to third parties, thus assuring to the maximum possible degree that no accident will result from a failure to warn of the dangerous nature of the product.

g. Effect of Qualifications of Purchaser

Suppliers of chattels may also be held negligent because of the probability that injuries will result from supplying chattels to incompetent persons. The rule, as explained by the Restatement, is as follows:

> One who supplies directly or through a third person a chattel for the use of another whom the supplier knows or from facts known to him should know to be likely because of his youth, inexperience or otherwise, to use it in a manner involving unreasonable risk of bodily harm to himself and others whom the supplier should expect to share in, or be in the vicinity of its use, is subject to liability for bodily harm caused thereby to them.[80]

This statement of the rule raises a number of problems for suppliers to atomic energy industry. It is generally realized that only highly trained scientific and technological personnel are equipped to handle the problems encountered in employing the fission process or radiation sources in research, medicine, or industry. Moreover, under the Atomic Energy Act of 1954 persons utilizing special nuclear materials (fissionable) or byproduct materials (radioactive) and operators of reactors must be licensed by the Atomic Energy Commission.[81] In respect to use of byproducts, licenses can be and are usually granted prior to the installation of the activity, but in connection with the utilization of special nuclear materials to produce electrical energy, the owners and their operators need not, and normally will not actually, receive their licenses until the installation is fully equipped and prepared for regular operation. However, the owner of a reactor must obtain a construction permit before building the facility.[82] To complicate the picture, the Atomic Energy Commission has promulgated regulations which establish general licenses for particular uses and quantities of radioactive byproduct materials. The existence of a general license, in effect, means that no individual license is required for certain activities although the participant may be required to comply with stated regulations.[83]

The supplier of radioisotopes or devices directly or indirectly associated with the fission process or the utilization of radiation sources is confronted with several questions. Should the supplier demand that his purchaser have a license? If a license is not essential or if general licensing exists, must he investigate the competence of the purchaser?

[80] Restatement, Torts §390 (1934).
[81] Atomic Energy Act of 1954, §§81, 101, and 109.
[82] *Id.* at §185.
[83] 10 Code Fed. Regs. Pt. 30.

Can he rely on the fact that a license has been issued to prove that he has not been negligent in supplying his product to the particular purchaser? If a construction permit has been issued for a reactor facility, must he investigate the degree of competence of the purchaser in view of the fact that the construction permit seems to require only a finding by the AEC that there is "reasonable assurance" that the facility will prove to be safe at a future date, namely at the time the reactor is ready for operation?[84] Where the license is issued to a corporation, must he investigate the competence of the persons who will actually use special nuclear or radioactive materials? Obviously, these questions relate to a standard of care which must usually be resolved in relations to the facts of specific cases, so no definitive answers are possible.

Possibly, an examination of the cases establishing liability for supplying dangerous products to children or incompetents may, although they are not too closely parallel, serve to indicate how some of these questions may be answered when litigated.

Generally the cases establishing liability for what may be described as a breach of duty in selection of a purchaser have involved sales to children of firearms,[85] fireworks,[86] or inflammable substances,[87] or the lending of motor vehicles to persons who were known by the lendor to be either reckless or inebriates.[88] Recently, a New York court upheld, as stating a good cause of action, an allegation that a wife was negligent in allowing her husband to drive her automobile when she knew that her husband had a dangerous heart condition. The plaintiff was injured when the defendant's car swerved to the wrong side of the road during a fatal heart attack suffered by the husband.[89] Manufacturers have also been held liable for negligence because of illegal sales of explosives or dangerous products to retailers.[90] For example, in *Milton Bradley Co.*

[89] Schneider v. Van Wyckhouse, 54 N.Y.S.2d 446 (1945).

[90] See cases cited in Annotation, "Liability of manufacturer or wholesaler for injury caused by third person's use of explosives or other dangerous article sold to retailer in violation of law," 11 A.L.R.2d 1028 (1950).

of Georgia, Inc. v. *Cooper*,[91] the defendant wholesaler sold fireworks to a retailer in violation of a city ordinance. The son of the retailer took a torpedo toy, which explodes when thrown on the ground, from the store and threw it so as to explode near the plaintiff. The resulting explosion caused the plaintiff to lose the sight of his left eye. The Georgia Court of Appeals held that a cause of action had been stated and that the question of "proximate cause" should be determined by the jury. Moreover, sales in violation of statute are classified in many jurisdictions as negligence *per se* if the plaintiff is a member of the class, and the harm is of the type, designed to be protected by the legislation.[92]

We have discovered no cases which have imposed liability on a supplier for furnishing a dangerous product to an adult person even where there may have been knowledge that the adult person did not have sufficient technical skills to handle the product safely. However, it is possible that the courts may impose liability by analogy to the cases dealing with children if the supplier has knowledge of incompetence and the product is "inherently dangerous," such as radioactive materials. Probably liability would not be imposed in conjunction with sales of atomic energy products, not radioactive in themselves, nor would it be imposed if the seller has no knowledge of the incompetence. At the present time, it appears that the seller of atomic energy products has no duty to investigate the degree of skills possessed by his purchaser. However, if the sale is to a non-licensed person, where licensing is required, liability to the purchaser and others may be imposed because of violation of the statute, or the violation may create a presumption or constitute evidence of negligence.

Lack of knowledge or competence on the part of a purchaser may have some bearing upon the duty to warn. If purchasers of a product are not likely to have knowledge of inherent dangers or dangerous uses, the supplier may have to exercise a higher standard of care in providing warnings in order to avoid liability under negligence doctrines. Representative of cases indicating that a high degree of care may be required is *J. C. Lewis Motor Company, Inc.* v. *Williams*.[93] In that case the plaintiff claimed injury as a result of inhaling carbon monoxide fumes

[91] 79 Ga. App. 302, 53 S.E.2d 761 (1949).

[92] Prosser, Torts §34 at 161 (2d ed. 1955). Dean Prosser points out that in some states a violation of statute creates a presumption of negligence and in a few only evidence of negligence. Also violations of ordinances or regulations of administrative agencies may be treated only as evidence of negligence even in those states holding violations of statutes to be negligence *per se*.

[93] 85 Ga. App. 538, 69 S.E.2d 816 (1952).

emanating from a tractor purchased by her husband, but operated by her. The facts showed that the defendant supplier had failed to deliver a pipe which would have diverted the fumes away from the operator of the tractor. Furthermore, the plaintiff's husband knew of the omission since he contacted the supplier on several occasions, and the supplier promised to place an order for the missing pipe. The instructions supplied with the tractor contained no specific warning concerning the danger of carbon monoxide, but did state, that to avoid fumes, the pipe should be attached. The court held that the allegations were sufficient for the case to go to the jury for a determination of the questions of negligence of the supplier and possible contributory negligence on the part of the plaintiff. The plaintiff only had a fifth-grade education but the facts did not indicate the level of competence of her husband. It would seem that a knowledge of the danger of carbon monoxide would be almost universal among adults today; nonetheless, the court found that the jury should determine whether the supplier was negligent for failing to warn. The case illustrates the proposition that suppliers of radioactive materials and devices employing radiation must exercise extreme care in providing warnings, even though one might assume that any AEC licensee must know of the dangers involved.

h. Effect of Negligence by Others

Because of the complexities of our modern economic system, a number of problems arise in product liability cases concerning the effect of negligence that may be committed by others. Generally speaking, negligent acts committed by persons other than the defendant supplier in respect to the product may have one or both of two possible effects. First, a negligent act of another may insulate the supplier from liability, either because it proves that the supplier himself was not negligent, or that his negligence was not the "proximate cause" of the injury. Second, a negligent act of another may be the basis for shifting the economic loss suffered as a result of a judgment against the particular supplier for injuries sustained by the purchaser or third persons. The legal ramifications in respect to both of these possible effects are so complex, particularly because of the many possible factual variations, that we shall merely suggest the major considerations involved.

The possibility that negligence of another may serve to insulate a supplier from liability may be illustrated by a hypothetical atomic energy case. Suppose *X* markets a portable reactor power installation into which it incorporated a part negligently manufactured by *Y*, and the

defects cause a release of radioactive materials which results in bodily injury to *A*, the purchaser, who sues *X*. Can *X* avoid liability by showing that *Y* produced the part and that *X* used reasonable care in selecting *Y* as his supplier? A first consideration is the question whether *X* was separately negligent for his failure to inspect or in his manufacturing operations. In the *MacPherson* case,[94] the defendant had purchased the defective part from another but the Buick Motor Company was not relieved from liability since it was found to be negligent in its inspection.[95] Accordingly, it would appear that if the supplier has been negligent, he cannot successfully avoid liability to purchasers injured by the product he assembled. However, and to the contrary, in similar cases an assembler has avoided liability, apparently on the basis that the degree of care required of the assembler in inspecting the part is not as great as that imposed upon the manufacturer of the part.[96] Professor James suggests that these cases do not follow the modern rule imposing liability on the person who represents the product as his own even though it is actually manufactured by others.[97] To the extent that the cases deny liability where the product is represented by the seller as his own, they probably will afford little protection against liability of the seller in view of the more recent decisions. However, it would appear that they may have some validity where the part bears the trade-name of the actual manufacturer and the seller of the finished product is not equipped to make the same type of inspection as the manufacturer. For example, if, in our hypothetical portable reactor situation, the defective part was an electronic control mechanism for the reactor and if that mechanism bore the trade-name of *Y* after assembly of the reactor by *X*, it would seem that *X* may avoid liability if his selection of *Y's* product was reasonable and if he made reasonable inspections. The extent of the inspection required of *X*, of course, might be substantially less than that required of *Y* for it might not be readily possible to disassemble the device, and, furthermore, *X* may not be required to hold himself forth as an expert in electronic mechanisms. However, because of the dangerous qualities of reactors, the standard of care required of *X* would undoubtedly be higher than that encountered in respect to ordinary industrial products. In our survey of product liability cases, we have not

[96] Smith v. Peerless Glass Co., 259 N.Y. 292, 181 N.E. 576 (1932); Martin v. Studebaker Corp., 102 N.J.L. 612, 133 Atl. 384 (1926).

[97] James, *supra* note 18 at 192, 215. See cases cited therein at n. 142.

discovered any case defining the liability of the manufacturer where the defective part was a separate product assembled into the finished product with the original manufacturer's label attached. Therefore the possible effect of this fact upon liability remains conjectural.

It is clear, however, that the failure of any subsequent handler of the product to fulfill his duty to inspect will not prevent a prior handler who also had the duty to inspect from being held liable for his negligence. In *Willey* v. *Fyrogas Co.*,[98] the plaintiff's husband was killed in attempting to light a gas heater because a defective valve caused an explosion. The manufacturer of the valve, the manufacturer of the finished product, the wholesaler, and the retailer were all joined as defendants. The valve manufacturer and the manufacturer of the finished product both argued that they were not liable because of the custom in the trade for the retailer to make further tests at the time of installation. The valve manufacturer further argued that the manufacturer of the gas heater made tests that should eliminate his liability. The court stated:

> . . . The retailer's duty to test or his negligence in making tests certainly does not discharge the manufacturer's duty to also test and inspect and is not a defense to the manufacturer's negligence in constructing the article or in failing to properly test and inspect it. . . . The failure of the vendee to properly inspect and test is within the foreseeable risk of the manufacturer.[99]

The valve manufacturer, the gas-heater manufacturer, and the retailer were held jointly liable. The wholesaler was not held liable since he merely warehoused the heaters in their original crates until retail orders were received. Therefore, subsequent negligent acts by others in merchandising processes from the supplier of raw materials to the retailer will not immunize a prior handler or supplier from liability.

A more difficult question is whether negligence on the part of the purchaser or user of the product will permit the supplier to avoid liability for his negligence. In those states not following comparative negligence rules, it is generally recognized that contributory negligence and assumption of risk are defenses against liability even where negligence has been established on the part of the defendant.[100] It is impossible for us to

[98] 363 Mo. 406, 251 S.W.2d 635 (1952).

[99] *Id.* at 421. See also Foley v. Pittsburgh-Des Moines Co., 363 Pa. 1, 68 A.2d 517 (1949), and Moran v. Pittsburgh-Des Moines Steel Co., 166 F.2d 908 (1948), discussed *infra*.

[100] See Prosser, Torts c. 10 (2d ed. 1955).

consider the innumerable cases involving these defenses in negligence actions in this study, but it should be pointed out that in the product liability cases, Dean Prosser's statement that the courts are becoming more reluctant to find contributory negligence as a matter of law and that juries are "notoriously inclined" to enter verdicts for the plaintiff where there has been evidence of contributory negligence [101] appears accurate.[102] Representative of the possible obstacles to reliance on the defense of contributory negligence where radiation injuries are involved is the case of *O'Connell* v. *Westinghouse X-ray Co., Inc.*[103] There the plaintiff, an experienced surgeon, claimed negligence on the part of the manufacturer of an X-ray machine for failure to explain the proper method of using the machine and for failure to provide a guard. The plaintiff, who did not witness the demonstration of the machine, thereafter used it during operations and suffered severe burning leading to the loss of three fingers. He also offered evidence that the condition was progressively deteriorating and that further amputations would be necessary. The jury returned a verdict against the manufacturer for $100,000 which was sustained by the trial court.[104] On appeal, the Appellate Division found that the surgeon was contributorily negligent as a matter of law, stating:

> It may be doubted that the truth is that plaintiff, a surgeon who had some experience with X-ray works, was ignorant of the fact that the nearer the hand is placed to the source of the X-ray beam, the greater the intensity of the beam falling upon the hand. But that is plaintiff's own claim, and it cannot be disregarded. If the purpose of the testimony is to lay the basis for a legal contention that a surgeon who works on bones under a fluoroscopic machine is not charged in law with knowledge of the factors determining intensity of effect upon the body, and that the surgeon is entitled to rest upon the same degree of ignorance as a layman, then it must be held that even a layman who attempts to set a fracture under a fluoroscopic machine without knowledge that intensity varies with distance is chargeable with contributory negligence as a matter of law.

[101] *Id.* at 296.

[102] See *e.g.*, Pezzo v. Paterno, 277 App. Div. 496, 101 N.Y.S.2d 391 (1950), *rev.* 302 N.Y. 884, 100 N.E.2d 176 (1951), where the jury returned a verdict for the plaintiff, the Appellate Division of the Supreme Court reversed on the ground that there was contributory negligence as a matter of law, and the New York Court of Appeals reversed the Appellate Division stating that the submission of the issue of contributory negligence to the jury was proper.

[103] 16 N.Y.S.2d 54 (1939), *rev.* 261 App. Div. 8, 24 N.Y.S.2d 268 (1940), *rev.* 288 N.Y. 486, 41 N.E.2d 177 (1942).

[104] 16 N.Y.S.2d 54 (1939).

> The evidence in plaintiff's case not only fails to establish his freedom from negligence, but establishes affirmatively as a matter of law that he was heedless of his own safety.[105]

Despite the rather positive assertions of contributory negligence on the part of the surgeon by the Appellate Division, the Court of Appeals reversed, ordering a new trial.[106] The difficulties involved for suppliers of devices that create radiation hazards are obvious. Even where knowledge of the danger may be assumed for persons in the same general class as the plaintiff, the supplier cannot escape liability if the plaintiff can show the absence of knowledge on his part and hence contributory negligence cannot be established.

The product liability cases where the plaintiff is a third person and there is evidence of negligence by the purchaser or user are even less susceptible to strict legal analysis. The problem is usually presented to the jury in terms of "proximate cause," but often this concept embraces the issue of duty and the standard of conduct.[107] Again, in the product liability cases there is a marked tendency to find that the intervening negligence was foreseeable so that the supplier is not relieved from liability.

Consider the following hypothetical atomic energy fact situations:

1. *A* supplies a container for radioactive material which is defectively constructed so that even a slight impact will cause it to break. *B*, in transporting cobalt 60 in the container, negligently drives the truck into a viaduct. *C*, a bystander, suffers radiation injuries. Is *A* liable to *C*?

2. *X* supplies a reactor control mechanism which is defective. *Y*, the reactor operator, negligently permits an increase in power level and the control mechanism fails causing a release of radiation injuring *Z*. Is *X* liable to *Z*?

In both cases, it should be noted that the suppliers may be able to defend successfully against suits by *B* and *Y* if the court or jury find they are guilty of contributory negligence as a matter of law or fact. However, *A* and *C* may nonetheless recover from the suppliers for the intervening

[105] 24 N.Y.S.2d at 270-271 (1940). Another issue involved was the nature of the negligence of the manufacturer in respect to the guard. The court pointed out that the omission of the guard was intentional since the purchaser wanted to keep down the price of his gift to the hospital of the machine. This fact situation alone, absent other allegations of negligence, raises the difficult question of what the supplier must provide from the standpoint of safety of radiation devices even though the purchaser does not want to pay the additional costs.

[106] 288 N.Y. 486, 41 N.E.2d 177 (1942).

[107] See Prosser, Torts c. 9 (2d ed. 1955).

negligence may be considered foreseeable so that a jury determination that *A*'s and *X*'s negligence was the "proximate cause" will be sustained. An example of cases involving a similar fact situation is *Benton* v. *Sloss*.[108] In that case the defendant used-car dealer obtained a partial down payment for a car from a minor and permitted the minor to take possession. The minor's father refused to sign the sales contract and told the minor to return the car. After two unsuccessful attempts to return it, the minor took the plaintiffs for a ride, and he raced with another car. When a car coming from the opposite direction suddenly appeared above a rise in the road, the minor tried to use the brakes, but only the right brake worked. The car was thrown off the highway into a telephone pole, thereby injuring the plaintiffs. They recovered judgments in the trial court against both the minor and the used-car dealer. In sustaining the judgment against the used-car dealer the Supreme Court of California stated:

> . . . [The minor's] negligent driving was unquestionably a cause of plaintiffs' injuries. . . . [The dealer's] negligence was also a cause of those injuries, if it was a substantial factor in bringing them about. . . . In the light of the evidence [the jury] could reasonably conclude that because of the defective brakes [the minor] could not avoid the collision. . . .
>
> . . . The negligent conduct of [the minor] did not relieve [the dealer] from liability, for the likelihood of negligent operation of the vehicle was one of the hazards that [the dealer] could reasonably foresee.[109]

The conclusion to be drawn would seem to be that suppliers must accept the risk that the extent of the injuries resulting from their own negligence may be increased by subsequent negligent acts of the purchaser or user of the products. Intervening negligence is often found to be "foreseeable," and the determination of the issue is left to the juries under the nebulous concept of "proximate cause."

There remains for discussion the possibility that all or a part of the economic loss suffered as a result of a judgment against a product supplier may be shifted. The incidence of economic loss may be shifted by contractual arrangements or, absent express agreement, by the operation of certain legal factors. The former includes express agreements between the seller and the purchaser under which the purchaser of the product promises to reimburse the seller for any losses that he may suffer for damages based upon defects in the product. It would also include

[108] 38 Cal.2d 399, 240 P.2d 575 (1952).
[109] *Id.* at 405.

insurance. These pose no especially unique legal problems for atomic energy suppliers except that they may afford no real protection if the assets of the purchaser are insufficient to cover the liability or where the insurance coverage is limited in amount. However, atomic energy suppliers should explore these possibilities in conjunction with their sales. There is already some indication that "save harmless" clauses are becoming standard practice in the atomic energy field.

The possibility of shifting the economic loss suffered as a result of satisfying a judgment by seeking recovery of all or part of the moneys paid to the injured from other persons is more tenuous. If two or more suppliers of the same chattel, such as a part manufacturer, the assembler, the wholesaler, and the retailer, are held jointly liable for a breach of duty, such as the duty to inspect, in the same action, the plaintiff may seek satisfaction of his judgment from one or all. If the plaintiff collects the judgment from only one of the defendants, that defendant may seek contribution from the others who were held jointly liable. However, contribution is not generally available unless there is statutory authority.[110] A discussion of the applicability of the statutes authorizing contribution in various fact situations is beyond the scope of this study, but the supplier who suffers the economic loss involved in a judgment should investigate the potentialities of having others share the loss.

Indemnity may also be available as a possible means of shifting the entire loss where negligent acts of others occur either prior or subsequent to the negligence of the person held liable to an injured person. The law concerning indemnity, however, is highly confusing,[111] and for some inexplicable reason there is a paucity of cases dealing with attempts by suppliers to seek recoveries from others whose negligence may have caused the injury. The Restatement of the Law of Restitution contains the following:

> Where a person has supplied to another a chattel which because of the supplier's negligence or other fault is dangerously defective for the use for which it is supplied and both have become liable in tort to a third person injured by such use, the supplier is under a duty to indemnify the other for expenditures properly made in discharge of the claim of the third person, if the other used or disposed of the chattel in reliance upon

[110] See Davis, "Indemnity Between Negligent Tortfeasors: A Proposed Rationale," 37 Iowa L. Rev. 517 (1952).

[111] Bohlen, "Contribution and Indemnity Between Tortfeasors," 21 Cornell L.Q. 552 (1936), 22 Cornell L.Q. 469 (1937); Hodges, "Contribution and Indemnity Among Tortfeasors," 26 Tex. L. Rev. 150 (1947); Note, "Contribution and Indemnity Among Tortfeasors in Minnesota," 37 Minn. L. Rev. 470 (1953); Davis, *supra* note 110.

> the supplier's care and if, as between the two, such reliance was justifiable.[112]

Most of the cases cited by the Reporters for this proposition, however, have dealt with the right to indemnity of the purchaser-owner from the supplier.[113] Nonetheless, the principle involved should be equally applicable to indemnity by the retailer against the manufacturer, etc. In food product cases where under warranty doctrines a type of strict liability may be imposed against the retailer, indemnity has been allowed against the wholesaler and by the wholesaler against the packer.[114] In two recent cases, manufacturer-assemblers have been unsuccessful in recovering from their suppliers for defective parts or materials, apparently on the ground that reliance on the prior supplier was not justifiable. In *Heath* v. *Channel Lumber Co.*[115] the manufacturer of a ladder settled for $57,500 a claim for injuries sustained by a workman when the ladder broke. The manufacturer then sought indemnity for breach of warranty from the lumber supplier who supplied fir instead of hemlock as ordered by the manufacturer. The court refused indemnity on the ground that the plaintiff did not prove that the "efficient cause of the structural failure of the ladder was that one of its railings was fir and not hemlock without which circumstance the ladder would not have broken." [116] Similarly in *Maryland Casualty Co.* v. *Independent Metal Products Co.*[117] the plaintiff insurer, as subrogee of the manufacturer-assembler of the finished product, sought to recover the damages recovered by a third person on the theory that it was the defendant part supplier's negligence in manufacturing a tank for a truck trailer which caused the injury. The claim for indemnity was disallowed apparently because the insured Fruehauf Trailer Company actively supervised the supplier's work and because actual negligence could not be established although it seems that the injured person had no difficulty with this issue in the prior litigation.[118] Indemnity, therefore, appears to be only a

[112] Restatement, Restitution §93(1) (1937).

[113] See Seavey and Scott, Notes on Restatement of Restitution §93 (1937).

[118] The difficulties in obtaining indemnity suggest that it may be advisable to have prior suppliers or subsequent vendees joined in the original action as defendants. In the Independent Metal Products Co. case, Fruehauf did tender the defense of the original action to the supplier, but he refused to accept. "Vouching in" practice should

remote possibility, but it exists and its possibilities should be explored by atomic energy suppliers in specific cases where there has been prior or subsequent negligence by other suppliers connected with the same chattel.

In summary, negligence by others may immunize product suppliers from liability, the most significant factor being, of course, contributory negligence on the part of the injured person. In addition, negligence by others, either prior or subsequent to the negligence of the product supplier, may offer the possibility of obtaining reimbursement of sums paid to satisfy claims of the injured. However, it appears that to date attempts to obtain reimbursement under indemnity theories have not been too effectual. For the product supplier to atomic energy industry, the most practicable approaches appear to be to obtain express agreements from purchasers or to purchase comprehensive insurance coverage.

i. Problems of Proof

In the atomic product liability field, as applied to atomic energy industry, some of the most unique problems are encountered in respect to the making of proof. As pointed out previously, the very nature of radiation injuries makes it difficult to prove causation in fact,[119] and there are the innumerable unique problems of proof connected with cumulative injuries, intervening causes, and peculiar injuries, such as genetic damage and shortened life span. All of these will appear in product liability cases and solutions similar to those evolved for other negligence situations will undoubtedly be evolved by the courts. In product liability cases involving negligence doctrines the plaintiff must show that an injury occurred because of the condition of the product, that the condition was unreasonably dangerous, and that the condition resulted from the defendant's negligence.[120] Each of these essential proof requirements may prove to be insurmountable obstacles to the plaintiff in atomic energy cases. In a highly scientific field it will frequently be extremely difficult for an injured person to prove that it was a defective product that caused a radiation injury. Possibly only the most exacting investigation would reveal the nature of a product defect that may have caused a reactor melt-down. Moreover, the accident may destroy the evidence of the defect. Even assuming that the injury may be traced to a defec-

be carefully scrutinized for its possible effects. For a recent case in which General Motors attempted unsuccessfully to have a retailer joined as defendant for its failure to inspect the brakes so that General Motors could avoid liability, see Birdsong et al. v. General Motors Corp., 99 F. Supp. 163 (1951).

[119] See Chapter III, *supra*.

[120] James, *supra* note 18 at 68-77.

tive product, the plaintiff may have difficulty in establishing the negligence of the supplier. Atomic science is undergoing almost daily change, and many theories are being subjected to complete reanalysis. Proof of reliance upon the best known existing methods may prevent the case from going to the jury because it may be impossible for the plaintiff to establish the precise nature of the standard of care which the defendant should have exercised in connection with the product.[121] If the product or the processes in which the product is used are complex, proof of negligent acts will be especially difficult. Moreover, proof of governmental inspection and certification, which may often be available for atomic energy installations and particularly in respect to reactors, may be offered as proof of the exercise of reasonable care, and hence freedom of negligence on the part of the supplier.[122] On the other hand, the doctrine of *res ipsa loquitur* may assist the plaintiff in establishing negligence on the part of a supplier. Although it is impossible in this study to explore fully the implications of the doctrine, a brief discussion of its use in a few cases will demonstrate its possibilities for assisting to establish negligence by suppliers of chattels.

In general discussions of *res ipsa loquitur* one of the stated requirements is that the defendant must have had exclusive control over the instrumentality causing the injury. Literal application of this requirement would prevent application of the doctrine in product liability cases involving suppliers once the product has passed into the hands of the purchaser or user. Although some courts have held that the doctrine was not applicable in such cases,[123] the modern and more commonly accepted view is that exclusive control by the defendant at the time of the accident is not essential. Thus, in *Gordon* v. *Aztec Brewing Co.*[124] *res ipsa loquitur* was applied against the bottler of the beverage in a case in which the explosion of the bottle caused damage to the plaintiff notwithstanding the fact that intermediate handlers had been in control of the product after it had left the possession of the bottler.[125] Moreover, the doctrine has been applied in product liability cases against multiple de-

[121] For an interesting analysis of the possible liability of Cutter Laboratories for the recent polio vaccine deaths indicating that negligence probably cannot be established, see Note, "The Cutter Polio Vaccine Incident: A Case Study of Manufacturers' Liability Without Fault in Tort and Warranty," 65 Yale L.J. 262 (1955).

[122] For a discussion of the possible effects of inspection and certification as a defense in the aircraft industry, see Hotchkiss, "Aircraft Manufacturers' Liability and the Civil Aeronautics Act of 1938," 16 Geo. Wash. L. Rev. 469 (1948).

fendants. In *Nichols* v. *Nold*[126] *res ipsa loquitur* was employed by the plaintiff who was injured by an exploding bottle to establish liability against the bottler, the distributor, and the retailer of a carbonated beverage. Furthermore, as in other negligence cases, the inference of negligence established by the doctrine is extremely difficult to refute. For example, in *Ortego* v. *Nehi Bottling Works*[127] the defendant offered considerable evidence tending to prove that because of the extreme precautions taken there was no negligence on its part. Nonetheless, the inference of negligence based upon application of *res ipsa loquitur* was deemed sufficient to sustain the verdict against the bottler. The Louisiana Supreme Court, in commenting on this evidence, stated:

> In fact [the defendants] are so strenuous in their arguments and the proof adduced to sustain the same that if it were not for the fact that the bottle in this case did actually explode without the touch of human hands, we would have no other recourse than to hold that the bottle did not in fact explode.[128]

In addition, *res ipsa loquitur* has been employed against suppliers of chattels even where the product has been in use for an extended period by the purchaser. In *Ryan* v. *Zweck-Wollenberg Company*[129] the plaintiff sought recovery from the retailer and the manufacturer of a refrigerator (Philco Corporation) for injuries suffered from electrical shock received when she placed one hand on the refrigerator and the other on a stove. The injuries were sustained in the spring of 1952, but the refrigerator had been purchased by the plaintiff's daughter in the spring of 1949. Moreover, in the interim the purchaser had moved the refrigerator from one community to another. Nonetheless, *res ipsa loquitur* was held to be applicable, reliance being placed on the fact that the defect was in a "sealed unit." The Wisconsin Supreme Court stated:

> Because of the fact that the refrigerator in the instant case had passed out of the possession of the defendant manufacturer approximately three years prior to the accident, Philco maintains that the principle of *res ipsa loquitur* cannot be invoked in behalf of the plaintiff to establish Philco's negligence inasmuch as the refrigerator was not within the exclusive control of Philco. If the refrigerator were a machine or appliance, such as an automobile or sewing machine, the moving parts of which are capable of being operated by the user, defendant's point would be well taken. In case of injury resulting from the use of such a machine the inference would be

[126] 174 Kan. 613, 258 P.2d 317 (1953).
[127] 199 La. 599, 6 S.2d 677 (1942).
[128] *Id.* at 607.
[129] 266 Wis. 630, 64 N.W.2d 226 (1954).

just as strong that the defect causing the injury occurred as the result of the operator's use as would the inference that the same was due to some defect in manufacture, and therefore the principle of *res ipsa loquitur* would not be applicable.

However, the operating mechanism of the refrigerator in question, consisting of the motor and compressor, was hermetically sealed within a metal inclosure and is commonly referred to as a "sealed unit." The evidence in the record shows that the sealed unit of the refrigerator causing plaintiff's injury was never opened or tampered with by anyone from the time the refrigerator was removed from its original shipping crate in which Philco had shipped the same, to the time of trial. There was nothing in connection with such sealed unit for the users of the refrigerator to operate. In the use of the refrigerator all that was done was to plug the electric cord of the refrigerator into one of the electric outlets forming part of the wiring system of the home. The testimony in the case definitely established that there was nothing in connection with the wiring of the refrigerator outside of the sealed unit which could have caused a short circuit. On the other hand, the evidence is undisputed that plaintiff did receive a severe electric shock as a result of a short circuit in the refrigerator. The inference, therefore, is almost inescapable that something inside of the sealed unit must have gone wrong to have caused such short circuit.[130]

The conclusion to be adduced by atomic energy suppliers from the application of *res ipsa loquitur* in product liability cases is perhaps abundantly obvious. It apparently will be difficult to avoid application of the doctrine, particularly where the product may be described as "inherently dangerous." If the doctrine is applied, the plaintiff's burden in establishing negligence by the supplier is diminished considerably. In fact, it may even be argued that the application of *res ipsa loquitur* amounts in its effect to the imposition of strict liability in the particular case. Therefore, *res ipsa loquitur* may serve as a method of removing the substantial difficulties confronting a plaintiff who suffers radiation damage in proving negligence by suppliers of chattels.

j. Summary

Throughout this discussion of liability of suppliers under general negligence doctrines two themes predominate so far as atomic energy

[130] *Id.* at 639-640. See also Peterson v. Minnesota Power & Light Co., 207 Minn. 387, 291 N.W. 705 (1940). But compare Jastrzembski v. General Motors Corp., 100 F. Supp. 465 (1951), in which the court thought several months use of a car prevented application of *res ipsa loquitur* to injuries caused by a defect in an automobile transmission because it was subjected to outside forces, namely use or abuse by the owner.

suppliers are concerned. First, general negligence doctrines are available as a basis for imposing liability, especially where the product can be described as "inherently" or "imminently" dangerous, which will often, if not normally, be the case where radiation injuries are involved. Second, the unusual scope of potential liability in a reactor disaster situation creates serious risks for the supplier since a single accident may destroy his business assets unless the potential economic losses can be avoided by insurance coverage, by other legal devices, or through indemnification under the recent amendments of the Atomic Energy Act, discussed below. Conversely, for those suffering injuries as a result of defects in atomic energy products, it will be difficult to prove negligence by suppliers because of the uncertain and constantly changing state of scientific knowledge and because it will often be difficult to prove in fact that radiation caused a particular injury.

3. Warranties

a. Express and Implied Warranties

Although warranty is generally considered today to be based on contract theory, it was originally based upon tort, and it still retains many tort elements.[181] For suppliers an important factor is that a breach of warranty results in the imposition of strict liability so that it is not necessary for the injured to prove negligence. Warranties may take one of two forms—either express or implied, and both are defined in most jurisdictions by legislative enactments of either the Uniform Sales Act or the Uniform Commercial Code.[182] The Uniform Sales Act defines an express warranty as follows:

> Any affirmation of fact or any promise by the seller relating to the goods is an express warranty if the natural tendency of such affirmation or promise is to induce the buyer to purchase the goods, and if the buyer purchases the goods relying thereon. No affirmation of the value of the goods, nor any statement purporting to be a statement of the seller's opinion only shall be construed as a warranty.[183]

The Uniform Commercial Code contains substantially the same definition.[184] What amounts to an express warranty in particular fact situa-

[181] 1 Williston, Sales §§195, 196 (Rev. ed. 1948).

[182] The Uniform Sales Act has been adopted in 36 jurisdictions and the Uniform Commercial Code is now operative in Pennsylvania. The Commercial Code has also been adopted, although not yet operative, in Massachusetts and Kentucky.

[183] Uniform Sales Act §12.

[184] Uniform Commercial Code §2-313.

tions has been the subject of considerable litigation.[135] In this study we cannot undertake a detailed analysis of the many problems involved in determining the existence of an express warranty. However, since express warranties may result in the imposition of strict liability, caution should be exercised by atomic energy suppliers during the negotiations for sales of products and in the drafting of sales agreements. In addition, atomic energy suppliers who wish to avoid liability on the basis of breach of express warranty should exercise care in the preparation of advertising circulars and literature. In some cases, the advertising representations have been characterized as warranties extending even to those not in privity with the advertiser.[136] For example, in *Bahlman* v. *Hudson Motor Car Co.*[137] the defendant had issued advertising matter representing that its car had a seamless roof. The plaintiff claimed reliance on this statement in purchasing the car from a dealer. He claimed damages for head lacerations received when the car overturned; the injury being caused by jagged edges along a welded seam in the roof. The court held the car manufacturer liable, even though it was conceded that the purchaser was negligent in operating the car, on the ground that the "defendant's representations amounted to express warranties of quality and construction." [138] Once express warranty was found, the court had no difficulty in dispensing with contributory negligence as a defense since warranty doctrines impose strict liability, the only question being whether the breach was the "proximate cause" of the injuries.[139]

In contrast with express warranties, over which the seller has a large degree of control, warranties are often implied even though the seller has apparently attempted to avoid all warranties in respect to his product. Once again it is impossible for us to consider the many ramifications of implied warranties,[140] but the statutory treatment is, of course, significant. The Uniform Sales Act provides:

> Subject to the provisions of this act and of any statute in that behalf, there is no implied warranty or condition as to

[135] See 1 Williston, Sales c. VIII (Rev. ed. 1948).

[136] See Rogers v. Toni Home Permanent Co., 167 Ohio St. 224, 147 N.E.2d 612 (1958).

[137] 290 Mich. 683, 288 N.W. 309 (1939).

[138] *Id.* at 690.

[139] See also Baxter v. Ford Motor Co., *supra* note 73, which may also be characterized as an express warranty case.

[140] See 1 Williston, Sales c. IX (Rev. ed. 1948); Amram and Goodman, "Some Problems in the Law of Implied Warranty," 3 Syracuse L. Rev. 259 (1952).

the quality or fitness for any particular purpose of goods supplied under a contract to sell or a sale, except as follows:

(1) Where the buyer, expressly or by implication, makes known to the seller the particular purpose for which the goods are required, and it appears that the buyer relies on the seller's skill or judgment (whether he be the grower or manufacturer or not), there is an implied warranty that the goods shall be reasonably fit for such purpose.

(2) Where the goods are bought by description from a seller who deals in goods of that description (whether he be the grower or manufacturer or not), there is an implied warranty that the goods shall be of merchantable quality.

(3) If the buyer has examined the goods, there is no implied warranty as regards defects which such examination ought to have revealed.

(4) In the case of a contract to sell or a sale of a specified article under its patent or other trade name, there is no implied warranty as to its fitness for any particular purpose.

(5) An implied warranty or condition as to the quality or fitness for a particular purpose may be annexed by the usage of trade.

(6) An express warranty or condition does not negative a warranty or condition implied under this act unless inconsistent therewith.[141]

The Uniform Commercial Code has broadened the implied warranty provisions slightly, but the same general types of implied warranties remain.[142] The possibility that implied warranties of fitness and merchantability under the statutes may expose atomic energy suppliers to strict liability is apparent. Furthermore, it can readily be understood from examination of the statutory language why the plaintiffs in product liability cases often plead both negligence and breach of warranty with the result that many cases are disposed of under warranty doctrines.[143]

The availability of implied warranty theories to establish liability of suppliers of chattels, however, is limited by a number of technical requirements. By far the most drastic limitation is the requirement of

[141] Uniform Sales Act §15.

[142] Uniform Commercial Code §§2-314, 2-315.

[143] A recent Georgia statute, Ga. Laws, 1957, Act 342, provides:

> The manufacturer of any personal property sold as new property, either directly or through wholesale or retail dealers, or any other person, shall warrant the following to the ultimate consumer, who, however, must exercise caution when purchasing to detect defects, and, provided there is no express covenant of warranty and no agreement to the contrary:
>
> 1. The article sold is merchantable and reasonably suited to the use intended.
>
> 2. The manufacturer knows of no latent defects undisclosed.

"privity of contract." Although we have seen that privity is no longer an essential element under negligence doctrines, implied warranty doctrine is not available to persons not parties to the contracts in a majority of jurisdictions.[144] Moreover, there are a number of potential pitfalls even for those in privity, such as the requirement of notice to the seller within a reasonable time after the breach, the possible selection of an inadequate remedy, and the necessity of showing reliance on the seller.[145]

However, in nearly one-third of the states the privity requirement has been abandoned in respect to food, drugs, and economic poisons.[146] Thus, there appears to be a development in the law of implied warranty corresponding to that in negligence law in that the privity requirement is being relaxed where the product is "imminently dangerous." A representative case is *Burr et al.* v. *Sherwin-Williams Co. of California.*[147] There the plaintiff sought recovery for damage to his cotton crop sustained from spraying the crop with a chemical, supplied by the defendant, which apparently contained 2-4-D, a weedkiller. The plaintiff alleged both negligence and breach of implied warranty. The trial court, after reading the provisions of the Sales Act, gave the following instruction to the jury:

> If you decide that any of the provisions of the code section . . . are applicable, and further decide that an implied warranty was made by the manufacturer, that warranty runs with the goods to the ultimate consumer, there being no requirement of privity of contract between the ultimate consumer and the manufacturer. And if you further find that the manufacturer breached such warranty, then it is liable for the damage caused by such breach, regardless of negligence.[148]

The California District Court of Appeals, after holding that the doctrine of *res ipsa loquitur* was applicable in respect to the cause of action based on negligence, concluded that the trial court's instruction was proper. Although the affirmation of the jury verdict was justified on grounds of negligence, the approval of the jury instruction on warranty indicates the willingness of the court to relax the requirements of privity when dealing with "imminently dangerous" articles.

[144] See James, *supra* note 18 at 192, 193-196, and cases cited therein.

[145] For an excellent discussion of these requirements in relation to product liability, see James, *supra* note 18 at 196-205. Also see 1 Williston, Sales c. IX (Rev. ed. 1948); Prosser, "The Implied Warranty of Merchantable Quality," 27 Minn. L. Rev. 117 (1943).

[146] Prosser, Torts §84, p. 507 (2d ed. 1955).

[147] (Cal. App.) 258 P.2d 58 (1953).

[148] 258 P.2d at 64.

The Supreme Court of Kansas also has allowed recovery under implied warranty doctrines in the absence of privity. In *Graham* v. *Bottenfield's Inc.*[149] the plaintiff was injured by a hair preparation which was purchased by the defendant distributor corporation from the manufacturer and was sold in the original container to a beautician who applied it to the plaintiff's hair. The plaintiff sought recovery for breach of an implied warranty of fitness. The defendant distributor defended on the grounds of no privity of contract and on the ground that it had no duty to test the product. The court, in holding that plaintiff could recover for breach of the implied warranty, discussed the food cases and stated:

> If the reasons . . . for recognizing the exceptions to the general rule of the common law are to be followed and adhered to we are forced to agree there is merit in appellee's position that there is just as much reason for holding public policy, which it is to be noted is the basic foundation for the imposition of liability under the doctrine of implied warranty . . . , requires, that a manufacturer, jobber or distributor who sells [hair preparations] . . . impliedly warrants that preparation as suited and fit for use . . . as there is for holding that food manufactured and sold for domestic consumption is impliedly warranted as wholesome and fit for that purpose or that glass bottles when sold and/or delivered in connection with the sale of liquid beverages are impliedly warranted to be in a safe and nonexplosive condition. Therefore, on the basis of the reasoning of such decisions and what is there said and held, consistency requires and we feel constrained to hold the scope of the exception to the common law rule of *caveat emptor* . . . should be extended to include sales of the product here in question.[150]

Despite the extensions of the implied warranty doctrine to cover those not in privity in the food, drug, economic poisons, and cosmetic cases, the courts have been reluctant to allow the use of implied warranty in connection with other products. For example, in *Wood* v. *General Electric Co.*[151] where the plaintiff sought to recover damages for a fire

[149] 176 Kan. 68, 269 P.2d 413 (1954).

[150] *Id.* at 74. See also DiVello v. Gardner Machine Co., 102 N.E.2d 289, 293 (Com Pleas Ohio, 1951): ". . .[T]his court is of the opinion that the sale of the grinding wheel carried with it an implied warranty of merchantability and fit for the usages designed and that such warranty extended to the workman of the vendee who was injured in its ordinary use because of a latent defect and in the absence of contributory negligence such workman could recover on the basis of a breach of warranty against the party who sold the wheel to his employer."

[151] 159 Ohio St. 273, 112 N.E.2d 8(1953).

caused by a defect in an electric blanket manufactured by the defendant on both theories of negligence and breach of implied warranty, the Supreme Court of Ohio held that the implied warranty doctrine was not available, stating:

> Although a subpurchaser of an inherently dangerous article may recover from its manufacturer for negligence, in making and furnishing of the article, causing harm to the subpurchaser or his property from a latent defect therein, no action may be maintained against such manufacturer by such subpurchaser for such harm, based upon implied warranty of fitness of the article so purchased. . . . Here, there was no such privity and hence no implied warranty upon the part of General Electric and no valid issue on that subject.[152]

Nonetheless, the parallel history of recovery for negligence seems to indicate further extensions of implied warranty doctrines in the product liability field. For those atomic energy products that fall into the category of food, drugs, or economic poisons, such as radioactive materials that are to be used upon humans for medical tests or therapy, implied warranty will be available to those injured by a defect in the product. Other atomic energy products will escape strict liability on implied warranty theories until there are further extensions of existing rules of law. However, the high degree of danger involved in certain atomic energy products and the difficulties for the injured in proving negligence may provide the type of case in which courts initially may allow recovery for breach of implied warranty.

b. Effect of Disclaimers

Since liability under warranty doctrine arises either as a result of express contract provisions or is implied by law as a part of the contract of sale, it is generally recognized that by mutual consent the parties may exclude all warranties, both express and implied.[153] However, in some cases, such agreements have been denied effect on grounds of public policy. This is especially true in the food cases.[154] Moreover, the courts have been reluctant to find an exclusion of warranties unless the language of the sales agreement is absolutely clear.[155] Finally, the courts may

[152] *Id.* at 279.

[153] Both the Uniform Sales Act §71 and the Uniform Commercial Code §2-316 provide that agreements may be made to exclude all express or implied warranties.

[154] See *e.g.*, Linn v. Radio Center Delicatessen, Inc., 169 Misc. 879, 9 N.Y.S.2d 110 (1939).

[155] See Note, 23 Minn. L. Rev. 784 (1939), and cases cited therein; James, "Assumption of Risk," 61 Yale L.J. 141, 162 *et seq.* (1952); James, *supra* note 18 at 192, 210-211.

find a disclaimer of warranties to be ineffective because the purchaser did not have proper notice of its existence, either because it was on the package, on an invoice, in small print, etc.[156] Nonetheless, if care is exercised, atomic energy product manufacturers may make effective use of disclaimers to limit liability under warranty theories.

In addition to disclaiming warranties, the supplier may also, by mutual consent, disclaim any liability on his part under negligence doctrines if public policy does not render the contract provision void. For example, in *Charles Lachman Co., Inc.* v. *Hercules Powder Co., Inc.*[157] the plaintiff sought recovery under negligence doctrines for damages caused to its carpets by use of a chemical manufactured by the defendant. The contract provided, in part: "Seller makes no warranty of any kind, express or implied, except that the materials sold hereunder shall be of Seller's standard quality, and Buyer assumes all risk and liability whatsoever resulting from the use of such materials, whether used singly or in combination with other substances." The court held that the contract provisions were sufficiently broad to preclude recovery under negligence theories,[158] stating:

> The general rule is that one party to a transaction may ordinarily contract to limit or eliminate his liability for negligence in performing his obligations. There is no rule of public policy which makes such provisions ineffective, particularly when the obligee is under no disadvantage by reason of confidential relationship, disability, inexperience or the necessities of the situation. In the present case the parties were both corporations engaged in large scale manufacturing. The plaintiff was under no compulsion to buy from the defendant and, if it desired to buy from it, had the choice of accepting the defendant's terms or going elsewhere.[159]

The court's statement indicates that there may be limitations on contracting away liability for negligence where one party is in a disadvantageous bargaining position. Such has often been found to be the case where public utilities, common carriers, innkeepers, and public warehousemen have attempted to limit liability.[160] However, for many

[156] Note, *supra* note 155 at 795; 1 Corbin, Contracts §33 (1950).

[157] 79 F. Supp. 206 (1948).

[158] See also Shafer v. Reo Motors, Inc., 205 F.2d 685 (1953), where the Lachman case is quoted with approval in holding a truck manufacturer not liable for negligence where the contract provided, in part, that "this Warranty being expressly in lieu of all other Warranties expressed or implied and of all other obligations or liabilities on our part, and we neither assume or authorize any other person to assume for us any liability in connection with the sale of our vehicles."

[159] *Supra* note 157 at 207.

[160] See Prosser, Torts §55, pp. 305-307 (2d ed. 1955), and cases cited therein.

atomic energy suppliers there appears to be no public policy that would render agreements to limit liability void.

However, disclaimers of warranty or liability for negligence will afford only limited protection to atomic energy suppliers in those instances in which a defect in the product leads to a major reactor mishap. The agreement between the supplier and his purchaser will have no effect on liability for negligence to persons not in privity. Even the broadest type of disclaimers of warranties and of liability for negligence will protect the supplier only from claims of injury to the purchaser and his property. They cannot be relied upon as a solution to the problem of the potential large-scale damages for which atomic energy suppliers may be held liable. They may, however, considerably reduce economic losses in those cases where the negligence caused minimal injuries to those not bound by the disclaimer. For example, if a defective control rod causes a reactor melt-down and if all radiation is contained within the building, the liability of the supplier who has the protection of disclaimers will be limited to satisfying the claims of persons irradiated within the building. It will not include the reactor loss. Therefore, the usefulness of disclaimers in the atomic energy industry should not be minimized, provided purchasers will accept the products on the specified terms and conditions.

4. Strict Liability

a. Common Law

It may be argued, and, we believe, quite effectively, that the extension of negligence concepts, the liberal use of *res ipsa loquitur,* the greater willingness to submit cases to juries, and the extension of implied warranty doctrines have carried us very close to the application of strict liability rules in the product liability field. However, with one possible exception, the courts have not as yet applied such rules against the product supplier, and the cases still are analyzed in terms of negligence, misrepresentation, or breach of warranty, even though a number of legal writers appear to urge the imposition of strict liability.[161] The one possible exception is the case of *Chapman Chemical Co.* v. *Taylor*[162] in which 2-4-D weedkiller sprayed from an airplane by a farmer drifted three-quarters of a mile and settled on the plaintiff's cotton crop. The defendant was the manufacturer. Testimony indicated that neither the

[161] See *e.g.,* James, *supra* note 18 at 192, 215; Ehrenzweig, Negligence Without Fault (1951).

[162] 215 Ark. 630, 222 S.W.2d 820 (1949).

manufacturer nor the user knew that 2-4-D had a propensity for floating much larger distances than experienced with other agricultural chemicals. Although the case may be analyzed in terms of negligence, the Arkansas Supreme Court, in holding the manufacturer liable, suggested that strict liability rules applied to the manufacturer by stating:

> We do not think the Chemical Company excused itself from liability by the mere showing that it was unaware of the peculiar carrying quality of the dust it was selling. Ordinary care required that it should know in view of the dangerous nature of the product it was selling, and it was charged with the knowledge which tests would have revealed. The case is therefore one in which the rule of strict liability should be applied.[163]

If other courts apply strict liability rules when dangerous products are involved, many atomic energy suppliers will be faced with potential liabilities that might not exist if only negligence concepts were applied. On the other hand, strict liability rules would assist injured persons in overcoming the difficulties of proving negligence in the highly technical atomic energy field. These difficulties may lead the courts to broaden the application of strict liability in atomic energy cases so that eventually liability in conjunction with any dangerous product may well be established under strict liability doctrines.[164]

b. Under Statutes

Statutes may also be the basis of imposing strict liability in the product liability field or of imposing what amounts to strict liability by the use of presumptions. For example, in many states violation of the pure food and drug laws gives rise to a civil action for damages, and it is not necessary to allege and prove specific negligence or knowledge on the part of the maker or seller.[165] Under such circumstances the basis of liability may be characterized as strict. Also, violation of statutory restrictions is treated as negligence *per se* by some courts while others treat it as creating a presumption of negligence which must be rebutted by the defendant. Only a small minority of courts treat violations of statutes as mere evidence of negligence.[166] Thus, in most jurisdictions

[163] *Id.* at 644. In Gotreaux v. Gary, 94 S.2d 293 (La. 1957), the Supreme Court of Louisiana held the user of 2-4-D liable for damages caused by the drifting of the weedkiller, applying a strict liability doctrine. The manufacturer was not a party to the litigation, however.

[164] See Chapter IV for a discussion of the applicability of strict liability to atomic energy pursuits.

[165] See generally, Prosser, Torts §61, p. 345 (2d ed. 1955).

[166] *Id.* at §34.

statutory violations afford the plaintiff considerable assistance in proving negligence with the result that a type of strict liability may be said to exist in fact. Atomic energy suppliers, therefore, must carefully avoid violations of statutory standards that may be prescribed by the Congress or the state legislatures. Violation of regulations of administrative agencies in most states are apparently treated only as evidence of negligence,[167] but in the atomic energy field the hazards are so unique that perhaps violations of rules of the Atomic Energy Commission or state health agencies may be held to be negligence *per se*. Once again, the atomic energy supplier must exercise utmost care to avoid violations of regulations. The Atomic Energy Act of 1954 gives the Atomic Energy Commission broad rule-making powers to protect the public health and safety [168] and many of the regulations promulgated by the Commission will apply to the activities of atomic energy suppliers.

5. Contractual Indemnification

Because of the magnitude of potential liability of atomic energy product suppliers, there are indications that the suppliers are requiring purchasers to execute sales contracts containing agreements to indemnify and hold the suppliers harmless from any possible liabilities. Such agreements, of course, will afford protection to the supplier only to the extent that the purchaser is able to bear the economic burden, either through insurance or otherwise. If the purchaser is unable to pay the claims of the injured, the supplier must respond in damages to the injured parties. If the federal government has agreed to indemnify the purchaser, the supplier is probably as adequately protected from economic loss as he can expect to be. Furthermore, under the recent governmental indemnity amendments to the Atomic Energy Act, the use of "save harmless" clauses will provide even greater protection to atomic energy suppliers. Therefore, atomic energy suppliers should examine thoroughly the possibilities of indemnity clauses in their sales contracts as a method of shifting the economic loss incurred through a nuclear accident, with the admonition, of course, that indemnity agreements will not insulate the supplier from loss if the purchaser is unable to pay.

6. Conclusion

We have sketched at length the several legal theories under which suppliers of atomic energy products may be held liable for injuries to third

[167] *Ibid.*

[168] Atomic Energy Act of 1954, §161(b).

persons. We feel that it is abundantly clear that, even without further expansions of strict liability doctrines, there are several available legal avenues for imposing liability on atomic energy suppliers. In our society there is a definite trend toward the establishment of enterprise liability in conjunction with the sale of products in our economy. Undoubtedly the major compelling reason for this trend is the fact that the supplier is more likely, than is the injured person, to be able to suffer the economic losses or to take appropriate steps to minimize them. In respect to atomic energy products we can expect a continuation of the trend because of the unusual dangers involved. Therefore, atomic energy suppliers should adopt two courses of action: (1) initiate all necessary and reasonable procedures to assure that their products are incapable of becoming the cause of radiation injuries and (2) take all expedient legal steps either to avoid the imposition of liability or to shift possible economic losses by taking advantage of insurance and other contractual arrangements.

B. Liability of Building Contractors

Persons who design or construct fixtures and buildings expose themselves to liability for injuries to third persons at least during the construction period and possibly thereafter. In respect to atomic energy, the problems of liability during construction of an atomic energy facility are no different than those encountered in respect to any other building activity. Hence they will not be discussed herein. However, we are concerned with liability problems arising after the building contractor of an atomic energy facility has completed performance of his contract. Perhaps these problems can best be brought into focus through the use of hypothetical fact situations. Suppose *X*, a building contractor, builds a reactor building designed by *A* and supposed to be leakproof in case of a reactor mishap. If a reactor accident occurs and radioactive gases leak into the environment causing injuries to third persons, is *X* liable if he followed *A*'s design? Would *X* be liable if he knew that *A*'s design was improper? Would *X* be liable if during construction he made minor variations in the design? Would *X* be liable if the owner accepted knowing of the changes by *X*? Would *X* be liable to third persons if he warned the owner that the design was faulty or that the construction should be inspected periodically? It will be noted that these questions are substantially the same as those we have already considered in the product liability field. The major difference here is that we are dealing with a product which is likely to be large and stationary so that it is treated as real property rather than personalty.

The general rule in the United States appears to be that building contractors are not liable to third parties who may be injured as a result of the contractor's negligence after completion and acceptance of the construction by the owner.[169] Among the various reasons expounded by the courts for the rule are (1) lack of contractual privity between the parties, (2) the owner's intervening negligence as the proximate cause of the injury, (3) lack of foreseeability of injury by the contractor, (4) lack of control by the contractor over the design, and (5) lack of control after completion of the work which prevents the contractor from correcting the defects.[170] It will be noted that most of these reasons no longer have any application in the product liability field although they were once employed to restrict the liability of manufacturers of chattels.

As in the case of the rule of non-liability for defects in chattels supplied by a party not in privity, exceptions have in recent years been made to the general rule in the case of contractors. Thus, where the completed work is turned over to the owner in a condition so negligently defective as to be imminently dangerous to third persons, recovery has been allowed.[171] In *Hale* v. *Depaoli*[172] the builder of a house was held liable for injuries sustained by the daughter of a tenant, when a railing which had been installed eighteen years previously gave way and the child was injured in a fall. An examination of the railing showed that nails too weak for safety had been used. The opinion referred to the doctrine of *MacPherson* v. *Buick Motor Company*[173] as supporting authority, despite the fact that that case concerned only a defective chattel. The court stated that the general rule was one of non-liability, and then proceeded to establish a significant exception, stating first, that when an article is such as to place life and limb in peril when negligently made, it then becomes a "thing of danger," and is subject to a rule of liability under the MacPherson doctrine; and, second, that when the article is of an abnormally dangerous and noxious nature, the rule against liability must give way, even in cases of defects in construction

[169] For an extensive collection of the cases, see Annotation, "Negligence of building or construction contractor as ground of liability upon his part for injury or damage to third person occurring after completion and acceptance of the work," 13 A.L.R.2d 191 (1950).

[173] *Supra* note 20.

or design of structures on land. This has, indeed, great significance for atomic energy industry, because it may herald a blanket application of the rule of liability to third parties against the builders of atomic installations.

While it is commonplace to find general statements in nearly all of the opinions to the effect that the rule is still one of non-liability to third parties, even aside from the widening exceptions, some cases have boldly obliterated all distinctions between chattels and realty and have adopted identical rules of liability both for contractors and suppliers of chattels.

Two recent decisions are likely to figure prominently in cases dealing with the failure of nuclear energy structures and the liability of their constructors or designers. In 1944 a cyclindrical tank, designed, constructed, and installed by the Pittsburgh-Des Moines Steel Company for the purpose of storing liquefied gas, exploded. Many persons were killed or injured and much property damage ensued. Over a hundred claims were filed against the defendant. Two test cases were tried, one in the federal and the other in the Pennsylvania state court. In each case the appellate courts expressly extended the doctrine of manufacturers liability to third parties to cases involving structures.

The federal decision, *Moran* v. *Pittsburgh-Des Moines Steel Company*,[174] was the first one rendered. The plaintiff's decedent, Moran, was an employee of the East Ohio Company, an operating public utility engaged in selling natural gas for both industrial and consumer use in the City of Cleveland. To meet the problem of storing the gas so as to be able to meet the consumer demand, which fluctuated according to the seasons of the year, a plan was worked out whereby the gas was liquefied by subjecting it to temperatures 260° below zero F. The condensation in volume attained by liquefying the gas was so great that 600 cubic feet of natural gas became one cubic foot of liquid gas. The gas remained liquid as long as the temperature was kept at the extremely low level. To contain the liquid gas and to keep it at the low temperature required, steel tanks were placed within outer tanks with cork insulation between them, somewhat like the principle of a thermos bottle. The defendants built three of these tanks and experience with them proved satisfactory. Increased demand for gas led East Ohio to seek further storage space. The defendants contracted to build a new tank with twice the storage space of those first installed. The new tank was cylindrical in design (rather than spherical as the earlier tanks had been) and was completed and installed in May 1943. Thirteen months later it exploded.

[174] 166 F.2d 908 (1948).

The plaintiff presented two alternative theories of recovery. One called for application of the doctrine of strict liability under Ohio law.[175] However, because the structure was not under the control of the defendant at the time of the explosion, the court held that the doctrine of strict liability was not applicable. The second theory was negligence, and the negligence alleged was that the defendants had installed a tank of improper design, made of inferior materials. Conflicting evidence on these subjects was adduced at the trial. The trial court refused to let the case go to the jury and entered an involuntary non-suit. In reversing this action of the trial court, Judge Goodrich, of the Circuit Court of Appeals, stated:

> The second theory of responsibility which the plaintiff urges against the defendants is that the defendants were negligent in the plans for the structure and materials used therein. Before we outline the plaintiff's allegations with regard to negligence there is a legal question to be met. Assume, for the moment, that the plaintiff has alleged and shown negligence on the part of the defendants in planning and erecting the structure. Does their responsibility extend to harm suffered by one in the position of the plaintiff after the structure has been turned over to the purchaser, East Ohio? . . .
>
> The old rule was that the manufacturer of a chattel was not responsible for injuries to others than his immediate vendee. Exceptions grew up to the rule and the whole matter received clarification by the New York Court of Appeals, through Judge Cardozo, in what is now the leading case of Mac Pherson v. Buick Motor Co. This decision puts responsibility for an injury to one operating the car on one who negligently manufactures a part of an automobile, and it is fair to call the decision a landmark in tort law. An examination of the Ohio authorities shows clearly, we think, that the principles upon which MacPherson v. Buick Motor Co. was decided are part of the law of Ohio. They are, likewise, generally, though not universally, accepted in modern law and are adopted in the Restatement of Torts.[176]

Recognizing that the doctrine of *MacPherson* v. *Buick Motor Company* in itself was not enough to sustain the position of the plaintiff, the court went on to explain the development of that doctrine in Ohio:

> We need to find that those courts have taken, or would take, one step more and possibly two. The first step is the manu-

[175] Although the case was tried in the Pennsylvania district the *lex loci delicti* was applicable.

[176] *Id.* at 914-915.

> facturer's or supplier's responsibility, not merely to the ultimate consumer of the article, but to a person in the vicinity of its use who is injured by the manufacturer's lack of due care. This extension of the MacPherson v. Buick Motor Co. doctrine is indicated in the Restatement and is clearly indicated to be the Ohio law in the decision of White Sewing Machine Co. v. Feisel. . . . We have no difficulty, therefore, in finding that the Ohio law imposes liability on a manufacturer, not alone to the ultimate consumer, but to one who might reasonably have been expected to be in the vicinity of the chattel's use.[177]

The second step to which the court alluded was whether or not the doctrine was applicable to cases concerning realty. On this subject Judge Goodrich continued with the statement that:

> We have no doubt that an Ohio court confronted with the question would, in accordance with the development of the law shown in its previous decisions, extend the liability of the manufacturer to negligence involved in building a structure even though that structure was affixed on another's land.[178]

Thus the MacPherson doctrine was extended to impose liability for injuries to third parties other than the purchasers or ultimate users injured as a result of negligence in the construction of a structure usually denominated as realty under property law rules.

The companion case, *Foley* v. *Pittsburgh-Des Moines Steel Co.*,[179] reached the same result by applying the same legal theories. There the trial court had permitted the case to go to the jury on the negligence issue, but when the jury returned a verdict for the plaintiff, the court granted the defendant's motion for judgment notwithstanding the verdict. The Pennsylvania Supreme Court reversed on the same principles as those applied by the federal court. In so doing the court stated that there was no logical basis for a distinction between chattels and realty "and it would obviously be absurd to hold that a manufacturer would be liable if negligent in building a small, readily movable tank which would undoubtedly be a chattel, but not in building an enormously large and correspondingly more potentially dangerous a one that legalistically was classified as realty." [180]

The older rule of non-liability for injuries caused by structures seems to be uniformly followed in England. In a fairly recent case a builder

[177] *Id.* at 915-916.
[178] *Id.* at 916
[179] 363 Pa. 1 (1949).
[180] *Id.* at 34-35.

was held under no duty, either to a future purchaser or to persons who come to live in the house, to take care that it is well constructed and safe. In *Bottomley* v. *Bannister* [181] a boiler had been installed which was heated by a gas burner. No flue was provided to carry the gas outside, and the occupants, husband and wife, were killed by the poisonous gas. The court found negligence, but since the case involved the installation of a structure on realty, the court held the chattel cases inapplicable and recovery was denied. *Donoghue* v. *Stevenson,*[182] the English equivalent of the MacPherson case, raised certain doubts as to the validity of the non-liability rule in the case of building contractors, but a later case, *Otto* v. *Bolton and Norris,*[183] expressly differentiated between chattel suppliers and builders and held the old rule still to be in effect. Certain qualifications were made, however, in the *Otto* case, which although mere dicta may forecast a weakening of the rule of non-liability even in Britain. The court speculated on the result if the rule of liability as stated in the *Stevenson* case should be applied to a case of negligent construction of realty if the defect was not discoverable by the purchaser on a careful inspection. It was the opinion of the court that the *Stevenson* case opened the door to possible liability to third parties when no inspection by the occupant was to be expected or possible. This reasoning could expose the designers and builders of atomic energy installations in England to liability to third parties, if the defect in the construction or design is so hidden that reasonable inspection would not disclose it.

The similarity between the explosion of pressurized gas in steel tanks and the effect of loss of control of nuclear reactors is too clear to escape the notice of the courts in the United States if the issue of liability of a builder of atomic energy installations should ever arise. Even some of the language used in the opinion of the *Moran* case is suggestive of the likely results if a "burn up" of a nuclear reactor should occur. The court noted that the plant was a novel experiment and a "poignant episode in the development of the kind of bold and ingenious engineering for which Americans have become famous," [184] a comment which is particularly apropos in respect to nuclear reactors. Although technically the *Moran* and *Foley* cases could be limited in their future application, the logic of the cases is compelling and can be viewed as the culmination of the slow process of equalization between the cases of suppliers of chattels and those involving builders of structures on land.

[181] (1932) 1 K. B. 458.
[182] (1932) A. C. 562.
[183] (1936) 2 K. B. 46.
[184] Moran v. Pittsburgh-Des Moines Steel Co., 166 F.2d 908 at 911 (1948).

Therefore, these decisions may well represent the law to be applied to atomic energy enterprise with respect to the liability of designers and builders of nuclear installations. If this should be the future development of the law, designers and contractors for real property structures will be held liable under doctrines comparable to those now applied to suppliers of chattels with similar results.

C. Protection Afforded Supplier Under the Indemnification Provisions of the Atomic Energy Act

In 1957 the Atomic Energy Act was amended to place a limitation upon the total public liability of atomic energy entrepreneurs and to provide for governmental indemnification.[185] These provisions, which were discussed in detail in Chapter III, are specifically designed to provide protection for suppliers of chattels, designers, and building contractors whose negligence may possibly result in a radiation accident. The significant provision is the definition of "person indemnified," which reads:

> The term "person indemnified" means the person with whom an indemity agreement is excuted and any other person who may be liable for public liability.

In its report, the Joint Committee on Atomic Energy indicated the applicability of the indemnification provisions to suppliers of chattels by stating:

> The definition "person indemnified" means more than just the person with whom the indemnity agreement is executed. In the case of license this agreement will be executed with the licensee. Where the Commission and a contractor decide to take advantage of the provisions of this act, an indemnity agreement will be executed with the prime contractor. The phrase "person indemnified" also covers any other persons who may be liable. For a licensee for a reactor, this would mean in addition to the licensee that the indemnification extends to such persons as the subcontractors of the licensee, including those responsible for the design and construction of the reactor and the supplying of parts. However, it is not meant to be limited solely to those who may be found liable due to their contractual relationship with the licensee. In the hearings, the question of protecting the public was raised where some unusual incident, such as negligence in maintaining an airplane motor, should cause an airplane to crash into a reactor and thereby cause damage to the public. Under this bill the public is protected and the airplane company can also

[185] Public Law 85-256, Act of Sept. 2, 1957.

> take advantage of the indemnification and other proceedings. The proposed AEC limitation to those in privity with the licensee was reconsidered by the Commission, and the Commission decided to accept the premise of the original bills which would make the person indemnified any person who might be found liable, regardless of the contractual relation.[186]

The sweeping nature of the indemnification and limitation of liability provisions removes the major hazards of potential liability from suppliers of goods and services for atomic energy industry in that financial protection is required for reactor installations. However, in respect to certain licenses, namely those for domestic distribution of special nuclear material, source material, and byproduct material, the Commission does not have to require financial protection. If the financial protection is not required, an indemnification agreement by the Atomic Energy Commission is also not required. Therefore, suppliers of goods and services may not be protected under the federal legislation in respect to some radiation injuries. However, financial protection will probably always be imposed by the Commission as a condition of a license wherever the hazard is substantial. If the hazard is not unusual, the suppliers should be able to obtain satisfactory private insurance coverage or indemnification agreements from their customers. It should be noted, however, that the existence of federal indemnification may have the effect of broadening present liability concepts in the law and these concepts may be carried over eventually into other product liability cases not involving atomic energy activities.

Although the indemnification provisions of the Atomic Energy Act cover the major areas of liability which are of deep concern to atomic energy suppliers, three limitations in the effectiveness of the indemnification provisions warrant attention. First, the definition of "public liability" does not include liability for damage to property "at the site and used in connection with the activity where the nuclear incident occurs." Since reactor installations are very costly, product suppliers will be faced with the potentialities of liability in tremendous sums if the purchaser can recover for property damage under theories of negligence, warranty, or strict liability. Therefore, suppliers should continue to obtain indemnity agreements from their purchasers wherever possible. The second limitation arises out of the definition of "nuclear incident" which is limited to "any occurrence within the United States." If a supplier furnishes his products to purchasers for use in other

[186] H. Rep. 435, 85th Cong., 1st Sess. 17 (1957).

countries or upon the high seas, and injuries occur outside the United States for which the supplier may be held liable, the provisions of the Atomic Energy Act will afford no relief.[187] Therefore, if atomic energy suppliers are engaged in sales of products to be used outside the United States, potential liability must be examined with reference to the laws of the foreign nations and the law of the high seas. A third limitation on the effectiveness of the indemnification provisions may arise whenever the scope of the financial protection required and obtainable through private insurance is less than the scope of possible public liability. Under the Atomic Energy Act the indemnification provisions do not operate unless the public liability is "in excess of the level of financial protection required of the licensee." [188] Therefore, if the private insurance arrangements of the licensee have a shorter limitations period or if they do not provide coverage for certain types of injury, the supplier who may be liable under theories of strict liability, negligence, or warranty still faces the possibility of substantial liability.

Although these limitations on the protection afforded by the indemnification provisions may affect some suppliers in certain phases of their activities, generally the Atomic Energy Act of 1954, as amended, has created a favorable climate for suppliers to atomic energy industry. Unless some such indemnification were available, atomic energy suppliers would be forced to accept highly unusual monetary risks and entrance into the supply industry would be discouraged. As further studies are made in connection with foreign sales and activities, it is entirely possible that other governments will provide similar protection for atomic energy product manufacturers or an expansion of the indemnification provisions may be enacted by Congress. The Atomic Energy Commission and the Joint Committee are continually studying the problems and any severe legal restraints on the development of peacetime uses of atomic energy will undoubtedly be corrected.

[187] Legislation providing indemnity protection for the proposed nuclear-powered merchant shop, the U.S. Savannah, has been approved by the Senate Committee on Interstate and Foreign Commerce, and has been transmitted to the Joint Committee on Atomic Energy for further study. S. 3106, 85th Cong., 2d Sess. (1958). Suppliers are expressly indemnified if the amendments recommended by the Maritime Commission are included in the proposed legislation. See BNA Atomic Industry Reporter 54:17 (1958).

PART II

WORKMEN'S COMPENSATION AND RADIATION INJURIES

WORKMEN'S COMPENSATION AND RADIATION INJURIES*

I. INTRODUCTION

Because of the extensive harmful potential of the materials and techniques involved in utilizing atomic energy and radioactive materials, radiation injuries to employees must be avoided wherever possible. To this end, atomic industry may be required to follow a number of unique personnel procedures not encountered in other industries. For example, consideration must be given to revision of the work week if radiation exposures become too hazardous for normal periods of time. Employers must also ascertain the significance of the age and sex of employees in relation to potential radiation exposures. It is generally believed that, due to rapid rate of development, persons under eighteen should not be employed in work requiring exposure to ionizing radiation. Moreover, the idea has been advanced, although it has not received any great degree of acceptance, that persons over forty-five may be able to tolerate doses of radiation double those considered safe for younger adults. Still again, pregnant women should not be exposed because prenatal sensitivity to radiation is high. These and other related factors obviously must be evaluated by employers in the assignment of work and personnel.

Once employees have been assigned to jobs associated with radiation, suitable monitoring apparatus is essential. Any employee apt to be working in locations where he will be exposed to radiation should be issued a personal monitoring device, such as a film badge or a pocket dosimeter, to measure the radiation received by him. Special problems arise in connection with the handling of radioactive equipment and materials. Remote control devices have been developed which permit handling of objects by means of tongs, mechanical hands, etc., while the operator remains behind suitable shielding. Specialized tools and methods have been devised to permit radioactive liquids to be handled; pipetting, filtering, precipitation, and the like can thus be carried out

* The authors wish to acknowledge the research assistance in the preparation of this manuscript of Rinaldo L. Bianchi, Graduate Research Assistant, University of Michigan Law School; Law Degree, University of Pisa (Italy), 1947; A.B., Wayne University, 1951; A.M., Wayne University, 1952; J.D., University of Michigan, 1955; and John W. Birchall, Graduate Research Assistant, University of Michigan Law School; A.B., University of Michigan, 1949; LL.B., University of Michigan, 1952.

with minimum hazards to the operator. Employers must provide the necessary equipment and facilities to avoid or to minimize radiation exposure.

From the point of view of protecting employees from radiation hazards the waste disposal problem is also highly significant. Not only must wastes be disposed of at no risk to the surrounding area, but also methods for accomplishing this must be devised with a view to protecting employees while handling the wastes or while working in the vicinity of disposal sites or along the routes selected for transportation of wastes. All areas involved in the disposal process will require regular monitoring to assure that the level of radiation is not such as to imperil employees. Wastes accumulating in work areas must be stored in suitably shielded containers.

An overriding consideration in this field is that of supervision and training. Employees will require constant supervision to make certain that they understand and will take the necessary precautions. Specific persons must be assigned the responsibility for radiation protection measures, including checking the efficiency of protective devices as well as detecting, with the use of the monitoring apparatus, the possible presence of contamination.

Since the effects of radioactivity on the human body are cumulative, at least when irradiations of a certain intensity occur and possibly also regardless of the minuteness of the amounts received, it will become necessary to maintain permanent records for the workers concerned, so that their exposures may be adequately and accurately followed throughout the course of their various employments. Just as radiation hazards must be given a long-term evaluation, so too will long-term personnel records become an integral part of operations in the atomic industry. Complete medical supervision, covering not only the period of employment but also the prior medical history, will permit detection of conditions rendering a person unsuitable for work in a radioactive environment. Such evidences may be provided by examinations of skin, bone, gonad, blood, and lung conditions, and complete records should be kept as a matter of personnel routine.

Although the first line of defense for atomic industry will be the avoidance of radiation injuries by utilization of adequate radiation safety measures, we must recognize that despite these efforts some such injuries will be inflicted. For industrial accidents, in general, workmen's compensation has been evolved as the method of supplying economic protection to employees. The existing workmen's compensation statutes

warrant re-examination to determine their adequacy in dealing with the new hazards created by the advent of industrial application of atomic energy. In identifying and discussing the problems likely to be raised by specific provisions of the workmen's compensation laws in relation to atomic energy injuries, it will be helpful to review briefly the several types of statutes providing relief for injuries which might occur in atomic industry. It is, of course, to be expected that the bulk of existing legislative provisions in this field can be adapted to radiation injuries without undue stress and will serve substantially the same policy ends as effectively as under present conditions. Atomic industry will doubtlessly have its share of typical industrial accidents whose nature and circumstances will not present any unusual difficulties. The fact remains, however, that the potential industrial applications of nuclear energy may precipitate situations of unusually complicated and unexpected character and of sufficient frequency to warrant concern over the adequacy of certain aspects of present day compensation legislation. The following review has the purpose of presenting a selective illustration of areas of workmen's compensation law that may require amendment so that we may not be totally unprepared for the proper disposition of industrial radiation injury cases.

II. SCOPE OF COVERAGE UNDER EXISTING LAWS

Workmen's compensation legislation, now enacted in every state, imposes, in effect, strict liability for certain injuries arising out of the employment relationship. Under workmen's compensation the losses are distributed throughout the industry by a liability insurance system with the theory being that the consumer should eventually bear the financial burden for injuries to employees. As we have already seen in connection with common law tort liability rules, the peculiarities of atomic energy and radiation injuries raise several new legal problems. An examination of selective workmen's compensation acts from the standpoint of atomic energy and radiation injuries also, as we shall see, uncovers new problems that must be resolved in the atomic age.

Since our discussion will be limited mainly to the possibilities of recovery for radiation injuries under existing compensation statutes, it may be helpful to define the several types of radiation injuries with which we are concerned primarily. For purposes of convenience, four types of radiation injuries warrant attention. First, there is the "immediate radiation injury" which is occasioned by a harmful exposure to radiation, fixed in time, and which results in radiation sickness or

death, coterminously or shortly after exposure. Second, there is the "delayed radiation injury" for which the cause (the harmful exposure) can be fixed in time but in which the effect develops over a period of time, or, conversely, the effect may be fixed in time but the harmful exposure occurs over an extended period. Third, there is the "cumulative radiation injury" where the cause occurs over an extended period and the effect also gradually develops. Fourth, there are the "distinctive radiation injuries" which have unusual effects, not normally encountered in other industrial pursuits, such as shortened life span, temporary or permanent sterility, probable or possible genetic damage, or increased susceptibility to disease, and which may occur as a result of any of the three other types of injury.

Under most workmen's compensation acts the statutory language covers two broad types of injuries; namely (1) "injuries by accident" "arising out of and in the course of employment" and (2) "occupational diseases." To be compensable, any injury suffered by an employee subject to the act must come within the definitions established for these two general categories of injuries by the statutes. Therefore, in respect to radiation injuries, we will first examine the extent to which current statutory provisions provide coverage. Secondly, problems arising out of successive injuries and successive exposures culminating in occupational diseases will be explored. Thereafter, the statutory provisions relating to the bases of compensation awards will be examined to ascertain their adequacy when applied to radiation injuries.

A. General Accidental Injury Coverage

1. Injury by Accident

Nearly all compensation statutes require that an injury be "accidental" to be compensable. "Accidental injury" or "injury by accident" is not defined in the statutes, with the result that judicial construction of these terms has been essential. In construing these terms the courts have universally required an element of unexpectedness, and most courts have added the further requirement that an accidental injury must be reasonably traceable to a definite time, place, and occasion or cause. In respect to "immediate radiation injuries," where both the cause and effect can be ascertained immediately, there appears to be no doubt that the statutory language is sufficiently broad to provide coverage. However, in applying traditional court tests difficulties are encountered in respect to the "delayed radiation injuries." In specific non-radiation

cases, the courts have reached divergent results in attempting to apply definitions of "accidental" to similar injuries. The common but troublesome issue is the question of whether the injury must have resulted from an unexpected and traceable external cause, or, in the alternative, whether it is sufficient that the injury was sudden and unusual though the immediate cause was not an external and unexpected event. The resolution of this question, is of course, crucial if the radiation injury is not compensable as an occupational disease.

In respect to "delayed radiation injuries," the cases of routine exposure, either to the elements or to conditions peculiar to the employee's environment while at work, provide some analogies. Many courts have distinguished between abrupt results on the one hand and subtle physiological disturbances on the other. For example, prolonged exposure to either heat or cold, resulting in heat prostration or frostbite respectively, has been held by most courts to give rise to an accidental and compensable injury,[1] though some courts stress the need for the existence of unusual conditions as contrasted with the usual exposure of the general public. A minority of courts have, however, refused relief on the ground that in certain jobs there is nothing unusual in being exposed to heat or cold whether in greater or lesser degree in relation to the normal exposure of the public, and thus the injury is held not to be a sudden and unexpected accident, and no compensation is allowed.[2] In atomic industry comparable cases may take the form of acute radiation sickness caused not by sudden excessive irradiation, but by the effect of cumulative exposures normal for the kind of employment. If the degree of usual exposure in the particular employment test should be imposed when dealing with immediately discernible radiation injuries, compensation may be unavailable. Such a result, however, may be seriously questioned, and it is doubtful that even courts following the minority rule would apply the same test in radiation cases.

In contrast to cases of immediate, tangible injury, cases involving routine exposures to the elements or to artificial conditions causing a latent disease or the formation of degenerative conditions in the organs or tissues, have found the courts much more reluctant to find an "accident."

[1] See citations classified by state in 1 Larson, The Law of Workmen's Compensation §38.40, n. 20 (1952).

[2] Beadle v. Bethlehem Steel Co., 172 Md. 541, 193 Atl. 240 (1937) (heat stroke suffered by employees whose duties were to remove heavy pieces of metal from furnace with temperature of 1300 degrees); Savage v. City of Pontiac, 214 Mich. 626, 183 N.W. 798 (1921) (freezing suffered by fireman whose wet clothes froze on him and whose neck was covered by ice).

When an employee incurs a disease from exposure to heat, cold, dampness, fumes, or dust, and the disease is not covered as an occupational disease under the statute, a majority of courts deny compensation for lack of accidental character of the injury.[3] The rule is tempered sometimes by the implication that if the exposure is of unusual occurrence for persons engaged in the victim's type of work, the disease can be held accidental.

A typical case illustrating the chief objection to the recognition as accidental of slowly developing injuries from exposure to the weather or to noxious substances, and indicating that the difficulty springs solely from the traditional definition of "accident," is *Deyo* v. *Village of Piermont.*[4] In that case a policeman's arthritis was aggravated from standing for hours in wet and freezing weather to direct traffic. The court denied compensation, saying: ". . . [W]e do not think the interpretation of what constitutes an 'accident' should be extended to fringe cases such as this, where there is no single incident which would be regarded as an accident by the common man. There must be some element of suddenness—something catastrophic—and some incident immediately noticeable." [5]

A minority of courts hold compensable, as accidental, slowly developing injuries that result from greater exposure than that to which the general public is submitted even if the exposure is a matter of routine in the victim's type of employment. The fact that the exposure is peculiar to the employment is often a corroborative factor in favor of compensability for courts following this approach.[6]

Any "delayed radiation injury" not compensable as an occupational

[3] Powell v. Taylor, 177 Pa. Super. 647, 112 A. 2d 415 (1955) (carpenter employed for over 3 years during which he used dusty and mouldy lumber which required brushing and scraping before use, breathed and inhaled this material and became totally disabled and afflicted with moniliasis. Medical expert was unable to state whether a single contact with fungus spores or exposure over a period of time had caused the disease. Held: compensation denied since neither an accident was shown nor a scheduled occupational disease); Davis v. Sunshine Mining Co., 73 Idaho 94, 245 P. 2d 822 (1952) (miner's tuberculosis from neither unusual conditions nor fortuitous event); Hasbrouck v. Goodyear Tire and Rubber Co. (Ohio, Ct. Com. Pleas) 99 N.E. 2d 329 (1951) (victim overcome by fumes while mixing vat of alcohol and benzol; recovery denied for lack of suddenness and unforeseeability and thus of accidental nature of injury); see also citations by state in 1 Larson, *supra* note 1 at §38.50, n. 21.

[4] 283 App. Div. 67, 126 N.Y.S. 2d 523 (1953).

[5] *Id.* at 69 and 525.

[6] Black v. Creston Auto Co., 225 Iowa 671, 281 N.W. 189 (1938) (lead poisoning from inhaling poisonous fumes over a period of time); Webb v. New Mexico Pub. Co., 47 N.M. 279, 141 P. 2d 333 (1943) (dermatitis from 6 months' use of irritating soap); see also citations by state in 1 Larson, *supra* note 1 at §38.50, n. 21.

disease would presumably receive similar judicial treatment whenever the injury was in the form of an aggravation of a latent disease or a slowly developing deterioration of tissue or organs. The fact that radiation-caused ailments may include disorders heretofore beyond scientific expectation and of a kind which may not be included within restrictive lists of occupational diseases suggests a reappraisal of policies of the law in this area for atomic energy industry.

"Cumulative radiation injuries," not covered as occupational diseases under the statutes, raise similar problems of coverage under existing legislation. The chief obstacle under many American statutes to compensability of gradual injuries of a clearly occupational nature consists in the difficulty experienced in determining the exact time of their occurrence. This is essential for the purpose of satisfying the requirement of proving an "injury by accident," which has been generally interpreted as calling for *an* accident and not including cases of slow and often imperceptible deteriorations. When the element of suddenness is totally absent for the reason that neither is the cause of an injury an untoward and unexpected event nor is the result a clear-cut collapse (for example, in a case of heat prostration), compensability has been granted and denied alternately in the same state.

These cases are often difficult to distinguish from the accidental diseases discussed above. They include situations in which protracted exposures result in gradual physical deteriorations or diseases but where both the cause and effect are gradual and span a considerable period of time. Some courts have granted compensation in these cases by assimilating gradual injuries to the traditional conception of "injury by accident," saying that each exposure produced a new trauma and constituted a small accident the repetition of which finally led to a compensable injury.[7] But some of the same courts have denied compensation in other similar cases because of absence of an accident sufficiently definite in time.[8]

Most of the radiation injuries caused by repeated exposures are, of course, of a nature that would qualify for compensation under statutes providing coverage for all occupational diseases, and the problem raised by gradual injuries in the atomic industry can perhaps be solved best by the amendment of compensation statutes where necessary to effect com-

[7] *E.g.*, Pan American Airways v. Willard, 99 F. Supp. 257 (1951) (skin disease from exposure to tropical sun); Batesville White Lime Co. v. Bell, 212 Ark. 23, 205 S.W. 2d 31 (1947) (inhalation of excessive dust for 23 years causing heart injury).

[8] Compare cases listed by jurisdictions in 1 Larson, *supra* note 1, at §39.10, notes 16 and 17.

prehensive occupational disease coverage. Otherwise unexpected gradual radiation injuries would be likely to remain uncompensated and thus produce an incongruity difficult to defend when we realize that constant though minimal and supposedly safe exposures to radioactivity are apt to be routine for employees in atomic industry.

2. "Arising out of and in the Course of Employment"

Another all but universal coverage provision in American compensation statutes is the requirement that the industrial injury must be one "arising out of and in the course of employment." Forty-one states and the Longshoremen's and Harbor Workers' Act [9] use this test. Utah has modified the formula to read "arising out of *or* in the course of the employment." [10] The statutes of North Dakota, Pennsylvania, Texas, and Washington, and the United States Employees' Compensation Act do not contain the "arising out of" portion of the formula.[11] West Virginia requires an injury "resulting from" instead of "arising out of" employment.[12] Wyoming has rejected the entire traditional approach and requires that the injury be "incurred in the employment." [13] Wisconsin has replaced the "course of employment" phrase with the requirement that the employee be injured "while performing service growing out of and incidental to his employment," [14] and the United States Employee's Compensation Act covers injuries "sustained while in the performance of duty." [15]

"Arising out of and in the course of employment" is normally said to indicate two separate tests which must be met before an injury may be held compensable. An injury is said to arise out of the employment when a causal connection between the conditions of work and the resulting harm is apparent to the rational mind. While restrictive interpretations of this phrase in earlier years interposed additional obstacles to compensability (such as the doctrine that an added peril resulting from the conduct of the worker himself excluded the requisite causal connection and the view that a hazard common to all mankind did not

satisfy the "arising out of" test), the trend of recent decisions is to the effect that it is enough if the employment was a contributing cause. Generally whether the employment is a sufficient contributing factor becomes a simple question of proof not subject to the ordinary tests used to determine the presence of proximate cause in tort cases. Insofar as it relates to the problems confronting atomic energy industry, this phase of the law will be considered when we deal with the modes of establishing a causal relation between the work and the injury or disease.

The part of the coverage formula which may work a hardship in certain radiation cases is the requirement that an injury arise "in the course of employment." This phrase implies that to be compensable, an accident must overtake an employee during working hours, or at a place where he is reasonably expected to be while carrying on an activity incidental to his job. Generally the courts have held that manifestation of the injury as well as origin must occur during the course of employment. This approach is likely to be unsatisfactory in atomic industry for the reason that the effects of an overexposure may make themselves felt hours after the workman leaves his place of employment.

There are at least two judicial decisions which, when considered in relation to comparable radiation injury situations, illustrate the awkward solutions which the present coverage formula may inspire. In *American Motorists Insurance Co.* v. *Steel*[16] an employee whose job required the drilling of holes in metal suffered a severe injury when sharp shavings, which had lodged in his eyebrows, fell into his eye. The accident took place about fifteen minutes after the end of working hours while the workman was on his way home. Because the harmful result did not occur "during the course of employment," the injury was held non-compensable. Again in *Gill* v. *Belmar Construction Company*[17] the workman had negligently left a dynamite cap in his pocket and was badly injured when it exploded the next morning while he was dressing in his hotel room. The time and place of the accident not coinciding with the employment, compensation was denied.

It is not difficult to imagine situations in atomic industry in which delayed-action injuries will occur. Indeed, without resorting to imagination, it is already possible to advance hypotheses based on actual events as reported in the press. For example, a worker on a construction project in Connecticut innocently carried away in his trousers pocket a capsule of cobalt 60 which was being used on the job for radiography of

[16] (Tex. App.) 229 S.W. 2d 386 (1950).
[17] 226 App. Div. 616, 236 N.Y. Supp. 379 (1929).

welds. The workman was interested in using the long string from which the small, one and three-eights inch cylinder of deadly cobalt was hanging, and he was unaware of the radioactive nature of the contents. After a general alarm had been given and a thorough search started, the cobalt was found in the glove compartment of the worker's car. Final information on the physical effect of this episode is lacking, but the construction worker is suing for $200,000 damages. If he and perhaps some of his companions in his car suffered radiation injuries, the rule of the above two cases would probably exclude compensability.

3. Summary

Existing statutory provisions relating to accidental injuries appear to cover adequately "immediate radiation injuries." However, in respect to "delayed radiation injuries" or "cumulative radiation injuries," statutory language requiring an "accident" probably cannot be relied upon, except in a minority of courts, as a basis for awarding compensation. Whenever the cause of an injury occurs over a prolonged period of time or whenever the injury develops at a remote time, the courts have often denied compensation because no "accident" can be established. Where both cause and effect span lengthy time periods, even the more liberal courts have found considerable difficulty in awarding compensation. Therefore, for many radiation injuries, the general statutory provisions relating to accidental injuries do not provide satisfactory coverage if it is deemed desirable that radiation injuries be afforded the same treatment as other types of industrial injuries. However, satisfactory compensation for radiation injuries may be available under occupational disease coverage provisions of the workmen's compensation acts.

B. Occupational Disease Coverage

Although they may occur occasionally, radiation "accidents" in all probability will not constitute the major source of atomic energy injuries. Of greater concern are the "cumulative radiation injuries" caused by chronic exposure, such as cataract, cancer, leukemia, leucopenia, bone necrosis, sterility, genetic mutations, shortened life span, epilation, or injury to any of the various organs within the body. While all these injuries can be caused by a single large dose of radiation, as in the case of an accident, most of them can also be caused by repeated exposures to low amounts of radioactivity.

Because of the manner in which these injuries develop, they resemble those injuries which have typically been classified as occupational dis-

eases under workmen's compensation statutes. Occupational diseases, which ordinarily develop gradually, generally lack the character of unexpectedness typical of industrial accidents. They are recognized as a hazard inherent in continued exposure under the peculiar conditions of the specific employment. The statutes which provide compensation for occupational diseases, either by defining "injury by accident" to include such diseases or by separate specific coverage, must be examined in each state to determine their effectiveness as a means of providing compensation for "delayed" or "cumulative" radiation injuries for which compensation would not be awarded under the "accidental" injury provisions.

Some of the statutes literally provide compensation for "all occupational diseases" and leave it to industrial commissions or the courts to decide which diseases fit within the terminology. Others provide full coverage by including within the scope of "injury" all known or even unknown diseases which result from employment.[18] A variation of this type of legislation is found in statutes which include a list of diseases for which compensation is provided, this device being known as "the schedule type of coverage." The lists may be exclusive or non-exclusive. Full coverage is achieved by those statutes which adopt a definite list of diseases and then add a general clause which usually reads: "any and all occupational diseases" or "all other occupational diseases." [19]

A number of states, not having full coverage for occupational diseases, have adopted statutes providing coverage, specifically and apparently exclusively, for some radiation diseases.[20] The statutes of six states that provide for occupational disease coverage by use of a schedule do not cover radiation-induced diseases expressly, and it is doubtful

[18] Alaska, Arkansas, California, Connecticut, Delaware, District of Columbia, Florida, Hawaii, Illinois, Indiana, Maryland, Massachusetts, Michigan, Minnesota, Missouri, Nebraska, New Jersey, North Dakota, Oregon, South Carolina, Virginia (alternative coverage), Washington, West Virginia, Wisconsin. Under federal legislation civil employees as well as workers falling under the Longshoremen's Act are similarly covered.

[19] New York, Ohio, Nevada, Rhode Island, and Utah.

[20] Arizona (ulceration of skin or destruction of tissue due to roentgen rays or radium emanations), Colorado (poisoning or disease caused by exposure to radioactive materials, substances, or machines, or fissionable materials), Georgia, Kansas, Louisiana, Oklahoma, Texas, Vermont (diseased condition caused by exposure to X-rays or radioactive substances), Idaho (radium poisoning or disability due to radioactive properties of substances or to roentgen rays), New Mexico (all diseases directly traceable to fissionable materials or radioactive materials), North Carolina (radium poisoning or injury by X-rays), South Dakota (ulceration of skin or destruction of tissue due to prolonged exposure to roentgen rays or radium emanations).

whether they can be construed to include such disorders.[21] Two states provide no coverage for occupational diseases.[22]

1. General Coverage

In respect to those statutes providing full coverage by the use of the language "all occupational diseases," it is obvious that anything that can be classified as an occupational disease will be compensable. This, of course, leaves open the question of what constitutes an "occupational disease," so as to come within the meaning of the statute. An occupational disease is generally defined as a disease which is peculiar to a particular industrial process, trade, or occupation and which does not arise from any single occurrence in the employment, but develops gradually.[23]

The problem of defining an occupational disease is one of attempting to draw a distinction between those diseases to which the human race as a whole is constantly subjected, and those diseases which are distinctively connected with the conditions under which the employee works.[24] Consequently, most of the definitions place emphasis upon the causal relationship of the particular disease to the employment.

The occupational disease statute of the state of Illinois defines occupational disease as follows:

> In this act the term "Occupational Disease" means a disease arising out of and in the course of the employment. Ordinary diseases of life to which the general public is exposed outside

[21] Alabama (specified dust diseases such as pneumoconiosis including silicosis, anthraco-tuberculosis, aluminosis, etc.), Iowa (16 specific diseases), Maine (15 specified diseases), Montana (a separate statute provides for payment of $60.00 a month from state funds for workers totally disabled from silicosis if they are residents of the state of 10 years standing), New Hampshire (silicosis and other pulmonary diseases, anthrax, lead poisoning, dermatitis venenata, and diseases caused by inhalation of poisonous gas and fumes), Tennessee (full coverage permissible).

[22] Mississippi and Wyoming.

[23] ". . . an occupational disease is one which is due wholly to causes and conditions which are normal and constantly present and characteristic of the particular occupation; that is, those things which science and industry have not yet learned how to eliminate." Cell v. Yale and Towne Manufacturing Co., 281 Mich. 564, 568, 275 N.W.250 (1937), quoting from Seattle Can Co. v. Dept. of Labor & Industry, 147 Wash. 303, 309, 265 Pac. 739 (1928).

[24] Many of the cases which are used to define occupational disease are cases in which the distinction between an occupational disease and an injury by accident was drawn so as to label the particular injury uncompensable. This occurred in the situation where there was no occupational disease law, and if the particular injury of the employee was labeled as an occupational disease, it could not be compensated as an "injury by accident." Thus in reading cases, it is important to keep in mind the purpose for which the distinction or definition of occupational disease is being made.

> of the employment shall not be compensable, except where the said disease follows as an incident of an occupational disease as defined in this section.
>
> A disease shall be deemed to arise out of the employment, only if there is apparent to the rational mind upon consideration of all the circumstances, a direct causal connection between the conditions under which the work is performed and the occupational disease, and which can be seen to have followed as a natural incident of the work as a result of the exposure occasioned by the nature of the employment and which can be fairly traced to the employment as the proximate cause, and which does not come from a hazard to which workmen would have been equally exposed outside of the employment. The disease must be incidental to the character of the business and not independent of the relation of employer and employee. The disease need not to have been foreseen or expected but after its contraction it must appear to have had its origin in a risk connected with the employment and to have flowed from that source as a rational consequence.[25]

Some state statutes are briefer. For example, the Nebraska statute reads:

> The term "occupational disease" shall mean only a disease which is due to causes and conditions which are characteristic of and peculiar to a particular trade, occupation, process, or employment, and shall exclude all ordinary diseases of life to which the general public are exposed.[26]

An even briefer statute defining "occupational disease" in terms of causal connection is that of the state of Connecticut:

> The words "occupational disease" shall mean a disease peculiar to the occupation in which the employee was engaged and due to causes in excess of the ordinary hazards of employment as such.[27]

In addition, some statutes provide coverage for occupational diseases without providing any definition of what is meant thereby. In these states it has been left to the courts to decide the limitations of the statutory language. The New York court, in *Harman* v. *Republic Aviation Corp.*, was required to define what was meant by the scheduled item "any and all occupational diseases." Expressing itself in terms of causal connection, the court said:

> An ailment does not become an occupational disease simply because it is contracted on the employer's premises. It must be

[25] Ill. Rev. Stat. c. 48, §172.36(d) (1955).
[26] Neb. Rev. Stat. §48-151(3) (1943).
[27] Conn. Gen. Stat. §7416 (1949).

> one which is commonly regarded as natural to, inhering in, and incident and concomitant of, the work in question. There must be a recognizable link between the disease and some distinctive feature of the claimant's job, common to all jobs of that sort. As this court observed in *Matter of Goldberg* v. *954 Marcy Corp.* (276 N.Y. 313, 318-319), an occupational disease is one "which results from the nature of the employment, and by nature is meant * * * conditions to which all employees of a class are subject, and which produce the disease as a natural incident of a particular occupation, and attach to that occupation a hazard which distinguishes it from the usual run of occupations and is in excess of the hazard attending employment in general." [28]

In contrast to the foregoing statutory and judicial definitions of occupational disease emphasizing an "affirmative" showing of the causal relationship between the disease and the job, the state of South Carolina has taken a negative approach. Its statute provides:

> The words *"occupational disease"* mean a disease arising out of and in the course of employment, which is due to hazards in excess of those ordinarily incident to employment and is peculiar to the occupation in which the employee is engaged. A disease shall be deemed an occupational disease only if caused by a hazard recognized as peculiar to a particular trade, process, occupation or employment as a direct result of continuous exposure to the normal working conditions thereof.
>
> No disease shall be deemed an occupational disease when:
>
> (1) It does not result directly and naturally from exposure in this State to the hazards peculiar to the particular employment;
>
> (2) It results from exposure to outside climatic conditions;
>
> (3) It is a contagious disease resulting from exposure to fellow employees or from a hazard to which the workman would have been equally exposed outside of his employment;
>
> (4) It is one of the ordinary diseases of life to which the general public is equally exposed, unless such disease follows as a complication and a natural incident of an occupational disease or unless there is a constant exposure peculiar to the occupation itself which makes such disease a hazard inherent in such occupation;
>
> (5) It is any disease of the cardiac, pulmonary or circulatory system not resulting directly from abnormal external gaseous pressure exerted upon the body or the natural entrance into the body through the skin or natural orifices thereof of foreign organic or inorganic matter under circumstances pe-

[28] 298 N.Y. 285, 288, 82 N.E. 2d 785 (1948).

culiar to the employment and the processes utilized therein or
(6) It is any chronic disease of the skeletal joints.[29]

The basic question is: Do statutes, which theoretically provide full coverage of occupational diseases, adequately cover radiation injuries? As we have seen, the crucial element is the showing of causal connection between a particular disease and the job. We must, then, determine the extent to which causal connection between radiation injuries and the occupations in which they are incurred can be proved. Consider, for example, the diseases of cancer and leukemia. These are diseases to which the general public is exposed, quite apart from employment. They are also diseases which are caused by exposure to radiation. While it has been shown that radiation does cause cancer, the mechanics of this causation have not yet been thoroughly understood. It is impossible, then, for even a medical expert to point to a particular case of cancer and assert with confidence that it was caused by exposure to radiation. The same is true of leukemia. While a higher than normal incidence rate of leukemia can be shown to occur among persons exposed frequently to radiation, such as radiologists, it is still impossible to point to any specific case of leukemia and conclude that it was caused by exposure to radiation. Thus, though we know that exposure to radiation can cause these diseases, it is impossible at present to testify that the occurrence of any of them in any individual employee is traceable to radiation exposure.

It may in fact be easier on the basis of statistics for an employer to disprove causation in radiation cases than for an employee to prove it. For example, to satisfy the causation requirement under the Illinois statute, it is necessary that the disease be one which can be "fairly traced to the employment as the proximate cause, and one which does not come from the hazards to which workmen would have been equally exposed outside of the employment." In respect to the first requirement, would it be sufficient to offer testimony to the effect that, because there is a higher leukemia incidence rate among workers who deal with radiation, the occurrence of a particular case was incident to the employment? To answer affirmatively to this question, would, in effect, make the employer an insurer against the risk of his employees coming down with this particular disease. This would result from the fact that even though the incidence rates themselves show that causes other than radiation produce a majority of the cases, the employer probably will be un-

[29] S.C. Code §72-251 (1952).

able to prove that any particular case of leukemia or cancer was caused by circumstances external to the employment.

The second statutory requirement, that the disease be one which does not come from a "hazard to which workmen would have been equally exposed outside of the employment," presents another troublesome problem of fact. The question is whether the cause of cancer or leukemia can be said to be due to the same "hazard," whether that "hazard" is inside or outside of the employment. From available evidence, it definitely appears that radiation can cause cancer or leukemia. However, the sources of radiation are not confined to those artificially produced in atomic energy plants alone. Everyone is subjected to the radiation that comes from outer space and to the natural radiation caused by the deterioration of the composition of the earth's surface. The amount of such radiation to which a person is subjected varies according to the location. Decomposition of the materials of the earth's surface in some areas is higher than in others, and a person receives more natural radiation from outer space when he is in the higher altitudes. It is very questionable therefore whether cancer or leukemia could be said to be due to a radiation "hazard" to which the workman would not have been equally exposed outside of the employment. The Atomic Energy Commission has pointed out that the average dosage of radiation within its plants is no greater than people generally receive from natural radiation. As more is learned about the nature of these diseases and their causes, it may be disclosed that natural radiation is too low to be a significant factor. It could be true that cancer is caused by subjection to radiation on an "exponential" basis and follows inevitably after exposure to a certain amount of radiation, or that possibly it is caused by a "chance" passage of radiation at any time. At the present time, however, adequate information concerning the significance of natural radiation simply is unavailable. Moreover, X-ray radiation to which people subject themselves voluntarily for medical or other purposes, also must be considered. Such exposure could qualify as a "hazard to which workmen have been equally exposed outside of the employment." Therefore, the problem of proving the causal connection essential to classifying a radiation injury as an occupational disease may prove insuperable.

A recent Illinois case, *City of Chicago* v. *Industrial Commission et al.*,[80] indicates the nature of the proof that probably will be required to show the causal connection in radiation cases where compensation is sought under the occupational disease provisions of the statute. In that

[80] 403 Ill. 105, 85 N.E. 2d 665 (1949).

case, an employee of the city's sewer department died from Weil's disease, a disease commonly transmitted from contact with the excreta of diseased rats. The presence of rats near or around the sewers where the decedent had worked was made to appear in the evidence. In affirming the denial of an award by the Industrial Commission, the court said:

> The evidence in the case at bar clearly falls short of establishing such a causal connection. In its aspect most favorable to plaintiff in error it shows merely that the disease from which the death resulted is commonly transmitted from contact with the droppings of infected rats, and that rats exist in the sewers where decedent worked. There is no evidence that any such rats were diseased or that the decedent came into contact with any rat droppings. A mere possibility of contamination in the course of employment is not sufficient to support an award of compensation. . . . In the case at bar the presence of spirochetes at decedent's place of employment can be inferred only by speculation. This cannot serve as proof of a direct causal connection.[31]

Thus the court required a showing of actual contact with the disease, or the cause of the employee's disease, at the place of employment. The fact that there were rats at the decedent's place of employment and that these rats could have carried the disease was not sufficient. It was necessary to show that there were diseased rats at the place of employment. The court distinguished this case from an earlier one, *Arquin* v. *Industrial Commission*,[32] where the disease had been treated as an injury by accident. In that case, the court held that there was a causal connection where an intern treating meningitis cases in a contagious ward had died from meningitis. The evidence showed that the employee had been in actual contact with the disease in the course of his employment.

Although no court demands absolute certainty in establishing the occupational origin of a disease, the problems of causation are bound to be very serious in atomic energy compensation cases especially because the diseases caused by radioactivity are the same as those originating from other causes. In other types of cases the courts have permitted reasonable inferences drawn from medical testimony of probabilities to justify the finding that certain diseases are occupational in nature. For example, in *Travelers Ins. Co.* v. *Donovan*,[33] the claimant, an employee of the Red Cross, was assigned to duty in Kyoto, Japan, where he contracted tuberculosis. The evidence showed that the incidence rate of

[31] *Id.* at 107-108.
[32] 349 Ill. 220, 181 N.E. 613 (1932).
[33] 125 F. Supp. 261 (1954).

tuberculosis at Kyoto in 1951 was 1040 per 100,000 population, and 1090 per 100,000 population in 1952. This compared with an incidence rate of 220.9 per 100,000 in 1951 and 215.7 per 100,000 for 1952 in the District of Columbia, the employee's residence in the United States. An award made on this basis was affirmed. The court remarked that it was reasonable to conclude that the disease was contracted not only in the course of the employment but also out of the employment, because there was an aggravated risk as a result of work in an area with a high incidence rate of tuberculosis. The chances were five times those in the District of Columbia. Further, the court stated that, although in an action for damages governed by common-law principles the causal relation between the employment and the disease could not be deemed to have been established, different principles govern under workmen's compensation laws.

In *Zaepfel* v. *E. I. DuPont de Nemours & Co.*[84] the deceased had been employed as a chemist by four successive employers. He had worked for DuPont from 1936 to 1943, for a second employer from 1944 to 1946, for a third from 1947 to 1948, and for a fourth for two months in 1948. He stopped work in 1948 because of illness, and in 1949, at the age of thirty-nine, he died of aplastic anemia, a disease which impairs the function of the marrow in producing blood. A claim was filed against all the employers, and it was alleged that exposure to chemicals during deceased's employment caused the disease. The compensation board found that the total disability was the result of poisoning from benzol and benzine derivatives contracted while in the employment of DuPont and causing an occupational disease. An award was made against DuPont only, for no causal relation was found between the disease and the employment with the other three defendants. An autopsy disclosed no trace of chemicals left from other employments. The medical testimony was conflicting as to the cause of the anemia. But in view of the general paucity of experience with aplastic anemia as an industrial disease, the court expressed a willingness to accept less than positive proof of causation. A physician's testimony to the effect that ". . . the picture could well have begun at the time he was employed handling the benzine ring products at DuPont" was held sufficient to support the board's award. As to the use of the word "could," the court remarked that it is highly probative, and that indeed such evidence is preferable to a glib manifestation of certainty in these cases. Asked whether other employments had anything to do with the disease, the

[84] 284 App. Div. 693, 134 N.Y.S. 2d 377 (1954).

medical expert refused to exclude them but maintained that the disorder was attributable to constant exposure to chemicals during the period of employment. He could not, however, give details as to how other employments could have contributed to or aggravated the disease. In justifying the decision of the board, the court pointed out: "Neither the spirit, purpose nor the language of the Workmen's Compensation Law requires that, to become entitled to compensation his widow must establish the precise exposure which caused his death to an absolute certainty." [85] It is interesting to observe that if any trace of other chemicals had been found in the deceased's body, other employers would probably also have been held liable.

On the question of causal relationship, therefore, it is possible for a court to take the view that a showing of exposure to radiation during the course of employment and a showing of subsequent development of a disease, which can be caused by radioactivity, satisfy the requirements of proof of the occupational character of the disease. This approach, however, will tend to make the employer in atomic industry an insurer against certain diseases such as cancer. On the other hand, if a greater burden of proof must be sustained by the employee to establish the causal connection, it is doubtful whether many of the cumulative radiation injuries will be found compensable as occupational diseases because of the lack of sufficient scientific and medical evidence. It is to be hoped that further discoveries of the specific nature of atomic energy injuries will diminish the area of conjecture. For example, if it can be shown by statistical evidence that it takes a cumulative dose of ninety roentgens to cause a certain type of cancer, such as cancer of the breast, then unless the employee could show that he was exposed to this much radiation during the course of his employment, he would have difficulty in proving a causal connection. In the absence of such conclusive scientific data, however, it seems preferable to err on the side of providing compensation for atomic injuries. If the existing statutory or judicial rules relating to proof of causal connection appear to create an insuperable burden for possible victims of radiation injuries, appropriate revision of the statutes appears desirable.

2. Schedule Type of Coverage

As previously mentioned, some statutes, instead of providing coverage for "all occupational diseases," purport to compensate for only a prescribed, exclusive "list" of such diseases. There are several policy rea-

[85] *Id.* at 696.

sons underlying the adoption of the schedule type of legislation. Primarily, it is an attempt to limit the employer's liability, so that industry will not be burdened with the cost of compensation for those diseases to which the human race as a whole is subject. Another important consideration is that of "definiteness," which serves the worthy purpose of reducing the amount of time and money employed in litigation over the question of whether the disease involved in the case is or is not a compensable occupational disease.

An examination of the various statutory lists of the occupational disease laws reveals a considerable variation concerning both the items included and the language employed. As indicated previously, in some states no item of the schedule relates to radiation injuries. In other states the schedules do incorporate items that have some relevancy to atomic injuries and these will be examined with a view toward determining their adequacy.

a. Examples of Older Legislation

North Carolina. The North Carolina statute enacted in 1935 reads:

> The following diseases and conditions only shall be deemed to be occupational diseases within the meaning of this article: . . . (15) radium poisoning or injuries by X-rays.[36]

Unless a particular disease appears on this list, it is not compensable. Twenty-six different items are listed as occupational diseases in the North Carolina statute and only item 15 pertains to radiation injuries.

Since today the use of X-rays in industrial processes probably exceeds the use of other radioactive materials or equipment, "injury by X-rays" probably will, numerically speaking, cover the greatest share of actual radiation injuries. However, as the use of newer atomic energy devices becomes more prevalent, the inadequacies of the North Carolina statute will become more apparent.

The statute also covers what is termed "radium poisoning." The use of the generic term "poisoning" raises the question of whether the "poisoning" referred to is that of a toxic nature, or one due to radioactive properties of the material mentioned in connection with it—in this case, radium. The dictionary definition of a poison is "any agent which, introduced into an organism, may chemically produce an injurious or deadly effect." [37] Adopting this definition, the term radium

[36] N.C. Gen. Stat. §97-53 (1950).
[37] Webster's New Collegiate Dictionary.

poisoning would make compensable only those diseases wherein some toxic consequences were produced chemically from the ingestion of radium compounds, thus excluding injuries caused by external or internal radiation. However, most of the statutes which adopted the words "radium poisoning" did so after the injuries suffered by the radium dial painters in New Jersey were publicized. Thus, it would appear that this language was directed toward covering that sort of injury. Since the injury was not due to the toxic nature of the radium material, but due to its radioactive properties, it is quite likely that the legislature meant to provide compensation for any harm caused the body by ingestion of radium. However, this is a disputable point. Some of the statutes have avoided this difficulty through the use of the word "disability" instead of the word "poisoning." Regardless of the scope of the term "poisoning," the language of the statute is obviously limited to injuries involving use of radium compounds only, and the language could be construed to exclude compensation for occupational diseases due to contact with other radioactive substances.

Accordingly there are several types of radiation injuries not covered by the North Carolina statute. One class not covered is that caused by the particle accelerators which produce high energy radiation, such as the cosmotron, the betatron, the cyclotron, the synchrotron, and the Van de Graaff machine. The development of cataracts due to chronic exposure to neutrons suffered by the scientists who experimented with the cyclotron at the University of California illustrates the possibility of such machines producing injuries which under a properly drafted statute could be classified as occupational diseases. Similarly, the statute does not cover injuries caused by types of radiation other than X-rays, such as alpha, beta, and gamma radiation.

Another type of radiation injury not made compensable under the language of the North Carolina statute is that which might be caused by the nuclear reactor or atomic pile. The nuclear reactor and the chemical separation plant needed to process the fuel elements are sources of tremendous amounts of radiation. Since it is anticipated that nuclear reactors will be used extensively in research, in the production of electricity, and otherwise, it would seem that a considerable number of injuries might be anticipated from these sources. The North Carolina statute makes no reference to injuries from such sources either specifically or by reference to "fissionable" material.

Texas. The state of Texas provides another variation in the statutory language concerning the atomic energy injuries considered com-

pensable as occupational diseases. The Texas occupational disease law reads in part as follows:

> Wherever the terms "injury" or "personal injury" are used in the Workmen's Compensation Law of this state, such terms shall be construed to mean damage or harm to the physical structure of the body and such diseases or infection as naturally result therefrom. Unless from the context the meaning is clearly to the contrary, such terms shall also be construed to mean and include occupational diseases, as hereinafter defined. The following diseases only shall be deemed to be occupational diseases: (a) Poisoning by: (separate and distinct items are listed including, for example, arsenic, chlorine, cyanide, hydrochloric acid, lead, nitric acid, phosphorus, sulphuric acid, and zinc) . . . (h) Diseased condition caused by exposure to x-rays or radioactive substances . . . .[38]

Under this language it is readily apparent that the coverage is much broader than that afforded under the North Carolina legislation. Although the Texas occupational disease law was enacted in 1947, indicating that the legislature should have been aware of the possibility of injuries through the new uses of atomic energy, a number of problems may be raised concerning the adequacy of the language. For example, do the words "diseased condition" apply only to a degenerative physical condition so that atomic injuries such as cancer and leukemia are covered but sterility is not? In resolving this question, it should be kept in mind that some of the early cases of injury from radioactive materials involved scientists who had experienced dermatitis and cancer. Also, the nature of the injuries received by the radium dial painters was such that the injury or disease grew progressively worse as time passed. In view of the fairly recent date of the Texas legislation, it is likely that the term "diseased condition" would be broadly construed to include all atomic energy injuries otherwise compensable under the statute. Moreover, the tendency on the part of the courts to give a liberal interpretation to the language of the workmen's compensation and occupational disease statutes could induce a court to take this broader view.

A number of questions may be raised concerning the meaning of "exposure to x-rays or radioactive substances." It may be argued that the language covers only exposures to external sources of radiation. Because the radiation injury which is compensable, *i.e.*, the "diseased condition," is accompanied by the phrase which links exposure to X-rays

[38] Tex. Civ. Stat. Ann. art. 8306, §20 (1956). The provisions of the Virginia statutes are comparable in that they cover "Radium disability or disability due to exposure to radioactive substances and X-Ray. . . ." Va. Laws 1958, H.B. 552, adding Va. Code §65-43.

and exposure to radioactive substances conjunctively and because exposure to X-rays can only be by external exposure, it may be that only external exposure to radioactive substances was contemplated. Moreover, because those instances of poisoning intended to be compensable are grouped together under another subheading, the failure to include certain radioactive materials which also have toxic effects may be interpreted to mean that, if such materials should result in toxic damage, the poisoning would not be compensable. Therefore, the scope of coverage for injuries resulting from ingestion of radioactive materials, either because of their emission of radiation or because of their toxic effect, remains conjectural.

More important is the question as to whether or not the fuel which "burns" in a nuclear reactor, or the nuclear reactor itself, can be termed a "radioactive substance." A radioactive element such as radium, or an artificially produced radioisotope like cobalt 60, is designated as radioactive because it is undergoing internal decay and in the process is giving off radiations of one kind or another. But what about neutron bombardment from a nuclear reactor? It is questionable whether the nuclear reactor itself could be thought of as a radioactive substance, because, for one thing, the reactor needs more than simply "a substance," *i.e.*, the uranium metal, in order to operate. Highly refined moderators, control rods, and cooling devices are essential to the operation of a reactor. Conceding that the uranium or plutonium is radioactive, and that the nuclear reactor would give off some radiation from "substances," this would be insignificant compared with the radiation resulting from neutron beam exposure. The functioning of the nuclear reactor does not depend upon the radioactivity of uranium 235, but upon its fissionable quality. Therefore, it would be more correct to speak of radiations given off from a nuclear reactor as being due to "fissionable substances" rather than to radioactive substances. On this basis, the statutory language "radioactive substances" seemingly would not include exposure to neutron radiation from a nuclear reactor. Similarly, the Texas statute apparently provides no coverage for those injuries which may be due to exposure to radiation produced by any of the high energy machines, such as the cyclotron.

Arizona. Another example of a statute supplying coverage for occupational diseases by setting forth a schedule of compensable diseases is that of the state of Arizona. This statute which was adopted in 1943 reads:

> For the purposes of this Act only the diseases enumerated in this section shall be deemed to be occupational diseases: . . .

(12) ulceration of the skin or destruction of tissue due to the prolonged exposure to roentgen rays or radium emanations.[39]

The injuries covered under this statute are limited to only those caused by prolonged exposure to either X-rays or radium emanations.[40] This limitation means the exclusion of many potential radiation injuries previously discussed in respect to other statutes. The different concept introduced by the Arizona statute is that of "radium emanations." There are two possible meanings of this term. The one which seems most plausible is that radium emanations are the rays given off by a source of radioactivity consisting only of radium. In other words, the emphasis is on the material, radium, and not on the qualities of the radiations. The other possible interpretation would include in the term all rays given off from any radioactive material, not only those from radium. The question is: Were the words "radium emanations" intended to mean the "type of rays" given off by any radioactive material or just those from radium? Would gamma and beta rays given off from cobalt 60 come within this language as well as gamma and beta rays given off by radium? An affirmative answer would appear to be an unwarrantable construction of the language. When the language was adopted in 1943, not much was known about the possibility of using other forms of radioactivity. The fact that other radioactive substances could be produced, which would give off the same types of rays as are given off by radium, was not general knowledge. Therefore, the coverage of occupational diseases provided for by this act is probably limited to those injuries caused by exposure to either X-rays or radium.

Another limitation is imposed by the statement of the nature of the injury for which recovery will be permitted. The act lists as compensable items, "ulceration of the skin and destruction of tissue." Since an ulcer is described as anything that festers and corrupts like an open sore, "ulceration of the skin" should cover an injury, such as cancer, that could occur to the skin through exposure to radioactivity. Whether heavy scar tissue would be included is questionable. There is also a question concerning the language "destruction of tissue." Is this broad enough to cover an injury that occurs to the cells, to internal organs such as the spleen or liver, or to the bone marrow? Tissue is defined biologically as an aggregate of cells, with its intercellular substance, constituting one of the structural materials of a plant or animal: for example, epithelium tissue, nerve tissue, muscular tissue, and connective tissue.

[39] Ariz. Rev. Stat. §23-1102 (1956).

[40] "Roentgen rays" are X-rays.

Thus, since tissue encompasses any of the structural materials of the body, it probably is broad enough to cover injury to any of the organs of the body and to the bone. It would not include damage to individual cells, as in the blood, but since blood deficiencies and excesses are usually a consequence of damage to blood producing organs, adequate coverage may also be provided by the definition. Though some of the atomic energy injuries, such as cancer, are not really a destruction of tissue but rather a malignant growth of tissue, they probably would be covered if the statute is given a liberal interpretation.

In summary, the Arizona statute covers only injuries caused by exposure to either X-rays or radium. It does not cover injuries from other sources of radioactivity now available in the form of radioisotopes, nor is there coverage for injuries due to such instrumentalities as the nuclear reactor. Except for the X-ray machine, no coverage is provided for injury which can be traced to radiation given off by any of the high energy machines.

Idaho. The schedule set out by the Idaho statute to provide compensation for radiation injuries reads as follows:

> Compensation as provided in this chapter shall be payable for disability or death of an employee resulting from the following occupational diseases: . . . (6) radium poisoning by or disability due to radioactive properties of substances or to Roentgen ray (X-ray) in any occupation involving direct contact therewith, handling thereof, or exposure thereto.[41]

This language, although adopted in 1939, would appear to cover most of the possibilities of injury by radium, X-rays, or radioactive materials, because it speaks of both poisoning and disability. However, toxic injuries are not included because the "poisoning" or disability must be due to the radioactive properties of substances, not their chemical properties. Thus radium poisoning is made to refer expressly to the radioactive injury caused. There is nothing in the language which would cover the neutron radiation given off from a nuclear reactor, because such injuries would not be "due to radioactive properties of substances," but to their fissionable qualities. Nor is there any coverage provided for injuries due to high-energy machines.

This statute, by using the words "in any occupation involving direct contact therewith, handling thereof, or exposure thereto," makes compensability also depend upon employment in such an occupation. Would this statute provide compensation for the office worker who happened

[41] Idaho Code §72-1204 (1949).

to be in an area close to a radioactive substance? Would his occupation be deemed to involve "exposure" to the radioactive material? His exposure would simply result from his having performed his duties in a radioactive area. If the statute is interpreted to provide compensation only for those occupations where, as a part of one's duties, there is direct contact with, handling of, or exposure to radioactive materials, it is conceivable that many radiation injuries will be excluded.

b. Recent Legislation

New Mexico. Some of the states which have utilized the schedule type of compensation law have attempted recently to modify their statutes to provide more complete coverage for radiation injuries. The New Mexico law, as amended in 1957, serves as an example:

> For the purpose of this act only the diseases enumerated in this section shall be deemed to be occupational diseases: . . . (27) ulceration of the skin or destruction of tissue due to prolonged exposure to roentgen rays or radium emanations . . . (32) diseases contracted by virtue of work connected with and directly traceable to fissionable materials or radioactive materials and not specifically listed herein.[42]

Since we have discussed statutory language similar to that used in item 27 of this statute, we will not dwell upon the scope of its coverage, except to say that it is apparently limited to injuries caused by exposure to radiation either in the form of X-rays or that emitted by radium. The new provision in item 32 includes any diseases which can be traced directly to "fissionable" materials. Undoubtedly the legislature had in mind the desirability of adding injuries resulting from the new uses of atomic energy. Any injury due to an explosion, such as the setting off of an atom bomb, or even the inadvertent reaching of the critical mass of fissionable material, probably would be pin-pointed in time and would doubtless be covered under the workmen's compensation law as an "injury by accident," as distinguished from an occupational disease. Therefore, it seems that the legislature intended to make compensable occupational diseases caused by the operation of a nuclear reactor.

What is the meaning of "fissionable"? Does it include any element which can undergo the fission process, in the sense of being split into two or more fragments, or does it apply only to those elements able

[42] N.M. Stat. §59-10-45; N.M. Laws 1957, c. 246, §10.

to sustain a chain reaction? A statement from Glasstone indicates that the word is used by scientists in the former sense:

> Until 1947, fission had not been observed in any element of atomic number less than 90, but in that year successful fission of bismuth, lead, thallium, mercury, gold, platinum and tantalum was achieved in the Radiation Laboratory, Berkeley, by means of alpha particles, deuterons or neutrons of very high energy. . . .[43]

If this broad meaning is given to the word "fissionable," then the statute would cover diseases caused by many of the elements. However, it would seem more likely that the legislature intended to adopt the interpretation of that word as it is used in the Atomic Energy Act of 1946. They probably meant to include within the term "fissionable materials" only those materials capable of sustaining a chain reaction, such as thorium, plutonium, or uranium 235. Another question raised by the language of item 32 is: Would an injury caused by fissionable material be compensable when caused by radioactivity or toxicity, rather than by the fissionable quality? For example, when plutonium is ingested, it has a very deleterious effect upon the body, both of a toxic and of a radioactive nature. The language is probably broad enough to include such injuries. It should be noted, however, that injuries arising in connection with thermonuclear (or fusion) processes may not be covered.

Colorado. On March 28, 1951, the state of Colorado added item number 22 to its list of compensable occupational diseases:

> The following diseases only shall be deemed to be occupational diseases, and compensation as provided in this act shall be payable for disability or death of employee resulting from such diseases and from no others: . . . (22) poisoning or disease caused by exposure to radioactive materials, substances, or machines, or fissionable materials.[44]

The words "poisoning or disease" are comprehensive enough to cover the possibility of injury by exposure to an external source of radiation. Also covered are injuries by ingestion of the material, causing either toxic or radiation damage or both. The descriptive wording of the sources of injury intended to be covered, *i.e.*, "radioactive materials, substances, or machines, or fissionable materials," is quite comprehensive. This language should be adequate to cover any disease or injury caused by exposure to any of the radioactive or fissionable materials

[43] Glasstone, Sourcebook on Atomic Energy 349 (1950).
[44] Colo. Rev. Stat. §81-18-9 (1953).

with which we are now acquainted. On the whole, this statute represents one of the better attempts to describe comprehensively the instrumentalities which may produce radiation injuries.

Conclusion. In nearly every state having schedule type coverage for occupational diseases, the existing statutory language is either nonexistent or unduly restrictive in coverage of atomic injuries that may be classified as occupational. In view of the fact that many delayed and cumulative radiation injuries will often not be compensable as "injuries by accident," amendatory legislation broadening the coverage for radiation injuries as occupational diseases is indicated, following the example of Colorado.

c. The Requirement of Causal Connection in Schedule Type Statutes

The showing of causal connection between the injury or disease and the employment is a requirement which appears to be highly regulated in some of the statutes providing for a schedule of occupational diseases. An example is the statute of New Mexico which reads:

> The occupational diseases hereinafter defined are deemed to arise out of the employment only if:
>
> A. There is a direct connection between the conditions under which the work is performed and the occupational disease; and
>
> B. The occupational disease can be seen to have followed as a natural incident of the work and as a result of the exposure occasioned by the nature of the employment; and
>
> C. The occupational disease can be traced to the employment as the cause; and
>
> D. The occupational disease does not come from a hazard to which the employee would have been equally exposed outside of the employment; and
>
> E. The disease is incidental to the character of the business and not independent of the relation of employer and employee, (the disease need not have been foreseen or expected, but, after its contraction, it must appear to have had its origin in a risk connected with the employment, and to have flowed from that source as a natural consequence). . . .[45]

Under this law an employee with a radiation injury may have extreme difficulty proving causation even though the injury appears on the schedule. The same considerations discussed previously in connection with the proof of causal connection under statutes providing coverage

[45] N.M. Stat. Ann. §59-10-44.

of all occupational diseases apply in the case of statutes employing schedule type coverage.

3. Voluntary Coverage

Finally, some of the states have provisions whereby the employer may elect coverage of "all occupational diseases" in lieu of the schedule. The Tennessee statute provides:

> Any employer may, in lieu of the schedule of occupational diseases enumerated in section 50-1101, reject the same and elect by written declaration filed with the division of workmen's compensation, department of labor, on a form provided by it, to be bound in accordance with the Workmen's Compensation Law by the provisions of this section and section 50-1104 relating to full coverage of all occupational diseases. Thereupon the employer shall be liable for all occupational diseases arising out of and in the course of the employment pursuant to all the provisions of the Workmen's Compensation Law.[46]

This provision has already been acted upon by the contractors of the Atomic Energy Commission operating the Oak Ridge installations, thereby affording compensation for radiation injuries not covered by the compulsory coverage provisions of Tennessee law. In those states where there may be some reluctance to expand the occupational disease statutory provisions to include all types of atomic radiation injuries, it would be desirable to at least permit expanded voluntary coverage, and it is to be hoped that atomic energy entrepreneurs would take advantage of the opportunities thereby afforded for satisfactory compensation of such injuries.

C. Successive Injuries and Second Injury Funds

Among the problems besetting modern workmen's compensation legislation is the case of two physical disabilities overtaking one man at different times and while in the employ of different employers. The combined effect of the injuries may be catastrophic although each accident by itself would give rise only to partial or total but only temporary disability. The typical example is the case of a man who loses the sight of one eye at one job and his other eye later at another job, thus becoming permanently and totally disabled. The vexing question in such instances is whether the last employer should bear the cost of compensa-

[46] Tenn. Code Ann. §50-1103 (1955).

tion for the whole final result or whether a system of apportionment of the loss among several employers ought to be used. The consequence of failing to provide a sharing of the cost may be the resort to discriminatory practices against previously injured workers, who present too great a financial risk, by refusing employment because of a prior minor injury.

Three general approaches to this problem are followed in American compensation statutes. The so-called "full responsibility" rule practically ignores the difficulty and places liability for the entire result on the employer in whose employment a worker became disabled. At the other extreme under some apportionment statutes the last employer is held liable only for the amount of the injury suffered in the second mishap, and the cumulative effect of the accidents is ignored.

Most states, including several having apportionment statutes, the District of Columbia, Hawaii, Puerto Rico, and the Longshoreman's Act, have sought to achieve equitable compensation for employees and fair relief for employers by instituting so-called second injury funds, under which usually an employer is held liable for the portion of disability arising out of the injury which occurred in his employment, while the fund contributes the difference between that amount and the total amount to which the combined effects of the two injuries entitle the worker.[47] These funds are financed in different ways. Usually they are supported by charges imposed upon employers or their insurance carriers in cases of death of employees without dependents. Some states provide funds by assessments against carriers based on total premiums collected or on compensation payments. A small number of states support the funds by special appropriations from the legislature.

In appraising the adaptability of existing second injury fund provisions to injuries suffered in private atomic industry, it should be noted that some of the second injury fund provisions apply only when the first injury consists of a listed injury, such as loss of use of an eye, leg, arm, or other member of the body, which causes a permanent partial disability, and the second injury produces the cumulative result of permanent total disability through loss or loss of use of another member. In other states, however, the second injury fund provisions are not limited in their application to listed injuries compensable under the fixed schedule of benefits. But even where the statutes are not limited, some courts have stressed that the prime objective of the statutes is maintaining the unimpaired competitive position of workmen in the

[47] The only states which do not provide for a second injury fund are Florida, Georgia, Louisiana, Nevada, New Mexico, and Virginia.

labor market and have denied the applicability of second injury fund provisions where the prior injury had no effect on the subsequent employment or where the "second injury" caused a prior non-disabling injury to become disabling. If the second injury fund provisions are not applicable, the last employer is held liable for the whole injury since the nearly universal principle is that an employer takes an employee as he finds him, and if an injury causes a disability aggravated by a previous latent condition, the entire disability is compensable without weighing the relative contributions of the two injuries.[48]

Illustrative of the cases imposing liability on the last employer for the entire extent of the ultimate injury is the case of *Scott* v. *Alaska Industrial Board*.[49] There the worker had been employed in mines since 1906 with the exception of several years in construction work. Prior to his disability he had worked in plaintiff's mine for thirty months. His prior injury was silicosis which, however, had not yet manifested itself at the time plaintiff hired him and therefore could not have placed him at a disadvantage when seeking new employment. The new injury was pneumonia, which, superimposed on silicosis, caused permanent total disability. The employer was held not to be entitled to recover from the second injury fund the portion of compensation covering effects in excess of the disability caused by pneumonia only. The court was clear that recovery could be had under the statute only when the prior disability or injury was "obviously manifested" so that the employer may have been deterred from hiring the worker. In addition, where the second accident or disease merely precipitates and renders disabling a prior non-disabling condition, it was the opinion of the court that the second injury fund legislation was inapplicable.

Radiation injuries are known to cause gradual deterioration of human tissues, and often the date of disability is postponed indefinitely. Certainly they are not of the type that will normally cause the immediate loss or loss of use of a member of the body except when amputations are necessary. Moreover, the possible cumulative effects of irradiation are not yet easily assessable. It is impossible for employers to appraise the financial risk involved in employing personnel with prolonged experience in atomic energy work, and yet skilled and experienced men offer the highest technical value. We must add to this the fact that the nature of atomic industry is such that irradiation of personnel often

[48] Only three states have special statutes on aggravation of disease: California Labor Code §4663; Kentucky Rev. Stat. §342.005(1); North Dakota Rev. Code §65-0102(8).

[49] 91 F. Supp. 201 (1950).

cannot be totally eliminated, but only reduced to levels believed to be safe. Consequently, a person applying for work in other than his original place of employment in atomic industry may be suspect to a prospective employer by reason of his experience in the field. If he has by chance been involved in minor radiation accidents, but has never been disabled even temporarily, it may nevertheless be unsound business practice for the employer to consider him for employment even in those states that do not place full responsibility on the last employer. Such hesitation is made more understandable when we realize that the state of present day knowledge of the biological effects of radiation is far from perfect, and thus atomic industry is deprived of a basic yardstick for calculating the gravity of the risk and the duration of possible complications and their financial import in terms of workmen's compensation liability. Nevertheless, if the lack of adequate second injury fund provisions, as applied to atomic energy injuries, tends to restrict the potentialities of employment of employees suffering prior radiation injuries, liberalization of the applicability of the second injury funds seems warranted.

D. Apportionment of Liability in Occupational Disease Cases

The problem of occupational diseases incubating for years before they cause a disability, with the victim engaged in several employments in the meantime, is similar in nature to the difficulties which inspired the creation of second injury funds. Its significance in relation to private atomic energy industry is apparent, for radiation diseases frequently and, indeed, normally develop slowly, a fact which is demonstrated by the medical histories of persons exposed to excessive amounts of radioactivity. Such cases threaten to be among the most troublesome from the compensation point of view.

Under present American statutes most courts impose liability on the employer or insurance carrier who assumed the risk as of the time when the disease caused the disability, so long as the employment at that time was of a kind contributing to the disease, regardless of the fact that the condition was caused in part through employment by more than the last employer. As an example, *Willingham* v. *Bryan Rock & Sand Co.* may be cited.[50] In that case the deceased worker died of silicosis. He had previously been twenty years in the employment of the person against whom the claim for compensation was filed. Following his first employment, he was hired by a second employer for five months, and it was

[50] 240 N.C. 281, 82 S.E. 2d 68 (1954).

during this employment that he became totally disabled from the disease. The second employer was joined as a defendant in the pending compensation case against the first employer and was held solely liable.

Though the last employer is held liable to the employee for the total effect of a gradually maturing disability, several statutes nevertheless provide for procedures whereby an apportionment of liabilities may be had among previous employers whose employments contributed to the disease.[51] The contribution to which each of several employers is subjected normally depends on the length of time spent in each employer's service, although Minnesota has adopted a system under which the compensation board can take into account the safety standards maintained by each employer in computing the share of contribution of each employer. This system ought to appeal greatly to framers of compensation legislation for the atomic industry because of the incentive it provides to maintain the highest safety standards.

California has adopted an apportionment scheme by judicial decision.[52] Under it a worker may recover fully from any insurance carrier who has assumed the risk at anytime during the long period of incubation of the disease, and the carrier may recover contributions from other carriers who insured the worker at some time during the several employments.

The administrative difficulties of the apportionment rule in cases in which the period of incubation may last for years or even decades, as it may in radiation diseases, and the virtual impossibility of showing the proper causal relationship between injuries and employments in which exposures to radioactivity occurred years prior to the disability, may render the apportionment system as applied today rather unsatisfactory when the attempt is made to enforce it in radiation injury cases. But, on the other hand, the adoption of the rule imposing liability only on the last employer who may have employed a workman for a relatively brief period of time may be unfair. Statutory provisions to create devices similar to those used in connection with second injury funds and intended to cover cases of slowly maturing occupational radiation-induced diseases are deserving of consideration for they may reduce the problems of providing adequate compensation for employees of atomic industry.

[51] *E.g.*, Mich. Stat. Ann. §17.228; Minn. Stat. Ann. §176.66(5); N.Y. Work. Comp. Law §44.

E. Disability and Loss of Earning Capacity

1. General Principles

Workmen's compensation and occupational disease statutes are subject to a limitation which permits compensation only for those injuries resulting in total or partial disability. Unless an injury falls within the definition of "disability," it is not considered compensable regardless of its seriousness. This restriction springs from the very basic policies underlying the adoption of the workmen's compensation and occupational disease acts.

Among the reasons for the adoption of workmen's compensation legislation was the fact that the cost of common law litigation often defeated its purpose. In many cases it consumed a good share of the proceeds of the final recovery of the workman. The time consumed in such litigation, moreover, made it difficult for the employee to pay his medical bills or support his family pending the outcome. Furthermore, the application of common law defenses to an action based upon negligence of the employer made recovery highly speculative. Confronted with the ever increasing number of injuries due to expanding industrialization, the legislatures concluded that the cost of support and medical care resulting from these injuries should be borne by the industry which created them. Workmen's compensation and occupational disease laws were thus intended to make industrial employers "pay their way" and to reduce litigation to a minimum.

Notwithstanding these factors underlying the adoption of all workmen's compensation and occupational disease legislation, there has been confusion regarding the basis for making awards for injuries. Some legislatures have been concerned with making awards for injuries which left employees in an impaired physical condition. Other legislatures have been more concerned with whether the employee was subsequently able to maintain his prior earning power, regardless of the injury he had received.[53]

In a tort action for personal injury, an "injury" to the person must be shown. Under compensation statutes a showing of "disability" is required to support an award. "Damages" in tort law and "compensa-

[53] Although death benefits comprise a substantial category of workmen's compensation claims and occupational disease claims, no discussion will be devoted to them here because there is apparently no significant difference between death caused by atomic energy and death caused by any other source, regardless of whether compensation is claimed under a workmen's compensation statute or under an occupational disease statute.

tion" under the statutes are different concepts. Therefore the extent to which atomic energy injuries will constitute compensable disabilities, taking into consideration the definitions used by the legislatures and the interpretations of the statutory wording by the courts, warrants examination. Generally speaking, a personal injury, while normally sufficient grounds for tort liability in another setting, may not be enough to entitle the injured person to compensation.

In deciding what constitutes either a total or partial disability, it should be recognized that there are two determinants: (1) actual physical disability which is determined by the reduction in ability of the claimant to use his body after the injury, *e.g.*, the inability to see because of cataract or to move because of muscular damage; and (2) loss of earning power which is determined by the extent to which claimant's injury subtracts from his attractiveness in the labor pool. These factors are corollary to the policy considerations which prompted the adoption of the workmen's compensation and occupational disease acts.

In most instances, both physical disability and inability to earn the same wages occur simultaneously. But this is not necessarily the case. At one extreme, it is conceivable that a workman can be made an almost totally handicapped person, such as a quadruple amputee, but yet, by perseverance and ingenuity, he may be able to earn a livelihood. Common sense would suggest that a man who has lost his arms and legs has suffered a serious decrease in his earning capacity. It would seem that the harm he has suffered physically should entitle him to compensation on the ground that his capacity to earn has been destroyed so far as his competitive position with his fellow workers is concerned. To deny him compensation because he develops a new means of earning a living would be to penalize a person who is more industrious and imaginative than the average. On the other hand, it is likely that a worker who has suffered an injury which only slightly impairs his physical activity may not be able to find employment, and therefore has suffered a severe diminution of his wage-earning capacity. This latter situation may very well be the case when occupational disease is involved, especially is this likely to be true in radiation overexposure cases. Since such radiation exposures have a cumulative effect, another atomic energy employer may refuse to hire a man who has been previously overexposed, for only a little additional exposure, even though small in amount, may produce disability. The last employer may have to bear the compensation payments because, as was noted in the preceding section, under most of the occupational disease laws the last employer is responsible for the entire compensation.

For classification purposes a four-fold subdivision of compensable disabilities has been established. These are temporary total, temporary partial, permanent total, and permanent partial disability. Ordinarily, there is little controversy regarding the loss of earning power under the categories of temporary partial or temporary total disability. The actual wage loss of the disabled employee can be determined directly from the amount of time and wages the employee has lost. Permanent partial and permanent total disabilities raise more complex questions in both accidental injury and occupational disease areas. In these instances, it becomes necesary to determine the employee's earning capacity after the condition created by the injury has stabilized.

The first problem in dealing with atomic energy injuries is to determine how they will be classified as disabilities. Then, it must be determined whether the disability is to be measured under the statutes on the basis of physical condition or loss of earning power, or both, in order to appraise the suitability of the solutions in respect to radiation injuries.

2. Application of General Principles to Atomic Injuries

a. Temporary Disabilities and Atomic Injuries from Accidents

Typical of the atomic energy injuries, which seem most likely to fall into the category of temporary disabilities, either partial or total, are the aftereffects, other than death, of a large single accidental overexposure to radiation. Radiation illness, due to a large overexposure to radiation, goes through four phases within a period of months, after which the immediately apparent effects either disappear or are latent. During this period, the employee may be totally incapacitated. In determining the amount of compensation for temporary disabilities, the problem becomes one of ascertaining the extent of the "disability" (unless this particular injury has a prescribed compensation listed in a statutory schedule).[54] "Disability" as used in a particular statute might mean either or both of the factors hitherto named, *i.e.*, physical incapacity or loss of earning capacity. However, in the temporary disability situation, the emphasis will be on loss of current wages. No forecast as to the employee's loss of earning capacity in the future is

[54] Typically, workmen's compensation statutes provide a specified weekly benefit for temporary disabilities requiring loss of earnings and prescribe a maximum total compensation. For example, see N.Y. Workmen's Comp. Law §15. It would be possible to prescribe a fixed number of weekly benefits for a specific injury, however.

necessary as would be true in the case of a permanent disability. In the case of acute overexposure to radiation, the effects are likely to be severe enough to warrant the assumption that the claimant will not be able to earn anything for the period of the disability. If the particular injury does not cause any loss of wages, compensation probably will not be awarded because of the emphasis in temporary disability cases on actual wage loss.

b. Permanent Disabilities and Atomic Injuries from Accidents

The atomic energy injuries which seem more likely to fall into the categories of permanent partial or total disabilities are those of sterility, genetic damage, leukemia, leukopenia, cancer, and shortened life span. The "distinctive radiation injuries," such as sterility, genetic damage, or shortened life span, may not fall within what is generally considered a "disability," although the damage is permanent. This results from the fact that these injuries may not result in wage loss or physical deterioration which affects the overall earning capacity. If the particular requirements of the statute as to a loss of earning capacity are not met, then regardless of whether the statute otherwise includes such an injury within its scope, no recovery will be allowed.

In respect to those radiation injuries, such as cancer, which may be classified as permanent partial disabilities, most states determine benefits on the basis of decreased earning capacity, disregarding actual wage loss. This will create some problems in relation to radiation injuries unless they are covered by a schedule which provides a definite amount of compensation. For example, certain seemingly permanent atomic energy injuries, such as cancer, leukemia, leukopenia, and bone necrosis, while definitely constituting physical impairment of the body, may not result in decreased earning power in the immediate period after they are contracted. That these injuries should qualify as physical disabilities affecting earning power can be illustrated by the likelihood that if a person had cancer, even though medical treatment temporarily arrested its development, his chances of future employment would be lessened. Since another employer would not be likely to hire him, the cancer would cause an actual decrease in the employee's earning potential thus warranting compensation.

The experience in Illinois demonstrates the typical judicial construction given to statutes which determine disability in terms of loss of earning capacity. Prior to 1955 the Illinois statute read:

> If, after the accidental injury has been sustained, the employee as a result thereof becomes partially incapacitated from pursu-

> ing his usual and customary line of employment, he shall, except in cases covered by the specific schedule set forth in paragraph (e) of this section, receive compensation . . . equal to fifty per centum of the difference between the average amount which he earned before the accident and the average amount which he is earning or is able to earn in some suitable employment or business after the accident.[55]

The purpose of the statute was stated in *Ridge Coal Mining Co.* v. *Industrial Commission:*

> The purpose of the act is to as nearly as possible give the injured employee fifty per cent of the difference between what his earnings would have been had he not been injured and what he is earning or is able to earn subsequent to the injury.[56]

In that case an employer sought to terminate compensation payments on the theory that the employee subsequently was earning higher wages. The employer did not introduce any evidence of the employee's physical condition. The court held that:

> Since the plaintiff in error has contented itself with presenting testimony only concerning the wages of the defendant in error, and has offered no other evidence concerning the condition of the defendant in error, its evidence is not sufficient to justify a holding that the disability of the defendant in error has ended.[57]

Thus the court interpreted the statute to mean that the employee's physical condition must be ascertained, regardless of his earnings, before an award will be terminated.

In a decision rendered by the same court the following year upon a petition to reduce an award on the ground that in a new position the employee had been able to work more days and thus earn more money than he would have earned had he continued in his former occupation, the court said: "Compensation is not based on physical or mental disability, except as it affects earning capacity, nor on opportunity to work, but is based on previous earnings and earning capacity and is measured by the loss of such earning capacity due to the accident." [58] In a very recent case, however, involving an attempt by an employee to base his

[55] Ill. Rev. Stat. c. 48, §145(d) (1949). The statute now provides for compensation equal to a minimum of 65% of the wage difference. Ill. Rev. Stat. c. 48, §138.8(d) (1955).

[56] 314 Ill. 509, 512, 145 N.E. 643 (1924).

[57] *Id.* at 517.

[58] Consolidated Coal Co. of St. Louis v. Industrial Commission et al., 314 Ill. 526, 528, 145 N.E. 675 (1924).

claim for compensation upon the fact that his wages were now less than formerly, if overtime pay were excluded, the same court stated: "The object of this provision is to compensate the injured employee for his reduced earning capacity and, if any injury does not reduce his earning capacity, he is not entitled to compensation." [59] From these cases, it can readily be seen that the earning capacity test cannot be easily applied in instances where there was no actual wage loss although some physical impairment could be demonstrated. For "distinctive radiation injuries," such as shortened life span and sterility, providing compensation under the loss of earning capacity test will be even more difficult unless statutes are amended to cover such cases in schedules or otherwise.

Wisconsin has a provision in its statute which may have the effect of permitting coverage of most atomic energy injuries. The Wisconsin statute establishes a schedule of specific disabilities and relative disabilities and makes allowance for disfigurement. It also states:

> For permanent partial disability not covered by the provisions of sections 102.52 to 102.56 [schedule, application of schedule, and disfigurement] the aggregate number of weeks of indemnity shall bear such relation to the number of weeks of indemnity set out . . . as the nature of the injury bears to one causing permanent total disability and shall be payable at the rate of 70 per cent of the average weekly earnings. . . .[60]

By this language, an injury is made compensable on the basis of how much the injury tends to impair, percentage-wise, bodily function. Interpreting this language, the court has stated that the legislature intended to put this kind of permanent partial incapacity on the same plane with scheduled injuries. The effect of this is to make an injury compensable much in the same manner as is true in the case of the regular scheduled injuries. In a recent case the court stated:

> The general scheme of the statutes following the development of schedule and relative injuries, all of which constituted a permanent partial disability, indicates that the legislature was concerned with bringing nonschedule and nonrelative disabilities into conformity with schedule and relative disabilities. . . . Such a construction leaves no disparity between schedule and relative injuries on the one hand, and nonschedule injuries causing permanent partial disability on the other. This also conforms to the practical necessities. During the healing period it is possible to establish a wage loss because that is a past event. But since an award for permanent disability is to

[59] Sroka v. Industrial Commission et al., 412 Ill. 126, 128, 105 N.E. 2d 716 (1952).
[60] Wis. Stat. Ann. §102.44(3) (1957).

> be made for all time at the end of this period it must be based upon some sort of prediction as to impairment of earning capacity. It appears to us that the legislature has specifically chosen in the case of nonschedule permanent partial disabilities the method of comparing the severity of the injuries causing such a disability with those causing permanent total disability.[61]

The case involved a salesman who had injured a vertebral disc while lifting a refrigerator during a demonstration for a prospective customer. Following an operation to alleviate his condition, he again resumed his occupation as a salesman at higher wages than before the injury. In this situation, the employee continued in the same work as prior to the injury, and he earned more money, yet he was classified as permanently partially disabled to the extent of twelve and a half per cent, due to the loss of some motion in the spine. It would seem that the award was really made because of the physical disability with its resulting effect on the competitive earning capacity of the employee. Since the court construed the statute to mean that the legislature intended to put nonschedule injuries on the same plane with schedule injuries, it appears that the award was made without reference to whether any diminished earning capacity is foreseeable. This treatment would permit compensation for atomic energy injuries because the commission could simply consider the particular injury the employee had suffered and could decide that it amounted to some percentage of total disability. The employee would then be compensated on this basis without having to overcome the obstacle of showing his earning capacity had been specifically decreased. The effect is similar to that of listing atomic energy injuries in the schedule. Even this type of statutory provision, however, may be difficult to apply in respect to such injuries as shortened life span and sterility. Moreover, as applied to atomic energy injuries, insurance companies may have difficulty in preparing contracts that are actuarily sound.

Generally, the post injury earnings used as the basis for computing decreased earning capacity are those the injured employee is able to earn in "any" kind of employment. However, a few states use earning capacity "in the same employment" as the basis for computing the difference between prior and subsequent earnings. The advantages of the latter approach to an employee are apparent. It would be quite possible for a highly skilled craftsman to receive injuries that compel

[61] Northern States Power Co. v. Industrial Commission, 252 Wis. 70, 75-76, 30 N.W. 2d 217 (1947).

him to discontinue his particular craft. However, if he is able to obtain employment as a common laborer, he might be able to earn some wages for the period which elapses before he has to file his claim. If wages earned in "any" employment were the criterion, the commission would be obliged to use his potential earning capacity as a common laborer in determining the disability award. In respect to atomic energy workers, the advantage of special training might be lost if an overexposure is suffered which prevents continuing in the same job. The loss of the value of this special training might go uncompensated if the employee were able to earn equivalent wages under a statute which used "any employment" as a basis of comparing a loss in earning capacity.

Michigan defines disability by reference to the same employment. The statute states:

> The word "disability" means the state of being disabled from earning full wages at the work in which the employee was last subject to the conditions resulting in disability. . . .[62]

In a case which arose under this statute an employee who had been employed as a motor tester suffered an arm injury which rendered his arm useless. Subsequent to his injury, he was employed as a motor inspector at a slightly higher rate of pay. The court held that though the occupations of the employee prior and subsequent to his injury were closely *related,* they were not identical and the statute explicitly provides that ability to work at the *same* employment is the statutory test. The court stated:

> Again, we must hold that this raises an equitable question barred from consideration as the law now stands, and we cannot hold that it was error for the board to award him compensation on the ground that from the time of the accident he was wholly incapacitated from earning any wages in the employment in which he was engaged at the time of the accident.[63]

Therefore, under Michigan law, an employee suffering an atomic energy injury preventing continuation in the same work would qualify as disabled.

While the preceding discussion concerning the Michigan treatment of compensability is limited to a consideration of whether the injury is within the statutory definition of a compensable disability in the first

[62] Mich. Stat. Ann. §17.220(a) (1950).

[63] Geis v. Packard Motor Car Co., 214 Mich. 646, 651, 183 N.W. 916 (1921).

instance, subsequent earnings of the employee are taken into consideration under that part of the Michigan statute which provides:

> The weekly loss of wages referred to in this act shall consist of such percentage of the average weekly earnings of the injured employee computed according to the provisions of this section as shall fairly represent the proportionate extent of the impairment of his earning capacity in the employment in which he was working at the time of the injury, the same to be fixed as of the time of the injury, but to be determined in view of the nature and extent of the injury: *Provided*, The compensation payable, when added to his wage earning capacity after the injury in the same or other employment, shall not exceed his average weekly earnings at the time of such injury.[64]

Interpreting this proviso, the Michigan court in *Markey* v. *S. S. Peter and Paul's Parish* [65] held that where the employee was regularly earning more money in a new and permanent employment subsequent to the injury, the proviso became operative, and the employer was entitled to an award stopping compensation.

At first glance it would seem that under this type of legislation if the employee subsequently earns equivalent or better wages, he will be denied compensation. However, in Michigan, once the employee is classified as having a compensable disability because he can no longer earn full wages at his old employment, he becomes entitled to compensation. From this point on, in order to stop payments, it is necessary for the employer to show that the employee is again holding a job which yields equal or higher wages. If such employment should cease, the employee does not have to show any actual change of physical condition to have the compensation restored. The policy underlying this approach is to encourage rehabilitation of the injured employee. This system would seem highly suitable to meet the needs of employers and employees in private atomic industry where, undeniably, injuries may have a marked impact on one's earning capacity in the indefinite future though no serious diminution of earning ability may result in the immediate or intermediate future, and, yet, on the employer's side, it may be considered fair not to burden an enterprise on account of damages which have not yet materialized. Of course, an extension of the limitations period for recovery may be necessitated to render these remedies meaningful when applied to radiation injuries.

[64] Mich. Stat. Ann. §17.161 (1950).
[65] 281 Mich. 292, 274 N.W. 797 (1937).

Another provision in many of the statutes which may provide compensation for some of the atomic energy injuries is that which deals with "disfigurement." Under these provisions, compensation is usually allowed, with a maximum limit, in case of any disfigurement to the face, head, neck, or hands, when such disfigurement interferes with the employee's future earning capacity. Such a provision may be used to cover such disfigurements as resulted from the accident which occurred during the Eniwetok experiments. In that case some of the personnel employed during the experiment picked up some "hot" equipment, seriously exposing their hands to radiation. The hands were scarred. If a statute provided compensation for disfigurement to the hands, then such an item would be compensable if it interfered with the individual's earning capacity. Another item which might be included within the term "disfigurement," is that of epilation, or loss of hair. This would depend upon whether the loss of hair is permanent and whether or not it could come within the definition of disfigurement. Where a loss of hair could be shown to result in decreased earning capacity, it might be compensable. Generally, the statutes do not define disfigurement, but instead leave it to the discretion of the commission in each case. The only general limitation is that the disfigurement must be such that it may affect the future earning capacity of the employee or influence a subsequent employer in deciding whether or not to hire the claimant.

c. Occupational Diseases and Atomic Injuries

The question as to the meaning of "disability" also arises in connection with radiation injuries that may be classified as occupational diseases, and problems similar to those discussed in connection with accidental radiation injuries are encountered. Generally speaking, in occupational disease legislation the emphasis is also placed upon diminished earning capacity.

In Michigan, disability is defined in terms of being unable to earn full wages in the same occupation, but the compensation therefore is measured by loss of earning capacity. The statute reads:

> The word "disability" means the state of being disabled from earning full wages at the work in which the employee was last subjected to the conditions resulting in disability. . . .[66]
>
> If an employee is disabled or dies and his disability or death is caused by a disease and the disease is due to the nature of

[66] Mich. Stat. Ann. §17.220(a) (1950).

> the employment in which such employee was engaged and was contracted therein, he . . . shall be entitled to compensation . . . for his disablement . . . all as provided in part 2 of this act, except as hereinafter stated in this part: *Provided, however,* That if it shall be determined that such employee is able to earn wages in another occupation, which shall be neither unhealthful nor injurious and such wages do not equal his full wages prior to the date of his disablement, the compensation payable shall be a percentage of full compensation proportionate to the reduction in his earning capacity.[67]

Thus, when the employee is unable to earn full wages at the work in which he was last subjected to the hazards of the disease, he will be considered disabled. However, the compensation he receives will depend directly upon the loss of earning capacity he has suffered.

Under the Wisconsin statute, compensation for occupational diseases is handled the same as for injuries by accident. "Injury" is defined as mental or physical harm to an employee caused by accident or disease.[68] Therefore, the compensation provisions which are applicable in the case of disability resulting from an injury by accident would also apply to the case of an occupational disease. The Wisconsin approach, as discussed in the preceding section dealing with injury by accident, is that of basing disability payments upon the percentage of the actual incapacity as related to permanent total disability. The employee is not disqualified from compensation simply because it can be shown that at the time of filing the claim he is able to earn more money than he did at the time of the injury.

In the occupational disease area, some states limit compensability to those occupational diseases as a result of which the individual is totally incapacitated, as distinguished from partial incapacity. A reason for so distinguishing between partial and total incapacity probably lies in the fear that, if partial incapacity were also made compensable, the employer would be subjected to many claims for compensation based upon minor difficulties. For example, the Idaho statute provides:

> Except as hereinafter otherwise provided in this chapter, "disablement" means the event of an employee's becoming actually and totally incapacitated, because of an occupational disease, from performing his work in the last occupation in which injuriously exposed to the hazards of such disease; and "disability" means the state of being so incapacitated.[69]

[67] Mich. Stat. Ann. §17.222 (1950).
[68] Wis. Stat. Ann. §102.01(2) (1957).
[69] Idaho Code §72-1205 (1949).

Thus in Idaho the employee who is only partially disabled from an occupational disease would not be able to recover compensation for his disability.

3. Summary

Under both the injury by accident and the occupational disease statutory provisions, there is a requirement that for the injury or disease to be compensable, there must be a "disability." The general approach taken is that a showing of decreased earning capacity satisfies the requirement of a disability. Most of the states also employ schedules which set out specific injuries and the amount of compensation which will be awarded for them. Under the schedule system, it is usually immaterial whether or not any decrease in the earning capacity can be shown. Thus if an item appears on the schedule, it may be compensable whereas otherwise it is not. It should be noted, however, that most of the injuries caused by radiation do not fall within the present coverage of the schedules unless amputation may be involved. In the occupational disease area emphasis is placed upon whether or not the disease only partially disables the employee. Some states require that the employee be totally disabled from performing his last occupation for his disability to be compensable. The extent to which the atomic energy injuries will be prejudiced by statutory language requiring a disability will depend upon the extent that the atomic energy injuries result in disabilities not affecting earnings, or not wholly incapacitating the employee. As of this time, not enough is known of the atomic energy injuries to be able to say positively just what their effect will be. From general considerations of the nature of these injuries, and from the extensive use of monitoring systems, it would seem that many cases of overexposure may be caught in the early stages and result in a job shift of one kind or another. Also some of the atomic energy injuries, such as sterility, will not result in any decreased earning capacity. Therefore, it seems that the disability requirement may exclude some of the atomic energy injuries from compensability.

III. MEDICAL BENEFITS

A. Hospitalization and Treatment Costs

In addition to financial assistance to injured workers, workmen's compensation statutes in the United States provide for hospital and medical care in varying degrees. Roughly one-half of the statutes

grant unlimited benefits as to both amount and period of time, while the remainder limit benefits to certain maximum amounts and periods of time.

In some states full benefits are authorized directly by statute,[70] and in other states, although the statutes set maximum costs or periods of time, equivalent unlimited benefits may result because the workmen's compensation boards are given authority to extend medical aid up to such amounts and for such times as they may consider necessary.[71]

In many of the statutes prescribing medical care that is limited in terms of time or costs, or both, the maximum rates are such that it seems obvious that this legislation was conceived and enacted without consideration being given to the unique needs of private atomic industry.[72] Although many of these statutes were enacted years ago when the legislatures could not have taken into account the problems likely to arise from the utilization of the atom, several states have only recently increased their rates to levels that are still very modest notwithstanding the fact that the legislatures presumably were aware of the forthcoming advent of private atomic industry.

When we consider the imperfect state of present day knowledge concerning biological effects of radioactivity, and the further fact that such knowledge as we now possess indicates that radiation injuries and diseases frequently develop gradually and, even after resulting in disability, may extend over long periods of time, it seems unquestion-

[70] California, Connecticut, District of Columbia, Hawaii, Idaho (for occupational diseases only for a reasonable length of time), Illinois (up to six months only in case of silicosis or asbestosis), Massachusetts, Minnesota, Nebraska, New York, North Dakota, Puerto Rico, Washington, Wisconsin, United States Longshoremen's Act, and United States Civil Employees Act.

[71] Arkansas, Delaware, Florida, Indiana, Maine, Maryland, Michigan, Missouri, New Hampshire, New Jersey, New Mexico, North Carolina, Ohio, Oregon, Pennsylvania, Rhode Island, and South Carolina.

[72] Alabama (maximum period 90 days; maximum amount $1000), Alaska (maximum period 4 years), Colorado (maximum period 6 months; maximum amount $1000), Georgia (maximum period 10 weeks extendable once; maximum amount $1125; board may permit additional $375), Iowa (maximum amount $1500; commission may permit additional services up to $1000), Kansas (maximum period 120 days; in case of occupational disease commission may authorize additional 90 days; maximum amount $2500), Kentucky (maximum amount $2500), Louisiana (maximum amount $2500), Montana (maximum period 18 months; maximum amount $2500 which may be increased by $1000), Nevada (maximum period 6 months, may be extended additional year; maximum amount in case of silicosis $1250), South Dakota (maximum period 20 weeks; maximum amount $1000); Tennessee (maximum period 1 year; maximum amount $1500), Texas (maximum period 180 days), Vermont (maximum amount $2500), Virginia (maximum period 1 year), West Virginia (maximum amount $1600; additional $800 may be authorized).

able that they may result in extraordinarily high medical and hospitalization costs to be borne by afflicted employees. The inadequacy of the arbitrary limits on medical benefits set by many statutes seems obvious when applied to accidents and diseases caused by overexposure or by the cumulative effects of normal exposure to radioactivity.

There is another consideration indicating that full coverage for medical benefits would be advisable in connection with radiation injuries. If experts in atomic medicine can be obtained to assist state boards in radiation compensation cases, and if unlimited medical aid is extended, publicly supervised treatment of such injuries and diseases will in the course of time make available to the states a backlog of experience which can be used to advantage in regulating atomic industry with respect to health and safety problems. This may well result in increased efficiency in the prevention and cure of the major effects of overexposure to radioactivity and in consequent savings to private atomic industry and to society generally.

B. Rehabilitation Provisions

Statutory provisions for the rehabilitation of disabled workmen are relative newcomers to American workmen's compensation statutes. Already more than twenty states as well as the federal compensation acts provide varying degrees of assistance to injured employees for training purposes aimed at returning them to useful lives in the same or other employments which they can fill despite their disabilities. Artificial limbs and other appliances are included within the medical benefits available under practically all compensation statutes.

Many argue that this feature of workmen's compensation acts results in eventual savings to employers and insurance carriers who can thereby avoid the expense of supporting permanently and totally disabled workers. In addition, under the Vocational Rehabilitation Act, as amended in 1943,[73] a cost-free state-federal program of vocational rehabilitation is open to patients unable to pay.

The states are becoming increasingly aware of the advantages of rehabilitation provisions and many already provide allowances for maintenance and travel while in training. One of the greater obstacles to the full development of this legislative device to offer more meaningful compensation to men handicapped by industrial injuries is the continued presence on the statute books of provisions limiting medical

[73] 57 Stat. 374.

benefits to certain plainly inadequate maximum amounts and periods of time.

Viewing the workability of present legislation on rehabilitation as it concerns private atomic industry, it seems indisputable that the more complete programs currently available will be highly useful. It is entirely possible that the sum total of irradiation of certain workmen in atomic industry may, as the result of repeated accidents or accumulation of low level exposure, render them unfit to pursue further work in exposed areas, for additional exposure might tip the scales so as to precipitate serious disabilities. And yet these men may still be physically and mentally healthy enough to fill positions not involving exposure to radioactivity. When we consider that technicians and even rank and file personnel in atomic industry must at present and in the foreseeable future be possessed of skills which are acquired only through long periods of training and application, it is readily understood that the sudden destruction of their professional capabilities stemming from the necessity of relinquishing their old pursuits may entail severe displacements in their economic life. Adequate provisions for the rehabilitation of such highly qualified personnel may well be deemed a method of effectuating more fully the underlying policies of workmen's compensation legislation.

IV. LIMITATIONS PERIODS ON NOTICE OF INJURY AND FILING OF CLAIMS

A. General Principles in Relation to Radiation Injuries

Among the restrictions, which may add difficulty to the compensability of injuries or diseases caused by the unique qualities of atomic energy, are the requirements of giving notice to the employer and filing of a claim for compensation within a specific time limit. Generally, depending on statutory variations, the injured or diseased employee must give his employer notice of such injury or disease within a specified short period of time, or as soon as practicable. Also, the injured employee must file his claim for compensation within a definite fixed period ranging between three or six months and two years.

The objective of requiring notice to the employer is to enable him to protect himself both by seeing that the injured employee gets adequate medical treatment, so as to minimize damages, and by determining the cause of the injury. This latter point serves the dual purpose of providing the employer a better opportunity to defend himself and of giv-

ing him knowledge of any dangerous condition within the plant which might be corrected before other employees are injured. For example, an unduly delayed notice of an alleged occupational disease might prevent the employer from making a reliable investigation. This would prejudice the employer, for he would be unable to gather the facts with which to defend the claim.

Time limitations upon giving notice and filing claims may prove especially troublesome because of the peculiar nature of atomic injuries. In an article dealing with the latent biological effects of radiation, Dr. G. Failla of Columbia University wrote:

> Radiologists in the early days, when the question of protection was not under study, got their hands particularly exposed to large doses of radiation. They did not see much change at first, but gradually skin changes started to appear. Warts began to develop, and sometimes open sores started to develop. It did not incapacitate them, but perhaps ten or fifteen years later cancer developed in those regions which had shown a considerable change in the appearance of the skin. Thus, you see the latent period can be even twenty-five years. As a matter of fact, there is a case on record in which cancer developed forty years after treatment. This patient was treated in the early days for an abdominal tumor. It probably was not a tumor because she lived forty years after the treatment. In those days X-rays were not very penetrating and the treatment could not possibly have cured the tumor.
>
> It is the latent period which makes the problem of protection extremely complicated, because the worst effects may not appear until twenty-five or thirty years later. To predict the dose today that would produce effects, or rather would not produce effects, twenty-five years later is quite a problem. It would be hopeless if we did not have the experience of many radiologists who have been overexposed to radiation. We have been able to watch them for long periods of time and see what has happened to them, and thus we may arrive at our permissible limits.
>
> Cataracts are another result of overexposure. They do occur from exposure to X-rays, and it also seems that neutrons produce cataracts more readily than X-rays. As you probably read in the papers, individuals who have worked with cyclotrons and had considerable local exposure to neutrons have developed cataracts of various degrees. Some are rather badly affected and some rather slightly. It takes, roughly, three years following the exposure for cataracts to appear. The latent period can be shortened if the dose is very large, but

> the height of the reaction really occurs at about the same time.[74]

In the atomic energy field, for such latent radiation injuries as cancer, leukemia, leukopenia, anemia, cataracts, genetic damage, or sterility, compensability may be barred, depending upon the nature of the applicable statute of limitations. Consideration must therefore be given the various types of limitations expressed in the statutes regarding notice and filing of claim.

B. Notice and Claims for Accidental Injuries

The problem arising under statutes granting compensation for accidental injuries is two-fold. Some states commence the running of the period from the time of the "accident" which caused the disabling condition. Other states date the claim period from the time of the "injury."

Under the former type of statute, notice must be given to the employer within so many days after the "accident," namely the harmful exposure in the case of radiation injuries, and the claim must be filed with the commission within a number of months or two years at the most after the same date. Under the "injury" type of statute the courts are almost unanimous in holding that notice and claim periods begin to run from the time a compensable injury becomes apparent.[75]

An example of the "accident" type of statute is the Kentucky one which reads:

> No proceeding under this chapter for compensation for an injury or death shall be maintained unless a notice of the accident shall have been given to the employer as soon as practicable after the happening thereof and unless a claim for compensation with respect to such injury shall have been made within one year after the date of the accident, or, in case of

[74] Failla, "Biological Effects of Radiation," AEC, TID—388, March 12, 1951, pp. 65-66.

[75] Compare the following: Under "injury" type statutes: Acme Body Works v. Industrial Commission, 204 Wis. 493, 234 N.W. 756 (1931) (cataract developed 6 years after accident compensable), English v. Industrial Commission, 73 Ariz. 86, 237 P. 2d 815 (1951) (injury from inhalation of gas fumes 5 years after leaving employment; claimant entitled to a hearing). Under "accident" type legislation: Lewis v. Carnegie-Illinois Steel Corp., 159 Pa. Super. 226, 48 A. 2d 120 (1946) (cataract developed 5 years after accident; claim barred), Whitted v. Palmer-Bee Co., 228 N.C. 447, 46 S.E. 2d 109 (1948) (cataract developed 18 months after steel chip hit claimant's eye; claim barred), Central Locomotive & Car Works v. Ind. Comm., 290 Ill. 436, 125 N.E. 369 (1919) (blindness 3 years after accident; claim barred).

death, within one year after such death, whether or not a claim has been made by the employee himself for compensation.[76]

Any recovery for latent accidental injuries caused by nuclear radiation may well be barred under such a statute. Or at most, in the absence of square precedents on the point, it may be an open question whether the later development of an injury due to exposure to radioactivity can be compensated in cases in which a workman was never aware of any harmful effect until he became disabled. This happens to be the present state of authority in Kentucky where it is clear that if a worker has suffered a minor compensable accident he is absolutely barred later from recovery for the worsening of his condition after the running of the period of limitations. Thus, in *Fiorella* v. *Clark* [77] the claimant knew immediately after a fall of about five feet from a grease rack that he had suffered minor compensable injuries and received payment from his employer in compromise of his claim. More than one year later it became apparent that the worker had suffered severe spinal injuries. The statute was held to bar this claim, the court saying: "The word 'accident' as used in our Statute does not mean the resulting injury, but means the occurrence itself, the happening of which causes the injury." [78] In the more recent case of *Goode* v. *Fleischmann Distilling Corp.*,[79] the court, in reaching a result similar to that of the *Fiorella* case, expressly left open the question whether, in the case of a latent injury of a kind which was never preceded by a harmful event noticed by the claimant, the statutory period would be tolled until it became reasonably apparent that a compensable injury had been sustained.

The policy argument concerning the choice of the date of the accident as the time from which the period should begin to run, rather than the time when the employee should become aware or actually becomes aware of the fact that he has an industrial injury, probably lies in the fact that the risk of permitting questionable claims to be compensated would be much greater under the latter situation. In the case of latent injuries, intervening factors beyond the employer's knowledge might

[76] Ky. Rev. Stat. §342.185 (1956).

[78] *Id.* at 824. See also Rutledge v. Sandlin, 181 Kan. 369, 310 P. 2d 950 (1957), where workman suffered a severe blow which several months later required surgical removal of a malignant tumor. In denying compensation, the court held that the statutory period started running with the day of the blow rather than with the day of the discovery of the injury.

[79] 275 S.W. 2d 903 (Ky. 1955).

subsequently cause the injury. Further, with the passage of time it becomes increasingly difficult for the employer to defend.

In other "injury by accident" states, the period for giving notice and filing claim commences as of the time of the injury. Thus, where an injury is latent, compensability is not barred because the injury develops some time later.[80] The Mississippi statute, which starts the period from the date of the injury, reads as follows:

> No claim for compensation shall be maintained unless, within thirty days after the occurrence of the injury actual notice was received by the employer or by an officer, manager or designated representative of an employer. . . . Regardless of whether notice was received, if no payment of compensation (other than medical treatment or burial expense) is made, and no application for benefits is filed with the commission within two years from the date of the injury or death, the right to compensation therefor shall be barred.[81]

Since the emphasis here is not upon the date of the accident but upon the occurrence of the injury, latent atomic energy injuries should not be denied compensability.

There is a further problem created where the employee does not realize the occupational connection of his injury within the statutory period following the manifestation of the injury. Does the period commence running as of the time the employee knows that his injury has an occupational connection, or when as a reasonable man he should have known of the occupational connection? For example, the statute of Missouri reads:

> No proceedings for compensation under this chapter shall be maintained unless a claim therefor be filed with the commission within one year after the injury or death, or in case payments have been made on account of the injury or death, within one year from the date of the last payment.[82]

The court, in interpreting this statute, which then had a six months limitation, said: "It seems to be a well-settled rule in respect to latent injuries that the six months' limitation for filing claims for compensation commences to run from the time it becomes reasonably apparent, and discoverable, that the employee has sustained a compensable in-

[80] This, of course, is subject to some other limitations within the statutes. For example, the claim must be filed within 5 years after leaving the employment.

[81] Miss. Code Ann. §6998-18 (1952).

[82] Mo. Rev. Stat. §287.430 (1949).

jury."[83] Under this interpretation of the "injury" type of statute, the period begins to run from the date the employee reasonably should know of his injury. This is important in the radiation injury field since the cause of some injuries may be difficult to determine.

Some states have attempted by statute to meet the problem of latent injuries. In Louisiana compensation claims generally must be filed within one year after the "accident"; however, in the case of latent injuries that statute is extended to two years. The Louisiana statute reads:

> In case of personal injury . . . all claims for payments shall be forever barred unless within one year after the accident or death the parties have agreed upon the payments to be made under this chapter or unless within one year after the accident proceedings have been begun as provided in Parts III and IV of this Chapter. Where such payments have been made in any case, the limitation shall not take effect until the expiration of one year from the time of making the last payment. Also, where the injury does not result at the time of, or develop immediately after the accident, the limitation shall not take effect until the expiration of one year from the time the injury develops, but in all such cases the claim for payment shall be forever barred unless the proceedings have been begun within two years from the date of the accident.[84]

The Louisiana court, in applying the above statute, has held that a suit for a latent injury is maintainable only if it is commenced within one year from the time the injury manifests itself, and within two years of the date of the accident.[85] The limitation to two years, of course, would be inadequate for some radiation injuries, but the statutory approach might be employed for a further relaxation of the notice requirements in respect to latent radiation injuries.

Massachusetts has a provision for ameliorating the harsh effects of the running of the period for the giving of notice and the filing of claim. The law reads in part:

> Failure to make a claim within the time fixed by Section 41 shall not bar proceedings under this chapter, if it is found that it was occasioned by the mistake or other reasonable cause, or if it is found that the insurer was not prejudiced by the delay. . . .[86]

[83] Cleveland v. Laclede Christy Clay Products Company, (Mo. App.) 129 S.W. 2d 12, 16 (1939).

[84] La. Rev. Stat. tit. 23, §1209 (1950).

[85] Hannafin v. Pelican Cracker Factory, Inc., (La. App.) 185 So. 479 (1939).

[86] Mass. Laws Ann. c. 152, §49 (1957).

The effect of this provision is to allow an even more liberal period of time in which to file a claim, if the statutory excuses can be shown. The statutory excuses give the court a wide area of discretion and, in one case, were the basis for holding that seven years' delay in filing a claim was not prejudicial as a matter of law.[87] It has also been held that delay in filing a claim until the employee learned from his doctor that his injury was probably caused by his work was for reasonable cause.[88] On the other hand, the court has held that where delay is due to mistake, the claim must be filed within a reasonable time after the mistake is discovered. The court said that since the statute is silent, a reasonable time will be assumed, and all circumstances should be considered.[89]

New York has recently amended its statute creating a two year statutory limitation period to exclude expressly certain types of atomic energy industry injuries from the scope of the limitation. The New York statute reads as follows:

> The right to claim compensation under this chapter shall be barred, except as hereinafter provided, unless within two years after the accident . . . a claim of compensation shall be filed . . . . The right of an employee to claim compensation under this chapter for disablement caused by . . . blood or lung changes or malignancies due to occupational exposure to or contact with . . . beryllium, zirconium, cadmium, chrome, lead or fluorine or to exposure to x-rays, radium, ionizing radiation or radioactive substances, shall not be barred by the failure of the employee to file a claim within such period of two years, provided such claim shall be filed after such period of two years and within ninety days after disablement and after knowledge that the disease is or was due to the nature of the employment. . . .[90]

This New York legislation obviously anticipates the problem of potential injuries and warrants consideration by other states. However, it is unfortunate that the exception is phrased in terms only of "blood or lung changes or malignancies" since these may be restrictively interpreted so that the exception may not apply to some atomic energy injuries such as sterility, damage to bone marrow, or cataract.

[87] The court would not overrule the finding of the commission that the employer was not prejudiced by the long delay in Morris Gaffer's Case, 279 Mass. 566, 181 N.E. 763 (1932).

[88] Wheaton's Case, 310 Mass. 504, 38 N.E. 2d 617 (1942).

[89] In re Carroll, 225 Mass. 203, 114 N.E. 285 (1916).

[90] N.Y. Workmen's Comp. Law §28, as amended by N.Y. Laws 1957, c. 411.

C. Notice and Claims for Occupational Diseases

Since occupational diseases are the result of chronic exposure to hazards over a long period of time, one anticipates more variety in the selection of the particular event which will start the running of the period. It is possible to choose (1) the time of the last exposure to the hazardous conditions, (2) the time of termination of the employer-employee relationship, (3) the time of the actual disability, or (4) any set period of years following exposure to the conditions which created the disease.

In Arkansas, which treats occupational diseases as injuries by accident, the notice and filing of claim requirements are:

> A claim for compensation for disability on account of injury which is either an occupational disease or occupational infection shall be barred unless filed with the Commission within two years from the date of the last injurious exposure to the hazards of the disease. . . .[91]

This statute commences the running of the period as of the time of the last injurious exposure. Thus, it would cover those injuries which manifested themselves while the employee was still exposed to the hazard, or within two years thereafter. If the employee continued to work on the job and continued to be subject to the hazard, his latent injury would be compensable. The statute does not cover the situation where the employee was transferred to another department, or where the operation creating the hazard was changed, if the incubation period is longer than two years. Since radiation and ingestion of radioactive materials can have a much longer latent period of development, the relation of the statutory period to the last exposure is inadequate.[92] Under Utah law [93] a limitation is imposed upon "partial" disability cases; the partial disability must result within two years following the last day of exposure to the occupational disease to be compensable. If the manifestation of the disease or injury simply resulted in a partial disability two years after the last exposure to radiation or radioactive materials, it would not be compensable.

A slightly different approach is taken by the Arizona statute which

[91] Ark. Stat. §81-1318(a)(2) (1957).

[92] Some other states also have statutory language which sets the period of the statute running, in relation to the time of the last exposure, but which cuts the period off at different times, such as 1 year or 3 years.

[93] Utah Code Ann. §35-2-56(c) (1953).

speaks in terms of "disablement" rather than "last exposure," and reads:

> The right to compensation under this act for disability or death from an occupational disease shall be forever barred unless written claim is filed with the commission. . . . (2) If the claim is made by an employee and based upon a disease other than silicosis or asbestosis it shall be filed within sixty days after the employee first becomes disabled. . . .[94]

Under this statute, it would make no difference when the latent injury or disease occurred because the period of the statute does not commence running until the employee is actually disabled. This could be at any time after the employee had ceased to be exposed to the hazards of radioactive materials. The language should cover all latent injuries, including toxic or radiation ingestion injuries and injuries caused by external exposure to radioactive materials.

However, there is the possibility that the employee, even after his disability occurs, may not discover its relationship to his employment until the sixty day period has elapsed. This is especially true in the case of latent injuries caused by internal irradiation. In many cases the injury may not appear for years after the exposure to radiation or radioactive materials has ceased. Also, radiation-induced diseases such as cancer or leukemia are not peculiar to persons working with radioactive materials. When the factor of time is coupled with the factor of ignorance, the occupational link between the disease and the employment may be difficult to discover even by competent physicians.

Would the discovery of occupational connection between the work and the injury after the sixty day period had elapsed bar the claim? This raises the question of whether "disablement" means not only the actual condition of the injury, but also awareness of its cause. The Pennsylvania court, under a similar statute which cuts off compensation unless notice is given the employer within ninety days after the beginning of disability, has held in *Roschak* v. *Vulcan Iron Works*[95] that where an employee did not realize the industrial connection of his disability within the time limit set by the statute, the date of disability was the date he learned the occupational nature of his disease. In the case, the physician did not inform the employee of the occupational nature of his disease until seven months after he had discontinued work, although he had been under constant medical care in the mean-

[94] Ariz. Rev. Stat. §23-1224 (1956).
[95] 157 Pa. Super. 227, 42 A. 2d 280 (1945).

time. The court adopted a liberal rule of construction, stating that the legislature could not have intended that the employee do the impossible, *i.e.,* file a claim when he was unaware that he had one. The court did suggest, as a limitation on this doctrine, that a possibility that the employee should have known of the industrial connection of the disease would start the statute running. This construction gives the disabled employee a reasonable opportunity to ascertain the industrial connection of his disablement before he is barred by the running of the period.

The Ohio court by way of dictum took the opposite approach in *Raymond* v. *Industrial Commission*[96] applying the statute literally without considering whether knowledge was present or not, saying, "Just why these claimants indulged in these delays is a matter about which this court is not informed nor permitted to concern itself." Under a statute which required that a claim must be filed within six months following the injury, "injury" being interpreted to include occupational diseases, the California court said in *Marsh* v. *Industrial Accident Commission:*[97] "Rather, according to our view should the date of the injury be deemed the time when the accumulated effects culminate in a disability traceable to the latent disease as the primary cause, and by the exercise of reasonable care and diligence it is discoverable and apparent that a compensable injury was sustained. . . ."

In Connecticut the statute does not commence to run until the employee is aware of the industrial connection of his disability:

> No proceedings for compensation under the provisions of this chapter shall be maintained unless a written notice of claim for compensation shall be given within one year from the date of the accident or from the first manifestation of a symptom of the occupational disease. . . . For the purposes of this section, "manifestation of a symptom" shall be deemed to mean its manifestation to the employee claiming compensation, or to some other person standing in such relation to him that the knowledge of such a person would be imputed to him, in such manner as is or ought to be recognized by him as symptomatic of the occupational disease for which compensation is claimed.[98]

The Connecticut court has interpreted this language by stating that: "The other implication arising out of the phrase in question is that there

[96] 140 Ohio St. 233, 42 N.E. 2d 992 (1942).
[97] 217 Cal. 338 at 351, 18 P. 2d 933 (1933).
[98] Conn. Gen. Stat. §7442 (1949).

must be a clear recognition of the symptom as being that of the occupational disease in question; however plain is the presence of the symptom itself, unless its relation to the particular disease also clearly appears, there cannot be said to be a manifestation of a symptom of that disease." [99]

The Wisconsin statute is similar to the Connecticut statute and reads:

> No claim for compensation shall be maintained unless, within 30 days after the occurrence of the injury or within 30 days after the employee knew or ought to have known the nature of his disability in its relation to his employment, actual notice was received by the employer. . . . Regardless of whether notice was received, if no payment of compensation . . . is made, and no application is filed with the commission within 2 years from the date of injury or death, or from the date the employee or his dependent knew or ought to have known the nature of the disability and its relation to the employment, the right to compensation therefor shall be barred, except . . . if the employer knew or should have known, within the 2-year period, that the employee had sustained the injury on which the claim is based.[100]

This legislation has been interpreted fairly literally. In the case of a nurse who had acquired tuberculosis by working in a hospital, but who knew of its connection to her employment more than two years before filing her claim, the court said in *Reinhold* v. *Industrial Commission:*[101] "The statute does not require absolute knowledge of this relationship but simply that the applicant know facts indicating its likelihood. What she probably did not know at that time was that she could get compensation. This is an error of law that we cannot relieve against." In *Trustees, Middle River Sanitarium* v. *Industrial Commission*[102] where a nurse did not know she had contracted tuberculosis the court said: "What an employee thinks must be based on something more than suspicion and conjecture in order to start the running of the statute of limitations. Such thought must be based upon knowledge of, or upon reliable information regarding the nature of his disability and its relation to his employment."

Utah commences the running of the period from the time of the accrual of a cause of action, the statute reading:

[99] Bremner et al. v. Marc Eidlitz & Son, Inc. et al., 118 Conn. 666, 174 Atl. 172 (1934).

[100] Wis. Stat. Ann. §102.12 (1957).

[101] 253 Wis. 606, 34 N.W. 2d 814 (1948).

[102] 224 Wis. 536, 542, 272 N.W. 483 (1937).

> The right to compensation under this act for disability or death from an occupational disease shall be forever barred unless written claim is filed. . . . (b) If the claim is . . . based on a disease other than silicosis it must be filed within 60 days after the cause of action arises. . . .[103]

Since the statute permits the filing of the claim up to sixty days after a "cause of action arises," it could be quite unlimited in scope of coverage for latent occupational diseases, depending upon when a cause of action accrues in an occupational disease case. Such language could be interpreted to mean that the period commences running as of the time of the last exposure, as of the time of the disability, or as of the time the employee is not only disabled but knows of the industrial connection of his disablement. How the Utah court will interpret this language in atomic energy injury cases is not known, but the present attitude of the court is enlightening. In *State Insurance Fund* v. *Industrial Commission*[104] a welder became disabled due to the inhalation of fumes over a period of twenty-two years, but was unaware of the industrial connection of his disability; the court held that the period of the statute had run against him. The welder had not filed the claim within the sixty day limit, although the full facts or reasons therefor did not appear. The court, in reaching its conclusion, said:

> The cause of action arises in this kind of case when the employee suffers compensable disability under the act and could by reasonable diligence ascertain that his disability was employment caused and by its nature compensable. . . . But if on account of his own failure to press his case or have a complete examination made under circumstances which would reasonably put him on notice that he was probably entitled to compensation, he failed to discover that this disability was compensable, then the fault is his own and he cannot recover.[105]

Thus Utah tends to take care of the situation where the individual, even though he is disabled, does not know of the industrial connection of his disease in much the same manner as those states which use the term "disability" and interpret it to mean the time when a disabled employee, as a reasonable man, should know of the industrial connection.

Besides the limitations of the previously discussed language relating

[103] Utah Code §35-2-48(b) (1953).
[104] 116 Utah 279, 209 P. 2d 558 (1949).
[105] *Id.* at 284-285.

to the time when the period commences to run for the giving of notice or the filing of a claim, there are other broad limitations, often in the same statutes. These limitations are designed to cut off liability at some final point, regardless of the fact that the statute may speak in terms of the date of injury or disability as the point from which the statute commences to run.

The statute of Connecticut contains such a limitation:

> No proceedings for compensation under the provisions of this chapter shall be maintained unless a written notice of claim for compensation shall be given within one year from the date of the accident or from the date of the first manifestation of a symptom of the occupational disease . . . provided no claim on account of an occupational disease shall be made by an employee or his dependents against the employer in whose employ the disease is claimed to have originated, except while the employee is still in such employ, or within five years after his leaving such employ.[106]

The additional limitation that the claim has to be filed during the employment or within five years after its termination has the effect of cutting off the period during which the claim may be filed, perhaps even before it has begun to run. If the claim must be filed within one year after the first manifestation of the disease and if the disease does not even materialize within five years after the employment terminates, then liability is cut off without regard to the period.

A distinction would probably be advisable in atomic energy industry between employees still employed and employees who have left for more than five years. Most of the concerns dealing with atomic energy are keeping records of the amount and types of exposure to radiation to which an employee is subjected. This is being done through the use of film badges and various monitoring devices. Therefore, the employer may have some material available in the form of records to use as evidence in disputing latent injury claims by disabled employees. This is a different situation from the case where the employer (*e.g.*, in a stone cutting or grinding operation) does not have any records of the amount of dust to which any employee was exposed, and has, therefore, to conduct the initial investigation when the claim is made. In the atomic energy field, it would seem that since the employer should maintain records, there would be less reason to cut off liability because the passage of time operates to the prejudice of the employer.

[106] Conn. Gen. Stat. §7442 (1949).

The Michigan statute serves to illustrate a slight modification in those provisions which might affect atomic energy injuries. The Michigan statute reads:

> No proceedings for compensation for an injury under this act shall be maintained, unless a notice of the injury shall have been given to the employer within three months after the happening thereof, and unless the claim for compensation with respect to such injury, which claim may be either oral or in writing, shall have been made within six months after the occurrence of the same . . . *Provided, however,* That in all cases in which the employer has been given notice of the injury, or has notice or knowledge of the same within three months after the happening thereof, but the actual injury, disability or incapacity does not develop or make itself apparent within six months after the happening of the injury, but does develop and make itself apparent at some date subsequent to six months after the happening of the same, claim for compensation may be made within three months after the actual injury, disability, or incapacity develops or makes itself apparent to the injured employee, but no such claim shall be valid or effectual for any purpose unless made within two years from the date the personal injury was sustained . . . and *Provided further,* That in all cases in which the employer has been given notice of the happening of . . . said accident within three months after the happening of the same, and fails, neglects, or refuses to report said injury to the compensation commission as required by the provisions of this act, the statute of limitations shall not run against the claim of the injured employee or his dependents, or in favor of either said employer or his insurer, until a report of said injury shall have been filed with the compensation commission.[107]

Provision is made for an extended time in case of latent injuries, provided that the employer has been given notice of the injury within three months of the happening thereof. This statute also provides that the statute of limitations will not run in the event that the employer has notice or knowledge of the happening of the accident or notice of the happening of the injury and does not report this information to the industrial compensation commission. The notice requirements in respect to occupational diseases are made applicable by another section which reads in part:

> The requirements as to notice as to occupational disease and death resulting therefrom and the requirements as to the bringing of proceedings for compensation for disability or

[107] Mich. Stat. Ann. §17.165 (1950).

> death resulting from such occupational disease shall be the same as required in section 15 of part 2 of this act, except that the notice shall be given to the employer within one hundred and twenty days after the disablement.[108]

Under the requirement of this section that notice of occupational disease be given to the employer within 120 days after disablement, the court has held that notice must be given within such time after the employee has knowledge or reasonable ground for knowledge of his disability.[109] The provision of the Michigan statute which does not allow the employer to plead the statute of limitations in regard to the giving of notice unless he has filed a report of the injury, is somewhat unusual. In a case involving benzol poisoning, where the employee subsequently interviewed an official of the defendant company, and the official had made the comment that he did not believe there was any of the "stuff in the finishing room," the court said:

> The reference to the "stuff in the finishing room" demonstrates that the official had knowledge of the fact that the plaintiff attributed his condition to a substance in the room in which he had worked, and, therefore, the defendant employer cannot successfully claim in this case, . . . that, although informed of plaintiff's condition, the employer was not told that it arose out of and in the course of the employment. . . .
>
> In the instant case, the employer had knowledge of the plaintiff's contention within 73 days after the occurrence of the disablement. It filed no report with the department and, therefore, is estopped to plead the statute of limitations.[110]

It should be noted that in accordance with an amendment made subsequently the commission promulgated a rule stating when and what reports of injuries and accidents should be made. Thus, unless the conditions of such injury or accident are such that a report has to be made, the employer is not estopped from using as a defense the statute of limitations.[111] The pertinence of this particular provision to atomic energy injuries lies in the fact that it will give relief from the notice requirements of the statutes in those cases where the employer, with notice or knowledge of the disability, fails to file a report. This might be especially important in the cases of atomic energy injuries because even though the employer may know of the disability, there may be considerable confusion regarding the industrial connection of such disability.

D. Summary

From the available evidence, atomic energy injuries often may be of a latent nature. In workmen's compensation laws the "injury by accident" statutes generally start the period for notice and the filing of claims as of the date of the accident. However, some states start the period running from the date that the injury appears. Another course is that of making a statutory exception in the case of latent injuries. Also, whereas some states do not start the period running until the injury develops, others go one step further, and do not commence the period running until the employee would also know of the industrial connection of his injury. As for occupational diseases, some statutes start the period running as of the date of the last injurious exposure to the condition or hazard which caused the disease, while others commence it as of the time the disability appears. At least one statute starts the period when a cause of action accrues. Many other limitations appear even where these requirements which concern the running of the period are met. Some states impose an over-all limitation, such as one year or five years, following the occurrence of the disability. Others cut off the claim within so many years after termination of employment. Of possible significance in atomic industry is the use of a provision that the employer may not use the defense of the statute of limitations if he does not file a report with the industrial commission. It may be concluded, therefore, that the amount of coverage afforded latent atomic energy injuries will depend in most cases upon the period of time allowed, after exposure to radiation, for filing the claim or giving notice. The application of notice and claim provisions to atomic energy injuries can be determined fully only by experience. It already seems evident that even on the basis of present knowledge of the nature of these injuries, and the causal relation between them and atomic radiations, amendments of the more restrictive statutes are desirable or essential.

V. RECOMMENDATIONS

Since atomic energy is already a significant factor in industrial operations and is destined to become even more important in our society, it seems clear that workmen's compensation laws should be amended to accommodate radiation injuries to the existing statutory patterns. There seems to be no reason at this time to conclude that an entirely separate compensation system is essential to deal adequately with the

peculiar features of atomic energy. Therefore, we conclude that each state should amend its laws to attain the following objectives:

1. Complete coverage of all radiation injuries sustained as a result of an accident.

2. Complete coverage of all radiation injuries which may be classified as occupational diseases.

3. Satisfactory second injury fund provisions in order to assist persons who have suffered prior radiation injuries to secure additional employment.

4. Apportionment of liability among employers where the worker has been exposed in a number of employments and a cumulative radiation injury results. (More accurate scientific and medical data are required before a satisfactory method of handling this objective can be resolved.)

5. Medical benefit payments in a sufficient amount and for a sufficient period to provide essential medical care for persons suffering radiation injuries.

6. Limitations period for filing notice of injury and claims sufficiently flexible to permit recovery for latent injuries and to permit recovery when the injured person discovers the connection of his employment to his injury.

It may be argued that these extensions of existing legislation will unduly burden atomic energy entrepreneurs. However, it must be remembered that employees may still face serious handicaps in proving that a particular injury was caused by radiation exposure. In fact, at some future date it may become necessary to change the burden of proof in respect to certain radiation injuries. Necessarily the workmen's compensation boards will have to exercise considerable discretion to assure that all real injuries are compensated and at the same time deny compensation in those cases having tenuous or even imaginary bases. The boards have had considerable experience in drawing similar lines under existing legislation, and it appears that they will be able to administer efficiently statutory provisions designed to handle radiation injuries. Furthermore, as experience is gained and as more scientific information concerning radiation injuries is developed, it will be possible to revise the governing legislation accordingly. Meanwhile, both employers and employees in atomic energy industry will find it beneficial if the state legislatures adopt statutes sufficiently broad to award compensation for those sustaining injuries during the infancy of the industry.

PART III

STATE REGULATION OF ATOMIC ENERGY

Chapter I

INTRODUCTION *

A prospective entrepreneur in the field of peaceful uses of atomic energy is immediately faced with the task of investigating and evaluating existing and potential types of governmental regulation. Among the crucial questions that must be answered are: (1) What types of governmental regulation will be encountered in financing, constructing, and operating atomic energy facilities? (2) What aspects of regulation will be unduly burdensome? (3) Can regulation be minimized properly by selection of place of activity, or by selection of financial and corporate organization techniques, or by requesting changes in legislation and regulation? Similarly, those responsible for formulation of public policies must examine such questions as: (1) Are existing powers and regulations adequate from the standpoint of protection of the public interest, health, and safety for application to atomic energy activities? (2) Do existing regulations unduly restrict the development of a new technology? (3) Should new legislative and administrative regulatory techniques be developed for the control of atomic energy activities?

The purpose of this study is to present a brief survey of the principal types of state and interstate regulations likely to have application in the development of an atomic energy industry both for the generation of electric power and for other industrial uses. Although it is too early to encounter any considerable number of statutes and regulations dealing with the peculiar problems arising out of the use of fissionable and radioactive materials, some explicit recognition of these issues has already found its way into the books. Moreover, many aspects of the development of atomic energy will be regulated extensively under statutes originally adopted for other purposes but general enough in nature to embrace atomic affairs. Since the earliest commercial utilization of atomic energy seems likely to be the production of electrical

* The authors wish to acknowledge the research assistance of Marvin O. Young, Legislative Analyst, Legislative Research Center, University of Michigan, member of the Michigan Bar, A.B., Westminster College, J.D., Michigan, 1954; Ivor M. Richardson, Legislative Analyst, Legislative Research Center, University of Michigan, Solicitor of the Supreme Court of New Zealand, LL.B., New Zealand, LL.M., S.J.D., Michigan, 1955; and Charles D. Olmsted, Research Assistant, Phoenix Project, University of Michigan, member of the Michigan Bar, LL.B., Michigan, 1957.

energy, considerable emphasis will be placed upon state public utility regulations which may affect the financing, construction, and operation of nuclear power reactors. In addition, state health and safety regulations will be emphasized because of the hazardous aspects of the utilization of fissionable and radioactive materials.

Federal, international, and certain types of state regulation will, however, be omitted from this discussion. For example, state labor relations acts, various forms of social insurance laws, general corporation laws, and blue sky laws are not discussed, since they are applicable to industry generally and have no unique application to the atomic energy field. Local zoning ordinances and building regulations are likewise excluded, for they are too localized and varied in character, although, of course, they must be explored prior to embarking upon an enterprise located in any particular locality. Furthermore, in the interests of brevity, the details of the specific legal problems arising out of the statutes and regulations will not be discussed, the purpose of this study being primarily to provide a check list which atomic energy entrepreneurs and governmental policy-makers may use as a basis for further investigation of specific legal problems. Limited in this manner, this study will serve to reveal the scope and character of the legal and policy problems raised by state regulatory enactments which must be considered in formulating plans for the development of a peacetime atomic energy industry.

In order to reduce the breadth of the examination of state regulations affecting atomic energy developments, ten states have been selected for the study: California, Illinois, Michigan, Missouri, New Jersey, New York, Ohio, Pennsylvania, Texas, and Wisconsin. Furthermore, because of the wide variations found from state to state in the distribution of regulatory powers among various state and local agencies, it has been found preferable to analyze the effect of these powers according to type of regulation rather than type of agency.

Chapter II

PUBLIC UTILITY REGULATION

The use of a nuclear reactor to generate electric power would undoubtedly subject the power plant to regulation as a public utility. All ten of the states under study have created regulatory commissions, commonly called public utility commissions or public service commissions, to regulate specified businesses said to be "affected with a public interest" and known as public utilities. It should be noted at the outset, however, that because electric companies are excepted from the jurisdiction of the Texas commission, an atomic energy electric power plant in Texas would encounter no regulation by a state public utility commission, although it would be subject to a rate-making power which has been delegated to incorporated cities and towns.[1]

The extent of the jurisdiction of the commissions in the nine states other than Texas is, of course, determined by statute, subject to constitutional limitations. In considering the jurisdiction of the commissions in these nine states, the first question encountered is whether an atomic energy power plant, engaged in generating electricity, falls within the statutory jurisdiction of the state commissions. In the event electricity is supplied directly to consumers, the power plant would unquestionably be subject to regulation by the respective public utility commissions. With the possible exception of Ohio, it also seems clear that an atomic power plant which sells electricity at wholesale to other electric companies would also be subject to the jurisdiction of the various state utility commissions. For example, the New York statute gives the Public Service Commission jurisdiction over "the manufacture, conveying, transportation, sale or distribution of . . . electricity" and over "electric plants" and "persons or corporations owning, leasing or operating the same." [2] The term "electric plant" includes "all real estate, fixtures and personal property operated, owned, used or to be used for or in connection with or to facilitate the generation, transmission, distribution, sale or furnishing of electricity. . . ." [3] It seems clear that the language embraces an atomic power generating plant. It would seem, moreover, that the definition is sufficiently broad to

[1] Tex. Civ. Stat. art. 1119.
[2] N.Y. Public Service Law §5(2).
[3] *Id.*, §2(12).

include a separate corporation operating a nuclear reactor and engaged in the business of selling heat energy to a generating station for conversion by the generating company into electric energy. In defining terms such as "public utility," "electric corporation," and "electric plant," the statutes of the other states are equally broad.[4]

However, a different situation may prevail in Ohio. There, "public utility" is defined as: "An electric light company, when engaged in the business of supplying electricity for light, heat, or power purposes *to consumers* within this state." [5] The Ohio Supreme Court has held that a plant supplying electric energy to other utility companies for distribution is not a public utility within the Ohio statute, and the statute has not been amended since this decision was rendered.[6] A corresponding provision defining a "gas company" [7] was amended in 1933 to include a person or corporation engaged in the business of supplying artificial or natural gas to consumers or of supplying artificial gas to gas companies or natural gas companies.[8] Thus, it is not unlikely that the Ohio legislature may amend the statute in order to include an electric company supplying electricity to other electric companies. Nonetheless, only Ohio among the states having commissions regulating electric companies would seem to permit a general industrial firm to avoid regulation by the device of selling power to existing utilities rather than directly to consumers.

Assuming that the nuclear plant itself is denoted a public utility and thereby subjected to regulation, what are the restrictions imposed upon one or a group of existing utilities in attempting to finance, construct, and operate a nuclear reactor for producing electricity? Moreover, what restrictions are imposed on investment by a general industrial firm in an atomic power corporation? In considering these questions, four specific problems have particular significance: (1) regulation of the acquisition of an atomic reactor by a corporation organized for the specific purpose, or by an existing corporation; (2) restrictions affecting the purchase of voting common stock in an atomic power corporation; (3) regulation of transactions between affiliated utility companies; and (4) rate regulation.

A. Regulation of the Ownership of an Atomic Reactor by a Corporation Organized for the Specific Purpose, or by an Existing Corporation

The development by private capital of atomic energy for power production may take place under a variety of organizational forms. An existing utility company may acquire an atomic reactor, owning and operating it within its existing corporate structure. Or it may be found advisable, at least during the experimental and developmental stage, to organize a separate corporation to construct and operate the reactor. Several statutes which may be applicable, depending on the organizational pattern adopted, and which present problems unique to the atomic energy business, must be consulted.

1. Ownership of Nuclear Reactor by an Existing Corporation

Whether an existing public utility corporation could legally own a nuclear reactor without altering its corporate powers depends, of course, on the charter of the corporation involved. However, notwithstanding the uniqueness of the source of energy, it would seem that generation of electric current, whatever the means used, and research for improved methods of generation would be rather clearly incidental to the business of supplying consumers with electric power; hence, there is little likelihood that such a venture would be deemed *ultra vires*.

Actually, considerations other than corporate power to purchase a nuclear reactor probably will be controlling in determining whether the reactor should be owned by an existing public utility company or by one created for the special purpose. These considerations include financing, possible effect on rate determination, and damage liability problems.

2. Certificates of Convenience and Necessity

Obtaining a certificate of public convenience and necessity is frequently a prerequisite to the initiation of a new type of activity on the part of a public utility. Statutes of six of the ten states covered in this survey specifically require that such a certificate be obtained before an electric utility may construct a plant. Of these six statutes, that of California is typical:

> No . . . electrical corporation . . . shall begin the construction of a . . . plant, or system, or of any extension thereof, without having first obtained from the commission

> a certificate that the present or future public convenience and necessity require or will require such construction.[9]

Moreover, a certified copy of the corporation's charter must be filed with the state commission, and any required municipal or county franchise must be obtained.[10] The statutes of Illinois, Michigan, Missouri, and New York are substantially the same.[11] The Wisconsin statute is somewhat more elaborate and detailed than those of the above five states. It permits the public service commission to require the utility periodically to submit plans of proposed construction. Furthermore, the commission is empowered to refuse a certificate if it appears that the completion of the project

> . . . (a) will substantially impair the efficiency of the service of such public utility; (b) provides facilities unreasonably in excess of the probable future requirements, or (c) will, when placed in operation, add to the cost of service without proportionately increasing the value or available quantity thereof unless the public utility shall waive consideration by the commission, in the fixation of rates, of such consequent increase of cost of service.[12]

Until nuclear reactors are proved to be commercially competitive, this statute will undoubtedly have a substantial effect because of the probable high cost of constructing the early nuclear reactors. Moreover, prospects of developing within a few years technological processes for commercial utilization of the fusion process and improved methods of using the fission process may lead public utility commissions to exercise cautiously their power to issue certificates of convenience and necessity because of a possible high obsolescence factor in first commercial reactor designs. It is likely that a similar result will also be reached in states that have adopted the California type of statute. As will be noted later, the problem of rate determination is one that is likely to assume considerable importance in the development of atomic energy for power purposes.

The statutes of Pennsylvania, while not specifically requiring permission to build a plant, require, subject to minor exceptions not relevant here, that a utility must obtain a certificate before acquiring any kind of property from any person.[13] This seemingly would em-

[9] Cal. Public Utilities Code §1001.

[12] Wis. Stat. (1957) §196.49(4).

[13] Pa. Stat. Ann. tit. 66, §1122.

brace plant construction.[14] In addition, in Pennsylvania and also in Missouri, the commissions are specifically given authority, in granting certificates of convenience and necessity, to impose such conditions as they deem reasonable and just.[15] These statutes obviously place great power in the hands of these commissions.

New Jersey and Ohio do not require that a certificate of convenience and necessity be obtained by a utility before it may construct a major property addition.[16] As previously noted, Texas has no state commission with jurisdiction over electric companies.

It may be mandatory in some states to incorporate an atomic power plant in the state in which it is to be operated in order to obtain a certificate of convenience and necessity. An Ohio statute provides:

> No franchise, permit, license, or right to own, operate, manage, or control any public utility which is an electric light company . . . shall be granted or transferred to any corporation not incorporated under the law of this state.[17]

Substantially identical provisions are found in the laws of California, Illinois, and Wisconsin.[18]

3. Financing a Corporation to Construct a Nuclear Reactor

State statutes frequently regulate various aspects of public utility financing. The statutes of nine of the ten states under study require that all proposed electric utility security issues be approved by the state public utility commissions, subject to a few minor exceptions to be noted later. Again, Texas is the exception.[19] These statutes are almost certain to affect substantially the financing of early nuclear electric power plants, especially for the reason that such developments frequently take the form of cooperative action by several utilities or possibly a combination of utilities and industrial corporations. Indeed, it may appear that desired financing programs are precluded by the applicable state regulatory statutes.

[14] The state officials so reported to the Federal Power Commission; see FPC, State Commission Jurisdiction and Regulation of Electric and Gas Utilities 24 (1948).

[15] Mo. Rev. Stat. (1949) §393.170; Pa. Stat. Ann. tit. 66, §§1121, 1123.

[16] FPC, State Commission Jurisdiction and Regulation of Electric and Gas Utilities 24 (1948).

[17] Ohio Rev. Code §4905.62.

[18] Cal. Public Utilities Code §704; Ill. Stat. Ann. c. 111 2/3, §28; Wis. Stat. (1957) §196.53.

[19] FPC, State Commission Jurisdiction and Regulation of Electric and Gas Utilities 26 (1948).

New York and Wisconsin were the first states to create the modern type of public utility commission with broad powers. Many states have patterned their laws, to some extent, upon these pioneer statutes.[20] For this reason the New York utility financing statute will be examined in some detail.

The New York statute provides that an electric utility corporation may issue stocks, bonds, notes, or other evidences of indebtedness if it has obtained from the public utility commission an order authorizing such issue, stating the purposes to which proceeds thereof are to be applied, and declaring that, in the opinion of the commission, the money, property, or labor to be procured or paid for by the issue of such stock, bonds, etc., is reasonably required. The purposes for which such securities may be issued are enumerated: (1) acquisition of property, (2) construction, completion, extension, or improvement of plant or distributing system, (3) improvement or maintenance of service, (4) refunding, (5) reimbursement of moneys "actually expended from income or from other moneys in the treasury of the corporation not secured or obtained from the issue of stocks, bonds, notes or other evidences of indebtedness. . . ." [21]

As a matter of procedure, in New York, a public utility must obtain a certificate of convenience and necessity authorizing construction of a new plant before the public service commission can authorize the issuance of securities to finance it.[22] A rather important judicial decision holds that consent may be given for issuance of securities only for purposes designated in the statute.[23]

The statutes of California, Illinois, Michigan, Missouri, and Ohio contain provisions very similar to those of New York.[24] In each of these statutes, construction of new facilities is stated to be a purpose for which securities may be issued.

The New Jersey statute is less specific and provides merely that the commission shall approve the proposed issue when the commission is satisfied that the issue is in accordance with law, and the commission approves it as within authorized purposes. The executive officer of the Board of Public Utility Commissioners in New Jersey has indicated

[20] Trachsel, Public Utility Regulation 111-112 (1947).

[21] N.Y. Public Service Law §69.

[22] People ex rel. N.Y. Edison Co. v. Willcox, 207 N.Y. 86, 100 N.E. 705 (1912).

[23] P.S.C. v. N.Y. & Richmond Gas Co., 244 App. Div. 398, 279 N.Y. Supp. 824 (1935).

[24] Cal. Public Utilities Code §§816-819; Ill. Stat. Ann. c. 111 2/3, §21; Mich. Stat. Ann. §22.101; Mo. Rev. Stat. (1949) §393.200; Ohio Rev. Code §4905.40.

that, when confronted with a proposed security issue to finance an atomic energy facility, the New Jersey commission would consider the question as to whether or not such a plant could be expected to produce electric energy at or below the unit costs of a conventional plant.[25] In Pennsylvania and Wisconsin the commissions are empowered to take into account the present and probable future capital needs of the public utility and "other relevant considerations" when an application for approval of a security issue is presented.[26] Presumably, all of these states would consider the possibility of initial reactors becoming obsolete at an early date because of improved technology or because of the development of processes for commercial exploitation of the fusion process.

The commissions of six states, California, Michigan, Missouri, New Jersey, New York, and Ohio are authorized to require competitive bidding on security issues, although none of them actually requires it in all cases.[27]

In view of these statutes requiring a commission permit to raise funds by the issuance of securities, cooperative action may be precluded unless the corporate contribution can be drawn from surplus.

a. Exemption of Short-Term Loans

Conceivably the request for a financing permit could be avoided by resort to short-term loans. The New York statute permits an electric corporation to issue notes "for proper corporate purposes," payable at periods of not more than twelve months, without approval of the commission.[28] Without further limitations, there is nothing to prohibit a utility from renewing these notes from year to year. However, the New York commission seeks to combat this practice whenever possible, as for example by requiring as a condition for approval of a bond issue that the company submit a plan for retirement of its outstanding short-term notes.[29] There is some indication that the New

[25] Letter from H. J. Flagg, dated Aug. 25, 1953. He also felt that the New Jersey commission would not be faced with the problem for many years because of an adequate supply of oil, coal, and natural gas providing for cheap thermo-electric generation in New Jersey.

[26] Pa. Stat. Ann. tit. 66, §1243; Wis. Stat. (1957) §184.03.

[27] FPC, State Commission Jurisdiction and Regulation of Electric and Gas Utilities 7 (1948).

[28] N.Y. Public Service Law §69.

[29] Re The Patchogue Electric Light Co., 73 P.U.R. (N.S.) 129 (1948). In this case, unsecured notes were involved. However, the statutory language appears to cover both secured and unsecured notes.

York courts might hold such a condition unlawful as in excess of the commission's powers, although no such decision has actually been rendered.[30] The Missouri statute is nearly identical with that of New York.[31]

In California, Illinois, and Pennsylvania, notes maturing in less than one year are exempted, but limitations on renewal are included in the California and Illinois statutes.[32] Michigan permits financing by notes maturing within twenty-four months without the consent of the Public Service Commission, but a refunding limitation is imposed.[33]

In Wisconsin, obligations maturing in less than one year are exempt, since such obligations are not included in the statutory definition of "security," requiring approval.[34] In New Jersey and Ohio the statutes are silent as to short-term obligations, but approval is required for those payable at periods of twelve months or more, hence short-term notes are exempted by implication.[35]

Accordingly, the short-term note possibility of financing cooperative atomic power development is attended by numerous difficulties and is by no means an assured method of avoiding regulation of security issues.

b. New York Public Service Commission—Basic Principles

Certain other aspects of financing warrant mention at this juncture. All that can be done at present is to suggest certain problems that may have to be faced and the attitudes that seem to prevail among public utility commissions.

The New York Public Service Commission indicates that approval of public utility securities should be guided by seven basic principles: (1) the issue must be for proper corporate purposes; (2) it must be adequately supported by assets; (3) there must be a proper ratio between funded debt and capital stock; (4) the utility must show that earnings will be sufficient to meet interest or dividends on securities

[30] See 22 Fordham L. Rev. 77, 81 (1935). In Rochester Gas & Electric Corp. v. Maltbie, 298 N.Y. 867, 84 N.E.2d 635 (1949), it was held that the commission had no power to require, as a condition to approving a security issue, that a certain type depreciation accounting be followed.

[31] Mo. Rev. Stat. (1949) §393.200.

[32] Cal. Public Utilities Code §823; Ill. Stat. Ann. c. 111 2/3, §21; Pa. Stat. Ann. tit. 66, §1241.

[33] Mich. Stat. Ann. §22.101.

[34] Wis. Stat. (1957) §184.01(3).

[35] N.J. Rev. Stat. (1937) §48:3-9; Ohio Rev. Code §4905.40.

authorized; (5) the utility must make an effort to obtain the best terms possible; (6) financing costs must be reasonable; (7) competitive bidding and public sale may be required in some cases.[36] Although similar policy enunciations have not been issued by other public utility commissions, it may be expected that they will follow some, if not all, of these principles.

Of these enumerated principles, two warrant special attention. The ratio between funded debt and capital stock may cause difficulty. The New York commission attempts to limit the proportion of bonds and fixed interest obligations to a maximum of 60% of the total capital structure.[37] This limitation is significant because of the preference of utilities for use of a higher percentage of debt obligations in high-cost undertakings.[38]

Again, the requirement of a showing that earnings will be sufficient to meet interest and dividends on securities authorized may prove to be a substantial problem in view of possible high operating costs of initial electric generating plants employing atomic fuel. This problem seems intimately related to the matter of rate determination, and a further discussion of it will therefore be deferred until the rate-making problem is analyzed.

B. Restrictions Affecting the Purchase of Securities of an Atomic Power Corporation

In the event that a separate corporation should be formed to construct and operate a nuclear reactor generating plant, it is necessary to determine what restrictions may be imposed upon the ownership of stock in such a corporation. In this connection, it is desirable to consider the effect of state regulatory measures upon a form of organization that involves stock ownership of the nuclear reactor public utility by existing electric utility companies and also by non-utility companies. Related to this general problem is the more specific question of whether either type of corporation has authority to acquire and own stock in a nuclear generating plant company. Limitations on methods of financing the purchase of such stock likewise demand attention.

1. Regulation of Acquisition by Utility Companies of Stock in Other Utility Companies

Many states require that the acquisition of voting stock of certain types of corporations by other corporations be approved by a state commission. In the electric utility area this requirement is very common. In eight of the ten states surveyed in this study, there is a requirement that a public utility company must obtain the permission of the public utility commission before it may acquire stock in another public utility. Only the Michigan and Texas statutes fail to impose such a limitation upon electric utilities. The ramifications of the statutes vary considerably. In some instances, bonds as well as stock are included.[39] In seven states, approval of the public utility commission is necessary when any amount, no matter how small, of the stock of one utility is acquired by another utility.[40] However, in Pennsylvania approval of the commission is required only when a public utility seeks "to acquire five per centum or more of the voting capital stock of any corporation." [41]

It is difficult to determine the standards that will be applied in determining whether in any particular instance the acquisition of stock by one public utility in another utility will be approved. Statutes are frequently rather general in nature, conferring broad discretionary powers upon the commissions and typically requiring that the commission shall approve the acquisition if it is "consistent with the public interest." [42] Other statutes are completely silent regarding the standards to be applied by the respective commissions.[43] In such states no doubt the public interest criterion is also applied by implication.

On the other hand, the statutes of several states appear to be somewhat more restricted in scope. For example, the California statute apparently requires approval of the commission only when the stock to be acquired is that of a utility "organized or existing under or by virtue of the laws of this State." [44] In Illinois, New Jersey, and Wis-

[44] Cal. Public Utilities Code §852.

consin approval apparently is required only for the purchase of stock in utilities *operating* within the state.[45]

Ohio has a somewhat unique statute concerning the necessity for commission approval of stock acquisitions by public utilities in other public utilities. The statute provides:

> With the consent and approval of the public utilities commission:
>
> (A) Any two or more public utilities furnishing a like service or product and doing business in the same municipal corporation or locality within this state, or any two or more public utilities whose lines intersect or parallel each other within this state, may enter into contracts with each other that will enable them to operate their lines or plants in connection with each other.
>
> * * *
>
> (D) Any such public utility may purchase the stock of any other such public utility.[46]

These provisions apparently mean that acquisitions by one public utility of the stock of another utility need be approved only if both are operating in the same locality, or if their lines are parallel or intersect.[47]

As a result of this type of regulation, existing utilities desirous of investing in an atomic power corporation will have to obtain commission approval by showing the necessary prerequisites. A commission policy opposing such investments will preclude public utilities from engaging in a jointly sponsored enterprise to develop atomic power.

2. Regulation of Acquisition by Non-Utility Companies of Stock in Electric Utility Companies

Only three of the ten states under study require commission approval in case of a non-utility company seeking to acquire the capital stock of an electric company. The New York statute provides: ". . . [N]o stock corporation of any description, domestic or foreign, other than a gas corporation or electric corporation . . . shall purchase or acquire . . . more than ten per centum of the voting capital stock issued by any gas corporation or electric corporation organized or

[45] Ill. Stat. Ann. c. 111 2/3, §10.3; N.J. Rev. Stat. (1937) §48:2-13; Wis. Stat. (1957) §196.01(1).

[46] Ohio Rev. Code §4905.48.

[47] 33 Ohio Jurisprudence 521. Such a restrictive interpretation of the section has been made by the Ohio Public Utilities Commission in respect to Clause (A); see Re Cincinnati Gas and Electric Co. No. 827 (1916) O.P.U.C.R. 419, P.U.R. 1916 D 929; Re Cincinnati Gas and Electric Co. No. 3112 (1924) O.P.U.C.R. 122.

existing under or by virtue of the laws of the state . . ." unless approved by the Public Service Commission.[48] However, the commission may not act arbitrarily in refusing its approval.[49] A Missouri statute is patterned after the New York provision.[50] The third state, New Jersey, requires approval by the Board of Public Utility Commissioners when, as a result of the sale of any portion of the capital stock of a public utility incorporated in New Jersey, there will be vested in any corporation, domestic or foreign, "a majority in interest of the outstanding capital stock of such public utility corporation." [51]

Where non-utility companies must obtain commission approval to purchase securities of an atomic power corporation, a restrictive commission policy may prevent a jointly owned project. In view of the substantial interest of chemical companies in nuclear reactor technology and resulting radioactive byproduct wastes and materials, these regulatory provisions may have a particularly unique effect on possible cooperation among utility and chemical companies in atomic energy affairs.

3. Financing the Purchase of Common Stock in an Atomic Energy Power Plant

Financing the purchase of common stock in an atomic energy power plant by existing electric utility companies presents some additional problems apart from the above-mentioned requirements that security issues be approved by state public utility commissions, and that security acquisitions by public utilities likewise be approved. Again, the fact that several utilities may wish to join in a cooperative effort during the early stages of the development of atomic power gives particular pertinence to these provisions. If any existing utility should have insufficient surplus with which to finance such a purchase, and should it desire to issue stocks, bonds, or debentures to cover such financing, approval by the state public utility commissions would be needed in all states under study except Texas.

[48] N.Y. Public Service Law §70.

[49] See New York State Electric Corp. v. Public Service Commission, 227 App. Div. 18, 236 N.Y. Supp. 411 (1929), 260 N.Y. 32, 182 N.E. 237 (1932). The Appellate Division held that the Public Service Commission had acted arbitrarily in refusing to permit a New York electric utility to sell stock to a Delaware holding company. The Court of Appeals in ruling that the order of the Appellate Division was not appealable seemed to say, however, that the order of the Appellate Division did not limit or destroy the discretion of the Public Service Commission.

[50] Mo. Rev. Stat. (1949) §393.190(2).

[51] N.J. Rev. Stat. (1937) §48:3-10.

In an administrative proceeding to obtain authority to issue stocks or bonds to finance the purchase of stock in an atomic energy corporation, there may be uncertainty as to whether or not it is a corporate purpose for which the commission may approve a security issue. It will be recalled that the statutes of New York, California, Ohio, Michigan, Missouri, and Illinois enumerate the purposes for which a public utility may issue securities. These purposes include: (1) the acquisition of property; (2) the construction, completion, extension, or improvement of its plant or distributing system; and (3) the improvement or maintenance of its service. The New York courts have approved the action of the Public Service Commission interpreting this statute to preclude approval of security issues for purposes other than those enumerated.[52]

The Ohio commission, under a nearly identical statute, had prior to 1945 repeatedly held that securities of another company do not constitute *property,* within the act, and that an issue for the purpose of acquiring such securities cannot be approved.[53] Probably because of these decisions, the Ohio statute was amended in 1945 to permit a public utility to issue shares of common stock (bonds are not mentioned) to acquire or pay for shares of common capital stock of another public utility, when approved by the commission. But certain limitations are imposed, including a requirement that the applicant must acquire 65% or more of the issued and outstanding common stock of the company whose shares are to be acquired. Moreover, the public utility whose shares are to be acquired must be located in Ohio or in an adjoining state so as to permit the operation of the properties as an integrated system.[54] In August 1953 the general counsel of the Ohio Edison Company was asked to comment on this statute. His reply indicated that with respect to his company, the statute has not been a problem, since they financed stock purchases in other utilities from "uncapitalized capitalizable expenditures"; in other words, from surplus.[55] However, in the absence of such reserve funds the Ohio statutes would become an obstacle.

In states other than Ohio, the commissions might approve the issuance of stocks or bonds to finance the purchase of electric utility

[55] Letter from D. Bruce Mansfield, dated Aug. 31, 1953.

securities either on the theory that such securities constitute "property" or that they are being purchased for the "improvement or maintenance of service." [56] As hitherto noted, the statutes of New Jersey, Wisconsin, and Pennsylvania are less specific than New York in regard to the purposes for which securities of public utilities may be issued, and accordingly in those states less difficulty could be anticipated. Nevertheless, a prospective entrepreneur in the atomic reactor field will be obliged to inquire of the state commissions to ascertain their views concerning approval of a security issue to finance the purchase of common stock in an atomic energy power plant. A letter received from the New Jersey Board of Public Utilities Commissioners indicates that because the cost of generating electricity by the use of nuclear fuels may prove to be higher than by conventional methods, the commission will be obliged to consider this factor in determining whether or not to grant the necessary approval for a security issue.[57]

C. Regulation of Transactions Between Affiliated Companies

Again, because some type of joint financing among public utilities and non-utility corporations may be desirable during initial phases of developing the atomic power industry, atomic energy entrepreneurs are necessarily interested in the regulations that are imposed in respect to the resulting intercorporate arrangements. In some instances this regulation may be considered so unacceptable to some firms, particularly non-utilities, that they may not consider it feasible to engage in a joint venture.

It must be kept in mind that state commission regulation of utilities varies not only with the statutes of the various states, but also with the strictness or liberality with which the commissions and courts interpret the laws granting regulatory power to administrative agencies. While certain commissions interpret their powers narrowly, others extend their regulatory authority to activities reached only by a broad construction of the pertinent statutes.[58] This difference in basic approach is manifested especially in the area of regulation of intercorporate relations between public utilities and affiliates.

Transactions with affiliates can be regulated to some extent without

[56] There are no reported court decisions defining these terms in other jurisdictions.

[57] Letter from H. J. Flagg, Executive Officer, N.J. Department of Public Utilities, dated Aug. 25, 1953.

[58] See FPC, State Commission Jurisdiction and Regulation of Electric and Gas Utilities (1948).

specific statutory authority, for such regulation is really an implied part of the power to control rates in that the commission may consider the propriety and reasonableness of expenditures of utilities subject to its jurisdiction.[59]

However, expressly authorized state regulation of such relations began in 1930 when New York and Wisconsin specifically accorded their commissions jurisdiction over these matters.[60] Because of federal constitutional difficulties, the states have resorted to indirect regulation of transactions with affiliated holding companies: by asserting jurisdiction over contractual relations of all local utilities over which they have jurisdiction, the states thereby reach affiliated companies regardless of whether they are domestic or foreign corporations. A 1932 United States Supreme Court decision upheld this type of state control.[61] Today, only California, Michigan, and Texas, of the ten states herein examined, do not have specific statutory provisions for regulation of transactions with affiliates of public utilities.[62] The other seven state commissions all exercise some degree of regulation over contracts and transactions between affiliated companies.

On the basic preliminary question of what constitutes "affiliated interests" the statutory definition is likely to be very comprehensive, as in New York. There such interests are defined to include:

> a. Every corporation and person owning or holding directly or indirectly five per centum or more of the voting capital stock of such utility corporation.
>
> b. Every corporation and person in any chain of successive ownership of five per centum or more of voting capital stock.
>
> c. Every corporation five per centum or more of whose voting capital stock is owned by any person or corporation owning five per centum or more of the voting capital stock of such utility corporation or by any person or corporation in any such chain of successive ownership of five per centum or more of voting capital stock.
>
> d. Every person who is an officer or director of such utility corporation or of any corporation in any chain of successive ownership of five per centum or more of voting capital stock.
>
> e. Every corporation which has one or more officers or one or more directors in common with such utility corporation.
>
> f. Every corporation or person which the commission may

> determine as a matter of fact after investigation and hearing is actually exercising any substantial influence over the policies and actions of such utility corporation even though such influence is not based upon stockholding, stockholders, directors or officers to the extent specified in this section.
>
> g. Every person or corporation who or which the commission may determine as a matter of fact after investigation and hearing is actually exercising such substantial influence over the policies and actions of such utility corporation in conjunction with one or more other corporations and/or persons with which or whom they are related by ownership and/or blood relationship or by action in concert that together they are affiliated with such utility corporation within the meaning of this section even though no one of them alone is so affiliated.[63]

The Illinois definition is substantially similar, except that the percentage of stock ownership is fixed at ten per cent, instead of five per cent as in New York.[64] The Wisconsin definition is nearly identical with that of New York.[65] All three state commissions are empowered to obtain the names of all shareholders who own one per cent or more of the voting capital stock of utilities under their jurisdiction.[66] The Pennsylvania definition of "affiliated interests" also employs the five per cent stock ownership criterion as well as the "substantial influence" test.[67] New Jersey defines affiliated interests only in terms of five per cent stock ownership.[68]

As to the type of regulation imposed on affiliated interests, the statutes in these states generally require that contracts providing for management, construction, engineering, accounting, legal, financial, or similar services must be filed with and approved by the state public utility commissions, and that contracts found to be not in the public interest may be disapproved by the commission.[69] The commissions are also given the power to examine all necessary accounts and records relating to transactions between affiliated interests.[70] These controls

are, of course, familiar to public utilities, but for many non-utility industries, such controls are often considered so restrictive on management policies that management scrupulously avoids subjection to the regulation. If financing an atomic power development in any area is rendered more difficult by these provisions, a re-examination of the desirability of the regulation may be warranted in order to encourage development of the new technology.

The statutes of Missouri and Ohio do not employ the term "affiliated interests," but the commission of each of these states has reported to the Federal Power Commission that it has jurisdiction over transactions with affiliates.[71] In Missouri it seems that the Public Service Commission regards the transactions between affiliates as within its rate-making authority, although there appears to be no express statutory provision giving it this power of control. There are several provisions in the Ohio statutes dealing with the subject. One states that when and as required by the Public Utilities Commission, "every public utility shall file with it a copy of any contract, agreement, or arrangement, in writing, with any other public utility relating in any way to the construction, maintenance, or use of its plant or property, or to any service, rate, or charge." [72] Another Ohio statute provides that if the consent of the Public Utilities Commission is obtained, "Any two or more public utilities furnishing a like service or product and doing business in the same municipal corporation or locality within this state, or any two or more public utilities whose lines intersect or parallel each other within this state, may enter into contracts with each other that will enable them to operate their lines or plants in connection with each other." [73] In neither of these states is it clear what kinds of transactions among affiliates are actually regulated since there are no reported court decisions or statements of commission policy interpreting the scope of the commissions' powers.

Since it may be desirable in the early stages of development of the atomic power industry to engage in a jointly financed product, these provisions will also have considerable importance for atomic energy entrepreneurs.

[73] *Id.*, §4905.48(A).

D. Rate Regulation Problems

The primary function of public utility commissions is the determination of rates that may be charged by the regulated public utilities. Many of the regulatory powers conferred on public utility commissions, such as the supervision over accounting, control of capitalization and security issues, and regulation of intercorporate relations, are added for the principal purpose of effectuating and perfecting control over rates.[74] All of the states under study excepting Texas provide for the regulation of electric rates by a state commission. In Texas rate-making power is delegated to the governing body of each incorporated town or city.[75]

The rate-making function of public utility commissions involves many complex and technical concepts, and no attempt will be made here to explain and discuss the many ramifications which have been the subject of extended discussion in legal periodicals and treatises. However, several unique rate-making problems which may stem from the development and use of nuclear reactors for the production of electrical power should be noted. These problems may be divided conveniently into two categories: (1) the treatment of expenditures for research and experimentation by existing electric utilities in the initial stages of the development of atomic energy for power production, and (2) accounting and rate-making problems which may arise from the construction and operation of a full-scale atomic power plant financed by private capital.

1. Expenditures for Research and Experimentation

At present, certain electric utility companies are expending considerable sums for research and experimentation in the use of nuclear reactors as a source of heat to generate electricity. The position taken by the state utility commissions concerning the allowance of these expenditures for rate-making purposes will have a significant bearing upon the amounts utility companies are likely to spend for the development of this new form of heat energy. To the extent that these expenditures are allowed to be charged to operating expenses (or perhaps capitalized and then amortized), they are of course being borne by the consumer. It is important, therefore, to examine the considerations which will influence the decisions of the commissions and to

[74] Barnes, *supra* note 59 at 282.
[75] Tex. Civ. Stat. art. 1119.

attempt to ascertain their attitude or probable attitude in regard to this matter.

At present, nearly seventy-five per cent of the electrical power produced in the United States is derived from steam-electric plants utilizing coal, oil, and gas as fuels. The remaining twenty-five per cent is produced in hydro-electric plants. The electrical power needs of the United States have been increasing tremendously year by year. In 1953 the electric energy production was 442.7 billions of kilowatt hours as contrasted with a total production of 141.8 billions of kilowatt hours in 1940. Since available water power is limited, steam-electric production has been steadily gaining in relative importance as a power source.[76] As compared with 75.8 millions of kilowatt capacity available in 1951,[77] it is estimated that by 1960 the required generating capacity will be about 164 millions of kilowatts, and by 1970, 205 millions of kilowatts. In view of diminishing supplies of coal, oil, and gas used in steam-electric generation, the importance of discovering a new source of heat energy becomes obvious. Atomic energy appears to be an excellent solution for increasing power needs, and the public will benefit. However, much research and experimentation will be necessary before atomic fuels may be utilized as a source of energy at a cost competitive with conventional fuels. Even the possibility of valuable byproduct production still leaves the balance sheet in a questionable state. If atomic energy does prove to be a cheaper source of energy, the public will benefit even more. These considerations certainly seem to indicate that public utility commissions will be fully justified in allowing substantial expenditures to be charged against operating expense for the development of this new power source. Therefore, in rate proceedings, allowances for the expenditures would seem to be eminently reasonable.

There are only a few reported rate cases in which allowance of expenditures for research has been a contested issue. Of course, payments to affiliates for services have frequently been questioned by utility commissions, but in such cases the question has usually been whether the payments have exceeded costs reasonably incurred by the affiliate furnishing the services.[78] State utility commissions have allowed reasonable expenditures for advertising and promotional activi-

[76] See FPC, Thirty-Fourth Annual Report 7, 63 (1955).

ties to be claimed in rate proceedings.[79] Somewhat more analogous to the development of electric power from atomic energy are the allowances which have been made for costs of development of new wells by the gas utility industry. Limited expenditures for research and for development of new gas sources have been allowed as operating expenses in some cases [80] but large expenditures have usually been treated as capital outlay.[81]

The public utility commissions of the nine states (Texas being excluded) have been surveyed in an effort to determine their attitude toward expenditures for research and experimentation in the use of nuclear reactors for power production. The commissions of three states have indicated that they would allow "reasonable" expenditures for such purposes. The Pennsylvania Public Utility Commission recently in a rate proceeding allowed a "substantial sum" to be claimed for this purpose.[82] While such expenditures have not been involved in rate cases in Michigan and Wisconsin, the public service commissions have taken official action by prescribing that the expenditures be charged to Account No. 801, Miscellaneous General Expenses.[83] This accounting treatment results in the expenditures being allowed as operating expenses in current rate-making proceedings. This procedure has been recommended by the Accounting Committee of the National Association of Railroads and Utilities Commissioners (NARUC).[84] The California Public Utilities Commission has indicated that no official action has been taken in this matter.[85] No information on this specific problem could be obtained from the other five state commissions.

It seems probable that most public utility commissions will allow

[85] Letter from R. J. Pajalich, Secretary, Cal. Public Utilities Commission, April 15, 1954.

reasonable expenditures for research and experimentation in the use of atomic fuels to be charged to operating expenses in the rate-making process. Most states do not have formal procedures whereby such expenditures can be approved in advance, but instead the question is determined by the allowance or disallowance in a subsequent rate proceeding.[86] Therefore, companies contemplating such expenses will presumably follow the usual practice of trying to obtain the informal consent of the state commission before substantial expenditures are incurred. In this connection it should be noted that the Pennsylvania Public Utility Commission is authorized by statute to require public utilities to file budgets of estimated expenditures. The commission may reject part or all of any contemplated expenditure found to be "contrary to the public interest." If rejected at this stage, the expenditure will not subsequently be allowed in a rate or valuation proceeding. If not rejected, the commission may nevertheless subsequently determine whether expenditures made under the budget were reasonable.[87] In New Jersey, Ohio, and Wisconsin budgets are required by regulation to be submitted in advance to the public utility commissions.[88] Since the statutes contain no provisions concerning such budgets, it is doubtful if the commissions of the three latter states have authority to reject proposed expenditures. In all probability, expenditures for atomic research may be charged to operating expenses, but the possibility that a commission may later either reject them as unreasonable or require a portion to be capitalized and subsequently amortized should not be overlooked. If the latter were done, the amount thus capitalized would become a part of the rate base until written off in subsequent years.[89]

Apparently, the federal government is taking the position that the taxpayers generally should bear some part of the costs of research in the development of atomic energy for power production and other purposes. For example, under the agreement between the AEC and the Duquesne Light Company for the construction and operation of the nation's first full-scale atomic power plant, Duquesne supplied only a portion of the reactor costs plus the generating facilities; other costs were absorbed by the federal government, with the electricity generated

[86] Barnes, *supra* note 59 at 605.

[89] See Burt and Highsaw, "Developmental Costs Under the Prudent Investment Theory," 94 U. of Pa. L. Rev. 1, 11 (1945).

going through Duquesne's distribution system to consumers at rates comparable to those charged for conventionally generated electricity. The Power Demonstration Reactor Program of the AEC, initiated in 1955, also contemplates considerable federal financial assistance in the form of research assistance without charge, research and development contracts, and the waiver of certain source and special nuclear material charges.[90] The object of this program is to promote the development of nuclear reactors for power production in the hope that future development of the technology will produce a fully competitive operation.

Of course, no question concerning the propriety of research expenditures will arise in rate proceedings if the research costs are underwritten by a government subsidy, and in all probability, the federal government will continue to contribute to the development of atomic energy for peacetime uses. Private industry, however, is expected to contribute financially to the costs of atomic research and experimentation even under the Power Demonstration Reactor Program.[91] Whenever such private contributions are made, the question of how they will be treated for rate-making purposes will become important.

2. Construction of a Full-Scale Atomic Power Plant

There is little doubt that after further research and experimentation in the use of atomic fuels, it will become financially feasible for private capital to build electric power plants utilizing such fuels in conjunction with conventional generating equipment. The commencement of such a program does not seem too remote, especially if favorable uses for byproducts can be developed. When this stage is reached, several regulatory problems somewhat unique in the electric utility field may arise. These problems can be understood only in the light of certain fundamental postulates regarding the cost of power and the role of a nuclear reactor in a power plant.

The cost of power from any source may be said to be comprised of

[90] Power Demonstration Reactor Program: "First Round," AEC Release No. 589 (Jan. 10, 1955); "Second Round," AEC Release No. 695 (Sept. 21, 1955); "Third Round," AEC Release No. 953 (Jan. 7, 1956). See CCH Atomic Energy Law Rep. ¶3021ff.

[91] *Ibid.* Also see Atomic Energy Act of 1954, §33, 42 U.S.C.A. §2053, which provides: "Where the Commission finds private facilities or laboratories are inadequate to the purpose, it is authorized to conduct for other persons, through its own facilities . . . [such research and development activities] . . . as it deems appropriate to the development of atomic energy. The Commission is authorized to determine and make such charges as in its discretion may be desirable for the conduct of such activities and studies."

two major elements, first, operating expenses and fixed charges (including, among the former, labor, fuel, materials, and among the latter, taxes, depreciation, and obsolescence) and second, return on capital (including interest and dividends, these being limited to a fair return on the fair value of the assets). In theory, the utility is entitled to establish a rate schedule which will result in total revenue equal to the aggregate of these costs. A conventional thermal-electric generating station may be considered as having two major components, one providing steam from heat energy sources and the other generating electricity by the use of the steam in the turbine. In an atomic power plant, the latter component will be substantially the same, but a reactor will be substituted as the heat source to produce steam. In a typical thermal-electric generating station utilizing conventional fuels, approximately one half of plant cost per kilowatt of capability is attributed to each of these two components.[92] The total per kilowatt cost of installed capacity of a conventional plant ranges between $150 and $250.[93] Present estimates of the per unit construction cost of a nuclear power plant greatly exceed these figures.[94] Moreover, it is undoubtedly a fact that the first nuclear plants will suffer a very high rate of obsolescence occasioned by the rapid development of the technology. Furthermore, development of methods of commercially utilizing the thermonuclear process may make present reactor technology obsolete in a relatively short period. However, entrepreneurs in the field hope that the resulting higher fixed charges and capital expenses can be offset in two ways: by lower operating expenses, principally because of lower fuel costs, and by the production and sale of byproducts. It will be deemed feasible from a competitive cost standpoint to construct and operate an atomic power plant when it appears that the reduction occasioned by fuel economies plus returns from the sale of byproducts compensate for the increase in construction costs, plus the higher obsolescence charges.

As noted earlier, before a new plant may be constructed it is necessary in most states to obtain a certificate of convenience and necessity from the state public utility commission. In determining whether such a certificate will be granted, or whether a proposed security issue to finance the plant will be approved, one factor that will surely be taken into account by most commissions is whether the new plant can be

[92] Cisler, *supra* note 77 at 64-65.
[93] AEC, Fifteenth Semi-Annual Report 17 (1954).
[94] *Ibid.*

expected to produce electric energy at as low or lower a unit cost as a plant of conventional design.[95] Until a nuclear plant can produce electric power at as low or nearly as low a per unit cost as that of existing generating methods, it is doubtful whether necessary commission approval can be obtained (excepting always for the small margin allowable in the name of research and development). Increasing scarcity of conventional fuels plus increased handling costs will certainly accelerate the time when favorable competitive costs can be shown, and this is a factor to be considered by the commission. Furthermore, there are already certain areas in the country where higher than average fuel costs may possibly make an atomic reactor plant economically feasible at the present time. In the absence of these conditions, there may be a possibility of obtaining approval upon the condition that only a part of the capital expenditure will be included in the rate base for future rate-determination. Apparently this is a device that may be utilized in at least one state, Wisconsin,[96] although it can not be regarded as an attractive course of action for any utility concerned.

If a certificate of convenience and necessity is issued for the construction of a nuclear plant which produces more expensive power than that produced in conventional plants, there is no legal assurance that actual costs will be reflected in the rate base for the purpose of determining rates. The issuance of the certificate of convenience and necessity by the state public utility commission merely represents a determination by the commission that the proposed construction is in the public interest. On subsequent rate proceedings the valuation of the facility is determined *de novo* as a legal matter. In other words, the issuance of the certificate does not commit the public utility commission to any specific valuation although the facility must be given some value since the certificate represents a determination that the construction was in the public interest. In fact, most state public utility commissions consider several costs, including reproduction cost, replacement cost, historical cost, and the original cost, in the valuation process. Therefore, the atomic energy power entrepreneur has no legal assurance that he will be able to recoup all costs through the established rate structure. If a statute authorized the public utility commission to commit itself to a specific valuation at the time of issuing a certificate of convenience and necessity, the atomic energy entrepreneur would then be able to proceed

[95] See especially Wis. Stat. (1957) §196.49. Letter from H. J. Flagg, N.J. Board of Public Utility Commissioners, dated Aug. 25, 1953.

[96] See Wis. Stat. (1957) §196.49.

with full knowledge of whether or not the consumer would be required to bear some portion of the increased costs occasioned by a change in generating methods at the time the atomic power plant is constructed. But as a practical matter, and wholly apart from the question of statutory authority, state commissions probably will decline to make binding decisions at the time of certifying the construction for the reason, among others, that many of the estimates of cost will necessarily be somewhat speculative in nature.

There are those who predict that all of the foregoing considerations may result in several private utility companies refraining from building nuclear power plants until they are actually known to be competitive with existing methods.[97] When that time arrives the development of atomic energy as a power source will not affect rates, except possibly in a downward direction if the new source produces relatively cheaper power.

There is a further aspect of the matter that demands consideration. If it proves possible to produce and sell byproducts from an atomic power plant in sufficient quantity to affect the balance sheet materially and thus to produce power at costs competitive with power from conventional fuels, several additional problems will be raised.

Today, there appear to be two primary types of marketable atomic energy byproducts.[98] First, fissionable material may be produced and sold; secondly, radioisotopes and radioactive waste products of value may be produced, refined, and sold. Fissionable materials have value as the initial charge for new reactors, as fuel replacements for nonbreeding reactors, and for military purposes. Reactor-produced radioisotopes will also yield substantial revenues, for they are being used in increasing quantities by industry, medicine, and agriculture. As of the end of June 1957, 4,109 organizations in the United States were licensed to use radioisotopes by the AEC,[99] and the number of users and shipments continues to increase. Furthermore, an increasing number of new uses of radioisotopes by industry, medicine, and research can be expected as the technology advances.

One problem of a unique character arises out of the fact that under

[97] This proposition was suggested by Leon Schwartz, Chairman, Pennsylvania Public Utility Commission, in a letter dated Oct. 7, 1953.

[98] "Byproducts" is used in a broader sense here and is to be distinguished from that used in the Atomic Energy Act of 1954. Under Section 11e, 42 U.S.C.A. §2014(e), "byproduct material" means any radioactive material except special nuclear material (fissionable material) produced in the processes of producing or utilizing fissionable material.

[99] AEC, Twenty-Second Semi-Annual Report 31 (1957).

the Atomic Energy Act of 1954, the federal government takes title to all special nuclear material (fissionable material) produced in private operations.[100] Lawful private producers are to be paid a "fair price" [101] for their product. Moreover, the federal government has retained a monopoly over the distribution of fissionable materials, and normal competitive pricing and sales thereof are not to be expected in the near future. In respect to radioactive byproducts, under Section 81 of the Atomic Energy Act of 1954, the AEC is authorized to distribute, "with or without charge," radioactive byproduct material.[102] To date the practice of the AEC has been to distribute radioisotopes at cost. Accordingly, as to fissionable materials the only market is the government; and as to other radioactive materials, the cost prices established by the federal government probably will have to be met by private utilities producing the same products. Therefore, abnormal market conditions are to be expected, and this fact not only has its bearing on rate regulation, but it presents some unusual problems of federal-state relations.

Another important question is the effect of the production and sale of byproducts on rate-making. Public utility commissions may treat the byproduct aspect of a nuclear reactor business in one of two ways, each of which will bear a definite relation to the establishment of power rates.

First, the byproduct operations may be treated as an entirely separate and distinct activity. In that event, costs directly attributed to each activity will have to be accounted for separately, and costs attributable to both activities will have to be properly allocated between them.[103]

[100] 42 U.S.C.A. §2072. "Special nuclear material" is defined as plutonium, uranium enriched in the isotope 233 or in the isotope 235 or any other material determined by the Commission to be capable of releasing substantial quantities of atomic energy.

[101] 42 U.S.C.A. §2072.

[102] *Id.*, §2111. Radioisotopes for biomedical, agricultural, and medical research are available to domestic users at 20 per cent of catalog price. AEC Release No. 627 (April 21, 1955).

[103] In several cases collateral operations of a utility have been treated as entirely separate for purposes of rate making. See, for example, Re Farmers Elevator Co., 1928A P.U.R. 469 (North Dakota) (grain elevator and electricity); Re Estelline Telephone & Electric Co., 1917F P.U.R. 151 (South Dakota) (telephone and electricity); Milwaukee Electric R. & Light Co. v. Milwaukee, 1919D P.U.R. 504 (Wisconsin) (heating and electricity); Re Manchester Street Railway, 19 N.H.P.S.C.R. 421 (1937) (New Hampshire) (street railway and electricity); Re Lockport Light, Heat & Power Co., 12 P.U.R. (N.S.) 413 (1935) (New York) (steam and electricity); Monticello v. Blue Mountain Irrigation Co., Case No. 1489 (Oct. 29, 1935) (Utah) (irrigation and electricity); Re Northwestern Electric Co., 36 P.U.R. (N.S.) 202 (1940) (FPC) (steam heating and electricity); Re Arkansas Power & Light Company, 55 P.U.R. (N.S.) 129 (1944) (Arkansas) (water, street railway, steam

The allocation of costs will be most difficult in regard to a nuclear reactor. A requirement that a large percentage of the costs be attributed to the separate and distinct byproduct operation will make electricity rates lower but may make the byproduct operation unprofitable. At the same time a different allocation of costs could conceivably make the byproduct operation extremely profitable. The method of allocation of costs will undoubtedly be prescribed by most public utility commissions. Except for Texas, all states examined in this study grant to their commissions a board authority over accounting.[104] Furthermore, in several states there are statutes which relate specifically to accounting aspects of non-utility business of a public utility. For instance, an Illinois statute provides:

> The Commission may require every public utility engaged directly or indirectly in any other than a public utility business, as defined by law, to keep separately in like manner and form the accounts of all such other business, and the Commission may provide for the examination and inspection of the books, accounts, papers and records of such other business, in so far as may be necessary to enforce any provision of this Act. The Commission shall have the power to inquire as to and prescribe the apportionment of capitalization, earnings, debts and expenses fairly and justly to be awarded to or borne by the ownership, operation, management or control of such public utility as distinguished from such other business.[105]

A second method of treating the byproduct operation would be to regard it as an integral part of the utility operation and, in establishing electricity rates, to include in the total estimated income, revenues anticipated from byproduct sales. This method has been employed in respect to certain gas utility byproducts such as coke, tars, and gasoline.[106] Moreover, in cases in which a subsidiary or affiliate has refined certain

---

heat, ice, and electricity); Re Consolidated Gas, Electric Light & Power Co., 61 P.U.R. (N.S.) 94 (1945) (Maryland) (gas, steam heat, merchandising, and electricity); Detroit v. Detroit Edison Co., 50 P.U.R. (N.S.) 1 (1943) (Michigan) (steam heating and electricity, where there was no physical interdependence).

[104] FPC, State Commission Jurisdiction and Regulation of Electric and Gas Utilities 22 (1948).

[105] Ill. Stat. Ann. c. 111 2/3, §12. See also Ill. Stat. Ann. c. 111 2/3, §8. Substantially identical provisions relating to electric companies may be found in Mo. Rev. Stat. (1949) §393.140(12); and N.Y. Public Service Law §66(13).

[106] See Re Uniform System of Accounts, 1917D P.U.R. 122 (New York); Re Los Angeles Gas & Electric Corp., 1919D P.U.R. 140 (California); Re Portage American Gas Co., 26 Wis. R.C.R. 369 (1922); Green Bay v. Wisconsin Public Service Co., 1922B P.U.R. 671 (Wisconsin); Re Wisconsin Gas & Electric Co., 1922C P.U.R. 829 (Wisconsin); Re Great Falls Gas Co., 1922D P.U.R. 385 (Montana).

byproducts, public utility commissions have required the parent utility to include in its estimated revenues a substantial percentage of the net proceeds from sales, even though the contract between the utility and subsidiary or affiliate may have established a different percentage.[107] Thus, when the revenues from byproduct sales are substantial, they will be reflected in lower electricity rates.

To summarize, whether the production and sale of byproducts is treated as an entirely distinct activity or as an integral part of the utility operation of an atomic energy facility, the byproduct aspects of the business will have a definite effect on rate-making. The greater the net proceeds of the byproduct activity, the lower will be the cost of electricity.

One additional aspect pertinent to rate-making should be mentioned. Public utility commissions may seek to impose, as a condition on the issuance of a certificate of public convenience and necessity for the construction of an atomic power facility, the requirement that the utility will not charge higher rates than those permitted for electricity produced by a conventional facility. Whether or not the imposition of such a condition is permissible under existing law is perhaps questionable, for statutory authority is ordinarily not explicit, and the commissions have apparently not hitherto attempted to impose such limitations under other circumstances.[108] As a matter of policy, it would seem inadvisable for commissions to impose such conditions, since they would unduly hamper the development and use of the new technology. Only through experience in operation can it be expected that the most economical methods of utilizing atomic energy will be achieved. Nonetheless, it must be recognized that the cost estimates of an atomic energy facility will be examined by the utility commission and will be taken into consideration in connection with the issuing of certificates. In fact, it would be extremely difficult for a commission to decide that a reactor plant producing electricity at a cost, for example, twice that of conventional plants should be regarded as constructed "in the public interest," at least if the costs are to be borne by the consumer by the imposition of

[107] See, for example, United Fuel Gas Co. v. Kentucky Railroad Commission, 278 U.S. 300, 49 S. Ct. 150 (1929); Charleston v. Public Service Commission, 95 W.Va. 91, 120 S.E. 328 (1924); East Ohio Gas Co. v. Cleveland, 27 P.U.R. (N.S.) 387 (1939) (Ohio); Hope Natural Gas Co. v. FPC, 134 F.2d 287, 47 P.U.R. (N.S.) 129 (1943).

[108] However, under the Federal Power Act, licenses contain limitations requiring that rates be computed upon the basis of original cost and that excess earnings be kept in reserve. See 16 U.S.C.A. §§803 *et seq.*

higher rates. Thus, the probable fixed charges and capital expenses and treatment of revenues from sale of byproducts will receive careful consideration both in issuing certificates of public convenience and necessity and in subsequent rate proceedings.

E. Conclusions

By way of summary of the foregoing discussion of the effect of public utility regulation statutes on atomic energy development we may observe that:

(1) Industrial development of atomic energy for power purposes poses several unique financial problems for an existing stabilized public utility and all pertinent statutes and regulations must be carefully analyzed before any particular financial organization or arrangement can be agreed upon;

(2) Moreover, advance approval of many types of expenditures in the highly regulated public utility industry appears desirable if the economic costs are to be borne by the consumers; and

(3) Finally, the accounting treatment of atomic energy byproducts costs and revenues should be ascertained at the earliest possible date because of the potential effect upon utility rates.

In some instances, it will doubtless happen that unfavorable public utility commission orders will prevent particular utilities from establishing nuclear reactor facilities, and especially will this be true if no opportunity for recoupment of costs is provided. Such action may make the raising of capital difficult, if not impossible, of achievement. On the other hand, if lower power costs may eventually be expected, it would seem that most public utility commissions will look favorably upon investments by existing utilities in nuclear reactor power facilities.

Chapter III

HEALTH AND SAFETY REGULATION

As with many industrial operations, proper precautionary measures must be taken in making industrial use of atomic energy if serious hazards to employees and the general public are to be avoided. The use of atomic energy presents a number of unique hazards, not so much from sudden atomic accidents, although these may occur, as from the cumulative effect of exposure to excessive radiation, the damaging effects of which may not be known for many years. However, the general nature of the hazards is known and so are the techniques for preventing or minimizing them. In the program of the Atomic Energy Commission, expenditures for radiation protection of workers as well as the public consume a substantial portion of the total expenditures for atomic energy development.[1] Under the Atomic Energy Act, the Commission has imposed rather stringent health and safety standards, not only on operations in government-owned installations, but also upon licensees who obtain and use fissionable materials and radioisotopes for private research and other purposes.[2] The experience of the Commission clearly indicates that the application of rigorous health and safety standards makes it possible to use atomic energy for many, if not most, peacetime purposes without endangering the health of workers or the public generally.[3]

Excessive radiation may become dangerous to health and even life in either of two ways. Due to close physical proximity to an external source of radiation, such as might result from inadequate shielding of radioactive materials or improper disposition of radioactive wastes, the human body may be injured by exposure to the source of radiation. Another type of radiation injury which can be even more serious than external radiation results from the ingestion of food, liquids, or gases contaminated by radioactivity. Radioactive particles which are ingested may remain lodged inside the body until the radioactivity has spent itself, which in the case of certain isotopes may be greatly in excess of

[3] AEC, Eighth Semi-Annual Report, "Control of Radiation Hazard in the Atomic Energy Program" (1950).

the life of the victim. This is referred to as internal radiation. Even small amounts of either type of radiation can have a very harmful effect on both animal and plant life. Therefore, in industrial use of atomic energy, the problem of protection against radiation hazards is a very important one. Not only are the hazards insidious in nature, just as with several other industrial operations, but the precautionary measures are often very expensive.

In 1954, in asking Congress to amend the Atomic Energy Act of 1946 to allow private industry to enter the field, President Eisenhower recommended the continuation of provisions authorizing the Atomic Energy Commission to establish minimum health and safety standards to govern the use and possession of fissionable and radioactive materials.[4] As a result, the Atomic Energy Act of 1954, like the 1946 Act, gives the Commission a broad authority to establish such standards.[5] This authority presents some unique problems for federal-state relationships in the regulation of health and safety with respect to industrial users of atomic energy.

Whether or not Congress intended to pre-empt the field of radiation health and safety regulation of Atomic Energy Commission licensees from state control, and the extent to which it may constitutionally do so, are questions for which no very clear answers exist at the present time. Prior to and at the time the Atomic Energy Act of 1954 was passed, Congress has very little to say on the subject, and the act itself does not contain an unequivocal statement of intent. Similarly, the case authority on the general subject of federal pre-emption in other areas of government activity is in a state of some confusion. Because the purpose of this chapter is to examine the general pattern of state health and safety regulation in the ten states selected for study—to consider the types of state agencies which may be involved, their respective jurisdictions, and the nature of their powers—analysis of the pre-emption questions is deferred until Chapter V of this Part where recent state radiation health and safety regulations are discussed in some detail. In this chapter it is assumed that state agencies may exercise power in respect to those radiation hazards regulated by the Atomic Energy Commission.

There are three general categories of state agencies which may possess specific authority under existing statutes to regulate various health and

[4] Message of the President to Congress, dated Feb. 17, 1954, New York Times, Feb. 18, 1954, p. 8, col. 8.

[5] 42 U.S.C.A. §§2133, 2134.

safety aspects of the use of atomic energy for industrial purposes. If private industry constructs plants which utilize nuclear fuels to generate electricity, the public utility commissions may have such authority. Furthermore, state labor departments or industrial commissions [6] are typically given authority to promulgate rules and regulations to protect the health and safety of employees. Finally, state and local health boards or departments usually exercise extremely broad powers over matters of health and safety. Thus, both labor and health agencies are likely to possess powers affecting the operation of atomic energy power plants even though public utility commissions also have regulatory powers in this area. In fact, the following discussion will demonstrate the confusing pattern of potential regulation and the overlapping jurisdiction of regulatory agencies in every state embraced in this study.

A. Public Utility Commissions

In the ten states surveyed in this study, most of the public utility commissions have been given general statutory authority that would permit the establishment of health and safety regulations relating to the construction and operation of atomic energy power plants. Since the first privately owned nuclear power generating station is yet to be built, there has been no occasion for the issuance of health and safety regulations by state public utility commissions relating to the operation of such a plant, but the authority is there ready to be exercised at the appropriate time. Actually, some of the commissions have not attempted to assert their health and safety regulatory powers, even in respect to conventional plants, and Texas, as previously indicated, has no state utility commission with jurisdiction over electric utilities.

In California, Illinois, and Missouri the state utility commissions are granted statutory authority to require a public utility, by special or general order, to construct, maintain, and operate its plant, equipment, and premises in such manner as to promote and safeguard the health and safety of its employees and the public generally.[7] However, none of these commissions has exercised its powers in this respect.[8]

[6] The name of the agency exercising rule-making power over the safety of employees varies from state to state.

[7] Cal. Public Utilities Code §768; Ill. Stat. Ann. c. 111 2/3, §61; Mo. Rev. Stat. (1949) §386.310,

[8] See Cal. Adm. Code, tit. 20, for regulations of the Public Utilities Commission. Letter from Marvin P. Moore, Secretary of the Missouri Commission, March 15, 1954. The Illinois Commerce Commission has not replied to a specific inquiry concerning health and safety regulations and available published records reveal no exercise of the authority.

The Wisconsin Public Service Commission has power to "make reasonable rules, regulations, specifications and standards for the installation, operation and maintenance of all safety devices and measures." [9] Another section of the Wisconsin statutes provides that every public utility which owns, controls, or operates any wires over which electricity is transmitted "shall construct, operate and maintain such wires and the equipment used in connection therewith in a . . . safe manner. . . ." [10] The commission may also order "any alteration in construction or location or change of methods of operation required for public safety. . . ." [11] As a matter of practice, in Wisconsin the Public Service Commission collaborates with the Wisconsin Industrial Commission in the preparation of the Wisconsin Electric Safety Code, and these two commissions administer the code jointly.[12] The Public Service Commission administers that part of the code having to do with outside plant and equipment, and the Industrial Commission administers that relating to inside equipment.[13] This method of demarking lines of authority serves to alleviate possibilities of duplicating and inconsistent regulation by the two agencies. In other states the extent of the jurisdiction exercised by these two types of agencies is not so clearly defined.

The New York Public Service Commission is given authority to investigate methods employed in manufacturing electricity, and it has power "to order such reasonable improvements as will best promote the public interest, preserve the public health and protect those using such gas or electricity and those employed in the manufacture and distribution thereof. . . ." [14] Many years ago, in 1913, an order was promulgated by the Public Service Commission relating to safeguarding and protecting employees from injury resulting from generating equipment, but it was revoked in 1932.[15] No other regulations relating to the health and safety of employees have been found. Moreover, it should be noted that the term "factory," as defined for purposes of the jurisdiction of the New York Labor Department, excludes generating plants of public utilities subject to the jurisdiction of the Public Service Commission.[16]

[9] Wis. Stat. (1957) §195.03(18).

[10] *Id.*, §196.74.

[11] *Ibid.*

[12] Provision is made for this type of joint administrative action in Wis. Stat. (1957) §20.904.

[13] Letter from George P. Steinmetz, Commissioner, Wis. Public Service Commission, March 29, 1954.

[14] N.Y. Public Service Law §66(2).

[15] 5 N.Y. Official Compilation of Codes, Rules & Regulations 1435, 1437 (1945).

[16] N.Y. Labor Law §2(9).

But whether the statutory definition means that the Public Service Commission is intended to have exclusive jurisdiction over the adoption of standards to protect the health and safety of employees of electric plants utilizing nuclear energy is apparently far from clear.[17]

The Ohio Public Utilities Commission is given general supervision over the manner in which public utilities are operated with respect to the "adequacy or accommodation afforded by their service, the safety and security of the public and their employees." [18] The commission also may require that repairs, improvements, or additions be made to the plant or equipment of any public utility "in order to promote the convenience or welfare of the public or of employees. . . ." [19]

In Pennsylvania the service and facilities of public utilities must conform with regulations and orders of the Public Utility Commission, and every public utility "shall make all such repairs, changes, alterations, substitutions, extensions, and improvements in or to such service and facilities as shall be necessary or proper for the accommodation, convenience, and safety of its patrons, employees, and the public." [20] A letter from the chairman of the Pennsylvania Public Utility Commission states: "While this Commission has express authority over matters of safety of workers and this would extend by implication to atomic energy plants the matter rarely comes up for adjudication." [21]

The Michigan and New Jersey statutes are somewhat less specific in granting authority to the utility commissions to prescribe health and safety regulations. The Michigan commission, however, apparently assumes that a general grant of power is sufficient. The Michigan statute vests power in the Public Service Commission to "regulate all rates, fares, fees, charges, services, rules, conditions of service and all other matters pertaining to the formation, operation, or direction" of public utilities.[22] Under this language, the Public Service Commission has promulgated an extensive set of regulations applicable to electric utilities, which includes provisions to protect employees.[23] The only relevant New

[17] Doubts were raised by letters from George H. Kenny, Ass't Counsel, N.Y. Public Service Commission, March 5, 1954, and Irving R. Tabershaw, Director, Division of Industrial Hygiene, N.Y. Dept. of Labor, March 25, 1954.

Jersey statute is one which provides that the Board of Public Utility Commissioners may require any public utility to furnish "safe, adequate and proper service and to maintain its property and equipment in such condition as to enable it to do so." [24] This provision seems to be directed primarily at the kind of service rendered rather than at the protection of employees, but it might, like the Michigan statute, be construed broadly to give the board jurisdiction over the safety of employees.

B. Labor Departments and Industrial Commissions

All ten states selected for this study have created some form of a state labor department or industrial commission to administer their labor laws. One of the primary functions of these labor agencies is the protection of the health and safety of employees, and accordingly the labor agency is usually given rule-making power to promulgate regulations safeguarding the health and safety of workers.

Many state labor agencies are evincing considerable interest in regulations relating to the use of fissionable and radioactive materials. As will be noted later, some states have already promulgated extensive regulations covering the use, handling, and storage of radioactive substances, and several other states plan to adopt similar regulations in the near future. Probably most of the state agencies will follow substantially the recommendations contained in handbooks published by the National Bureau of Standards on problems of radioactivity.[25] The extent of the jurisdiction of the labor agencies varies from state to state. In most states the agency is given jurisdiction over employers and employees

[24] N.J. Rev. Stat. (1937) §48:2-23.

[25] Several letters from state labor agencies indicated this intention. The recommendations contained in these handbooks are formulated by the National Committee on Radiation Protection and its subcommittees. The handbooks available thus far include: No. 23, "Radium Protection"; No. 27, "Safe Handling of Radioactive Luminous Compounds"; No. 41, "Medical X-ray Protection"; No. 42, "Safe Handling of Radioactive Isotopes"; No. 48, "Control and Removal of Radioactive Contamination in Laboratories"; No. 49, "Recommendations for Waste Disposal of Phosphorus-32 and Iodine-131 for Medical Users"; No. 50, "X-ray Protection Design"; No. 51, "Radiological Monitoring Methods & Instruments"; No. 52, "Maximum Permissible Amounts of Radioisotopes in the Human Body and Maximum Permissible Concentrations in Air and Water"; No. 53, "Recommendations for the Disposal of Carbon-14 Wastes"; No. 54, "Protection Against Radiations from Radium, Cobalt-60, and Cesium-137"; No. 55, "Protection Against Betatron-Synchrotron Radiations up to 100 Million Electron Volts"; No. 56, "Safe Handling of Cadavers Containing Radioactive Isotopes"; No. 57, "Photographic Dosimetry of X- and Gamma Rays"; No. 58, "Radioactive Waste Disposal in the Ocean"; No. 59, "Permissible Doses from External Sources of Ionizing Radiation"; No. 61, "Regulation of Radiation Exposure by Legislative Means"; No. 63, "Protection Against Neutron Radiation Up to 30 Million Electron Volts." All are available from the U.S. Government Printing Office at nominal prices.

wherever located. Because the employment relation is emphasized, the labor agency would seem to be without power to regulate safety standards for other persons, such as the self-employed person and the independent contractor, although the applicability of the statutes to the independent contractor is by no means clear. Therefore, under this type of statute there is a possible gap in the regulation by labor agencies of the use of atomic energy. But it is an extremely small gap, because most uses of atomic energy will undoubtedly involve employment of persons in the usual sense. Certainly any electric utility operation would involve an employer-employee relationship.

Another type of statute found in many states gives the labor agency jurisdiction over types of operations, typically "factories" or "manufacturing establishments." Under such statutes the jurisdiction of the agency will depend on the definition of these terms. Some states undertake to define further these terms, while others are silent as to their meaning. There are few cases in which it has been necessary to decide whether or not an electric utility is a "factory" or "manufacturing establishment." Certainly the weight of authority supports the view that an electric generating plant is a manufacturing establishment,[26] and it would seem also that the term "factory" would normally cover electric utilities.[27] However, as to certain potential users of radioactive by-products, such as hospitals, laboratories, etc., it is doubtful whether the statute will apply.

Because of the differences in the statutory patterns in the states under discussion, a state by state analysis seems to be the best method of surveying the kinds of powers possessed by state labor agencies,[28] together with questions of possible overlapping jurisdiction, and the current state of regulation with respect to the use of radioactive substances.

1. California

At least three provisions of the California labor statutes should be noted for possible bearing on the regulation of uses of radioactive sub-

[26] See Annot., "What is a 'manufacturing establishment' within meaning of regulatory statutes," 96 A.L.R. 1351 at 1354 (1935).

[27] See Annot., "What is a 'factory' within statutes relating to safety and health of employees," 163 A.L.R. 447 at 473 *ff.* (1946).

[28] Because many electric plants using nuclear power will still use steam boilers in their operations, it will be necessary for the industry to comply with any applicable state regulations. Nearly all states have statutes relating to the operation, inspection, and licensing of steam boilers. See, *e.g.*, Cal. Labor Code §§7681 *et seq.;* Ill. Stat. Ann. c. 24, §§23-72 *et seq.;* Mich. Stat. Ann. §17.132; N.Y. Labor Law §204; Ohio Rev. Code §§4103.01 *et seq.*

stances. One provision requires that every "factory or workshop in which one or more persons are employed" shall be ventilated so as to render harmless, so far as practicable, all injurious gases, vapors, dust, or other impurities which may be produced,[29] and criminal sanctions are provided for violations.[30]

Another statute requires the owner of every "factory" to register with the Division of Labor Statistics and Research, and also to furnish certain pertinent information.[31] "Factory" is defined as ". . . any factory, workshop, mill, or other manufacturing establishment where five or more persons are employed." [32] Although there is little authority on the matter, it is quite likely that an atomic power plant would be considered a "factory" for the purpose of this statute,[33] and therefore any such plant built in California would be required to register. Chemical plants built to process radioactive substances would seem likewise to be subject to registration under this statute.[34]

The most significant California statute, however, is that which confers industrial safety rule-making authority on the Division of Industrial Safety.[35] The division is given "power, jurisdiction, and supervision over every employment and place of employment in this State" in order to enforce all laws and lawful orders relating to the protection of the life and safety of employees.[36] "Employment" is defined to include "the carrying on of any trade, enterprise, project, industry, business, occupation or work . . . or any process or operation in any way related thereto. . . ." [37] "Place of employment" is defined to include "any place, and the premises appurtenant thereto, where employment is carried on, except a place the safety jurisdiction over which is vested by law in any State or Federal agency other than the division." [38] It was noted previously that in California the Public Utilities Commission is given authority to make rules and regulations to promote and safeguard the

health and safety of employees in public utility plants.[39] Since an atomic power plant would be classified as a public utility, does the statute mean that because the Public Utilities Commission has safety jurisdiction over plant employees, the Division of Industrial Safety does not? A 1953 statute seems to answer this question in the negative, for it is there provided that the "jurisdiction vested in the division shall in no instance, except those affecting exclusively the safety of employees, impair, diminish, or in any way affect the jurisdiction of the Public Utilities Commission. . . ." [40] Therefore, the division apparently has jurisdiction over the safety of employees in public utility plants, and the similar power previously vested in the Public Utilities Commission is displaced.

Under this statutory authority over "employment" and "places of employment," and without any legislative authority to regulate radiation hazards specifically, the Division of Industrial Safety has promulgated a somewhat extensive set of regulations as a part of the "General Industry Safety Orders" establishing minimum standards for employees exposed to ionizing radiation.[41] These regulations are discussed in detail and compared with the standards of the Atomic Energy Commission and the National Committee on Radiation Protection and Measurement in Chapter V.

There are other General Industry Safety Orders which may be applicable to establishments in California using radioactive substances. There are regulations establishing minimum standards for the prevention of harmful exposure of employees to dusts, fumes, mists, vapors, and gases,[42] and other regulations create minimum standards for the use, handling, and storage of hot, flammable, poisonous, corrosive, and hazardous substances in all places of employment except laboratories.[43] The General Industry Safety Order concerning radiation protection does not explain its effect on these orders.

2. Illinois

The Illinois Health and Safety Act of 1937 [44] is applicable "to all employers engaged in any occupation, business or enterprise in this State, and their employees," except farming and coal mining opera-

[39] Cal. Public Utilities Code §768.

[43] *Id.*, §§4140 *et seq.*

[44] Ill. Stat. Ann. c. 48, §§137.1-137.21.

tions.[45] The Industrial Commission, an agency of the State Department of Labor,[46] is given authority to administer the act [47] and to make rules to protect the life, health, and safety of employees.[48] However, to effectuate these purposes, the act limits the Industrial Commission by providing that it "shall make such rules only for:

> (a) The proper sanitation and ventilation of all places of employment to guard against personal injuries and diseases.
>
> (b) The arrangement and guarding of machinery and the storing and placing of personal property to guard against personal injuries and diseases.
>
> (c) The prevention of personal injuries and diseases by contact with any poisonous or deleterious materials, dust, vapors, gases or fumes." [49]

While no rules relating specifically to radiation or radioactivity have been adopted under this act,[50] it would appear that the commission has power to adopt regulations affecting various aspects of the use of radioactive materials. Clause (a) would authorize regulations in regard to air contamination and the disposal of radioactive wastes, Clause (b) would authorize the regulation of shielding and the storage of radioactive materials, and Clause (c) would authorize rules for monitoring, maximum exposures, and the safe handling and use of radioactive substances. However, the commission is expressly denied power to make any rule requiring the "submission of any plan, specifications or other information concerning any proposed installation, alteration, construction, apparatus or equipment . . ." [51] and therefore no procedure can be established requiring advance approval of radiation installations.

In 1951 the Illinois Industrial Commission issued regulations relating to labeling in the use, handling, and storage of substances harmful to the health and safety of employees.[52] The regulations provide for the labeling of containers of substances "known to constitute a health,

[52] Ill. Health and Safety Rules, Industrial Commission (1953), Part "J".

poison, fire or explosion hazard." [53] Such regulations would probably apply to radioactive substances, since they constitute a health hazard and because poisons are defined as substances known to be "so toxic to man as to afford a hazard to health. . . ." [54]

It was noted previously that broad powers are granted to the Illinois Commerce Commission regarding the health and safety of employees and the public in the operation of public utilities.[55] In a rather recent case, it was argued that the authority given to the Industrial Commission under the Health and Safety Act gave that commission exclusive jurisdiction over matters relating to the health and safety of employees, and consequently by implication repealed the provisions of the Public Utilities Act giving jurisdiction to the Commerce Commission over the employees of public utilities. However, the Illinois Supreme Court rejected this argument on the well-recognized principle that a statutory construction which would result in repeal by implication of another statute is not favored, and that there must be an irreconcilable repugnancy to justify an inference of repeal. The court, therefore, enforced a Commerce Commission order applicable to railroad employees.[56] Apparently, the decision means that both the Industrial Commission and the Commerce Commission may prescribe rules and regulations establishing standards covering the use of radioactive materials and maximum radiation exposures in atomic energy power plants if built in Illinois.[57] This type of overlapping jurisdiction is confusing and objectionable.

3. Michigan

No general rule-making authority has been given to the Department of Labor in Michigan, consequently no general safety regulations are

[53] *Id.*, §1, Rule 1.

[54] *Id.*, §1, Rule 2(b).

[55] Ill. Stat. Ann. c. 111 2/3, §61.

[56] Brotherhood of Railroad Trainmen v. Elgin, Joliet and Eastern R. Co., 382 Ill. 55, 46 N.E.2d 932 (1943).

[57] One fact, peculiar to Illinois, which should be noted, is that the industrial hygiene program is administered by the State Labor Department [U.S. Federal Security Agency, Public Health Service, "Directory of State and Territorial Health Authorities —1952," p. 20], in contrast to other states in which this program is a function of the Department of Health. The statute provides that the Department of Labor shall prosecute any violation of law relating to the inspection of factories, provided that "before any prosecution is instituted based upon the laboratory findings of any industrial hygiene unit of the Department of Labor, any person dissatisfied with such findings shall be entitled to have an independent review by the central laboratory of the Department of Public Health." Ill. Stat. Ann. c. 48, §59.15.

in existence.[58] However, a statute requires that the owner of any factory operating "machinery of every description" must equip it with "proper safeguards." The "commission" or "factory inspector" shall determine whether machinery and equipment are properly guarded.[59] The Commissioner of Labor also has authority to order the installation of proper and adequate ventilation devices to preserve the health and safety of persons in "manufacturing, mercantile and other establishments." [60] Apparently, the conclusion to be drawn is that, while no generally applicable regulations can be adopted by the Department of Labor in Michigan, it has authority to deal with specific plants on an individual basis regarding industrial safety hazards.

Under existing statutes, perhaps the Public Service Commission would be more likely to adopt regulations establishing minimum safety standards in the use of radiation sources than would the Department of Labor. It was noted earlier that the Public Service Commission has promulgated employee health and safety regulations applicable to electric utility plants. If nuclear energy were used in such a plant in Michigan, it is conceivable that the Public Service Commission would formulate health and safety regulations to cover the peculiar hazards incident to such operations. Moreover, "the investigation and prevention of hazards associated with industrial operations is a function of the Division of Occupational Health," of the Michigan Department of Health, and that agency has recently promulgated comprehensive radiation safety rules.[61] Thus, in Michigan there is also the potentiality of at least three regulatory agencies having jurisdiction to regulate matters of radiological health, and inconsistent action could create a regulatory "maze" for atomic power installations.

4. Missouri

The Industrial Commission of Missouri, which controls and supervises the work of the Department of Labor and Industrial Relations, has authority to approve or disapprove all rules or regulations promulgated by any division within the department.[62] One of these divisions is the

[58] Regulations with respect to workmen's compensation, employment of women and minors, steam boilers, and elevators do exist. Mich. Adm. Code (1954) R 408.201-R 408.473.

[59] Mich. Stat. Ann. §17.25.

[60] *Id.*, §17.33.

[61] On February 14, 1958, a very comprehensive set of regulations governing the use of radioactive isotopes, X-radiation and all other forms of ionizing radiation published by this division, became effective in Michigan. Mich. Adm. Code (1954, Supp. No. 13).

[62] Mo. Rev. Stat. §286.060(4).

Division of Industrial Inspection.[63] Within one month after the occupancy of any factory, workshop, or mill, the Director of Industrial Inspection must be notified thereof,[64] and thereafter annual reports are required to be made to the director by every "factory, foundry or machine shop or other manufacturing establishment doing business within this state." [65] All machines and machinery used in "manufacturing, mechanical, and other establishments" must be "safely and securely" guarded to prevent injury to employees. In the alternative, notice of dangers must be posted when it is not possible to guard the equipment. The director may order necessary alterations, additions, or repairs to enforce compliance.[66] Any person operating any machine which generates poisonous gases in its operation (this might embrace radioactive gaseous wastes) must provide the machine with a hood connected to a blower or suction fan.[67] Apparently, the director does not possess specific authority to promulgate generally applicable safety regulations, but he can order necessary alterations or additions to protect the health and safety of employees "of any establishment." [68] In this respect the situation in Missouri is somewhat similar to that prevailing in Michigan.

There are special provisions relating to the prevention of occupational diseases in the Missouri statutes which are more or less applicable to the hazard associated with radioactive materials. Every employer carrying on any "work, trade or process which may produce any illness or disease peculiar to the work or process carried on, or which subjects the employee to the danger of illness or disease incident to such work, trade or process . . ." shall provide approved and effective devices or methods to prevent industrial or occupational diseases.[69] This statute would seem to embrace the uses of radioactive materials which involve radiation hazards. Certain processes are declared especially dangerous to the health of employees. Included among them is any process involving certain enumerated metals "or any poisonous chemicals, minerals, acids, fumes, vapors, gases, or other substances," in which these substances are "generated or used, employed or handled by the employees in harmful quantities, or under harmful conditions, or come in contact with in a harmful way. . . ." [70] If radioisotopes are considered a "poisonous

[70] *Id.*, §292.310.

chemical," their use by employees would be within the letter of the statute. Radioactive materials may and probably will be considered "poisonous substances." [71] If these special provisions apply to an employer, he must provide working clothes and "adequate and approved respirators." Moreover, employees subject to the hazards must be examined monthly by a physician.[72] Employers subject to these special provisions must also provide sanitary and adequate dressing rooms and lavatories,[73] maintain working areas in a sanitary condition,[74] take prescribed measures to prevent and remove dust,[75] and post prescribed notices.[76] The extent of the applicability of these provisions will have to be worked out from time to time as occupational hazards result from the radioactive substances.

5. New Jersey

The statutes of New Jersey do not precisely define the extent of the jurisdiction of the Department of Labor and Industry, but apparently it is broad enough to include factories and other establishments as well as extending to the employment relationship, and the commissioner has a general rule-making authority to enforce provisions of the labor laws he administers.[77] Several statutes and regulations may possibly be relevant to the use of radioactive materials.

One New Jersey statute requires that every person "engaging in any productive industry within the supervision of the department" shall register with the Commissioner of Labor and Industry.[78] An occupational disease statute provides: "Every employer shall, without cost to his employees, provide reasonably effective devices, means and methods to prevent the contraction by them of any illness or disease incident to the work or process in which they are engaged." [79] Certain special precautions are necessary with respect to especially dangerous processes, but these are so defined as to include only those relating to the manu-

facture of certain lead compounds.[80] Other statutes require proper ventilation to render harmless any gases, vapors, dust, or other impurities injurious to health that may be generated in any manufacturing establishment,[81] and for proper safeguards to be placed on all machinery.[82]

Existing regulations of the New Jersey Department of Labor and Industry include a listing of "permissible concentration limits of vapors, gases, fumes, mists, dusts and radiant energy" applicable to "all places of employment." [83] In these regulations, radiant energy is defined as "energy derived from radio-active substances or shortwave radiation which, upon exposure, may have a toxic and injurious effect on the body." These limits, which are discussed in Chapter V of this Part, do not conform with the current standards of the Atomic Energy Commission or the National Committee on Radiation Protection and Measurement. In 1954 and 1955 the New Jersey Department of Labor and Industry indicated that it was in the process of formulating comprehensive rules and regulations to cover all types of radiation hazards.[84] These regulations were to follow the recommended standards of the National Committee on Radiation Protection and Measurement, except that a qualifying board was to be appointed to review applicants for certification. Furthermore, a substantial filing fee, based on the value of the installation, was to be exacted so that, in effect, the proposed New Jersey code would establish a licensing system for users of radiation sources. It does not appear that these regulations have been promulgated.

The Public Health Council of New Jersey, an official state agency having jurisdiction over general public health problems, has promulgated regulations relating to radiation. In the Sanitary Code, it is provided that "X-ray machines and all other sources of radiation shall be shielded, transported, handled, used and kept in such manner as to prevent users thereof and all persons within effective range thereof from being exposed to excessive dosage of radiation." [85] Maximum exposures, however, are not prescribed.[86]

[85] N.J. State Sanitary Code, June 22, 1953, pamphlet, p. 22.

[86] New Jersey labor regulations also require that safety committees be organized in plants under the jurisdiction of the Department of Labor and Industry. These committees supervise safety inspection work, devise methods to avoid accidents, and insure that new employees are properly instructed as to hazards and that employees are

6. New York

New York's Department of Labor, headed by an Industrial Commissioner,[87] contains the Board of Standards and Appeals [88] which has broad authority to promulgate rules and regulations to effectuate various provisions of the labor laws.[89] Rules may be made to minimize personal injuries and diseases and to require "reasonable and adequate" protection for the lives, health, and safety of employees.[90] Rules adopted by the board constitute the Industrial Code.[91]

New York statutes also require the registration of "factories" with the Industrial Commissioner.[92] In addition, there are provisions requiring the guarding of machinery in factories,[93] and others requiring adequate ventilation and removal of "gases, fumes, vapors, fibers or other impurities" from factories.[94] However, "power houses, generating plants and other structures owned or operated by a public service corporation or a municipal corporation other than construction or repair shops, subject to the jurisdiction of the public service commission" are excluded from the definition of factory.[95] Therefore, an atomic energy installation used exclusively to generate electrical energy would seemingly not be subject to the jurisdiction of the Industrial Commissioner over "factories."

However, it seems probable that the Board of Standards and Appeals could make certain rules applicable to atomic energy power plants, even though such plants would not be subject to the provisions relating to "factories," for it is provided that: "Whenever the board finds that any industry, trade, occupation or process involves such elements of danger to the lives, health, or safety of persons employed therein as to require special regulation for the protection of such persons . . . ," the board may make rules to guard against these dangers by requiring licenses, by

educated in safety practices. Safety inspectors are required, and weekly safety inspections must be made. Slightly different regulations apply to three categories of plants: 1 to 50 employees, 150 to 500 employees, and over 500 employees. There are other requirements as to first aid facilities, emergency hospital, and a dispensary, including the items of equipment that must be on hand in each of these units. State and Federal Labor Laws, New Jersey Edition, 493-500 (1953).

[95] *Id.*, §2(9).

requiring medical supervision of persons employed, and by "other appropriate means."[96] It is the opinion of the counsel to the Labor Department that this provision authorizes the board to make rules applicable to power plants even though they are subject to the general jurisdiction of the Public Service Commission.[97]

Under this provision, the Board of Standards and Appeals of the State Department of Labor has, in fact, issued regulations relating to radiation protection.[98] The code, effective December 15, 1955, is very extensive, and its purpose is to offer reasonable and adequate protection in "every place where any employee in the course of his work may be exposed to radiation in excess of one tenth the permissible weekly dose" except medical, dental, veterinary, and educational institutions, clinics, and officers which are subject to the provisions of the Sanitary Code.[99] The provisions of both the Labor and the Sanitary Codes, which apply to sources of radiation, are discussed and compared in Chapter V.

Since the New York State Department of Health has also issued regulations covering ionizing radiation, it should also be noted at this point that the Division of Industrial Hygiene in the Department of Labor administers all laws relating to industrial hygiene for the Department of Health.[100] But when a condition resulting from the operation of a business, plant, or public utility constitutes a threat to the general public health, as distinguished from that of employees only, the jurisdiction of the Department of Health will probably be paramount.[101] Furthermore, the regulations of the Labor Department do not apply to hospitals, medical clinics, dental offices, podiatry offices, veterinary clinics, educational institutions, and commercial, private, or research laboratories performing diagnostic procedures or handling equipment of material for medical use which are subject to the provisions of the New York State Sanitary Code promulgated by the Health Department.[102]

[102] N.Y. Industrial Code No. 38, Reg. 38-6.

7. Ohio

The Ohio Department of Industrial Relations has jurisdiction over "every employment and place of employment. . . ." [103] It has the duty, among others, to administer and enforce the general laws of Ohio relating to "manufacturing" and "electrical" establishments and all other laws protecting the life, health, safety, and welfare of employees.[104] Statutes require that the employer furnish safe employment; *i.e.*, furnish and use safety devices, safeguards, methods, and processes which will protect employees.[105]

All shops and factories, which are defined to include manufacturing and electrical establishments,[106] are subject to inspection by personnel of the Division of Workshops and Factories, and the division may order the owners of these establishments to correct dangerous, unhealthy, or unsanitary conditions.[107] Furthermore, numerous requirements are imposed on owners and operators of shops and factories relating to safety precautions,[108] accident reports,[109] notices to be posted on dangerous machinery,[110] and additional safety rules.[111]

Although independent of the Department of Industrial Relations, the key rule-making agency in matters of employee health and safety appears to be the Industrial Commission,[112] which has broad authority to adopt rules and regulations prescribing safety devices, safeguards, or other means or methods to protect the life, health, and safety of employees.[113]

It should be noted at this point that the Ohio Department of Health promulgated regulations in 1947 for the prevention and control of diseases resulting from toxic fumes, vapors, mists, gases, and dusts applicable to every place of employment.[114] One regulation provides that "No employer shall use or permit to be used in the conduct of his busi-

[112] The Industrial Commission is not a part of the Department of Industrial Relations, Ohio Rev. Code §121.04, but apparently the Industrial Commission performs the rule-making functions for the department. See §§4101.06, 4121.22. See also, §§4121.02 to 4121.09 for establishment and organization of the Industrial Commission.
[113] *Id.*, §4121.13.
[114] Mimeographed regulations of the Ohio Dept. of Health.

ness, manufacturing establishment or other place of employment, any process, material or condition known to have an adverse effect on health, unless reasonable provisions have been made to prevent injury to the health of the employees and of the public." [115] Radiation exposures are limited to 0.1 roentgen per day,[116] which was the old standard. Regulations also exist with respect to ventilation,[117] personal protective equipment,[118] isolation of hazardous operations,[119] and posting notices and giving periodic instruction to employees regarding radiation hazards.[120] However, these Ohio Department of Health regulations do not contain the amplification of standards contained in detail in California and New York regulations. The failure to include standards in respect to handling, storage, and disposal of radioactive materials and to provide a more detailed listing of permissible exposures can be attributed largely to the fact that the Ohio regulations were adopted when relatively little technological information was available. Nonetheless, the action of the Ohio Department of Health in respect to places of employment coupled with the seemingly broad jurisdiction of the Ohio Department of Industrial Relations in respect to matters of employee health and safety further demonstrates the confusion in jurisdiction over atomic energy affairs among several state agencies.

8. Pennsylvania

In Pennsylvania the situation is somewhat confused by the existence of both a Department of Labor and Industry having broad rule-making powers and an Industrial Board [121] which not only has rule-making powers of its own [122] but also must approve or disapprove all regulations promulgated by the Department of Labor and Industry.[123]

The most important legislation is the Health and Safety Act of 1937,[124] which grants the Department of Labor and Industry power to make rules and regulations to effectuate the provisions of the act. The statute extends to every "establishment" in the state, which is de-

fined as "any room, building or place . . . where persons are employed . . . except farms or private dwellings. . . ." [125] All establishments must be "constructed, equipped, arranged, operated, and conducted as to provide reasonable and adequate protection for the life, limb, health, safety, and morals of all persons employed therein." [126] All toxic and noxious dusts, fumes, vapors, and other atmospheric impurities which create a condition of danger to employees must be removed, or if that is impractical, employees must wear personal protective devices.[127] Recognizing hazards of radioactivity, in 1953 the Pennsylvania legislature added the underlined words to the following provision:

> When employees, due to the nature of employment, are subject to injury from flying particles, falling objects, sharp or rough surfaces or materials, hot, corrosive or poisonous substances, acids or caustics and injurious light rays or harmful radioactive materials, they shall be provided with and shall wear goggles, other head and eye protectors, gloves, leggings, and other personal protective devices.[128]

Other Pennsylvania statutes require proper ventilation, sanitation,[129] and proper guarding of machinery [130] in all establishments within the state. Thus, in Pennsylvania, as in other states, there are several possibly applicable statutes governing atomic energy health and safety problems, and at least two state agencies apparently have rule-making power so that inconsistent regulations may prove overly burdensome on the new atomic energy industry.

In 1955 the Pennsylvania Department of Labor and Industry indicated that it intended to issue a comprehensive set of radiation health and safety regulations to protect persons within its jurisdiction,[131] but it was subsequently decided to establish an "Interdepartmental Committee and prepare regulations in which both the Department of Labor and Industry will be vitally interested. . . . It is the intent of the Interdepartmental Committee to have the Department of Health police the regulations and the Department of Labor and Industry enforce them." [132] As of February of 1958 no regulations had been promulgated by this committee.

9. Texas

Texas has not created an industrial board or commission with authority to adopt rules and regulations establishing health and safety standards for employees. There is, however, a Bureau of Labor Statistics, headed by a Commissioner [133] whose duties involve the gathering of data, making reports, and reporting to the appropriate authority the violation of any law with respect to employment.[134] Under a chapter entitled "Protection of Female Employees" are found several provisions which require that factories and establishments be kept free from poisonous or noxious gases and injurious dust arising from any process,[135] and that wastes be removed and disposed of "in such manner as not to cause a nuisance." [136] The Commissioner of Labor Statistics is authorized to inspect any factory or other establishment where five or more persons are employed and to require the correction of any unsanitary or dangerous condition.[137] But since the title of the statute embracing these provisions refers to the health, safety, and comfort of employees of establishments where *females are employed,* this statute may only be applicable to plants or establishments which employ women, even though the body of the statute does not seem thus to limit its applicability.[138] Hence, the extent of the authority of the Commissioner of Labor Satistics is not clear from a study of the statutes.

However, the Texas State Department of Health has general rule-making authority to require that industrial establishments provide adequate protection for the health and safety of workers.[139] A statute administered by the State Department of Health provides that no employer shall use in the conduct of any place of employment "any process, material, or condition known to have any possible adverse effect on the health of any person . . . employed therein unless arrangements have been made to maintain the occupational environment to the extent that such injury will not result." [140] The Department of Health is required to make available information concerning maximum allowable concentrations of toxic gases and concerning environmental standards

which pertain to the health and safety of employees of industrial establishments.[141] Pursuant to the above authority, the Department of Health issued Regulations on Radiation Exposure which became effective in September of 1956. These regulations, which are discussed in Chapter V, follow the recommendations of the National Committee on Radiation Protection and Measurement.

10. Wisconsin

In Wisconsin under the act which establishes the Industrial Commission,[142] it is made the statutory duty of every employer to furnish a safe place of employment and to do everything reasonably necessary to protect the "life, health, safety, and welfare" of employees and "frequenters." [143] The terms "place of employment" and "employment" are defined broadly to include all activity wherein any person is, directly or indirectly, employed by another for direct or indirect gain or profit, except in private domestic services and agricultural operations.[144]

The Industrial Commission has been given very broad rule-making powers to ascertain and determine reasonable safety devices and safeguards and to adopt standards to protect employees and "frequenters" of places of employment.[145] It is further provided that local regulatory bodies, such as city councils or boards of health, shall not be deprived of power over places of employment, but in case of conflict with an order of the Industrial Commission, the latter shall amend or modify the local order.[146]

Unquestionably, the Industrial Commission would have jurisdiction over an atomic power plant built in Wisconsin. Moreover, the fact that such a plant would be subject to the Wisconsin Public Service Commission seemingly has no effect on the powers of the Industrial Commission over the same plant.[147] As was noted earlier, the Industrial Commission and the Public Service Commission collaborate in the preparation and administration of regulations affecting electric utility plants.

[146] *Id.*, §101.16(1).

[147] Letter received from O. T. Nelson, Director of Safety and Sanitation, Wisconsin Industrial Commission, dated Feb. 19, 1954.

The Industrial Commission has adopted a number of regulations relating to industrial safety which would be applicable to uses of radioactive materials.[148] An order prescribing maximum permissible exposures, as amended April 2, 1954, stipulates 0.3 roentgen per week.[149] Uranium is included on the list of toxic dusts, fumes, and mists, and the allowable limit for uranium in soluble compounds is 0.05 milligrams per cubic meter and 0.25 milligrams per cubic meter in insoluble compounds.[150] Other regulations require adequate ventilation, protection from dusts, proper disposal of exhaust materials, and personal protective devices.[151] Many other regulations are in force relating to specific operations or specific hazards.[152]

As with other states it is apparent that more than one agency has jurisdiction to promulgate regulations governing the health and safety of atomic energy operations. However, the cooperation between the Public Service Commission and Industrial Commission in Wisconsin has served to ameliorate potentialities of inconsistent or overlapping regulations that may have a detrimental effect on growth of atomic energy industrial pursuits.

11. Conclusion

The analysis of the foregoing statutory provisions concerning labor safety regulatory agencies reveals that the statutes and regulations applicable to an atomic energy industry vary considerably from state to state, but that in all the states covered by this study some type of regulatory agency has been granted sufficient power to have some authority over users of nuclear power and radioisotopes. A failure on the part of persons entering the atomic field to assess existing and prospective statutes and regulations may lead to wasteful expenditures if basic redesigning or supplemental equipment are required subsequently by order of a state labor agency. The establishment of an atomic energy industry where a state agency has regulatory power, but has not yet exercised the power, will be even more difficult to handle, since a later adoption of regulations may even cause temporary suspension of operations. Therefore, consultation with appropriate agencies appears advisable to determine in advance the permissible scope of activity.

[148] These regulations are available in pamphlet and mimeographed form from the Industrial Commission. They will be cited simply by number.

[149] Order 2002.

[150] *Ibid.*

[151] Orders 2003 to 2021.

[152] See General Orders on Safety, Orders 1 to 83.

Undoubtedly the most significant aspect of the present state regulatory pattern is the conflict of jurisdiction of state agencies in matters of employee health and safety. Not only do the public utility commissions typically have regulatory powers, but also labor departments and, in some instances, health departments are authorized to issue regulations relating to employees and places of employment. Moreover, as we progress to an examination of (1) the general powers of health departments in respect to the health and safety of members of the general public and (2) the powers of other typical state agencies, the confusing and overlapping jurisdictions of the several agencies will appear to have even a greater possibility of seriously impeding the exploitation of atomic energy if unreasonable duplication of effort is required on the part of the atomic energy industry.

C. Health Departments and Boards

All ten states selected for study have established state health departments and, in addition, have provided for various local boards of health. In the past, it would appear that the health departments have been primarily concerned with standards and measures to protect the general public, leaving specific safety regulations for employees to appropriate labor agencies. However, recent experience indicates that this may not be the case with respect to radiation hazards: of the seven comprehensive state radiation health and safety codes in effect as of April 1958, only two were promulgated by labor agencies, and, of the five issued by health departments, four are designed to protect employees as well as the general public.

Of all the state agencies which may regulate radiation hazards, the powers of the state health departments and boards appear to be the most significant. For the most part, the regulations of the departments of labor and the public utility commissions are limited in their application to places within the control of the person subject to the regulations. Quite obviously these boundaries are not recognized by either direct radiation or by disseminated radioactive materials which may contaminate the surface and underground waters, sewage systems, and the atmosphere of the state. Adequate employee protection standards do not necessarily assure that the health of the general public outside the radiation installation will be safeguarded against radiation hazards caused by products containing radioactive materials or radioactive stack gases, for example. While it appears that the state health departments have the broadest health and safety powers and, therefore, are in the best

position to give radiation hazards the sort of comprehensive attention required, it is unfortunately difficult to draw a clear line of demarcation between those matters which may be regulated by state health agencies and those matters which fall into the regulatory sphere of other state agencies. As is indicated in Chapter V of this Part, only New York has made any attempt to solve the jurisdictional problem, and that solution is not altogether satisfactory. Moreover, since both local boards of health and local legislative bodies may possess general powers over public health and safety, the problems created by overlapping jurisdiction are compounded.[153] It is desirable, therefore, to examine the general scope of the existing statutory powers of state and local health agencies, together with possible limitations thereon, in order to form some appraisal of the extent to which they will bear upon atomic enterprise.

1. State Health Departments

The state health departments of the ten states studied typically have "general supervision of the interests of the health and lives of the people of the state," [154] and are given power "to adopt, promulgate, repeal and amend rules and regulations consistent with law for the protection of the public health." [155] Under the Ohio statute conferring rule-making power on the Public Health Council, the Attorney General of Ohio has ruled that the council has authority to adopt regulations establishing maximum allowable concentrations for substances used in industry which are dangerous to public health.[156] As indicated in the discussion of labor department regulation, the Ohio Department of

(1949) § 192.020 (the Missouri statute extends only to "infectious, contagious, communicable or dangerous diseases." A letter from the Missouri Division of Health, dated March 17, 1954, written by L. E. Ordelheide, Director, Bureau of Public Health Engineering, indicates that the Division of Health feels that it has authority under this statute to adopt regulations prescribing maximum radiation exposures although they have not yet done so); N.J. Rev. Stat. §26:1A-7 (Cum. Supp. 1945-47); N.Y. Public Health Law §225(3); Ohio Rev. Code §3701.34; Pa. Stat. Ann. tit. 71, §532; Tex. Civ. Stat. art. 4418d; Wis. Stat. (1957) §140.05(3).

[156] 1945 Op. Atty. Gen. (Ohio) #609.

Health has in fact issued regulations governing places of employment.[157] In Michigan an inter-office memorandum to the Attorney General stated that the State Commissioner of Health has sufficient powers to issue "regulations concerning persons dealing in or operating with radioactive or fissionable materials." [158] As a result the commissioner has recently promulgated health and safety regulations pertaining to all sources of ionizing radiation in Michigan.[159] While the memorandum considered it doubtful if a registration requirement could be sustained under the existing powers, the Michigan regulations nevertheless contain such a provision. In contrast, it apparently was believed necessary to extend the powers of the health departments in Colorado, Connecticut, Massachusetts, New Jersey, New York, Oregon, and South Dakota to authorize them to regulate radiation hazards, for the legislatures of each of these states have recently enacted appropriate statutes. The Colorado Board of Health is authorized "to establish and enforce standards for exposure to environmental conditions, including radiation, that may be deemed necessary for the protection of the public health." [160] In Connecticut the State Department of Health may incorporate into the Sanitary Code regulations governing the operation of any source of ionizing radiation or the production, transportation, storage, possession, or disposition of radioactive materials.[161] These regulations are to be based on the standards of the Atomic Energy Commission or, in lieu thereof, upon the latest recommendations of the National Committee on Radiation Protection and Measurement. Registration requirements are specifically authorized. Massachusetts conferred a more limited authority upon its Department of Public Health in a statute which directs it to "prescribe and establish rules and regulations to control the transportation, storage, packaging, sale, distribution, production and disposal of radioactive materials which may affect the public health," [162] but the statute does not authorize the promulgation of regulations concerning the *use* of radioactive materials. Similarly, sources of radiation which do not consist of radioactive materials are not covered. Furthermore, the act specifically states that the powers of the Department

of Labor and Industries to establish regulations for the protection of the health and safety of employees against radiation hazards are not impaired. In 1958 the New Jersey legislature enacted a "Radiation Protection Act" establishing a Commission on Radiation Protection within the Department of Health and empowering the Commission to adopt rules and regulations to prohibit and prevent "unnecessary radiation." [163] The New York Public Health Law was amended in 1955 to authorize the Department of Public Health to regulate the "public health aspects of the use of ionizing radiation and the handling and disposal of radioactive wastes." [164] Similarly, the Oregon Board of Health in 1957 was directed to promulgate regulations and standards for the safe use, handling, disposal, and control of all radiation sources within the state after it had conducted a two-year study of the problems.[165] Finally, the South Dakota Department of Health is authorized to "develop comprehensive policies and programs for the evaluation and determination of hazards associated with the use of radiation" and to "adopt, promulgate, and enforce such rules and regulations as may be necessary." [166] These statutes are analyzed in greater detail in Chapter V of this Part as are the regulations of the health departments of Connecticut and New York, which were promulgated pursuant to the above authorization.

Another general power commonly given to state departments of health is the power to investigate complaints involving nuisances or potential hazards to life and health and to require the abatement of any such nuisance.[167] In some states the abatement of nuisances is left to local boards of health.[168]

For illustrative purposes, two statutes may be noted. In Ohio it is provided that any industrial establishment which produces industrial wastes must submit plans for the treatment and disposal of such wastes to the State Department of Health. These plans must be approved before the plant may be constructed.[169] Under the California statutes, the State Department of Health is empowered to abate "contamina-

[168] For detailed provisions, see below.

[169] Ohio Rev. Code §3701.19.

tion." [170] "Contamination" is defined as a condition which results from the disposal of industrial wastes of such a nature as to create an actual hazard to the public health.[171] Contamination is also made a crime.[172] These two statutes illustrate the two different approaches to the problem; *i.e.*, advance approval on the one hand and subsequent action on the other.

Other states considered in this study have not yet adopted radiological health regulations, but some of them use as a guide to determine the existence of possible health hazards the standards adopted by the American Conference of Governmental Industrial Hygienists or by official bodies such as the United States Public Health Service, the National Bureau of Standards, or the Atomic Energy Commission.[173]

2. Local Health Agencies

Each of the ten states examined in this study has also established some form of health regulation at the city and county levels. In addition, many states have provided for the organization of township health boards and health districts which may be comprised of nearly any possible combination of political subdivisions. Usually these local health boards are invested with powers very similar to those of the state health departments, except that the territorial jurisdiction of the local health agency, of course, is limited, and the local health board is normally subject to the paramount authority of the state department of health.[174] As might be expected, there is considerable divergence in the types of health boards authorized by the various statutes. However, the powers conferred on the agencies appear to be somewhat similar, whether the boards are established at the city, township, county, or a hybrid district level.

a. Cities

In some states incorporated cities and towns are given authority to pass such ordinances as may be deemed necessary for the protection of the health of the inhabitants.[175] Other states authorize the creation of

[170] Cal. Health & Safety Code §5412.

[175] Cal. Health & Safety Code §500; Ill. Stat. Ann. c. 24, §§23-81, 42-1 *et seq.*; Mich. Stat. Ann. §§5.1331, 5.1337, 5.1757; Mo. Rev. Stat. (1949) §§71.780, 73.110(10), 74.133(1), 77.560; Pa. Stat. Ann. tit. 53, §§3800-11, 9673, 13329; Tex. Civ. Stat. arts. 1015, 1072.

city health boards which are invested with powers to make rules and regulations necessary for the protection and preservation of the public health.[176] It is possible that an industry located within the corporate limits of a municipality may even be subject to regulation both by municipal ordinance adopted by the city council and by administrative regulation promulgated by a local health board.[177] Only detailed examination of the regulations applicable in any given area can resolve the complexities of the situation.

b. Counties

Again the statutory provisions are diverse. In Texas and Missouri health regulation at the county level is not very extensive. In Texas the statutes provide that a "City-County Health Unit" may be formed in any county containing an incorporated city which has a population of not less than 90,000 nor more than 120,000.[178] The City-County Board of Health is authorized to make rules and regulations "to promote and preserve the health of the county." [179] Apparently, this is the only instance of county health regulation in Texas. In Missouri rule-making power over public health matters is granted to the county court (a governing body) but only in counties having an assessed valuation of $300,000,000 or more.[180]

Each of the remaining eight states covered by this study provides for some form of health regulation either by a county health board or by the governing body of the county. In California and Illinois the governing body of each county is given power to adopt ordinances and regulations for the protection of the public health.[181] In Ohio townships and villages in each county constitute a general health district,[182] and the board of health of a general health district "may make such orders and regulations as are necessary for . . . the public health, the prevention or restriction of disease, and the prevention, abatement, or suppression of nuisances." [183] County health boards in Michigan, New

[183] *Id.*, §3709.21.

Jersey, New York, and Wisconsin are given authority to promulgate rules and regulations to protect the public health.[184]

The power to abate or suppress nuisances is normally a corollary of the rule-making power. In 1951 Pennsylvania passed a rather elaborate "Local Health Administration Act." [185] This act, applicable to all but first-class counties,[186] authorizes the creation of county or joint-county departments of health [187] which are given broad rule-making power to make regulations "for the prevention of disease, for the prevention and removal of conditions which constitute a menace to health, and for the promotion and preservation of the public health generally." [188] In 1943 Illinois passed a somewhat similar act providing for county or multiple-county public health departments.[189] However, under this act, the county health board recommends to the county governing board the adoption of ordinances, rules, and regulations necessary to promote and protect public health, which latter board has power to promulgate the ordinances, rules, and regulations.[190]

c. Townships

In at least four states township boards of health may also exist. In Michigan each township board is a board of health,[191] with authority to make regulations concerning nuisances or causes of sickness and to abate nuisances.[192] Likewise in Illinois and New Jersey rule-making powers may be exercised by township boards of health.[193] In Pennsylvania the governing authorities of townships are empowered to make such regulations as may be deemed necessary for the health and safety of the inhabitants of the township.[194]

d. Health Districts

Many states also authorize the consolidation of political subdivisions into "hybrid" health districts. For example, California provides that a

[184] Mich. Stat. Ann. §§14.161, 14.166; N.J. Rev. Stat. (1937) §26:11-26; N.Y. Public Health Law §§308(e), 347; Wis. Stat. (1957) §140.09(6).

[194] Pa. Stat. Ann. tit. 53, §19093-702 (XXIX).

local health district may be formed from either incorporated or unincorporated territory of one or more counties.[195] Illinois authorizes towns or road districts to be combined to form "public health districts." [196] Rule-making power is not given by express statutory provision to the governing boards of either of these types of districts, but by liberal statutory interpretation they may be deemed to have such power.[197] In Michigan, New Jersey, Ohio, Pennsylvania, and Wisconsin political subdivisions may join in the creation of a consolidated health district, consisting of two or more counties, two or more municipalities, or two or more existing health districts.[198] In New York "part-county health districts" may be established in counties containing one or more cities having a population of 50,000 or more. The cities themselves are excluded from such districts.[199] These health districts which are merely combinations of other health districts or counties have the same powers as the component elements had before combination.

3. Conclusion

This somewhat cursory examination of state and local health agencies and their powers is sufficient to indicate that an atomic energy entrepreneur will assuredly be confronted with a legion of health boards, commissions, and agencies when he embarks upon his atomic enterprise. He should consult with both state and local health agencies at the earliest possible planning stage. In spite of the fact that few of these agencies have established regulations governing the use of radioactive and fissionable materials, the legal power to do so exists. Therefore, the entrepreneur will necessarily have to assume the burden of ascertaining to the best of his ability the probable scope of health regulation. As an initial proposition, it would appear advisable to err on the side of safety by installing all proved types of safety equipment designed for the protection of the public health. However, prohibitive costs may constitute a substantial deterrent to following that course of action, and the possibility will always remain that subsequent administrative regulations may result in the necessity of expensive changes in equipment or manner of operation.

[198] Mich. Stat. Ann. §14.167; N.J. Rev. Stat. §26:3A1-2 (Cum. Supp. 1951-52); Ohio Rev. Code §§3709.07, 3709.10; Pa. Code Ann. tit. 16, §4205; Wis. Stat. (1957) §140.09(1)(a).

[199] N.Y. Public Health Law §340(2).

The burden thus placed on new atomic energy ventures to guess the extent of future health regulation suggests, of course, that the state and local health agencies should be induced to adopt extensive regulations as promptly as feasible. However, a general unfamiliarity with atomic energy health hazards prevails among state and local officials, and reliable scientific data as to the effect of radiation on human life is not yet available. Moreover, the technical nature of the requirements of standards adequate to afford safety against radiation is not generally understood although knowledge is increasing rapidly. These factors would seem to necessitate an attitude of extreme caution on the part of state and local health officials. Unduly burdensome health regulations may serve to delay or even prevent the establishment of a new industry in the community. On the other hand, too lax regulations may result in serious impairment of public health and safety. This dilemma is not one that is easily resolved, but on balance we are led to the conclusion that the wiser course is to avoid the promulgation of exhaustive health standards until such time as more reliable scientific data is available. Meanwhile, general regulations not only may provide a sufficiently definite pattern to justify industrial expenditures but they also may be adaptable to changing conditions.

D. Summary of State Health and Safety Regulations

The foregoing examination of the health and safety regulatory agencies and powers of the ten selected states makes it evident that in each state at least one, and in most cases, two or more state or local agencies have been given by statute sufficient power to regulate health and safety conditions for atomic energy enterprises. It is true that the precise reasons for conferring jurisdiction upon a labor department differ from those which result in the power being given to a health department or a public service commission. The labor department is primarily concerned with health and safety of employees; the health department is primarily concerned with the health and safety of the general populace; and the public service commission is responsible for the conservation of public interests in connection with public utilities and their operation. The regulations evolved by the different agencies for these separate purposes may happen to be identical or they may be so divergent as to be absolutely impossible of simultaneous achievement. When the latter situation prevails, and it is very likely to happen unless proper cooperative measures are taken, atomic energy enterprises will find themselves operating in violation of at least one set of valid regulations and as a

result becoming subject to consequent penalties. Then, too, there will be the very considerable waste of effort by the state and the regulated industry. Of course, the potentiality of inconsistent regulation by different state and local agencies already exists for industries other than atomic, but it generally has been avoided in fact by cooperative efforts among the several agencies. It is to be hoped, and perhaps expected, that the agencies will cooperate in a similar manner in regard to atomic affairs, and that they will adopt regulations which will be consistent and not impose insuperable burdens upon a new industry.

Chapter IV

MISCELLANEOUS REGULATION

A. Disposal of Wastes

Many industrial processes require the disposal of large quantities of noxious waste materials in the course of their operations. Since improper disposal of industrial wastes may endanger the health, safety, or comfort of persons or may be detrimental to property rights, special types of governmental regulation have been evolved to control such action. In the interests of public health, many states have established water pollution control programs which may restrict the disposal of certain types of industrial wastes. Also, in the interests of conservation, laws are frequently enacted protecting fish and wildlife by prohibiting the discharge of harmful or poisonous substances into waters of the state, and such laws may serve indirectly to regulate waste disposal. The prevention and abatement of air pollution in some states, especially in metropolitan areas, is another type of regulation of disposal of industrial waste products. Finally, the law of public and private nuisance, affording remedies to public officials as well as private individuals, may be invoked to restrict or prohibit the discharge of waste materials produced in industrial processes.

Waste products created in operations involving the use of atomic energy are unique and potentially even more dangerous than ordinary industrial wastes since they may contain substantial amounts of radioactivity. Radioactive wastes produced in reactor operation or in other utilization of atomic energy may be found in the form of either solids, liquids, or gases. Since either existing or future regulation of industrial waste disposal will no doubt embrace the disposal of radioactive wastes as well, an examination of the various types of regulation is desirable.

The subject of radioactive waste disposal has received express legislative or administrative attention in a number of states recently. In California "no person shall bury, throw away, or in any manner dispose of radioactive wastes in such a manner as to endanger the lives or health of human beings."[1] The California Department of Public Health is authorized to issue written orders prohibiting dispositions in

[1] Cal. Health & Safety Code §§25600 to 25604.

violation of this statute and to seek injunctions against violators of these orders. Similarly, the South Dakota Department of Health is authorized to "issue, modify, or revoke orders prohibiting or abating the discharge of radioactive material or waste into the ground, air, or waters of the state." [2] Violations of these orders are deemed misdemeanors upon each day in which they occur.[3] Since the term "radioactive materials" may be construed to include radioactive wastes under the laws of Connecticut,[4] Massachusetts,[5] New York,[6] and Oregon,[7] persons disposing of radioactive wastes in these states are subject to the appropriate regulations of the respective health departments. In Wisconsin the county board of each county with a population of 500,000 or more is authorized to regulate the discharge of radioactive materials into the open air.[8] The problem of radioactive waste disposal has received administrative attention in the health department regulations of Connecticut,[9] Michigan,[10] New York,[11] Pennsylvania,[12] and Texas.[13] The above mentioned statutes and regulations are discussed in greater detail in Chapter V of this Part.

1. Water Pollution Regulation

Liquid radioactive wastes may result from several possible operations, including using water as a reactor coolant,[14] processing radioactive materials by chemical means, and using radioisotopes in industry and laboratories.[15] If these wastes find their way into streams, they may become potential health hazards by invading domestic water supplies or by affecting fish or vegetation.

[15] *Id.* at 15-17.

Because pollution of streams and lakes from sewage and industrial wastes has become a very serious problem, statutes regulating water pollution have been enacted in most states. Water pollution boards or commissions, often associated with the state health departments, have been created by many of the states covered by this study. Some of the boards are given administrative discretion to determine what constitutes "pollution." Some statutes apparently define industrial wastes broadly enough to encompass radioactive wastes. Many states require that permits be obtained from the water pollution board before wastes of any kind may be discharged into waters of the state. Moreover, nearly every state has a statute which absolutely prohibits the discharge of "harmful" or "poisonous" substances into the waters of the state. In the event that deleterious substances likely to injure fish or wildlife are discharged into waters, conservation laws may be involved. Criminal sanctions may attach, or perhaps permits from conservation commissions may be necessary.

Solid radioactive wastes include the products of fission taken from atomic reactors together with such items as contaminated clothing, contaminated metals used as equipment, pipes, or shielding, contaminated buildings, and residues from the incineration of radioactive wastes. The control of many of these hazards lies within the sphere of state agencies having jurisdiction over matters of health and safety. However, several statutes, notably those of California, Ohio, and Texas, cover industrial waste disposal irrespective of whether water pollution is involved.

Because of the differences in the regulatory pattern of the ten states examined in this study with respect to the regulation of industrial waste disposal, water pollution, and the role of the conservation department, a state-by-state analysis will again be necessary.

a. New York

In 1949 New York enacted a rather comprehensive program of water pollution control. The Water Pollution Control Board, created within the Department of Health, is given wide administrative discretion with respect to fixing standards of water purity, the classification of various waters, etc.[16] A general prohibition against pollution makes it unlawful to discharge any organic or inorganic matter into waters of the state that will cause or contribute to a condition in contravention of standards adopted by the board.[17]

[16] N.Y. Public Health Law §1209.
[17] *Id.*, §1220.

A significant feature of the New York statute is the licensing power granted to the board. Subject to a few minor exceptions, it is necessary to obtain a permit from the board before any person may:

> (a) make or cause to make any new outlet for the discharge of sewage, industrial waste or other wastes, or the effluent therefrom, into the waters of this state, or
>
> (b) construct or operate and use a new disposal system for the discharge of sewage, industrial waste, or other wastes or the effluent therefrom, into the waters of the state. . . .[18]

"Industrial waste" is defined as: "any liquid, gaseous, solid or waste substance or a combination thereof resulting from any process of industry, manufacturing, trade, or business or from the development or recovery of any natural resources, which may cause or might reasonably be expected to cause pollution of the waters of the state in contravention of the standards adopted as provided herein." [19]

In addition to the license which must be obtained from the Water Pollution Control Board and even though the Commissioner of Health is a member of the board,[20] it will probably be necessary for businesses utilizing nuclear energy also to obtain the written permission of the Commissioner of Health himself.[21] On this point the New York statute provides:

> No person, corporation . . . shall place . . . or cause to be discharged into any waters of this state, in quantities injurious to the public health, any . . . substance, chemical or otherwise, or any refuse or waste matter, either solid or liquid, from any . . . shop, factory, mill or industrial establishment; unless express permission to do so shall have been first given in writing by the commissioner. . . .[22]

This permission may be given to an industrial establishment "whenever the public health and purity of the waters shall warrant it," subject to conditions as the public health may require.[23] Discharges into certain waters are absolutely prohibited.[24] The provisions, requiring the permission of the Commissioner of Health and prohibiting the discharge

[18] *Id.*, §1230.

[19] *Id.*, §1202(e).

[20] *Id.*, §1205.

[21] *Id.*, §1232 indicates that in certain cases permission of the Department of Health is not required, but this is only true when a permit is not required from the Water Pollution Control Board under §1230(4).

[22] *Id.*, §1150(1).

[23] *Id.*, §1161(1).

[24] See *id.*, §§1151 to 1155.

of waste into certain waters, are, however, currently effective only until April, 1959.[25]

In addition to the public health statutes, the New York conservation statutes prohibit the discharge of any deleterious or poisonous substance into the waters of the state which may be injurious to fish life. This is an absolute prohibition; *i.e.*, no administrative authority to permit deviations is conferred. Violation constitutes a public nuisance and is subject to abatement and possible criminal penalties.[26]

b. Pennsylvania

Pennsylvania also has adopted a comprehensive program of water pollution control, in many respects similar to that of New York. Under a water pollution control act enacted in 1937, a Sanitary Water Board, a part of the Department of Health, is charged with the administration of the program.[27] "Industrial waste" includes any liquid, gaseous, or solid substance which results from any industry and which causes pollution.[28] The Sanitary Water Board is empowered to determine when pollution exists and to establish standards to define pollution.[29]

As in New York, the Pennsylvania statute provides that it is unlawful to "erect, construct or open" any establishment which in its operation results in the discharge of industrial wastes causing pollution unless a permit is first obtained from the board approving the proposed process for treatment of the wastes.[30] All plans for the proposed construction of a plant or process to treat the wastes must be submitted to the board before construction.[31] This requirement of advance consultation with the Sanitary Water Board, before construction involving potential pollution is initiated, is burdensome but advantageous from both the standpoint of the public and that of the operator.[32]

A Pennsylvania conservation statute provides that no person shall allow any substance of any kind or character which is deleterious, destructive, or poisonous to fish to be discharged into any waters of the

state unless it is shown to the satisfaction of the Board of Fish Commissioners that every reasonable and practicable means has been taken to abate and prevent the pollution of the water.[33] This prohibition is somewhat less severe than that set forth in the New York conservation statutes.

c. Ohio

In 1951 Ohio passed a comprehensive water pollution control act patterned on the Pennsylvania statute.[34] Like the New York and Pennsylvania water pollution boards, Ohio's Water Pollution Control Board is within the Department of Health.[35] The board has power to issue and deny permits for the discharge of industrial wastes into waters of the state;[36] and in order to avoid a possible determination after installation that an operation is polluting the waters of the state,[37] it is necessary to obtain a permit in advance from the board.[38]

As in New York, it appears necessary to obtain the consent of the Director of Health before discharging industrial wastes into the waters of the state, despite the fact that he is also the chairman of the Water Pollution Control Board.[39] The Department of Health is given general jurisdiction over the disposal of industrial wastes, and it is necessary to obtain the approval of this department relative to the manner of disposal of these wastes.[40] It is important to note that the supervisory power is not confined to disposal of wastes into waters, as it is in New York and Pennsylvania, but includes disposal in any manner. Furthermore, the department is given specific power to prevent pollution by adopting and enforcing regulations relative to the discharge of industrial wastes into waters of the state.[41] It also has the power to approve processes and plans for the treatment of such wastes.[42]

The Ohio statutes also create a Water Resources Board in the Department of Natural Resources. This board has power to prevent the

[42] *Id.*, §3701.59.

contamination of underground waters,[43] but its principal authority is concerned with water conservation, use, and supply.[44]

Ohio has established still another sanction for the protection of the state's waters. A 1948 opinion of the Attorney General of Ohio [45] indicates that when the habitat, food supply, and other environmental conditions of fish are threatened with injury or destruction by pollution of waters of the state, the Director of Natural Resources [46] may bring an action for an injunction or for damages. The statute upon which such an action would be based provides that no person shall corrupt or render unwholesome or impure a watercourse, stream, or water.[47]

Furthermore, various types of control districts may be formed under Ohio statutes to regulate nearly every conceivable aspect of water usage. At least three kinds of districts have control over the discharge of wastes and water pollution: conservancy districts,[48] sanitary districts,[49] and regional water and sewer districts.[50] If any of these districts are in existence and embrace an area considered for the location of an atomic energy generating plant, it is essential that the board of directors or trustees be consulted and any necessary approval obtained from them.

d. Wisconsin

Like New York and Ohio, Wisconsin has a dual set of controls over water pollution. The State Board of Health is vested with general jurisdiction over the waters of the state,[51] and it is necessary to obtain the approval of this board before using streams to dispose of industrial wastes.[52] The State Health Officer is also a member of the Committee on Water Pollution.[53] This committee, having general jurisdiction over water pollution, may require the submission and approval of plans for the installation of systems and devices for disposing of industrial

wastes.[54] It is unlawful to deposit any acids, wastes, or refuse arising from the manufacture of articles of commerce or any other substance deleterious to fish life into any of the waters of the state, unless it is done in compliance with the orders of the Committee on Water Pollution.[55] The constitutionality of this regulatory scheme has been attacked on the ground that parts of the statute are indefinite and uncertain, there being no standard or guide set forth to govern the actions of the Committee on Water Pollution. The attack failed, and the statute was sustained by the Wisconsin Supreme Court.[56]

The powers of the State Board of Health and the Committee on Water Pollution overlap, but these agencies apparently cooperate and issue joint orders. In 1944 a joint order was held to be *ultra vires* and hence invalid on the ground that different modes of judicial review were authorized for each of the two agencies.[57] However, a year later the legislature promptly remedied this defect by the addition of a statutory provision expressly permitting the issuance of a joint order.[58] Thus, the concurrent nature of the jurisdiction of the Health Department and the Committee on Water Pollution is expressly recognized in Wisconsin,[59] whereas the situation in New York and Ohio is somewhat more uncertain in this respect. However, the Wisconsin statutes retain individual jurisdiction for both the Committee on Water Pollution and State Board of Health when either or both agencies assume jurisdiction in a situation involving pollution.[60]

e. Illinois

In 1951 Illinois passed a new comprehensive water pollution statute.[61] A Sanitary Water Board, with extensive regulatory powers, was created, together with a Water Pollution Control Advisory Council.[62] The statutory definition of "industrial waste" is nearly identical with the New York definition, quoted above. But it is interesting to note that

[59] See *id.*, §144.535.

[60] *Ibid.*

[61] Ill. Stat. Ann. c. 19, §§145.1 *et seq.*

[62] *Id.*, §145.3(e).

Illinois attempts a broad definition of "pollution" [63] whereas New York leaves the establishment of standards to the discretion of the Water Pollution Control Board.

It is necessary to obtain a permit from the Illinois Sanitary Water Board before constructing, installing, or operating any establishment which will cause the discharge of wastes into the waters of the state.[64]

In addition, river conservancy districts may be organized under the Illinois statutes for the purpose of preventing water pollution.[65] However, it is provided that the authority of the Sanitary Water Board shall not be superseded,[66] which would seem to mean that if a permit is obtained from the Sanitary Water Board to discharge waste into a stream, the trustees of a river conservancy district would have no power to interfere.

Furthermore, sanitary districts, primarily concerned with sewage problems, may be organized under various Illinois statutes.[67] The board of trustees of a sanitary district has authority to prevent pollution of any waters from which any city or town obtains its water supply,[68] and any person proposing to discharge industrial waste within a sanitary district must obtain a permit from the trustees of the district.[69]

Finally, the Department of Conservation has general authority to take measures to prevent water pollution to preserve fish and game and to cooperate with other departments to prevent water pollution.[70] Another statute empowers the attorney general to bring an action to recover the reasonable value of any aquatic life destroyed by pollution of waters of the state.[71] Moreover, it is a public nuisance to corrupt or render unwholesome or impure the waters of any stream to the prejudice of others.[72]

f. California

A somewhat different water pollution regulation scheme is in effect in California. In 1949 the Dickey Water Pollution Act was passed which creates a State Water Pollution Control Board and nine re-

[63] *Id.*, §145.2(a).

[71] *Id.*, c. 56, §160.
[72] *Id.*, c. 38, §466.

gional water pollution control boards.[73] The state board is concerned only with formulation of policy, research, and administration of the financial aspects of water pollution,[74] whereas the regional boards are charged with the abatement, prevention, and control of water pollution and nuisances.[75] It is the appropriate regional board which must approve any proposed discharge of industrial waste and which prescribes requirements with respect to the treating of these discharges.[76] Each regional board also has power to investigate any source of water pollution or nuisance within its region and to order an abatement thereof.[77]

The act was designed to coordinate the actions of various state agencies regulating water pollution.[78] While power to regulate water pollution was not taken away from other state agencies, it is no longer necessary to secure a permit from the State Health Department in order to dispose of wastes, and this would seem to be a thoroughly worthy achievement.[79]

The California Water Pollution Act contains the usual definitions which are substantially similar to those of the other states discussed above, except that the definition of "contamination" is somewhat unique in its breadth and scope:

> "Contamination" means an impairment of the quality of the waters of the State by sewage or industrial waste to a degree which creates an actual hazard to the public health through poisoning or through the spread of disease. "Contamination" shall include any equivalent effect resulting from the disposal of sewage or industrial waste, *whether or not waters of the State are affected.*[80]

The matter of "contamination" is not mentioned elsewhere in the Water Pollution Act. However, the Health and Safety Code employs definitions identical to those of the Water Pollution Act,[81] and that code prohibits the discharge of industrial waste which will result in contamination, pollution, or nuisance.[82] Contamination is also made a crime[83]

[83] *Id.*, §5461.

and the Health Department is charged with the abatement of any contamination,[84] although pollution and nuisance are referred to the appropriate regional water pollution board for action.[85]

Moreover, the California statutes make it unlawful to cause any substance or material deleterious to fish, plant life, or bird life to pass into waters of the state of California.[86] The Fish and Game Commission is required to report any condition of pollution to the appropriate regional water pollution control board.[87]

g. New Jersey

New Jersey has adopted a unique pollution control system. It has not created a specific water pollution board to regulate pollution. Rather, the statutes leave this matter to the State Department of Health. Sprinkled liberally throughout the statutes are provisions which prohibit the discharge of any kind of polluting matter into the waters of the state.[88] It is necessary to obtain the consent of the State Department of Health before any "harmful" or "deleterious" matter may flow into the waters of the state.[89]

Moreover, the person responsible for the operation of any "factory, workshop or place for the manufacture of materials or goods" must obtain a written permit from the Health Department before it may be established in any watershed in the state above the point at which any public supply of potable water is taken.[90] The permit is required even though no discharge of wastes into the waters of the state is contemplated. The Health Department must also be furnished with information concerning any processes established or intended to be established for the purification or treatment of industrial wastes.[91]

Industrial establishments in New Jersey must also give consideration to the possible existence of sanitary sewer district authorities. These may be established by any first- or second-class county when a stream flowing through the county is subject to pollution.[92] "Sewage" is defined to include industrial wastes and any other matter having a tendency

to pollute streams and watercourses.[93] A 1953 amendment prohibits the discharge of any polluting matter into the waters of any stream or river included within the sewer district established by a county.[94] Finally, New Jersey has made it a crime to discharge into waters of the state any deleterious or poisonous substance which is injurious to or disturbs the habits of fish.[95]

h. Michigan

In Michigan water pollution is subject to regulation by the Water Resources Commission.[96] The commission is empowered to establish pollution standards for the various bodies of water in the state and has authority to "make regulations and orders restricting the polluting content of any waste material or polluting substance discharged or sought to be discharged into any lake, river, stream, or other waters of the state." [97] The jurisdiction of the commission extends to both surface and underground waters as well as the Great Lakes.[98] It is unlawful to discharge any substance which is harmful to the public health, fish, and wildlife, or to lawful enterprises.[99]

The statutes make no provision for obtaining a permit, but undoubtedly industrial managers should consult the Water Resources Commission when an industry plans to use water from a stream or lake or to discharge wastes into such waters.

In Michigan the Conservation Commission is given general power to prevent water pollution and to encourage the propagation of game and fish.[100] Again, there seems to be no requirement that a license be obtained; rather, it is made a violation of the conservation statutes to discharge wastes into the waters of the state if they will tend to "stupefy, injure or kill" any fish.[101] The State Health Department's broad powers over problems of general public health also extend to matters of water pollution, and therefore, as in other states, overlapping jurisdiction in problems of water pollution presents unusual problems for atomic energy industries.

[100] *Id.*, §13.3.
[101] *Id.*, §13.1671.

i. Texas

Texas has not established an administrative agency with authority to regulate water pollution, although in 1953 a five-member water pollution council, without regulatory powers, was created.[102] The function of this council is to collect and disseminate information relating to water pollution, its prevention, and abatement.

However, water pollution is made a crime in Texas.[103] The Penal Code defines pollution as rendering the water unfit "for one or more of the beneficial uses for which such water was fit or suitable prior to the introduction of such substance, material, or thing," or is detrimental to public health, game, birds, fish, etc.[104] Insofar as fish are affected by pollution, enforcement power is given to the Game and Fish Commission.[105]

Moreover, the State Board of Health has power to enjoin water pollution,[106] and it is unlawful to store, dispose of, or deposit wastes which will *pollute surrounding land* or contaminate well waters to the extent of endangering public health.[107]

The Texas statutes also provide for the establishment of several types of districts which relate to various aspects of water use, supply, and control. These districts are normally established by counties or a combination of counties. "Water Control and Improvement Districts" may be organized to protect, preserve, and restore the purity and sanitary condition of water [108] and to control, process, and dispose of industrial wastes.[109] "Water Control and Preservation Districts" may be organized to control and preserve the purity of the waters within the district.[110] Other types of districts authorized in Texas include "Underground Water Conservation Districts," [111] "Fresh Water Supply Districts," [112] "Levee Improvement Districts," [113] "Drainage Districts," [114]

"Conservation and Reclamation Districts," [115] and "Navigation Districts." [116] Industrial planners must consult the directors of these districts, if they exist in the county, in connection with the planning of an industry which may use water in any way.

j. Missouri

Missouri adopted a statute in 1957 which establishes a program of water pollution control similar to those of New York, Pennsylvania, and Ohio.[117] As in those states, the principal feature of the program is the establishment of a Water Pollution Board, organized within the Department of Public Health and Welfare, which is empowered to issue and deny permits for the disposal of wastes into waters of the state. The statute directs that "No person, without first securing from the board a permit, shall construct, install or modify any system for disposal of sewage, industrial wastes, or other wastes . . . when the disposal . . . constitutes pollution as defined in this act." [118]

The Water Pollution Board may require the submission of such plans and specifications as it deems relevant in connection with the issuance of permits and is empowered to determine whether or not the proposed discharge will "cause a condition contrary to the public interest." [119] The board is also given the power to determine when pollution exists and to establish standards of water purity for any waters of the state.[120]

The Missouri statutes also contain a provision prohibiting the discharge of any deleterious substance which is injurious to fish life into any stream in the state; however, the State Conservation Commission has authority to grant exceptions to industries.[121]

k. Conclusion

Although the statutory and regulatory pattern concerning water pollution varies from state to state, it is clear that atomic energy industries will be required to meet some rather positive standards if waste products are to be discharged into the waters of any state. In fact, close supervision of the disposal of wastes seems imperative in the public interest

[115] *Id.*, art. 8194.

because both the toxic and radioactive nuclear wastes are highly dangerous to the public health particularly where the streams constitute a source of water for human consumption.

It should be noted that under certain types of statutes, some atomic energy activities may not be regulated at the present time under statutes governing water pollution. For example, where the statutes govern only industrial activity, research laboratories and hospitals may not be subject to regulation. Nonetheless, use of radioactive materials and their disposal through conventional sewerage and drainage systems may so pollute bodies of water as to constitute a definite health hazard. Therefore, in those states where discharges of certain radioactive materials into state waters are not controlled under present statutes, amendatory legislation appears advisable and will doubtless be forthcoming as soon as the hazards become known in legislative halls.

The foregoing review of the statutes reveals that water pollution is in many states subject to regulation by several different agencies. This duplication of effort and overlapping of jurisdiction raises once again the problem of administrative conflicts. Obviously, coordination of the several health and safety regulations affecting atomic energy enterprises is desirable. This coordination can be achieved either by cooperation among the agencies or by transferring all atomic energy health and safety regulatory powers including control of water pollution to one agency. The latter course has much to be said in its favor, especially if all types of specialization can be represented within the regulatory agency. In the absence, however, of the creation of a single authority, persons desiring to engage in atomic energy activities must consult with all regulatory agencies exercising health and safety powers. Certainly they should encourage cooperative efforts among those agencies.

2. Regulation of Air Pollution

Several types of operations which utilize atomic energy may produce radioactive particles which will create a hazard if discharged into the air. Radioactive gases may result from air-cooled reactor operations, chemical processing operations, refining operations of uranium ores, laboratory uses of radioisotopes, and incineration of radioactive wastes, byproducts, or contaminated apparel or materials.[122] To prevent dangerous atmospheric contamination near Atomic Energy Commission installations, high stacks have been utilized for the discharge of radio-

[122] AEC, "Handling Radioactive Wastes in the Atomic Energy Program," 11-15 (1951).

active gases, thus causing them to be diluted with uncontaminated air.[123] In addition, the Commission has engaged in meteorological surveys and has instituted a program of area monitoring in the vicinity of installations such as Brookhaven, where air-cooled reactors are in operation.[124]

Insofar as employees may be adversely affected by the presence of radioactive gases in the place of employment, the powers of public utility commissions, labor departments, and health departments will be involved. However, if the atmospheric contamination extends outside the installation itself the public health may be endangered. Radioactive particles may be inhaled or deposited on plants which may in turn be eaten by animals or people. Notwithstanding the use of high stacks and the processing of the gases in connection with air-cooled reactors or chemical operations, adverse weather conditions may render hazardous otherwise satisfactory operations. Under the general authority granted to various state and local health agencies, regulations may be promulgated which establish limits for permissible contamination of the atmosphere from smoke and other foreign substances.[125] Municipalities also have broad powers to pass ordinances regulating matters of air pollution, such as smoke emission. These powers can and doubtless will be used to regulate contamination by radioactive gases.

In recent years, because of the "smog" conditions prevailing in many industrial communities, interest in air pollution control has grown. Because it was felt that the prevention and reduction of air contamination could not be handled adequately by local legislative bodies,[126] the California legislature in 1947 passed a comprehensive statute providing for the creation of air pollution control districts. In 1954 the New Jersey legislature also enacted comprehensive legislation for the control of air pollution.[127] Detailed examination of the California and New Jersey statutes seems desirable.[128]

Under the California statute, each county is declared to be an air

[123] *Id.*, at 7-8.

[124] *Id.*, at 12-13.

[125] In Bd. of Health of Weehawken Tp. v. N.Y. Central R. Co., 4 N.J. 293, 72 A.2d 511 (1950), the defendant railroad was charged with the violation of a smoke ordinance passed by the Board of Health of the Township of Weehawken by the operation of its power plant. The New Jersey Supreme Court upheld a conviction under this ordinance, holding that local boards of health may regulate and control air pollution in the interest of public health and welfare by barring the excessive emission of smoke.

[126] Cal. Health & Safety Code §§24198 to 24341.

[127] N.J. Laws 1954, c. 212.

[128] In 1953 the Illinois legislature created a commission to study air pollution and recommend regulatory legislation. Ill. Laws 1953, S. 204.

pollution control district.[129] Before a district can function, however, the board of supervisors of the county must hold a public hearing to determine the need of such a district.[130] The board must find that two conditions exist prior to adopting a resolution activating the district: (1) that the air in the county is polluted with air contaminants so that it is injurious to health, or is an obstruction to the free use of property, or is offensive to the senses of a considerable number of persons; and (2) that it is not practicable to rely on the enactment and enforcement of local county and city ordinances to prevent air pollution.[131] "Air contaminant" is defined to include "smoke, charred paper, dust, soot, grime, carbon, noxious acids, fumes, gases, odors, or particulate matter, or any combination thereof." [132] Although the definition does not expressly include radioactively contaminated air, it appears to be sufficiently broad to encompass this type of contamination. If a district is authorized to function, the following statutory prohibition is operative:

> A person shall not discharge from any source whatsoever such quantities of air contaminants or other material which cause injury, detriment, nuisance or annoyance to any considerable number of persons or to the public or which endanger the comfort, repose, health or safety of any such persons or the public or which cause or have a natural tendency to cause injury or damage to business or property.[133]

Any violation of this provision may be enjoined or punished criminally.[134] It is expressly provided, however, that the legislature does not intend to occupy the entire field or to supersede any local rules and ordinances imposing higher standards.[135]

The county board of supervisors constitutes the air pollution control board,[136] but it is required to appoint an air pollution control officer.[137] The air pollution control board is granted broad rule-making authority,[138] including power to make and enforce orders directing the reduction of the amount of air contaminants [139] and power to require that

[139] *Id.*, §24262.

a permit be obtained from the air pollution control officer before a structure is built or a contrivance is operated which may produce air contaminants.[140] This permit may be withheld unless it is shown that air contamination will not result.[141] Any applicant for or holder of a permit may be required to furnish information disclosing the nature, extent, quantity, or degree of air contaminants which are or may be discharged from any source.[142] However, the air pollution control board or a court, after hearing, may grant variances either from the regulations or from the statute itself when "necessary." [143] The board may "exercise a wide discretion in weighing the equities involved," [144] and it may prescribe different requirements applicable to certain industries or persons.[145]

It may be concluded that California has a rather complete and far-reaching system of regulating the air pollution, and since the discharge of radioactive particles is in all probability included in the definition of air contaminants, careful compliance by atomic energy users will be necessary if the contemplated use involves a discharge of radioactive gases into the atmosphere.

In contrast to California, the problem of air pollution in New Jersey is handled on a state rather than a local basis. In 1954 the New Jersey legislature created an Air Pollution Control Commission within the Department of Health.[146] The commission has power to promulgate rules and regulations controlling or prohibiting air pollution throughout the state.[147] "Air pollution" is defined as "the presence in the outdoor atmosphere of substances in quantities which are injurious to human, plant or animal life or to property, or unreasonably interfere with the comfortable enjoyment of life and property throughout the State . . . and excludes all aspects of employer-employee relationship as to health and safety hazards." [148] Clearly, release of radioactive gases and substances into the atmosphere falls within this broad definition. Persons engaged in operations which may result in air pollution may be required to register and file reports containing information

"relating to location, size of outlet, height of outlet, rate and period of emission and composition of effluent. . . ." [149]

The New Jersey Air Pollution Control Commission is authorized to establish county air pollution control associations to which rules of strictly local application must be submitted for discussion and report.[150] However, the county associations act only in an advisory capacity.[151]

Rules and regulations of the commission are enforced by the State Commissioner of Health,[152] and the Department of Health may seek injunctive relief to prevent violations, and fines may be imposed for continuing violations.[153]

Although none of the other states covered by this study has comprehensive air pollution legislation,[154] it should be noted that several cities have adopted ordinances concerning air pollution.[155] However, some of the ordinances refer only to smoke abatement, and they probably will be inapplicable to radioactive gases discharged into the air.

Conclusion: State agencies created especially for the control of air pollution are not yet as commonly established as are agencies for the control of water pollution. However, a definite trend in the direction of the creation of such agencies has resulted largely because of the increasing recognition of the "smog" problem in industrial areas. Moreover, in many instances existing powers of state departments of health are sufficiently broad to embrace control of air pollution. Therefore, atomic energy enterprises which involve the release of radioactive gases, vapors, and dusts into the atmosphere can expect regulation by some state agency and perhaps by a local government agency as well, depending, of course, upon location of the plant facilities.

Because the release of large amounts of radioactive materials into the atmosphere may be dangerous to surrounding populations and property, strict precautionary safety measures are definitely indicated, and, indeed, industry will no doubt exert extraordinary efforts in this direction. States which do not have agencies possessing authority to control

For a recent conviction under New York City air pollution control authority, see People v. Tatje, 121 N.Y.S.2d 147 (1953). From this case it appears that in 1952 the city created a Department of Air Pollution Control.

the discharge of dangerous substances into the atmosphere will no doubt be so equipped as soon as the legislature is informed of the existence of the problem. In states which have agencies with regulatory power as yet unexercised, the necessary investigation and study of air pollution problems will doubtless commence at an early date so that rules and regulations can be promulgated before atomic energy activities cause an extra-hazardous public health problem.

3. Nuisances

Thus far in this study, primary emphasis has been placed on state regulatory agencies which have been given statutory powers to regulate some of the aspects of peaceful uses of atomic energy. Now, however, we should turn briefly to an examination of the pertinent legal principles of the law of nuisance since under these principles some regulation of uses of atomic energy will be imposed by courts acting either at the instance of private individuals or of public officials. Even though applicable zoning ordinances and health regulations are complied with, a type of judicial zoning regulation may result from industrial operations which occasion harm or discomfort to individuals in the vicinity of the installation. Since radiation hazards may, and at the outset probably will, be greatly feared by those who live near plants utilizing atomic energy, account must be taken of the fact that such persons may institute legal actions to restrict operations thought likely to create these dangers. The law of nuisance will afford a basis for this type of action.

It has been said that "There is perhaps no more impenetrable jungle in the entire law than that which surrounds the word 'nuisance.' " [156] It is obvious that a subject so vast and confused cannot be examined in detail in this study. We can, however, suggest some of the problems that may arise under the application of the fundamental propositions which are a part of the law of nuisance. Abundant authority is available, but most cases provide little guidance since each case turns largely on its own fact situation. However, cases involving power plants and gas plants may have some special significance and will therefore be noted.

Nuisances are usually divided into two somewhat unrelated and separate categories: public nuisances and private nuisances. As will be seen, these involve different ideas and require separate discussion.

[156] Prosser, Torts 549 (1941).

a. Public Nuisances

Public nuisances are minor criminal offenses arising out of acts which cause interference with the public health, safety, morals, comfort, or convenience.[157] To be considered public, the nuisance must affect an interest common to the general public in the exercise of public rights, rather than rights belonging and peculiar to one or more individuals.[158]

Public nuisances are often defined by statutes, but definitions so given are often couched in very general terms. Violations of water pollution, smoke, or zoning ordinances are often made public nuisances. Statutes or ordinances also frequently declare that establishments which emit offensive odors are public nuisances.[159] The New York statutes define a public nuisance as any act or omission which, among other things, "1. Annoys, injures or endangers the comfort, repose, health or safety of any considerable number of persons. . . . 4. In any way renders a considerable number of persons insecure in life, or the use of property." [160] These provisions have been held to be declaratory of the common law.[161] Under the New York type of statute, the operation of an atomic energy establishment which discharges radioactive materials into the streams or gases into the atmosphere might be held to annoy or endanger the comfort, health, or safety of a considerable number of persons and hence to violate the statute. However, a public nuisance may be held privileged if it is authorized by the legislature.[162] The crucial question, of course, is what conduct has been so authorized. Another defense that may be effective in certain unusual circumstances is the fact that the public has an overriding interest in the activity, such as in essential war production. In such event, the defendant is relieved of criminal though not civil liability.[163] Remedies available to the state are either injunction or imposition of fines or other penalty. If a private individual can show special damage to himself, he may have a cause of action for injury.[164]

[164] Prosser, Torts 569 (1941).

b. Private Nuisances

A private nuisance is created when an unreasonable interference is inflicted upon an individual's use or enjoyment of land. There are two principal kinds of such interferences: (1) actual physical injury to land, such as damage to a structure caused by vibration or blasting, pollution of water, or injury to buildings or plant life resulting from the discharge of harmful substances, and (2) disturbance of the comfort or convenience of the occupant of land, such as by unpleasant or harmful odors or gases, or storage in the vicinity of highly dangerous materials.[165] An important feature of any liability incurred as a result of acts involving such interferences is the fact that the fault of the actor is immaterial; *i.e.*, liability may result whether the act is intentional, negligent, or entirely without fault.[166] In short, nuisance giving rise to liability is a type of damage or injury, rather than a type of conduct. Most of the litigation involving private nuisance has dealt with the broad question of the reasonableness of the defendant's conduct, and the issue is essentially one of resolving the conflicting interests of landowners.[167] In a sense, therefore, the law of private nuisance becomes a process of judicial zoning in which the nature of the locality and the public interest involved are two important factors weighed by the courts.

The two types of legal relief available against a private nuisance are an action at law for damages and injunctive relief in equity.[168] Under the latter remedy, a court may in rare instances completely restrain the operation of a plant which creates the nuisance. More often the court will require that the plant be shut down unless additional equipment is installed or care taken to eliminate the nuisance.[169] In contrast to the public nuisance it should be noted that legislative authorization, such as the grant of a franchise or permit by a branch or agency of a government, does not create a privilege in favor of a private nuisance, especially those that cause substantial injury, since this would amount to condemnation without payment of compensation.[170] Neither is it any de-

[165] *Id.* at 573-575.

[170] Churchill v. Burlington Water Co., 94 Iowa 89, 62 N.W. 646 (1895); Rosenheimer v. Standard Gas Light Co., 36 App. Div. 1, 55 N.Y. Supp. 192 (1898); 37 A.L.R. 801 (1925); Note, 52 Col. L. Rev. 781, 784 (1952). For a discussion of the possible effect of zoning ordinances on private nuisance actions, see Beuscher and

fense that the best available devices or equipment are being employed in the operation of a plant since liability is not based on fault but arises from the injury itself.[171]

Private individuals, normally adjoining landowners, have brought numerous actions against public utility companies both for damages and for injunctive relief. In a substantial number of cases relief by way of damages for nuisance has been allowed,[172] but courts have been reluctant to enjoin the operation of such plants. In reaching such conclusions, reliance has been placed on such factors as the quasi-public character of the industries, the adequacy of the damage remedy, the nature of the area where the plant was located, the cost required to move the plant if enjoined, and the fact that the best available devices to prevent injury to adjoining landowners were being used.[173]

The general principle that an equity court will weigh the advantage to be gained by the plaintiff against the injury suffered by the public before restraining the operation of an industry is said to be especially applicable in the case of public utilities.[174] However, in a few instances, courts have temporarily restrained the operation of gas or electric power plants, by requiring that additional protective devices be installed and that the plant be shut down unless these are installed.[175] For example, in *Judson* v. *Los Angeles Suburban Gas Company* a decree enjoining the gas company "from conducting and operating the gasworks and manufactory . . . in such a manner as to cause or permit smoke, gases or offensive smells or fumes to be emitted therefrom or to be precipitated therefrom upon the property of the plaintiff" was affirmed.[176] In *Anstee* v. *Monroe Light and Fuel Co.* the gas company was perpetually enjoined from making further deposits of industrial waste that polluted neighboring soil, the gas company was required to alter its smokestack to abate a smoke nuisance, and in addition damages were awarded.[177]

Morris Electric Co., 56 App. Div. 23, 67 N.Y. Supp. 391 (1900); Parker v. Pacific Gas & Elec. Co., 50 Cal. App. 264, 195 Pac. 60 (1920).

[174] 37 A.L.R. 800 at 802 (1925).

[175] Transcontinental Gas Pipe Line Corp. v. Gault, *supra* note 169; Price v. Philip Carey Mfg. Co., *supra* note 169 (power plant of a manufacturing company); English v. Progress Electric Light & Motor Co., 95 Ala. 259, 10 So. 134 (1891).

[176] 157 Cal. 168, 173, 106 Pac. 581 (1910).

[177] 171 Wis. 291, 177 N.W. 26 (1920).

In the light of these decisions, careful consideration must be given to the location, construction, and operation of industrial plants utilizing atomic energy, for conceivably such a plant could be partially or wholly restrained as a nuisance if injury to landowners resulted. Furthermore, because of the exceptionally dangerous character of atomic energy activities, a court would probably have less difficulty than in cases of conventional plants in holding the owners of an atomic energy plant liable for damages.[178]

c. Conclusion

Although a full development of the law of public and private nuisance is beyond the scope of this study, the foregoing brief mention of its ramifications suffices to show that it may serve in some instances as a regulatory device effectuated by the courts under common law principles. Since nuisance law is invoked only through litigation involving specific factual settings, it is impossible to draw any but the most general conclusions. However, so far as atomic energy plants are concerned, it is clear that both public officials and private persons may commence litigation with some likelihood of success, particularly if the atomic enterprise creates a hazardous or even an annoying condition in its vicinity. Atomic energy entrepreneurs undoubtedly will have to exercise exceptional prudence in selection of location especially since limited public knowledge of the subject coupled with the fears engendered by the mystery of atomic forces may easily precipitate troublesome litigation. Specific governmental authorization for a particular installation may provide a defense against the charge of committing a public nuisance, but the authorization will not provide a defense in respect to actions for private nuisance. Accordingly, sites embracing large exclusion areas well removed from populated centers seem advisable wherever possible, not only as a means of protection of the public against possible accidents, but also from the standpoint of avoiding monetary liability and regulation through court orders.

B. Diversion of Waters

If a nuclear reactor or other atomic energy plant utilizes large quantities of water,[179] diverted from regular watercourses, an additional problem arises. Many states have enacted statutes which restrict the

[178] See Part I of this volume.

[179] The full-scale atomic power plant built at Shippingport, Pennsylvania, by the AEC and Duquesne Light Company employs water as a coolant.

diversion of water, and unauthorized diversion of substantial quantities thereof may constitute a public or private nuisance. Most of these statutes were enacted for other specific purposes; *e.g.*, some of them are concerned with the building of dams or other obstructions in watercourses, with impeding the navigability of streams, with preventing the free passage of fish, or preserving water supply facilities. However, some of the language in these statutes may be broad enough to be applicable to the withdrawing of sizable quantities of water for industrial uses, even though it is subsequently returned to the body of water from which it is taken.

Obviously, states which are faced with the problem of water scarcity are more likely to regulate the use of waters than are states that have no such problem. In varying degrees five of the ten states surveyed in this study fall within this category.

Texas and California are among those western states which follow the law of "prior appropriation" with respect to water use. In these states it is necessary to obtain a permit from an appropriate state agency before water may be appropriated or diverted.[180] These state agencies are given authority to reject an application if the use is detrimental to the public interest. Elaborate systems of priority are set up to obtain the most beneficial use from the available water.

New Jersey requires that a permit be obtained from the Division of Water Policy and Supply if, in designated areas, water is to be taken from subsurface or percolating sources in excess of 100,000 gallons per day.[181] In Pennsylvania it is necessary to obtain a permit from the Water and Power Resources Board in order to change, diminish, or appropriate water from any body of water in the state.[182] This permit is required regardless of whether the stream is navigable or non-navigable. It is expressly made unlawful to divert water for use in the generation of electricity without such a permit.[183]

Ohio is another state in the category of those which regulate the use of water rather closely, but it appears to do so on a local level only, through the granting of permission for the organization of various types of local water control districts. In an area where one of these districts has been formed, it is necessary to obtain the consent of the

[180] In Texas the permit must be secured from the State Board of Water Engineers, Tex. Civ. Stat. art. 7492. In California the permit is obtainable from the Dept. of Public Works, Div. of Water Resources, Cal. Water Code §1252.

[181] N.J. Rev. Stat. §58:4A-2 (Cum. Supp. 1945-47).

[182] Pa. Stat. Ann. tit. 71, §468.

[183] Pa. Stat. Ann. tit. 32, §594.

governing board prior to making use of waters within the district. In addition, the board of directors of a conservancy district, the board of directors of a sanitary district, and the board of trustees of a regional water and sewer district are given the authority to "prescribe the permissible uses of the water supply provided by the district" by regulation.[184]

The possible existence of various types of local water districts authorized by statute must be checked and taken into account before an industry may select any given plant location. As was noted above in the discussion of pollution, both Texas and Illinois authorize various types of local water districts. Those authorized by the Illinois statutes seem primarily concerned with pollution problems,[185] but those authorized by Texas statutes are concerned as well with water usage.[186] California, too, provides for the formation of various types of local water districts.[187]

It may be necessary to secure the consent of a state agency when water from a particular stream is desired for industrial use. For example, the appropriation of water from the Delaware River is stringently controlled by at least three states: New Jersey, New York, and Pennsylvania,[188] as well as an interstate agency, as will appear below in the discussion of interstate compacts.

Several different statutory objectives may be involved in the statutes under consideration. In several states it is deemed a public nuisance to obstruct or impede the passage of any navigable river or waters without legal authority.[189] In others the statutes are apparently directed toward the maintenance of streams for navigable purposes. In at least two states there are provisions which prohibit the obstruction of streams so as to impede the free passage of fish.[190] Exceptions may be made by

[184] Ohio Rev. Code §6101.19(4) (conservancy districts); §6115.23(c) (sanitary districts); §6119.08(c) (regional water and sewer districts).

[185] But see Ill. Stat. Ann. c. 111 2/3, §§223-228, which authorize the establishment of "Water Authorities." The board of trustees appears to have some control over water use, although the act seems directed primarily at pollution of underground waters.

[190] Mich. Stat. Ann. §13.1657.

the Conservation Department in Michigan.[191] The statutes of Missouri and Wisconsin seem primarily concerned with the construction of dams.[192] In Wisconsin the Public Service Commission has jurisdiction over the level and flow of water in navigable streams,[193] and water declared surplus by this commission may be diverted.[194] Missouri provides for a condemnation procedure to divert water when used in connection with the generation of electric power for sale to the public.[195] Whether this statute may be used for obtaining water for cooling purposes in an atomic reactor rather than in conjunction with hydroelectric power is uncertain.

Several unique Michigan statutes should also be noted. One provides that the stage of water in any watercourse shall not be altered without the written consent of the commissioner having jurisdiction over all the bridges and culverts passing over the watercourse.[196] Another statute gives authority to each county board of supervisors to "permit or prohibit the construction of any dam or bridge over or across any navigable stream." [197]

Another possible source of restriction upon the use of streams stems from common law remedies available to riparian owners for an injury to their water rights. This type of remedy may take the form of either a suit for damages or an injunction against unreasonable use or pollution.[198] It is important also to note that statutes which outlaw or regulate water pollution in all probability do not displace the common law rights to abate pollution.[199]

The existing statutes do not cover the possible problem of substantially increasing water temperature which may occur in the operation of a nuclear reactor.

Conclusion: The consuming of large quantities of water in an atomic energy enterprise, such, for example, as a water-cooled nuclear reactor, may in several states necessitate approval by state and local governmental authorities. Although the problems involved are not especially unique as applied to atomic energy industries, nevertheless state and

local control of water diversion represents one more factor that must be considered by atomic entrepreneurs in determining the type of facility and its location.

C. Regulation of Radioactive Materials as Drugs or Dangerous Substances

The use of radioactive materials in medical therapy and industrial operations has increased rapidly and can be expected to continue to increase as new applications and better techniques are discovered. Since radioisotopes can be produced as byproducts of any type nuclear reactor, it is probable that many owners of nuclear reactors will find themselves engaged in the sale of radioactive materials to medical, research, and industrial consumers. As a result, two additional types of state regulation may be encountered: namely, regulation of sale of drugs and regulation of transportation of dangerous substances.

At least four types of state statutes exist which may have some application to the manufacture, sale, and use of radioisotopes in connection with the study and treatment of diseases. Since the California statute books contain all four of these types and since the scheme of regulation in California in respect to drugs and poisons is quite extensive, its statutes will be examined in some detail. Similar provisions in the statutes of the other nine states will be indicated, together with other pertinent provisions not found in the California statutes.

California, as well as the other nine states covered in this study, has a statute regulating the pharmacy profession which provides for the licensing of pharmacists and pharmacies and establishes a State Board of Pharmacy.[200] In addition to regulating the sale of drugs at retail, the statute requires that any manufacturer of drugs obtain a permit from the State Board of Pharmacy.[201] New York, Pennsylvania, Texas, and Wisconsin similarly require the registration of drug manufacturers.[202] The California statute also states that "Except as otherwise provided in this chapter, it is unlawful for any person to manufacture . . . any drug, poison, medicine or chemical . . . unless he is a regis-

(1937) §§45:14-1 *et seq.;* N.Y. Education Law §§6801 *et seq.;* Ohio Rev. Code c. 4729; Pa. Stat. Ann. tit. 63, §§291 *et seq.;* Tex. Civ. Stat. art. 4542a; Wis. Stat. (1957) §§151 *et seq.*

[201] Cal. Business & Professions Code §4084.

[202] N.Y. Education Law §6805(5); Pa. Stat. Ann. tit. 35, §794; Tex. Civ. Stat. art. 4542a, §17; Wis. Stat. (1957) §151.04(4).

tered pharmacist. . . ." [203] However, since a corporation cannot be a registered pharmacist, this provision must mean that a manufacturer of drugs must either be a registered pharmacist or comply with the provision requiring that a manufacturer obtain a permit from the State Board of Pharmacy. Pennsylvania, Texas, and Wisconsin require the supervision of a registered pharmacist "or other qualified person" in the manufacture of drugs.[204] The State Board of Pharmacy is also given broad administrative authority to regulate the manufacture of drugs for the protection of the public.[205] In view of these statutes, it may be necessary for an atomic energy enterprise, if it produces byproduct radioisotopes to be used in medical diagnosis and therapy, to register with the state board of pharmacy and to comply with any applicable statutes or regulations governing the manufacture of drugs.

A second category of statutes which must be taken into consideration are the pure drug acts, many of them patterned after the Federal Food, Drug, and Cosmetic Act. These statutes commonly prohibit "adulteration" and "misbranding" of drugs. Elaborate statutory definitions of these two terms are set forth, and drug manufacturers are required to comply.[206] Another provision found in many of the pure drug acts relates to "new drugs," and typically a new drug may not be sold unless it has been approved under the Federal Food, Drug, and Cosmetic Act or approved by the state board of pharmacy.[207]

A third category of state statutes establishes special regulations for "dangerous drugs." For instance, California statutes define a "dangerous drug" as any drug unsafe for self-medication. Certain specific drugs are listed as dangerous, with power given to the Board of Pharmacy to add others to the list.[208] Certainly many, if not most, radioisotopes would fall within this definition. Manufacturers of dangerous drugs must be registered with the Board of Pharmacy and keep a record of sales of such drugs to wholesalers, pharmacies, and laboratories.[209]

[203] Cal. Business & Professions Code §4030.

Code §§3715.08, 3715.11; Pa. Stat. Ann. tit. 35, §§781 to 805; Tex. Civ. Stat. art. 4471; Wis. Stat. (1957) §97.25.

[207] Cal. Health & Safety Code §26288; Mo. Stat. Ann. §196.105; N.J. Rev. Stat. §24:6A-1; N.Y. Education Law §6809.

[208] Cal. Business & Professions Code §§4211, 4240.

[209] *Id.*, §§4217, 4227. Wisconsin also has a statute regulating the sale of dangerous drugs. Wis. Stat. (1957) §151.07.

The fourth type of state statute which may have some significance to producers of radioisotopes is that relating to poisons. The California statute lists compounds and preparations which are deemed poisonous, and gives power to the Board of Pharmacy to add others to the schedule when required in the interest of public health.[210] Other statutes define a poison as any drug, chemical, or preparation which is likely to be destructive to human life in quantities of sixty grains or less,[211] or for some purposes any substance likely to be destructive of human life in quantities of five grains or less.[212] These statutes typically require that specified labels be attached to the container containing the poisonous substances and that records be kept of their sale. The probable applicability of these statutes should be taken into account by concerns intending to market radioisotopes.

D. Transportation of Radioactive Materials

The transportation of radioactive materials may also be regulated by several federal, state, and local agencies. Although the Atomic Energy Commission apparently has power to regulate the transfer of radioactive materials, the Commission has subordinated its authority to the federal agencies having jurisdiction over the various types of carriers.[213] As a result, the Interstate Commerce Commission, the Civil Aeronautics Board, the U. S. Coast Guard, and the Post Office Department have issued detailed regulations governing the transportation of radioactive substances under their authority to regulate transportation of "explosives and other dangerous articles." [214] However, the authority of the federal agencies, other than the Post Office, is generally limited to interstate commerce so that matters of intrastate commerce are governed by state and local laws and regulations.

In each of the ten states studied, a state agency has general supervisory powers over the railroad and motor vehicle common carriers. Typically, common carriers are denoted "public utilities" and are subject to the jurisdiction of the public utility commissions. However, in

[210] Cal. Health & Safety Code §§20703, 20800. See also Ill. Stat. Ann. c. 38, §184; Mich. Stat. Ann. §14.745; Mo. Rev. Stat. (1949) §338.090; N.J. Rev. Stat. (1937) §45:14-19; N.Y. Education Law §6813; Ohio Rev. Code §3719.32; Tex. Penal Code art. 726; Wis. Stat. (1957) §151.10(1).

[212] N.J. Rev. Stat. (1937) §45:14-19; Pa. Stat. Ann. tit. 35, §902.

[213] BNA, Atomic Industry Reporter 281.1.

[214] For a compilation of the federal regulations, see AEC, Handbook of Federal Regulations Applying to Transportation of Radioactive Materials (1955).

some states the trucking industry is regulated by a separate agency. In California, Illinois, Michigan, Missouri, New York, Ohio, and Pennsylvania the public utility commissions have been granted sufficiently broad powers to establish health and safety standards for the transportation of radioactive materials by all types of common carriers.[215] In New Jersey the Public Utilities Board has broad rule-making powers in respect to railroad safety,[216] but the Commissioner of Motor Vehicles is given only a limited power in respect to the trucking industry to regulate the construction and equipment of vehicles.[217] In Texas only the State Highway Commission seems to have sufficiently broad powers to issue regulations covering transportation of radioactive materials.[218] In Wisconsin the Public Service Commission has jurisdiction over both railroads and motor vehicles, but its power to make rules and regulations covering procedures to be followed in transporting radioactive substances is not clear. For example, the commission is vested with power and authority to "supervise and regulate such common motor carriers in all matters affecting their relationship with the public . . . to the end that adequate service at reasonable rates shall be afforded." [219] The power to regulate health and safety matters is thus not expressly granted, but probably is implicit since it is made the duty of every common motor carrier to "furnish reasonable, safe and adequate service and facilities." [220] Similarly, in respect to railroads in Wisconsin, every railroad is directed to adopt "reasonably adequate safety measures and install, operate and maintain reasonably adequate safety devices for the protection of life and property." [221] But this general terminology is followed by a sentence authorizing the commission to require the installation of a block system. This probably limits the authority of the commission to regulate only those safety matters connected with equipment and practices in moving freight; the authority apparently does not extend to regulation of such matters as amount of material, packaging, warnings, etc.

Two statutes,[222] enacted in New York and Pennsylvania, which are

[215] Cal. Public Utilities Code §761; Ill. Stat. Ann. c. 111 2/3, §§32, 49, 61; *id.*, c. 95 1/2, §§282.4, 282.14; Mich. Stat. Ann. §§22.53, 22.543; Mo. Rev. Stat. (1949) §386.310; N.Y. Public Service Law §49(2); Ohio Rev. Code §§4905.04, 4921.04; Pa. Stat. Ann. tit. 66, §§1183, 1186.

[221] *Id.*, §195.26.

[222] N.Y. Vehicle and Traffic Law §16-c; Pa. Stat. Ann. tit. 75, §715.

substantially identical in nature and regulate the transportation of dangerous articles by motor vehicle, should also be mentioned. It is made unlawful to transport by motor vehicle over the highways of the state any dangerous article (which is defined to include radioactive materials) in a manner that will unreasonably endanger persons or property. The transporting motor vehicle must be conspicuously marked to indicate the danger, but an exemption is granted when applicable regulations of the Interstate Commerce Commission have been followed.

In addition to the authority of state agencies having direct jurisdiction over common carriers, it should be noted that the labor departments and health departments typically are granted such broad powers in respect to the health and safety of employees and the public that they may also attempt to regulate the transportation of radioactive materials.[223] Furthermore, local governmental units may also have authority to regulate transportation of radioactive substances. Therefore, we find once again an imposing array of state and local agencies potentially capable of exercising jurisdiction in respect to the same activity.

E. Regulation by Interstate Compact

The interstate compact was little used until the 1920's,[224] but recent years have seen a great increase in the application of this device in various regulatory fields, including conservation of natural resources, control and improvement of navigation, civil defense, education, flood control, labor legislation, and stream pollution.[225] Both Congress and the Supreme Court have encouraged the use of the interstate compact as a means of solving problems essentially regional in character [226] which do not readily lend themselves to solution by the states acting individually.

Several compacts recently entered into by two or more states have established interstate administrative agencies. The compacts of greatest significance with respect to the development of atomic energy for industrial uses are those relating to water pollution. However, the interstate compact may conceivably be used to regulate other activities affecting the use of atomic energy in the future. Therefore, in addition to consulting and obtaining the necessary permission from appropriate

[223] See discussion of general powers of the labor and health departments, *supra*, Part III, Chapter III.

[224] Zimmerman, The Interstate Compact Since 1925, 3 (1951).

[225] Note, 100 U. of Pa. L. Rev. 130, 131 (1951); Book of the States 20 (1952-53).

[226] See, *e.g.*, New York v. New Jersey, 256 U.S. 296, 313, 41 S.Ct. 492 (1921); Dyer v. Sims, 341 U.S. 22, 71 S.Ct. 557 (1951); Water Pollution Control Act of 1948, 33 U.S.C.A. §466a(c); 36 Stat. 961 (1911).

state agencies, an industry planning a venture into this new field of activity should also investigate the existence of interstate agencies as another possible instrumentality of governmental regulation.

Since the landmark Colorado River Compact, approved by Congress in 1928,[227] the compact has been employed extensively in regard to water problems common to several states. In the western states, including Colorado, New Mexico, Texas, Wyoming, Idaho, Nebraska, North Dakota, South Dakota, and Kansas, numerous compacts have been formed relating to matters of water allocation since scarcity of water is a crucial problem in these states.[228] These compacts would assume significance if a nuclear reactor employing large quantities of water as a coolant were built in any of these states.

In the eastern and midwestern states, a number of compacts directed toward the problem of pollution of interstate streams have been negotiated between states and approved by Congress. Various factors have accounted for the increasing use of the interstate compact in this area, including especially the increasing number of instances of pollution of interstate waters and the reluctance of the Supreme Court to enjoin pollution at the instance of one state suing another.[229]

Some of the more significant water pollution compacts merit discussion. Compacts to be examined will be primarily those involving the states selected for this study in connection with regulation at the state level. These compacts may be divided into two principal categories: (1) compacts which create administrative agencies, some of which have enforcement powers; and (2) compacts which create committees to collect and disseminate information and to make recommendations to the states. Since the second type does not involve regulatory powers, they are of little significance for present purposes, although action taken as a result of recommendations of the committees may have importance in the future.

1. Compacts Creating Joint Administrative Commissions

a. Commissions with Enforcement Powers

The following are representative interstate compacts pursuant to which enforcement powers are conferred upon administrative commissions:

(1) *Ohio River Valley Water Sanitation Compact.* The Ohio River

[227] 45 Stat. 1057 (1928).

[228] Zimmerman, *supra* note 224 at 16, contains citations to many of these compacts.

[229] Missouri v. Illinois, 200 U.S. 496, 26 S.Ct. 268 (1906); New York v. New Jersey, *supra* note 226.

Valley Water Sanitation Compact, drawn in 1936, became effective in 1948 when the requisite number of states ratified it.[230] The signatory states are Illinois, Indiana, Kentucky, New York, Ohio, Pennsylvania, Tennessee, Virginia, and West Virginia. The compact creates the Ohio River Valley Water Sanitation Commission, which is authorized to adopt, prescribe, and promulgate rules, regulations, and standards for administering and enforcing provisions of the compact. All industrial wastes discharged into the Ohio River or its tributaries must be modified or treated to protect the public health or to preserve the waters for other legitimate purposes as determined to be necessary by the commission after investigation, due notice, and hearing. The commission is empowered to order a person to discontinue, modify, or treat any discharge of industrial waste, and the orders are enforceable in any court of general jurisdiction. In addition, the commission is ordered to make surveys and recommendations and reports to the various signatory states.[231]

(2) *Tennessee River Basin Water Pollution Control Compact.* The purpose of the Tennessee River Basin Water Pollution Control Compact is to promote the effective control and reduction of pollution in the waters of the Tennessee River basin.[232] The signatory states are Alabama, Georgia, Kentucky, Mississippi, North Carolina, Tennessee, and Virginia. The compact has not yet come into effect for it still requires enactments by certain state legislatures and approval by the Congress. When it comes into operation,[233] it will give the commission established under the compact [234] powers in respect to the Tennessee River basin somewhat similar to those possessed by the Ohio River Valley Water Sanitation Commission over the Ohio River basin.

(3) *Delaware River Basin Water Commission Compact.* The Delaware River Basin Water Commission Compact involves New York, New Jersey, Delaware, and Pennsylvania. Apparently, all states have approved except Pennsylvania.[235] According to its terms, it is not to

[230] Zimmerman, *supra* note 224 at 7, n. 33. Dyer v. Sims, *supra* note 226, concerned the validity of this compact, and the court's opinion contains background material as well as some of the provisions of the compact.

[231] The text of this compact may be found in Ohio Rev. Code §6113.01; Pa. Stat. Ann. tit. 32, §816.1; 54 Stat. 752 (1940).

[232] For text of the compact, see Tenn. Laws 1955, c. 151.

[233] It enters into force when enacted into law by Tennessee and one other of the signatory states and approved by Congress. *Id.*, art. XII.

[234] *Id.*, art. II.

[235] See 11 Del. Code Ann. (1953) tit. 23, §901-904, annotation to §902. See also N.Y. Unconsolidated Laws §1581.

become effective until approved by all four states;[236] moreover, Congress has not yet approved the compact.

When it becomes effective, the Delaware River Basin Water Commission will have power, among other things, to "exercise an essential governmental function of each of the signatory states, for the purposes of developing, utilizing, controlling, and conserving the water resources of the Delaware River Basin in order to insure an adequate water supply. . . ." Among the primary purposes is the assurance of an "adequate minimum flow in the Delaware River for the protection of public health, for the benefit of industry and of fisheries . . . , for recreation, for general sanitary conditions, for the dilution and abatement of pollution, and for the prevention of undue salinity. . . ."

It would seem imperative that an industry contemplating the use of large quantities of water consult this commission if and when the compact goes into effect.

(4) *Interstate Sanitation Commission.* The Interstate Sanitation Commission was created by a tri-state compact, negotiated in 1935 between New York, New Jersey, and Connecticut.[237] The boundaries of the Interstate Sanitation District established by the compact and the waters embraced by it are defined rather precisely in the agreement. In general, the compact is aimed at abating and reducing the pollution of harbor, coastal, and tidal waters and tributaries of tidal waters.

The commission is given power to classify and establish standards of purity for the various bodies of water embraced within the district. Unless properly treated, sewage or other polluting matters may not be discharged into the waters in the district. Enforcement powers are granted to the commission, as well as authority to issue orders. These powers have been exercised in at least one instance, and a New Jersey court has enforced the commission order by a mandatory injunction directed against the discharge of sewage by a municipality.[238]

The commission must be consulted in the event that coastal, estuarial, or tidal waters of any of the signatory states are considered for use by an atomic energy establishment. Moreover, the commission has recently been authorized to study air pollution in the New York-New Jersey area.[239]

[236] *Ibid.*

[237] N.J. Rev. Stat. (1937), §§32:18-1 *et seq.* See also, 49 Stat. 932 (1935).

[238] Interstate Sanitation Commission v. Weehawken, 141 N. J. Eq. 536, 58 A.2d 530 (1948).

[239] N.Y. Laws 1954, c. 321.

b. Commissions without Enforcement Powers

The following are representative interstate compacts conferring advisory authority but not granting administrative enforcement powers:

(1) *New England Interstate Water Pollution Control Compact.* The New England Interstate Water Pollution Control Compact embraces the states of Maine, Massachusetts, Connecticut, Rhode Island, Vermont, New Hampshire, and New York. Congress and all of the states have approved the compact.[240] According to Article I, the compact shall apply to:

> . . . [S]treams, ponds and lakes which are contiguous to two or more signatory states or which flow through two or more signatory states or which have a tributary contiguous to two or more signatory states or flowing through two or more signatory states, and also shall apply to tidal waters ebbing and flowing past the boundaries of two states.

The New England Interstate Water Pollution Control Commission is given rule-making authority and is required to "establish reasonable physical, chemical and bacteriological standards of water quality satisfactory for various classifications of use." [241] The commission is not authorized to issue permits or orders. However, appropriate state agencies (*i.e.*, agencies regulating health and water pollution) are charged with establishing treatment programs to meet these standards. Each signatory state pledges itself to provide for the abatement of existing pollution and for the control of future pollution of the waters concerned.[242] Hence, all enforcement powers are retained by the individual signatory states. Of course, there is a possibility that the United States Supreme Court may enforce the compact obligations.

(2) *Bi-State Development District.* The Bi-State Development District is the result of a compact between Illinois and Missouri. It was approved by Congress in 1950.[243] The purpose of the compact is to establish a metropolitan development district, consisting of the city of St. Louis and several surrounding counties. The Bi-State Development Agency created pursuant to this interstate agreement is given power to "plan, construct, maintain, own and operate bridges, tunnels, airports and terminal facilities and to plan and establish policies for sewage and

[240] 61 Stat. 682 (1947).
[241] *Id.*, art. V.
[242] *Id.*, art. VI.
[243] 64 Stat. 568 (1950); see also, Ill. Stat. Ann. c. 127, §63r-1; Mo. Stat. Ann. §70.370.

drainage facilities." [244] Apparently, this agency will act as a general planning agency for this area.[245]

While the agency has no direct powers of enforcement with respect to matters of water pollution and use, nevertheless as a planning and rule-making agency it has policy-forming authority, and it would seem advisable to consult it should an industry contemplate the use of waters in the area covered by the compact.

(3) *Interstate Commission on the Delaware River Basin.* The Interstate Commission on the Delaware River Basin might be termed a "joint advisory commission," created pursuant to a compact between New York, New Jersey, Delaware, and Pennsylvania.[246] The compact outlines detailed requirements for the disposal of wastes in the Delaware River basin. The basin is divided into four zones, and it has been said: "For the industry operating in one of these zones or planning to build there, the agreement provides an exact picture of what will be required." [247] No enforcement powers are given to the commission, its powers being purely advisory. The Delaware River Basin Water Commission Compact, discussed above, now in the process of being adopted by the same four states, will have enforcement powers and is a product of the recommendations of this older commission.

(4) *Columbia Interstate Compact.* The Columbia Interstate Compact was signed in 1955 by the states of Idaho, Montana, Oregon, Washington, Nevada, Utah, and Wyoming. It will become effective when ratified by the first four states listed above and approved by Congress.[248] Under the compact, the Columbia Interstate Compact Commission will have advisory powers in respect to the utilization of the water and other related resources of the Columbia River basin. It is of particular interest for the purposes of this study to note that specific power is given the commission to prepare and recommend plans for achieving the most efficient use of the hydroelectric power resources in the basin and for controlling pollution of waters of the Columbia River system.[249]

2. Compacts Creating Informal Advisory Commissions

Several compacts establishing purely advisory commissions on water pollution have been entered into by different groups of states. These

[244] 64 Stat. 569 (art. III) (1950).

[245] See Zimmerman, *supra* note 224 at 12.

[246] For test, see Pa. Stat. Ann. tit. 32, §815.31.

[247] Comment, "Statutory Stream Pollution Control," 100 U. of Pa. L. Rev. 225, 237 (1951).

[248] For the text of the compact, see Idaho Laws 1955, c. 185.

[249] Art. V, §C(3) and art. VIII, §B of the compact respectively.

compacts are of little significance at present, except insofar as they may lead to future compacts or statutes which may be recommended by the respective commissions. These compacts typically embrace a particular river basin, and give the commission authority to make investigations, disseminate information, and make recommendations to their respective signatory states. The signatory states typically agree to cooperate in the abatement of existing pollution, to prevent future pollution, and to enact uniform legislation for the abatement and prevention of water pollution.[250]

Another type of agreement, even more informal, provides simply that departments of health of several states agree to cooperate with each other and with the United States Health Service in abating and preventing water pollution. Apparently these agreements create a committee which meets periodically, discusses mutual problems of water pollution, and makes suggestions. Beyond this the committee cannot go.[251]

Illustrative of such agreements and the corresponding signatory states are: Upper Mississippi River Drainage Basin Sanitation Agreement (Minn., Ind., Iowa, Wis., Ill., Mo.); Missouri River Basin Sanitation Agreement (Colo., Kan., Mo., Neb., Iowa, Minn., Mont., N. D., S. D., Wyo.); The Great Lakes Drainage Basin Sanitation Agreement (Minn., Wis., Ill., N. Y., Pa., Ohio, Mich., Ind.).

Also to be mentioned are joint resolutions between water pollution commissions of two or more states. For example, Minnesota has joined with Wisconsin in at least two joint resolutions, one in 1952 and the other in 1953. By the terms of these resolutions each signatory state agrees to require certain minimum treatment of wastes to prevent water pollution. Another joint resolution was entered into by the states of Illinois, Iowa, and Wisconsin in 1952, with essentially the same provisions as the resolutions between Wisconsin and Minnesota.

3. Conclusion

It will be important for any private industry contemplating the establishment of a plant utilizing nuclear power or otherwise using nuclear energy in such manner as to affect interstate streams to take into consideration any interstate compacts that may be applicable and to consult with the interstate commissions whether the commissions have enforce-

[250] See, *e.g.*, Interstate Commission on the Potomac River Basin, 54 Stat. 748 (1940), Pa. Stat. Ann. tit. 32, §741.

[251] These compacts do not ordinarily get into the state statute books, but are matters of informal public record.

ment or merely advisory powers. If the particular commission has enforcement powers, then clearly an industry will be subject to them. In the case of a commission with only advisory powers, a private industry would nevertheless be well advised to follow its recommendations. The commission's proposals may be implemented by statutes of the states party to the compact. Moreover, good public relations will demand that the industry adopt the health and safety standards recommended by the interstate commission. Furthermore, a failure to adopt the recommended standards may serve as evidence of negligence, if persons or property are injured, and actions are brought in the courts to recover damages.

Chapter V

RECENT STATE ATOMIC ENERGY LEGISLATION AND REGULATION

In recent years a number of states have recognized some of the problems inherent in the peaceful uses of atomic energy and have enacted legislation, promulgated regulations, or taken other executive action. Although this legislation and regulation cannot be easily classified, basically state action expressly concerned with atomic energy problems seems to fall into three categories: (1) legislation or executive action creating study commissions to investigate the problems involved and recommend solutions; (2) legislation to encourage atomic energy activities and establish education programs; and (3) legislation and regulations to control radiation hazards.

A. Study Commissions

Before a state invokes any of its powers, reason suggests that it first determine what problems are involved and in what directions solutions are most likely to lie. This is especially true where the state proposes to anticipate the development and effect of a new scientific, industrial, agricultural, and medical instrument and source of energy. Investigations of this magnitude require the concerted efforts of representatives of a number of disciplines.

Recognizing the dimensions and complexity of the problem posed by the peaceful uses of atomic energy, many states, either individually or as members of a geographic region with similar interests, have established special investigating, study, and planning commissions to determine the scope and purpose of any state program. These commissions have been established by both legislative and executive action. All of them have sought to focus the minds of a representative group of experts upon the problems of promoting and integrating the utilization of atomic energy into the activities of the state or region. Most of them are of a temporary character, existing until such time as their recommendations are tendered to the governor or to the legislature.

Typical of this approach are the actions of Georgia, Illinois, New Jersey, and South Carolina. In 1955 the Illinois legislature established the Atomic Power Investigating Commission by statute.[1] The commis-

[1] Ill. Laws 1955, S.B. 577.

sion consists of the directors of public health, civil defense, and public welfare (who are members ex officio), three members from the General Assembly, three from labor, three from industry, and three from science. The commission was charged with the duty of making a thorough investigation and study of the economic and social impact of the peaceful uses of atomic energy upon the state and submitting a report of the results and recommendations to the governor and the General Assembly within two years. In 1957 another statute was passed to continue this organization for another two years.[2]

A permanent Nuclear Advisory Commission, consisting of not less than twenty, nor more than forty, members (representing agriculture, power, medicine, public health, education, industry, labor, banking, insurance, law, government, and such other fields as the governor deemed advisable), was created by a resolution of the Georgia legislature in 1957.[3] Its duties include making a study as to the best possible means of achieving the social and economic benefits of nuclear energy, keeping itself advised on all phases of nuclear energy development, keeping the governor informed and advised, and determining whether additional legislation is necessary. By virtue of a recommendation in the resolution that no legislation relating to nuclear energy be introduced or enacted unless first approved by the commission, it has been made, in effect, a clearing house for legislation.

A fifteen member Atomic Energy Commission was authorized by a joint resolution of the New Jersey legislature in 1956 for the purpose of conducting a similar study.[4] And in 1956 the New York legislature created the Joint Committee on State's Economy, which is authorized to make a thorough study of the effect of the advance in the civilian use of atomic energy upon the economy of the state and of the measures to be taken in relation thereto. The South Carolina Senate, by resolution, amended its rules to create a Committee on Atomic and Nuclear Energy for purposes similar to those of New York.[5]

The governors of Arkansas, Connecticut, Maine, Massachusetts, Michigan, New Hampshire, Ohio, Tennessee, and Washington have revealed an independent concern with atomic energy problems by appointing study committees to assist them.[6]

[6] Atomic Industrial Forum, Inc., "State Activities in Atomic Energy," (mimeo. Feb. 1957).

In addition to the above state measures taken independently, several regional organizations have been established to make studies concerning the social and economic impact of atomic energy. Sixteen southern states,[7] through the Southern Regional Education Board, conducted a study program which resulted in the presentation of a report to the Southern Governors' Conference in 1956. The report pointed out two principal areas of state action—to control and to develop the use of atomic energy. The report also recommended (1) that each governor appoint a special assistant for atomic energy matters, (2) that existing state agencies continue to exercise existing regulatory authority in their respective areas of activity, (3) that each state study its existing laws and regulations applicable to nuclear energy, and (4) that state development and promotional agencies re-evaluate their practices and programs to include the atom. These recommendations covered the field of agriculture, atomic power, general industrial applications, manpower, education, medicine, and public health.[8]

Having received this report and recommendation, the Southern Governors' Conference, in turn, recommended that individual states create a state nuclear energy advisory committee for the purpose of (1) reviewing the work conference report, (2) recommending state programs, and (3) advising the state governor on atomic energy matters. The Georgia Nuclear Advisory Commission, described above, is an example of the recommended organization. It also was suggested that the chairmen of the various state advisory commissions serve as members to a regional advisory council.[9]

On February 8, 1954, the New England Committee on Atomic Energy was established by a resolution adopted at the New England Governors' Conference. It consisted of twelve members, selected by the chairman of the Conference from nominations submitted by the six New England governors,[10] and was to make a survey concerning:

[7] Alabama, Arkansas, Delaware, Florida, Georgia, Kentucky, Louisiana, Maryland, Mississippi, North Carolina, Oklahoma, South Carolina, Tennessee, Texas, Virginia, and West Virginia.

[8] *Supra* note 6, p. 3.

[9] *Ibid.* At the request of the Regional Advisory Council on Nuclear Energy of the Southern Governors Conference, the Southwestern Legal Foundation of Dallas, Texas has undertaken a study to ascertain the feasibility and advisability of an interstate compact pertaining to nuclear energy among the sixteen states represented at the conference. On September 1, 1957 the Foundation published its interim report on "The Feasibility of a Southern Regional Compact on Nuclear Energy." The report contains a general discussion on the areas of state responsibility, plus tentative remarks regarding areas for interstate coordination and separate state action.

[10] Connecticut, Maine, Massachusetts, Rhode Island, New Hampshire, and Vermont.

(1) The interests of New England in the development of atomic energy, present and potential, for peaceful purposes, particularly in the field of power generation;
(2) The extent and effectiveness of present efforts in this field on the part of the New England state governments, educational institutions, private associations, industrial and business firms and individuals;
(3) Measures appropriate for both public and private organizations which would stimulate and enlarge New England's participation in the atomic energy program; and
(4) Such other matters relating to atomic energy as in the judgment of the Committee should be brought to the attention of the Conference.[11]

In July of 1955 the committee submitted an extensive report in which it concluded that the effect of the 1954 Atomic Energy Act was to open a new phase of state and private atomic activity; that such activity called for ". . . an industrial base in which scientific and engineering talent, supported by mechanical skills, is the indispensable element"; that, while atomic power was not then economically competitive, since New England was a high power cost area, it should be in the forefront of atomic power development; that the new phase in atomic activity affects state governments in at least three of their traditional capacities: (1) "The exercise of the police power for the protection of the health, safety, and welfare of the citizen"; (2) ". . . the exercise of . . . [the police] power with respect to financial, insurance, and rate regulation as new atomic industries are financed and come into being"; and (3) ". . . the capability of the state to encourage and enhance the development of new industrial activity through promotion, dedication of resources, and sound tax policy." [12]

Also included in the committee's report were its recommendations (1) to the states—that they undertake a legislative program similar in concept to that contained in a suggested state statute (discussed below in this chapter); (2) to Congress and the AEC—that some federal atomic energy installations, an AEC administrative office, and a library of classified technical information be located in New England; (3) to New England educational institutions—that they should undertake to construct research reactors and to institute appropriate training programs on all phases of atomic energy; and (4) to New England indus-

[11] New England Committee on Atomic Energy, "Atomic Energy and New England," app. (i) (1955).
[12] *Id.* at 2.

trial and business leaders—that atomic energy uses, opportunities, and enterprises should be aggressively pursued.[13]

B. State Promotional Programs

A number of states have acted to establish special administrative agencies charged primarily with the task of encouraging atomic energy development, and, in some instances, secondarily with some minor regulatory functions. In respect to these promotional efforts there is an understandable lack of specificity. It is doubtful if these states regard their actions as anything but tentative, and it is obvious that all of them desire to move with caution. There is a noticeable reluctance to adopt any measures which are as revolutionary in nature as atomic energy itself. None of the states appears much inclined toward fresh experiments in the business of government. Certainly their actions do not manifest anything like the magnitude of concern which caused Congress to establish the Atomic Energy Commission, with its extraordinary powers, in 1946. Of course, in justice to the states, it should be pointed out that this conservatism probably is due in large part to the existence of the AEC as well as to a justifiable perplexity as to just what areas of influence the Atomic Energy Act of 1954 leaves open to them. On the other hand, should the states desire to exercise their traditional prerogatives in the field of atomic energy, they will have to take a bolder line than has been taken thus far.

Unlike Congress, none of the states has vested its promotional and control powers and duties with respect to atomic energy in one agency or treated both aspects of such a program in one statute. For the most part these subjects have been separately provided for, and, especially in regard to regulation, existing state agencies have been utilized.

By far the most popular statutory scheme for state promotion (and some control) of atomic energy is that recommended by the New England Committee on Atomic Energy. This committee's "Model Act to Coordinate Development and Regulatory Activities Relating to the Peaceful Uses of Atomic Energy"[14] has been followed in Arkansas,[15] Connecticut,[16] Maine,[17] Massachusetts,[18] New Hampshire,[19] Ohio,[20]

[13] *Ibid.*
[14] *Id.*, app. (iii); reprinted as Appendix B, Item 1.

[19] N.H. Rev. Stat. Ann. c. 162-B, §§1-6.
[20] Ohio Rev. Code §§4163:01 *et seq.*

and Washington.[21] Furthermore, recent enactments of Florida,[22] Rhode Island,[23] South Carolina,[24] and Tennessee [25] indicate that they gave close attention to the recommendations of the New England Committee. Because of the widespread legislative recognition afforded the New England Model Act, a discussion of its significant features is warranted.

In an interim report, published on December 27, 1954, the New England Committee on Atomic Energy recommended to the attention of the member states an act which was designed:

> (1) to provide the basis for a single harmonious system of atomic energy regulatory activity within each state through the exercise of coordinate federal and state regulatory powers,
> (2) to open the way for orderly and intelligent study, within each affected state administrative area, of the new problems posed by privately financed atomic energy enterprise . . . and
> (3) to provide a focus within the state for atomic energy matters—as well as a basis for regional and state coordination—by the creation, on the staff of each governor, of a Coordinator of Atomic Energy Development.[26]

In the first section of this statute the enacting state declares itself to be in accord with ". . . the action of the Congress of the United States in enacting the Atomic Energy Act of 1954," and that it intends to ". . . cooperate actively in the atomic energy program" and exercise its police powers in a manner ". . . so as to conform, as nearly as may be, to the Atomic Energy Act of 1954 and regulations issued thereunder."

Section 3 of the act directs a number of affected state departments and agencies, such as the departments of public health, labor, highways, etc., to ". . . initiate and pursue continuing studies as to the need if any for changes in the laws and regulations administered by . . . [them] . . . that would arise from the presence within the state of special nuclear materials and by-product materials and from operation herein of production or utilization facilities." This section also authorizes the governor to direct other departments and political subdivisions of the state, which are not specified, to initiate similar studies. Pursuant to these

[21] Wash. Rev. Code c. 43.39.
[22] Fla. Stat. Ann. c. 290.
[23] R.I. Gen. Laws tit. 42, c. 27, §§1 *et seq.*

[25] Tenn. Code Ann. §§53-3101 *et seq.*
[26] *Supra* note 11 at 5.

studies, each department or agency is ". . . to make such recommendations for the enactment of laws or amendments to laws administered by it, and such proposals for amendments to the regulations issued by it, as may appear necessary and appropriate."

This section reflects the realization that the problems involved are not amenable to any one solution, since conditions may be expected to change rapidly and move in unexpected directions, and that the experience of a number of existing state agencies can be utilized advantageously in this continuing endeavor to maintain a flexible promotional program. Presumably, within the limitations of its budget and the qualifications of its personnel or those it can afford to hire, each department is free to conduct its investigation as it sees fit. It should be noted that all of the states which have enacted this statute apparently have assumed that the existing agencies were adequate to the task. None has expressly authorized the establishment of specialized organizations within the departments and agencies for this purpose. As will be pointed out below, several states have created a special advisory board to which the departments and agencies have access, and a recent amendment to the Maine statute authorizes the advisory board to obtain technical advice from the AEC as well as to cooperate with the federal government in performing functions relating to atomic energy.[27]

A significant feature of the act in general, and Section 3 in particular, lies in the fact that none of the departments and agencies mentioned are given any new authority to promulgate regulations concerning atomic energy matters or to institute anything except a study program. However, the act apparently contemplates the issuance of regulations by state departments and agencies, under existing statutory authority, for, in Section 4(c), it provides that:

> No regulation or amendment to a regulation applying specifically to an atomic energy matter which any such department or agency may propose to issue shall become effective until 30 days after it has been submitted to the Coordinator [of Atomic Development Activities]. . . .

It should be noted, however, that whatever implication this provision carries with it is obscured by a noticeable absence of standards. The only thing offered by way of a guide is that the state intends to exercise its powers in such a manner as ". . . to conform, as nearly as may be, to the Atomic Energy Act of 1954 and regulations issued thereunder." Although this standard will assist departments and agencies concerned

[27] Me. Rev. Stat. c. 52-A, §7.

with radiation safety regulation, it is not much help to those agencies which are charged with other types of regulatory activities.

Section 4 of the act provides for the establishment in the state's administrative hierarchy of the office of Coordinator of Atomic Development Activities. The only qualifications for this officer are that he be a "citizen of this state." In New Hampshire he also must be selected from among the commissioners of the various departments and agencies.[28] Under the Model Act he is to be appointed by the "Governor and Council," while in Arkansas,[29] Connecticut,[30] and Washington,[31] the governor alone may appoint, and in Ohio the advice and consent of the Senate is required.[32]

The duties of this official are: (1) to coordinate the studies, recommendations, and proposals of the several departments and agencies ". . . with each other and also with the programs and activities of the Department of Industrial Development of the State," and like activities in other states and with the policies and regulations of the AEC; (2) to ". . . keep the Governor and Council and the several interested departments and agencies informed as to private and public activities affecting atomic industrial development"; (3) to further such atomic industrial development ". . . as is consistent with the health, safety, and general welfare" of the people of the state; and (4) to represent the state's interest in regional atomic activities and in cooperation with the federal government.

Essentially, the coordinator has no appreciable powers unless he could be said to derive some as ". . . deputy to the Governor in matters relating to atomic energy." Quite obviously, the success of this office largely depends upon the personal persuasiveness of the individual appointed. In this connection, the provision in Section 4(c), requiring submission of all proposed regulations to the coordinator thirty days prior to their effective date (". . . unless, upon a finding of emergency need, the Governor by order waives all or any part of this 30 day period"), may prove of some assistance to the coordinator. Also, it should be noted that the several departments and agencies are directed to keep the coordinator fully and currently informed as to their activities relating to atomic energy. The New England Committee has likened these provisions to those contained in the 1954 Atomic Energy Act

[28] N.H. Rev. Stat. Ann. c. 162-B, §4.
[29] Ark. Stat. Ann. §82-1404.
[30] Conn. Gen. Stat. §1938d.
[31] Wash. Rev. Code §43.39.050.
[32] Ohio Rev. Code §4163.04.

requiring advance notice of proposed AEC action to the Joint Committee on Atomic Energy in Congress.

According to the New England Committee, Section 4 ". . . is premised on the proposition that what is everybody's business is nobody's business and therefore seeks to make sure that atomic development and regulation is somebody's business." [33] One wonders just how much of a "somebody" this coordinator is in the states listed. None of the enacting states has seen fit to provide compensation for him on a full-time basis.

Sections 2 and 5 combine to form the only direct regulatory provisions of this act. Section 2 simply provides that no persons within the state shall carry on any activity with respect to "special nuclear material, byproduct material, production facility or utilization facility," for which type of activity an AEC license or permit is required by federal law, without first obtaining the license or permit. Section 5 authorizes the state attorney general to apply to an appropriate court for an order enjoining any person who is violating, or is about to violate, Section 2. No criminal penalties for violation of Section 2 are provided.

The drafters of this act have indicated that there may be some doubt as to whether, in the absence of a war emergency, the AEC's authority reaches as far as the licensing requirements of the 1954 Atomic Energy Act would extend it. Therefore, Section 2 is intended to remove the possibility of a jurisdictional "no-man's land," without imposing licensing burdens and expenses upon the states, and, also, to discourage possible challenges of the federal licensing power.[34] There may be some question as to whether a user of byproduct material (material not owned by the federal government), who is not in interstate commerce or in an activity affecting interstate commerce (assuming that this is possible any longer), is within the regulatory jurisdiction of the AEC. The fact cannot be ignored, however, that since the AEC is the principal supplier of byproduct materials today and practically all other sources of supply clearly come under federal regulation, should this intrastate user fail to comply with federal regulations, further supply of byproduct material could be denied to him.[35] Thus, it is doubtful if Section 2

[33] *Supra* note 11 at 66.

[34] *Id.* at 64. On the extent of the congressional power to regulate in the atomic energy field see Estep, "Federal Control of Health and Safety Standards in Peacetime Private Atomic Energy Activities," 52 Mich. L. Rev. 333 (1955).

[35] The Radiation Products Company of Dallas, Texas, a licensed user of radioisotopes, has been ordered by the AEC to cease temporarily operations involving radioactive materials, pending a public hearing on possible modification, suspension or revocation of the company's license. AEC Release No. A-28, Feb. 10, 1958, indicated that

is necessary to sustain the federal licensing and regulatory provisions in even the shadow areas of federal jurisdiction. Nevertheless, it is useful in that it authorizes a state authority, which is closer to the scene, to enforce a state law and thus to act directly in protecting the interests of the state and its citizens.

If the combination of Sections 2 and 5 should ultimately prove necessary, the question may arise as to whether Section 2 is an unconstitutional delegation of state legislative power because the licensing requirements are subject to future changes by Congress and the AEC, thereby automatically effecting a change in state law. The drafters of the act have pointed out that "Section 2 seems reasonably safe from attack, however, since it merely uses the possession of a federal license as a fact indicating that the possessor is a fit person to engage in the activity to which the license applies." [36]

The federal constitutional question as to whether a state, in effect, can enforce in this fashion a federal regulatory program where Congress may have pre-empted the field will be considered at a later point in this chapter.

The key terms used in Section 2—"special nuclear material, by-product material, production facility . . . [and] . . . utilization facility"—are defined in Section 7 in such a way as to keep their meaning consistent with federal definitions under the 1954 Atomic Energy Act. The scope of the act and the radiation hazard with which it manifests some concern is no broader than the federal program. Several sources of radiation, which are fairly abundant, are not covered by the act: X-ray machines, various types of particle accelerators, radium, and source material. It was felt that source material does not present a significant radiation hazard and that its inclusion might embarrass activities involving ores containing small quantities of uranium. Recently, however, the Maine legislature amended its act to include source material.[37]

Commission inspectors had discovered that the company had transferred at least two radioactive cobalt 60 sources, of approximately one curie each, to persons not licensed by the AEC to receive them. The hearing was scheduled for 10:00 a.m., Feb. 24, 1958, in Dallas, but was postponed by the AEC. 2 CCH Atomic Energy Law Rep. ¶9517.

[36] *Ibid.* Regarding the question of state constitutional law, the New England Committee said: "Section 2 is like a statute conferring certain privileges on persons who have been admitted to the bars of other states. Statutes of this sort are not considered unconstitutional by the fact that the requirements for admission to the bar may be changed by other states in the future. And a state may condition the transport of intoxicating liquor through its territory on the fact that the consignee in another state may lawfully receive it. Carter v. Virginia, 321 U.S. 131, [64 S. Ct. 464] (1944)."

[37] Me. Rev. Stat. c. 52-A, §§1-7. The term "source material" is defined and inserted between the terms "special nuclear material" and "byproduct material" wherever they occur in the Maine statute.

Several of the states which have followed the recommendations of the New England Committee have made significant additions to the Model Act. While creating the position of coordinator, Massachusetts, Ohio, and Washington have also established atomic energy advisory boards. Massachusetts' "Commission on Atomic Energy" consists of seven members (one of whom is the coordinator, who is also the chairman) appointed by the governor with the advice and consent of the Council for five year terms. They are to be representative of industry, labor, and science. The duties of this commission are: (1) to keep fully and currently informed as to atomic energy developments and activities; (2) to consult with and advise the coordinator; and (3) to render an annual report. There are to be at least four meetings of the commission annually.[38]

Ohio's Atomic Energy Advisory Board consists of eleven members, appointed by and serving at the pleasure of the governor. The coordinator is a member; labor, management, and medicine are represented by one member each; two members are persons with scientific training in the atomic energy field; and the five remaining members need not have any particular qualifications. This board is: (1) to review the studies, policies, and activities of the state departments and agencies; (2) to review atomic developments within the United States and elsewhere; (3) to make recommendations to the governor; and (4) to furnish the coordinator, or any state department, such technical advice as may be required upon all matters relating to the production or use of atomic energy and the protection and welfare of persons employed in industries so engaged.[39]

The Washington Atomic Energy Advisory Council consists of five members, appointed by the governor. No qualifications for these persons nor duties for the council are stipulated. The coordinator is to act as executive secretary to the council.[40]

In Maine, in addition to being entitled to a thirty day notice of proposed regulations, the coordinator may (within this time) notify the governor of his objections and reasons therefor. After discussion with the affected department or agency, and within fifteen days after receipt of objections from the coordinator, the governor may declare the proposed regulation valid and effective or invalid and ineffective.[41] This

[38] Mass. Ann. Laws c. 6, §88.
[39] Ohio Rev. Code §4163.05.
[40] Wash Rev. Code §43.39.060.
[41] Me. Rev. Stat. c. 52-A, §51.

provision appears to be something of an improvement over that contained in the Model Act.

The Tennessee statute does not create the position of a coordinator, but establishes a seven to ten member "Advisory Committee on Atomic Energy," with duties identical with those of the coordinator under the Model Act. This committee is authorized to obtain full-time administrative and consultant staff assistance with the concurrence of the governor. The statute also omits the injunction provision.[42]

Promotion commissions have been established in Florida and Rhode Island by statutes which are conceptually similar to the New England Model Act. The Florida Nuclear Development Commission consists of nine members appointed by the governor for terms concurrent with his. It is authorized to appoint a salaried, executive director and to employ such personnel as may be necessary. Essentially, its duties are: (1) to coordinate all local and state nuclear energy activities; (2) to promote and support programs of education, research, and information; (3) to provide for and work with groups in the state relative to problems of regulation, insurance, safety, and public health as related to nuclear energy; (4) to assist and attract nuclear energy industries; and (5) to advise and make legislative recommendations to the governor.[43]

The Rhode Island Atomic Energy Commission consists of five members appointed by the governor for overlapping terms of five years. Basically this commission is to make a study of the need for changes in state laws and regulations, advise and make recommendations to the governor and the General Assembly, coordinate development and regulatory activities relating to industrial and commercial uses of atomic energy, and cooperate with the AEC and similar commissions of other states.[44]

C. State Statutes and Regulations to Control Radiation Hazards

A number of states have recently enacted statutes or promulgated regulations which are specifically designed to control some or all radiation hazards. These warrant extended discussion because of the predominant concern of the states in respect to the health and safety of their citizens. The discussion of state laws in Chapter III of this Part concerned the general powers and duties of the public utility commissions, the labor departments and industrial commissions, and the state

[42] Tenn. Code Ann. §53-3104.
[43] Fla. Stat. Ann. §290.06.
[44] R. I. Gen. Laws tit. 42, c. 27, §§1, 2.

departments of health, as they might affect sources of radiation. That material will be alluded to only when it is necessary to indicate the authority for recent radiation health and safety regulations. It should be noted that where, for example, the departments or agencies of certain states have been granted specific powers under recent radiation hazard legislation, this does not mean that the corresponding departments and agencies of states not mentioned do not have similar powers under general health and safety legislation; it merely means that the legislatures of the other states have not bestowed those powers upon their respective state departments and agencies with radiation health and safety control specifically in mind.

It should also be noted that this discussion is limited to recent state regulatory action concerning radiation health and safety matters. State control of atomic energy matters has broader connotations than mere health and safety regulation; various forms of economic regulation also are likely to be imposed. The fact remains, however, that, to date, no state appears to have invoked its powers so as to regulate specifically the economic aspects of atomic energy activities, with the exception of Massachusetts which recently amended its insurance laws in the matter of issuing and classifying policies insuring against nuclear energy hazards.[45]

The actions on the part of the states with respect to radiation hazards range everywhere from no state action to the issuance and enforcement of very comprehensive regulations by at least one, and in one case, several state agencies. At the present time slightly less than one-half of the states have taken no official action regarding the problem.[46] Some of these states, however, are in the preliminary stages of preparing legislative and administrative solutions.[47]

[45] Mass. Ann. Laws §§175:80, 175:111A.

[46] These states include Alabama, Arizona, Idaho, Indiana, Iowa, Kansas, Louisiana, Maryland, Minnesota, Mississippi, Missouri, Montana, Nebraska, Nevada, New Mexico, North Carolina, Oklahoma, Vermont, and West Virginia.

[47] Indiana is reported to be regulating exposures to ionizing radiation from shoe-fitting fluoroscopes, and the State Board of Health indicated in December of 1956 that it was revising its hospital licensing regulation on radiation protection. In addition, the board reported that it had made several joint inspections of byproduct users with AEC officials. *Supra* note 6 at 8.

The Kansas State Board of Health has indicated that it is carrying on "a small non-regulatory radiological health program" and that it has been making joint inspections with AEC officials. It also has established a "Radiological Health Advisory Committee," which is reported to be working upon a proposed bill to place control of radiation under the board. This bill is said to be modeled upon the recommendations

Affirmative and official action to protect the public against radiation hazards has been taken by both the legislatures and state agencies, pursuant to existing powers. Where the legislatures have acted, some have vested radiation safety rule-making and enforcing powers in state agencies, while others have acted only to impose certain duties upon radiation source users or possessors in the interests of public health and safety, and a number of legislatures have merely directed that studies be made regarding radiation hazards. As for administrative action, a few state agencies have issued very comprehensive radiation safety regulations, but the majority of those which have acted, have merely concerned themselves with limited aspects of the problem.

1. Legislative Action

a. Legislation Granting Rule-Making and Enforcing Powers

The legislatures of Colorado, Connecticut, Massachusetts, New Jersey, New York, Oregon, and South Dakota have recently enacted statutes to confer upon their respective public health agencies the power to promulgate and enforce radiation health and safety regulations of general application. With maximum economy and minimum guidance the powers and duties of the Colorado State Board of Health were extended so as to authorize it ". . . to establish and enforce standards for exposure to environmental conditions, including radiation, that may be deemed necessary for the protection of the public health." [48]

In a somewhat less obvious fashion the Connecticut State Department of Health appears to have been similarly empowered by a statute which specifies that:

> No person, firm, corporation, town, city or borough shall operate or cause to be operated any source of ionizing radiation or shall produce, transport, store, possess or dispose of radioactive materials except under conditions which comply with

---

of the National Committee on Radiation Protection and Measurements, as published in National Bureau of Standards Handbook 61. *Supra* note 6 at 8.

The Minnesota Department of Health has reported its intention to ask the 1957 legislature to grant it specific authority to make and adopt regulations relating to the control of ionizing radiation. *Supra* note 6 at 10.

While the Missouri Division of Health claims authority under existing law, it has not promulgated radiation safety regulations. It has employed, however, a radiological health physicist. *Supra* note 6 at 11.

The New Mexico Department of Public Health has reported that a bill similar to that suggested by the NCRPM will be introduced to the legislature in 1957. *Supra* note 6 at 12.

[48] Colo. Rev. Stat. §66-1-7(21).

> regulations that may be incorporated in the sanitary code or with orders imposed by the state department of health for the protection of the public health.[49]

The standards which are to be followed by the State Department of Health are specified in the succeeding sentence which reads:

> Such regulations or orders shall be based to the extent deemed practicable by the state department of health on the regulations of the United States atomic energy commission, . . . entitled "Standards for Protection Against Radiation," or, if such regulations of the United States atomic energy commission should be deemed inappropriate by the state department of health, on the latest recommendations of the national committee on radiation (protection and measurements), as published by the United States department of commerce, national bureau of standards.[50]

Furthermore, this section specifies that radiation sources shall be utilized at the lowest practical level ". . . consistent with the best use of the radiation facilities or radioactive materials involved." [51] The section also requires that proposed sanitary code regulations pertaining to radiation sources be submitted to the Connecticut Coordinator of Atomic Development Activities thirty days before they are to become effective.[52] The sanitary code regulations which have been issued by the State Department of Health pursuant to this authority are discussed later in this Chapter.

In addition to authorizing the promulgation of radiation safety regulations, the Connecticut statute also provides for registration by ". . . each person, firm, corporation, town, city or borough conducting or planning to conduct any operation within the scope of this Act . . . with the state department of health." [53] The department may require the registrant to state ". . . the qualifications of the supervisory personnel, the protective measures contemplated . . . and such other information as it determines is necessary." [54] Re-registration is required where modifications are made which will increase the amount of radiation. A number of exemptions to the registration requirement are stated, the most significant of which is that for X-ray devices used by or under the supervision of persons licensed to practice the several healing arts.

[49] Conn. Public Acts 1957, Public Act 154, §2.
[50] *Ibid.*
[51] *Ibid.*
[52] *Ibid.* See also Conn. Gen. Stat. §1938d.
[53] *Id.*, §3.
[54] *Ibid.*

It is finally specified that the registration is not intended to imply state approval of the manner in which the radiation activities are carried out. Apparently, Connecticut has no desire to have its registration requirement construed as a licensing procedure; the State Department of Health has no discretionary authority to withhold a registration certificate. In this connection, however, it should be remembered that Connecticut law does necessitate the procurement of an AEC license or permit by those persons intending to carry on atomic energy activities within the state for which licenses are required by federal law.[55]

Shortly after the above statute was enacted the Connecticut General Assembly directed the Commissioner of State Police to make ". . . reasonable regulations concerning the safe storage and transportation of hazardous chemicals," [56] which are so defined by the act as to include "radioactive materials." [57] "In adopting such regulations, said commissioner *may* be guided by recognized national standards for the prevention of damage to property and injury to life." [58] While these regulations are not to apply to "electric companies," [59] the authority, nevertheless, overlaps that of the State Department of Health, thus making for a fruitful area of conflict, especially since this subsequent statute does not mention any requirement that the regulations first be submitted to the State Coordinator of Atomic Development Activities before they can become effective. Inspections to determine if there is compliance with the commissioner's regulations are to be made by the local fire marshal of each town, city, or borough.[60]

In 1955 a somewhat narrower or more limited authority to issue radiation health and safety regulations was conferred upon the Department of Public Health by a Massachusetts statute which provides:

> The department shall, from time to time, after a public hearing and subject to the approval of the governor and council, prescribe and establish rules and regulations to control the transportation, storage, packaging, sale, distribution, production and disposal of radioactive materials which may affect the public health or the health of persons exposed to radioactivity or ionizing radiation. . . . Nothing in these rules and regulations shall be inconsistent with those now or hereafter estab-

> lished by the National Bureau of Standards relative to the handling and disposing of radioactive materials.[61]

The omissions of the word "use" among the activities to be regulated and of "radiation installation" or "radiation source" among the objects to be controlled, obviously leaves a great deal uncovered by this regulatory authority. Perhaps it was felt that the hazards not provided for would be regulated by other authority, for the statute further stipulates:

> Nothing in this section shall prevent the department of labor and industries from establishing rules and regulations for the protection of the health and safety of employees against ionizing radiation in any place of employment. . . .[62]

Whatever the rationale, as yet no radiation health and safety regulations have been forthcoming from any Massachusetts agency, and in September of 1957 the Department of Public Health was authorized and directed "to make a study and investigation of regulatory and protective measures pertaining to radioactive materials" with which "related departments and agencies shall cooperate." [63]

Like that of Connecticut, Massachusetts law requires the procurement of an AEC license or permit by those persons intending to carry on atomic energy activities within the state for which licenses or permits are required by federal law.[64]

Under a 1958 act, New Jersey has created a Commission on Radiation Protection within the State Department of Health empowered to formulate such rules and regulations "as may be necessary to prohibit and prevent unnecessary radiation." [64a] "Unnecessary radiation" is defined as the use of gamma rays, X-rays, alpha and beta particles, and other atomic or nuclear particles "in such manner as to be injurious or dangerous to the health of the people or the industrial or agricultural potentials of the State." [64b] Regulations may be adopted by the commission only after a public hearing preceded by thirty days notice and may not become effective until sixty days following adoption.[64c] No regulation concerning unnecessary radiation adopted by any local government agency shall be effective until submitted to the commission for

[64c] *Id.*, §7.

approval.[64d] The Commission on Radiation Protection is limited to the rule-making function, and the duties of administration and enforcement of rules promulgated by it are delegated to the Department of Health. The statute directs that the department, among other things, "Require registration of sources of radiation," and "Inspect radiation sources, their shielding and immediate surroundings and records concerning their operation for the determination of any possible radiation hazard." [64e] The department is also invested with broad powers to issue general and emergency orders to prevent violations of any regulations of the commission and to obtain injunctions against violations of such orders.[64f]

As was mentioned in Chapter III of this Part, the New York Public Health Law was amended in 1955 so as to add to the functions, powers, and duties of the Department of Public Health the supervision and regulation of the ". . . public health aspects of the use of ionizing radiation and the handling and disposal of radioactive wastes." [65] Pursuant to this authorization, the department has issued comprehensive regulations, which will also be discussed later. Apparently, this grant of power was not intended to preclude regulation by other agencies of the state having health and safety responsibilities, for, without any express authority to issue radiation health and safety regulations specifically, the New York Department of Labor also has incorporated such regulations in its Industrial Code. These regulations, and the manner in which they conflict with those of the Department of Public Health, will be discussed under the heading of "Administrative Regulation."

In July of 1957 the Oregon legislature directed the State Board of Health to promulgate regulations and standards for the safe use, handling, disposal, and control of all radiation sources within the state,[66] except those ". . . emitting nonhazardous quantities of radiation." [67] To this authority, however, is added the rather curious condition that the board is to promulgate these regulations and standards only ". . . after making a two-year study of the problem." [68]

In the matter of standards, it is indicated that ". . . the public policy of this state [is] to encourage the constructive uses of radiation and

[64d] *Id.*, §17.

[67] *Id.*, §4.
[68] *Id.*, §3.

to control any associate harmful effects." [69] Any regulations promulgated must conform with this policy.[70] Furthermore, the act directs the board to appoint a Radiation Advisory Committee to advise it upon ". . . matters relating to radiological health and radiation protection." [71] The committee is to consist of five persons who, by training and experience, are qualified to advise the board on such matters.

No regulations have been or could be made effective, as yet, by the Oregon State Board of Health pursuant to this authority, but certain standards and regulations were recommended before the statute was enacted.[72]

Pursuing a declared policy nearly identical to that of Oregon,[73] the South Dakota legislature has directed the State Department of Health to

> . . . develop comprehensive policies and programs for the evaluation and determination of hazards associated with the use of radiation, and for their amelioration,[74]

and to

> . . . adopt, promulgate, and enforce such rules and regulations as may be necessary to implement or effectuate the powers and duties of the [Department] . . . under this Act.[75]

Other duties of the Department under this act are: (1) to ". . . advise, consult, and cooperate" with local, state, interstate, and federal agencies and with affected groups and industries; [76] (2) to ". . . collect and disseminate information relating to the determination and control of radiation exposure hazards"; [77] and (3) upon request, to ". . . render opinions concerning such plans and specifications on the design and shielding for radiation sources as may be submitted before or after construction, for the purpose of determining the possible radiation hazard." [78] Furthermore, the department has the power: (1) to ". . . encourage, participate in, or conduct studies, investigations, training, research, and demonstrations relating to the control of radiation haz-

ards";[79] (2) to ". . . issue, modify, or revoke orders prohibiting or abating the discharge of radioactive material or waste into ground, air, or waters of the state";[80] and (3) to ". . . make inspections of radiation sources, shielding and immediate surroundings for the determination of any possible radiation hazard."[81]

Like the Connecticut law discussed above, and the suggested act of the National Committee on Radiation Protection and Measurement,[82] from which much of its language was taken, the South Dakota statute makes it unlawful for any person: (1) ". . . to produce radiation, or to produce, use, store, or dispose of radioactive materials, unless he registers in writing with the . . . [Department]"; (2) ". . . to modify, extend, or alter programs involving the production of radiation or the production, use, storage, or disposal of radioactive materials unless he notifies the . . . [Department]"; or (3) to do any of the forementioned ". . . except in accordance with the provision of this Act and rules and regulations promulgated thereunder."[83] It also is unlawful ". . . for any person to expose any other person to diagnostic or therapeutic radiation" unless he is, or is under the direction of, a person licensed to practice the "healing arts" or dentistry in South Dakota.[84] Apparently, the Department of Health may prescribe methods and amounts of diagnostic and therapeutic radiation even as to persons so licensed since the act does not contain any limitation which would prohibit it from doing so.

Violations of the South Dakota statute, or orders or rules promulgated pursuant to it, are deemed misdemeanors upon each day in which they occur, and the Attorney General, at the request of the department, is directed to seek injunctions against such violations.[85] While this statute does not specifically so provide, it nevertheless implies that the State Department of Health is to have exclusive jurisdiction over radiation hazards in South Dakota.

While no general rule-making authority as to radiation hazards appears to have been bestowed specifically upon any state agency of Wis-

consin, a recent enactment of that state authorizes the county board of each county, having a population of 500,000 or more, to

> . . . regulate by ordinance within the territorial limits of such county the ejection, discharge or emission into the open air of smoke, and solids, liquids, gases, fumes, acids, burning embers, sparks, cinders, soot, particulate wastes or dusts, including their radioactive fractions or counterparts, from any chimney, smokestack, vest, fuel burning equipment, open fire, apparatus, device, mechanism, substance, material or premises; . . . prescribe rules and standards in aid of such regulations; . . . provide for commencing actions to enjoin acts, threats of acts and the procuring or suffering of acts to be done in violation of such ordinance.[86]

b. Legislation Imposing Certain Duties upon Radiation Source Users or Possessors but Not Conferring Rule-Making Authority upon State Agencies

State legislation imposing a bare minimum of regulation is to be found in the laws of Arkansas,[87] Maine,[88] New Hampshire,[89] Ohio,[90] South Carolina,[91] Tennessee,[92] and Washington,[93] which, following the New England Model Act, provide:

> No person shall manufacture, construct, produce, transfer, acquire or possess any special nuclear material, by-product material, production facility, or utilization facility, or act as an operator of a production or utilization facility wholly within this State unless he shall have first obtained a license or permit for the activity in which he proposes to engage from the United States Atomic Energy Commission if, pursuant to the Atomic Energy Act of 1954, the Commission requires a license or permit to be obtained by persons proposing to engage in activities of the same type over which it has jurisdiction.[94]

These statutes, as well as similar laws in Connecticut and Massachusetts, have been discussed above.

In addition to the previously discussed laws of Connecticut and South

[94] *Supra* note 14 at 64.

Dakota, statutes of Illinois, North Dakota, and Wyoming also impose upon the radiation source user or possessor the duty to register the source with a state agency.

The effect of two recently enacted Illinois statutes is to authorize the Department of Public Health:

> To register and inspect locations or facilities where radiation machines are used or where radioactive material is being produced, transported, stored, disposed or used for any purpose. . . .[95]

and to require:

> Every operator of a radiation installation . . . [to] . . . register such installation with the Director of the Department of Public Health . . . before said installation is placed in operation.[96]

Re-registration is required in the event that there is ". . . any change in such installation which might increase or decrease the number of sources, source strength, output or energy of radiation produced."[97] Registration forms are prescribed by the department and are to contain the following information: "the name of the operator; the location and a designation of the confines of the installation; a statement of the type and strength of the sources of radiation expected to be produced, used, operated, stored or disposed of within the installation and the approximate total number of each type; and such other information as the Department may deem necessary."[98] Registration is not intended to imply approval of the installation. Operators of registered installations are required to notify the director within thirty days after discontinuance of operations.[99] Specific provision is made for a number of exemptions from the registration requirements for non-hazardous sources of radiation.[100]

The Illinois Department of Health is authorized to inspect and investigate ". . . the premises and operations of all radiation installations in . . . [the] state, whether or not such installations are required to be registered."[101] The operation of an unregistered radiation source is enjoinable, and is made a misdemeanor on each day such offense con-

tinues.[102] The only express purpose of these Illinois statutes is to aid the Department of Public Health in ". . . studying and evaluating the potential hazard to the health of the people of this state caused by the increasing use and operation of . . . [radiation] machines and installations." [103] No new authority is granted to the Department to promulgate radiation protection rules and standards, nor is it authorized to refuse acceptance of registration by any source of which it does not approve.

As for North Dakota and Wyoming, it is not entirely clear what was intended by the legislatures of those states, for, while they speak of registration, they appear to have provided for licensing. The North Dakota statute designates the State Department of Health as the "registration" agency,[104] and further requires:

> Each manufacturer, processor, and refiner of radioactive isotopes and each hospital, clinic, manufacturing establishment, research or educational institution, experiment station, processing mill, or other institution or place of business or process where radiation is produced or radioactive materials are used, manufactured, processed, packaged, refined, produced, disposed or concentrated shall register.[105]

The State Health Officer is directed to issue a certificate of registration to the applicant, but it appears that he is only required to do so

> . . . upon satisfactory completion and submission of the registration form supplying the required information to determine whether the health of the public or persons working in such establishments may be adversely affected by using, manufacturing, processing, packing, refining, disposing, producing, or concentrating of such radioactive isotopes and materials.[106]

Apparently, if the information supplied by the registrant does not indicate that the installation will be safe, the State Health Officer is under no obligation to issue a certificate. Since the act makes it a misdemeanor to operate without a certificate, it would appear that this statute has all the indicia of a licensing law. Notice, however, that the above provision only applies to ". . . establishments . . . using, manufacturing, . . . [etc.] radioactive isotopes and materials." It does not speak of sources of radiation involving no radioactive materials, and presumably, the State Health Officer has no discretionary authority to withhold a regis-

[105] *Id.*, §4.
[106] *Id.*, §5.

tration certificate regarding such sources. It seems doubtful that the distinction was made intentionally.

The Wyoming statute appears to effect a licensing law in the same fashion as does that of North Dakota; however, it clearly applies only to places connected with radioactive materials, as distinguished from those producing radiation. The statute reads:

> Each hospital, clinic, manufacturing establishment, research or educational institution, experiment station, processing mill, or other institution or place of business or process where radioactive isotopes or materials are used, manufactured, processed, packaged, refined, produced, disposed or concentrated shall be registered with the State Department of Public Health.[107]

The statute further provides:

> The Director of the Department of Public Health, upon receipt of a properly executed application for registration and upon satisfactory compliance by such applicant with regulations and limits that are or shall be in effect governing the same exposure to such isotope or material, shall issue to the applicant a certificate of registration.[108]

Operation of the above mentioned installations without a certificate of registration is deemed to be a misdemeanor;[109] therefore, the person can be prohibited very effectively from operating should his registration form fail to satisfy the director as to the safety of the operation.

It is possible to argue that, in a rather backhanded way, the above statute authorizes the Wyoming Department of Public Health to issue regulations governing the exposure to radioactive isotopes and materials, though it would be difficult to conceive of a less precise manner of doing so. Apparently, none has been promulgated.

c Legislation Directing That Studies Be Made as to Radiation Hazards

In addition to the above considered statutes of Arkansas,[110] Connecticut,[111] Florida,[112] Illinois,[113] Maine,[114] Massachusetts,[115] New Hamp-

shire,[116] North Dakota,[117] Ohio,[118] Rhode Island,[119] South Carolina,[120] Tennessee,[121] and Wyoming,[122] legislative action in Georgia, New Jersey, and Virginia indicates that these states are concerned at the present time with the problems of protecting persons and property against radiation hazards, at least to the extent that the problems are being studied. While the Georgia Nuclear Advisory Commission seems to be more in the nature of an economic development commission, the resolution by which it has been established contains language which indicates that the governor and the General Assembly wish to be informed upon this subject ". . . with a view toward determining whether any legislation is necessary or advisable for Georgia." [123] Similarly, the New Jersey Commission for Atomic Energy Study has been directed ". . . to make studies of the need for changes in the laws and regulations administered by any department of the State that would arise from the presence within the State of special nuclear material and by-product material and from the operation in the State of production or utilization facilities," [124] and the Virginia Advisory Legislative Council also has received similar orders and authority.[125]

2. Administrative Action

a. Comprehensive Radiation Health and Safety Regulation

Government agencies of California, Connecticut, Michigan, New York, Pennsylvania, and Texas have issued comprehensive regulations to protect employees or both employees and the public from radiation hazards. It is interesting to notice that those of the California Division of Industrial Safety,[126] the Michigan Department of Health,[127] the New York Department of Labor,[128] the Pennsylvania State Department of

Health,[129] and the Texas Department of Health [130] were issued pursuant to the general authority of these organizations, while only those of the Connecticut State Department of Health [131] and the New York Department of Public Health [132] were promulgated pursuant to legislation authorizing them to regulate radiation hazards specifically. In none of these states, nor in any others for that matter, has a new agency been created for the purpose of enforcing radiation safety standards and regulations, and only in New Jersey has a new agency been created to promulgate such regulations. With the exception of New Jersey, in each of the above mentioned states the radiation regulations have been issued, and are being enforced, by existing agencies whose principal concern is health and safety. However, especially in New York, it does not appear that these agencies have exclusive authority within their respective states to regulate radiation hazards. Moreover, with the possible exception of Connecticut,[133] none of these states has established a system whereby the regulations of different agencies within the same state are to be made uniform and consistent with one another. Again with the exception of Connecticut,[134] none of these states requires by statute conformity with the standards of the AEC, although a measure of conformity has been achieved nevertheless, especially in Connecticut and Michigan which have issued regulations most recently. This matter of conformity with AEC standards is mentioned (and considered in greater detail below) for two reasons: (1) most of the state radiation regulations (and all of the comprehensive ones) apply to persons and activities licensed by the AEC, and (2) this assertion of state powers in a federally regulated area obviously raises a constitutional question upon which the conformity of state standards with those of the AEC will have some effect. Conflicts and inconsistencies between state and federal regulations, as they apply to atomic energy activities, should be avoided as much as possible since they cannot help but have an adverse effect on the industry, and, except in the rare case, there is no

[134] *Supra* note 49.

scientific or practical justification for them. Moreover, lack of uniformity between the states and variance from federal standards will tend to increase the possibility that the United States Supreme Court will declare an inconsistent state regulation to be an unconstitutional invasion of a federally pre-empted area of activity.[185]

All of the comprehensive state regulations are a blend (in varying proportions, as between states) of "performance" and "specification" type provisions.[186] As might reasonably be expected, these regulations tend to be of the performance type as to matters about which the least is known. For example, none of them attempts to specify how a nuclear reactor is to be shielded. This considerable problem is avoided by the simple expedient of establishing maximum permissible exposures of persons near the reactor and requiring that personnel and work areas be monitored to determine the extent of actual exposure. Thus, the physical arrangements by which radiation is to be kept below the maximum limits are left to the discretion of the owner or user under penalty of violating the law should those arrangements prove insufficient. This burden, however, is preferable to premature regulations that attempt the incredibly complex (if not impossible) task of specifying the dimensions and design of containment barriers for all sizes and types of nuclear reactors under all conditions of operation and in all sorts of locations.

Other matters, about which considerably more is known or about which no doubt could exist, are covered by specification type provisions. All of these comprehensive regulations, for example, contain detailed sections concerning standard warning labels, signs, and signals, except those of California. Some of them, especially those of Michigan which were published most recently, are fairly specific in connection with the use and installation of sources of radiation, such as X-ray machines, which are relatively less complex than nuclear reactors and have been exhaustively studied over a longer period of time.

[185] The problem of federal pre-emption of atomic energy health and safety regulations is discussed in the last part of this chapter.

[186] For a detailed discussion of performance and specification type regulations in the atomic energy field, see: Blatz, "State and Federal Radiation Safety Regulations," an address delivered at the Nuclear Engineering and Science Congress at Cleveland, Ohio in December 1955, mimeographed by the Atomic Industrial Forum, Inc.; Tabershaw and Harris, "Administrative Problems in Radiation Protection," Nucleonics, Vol. 12, No. 12, pp. 8-13 (December 1954); Taylor, "State Control of Protection Against Ionizing Radiation," American Journal of Roentgenology, Radium Therapy and Nuclear Medicine, Vol. LXXI, No. 4, pp. 691-702 (April 1954); Taylor, "The Achievement of Radiation Protection by Legislative and Other Means," Progress in Nuclear Power, Series VIII—The Economics of Nuclear Power, pp. 418-429 (1957).

A comparison of the regulations of California, which were last revised in January of 1955, and of Michigan, which became effective on February 14, 1958, and those of the other states which were issued during the interim period, may justify the observation that there appears to be a trend toward greater specificity. Certainly, those of Michigan are considerably more detailed and comprehensive than are the regulations of California. Moreover, if the regulations of Connecticut and Michigan are any indication, the recent tendency appears to be toward adopting the general standards of the AEC, at least where the state regulations affect federal licensees.[137]

To give some indication of these trends, the comprehensive state radiation health and safety regulations are discussed in the order in which they have made their appearance—starting with California and ending with Michigan.

(1) California

The California General Industry Safety Orders on "Radiation and Radioactivity" were promulgated to establish minimum standards for the protection of employees from injurious levels of ionizing radiation.[138] The general scheme of these regulations is to provide maximum permissible exposure limits for employees; to require radiation safety supervision by competent technical personnel and safety instruction of employees regularly or frequently exposed; to require radiation monitoring of exposed employees and work locations containing sources of radiation and records of these surveys and measurements; and to provide certain operating rules relative to maintenance of protective devices, handling and disposition of radioactive materials, and warning signs or signals.

The California regulations contain repeated references to National Bureau of Standards handbooks and reflect an obvious desire to conform to the standards of the National Committee on Radiation Protection and Measurement.[139] However, in this they are not altogether

[137] A recently proposed, but as yet ineffective, set of regulations for New York City would simply define "maximum permissible dose" as that "dose rate recommended by the National Committee on Radiation Protection and Measurement." 2 CCH Atomic Energy Law Rep. ¶17,974, §213.01(d).

[138] *Supra* note 126, §3800.

[139] The National Committee on Radiation Protection and Measurement (NCRPM) was formed in 1929 as the Advisory Committee on X-ray and Radium Protection upon the recommendation of the International Commission on Radiological Protection. It

successful, nor do they conform with AEC standards in all respects. Maximum permissible exposures are expressed in rads, whereas the AEC and the NCRPM use the rem (or millirem) as the unit of measurement.[140] Relative biological effect factors are included, however, so that conversion from rads to rems may be made. Such a conversion indicates that California may have been anticipating the apparent trend in the direction of lower permissible limits, for its weekly exposure standards are lower than the current weekly standards of the AEC and the

---

has since expanded the scope of its concern to include all known sources and types of ionizing radiation. The NCRPM is sponsored by the National Bureau of Standards and governed by representatives of participating organizations. The reports and recommendations of the NCRPM are published in National Bureau of Standards handbooks.

[140] The reader will recall, from the discussion in Part I, Chapter I, that there are a number of units in which quantities of various kinds of radiation may be expressed: the roentgen, the rep, the rad, and the rem. The roentgen is the quantity of X or gamma radiation such that the associated corpuscular emission per 0.001293 grams of air produces, in air, ions carrying one electrostatic unit of quantity of electricity of either sign. (National Bureau of Standards Handbook 59 at 6.) It is not a unit of absorbed dose, but will result in the absorption of 83 ergs of energy in one gram of dry air at standard temperature and pressure or about 94 ergs of energy in one gram of soft tissue. The limitations of this unit are that it applies only to X and gamma radiation and it does not express the amount of energy absorbed by various types of target material.

The rep, or roentgen-equivalent-physical, is a unit of any nuclear radiation (alpha or beta particles, neutrons, protons, etc.) that results in 93 ergs of energy being absorbed in one gram of soft tissue, and thus it is comparable to the roentgen. (National Bureau of Standards Handbook 59 at 6.) It shares one of the limitations of the roentgen in that it does not indicate the amount of energy absorbed by substances with a greater density than soft tissues.

The rad was adopted in 1953 to signify the unit quantity of absorbed dose due to any kind of ionizing radiation that would cause one gram of any target material to absorb 100 ergs of energy. It is a measure of the energy imparted to matter by ionizing particles per unit mass of irradiated material at the place of interest. (National Bureau of Standards Handbook 59 at 6; National Bureau of Standards Handbook 61 at 38.)

All three of the above units are subject to a third limitation: they do not express the unit of radiation in terms of its biological effect upon the target material or, what is more important, in terms of its effect on various types of human tissue. While all kinds of ionizing radiation are capable of producing the same kinds of biological effect, their ability to do so is not the same. In producing some effects, certain radiations are more effective than others, in the sense that a smaller absorbed dose of these radiations is required to produce a given degree of effect. This "biological effectiveness" depends upon the type of result under consideration, the specific ionization of the particular type of radiation, the type of cell or tissue, the organism studied, the conditions of exposure, the time distribution of the dose, etc. Insofar as possible, "relative biological effectiveness" factors (relative to that of lightly filtered X-rays generated at potentials of 200 to 300 kilovolts) have been determined empirically, or estimated, for particular biological systems and for various types and energies of radiation.

In the protection problem it is sufficient to consider the effects of radiation on certain

NCRPM.[141] Dose limits are prescribed for the "whole body" and the "hands," as measured in the basal layer of the epidermis, instead of following the more elaborate anatomical breakdown of the federal regulations.[142] As for allowed concentrations of radioactive materials in the atmospheres of workrooms, the California regulations express the maximum limits in much less precise terms than do the AEC regulations or the NCRPM recommendations.[143] Unlike the AEC, California makes no distinction as to employees under eighteen years of age,[144] nor is the NCRPM recommendation allowing double doses for persons over

critical organs, which are generally taken by the AEC and the NCRPM as the skin, blood-forming organs, gonads, and lenses of the eyes, and for certain potential effects on these organs under specified modes of exposure.

The combination of RBE factors and the rad unit of absorbed dose (the rep before 1953) has resulted in a fourth unit—the rem or roentgen-equivalent-man. The rem is defined as the quantity of any radiation such that the energy imparted to a biological system (cell, tissue, organ, or organism) per gram of living matter by the ionizing particles present in the region of interest, has the same biological effectiveness as an absorbed dose of 1 rad from lightly filtered X-rays generated at potentials of 200 to 300 kilovolts. (National Bureau of Standards Handbook 61 at 39.) Therefore, a dose in rems is equal to the dose in rads multiplied by the appropriate RBE factor, or, conversely, a dose in rads equals the dose in rems divided by the appropriate RBE factor.

For particulate ionizing radiation, such as alpha and beta particles, neutrons, protons, and deutrons, both the AEC and the NCRPM have elected to express exposure limits in rems or millirems (a one-thousandth part of a rem). As for X- and gamma radiation, the NCRPM continues to express exposure limits in millirads. Due to the inaccuracies implicit in arriving at a particular RBE factor, many scientists feel that it is best to do as the California Division of Industrial Safety has done, and specify exposure limits in rads and indicate the estimated RBE factor on which the particular limit is based.

[141] For example, conversion (from rads to rems) of the California exposure limits, where the entire body is exposed and the absorbed dose is measured in the skin, indicates that no more than 500 millirems is permitted. Under the same conditions, the regulations of the AEC and the recommended standards of the NCRPM would allow 600 millirems of any radiation to the skin and 1500 millirems of any low penetrating radiation (with a half-value-layer of less than one millimeter of soft tissue.) 10 Code Fed. Regs. §20.101. National Bureau of Standards Handbook 61 at 52.

[142] The regulations of the AEC and the recommendations of the NCRPM break down weekly dose limits into three conditions: (1) type of radiation, (2) conditions of exposure, and (3) critical organs affected. Conditions of exposure include exposure of the whole body, the hands and forearms, feet and ankles, and head and neck. Under these conditions of exposure permissible doses are given for the skin, the blood-forming organs, the gonads, and the lenses of the eyes. 10 Code Fed. Regs. Pt. 20, App. "A" and National Bureau of Standards Handbook 61 at 56.

[143] In the California regulations permissible concentrations of radioactive materials in the air of workrooms is expressed in the form of only two classes: alpha emitters and beta and gamma emitters. In the NCRPM recommendations such concentrations are expressed for each radioisotope. National Bureau of Standards Handbook 61 at 56.

[144] 10 Code Fed. Regs. §20.101(c).

forty-five followed.[145] Finally, the California regulations do not limit the exposure of non-employees or regulate the amount of radiation in areas other than employment locations.

To insure that the exposure standards are met, the California regulations require that all radiation operations are to be under the supervision of competent technical personnel, who are described as persons capable of evaluating radiation hazards and specifying protection techniques. Furthermore, employees must be under the supervision of a competent medical expert, and those who are regularly exposed must be instructed in radiation hazards and methods of protection.[146]

To determine whether radiation is being kept within the prescribed limits, workrooms and other locations containing radiation machines or radioactive materials are to be monitored and inspected periodically or according to a schedule established by the Division of Industrial Safety. Exposed employees are to wear monitoring devices as well, and permanent records of dosage measurements are to be kept.[147]

Also included in the California regulations are certain general operating rules. If monitoring indicates that protective devices are defective, operations are to be terminated until the defects are remedied, and employees who have been exposed to excessive radiation are to be referred immediately to the medical supervisor.[148] Wherever unsealed radioactive materials are handled, adequate ventilation must be provided, radioactive wastes are not to be allowed to accumulate, immediate decontamination is to be undertaken in the event of accident, eating is forbidden, and adequate protective clothing is to be worn.[149] Radioactive materials stored in workrooms are to be enclosed and shielded, and other storage areas are to be isolated by construction or location and ventilated if the material is not contained.[150] General orders regarding the placement of warning signs at locations where radiation may be encountered and on containers of radioactive materials are provided.[151] Special orders for radium dial painting are provided which prohibit dry application and require ventilation hoods. Also included are specifications as to radium compound containers and brushes as well as rules regarding their use.[152]

The California regulations prohibit the operation of "totally protective installations" while employees are within the confines of the barrier. Automatic interlocks are required on the entrances, at least one of which must operate from the inside, and visible or audible signals are required while ionizing radiation is being produced.[153]

(2) New York

New York is the only state which at the present time has more than one set of comprehensive radiation health and safety regulations. In September of 1955 Chapter XVI of the New York State Department of Health's Sanitary Code became effective. The following December Rule Number 38 of the New York Department of Labor Industrial Code also became effective; it applies "to every place where any employee in the course of his work may be exposed to radiation in excess of one tenth the permissible weekly dose" except medical, dental, veterinary, and educational institutions, clinics, and offices, which are subject to the provisions of the Sanitary Code.[154] Unfortunately, it is not entirely clear whether the Sanitary Code may be applied to installations subject to the Industrial Code. (This matter is considered in more detail below.)

The scheme of both sets of New York regulations is to establish performance standards, in the form of maximum permissible doses of radiation to persons (other than persons receiving radiation diagnosis or treatment), and then to provide a system of safety and medical supervision, registration and reporting, monitoring and inspection, and operating rules and specifications to insure that the exposure standards are met.

In essential respects the maximum permissible radiation dose limits of the two New York regulations are similar; however, sufficient difference does exist to cause difficulty. Both the Sanitary and the Industrial Codes establish limits to radiation from sources which are outside and inside the body. The limits of radiation exposure to sources outside the body are very nearly identical with the current permissible exposure standards of the AEC[155] in that the same unit (millirems), time period (week), conditions of exposure (whole body, hands and forearms, etc.), anatomical scheme (skin, blood-forming organs, gon-

[153] *Id.*, §§3801(d), 3809.

[155] 10 Code Fed. Regs. §20.101 and App. "A".

ads, and the lenses of the eyes), and amounts are specified.[156] The Industrial Code, however, does appear to contain a drafting error or oversight. Under the heading "Permissible Weekly Dose Limit" it is provided that:

> For employees whose entire body or major portion thereof is exposed to radiation of very low penetrating power from external sources: 300 mrem in the lenses of the eyes; 1500 mrem *in any other part of the body.*[157]

It seems doubtful that this means what it says, for such a dose to the gonads or the blood-forming organs is not recommended. The provision probably was intended to read like that of the Sanitary Code: "1500 mrems *in the skin*" (of any other part of the body).[158]

Both sets of New York regulations limit the exposure to sources of radiation inside the body by specifying the allowable concentrations of radioactive materials in air and water ingested by the persons to be protected. Included in the Industrial Code is a table which sets forth the maximum permissible average concentrations of inhaled or ingested radioactive materials in microcuries per unit of air or water,[159] which is identical with a table found in the federal regulations.[160] No such table is included in the Sanitary Code, which simply refers to "nationally recognized limits" and, more specifically, to National Bureau of Standards handbooks, in stating permissible concentrations.[161] Presumably, a change in these nationally recognized standards is expected to produce an automatic and corresponding change in the permissible concentration limits of the Sanitary Code.

The Sanitary Code also differentiates between the exposure of persons inside and persons outside of the radiation installation. Operations are to be carried on so that persons outside shall receive no more than one tenth the dose to which persons inside the installation may be subjected. Persons under eighteen years of age are to receive no more than one tenth of "inside" dose no matter where they are located.[162] The Industrial Code also observes this AEC rule[163] of limiting the dose to minors, and while theoretically these exposure limits are designed to

protect employees only, the AEC distinction between dose levels in "restricted" and "unrestricted" areas is observed as well by a provision that commands the owners of all radiation sources so to shield, isolate, protect, or otherwise arrange and control them as to avoid exposure of their own or another's employees outside the installation to radiation in excess of ten per cent of the permissible inside dose.[164]

Both the Sanitary and the Industrial Codes follow the AEC and the NCRPM practice of allowing weekly doses up to three times the basic limits if during the thirteen week period the total dose does not exceed ten times the general weekly limits.[165] Only the Sanitary Code, however, is in accord with the NCRPM practice of authorizing double doses to persons forty-five and older in special cases.[166]

Both New York codes require the registration of radiation installations, and the Industrial Code requires registration of "mobile sources" as well.[167] By virtue of the fashion in which the term "installation" is defined by the two sets of regulations, however, double registration should not be required of any source. Registration under the Sanitary Code must include a summary of the radiation safety program, while the Industrial Commissioner merely need be informed as to the name and qualifications of the person in charge of radiation protection. A change in the character of the radiation installation which might increase exposure is considered a new installation and requires re-registration under the Sanitary Code, while, under the Industrial Code, the Commissioner is to be advised of such changes.[168]

Radiation safety supervision, in the form of a person or persons responsible for all necessary precautions, is required by both sets of New York regulations. The Sanitary Code merely requires that "all radiation installations shall be operated by or under the direction of a competent person who shall be responsible for all necessary safety precautions."[169] No qualifications are stated. The Industrial Code, on the other hand, contemplates more elaborate supervision: a "radiation safety supervisor" for each source and a "radiation safety officer" for sources creating a "high radiation area or a high airborne concentration area." High standards of technical competence are specified for the

radiation safety officer, while the radiation safety supervisor only need be instructed and trained by an officer.[170]

Radiation safety instruction of all persons working with radiation equipment or radioactive materials is required by both New York codes.[171] The Industrial Code also requires that employees who work in radiation areas be informed of the presence of radiation and instructed in necessary measures for protection.[172]

Monitoring of radiation installations is required by the Sanitary and Industrial Codes, as is personnel monitoring; however, the details of these surveys are treated somewhat differently under the two codes. The Sanitary Code requires surveys of radiation installations where radioactive material is present, but not contained in a sealed source, at least once a month. Other installations, where radiation equipment or sealed containers of radioactive materials are used, must be surveyed upon original establishment and whenever changes are made or physical conditions may cause changes. Records of these surveys and measurements must be kept for a period of five years, and must be open to inspection by health officials.[173] The Industrial Code does not specify when radiation surveys are to be made; however, the records of those which are made must be maintained indefinitely and may be inspected by the "attending physician of any person who may have undergone exposure" as well as by the Labor Commissioner.[174] The personnel monitoring required by both sets of regulations applies to all persons who may possibly receive routinely a weekly radiation dose in excess of one fourth the maximum permissible dose.[175] In high radiation areas, the Industrial Code also requires personnel monitoring of any employees when the dose rate may exceed 100 mrems in any one hour. Individuals may obtain a summary statement of their exposure records under either set of regulations.

The Sanitary Code requires annual physical examinations of all persons who might regularly ingest or inhale radioactive materials in concentrations exceeding one quarter of the maximum permissible amounts, and persons subject to external radiation are to be examined too, but the code does not specify how often.[176] The Industrial Code apparently

[170] *Supra* note 128, §§38-5.2, 38-5.3.

[176] *Supra* note 132, Reg. 7.

assumes that physical examinations will be given, since records of them must be maintained,[177] but the regulations do not specifically require such examinations.

Reporting to appropriate officials in the event of excessive exposures to individuals is necessary under both sets of New York regulations, although the conditions are somewhat different. Under the Sanitary Code doses in excess of five times the maximum permissible weekly dose must be reported within three days to the health officer having jurisdiction,[178] whereas ingestion of "an excessive amount of radioactive material" or total thirteen week doses in excess of ten times the permissible weekly dose must be reported to the Labor Commissioner within seven days of discovery under the Industrial Code.[179] The Sanitary Code also requires reporting, by telephone or telegraph, to the health officer having jurisdiction of the following events: the discharge of excessive amounts of radioactive wastes; the spillage, loss, or theft of radioactive materials; incidents affecting the security of storage places; and other circumstances giving rise to radiation hazards. This requirement must be observed by the person in charge of any radiation installation, irrespective of whether it is registered with the Department of Health. Furthermore, physicians are required to report all cases of radiation injury or illness, caused by non-therapy radiation, to the New York State Department of Health.[180] Presumably, radiation injury or illness caused by diagnostic procedures do have to be reported.

The Industrial Code contains a brief directive as to storage of radioactive materials not in use, requiring that they "be stored in properly shielded and secured containers." [181] Such a requirement is only implicit in the Sanitary Code, but the operator of a radiation installation is directed to maintain an accurate account of all radioactive materials.[182] On the other hand, control of radioactive waste disposal is only implicit in the Industrial Code,[183] whereas the Sanitary Code contains specific provisions on this subject.[184] Neither the standards of the AEC nor the recommendations of the NCRPM have been followed, however, for the provision of the Industrial Code merely prohibits the

discharge of radioactive wastes into the environment in a manner that will lead any person to receive a dose in excess of one tenth the occupational dose. Where waste discharges of two or more users into the same environment are additive, they must either enter into a mutual agreement, "each to limit his release, so that the total comes within the permissible limit specified," or the State Commissioner of Health will make the determination as to each. This provision of the Sanitary Code is not directed simply to radiation installations required to register under Regulation 2. The question is whether it applies to installations subject to the Industrial Code. In view of the broad grant of authority to the New York State Department of Health to supervise and regulate the "public health aspects of the use of ionizing radiation and the handling and disposal of radioactive wastes," [185] and the all inclusive phrasing of Regulation 9, the implication is that disposal of radioactive wastes by all users in New York comes under the Sanitary Code.

Other provisions included in the Sanitary Code, but not in the Industrial Code, are those which require the filtration equivalent of at least two millimeters of aluminum and automatic, four minute, shutoff timers on diagnostic X-ray equipment,[186] automatic interlocks and signs or signals on radiation therapy rooms,[187] and prescribe installation and operation specifications for shoe-fitting fluoroscopes.[188] Instead of simply banning shoe-fitting fluoroscopes (which seems to be the most sensible course), the New York State Department of Health has chosen so to burden and restrict their use and operation that it is difficult to see how anyone would find it profitable to use one. Finally, the Sanitary Code requires the identification of cadavers containing radioisotopes, specifying that a report accompany every cadaver containing more than five millicuries of radioactive material. Autopsies of such cadavers are not to be commenced without the consultation and advice of a hospital radiation safety officer.[189]

(3) Pennsylvania and Texas

The radiation health and safety regulations of Pennsylvania and Texas became effective in October and September of 1956, respectively. The departments of health of both these states closely followed the

[185] *Supra* note 65.
[186] *Supra* note 132, Reg. 8.

[188] *Id.*, Reg. 19.
[189] *Id.*, Reg. 11.

suggested regulations of the NCRPM [190] with the result that their regulations are very nearly identical. These regulations are applied to "the use of all radiation, radiation machines, and radioactive materials," and are intended "to insure the maximum safety to all persons at, or in the vicinity of, the place of use, storage, or disposal thereof." [191] The regulations, however, are not intended "to limit the kind and amount of radiation that may be intentionally applied to a person for diagnostic or therapeutic purposes by, or under the direction of, a physician or dentist," nor do they apply to radiation machines not in use and certain specified quantities of radioactive materials which are considered to be harmless.[192]

The general plans of these regulations are similar to those previously discussed in that they prescribe maximum permissible doses; impose responsibility for radiation safety upon a designated person; require area and personnel monitoring, registration, keeping of survey and dosage records; and include operating rules relative to the storage of radioactive materials, disposal of radioactive wastes, radioactive contamination controls, and information labeling.

The maximum permissible doses allowed by the Pennsylvania and Texas regulations are identical with those suggested by the NCRPM in December of 1955.[193] Exposures to external sources of radiation are specified according to type of radiation, conditions of exposure, and critical organs affected.[194] Internal radiation exposures are controlled by limiting concentrations of radioactive materials in air and water used by individuals to those prescribed for each radioisotope.[195] Maximum permissible radioisotope concentrations in air and water are given for occupational areas, in terms of an eight and a twenty-four hour work day, and for non-occupational environments into which radioactive wastes are discharged.[196] These concentrations are nearly the same as those required by AEC regulations.[197] Unlike the AEC standards, no distinction is made as to minors in occupation areas and double exposures are allowed for persons over forty-five in certain situations. Like the AEC standards, however, exposures up to three times the basic

[190] National Bureau of Standards Handbook 61 at 36.

weekly dose are allowed provided the total quarter-year dose does not exceed ten times the basic weekly limit.[198] No yearly limits are specified.

Sections entitled "Responsibility" require that "all work performed in an installation where radiation may be present shall be under the direction of a person responsible for the radiation safety therein." Imposed upon this person are the duties of: informing himself and persons who may be exposed as to radiation hazards, safe working practices, and necessary safeguards; accounting for radioactive materials; insuring adequate shielding; and conducting exposure surveys.[199] It is interesting to notice that in the NCRPM recommendations and the Texas regulations the person responsible for radiation safety "shall insure beyond reasonable doubt" that certain things are done, while those of Pennsylvania require that he "shall take all necessary precautions" that the same things are done.[200] A second change and an addition found in the Pennsylvania regulations regarding "responsibility" indicate that a higher duty of care is imposed in this state. It is there provided that the person responsible for radiation safety

> . . . shall take all necessary precautions that every employee and authorized visitor shall use such safety devices as are furnished for his protection and carry out all radiation safety rules that concern or affect his conduct.[201]

Under the NCRPM recommendations and the Texas regulations, this is the responsibility of "every employee and authorized visitor" and not the safety officer alone. Furthermore, to this section the Pennsylvania Department of Health has appended the statement:

> The designation of a person responsible for radiation safety shall in no way relieve the owner, management, or user from responsibility for compliance with the provisions of this regulation.[202]

"Any person using or operating any radiation machine, or storing, manufacturing, using, or handling any radioactive material" in Pennsylvania or Texas must register with the state health department. In New York the installation or mobile source is to be registered by the owner or the organization conducting the business or activities carried on within the radiation installation. Obviously the Pennsylvania and

[200] *Ibid.*
[201] *Supra* note 129, §10b(10).
[202] *Id.*, §10b(11).

Texas regulations impose the duty to register on a considerably broader group of persons. The registration must include an estimate of further acquisitions during the year, and acquisitions causing radiation in excess of the estimate must be registered promptly. Acknowledgement of registration does not imply state approval of any feature of the radiation operation.[203]

Regularly scheduled radiation surveys are required for all accessible areas in the vicinity of a radiation-producing source where there is a reasonable possibility that a person could receive more than one quarter of the maximum permissible dose. Personnel monitoring is required for all persons who may possibly receive a dose in excess of the same amount.[204] Records of these measurements are to be kept available indefinitely for health department inspection, and, upon termination of a person's employment, and at the request of the department, a summary record of the person's exposure is to be forwarded to the health department. In addition, accidental exposures in excess of five times the permissible amounts must be reported within seven days of their discovery.[205]

The provisions of the Pennsylvania and Texas regulations which concern the storage and handling of radioactive materials and the disposal of radioactive wastes are more elaborate than those of California and New York. They are, nevertheless, performance type rules in that they establish operation and construction standards and do not specify dimensions or details of design.[206]

(4) Connecticut

The Connecticut radiation health and safety regulations were adopted by the State Department of Health in October of 1957, and were the first set of comprehensive state regulations that became effective after the AEC issued its "Standards for Protection Against Radiation." [207] Under these regulations, "when the source of radiation is outside the body, the maximum permissible doses for persons occupationally engaged in radiation work" are not to exceed "those established for the purpose by the United States Atomic Energy Commission." Similarly, "when the source of radiation is within the body, radiation dosages"

[203] *Supra* notes 129 and 130, §6.
[204] *Id.*, §8.
[205] *Id.*, §9.
[206] *Id.*, §§11, 12, 14.
[207] 10 Code Fed. Regs. Pt. 20 became effective on Feb. 28, 1957.

are to be controlled "by limiting the average rates at which radioactive materials are taken into the body by inhalation or by ingestions" and the average concentrations of radioisotopes are not to exceed "the maximum permissible concentration established by the United States Atomic Energy Commission." Persons under eighteen years of age and persons not occupationally engaged in radiation work are not to receive more than ten per cent of occupational dose.[208] Although it can be seen that the Connecticut Department of Health intended to follow the standards of the AEC, some variance exists, for they have applied a different distinction. Prescribing "occupational" and "non-occupational" doses (as the NCRPM has done) is not the same as prescribing, as does the AEC, doses for "restricted" and "unrestricted" areas. The term "restricted area means any area access to which is controlled by the licensee," except residential space.[209] The AEC, therefore, applies the same limits to all persons in the restricted area, whereas Connecticut applies two different limits depending upon whether or not the person exposed is "occupationally engaged in radiation work." The Connecticut standards also differ from those of the AEC in that they do not appear to allow any weekly doses in excess of the basic limits.

Subsequent modification of the Connecticut standards, so as to conform with changes in AEC and NCRPM standards, is contemplated in a section which provides:

> Whenever the United States Atomic Energy Commission or the National Committee on Radiation Protection [and Measurement] publish modifications in their respective standards or recommendations, such modifications shall be operative within the scope of this regulation immediately upon the issuance of an emergency order by the department to interested parties including registrants.[210]

Annual registration of radiation installations and mobile sources is required in Connecticut, as well as re-registration "when any increase is contemplated in the number of sources, the source strength, the output or the types of radiation energy involved." [211] Only the owner of the installation or mobile source, however, is required to register.[212]

The Connecticut regulations require personnel monitoring and regularly scheduled area radiation surveys under conditions similar to those

[208] *Supra* note 131, §E.
[209] 10 Code Fed. Regs. §20.3,(a)(12).
[210] *Supra* note 131, §N.
[211] *Id.*, §C.
[212] *Supra* note 131, §F.

imposed by the Pennsylvania and Texas regulations.[213] Individual personnel exposure records and records of radioactive materials released into the environment must be maintained.[214] "Any exposure of twenty-five rems or more" is to be reported to the State Department of Health within twenty-four hours, and "an accidental exposure of a person to three rems or more" is to be "promptly reported." Loss or theft of radioactive materials is to be "immediately reported." [215] Supervision of all radiation installations and mobile sources, by a "person qualified to evaluate radiation hazards and to advise with respect thereto," is required, as is medical consultation service by a qualified, licensed physician.[216]

The operating rules of the Connecticut regulations are, for the most part, of the performance type. Storage of radioactive materials, for example, must be done in such a manner that "no person will inadvertently receive a dose in excess of the limits" specified in the section on maximum permissible doses.[217] No specifications are provided regarding storage places or containers. Similarly, "all work with radioactive materials" is to be "carried out under such conditions as to minimize the possibility of any contamination that would result in any person's being subjected to radiation levels exceeding those specified" in the section on maximum permissible doses. More specifically, however, where contamination of a person or his clothing is possible, "(1) both shall be monitored, (2) persons' bodies shall be decontaminated, [and] (3) clothing shall either be decontaminated or disposed of in a manner approved by the department." [218]

The section of the Connecticut regulations on "disposal of radioactive wastes" is similar to the provisions of the AEC regulations [219] and allows the discharge of radioactive wastes into the air, water, or sewage systems and the burial of radioactive wastes under virtually the same conditions as does the AEC. Where two or more owners are discharging radioactive wastes into the same environment, they must file a statement of their agreed prorated releases for approval of the State Department of Health, or the Department may arbitrarily assign quantities to them severally.

(5) Michigan

In November of 1957 the Michigan Department of Health adopted a comprehensive set of radiation health and safety regulations which became effective on February 14, 1958. While the Michigan regulations are not to be construed as limiting "the intentional exposure of patients to radiation for the purpose of medical diagnosis, medical therapy, or medical research conducted by duly licensed members of the healing professions," they apply "to all persons who receive, possess, or use materials or devices capable of emitting ionizing radiation," except certain exempted sources which have no significant effect on health.[220]

By virtue of Part I of the Michigan regulations the State Health Commissioner is to appoint the members of the Commissioner's Radiation Committee, which is to consist of nine members, each of whom is to be selected on the basis of his "recognized knowledge in the field of radiation." The purpose of this committee is to review "these regulations at least once annually and at such other times, not to exceed four times a year, as may seem necessary." The Commissioner acts as chairman of the committee.[221]

These regulations are to be enforced by personnel of the Michigan Department of Health, but the "Commissioner may delegate authority to county, city or district health departments to enforce" them.[222]

Following the method of the AEC, the Michigan regulations establish permissive dose levels and concentrations in "controlled" and "uncontrolled" areas as well as allowed concentrations of radioactive effluents in "uncontrolled" areas. The permissible weekly exposure standards for persons in controlled areas are identical with the current standards of the AEC for "restricted" areas as to units, amounts, conditions of exposure, and critical organs affected. Also authorized are exposures up to three times the basic weekly dose if the quarter year dose does not exceed ten times the permissible weekly limit. Exposures of persons under eighteen in controlled areas must be kept to ten per cent of the basic dose. The AEC limits for allowed concentrations of airborne radioactive materials in controlled areas are followed. This

[220] *Supra* note 127, R. 325.1305.

[221] The function of the committee is advisory only. Committee approval of radiation health and safety regulations is not a condition precedent to effectiveness, however prior approval of a majority of the members of the State Council of Health is required. See Mich. Stat. Ann. §14.7.

[222] *Supra* note 127, R. 325.1304. It might be added that the local boards of health appear to have ample authority to issue their own regulations concerning radiation. See Mich. Stat. Ann. §§14.63, 14.64.

section also contains a rule limiting the "maximum permissible accumulated dose, in rems . . . [to] 5 times the number of years beyond the age of 18." Moreover, no annual increment is to exceed fifteen rems.[223] Michigan, therefore, apparently is the first state to follow the recent recommendations of the NCRPM and the cumulative dose standard which the AEC is now applying in its own installations.[224]

Permissible levels of radiation in uncontrolled areas in Michigan are also identical with the current standards of the AEC.[225] Registration of a radiation source is to include information on "anticipated average radiation levels and anticipated occupancy times for each uncontrolled area involved," and *may* include "proposed limits on levels of radiation in uncontrolled areas." Should it be demonstrated "that the proposed limits are not likely to cause any individual to receive a dose in any period of 7 consecutive days in excess of 10%" of the basic dose for controlled areas, "the state health commissioner *may* approve the proposed limits." [226] The succeeding subsection imposes limits on concentrations of radioactive materials released into the atmosphere of uncontrolled areas which are identical with AEC requirements.[227] Here, again, the registrant must include "information as to anticipated average concentrations and anticipated occupancy time for each uncontrolled area," and he also *must* include "proposed limits of concentrations . . . released into the air in uncontrolled areas." Curiously enough, "if the registrant demonstrates that it is not probable that any individual will be exposed to concentrations in excess of the limits specified," the Commissioner *"will* approve the proposed limits." [228] The reasons for this distinction are obscure.

[223] *Id.*, R. 325.1309.1.

[224] The NCRPM proposal to limit the maximum permissible accumulated dose to five rems per year for any age beyond eighteen was announced in a preliminary statement dated January 8, 1957. 1 CCH Atomic Energy Law Rep. ¶4034. This rule was subsequently incorporated into the National Bureau of Standards Handbook 63, "Protection Against Neutron Radiation Up to 30 Million Electron Volts." A statement of the AEC, issued December 10, 1957, announced the approval for use in its own facilities and those of its contractors the new maximum permissible accumulated doses of the NCRPM. It also announced that it was currently considering amending 10 Code Fed. Regs. 20 to make this regulation consistent with the new recommendations. 1 CCH Atomic Energy Law Rep. ¶4050.

[225] *Supra* note 127, R. 325.1309.2.2.

[226] *Id.*, R. 325.1309.2.1. The language of this provision is nearly identical with that of 10 Code Fed. Regs. §20.102 except that the AEC *"will* approve the proposed limits" if the conditions are met.

[227] *Id.*, R. 325.1309.3.

[228] *Id.*, R. 325.1309.3.1. Under the federal regulations "there *may* be included in any application for a license or for amendment of a license proposed limits upon concen-

While the Michigan Department of Health has taken practically all of the language of Section 9 on "basic standards" from the AEC regulations, it also has deemed it necessary to add a paragraph which contains rules and packaging specifications for radioactive materials which are transferred or moved through uncontrolled areas.[229]

Registration of "all sources of ionizing radiation" with the State Health Commissioner "by the legal owner, user or an authorized representative" is required in Michigan. In addition to the name and address of the person registering, and the above mentioned items, the name, training, and qualifications of the individual responsible for safety, and the location, type, and capacity of the radiation source is to be included in the registration. Installation changes which materially increase the potential health hazard must receive the prior approval of the Commissioner.[230]

Except for the above reference in the registration section to the "individual who will be appointed by the owner or user to see that the radiation source is safely used and stored," the Michigan regulations are silent on the subject of radiation safety personnel. Neither do these regulations mention medical supervision or required physical examinations.

In the event of excessive exposures, the rule of the AEC is followed,[231] and the subsequent exposure of the individual must be reduced to ten per cent of the basic limit until such time as the average dose over the period is within acceptable limits again.[232] In addition, the following incidents must be reported to the State Health Department by phone and telegraph: (1) within six hours—exposures of individuals to twenty-five rems or more or "the release of radioactive materials which, if averaged over a period of 24 hours, would exceed 5,000 times" the limits specified for uncontrolled areas; (2) within twenty-four hours—exposure of an individual to three rems or more, or the release of radioactive materials which would exceed 500 times the limits specified for uncontrolled areas. Written reports of all incidents involving exposures in excess of the specified limits are required within thirty days.[233]

---

trations of licensed and other radioactive material released into air or water in unrestricted areas as a result of the applicant's proposed activities." 10 Code Fed. Regs. §20.103(a).

[229] *Id.*, R. 325.1309.2.3.

[230] *Id.*, R. 325.1306.

[231] 10 Code Fed. Regs. §20.105.

[232] *Supra* note 127, R. 325.1310.1.

[233] *Id.*, R. 325.1310.2.

By way of precautionary procedures, the Michigan regulations require that "each registrant shall make or cause to be made such surveys as may be necessary for him to comply with the regulations"; and that "each individual who enters a high radiation area" or "who enters a controlled area under such circumstances that he receives, or is likely to receive, a dose in excess of 25% of the limits specified in . . . these regulations," shall have and use personnel monitoring equipment.[234] Radiation safety instruction is required for any "individual working in or frequenting any portion of a controlled area." [235] Registered materials stored in uncontrolled areas must be secured against unauthorized removal, and unattended X-ray apparatus must be secured against unauthorized use.[236] Caution signs, labels, and signals, which are virtually identical with those employed by the AEC, are required.[237]

Radioactive waste disposal into sanitary sewage systems or by burial in the soil is allowed in Michigan under conditions identical with those imposed by the AEC. Registrants also may apply to the State Health Commissioner for approval of proposed disposal procedures which are not otherwise authorized in the regulations except for disposal to surface waters.[238]

Parts VII through XI of the Michigan regulations establish operating procedures and detailed specifications for industrial radiographic installations, medical radiographic installations, dental radiographic installations, fluoroscopic shoe machines, and miscellaneous types of X-ray installations. Industrial radiographic installations are subdivided into four classes depending upon their capacity and amount of use. While the term "industrial radiographic installation" refers primarily to X-ray devices, it also includes those "utilizing high intensity sealed sources of radioactive materials" (in other words, "byproduct materials" which are licensed by the AEC). The most curious feature of these provisions regarding industrial radiographic installations is that they contain

[234] *Id.*, R. 325.1311.1 and .2. Except for "personnel occupationally exposed to ionizing radiation from diagnostic equipment," who must wear film badges "for at least 13 consecutive weeks during each calendar year" and for whom records must be kept in a permanent file (R. 325.1318.1.8), the Michigan regulations are silent as to whether records must be kept of radiation surveys and personnel monitoring.

[235] *Id.*, R. 325.1311.5.

[236] *Id.*, R. 325.1311.6 and .7.

[237] *Id.*, R. 325.1311.3.

[238] *Id.*, R. 325.1312. Due to the fact that the Michigan Water Resources Commission controls the dumping of contaminants into the surface waters of the state (Mich. Stat. Ann. §§3.521-3.533), the State Health Commissioner does not have the authority to allow a system which contemplates such disposition.

their own permissible dose levels for personnel working in or adjacent to the enclosure area. This dose level is 100 milliroentgens per week, which is considerably lower than the basic standards of Section 9.1 and the current standards of the AEC for licensed byproduct material users. No distinction is made as to conditions of exposure or critical organs affected. It would appear that in Michigan, commercial users of byproduct materials in sealed containers (but not unsealed sources) must limit exposures of employees to one third the amounts allowed by the AEC.

b. Partial Radiation Health and Safety Regulation

Government agencies of Colorado, Florida, Kentucky, New Hampshire, New Jersey, Ohio, Oregon, Utah, West Virginia, and Wisconsin have issued regulations which impose some sort of radiation exposure limits. These regulations are characterized as partial since they cover only this limited aspect of radiation health and safety and are not concerned with such problems as waste disposal, personnel monitoring, area radiation surveys, etc. Most of them are confined to industrial radiation hazards from X-rays, gamma rays, and atmospheric concentrations of radon and thorium. In addition to the above, regulations of Arkansas, Delaware, and Indiana indicate an intention by those states to control some phase of radiation hazards.

Of the states having partial regulations concerning exposure limits, only those of Colorado and New Jersey purport to cover all forms of radiation. Colorado regulations limit exposures to X-rays, gamma rays, alpha and beta rays, and thermal neutrons to 0.05 rems per day.[239] By using the day, instead of the week, as the exposure period, and by failing to make appropriate refinements regarding conditions of exposure, critical organs affected, and the location or employment status of the person exposed, these regulations are, in general, at variance with the standards of the AEC and the current recommendations of the NCRPM. New Jersey, on the other hand, avoids the embarrassment of such variance by using a standard which is all but meaningless. The regulations of the New Jersey Health Department specify:

> . . . [All] sources of radiation shall be sealed, transported, handled, used and kept in such manner as to prevent all users thereof and all persons within effective range thereof from being exposed to excessive dosage of radiation.[240]

[239] Regulations—Occupational Diseases Reportable in Colorado, Colo. Dept. of Public Health, Reg. 3.

[240] Chap. VI—Radiation Regulations, New Jersey Public Health Council, eff. Dec. 15, 1952.

"Excessive dosage" is not defined. However, in view of the fact that New Jersey has created a new rule-making commission, discussed earlier, the likelihood is great that more definite standards will soon be forthcoming.

General variance from the current standards of the NCRPM is found in the regulations of Florida,[241] New Hampshire,[242] Oregon,[243] West Virginia,[244] and Wisconsin,[245] which simply limit exposures to X-rays and gamma rays, under all industrial conditions, to 0.3 roentgens per week, as well as in Ohio, where the general exposure limit is 0.1 roentgens per day.[246] Greater conformity with NCRPM standards is found in the regulations of the Kentucky Department of Health, which limit the occupational exposure to X-rays and gamma rays to 300 milliroentgens for the whole body, 450 milliroentgens to the lenses of the eyes, and 1500 milliroentgens to the skin of the hands, forearms, feet, ankles, head and neck.[247] The only Utah regulation which purports to regulate exposures limits the ". . . atmospheric concentration of the immediate daughters of radon . . . [to] 300 micro-microcuries per liter," [248] which differs from the standard of the AEC.

While the environmental sanitation regulations of Arkansas do not limit exposure to radiation, it is required that:

> In all places of employment where recognized health hazards exist from . . . radiation . . . [and] radioactive materials, . . . the employer shall provide pre-employment medical examination and periodic medical examination thereafter. The employer shall also provide warning signs . . . in prominent sites around the plant and shall periodically instruct all employees regarding the health hazards connected with their

> duties and the best preventative measures and methods to protect themselves therefrom.[249]

In Indiana the only regulations regarding radiation hazards concern the operation of shoe-fitting fluoroscopes.[250]

Pursuant to its general authority[251] the Delaware Board of Health has promulgated a curious regulation which will probably be more hindrance than help, for it specifies:

> No person shall manufacture, distribute, offer for sale, store, keep, install or dispose of any radioactive material or any device containing radioactive material which is capable of causing injury or death to human beings or animals without *first* securing a written permit from the State Board of Health. . . . The State Board of Health reserves the right to deny any permit when there is unsatisfactory proof that the material or device will not be a hazard to health.[252]

This regulation does not apply to hospitals, clinics, physicians, veterinarians, or dentists.

D. Summary of State Atomic Energy Legislation and Regulation

The foregoing examination of recent state atomic energy and radiation hazard legislation and regulation reveals considerable state interest and activity in the field since the Atomic Energy Act was amended in 1954. It is apparent from this examination that many states, after the example of the federal government, regard atomic energy as an appropriate subject for both governmental encouragement and control in the public interest. However, the promotional programs are, for the most part, still in only tentative form. They do little more than indicate a vague policy of encouragement, suggesting the need for further study of the problems involved. Some of the states have created commissions, either temporary or permanent, to conduct these studies and suggest fruitful courses of government action. While none of the states have responded to the impact of atomic energy upon society with anything like the political innovations of Congress, a few have recognized the need for intra- and inter-governmental coordination to assure consistent

[249] Ark. Bd. of Health, Rules and Regulations Pertaining to Environmental Sanitation in Manufacturing Establishments, §3.9.

[250] *Supra* note 6 at 8.

[251] Del. Ann. Code tit. 16, c. 1, §122.

[252] Del. Bd. of Health, Regulations Governing the Manufacture, Distribution, Sale, Storage, Installation, and Disposal of Radioactive Sources, Materials, or Devices, §II, adopted Dec. 5, 1955.

state action, establishing for this purpose the position of coordinator of atomic development activities. Beyond this, however, there is no indication that the states intend to concentrate and centralize state powers to deal with matters affecting the development and utilization of atomic energy in one officer or agency.

As might well be expected, the subject of radiation hazard control has received somewhat more comprehensive treatment by some of the states than has the subject of promotion. The need and the urgency for state action in this area is more obvious and more easily justified in terms of traditional political principles. It is encouraging to observe these states establishing programs to control radiation hazards at a time when significant damage is yet to occur and the privately controlled atomic energy industry is still in its infancy. Not only does this serve to reduce the possibility of future injury, but it also serves the interests of the regulated industries by informing them before their entry into the field as to the design and operational standards which will be imposed upon them, thus avoiding much of the expense of subsequent structural modifications.

It is somewhat less encouraging to observe the failure of the state legislatures to avoid multiple regulation of radiation hazards by several agencies within the state. None of the states has followed the advice of the NCRPM and bestowed exclusive authority to regulate radiation hazards on one agency. Neither has any state expressly subdivided the field among existing agencies or provided a means by which the regulations of all agencies can be made uniform and consistent. Fortunately, the tendency seems to be to adopt the standards of the AEC or the NCRPM regardless of whether directed to or not, so that there probably will be less conflict between the regulations of various state agencies themselves, and between them and the AEC regulations, than might be feared.

This last feature becomes especially important when it is evident that many of the states have every intention of concurrently regulating the activities of AEC licensees. The comprehensive state radiation health and safety regulations make no distinction between sources of radiation licensed and controlled by the AEC and those which are not. By and large, however, they impose no additional burden on licensed activities other than registration and reporting to designated state officials. If there are some dissimilarities between state and federal regulations, they are not of the sort which makes simultaneous observance of both standards impossible. It remains to be seen whether concurrent federal-state regulation is authorized.

E. The Problem of Federal Pre-emption

1. Introduction

The comprehensive nature of the powers granted the Atomic Energy Commission under the Atomic Energy Act in the field of radiation health and safety regulation raises the pivotal question of whether all or part of the field has been so occupied by the federal government as to preclude state action. In view of the fact that Congress has failed to clarify the matter of pre-emption and, to date, no court has ruled on the question, considerable uncertainty exists concerning the validity of state radiation health and safety regulations. Therefore the possible solutions to the question of the possibility and extent of federal pre-emption must be sought by recourse to the principles employed by the courts in resolving the same type of question in analogous cases.

If Congress had not asserted national powers and established a federal program to promote and control atomic energy, the states undoubtedly could regulate all radiation hazards created by others than the federal government itself. The mere existence of constitutional power in the federal government does not preclude the exercise of state police powers with respect to all matters which might be made subject to national powers. For example, regarding the commerce power, which is one of the principal powers upon which the Atomic Energy Act is based, the Supreme Court has said:

> Although the commerce clause conferred on the national government power to regulate commerce, its possession of that power does not exclude all state power of regulation.[253]

Where the commerce power is unexercised by Congress, the states may enforce laws for the protection and safety of society, although they affect interstate commerce, except "where the subject matter requires a uniform system as between the States." [254]

Even if Congress undertook the promotion and exclusive control of every phase of atomic energy development and utilization except that of public health and safety, there would be little doubt of the states' authority to protect this interest as long as the regulation did not materially interfere with the federal program. It scarcely could be asserted that the national interest in promoting the development and utilization of atomic energy by private persons is so great as to preclude state regulation of the very substantial hazards to life and property involved.

[253] Southern Pacific Co. v. Arizona, 325 U.S. 761, 766, 65 S. Ct. 1515 (1945).
[254] Leisy v. Hardin, 135 U.S. 100, 108-109, 10 S. Ct. 681 (1890).

The situation with respect to atomic energy hazards, however, is not as posed above. Congress, in the Atomic Energy Act of 1954,[255] has definitely asserted its powers to control atomic energy in the interest (among others) of public health and safety. As indicated in Section 2 of the act, the constitutional bases of the federal health and safety program are the powers of Congress: (1) to provide for the common defense and security,[256] (2) to regulate interstate and foreign commerce,[257] and (3) to make all needful rules and regulations respecting the territory or other property belonging to the United States.[258] The phrase "health and safety of the public" and terms of similar import are used repeatedly throughout the act.[259] Of greater significance, however, is the elaborate and comprehensive program of radiation hazards control which Congress has created, for it raises the problem: to what extent has Congress pre-empted the field of health and safety regulation in connection with atomic energy activities?

In exercising any one of the above mentioned powers, Congress, if it so desires, may pre-empt state regulation of matters within the scope of the national power. In discussing federal supremacy and the commerce power, the Supreme Court has said:

> Congress has undoubted power to redefine the distribution of power over interstate commerce. It may either permit the states to regulate the commerce in a manner which would otherwise not be permissible . . . or exclude state regulation even of matters of peculiarly local concern which nevertheless affect interstate commerce.[260]

Similarly, where Congress has undertaken to legislate pursuant to its defense powers, the Supreme Court has declared that state law in conflict therewith, which would be valid but for the congressional act, must give way to federal supremacy.[261] Again, where a state has attempted

[259] The phrase "health and safety of the public," or phrases of similar import, may be found in the Atomic Energy Act of 1954 at §§2b, 2d, 2e, 3d, 11p, 11v, 31a(5), 31c, 41b, 53b, 53e(7), 63b, 81, 103b, 103d, 104a, 104b, 104c, 104d, 144(a)(4), 161b, 161e, 161i, 182a, and 186c, 42 U.S.C.A. §§2012(b), 2012(d), 2012(e), 2013(d), 2014(t), 2014(aa), 2051a(5), 2051(c), 2061(b), 2073(b), 2111, 2133(b), 2133(d), 2134(a), 2134(b), 2134(c), 2164(a)(4), 2201(b), 2201(e), 2201(i), 2232(a), and 2236(c).

[260] Southern Pacific Co. v. Arizona, *supra* note 253 at 769.

[261] In Case v. Bowles, 327 U.S. 92, 66 S.Ct. 438 (1946), the sale by the State of Washington of timber from school lands was held subject to the maximum price prescribed by the OPA under the authority of the Emergency Price Control Act of World War II. *Cf.* Hulbert v. Twin Falls County, 327 U.S. 103, 66 S.Ct. 444 (1946).

to regulate the distribution of federally owned chattels to private persons and exact the payment of inspection fees, the court has said:

> . . . [W]here, as here, the governmental action is carried on by the United States itself and Congress does not affirmatively declare its instrumentalities or property subject to [state] regulation or taxation, the inherent freedom continues.[262]

It is clear that Congress has the power to regulate many aspects of radiation health and safety [263] and, when it desires to do so, may pre-empt the field as to these matters. Our question is, therefore, twofold: (1) to what extent did Congress intend exclusive federal regulation, and (2) to what extent are there any limits to the exclusiveness of federal regulation? In the light of analogous cases there is considerable uncertainty as to pre-emption of regulation of non-federal activities. The bulk of this study, therefore, is devoted to pre-emption in this area. There are a few areas, however, where regardless of congressional intent there may be no power to pre-empt, and these will be discussed at the end of the chapter. The one matter that warrants no discussion is the question of the power of the states to regulate the activities of federal agencies or of contractors carrying out the work of such agencies because the answer is clearly that no such power exists.[264]

2. The Permissible Limits of State Health and Safety Regulation of Atomic Energy Activities

a. Explicit Provision Allowing State Regulation

The Atomic Energy Act of 1954 contains only one express reference to the problem of pre-emption. Section 271 provides:

> Nothing in this Act shall be construed to affect the authority or regulations of any Federal, State, or local agency with respect to the generation, sale, or transmission of electric power.[265]

[262] Mayo v. United States, 319 U.S. 441, 448, 63 S. Ct. 1137 (1943). In this case federal officers shipped federally owned fertilizer into Florida for distribution to farmers there under the Soil Conservation and Domestic Allotment Act. The Supreme Court held that Florida could not enforce its statute requiring inspection of fertilizers, labeling, and payment of inspection fees.

[263] On the power of the federal government to control radiation health and safety see Estep, "Federal Control of Health and Safety Standards in Peacetime Private Atomic Energy Activities," 52 Mich. L. Rev. 333 (1954).

King & Boozer, 314 U.S. 1, 62 S. Ct. 43 (1941); City of Cleveland v. United States, 323 U.S. 329, 65 S. Ct. 280 (1945).

[265] §271, 42 U.S.C.A. §2018.

It might be argued from this explicit, but limited, recognition of state regulatory power that Congress intended to exclude every other form of state action. Such an argument, however, would ignore the real basis of the provision. There appears to have been considerable concern in Congress lest the AEC become a super power administration.[266] The provision was clearly intended to avoid such an event. Senator Clinton P. Anderson, a member of the Joint Committee on Atomic Energy and a principal author of the act, pointed out to the Senate that:

> The Commission has no special competence in the field of electric energy distribution and seeks no responsibility in the field. Its functions should be limited, as the bill contemplates, to those areas in which the Commission does have special competence or responsibility. These areas include the review of design criteria, the supervision of construction, and decisions on the technical qualifications of applications to operate nuclear plants, on health and safety standards, and on security safeguards.[267]

Thus Section 271 apparently was intended as a limitation upon the powers of the Commission and not as the single exception to federal pre-emption. It may also be noted that the Senator did not specify exclusive Commission control within the areas of "special competence." There is nothing in the Congressional Record to suggest that his attention was directed in any way to the pre-emptive question.

The whole pre-enactment legislative history of the 1954 act in fact is barren of any indication that Congress was even aware of the pre-emption problem with respect to health and safety regulation. For what it is worth in determining the intent of Congress when the act was passed, however, there have been several subsequent manifestations of congressional concern with the problem in the form of bills or recommendations to amend the act. On January 23, 1956, Representative Carl T. Durham introduced a bill to amend the act which would (1) authorize and direct the Commission "to cooperate with the States in the formulation of standards for regulating the health and safety aspects of the atomic energy field"; and (2) direct the Commission "to relinquish the jurisdiction of health and safety in the areas specified in the certificate" six months after the date upon which the "Commission receives from the governor of any State a certificate to the effect that

[266] See the Congressional Record for July of 1954 for debates on this subject.

[267] 100 Cong. Rec. 10559 (July 15, 1954), quoting a statement by Chairman Strauss of the Atomic Energy Commission.

the State has an agency competent to exercise jurisdiction" in a specified field of radiation hazard regulation.[268]

A somewhat more cautious solution was offered by Senator Anderson in a bill introduced on July 26, 1956, which would (1) authorize and direct the Commission "to cooperate with the States in the formulation of standards regulating the health and safety aspects and other aspects of the atomic energy field" and (2) authorize the Commission "to negotiate compacts or agreements with the States relating to health and safety aspects . . . of the atomic energy program prior to their submission to the Congress for approval." Pursuant to these compacts, "the Commission (would be) authorized to turn over such areas to the States for regulation as it finds the States are competent to assume such powers." [269]

While the AEC has declined to issue an administrative interpretation or adopt an official position on the extent to which Congress intended that it share its regulatory jurisdiction with the states, it has established a program to advise, consult, and cooperate with state officials.[270] Furthermore, in June of 1957, the Commission transmitted a proposed amendment to the Joint Committee which was intended "to provide clarification of the Commission's authority in dealing with the states in carrying out the Commission's regulatory functions, and, more importantly, to define the role of the states in regulating in those areas of radiation, health and safety protection regarding which Congress has delegated responsibilities to the Commission." [271] This amendment would authorize the AEC "to cooperate with any State or group of States in carrying out the Commission's responsibilities for protecting the health and safety of the public from radiation hazards incident to the processing and utilization of source, byproduct, and special nuclear material." It also provided that:

> Nothing in this Act shall be deemed to prevent the States from adopting, inspecting against, and enforcing standards, not in conflict with those adopted by the Commission, for protecting the health and safety of the public from radiation hazards incident to the processing and utilization of source, byproduct,

[268] H.R. 8676, 84th Cong., 2d Sess. (1956).

[269] S. 4298, 84th Cong., 2d Sess. (1956).

[270] AEC, Twenty-first Semi-Annual Report 128-129 (1957).

[271] Letter dated June 1957 (exact date not known) to Rep. Carl T. Durham, Chairman of the Joint Committee on Atomic Energy, from Chairman Lewis Strauss of the Atomic Energy Commission. The letter was accompanied by a copy of the Commission's "Proposed Amendment to the Atomic Energy Act of 1954, Section 274 Cooperation with the States," and an "Analysis" of the proposed amendment.

> and special nuclear material, *Provided,* that this subsection shall not be deemed to authorize any State to exercise licensing responsibilities concerning those aspects of activities with regard to which the Commission has licensing responsibilities, and *Provided further,* that State radiation standards shall not apply to facilities operated by the Government or facilities operated under contract with and for the account of the Government.[272]

An analysis, which accompanied the proposed amendment, pointed out that:

> By "not in conflict with," we mean that the states cannot relieve anyone from compliance with the Commission's radiation standards, but could impose, if they so chose, more restrictive standards.[273]

To this was appended the pious hope that the states would consult with the AEC before imposing more restrictive standards.

Inasmuch as Congress has not acted on any of these proposed amendments, it may be claimed that pre-emptive effect was intended in the 1954 act and, furthermore, that the inaction indicates that Congress is disinclined to change the situation. On the other hand, it may be claimed that the inaction suggests that no change is necessary, since the 1954 act was not intended to have pre-emptive effect in the first place. Legally, however, the use of either conclusion is not justified because congressional intent should be determined as of the time of enactment of the particular legislation. No more can be claimed for these unsuccessful amendments and congressional inaction than that they may suggest present intent which may be quite different from original intent.[274]

The failure of these amendments to obtain congressional approval, however, does occasion the necessity for a fairly extended study of the pre-emption problem under the 1954 act. Apparently, Congress desires to evaluate more completely state attitudes and programs and the extent of the integration with the health and safety regulations of the AEC

[272] *Id.*, §274(b).

[273] *Id.*, "Analysis" at 2.

[274] Evidence of a failure by Congress to adopt amendments would seem to lack probative value. Moreover, to one concerned with the theory of interpretation, it seems completely unjustified to use such evidence as any indication of the earlier legislative intent and certainly silence is not the way to comply with constitutional methods of passing amendatory laws. See the related suggestion by Justice Rutledge in Cleveland v. United States, 329 U.S. 14, 67 S. Ct. 13 (1946). It is recognized, of course, that use has occasionally been made of such material by the court.

before acting definitively. Meanwhile the states and Commission licensees are faced with uncertainties and must seek guidance from the decisions of the Supreme Court involving the most nearly similar circumstances to determine the implied permissible limits of state regulation. In any event, none of the proposed amendments seems a satisfactory solution, and it is to be hoped that Congress will not take action on the pre-emption problem without considering the many problems and policy questions that necessarily are involved.[275]

b. Implied Pre-emption and State Regulation

Absence of express manifestation of congressional intent does not conclude the matter of federal pre-emption. In numerous situations, where Congress has undertaken to regulate in areas with which the states also are concerned, the Supreme Court has found or, if the reader prefers, has supplied an implied pre-emptive intent. In these situations, however, the court seldom finds complete federal pre-emption. The question of whether there has been implied pre-emption in a general area of regulation simply does not lend itself to categorical yes or no answers. The court has shown itself to be quite painstaking in applying a rather complex rationale to determine whether or not Congress impliedly intended to preclude the *particular* state action under consideration. The purpose of this study is to determine what specific types of state health and safety regulation of radiation hazards and AEC licensees will be allowed under the 1954 act if it is not amended in any of the ways discussed above. In the light of many analogous cases, it appears that, while definite limits may be anticipated, some types of state action will be permitted.

(1) Analogous Cases Involving the Implied Pre-emption Question

For purposes of illustrating the doctrine and methods developed by the Supreme Court to establish pre-emption where congressional intent is buried in the interstices of the statutory language, the following areas of analogy have been chosen: (1) labor-management relations and unfair labor practices in industries affecting interstate commerce; (2) health and safety regulation in connection with vehicles and products in interstate commerce; and (3) several miscellaneous cases having

[275] See Cavers, "Legislative Readjustments in Federal and State Regulatory Powers over Atomic Energy," 46 Cal. L. Rev. 22 (1958), for a critical discussion of the proposals for amendment.

pertinency to the problem. In each of these areas the Supreme Court has found exclusive federal control of some matters and allowed, or indicated that it would allow, concurrent exercise of state police powers with respect to others.

(a) Labor Cases

Over the last twenty years more cases involving the question of implied federal pre-emption have arisen in the field of labor relations and unfair labor practices than in any other. To avoid the industrial strife which was interfering with the normal flow of commerce as well as jeopardizing the "public health, safety, and interest" Congress enacted the National Labor Relations (or Wagner) Act in 1935.[276] The declared purpose of the Wagner Act was to encourage the practice and procedure of collective bargaining and to protect the full freedom of workers to associate, organize, and designate representatives of their own choosing. The act gave the National Labor Relations Board the power to prevent an employer from engaging in certain unfair labor practices, as that term was defined in the act, and the power to promulgate rules and regulations necessary to carry out the provisions of the act. In 1947 Congress enacted the Labor Management Relations (or Taft-Hartley) Act, which re-enacted most of the earlier law and gave to the NLRB additional powers to prevent labor organizations and their agents from committing enumerated unfair labor practices.[277]

Several statements of the Supreme Court found in cases involving federal labor legislation may quite possibly be applicable in solving the problem of congressional intent in adopting the Atomic Energy Act. First, the court has said that the subject matter of federal labor legislation "is not so 'intimately blended and intertwined with responsibilities of the national government' that its nature alone raises an inference of exclusion." [278] This remark seems equally applicable to the non-military aspects of atomic energy. Second, regarding express congressional intent, the Supreme Court has said:

> Congress has not seen fit to lay down even the most general of guides to construction of the [National Labor Relations] Act, as it sometimes does, by saying that its regulation either shall or shall not exclude state action.[279]

[276] 29 U.S.C. §§151 *et seq.* (1946).

[277] 29 U.S.C.A. §§141 *et seq.*

[278] Bethlehem Steel Co. v. State Board, 330 U.S. 767, 772, 67 S. Ct. 1026 (1947), citing Hines v. Davidowitz, 312 U.S. 52, 66, 61 S. Ct. 399 (1941), as authority for the proposition.

[279] Bethlehem Steel Co. v. State Board, *supra* note 278 at 771.

The same may well be said of Congress in enacting the original Atomic Energy Act of 1946 and the subsequent 1954 act. Third, when confronted by this situation, the Supreme Court declared:

> It long has been the rule that exclusion of state action may be implied from the nature of the legislation and the subject matter although express declaration of such result is wanting.[280]

Thus should the Supreme Court be confronted with a case in which an AEC licensee is charged with violating a state health and safety law, the labor cases may be examined as furnishing precedents.

Several distinctions between labor-management regulation and radiation hazard control require comment before the cases are examined. Unlike the federal program of radiation health and safety, which filled a regulatory vacuum and anticipated both the events it was designed to prevent and the growth of activities subject to its standards, the federal program of labor-management regulation entered a field of national chaos, characterized by conflicting and anachronistic state laws and consequent labor unrest. It may be argued that the historical background of labor legislation gives greater force to an assertion of pre-emption than do the circumstances out of which the AEC program arose. While it appears that federal labor legislation became necessary, in large part, because of state laws, it was partly because of the absence of effective controls and the scarcity of qualified personnel at the state level that the federal radiation health and safety program became necessary. Perhaps the Supreme Court will find it more difficult to ascribe pre-emptive effect to an act of Congress, where, at the time of passage, there were no state regulations in competition or conflict with congressional policies.[281] Contrawise, it may be argued that, since governmental action was urgently needed and the states had taken no action with respect to radiation hazards arising out of atomic energy activities prior to the 1954 act, Congress felt compelled to pre-empt the field in its entirety.

As a further cautionary note, it should be pointed out that the type and purpose of federal regulation of these two subjects are not the same. Federal labor legislation and the cases arising under it are concerned primarily with rights and obligations of employers and employees.[282] Only occasionally does public health and safety become a central issue in this area; when it does, as is pointed out below, the court is inclined to treat state action with exceptional solicitude. In the

[280] *Id.* at 772.

[281] See California v. Zook, 336 U.S. 725, 736, 69 S. Ct. 841 (1949).

protection and enforcement of economic rights and obligations, it may be argued that the national interests in uniformity and consistency demand centralized administration. Where the public health and safety are in jeopardy, however, it may be argued that the national interests in uniformity and consistency are subordinate to the local interest in swift and effective action to eliminate the hazard. Furthermore, labor disputes and unfair labor practices have a way of advertising themselves which assists centralized administration, whereas radiation hazards are far from obvious to either the persons who are causing them or those who are injured. To exclude the states entirely from seeking out and eliminating these hazards places a heavy burden upon the AEC, a burden which scarcely seems justified by the advantages of exclusive federal control, absent affirmative showing of state incompetence and obstruction. It must be recognized to the contrary, however, that in the labor field Congress was not really concerned with physical health and safety, while in the Atomic Energy Act of 1954 it was very much concerned with this very matter. This difference is discussed below.

(i) Labor Cases Finding Federal Pre-emption

The fundamental concern of the Supreme Court in considering state action within the labor-management relations regulation area is with conflict—conflict with federal standards, whether established by Congress or the NLRB, and conflict with their application to a particular labor dispute. To illustrate, in *Hill* v. *Florida* [283] a state law provided that business agents of labor unions must be licensed, and no person was eligible for a license who had not been a citizen of the United States for more than ten years, who had been convicted of a felony, or who was not a person of good moral character. Violation of the statute was deemed a misdemeanor. The Florida Attorney General invoked the statute against Hill and the union he represented since Hill had not applied for a license. In reversing the judgment of the state court against Hill and the union, the Supreme Court stated:

> The declared purpose of the Wagner Act . . . is to encourage collective bargaining, and to protect the "full freedom" of workers in the selection of bargaining representatives of their own choice. . . . Congress attached no conditions whatsoever to their freedom of choice in this respect. Their own best judgment, not that of someone else, was to be their guide. "Full freedom" to choose an agent means freedom to pass upon that agent's qualifications.[284]

[283] 325 U.S. 538, 65 S. Ct. 1373 (1945).
[284] *Id.* at 541.

Accordingly, since the state act imposed on the "full freedom" of employees to bargain collectively limitations which were in excess of those Congress thought necessary, the state law was found to be an obstacle to the accomplishment and execution of the full purposes and objectives of Congress. The court also pointed out that:

> . . . Congress did not intend to subject the "full freedom" of employees to the eroding process of "varied and perhaps conflicting provisions of state enactments." [285]

The court found the "intent" of Congress not from any language dealing with pre-emption but from this very general policy of freedom to choose.

A conflict between state and federal law was held to be fatal to a Michigan statute in *Automobile Workers* v. *O'Brien.*[286] Here the union struck against the Chrysler Corporation without conforming with pre-strike procedures imposed by state law. The strike, which was called to obtain higher wages, was conducted peacefully. Michigan law, in effect, delayed the time when a strike could be called beyond the time specified by the Taft-Hartley Act and, unlike the federal law, required majority authorization for any strike. These conflicts, plus the fact that the matter clearly was within the jurisdiction of the NLRB and was covered by federal law, caused the court to decide that Congress had occupied the field and closed it to this type of state regulation although the federal act said nothing about its provisions excluding state action.

Where Congress has provided certain procedures to deal with particular emergency situations, state attempts to deal with local emergencies for which no special provision is made by federal law may also be held to conflict with federal policy. In *Bus Employees* v. *Wisconsin Board*[287] the validity of the Wisconsin Public Utility Anti-Strike Law, which prohibited any group of public utility employees from engaging in a strike that would interrupt essential public services, was at issue. Although the Taft-Hartley Act contains special procedures to deal with strikes that might create national emergencies, it does not prohibit strikes by public utility employees for higher wages and says nothing about local emergencies. The Wisconsin statute, however, was held to be in conflict with federal labor legislation.

The general principle illustrated by these three labor cases is that a

[285] *Id.* at 542.
[286] 339 U.S. 454, 70 S. Ct. 781 (1950).
[287] 340 U.S. 383, 71 S. Ct. 359 (1951).

state may not act where its action may constitute an obstacle to the accomplishment and execution of the full purposes and objectives of Congress as stated or implied in a statute, thus conflicting with federal policy. Precise opposition of the state act to the federal act or complete frustration of the purposes and objectives of Congress is not required. The mere fact that it is possible for the person subject to both federal and state controls to comply with the requirements of both does not remove the implication of pre-emptive congressional intent. Apparently state action that conflicts with federal policy will not be allowed even though the state law is not concerned with the same aspects of the regulated subject or even though Congress has not acted to occupy the entire field subject to regulation. The extent to which Congress has occupied a field of regulation, or authorized a federal agency to do so, is significant, however, in deciding if there is implied pre-emption, as we shall see in later cases.

A second group of labor cases illustrates how far the Supreme Court will go to find a conflict and therefore pre-emption where the state acts within the quasi-legislative jurisdiction of a federal agency.

In *Bethlehem Steel Co.* v. *State Board*[288] the New York Labor Relations Board had certified a union as bargaining agent for the company's foremen at a time when the policy of the NLRB was to refuse certification of foremen's unions (even though it had the power to certify them).[289] The NLRB had taken the position that to permit them would obstruct the purposes of the Wagner Act. The union had not petitioned the NLRB for certification as a bargaining agent. The court held the state action invalid since the federal statute was general and inclusive on the subject of union certification and, pursuant to its delegated powers, the NLRB had promulgated comprehensive regulations effectively governing the subject. The failure of the NLRB to exercise affirmatively their full authority and certify foremen's unions was said to take on "the character of a ruling that no such regulation is appropriate or approved pursuant to the policy of the statute."[290] The matter was within the rule-making jurisdiction of the NLRB. Thus the state could not act to authorize bargaining agents which the NLRB could, but did not, recognize.

The *Bethlehem* rule is applicable even where the NLRB has not established a standard at all if the choice of standards is left to its dis-

[290] *Supra* note 278 at 774.

cretion. In *La Crosse Telephone Corp.* v. *Wisconsin Board* [291] the state law, under which the Wisconsin board acted, provided that a majority of the employees in a single craft, division, department, or plant of an employer might elect to constitute that group a separate bargaining unit. Since the Wagner Act left the matter of bargaining units to the discretion of the NLRB, enforcement of the state law was not allowed even though the NLRB had not authorized different bargaining units for the company's employees. The court decided that Congress intended that the NLRB have exclusive authority to determine the nature of bargaining units.

A third group of labor cases illustrates another refinement of the bases of federal pre-emption and demonstrates the Supreme Court's reluctance to allow the states to act within the quasi-judicial jurisdiction of a federal agency. The NLRB has been authorized to conduct investigations and hearings to determine whether certain "unfair labor practices" have been committed and to issue appropriate orders. Furthermore, the board may petition any United States Court of Appeals for the enforcement of its order or for an appropriate temporary relief or restraining order. As a result of the pre-emptive effect found to be implicit in this grant of power in *Garner* v. *Teamsters Union,*[292] a state court was not authorized to issue an injunction, on the petition of an interstate trucking firm, against a union attempting to coerce the petitioner into compelling or influencing his employees to join the union. The petitioner's grievance was clearly within the quasi-judicial jurisdiction of the NLRB under the Taft-Hartley Act and, therefore, was impliedly outside state power. Similarly, a strike by a union as a result of a jurisdictional dispute with another union over competing work claims for their respective members could not be enjoined by a state court as a "restraint of trade" in *Weber* v. *Anheuser-Busch, Inc.*[293] because the activity amounted to an unfair labor practice under the Taft-Hartley Act and jurisdiction over such matters had been, though only by implication, pre-empted by the authority vested in the NLRB. The *Weber* case controlled in *Teamsters Union* v. *N.Y., N.H. & H.R. Co.*[294] where respondent railroad brought an action in a state court to enjoin the union from interfering with its "piggy back" truck-trailer operations by persuading employees of trucking companies to refrain from

[291] 336 U.S. 18, 69 S. Ct. 379 (1949).
[292] 346 U.S. 485, 74 S. Ct. 161 (1953).
[293] 348 U.S. 468, 75 S. Ct. 480 (1955).
[294] 350 U.S. 155, 76 S. Ct. 227 (1956).

delivering loaded trailers to respondent's railroad yards. While respondent's own labor relations were not subject to the provisions of the Taft-Hartley Act, the case was held to be within the exclusive jurisdiction of the NLRB since the union's activities might be an unfair labor practice or protected by the act. In either case, it was for the NLRB, and not the state, to decide. Each of these cases was concerned with possible conflict—that is, the possibility that the state would enjoin a union act with respect to which the NLRB might take a different view, even though it had not done so yet.

The recent case of *Guss* v. *Utah Labor Board* [295] shows the lengths to which the Supreme Court will go in finding pre-emption where a general and inclusive statute grants quasi-judicial power to a federal agency to decide specific cases. In that case the employer was doing interstate business but in an amount less than the jurisdictional minimum required by the rules of the NLRB.[296] The union filed a complaint with the NLRB's regional director, alleging an unfair labor practice covered by federal law. Jurisdiction was declined on the ground that the employer's operations were predominantly local in character. The union thereupon filed the same complaint with the Utah board which granted relief. Section 10(a) of the Taft-Hartley Act, which authorizes the NLRB "to prevent any person from engaging in any unfair labor practice . . . affecting commerce," provides:

> . . . [T]he Board is empowered by agreement with any agency of any State or Territory to cede to such agency jurisdiction over any cases in any industry (other than mining, manufacturing, communications, and transportation except where predominantly local in character) even though such cases may involve labor disputes affecting commerce, unless the provision of the State or Territorial statute applicable to the determination of such cases by such agency is inconsistent with the corresponding provision of this subchapter or has received a construction inconsistent therewith.[297]

Noting that the use of the term "affecting commerce" indicated that "Congress meant to reach the full extent of its power under the com-

[295] 353 U.S. 1, 77 S. Ct. 598 (1957).

[296] Budgetary limitations and other considerations have prevented the NLRB from exercising jurisdiction over all cases in which interstate commerce is affected. In 1950 the Board published standards, largely in terms of yearly dollar amounts of interstate inflow and outflow, that had to be met before jurisdiction would be assumed (26 L.R.R.M. 50). These jurisdictional standards were revised upwards in 1954 (34 L.R.R.M. 75).

[297] §10a, 29 U.S.C.A. §160(a).

merce clause," [298] the Supreme Court emphasized the following uncontroverted facts: (1) the employer's business affected commerce within the meaning of the act, and the NLRB had jurisdiction even though it had declined the exercise of its authority; (2) the act expressly covered the alleged unfair labor practice; and (3) the NLRB had not ceded jurisdiction over the matter to the Utah Labor Board in the manner authorized by Section 10(a). In the *Bethlehem Steel* case the separate opinion of Justice Frankfurter had pointed out that the effect of the majority opinion was to deny that the NLRB could cede jurisdiction to the states under the Wagner Act to decide labor disputes. Since that decision immediately preceded passage of the Taft-Hartley Act, the court concluded that Congress must have known of this limitation. Therefore, it also concluded that Section 10(a) provided the exclusive means by which the states could be given jurisdiction over labor cases falling within the quasi-judicial power of the NLRB. While regretting the creation of this jurisdictional "no-man's-land," the court nevertheless set aside the action of the Utah board.

In *Meat Cutters* v. *Fairlawn Meats* [299] and *San Diego Building Trades Council* v. *Garmon* [300] the same result was reached in similar fact situations. In the *Fairlawn* case, however, the court refrained from deciding whether a state might possibly frame and enforce an injunction aimed narrowly at a trespass by union pickets on land owned or leased by the employer. The Ohio court had based its injunction on the erroneous premise that it had the power to reach the union's conduct in its entirety, but this power was impliedly precluded by the provisions of the federal statute.

From these three cases we might fairly say that, where a general and inclusive federal statute delegates quasi-judicial power to a federal agency and contains a provision which specifies the manner in which the states can be given jurisdiction over matters falling within that of the federal agency, the state may not act unless jurisdiction is expressly ceded to it, even though the federal agency decides not to exercise its full authority.

(ii) Labor Cases Finding No Federal Preemption

Assuming that a state act affecting interstate labor matters is authorized in the absence of any federal regulation, the first determination

[298] *Supra* note 295 at 3.
[299] 353 U.S. 20, 77 S. Ct. 604 (1957).
[300] 353 U.S. 26, 77 S. Ct. 607 (1957).

made by the Supreme Court, in a dispute in which pre-emption is asserted, is whether or not the specific subject of the state action is regulated under federal law. To illustrate, *in Allen-Bradley Local* v. *Wisconsin Board* [301] the Wisconsin board, pursuant to comprehensive state labor legislation, had ordered the union to cease and desist from mass picketing, threatening employees desiring to work, obstructing entrance to and egress from the employer's factory, and picketing the homes of non-striking employees. The Supreme Court refused to invalidate the state action even though many provisions of the Wisconsin labor code were in conflict with the Wagner Act; it looked at only those provisions of the state law that authorized the specific order given. Starting with the initial premise that an "intention of Congress to exclude States from exerting their police power must be clearly manifested," [302] the court determined that: (1) the Wagner Act did not delegate to the NLRB the authority to regulate the particular kind of union conduct in question; (2) the federal scheme of control was not so pervasive as to suggest exclusion of supplemental state regulation; and (2) the board's order did not affect the status of employees, cause forfeiture of collective bargaining rights, or impair other rights protected by the Wagner Act. While the objectives of the union's actions were protected by federal law, its methods were neither protected nor prohibited. Since union violence could scarcely be deemed essential to the assertion of collective bargaining rights, the court concluded that it could be prohibited by state action.

An attitude of congressional indifference, rather than pre-emptive intent, was found in *International Union, United Automobile Workers* v. *Wisconsin Board.*[303] During a period of deadlock in collective bargaining negotiation, the Wisconsin board asserted the power under state law to order the union to cease and desist from its tactic of calling union meetings at irregular times during working hours without advance notice to the employer or informing the employer of the demands or concessions these tactics were meant to obtain. The court pointed out that neither the Wagner Act nor the Taft-Hartley Act permitted or forbade this type of harassing union conduct. The only union methods or tactics made illegal by the Taft-Hartley Act were those which restrained or coerced employees or employers in the exercise of rights protected by the act. Non-coercive union tactics could not be con-

[301] 315 U.S. 740, 62 S. Ct. 820 (1942).
[302] *Id.* at 749.
[303] 336 U.S. 245, 69 S. Ct. 516 (1949).

trolled by the NLRB. Policing of such conduct, therefore, remained with the states.

These two cases illustrate the general proposition that the state may act where the federal statute leaves unregulated some aspects of the general field. The absence of specific federal controls of the particular subject of state action is said to imply a policy of congressional indifference to the state action even though Congress has brought other subjects in the general field under federal control. Of course, this proposition may not be cited in support of a state action which conflicts, directly or indirectly, actually or potentially, with the federal policies reflected in federal statutes or administrative regulations in the same field.

An exception to the rule of construction applied in the *Garner, Weber,* and *Teamsters Union* cases—that the states may not assert their police powers with respect to matters within the quasi-judicial jurisdiction of a federal agency—is found in *United Automobile, Aircraft & Agricultural Implement Workers* v. *Wisconsin Board.*[304] In this case the union's activities and the Wisconsin board's order were similar to those described in the *Allen-Bradley* decision. Subsequent congressional action, however, had placed a different complexion on the matter, for the Taft-Hartley Act declared it to be "an unfair labor practice for a labor organization or its agents— (1) to restrain or coerce (A) employees in the exercise of the rights guaranteed in section 7." [305] Section 7 protects such rights as that of employees to refrain from joining or assisting a union. Thus, in contrast to the situation in *Allen-Bradley,* "the National Labor Relations Board might have issued an order similar to that of the State Board." [306] It had not done so, however. In holding that Wisconsin, nevertheless, might enjoin violent union conduct, the Supreme Court said:

> As a general matter we have held that a State may not, in the furtherance of its public policy, enjoin conduct "which has been made an 'unfair labor practice' under the federal statutes" . . . But our post-Taft-Hartley opinions have made it clear that this general rule does not take from the States power to prevent mass picketing, violence, and overt threats of violence. The dominant interest of the State in preventing violence and property damage cannot be questioned. It is a matter of genuine local concern. Nor should the fact that a union commits a federal unfair labor practice while engaging in

[304] 351 U.S. 266, 76 S. Ct. 794 (1956).
[305] §8(b), 29 U.S.C.A. §158(b).
[306] *Supra* note 304 at 271.

> violent conduct prevent the States from taking steps to stop the violence. . . .
>
> The States are the natural guardians of the public against violence. It is the local communities that suffer most from the fear and loss occasioned by coercion and destruction. We would not interpret an act of Congress to leave them powerless to avert such emergencies without compelling directions to that effect.[307]

Several facts which may narrow the scope of this exception to the general rule of construction must be mentioned. The old Wagner Act declared the power of the NLRB to prevent the enumerated unfair labor practices to be "exclusive." This term was omitted from the Taft-Hartley Act although the old language, to the effect that the power of the NLRB to prevent unfair labor practices "shall not be affected by any other means of adjustment or prevention that has been or may be established by agreement, law, or otherwise," [308] was retained in the new act. Moreover, Senator Taft had explained to the Senate that state action to prevent threats to public health and safety was not disturbed by the NLRB's authority to control coercive union methods.[309] While these matters were mentioned by the court, the decision appeared to rest primarily upon considerations of the "dominant interest of the State" under the circumstances.

To summarize, even where the federal labor act is general and inclusive and delegates quasi-judicial power to a federal agency to prohibit labor activities which seriously threaten the public health and safety, the state also may act to prevent violent conduct in labor disputes which may cause personal injury or property damage. The court has thus demonstrated a greater reluctance to find implication of federal preemption where matters of public health and safety assume significant proportions. How significant must the threat to public health and safety be? A comparison of the *United Automobile Workers* and *Bus Employees* [310] cases suggests that the threat of damage to person or property must be of immediate and violent nature—that is, a situation calling for quick intervention by officials close to the scene. The public inconvenience, discomfort, and more remote threat to health and safety occasioned by the strike of public utility employees in the *Bus Employees* case did not justify a similar exception.

[307] *Id.* at 274-275.

[309] 93 Cong. Rec. 4437 (May 2, 1947).
[310] *Supra* note 287.

Lest the *United Automobile Workers* case be given greater significance than it may be entitled to, one further thought needs to be mentioned. The federal labor laws are not primarily intended to protect public health and safety. They do so collaterally, of course, but other considerations—principally economic, political, and social—are paramount. This feature may have caused the court to reach the conclusion that Congress did not intend to pre-empt state regulation of matters where the public health and safety are central. Faced with a federal act like the Atomic Energy Act, where health and safety is of central concern to Congress, the court may not feel justified in carving out a similar exception.

A recent labor case, *Automobile Workers* v. *Russell*,[311] helps to explain the criteria of implied pre-emption in this area of federal action. In this case Russell, a non-union electrician, had been prevented from working for a period of five weeks by the striking union. Mass union pickets, by force of numbers and by threats of bodily injury to Russell and of damage to his property, denied him entrance to the employer's plant. The union conduct was clearly an unfair labor practice under the Taft-Hartley Act. Alleging that the union wilfully and maliciously prevented him from working, Russell brought suit in an Alabama court for compensatory damages for his loss of earnings and mental suffering, plus punitive damages. He obtained a judgment in the amount of $10,000, of which roughly $500 was for lost wages. On appeal the union asserted that the jurisdiction of the state court had been preempted by Congress and vested exclusively in the NLRB inasmuch as the union acts complained of were unfair labor practices under the Taft-Hartley Act and Section 10(c) of that act authorized the NLRB to award back pay to employees unable to work as a result of union discrimination suffered by them, if the award effectuated the policies of the act.[312] The Supreme Court affirmed the judgment for Russell, pointing out that Section 10(c) power to order affirmative relief was merely incidental to the primary purpose of Congress to stop and to prevent unfair labor practices. The court reasoned that (1) awards for back pay were purely discretionary and not compulsory, (2) only awards which would "effectuate the policies" of the act were authorized, and (3) Congress had not established a general scheme to award full compensatory damages. In response to the union's assertion that pre-

[311] *Supra* note 282. *Cf.* International Assn. of Machinists v. Gonzales, 356 U.S. 617, 78 S. Ct. 923 (1958).

[312] §10(c), 29 U.S.C.A. §160(c).

emption is implied where there is a possible conflict of federal and state remedies, the court said:

> Our cases which hold that state jurisdiction is pre-empted are distinguishable. In them we have been concerned lest one forum would enjoin, as illegal, conduct which the other forum would find legal, or that state courts would restrict the exercise of rights guaranteed by the Federal Acts.
>
> In the instant case, there would be no "conflict" even if one forum awarded back pay and the other did not. There is nothing inconsistent in holding that an employee may recover lost wages as damages in a tort action under state law, and also holding that the award of such is not necessary to effectuate the purposes of the Federal Act.[313]

Certain features of this case are important in considering its significance. The first of these is the distinction drawn by the court between that which Congress directs and that which it merely authorizes a federal agency to do. Apparently the court is more apt to conclude that pre-emption was not intended as to matters which Congress has only authorized a federal agency to control. This distinction and the reasons for it are illustrated more fully in several of the health and safety regulation cases discussed later. The second feature of this case which is important for our purposes is contained in the first of the above-quoted paragraphs. That statement emphasizes the court's apprehension regarding possible federal-state conflict. Moreover, it specifies the type of conflict—that is, the possibility that the state will prevent that which the federal agency allows, and vice versa. Necessarily, the "unfair labor practices," which the Taft-Hartley Act prohibits, cannot be defined or described with sufficient exactitude and precision to make enforcement of the law an automatic and mechanical process. Except in the extreme case, this is not the sort of matter with respect to which no two tribunals could reasonably differ. The carefully framed conditions in the proviso of Section 10(a), which allows the NLRB to cede jurisdiction over some matters to the states (discussed above in connection with the *Guss* case), reflect congressional realization of, and concern with, this fact. It is not surprising, therefore, to find the Supreme Court declaring the jurisdiction of the NLRB to be exclusive, except under circumstances where state action *obviously* does not conflict with congressional policy or impair administration of federal law. Finally, in the second paragraph quoted above we find a distinction which further illuminates the sort of conflict which implied pre-

[313] *Supra* note 282 at 644-645.

emption seeks to avoid. The court has said, in effect, that there is nothing inconsistent in allowing a state to do what a federal agency may, but need not, do if the policies which each seeks to effectuate are different. The NLRB, in a situation such as that in the *Russell* case, could award back pay if this would effectuate the policies of the Taft-Hartley Act—namely, to inhibit the occurrence of an unfair labor practice. The state act, on the other hand, might have been intended to effectuate any one or more of several policies which had little to do with labor peace: (1) to give compensation for wrongful injury; (2) to discourage and penalize intentional tortfeasors; or (3) to protect persons and property from physical harm.

(iii) Summary of Labor Case Pre-emption Principles

The principles applied by the Supreme Court to find by implication a pre-emptive congressional intent in labor legislation are somewhat elusive. Nevertheless, certain conclusions appear to be justified by the cases. The court's central concern has been with conflict, or the possibility of it, between federal policy and state action. That conflict can be one of statutory substance, in the sense that state and federal statutory policies and standards regarding the same matter are not consistent, or it can be a conflict arising out of the exercise of powers granted to an administrative agency. The conflict need not be head-on, and it is not necessary that the state act be definitely incompatible with already formulated federal standards. The court has said that Congress intends to exclude any state action that creates an obstacle to the accomplishment and execution of the full purposes and objectives of Congress, even when the state law or other action will produce results probably incompatible with federal policy. Where Congress has granted quasi-legislative powers to a federal agency, pre-emption is implied on the theory that Congress does not intend the regulated activities to be burdened by any substantive standards in addition to those which the federal agency is authorized to impose. Moreover, the grant to a federal agency of power to decide particular cases implies that in a situation where enforcement of federal standards by a multitude of state tribunals might well produce inconsistent results, Congress has granted an exclusive power to the agency. The mere fact that Congress has established certain controls in a general field, however, does not raise a presumption of pre-emption as to all state action in the same field. Absent express congressional declaration of complete pre-emption,

where the federal statute leaves unregulated some aspects of its subject, Congress is deemed to have been indifferent to state action in the unregulated phases of the general field if the action does not otherwise conflict with federal policies. Even where the federal act is broad and inclusive and delegates quasi-judicial power over matters which affect public health and safety to the federal agency, the Supreme Court is reluctant to declare the state powerless to avert a local, immediate, and substantial hazard to persons and property in the area. If the state action does not make illegal what is legal under the federal act, or vice versa, and if the state acts in a fashion which is entirely consistent with what the federal agency would do under the circumstances, the court will not always find congressional intent to exclude state action to protect public health and safety.

(b) Health and Safety Regulation Cases

Congress has often invoked its commerce powers to regulate products and vehicles in interstate or foreign commerce in the interest of public health and safety. It has done this for any one or more of several reasons: (1) because the mere existence of the commerce power, though unexercised, severely limited the ability of the states to regulate effectively the matter independently; (2) because independent and uncoordinated state regulation would, or had, produced conditions burdening and frustrating commerce; or (3) because the states had not assumed the responsibility to regulate. To these we might well add another reason which appears to be applicable to federal health and safety regulation of atomic energy activities: (4) because, at the time regulation was deemed necessary, most of the activities were being conducted by the federal government, or its contractors, and most of the governmental experience in radiation health and safety regulation had been acquired by the federal government.

In this area of regulation Congress frequently has neglected to specify what effect its statute is to have upon state regulation of the same or similar matters. As a consequence the Supreme Court has been obliged to determine congressional intent from the nature of the legislative subject, the purposes and objectives of Congress, the language, scope, and structure of the statute, the character, powers, and duties of the federal agency having enforcement responsibilities, and the action (or inaction) of the federal agency. Federal pre-emption, however, is not determined merely from consideration of the federal policy and action; the Supreme

Court also considers the nature and effect of the state action upon the federal scheme of regulation.

The cases involving federal health and safety regulation probably furnish the closest analogy to the problems confronting the states in regulating atomic energy hazards, but one difference which may prove significant should be mentioned. All of these cases involve actual interstate movement of products or vehicles. Consequently, when the state attempts to regulate these products or vehicles it may be close to encroaching upon matters which, in the opinion of the Supreme Court, require uniform national regulation if they are to be regulated at all because differing health and safety standards of the various states will unduly burden the interstate flow of goods. Congress has stated that "the processing and utilization of source, byproduct, and special nuclear material *affect* interstate and foreign commerce," [314] but movement of goods across state lines is not an important factor, except in the shipment of radioactive materials and the atmospheric or hydrologic dispersal of radioactive effluents. While it is not asserted here that Congress lacks the power to pre-empt the regulation of matters which only "affect" commerce (indeed, the Supreme Court has stated in one case that, by using this term, "Congress meant to reach the full extent of its power under the Commerce Clause."),[315] it is possible that local interests in assuring adequate protection may be afforded more significance by the Supreme Court where the subjects of health and safety regulation merely "affect" rather than "move in" interstate commerce.

In the health and safety regulation cases the Supreme Court has revealed a special solicitude for state action. In one case it has said:

> The principle is thoroughly established that the exercise by the State of its police power, which would be valid if not superseded by federal action, is superseded only where the repugnance or conflict is so "direct and positive" that the two acts cannot "be reconciled or consistently stand together." [316]
>
> The application of the principle is strongly fortified where the State exercises its power to protect the lives and health of its people.[317]

(i) Health and Safety Regulation Cases Finding Federal Pre-emption

As in the labor cases, the fundamental concern of the Supreme Court in the health and safety cases is with actual or possible conflict—that is, conflict with health and safety standards specified by Congress or by a federal agency which is directed or authorized to set standards and conflict with the administration of the federal health and safety program. To illustrate, in *Erie R.R. Co.* v. *New York* [318] the defendant railway had been convicted of violating the New York Labor Law which specified that telegraphers employed to space trains were not to be on duty more than eight hours per day. The violation took place on November 1, 1907. Eight months earlier Congress had approved the "Hours of Service" Act which authorized the employment of telegraphers for nine hours, if employed during the day and night, and for thirteen hours when employed only during the day. The maximum hours prescribed by the federal act, however, were not to take effect until March of 1908. In reversing the conviction, the court concluded:

> . . . [T]he "Hours of Service" law of March 4, 1907, is the Judgment of Congress of the extent of the restriction necessary. It admits of no supplement; it is the prescribed measure of what is necessary and sufficient for the public safety and of the cost and burden which the railroad must endure to secure it.[319]

It should be noted that the state law conflicted with the federal statute in two senses: (1) the state standard was to be imposed during the period which Congress had given to the railroads to make necessary adjustments; and (2) the state standard was more strict than that which Congress felt necessary. The court specifically mentioned the first type of conflict, and the quoted statement seems to imply the second.

At the very least, this case stands for the proposition that, where Congress itself specifies a health and safety standard for a matter affecting interstate commerce, the Supreme Court will not allow the states to impose higher standards concerning the same matter, for the congressional act is said to be accompanied by an intention that no greater burden will attend the matter than Congress has deemed necessary. Furthermore, where Congress has provided a period of grace to the

[318] 233 U.S. 671, 34 S. Ct. 756 (1914). See also Northern Pacific Ry. v. Washington, 222 U.S. 370, 32 S. Ct. 160 (1912).

[319] *Id.* at 683.

affected activity, the states may not act to nullify its effect. Had Congress not acted at all with respect to hours of service, the New York law would have been valid, but, Congress having acted, the states will not be allowed to frustrate the accomplishment and execution of its full purposes and objectives. Unanswered by this case is the question of whether a state "hours of service" law, identical in all respects with the federal law, could have been enforced after the federal standards became effective.

Because of the complexities of health and safety regulation, Congress usually directs or authorizes a federal agency to establish health and safety standards and delegates to it the authority to enforce them rather than set up the standards in the statute itself. Here, also, state action may be pre-empted. For example, the Agricultural Appropriation Act of 1917 directed and authorized the Secretary of Agriculture to impose plant quarantines and to prevent or control the interstate shipment of any class of nursery stock or any other class of plants, fruits, vegetables, roots, bulbs, seeds, or plant products capable of carrying any dangerous plant disease or insect infestation whenever he determined such measures were necessary to prevent the spread of a dangerous plant disease or insect infestation. The Secretary was also authorized to issue rules and regulations providing for inspections, disinfection, certification, and the method and manner of delivery of any article capable of carrying plant diseases and insect infestation. Similar powers and duties were given as to importation of the same articles into the United States, and criminal penalties were specified for violations of the provisions of the act or the Secretary's orders and regulations. In *Oregon-Washington Co.* v. *Washington*[820] the federal act was held to preclude an attempt by the Washington Director of Agriculture to establish a quarantine against alfalfa hay and meal from certain areas of Utah, Wyoming, Colorado, Oregon, and Nevada which were infested with the alfalfa weevil. The court said:

> It is impossible to read this [federal] statute and consider its scope without attributing to Congress the intention to take over to the Agricultral Department of the Federal Government the care of horticulture and agriculture of the States, so far as these may be affected injuriously by the transportation in foreign and interstate commerce of anything which by reason of its character can convey disease to and injure trees, plants, or crops. All the sections look to a complete provision for quarantine against importation into the country and quar-

[820] 270 U.S. 87, 46 S. Ct. 279 (1926).

> antine as between the States under the direction and supervision of the Secretary of Agriculture.[321]

In answer to the suggestion that the states might act in the absence of any action by the Secretary of Agriculture, the court replied:

> The obligation to act without respect to the State is put directly upon the Secretary of Agriculture whenever quarantine, in his judgment is necessary. When he does not act, it must be presumed that it is not necessary.[322]

It might be inferred from the first statement quoted that, from the very pervasiveness of the scheme of federal regulation, the Supreme Court was compelled to reach the conclusion that Congress intended to pre-empt regulation of the matters covered by the federal act. In only one of the cases in this discussion (a recent and highly controversial case involving sedition against the federal government),[323] however, has the Supreme Court appeared to pose this as a separate and complete test of pre-emption. It is submitted that the second statement, rather than the pervasiveness of the federal scheme of regulation, contains the principal basis of the decision. The test implicit in that statement is the familiar one of conflict. The Secretary of Agriculture was *directed* to impose a plant quarantine should he determine that such a measure was necessary to prevent the spread of dangerous plant diseases or insect infestations across state lines. His power in this respect was quasi-legislative. If the Secretary did not impose a quarantine, it followed (in the court's opinion at least) that none was necessary, and, if not necessary, it also followed that the state action was in conflict with federal policy. That being the case, the Supreme Court was compelled to conclude that state action of this sort was precluded.

From this case we may fairly conclude that, where a general and all-inclusive federal statute *directs* (not just authorizes) a federal agency to establish health and safety standards, as circumstances require, the Supreme Court will not allow the states to impose different or higher standards concerning matters within the scope of the federal grant of power. Where the federal agency has acted to establish the appropriate standard, a different or higher state standard constitutes an actual conflict; where the federal agency has not acted, any state standard constitutes a possible conflict. Either situation is fatal to the validity of the state act. It may be worth while to mention that, following the *Oregon-*

[321] *Id.* at 99.
[322] *Id.* at 102-103.
[323] Pennsylvania v. Nelson, 350 U.S. 497, 76 S. Ct. 477 (1956).

Washington case, Congress promptly intervened by further amending the federal statute to permit the states to impose quarantines in situations overlooked by the Secretary of Agriculture.[324] Like the earlier *Erie Railroad* decision, this case did not throw any light upon whether the state might have supplemented federal law by making it a state offense to import the specified articles into the state in violation of a quarantine imposed by the Secretary of Agriculture.

Not only may states be precluded from establishing health and safety standards different from those established by a federal agency pursuant to congressional directive, but they also may be prevented from doing so where the federal agency is only authorized, but not obligated, to establish a particular safety standard. For example, in *Penn. R.R. Co.* v. *Public Service Commission*[325] the laws of Pennsylvania forebade the operation of any train consisting of U.S. mail or express cars without a railed platform, thirty inches in width, attached to the rear end of the rear car. The Postmaster General, with congressional authorization, had issued regulations concerning the construction of mail cars when used as the end car. Furthermore, the ICC, pursuant to the authority granted it by the Safety Appliance Act, had issued elaborate regulations pertaining to "Caboose Cars without Platforms." In reversing the order of the state Public Service Commission requiring compliance with the state law, the Supreme Court noted that the specifications and equipment of the railroad's end cars on mail and baggage runs were: (1) matters calling for uniform laws; (2) covered by detailed and comprehensive federal regulations; and (3) in compliance with those federal regulations. While it would have been possible for the railroad to comply with both federal and state regulations, the Supreme Court inferred from the detailed and comprehensive federal regulations that no more was necessary to assure safety than what the federal regulations required. Therefore, the state requirement indirectly conflicted with federal policy.

A similar question was raised in *Napier* v. *Atlantic Coast Line*[326] where the railroads claimed that the federal Boiler Inspection Act, as amended in 1915 and 1924, had occupied the field as to regulation of locomotive equipment used on interstate railways and therefore precluded enforcement of state laws requiring automatic firebox doors and cab curtains during the winter season. Amendments to the Boiler In-

[324] 44 Stat. 250 (1926).
[325] 250 U.S. 566, 40 S. Ct. 36 (1919).
[326] 272 U.S. 605, 47 S. Ct. 207 (1926).

spection Act gave the ICC authority to establish health and safety standards for the entire locomotive and tender. Pursuant to this authority the ICC required a number of safety devices, but automatic firebox doors and cab curtains were not among them. The Supreme Court held the state laws to be unenforceable against the railroad. It was assumed that the state acts were a proper exercise of the police power, that there was no direct conflict between state and federal requirements, and that the interference with commerce was only incidental. Nevertheless, since Congress had authorized the ICC to establish all safety features for interstate locomotives and tenders, and the ICC had exercised that power *extensively,* the court felt compelled to assume that Congress could not have intended the imposition of *additional* state safety requirements.

The feature that distinguishes these two cases from the *Oregon-Washington* decision is that appropriate action was merely authorized in the two railroad cases while it was obligatory in the quarantine case. The implication of pre-emptive intent becomes quite as strong, however, when the authorized federal agency has effectively exercised its power by establishing comprehensive and detailed safety standards. The significance of this distinction will become more readily apparent when we consider subsequent cases where the states have been allowed to establish safety standards within an area where the quasi-legislative authority delegated to a federal agency has not been exercised as to the particular safety matter.

One case which is apt to prove especially troublesome to a state seeking to establish and enforce a radiation health and safety program is *Cloverleaf Butter Co.* v. *Patterson.*[327] Under federal law the production of renovated butter was taxed and regulated by the federal government. This law authorized the Secretary of Agriculture to inspect places of manufacture and storage of both the ingredients (*i.e.,* packing stock butter) and the renovated butter and to confiscate the finished product should it be found unwholesome or deleterious to health. State law conferred upon the Alabama Board of Agriculture and Industries the power to promulgate and enforce rules and regulations in regard to foods and drugs. Under this authority the Alabama commissioner condemned packing stock butter held by petitioners for renovation. Seventy-five per cent of petitioner's packing stock butter came from outside of the state, and ninety per cent of the renovated butter was shipped in interstate commerce. The action was brought to enjoin

[327] 315 U.S. 148, 62 S. Ct. 491 (1941).

enforcement of the state law on the ground of federal pre-emption. In reversing the judgment of the state court and ruling in petitioner's favor, a divided court (5 to 4) pointed out:

> . . . [The federal Act] left the states free to act on the packing stock supplies prior to the time of their delivery into the hands of the manufacturer and to regulate sales of the finished product within their borders. But, once the material was definitely marked for commerce by acquisition of the manufacturer, it passed into the domain of federal control. . . . Confiscation by the state of material in production nullifies federal discretion over ingredients.[328]

The majority opinion also stated:

> Congress hardly intended the intrusion of another authority during the very preparation of a commodity subject to the surveillance and comprehensive specifications of the Department of Agriculture. To uphold the power of the State of Alabama to condemn the material in the factory, while it was under federal observation and while federal enforcement deemed it wholesome, would not only hamper the administration of the federal act but would be inconsistent with its requirements. Whether the sanction used to enforce the regulation is condemnation of the material or the product is not significant. Since there was federal regulation of the materials, there could not be similar state regulation of the same subject.[329]

While the fact was not cited in support of the majority opinion in this case, Justice Frankfurter acknowledged in his dissenting opinion that in proposing this legislation the Department of Agriculture ". . . did ask Congress to make some restrictions upon the authority which had been exercised by the states in regulating the manufacture and sale of butter for the protection of their citizens." [330] It is not unreasonable to assume that this legislative history and the attitude of the Department of Agriculture influenced the decision. Several cases considered later suggest that an intention upon the part of a federal agency to exclude or allow state action may affect the court's decision.

Several other features of this case require comment. There was nothing hazardous, to either the employees or the public generally, in the renovated butter manufacturing process itself. Thus there was little local interest in the safety of the manufacturing process since the prod-

[328] *Id.* at 168.
[329] *Id.* at 169.
[330] *Id.* at 177.

uct was only dangerous when consumed, and, by express limitation, the court's decision did not prevent the state from condemning unwholesome raw materials prior to the time they were acquired by an interstate manufacturer. Moreover, the decision did not prevent the state from regulating the sale of the finished product within the state's borders. It was not necessary, therefore, for the court to hold the state powerless to protect the health and safety of its people. It was only necessary for the court to conclude that the state could not regulate in a manner that might possible conflict with or impair the administration of a comprehensive federal health and safety program.

(ii) Health and Safety Regulation Cases Finding No Federal Pre-emption

A careful study of the decided cases leads one to conclude that the Supreme Court is somewhat reluctant to declare that an act of Congress has pre-emptive effect, particularly where this would leave the states powerless as to health and safety matters where the local concern is great. Thus the fact that the federal government has entered a field of regulation does not alone lead the court to infer a pre-emptive congressional intent as to the entire field of regulation. To illustrate, in *Reid* v. *Colorado* [331] the defendant had been convicted of violating a state law prohibiting any person from bringing or driving cattle or horses into the state, between April 1 and November 1, from any place south of the 36th parallel, unless they had been held at a place north of the parallel for at least ninety days prior to importation or unless the shipper obtained a certificate from the State Veterinary Sanitary Board indicating that the animals were free from all infectious or contagious diseases and had not been exposed to such diseases during the ninety days prior to inspection. The defendant appealed on the ground that the state law was repugnant to the Federal Animal Industry Act of 1884, alleging that the animals had been inspected, found healthy, and certified by an inspector of the Federal Bureau of Animal Industry. Under the federal act the Secretary of Agriculture was authorized: (1) to conduct a study of livestock diseases and methods of suppression; (2) to frame appropriate rules and regulations for *certification* to the states; and (3) to control the export of diseased livestock from ports of the United States. Furthermore, the act made it unlawful to drive or transport in interstate commerce any livestock

[331] 187 U.S. 137, 23 S. Ct. 92 (1902).

known to be affected with any contagious, infectious, or communicable disease. Pointing out that persons transporting livestock in interstate commerce might not know them to be diseased, the court concluded that the state and federal acts did not cover the same ground and, therefore, that there could be no direct conflict between them. Because the federal act also contemplated state action, the state act did not indirectly conflict with federal policy. Apparently, the inspection and certification by the federal officer was gratuitous since the Animal Industry Act did not give to any agency the authority to issue a certificate that could be considered as authorizing transportation of livestock in interstate commerce. The Supreme Court affirmed the conviction, holding that the state was free to take reasonable steps to control importation of diseased livestock and to determine whether disease was present.

In *Savage* v. *Jones* [332] a Minnesota citizen sought to enjoin the enforcement of an Indiana statute regulating the sale, and requiring a statement of the ingredients formula, of concentrated commercial livestock food on the ground that it was repugnant to the Federal Pure Food and Drugs Act of 1906. The federal act dealt with the subject of adultered and misbranded foods, making it unlawful to misrepresent the ingredients of foods, but did not require a disclosure of ingredients. The court concluded that Congress had not occupied the field and that the state law could be imposed without impairing the administration of the federal act.

The subject of diseased cattle arose again in *Mintz* v. *Baldwin* [333] where the plaintiffs, cattle importers, sought to enjoin the enforcement of an order of the New York Commissioner of Agriculture prohibiting the delivery of certain cattle into New York from Wisconsin. The cattle were accompanied by a Wisconsin certificate indicating freedom from Bang's disease, but, as required by New York law, there was nothing to show that the herd from which the cattle came was similarly free from disease. The plaintiff argued that two federal acts had pre-empted the field of cattle importation regulation. The Cattle Contagious Diseases Act of 1903 authorized and directed the Secretary of Agriculture to establish rules and regulations concerning interstate transportation from any place where he had reason to believe livestock diseases existed. Furthermore, the act specified that whenever an inspector of the Bureau of Animal Industry issued a certificate showing

[332] 225 U.S. 501, 32 S. Ct. 715 (1912).
[333] 289 U.S. 346, 53 S. Ct. 611 (1933).

that he had inspected any cattle from a diseased area and found them free of communicable disease, the cattle might be shipped, driven, or transported in interstate commerce without further inspection or the exaction of any fees. The Cattle Contagious Diseases Act of 1905 authorized the Secretary to establish quarantine districts and to control livestock shipments from such areas. Wisconsin had not been quarantined, and the plaintiff's cattle had not been inspected by a federal officer. The Supreme Court held that Baldwin's order did not conflict with the act of 1905 because the shipments were not made from a federally quarantined area. Moreover, that order did not conflict with the act of 1903 because no federal inspection had been made or certificate issued. Applying the principle of construction that specification of exclusive federal actions negatives pre-emption in areas not specified, and finding that federal inspection and certification under the act of 1903 were only exclusive if actually made, the court concluded that this act did not otherwise limit state powers. The *Oregon-Washington* case [334] was distinguished on the grounds that the Plant Quarantine Act involved in that decision covered the whole field and did not, "by specification of the cases in which action under it [should] be exclusive, disclose the intention of Congress that, subject to the limitations defined, state measures [might] be enforced." [335] In reality the scope and coverage of the two Cattle Contagious Diseases Acts seems no less pervasive than was the Plant Quarantine Act in the earlier case; however, the second basis of distinction appears sound. To this we might add that in the earlier case the state officer ordered a complete prohibition against importation of the offending article into the state, whereas in the *Mintz* case the effect of the New York Commissioner's order was not so drastic; the cattle could be brought into the state if both the individual animals and the herd from which they came were certified to be free from Bang's disease. A further basis of distinction is to be found in the acquiescence of the Department of Agriculture to enforcement of state measures to suppress Bang's disease. This fact was mentioned by the court, and suggests that the administrative agency may make the decision to exclude or allow state action, at least in areas where it is authorized, but not directed, to act.

In *Kelly* v. *Washington* [336] the owner of a fleet of motor-driven (non-steam) tugs sought a writ of prohibition against enforcement of a state

[334] *Supra* note 320.
[335] *Supra* note 333 at 352.
[336] *Supra* note 316.

law providing for the inspection and regulation of every vessel operated by machinery but not subject to inspection under federal law. Federal acts and regulations regarding vessels on the navigable waters of the United States were detailed and elaborate, but they did not provide for inspection of the hulls and machinery of motor-driven tugs that did not carry passengers or freight for hire or had a gross tonnage of less than 300 tons. Therefore, it followed that inspection of the hulls and machinery of the plaintiff's vessels by state officials to insure safety and seaworthiness was not in conflict with any express provision of federal law or regulation. On the question of pre-emption by virtue of the negative implication of elaborate, but less than comprehensive, federal laws, the court said:

> It would hardly be asserted that when Congress set up its elaborate regulations as to steam vessels, it deprived the State of the exercise of its protective powers as to vessels not propelled by steam. The fact that the federal regulations were numerous and elaborate does not extend them beyond the boundary they established.[337]

It should be noted that the state officials were merely inspecting hulls and machinery to determine safety and seaworthiness. The state law was not being applied in such a manner as to require the owners of the vessels to build, modify, or operate the vessels according to state specifications and rules. By way of dictum on this matter, the court said:

> If, however, the State goes farther and attempts to impose particular standards as to structure, design, equipment and operation which in the judgment of the authorities may be desirable but pass beyond what is plainly essential to safety and seaworthiness, the state will encounter the principle that such requirements, if imposed at all, must be through the action of Congress which can establish a uniform rule.[338]

From time to time each of these four cases has been cited to support the proposition or inference that, where federal acts leave some matters in a general field unregulated, a policy of federal indifference to state action is indicated, and the state may regulate if its action does not otherwise constitute an obstacle to the accomplishment and execution of the full purposes and objectives of Congress. In each of these cases the court concluded that no conflict was indicated. And, in the *Reid* and *Mintz* cases, the court demonstrated a willingness to place the state

[337] *Id.* at 13.
[338] *Id.* at 15.

action outside of the scope of rather comprehensive schemes of federal regulation.

Other cases also illustrate this willingness of the court to allow state action in areas covered by a general and inclusive federal statute which delegates quasi-legislative authority to a federal agency. In *Welch* v. *New Hampshire* [339] the State Public Service Commissioner had suspended the appellant's state certificate to use state highways. It was shown that in 1937 the appellant violated a state law which forbade the operation of motor vehicle carriers by a driver who had been continuously on duty for more than twelve hours. The Federal Motor Carrier Act of 1935 imposed upon the ICC the duty to regulate interstate common and contract carriers by motor vehicle. To this end the ICC was expressly authorized to establish reasonable standards with respect to qualifications and maximum hours of service of employees and safety of operation and equipment. Pertinent regulations specifying no more than ten hours of continuous duty were promulgated by the ICC in 1937, but the effective date was postponed until January of 1939. The decision in this case, rejecting the appellant's assertion of federal preemption and affirming the action of the state agency, is in striking contrast to *Erie R.R. Co.* v. *New York* [340] which was distinguished. As in the *Erie* case, the violations occurred after enactment of the federal law and promulgation of the federal hour standards but before those standards became effective. Unlike the situation in the *Erie* case, however, those hours standards were not established by Congress in the statute itself but by the ICC. Moreover, the ICC was authorized, but not directed, to establish the standards. The court stated that if the federal act had imposed a duty on the ICC to prescribe qualifications and hours of service the state law would have been pre-empted in 1935. Since it was only authorized to do so, however, the court would not infer that Congress intended to supersede a state safety measure prior to the taking effect of a federal measure found suitable to put in its place. One further distinction should be noted: the state law allowed more hours of continuous operation than did the deferred federal regulation. In the *Erie* case, the circumstances were reversed.

Pursuant to the authority granted to it by the same statute, the ICC promulgated regulations establishing *minimum* qualifications for drivers of motor vehicles, including taxicabs, operating as carriers in interstate and foreign commerce. A San Diego County ordinance required taxi-

[339] 306 U.S. 79, 59 S. Ct. 438 (1939).
[340] *Supra* note 318.

cab drivers to make written application for an operator's permit to the sheriff and to pay a fee of $1.00. Applicants were examined as to their knowledge of the ordinance, the Vehicle Code, traffic regulations, and county geography. The permit could be denied a person of "bad moral character," a person convicted of a crime involving moral turpitude, an unsuccessful examinee, and a person who had violated any provision of the ordinance. In *Buck* v. *California* [341] the court held that the county ordinance could be applied to drivers of cabs making trips between Mexico and points in the county, pointing out that the ordinance did not conflict with any federal law, that the operation of taxicabs is a local business, and that commerce is affected only indirectly. Since the ICC had established only minimum driver qualifications, the court concluded that:

> This does not prevent the state or a subdivision thereof, in the exercise of its police powers, from providing additional specifications as to qualifications, not inconsistent or in conflict with the regulations of the Interstate Commerce Commission. Especially is this true since the regulations of the Commission are only minimum.[342]

In *Terminal Assn.* v. *Trainmen* [343] the Supreme Court sustained the order of the Illinois Commerce Commission requiring the appellant to provide cabooses on all designated runs within the state in order to protect the lives and health of employees. Appellant was a corporation engaged in performing terminal services for a number of railroads in and around East St. Louis. It operated several yards for the sorting, classification, and interchange of cars. Appellant claimed congressional occupation of the field by virtue of the Boiler Inspection Acts, the Safety Appliance Acts, the Interstate Commerce Act, and the Railway Labor Act, in that they authorized the ICC to prescribe requirements as to the use of cabooses in the type of railroad activities being carried on by appellant. Despite this acknowledged authorization, however, the ICC had not established any requirements respecting the use of cabooses on switching and sorting runs. While the ICC could have regulated the matter and certainly had issued comprehensive regulations concerning other railroad activities, neither the general and inclusive power nor the extensive exercise of that power by the ICC implied pre-emptive intent as to local matters of public safety upon which no action had been taken.

[342] *Id.* at 101-102.
[343] 318 U.S. 1, 63 S. Ct. 420 (1943).

On frequent occasions since the statement was made by Holmes in 1915 in the case of *Charleston & Car. R.R.* v. *Varnville Furniture Co.*,[344] the Supreme Court has said that when "Congress has taken the particular subject-matter in hand coincidence [of state law] is as ineffective as opposition." The statement, however, was dictum in that case, since the state law did not coincide with federal law, and it is believed that a careful study of the health and safety cases will bear out the assertion that it has been no less gratuitous when it has been repeated. In *California* v. *Zook*[345] the Supreme Court was presented with a situation in which state and federal law did coincide. A 1947 California statute prohibited the sale or arrangement of any transportation over the public highways of the state if the carrier did not have an ICC permit. The Motor Carrier Act had substantially the same provision; however, until 1942, the ICC had declined to require permits of persons engaged in "casual, occasional, or reciprocal" transportation. In that year the ICC regulations were amended to require "share-the-expense" passenger carriers to obtain a permit. Respondents operated a travel bureau in Los Angeles and admitted selling and arranging transportation to Arizona on a "share-the-expense" basis in vehicles operated by drivers who did not hold ICC permits, but demurred to the criminal complaint on the ground that the law invaded an exclusive congressional domain. In support thereof they invoked the familiar phrase of the *Varnville* decision. A sharply divided court (5 to 4) refused to be persuaded by the "logic" of this argument and upheld the conviction for violation of state law. While state boundaries had been crossed on the trips for which respondents had made arrangements, the court concluded that the state interest was not outweighed by the national interest. The theory that coincidence is as ineffectual as opposition and that state laws aiding enforcement of federal laws are invalid was specifically rejected. The court pointed out that the *Varnville* principle assumes that Congress has taken the particular subject matter in hand to the exclusion of state law. Where the question to be answered by the court is whether Congress has prohibited state action, application of the principle would be unsound. The court said:

> The "coincidence" rationale is only an application of the first principle of conflict with national policy. The phrase itself simply states the familiar rule. If state laws on commerce are identical with those of Congress, the Court may find congres-

[344] 237 U.S. 597, 35 S. Ct. 715 (1915).
[345] *Supra* note 281.

> sional motive to exclude the states. . . . But the fact of identity does not mean the automatic invalidity of state measures. Coincidence is only one factor in a complicated pattern of facts guiding us to congressional intent.[346]

Several factors appeared to be significant to the majority. (1) The state and federal laws did not collide or conflict, and enforcement of the state law would not impair administration of the federal law. To the contrary, the court said:

> It is difficult to believe that the I.C.C. intended to deprive itself of effective aid from local officers experienced in the kind of enforcement necessary to combat this evil—aid of particular importance in view of the I.C.C.'s small staff.[347]

(2) The state law pertained to a matter of great local interest; a traditional subject of state regulation. (3) No conflicting state laws on this subject existed in 1942 when the ICC amended its regulations. The court felt that "it would be startling to discover congressional intention to 'displace' state laws when there were no state laws to displace when Congress acted." [348] This absence of state law demonstrated the purpose "to provide rather than displace local rules—to fill a void rather than nationalize a single rule." [349] (4) The ICC did not express an intention to supersede state laws. The court pointed out that since the ICC's order requiring permits of "share-the-expense" passenger carriers was issued after the court had determined that California could regulate interstate passenger transportation in a similar fashion,[350] it ". . . would expect the federal agency to be specific if it intended to supersede state laws." [351]

It must be recognized that to the state seeking to regulate the activities of AEC licensees in the interest of public health and safety the *Zook* case offers but a slender and tenuous margin of authority. Of the majority group only Justice Black remains on the court in 1958, whereas two of the minority, Justices Douglas and Frankfurter, still sit. It also must be added that the language in the opinion is in rather striking contrast to that of the court in *Pennsylvania* v. *Nelson*,[352] a later case which is discussed (and distinguished) below.

[352] *Supra* note 323.

Through the *Welch, Buck, Terminal Assn.,* and *Zook* cases there appears to run a common thread. In each of them the state had established and enforced a safety standard in an area covered by a general and inclusive federal law which delegated the authority, but did not impose the duty, to regulate the same general area to a federal administrative agency. In each of them federal-state conflict was found to be absent in spite of schemes of federal regulation. On the basis of these four cases we may fairly conclude that the Supreme Court will not find implied congressional intent to exclude state action where a general and inclusive federal statute delegates the power (but does not impose a specific duty) to determine its specific application to a federal agency: (1) if the federal agency has not established a safety standard similar to that which the state is imposing to alleviate a local hazard; (2) if the federal agency has established only minimum safety standards and the local need for additional standards is great; (3) even where extensive, similar, federal regulations have been issued, if the state action relates to what may be considered a separable or distinct segment of the matter which is within the scope of the federal act but which appears to have escaped the attention of the federal agency and is of substantial local interest; and (4) even where federal safety standards have been established, if the state standard is identical and its enforcement will not materially interfere with the administration of the federal act. In every case, of course, the state action must not otherwise conflict with, or stand as an obstacle to, the accomplishment and execution of the full purposes and objectives of Congress. It also is important to note that in several of these cases, in which the federal agency is authorized but not obligated to act, the Supreme Court appears to assume that Congress also authorized the federal agency to determine whether its regulation would be exclusive or not.

(iii) Summary of Health and Safety Case Pre-emption Principles

As in the labor cases, in determining whether Congress intended to exclude state health and safety regulation, the central concern of the Supreme Court is with conflict, or the possibility of it, between federal and state policies and actions. Moreover, in this area there are few substantive rules since the solution is essentially a task of statutory construction. The one clear rule flows from the Supremacy Clause of the Constitution [353] and is manifested in the court's examination of the

[353] U.S. Const., Art. VI, cl. 2.

particular situation for possible conflict. The remaining principles are simply inferences to be drawn from certain factual considerations. Among these considerations are: (1) the pervasiveness of the federal scheme of regulation; (2) the burden on interstate commerce imposed by local regulations as balanced against the local interest in the subject of regulation; (3) whether safety standards are prescribed by Congress in a statute or are to be issued by a federal agency; (4) whether Congress has directed a federal agency to take appropriate action or merely authorized it to do so; (5) the comprehensiveness and effectiveness of federal agency action in the regulatory field generally; (6) whether the federal agency has acted upon the particular subject or, in the event that it has not acted, its reasons for not acting; (7) whether the federal agency, which has been authorized to act by Congress, has indicated that its regulations are to be exclusive; (8) the practical feasibility of exclusive federal control; (9) whether state action preceded or succeeded federal action in the field; (10) whether state safety standards are higher, in addition to, or identical with those imposed by federal law; and (11) whether enforcement of state standards will interfere with administration of federal law.

(c) Other Pre-emption Cases

The question of implied congressional pre-emption also has been considered by the Supreme Court in two cases involving alien regulation and national security and in three cases addressed to the rather narrow problem of the applicability of federal safety standards and licensing procedures for carrying on interstate activity as these affect property or action of a state or a subdivision thereof.

(i) National Security and Alien Regulation Cases

In 1941 the Supreme Court decided the case of *Hines* v. *Davidowitz* [354] where the validity of the Pennsylvania Alien Registration Act of 1939 was challenged. The assertion was made that the Federal Alien Registration Act of 1940 and other federal laws dealing with aliens had pre-empted the field. Under the state act aliens, eighteen years or over, were required to register annually with the Department of Labor and Industry, to carry an alien registration card at all times, to show the card upon demand to any officer of the Department of Police, and to

[354] *Supra* note 278.

exhibit the card when applying for a driver's license or registering a motor vehicle. Discretionary authority to prescribe the information registrants were to supply was given to the department, which was to classify the registrants and furnish a copy of the classification to the Pennsylvania Motor Police. Violations of the state act could be punished by fine or imprisonment, or both. Under the federal act aliens, fourteen years or over, were required to register only once at a local post office. No registration card was issued or required to be carried. The registration and fingerprint records were forwarded to the Department of Justice where the information was kept secret and confidential. It could be made available only to those persons or agencies authorized to receive it by the Commissioner of Immigration and Naturalization, with the approval of the Attorney General. Only wilfull failure to register subjected the alien to criminal penalties. Other federal laws provided a comprehensive program to regulate the admission and deportation of aliens and the means by which they might acquire citizenship. While other issues were raised on the appeal, the case was decided on appellee's contention that "by its adoption of a comprehensive, integrated scheme for regulation of aliens—including its 1940 registration act—Congress [had] precluded state action like that taken by Pennsylvania." [355] The order of the federal district court enjoining enforcement of the state law was affirmed by the Supreme Court.

Two features of this case were pointed out by the court which distinguish it from a case involving the competing interests of the federal and state governments to regulate health and safety matters. Referring to alien control laws, the court said:

> . . . [I]t is also of importance that this legislation deals with the rights, liberties, and personal freedoms of human beings, and is in an entirely different category from state tax statutes or state pure food laws regulating the labels on cans.[356]

Referring to the subject of alien regulation, the court also said:

> . . . [T]he regulation of aliens is so intimately blended and intertwined with responsibilities of the national government that where it acts, and the state also acts on the same subject, "the act of Congress, or the treaty, is supreme; and the law of the State, though enacted in the exercise of powers not controverted, must yield to it." [357]

[355] *Id.* at 61.
[356] *Id.* at 68.
[357] *Id.* at 66.

From the quoted premise it followed that Congress could establish an exclusive system of regulation—not that it had done so merely by acting. The court went on, however, to point out that:

> . . . [W]here the federal government, in the exercise of its superior authority in this field, has enacted a complete scheme of regulation and has therein provided a standard for the registration of aliens, states cannot, inconsistently with the purpose of Congress, conflict or interfere with, curtail or complement, the federal law, or enforce additional or auxiliary regulations.[358]

Thus the court's analysis began with two questions: (1) did Congress establish a standard for the registration of aliens as a part of a complete scheme of alien regulation?; and, (2) did "Pennsylvania's law [stand] as an obstacle to the accomplishment and execution of the full purposes and objectives of Congress?" [359] An examination of the Alien Registration Act of 1940 and the other federal laws mentioned above indicated to the court that Congress had established a uniform system of alien regulation. Congressional history, since repeal of the Alien and Sedition Acts of 1798, revealed a consistent opposition to laws requiring aliens to register annually, to carry identification cards, to exhibit such cards on demand, or to pay a registration fee. Therefore, since the federal act contained a minimum of such requirements, and since those not included had been rejected by Congress from time to time, it followed that the state act was inconsistent with the purposes and objectives of Congress.

In *Pennsylvania* v. *Nelson,*[360] a 1956 case, the respondent, an acknowledged Communist Party member, had been convicted in a state court for violation of the Pennsylvania Sedition Act, in that he knowingly advocated the overthrow of the federal government. Under the state law indictment for sedition could be initiated upon an information made by a private person, and conviction could result in a fine of up to $10,000 or imprisonment up to twenty years or both. Under the Smith Act of 1940, as amended, knowing advocacy of the "duty, necessity, desirability, or propriety of overthrowing or destroying the government of the United States or the government of any State . . . by force or violence," was made a federal crime, punishable by a fine of up to $10,000 or imprisonment up to ten years, or both.[361] A Smith Act

[358] *Ibid.*
[359] *Id.* at 67.
[360] *Supra* note 323.
[361] §1, 18 U.S.C.A. §2385.

indictment could be initiated only by federal officers acting in their official capacity. In addition to the Smith Act Congress had enacted several other laws to meet the Communist conspiracy. The Internal Security Act of 1950 required annual registration and reporting by "Communist-action" and "Communist-front" organizations, and the Communist Control Act of 1954 declared the Communist Party of the United States to be an instrumentality of a conspiracy to overthrow the government of the United States and that its role as an agency of a hostile foreign power rendered its existence a clear, present, and continuing danger to natural security. Knowing members of the Communist Party were made subject to certain provisions and penalties of the Internal Security Act. It should be mentioned that, after his conviction in the state court, Nelson had been indicted, convicted, and sentenced in a federal district court for conspiracy to violate the Smith Act.[362] "The acts proven in the Federal Court to effectuate the alleged conspiracy consisted of practically the same matter as was offered against Nelson in the trial in the State Court."[363] On review the Supreme Court affirmed the decision of the Supreme Court of Pennsylvania, which had reversed the conviction, on the ground that federal law pre-empted the field.

The Supreme Court's analysis of the pre-emption problem in this case is significantly different from that employed in the *Hines* case and other cases discussed above. The court's language appears to establish much more precise and strict criteria of federal pre-emption than had been applied in earlier cases. Before examining these tests of federal pre-emption, however, a word or two is necessary to indicate the limits of the decision. It is to be noted that Nelson was convicted under state law for knowingly advocating the overthrow of the federal government. No evidence was offered to show that he had committed any seditious acts directed against the state or local governments. In view of these facts the Chief Justice in his prefatory remarks carefully pointed out that:

> . . . [The decision in this case does not] limit the right of the State to protect itself at any time against sabotage or attempted violence of all kinds. Nor does it prevent the state from prosecuting where the same act constitutes both a federal offense and a state offense under the police power.[364]

[362] United States v. Mesarosh (Nelson), 116 F. Supp. 345 (1953), *aff'd* 223 F.2d 449 (1955), *cert. granted* 350 U.S. 922, 76 S. Ct. 218 (1955).

[363] Commonwealth v. Nelson, 377 Pa. 58, 71, 104 A.2d 133 (1954).

[364] *Supra* note 323 at 500.

In other words, the holding that the state could not make criminal an act intended to further the overthrow of the federal government when federal law proscribed that act was not intended by the court to mean that the state was prevented from protecting itself from the same act if it was actually directed against the state as well, even though the Smith Act also made it a federal crime to attempt the violent overthrow of state governments.

In the *Nelson* case the court appears to have taken the three factors discussed in the *Hines* case and made separate and self-sufficient tests for pre-emption of each. The court said:

> In this case, we think that each of several tests of supersession is met.
>
> *First,* "the scheme of federal regulation [is] so pervasive as to make reasonable the inference that Congress left no room for the States to supplement it" . . .[365]
>
> *Second,* the federal statutes "touch a field in which the federal interest is so dominant that the federal system [must] be assumed to preclude enforcement of state laws of the same subject" . . .[366]
>
> *Third,* enforcement of state sedition acts presents a serious danger of conflict with the administration of the federal program.[367]

To find the pervasive scheme of federal regulation, upon which an apparently conclusive presumption of pre-emptive congressional intent was based, the court examined the combined scope of the Smith Act, the Internal Security Act of 1950, and the Communist Control Act of 1954. Apparently, where federal laws are *in pari materia,* the Supreme Court may find a pre-emptive effect in the earlier law by virtue of later enactments establishing regulation in the general field if the consecutive increments add up to "pervasiveness." Having found in these three federal statutes ". . . a congressional plan which [made] it reasonable to determine that no room [had] been left for the States to supplement it," [368] the court quoted the familiar phrase of the *Varnville* case to conclude that coincidence was as ineffective as opposition. On its facts this case does not differ from others in which federal pre-emption has been found for the court did find conflict with federal law or impairment of its administration. It does appear to depart from the earlier cases, however, in the conclusively pre-emptive effect which the

[365] *Id.* at 502.
[366] *Id.* at 504.
[367] *Id.* at 505.
[368] *Id.* at 504.

court assigns to pervasiveness of the federal scheme alone. While the congressional plan considered in this case is no more pervasive than that established by the Atomic Energy Act of 1954, it likewise is no more pervasive than the system of laws under which the NLRB or the ICC operate. It is difficult to believe, therefore, that the court, in a situation where its second and third tests are not met, would prohibit state action simply because Congress has been very active in the field.

As authority for the second test applied in the *Nelson* case the court cited *Hines* v. *Davidowitz*. In that case, however, the dominant national interest in the subject of federal regulation was emphasized to support the proposition that the states could not regulate the subject inconsistently with the purposes and objectives of Congress. The mere fact that the federal interest was dominant did not inevitably lead to a conclusion of pre-emption, absent conflict. In any event, the very terms of this test limit its application to matters affecting national sovereignty or, at the least, to matters which require uniform national standards. To modify the court's own phrase, it would be difficult to imagine the court saying, "Congress having thus treated . . . [the radiation hazard] as a matter of vital national concern, it is in no sense a local enforcement problem." [369]

In the third test applied by the court in the *Nelson* case there is found the one clear case for implied federal pre-emption—that based on actual or possible conflict. On the facts of this case there was a serious danger of conflict between the enforcement of the state sedition act and the administration of the federal program. In 1939 the federal government had asked local authorities not to intervene in matters of national security and to turn over information regarding subversive activities immediately and unevaluated. It was recognized that the threat of subversion must be met on a coordinated, nationwide basis and not as isolated incidents within the states. For purposes of broader strategy the federal government might not want to prosecute certain individuals in the hope of catching a larger group spread over a number of states. The laws of forty-two states on this subject were examined, and some of them were found to be vague and without fundamental safeguards. Moreover, the Pennsylvania statute was said to present a peculiar danger of interference in that it allowed initiation of indictment on the information of a private person, thereby presenting the opportunity for the indulgence of personal spite and hatred. The court concluded that Congress, which had provided other means for the initiation of an indictment, could not have intended the defense of the nation to be a private undertaking.

[369] *Id.* at 505.

It is difficult to ascertain the full import of the *Nelson* decision for the future, and it has been severely criticized by the Senate Judiciary Committee.[870] If the court intends to apply the "pervasive federal scheme" test of pre-emption in the manner indicated by Chief Justice Warren's language, little remains to the states in a large number of regulatory areas, including health and safety regulation of atomic energy activities. In view of the limitations recognized by the court in *Nelson* and the enormous difficulties which would attend such a result, however, it seems unlikely that the court will apply such a deceivingly simple rule of construction where the issue is almost always very complex without a showing of actual or possible conflict between federal and state law.

(ii) Vehicle Weight Regulation Cases

The last three cases to be considered are treated separately from the health and safety regulation cases because, while the federal acts or standards concerned health and safety, the state laws were concerned primarily with the conservation of state highways. In *South Carolina Highway Dept.* v. *Barnwell Bros.*[871] the Supreme Court held that, in the absence of national legislation covering the subject in its relation to interstate commerce, a state might adopt regulations limiting the weight and width of vehicles that used its highways in order to conserve them and promote safety thereon if those regulations did not discriminate against interstate motor carriers. No question of federal pre-emption as a result of the Federal Motor Carrier Act of 1935 was raised, but in *Maurer* v. *Hamilton*[872] the interstate motor carrier appealed on the ground that the act impliedly pre-empted regulation of these matters by delegating such power to the ICC. For purposes of this study the case is chiefly interesting for the light it casts upon the question of whether or not Congress constitutionally can pre-empt regulation of a matter where the state has a proprietary interest and the effect of federal action is to deny to the state the power to conserve its

[870] The Nelson decision has inspired a number of bills in Congress which seek to disavow the congressional intent ascribed by the Supreme Court in connection with the Smith Act. Furthermore, many of these proposals would go so far as to prohibit the court from finding implied pre-emptive effect in any federal legislation (past, present, or future) unless such a result is expressly declared by Congress. At the urging of the Justice Department the Senate Judiciary Committee has been persuaded to omit the general pre-emption proposal. N.Y. Times, April 29, 1958, p. 1, col. 3.

[871] 303 U.S. 177, 58 S. Ct. 510 (1938).

[872] 309 U.S. 598, 60 S. Ct. 726 (1940).

property by such regulations as it feels to be necessary. Unfortunately for our purposes the court avoided answering this question by finding that Congress had not intended to pre-empt although it did acknowledge the existence of the problem. One of the reasons for concluding that pre-emption was not intended, however, was that in testifying at the hearing on the act before the Senate Committee on Interstate Commerce, an official had expressed the ICC's doubts as to the power of Congress to authorize it to establish a minimum weight standard, below which the states could not go, in view of the states' ownership of highways and their interests in conserving them.

In *Castle* v. *Hayes Freight Lines*[373] a somewhat different question was presented to the court. The issue was whether Ilinois might bar an interstate motor carrier from using state roads for a specified time as punishment for repeated violations of state highway weight regulations. The respondent held a certificate of convenience and necessity issued by the ICC under authority of the Motor Carrier Act. While it had been determined earlier by the court that a state's regulation of weights and distribution of loads carried on interstate trucks did not conflict with the federal act, it was decided in the *Castle* case that no power remained in the states to determine what carriers could or could not operate in interstate commerce. The Motor Carrier Act authorized the ICC to revoke, suspend, or modify a certificate of convenience and necessity, but only after a hearing and finding that the carrier had willfully failed to comply with the provisions of the act or regulations promulgated under it. Presumably, the ICC could also do this for repeated violations of state laws. "Under these circumstances," the court said, "it would be odd if a state could take action amounting to a suspension or revocation of an interstate carrier's commission-granted right to operate."[374] In response to the claim that without the power of suspension the state was without appropriate remedies to enforce its laws, the court said that the conventional forms of punishment appeared adequate. Furthermore, the state might petition the ICC for appropriate action regarding the carrier's right to operate.

c. The Nature and Scope of the Federal Health and Safety Program

The cases examined above make it clear that, in considering the pre-emptive effect of federal legislation, the Supreme Court looks to the

[373] 348 U.S. 61, 75 S. Ct. 191 (1954).
[374] *Id.* at 64.

purpose, nature, and scope of federal regulation to determine if there is any room left for state action and, if so, whether the state action is within the limits indicated. It is necessary first, therefore, to consider briefly the salient features of the radiation health and safety provisions of the 1954 act and the regulatory scheme adopted pursuant to them.

In creating the AEC, Congress has established a federal agency with broad administrative, quasi-judicial, and quasi-legislative powers, among others, to promote, implement, and control the development and utilization of atomic energy for peaceful purposes to the maximum extent consistent with public health and safety. Congress obviously felt that, under the circumstances, federal regulation of health and safety matters generally was a necessary adjunct to the national atomic energy program. In response to this necessity Congress *directed* the Commission to take certain steps to protect health and safety and *authorized* the Commission to undertake others. For purposes of analyzing the preemption question this program must be separated into its two principal phases: (1) precautions taken to assure safety before operation of a radiation source or commencement of an atomic energy activity; and (2) measures taken to assure safety after construction or installation and during operation or use. Generally speaking, the Commission has been directed to provide the first type of precaution and authorized to provide the second. Also, with respect to the first type of precaution, the Commission has fashioned its standards to the requirements of each proposed activity or installation, whereas the regulations providing for operating safety are of a more general character, applying to all licensees or classes of licensees. There is, perhaps, some justification for finding a third distinction within the federal health and safety program which may prove significant. Congress has manifested greater concern as to the hazards associated with production and utilization facilities, where critical masses of special nuclear material are present, than in the case of hazards arising out of the use of byproduct materials.

(1) Federal Precautions Preceding Operation

To protect health and insure safety Congress has "authorized" the Commission to issue licenses for special nuclear material, source material, byproduct material, production and utilization facilities, and facility operators.[875] The use of the term "authorized" is misleading, however, for the act definitely contemplates the pursuit of atomic energy

[875] §§53a, 63a, 81, 103, 104, 107, 42 U.S.C.A. §§2073(a), 2093(a), 2111, 2133, 2134, 2137.

activities by private persons for their own purposes, and such activities are declared unlawful unless a license has been issued.[876] With minor exceptions, therefore, the net effect of the licensing provisions of the 1954 act is to direct the Commission to license any non-federally owned or conducted atomic energy activity if the Commission decides to allow the activity at all. Furthermore, the act provides that ". . . the Commission shall establish, by rule, minimum criteria for the issuance . . ." of source and special nuclear material licenses ". . . depending upon the degree of importance . . . to the health and safety of the public,"[877] and "shall not permit the distribution of any byproduct material to any licensee . . . who is not equipped to observe . . . such safety standards to protect health as may be established by the Commission."[878] In respect to commercial or research and development licenses to operate production or utilization facilities, ". . . no license may be issued to any person in the United States, if in the opinion of the Commission, the issuance of a license to such person would be inimical . . . to the health and safety of the public."[879] Both commercial facility and research and development facility licenses have received special congressional attention. The Price-Anderson amendment of 1957 gave statutory status to the Advisory Committee on Reactor Safeguards. The Committee is directed to ". . . review safety studies and facility license applications referred to it and . . . make reports thereon, . . . advise the Commission with regard to the hazards of proposed reactor safety standards, and . . . perform such other duties as the Commission may request."[880] The preferred status of research and development facility licenses, as opposed to commercial facility licenses, is illustrated in a provision which directs the Commission ". . . to impose the minimum amount of regulation consistent with its obligations under [the] Act . . . to protect the health and safety of the public."[881] In connection with license applications generally, the Commission may require the applicant to furnish such information as it deems necessary to determine ". . . the technical and financial qualifications of the applicant, the character of the applicant, the citizenship of the applicant, or any other qualification of the applicant . . . [deemed] appropriate for the license."[882] In addition, applicants for facility licenses must ". . .

[876] §§57a, 62, 81, 101, 42 U.S.C.A. §§2073(a), 2092, 2111, 2131.
[877] §§53b, 63b, 42 U.S.C.A. §§2073(b), 2093(b).
[878] §81, 42 U.S.C.A. §2111.
[879] §103d, 42 U.S.C.A. §2133d.
[880] Pub. L. 85-256, §5, 85th Cong., 1st Sess., 42 U.S.C.A. §2039.
[881] §104, 42 U.S.C.A. §2134.
[882] §182a, 42 U.S.C.A. §2232(a).

state such technical specifications, including information of the amount, kind, and source of special nuclear material required, the place of use, the specific characteristics of the facility, and such other information as the Commission may, by rule or regulation, deem necessary in order to enable it to find that the utilization or production of special nuclear material . . . will provide adequate protection to the health and safety of the public. Such technical specifications . . . shall . . . be a part of any license issued." [883]

The above mentioned provisions of the act make it obvious that Congress has charged the Commission with the responsibility of making as certain as is reasonably possible that each proposed private atomic energy activity, especially a production or utilization facility, will not be inimical to the public health and safety before the activity commences or the facility goes into operation. In response to these directives, the Commission has promulgated regulations prescribing general licensing standards.[884] These regulations do not attempt to spell out specific safety criteria. Instead, the burden is on the applicant to prove safety to the Commission's satisfaction. Basically, the licensing regulations require each applicant to furnish information that will enable the Commission to determine that (1) the applicant, or his employees, are qualified by training and experience to use the material or facility for the purposes requested in accordance with the Commission's "Standards for Protection Against Radiation"; [885] (2) the applicant's proposed equipment and facilities are adequate to protect health and minimize danger to life or property; and (3) the applicant's proposed procedures to protect health and minimize danger to life or property are adequate.

In licensing of production and utilization facilities the Commission is especially painstaking. Prior to submission of the application informal discussions may be held to outline the broad objectives of reactor hazards analysis. A preliminary hazard report accompanies the application. This report must be submitted by the Commission to the Advisory Committee on Reactor Safeguards where the application is for a commercial facility, for one leading to the demonstration of the practical value of such a facility for industrial or commercial purposes, or for a testing facility.[886] Before issuance of a construction permit, the Commission must have sufficient information to provide reasonable assurance that a facility of the general type proposed can be constructed and operated safely at the

[883] *Ibid.*
[884] 10 Code Fed. Regs. Pts. 30, 40, 50, 55, 70.
[885] 10 Code Fed. Regs. Pt. 20.
[886] Pub. L. 85-256, §6, 85th Cong., 1st Sess., 42 U.S.C.A. §2232(b).

proposed location. From the time the construction permit is issued until initial operation, inspectors from the AEC's Division of Inspection are supposed to observe details of construction, tests of equipment, and pre-operational integrated test runs. If, after completion of construction and review of the final hazards summary report, including the statement of proposed operating procedures, and only if the Commission finds the facility can operate safely, the construction permit may be converted into an operating license under such safety restrictions as the Commission deems necessary.[387]

Ultimately, the Commission hopes to develop detailed standards, codes, and regulations for facilities, but, while the industry remains in its developmental stage, the Commission feels it undesirable to do so.[388] Under the present procedure, when a license is issued by the Commission, it amounts to a federal determination that the qualifications of the particular licensee, his equipment and facilities and their location, and his operating procedures offer assurance of radiation safety.

(2) Federal Measures to Assure Safety During Operation

The 1954 act does not contain any express directives to the Commission as to how it is to carry out its health and safety program once a license has been issued. In fact, the act does not even state that it must do so, although there is the implication throughout the whole act that Congress expects as much. If the duty is not clear, however, the authority is, for Section 161 provides:

> In the performance of its functions the Commission is authorized to—
>
> b. establish by rule, regulation, or order, such standards and instructions to govern the possession and use of special nuclear material, source material, and byproduct material as the Commission may deem necessary or desirable to promote the common defense and security or to protect health or to minimize danger to life or property:
>
> i. prescribe such regulations or orders as it may deem necessary . . . (3) to govern any activity authorized pur-

[387] AEC, Twenty-first Semi-Annual Report 120-125 (1957). Under §170a of the Atomic Energy Act, 42 U.S.C.A. §2210a, as added by Pub. L. 85-256, 85th Cong., 1st Sess., financial protection may be required for the issuance of licenses for research reactors under §104c. Applications for licenses for research reactors under 104c are not required to be submitted to the Advisory Committee on Reactor Safeguards for review unless so specified by the Commission. §182b, 42 U.S.C.A. §2232b.

[388] AEC, Twenty-first Semi-Annual Report 121-122 (1957).

> suant to this Act, including standards and restrictions governing the design, location, and operation of facilities used in the conduct of such activity, in order to protect health and to minimize danger to life or property.
>
> p. require by rule, regulation, or order, such reports, and the keeping of such records with respect to, and to provide for such inspections of, activities and studies of types specified in section 31 and of activities under licenses issued pursuant to sections 53, 63, 81, 103, and 104, as may be necessary to effectuate the purposes of this Act. . . .[389]

This language makes it clear that the Commission has broad authority to prescribe operating standards and procedures, to require the keeping of records and the submission of reports pertinent to health and safety, and to inspect licensed activities and facilities.

Pursuant to this authority, the Commission has issued performance type regulations on "Standards for Protection Against Radiation," [390] which apply to all persons who receive, possess, use, or transfer source, byproduct, or special nuclear material under a general or specific license from the Commission. The regulations prescribe maximum permissible limits of radiation for persons in "restricted areas" (an area access to which is controlled by the licensee) and "unrestricted areas." Also included are provisions for personnel monitoring and area radiation surveys, protective devices, records and reports, radiation safety instruction, safe handling of radioactive materials, caution signs and signals, and disposal of radioactive wastes.

While the basic responsibility for safety of operation is upon the licensees themselves, all licensees, from those operating major facilities to those using comparatively small quantities of byproduct materials, are subject to periodic inspections to assure compliance with regulatory standards and the terms and conditions of the licenses. Users of uranium, thorium, and byproduct materials are inspected by personnel of the inspection sections of the Commission's Operations Offices. Inspection of licensed production and utilization facilities, however, is made by the Division of Inspection in Washington.[391]

(3) Enforcement of Federal Safety Standards

The 1954 act contains a number of provisions specifying the manner in which its provisions and Commission regulations shall be enforced.

[389] §161, 42 U.S.C.A. §2201.
[390] 10 Code Fed. Regs. Pt. 20.
[391] AEC Rel. No. 1018, April 4, 1957.

The most obvious enforcement mechanism is the Commission's authority (and in some cases, duty) to deny, suspend, and revoke licenses. The Commission may revoke a license (1) "for any material false statement in the application," (2) for any reason that would have justified refusal to issue a license originally, (3) "for failure to construct or operate a facility in accordance with the terms of the construction permit or license or the technical specifications in the application," or (4) "for violation of, or failure to observe any of the terms and provisions of [the] Act or of any regulation of the Commission." [892] Furthermore, upon revocation of the license, the Commission may take possession of all special nuclear material held by the licensee.[893] While the act does not declare byproduct material to be subject to recapture or seizure, this is implied since it does provide that:

> The Commission . . . shall recall or order the recall of any distributed [byproduct] material from any licensee, who is not equipped to observe or who fails to observe such safety standards to protect health as may be established by the Commission. . . .[894]

Apparently, this also is a condition of the byproduct material license.[895]

Acts and practices which, in the judgment of the Commission, constitute or will constitute a violation of the act or any regulation or order of the Commission may be enjoined by an appropriate court on the petition of the Attorney General,[896] and severe criminal punishment may be imposed upon persons who wilfully violate, attempt to violate, or conspire to violate, any provision of the act or any regulation or order issued by the Commission under its general authority.[897]

It is readily apparent that the federal program to protect health and maintain safety in connection with atomic energy activities is as comprehensive and pervasive as any confronting the Supreme Court in the cases considered earlier. What power, then, do the states retain to regulate atomic energy activities with respect to health and safety?

[892] §186a, 42 U.S.C.A. §2236(a).

[893] §186c, 42 U.S.C.A. §2236(c).

[894] §81, 42 U.S.C.A. §2111. Under this section, the Commission has acted to suspend or revoke licenses in two instances involving a Texas company. [896] §232, 42 U.S.C.A. §2280.

[897] §§222, 223, 42 U.S.C.A. §§2272, 2273.

d. Permissible Limits of State Action

The writers believe that the above question cannot be answered categorically. Because the solution appears to lie in determining what Congress impliedly intended to pre-empt, we submit that the Supreme Court probably will apply those principles of statutory construction which will effect a result in the particular case which is most nearly consistent with the objectives of the 1954 act and with the regulatory scheme adopted under it. In reality there is not one pre-emption question but many—as many as there are types of state health and safety actions affecting federally regulated atomic energy activities. Each of these questions can only be answered by considering the particular state action in relation to the system of federal law and administrative action as well as the nature of the matter regulated.

(1) State Regulation of Radiation Hazards Not Covered by the Atomic Energy Act of 1954

The scope of the 1954 act and the Commission's health and safety program is limited to activities involving "byproduct material," "source material," "special nuclear material," "production facilities," and "utilization facilities," as these terms are defined in the act.[398] Other sources of radiation, such as X-ray and fluoroscopic devices used in medicine, dentistry, and science generally, as well as in commerce and industry, are not controlled by the federal government regardless of whether or not they affect interstate and foreign commerce. Also not covered by the 1954 act are atomic particle accelerators, naturally occurring radioisotopes (other than source materials), and isotopes made radioactive by processes other than exposure to radiation in utilization or production facilities. Since these sources of radiation fall outside the scope of federal regulation established by the 1954 act, it follows that no limit upon the exercise of the state police power to regulate them is implied. We have seen in *Allen-Bradley Local* v. *Wisconsin Board*,[399] *International Union, United Automobile Workers* v. *Wisconsin Board*,[400] *Reid* v. *Colorado*,[401] *Savage* v. *Jones*,[402] *Mintz* v. *Baldwin*,[403] and *Kelly* v. *Washington*,[404] that, where federal law leaves some matters in a gen-

[404] *Supra* note 336.

eral field (*i.e.,* radiation health and safety regulation) unregulated, a policy of indifference to state action is indicated, and the state may act if its action does not otherwise constitute an obstacle to the accomplishment and execution of the full purposes and objectives of Congress or unduly interfere with interstate commerce.

(2) State Regulation of Non-Radiation Health and Safety Hazards Connected with Federally Licensed Activities

Congress has said, "The processing and utilization of source, by-product, and special nuclear material must be regulated . . . to protect the health and safety of the public." [405] In its repeated references to the "health and safety of the public" Congress has not expressly limited the meaning of this term to radiation health and safety. Obviously, non-radiation hazards may be involved in many of the activities and facilities licensed by the Commission. Does the "special competence" of the Commission described by Senator Anderson,[406] and to which the Commission's functions are limited, extend this far? It should not be asserted seriously that the use of a radioactive thickness gauge would give the Commission the power to regulate, for example, the entire process of rolling steel or manufacturing tires in the interests of public health and safety. In contrast, however, it is somewhat more plausible to say that the Commission has the power to control all the health and safety features of a production or utilization facility for the reason that in such a facility nearly all the features ultimately relate to some matter affecting radiation health and safety. In view of the legislative history it is difficult to escape the conclusion that Congress was concerned only with the uniquely hazardous characteristics of the specified materials and facilities.

In any event, since the Commission has not construed its responsibility to extend beyond radiation hazards, the question is largely academic. Cases such as *Welch* v. *New Hampshire,*[407] *Buck* v. *California,*[408] and *Terminal Assn.* v. *Trainmen* [409] indicate that the states may act to control matters within the scope of a broad and inclusive federal statute which delegates to a federal agency the power to determine specific

[405] §2d, 42 U.S.C.A. §2012(d).
[406] *Supra* note 267.
[407] *Supra* note 339.
[408] *Supra* note 341.
[409] *Supra* note 343.

application, if the federal agency has not exercised its powers with respect to the particular subject of state action, unless the federal agency believes the action to be unnecessary. It scarcely could be claimed that the Commission's failure to prescribe standards for non-radiation hazards associated with licensed activities is tantamount to the decision that such hazards need not be regulated. Therefore, whether the AEC does or does not have the power to regulate non-radiation hazards associated with licensed activities, we may fairly conclude that the state and local governments may require licensees to comply with laws and regulations pertaining to electrical wiring, plumbing and sanitation, structural design and materials, fire prevention and equipment, elevator design and safety features, ventilation, safety features on non-radiation machinery and equipment, and other matters not directly related to radiation safety.

Quite obviously some of these state and local laws could apply to objects for which the AEC has provided standards and specifications in the construction permit or license. The Commission may require, for example, the installation of a particular type of removable floor-covering material in places where there is a possibility of radioactive material spillage. Local building codes and industrial safety codes also may contain specifications for floors in similar establishments. The building code may require floor joists of specified minimum dimensions, a specified distance apart, and flooring material of a particular thickness and strength. The industrial safety code may require the installation of a relatively permanent "non-skid" floor-surfacing material. Despite the fact that they pertain to the same general object, no conflict would exist between the federal requirement and the building code specifications since they are intended to serve different purposes, and imposition of the local requirement often will not prevent or hinder compliance with the Commission's specification. However, in some situations it is conceivable that, even though the purpose of the state industrial safety requirement is different from that of the AEC's regulations, the state requirements may constitute an obstacle to compliance with the federal safety feature. Cases such as *Hill* v. *Florida*,[410] *Automobile Workers* v. *O'Brien*,[411] and *Erie R.R. Co.* v. *New York*[412] indicate that in such a situation the state industrial code requirement may not be imposed on the licensed installation. Other cases, such as *Allen-Bradley Local* v. *Wisconsin Board*,[413] *International Union, United Automobile Workers*

[410] *Supra* note 283.
[411] *Supra* note 286.
[412] *Supra* note 318.
[413] *Supra* note 301.

v. *Wisconsin Board,*[414] *Reid* v. *Colorado,*[415] *Savage* v. *Jones,*[416] *Mintz* v. *Baldwin,*[417] *Kelly* v. *Washington,*[418] *Welsh* v. *New Hampshire,*[419] *Buck* v. *California,*[420] and *Terminal Assn.* v. *Trainmen,*[421] however, suggest that in this situation the federal pre-emption would be only partial. For example, the state still may require the installation of "non-skid" floor-surfacing material to prevent slippage, if it is easily removable in the event of spillage, and otherwise meets the Commission specifications. The general position here asserted is that the states may specify design features, specifications, materials, and other safety features aimed at non-radiation hazards, even though they affect objects touched by federal specifications, if the state requirements do not prevent the licensee from complying with Commission requirements or make it unreasonably difficult to do so. In this sense, we believe that the state or local government may require the submission of installation plans and specifications to an appropriate official and insist upon the issuance of a building permit before construction. In similar fashion, the issuance of an AEC license to use byproduct materials for purposes of medical therapy would not excuse the physician from obtaining a state license to practice medicine.

Since the only health and safety determination made by the Commission at the present time is that a particular production or utilization facility is radiologically safe for a proposed site, it seems entirely probable that the Supreme Court would not deny to the states, or local governments, the power to exclude the facility from the particular location altogether, if the reason for doing so is not related to radiation health and safety and the facility is not owned by the federal government. While the case is not likely to arise, inasmuch as the AEC has indicated that it would respect local zoning ordinances concerning matters other than radiation protection,[422] the holder of a facility construction permit from the Commission could be prohibited by a state from

[414] *Supra* note 303.
[415] *Supra* note 331.
[416] *Supra* note 332.

[421] *Supra* note 343.
[422] In the analysis accompanying the proposed amendment to the 1954 act which Chairman Strauss sent to Rep. Carl T. Durham in June of 1957, it was admitted that ". . . the states have responsibilities for zoning and use of water resources by industrial facilities." *Supra* note 271.

building in an area zoned against commercial and industrial establishments. The issuance of a construction permit indicates no more than the fact, as determined by the Commission, that there is reasonable assurance of radiation safety. The issuance does not suggest that the Commission has determined that operation of the facility in the particular location will not affect the health and safety of the public in some other objectionable manner, such as by substantially increasing truck traffic on residential streets. The conclusion is not applicable, however, to establishment of such facilities owned by and operated for the federal government for its own purposes. Likewise, if the zoning ordinance discriminates against production and utilization facilities, however, it falls within the scope of the federal health and safety program and different principles of pre-emption apply. This situation is discussed below.

(3) State Regulation of Radiation Hazards Covered by the Atomic Energy Act of 1954

When the state undertakes radiation health and safety regulation of persons, materials, devices, facilities, and activities licensed or otherwise regulated by the AEC, it clearly is acting within the scope of a general and all-inclusive federal statute which imposes certain regulatory duties and bestows even broader powers upon a federal agency. Furthermore, the AEC has issued comprehensive radiation safety standards, by regulation or order, covering the subject of radiation health and safety. Nevertheless, we believe that some state regulation of radiation hazards remains permissible.

(a) State Precautions Preceding Operation

Essentially radiation health and safety precautions preceding operation, as indicated earlier, may be reduced to three official determinations by the AEC: (1) that the persons in charge of the atomic energy activity are qualified to operate safely; (2) that their proposed operating and accident procedures to protect health and minimize danger to life and property are adequate; and (3) that the nuclear materials, devices, and facilities will be so disposed, designed, installed, constructed, and used as not to endanger life, health, or property. Each of these determinations is associated with the federal program of licensing. Obviously, they are not absolute determinations. They are no more than scientifically informed predictions which are translated into installation

designs, specifications, and operating procedures. Starting with empirically determined safe radiation dosage levels (which are largely predictions themselves and none too certain at this time), the engineer and the scientist attempt to incorporate those design features and materials into the radiation device or facility that will keep exposures of persons below the acceptable levels. The complexities of the situation are such that, at the existing level of the art or science, safety cannot be guaranteed. Every atomic energy activity involves a calculated risk, and approval for licensing merely indicates that the risks have been reduced to an acceptable percentage.

There are a number of features of the federal licensing program which indicate that it probably will be found to have pre-empted the field, thus precluding a parallel state licensing program. Among these are the following:

First. The federal licensing scheme to control the development and utilization of atomic energy, as established by Congress and implemented by the AEC, is extraordinarily pervasive, probably more pervasive than any regulatory scheme considered by the Supreme Court in analogous cases discussed above. Furthermore, the Commission's licensing system is but a part of an intensive program to promote the public and private development and utilization of atomic energy. The tendency of the court to regard the feature of "pervasiveness" as one manifestation of implied pre-emptive intent is illustrated in *Bethlehem Steel* v. *State Board,*[428] *La Crosse Telephone Corp.* v. *Wisconsin Board,*[424] *Garner* v. *Teamsters Union,*[425] *Weber* v. *Anheuser-Bush, Inc.,*[426] *Oregon-Washington Co.* v. *Washington,*[427] *Penn. R.R. Co.* v. *Public Service Commission,*[428] *Napier* v. *Atlantic Coast Line,*[429] *Cloverleaf Butter Co.* v. *Patterson,*[430] *Hines* v. *Davidowitz,*[431] and *Pennsylvania* v. *Nelson.*[432] It is also significant that quite recently Congress has made the federal system of licensing production and utilization facilities even more pervasive than it was originally by giving statutory standing to the Advisory Committee on Reactor Safeguards.[433]

Second. By forbidding all non-federal atomic energy activities unless carried on under a Commission license and by authorizing the Commission to issue appropriate licenses, Congress, in effect, has directed the AEC to establish and administer a comprehensive licensing program. *Automobile Workers* v. *Russell,*[434] *Oregon-Washington Co.* v. *Washington,*[435] and *Welch* v. *New Hampshire*[436] suggest that the Supreme Court finds stronger indication of pre-emptive intent in areas where Congress has *directed* a federal agency to act than in those where the agency is merely *authorized* to act.

Third. The Commission has been directed to establish minimum criteria for the issuance of source and special nuclear material licenses. These criteria are to be based, in part, upon considerations of public health and safety. Moreover, in connection with research and development facility licenses, as opposed to commercial facility licenses, the 1954 act directs the Commission to impose the minimum amount of regulation consistent with public health and safety. The context rather clearly suggests that, in the interest of promoting the study, development, and utilization of atomic energy, Congress has cautioned the Commission to avoid burdening the science and development of the industry with any requirements except those essential to public health and safety. Lest any essential requirements be overlooked, however, all commercial, research and development, and testing facility applications must be referred to, reviewed by, and publicly reported on by the Advisory Committee on Reactor Safeguards. It seems evident, therefore, that any state licensing requirement which imposes a higher radiation safety standard than that which the Commission finds consistent with public health and safety would necessarily conflict with congressional policy as expressed in the 1954 act. In *Hill* v. *Florida*[437] a state licensing requirement, together with license qualifications which Congress had not thought it necessary to impose, were found to be in conflict with congressional policy encouraging collective bargaining and thus invalid. Similarly, in *Automobile Workers* v. *O'Brien*[438] state imposed conditions on the doing of an act allowed by a federal law which imposed less stringent conditions than those of the state were found to be pre-empted.

Fourth. The 1954 act clearly reflects the realization by Congress that

[434] *Supra* note 282.
[435] *Supra* note 320.
[436] *Supra* note 339.
[437] *Supra* note 283.
[438] *Supra* note 286.

standard safety designs and specifications were not feasible at the time the act was passed. Therefore, while Congress directed that a licensing program be established and that steps be taken to assure safety before operation, it left the details of this program to the informed discretion of a federal agency it had created largely for the purpose. This is re-emphasized in the Price-Anderson amendment which raises the Advisory Committee on Reactor Safeguards to statutory status and provides for review by the ACRS of each facility license application. It scarcely need be mentioned that the Commission is far better qualified to establish and administer the essentials of a licensing program than any comparable state agency. Subsequent Commission action and the close attention it gives to each license application indicate that the sort of standardized safety specifications which can be applied in a comparatively automatic or mechanical fashion are still a development of the future. In this type of atomic energy regulation, expert judgment is especially imperative. The AEC has even indicated in its proposed amendment to the 1954 act that an exclusive system of federal licensing is desirable.[439] These facts may well lead the Supreme Court to conclude that the policy of Congress and the AEC is to maintain the sort of flexibility which centralized administration makes possible so as to encourage experimentation and variation in the part of licensees in the hope of obtaining both greater economy and safety. This does not appear to be the time, for example, for the state to specify the precise amount, design, and type of shielding material that is necessary to operate a nuclear reactor or other atomic energy device, and it is doubtful that Congress intended the almost inevitable frustration of its policies by such state licensing specifications. The *La Crosse Telephone* case [440] suggests that the Supreme Court will find implied congressional intent to pre-empt any state act, the effect of which is to standardize matters left to the discretion of the AEC where the Commission has indicated flexibility and variation is desirable to effectuate the purposes of the act.

Fifth. The AEC is exercising the full measure of its licensing power, and where it has exempted certain classes or quantities of byproduct and source material, or kinds of uses or users, from the requirements of a "specific" license, it has done so after a finding that no unreasonable risk to the health and safety of the public will result. Insofar as radiation hazards are concerned, there do not appear to be any gaps in the

[439] *Supra* note 272.
[440] *Supra* note 291.

Commission's licensing program. Those matters which are not covered by general radiation health and safety standards are covered by more detailed and individually tailored specifications in the license itself. Not only does the Commission study the proposed atomic installation itself and the radiation safety precautions within it, but it also gives due consideration to all of the local geographic (*i.e.,* population density, etc.), geologic, and meteorologic features as well. In short, when the license is issued, the Commission, pursuant to congressional directive, has determined that the particular licensee is qualified to construct and operate a particular atomic energy installation in a specified location, for specified purposes, and in a specified manner. We have seen in *Penn. R.R. Co.* v. *Public Service Commission* and *Napier* v. *Atlantic Coast Line* [441] that the implication of pre-emptive intent becomes quite strong when the authorized federal agency has effectively exercised its power by establishing comprehensive and detailed safety standards.

Sixth. That there is real efficacy and feasibility in an exclusive federal licensing program, at least at the present time, is especially seen in the case of an atomic energy production or utilization facility, the existence of which is not likely to escape the Commission's attention since the federal government owns all special nuclear material. As in the case of union certification and unfair labor practices which are brought to the attention of the NLRB by the parties involved, most proposed atomic energy activities, and therefore the potential hazards they entail, will be brought directly to the attention of the Commission either by the parties intending to act or by other parties possibly affected by the action.[442] It is more likely that the Commission will receive notice of proposed hazardous activities than of actual hazardous conditions after an atomic energy activity becomes operational. The AEC is not only the principal source of atomic energy materials but also is the best informed organization in the nation on the subject of their use, and so it becomes advantageous for the person proposing to undertake a regulated activity to take his problems of installation design and other preliminary matters of radiation safety to the Commission. Furthermore, we may rely upon others, such as state health agencies, unions, and adjacent property owners, to bring these matters to the attention of the Commission should those who are required by law to do so fail in this respect, and there

[441] *Supra* notes 325 and 326.

[442] An example of this is the intervention of the United Automobile Workers in the construction of a reactor by the Power Reactor Development Company. See In the Matter of Power Reactor Development Company, AEC Dkt. F-16, "Notice of Hearing Order," 21 Fed. Reg. 7809 (Oct. 12, 1956), BNA, Atomic Industry Reporter 52:40.

is no public hazard in the pre-operation situation if we wait for action by the more expert federal agency.

Seventh. Reason and experience both suggest that any parallel system of state licensing, predicated on considerations of radiation health and safety, will inevitably conflict with the federal licensing program. Clearly, the Supreme Court is not likely to ascribe to Congress an attitude of indifference toward state licensing requirements which might prevent activities authorized by the Commission because of possible radiation hazards which the Commission has found to be insignificant or non-existent. *Hill* v. *Florida,*[443] *Automobile Workers* v. *O'Brien,*[444] and *Bus Employees* v. *Wisconsin Board*[445] suggest that any state radiation health and safety licensing requirement in addition to, or in excess of, Commission requirements would be found to stand as an obstacle to the accomplishment and execution of the full purposes and objectives of the 1954 act and would not be allowed by the Supreme Court. Such independent state action would very likely tend to discourage activities which Congress clearly wants to encourage. Furthermore, we have seen in *Erie R.R. Co.* v. *New York*[446] that, where Congress imposes burdens on a regulated activity in the interests of health and safety, the implication arises that this is the prescribed measure of what is necessary and sufficient for the purpose as well as the cost which must be sustained to secure the degree of safety desired. In other cases, such as *Oregon-Washington Co.* v. *Washington*[447] or *Welch* v. *New Hampshire,*[448] the court has indicated that a similar implication arises where Congress has directed a federal agency to establish the appropriate safety standard. Even if, for example, the state were to specify dimensions of shielding materials, basing those dimensions on radiation exposure limits identical with those of the AEC, the effect of the state action would be to standardize safety features left to the discretion of the Commission and which the Commission prefers to specify on a case-by-case basis. There is not one but a variety of ways of building a nuclear reactor or a radiation device in order to obtain a desired degree of safety. There is considerable merit, which probably appealed to Congress, in a system which allows the applicant and the Commission to agree on the alternatives to be employed without the intrusion of state

[443] *Supra* note 283.
[444] *Supra* note 286.
[445] *Supra* note 287.
[446] *Supra* note 318.
[447] *Supra* note 320.
[448] *Supra* note 339.

officials. To modify the court's phrase in the *Cloverleaf* case, state licensing requirements would nullify federal discretion over the designs, specifications, and other radiation safety features of atomic energy installations and devices.[449] In the last analysis, then, any parallel state system of radiation safety precautions preceding operation probably would either conflict with the federal licensing system in a substantive sense or it would impair administration of the program. Either event, or the possibility of either event, has generally been held fatal to the state action. At the very least, such a parallel state system would be superfluous expense to both the Commission licensee and the state.

In the light of the above considerations, it seems reasonably safe to assume that the Supreme Court will hold that Congress has prevented any state or local government from requiring a person, who is licensed or otherwise authorized by the Commission, to obtain prior state or local permission to operate if the granting or denying of that permission is predicated upon an independent analysis or standards of radiation health and safety. This does not include, however, state or local action which is designed to alleviate an actual radiation hazard arising out of a federally licensed activity and also constituting a violation of the Commission standards. This type of state action involves regulatory measures during operation and is considered below. It was pointed out previously that the statutes or regulations of several states appear to require prior approval by a state official. While the laws of North Dakota[450] and Wyoming[451] require registration, they are so phrased as also to suggest that permission of state health officials is required. The regulations of the Delaware Board of Health definitely require a permit which may be denied ". . . when there is unsatisfactory proof that the material or device will not be a hazard to health."[452] Although the Michigan Department of Health regulations requiring registration may not be construed as a licensing provision, the State Health Commissioner has reserved discretionary authority to approve: (1) proposed limits on levels of radiation in uncontrolled areas; (2) proposed limits on concentrations of radioactive materials released into the atmosphere of uncontrolled areas; (3) installation changes which materially increase the potential health hazard; and (4) radioactive waste disposal

[449] *Supra* note 327, quoted *supra* note 328.

[452] Del. Bd. of Health, Regulations Governing the Manufacture, Distribution, Sale, Storage, Installation, and Disposal of Radioactive Sources, Materials, or Devices, §II, adopted Dec. 5, 1955.

procedures not otherwise authorized by the regulations.[453] In view of the foregoing discussion, these state requirements, as applied to Commission licensees, are probably not valid.

Local zoning ordinances which clearly discriminate against atomic energy uses and facilities, merely because they constitute radiation hazards deemed undesirable by the community, will probably suffer the same fate as state licensing requirements. Such an ordinance would obviously conflict with a determination by the Commission that a licensed use or facility will not create an unreasonable hazard in the particular location. A more difficult question is presented, however, by a zoning ordinance which discriminates against a production or utilization facility for reasons which are not connected with health and safety. For example, in response to a policy which seeks to promote intensive industrial development in an area and thereby increase local property tax revenues and employment possibilities, the local government may zone against commercial reactor facilities because the use of large tracts of land as exclusion areas around reactors, rather than as conventional industrial sites, would lower assessment value and the number of jobs available. While the Commission is not likely to license a facility for such a location, since its policy is to respect the desires of the community, the situation might arise. There appears to be nothing in the 1954 act which would preclude enforcement of such an ordinance if its revenue raising or job promoting purpose is bona fide. It is possible, of course, to frame such a discriminatory zoning ordinance without revealing the reason behind it upon which validity depends. The case of *Village of Euclid* v. *Amber Realty Co.*[454] suggests, however, that in such a case the Supreme Court will not hesitate to look behind the ordinance to determine its real purpose if its validity depends thereon. This statement is not meant to imply in any way that the federal government could not condemn land free of local zoning restrictions in order to construct a government facility if it so desired.

Several other possibilities for state action are offered in the area of radiation regulation preceding operation. Whereas the state probably may not impose licensing requirements of its own, the *Zook*[455] case suggests that the state may make it unlawful for any person to do any of the things for which a Commission license, construction permit, or

[453] Supplement No. 13 to 1954 Mich. Adm. Code pp. 41-70 (adopted Feb. 14, 1958), Regs. 325.1309.2.1, 325.1309.3, 325.1306.2, 325.1312.2.1.

[454] *272* U.S. 365, 47 S. Ct. 114 (1926).

[455] *Supra* note 281.

other authorization is required, without first obtaining the appropriate authorization from the Commission. The enforcement of such a provision, by injunction or by the imposition of criminal sanctions, would not conflict with the federal licensing program. There would be little or no likelihood of the state prohibiting that which the federal law authorizes. Unlike the situation in the *Nelson* case,[456] violation of a state law to this effect definitely affects local as well as national interests. Also, there is less justification for the claim that the threat must be met on a nationwide basis, for no national or international criminal conspiracy is involved. There would seem to be no need for secrecy or delay in prosecution as suggested in the *Nelson* case. Such a situation can be distinguished from that presented in the *Cloverleaf* case [457] where the state act was said to nullify federal discretion over the regulated process. Such a conclusion is necessary to sustain the validity of the New England type of statute and seems justified in the light of applicable Supreme Court cases.

Further opportunity for state action is presented within the administrative procedures of the AEC. Section 189 of the 1954 act provides that:

> In any proceeding under this Act, for the granting, suspending, revoking, or amending of any license or construction permit, or application to transfer control, and in any proceeding for the issuance or modification of rules and regulations dealing with the activities of licensees, . . . the Commission shall grant a hearing upon the request of any person whose interest may be affected by the proceeding, and shall admit any such person as a party to such proceeding.[458]

This section also requires that a hearing be held on each application for a commercial or research and development facility license, whether requested or not. Under the act "person means . . . any State or any political subdivision of, or any political entity within a State." [459] Thus, should the state feel that the public health and safety are not served or adequately protected by a proposed activity or facility, it may petition the Commission for a hearing on the matter or petition to intervene in a facility license hearing.[460]

In order to facilitate prompt state action notice to the state of the

[456] *Supra* note 323.
[457] *Supra* note 327.
[458] §189, 42 U.S.C.A. §2239.
[459] §11q, 42 U.S.C.A. §2014q.
[460] 10 Code Fed. Regs. §2.705.

existence and character of radiation activities and facilities within the state's borders is essential. While there appears to be sufficient pre-emptive effect in the 1954 act to preclude state licensing or the imposition of state safety measures in excess of those provided by Congress and the AEC, this should not prevent the states from requiring the registration of radiation sources, activities, and persons so engaged. A state statute requiring registration only does not directly affect the right of any person to carry out activities authorized by the Commission, and it does not affect the manner of conducting federally authorized activities or the physical characteristics of the nuclear device or facility. It seems doubtful if the rationale applied in *Hines* v. *Davidowitz*,[461] or any other case discussed above, could be successfully invoked to defeat state registration, unless it is a disguised form of licensing. Obviously, the registration of radiation sources and activities is not so intimately blended with responsibilities of the national government as to give rise to an inference of pre-emption. Furthermore, it pertains to the very subject—matters of public health and safety—which Justice Black distinguished in the *Hines* case as being in "an entirely different category" for purposes of federal pre-emption,[462] and Congress certainly has never manifested a consistent opposition to state registration statutes in the interests of public health and safety. Lastly, whatever additional burden is imposed upon a Commission licensee, by reason of a state registration requirement, is only minimal. It should also be pointed out that a state radiation source registration requirement can be sustained for reasons not directly related to radiation hazard regulation. State workmen's compensation commissions, water and wildlife conservation organizations, fire departments, and other state and local agencies may require the information for purposes of administering their respective programs. These clearly provide sufficient reason to justify a state placing such a minimal burden upon a licensee.

(b) State Regulatory Measures During Operation

The task of regulating the use and possession of nuclear materials and facilities during operation is essentially one of establishing operating standards and inspecting to determine whether the standards are met. To this end Congress has authorized, but not directed, the Commission to establish operating standards, instructions, and procedures, to require records and reports relative to radiation safety, and to inspect licensed

[461] *Supra* note 278.
[462] *Ibid.*, quoted *supra* note 356.

activities and facilities. Manifestly, the establishment of any operating radiation health and safety standard, as it affects AEC licensees, falls within the scope of a general and inclusive federal statute which delegates quasi-legislative power to the Commission. In this area of federal regulation there are no gaps in the congressional plan of control which might indicate to the Supreme Court a policy of congressional indifference to state action. Similarly, there are few, if any, gaps in the Commission's radiation health and safety standards. In short, Congress and the Commission have occupied the field of atomic energy safety standards, both before and during operation. Accordingly, cases such as *Penn. R.R. Co.* v. *Public Service Commission*[463] and *Napier* v. *Atlantic Coast Line*[464] indicate that in this situation the states may not impose any operating radiation health and safety standards in addition to those imposed by the Commission. These cases stand for the proposition that where a general and inclusive federal statute confers quasi-legislative authority upon a federal agency and the federal agency has effectively exercised its authority by establishing comprehensive safety standards, the states may not add refinements or impose a higher safety standard since to do so would conflict with the federal policy reflected in the uniform national standard. State action of this nature imposes a heavier burden upon Commission licensees. The additional cost of meeting the higher state standard tends to discourage developments in which Congress has affirmatively manifested an interest. Such being the case, it seems reasonably certain that the states cannot establish and enforce radiation exposure limits against Commission licensees which are more strict than those of the Commission. An attempt by the state to do this indirectly would probably be just as futile. For example, while the Commission has not specified the number of hours per day or week that an employee may work in a radiation installation, exposure limits are expressed and are to be adjusted in terms of hours of employment.[465] Should a state impose a regulation establishing a twenty hour work-week in production and utilization facilities in order to reduce exposures to below the Commission limit, the chances are that the Supreme Court would pronounce the state regulation invalid.

At the present time the Commission has two systems of exposure limits in effect. One of them, the weekly and quarter-year limits set forth in the Commission's "Standards for Protection Against Radia-

[463] *Supra* note 325.
[464] *Supra* note 326.
[465] 10 Code Fed. Regs. §20.101(b).

tion" applies to all licensees. The other applies to Commission activities and those of its contractors, but not to licensees.[466] The second system of limits reduces annual permissible exposures to one third of that allowed under the earlier system. Ultimately the Commission intends to hold licensees to the newer limit, but it has postponed application for several years because of the substantial economic impact on existing installations and facilities. At least one state, Michigan, has anticipated the Commission and imposed the new accumulated annual dose limit upon users of federally licensed materials.[467] This state act obviously conflicts with federal policy, and it is doubtful if Michigan can enforce the higher standard against a federal licensee, even though the Commission intends to do so eventually, for the effect of the Michigan action is to remove the period of grace offered by the Commission's postponement. The significance of this fact is indicated in *Erie R.R. Co.* v. *New York*.[468] The doctrine of the *Welch* decision[469] is not applicable for in that case there was no federal standard in effect at the time the state hour law was violated, the state standard was not as strict as that which the ICC intended to apply in the future, and the ICC had not delayed effectiveness to give interstate motor carriers time to make necessary adjustments.

One possible exception to the above limit on state operating standards exists as to disposal of radioactive wastes by release into sanitary sewage systems. Pursuant to its general authority, the Commission has specified the amount and manner of such disposition. It has even exempted excreta from individuals undergoing medical diagnosis or therapy with radioactive materials from any limitations.[470] Conceivably Commission authorized discharges of radioactive wastes into publicly owned sewage systems may result in conditions which local sanitation officials deem unsafe and necessitate the enlargement, improvement, or other modification of the system at local expense. The analogy between this situation and that where the state has imposed a lower weight limit for interstate motor carriers operating on state owned highways is obvious. The state or local government perhaps has an even stronger argument in connection with the sewers in that there is considerably less federal subsidy than in the case of interstate highways, and the public sewer is scarcely in interstate commerce. The Supreme Court's language in *Maurer* v.

[466] AEC Manual, c. 0524, "Permissible Levels of Radiation Exposure."
[467] *Supra* note 453, R. 325.1309.1.1(3).
[468] *Supra* note 318.
[469] *Supra* note 339.
[470] 10 Code Fed. Regs. §20.303.

Hamilton [471] at least suggests that state or local public ownership of a sewage system raises some question of whether Congress can pre-empt in this area. While it is entirely certain that the federal licensee could not release any greater quantity of radioactive wastes into a publicly owned sewage system than the Commission has specified, it is fairly arguable that the state or local government may impose a higher standard if federally authorized discharges will result in substantial expense to the state or a political subdivision. As in the *Maurer* case, there is a good possibility that the court would simply avoid the question by finding that Congress had not intended to pre-empt regulation of this matter.

A determination that the states may not establish and enforce higher radiation health and safety standards, or fill the gaps in the AEC's program does not conclude the matter of state standards or enforcement, for the question of whether the states may establish and enforce identical operating radiation health and safety standards still remains. It is curious that this question has been litigated infrequently in the Supreme Court. Practically all of the cases have involved situations where state action differed in some essential respect from federal law or might produce a different result, either because the standards were irreconcilable or because the state presumed to tread upon matters over which a federal agency exercised discretionary authority on a case-by-case basis.

The basic standards—that is the permissible doses and levels of radiation and environmental concentrations of radioactive effluents—used by the AEC in operational regulation are the same as those used by its safety experts in analyzing a proposed use or facility and in requiring incorporation of appropriate safety features into its design. A distinction exists, however, in the manner in which the standards are applied before and after operation. Where the standards are applied in licensing a proposed nuclear use or facility, they are applied affirmatively to determine what the applicant must do to assure future safety. By extremely complex calculations and estimates the standards are translated into facility designs, specifications, and materials, which become, in effect, regulations for the particular facility. In contrast, where the standards are applied to regulate activities during operation—after installation or construction—they are applied negatively to indicate what the licensee must not do, regardless of whether or not the facility or installation conforms with the license specifications. As an example, he must not expose the whole body of any person in the area subject to

[471] *Supra* note 372.

his control to more than 600 millirems of any radiation with a half-value-layer greater than one millimeter of soft tissue during any one week.[472] The fact that he has furnished the radiation source with the specified type and amount of shielding material does not excuse him from complying with the standard. Since the basic standards are expressed in terms of measurable units, the calculations necessary to compare actual radiation and concentration levels with permissible limits are fairly simple and straightforward; comparatively little scientific expertise is necessary in determining whether existing uses and facilities meet the basic standards. Even less expertise is necessary to determine whether the licensee is complying with safety standards providing for specified warning signs and signals, personnel monitoring devices, protective clothing, radiation safety instruction, personnel exposure and radioactive material accounting records, and accident and injury reports. The point of this discussion is that once the operating radiation health and safety standards are established by the AEC, there is no logical reason why any qualified state official should not be able to determine compliance. This is particularly true in the case of byproduct material uses, where the problems of regulation are less complex than in the case of a nuclear facility. Whether or not the state official would be qualified to order affirmative action to correct a hazardous condition in a nuclear reactor is, of course, a different matter, but, at least, he could order the cessation of activities and the evacuation of personnel until appropriate action has been taken.

Unfortunately, "the life of the law is not logic," and, to make matters worse, Congress is even less circumscribed by logical considerations than are the courts. Pre-emptive intent is just as effective where the result is unreasonable as it is where reason supports it. The Supreme Court undoubtedly would prefer a sensible solution to a pre-emption problem, but anyone familiar with *Guss* v. *Utah Labor Board*[473] should know that it cannot supply one if it believes that Congress intended otherwise. It is necessary, therefore, to apply the doctrines of the analogous cases.

In *Cloverleaf Butter Co.* v. *Patterson*[474] the Supreme Court said that state officials could not enter a factory to inspect and condemn the raw materials of a food manufacturing process, found to be unwholesome and deleterious to health, when that process was subject to federal supervision and a federal agency had authority to condemn the finished

[472] 10 Code Fed. Regs. §20.101.
[473] *Supra* note 295.
[474] *Supra* note 327.

product for the same reasons. Notice, however, that there was little local interest in the safety of the manufacturing process since there was nothing hazardous in the manufacturing process itself; the product was only dangerous when consumed, and, by express limitation, the court's decision did not prevent the state from condemning unwholesome raw materials prior to the time they were definitely marked for commerce by the manufacturer's acquisition. Neither did the decision prevent the state from regulating the sale of the finished product within the state's borders. In other words, the pre-emptive effect found by the sharply divided court did not entirely prevent the state from protecting the health and safety of the local public.

In *California* v. *Zook*,[475] a later case and one in which the court was again divided five-to-four, the court, in effect, said that it would not presume federal pre-emption as against state enforcement of a law which prohibited precisely the same thing prohibited by federal administrative regulations where (1) state enforcement would not impair administration of the federal law, (2) the state law pertained to public health and safety, (3) neither Congress nor the federal agency had expressed any pre-emptive intent, and (4) federal action preceded state regulation of the same matters. The court also was influenced by the practical need for effective state aid to help enforce the federal requirement. It might be added that under the Federal Motor Carrier Acts, Congress and the ICC had established a system of regulation about as pervasive as the federal system of radiation health and safety regulation.

It is submitted that, if a state establishes and enforces operating radiation health and safety standards identical with those of the AEC, the rationale of the *Zook* case is likely to be applied in any case involving a challenge of the state action, though one should not forget that only one of the majority and two of the dissent on that case are now on the court. The second, third, and fourth of the above conditions would be satisfied in such a case, and the principal question would be whether state action impairs administration of the Atomic Energy Act by the Commission. In the *Nelson* case [476] any state action was held to impair administration of federal laws intended to meet the national emergency arising out of the Communist conspiracy. It was certainly arguable that it was to the nation's advantage that the threat be met by a coordinated national program. In the labor area the standards are quite

[475] *Supra* note 281.
[476] *Supra* note 323.

general and the disputes usually require quasi-judicial solution; the possibility for conflict between state and NLRB decisions, even where the same general standards are applied, is great. *The Oregon-Washington* case [477] presented a condition of possible impairment. The state was asserting the power to do precisely what federal law directed the Secretary of Agriculture to do should circumstances, in his judgment, so required. Determination of the necessity for the specified action, however, involved an analysis of many complex facts and the exercise of considerable expert judgment. Even so, had the Washington law merely prohibited the importation into the state of alfalfa hay and meal from areas quarantined by the Secretary of Agriculture, without his certification, the result probably would have been different. In essence, the state was presuming to establish a regulation which the Secretary was directed to issue upon a finding of urgent need. Since he had not done so, the case turned on irreconcilability of standards, and not so much on impairment of federal administration of fixed health and safety standards.

None of the above types of impairment of federal law administration need occur if the state (1) adopts and enforces operating radiation health and safety standards identical with the current standards of the Commission, (2) carefully refrains from adopting any standard inconsistent with or stricter than those of the Commission, and (3) does not invade any area of regulation in which the Commission applies a flexible standard to the particular situation. The only safe course is for the state to cooperate with the AEC and aid in the enforcement of federal standards in every way, emphasizing maximum safety and avoiding futile assertions of state independence.

(4) Enforcement of State Safety Standards

While it is felt that the pre-emptive effect of the 1954 act probably does not prevent all state health and safety regulation of AEC licensees, there is some question remaining as to permissible methods of state enforcement of such standards. Obviously, the method least calculated to raise the issue of federal pre-emption would be a state petition or other request to the Commission to take appropriate action where state inspectors discover a violation of federal-state health and safety standards. This method seems especially desirable where the violation is of the sort that is not likely to cause immediate injury to persons or property and the short delay occasioned by such a procedure is comparatively

[477] *Supra* note 320.

unimportant to public health and safety. Where a violation poses an immediate threat to safety, however, or where the licensee has wilfully violated radiation health and safety standards, the state may find it advisable and necessary to take more direct action such as by injunction and possibly criminal prosecution.

In order to enforce its radiation health and safety standards, orders, and regulations, the Commission is empowered to deny, suspend, modify, or revoke its licenses, to seize byproduct and special nuclear materials in the possession of a violator, and, through the Attorney General, to seek injunctions or orders enforcing compliance against violators. Furthermore, under the direction of the Attorney General, willful violators may be prosecuted criminally. From this it could be argued that there is no room for duplicating state enforcement procedures. The *Zook* case suggests, however, that it would be permissible where the activity is clearly contrary to federal standards. The local interest in the safety of the local public is more, and the impact on the federal program is much less, than when a state is trying to punish someone for attacking the federal government, as in the *Nelson* case. Therefore, an attempt by the states to enforce federal standards would seem well worth the try.

There seems to the writers to be more than sufficient reason for the states to adopt a radiation hazards regulatory statute of the kind discussed in Chapter VI. There is sufficient radiation hazard from activities and sources which are not within the scope of the federal scheme to justify a comprehensive state program. In addition, there is every reason why a state should at least establish a registration center and collect that information which is necessary to permit the state to protect its own government personnel (*e.g.*, fire fighters, industrial safety inspectors), to administer such programs as workmen's compensation, and to allow it to represent the interests of the state generally in proceedings before the federal agencies. Even more pertinent is the scope of state regulation which in our opinion is still permissible in spite of the pervasive federal regulations. Moreover, the states should act now to establish expert staffs and gain experience so that in the future they may represent fairly to Congress that Congress should re-delegate many radiation health and safety functions to the states. It is our belief that until the states demonstrate their capabilities through existing and efficient staffs and programs Congress will not revise the Atomic Energy Act in respect to radiation health and safety, and perhaps even should not do so. Radiation hazards are too great to risk non-regulation or ineffective regulation.

Chapter VI

FUTURE STATE REGULATION OF ATOMIC ENERGY: A SUGGESTED STATE ACT

A. General Observations

The foregoing examination of state legislation and interstate compacts makes it abundantly clear that atomic energy industry is destined to be subjected to comprehensive health and safety regulation at state, interstate, and local governmental levels. Considerable statutory authority to regulate already exists although with varying degrees of completeness in the several states, and certainly with most unsatisfactory overlapping, indefiniteness, and multiplicity of jurisdiction. Order must be brought out of this statutory chaos.

So far as administrative regulations are concerned, the states, with the notable exceptions of California, Connecticut, Michigan, New York, Pennsylvania, and Texas, have not seen fit to adopt comprehensive codes of regulations dealing specifically with the rather unique radiation hazards. To the extent that federal regulations issued by the Atomic Energy Commission, the Interstate Commerce Commission, and other federal agencies provide an adequate safeguard for the general public, the cautious approach of the states toward establishing definitive regulations is commendable. This is particularly true in view of the fact that knowledge of atomic energy injuries at the present time is somewhat limited, and development of proper precautionary techniques has not as yet been possible. Hasty, ill-conceived standards may prove unduly burdensome, even to the extent of preventing or at least retarding the establishment and growth of the new industry. However, if at some time in the future serious industrial accidents take place as a result of radiation, the responsible state agencies will be placed in a most embarrassing position unless proper and adequate health and safety regulations are adopted at the state level. Therefore, it can only be concluded that the basic statutes will be amended to provide adequate administrative authority and comprehensive health and safety codes will be forthcoming in the near future, at least in those states that are likely to be participating in the early development of atomic enterprise.[1]

[1] For a brief resume of state activities regarding radiation protection, see Atomic Industrial Forum, Inc., "State Governmental Activities Relating to Radiation Protec-

To the atomic energy entrepreneur the maze of statutes and prospective health and safety regulations imposed and to be imposed by numerous state and local agencies presents a most foreboding picture. If such regulations are inconsistent with each other, as may easily prove to be the case when they are adopted by different state agencies with overlapping jurisdiction, it may even prove to be impossible for an atomic industry to comply faithfully with them. Moreover, the cost of compliance with unduly prolix and unnecessarily duplicating regulations may even preclude economic utilization of atomic energy. The potentialities inherent in the atom appear to be very great indeed, and the prospective benefits to mankind seem well worth attaining. Nevertheless it is a fact that in some of its applications at least, and especially in connection with the development of electric power through use of nuclear heat sources, the possibilities do not yet seem to be economically attainable in most portions of the United States. The new industry has a considerable distance to go before it can enter the market in the low cost power areas on a fully competitive basis. It is therefore little short of imperative that state and local regulation of atomic activities be reduced to the most economical possible basis consistent with proper safeguarding of employees and the general public. It is necessary that clear-cut, direct, and consistent regulatory schemes be adopted, taking full cognizance of the latest technology, and that they be no more stringent than the necessities of health and safety demand. Otherwise, peacetime uses of atomic energy may be unreasonably handicapped.

How can inconsistencies, undue prolixity, and unnecessary duplication of effort be avoided? How can the latest and best technology be brought to bear on the state regulatory process? First of all, a comprehensive, competent, and properly integrated state administrative plan must be established by statute after careful consideration of the various possibilities. Several principal types of state administrative organization seem to be worthy of consideration.

1. Utilization of Existing State Agencies

There are many who will argue in favor of use of existing agencies to cover the atomic field, making arrangements through cooperating committees for informal interchange of ideas, and thus seeking uniformity and avoiding overlapping jurisdiction by cooperative solution

tion," Dec. 1, 1955 (mimeo.). For a compilation of all foreign, federal, and state laws and regulations concerning radiation protection, see World Health Organization, National Laws and Regulations on Radiation Protection (July 1955).

of problems that affect two or more agencies. If this method is adopted, it will doubtless become necessary to amend state legislation to extend the powers of some or perhaps all of the agencies thus to include the new and unique problems raised by atomic enterprise that would otherwise not be covered. Pursuant to this plan of utilizing existing agencies each agency would be responsible for preparing and promulgating the necessary regulations, and each would be empowered to issue the requisite orders to compel compliance with its own jurisdictional field.

If this method of administrative control is utilized, it will be necessary for each of the several agencies, that is, the public utilities commission, the labor department, the health department, the water resources board, and perhaps others, to obtain the services of persons properly trained to deal with radiation health and safety problems. It will not be an easy matter to muster such personnel, for properly qualified candidates are in short supply; and this method will be relatively expensive from the standpoint of the state payroll. Moreover, the elimination of overlapping jurisdiction and conflicting regulations by such informal cooperative means will be only partially successful, and, therefore, although this scheme of administrative organization will preserve existing jurisdictional boundary lines and possibly for that reason would prove to be more acceptable to existing state administrative authorities, it will nevertheless prove to be relatively cumbersome and expensive from the standpoint of the state and burdensome from that of industry. It is this plan which is at present operative in New York State, and it has already resulted in two comprehensive health and safety codes—one issued by the New York Department of Health [2] and the other by the New York State Department of Labor.[3]

2. Utilization of an Official Coordinator

The plan involving the use of existing agencies but adding to the payroll an official "coordinator," as proposed by the New England Committee on Atomic Energy, has been discussed in detail in Chapter V. As indicated there, a number of state legislatures have enacted legislation patterned on this proposal.[4] There is much to be said in favor of the coordinator plan as it has been evolved by the New England Committee on Atomic Energy. It preserves the existing agency authority and

[3] N.Y. Industrial Code No. 38, effective Dec. 15, 1955. The code is set forth in Appendix A, Item 3.

[4] See Part III, c. V, text at notes 14-25.

extends it wherever necessary to cover atomic activities. In addition, it makes full use of the principle of cooperation with the United States Atomic Energy Commission, which, of course, possesses the largest available amount of technical knowledge and understanding of the subject matter. There is much to be said for such cooperation. However, in view of the fact that the coordinator will have no powers of enforcement and no means of compelling agencies to adopt or refrain from adopting any particular policies or practices, his position will be far from enviable. Since his directing authority is *nil,* his effectiveness will be dependent upon his personal powers of persuasion, backed to whatever extent is feasible by the chief executive of the state. This is a dubious device for carrying on complex day-by-day administrative functions.

3. Utilization of a Central Agency Plan

This plan would involve the creation of a new central agency to deal with atomic energy problems wherever they may arise within the jurisdiction of the enacting state. Such a plan has in fact been proposed by the National Committee on Radiation Protection. The report of that committee has been published as a National Bureau of Standards handbook.[5] In the recommended draft of a bill contained in this report, Section 3 provides for the establishment of an independent State Radiation Control Agency in charge of a director assisted by a State Radiation Technical Advisory Board of five members.

By Section 4 of the proposed bill, the agency is given the power "to develop comprehensive policies and programs for the evaluation and determination of hazards associated with the use of radiation and for their amelioration." It is further given the power and the duty of consultation and cooperation with the other agencies of the state and those of the federal government and other state and interstate agencies. It is given authority "to adopt and promulgate such rules and regulations as may be necessary to further the purposes of the act," and it is expressly given authority to incorporate by reference the recommended standards of nationally recognized bodies in the field of radiation protection such as the National Committee on Radiation Protection and the American Standards Association. The agency is also given authority "to issue, modify, or revoke orders prohibiting or abating the discharge of radioactive material or waste into the ground, air, or waters of the state."

[5] National Bureau of Standards Handbook No. 61, "Regulation of Radiation Exposure by Legislative Means," Dec. 9, 1955. The recommended legislation is set forth in Appendix B, Item 2.

It is authorized to render opinions upon plans and specifications relative to the design and shielding of radiation sources. It is empowered to make inspections of radiation sources and to report known or suspected deficiencies.

By Section 5 it is required that every person who generates or produces ionizing radiation or who produces, uses, stores, or disposes of radioactive materials must register in writing with the agency, thus giving the agency the requisite information concerning the existence and utilization of radioactive sources within the state.

By Section 6 the agency is authorized to classify and identify radioactive sources, exposures, and hazards, and to adopt standards of protection. Sections 7 and 10 provide authority for the making of inspections and giving notice of deficiencies, and Sections 8, 9, and 12 are concerned with such matters as proceedings before the agency in the case of violations, the notice that must be given, and the opportunity for a fair hearing before the entry of the order. Suitable provisions are made for review of agency decisions by courts of competent jurisdiction.

A centralized agency such as that proposed by the National Committee on Radiation Protection apparently would cut across the jurisdictional areas of numerous existing state agencies (something that the agencies are not likely to welcome), and the fact that industrial establishments throughout the state would be subject to an additional regulatory agency would create additional problems from the standpoint of industry. Furthermore, the creation of an additional agency with extensive enforcement powers, including the necessity for carrying on a system of inspections, would entail substantial expense and require sizable appropriations from the state treasury. On the other hand, with but a single agency responsible for atomic matters, a maximum of technical expertness would result, and the concentration of authority over atomic energy in such agency would minimize or eliminate the necessity of other state agencies obtaining the services of the all too rare technical experts in the atomic field. Although the National Committee plan has both advantages and disadvantages, it would seem that, everything considered, the latter outweigh the former and the likelihood of such an agency being actually established in any state is remote indeed.

4. A Proposed Specialized Rule-Making Agency Plan

A consideration of the advantages and disadvantages inherent in each of the foregoing plans for the promulgation and enforcement of atomic regulations leads to another proposal—one which will divide the neces-

sary functions into two categories, namely, rule-making in the atomic regulatory field on the one hand, and inspection and enforcement on the other, each in the hands of a separate administrative organization. The task of prescribing and promulgating rules and regulations in the field of atomic energy will involve comprehensive and detailed knowledge of a new field of technology which is changing rapidly and is only partly understood at the present time. Such a task might well be delegated to a small, specially constituted body of experts, selected because of knowledge of atomic energy and skill in working out appropriate rules and regulations to protect employees and the general public from radiation injuries. After promulgation, such regulations could fairly readily be enforced by the existing agencies which already exercise jurisdiction over specified areas of industrial activity within the state, that is, the department of labor, with respect to the health and safety of employees, the department of public health, with respect to matters affecting the general public, the public service commission, with respect to transportation of radioactive materials and other phases of its specialized jurisdiction, the conservation commission, with respect to its areas of interest, and other state and local agencies according to their specified powers and duties.

Some such bifurcation of the functions of state administration in the atomic energy field would, like all of the other plans, have both advantages and disadvantages. On the favorable side, it can be said that the formulation of regulations would be carried on by a specialized, technically competent group, and since only one agency would be exercising the rule-making power, the inconsistencies rendered likely by a multiple rule-making plan would be eliminated. With respect to inspection and enforcement, the utilization of existing agencies, personnel, and procedures would minimize the impact upon the state payroll and would also minimize the number of inspection visits to be received each year by industry subject to inspections. The inspectors of the existing agencies would not be required to possess high technical qualifications in the atomic energy field. Certain rules of thumb and mechanically obtained measurements would suffice for most purposes and a small amount of inservice training would take care of the necessities of the situation. In short, this bifurcation plan would seem to have a considerable number of advantages, not the least of which is it does not disturb the vested interests of existing agencies, a real political fact of life.

On the other hand, uncertainties may result in the interpretation of regulations because of the fact that the agency which makes the regula-

tions is not engaged in the enforcement process. Although there are disadvantages to this plan, we believe it is the best possible approach, at least at this stage of development of atomic energy technology, to the creation of sound methods of handling the governmental problems which are destined to arise from peacetime applications of this new and unique type of energy.

a. Registration versus Licensing

A comprehensively drafted statute setting up an organization for the handling of the regulatory problems of atomic energy will include many items. Among others, it will include a statement of policy. It will certainly include definitions—definitions of radiation, radioactive material, radiation producing equipment, and other items. It will create any necessary new agency and provide for its organization and staff. It will set forth the powers and duties of the agency, including the necessary quasi-legislative and quasi-judicial authority. It will establish requisite procedures pursuant to which agency business is to be handled.

Among the most important items for consideration, however, is the question of utilizing registration or licensing as the method pursuant to which the agency will acquire the requisite information concerning the individual radioactive operations in progress throughout the state. There is, of course, a third possibility—*i.e.*, neither registration nor licensing, but instead reliance may be placed upon the adoption of regulations, the establishment of an adequate inspection scheme, and the use of the injunction and criminal sanctions for enforcement. However, in view of the fact that this third named possibility imposes an undue burden upon state administration, it is likely that legislation in the field will resort to either registration or licensing as a means of placing in the hands of the agency the names, locations, and details of the activities of the various industries subject to regulation.

Registration merely requires the filing of a document stating the facts; licensing requires the issuing of a permit to operate. The former is the less cumbersome device; the latter is by far the more undesirable procedure, for it is necessary for the agency to establish arrangements pursuant to which applications for licenses can be reviewed, hearings held, if necessary, and decisions reached in individual cases. This is burdensome and expensive. Accordingly, both the New England Committee on Atomic Energy and the National Committee on Radiation Protection recommend registration rather than licensing, and all arguments seem to favor this conclusion.

b. Uniformity of Regulation

There is one other substantive feature of the regulatory legislation under consideration which should be mentioned. This is the very great desirability of uniformity of regulation, not only within each state but between states, at least states within a given region, and between the states and the United States. It is a fact that the United States Atomic Energy Commission possesses a more complete understanding of the necessities in the field than does any other agency in the country. Accordingly, it should provide leadership, and state agencies should accept this leadership in connection with the establishment of the standards of health and safety. The states can well afford to take advantage of federal experience and understanding, and in so doing they will not in any sense be surrendering state sovereignty. Indeed, they will be exercising such sovereignty in a wise and effective manner, always with the full recognition of the fact that any state which desires to do so, can depart from the federal standard, either by imposing more stringent requirements, or by way of relaxation, except in cases where federal control has pre-empted the field.

In order to conform with this principle of uniformity, state legislation should authorize state agencies in adopting the detailed health and safety codes to take advantage of United States Atomic Energy Commission regulations, either by incorporating by reference or adopting their substance if that be deemed preferable.

c. Public Utility Rate Regulations

The foregoing discussion has been concerned primarily with health and safety regulations to be adopted by state agencies. Different considerations apply when dealing with public utility rate and service regulation. In regard to these matters, it is clear that the state public utility commission must have plenary control over such matters as the kind and quality of service to be rendered, accounting for capital expenditures, operating costs, fixed charges, depreciation and obsolescence allowances, rate bases, rate schedules, and all of the rest of the apparatus of utility regulation.[6] These matters must be left in the hands of the same agency as that which is given responsibility for the regulation of the rates and services of utilities deriving their energy from conventional sources.

This study of state regulatory measures likely to affect atomic utili-

[6] See remarks of John H. McCarthy, Chairman, Michigan Public Service Commission, "Atomic Energy from the Regulator's Point of View," made before the Section of Public Utility Law, American Bar Association (Aug. 23, 1955).

zation for peaceful purposes is revealing in several significant respects. It reveals the almost incomprehensible maze of existing statutes and regulations. It indicates the need of bringing order out of chaos to protect the public and at the same time facilitate the rapid development of a new and useful area of industrial enterprise. It suggests that imaginative and careful constructive work lies ahead, both in the drafting of the basic statutes to handle the subject matter and in the preparation and promulgation of the detailed codes of regulation that within the near future will be necessary for the protection of public health and safety in this new and unique field of endeavor.

B. A Suggested State Act

1. Introduction

Because the utilization of atomic energy is destined to become increasingly important in the American industrial complex, and radiation sources will be more exhaustively employed in medical and research installations, the states are faced with the questions of what phases of this new force warrant state governmental regulation; what should be the nature of the regulation; and what should be the governmental organizational pattern to accomplish the objectives of any desired regulatory pattern. The answers to these questions are not easily resolved because of the singularly unique manner in which atomic energy has been developed as a military, scientific, technological, industrial, and research instrument under the aegis of the federal government during World War II as a military project and since then by the Atomic Energy Commission in accordance with the provisions of the Atomic Energy Acts of 1946 and 1954.

Setting aside temporarily the purely legal problem of federal preemption, as a practical matter the states are not equipped to engage in the production of special nuclear material, military research and production, large scale reactor research, and major basic scientific research of the type now carried on by the Atomic Energy Commission. To the extent that there remains a need for these types of activities, it would appear that the federal government is the logical repository for these functions. Nor are the states likely in the immediate future to be in a position of being able to cope adequately with the problem of reactor technology and safeguards. Even if the states were able to maintain competent staffs, there probably would be a wasteful duplication of

effort at the individual state level.[7] Despite these observations, however, there remain significant areas of activity, predominantly in the field of health and safety, which are of legitimate state concern. At this juncture it appears that the states must accept certain responsibilities on their own initiative. Otherwise, the federal government will assume the activities with the resulting diminution of the role of the states in the federal system. It is not necessary here to reiterate the arguments against further centralization of regulatory functions in Washington which the states are capable of handling themselves. It is our opinion, however, that these arguments validly apply to certain phases of governmental regulation of atomic energy, and we therefore propose the enactment of comprehensive state legislation to deal with those problems created by atomic energy which the states as a practical matter can assume effectively at this time.

In Chapter V the question of federal pre-emption of health and safety regulation under the Atomic Energy Act of 1954 was examined at length. In the absence of judicial determinations, it is impossible to state precisely those areas of state health and safety regulation of atomic energy activities which will be sustained as a matter of constitutional law. Nonetheless, the expansion or clarification of the role of the states by federal amendatory legislation probably will be achieved only upon demonstration by the states of their willingness to accept their responsibilities, so definitive action by the states is called for at an early date. The powers of the Atomic Energy Commission under existing legislation appear sufficiently broad so that the states could act with AEC approval without raising the question of constitutionality. Section 161 of the Atomic Energy Act of 1954 provides in part:

> In the performance of its functions the Commission is authorized to—
> . . . f. with the consent of the agency concerned, utilize or employ the services or personnel of any Government agency or any State or local government . . . to perform such function on its behalf as may appear desirable. . . .[8]

The AEC has already expressed its desire to receive the cooperation of the states with the ultimate goal of turning over to the states at least a portion of its inspection responsibilities. As explained by Curtis A. Nelson, director of the AEC's Division of Inspection:

> It is the Commission's plan to assist the states in every way possible in the training of personnel, particularly those used

[7] The interstate compact device might be a method of establishing practical, economic staffs for this function.

[8] 42 U.S.C.A. §2201(f).

> in the inspection field dealing with health radiology. We have a number of training programs and expect to have more. Some of the states are themselves setting up training programs. Further, we plan to contact the governor of each state, or his designee, in due course of time, to seek agreement as to how the state and the Commission can productively cooperate.
>
> Ordinarily we would hope to end up by designating a group of isotope licensees to be inspected by the appropriate state agency. This obviously could be done only after the state was equipped with the necessary technical resources.
>
> In order for these plans to work properly and in order to avoid duplication of effort, it would be necessary for the state inspection agency to inspect against federal standards and regulations. It would be necessary that the Commission receive copies of the reports prepared by the state inspectors in the case of each inspection made.
>
> In the event a licensee was found to be in noncompliance with his license, the Commission would expect to take appropriate action. We do not expect to accomplish this type of cooperation overnight, but to plan ahead for a working agreement as each interested state is adequately prepared to take on the additional burden.[9]

In 1956 a bill was introduced in Congress whereby greater power would be given to the states in respect to regulation of health and safety. The bill proposed the addition of a new section of the Atomic Energy Act to read as follows:

> The Commission is authorized and directed to cooperate with the States in the formulation of standards for regulating the health and safety aspects of the atomic energy field within those areas in which the Commission is now authorized. . . . Whenever the Commission receives from the governor of any State a certificate to the effect that the State has an agency competent to exercise jurisdiction in any portion of the health and safety aspects of the Atomic Energy Commission, then the Commission is directed, on the day six months after the date of the receipt of that certificate, to relinquish the jurisdiction of health and safety in the areas specified in the certificate.[10]

Undoubtedly, this bill would receive more favorable consideration if the states had already taken positive action to enter the field of health and safety regulation.

Elsewhere in this volume,[11] the unusual nature of the radiation hazard

[9] Address before Regional Advisory Council on Nuclear Energy, Atlanta, Ga., Feb. 2, 1957; BNA, Atomic Industry Reporter 265.5 (1957).

[10] H.R. 8676, 84th Cong., 2d Sess. (1956).

[11] Part I, c. I.

created by atomic energy has been explained. It cannot be disputed that governmental health and safety regulation is essential in the public interest. Traditionally, the state has been the governmental unit responsible for the health and safety of its citizens. As atomic energy becomes more commonplace than it is today, there appear to be no practical obstacles to the states' undertaking their traditional role in the field. Some may argue that only the federal government can obtain the staff essential for the task because of the shortage of trained scientific and technical personnel. In respect to reactor technology and hazard evaluation, this argument has validity today and may continue to have validity in the relatively near future. However, in respect to the uses of radioactive materials and routine reactor safety measures the states should be able to acquire as adequate staffs for inspection as can the federal government. If the activity remains largely federal, the AEC will have several field offices for the function as any effective inspection system requires almost continuous activity at the installations creating radiation hazards. These staff organizations could be as easily maintained at the state level. On balance, it appears desirable to treat the health and safety aspects of atomic energy in accordance with conventional federal-state lines of authority as rapidly as possible.

Aside from those radiation hazards over which the Atomic Energy Commission exercises health and safety jurisdiction, there are three major radiation sources over which the federal government today exercises no control. These are the radiation hazards created by the utilization of X-ray machines, particle accelerators, and radium. The health problem created by these sources are of utmost importance in the whole radiological health field, and even though the states were to relinquish all regulatory power in those areas covered by federal legislation, it is eminently desirable that the states exercise more complete controls over these radiation sources. In fact, it appears that the greatest health hazards are currently created outside the arena of activities of the Atomic Energy Commission and its licensees. The nature and extent of these hazards have only recently been fully appreciated as a result of the extensive research in problems of radiological health stimulated by the advent of atomic energy. Because only the states today can regulate these hazards, affirmative state action is necessitated. Thus, the states must equip themselves to handle those radiological health problems of sole state concern, thereby making it even more practicable for the states also to take the responsibility for the health and safety of their citizens in relation to those activities licensed and regulated by the AEC.

In addition to the radiation health and safety problem, the states also have a legitimate interest in promoting the development and utilization of atomic energy within their borders and in continually studying existing state laws and regulations with the view of recommending revisions whenever unusual problems arise adversely affecting atomic energy activities. At the present time, it does not appear that any radical innovations will be necessary for the satisfactory accommodation of atomic energy into the legal structure. However, minor but nonetheless significant changes may be required, and the states should have an established organization examining the various potential solutions and recommending the precise nature of desirable revisions of legislation or administrative rules.

As indicated previously in this chapter, any number of state governmental organizational patterns may be employed to accomplish the objectives of an atomic energy state regulatory program. On balance, after full consideration of the purpose of any state program and the role of existing state governmental agencies, we believe that the most adequate state structure would be attained by: (1) creating an office of Director of Atomic Energy Activities; (2) establishing a Radiation Safety Standards Board composed of the Director and the heads of existing state agencies concerned with atomic energy developments; and (3) establishing a Scientific Advisory Committee on Atomic Energy composed of scientifically trained personnel having considerable experience in atomic energy affairs. The Director would be a full-time state official charged with the duties of: (1) acting as adviser to the governor; (2) advising and consulting with the federal government, interstate agencies, other states, and state and local governmental agencies; (3) developing comprehensive state policies and programs for developing atomic energy and for evaluating and determining radiation hazards; (4) acting as chairman and chief administrative officer of the Radiation Safety Standards Board; (5) acting as a non-voting secretary of the Scientific Advisory Committee; and (6) submitting reports to the governor and legislature. In addition, the Director would be authorized to train personnel in matters relating to the promotion of atomic energy and the control of radiation hazards and to utilize the services of other governmental agencies to carry out his duties upon the consent of the agencies involved. The Radiation Safety Standards Board would be charged with the responsibility of adopting radiation safety rules and regulations, developing state policies and programs, making continuing studies, and submitting reports to the governor and

legislature. The Scientific Advisory Committee, to be composed of part-time personnel, would have the duties of reviewing all proposed rules of the Safety Board and submitting written opinions concerning their desirability, and of reviewing policies and programs and providing scientific and technical guidance upon request of the Director. In adopting safety rules, the Safety Board would designate the appropriate state agencies to be charged with the enforcement of the rules.

This recommended organization has the advantages of making atomic energy the major responsibility of a state official, utilizing existing state officials concerned with atomic energy in the rule-making process, affording scientific personnel in an area where expertise is essential, and utilizing existing state agencies to enforce radiation safety rules. Moreover, the cost of establishing such an organization would be minimal since the only full-time personnel required is the Director and such enforcement personnel as may have to be added to existing staffs. The costs of the program could be recovered by the state in the form of registration fees paid by persons utilizing atomic energy and radiation sources. Because the preparation of an appropriate fee schedule requires careful study, the Radiation Safety Standards Board should report its recommendations on the matter to the legislature as soon as possible after the establishment of the agency.

In addition to establishing a state organization charged with general promotional programs in respect to atomic energy and with establishing and enforcing radiation safety rules, state legislative enactments should include appropriate provisions for registration and reporting so that the government is kept fully informed of all hazards within the state and for enforcement of the statutory requirements and any radiation safety rules. Furthermore, existing state agencies should be charged with the responsibility of reporting to the governor and legislature recommended revisions of other laws of the state that may be affected by atomic energy developments.

For the purpose of accomplishing what the authors believe to be a desirable program for state action at this time and in accordance with the conclusions explained previously, the authors have drafted the following Model State Act to Promote Atomic Energy and Control Radiation Hazards.[12]

[12] The model act was drafted in 1957 by Dean E. Blythe Stason, Prof. Samuel D. Estep, Prof. William J. Pierce, and Charles D. Olmsted (research assistant) of the University of Michigan Law School at the request of the Governor of the State of Michigan. After the Governor's Advisory Committee on Atomic Energy made certain changes, the bill was introduced in the Michigan 69th Legislature on Feb. 13, 1958, by

2. Model State Act to Promote Atomic Energy and Control Radiation Hazards: Text and Comments

Section 1. *Declaration of policy; purpose*

(a) The State of ———— desires to encourage widespread participation in the development and utilization of atomic energy for peaceful purposes to the maximum extent consistent with the public health and safety and declares the policy of the state to be:

(1) to cooperate actively in the program established under the United States Atomic Energy Act of 1954, and through the exercise of state powers, to encourage and effect the optimum orderly utilization of atomic energy for peaceful purposes consistent with the public health and safety; and

(2) to the extent that the presence of radiation sources within this state constitute a hazard to the public health and safety, to provide for the exercise of the authority of the state so as to establish a uniform and harmonious system of regulation consistent with the standards of the federal government and other recognized bodies in the field of radiation safety.

(b) The State of ———— recognizes that the impact of atomic energy has resulted in new conditions calling for changes in the laws of the state, and rules issued thereunder, with respect to the public health and safety, working conditions, workmen's compensation, transportation, public utilities, industry, insurance, agriculture, education, and the conservation of natural resources, and therefore declares the purpose of this act to be:

(1) to establish and coordinate responsibility within the state government for the state's part in promotion and control of public and private atomic energy affairs;

(2) to provide technical atomic energy advisory services for the executive and legislative bodies of this state and its political subdivisions;

(3) to provide for promulgation of uniform radiation safety rules and for their coordination with the corresponding regulatory program of the federal government and the recommended standards of nationally recognized bodies in the field of radiation safety;

(4) to provide for the regulation of public and private use and

Reps. Phillips and Copeland, as House Bill No. 303 and referred to the Committee on Ways and Means of the House of Representatives. The bill was not enacted during the 1958 session.

possession of radiation sources within this state in the interest of the public health and safety;

(5) to provide penalties for violations of radiation safety rules and orders; and

(6) to provide for continuing studies as to the need for changes in the law of the state to encourage the optimum development of the peaceful uses of atomic energy.

Comment

This general purpose section has a twofold purpose: (1) to establish a general legislative policy; and (2) to declare the public interest in atomic energy and to indicate the desirability of regulation of radiation hazards consistently with standards employed by the federal government and other recognized bodies in the field of radiation safety.

Section 2. *Definitions*

As used in this Act—

(a) "Advisory Committee" means the Scientific Advisory Committee on Atomic Energy established by Section 5 of this Act.

(b) "Atomic energy" means all forms of energy released in the course of nuclear fission or nuclear transformation.

(c) "Byproduct material" means any radioactive material (except special nuclear material) yielded in or made radioactive by exposure to the radiation incident to the process of producing or utilizing special nuclear material.

(d) "Director" means the Director of Atomic Energy Activities appointed under the authority of Section 3 of this Act.

(e) "Government agency" means any political subdivision or any officer, department, bureau, division, board, authority, agency, commission, or institution of this state or any political subdivision, except the judicial branch and the legislature.

(f) "Operator" means any individual who manipulates the controls of a utilization or production facility.

(g) "Person" means any individual, partnership, association, joint-stock company, public or private corporation, or government agency.

(h) "Production facility" means any equipment or device capable of the production of special nuclear material in such quantity as to be of significance to the common defense and security of the United States, or in such manner as to affect the health and safety of the public.

(i) "Radiation" means gamma rays and X-rays, alpha and beta particles, high speed electrons, neutrons, protons, and other nuclear particles or electromagnetic radiations capable of producing ions directly or indirectly in their passage through matter, but does not include sound or radio waves, or visible, infra-red, or ultra-violet light.
(j) "Radiation safety rule" means every rule, regulation, or order of general application, including any amendment or repeal thereof, adopted and promulgated by the Safety Board pursuant to this Act.
(k) "Radiation source" means any radioactive material or any instrument, equipment, machine, installation, or other device used for the production of radiation.
(l) "Radioactive material" means any material, solid, liquid, or gas, that emits radiation spontaneously.
(m) "Safety Board" means the Radiation Safety Standards Board established by Section 4 of this Act.
(n) "Source material" means uranium, thorium, or any other material which the Safety Board declares by rule to be source material after the United States Atomic Energy Commission by regulation has made a similar determination; or ores containing one or more of the foregoing materials, in such concentrations as the Safety Board declares by rule after the United States Atomic Energy Commission by regulation has made a similar determination.
(o) "Special nuclear material" means (1) plutonium and uranium enriched in the isotope 233 or in the isotope 235, and any other material which the Safety Board declares by rule to be special nuclear material after the United States Atomic Energy Commission by regulation has made a similar determination; or (2) any material artificially enriched by any of the foregoing.
(p) "Utilization facility" means any equipment or device, except an atomic weapon, capable of making use of special nuclear material in such quantity as to be of significance to the common defense and security of the United States, or in such manner as to affect the health and safety of the public, or peculiarly adapted for making use of atomic energy in such quantity as to be of significance to the common defense and security of the United States.

Comment

The meanings of the terms used in this act are identical or consistent with those of the Atomic Energy Act of 1954, or, where additional terms are included, with those used by the National Committee on Radi-

ation Protection and Measurement. Consistency is particularly important because atomic energy affairs have such broad interstate and international ramifications and are subject to both federal and state control.

The definition of "atomic energy" is taken from the federal statute;[13] however, for purposes of this act, it is used primarily in connection with the promotional program and not with health and safety regulation. It should be noted that while the meaning of this term is sufficiently broad to include both fission and fusion processes, it does not include all forms of energy which can give rise to harmful radiations.

The key terms used in connection with the health and safety program are "special nuclear material," "byproduct material," "source material," "production facility," "utilization facility," "operator," "radiation," "radiation source," and "radioactive material." The first six terms are used in the Atomic Energy Act of 1954,[14] and the federal definitions have been followed insofar as possible, or necessary. However, because these terms are not entirely satisfactory, in light of the state's broader radiation health and safety problem, they are only used in Section 8(a) which prohibits activities for which an AEC license is required unless such a license is obtained. It was necessary to modify the definitions of several of these terms to avoid the possibility of an unconstitutional delegation of state power to the AEC.[15]

The definition of the term "radiation" follows the NCRPM definition;[16] however, certain changes were deemed advisable to avoid possible omission. The definition is sufficiently broad to cover the possible discovery of new types of injurious radiation.

Because of the fact that some sources of radiation, such as radium and other spontaneous radiation emitters, may constitute hazards to health irrespective of how or whether they are being used, and whether they are stationary or in transport, it was necessary to include both a general term, "radiation source," which includes both materials and machines, and a more limited term, "radioactive material." As defined,

[13] 68 Stat. 923 (1954), 42 U.S.C.A. §2014(c).

[14] 68 Stat. 922-4 (1954), 42 U.S.C.A. §2014.

[15] Under the terms of this act, the Safety Board has the power (within prescribed limits) to determine what is "source material" and "special nuclear material." It is believed that the imposition of a limitation on this power, which would first require a similar determination by the AEC, does not involve an unconstitutional delegation of state power to a federal agency.

[16] The term "radiation" is defined by the NCRPM as "gamma rays and X-rays, alpha and beta particles, high-speed electrons, neutrons, protons, and other nuclear particles; but not sound or radio waves, or visible, infrared, or ultraviolet light." National Bureau of Standards Handbook 61 at 27.

"radiation source" provides broader coverage than would be achieved by using only those terms defined in the Atomic Energy Act of 1954.

Section 3. *Director of Atomic Energy Activities: appointment, qualifications, term, salary, duties, and powers*

(a) The Governor, with the approval of the Senate, shall appoint a person having training and experience in radiation protection, or a related science, to be Director of Atomic Energy Activities. In submitting any nomination for the position of Director to the Senate, the Governor shall set forth the training, experience, and other qualifications of the nominee. The Director shall serve at the pleasure of the Governor, and he shall receive an annual salary of $———. The Director shall not engage in any business, vocation, or employment other than that of serving as Director of Atomic Energy Activities. The Department of ———— shall provide suitable office facilities for the Director.

(b) The Director shall—

(1) act as adviser to the Governor on all atomic energy matters and, as deputy to the Governor, advise, consult and cooperate with the federal government, interstate agencies, other states, government agencies of this state, and other persons and groups, public and private, in furtherance of the purposes of this Act;

(2) with the consent of the Governor, represent the interest of the state in communications, negotiations, transactions, and other dealings with the federal government, interstate agencies, and other states concerning atomic energy and radiation safety matters;

(3) submit reports at least once each year, and at such other times as the Governor may direct, to the Governor and to the Legislature concerning developments in atomic energy and radiation safety matters and make such recommendations as should be considered by them;

(4) serve as a member of (*e.g.,* the commission of economic development);

(5) serve as chairman and chief administrative officer of the Safety Board;

(6) serve as secretary, without vote, of the Advisory Committee;

(7) develop comprehensive policies and programs—

(a) for the evaluation and determination of radiation hazards to guide the Safety Board and government agencies charged with the enforcement of radiation safety rules; and

(b) for the development and utilization of atomic energy for

peaceful purposes to guide (*e.g.*, the commission of economic development) and other government agencies;

(8) receive and maintain the following records, reports, and written opinions, and disseminate the information therein contained to any interested and affected government agency in accordance with the rules issued by the Safety Board:

(a) registration records required by Section 8 of this Act and the rules promulgated by the Safety Board;

(b) other reports required to be submitted to the Director by Section 8 of this Act and the rules promulgated by the Safety Board; and

(c) written opinions of the Advisory Committee required to be submitted by Sections 4 and 5 of this Act; and

(9) collect and disseminate information relating to the promotion of atomic energy for peaceful purposes and radiation protection to any government agency and to any interested person or group.

(c) The Director may—

(1) accept and administer loans, grants, or other funds and gifts from the federal government and from other sources, public and private, for carrying out the purposes of this Act;

(2) encourage, participate in, or conduct studies, investigations, research, and demonstrations deemed necessary and desirable to further the purposes of this Act;

(3) employ, train, and prescribe the powers and duties of such persons as may be deemed necessary and desirable to assist him in carrying out the provisions of this Act; and

(4) train and instruct the personnel of other government agencies in matters relating to the promotion of atomic energy and the control of radiation hazards upon the request of the government agencies concerned.

(d) The Director shall utilize the services and personnel of other government agencies to assist him in carrying out his duties under this Act insofar as practicable and with the consent of the government agencies concerned.

Comment

Section 3 creates the office of Director of Atomic Energy Activities to be filled by a person who is experienced in radiation protection or a related science and who will devote his full energies and time to the duties of the office. Atomic energy is of sufficient importance to the

state to warrant making the problems of radiation protection and promotional programs the responsibility of a state official. Moreover, coordination of state activities is desirable in at least three senses: (1) coordination of the policies, regulations, and actions of the several interested state agencies and officers; (2) coordination of the state program with those of the federal government and other states; and (3) coordination of the promotional and regulatory phases of the state program. Essential coordination can be achieved through the creation of the office of the Director.

The duties imposed under Section 3(b) and designed to establish his position as the state official primarily responsible for state atomic energy affairs include: (1) acting as adviser to the governor and, as deputy to the governor to advise, consult, and cooperate with the federal government, interstate agencies, other states, and state and local governmental agencies and private groups; (2) representing the state, with consent of the governor, in negotiations with agencies outside the state; (3) reporting to the governor and legislature; (4) serving as a member of the state's economic or industrial development commission; (5) serving as chairman of the Radiation Safety Standards Board; (6) serving as secretary of the Scientific Advisory Committee; (7) developing comprehensive state policy and programs for the determination and evaluation of radiation hazards and for atomic energy promotional programs; (8) receiving and maintaining records, reports, and opinions required under the act; and (9) collecting and disseminating information relative to atomic energy affairs.

The most important duty of the Director is that of chairman and chief administrative officer of the Radiation Safety Standards Board. As the only full-time member and the only member required to have experience in radiation protection, it is contemplated that the Director will play a major role in the development and promulgation of radiation safety rules and standards. Although enforcement of the rules is the responsibilty of other state agencies under the act, the general powers are sufficiently broad to assure that the Director will be informed of enforcement problems so that whatever additional action is called for can be taken by either the Director or the Radiation Safety Standards Board. Knowledge of new problems will be available by reason of the fact that the Director is responsible for receiving and maintaining all records, reports, and opinions required under other sections of the act.

At this time one of the most compelling needs is the availability of a state official to represent the state in negotiations with the AEC. When-

ever problems of state-federal relations arise today, the AEC is faced with the task of negotiating with several state officers, none of whom may represent all state and local agencies. As a result, the AEC may avoid negotiations merely because of the complexities involved. With the approval of the governor under Section 3(b)(2) the Director can act as representative of the state in negotiations. It should be noted, however, that the Director cannot commit the state to any particular program affecting another state agency without that agency's approval or definitive legislative or executive action.

The discretionary powers of the Director include: (1) accepting and administering loans, grants, or gifts; (2) participating in or conducting studies, investigation, and research; and (3) employing and training personnel to assist him in carrying out his duties. Since the enforcement of radiation safety rules is the responsibility of other state agencies, it is expected that the Director will be assisted by a rather small staff organization.

Section 4. *Establishment of the Radiation Safety Standards Board; composition, powers, and duties*

(a) There is hereby established a Radiation Safety Standards Board consisting of (1) the Director of Atomic Energy Activities, who shall be chairman, (2) (*e.g.*, the state health commissioner), (3) (*e.g.*, the public service commissioner), (4) (*e.g.*, the labor commissioner), and (5) (*e.g.*, the state police commissioner). The members shall have equal responsibility and authority. The powers and duties of the Safety Board shall be exercised only in accordance with a majority vote of the entire membership.

(b) The Safety Board shall—

(1) develop comprehensive policies and programs for the evaluation, determination, and control of radiation hazards in this state;

(2) adopt and promulgate, in accordance with Section 6 of this Act and as may be deemed necessary and advisable to protect persons and property, all radiation safety rules relating to (a) radiation safety standards, (b) enforcement of radiation safety standards, (c) registration, keeping of records, and submission of reports in connection with radiation sources, and (d) dissemination of information contained in the records and reports to government agencies;

(3) make continuing studies and submit reports, from time to time, to the Governor and to the Legislature concerning radiation dis-

aster problems and the need for changes in the laws of the state to protect persons and property; and

(4) make a study and submit a report to the Governor and to the Legislature concerning the establishment of a schedule of gradual annual registration fees for radiation sources to defray the costs of the administration and enforcement of this Act, including the radiation safety rules promulgated by the Safety Board.

(c) The Safety Board may—

(1) order the Director to encourage, participate in, or conduct studies, investigations, training, research, and demonstrations relating to the control of radiation hazards, the measurement of radiation, the effects on health of exposure to radiation, and related problems;

(2) render opinions, upon request, concerning such plans and specifications on the design and shielding of radiation sources as may be submitted before or after construction, for the purpose of determining the possible radiation hazard; and

(3) order the Director to convene the Advisory Committee or to request written opinions from its members in connection with any matter relating to radiation safety.

Comment

Section 4 creates the Radiation Safety Standards Board which is charged primarily with the task of promulgating radiation safety rules. Aside from purely political or economic considerations, it appears desirable that the heads of other state departments or agencies having enforcement responsibilities under the act should have the power to adopt radiation rules. These representatives of other agencies will be able to assess the capabilities of their agencies and are more qualified to determine the respective jurisdictions of the state agencies concerned with the various radiation safety problems. Although these officers may not be trained specifically in radiation safety, their broader regulatory experience is invaluable. The task of training is offset by the presence of the Director of Atomic Energy Activities and the availability of the Scientific Advisory Committee for consultation and recommendations concerning the content of specific rules. Although all state agencies having an interest in atomic energy affairs are not included in the recommendations, it is believed that the membership should not exceed five in order to prevent the Board from becoming unwieldy as an administrative body.

Section 4(b) imposes upon the Board the duties of: (1) developing

comprehensive policies and programs for the evaluation, determination, and control of radiation hazards; (2) promulgating rules relating to radiation safety standards, enforcement of radiation safety standards, registration, maintenance of records and reports, and dissemination of information; (3) making studies and reports to the governor and legislature concerning radiation disaster problems; and (4) studying the problem of registration fees and reporting thereon.

The Safety Board is authorized to direct one or more state agencies to be responsible for the enforcement of specific radiation safety rules. It is expected, of course, that unnecessary duplications will be avoided, not only in the interest of economy, but also to minimize the burdens imposed on the persons using radiation sources. Although the Director is charged with the responsibility of receiving and maintaining records and reports, the Safety Board is given the power to adopt regulations affecting this responsibility.

The "radiation disaster" problem, including both war disaster and major reactor mishaps, requires careful study and perhaps the enactment of new legislation or even constitutional revision. Among the possible types of action that may be necessary in the event of a radiation disaster are mobilization of the state's military and police forces, large-scale evacuation efforts, seizure and destruction of contaminated private property, and decontamination of property and persons. To date, the radiation disaster problem has not received careful deliberative efforts at either the federal or state levels, and it appears desirable that some state agency should undertake the task of studying the problems involved and making recommendations as to feasible courses of action.

In view of the fact that many states have fiscal problems in establishing new governmental agencies, some method of financing of a state atomic energy program is essential. Since the users of radiation sources may be in a position of being able to pass the costs of a radiation safety program to the consumer of the products, it appears feasible that a major percentage of the costs to the state could be recovered through registration fees. The precise form the fee schedule should take, however, cannot be accurately ascertained until the nature of radiation sources within the state is compiled. The registration requirements under the act will provide essential information as to the potential hazard created by each radiation source and the probable scope of state supervision and inspection. On the basis of this information the Safety Board will be capable of making explicit recommendations concerning the establishment of an equitable fee schedule.

Under Section 4(c) the discretionary powers of the Safety Board are set forth. Because existing governmental agencies will enforce radiation safety rules, those agencies will require considerable assistance from qualified persons to instruct personnel in procedures and measurements. Furthermore, as new uses of radiation emerge, a qualified person should make an investigation to determine the best method of protecting the public health and safety against possible hazards. It is therefore suitable for the Director, as a qualified person in radiation safety, to undertake these tasks at the request of the Board which is representative of the state agencies.

Although the Board is not a body of radiological safety experts, it has the necessary means available to render opinions, upon request, concerning plans and specifications of installations employing radiation sources. Although the recommended statute of the National Committee on Radiation Protection and Measurement makes this requirement mandatory, in some instances, particularly in respect to new reactor designs, the state personnel will not be qualified to render opinions. The opinions, although purely advisory and not binding, in respect to installations where the radiation problems are well understood would, of course, be helpful to the potential user of a radiation source in that expensive alterations to conform to state standards may be avoided. Two arguments have been advanced in opposition to the creation of even a discretionary power to render opinions. First, it has been contended that during the initial phases of a state program that the state officials involved will be so burdened with other duties that it is inadvisable to assign even a discretionary power. Secondly, the question of the possible effect on litigation regarding injuries to persons and property in the event of a failure to seek an advisory opinion has been raised. On balance, it has been concluded that the discretionary power should be granted to the Board in the belief that some major assistance could be rendered users even during the earlier period of the state program and that the impact upon tort litigation will be relatively insignificant.

Section 5. *Establishment of the Scientific Advisory Committee on Atomic Energy; composition, qualifications, appointment, term, compensation, functions, and duties*

(a) There is hereby established a Scientific Advisory Committee on Atomic Energy to consist of five persons, who each have training and experience in a science related to the development and utilization of atomic energy for peaceful purposes, and representing, as a group,

the broadest possible range of training and experience in atomic energy matters. The members of the Advisory Committee shall be appointed by the Governor for terms of five years, except that initial appointments and filling of vacancies shall be so made that the term of one appointed member expires each year. The members of the Advisory Committee, while engaged in the work of the Advisory Committee, shall be entitled to receive compensation at $———— per diem and reimbursement for actual and necessary traveling and subsistence expenses. The Advisory Committee shall meet or submit written opinions, or both, at the request of the Director.

(b) Within thirty days after submission of a proposed radiation safety rule by the Safety Board, as provided in Section 6 of this Act, the Advisory Committee shall submit a written opinion to the Director as to the desirability of the rule. When requested by the Director, the Advisory Committee also shall (1) review the policies, programs, and rules developed and promulgated pursuant to this Act; (2) make such recommendations as are deemed necessary and desirable; and (3) give technical advice and assistance on matters relating to the promotion and control of atomic energy in this state.

Comment

Section 5 creates the Scientific Advisory Committee on Atomic Energy, composed of five persons trained in sciences related to the development and utilization of atomic energy. The Committee is to be composed of part-time personnel paid on a per diem basis so that highly qualified persons can be attracted to accept the positions.

Section 5(b) requires the Advisory Committee to submit written opinions on proposed safety rules within thirty days after their submission by the Radiation Safety Standards Board. Through this device, technologically competent review of proposed rules will be achieved. The Safety Board, however, has final authority in deciding the precise nature of radiation safety rules. Upon request by the Director, the Advisory Committee also is directed to review the state policies and programs, to make suitable recommendations, and to give technical advice and assistance on atomic energy matters.

While the act bestows final authority upon the Safety Board to promulgate relations, this subsection is designed to assure that they are necessary and adequate. In effect, the Advisory Committee is an entirely independent board of technical experts which not only advises and assists the Safety Board in establishing radiation safety standards

and issuing regulations, but also must publish its opinions on the desirability of each rule before it becomes effective. These opinions are received and kept on file by the Director, and are intended to indicate how well the regulations conform with current scientific thought.

It should be noted that the Advisory Board is not limited to giving advice and assistance on radiation safety matters. Through the Director, this body is available to give technical advice and assistance on any atomic energy or radiation matter to any agency of the state government.

Section 6. *Promulgation of radiation safety rules*

(a) The Safety Board shall have the exclusive authority in this state to adopt and promulgate radiation safety rules relating to (1) radiation safety standards, (2) enforcement of radiation safety standards, (3) registration, keeping of records, and submission of reports in connection with radiation sources, and (4) dissemination of information contained in the records and reports to government agencies. In adopting and promulgating a radiation safety rule, the Safety Board shall designate the government agency or agencies which shall enforce the rule. In making the enforcement agency selection, the Safety Board shall give due consideration to the technical qualifications and to the enforcement powers and jurisdiction of the individual government agencies.

(b) Except where the rules and standards of federal agencies or nationally recognized bodies in the field of radiation safety are deemed inadequate for this state, the Safety Board, in the interest of uniformity, shall make its radiation safety rules consistent with federal rules or, in the case of radiation hazards not regulated by federal agencies, with the recommended rules and standards of nationally recognized bodies in the field of radiation safety, such as the National Committee on Radiation Protection and Measurement or the American Standards Association.

(c) In promulgating radiation safety rules the Safety Board shall comply with the provisions of (*e.g.,* the state administrative procedure act). Not less than thirty days before final approval of a proposed radiation rule, the Safety Board shall submit the proposed rule to the Advisory Committee for its review and recommendations, except that, upon his finding of emergency need, the Governor may waive all or any part of the thirty day period.

Comment

Section 6(a) establishes the jurisdiction of the Radiation Safety Standards Board in respect to radiation safety rules and authorizes the

Safety Board to determine enforcement agencies by rule. The Safety Board is given exclusive jurisdiction within the state to promulgate radiation safety rules relating to radiation safety standards, to enforce radiation safety standards, registration, record maintenance, and submission of reports, and dissemination of information contained in records and reports to government agencies. In selecting the enforcement agency, the Safety Board is to consider the technical qualifications of the state agencies and the powers and jurisdiction of the state agencies. However, the section does not impose any rigid requirements in selecting enforcement agencies so that complete flexibility is possible.

Section 6(b) recognizes the desirability of uniformity in the field of radiation safety standards and therefore directs the Safety Board to adopt, whenever possible, regulations consistent with standards employed by the federal government or nationally recognized bodies in the field of radiation safety.

Section 6(c) requires the Safety Board to comply with the provisions of the state administrative procedure act in relation to rule-making. In addition, the Safety Board is required to submit its proposed rules to the Scientific Advisory Committee for review and recommendations thirty days before final approval. The governor is given the power to waive all or part of the thirty day period. If a state does not have a state administrative procedure act, it may be desirable to add provisions relating to the rule-making process including notice of proposed rule-making to interested persons, opportunities for interested persons to submit written opinions, and hearings.

Section 7. *Enforcement of radiation safety rules; powers and duties of enforcing government agencies*

(a) Only those government agencies authorized by the Safety Board, pursuant to Section 6(a) of this Act, shall have the power and the duty to enforce the radiation safety rules of this state. The enforcing government agencies shall receive from the Director such information and technical advice and assistance as he is capable of providing and as is necessary for the enforcement of radiation safety rules.

(b) The enforcing government agency shall have the power to enter at reasonable times upon any public or private property wherein a radiation source exists for the purpose of inspecting and investigating conditions and examining records relative to the purposes of this Act and the radiation safety rules the government agency is authorized to enforce. If such inspection and examination indicates that the radiation source does

not constitute a hazard to persons and property and is in compliance with radiation safety rules, the owner, operator, or user shall be so notified in writing by the government agency.

(c) When, in connection with a radiation source within its enforcement jurisdiction, a government agency finds that an emergency exists requiring immediate action to protect persons and property from radiation hazards, it shall, without notice or hearing, issue an order reciting the existence of such emergency and requiring that such action be taken as it deems necessary to meet the emergency. Any person to whom such order is issued shall comply immediately. On application to the government agency, the person to whom the emergency order has been issued shall be afforded a hearing by the government agency within thirty days and in accordance with the provisions of (*e.g.,* the state administrative procedure act). On the basis of such hearing the government agency, in its final order, may continue such emergency order in effect, revoke it, or modify it.

(d) When, in connection with a radiation source within its enforcement jurisdiction, a government agency finds that there are reasonable grounds to believe that a radiation hazard exists or that there is a continuing violation of radiation safety rules, but which does not constitute an emergency requiring immediate action to protect persons and property, it shall give written notice to the alleged violator or violators specifying the grounds of the complaint and the action to be taken to correct the alleged violation. This notice shall require that the alleged violations be corrected or that the alleged violator or violators appear before the agency at a time and place specified in the notice. The notice shall be delivered not less than thirty days before the time set for the hearing. Before any order issued under this subsection shall become final, the government agency shall afford the alleged violator or violators an opportunity for hearing, and, on the basis of evidence produced at the hearing, shall enter such final order as will best effectuate the purposes of this Act and the radiation safety rules it is authorized to enforce. Written notice of such final order shall be given to the alleged violator or violators and to such other persons as may have appeared at the hearing and made written request for notice of the order. The notice and hearing required by this subsection shall conform to the provisions of (*e.g.,* the state administrative procedure act). The final order of the government agency under this subsection shall become binding on all parties to the hearing within thirty days after notice of it has been sent to the parties, unless it shall be appealed to the courts as provided in (*e.g.,* the state administrative procedure act).

(e) In the event of a violation of an emergency order or a final order, the government agency shall immediately apply to the circuit court of the county wherein the violation occurs for an order to restrain and enjoin the persons responsible for such violation. In any action for an injunction brought pursuant to this subsection, any findings of the government agency after hearing or due notice shall be prima facie evidence of the fact or facts found therein. No bond shall be required when such injunctive relief is sought upon the application of the government agency, the attorney general, or the prosecuting attorney of any county.

(f) Any person aggrieved by a final order issued by a government agency authorized to enforce radiation safety rules is entitled to judicial review thereof in the circuit court in the county wherein the person resides or has a place of business in the state or in the circuit court for ———— County, within thirty days after personal service of the final decision of the government agency or within thirty days after the mailing thereof, if notice is given by mail. Judicial review of this final decision shall be controlled by the provisions of (*e.g.*, the state administrative procedure act).

(g) Government agencies acting under the authority of this section shall give written notice to the Director of all emergency and final orders within ——— days after issuance and of all applications for injunction within ——— days after filing with the court.

(h) Except as specifically provided in this section, nothing in this Act shall be construed as extending any government agency's jurisdiction over persons, property, or activities within this state.

Comment

Section 7 establishes the procedures and methods for the enforcement of radiation safety rules. Subsection (a) defines the jurisdiction of the enforcing governmental agencies and provides that the Director shall render technical advice and assistance to the agencies. Subsection (b) authorizes the enforcing agency to inspect and investigate facilities. In addition, the agency is to give written notice to the owner, operator, or user of a radiation source if it finds that the radiation source does not constitute a hazard and that there is compliance with the radiation safety rules.

Section 7(c) authorizes the enforcing agency to enter emergency orders whenever immediate action is necessary to protect persons and property. Although the emergency orders may be issued without notice and hearing, a hearing within thirty days is required upon application

of the affected person. Meanwhile, compliance with the order is required. The hearing procedure is governed by the applicable provisions of the state administrative procedure act. After the hearing, the government agency may enter a final order continuing, revoking, or modifying the emergency order.

Section 7(d) authorizes the enforcing agency to give written notice of alleged violations whenever an emergency situation does not exist. The notice is to specify the nature of the hazard or violation and the action deemed necessary by the agency to correct the violation. A hearing is required before the entry of a final order, and after entry thereof, judicial review may be obtained in accordance with the provisions of the applicable state administrative procedure act. If the state does not have general legislation covering administrative procedures, the statute should be amended to include basic provisions relating to notice, hearing, and judicial review.

Section 7(e) authorizes the government agency to apply to the appropriate state court for necessary injunctions whenever there is a continuing violation of an emergency or final order. The findings of the government agency are made prima facie evidence of the facts, and the government agency is relieved of any bonding requirements when seeking injunctive relief. Section 7(f) assures that any aggrieved person may receive judicial review of agency action which is final. Section 7(g) requires the enforcing government agency to give written notice of any emergency or final order to the Director so that he may be kept currently informed of all enforcement problems. The Director will be able to inform the Safety Board of any problems requiring revision of rules or statutes. Section 7(h) assures that the statute will not be construed as extending the jurisdiction of any government agency except as specifically provided.

Section 8. *United States licenses or permits required; registration of radiation sources required; compliance with radiation safety rules required*

(a) No person shall manufacture, construct, produce, use, transfer, acquire, or possess any source material, byproduct material, special nuclear material, production facility, or utilization facility, or act as an operator of a production or utilization facility within this state unless he shall have first obtained a license or permit for the activity from the United States Atomic Energy Commission, if pursuant to the Atomic Energy Act of 1954, as amended, a license or permit is required.

(b) No person shall produce radiation or produce, use, transport, store, or dispose of radioactive materials, or modify, extend, or alter such activities, except in accordance with the provisions of this Act, the radiation safety rules promulgated thereunder, or emergency or final orders issued to such person by a government agency authorized to enforce radiation safety rules.

(c) Subject to exceptions provided by the rules of the Safety Board, every person who produces radiation or produces, uses, transports, stores, or disposes of radioactive materials, shall register annually in writing with the Director in accordance with rules established and on forms provided by the Safety Board. If the person modifies, extends, or alters such activities, he shall amend his registration accordingly. The Safety Board may by rule exempt from the requirements of registration persons who produce minimal quantities of radiation or who produce, use, transport, store, or dispose of minimal quantities of radioactive materials which the Safety Board determines have no substantial effect on the public health and safety.

Comment

Section 8 requires compliance with the licensing and permit provisions of the Atomic Energy Act of 1954, compliance with radiation safety rules and lawful orders entered in accordance with the provisions of the act, and registration of radiation sources. Section 8(a) is similar to Section 2 of the New England Model Act, and, while perhaps not essential, the provision may serve a useful purpose in the event that constitutional difficulties prevent enforcement of existing AEC licensing practices. Section 8(b) establishes the positive requirement that each person producing radiation or producing, using, transporting, storing, or disposing of radioactive materials comply with radiation safety rules and emergency or final orders issued in accordance with the provisions of the act.

Section 8(c) requires the same persons to register annually with the Director and to amend registrations if activities are modified. The Radiation Safety Standards Board is empowered to exempt persons from the registration requirements if the Board determines that there is no substantial public health and safety problem involved. The registration requirement assures that the Board will have knowledge of all radiation hazards. Although the AEC now informs state officials of the issuance of federal licenses, the registration requirement is essential to ascertain the nature of radiation hazards not covered by federal legis-

lation. The Safety Board is to establish rules for registration and, in respect to a single radiation source, more than one person may be required to register if the Board finds such a requirement beneficial. This may be particularly desirable whenever, for example, the owner of the radiation source has no control over the utilization of the source.

Section 9. *Penalties*

(a) Any person who violates any provision of Section 8 of this Act or any radiation safety rule promulgated pursuant to this Act shall, upon conviction, be subject to a fine of not more than $————.
(b) Any person who willfully violates any provision of Section 8 of this Act or any radiation safety rule promulgated pursuant to this Act shall, upon conviction, be subject to a fine of not more than $———, or imprisonment for not more than ————, or both. Each day on which such violation occurs shall constitute a separate violation.
(c) Any person who violates any emergency or final order issued pursuant to Section 7 of this Act by a government agency authorized to enforce radiation safety rules shall, upon conviction, be subject to a fine of not more than $————, or imprisonment for not more than ———, or both. Each day on which such violation occurs shall constitute a separate violation.

Comment

Section 9 establishes criminal penalties for three types of offenses: (1) simple violations of radiation safety rules, (2) willful (*i.e.*, knowing and intentional) violations of radiation safety rules, and (3) violations of emergency or final orders. As to the second and third types, each day on which a violation occurs constitutes a separate offense.

While the amount of the fines and the duration of the imprisonments is not specified, it is felt that the penalties should increase in the order in which the offenses are listed. On this matter, however, it should be pointed out that the state, in prescribing the magnitude of the penalties, would be well advised to consider those established by the Atomic Energy Act of 1954, for the Supreme Court has indicated that state penalties in excess of those provided by federal laws concerning the same offense are a factor to be considered in deciding in favor of federal pre-emption.[17] Under federal law a willful violation, or conspiracy to violate, a radiation safety regulation of the AEC may ". . . be pun-

[17] See the dissenting opinion in California v. Zook, 336 U.S. 725, 69 S. Ct. 841 (1948).

ished by a fine of no more than $5,000 or by imprisonment for not more than two years, or both." [18]

Section 10. *Conduct of studies concerning changes in laws and rules with a view to the promotion of atomic energy uses*

The following state agencies are directed to initiate and to pursue continuing studies as to the need for changes in the laws and rules administered by them in order to encourage the optimum development of the peaceful uses of atomic energy in this state, and, on the basis of such studies, to make such recommendations to the Governor and to the Legislature for the revision of laws as may appear necessary and appropriate:

(a) The department of economic development, particularly as to opportunities for atomic energy industries.

(b) The department of public instruction, particularly as to the need and facilities for scientific instruction and training.

(c) The department of agriculture, particularly as to the uses of atomic energy in agriculture.

(d) The department of insurance, particularly as to the insurance of persons and property from hazards to life and property resulting from atomic energy development.

(e) The department of workmen's compensation, particularly as to the time and character of proof of claims of radiation injuries and the extent of compensation allowable therefor.

(f) The public service commission, particularly as to the participation by public utilities in projects and research looking to the development of production and utilization facilities of commercial and industrial use.

(g) Such other government agencies as the Governor may direct and for the purposes specified by him.

Comment

With respect to a similar provision the New England Committee on Atomic Energy stated:

> This section is premised on the supposition that study will disclose a need for a number of changes in existing laws and regulations to take care of new conditions created by atomic development for peaceful uses. The statutory directive will justify the use by the several departments and agencies of their personnel in making the studies thus called for, a step that some of them might otherwise be reluctant to make.[19]

[18] 68 Stat. 958 (1954), 42 U.S.C.A. §2273.

[19] Atomic Energy and New England 65 (1955).

Section 11. *Non-applicability of this Act*

(a) Nothing in this Act, or in the radiation safety rules promulgated pursuant to this Act, shall be construed to apply to installations owned or operated by the federal government or to radiation sources operated by the federal government, unless such application is specifically authorized by the federal government.

(b) Nothing in this Act, or in the radiation safety rules promulgated pursuant to this Act, shall be construed to limit the kind or amount of radiation that may be intentionally applied to a person for diagnostic or therapeutic purposes by, or under the direction of, a duly licensed member of the healing professions.

Comment

Section 11(a) recognizes the overriding power of the federal government in relation to its own activities and property. Radiation sources owned and operated by other than the federal government but for the federal government are not exempted, but federally owned installations operated by private contractors are exempted.

Section 11(b) prevents any restriction upon the kind or amount of radiation intentionally employed for diagnostic or therapeutic purposes by persons duly licensed under state law. However, radiation safety rules may be established for medical radiation sources in respect to shielding, the storage of radioactive isotopes, exposure to personnel, and other matters. Only the exposure to which a patient may be submitted for diagnostic or therapeutic purposes is exempted.

Section 12. *Existing rules preserved; pending proceedings*

(a) Until a superseding radiation safety rule has been promulgated by the Safety Board, all health and safety laws or rules concerning radiation shall remain in effect and shall be enforced in the same manner as if this Act had not been adopted.

(b) All proceedings pending and all rights and liabilities existing, acquired, or incurred, at the time this Act takes effect, are hereby saved, and such proceedings shall be consummated under and according to the law in force at the time such proceedings are or were commenced. This Act shall not be construed to alter, affect, or abate any pending prosecution, or prevent prosecution hereafter instituted under such repealed section, chapters, or acts for offenses committed prior to the effective date of this Act; and all prosecutions pending at the effective date of

this Act, and all prosecutions instituted after the effective date of this Act, for offenses committed prior to the effective date of this Act, shall be continued or instituted under and in accordance with the provisions of the law in force at the time of the commission of such offenses.

Section 13. *Effective date; exception*

(a) This Act shall take effect ————————.
(b) The provisions of Section 8(c) of this Act shall not be effective until sixty days after the effective date of this Act as to persons engaged in activities requiring registration at the effective date of this Act.

Appendix A

ITEM 1

Atomic Energy Commission

10 Code Fed. Regs. Part 20

Standards for Protection Against Radiation

General Provisions

§ 20.1 *Purpose.* (a) The regulations in this part establish standards for protection against radiation hazards arising out of activities under licenses issued by the Atomic Energy Commission and are issued pursuant to the Atomic Energy Act of 1954 (68 Stat. 919).

(b) The use of radioactive material or other sources of radiation not licensed by the Commission is not subject to the regulations in this part. However, it is the purpose of the regulations in this part to control the possession, use, and transfer of licensed material by any licensee in such a manner that exposure to such material and to radiation from such material, when added to exposures to unlicensed radioactive material and to other unlicensed sources of radiation in the possession of the licensee, and to radiation therefrom, does not exceed the standards of radiation protection prescribed in the regulations in this part.

§ 20.2 *Scope.* The regulations in this part apply to all persons who receive, possess, use or transfer byproduct material, source material, or special nuclear material under a general or specific license issued by the Commission pursuant to the regulations in Part 30, 40, or 70 of this chapter.

§ 20.3 *Definitions.* (a) As used in this part:

(1) "Act" means the Atomic Energy Act of 1954 (68 Stat. 919) including any amendments thereto;

(2) "Airborne radioactive material" means any radioactive material dispersed in the air in the form of dusts, fumes, mists, vapors, or gases;

(3) "Byproduct material" means any radioactive material (except special nuclear material) yielded in or made radioactive by exposure to the radiation incident to the process of producing or utilizing special nuclear material;

(4) "Commission" means the Atomic Energy Commission or its duly authorized representatives;

(5) "Government agency" means any executive department, commission, independent establishment, corporation, wholly or partly owned by the United States of America which is an instrumentality of the United States,

or any board, bureau, division, service, office, officer, authority, administration, or other establishment in the executive branch of the Government;

(6) "Individual" means any human being;

(7) "Licensed material" means source material, special nuclear material, or byproduct material received, possessed, used, or transferred under a general or specific license issued by the Commission pursuant to the regulations in this chapter;

(8) "License" means a license issued under the regulations in Part 30, 40, or 70 of this chapter. "Licensee" means the holder of such license;

(9) "Person" means (i) any individual, corporation, partnership, firm, association, trust, estate, public or private institution, group, Government agency other than the Commission, any State, any foreign government or nation or any political subdivision of any such government or nations, or other entity; and (ii) any legal successor, representative, agent, or agency of the foregoing;

(10) "Radiation" means any or all of the following: alpha rays, beta rays, gamma rays, X-rays, neutrons, high-speed electrons, high-speed protons, and other atomic particles; but not sound or radio waves, or visible, infrared, or ultraviolet light;

(11) "Radioactive material" includes any such material whether or not subject to licensing control by the Commission;

(12) "Restricted area" means any area access to which is controlled by the licensee. "Restricted area" shall not include any areas used as residential quarters, although a separate room or rooms in a residential building may be set apart as a restricted area;

(13) "Source material" means any material except special nuclear material, which contains by weight one-twentieth of one percent (0.05 percent or more of (i) uranium, (ii) thorium, or (iii) any combination thereof;

(14) "Special nuclear material" means (i) plutonium, uranium 233, uranium enriched in the isotope 233 or in the isotope 235, and any other material which the Commission, pursuant to the provisions of section 51 of the act, determines to be special nuclear material, but does not include source material; or (ii) any material artificially enriched by any of the foregoing but does not include source material;

(15) "Unrestricted area" means any area entry into which is not controlled by the licensee, and any area used for residential quarters.

(b) Definitions of certain other words and phrases as used in this part are set forth in other sections, including;

(1) "Airborne radioactivity area" defined in § 20.203;

(2) "Radiation area" and "high radiation area" defined in § 20.202;

(3) "Personnel monitoring equipment" defined in § 20.202;

(4) "Survey" defined in § 20.201;

(5) Units of measurements of dose (rad, rem) defined in § 20.4;

(6) Units of measurement of radioactivity defined in § 20.5.

§ 20.4 *Units of radiation dose.* (a) "Dose," as used in this part, is the quantity of radiation absorbed, per unit of mass, by the body or by any portion of the body. When the regulations in this part specify a dose during a period of time, the dose means the total quantity of radiation absorbed, per unit of mass, by the body or by any portion of the body during such period of time. Several different units of dose are in current use. Definitions of units as used in this part are set forth in paragraphs (b) and (c) of this section.

(b) The rad, as used in this part, is a measure of the dose of any ionizing radiation to body tissues in terms of the energy absorbed per unit mass of the tissue. One rad is the dose corresponding to the absorption of 100 ergs per gram of tissue. (One millirad (mrad) = 0.001 rad.)

(c) The rem, as used in this part, is a measure of the dose of any ionizing radiation to body tissue in terms of its estimated biological effect relative to a dose of one roentgen (r) of X-rays. (One millirem (mrem) = 0.001 rem.) The relation of the rem to other dose units depends upon the biological effect under consideration and upon the conditions of irradiation. For the purpose of the regulations in this part, any of the following is considered to be equivalent to a dose of one rem:

(1) A dose of 1 r due to X− or gamma radiation;

(2) A dose of 1 rad due to X−, gamma, or beta radiation;

(3) A dose of 0.1 rad due to neutrons or high energy protons;

(4) A dose of 0.05 rad due to particles heavier than protons and with sufficient energy to reach the lens of the eye;

If it is more convenient to measure the neutron flux, or equivalent, than to determine the neutron dose in rads, as provided in subparagraph (3) of this paragraph, one rem of neutron radiation may, for purposes of the regulations in this part, be assumed to be equivalent to 14 million neutrons per square centimeter incident upon the body; or, if there exists sufficient information to estimate with reasonable accuracy the approximate distribution in energy of the neutrons, the incident number of neutrons per square centimeter equivalent to one rem may be estimated from the following table:

Neutron energy	Number of neutrons per square centimeter equivalent to a dose of 1 rem
Thermal	960×10^6
0.0001 mev.	480×10^6
0.01 mev.	480×10^6
0.1 mev.	96×10^6
0.5 mev.	38×10^6
1 mev.	29×10^6
2 mev.	19×10^6
3 mev. and higher	14×10^6

§ 20.5 *Units of radioactivity.* (a) Radioactivity is commonly, and for purposes of the regulations in this part shall be, measured in terms of dis-

integrations per unit time or in curies. One curie (c) $=3.7\times10^{10}$ disintegrations per second (dps) $=2.2\times10^{12}$ disintegrations per minute (dpm). A commonly used submultiple of the curie is the microcurie (μc). One μc= 0.000001 c $=3.7\times10^{4}$ dps $=2.2\times10^{6}$ dpm.

NOTE: Many radioisotopes disintegrate into isotopes which are also radioactive. In expressing maximum permissible concentrations in air and water of these materials, as in Appendix B of this part, the activity stated is that of the parent isotope. In some cases, the fact that daughter products may contribute to the total dose has been taken into account in the determination of the maximum permissible concentration of the parent isotopes. In the tables of Appendix B of this part this is indicated by writing $Ba^{140}+La^{140}$, $Sr^{90}+Y^{90}$, $Rn^{222}+dr$, $Ra^{226}+\frac{1}{2}$ dr, etc.

EXAMPLE. In Column 1, Table I, Appendix B, the maximum permissible concentration of Ba^{140} in air for occupational use is $2\times10^{-7}\mu$c/ml. This is the maximum permissible concentration regardless of whether or not any of the La^{140} which may have resulted from the decay of the Ba^{140} is present or not. However, the value given for BA^{140} is less than it would be if La^{140} were a stable isotope, not only because of the possibility of La^{140} in the air but principally because, if the Ba^{140} is inhaled, its radioactive decay in the body will result in the production of La^{140} in the body.

(b) *Radon.* Airborne radioactivity of radon and its decay products may be determined by measurement of the activity of one or more decay products on dust filtered from the air. For purposes of the regulations in this part, the limit prescribed here will be considered to be met if the measured radioactivity of one or more decay products (for example, RaC') does not exceed that which would result from the occurrence, at the time of sampling, of 1×10^{-7} microcuries, per milliliter of air, of RN^{222} and each of its short-lived decay products, RaA, RaB, RaC, and RaC'. For this purpose, due allowance shall be made for changes in the radioactivity of the measured decay products from time of sampling through the period of measurement.

(c) *Natural uranium and natural thorium.* Natural uranium and natural thorium occur as mixtures of isotopes of the respective elements. In the case of uranium or of thorium, the number of microcuries shall be determined by dividing the total rate, in dpm, of alpha emissions from the mixture by 2.2×10^{6} dpm per μc.

§ 20.6 *Interpretations.* Except as specifically authorized by the Commission in writing, no interpretation of the meaning of the regulations in this part by any officer or employee of the Commission other than a written interpretation by the General Counsel will be recognized to be binding upon the Commission.

§ 20.7 *Communications.* All communications and reports concerning the regulations in this part, and applications filed under them, should be addressed to the Atomic Energy Commission, 1901 Constitution Avenue NW., Washington 25, D. C., Attention: Division of Civilian Application.

Permissible Doses, Levels, and Concentrations

§ 20.101 *Exposure of individuals in restricted areas*—(a) *Exposure to radiation.* (1) Except as provided in subparagraph (2) of this paragraph, no licensee shall possess, use, or transfer licensed material in such a manner as to cause any individual in a restricted area to receive in any period of seven consecutive days from radioactive material and other sources of radiation in the licensee's possession a dose in excess of the limits specified in Appendix A of this part.

(2) A licensee may permit an individual in a restricted area to receive a dose in excess of the limits established in subparagraph (1) of this paragraph: *Provided,* (i) That the dose during any period of 7 consecutive days does not exceed three times the limits specified in Appendix A of this part, and (ii) that the dose during any period of 13 consecutive weeks does not exceed 10 times the limits specified in Appendix A of this part.

(b) No licensee shall possess, use or transfer licensed material in such a manner as to cause any individual in a restricted area to be exposed to airborne radioactive material possessed by the licensee in an average concentration in excess of the limits specified in Appendix B, Table I, of this part.

The limits given in Appendix B, Table I of this part, are based upon exposure to the concentrations specified for forty hours in any period of seven consecutive days. In any such period where the number of hours of exposure is less than forty, the limits specified in the table may be increased proportionately. In any such period, where the number of hours of exposure is greater than forty, the limits specified in the table shall be decreased proportionately.

(c) *Exposure of minors.* No licensee shall possess, use, or transfer licensed material in such a manner as to cause any individual under 18 years of age within a restricted area to receive in any period of seven consecutive days from radioactive material and other sources of radiation in the licensee's possession a dose in excess of 10 percent of the limits specified in Appendix A of this part, or to be exposed to airborne radioactive material possessed by the licensee in a concentration in excess of the limits specified in Appendix B, Table II, of this part. For purposes of this paragraph, concentrations may be averaged over periods not greater than a week.

§ 20.102 *Permissible levels of radiation in unrestricted areas.* (a) There may be included in any application for a license or for amendment of a license proposed limits upon levels of radiation in unrestricted areas resulting from the applicant's possession or use of radioactive material and other sources of radiation. Such applications should include information as to anticipated average radiation levels and anticipated occupancy times for each unrestricted area involved. The Commission will approve the proposed limits if the applicant demonstrates that the proposed limits are not likely to cause any individual to receive a dose in any period of seven consecutive

days in excess of 10 percent of the limits specified in Appendix A of this part.

(b) Except as authorized by the Commission pursuant to paragraph (a) of this section, no licensee shall possess, use, or transfer licensed material in such a manner as to create in any unrestricted area from radioactive material and other sources of radiation in his possession:

(1) Radiation levels which, if an individual were continuously present in the area, could result in his receiving a dose in excess of two millirems in any one hour, or

(2) Radiation levels which, if an individual were continuously present in the area, could result in his receiving a dose in excess of 100 millirems in any seven consecutive days.

§ 20.103 *Concentrations in effluents to unrestricted areas.* (a) There may be included in any application for a license or for amendment of a license proposed limits upon concentrations of licensed and other radioactive material released into air or water in unrestricted areas as a result of the applicant's proposed activities. Such applications should include information as to anticipated average concentrations and anticipated occupancy times for each unrestricted area involved. The Commission will approve the proposed limits if the applicant demonstrates that it is not likely that any individual will be exposed to concentrations in excess of the limits specified in Appendix B, Table II, of this part. For purposes of this paragraph, concentration may be averaged over periods not greater than one year.

(b) Except as authorized by the Commission pursuant to § 20.302 or paragraph (a) of this section, no licensee shall possess, use, or transfer licensed material in such a manner as to release into air or water in any unrestricted area any concentration of radioactive material in excess of the limits specified in Appendix B, Table II of this part. For purposes of this paragraph, concentrations may be averaged over periods not greater than one year.

(c) For purposes of this section, determinations as to the concentration of radioactive material shall be made with respect to the point where such material leaves the restricted area. Where the radioactive material leaves the restricted area in a stack, tube, pipe, or similar conduit, the determination may be made with respect to the point where the material leaves such conduit.

(d) The provisions of this section do not apply to disposal of radioactive material into sanitary sewerage systems (see § 20.303).

§ 20.104 *Medical diagnosis, therapy, and research.* Nothing in the regulations in this part shall be interpreted as limiting the intentional exposure of patients to radiation for the purpose of medical diagnosis or medical therapy.

§ 20.105 *Measures to be taken after excessive exposures.* In the event

that any individual in a restricted area receives a dose or is exposed to concentrations of radioactive material in excess of the permissible limits established in § 20.101, the licensee shall limit the weekly dose or exposure of the individual to 10 percent of such permissible limit until such time as the average weekly dose or exposure to the individual for the period beginning with the week in which the excessive dose or exposure occurred is less than the permissible limit established in § 20.101.

Precautionary Procedures

§ 20.201 *Surveys.* (a) As used in the regulations in this part, "survey" means an evaluation of the radiation hazards incident to the production, use, release, disposal, or presence of radioactive materials or other sources of radiation under a specific set of conditions. When appropriate, such evaluation includes a physical survey of the location of materials and equipment, and measurements of levels of radiation or concentrations of radioactive material present.

(b) Each licensee shall make or cause to be made such surveys as may be necessary for him to comply with the regulations in this part.

§ 20.202 *Personnel monitoring.* (a) Each licensee shall supply appropriate personnel monitoring equipment to, and shall require the use of such equipment by:

(1) Each individual who enters a restricted area under such circumstances that he receives, or is likely to receive, a dose in excess of 25 percent of the limits specified in Appendix A of this part;

(2) Each individual who enters a high radiation area.

(b) As used in this part,

(1) "Personnel monitoring equipment" means devices designed to be worn or carried by an individual for the purpose of measuring the dose received (e. g., film badges, pocket chambers, pocket dosimeters, film rings, etc.);

(2) "Radiation area" means any area, accessible to personnel, in which there exists radiation, originating in whole or in part within licensed material, at such levels that a major portion of the body could receive in any one hour a dose in excess of 5 millirem, or in any 5 consecutive days a dose in excess of 150 millirem;

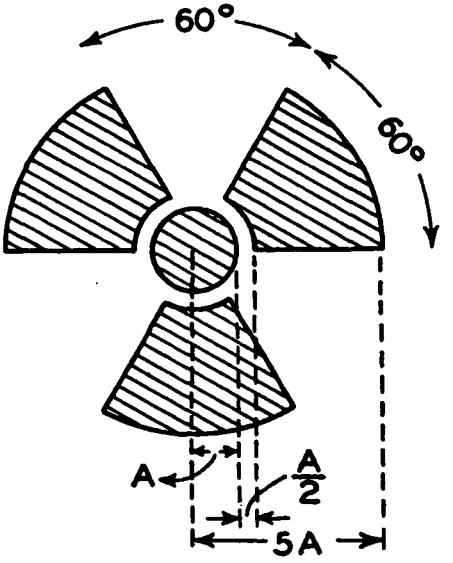
(3) "High radiation area" means any area, accessible to personnel, in which there exists radiation originating in whole or in part within licensed material at such levels that a major portion of the body could receive in any one hour a dose in excess of 100 millirem.

§ 20.203 *Caution signs, labels, and signals*—(a) *General.* (1) Except as otherwise authorized by the Commission, symbols prescribed by this section shall use the conventional radiation caution colors (magenta or

purple on yellow background). The symbol prescribed by this section is the conventional three-bladed design:

RADIATION SYMBOL

1. Cross-hatched area is to be magenta or purple.
2. Background is to be yellow.



(2) In addition to the contents of signs and labels prescribed in this section, licensees may provide on or near such signs and labels any additional information which may be appropriate in aiding individuals to minimize exposure to radiation or to radioactive material.

(b) *Radiation areas.* Each radiation area shall be conspicuously posted with a sign or signs bearing the radiation caution symbol and the words:

CAUTION [1]

RADIATION AREA

(c) *High radiation areas.* (1) Each high radiation area shall be conspicuously posted with a sign or signs bearing the radiation caution symbol and the words:

CAUTION [1]

HIGH RADIATION AREA

(2) Each high radiation area shall be equipped with a control device which shall either cause the level of radiation to be reduced below that at which an individual might receive a dose of 100 millirem in one hour upon

[1] Or "Danger."

entry into the area or shall energize a conspicuous visible or audible alarm signal in such a manner that the individual entering and the licensee or a supervisor of the activity are made aware of the entry. In the case of a high radiation area established for a period of 30 days or less, such control device is not required.

(d) *Airborne radioactivity areas.* (1) As used in the regulations in this part, "airborne radioactivity area" means (i) any room, enclosure, or operating area in which airborne radioactive materials, composed wholly or partly of licensed material, exist in concentrations in excess of the amounts specified in Appendix B, Table I, Column 1 of this part; or (ii) any room, enclosure, or operating area in which airborne radioactive material composed wholly or partly of licensed material exists in concentrations which, averaged over the number of hours in any week during which individuals are in the area, exceed 25 percent of the amounts specified in Appendix B, Table I, Column 1 of this part.

(2) Each airborne radioactivity area shall be conspicuously posted with a sign or signs bearing the radiation caution symbol and the words:

CAUTION [1]

AIRBORNE RADIOACTIVITY AREA

(e) *Additional requirements.* (1) Each area or room in which licensed material is used or stored and which contains any radioactive material (other than natural uranium or thorium) in an amount exceeding 10 times the quantity of such material specified in Appendix C of this part shall be conspicuously posted with a sign or signs bearing the radiation caution symbol and the words:

CAUTION [1]

RADIOACTIVE MATERIAL(S)

(2) Each area or room in which natural uranium or thorium is used or stored in an amount exceeding one-hundred times the quantity specified in Appendix C of this part shall be conspicuously posted with a sign or signs bearing the radiation caution symbol and the words:

CAUTION [1]

RADIOACTIVE MATERIAL(S)

(f) *Containers.* (1) Each container in which is transported, stored, or used a quantity of any licensed material (other than natural uranium or thorium) greater than the quantity of such material specified in Appendix C of this part shall bear a durable, clearly visible label bearing the radiation caution symbol and the words:

CAUTION [1]

RADIOACTIVE MATERIAL

[1] Or "Danger."

(2) Each container in which natural uranium or thorium is transported, stored, or used in a quantity greater than ten times the quantity specified in Appendix C of this part shall bear a durable, clearly visible label bearing the radiation caution symbol and the words:

CAUTION [1]

RADIOACTIVE MATERIAL

(3) Notwithstanding the provisions of subparagraphs (1) and (2) a label shall not be required:

(i) If the concentration of the material in the container does not exceed that specified in Appendix B, Table I, Column 2 of this part, or

(ii) For laboratory containers, such as beakers, flasks, and test tubes, used transiently in laboratory procedures, when the user is present.

(4) Where containers are used for storage, the labels required in this paragraph shall state also the quantities and kinds of radioactive materials in the containers and the date of measurement of the quantities.

§ 20.204 *Exceptions from posting requirements.* Notwithstanding the provisions of § 20.203,

(a) A room or area is not required to be posted with a caution sign because of the presence of a sealed source provided the radiation level twelve inches from the surface of the source container or housing does not exceed five millirem per hour.

(b) Rooms or other areas in hospitals are not required to be posted with caution signs because of the presence of patients containing byproduct material provided that there are personnel in attendance who shall take the precautions necessary to prevent the exposure of any individual to radiation or radioactive material in excess of the limits established in the regulations in this part.

(c) Caution signs are not required to be posted at areas or rooms containing radioactive materials for periods of less than eight hours provided that (1) the materials are constantly attended during such periods by an individual who shall take the precautions necessary to prevent the exposure of any individual to radiation or radioactive materials in excess of the limits established in the regulations in this part and; (2) such area or room is subject to the licensee's control.

§ 20.205 *Exemptions for radioactive materials packaged for shipment.* Radioactive materials packaged and labeled in accordance with regulations of the Interstate Commerce Commission shall be exempt from the labeling and posting requirements of § 20.203 during shipment, provided that the inside containers are labeled in accordance with the provisions of § 20.203 (f).

[1] Or "Danger."

§ 20.206 *Instruction of personnel.* All individuals working in or frequenting any portion of a restricted area shall be informed of the occurrence of radioactive materials or of radiation in such portion, and shall be instructed in the hazards of excessive exposure to such materials or radiation and in precautions or procedures to minimize exposure.

§ 20.207 *Storage of licensed material.* Licensed materials stored in an unrestricted area shall be secured against unauthorized removal from the place of storage.

WASTE DISPOSAL

§ 20.301 *General requirement.* No licensee shall dispose of licensed material except:

(a) By transfer to an authorized recipient as provided in the regulations in Part 30, 40, or 70 of this chapter, whichever may be applicable; or

(b) As authorized pursuant to § 20.302; or

(c) As provided in § 20.303 or § 20.304, applicable respectively to the disposal of licensed material by release into sanitary sewerage systems or burial in soil, or in § 20.103 (Concentrations in Effluents to Unrestricted Areas).

§ 20.302 *Method for obtaining approval of proposed disposal procedures.* Any licensee or applicant for a license may apply to the Commission for approval of proposed procedures to dispose of licensed material in a manner not otherwise authorized in the regulations in this chapter. Each application should include a description of the licensed material and any other radioactive material involved, including the quantities and kinds of such material and the levels of radioactivity involved, and the proposed manner and conditions of disposal. The application should also include an analysis and evaluation of pertinent information as to the nature of the environment, including topographical, geological, meteorological, and hydrological characteristics; usage of ground and surface waters in the general area; the nature and location of other potentially affected facilities; and procedures to be observed to minimize the risk of unexpected or hazardous exposures.

§ 20.303 *Disposal by release into sanitary sewerage systems.* No licensee shall discharge licensed material into a sanitary sewerage system unless:

(a) It is readily soluble or dispersible in water; and

(b) The quantity of any licensed or other radioactive material released into the system by the licensee in any one day does not exceed the larger of subparagraphs (1) or (2) of this paragraph:

(1) The quantity which, if diluted by the average daily quantity of sewage released into the sewer by the licensee, will result in an average concentration equal to the limits specified in Appendix B, Table I, Column 2 of this part; or

(2) Ten times the quantity of such material specified in Appendix C of this part; and

(c) The quantity of any licensed or other radioactive material released in any one month, if diluted by the average monthly quantity of water released by the licensee, will not result in an average concentration exceeding the limits specified in Appendix B, Table I, Column 2 of this part; and

(d) The gross quantity of licensed and other radioactive material released into the sewerage system by the licensee does not exceed one curie per year.

Excreta from individuals undergoing medical diagnosis or therapy with radioactive material shall be exempt from any limitations contained in this section.

§ 20.304 *Disposal by burial in soil.* No licensee shall dispose of licensed material by burial in soil unless:

(a) The total quantity of licensed and other radioactive materials buried at any one location and time does not exceed, at the time of burial, 1,000 times the amount specified in Appendix C of this part; and

(b) Burial is at a minimum depth of four feet; and

(c) Successive burials are separated by distances of at least six feet and not more than 12 burials are made in any year.

RECORD, REPORTS, AND NOTIFICATION

§ 20.401 *Records of surveys, radiation monitoring, and disposal.* (a) Each licensee shall maintain records showing the radiation exposures of all individuals subject to personnel monitoring control under § 20.202 of the regulations in this part.

(b) Each licensee shall maintain records showing the name of each individual exposed to radiation pursuant to § 20.101 (a) (2) and the weekly dose of each such individual for the 13 consecutive weeks of highest cumulative weekly dose.

(c) Each licensee shall maintain records in the same units used in the appendices to this part, showing the results of surveys required by § 20.201 (b), and disposals made under §§ 20.302, 20.303, and 20.304.

§ 20.402 *Reports of theft or loss of licensed material.* Each licensee shall report by telephone and telegraph to the Manager of the nearest Atomic Energy Commission Operations Office listed in Appendix D, immediately after its occurrence becomes known to the licensee, any loss or theft of licensed material in such quantities and under such circumstances that it appears to the licensee that a substantial hazard may result to persons in unrestricted areas.

[22 F. R. 3389, May 14, 1957]

§ 20.403 *Notifications and reports of incidents*—(a) *Immediate notification.* Each licensee shall immediately notify the Manager of the nearest Atomic Energy Commission Operations Office listed in Appendix D by tele-

phone and telegraph of any incident involving licensed material possessed by him and which may have caused or threatens to cause:

(1) Exposure of any individual to 25 rems or more of radiation, including any radioactive material taken into the body; or

(2) The release of radioactive material in concentrations which, if averaged over a period of 24 hours, would exceed 5000 times the limits specified for such materials in Appendix B, Table 2; or

(3) A loss of one working week or more of the operation of any facilities affected; or

(4) Damage to property in excess of $100,000.

(b) *Twenty-four hour notification.* Each licensee shall within 24 hours notify the Manager of the nearest Atomic Energy Commission Operations Office listed in Appendix D by telephone and telegraph of any incident involving licensed material possessed by him and which may have caused or threatens to cause:

(1) Exposure of any individual to 3 rems or more of radiation, including any radioactive material taken into the body; or

(2) The release of radioactive material in concentrations which, if averaged over a period of 24 hours, would exceed 500 times the limits specified for such materials in Appendix B, Table 2; or

(3) A loss of one day or more of the operation of any facilities affected; or

(4) Damage to property in excess of $1,000.

(c) *Thirty-day reports.* Each licensee shall make a report in writing within 30 days to the Director, Division of Civilian Application, United States Atomic Energy Commission, Washington 25, D. C., of each incident involving licensed material possessed by him which appears to have resulted in the exposure of an individual to radiation or to concentrations of radioactive material, or to have resulted in levels of radiation or concentrations of radioactive material, in excess of any applicable limits set forth in these regulations or in the licensee's license. Each report required under this paragraph shall describe the nature of the incident, the extent of exposure of persons to radiation or to radioactive material, the levels of radiation and concentrations of radioactive material involved, the cause of the incident, and corrective steps taken or planned to assure against a recurrence of the incident. A copy of each report shall be transmitted to the Manager of the nearest Atomic Energy Commission Operations Office listed in Appendix D. [22 F. R. 3389, May 14, 1957]

EXCEPTIONS AND ADDITIONAL REQUIREMENT

§ 20.501 *Applications for exemptions.* The Commission may, upon application by any licensee or upon its own initiative grant such exemptions

from the requirements of the regulations in this part as it determines are authorized by law and will not result in undue hazard to life or property.

§ 20.502 *Additional requirements.* The Commission may, by rule, regulation, or order, impose upon any licensee such requirements, in addition to those established in the regulations in this part, as it deems appropriate or necessary to protect health or to minimize danger to life or property.

ENFORCEMENT

§ 20.601 *Violations.* An injunction or other court order may be obtained prohibiting any violation of any provision of the act or any regulation or order issued thereunder. Any person who willfully violates any provision of the act or any regulation or order issued thereunder may be guilty of a crime and, upon conviction, may be punished by fine or imprisonment or both, as provided by law.

APPENDIX A

PERMISSIBLE WEEKLY DOSE

Conditions of exposure		Dose in critical organs (mrem)			
Parts of body	Radiation	Skin at basal layer of epidermis	Blood forming organs	Gonads	Lens of eye
Whole body	Any radiation with half-value-layer greater than 1 mm of soft tissue....	[1] 600	[1] 300	[1] 300	[1] 300
Whole body	Any radiation with half-value-layer less than 1 mm of soft tissue.....	1,500	300	300	300
Hands and forearms or feet and ankles or head and neck.	Any radiation	[2] 1,500	...	...	...

[1] For exposures of the whole body to X or gamma rays up to 3 mev, this condition may be assumed to be met if the "air dose" does not exceed 300 mr, provided the dose to the gonads does not exceed 300 mrem. "Air dose" means that the dose is measured by an appropriate instrument in air in the region of highest dosage rate to be occupied by an individual, without the presence of the human body or other absorbing and scattering material.

[2] Exposure of these limited portions of the body under these conditions does not alter the total weekly dose of 300 mrem permitted to the bloodforming organs in the main portion of the body, to the gonads, or to the lens of the eye.

APPENDIX B

PERMISSIBLE CONCENTRATIONS IN AIR AND WATER ABOVE NATURAL BACKGROUND

Material	Table I		Table II

Y^{91}	1.2×10^{-7}	6×10^{-1}	4×10^{-9}	2×10^{-2}
Zn^{65}	6×10^{-6}	2×10^{-1}	2×10^{-7}	6×10^{-3}
Unidentified beta or gamma emitters or any undetermined mixtures of beta or gamma emitters	.....	.....	1×10^{-9}	1×10^{-7}
Unidentified alpha emitters or any undetermined mixtures of alpha emitters	.....	.....	5×10^{-12}	1×10^{-7}

[1] Air concentrations are given in microcuries per milliliter of air.

[2] Water concentrations are given in microcuries per milliliter of water. These figures also apply to foodstuffs in microcuries per gram (wet-weight).

[3] For enriched uranium the same radioactivities per unit volume as those for natural uranium are applicable. It should be noted that the contribution of U-234 to the gross activity of enriched uranium is 20–40 times that of the U-235.

Y^{90}	1
Y^{91}	1
Zn^{65}	10
Unidentified radioactive materials or any of the above in unknown mixtures	0.1

NOTE: For purposes of §§ 20.203 and 20.304, where there is involved a combination of isotopes in known amounts the limit for the combination should be derived as follows: Determine, for each isotope in the combination, the ratio between the quantity present in the combination and the limit otherwise established for the specific isoptope when not in combination. The sum of such ratios for all the isoptopes in the combination may not exceed "1" (i.e., "unity").

EXAMPLE: For purposes of § 20.304, if a particular batch contains 2,000 μc of Au^{198} and 25,000 μc of C^{14}, it may also include not more than 3,000 μc of I^{131}. This limit was determined as follows:

$$\frac{2{,}000\ \mu c\ Au^{198}}{10{,}000\ \mu c} + \frac{25{,}000\ \mu c\ C^{14}}{50{,}000\ \mu c} + \frac{3{,}000\ \mu c\ I^{131}}{10{,}000\ \mu c} = 1$$

The denominator in each of the above ratios was obtained by multiplying the figure in the table by 1000 as provided in § 20.304.

ITEM 2

CALIFORNIA GENERAL INDUSTRY SAFETY ORDERS

Title 8, Group 6

Article 53. *Radioactivity and Ionizing Radiation*

3800. *Purpose.* Article 53 sets up minimum standards for the protection of employees exposed to potentially injurious levels of ionizing radiation or potentially injurious quantities of radioactive materials but does not include such ionizing radiation or radioactive materials as cosmic radiation or normal radon or thoron in the atmosphere.

3801. *Definitions.* (a) "Roentgen" (r) is the international unit of quantity of x-rays or gamma rays.

(b) "Milliroentgen" (mr) is one thousandth of a roentgen.

(c) "Rad" is the unit of absorbed dose, defined as 100 ergs per gram of tissue.

(d) "Totally protective installation" is one where the radiating equipment or material is surrounded by barriers such that no person has access to any place where exposure can be more than seven milliroentgens in an hour. If the radiation is not properly measurable in roentgens, then the biological effect shall be no greater than that from seven mr of x-rays in an hour.

(e) "Sealed container" means one from which radioactive contents cannot escape whether the radiations from them do or not.

(f) "Shielded container" means one such that the radiations produced by the equipment or materials within it will measure no more than 200 milliroentgens in an hour at any point on the outside surface of the container and no more than 10 milliroentgens in an hour at a distance of one meter from the container. In the case of radiations not properly measurable in roentgens, the biological effect shall be no greater than that from x-rays in the above named amounts.

(g) "Curie" is the international unit of radioactivity.

(h) "Integral absorbed dose" (total body dose) is the total energy absorbed throughout a given body or region of interest. The unit is the gramrad (equal to 1/100,000 joule).

3802. *Supervision and Instruction.* (a) All operations involving exposure to potentially injurious levels of ionizing radiation or potentially injurious quantities of radioactive materials shall be under the supervision of competent technical personnel. A competent technical person is one who is capable of evaluating the radiation exposure to employees and specifying such protection as required by these orders.

(b) Every employee who may be regularly or frequently exposed to ionizing radiation shall be instructed in the hazards he may encounter in the course of his duties and in methods of protecting himself and others against them.

3803. *Maximum Permissible Exposures.* (a) No employee shall be exposed to more than 0.3r of x-rays or gamma rays, or other ionizing radiation producing equivalent biologic effect, in a week. Measured or presumed exposure of any employee of more than 0.3r in any week shall be reported to the medical supervisor. See Section 3811.

Note: The maximum allowable exposures set forth in 3803 are derived from best available authorities on the subject. However, since it is probable that further experience may lead to revision of some of these figures, the Division of Industrial Safety plans to hold hearings on revisions of 3803 periodically. The following handbooks should be consulted for a more thorough and detailed discussion of the subject of radiological health safety, including more details on the maximum allowable exposures in

the table in 3803(b). Reference: National Bureau of Standards Handbooks Nos. 23, 27, 41, 42, 47, 48, 49, 50, 51, 52, and 55.

(b) For the purpose of these orders the following table gives the biological effect of other ionizing radiations equivalent to unit x-ray exposure, and the permissible limits for whole body exposed and for hands only exposed. (See table below.)

(c) Concentrations of radioactive substances in the air of workrooms or other locations in which employees are regularly or frequently present shall not be greater than:

(1) 5×10^{-12} microcuries per cubic centimeter for alpha emitters.

(2) 10^{-9} microcuries per cubic centimeter for beta and gamma emitters.

Type of Radiation	Relative Biological Effect	Exposure	Maximum Permissible Absorbed Dose as Measured in Basal Layer of Epidermis	
			Entire Body	Hands Only
X-rays	1	0.3r	0.5 rads	1.5 rads
Gamma rays	1	0.3r	0.5 rads	1.5 rads
Beta rays	1	—	0.5 rads	1.5 rads
Proton rays	10	—	0.05 rads	0.15 rads
Alpha rays	20	—	0.025 rads	0.075 rads
Fast neutrons	10	—	0.05 rads	0.15 rads
Thermal neutrons	5	—	0.1 rads	0.3 rads

For more detailed maximum permissible amounts of radioisotopes in the human body and maximum permissible concentrations in air and water, see National Bureau of Standards Handbook No. 52.

3804. *Monitoring.* (a) Workrooms or other locations in which material giving rise to ionizing radiation is used or handled shall be inspected for hazardous amounts of radiation at scheduled intervals. The Division of Industrial Safety may prescribe a monitoring schedule for a particular operation but such a schedule is subject to an immediate change if it is indicated by personnel monitors or other means that more frequent inspections are necessary to maintain exposures below those set forth in 3803. When such materials are received, transferred, or used for different operations, they shall be monitored to assure safe handling. Radioactive materials in sealed containers shall be inspected for leaks at least yearly.

Note: National Bureau of Standards Handbook No. 51, Radiological Monitoring Methods and Instruments, should be consulted for details of radiological monitoring.

(b) Equipment, machines or totally protective installations giving rise to ionizing radiation shall be surveyed to determine the stray radiation level when first installed and thereafter whenever any change is made in the installation or its use which would affect its protective features, but in no case shall monitoring be done less often than yearly. Where such equipment, machines or installations are in such locations or are so constructed

that vibration or other physical conditions may cause changes in the protective features, inspection of protective devices and check for stray radiation shall be made at least every six months and also whenever it is indicated, by personnel monitors or other means, that more frequent inspections are necessary to maintain exposures below those set forth in 3803.

(c) The monitoring and inspections required by (a) and (b) shall be done by a competent person with instruments adequate to discover hazardous amounts of whatever radiations the machines or materials are producing. Records of such inspection shall be reviewed by the competent technical person and shall be filed as a permanent record available to representatives of the division. These records shall show the dates and results of the monitoring and the observations, recommendations or comments of the competent technical personnel.

(d) Employees who may be subjected to ionizing radiation which could potentially exceed the exposures referred to in 3803 shall wear appropriate indicating or monitoring devices to show the amount of ionizing radiation to which such employees have been subjected. Personnel monitoring devices shall be worn on that part of the body expected to receive the greatest exposure. Records of exposure as recorded by these devices shall be reviewed by the competent technical person and shall be filed as a permanent record available to representatives of the division.

3805. *Maintenance of Protective Devices.* (a) Whenever it is found, by monitoring or otherwise, that any shielding or other protective device is defective, insufficient or inoperative, such shielding or device shall be promptly repaired or augmented as may be needed, and operations involving productions of ionizing radiation shall not be resumed until adequate repairs or changes are completed.

(b) Whenever it is found, by personnel monitoring or otherwise, that any employee is exposed to a weekly dosage of ionizing radiation greater than that specified in 3803, immediate steps shall be taken to locate the condition giving rise to such exposure, and the operation giving rise to the exposure shall be discontinued until such condition is corrected. The employees who have been exposed to excessive radiation shall be immediately referred to the medical supervisor.

3806. *Handling of Radioactive Materials.* Wherever radioactive materials are handled except in sealed containers:

(a) General or local exhaust ventilation shall be provided adequate to prevent concentrations of radioactive substances in the air greater than those set forth in 3803 and National Bureau of Standards Handbook No. 52.

(b) Spillage or other contamination of floors, walls or workbenches shall be removed promptly and monitored for adequate decontamination. In the event of a spill of a significant quantity of long-lived material the employer shall immediately notify the Division of Industrial Safety. Cloth-

ing contaminated by spillage shall be changed promptly and persons monitored for adequate decontamination. Contaminated clothing shall be decontaminated by special decontamination facilities equipped to safely cope with the problem. See National Bureau of Standards Handbooks Nos. 42 and 48.

(c) Radioactive wastes shall not be allowed to accumulate in sufficient amounts to cause hazardous exposures and shall be disposed of in such manner as will not cause harmful concentrations of radioactive material in either the atmosphere or other environment. See Bureau of Standards Handbooks Nos. 42, 48, and 49.

(d) Surfaces shall be designed and used as to afford easy and safe decontamination. See National Bureau of Standards Handbook No. 48 for details.

(e) Smoking or eating shall not be permitted in workrooms. Food, tobacco, or personal effects such as purses, combs or cosmetics shall not be set down in such rooms.

(f) At the close of each work period, workers' faces, hands, hair and clothes shall be inspected for contamination by radioactive material. Such inspection shall be made by a competent person. Unsafe garments shall be decontaminated or adequately disposed of. Skin surfaces shall be decontaminated. Protective clothing or other protective devices, which may include gowns, coats or overalls, shoes or overshoes, caps, hoods, or respiratory protection, shall be provided by the employer and used by the employee. Such personal safety devices or safeguards shall be suitable and adequate to provide protection against exposure to the radioactive materials being handled. If contamination of clothing or any part of the body is possible, both shall be monitored before leaving the work area, and suitable action (disposal or decontamination) taken. When skin surfaces have become contaminated the medical supervisor shall be notified. See National Bureau of Standards Handbooks Nos. 42, 48, and 52, and Sections 3803 and 3811 in these orders for more details.

(g) Where monitoring indicates contamination, floors and benches shall be cleaned by a process which will prevent the dispersion of radioactive dust. Dry sweeping with broom or brush is prohibited.

(h) All working surfaces where radioactive materials are handled shall be provided with illumination of not less than 50 foot-candles.

3807. *Storage of Radioactive Materials.* (a) Radioactive materials stored in a workroom or other location where employees are regularly or frequently present shall be enclosed in containers of such thickness and construction that employees will not be exposed to radiation in amounts greater than those set forth in 3803.

(b) Vaults or rooms in which substances giving rise to ionizing radiation are stored shall be so isolated by construction, location or a combination of

the two that no employee shall in the course of his employment be exposed to radiation in quantities greater than those set forth in 3803. Such rooms or vaults shall be ventilated as required by 3806(a) unless all radioactive materials are stored in sealed containers.

(c) Each container of radioactive materials in storage shall be labeled to indicate:

(1) That the material is radioactive.
(2) The chemical name of the material or the isotope.
(3) The amount or quantity of the radioactive material.
(4) The date received and the person responsible for the material.

(d) Radioactive materials should be housed in fireproof containers and preferably placed in a fireproof room or enlosure for storage purposes.

3808. *Warning Signs or Signals.* (a) All locations or installations where ionizing radiation from radioactive materials may be encountered in injurious amounts shall be marked or posted with warning signs, signals or lights. Purple shall be the basic color for the radioactive warning symbol, and the background should be yellow.

(b) All locations where machines may produce injurious amounts of ionizing radiation shall be provided with warning signals or lights activated when the machine is producing such radiation.

3809. *Totally Protective Installations.* (a) No employee shall be permitted to remain within the confines of such an installation while ionizing radiation is being produced or generated.

(b) Every entrance to such an installation shall be provided with an electrically contacted or interlocked door or gate so arranged that no person or part of body can enter the enclosure while the source of ionizing radiation is in operation. Visible or audible signals shall be provided in each such enclosure and shall be so arranged as to be in continuous operation while the source of ionizing radiation is producing radiation.

(c) At least one door shall be provided with knobs or handles on the inside of the door so that anyone who may have been locked in accidentally can leave the enclosure without delay.

3810. *Special Orders for Radium Dial Painting.* (a) All pertinent provisions of 3800 to 3809 inclusive shall apply to radium dial painting operations. See National Bureau of Standards Handbook No. 27 for additional details.

(b) All radioactive luminous compounds shall be mixed with adhesive before being applied; no dry method of application of powder shall be used. Mixing and painting shall be done under a mechanically ventilated hood.

(c) When in use, radioactive luminous paint shall be kept in a porcelain or other impervious container of proper size to avoid spillage and shall be set in a lead block. Not more than one container shall be on any work bench

at any time, and no container shall contain more than one gram of mixed luminous compound. The container shall provide at least one inch of lead protection and shall be covered when the paint is not in use.

(d) Brushes in use for radium dial painting shall be kept on racks in the ventilated hood so that the bristle part does not touch the table top. Solvents and small wiping papers shall be used to clean brushes. Wiping papers shall be discarded after a single use and placed in covered containers, and they shall be disposed of as radioactive waste material.

(e) Brushes shall never be pointed in the mouth.

(f) Removal of radioactive paints from dials shall be done under liquid. Dry scraping or removal of luminous compounds by buffing is prohibited.

(g) Drying racks in the workroom shall be equipped with exhaust ventilation which will remove radon and prevent its dispersal in the workroom. Finished work shall be placed in the drying racks promptly and shall not be allowed to accumulate on work benches.

3811. *Medical Supervision.* (a) Each employee exposed to ionizing radiation shall be under the supervision of or in consultation with a competent medical expert experienced in the diagnosis of the harmful effects of ionizing radiation. Such supervision shall include an examination prior to starting work with a source of ionizing radiation and again at intervals not less than once yearly while so employed. Certification of such supervision shall be kept current and shall be posted conspicuously in the place of employment. Such notice shall contain (1) the name of the competent medical expert providing the medical supervision and (2) the number and names of the employees under supervision and their occupation. The employer shall be responsible for the provision of the necessary medical supervision.

(b) When in the opinion of the medical supervisor continued exposure to ionizing radiation is likely to injure an employee's health, such employee shall be removed from the exposure. See Section 3803(a) in these orders.

3812. *Devices Containing Radioactive Materials That Are Used as Hand Tools or Worn on the Person.* (a) The employer shall not require or permit the use of such devices unless a complete set of instructions is supplied with the device. The instructions must contain at least the following information:

(1) A statement that the device has been tested and is free from radioactive contamination on its external surfaces. The name of the person who made the test and the date on which it was made shall be included in the statement.

(2) Instructions for operation and use, with specific reference to the nature of the danger if the device should become defective, permitting the escape of sources of ionizing radiation.

(3) Detailed instructions giving proper methods of decontamination in the event of contamination.

(4) Instructions for safe disposal of damaged or wornout devices.

(b) Each device must be legibly labled with words or phrases equivalent to the following:

WARNING: Contains Radioactive Material

Handle With Care

DO NOT DISMANTLE

Note: The division may require additional warning words or precautionary statements on the label where the potential exposure justifies such additional precautions.

3813. *Radioactive Luminous Compounds.* The container of every radioactive luminous compound shall be labeled or tagged as follows:

DANGER! Contains radioactive substance.

POISON

(Name substance)

Do not take internally.

Avoid contact with skin.

Do not breathe dust, vapors, or gas.

ITEM 3

NEW YORK INDUSTRIAL CODE RULE NO. 38

RADIATION PROTECTION

Finding of Fact

The Board finds that every industry, trade, occupation and process involving the use or presence of radioactive material or radiation-producing equipment involves elements of danger to the lives, health and safety of persons employed therein. The Board further finds that special regulations are necessary for the protection of such persons, in that such material and equipment may emit invisible and imperceptible rays or particles having the property of producing deleterious or fatal effects, immediate or deferred, upon and within the human body.

38-1 APPLICATION

This rule applies to every place and every operation where any employee in the course of his work may be exposed to radiation in excess of one tenth the permissible weekly dose as set forth in this rule except the following places and installations which are subject to the provisions of the New York State sanitary code relating to ionizing radiation, to wit:

1. Hospitals, institutions, medical clinics, medical offices, dental offices and podiatry offices.

2. Veterinary clinics and veterinary offices.

3. Educational institutions.

4. Commercial, private or research laboratories performing diagnostic procedures or handling equipment or material for medical use.

38-2 EXEMPTIONS

Except as herein specifically provided, every operation involving only the following devices, appliances and materials are hereby exempted from the application of this rule:

1. Small lots of timepieces, instruments, novelties or devices containing self-luminous elements during the course of retail sale, during industrial use or during repair. The repair and refinishing of the self-luminous elements themselves, however, are not exempted.

2. Naturally radioactive materials of a degree of specific radioactivity approximately equivalent to that of potassium as it occurs normally.

3. Electrical equipment having thermionic conduction current and operated at voltages less than 16 kilovolts which is not primarily intended to produce radiation.

4. Domestic television receivers except during production testing.

5. Potentially radiation-producing equipment which is not being used or operated in such manner as to produce radiation, e.g., during storage or shipping or during the course of retail sale. Such equipment is not, however, exempted from the labeling requirements of this rule.

6. Any radioactive material being transported by common carrier and subject to the jurisdiction of the Interstate Commerce Commission or other governmental agency having jurisdiction.

7. Total quantities of the following radioactive material not exceeding the amounts specified in Columns 1 and 2 below:

	Column 1 Unsealed (Microcuries)	Column 2 Sealed (Microcuries)
Antimony 124 (Sb 124)	1	10
Arsenic 76 (As 76)	10	10
Arsenic 77 (As 77)	10	10
Barium 140—Lanthanum 140 (Ba La 140)	1	10
Beryllium (Be 7)	50	50
Cadmium 109—Silver 109 (Cd Ag 109)	10	10
Calcium 45 (Ca 45)	10	10
Carbon 14 (C 14)	50	50
Cerium 144—Praseodymium 144 (Ce Pr 144)	1	10
Cesium 137—Barium 137 (Cs Ba 137)	1	10
Chlorine 36 (Cl 36)	1	10
Chromium 51 (Ch 51)	50	50
Cobalt 60 (Co 60)	1	10
Copper 64 (Cu 64)	50	50
Europium 154 (Eu 154)	1	10
Fluorine 18 (F 18)	50	50
Gallium 72 (Ga 72)	10	10
Germanium 71 (Ge 71)	50	50
Gold 198 (Au 198)	10	10

	Column 1 Unsealed (Microcuries)	Column 2 Sealed (Microcuries)
Gold 199 (Au 199)	10	10
Hydrogen 3 (Tritium) (H 3)	250	250
Indium 114 (In 114)	1	10
Iodine 131 (I 131)	10	10
Iridium 192 (Ir 192)	10	10
Iron 55 (Fe 55)	50	50
Iron 59 (Fe 59)	1	10
Lanthanum (La 140)	10	10
Manganese 52 (Mn 52)	1	10
Manganese 56 (Mn 56)	50	50
Molybdenum 99 (Mo 99)	10	10
Nickel 59 (Ni 59)	1	10
Nickel 63 (Ni 63)	1	10
Niobium 95 (Nb 95)	10	10
Palladium 109 (Pd 109)	10	10
Palladium 103—Rhodium 103 (Pd Rh 103)	50	50
Phosphorus 32 (P 32)	10	10
Polonium 210 (Po 210)	0.1	1
Potassium 42 (K 42)	10	10
Praseodymium 143 (Pr 143)	10	10
Promethium 147 (Pm 147)	10	10
Radium 226 (Ra 226)	1	10
Rhenium 186 (Re 186)	10	10
Rhodium 105 (Rh 105)	10	10
Rubidium 86 (Rd 86)	10	10
Ruthenium 106—Rhodium 106 (Ru Rh 106)	1	10
Samarium 153 (Sm 153)	10	10
Scandium 46 (Sc 46)	1	10
Silver 105 (Ag 105)	1	10
Silver 111 (Ag 111)	10	10
Sodium 22 (Na 22)	10	10
Sodium 24 (Na 24)	10	10
Strontium 89 (Sr 89)	1	10
Strontium 90—Yttrium 90 (Sr Y 90)	0.1	1
Sulfur 35 (S 35)	50	50
Tantalum 182 (Ta 182)	10	10
Technetium 96 (Tc 96)	1	10
Technetium 99 (Tc 99)	1	10
Tellurium 127 (Te 127)	10	10
Tellurium 129 (Te 129)	1	10
Thallium 204 (Tl 204)	50	50
Tin 113 (Sn 113)	10	10
Tungsten 181 (W 181)	10	100
Tungsten 185 (W 185)	10	10
Vanadium 48 (V 48)	1	10
Yttrium 90 (Y 90)	1	10
Yttrium 91 (Y 91)	1	10
Zinc 65 (Zn 65)	10	10
Natural Uranium	1,000	10,000
Natural Thorium	1,000	10,000

Such materials however, are not exempted from the labeling requirements of this rule.

8. Any other radiation-producing device or radiation appliance incorporating either radioactive materials or radiation-producing equipment which the Board finds, either by variation or by approval, to be exempt from the application of this rule.

38-3 Definitions

As used herein and for the purposes of this rule, the following terms mean:

38-3.1 Airborne Radioactive Material. Airborne radioactive material in any form such as dusts, fumes, mists or gases.

38-3.2 Approved. In compliance with a subsisting resolution of approval adopted by the Board.

38-3.3 Board. The Board of Standards and Appeals of the New York State Department of Labor.

38-3.4 Commissioner. The Industrial Commissioner of the State of New York.

38-3.5 Controlled Area. Any area access to which is restricted by the owner.

38-3.6 Dose. Radiation received by an individual during exposure thereto expressed in "mrem." The dose for an individual includes all doses to the region of interest from all types and energies of radiation.

38-3.7 Dose Rate. The dose per unit of time.

38-3.8 Employee. A person employed; one who works for wages or salary in the service of another.

38-3.9 Exposure. The presence of an individual in a field of radiation.

38-3.10 High Airborne Concentration Area. Any room, enclosure or area of operation accessible to employees in which airborne radioactive material exists in excess of the amounts specified in 38-6.1, Table I, at any one time or in excess of 25 percent of the amounts specified in 38-6.1, Table I, averaged over a period of one week.

38-3.11 High Radiation Area. A radiation area accessible to employees in which there exists a radiation level in excess of 100 millirem in any one hour.

38-3.12 Installation. A location where for a period of more than 30 days one or more sources of radiation are used, operated or stored. The confines of an installation shall be as designated by the owner. A part of a building, an entire building or a plant may be designated as an installation.

38-3.13 Mobile Source. A source of radiation used or operated outside an installation.

38-3.14 Owner—of an Installation. The person or organization having by law the administrative control of a source or radiation located within the confines of the installation, whether as proprietor, lessee, or otherwise.

Of a Mobile Source. The person or organization having by law the administrative control thereof, whether as owner, lessee, contractor or otherwise.

38-3.15 Personnel Monitoring Equipment. Devices designed to be worn or carried by an individual for the purpose of measuring radiation received by him. Examples of personnel monitoring equipment include film badges, pocket chambers, pocket dosimeters and film rings.

38-3.16 Radiation. Alpha and beta particles, electrons, protons, neutrons, gamma and x-rays and all other radiations which produce ionizations directly or indirectly but not electromagnetic radiations other than gamma and x-rays.

38-3.17 Radiation Area. Any part of an installation accessible to employees in which there exists a radiation level over 5 millirem in any one hour or over 150 millirem in any seven consecutive days.

38-3.18 Radiation Worker. A person entrusted with or put in charge of a source of radiation by the owner of such source for the purpose of actually using the radiation thereof for a prescribed purpose.

38-3.19 Radiation of Very Low Penetrating Power. Radiation whose half value layer is less than one millimeter of soft tissue.

38-3.20 Radiation-Producing Equipment. Any equipment producing radiation by the application of electrical energy.

38-3.21 Radiation Safety Physician. A duly licensed physician who has had training or experience in the biological or physiological effects of radiation.

38-3.22 Radiation Safety Officer. A person qualified by training and experience in radiological science and the control of the health hazards of radiation to perform dependable radiation protection surveys and to assume all responsibilities required of him under this rule.

38-3.23 Radiation Safety Supervisor. A person employed at supervisory level who has been sufficiently instructed and trained to manage the application of all protective techniques applicable to the radiation areas within an installation to the satisfaction of a radiation safety officer.

38-3.24 Radioactive Material. Any material either solid, liquid or gas, which emits radiation spontaneously.

38-3.25 Sealed Source. Radioactive material that is encased in and is to be used in a container in a manner intended to prevent leakage of the radioactive material.

38-3.26 Shall. The word "shall" is always mandatory.

38-3.27 Survey. An evaluation of the radiation hazards associated with each source of radiation under normal use or storage conditions. Such an evaluation may include a physical survey of the location of each source and the measurement of the dose rate of radiation therefrom.

38-3.28 Weekly Dose. The total dose received by an individual in any period of 7 consecutive days.

38-3.29 Weekly Intake. The total amount of radioactive material taken into an individual's body in any period of seven consecutive days.

38-4 Registration

38-4.1 Installations. The owner of every installation shall register the same or cause it to be registered with the Industrial Commissioner. Such

registration shall be in a form acceptable to the Commissioner, and shall include the following:

(a) The name and address of the owner.

(b) A designation of the confines of the installation.

(c) A designation of the type or types of sources of radiation expected to be in the installation. (For example, x-ray machines, particle accelerators, sealed radioactive sources, unsealed radioactive material.)

(d) For each type of source designated in (c), an estimate of the maximum number of sources of radiation expected to be in the installation at any one time, and an estimate of the maximum size or rating of such sources of radiation. (For example, 5 x-ray machines, maximum rating 250 kilovolts, 5 milliamperes; 75 sealed gamma ray sources, 15 millicuries each ; 50 millicuries of unsealed radioactive material.)

(e) The name, address, qualifications and signature of the radiation safety officer or other person in charge of radiation protection for the installation.

38-4.2 Mobile Sources. Every mobile source shall be registered by its owner with the Commissioner.

Such registration shall be in a form acceptable to the Commissioner and shall include the following:

(a) Name and address of owner.

(b) Type of source and its size or rating. (For example, 2 x-ray machines, 250 KV, 5 milliamps.)

(c) Name and address and the qualifications and signature of the radiation safety officer or other person in charge of radiation protection for the source.

38-4.3 Time of Registration. Existing installations and mobile sources shall be registered within ninety (90) days after the effective date of this rule and every new installation and mobile source shall be registered before it is placed in operation.

38-4.4 Changes in Installations. The owner of every registered installation or mobile source shall advise the Commissioner forthwith of all changes which may substantially increase the potential hazard to any employee.

38-5 Control of Exposure

38-5.1 Control—General. The owner of every source shall shield, protect or isolate the same or arrange and control exposure thereto so that no employee in the course of his work receives a dose in excess of the permissible limits specified in 38-6.

38-5.2 Supervision Required—General. The owner of every installation and every mobile source shall provide or cause to be provided the safety measures required by this rule and shall designate a radiation safety supervisor who shall maintain such safety measures in accordance with this rule.

38-5.3 Supervision Required—High Hazards. The owner of a source creating a high radiation area or a high airborne concentration area shall designate a radiation safety officer as herein defined. Such officer shall cause to be provided the required safety measures with respect to such areas.

38-5.4 Control Outside an Installation. The owner of every source shall shield, isolate, protect or otherwise arrange and control the same so that radiation cannot penetrate walls, partitions, floors, ceilings or other enclosing structural portions delimiting the source as a whole to an extent capable of exposing employees of himself or another outside the installation to radiation in excess of 10% of the permissible weekly dose as specified in 38-6.

38-5.5 Maintenance. The owner of protection devices required by this rule shall maintain them in good repair and proper operating condition.

38-5.6 Control of Airborne Radioactive Material. Airborne Radioactive Material shall be controlled by means of local exhaust ventilation, isolation of the process, approved respiratory equipment or other effective means as may be necessary to maintain the average concentration of inhaled or ingested radioactive material within the limits specified in 38-6.1, paragraph 7, Table I, of this rule.

38-5.7 Mobile Sources. The placing in storage, the transportation and the use of every mobile source shall be under the supervision of a radiation safety supervisor.

38-5.8 Doors from Shielded Enclosures. Shielded enclosures of radiation areas with access openings large enough for the entry of personnel shall have at least one exit door easily and quickly openable manually from the inside.

38-5.9 Warning Signals—High Radiation Areas. Within and at the entrance to all high radiation areas conspicuous warning signs shall be posted or signals shall be installed and arranged to operate whenever the dose rate exceeds 100 mrem per hour except as provided in 38-10.5.

38-5.10 Instruction of Employees. No employer shall suffer or permit an employee of himself or another to work in a radiation area unless such employer has first informed the employee of the presence of radiation, instructed him as to the safe means and methods of performing his work during such exposure, and taken all necessary measures for his protection.

38-5.11 Training of Radiation Worker. No employer shall employ any person as a radiation worker unless such person is sufficiently informed, instructed and trained by a radiation safety supervisor or radiation safety officer to handle, use or operate the source of radiation with which he works so that the exposure to radiation is maintained within the limits prescribed by this rule.

38-5.12 Radiation Safety Supervisor—Qualifications. No employer shall employ or designate any person as a radiation safety supervisor unless such person has been instructed and trained by a radiation safety officer in the use of all protective measures that may be necessary for all radiation sources

that may be in his charge. The qualifications of the radiation safety supervisor shall be in writing and shall be signed by the qualifying radiation safety officer.

38-5.13 Minors Under 18. No employer shall suffer or permit an employee under 18 years of age to be exposed to radiation in excess of 10% of the permissible weekly dose limits as specified in 38-6.1.

38-5.14 Leakage. Every sealed source shall be so maintained that the concentration in any area accessible to employees, as a result of leakage, will not exceed the limits specified in 38-6.1, paragraph 7, Table I.

38-5.15 Eating Places. No person shall use any part of a high airborne concentration area for eating purposes.

38-6 Dose Limits

38-6.1 Permissible Weekly Dose Limit. Except as below provided no employer shall suffer or permit an employee to receive in the course of his work a weekly dose greater than the following:

1. For employees whose entire body or major portion thereof is exposed to radiation from external sources: 300 mrem in the blood-forming organs, in the gonads and the lenses of the eyes; 600 mrem in the skin.

2. For employees whose entire body or major portion thereof is exposed to radiation of very low penetrating power from external sources: 300 mrem in the lenses of the eyes; 1500 mrem in any other part of the body.

3. For employees whose hands and forearms only are exposed to radiation from external sources: 1500 mrem in the skin area receiving the highest dose.

4. For employees whose feet and ankles only are exposed to radiation from external sources: 1500 mrem in the skin area receiving the highest dose.

5. For employees whose heads and necks only are exposed to radiation from external sources: 1500 mrem in the skin area receiving the highest dose; 300 mrem in the lenses of the eyes.

6. For employees exposed to radiation from both external sources and ingested or inhaled radioactive material simultaneously or successively; an aggregate weekly dose not exceeding any of the appropriate weekly doses specified above.

7. For employees who are exposed to radiation from ingested or inhaled radioactive material only: 300 mrem in any part of the body.

For the purpose of this rule continuous inhalation or ingestion during a work week of 40 hours of concentrations of radioactive material set forth in Table I below are deemed to produce a weekly dose equivalent to 300 mrem in some part of the body.

TABLE I

MAXIMUM PERMISSIBLE AVERAGE CONCENTRATIONS OF INHALED OR INGESTED RADIOACTIVE MATERIALS

Col. (1) Effective half life in body in days.
Col. (2) Inhaled concentrations in microcuries per milliliter of air.
Col. (3) Ingested concentrations in microcuries per milliliter of water.

Material	Col. (1)	Col. (2)	Col. (3)
A^{41}	0.74	1.6×10^{-6}	1.4×10^{-3}
Ag^{105}	2.8	3.6×10^{-5}	5
Ag^{111}	2.1	1×10^{-4}	1.3×10
Am^{241}	890.	8×10^{-11}	4×10^{-4}

38-6.2 Quarter Year Dose Limits. Notwithstanding the provisions of 38-6.1, an employer may, during any quarter-year period, suffer and permit an employee over 18 years of age to receive a weekly dose greater than a permissible weekly dose subject to the following requirements:

1. Personnel monitoring equipment and a proper method of determining the dose shall be provided and used.

2. During such quarter-year period the employer shall not suffer or permit the employee to receive a weekly dose or intake exceeding three times the weekly limits specified in 38-6.1.

3. The employer shall not suffer or permit an employee to receive a total dose or intake throughout such quarter-year period exceeding ten times the weekly limits specified in 37-6.1.

38-6.3 Repeated Excessive Dose. Whenever personnel monitoring, physical examination by a radiation safety physician or appropriate tests indicate that any employee may have received an excessive amount of radioactive material or received during a period of 13 consecutive weeks more than 10 times the permissible weekly dose specified in 38-6.1, the employer shall report the fact to the Commissioner within 7 days after such finding. Such report shall describe the nature and extent of the exposure and the reason therefor and a description of corrective measures instituted.

38-7 Surveys

38-7.1 General. Every employer shall cause such surveys to be made by a radiation safety officer as may be necessary to determine whether the dose to any employee is maintained within the limits prescribed by this rule.

38-7.2 Report. A report shall be made of each survey and shall be signed by the person by or under whose direction it was made and shall show the date when the survey was completed.

38-7.3 Radiation Instruments. Every owner of an installation wherein radiation areas associated with radioactive materials, other than sealed sources, are present shall provide or have readily available instruments and procedures suitable for detecting and measuring radiations or contamination in accordance with the requirements of this rule and said instruments shall be maintained in proper calibration.

38-8 Records

38-8.1 Retention of Records. The owner of every installation shall keep in his possession a copy of all reports of surveys, dosimeter readings and physical examinations or tests.

38-8.2 Record of Use—Sources Outside Installations. The owner of every source of radiation used outside an installation shall keep a written record of each such use setting forth the following information:

1. The specific identification of each source.
2. The place or site of use.
3. The date and time of the removal of the radiation source from its installation or place of storage.
4. The date and time of its return thereto.
5. The name of the radiation worker by whom each source was used and the name of the radiation safety supervisor in charge.

38-8.3 Availability and Destruction of Records. No person shall damage or destroy any required radiation records, or suffer or permit the same to be destroyed without first having obtained the written consent of the Commissioner. All pertinent radiation records or copies thereof shall be readily available to the attending physician of any person who may have undergone exposure in connection with the installation to which such records relate and they shall also be available to the Commissioner.

38-8.4 Commissioner to Receive Records. The Commissioner shall receive all radiation records of a discontinued radiation installation which are voluntarily presented to him by the owner of such installation and acknowledge the receipt thereof in writing. The delivery of such records to the Commissioner relieves the owner from all subsequent responsibility in respect thereto. The Commissioner may keep or destroy such records in his discretion.

38-9 Personnel Monitoring

38-9.1 General. Any employee who in any week receives or is likely to receive a radiation dose which is more than 25% of the limits set forth in 38-6.1 shall be supplied with and shall use appropriate personnel monitoring equipment.

38-9.2 High Radiation Areas. Every employee having any occasion to enter a high radiation area shall be supplied with and shall use appropriate personnel monitoring equipment when the dose rate may exceed 100 mrem in any one hour.

38-10 Caution Labels and Signs

38-10.1 General. Except as provided in 38-10.5, the owner of every installation or mobile source shall indicate the presence of each source of radiation by conspicuous labels on the source or container thereof or by conspicuous signs in their immediate vicinity, or both.

Each label or sign shall bear the standard radiation warning symbol specified in 38-10.3 and appropriate explanatory wording, such as "radiation," "radioactive," "airborne radioactivity" or "X-ray." The printing of any further matter upon such label shall not obliterate or obscure the symbol or the said words.

38-10.2 Special Provision. Where, in the judgment of the radiation safety officer, personnel monitoring or the use of respiratory equipment is required for employees entering a high radiation area or high airborne concentration area, the posted signs shall conspicuously indicate such requirement.

38-10.3 Standard Radiation Warning Symbol. The following described standard radiation warning symbol is hereby adopted:

1. Upon a yellow background there shall be the design shown in purple.

. . .

2. The design in purple must be centered within a sufficient area of yellow background to make it conspicuous.

* * *

(Reproduction of Symbol Deleted)

38-10.4 Use of Symbol Restricted. No person shall affix, post or display any sign or label bearing said standard radiation warning symbol or any closely similar symbol to, upon or in any thing or location in any place to which this rule applies except for the purpose of warning of the presence of radiation.

38-10.5 Exception from Posting Requirements. Caution signs are not required to be posted at areas or rooms containing sources of radiation for periods of less than twenty-four hours provided such sources are attended by a radiation worker during such periods.

38-11 Storage of Radioactive Material

Radioactive material not in use shall be stored in properly shielded and secured containers.

38-12 Severability

If any provisions of this rule or the application thereof to any person or circumstances is held invalid, such invalidity shall not affect other provisions or applications of this rule which can be given effect without the invalid provision or application, and to this end the provisions of this rule are declared to be severable.

ITEM 4

New York State Sanitary Code

Chapter XVI

Ionizing Radiation

Regulation 1. Definitions (a) The term "radiation" or "ionizing radiation" as used in this chapter shall refer to electromagnetic radiations (x-rays and gamma rays, etc.) or particulate radiations (electrons or beta particles, protons, neutrons, alpha particles, etc.) usually of high energy, but in any case it includes all radiations capable of producing ions directly or indirectly in their passage through matter.

(b) The term "roentgen" (r) shall mean the quantity of x-radiation or gamma radiation such that the associated corpuscular emission per 0.001293 grams of air produces, in air, ions carrying an electrostatic unit of quantity of electricity of either sign. Milliroentgen (mr) equals 1/1000 of a roentgen.

(c) The "rad" is the unit of absorbed dose and is equal to 100 ergs per gram of matter irradiated. Millirad (mrad) is equal to 1/1000 rad.

(d) The term "rem" is that quantity of any type of ionizing radiation such that the energy imparted to a biological system (cell, tissue, organ or organism) per gram of living matter by the ionizing particles present in the region of interest has the same biological effectiveness as an absorbed dose of 1 rad of lightly filtered x-radiation generated at potentials of 200 to 300 kilovolts. Millirem (mrem) is equal to 1/1000 rem.

(e) The term "Relative Biological Effectiveness" (RBE) is the ratio of the absorbed dose of lightly filtered x-radiation generated at potentials of 200 to 300 kilovolts, to the absorbed dose of any other type and/or energy of radiation that is required to produce the same biological effect on a particular biological system, when the conditions under which the radiation is received

are the same. A dose in rems is equal to the dose in rads multiplied by the appropriate RBE.

(f) The term "curie" as used in this chapter shall mean that quantity of any radioactive material in which the number of disintegrations per second is 3.7×10^{10}. Millicurie (mc) equals 1/1000 of a curie. Microcurie (uc) equals 1/1000 of a millicurie.

(g) The term "radiation installation" shall mean a location or facility where radiation equipment is used or where radioactive material is produced, transported, stored or used for any purpose. The limits of the radiation installation area shall be as designated by the operator. (See regulation 4(e) and 5.) As used in this chapter, "radiation installation" shall refer only to those installations located in a hospital; institution; medical clinic; medical office; dental clinic; dental office; veterinarian clinic; veterinary office; podiatry office; educational institution; commercial, private or research laboratory performing diagnostic procedures or handling equipment or materials for medical use; shoe store; trucking, storage, messenger or delivery service establishment; or any industrial or commercial establishment not subject to supervision by the New York State Department of Labor in accordance with the Laws of New York State. "Radiation installation," as used in this chapter, shall include, whether or not it is specifically stated above, any facility where radiation is applied intentionally to a human. "Radiation installation," as used in this chapter, shall not include facilities subject to the regulations adopted by the Interstate Commerce Commission, United States Coast Guard, United States Post Office or Civil Aeronautics Board.

(h) The term "radiation equipment" as used in this chapter, unless otherwise specified, shall include any device which emits or may emit ionizing radiation, except that radiation equipment shall not include equipment operated at less than 15 Kilovolts and which is not designed primarily to produce useful radiation; or, except for the repair and servicing thereof, equipment operating normally at higher voltages, but which, by nature of design, does not produce radiation at the point of nearest normal approach at a weekly rate higher than one-tenth the appropriate basic minimum permissible total weekly dose for any critical organ exposed. It shall not include equipment in storage, in transit or not being used, or equipment operated in such a manner that it cannot produce radiation.

(i) The term "radioactive material" as used in this chapter is any solid, liquid or gaseous substance containing radioactive atoms which undergo spontaneous disintegration resulting in the emission of one or more types of radiation. As used in this chapter, radioactive material shall not include:

(1) Natural radioactive materials having an equivalent specific radioactivity not exceeding that of natural potassium.

(2) Small lots of time pieces, instruments, novelties or devices containing self-luminous elements, except during manufacture or repair of the self-

luminous elements themselves. Such time pieces, instruments, novelties or devices shall be included, however, if they are stored, used or handled in such quantity or fashion that any person might receive within a week a radiation dose exceeding 1/10 the maximum permissible total weekly dose.

(3) Radioactive material of such quantity that if the total amount were taken internally by a person, no serious harm would be likely to result. (Column 3—Table 3—National Bureau of Standards Handbook 52 can be used as a guide.)

(j) The term "radioactive waste" as used in this chapter shall include any solid, liquid or gaseous substance containing radioactive material, regardless of its source, which is discharged into the environment.

(k) The term "competent person" as used in this chapter shall mean an individual who has received training or instruction in radiation hazards and their control, sufficient to specify protection for himself and others in the vicinity.

(l) The terms "hazard," "radiation hazard," or "hazardous amounts of radiation" when used in relation to external radiation exposure, shall refer to any exposure rate, which may result in a person receiving within a period of one week a total radiation dose exceeding the maximum permissible total weekly dose. When used in relation to internal exposure, they shall refer to concentrations of radioactive material in air, food or water, which exceed the maximum permissible concentrations in air, food or water for continuous exposure.

(m) The term "sealed source" as used in this chapter shall mean any device containing radioactive material to be used primarily as a source of radiation which has been constructed in such a manner as to prevent the escape, under normal conditions, of any radioactive material.

(n) The term "survey" as used in this chapter shall mean the evaluation of the potential radiation hazard in the vicinity of a radiation source.

(o) The term "personnel monitoring equipment" as used in this chapter shall mean devices or equipment which are capable of indicating or recording with reasonable accuracy the radiation dose a person has received during a specific period.

(p) The term "operator" as used in this chapter shall mean an individual, group of individuals, partnership, firm, corporation or association conducting the business or activities carried on within the radiation installation.

(q) The term "health officer" as used in this chapter shall mean the county or part-county health officer, the health officer of a city of 50,000 population or over or the state district health officer.

REGULATION 2. REGISTRATION. Every operator of a radiation installation as defined in this chapter shall register such installation with the health officer having jurisdiction, prior to March 1, 1956. All new installations as defined in this chapter made on or after September 1, 1955, shall be regis-

tered with the health officer having jurisdiction, before the installation is placed in operation. Such registration shall be made on a form prescribed by the state commissioner of health. The following information shall be provided by the operator at the time of registration: The name of the operator; a designation of the confines of the installation; a statement of the type of sources of radiation expected to be used, operated or stored within the installation and of the approximate total number of each type; a summary of the radiation safety program.

A central committee (such as an isotope committee) having supervision for radiological safety over two or more radiation installations may register such installations in lieu of registration by the individual operator.

Registration shall not imply approval of manufacture, storage, use, handling or operation, but shall serve merely to notify the health officer having jurisdiction, of the location and character of radiation sources.

Any change in the character of the radiation installation which might increase the radiation exposure, such as addition to number of sources, increase in source strength, increase in output, increase in energy of radiation produced, shall be considered a new installation and shall be registered with the health officer having jurisdiction.

If the registration of each device or each change in the character of the installation would be impractical, the state commissioner of health, upon request of the operator or central committee, may approve blanket registration of the installation.

Radioactive materials in quantities not exceeding the amounts shown in Table 1 shall be exempt from registration.

REGULATION 3. CONSTRUCTION MAINTENANCE AND OPERATION. Every radiation installation shall be constructed, maintained and operated in such a manner as not to create a hazard.

Note: As a general guide to compliance with Regulation 3, the recommendations of the National Committee on Radiation Protection, as published in Handbooks 41, 42, 47, 48, 49, 50, 51, 52, 53, 54, 55, 56, 57, 58, and 59 of the National Bureau of Standards, and such other recommendations as may be made by that Committee, may be followed.

The applicable regulations of the Interstate Commerce Commission, Civil Aeronautics Board, United States Coast Guard and United States Post Office may be used as a general guide to compliance with this regulation in relation to the proper storage and intrastate shipment of radioactive materials. [See Chapter 281: TRANSPORTATION.]

REGULATION 4. MAXIMUM PERMISSIBLE DOSES. (a) The radiation exposure of a person or persons shall always be kept at the lowest practical level, in accordance with the current recommendations of the National Com-

mittee on Radiation Protection, as published in the handbooks of the National Bureau of Standards.

(b) When the source of radiation is outside the body, the maximum permissible total weekly dose under the conditions noted shall not exceed the following:

(1) *Entire body or major portion thereof exposed to penetrating radiation (half-value layer greater than 1 mm of soft tissue).* The maximum permissible total weekly dose shall be 600 mrems in the skin; and 300 mrems in the blood-forming organs, gonads and lens of the eye. For exposure of the whole body to x-rays or gamma rays with an energy up to 3 million electron volts, this condition may be assumed to be met if the "air dose" does not exceed 300 milliroentgens.

(2) *Entire body or major portion thereof exposed to radiation of very*

penetrating power. (*Half-value layer less than 1 mm of soft tissue.*) The maximum permissible total weekly dose shall be 1500 mrems in the skin and 300 mrems in the lens of the eye.

(3) *Hands and forearms or feet and ankles or head and neck exposed to any radiation.* The maximum permissible total weekly dose shall be 1500 mrems in the skin.

(4) *Exposures Exceeding Basic Permissible Weekly Doses.* In exceptional cases, it may be necessary for a person to receive in one week a radiation dose exceeding the basic permissible total weekly dose, outlined in Regulation 4(b): 1, 2, & 3. This shall be allowable provided that the basic permissible dose during any seven consecutive days is not exceeded by more than a factor of three; and provided further that the total dose in any organ accumulated during a period of thirteen (13) consecutive weeks does not exceed ten (10) times the basic permissible weekly dose.

(5) *Accidental or Emergency Exposure to Radiation.* Accidental or emergency exposure of the whole body or parts thereof to x-rays or gamma rays with photon energy less than 3 million electron volts occurring only once in a lifetime of a person shall be assumed to have no effect on the radiation tolerance status of that person provided that the total exposure of the whole body or major portion thereof does not exceed 25 roentgens measured in air and provided also that the exposure to the hands, forearms, feet and ankles does not exceed 100 roentgens in addition to the whole body exposure.

Accidental or emergency exposure to radiation of other types and energies occurring once in a life-time of a person shall be assumed to have no effect on the radiation tolerance status of the person provided that the total tissue doses resulting therefrom in the different tissues and organs of the body (expressed in rems) do not exceed numerically the respective tissue doses in rads resulting from exposure to x-rays with photon energy less than 3 million electron volts.

Planned emergency exposure shall be carried out on the basis that a person will not receive doses higher than one-half the tolerable accidental or emergency dose.

(c) When the source of radiation is radioactive materials within the body, the dose rates to the tissues of the body shall be controlled by limiting the average rates at which radioactive materials are taken into the body either by inhalation or by ingestion. The maximum permissible concentrations of radioactive material in air and water shall be in accordance with nationally recognized limits (Table 3 and Appendix 3—National Bureau of Standards Handbook #52).

(d) The maximum permissible dose for any person shall include all doses from all types and energies of radiation, whether delivered simultaneously or successively, during the period of measurement, to the region of interest.

(e) The radiation dose delivered to any person outside the installation

shall be limited to 1/10 the maximum permissible amounts stated in Regulation 4(b): (1), (2), & (3) and 4(c).

(f) Nothing in this regulation shall be construed to limit the kind and amount of radiation that a physician, dentist, or other licensed practitioner may intentionally apply to a person in diagnosis or treatment.

(g) The limitations expressed in this regulation shall not apply to exposure received by persons being fitted for shoes in a shoe fitting fluoroscope, provided such fluoroscope installation is constructed, operated and maintained in compliance with Regulation 19 of this Chapter.

TABLE 2

MAXIMUM PERMISSIBLE TOTAL WEEKLY DOSES IN CRITICAL ORGANS UNDER VARIOUS CONDITIONS OF EXPOSURE

Conditions of Exposure		Dose in Critical Organs (mrem per week)			
Part of Body	Radiation	Skin, at Basal Layer of Epidermis	Blood-Forming Organs	Gonads	Lens of Eye
Whole Body	Any Radiation with Half-value layer greater than 1 mm of soft tissue	600[a]	300[a]	300[a]	300[a]
Whole Body	Any Radiation with Half-value layer less than 1 mm of soft tissue	1500	300	300	300
Hands and Forearms or Feet and Ankles or Head and Neck	Any Radiation	1500[b]			

[a] For exposures of the whole body to x-rays or gamma rays up to 3 Mev, this condition may be assumed to be met if the "air dose" does not exceed 300 mr, provided the dose to the gonads does not exceed 300 mrem. "Air dose" means that the dose is measured by an appropriate instrument in air in the region of highest dosage rate to which an individual might be exposed without the presence of the human body or other absorbing and scattering material.

[b] Exposure of these limited portions of the body under these conditions does not alter the total weekly dose of 300 mrem permitted to the blood-forming organs, the main portion of the body, to the gonads, or to the lens of the eye.

(h) In special cases, exposure in excess of the values outlined in this regulation may be permitted for individuals over 45 years of age. This will be allowable if such exposures are in accordance with nationally recognized standards (National Bureau of Standards Handbook #59).

(i) The radiation dose delivered to any person less than 18 years of age shall be limited to a maximum of 1/10 the maximum permissible total weekly amounts specified in Regulation 4(b): 1, 2, & 3 and 4(c).

REGULATION 5. SUPERVISION. All radiation installations shall be operated by or under the direction of a competent person who shall be responsible for all necessary safety precautions.

The operator of a radiation installation shall be responsible for:

(a) Insuring beyond reasonable doubt that all persons working with radiation equipment or radioactive materials are properly and adequately instructed in the hazards associated with and the safe methods of handling or operation and use of the radiation equipment or radioactive materials.

(b) Insuring beyond reasonable doubt that all persons working with radiation equipment or radioactive materials are properly and adequately instructed in the purpose and proper use of any protective and monitoring equipment provided. This shall also apply to visitors to areas under his control.

(c) Insuring beyond reasonable doubt, by means of radiation surveys, that any space normally occupied by persons not primarily engaged in radiation or associated work is not subjected to radiation levels which would result in a person receiving a dose exceeding one-tenth the maximum permissible amounts indicated in Regulation 4(b): 1, 2, & 3 and 4-c of this chapter.

(d) Controlling the discharge of radioactive wastes so that any person outside the installation is not subjected to radiation levels exceeding one-tenth the maximum permissible levels specified in Regulation 4-c of this chapter.

REGULATION 6. PERSONNEL PROTECTION. The operator of a radiation installation shall provide personnel monitoring equipment, properly calibrated, for every individual who may possibly receive routinely, a weekly radiation dose in excess of one-fourth the maximum permissible amounts specified in Regulation 4(b): 1, 2, & 3 of this chapter. Summary records shall be kept of all exposures indicated or recorded on personnel monitoring equipment and shall be filed by the operator; (1) for the length of the employment of the exposed individual plus 5 years, or (2) until two years following the death of the exposed individual, or (3) until, upon application, specific instructions have been given by the state commissioner of health for the disposition of the records. These records shall be open to inspection by a duly authorized representative of the health officer and/or the state commissioner of health. The operator shall on request furnish any person with a summary statement of his radiation exposure record.

Personnel monitoring equipment shall be worn on the torso. If it is determined that the head and neck or extremities might receive exposures greater than 1/4 the maximum permissible amounts specified for these areas of the body, personnel monitoring equipment shall be worn also on the body area likely to be so exposed.

Protective equipment such as interlocked tube screen, leaded rubber aprons and leaded rubber gloves, shall be available to and used by the operator of fluoroscopic equipment. Protective equipment shall be without defects.

Radiation shields, including protective windows or other visualization de-

vices or their equivalent, which will provide protection for the person operating the equipment, shall be supplied for all radiographic equipment.

When it is known or believed that the exposure of an individual during any one week may have exceeded five times the maximum permissible total weekly amounts specified in Regulation 4(b): 1, 2, & 3 of this chapter, the person shall be notified and all known facts relative to its occurrence shall be reported to the health officer having jurisdiction, within 72 hours of the discovery thereof and a copy of the report shall be put into that person's personnel file. Immediate corrective measures leading to the elimination of the recurrence or continuance of the overexposure shall be undertaken by the operator.

REGULATION 7. MEDICAL EXAMINATIONS. All persons who might regularly ingest or inhale radioactive materials in concentrations exceeding one-quarter of the maximum permissible amounts specified in Regulation 4(c) shall be examined by a physician at least once each year to determine the presence of radioactive material in the body. Such examinations shall include, according to the physician's judgment, pertinent laboratory examinations such as urinalysis, expired air analysis or other laboratory tests or aids which will give data of value bearing on the person's state of health.

All persons who might be exposed accidentally or under emergency conditions to external radiation exceeding the maximum outlined in Regulation 4(b)(5) shall be examined by a physician for evidence of radiation injury or for any physical condition which would tend to predispose to radiation injury. Such examination shall include, according to the physician's judgment, pertinent laboratory examinations, such as blood counts.

Records shall be kept of physical examinations and shall be filed by the operator; (1) for the length of the employment of the exposed individual plus five years, or (2) until two years following the death of the exposed individual, or (3) until, upon application, specific instructions in writing have been given by the state commissioner of health for the disposition of records.

REGULATION 8. PROTECTION OF PATIENT. Filtration equivalent to at least a total of 2 millimeters of aluminum shall be used with all diagnostic x-ray equipment.

Fluoroscopy equipment installed after September 1, 1955 shall not be operated for the examination of a patient unless an automatic timer is installed, so set and functioning as to interrupt the x-ray exposure at the end of four minutes' total exposure. The timer shall be so installed that the equipment may not be reactivated without resetting the equipment controls.

Focal skin distance for all fluoroscopes shall be not less than twelve inches. The dosage rate at table top shall not exceed ten roentgens per minute.

REGULATION 9. DISPOSAL OF RADIOACTIVE WASTES. Radioactive wastes discharged to the environment shall not be released in such manner that they

will accumulate in the environment in concentrations that may lead to any person receiving a dose exceeding that specified in Regulation 4(e) of this chapter. If several users are discharging wastes in such way that the radioactivities are additive, they shall enter into a mutual agreement each to limit his release, so that the total comes within the permissible limit specified in Regulation 4(e). If no agreement is reached, then the amount of maximum discharge for each user shall be set by the State Commissioner of Health.

Radioactive wastes shall not be disposed of by dumping on the surface of the ground or by burial in the soil, except in areas specifically approved by the state commissioner of health. Controlled surface or subsurface storage in such a fashion that radioactive material cannot mix with the soil or enter the ground water shall not be considered disposal by dumping or burial.

Note: The contamination of soil resulting from the use of radioactive materials in plant, animal and similar studies shall not be considered as contamination by radioactive waste. It is recommended, however, that the health officer having jurisdiction be consulted prior to the initiation of such studies.

REGULATION 10. RADIATION INSTRUMENTS. Every operator of a radiation installation where radioactive materials, not in sealed sources, are present shall provide or have immediately available instruments suitable for detecting and measuring radiation and radioactive contamination. Such instruments shall be maintained in proper calibration.

REGULATION 11. HANDLING OF CADAVERS CONTAINING RADIOISOTOPES. The identification of a particular patient as radioactive shall be the responsibility of the physician in charge of the case or his designated representative. If such a patient dies in a hospital, the doctor who pronounces him dead shall notify the physician in charge of the case or his designated representative at once.

An autopsy shall not be commenced on a body that contains more than five millicuries of radioactivity without the consultation and advice of the radiation safety officer of the hospital or, if he is not available, of the physician responsible for the administration of the radioactive material. If neither is available, their designated representative may serve.

Note: An official radiation safety officer is required by the Isotopes Division of the Atomic Energy Commission in institutions equipped for treatment with radioisotopes obtained from Atomic Energy Commission or secondary suppliers.

A radioactivity report on every cadaver containing more than 5 millicuries of radioactivity shall be completed by the radiation safety officer or the physician responsible for the administration of the radioactive material or their designated representatives. This report shall accompany the body

(whether autopsied or not) when it is surrendered to the funeral director. This report shall contain the following information:

(a) Name of hospital

(b) Name of deceased

(c) A statement, "This certifies that the remains of..... .....has been examined this date by..... (person certifying) Radioactivity close to the surface of the body, as determined by..... .....(is) (is not) below the rate of 30 mr/hr (state instrument or method) that is acceptable for embalmers during their work. This maximum permissible dose per hour will not be exceeded, if rubber gloves are worn, and further precautions are observed as listed below."

(d) Statement of precautions to be taken

(e) Date

(f) Signature of Radiation Safety Officer or physician.

Note: As a general guide to compliance with Regulation 11, the recommendations of the National Committee on Radiation Protection, as published in Handbook 56 of the National Bureau of Standards, may be followed.

REGULATION 12. MONITORING OF RADIATION INSTALLATION. It shall be the responsibility of the operator of a radiation installation to make certain that surveys of the radiation installation are made by a competent person with appropriate, properly calibrated monitoring equipment.

Records shall be made of such surveys and shall be filed by the operator for: (1) five years following the date of the survey, or, (2) until, upon application, specific instructions have been given by the state commissioner of health for the disposition of such records. Such records shall be open to inspection by a duly authorized representative of the health officer and/or the state commissioner of health. The operator shall keep the radiation intensity in any occupied space below that which would result in any person receiving more than the maximum permissible total weekly dose during the time the space is occupied by that person during the week.

Surveys of radiation installations shall be made at the intervals outlined below:

(a) Installations where radioactive materials not contained in a sealed source are handled shall be surveyed at least once a month. Such surveys shall be made more often if it is indicated by personnel monitoring equipment or other means that more frequent surveys are necessary to limit radiation intensities or contamination below the permissible maximum. Regularly scheduled radiation monitoring of the air shall be required where there is any reasonable possibility that concentrations of radioactivity in inhaled air may exceed the amounts specified in Regulation 4-c of this chapter.

(b) Installations where radiation equipment is used or where radioactive materials in a sealed source are handled or installed on or after September 1, 1955 shall be surveyed when originally installed.

All radiation installations of this type, regardless of the date of installation, shall be surveyed whenever any change is made in the installation or its use that might increase the radiation to which a person could be exposed.

When vibrations or other physical conditions exist which may cause changes in the protective features, inspection of protection devices and surveys for radiation rates shall be made at least every six months or at more frequent intervals if required by the health officer having jurisdiction.

REGULATION 13. THERAPY ROOMS. No person other than the patient and those who may be required to hold the patient, shall be allowed to remain within a therapy room during irradiation. No person who is habitually near radiation producing equipment or materials shall hold a patient during irradiation. The person holding the patient shall not be in the useful beam and shall be protected as much as practicable from scattered radiation.

Every entrance to an x-ray therapy room in which equipment is operated at a potential above 150 KV and every entrance to a teletherapy room shall be protected by interlocks so that no person can enter without turning off the radiation equipment or adequately shielding the radiation source. It shall be so arranged that irradiation equipment cannot be started again, or the radiation source unshielded again, without resetting the controls.

In addition to the interlocking controls, signals shall be installed which are visible or audible inside the therapy room. These signals shall be installed so that they will be activated whenever irradiation is proceeding. It shall be possible for a person to escape from a therapy room at all times.

REGULATION 14. WARNING SIGNS. (a) Standard Symbol. A standard symbol for designating any radiation hazard has been adopted . . .

[Symbol Omitted]

(b) Radiation Areas—The operator of a radiation installation shall post conspicuous warning signs to indicate the area where a radiation hazard exists. Such warning signs shall contain the standard symbol and the words "Danger" and "Radiation Area."

(c) Radiation Sources—The operator of a radiation installation shall label conspicuously all radioactive material as follows:

(1) Containers for sealed sources of external hazard only: A label containing the standard symbol and the words "Danger—Radiation." Where a time limit is specified, it shall be posted.

(2) Containers for storage or shipment of loose bulk or unsealed sources primarily of an internal hazard: A label containing the standard symbol and the words, "Danger—Radioactive Material."

(3) Additional Precautions: The printing of further precautions and instructions on the warning labels for radioactive materials shall not obscure the standard symbol and required precautionary words.

(d) Removal of signs and labels—All radiation labels or signs which may have been posted at a time when a radiation hazard existed shall be removed when there is no longer a need for such warning.

REGULATION 15. ACCOUNTING FOR RADIOACTIVE MATERIALS. The operator of a radiation installation shall maintain an accurate account of all radioactive materials in a radiation installation. Such records shall show amounts and form of the radioactive materials received, purpose for which used, amounts of wastes and such other information as may be necessary to account for the difference between the amount of radioactivity received and the amount on hand. Such records shall be open to inspection on request by the state commissioner of health and/or the health officer having jurisdiction, or their authorized representatives.

The state commissioner of health, or his authorized representative, upon application, may modify this accounting requirement under special circumstances.

REGULATION 16. RADIATION ILLNESS, INJURIES, EMERGENCIES, ACCIDENTS. Accidents involving the serious overexposure of personnel; the discharge of radioactive wastes in a concentration above an acceptable limit; the spillage, loss or theft of radium, or other radioactive materials; fire; flood or other catastrophe affecting places using or storing radioactive materials; or other incidents, which will or are likely to expose people to hazardous quantities of radiation; whether it occurs at an installation as defined in this chapter or in any other place, shall be reported immediately by the person in charge by telephone or telegraph to the health officer having jurisdiction. Such reporting shall not relieve the operator of the responsibility for instituting and performing such corrective and preventive measures as are necessary to reduce the hazard. Following the receipt of notification, the health officer having jurisdiction shall investigate the incident promptly and determine that the operator has taken all necessary corrective and preventive measures.

For the purpose of this regulation, "the serious overexposure of personnel" shall mean the exposure of a person to a quantity of external radiation exceeding that specified in Regulation 4(b-5) of this chapter, or to a quantity of internal exposure which would result from the ingestion or inhalation of radioactive material in such quantities as to exceed 50 times the maximum permissible amount (Handbook 52, National Bureau of Standards).

For the purpose of this regulation, "acceptable limit" shall mean that concentration of radioactive material which will not constitute a hazardous external or internal exposure to a person.

It shall be the duty of every physician to report in writing to the state department of health the full name, address and age of every patient who is suffering from radiation illness or injury from exposure to ionizing radiation.

Radiation received by a patient for therapy under the supervision of a physician or the effects of such radiation shall not come within the intent of this regulation.

REGULATION 17. ELECTRICAL HAZARDS. All x-ray equipment installed in a radiation installation after September 1, 1955, shall, where applicable, bear the seal of approval of the Underwriters' Laboratories, Inc., or shall be required to meet an equivalent safety standard. All equipment installed prior to September 1, 1955, if not bearing such seal, shall be altered to comply with the pertinent requirements of the standard of the National Board of Fire Underwriters' (The National Electrical Code) prior to September 1, 1956.

Certification by a duly constituted local authority that the installation is free of electrical hazards shall be acceptable.

REGULATION 18. VACATED PREMISES. Upon vacating any radiation installation handling radioactive materials, the operator shall decontaminate it, if necessary. If decontamination is not possible, the operator shall inform the owner and the health officer having jurisdiction. The owner shall inform the future occupants of any residual potential hazard.

> *Note:* As general guide to decontamination, the recommendations of the National Committee on Radiation Protection as published in Handbook 48 of the National Bureau of Standards may be followed.

REGULATION 19. SHOE-FITTING FLUOROSCOPES. (a) No fluoroscopic or x-ray equipment for fitting shoes shall be operated unless it is equipped with an automatic timer which will cut off each x-ray exposure at the end of a five-second interval.

(b) All establishments which use a shoe-fitting fluoroscope shall display at all times, in a location where all users can see it, a warning sign furnished by the state department of health.

(c) Exposure to the useful beam measured on the base of the foot opening in fluoroscopic shoe-fitting machines installed after September 1, 1955, shall not exceed 1.0 roentgen per five-second exposure.

Exposure to the useful beam measured on the base of the foot opening of fluoroscopic shoe-fitting machines installed prior to September 1, 1955, shall not exceed two roentgens per five-second exposure. After January 1, 1960, no shoe-fitting fluoroscope shall be operated if the exposure to the useful beam measured on the base of the foot opening exceeds 1.0 roentgen per five-second exposure.

(d) The base of the foot opening shall be covered with a sheet of aluminum at least 2 mm. thick and of dimensions equal to or greater than the base. This aluminum filter shall be protected from wear by a covering layer of other material and shall be installed in such a fashion that its thickness can be conveniently determined.

(e) Only salespersons shall be permitted to operate a shoe-fitting fluoroscope. The starting mechanism shall be so designed and located as to prevent operation by customers.

(f) The fluorescent viewing screen shall be covered with leaded glass having a lead equivalent of at least 1.5 mm.

(g) Customers should be required to have shoes on both feet during a fluoroscopic examination.

(h) Customers should be questioned regarding dates and numbers of previous shoe-fitting fluoroscopic examinations and may not be allowed such fittings in excess of 12 five-second viewings per year or in excess of three per day.

(i) Salespersons shall operate the device for their own customers only.

(j) Salespersons shall not use their own feet or hands for demonstrating x-ray fluoroscopy. Children's feet shall not be held in position by any person while the machine is in operation.

(k) Salespersons shall report any defects in the machine to the person in charge of the establishment wherein such machine is installed. Defective machines shall not be operated until repairs are made.

(l) Machines shall be located as far as possible from frequently occupied areas. X-ray tubes shall be shielded and cabinets constructed so that stray radiation is reduced to less than 10 milliroentgens per hour at all positions six inches from the cabinet surface and at viewing ports at eye level, except at the foot opening. Foot openings shall be so oriented and shielded that scattered radiation from the openings is not directed toward areas which are continuously or frequently occupied unless suitable protecting screens are interposed. Scatter radiation from the foot opening shall not exceed a rate of 10 milliroentgens per hour at a distance of ten feet.

(m) All metal non-current carrying parts shall be properly grounded.

(n) An interlocking switch shall be provided on any door or panel giving access to high voltage components. This switch shall operate to break the electrical current whenever the door or panel is opened.

(o) Cabinet doors or panels shall be kept locked at all times except when making necessary repairs.

ITEM 5

MICHIGAN ADMINISTRATIVE CODE

Michigan Department of Health

Division of Occupational Health

REGULATIONS GOVERNING THE USE OF RADIOACTIVE ISOTOPES, X-RADIATION AND ALL OTHER FORMS OF IONIZING RADIATION

PART 1. ADMINISTRATIVE RULES AND PROCEDURES

R 325.1301. Radiation protection advisory committee.

Sec. 1. The state health commissioner shall appoint a radiation protection advisory committee to be known as the commissioner's radiation committee which will serve to advise him on all matters pertaining to radiation protection and the rules and regulations promulgated for this purpose.

R 325.1302. Same; qualification of members, chairman.

Sec. 2. The state health commissioner shall appoint 9 members to serve on the commissioner's radiation committee.

2.1 Members shall be appointed on the basis of their recognized knowledge in the field of radiation and the committee shall be so constituted as to be a fair representation of all interested groups of users of ionizing radiation.

2.2 The state health commissioner or his representative shall act as chairman of the committee.

2.3 Members shall be appointed for 3-year periods. Of the original appointees, 3 shall be appointed for 1 year, 3 for 2 years, and 3 for 3 years.

2.4 The committee shall meet for review of these regulations at least once annually and at such other times, not to exceed 4 times a year, as may seem necessary. Meetings may be called by the state health commissioner on his own initiative or at the request of 5 or more of the members.

R 325.1303. Technical committees or consultants, appointment.

Sec. 3. The state health commissioner may appoint such technical committees or consultants as may be indicated from time to time.

R 325.1304. Local health departments, enforcement of rules.

Sec. 4. The state health commissioner may delegate authority to the county, city or district health departments to enforce these rules and regulations.

PART 2. GENERAL REQUIREMENTS AND DEFINITIONS

R 325.1305. Sec. 5. Scope of regulations.

5.1 These regulations apply to all persons who receive, possess or use materials or devices capable of emitting ionizing radiation as de-

fined in these regulations except the sources or uses cited in section 7, exemptions.

5.2 Person includes any municipality, industry, public corporation, copartnership, firm or any other entity whatsoever.

5.3 Nothing in these regulations should be interpreted as limiting the intentional exposure of patients to radiation for the purpose of medical diagnosis, medical therapy, or medical research conducted by duly licensed members of the healing professions.

R 325.1306. Sec. 6. Registration of users and sources of radiation.

6.1 Within 10 days after receipt or completion thereof all sources of ionizing radiation shall be registered with the state health commissioner by the legal owner, user or authorized representative. Registration information shall include the name and address of the owner or user, the name of the individual and the training and/or qualification of the individual who will be appointed by the owner or user to see that the radiation source is safely used and stored, location in which the radiation source shall be used or stored, type of radiation source, and the quantity in curies or the energy and capacity of the radiation source. Existing sources of ionizing radiation shall be registered within 90 days of the effective date of these rules and regulations. The owner of every registered source of ionizing radiation shall advise the state health commissioner and receive prior approval for all changes which may materially increase the potential health hazard.

6.2 A written exemption to the notification of changes, which may materially increase the potential health hazard in an existing installation, or the registering of each individual source or use may be granted by the state health commissioner, provided that the legal owner, user or authorized representative of the registered source is registered with the state health commissioner and the registrant meets the health and safety requirements specified and prescribed in these regulations for such registrant by the state health commissioner.

R 325.1307. Sec. 7. Exemptions.

7.1 The following materials, sources and uses are exempted from registration:

7.1.1 Natural radioactive materials of an equivalent specific radioactivity not exceeding that of natural potassium.

7.1.2 (1) Radioactive materials in such total quantity that if the entire amount were taken internally, at any one time by a single person, no harmful effects would be likely to result. A listing of the upper quantities of radioactive material that shall not require registration are given in appendix D. Up to

10 quantities of material listed in this appendix may be possessed by any person provided that no 2 or more quantities are combined in any way so as to increase the amount of radioactive material in any one quantity.

(2) Radioactive materials in air, water, or food in concentrations not exceeding those listed in appendix B, table II, columns 1 or 2 of these regulations, or radioactive materials in non-edible liquids and solids in such concentrations that they would not result in contamination of air, water, or edibles in excess of the limits in appendix B, table II, columns 1 or 2 of these regulations.

7.1.3 Electrical equipment that is primarily not intended to produce radiation and that, by nature of design, does not produce radiation at the point of nearest approach at a rate higher than 1/10 of the appropriate permissible limit for any critical organ exposed. The production testing or production servicing of such equipment shall not be exempted only if the dose to the gonads is less than 1/10 of the appropriate maximum permissible limit.

7.1.4 Timepieces, instruments, novelties, or devices containing self-luminous elements. However, all persons engaged in the manufacture or repair of self-luminous elements and possessing amounts of radioactive materials in excess of the limits prescribed in appendix B, table II, column 2, of these regulations shall register such sources.

7.1.5 Radiation devices not being used in such manner as to produce radiation.

7.1.6 Radioactive material being transported in accordance with specific radiation safety regulations of a state or federal agency having jurisdiction over such transport.

7.1.7 Any other special research devices or nuclear devices so specified by the state health commissioner.

R 325.1308. Sec. 8. Definition of terms.

8.1 For the purpose of these regulations, the following terms shall mean:

8.1.1 Air-borne radioactive material means any radioactive material dispersed in the air in the form of dusts, fumes, mists, vapors, or gases.

8.1.2 Air-borne radioactivity area means any area in which air-borne radioactive materials are accessible to persons in concentrations of which

(1) Values at any time are in excess of respective values stated in appendix B, table I, column 1; or

(2) Values averaged over a week of working time are in excess of 25% of the respective values stated in appendix B, table I, column 1.

8.1.3 Authorized recipient means any person licensed by the Atomic Energy Commission to possess radioactive materials, and if resident in Michigan, registered under these regulations.

8.1.4 Controlled area means any area in which the activities of occupants are subject to control or supervision by the registrant and which is designated by the registrant as a potential radiation hazard area. (A controlled area shall not include space in use as residential quarters, although a room or rooms in a residential building may be set apart as a controlled area.)

8.1.5 Diagnostic-type housing. A type of x-ray tube housing that reduces the leakage radiation to at most 0.10 r/hr at a distance of 1 meter from the tube target when the tube is operating at its maximum continuous rated current for the maximum rated voltage.

8.1.6 Dose is a quantity of radiation measured at a certain point expressed in roentgens, rems or rads.

Absorbed dose of any ionizing radiation is the amount of energy imparted to matter by ionizing particles per unit mass of irradiated material at the place of interest (expressed in rads).

Exposure dose is a quantity of radiation measured in air in roentgens without back scatter at a given point.

Dose rate is dose per unit time.

8.1.7 Film badge is an appropriately packaged and calibrated sensitive film for detecting and measuring ionizing radiation received by persons. It is usually dental-film size and worn/or carried on the person.

8.1.8 High radiation area means any area accessible to personnel, in which there exists radiation at such levels, that a major portion of the body could receive in any 1 hour a dose in excess of 100 millirems.

8.1.9 Installation is a location where for a period of more than 30 days 1 or more sources of radiation are used, operated, or stored. The confines of an installation shall be designated by the owner. A part of a building, an entire building or a plant may be designated as an installation.

8.1.10 Ionizing radiation means any or all of the following forms of ionizing radiation: alpha rays, beta rays, gamma rays,

x-rays, neutrons, high-speed electrons, high-speed protons and other atomic particles; but not sound or radio waves, or visible, infra-red, or ultraviolet light.

8.1.11 Leakage radiation is all radiation coming from within the tube housing except the useful beam.

8.1.12 Maximum permissible dose is that dose of ionizing radiation which, in the light of present knowledge, is not expected to cause bodily injury to a person during his lifetime.

8.1.13 Normal operating conditions for x-ray machines. Operating conditions under which the x-ray apparatus is normally used with respect to the following:

(a) Maximum tube voltage
(b) Maximum tube current
(c) Total weekly operational time
(d) Direction of the useful beam
(e) Minimum radiographically usable distance from the tube to personnel barrier
(f) Occupancy of adjacent areas

8.1.14 Occupancy factor (T) is the factor by which the work load should be multiplied to correct for the degree or type of occupancy of the area in question.

8.1.15 Occupied area is an area that may be occupied by persons or radiation sensitive materials.

8.1.16 Personnel barrier is a barrier which restricts the movements of personnel in the vicinity of an x-ray apparatus.

8.1.17 Potential radiation area. That area surrounding a radiation source such that the radiation source may produce a radiation field in the area, if it is operated under maximum conditions, which exceeds 1/10 of the maximum permissible dose based on 13 weeks of continuous occupancy.

8.1.18 Primary radiation is radiation coming directly from the target of an x-ray tube or from other radiation sources.

8.1.19 Protective apron is an apron made of attenuating materials used to reduce radiation hazards.

8.1.20 Protective barrier is attenuating material used as shield to reduce radiation hazards.

Primary protective barrier is a barrier sufficient to attenuate the useful beam to the required degree.

Secondary protective barrier is a barrier sufficient to attenuate the stray radiation to the required degree.

8.1.21 Protective glove is a glove made of attenuating materials used to reduce radiation hazards.

8.1.22 Rad is that quantity of any radiation which produces an absorbed dose of 100 ergs per gram.

8.1.23 Radiation area. Any part of an installation accessible to employees in which there exists a radiation level of 7.5 millirem in any 1 hour or over 150 millirem in any 7 consecutive days.

8.1.24 Radiation field is the region in which ionizing radiation is propagated.

8.1.25 Radiation hazard is any situation where persons might be exposed to radiation in excess of the maximum permissible dose.

8.1.26 Radiation monitoring is the periodic or continuous determination of the dose rate in an occupied area (area monitoring) or of the dose received by a person (personnel monitoring).

8.1.27 Radioactive material means any compound or element which may emit any or all of the following: alpha and beta particles, electrons, photons, neutrons and gamma and all other emissions which produce ionization directly or indirectly.

8.1.28 Relative biological effectiveness (RBE) is the biological effectiveness of 1 type and energy of radiation, relative to that of lightly filtered x-rays, generated at potentials of 200 to 300 kv, for the particular biological system and biological effect, and for the conditions under which the radiation is received.

8.1.29 Rem is the quantity of any radiation such that the energy imparted to a biological system (cell, tissue, organ, or organism) per gram of living matter by the ionizing particles present in the region of interest, has the same biological effectiveness as an absorbed dose of 1 rad from lightly filtered x-rays generated at potentials of 200 to 300 kv. A dose in rems is equal to the dose in rads multiplied by the appropriate RBE.

8.1.30 Roentgen is the quantity of x or gamma radiation such that the associated corpuscular emission per 0.001293 grams of air produces, in air, ions carrying 1 electrostatic unit of quantity of electricity of either sign. The roentgen is applicable only to x- and gamma radiation of quantum energies up to 3,000,000 electron volts.

8.1.31 Scattered radiation is radiation that has been deviated by substances in its path.

8.1.32 Sealed source means any radioactive material that is encased in and is to be used in a container in a manner intended to prevent leakage of the radioactive material.

8.1.33 Secondary radiation is radiation emitted by any matter being irradiated with x-rays, gamma rays, etc. or with any high energy rays or particles.

8.1.34 Source of ionizing radiation is any material that is emitting ionizing radiation spontaneously or as a result of impingement of energy upon it.

8.1.35 Stray radiation is radiation not serving any useful purpose. It includes leakage and secondary radiation.

8.1.36 Survey means an evaluation of the radiation hazards incident to the production, use, release, disposal, or presence of radioactive materials or other sources of radiation under a specific set of conditions.

8.1.37 Therapeutic-type housing. An x-ray tube housing that reduces the leakage radiation to at most 1.0 r/hr at a distance of 1 meter from the tube target and 1.0 r/min. at any point on the surface of the housing when the tube is operating at its maximum continuous rated current for the maximum rated voltage.

8.1.38 Uncontrolled area means any area not designated as a controlled area.

8.1.39 Use factor (U) is the fraction of the work load during which the useful beam is pointed in the direction under consideration.

8.1.40 Useful beam is that part of the primary radiation that passes thru the aperture, cone or other collimator.

8.1.41 (1) Workload (W) is the working activity of an x-ray machine measured in milliampere minutes per week.
(2) Workload (W) is the total exposure measured in roentgens per week in the useful beam at 1 meter from a teletherapy source.

8.1.42 X-ray apparatus shall mean any source of x-ray and its high voltage supply, including high energy betatron.

Part 3. Permissible Dose Levels and Concentrations

R 325.1309. Sec. 9. Basic standards.

These basic standards are designed to be in general conformance with requirements of recognized authorities, are based on current knowledge of biological effects of radiation, and subject to change with the development of new information or with substantial increase in the average exposure of the whole population to radiation.

9.1 Exposure of individuals in controlled areas.

9.1.1 Exposure to radiation:

(1) Except as provided in subparagraph (2) of this paragraph no registrant shall possess, use or transfer radioactive material in such a manner as to cause any individual in a controlled area to receive in any period of 7 consecutive days from radioactive material and other sources of radiation in the registrant's possession a dose in excess of the limits specified in appendix A.

(2) A registrant may permit an individual in a controlled area to receive a dose in excess of the limits established in sub-paragraph (1) of this paragraph provided (a) this dose accumulated during any period of 7 consecutive days does not exceed 3 times the limits specified in appendix A, and (b) that the dose accumulated during the period of any 13 consecutive weeks does not exceed 10 times the limits specified in appendix A.

(3) It is further provided that the maximum permissible accumulated dose, in rems, at any age, shall not exceed 5 times the number of years beyond the age 18, and that no annual increment shall exceed 15 rems.

9.1.2 No registrant shall possess, use, or transfer registered material in such a manner as to cause any individual in a controlled area to be exposed to air-borne radioactive material as specified by the registrant in an average concentration in excess of the limits specified in appendix B, table I. The limits given in appendix B, table I are based on exposure to the concentrations specified for 40 hours in any period of 7 consecutive days. In any such period where the number of hours of exposure is less than 40, the limits specified in the table may be increased proportionately, provided the number of hours of work in any period of 7 consecutive days is less than 40. In any such period where the number of hours of exposure is greater than 40, the limits specified in the table shall be decreased proportionately.

9.1.3 Exposure to minors: No registrant shall possess, use or transfer registered material in such a manner as to cause any individual under 18 years of age within a controlled area to receive in any period of 7 consecutive days from radioactive material and other sources of radiation in the registrant's possession a dose in excess of the 10% of the limits specified in appendix A or to be exposed to air-borne radioactive material possessed by the registrant in a concentration in excess

of the limits specified in appendix B, table 2. Concentrations may be averaged over a period of not greater than a week.

9.2 Permissible levels of radiation in uncontrolled areas.

9.2.1 There may be included in any registration proposed limits on levels of radiation in uncontrolled areas resulting from the registrant's possession or use of radioactive material and other sources of radiation. Such registration should include such information as anticipated average radiation levels and anticipated occupancy times for each uncontrolled area involved. The state health commissioner may approve the proposed limits if the registrant will demonstrate that the proposed limits are not likely to cause any individual to receive a dose in any period of 7 consecutive days in excess of the 10% of limits specified in appendix A.

9.2.2 Except as authorized by the state health commissioner pursuant to paragraph 9.2.1 no registrant shall possess or use registered material in such a manner as to create in any uncontrolled area from radioactive material and other sources of radiation in his possession:

(1) Radiation levels which if an individual were continuously present in the area could result in his receiving an exposure dose in excess of 2 mr in any 1 hour.

(2) Or radiation levels which if an individual were continuously present in an area could result in his receiving an exposure dose in excess of 10 mr in any 7 consecutive days.

9.2.3 Except for radioactive materials being transported as contemplated by section 7.1.6 all radioactive materials which are transferred or moved through uncontrolled areas shall be packaged in tightly sealed unbreakable containers. Absorbent materials sufficient to absorb the liquid contents of any radioactive liquids shall be wrapped around the container inside any shielding present if the radioactivity is transferred in liquid form. In addition the radioactive material must be packaged so that:

(1) The radiation field on any acceptable surface of the container is less than 200 mr per hour.

(2) The radiation field 1 meter from the center of the container is less than 10 mr per hour.

(3) The outside dimensions of the container are equal to or greater than 4 x 4".

In the process of transferring or moving radioactive materials in such containers they shall not be allowed to remain

in any 1 uncontrolled area longer than 2 working days. All containers shall in addition be labeled as specified in section 11.3.6.

9.2.4 An exemption may be granted by the state health commissioner if it can be shown that an unwarranted hardship is caused by the requirements in section 9.2.2.

9.3 Concentrations of effluent to uncontrolled areas.

9.3.1 There must be included in any registration, proposed limits of concentrations of registered radioactive material released into the air in uncontrolled areas as a result of the registrant's proposed activity. Such registration should include information as to anticipated average concentrations and anticipated occupancy time for each uncontrolled area involved. The state health commissioner will approve the proposed limits if the registrant demonstrates that it is not probable that any individual will be exposed to concentrations in excess of the limits specified in appendix B, table II, column 1. For purposes of this section concentrations may be averaged over periods not greater than 1 year.

9.3.2 Except as authorized by the state health commissioner pursuant to paragraph 9.3.1 no registrant shall possess, use or transfer registered material in such a manner as to release into air in any uncontrolled area any concentration of radioactive material in excess of the limits specified in appendix B, table II, column 1. For purposes of this section concentrations may be averaged over a period not greater than 1 year.

Part 4. Excessive Exposures

R 325.1310. Sec. 10. Excessive exposures.

10.1 Measures to be taken in event of excessive exposures.

10.1.1 In the event that any individual in a controlled area receives a dose or is exposed to concentrations of radioactive material in excess of the permissible limits established in part 3, section 9.1, the registrant shall limit the weekly dose or exposure of the individual to 10% of such permissible limits until such time as the average weekly dose or exposure to the individual for the period beginning the week the excessive dose or exposure occurred is less than the permissible limit established in part 3, section 9.1.

10.2 Emergency exposure for firemen, policemen and other emergency personnel.

10.2.1 Emergency work involving high level exposure to radiation from external sources with photon energy less than 3,000,000 electron volts shall be carried out on the basis that the person will not receive doses higher than the following:

(1) Exposure of the whole body—any adult—total dose measured in air up to 25 r.

(2) Local exposure—any adult—dose measured in air and additional to whole-body doses:

Hands and forearms, up to 100 roentgens

Feet and ankles, up to 100 roentgens

10.2.2 The responsibility for monitoring of the area or the personnel subjected to emergency exposure shall be assigned to a person designated by the registrant to be responsible for the radiological health phase of the operation and said person shall not be assigned other duties during the emergency.

10.2.3 Women shall not be subjected to emergency exposure unless physically incapable of reproduction.

10.2.4 The following incidents shall be reported to the state health department within 6 hours by phone and telegram of any incident involving registered material possessed by him and which may have caused or threatens to cause:

(1) Exposure of any individual to 25 rems or more, including any radioactive material taken into the body; or

(2) The release of radioactive material in concentrations which, if averaged over a period of 24 hours, would exceed 5,000 times the limits specified for such materials in appendix B, table II.

10.2.5 The following incidents must be reported to the state health department within 24 hours by phone and telegram of any incident involving registered material possessed by him and which may have caused or threatens to cause:

(1) Exposure of any individual to 3 rems or more, including any radioactive material taken into the body, or

(2) The release of radioactive materials in concentrations which, if averaged over a period of 24 hours, would exceed 500 times the limits specified for such materials in appendix B, table II.

10.2.6 Those incidents requiring 30 day reports

(1) Each registrant shall make a report in writing within 30 days to the state health department of each incident involving a registered facility owned or leased by the

registrant, which has caused an exposure of an individual to radiation or concentrations of radioactive material or have resulted in levels of radiation or concentrations of radioactive material in excess of applicable limits set forth in these regulations.

Part 5. Precautionary Procedures

R 325.1311. Sec. 11. Precautionary procedures.

11.1 Surveys.

11.1.1 Each registrant shall make or cause to be made such surveys as may be necessary for him to comply with the regulations.

11.2 Personnel monitoring.

11.2.1 Each registrant shall supply appropriate personnel monitoring equipment to, and shall require the use of such equipment by:

(1) Each individual who enters a controlled area under such circumstances that he receives, or is likely to receive, a dose in excess of 25% of the limits specified in appendix A of these regulations.

(2) Each individual who enters a high radiation area.

11.3 Caution signs, labels, and signals.

11.3.1 Except as otherwise authorized by the state health commissioner, symbols prescribed by this section shall use the conventional radiation caution colors (magenta or purple on yellow background). The symbol prescribed by this section is the conventional 3-bladed design:

Radiation Symbol

(1) Cross-hatched area is to be magenta or purple.

(2) Background is to be yellow.

11.3.1.1 In addition to the contents of signs and labels prescribed in this section, registrants may provide on or near such signs and labels any additional information which may be appropriate in aiding individuals to minimize exposure to radiation or to radioactive material.

11.3.2 Radiation area. Each radiation area shall be conspicuously posted with a sign or signs bearing the radiation caution symbol and the words (medical installations may be exempted from this posting):

Caution—Radiation Area

11.3.3 High radiation areas.

11.3.3.1 Each high radiation area shall be conspicuously

posted with a sign or signs bearing the radiation caution symbol and the words:

Caution
High Radiation Area

11.3.3.2 Each high radiation area shall be equipped with a control device which shall either cause the level of radiation to be reduced below that at which an individual might receive a dose of 100 millirem in 1 hour upon entry into the area or shall energize a conspicuous visible or audible alarm signal in such a manner that the individual entering and the registrant or a supervisor of the activity are made aware of the entry.

11.3.4 Air-borne radioactivity areas.

11.3.4.1 Each air-borne radioactivity area shall be conspicuously posted with a sign or signs bearing the radiation caution symbol and the words:

Caution
Air-borne Radioactivity Area

11.3.5 Additional requirements.

11.3.5.1 Each area or room in which registered material is used or stored and which contains any radioactive material (other than natural uranium or thorium) in an amount exceeding 10 times the quantity of such material specified in appendix C of this part shall be conspicuously posted with a sign or signs bearing the radiation caution symbol and the words:

Caution
Radioactive Material (s)

11.3.5.2 Each area or room in which natural uranium or thorium is used or stored in an amount exceeding 100 times the quantity specified in appendix C shall be conspicuously posted with a sign or signs bearing the radiation caution symbol and the words:

Caution
Radioactive Material (s)

11.3.6 Containers.

11.3.6.1 Each container in which is transported, stored, or used a quantity of any registered material (other than natural uranium or thorium) greater than the quantity of such material specified in

appendix C shall bear a durable, clearly visible label bearing the radiation caution symbol and the words:

Caution
Radioactive Material

11.3.6.2 Each container in which natural uranium or thorium is transported, stored, or used in a quantity greater than 10 times the quantity specified in appendix C shall bear a durable, clearly visible label bearing the radiation caution symbol and the words:

Caution
Radioactive Material

11.3.6.3 Notwithstanding the provisions of subparagraphs (1) and (2) a label shall not be required:
(1) If the concentration of the material in the container does not exceed that specified in appendix B, table I, column 2 or
(2) For laboratory containers, such as breakers, flasks, and test tubes, used transiently in laboratory procedures, when the user is present.

11.3.6.4 Where containers are used for storage, the labels required in this paragraph shall state also the quantities and kinds of radioactive materials in the containers and the date of measurements of the quantities.

11.4 Exceptions from posting requirements. (Notwithstanding the provisions of 11.3.)

11.4.1 A room or area is not required to be posted with a caution sign because of the presence of a sealed source provided the radiation level 12 inches from the surface of the source container or housing does not exceed 5 millirem per hour.

11.4.2 Rooms or other areas in hospitals are not required to be posted with caution signs because of the presence of patients containing byproduct material provided that there are personnel in attendance who shall take the precautions necessary to prevent the exposure of any individual to radiation or radioactive material in excess of the limits established in the regulations.

11.4.3 Caution signs are not required to be posted at areas or rooms containing radioactive materials for periods of less than 8 hours provided that (1) the materials are constantly

attended during such periods by an individual who shall take the precautions necessary to prevent the exposure of any individual to radiation or radioactive materials in excess of the limits established in the regulations, and, (2) such area or room is subject to the registrant's control.

11.5 Instruction of personnel.

11.5.1 All individuals working in or frequenting any portion of a controlled area shall be informed of the presence of radioactive materials or of radiation in such area, and shall be instructed in the hazards of excessive exposure to such materials or radiation and in precautions or procedures to minimize exposure.

11.5.2 Each registrant shall have on file and available 1 or more copies of these regulations and of the appropriate national bureau of standards radiation protection handbooks.

11.6 Storage of registered material.

11.6.1 Registered material stored in an uncontrolled area shall be secured against unauthorized removal from the place of storage.

11.7 No x-ray apparatus shall be left unattended without locking the apparatus itself, or the room or building in some manner which will prevent its use by unauthorized persons.

Part 6. Waste Disposal

R 325.1312. Sec. 12. Waste disposal.

12.1 General requirements—No registrant shall dispose of registered waste material except:

12.1.1 By transfer to an authorized recipient, or

12.1.2 As authorized pursuant to 12.2, or

12.1.3 As provided in 12.3 or 12.4 applicable respectively to the disposal of registered material by release into sanitary sewerage systems or burial in soil, or in 9.3.

12.1.4 In accordance with Act 245, Public Acts of 1929 (CL 1948, § 323.1 et seq.), as amended by Act 117, Public Acts of 1949.

12.2 Method for obtaining approval of proposed disposal procedures.

12.2.1 Any registrant may apply to the state health commissioner for approval of proposed procedures to dispose of registered material in a manner not otherwise authorized in the regulations except for disposal to surface waters. Each application should include a description of the registered material and any other radioactive material involved, including the quantities and kinds of such material, the levels

of radioactivity involved, and the proposed manner and conditions of disposal. The application should also include an analysis and evaluation of pertinent information as to the nature of the environment, including topographical, geological, meteorological, and hydrological characteristics; usage of ground and surface waters in the general area; the nature and location of other potentially affected facilities; and procedures to be observed to minimize the risk of unexpected or hazardous exposures.

12.3 Disposal by release into sanitary sewerage systems.

12.3.1 No registrant shall discharge registered material into a sanitary sewerage system unless:

(1) It is readily soluble or dispersible in water; and

(2) The quantity of any registered material released into the system by the registrant in any 1 day does not exceed the larger of subparagraphs (a) or (b) of this paragraph.

(a) The quantity, which if diluted by the average daily quantity of sewage released into the sewer by the registrant, will result in an average concentration equal to the limits specified in appendix B, table I, column 2, or

(b) Ten times the quantity of such material specified in appendix C, and

(3) The quantity of any registered material released in any 1 month, if diluted by the average monthly quantity of water released from the premises of the registrant, will not result in an average concentration exceeding the limits specified in appendix B, table I, column 2, and

(4) The gross quantity of registered material released into the sewerage system by the registrant does not exceed 1 curie per year.

12.4 Disposal by burial in soil. No registrant shall dispose of registered material by burial in soil unless:

12.4.1 The total quantity of registered materials buried at any 1 location and time does not exceed, at the time of burial, 1,000 times the amount specified in appendix C of these regulations, and

12.4.2 Burial is at a minimum depth of 4 feet, and

12.4.3 Successive burials are separated by distances of at least 6 feet and not more than 12 burials are made in any year.

12.4.4 Burial of registered materials in amounts exceeding 1,000 times the amounts specified in appendix C may be per-

mitted in a controlled and posted area at the discretion of and with the express permission of the state health commissioner. Applications for the establishment of controlled burying grounds must be reviewed by the advisory committee.

12.4.5 Burial sites shall be approved and registered with the state health commissioner. Burial shall be in a controlled area.

Part 7. Industrial Radiographic Installations

R 325.1313. Sec. 13. Industrial radiographic installations; classification.

For the purpose of registering and approving industrial radiographic installations all industrial installations shall be classified as either class A, class B, class C or class D. This section is to include isotopic sources in which case appropriate requirements under each installation class shall be applied.

13.1 Class A installation requirements for unlimited use at maximum capacity.

13.1.1 The x-ray source and objects exposed thereto must be contained within a permanent enclosure.

13.1.2 The enclosure shall be constructed

(1) So that the primary and secondary x-rays are attenuated to a dose rate as measured in air at any accessible external point not to exceed 7 mr/hr when the x-ray beam is adjusted to give maximum dose rate with the x-ray generator running at maximum operating conditions and the x-ray tube placed in the shortest "tube to wall" radiographically usable position. Mechanical or electrical limiters may be placed on the x-ray apparatus to restrict the movement of the beam to an area which will result in a dose rate not in excess of 7 mr/hr measured in air at any accessible point. Personnel working adjacent to the enclosure area shall not be exposed to a dose greater than 100 mr/week.

(2) With reliable interlocks which will either prevent anyone from entering the enclosure while the x-ray generator is in operation or will terminate the generation of x-rays should anyone enter the enclosure.

(3) So that persons may at all times be able to escape from within the enclosure.

(4) With visible and/or audible signals within the enclosure which are actuated a minimum of 5 seconds before the generation of x-rays.

(5) When the ceiling barrier does not meet the dose rate as indicated in the part above, a barrier such as a fence may be used to restrict access to the area on the roof.

13.1.3 No person is to be permitted to remain within the enclosure while the x-ray generator is in operation.

13.1.4 All protective enclosures and equipment shall be kept in good repair.

13.2 Class B installations for unlimited use under normal operating conditions as specified by the registrant at the time of registration.

13.2.1 The x-ray source and objects exposed thereto must be contained within a permanent enclosure.

13.2.2 The enclosure shall be constructed

(1) So that the primary and secondary x-rays are attenuated to a dose rate as measured in air at any accessible external point not to exceed 7 mr/hr when the x-ray beam is adjusted to give maximum dose rate with the x-ray generator running at normal operating conditions and the x-ray tube placed in the shortest "tube to wall" radiographically usable position. Mechanical or electrical limiters may be placed on the x-ray apparatus to restrict the movement of the beam to an area which will result in a dose rate not in excess of 7 mr/hr measured in air at any accessible point. Personnel working in the immediate enclosure area shall not be exposed to a dose greater than 100 mr/week.

(2) With reliable interlocks which will either prevent anyone from entering the enclosure while the x-ray generator is in operation or will terminate the generation of x-rays should anyone enter the enclosure.

(3) So that persons may at all times be able to escape from within the enclosure.

(4) With visible and/or audible signals within the enclosure which are actuated a minimum of 5 seconds before the generation of x-rays.

(5) When the ceiling barrier does not meet the dose rate as indicated in the part above, a barrier such as a fence may be used to restrict access to the area on the roof.

13.2.3 The controls for the kilovoltage and milliamperage shall be limited by mechanical or electrical means so as not to exceed the normal operating conditions as specified by the registrant at the time of registration.

13.2.4 No person is to be permitted to remain within the enclosure while the x-ray generator is in operation.

13.2.5 All protective enclosures and equipment shall be kept in good repair.

13.3 Class C installations for limited use under conditions specified by the registrant at the time of registration.

13.3.1 The x-ray source and objects exposed thereto must be contained within a permanent enclosure.

13.3.2 The enclosure shall be constructed

(1) So that the primary and secondary x-rays are attenuated to a dose rate as measured in air at any accessible external point not to exceed 50 mr/hr when the x-ray beam is adjusted to give a maximum dose rate with the x-ray generator running at its maximum rated capacity and the x-ray tube placed in the shortest "tube to wall" radiographically usable and/or limited position.

(2) With reliable interlocks which will either prevent anyone from entering the enclosure while the x-ray generator is in operation or will terminate the generation of x-rays should anyone enter the enclosure.

(3) So that persons may at all times be able to escape from within the enclosure.

13.3.3 The workload of the machine shall be restricted so that the dose at any accessible point outside the protective enclosure does not exceed 100 mr/week with the x-ray generator running at its maximum capacity.

13.3.4 The number of hours per day or week for permissible operation shall be established for the x-ray generator by the state health commissioner under the conditions established by the registrant at the time of registration.

13.3.5 Warning signs should be posted in those areas outside the protective barriers in which the dose rate in air at any accessible external point exceeds 2 mr/hr with the generator operating at its maximum rated capacity and the x-ray beam adjusted to give its maximum dose rate and the x-ray tube placed in the shortest "tube to wall" usable and/or limited radiographic position.

13.3.6 Mechanical or electrical limiters shall be placed on the x-ray apparatus to restrict its movement to an area which will result in a dose rate not in excess of 50 mr/hr measured in air at any accessible point.

13.3.7 All protective enclosures and equipment shall be kept in good repair.

13.3.8 No person is to be permitted to remain within the enclosure while the x-ray generator is in operation.

13.3.9 Film badges or other permanent recording instruments shall be provided and required to be worn continuously by persons in the area at all times.

13.4 Class D installations for limited use and for temporary operation (to include portable or mobile industrial x-ray installations).

13.4.1 An x-ray installation not meeting the conditions and specifications as described as class A, class B, or class C may be operated for a period not to exceed 30 days or when it is impractical or when an undue and unnecessary hardship is involved, it may be extended by the state health commissioner for a period longer than 30 days. In either case such installation and operation of such installation shall have the approval of the state health commissioner and shall be classified as a class D installation.

13.4.2 All such installations shall have the radiation area in excess of 5 mr/hr barricated by a fence, a rope or other suitable barriers erected along the 5 mr/hr contour line.

13.4.3 The area described by the temporary barricade shall be suitably posted with caution signs.

13.4.4 Film badges or other permanent recording instruments shall be provided and required to be properly used on a continual basis for personnel in the area at all times.

13.5 Industrial radiographic installations utilizing high intensity sealed sources of radioactive material shall meet all appropriate requirements for radiological safety specified for x-ray installations of class A, B, C, or D, whichever may be applicable.

13.5.1 The source when not in use shall be enclosed within a protective housing such that the dose rate does not exceed an average of 2 mr/hr or a maximum of 10 mr/hr at 1 meter from the source.

13.5.2 If the source is permanently mounted in a housing with a beam control device or extended from and retracted into a housing, this device shall be of positive design capable of acting in any position of the housing. It shall also be possible to move the source to a shielded position manually with a minimum risk of exposure in the event of the failure of the automatic mechanism. There shall be on the housing and on the control panel, a warning device which plainly indicates whether the apparatus is "on" or "off."

13.5.3 If the apparatus is of a type in which the source is removed from the shield when in use, transfer shall be accomplished

by a remote control mechanism. Transfer mechanisms shall be so designed as to minimize the possibility of damage to the source in transit.

APPENDIXES

APPENDIX A—Permissible Total Weekly Doses in Significant Volumes of Critical Organs Under Various Conditions of Exposure
APPENDIX B—Maximum Permissible Average Concentrations of Radioactive Materials in Air and Water
APPENDIX C—Permissible Levels for Burials and Labelling Requirements
APPENDIX D—List of Maximum Quantities of Radioactive Material Exemptions
APPENDIX E—Protection Requirements for Fluorographic Installations
APPENDIX F—Protection Requirement for Fluoroscopic Installations
APPENDIX G—Protection Requirements for Radiographic Installations
APPENDIX H—Protection Requirements for Dental Installations
APPENDIX I—Protection Requirements for Therapeutic Installations

APPENDIX "A"

PERMISSIBLE TOTAL WEEKLY DOSES IN SIGNIFICANT VOLUMES OF CRITICAL ORGANS UNDER VARIOUS CONDITIONS OF EXPOSURE

Conditions of Exposure		Dose in Critical Organs (mrem) per week			
Part of Body	Radiation	Skin, at Basal Layer of Epidermis	Blood Forming Organs	Gonads	Lens of Eye
Whole Body	Any radiation with half-value-layer greater than 1 mm of soft tissue	600[a]	300	300	300
Whole Body	Any radiation with half-value-layer less than 1 mm of soft tissue	1500	300	300	300
Hands and Forearms or Feet and Ankles or Head and Neck	Any radiation	1500[b]			

[a] For exposures of the whole body to X or gamma rays up to 3 Mev, this condition may be assumed to be met if the exposure dose does not exceed 300 mr, provided the dose to the gonads does not exceed 300 mrem.

[b] Exposure of these limited portions of the body under these conditions does not alter the total weekly dose of 300 mrem permitted to the bloodforming organs in the main portion of the body, to the gonads, or to the lens of the eye.

APPENDIX "B"

MAXIMUM PERMISSIBLE AVERAGE CONCENTRATIONS OF RADIOACTIVE MATERIALS IN AIR AND WATER

Note: In applying table I, exposures in any week should be averaged over 40 hours. In applying table II, concentrations of radioactive material should be averaged over 1 year.

Material	Half-Life (1) (Days)	Controlled (40 hrs.-week) Table I Column 1 Air (2)	Table I Column 2 Water (3)	Uncontrolled Table II Column 1 Air (2)	Table II Column 2 Water (3)
A^{41}	0.074	1.6×10^{-6}	1.4×10^{-3}	5×10^{-6}	5×10^{-5}
Ag^{105}	2.8	3.6×10^{-5}	5	1.2×10^{-6}	1.6×10^{-1}
Ag^{111}	2.1	1×10^{-4}	13	3×10^{-6}	4×10^{-1}
Am^{241}	890	8×10^{-11}	4×10^{-4}	3×10^{-12}	1.3×10^{-5}
As^{76}	1.09	7×10^{-6}	6×10^{-1}	2×10^{-7}	2×10^{-2}
At^{211}	0.31	9×10^{-10}	6×10^{-6}	3×10^{-11}	2×10^{-7}
Au^{198}	2.6	3.4×10^{-7}	9×10^{-3}	1.1×10^{-8}	3×10^{-4}
Au^{199}	3.1	8×10^{-7}	2×10^{-2}	2.5×10^{-8}	7×10^{-4}
$Ba^{140} + La^{140}$	12	2×10^{-7}	6×10^{-3}	6×10^{-9}	2×10^{-4}
Be^{7}	48	1.3×10^{-5}	3	4×10^{-7}	1×10^{-1}
C^{14}	180	1.4×10^{-6}	1×10^{-2}	5×10^{-8}	3.6×10^{-4}
Ca^{45}	151	9×10^{-8}	1.5×10^{-3}	3×10^{-9}	5×10^{-5}
$Cd^{109} + Ag^{109}$	77	2×10^{-7}	2×10^{-1}	7×10^{-9}	7×10^{-3}
$Ce^{144} + Pr^{144}$	180	2×10^{-8}	1×10^{-1}	7×10^{-10}	3.6×10^{-3}
Cl^{36}	29	1×10^{-6}	7×10^{-3}	4×10^{-8}	2.4×10^{-4}
Cm^{242}	120	5×10^{-10}	2.7×10^{-3}	1.8×10^{-11}	1×10^{-4}
Co^{60}	8.4	3.4×10^{-6}	5×10^{-2}	1.2×10^{-7}	1.8×10^{-3}
Cr^{51}	22	2.4×10^{-5}	1.4	8×10^{-7}	5×10^{-2}
$Cs^{137} + Ba^{137}$	17	6×10^{-7}	4.5×10^{-3}	2×10^{-8}	1.5×10^{-4}
Cu^{64}	0.53	2×10^{-5}	2.5×10^{-1}	6×10^{-7}	8×10^{-3}
Eu^{154}	820	2×10^{-8}	1×10^{-1}	6×10^{-10}	3×10^{-3}
F^{18}	.078	3.5×10^{-4}	2.6	1.2×10^{-5}	9×10^{-2}

(1) Effective half-life in body.

(2) Air concentrations are given in microcuries per milliliter of air.

(3) Water concentrations are given in microcuries per milliliter of water. Those figures also apply to foodstuff in microcuries per gram (wet weight).

* For enriched uranium the same radioactivities per unit volume as those for natural uranium are applicable. It should be noted that the contribution of U^{234} to the gross activity of enriched uranium is 20–40 times that of the U^{235}.

I^{131}	10	S^{35}	50		
In^{114}	1	Sb^{124}	1		
		Sc^{46}	1		

Note: For purposes of paragraphs 10.3 and 11.4 where there is involved a combination of isotopes in known amounts the limit for the combination should be derived as follows:

Determine for each isotope in the combination, the ratio retween the quantity present in the combination and the limit otherwise established for the specific isotope when not in combination. The sum of each ratios for all the isotopes in the combination may not exceed "1" (i.e. "unity").

Example: For purposes of paragraph 11.4, if a particular batch contains 2,000 μ of Au^{196} and 25,000 μ of C^{14}, it may also include not more than 3,000 μ of I^{131}. This limit was determined as follows:

$$\frac{2{,}000\ \mu\ Au^{196}}{10{,}000\ \mu} + \frac{25{,}000\ \mu\ C^{14}}{50{,}000\ \mu} + \frac{3{,}000\ \mu\ I^{131}}{10{,}000\ \mu} = 1$$

The denominator in each of the above ratios was obtained by multiplying the figure in the table by 1,000 as provided in paragraph 11.4.

Limits listed are for radiological health reasons only. Other considerations such as chemical toxicity may require lower limits.

[1] Constant potentials may require 15 to 25% larger thicknesses of lead and 5 to 15% larger thicknesses of concrete than those given here for pulsating potentials. These differences were estimated from the data of Miller and Kennedy at 275 to 525 kvcp and from the data of Trout at 50 to 250 kvp. As these experimenters used very different filtrations, the differences indicated here may be high, especially for concrete.

[2] W = workload, U = use factor, T = occupancy factor. Use factor for secondary barrier is always 1.

[3] The concrete requirements are based on a concrete density of 2.35 g/cm^3.

[4] Distance from target at which the weekly useful beam dose will not exceed 0.3r. These distances were computed from the outputs at zero barrier thickness and the air absorption coefficient for double the minimum wave length.

[5] Note that a target-to-skin distance of 50 cm is assumed.

[6] Equivalent to 3,000 40-ma-sec exposures per week.

Note: 1.5 hvl should be added for controlled areas and 5 hvl outside the controlled area to each of the tabular barrier thicknesses.

APPENDIX "F"

PROTECTION REQUIREMENTS[1] FOR FLUOROSCOPIC INSTALLATIONS

Tube potential[2]	Workload x occupancy factor (WT)	Lead thickness required for secondary barrier[3] at a target-to-occupied-area distance of—						Concrete thickness required for secondary barrier[3] at a target-to-occupied-area distance of—					
		3 ft.	5 ft.	8 ft.	10 ft.	15 ft.	20 ft.	3 ft.	5 ft.	8 ft.	10 ft.	15 ft.	20 ft.

[1] Constant potentials may require 15 to 25% larger thicknesses of lead and 5 to 15% larger thicknesses of concrete than those given here for pulsating potentials. These differences were estimated from the data of Miller and Kennedy at 275 to 525 kvcp and from the data of Trout at 50 to 250 kvp. As these experimenters used very different filtrations, the differences indicated here may be high, especially for concrete.

[2] W = workload, U = use factor, T = occupancy factor. Use factor for secondary barrier is always 1.

[3] The concrete requirements are based on a concrete density of 2.35 g/cm³.

[4] Distance from target at which the weekly useful beam dose will not exceed 0.3r. These distances were computed from the outputs at zero barrier thickness and the air absorption coefficient for double the minimum wave length.

[5] Note that a target-to-skin distance of 50 cm is assumed.

Note: 1.5 hvl should be added for controlled areas and 5 hvl outside the controlled areas to each of the tabular barrier thicknesses.

	50	13.0	10.1	7.6	6.6	4.7	3.6	...	10.5	8.9	8.0	6.5	5.5	60	...	...	...	...	...	...	...	...	...	...

[1] W = workload, U = use factor, T = occupancy factor. Use factor for secondary barrier is always 1.

[2] The concrete requirements are based on a concrete density of 2.35 g/cm³.

[3] Distance from target at which the weekly useful beam dose will not exceed 0.3r.

[4] Note that a target-to-skin distance of 50 cm is assumed.

[5] Constant potentials may require 15 to 25% larger thicknesses of lead and 5 to 15% larger thicknesses of concrete than those given here for pulsating potentials. These differences were estimated from the data of Miller and Kennedy at 275 to 525 kvcp and from the data of Trout at 50 to 250 kvp. As these experimenters used very different filtrations, the differences indicated here may be high, especially for concrete.

[6] Pulsating potentials may require 10 to 20% smaller thicknesses of lead and 5 to 15% smaller thicknesses of concrete than those given here for constant potentials. These differences were estimated from the data of Miller and Kennedy at 275 to 525 kvcp and from the data of Trout at 50 to 250 kvp. As these experimenters used very different filtrations, the differences indicated here may be high, especially for concrete.

Note: 1.5 hvl should be added for controlled areas and 5 hvl outside the controlled areas to each of the tabular barrier thicknesses.

Appendix B

ITEM 1

Report of the New England Committee on Atomic Energy to the New England Governors' Conference

Draft of an Act to Coordinate Development and Regulatory Activities Relating to the Peaceful Uses of Atomic Energy

Be it enacted by, etc.

Section 1. Declaration of Policy

a. The State of.....endorses the action of the Congress of the United States in enacting the Atomic Energy Act of 1954 to institute a program to encourage the widespread participation in the development and utilization of atomic energy for peaceful purposes to the maximum extent consistent with the common defense and security and with the health and safety of the public; and therefore declares the policy of the State to be—

1. To cooperate actively in the program thus instituted; and
2. To the extent that the regulation of special nuclear materials and by-product materials, of production facilities and utilization facilities, and of persons operating such facilities may be within the jurisdiction of the State, to provide for the exercise of the State's regulatory authority so as to conform, as nearly as may be, to the Atomic Energy Act of 1954 and regulations issued thereunder, to the end that there may, in effect, be a single harmonious system of regulation within the State.

b. The State of.....recognizes that the development of industries producing or utilizing atomic energy may result in new conditions calling for changes in the laws of the State and in regulations issued thereunder with respect to health and safety, working conditions, workmen's compensation, transportation, public utilities, life, health, accident, fire, and casualty insurance, the conservation of natural resources, including wildlife, and the protection of streams, rivers, and airspace from pollution, and therefore declares the policy of the State to be—

1. To adapt its laws and regulations to meet the new conditions in ways that will encourage the healthy development of industries producing or utilizing atomic energy while at the same time protecting the public interest; and
2. To initiate continuing studies of the need for changes in the relevant laws and regulations of the State by the respective departments and agencies of the State which are responsible for their administration; and
3. To assure the coordination of the studies thus undertaken,

particularly with other atomic industrial development activities of the State and with the development and regulatory activities of other States and of the Government of the United States.

Section 2. United States Licenses or Permits Required

No person shall manufacture, construct, produce, transfer, acquire or possess any special nuclear material, by-product material, production facility, or utilization facility, or act as an operator of a production or utilization facility, wholly within this State unless he shall have first obtained a license or permit for the activity in which he proposes to engage from the United States Atomic Energy Commission if, pursuant to the Atomic Energy Act of 1954, the Commission requires a license or permit to be obtained by persons proposing to engage in activities of the same type over which it has jurisdiction.

Section 3. Conduct of Studies Concerning Changes in Laws and Regulations with a View to Atomic Industrial Development

Each of the following departments and agencies of the State Government is directed to initiate and to pursue continuing studies as to the need, if any, for changes in the laws and regulations administered by it that would arise from the presence within the State of special nuclear materials and by-product materials and from the operation herein of production or utilization facilities, and, on the basis of such studies, to make such recommendations for the enactment of laws or amendments to law administered by it, and such proposals for amendments to the regulations issued by it, as may appear necessary and appropriate.

a. The Department of Public Health, particularly as to hazards, if any, to the public health and safety.

b. The Department of Labor, particularly as to hazardous working conditions, if any.

c. The Workmen's Compensation Commission, particularly as to the time and character of proof of claims of injuries and the extent of the compensation allowable therefor.

d. The Department of Public Highways, particularly as to the transportation of special nuclear materials and by-product materials on highways of the State.

e. The Public Utilities Commission, particularly as to the transportation of special nuclear materials and by-product materials by common carriers not in interstate commerce and as to the participation by public utilities subject to its jurisdiction in projects looking to the development of production or utilization facilities for industrial or commercial use.

f. The Department of Insurance, particularly as to the insurance of

persons and property from hazards to life and property resulting from atomic development.

g. The Department of Conservation, particularly as to the hazards, if any, to the natural resources of the State, including wildlife, and as to the protection, if necessary, of rivers, streams, and airspace from pollution.

h. Such other departments and agencies (including departments and agencies of political subdivisions of the State) as the Governor may direct and for the purposes specified by him.

Section 4. Coordination of Studies and Development Activities

a. The Governor and Council shall appoint a citizen of this State to serve as adviser to the Governor with respect to atomic industrial development within the State; as coordinator of the development and regulatory activities of the State relating to the industrial and commercial uses of atomic energy; and as deputy of the Governor in matters relating to atomic energy, including participation in the activities of any committee formed by the New England States to represent their interest in such matters and also cooperation with other States and with the Government of the United States. The person so appointed shall have the title of Coordinator of Atomic Development Activities.

b. The Coordinator of Atomic Development Activities shall have the duty of coordinating the studies, recommendations, and proposals of the several departments and agencies of the State (and its political subdivisions) required by Section 3 of this Act with each other and also with the programs and activities of the Department of Industrial Development of the State. So far as may be practicable, he shall coordinate the studies conducted, and the recommendations and proposals made, in this State with like activities in the New England and other States and with the policies and regulations of the United States Atomic Energy Commission. In carrying out his duties, he shall proceed in close cooperation with the Department of Industrial Development.

c. The several departments and agencies of the State (and its political subdivisions) which are directed by Section 3 of this Act to initiate and pursue continuing studies are further directed to keep the Coordinator of Atomic Development Activities fully and currently informed as to their activities relating to atomic energy. No regulation or amendment to a regulation applying specifically to an atomic energy matter which any such department or agency may propose to issue shall become effective until 30 days after it has been submitted to the Coordinator, unless, upon a finding of emergency need, the Governor by order waives all or any part of this 30-day period.

d. The Coordinator of Atomic Development Activities shall keep the Governor and Council and the several interested departments and agencies

informed as to private and public activities affecting atomic industrial development and shall enlist their cooperation in taking action to further such development as is consistent with the health, safety and general welfare of this State.

e. The Coordinator of Atomic Development Activities shall be paid a salary of $——— per annum.

Section 5. Injunction Proceedings

Whenever, in the opinion of the Attorney General, any person is violating or is about to violate Section 2 of this Act, the Attorney General may apply to the appropriate court for an order enjoining the person from engaging or continuing to engage in the activity violative of this Act and upon a showing that such person has engaged, or is about to engage in any such activity, a permanent or temporary injunction, restraining order, or the other order may be granted.

Section 6. Funds Provided

There is hereby authorized to be appropriated the sum of $——— for the salary of the Coordinator of Atomic Development Activities and for secretarial, travel, printing, and other necessary expenses incurred by him in the performance of his duties.

Section 7. Definitions

As used in this Act,

a. The term "atomic energy" means all forms of energy released in the course of nuclear fission or nuclear transformation.

b. The term "by-product material" means any radioactive materials (except special nuclear materials) yielded in or made radioactive by exposure to the radiation incident to the process of producing or utilizing special nuclear materials.

c. The term "production facility" means (1) any equipment or device capable of the production of special nuclear material in such quantity as to be of significance to the common defense and security, or in such manner as to affect the health and safety of the public; or (2) any important component part especially designed for such equipment or device.

d. The term "special nuclear material" means (1) plutonium and uranium enriched in the isotope 233 or in the isotope 235, and any other material which the Governor declares by order to be special nuclear material after the United States Atomic Energy Commission has determined the material to be such; or (2) any material artificially enriched by any of the foregoing.

e. The term "utilization facility" means (1) any equipment or device,

except an atomic weapon, capable of making use of special nuclear materials in such quantity as to be of significance to the common defense and security, or in such manner as to affect the health and safety of the public, or peculiarly adapted for making use of atomic energy in such quantity as to be of significance to the common defense and security, or in such manner as to affect the health and safety of the public; or (2) any important component part especially designed for such equipment or device.

f. The term "operator" means any individual who manipulates the controls of a utilization or production facility.

ITEM 2

A Suggested State Radiation Protection Act

From the National Bureau of Standards Handbook No. 61, "Regulation of Radiation Exposure by Legislative Means." (December 9, 1955)

"AN ACT for the Control of Radiations from Machines and Radioactive Materials, for the Purpose of Protecting Health."

Short Title. This Act may be referred to as the ..... Radiation Hygiene Act. (State)

Section 1. *Statement of Policy.* Whereas, radiation can be instrumental in the improvement of health, welfare, and productivity of the public if properly utilized, and may impair the health of the people and the industrial and agricultural potentials of the State if improperly utilized, it is hereby declared to be the public policy of this State to encourage the constructive uses of radiation and to control any associated harmful effects.

Section 2. *Definitions.* For the purposes of this Act, the following words and phrases are defined:

(a) *Radiation* is gamma rays and X-rays, alpha and beta particles, high-speed electrons, neutrons, protons, and other nuclear particles; but not sound or radio waves, or visible, infrared, or ultraviolet light.

(b) *Radiation machine* is any device that produces radiations when the associated control devices are operated.

(c) *Radioactive material* is any material, solid, liquid, or gas, that emits radiation spontaneously.

Additional definitions may be included.

Section 3. *Creation and Organization of Agency: Advisory Board, Meetings, Employees.*

(a) There is hereby created and established a State Radiation-Control Agency hereinafter referred to as the Agency. The Agency shall be an

organizational component of the State Department of ..... (Alternate: There is hereby created and established an independent State Radiation Control Agency, hereinafter referred to as the Agency.)

(b) The Governor shall appoint a Director of the Agency (hereinafter called the Director) who shall perform and carry out all functions and duties given to the Agency under this Act, and shall direct, carry out, and enforce all radiation safety control activities and measures vested in the Agency. The Director shall be a person having extensive training and experience in the field of health and of radiation protection.

(c) In accordance with the laws of the State, the Agency may employ, compensate, and prescribe the powers and duties of such persons as may be necessary to carry out the provisions of this Act. However, technical, legal, and other services shall be performed, insofar as practicable, by personnel of existing State departments, agencies, and offices.

(d) The Director may delegate to officers and employees of the Agency such function, duties, and authority as are vested in the Agency by this Act; except the authority to adopt and promulgate standards, rules, and regulations, and to issue or modify orders.

(e) There is hereby established within the Agency a State Radiation Technical Advisory Board, hereinafter referred to as the "Board," consisting of five members. The Director of the Agency shall be a member of the Board. The other four members shall be persons with scientific training in one or more of the following fields: health, agriculture, medicine, radiology, radiation physics, biology, industry, labor, atomic energy. The Governor shall appoint these four members after seeking recommendations of established authorities or organizations in the above-specified fields. The members' term of office shall be four years, except that the terms of those first appointed shall expire as follows:

1 at the end of 1 year after such date,
1 at the end of 2 years after such date,
1 at the end of 3 years after such date, and
1 at the end of 4 years after such date

as designated by the Governor at the time of appointment. If a vacancy occurs, the Governor shall appoint a member for the remaining portion of that term. The Director of the Agency shall be Chairman of the Board. The Board shall hold four regular meetings each calendar year, and special meetings as deemed necessary by the Board or the Director. It shall be the duty of the Board to review the policies and program of the Agency as developed under authority of this Act; to make recommendations thereon to the Agency; to provide the Agency with such technical advice and assistance as may be required relative to permissible exposure levels, standards of practice, radiation instrumentation, and other technical matters. Members of the Board, other than the Director, shall be entitled to receive compensation

at ..... dollars per diem and reimbursement for actual and necessary traveling and subsistence expenses while engaged in the business of the Board.

Section 4. *Powers and Duties of the Agency.* The Agency shall have the following powers and duties:

(a) Shall develop comprehensive policies and programs for the evaluation and determination of hazards associated with the use of radiation, and for their amelioration;

(b) Shall advise, consult, and cooperate with other agencies of the State, the Federal Government, other States and interstate agencies, and with affected groups, political subdivisions, and industries in furtherance of the purposes of this Act;

(c) May accept and administer loans, grants, or other funds or gifts from the Federal Government and from other sources, public or private, for carrying out any of its functions;

(d) May encourage, participate in, or conduct studies, investigations, training, research, and demonstrations relating to the control of radiation hazard, the measurement of radiation, the effects on health of exposure to radiation, and related problems as it may deem necessary or advisable for the discharge of its duties under this Act;

(e) Shall collect and disseminate information relating to the determination and control of radiation exposure and hazard;

(f) Shall adopt and promulgate such rules and regulations as may be necessary to further the purposes of this Act; such rules and regulations may incorporate by reference the recommended standards of nationally recognized bodies in the field of radiation protection such as the National Committee on Radiation Protection or the American Standards Association;

(g) Shall devise, modify, repeal, promulgate, and enforce rules and regulations as necessary to implement or effectuate the powers and duties of the Agency under this Act;

(h) May issue, modify, or revoke orders prohibiting or abating the discharge of radioactive material or waste into the ground, air, or waters of the State in accordance with the provisions of this Act and rules and regulations adopted thereunder;

(i) Upon request, shall render opinion concerning such plans and specifications on the design and shielding for radiation sources as may be submitted before or after construction, for the purpose of determining the possible radiation hazard;

(j) May make inspections of radiation sources shielding, and immediate surroundings for the determination of any possible radiation hazard; and shall provide the owner, user, or operator thereof with a report of any known or suspected deficiencies;

(k) May exercise all incidental powers necessary to carry out the purposes of this Act.

Section 5. *Registration*

(a) It shall be unlawful for any person to produce radiation, or to produce, use, store, or dispose of radioactive materials, or to modify, extend, or alter such activities, unless he registers in writing with the Agency in accordance with the procedures prescribed by such Agency, except that a period of 90 calendar days shall be allowed for such registration after the effective date of this Act.

(b) It shall be unlawful for any person to produce radiation, or to produce, use, store, or dispose of radioactive materials, except in accordance with the provisions of this Act and rules and regulations promulgated thereunder.

Section 6. *Classification of Sources and Hazards and Standards of Protection*

(a) The Agency is authorized, with the concurrence of the Board, to classify radiation sources, exposures, and hazards for the purpose of (1) making inspections, (2) determining the competence of the radiation users, (3) determining the adequacy of radiation-protective devices and procedures, and (4) other purposes compatible with the present and future utilization of all forms of radiation, taking into account the protection of the health of the people of this State.

(b) Prior to the establishment of a system of classification of sources or uses, or setting standards of protection, or modifying such classifications or standards, the Agency shall conduct public hearings in connection therewith. Notice shall be given of time, date, and place of public hearing and shall specify the technical area in which a classification is sought to be made or for which standards are sought to be adopted. Such notice shall be published at least twice in a newspaper of general circulation in the area affected, and shall be mailed at least 20 days before such public hearing to the chief executive of each political subdivision of the geographical area affected, and may be mailed to such other persons as the Agency has reason to believe may be affected by such classification and the setting of such standards. The Agency shall utilize the assistance of the Board in connection with such hearings.

(c) The adoption of standards of protection and the classification of radiation sources, or any modification or change thereof, shall, upon approval of the Board, be issued as an order of the Agency and shall be published in a newspaper of general circulation in the area affected. In classifying sources and setting radiation-protection standards, or making any modification thereof, the Agency shall permit and announce a reasonable

time for the persons or users involved to comply with such classification and standards, if their operations create a known hazard to health; except that a user may be directed to abate without delay a serious known hazard to health.

Section 7. *Examination for Compliance: Statement of Non-compliance*

(a) The Agency shall itself, or by its duly designated representatives, inspect and examine such sources of radiation as it desires, in order to determine their compliance with the adopted classification and radiation-protection standards of the Agency.

(b) If such inspection and examination indicates that the source of radiation is not in compliance with the adopted classification and radiation-protection standards, the owner, operator, or user shall be so notified in writing, with full particulars regarding any deficiencies.

Section 8. *Proceedings Before Board*

(a) Whenever the Agency determines there are reasonable grounds to believe that there has been a violation of any of the provisions of this Act or of any order of the Agency, it may give written notice to the alleged violator or violators specifying the causes of complaint. Such notice shall require that the alleged violations be corrected or that the alleged violator appear before the Agency at a time and place specified in the notice, and answer the charges. The notice shall be delivered to the alleged violator or violators in accordance with the provisions of subsection (d) of this section not less than .... days before the time set for the hearing.

(b) The Agency shall afford the alleged violator or violators an opportunity for a fair hearing in accordance with the provisions of section 9 at the time and place specified in the notice or any modification thereof. On the basis of the evidence produced at the hearing the Agency shall make findings of fact and conclusions of law and enter such order as in its opinion will best further the purposes of this Act and shall give written notice of such order to the alleged violator and to such other persons as shall have appeared at the hearing and made written request for notice of the order. If the hearing is held before any person other than the Agency itself, such person shall transmit the record of the hearing together with recommendations for findings of fact and conclusions of law to the Agency, which shall thereupon enter its order on the basis of such record and recommendations. The order of the Agency shall become final and binding on all parties unless appealed to the courts as provided in section 12 within .... days after notice has been sent to the parties.

(c) Whenever the Agency finds that an emergency exists requiring immediate action to protect the public health or welfare, it may, without

notice or hearing, issue an order reciting the existence of such an emergency and requiring that such action be taken as it deems necessary to meet the emergency. Notwithstanding the provisions of subsection (b) of this section, such order shall be effective immediately. Any person to whom such order is directed shall comply therewith immediately, but on application to the Agency shall be afforded a hearing as soon as possible. On the basis of such hearing the Agency shall continue such order in effect, revoke it, or modify it.

(d) Except as otherwise expressly provided, any notice, order, or other instrument issued by or under authority of the Agency may be served, personally or by publication, on any person affected thereby, and proof of such service may be made in like manner as in case of service of a summons in a civil action, such proof to be filed in the office of the Agency; or such service may be made by mailing a copy of the notice, order, or other instrument by registered mail, directed to the person affected at his last known post office address as shown by the files or records of the Agency, and proof of such service may be made by the affidavit of the person who did the mailing, such proof to be filed in the office of the Agency.

(e) Every certificate or affidavit of service made and filed as herein provided shall be *prima facie* evidence of the facts therein stated, and a certified copy thereof shall have like force and effect.

Section 9. *Hearings.* The hearings herein provided may be conducted by the Director, or the Director may designate hearing officers who shall have the power and authority to conduct such hearings in the name of the Agency, at any time and place. A record or summary of the proceedings of such hearings shall be made and filed with the Agency, together with findings of fact and conclusions of law made by the Agency. A member of the Agency or a hearing officer, designated by the Agency, shall have the power to issue in the name of the Agency notice of the hearings or subpoenas requiring the testimony of witnesses and the production of evidence relevant to any matter involved in such hearing, and to administer oaths and examine witnesses during such hearings. Witnesses who are subpoenaed shall receive the same fees and mileage as in civil actions. In case of contumacy or refusal to obey a notice of hearing or subpoena issued under this section, the ..... Court shall have jurisdiction, upon application of the Agency or its representative, to issue an order requiring such person to appear and testify or produce evidence as the case may require, and any failure to obey such order of the court may be punished by such court as contempt thereof.

Section 10. *Inspections and Investigations: Maintenance of Records.* The Agency or its duly authorized representative shall have the power to enter at reasonable times, and after prior notice of at least 2 days, upon any

private or public property for the purpose of inspecting and investigating conditions relative to the purposes of this Act; except that such entry into security areas under the direct or indirect jurisdiction of the Federal Government shall be permitted only by and with the concurrence of the Federal Government Agency or its duly designated representative.

Any authorized representative of the Agency may examine any records or memoranda pertaining to the operation of radiation machines and radioactive materials. The Agency may require the maintenance of records relating to the operation of disposal systems. Copies of such records must be submitted to the Agency on request.

Section 11. *Penalties: Injunctions*

(a) Any person who violates any of the provisions of, or who fails to perform any duty imposed by, this Act, or who violates any order of the Agency promulgated pursuant to this Act, shall be guilty of a misdemeanor, and in addition thereto may be enjoined from continuing such violation. Each day upon which such violation occurs shall constitute a separate violation.

(b) It shall be the duty of the Attorney General on the request of the Agency to bring any action for an injunction against any person violating the provisions of this Act, or violating any order of the Agency. In any action for an injunction brought pursuant to this section, any findings of the Agency after hearing or due notice shall be *prima facie* evidence of the fact or facts found therein.

Section 12. *Review*

(a) An appeal may be taken from any final order, or other final determination of the Agency, by any person who believes himself adversely affected thereby, or by the Attorney General on behalf of the State of the ..... Court of ..... Within 30 days after
(Seat of Government)
receipt of a copy of the order, or other determination, or after service of notice thereof by registered mail, the appellant or his attorney shall serve a notice of appeal on the Agency through its (Director) provided that during such 30-day period the court may, for good cause shown, extend such time for an additional period not to exceed 60 days. The notice of appeal shall refer to the action of the Agency appealed from, shall specify the grounds of appeal, including both points of law and fact which are asserted or questioned by the appellant. A copy of the original notice of appeal with proof of service shall be filed by the appellant or his attorney with the clerk of the court within 10 days of the service of the notice and thereupon the court shall have jurisdiction of the appeal.

(b) The appellant and the Agency shall in all cases be deemed the original

parties to an appeal. The State, through the Attorney General or any other person affected, may become a party by intervention, as in a civil action, upon showing cause therefor. The Attorney General shall represent the Agency, if requested, upon all such appeals unless he appeals or intervenes in behalf of the State. If the Attorney General or a member of his staff is not available to represent the Agency in any particular proceeding, the Agency is empowered to appoint special counsel for such proceeding. No bond or deposit for costs shall be required of the State or Agency upon any such appeal or upon any subsequent appeal to the Supreme Court or other court proceedings pertaining to the matter.

(c) The appeal shall be heard and determined by the court upon the issues raised by the notice of appeal and the answer thereto according to the rules relating to a trial in the nature of an appeal in equity of an administrative determination. All findings of fact by the Agency are to be deemed final, unless it is shown that such findings were not supported by substantial evidence produced before the Agency at the hearing. In any appeal or other proceeding involving any order, or other determination of the Agency, the action of the Agency shall be *prima facie* evidence reasonable and valid and it shall be presumed that all requirements of the law pertaining to the taking thereof have been complied with. A copy of the proceedings before the Agency shall be certified to the court in connection with each appeal.

(d) A further appeal may be taken to the Supreme Court of the State in the same manner as appeals in equity are taken.

Section 13. *Conflicting Laws.* This Act shall not be construed as repealing any laws of the State relating to radiation sources, exposures, radiation protection, and professional licensure, but shall be held and construed as auxiliary and supplementary thereto, except to the extent that the same are in direct conflict herewith.

Section 14. *Existing Rights and Remedies Preserved.* It is the purpose of this Act to provide additional and cumulative remedies to evaluate, control, and prevent impairment to health from radiation and to encourage the constructive use of radioactive materials and radiation machines. Nothing herein contained shall be construed to abridge or alter rights of action or remedies in equity or under the common law or statutory law, criminal or civil, nor shall any provision of this Act, or any act done by virtue thereof, be construed as estopping the State, or any municipality or person, in the exercise of their rights in equity or under the common law or statutory law to protect the public health and encourage commerce and industry.

Section 15. *Severability.* If any section, subsection, sentence, clause, phrase, or word of this Act is for any reason held to be unconstitutional, such decree shall not affect the validity of any remaining portion of this Act.

PART IV

FEDERAL STATUTORY AND ADMINISTRATIVE LIMITATIONS UPON ATOMIC ACTIVITIES

Federal Statutory and Administrative Limitations Upon Atomic Activities

COURTS OULAHAN *

I. INTRODUCTION

Scientific and technological considerations heretofore have dominated the interest and work of the United States government and private American business in the field of atomic energy. This major preoccupation with research and engineering problems in the development of a new source of energy for peacetime uses is understandable. The product of the exigencies of World War II and the post-war arms race between the Soviet bloc and the United States and its allies, the atomic bomb and its proliferations as a hydrogen and cobalt weapon constitute an important factor in the present balance—or imbalance—of world power. Adopting a new source of energy developed in the context of conflict and of government monopoly to the peacetime needs of medicine, public utilities, and industry may well comprise the beginning of a new industrial revolution of which the scientist and engineer are the principal architects.

A. Scope and Policy of AEC Regulation

In their preoccupation with technology, private industry and the American public have tended to overlook the problems of, and the present justification for, government regulation which covers every facet of the field of atomic energy.[1] The Atomic Energy Act of 1954[2] establishes the broadest control ever exercised by the federal government over any one industry in the United States.[3] The statutory provisions en-

[1] ". . . [T]he dictatorship of the technically competent" must not over-shadow "the importance of developing procedural formalities as a means of assuring just administration." Plaine, "Atomic Energy—A New Body of Administrative Law," 24 D.C. Bar A.J. 71, 75 (1957).

[2] 68 Stat. 921 (1954), 42 U.S.C.A. §§2011 *et seq.*

[3] The Civil Aeronautics Board is "[n]ext to the AEC . . . perhaps the administrative agency with the widest and most complex range of responsibility," Joint Committee on Energy, "A Study of AEC Procedures and Organization in the Licensing of Reactor

acted by Congress are the framework of this control, which is, in turn, implemented and effected by the administrative regulation and policy of the Atomic Energy Commission.

The Atomic Energy Act of 1946,[4] otherwise known as the McMahon Act, was enacted to substitute civilian for military control over the application of atomic energy largely to the field of warfare. The "primary purpose" of the Atomic Energy Act of 1954 was "to make our Nation's legislative controls better conform with the scientific, technical, economic, and political facts of atomic energy as they exist today," principally in the field of its peaceful uses.[5] Thus, the Atomic Energy Act of 1954 states:

> *Atomic energy is capable of application for peaceful as well as military purposes.* It is therefore declared to be the policy of the United States that—
> a. the development, use, and control of atomic energy shall be directed so as to make the maximum contribution to the general welfare, subject at all times to the paramount objective of making the maximum contribution to the common defense and security; and
> b. *the development, use, and control of atomic energy shall be directed so as to promote world peace, improve the general welfare, increase the standard of living, and strengthen free competition in private enterprise.* (Emphasis supplied.)[6]

Of course, the 1954 statute was not enacted without wide differences of opinion between both major political parties. The debate continues, especially concerning the extent to which government should participate in the process of industrial exploitation of atomic energy.[7] Indeed, tech-

Facilities," 85th Cong., 1st Sess. 41 (1957) (hereafter cited as Joint Committee Staff Study). This document is perhaps the most useful and comprehensive ever published by the Joint Committee with respect to administrative law problems of the atomic energy field. Findings of the Staff Study are summarized in BNA, Atomic Industry Reporter 3: 115.

[4] 60 Stat. 755 (1946), 42 U.S.C.A., §§1801 *et seq.*

[5] H.R. Rep. No. 2181, 83d Cong., 2d Sess. 1 (1954).

[6] 42 U.S.C.A. §2011. See Cole, "The Power and the Prize—Development of Civilian Nuclear Power in the United States," 25 Geo. Wash. L. Rev. 471, 475, 478 (1957).

[7] Spokesmen for opposing points of view with respect to the means whereby American development of atomic energy for peaceful uses shall be fostered have disclaimed any desire to plunge this field of regulation into the controversy between so-called "public" and "private" power policy adherents. See remarks of Rep. Holifield (Dem., Cal.), *Hearings before Joint Committee on Atomic Energy, "Development, Growth and State of the Atomic Energy Industry,"* 85th Cong. 1st Sess. 65 (1957) (hereafter cited as 1957 Section 202 Hearings); and remarks of AEC Chairman Strauss, Nov. 9, 1955, claiming the Commission "has no philosophy as regards the issue of Public versus Private Power" (BNA, *Atomic Industry Reporter* 1: 187). However, the issue clearly

nological and scientific developments, with attendant economic effects, may well require a reappraisal from time to time of the respective roles of government and private business. However, the fact is that Congress has enacted a statute, and the Commission is bound by a policy, which stresses that

> . . . the goal of atomic power at competitive prices will be reached more quickly if private enterprise, using private funds, is now encouraged to play a far larger role in the development of atomic power than is permitted under existing legislation. In particular, we do not believe that any developmental program carried out solely under governmental auspices, no matter how efficient it may be, can substitute for the cost-cutting and other incentives of free and competitive enterprise.[8]

Prior to 1956 only a limited recognition had been given to the effect of the statutory and administrative restraints imposed under atomic

---

was raised in the 85th Congress with the introduction of S. 151 and H.R. 2154, introduced, respectively, by Sen. Gore (Dem., Tenn.) and Rep. Holifield, requiring the Commission to launch an accelerated program of reactor building for the generation of electrical energy, by means of government construction, ownership, and operation of plants. See, *e.g.*, Report of the Standing Committee on Commerce concerning "Federal v. Private and Local Atomic Power for Civilian Use," 82 A.B.A. Rep. 426 (1957); *Hearings before Joint Committee on Atomic Energy on "Authorizing Legislation,"* 85th Cong., 1st Sess. 594-595 (1957) (hereafter cited as 1957 Authorizing Legislation Hearings); Cole, *supra* note 6 at 477-478; remarks of Rep. Holifield, *Hearings before Joint Committee on Atomic Energy on "Congressional Review of Atomic Power Program,"* 85th Cong., 1st Sess. 11 (1957) (hereafter cited as 1957 Congressional Review Hearings); Winsbrough, "A Partnership Plan for Atomic Power Development," 59 P.U. Fort. 217, 219 (1957). The principal attack upon the Atomic Energy Commission program to date was made by Rep. Cannon (Dem., Mo.), Chairman of the House Appropriations Committee, April 16, 1957, charging that "[t]he Commission's atomic electric power program is in some respects in contravention of the law," "[t]he program from a factual viewpoint is practically nonexistent," "[t]he atomic giveaway under the independent industrial program is not authorized by law," and "[t]he whole power-demonstration program is nothing but paper hopes" (103 Cong. Rec. 5188, 5189, 5195, and 5196 (1957)).

[8] H.R. Rep. No. 2181, *supra* note 5 at 3. The majority report on H.R. 9757 to amend the Atomic Energy Act of 1946 further stated (p. 9): "It is our firmly held conviction that increased private participation in atomic power development, under the terms stipulated in this proposed legislation, will measurably accelerate our progress toward the day when economic atomic power will be a fact. . . . We do not believe that the efforts of free enterprise, using its own resources and money, are by themselves adequate to achieve the speediest possible attack on the goal of peacetime power. Neither do we believe that maximum progress toward this objective will be afforded by an effort relying exclusively on governmental research and development, using the public's moneys. We believe, rather, that teamwork between Government and industry—teamwork of the type encouraged by these amendments—is the key to optimum progress, efficiency, and economy in this area of atomic endeavor. . . ."

energy legislation upon the hopes and expectations of the American public with respect to the benefits realizable from the peaceful uses of this energy, as clearly intended by the Congress when it enacted the Atomic Energy Act of 1954.[9] Early in 1956, in its important report on the "Peaceful Uses of Atomic Energy" to the Joint Congressional Committee on Atomic Energy, the McKinney Panel on the Impact of the Peaceful Uses of Atomic Energy pointed out that "the role of the Federal Government in this field [atomic energy] could strongly influence, if not control, the rate of future development" of its peaceful uses.[10] Indeed, with respect to the administrative controls exercised by the Atomic Energy Commission through its licensing and rule-making powers and its ownership of special nuclear material, the Panel found:

> One of the consequences of regulatory systems is a tendency toward overregulation. This is particularly true where all initiative for making determinations rests with the regulatory body.[11]

The Atomic Energy Commission has, to a certain extent, recognized the dangers inherent in "overregulation" and claims that it "has sought, within the limits required for the protection of the public, to impose no unnecessary restrictions upon the developing industry."[12] In a major statement of policy contained in its semiannual report to Congress for the last six months of 1957, the agency said:

> Development of the atomic energy industry necessarily has depended primarily upon the initiative of private enterprise organizations. The Commission has played a principal role also because of the peculiar nature of the special nuclear material on which the industry rests, its military importance, the Government activities and industry based on its processing and

[9] See, *e.g.*, Atomic Industrial Forum, Inc., "A Growth Survey of The Atomic Industry 1955-1965" (1955) (hereafter cited as AIF Growth Survey) (p. 10): "Further, in using the data presented in this report, . . . it is suggested that the reader take into account, as they may affect his own situation, such factors as . . . [t]he possible effect of future . . . federal regulatory actions. . . ."

[10] "Report of the Panel on Impact of Peaceful Uses of Atomic Energy to Joint Committee on Atomic Energy," 84th Cong., 2d Sess. xi (1956) (hereafter cited as McKinney Panel Report). The panel consisted of Robert McKinney, Chairman, Ernest R. Breech, George R. Brown, Sutherland C. Dows, John R. Dunning, Frank M. Folsom, T. Keith Glennan, Samuel B. Morris, and Walter P. Reuther.

[12] AEC, Twenty-third Semi-Annual Report 175 (1958). See also *id.* at 138: "It has been the policy of the Commission to encourage industry to carry on the various phases of industrial participation in atomic energy with a minimum of Governmental financial assistance and controls."

use, the secrecy that necessarily surrounded so much of the technology and cost data, and the possible hazards to public health and safety created by radioactivity. *Much of the Commission's efforts . . . have been directed toward helping private enterprise groups to overcome the obstacles created by Federal dominance of the field and by the continuing paramount position of national defense considerations.*[13] [Emphasis supplied.]

B. Encouragement of Private Industrial Development

In carrying out what it conceives to be its mandate under the 1954 act, the Commission has established several programs for the development of civilian power reactors, utilizing the resources and experience of private industry but assuring the cooperation of government in connection with certain important phases of research and development. The Commission has summarized the general principles governing the reactor programs, as follows:

1. Developing economically competitive nuclear power for civilian use will be aided by maximum practical utilization of the financial incentive common to business ventures in order to stimulate ingenuity and imagination and the assumption of calculated technical and economic risks.

2. The Commission's role should be to develop advanced technology at Government expense and to stimulate outside groups to undertake developmental or demonstration power projects primarily with non-Commission financing.

In general, the application of these principles has involved:

(a) Financing almost entirely by the Commission of experimental reactors and studies whose primary aim is to develop and prove out basic technology;

(b) Limited financial help by the Commission to industrial, cooperative, or public power groups in construction and operation of reactor demonstration projects which build on the technology developed in the experiments and add operational and economic data.

(c) Complete financing by industry of certain independent projects which also contribute further to technology and add operational and economic data.[14]

The first of these three branches of the power reactor program, which is concerned with Commission-financed development of basic reactor

[13] *Id.* at 161.

[14] AEC Statement Feb. 1957 to Joint Committee, 1957 Section 202 Hearings, *supra* note 7 at 113.

types, has produced twelve reactor experiments, with four under construction and one planned.[15]

Of more direct importance to private and public power groups has been the power demonstration reactor program inaugurated in January, 1955, and involving three so-called "rounds" or invitations to negotiate with the government.[16] This program has the principal aim of developing joint participation by "private, cooperative, and public power groups and the Commission . . . to develop prototype power reactor plants to demonstrate technical and economic feasibility of various reactor concepts." [17]

Under the first round invitation, issued in January, 1955,[18] the Commission called for proposals from private industry without limitation as to size of plant and has approved three proposals as bases for contracts.[19] The second round invitation, issued in September, 1955,[20] proposed the development, design, and construction of smaller reactors ranging from 5,000 to 40,000 kilowatts of electricity, which program has been confined to date to proposed publicly and cooperatively owned facilities.[21] It has produced seven proposals, four of which initially were approved by the Commission as bases for contract negotiations.

[21] These projects are "almost entirely a Government program," since the Rural Electrification Administration (REA) furnished loans for each such project; state-

As the result of strong representations to the Joint Committee in 1957,[22] Congress included special provisions in the appropriations act for fiscal year 1958 with respect to contracting for such publicly and cooperatively owned projects.[23] This legislation also contained provision, at an initial cost of $18,000,000, for the institution of a prototype power reactor facilities program by the AEC itself involving the construction of a natural uranium, graphite-moderated, gas-cooled power reactor facility and a plutonium recycle experimental reactor.[24]

---

ment of Sen. Gore, 1957 Authorizing Legislation Hearings, *supra* note 7 at 145. For a list of the projects accepted and the three rejected, see 1957 Section 202 Hearings, *supra* note 7 at 117-118. In May 1958, the Commission announced that, "in and because of 'little or no early economic promise,' consultation with Wolverine's management" the agency had decided to discontinue consideration of the aqueous homogeneous power reactor project submitted by Wolverine Electric Cooperative, Big Rapids, Michigan (BNA, Atomic Industry Reporter 4: 165).

[22] Section 202 of the 1954 act, 42 U.S.C.A. §2252, requires the Joint Committee during the first 60 days of each session of Congress to "conduct hearings in either open or executive session for the purpose of receiving information concerning the development, growth, and state of the atomic energy industry."

[23] This is the so-called "cooperative power reactor demonstration program," provided in Section 111 of Pub. L. 85-162, 85th Cong., 1st Sess. (1957). Under this program, $129,915,000 initially was authorized for use in a program not to exceed $149,915,000 for, among other purposes, "arrangements for projects sponsored under the second round of the Commission's power reactor demonstration programs by cooperatives and publicly owned agencies under which the reactor is financed in major part by the Government." In connection with these projects, the Commission is required to contract directly with the private manufacturers of facilities, rather than have the utility make the contract. After operation for five years by the Commission under contract with the utility, the latter has the option to purchase the plant; if such a purchase is not made, the plant must be dismantled. This special treatment for publicly or cooperatively owned utilities was held warranted by the policy consideration that "the need for advancing the small or intermediate reactor art should be the AEC's primary interest and negotiations with cooperatives and publicly owned organizations should take into consideration basic differences in their size, financial structures, and capacity for participation" without "jeopardizing the financial integrity of cooperatives and publicly owned organization" (Sen. Rep. No. 791, 85th Cong., 1st Sess. 16-17 (1957)). In its authorization legislation for fiscal year 1959, the Joint Committee on Atomic Energy increased the amounts authorized for the next 12 months from $129,915,000 to $155,113,000 and increased the over-all program totals from $129,915,000 to $155,113,000; H.R. Rep. No. 2108, 85th Cong., 2d Sess. 20-21 (1958).

[24] Sections 101(e)(14)-(15) and 110, Pub. L. 85-162, 85th Cong., 1st Sess. (1957); see Sen. Rep. No. 791, *supra* note 23 at 21-33. This program is based on the Joint Committee contention that the Commission has not "been making sufficient progress in the development of prototype power reactors to test and demonstrate the practical problems of achieving economic nuclear power," *id.* at 21. In a statement issued when he approved Pub. L. 85-162, Aug. 21, 1957, President Eisenhower stated that, while he was "not opposed to such projects [for natural uranium and plutonium production reactors] as studies by the Commission, . . . I will oppose the expenditure of public money for the construction and operation by the Government of any large-scale power reactor, or

The third round announced by the Commission on January 7, 1957, and requiring proposals by December 31, 1958 (later extended to June 30, 1959), placed no limitation on the types or sizes of plants which may be proposed, except that "they should make significant contributions toward the achievement of commercial utilization of nuclear power and that construction will be completed by June 30, 1962," which date apparently will be extended in the case of individual proposals.[25] The third round contemplates assistance in the form of:

---

any prototype thereof, unless private enterprise has first received reasonable opportunity to bear or share the cost" (N.Y. Times, Aug. 22, 1957). In a letter to Rep. Cole, Aug. 3, 1957, prior to enactment of the legislation, AEC Chairman Strauss charged that the provision for reactor prototypes in the appropriation legislation "would constitute a substantial start toward a program for Government-owned atomic power facilities" and that "a congressional direction to the Commission to proceed with particular reactor concepts would set an unwise precedent" (103 Cong. Rec. A6319-21 (Aug. 5, 1957)). Sections 101(e) and 110 of Pub. L. 85-162 represented considerably diluted versions of continuous attempts in recent years to require the Commission to develop a prototype reactor program with an initial expenditure of as high as $400,000; see 1957 Section 202 Hearings, *supra* note 7 at 41, 58; S. 151, 85th Cong., 1st Sess. (Jan. 7, 1957); Winsbrough, *supra* note 7 at 219; BNA, Atomic Industry Reporter 2: 171-179 and 2: 211; Cole, *supra* note 6 at 487-488.

[25] AEC Statement, 1957 Section 202 Hearings, *supra* note 7 at 118-119. See BNA, Atomic Industry Reporter 3: 11, 13 and 15; statement of AEC General Manager Fields, 1957 Authorization Legislation Hearings, *supra* note 7 at 145-146, 152-153; Cole, *supra* note 6 at 480-482. As of Jan. 1, 1958, four utilities or groups of utilities had submitted proposals under this round, one of which (Northern States Power Co., Sioux Falls, Iowa) signed a contract with the AEC on Nov. 19, 1957; AEC, Twenty-third Semi-Annual Report 101 (1958). Extension of the termination date of this round from Dec. 31, 1958, to June 30, 1959, was agreed to by the Joint Committee in its proposed appropriation legislation for fiscal year 1959, H.R. 13121, Section 109; see H.R. Rep. No. 2108, *supra* note 23 at 21 and 31. The Commission itself early recognized the difficulty of meeting the completion deadline of June 30, 1962 (BNA, Atomic Industry Reporter 4: 19) and has sought extension of the deadline with respect to two particular projects. These are (1) the proposal of East Central and Florida West Coast Nuclear Groups for a gas-cooled reactor, to be completed by June 30, 1963, the basis for the arrangement for which the Joint Committee approved in the 1959 authorization legislation (H.R. 13121, Section 109 Pub. L. 85-590, 85th Cong., 2d Sess. (1958); see H.R. Rep. No. 2108, *supra* note 23 at 21 and 31, and BNA, Atomic Industry Reporter 4: 75 and 4: 94) and (2) the proposal of Pennsylvania Power & Light Co. and Westinghouse Electric Corp. for a homogeneous reactor project, with no firm construction date. The latter proposal was the subject of critical concurrent resolutions introduced in April 1958, by Sen. Anderson (Dem., N.M.) and Rep. Holifield (Dem., Cal.), S. Con. Res. 78 and H. Con. Res. 307, 85th Cong., 2d Sess., and an adverse decision by the Comptroller General, April 8, 1958, Dec. B-135649, BNA, Atomic Industry Reporter 4: 123 and 221: 827. The Commission thereupon made a specific submission of the proposed contract, in restricted form, to the Joint Committee, which approved such submission as the basis for an arrangement in the proposed appropriation legislation for fiscal year 1959 (Sec. 109, Pub. L. 85-590, *supra;* see H.R. Rep. No. 2108, *supra* note 23 at 21-22 and 32).

(1) Waiver of established Commission charges for use of source and special nuclear materials over a specified period of time; (2) performance either without cost or at less than full cost in Commission laboratories of mutually agreed-upon research and development not reasonably available elsewhere; and (3) support of research and development required to advance the technology of projects which promise to make a significant contribution toward achieving cheap, abundant, and safe nuclear power.[26]

Criticism of the Commission's program, which became particularly acute in the 1957 session of Congress,[27] resulted in the amendment of the appropriations provisions of the Atomic Energy Act of 1954. Under Section 261 [28] of that statute as then amended, any arrangement between the Commission and a private party must be reviewed and specifically authorized by the Joint Committee.[29] This provision conceivably could permit congressional review of all expenditures heretofore made under the first and second rounds,[30] a development which has been termed an attempt to effect *ex post facto* application of a statute.[31]

[26] AEC Statement, 1957 Section 202 Hearings, *supra* note 7 at 118.

[27] A principal criticism has been that the third round invitation would permit applicants under the other two rounds to "get more money even though it previously had been limited to a fixed amount" (Rep. Cannon, 103 Cong. Rec. 5195-5196 (1957)). Sen. Gore characterized this invitation as a Commission attempt "to further feather the bed of private concerns in order to entice them to submit proposals" and "to add feathers to the bed of those with whom you [AEC] entered into contracts even as far back as 1956" (1957 Section 202 Hearings, *supra* note 7 at 35-36). In its report authorizing appropriations for the AEC in accordance with Section 261, as amended in 1957, the Joint Committee stated (Sen. Rep. No. 791, *supra* note 23 at 20): "During the hearings it was also brought out that the language of the third round might make available third round funds to the first and second round participants and to other reactor projects already under construction. The committee does not approve the implications of this language. Such language would permit the transference of funds authorized by Congress for specific future projects retroactively to past projects which were proposed under different terms and conditions. . . . Provision is made in the third round for postconstruction research and development assistance which, if attempted to be applied as proposed in the second round . . . could result in outright subsidies to the operators of private reactors."

[28] 42 U.S.C.A. §2017.

[29] Pub. L. 85-162, 85th Cong., 1st Sess. (1957). In the AEC authorization legislation for fiscal year 1959, Congress provided that, "[b]efore the Commission enters into any arrangement the basis of which has not been previously submitted to the Joint Committee . . ., it shall make public announcement of each particular reactor project it considers technically desirable for construction and shall set reasonable dates for submission, approval of the proposal and negotiations of the basis of the arrangement, and commencement of construction" (Section 109, Pub. L. 85-590, *supra;* see H.R. Rep. No. 2108, *supra* note 23 at 22 and 32).

[31] See statement of AEC Chairman Strauss, *supra* note 7 at 69.

C. Development of Private Industry

Although confronted with numerous technical and financial problems [32] which may presage "lean and trying years" in the foreseeable future,[33] the private industry regulated by the 1954 statute is no mere economic fledgling. Even prior to 1954 approximately $50 millions were spent by private sources for nuclear research and development.[34] Between 1954 and 1958, it is reliably estimated that some $300 millions of non-government funds will have been spent for such research and development,[35] of which approximately $115 millions will go into capital facilities.[36]

As the peaceful uses of atomic energy are expanded, private industry should assume an increasingly important role. In 1952, for example, the research institutions spent $1.2 millions, and industry $4.8 millions, for facilities and equipment and operations in the field. During 1956-1958, however, such industrial expenditures are expected to reach $44.1 millions annually, compared with $3.7 millions for the institutions.[37] These efforts are believed capable of producing nuclear power on a nearly commercial basis sometime between 1965 and 1970.[38]

[32] 1957 Section 202 Hearings, *supra* note 7 at 58-59; 1957 Authorizing Legislation Hearings, *supra* note 7 at 203, 331-339; Sen. Rep. No. 296, 85th Cong., 1st Sess. 1 (1957). See AEC Twenty-third Semi-Annual Report 7 (1958): "Late in 1957, some readjustment was going on in that part of the atomic energy industry concerned with civilian power reactors. Some firms had dropped out, or reduced their undertakings. Current economic trends undoubtedly were a partial factor in some cases. While this adjustment may temporarily deter new firms from entering the industry, the hard core of the atomic energy business is already established and growth is steady. . . ." For a discussion of technological and economic factors affecting industry, including reduction in capital, fuel, and maintenance costs, see *id.* at 94-98; for the point of view of industry concerning retrenchment during 1957, see *Hearings Before Joint Committee on Atomic Energy on "Development, Growth and State of the Atomic Energy Industry,"* 85th Cong., 2d Sess. 218, 270 (1958) (hereafter cited as 1958 Section 202 Hearings).

[33] C. L. Wilson, President, Metals & Controls Corp., BNA, Atomic Industry Reporter 3: 51.

[34] AIF Growth Survey, *supra* note 9 at 6.

[35] *Id.* at 11.

[36] *Id.* at 26. According to former AEC Chairman Strauss, "industry's share . . . represents about one-third of the total national effort to develop economic nuclear power" (BNA, Atomic Industry Reporter 4: 21).

[37] AIF Growth Survey, *supra* note 9 at 14.

[38] See *id.* at 35; Cole, *supra* note 6 at 475-476. The McKinney Panel Report, *supra* note 10 at 2, states that "[b]y 1975 atomic power could amount to 20 to 40 per cent of presently installed electric generating capability in the United States. If this occurs, however, it will be in the context of a total generating capability of 3 to 4 times present levels." The goal of the AEC itself is achieving "competitive nuclear power in the United States during the next ten years," according to a statement by the Commission

Progress in the atomic energy industry is, in the opinion of the Atomic Energy Commission, "without precedent," due to the fact that "[n]o other major scientific discovery has ever before been applied so quickly to so many practical uses." [39] The Commission has thus described the condition of this industry at the end of 1957:

> Since 1953, an atomic energy industry has come into being, though still on [a] relatively small scale for a major industry in the United States, and a foundation has been laid for healthy growth and expansion.
>
> Basically, the industry has two main divisions—that which purchases and uses atomic energy products, such as the companies processing radioisotopes, and the manufacturers of such devices as thickness or density gauges that incorporate radioisotopes; and the section which designs, constructs, and operates or sells research and power reactors, plus the suppliers of materials, components, and services for Federal or private reactors. The radioisotope part of the industry is older and better developed, and still is rapidly expanding. The reactor part, a composite of Federal and private activities, is mostly new since 1953, but already has attracted considerable risk capital.
>
> Private companies have entered many phases of the reactor part of the industry, particularly where there was a promising market for products or services. Industry has assumed heavy outlays in designing, building, and operating nuclear reactors to produce electric power. A foreign market is developing for United States built research and power reactors. Heavy expense has been incurred in nuclear research, development, and engineering.

---

submitted June 4, 1958, to the Joint Committee on Atomic Energy (BNA, Atomic Industry Reporter 54:39). This statement was made in connection with a program for projecting the civilian power reactor development effort through fiscal year 1963 and clearly was formulated in the light of continuous criticism of the AEC for its alleged failure to prepare and announce a long-range program in the civilian power reactor field. See, *e.g.*, H.R. Rep. No. 2108, *supra* note 23 at 9-10; 1958 Section 202 Hearings, *supra* note 32 at 209. As of January 1, 1958, actual or potential electrical capacity of civilian nuclear power projects aggregated 1,306,500 kilowatts, of which 65,000 kilowatts were being produced by plants then in operation, 689,000 kilowatts were planned to be produced by plants then being built, and 552,500 kilowatts were proposed for plants then being planned. AEC, Twenty-third Semi-Annual Report 77, 357 (1958). The two plants in operation at the end of 1957 were the Vallecitos boiling water reactor at Pleasanton, Cal., operated by Pacific Gas & Electric Co., which achieved criticality in Oct. 1957 and has a capacity of 5,000 kilowatts, and the pressurized water reactor operated by the AEC and Duquesne Light Co. at Shippingport, Pa., which achieved criticality Dec. 2, 1957, and has a capacity of 60,000 kilowatts.

[39] AEC, Twenty-third Semi-Annual Report 3 (1958).

> Private organizations and Government were constructing 89 reactors as of the end of 1957. Including 7 critical assemblies, there were 43 research, training, and test reactors (11 of them for the foreign market). The 46 power reactors, of which 36 were military machines, included 10 civilian powerplants, 1 for overseas sale.
>
> Expenditures or obligations by the Federal Government for research and development and construction of civilian and military power and propulsion reactors are estimated at more than $500 million for the fiscal year ending June 30, 1958. Estimates were that private industry was spending about $64 million on civilian power reactors during the same period.[40]

D. Role of Administrative Law

Federal administrative law includes those statutes and regulations governing the departments, agencies, and regulatory commissions of the Executive Branch of the Government, as well as those rules made by such organizations to govern private activity. This branch of the law can and does have a widespread impact upon citizens and businesses in every state of the Union.[41] The field is as broad as the field of national government. By enacting the Atomic Energy Acts of 1946 and 1954, Congress brought the control of the peaceful uses of atomic energy into an area where the established agencies and the courts have been guided by fairly well-defined concepts of administrative due process consistent with the needs and powers of government.

Except for unique scientific, technological, and economic problems which will be solved by the passage of time, the atomic energy field is no different from any other area of government regulation. The Atomic Energy Commission uses traditional forms of administrative controls, such as rule-making and licensing, to carry out its powers. In addition, that Commission has utilized conditions in contract awards as a means of industry control to a very great extent, probably more than heretofore used by any other federal agency.

Although special problems concerning atomic energy must be given due consideration in establishing a system of administrative regulation, a moratorium should not be declared in that area on Congressionally enacted and judicially developed concepts of due process and delegated

[40] *Id.* at 6; for a detailed list of the reactors and projects involved, see 1958 Section 202 Hearings, *supra* note 32 at 36ff.

[41] Cooper, The Lawyer and Administrative Agencies 1-2 (1957); Cragun and de Seife, "A Skeptic Views 25 Years of Administrative Process," 16 Fed. Bar J. 556 (1956); Oulahan, "A Challenge to the American Bar," 51 The Brief 101, 103-104 (1956).

power otherwise applicable to an agency of the United States government. In passing the Atomic Energy Acts of 1946 and 1954, Congress, instead of conferring a special status upon administrative procedures of the Atomic Energy Commission, expressly made applicable thereto the provisions of the Federal Administrative Procedure Act of 1946.[42] As Congress has recognized in passing atomic energy legislation, the Administrative Procedure Act

> . . . was enacted by the Congress in 1946 to regulate and make uniform, where practicable, the administrative process, particularly in the control of private and property rights by agencies of the executive branch. That statute represented the culmination of nearly two decades of effort on the part of the Congress, the executive branch, members of the Judiciary, and the organized bar to meet the numerous problems of procedure and substantive rights which have arisen out of the multiplication of Federal administrative agencies and the expansion of their functions.[43]

However, Congress took cognizance of situations where so-called Restricted Data or defense information was involved in connection with atomic energy. As more fully discussed hereafter, special provision was made in the 1954 statute for parallel non-public procedures in such cases.[44]

In this study, the procedures used by the Atomic Energy Commission will be considered with particular regard to the philosophy and provisions of the Administrative Procedure Act and to the special problems of administrative law which have arisen under the atomic energy statutes of 1946 and 1954. Rule making (the procedure whereby the Commission largely effects and implements controlling legislation) and licensing and contracting (the administrative means for enforcing the rules) comprise the three major categories of administrative activity carried on by the Atomic Energy Commission. Accordingly, these three subjects are treated separately.

II. RULE-MAKING PROCEDURES

A. Rule Making in Administrative Law

Rule making, sometimes called subordinate legislation, results from a delegation of legislative power to an administrative agency to implement the basic law established by Congress. Although "a normal feature of Federal administration ever since the Government was established," [45] the rule-making process has assumed its present importance only with the development of numerous federal regulatory agencies and the increasingly common practice of Congress "to establish legislative standards [for agency rule making] in broad, vague and general terms." [46]

The power of agencies to issue rules is in many respects more important than the legislative authority of the Congress in creating the rule-making power. Rules, no less than statutes, establish standards of conduct for all to whom their terms apply.[47] It was in recognition of this important role of rule making in the federal administrative process [48] that Congress in 1946 included special provisions with respect thereto in the Administrative Procedure Act.[49]

This statute establishes two categories of rule making, formal and informal. It specifies procedures applicable to rule making except where "there is involved any military, naval, or foreign affairs function of the United States or . . . any matter relating to agency management or personnel or to public property, loans, grants, benefits, or contracts." [50]

Informal rule making is required to be effected by publishing notice thereof in the Federal Register [51] and by giving interested persons an opportunity to submit written or oral views with respect to the subject

[45] Administrative Procedure in Government Agencies—Report of the Attorney General's Committee on Administrative Procedure, Sen. Doc. No. 8, 77th Cong., 1st Sess. 78 (1941).

[46] Cooper, Administrative Agencies and the Courts 259 (1951). For a discussion of legislative delegations of authority, see Hoover Commission Legal Task Force Report, *supra* note 43 at 133-136.

[48] Sen. Doc. No. 248, *supra* note 43 at 18, 194-195, 251-252, 304-305, 353-354, and 358. See Cooper, *supra* note 46 at 253-302.

[49] Sections 2(c), 4, and 7(c), 5 U.S.C.A. §§1001(c), 1003, and 1006(c).

[50] Section 4(1) and (2), 5 U.S.C.A. §1003(1) and (2). These exceptions assume importance in the light of the military and international aspects of the Atomic Energy Commission's authority and of its powers with respect to leasing atomic materials, providing grants for research and development by contract or otherwise, and making contracts to implement the Government's atomic energy program.

[51] Section 4(a), 5 U.S.C.A. §1003(a).

matter under consideration.[52] Notice of proposed rule making may be omitted, however, where "the agency for good cause finds . . . that notice and public procedure thereon are impracticable, unnecessary, or contrary to the public interest." Except where the agency otherwise provides "upon good cause found and published with the rule," proposed rules must be published at least thirty days before their effective date.[53]

In addition to informal rule making, the Atomic Energy Commission is authorized, together with nine other federal agencies and departments,[54] to engage in formal rule making. Such rule making is involved wherever the statutes require that regulations be made on the record after opportunity for agency hearing in an adjudicatory proceeding.[55] Under such procedure, an opportunity for a hearing must be afforded before the agency, a member thereof, or a hearing examiner [56] appointed in accordance with the requirements of the Administrative Procedure Act.[57] The presiding officer is authorized to issue a recommended decision based on the evidence; or the agency may issue a tentative decision or order the record certified to it for immediate final decision when it finds "upon the record that due and timely execution of its functions imperatively or unavoidably so requires." [58] The parties to

the proceeding are afforded opportunity for the submission of evidence and the taking of exceptions to the decisions of the hearing officer equivalent to that afforded in formal adjudication.[59]

B. Rule Making under the Atomic Energy Act of 1946

The Atomic Energy Act of 1946 contained few statutory references to the rule-making authority of the Atomic Energy Commission.[60] Indeed, provision for general rule-making authority was not made in that statute until 1953.[61] However, a number of regulations of wide scope and importance were developed under the Atomic Energy Act of 1946.[62]

In order to assure continuity of regulation, the transition from the 1946 to the 1954 statute required special action by the Commission when the President signed the present legislation on August 30, 1954. This was effected the same day by a "note . . . promulgated as a rule" in which the Atomic Energy Commission announced:

> Until further order of the . . . Commission, all provisions of rules, regulations and notices, published . . . under the authority of the Atomic Energy Act of 1946 and in effect immediately prior to the effective date of the Atomic Energy Act of 1954, are continued in force and effect to the extent that they are not inconsistent with the Atomic Energy Act of 1954.[63]

Thus, a possible inconsistency between the definition of "fissionable material," the term used in the 1946 statute,[64] and "special nuclear material," the equivalent term used in the 1954 statute,[65] as well as the regulatory hiatus which might have otherwise resulted, were avoided. The Commission resorted to provision in the Administrative Procedure

[59] *Id.*, Sections 7(c) and 8(a) and (b), 5 U.S.C.A. §§1006(c) and 1007 (a) and (b).

[60] Sections 5(a)(4), 5(c)(2), 7(c), and 12(a)(2), 42 U.S.C. §§1805(a)(4), 1805(c)(2), 1807(c), and 1812(a)(2)(1946).

[61] Section 12(a)(10), as added by Pub. L. 164, 83d Cong., 1st Sess. (1953).

[62] *E.g.*, "Control of Source Material," 10 Code Fed. Regs. Pt. 40.

[63] The Commission filed this "Note" on September 2, 1954. It was published in the Federal Register the following day, 19 Fed. Reg. 5628.

[64] Section 5(a)(1), 42 U.S.C.A. §1805(a)(1)(1946), which provided, in part, that ". . . the term 'fissionable material' means plutonium, uranium enriched in the isotope 235, any other material which the Commission determines to be capable of releasing substantial quantities of energy through nuclear chain reaction of the material, or any material artificially enriched by any of the foregoing. . . ."

[65] Section 11y, 42 U.S.C.A. §2014(y): "The term 'special nuclear material' means (1) plutonium, uranium enriched in the isotope 233 or in the isotope 235, and any other material which the Commission . . . determines to be a special nuclear material . . . ; or (2) any material artificially enriched by any of the foregoing. . . ."

Act authorizing adoption of a rule without resort to public rule-making procedures on the ground that such procedures "would be contrary to the public interest by reason of the fact that the public health and safety and the national defense necessitate the uninterrupted continuation of the effectiveness of all existing controls." [66] The Commission indicated its intention in the future to secure wide public and industry participation in rule making when it stated that the provisions of the "Note" were considered "interim" only and that "comments by all interested parties are invited." [67]

C. Rule Making under Atomic Energy Act of 1954

1. General Authority

The rule-making authority of the Atomic Energy Commission under the 1954 legislation is one of the keystones of the system of controls contemplated by that statute.[68] Under Section 161q of that act, the Commission is given general authority to "make, promulgate, issue, rescind, and amend such rules and regulations as may be necessary to carry out the purposes of this Act." [69] Seven other sections of the 1954 statute confer specific authority upon the Commission with respect to rule making in matters of safety,[70] issuance of licenses,[71] and definition of materials.[72]

[66] Section 4(a), 5 U.S.C.A. §1003(a).

[67] By additional rule announced September 3, 1956 (19 Fed. Reg. 5628) and made effective Aug. 30, the Commission also amended its prior rules (10 Code Fed. Regs. §50.2) to make the term "production facility" under Section 11p of the new act (now Section 11t, 42 U.S.C.A. §2014t) include all facilities for the production of "fissionable material." Such rule making also was effected without notice and public procedure "for good cause found by the Commission on the ground that such are impracticable by reason of the fact that due and timely execution of the Commission's functions in giving effect to the Atomic Energy Act would be impeded by such notice and procedure." As in the case of the "Note" published Aug. 30, 1954, this rule was stated to be "interim" only, and comments by interested parties were invited.

[68] See McKinney Panel Report, *supra* note 10 at 21: "This sweeping revision [the 1954 Act] replaced a relatively simple Government monopoly with a complex structure for regulation of private activities. At the same time, it gave wide discretionary authority to the Commission to stimulate and aid private development. . . . Many new provisions required Commission interpretation and action before industry could tell what it could or could not do. . . ."

[69] 42 U.S.C.A. §2201(q), which section is identical with Section 12(a)(10) of the 1946 act, added by Pub. L. 164, 83d Cong., 1st Sess. (1953).

[70] Section 53e(7), 42 U.S.C.A. §2073(e)(7) (distribution of special nuclear material "only pursuant to such safety standards as may be established by rule . . . to protect health and to minimize danger to life or property").

[71] Sections 53b and 63b, 42 U.S.C.A. §§2073(b) and 2093(b) (establishing "by

Although an improvement in degree of specificity over the 1946 legislation, the Atomic Energy Act of 1954 exemplifies a tendency of Congress at times to give administrative agencies unusually broad latitude in effectuating Congressional policies, without providing clear and precise standards to channel and govern administrative implementation of such policies.[73] With a few exceptions the formulation of Commission rules is limited only by vague and general concepts of "common defense and security" or "health and safety of the public." [74] The statute, however wise its administration has been to date, represents an extreme example of so-called "skeleton legislation," which must be clothed by executive regulations.[75]

2. Informal Rule-Making Procedures

Section 181 of the Atomic Energy Act of 1954 applies the Federal Administrative Procedure Act of 1946 "to all agency action taken under this [Atomic Energy] Act," except where Restricted Data and defense information are involved.[76] In the latter event, "parallel procedures" are permitted, preserving administrative due process but at the same time precluding unauthorized disclosure of secret information.

Although the Commission has, by regulation and in apparent good faith, sought to implement these requirements with respect to rule making, the regulations governing rule making clearly emphasize informal procedures and do not encourage an opportunity for oral hearing. Indeed, it is Commission policy that

> Informal hearings will normally be held for the purposes of obtaining necessary or useful information, and affording par-

---

rule, minimum criteria for the issuance of . . . licenses for the distribution of . . . [special nuclear material and source material respectively] depending upon the degree of importance to the common defense and security or to the health and safety of the public of . . . [its] physical characteristics . . . , the quantities . . . to be distributed . . . , and . . . [its] intended use . . ."); and Section 103a, 42 U.S.C.A. §2133(a) (commercial licenses to be issued "subject to such conditions as the Commission may by rule or regulation establish to effectuate the purposes and provisions of this Act").

[72] Sections 11x, 42 U.S.C.A. §2014(x) (formerly Section 11s); Section 11y, 42 U.S.C.A. §2014(y) (formerly Section 11t); Section 51, 42 U.S.C.A. §2071; and Section 61, 42 U.S.C.A. §2091.

[73] See Hoover Commission Legal Task Force Report, *supra* note 43, at 133-136.

[74] *E.g.*, Sections 53b and 63b, *supra* note 71.

[75] Sen. Doc. No. 8, *supra* note 45, at 98.

[76] 42 U.S.C.A. §2231, comparable to Section 14 of the 1946 act, 42 U.S.C. §1814 (1946).

> ticipation by interested persons, in the formulation, amendment, or rescission of rules and regulations.[77]

Thus, in the case of "informal hearings," the procedure to be followed

> . . . shall be such as will best serve the purpose of the hearing. For example, an informal hearing may consist of the submission of written data, views, or arguments with or without oral argument, or may partake of the nature of a conference, or may assume some of the aspects of a formal hearing in which the subpoena of witnesses and the production of evidence may be permitted or directed.[78]

Informal public rule-making procedure is further covered in the Commission's Rules of Practice,[79] which relate to "the issuance, amendment, or rescission of substantive rules in which participation by interested persons is prescribed under Section 4 of the Administrative Procedure Act." [80] This procedure for "substantive rules" conforms to the provisions of the Administrative Procedure Act concerning hearing requirements for such rules.[81]

Under the Commission procedure, rule making is commenced by an "initiation petition" made upon the agency's own motion, the recommendation of another federal agency, or the request of "any other in-

[77] 10 Code Fed. Regs. §2.708. See Plaine, "Rules of Practice of Atomic Energy Commission," 34 Tex. L. Rev. 801, 818 (1956): "Because hearings for rule-making under the Atomic Energy Act are not 'on the record,' trial-type hearings, but are hearings in the legislative sense, the public rule-making procedure will normally be an informal hearing. Thus interested persons will be provided the opportunity, as the Commission determines and states in the notice, to submit written views or arguments, or to participate in a conference, or in an oral hearing as the case may be. . . ." House Committee on Government Operations, "Survey and Study of Administrative Organization, Procedure, and Practice in the Federal Agencies—Agency Response to Questionnaire," Part 11A—Independent Agencies (1957) (hereafter cited as AEC Response to Questionnaire), in which the AEC stated (p. 1081): ". . . [E]ven if an oral hearing [for rule making] were held, it would be most likely to be informal, in the nature of a conference so that formal procedures would not be necessary. . . ."

[78] 10 Code Fed. Regs. §2.720.

[79] 10 Code Fed. Regs. §§2.780-2.787.

[80] 10 Code Fed. Regs. §2.780.

[81] Under the Administrative Procedure Act, an agency rule is considered "substantive" unless it relates to "any military, naval or foreign affairs function of the United States," "any matter relating to agency management or personnel or to public property, loans, grants, benefits, or contracts," "interpretative rules," "general statements of policy," and "rules of agency organization, procedure or practice." See Section 4(1), (2), and (a), 5 U.S.C.A. §1003 (1), (2), and (a); Sen. Doc. No. 248, *supra* note 43 at 199-200. The Commission believes that "public participation in these matters [nonsubstantive rule making] to the extent of commenting on proposed regulations is generally desirable" (AEC Response to Questionnaire, *supra* note 77, at 1082).

terested person." [82] Petitions by such persons for the issuance, amendment, or rescission of AEC rules are required (1) to state "the substance or text of any proposed rule or regulation, or amendment thereof" or to "specify the rule or regulation the rescission of which is desired," and (2) to "state the basis for the request." Such petitions are to be given "a docket or other identifying number" and to become a matter of public record,[83] except where Restricted Data or defense information is involved.[84] In the latter event the Commission presumably will resort to "parallel procedures."

A hearing on a petition filed by an interested person is not held "unless the Commission deems it advisable," in which event notice of public rule making is given. Where "the Commission determines that the petition does not disclose sufficient reasons to justify instituting the public rule making procedure," the petitioner is so notified "with a simple statement of the grounds" for the agency's failure to act.[85]

The notice provisions of the Commission's rules with respect to institution of public rule-making proceedings [86] conform to those of the Administrative Procedure Act.[87] The latter statute does not contain a provision with respect to the minimum time required for the giving of such notice. However, the Commission in its rules specifies a 15-day

[82] 10 Code Fed. Regs. §2.781. See Section 4(d) of the Administrative Procedure Act, 5 U.S.C.A. §1003(d), which provides: "Every agency shall accord any interested person the right to petition for the issuance, amendment, or repeal of a rule."

[83] 10 Code Fed. Regs. §2.782. See notice of petition requesting amendment of 10 Code Fed. Regs. §2.301 concerning the definition of a "patent owner," assigned Docket No. PRM-1, 22 Fed. Reg. 524 (Jan. 26, 1957). The docket number indicates that this petition either is the first ever to be formally filed with the Commission or is the first document to be considered by the agency as falling within the meaning of "petition for rule making," as set forth in §2.782. However, the Commission ordered no hearing on the petition but merely stated that it could be examined in the public document room. Changes in the Commission's rules to date apparently have been made as the result of conferences between the agency and interested parties, rather than by petition, see Statement of AEC to Joint Congressional Committee on Atomic Energy, 1957 Section 202 Hearings, *supra* note 7 at 148.

[84] As defined in Sections 11h, 42 U.S.C.A. §2014(h), and 11w, 42 U.S.C.A. §2014(w) (formerly Section 11r) of the 1954 act.

[85] 10 Code Fed. Regs. §2.783.

[86] 10 Code Fed. Regs. §2.784.

[87] Section 4(a), 5 U.S.C.A. §1003(a), which states: "General notice of proposed rule making shall be published in the Federal Register (unless all persons subject thereto are named and either personally served or otherwise have actual notice thereof in accordance with law) and shall include (1) a statement of the time, place, and nature of public rule making proceedings; (2) reference to the authority under which the rule is proposed; and (3) either the terms or substances of the proposed rule or a description of the subjects and issues involved."

notice "provided that a lesser time may be prescribed upon good cause found and incorporated with a brief statement of the reasons in the notice." [88]

As noted previously, the hearing itself may not necessarily include the taking of testimony before a designated Commission officer but may be limited merely to the submission of views in writing.[89] However, the interests of participating parties appear to be adequately protected by provisions in the rules that "opportunity to participate may include an opportunity to comment upon or respond to the data, views, or arguments submitted by others" and that additional time therefor may be granted at the discretion of the Commission.[90]

Adoption of a rule under Commission procedure, as provided in the Administrative Procedure Act,[91] requires consideration of relevant information by the Commission and publication of the rule with "a concise general statement of its basis and purpose." [92] Such publication must be made at least 30 days before the effective date of the rule "unless the Commission may provide otherwise upon good cause found and published with the rule." [93]

3. Formal Rule-Making Procedures

Under Section 189a of the 1954 act, the Commission must, "upon the request of any person whose interest may be affected by the proceeding," grant a hearing "in any proceeding for the issuance or modification of rules and regulations dealing with the activities of licensees." [94] The term "dealing with the activities of licensees" relates clearly to those rules and regulations which prescribe the terms and conditions imposed

[88] 10 Code Fed. Regs. §2.784.

[89] 10 Code Fed. Regs. §§2.720 and 2.785.

[90] 10 Code Fed. Regs. §2.785. According to the Commission, its practice is "to publish all regulations, procedural or otherwise, as notices of proposed rulemaking with a request for comments"; however, in actual practice, the Commission has used in rule making "the professional knowledge of the AEC staff and the knowledge and experience which AEC has acquired since its establishment in 1946 . . . supplemented by comments of advisory groups and the public (and by studies of independent experts when available)" (AEC Response to Questionnaire, *supra* note 77, at 1080).

[91] Section 4(b) and (c), 5 U.S.C.A. §1003(b) and (c).

[92] 10 Code Fed. Regs. §2.786; see, to the same effect, Section 4(b) of the Administrative Procedure Act, 5 U.S.C.A. §1003(b).

[93] 10 Code Fed. Regs. §2.787.

[94] 42 U.S.C.A. §2239(a).

upon licensees,[95] and also, it is believed, to those which set forth the grounds for suspending, revoking, or amending any license.[96]

Although Section 189a does not specifically prescribe either a "formal" hearing or one "on the record" for rules affecting licensing, the section undoubtedly applies to such rule-making procedures where regulations involving licensing are concerned, particularly in view of Section 189b which provides for judicial review of "any final order entered in any proceeding" under Section 189a.[97] In order for court review to be effected under Section 189b, there must be a record made under Section 189a. For the Commission to take any other position would be to open the door to possible use of rule making by informal procedure without hearing to affect the substantive rights of existing licensees, where a formal licensing proceeding would otherwise be required by Section 189a.[98]

As provided under the Administrative Procedure Act [99] and the pro-

[95] *E.g.*, maintenance of records and making of reports by licensees of production and utilization facilities, 10 Code Fed. Regs. §50.71.

[96] *E.g.*, grounds for revocation, suspension, or modification of a license, 10 Code Fed. Regs. §70.61(b).

[97] Although the issue has not yet arisen, the Commission may well take a position restricting the application of formal hearing procedures to the second clause of Section 189a of the 1954 statute requiring a "hearing" upon request of any party "in any proceeding for the issuance or modification of rules and regulations dealing with the activities of licensees." See Plaine, *supra* note 77 at 811: "Section 189a of the Atomic Energy Act is the provision governing the grant of hearings by the Atomic Energy Commission, in particular affecting licensing. It provides opportunity for hearings in both adjudicative cases (*e.g.*, the granting or revoking of licenses) and sublegislative matters (*e.g.*, the issuance of rules dealing with the activities of licensees). It is silent respecting an 'on the record' requirement for hearings. Nothing in the text or history of Section 189 indicates that Congress intended to depart from the dichotomy under the Administrative Procedure Act between adjudication and sublegislation. The AEC has therefore quite properly followed the accepted interpretation that an 'on the record' requirement is implied in adjudicative proceedings, but not in sublegislative proceedings involving rule-making."

[98] See Zenith Radio Corp. v. Federal Communications Commission, 211 F. 2d 629, 633-634 (D.C. Cir. 1954) (". . . Such an established statutory right [to a license] requires adjudicatory disposition, and the procedure which is sufficient for the rule making is not sufficient for that purpose. . . .") The fact that Section 189a of the 1954 act does not contain the words "on the record" should be immaterial in the context of the provisions for adjudication and judicial review contained therein and the broad interpretation placed upon Section 5 of the Administrative Procedure Act, 5 U.S.C.A. §1004, prescribing opportunity for a hearing in cases of adjudication "required by statute to be determined on the record" and upon Section 4(b), 5 U.S.C.A. §1003(b), requiring a formal hearing for rule making "required by statute to be made on the record after opportunity for an agency hearing" (Wong Yang Sung v. McGrath, 339 U.S. 33, 48 (1950), as modified, 339 U.S. 908 (1950)).

[99] Sections 7, 8, and 10, 5 U.S.C.A. §§1006, 1007, and 1009.

cedure of the Commission,[100] a "formal" rule-making proceeding includes the use of a hearing officer or of the agency itself, the conduct of the hearing along lines of judicial procedure where practicable, and the rendering of a decision by such presiding officer, with appropriate review by the agency and by a court.[101]

The inclusion of the requirement for "formal" rule making in areas in which that process closely resembles adjudication[102] represents a salutary legislative policy. This policy does much to protect the interests of atomic energy licensees in administrative due process, as well as to advance the interests of the Commission in orderly procedures which inspire public confidence.

4. Public Rule-Making Hearings[103]

On only one occasion has the Commission announced and held public hearings in connection with rule making. Notice of this proceeding was given February 26, 1955, for the purpose of obtaining the views of all interested persons with respect to procedures and methods for awarding leases for the mining of uranium on federal lands under the control of the Atomic Energy Commission.[104] In commenting on this proceeding, the Commission has stated:

> No oral hearing has ever been requested on proposed rules nor has the Commission ever felt it desirable to initiate such a hearing. In one case, oral hearings were held to determine the advisability of changing our source material purchasing practices.[105]

5. Written Submissions

On numerous occasions the Commission has published a notice of "contemplated" rule making without public hearing but requesting that

[100] 10 Code Fed. Regs. §§2.780-2.787.

[101] These procedures are described in detail in Section C, "Licensing," *infra*.

[102] "To assert that formal rule making is, unlike adjudication, not an adversary proceeding is to have regard only to the form of the proceeding and to ignore realities. In many respects, where rules are promulgated on the basis of a record made at a formal hearing involving sharply contested issues of fact, the agency is, in effect, prosecuting the proceeding against private parties to be affected in the future by the rules" (Hoover Commission Legal Task Force Report, *supra* note 43, at 164).

[103] The rule making described in subsections d-i generally covers the period through June 30, 1957.

[104] 20 Fed. Reg. 1227 (Feb. 26, 1955). The hearings were to be held Mar. 29-31, 1955, at Grand Junction, Colorado, under the supervision of the AEC's Manager, Grand Junction Operations Office.

[105] AEC Response to Questionnaire, *supra* note 77 at 1080-1081.

"[i]nterested persons . . . submit their views or other relevant information" concerning proposed changes in rules within thirty days [106] or, in one instance, within fifteen days.[107] With respect to the licensing of by-product material [108] and also in connection with so-called "parallel procedures" for licensing involving classified information,[109] the Commission has promulgated rules to be effective within thirty days but requested written submittals thereon in the meanwhile. Such comments and submittals usually are directed to be sent to the chief of the division, branch, or field office of the Commission which will administer the rules involved.

6. Promulgation of Rules

As a general, although not necessarily a uniform, policy, the Commission gives thirty days' notice of the promulgation of final rules as required by the Administrative Procedure Act.[110] However, no such notice has been given in a number of cases.

[106] See, *e.g.*, "Notice of Proposed Rule Making—General Rules of Procedure on Applications for Determination of Reasonable Royalty Fee, Just Compensation, or Grant of Award for Patents, Inventions, or Discoveries," 10 Code Fed. Regs. Pt. 80, 20 Fed. Reg. 2193 (April 7, 1955). Similar procedure has been utilized with respect to "Standard Specifications for Granting of Patent Licenses," 10 Code Fed. Regs. Pt. 81, 20 Fed. Reg. 2283 (April 8, 1955); "Control of Facilities for the Production of Fissionable Materials," 10 Code Fed. Regs. Pt. 50, 20 Fed. Reg. 2486 (April 15, 1955); "Definition of Fissionable Material," 10 Code Fed. Regs. Pt. 70, 20 Fed. Reg. 2491 (April 15, 1955); "Safeguarding of Restricted Data," 10 Code Fed. Regs. Pt. 95, 20 Fed. Reg. 2495 (April 15, 1955); "Access to Restricted Data," 10 Code Fed. Regs. Pt. 25, 20 Fed. Reg. 3634 (May 24, 1955); "Operators Licenses," 10 Code Fed. Regs. Pt. 55, 20 Fed. Reg. 4658 (June 30, 1955); "Standards for Protection Against Radiation," 10 Code Fed. Regs. Pt. 20, 20 Fed. Reg. 5101 (July 16, 1955); "Rules of Practice," 10 Code Fed. Regs. Pt. 2, 20 Fed. Reg. 5786 (Aug. 10, 1955); "Priorities Regulations," 10 Code Fed. Regs. Pt. 130, 20 Fed. Reg. 8608 (Nov. 22, 1955); "Waiver of Patent Rights," 10 Code Fed. Regs. Pt. 83, 21 Fed. Reg. 7007 (Sept. 18, 1956); "Rules of Practice," 10 Code Fed. Regs. §2.102, 22 Fed. Reg. 2433 (April 11, 1957); and "Intervention in Proceedings on Application for Facility Export License," 10 Code Fed. Regs. §2.705, 22 Fed. Reg. 4054 (June 8, 1957).

Promulgation of regulations on the date of the notice of final formulation or prior thereto has been justified by the Commission on the grounds that such rules involved non-substantive or security matters not required to be developed according to the Administrative Procedure Act.[111] In such cases the Commission usually has found merely that "good cause exists why the regulations . . . should be made effective without the customary thirty-day period of notice." [112] "Good cause" for dispensing with the thirty-days requirement of the Administrative Procedure Act also has been found where rules are needed in pending proceedings [113] or because of safety considerations.[114] Also, the Com-

Reg. 3634 (May 24, 1955); amendment to "Access to Restricted Data," 10 Code Fed. Regs. §25.11(b)(7), 21 Fed. Reg. 5733 (Aug. 1, 1956); and "Criteria and Procedures for Determining Eligibility for Security Clearance," 10 Code Fed. Regs. Pt. 4, 21 Fed. Reg. 3103 (May 10, 1956), as amended, 21 Fed. Reg. 7147 (Sept. 20, 1956).

[112] *E.g.*, 10 Code Fed. Regs. Pt. 110, 21 Fed. Reg. 418 (Jan. 20, 1956), *supra* note 111.

[113] "Public Records," 10 Code Fed. Regs. Pt. 9, 21 Fed. Reg. 9743 (Dec. 8, 1956), as corrected 22 Fed. Reg. 2005 (Mar. 27, 1957). Fifteen days' notice has been given for the same reason where the Rules of Practice have been amended, 10 Code Fed. Regs. Pt. 2, 21 Fed. Reg. 8594 (Nov. 8, 1956) and 21 Fed. Reg. 9741 (Dec. 8, 1956).

[114] Amendments to "Standards for Protection Against Radiation," 10 Code Fed. Regs. Pt. 20, 22 Fed. Reg. 3389 (May 14, 1957).

mission has utilized the exceptions contained in the Administrative Procedure Act [115] permitting promulgation, without notice, of rules "recognizing exemption or relieving restriction" [116] and dealing with public property and personnel.[117]

Where the Commission publishes an advance statement of the proposed rules, which rules are later promulgated without thirty days' notice, interested persons have some degree of prior notice. However, this is not the case where the rules are not published in proposed form but are nevertheless made immediately effective.

7. Special Non-Public Procedures

Under the 1954 statute, the Commission is authorized to promulgate certain rules by special non-public procedures involving the President and the Joint Congressional Committee on Atomic Energy. These procedures are used when the Commission desires to add "other material" to the categories of "special nuclear material" [118] or "source material." [119]

Pursuant to these procedures, the Commission is required to make findings (1), with respect to "special nuclear material," that the material to be added to that category "is capable of releasing substantial quantities of atomic energy"; and (2), with respect to "source material," that such additional material "is essential to the production of special nuclear material." In both cases, the Commission also must find that its determination "is in the interest of the common defense and security." Express Presidential assent to each such determination then is required, whereupon

> The Commission's determination, together with the assent of the President, shall be submitted to the Joint Committee and

[116] Amendments to "Licensing of Byproduct Material," 10 Code Fed. Regs. §§30.22(c), 30.71-30.72, 21 Fed. Reg. 7265 (Sept. 25, 1956) and 21 Fed. Reg. 7503 (Oct. 3, 1956); amendments to "Operators' Licenses," 10 Code Fed. Regs. §55.10(d), 21 Fed. Reg. 7265 (Sept. 25, 1956); and amendments to "Control of Source Materials," 10 Code Fed. Regs. §40.12, 22 Fed. Reg. 1318 (March 2, 1957).

[117] See, *e.g.*, "Radioisotope Research Support Program," 10 Code Fed. Regs. Pt. 37, 20 Fed. Reg. 4712 (July 2, 1955) and 20 Fed. Reg. 6604 (Sept. 9, 1955); "Uranium Leases on Lands Controlled by the Commission," 10 Code Fed. Regs. §60.8, 21 Fed. Reg. 5259 (July 14, 1956) and 10 Code Fed. Regs. §60.9, 22 Fed. Reg. 1326 (March 5, 1957); and "Advisory Boards," 10 Code Fed. Regs. Pt. 7, 20 Fed. Reg. 6515 (Sept. 3, 1955) and 21 Fed. Reg. 4271 (June 19, 1956).

[118] Section 11y, 42 U.S.C.A. §2014(y) (formerly Section 11t) and Section 51, 42 U.S.C.A. §2071.

[119] Section 11x, 42 U.S.C.A. §2014(x) (formerly Section 11s) and Section 61, 42 U.S.C.A. §2091.

> a period of thirty days shall elapse while Congress is in session . . . before the determination of the Commission may become effective: *Provided, however,* That the Joint Committee, after receiving such determination, may by resolution in writing, waive the conditions of all or any portion of such thirty-day period.[120]

These special procedures represent an innovation in the 1954 statute as compared with the 1946 act. They were intended to permit the Commission "to enlarge the traditional scope of materials covered under the [1954] Act, but only after appropriate safeguards are provided for careful review." [121] The first such determination by the Commission under Section 51 was announced on June 30, 1955,[122] when, effective that date, Uranium 233 was declared to be "special nuclear material." [123] The fact that these highly important definitions of "special nuclear material" and "source material" can be expanded by essentially secret rule-making procedures, without notice to interested persons who might comment thereon, has been criticized.[124]

8. Miscellaneous Rule-Making Procedures

a. Policy Determinations

The Commission has published, by notice effective immediately, important policy decisions affecting the civilian reactor program. Thus, on March 3, 1956, the agency announced a classified schedule of guaranteed fair prices for special nuclear material lawfully produced under

[120] Sections 51 and 61, 42 U.S.C.A. §§2071, 2091.

[121] Statement of Mr. William Mitchell, former AEC General Counsel, Oct. 13, 1954, 1 CCH Atomic Energy Law Rep. ¶508. See H.R. Rep. No. 2181, *supra* note 5 at 15: "In view of the potentially great impact any future declaration of the addition of further materials to the category of special nuclear material [under Section 51 of the 1954 act] could have on the economy of the Nation, these statutory steps were deemed to be necessary. . . . It is believed that this provision gives the Commission the statutory basis it needs for including new materials within this category, and still provides adequate safeguards to assure that this power is not abused. . . ."

[122] 20 Fed. Reg. 4664. The notice stated that the Commission's determination, with Presidential approval, was submitted to the Joint Committee on April 12, 1955. This indicates considerable negotiation between the Commission and the Committee before the latter gave its approval. The 30-day limitation in the statute appears meaningless, because the Committee could take adverse action prior to the expiration thereof, to forestall a promulgation of the determination by the Commission without the Committee's complete approval.

[123] Section 11y(1), 42 U.S.C.A. §2014(y)(1) (formerly Section 11t(1)), merely defines "special nuclear material" as including "uranium enriched in the isotope 233."

[124] 1 CCH Atomic Energy Law Reporter ¶1175a.

license, such prices to take effect July 1, 1955, and to be effective until June 30, 1962.[125] The basis for the determination was not disclosed and the schedule was at that time classified.[126] On November 17, 1956,[127] and June 6, 1957,[128] the Commission announced nonclassified guaranteed fair prices to be paid for plutonium and uranium 233 produced in licensed reactors and delivered to the Commission for one year after July 1, 1962.[129]

Other policy decisions affecting the domestic reactor program also have been announced by notice rather than by rule.[130] The Commission has indicated that the practice of making such decisions by automatic notice without opportunity for rule-making procedures might be changed.[131]

b. Interpretations

The Commission has recognized as rules certain interpretations of the Atomic Energy Act. This has been effected by the creation of a special Part 8 of its regulations "to contain interpretations of the . . . Act of 1954 . . . and of regulations . . . issued thereunder." [132] Only one such interpretation, however, has been issued.[133]

c. Special Determinations and Authorizations

Under the 1954 act, before proposing or receiving written submittals with respect to draft regulations, the Commission has adopted the prac-

tice in a few instances of announcing a policy determination preliminary to public rule making.

This was first done by the Commission to meet the need for clarifying and regularizing the status of American consultants who were called upon to advise concerning atomic energy projects and plants abroad.[134] On October 5, 1955,[135] the Commission announced that "any activity which . . . constitutes directly or indirectly engaging in the production of special nuclear material in any [friendly] foreign country" and which did not "involve the communication of Restricted Data or other classified defense information" or the "violation of other provisions of law" would not be considered a violation of Section 57a(3)(B) of the 1954 act.[136] The agency also announced its intention to incorporate and implement the foregoing "determination and authorization" in regulations, which were subsequently promulgated on January 20, 1956.[137]

9. General Content and Form of Rules

Rules and regulations promulgated by the Atomic Energy Commission generally show careful and clear draftsmanship and are cast in a form which makes their content readily ascertainable by the person consulting them. Thus, each part of the rules usually begins with paragraphs which set forth the purpose,[138] basis,[139] and scope [140] of the rules. In some cases, policy "findings" upon which the rules are based, are included.[141] "Definition" sections often are included where required or appropriate.[142]

The Commission apparently has sought to find a practical solution to two problems which often face regulated persons or businesses. The first of these problems arises from the fact that rules of procedure often seem to conflict whenever two or more rules or sets of rules are appli-

[135] 20 Fed. Reg. 7399 (Oct. 5, 1955).

[136] 42 U.S.C.A. §2077(a)(3)(B): "It shall be unlawful for any person to . . . directly or indirectly engage in the production of any special nuclear materials outside of the United States except . . . upon authorization by the Commission after a determination that such activity will not be inimical to the interest of the United States."

[137] 21 Fed. Reg. 418 (Jan. 20, 1956).

[138] *E.g.,* 10 Code Fed. Regs. §7.1 ("Advisory Boards").

[139] *E.g.,* 10 Code Fed. Regs. §40.1 ("Control of Source Material").

[140] *E.g.,* 10 Code Fed. Regs. §2.1 ("Rules of Practice").

[141] *E.g.,* 10 Code Fed. Regs. §6.10 ("Security Policies and Practices Relating to Labor Management Relations").

[142] *E.g.,* 10 Code Fed. Regs. §80.2 ("General Rules of Procedure on Applications for the Determination of Reasonable Royalty Fee, etc.").

cable to a given situation. Under the Commission's Rules of Practice, where there is any conflict between a general procedural rule applicable to every type of agency proceeding "and a special rule in another subpart applicable to a particular type of proceeding, the special rule will govern." [143]

More important, however, has been the Commission's attempt to deal with the problem of reliance by private parties upon official interpretations of its rules. To provide some protection for the private party who seeks an interpretation of the meaning and applicability of a rule and desires to rely upon such interpretation, each of eleven parts of the Atomic Energy Commission's regulations provide, with respect to the subject matter of that part, that

> Except as specifically authorized by the Commission in writing, no interpretation of the meaning of the regulations in this part by any officer or employee of the Commission other than a written interpretation by the general counsel will be recognized to be binding upon the Commission.[144]

It is to be hoped that the above type of provision will be extended to all parts of the Commission's rules.

Only in a few cases throughout the entire federal government does the private party have such a right to rely in good faith upon an interpretation of an administrative rule or its application to the facts of a particular case.[145] In most cases, the party acts at his peril in so relying, particularly where the application of a rule is controversial and subject to the vicissitudes of changes in agency policy.

[143] 10 Code Fed. Regs. §2.3.

[144] 10 Code Fed. Regs. §20.6 ("Standards for Protection Against Radiation"); §25.4 ("Access to Restricted Data"); §30.5 ("Licensing of Byproduct Material"); §40.50 ("Control of Source Material"); §50.3 ("Licensing of Production and Utilization Facilities"); §55.5 (Operators' Licenses"); §70.6 ("Special Nuclear Material"); §81.4 ("Standard Specifications for Granting of Patent Licenses"); §95.7 ("Safeguarding of Restricted Data"); §110.5 ("Unclassified Activities in Foreign Atomic Energy Programs"); and §140.4, ("Financial Protection Requirements and Indemnity Agreements"). For an example of a similar rule adopted under the 1946 act, see §50.60 ("Control of Facilities for the Production of Fissionable Material"), now obsolete.

[145] By statute, an advisory agency opinion may be relied upon from the Office of Alien Property, 50 U.S.C. App. §5(b), and the Department of Labor under the "Portal-to-Portal" Act, 29 U.S.C.A. §259. These two statutes, as well as the Defense Production Act of 1950, 64 Stat. 818, 50 U.S.C.App. §2157, and the six regulatory statutes administered by the Securities and Exchange Commission, 15 U.S.C.A. §§77s(a), 77sss(c), 78w(a), 79t(d), 80a-37(c), and 80b-11(d), permit reliance in good faith upon a rule or regulation of the agency concerned. See Hoover Commission Legal Task Force Report, *supra* note 43 at 189: "By practice and precedent, letters of advice and staff opinions are given limited validity by the Bureau of Foreign Commerce,

D. Conclusions

By the end of 1957 the Atomic Energy Commission had developed the major framework of rules implementing the Atomic Energy Act of 1954.[146] Criticism of the agency's delay in developing and promulgating these rules, particularly under the impetus of a pending administrative proceeding,[147] has been countered by the claim that the Commission "went about its job slowly and deliberately so that there would be an opportunity for industry to comment on what the AEC proposed and for the AEC to think carefully about its regulations before they were issued."[148] Consultation with advisory groups, rather than resort to public rule-making proceedings, seems to have been the primary reliance of the Commission in developing its regulations.[149] This policy, while not apparently abused to date, is vulnerable to imputations of *ex parte* influence in the eyes of the public and could be so abused in the future.

In general, the Atomic Energy Commission would appear to have exercised its rule-making authority under the 1954 statute in accordance with both the letter and the spirit of the Administrative Procedure Act of 1946.[150] A desire to improve public policy and relations with the

---

Department of Commerce, by the Federal Deposit Insurance Corporation, by the Interstate Commerce Commission, by the Post Office Department, and by the Office of Munitions Control, Department of State. This excellent practice . . . has been most effectively used by the Securities and Exchange Commission, which issues several thousand such opinion letters annually."

[146] See 1957 Section 202 Hearings, *supra* note 7 at 18, 147; Trowbridge, "Licensing and Regulation of Private Atomic Energy Activities," 34 Tex. L. Rev. 842 (1956).

[147] In the Matter of Power Reactor Development Company, AEC Dkt. F-16. This proceeding was inaugurated on Aug. 31, 1956, by the filing of a petition of intervention to oppose the conditional granting of a construction permit to the applicant, awarded to the applicant by the Commission on Aug. 4, 1956.

[149] 1957 Section 202 Hearings, *supra* note 7 at 149; AEC Response to Questionnaire, *supra* note 77 at 1081.

[150] See McKinney Panel Report, *supra* note 10 at 130: "The Commission has selected a complex and time-consuming technique for developing its regulations. It has conducted conferences with representatives of diverse organizations on each aspect of regulations. . . . While some points of view may not be fully reflected by this technique, opportunity for comment is also afforded after publication of proposed regulations in the Federal Register. The logic of this course of Commission action appears sound and is not being vigorously opposed by any interests or groups so far as can be observed." The only substantial attack to date upon the Commission in the field of rule making has come from intervenors United Automobile Workers and AFL-CIO in AEC Dkt. No. F-16, in the matter of Power Reactor Development Company. The intervenors did not specifically attack the licensing rules involved in that proceeding but argued that the Commission, "in granting the conditional construction permit," violated 10 Code Fed. Regs. §§50.35, 50.40, and 50.45; see "Petition for Intervention

industries and individuals subject to regulation might have dictated uniform resort to public rule-making procedures and to notice of promulgation of rules, even where non-substantive matters traditionally have been exempt therefrom under the Administrative Procedure Act.

Particularly commendable, so far as the practice goes, has been the adoption of the regulation for interpretation of rules by the Commission's General Counsel, upon which good-faith reliance can be placed. This procedure should be extended to all parts of the agency's rules, which step could be effected by an appropriate amendment to Part 8 of the Commission's rules.

Largely untested is the 1954 statute's provision for review of certain rules by the Joint Congressional Committee on Atomic Energy, which rules relate to changes in the definitions of "special nuclear material" and "source material." The Committee's authority thus conferred tends to give the Committee "a very substantial role in the atomic energy program." [151] This review procedure affords a relatively speedy means for amending Sections 11x and 11y of the 1954 act by a quasi-legislative process. However, the power exercised by the Joint Committee in this connection conceivably could be used in the future to affect the administration of the atomic energy law by the Executive Department.[152]

III. LICENSING

A. Licensing in Administrative Law

In its report published in 1941, the Attorney General's Committee on Administrative Procedure referred to licensing by federal agencies as a distinguishing characteristic of the "trend toward preventive legislation" in the United States. Indeed, the report stated:

> Licensing of any activity may be one of the most burdensome forms of regulation, since all who engage in the activity must

---

and Request for Formal Hearing" 4-13 (Aug. 31, 1956); Notice of Hearing Order, 21 Fed. Reg. 7809 (Oct. 12 1956).

In May 1958 the AEC informed the Joint Committee that "informal" public rule-making procedures would be utilized in connection with consideration of that agency's regulations on "Financial Protection Requirements and Indemnity Agreements," 10 Code Fed. Regs. Pt. 140, issued initially Sept. 11, 1957, with only 15 days' public notice (22 Fed. Reg. 7223, BNA, Atomic Industry Reporter 227:625). Industry advisory conferences on the subject occurred in Dec. 1957, and Jan. 1958, but the Commission felt the need for further industry advice concerning, and public support for, the regulations in this field; see BNA, Atomic Industry Reporter 4:100 and 4:157.

[151] 1 CCH Atomic Energy Law Reporter ¶568.

[152] See, *e.g.*, Letter of AEC Chairman Strauss to Rep. Cole, Aug. 3, 1957, concerning the Commission authorization bill for fiscal year 1958, 103 Cong. Rec. A6319-A6320 (Aug. 5, 1957).

> be licensed in order that the persons who would probably act improperly may be controlled. But it is also one of the most effective [means of control], and it is particularly likely to be resorted to where the effort to effectuate policies is made with conviction.[153]

More than a decade later another governmental body, after a survey of federal administrative functions, observed that the "power to license is in effect the power to control the business and commercial life of the community." [154]

In no field of regulation affecting American private industry has the Congress used licensing more extensively to assure governmental control than in that of atomic energy. The major areas of private industrial and research activity permitted under the Atomic Energy Act of 1946 were severely circumscribed by restrictions upon the licensing process. One of these areas—the manufacture or production of any device utilizing fissionable material or atomic energy, or the utilization of such forms of energy—was never exploited. Under the Atomic Energy Act of 1954, expanded private use of atomic energy is governed by licensing requirements which give the President, the Atomic Energy Commission, and even the Joint Committee on Atomic Energy, greater control over industry than is the case in any other area of federally regulated activity.

In enacting the Atomic Energy Act of 1946 [155] and the statute which superseded it in 1954,[156] Congress had the foresight to require that the licensing authority of the Atomic Energy Commission be subject to safeguards of the Federal Administrative Procedure Act. Provisions of that legislation affecting the licensing process clearly were enacted by Congress in 1946 "because of the very severe consequences of the conferring of licensing authority upon administrative agencies" and "to remove the threat of disastrous, arbitrary, and irremediable administrative action." [157]

Under the Administrative Procedure Act, licensing covers "any form

[153] Sen. Doc. No. 8, *supra* note 45 at 14.

of required official permission." [158] Agencies are required to proceed with reasonable dispatch to conclude and decide proceedings on applications for licenses.[159] No license may be withdrawn without the agency's first giving the licensee notice thereof in writing and an opportunity to demonstrate or achieve compliance with all lawful requirements. In business of a continuing nature, no license can expire until timely application for a new license or for a renewal thereof is determined by the agency, except in "cases of willfulness or those in which the public health, interest, or safety requires." In the latter cases, an agency can summarily suspend or revoke a license.[160]

B. Licensing Under Atomic Energy Act of 1946

Licensing under the Atomic Energy Act of 1946 was rigorously curtailed by Congressional policy, even though the Commission was required to carry out a program "directed toward improving the public welfare, increasing the standard of living, [and] strengthening free competition in private enterprise." [161] Particularly restrictive was the direction of the statute for a "program for Government control of the production, ownership, and use of fissionable material to assure the common defense and security and to insure the broadest possible exploitation of the fields." [162] This policy was further effectuated in Section 4(e) of the Atomic Energy Act of 1946,[163] which provided that

[158] *Id.* at 306; see 197, 254. Under Section 2(d), 5 U.S.C.A. §1001(d), licensing constitutes a form of agency "adjudication" and is always the subject of an "order." Under Section 2(e), a license is defined as including "the whole or part of any agency permit, certificate, approval, registration, charter, membership, statutory exemption or other form of permission"; and "licensing" as including "agency process respecting the grant, renewal, denial, revocation, suspension, annulment, withdrawal, limitation amendment, modification, or conditioning of a license." Under Section 2(f), an agency "sanction" "includes the whole or any part of any agency . . . requirement, revocation, or suspension of a license"; and agency "relief" includes "any agency . . . grant of . . . license." Under Section 2(g), an "agency proceeding" includes licensing, and "agency action" includes an agency license.

[159] See Section 6(a), 5 U.S.C.A. §1005(a): ". . . Every agency shall proceed with reasonable dispatch to conclude any matter presented to it except that due regard shall be had for the convenience and necessity of the parties or their representatives. . . ." Although this provision was intended by Congress to assure a speedy decision with respect to matters before any agency, consistent with the public interest in a full and complete record, "The Administrative Procedure Act provides no remedy for failure of agencies to proceed with reasonable dispatch" (Hoover Commission Legal Task Force Report, *supra* note 43 at 183-186).

[160] Section 9(b), 5 U.S.C.A. §1008(b).

[161] Section 1(a), 42 U.S.C. §1801(a)(1946).

[162] Section 1(b)(4), 42 U.S.C. §1801(b)(4)(1946).

[163] 42 U.S.C. §1804(e)(1946).

licenses for the manufacture of production facilities for fissionable material [164] were to be issued "in accordance with such standards and upon such conditions as will restrict the production and distribution of such facilities to effectuate the policies and purposes of this Act."

1. Types of Licenses

Licensing activities of the Atomic Energy Commission under the 1946 act were limited to four major categories. These included licenses (1) for facilities (including important component parts thereof) for the production of fissionable material,[165] (2) for the transfer of source materials,[166] and (3) for the distribution and use of by-product materials (radioisotopes).[167] A fourth licensing activity, never implemented, covered the manufacture or production of any equipment or device utilizing fissionable material or atomic energy.[168]

In controlling facilities for the production of fissionable material, the Commission under the 1946 act issued both specific licenses for domestic and foreign activities and also general licenses for domestic activities.[169] The general licensing device was especially convenient because of the fact that the definition of facilities for the production of fissionable material was broad enough to encompass an extensive list of articles in common use.[170] These included Geiger counters and mass spectrometers and spectrographs. The production and utilization of these articles, together with those of some twenty other devices, were controlled by general licenses [171] subject only to reporting requirements.[172]

The same division of licenses into general and special categories [173] was made with respect to the licensing of source material transfers. This was effected by the use of a detailed list of exempted products [174]

[164] Defined in Section 5(a)(1) generally as "plutonium, [and] uranium enriched in the isotope 235," 42 U.S.C. §1805(a)(1)(1946).

[165] Section 4(e), 42 U.S.C. §1804(e)(1946).

[173] 10 Code Fed. Regs. §40.23.

[174] 10 Code Fed. Regs. §40.60, listing "Schedule I" which covered incandescent mantles, ceramic products, refractories, glass products, photographic supplies, certain rare earth metals, and vacuum tubes, and certain types of thoriated tungsten. Section 40.61, containing "Schedule II" and §40.28 prohibit the use of source material, containing by weight uranium in excess of 0.05%, in the manufacture of ceramic, glass, and photographic products.

and transactions protected by general license.[175] A similar program for general and special licensing was in effect promulgated to regulate the distribution of byproduct material by exempting from the AEC's rules therefor certain categories of items and quantities thereof.[176]

2. Standards and Conditions

It is perhaps fortunate that licensing under the Atomic Energy Act of 1946 did not assume the importance that this function has under current legislation. The statutory standards under which the Atomic Energy Commission exercised its authority under the 1946 legislation were sketchy, if not entirely non-existent from a practical point of view, with the "licensing power . . . left to the virtually uncontrolled discretion of the Commission." [177] Except in the case of authorizations for radioisotope procurement, licensing regulations issued by the agency failed to provide specific standards for licenses and the conduct of licensees.

The tone of the regulations under the 1946 act was, of course, set by the statute itself. Under that act, licenses for the manufacture, production, transfer, or acquisition of any facilities for the production of fissionable material were to "be issued in accordance with such standards and upon such conditions as will restrict the production and distribution of such facilities to effectuate the policies and purposes of this [1946] Act." [178] The standards and conditions with respect to transfers of source materials were only slightly more specific and required that licenses should not impair an adequate supply of source materials or permit "the use of such materials in a manner inconsistent with the national welfare." [179] More exact and readily ascertainable standards and conditions were stated with respect to authorizations for the use of radioisotopes.[180] Licensing of fissionable and source materials was prohibited under the 1946 act "if, in the opinion of the Commission, the issuance

[177] Report of the American Bar Association Special Committee on Atomic Energy to Joint Committee on Atomic Energy 12 (Mimeo Nov. 20, 1953) (hereafter cited as ABA Committee Report).

[178] Section 4(e), 42 U.S.C. §1804(e)(1946).

[179] Section 5(b)(3), 42 U.S.C. §1805(b)(3)(1946).

[180] Section 5(c)(2), 42 U.S.C. §1805(c)(2)(1946), set forth the authorized uses for byproduct materials. Further, authorization was to be denied to "any applicant, who is not equipped to observe or who fails to observe such safety standards to protect health as may be established by the Commission." See 10 Code Fed. Regs. Pt. 30 (repealed).

of a license to such person . . . would be inimical to the common defense and security." [181] A similar vaguely-worded condition was applied to licenses for the manufacture, production, or export of any equipment utilizing fissionable material or atomic energy.[182]

The regulations issued with respect to licenses for facilities for the production of fissionable material [183] and for transfers of source material [184] followed the statute and permitted the Commission to impose "such conditions as it deems appropriate and in accordance with law." Regulatory standards incorporated in the rules were as indefinite as those of the statute itself. They included such terms, capable of varied interpretation, as "assurance of the common defense and security," [185] "assurance of adequate" supplies of the materials or facilities concerned,[186] "prevention of the use of source materials in a manner inconsistent with the national welfare," [187] "preservation of health and safety," [188] "inimical to the common defense and security," [189] and "effectuating the policies and purposes of the Atomic Energy Act of 1946." [190] Since compliance with all regulations of the Commission was a condition of every license and since the Commission reserved the right to change its regulations,[191] there existed no clearly ascertainable standards and conditions with respect to licenses for facilities to produce fissionable materials and to transfer source material.

Only in the case of regulations with respect to authorization for utilization of radioisotopes did the Commission set forth standards and conditions which could be readily ascertained with reasonable cer-

[181] Section 5(d), 42 U.S.C. §1805(d)(1946). The phrase "common defense and security," nowhere explained in the Act, also appeared in Section 1(a), 42 U.S.C. §1801(a) (1946) ("Findings and Declaration") and Section 1(b)(4), 42 U.S.C. §1801(b)(4)(1946)("Purpose of Act").

[182] Section 7(c), 42 U.S.C. §1807(c)(1946).

[183] 10 Code Fed. Regs. §50.21 (repealed).

[184] 10 Code Fed. Regs. §40.21.

[185] 10 Code Fed. Regs. §§40.22(a) and 50.22(a)(repealed).

[186] 10 Code Fed. Regs. §§40.22(b) and 50.22(b)(repealed).

[187] 10 Code Fed. Regs. §§40.22(c) and 50.22(c)(repealed).

[188] 10 Code Fed. Regs. §40.22(d).

[189] 10 Code Fed. Regs. §40.22.

[190] 10 Code Fed. Regs. §50.22(d)(repealed).

[191] 10 Code Fed. Regs. §40.25: "Nothing in this section [on revocation, suspension, and modification of licenses] shall limit the authority of the Commission to issue or amend its regulations in accordance with law." See, to the same effect, §50.32 (repealed). The open-end nature of the licenses issuable under the 1946 Act also arises under the 1954 act; see Section 187 of the latter statute, 42 U.S.C.A. §2237 and 10 Code Fed. Regs. §70.32(b), more fully discussed hereafter.

tainty.[192] Thus, requirements for approval of an authorization for the use of radioisotopes required specified uses for the byproduct material, suitable equipment for health and safety, and suitably trained personnel.

3. Licensing Procedures

Although subject to the requirements of the Federal Administrative Procedure Act, procedures for licensing under the Atomic Energy Act of 1946 [193] were not otherwise defined or marked out by Congress.[194] However, except in the case of appeals from denials or revocations of licenses, licensing procedures complied generally with those required by the Administrative Procedure Act.[195]

Appeals procedure was clearly deficient in the case of licenses for the manufacture of facilities for the production of fissionable material and transfer of byproduct materials. In each case, the only procedure provided was for an applicant to file a "petition" in letter form with the Commission "stating the reasons why the petition should be granted." [196] Although the General Counsel of the Commission at one time held the view that these regulations in effect authorized an intra-agency appeal when desired by an applicant,[197] such a construction depended more upon the practice of the agency itself than upon the actual language of the regulations involved.

[192] 10 Code Fed. Regs. §30.21(a)(1)-(2) (repealed). Special requirements were listed for human uses by institutions (§30.24(a)) and by individual physicians (§30.24(b)), for human use of sealed sources (§30.24(c)), for use in research and development (§30.24(d)), and for processing (§30.24(e)).

[193] Section 14, 42 U.S.C. §1814 (1946).

[194] Thus, Section 4(e), 42 U.S.C. §1804(e)(1946), stated that licenses for the manufacture of facilities for the production of fissionable material "shall be issued in accordance with such procedures as the Commission may by regulation establish." Section 5(b)(3), 42 U.S.C. §1805(b)(3)(1946), was to same effect with respect to licenses for the transfer of source materials. Section 5(c)(2), 42 U.S.C. §1805(c)(2)(1946), covering authorizations for distribution of radioisotopes, contained no provision whatsover for licensing procedures.

[195] See 10 Code Fed. Regs. §§30.30 (repealed), 40.20, and 50.20 (repealed) dealing with license applications; §§30.34 (repealed), 40.25, and 50.32 (repealed) dealing with license revocation, suspension, or modification; and §40.26 dealing with license renewals.

[196] 10 Code Fed. Regs. §§40.51 and 50.61 (repealed).

[197] Answers of Atomic Energy Commission to Questionnaire Submitted by Task Force on Legal Services and Procedure, Commission on Organization of Executive Branch of the Government (1954): "As indicated in §40.51 and 50.61 of the regulations, an appeal may be made by filing a letter with the Commission, stating the reasons for the appeal. If reason therefor appears, the action may be modified by the Licensing Controls Branch. Otherwise the appeal and the related file data are referred to the General Manager for consideration and response to the applicant."

C. Licensing Under Atomic Energy Act of 1954

Licensing under the Atomic Energy Act of 1954 is the means whereby the government not only regulates the atomic energy industry but also effects the development of that industry in accordance with the aims of that legislation. "[A] comparative newcomer among the Commission's many other functions," licensing constitutes a fairly "narrow but highly significant area of the Commission's overall responsibilities for atomic energy development" which is "closely linked with the AEC's nonregulatory responsibilities." [198]

The overriding national defense policy of the Congress in enacting the 1946 Act set the tone of licensing thereunder. In enacting the Atomic Energy Act of 1954, however, Congress manifested a compelling intention to take advantage of the potentialities of private industry in the development of atomic energy for peaceful uses. Accordingly, "the development, use, and control of atomic energy . . . to [among other things] strengthen free competition in private enterprise," [199] as provided in the 1954 act, should and must guide the Commission in enacting regulations to implement the legislation. Further, Congress intended that Commission programs for assistance to research and development and the "dissemination of unclassified scientific and technical information" should "encourage scientific and industrial progress." [200] Indeed, one of the specific purposes of the present statute, clearly designed to set the administrative tone of the licensing function thereunder, is the stated policy "to encourage widespread participation in the development and utilization of atomic energy for peaceful purposes to the maximum extent consistent with the common defense and security and with the health and safety of the public." [201]

Licensing under the Atomic Energy Act of 1954 is subject to two controlling factors that did not exist under the earlier legislation. First, the Commission acts "in the dual capacity of encouraging as well as regulating private activity," with the result that "considerations of Government promotion and assistance were more closely interrelated with those of regulation than is the case in most other regulatory agencies." [202] Second, the Joint Congressional Committee on Atomic Energy acts, under a 1957 amendment to Section 261 of the 1954 stat-

[198] Joint Committee Staff Study, *supra* note 3 at 2-3.
[199] Section 1b, 42 U.S.C.A. §2011(b).
[200] Section 3a and b, 42 U.S.C.A. §2013(a) and (b).

ute,[203] in a reviewing capacity with respect to all major licenses where federal government assistance in any form is involved. These two factors vitally affect the development of private atomic enterprise under the 1954 act, as amended.

The Atomic Energy Act of 1954 establishes a complex system of integrated licensing controls. Thus, where a public utility or research institution desires to build and operate on atomic reactor, it must obtain (1) a construction permit to build the reactor; (2) a facility license to operate the reactor; (3) depending on the reactor design, a license to acquire, possess, and use source material; (4) a license to possess and use special nuclear material; and (5) a license for each person operating the reactor.

Several statutory features promote the integration of licensing functions. For example, the licensing provisions of the 1954 act are, for the most part, contained in a single chapter of the statute.[204] An applicant for a so-called "commercial" [205] or "non-commercial" [206] license for a facility utilizing or producing special nuclear material is encouraged to develop the information which will be required by the Commission by prior consultation with the agency and to submit its application for each type of license required in connection with the operating permit, insofar as possible, at the same time.[207] Further, Section 161h of the present statute authorizes the Commission to

> . . . consider in a single application one or more of the activities for which a license is required by this Act, [and] combine in a single license one or more of such activities. . . .[208]

The licensing system now administered by the Atomic Energy Commission requires the following types of authorizations before a private person or business can act:

> 1. *Special Nuclear Material*—License to receive, possess, use, and transfer special nuclear material, as provided in Sections 53 and 57a(1)-(2): for the conduct of research and development activities under Section 31; for use in conduct of research and development activity or in medical therapy, under

[205] Under section 103, 42 U.S.C.A. §2133.

[206] Under section 104, 42 U.S.C.A. §2134.

[207] Joint Committee Staff Study, *supra* note 3 at 11-15 and 101-105; Upton, "Licensing and Services to Licensees and Others Under the Atomic Energy Act of 1954," 24 Geo. Wash. L. Rev. 488, 489 (1956).

[208] 42 U.S.C.A. §2201(h).

non-commercial licenses pursuant to Section 104; and for use under commercial licenses pursuant to Section 103.

2. *Source Material*—License to transfer, deliver, receive, possess, import, or export source materials after removal from the place of deposit in nature, as provided in Sections 62 and 63: for use in the conduct of research and development activities under Section 31; for use in research and development activities or in medical therapy under non-commercial licenses pursuant to Section 104; for use under commercial licenses pursuant to Section 103; or for "any other use approved by the Commission as an aid to science or industry."

3. *Byproduct Material*—License to transfer, manufacture, produce, acquire, own, possess, import, or export byproduct material, as provided in Sections 81 and 82, for use in research and development, medical therapy, industrial uses, agricultural uses, and "such other useful applications as may be developed."

4. *Activity Abroad*—Authorization for activity involving the production of special nuclear material outside the United States, as provided in Section 57a(3)(B), where United States has no agreement for cooperation with a foreign country pursuant to Sections 54 and 123.

5. *Commercial Utilization or Production Facility*—License for commercial utilization or production facility using special nuclear material as provided in Section 103.

6. *Non-Commercial Utilization or Production Facility*—License for non-commercial utilization or production facility using special nuclear material as provided in Section 104 for medical therapy, research and development activities for industrial or commercial purposes, and research and development activities for non-commercial purposes.

7. *Construction Permit*—Construction permit for construction prior to licensing, or alteration after licensing, of utilization or production facility licensed under Sections 103 and 104, as provided in Section 185.

8. *Operator's License*—License to operate, as provided in Section 107, various classes of utilization or production activities otherwise licensed under Sections 103 and 104.

9. *Access Permit*—License authorizing access, subject to personnel security clearances, to confidential or secret Restricted Data, as developed by Commission regulation under Sections 3b, 141, 145, and 161i.

With respect to the domestic distribution of special nuclear material,[209] the transfer of source material in interstate or foreign com-

[209] Section 53b, 42 U.S.C.A. §2073(b); see 10 Code Fed. Regs. §§70.11-.14.

merce,[210] the domestic distribution of byproduct material,[211] and the domestic production or use of component parts of utilization and production facilities,[212] the Commission is authorized to issue either a special or general license. The authority of the Commission in this respect is considerably expanded under the Atomic Energy Act of 1954, as compared with the situation under the 1946 statute.

1. Standards and Conditions

The statutory standards established by the Atomic Energy Act of 1954 for Commission licensing, and also the conditions and terms imposed on licensees under Commission regulations, constitute only a minor improvement over those of the 1946 legislation and rules issued thereunder. For example, the completely vague and meaningless standard of "national welfare," so commonly used in the Atomic Energy Act of 1946, appears infrequently in the 1954 legislation [213] and survives in the present regulations only as a licensing condition for source materials.[214] However, the Atomic Energy Act of 1954, particularly with respect to licensing, provides "only the vaguest 'standards' to guide the hand of the Commission." [215]

The indefinite standard of "common defense and security" [216] appears

[210] Sections 62 and 63b, 42 U.S.C.A. §§2092 and 2093(b); see 10 Code Fed. Regs. §§40.11, 40.23, 40.60, and 40.62.

[211] Section 81, 42 U.S.C.A. §2111; see 10 Code Fed. Regs. §§30.71-.72.

[212] Section 109(a), 42 U.S.C.A. §2139(a).

[213] Under Section 1a, 42 U.S.A. §2011(a) ("Declaration"), it is "the policy of the United States that . . . the development, use, and control of atomic energy shall be directed so as to make the maximum contribution to the general welfare. . . ." Under Section 3c, 42 U.S.C.A. §2013(c), the Commission is directed to carry out, among others, "a program for Government control of the possession, use, and production of atomic energy and special nuclear material so directed as to make the maximum contribution to . . . the national welfare." See also Section 2g, 42 U.S.C.A. §2012(g), concerning the use of funds "to promote general welfare," and Section 2i, 42 U.S.C.A. §2012i, concerning government indemnity in the interest of the general welfare.

[214] 10 Code Fed. Regs. §§40.1 and 40.22(c).

[215] Stason, Workshops on Legal Problems of Atomic Energy 4 (1956) (hereafter cited as Atomic Energy Workshops); see "Report of Workshop III" at 58-59. See also statement of Rep. Holifield concerning Section 53 of the 1954 act with respect to licenses for special nuclear material, 1957 Congressional Review Hearing, *supra* note 7 at 16: "Under Section 53 . . . of the act, you [the AEC] have wide latitude to make administrative judgments in the granting of a license. You can, in effect, include in this granting of the license every kind of a term and condition that you want. . . ."

[216] This is nowhere defined in the new act except in Section 11g, 42 U.S.C.A. §2014(g), which merely states, "The term 'common defense and security' means the common defense and security of the United States."

frequently throughout the present statute [217] and the regulations issued thereunder.[218] Further, under the Atomic Energy Act of 1954, any license may contain "such terms and conditions as the commission may, by rule or regulation, prescribe to effectuate the provisions of this Act." [219] This language confers on the Commission almost unlimited discretionary authority over licenses in the atomic field. This broad authority also is written into the regulations by the provision that a license shall be issued "in such form and upon such conditions as it [the Commission] deems appropriate and in accordance with law." [220]

Of even more doubtful regulatory justification is the statutory [221] and regulatory [222] provision under the 1954 act that licenses may be, *ipso facto,* modified or amended by subsequent changes in legislation or regulations.[223] This is particularly true in view of the fact that a hearing on

[217] Section 1a, 42 U.S.C.A. §2011(a) ("Declaration"); Section 2a, b, d, e, g, and i, 42 U.S.C.A. §2012(a), (b), (d), (e), (g), and (i) ("Findings"); Section 3c, d, and e, 42 U.S.C.A. §2013(c), (d), and (e) ("Purpose"); Sections 53b and 57b(2), 42 U.S.C.A. §§2073(b) and 2077(b)(2) ("Domestic Distribution of Special Nuclear Material" and "Prohibition"); Sections 63b and 69, 42 U.S.C.A. §§2093(b) and 2099 ("Domestic Distribution of Source Material" and "Prohibition"); Section 81, 42 U.S.C.A. §2111 ("Domestic Distribution of Byproduct Material"); Sections 103b and d and 104a, c, and d, 42 U.S.C.A. §§2133(b) and (d) and 2134(a), (c), (d) ("Atomic Energy Licenses"); and Section 182a, 42 U.S.C.A. §2232(a) (general licensing standards).

[218] 10 Code Fed. Regs. §§30.31b(1) and 30.33(c) ("Licensing of Byproduct Material"); §40.22(a) ("Control of Source Material"); §70. 32(b)(1) ("Special Nuclear Material"); §§50.12 and 50.40(c) ("Licensing of Production and Utilization Facilities").

[219] Section 183, 42 U.S.C.A. §2233; see, to the same effect, Section 103a, 42 U.S.C.A. §2133(a), with respect to commercial licenses.

[220] 10 Code Fed. Regs. §40.21; see, to the same effect, §§30.31(b), 50.50, 55.30, and 70.31(a).

[221] Sections 183d and 187, 42 U.S.C.A. §§2233(d) and 2237. "Section 183d would seem to imply that while licenses are subject to the hazard of a change in the act, they are not subject to the hazard of a change in regulations without a change in the act"; but "section 187 indicates that license terms are subject to modification by subsequent regulations" and to revocation for failure to observe such subsequent regulations, Upton, *supra* note 207 at 496, 497.

[222] 10 Code Fed. Regs. §§30.32(a), 40.25, 50.54(h), 55.40(a), and 70.61(a).

[223] Section 170a of the 1954 act, 42 U.S.C.A. §2210(a), added by Congress in 1957, requires that, as a condition of their licenses, certain classes of licensees "have and maintain financial protection" in the form of liability insurance or otherwise, as determined by the Commission under Section 170b, 42 U.S.C.A. §2210(b). It is a further condition of such licenses that the licensee enter into an indemnity agreement with the AEC, Section 170c, 42 U.S.C.A. §2210(c). With respect to these conditions imposed upon persons licensed by the Commission prior to enactment of the 1957 legislation, the Joint Committee has stated, H.R. Rep. No. 435, 85th Cong., 1st Sess. 21 (1957): "In view of the provisions in section 187 of the Atomic Energy Act of 1954, making

changes in the licensing regulations usually is held only upon the request of any licensee affected thereby.[224]

2. Types of Licenses

a. Use and Production of Special Nuclear Material

Under the Atomic Energy Act of 1954, the United States retains title to all special nuclear material.[225] The Atomic Energy Commission is authorized to distribute such material at a reasonable charge to persons licensed to possess it. The statute also requires that the Commission purchase from licensees at a fair price special nuclear material produced by licensees in the course of their operations.

Section 31 of the Atomic Energy Act of 1954 [226] authorizes assistance by the Commission to private or public institutions or persons for research and development activities relating to nuclear processes, the theory and production of atomic energy, utilization of special nuclear material, and the protection of health and the promotion of safety. Under Section 104,[227] licenses are authorized for medical therapy and for research and development for industrial or commercial purposes. Where special nuclear material is licensed by the Commission for activities authorized under Sections 31 and 104, the Commission may, but is not required to, make a reasonable charge for the use of such material, the charge to be based upon established criteria, "considering, among other things, whether the licensee is a nonprofit or eleemosynary institution and the purposes for which the special nuclear material will be used." [228]

On the other hand, the Commission is required to make a reasonable charge for special nuclear material for use by commercial licensees [229] under Section 103 of the Atomic Energy Act of 1954.[230] Further, with respect to charges for such material to be used by both Section 104 non-

---

all licenses subject to later amendment of the act, there is no need to incorporate language here amending the licenses where this financial protection may be required. . . ." For a discussion of the insurance and indemnity provisions of the 1954 act, see *infra*, text at note 495.

[224] Section 189b, 42 U.S.C.A. §2239(b).

[225] Sections 2b and 52, 42 U.S.C.A. §§2012(b) and 2072.

[226] 42 U.S.C.A. §2051.

[227] 42 U.S.C.A. §2134.

[228] Section 53b(1)-(2) and c, U.S.C.A. §2073(b)(1)-(2) and (c).

[229] Section 53b(3) and c, 42 U.S.C.A. §2073(b)(3) and (c).

[230] 42 U.S.C.A. §2133.

commercial licensees and Section 103 commercial licensees, the Commission must take into consideration

> (1) the use to be made of the special nuclear material;
> (2) the extent to which the use of the special nuclear material will advance the development of the peaceful uses of atomic energy; [and]
> (3) the energy value of the special nuclear material in the particular use for which the license is issued. . . .[231]

Where a Section 103 commercial license is involved, the Commission must, "insofar as practicable, make uniform, nondiscriminatory charges" for special nuclear material used in connection with such a license.[232] In addition,

> . . . with respect to special nuclear material consumed in a facility licensed pursuant to section 103, the Commission shall make a further charge based on the cost to the Commission, as estimated by the Commission, or the average fair price paid for the production of such special nuclear material as determined by Section 56, whichever is lower.[233]

Section 56 of the Atomic Energy Act of 1954 deals with the "fair price" to be paid by the Commission for special nuclear material produced in licensed private facilities.[234] Such a price must be applicable to all producers of the same type of material and must reflect the value of the material for its intended use by the United States, and the Commission "may give such weight to the actual cost of producing that material as the Commission finds to be equitable." Further, Section 56 provides that

> . . . the Commission may establish guaranteed fair prices for all special nuclear material delivered to the Commission for such period of time as it may deem necessary but not to exceed seven years.

By the middle of 1957 the Commission had made available to private industry for domestic use 50,000 kilograms of contained uranium 235.[235]

[231] Section 53d(1)-(3), 42 U.S.C.A. §2073(d)(1)-(3).
[232] Section 53d(4), 42 U.S.C.A. §2073(d)(4).
[233] Section 53d(5), 42 U.S.C.A. §2073(d)(5).
[234] 42 U.S.C.A. §2076.
[235] Twenty thousand kilograms were made available Feb. 22, 1956, and an additional 30,000 kilograms July 3, 1957. At the same time, equal amounts were released for use by cooperating foreign nations. See AEC, Twenty-third Semi-Annual Report, 19, 23 (1958); AEC Twentieth Semi-Annual Report vii-ix (1956); Atomic Energy Facts 3 (GPO 1957).

Subsequently, the Commission by regulation established guaranteed fair prices for special nuclear material lawfully produced under license through June 30, 1963.[236] The agency also has sought to waive the use charge for special nuclear material in connection with certain projects under the civilian reactor program.[237] In addition, the Commission, at a fixed unit charge to the licensee, recovers in Commission-owned facilities source and special nuclear materials from spent reactor fuel or blanket materials of licensees under Sections 103 and 104 of the Atomic Energy Act of 1954.[238]

Opponents of the 1954 legislation have attacked these sale and purchase provisions, as administered by the Commission, as a "built-in subsidy feature" to industry.[239] As a result of this criticism, a new Section 58 was added to the statute by Congress in July 1957, providing:

> Before the Commission establishes any fair price or guaranteed fair price period in accordance with the provisions of Section 56, or establishes any criteria for the waiver of any charge for the use of special nuclear material licensed or distributed under section 53, the proposed fair price, guaranteed fair price period or criteria for the waiver of such charge shall be submitted to the Joint Committee. . . .[240]

The Commission-proposed price must lie before the Joint Committee for a period of forty-five days prior to its effective date. This provision was aimed directly at curbing the future exercise of Commission discre-

[236] 21 Fed. Reg. 1421 (Mar. 3, 1956), AEC Press Rel. No. 930 (Nov. 18, 1956), 22 Fed. Reg. 3985 (June 6, 1957), and 22 Fed. Reg. 10965 (Dec. 28, 1957).

[237] Under the first, second, and third round invitations; see statement of AEC General Manager Fields, 1957 Authorizing Legislation Hearings, *supra* note 7 at 153-154. In its request for authorization of funds for fiscal year 1958, the AEC asked authorization for a total of $23,115,000 for waiver of fuel-use charges under the three rounds, but Congress authorized only $20,000,000 to be used under the third round invitation (Sen. Rep. No. 791, *supra* note 23 at 39). Waiver of use charges aggregating $1,325,000 under the first round invitation and $1,790,000 under that of the second round, as requested by the Commission, were disallowed by Congress.

[238] Section 161m(1), 42 U.S.C.A. §2201(m)(1); 22 Fed. Reg. 1591 (Mar. 12, 1957).

[239] H.R. Rep. No. 2181, *supra* note 5 at 130-131; Adams, "Atomic Energy: the Congressional Abandonment of Competition," 55 Col. L. Rev. 158, 168-169 (1955); Rep. Holifield, 1957 Authorizing Legislation Hearings, *supra* note 7 at 183; Rep. Cannon, 103 Cong. Rec. 5192 (1957). In his report on a review of AEC contract No. AT(30-3)-22 with Yankee Atomic Electric Co. executed in Nov. 1956, the Comptroller General charged that the Commission's announced policy of waiving fuel-use charges up to an agreed-upon amount of money was not fully complied with in the Yankee contract "since it provides that AEC will waive its use charge, without limitation, for all special nuclear material used during the contract period" (1957 Section 202 Hearings, *supra* note 7 at 758).

[240] Pub. L. 85-79, 85th Cong., 1st Sess. (1957), 42 U.S.C.A. §2078.

tion with respect to prices for special nuclear material used in the civilian reactor program.[241]

As a matter of law, ownership of special nuclear material by the United States is not necessary to adequate regulation of the atomic energy industry.[242] As long as the Commission remains the major producer of special nuclear material and as long as the number of private users of such material for energy producing purposes is limited, the need for private ownership is not particularly pressing. However, as the number of private reactors increases, the availability of an assured source of enriched reactor fuel at reasonably foreseeable prices will become a requisite to financial and operational stability of the industry. The more the industry is subject to normal competitive market conditions, the healthier it will be, and the greater will be the benefit to the public welfare from a thriving private atomic energy production base.

The Commission appears conscious of these factors. As it has emphasized to the Joint Committee:

> The AEC policy on pricing materials and services which it makes available, and on establishing fair prices which it will pay for special nuclear materials produced in licensed facilities is recognized as being of major importance to the growth and development of the industry, both here and abroad.
>
> The influence of these prices on the industry depends not only upon their actual level, but almost equally upon their stability, for without some assurance that these prices will remain reasonably stable, industry will be unable to make the long-range plans essential to the procurement of the financing necessary to proceed with its projects.[243]

At the present time, industry has no guarantee that it can obtain a reasonably assured quantity of special nuclear material at prices which will

[241] H.R. Rep. No. 571, 85th Cong., 1st Sess. 6 (1957): "It is intended that the provisions of section 58 shall apply to changes by the Commission to any presently established fair price, guaranteed fair price period, or criteria for the waiver of charge period, as well as to the establishment of such matters in the future."

[242] Estep, "Federal Control of Health and Safety Standards in Peacetime Private Atomic Energy Activities," 52 Mich. L. Rev. 333 (1954); see "Report of Workshop III," Atomic Energy Workshops, *supra* note 215 at 56-57: ". . . [A]uthority for adequate regulation of such industry exists under the several clauses of the Constitution, including, for example, the commerce power and the war power and established regulatory powers thereunder."

[243] 1957 Section 202 Hearings, *supra* note 7 at 107. See 1958 Section 202 Hearings, *supra* note 32 at 62, 67, and 127 (". . . the Government's price for fissionable material and associated processing operations is potentially one of the most significant factors that determine the course and speed of power reactor development.").

be set by supply and demand rather than by administrative or congressional fiat, possibly based on political, not economic, considerations.[244]

The McKinney Panel has urged that Congress re-examine the policy of federal ownership of special nuclear material. In the meantime, problems created by such ownership confront the industry.

> Federal ownership does create some problems which may tend to grow with the growth of a private atomic industry. The most critical of these is the role of the Federal Government in the pricing of special nuclear materials, hence its role in the economics of private licensed operations. . . .
>
> In most prospective near-term commercial atomic power reactors, the "buy back" price could make or break the economies of the plant. By law, the Commission can only guarantee "buy back" prices for 7 years, while plants able to produce such material must run for 25 to 40 years to amortize their costs. Thus, private investors have no way of forecasting when they may suddenly be thrown into a losing operation as a result of changes in future Commission-guaranteed prices. It is true that all licensees receive the same prices, but all licensees will not have the same types of plants and may have differing economic break-even points.
>
> During the period when there are relatively few atomic power-plants in operation, there are advantages to the principle of Federal ownership [*i. e.*, assured buyer of byproduct materials and stability of prices]. . . .
>
> As the number of atomic power-plants increases, a market for the byproduct plutonium or uranium 233 for use as reactor

[244] 10 Code Fed. Regs. §50.60(a); see Upton, *supra* note 207 at 493-94: "How binding is this [Commission] allocation? The difficulty is that Section 161m of the act, which permits the Commission to make long-term agreements to sell source material, expressly denies similar authority for the distribution of special nuclear material. Thus, one could argue that the Commission's assurances would be meaningless and that the licensee would not have any legal remedy if the Commission failed to honor its assurances." See also statement of AEC to Joint Committee, 1957 Section 202 Hearings, *supra* note 7 at 107: "The Commission's prices [for enriched uranium] . . . are not guaranteed, but . . . it is the intention of the Commission to maintain the price schedule on as stable a basis as is possible. . . ." On the other hand, Section 56, 42 U.S.C.A. §2076, authorizes Commission-guaranteed fair prices for special nuclear material produced in private facilities for up to 7 years, which presumably have the binding force of a contract between the government and private parties acting in reliance upon the guarantee, provided Joint Committee approval of such guarantee has been given under Section 58, 42 U.S.C.A. §2078. Under Section 161m(2), 42 U.S.C.A. §2201(m)(2), the Commission may sell or lease source or byproduct material to Section 103 or 104 licensees, subject to cancellation by the licensee; this section specifically excludes special nuclear material from the provisions thereof. Special nuclear material may be recaptured by the AEC during a war or national emergency declared by Congress (Section 108, 42 U.S.C. §2138).

> fuel will undoubtedly develop, thus a degree of inherent market stabilization will come into existence. . . . When that time does arrive, the policy of Federal ownership should be re-examined.[245]

b. Use of Source and Byproduct Materials

The transfer, receipt, delivery, or possession of source materials [246] and byproduct materials [247] are subject to Commission licensing.[248] Such materials may be sold, leased, or otherwise made available by the Commission to its licensees [249] at reasonable charges and upon written criteria established by the Commission,[250] without, however, the necessity of obtaining Joint Committee approval as in the case of special nuclear material.[251]

Licenses for the transfer, delivery, or possession of source and byproduct material are issued pursuant to regulations which establish general conditions with respect to the common defense and security, the preservation of health and safety, the furnishing of reports, and the keeping of records.[252] Prior to May 1957, the Atomic Energy Commission did not require immediate reporting of incidents involving possible radiation hazards from the use of byproduct materials. This

[245] McKinney Panel Report, *supra* note 10 at Vol. 1, p. 131; see also 13 and 134.

[246] Defined as uranium, thorium, and their refined counterparts after removal from the place of deposit in nature (Section 11x, 42 U.S.C.A. §2014(x), formerly Section 11s, 42 U.S.C.A. §2014(s)).

[247] Defined as "any radioactive material (except special nuclear material) yielded in or made radioactive by exposure to the radiation incident to the process of producing or utilizing special nuclear material" (Section 11e, 42 U.S.C.A. §2014(e)).

[248] Section 62 (source material) and Section 81 (byproduct material), 42 U.S.C.A. §§2092, 2111.

[249] Section 161m(2), 42 U.S.C.A. §2201(m)(2).

[250] Section 63c (source material) and Section 81 (byproduct material), 42 U.S.C.A. §§2093(c), 2111.

[251] Section 58, 42 U.S.C.A. §2078.

[252] 10 Code Fed. Regs. §§40.21-.22 and 40.30 (source material) and 30.23-.24, 30.31(b)-.32, and 30.41-.43 (byproduct material). As of the end of 1957, the AEC had issued 1,200 licenses to use radioisotopes for industrial purposes to about 1,667 industrial organizations, AEC, Twenty-third Semi-Annual Report 25 (1958). In addition, 7 commercial firms have received licenses to dispose of low-level radioactive byproduct and source material wastes (*id.* at 151). On March 8, 1958, the AEC for the first time gave notice of its intention to issue a byproduct and source material license to provide radioactive waste disposal service, 23 Fed. Reg. 1663, BNA, Atomic Industry Reporter 4:88. As of March 1958, the AEC had denied 4 applications for licenses for source materials and 46 applications for licenses for byproduct materials, while 21 applications of the latter type were withdrawn, 1958 Section 202 Hearings, *supra* note 32 at 91.

serious omission in the agency's regulations was corrected by amendment to the rules [253] governing licensees of such materials as the result of an accident reported to the Commission more than a month after its occurrence.[254] For both source and byproduct material, the Commission has exempted certain types of uses from the requirements of a specific license and provided instead a general license in such situations.[255]

c. Operators

Although its statutory authority with respect to operators' licenses is practically unfettered,[256] the Commission has exercised restraint in restricting to the minimum the classes of persons required to obtain licenses.[257] Licenses for individual operators of utilization and production facilities have been generally controlled by reasonable conditions of health and proficiency.[258]

[253] 10 Code Fed. Regs. §20.403, 22 Fed. Reg. 3389 (May 14, 1957). This regulation requires that (1) each byproduct material licensee "immediately" notify the nearest AEC Operations Office by telephone and telegraph "of any incident involving licensed material possessed by him and which may have caused or threatens to cause" serious exposure to individuals and the suspension of work in the facility involved for one week or more; (2) each such licensee notify the AEC within 24 hours of any incident involving minor exposure to individuals and the suspension of work in the facility involved for less than one week; and (3) each such licensee submit to the AEC a written report of any of the above types of incidents within 30 days thereafter. At the time these additions to the regulations affecting byproduct material licenses were issued, the Commission also added a regulation requiring such licensees to report "immediately" any theft or loss of licensed material, 10 Code Fed. Regs. §20.402.

[254] This involved Byproduct Material License Nos. 31-246-1 and 31-246-2 issued to M. W. Kellogg Company, *infra* note 454. The incident involving byproduct material occurred on March 13, 1957, but was not reported to the Commission until April 19, 1957, acording to the AEC General Manager (BNA, Atomic Industry Reporter 265:206).

[255] 10 Code Fed. Regs. §§40.23, 40.60, and 40.62 (source material) and 30.20-.21 and 30.71-.72 (byproduct material). On June 27, 1958, the AEC announced that depleted uranium (containing less than .007 percent by weight of uranium 235) would be sold by the Commission on an unclassified basis to domestic buyers for such goods as ceramics, glass products, coloring agents, and photographic supplies; such sales and transfers of the material involved would continue to be subject to the Commission's licensing procedures; AEC Press Rel. No. A-158.

[256] Section 107, 42 U.S.C.A. §2137.

[257] For example, licensing is not required of persons who may manipulate controls but who do so in the presence and under the direction of a licensed operator. As of the end of 1957, only 148 operators' licenses had been issued, AEC, Twenty-third Semi-Annual Report 195-199 (1958); see BNA, Atomic Industry Reporter 227:851-857. As of March 1958, only one application for an operator's license had been denied by the AEC; 1958 Section 202 Hearings, *supra* note 32 at 91.

[258] 10 Code Fed. Regs., Pt. 55, particularly §55.11.

d. Foreign Activity, Imports, and Exports

The Atomic Energy Act of 1954 established several categories of regulated activity concerning the export, import, or use abroad of atomic materials or of atomic information. These activities are controlled by the requirement of a license.

Section 62 of the present legislation [259] requires a license for the import into, or export from, the United States of any source material. Section 82c contains a similar requirement with respect to byproduct material.[260] The export or import of special nuclear material by private individual is, of course, impossible under the 1954 act, since title to such material is vested in the United States government.[261]

Persons under the jurisdiction of the United States are prohibited from directly or indirectly engaging "in the production of any special nuclear material outside of the United States" except in two circumstances.[262] In the first circumstance, such activity is authorized where carried on pursuant to an agreement for cooperation between the United States and a foreign country,[263] which requires the approval of the Atomic Energy Commission, the Department of Defense, the President, and the Joint Committee.[264] In the second circumstance, the activity may be authorized by the Commission if it determines that "such activity will not be inimical to the interest of the United States." As an implementation of this authority, licenses are required by the Commission for private concerns and persons to engage in certain unclassified activities in foreign atomic energy programs, outside of the scope of agreements for cooperation.[265]

[259] 42 U.S.C.A. §2092.

[260] 42 U.S.C.A. §2112(c); see 10 Code Fed. Regs. §30.33.

[261] Section 52, 42 U.S.C.A. §2072.

[262] Section 57a(3), 42 U.S.C.A. §2077(a)(3).

[263] Section 123, 42 U.S.C.A. §2153; see also Section 144, 42 U.S.C.A. §2164.

[264] Thirty-nine such agreements with 37 countries were in effect at the end of 1957. AEC, Twenty-third Semi-Annual Report 195-199 (1958); see BNA, Atomic Industry Reporter 287:203. Once such an agreement is reached, the Commission issues an authorization letter to the private concern or individual to act under the agreement; see AEC authorization letter to Westinghouse Electric Corporation dated April 2, 1956, under an agreement with Belgium; BNA, Atomic Industry Reporter 287:401.

[265] 10 Code Fed. Regs., Pt. 110. Section 110.7(a) of the regulations states the determination by the Commission that "any activity which . . . (1) Constitutes directly or indirectly engaging in the production of special nuclear material in any foreign country [other than countries or areas within the Soviet or Communist Chinese bloc] . . . ; and (2) Does not involve the communication of Restricted Data or other classified defense information; and (3) Is not in violation of other provisions of law . . . will not be inimical to the interests of the United States and is authorized by the

The principal difficulty which arises in the international field derives from the fact that the Atomic Energy Commission is not the only federal regulatory body concerned with exports and imports. The Commission is a member of the Advisory Committee on Export Policy created by the Secretary of Commerce in 1950[266] to administer the Export Control Act of 1949.[267] This Committee advises the Secretary of Commerce with respect to "export measures required from the standpoint of national security, foreign policy, and short supply," which measures are administered under Department of Commerce regulations. Under this system, import certificates are required from the Department for source materials or for facilities for the production or utilization of special nuclear material.[268] Export licenses issued by the Department of Commerce also are required for components of facilities for the production or utilization of special nuclear material,[269] isotopes for which procurement authorization previously has been obtained from the Atomic Energy Commission,[270] unclassified technical data,[271] and certain types of unpublished technical data.[272] Validated licenses are required for the export of certain metals such as beryllium and boron[273] to all foreign countries except Canada.[274] Special licensing restrictions apply to the exportation of certain materials to the Soviet and Chinese Communist bloc.[275]

Although diffuse exercise of federal regulatory power by different agencies of the government is ordinarily objectionable, over-all control of exports and imports by the Department of Commerce appears justified in view of the aspects of foreign policy involved. The burden imposed on the private or business interest by having to deal with two

---

Atomic Energy Commission." Prior to the promulgation of Part 110 in 21 Fed. Reg. 418 (Jan. 20, 1956), the Commission issued a notice of Commission policy identical with Section 110.7(a) of the regulations, 20 Fed. Reg. 7399 (Oct. 5, 1955).

[275] So-called "R" commodities, such as naphthenates of metals, for which no license is required for export to countries outside this bloc, 15 Code Fed. Regs. §§371.3(a)(2) and 399.1(f).

different agencies—that department and the Atomic Energy Commission—is, to a certain extent, outweighed by the need for centralized control of strategic exports and imports.

e. Access Permits

To make "available to private enterprise classified scientific and technical information relating to the civilian uses of atomic energy" under the Atomic Energy Act of 1954,[276] the Atomic Energy Commission in 1955 instituted its information access permit program. No such program existed under the Atomic Energy Act of 1946, although that statute stated the policy, never implemented, that

> . . . the dissemination of scientific and technical information relating to atomic energy should be permitted and encouraged so as to provide that free interchange of ideas and criticism which is essential to scientific progress.[277]

The Atomic Energy Act of 1954 sought to raise, consistent with national security, the paper curtain imposed by the earlier statute. Congress therefore laid down the policy for the Commission that

> The dissemination of scientific and technical information relating to atomic energy should be permitted and encouraged so as to provide that free interchange of ideas and criticism which is essential to scientific and industrial progress and public understanding and to enlarge the fund of technical information.[278]

The dissemination of information under atomic energy legislation is complicated by the existence of a special category of information created under the 1946 statute, Restricted Data.[279] Such information is defined in the Atomic Energy Act of 1954 as

> . . . all data concerning (1) design, manufacture, or utilization of atomic weapons; (2) the production of special nuclear

[276] AEC Statement to Joint Committee, 1957 Section 202 Hearings, *supra* note 7 at 92; see AEC, Twenty-third Semi-Annual Report 165-66 (1958).

[277] Section 10a(2), 42 U.S.C.A. §1210(a)(2)(1946); see, to the same effect, Section 1(b)(2), 42 U.S.C.A. §1801(b)(2)(1946).

[278] Section 141 b, 42 U.S.C.A. §2161(b); see, to the same effect, Section 3b, 42 U.S.C.A. §2013(b), authorizing the Commission to engage in "a program for the dissemination of unclassified scientific and technical information and for the control, dissemination, and declassification of Restricted Data, subject to appropriate safeguards, so as to encourage scientific and industrial progress." Section 142, 42 U.S.C.A. §2162, provides for classification and declassification procedures. Under Section 146b, 42 U.S.C.A. §2166(b), "[t]he Commission shall have no power to control or restrict the dissemination of information other than as granted by this or any other law."

[279] Section 10(b)(1), 42 U.S.C.A. §1810(b)(1)(1946). This definition does not substantially differ from that under the 1954 legislation.

material; or (3) the use of special nuclear material in the production of energy. . . .[280]

Persons employed by private concerns in connection with Commission contracts or commercial or non-commercial licenses under Sections 103 and 104 of the 1954 act must receive permission from the Commission, after investigation, to have access to Restricted Data.[281] Since administration of an atomic energy license or operation of an atomic energy reactor pursuant to license will in all cases require the use of such data, the access permit is an absolute necessity for the private concern involved.[282]

Access permits are issued by the Commission for periods of two years for three separate categories of Restricted Data. These are (1) an "L" clearance for Confidential Restricted Data, (2) a "Q" clearance for Secret or Top Secret Restricted Data in areas outside the controlled thermonuclear field, and (3) a special "Q" clearance for access to information involving the controlled fusion process. For an "L" clearance, the applicant must demonstrate to the Commission that he has "potential use" for the information desired.[283] For a "Q" clearance involving access to Secret or Top Secret Restricted Data not related to the controlled thermonuclear field, the applicant must demonstrate to the agency a specific need for the information desired.[284] A "Q" clearance for access

[280] Section 11w, 42 U.S.C.A. §2014(w) (formerly Section 11r).

[281] Under Section 161i(1) of the 1954 Act, 42 U.S.C.A. §2201(i)(1), the Commission is authorized to issue regulations necessary "to protect Restricted Data received by any person in connection with any activity authorized pursuant to this Act." Section 145a, 42 U.S.C.A. §2165(a), further provides that "[n]o arrangement shall be made under section 31, no contract shall be made or continued in effect under section 41, and no license shall be issued under section 103 or 104, unless the person with whom such arrangement is made, the contractor or prospective contractor, or the prospective licensee agrees in writing not to permit any individual to have access to Restricted Data until the Civil Service Commission shall have made an investigation and report to the Commission on the character, associations, and loyalty of such individual, and the Commission shall have determined that permitting such person to have access to Restricted Data will not endanger the common defense and security." Similar clearance is required for Commission employees, Section 145b, 42 U.S.C.A. §2165(b). Investigation procedures are covered by Sections 142c-e, 143, and 145c, 42 U.S.C.A. §§2162(c)-(e), 2163, and 2165(c), and criminal penalties concerning misuse of Restricted Data are prescribed in Sections 221 and 224-227, 42 U.S.C.A. §§2271 and 2274-2277. Effective July 1, 1958, issuance of access permits became the authority of the AEC's field offices; AEC Press Rel. No. A-152 (June 23, 1958).

to Secret or Top Secret Restricted Data related to controlled thermonuclear processes will not be granted unless the applicant is, among other things, "directly engaged in a substantial effort to develop, design, build or operate a fission power reactor that is planned for construction and is making or proposes to make a comparative evaluation of fission and controlled thermonuclear processes for production of power." [285]

Although an access permit is probably a license within the meaning of the Federal Administrative Procedure Act,[286] the Atomic Energy Commission has refused to recognize that such a permit is protected by the licensing provisions of the Atomic Energy Act of 1954. However, the Commission has followed a liberal, rather than a restrictive, policy in issuing such permits,[287] and the denial of permits has not been up to the present time, in any event, a serious factor adversely affecting the atomic energy program.[288]

The only major criticism of the access permit program has been made in connection with the application by Power Reactor Development Company for a construction permit.[289] In that proceeding counsel for certain intervenors moved the Commission to grant access, "without imposition of any security requirements," to information relevant to the proceeding. The motion alleged that the information required by counsel had been "published" within the meaning of Section 142a of the 1954 Act by its being "made available or offered by the Commission to many hundreds of persons under the Commission's access permit program, and to many thousands of the employees of such persons." The motion concluded that (1), "[t]o the extent that the Atomic Energy Act of 1954 requires Intervenor's attorneys to submit to the security regulations of the Commission as a condition of access to any information essential and pertinent to the preparation and trial of this proceeding, the Act abridges freedom of speech and violates due process of law contrary to the First and Fifth Amendments of the Constitution. . . ."; and (2) due process of law and the Fifth Amendment would be

[285] 10 Code Fed. Regs. §25.15(b)(2), as amended, 22 Fed. Reg. 6568 (Aug. 15, 1957).

[286] Section 2(e), 5 U.S.C.A. §1001(e), made applicable to AEC functions by Section 181 of the Atomic Energy Act of 1954, 42 U.S.C.A. §2231.

[287] At the end of 1957, 1,404 access permits were in force, involving 22,352 persons cleared for access to classified documents in 26 major categories of American industry; 57 percent of the permits allowed access to secret and confidential Restricted Data, and the remainder to confidential Restricted Data alone. AEC, Twenty-third Semi-Annual Report 138, 166 (1958).

[288] Green, *supra* note 282 at 555-556.

[289] AEC Dkt. No. F-16.

violated as to the intervenors "for the Commission to condition Intervenors' ability effectively to pursue their rights and privileges under law upon their attorneys' submission to the Commission's security requirements." The motion of intervenors was opposed by Commission counsel, and the Commission denied the motion March 5, 1957.[290] The intervenors claimed that Commission refusal to grant the motion constituted "denial of a fair hearing." [291]

f. Commercial and Non-Commercial Facilities

The most important category of atomic energy licenses are those prescribed in Chapter 10 of the Atomic Energy Act of 1954. This category covers licenses for the construction and operation of facilities utilizing or producing special nuclear material either for medical therapy and research and development (a Section 104 [292] "non-commercial" license) or for private industrial uses (a Section 103 [293] "commercial" license). Even though Section 103 or Section 104 licenses are used for different purposes, both types of licenses were intended to be subject

> . . . to the same general conditions . . ., namely, ownership and control in United States citizens, and operation to be consonant with the common defense and security and with the health and safety of the public.[294]

(1) Construction Permits

An integral part of the licensing system is the so-called construction permit provided for under Section 185 [295] of the 1954 statute. A construction permit is a form of intermediate licensing issued prior to the

[290] BNA, Atomic Industry Reporter 3:12, 3:85, and 246:739-743. Considerations of public policy probably favor the Commission's making access to Restricted Data as easy as possible for intervenors' counsel within the requirements established by Congress. However, the extreme position on the motion would, if sustained, have weakened the entire information security program; see *id.* at 2:379.

[291] Post-Hearing Brief of Intervenors with Proposed Findings and Conclusions 28-35. The intervenors conceded that 40 out of the 73 documents requested in the motion were declassified by the Commission without any deletions. The applicant in the proceeding argued to the Commission that the question raised by the intervenors was "utterly without merit" and claimed that "[n]o classified evidence has been offered by any party to this proceeding, and there has been no indication that any information still classified is directly relevant to any issue in the proceeding" (Reply Memorandum for Applicant 2-3 (Nov. 19, 1957)).

[292] 42 U.S.C.A. §2134.

[293] 42 U.S.C.A. §2133.

[295] 42 U.S.C.A. §2235.

granting of a Section 103 or 104 license.[296] This two-step procedure for licensing an atomic energy facility was based on that contained in the Federal Communications Act of 1952.[297] The standards and conditions attached to a construction permit are generally the same as those for the license eventually desired by the permit applicant.[298]

As of June 30, 1958, the Commission had issued construction permits for five facilities [299] to conduct research and development activities for industrial or commercial purposes under Section 104b of the 1954 act.[300] By that time the agency also had issued construction permits for thirty-two facilities [301] to conduct research and development activities for nu-

[296] 10 Code Fed. Regs. §50.23.

[297] 47 U.S.C.A. §§153(dd) and 308; see Hollis, "Atomic Energy and Lawyers," 24 D.C. Bar Assn. J. 76, 79 (1957). An excellent description of the negotiations and procedures whereby application is made to the Commission for a construction permit and its conversion to a license is to be found in the Joint Committee Staff Study, *supra* note 3 at 11-15 and App. 4 at 100-108; see also remarks of F. K. Pittman, Deputy Chief, AEC Division of Civilian Application, Dec. 12, 1955, BNA Atomic Industry Reporter 51:105. In its Brief filed in the PRDC proceeding, AEC Dkt. No. F-16, the so-called "separated staff" of the Commission claimed that the "legislative history [of the Atomic Energy Act of 1954] indicates that the concept of a construction permit was patterned in some measure on that contained in the Federal Communications Act" (p. 16).

[298] 10 Code Fed. Regs. §§50.45 and 50.55(c).

[299] Consolidated Edison Co., CPPR-1 (May 4, 1956); Commonwealth Edison Co., CPPR-2 (May 4, 1956); General Electric Co., CPPR-3 (May 14, 1956); Power Reactor Development Co. (PRDC), CPPR-4 (Aug. 4, 1956); and Yankee Atomic Electric Company, CPPR-5 (Nov. 4, 1957). The PRDC permit has been the subject of a formal AEC hearing.

[300] Providing for facilities "involved in the conduct of research and development activities leading to the demonstration of the practical value of such facilities for industrial or commercial purposes."

[301] *Research reactor construction permits:* University of Michigan, CPRR-1 (Feb. 17, 1955); Armour Research Foundation, CPRR-2 (Mar. 28, 1955); U.S. Naval Research Laboratory, CPRR-3 (April 29, 1955); Battelle Memorial Institute, CPRR-4 (Aug. 5, 1955); Massachusetts Institute of Technology, CPRR-5 (May 7, 1956); Aerojet-General Nucleonics, CPRR-6 (Aug. 16, 1956); AMF Atomics, Inc., CPRR-7 (Jan. 22, 1957); Westinghouse Electric Corp., CPRR-8 (July 3, 1957); Aerojet-General Nucleonics, CPRR-9 (Feb. 22, 1957); North Carolina State College, CPRR-10 (Mar. 7, 1957); Curtiss Wright Corp., CPRR-11 (June 20, 1957); Aerojet-General Nucleonics, CPRR-12 (July 8, 1957); Aerojet-General Corp. and Aerojet-General Nucleonics, CPRR-13 (July 8, 1957); North American Aviation Inc., CPRR-14 (Aug. 2, 1957); University of Virginia, CPRR-15 (Sept. 13, 1957); Ordnance Materials Research Office, CPRR-16 (Oct. 2, 1957); Daystrom, Inc., CPRR-17 (Oct. 11, 1957); Union Carbide Corp., CPRR-18 (Oct. 31, 1957); General Electric Co., CPRR 19 (Oct. 26, 1957); and American Radiator and Standard Sanitary Corp., CPRR-20 (Oct. 31, 1957).

Critical experiment construction permits: Babcock and Wilcox, CPCX-1 (Dec. 9, 1955) and CPCX-9 (Oct. 2, 1957); Battelle Memorial Institute, CPCX-2 (Dec. 28,

clear processes and for the theory and production of atomic energy under Sections 31 [302] and 104c [303] of the Atomic Energy Act of 1954.[304]

Two problems are presented in connection with construction permits. The first, which has not yet arisen but which nevertheless deserves consideration, concerns the conversion of a permit into a license upon construction of a facility, in the absence of "good cause." [305] The phrase "good cause" as used in this context is not defined by the act or regulations [306] and creates considerable uncertainty as to the right of a permittee to receive a license.[307]

The second problem presented with respect to a construction permit arises under the regulation which authorizes the Commission to issue a provisional permit in cases where

> . . . an applicant is not in a position to supply initially all of the technical information otherwise required to complete the application. . . . If the Commission is satisfied that it has information sufficient to provide reasonable assurance that a facility of the general type proposed can be constructed and operated at the proposed location without undue risk to the

---

1955); Nuclear Development Corp. of America, CPCX-3 (June 11, 1956); General Electric Co., CPCX-4 (July 5, 1956); Lockheed Aircraft Corp., CPCX-5 (Mar. 15, 1957); Martin Co., CPCX-6 (May 13, 1957); General Dynamics Corp., CPCX-7 (June 18, 1957); General Electric Co., CPCX-8 (Sept. 20, 1957); Westinghouse Electric Corp., CPCX-10 (Oct. 17, 1957) and CPCX-12 (June 16, 1958); and National Advisory Committee for Aeronautics, CPCX-11 (Jan. 22, 1958).

[302] 42 U.S.C.A. §2051, providing for AEC research assistance.

[303] Providing for facilities "useful in the conduct of research and development activities of the types specified in Section 31 and which are not facilities of the type specified in subsection 104b."

[304] One application for a license for a research reactor was denied by the Commission prior to 1958. On Dec. 31, 1957, the Commission by notice advised that the application of The Prosperity Company, Syracuse, N.Y. had been denied "with the consent of the applicant and without prejudice to submittal of a new application." 22 Fed. Reg. 11088 (Dec. 31, 1957); see BNA, Atomic Industry Reporter 4: 16.

[305] Section 185, 42 U.S.C.A. §2235; see 10 Code Fed. Regs. §50.56.

[306] "Good cause" for the purpose of extending the completion date of a permit is defined in the regulations as including "developmental problems attributable to the experimental nature of the facility or fire, flood, explosion, strike, sabotage, domestic violence, enemy action, an act of the elements, and other acts beyond the control of the permit holder." (10 Code Fed. Regs. §50.55(b)).

[307] See Upton, *supra* note 207 at 492: ". . . [A] permit does not mean very much under present circumstances. The unsolved technological problems are such that any permit must be stated in terms so general to be of questionable value as assuring the issuance of a subsequent facility license." It is the opinion of the Chairman of the AEC's Advisory Committee on Reactor Safeguards that "it is impossible to give a construction permit which can be guaranteed to be converted into an operating license in my view" (1958 Section 202 Hearings, *supra* note 32 at 120).

> health and safety of the public and that the omitted information will be supplied, it may process the application and issue a construction permit on a provisional basis without the omitted information subject to its later production and an evaluation by the Commission that the final design [of the facility] provides reasonable assurance that the health and safety of the public will not be endangered.[308]

The regulations also provide for certain "common standards" for both construction permits and licenses [309] and for the granting of a construction permit to an applicant for a license "if the application [for a construction permit] is in conformity with and acceptable under the criteria . . . and standards" applicable to a license.[310]

The issuance of a provisional construction permit to Power Reactor Development Co. (PRDC)[311] to build a fast-neutron breeder reactor at Monroe, Michigan, for the production of electrical energy developed the opposing points in view concerning the Commission's authority to issue such a permit under the Atomic Energy Act of 1954.[312] The view

[308] 10 Code Fed. Regs. §50.35.

[309] 10 Code Fed. Regs. §50.40.

[310] 10 Code Fed. Regs. §50.45.

[311] CPPR-4 (Aug. 4, 1956), 21 Fed. Reg. 5974 (Aug. 9, 1956). The conversion of the construction permit into a license is subject to two general conditions, namely: (1) "Unless, within twelve months from the date of this construction permit, PRDC submits sufficient information relating to its financial resources to enable the Commission to make a finding that the Company has adequate financial resources to meet the requirements of the law and the regulations, this permit shall expire; provided that the Commission may for good cause shown extend the time for the submission of such data"; and (2) "The conversion of this permit to a license is subject to submittal by PRDC to the Commission (by amendment of the application) of the complete, final Hazards Summary Report (portions of which may be submitted and evaluated from time to time). The final Hazards Summary Report must show that the final design provides reasonable assurance to the satisfaction of the Commission that the health and safety of the public will not be endangered by operation of the reactor in accordance with the specified procedures." (Ed. Note: On December 10, 1958, the Commission issued its Opinion and Initial Decision in the PRDC case and continued the provisional construction permit in effect, subject to further conditions to establish complete safety and financial qualifications.)

[312] See Petition for Intervention and Request for Formal Hearing, AEC Dkt. No. F-16, filed Aug. 31, 1956, by three unions and their officials; BNA, Atomic Industry Reporter 2:283 and 2:294. The principal contentions were that (1) the Commission failed to make the requisite findings of "Reasonable Assurance" of safety required by Section 185 of the act and §50.35 of the regulations, particularly in view of a generally adverse report dated June 6, 1956, by the Commission's Advisory Committee on Reactor Safeguards (*Petition*, pp. 4-11); and (2) the Commission could not issue a permit conditional upon the satisfaction of "financial qualifications" at a later date (*id.* at 11-13). See also statement of Rep. Cannon, 103 Cong. Rec. 5196-5198 (1957); statements of W. P. Reuther, President, United Automobile Workers, AFL-CIO,

taken by the intervenors in that proceeding against the validity of the provisional construction permit issued to PRDC was that no section of the Atomic Energy Act of 1954, including Section 185,

> . . . provides for the issuance of conditional or provisional construction permits. There is nothing in this section [185], nor in any other section of the Act, which indicates that there may be inconsistent criteria for the issuance of construction permits.
>
> It is true that Section 185 does enumerate, as one of the conditions for the issuance of an *operating* license, that the applicant file "any additional information needed to bring the original application up to date.". . . It was not contemplated that the kind of *construction* permit to be issued would depend on the amount of information filed with the application. In other words, Congress did not contemplate that the filing of additional information was one of the requirements that make the application acceptable to the Commission. . . . [A]cceptability must be determined *at the beginning,* when the construction permit is granted. . . .
>
> It seems quite clear that Sections 50.45 and 50.40 [10 Code Fed. Regs.] were based on this interpretation of the Act. . . . This means that there must be a *present* determination that the information supplied to the Commission gives reasonable assurance that the health and safety of the public will not be endangered by the construction and operation of the reactor.[813]

The view supporting the validity of a provisional construction permit stresses the necessity for such a device under a broad interpretation

---

B. C. Sigal, counsel, UAW, and Leo Goodman, staff member, UAW, 1957 Authorizing Legislation Hearings, *supra* note 7 at 597-633; statement of A. J. Biemiller, Legislative Director, AFL-CIO, 1957 Section 202 Hearings, *supra* note 7 at 440; statements of Sen. Anderson and Rep. Holifield, Joint Committee Staff Study, *supra* note 3, App. 7.B and C, at 125-127. The standing of intervenors to intervene in the proceedings was questioned by PRDC, which stated, however, that it was willing to have the issues involved in the granting of the construction permit heard in a proper hearing (BNA, Atomic Industry Reporter 2:307 (Sept. 26, 1956)). "Notice of Hearing, Order and Memorandum" were issued by the Commission Oct. 8, 1956, 21 Fed. Reg. 7809 (Oct. 12, 1956) and Joint Committee Staff Study, *supra* note 3, App. 7.D. at 128-132. After prehearing conferences held Oct. 29 and Nov. 29, 1956, the hearing commenced Jan. 8, 1957, with the introduction of testimony in narrative form by the applicant, PRDC. Witnesses were examined May 13, June 10, Aug. 1, and Aug. 7, 1957. Briefs were submitted by Nov. 29, 1957, and the record was certified to the Commission without decision by the hearing examiner appointed in the case. Procedural and other issues presented in these proceedings are discussed where appropriate elsewhere in this chapter.

[813] Reply Brief of Intervenors 9 (Nov. 19, 1957). See, to the same effect and arguing that the legislative history of Section 185 supported this position, Post-Hearing Brief of Intervenors, *supra* note 291 at 16-17.

of the Atomic Energy Act of 1954 and the Commission's regulations. In the light of Section 185,

> . . . the Commission was thus faced with the very practical problem of determining what showing is to be required at the construction permit stage, especially by applicants for licenses for developmental projects. The construction of a large power reactor and associated generating facilities necessarily takes approximately four or five years. Yet the entire history to date of the peaceful application of nuclear energy comprises a span of only a little over a decade, and at least for the next few years relatively brief periods undoubtedly will continue to witness vast accretions of knowledge in this field. The Commission was therefore aware that if the basic policies of the Atomic Energy Act of 1954 were to be effectuated, and if the United States is not to fall far behind in this rapidly moving field, the construction of developmental projects . . . must not only be permitted but must be encouraged to be started without waiting for all of the technological problems associated with them to be definitively solved.
>
> Thus it was clear that if the Commission required applicants for licenses to submit at the outset all of the technical information required to be included in the final Hazards Summary Report, it would effectively defeat the purposes of the Act by seriously delaying if not utterly eliminating most developmental projects, and particularly those which will lead to substantial technological advances.[814]

Regardless of the issues involved in the PRDC proceeding, the provisional construction permit represents one of the means whereby private industry can carry out its role in the atomic energy field in the present fluid state of the technology involved. An alternative to legislation and regulations which permit industry to construct reactors on the basis of

[814] Brief for Applicant 34-35 (Oct. 29, 1957). In its Brief filed with the Hearing Examiner in the PRDC proceeding, the so-called "separated staff" of the AEC, represented by the Acting General Counsel of the Commission and two other AEC attorneys, argued (p. 21): "Thus, the legislative history of Section 185 reflects both the desire of industry for maximum assurance that conversion of a construction permit to a license will be semi-automatic, and the concern by at least some members of Congress that once a construction permit is granted and substantial funds are expended, the pressures for conversion of the permit into a license may become overwhelming. Both considerations serve to emphasize the importance of the determinations made at the construction permit stage." PRDC took the position that "there is no legal, moral or other commitment of any sort to convert this [construction] permit into an operating license unless and until the full showing required by the law and the regulations to be made at that time has been completed to the satisfaction of the Commission. . . . The only risk involved in going forward with this project . . . is a financial one, and a financial one to PRDC alone. . . ." (Brief for Applicant 87).

continually expanding knowledge of science and engineering is, of course, a government monopoly of all such developmental work.

(2) Non-Commercial Licenses

Non-commercial licenses issuable under Section 104 of the 1954 act are used for medical therapy,[315] research and development for industrial or commercial purposes,[316] and research and development of a theoretical and purely scientific nature.[317] Through the end of June 1958, forty-two licenses had been issued, and one proposed, for reactors in the last-named category.[318]

Standards and conditions applicable to non-commercial licenses relate primarily to considerations of health and safety and the value of the research involved.[319] The principal administrative problem with respect to non-commercial licenses arises not so much under these regulations

[315] Section 104a and d, 42 U.S.C.A. §2134(a) and (d); see 10 Code Fed. Regs. §§50.21(a) and 50.41(a) and (b).

[316] Section 104b, 42 U.S.C.A. §2134(b); see 10 Code Fed. Regs. §§50.21(b) and 50.41(c).

As of June 30, 1958, the AEC also had issued 11 critical experiment licenses, as follows: Babcock & Wilcox Co., CX-1 (Mar 20, 1957) and CX-10 (Jan. 22, 1958); General Electric Co., CX-2 (July 29, 1957), CX-4 (Aug. 30, 1957), and CX-5 (Oct. 16, 1957); General Dynamics Corp., CX-3 (June 26, 1958); Westinghouse Electric Co., CX-6 (Nov. 25, 1957) and CX-11 (June 17, 1958); Martin Co., CX-7 (June 12, 1958); Nuclear Development Corp., CX-8 (Jan. 22, 1958), and Battelle Memorial Institute, CX-9 (Jan. 16, 1958)

[319] *E.g.* 10 Code Fed Regs §§50.34 and 50.41.

as under another statutory requirement which must be met before a reactor, developed under Section 104b and shown to have the necessary safety and operational features,[320] can be licensed for commercial use under Section 103.

Under Section 102 [321] of the act, whenever the Commission has made "a finding in writing that any type of utilization or production facility has been sufficiently developed to be of practical value" under Section 104, a Section 103 license therefor may be issued upon appropriate application.[322] "Practical value" appears to embrace both technical and economic considerations, and up to the end of 1958 the Commission never had issued such a finding. This probably is due in part to the economic uncertainties in private atomic enterprise at this beginning stage of development and also to the failure of the statute and regulations to permit a private citizen to request, and provide the evidentiary basis for, a determination of "practical value" and to set forth the standards for such a finding.[323] Indeed, until these deficiencies in Section 102 are corrected, the section can be used as "a barrier of Commission discretionary authority" to the issuance of Section 103 licenses.[324]

Further, a problem arises in connection with the transition from a "developmental" to a practically useful stage of reactor development. The private operator has no statutory assurance that his Section 104b license will be permitted to remain in effect for its prescribed term after the Section 103 license is issued, thus protecting the investment and research of the licensee.[325] It is true that the Commission has adopted a

[320] A Section 104b license is essentially a "demonstration" license; Upton, *supra* note 207 at 490.

[321] 42 U.S.C.A. §2132.

[322] H.R. Rep. No. 2181, *supra* note 5 at 19: "This finding [under Section 102] separates the issuance of research and development licenses for any facility under Section 104b, and the issuance of commercial licenses under Section 103. . . ."

[323] The McKinney Panel has recommended that the statute be amended to permit private citizens to initiate a proceeding for a finding of "practical value" and to limit the definition thereof to "technical considerations" (Report, *supra* note 10 at 13). The Panel further stated (*id.* at 132-133): "The Commission's interpretation of section 102 . . . particularly strains our concepts of private enterprise. As yet undefined tests of economic feasibility are to be applied by the Commission in arriving at such findings. While the Federal Government does frequently require applicants for other licensed activities to prove economic feasibility of proposed activities, this is the first time, so far as can be determined, that the Federal Government has set itself up to decide on its own initiative when private licensees can profitably embark on regulated activities, denying private investors the right to proceed before that time. . . ."

[324] *Id.* at 132.

[325] See Upton, *supra* note 207 at 490.

rule that seemingly covers the situation,[326] but a rule can always be changed.

(3) Commercial Licenses

Although the Commission has sought to develop [327] some semblance of regulatory order out of the hodgepodge of provisions contained in Section 103 and related sections, particularly Section 105,[328] the result does not inspire confidence that the regulatory authority can maintain a proper balance between the public and private interests involved.[329]

Under Section 7 of the Atomic Energy Act of 1946,[330] the licensing of atomic power for commercial use was made practically impossible by statutory strictures. Under the procedure therein provided, the Commission was required to report to the President and through him to Congress that industrial, commercial, or non-military use of atomic energy had been developed to a point where such use was practicable. No license for such use could be issued by the Commission until the report had been submitted to Congress while in session and ninety days had elapsed after such submission.[331]

Due to the strictures of Section 7 and the prevailing governmental sentiment prior to 1954 towards the development of atomic energy for peaceful uses, Section 7 was never utilized. Moreover, much of the restrictive philosophy of the section has crept into Section 103 of the present act. Indeed, it is the conflict between these restrictions and the

[326] Effective November 30, 1956, 21 Fed. Reg. 9354, a new §50.24 was added to the licensing regulations, which provided that "[t]he making of a finding of practical value pursuant to section 102 of the act will not be regarded by the Commission as grounds for requiring: (a) The conversion to a Class 103 license of any Class 104 license prior to the date of expiration contained in the license; or (b) The conversion to a Class 103 license of any construction permit, issued under section 104 of the act, prior to the date designated in the permit for expiration of the license." Implementing a policy adopted more than a year previously by the Commission, the regulation "may serve to set at rest, at least for the time being, one possible uncertainty facing those companies engaged in proving out power reactor concepts through construction of full-scale prototypes" (BNA, Atomic Industry Reporter 2: 389).

[327] 10 Code Fed. Regs. Pt. 50.

[328] 42 U.S.C.A. §2135 ("Antitrust Provisions").

[329] McKinney Panel Report, *supra* note 10 at 13: "Despite recognition of the fact that there is no evidence of anyone now being injured by the licensing provisions of sections 103 and 104, the principles involved in these sections . . . conflict with the principles of private enterprise which the 1954 act has been represented as advancing." See also 132-134.

[330] 42 U.S.C. §1807 (1946).

[331] For a favorable view of Section 7, see H.R. Rep. No. 2181, *supra* note 5 at 107-108. For a criticism thereof, see ABA Committee Report, *supra* note 177, at 15-21.

underlying philosophy of the Atomic Energy Act of 1954 to encourage investment of private capital in atomic energy facilities which creates the problem for industry. In this connection it is significant that Section 104 of the present act specifically states that licenses issued thereunder should be "subject to the minimum amount of regulation" consistent with the regulatory duties of the Commission.[332] No such policy statement is contained in Section 103, although the inference to be drawn from its absence is far from clear.[333]

(a) Section 182 Restrictions

Restrictions imposed upon Section 103 licensees concern notice requirements, priorities, the right of the Commission to require information, and antitrust provisions. Under Section 182c of the present statute,[334] notice prior to the issuance of such a license is required to be given to "such regulatory agency as may have jurisdiction over the rates and services of the proposed activity, to municipalities, private utilities, public bodies, and cooperatives within transmission distance and which are authorized to engage in the distribution of electric energy." [335] The effective date of the license is further delayed by a requirement of notice for four consecutive weeks in the Federal Register, followed by another period of four weeks before the license becomes effective.

[332] Section 104a, b, and c, 42 U.S.C.A. §2134(a), (b), and (c).

[333] The applicant PRDC in AEC Dkt. F-16 argued that "Section 104.b enjoins the Commission not to impose in the way of developmental projects any administrative road blocks that are not absolutely essential from the standpoint of security and safety, and it requires that priority be given to those activities most likely to lead to 'major advances' in the industrial application of nuclear energy" (Brief for Applicant, *supra* note 314 at 34). The policy of the section was urged in support of the PRDC position that, in order to qualify for a provisional construction permit, the applicant need only establish "a reasonable probability under all the circumstances that . . . the proposed [PRDC] reactor . . . can in due course be proved safe for operation at the proposed site" (*id.* at 36) and "is reasonably assured under all the circumstances of obtaining the financial resources that it will probably need," taking into consideration "the determination of its [PRDC's] member companies to see the project through" (*id.* at 16 and 12). The contrary view, advanced by the intervenors in that proceeding, was that, notwithstanding Section 104b, "nothing takes priority over the twin elements of (1) common defense and security and (2) health and safety of the public. The encouragement of private participation in the atomic energy industry is a means to these ends, not a qualification of them" (Reply Brief of Intervenors, *supra* note 313 at 3).

[334] 42 U.S.C.A. §2232(c).

[335] See 10 Code Fed. Regs. §50.43(a). The Joint Committee Staff Study, *supra* note 3 at 69-70, outlines briefly the legislative history of Section 182.

Licensing of activities involving interstate as well as intrastate commerce by joint action of a federal and state regulatory body is not an uncommon practice under administrative law.[336] The provisions of Section 182c go further, however, and can only be regarded as a means of prolonging for a period of eight weeks the licensing of an otherwise qualified private commercial facility. During that period application can be made to a court to enjoin the license, or Congress, if in session, can take action by legislation to reverse the performance of Executive Department functions.[337] However, other than the delay involved, this particular restriction raises no insuperable problems for private industry.

Section 182d of the present act also establishes a system of priorities to be given to license applicants. That section provides:

> The Commission, in issuing any license for a utilization or production facility for the generation of commercial power under section 103, shall give preferred consideration to applications for such facilities which will be located in high cost power areas in the United States if there are conflicting applications for a limited opportunity for such license. Where such conflicting applications resulting from limited opportunity for such license include those submitted by public or cooperative bodies such applications shall be given preferred consideration.[338]

As summarized by the Commission in its regulations, such priorities among "conflicting applications for a limited opportunity for such license" are as follows:

> 1. Applications submitted by public or cooperative bodies for facilities to be located in high cost power areas in the United States.
> 2. Applications submitted by others for facilities to be located within such high cost power areas in the United States.
> 3. Applications submitted by public or cooperative bodies for facilities to be located in other high cost power areas.
> 4. All other applications.[339]

[336] See, *e.g.*, Interstate Commerce Commission use of "joint boards" composed of representatives of the agency and state regulatory bodies, 49 U.S.C.A. §305.

[337] Representatives Holifield and Price have charged that these notice requirements lack "specific recognition of those interests whose rights may be affected by Commission action or whose participation may be in the public interest," H.R. Rep. No. 2181, *supra* note 5 at 122.

[338] 42 U.S.C.A. §2232(c).

[339] 10 Code Fed. Regs. § 50.43(b).

Section 182d raises several questions which are not satisfactorily answered by its legislative history.[340] The term "limited opportunity" is susceptible of varying interpretations, although a reasonable meaning would seem to be "limited availability of special nuclear material." [341] Moreover, what constitutes a "high cost power area" is an exceedingly difficult question to answer because of very slight differences in the cost of generating electricity from conventional sources among several areas within the United States.[342]

Both the Commission indirectly, and the Joint Committee directly, have implemented the preference provisions of the 1954 statute with respect to cooperatively and public-owned utilities. The Commission's second round invitation in September 1955, under the civilian power reactor program encouraged application by seven utilities of the preferred publicly or cooperatively owned type to develop, design, construct, and operate nuclear power plants with generating capacities of between 5,000 and 40,000 kilowatts.[343]

However, the limitations on funds available to such groups of utilities have tended to prevent their full-scale participation in the civilian atomic energy program.[344] Although recognizing that this preferred

[340] See H.R. Rep. No. 2181, *supra* note 5 at 28: ". . . [W]here all other conditions are equal and there are conflicting applications for a limited opportunity for a license, the Commission is required to give preferred consideration to facilities which will be located in high-cost power areas." See Joint Committee Staff Study, *supra* note 3 at 69-70.

[341] Upton, *supra* note 207 at 491.

[342] See Atomic Energy Facts 78 (GPO 1957); Rep. Cole has characterized Section 185c as "this fear and apprehension [in private industry] which I call a roadblock" (1957 Section 202 Hearings, *supra* note 7 at 69). After agreeing with Sen. Pastore (Dem., R.I.) that New England "certainly is a high cost area," Mr. E. L. Lindseth, Vice Chairman, Committee on Atomic Power, Edison Electric Institute, told the Joint Committee in the 1957 Section 202 Hearings, *id.* at 268-269: "Our industry takes no exception to that portion of the act which relates to preference in favor of high cost fuel areas. . . ."

[343] See AEC Twenty-fourth Semi-Annual Report 335 (1958); four of those have been accepted as bases for negotiation of contracts, statement of AEC, 1957 Section 202 Hearings, *supra* note 7 at 117-118. These four proposals "are all entitled to preference under the Atomic Energy Act" (Statement of AEC Division of Reactor Development Director, 1957 Authorizing Legislation Hearings, *supra* note 7 at 186). One public body, Consumers Public Power District, of Columbus, Nebraska, has applied for a contract under the first round invitation, Sen. Rep. No. 791, *supra* note 23 at 10-11.

[344] Cole, *supra* note 6 at 480: ". . . [A]ll three invitations for proposals under the demonstration program have emphasized the specific types of available government assistance and have stressed that the Commission's obligations would be limited or 'closed end.' There is one dilemma which is posed by the Commission's desire to

class of utilities showed no "particular competence or experience" with respect to atomic reactors, the Joint Committee in 1957 recommended, and Congress enacted, legislation which specifically directed the Commission to give such utilities a highly preferred position under the civilian power reactor program,[345] with advantages not available to privately owned utilities.[346]

(b) Section 105 Restrictions

Another type of restriction imposed on Section 103 licenses is created by Section 105 of the Atomic Energy Act of 1954 concerning antitrust problems.[347] Previously, under Section 7(c) of the 1946 act:

> Where activities under any license might serve to maintain or to foster the growth of monopoly, restraint of trade, unlawful competition, or other trade position inimical to the entry of new, freely competitive enterprises in the field, the Commission is authorized and directed to refuse to issue such license or to establish such conditions to prevent these results as the Commission, in consultation with the Attorney General, may determine. The Commission shall report promptly to the Attorney General any information it may have with respect to any utilization of fissionable material or atomic energy which appears to have these results. . . .[348]

Under the present legislation, the restrictions imposed under the 1946 legislation have been broadened by new statutory provisions which were "in large part, the product of compromise." [349]

The antitrust provisions of the 1954 act have three principal effects upon the regulated atomic energy industry. Each of these is presumably based on the intended policy of strengthening "free competition in private enterprise." [350]

---

limit commitments and this is a result of a preference clause contained in the Atomic Energy Act of 1954. The very limited funds generally available to such 'preference' groups . . . for assumption of technological risk make it difficult, in a practical sense, for these groups to assume responsibility for excessive costs. Thus difficulty is encountered in making contractual arrangements containing strong incentives for cost-reduction except as these groups may be able to make favorable arrangements with reactor manufacturers."

[345] Sen. Rep. No. 791, *supra* note 23 at 16.

[346] These preferred contractual arrangements were contained in Section 111(a)(1) of Pub. L. 85-162, 85th Cong., 1st Sess. (1957), and are discussed in detail, *infra*.

[347] 42 U.S.C.A. §2135.

[348] 42 U.S.C. §1807(c)(1946).

[349] Attorney General Brownell, 1957 Section 202 Hearings, *supra* note 7 at 631-635.

[350] Section 1b, 42 U.S.C.A. §2011(b); see Jacobs and Melchoir, "Antitrust Aspects of the Atomic Energy Industry," 25 Geo. Wash. L. Rev. 508 (1957). The authors were listed as members of the Antitrust Division, Department of Justice.

The first, and most important, is the mandate that no provision of the act "shall relieve any person from the operation" of the antitrust laws.[351] These laws may well be applied not only to actual violations thereof, but also, and of more practical significance to the industry, to "incipient practices which could ultimately lead to Sherman Act violations." [352] Moreover, in the event a license is found by a court of competent jurisdiction to have violated any provision of the federal antitrust laws, then the Commission "may suspend, revoke or take such other action as it may deem necessary with respect to any license issued by the Commission under the provisions of this Act." [353]

As under the 1946 act, Section 105b of the 1954 act requires the Commission to report to the Attorney General any information coming to its attention with respect to license activity "which appears to violate or to tend toward the violation of any of the [antitrust] . . . Acts, or to restrict free competition in private enterprise." [354] Further, under

[351] Further designated in the Atomic Energy Act as the Sherman Act of 1890, 15 U.S.C.A. §§1-7; the Wilson Tariff Act of 1894, 15 U.S.C.A. §§8-11; the Clayton Act of 1914, 15 U.S.C.A. §§12-27; and the Federal Trade Commission Act of 1914, 15 U.S.C.A. §§41-46 and §§47-58.

[352] Jacobs and Melchoir, *supra* note 350 at 509; see Brownell, 1957 Section 202 Hearings, *supra* note 7 at 631: ". . . In this evolving [atomic energy] industry, we [the Federal Government] attempt preventive measures to foster competition, rather than remedial litigation to undo the effect of anticompetitive action already taken." Critics of the current AEC program have emphasized the alleged danger from incipient violations of the antitrust laws. Rep. Cannon, 103 Cong. Rec. 5197-5198 (1957) has referred to "serious antitrust implications" in the PRDC project because it was being undertaken by "two separate combinations of companies." Some witnesses in the Joint Committee 1957 Section 202 Hearings charged that the 1954 act was being administered in such a fashion as to effect "monopolization of the atomic energy field" by major power companies, which were accused of engaging in "a form of legalized collusion" to violate the antitrust laws, *supra* note 7 at 452-456; see, to the same effect, *id.* at 285-289 and 460-462.

[353] Jacobs and Melchior, *supra* note 350 at 511-12: "Should the Federal Trade Commission find a violation of section 5 of its act and the respondent not seek court review, the [Atomic Energy] Commission could not under this section [105a of the Atomic Energy Act] cite the finding as a basis for suspension, as this would not constitute a finding by a court of competent jurisdiction. . . . Thus, considerable importance attaches to what might be an accident of procedure, *i.e.*, whether an action for violation of one of the antitrust laws is brought in the first instance by the Department of Justice or by the Federal Trade Commission." The opposite position would be that Congress intended an atomic energy licensee to have its alleged violation of the antitrust laws adjudicated in a federal court, either at the District Court level in an original proceeding or at the Court of Appeals level on review of a Federal Trade Commission order, rather than have the atomic energy license jeopardized by merely an administrative determination.

[354] Jacobs and Melchior, *supra* note 350 at 512: "The obligation will require the application of a degree of antitrust expertise at an early stage, to make possible the detection of anti-competitive practices in their incipience."

Section 105c, when the Commission proposes to issue a Section 103 license, the Attorney General must be notified, and he must give an opinion within 90 days, to be published in the Federal Register, "whether insofar as he can determine, the proposed license would tend to create or maintain a situation inconsistent with the antitrust laws." This section empowers the Attorney General to request, and the Commission to furnish or "cause to be furnished, such information as the Attorney General determines to be appropriate or necessary to enable him to give the advice called for by this section." It should be noted that Section 105c has application only to proposed Section 103 commercial licenses. It does not apply to construction permits for either Section 103 or 104 licenses, nor does it reach to Section 104 licenses, a fact which has occasioned some controversy.[355]

Indeed, Section 105 was one of the most controversial portions of the Atomic Energy Act of 1954. The theory underlying the section is derived from certain other administrative powers and duties delegated by Congress with respect to government ownership, regulation, or disposal of war industries and materials.[356] As originally proposed in Congress, this section would have permitted a licensee to purge itself of any violation of the antitrust laws in connection with any atomic energy activity, before the Atomic Energy Commission could take any action with respect to the license.[357] The legislation reported out by the Joint Committee on Atomic Energy would have provided "for hearings [before

[355] 1957 Section 202 Hearings, *supra* note 7, at 285, 288-289, 292; Jacobs and Melchior, *supra* note 350 at 513-514; Rep. Cannon, 103 Cong. Rec. 5198 (1957).

[356] Section 20 of the Surplus Property Act of 1944, reenacted as Section 207 of the Federal Property and Administrative Service Act of 1949, 40 U.S.C.A. §488 (whenever an executive agency begins negotiations for the disposition of plant or property which cost the United States at least $1 million or of patents, processes, and inventions, the Attorney General must advise within 60 days whether "the proposed disposition tend to create or maintain a situation inconsistent with the antitrust laws"); Section 708 of Defense Production Act of 1950, 50 U.S.C.A. App. §2158 (requiring submission of "voluntary agreements and programs" within an industry to the Attorney General and Federal Trade Commission, publication thereof in the Federal Register, and formal approval thereof by the Attorney General before the President can put any such agreement or program into effect); Rubber Producing Facilities Disposal Act of 1953, 50 U.S.C.A. App. §1941a (before submission of proposed disposal of rubber plant to Congress, Rubber Producing Facilities Disposal Commission must obtain, but need not follow, advice of Attorney General with respect to antitrust problems in connection with such disposal). See Austern, "Memorandum of Collateral Antitrust Enforcement," Atomic Energy Workshops, *supra* note 215 at 165-166; Jacobs and Melchoir, *supra* note 350 at 515-516.

[357] Austern, "Legislative History of Sections 105 and 158 of the Atomic Energy Act of 1954," Atomic Energy Workshops, *supra* note 215 at 155.

the Federal Trade Commission] and judicial review in case there is any claim by the Attorney General or the Federal Trade Commission that a proposed license of any production or utilization facility would violate the antitrust laws." [358] A Senate amendment to the bill passed by the House, which was rejected by the conference committee, would have

> . . . required that the Commission follow the advice of the Attorney General unless the President made a finding that the issuance of such a license was essential to the common defense and security and the finding was published in the Federal Register. This amendment in effect made the advice of the Attorney General a decision binding upon the Commission and the applicant without hearing. . . .[359]

As finally enacted, Section 105 does not require the denial of a license because of a possible antitrust violation as was the case under the 1946 statute. The Commission merely takes "due account" of the Attorney General's opinion.[360] It would, however, take a foolhardy Commission to disregard the Attorney General's opinion.[361]

Thus, the atomic energy industry faces the possibility of adverse decisions based upon administrative interpretation and the application of the antitrust laws without an opportunity for administrative hearing or judicial review.[362] However, it is to be hoped that the Commission,

[358] H.R. Rep. No. 2181, *supra* note 5 at 20.

[359] H.R. Rep. No. 2639, 83d Cong., 2d Sess. 47 (1954). The amendment rejected was proposed by Sen. Humphrey (Dem., Minn.), see Adams, *supra* note 222, 55 Col. L. Rev. 169-170.

[360] 10 Code Fed. Regs. §50.42(b); see also §50.54(g); Austern, *supra* note 339 at 165. Concerning this provision, Attorney General Brownell has stated, 1957 Section 202 Hearings, *supra* note 7 at 633: "This provision, patterned after earlier surplus of property disposal laws, makes available to the [Atomic Energy] Commission analysis of any special anticompetitive considerations presented. Antitrust advice, however, need not be controlling. For the Commission must also weigh the necessities of defense and security and public health and safety. Nonetheless such a procedure provides an effective means to insure that knowledge of possible antitrust difficulties required to foster competition."

[361] See Adams, *supra* note 239 at 170. It is possible that, where the Attorney General either gives adverse or favorable advice concerning a Section 103 license application to the Commission, he would not be precluded from proceeding by appropriate antitrust proceedings against the licensee for future violations of these laws or for violations unknown and undisclosed to the government at the time the application was processed. See Attorney General Brownell, 1957 Section 202 Hearings, *supra* note 7, at 633; Jacobs and Melchior, *supra* note 350 at 517-518. Probably the Attorney General's position would not be binding upon a private party seeking treble damages or other relief under the antitrust laws.

[362] Under the Humphrey amendment, *supra* note 359, the Attorney General was both "a judge and jury," "not an appropriate role for the prosecuting attorney to play" (Sen. Hickenlooper (Rep., Iowa), 100 Cong. Rec. 14344 (Aug. 13, 1954)).

if so requested by an applicant for a license which initially is denied as a result of Section 105, would make the antitrust question an issue at the formal hearing provided by statute and regulation.[363]

Section 105, as enacted by Congress and implemented by Commission regulation, represents a probable deterrent to private participation in the atomic energy field. Section 105a providing that no official action under the Atomic Energy Act shall prevent appropriate action by the Department of Justice and Federal Trade Commission under the antitrust laws merely states existing law for "normal application of antitrust to the civilian atomic industry." [364] These provisions are unobjectionable, even if unnecessary. The only basic objection to Section 105a lies in the unlimited discretion granted the Atomic Energy Commission in the event a licensee is found by a court to have violated an antitrust act, clearly a matter which should be left exclusively in the jurisdiction of the court,[365] without permitting extrapunitive action by an administrative body.[366]

The language of Section 105b and c, especially with respect to the grounds on which the Attorney General may render an adverse advisory opinion or the Commission may refuse a license, go far beyond ordinary concepts of antitrust law developed heretofore by statutes, the courts, and administrative agencies.[367] A final source of possible administrative overreaching under Section 105 lies in the requirement, under Section 161p of the act, that licensees furnish information and reports, and permit inspections, "as may be necessary to effectuate the purposes

[363] Section 189a, 42 U.S.C.A. §2239(a); 10 Code Fed. Regs. §2.102(a).

[364] Attorney General Brownell, 1957 Section 202 Hearings, *supra* note 7 at 632.

[365] See Atomic Energy Workshops, *supra* note 215 at 61.

[366] "Those who engage in activity in this [atomic energy] field in violation of the antitrust laws should get no better and no worse treatment, be subjected to the same sanctions, imposed by the same administrative and judicial tribunals, and prosecuted by the same enforcement agencies, as are those who engage in any other business subject to the antitrust laws" ("Report of Workshop III," Atomic Energy Workshops, *supra* note 215 at 58).

[367] See "Report of Workshop III," Atomic Energy Workshops, *supra* note 215 at 58; Austern, *supra* note 357, at 155; Austern, *supra* note 356 at 167-168: "In Section 105c of the Atomic Energy Act, the Attorney General is to decide whether a proposed license would tend to create or maintain 'a situation inconsistent with the antitrust laws.' This language does not confine the Attorney General's interest in the matter to any particular area of the company's business. On occasion the Attorney General is bound to be influenced by the existence of litigation which he is conducting against a proposed licensee, even if the litigation does not directly involve atomic energy at all. . . ." For a similar criticism of the standards in Section 7(c) of the 1946 Act, see ABA Committee Report, *supra* note 177 at 20.

of the Act, including Section 105 of the Act." [368] This statutory provision, as implemented by regulation,[369] in effect constitutes an unlimited hunting license for the federal government to police the atomic energy industry without any of the traditional safeguards afforded other branches of industry subject to the antitrust laws.

The provisions of Section 105 as enacted have been characterized as " 'passing the buck' on monopoly prevention" and as locking "the barn after the horse is stolen." [370] The power given the Atomic Energy Commission under the 1946 act to decide antitrust questions has been supported and justified on the basis of the argument that eight Federal agencies,[371] other than the Federal Trade Commission, have the same authority in the fields regulated by them.[372] What has been termed the "collateral enforcement" of the antitrust laws is, however, subject to serious objection because of diffusion of responsibility [373] and possible inefficient administration.[374]

However, in enacting the Atomic Energy Act of 1954, Congress has avoided adding to the conflicting interpretation and sometimes overlapping jurisdiction in the antitrust field by excluding the Atomic

[368] 42 U.S.C.A. §2201(p).

[369] 10 Code Fed. Regs. §§50.70 (inspections) and 50.71 (records and reports). These requirements present real problems for the licensee who conceivably could withhold no operating information from the Commission, and the Commission apparently is under no affirmative obligation to refrain from publishing what might ordinarily be a business secret. Limited protection for business secrets is afforded by 10 Code Fed. Regs. §2.790, which permits the Commission to "withhold any document or part thereof from public inspection if disclosure of its contents is not required in the public interest and would adversely affect the interest of a person concerned," subject, of course, to the exercise of Commission discretion. As of March 6, 1957, the Commission had received four requests for the withholding of certain information contained in license applications, two of which were granted. "Requests by License Applicants to Withhold Matters from Public Inspection," Joint Committee Staff Study, *supra* note 3, App. 13, at 183-186.

[370] H.R. Rep. No. 2181, *supra* note 5 at 125-126. See Adams, *supra* note 239 at 178-179: "If monopoly comes to atomic energy, it shall not have been inevitable. . . . It shall have come about because of unwise, man-made, discriminatory, privilege-creating legislation which throttles competition and restricts opportunity. . . ."

[371] Interstate Commerce Commission, Federal Communications Commission, Civil Aeronautics Board, Federal Reserve Board, U.S. Tariff Commission, Federal Power Commission, Department of Interior, and Department of Agriculture.

[372] H.R. Rep. No. 2181, *supra* note 5 at 125-126. For a criticism of this situation, see Hoover Commission Legal Services Report, *supra* note 154 at 86 and Hoover Commission Legal Task Force Report, *supra* note 43, at 250-255.

[373] Austern, *supra* note 356 at 165; see Report of Attorney General's National Committee to Study the Antitrust Laws 367-369 (1955).

[374] See Transamerica Corp. v. Board of Governors of Federal Reserve System, 206 F. 2d 163 (3d Cir. 1953).

Energy Commission from issuing orders based upon antitrust considerations. There has been substituted the procedure for reports to and from the Attorney General, with the possible withholding of the license by the Commission based upon these reports. Because of the extra-judicial character of the Attorney General's participation in the atomic energy licensing process, this procedure can hardly be regarded as an improvement from the standpoint of the licensee.

More recently, still another extra-judicial forum to consider possible antitrust problems affecting individual licensees has been established. This results from the 1957 amendments by Congress to Section 261a of the Atomic Energy Act.[375] In its review of the bases requested for appropriations by the Commission for financial assistance to private parties under the civilian power reactor programs, the Joint Committee will have the opportunity "to review the antitrust and patent implications of each individual arrangement before it is consummated." [376]

3. Hearing Procedures

The general licensing provisions of the 1954 statute,[377] as implemented by the Commission's regulations,[378] establish procedures for the granting, denial, or revocation of licenses which substantially comply, both in spirit and in letter, with the requirements of the Federal Administrative Procedure Act. Inasmuch as these hearing procedures in their formal aspects are only now being gradually utilized by the Commission, considerable question remains concerning their application and implementation. The hearing procedures of the Commission have, in fact, undergone considerable statutory and policy change since enactment of the 1954 legislation.

Initially, Section 189a of the statute [379] provided only that "in any proceedings . . . for the granting, suspending, revoking, or amending of any license . . . and in any proceeding for the issuance or modifica-

[375] 42 U.S.C.A. §2017(a).

[376] Remarks of Rep. Holifield outlining scope of review of Joint Committee under Section 261a, 1957 Congressional Review Hearings, *supra* note 7 at 38: "Antitrust policy and patent policy: Under the Joint Committee bills . . . the basis for each individual arrangement must be submitted to the Joint Committee . . . before becoming effective it it provides any financial assistance. Such basis shall include a description of 'the general features of the proposed arrangement or amendment' . . . and it is contemplated that the Joint Committee may therefore be able to review the antitrust and patent implications of each individual arrangement before it is consummated."

[377] Sections 181-189, 42 U.S.C.A. §§2231-2239.

[378] 10 Code Fed. Regs Pt. 2.

[379] 42 U.S.C.A. §2239(a).

tion of rules and regulations dealing with the activities of licensees . . . the Commission shall grant a hearing upon the request of any person whose interest may be affected by the proceeding. . . ." Section 181 provides that the "provisions of the Administrative Procedure Act shall apply to all agency action taken under this act." [380] Licensing under the Atomic Energy Act clearly constitutes adjudication under the Administrative Procedure Act.[381] The Commission has taken the praiseworthy and correct [382] position that a "formal hearing" should be held on applications for the issuance, amendment, or transfer of a license or construction permit [383] or the modification, suspension, or revocation thereof.[384] However, "informal" proceedings are obviously preferred by the Commission for the collection of necessary information and for rule making.[385]

Prior to 1957, a "formal" proceeding could be initiated under two circumstances. Before the Commission acted on an application, such a hearing could be ordered upon the request of the applicant, an intervenor, or the Commission itself. Request by the applicant or an intervenor for such a hearing also could be made, within thirty days after notice of Commission action with respect to the license had been published.[386]

Further, "in such cases as it deems appropriate," the Commission could serve notice of proposed action on an application upon the appli-

[380] 42 U.S.C.A. §2231.

[381] Section 2(d), 5 U.S.C.A. §1001(a).

[382] Under Section 5 of the Administrative Procedure Act, 5 U.S.C.A. §1004, formal adjudication occurs where the applicable statute requires a determination "on the record after opportunity for an agency hearing." Although Section 189a of the Atomic Energy Act of 1954 prior to the 1957 amendment did not use the words "on the record," the context in which the hearing requirement was used and the liberal interpretation to be accorded the Administrative Procedure Act warranted the Commission's position that a hearing "on the record" was required where requested under Section 189a. See Wong Yang Sung v. McGrath, 339 U.S. 33, 50, 70 S. Ct. 445 (1950) as modified, 339 U.S. 908, 70 S. Ct. 564 (1950); Hoover Commission Legal Task Force Report, *supra* note 43 at 167-170. For a contrary point of view, see Davison, "Requirements of Hearings in Administrative Adjudication," Joint Committee Staff Study, *supra* note 3, App. 15 at 195. In the case of the first such request in a licensing proceeding, the Commission correctly ordered a formal hearing. In the Matter of Power Reactor Development Company, AEC Dkt. F-16, "Notice of Hearing Order," 21 Fed. Reg. 7809 (Oct. 12, 1956). Prior to 1957, it was recommended that the Commission, as a matter of policy, order a formal hearing in each Section 103 licensing proceeding, "Report of Workshop III," Atomic Energy Workshops, *supra* note 215 at 59.

[383] 10 Code Fed. Regs. §2.102(a).

[384] 10 Code Fed. Regs. §2.202.

[385] 10 Code Fed. Regs. §2,708.

[386] 10 Code Fed. Regs. §2.102(a).

cant and interested parties and publish such notice, and a formal hearing could be held upon request of such applicant or other parties if request therefor was made within fifteen days after service of the notice.[387] Under this procedure, the Commission "uniformly" [388] took its action first, subject to a request for hearing within thirty days.

However, after December 1956, the agency changed its practice and issued notices of intention to grant a license affording fifteen days' time in which to file requests for hearing.[389] In April 1957, the Commission by rule formalized the latter procedure.[390] The Commission's action was taken partly as the result of a Joint Committee Staff Study which set forth in compelling terms the reasons for requiring a formal hearing in every case prior to issuance of a construction permit or license under Sections 103 or 104 of the statute.[391] The proposal had, in fact, been opposed by the Commission.[392] Subsequently, Congress followed the Staff recommendation, and in September 1957, it amended Section 189a to require that the "Commission . . . hold a hearing after thirty days notice and publication once in the Federal Register on each application under Sections 103 or 104b for a license for a facility, and on any application under Section 104c for a license for a testing facility." [393]

[387] 10 Code Fed. Regs. §2.102(b).

[388] Joint Committee Staff Study, *supra* note 3 at 19.

[389] See "Notice of Proposed Issuance of Construction Permit to AMF Atomics, Inc.," Dec. 19, 1956, Dkt. No. F-17, as explained in AEC Press Rel. Dec. 28, 1956, Joint Committee Staff Study, *supra* note 3, App. 14A and B at 186-189.

[390] This was done by amending 10 Code Fed. Regs. §2.102(b) and (c); see "Notice of Proposed Rule Making," 22 Fed. Reg. 2433 (April 11, 1957).

[391] Joint Committee Staff Study, *supra* note 3 at 23: "The advantages of this notice of intent and hearing procedure are that it would provide the maximum amount of information concerning the proposed reactor to the public, and would also provide easy opportunity for participation by interested parties and the public. This type of procedure would seem to provide maximum assurance of fair and open dealings on the part of the agency." Sen. Anderson indicated support for such a recommendation during floor debate on Section 189 of the 1954 act, *id.*, at 17, n.2 see recommendation that the AEC, as a matter of policy, order a formal hearing in each Section 103 licensing proceeding, "Report of Workshop III," Atomic Energy Workshops, *supra* note 215 at 59.

[392] Chiefly on the grounds that such procedure would destroy "administrative simplicity" and cause unnecessary delay in proceedings, particularly where uncontested, Joint Committee Staff Study, *supra* note 3 at 22-24 and App. 5 at 109-110.

[393] Pub. L. 85-256, 85th Cong., 1st Sess. (1957); see H.R. Rep. No. 435, 85th Cong., 1st Sess. 12, 25 (1957). As the result of the amendment to Section 189a, the Commission was required to vacate the notice of proposed issuance of a construction permit for a Section 104b research reactor to Yankee Atomic Electric Co., Dkt. No. 50-29, and to set the matter for hearing, 22 Fed. Reg. 7188 (Sept. 7, 1957). After a hearing on Oct. 8 and 24, 1957, the AEC on Nov. 19, 1957, published a notice of its findings and

This congressional action represents an important step in bringing administrative due process to atomic energy procedures, a development which had been parallelled to a certain extent by Commission procedure developed by regulation and precedent in the Power Reactor Development Company licensing proceeding, the first of its kind held by the agency.[394] The requirement of an opportunity for a hearing before an application for a construction permit or license is issued also resolves the question concerning the suspension of such a permit or license which is once issued but later becomes the subject of a hearing.[395]

---

order and of the issuance of a construction permit to Yankee, 22 Fed. Reg. 9237. The "Memorandum of Opinion of the Commissioners" granting the permit was not published in the Federal Register, an omission which should be corrected in the interests of complete public information in the field of atomic energy (see BNA, Atomic Industry Reporter 227:644a). The Yankee proceeding was the first completed under the new Section 189a procedure.

[394] The PRDC proceeding "has already begun the development of quasi-judicial attitudes and techniques on the part of the Commission" (Plaine, *supra* note 1 at 75).

[395] In its order for hearing dated Oct. 8, 1956, in the PRDC proceeding, the Commission denied the request of intervenors "for an immediate suspension of said construction permit pending the final determination of the matters raised by said petitions . . . without prejudice to ultimate determination by the Commission as to whether the permit should be continued, modified, or vacated" (Para. (4)). The intervenors in that proceeding argued that the "continuance of the construction permit to PRDC . . . would be contrary to the Act and the regulations of the Commission" and that the permit "should be suspended" during the hearing (Reply Brief of Intervenors, *supra* note 313 at 43). The dilemma in which the AEC had placed itself by issuing a provisional construction permit and then by passing upon the merits of the controversy after a formal hearing thereon is stated by the intervenors in their Post-Hearing Brief, *supra* note 291 at 36: "If this were . . . a case of initial licensing in which the Commission had not taken a position on the merits at the time of the hearing, there can be no question that it would have been entirely appropriate for AEC not to take a position with respect to the issues. . . . But this is not in fact a case of initial licensing. The Commission had already issued the license when the instant proceeding was instituted, and it has continued that license, in effect, over the strenuous objections of Intervenors. It is utterly unrealistic for the Commission to act as if it had not already rendered a decision on the issues, and to ignore the fact that it was being called on, in effect, to defend or reverse its position." Refusal of the Commission to take a position during the proceeding was claimed to be a denial of a fair hearing. In this connection, the following exchange occurred between AEC Chairman Strauss and Sen. Gore during the 1957 Section 202 Hearings, *supra* note 7 at 43-44: "Senator Gore. Is not that [the PRDC construction permit] in fact in a state of suspension? . . . Mr. Strauss. There is a hearing in progress, Senator. . . . [C]onstruction is going ahead with no suspension or delay as far as the Commission is aware. Senator Gore. You have given a construction permit? Mr. Strauss. That is right. It is not in suspension in any way." Under the Federal Communications Act of 1952, 47 U.S.C.A. §309(c), a construction permit automatically is suspended for the duration of a hearing initiated by a protest. See Joint Committee Staff Study, *supra* note 3 at 21.

Subject, of course, to actual observance by the Commission of the Atomic Energy Act of 1954 and the Administrative Procedure Act in spirit as well as letter, the agency appears to have provided very adequately by its rules for administrative due process on such matters as service of papers,[396] representation,[397] intervention,[398] consolidation of related proceedings,[399] and notice of hearing.[400] The burden of proof in any proceeding has been placed properly upon the applicant for a construction permit or license, which must affirmatively "demonstrate at the hearing that it is able to satisfy those requirements of law and the Commission's regulations which are in controversy." [401]

[396] 10 Code Fed. Regs. §2.703.

[397] 10 Code Fed. Regs. §2.704. In formal hearings, involving as they do the practice of law, only attorneys at law will be permitted to represent others, 10 Code Fed. Regs. §2.704(b); see Plaine, *supra* note 77 at 808-809.

[398] 10 Code Fed. Regs. §§2.705-.706; see Plaine, *supra* note 77 at 809. The PRDC proceeding, AEC Dkt. No. F-16, raises an interesting question with regard to the right of intervention. The three unions petitioning to intervene therein largely based their right to do so on their representation of union members whose health and safety allegedly would be adversely affected if the application were granted; see Post-Hearing Brief of Intervenors, *supra* note 291 at 1-2. The standing to intervene was questioned but not actually controverted by the applicant, and the Commission held that "[p]rima facie these allegations provide a basis for the granting of leave to intervene in the procedings before the Commission" ("Memorandum of the Commission" 1 (Mimeo Oct. 8, 1956); see BNA, Atomic Industry Reporter 52:41). The applicant, in a subsequent filing with the Commission, asked to have one of the issues, *i.e.*, the issue of financial qualification, eliminated on the grounds, *inter alia*, that the intervening unions had no interest in the matter of financial qualification. On Mar. 4, 1957, the State of Michigan filed a petition, and was permitted, to intervene in the PRDC proceedings, to participate therein "as its interests may arise" (BNA, Atomic Industry Reporter 3:77).

[399] 10 Code Fed. Regs. §2.707.

[400] 10 Code Fed. Regs. §2.735. This regulation provides for the specification of issues by the AEC in its order for hearing, to which specification in the PRDC proceeding intervenors strongly objected. Charging that the Commission had been "capricious" in its limitation of issues in the order dated Oct. 8, 1956, counsel for the intervenors charged before the Joint Committee that "we [the intervenors] had to consider it [participation in the hearing] on their [the AEC's] terms and only on their terms," without regard to "the question of whether the AEC itself had violated the law" (1957 Section 202 Hearings, *supra* note 7 at 467, 476-477). It was the position of the intervenors that, by its limitation of the issues of the proceeding "so as to preclude proof of illegal conduct on the part of the Commission in the issuance of a conditional construction permit to PRDC," the AEC had denied them a fair hearing (Post-Hearing Brief of Intervenors, *supra* note 291 at 19); see Reply Memorandum for Applicant, *supra* note 291 at 4.

[401] Power Reactor Development Company, AEC Dkt. No. F-16. "Memorandum of the Commission," *supra* note 398 at ¶6.

a. Hearing Officers

In formal licensing proceedings, Atomic Energy Commission rules [402] require that the hearing officer be either a member of the Commission, an officer or board to whom has been delegated final authority of the agency to act, or a hearing examiner appointed under Section 11 of the Administrative Procedure Act.[403] The appointment of Section 11 hearing examiners in the first formal proceedings under the Atomic Energy Act of 1954 [404] indicates the Commission will use such examiners to the greatest extent possible. The powers of a presiding officer [405] are essentially those provided for under the Administrative Procedure Act.[406] The use of prehearing conferences [407] and deposition procedure [408] also is emphasized. Time-consuming interlocutory appeals to the Commission from rulings of presiding officers are prohibited "except in extraordinary circumstances." [409]

Ordinarily, a presiding officer issues an intermediate decision which becomes final unless it is excepted to by the parties to the proceeding or

[402] 10 Code Fed. Regs. §2.732. This conforms to Section 7(a) of the Administrative Procedure Act, 5 U.S.C.A. §1006(a).

[403] 5 U.S.C.A. §1010.

[404] Power Reactor Development Company, AEC Dkt. No. F-16, "Notice of Hearing Order," BNA, Atomic Industry Reporter 52:40; Yankee Atomic Electric Co., AEC Dkt. No. 50-29; National Advisory Committee for Aeronautics, AEC Dkt. No. 50-30, "Hearings: Additions and Modifications," 22 Fed. Reg. 7214 (Sept. 10, 1957), BNA, Atomic Industry Reporter 53:67; General Electric Company, AEC Dkt. No. 50-70, BNA, Atomic Industry Reporter 4:95; see Plaine, *supra* note 77 at 812-813. On Aug. 5, 1958, the AEC announced that an Office of Hearing Examiner has been established, and Samuel W. Jensch appointed thereto, "to fill the Commission's requirement for hearings and to keep pace with the growth of the regulatory functions of the Commission" (AEC Press Rel. No. A-201).

[405] 10 Code Fed. Regs. §§2.733, 2.744, 2.745, 2.746, and 2.747.

[406] Section 7(b), 5 U.S.C.A. §1006(b).

[407] 10 Code Fed. Regs. §2.740; such a conference was held in the PRDC proceeding.

[408] 10 Code Fed. Regs. §2.745.

[409] 10 Code Fed. Regs. §2.748. This regulation provides that the hearing officer shall not permit interlocutory appeals to the Commission during a proceeding "except in extraordinary circumstances where in the judgment of the presiding officer prompt decision by the Commission is necessary to prevent detriment to the public interest or unusual delay or expense." In the PRDC proceeding, AEC Dkt. No. F-16, the hearing examiner refused to permit an interlocutory appeal from his order overruling objections to the use of written narrative testimony by PRDC witnesses. This decision was affirmed by the Commission Feb. 27, 1957, on the grounds that ". . . to allow the requested appeal would simply mean allowing one of the parties to circumvent a sound rule aimed at expediting the course of hearings, and would encourage continuing interruptions of this hearing by recurring appeals to the Commission" (BNA, Atomic Industry Reporter 3:78).

unless it is ordered by the Commission to be certified to it.[410] Prior to December 1957, in neither its regulations nor its practice had the Commission permitted a hearing officer to issue an initial decision, which would become final unless appealed.[411] Such decisions, if permitted, would have afforded the agency the benefit of the views of the officer who heard the testimony.[412] However, the Commission in orders issued in December 1957, instructed its hearing examiner to render initial decisions in two proceedings, a development which, it is hoped, may establish a new policy for the Commission in the future.[413]

Hearing examiner orders, in cases where permitted by the Commission, and final orders of the agency itself are required to contain findings of fact and conclusions of law.[414] Provision also is made in the AEC regulations for briefs and oral argument before the Commission [415] and for petitions for reconsideration of a final order of the agency.[416]

[410] 10 Code Fed. Regs. §§2.751-.752.

[411] The Commission, in every proceeding prior to 1958, has directed that the record be certified to it by the presiding officer without decision, Power Reactor Development Company, AEC Dkt. No. F-16, "Notice of Hearing Order," 21 Fed. Reg. 7809 (Oct. 12, 1956), BNA, Atomic Industry Reporter 52:40; Yankee Atomic Electric Co., AEC Dkt. No. 50-29, and National Advisory Committee of Aeronautics, AEC Dkt. No. 50-30, "Hearing: Additions and Modifications," 22 Fed. Reg. 7214 (Sept. 10, 1957), BNA, Atomic Industry Reporter 53:67.

[412] If hearing examiners are to perform the quasi-judicial role intended for them by Congress, then agencies should permit them to tender initial decisions in every case, unless the parties stipulate otherwise; Hoover Commission Legal Task Force Report, *supra* note 43 at 203-206. See Joint Committee Staff Study, *supra* note 3 at 39, n. 7: "The Commission's reluctance to permit the hearing examiner to make an initial decision [in the PRDC proceeding] is understandable, since he had no previous background in atomic energy matters, but it points up the need for qualified hearing examiners who are conversant with the Atomic Energy Act, AEC regulations and atomic energy technology." In questioning witnesses before the Joint Committee, Rep. Holifield claimed that the hearing examiner in the PRDC proceeding was a "special examiner appointed by the AEC" (1957 Section 202 Hearings, *supra* note 7 at 441 and 467-468). For a criticism of the AEC's refusal to permit a decision at the examiner level, see *id.* at 478.

[413] National Advisory Committee for Aeronautics, AEC Dkt. No. 50-30, 22 Fed. Reg. 9895 (Dec. 11, 1957), BNA, Atomic Industry Reporter 3:422; General Electric Co., AEC Dkt. No. 50-70, 22 Fed. Reg. 10126 (Dec. 18, 1957). On February 26, 1958, the hearing examiner gave his decision that the order for a construction permit be granted as of March 25, 1958, unless exceptions were filed to his decision or the Commission took the matter under advisement. On March 3, 1958 the applicant moved that the construction permit be granted immediately, to which motion the Commission staff consented, and the Commission ordered the construction permit issued on March 7, 1958. See BNA, Atomic Industry Reporter 4:95-96.

[414] 10 Code Fed. Regs. §§2.749, 2.750, and 2.754.

[415] 10 Code Fed. Regs. §2.753. This rule does not contemplate oral argument before an intermediate decision provided under 10 Code Fed. Regs. §2.751. However, in the PRDC proceeding, the Commission announced that it would have oral argument before

b. Evidence

By both rule and practice, the Commission has shown a realistic but fair attitude towards the submission of evidence in formal proceedings before that agency. In accordance with the Administrative Procedure Act,[417] the AEC regulations provide for the submission of "such oral or documentary evidence . . . as may be required for a full and true disclosure of the facts," [418] with an admonition to the hearing officer to "exclude all irrelevant, immaterial or unduly repetitious evidence." [419]

The regulations also encourage the submission of evidence in written form.[420] This practice has been used extensively, and it is believed wisely, in the Power Reactor Development Company proceedings.[421]

---

the agency itself issued an intermediate decision; BNA, Atomic Industry Reporter 4:22. Oral argument was held before Commissioners Floberg, Graham, and Vance on May 29, 1958, at which Commissioner Floberg stated that consideration had been given to remanding the case to the hearing examiner for an intermediate decision but that the Commission had decided itself to issue such a decision, to which the parties would have an opportunity to file exceptions and comments before a final decision was rendered; see BNA, Atomic Industry Reporter 4:179.

[416] 10 Code Fed. Regs. §2.756.

[417] Section 7(c), 5 U.S.C.A. §1006(c), which provides, in part: "Any oral or documentary evidence may be received, but every agency shall as a matter of policy provide for the exclusion of irrelevant, immaterial or unduly repetitious evidence. . . . Every party shall have the right to present his case or defense by oral or documentary evidence . . . as may be required for a full and true disclosure of the facts. . . ."

[418] 10 Code Fed. Regs. §2.747(a); see Plaine, *supra* note 77 at 816.

[419] 10 Code Fed. Regs. §2.747(b). In the PRDC proceeding the applicant charged that, as the result of cross-examination by the intervenors, "the proportion of the testimony included in the transcript which is totally irrelevant to any issue presented is extraordinarily high" (Brief for Applicant, *supra* note 314 at 5, n. 7).

[420] 10 Code Fed. Regs. §2.747(a): "The parties shall be encouraged to present evidence in written form."

[421] At a pre-hearing conference in the proceeding, AEC Dkt. No. F-16, on Nov. 29, 1956, the hearing examiner permitted the applicant to prepare the "substantial part" of its case in the form of sworn statements by witnesses, subject to objection by the intervenors and cross-examination of the witnesses concerned; BNA, Atomic Industry Reporter 2:387. On Jan. 8, 1957, the applicant presented and rested its case with the introduction of so-called "canned testimony" by six witnesses, whereupon the hearing was adjourned to Jan. 28, 1957, for objection to the testimony by the other parties concerned; *id.* at 3:11. After oral argument, the examiner on Jan. 29, 1957, overruled all but 5 of 62 objections to the PRDC evidence. The principal attack by intervenors on the evidence was that (1) under 10 Code Fed. Regs. §2.740(b), providing for pre-trial orders, the consent of intervenors was required to the entry of the examiner's pre-trial order with respect to written evidence and (2) counsel was denied the right to observe the demeanor of the witnesses. The intervenors filed an interlocutory appeal from the examiner's ruling (*id.* at 3:45) which was denied by the Commission Feb. 27, 1957 (*id.* at 3:78). The issue was extensively argued by the parties in their briefs, the intervenors taking the position that a fair hearing had been

It is a matter of common practice in the older established agencies like the Federal Communications Commission [422] and Federal Power Commission.[423]

c. Public Records

An important problem that arises in connection with licensing by any agency is the manner in which the agency implements Section 3(c) of the Administrative Procedure Act which provides:

> Save as otherwise required by statute, matters of official record shall in accordance with published rule be made available to persons properly and directly concerned except information held confidential for good cause found.[424]

Aside from problems which arise under the Atomic Energy Commission's access permit program,[425] that organization is one of the few executive agencies and departments which has spelled out by regulation the meaning of the term "public records." [426]

---

denied them; Post-Hearing Brief of Intervenors, *supra* note 291 at 6-7 and 37-41; Reply Memorandum for Applicant, *supra* note 291 at 2-4. In connection with the National Advisory Committee for Aeronautics proceeding, AEC Dkt. No. 50-30, the presiding examiner requested parties thereto to distribute written copies of testimony to each other prior to the hearing; BNA, Atomic Industry Reporter 4: 13. The use of sworn memoranda in proceedings, particularly where uncontested, was approved by the Joint Committee Staff Study, *supra* note 3 at 21-22, 24. The AEC has indicated that proposed written testimony by Commission witnesses will be submitted in advance of hearing to an applicant for a license where the application is not contested and the Advisory Committee on Reactor Safety report is generally favorable, whereby "the applicant and other parties will be in a position to cross-examine promptly, if they desire to do so." (Statement of Robert Lowenstein, Office of General Counsel, AEC, to Atomic Industrial Forum (mimeo, 1958)).

[422] *E.g.*, In the Matter of Carolina Gas Corp., et al., FPC Dkt. No. G-1335 (1950).

[423] *E.g.*, In the Matter of Charges for and in Connection with Marine Telegraph Services, FCC Dkt. Nos. 9915 'and 9822 (1951). In particular, see testimony introduced by South Porto Rico Sugar Company, operator of a small coastal radio station which was saved considerable expense by the use of "canned testimony." Indeed, without such a device, such small companies would find participation in rate and other proceedings almost prohibitively high in cost. Further, the device speeds the proceeding, a result which the intervenors in the PRDC case recognized but probably did not favor.

[424] 5 U.S.C.A. §1002(c). See Hoover Commission Legal Task Force Report, *supra* note 43 at 155: "A weakness of the Administrative Procedure Act is that it contains no definition of matters of official record. The majority of agencies have not defined this term. Even where a definition has been provided, it has usually been too restrictive. . . ."

[425] See text, *supra* at note 289.

[426] 10 Code Fed. Regs. Pt. 9, adopted Dec. 8, 1956. For the more important provisions of these regulations, see Joint Committee Staff Study, *supra* note 3, App. 3C, at 90-91; BNA, Atomic Industry Reporter 2: 355.

Adopted to meet the needs of the AEC's first adjudicatory proceeding, the rules are not without their shortcomings, a fact which Congress has sought to remedy by amendment of the Atomic Energy Act of 1954. The practice of the Commission prior to the PRDC licensing proceeding was to withhold from the public the report of the agency's Advisory Committee on Reactor Safeguards (ACRS).[427] A qualified report by the ACRS with respect to the PRDC reactor [428] was leaked through Congressional sources, whereupon the Commission in October 1956, published the Committee report together with the AEC's order setting the PRDC case for hearing.[429] The Commission made clear that this action was not to be considered a precedent, but modified its previous procedure in licensing cases to the extent that a summary of the ACRS report was contained in the memorandum accompanying the Commission issuance of a construction permit or license.[430]

This action did not, however, completely answer doubts raised as to the wisdom of the Commission's policy of withholding ACRS reports, particularly in view of the indemnity program then being considered by the 85th Congress.[431] The result was that, in enacting legislation to provide for a federal indemnity for atomic accidents and a limitation on the liability of persons participating in the atomic energy program,[432] Congress gave the ACRS legislative status.[433] This legislation also required that all applications for construction permits and licenses under Sections 103 and 104 be reviewed by ACRS, and that the report be "made part of the record of the application and available to the public, except to the extent that security classification prevents disclosure." [434]

d. "Parallel Procedures"

The Atomic Energy Act of 1954 authorizes the Commission to provide by regulation

> . . . in the case of agency proceedings or actions which involve Restricted Data or defense information . . . for such parallel procedures as will effectively safeguard and prevent disclosure of Restricted Data or defense information to unauthorized persons with minimum impairment of the procedural rights which would be available if Restricted Data or defense information were not involved.[435]

This provision constitutes a landmark in administrative law and a praiseworthy attempt to accommodate the national need for information security with administrative due process and fairness to persons participating in the atomic energy program.[436]

The Commission delayed in implementing the statutory provision for

---

hearing in all Section 103, 104b, and 104c procedings. See H.R. Rep. No. 435, *supra* note 223 at 12: "Having established the Committee [ACRS] under the bill, it was thought that its functions would be best served if its reports should be made public, and if the facilities of the type on which its report were required should be licensed only after a public hearing. . . . [F]ull, free, and frank discussion in public of the hazards involved in any particular reactor would seem to be the most certain way of assuring that the reactors will indeed be safe and that the public will be fully apprised of this fact." The policy of ACRS, according to its chairman, is to avoid "concerning itself with problems of national policy other than the question of safety. The Committee believes that it is possible to conduct the operation of nuclear reactors without unnecessarily exposing the public or workers to harmful amounts of radiation" (1958 Section 202 Hearings, *supra* note 32 at 118). The emphasis by members of the Joint Committee on the role of ACRS is on its freedom of action "to exercise your judgment fully without restriction in this field" (*id.* at 117). With respect to the ACRS, an official of the AEC has recently emphasized that the group is an advisory group only and "not an 'independent agency,'" with the ultimate responsibility for the issuance or non-issuance of a license resting with the Commission; meetings of the ACRS probably will not be open, although representatives of the applicant may be asked to answer questions of ACRS after preliminary study of the application by the latter; in cases where the ACRS report is favorable, "the hearing is not likely to be protracted" before a hearing examiner (Lowenstein, *supra* note 421).

[435] Section 181, 42 U.S.C.A. §2231.

[436] As originally proposed, Section 181 required the AEC to "provide by regulation for identical procedures except that they shall not be made public." The language of the section as enacted was proposed by Sen. Hickenlooper (Rep., Iowa), with the following comment (Joint Committee Staff Study, *supra* note 3 at 68-69): ". . . [T]he change in section 181 relating to the Administration Procedure Act is to provide the Commission with a little more flexibility in dealing with procedures than was provided in this section in the bill. . . . [T]he procedures are such as to protect against the wrongful dissemination of restricted data and defense information while at the same time preserving as many of the normal procedures as possible. . . ."

such "parallel procedures." Apparently as the result of some prodding by the Joint Committee on Atomic Energy and "a need in pending proceedings" for such rules, the Commission finally in late 1956 provided for "parallel procedures" for Restricted Data.[437]

As the Commission stated in its notice of rule making:

> Discharge of this responsibility [under Section 181 of the Act] requires the framing of novel procedures; and a delicate balancing of the need to provide adequate protection for Restricted Data in relation to the importance of providing access for parties and the public to the records of administrative proceedings before the Commission and information relating thereto.[438]

An important step in the implementation of the statutory provision was taken in placing these rules in effect.

The principal features of the new "parallel procedures" are (1) the obligation of parties to a proceeding to avoid introduction of Restricted Data,[439] (2) the requirement of a notice of intent to introduce Restricted Data,[440] and (3) the authority of the presiding officer to rearrange or suspend the proceeding pending the satisfaction of security requirements by interested parties and counsel.[441] Effective implementation of these rules will depend, in large part, upon the whole-hearted cooperation of parties, their counsel, the hearing officer, and the Commission, a pattern which has been established in other types of administrative proceedings before federal agencies where the schedule of hearings, admission of evidence, and the examination of witnesses often is adjusted to suit the convenience and needs of the parties by mutual consent.[442] The present rules are not without possible defect, and im-

[437] 21 Fed. Reg. 8594 (Nov. 8, 1956) and 21 Fed. Reg. 9741 (Dec. 8, 1956), 10 Code Fed. Regs. §§2.800-.814. It is significant that on the same December date that the AEC published notice of intention to promulgate the parallel procedure regulations, the agency announced promulgation of new rules with respect to public records; 21 Fed. Reg. 9743, 10 Code Fed. Regs. §§9.1-9.7.

[441] 10 Code Fed. Regs. §2.809.

[442] See Section 5(a) of the Administrative Procedure Act, 5 U.S.C.A. §1004(a) which provides, *inter alia:* "In fixing the times and places for hearings, due regard shall be had for the convenience and necessity of the parties or their representatives." In the PRDC proceedings, AEC Dkt. No. F-16, the agency has had a "classification officer" available at the hearing to advise the hearing examiner on questions of security information; BNA, Atomic Industry Reporter 3:87 and 3:102.

provements in the procedure certainly should result from experience gained by the Commission and private parties thereunder.[443]

4. Revocation, Suspension, and Modification of Licenses and Construction Permits

Revocation of a license is specifically subject [444] to the safeguards of Section 9(b) of the Administrative Procedure Act.[445] This requirement is implemented by Atomic Energy Commission regulation providing for opportunity for a formal hearing.[446] However, unlike applications for a construction permit or license under Sections 103 and 104 of the statute, the suspension, revocation, or modification of a license requires only that the agency provide opportunity for hearing.

As under the Administrative Procedure Act, a license or construction permit may be suspended or revoked,[447] or an order to show cause immediately issued,[448] where "in the opinion of AEC the public health, interest, or safety requires, or the failure to be in compliance [with the Act, regulations issued thereunder, or license conditions] is wilful." Aside from failure to comply with the act, regulations issued thereunder, or license conditions, other grounds for immediate or future suspension or revocation of a license include a "material false statement" in an

[443] See Report of the Special Committee on Atomic Energy Law, 82 ABA Rep. 324-25 (1957): (1) "The . . . rules seem to contemplate the interruption of public hearings whenever restricted data may be requested from a witness. . . . This might be completely disruptive, and, indeed, it might even be used for that purpose. An alternative procedure would postpone the introduction of restricted data until some convenient occasion later in the hearing. . . . " (2) Provision of §2.805(d) for interlocutory appeals from rulings of a hearing examiner concerning safeguarding of restricted data "would seem to open the door to innumerable interlocutory appeals which could delay and disrupt the proceeding. . . . [T]he presiding officer should be left in control of the proceedings with authority to certify questions relating to access to restricted data if in his judgment it should seem desirable to do so. . . ." (3) "No provision is made in the . . . rules relative to court review of Commission decisions involving classified information. . . . It would seem desirable to take notice of the possibility of review in cases involving classified information. Provision could be made, for example, for certifying the non-classified record which could be amplified to contain non-classified statements concerning the general nature and content of the classified information. . . . The classified record could thereafter be made available upon court order to the court itself for the purpose of determining its relevance and importance to an adequate court review. . . ."

[447] 10 Code Fed. Regs. §§2.201(b), 70.61(d), 40.25, 30.51(c), 50.100, and 55.40(a) and (b).

[448] 10 Code Fed. Regs. §2.202(a)(2).

application or report,[449] conviction of the licensee for violation of the antitrust laws "in the conduct of the licensed activity," [450] and, in the case of an operator's license, for personal behavior on the job deemed by the Commission to create a hazard in the operation of a facility.[451] In connection with the requirements of compliance with license conditions, failure to maintain the records, submit the reports, and permit the tests and inspections imposed by the statute and regulations,[452] as required by the license, would constitute grounds for immediate or proposed suspension or revocation of a license. When a license for a commercial or non-commercial production or utilization facility is revoked or suspended, the facility can be seized and operated by the government upon payment of "just compensation." [453]

Prior to 1958, the Commission suspended only one license, and this without hearing because of the danger to public health and safety. By order dated May 2, 1957, a byproduct material license was temporarily suspended because of "certain incidents . . . resulting in the contamination of major portions of the facility from by-product material," the contamination of clothing or employees, and "a potential hazard to the health and safety of employees of the Company and members of their families." [454]

This AEC action represents a wise exercise of the extensive discretionary power which is conferred upon the agency with respect to licenses once they have been issued.[455] However, in general, there is some reason

[449] Section 186a, 42 U.S.C.A. §2236(a); 10 Code Fed. Regs. §§70.61(b), 40.24, 40.40, 30.51(b), 50.100, and 55.40(a) and (b).

[450] Section 105a, 42 U.S.C.A. §2135(a); 10 Code Fed. Regs. §50.54(g).

[451] 10 Code Fed. Regs. §55.40(c).

[452] Sections 65 and 103b, 42 U.S.C.A. §§2095 and 2133(b); 10 Code Fed. Regs. §§70.32(b)(5), 70.51-.54, 40.24, 40.29-.30, 30.41-.44, 110.10-.11, 50.34-.35, 50.70-.71, and 55.41.

[453] Section 188, 42 U.S.C.A. §2238; 10 Code Fed. Regs. §50.102.

[454] Byproduct Material License No. 31-246-1 and 31-246-2, M. W. Kellogg Co., "Temporary Suspension Order," 22 Fed. Reg. 3263 (May 9, 1957). The order was modified to permit, among other things, decontamination of the premises involved, "Notice of Proposed Modification of Temporary Suspension Order," 22 Fed. Reg. 8965 (Nov. 7, 1957). For the complete text of the documents involved in this proceeding, including the full text of the conditions imposed in the modification order dated Nov. 7, 1957, and a statement by the General Manager with respect to the incident dated Nov. 2, 1957, see BNA, Atomic Industry Reporter 265: 203-208. On March 14, 1958, the Commission permanently cancelled Kellogg's license at the request of the licensee; 23 Fed. Reg. 1938 (March 22, 1958).

[455] By order dated Feb. 12, 1958, the Commission temporarily suspended without hearing Byproduct Material License No. 42-9000-2 of Radiation Products Company and issued an order for the licensee to show cause why the license should not be sus-

for apprehension over the Commission's wide authority to revoke licenses. This is particularly important because the agency's regulations themselves "do not impose self-restraints upon the exercise of that authority." [456]

5. Internal Separation of Functions

Under Section 5(c) of the Administrative Procedure Act, except in cases, among others, of initial licensing, a separation of functions is required in formal adjudication with respect to hearing officers and investigatory and prosecuting officers.[457] A hearing officer may not be subject to the direction or jurisdiction of an investigatory or prosecuting officer, nor may such latter type of officer participate or advise in the decision of a case which he has investigated or prosecuted. The principles involved in this salutory provision of the Administrative Procedure Act have been thus summarized:

> By internal separation of powers is meant an arrangement within an agency designed to prevent the contamination of judging by other inconsistent functions. The basic objective is to maintain the integrity of, and public confidence in, case adjudication affecting private rights. The agency employee who investigates should play no further role in such proceedings than that of witness. The legal staff members who present

pended or revoked; "Temporary Order and Order to Show Cause," 23 Fed. Reg. 1100 (Feb. 19, 1958). The order alleges that "[u]pon the basis of preliminary investigation, it apears that . . . the company has willfully transferred quantities of Cobalt 60, a byproduct material . . . to one or more persons in violation" of the Atomic Energy Act of 1954 and the applicable regulations issued thereunder. A hearing on the order initially was set for Feb. 24, 1958, but the respondent waived the hearing. The AEC was reported to have notified the Texas State Commissioner of Health and the Dallas City Health Officer of the action taken by the federal agency. ". . . [T]he fact that the AEC has taken this action in the Radiation Products case may stem from the reaction to last year's M. W. Kellogg Company radiation incident at Houston" (BNA, Atomic Industry Reporter 4:60-61). On April 18, 1958, the AEC served notice of intent to revoke the Radiation Products Company license effective February 7, 1958, unless contested by the licensee, for violation of the original suspension order. The Commission claimed failure by Radiation Products Company to request a transfer of the original license from it to Radiation Products Company, incorporated by the former principal, in Radiation Products Company, 23 Fed. Reg. 2817 (April 26, 1958). By order dated June 13, 1958, as modified July 24, 1958, the AEC temporarily suspended part of the license of a user of byproduct material for non-destructive testing, and a hearing before the AEC hearing examiner on claimed violations of the license was held in July, 1958, *In The Matter of Advance Industrial X-Ray Laboratories*, By-Product Material License No. 41695-2B59.

[456] Trowbridge, *supra* note 146 at 859.

[457] 5 U.S.C.A. §1004(c); see Plaine, *supra* note 77 at 813-14.

> evidence on behalf of the agency should not participate in the ultimate decision of the case. The officer who presides at the hearing can exercise his independent judgment on the evidence only if he is insulated against agency and staff influence. The agency members should exercise their judgment on the written record without consultation with those who investigated, prosecuted and heard the case below. These are the fundamental objectives of internal separation of functions vital to the protection of private rights.[458]

Problems of internal separation have been presented to the Atomic Energy Commission in its first formal licensing proceeding, that involving PRDC.[459] One of these related to the role of agency counsel in the proceeding, since the PRDC conditional construction permit had been issued with the active support and encouragement of the Commission itself. The PRDC proceeding involved initial licensing, and the separation of functions ordinarily required by the Administrative Procedure Act was not applicable.[460] The Commission complied, to a limited extent, with the spirit of the latter statute by creating a separated legal staff for AEC participation at the hearing level.[461] The Commission did not, however, permit the hearing examiner to issue an intermediate or

[458] Hoover Commission Legal Task Force Report, *supra* note 43 at 176-177.

[459] Power Reactor Development Company, AEC Dkt. F-16. As the result of the criticism of the Commission's role in this proceeding, the Chairman of the Joint Committee directed its staff to study the problem of insuring "sharper separation of the licensing function within the AEC organization" and invited comments thereon from the AEC itself, Joint Committee Staff Study, *supra* note 3 at v and 1. See also BNA, Atomic Industry Reporter 2:413.

[460] Section 5(c), 5 U.S.C.A. §1004(c).

[461] The separated staff was represented by the Acting General Counsel and two other attorneys of the AEC. Briefs filed by these attorneys stated that they were "submitted by the separated staff established for the purpose of representing AEC as a party to this proceeding" and reflected "only the views of the separated staff" and not those of the Commission itself. See AEC Response to Questionnaire, *supra* note 77 at 1095; AEC General Manager Fields' letter to Joint Committee Chairman Anderson, Dec. 12, 1956, Joint Committee Staff Study, *supra* note 3, App. 11B at 178-179, which read, in part: ". . . [T]he Commission has established a separated staff for the preparation and conduct of the proceeding on behalf of the AEC. . . . In the preparation and conduct of the proceeding, the separated staff will not be subject to supervision by persons not on the separated staff. This staff will not participate in advising the Commission with respect to its decision. . . . To assure the impartiality of these AEC staff members in advising the Commission, the Commission has directed that such staff members may not discuss with members of the separated staff questions relating to the position to be taken by the separated staff at the proceeding. . . . The separated staff will attempt in the public interest to insure that all relevant facts not brought out by the other parties are fully developed at the hearing. . . ."

initial decision in the case, thus reserving unto itself all of the judging function.[462]

The PRDC proceeding brought to public attention an equally important problem with respect to the application of separation of functions to the Atomic Energy Commission itself.[463] Prior to December 1957, the Division of Civilian Application of the AEC exercised regulatory functions with respect to licensing and non-regulatory functions with respect to the stimulation of reactor development by private industry.[464] That the promotional efforts of the Commission might conflict

[462] Joint Committee Staff Study, *supra* note 3 at 39: "The separation of the 'judging' function in the PRDC case was of a limited nature, however, and only applied to staff advisers, because the Commission did not delegate to the hearing examiner any power to make an initial decision, but retained all 'judging' authority and responsibility itself." The Commission recognizes the importance of maintaining the independence of hearing examiners assigned to it. (1958 Section 202 Hearings, *supra* note 32 at 87 and 89); see statement by Commissioner Floberg to the Joint Committee, *id.* at 89-90: "One of the things I am particularly sensitive to is the complete independence of the trial examiners. As long as I have anything to do with this Commission, our trial examiners will be the most independent of any agency in Washington"; see note 404, *supra*.

[463] A less spectacular, but no less important, problem raised by the PRDC proceedings concerned the role to be played by AEC employees and consultants as expert witnesses during the course of the hearing. Since many such persons had played an important part in developing the PRDC project, the evidence of these witnesses was pertinent and important to the making of a complete factual record. During the proceedings, charges were made by the intervenors to the Joint Committee that the AEC had sought to draw "a curtain between nuclear experts [of the AEC] and critics of the Commission" (statement of B. C. Sigal, IUE, AFL-CIO, General Counsel, 1957 Section 202 Hearings, *supra* note 7 at 470). This situation was claimed to have arisen because of instructions issued to AEC staff members by the Director, Division of Civilian Application, generally cautioning against participation in such procedings as witnesses unless ordered to appear by subpoena (*id.* at 471-475). In the Post-Hearing Brief of Intervenors, it was argued that the "Commission denied Intervenors a fair hearing in warning consultants of the Commission that they may be subject to criminal prosecution under conflict of interest laws if they have testified for the parties in this case, other than AEC" (*supra* note 291 at 22-25). See AEC Response to Questionnaire, *supra* note 77 at 1096: ". . . [T]here has been direction to AEC personnel concerning their participation on behalf of parties other than the AEC in proceedings before the agency. AEC employees are directed to provide information and services to parties to a proceeding on the same basis as they would follow with regard to other persons, but are prohibited from consulting on their own time or voluntarily serving as witnesses for any party. AEC employees were for the purposes of the PRDC matter permitted to appear on subpoena by any party to a proceeding. In the matter of PRDC the General Manager did testify upon subpoena by the intervenors."

[464] AEC Release No. 1238, Dec. 26, 1957, BNA, Atomic Industry Reporter 209:21; see AEC Announcement No. PSMO-3, "Organization of the Division of Civilian Application," Nov. 2, 1956, Joint Committee Staff Study *supra* note 3, App. 11 at 176-178; statement of AEC Commissioner Graham, 1958 Section 202 Hearings, *supra* note 32 at 84.

with its responsibilities in adjudicating applications for construction permits and commercial licenses always was inherent in that agency's organization so long as promotional and adjudicatory functions were grouped at the staff level in one division.[465]

The most drastic proposal for reorganization of the Commission contemplated the creation of two entirely separate statutory agencies, the one concerned with regulation of private industry and the other with military matters and the promotion and development of atomic energy technology.[466] The Commission, to date, has opposed this step.[467] A middle course proposed by the staff of the Joint Committee on Atomic Energy, which would create separate regulatory and promotional divisions within the Commission,[468] was, in fact, adopted by the Commission in December 1957.[469] Under this reorganization, a Division of Licensing and Regulation, reporting to the General Manager,[470] handles all licensing and regulatory functions theretofore assigned to the Divi-

[465] The intervenors in the PRDC proceeding sought to take advantage of claimed conflicts of interest within the AEC between that agency's promotional responsibilities and those relating to licensing. They moved that the AEC Chairman disqualify himself from considering the case when it reached the Commission because of two public statements made by him concerning the PRDC project. These statements, the intervenors argued, revleaded "bias and prejudice in favor of PRDC" (Post-Hearing Brief of Interveners, *supra* note 291 at 25-28. In its Brief, *supra* note 314 at 8, the applicant argued that the position of intervenors "if sustained, would frustrate the administration of the Atomic Energy Act of 1954. It would mean that if, as here, the Chairman or a member of the Commission fulfills his executive obligations to expound congressional and Commission policy and to make recommendations to Congress regarding its effectuation, he *ipso facto* disqualifies himself from performing the adjudicatory duties that the law places upon him. . . ."

[466] Joint Committee Staff Study, *supra* note 3 at 44: "The separated agency would regulate the private atomic energy industry, while the AEC would continue to be responsible for the main operating program, including procurement of raw materials, production of special nuclear materials, manufacture of weapons, and the research and development program. . . . This separation could be achieved by reducing the present number of AEC Commissioners from 5 to 3, and by creating a second commission of 3 members to regulate the atomic industry. . . ."

[467] AEC Chairman Strauss' letter to Joint Committee Chairman Anderson, Jan. 4, 1957, *id.*, App. 5 at 109; see 46-47.

[468] *Id.* at 44-45.

[469] Plans for the reorganization were announced by the AEC at the time it published Part 1 of its regulations dealing with the offices and divisions of the Commission; 22 Fed. Reg. 9972 (Dec. 12, 1957). However, these regulations still provided for a Division of Civilian Application, 10 Code Fed. Regs. §1.113. On Dec. 26, 1957, the Commission announced that the Division of Civilian Application had been replaced by the Division of Licensing and Regulation and the Office of Industrial Development; BNA, Atomic Industry Reporter 4:3.

[470] Section 24a, 42 U.S.C.A. §2034(a); 10 Code Fed. Regs. §1.107.

sion of Civilian Application.[471] An Office of Industrial Development, reporting to the Assistant General Manager for Research and Industrial Development,[472] was assigned the responsibility for developing over-all Commission policy to encourage and assist private activities in the civilian application of atomic energy.

The greater the internal separation of functions achieved by the agency itself within the spirit and the letter of the Administrative Procedure Act, the less need, and the less pressure, for legislative action creating a separation at the level of the agency or the divisions thereof. In view of the special problems which affect the Atomic Energy Commission and the industry regulated thereby,[473] greater adherence by the AEC to the areas of internal separation marked out by the Congress in the 1946 procedure statute would go far to meet the criticisms leveled at the agency. Should these procedures fail to provide that degree of insulation of the judging from the prosecuting, investigating, and developmental functions which will assure administrative due process and encourage public and Congressional confidence in the atomic energy program, then more drastic action by the legislature may well be favorably considered. Such drastic action, of course, will be invited by the Commission if it fails to meet the standards set by the spirit as well as the letter of the Administrative Procedure Act.[474]

6. Congressional Review of Licensing

Although the Joint Committee on Atomic Energy was given the authority under the Atomic Energy Act of 1946 [475] to sit as a reviewing body in the case of facilities' licenses proposed to be issued by the

[471] 10 Code Fed. Regs. §1.113.

[472] Section 24c, 42 U.S.C.A. §2034(c); 10 Code Fed. Regs. §1.110.

[473] Joint Committee Staff Study, *supra* note 3, at 42-43; see *id.* at 47: "At this stage of the atomic-development program, the arguments against a separate agency are perhaps more persuasive than they will be at a later stage when commercial production of atomic power is achieved and the Government's developmental and promotional assignments are a less prominent part of the Government's overall role [in] atomic-power development. . . . As a longer range view is taken of atomic energy development, however, the strength of the arguments against a separate agency diminish, and tend at some point to be outweighed by the arguments favoring separation. . . ."

[474] Such was the case when Congress in 1947 conferred final authority on the General Counsel of the National Labor Relations Board with respect to investigation of unfair labor practices, issuance of complaints thereon, and prosecution of such complaints before the Board, 29 U.S.C.A. §153(d), while the Board continued to exercise the adjudicatory authority of the agency, 29 U.S.C.A. §160.

[475] Section 7, 42 U.S.C. §1807 (1946).

Atomic Energy Commission, this authority never was exercised. As originally enacted, the Atomic Energy Act of 1954 did not provide for such review, but, by amendment to the appropriations provisions of the statute in 1957, this review has been provided for indirectly.

It is reported that the Chairman of the Joint Committee refused in January 1957 to have a hearing devoted exclusively to the then pending construction permit for Power Reactor Development Co.[476] However, in the hearings which the Committee held thereafter with respect to the development, growth, and state of the atomic energy industry[477] and to authorizing legislation for the AEC budget for fiscal year 1958,[478] the issues involved in the PRDC proceeding were a major source of discussion and controversy. Although the procedure whereby AEC funds were authorized and then appropriated had been the subject of prior adverse comment by some members of Congress,[479] it is clear that the controversy resulting from the proposed construction permit for PRDC brought the matter to a head. The result was a drastic change in the authorizing procedure[480] which may well result in Joint Committee review of all construction permit and licensing proceedings involving in any way financial help from the federal government.

[476] By letter dated Jan. 16, 1957, Rep. Ashley (Dem., Ohio) requested Joint Committee Chairman Durham "to make it [the PRDC project] a proper subject of hearings by the Joint Committee on Atomic Energy." The Chairman responded that the question was "not appropriate" for a separate hearing. BNA, Atomic Industry Reporter 3: 46-47.

[477] See, *e.g.*, exchange between between Rep. Holifield and counsel for some of the intervenors, 1957 Section 202 Hearings, *supra* note 7 at 479: "Representative Holifield. So your contention essentially is this; That . . . you are now asking this committee to exercise its jurisdiction and go into this matter [the PRDC proceeding] thoroughly? Mr. Sigal. Yes. . . ."

[478] See, *e.g.*, Statement of Walter P. Reuther, President, UAW, AFL-CIO, 1957 Authorizing Legislation Hearings, *supra* note 7 at 602: "The Atomic Energy Commission will probably wait until this session of the Congress had adjourned and reaffirm their decision taken last year. The only recourse the people of Detroit and Toledo have lies in this Committee. We urge you not to permit the construction of this hazardous fast-breeder reactor. . . . *We urge you to disapprove and disallow the authorization sought here until the AEC cancels the construction permit . . .*" [Emphasis supplied.] The opposite point of view was expressed by Robert W. Hartwell, Assistant General Manager of PRDC, *id.* at 634: "Messrs. Reuther and Sigal have asked the subcommittee to sit in judgment on the uncompleted record of the construction permit proceeding. . . . Messrs. Reuther and Sigal obviously want the subcommittee and the Congress to sit as a court of appeal and to do so before all the facts are in. . . ."

[479] H.R. Rep. No. 571, *supra* note 241 at 2; Rep. Cannon, 103 Cong. Rec. 5189 (1957); BNA, Atomic Industry Reporter 1: 19.

[480] Section 261, 42 U.S.C.A. §2017; see Green, "The Strange Case of Nuclear Power," 17 Fed. Bar J. 100, 123-125 (1957).

Prior to the 1957 amendment to Section 261 of the Atomic Energy Act, the Commission was required to submit the construction portion of its proposed program for the coming fiscal year for review and authorization by the Joint Committee and Congress before appropriations were requested from Congressional appropriations committees. The remainder of the Commission's program, that is, expenditures not involving so-called "bricks and mortar," was submitted directly to the House Ways and Means Committee without prior authorizing legislation initiated by the Joint Committee on Atomic Energy and passed by Congress.[481]

The original appropriations procedure of the 1954 act was, in the opinion of the Chairman of the House Ways and Means Committee, "inadequate as a framework within which appropriation requests can be adequately considered for atomic electric power." He criticized the practice of the Commission in "arbitrarily" dividing its civilian power reactor program under the first three rounds of invitation into two fiscal categories, one covering physical structures subject to prior Congressional authorization by the Joint Committee and the other covering operating expenses not so subject to such prior authorization. The result, according to the Chairman,

> . . . has been that for fiscal years 1956, 1957, and 1958 the amount appropriated and requested for the civilian power reactor program totals $236.8 million, of which only $40 million was authorized under authorizing legislation reported out by the joint committee and approved by the Congress. . . .[482]

Section 261, as amended in 1957, now requires that appropriations involving any non-military experimental reactor designed to produce more than 10,000 thermal kilowatts of heat or designed to be used in the production of electric power must be authorized by the Joint Committee on Atomic Energy before legislation appropriating the funds

[481] This departure from the treatment accorded most regulatory agencies by legislation affecting their appropriations was made possible by the former language of Section 261, which automatically authorized to be appropriated "such sums as may be necessary and appropriated to carry out the provisions and purposes of this Act except such as may be necessary for the acquisition or condemnation of any real property or any facility or for plant or facility acquisition, construction, or expansion." Under Section 19 of the 1946 statute, 42 U.S.C. §1819 (1946), "there are hereby authorized to be appropriated such sums as may be necessary and appropriate to carry out the provisions of this Act," without any requirement for authorizing legislation.

[482] Rep. Cannon, 103 Cong. Rec. 5189 (1957); see H.R. Rep. No. 571, *supra* note 241 at 2.

therefor can be enacted.[483] Specific authorization also now is required for funds

> . . . necessary to carry out cooperative programs with persons for the development and construction of reactors for the demonstration of their use, in whole or in part, in the production of electric power or process heat, or for propulsion, or solely or principally for the commercial provision of byproduct material, irradiation, or other special services, for civilian use, by arrangements (including contracts, agreements, and loans) or amendments thereto, providing for the payment of funds, the rendering of services, and the undertaking of research and development without full reimbursement, . . . by the Commission of any other financial assistance pursuant to such arrangement. . . .[484]

The effect of this legislation [485] is to bring the regulation and development of contractual arrangements between the Commission and private industry and many non-profit research institutions under the additional umbrella of Joint Committee supervision. Thereby, that committee will be placed in a position to review all applications for construction permits or licenses involving financial benefits.[486] Although reform in the procedure for authorizing the appropriation of funds for the Atomic Energy Commission probably was long overdue, the atmosphere in

[483] Section 261a(1), 42 U.S.C.A. §2017(a)(1).

[484] Section 261a(2), 42 U.S.C.A. §2017(a)(2).

[485] The administration of Section 261a(2), as implemented by Section 111 of each authorization bill, is thus explained by the Joint Committee, H.R. Rep. No. 571, *supra* note 241 at 9: "Under Section 261a(2) and proposed section 111 of the authorization bill, it is contemplated that the Commission will request each year authorization for a certain amount of funds as a lump sum for use in a program not to exceed another lump sum, larger in amount. The first amount would cover appropriations to be authorized, while the second amount would provide a total limitation on the payments and other considerations which could be made available under the program . . . *As each individual agreement is negotiated under that lump sum, the basis of the proposed individual arrangement . . . must be submitted to the Joint Committee, and a period of 45 days must elapse while Congress is in session . . . before the Commission may enter the individual arrangement*" (emphasis supplied). The latter requirement is that provided in a uniform Section 111 for authorization bills agreed upon by the Joint Committee, *id.* at 8, and as enacted in the authorizing legislation for fiscal year 1958, Pub. L. 85-162, 85th Cong., 1st Sess. (1957).

[486] This will affect all outstanding construction permits held by persons under the first and second rounds of the civilian power reactor program. See H.R. Rep. No. 571, *supra* note 241 at 9: "Thus [under Section 261 of the Atomic Energy Act and Section 111 of authorizing legislation] the basis for each arrangement by the AEC with industry under the first, second, third, and all subsequent rounds, will be submitted individually to the Joint Committee before the Commission may proceed to enter into the arrangement. All arrangements heretofore entered into are subject to the authorization and appropriation of funds, unless obligated. . . ."

which this legislative change has been effected was unfortunate. The new Section 261 was designed in general to increase Congressional control over the atomic energy program. In particular, it was intended to give the Joint Committee indirect control over the licensing of the civilian atomic energy industry both in the production of electrical energy and in research and development.

It is clear that Commission financial support for many developmental projects will be required in the future. Under the civilian power reactor program, this aid has taken the form of waiver of established Commission charges for use of source and special nuclear material, mutually agreed-upon research and development work in federal laboratories where such work is not reasonably available elsewhere, and support of research and development required to advance the technology of the industry as a whole. To limit this help, or to subject all contracts and other arrangements concerned therewith to Congressional scrutiny and possible rejection, therefore constitutes a limitation upon the licensing authority of the regulatory body involved.

7. Judicial Review

Under Section 14(a) of the McMahon Act of 1946 [487] the provisions of Section 10 of the Administration Procedure Act [488] were made applicable to decisions of the Atomic Energy Commission. Under the Administrative Procedure Act, judicial review of agency action causing legal wrong to any person is provided, except where "(1) statutes preclude judicial review or (2) agency action is by law committed to agency discretion."

The 1946 provision never was implemented by either statutory review procedure or agency regulation. Only two judicial decisions have been found dealing with Section 14, and they did not construe the scope of review intended by Congress, except to emphasize the bar to judicial reconsideration of agency discretion.[489]

The 1954 statute established a more explicit set of provisions for

[487] 42 U.S.C. §1814(a) (1946).

[488] 5 U.S.C.A. §1009.

[489] Fletcher v. Commission, 192 F. 2d 29, 33 (D.C. Cir. 1951), *cert. den.* 342 U.S. 914 (1952) (Court of Appeals can review Commission denial of award for alleged use of petitioners' inventions but not denial of "just compensation" for such alleged use, the remedy therefor being suit in Court of Claims); United Electrical, Radio & Machine Workers of America v. Lilienthal, 84 F. Supp. 640 (D.C.D.C. 1949) (Court cannot review "executive action committed by law to the discretion of the Atomic Energy Commission")

judicial review. Under Section 189b,[490] judicial review is expressly permitted from final orders entered in proceedings for (1) the granting, suspending, revoking, or amending of any license or construction permit or application to transfer control, (2) the issuance or modification of rules and regulations dealing with the activities of licensees, and (3) the payment of compensation, awards, or royalties.

The area of judicial review may be actually narrower under the Atomic Energy Act of 1954 than under the 1946 atomic energy legislation. It is not impossible that the government would claim that any other final order of the Commission entered in a proceeding not specifically listed in Section 189b is impliedly excluded from judicial review.[491] Such a position, however, would be contrary to the legislative intent in enacting Section 10 of the Administrative Procedure Act.[492]

The procedure for invoking review under the Atomic Energy Act of 1954 is provided under a statute enacted by Congress in 1950.[493] This legislation, after 1954, gave the Federal Courts of Appeals "exclusive jurisdiction to enjoin, set aside, suspend (in whole or in part), or to determine the validity of, all final orders . . . of the Atomic Energy Commission made reviewable" by Section 189 of the 1954 act.[494] The restrictive language of this statute as to the reviewable orders of the Commission also creates a likelihood that judicial review of Commission action will be sought to be closely restricted by the government.

8. Indemnity and Public Liability

By amendment in 1957 to the Atomic Energy Act of 1954,[495] Congress has sought to meet the problems of public liability and property

[490] 42 U.S.C.A. §2239(b).

[491] Thus, the Joint Committee report on the 1954 act stated that "Section 189 provides for judicial review of a final order of the Commission *entered in certain agency actions*" (H.R. Rep. No. 2181, *supra* note 5 at 29). [Emphasis supplied.] See Joint Committee Staff Study, *supra* note 3 at 71-75; McGrath v. Zander, 177 F. 2d 649 (D.C. Cir. 1949) (orders of Alien Property Custodian).

[492] Sen. Doc. No. 248, *supra* note 43 at 275: "To preclude judicial review under this bill [Administrative Procedure Act] a statute, if not specific in withholding such review, must upon its face give clear and convincing evidence of an intent to withhold it. The mere failure to provide specially by statute for judicial review is certainly no evidence of intent to withhold review."

[493] 5 U.S.C.A. §§1031 *et seq.*

[494] 5 U.S.C.A. §1032.

[495] Pub. L. 85-256, 85th Cong., 1st Sess. (1957). See Butler, "Liability Insurance for the Nuclear Energy Hazard," 60 P. U. Fort. 913 (1957).

damage which might arise from a nuclear accident. As stated by the Joint Committee,

> . . . [T]he problem of possible liability in connection with the operation of reactors is a major deterrent to further industrial participation in the [civilian reactor] program. While the [Section] 202 hearings held in 1957 indicate that it may not be the most important deterrent—that appears to be the current lack of economic incentive—the problem of liability has become a major roadblock.[496]

Although evidence available to date does not indicate that the chances for, and damages resulting from, such an accident are considerable,[497] Congress has shown salutary foresight and ingenuity in developing a system of private insurance and governmental indemnity which is made an integral part of the contracting and licensing controls of the Atomic Energy Commission.[498] The policy underlying the Congressional action, as added to the Atomic Energy Act of 1954 itself, is that

> In order to protect the public and to encourage the development of the atomic energy industry, in the interest of the general

[496] H.R. Rep. No. 435, *supra* note 223 at 1; AEC, Twenty-third Semi-Annual Report 177 (1958): "The remote possibility that privately owned nuclear reactors might have a catastrophic accident created the problem that private organizations building or operating the facilities might incur a public liability larger than could be met either by the financial structure of their organization or by the resources of the insurance industry. . . ." See *Hearings on Governmental Indemnity and Reactor Safety Before the Joint Committee on Atomic Energy*, 85th Cong., 1st Sess. 147 (1957) (hereafter cited as 1957 Indemnity Hearings): ". . . [I]n a recent poll conducted by the Atomic Industrial Forum, the unresolved liability question was rated second only to the lack of economic incentives as a roadblock to further progress" (testimony of Francis K. McCune, Vice-President, General Electric Co.); Atomic Industrial Forum, Inc., Financial Protection Against Atomic Hazards (1957).

[497] H.R. Rep. No. 435, *supra* note 223, at 3: "Assuming that there were 100 large power reactors operating in the United States, the [Atomic Energy] Commission has found that the most pessimistic of the probabilities involved lead to the estimate that there would be less than 1 chance in 50 million of any person getting killed in any year in a reactor incident as compared to 1 chance in 5,000 for getting killed in an automobile accident. It is also concluded that hypothetical property damages range from a lower limit of about one-half a million dollars to an upper limit, in the worst imaginable case, of $7 billion. This latter figure is largely due to a contamination of land with fission products. . . . There was no disagreement that the probability of major reactor accidents was exceedingly low." See testimony of AEC Chairman Strauss, 1957 Indemnity Hearings, *supra* note 496 at 11-12; AEC, Twenty-third Semi-Annual Report 177-178 (1958).

[498] The principal opposition to the enactment of governmental indemnity legislation was voiced by Rep. Holifield in a vigorous dissent to the Joint Committee report favoring the legislation, H.R. Rep. No. 435, *supra* 223 at 35-40. In his opinion, the legislation "would provide another Government subsidy to atomic power development with-

> welfare and of the common defense and security, the United States may make funds available for a portion of the damages suffered by the public from nuclear incidents, and may limit the liability of those persons liable for such losses.[499]

The system established by Congress, to be administered by the Atomic Energy Commission in conjunction with the Joint Committee, regulates both licensees and contractors of the Commission. Holders of licenses for the distribution of special nuclear material previously were required, as a condition of that license, to "hold the United States and the Commission harmless from any damages resulting from the use or possession" of such material.[500] This requirement has been modified to the extent that indemnification by the United States and limitation of liability are available to licensees and contractors [501] under new Section 170 of the Atomic Energy Act of 1954.[502]

Section 170a requires that a person holding a license or construction permit pursuant to either Section 103 or Section 104 of the act [503] must provide certain financial protection against losses arising from a "nuclear

---

out any commensurate benefits to taxpayers and power consumers" and "is just another prop for industries too timid to move ahead without paternalistic Government help" (*id.* at 35-36).

[499] Section 2*i*, 42 U.S.C.A. §2012(i). See H.R. Rep. No. 435, *supra* note 223 at 15: "The primary concern of the Federal Government is with the protection to the people who might suffer damages from the new atomic energy industry. Since many of the reactors which will be built will be producing special nuclear material which is vital to the defense of the country, it is in the interest of the common defense and security to see that these companies are protected in their operations by having moneys available to them for payment of public liability claims and having limitations of liability proceedings available when those funds are insufficient. Since title to special nuclear material is in the United States, Congress has special powers and duties with respect to the use of that material. One of the other constitutional bases for the limitation of liability program is the bankruptcy power of the United States for it is improbable that any firm could survive claims against it of $500 million, over and above the insurance which might be available."

[500] Section 53e(8), 42 U.S.C.A. §2073(e)(8).

[501] See H.R. Rep. No. 435, *supra* note 223 at 15.

[502] 42 U.S.C.A. §2210.

[503] In addition, the Commission has the option to require that a licensee for special nuclear materials (Section 53 of the 1954 act), source materials (Section 63), and byproduct materials (Section 81) furnish such financial protection, but it "is not expected that ordinarily the Commission will use the authority given to it with respect to these latter three types of materials." H.R. Rep. No. 435, *supra* note 223 at 19. In its 1958 report to the Joint Committee required to be submitted under Section 170i of the statute, the AEC stated that it was studying the problem of extending insurance-indemnity requirements to licensees other than those licensed under Sections 103 or 104, BNA, Atomic Industry Reporter 4:116.

incident," [504] and also must enter into an indemnity agreement with the Atomic Energy Commission.[505] Under Section 170b and temporary Commission regulation,[506] financial protection, i.e., the ability to respond in damages for public liability,[507] must be provided in the amount of $150,000 per thousand kilowatts of thermal energy capacity authorized by the applicable license, but in no cases shall the amount of coverage be less than $250,000 for each nuclear reactor.[508]

[504] A "nuclear incident" is defined in Section 110, 42 U.S.C.A. §2014(o), as "any occurrence within the United States causing bodily injury, sickness, disease, or death, or loss of or damage to property, or for loss of use of property, arising out of or resulting from the radioactive, toxic, explosive, or other hazardous properties of source, special nuclear, or byproduct material." See H.R. Rep. No. 435, *supra* note 223 at 16: "The definition of 'nuclear incident' is designed to protect the public against any form of damage arising from the special dangerous properties of the materials used in the atomic energy program. . . . [I]t was not thought that an incident would necessarily have to occur within any relatively short period of time. For instance, the steady exposure to radiation . . . could constitute an incident. . . . The indemnification agreements are intended to cover damages caused by nuclear incidents for which there may be liability no matter when the damage is discovered, *i.e.*, even after the end of the license. . . ."

[505] Section 170a also establishes a third type of licensing condition applicable to persons which have immunity against suit, *i.e.*, state-owned educational institutions. Such an institution may be required by the Commission to "shed its immunity," H.R. Rep. No. 435, *supra* note 223 at 19-20; see 10 Code Fed. Regs. §140.16. The provision of Section 170a that the AEC "may require, as a further condition of issuing a license, that an applicant waive any immunity from public liability conferred by Federal or State law" has created difficulties for the Commission which are not yet satisfactorily resolved. In its April 1958 report to the Joint Committee, the AEC stated that, with only one exception, federal and state agencies receiving facilities' licenses from the Commission claimed they could not waive immunity from public liability because of existing statutory or constitutional law. According to the AEC, work was progressing on possible legislation to waive federal immunity from tort liability with respect to claims arising out of nuclear incidents and on a model bill for such waiver by the states up to the amount of insurance carried and the AEC indemnity. BNA, Atomic Industry Reporter 4: 115-116. (Ed. Note: By Pub. L. 85-744 (72 Stat. 837), Congress added Section 170k to the Act to exempt nonprofit educational institutions from the requirements of Section 170 and provided for the federal indemnity of $500,000 to apply to public liability in excess of $250,000 arising from a nuclear incident.)

[506] 10 Code Fed. Regs. §140.11. The temporary regulations were issued Sept. 11, 1957, shortly after enactment of Section 170 of the statute; 22 Fed. Reg. 7223, BNA, Atomic Industry Reporter 227:625. In its report to the Joint Committee in April 1958, the AEC submitted the draft of a proposed permanent regulation with respect to amounts of insurance to be carried by reactors, 10 Code Fed. Regs. §140.11, and stated that it was considering the amendment of other provisions of the temporary regulation, BNA, Atomic Industry Reporter 54: 31.

[507] Section 11j, 42 U.S.C.A. §2014(j).

[508] AEC licensees under Sections 103 and 104 of the statute were required to submit proof of financial protection to the agency within 30 days after Sept. 26, 1957, 10

Although Section 170b and the Commission's regulations permit financial protection in the form of private contractual indemnities, self insurance, other proof of financial responsibility, or a combination of such measures,[509] it is clear that insurance coverage from private sources is, and will be, the preferred method for complying with the Congressional mandate. Insurance pools established by stock and mutual companies prior to 1957 were believed capable of insuring losses up to $65 million in connection with a single nuclear accident.[510]

Provided a licensee has secured the necessary financial protection, he then is entitled to an agreement of indemnity[511] from the Atomic Energy Commission. In providing for this protection, Section 170c of the Atomic Energy Act of 1954, as amended, provides:

> The Commission shall, with respect to licenses issued between August 30, 1954, and August 1, 1967, for which it requires financial protection, agree to indemnify and hold harmless the licensee and other persons indemnified, as their interest may appear, from public liability arising from nuclear incidents which is in excess of the level of financial protection required of the licensee. The aggregate indemnity for all persons in-

---

Code Fed. Regs. §140.13(a). Licensees are required to notify the Commission of any material change in proof of financial protection or in other financial information filed with the agency in connection therewith, *id.*, §140.13(e). Where an insurance policy is furnished by the licensee, notice of renewal thereof must be furnished the Commission at least 30 days prior to its expiration date, *id.*, §140.14(b). Under 10 Code Fed. Regs. §140.15(b), failure to provide proof of financial protection is grounds for suspension or revocation of a license. The proposed permanent amendment to 10 Code Fed. Regs. §140.11 would require a minimum of $3,000,000 in financial protection for any nuclear reactor, with a maximum required coverage of $60 millions, the amount of the insurance to be determined by formula based, among other things, on maximum power level, fuel cycle, and population possibly subject to a nuclear accident.

[509] 10 Code Fed. Regs. §140.12. Under this regulation, "the licensee shall not substitute one type of financial protection for another type without first obtaining the written approval of the Commission." See H.R. Rep. No. 435, *supra* note 223 at 20-21. The AEC reported to the Joint Committee, in April 1958, that 12 out of 22 licensees required to submit proof of financial protection submitted insurance policies, and one elected to show adequate resources for self-insurance (BNA, Atomic Industry Reporter 4: 115).

[510] H.R. Rep. No. 435, *supra* note 223 at 7 and 10-11; AEC, Twenty-third Semi-Annual Report 177-178 (1958); 1957 Indemnity Hearings, *supra* note 496 at 81-144.

[511] Although the Commission has not yet announced a form of indemnity agreement to be used under Section 170, "The Commission will, in due course, execute and issue agreements of indemnity," such agreements to be effective on the date of the regulations issued under Section 170 170 (Sept. 26, 1957) or the "effective date of the license authorizing the licensee to operate the nuclear reactor involved, whichever is later" (10 Code Fed. Regs. §140.17(a)). Section 170f and 10 Code Fed. Regs. §140.17(b) establish a fee of $30 per year per thousand kilowatts of thermal capacity authorized for the licensee to be issued an agreement of indemnity.

> demnified in connection with each nuclear incident shall not exceed $500,000,000 including the reasonable costs of investigating and settling claims and defending suits for damage. Such a contract of indemnification shall cover public liability arising out of or in connection with licensed activity.[512]

Under Section 170e, the liability of persons indemnified by the Commission is limited to $500 millions, together with the amount of financial protection required, with respect to any single nuclear incident.[513] Such limitation may be enforced by a proceeding instituted by the Commission or any person indemnified in the appropriate United States District Court having jurisdiction in bankruptcy over the applicant.[514]

Under Section 170d of the 1957 amendment to the Atomic Energy Act of 1954, the Commission is authorized

> . . . to treat with its own contractors in the same way it can treat with licensees under the provisions of this bill. . . . It is hoped that the Commission will adopt a policy of extending indemnity provisions to contractors and subcontractors consistent with that extended to licensees and their suppliers and subcontractors. . . .
>
> In this subsection, however, the Commission is allotted discretion as to the amount of financial protection which may be

[512] 42 U.S.C.A. §2210(c). Section 170h further provides that the "agreement of indemnity may contain such terms as the Commission deems appropriate to carry out the purposes of this section," and shall require the person indemnified to cooperate with the Commission and Attorney General of the United States in any proceedings involving payment of the indemnity. With respect to the reasons for establishing a system of governmental indemnity, rather than of insurance, the Joint Committee has stated, H.R. Rep. No. 435, *supra* note 223 at 9: "A system of indemnification is established rather than an insurance system, since there is no way to establish any actuarial basis for the full protection required. The chance that a reactor will run away is too small and the foreseeable possible damages of the reactor are too great to allow the accumulation of a fund which would be adequate. . . . [I]f, as the Joint Committee anticipates, there never will be any call on the fund for payments, the funds will have been accumulated to no purpose. Hence, in this instance it seemed wisest to the Joint Committee not to treat this as an insurance problem but to treat it as an indemnification problem. . . ."

[513] In its report the Joint Committee recognized that it might be necessary for Congress to increase the amount of the indemnity, or the amount of limitation of liability, "in the light of the particular incident" (H.R. Rep. No. 435, *supra* note 223 at 21-22).

[514] *Id.* at 22-23. Under Section 170i, the Commission is required to make a survey of the incident and report the same to the Joint Committee, as "an aid to the Congress in establishing the causes of a nuclear incident. It is, in part, an aid to the parties in any action where it is unlikely that the public would be able to obtain the full amount of technical information which might be required. . . ." (H.R. Rep. No. 435, *supra* note 223 at 24). The AEC also must report to the Joint Committee on April 1 of each year concerning operations under Section 170.

> required of its contractors before the $500 million guaranteed indemnity attaches. This authority is to be available for any type of contract which the Commission may enter into, as well as to contracts and projects which the Commission may enter into jointly with other agencies of the Government. . . .[515]

Although the Commission has not issued regulations with respect to the above provisions, persons contracting with a licensee will be afforded protection under the indemnity agreement made by the Commission with such a licensee.[516]

9. Transportation and Transmission

Areas of possible conflict between the Atomic Energy Commission and other federal and state regulatory agencies arise in connection with the transportation of atomic materials and the transmission of electricity produced from nuclear energy. Although these two phases of government regulation are generally unrelated, they have a common characteristic in that the jurisdiction of the AEC is either duplicated or supplemented, and they present possible problems of conflicting jurisdiction.

a. Transportation

Although possession of source, byproduct, and special nuclear materials must be licensed by the Atomic Energy Commission, in the case

[515] *Id.* at 21-22.

[516] As a "person indemnified" within the definition of that term in Section 11r of the statute, 42 U.S.C.A. §2014(r); see H.R. Rep. No. 435, *supra* note 223 at 17. The Joint Committee report also dealt with the problem facing carriers "transporting spent fuel elements from a reactor to a processing plant. If such a company, whether through negligence or otherwise, should have an accident which would spill the radioactive materials into a stream, this bill would afford protection to the public and to the carrier, even though the carrier is not required to be a licensee under the Atomic Energy Act of 1954. . . ." Where the carrier transports materials and assemblies, such as reactor parts with fuel elements installed therein, it usually does so without any knowledge of the contents of the shipment, which is made by a contractor of the Commission. In such cases, the only recourse of the carrier, to assure protection in the event of a nuclear accident, may be to obtain a contract of carriage directly from the Commission. See 1958 Section 202 Hearings *supra* note 32 at 274-276.

On January 16, 1958, the AEC announced that it was offering statutory indemnity to "[C]ommission prime contractors and their suppliers engaged in the operation of nuclear reactors or in operation of facilities such as gaseous diffusion plants or chemical separation plants" and "to other contractors engaged in activities involving the risk of occurrence of a substantial nuclear incident" (AEC Press Rel. No. A-9, see BNA, Atomic Industry Reporter 227:629). In May 1958 the AEC indicated to the Joint Committee that the decision not to require private insurance from contractors was being reconsidered; see BNA, Atomic Industry Reporter 4:159.

of persons transporting such materials, the ways and means for effecting such transportation come within the jurisdiction of four other federal agencies. After debate as to whether or not the Interstate Commerce Act was superseded by provisions of the Atomic Energy Act of 1946 with respect to transportation of atomic materials,[517] the Atomic Energy Commission acceded to the claims of the Interstate Commerce Commission for overriding authority in that field. In fact, the Atomic Energy Commission has temporarily relinquished its apparent authority over transportation of atomic materials not only to the Interstate Commerce Commission,[518] but also to the United States Coast Guard,[519] the Civil Aeronautics Board,[520] and the U. S. Post Office Department.[521] This has been accomplished by exempting from Atomic Energy Commission licensing regulation the interstate transportation activity of regulated carriers and the mails.[522] In effect, the AEC has granted a general license to persons subject to the jurisdiction of these four agencies, without actually relinquishing jurisdiction of the subject matter.

The continuing jurisdiction of the Atomic Energy Commission in the field of transportation is demonstrated by that agency's announcement on September 21, 1957, of proposed regulations

> . . . to establish appropriate precautions in connection with the transportation of special nuclear material to prevent accidental conditions of criticality. Requirements to protect against other hazards in the shipment of such materials are prescribed pursuant to other parts [of the AEC's regulations] . . . and in regulations of other agencies having jurisdiction over means of transportation. Accordingly, the requirements of this part are in addition to, and not in substitution for, such other requirements.[523]

Reg. 2221 (Apr. 4, 1958), BNA, Atomic Industry Reporter 4: 126.

[522] 10 Code Fed. Regs. §§30.7, 40.62(b), 50.11(d), and 70.12

[523] Proposed 10 Code Fed. Regs. §71.1, 22 Fed. Reg. 7541 (Sept. 21, 1957)

The Commission has summarized the proposed regulations as follows:

> The following proposed rule distinguishes between transportation by licensees [for special nuclear material] and transportation by such unlicensed carriers. Where special nuclear material is to be transported by a licensee, prior Commission approval of proposed shipping procedures must be obtained for all shipments in excess of the quantities of special nuclear material specified. . . . In the case of unlicensed carriers, there normally exists a possibility that a number of small quantities of special nuclear material from different shippers might come into hazardous proximity to each other. For this reason the quantity of special nuclear material which may be delivered to a carrier authorized to transport special nuclear material without a Commission license is set considerably lower . . . except for cases where the licensee who makes the shipment is in a position to, and does, exercise such control over transportation of the shipment as to assure that the total quantity of special nuclear material in the shipment does not exceed the limits specified. . . .[524]

Although the regulations of the Interstate Commerce Commission, Coast Guard, Civil Aeronautics Board, and the U. S. Post Office usually do not require the issuance of a license as such, the packaging, marking, and container limitations imposed by these agencies constitute a form of indirect licensing control. Atomic material cannot be transported unless in conformity with these regulations.

There apparently has been no effort to make these licensing requirements uniform even where practicable. More efficient and economical administration of the transportation of atomic material, and consequently a less restrictive burden on the shippers and carriers involved, would result if the Atomic Energy Commission were to work out a uniform system of transportation requirements with the other four agencies involved, even though administration of these requirements were vested in the other agencies.

[524] *Ibid.* Appendix A to the proposed regulation lists the qualities of uranium 235 and 233 and plutonium which a licensee of special nuclear material may deliver to a carrier, without prior specific AEC approval, provided the licensee exercises "such supervision and control over the shipment as to assure that, if said special nuclear material is transported with any other quantity of special nuclear material, the total quantity of special nuclear material does not exceed the limits specified in Appendix A"; proposed 10 Code Fed. Regs. §71.22(a)(2). Appendix B lists the maximum quantity of types of special nuclear material which a licensee may deliver to a carrier unless in accordance with §71.22(a) or with special procedures approved by the Commission in connection with an application for a license for special nuclear material under §71.23.

b. Transmission

Whenever the holder of a commercial atomic energy license transmits electric energy in interstate commerce or sells it at wholesale in such commerce, the Federal Power Commission is obliged to exercise jurisdiction with respect thereto. Such authority is in fact required as a condition of the Atomic Energy Commerce license.[525]

The dual jurisdiction thus involved creates the possibility of conflicting regulatory standards. This is particularly true with respect to accounting practices. The accounting standards required to establish financial responsibility under the Atomic Energy Act [526] may well differ from those of the Federal Power Commission for rate-making purposes. Indeed, critics of the present Atomic Energy Act have attacked its Section 103 commercial licensing provisions as lacking the accounting and other financial restrictions imposed by the Federal Power Commission by statute and regulation.[527]

Further, a possible conflict in accounting practices may arise in connection with the determination of a "fair price" to be paid by the AEC for the production of special nuclear material in a licensed reactor. Section 56 of the Atomic Energy Act of 1954 [528] provides that the agency, in determining such fair price, "may give such weight to the actual cost of producing that [special nuclear] material as the Commission finds to be equitable." Any difference in the methods of computing costs of such material under accounting regulations enforced by the AEC, Federal Power Commission, or a state agency would, of course, be undesirable and possibly result in inequity to the licensee.

[525] Atomic Energy Act of 1954, Section 272, U.S.C.A. §2019; see 10 Code Fed. Regs., §50.43(c). Section 271 of the statute further provides that "[n]othing in this Act shall be construed to affect the authority or regulations of any Federal, State, or local agency with respect to the generation, sale, or transmission of electric power" (42 U.S.C.A. §2018).

[526] Section 182a, 42 U.S.C.A. §2232(a); 10 Code Fed. Regs. §50.40(b).

[527] H.R. Rep. No. 2181, *supra* note 5, at 122-123; Adams, *supra* note 239 at 168-170. In its report at the end of 1957, the Commission stated (Twenty-third Semi-Annual Report 98-99 (1958)): "Ascertaining costs for nuclear electric plants has required new applications of accounting principles. The items of capital costs of conventional plants are specified by the Federal Power Commission, for example, but as yet there is no agreement on the components of capital costs for nuclear reactors. During the past year the [Atomic Energy] Commission has studied the accounting problems inherent in power reactor construction and operations, and has developed an accounting basis for use in determining the operating economics of these new plants. . . . The Commission has been working with the Federal Power Commission and the National Association of Railroad and Utility Commissioners on revising classification of accounts to cover production of power through the use of reactors."

[528] 42 U.S.C.A. §2076.

D. Conclusions

As officials of the Atomic Energy Commission often have observed since passage of the Atomic Energy Act of 1954, a license issued thereunder is not, like a contract, a mere matter of negotiation.[529] Presumably, all requirements of the statute and regulations being satisfied, the applicant for a license will be entitled as a matter of legal right to engage in the activities covered by the 1954 act and his application.

This approach, however, oversimplifies the problem confronting the private organization or business seeking to risk its capital and resources in the development of atomic energy for peacetime uses.[530] A license could be a "gun [without] . . . ammunition" if the Commission chose not to make available to the licensee such services as supplying enriched uranium, a matter of negotiation and not of right.[531] Moreover, although an applicant may satisfy the requirements when the license is issued and may negotiate successfully for necessary supplies and services from the Commission, he can never be sure what changes in these requirements, and consequently changes in the terms of the license itself, will be made in the future.

As the McKinney Panel has found, the over-all effect of the restrictions imposed upon Section 103 and 104 licensees "appears to be contrary to the stated objectives of the [1954] Act" and constitutes "an interference by the Federal Government in the right of the private investor to risk his own money, even to go broke, if he chooses to do so." [532] Further,

> The emphasis in the 1954 Act on licensing is sound as a means of establishing equality of treatment of private participants, only if it is recognized that licensing rather than Federal ownership is to be the future course.[533]

So long as regulation of licensing is uniform and without serious changes in policy, the infant atomic energy industry can be reasonably certain of the requirements which must be met. In this respect, the

[529] Speech by Charles G. Manly, AEC Division of Civilian Application, July 27, 1955, BNA, Atomic Industry Reporter 277: 1.

[530] See Brief for Applicant in the PRDC proceeding, *supra* note 314 at 87.

[531] Upton, *supra* note 207 at 496. The Commission occupies the dual function of licensing regulator and "bargaining agent for the services" needed under a license. This means that the licensee is "dependent upon the Commission's good will alone and therefore is small consolation to lawyers accustomed to ascertaining their clients' rights and not merely negotiating their privileges" (*id.* at 498).

[532] McKinney Panel Report, *supra* note 10 at 132.

[533] *Id.* at 134.

Commission and its staff, in general, have performed an outstanding public service in establishing a unique system of federal regulation in which the interests of the government and of private industry, not always mutual, must be accommodated. The regulatory procedures established have been in general conformity with both the spirit and the letter of the Federal Administrative Procedure Act, as required by the Atomic Energy Act itself and in the interest of administrative due process.

The infirmities in the present licensing system are due not so much to the officials who administer the Atomic Energy Act of 1954 but to the statute itself, which these officials are bound to follow in promulgating the applicable regulations. The language of that act is so general in many important particulars as to be capable of differing interpretations.[584] For example, "national welfare" as used in the act has been interpreted with two entirely different emphases by proponents and opponents of private enterprise in the atomic field. The one interpretation favors minimum regulation to the extent consistent with national security and public health and safety. The other would require maximum regulation which would place private industry under complete government domination in the licensed activity and thus tend to leave the field for public agencies alone.

The result is that the 1954 act and the regulations issued thereunder contain within their provisions the possibilities for destroying the private participation which the act purports to seek and encourage. Such an event could result from a radical change in Commission membership, with a consequent reversal of current policies. Therefore, in the interests of both the government and private enterprise, the 1954 statute should be re-examined with a view to establishing more definite standards for licensing, particularly with respect to commercial production and utilization facilities. If a reasonably favorable climate of regulation is lacking and especially if a markedly unfavorable attitude is adopted by the AEC and Congress, then it is clear that atomic development will be retarded, and the public will not enjoy the full benefits of this new source of energy.

Re-examination of the antitrust procedures and conflicting jurisdictional problems arising under provisions of the present act and its regu-

[584] Stason, Atomic Energy Workshops, *supra* note 215 at 4: ". . . [T]here are only the vaguest 'standards' to guide the hand of the Commission. Whether or not licenses shall be issued in the first instance and whether or not they shall be modified or revoked subsequence to issuance, depends almost exclusively upon the uncontrolled discretion of the Commission"

lations also is desirable in the public interest. If industry is to assume the role intended and stated by Congress in developing the field of peacetime atomic energy without huge expenditures of federal funds, then the means for harassment of industry which are potentially present in the act must be modified, consistently with the public interest to encourage the development of a new and useful form of power.

The statutory deficiencies in the Atomic Energy Act of 1954 have assumed added importance in the light of amendments to that statute enacted by Congress during 1957, the cumulative effect of which is to add greatly to the powers of the Joint Committee on Atomic Energy. Indeed, it is not an exaggeration to state

> . . . that the Congress, and in particular the Joint Committee on Atomic Energy, has seized control over the civilian atomic power program and has stripped the AEC of a large measure of the responsibility, authority, and discretion which it previously had possessed and which executive agencies normally possess.[535]

Under the 1946 statute, the Joint Committee came close to assuming the authority of the Commission itself, with the agency relegated to the role of general manager of the program. This unsatisfactory division of authority was rectified in some degree by the provisions of the 1954 legislation. Yet, with the new powers exercised by the Joint Committee under the 1957 amendments, particularly with respect to detailed control over expenditures by the Commission, the pre-1954 situation may well have been re-established.

Until the respective relationships and authorities of the Congressional Committee and the Commission are definitely established, uniform and consistent administration of the licensing provisions of the Atomic Energy Act of 1954 is not assured, and a program of peaceful utilization of atomic energy may well be inhibited.

IV. ATOMIC ENERGY COMMISSION CONTRACTING[536]

Just as the issuance of licenses constitutes the most important aspect of the regulatory functions of the Atomic Energy Commission, so the

[535] Green, *supra* note 480 at 124. See letter from AEC Chairman Strauss to Rep. Cole, Aug. 3, 1957, 103 Cong. Rec. A6319-A6321 (Aug. 5, 1957); Hartwell, *supra* note 478 at 639: "To encourage the parties in a formal AEC proceeding to try their case not only judicially but also at the same time before Congress is not only in derogation of the administrative and judicial processes provided by law but will in our judgment go far toward destroying efficient and speedy administration of the development of civilian atomic power. . . ."

[536] For general background information on government contract problems and pro-

making of contracts provides the major means whereby the Commission administers and operates the atomic energy plant owned in a proprietary capacity by the United States government. Indeed, that plant is the largest single business of its kind in the United States, and probably in the free world. Atomic energy installations and other facilities have an estimated value before depreciation of approximately $7.06 billion.[537] More than 117,000 persons, including over 6,700 government personnel, are engaged in the operation of existing, and the construction of new, production facilities[538] under government control. Over one billion dollars was paid out by the Commission during fiscal year 1955 to cost-type contractors and directly to subcontractors.[539]

Commission contracting powers go further than the mere provision for the construction and operation of the government's atomic energy plant. Under the civilian power reactor program authorized by the Atomic Energy Act of 1954, the Commission's willingness to supply certain services and to contract for research has become an important adjunct to the system of licensing control established under that statute.

The Manhattan Engineer District, predecessor of the Commission, established the policy of operating its facilities through contracts with private business units. This practice was continued by the Commission when it took over the operations of the District on January 1, 1947.[540]

[540] AEC, Twenty-third Semi-Annual Report 10 (1958).

Government operation of production facilities appears to have been conclusively rejected by the Commission. This policy assumes additional importance under the Atomic Energy Act of 1954, whereby Congress sought to encourage a privately owned and operated atomic energy industry through contractual relationships and cooperation between government and business.[541]

Despite the increasing importance of the role of contracting between the Commission and private business in the development and expansion of atomic energy for both military and industrial uses, the procedural and substantive problems created by this method of administrative control have tended to be overlooked by both government and private interests. This failure is unfortunate, but not surprising, in view of the current lack of development of procedures assuring administrative due process in other fields of government contract endeavor.

A. Contracts in Administrative Law

The current attitude of the Executive Branch of the government and of the courts towards contracts between the government and its citizens stems in large part from the concept that, when entering into a contract, the government exercises a "proprietary" function.[542] This means that, since the government claims to assume the role of a private person in contractual dealings with private business, the government's actions are not necessarily held to be controlled by, or reviewable with respect to, accepted standards of administrative due process applicable to licensing and other more orthodox regulatory procedures. Moreover, government ownership of special nuclear material under the Atomic Energy Act of

[541] See BNA, Atomic Industry Reporter 221:1: "Contractor operation of Commission-owned research and production facilities lays the foundation for eventual termination of Government monopoly in this field and for integration of atomic energy development into the private enterprise system which is characteristic of this nation. Under the present atomic energy program as a whole, the Government draws upon the managerial skill of private enterprise, in return for which private enterprise acquires specialized technical knowledge in the field of atomic energy which, under present necessities of information control, is obtainable in no other manner." See also AEC Response to Questionnaire, *supra* note 77 at 1088: "The operations of AEC are carried out largely by industrial concerns and by private and public institutions under contract with the Commission. . . ." AEC, Twenty-third Semi-Annual Report 138, 161 (1958).

[542] The closest statutory definition of what constitutes a "proprietary" function is found in Section 4(2) of the Federal Administrative Procedure Act of 1946, 5 U.S.C.A. §1003(2), which refers to "any matter relating to agency management or personnel or to public property, loans, grants, benefits, or contracts" and which excludes these subjects from the requirements for public rule making.

1954 [543] gives the Commission, if it desires to exercise it, a powerful means of controlling not only contracting but also licensing under claim of exercise of the agency's "proprietary" rights.

A corollary of the doctrine of "proprietary" function is that the private citizen or business dealing contractually with the government has only a privilege, not a right.[544] Persons contracting with the government, as the Supreme Court has stated, are not "compelled or coerced into making the contract" which is considered a "voluntary undertaking on their part." [545] Should this exercise of the "privilege" be curtailed or denied in any way, therefore, neither general nor constitutional law provides an effective remedy for the injured party as a matter of right, except insofar as the courts are empowered to consider cases involving damages arising from breach of contracts.

This concept of the government's "proprietary" functions and, as a corollary, the privilege status of private parties in the field of contracts are reflected in the provisions—or lack of them—with respect to contracting in the Federal Administrative Procedure Act of 1946. Procedures under the Contract Settlement Act of 1944 [546] are specifically exempted from the Administrative Procedure Act.[547] In Section 4(2) of the Administrative Procedure Act [548] the making of rules with respect to contracts, public property, and similar "proprietary" matters is excepted from the salutary requirements of public notice and hearing procedures required of most types of federally issued rules and regulations.

[543] Section 52, 42 U.S.C.A. §2072.

[544] See Schwartz, "A Decade of Administrative Law," 51 Mich. L. Rev. 775, 843 (1953): "The government contractor . . . is seen to have only the 'privilege' of dealing with the government. He is placed in a different position from that of the private citizen whose property or personal 'rights' are adversely affected by administrative action." For what a congressional committee has termed "All in all . . . a shameful story" of unrestrained administrative over-reaching in the field of government contracts, see Heyer Products Co., Inc. v. United States, 140 F. Supp. 409, 412 (Ct. Cls. 1956).

[545] United States v. Wunderlich, 342 U.S. 98, 100, 72 S. Ct. 154 (1951). See Wells Bros. Co. v. U.S., 254 U.S. 83, 87, 41 S. Ct. 34 (1920) ("Men who take million dollar contracts for Government buildings are neither unsophisticated nor careless. . . .").

[546] 41 U.S.C.A. §§101 *et seq.*

[547] Section 2(a), 5 U.S.C.A. §1001(a); see Sen. Doc. No. 248, *supra* note 43 at 44, 196, 302, 313, where the congressional emphasis is upon the temporary wartime nature of the Contract Settlement Act as justification for the exception.

[548] 5 U.S.C.A. §1003(2); see Sen. Doc. No. 248, *supra* note 43 at 199, 257: "The exception of proprietary matters is included because the principal considerations in most such cases relate to mechanics and interpretations or policy, and it is deemed wise to encourage and facilitate the issuance of rules by dispensing with all mandatory procedural requirements. . . ."

In this connection, the rules of the Atomic Energy Commission with respect to procurement policy [549] and to the procedure of agency's Advisory Board of Contract Appeals [550] were promulgated apparently, without public participation in the rule-making process.

Although the federal government and the courts consistently adhere to the theory that the making and administration of public contracts is not a phase of administrative procedure,[551] it is clear that a "Government contract . . . is but a convenient administrative device for the Government to get its procurement work done and . . . administrative decisions of the Government's officers should be treated no differently from other administrative orders which affect private interests." [552] As is the case in most other federal agencies and departments, however, neither the statutory nor regulatory procedures of the Atomic Energy Commission recognize this obvious and important fact of governmental life.

B. Contracting Authority under Atomic Energy Act of 1946

Provisions of both the Atomic Energy Acts of 1946 and 1954 dealing with the contracting authority of the Atomic Energy Commission were, until 1957, substantially similar. The major difference arose from the implementation of sections of the later statute with respect to the use of electrical power produced by atomic energy, which authority was not sought to be exercised by the Commission under the earlier legislation. However, in 1957, Congress provided for certain special contractual treatment for publicly and cooperatively owned utilities [553] and for Con-

[549] 10 Code Fed. Regs. Pt. 5, 16 Fed. Reg. 1759 (Feb. 22, 1951).

[551] See Ramey and Erlewine, "Introduction to the Concept of the 'Administrative Contract' in Government Sponsored Research and Development," 17 Fed. Bar J. 354, 355 n. 3 (1957).

[552] Schultz, *supra* note 536 at 246-47, who adds: "Be that as it may, contract notions are so deeply imbedded in the thinking of judges and businessmen that it would be revolutionary for one to deny their expectation that an individual or corporation contracting with the Government will be fully protected with traditional rights and remedies. . . ." Proposed legislation drafted by the Task Force on Legal Services and Procedure of the Commission on Organization of the Executive Branch of the Government specifically defines "the performance of all proprietary functions such as . . . the execution [or performance] of public contracts in which private rights, claims, or privileges are asserted or affected" as informal adjudication; Administrative Code, Section 202(b), Hoover Commission Legal Task Force Report, *supra* note 43 at 366.

[553] Section 111(a)(1), Pub. L. 85-162, 85th Cong., 1st Sess. (1957); see discussion, *infra*.

gressional review of contracts involving the expenditure of public funds in connection with private projects.[554]

Authority to execute contracts was specifically granted the Atomic Energy Commission under the 1946 statute with respect to four major categories of activity. Three of these provisions were extensively used by the agency. The fourth, relating to byproduct power resulting from utilization of atomic energy, proved a deadletter.

Under Section 3(a) of the Atomic Energy Act of 1946,[555] the Commission was "authorized and directed to make arrangements (including contracts, agreements, and loans)" for the conduct of research and development activities relating to nuclear processes, the theory and production of atomic energy, and similar matters of primarily scientific importance. Section 4(c)(2) [556] conferred the authority to contract with private industry for the construction and operation of production facilities for fissionable materials. Section 5(a)(5) [557] authorized contracts for the purchase of fissionable materials outside the United States, or of "any interest in facilities for the production of fissionable material or in real property on which such facilities are located." Finally, under Section 5(b)(5) and (6),[558] authority was granted the Commission to contract for supplies of source material or for any interest in real property containing source material, and for "exploratory operations, investigations, and inspections" with respect to such material.

In exercising its authority under the above sections, the Commission was permitted to forego competitive bidding by advertising "upon certification . . . that such action is necessary in the interest of the common defense and security, or upon a showing that advertising is not reasonably practicable." [559] The statutory conditions imposed upon contractors under these sections related to health and safety measures, requirements for reports and inspections, and subcontracting only with Commission approval.[560]

[555] 42 U.S.C. §1803(a)(1946).

[556] 42 U.S.C. §1804(c)(2)(1946).

[557] 42 U.S.C. §1805(a)(5)(1946).

[558] 42 U.S.C. §1805(b)(5) and (6)(1946).

[559] Otherwise required by Section 3709 of the Revised Statutes, 41 U.S.C.A. §5. Under Executive Orders 10216 (Feb. 23, 1951) and 10210 (Feb. 2, 1951), Commission contracts made without competitive bidding had to contain a clause authorizing the Comptroller General to have access to, and to examine, the contractor's books.

[560] Section 3(a), 42 U.S.C. §1803(a)(1946), also provided with respect to research

Two sections of the 1946 act related to sales of electrical energy generated in connection with the production of fissionable material. The first of these provisions under Section 7(d) [561] was never utilized, since no commercial licenses which might have resulted in power generation ever were authorized. Under the second statutory provision enacted July 17, 1953,[562] the Commission was authorized, in connection with the construction or operation of its Oak Ridge, Paducah, and Portsmouth installations, to enter into contracts for electric-utility services for periods not exceeding twenty-five years. This authority served as the basis for a similar but expanded provision in the 1954 act.[563]

The Atomic Energy Act of 1946 contained no provisions dealing with the general contracting authority of the Atomic Energy Commission, other than that the agency was empowered to acquire materials, property, equipment, and facilities, and to acquire, purchase, lease and hold real and personal property required to carry out its functions.[564] Procurement regulations,[565] and the statutory [566] authority of, and regulations affecting,[567] the Advisory Board of Contract Appeals under the 1946 act were continued in effect under the Atomic Energy Act of 1954,[568] and will be discussed in connection therewith.

C. Contracting Authority under Atomic Energy Act of 1954

1. Research

Section 31 of the Atomic Energy Act of 1954 [569] is the counterpart of Section 3(a) of the earlier statute. The principal difference in language between the earlier and later provisions lies in the broadened scope of research and development activities under the 1954 act,[570] this being in accordance with the proposed aims of that statute.[571]

---

that no contract "shall . . . contain any provisions or conditions which prevent the dissemination of scientific or technical information, except to the extent such dissemination is prohibited by law."

[561] 42 U.S.C. §1807(d)(1946).

[562] Section 12(d), 42 U.S.C. §1812(d)(1946).

[563] Section 164, 42 U.S.C.A. §2204.

[564] Section 12(a)(5) and (7), 42 U.S.C. §1812(a)(5) and (7)(1946).

[565] 10 Code Fed. Regs. Pt. 5, 16 Fed. Reg. 1759 (Feb. 22, 1951).

[566] Section 12(a)(1) and (c), 42 U.S.C. §1812(a)(1) and (c)(1946).

[567] 10 Code Fed. Regs. Pt. 3, 15 Fed. Reg. 5834 (Aug. 30, 1950).

[568] Note, 10 Fed. Regs. Ch. I, 19 Fed. Reg. 5628 (Sept. 3, 1954).

[569] 42 U.S.C.A. §2051.

[570] Section 3(a)(4) of the Atomic Energy Act of 1946 authorized AEC contracts for, among other things, "utilization of fissionable and radioactive materials and processes entailed in the production of such materials for all other purposes, including in-

Under Section 31 of the present statute,[572] the Commission is authorized and directed to make arrangements, including contracts, for the conduct of research, development, and training activities relating to (1) nuclear processes, (2) the theory and production of atomic energy, (3) utilization of special nuclear material and radioactive material for medical or other purposes, (4) utilization of special nuclear material, atomic energy, and radioactive material and processes entailed in the utilization or production of atomic energy or such material for all other purposes, including industrial uses, the generation of usable energy, and the demonstration of the practical value of utilization or production facilities for industrial or commercial purposes, and (5) protection of health and safety. Where the Commission "finds private facilities or laboratories are inadequate to the purpose," it is authorized to conduct research for private parties in its own facilities for the purposes stated in Section 31.[573] Although Section 169 [574] of the 1954 act prohibits the making of any subsidy to the holder of a license or construction permit under Sections 103 and 104, a payment made by the Commission to a permittee or licensee, pursuant to a contract under Section 31, is specifically permitted by Section 169.

Section 31 contains provisions with respect to contractual conditions assuring health and safety, requiring reporting, and permitting inspection of work done thereunder. As was the case under the Atomic Energy Act of 1946,[575]

> No such arrangement [under Section 31] shall contain any provisions or conditions which prevent the dissemination of scientific or technical information, except to the extent such dissemination is prohibited by law.[576]

Contracts may be made without public advertising for bids upon Commission certification that such action is necessary in the public interest or upon a showing that advertising is not reasonably practicable.[577]

---

dustrial uses." Under Section 31a(4) and the 1954 act, this class of contracts has been greatly extended beyond mere "industrial uses."

[571] Sections 1, 2a and g, and 3b and d, 42 U.S.C.A. §§2011, 2012(a) and (g), and 2013(b) and (d).

[573] Section 33, 42 U.S.C.A. §2053.

[574] 42 U.S.C.A. §2209.

[575] Section 3(a), 42 U.S.C. §1803(a)(1946).

[576] Section 31d, 42 U.S.C.A. §2051(d). Control of information is covered in Sections 141-146, 42 U.S.C.A. §§2161-2166, of the 1954 act.

[577] Section 31b, 42 U.S.C.A. §2051(b); see note 559, *supra*. Detailed regulations concerning procurement without formal advertising are contained in 10 Code Fed. Regs. §§5.81-5.93.

2. Commission Production Facilities

Contracting authority of the Commission with respect to the production of special nuclear material under the Atomic Energy Act of 1954 [578] is broader than under the 1946 statute.[579] Under Section 41b of the new act, substantially equivalent to Section 4(c)(2) of the Atomic Energy Act of 1946, the Commission may continue former contracts or enter into new contracts for the construction and operation of facilities owned by the Commission for the production of special nuclear material. Such contracts must assure protection against health and safety hazards, must permit inspection by and require reports to the Commission,[580] must contain security restrictions,[581] and may be negotiated without competitive bidding under certain stated circumstances.[582] The Commission also is given authority to acquire production facilities or to acquire real estate for the construction of production facilities for its own needs, again in some cases without regard to public advertising.[583]

3. Energy Generated in Production Facilities

An important provision of the 1954 act, as originally enacted, with respect to the production of special nuclear material,[584] permitted the Commission "to dispose of usable energy generated in the production facilities or in the experimental utilization facilities owned by the Commission." [585] Concerning this statutory provision, the Joint Committee on Atomic Energy has stated:

> If the energy is sold to publicly or privately owned utilities or users, the price is to be subject to regulation by the appropriate agency, State or Federal, having jurisdiction. This section will permit the Commission to dispose of that utilizable energy it produces in the course of its own operations, but does not permit the Commission to enter the power-producing business without further congressional authorization to construct or operate such commercial facilities.[586]

[578] Sections 41-44, 42 U.S.C.A. §§2061-2064.

[579] Section 4(c), 42 U.S.C. §1804(c)(1946).

[580] Section 41b(1)-(2), 42 U.S.C.A. §2161(b)(1)-(2).

[581] Section 145a, 42 U.S.C.A. §2165(a).

[582] Section 41b provides that "[a]ny contract . . . may be made [without competitive bidding] . . . upon certification of the Commission that such action is necessary in the interest of the common defense and security or upon a showing by the Commission that advertising is not reasonably practical." See notes 559 and 577, *supra*.

[584] Section 44, 42 U.S.C.A. §2064.

[585] H.R. Rep. No. 2181, *supra* note 5 at 14-15.

[586] *Ibid.*

By a 1957 amendment to the statute, the agency was authorized to sell, or contract for the sale of, certain utilities, including electric power and steam, to purchasers within the Commission-owned communities or in the immediate vicinity thereof, where the Commission determined that such utilities "are not available from another local source and that the sale is in the interest of the national defense or in the public interest." [587]

Under the Atomic Energy Act of 1954, preference and priority in the use of Commission-produced power must be given "to public bodies and cooperatives or to privately owned utilities providing electric utility services to high cost areas not being served by public bodies or cooperatives." [588] This provision applies to contracts for the sale of energy derived from government plants the same priorities imposed upon holders of commercial licenses for a utilization or production facility for the generation of commercial power.[589]

4. Purchase of Special Nuclear and Source Materials

Under the Atomic Energy Act of 1954, the Commission is authorized to contract for the purchase of special nuclear material outside the United States.[590] This constitutes a little-known but highly important activity of the Commission in the field of contract authority.[591]

The purchase of source materials by the Atomic Energy Commission is covered in some detail in the 1954 statute. Under Section 66 [592] thereof, the agency is authorized to acquire supplies of source material, interests in real property containing such material, or rights of entry into property believed to contain such material. Section 67 [593] authorizes the Commission to lease lands belonging to the United States for mining or prospecting for source materials in special situations requiring Commission inducement of private efforts in this field.[594]

[587] Section 161s, 42 U.S.C.A. §2201(s), as added by Pub. L. 85-162, 85th Cong., 1st Sess. (1957).

[588] Section 44, 42 U.S.C.A. §2064.

[589] Sections 103 and 182c, 42 U.S.C.A. §§2133 and 2232(c).

[590] Section 55, 42 U.S.C.A. §2075.

[591] This is done largely through the Combined Development Agency (CDA), established in 1944 for joint foreign procurement by the United States and the United Kingdom. Formerly a member of CDA, Canada sells uranium to the United States under AEC contracts. Belgium, South Africa, Australia, and Portugal have contracts with CDA. See AEC, twentieth Semi-Annual Report 3-5 (1956); AEC, Twenty-second Semi-Annual Report 4-7 (1957).

[593] 42 U.S.C.A. §2097.

[594] See H.R. Rep No. 2181, *supra* note 5 at 17-18: "The Commission has exercised this right in the past based on reservation to the United States of all rights to source

5. Electric Utility Contracts

The Atomic Energy Act of 1954 contains the most controversial section dealing with the contracting authority of the Commission since the agency's inception in 1947. In 1953 Congress added a subsection to the 1946 statute permitting the Commission to make 25-year contracts for the purchase of electrical power to operate the Oak Ridge, Paducah, and Portsmouth installations, without advertising for bids therefor and with authority to terminate the contracts upon payment of cancellation costs.[595] What had been enacted in 1953 as Section 12(d) of the 1946 act was proposed in the same form in the first bill which the Joint Committee reported to Congress as the Atomic Energy Act of 1954.[596]

In an attack upon the Commission's interpretation of Section 12(d), which was proposed Section 164 of the new act, two members of the Joint Committee claimed that the agency proposed

> . . . to maintain its present firm contract for TVA power to run the Paducah Plant while contracting for some 600,000 kilowatts of additional power to be delivered by the private utility group to the TVA for service in the Memphis area, several hundred miles away from any atomic-energy installation. In other words, the AEC would become a "power broker," purchasing power it does not need for an area far removed from its activities. The TVA would be forced into buying the power from the private group through AEC instead of building its own plant to serve the Memphis area.[597]

---

materials in the public lands. This reservation is contained in the Act. The Commission believes that it needs to have the power to lease expressly granted to it, now that this reservation is no longer carried in the bill. . . . It is the intent of Congress that this leasing power should be invoked only where it is the only means of achieving private development of deposits of source materials in lands belonging to the United States. It is not intended to supplant the mining laws in any normal situation."

[595] Section 12(d), 42 U.S.C.A. §2204, Pub. L. 137, 83rd Cong., 1st Sess. (1953). See H.R. Rep. No. 676, 83d Cong., 1st Sess. 3 (1953): "By the arrangements that have been negotiated with the three utility companies [Ohio Valley Electric Co., Electric Energy, Inc., and Tennessee Valley Authority], the Commission is kept out of the utility business, the Congress is relieved of the necessity of appropriating an additional sum of $1 billion this year for power-generating stations for the new gaseous diffusion plants, and in the event of a shutdown in the future, the Government will not be faced with the problem of disposing of a super Muscle Shoals." In its opinion in Mississippi Valley Generating Company, Holding Company Act Rel. No. 12, 794 (Feb. 9, 1955), the Securities and Exchange Commission indicated that it considered Congress to have passed upon the validity of the MVG contract in enacting Section 164 of the Atomic Energy Act of 1954, CCH Fed. Sec. Law Rep., ¶76,330, p. 79,403.

[596] Section 164, H.R. 9757, 83d Cong., 2d Sess. (1954).

[597] H.R. Rep. No. 2181, *supra* note 5 at 115. See also dissenting opinion of SEC Commissioner Rowen in Mississippi Valley Generating Company, *supra* note 595 at

The dissenters further argued that the legislative history of the 1946 act did not substantiate the intrepretation placed by a majority of the Commission upon Section 12(d).[598]

As finally enacted,[599] Section 164 contained the questionable device of a Congressional interpretation of authority, rather than an outright grant thereof.[600] Further, the authority retained by the Joint Committee to consider a proposed contract for thirty days created serious problems with respect to the proper division of powers between the Executive and the Legislative Departments and was bound to be the subject of con-

---

79,411: "The MVG plant will not make available to the AEC facilities additional electrical energy not otherwise available. . . . The power to be generated by MVG will be supplied to TVA and will be consumed in the Memphis area. . . ."

[598] H.R. Rep. No. 2181, *supra* note 5 at 115: "When the Atomic Energy Commission sought and received this authority from the Congress to make long-term contracts, and to pay cancellation charges to the utility groups involved in the event the contracts were terminated, the authority was specifically limited to utility services for the Oak Ridge, Paducah, and Portsmouth installations of the Commission. As the former General Manager, Marion W. Boyer, testified in answer to a question from Congressman Holifield at the time the authorizing legislation was being considered by the committee: 'In other words, it is limited to the power requirements for those three installations. It is not a wide-open authority.'"

[599] "The Commission is authorized in connection with the construction of the Oak Ridge, Paducah, and Portsmouth installations of the Commission, without regard to section 3679 of the Revised Statutes, as amended, to enter into new contracts, or modify or confirm existing contracts to provide for electric utility services for periods not exceeding twenty-five years, and such contracts shall be subject to termination by the Commission upon payment of cancellation costs as provided in such contracts, and any appropriation presently or hereafter made available to the Commission shall be available for the payment of such cancellation costs. Any such cancellation payments shall be taken into consideration in determination of the rate to be charged in the event the Commission or any other agency of the Federal Government shall purchase electric utility services from the contractor subsequent to the cancellation and during the life of the original contract. The authority of the Commission under this section to enter into new contracts or modify or confirm existing contracts to provide for electric utility services includes, in case such electric utility services are to be furnished to the Commission by the Tennessee Valley Authority, authority to contract with any person to furnish electric utility services to the Tennessee Valley Authority in replacement thereof. Any contract hereafter entered into by the Commission pursuant to this section shall be submitted to the Joint Committee and a period of thirty days shall elapse while Congress is in session (in computing such thirty days, there shall be excluded the days on which either House is not in session because of adjournment for more than three days) before the contract of the Commission shall become effective: *Provided, however,* That the Joint Committee, after having received the proposed contract, may by resolution in writing, waive the conditions of or all or any portion of such thirty-day period."

[600] Similar problems are created by Sections 51 and 61, 42 U.S.C.A. §§2071 and 2091, requiring submission of expanded definitions of special nuclear material and source material, respectively, for a period of 30 days to the Joint Committee.

flicting interpretation. The procedure provided in Section 164 set the pattern for Congressional review and control of Commission contracts under the Atomic Energy Act of 1954 as amended in 1957.[601]

The controversy over the sale of energy by private facilities to TVA in alleged replacement of Commission power needs from TVA, has ended in the Court of Claims.[602] Incidental to the controversy has been the conflicting interpretation of the Joint Committee's authority under Section 164. Two days after the contract between the Commission and Mississippi Valley Generating Company was executed November 11, 1954, the Joint Committee decided to waive the thirty-day waiting period under that section. On December 17, 1954, the Comptroller General approved the contract, whereupon a minority of the Joint Committee maintained that the waiting period could not be waived until a contract, approved by that official and otherwise immediately effective, was presented to Congress. On January 28, 1955, the Joint Committee

[601] Section 261a, 42 U.S.C.A. §2017(a).

[602] The early history of the MVG contract is summarized by the SEC in Mississippi Valley Generating Co., *supra* note 595, at 79, 372-79, 395. On July 11, 1955 the President ordered the AEC's contract with the Mississippi Valley Generating Company to be terminated. At that time the Attorney General stated that a "negotiated settlement" would be effected "and added that he had no idea how much the termination might cost the U.S." (BNA, Atomic Industry Reporter 1:38). On July 29, 1955 the Comptroller General ruled that the Commission had authority to use its funds to pay costs for cancellation of a contract which did not contain any provision therefor and despite the language of Section 164 of the Atomic Energy Act of 1954 (Dec. B-120188). On October 7, 1955 the Commission informed the Joint Committee on Atomic Energy that "negotiations for settlement of cancellation costs are being held in abeyance to determine whether the contract actually exists, because of circumstances surrounding the contract's making. The AEC mentions 'possible conflict of interest and public policy'" (BNA, Atomic Industry Reporter 1:146). Five days later the General Accounting Office stated that it had "recommended a go-slow policy to the Commission in reaching a settlement of the contract . . . that might circumvent the government's right to a court test on the validity of the contract" (*id.* at 1:159). Finally, in November 1955, the Commission through its General Counsel repudiated the contract for the reason that "there is a substantial question as to whether there were material violations of law and public policy in the inception of the contract which would result in its being held invalid by the courts" (*id.* at 1:203). The result was the filing on December 13, 1955, of suit by Mississippi Valley Generating Company in the Court of Claims to recover $3,543,778 in cancellation costs from the federal government (*id.* at 1:219). In its answer filed with the court, the Department of Justice prayed that the action be dismissed because the contract was "in violation of the statutes and laws of the United States and . . . unlawful, null, and void, and contrary to public policy" for the reasons that, among others, the activities of one government adviser "involved a conflict of interest so contrary to public policy as to render the alleged agreement null and void," the agreement violated Section 164 of the Atomic Energy Act of 1954, and the contract had not been before the Joint Committee for 30 days (*id.* at 2:229-230).

sought to justify rescission of its original waiver of the thirty-day period in these words:

> In our view the conditions of section 164 were satisfied regardless of the effect of the resolution of rescission. We do not believe that section 164 requires that contracts submitted to the Joint Committee thereunder be immediately effective upon the granting of waiver or the lapse of the thirty-day waiting period. *The purpose of the requirement of section 164 for a waiting period or a waiver was to accord the Congress an opportunity to review the power to make such contracts and to take appropriate legislative action if it so desired.* . . . [T]he section does not require the submission to the committee of a contract which is immediately effective in all respects upon the expiration of the waiting period or the granting of a waiver. The contract has been on file with the Joint Committee from November 11, 1954, to the present time. Thus, even if the waiver action of November 13, 1954, should be considered invalid, the prescribed waiting period of thirty days expired on February 4, 1955, the Congress having been in session since January 5, 1955. The effective date of the contract . . . is then either February 4, 1955, or December 17, 1954, depending on the effectiveness of the waiver, but this difference is not material. . . . (emphasis supplied.) [603]

By this statement, the Joint Committee itself has demonstrated the ineptness of the language of Section 164 and the questionable nature of the requirement that contracts be referred to that body for a period of thirty days. The Committee claims that it merely reviews the "power to make such contracts." The fact is that the Committee reviews the contract itself before its execution and implementation, a power which may well affect what would appear to be essentially an executive function.

6. Congressional Review of AEC Contracts

Atomic Energy Commission discretion in the making of certain types of contracts under the civilian power reactor program has been severely curtailed by action of Congress in 1957. These contracts are those under the first, second, and third rounds of the program in which the agency contributes financial support directly or indirectly to reactor demonstration projects.[604]

Congressional action was due, in part, to a decision of the Comptroller

[603] BNA, Atomic Industry Reporter 221:821.

[604] See text, *supra*, at note 16.

General with respect to the initial contract made by the Commission under the first round invitations of that program, that with Yankee Atomic Electric Company. Under that contract, dated June 4, 1956, the company was to bear construction costs of a pressurized water type reactor with an initially estimated cost of $34.5 millions, while the Commission was to undertake research and development work of up to $1 million in agency facilities and to underwrite up to $4 million of such work by the company itself. The Commission also agreed to waive its normal charge for the use of special nuclear material to fuel the reactor for a five-year period after the issuance of an agency license, at an estimated loss of revenue to the Commission of $3.3 million. Research and development work under the Yankee contract commenced in June 1956 and will continue through at least 1960.[605]

In his report to the Joint Committee February 19, 1957, on review of the Yankee Atomic contract [606] the Comptroller General criticized, among other things, the agreement by the Commission to waive its material use charge for five years,[607] as permitted under the second round invitation for small reactor plants,[608] instead of for 2½ years as provided under the first round invitation.[609] Further, according to the Comptroller General,

> . . . AEC announcements provide that material use charges may be waived up to an agreed-upon amount of money. The [Yankee] contract does not comply with this policy to the extent that it does not specify any limitation on the amount of money of the material use charge waiver but, instead, provides that AEC will waive its use charge for all special nuclear material used during the contract period.[610]

As a result of this criticism by the Comptroller General and Joint Committee sentiment "to shape the development of nuclear power along the lines of its own preference," [611] legislation was enacted by Congress in 1957 which gives, in effect, almost complete legislative control over

[605] For the text of the contract, see 1957 Section 202 Hearings, *supra* note 7 at 741-752; see statement of AEC General Manager Fields, *id.* at 727-728; AEC, Twenty-third Semi-Annual Report 105 (1958); BNA, Atomic Industry Reporter 2: 187.

[606] 1957 Section 202 Hearings, *supra* note 7 at 757-768.

[607] *Id.* at 764.

Commission contracts involving the expenditure of federal funds for the direct or indirect benefit of the private contracting party. This change in the operation and administration of the United States atomic energy program was effected by amendments to Section 261 of the 1954 statute [612] and by provisions of the appropriation act for fiscal year 1958.[613]

As amended, Section 261 of the Atomic Energy Act of 1954 permits only the appropriation of funds, without authorizing legislation approved by the Joint Committee and enacted by Congress, for contracts involving non-military reactors designed to produce less than 10,000 thermal kilowatts of heat. Otherwise, the basis for each individual arrangement, including contracts, agreements, or loans, which involves the expenditure of public funds for other than pure research unrelated to a specific project proposed under the civilian power reactor program, must be presented to the Joint Committee for appropriate authorization. This requires specific approval of "each of the seven arrangements contemplated under the first and second rounds of its [the AEC's] program." [614]

Section 261 was implemented by Congress in the authorization act for fiscal year 1958 [615] to effect the following procedures, thus described by the Joint Committee:

> . . . [B]efore the Commission enters into any arrangement (including contract, agreement or loan) or amendment thereto, the basis of which has not been included in the program justification data previously submitted to the Joint Committee and which involves appropriations . . ., the basis for the arrangement or amendment thereto shall be submitted to the Joint Committee, and a period of 45 days shall elapse while Congress is in session. . . .
>
> . . . [S]uch arrangements or amendment must be entered into in accordance with 'program justification data' submitted in connection with the hearings [before the Joint Committee] and with the 'basis' of the arrangement. . . . The phrase 'program justification data' was intended to include the scope, policies, and criteria of the various 'rounds' of the Commission's power demonstration program, as explained by the Commission and interpreted by the [Joint] committee at the time of the hearings and outlined in committee reports.

[614] H.R. Rep. No. 571, *supra* note 241 at 9.
[615] Pub. L. 85-162, *supra* note 613, §111(a)-(b).

> of arrangements with program justification data . . . would be to prevent the Commission from changing its rules and criteria after congressional review during the authorization process. The scope, rules, and criteria of the various rounds of the program could be changed only in connection with resubmission in a subsequent authorization hearing by the Joint Committee.
>
> The contract or arrangement shall also be in accordance with the basis for the arrangement which has been previously submitted to the Joint Committee either during the hearings on the authorizing legislation, or else by the 45-day procedure set forth in the subsection. The Commission must specifically advise the committee when it is submitting a proposal to the Joint Committee as a basis for the proposed contract or arrangement. For example, during the hearings on this bill . . ., the Commission advised the Joint Committee that of the various proposals which it had under consideration, it was submitting only one (Power Reactor Development Co.) for review by the Joint Committee as a basis for a proposed contract or arrangement.[616]

That the Joint Committee will have the final word with respect to Commission contracts involving research and development for particular projects is demonstrated by the Committee's handling of the Commission's request for funds in connection with the Power Reactor Development Co. (PRDC) project. Under its contract with PRDC, the Commission was to provide pre-construction research and development assistance in AEC facilities up to a maximum of $4,450,000. PRDC and its affiliate, Atomic Power Development Associates (APDA) were to pay the remaining cost estimated to be $9 million. The Commission further agreed to waive charges for the use of special nuclear material for five years in an amount aggregating $3,702,600.[617] Two hundred and forty-four thousand dollars having been obligated by the Commission in fiscal year 1957 under the PRDC contract, the agency requested an additional $4,206,000 for authorization in fiscal year 1958, with $1,500,000 of this amount to be obligated in that year and the remainder in fiscal years 1959 and 1960.

The Joint Committee rejected both the request for authorization of funds for pre-construction research and for waiver of fuel charges, "since legal proceedings before the AEC to determine the probable safety of the proposed reactor are still pending." [618] The Committee only

[616] Sen. Rep. No. 791, *supra* note 23 at 33-35.

[618] *Id.* at 19.

approved for authorization "the amount of $1,500,000 . . . [to] be expended for research and development in Commission laboratories to advance the technology of the fast breeder reactor concept," [619] and not for pre-construction research and development in connection specifically with the PRDC project.

Coincident with its establishment of *de facto* control over AEC contracting involving the expenditure of federal funds, Congress also has spelled out the manner in which the agency is to make contracts with publicly and cooperatively owned utilities. This Congressional action was designed to expand the Commission's second round invitation under the civilian power reactor program.

The so-called "Cooperative Power Reactor Demonstration Program" inaugurated by Congress was legislatively launched in the authorization act for appropriations for fiscal year 1958.[620] This program requires that, in connection with power reactors proposed to be constructed by publicly and cooperatively owned utilities:

> 1. Arrangements for such projects must be effected by direct negotiations between the Commission and the equipment manufacturer or engineering organization developing, constructing, and designing the nuclear reactor and related facilities.
>
> 2. The Commission must contract with such utilities for "the provision of a site and conventional turbogenerating facilities, operation of the entire plant including training of personnel, sale by the Commission of steam [from the reactor complex to the cooperative or publicly owned organization], and other relevant matters."
>
> 3. Sale of steam by the Commission under its contract with the utility "shall be at the rate based upon cost or value of comparable steam from present or projected plants at the site area," regardless of the actual cost of producing such steam which probably would exceed that of, and be unable to compete with, fossil fuels in the foreseeable future.
>
> 4. Contracts for research and development in connection with these facilities shall be for periods of not more than 10 years.
>
> 5. The reactor installation must be dismantled at the end of the contract period in the event the utility is unwilling to purchase it "at a price to reflect appropriate depreciation but not to include construction costs assignable to research and development." [621]

[619] Section 111(a)(2), Pub. L. 85-162, 85th Cong., 1st Sess. (1957).

[620] *Id.*, Section 111(a)(1).

[621] Sen. Rep. No. 791, *supra* note 23 at 33. The Comptroller General has approved

The special treatment to be accorded contracts with publicly and cooperatively owned utilities by the Commission, by Congressional direction, stemmed from the feeling of the Joint Committee that

> Negotiations by the AEC which would result in jeopardizing the financial integrity of cooperatives and publicly owned organizations would not be warranted on the basis of advancement of the atomic technology. Neither would it be wise to set a contractual pattern on the part of the Government with these small groups and thereby create a precedent for widespread subsidy to large profitmaking private utilities later.[622]

The requirements established by Congress create a double standard of contractual relations which places the major financial and operating responsibility for reactor facilities to be operated by publicly or cooperatively owned utilities squarely upon a federal governmental agency.[623]

D. Contracting with the AEC

Although the Atomic Energy Act of 1954 did not deal comprehensively with the contracting authority of the Commission, that legislation represented a distinct improvement over the 1946 act. As under the prior statute, the 1954 legislation authorized the Commission to acquire material, property, equipment, and facilities and to purchase, lease, and hold real and personal property, as required in the exercise of its functions.[624] The President is authorized to exempt any action of the Com-

---

two proposed contracts of the AEC with the Rural Cooperative Power Association, Elk River, Minn., and with the City of Piqua, Ohio, which provided for a flexible price for sale of interruptible reactor steam by the AEC to the utility concerned; Dec. B-136015, May 7, 1958, BNA, Atomic Industry Reporter 221:830.

[622] Sen. Rep. No. 791, *supra* note 23 at 17.

[623] For an initial difficulty experienced by the Commission in negotiating a contract for construction of a reactor under the cooperative program, see AEC, Twenty-third Semi-Annual Report 109 (1958). This involved the proposed construction by Rural Cooperative Power Association of Elk River, Minn., of a 22,000-electric-kilowatt boiling water reactor plant, accepted as a basis for contract negotiations under the second round invitation in April 1956. With the enactment of Pub. L. 85-162, the AEC became responsible for direct negotiations with the selected reactor manufacturer. These negotiations were terminated when the manufacturer notified the Commission that its price for building the reactor, and for accompanying research and development work, would be $10.75 million rather than the $7.93 million ceiling previously agreed upon. Also, on Sept. 20, 1957, the AEC signed a contract with Consumers Public Power District of Columbus, Nebraska, covering construction and operation of a large-scale nuclear power plant at Hallam, Nebraska. This contract, entered as the result of a proposal made under the first round invitation, was signed after the Joint Committee waived the 45-day waiting period established by Pub. Law 85-162.

[624] Section 161e and g, 42 U.S.C.A. §2201(e) and (g); see Section 174, 42 U.S.C.A. §2224.

mission "from the provisions of law relating to contracts whenever he determines that such action is essential in the interest of the common defense and security." [625]

The statute deals with several matters which directly govern provisions of a Commission contract with a prime contractor. First, the cost-plus-percentage-of-cost contract is outlawed.[626] Second, the contract may not provide "for direct payment or direct reimbusement by the Commission of any Federal income taxes on behalf of any contractor performing such contract for profit." [627] Third, where a contract is negotiated with a domestic concern without advertising, it must contain a provision permitting the Comptroller General to have access to the contractor's books for three years after the final payment is made under the contract by the United States.[628] Finally, subcontracts under a prime contract are forbidden unless authorized by the Commission.[629]

[625] Section 162, 42 U.S.C.A. §2202.

[626] Section 165a, 42 U.S.C.A. §2205(a); see, to the same effect, 10 Code Fed. Regs. §5.103. This type of contract also is outlawed by the Armed Services Procurement Act of 1947, 41 U.S.C.A. §153(b), and the Federal Property and Administrative Services Act of 1949, 41 U.S.C.A. §254(b). See Risik, *supra* note 536 at 130; Minsch, *supra* note 539 at 195.

[627] Section 165b, 42 U.S.C.A. §2205(b).

[628] Section 166, 42 U.S.C.A. §2206; see AEC Manual, Section 9111-0311. This requirement applied to Commission contracts prior to 1947 by virtue of Executive orders 10210, 16 Fed. Reg. 1049 (Feb. 6, 1951), and 10216, 16 Fed. Reg. 1815 (Feb. 27, 1951), issued pursuant to the First War Powers Act of 1941, as amended. In contracting with Yankee Atomic Electric Company under the power demonstration reactor program, the Commission agreed, subject to review by the Comptroller General, to amend the examination-of-records' provision to limit its applicability to that portion of the work performed by Yankee which was paid for by the Commission. The Comptroller General ruled that, under the Yankee contract, records relating to all work performed thereunder, and not necessarily reimbursable work, were subject to examination by the General Accounting Office (Dec. B-129114, Oct. 10, 1956). In connection with the AEC's contract with Power Reactor Development Co. (PRDC) the Comptroller General has ruled that, where research and development work by the Commission with appropriated funds would be made under separate contract subject to audit by the General Accounting Office, the prime contract between the agency and PRDC does not violate Section 166 when it fails to include a provision requiring such government audit of accounts in connection with the prime contract (Dec. B-131013, Mar. 22, 1957).

[629] Section 41b(1), 42 U.S.C.A. §2061(b)(1). See Minsch, *supra* note 539 at 194-195: "This somewhat unique statutory restriction on subcontracting is actually but a logical concomitant of the general scheme of the Atomic Energy Act of 1954 (and its predecessor statute) for ensuring, in the interests of the common defense and security and the health and safety of the public, that the AEC will have adequate control over the production and use of special nuclear material." Approximately one-third of the over $1 billion paid by the Commission directly under contracts during fiscal year 1955 went to subcontractors, *id.* at 190-191.

1. Contracting in General

The negotiation, execution, and administration of a contract with the Atomic Energy Commission does not have the same procedural and substantive safeguards which are afforded the businessman or firm seeking a license from that agency. Absent the assimilation of contract procedures to the requirements of administrative due process, the principal safeguard that the prospective government contractor has is his own sense of caution and care in negotiating the terms of the agreement with the agency or department involved. In spite of the general success of the Atomic Energy Commission's program in satisfactorily administering a contract program involving billions of dollars with little public criticism and litigation, healthy self-interest should never be forgotten by the private businessman or concern in negotiating with the Commission.

Like every other agency and department of the federal government, the interests of the Atomic Energy Commission are paramount in negotiating and administering a contract with a private party. Indeed, the basic procurement policy of the Commission, in its own words, is "that supplies and services be procured by the methods most advantageous to the government." [630] In one of the two reported decisions in which he has reversed a recommendation of the Commission's Advisory Board of Contract Appeals, the AEC General Manager has stated that he was "not convinced the rights of the Government should be relinquished by any action of mine which would not have adequate support in the record." [631]

Otherwise stated, "the Government has no paternalistic attitude towards its contractors," and the "contracting officer is going to make the best 'deal' he can for the Government and takes his obligation to protect the Government's interest with seriousness." [632] The General Counsel of the Navy Department has issued this advice in that regard:

> I believe there has been a great deal of misunderstanding about the very character of a Government contract. There are some people who apparently have felt that getting a Government contract means "getting in on the gravy"—that you just

[630] 10 Code Fed. Regs. §5.21; see, to the same effect, §§5.101 and 5.501.

[631] Raecolith Flooring Company, AEC ABCA Dkt. No. 3 (Board's recommendations rejected Sept. 1, 1950), BNA, Atomic Industry Reporter 221:311.

[632] Moss, *supra* note 536 at 159. He adds: "Many contractors seem to be laboring under the impression that the Government will 'take care of them' regardless of contractual provisions. . . . Nothing is further from the truth. The Government is, in fact, a sharp trader, and its officers are trained in that regard. . . ."

> sign up with the Government, and the money begins to roll in. But nothing could be farther from the truth. The Government has a carefully-worked out, meticulous and responsible system of purchasing, designed to provide quality, as well as quantity, which meets the complex and precise requirements of defense and at the very best price. As a result, the so-called 'Government contract' that we hear about has become, not a simple document that can be disposed of with a casual glance; on the contrary, just as the legal requirements and many of the goods which are called for by a Government contract are highly complex, the Government contract has also become complex. . . .
>
> . . . [T]he Government does not sit in a paternalistic capacity with its contractors. It does not undertake to "take care" of anybody or to "guarantee" them against loss or against anything else. Its only position is that of a contractor dealing at arms length.[633]

The misconception that the government contracts in other than an attitude of hard bargaining may even be encouraged by the agency or department concerned. The emphasis in attracting would-be bidders for government contracts often is that the entire matter is solely one of "public relations." [634] This approach is used to some extent by the Atomic Energy Commission.[635]

In this connection, it always should be remembered that the government is represented by legal counsel in preparing and negotiating contracts with private persons.[636] This follows logically from the govern-

[633] Vom Bauer, *supra* note 536 at 29 and 31.

[634] Moss, *supra* note 536 at 166.

[635] "Counselor, advisers, or agents are not necessary to obtain business from the AEC, its contractors or subcontractors. Such persons cannot obtain AEC business which the reader of 'Selling to AEC' cannot obtain for himself." (AEC, Selling to AEC (1956), reproduced in BNA, Atomic Industry Reporter 221 : 121). This statement goes beyond the salutary warning needed against use of "five percenters" and "influence peddlers" and encourages the businessman not only to seek business from the Commission but to execute a contract therefor without adequate expert engineering or legal advice.

[636] Vom Baur, *supra* note 536 at 32: "However, there are some Government contractors who appear to feel that they do not need legal advice. They sometimes enter into contracts with the Government without benefit of counsel, and sometimes afterwards complain bitterly when they find out the exact nature of the rights and obligations which they have unwittingly assumed. True, the Government cannot insist that a contractor be represented by counsel. That is his own personal business. But I may say frankly, speaking personally at least, that in my opinion it is very greatly to the advantage of the Government, as well as to that of the contractor, to have him represented by a lawyer. He should be so represented not only at the outset of the negotiations so that the contractor may understand clearly what he is getting into, but

ment's understandable desire to make the best contract possible from its point of view.[637] The need for adequately protecting his business and legal interests is required of the contractor dealing with the Atomic Energy Commission, particularly with respect to cost contracts for large research and development projects. These so-called "administrative contracts" [638] deal only in the broadest terms with the rights and obligations of the parties.[639]

A contract negotiated by a private contractor with any government department or agency is not one negotiated between, or to be administered by, equals. The traditional concept of the Executive Department

---

also in the course of the performance of the contract, and in cases before the Armed Services Board of Contract Appeals." See Ramey and Erlewine, *supra* note 551 at 360, n. 8: "In AEC contract negotiations are normally carried on in the field by a 'team' under the leadership of the field manager of operations . . . and with the advice and assistance of the Assistant General Counsel, or other attorney, the Director of Finance and other appropriate staff. . . ."

[637] See Beryllium Corp., AEC ABCA Dkt. No. 6 (Recommendations adopted by General Manager Dec. 19, 1949), BNA, Atomic Industry Reporter 221:312; "Contractor committed to construction of complete buildings for lump-sum consideration cannot recover from Government amount paid sub-contractor in reimbursement for expenses which, because of Government's need for speed, had been overlooked in computation of price."

[638] The term first was used by the AEC in 1951; AEC, Ninth Semi-Annual Report 52 (1951): "The type of cost contract used to a large extent by the Commission for development work may perhaps best be described as an 'administrative contract.' A main emphasis here, as in many other contracts, is upon cooperation between the Government and the contractor to accomplish the particular task. . . ."

[639] See BNA, Atomic Industry Reporter 221:4-5. For a discussion of the "steady trend away from a fixed and definite contract," see Moss, *supra* note 536 at 160-161. The most comprehensive discussion of the "administrative contract" is contained in Ramey and Erlewine, *supra* note 551 at 354 *et seq.* According to the authors, an "administrative contract" is merely a "memorandum of understanding," with a "'charter-like' nature," using "a minimum of legal or technical jargon" (*id.* at 363, 364, 365). In such an agreement, "[t]he parties are not overly concerned with the legal consequences of their relationships in terms of enforcement through litigation, but are careful that the agreement will pass muster with the court of first instance in Government contracts, the General Accounting Office" (*id.* at 355). Although cooperation between the Commission and its contractors is certainly to be sought, and ordinarily assured, this theory of cooperation to the exclusion of spelling out the legal relationship between the government agency and the private party hardly converts the "administrative contract" into a partnership between the parties. Nor does the "growing use of the regulatory approach [to government contracts, emphasizing a detailed contract between the parties] seriously endanger . . . the cooperative, mutual agreement approach to the administrative contract" or defeat "the very purposes" of government contracting (*id.* at 371). If any misunderstanding requiring administrative or judicial relief arises under the contract, it is the private party, not the government, which will find the loose language of the administrative contract the doorway to an adverse decision. Unfortunately for the private contractor, the government is not ordinarily forced to use that doorway.

and the courts that no real difference exists between government and private contracts [640] is unrealistic. The doctrine of sovereign immunity gives the government the choice of determining the forum in which disputes and suits with respect to a contract may be determined. Indeed, "the Government, as a contractor, has insisted on and received favorable treatment in its contracting capacity which it would not receive under ordinary principles of private contract law." [641] The contracting officer, who administers the contract and initially determines disputes thereunder, is hardly an unbiased or disinterested party to the proceedings. Finally, the government has the ultimate authority, on behalf of the Atomic Energy Commission, to seize facilities of a manufacturer who refuses or fails to honor a mandatory order "to obtain prompt delivery of any articles or materials the procurement of which has been authorized by the Congress exclusively for the use of . . . the Atomic Energy Commission." [642]

2. Types of AEC Contracts [643]

The Atomic Energy Commission uses three general types of contracts. The first, the unit-price contract, is used in purchases of supplies, materials, equipment, and other items on which a definite price can be fixed by unit of sale. Purchases of uranium concentrate from uranium processors fall into this category.[644]

Construction programs are largely effected through the use of lump-sum contracts. This is also the type of contract used by the Commission in contracting for research by educational and other types of institutions, the latter being required to put up a certain percentage of the cost of the project.

[640] *E.g.*, United States v. Wunderlich, 342 U.S. 98, 100, 72 S. Ct. 154 (1951); Martinsburg & P.R. Co. v. March, 114 U.S. 549, 553-554, 5 S. Ct. 1035 (1884); see Schultz, *supra* note 536 at 218-219, 222-223.

[641] Schultz, *supra* note 536 at 220.

[642] Selective Service Act of 1948, 50 U.S.C.A. App. §468(a). The armed services are the only other branch of the federal government with this authority.

[643] For excellent discussions of this subject, see BNA, Atomic Industry Reporter 221: 1-7 and 1 CCH Atomic Energy Law Reporter, ¶571 ff.

[644] See 10 Code Fed. Regs. Pt. 60, providing for purchases by the Commission of uranium at guaranteed minimum prices pursuant to contract (§60.1(d)). In connection with a contract by the Commission for the purchase of four to seven million pounds of high purity magnesium annually over a period of 5 years, the Comptroller General has ruled that the Commission lacks authority to contract beyond one year in the absence of special provision therefor, and that, while ". . . no question will be raised about earlier contracts [by the AEC], the principles [in the decision] will apply in the future" (Dec. B-130815, April 2, 1957); see BNA, Atomic Industry Reporter 3: 133

Finally, there is the cost type contract, in which the government pays for the contractor's costs plus a negotiated fixed fee. This category of contract has been used for the construction and operation by private business of agency-owned facilities and represents the so-called "administrative contract." Under this type of agreement, its terms are stated in broad and general terms, the particulars to be developed and agreed upon as the work progresses.

3. AEC Contract Clauses

Like other federal government agencies,[645] the Atomic Energy Commission seeks to standardize clauses contained in the various types of contracts which it makes.[646] This is effected by establishing one series of clauses, the inclusion of which in every contract for over $500 is required,[647] and another series of clauses the inclusion of which is recommended in each type of contract to which applicable.[648]

a. Mandatory Clauses

Mandatory clauses or articles contained in Atomic Energy Commission contracts cover a multitude of public sins which the Congress, by legislation, has seen fit to proscribe.[649] The settlement of disputes also is prescribed in a mandatory contract clause.

In the public policy category of mandatory clauses are the prohibitions against

1. Convict labor;[650]
2. Contingent fees;[651]

[645] See Risik, *supra* note 536 at 132-133.

[646] See AEC Manual, Section 9111-022: "It is the policy of AEC to use standard contract articles and forms wherever practicable. Uniformity in form and substance of contract articles and forms tend to assure impartial treatment of all contractors, expedites negotiation and contract review, and facilitates contract administration." Yet the Joint Committee has found that AEC "contract negotiations have developed a set of unrelated and complicated proposed contracts [under the civilian power demonstration reactor program]. Apparently the terms of each proposal have depended upon the request of the proposer, and the AEC has established no across-the-board standards. Accordingly, there is considerable variation between the types of assistance to be provided under the contracts [negotiated or being negotiated under the first, second, and third-round invitations] . . ." (Sen. Rep. No. 791, *supra* note 23 at 15-16).

[647] AEC Manual, Section 9111-031.

[648] *Id.*, Section 9111-041.

[649] See Gantt, "Labor Provisions of Government Contracts and Subcontractors," 16 Fed. Bar J. 331 (1956).

[650] AEC Manual, Sections 9111-032 and 9116-073. See 18 U.S.C.A. §436, 41 U.S.C.A. §35(d); Gantt, *supra* note 649 at 352-354.

[651] AEC Manual, Section 9111-033.

3. Non-discrimination in employment;[652]
4. Benefits to members of Congress;[653]
5. Assignment of claims;[654]
6. Work in excess of eight hours;[655]
7. Payment of less than minimum wages established by Secretary of Labor;[656] and
8. Purchases of foreign goods contrary to the Buy American Act.[657]

These clauses, together with the Commission's statements of policy with respect to aiding "small business," [658] represent the government's attempt to implement, at the behest of Congress, prevailing social and economic policies.[659]

[652] *Id.*, Sections 9111-035, 9116-083, and 4228-01 *et seq.* See Executive Order 10557, 19 Fed. Reg. 5655 (Sept. 3, 1954); Gantt, *supra* note 649 at 366-370.

[654] AEC Manual, Section 9111-037. See 31 U.S.C.A. §203, 41 U.S.C.A. §15.

[655] AEC Manual, Section 9111-0314. See 40 U.S.C.A. §§324-326; Gantt, *supra* note 649 at 342-348.

[656] AEC Manual, Section 9111-0315. See 40 U.S.C.A. §§276a *et. seq.* (Davis-Bacon Act); Gantt, *supra* note 649 at 333-342. The Walsh-Healey Public Contracts Act, 41 U.S.C.A. §§35-45, extends to workers employed under Government supply contracts the protections afforded by the Davis-Bacon Act and the Eight-Hour Laws; see Gantt, *id.* at 354-366.

[657] AEC Manual, Sections 9111-0317-0318 and 9110-019a-019b. See 41 U.S.C.A. §§10a-10d (Buy American Act); Gantt, *supra* note 649 at 364.

[658] 10 Code Fed. Regs. §§5.24, 5.69(a)(2)-(4), 5.506. For a discussion of AEC policies with respect to "small business," see BNA Atomic Industry Reporter 2:110; AEC, Twenty-third Semi-Annual Report 303 (1958); Minsch, *supra* note 539 at 191, n.3 (nearly of the AEC direct payments to subcontractors "went to small business firms"); and Risik, *supra* note 536 at 134: "This clause is generated by a statement of government policy contained in several pieces of legislation to the effect that small business concerns must receive a fair share of government contracts. The purpose of this clause is laudable; it is not conceivable that our economy could function properly without small business concerns. But, it is difficult to see how a pious prayer such as the utilization-of-small-business-concerns helps the situation. The enforceability of such a covenant is doubtful to say the least, and at worst, a contractor might seek to escape responsibility for the acts of his small business concern subcontractors."

[659] Risik, *supra* note 536 at 133-134, 136: "Several clauses find their way into government contracts which actually have only a remote connection with the basic purpose of a contract. . . . There has been an increasing tendency to use government procurement to implement social and economic policies. . . . The effect of these philosophies is a severe headache to the draftsman of a government contract. Not only does the contract become cluttered with impediment which are not encountered in commercial contracting, but the net result is frequently poor and meaningless draftsmanship. If government contracts could be shorn of these extraneous matters in some way, without necessarily freeing the contract from being subject to such national policies as are deemed by the Congress or an administration to be wise, these

Other mandatory clauses deal with disputes, to be discussed hereafter; assignments of contracts without the permission of the Commission;[660] safety, health, and fire protection;[661] permits and licenses required to be obtained by the contractor from local authorities;[662] security;[663] litigation and claims;[664] required bonds and insurance;[665] and renegotiation of profits.[666] Aside from the disputes clause, particularly important to the contractor are the mandatory clauses which (1) permit the Comptroller General to have access to the contractor's books for three years after a final payment under the contract in question,[667] and (2) require the contractor immediately to notify the Commission whenever "an actual or potential labor dispute is delaying or threatens to delay the performance of the work."[668]

b. Non-Mandatory Clauses

Suggested articles to be contained in Commission contracts cover every type of situation which may be involved in the agency's procurement work.[669] Even though primarily or entirely drafted by the govern-

contracts would compare favorably with good commercial documents with respect to simplicity of content, length, and quality of draftsmanship."

[665] *Id.*, Section 9111-0320.

[666] *Id.*, Section 9111-0321; see Renegotiation Act of 1951, 50 U.S.C.A. App. §§1211 *et seq.* Under Sections 102(a) and 103(a), 50 U.S.C.A. App. §§1212(a) and 1212(c), all contracts with the Atomic Energy Commission "to the extent of the amounts received or accrued by a contractor or subcontractor" on or after January 1, 1951, are made subject to the renegotiation procedure.

[667] AEC Manual, Section 9111-0311. This clause also requires the prime contractor to insert a similar provision in subcontracts. See Comp. Gen. Dec. No. B-129114 (Oct. 10, 1956).

[668] AEC Manual, Section 9111-0313. See Mid West Contracting Co., AEC ABCA Dkt. No. 35 (Board's recommendation adopted by General Manager April 29, 1953), BNA, Atomic Industry Reporter 221: 328: "Contract specification's requirement that contractor satisfy himself as to general and local labor conditions which can affect cost under contract bars his recovery of additional costs incurred when he was required to use plumbers instead of pipelayers to install iron water pipes; contractor was obligated by local custom and local union rules to use plumbers, instead of pipelayers, and he could and should have discovered this by reasonable inquiry required of him under contract specification; less than total observance of union jurisdictional boundaries in installing subdivision water lines does not relieve contractor of obligation to use plumbers since he was engaged in overall large federal construction where many other trades and unions were employed."

[669] AEC Manual, Sections 9111-04 through 096.

ment, such clauses tend to be strictly construed against the contractor and in favor of the government.[670]

E. Settlement of Contract Disputes at Administrative Level

Controversies arising under government contracts traditionally have been sought to be settled by the use of a disputes clause inserted in the contract itself at the insistence of the public agency. In addition, many agencies like the Atomic Energy Commission have appointed a semi-independent body generally known as a Board of Contract Appeals to review decisions of the contracting officer, with or without that decision being binding on the head of the agency. A third method of contract dispute settlement at the administrative level relates to the authority of the Comptroller General.

1. The Disputes Clause [671]

The government has used two types of disputes clauses which empower the contracting officer, as the government's representative, to settle all controversies arising under the contract, such decision to be final and conclusive, subject only to administrative review. The first, the "all disputes" clause, permits the contracting officer to decide all questions of law and fact.[672] The second, and more common,[673] type is the "facts disputes" clause, which leaves to the contracting officer's final determination only questions of fact.

The Atomic Energy Commission has adopted the "facts dispute" clause.[674] This clause provides:

> Except as otherwise provided in this contract, any dispute concerning a question of fact arising under this contract which is not disposed of by agreement shall be decided by the Con-

[670] See Frank Belluscio & Sons, Inc., AEC ABCA Dkt. No. 4 (Board's recommendations adopted by General Manager Nov. 16, 1950), BNA, Atomic Industry Reporter 221: 311-312, strictly construing a "changes" article.

[671] For a general discussion of this type of contract provision, used in some form or another in government contracts since after the Civil War, see Joy, *supra* note 536 at 13-17; Schultz, *supra* note 536 at 219-220.

[672] See, *e.g.*, Graham Mfg. Co. v. U.S., 91 F. Supp. 715, 716 (D. Cal. 1950).

[673] Generally, Article 15 of the contract, see Shea, *supra* note 536 at 356; Joy, *supra* note 536 at 11.

[674] AEC Manual, Section 9111-034. 10 Code Fed. Regs. §3.1 specifically provides that such a clause may be included in subcontracts, a practice which is not commonly found in the contract appeals procedure of other agencies, see Cuneo, "Disputes Between Subcontractors and Prime Contractors Under Government Contracts, 16 Fed. Bar J. 246, 253 (1956).

> tracting Officer, who shall reduce his decision to writing and mail or otherwise furnish a copy thereof to the contractor. Within 30 days from the date of receipt of such copy, the contractor may appeal by mailing or otherwise furnishing to the Contracting Officer a written appeal addressed to the Commission, and the decision of the Commission shall, unless determined by a court of competent jurisdiction to have been fraudulent, arbitrary, capricious, or so grossly erroneous as necessarily to imply bad faith, or is not supported by substantial evidence, be final and conclusive: Provided, That if no such appeal to the Commission is taken, the decision of the Contracting Officer shall be final and conclusive. In connection with any appeal proceeding under this clause, the contractor shall be afforded an opportunity to be heard and to offer evidence in support of its appeal. Pending final decision of a dispute hereunder, the contractor shall proceed diligently with the performance of the contract and in accordance with the Contracting Officer's decision.

This clause contains five component parts with respect to procedure at the administrative level. First, the contracting officer has sole authority to decide "a question of fact arising under this contract" on which mutual agreement is not reached with the private contractor. This provision is detailed in the Commission's rules to require the contracting officer to issue, and to serve upon the contractor, a "decision" consisting of a statement of his decision, specific findings of fact thereon, and a copy of the rules governing appeals to the agency's Advisory Board of Contract Appeals.[675]

Second, the clause gives the contractor thirty days from the date of receipt of a "decision" by the contracting officer to file his appeal with the Commission, that is, the Advisory Board of Contract Appeals.[676]

[675] 10 Code Fed. Regs. §3.10. In the Board's view, specific findings of fact are ". . . important. . . . Not only do such Findings formulate the issues for appeal . . . but they evidence a vital part of the mental processes essential to any decision. Until the formal Findings of Fact have been completed, any purported decision (no matter how designated) is tentative by the very nature of human thinking. The ultimate decision must rest on, and be supported by, the Findings of Fact, and absent such Findings, there is no decision . . ." (Frontier Drilling Co., AEC ABCA Dkt. No. 74 (Board's recommendations adopted by General Manager July 1, 1955), BNA, Atomic Industry Reporter 221 : 374).

[676] 10 Code Fed. Regs. §§3.11-12. The 30-day requirement has been liberally construed by the Board in favor of the contractor, J. F. Byrd, AEC ABCA Dkt. No. 22 (Board's recommendations adopted by General Manager June 6, 1951), BNA, Atomic Industry Reporter 221 : 325; Sound Construction and Engineering Co., Dkt. No. 63 (Board's recommendations adopted Dec. 23, 1954), BNA, Atomic Industry Reporter 221 : 355; Frontier Drilling Co., *supra* note 675.

Third, if no appeal is taken, the decision of the contracting officer is "final and conclusive." Fourth, the Commission must afford procedure for the contractor to be given a hearing before it, which has been done through the Advisory Board of Contract Appeals. Fifth, the contractor must proceed "diligently" with the work during the pendency of the dispute.

The government often has taken the position that the procedure established by the disputes clause represents a true form of arbitration consistent with principles of arbitration applicable to private contracts.[677] The facts, however, do not support this claim. The contracting officer is hardly an impartial third party, completely disinterested in the result of the settlement of the dispute,[678] in spite of the AEC Board's praiseworthy efforts to improve the status of the contracting officer in contract appeals procedure.[679] The contracting officer's job is to keep the contract moving, with maximum benefit to the government, and the disputes clause procedure provides a "relatively inexpensive and rapid method of settling controversies." [680] The disputes clause may afford some measure of due process in the settlement of controversies arising under a contract while it is being carried out, but it is not a true agreement to arbitrate

> . . . because the decision is made by a representative of the Government. The bargaining power of the Government is

[677] Joy, *supra* note 536 at 11, 13; Anderson, *supra* note 536 at 220.

[678] See, *e.g., Review of Finality Clauses in Government Contracts, Hearings before House Judiciary Committee on H.R. 1839 et al.*, 83d Cong., 1st and 2d Sess. 24 (1954), in which the representative of the American Bar Association stated, in part: "Such a contracting officer may not intend to do any wrong; unwittingly, he is just not impartial. . . ." Other commentators are less charitable, see, *e.g.*, Schultz, *supra* note 536 at 224.

[679] See Otis Williams & Co., AEC ABCA Dkt. No. 88 (Board's recommendations adopted by General Counsel Nov. 8, 1956), BNA, Atomic Industry Reporter 221:388: "Contracting officers have many duties in connection with the execution of, and performance under, both prime and subcontracts. In most of these, they act purely as agencies of the Commission as a party to a contractual arrangement. But when a contracting officer proceeds under the 'disputes articles' of a prime or a subcontract, to decide a dispute, he then acts in a quasi-judicial capacity, obligated to proceed impartially, and without favoritism either to the subcontractor, to the contractor or to the Commission. Once he has rendered his decision, his judicial connection with the dispute ceases. . . . If the dispute was under a prime contract, he reverts to his status as an agent of the Commission and appears, in that capacity, as appellee. . . . [W]hen the dispute reaches this Board, appearances by counsel are on behalf of the proper parties, and a purported appearance for the contracting officer in his *judicial* capacity is as impossible and as improper as would be the appearance in an appellate court by counsel for the trial judge. . . ."

[680] Joy, *supra* note 536 at 20.

very great since many contractors depend upon Government contracts for their very existence, and are thus in no position to force their demands upon the Government. As a result, the disputes clause is heavily in favor of the Government.[681]

2. Advisory Board of Contract Appeals

Chartered in April, 1948, the Advisory Board of Contract Appeals of the Atomic Energy Commission represents a salutary, although incomplete, attempt by that agency to assure a measure of due process in the consideration of disputes appealed to the Commission from the contracting officer. Authority for the creation of the Board stems from Section 12(a) of the 1946 Act and Section 161a of the 1954 Act authorizing the Commission to "establish advisory boards to advise with and make recommendations to the Commission . . . administration." [682]

This type of intra-agency review procedure also has been used effectively in other agencies of the government. Some of these boards follow the pattern of the Atomic Energy Commission Advisory Board, the decisions of which are merely recommendations.[683] Others [684] follow the pattern of the Armed Services Board of Contract Appeals, the decisions of which are binding on the agency involved.[685]

[681] Shea, *supra* note 536 at 356.

[682] 42 U.S.C. §1812(a)(1946); 42 U.S.C.A. §2201(a). The general administration of advisory boards to the Commission, including the Advisory Board of Contract Appeals, is provided for in 10 Code Fed. Regs. Pt. 7, adopted Sept. 1, 1955, in "the midst of a growing controversy over what has been termed in press reports as 'big business domination' of the drive to develop industrial uses of atomic energy" (BNA., Atomic Industry Reporter 1:107). For a discussion of the antitrust problems arising with respect to AEC advisory boards, see Jacobs and Melchior, *supra* note 350 at 531-533. (Ed. Note: On February 3, 1959, 10 C.F.R., Part 3 of the AEC's Rule was amended to place the hearing of contract appeals under the agency's hearing examiner, 22 Fed. Reg. 726.)

[683] General Services Administration Board of Review, established March 7, 1950; Veterans' Administration Construction Appeals Board and Supply Contract Appeals Board, established April 8, 1949, and March 12, 1954, respectively.

[684] Department of Interior Board of Contract Appeals, established December 29, 1954; Contract Disputes Board for Commodity Credit Corp., established April 4, 1946; and Army Corps of Engineers Claims and Appeals Board, established August 9, 1946. Army overseas commands also have Boards of Contract Appeal with jurisdiction of claims up to $50,000, see Joy, *supra* note 536 at 17.

[685] Established May 1, 1949, and merging the former War Department and Navy Department Boards of Contract Appeals created August 24, 1942, and December 1, 1944, respectively. See Cuneo, *supra* note 536 at 376: "The charter of the Board also states that 'when an appeal is taken pursuant to a disputes clause in a contract which limits appeals to disputes concerning questions of fact, the Board may nevertheless in its discretion hear, consider, and decide all questions of law necessary for the complete adjudication of the issue,' and unless the contract provides otherwise,

a. Jurisdiction

Although obviously exercising considerable influence on the Atomic Energy Commission with respect to contract disputes, the Commission Advisory Board of Contract Appeals is exactly what its title signifies—an advisory body. Its decisions are merely recommendations to the General Manager, who, in every reported case but two through 1957, has approved such recommendations.[686] As the Board itself has stated, it is only "the creature of the Commission, and it has only such power as the Commission has chosen to confer." [687]

The Boards' jurisdiction primarily is established by the scope of the disputes clause itself and by Commission regulation. Thus, the Board is limited by that clause to settling controversies which arise "under the contract." It does not have jurisdiction over questions of general law connected with, but not directly arising under, the contract, nor can it deal with controversies after the contract is completed.[688] Further, the Commission's regulations stipulate that

> The General Manager of the Commission is the designated representative to decide finally all appeals arising under the "disputes articles" of commission contracts and subcontracts. The Commission has established an Advisory Board of Contract Appeals to assist the General Manager in his discharge of this responsibility by hearing the appeal and recommending to the General Manager appropriate disposition of the appeal. . . .[689]

---

if it appears that a claim for unliquidated damages is involved in the appeal, 'the Board shall, insofar as the evidence permits, make findings of fact with respect to such claim without expressing an opinion on the questions of liability.' . . . The wisdom of the Secretaries in giving the Armed Services Board administrative authority not set forth in the contract was recognized by the Court of Claims in McWilliams Dredging Company, 118 Ct. Cl. 1, 16 (1950). The court likened the Board as the representative of the Secretary, to an owner who would reverse his representative if he were wrong, not because the contract gave him the authority to make a final decision, but because it would be the natural and fair way for an owner to act. The courts have said that mistakes should be corrected within the agency whenever possible. Edmund J. Rappoli Company, Inc., 98 Ct. Cl. 499 (1943)."

[686] Raecolith Flooring Company, *supra* note 631; F. H. McGraw & Co., AEC ABCA Dkt. No. 60 (Board's recommendations rejected by General Manager Aug. 20, 1957), BNA, Atomic Industry Reporter 221:396 (cost-plus-fixed-fee contractor not entitled to reimbursement for expenses incurred in unsuccessfully contesting unfair labor practice charge before National Labor Relations Board).

[687] Frontier Drilling Co., *supra* note 675; see, to the same effect, C. H. Leavall & Co., AEC ABCA Dkt. No. 112 (Board's recommendations adopted by Deputy General Manager Oct. 24, 1957), BNA, Atomic Industry Reporter 221:397.

[688] *Ibid.*

[689] 10 Code Fed. Regs. §3.1.

In construing the above grants of power, the Board has severely limited its authority. Thus it has held that

> . . . [T]he rules do not establish the Board as an advisor at large to the General Manager. Its advice can be sought, and given, only where the appeal falls within the first sentence of Section 3.1, namely a dispute arising *under* a contract or subcontract. . . .
> . . . Finally, the Board's jurisdiction is limited by the language of the particular disputes clause involved. Section 3.2 of the Rules provides for an appeal only where it arises "under the disputes article" of the contract involved. Absent a disputes article, the Board has no power to pass on any issue. . . .[690]

In exercising its limited jurisdiction, the Board also is governed by the provisions of Public Law 356 enacted by Congress May 11, 1954. This statute, which is fundamental law in the field of Government contracts, provides:

> No provision of any contract entered into by the United States, relating to the finality or conclusiveness of any decision of the head of any department or agency or his duly authorized representative or board in a dispute involving a question arising under such contract, shall be pleaded in any suit now filed or to be filed as limiting judicial review of any such decision to cases where fraud by such official or his said representative or board is alleged: Provided, however, That any such decision shall be final and conclusive unless the same is fraudulent or capricious or arbitrary or so grossly erroneous as necessarily to imply bad faith, or is not supported by substantial evidence.
> No Government contract shall contain a provision making final on a question of law the decision of any administrative official, representative, or board.[691]

In construing the operation of the above provisions upon contract appeals within the Atomic Energy Commission, the Advisory Board has stated:

> It will be noted that this statute does not operate to deprive "any administrative official, representative or board" of jurisdiction over questions of law. It says, and means, only that whereas (under Section 1 of the same statute) decisions on questions of fact are final (absent the qualifications set out in the proviso to that section), decisions on questions of law are subject to judicial redetermination. *But it is impossible for*

[690] Frontier Drilling Co., *supra* note 675.
[691] 41 U.S.C.A. §§321-322.

Contracting Officers or their superiors to pass on claims without reaching decisions on matters of law. Nor can this Board fulfill its advisory function without similar action, if a dispute involving such issues is otherwise properly before it. (Emphasis supplied.) [692]

The "proper" presentation of legal issues to the Advisory Board, however, poses the problem, heretofore unsatisfactorily resolved, of how to differentiate between questions of fact and questions of law. This problem arises most acutely in judicial review of administrative decisions.[693] It also has arisen in the field of contract law because of the understandable desire of procurement agencies to insulate themselves from judicial intervention in the exercise of a so-called "proprietary" function.[694]

The problem is not academic for contractors with the Atomic Energy Commission. It is almost impossible for the contractor to decide when the contracting officer, under the "disputes" clause, has decided a question of fact which, unless appealed to the Advisory Board within thirty days, will be binding upon him in any administrative or judicial proceeding involving the contract. The safest course for the contractor to take is to appeal within the prescribed time.[695]

[692] Frontier Drilling Co., *supra* note 675.

[693] See Schwartz, *supra* note 544 at 854-857; Hoover Commission Legal Task Force Report, *supra* note 43 at 216-217: ". . . [I]t is seldom that any issue on judicial review of administrative action is purely a question of law, see Dobson v. Commissioner, 320 U.S. 489, 500-501 (1943). In almost every case the question of law depends in part upon the facts." As the foregoing report points out, the ultimate point in this judicial and legislative fetish of trying to distinguish facts from the law was reached in National Labor Relations Board v. Hearst Publications, 322 U.S. 111 (1941). In this decision the Supreme Court, in sustaining a decision of the Board that newsboys were "employees" of a newspaper under the Wagner Act (question of law) based upon the facts of the situation, "applied a restrictive review of fact issues rather than a broad review of legal questions." The judiciary's attitude in this chronic problem of court review is praiseworthy, because it is based on a healthy desire to prevent encroachment by the courts upon the authority of the Executive Branch. However, the insistence of the latter upon this restrictive scope of review is a part of the policy of administrative agencies to limit any judicial review of their decisions. One solution is to require courts, by legislation, to apply the law to the facts in all cases, see Section 207(g) of proposed Administrative Code, Hoover Commission Legal Task Force Report, *supra* note 43 at 374: "The reviewing court shall determine all relevant questions of law and interpret any constitutional and statutory provisions involved, and it shall apply such determination to the facts duly found or established, whether or not such court is the trier of the facts. . . ."

[694] Etheridge, *supra* note 536 at 556; Moss, *supra* note 536, at 163; Joy, *supra* note 536 at 20-21; Schultz, *supra* note 536 at 246.

[695] Etheridge, *supra* note 536 at 556-557; Cuneo, *supra* note 536 at 377: "Another difficulty is to determine whether the dispute is factual or legal. The uncertainty of

The problem again arises at the Advisory Board level. Under its charter, the latter considers the "appeal . . . de novo, and independent findings of fact will be made, although the findings of fact of the contracting officer may be adopted by the Board in whole or in part." [696] This type of review, of course, is not a true trial *de novo* in which the findings of fact of an administrative body would not be entitled to any legislative or judicial conclusiveness.[697]

The Advisory Board has endeavored to clarify the distinction between reviewable questions of fact, to which may be allied issues of law, and non-reviewable issues of law standing alone. It has held itself without jurisdiction to interpret a contract lacking a disputes clause.[698] However, the Board will make "some preliminary rulings" on legal issues where necessary to determine its own jurisdiction or "to put a factual dispute in its proper setting." [699] As a practical matter, like other intra-agency contract review boards, the Advisory Board of the Atomic Energy Commission probably will hear and decide an appeal from an initial determination of a contracting officer as an issue of fact to which issues of law are incidental.

b. Nature of Proceeding

On paper, the conduct of hearings by the Advisory Board appears to be highly informal and possesses none of the attributes of formal

---

arriving at any clear-cut definition of what constitutes a question of 'law' or 'fact' has generally been recognized by lawyers. . . . Whenever there is any doubt as to what should be done, the wise course to follow is to appeal. In most cases the effort and cost involved are negligible."

[696] 10 Code Fed. Regs. §3.22.

[697] For a statutory equivalent of this quasi-*de novo* administrative review, see 49 U.S.C.A. §16(2) and 7 U.S.C.A. §210, providing for review of reparations' orders of the Interstate Commerce Commission and Department of Agriculture. "Such restriction on the scope of review is inconsistent with a complete retrial of the facts under a trial de novo" (Hoover Commission Legal Task Force Report, *supra* note 43 at 219).

[698] Frontier Drilling Co., *supra* note 675.

[699] The Board held, in part, *ibid.*: "While, under such an ['facts disputes'] article, the Board can—and frequently must—make some preliminary rulings on legal issues where necessary either to determine (as here) jurisdictional questions, or to put a factual dispute in its proper setting, it is clear that the Board cannot pass on an appeal which raises only legal issues. . . . The present dispute raises only a question as to the interpretation of the contract. By long settled rule, the interpretation of contract clauses, although a dispute *under* a contract, is a dispute over issues of law. It follows that the Board has no jurisdiction. . . ." But see Retenbach Engineering Co., AEC ABCA Dkt. No. 11 (Board's recommendations adopted by General Manager May 29, 1951), BNA, Atomic Industry Reporter 221:313: "Dispute over whether contract gave Government or contractor responsibility for rerouting traffic around construction site is question of fact determinable by Board under contract's disputes clause."

adjudication [700] or of an adversary proceeding. Such hearings, by rule, are required to "be informal, with no fixed form of procedure." [701] These are no formal rules of evidence,[702] and parties may be represented "by any authorized person." [703]

Although neither the Atomic Energy Commission nor its Advisory Board of Contract Appeals ever has publicly taken the position with respect to contract review proceedings, there exists some sentiment that such proceedings are in the nature of an airing of grievances or of a friendly discussion.[704] The substance of contract appeals procedure and the issues at stake repudiate this characterization. So does the government's own position in the proceedings by always being represented by legal counsel. In fact as well as in theory, a proceeding before the Advisory Board of Contract Appeals of the Atomic Energy Commission is litigation in the substantial sense and clearly quasi-judicial.[705] Indeed, a prominent and long-time member of contract review boards in the Department of Defense has stated:

> Hearings before the Board have been described as being informal. This does not mean that they are of a roundtable discussion or conference variety. The procedure and atmosphere more closely resemble a court trial without a jury.[706]

[700] Under Section 2(d) of the Administrative Procedure Act, 5 U.S.C.A. §1001(d), made applicable to Commission proceedings by Section 181 of the 1954 Atomic Energy Act, adjudication is the formulation of any agency order which finally disposes of any matter other than by rule making. "Formal" adjudication is that which is "required by statute to be determined on the record after opportunity for an agency hearing" (Section 5, 5 U.S.C.A. §1004).

[701] 10 Code Fed. Regs. §3.23.

[702] *Id.*, §3.23(d): "Testimony and evidence may be submitted without regard to the formal rules of evidence. . . ."

[703] *Id.*, §3.23(g).

[704] See, *e.g.*, Moss, *supra* note 536 at 166, n. 26: "For example, one member of the ASBCA [Armed Service Board of Contract Appeals] argues openly that the Board's primary function is to provide contractors with a place to air their grievances, regardless of the validity thereof: a sort of wailing wall so to speak." This view coincides with the misconception that Government contracting is largely a matter of public relations.

[705] Vom Baur, *supra* note 536 at 32-33; Moss, *supra* note 536, at 163-164; see Plaine, *supra* note 1 at 78: ". . . [P]ossibly the relationship between the AEC and the contractors [under so-called reimbursement-type 'administrative contracts'] could be considered, on analysis, as a branch of 'administrative law.'" It also can be argued that Pub. L. 356 requires a hearing on the record within the meaning of Section 5 of the Administrative Procedure Act and that such a right to a formal hearing is required by the Constitution, even without the provisions of Pub. L. 356; see United States v. Blair, 321 U.S. 730, 734-737, 64 S. Ct. 820 (1944); United States v. Jos. A. Holpuch Co., 328 U.S. 234, 238-241, 66 S. Ct. 1000 (1946); Morgan v. U.S., 298 U.S. 468, 477-482, 56 S. Ct. 906 (1936).

[706] Cuneo, *supra* note 536 at 435.

3. Comptroller General

In addition to an appeal from the initial determination of a contracting officer to the Advisory Board of Contract Appeals, an Atomic Energy Commission contractor has another means of administrative review in the General Accounting Office, headed by the Comptroller General.[707]

This procedure has been well summarized, as follows:

> The GAO, while not a party to the contract, may enter the picture whenever vouchers are presented to it by an administrative agency for "direct settlement" with a contractor, or whenever a disbursing officer or head of an administrative agency requests an advance decision. The GAO also enters the picture when a contractor makes a claim against the United States where payment has been denied. It can deny payment or demand payment back; if the latter is refused, it can collect directly from any other governmental funds that may be due a contractor, and failing that method, it may request that the Attorney General sue on behalf of the United States in the appropriate court. It can also pay claims denied by the contracting agency, and a contractor dissatisfied with a decision of a contracting officer or board of contract appeals has a second opportunity for administrative review. Unlike the departmental review, however, this GAO review is optional and is not a prerequisite to filing a court action. . . .
>
> From the point of view of the contractor the administrative review procedure of the GAO is not too dissimilar from departmental review. If anything, it is more informal. The statutes under which the GAO is authorized to settle and adjust claims by and against the United States prescribe no definite form of procedure for the presentation and settlement of claims, leaving it entirely to the Comptroller General. Moreover, as an arm of Congress the GAO would appear to be excluded from the requirements of the Administrative Procedure Act, under Section 2(a). On the other hand, there may be some advantage to arguing a case to accountants, rather than lawyers, where the issue is cost accounting; there may also be psychological satisfaction in dealing with an office closer to the source of payment. And, of course, if the amount is worth fighting about, it is nice to have a second chance before resort to the courts.[708]

This administrative forum offers the advantage to the contractor of securing a determination of both his legal rights and the factual ques-

[707] Pursuant to Section 305 of the Budget and Accounting Act of 1921, 31 U.S.C.A. §74.

[708] Schultz, *supra* note 536 at 230-232. See Joy, *supra* note 536 at 41.

tions under the contract, without being limited on further judicial review to the restrictions of Public Law 356. Where both the contractor and agency submit a dispute to the Comptroller General, it may not later be redetermined by a board of contract appeals. Should the agency unilaterally submit the dispute to the Comptroller General, the contractor does not lose his rights to administrative and judicial review under the disputes clause and, indeed, may immediately bring suit in the courts on the grounds that the agency, by its actions, has waived the procedure provided under that clause.[709]

F. Judicial Review of Contract Disputes

1. Exhaustion of Administrative Remedies

Except where the Atomic Energy Commission voluntarily might waive the requirements of the disputes clause, the contractor is required to exhaust his administrative—or, more properly, contractual—remedies before he may proceed in court.[710] This means that a dispute arising under the contract must be disposed of, first, at the contracting officer level; second, at the Advisory Board level; and, third, at the General Manager level, all in accordance with the regulations of the Commission.

This exhaustion of remedies at the various administrative levels does not mean that the agency can delay its decision indefinitely, thus keeping the contractor out of the courts. Two years between the time of filing of a notice of an appeal of a contracting officer's decision and the date of a final decision by the agency has been held by the courts to be reasonable, but it appears that any further delay would be treated as a breach of the contract by the government which immediately would be actionable.[711]

2. Judicial Forums Available

Two judicial forums are available to the contractor once the administrative proceeding stage has been passed. These are the Court of Claims and the Federal District Courts.

Both of these tribunals have jurisdiction over suits involving "any claim against the United States . . . founded upon any express or im-

[709] Brooks-Callaway Co. v. U.S., 97 Ct. Cl. 689, 704 (1942); H.P. Andrews Paper Co., ASBCA Dkt. No. 2486 (1955).

[710] Cuneo, *supra* note 536 at 377; Joy, *supra* note 536 at 21-22; Etheridge, *supra* note 536 at 558-559; see Schwartz, *supra* note 544 at 831.

[711] Southeastern Oil Florida v. U.S., 115 F. Supp. 198, 201 (Ct. Cl. 1953); Wessel, Duval & Co. v. U.S., 126 F. Supp. 79, 81 (D.N.Y. 1954); see Joy, *supra* note 536 at 26.

plied contract with the United States; or . . . for liquidated or unliquidated damages in cases not sounding in tort." [712] However, the amount in suit is limited in the District Courts to $10,000. No such limitation is imposed by Congress on the jurisdiction of the Court of Claims.

The practical efficacy of submitting contract appeals to the courts is subject to some question, in view of the cost and time involved and the possibility that the government will fight the case to the Supreme Court if necessary.[713] Indeed, one such contractor, who travelled the road to the Supreme Court via the Court of Claims and lost, thereafter told a Congressional committee:

> Contractors are reluctant to go into the Court of Claims unless they are grossly wronged. It is a costly and time-consuming process to litigate a dispute under a Government contract. It is usually in their best interest to accept a decision and go about their established business. . . .[714]

As a result of the Supreme Court's decision in that case, *United States* v. *Wunderlich*,[715] the burden on the contractor to overturn an adverse decision by a contracting officer became almost impossible to meet.

3. Scope of Judicial Review

Prior to the *Wunderlich* decision in 1951, the courts clearly had established the rule that the decision of the contracting officer would not be disturbed unless it involved "fraud or such gross mistake as would necessarily imply bad faith, or a failure to exercise an honest judgment." [716] In *Wunderlich*, which involved a "facts dispute" clause similar to that used by the Atomic Energy Commission, a majority of the Supreme Court narrowed the scope of review to allegations and proof of actual fraud, that is

> . . . conscious wrongdoing, an intention to cheat or be dishonest. . . . If the standard of fraud that we adhere to is too limited, that is a matter for Congress.[717]

[712] Court of Claims—28 U.S.C.A. §1491; district courts—28 U.S.C.A. §1346(a)(2).

[713] Schultz, *supra* note 536 at 249-250, who recommends that the $10,000 limitation imposed in the district courts by the Tucker Act of 1887 is now unrealistic and should be raised to at least $100,000.

[717] 342 U.S. 98, 100. 72 S.Ct. 154 (1951). Three justices (Douglas, Reed, and Jack-

Matter for Congress that decision did become. The standard imposed thereby was recognized as "a departure from the previously settled law" and "a clear invitation to injustice." [718] After prolonged hearings,[719] Congress in May 1954 enacted Public Law 356.

The latter statute overrules the decision in *Wunderlich*. As noted previously, the legislation reinstates the pre-1951 scope of contract review by providing that the final decision by the contracting agency, in cases where there is a disputes clause, "shall, unless determined by a court of competent jurisdiction to have been fraudulent, arbitrary, capricious, or so grossly erroneous as necessarily to imply bad faith, or is not supported by substantial evidence, be final and conclusive." This language is incorporated in the disputes clause used by the Atomic Energy Commission.[720] The Commission clause also conforms to the statutory requirement that the decision of any administrative officer cannot be final with respect to questions of law.

Not only did Public Law 356 restore a rule of law which gave the contractor some semblance of contractual due process, it also added the requirement of substantial evidence to underlie the agency decision. This means that, for such a decision to be sustained, it must be supported in the record on review by "such relevant evidence as a reasonable mind might accept as adequate to support a conclusion." [721] The new evidentiary standard represents a definite reform in contract review procedure, since theretofore the decision of the contracting officer or agency could be sustained by a court on a mere preponderance of the evidence. The provision clearly was designed to bring into this field of judicial review at least one of the salutary standards required by the Administrative Procedure Act.[722] Further, Public Law 356 has been construed

son) vigorously dissented, stating in part, 342 U.S. 101: "But the rule we announce has wide application and a devastating effect. It makes a tyrant out of every contracting officer. He is granted the power of a tyrant even though he is stubborn, perverse or captious. He is allowed the power of a tyrant though he is incompetent or negligent. He has the power of life and death over a private business even though his decision is grossly erroneous. Power granted is seldom neglected." See Palace Corp. v. U.S., 110 F. Supp. 476, 478 (Ct. Cl. 1953), literally interpreting the Wunderlich rule.

[722] Section 10(e)(B)(5), 5 U.S.C.A. §1009(e)(B)(5) (". . . the reviewing court . . . shall . . . hold unlawful and set aside agency action, findings, and conclusions

to permit consideration by a reviewing court of evidence outside the so-called "administrative record" considered by the deciding officer of the contracting agency.[723]

G. Conclusions

Except with respect to the controversy involving Mississippi Valley Generating Company, the contract policies and procedures of the Atomic Energy Commission have not of themselves evoked substantial adverse comment or criticism. Indeed, the agency appears to have done an outstanding job in establishing and operating a multi-billion dollar atomic energy plant in the United States.

This does not mean, however, that the contract procedures of the Commission cannot be improved. Such improvement only can be effected when the Commission and contractors alike recognize procurement as a form of administrative procedure and dispel the present theory

---

found to be . . . unsupported by substantial evidence. . . ."); H.R. Rep. No. 1380, *supra* note 719 at 4-5. For decisions construing the provisions of Public Law 356, see Allied Contractors, Inc. v. U.S., 124 F. Supp. 366 (Ct. Cl. 1954) (contractor need not take appeal from contracting officer's decision on question of law); Atlantic Carriers v. U.S., 131 F. Supp. 1, 5 (D.N.Y. 1955) (dismissing libel in admiralty for government breach of charter party by returning ship in damaged condition, the court holding: "A question of 'law' is not a 'claim' of which the court acquires immediate jurisdiction before the administrative fact-finding process is completed. Questions of law usually arise only after the disputed questions of fact relegated to administrative determination have been resolved. If a claim arising under a disputes clause involves *solely* questions of law, then immediate jurisdiction may properly be held to be present"); United States v. Lennox Metal Mfg. Co., 131 F. Supp. 717, 732-733 (D.N.Y. 1954), *affirmed* 225 F. 2d 302, 318-319 (2d Cir. 1955) (holding substantial evidence rule of Administrative Procedure Act and dissents in Wunderlich case enacted into contract law by Public Law 356); Wagner Whirler and Derrick Corp. v. U.S., 121 F. Supp. 664 (Ct. Cl. 1954) (overruling decision of contracting officer for lack of substantial evidence therefor in record).

[723] Volentine and Littleton v. U.S., 145 F. Supp. 952, 954 (Ct. Cl. 1956): "There is logic in the Government's position. But we do not adopt it. It would require two trials in many cases involving this question. The first trial would include the presentation of the 'administrative record' and its study to determine whether, on the basis of what was in it, the administrative decision was tolerable. But the so-called 'administrative record' is in many cases a mythical entity. There is no statutory provision for these administrative decisions or for any procedure in making them. The head of the department may make the decision on appeal personally or may entrust anyone else to make it for him. Whoever makes it has no power to put witnesses under oath or to compel the attendance of witnesses or the production of documents. There may or may not be a transcript of the oral testimony. The deciding officer may, and even in the departments maintaining the most formal procedures, does, search out and consult other documents which, it occurs to him, would be enlightening, and without regard to the presence of the claimant."

that the contracting function of the government is exactly analogous to that of a private party. Congressional authority to, in effect, review certain types of Commission contracts presents a new and complicating factor in the relations between private industry and the federal agency.

Within the Commission itself, the Advisory Board of Contract Appeals should be reconstituted as a true intra-agency review body, with final—not advisory—authority to pass upon the initial determinations of contracting officers. The success of, and general public confidence in, the Armed Services Board of Contract Appeals which has authority to bind the Secretary of Defense, points the way towards a similar development within the Atomic Energy Commission.

The fiction that the Board only makes findings of fact, and reaches conclusions of law incidental thereto, also should be laid to rest. This can be done by amending the Rules of Procedure of the Board. There exists no sound reason why the Board cannot consider mere questions of law, which consideration, of course, would be reviewable in the courts as at present. Such a step would benefit both the agency and contractors. The latter would be encouraged to confine the settlement of all disputes arising under or in relation to a contract within the intra-agency review framework, without any resort to the courts.

Any Commission or industry misconception that a proceeding before the Board is merely a forum to air grievances also should be dispelled. Form and theory to the contrary, such a proceeding is a quasi-judicial hearing in which adverse interests litigate. The present emphasis of the Commission's regulations on informality and lack of evidentiary rules is misleading and detrimental to the interests of both the government and the contractor.

Time and effort are expended by both sides in a proceeding which could be shortened by greater formality and regard for the rules of evidence. The often repeated argument that informality simplifies administrative proceedings is not borne out by the facts. Informality lengthens the record and permits the introduction of arguments completely unrelated to the subject matter of the proceeding. More important, however, the contractor choosing to take his case to the courts must do so with a record which is difficult for the latter to review in many cases because of disregard for the rules of evidence at the agency level. In this, the contractor probably is the chief sufferer since he is seeking to reverse an agency decision.[724] Indeed, the substantial evidence

[724] Even those who favor the "administrative contract" admit that "judicial enforcement of total performance by either party would be difficult" (Ramey and Erlewine, *supra* note 551 at 354; see Moss, *supra* note 536 at 160-161)

rule used by the courts since 1954 to review contract decisions would seem to require that the record be made by practical and reasonable use of the rules of evidence.

Finally, and most important, the contractor must realize the nature of the transaction in which he engages when he contracts with the government. The fine print on the back of a government contract form is just as binding as the clauses of a contract prepared on typing paper. Despite the government's insistence at times on speed in negotiating and executing the contract, the private party should approach the transaction with the same care and caution which he would use in other legal matters affecting his business.

PART V

INTERNATIONAL CONTROL OF ATOMIC ENERGY

Chapter I

ATOMS FOR PEACE: THE NEW INTERNATIONAL ATOMIC ENERGY AGENCY †

BERNHARD G. BECHHOEFER * AND ERIC STEIN **

On October 26, 1956, seventy states signed an international agreement described as the Statute of an International Atomic Energy Agency. This signing followed a conference of over a month in which eighty-two states participated.[1] All of the participating states supported the text which resulted from this conference—a truly remarkable result considering that the subject of the conference was atomic energy with its far-reaching international security implications. The Agency came into existence on July 29, 1957, as a result of the ratification of the statute by the requisite number of states. On October 1 when its first General Conference convened in Vienna, the Agency had fifty-four members.

The International Atomic Energy Agency in several respects is

† The authors gratefully acknowledge the support of the Stanford Research Institute, Menlo Park, California, in the preparation of this article. The authors are indebted also to The University of Michigan Law School for providing able research assistance by Mr. Frederick Juenger, graduate student at the Law School.

Any views expressed in this article are the personal views of the authors and not necessarily the views of any agency of the United States Government. This article appeared originally in the April 1957 issue of the Michigan Law Review; it has been revised to bring the developments concerning the International Atomic Energy Agency up to October 1, 1957.

* Member, District of Columbia Bar; formerly Foreign Service Officer detailed to U.S. Atomic Energy Commission as Chief of International Atomic Energy Agency Branch, Division of International Affairs; A.B. 1925, Harvard College; LL.B. 1928, Harvard Law School; member, Minnesota Bar; from November 1954 to December 1955, Special Assistant to the United States Representative for International Atomic Energy Agency Negotiations.

** Professor of Law, University of Michigan; J.U.D. 1937, Charles University of Prague, Faculty of Law; J.D. 1942, University of Michigan; formerly of the Department of State, Adviser to the United States Delegation to the International Conference on Peaceful Uses of Atomic Energy in Geneva and to the United States Representative for International Atomic Energy Agency Negotiations.

[1] See Official Records of the 1956 Conference on the Statute of the International Atomic Energy Agency (hereinafter referred to as the statute), IAEA/CS/OR.39, p. 2, for the unanimous adoption of the statute. The text of the statute (reproduced as Appendix A, Item 10) is contained in booklet form in IAEA/CS/13. For the list of the states which signed the statute see IAEA/CS/OR. 40, pp. 11-15.

unique among international organizations. In the first place, it combines two functions. It has the positive function of seeking "to accelerate and enlarge the contribution of atomic energy to peace, health and prosperity throughout the world." [2] Also, it has the negative function of insuring, "so far as it is able, that assistance provided by it or at its request or under its supervision or control, is not used in such a way as to further any military purpose." [3]

When President Eisenhower first launched the idea of the Agency in the United Nations on December 8, 1953, he indicated that one of its prime objectives should be to "begin to diminish the potential destructive power of the world's atomic stockpiles." [4] This envisioned utilizing the Agency to siphon off fissionable materials from wartime uses to peacetime uses.[5] Thus one function aims at raising standards of living; the other theoretically relates to the over-all problem of disarmament.[6]

Another unusual feature of the Agency is that there will in fact be three different types of relationships between the Agency and its members. This is reflected in the statute, particularly in the provisions on the selection of the Board of Governors.[7] The first type of relationship will apply to those members which now produce substantial quantities of fissionable materials; [8] those states probably will not apply

[2] Statute, art. II, first sentence.

[3] Statute, art. II, second sentence.

[4] U.N. General Assembly Off. Rec., 8th Session (1953), Plenary Meetings, A/PV.470, p. 443 at 452, par. 122.

[5] The same thought was repeated by Mr. Lewis Strauss, Chairman of the United States Atomic Energy Commission, in the International Conference on the Statute. He expressed the hope that the creation of an International Atomic Energy Agency ". . . will divert important amounts of fissionable material from atomic bomb arsenals to the uses of benefit to mankind, and those amounts will steadily grow with the maintenance of peace. More tons of these materials will be devoted to welfare, fewer tons to weapons and warfare." IAEA/CO/OR.1, p. 11. However, see the United States note of May 1, 1954 handed by Secretary of State Dulles to Soviet Foreign Minister Molotov [in Atoms for Peace Manual, S. Doc. No. 55, 84th Cong., 1st sess. 274 (1954)] to the effect that ". . . this proposal [for an international atomic energy agency] was not intended as a measure for the control of atomic weapons. . . ."

[6] For the position of the Soviet Union on the relation between negotiations for the Agency and disarmament negotiations, see Appendix A, Items 1 and 7, and footnotes 74 and 129 *infra*.

[7] Statute, art. VI, par. A.

[8] The statute defines fissionable materials in art. XX as follows:

"1. The term 'special fissionable material' means plutonium—239; uranium—233; uranium enriched in the isotopes 235 or 233; any material containing one or more of the foregoing; and such other fissionable material as the Board of Governors shall

in the foreseeable future for any assistance whatsoever from the Agency.[9] The second type of relationship will involve the states that have substantial quantities of "source material" (uranium and thorium) [10] and therefore will be in a position to make contributions to the Agency as well as to receive benefits from the Agency.[11] This same category would include countries such as Norway, Sweden, and the Netherlands, which have developed considerable technical skills in the field of atomic energy but lack, at the present time, source materials. The third type of relationship will involve those members that have neither technical skills nor source materials. These states constituting most of the membership will derive benefits from the Agency but their contributions, if any, are likely to be much smaller than the benefits which they will derive.

While the states in this third category received texts of the draft statute as early as August 1955 and made suggestions both in the U. N. General Assembly and to the negotiating states, they did not participate directly in the negotiations until the convening of the International Conference.[12] Many of the changes in the statute made at the conference resulted from their suggestions.[13]

---

from time to time determine; but the term 'special fissionable material' does not include source material.

"2. The term 'uranium enriched in the isotopes 235 or 233' means uranium containing the isotopes 235 or 233 or both in an amount such that the abundance ratio of the sum of these isotopes to the isotope 238 is greater than the ratio of the isotope 235 to the isotope 238 occurring in nature." *Cf.* the definition of "special nuclear material" in §11y of the United States Atomic Energy Act of 1954, 68 Stat. 921, 42 U.S.C.A. §§2011 *et seq.* (P.L. No. 703, 83d Cong., 2d sess., August 1954).

[9] This group includes the United States, the United Kingdom, Canada, and the U.S.S.R. and perhaps France. The Chairman of the U.S. Atomic Energy Commission estimated that France would seek Agency assistance. (*Hearings before the Committee on Foreign Relations,* U.S. Sen., 85th Cong., 1st sess., on Exec. I, May 14-20, 1957, p. 117.)

[10] Art. XX of the statute defines "source material" in the following manner:

"3. The term 'source material' means uranium containing the mixture of isotopes occurring in nature; uranium depleted in the isotope 235; thorium; any of the foregoing in the form of metal, alloy, chemical compound, or concentrate; any other material containing one or more of the foregoing in such concentration as the Board of Governors shall from time to time determine; and such other material as the Board of Governors shall from time to time determine." *Cf.* the definition of "source material" in the U.S. Atomic Energy Act of 1954, 42 U.S.C.A. §2014(x).

[11] *E.g.*, France, the Union of South Africa, Belgium, Czechoslovakia, Portugal, Australia.

[12] Ambassador Morehead Patterson, U.S. representative in the initial negotiating group, states in his Report to the President: "Many comments have been received either through communications to the State Department or through statements made in the recent debate on this subject in the Tenth General Assembly. These com-

Three drafts emerged successively during the negotiations:

1. The text of August 22, 1955, prepared by the initial negotiating group of eight states, referred to below as the eight-power draft;[14]

2. The text of April 18, 1956, prepared by the enlarged negotiating group of twelve states, referred to as the twelve-power draft;[15] and

3. The final text approved by the International Conference.[16]

Separate and parallel negotiations were carried on between the United States and the Soviet Union until the Soviet Union joined in the negotiating group of twelve in November 1955.[17]

A. Membership

The initial membership of the Agency is limited to states which are members of the United Nations or of any of the specialized agencies which sign the statute within the specified period and ratify it.[18] As a practical matter, all states are eligible for initial membership excepting the Chinese Communist regime, North Korea, East Germany, Outer Mongolia, and Viet Minh. These regimes are neither members of the United Nations nor of any of the specialized agencies. States other than the initial members may become members "after their membership has been approved by the General Conference upon the recommendation of the Board of Governors." [19]

---

ments indicate that differences in viewpoints as disclosed to date are mainly concentrated on a few points such as: a) composition and manner of selection of the Board of Governors of the Agency; b) relationship of the Agency to the United Nations; c) procedures for approval of the budget and prorating among States of operating expenses. The United States and the other negotiating States have sought to give full consideration to the viewpoints expressed by all of the States." 34 Dept. of State Bul. 5 at 6 (1956).

[13] The vast majority of the amendments to the statute offered at the International Conference were proposed by these states. Approximately half of the amendments brought to vote at the Conference were adopted. For a list of amendments and their authors see IAEA/CS/INF.4/Rev. 1, dated October 3, 1956.

[14] Published in 33 Dept. of State Bul. 666-672 (1955).

[15] Annex III of the Report of the Working Level Meeting on the Draft Statute of the International Atomic Energy Agency, Doc. 31, Washington, D.C., July 2, 1956; also IAEA/CS/3, September 10, 1956, as corrected by IAEA/CS/3/Corr. 1 and IAEA/CS/3/Corr. 2.

[16] See note 1 *supra*.

[17] See Appendix A, Item 1.

[18] Statute, art. IV, par. A. The statute was opened for signature on October 26, 1956. Statute, art. XXI, par. A. Fifty-seven states deposited their ratification in time to become "initial members."

[19] Statute, art. IV, par. B. This provision also applies to members of the United Nations or one of the specialized agencies which have not signed the statute within ninety days after it was opened for signature. See Appendix A, Item 2.

B. Organs of the Agency

The Agency has three organs: the General Conference composed of all members,[20] the Board of Governors,[21] and the staff headed by a director general.[22] The negotiators at an early stage concluded that in distributing responsibility among these three organs, the Board of Governors would be given preponderant authority.[23] This conclusion was due to the fact that the great bulk of contributions to the Agency would come from the very few states that had fissionable materials or large resources of uranium. These states, which were the only negotiators of the earlier drafts, were sure to play a large role on the Board of Governors. As the group of negotiating states broadened, the powers of the General Conference vis-a-vis the Board of Governors have increased. This was in response to the strong views expressed by many states, particularly in the General Assembly and the International Conference.[24]

[20] Statute, art. V.

[21] Statute, art. VI.

[22] Statute, art. VII.

[23] See the remarks of Mr. Morehead Patterson in his Report, 34 Dept. of State Bul. 5 at 6 (1956): "It was clear that the membership as a whole could not deal with the day-to-day technical problems which would confront the Agency. Therefore, we provided in the Statute for a Board of Governors with broad authority to make most of the necessary decisions for the Agency. The membership as a whole—described in the Statute as the General Conference—maintains its control over the Board of Governors through election of a number of its members and through complete control over the purse."

See also the eight-power draft, which already provided (in art. VII, par. H), "The Board of Governors shall be charged with complete authority to carry out the functions of and determine the policies of the Agency in accordance with the present Statute subject to its responsibilities to the General Conference. . . ."

[24] Already in the debates in the Ninth General Assembly (in 1954) some delegations called for increased participation by underdeveloped countries in the drafting of the statute. *E.g.*, Mr. Barrington (Burma) said that "it was to be regretted that Asia and Latin America had not been called upon to take part in the organization of the international agency. . . ." U.N. General Assembly Off. Rec., 9th Session (1954), First Committee, A/C.1/SR.723, p. 371 at 372. Similar views were expressed by Mr. Menon (India). *Id.*, A/C.1/SR.725, p. 381. Increased representation of the "have-nots" on the proposed board as well as in the negotiations was advocated by a number of countries in the Tenth General Assembly (1955). See particularly *Syria*, U.N. General Assembly Off. Rec., 10th Session (1955), First Committee, A/C.1/SR.764, p. 39 at 43; *Indonesia, id.*, A/C.1/SR.765, p. 45 at 47; *Israel, id.*, A/C.1/SR.765, p. 45 at 48; *Liberia, id.*, A/C.1/SR.766, p. 53 at 55; *India, id.*, A/C.1/SR.768, p. 63 at 65. The Indonesian representative said: "I have already cautioned against repeating the inequalities of the earlier industrial revolution, with its sharp division between the 'haves' and the 'have-nots,' between the producers of manufactured goods and the suppliers of raw materials. . . . It is our sincere hope that the governing

From the very outset of the negotiations, the General Conference was given control over the purse strings.[25] The budget of the Agency required the approval of the General Conference.[26]

Among the additional powers granted to the General Conference at the International Conference is the authority to make "decisions" (as distinguished from recommendations) on matters referred to it by the Board.[27] If this amounts to a delegation of decision-making authority it may be of practical importance particularly in the event of the inability of the Board to decide upon a course of action. The General Conference was also given the authority to "discuss any questions or any matters within the scope of this Statute or relating to the powers and functions of any organs provided for in this Statute, and may make recommendations to the membership of the Agency

---

body of the agency will, in the first place, be founded on the principle of equitable geographic distribution. This means, naturally, that the Asian, African and Latin American Continents must be adequately represented on this body." *Id.*, A/C.1/PV.765, pp. 22-23. In regard to the position of the underdeveloped countries see also William R. Frye, "Atoms for Peace: 'Haves' Vs. 'Have-Nots'" in 35 Foreign Policy Bul. 41 (1955).

[25] See art. VI, par. D, subpar. 5, and art. XVI of the eight-power draft; art. V, par. D, subpar. 5, and art. XIV of the twelve-power draft.

[26] The General Conference under Article V (E) 6 will approve reports to be submitted to the United Nations as required by the Relationship Agreement between the Agency and the United Nations, except reports referred to in par. (C) of art. XII, or return them to the Board with its recommendations. (The reports provided in par. (C), art. XII, concern non-compliance by a state with orders of the Board of Governors to remedy violations of "safeguards" agreements.) Under art. III of the Draft Relationship Agreement (General Assembly Document A/3620, July 23, 1957), the Agency must submit (a) reports covering Agency activities at each regular session of the General Assembly; (b) reports when appropriate to the Security Council "whenever, in connexion with the activities of the Agency, questions within the competence of the Council arise"; and (c) reports to the Economic and Social Council and to other organs of the United Nations on matters within their special competence.

[27] Statute, art. V, par. F, subpar. 1. This provision was part of the Indonesian-Pakistanian amendment (IAEA/CS/Art. V/Amend. 8). Mr. Ahmad (Pakistan) stated: "This amendment has been submitted with the idea of giving greater authority to the General Conference within the scope of the present statute. . . . If . . . there is any matter on which the Board of Governors is unable to arrive at a decision or on which it may definitely and explicitly want the opinion or the decision of the General Conference, then we think that instead of the present phraseology, the General Conference should be authorized to take decisions on those matters which are specifically referred to it by the Board." IAEA/CS/OR.18, p. 46. Mr. Surjotjondro (Indonesia) remarked that ". . . the insertion . . . will add a very useful constitutional provision for a matter which we are justified in anticipating will come up in the course of the operation of the agency" IAEA/CS/OR.19, p. 9. This amendment was adopted by 63 votes to 1, with 14 abstentions. IAEA/CS/OR.22, p. 46.

or to the Board of Governors or to both on any such questions or matters." [28] This language follows closely article 10 of the United Nations Charter concerning the powers of the United Nations General Assembly. While the Board of Governors still makes final decisions on most matters and while the powers of the General Conference are confined to those expressly granted to it in the statute, nevertheless, this authority of the General Conference to make recommendations is significant. The Board of Governors is certain to give the greatest weight to the recommendations of the General Conference. The legislative history raises some doubt whether the authority to make "recommendations to the membership" means only general recommendations applicable to all members or whether it includes also specific recommendations directed to an individual member. The authority to make recommendations of the latter type would provide a rather powerful means of pressure on individual members.[29]

[28] Statute, art. V, par. D. This addition also originated in the amendment proposed at the Conference by Indonesia and Pakistan. IAEA/CS/Art. V/Amend. 8. In regard to this amendment Mr. Michaels (United Kingdom) said: ". . . [W]e recognize that perhaps the arrangements in the Agency should be brought a little more closely into line with those which now apply to the United Nations as a whole." IAEA/CS/OR.18, p. 38. The Pakistanian representative remarked: "This paragraph . . . is taken from the Charter of the United Nations where the powers of the General Assembly *vis-a-vis* the special organs of the United Nations are defined. . . . By the introduction of this new paragraph, the powers of the General Conference . . . would be widened." IAEA/CS/OR.18, pp. 44-45. The Czechoslovak representative remarked: "Views that the General Conference should be an organ with decisive authority in matters concerning the Agency's activities have been expressed by many Governments in their comments on the original draft, as well as in the opening statements of many delegations at our Conference." IAEA/CS/OR.18, p. 41. The amendment was adopted by 76 votes to none, with 4 abstentions. IAEA/CS/OR.22, p. 42.

[29] The importance of this new wording seems to lie in the power to make recommendations to the *membership* of the Agency, because the former art. V, par. E, subpar. 1, of the twelve-power draft had already provided for the power "to make recommendations to the *Board of Governors* on any matter relating to the functions of the Agency." (Emphasis added.) (The phrasing "within the scope of this Statute or relating to the powers and functions of any organs" does not seem to differ substantially from "relating to the functions of the Agency.")

The amendment in its original form used the words "to the *members*." (Emphasis added.) Mr. Michaels (United Kingdom) argued against this on the ground that a situation should be avoided in which the General Conference would make recommendations to individual member states which were in conflict with arrangements made by the Board, and that therefore the term "membership" rather than "members" should be used. See IAEA/CS/OR.18, p. 38. The Mexican representative said: "As we understand it, the United Kingdom representative proposes that the General Conference should be given authority to address recommendations to the members of the Agency as a whole, and not to an individual member or group of members. If that understanding is correct, the result, in our opinion, would be to restrict the

This increase in the powers of the General Conference [80] as the negotiations progressed [81] is reminiscent of the United Nations where the authority of the General Assembly was considerably increased at the San Francisco conference in contrast to the original Dumbarton Oaks proposals worked out by the great powers with emphasis upon the functions of the Security Council.[82]

The most difficult and controversial question which arose in the negotiations prior to the International Conference was the composition and manner of selection of the Board of Governors.[83]

A number of formulae for the composition of the Board were considered and rejected. At one time, a system of weighted voting based

---

powers and functions of the General Conference. The provision would lose any practical value." IAEA/CS/OR.19, p. 17. The Chairman of the Conference stated before the amendment was brought to vote: "I understand that the sponsors of this amendment will accept the proposed substitution of the words 'to the membership' for the words 'to the members.'" IAEA/CS/OR.22, p. 41.

[80] See Appendix A, Item 3.

[81] This progress is described by Mr. Michaels (United Kingdom) in the following manner: "I would point out to the Committee that the original draft of this statute, which was circulated in August 1955, gave the Board of Governors a very large degree of direct responsibility, not only in carrying out, but in initiating and approving the policies to be followed by the Agency. A number of countries criticized this arrangement because they felt that on certain broad matters of policy affecting the actions of the Board they should be more closely subordinated to the over-all direction of the General Conference. The twelve-power negotiating group, at its meeting in March of this year, took these criticisms very seriously, and although I will not enumerate them here, a number of very substantial changes were made to meet the views expressed. . . . [T]the article as it now stands describes reasonably satisfactorily the relative field of responsibility of the Board and the General Conference. To try to give the General Conference the attributes of the executive organ of the Agency, for which by its very nature it is not fitted, would, in view of my delegation, lead only to inefficiency and misunderstanding. It would leave the Board without effective influence or authority. As was pointed out by the representative of Portugal, the operation of the Agency undoubtedly would require decisions which cannot wait a year between meetings of the General Conference." IAEA/CS/OR.18, pp. 36-37.

[82] Compare chapter V, sec. B, of the proposal for the Establishment of a General International Organization [Dumbarton Oaks, Washington, October 7, 1944, 11 Dept. of State Bul. 368 (1944)] with arts. 10, 11 and 14 of the Charter of the United Nations. For the history of this development see Bentwich and Martin, A Commentary on the Charter of the United Nations 35 (1950), and Gilchrist, "The United Nations Charter with Explanatory Notes of Its Development at San Francisco . . . ," 413 International Conciliation 452-454 (1945).

[83] Concerning the Board, the original outline of the statute transmitted to the Soviet Union on March 19, 1954 (see Appendix A, Item 1) provided in art. II, par. C, subpar. 1, for a "limited membership" representing governments in which it "might be desirable to take account of geographic distribution and membership by prospective beneficiaries," and that "the principal contributors would be on the Board of Governors."

on contributions was suggested but was discarded largely because of the technical difficulties of evaluating the contributions in different types of materials. The advisability of granting permanent seats to the most advanced atomic powers was also studied and rejected because of the impossibility of developing long-term criteria for permanent membership.[34] As the number of negotiating powers increased, the proposed number of the Board members increased. The additional seats would be filled mainly by "atomic have-nots," thus diluting the influence of the "atomic powers" in the Board. The debate in the United Nations General Assembly created pressures in this direction.[35]

The twelve-power draft and the final text provide for a Board of twenty-three of which ten are elected by the General Conference.[36] The remaining thirteen are chosen by the outgoing Board on the basis of (a) their potential for contributions in materials and skills, and (b) a pattern of geographic representation for the major regions of the world. The top five "atomic powers" [37] may claim what amounts in fact to continuing membership as long as they retain their leading position in the atomic energy field—regardless of whether they actually contribute to the Agency and regardless of any geographic criteria.[38]

Despite widespread criticism in the International Conference of the composition of the Board and despite a number of amendments suggested particularly by the Afro-Asian states to increase their representation on the Board, the provisions of the twelve-power draft were adopted without change by the conference.[39] All the negotiating

[34] See Report by Ambassador Morehead Patterson, 34 Dept. of State Bul. 5 at 6 (1956). Art. II, par. C, subpar. 2 of the first American outline [Atoms for Peace Manual, note 5 *supra* at 267] stated that "arrangements could be worked out to give the principal contributing countries special voting privileges on certain matters, such as allocations of fissionable material."

[35] See note 24 *supra*.

[36] Art. VI, par. A, subpar. 3 of the twelve-power draft and identical article in the statute. The membership of the Board will be twenty-three, on the assumption that "the five members most advanced in the technology of atomic energy" continue to be the United States, United Kingdom, U.S.S.R., Canada, France, or continue to represent three geographic areas. If the five represented more or fewer than three areas, it would change the size of the Board. The eight-power draft in art. VII, par. A provided for a Board of 16. Five of the members would be the most important contributors of technical assistance and fissionable material, five others selected from the principal producers and contributors of source materials, and only six were to be elected by the General Conference.

[37] At present the United States, the Soviet Union, the United Kingdom, France, and Canada.

[38] See Appendix A, Item 4.

[39] Seven amendments to art. VI were proposed, five of them dealing with the com-

powers including the Soviet representative urged strongly that no change be made in the formula on the ground that no better formula could be contrived in view of the political realities.[40]

However, two concessions were made to the critics of this formula. First, it was provided that the question of a general review of the provisions of the statute should be placed on the agenda of the fifth annual session of the General Conference.[41] In the debate, it was made clear that the composition of the Board would be included in such review. In particular, the special representation of the producers of source materials would be reconsidered since many additional states during the next five-year period were likely to become large-scale producers of either uranium or thorium.

The second concession related to the composition of the Prepara-

position and selection of the members of the Board. These five amendments were sponsored respectively by: *Denmark and Iran,* IAEA/CS/Art. VI/Amend. 2; *Philippines,* IAEA/CS/Art. VI/Amend. 4; *Liberia,* IAEA/CS/Art. VI/Amend. 5; *Egypt, Ethiopia, Indonesia and Syria,* IAEA/CS/Art. VI/Amend. 6; and *Italy,* IAEA/CS/Art. VI/Amend. 7. None of these amendments was adopted. Amendments 2 and 7 were withdrawn. Amendment 4, though not formally withdrawn, was not pressed to a vote. Amendment 5 was rejected by 31 to 15 votes, 20 abstaining. Amendment 6 was rejected by 26 to 26 votes with 18 abstaining. (Amendments 5 and 6 attempted to increase the participation of Africa and the Middle East.) Art. VI as a whole was adopted by 71 votes to 1, with 3 abstentions.

[40] The Soviet representative, Mr. Zarubin, said: "The draft article before the Committee seems to be the reasonable compromise. . . . [I]n a spirit of co-operation the delegation of the Soviet Union has decided not to move any amendments to draft article VI. . . . [T]he delegation of the Soviet Union hopes that the same spirit of co-operation will prevail among other delegations, and it appeals to all to accept article VI of the draft statute as it stands." IAEA/CS/OR.20, p. 3.

Mr. Wadsworth, U.S. representative, agreed. "As the representative of the Soviet Union has just said, since the outset of the negotiations on the statute over two years ago, the question of the Board has presented arduous and complicated problems. It was only with considerable difficulty that agreement was reached among the original eight Negotiating States on the formula which was contained in the draft statute of 22 August 1955. . . . [S]ince this formula represents a finely balanced compromise, even one small part cannot be changed without affecting the whole." IAEA/CS/OR.20, pp. 4-6.

Mr. Bhabha, representative from India, remarked: ". . . [W]e recognize that the composition as set up in the present draft has been arrived at by give and take on all sides, and we cannot, therefore, expect to have those particular articles changed that we do not agree with without, naturally, others also asking for a change in articles with which they do not agree. We are, therefore, prepared to accept this article as it now stands and to support it." IAEA/CS/OR.20, p. 12.

[41] Statute, art. XVIII, par. B. Interesting to recall is the analogy to the United Nations Charter: The critics of the Great Power veto at the San Francisco conference were placated in part by the inclusion in the Charter of a provision for a review and revision of this instrument (art. 109 of the Charter). See Goodrich and Hambro, Charter of the United Nations, Commentary and Documents 539-540 (2d ed., 1949).

tory Commission set up under the statute with the task of completing the arrangements necessary for the actual establishment of the Agency. All six elected representatives on the Preparatory Commission were chosen from among the Afro-Asian and Latin American group.[42] Similarly, the first Board of Governors includes four Latin American states and seven states from the Middle East and Far East.[43]

C. Functions of the Agency

1. Peaceful vs. Military Purposes

All Agency functions relate solely to the utilization of atomic energy for *peaceful* purposes. The Agency is directed to ensure, "so far as it is able," that its assistance is not used in such a way as to further any "military purpose." [44]

During the International Conference, France introduced an amendment defining "military purpose" as follows: "The only uses of atomic energy which shall be regarded as uses for non-peaceful purposes are military applications of the atomic explosion and of the toxicity of radioactive products." [45] This amendment seems to be based on the conclusion that the greatest menace to the world from the military use of the atom arises as a result of nuclear explosions and from the toxicity of radioactive materials. The concept of "military purpose" thus would be limited to these uses only and would not include, for instance, the use of nuclear fuel in the propulsion of a submarine, an aeroplane, or a missile; the menace from these latter uses is not much greater than that arising from the use of conventional fuels for similar objectives. Under the French amendment the use of power derived from atomic fuel in a munitions plant, for instance, would not constitute a military use.

In urging the adoption of a restrictive definition of "military purposes" the Indian representative suggested that any state having a military program should be ineligible for any Agency assistance, since, for instance, material made available to such state, under Agency

[42] See Appendix A, Item 5.

[43] The first Board of Governors is composed of the United States, Canada, United Kingdom, U.S.S.R., France, Portugal, Czechoslovakia, Australia, Brazil, India, South Africa, Sweden, Japan, Italy, Rumania, Egypt, Pakistan, Indonesia, Korea, Guatemala, Peru, Turkey, and Argentina. The 10 states listed last were elected by the first General Conference.

[44] Statute, art. II, second sentence.

[45] IAEA/CS/Art. XX/Amend. 1.

safeguards, for its non-military program would release corresponding materials for its military program.[46]

During the conference, it became apparent that any attempt to define "military purpose" in the statute would raise more problems than it would solve. France never brought its amendment to a vote.[47] It would not have been desirable for the Agency to adopt a definition that by implication would sanction, for example, the use of Agency assistance for an atomic submarine. The present text sets up a broad standard under which the Board of Governors will have to develop criteria applicable to specific situations as they may arise.

2. Atomic Power

From the beginning of the negotiations, recognition has been given to the principle that the Agency shall have a broad responsibility for *all* phases of development of the peaceful uses of atomic energy. However, the portion of President Eisenhower's address to the General Assembly of December 8, 1953, that had the greatest effect on public opinion throughout the world was his statement that ". . . peaceful *power* from atomic energy is no dream of the future. That capability, already proved, is here—now—today." [48] Thus, the function of the Agency which has received the greatest public attention is to furnish atomic fuel for the production of electric power.[49] The functions of the Agency, however, extend to many other matters such as research, training, exchange of information, and development of standards of health and safety.[50] The Report of the Preparatory Commission to the General Conference recognizes that on the basis of current eco-

[46] IAEA/CS/OR.28, pp. 66-67.

[47] France withdrew its amendment with the understanding that its substance should be considered by the Preparatory Commission. IAEA/CS/OR.36, p. 33. There also was a proposed revision of the French amendment submitted by India. See Conference Room Paper No. 17. This revision read: "Any military purpose shall mean the production, testing or use of nuclear, thermonuclear and radiological weapons." This revision also was withdrawn, the Indian delegate commenting: "We agree that this matter should be noted in the future and we do not wish at this stage to press this particular amendment to a vote." IAEA/CS/OR.36, p. 34.

[48] Atoms for Peace Manual, note 5 *supra* at 5.

[49] It is widely expected that, in the long run, the development of reactors and, in particular of power reactors, will be the most important peaceful application of atomic energy, and that the Agency's assistance to its members in this field may in time become the most extensive of its activities. Report of Preparatory Commission of the International Atomic Energy Agency (PRECO), G.C.1/1, GOV/1 (New York 1957) par. 43.

[50] See Statute, art. III.

nomics, the initial Agency programs are likely to stress these other functions.[51]

3. Training and Research

The final text of the statute reflects the importance of the function of training—a recognition that the absence of trained technicians and engineers may be a serious obstacle to early development of worldwide electric power derived from atomic fuels.[52] There is every indication that the Agency will place great emphasis in its early years on the subject of training.[53]

It should be noted that the Agency is authorized to encourage and assist research and "to perform any operation or service useful in research." [54] While there is no express provision authorizing Agency research,[55] it is doubtful whether the Agency could successfully carry out its safeguard and health and safety functions or attract qualified personnel without some research program. The Preparatory Commission suggested that the Agency undertake research programs in connection with "its statutory functions, such as waste disposal, health and safety, and methodology of safeguards and should also encourage such work in Member States." [56] However, the Commission did not specifically recommend the immediate establishment of Agency laboratory facilities, but merely that "The Agency should examine at an

[51] PRECO Report, note 49 *supra*, par. 43.

[52] Note, *e.g.*, the inclusion of the words "and training" in art. III, par. A, subpar. 4 of the statute, which originated in a Polish amendment. IAEA/CS/Art. III/Amend. 2/ Rev. 1. This addition was adopted by 78 votes. IAEA/CS/OR.22, p. 11.

[53] PRECO Report, note 49 *supra*, par. 70. A number of amendments were proposed during the International Conference which would provide for specific activities of the Agency, such as the amendments submitted by Bolivia and Ecuador to establish a world university of the atom (IAEA/CS/Art. III/Amend. 9), the Haitian amendment to provide for granting scholarships by the Agency (IAEA/CS/Art. III/Amend. 1), and the Polish amendment to publish an international periodical devoted to the peaceful uses of atomic energy (IAEA/CS/Art. III/Amend. 2/Rev. 1). These amendments were all defeated on the ground that the functions of the Agency should be general and the decision on specific activities should be left to the Board of Governors. (*E.g.*, the argument of Mr. Wadsworth, representative of the United States in IAEA/CS/OR.16, p. 17).

[54] Statute, art. III, par. A, subpar. 1.

[55] The first United States outline (see Appendix A, Item 1) mentioned "data developed as a result of its own activities" (art. III, par. C, subpar. 2), which would imply independent research by the Agency. In the later drafts no such clause can be found. However, there is nothing in the statute to prohibit research by the Agency as long as it is for peaceful uses and furthers the purposes of the statute.

[56] PRECO Report, note 49 *supra*, par. 30, and generally pars. 20-41.

early date the need for the establishment of laboratory facilities at its headquarters." [57]

4. Health and Safety Standards

The Agency has broad functions in the field of health and safety. It is authorized "to establish or adopt . . . standards of safety for protection of health and minimization of danger to life and property (including such standards for labour conditions). . . ." It may "provide for the application of these standards to its own operations as well as to the operations making use of materials, services, equipment, facilities, and information made available by the Agency or at its request or under its control or supervision. . . ." [58] As in the case of safeguards against diversion of materials, it may also "provide for the application of these standards, at the request of the parties, to operations under any bilateral or multilateral arrangement, or at the request of a State, to any of that State's activities in the field of atomic energy. . . ." [59] States receiving Agency assistance must agree to meet Agency health and safety standards.[60]

The authority of the Agency to prescribe such standards is not confined to the type of hazards peculiar to operations utilizing nuclear materials. Likewise there is nothing to prevent the Agency from applying to operations coming under its jurisdiction far more stringent standards than the country where the operation takes place applies to its operations. In such an event, as a practical matter, the Agency would probably have to rely for enforcement of these higher standards on its own inspectors. It could not readily utilize the local authorities even in policing non-radiological hazards if those authorities applied different and less stringent standards.

It would seem advisable for the Agency in setting up the standards in this field to cooperate as fully as possible with the state where the facility is located; in general, the Agency should insist on more rigorous standards than those prescribed by local laws only in the interest of preventing hazards affecting more than one state (for example, reactor incidents which would contaminate a considerable area or waste disposal affecting international waterways).[61]

[57] PRECO Report, note 49 *supra*, par. 104.

[58] Statute, art. III, par. A, subpar. 6.

[59] *Ibid.*

[60] Statute, art. XI. par F subpar. 4(b); and art. XII, par. A, subpars. 1 and 2.

[61] For a discussion of analogous problems arising from federal v. state regulations in this field, see State Regulation of Atomic Energy, Part III of this volume.

Health and safety standards and practically every function of the Agency, excepting the procurement and disposal of materials and the operation of the safeguard system against diversion, are of some concern to various specialized agencies of the United Nations. This makes it essential that there should be a clear-cut division of functions.

The Draft Relationship Agreement between the United Nations and the Agency [62] takes note of this situation and suggests as one of the principles of that relationship that the United Nations recognize "the International Atomic Energy Agency . . . as the agency, under the aegis of the United Nations as specified in this Agreement, responsible for international activities concerned with the peaceful uses of atomic energy in accordance with its Statute, without prejudice to the rights and responsibilities of the United Nations in this field under the Charter." [63] If this principle is carried out, the present and prospective programs of some of the specialized agencies in the atomic energy field may be considerably curtailed.[64]

5. Exchange of Information

The Agency is to disseminate the information obtained from the members and encourage the exchange of information among them. The statute differentiates between information arising from assistance extended by the Agency and other information. With respect to the former, "Each member *shall* make available to the Agency" all such information.[65] The obligation in connection with information from other sources is much less sweeping: each member "*should* make available such information as would *in the judgment of the member* be helpful to the Agency." [66] This latter loose undertaking and the obligation to share in the administrative budget seem to be the duties which a member assumes through signing and ratifying the statute. Other obligations arise only in connection with specific agreements between the member and the Agency concerning the receipt of benefits, contributions to the Agency, or the application of safeguards on re-

[62] General Assembly Document A/3620 of July 23, 1957.

[63] *Id.* at art. I. This provision follows closely the suggestions of the Secretary General of the United Nations in a study of the question of the relation of the Agency to the United Nations. Par. 4, General Assembly Document A/3122 of April 20, 1956, reproduced in IAEA/CS/5, Sept. 24, 1956.

[64] See Appendix A, Item 6.

[65] Statute, art. VIII, par. B (emphasis added).

[66] Statute, art. VIII, par. A (emphasis added).

quest. The Preparatory Commission recommended a fairly extensive initial Agency program for exchange of unclassified information.[67]

Under article III, paragraph A, subparagraph 5 of the statute, it would be possible to extend the Agency safeguards system into the field of information. Theoretically, therefore, the United States and other governments could turn over classified data to the Agency.[68] As a practical matter, this is unlikely to happen since data available to the Agency will generally become available to all of its members.[69]

The Director General and the staff of the Agency are required not to "disclose any industrial secret or other confidential information coming to their knowledge by reason of their official duties for the Agency." This provision was included by the Conference on the initiative of Switzerland.[70]

D. Agency Facilities

The Agency is authorized "to acquire or establish any facilities, plant and equipment useful in carrying out its authorized functions, whenever the facilities, plant and equipment otherwise available to it in the area concerned are inadequate or available only on terms it deems unsatisfactory." [71] This emphasizes a more gradual acquisition of facilities than another provision that "the Agency shall as soon as practicable establish or acquire" *storage* facilities and certain types of other facilities.[72] These provisions are the end product of discussions which commenced on the day of President Eisenhower's address as to whether the Agency should be "a bank"—should have actual possession of fissionable materials—or a "clearing house" merely arranging as an intermediary for the international distribution of fissionable materials from one country to the other. The statute clearly authorizes the Agency to be a "bank" and contemplates such a result. The Agency may, however, operate also as a "clearing house."

[67] PRECO Report, note 49 *supra*, pars. 58-65.

[68] For the provisions of U.S. law, see 42 U.S.C.A. §§2164, 2153, 2154 (Atomic Energy Act of 1954, note 8 *supra*, §§144, 123, 124).

[69] The Department of State interprets the statute as imposing "no obligation for us to furnish any information. In no case is it contemplated that we furnish the Agency or Members of the Agency classified information." *Hearings before the Senate Foreign Relations Committee*, note 9 *supra*, at 55.

[70] Statute, art. VII, par. F. IAEA/CS/Art. VII/Amend. 5/Rev. 1, adopted in revised form (Conference Room Paper No. 4) by 76 votes to none. IAEA/CS/OR.26, p. 12.

[71] Statute, art. III, par. A, subpar. 7.

[72] Statute, art. IX, par. I.

The Preparatory Commission concluded that "it would be premature at this stage to make definite proposals regarding the timing of the steps the Agency will have to take" to acquire storage facilities.[73]

E. Agency Safeguards

There were three possible ways of dealing with the problems of safeguards against diversion of fissionable materials into military uses. First, international transfer of fissionable materials for peaceful uses might have taken place without any safeguards. The result of this course would have been that in a short time a number of states would have been in a position to develop atomic weapons.[74] It certainly would not be in the interest of world peace if a large number of states were in a position to use or threaten to use atomic weapons. There is less danger when three states have atomic weapons than when more than eighty states have them. In this respect, it is possible that the interests of the United States and of the Soviet Union might coincide.

A second possible course would have been to delay the development of the peaceful uses of atomic energy because of the danger to world peace through diversion to military purposes. In view of the rapid worldwide increase in power requirements and imminent shortages of conventional fuels any such course would have inevitably handicapped efforts to improve world standards of living.

The statute follows a third and middle course which permits the development of peaceful uses with safeguards designed to deter the development of new weapons programs. The success of the system of safeguards will depend on a wide variety of factors including technological and political developments.

The statute establishes the basic principle that safeguards will be *imposed* only in connection with agreements between the Agency and states which are beneficiaries of Agency projects.[75] States do not sub-

[73] PRECO Report, note 49 *supra*, par. 102. The only other technical facilities with which the Commission deals in its Report are laboratory facilities, PRECO Report, pars. 103 and 104.

[74] The possible increase of the production of atomic weapons resulting from peaceful uses was used by the Soviet Union as an argument against international co-operation in the field of peaceful uses of atomic energy. See, *e.g.*, the Aide-Memoire of September 22, 1954 in the Atoms for Peace Manual, note 5 *supra*, 278 at 281.

[75] Art. XI, par. F of the statute reads (in part): "Upon approving a project, the Agency shall enter into an agreement with the member or group of members submitting the project, which agreement shall: . . . 4. Include undertakings by the member or group of members submitting the project (a) that the assistance provided shall not be used in such a way as to further any military purpose; and (b) that the

mit to the system of safeguards merely by ratifying the statute. A further step is essential.

The Soviet Union during the negotiations has on the surface at least made a complete about-face in its attitude toward safeguards. Pointing to the fact that weapons grade plutonium is a neccessary by-product of the operation of every power reactor, the Soviet Union initially opposed all safeguards (and for that matter any agency dealing with quantities of fissionable materials) in the absence of a prohibition of atomic weapons. Gradually the Soviet Union altered its position until it accepted the present provisions of the statute with some vague warnings about infringement of sovereignty through operation of the inspection system.[76]

It is possible that the changed attitude was influenced by the discussions on the subject of safeguards which took place in Geneva in August 1955 immediately following the United Nations Scientific Conference. The exchange of notes between the United States and the Soviet Union on this subject indicates the probability of further bilateral discussions with the Soviet Union on the problem of safeguards.[77]

---

project shall be subject to the safeguards provided for in art. XII, the relevant safeguards being specified in the agreement. . . ." The Agency could not waive the inclusion of the safeguard provision in the project agreement. See art. XI, par. F, subpar. 4, and art. III, par. D referring to "agreements . . . which *shall* be in accordance with the provisions of the statute." [Emphasis added.] What would be the situation if the safeguards specified in the agreement are for some reason less stringent than the "relevant" safeguards specified in article XII? Could the Agency under article XII nevertheless enforce the "statutory" safeguards? There may be some support for an affirmative answer in the language of the statute and particularly in the fairly detailed enumeration of the safeguards therein. However, such detailed enumeration may well have been due solely to the desire to avoid complaints on the part of beneficiary states that the proposed project agreements worked out by the Board bore no relation to the obligations which they thought they assumed when they signed the statute. It was agreed among the eight negotiating states that some provisions specifying the nature of the safeguards should be included in the statute. These provisions were vastly expanded and improved in subsequent drafts.

[76] See Appendix A, Item 7.

[77] The Soviet Union in its Aide-Memoire of July 3, 1956 (United States Department of State Press Release No. 527, Oct. 6, 1956, p. 28) stated that "the consideration of this problem [of the extension of the Agency safeguards to bilateral agreements] could be resumed after the statute is adopted by the Conference and after it is ratified by the countries involved." In its answer of August 15, 1956 (*id.* at 30, 31), the United States pointed to the fact that it will take some time until the Agency safeguards will be operative and that the United States Government is therefore interested in standardizing the already existing safeguards. Mentioning the statement of the Soviet Union that it had already initiated a program for rendering assistance to a number of states and that the same was true with respect to the United Kingdom and

The statute elaborates in considerable detail the Agency safeguards,[78] which include the right of the Agency

> 1. To approve the design of specialized equipment and facilities, including nuclear reactors;
> 2. To require the observance of Agency prescribed health and safety measures;
> 3. To require the maintenance and production of operating records;
> 4. To call for and receive progress reports;
> 5. To exercise stringent controls over the operations connected with production of power where diversion of fissionable materials to weapons can most readily take place, and to approve means to be used for chemical processing of spent fuel elements;
> 6. To establish a system of inspection through a staff of international inspectors.[79]

The statute deals in some detail with remedies in the event of non-compliance with the safeguard requirements.[80] Inspectors shall report any non-compliance to the Director General, who shall transmit the report to the Board of Governors. The Board shall call upon the recipient state to remedy forthwith any non-compliance which it finds to have occurred. The Board shall report the non-compliance to all members and to the Security Council and General Assembly of the United Nations. If the non-compliance constitutes a potential or actual threat to international peace, the Security Council could exercise its considerable powers under the United Nations Charter, assuming, of course, that the five permanent members agree. The General Assembly might also exercise its recommendatory authority on the basis of the report of the Board.[81]

Canada (France having similar plans), the Department of State, in the interest of assuring the effectiveness of the Agency proposed an early commencement of staff level talks to explore the possibility of reaching uniform safeguards for bilateral agreements not less comprehensive than the present ones of the Agency. The United States Aide-Memoire also mentioned that Canada, France and the United Kingdom indicated their interest in participating in such talks.

[78] Statute, art. XII, par. A, subpars. 1-6.

[79] For the functions of the inspectors see art. XII, par. A, subpar. 6, par. B and par. C of the statute. The inspectors supervise the compliance with health and safety standards and safeguards against diversion both in the Agency facilities and in the facilities of its members under project and other agreements.

[80] Statute, art. XII, par. C, and par. A, subpar. 7. The purpose of art. XII, par. A, subpar. 7 is not at all clear in view of the almost identical provision in art. XII, par. C.

[81] For full discussion of the powers of the Security Council and the General Assembly in this respect see Goodrich and Simons, the U.N. and the Maintenance of International Peace and Security (1955).

In the event of non-compliance, the Board may direct curtailment or suspension of assistance provided by the Agency and call for return of materials and equipment made available to the recipient member. Obviously, the "recapture" of misused material would depend ultimately on the cooperation of the recipient state. The Agency may also suspend the non-complying member from exercise of the rights and privileges of membership.[82]

It would seem that the finding of non-compliance by the Board may serve as a basis for immediate withdrawal of any Agency assistance and for other remedial measures.[83] The state affected will no doubt be given full opportunity to present its defense. However, it would appear that under the statute such a state does not have the right to avoid or delay the remedial measures by invoking the procedure for settlement of disputes discussed below.[84]

The provisions for sending inspectors designated by the Agency "after consultation" with the state involved into territories of recipient states permit access of these inspectors "at all times to all places and data and to any person who by reason of his occupation deals with materials, equipment, or facilities . . . to be safeguarded, as necessary to account" for the materials, to check on compliance with health and safety measures and other conditions of the Agency project agreements.[85] These are truly unprecedented inspection powers which apply regardless of the type or extent of Agency assistance. Yet, these provisions resulted in relatively little controversy during the International Conference.[86] They may, however, cause considerable difficulty when

[82] Statute, art. XII, par. C, and art. XIX, par. B. Since the suspension can only take place in accordance with art. XIX, it seems that all the requirements of par. B of art. XIX must be present, namely, *persistent* violation of the statute or agreements, unless art. XII, par. C can be read as providing for an independent basis for suspension in accordance with the *procedure* laid down in art. XIX.

[83] As to anticipated effect of remedial measures see *Hearings before the Senate Foreign Relations Committee,* note 9 *supra* at 60, 121.

[84] Pp. 776 and 777.

[85] Statute, art. XII, par. A, subpar. 6.

[86] Switzerland proposed 2 changes in subpar. 6 of art. XII, par. A of the statute. The first of them was to clarify that the persons subject to control by Agency inspectors are only those who because of their occupations deal with materials, equipment, and facilities supplied by the Agency. The second envisaged that the inspectors be accompanied by representatives of the state concerned, if the state requested it and the inspectors are not impeded thereby. See IAEA/CS/Art. XII/Amend. 1/Corr. 1 and Corr. 1/Rev. 1. See also Conference Room Papers Nos. 6 and 13 and the Swiss statement in IAEA/CS/OR.37, p. 102, for changes from the original wording of the amendments. Both amendments were accepted by 77 votes to none with no abstentions. For rather unenlightening statements on the scope of inspection, see IAEA/CS/OR.29, pp. 17, 62, 87.

the time comes to apply them. Substantially the same powers of access, however, are given to the United States audit inspectors under the bilateral agreements concluded by the United States.[87] Some countries which are parties to these agreements might prefer to have the inspection performed by an international agency rather than by nationals of the United States.[88]

The principal opposition to the safeguards provisions in the twelve-power draft came from India. Practically the entire debate on safeguards in the conference centered on the three reservations entered by India.[89] The main thrust of the Indian objection was directed against the inclusion of source materials [90] in the accountability system and against the almost unrestricted right of the Agency to dispose of the by-product weapon grade material produced in operation of the power reactors. This latter right was considered essential to the safeguards system for a number of reasons, one of which was to prevent states

[87] See, *e.g.*, art. X of the agreement for cooperation between the United States and France, 102 Cong. Rec. 10398 (June 29, 1956). For detailed comparison of Agency and U.S. bilateral safeguards provisions, see *Hearings before the Senate Foreign Relations Committee*, note 9 *supra*, at 72-77.

[88] One of the problems that might confront the Agency in working out its system of inspection, namely the composition of inspection teams, was brought to the attention of the Conference in the proposed Philippines addition to article XII (IAEA/CS/Art. XII/Amend. 4) reading as follows: "Any mission of inspection to determine any diversion to military end contrary to this statute shall consist of at least three members: one from the Union of Soviet Socialist Republics and two others from the five members most advanced in the technology of atomic energy referred to in sub-paragraph A-I of Article VI of this statute." (U.K., U.S., U.S.S.R., Canada, France.) This amendment received no substantial support. For an explanation of the motivation of this amendment, see the statement of the Philippine representative in IAEA/CS/OR.27, p. 36.

Mr. Virgin, Swedish representative, remarked: "The recruitment of the staff of inspectors and the selection of members of a mission will obviously give rise to many problems. . . . My delegation feels that on those questions one should not go into further detail in the statute itself than has been done, but that it should be left to the Agency to find an appropriate course of action and to arrange in each particular case for the inspection under the general rules of the statute and, of course, of any agreement between the Agency and the recipient member country. The consultation envisaged in paragraph A 6 to which I just referred will give ample opportunity to the recipient country to give its views for the consideration and guidance of the Agency. . . . It would mean introducing an entirely new principle if staff members from particular countries or group of countries were to be given the right of being represented in a given function of an international organization." IAEA/CS/OR.27, pp. 67-68. For further statements in opposition to the Philippine amendment, see IAEA/CS/OR.24, p. 67 (Australia); IAEA/CS/OR.30, pp. 26 (U.S.S.R.). The Philippine delegation did not press the amendment to a vote. IAEA/CS/OR.30, p. 47.

[89] See Appendix A, Item 8.

[90] See note 10 *supra* for the definition of this term.

from stockpiling greater quantities of weapons grade by-product than they could presently use for peaceful purposes.[91] India contended that the statute would give the Agency perpetual and far-reaching power to affect the economic life of states. The ingenious compromise solution reached in the conference retains the accountability of source materials but restricts the right of the Agency with respect to the "special fissionable materials recovered or produced as a by-product"; the states will have the right to retain (under continuing Agency safeguards) such quantities of the by-product materials as they can use "for research or in reactors, existing or under construction." [92]

The discussion on the safeguards occupied about half of the conference debates. The compromise solution removed the last obstacle to the unanimous approval of the statute.

While the provisions of the statute concerning safeguards are fairly detailed, the agreements between the Agency and its members will very likely have to go into considerably greater detail. The only restriction on the terms of the agreements is that all their provisions "shall be in accordance with the provisions of the statute. . . ." [93]

The elaboration and establishment of a detailed system of safeguards will pose a great challenge to the Board of Governors; outstanding scientific skill coupled with wise political counsel will be required to meet this challenge.[94] If the Agency grows into an active

[91] For the United States view see the statement by Mr. Wadsworth, United States representative, in IAEA/CS/OR.29, pp. 59-61.

[92] Statute, art. XII, par. A, subpar. 5. See Conference Papers Nos. 19 and 21, containing the amendments adopted in the statute. As a practical matter under existing technology very little plutonium or U-233 would come under this exception at the present time, and the states will thus be required to dispose of the bulk of these materials as instructed by the Agency. In addition, states would have the right to require that special fissionable materials produced as a result of such operations and deposited with the Agency, "be returned promptly to the member or members concerned for use under the same provisions as stated above." Thus economic and political factors could not deprive states of the plutonium and other fissionable by-products produced from their reactors. At the same time, states would not be permitted to accumulate idle stockpiles of plutonium readily usable for atomic weapons.

[93] Statute, art. III, par. D.

[94] As the representative of Pakistan, Mr. Ahmad, put it, "It will be up to the Board of Governors, as it considers different specific situations and as it attempts to implement agreements which the statute provides for, to consider most carefully where there is a necessity for applying rigidly the rules contained in the statute in this specific case, and I take it that it will, in a realistic way, seek for each project technical solutions which, while upholding the main ideas of control, will burden the recipient country with the minimum of difficulties." IAEA/CS/OR.28, pp. 24-25. The Report of the Preparatory Commission contains the following recommendations for implementation of safeguard programs:

body, its standards of safeguards for security as well as of health and safety will have direct influence on national standards developed by member states. The Agency may contribute to worldwide uniformity of these vital standards.[95] Unprecedented questions will arise in coordinating the inspection and enforcement functions between the Agency and the member states or groups of states such as EURATOM.

F. Supplying of Materials

The statute makes a differentiation between fissionable materials and other materials which may be useful to the Agency.[96]

Theoretically, the Agency is to accept any amounts of special fissionable materials offered to it subject only to reaching agreement on a proper price and matters incidental to the transfer.[97] This would carry out the underlying concept advanced by President Eisenhower in the General Assembly in 1953 that the Agency should siphon off the supplies of fissionable materials from military to peacetime uses.[98]

"(a) The safeguard procedures should keep pace with the development of the Agency's activities, starting with problems related to the transport and storage of source and special fissionable materials and extending to the use of these materials in Agency-sponsored projects and to their subsequent treatment;

"(b) The safeguard procedures should be adapted to the specific character of each individual project and the degree of potential risk of material diversion. The safeguards should ensure adequate accountability in accordance with the statutory provisions, including both physical security and material accountability measures to the extent required; . . ." PRECO Report, note 49 *supra*, par. 84(a) and (b).

[95] Secretary of State Dulles pointed out to the Senate Foreign Relations Committee: ". . . if there is no such organization with a standard system of controls, then you may get into a situation where nations will shop around and buy their materials from the nation which imposes the least controls . . . and in the end the whole control system would break down." *Hearings before the Senate Foreign Relations Committee*, note 9, *supra* at 8.

[96] The definitions of the various types of materials as defined in art. XX (notes 8 to 10 *supra*) bear resemblance to those of the United States Atomic Energy Act of 1954, 42 U.S.C.A. §2014(x) and §2014(y). The definitions in the statute are, however, more specific than those of the Act. Definitions similar to those of the Atomic Energy Act of 1954 are contained in the bilateral agreements between the United States and other countries. See, *e.g.*, art. I, pars. H and I, of the Agreement for Co-operation Between the United States and France, 102 Cong. Rec. 10398 (June 29, 1956). The Indian amendment (IAEA/CS/Art. XX/Amend. 2), which had proposed that irradiated source material should be excluded from the definition of special fissionable material (art. XX, par. 1), was not adopted by the International Conference.

[97] Statute, art. IX, par. A. This provision does not have the restriction contained in par. B for source materials, namely, the power of the Board of Governors to "determine the quantities of such materials which the Agency will accept. . . ."

[98] See text at note 4, *supra*. For the proposition that such was the purpose of the language in par. A of art. IX, see Mr. du Plessis (representative of the Union of

In contrast, the Agency would accept only such quantities of source materials and other materials as determined by the Board of Governors.[99] Without such a provision, the Agency might be overwhelmed with materials useful in connection with atomic energy programs but in surplus supply.

The statute does not specify whether the contributed material will be sold or leased to the Agency; nor does it fix the legal form of the transaction through which the material will be made available by the Agency to the recipient state.[100] This commendable omission will allow the Board to work out agreements tailored to different types of projects and fitting the requirements of national legislation.[101] As long as the safeguards obligations are effectively imposed, the question of the legal form of the transaction is relatively unimportant.[102]

One of the most difficult problems in connection with the supplying of materials will be the determination of the amount the Agency will pay for the contributed materials. This is intertwined with the problems of financing of the Agency and will be dealt with later in that connection.

No member may require that the materials it makes available to the Agency be kept separately by the Agency or designate the specific project in which they must be used.[103] It seems to be the purpose of

---

South Africa), who said: "Article IX . . . does not give the Agency the right to refuse these materials since such a right would be incompatible with the disarmament purposes of the Agency." IAEA/CS/OR.20, p. 28.

[99] Statute, art. IX, par. B.

[100] The statute uses the inconclusive term "reimbursement" in art. XIII to describe the payment made to contributing members. The terms "withdraw" used in art. XII, par. A, subpar. 7, and "return" in art. XII, par. C of the statute are also inconclusive.

[101] For problems arising under the United States Atomic Energy Act of 1954 in regard to the title to fissionable material and the forms of transaction used, see text at note 171, *infra*.

[102] For the solution adopted by EURATOM see Treaty establishing the European Atomic Energy Community (EURATOM), and connected documents, Secretariat of the Interim Committee for the Common Market and EURATOM, Brussels, 1957, Chap. VI.

[103] See art. IX, par. J of the statute. This provision refers both to material stored with the Agency and those stored by the member in accordance with art. IX, par. A, second sentence, for in either case the materials are "made available." While a member has not the right to demand that its contribution be used for a specific project, the article does not seem to preclude the Agency from agreeing to such a use. To what extent would such agreement bind the Agency? Does the express exclusion of the right to demand the use of a contribution in a specific project exclude any and all conditions, *e.g.*, the condition that the contribution be *not* used in a specified area or for a certain type of project? Ambassador Wadsworth suggested that such a

this provision to ensure that all contributed materials are available for all approved projects.

Once a member has notified the Agency of its intention to make a contribution, the member must be in a position to make delivery immediately to the recipient state as instructed by the Agency or to the Agency itself to the extent that such materials are "really necessary for operations and scientific research in the facilities of the Agency." [104] However, the member in its discretion may decide whether it will retain possession of the material pending instructions to deliver or make an agreement with the Agency for storage in the Agency's depots.[105] The latter alternative will be feasible, of course, only when the Agency has established its storage facilities.

One great problem that will confront the Agency is the location of storage facilities when they are established. The headquarters of the Agency in Vienna would not be a particularly suitable location for storage facilities. In storing special fissionable materials in its possession, the Agency is under obligation to insure the geographical distribution of these materials in such a way as not to allow concentration of large amounts of such materials in any one country or region of the world.[106] It will be difficult to find locations where the fissionable materials could be disposed of on short notice in the event of an attempt to seize them. A possible location would be on an island where in an emergency they could be dumped into the sea.

According to the statute, unless the Board decides otherwise, the materials shall initially be made available for the period of one year.[107]

A provision of this nature was probably necessary since the chief contributors would not wish to bind themselves for any longer period until they could determine how well the Agency was functioning.

---

condition "would be contrary to the spirit of paragraph J of Article IX" and would result in "chaos fairly soon." For extensive discussion of this problem see *Hearings before the Senate Foreign Relations Committee,* note 9 *supra* at 154-156.

[104] Statute, art. IX, par. D. This means that a state is obliged to deliver materials to the Agency only for the Agency's own immediate needs. Therefore, the Agency acts as a "bank" only for the materials stored at the request of the supplying member. All other material is transferred directly from the contributing to the recipient country. The word "really," which is bad English, was designed to emphasize the immediate character of the Agency's own requirements for operations and research. It was introduced in the twelve-power draft on Soviet insistence.

[105] Statute, art. IX, par. A, second sentence.

[106] Statute, art. IX, par. H, third sentence.

[107] Statute, art. IX, par. F, second sentence. The statute does not say specifically whether the period covered by the contribution must be determined in the agreement with the contributor and whether the Board has discretion to modify such period.

However, it is somewhat unrealistic. The Agency projects will require a continuous supply of fissionable materials. It will be necessary for the Agency, before it approves a project, to have some assurance of a continuing supply of fissionable materials for the life of the project. The bilateral agreements of the United States generally provide for the supply of materials for at least five years.[108] In comparison, an Agency project would not be particularly attractive if it could guarantee materials only for one year. The United States has already indicated its intention to make materials available to the Agency for a longer period. On the final day of the conference, Chairman Lewis Strauss of the United States Atomic Energy Commission delivered a message of the President of the United States:

> To enable the International Atomic Energy Agency, upon its establishment by appropriate governmental actions, to start atomic research and power programs without delay, the United States will make available to the Agency, on terms to be agreed with that body, 5,000 kilograms of a nuclear fuel uranium 235 from the 20,000 kilograms of such material allocated last February by the United States for peaceful uses by friendly nations. . . . In addition to the above mentioned initial 5,000 kilograms of uranium 235, the United States will continue to make available to the International Atomic Energy Agency nuclear materials that will match in amount the sum of all quantities of such materials made similarly available by all members of the International Agency, and on comparable terms, for the period between the establishment of the Agency and July 1, 1960. The United States will deliver these nuclear materials to the International Agency as they are required for Agency approved projects.[109]

During the General Conference in Vienna, Portugal offered to make available to the Agency 100,000 kilograms of "black oxide of uranium in concentrated form," and the Soviet Union and the United Kingdom reaffirmed their intention to contribute respectively 50 and 20 kilo-

[108] *E.g.*, in art. XI of the Agreement for Co-operation between the United States and Cuba, 102 Cong. Rec. 10396 (June 29, 1956), and between the United States and the Dominican Republic (also art. XI), *id.*, 10401 at 10402.

The Atomic Energy Commission on November 18, 1956, announced that it is prepared to furnish fuel requirements beyond the term of ten years. Statement by the Chairman of the Atomic Energy Commission, AEC Press Release, Nov. 18, 1956, p. 3.

[109] IAEA/CS/OR.40, p. 7. The announcement of the Atomic Energy Commission, referred to in the preceding footnote, leaves the door open for arrangements between the United States and the Agency on terms similar to those of the bilateral agreements.

grams of 20% enriched uranium.[110] The Chairman of the United States Delegation stated that the United States would match these contributions referring to the terms of the President's message.[111] It should be pointed out that the President's offer to match contributions of other states was generally interpreted to refer only to fissionable materials and not to source materials.[112]

G. Project Agreements

The principal obligations of members of the Agency including the obligation to submit to safeguards and to health and safety regulations will arise only when the member signs a project agreement with the Agency. The statute specifies the principal elements which must be included in such agreement.[113]

A majority of members of the Agency will have at the outset little technological skill in the field of atomic energy. For such a state to secure a power reactor through the Agency, it must obtain fissionable materials, technical advice, reactor components, and financing.

The applicant state will receive its fissionable materials from the Agency as a result of an agreement with the Agency. On the other hand, reactor components and much of the technical advice are likely to be obtained from sources outside of the Agency.[114] The terms and conditions under which the services and components are obtained must

[110] See the statement of Mr. Nutting in the 718th meeting of the First Committee of the 9th General Assembly on November 16, 1954, that the United Kingdom was prepared to hold available 20 kilograms of fissionable material as initial contribution to the Agency. U.N. General Assembly Off. Rec., 9th Session (1954), First Committee, A/C.1/CR.718, p. 347 at 348. The Soviet Union on July 18, 1955, stated that it is ready "to deposit into an international fund for atomic materials under an international agency for atomic energy 50 kilograms of fissionable materials, as soon as agreement has been reached on the creation of such an agency." Note of the Soviet Ministry of Foreign Affairs to the American Embassy, in United States Department of State Press Release No. 527, Oct. 6, 1956, p. 11.

[111] U.S. Press Releases, Vienna General Conference, Nos. 4, 7 and 8.

[112] Mr. Strauss during the Senate Hearings stated that the figure of 5,000 kilograms referred to 20 percent enriched uranium. At the same time it was contemplated that the bulk of uranium to be utilized would be enriched only to the extent of 2 or 3 percent. "If this [the uranium made available] had been stated, for example, in terms of 2 or 3 percent, the figure of 5,000 kilograms would have been multiplied. If one were mentioning it in terms of 100 percent enrichment, it would be yet another figure." *Hearings before the Senate Foreign Relations Committee*, note 9 *supra* at 111.

[113] See art. XI, par. F of the statute.

[114] The Preparatory Commission recommended that the Agency be in a position to provide technical advice to its members. PRECO Report, note 49 *supra*, par. 49.

be set forth in the project agreement with the Agency.[115] The Agency has no responsibilities in connection with financing the project but "upon request the Agency may also assist any member or group of members to make arrangements to secure necessary financing from outside sources to carry out such projects. In extending this assistance, the Agency will not be required to provide any guarantees or to assume any financial responsibility for the project." [116]

H. Relation to Bilateral, Multilateral, and National Programs

An important aspect of the functions of the Agency revolves around its relation to the bilateral agreements for developing peaceful uses of atomic energy (such as some forty bilateral agreements for cooperation between the United States and other states) and multilateral arrangements (such as the EURATOM plan negotiated by the six members of the European Coal and Steel Community [117] and the proposed scheme of the Organization for European Economic Cooperation).[118] To what extent will the Agency replace bilateral and multilateral arrangements for international cooperation in the atomic energy field? [119] To what extent will the parties to these arrangements utilize the Agency system of safeguards against diversion for military uses?

[115] Statute, art. XI, par. F, subpar. 3. It is interesting to note that no specific provision is made in this subparagraph with reference to supply of information, unless the term "services" is meant to include supplying of information. Furthermore, subpar. 3 seems to be limited to situations where a project is assisted by the Agency or by the Agency and a "member." What if assistance is given by a non-member?

[116] Statute, art. XI, par. B. This wording originated in amendment IAEA/CS/Art. XI/Amend. 1, contained in revised form in Conference Room Paper No. 5, sponsored by all 20 Latin American countries, which was adopted by 57 votes to none. IAEA/CS/OR.28, pp. 2-5.

[117] Treaty establishing the European Atomic Energy Community, Secretariat of the Interim Committee for the Common Market and EURATOM, Brussels, 1957. For an earlier description of the EURATOM plan see "Report of the Intergovernmental Committee on European Integration" (Brussels, 1956), reprinted in Univ. of Mich. Law School Summer Institute, Workshops on Legal Problems of Atomic Energy 201-215 (1956). See also Knorr, EURATOM and American Policy (1956).

[118] For a description of this scheme see "Report of the Special Committee for Nuclear Energy to the Council," with annexes and decisions adopted by the Council on July 18, 1956, in Joint Action by O.E.E.C. Countries in the Field of Nuclear Energy (1956). For an earlier report, see Possibilities of Action in the Field of Nuclear Energy (O.E.E.C.) (1956). On both EURATOM and O.E.E.C. plans, see Knorr, Nuclear Energy in Western Europe and United States Policy (1956).

[119] The Chairman of the United States Atomic Energy Commission discussed these problems before the Senate Committee on Foreign Relations and concluded that there would not be a duplication of activities. "The task is so great and the opportunities so broad that, for a number of years, the combined activities of the United States—

During the United Nations General Assembly discussions of the Agency in the fall of 1954, in response to a question by Mr. Vyshinsky, Ambassador Lodge indicated that the United States did not contemplate that the Agency would have exclusive authority for international transfers of fissionable materials for peaceful uses of atomic energy.[120] During the negotiations on the Agency statute it became apparent that one of the prime objectives of the Agency—prevention of the diversion of fissionable materials to military uses—could be totally defeated if the United States, the United Kingdom, or the Soviet Union in their bilateral agreements should make fissionable materials available to other countries under less onerous safeguards than those provided in the Agency statute.[121] Obviously, if safeguards are to be effective, the systems of safeguards under bilateral and multilateral agreements must in general conform to the Agency safeguard system.

A step in this direction was made by the United States in providing in its more recent bilateral agreements for safeguards substantially identical to those in the statute.[122] Furthermore, states which are parties to these agreements undertook upon the establishment of the Agency to consult with a view to transferring the administration of

---

together with countries with which we already have or will negotiate direct agreements—and of the world Agency should all serve a constructive, harmonious purpose." *Hearings before the Senate Foreign Relations Committee,* note 9 *supra* at 85 and 86.

[120] In the 715th meeting of the First Committee Mr. Vyshinsky said that the meaning of the term "clearing-house" used for the activities of the Agency was not clear to him. He interpreted it to mean that if projects for the use of fissionable material transferred through the International Agency from one state to another were made contingent upon approval by the International Agency, the Agency would have the right to approve or reject the plans established by states for the use of fissionable materials for peaceful ends. This would constitute a violation of international law, if the decisions of the Agency should be unacceptable to the states concerned. U.N. General Assembly Off. Rec., 9th Session (1954), First Committee, A/C.1/SR. 715, p. 329 at 333.

In the 717th meeting Mr. Lodge answered that in practice the Agency would have no control over the use of fissionable material except when such material was specifically earmarked for Agency projects. Thus any state would be free to transfer fissionable materials to another state without having to secure the consent of the Agency. A/C.1/SR.717, p. 341 at 343.

[121] A meeting of experts was held in Geneva immediately following the scientific conference in August 1955 to discuss the question of uniform safeguards. See generally United States Department of State Press Release No. 527, Oct. 6, 1956, and Appendix A, Item 1. See also note 95 *supra.*

[122] In regard to the standardization of safeguards, see the United States Aide-Memoire of August 15, 1956, United States Department of State Press Release No. 527, Oct. 6, 1956, pp. 29-30, and the model article, *id.* at 31. For actual safeguards provisions in a "power-bilateral," see arts. XIII and XIV of the agreement between the United States and Australia, 102 Cong. Rec. 10412 at 10414 (June 29, 1956).

the safeguards to the Agency; either party was given the right to terminate a bilateral agreement if such consultations do not lead to an understanding.[123] It remains to be seen whether the Soviet Union would be willing to take a similar step with respect to the arrangements to which it is a party.[124] The scheme proposed by the Organization for European Economic Cooperation for the control of its activities in the nuclear field calls for arrangements with the Agency "with regard to the exercise of the control on the territory of countries participating both in the Organization and in the Agency."[125] The Agency statute now specifically provides that the Agency safeguards system (including inspection by Agency inspectors) may be extended "at the request of the parties, to operations under any bilateral or multilateral arrange-

[123] On December 1, 1957, 39 bilateral agreements for cooperation were in force between the United States and other states. Of this total 29 were agreements for cooperation in the research reactor field and 10 were "power bilaterals." A number of other agreements are in the process of completion. On U.S. bilateral agreements, see Fisher, L'Energie Atomique et les États-Unis 241-296 (1957).

Before the middle of 1956 the agreements did not refer to the International Agency. Agreements concluded after that time took into consideration the future establishment of the Agency in the following manner:

"The Government of ———————— and the Government of the United States of America affirm their common interest in the establishment of an international atomic energy agency to foster the peaceful uses of atomic energy. In the event such an international agency is created:

"1. The parties will consult with each other to determine in what respects, if any, they desire to modify the provisions of this agreement for cooperation. In particular, the parties will consult with each other to determine in what respects and to what extent they desire to arrange for the administration by the international agency of those conditions, controls, and safeguards, including those relating to health and safety standards, required by the international agency in connection with similar assistance rendered to a cooperating nation under the aegis of the international agency.

"2. In the event the parties do not reach a mutually satisfactory agreement following the consultation provided in paragraph A [*sic*] of this article, either party may by notification terminate this agreement. In the event this agreement is so terminated, the Government of ———————— shall return to the United States Commission all source and special nuclear materials received pursuant to this agreement and in its possession or in the possession of persons under its jurisdiction." See United States Department of State Press Release No. 527, Oct. 6, 1956, p. 33, and, for a practical example, art. XII, par. A, of the Agreement for Cooperation with France, 102 Cong. Rec. 10400 (June 29, 1956).

[124] See note 77 *supra*.

[125] Sec. III, par. 12, subpar. a of the decisions adopted by the Council of the European Organization for Economic Cooperation on 18th July, 1956, Joint Action by O.E.E.C. Countries in the Field of Nuclear Energy 132-133 (1956). For the type of security controls and safeguards contemplated, see *id.* at 57-73. For the controls and safeguards contemplated by EURATOM, see Treaty establishing the European Atomic Energy Community, note 117 *supra*, arts. 77-85.

ment." [126] During the International Conference, at the suggestion of Thailand, this provision was further broadened to permit the safeguards system and the health and safety system to be extended "at the request of a state to any of that state's activities in the field of atomic energy." [127] This obviously is a further step in the direction of making possible a uniform international system of safeguards.

The remaining steps necessary to transfer the concept of uniform safeguards from the realm of ideas have not yet been taken: first, an agreement among states disposing of fissionable materials outside the Agency that they will require in each instance the acceptance of the Agency system of safeguards as a condition of turning over the materials; and second, the ultimate establishment of a system of safeguarded disarmament which would apply the system of safeguards universally to the entire atomic establishment of all states including those possessing atomic weapons. In view of the present Soviet attitudes, the outlook for the attainment of this last goal in the foreseeable future is most unpromising. Nevertheless, the Agency could create a working model of an inspection system which on a vastly broadened scale would be useful in a disarmament program.[128]

The United States, the United Kingdom, and the Soviet Union supported the Thai suggestion but gave no indication that their own programs would be subjected to Agency safeguards. The Soviet Union has on a number of occasions stated that it will supply fissionable materials to other countries without any safeguards excepting an agreement by those countries to devote the materials only to peaceful purposes.[129] However, to date the Soviet Union has apparently not offered

[126] Art. III, par. A, subpar. 5 of the statute. This provision was first included in the twelve-power draft.

[127] Statute, art. III, par. A, subpar. 5. Mr. Khoman, representative from Thailand, remarked in the Conference: ". . . [I]f for no other reasons than those of equality and equity, as well as the reason that the *eventual establishment of world-wide security from atomic danger is possible,* these safeguards shall not be restricted to the present boundaries but extended to all the countries of the world." [Emphasis added.] IAEA/CS/OR.15, p. 65.

[128] "The Agency will not, of course, achieve atomic disarmament, nor was it conceived to attempt that. However, it can promote United States objectives in the field of disarmament by creating a practical working model of an inspection system, and a climate of international opinion in support of our objectives. This, we may hope, will facilitate establishment of the broader controls needed for a successful disarmament agreement" (statement of Mr. Lewis Strauss, *Hearings before the Senate Foreign Relations Committee,* note 9 *supra* at 87).

[129] Mr. Zarubin, representative of the Soviet Union, stated at the Conference: "The Agency should impose upon no country control that might infringe upon its sovereign rights. . . . It is . . . necessary to note that the agreement on the peaceful

significant quantities of fissionable materials to countries other than those which it fully controls.

Most of the inter-governmental discussions of the relationship of the Agency to bilateral or multilateral programs of cooperation have concentrated on the systems of safeguards. However, the success or failure of the Agency will depend equally upon working out a proper relationship on other phases of the program. It is apparent that the United States, the United Kingdom, and the Soviet Union can through bilateral or multilateral agreements make available all types of assistance which the Agency might provide. If the terms offered by one of these states are more favorable than those offered by the Agency or if the procedures are less cumbersome, then there would be little incentive for a state to request assistance from the Agency.

If the Agency is to play a meaningful role in the development of the peaceful uses of the atom, it will be necessary to work out some form of relationship between the Agency program and bilateral and multilateral programs. Three possible types of relationship immediately suggest themselves.

1. The United States (and also the United Kingdom and the Soviet Union) might gradually arrange for the Agency to take over the bilateral and multilateral programs in their entirety. Some of the recent bilateral agreements of the United States provide for consultations between the parties after the establishment of the Agency with a view to possible modifications of the agreements.[130] Any change in the agreements would require the consent of both parties. The present policy of the United States, however, contemplates continuance and expansion of bilateral programs of cooperation.[131]

---

utilization of atomic energy concluded between the Soviet Union and other countries does not contain any conditions which might infringe upon the sovereign rights of countries participating therein. The Soviet Union considers that a sufficient guarantee is to provide in the draft statute that countries must be obligated not to make use of the assistance which they receive from the Agency for the production of atomic weapons, and must submit reports with respect to the assistance received. The system of guarantees contemplated under the draft statute would have meaning if it had been connected with the prohibition of the atomic weapon and if it had been made applicable to both the recipient countries and the countries giving assistance." IAEA/CS/OR.3, pp. 31-35. For the position taken by the Soviet Union in regard to safeguards, see also Appendix A, Item 7.

[130] See note 123 *supra*.

[131] As to relationship of the International Atomic Energy Agency to bilateral and multilateral arrangements see *Hearings before the Senate Foreign Relations Committee* (statements of Mr. Lewis Strauss and of Mr. Gerard C. Smith), note 9 *supra* at 86 and 165.

2. The bilateral and multilateral arrangements might continue with the parties requesting the Agency to assume the responsibility for the administration of safeguards. The statute contemplates this possibility, which was discussed above.[132]

3. The bilateral and multilateral arrangements might continue to cover the same broad fields where the Agency furnishes assistance. In this event, in order to avoid unnecessary duplication of activities, it might be advisable for the three Great Powers to agree that certain specific types or sizes of reactors would be furnished with the assistance of the Agency while countries in their separate programs would concentrate on other types or sizes.[133] EURATOM and the Organization for European Economic Cooperation have under study the establishment of "common installations" (or "joint undertakings"), such as isotope separation and chemical processing plants.[134] Coordination of Agency activities with these multilateral arrangements will also be necessary.

In the absence of some arrangement to correlate the various programs, the Agency might find that practically all feasible projects were being undertaken outside the Agency.

I. Privileges and Immunities

The statute grants the Agency such legal capacity and privileges and immunities in the territory of each member "as are necessary for the exercise of its functions." [135] The delegates of the members and Governors (members of the Board) with their staff as well as the Director General and the staff of the Agency are accorded privileges and immunities "necessary in the independent exercise of their functions. . . ." [136] Separate agreements to be negotiated between the Agency and the members are to define the legal capacity, privileges, and immunities so conferred.[137] These limited "functional" privileges follow generally the provisions in the Charter of the United Nations and the statutes of some specialized agencies of the United Nations.[138]

[132] Statute, art. III, par. A, subpars. 5 and 6.

[133] See statements in note 131 *supra*.

[134] On EURATOM "joint enterprises," see Treaty establishing the European Atomic Energy Community, note 117 *supra*, arts. 45-51. On O.E.E.C. "joint undertakings," see Joint Action by O.E.E.C. Countries in the Field of Nuclear Energy 23-52 (1956).

[135] Statute, art. XV, par. A.

[136] *Id.*, par. B.

[137] *Id.*, par. C.

[138] See, *e.g.*, art. 105 of the United Nations Charter, which, contrary to the Covenant

The question arises whether or not the grant of the legal capacity, privileges, and immunities was intended to become effective from the date of the ratification of the statute in the absence of separate agreements. It is pertinent to note that the final draft omits the eight-power draft provision to the effect that the requirement of separate agreements is "without prejudice to the immediate effectiveness" [139] of the grant of the legal capacity, privileges, and immunities.[140]

J. Settlement of Disputes

"Any question or dispute concerning the interpretation or application" of the statute, not settled by negotiation, "shall be referred to the International Court of Justice in conformity with the Statute of the Court unless the parties concerned agree on another mode of settlement." [141] In order to bring a matter before the Court under this provision, it will apparently be necessary for the parties to conclude a special agreement unless both parties had previously accepted the compulsory jurisdiction of the Court. The provision in the eight-power draft which would have conferred unequivocally upon the Court compulsory jurisdiction in this matter has been abandoned.[142] This is clearly a concession to the opposition on the part of the Soviet Union to the compulsory jurisdiction of the International Court in any form or shape.

The statute provides that both the General Conference and the Board of Governors "are separately empowered, subject to authorization from the General Assembly of the United Nations to request the International Court to give an advisory opinion on any legal question aris-

---

of the League of Nations, does not provide for diplomatic immunities but only (as in the case of the Agency) for limited privileges. The provisions in the constitutions of other specialized agencies are similar. See, *e.g.*, art. 67 of the Constitution of the World Health Organization; art. 40 of the Constitution of the International Labor Organization.

[139] Art. XVII, par. C of the eight-power draft.

[140] For a view that limited privileges are available even in absence of separate agreements, see the excellent statement of Mr. Leonard C. Meeker, Assistant Legal Advisor, Department of State, in *Hearings before the Senate Foreign Relations Committee*, note 9 *supra* at 161.

[141] Statute, art. XVII, par. A.

[142] Art. XIX, par. E, the relevant provision of the eight-power draft, read: "The Parties to the present Statute *accept* the jurisdiction of the International Court of Justice with respect to any dispute concerning the interpretation or application of the Statute. Any such dispute may be referred by any Party concerned to the International Court of Justice for decision unless the Parties concerned agree on some other mode of settlement. . . " [Emphasis added.]

ing within the scope of the Agency's activities." [143] The General Assembly was to grant such authorization on all questions "other than a question concerning the mutual relationships of the Agency and the United Nations or the specialized agencies." [144]

The above-quoted provision of the statute referring to advisory opinion is broad enough to cover not only disputes among member states but also disputes between the Agency on one hand and a member on the other. The latter type of dispute would include differences arising between the Agency and a recipient state over the interpretation of a project agreement. Under the statute, any such project agreement is to "make appropriate provision regarding settlement of disputes." [145] It is hoped that the Board will develop a formula to be included in all project agreements—for a speedy and binding solution of such disputes in the event the efforts at a settlement by the Director General and the Board should fail. A possible formula would be to refer the dispute to the International Court of Justice for an advisory opinion which the parties would undertake to accept in advance.[146] Another possible

[143] Statute, art. XVII, par. B. This provision is based on art. 96, par. 2 of the United Nations Charter which provides that "other organs of the United Nations and specialized agencies, which may at any time be so authorized by the General Assembly, may also request advisory opinions of the Court on legal questions arising within the scope of their activities." It is of somewhat academic interest to speculate whether under this article, the Agency would be considered a "specialized agency." The Agency cannot be a party to a contentious proceeding before the International Court since the Statute of the International Court of Justice provides in art. 34, par. 1, that only *states* can be parties in cases before it. It is interesting to note that the Draft Relationship Agreement between the United Nations and the International Atomic Energy Agency (General Assembly Document A/3620, July 23, 1957, arts. I and XX) apparently does not consider the International Atomic Energy Agency a specialized agency. Article I of the Agreement refers to the Agency as "autonomous." Article XX refers to the relationships of "The Agency with any specialized agency."

[144] See art. X, Draft Relationship Agreement between the United Nations and the International Atomic Energy Agency, General Assembly Document A/3620, July 23, 1957.

[145] Statute, art. XI, par. F, subpar. 6. This provision originated in an amendment submitted by the Netherlands. IAEA/CS/Art. XI/Amend. 3. In view of its adoption, a Swiss amendment (IAEA/CS/Art. XVII/Amend. 1/Corr.1) designed to provide for the settlement of disputes of any kind and including disputes with the Agency was withdrawn.

[146] Although this formula by itself would of course not establish compulsory jurisdiction of the Court over the Soviet Union, the Russians nevertheless may be expected to oppose it. They may oppose it perhaps somewhat less vigorously and—it is hoped—less successfully than the original text of the disputes article in the eight-power draft. For a possible procedure utilizing the advisory opinion of the International Court of Justice in an arbitration procedure see sec. 21 of the Headquarters Agreement between the United States and the United Nations, signed June 26, 1947. U.N. General Assembly Off. Doc., Second Session (1947), Resolutions, 169 (II), p. 91.

formula would be to provide for arbitration by a special commission which could develop into an expert judicial body on matters relating to atomic energy.[147]

K. Financing of the Agency

One of the most difficult problems confronting the Agency will be that of financing its operations. The reason, of course, is that most activities in the field of atomic energy involve vast expenditures.

It is clear that the International Agency, at the outset, will have the financial resources to carry on only a small fraction of the total activities associated with the peaceful development of atomic energy.

The statute recognizes four methods of financing Agency activities. First, administrative expenses [148] will be included in a separate budget and apportioned among the members in accordance with a scale to be fixed by the General Conference. The General Conference, in fixing this scale, shall be guided by the principles adopted by the United Nations in assessing contributions of member states to the regular budget of the United Nations.[149] In the early years of the Agency, only a small fraction of the eighty-seven states eligible for initial membership will be the beneficiaries of power projects. Most of the remaining members will be unwilling to accept large assessments which would be utilized for the general administration of the Agency without any direct benefit to them, thus limiting the funds assessed in this manner.[150]

[147] As pointed out above, a beneficiary state cannot avoid or delay the measures imposed by the Board for noncompliance with the safeguards provisions by invoking the dispute settlement provisions contained in art. XVII or in the project agreement. Any effort to provide for such avoidance or delay in the project agreement would seem to be contrary to the safeguards provisions of the statute, and particularly to art. XII, par. C.

[148] Administrative expenses are defined in art. XIV, par. B, subpar. 1 of the statute to include (a) costs of the staff of the Agency (other than the staff employed in connection with materials, services, equipment and facilities required in carrying out the Agency's functions or necessary for Agency projects); cost of meetings, expenditures required for the preparation of Agency projects and for the distribution of information, as well as (b) costs of implementing safeguards and expenses incurred in the "syphoning off" of special fissionable material not used for any project. The expenses under (a) are apportioned to the full extent. According to par. C of art. XIV, the expenses under (b) are apportioned only to the extent that they are not recoverable under agreements regarding the application of safeguards between the Agency and parties to bilateral and multilateral arrangements.

[149] Statute, art. XIV, par. D.

[150] During the Preparatory Commission discussions some question arose as to the scope of expenditures which could properly be included within the administrative budget. For example, it was contended that the cost of a fellowship program could

A second method of financing the Agency would be through borrowing. Under rules and limitations to be approved by the General Conference, the Board of Governors has the authority to exercise borrowing powers on behalf of the Agency without, however, imposing on the individual members of the Agency any liability in respect of the loans.[151] While the language of the statute is most ambiguous, presumably loans would be utilized chiefly for the construction of Agency facilities and not for the day-to-day operations of the Agency.[152]

A third method of financing is through voluntary contributions. The Board of Governors is authorized to accept voluntary monetary contributions made to the Agency.[153] There are a number of parallels for financing international bodies in this manner, for example, the United Nations agency supporting the Palestine refugees. However, the amount of voluntary contributions which states might be willing to make is likely to be limited.

The fourth method of financing the Agency is through charges imposed in project agreements between the Agency and states recipient of materials and services. Such charges will include costs of special fissionable materials and of their handling and storage and probably a large proportion of the cost of administering the system of safe-

not be deemed an administrative expense. The Commission ultimately recommended the inclusion within the administrative budget of $250,000 "for a limited fellowship program which from the administrative point of view could be undertaken by the Agency during the course of 1958 if funds were to be made available." This was justified on the grounds that such expenses might be deemed as "other expenses, such as may for example be contemplated under Article XIV F of the Statute." PRECO Report, note 49 *supra*, pars. 170 and 171. This narrow definition of administrative expenses was emphasized during the *Hearings before the Senate Foreign Relations Committee*, note 9 *supra*, at 57 and 136.

[151] Statute, art. XIV, par. G. The provision that the members shall not be liable for loans was included on British initiative following a suggestion made by Yugoslavia. IAEA/CS/OR.31, p. 42. See also IAEA/CS/OR.32, p. 17 and pp. 60-61 for the British and U.S.S.R. positions in this matter. The amendment is contained in Conference Room Paper No. 12/Rev. 1. The Soviet Union opposed any borrowing power for the Agency. The amendment proposed by the Soviet Union to delete par. G (IAEA/CS/Art. XIV/Amend. 4) was rejected by 49 votes to 9, with 14 abstentions. IAEA/CS/OR.36, p. 22.

[152] See Appendix I.

[153] Statute, art. XIV, par. G, last clause. This provision was included in the statute as a result of an amendment submitted by Egypt, Indonesia, and Syria. IAEA/CS/Art. XIV/Amend. 2, as revised by Conference Room Paper No. 10. The Soviet Union proposed an amendment to add a new par. E to art. XIV providing for financing of expenses under par. B, subpar. 2, to the extent that they concern the acquisition of Agency-owned materials, facilities, and equipment, by voluntary contributions. IAEA/CS/Art. XIV/Amend. 4. This amendment was rejected by 52 votes to 10, with 10 abstentions. IAEA/CS/OR.36, pp. 24-25.

guards.[154] Here again there are practical limitations upon the funds that can be raised through such charges. The greater the charges the greater the cost of production of electric power utilizing atomic fuel. If the charges imposed under Agency agreements are onerous, the result will be to delay substantially the time when atomic power will be competitive with conventional power. Furthermore, if the charges are greater under the Agency program than under bilateral programs, states will be discouraged in utilizing the Agency. On the other hand, there may be no other practical way to finance the safeguards system. One possible solution for this dilemma would be for states contributing fissionable and other materials to contribute those materials to the Agency at less than cost. There is nothing in the statute which would prevent such an indirect subsidy of the Agency.[155]

The Preparatory Commission recommended a first year budget of slightly in excess of four million dollars (excluding working capital fund of two million dollars).[156]

L. Amendment Procedures

Amendments to the statute come into effect when approved by the General Conference by a two-thirds majority and "by two-thirds of all the Members in accordance with their respective constitutional processes." [157]

[154] Statute, art. XIV, par. B, subpars. 1 (b) and 2.

[155] As stated previously, contributions of fissionable and other materials to the Agency will be made on terms agreed upon between the Agency and each individual state making the contribution. Statute, art. IX, pars. A and B. The agreement between the contributing state and the Agency might provide for furnishing the material at cost, at less than cost or at more than cost. There is nothing in the statute to require the Agency to pay uniform sums to the states making the contributions. For U.S. policy and legislation see note 169 *infra*, and text at that note. Chairman Strauss of the U.S. Atomic Energy Commission, in his statement to the International Conference on October 26, 1956 (IAEA/CS/OR.40, p. 2 *et seq.*), indicated that the United States contributions would be "on comparable terms" to the contributions made by other members. *Id.* at 7. It thus would be possible for the United States and other contributors to adjust the amount they charge to the Agency in such a manner that the cost of fissionable materials to recipient states including surcharges for operation of the safeguards system would be comparable to the cost of fissionable materials furnished under the bilateral programs. It should be noted that under the bilateral programs of the United States the net cost of fissionable materials to cooperating states is reduced through the amounts which the United States pays to such states for the plutonium by-product recovered when the fuel elements are chemically reprocessed in the United States. The Agency would not be in a position to make similar payments until the technology of utilizing plutonium for peaceful purposes is further advanced so as to allow the Agency to make profitable use of it.

[156] PRECO Report, note 49 *supra* at 39, pars. 174-187.

[157] Statute, art XVIII, par C

A member unwilling to accept an amendment to the statute may withdraw from the Agency at any time but must fulfill its contractual obligations to the Agency.[158] In theory, at least, this right to withdraw from the Agency protects a member against unacceptable amendments which would make basic changes in the rights and obligations of membership. In practice, however, if the Agency becomes a truly important source of assistance it might not be feasible for a state to withdraw. In all probability, agreements between the Agency and its members for the supply of special fissionable materials will result in obligations extending over a number of years.[159] It might be wise for a state furnishing fissionable materials to provide specifically in its agreement with the Agency for the termination of its obligation to furnish the materials in the event of its withdrawal from the Agency because of an amendment to which it was unwilling to agree. Likewise, the obligations of a state receiving assistance from the Agency will presumably extend for the life of the project and would make a withdrawal difficult. This raises the problem of the status of a power reactor constructed with assistance of the Agency if the state where the reactor is located withdraws from the Agency. Presumably the agreement between the Agency and the recipient state would cover this contingency. The statute provides that withdrawal by a member from the Agency shall not affect its contractual obligations entered into pursuant to the provisions governing Agency projects.

The United States Senate subjected its advice and consent to the "interpretation and understanding" that (1) any amendment to the statute shall be submitted to the Senate for its advice and consent, and (2) the United States will not remain a member of the Agency in the event of an amendment being adopted to which the Senate by a formal vote should refuse its advice and consent.[160] The act of Congress providing for the participation of the United States in the Agency made provision for "the prompt and orderly settlement of obligations and commitments to the Agency" and "orderly termination of United States participation in the Agency" if such a contingency should arise.[161]

[158] *Id.*, pars. D and E.

[159] For considerations concerning the duration of obligations of member states contributing materials, see text at note 107ff. *supra.*

[160] The "interpretation and understanding" originated in The Committee on Foreign Relations (Ex. Rep. 3 on Exec. I, 85th Cong., 1st. sess., at 17, June 14, 1957) and was adopted by the Senate, 103 Cong. Rec. 8463 *et seq.*, June 18, 1957.

[161] International Atomic Energy Agency Participation Act of 1957, P.L. 85-177, 85th Cong., 71 Stat. 455.

M. United States Cooperation with the Agency

The statute appears to conform to the concept of "an international arrangement" for an "international atomic pool" into which the President was "authorized" by the Congress to enter by the Atomic Energy Act of 1954.[162] The adherence of the United States to such an "arrangement" under the Act could have become effective either upon approval by the Congress or upon advice and consent of the Senate (as a treaty).[163] The Agency statute was submitted by the President to the Senate as a treaty, and, after approval by the Senate, was ratified on July 29, 1957.

The Executive Branch of the United States Government had concluded that under the conditions of the Act of 1954 United States cooperation with the Agency could and should be provided through the Atomic Energy Commission negotiating with the Agency periodic "agreements for cooperation" specifying amounts and terms of the contributions of fissionable materials for a given period.[164]

[162] Atomic Energy Act of 1954, 42 U.S.C.A. § 2154 (P.L. 703, § 124).

[163] *Id.*, §§ 2145 and 2014 (l) (P.L. 703, § 124, § 11 k). The statute provides for "ratification or acceptance" in accordance with "respective constitutional processes." Art. XXI, par. D. For discussion of § 2154 (P.L. 703, § 124) and generally of subchapter X (P.L. 702, c. 11) of the Atomic Energy Act of 1954 on International Activities, see Cole, "The Meaning of the New Atomic Law," Nucleonics, p. 12 (March 1955); Wit, "Some International Aspects of Atomic Power Development," 21 Law and Contem. Prob. 167-169 (1956). For a discussion of the provisions of the act concerning international activities generally see Ruebhausen, "New Atomic Problems," 9 N.Y. City Bar Assn. Rec. 368 (1954). See also University of Michigan Law School, Summer Institute, Workshops on Legal Problems of Atomic Energy 63-84 (1956).

[164] This general position was set forth to the Senate by the Secretary of State. *Hearings before the Senate Foreign Relations Committee,* note 9 *supra* at 6 and 7. Section 124 (P.L. 703, § 124) of the Atomic Energy Act of 1954, 42 U.S.C.A. § 2154, contemplates that the United States' cooperation with the "pool" will be "pursuant to an agreement for cooperation entered into in accordance with section 123." Section 123 (P.L. 703, § 123) provides for such an agreement with "any nation or regional defense organization." Since the Agency is not a "regional defense organization," the question may be asked whether under § 123 (P.L. 703, § 123) an agreement with the Agency is possible. This question clearly must be answered in the affirmative since in the absence of new legislation any other arrangement in the general context of the act and the Agency's statute would seem to be impracticable. It could perhaps be said that the giving of advice and consent by the Senate to the statute (or the approval by Congress of the Statute), since the statute provides for agreement between individual contributors (such as the United States) and the Agency, supersedes §§ 123 and 124 (P.L. 703, §§ 123, 124) to the extent that they are interpreted as precluding a bialteral agreement between the United States and the "international atomic pool." *Cf.* H.R. Rep. No. 2181, 83rd Cong. 2d Sess., "Separate Views on International Activities" and "Separate Views of Representative Holifield and Representative Price on H.R. 9757," reprinted in Atoms for Peace Manual, note 5 *supra* at 156-160, 161, 190-193.

The safeguards provisions of the Agency statute might be considered sufficient to enable the Agency to undertake in the agreement for cooperation the guarantees against diversion of materials to military purposes required in the Act. Upon completion of negotiations under this procedure the Commission would have to recommend approval of the agreement to the President. Before approving, the President would have to make "a determination in writing" that the agreement "will promote and will not constitute an unreasonable risk to the common defense and security." If it can be assumed that the participation of the Soviet Union and its satellites in the "international atomic pool" was contemplated by the Congress, such determination would be possible. Finally, before it came into effect, the proposed agreement—after approval by the President—would have to lie before the Joint Committee on Atomic Energy of the Congress for thirty days while Congress is in session.

The provisions of the Agency statute seemed compatible with the procedure required by the Atomic Energy Act interpreted in the above fashion. In fact, as pointed out earlier, the Agency statute itself envisaged notification by members of contributions made available "in conformity with its laws" and periodic agreements with contributors determining the terms of the contributions.[165]

These procedures required by the Atomic Energy Act proved to be rather cumbersome in connection with bilateral agreements. Unfortunately the Congress in the 1957 Act providing for the United States participation in the Agency appears to have complicated rather than simplified the procedures.[166]

Under Section 7 of the Participation Act, the Atomic Energy Act of 1954 was amended to provide that with the exception of the 5,000 kilograms containing uranium 235 already earmarked for the Agency,[167] "The Commission may distribute to the International Atomic Energy Agency or to any group of nations such amounts of special nuclear materials and for such periods of time *as are authorized by Congress.*" [168] This means that special legislation will be necessary for any further contribution to the Agency or for any contribution to other multilateral groups such as EURATOM. This requirement is far more burdensome than the procedures of the Atomic Energy Act of 1954.

[165] Statute, art. IX, par. C.
[166] P.L. 85-177, 85th Cong., 71 Stat. 453.
[167] Note 112 *supra.*
[168] Emphasis added. Sec. 7, P.L. 85-177, 85th Cong., 71 Stat. 455.

The same section of the Participation Act provided "unless hereafter otherwise authorized by law the Commission shall be compensated for special nuclear materials so distributed at no less than the Commission's published charges applicable to the domestic distribution of such material," with the exception of certain relatively small quantities of materials which might be made available for research purposes. This provision was included in the Act despite the unqualified assurances by the Executive Branch that full payment would be required for any materials made available to the Agency.[169]

It would seem desirable that the entire problem of United States cooperation not only with the Agency but also with certain regional arrangements such as EURATOM should be reviewed with a view to further amending the Atomic Energy Act of 1954 and the Participation Act of 1957 to permit greater flexibility in the relationships between the United States and these international groups, under general policy directives determined by the Congress.

Neither the Atomic Energy Act nor the Participation Act specify the form of the legal transaction (sale, lease, etc.) through which the United States fissionable material may be made available abroad.[170] The Atomic Energy Act of 1954 does provide that the title to all such materials *"within or under the jurisdiction of the United States"* shall be vested in the United States Government.[171] The United States bilateral agreements provide for either a lease or a sale of such materials to the cooperating government with the further provision in the case of sale that the title must remain vested in that government (and not passed to a private party under its jurisdiction) as long as private ownership of fissionable materials is not recognized in the United States.[172] The cooperating government is also required to agree that any material supplied by the United States will not be transferred

[169] During the hearings before the Senate Foreign Relations Committee the Secretary of State, the Chairman of the Atomic Energy Commission, and Ambassador Wadsworth, all stressed that the United States intended to receive full payment for the fissionable materials which it proposed to make available to the Agency and that the furnishing of these materials would not be on terms constituting in effect an indirect subsidy. For example, at the end of his testimony, Mr. Lewis Strauss, in response to a question, made the following statement: "They [countries receiving help from the Agency] will not get the donation out of the 5,000 kilograms we have been talking about because that is going to be cash on the barrelhead until Congress should determine differently." *Hearings before the Senate Foreign Relations Committee,* note 9 *supra* at 125.

[170] Section 54 of the Atomic Energy Act of 1954, 42 U.S.C.A. § 2074.

[171] *Id.*, § 52 and § 2h, 42 U.S.C.A. § 2072 and § 2012(h)

[172] The sale arrangement is used in "power bilaterals," *e.g.*, art. VII of the Agreement with Australia 102 Cong. Rec. 10412 at 10413 (June 29, 1956) The lease arrange-

"beyond the jurisdiction" of that government except as specified in the agreement itself.[173]

It seems unlikely that the legislation authorizing distribution of United States materials to the Agency will specify the form of the legal transaction. It is hoped that within the framework of the Atomic Energy Act and the Agency statute the Board of Governors will be able to work out with the Atomic Energy Commission a formula which would allow the Agency to make use of the United States contribution in the form most suitable to a given transaction keeping in mind, of course, that under the statute no member "shall have the right to require" that its contribution be "kept separately" or used for a designated purpose.[174] Neither the concept of a lease nor that of a sale may necessarily fit the actual arrangements desired.

N. Conclusions

The Agency as originally conceived had the twofold objective of making available the benefits of the peaceful uses of atomic energy on a worldwide basis and at the same time making a beginning in the direction of worldwide limitation of armaments through siphoning off to peaceful uses a portion of the materials available for nuclear weapons. For long periods of time during the negotiations the outlook for any tangible achievement toward either of these objectives was clouded. During the year immediately following the President's address to the United Nations, it appeared that the Soviet Union might not be a member and that the Agency might have limited membership largely confined to Western Europe and Latin America. Despite these fears it now appears that the Agency will have practically a worldwide membership.

The statute in its present form looks forward to a substantial contribution by the Agency to the peaceful development of atomic energy on a worldwide basis. However, largely because of the vast cost of the necessary facilities, for some years, its role is likely to be less significant

---

ment is used in "research bilaterals," *e.g.*, art. IV of the Agreement with New Zealand. *Id.* at 10403.

The EURATOM plan contemplates that with certain qualifications EURATOM will have the option to purchase uncommitted quantities of source and fissionable material of the member states and will be the exclusive source of supply of such material for the members. [173] Par. a(4) of § 123 (P.L. 703, § 123) of the Atomic Energy Act of 1954, 42 U.S.C.A. § 2153.

[174] Statute, art. IX, par. J.

than the role of national, bilateral, and multilateral regional programs.[175] The safeguards system developed by the Agency should as a minimum reduce the possibility of diversion of fissionable materials from peaceful to military uses and should assist in establishing uniform worldwide standards of health and safety. It could serve as a model for a control system if agreement were reached among the Great Powers that all future production of fissionable materials be utilized for peaceful purposes under adequate international control.[176]

In the eyes of the world, the success of the Agency is likely to be gauged by its progress toward establishment of power plants utilizing atomic fuel in the various areas of the world. The provisions in the statute regarding the powers, composition, and manner of selection of the Board of Governors can be justified to the world only if the Agency in the near future disposes of substantial quantities of fissionable materials for this purpose.

There are many hurdles in the path of rapid progress toward atomic power on a worldwide basis. Assuming as we may on the basis of the assurances given by the United States that the Agency will have a sufficient amount of fissionable materials to start operating, progress toward the goals of the Agency will, nevertheless, be slowed down by a shortage of trained technical personnel and a shortage of finances. The lack of available capital and personnel will affect not only the budget of the Agency but also national programs. Much skillful planning and action lie ahead to surmount these obstacles. The success of the undertaking depends also in large measure on securing for both the Agency staff and the Board of Governors individuals with the highest technical competence and the creative imagination necessary to visualize the Agency program and carry it out successfully. Finally, the Agency will play a significant role only if the participating states show sufficient imagination to see its potentialities and give it the necessary support.[177]

[175] *E.g.*, an Agency gaseous diffusion plant is an unlikely development for many years.

[176] See proposal of Canada, France, the United Kingdom and the United States, United Nations Disarmament Commission Document DC/113, Sept. 11, 1957, Annex 5.

[177] The experience in negotiating the statute of the Agency has created a useful precedent for preparing drafting international legislation under U.N. auspices. Rather than trying to draft a treaty in a committee of the General Assembly, it is preferable to organize a small but representative group such as the twelve-power group including those most vitally interested in the project. This group would then prepare the draft treaty and submit it to an international conference of all members with the understanding that it should not be changed except as a result of a demand by two-thirds of the members. During the negotiations, intermediate reports could well be made to the General Assembly which might discuss the progress and the chief issues without entering, however, into the drafting process.

Chapter II

SOVIET RUSSIA'S ROLE IN INTERNATIONAL COOPERATION FOR PEACEFUL USE OF ATOMIC ENERGY

HORACE W. DEWEY *

A. Introduction

The U.S.S.R. Council of Ministers announced on June 30, 1954, that the world's first industrial power station using atomic energy had begun producing electrical current for industry and agriculture in the Soviet Union.[1] Development of atomic energy for peaceful purposes was emphasized in the Soviet Union Communist Party's directives on the Sixth Five-Year Plan [2] and soon after the publication of these important directives the Council of Ministers issued a decree establishing a new body, the Chief Administration for Use of Atomic Energy, to direct atomic research, develop atomic reactors for electric power installations, and "further cooperation in the peaceful utilization of atomic energy between the U.S.S.R. and other nations." [3] By mid-1957 a report prepared for the United States Congress by staff experts of a subcommittee of the Joint Economic Committee predicted a possible Soviet victory over the United States in the "first round" of the atomic-energy "kilowatt race." [4] While kilowatts provide only one measure of progress, the consistency and magnitude of the Soviet effort in the whole area of peaceful utilization of atomic energy cannot be denied.

* LL.B., Ph.D.; Assistant Professor of Russian, Department of Slavic Languages and Literatures, University of Michigan.

[1] Pravda, July 1, 1954, p. 1.

[2] Pravda, Feb. 26, 1956, pp. 2-7. These directives specified five areas in which the use of atomic energy for peaceful purposes was to be "considerably expanded": electric power, transportation, agriculture and industry, medicine, and scientific research. Since then the Soviet press has been full of reports on new atomic power plants (one with a capacity of 420,000 kw.), an atomic-powered icebreaker (the *Lenin*), new nuclear research institutes, etc.

[3] Pravda, April 19, 1956, p. 3.

[4] N.Y. Times, July 11, 1957, p. 2. The Soviets feel that the victory is already theirs. A. N. Nesmeyanov, President of the U.S.S.R. Academy of Sciences, declared in late 1955 that the Soviet Union had attained full supremacy in the field of atomic energy. Pravda, Dec. 31, 1955, p. 2. In his report to the Jubilee Session of the U.S.S.R. Supreme Soviet on Nov. 6, 1957, Khrushchev said, "I shall limit myself to reminding you that our country leads the world in the peaceful uses of atomic energy . . ." (New Times, No. 46 (Nov. 14), Supplement, p. 12 (1957).)

The Soviet Union undoubtedly is facing a host of legal problems relating to the peaceful uses of atomic energy: problems in administrative law, torts, patents, and insurance law. Other areas, such as labor law and trade union legislation, may likewise be affected by atomic energy developments in the U.S.S.R. Although discussions of such problems have been published by the dozen in American periodicals, the Soviet Union has not yet seen fit to publish any legal materials on these subjects. The paucity of information on Soviet domestic legal problems connected with peaceful uses of atomic energy would lead one to believe that such information is considered secret because it affects state security. If this is the case, the reason may perhaps be found in the oft-repeated Soviet view that atomic energy's peaceful uses are inextricably interwoven with its military uses and that complete exchange of information and data on atomic energy cannot be expected between nations until nuclear weapons have been outlawed.

Liability for radiation injuries is one example of the kinds of legal problems which have not received attention in available Soviet materials.[5] Presumably, the imposition of liability is governed by Article 404 of the Soviet Civil Code which reads:

> Individuals and enterprises whose activities involve increased hazard for persons coming into contact with them, such as railways, tramways, industrial establishments, dealers in inflammable materials, keepers of wild animals, persons erecting buildings, and other structures, and the like, shall be liable for the injury caused by the source of increased hazard, if they do not prove that the injury was the result of an irresistible force or occurred through the intent or gross negligence of the person injured.
>
> Note: The period within which actions based on this section may be filed against governmental agencies shall be limited to two years and shall be computed from the day of the injury.
>
> The period shall be suspended, aside from the general grounds for the suspension and extension of periods of limitations (Sections 48 and 49) from the day that the injured person or, in the event of his death, persons theretofore supported by him, apply to the proper agency of social insurance, until the

[5] Several such incidents have been reported in Great Britain, Canada, and the United States in the last year. That Soviet scientists and doctors, if not lawyers, have been concerned with such cases is seen from such titles as *Two Cases of Acute Radiation Sickness in Man* and *Labor Hygiene in Conditions of Ionizing Radiations*—titles of Soviet papers delivered at Geneva in 1955. Atomic Industrial Forum, Inc., World Development of Atomic Energy 156-160 (1955).

day when the pension is either awarded or refused (as amended December 27, 1926, R.S.F.S.R. Laws 1927, text 3).[6]

Is an atomic installation "an enterprise whose activity involves increased hazard" in the terms of the code? It seems likely to be so considered, in view of Soviet judicial practice, which has been to extend the increased hazard concept to automobiles, sea and river vessels with motors, various types of production in which mechanical motors are used, loading operations, chemical factories, and the like.[7] A commentator on Soviet civil law has explained that the term "sources of increased hazard" refers to properties of things or of natural forces which, at the present level of technological development, are not completely subject to human control and, as a result, create a likelihood of harm to human life and health, as well as to property.[8]

Assuming the doctrine of increased hazard is involved, when is a radiation injury the result of an "irresistible force," relieving the defendant of liability? The most common examples of "irresistible force" are such external forces as floods or earthquakes which act on the source of increased hazard and cause it to manifest its dangerous properties. But Soviet law also recognizes as an "irresistible force" one "which cannot be prevented by a given person but by a given society in general."[9] Another question is: What is the effect of the plaintiff's status? Soviet materials indicate that a defendant enterprise might not be held "responsible without fault" for injuries to an employee despite the seemingly unequivocal language of the code.[10] Still other questions are: What type of conduct manifests the necessary "intent" or "gross negligence," *i.e.,* contributory negligence, to relieve from liability? Are there any exceptions to the two year period within which tort suits must be brought? In view of the delayed effect of some radiation injuries, the two year period is not realistic. What will be the nature of the damages? The customary damages in cases of injuries caused by a "source of increased hazard" amount to the difference between the injured plaintiff's social insurance benefits and his wages at the time of injury.[11] But would such a scale of damages be considered adequate in the case of radiation injuries? What damages are awarded

[11] *Id.* at 236.

if the plaintiff is uninsured—for example, a minor? This problem has arisen in other cases involving injuries from "sources of increased hazard," and Soviet courts have handled it in various ways.[12] Who must bear the economic loss if the "source of increased hazard" was being operated by some one other than the "holder" or "owner" (Russian *vladelets*) at the time of injury, as, for example, under a contract? Soviet law would presumably hold both the "holder" and the contracting party responsible to the injured person.[13] The "holder," however, apparently has rights of recovery against his own agent, if the latter is proved to have been negligent, to the extent permitted by labor legislation. The agent may, in addition, be held criminally liable if his actions displayed "signs of socially-dangerous activity." [14]

These are only a few of the legal questions that may demand solution in connection with the peaceful uses of atomic energy in the Soviet Union. Any answers can only be conjectural until such time as Soviet "atomic law" is made available to legal scholars throughout the world.

In contrast to the area of domestic Soviet "atomic law," in the area of international cooperation for peaceful uses of atomic energy the Soviets have published several documents and commentaries.[15] Therefore this paper will be limited to a survey of three forms which Soviet activity has taken in the international sphere that have been discussed in Soviet sources: the Soviet-sponsored Joint Nuclear Research Institute, the U.S.S.R.'s relations to the International Atomic Energy Agency, and bilateral agreements which the Soviet Union has concluded with a number of states both inside and outside the Communist bloc.

B. The Joint Nuclear Research Institute

Soviet jurists contend that there are two basic types of organization for possible cooperation between European states in the peaceful use of atomic energy. One of these types—bitterly assailed by the U.S.S.R.—is the "closed grouping of several states on the basis of existing military blocs in Europe," as primarily exemplified by EURATOM. The other —Soviet-approved—type is the "intergovernmental regional organiza-

[12] *Id.* at 240-41.

[13] Bratus, *supra* note 7 at 310.

[14] *Ibid.*

[15] This paper is based primarily on Soviet sources. Considerations of time and space have not permitted extensive use of East European materials. The English titles of dozens of articles dealing with international cooperation in peaceful uses of atomic energy which have been published in East European countries may be found in the Library of Congress' East European Accession List, published monthly.

tion open to participation by all interested European states." The latter method of international cooperation, according to Soviet legal writers, has been outlined in the Soviet government's proposals for all-European cooperation in peaceful utilization of atomic energy. They add, in this context, that a "model multilateral agreement for peaceful utilization of atomic energy by means of an organized international scientific research center for study in the field of nuclear physics and peaceful uses of atomic energy may be seen in the Charter of the Joint Nuclear Research Institute, founded on March 26, 1956, on the Soviet Union's initiative." [16]

On that date delegates from eleven Communist states signed an agreement making their respective countries "equal members" of an organization called the Joint Nuclear Research Institute (*ob'edinennyi institut iadernykh issledovanii*).[17] The Soviet press at the time paraphrased certain passages of the agreement, emphasizing that the new institute was to be devoted exclusively to the peaceful utilization of atomic energy.

The full text of the Agreement to establish the Joint Nuclear Research Institute, published on July 11, 1956, specified that the Institute's activities would be conducted in accordance with a separate Charter, which was to be prepared by the Institute's management and approved by the governments of the member states. This Charter was officially adopted, along with a Personnel Statute, at a conference of member states held on September 23, 1956, at Dubna, near Moscow. The Institute itself is located at Dubna.

[16] Malinin, "Pravovye formy mezhdunarodnogo sotrudnichestva v oblasti mirnogo ispol'zovaniya atomnoi energii," Sovetskoe Gosudarstvo I Pravo, No. 7 (July) 122-27 (1957). For texts of the Soviet government's proposals, see Appendix B, Item 3. Malinin's mention of the Joint Nuclear Research Institute in connection with the Soviet proposals for an intergovernmental regional organization open to participation by all European states, as opposed to "closed military groupings," is misleading. For one thing, the Joint Nuclear Research Institute itself resembles one of the "closed groupings of several states on the basis of existing military blocs" so vigorously condemned by Soviet writers, inasmuch as its membership thus far consists exclusively of Communist states which have concluded military alliances with the U.S.S.R. Another Soviet writer also mentions the Joint Nuclear Research Institute as a model of "regional atomic cooperation," whose equipment is much more modern and complete than that of the European Organization for Nuclear Research (C.E.R.N.), organized in 1953 and "just getting started" (Larin, Mezhdunarodnoe Agenstvo Po Atomnoi Energii 10-12 (1957)). Like Malinin, Larin cites the two Soviet proposals for all-European cooperation in peaceful use of atomic energy.

[17] Pravda, Mar. 15, 1956, p. 3. The document signed at that time will be called the Agreement in this paper, as distinguished from the Charter.

The texts of the Agreement [18] and the Charter,[19] which is doubtless regarded as subordinate to the Agreement and an implementation of it, and a considerable body of secondary sources dealing with the Joint Nuclear Research Institute are now available, and problems relating to membership in the organization, its functions, facilities, structure, basic operational procedures, and its relation to other international atomic research organizations have become quite clear.

According to the Agreement, the Joint Nuclear Research Institute is to be "an international scientific-research organization" with the "rights of a juridical person." [20] The Charter also defines the Institute as a legal entity and adds that it shall possess the capacity and status necessary to achieve its aims and functions "according to the laws of the country wherein it is situated" [21]—in other words, the laws of the Soviet Union.

These generally-worded provisions, restated in more specific terms, would appear to mean that the Institute, in addition to managing and disposing of its property according to the terms of its Charter, may, in its own name, make contracts and enter into other formal negotiations and relationships with such Soviet organizations as the Chief Administration for Use of Atomic Energy [22] or the All-Union Ministry of Medium Machine Building (to which the Chief Administration for Use of Atomic Energy is supposedly subordinated),[23] as well as with other Soviet organizations engaged in supplying the Institute with materials or designing and constructing new equipment for it.[24] The provisions

[18] The text of the Agreement is reproduced as Appendix B, Item I.

[19] The text of the Charter is reproduced as Appendix B, Item 2.

[20] Article 2.

[21] Article 3.

[22] The Soviet Council of Ministers' decree setting up this body was published in Pravda, Apr. 19, 1956, p. 3. Its functions include "furthering cooperation in the peaceful uses of atomic energy between the U.S.S.R. and other nations." V. S. Emelianov was appointed its Director in September, 1957; Izvestiya, Sept. 8, 1957, p. 6.

[23] E. P. Slavskii, the former Director of the Chief Administration for Use of Atomic Energy, succeeded Mikhail Pervukhin as Minister of Medium-Machine Building. The All-Union Ministry of Medium-Machine Building is believed to be in charge of over-all atomic energy development. For the report of Slavskii's promotion and Western hypotheses regarding the role of the Ministry of Medium-Machine Building, see the N.Y. Times, July 25, 1957, p. 1.

[24] See the Soviet legal provisions pertaining to "legal entities" in Article 13 of the Soviet Civil Code. A detailed study of Soviet legal entities may be found in Bratus, Yudidicheskie Litsa v Sovetskom Grazhdanskom Prave 124 and 140-152 (1947). A scholar of Soviet law in this country has declared that Soviet legal entities are in fact "sham entities and their mutual contracts are sham contracts." (I Gsovski, Soviet Civil Law 392 (1948).)

would also appear to give the Institute the capacity, in case of disputes with these organizations, to sue or be sued in Soviet courts and tribunals—for example in the *Gosarbitrazh* (State Arbitration System) which handles hundreds of disputes between Soviet enterprises yearly.[25] Both the Agreement [26] and the Charter [27] further stipulate that the Institute may deal with other national and international scientific-research organizations and other organizations in the development of nuclear physics and the exploration of new possibilities for peaceful uses of atomic energy. The Institute's relations to organizations of this type will be examined in another context, later in this chapter.

A comparison of the Institute's Charter with the basic documents of certain other international organizations devoted to peaceful utilization of atomic energy reveals some similarities, but there are also fundamental differences.

The Charter of the Joint Nuclear Research Institute specifies that the "Institute will concern itself exclusively with the development of peaceful uses of atomic energy to benefit all mankind" and authorizes five closely-related functions: (1) coordination of atomic research among member-states; (2) exchange of experience and research results among member-states; (3) communication with national and international organizations devoted to the peaceful use of atomic energy; (4) training (on all levels) of member-state personnel; and (5) announcement of results of the Institute's work in publications, reports to members, or in conferences.[28]

Such aims and functions, as far as they go, coincide largely with those of the International Atomic Energy Agency and EURATOM (both frequently contrasted with the Joint Nuclear Research Institute by Soviet writers) and, most of all, the European Organization for Nuclear Research (about which the Soviets have had much less to say).[29] However, the basic documents of these organizations (especially

[25] A study in the English language on the Soviet arbitration system has been made by Yaresh, Arbitration in the Soviet Union (1954). This work discusses the types of conflicts handled by *Gosarbitrazh* and the scope of its activities. The role of *Gosarbitrazh* in handling disputes between the Institute and other organizations, at least those within the Soviet Union, is made the more likely by the absence in the Charter of any specific machinery to handle such litigation.

[26] Article 2.

[27] Article 4.

[28] *Ibid.*

[29] Compare the aims and functions of the Joint Nuclear Research Institute with those of the European Organization for Nuclear Research (C.E.R.N.) as stated in Atoms for Peace Manual, 549 ff. One notes other similarities between the Joint Nuclear Research Institute and C.E.R.N.: both originally had eleven members, then added a

of the International Atomic Energy Agency and of EURATOM) are far more detailed than the Joint Nuclear Research Institute's Agreement and Charter, and contain considerably more implementing provisions. The Institute's Charter, for example, fails to prescribe any machinery for handling disputes among member-states [80] and is silent on the subject of formal contracts or "project agreements" between the Institute and organizations in member-states, although as a "legal entity" it theoretically has the capacity to conclude such agreements. There is no mention in the Charter of guaranteeing the "sovereignty" of member-states or of making Institute assistance independent of "political, economic and military considerations"—conditions which the Soviet delegates insisted on including in the Statute of the International Atomic Energy Agency. Nowhere in the Joint Nuclear Research Institute's Charter will one find any clauses giving the Institute powers of inspection and control—functions so strongly opposed by the U.S.S.R. in the final draft of the International Atomic Energy Agency Statute. Moreover, no health and safety standards are prescribed.

The Joint Nuclear Research Institute is, as its name would indicate, primarily a *research* organization and an educational or training center, encouraging the "comprehensive development of creative capacities of the member-states' scientific-research cadres." [81] As such, it has a far more limited range of functions than those which the International Atomic Energy Agency and EURATOM are expected to perform.[82] Its functions do not include supplying fissionable materials or designing and equipping atomic installations. Because it is a collective research body, rather than an atomic "bank" or distributor of fissionable materials, there was doubtless less need to include in its Charter any clauses setting up safeguards against diversion of fissionable materials from

twelfth; the Institute has four laboratories, and C.E.R.N. has four basic "study groups" (but only one laboratory); the documents of both organizations carefully define the scale of payments each member-state must make to meet the costs of organizational activities (in the case of C.E.R.N., the scale of payments from Yugoslavia and Greece were eventually reduced to .35%); both organizations have "open" membership, at least in theory.

[80] The statute of the International Atomic Energy Agency, on the other hand, provides for such machinery in its Article XVII, and EURATOM has its own "court of justice"; see Section IV in Secretariat of the Interim Committee for the Common Market and EURATOM. Treaty establishing the European Atomic Energy Community (EURATOM) (Brussels, 1957) (hereinafter called the "EURATOM treaty").

[81] Lebedenko, "Ustav ob'edinnogo instituta yadernykh issledovanii," Sovetskoe Gosudarstvo I Pravo, No. 2 (Feb.), 117 (1957).

[82] For a description and analysis of International Atomic Energy Agency functions, see Bechhoefer and Stein, *supra*.

peaceful to military uses, although the Soviet Union has always insisted that atomic energy's peaceful and military uses are inseparably interrelated.

Could the danger of diversion—of materials or techniques—even arise in connection with the activities of the Joint Nuclear Research Institute? Would it be possible, for example, for a member-state such as China to use Institute materials, or techniques developed at the Institute, for military projects without the knowledge and approval of the U.S.S.R. and other Institute members? Such a development seems highly unlikely, at least in the case of materials. One might speak of two types of protection against diversion of this type. One of them could be called "external security"—the fact that the Institute and all its installations are physically located in the Soviet Union, eliminating such difficulties and problems as "infringement of sovereignty" which arise in connection with the enforcement of the inspection and control clauses contained in the International Atomic Energy Agency statute or the EURATOM treaty. The second type of protection might be termed "internal security," being afforded by the structure and operational procedures (which we shall presently examine) of the Institute itself. The requirement that all the Institute's undertakings be planned (or known to and approved) by the management, the Scientific Council, and the Finance Committee, as well as the *collective* character of these undertakings, would seem to rule out the possibility of serious diversions of materials by individual member-states for unauthorized military purposes. It would, of course, be virtually impossible to limit the application of *techniques* to the physical confines of the Institute.

The Soviet Union has provided impressive facilities for the Institute. These include four laboratories: a laboratory of nuclear physics, which has a synchrocyclotron with proton energy of 680 megelectron volts (formerly the Nuclear Problems Institute of the U.S.S.R. Academy of Sciences); a high-energy physics laboratory which has a proton synchrotron with proton energy of 10,000 megelectron volts (formerly the Electrophysics Laboratory of the U.S.S.R. Academy of Sciences); a theoretical physics laboratory, and an electron physics laboratory. Both the Agreement and the Charter provide for other experimental installations and laboratories.[33] Some of the world's top nuclear physicists—men like Topchiyev and Veksler of the U.S.S.R.—work for the Institute.

There were eleven original signatories of the Agreement to establish

[33] Article 4 of the Agreement; Article 28 of the Charter.

a Joint Nuclear Research Institute: Albania, Bulgaria, Hungary, East Germany, China, North Korea, Mongolia, Poland, Rumania, the U.S.S.R., and Czechoslovakia.[84] The original Agreement specified, in its third article, that any other states wishing to take full part in the Institute's work should declare their concurrence with the provisions of the Agreement and that they could become members of the Institute by the decision of a majority of the member-states. A somewhat different procedure, however, was followed in the case of the only new member to date, Viet Nam, which joined the Institute on September 20, 1956, upon the "invitation" of the member-states.[85]

Membership qualifications as set forth by the Charter [86] remain substantially the same as those in the Agreement. An additional clause declares that the amount of participation in the Institute's maintenance and construction costs allotted to newly-joined member-states shall be decided by the Institute's Finance Committee and approved by the governments of the member-states. The Charter's sixth article states that all members of the Institute shall participate equally in its scientific work and management.

Soviet writers on the Joint Nuclear Research Institute have made a great deal of this "open-doors-to-all" membership policy, while criticizing EURATOM as a "closed grouping" and condemning the "discriminatory" policy of the United States and others who have insisted that only members of the United Nations or its specialized agencies should be members of the International Atomic Energy Agency. Such a policy is held to be "illegal" and "in contradiction to the principle of universality and of truly extensive international cooperation in the peaceful use of atomic energy." [87]

A condition of membership in the Institute is the payment of a specified percentage of the Institute's expenditures for construction and maintenance. The share borne by Albania, Mongolia, and North Korea, on the one hand, is only 0.05 percent apiece; the Soviet Union, on the

[84] The order of listing is according to the Russian alphabet, as followed in all documents.

[85] Izvestiya, Sept. 21, 1956, p. 1.

[86] Article 5.

[87] Trud, Sept. 14, 1956, p. 3. The article goes on to denounce the exclusion of the German Democratic Republic, the Mongolian People's Republic, the Korean People's Democratic Republic and China from membership in the Agency. These states, it will be noted, were among those signing the original agreement to set up the Joint Nuclear Research Institute. See also New Times, No. 8 (Feb. 21), 11 12 (1957) and numerous sources cited in our chapter on the Soviet Union and the International Atomic Energy Agency.

other hand, pays 47.25 percent.[38] The Agreement declares that the share of a member-state's contribution cannot be a factor bearing on the degree of its participation in the Institute's scientific work or administration. "Unless this principle were observed," writes a Soviet jurist, "membership in the Institute would be impossible for many states, and 'open doors for all' would remain an empty declaration of policy." [39]

The Agreement's seventh article, and article 8 of the Charter, state that any member-state may withdraw from the Institute by having its plenipotentiary give the Institute's Director written notice of its intention to withdraw not later than three months before the end of the current fiscal year. This would necessitate a revision of the percentage shares of the remaining member-states in meeting Institute expenses—a procedure outlined in Article VI of the Agreement.

The Charter's seventh article creates a type of guest membership for scientists from non-member states, enabling them to work in the Institute. Scientists from non-member states are encouraged to visit the Institute and to participate in its activities, and we frequently read of such visits and participation in Institute activities by foreign scientists, including scientists from the United States.[40]

The present charter membership in the Joint Nuclear Research Institute is exclusively Communist. This membership fails, however, to include one important Communist state, Yugoslavia. Yugoslavia was not among the original signatories of the Agreement to organize a Joint Nuclear Research Institute, nor is there any record of its being "invited" to join the Institute, as in the case of Viet Nam. Detailed speculation on the reasons for Yugoslavia's non-membership could hardly be justified in this paper, although a number of possible explanations come to mind. First, Yugoslavia may have been deterred from joining by considerations of its relations with the West. Second, Marshal Tito may have been reluctant to rush into joining a potential atomic Cominform in view of Yugoslavia's banishment from the political Cominform in 1948. Third, Yugoslavia's membership as the only Communist state in the twelve-member European Organization for

[38] Article VI of the Agreement.

[39] Lebedenko, *supra* note 31 at 117. For a similar description of the "open doors" policy, see Kapryin, "V Dubne, pod Moskvoi," Pravda, Jan. 4, 1957, p. 4.

[40] Iordansky, "Atomgrad," New Times, No. 4 (Jan. 24) 25-27 (1957) and Pravda, July 6, 1957, p. 4. One British scientist who has apparently become a regular staff member of the Institute is Bruno Pontecorvo, who fled England and obtained Soviet citizenship several years ago. His picture appears with a group of Institute scientists in Pravda, Jan. 4, 1957, p. 4.

Nuclear Research (CERN) may have been held against it by some of the states in the twelve-member Joint Nuclear Research Institute. Until the spring of 1958, Yugoslavia's absence from the Institute membership rolls did not seem to make much difference. A bilateral agreement had been concluded with the Soviet Union, on what appeared to be highly advantageous terms, for "cooperation in the use of atomic energy for peaceful purposes." [41] A Yugoslav scientist who visited the Joint Nuclear Research Institute was most impressed by its facilities and regretted that, so far, the Soviet Union and Yugoslavia had not exchanged scientific personnel—professors and research students. The scientist stressed, however, that the Soviet-Yugoslav bilateral agreement was especially satisfactory because "both from a political and a scientific viewpoint" it constituted "an arrangement between equal parties." [42] The Communist-bloc attacks on Tito in 1958 would appear to lessen the likelihood of Yugoslavia's joining the Institute and may result in serious curtailment of over-all Soviet atomic aid to Yugoslavia.[43]

The Joint Nuclear Research Institute is headed administratively by a Director and two Deputy Directors, elected by a majority of the member-states (through their plenipotentiaries) from among scientists of those states. The Director is elected for a term of three years. A Soviet professor, D. I. Blokhintsev (corresponding member of the Ukrainian Academy of Sciences) is the present Director. Deputy Directors serve

[41] The general terms of this agreement were outlined in a Tass communique from Belgrade, dated Jan. 28, 1956. The actual text of the agreement has not yet been published.

[42] Juric, "Nuclear Research in Yugoslavia," New Times, No. 23 (May 31), 20-21 (1956). Yugoslav spokesmen have criticized the Soviet Union as well as Great Britain and the United States for keeping atomic data secret: "The Russians . . . kept silent about their work and only revealed their final results: the explosion of atomic and hydrogen bombs and the setting in operation of a nuclear power plant . . . In spite of all attempts of the big powers to keep [atomic information] to themselves, humanity will not be checked from progressing along its road." Popovic, "International Cooperation and Nuclear Energy," 6 Review of International Affiairs, No. 126-128 (July-Aug.) 28 (1955). Yugoslav scientists and statesmen have called for the banning of atomic tests and have accused the U.S.S.R. (as well as Britain and the U.S.) of endangering world health by conducting nuclear tests. See statement by Academician Pavle Savic to Borba, "Extremely Harmful Consequences of Nuclear Explosions for the Whole World," Information Service Yugoslavia (n.d.) and statement by Tito on May 15, 1957, Information Service Yugoslavia (n.d.).

[43] During the crisis of mid-1958, Poland appeared to be the most reluctant of the Communist-bloc states to criticize Yugoslavia, and some Poles were inclined to hold China (rather than the U.S.S.R.) primarily responsible for the attack on Tito. Interestingly enough, a Polish-Yugoslav agreement for cooperation in peaceful uses of atomic energy through 1959 was reported by the Polish press on May 31, 1958; N.Y. Times, June 2, 1958, p. 10.

two-year terms. The current Deputy Directors are Professor Vaclav Votruba (of Czechoslovakia) and Marian Danysz (of Poland). The three together form the "management" or "Board of Directors" (*direktsiia*) of the Institute. They formulate the all-important plans for Institute activities and present the budget. The Agreement and Charter make this Board responsible to the governments of the member-states and oblige it to submit regular reports to those governments.[44] The Board's role in amending the Charter will be discussed later.

The Director acts as the Institute's plenipotentiary in relations with appropriate institutions in the member-states on all questions pertaining to the Institute's work.[45] Professor Blokhintsev, for example, would represent the Institute in its dealings with the Polish Academy of Sciences on research projects of mutual interest. He also serves as chairman of the Scientific Council (*uchenyi soviet*), which considers and approves the Institute's scientific research programs, examines the results of completed programs (and also the results of individual studies), and considers "other questions concerning the scientific work of the Institute." [46] The Charter requires this body to meet not less than twice a year.

Acting in his dual capacity of management head and chairman of the Scientific Council, the Director obviously wields great power, both executive and administrative. The Charter also confers on him the right to hire and discharge employees according to the Personnel Statute (the text of which has not yet been made public), to establish or alter the wages of all employees within the official wage limits approved by the Financial Committee, and to initiate individual pay raises of up to fifty percent for highly-skilled workers.[47] The Director is the formal manager-in-chief of all the Institute's assets.[48] He also appoints the deputy, or "Administrative Director," who is in charge of construction and business affairs of the Institute.[49]

The policy-making importance and supervisory powers of the Scientific Council are clear from the above-outlined provisions of the

[44] Article V of the Agreement; Articles 20, 23, and 25 of the Charter.

[45] Article V of the Agreement; Article 21 of the Charter.

[46] Article 18 of the Charter. Member-states' representation in this body is more "equal" (three scientists from each state) than in the corresponding organs of the International Atomic Energy Agency or EURATOM; see Article 118 of the EURATOM treaty and Article VI of the Agency statute. Each member-state of C.E.R.N. has one vote in the Council; Atoms for Peace Manual 550.

[47] Article 27 of the Charter.

[48] Article 26 of the Charter.

[49] Articles 33-35 of the Charter.

Charter. The relative brevity of this Charter and its paucity of detail means that most of the Institute's activities are determined by the Scientific Council. Minutes of the Scientific Council's first session give some additional information on the Institute's program and provide insight into procedures within the Council itself. These procedures display unmistakably Soviet characteristics. We learn, for example, that a five-year plan for further Institute development was approved in the first session of the Council. Elections for laboratory directors' posts were also held. First, the list of candidates was presented by the Board of Directors, and after this list was "discussed," three Soviet scientists were "chosen by secret ballot." Two of these laboratory directors (Veksler and Dzhelepov) immediately delivered addresses, apparently well-prepared, which furnished thorough and detailed "explanations" of the tasks to be undertaken by their respective laboratories. The Institute Director "suggested" a number of basic plans for constructing or acquiring new installations and equipment and for training specialists from member-states, after which a "lively discussion" took place. During this discussion "many questions were clarified, remarks studied, and certain legislative enactments were adjusted." There were "some differences of opinion," but the session closed with the "unanimous conclusions" which one has come to expect in Soviet organizational procedures.[50]

To what degree is the Institute's Board dependent upon the Finance Committee? The Charter's twenty-first article declares that the Board of Directors shall be guided exclusively by the decisions of the Scientific Council and the Finance Committee. While the Director presides over the former, he would appear to have no formal influence over the activities of the latter. The Finance Committee is made up of representatives of all member-states (one representative from each state), appointed directly by the governments of these states. The chairmanship of this body rotates among its members. It meets at least once a year, and its decisions are made by a majority of not less than two-thirds of the votes cast by its members. Its approval is formally required for a wide range of expenditures,[51] and the Charter states that the Finance

[50] Votruba, "The First Session of the Joint Nuclear Research Institute's Scientific Council," 2 Atomnaya Energiya, No. 1, 72-74 (1957) (each issue of this periodical is translated into English by Consultants Bureau, New York). Another reference to the single plan governing all Institute research may be found in Karnaukh, "Foreign Scientists in Dubna—International Center of Nuclear Research," 2 Atomnaya Energiya, No. 4, 482 (1957).

[51] Article 10 of the Charter.

Committee shall "generally control all financial affairs of the Institute." Thus the budget which the Board of Directors prepares must be submitted to it,[52] and the Committee determines the amount of money (in Soviet currency) to be expended by the Institute for "equipment, instruments and technical scientific literature or periodicals from states not belonging to the Institute." [53] It is the Finance Committee's function to establish "the manner of computing the value of equipment, materials and instruments supplied by the member-states, as well as the value of individual work accomplished according to Institute laws." [54]

Yet it probably would be erroneous to regard the Finance Committee as holding the purse strings and seeking to curtail, or otherwise actively interfere with, the plans of the executive. Since the members of the Joint Nuclear Research Institute are all states firmly committed to "planned economy," it seems likely that the Finance Committee's chief function is to work out practical financial arrangements in order that the plans of the Director and the Scientific Council may be carried out as effectively as possible. Its role is probably not to challenge any plans on their merits, beyond deciding on their economic feasibility. That the Committee operates largely in a "rubber stamp" manner seems clear from the aforementioned report on the Scientific Council's first session. The minutes note simply that "after the Scientific Council had finished its work, the first meeting of the Finance Committee took place; the Committee confirmed the tentative budget presented by the Institute's Directors for 1956-57 and thus guaranteed the completion of plans for the development of the Institute and of scientific-research problems approved by the Scientific Council." [55] Nevertheless, the Institute appears to follow strict accounting procedures. Each state's percentage share in the Institute's expenditures is credited with the value of equipment and materials which it delivers in accordance with orders placed by the Institute. Credit is also given for the value of research done by individual scientists working on Institute assignments and for sums which are withheld or deducted from members' salaries in form of taxes by the states of which they are citizens.[56]

We have already described the four laboratories which are attached to the Institute. Each laboratory has its own director, whose appointment by the Board (from among scientists of member-states) must, accord-

ing to the Charter's twenty-ninth article, be approved by the Scientific Council. Apparently the "secret ballot" procedure described earlier applies to the selection of four directors from a larger list of candidates, or represents a failure to observe the exact procedure provided for by the Charter. In this writer's opinion it makes little difference which method is followed; the laboratory directors appear in any event to be selected by the Board. Each laboratory, under its director, is charged with preparing programs for the scientific research work assigned to it and with examining the results of this work as well as of studies made by individual scientists in the laboratory. The laboratories each have their own Scientific Council, which must be approved by the Institute's Scientific Council, and each laboratory contains a number of departments and "sections" (*sektory*) which may be altered by the Institute Board. The laboratories have the right to confer learned degrees, including the degree of "doctor" of physico-mathematical sciences, upon students at the Institute. Each laboratory may also consider "other questions concerning the scientific work of the laboratory." [57]

The Charter declares that all members of the Institute staff are employees or associates (*sotrudniki*) of the international scientific organization and are obliged to carry out its purposes and tasks.[58] A Soviet jurist speaks of some members being "dispatched" or "ordered" (*komandirovannye*) by their governments to work at the Institute for periods of not less than a year, while others have a considerably shorter tour of duty.[59] The rights and obligations of staff members are regulated in detail by a Personnel Statute (*polozhenie o personale*) which is appended to the Charter. (This statute is mentioned in the thirty-eighth article of the Charter, but its text has not yet been made public.) Its norms are said to correspond to the "basic principles of labor legislation" of the various member-states.[60] The Charter specifies that Institute personnel shall be "subject to the laws of the country in which the Institute is located"—*i.e.*, the laws of the U.S.S.R.[61]

Are the member-states all equal participants in the Institute's scientific research activities? Legally, yes. At least, the Charter's sixth article says that they are. Do member-states enjoy equality in determining and administering Institute policy? Here the legal answer is less clear. A Soviet jurist has hailed the "democratic nature" (*demo-*

[60] *Ibid.*

[61] Article 38.

kratichnost') of the Charter provisions.[62] These provisions make the Institute's Board of Directors responsible for Institute activities to the collective governments of the member-states and require the Board to submit periodic reports to these governments.[63] In its twenty-second article the Charter also makes clear that the Institute's Board shall not undertake to carry out the instructions of any *individual* member-state, but shall be guided exclusively by decisions of the Scientific Council and the Financial Committee, in which all member-states enjoy equal representation. We have already noted that a member-state's percentage share in the Institute's expenditures and maintenance is supposed to have no bearing on that state's degree of participation in Institute research or activities. Thus, on the surface at least, member-states are equals when it comes to administering the Institute and shaping its policies, as well as participating in its research activities.

Yet the Charter contains other passages whose legal effect would appear to increase the Soviet Union's influence over the Institute to the point of giving the Institute a Soviet character rather than an international one. We have already noted that the Joint Nuclear Research Institute is a Soviet "legal entity" whose rights—and obligations—are determined by Soviet law. This is in contrast to EURATOM whose legal personality is subject to separate definition under the respective municipal laws of the member-states.[64] We have likewise noted that, while the Personnel Statute's regulations allegedly conform to the "basic principles" of labor legislation in member-states, the Institute's staff is specifically made subject to Soviet law. There is no passage in the Institute's Charter dealing with privileges or immunities of personnel, as is to be found in the fifteenth article of the International Atomic Energy Agency statute. Problems of conflicts of laws, in which jurisdiction and disposal of cases involving Institute personnel would be at issue, could hardly arise under the Institute Charter's provisions. The member-states' property rights in Institute installations have never been defined, but the Charter acknowledges the Soviet Union's reversionary rights in these installations in the event of the Institute's dissolution, with the other member-states to receive monetary reimbursement proportionate to the amount of their participation and monetary contributions. The installations include "all Institute equipment and all . . . buildings." [65]

[62] Lebedenko, *supra* note 31 at 117.
[63] Article 22.
[64] *Cf.* Articles 184 and 185 of the EURATOM treaty.
[65] Article 40.

Although the Charter makes no mention of it, we must assume that the ultimate source of authority over matters affecting the Joint Nuclear Research Institute is the Communist Party of the U.S.S.R.[66] Whatever the Joint Nuclear Research Institute may have in common with other international organizations devoted to peaceful uses of atomic energy, this political feature of subordination to a single national political party—the Soviet Union's Communist Party—sets the Joint Nuclear Research Institute apart.

There are other considerations which lead one to doubt that the U.S.S.R. has only one vote in twelve in shaping Institute policy and controlling its administration. Without the guiding impetus and tremendous material contributions of the Soviet Union, the Institute could never have become the impressive organization that it is today. It might well continue to function effectively if one or more of the other member-states withdrew, but what would become of the Institute if the U.S.S.R. chose to exercise its right of withdrawal? It is difficult to imagine the success of any Institute project if that project met the opposition of the Soviet Union. Questions of formal status aside, the U.S.S.R. remains the scientific and economic "big brother" to the other members. Representatives of the smaller states are the first to recognize this fact. Professor Andrzej Soltan, Director of the Polish Academy of Sciences' Nuclear Research Institute, has hailed the creation of the Joint Nuclear Research Institute as "above all a manifestation of international scientific cooperation . . . a great step forwards in the development of atomic nuclear physics research, which permits scientists of small countries to achieve work which they could not carry out by themselves. We will use not only the experience of the Soviet scientists, but also their equipment." [67] Lajos Janosi, a member of the Hungarian Academy of Sciences, concedes that "such a small state as Hungary would not be in a position to construct and equip such an institution by its own means. And it would not be expedient, anyway. The problem has been resolved

[66] The Soviet Communist Party's complete power over all national organizations within the U.S.S.R. is unquestioned. Does the Joint Nuclear Research Institute's status as an "international organization" make a difference here? We believe not. It is an international organization of Communist states run by Communist parties, among whom the Soviet Communist Party continues to play the directing role. The Soviet Union's dominant position in international affairs between Communist states (with the much-publicized exception of Yugoslavia) appears unaltered at this date. Even without considering the Charter provisions which favor the Soviet Union, we see no reason to expect any of the other Institute member-states to object to, or in any way challenge, the factual domination of that body by the U.S.S.R. and the Soviet Communist Party.

[67] Izvestiya, April 4, 1956, p. 3.

correctly: the Institute was set up in a large country which has the necessary equipment at its disposal, while other lands are given the opportunity to participate in its work and to benefit by common experience." [68]

The Institute's Charter sets up a simple procedure for amendment of its provisions. Proposals for amending the Charter may be submitted by Institute members to the Board of Directors. The Board, in turn, has the right to introduce amendment proposals on its own initiative. In either case, the amendments take force when adopted by a majority of the member-states.[69]

The Charter provides for the liquidation of the Joint Nuclear Research Institute, but tells us only that this may be done "by agreement of the member-state's governments." [70]

The Institute's relations to other organizations and programs for peaceful utilization of atomic energy were highlighted by a visit which Sterling Cole, Director-General of the International Atomic Energy Agency, paid to the Joint Nuclear Research Institute in the spring of 1958.[71] The Institute Charter's fourth article provides that one of its purposes shall be to maintain communication between national and international scientific research organizations for the peaceful use of atomic energy, and in the future some cooperation between the International Atomic Energy Agency and the Joint Nuclear Research Institute may be realized. For example, the Institute would appear to be the logical institution to which students and specialists from Agency member-states would come for training under the Soviet program outlined in letters to Sterling Cole just before his trip to the U.S.S.R.[72]

The record shows a fundamental difference, however, in the Joint Nuclear Research Institute's relations with the various organizations devoted to the peaceful use of atomic energy. It is hardly surprising that the Institute cooperates most closely with organizations in the Soviet bloc. Its Charter specifies that it shall coordinate the theoretical and experimental research of member-state scientists,[73] and the Agreement's second article states that it shall cooperate in its work with the

[68] Pravda, Jan. 4, 1957, p. 4.

[69] Section XII of the Charter. We are not told whether the majority in question refers to a meeting of the Scientific Council or to some sort of general vote of members.

[73] Article 4.

appropriate institutes and laboratories in the territories of member-states. The member-states, as we have seen, are placing great hopes in this arrangement. The director of the Polish Academy of Sdiences' Nuclear Research Institute, for example, has declared that he is counting on the closest cooperation between the Institute and his organization.[74]

The Institute's relations with the U.S.S.R. Academy of Sciences are intimate. The Academy's Nuclear Problems Institute and Electrophysics Laboratory have become laboratories of the Joint Nuclear Research Institute, and the Academy's greatest scientists are working for the Institute. We have no information on the Institute's ties with the U.S.S.R. Ministry of Medium Machine Building or the Chief Administration for Use of Atomic Energy, but there can be little doubt that such ties are fully exploited. The lavish expressions of gratitude for Soviet assistance on the part of scientists of smaller states should not obscure the fact that the U.S.S.R. itself stands to benefit considerably from the results of the joint scientific research conducted by the Institute. According to a West German scholar, the Soviets expect valuable contributions from scientists of Poland, China, and Czechoslovakia in particular.[75] Further evidence of the advantages which the U.S.S.R. will enjoy by virtue of its Institute membership is seen, curiously enough, in a letter from a Rumanian scientist expressing thanks for Soviet assistance to his country. Commenting on the atomic energy program in the Soviet Union's own five-year plan, this Rumanian scientist adds that "in carrying out the scientific part of this program, a part will be played by the Joint Nuclear Research Institute, and Rumanian physicists are proud that they will be able to work at this Institute." [76]

With reference to non-Communist atomic organizations and agencies, however, the Institute's attitude assumes a political and diplomatic significance of a special type. The Institute's historical and political background reveal a pattern which must be considered quite apart from problems of research on peaceful uses of atomic energy. On the day following the announcement of the Agreement to organize the Joint Nu-

[74] Izvestiya, April 4, 1956, p. 3. See also Wspolpraca ze wszystkimi narodami, I Polska, No. 41, 6-7 (1958), which mentions bilateral agreements between Poland and Yugoslavia, and Poland and East Germany, in addition to Polish participation in the Joint Nuclear Research Institute.

[75] Huber, Internationale Ordnung Der Friedlichen Verwendung Der Atomenergie 51 (1956).

[76] Sanielevich, "Aid Accorded to Atomic Scientists Coming from People's Democracies," 2 Atomnaya Energiya, No. 1, 98-99 (1957).

clear Research Institute, the Soviet government came out with a bitter attack against EURATOM, a "narrow and closed group of West European states" whose American and West European sponsors "intend to bypass the Paris Agreement clauses which prohibit West Germany from producing and stockpiling atomic and hydrogen weapons." [77] Shortly after the full text of the Agreement to organize the Joint Nuclear Research Institute was published (on July 11, 1956), EURATOM was again denounced—this time in a statement by the Soviet government on general European cooperation in the peaceful uses of atomic energy.[78] Once again, the twin facts that EURATOM was a "closed grouping" and that West Germany was to be one of its members drew Soviet criticism. It was pointed out that several states within this "closed grouping" were also members of closed military blocs, and the fear was expressed that EURATOM's creation would in effect lead to the removal of any restrictions on the production of atomic energy in West Germany. "This," in the words of the statement, "would permit revenge-seeking West German circles to organize in their country production of atomic weapons, which would create a serious threat to the cause of peace in Europe." The statement went on to describe, by way of contrast, the "open" character of the Joint Nuclear Research Institute and the purely peaceful purposes for which it was being organized.

Any doubt that the Joint Nuclear Research Institute had been organized as the Communist bloc's answer to atomic research organizations sponsored by the West must have been dispelled when a Soviet jurist wrote early in 1957 that "C.E.R.N. is a closed organization which does not admit states of the Socialist camp into its membership. This has compelled a number of states to create their own international research organization. With this purpose in mind, a conference was held in Moscow, in March, 1956. . . ." [79]

On March 17, 1957, in a declaration concerning the plans to create EURATOM and a Common Market, the U.S.S.R. Ministry of Foreign Affairs warned:

> The entire activity of EURATOM and the "common market" will be subordinated to the aims of NATO, whose aggressive character is widely known. Under such conditions the fulfillment of plans to create EURATOM and the "common market" will inevitably lead to a further deepening of the division which splits Europe, to the increase of tensions in

[77] Izvestiya, March 28, 1956, p. 3.
[78] See Appendix B, Item 4.
[79] Lebedenko, *supra* note 31 at 116.

> Europe. It will greatly complicate the establishment of economic and political cooperation on an all-European basis; it will bring into being new difficulties in solving the problems of European security.[80]

The declaration cautioned those who believed that the creation of EURATOM would lessen their countries' economic dependence on the United States:

> On the contrary, their dependence on the U.S.A. will only increase, to the detriment of the national sovereignty of the countries participating in this grouping, since the United States—and nobody attempts to conceal this fact—will in reality control EURATOM, acting in the capacity of chief supplier of fissionable materials and of equipment for atomic production in the EURATOM countries.[81]

In place of EURATOM, the Soviet government proposed an all-European organization for peaceful utilization of atomic energy, "bearing in mind that this organization would be a regional division or department of the International Atomic Energy Agency." Just what advantages such a "regional division" of the International Atomic Energy Agency would offer over the Agency itself was not disclosed.

The International Atomic Energy Agency has suffered greatly by comparison with the Joint Nuclear Research Institute in the Soviet press. During the New York conference which began on September 20, 1956, for examination and confirmation of the International Atomic Energy Agency's statute, Soviet publications were filled with articles drawing distinctions between the Agency and the Communist-sponsored Joint Nuclear Research Institute.[82] These articles emphasized that membership in the Joint Nuclear Research Institute was open to all, even to non-Socialist states, but that membership in the International Atomic Energy Agency was denied, quite illegally, to such states as the German Democratic People's Republic, the Korean People's Democratic Republic, the Mongolian People's Republic, and China. All member-states in the Joint Nuclear Research Institute were said to enjoy full legal equality. The draft statute of the International Atomic Energy Agency was condemned for its failure to include any clearly-formulated provision that the sovereign rights of its member-

[80] See note 16, *supra*.

[81] *Ibid.*

[82] Some examples may be found in Trud, Sept. 14, 1956, p. 3; Izvestiya, Sept. 21, 1956, p. 1; Pravda, Sept. 27, 1956, p. 4 and Sept. 28, 1956, p. 6; Izvestiya, Sept. 29, 1956, p. 4.

states must be observed in all activities of the Agency. With respect to the Joint Nuclear Research Institute, the articles claimed that member-states have equal participation rights and equal use of the Institute's facilities, regardless of their financial share in meeting its expenses. The statute of the International Atomic Energy Agency was denounced as financially discriminatory, providing in essence that countries which obtain aid from the Agency should not only pay for this aid, but should also ensure that the Agency have the income which it needs to construct or acquire its own plants, laboratories, and other installations. The argument was advanced that the financial arrangements naturally discriminated against the smaller, or economically-undeveloped, countries. In addition, the articles charged that the capitalist countries producing atomic raw materials and fissionable materials in quantity were intent upon using the International Atomic Energy Agency as a marketing channel. Finally, the equipment and facilities of the Agency and of EURATOM were described as lagging far behind those donated by the Soviet Union to the Joint Nuclear Research Institute, the finest in the world, and a number of which were already in operation.

From comparisons of this sort, one must conclude that the Joint Nuclear Research Institute serves not only as an international research organization, but also as an instrument of Soviet diplomacy and propaganda.

C. The Soviet Union and the International Atomic Energy Agency

The Soviet position with regard to the International Atomic Energy Agency, since Moscow's first published reaction to President Eisenhower's proposal of December 8, 1953, deserves serious study. If we are to understand the Soviet approach to international cooperation in the peaceful uses of atomic energy, the Soviet role in the history of the International Atomic Energy Agency cannot be ignored.

Two closely-related propositions form the ostensible basis of Soviet policy in international cooperation for the use of atomic energy. Without a consideration of these two tenets any discussion of the subject is viewed by the U.S.S.R. as fruitless. Repeatedly raised and emphasized in all the channels of communication available within the Soviet Union, the propositions amount simply to this: (1) at present the peaceful uses of atomic energy are inextricably interwoven with its military uses; and (2) effective cooperation in peaceful use of atomic energy cannot be fully achieved until an international agree-

ment to prohibit the manufacture, storage, and use of nuclear weapons is reached. The author of a recent Soviet volume on the International Atomic Energy Agency warns that the basic efforts of all states will inevitably be concentrated on the military, rather than the peaceful, uses of atomic energy until atomic weapons have been outlawed.[83] Although American scientists and officials have repeatedly praised the *personal* goodwill and cooperative spirit of Soviet scientists at international congresses and other gatherings, Igor V. Kurchatov, director of the Soviet Academy of Sciences' Atomic Energy Institute has admitted that "full candor" in relations between Soviet and Western scientists cannot be expected until atomic and hydrogen weapons have become a thing of the past.[84]

In the following pages the Soviet position with regard to the International Atomic Energy Agency, as presented to the reader of Soviet materials on the subject, is surveyed. It should be emphasized that the Soviet views reach an enormous public, both inside and outside the U.S.S.R.

A Soviet legal scholar has enumerated four basic juridical forms of organization for international cooperation in the peaceful uses of atomic energy. One of these forms is the bilateral agreement concluded directly between interested nations. Another is created through so-called intergovernmental "regional organizations." A third is the organization of international scientific-research centers based on multilateral agreements between states situated in various parts of the globe. The fourth form is the international organ created within the framework of the United Nations and (the Soviets insist on this) based upon the "principle of universality." [85]

What is the place of the International Atomic Energy Agency in this juridical scheme? In answering this question, the Soviet scholar has offered the following description of the Agency's relationship with the United Nations. First, the Agency was created within the framework of the United Nations, which ensures the proper observation and control of the Agency's work. Secondly, the United Nations Security Council and General Assembly have the right to demand reports from the Agency. They may criticize these reports, give the Agency in-

[83] Larin, *supra* note 16 at 46. Larin's book is especially important because it is the only Soviet monograph on the International Atomic Energy Agency to appear thus far. The book was edited by S. B. Krylov, the prominent Soviet specialist in international law.

[84] Pravda, Feb. 28, 1958, p. 3.

[85] Malinin, *supra* note 16 at 122.

structions resulting from their discussion of the reports, and may demand an accounting of the Agency's fulfillment of these instructions. Third, the Agency may not decide on questions falling under the exclusive jurisdiction of the Security Council. Therefore, any instructions of the Security Council which concern the ensuring of states' security are binding upon the Agency and its organs. These three characteristics of the Agency, taken together, show that the International Atomic Energy Agency's statute provides for a closer relation between the Agency and the United Nations than that which exists beween the United Nations and its specialized agencies. The specialized agencies, having been created by intergovernmental agreements, are in matter of fact outside the United Nations. Their activity is merely related to, or coordinated with, the activity of the United Nations.[86]

In contrast to the specialized agencies, the author reminds us, the Agency was placed in a definite relationship to the United Nations from the outset. This relationship was based, not on Article 63 of the United Nations Charter (which pertains to special agreements of the type used by the specialized agencies and the United Nations), but on the provisions of the Agency's own statute. The statute's sixteenth article, to be sure, requires an agreement between the Agency and the United Nations concerning Agency reports to the United Nations, and concerning the Agency's consideration of resolutions adopted by various United Nations organs on the subject of the Agency. But such agreements, as seen from the sixteenth article itself, merely pursue the practical aim of making more precise certain general provisions contained in the Agency statute.

Further distinctions between the International Atomic Energy Agency and United Nations specialized agencies can be found in the Agency's statute which define its relation to the United Nations and which emphasize that it was created within the framework of the United Nations.

At the same time, the author points out, the Agency cannot be regarded as an auxiliary organ of the Security Council (such as the United Nations Disarmament Commission), created in accordance with Article 29 of the United Nations Charter. Such organs are set up to ensure the performance by the Security Council of its immediate functions, which clearly cannot be turned over to a body like the International Atomic Energy Agency. Furthermore, such organs are created by the Security Council itself, whereas the Agency was created

[86] *Id.* at 126.

on an intergovernmental basis. Again, the organs created in accordance with Article 29 of the United Nations Charter are completely subordinated to and exclusively controlled by the Secuity Council, while the Security Council's control over the Agency is limited to guarding the security of states and maintaining international peace.

Thus the Soviet scholar concludes that the Agency, in its juridical position, differs both from a specialized agency and from an organ created in accordance with Article 29 of the United Nations Charter. In the author's opinion, the Agency is "a new international mechanism, created by intergovernmental agreement, albeit within the framework of the United Nations, and placed in direct relation to its chief organs—the Security Council and the General Assembly." [87]

Turning to the historical background of the International Atomic Energy Agency, the first step taken by the Soviet Union was to discount the United States' role in creating the Agency. President Eisenhower's proposal of December 8, 1953, to create an international agency for peaceful uses of atomic energy was (and still is) dismissed as a "face-saving measure," one designed to cover up the Americans' refusal to outlaw nuclear weapons. Furthermore, the Communists state that the President's proposal was much more limited in scope than claimed by the "bourgeois press" which had hailed it as an unprecedented step in the development of peaceful use of atomic energy. Actually (say Soviet spokesmen), Eisenhower's plan completely ignored the problem of removing the threat of atomic warfare. Providing merely that a small portion of atomic materials be set aside for peaceful purposes, the proposal tacitly assumed that the main mass of these materials would, as before, be directed toward the production of newer and more destructive nuclear weapons.[88] This, according to the Russians, was confirmed by American sources themselves; the United States' memorandum of January 11, 1954, and Secretary Dulles' informal paper to Molotov at Geneva on May 1, 1954, explained that the American proposal was merely a "first effort" on a "modest basis," naturally not conceived as a measure for bringing atomic weapons under control. Furthermore, it is argued that the United States was in no sense the initiator of international cooperation in peaceful uses of atomic energy. The claim is advanced that the Soviet Union had stood for such cooperation long before Eisenhower's proposal.[89]

[87] *Ibid.*

[88] See Larin, *supra* note 16 at 17.

[89] *Id.* at 18-19. See also the Soviet Aide-Memoire of April 27, 1954; Atoms for Peace Manual 269-274. The reader of such passages might well conclude that the

Before completion of the first draft of the International Atomic Energy Statute in July, 1955, the Soviet government presented a number of points which it declared should be basic principles of the new Agency. These points were contained in a pair of memoranda, the first issued on September 22, 1954 and the second on July 18, 1955.[90] The second (and more important) of these documents, in addition to certain broad and general suggestions (that the Agency should be created within the framework of the United Nations, and that it should encourage the exchange of scientific and technical information, establish research establishments, and maintain a number of specialists to assist states receiving help from the agency, etc.) contained some demands which proved to be sources of great discord in the subsequent history of the International Atomic Energy Agency. These demands included the principle that membership in the Agency should be open to *all* states, that there should be no privileged status for any state or group of states in the Agency, and that the Agency should never be used "for security purposes of any states."

These principles became issues almost immediately. The U.S.S.R. was not represented among the powers responsible for preparing the first draft of the International Atomic Energy Agency statute, and when it received this draft at the end of July, 1955, it criticized the document for three major reasons. First, no close ties were established between the Agency and the United Nations. Secondly, it was "undemocratic," in that it gave all power to the Board of Governors, leaving the

Soviet Union stood for an international agreement to prohibit nuclear weapons, but that the United States would hear of no such thing. The Soviet account fails to mention other highly pertinent passages in the American documents. Point 4 of the January 11 note, for example, states that "The United States is prepared to consider any proposal that the Soviet Union sees fit to make with reference to atomic, hydrogen and other weapons of destruction." Point 5 goes on: "However, the United States believes that the first effort should be to proceed on a modest basis which might engender the trust and confidence necessary for planning of larger scope." Atoms for Peace Manual 262. In the informal paper of May 1, 1954, Dulles declared (in point 3) that "the US cannot concur in the view of the Soviet Union that creation of an international agency to foster the use of atomic materials for peaceful purposes would not be useful in itself." In point 5 of the same paper, the American statesman repeated that "The US proposal of March 19 was, of course, not intended as a substitute for an effective system of control of atomic energy for military purposes. The US will continue, as heretofore, to seek means of achieving such control under reliable and adequate safeguards." Atoms for Peace Manual at 274. In contrast to the Soviets, Yugoslav spokesmen have freely recognized Eisenhower's initiative in international cooperation for peaceful uses of atomic energy; Damjanovic, "Toward an International Atomic Agency," VII Review of International Affairs, No. 156 (Oct. 1), 11 (1956).

[90] Atoms for Peace Manual 278-281 and Larin, *supra* note 16 at 21-22.

General Conference with merely consultative functions, and it limited membership in the Agency to states which were members of the United Nations or its specialized agencies. Thirdly, by failing to define the dimensions of the budget, the draft statute would impose uncertain financial obligations on Agency members.

In a memorandum devoted to the draft statute, dated October 1, 1955, the Soviet Union raised the following seven points. The first stressed the necessity for control provisions; since the Agency would be dealing with dangerous fissionable materials, and because the production of atomic energy for military and peaceful purposes was closely connected, it would be necessary to observe and control the activity of the Agency through some representative international organ such as the United Nations. Secondly, there must be no "privileged groups" in Agency membership. The statute must be based on recognition of the principle that no single country or group of countries be accorded a privileged position. In addition, the Agency's assistance was never to be made conditional on political, economic, or military considerations, or on any other considerations which were incompatible with the "sovereign rights" of states. Third, the statute's provisions dealing with the Agency's inspection and control powers must be in keeping with the "sovereign rights" of states receiving assistance from the Agency. Fourth, *any* state, regardless of whether or not it was a member of the United Nations or its specialized agencies, must have the right to be included among the founders of the International Atomic Energy Agency. Fifth, the first Board of Governors must include India, Indonesia, Egypt, and Rumania. Sixth, the statute must provide for a three-fourths majority vote in both the General Conference and the Board of Governors for approval of the budget and for establishing the scale of payments made by individual member-states. Seventh, the International Court of Justice was to have jurisdiction of cases involving the interpretation or application of the statute's provisions if the interested parties consented to its jurisdiction.[91]

By the time of the negotiations for creating the International Atomic Energy Agency in the fall of 1955, the Soviet position was clear to everyone. At the tenth session of the United Nations General Assembly, the Soviet delegate (Kuznetsov) repeated the demand that membership in the Agency be open to all. It was "unfair and unjust" that

[91] Larin, *supra* note 16 at 22-23. We shall presently see, in discussing Soviet bilateral agreements with states outside the Communist bloc, that the Soviet Union was soon to conclude agreements with Egypt and Indonesia, and was offering aid to India.

Communist China and the German Democratic Republic had been excluded from the Geneva conference that summer; no state should be barred from international cooperation in the peaceful uses of atomic energy. The inevitable appeal was made for an agreement prohibiting nuclear weapons. The Soviet delegation submitted a resolution that the General Assembly: (1) call upon all states to continue their efforts to reach such an agreement; (2) call for the creation of an international agency for peaceful uses of atomic energy within the framework of the United Nations; (3) call a conference of experts from various governments for joint consideration of problems relating to the drafting of a statute for the Agency; (4) recognize as desirable the periodic convocation of conferences on exchange of experience in the peaceful use of atomic energy in various fields (science, industry, agriculture, health, etc.), and authorizing the General Assembly to take steps for calling such a conference not later than 1957; and (5) decide on an international publication of works by scientists on problems of peaceful uses of atomic energy by 1956. The Soviet account would lead one to believe that all these suggestions originated with the Soviet delegation and adds that most of them were included in the final text of the resolution unanimously adopted by the General Assembly on December 3, 1955.[92]

According to the Soviet version, the Washington conference on drafting the International Atomic Energy Agency statute was subjected, from the outset, to tremendous pressure by the United States. The Americans gave all to understand that the U. S. policy toward the Agency would depend on the extent to which American wishes were followed.[93] The U.S.S.R., supported by Czechoslovakia, India, and others, posed as a defender of the United Nations against the American machinations. Upon the insistence of these powers, a provision was included in the statute requiring the Agency to present reports to the General Assembly and, in necessary cases, to the Security Council and other United Nations organs. The Agency was to examine the resolutions of these organs with respect to Agency activities, and was to submit reports on measures taken by it after consideration of these resolutions; "thus closer ties were set up between the Agency and the

[92] Larin, *supra* note 16 at 27.

[93] Larin, *supra* note 16 at 28-29. Once again, it is interesting to contrast the Soviet point of view with that of Yugoslav spokesmen who praised the "flexibility shown by the United States representatives towards the criticism of the attitude formulated in the original draft statute," which "made it possible to broaden the platform on which the Agency would be created." Damjanovic, *supra* note 89 at 12.

United Nations." [94] But these powers condemned the limitation of membership in the Agency to states which are members of the United Nations or its specialized agencies as "discrimination" contradicting the very concept of international cooperation in peaceful utilization of atomic energy. The U.S.S.R. and Czech delegates also attacked a provision in the draft statute which would have enabled the Agency's organs (the Board of Governors and the General Conference) to determine whether a given state would be capable of carrying out its obligations according to the United Nations Charter. They also argued that such powers belong to the United Nations' General Assembly and that the provision in question would lead to the "absurd result" that the Agency could pass on whether a particular state, already a member of the United Nations, could fulfill obligations contained in the United Nations Charter. According to Soviet reports, although the United States and other nations "stubbornly defended this provision," a new, changed formula was finally adopted.

The most controversial problem to arise at the conference concerned the composition of the Agency's Board of Governors. Here again, the Soviet delegation came out as a defender of "democracy" and "fair representation" against the alleged attempts of the Anglo-American bloc to subvert these principles. First, the Soviets proposed that the number of members on the Board be increased from sixteen to twenty-four. Secondly, procedures for election to the Board of Governors should be changed: nine member-states (including the five constant members of the United Nations Security Council) would be Board members by virtue of their advanced atomic technology and/or abundance of atomic resources. Fifteen other Board members would be selected by the General Conference according to geographical distribution (three members of American states, three from West Europe, two from East Europe, three from the Near East and Africa, and four from Southeast Asia and the Far East). These selections were to be made on the basis of two principles: (1) the guarantee of representation of members *receiving* benefits from the Agency, not contributing to it; and (2) "the offer of services, equipment, and information enabling the Agency to achieve its aims and fulfill its functions." The Soviet Union also demanded that Communist China be represented on the Board of Governors. Throughout the conference the U.S.S.R. maintained that the supreme organ of the International

[94] Larin, *supra* note 16 at 30.

Atomic Energy Agency should be its General Conference, with decisions binding upon the Board of Governors.[95]

The Soviet delegation recognized the danger that fissionable materials obtained from the Agency might be used for military purposes rather than peaceful ones, but insisted that there should only be as much control as was "really necessary," and that the "sovereignty" of member-states should always be "strictly observed." The statute should therefore provide that the Agency's activities never be made subject to conditions of economic, political, or military character—or in any way "incompatible with the sovereignty" of the recipient state. The United States-British insistence on strong inspection and control provisions, and their failure to accept the Soviet proposals for weakening these provisions, were denounced as "a refusal to accept the Soviet proposals to safeguard the sovereign rights of states making use of Agency assistance." [96]

In budgetary matters the U.S.S.R. sought to guarantee the fulfillment of the Agency's "true function"—assistance of underdeveloped countries in practical application of atomic energy for peaceful purposes. The U.S.S.R. suggested that all decisions on financial questions be made by a three-fourths majority vote, rather than two-thirds as provided in the original draft of the statute. It also proposed that the maximum contribution of any single state not exceed fifteen percent. It recommended that the Agency provide nuclear materials to underdeveloped countries at especially low prices, and in some cases entirely free. The Western powers were censured for rejecting this proposal, and for insisting that the Agency be given the right to acquire or construct atomic plants, laboratories, and other equipment. According to Soviet spokesmen, this would require enormous expenses, which would of necessity fall upon Agency members, even when they considered such construction and acquisition unnecessary.[97]

Representatives of states attending the New York conference which opened on September 20, 1956, to draft a statute for the International Atomic Energy Agency were strongly reminded of the Soviet stand on most of the points raised earlier. Bulganin dispatched a telegram to the conference, repeating that only with prohibition of atomic and

[95] *Id.* at 31-32. In this instance the Soviet view (on the relation of the Board of Governors to the General Conference) is supported by Yugoslavia. Arnejc, "Conference for the International Atomic Agency," 7 Review of International Affairs, No. 155 (Sept.), 9 (1956).

[96] Larin, *supra* note 16 at 33.

[97] *Id.* at 37.

hydrogen weapons could the most favorable conditions exist for peaceful use of atomic energy. Other familiar problems emerged in the course of discussions: the participation of the Chinese People's Republic and other Communist states in the Agency, the Agency's general tasks and aims, membership policy, composition and powers of the Board of Governors, and the Agency's inspection and control functions. There was little new in what the Soviet delegates said, but some fresh arguments were presented in support of their position.

On the question of Communist China's participation the Soviets have pointed out that such "states" as Monaco and the Vatican were invited to attend the conference, but the "great Asiatic power, the Chinese People's Republic"; yet China's contribution could be a valuable one. Outstanding Chinese scientists were said to be devoting themselves to problems of peaceful utilization of atomic energy. The Soviets also claimed that considerable deposits of fissionable materials have been discovered in China and that the Chinese government is giving a high priority to atomic research. China has a twelve-year plan in science and technology which envisages the achievement by 1967 of a level in atomic energy research equal to that of the most advanced countries. The Soviet Union's position is that the Chinese People's Republic must sooner or later be admitted into the Agency and that the present "short-sighted and discriminatory policy" can only harm the Agency, undermining its influence and authority.

At the conference G. N. Zarubin, the Soviet delegate, declared that the tasks and aims of the Agency must not be confined to serving the interests of a narrow group of highly-developed industrial powers; cooperation in peaceful uses of atomic energy can only be effective under conditions of equality of all participating states, with strict observance of their sovereignty and the principles of the United Nations. "In its foreign policy, the U.S.S.R. always adheres strictly to the principles of equality and observance of the sovereign rights of all people, great and small, highly-developed or backward," declared Zarubin (hardly a mouth before the tragic events which were to take place in Hungary that year), and he again emphasized that international cooperation in the peaceful uses of atomic energy could not be truly effective or complete until an international agreement was reached outlawing atomic and hydrogen weapons and until these weapons were removed from the arsenals of all states.[98]

The American-British insistence on strong inspection and control

[98] *Id.* at 45-47.

provisions was interpreted by the Russian representative as an effort to acquire control of the atomic industry in other lands. Paragraph D of the statute's third article was seen as "making sovereignty dependent upon carrying out the provisions of the Agency statute," [99] constituting a violation of the United Nations Charter itself.[100] The Soviets insisted that a danger lies in the fact that whether or not the statute and agreements made in accordance with its provisions have been observed is a question of interpretation. The interpretation may differ widely, according to who is doing the interpreting, and what considerations guide the interpretation. One delegate from the Soviet Union claimed that "there will always be those who are ready to accuse a state of failing to comply with the provisions of the statute or the agreements in order to use this as a pretext to interfere in the internal affairs of that state." According to the Soviet view, there are other means which are quite adequate for bringing pressures to bear on states guilty of violating statute provisions or otherwise failing to carry out their obligations. It was pointed out in this connection that the Agency statute provides sanctions, including withdrawal of Agency assistance from offending states, and expulsion of these states from the Agency.

Raising the question of Agency membership anew, the U.S.S.R. protested the exclusion of "certain states whose sociopolitical structure does not please the Western powers: the German Democratic Republic, the Mongolian People's Republic, the Korean Popular Democratic Republic and the Democratic Republic of Viet Nam." Claiming that the United States could offer no justification for its discriminatory policy, the U.S.S.R. advanced two arguments against the American position. One was that the wording of the statute's fourth article dealing with membership contradicted the second and third articles. The second article spoke of the Agency's efforts to attain a broader and more rapid use of atomic energy for peace, health and welfare throughout the *whole world;* the third article envisaged the Agency's contributions to scientific research in atomic energy, and practical application of atomic energy for peaceful purposes, *over the entire earth.* Such provisions made the Agency's aims and tasks clear to the Soviets: the Agency must be a body open to *all states* desiring to make a contribution to, or to benefit from international atomic cooperation. In other words, the Agency must possess a truly universal character, embracing all states without exception. In the opinion of the U.S.S.R. the dis-

[99] *Id.* at 47.

[100] The Charter provision in question is point 7 of Article 2.

criminatory membership terms contained in the fourth article clearly contradicted such a universal character. The second Soviet argument was based on alleged inconsistencies in the American position. The Soviet representatives stated that originally the United States had no discriminatory policy. It was pointed out that the United States memorandum of March 19, 1954, in which basic principles for a treaty establishing the International Atomic Energy Agency were proposed, declared that "all states signing the treaty" would be Agency members.[101] Furthermore, they alluded to the statement of Secretary Dulles, at the plenary session of the United Nations General Assembly on September 23, 1954, emphasizing the fact that the United States had no intention of excluding any states whatever from participation.[102] It was claimed that it was only in the spring of 1956, at the Washington conference, that the United States "came out against its own idea."

In discussions concerning the composition and powers of the Board of Governors, the U.S.S.R. upheld the view that the General Conference should be the general policy-making body. The Western insistence that the Board of Governors have sufficient powers to make frequent decisions on important matters, without constantly being compelled to turn to the General Conference, was attacked on two grounds. First, it abrogated the principle of the "sovereign equality of all the Agency's members"—the principle that all interested countries should participate in deciding fundamental problems of Agency activity. Secondly, the Western position was *not* based on considerations of expediency in the sense of making rapid, effectual decisions. This, to be sure, was the argument of certain Western powers, but in the Soviet view the real objective was to occupy a dominant position on the Board of Governors and to make the Board independent of the General Conference, where "the distribution of forces might sometimes be unfavorable to the Western powers." [103]

[101] The text of this memorandum may be found in Atoms for Peace Manual 266-269.

[102] *Id.* at 283-285. Secretary Dulles' words were that "I would like to make perfectly clear that our planning excludes no nation from participation in this great venture. As our proposals take shape all nations interested in participation and willing to take on the responsibilities of membership will be welcome to join with us in the planning and execution of this program." The Secretary of State apparently had the U.S.S.R. itself specifically in mind when he made these remarks, for he points out earlier in the address that "to date the Soviet government has shown no willingness to participate in the implementation of President Eisenhower's plan except on this completely unacceptable condition [a prior agreement outlawing nuclear weapons]. Yesterday when it was made known that I would speak on this topic today, the Soviet Union broke a five months' silence by affirming its readiness to talk further. But the note still gave no indication that the USSR had receded from its negative position."

[103] Larin, *supra* note 16 at 55-57.

The Soviet arguments proved somewhat successful on the point because the U.S.S.R. and other opponents of the Western (particularly American) position were able to secure a number of amendments at the New York conference which broadened the powers of the General Conference to a limited extent.[104]

The Agency's inspection and control functions were the most severely criticized by representatives of the Soviet Union who raised a series of objections and consistently used these provisions for attacking the United States. The inspection and control provisions contained in Article XII, first of all, conformed to the terms in the bilateral agreements which the United States had concluded with other countries for assistance in peaceful uses of atomic energy. The terms of inspection and control in these bilateral agreements were not merely denounced as harsh by the Soviets, but they were described as "violations of sovereignty." [105] The United States, however, insisted upon retention of these provisions in the International Atomic Energy Statute. In essence, the American position at conferences for drafting the statute was characterized by the Soviets as follows: "If you wish the United States to make its contribution, do not change these provisions." [106]

What were the motives underlying the American insistence on rigid inspection and control provisions? According to the Soviet view, the United States and "certain other Western powers" hope to occupy a dominant position in the Agency, and once the Agency has acquired broad powers of inspection and control, the Western bloc will be able to use these powers for its own ends: to control the development of atomic industry in lands obtaining assistance from the Agency. The Soviets charged that the Western bloc further was seeking to place under Agency control all bilateral agreements for cooperation in peaceful use of atomic energy without exception, and thus to extend its influence and control to the atomic industries of all lands of the earth. The United States was alleged to be desirous of using the Agency's control powers to hinder free development of atomic energy in other lands, because such development would mean the undermining of American influence there. Furthermore, Soviet representatives stated that the United States was attempting to transform the Agency into an "international policeman," thereby contradicting the entire concept of

[104] *Id.* at 57.

[105] The correspondence between the U.S. and the U.S.S.R. on the question of inspectors and other controls was published in a special supplement to the Soviet periodical New Times, No. 42 (Oct. 11) (1956).

[106] Larin, *supra* note 16 at 60.

international cooperation in atomic energy development on the basis of equality and respect of the sovereign rights of states.[107]

Soviet spokesmen did not deny the necessity of certain specific security measures in the handling of fissionable materials. They claimed, however, that the control mechanism which the United States suggested was worthless. American claims that strict measures were necessary in the interests of peace and security were denoted as "false and hypocritical." The Soviet delegates stated that if the Western powers were sincerely interested in such aims, they would support the Soviet proposal for prohibiting the production, storage, and testing of nuclear weapons and rid humanity of the threat of atomic war. The Soviet view was that only when such prohibition has been effected will strict international control be fully justified; thereafter international control could be extended to all states and could be successfully directed toward the use of nuclear energy for exclusively peaceful purposes if all existing supplies of nuclear weapons were destroyed.

The Soviets argued that the Agency statute provided no controls over the United States, Britain, the U.S.S.R., or other states whose atomic energy development is highly developed because these powers will not be seeking help from the Agency; on the contrary, they will be rendering assistance, through the Agency, to other states. Furthermore, they stated that the Agency can have no control, regardless of strict provisions in its statute, over states possessing adequate technical and material resources for carrying on their own program in peaceful utilization of atomic energy without help from the Agency. If such states were to undertake the costs involved, they would be able to produce nuclear weapons on their own. According to the Soviet view, those nations which are sufficiently developed technologically to carry out their own atomic programs could make use of the Agency's assistance and still manage to evade control by the Agency.[108]

The Soviets concluded with the following line of argument. Those states to whom the control provisions would apply are precisely the states least likely to produce atomic weapons in the first place; namely, the weakly-developed backward states whose need for Agency assistance is the greatest. We are thus confronted with a paradox: those states having no atomic installations or dangerous fissionable materials, and who need help from the Agency, are expected to submit to inspection and control at any time and any place. They can literally take no step

[107] *Id.* at 61.

[108] *Id.* at 63; the author does not elucidate.

in the development of their atomic industry without the Agency's knowledge and permission. On the other hand, such states as the United States, which possess huge supplies of dangerous fissionable materials and are constantly manufacturing atomic and hydrogen bombs, remain completely outside the sphere of Agency control.[109]

In view of their conclusion regarding this paradoxical situation, and because no general agreement has been reached outlawing nuclear weapons, the Soviet Union felt that the promise of recipient states not to use Agency-furnished fissionable materials for military purposes, along with the statute's requirements for accounting and reports, should prove sufficient safeguards. At the New York conference, however, the "unnecessary" inspection and control clauses were adopted. The Soviet proposals, made to "protect the sovereignty of states," found some reflection, however, in the Agency statute to the extent that the Agency cannot make its aid contingent upon political, economic, military, or other conditions which are incompatible with the Agency's rules, and that the Agency's activities with respect of fulfillment of control functions must be agreed upon between the Agency and the recipient states.[110]

Despite its dissatisfaction with many provisions of the International Atomic Energy statute, the Soviet Union was the first great power to ratify the statute, "thereby demonstrating once again its desire for broad international cooperation in promoting peaceful uses of atomic energy." [111] However, the same familiar issues were immediately raised by the Soviet Union at the general conference of the International Atomic Energy Agency in October, 1957. In a telegram to the chairman of the first session, K. Voroshilov (Chairman of the U.S.S.R. Supreme Soviet Presidium) declared that the Soviet Union attached great significance to the new international organization and had taken an active part in its creation, seeking to "ensure for it the most democratic character possible, and to ensure the broad participation and equal treatment of all countries participating in its work." He reminded the conference delegates that the U.S.S.R. had been the first great power to ratify the Agency's statute. He repeated the plea for an international agreement prohibiting atomic and hydrogen weapons and stressed that the Soviet Union was ready to conclude such an agreement. "How-

[110] Article III.

[111] Larin, "Atoms for Peace and Progress," New Times, No. 8 (Feb. 21) 11 (1957). For decree of U.S.S.R. Supreme Soviet Presidium, ratifying the statute, and dated Feb. 9, 1957, see Vedomosti Verkhovnogo Soveta SSSR, Mar. 8, 1957, at 163.

ever, the Soviet Union's proposals to prohibit atomic and hydrogen weapons have unfortunately not met with support from the Western powers." [112] The U.S.S.R. and Czechoslovakia renewed their efforts to admit Communist China into the Agency,[113] and the Soviet embassy in Washington dispatched a note to the U. S. State Department insisting that the "Kuomintang (Nationalist China) has no right to represent China in the International Atomic Energy Agency. The Soviet Union again reaffirms its position and declares that it does not recognize the legality either of the Kuomintang's signature on the statute nor the Kuomintang's ratification of this Statute, since it does not represent China." [114]

So far, according to Soviet sources, the tone of the general conference had been "normal" and "business-like." But suddenly an attempt was made to "poison the atmosphere and bring back the cold war spirit," when the United States delegation, "for no apparent reason," introduced a resolution questioning the authority of the delegation representing the Hungarian People's Republic. "Of course, the American delegate was unable to provide any reasonable explanation of this provocatory resolution." The Soviets also expressed strong disapproval of the American insistence on procedures "which have become standard for the United Nations and other international organs" because these procedures blocked a proposal to exclude Nationalist China and prevent the admission of Communist China into the Agency. In general, the United States opposed Soviet proposals, which flowed from "the principle of the Agency's universality" (the apparent exception from this "universality" was Nationalist China), and the Soviet "efforts to create a healthy setting for the Agency's practical activity." The Soviet Union's spirit of cooperation and good will was claimed to have been shown in the appointment of the Agency's General Director. Although the U.S.S.R. would have preferred a representative of a "neutral state" for this post, the U. S. A. "stubbornly insisted" that Sterling Cole be named director, and the Soviet delegation "refrained from objecting" to Cole's candidacy.[115]

The "bourgeois press" made a great deal of the American offer "to supply Uranium 235 on a commercial basis." Some Western newspapers went so far as to proclaim the Agency an "enterprise subsidized

[112] The text of this telegram was published in Pravda, Oct. 2, 1957, p. 2.
[113] N.Y. Times, Oct. 3, 1957, p. 4.
[114] Pravda, Oct. 4, 1957, p. 5.
[115] Izvestiya, Oct. 10, 1957, p. 4.

by America," but all these "fantasies died a quick death" on October 10, 1957, when V. S. Emelianov, the Soviet representative, gave a speech outlining the U.S.S.R.'s aid program. This program included placing fifty kilograms of enriched uranium at the disposal of the Agency.[116] While recognizing the importance of supplying the Agency with an adequate amount of fissionable material, the U.S.S.R. claimed that the more urgent problem was how to utilize the material. The heart of the problem lay in training national cadres of scientists and specialists in underdeveloped countries. Thus a particularly strong impression was created when the Soviet delegate spoke of the Soviet Union's readiness to offer Agency member-states assistance in training scientific cadres in the technology necessary for manufacturing heat-generating elements for reactors. The U.S.S.R. was ready to take fifty or one hundred students from member-states to study in Soviet institutes of higher learning and to grant fifty scholarships to students from underdeveloped countries. It was moreover prepared to train specialists from member-states in the use of radioactive isotopes in science, industry, medicine, and agriculture. It would also be willing to design the atomic power and experimental projects and installations which were to be built by the Agency in prospecting for uranium and in mining uranium deposits. The Soviet account also stated that the American, British and French delegates made a "general statement that they were prepared to share their own atomic knowledge and experience with the Agency. Unfortunately, they did not specify any concrete form in which this aid might be rendered." [117]

The specter of American domination was raised again at this time. Far from having any desire to help underdeveloped countries in the peaceful use of atomic energy, the United States (according to the Soviet account) is interested only in using the Agency to control the work which scientists of other states are doing in the field. "These

[116] Izvestiya, Oct. 18, 1957, p. 4. This report fails to mention Sterling Cole's expressed hope that the Soviet Union would increase its contribution to the Agency's stocks of fissionable material. The Soviet contribution was only a hundredth of the pledge made by President Eisenhower; N.Y. Times, Oct. 17, 1957, p. 11. Here again the Yugoslav position is worth noting. With reference to Eisenhower's promise of 5,000 kilograms of uranium 235, a Yugoslav writer notes that this offer "has enabled the Agency to take steps for atomic research and for the realization of energy programs without delay." Arnejc, "Positive Prospects," 7 Review of International Affairs, No. 158 (Nov.) 9 (1956).

[117] Izvestiya, Oct. 18, 1957, p. 4. Another statement that the U.S.S.R. regards the Agency's chief aim to be in creating "national cadres of specialists and local production bases in underdeveloped lands" may be found in a short article by Podkliuchnikov, Pravda, Oct, 1957, p. 4.

motives, in particular, explain why the American delegation spent its whole effort in getting Sterling Cole, former chairman of the U. S. Congress' joint committee for atomic energy, appointed as the Director-General of the Agency." It was no accident that the United States had "no concrete proposals for rendering aid to underdeveloped countries through the International Atomic Energy Agency." The "ruling circles of the United States" want the Agency to be their subservient organ so that the United States may control every step of the Agency's members.[118]

In April, 1958 Sterling Cole received three letters from L. M. Zamyatin, U.S.S.R. Deputy Permanent Representative to the International Atomic Energy Agency. The first of the letters contained the information that the Soviet Union would appoint twenty to thirty advisers and consultants for temporary aid to Agency member-states and that the Soviet government would bear all expenses connected with the assignments of these specialists, who were to be sent by the Agency to various countries to assist in setting up national scientific and technical programs for the peaceful use of atomic energy. The other letters stated that the U.S.S.R. was prepared to accept forty to forty-five students in the academic year of 1958-59 for a period of from five to six years of instruction in basic atomic specialties. The Soviet government would assume the maintenance and tuition costs for twenty-five of these students. In addition, the Soviet Union would be willing to accept fifty scientists and specialists from Agency member-states for three-to-six-months "refresher courses" with the Soviet government bearing the expenses of twenty of these specialists.[119]

Such have been the views, as presented to the reader of Soviet publications, of the International Atomic Energy Agency, some of the provisions of its statute, and the role played by various states in the Agency. These published views appear to bear out a remark made by John Foster Dulles (in the early stages of negotiations for creating the Agency) that "negotiations publicly conducted with the Soviet Union tend to become propaganda contests." [120] American readers will quickly recognize the extent to which the United States' role in the Agency has been distorted and may be puzzled by certain inconsistencies in the Communists' own position. The active Soviet role in international cooperation for peaceful uses of atomic energy is stressed, and one is

[118] Podkliuchnikov, *supra* note 117.
[119] Pravda, April 4, 1958, p. 5.
[120] Atoms for Peace Manual 283.

repeatedly reminded that the U.S.S.R. was the first major power to ratify the Agency statute, despite the Soviet Union's originally negative attitude toward the project of such an Agency.[121] Voroshilov's telegram in 1957 described the U.S.S.R. as a "disinterested member" and claimed that the Soviet Union was striving for the greatest degree of international cooperation, employing a completely objective and harmonious approach to the Agency and its operations, yet almost in the next breath he expressed satisfaction that the Agency's headquarters were in a "neutral state" (Austria).[122] In bemoaning the election of an American rather than some "representative of a neutral state" to the post of Director-General, the Soviet press makes it clear that, come what may, America remains in the "enemy camp." [123]

There is more political expediency than logical consistency in the Soviet view on the Agency's relations to the United Nations. On one hand, the U.S.S.R. has always insisted that the Agency be within the framework of the United Nations and strictly accountable to it, and Soviet jurists have defined the Agency's ties to the United Nations as considerably closer than those of the specialized agencies to the United Nations.[124] On the other hand, the Soviets have denounced American insistence on following United Nations procedures [125] and have insisted that the statute's membership provisions are discriminatory and unacceptable because they exclude states not members of the United Nations. Whereas the U.S.S.R. at one time called for a strong control mechanism, with inspectors investigating atomic installations of recipient states,[126] it became satisfied with minimum safeguards, (excluding inspection or control within the recipient state), ostensibly because inspection and control provisions make no sense in the absence of an over-all prohibition of nuclear weapons and because such provisions would result in violations of the recipient states' sovereignty by the United States (not the U.S.S.R.).

Early in 1958 the United States proposed international inspection teams to implement a general agreement to outlaw nuclear weapons—the very type of agreement which the Soviets have constantly advocated. The American position was that no agreement to outlaw nu-

[126] Dept. of State Press Release No. 527, Oct. 6, 1956, p. 23; see Bechhoefer and Stein, *supra* at note 77.

clear weapons could have meaning without concrete implementation of this type.[127] The initial Soviet response was disappointing,[128] but U. S. officials later saw hopes that an accord might be reached.[129] It remains to be seen whether the U.S.S.R. will agree to effective measures implementing a general agreement to ban nuclear weapons,[130] and how such an agreement will affect the Soviet attitude towards the International Atomic Energy Agency and other forms of international cooperation for peaceful use of atomic energy.

D. Bilateral Agreements on the Peaceful Use of Atomic Energy in the Communist Bloc

Primary sources for studying bilateral agreements pertaining to the peaceful use of atomic energy within the Communist bloc are meager. The Soviet press periodically reports such agreements between the U.S.S.R. and other states, and the Soviet government has published a number of "joint declarations" concerning its negotiations with other states for cooperation in peaceful utilization of atomic energy. Passing references are made to bilateral agreements between other Communist states,[131] but so far the actual texts of bilateral agreements in the Communist bloc have not been made public. The testimony of former citizens of the Communist states who have defected to the West has provided some additional information not found in Communist-bloc publications, but it is apt to be heavily biased and must be read with caution.

According to some reports, the U.S.S.R. has been furnishing radioactive isotopes to Communist-bloc states since 1951 and was approached by China with a request for assistance in constructing atomic laboratories in March, 1954.[132] It was not until January, 1955, however,

[127] The text of Eisenhower's arms inspection proposal was published in the N.Y. Times, April 8, 1958, p. 10. For concrete data on the proposed inspection teams, see N.Y. Times, April 16, 1958, p. 9.

[128] The text of Khrushchev's reply was published in Pravda and Izvestiya, April 24, 1958, p. 2.

[129] N.Y. Times, May 12, 1958, p. 1; June 3, 1958, p. 1 and June 10, 1958, p. 1.

[130] It has been suggested that the Soviet Union would enjoy important strategic advantages if all nations stopped testing nuclear weapons without guarantees of real world-wide disarmament; Kissinger, "Missiles and the Western Alliance," 36 Foreign Affairs, No. 3 (April) 383-401 (1958) and Sulzberger, "Nuclear Tests and Soviet Strategy," N.Y. Times, April 9, 1958, p. 32.

[131] See, for example, Wspolpraca ze wszystskimi narodami, I Polska, No. 41, 6-7 (1958) and N.Y. Times, June 2, 1958, p. 10, for references to bilateral agreements between Poland and Yugoslavia and Poland and East Germany.

[132] Huber, *supra* note 75 at 41.

that the Soviet Union embarked on a vast program of extending scientific, technical, and industrial aid to other states for the establishment of "experimental scientific centers to develop atomic energy for peaceful purposes." In the original announcement of this program,[133] the Soviet government promised five states—China, Poland, Czechoslovakia, Rumania, and East Germany—that it would aid them in designing and supplying equipment for the construction of "experimental atomic piles," with a capacity of up to five thousand kilowatts, and for the construction of accelerators of elementary particles.[134] The U.S.S.R. was to furnish these five countries with necessary quantities of fissionable materials for their atomic piles and scientific research work. Means of extending the number of countries to be aided were considered. Recipient states were to supply "appropriate raw materials" to the U.S.S.R. in return for Soviet aid.

This program was inaugurated very rapidly. At the beginning of March, 1955 a Czech government committee for research and use of atomic energy for peaceful purposes met to discuss problems of carrying out the Soviet proposals.[135] By early June bilateral agreements had been drafted and signed with the five states named in the original Council of Ministers announcement, and similar aid was promised to Hungary and Bulgaria in the near future.[136] Agreements to aid Hungary and Bulgaria were reported a week later.[137]

Although the texts of these bilateral agreements have not been published, their main features have been summarized in the Soviet press.[138] The Soviet Union was to supply the other states with experimental reactors and accelerators designed in the U.S.S.R. and to provide free scientific and technical documentation concerning them, as well as assigning Soviet specialists to aid in assembling and placing

[133] This announcement appeared on the front page of both Pravda and Izvestiya on Jan. 18, 1955, the day after its issuance by the Council of Ministers.

[134] Some revision in these figures was supplied in a report in Pravda, Aug. 29, 1955, which stated that Poland, Czechoslovakia, Rumania, Hungary and the German Democratic Republic would have reactors with a capacity of 2000 kilowatts and cyclotrons with up to 25 million electron volts of energy. China, on the other hand, was to acquire a similar cyclotron, but a reactor of 6500 kilowatts thermal capacity. A United Press dispatch from Tokyo on Mar. 7, 1958, announced the completiton of a 7000 kilowatt reactor "with Soviet assistance."

[135] Pravda, Mar. 12, 1955, p. 2.

[136] Pravda, April 30, 1955, p. 2.

[137] Pravda, June 15, 1955, p. 2.

[138] Pavda, April 30, 1955, p. 2. This issue summarized the agreements with China, Czechoslovakia, Poland, Rumania, and East Germany, stating that similar agreements would be concluded with Hungary and Bulgaria.

them in operation. The Soviet Union was to make available to these states the necessary amount of fissionable and other materials, and the U.S.S.R. was to deliver necessary amounts of radioactive isotopes until the experimental reactors went into operation. The agreements further declared that scientists and engineers from these states would receive training in the Soviet Union in nuclear physics, radiochemistry, use of isotopes, and reactor technology.

By mid-July of 1955, top-ranking scientists of Poland, Czechoslovakia, and East Germany were referring gratefully to the atomic "assistance agreements" between their states and the U.S.S.R., and it was reported that Poland and Czechoslovakia were reorganizing their over-all atomic energy programs (combining existing laboratories into single research institutes and establishing national committees to coordinate their research efforts) in order to take full advantage of Soviet aid.[139]

A Soviet-Yugoslav protocol on economic and scientific-technical cooperation was signed in Moscow on September 1, 1955. On January 28, 1956, a Soviet-Yugoslav Agreement on Cooperation in the Use of Atomic Energy for Peaceful Purposes was signed in Belgrade.[140] This agreement provided for "general cooperation and experimental exchange in the field of atomic energy" and for Soviet scientific and technical aid in constructing a reactor for Yugoslavia. The type of reactor was to be based on the Yugoslav program and specifications. The Soviet Union promised to supply the equipment and nuclear fuel necessary to ensure the uninterrupted operation of the reactor. Prices for materials and nuclear fuel were to be set according to "prices in the world market." In addition to the agreement itself, supplementary protocols setting forth "technical and commercial details" were to be signed.[141]

[139] See New Times, No. 30 (July 21) 13-14 (1955).

[140] Pravda, Jan. 29, 1956, p. 6. According to Huber, this agreement would have been concluded in 1955, but Yugoslavia was bound under an agreement with the World Bank not to accept new credits until the end of 1955; Huber, *supra* note 75 at 53.

[141] Talks were held in Belgrade during practically the entire month of May, 1956, to "implement" the January agreement; Izvestiya, May 27, 1956, p. 3. The Soviet press reported early in 1957, in a very brief communique, that a new protocol to the agreement of Jan. 28, 1956, had been signed, providing for further cooperation between Soviet and Yugoslav organizations and scientific institutes in the field of nuclear physics research and use of atomic energy for peaceful purposes. In the words of the communique, "the negotiations took place in a spirit of mutual understanding and desire to cooperate further in this field"; Izvestiya, Feb. 13, 1957, p. 12. A United Press dispatch of April 30, 1958, quoted Tanjug, the official Yugoslav news agency, to the effect that Yugoslav scientists had successfully tested a nuclear reactor and that the reactor would go into

In 1956 the Joint Nuclear Research Institute was also organized. The Institute has figured prominently in some of the later "joint declarations" between the Soviet Union and individual Communist states. Four states which are members of the Institute (Albania,[142] North Korea, Viet Nam, and Mongolia) have not yet concluded bilateral agreements with the U.S.S.R. A possible explanation is that these states lack the necessary technical personnel.

An agreement between the Soviet Union and Egypt for cooperation in the peaceful use of atomic energy was signed in Cairo on July 12, 1956. Its terms appear to be very similar to those of the bilaterals concluded between the U.S.S.R. and states in the Communist bloc.[143]

Later in July a "statement of the results of negotiations between government delegations of the Soviet Union and the German Democratic Republic" reported a new bilateral agreement. The statement limited itself to a description of the benefits which East Germany was to enjoy under the agreement; no terms favorable to the U.S.S.R. (for example, shipment of East German uranium ore to the Soviet Union) were listed. The U.S.S.R. was to assist in designing an East German atomic power plant with a capacity of up to 100,000 kilowatts, and the Soviet government undertook to supply the German Democratic Republic with the necessary equipment and materials.[144]

In a general agreement between the U.S.S.R. and Indonesia, signed on September 15, 1956, the parties agreed, *inter alia,* to cooperate in

operation in early May, 1958. It remains to be seen what effect the ideological conflict between Yugoslavia and the U.S.S.R. which was resumed in 1958, will have on Soviet atomic assistance to Yugoslavia.

[142] The Joint Soviet-Albanian Declaration of April 17, 1957, contains a single sentence on the subject: "The parties have discussed cooperation in peaceful uses of atomic energy"; New Times No. 17 (April 25) 38 (1957).

[143] Pravda, July 15, 1956, p. 5.

[144] Pravda, July 18, 1956, p. 4. A joint statement over the signatures of Bulganin and Grotewohl in January, 1957, restricted itself to remarks on the desirability of a "general European organization for the peaceful application of atomic energy, which both parties ardently support," and concluding that "utilization of atomic energy for peaceful purposes would bring the European working people higher living standards." New Times, No. 3 (Jan. 17) 36 (1957). For a description of the administration of East Germany's atomic energy program, see Huber, *supra* note 75 at 44-46. Pravda for Mar. 15, 1957, p. 6, reported negotiations between Soviet and East German delegations on payments for the products of the Wismuth Aktiengesellschaft (a Soviet-controlled corporation which administers uranium mining in East Germany), but the report was couched in such general terms that it adds nothing to our knowledge of Soviet-East German relations in the atomic energy field. Construction on East Germany's first atomic power station started on October 8, 1957. New Times, No. 42 (Oct. 17) 32 (1957).

peaceful uses of atomic energy, particularly in the use of radioactive isotopes in medicine, science, and technology, and in the training of Indonesian specialists in the use of atomic energy.[145]

Shortly after the Polish unrest and the Hungarian uprising of late 1956, a series of "joint declarations" between the U.S.S.R. and other Communist states were published. Some analysts believe that the Soviet Union was induced by the events in Poland and Hungary to make concessions (including concessions in the field of atomic energy) which were reflected in these declarations.[146] The declarations were extremely broad in scope, and several of them touched upon the question of cooperation in peaceful uses of atomic energy. Those involving Czechoslovakia, Bulgaria, and Hungary deserve particular attention.

In the Joint Soviet-Czechoslovak Declaration of January 29, 1957, the two governments agreed that the Czechoslovak Republic would continue to supply uranium ore to the Soviet Union. The declaration emphasized that Czech uranium ore was being sold to the U.S.S.R. at a "fair and mutually-advantageous price which makes possible the continued development of mining and refining of this raw material." The Soviet Union undertook to provide Czechoslovakia with the necessary assistance for the construction of an atomic power plant and a nuclear physics institute. It promised close cooperation with Czechoslovakia in problems of peaceful application of atomic energy. The declaration concluded with references to the two countries' active part in the work of the Joint Nuclear Research Institute.[147] It contained one other important statement which will be discussed later in a different context.

[145] Izvestiya, Sept. 18, 1956, p. 1. See N.Y. Times, Jan. 16, 1958, p. 53, for Indonesian plans to earmark special funds to finance the Soviet aid program.

[146] According to Soviet sources themselves, these bilateral talks were based on a Soviet government declaration issued on October 30, 1956, "On the Principles of Development and Further Strengthening of Friendship and Cooperation between the Soviet Union and Other Socialist States"; Pravda, July 14, 1957, p. 5.

[147] New Times, No. 6 (Feb. 7) 42 (1957). The Czech government committee for research and use of atomic energy for peaceful purposes met early in March, 1955, to discuss problems concerning the Soviet government's proposal to grant Czechoslovakia scientific, technical and production assistance in setting up scientific bases for developing research in nuclear physics and the peaceful use of atomic energy; Pravda, Mar. 12, 1955, p. 3. A national committee for the study of peaceful uses of atomic energy was established shortly afterwards, to "coordinate research effort," and it was hoped that the Soviet-built reactor and cyclotron would be in operation before the end of 1956; New Times, No. 30 (July 21) 14 (1955). (According to later reports, the first Czech atomic reactor started operations on Sept. 25, 1957: Pravda, Sept. 26, 1957, p. 3). According to a former member of the Ministry of Foreign Affairs in Prague, a Czech-Soviet treaty was concluded in 1945 (but kept secret until late in 1947) in which Czechoslovakia agreed to deliver its entire stock of uranium ore, and its

In respect to the declaration on negotiations between the governments of the U.S.S.R. and Bulgaria, it was announced that "together with the other Socialist countries, Bulgaria will take an active part in the work of the Joint Nuclear Research Institute, both in theoretical research and experimentation." It was further agreed that the Bulgarian People's Republic would continue to supply the Soviet Union with uranium ore "at a fair and mutually advantageous price that will enable the further development of the mining of uranium ore." [148]

Bulganin and Kadar signed a "Declaration of the Governments of the Soviet Union and Hungarian People's Republic" on March 28, 1957. This declaration listed four points of cooperation between the U.S.S.R. and Hungary in the peaceful utilization of atomic energy. First, both states would continue to participate in the work of the Joint Nuclear Research Institute. Second, the Soviet Union would continue to render Hungary economic and technical assistance in the geological survey of uranium deposits and to supply equipment and instruments. Third, the U.S.S.R. would aid Hungary in constructing atomic power plants and in obtaining fissionable material necessary for their operation. Fourth, after "reorganization of the mining of uranium ore," Hungary would sell the Soviet Union surplus ore "not required by her own economy" at a "fair and mutually advantageous price." [149]

---

entire production thereof, to the Soviet Union. Mining and shipping of uranium were to be under Soviet direction. The terms of payment were left undefined, the treaty stating simply that Soviet payments would be based on "expenses incurred in mining the ore." Since vast quantities of ore were already on the surface, in pit heaps, these "expenses" amounted to very little. It would have been far more to Czechoslovakia's advantage to sell the ore at world market prices. The Czechs were obliged to supply capital for new investments, which were made on an enormous scale. The Soviet demands became so "cynical and ruthless," however, that finally the Czech Communist premier (Gottwald) had to dispatch an envoy to Moscow to try to negotiate more favorable terms. The Russians finally consented to appraise the pit heaps on the basis of the market price of uranium and to refund investments financed by Czechoslovakia. Kasparek, "Soviet Russia and Czechoslovakia's Uranium," 10 Russian Review, No. 4 (Oct.) 97-105 (1951).

[148] New Times, No. 9 (Feb. 28) 37 (1957). Bulgaria's copper, mica and important uranium mines are operated by *Gorubso,* a joint Soviet-Bulgarian corporation; Levitsky, "The Soviet Union and Satellite Uranium," IV Bulletin of the Institute for the Study of the U.S.S.R., No. 2 (Feb.) 39 (1957).

[149] New Times, No. 14 (Apr. 14) Supplement, p. 8 (1957). The formation of an "All-Hungarian Atomic Energy Committee" was reported in early 1956; Pravda, Jan. 22, 1956, p. 5. But all was apparently not well. The Hungarian scientist Lajos Janosi (the same Lajos Janosi whose enthusiastic approval of locating the Joint Nuclear Research Institute was cited earlier in this paper) reportedly complained in November, 1956, that the Soviet authorities had zealously guarded everything connected with uranium and had kept the Hungarian experts—including himself (he was

The Soviet Union's joint declarations with Poland and Rumania contained no clauses on cooperation in peaceful utilization of atomic energy although both those countries are known to possess uranium deposits. It has been reported that Gomulka brought up the question of Polish uranium mines when in Moscow in late 1956, and Poland may have received Soviet agreement on a similar arrangement to that which the U.S.S.R. has worked out with Czechoslovakia and East Germany.[150] But the Joint Statement on Soviet-Polish Talks, signed by Khrushchev, Bulganin, Gomulka, and Cyrankiewicz in Moscow on November 18, 1956, made no mention of atomic energy.[151] The Soviet press reported that a reactor was commissioned in Rumania in early August of 1957,[152] but little else is known about Rumanian-Soviet relations in this area. According to one source, Soviet geologists discovered important uranium deposits in Rumania several years ago and established a corporation (*Sovromquartz*) in charge of uranium mining and export. This same source cites a Soviet-Rumanian agreement of October 22, 1956, under which the Rumanians acquired the right to buy up the Soviet share in this corporation "under advantageous conditions." [153] G. Ionescu, an anti-communist Rumanian economist, claims that *Sovromquartz* was working exclusively on Soviet army requirements and not on peaceful uses of atomic energy.[154] Nothing pertaining to peaceful uses of atomic energy was to be found in the Statement on Soviet-Rumanian Negotiations signed by Bulganin and Stoica on December 3, 1956.[155]

Vice-Chairman of the "All-Hungarian Atomic Energy Committee")—completely in the dark; See Stolte, "Moscow's Current Hungarian Policy," IV Bulletin of the Institute for the Study of the U.S.S.R., No. 7 (July) 27 (1957) and sources therein cited. A former Soviet economist has summarized the role which the issue of Hungarian uranium-mine control played in that country's tragic uprising in 1956. He reports that the uranium mines had been controlled by the Soviet Union since the end of the second World War, in accordance with a secret treaty which gave the U.S.S.R. the exclusive rights to Hungarian uranium for twenty-five years without compensation. When the Hungarian revolt broke out, the revolutionaries demanded that the terms of the secret agreement be made public and that the mines be returned to Hungary Failing this, they threatened to seize the mines by force, and as the revolution progressed the mines were so badly damaged that Hungarian uranium production came to a standstill. In early 1957, Kadar announced that the Soviet-Hungarian uranium agreement would be 'reexamined"; Levitsky, *supra* note 148 at 40-41, and sources therein cited. The declaration we have quoted followed soon thereafter.

[155] New Times, No. 50 (Dec. 6) Documents, pp. 1-4 (1956).

An agreement for Soviet assistance to Poland in the peaceful uses of atomic energy was signed on January 22, 1958. The account of negotiations preceding the agreement discloses that both sides "discussed" a number of problems of technical assistance, including: the construction and equipping of a second experimental reactor in Poland; the design and construction of Poland's first atomic-powered electric plant; problems of uranium prospecting, mining and processing; the organization of Polish production of equipment and apparatus necessary for experimental work and equipment of nuclear physics and chemistry laboratories; further development of research and preparation of specialist cadres for peaceful utilization of atomic energy; and the organization of work in radiology. Technical assistance was to be carried out by: transmission of specialized literature and technical documents; delivery of special materials and equipment for nuclear physics and chemistry laboratories and also of equipment and apparatus which could not be produced by Polish industry; the assignment of Soviet specialists to Poland for advising and consulting; the training of Polish specialists in technology and production methods in the Soviet Union; education of Polish students in Soviet institutions of higher learning; and the assignment of teachers from Soviet institutions of higher learning to Poland for lecturing and consultation. The Soviet technical assistance to Poland was to be paid for according to the terms of a trade agreement which had been concluded earlier between the two countries.[156] The Polish delegation visited the Joint Nuclear Research Institute after the signing of the agreement, and V. Billig (the head of the Polish delegation) declared there that this new agreement, along with Polish participation in the Institute "in which the number of Polish associates is increasing," gave Poland a "firm basis for further successful solution of our problems in the field of peaceful utilization of atomic energy." [157]

As in other areas of international cooperation in the peaceful uses of atomic energy, Soviet writers have contrasted the activities of the U.S.S.R. and the Western powers in the field of atomic bilateral agreements. The American and British agreements with other lands have been denounced as "incompatible with the principles of sovereignty and

[156] Pravda, Jan. 23, 1958, p. 4. Poland's first nuclear reactor went into operation on June 14, 1958. It will be used in research work in medicine, physics, chemistry and biology and will produce isotopes of iodine, gold, coal and cobalt. Most of the equipment was purchased from the U.S.S.R., but Poles did most of the assembly work. The Poles report plans for another, larger nuclear plant which they hope to build themselves. N.Y. Times, June 16, 1958, p. 9.

[157] Pravda, Jan. 28, 1958, p. 6.

equality of states' rights"; the "ruling circles of imperialist states," writes one Soviet jurist, "seek to use such bilateral agreements to dictate their will to the other contracting parties, to seize sources of atomic raw-material and to interfere in the internal affairs of those states. The aid which the Soviet Union, on the other hand, is rendering through its bilateral agreements is in full harmony with the principles of the United Nations Charter, being based on complete equality of rights between states. It is not accompanied by any political, economic or military conditions whatsoever which would in any degree affect the independence of states." [158] The jurist also emphasized that although it had cost the U.S.S.R. vast sums to develop and construct atomic reactors and accelerators, the necessary scientific and technical documentation and experience was furnished other lands free of charge. The aided countries pay only the actual costs of making the equipment which is to be delivered to them.[159]

We are handicapped through our lack of the texts of the bilateral agreements. Although they are said to be "in full harmony with the principles of the United Nations," they have not yet been registered with the United Nations. It appears beyond question, however, that the agreements serve important political and diplomatic purposes. The timing of the U.S.S.R. Council of Ministers' first announcement on the atomic aid program, for example, is highly significant. This announcement, described earlier, was published on January 18, 1955, at the very moment when a United Nations consultative committee was meeting in New York to prepare for the International Conference on Peaceful Uses of Atomic Energy. On the day following the Council of Ministers' announcement, Pravda carried a front-page editorial contrasting the "two policies and two paths" followed by the Soviet Union and the West in using atomic energy. The editorial repeated some of the Soviet views on Eisenhower's proposal of December, 1953, which were discussed in connection with the International Atomic Energy Agency, and then added:

> It must be clear to everyone that two policies and two paths arose long ago concerning the use of atomic energy. The

[158] See Malinin, *supra* note 16 at 122-123, referring to U.S. treaties (with Turkey, South Korea and Latin American states) and the British treaty with Germany. A particularly violent attack on U.S. bilateral agreements with other states was made in connection with the U.S.-Swiss agreement of June 21, 1956. In an article appearing in Izvestiya, Sept. 4, 1956, p. 4, it was claimed that the terms of this treaty gave the United States the right to control the activity of all Swiss scientific institutes and enterprises which were to receive American supplies and information.

[159] Larin, *supra* note 16 at 8.

> Soviet Union is struggling consistently to free mankind forever from the danger of war and to pave the way for the most extensive peaceful use of atomic energy. In contrast to the American government, which prefers to make *verbal statements* on the peaceful use of atomic energy and *in practice* to prepare for atomic war, the Soviet government is furthering by concrete practical measures the use of atomic energy for peaceful purposes.

Subsequent events have made it difficult to agree with this important editorial. It seems more likely that the Soviet Union, far from feeling genuine contempt for America's "verbal statements" on the peaceful uses of atomic energy, had become alarmed at the progress of the American aid program and negotiations for creating the International Atomic Energy Agency. It may have felt impelled to launch its atomic aid program and to include as many states in this program as possible before the American aid program had progressed further and the International Atomic Energy Agency could start operations. Bilateral agreements with Communist states were quickly concluded. The Joint Nuclear Research Institute was created. Atomic aid treaties were made with the important "uncommitted" countries of Egypt and Indonesia. Libya and Sweden received Soviet offers of assistance. An offer was made to India, but that state concluded a treaty with Great Britain three weeks after the Soviet offer.[160] According to E. P. Slavskii, then Director of the Chief Atomic Administration of the U.S.S.R., an agreement could have been reached between the Soviet Union and Switzerland "had the latter referred this question to us." [161]

The political and diplomatic aspects of atomic energy negotiations and agreements were likewise apparent in the various "joint declarations" made in late 1956 and early 1957. Cooperation in peaceful use of atomic energy was merely one of many points covered in these declarations. All of them stressed the solidarity and "everlasting friendship" of states in the "socialist camp"; they uniformly condemned the United States and Western "warmongers" and went to great lengths to justify Soviet actions during the revolt in Hungary.

The U.S.S.R. has constantly emphasized the peaceful purposes of its atomic aid program. Some observers, however, might wonder whether the Soviet aid program has exclusively peaceful uses of atomic energy in mind. Two days after announcing the atomic aid program, the

[160] Huber, *supra* note 75 at 55-56.
[161] Pravda, Sept. 7, 1956, p. 2.

Soviet press explained why the U.S.S.R. had been engaged in producing atomic and hydrogen bombs:

> Although the Soviet Union has had to produce atomic and hydrogen weapons in order to defend the peaceful life and labor of its peoples, Soviet scientists and engineers have been working persistently and purposefully to utilize atomic energy for peaceful purposes.[162]

Some of the raw materials for these bombs doubtless comes to the U.S.S.R. from states with which it has concluded pacts for cooperation in the "peaceful" uses of atomic energy. In the words of the Joint Soviet-Czechoslovak declaration of January 29, 1957:

> The parties declare that the Czechoslovak uranium ore is being sold to the Soviet Union at a fair and mutually-advantageous price which makes possible the continued development of mining and refining of this raw material. *But it is not only a matter of economic advantage. The Czechoslovak people fully realize that in the hands of the Soviet Union nuclear energy is a powerful instrument of the peace and security of nations against the atomic threats and provocations of the international forces of aggression.*[163]

Such a declaration as this adds new significance to the Soviet program of atomic assistance to other countries, at least those countries which are loyal "satellites" within the Communist bloc. From the "joint declarations" on this program, and from the little that has been published concerning the bilateral agreements which implement it, one can say that it embraces frankly political and diplomatic aims, as well as economic and technological ones. The Joint Soviet-Czech declaration appears quite clearly to show that the Soviet aid program for "peaceful" use of atomic energy has important military objectives as well.

Appendix A

ITEM 1

Brief Summary of Negotiations for the International Atomic Energy Agency

1. First Phase of Diplomatic Correspondence Between the United States and the Soviet Union

The first outline of a statute for an agency of the kind envisaged in President Eisenhower's proposal of December 8, 1953, was contained in a United States Department of State memorandum handed to Soviet Ambassador Zarubin on March 19, 1954. This memorandum is the first in a series of six documents representing the first phase of the correspondence between the United States and the Soviet Union, covering the period from March 19 to September 23, 1954. For the text of these documents see Atoms for Peace Manual, note 5 *supra* at 266-283; also U. N. General Assembly Off. Rec., 9th Session (1954), Annexes, Agenda Item 67, p. 4 (Doc. A/2738). The outline already contained many features of the Agency in its present form. In its reply the Soviet Union claimed that the United States memorandum evaded the problem of nuclear weapons and would tend to intensify the atomic armament race. Soviet Union Aide-Memoire of April 27, 1954, in Atoms for Peace Manual, note 5 *supra*, 269 at 271-272. Later on, however, the Soviet Union indicated its willingness to separate the issues of disarmament and peaceful uses of atomic energy. Soviet Union Aide-Memoire of September 22, 1954, *id.* at 278 *et seq.*

2. Negotiations of Eight States

Ambassador Morehead Patterson, U. S. representative in the original negotiating group consisting of Australia, Belgium, Canada, France, Portugal, the Union of South Africa, the United States, and the United Kingdom, describes the development that followed the discussion in the 9th General Assembly in the fall of 1954: "The United States prepared a first draft of the Statute taking into consideration suggestions received from other negotiating States and also from the United Nations General Assembly debates. This draft was then submitted to the negotiating States on March 29, 1955. During April and May the United States discussed this draft with all the negotiating States and also received further comments from interested agencies of the United States Government which had not participated in the original drafting.

"After a thorough discussion, it developed that there was sufficient

unanimity among all negotiating states so that substantially all of the suggested changes could be reconciled and incorporated into a new draft of the Statute. This new draft was transmitted to the Soviet Union on a confidential basis on July 29, 1955, and its comments were requested. It was distributed by the United States on behalf of the negotiating States, also on a confidential basis, to all eighty-four States Members of the United Nations or of the specialized agencies on August 22, 1955. Comments on the Statute were requested from all States." Report of Ambassador Morehead Patterson, 34 Dept. of State Bul. 5 at 6 (1956).

3. Discussion in the Ninth General Assembly

The question of the Agency came up for the first time for general international discussion in the 9th General Assembly. (See U. N. General Assembly Off. Rec., 9th Session (1954), Plenary Meetings, A/PV. 475, p. 17 at 25, A/PV. 478, p. 63 at 66, A/PV. 503, p. 339 at 339-349; First Committee, A/C. 1/SR. 707-725, pp. 289-387, Annexes, Agenda Item 67.) The debates there led to the unanimous adoption of a draft resolution which referred to ". . . negotiations . . . in progress . . . for the establishment of an International Atomic Energy Agency . . .," expressed the hope that ". . . the International Agency will be established without delay . . .," and suggested that ". . . once the Agency is established, it negotiate an appropriate form of agreement with the United Nations . . .," and that ". . . Members of the United Nations be informed as progress is achieved in the establishment of the Agency and that the views of members which have manifested their interest be fully considered. . . ." Resolution 810(IX), Document A/Resolution/230, in U. N. General Assembly Off. Rec., 9th Session (1954). Annexes, Agenda Item 67, pp. 24-25. For the report of the First Committee, see *id.* at 22-23.

4. Second Phase of Diplomatic Correspondence Between the United States and the Soviet Union

In the second series of notes (Department of State Press Release No. 527, Oct. 6, 1956, containing fifteen notes exchanged between Nov. 3, 1954 and Jan. 27, 1956) the Soviet Union demanded that the Agency be closely connected with the United Nations (in particular the Security Council) and that no member should have a "privileged position" within the Agency.

The United States, in a note of April 14, 1955 (*id.* at 8, 9), expressed its willingness to consider these comments and made clear that it kept the door open for the Soviet Union to join the negotiating group. It stated,

however, its intention in the meantime to carry on the negotiations regardless of Soviet participation. The United States furthermore submitted an agenda for a joint discussion by experts of both countries on safeguards against diversion of fissionable materials.

The U. S. S. R., on July 18, 1955 (*id.* at 11-13), declared its readiness to participate in the negotiations and agreed to deposit 50 kilograms of fissionable materials with the Agency as soon as agreement on the creation of the Agency has been reached. Again it referred to principles which it considered basic, among them the participation of *all* nations (obviously designed to bring in Red China) in the Agency with no privileged position for any state. The joint study of safeguards should take place after the completion of the scientific conference in Geneva scheduled for the summer of 1955.

In its answer of July 29, 1955 (*id.* at 14-15), the United States transmitted the draft statute worked out by the eight-power negotiating group (note 14 *supra*), which was identical with the draft distributed on August 22, 1955 to all members of the United Nations and of the specialized agencies, except for two minor changes. Later on the United States and U. S. S. R. agreed on the conference of experts on the safeguards to include experts from Canada, Czechoslovakia, France, and the United Kingdom. On Oct. 1, 1955 the Ministry of Foreign Affairs of the Soviet Union wrote to the American Embassy (*id.* at 22-24) that the eight-power draft could, with certain amendments, serve as a basis for drawing up the charter of an atomic energy agency. The permanent members of the Security Council should become permanent members of the Agency's Board of Governors. There should be a strong control mechanism, with inspectors investigating atomic installations of countries receiving aid under provisions which should give "due regard to the sovereign rights of the states." India, Indonesia, Egypt, and Rumania should be added to an increased first Board of Governors. A ¾ majority in the Board and the General Conference should be necessary for financial decisions. In conformity with the eight-power draft, these Soviet proposals now envisaged the Agency acting not only as a clearing house but also as a "bank" for fissionable materials. The International Court of Justice should not have compulsory jurisdiction over disputes arising from the application of the statute. After the discussion of the Agency in the 10th General Assembly (see *infra*), the exchange was continued in a United States note of Jan. 27, 1956 (*id.* at 25) suggesting further discussions at a twelve nation working group meeting scheduled for Feb. 27, 1956.

The remaining portion of the exchange between the United States and the U. S. S. R. is concerned with the problem of safeguards, in particular the possible extension of safeguards to existing international arrangements (see note 77 *supra*).

5. Discussion in the Tenth General Assembly

The main points of discussion in the 10th General Assembly of the United Nations were the relationship between the Agency on one hand and the United Nations and its specialized agencies on the other; fair representation of states, both in regard to the negotiations on the statute and in the mode of selection and voting of the Board of Governors; universality of membership; and the relationship of the Agency to regional or bilateral programs outside the Agency. See U. N. General Assembly Off. Rec., 10th Session (1955), First Committee, A/C. 1/SR. 757-772, pp. 5-93. A resolution was adopted unanimously [Resolution 912 (X) Document A/3116, in U. N. General Assembly Off. Rec., 10th Session, Supp. 19 (A/3116), pp. 4-5,] welcoming the intention of the nations sponsoring the draft statute of the Agency to invite all members of the United Nations and its specialized agencies to a conference on the final text of the statute; welcoming the invitations extended to Brazil, Czechoslovakia, India, and the U. S. S. R. to join the sponsors; recommending that the sponsors take into account the views expressed by the Agency during the debates in the United Nations and the comments made directly to the sponsors; recommending that measures be taken to establish the Agency without delay; and requesting that the Secretary General in consultation with his Advisory Committee study the question of the Agency's relationship to the United Nations and transmit the results of this study to the sponsors before the conference.

6. Negotiations of the Twelve States

A working group consisting of representatives of the original eight negotiating powers and of the representatives of Brazil, Czechoslovakia, India, and the U. S. S. R. met in Washington from Feb. 27 to April 18, 1956, for further discussion of the draft statute. The report of the working level meeting dated July 2, 1956, reads (in part): ". . . [T]he Group reviewed each article of the Statute, together with the proposed amendments, taking into account the comments advanced during the proceedings of the tenth regular session of the United Nations General Assembly as well as those of the thirty-nine States which submitted observations on the Statute in response to a request made by the initial Negotiating Group in August 1955 to all States Members of the United Nations and its Specialized Agencies. . . . At the final plenary session on April 18, 1956, the Negotiating Group approved, *ad referendum,* the revised text of the draft Statute. . . . While the Australian, Czechoslovak, Indian and Soviet Delegations reserved their positions on certain provisions of the Statute, . . . all delegations voted in favor of the Statute as a whole. . . . At the same session, the Group agreed that a conference should be convened at the United Nations Headquarters in New York in the latter part of September

1956 to discuss, approve and open for signature the Statute of the International Atomic Energy Agency. . . . The Group also unanimously approved the Agenda and Rules of Procedure for the Conference." Report of the Working Level Meeting on the Draft Statute of the International Atomic Energy Agency, Doc. 31, Washington, D. C., July 2, 1956, pp. 1, 2.

ITEM 2

(Footnote 19)

Article V, par. D, subpar. 2 of the twelve-power draft mentioned as one of the functions of the General Conference "to *admit* new Members in accordance with Article IV." This was changed in art. V, par. E, subpar. 2 of the final text to read "to *approve* states for membership in accordance with Article IV." (Emphasis added.) The change was perhaps motivated by the desire to make it clear beyond any doubt that a *favorable* recommendation by the Board is necessary for the admission of a new member. The drafters may have had in mind the advisory proceedings before the International Court of Justice on the question whether a favorable recommendation from the Security Council is required for admission of a state to the United Nations by the General Assembly. The Court answered this question in the affirmative. Advisory Opinion of the International Court of Justice of March 3, 1950, in I. C. J. Reports of Judgments, Advisory Opinions and Orders, 1950, p. 4 at 10.

In approving states for membership under this paragraph the Board of Governors and the General Conference make the determination "that the State is able and willing to carry out the obligations of membership in the agency." Statute, art. IV, par. B. In making this determination "due consideration" is to be given to the state's ability and willingness to act in accordance with the purposes and principles of the Charter of the United Nations. The eight-power draft would have had the Board of Governors and the General Conference each make two determinations: first, that the state was in a position to carry out the obligations of the Agency, and second, that the state was able and willing to carry out the obligations contained in the Charter of the United Nations. This would have excluded Switzerland which considers that it is not in a position to undertake the obligations required by the Charter of the United Nations.

ITEM 3

(Footnote 30)

The powers of the General Conference were a much debated item in the International Conference on the statute of the Agency. Apart from the additional powers already mentioned, the International Conference provided

for the authority of the General Conference to approve the appointment by the Board of the Agency's chief executive, the Director General. See art. V, par. E., subpar. 10 and art. VII, par. A. This originated in an Indonesian-Pakistanian amendment. IAEA/CS/Art. V/Amend. 8. The amendment was adopted by 77 votes to 1, with 1 abstention. IAEA/CS/OR. 22, p. 43.

Already before the discussions in the International Conference, the powers of the General Conference had been controversial matter. The smaller nations, not being represented on the Board of Governors, wanted to accord more authority to the General Conference. In response to the suggestions made to the negotiating parties, the twelve-power draft added a provision in art. V, par. E, subpar. 3 giving the General Conference the power to "propose matters for consideration by the Board and request from the Board reports on any matter relating to the functions of the Agency" (now art. V, par. F, subpar. 2 of the statute). Furthermore, the reference to the policy making power of the Board in art. VII, par. H of the eight-power draft no longer appears in the twelve-power draft and the statute. The powers of the General Conference other than those mentioned earlier are:

To elect the ten members of the Board mentioned in art. VI, par. A, subpar. 3 of the statute (art. V, par. E, subpar. 1);

To determine the place of its sessions (art. V, par. A);

To elect a President and other officers (art. V, par. C);

To adopt its rules of procedure (art. V, par. C);

To request the Director General to convene special sessions (art. V, par. A);

To approve states for membership upon recommendation by the Board (art. IV, par. B);

To suspend members (art. XIX);

To consider the Board's annual report (art. V, par. E, subpar. 4);

To approve or return to the Board reports to the United Nations (art. V, par. E, subpar. 6; art. III, par. B, subpars. 4 and 5);

To approve or return to the Board agreements between the Agency and the United Nations or other international agencies (art. V, par. E, subpar. 7; art. XVI, par. A);

To approve rules regarding (a) the exercise of borrowing powers by the Board (art. V, par. E, subpar. 8; art. XIV, par. G); (b) the acceptance of voluntary contributions to the Agency (art. V, par. E, subpar. 8; art. XIV, par. E); (c) the use of the general fund (art. V, par. E, 8; art. XIV, par. F);

To approve amendments of the statute (art. V, par. E, subpar. 9; art. XVIII, par. C(i)).

It seems that the enumeration in art. V is exclusive, *i.e.*, the Conference

has no other powers besides the ones specifically mentioned. A Polish amendment (IAEA/CS/Art. V/Amend. 1) to art. V proposed to insert at the beginning of the functions of the Conference a sentence reading "to determine the general policy of the Agency." This amendment, in effect a general clause granting additional powers to the Conference was rejected by 37 votes to 24, with 18 abstentions. IAEA/CS/OR. 22, p. 42.

The voting procedures of the Conference are laid down in art. V, par. C. Every member of the Agency has one vote. Except for decisions on financial questions (art. XIV, par. H), approval of amendments (art. XVIII, par. C(i)), and the suspension of privileges (art. XIX, par. B), which requires a $\frac{2}{3}$ majority, decisions are made by the majority of members present and voting, the majority of members constituting a quorum. Simple majority suffices for the determination of what additional questions are to be decided by a $\frac{2}{3}$ majority.

ITEM 4

(Footnote 38)

The eight-power draft, art. VII, par. A, subpars. 1 and 2, as well as the first outline of the statute, art. II, par. C, subpar. 1, third sentence [Atoms for Peace Manual, note 5 *supra*, 266 *et seq.*], envisaged actual contributions as a prerequisite for selection to the non-elective seats on the Board. This prerequisite was dropped in the twelve-power draft. In the International Conference on the statute, Denmark and Iran jointly submitted an amendment to art. VI, par. A, subpar. 1, which provided that in designating members of the Board under this sub-paragraph the contributions to the Agency should be taken into consideration. IAEA/CS/Art. VI/Amend. 2. In explaining this amendment the Danish representative said: "The main idea behind the Agency is that countries which are advanced and which are producing source material should give to other countries . . . their aid and their help. . . . [S]tress should be laid also on the contributions . . . because that is really the main point in the building up of this idea. . . . [N]o one in this room will suggest that any member elected on the basis of advanced technology and of production of source materials should be allowed to sit if that member were not willing to make contributions and was not actually making contributions." IAEA/CS/OR. 19, p. 27. The Philippine representative remarked: "[T]hat paragraph [*i. e.*, art. VI, par. A, subpar. 2] mentions 'producers. . . .' However, what good would that do as far as the Agency is concerned unless they make a contribution?" IAEA/CS/OR. 19, pp. 29-30. In arguing against the amendment, Mr. du Plessis (Union of South Africa) pointed to the difficulty of evaluating contributions and deciding what transactions were to be regarded as

contributions. IAEA/CS/OR. 20, p. 26 *et seq.* Subsequently, this amendment was withdrawn. See IAEA/CS/OR. 23, p. 3.

The composition of the Board in its present form is somewhat comparable to that of the Council of the Intergovernmental Maritime Consultative Organization. Art. 17, Convention of the IMCO. For the text of this convention, which is not yet in force, see 18 Dept. of State Bul. 499 *et seq.* (1948). There six members with the largest interest in the international seaborne trade and six with the largest interest in providing international shipping services are represented in this Council, together with 4 members elected by the Assembly of the IMCO. Other international organizations such as the International Bank for Reconstruction and Development and the International Monetary Fund have a system of weighted voting, based on actual contributions. See art. V, sec. 3 of the Articles of Agreement of the IBRD, and art. XII, sec. 5, of the Articles of Agreement of the IMF. Certain other organizations have all-elected executive bodies with one vote for each member, *e.g.*, the United Nations Food and Agricultural Organization, the United Nations Educational, Scientific and Cultural Organization, the World Health Organization, and the World Meteorological Organization.

ITEM 5

(Footnote 42)

See IAEA/CS/OR. 39, p. 61. The six states elected were Egypt, Indonesia, Pakistan, Japan, Argentina, and Peru. Apart from these six elected members, the Preparatory Commission was composed of representatives of Australia, Belgium, Brazil, Canada, Czechoslovakia, France, India, Portugal, Union of South Africa, the U. S. S. R., the United Kingdom, and the United States. The Commission came into existence with the opening of the statute for signature and continued till the first General Conference was convened and the first Board of Governors was selected. Statute, Annex I, par. A. The functions of this Commission were of a provisional nature. Apart from organizing itself and appointing its staff it was to make arrangements for the first session of the General Conference. This included the preparation of a provisional agenda and draft rules of procedure. The Commission was to designate members of the first Board in accordance with art. VI, pars. A and B; to make studies, reports and recommendations on various important problems for the first meetings of the Board and the Conference; and, finally, to enter into negotiations with the United Nations for a draft agreement on the relationship of the Agency to the United Nations and to make recommendations to the first sessions of the Conference and of the Board in regard to the relationship to other international organizations. Annex I, par. C, subpars. 1-7. The Report of the Preparatory Commission included detailed recommendations for an

initial Agency program. (G. C. 1/1, GOV/1, Report of the Preparatory Commission of the International Atomic Energy Agency (PRECO), New York, 1957).

ITEM 6

(Footnote 64)

The specific question of the Agency's relation to the specialized agencies for which the statute provides in art. XVI, par. A is dealt with in a memorandum by the executive heads of the specialized agencies presented to the International Conference (IAEA/CS/6, Sept. 24, 1956). In this memorandum attention was called to par. 9 of the United Nations, Doc. A/3122 (reproduced in IAEA/CS/5, Sept. 24, 1956), which calls for effective coordination between the activities of the Agency and those of the specialized agencies, with the aim of avoiding overlapping and duplication of activities. The annex to the memorandum contains comments by the International Labor Organization (ILO) and the World Health Organization (WHO), which seem to indicate a tendency not to relinquish much of the jurisdiction of these bodies to the Agency. Thus it was the opinion of the ILO that the protection of the health and safety of the workers cannot be the responsibility of an agency dealing solely with atomic energy. ILO felt that the present position, whereby the draft statute fails to make any explicit provision for cooperation with the ILO, but specifically authorizes the Agency "to establish or adopt standards of safety for protection of health and minimization of danger to life and property (including standards for labor conditions)," called for further consideration at the Conference. IAEA/CS/6/Annex. See also the statements of the representatives of various specialized agencies in the International Conference on October 4, 1956. IAEA/CS/OR. 16, p. 31 *et seq.*

Under art. III, par. A, subpar. 1, the Agency is given responsibilities in connection with "research on, and development and practical application of, atomic energy for peaceful uses throughout the world. . . ." The Food and Agricultural Organization includes among its functions "to stimulate and coordinate the use of radiation and radioisotopes in agricultural research and development, and to promote necessary investigations of the possible effects of radioactive materials on agriculture and food production." FAO is organizing an information service on the applications of atomic energy in agriculture and related fields. United Nations, Economic and Social Council, Doc. E/2931, Annex II, October 18, 1956, p. 7.

UNESCO authorized its Director General "to study and, if necessary, to propose measures of an international scope to facilitate the use of radioisotopes in research and industry." *Id.* at 9.

The International Bank for Reconstruction and Development states: "In carrying out its responsibilities, both to itself and to its members, in

respect of the foregoing the IBRD will, from time to time, undertake studies of general and specific power needs, and the relationship of atomic fuels to conventional energy resources." *Id.* at 19.

Under art. III, par. A, subpar. 3 the Agency is authorized "to foster the exchange of scientific and technical information on peaceful uses of atomic energy." Under par. A, subpar. 4 of this article the Agency is authorized "to encourage the exchange and training of scientists and experts in the fields of peaceful uses of atomic energy." UNESCO's program of work includes an item entitled "Training of Specialists." UNESCO proposes to convene an international conference "to organize a far-reaching exchange of information on the methods at present in use in various countries for training engineers, technicians, laboratory research workers and, in general, all the different scientific specialists who are concerned with the peaceful uses of atomic energy." *Id.* at 11. The conference will also recommend to UNESCO "action at the international level to secure the most efficient cooperation possible among the various countries; in particular, problems relating to exchange of teachers and students will have to be considered." *Id.* at 12.

Under art. III, par. A, subpar. 6 the Agency is given certain functions in developing standards of safety for protection of health and minimization of danger to life and property (including such standards for labor conditions), and to provide for the application of these standards to its own operations as well as to other operations coming under the jurisdiction of the Agency. The International Labor Organization states "the most immediate problems of concern to ILO is the protection of workers against ionizing radiations." *Id.* at 3. It is also planned to issue codes of practice dealing with the technical protective measures required in industrial and other undertakings. In addition, ILO will be able to provide advice and assistance to governments and industry in the training of specialized safety personnel and inspectors. *Id.* at 5. The World Health Organization has adopted a provisional program of work which includes training of specialists for health protection in atomic energy laboratories or plants, public health administrators and medical users of radioisotopes. The WHO also includes in its program the entire subject of the "health problems involved in the control of the location of reactors and in radioactive waste disposal from factories, laboratories and hospitals." *Id.* at 16 (emphasis omitted).

The World Meteorological Organization has an extensive program concerning collection and analysis of atmospheric radioactivity and its relation to health and safety. *Id.* at 22.

ITEM 7

(Footnote 76)

The history of the Soviet attitude toward the safeguards provisions is of considerable interest. The first outline of an International Atomic Energy Agency (see Appendix A above) in art. III, par. B, subpar. 3 included provisions for both health and safety standards and safeguards against diversion of fissionable materials. Mr. Molotov, in his reply of April 27, 1954 (in Atoms for Peace Manual, note 5 *supra*, 269 at 271) described very vividly the situation which makes safeguards a necessity in connection with any program for the peaceful uses of atomic energy. He said: "[T]he level of science and technique which has been reached at the present time makes it possible for the very application of atomic energy for peaceful purposes to be utilized for increasing the production of atomic weapons." Mr. Molotov's solution to that problem was the restatement of the Soviet line calling for the prohibition of atomic weapons without safeguards. In a memorandum handed to Ambassador Zarubin by Assistant Secretary of State Merchant on July 9, 1954, (*id.*, 274 at 276) the United States pointed out: "In reality, however, ways can be devised to safeguard against diversion of materials from power producing reactors. And there are forms of peaceful utilization in which no question of weapon grade material arises." On Sept. 22, 1954, the day before the opening of the General Assembly, Mr. Gromyko handed an Aide-Memoire to Ambassador Bohlen in Moscow (*id.*, 278 at 281) stating: "The Soviet Government is ready to examine in course of further negotiations the United States Government's views on this question (safeguards)."

In the 716th Session of the 9th General Assembly's First Committee on Nov. 15, 1954, Mr. Vyshinsky emphasized the necessity of control provisions by referring to President Eisenhower's plan contained in his speech before the General Assembly of Dec. 8, 1953: ". . . [*A*]*lthough the plan had contained no safeguards* to ensure that atomic energy would be used only for peaceful purposes . . . that did not mean that the Soviet Union considered it a bad one." [Emphasis added.] A/C. 1/SR. 716, p. 335 at 339.

The note of the Soviet Union of Oct. 1, 1955, to the American Embassy in Moscow called for an appropriate staff of inspectors to investigate atomic installations of the beneficiary states and to verify the use of materials and equipment received from the Agency, such observations and control to be accomplished "with due observation of sovereign rights of the above-mentioned states and within the framework of an agreement between a given state and the Agency." United States Dept. of State Press Release No. 527, Oct. 6, 1956, p. 23. See statement of the Soviet representative in the First Committee of the 10th General Assembly, Oct. 11, 1955, U. N. General

Assembly Off. Rec., 10th Session (1955), First Committee, A/C. 1/SR. 759, p. 13 at 14.

In its opening statement at the International Conference the Soviet Union representative, Mr. Zarubin, stated that ". . . the conditions for control and inspection, which are contemplated in the agreements between the United States and other countries and in the draft statute, do, in our opinion, infringe upon the sovereign rights of the recipient countries, and do therefore give rise to justified criticism on their part." IAEA/CS/OR. 3, p. 31. In the following discussion on Agency safeguards, Mr. Zarubin said: "The delegation of the Soviet Union had already declared that it considered that a sufficient safeguard would be to abide by the provision of the statute which makes recipient states assume their obligation not to use the assistance received for the production of nuclear weapons and to submit reports on the use to which the assistance given by the Agency has been put. The safeguards and controls which the draft statute provides would be significant only if these provisions found their place within the framework of a general prohibition of nuclear weapons and if these guarantees and safeguards extended to all States, both the States receiving the assistance of the Agency and those supplying it. The application of safeguards to recipient countries alone—that is, in the first place, to underdeveloped countries—falls short of the mark and imposes upon the recipient countries such conditions of control and inspection as violate their sovereignty and which would no doubt slow down the utilization of atomic energy for peaceful purposes in these countries." IAEA/CS/OR. 36, pp. 6, 7.

ITEM 8

(Footnote 89)

India made three reservations to art. XII of the twelve-power draft. Report of the Working Level Meetings, Annex IV, p. 3. First, the provisions of the twelve-power draft and also of the final statute require the agreement between the Agency and states receiving fissionable materials from the Agency to provide for certain Agency rights and responsibilities "to the extent relevant to the project or arrangement." The Indians would have added to this that the safeguards should be required only as specifically provided for in individual agreements between the Agency and the members thereof, thus permitting agreements with less safeguards than those prescribed in the statute. While there was considerable discussion on this subject India never submitted a specific amendment to the International Conference.

The second reservation concerned art. XII, par. A, subpar. 3 requiring the maintenance and production of operating records to assist in ensuring accountability for *source* and special fissionable materials used *or produced*

in the project or arrangement. The Indians would have amended the article to restrict accountability to *fissionable materials supplied.* This would have eliminated from accountability all of the source materials as well as plutonium or U-233, produced as by-products of the operation of the reactor. IAEA/CS/OR. 7, p. 48 *et seq.* France joined India in advocating the removal of source materials from accountability. IAEA/CS/OR. 24, p. 46 *et seq.* The third reservation (both the second and the third reservations are contained in amendment IAEA/CS/Art. XII/Amend. 5 sponsored by Ceylon, Egypt, India, and Indonesia) related to art. XII, par. A, subpar. 5, dealing with the chemical processing of fissionable materials and the disposition of plutonium and U-233 produced as a result of the reactor operations. The statute provided for complete Agency control over both the chemical processing of fuel elements and of the disposition of the fissionable materials produced in the reactor. This is one of the crucial points in reactor operations where diversion to war uses can most readily take place. India called for considerably less stringent control in connection with the by-product materials that would be produced from a reactor. Under this suggestion, states would be able to stockpile the plutonium and U-233 produced in reactors for use within the state for peaceful purposes and under Agency safeguards. Under present technology there are few peaceful uses for plutonium and for U-233. The result of the Indian suggestions would be that substantial stockpiles of materials unusable for peacetime purposes would accumulate in many parts of the world. The United States regarded this as a serious potential threat to the peace. India insisted that under the original wording of the statute, the Agency would be in a position to dictate in perpetuity what fissionable materials would be allotted to all states; it was entirely possible that the Board of Governors of the Agency on the basis of political or economic considerations unrelated to international safety would prevent states from acquiring the fissionable materials necessary for development of their economic welfare. IAEA/CS/OR. 28, p. 55 *et seq.*

ITEM 9

(Footnote 152)

Art. XIV in pars. B and E in effect reduces to a minimum the occasions when the Agency would be justified in utilizing its borrowing powers under art. XIV, par. G. Theoretically, all of the expenditures coming under the administrative budget (par. B, subpar. 1) will be apportioned among the members pursuant to par. D of art. XIV. All other expenditures will be met through a combination of revenue from a scale of charges (art. XIV, par. E) and voluntary contributions (donations). The Board of Governors is required to fix a scale of charges at least adequate (together with donations) to cover the operational expenditures described in par. B, subpar. 2.

Indeed, it is contemplated that there might be an excess of revenue which would go into the general fund (see par. F of art. XIV) and thus be available, for example, to meet a part of the cost of the safeguards system. On the other hand, the administrative expenses are likely to exceed the amounts that could be raised through apportionment among the members, especially if the administrative budget includes substantial sums for items such as the construction of safeguards facilities and storage costs for the "syphoned off" fissionable material not used for Agency projects. Statute, art. XIV, par. B, subpar. 1(b), last clause. Could the words "the costs of handling and storage of special fissionable material" in that clause be interpreted to include also the costs of *building* storage facilities for this material? Similarly, Agency facilities to be included in the operational budget under par. B, subpar. 2 may prove too expensive to be charged to the beneficiary members in accordance with art. XIV, par. E. It is these deficits which might be covered through borrowing. It seems probable that Agency borrowing would be directed primarily to that objective. Repayment of loans would come from the General Fund of the Agency resulting from an excess of revenues arising from the scale of charges and from donations. If loans are used for administrative expenses they could presumably be repaid by apportionment among members. Presumably, loans to construct facilities would be repaid over a period of years bearing some relationship to the life of the facilities.

The financing provisions were the subject of a lively discussion in the International Conference. The main point raised was the question as to who should be burdened with the financing of Agency facilities. See Mr. Zarubin (U. S. S. R.), IAEA/CS/OR. 31, p. 11; Mr. Wershof (Canada), *id.* at 16; Mr. Wadsworth (United States), *id.* at 26, and other statements in IAEA/CS/OR. 31 and 32.

ITEM 10

STATUTE OF THE INTERNATIONAL ATOMIC ENERGY AGENCY

ARTICLE I

Establishment of the Agency

The Parties hereto establish an International Atomic Energy Agency (hereinafter referred to as "the Agency") upon the terms and conditions hereinafter set forth.

ARTICLE II

Objectives

The Agency shall seek to accelerate and enlarge the contribution of atomic energy to peace, health and prosperity throughout the world. It

shall ensure, so far as it is able, that assistance provided by it or at its request or under its supervision or control is not used in such a way as to further any military purpose.

ARTICLE III

Functions

A. The Agency is authorized:

1. To encourage and assist research on, and development and practical application of, atomic energy for peaceful uses throughout the world; and, if requested to do so, to act as an intermediary for the purposes of securing the performance of services or the supplying of materials, equipment, or facilities by one member of the Agency for another; and to perform any operation or service useful in research on, or development or practical application of, atomic energy for peaceful purposes;

2. To make provision, in accordance with this Statute, for materials, services, equipment, and facilities to meet the needs of research on, and development and practical application of, atomic energy for peaceful purposes, including the production of electric power, with due consideration for the needs of the under-developed areas of the world;

3. To foster the exchange of scientific and technical information on peaceful uses of atomic energy;

4. To encourage the exchange and training of scientists and experts in the field of peaceful uses of atomic energy;

5. To establish and administer safeguards designed to ensure that special fissionable and other materials, services, equipment, facilities, and information made available by the Agency or at its request or under its supervision or control are not used in such a way as to further any military purpose; and to apply safeguards, at the request of the parties, to any bilateral or multilateral arrangement, or, at the request of a State, to any of that State's activities in the field of atomic energy;

6. To establish or adopt, in consultation and, where appropriate, in collaboration with the competent organs of the United Nations and with the specialized agencies concerned, standards of safety for protection of health and minimization of danger to life and property (including such standards for labour conditions), and to provide for the application of these standards to its own operations as well as to the operations making use of materials, services, equipment, facilities, and information made available by the Agency or at its request or under its control or supervision; and to provide for the application of these standards, at the request of the parties, to operations under any bilateral or multilateral arrangement, or, at the request of a State, to any of that State's activities in the field of atomic energy;

7. To acquire or establish any facilities, plant and equipment useful in

carrying out its authorized functions, whenever the facilities, plant, and equipment otherwise available to it in the area concerned are inadequate or available only on terms it deems unsatisfactory.

B. In carrying out its function, the Agency shall:

1. Conduct its activities in accordance with the purposes and principles of the United Nations to promote peace and international cooperation, and in conformity with policies of the United Nations furthering the establishment of safe-guarded world-wide disarmament and in conformity with any international agreements entered into pursuant to such policies;

2. Establish control over the use of special fissionable materials received by the Agency, in order to ensure that these materials are used only for peaceful purposes;

3. Allocate its resources in such a manner as to secure efficient utilization and the greatest possible general benefit in all areas of the world, bearing in mind the special needs of the under-developed areas of the world;

4. Submit reports on its activities annually to the General Assembly of the United Nations and, when appropriate, to the Security Council: if in connexion with the activities of the Agency there should arise questions that are within the competence of the Security Council, the Agency shall notify the Security Council, as the organ bearing the main responsibility for the maintenance of international peace and security, and may also take the measures open to it under this Statute, including those provided in paragraph C of article XII;

5. Submit reports to the Economic and Social Council and other organs of the United Nations on matters within the competence of these organs.

C. In carrying out its functions, the Agency shall not make assistance to members subject to any political, economic, military, or other conditions incompatible with the provisions of this Statute.

D. Subject to the provisions of this Statute and to the terms of agreements concluded between a State or a group of States and the Agency which shall be in accordance with the provisions of the Statute, the activities of the Agency shall be carried out with due observance of the sovereign rights of States.

ARTICLE IV

Membership

A. The initial members of the Agency shall be those States Members of the United Nations or of any of the specialized agencies which shall have signed this Statute within ninety days after it is opened for signature and shall have deposited an instrument of ratification.

B. Other members of the Agency shall be those States whether or not Members of the United Nations or of any of the specialized agencies, which deposit an instrument of acceptance of this Statute after their membership

has been approved by the General Conference upon the recommendation of the Board of Governors. In recommending and approving a State for membership, the Board of Governors and the General Conference shall determine that the State is able and willing to carry out the obligations of membership in the Agency, giving due consideration to its ability and willingness to act in accordance with the purposes and principles of the Charter of the United Nations.

C. The Agency is based on the principle of the sovereign equality of all its members, and all members, in order to ensure to all of them the rights and benefits resulting from membership, shall fulfil in good faith the obligations assumed by them in accordance with this Statute.

ARTICLE V

General Conference

A. A General Conference consisting of representatives of all members shall meet in regular annual session and in such special sessions as shall be convened by the Director General at the request of the Board of Governors or of a majority of members. The sessions shall take place at the headquarters of the Agency unless otherwise determined by the General Conference.

B. At such sessions, each member shall be represented by one delegate who may be accompanied by alternates and by advisers. The cost of attendance of any delegation shall be borne by the member concerned.

C. The General Conference shall elect a President and such other officers as may be required at the beginning of each session. They shall hold office for the duration of the session. The General Conference, subject to the provisions of this Statute, shall adopt its own rules of procedure. Each member shall have one vote. Decisions pursuant to paragraph H of article XIV, paragraph C of article XVIII and paragraph B of article XIX shall be made by a two-thirds majority of the members present and voting. Decisions on other questions, including the determination of additional questions or categories of questions to be decided by a two-thirds majority, shall be made by a majority of the members present and voting. A majority of members shall constitute a quorum.

D. The General Conference may discuss any questions or any matters within the scope of this Statute or relating to the powers and functions of any organs provided for in this Statute, and may make recommendations to the membership of the Agency or to the Board of Governors or to both on any such questions or matters.

E. The General Conference shall:

1. Elect members of the Board of Governors in accordance with article VI;

2. Approve States for membership in accordance with article IV;

3. Suspend a member from the privileges and rights of membership in accordance with article XIX;

4. Consider the annual report of the Board;

5. In accordance with article XIV, approve the budget of the Agency recommended by the Board or return it with recommendations as to its entirety or parts to the Board, for resubmission to the General Conference;

6. Approve reports to be submitted to the United Nations as required by the relationship agreement between the Agency and the United Nations, except reports referred to in paragraph C of article XII, or return them to the Board with its recommendations;

7. Approve any agreement or agreements between the Agency and the United Nations and other organizations as provided in article XVI or return such agreements with its recommendations to the Board, for resubmission to the General Conference;

8. Approve rules and limitations regarding the exercise of borrowing powers by the Board, in accordance with paragraph G of article XIV; approve rules regarding the acceptance of voluntary contributions to the Agency; and approve, in accordance with paragraph F of article XIV, the manner in which the general fund referred to in that paragraph may be used;

9. Approve amendments to this Statute in accordance with paragraph C of article XVIII;

10. Approve the appointment of the Director General in accordance with paragraph A of Article VII.

F. The General Conference shall have the authority:

1. To take decisions on any matter specifically referred to the General Conference for this purpose by the Board;

2. To propose matters for consideration by the Board and request from the Board reports on any matter relating to the functions of the Agency.

ARTICLE VI

Board of Governors

A. The Board of Governors shall be composed as follows:

1. The outgoing Board of Governors (or in the case of the first Board, the Preparatory Commission referred to in Annex I) shall designate for membership on the Board the five members most advanced in the technology of atomic energy including the production of source materials and the member most advanced in the technology of atomic energy including the production of source materials in each of the following areas not represented by the aforesaid five:

(1) North America

(2) Latin America

(3) Western Europe
(4) Eastern Europe
(5) Africa and the Middle East
(6) South Asia
(7) South East Asia and the Pacific.
(8) Far East.

2. The outgoing Board of Governors (or in the case of the first Board, the Preparatory Commission referred to in Annex I) shall designate for membership on the Board two members from among the following other producers of source materials: Belgium, Czechoslovakia, Poland, and Portugal; and shall also designate for membership on the Board one other member as a supplier of technical assistance. No member in this category in any one year will be eligible for redesignation in the same category for the following year.

3. The General Conference shall elect ten members to membership on the Board of Governors, with due regard to equitable representation on the Board as a whole of the members in the areas listed in sub-paragraph A-1 of this article, so that the Board shall at all times include in this category a representative of each of those areas except North America. Except for the five members chosen for a term of one year in accordance with paragraph D of this article, no member in this category in any one term of office will be eligible for re-election in the same category for the following term of office.

B. The designations provided for in subparagraphs A-1 and A-2 of this article shall take place not less than sixty days before each regular annual session of the General Conference. The elections provided for in sub-paragraph A-3 of this article shall take place at regular annual sessions of the General Conference.

C. Members represented on the Board of Governors in accordance with sub-paragraphs A-1 and A-2 of this article shall hold office from the end of the next regular annual session of the General Conference after their designation until the end of the following regular annual session of the General Conference.

D. Members represented on the Board of Governors in accordance with sub-paragraph A-3 of this article shall hold office from the end of the regular annual session of the General Conference at which they are elected until the end of the second regular annual session of the General Conference thereafter. In the election of these members for the first Board, however, five shall be chosen for a term of one year.

E. Each member of the Board of Governors shall have one vote. Decisions on the amount of the Agency's budget shall be made by a two-thirds majority of those present and voting, as provided in paragraph H of article XIV. Decisions on other questions, including the determination of addi-

tional questions or categories of questions to be decided by a two-thirds majority, shall be made by a majority of those present and voting. Two-thirds of all members of the Board shall constitute a quorum.

F. The Board of Governors shall have authority to carry out the functions of the Agency in accordance with this Statute, subject to its responsibilities to the General Conference as provided in this Statute.

G. The Board of Governors shall meet at such times as it may determine. The meetings shall take place at the headquarters of the Agency unless otherwise determined by the Board.

H. The Board of Governors shall elect a Chairman and other officers from among its members and, subject to the provisions of this Statute, shall adopt its own rules of procedure.

I. The Board of Governors may establish such committees as it deems advisable. The Board may appoint persons to represent it in its relations with other organizations.

J. The Board of Governors shall prepare an annual report to the General Conference concerning the affairs of the Agency and any projects approved by the Agency. The Board shall also prepare for submission to the General Conference such reports as the Agency is or may be required to make to the United Nations or to any other organization the work of which is related to that of the Agency. These reports, along with the annual reports, shall be submitted to members of the Agency at least one month before the regular annual session of the General Conference.

ARTICLE VII

Staff

A. The staff of the Agency shall be headed by a Director General. The Director General shall be appointed by the Board of Governors with the approval of the General Conference for a term of four years. He shall be the chief administrative officer of the Agency.

B. The Director General shall be responsible for the appointment, organization, and functioning of the staff and shall be under the authority of and subject to the control of the Board of Governors. He shall perform his duties in accordance with regulations adopted by the Board.

C. The staff shall include such qualified scientific and technical and other personnel as may be required to fulfil the objectives and functions of the Agency. The Agency shall be guided by the principle that its permanent staff shall be kept to a minimum.

D. The paramount consideration in the recruitment and employment of the staff and in the determination of the conditions of service shall be to secure employees of the highest standards of efficiency, technical competence, and integrity Subject to this consideration, due regard shall be paid

to the contributions of members to the Agency and to the importance of recruiting the staff on as wide a geographical basis as possible.

E. The terms and conditions on which the staff shall be appointed, remunerated, and dismissed shall be in accordance with regulations made by the Board of Governors, subject to the provisions of this Statute and to general rules approved by the General Conference on the recommendation of the Board.

F. In the performance of their duties, the Director General and the staff shall not seek or receive instructions from any source external to the Agency. They shall refrain from any action which might reflect on their position as officials of the Agency; subject to their responsibilities to the Agency, they shall not disclose any industrial secret or other confidential information coming to their knowledge by reason of their official duties for the Agency. Each member undertakes to respect the international character of the responsibilities of the Director General and the staff and shall not seek to influence them in the discharge of their duties.

G. In this article the term "staff" includes guards.

ARTICLE VIII

Exchange of information

A. Each member should make available such information as would, in the judgment of the member, be helpful to the Agency.

B. Each member shall make available to the Agency all scientific information developed as a result of assistance extended by the Agency pursuant to article XI.

C. The Agency shall assemble and make available in an accessible form the information made available to it under paragraphs A and B of this article. It shall take positive steps to encourage the exchange among its members of information relating to the nature and peaceful uses of atomic energy and shall serve as an intermediary among its members for this purpose.

ARTICLE IX

Supplying of materials

A. Members may make available to the Agency such quantities of special fissionable materials as they deem advisable and on such terms as shall be agreed with the Agency. The materials made available to the Agency may, at the discretion of the member making them available, be stored either by the member concerned or, with the agreement of the Agency, in the Agency's depots.

B. Members may also make available to the Agency source materials as defined in article XX and other materials. The Board of Governors

shall determine the quantities of such materials which the Agency will accept under agreements provided for in article XIII.

C. Each member shall notify the Agency of the quantities, form, and composition of special fissionable materials, source materials, and other materials which that member is prepared, in conformity with its laws, to make available immediately or during a period specified by the Board of Governors.

D. On request of the Agency a member shall, from the materials which it has made available, without delay deliver to another member or group of members such quantities of such materials as the Agency may specify, and shall without delay deliver to the Agency itself such quantities of such materials as are really necessary for operations and scientific research in the facilities of the Agency.

E. The quantities, form and composition of materials made available by any member may be changed at any time by the member with the approval of the Board of Governors.

F. An initial notification in accordance with paragraph C of this article shall be made within three months of the entry into force of this Statute with respect to the member concerned. In the absence of a contrary decision of the Board of Governors, the materials initially made available shall be for the period of the calendar year succeeding the year when this Statute takes effect with respect to the member concerned. Subsequent notifications shall likewise, in the absence of a contrary action by the Board, relate to the period of the calendar year following the notification and shall be made no later than the first day of November of each year.

G. The Agency shall specify the place and method of delivery and, where appropriate, the form and composition, of materials which it has requested a member to deliver from the amounts which that member has notified the Agency it is prepared to make available. The Agency shall also verify the quantities of materials delivered and shall report those quantities periodically to the members.

H. The Agency shall be responsible for storing and protecting materials in its possession. The Agency shall ensure that these materials shall be safeguarded against (1) hazards of the weather, (2) unauthorized removal or diversion, (3) damage or destruction, including sabotage, and (4) forcible seizure. In storing special fissionable materials in its possession, the Agency shall ensure the geographical distribution of these materials in such a way as not to allow concentration of large amounts of such materials in any one country or region of the world.

I. The Agency shall as soon as practicable establish or acquire such of the following as may be necessary:

1. Plant, equipment, and facilities for the receipt, storage, and issue of materials;

2. Physical safeguards;

3. Adequate health and safety measures;

4. Control laboratories for the analysis and verification of materials received;

5. Housing and administrative facilities for any staff required for the foregoing.

J. The materials made available pursuant to this article shall be used as determined by the Board of Governors in accordance with the provisions of this Statute. No member shall have the right to require that the materials it makes available to the Agency be kept separately by the Agency or to designate the specific project in which they must be used.

ARTICLE X

Services, equipment, and facilities

Members may make available to the Agency services, equipment, and facilities which may be of assistance in fulfilling the Agency's objectives and functions.

ARTICLE XI

Agency projects

A. Any member or group of members of the Agency desiring to set up any project for research on, or development or practical application of, atomic energy for peaceful purposes may request the assistance of the Agency in securing special fissionable and other materials, services, equipment, and facilities necessary for this purpose. Any such request shall be accompanied by an explanation of the purpose and extent of the project and shall be considered by the Board of Governors.

B. Upon request, the Agency may also assist any member or group of members to make arrangements to secure necessary financing from outside sources to carry out such projects. In extending this assistance, the Agency will not be required to provide any guarantees or to assume any financial responsibility for the project.

C. The Agency may arrange for the supplying of any materials, services, equipment, and facilities necessary for the project by one or more members or may itself undertake to provide any or all of these directly, taking into consideration the wishes of the member or members making the request.

D. For the purpose of considering the request, the Agency may send into the territory of the member or group of members making the request a person or persons qualified to examine the project. For this purpose the Agency may, with the approval of the member or group of members making the request, use members of its own staff or employ suitably qualified nationals of any member.

E. Before approving a project under this article, the Board of Governors shall give due consideration to:

1. The usefulness of the project, including its scientific and technical feasibility;

2. The adequacy of plans, funds, and technical personnel to assure the effective execution of the project;

3. The adequacy of proposed health and safety standards for handling and storing materials and for operating facilities;

4. The inability of the member or group of members making the request to secure the necessary finances, materials, facilities, equipment, and services;

5. The equitable distribution of materials and other resources available to the Agency;

6. The special needs of the under-developed areas of the world; and

7. Such other matters as may be relevant.

F. Upon approving a project, the Agency shall enter into an agreement with the member or group of members submitting the project, which agreement shall:

1. Provide for allocation to the project of any required special fissionable or other materials;

2. Provide for transfer of special fissionable materials from their then place of custody, whether the materials be in the custody of the Agency or of the member making them available for use in Agency projects, to the member or group of members submitting the project, under conditions which ensure the safety of any shipment required and meet applicable health and safety standards;

3. Set forth the terms and conditions, including charges, on which any materials, services, equipment, and facilities are to be provided by the Agency itself, and, if any such materials, services, equipment, and facilities are to be provided by a member, the terms and conditions as arranged for by the member or group of members submitting the project and the supplying member;

4. Include undertakings by the member or group of members submitting the project: (*a*) that the assistance provided shall not be used in such a way as to further any military purpose; and (*b*) that the project shall be subject to the safeguards provided for in article XII, the relevant safeguards being specified in the agreement;

5. Make appropriate provision regarding the rights and interests of the Agency and the member or members concerned in any inventions or discoveries or any patents therein, arising from the project;

6. Make appropriate provision regarding settlement of disputes;

7. Include such other provisions as may be appropriate.

G. The provisions of this article shall also apply where appropriate to a

request for materials, services, facilities, or equipment in connection with an existing project.

ARTICLE XII

Agency safeguards

A. With respect to any Agency project, or other arrangement where the Agency is requested by the parties concerned to apply safeguards, the Agency shall have the following rights and responsibilities to the extent relevant to the project or arrangement:

1. To examine the design of specialized equipment and facilities, including nuclear reactors, and to approve it only from the viewpoint of assuring that it will not further any military purpose, that it complies with applicable health and safety standards, and that it will permit effective application of the safeguards provided for in this article;

2. To require the observance of any health and safety measures prescribed by the Agency;

3. To require the maintenance and production of operating records to assist in ensuring accountability for source and special fissionable materials used or produced in the project or arrangement;

4. To call for and receive progress reports;

5. To approve the means to be used for the chemical processing of irradiated materials solely to ensure that this chemical processing will not lend itself to diversion of materials for military purposes and will comply with applicable health and safety standards; to require that special fissionable materials recovered or produced as a by-product be used for peaceful purposes under continuing Agency safeguards for research or in reactors, existing or under construction, specified by the member or members concerned; and to require deposit with the Agency of any excess of any special fissionable materials recovered or produced as a by-product over what is needed for the above-stated uses in order to prevent stockpiling of these materials, provided that thereafter at the request of the member or members concerned special fissionable materials so deposited with the Agency shall be returned promptly to the member or members concerned for use under the same provisions as stated above;

6. To send into the territory of the recipient State or States inspectors, designated by the Agency after consultation with the State or States concerned, who shall have access at all times to all places and data and to any person who by reason of his occupation deals with materials, equipment, or facilities which are required by this Statute to be safeguarded, as necessary to account for source and special fissionable materials supplied and fissionable products and to determine whether there is compliance with the undertaking against use in furtherance of any military purpose referred to in sub-paragraph F-4 of article XI, with the health and safety measures

referred to in subparagraph A-2 of this article, and with any other conditions prescribed in the agreement between the Agency and the State or States concerned. Inspectors designated by the Agency shall be accompanied by representatives of the authorities of the State concerned, if that State so requests, provided that the inspectors shall not thereby be delayed or otherwise impeded in the exercise of their functions;

7. In the event of non-compliance and failure by the recipient State or States to take requested corrective steps within a reasonable time, to suspend or terminate assistance and withdraw any materials and equipment made available by the Agency or a member in furtherance of the project.

B. The Agency shall, as necessary, establish a staff of inspectors. The staff of inspectors shall have the responsibility of examining all operations conducted by the Agency itself to determine whether the Agency is complying with the health and safety measures prescribed by it for application to projects subject to its approval, supervision or control, and whether the Agency is taking adequate measures to prevent the source and special fissionable materials in its custody or used or produced in its own operations from being used in furtherance of any military purpose. The Agency shall take remedial action forthwith to correct any non-compliance or failure to take adequate measures.

C. The staff of inspectors shall also have the responsibility of obtaining and verifying the accounting referred to in sub-paragraph A-6 of this article and of determining whether there is compliance with the undertaking referred to in sub-paragraph F-4 of article XI, with the measures referred to in sub-paragraph A-2 of this article, and with all other conditions of the project prescribed in the agreement between the Agency and the State or States concerned. The inspectors shall report any non-compliance to the Director General who shall thereupon transmit the report to the Board of Governors. The Board shall call upon the recipient State or States to remedy forthwith any non-compliance which it finds to have occurred. The Board shall report the non-compliance to all members and to the Security Council and General Assembly of the United Nations. In the event of failure of the recipient State or States to take fully corrective action within a reasonable time, the Board may take one or both of the following measures: direct curtailment or suspension of assistance being provided by the Agency or by a member, and call for the return of materials and equipment made available to the recipient member or group of members. The Agency may also, in accordance with article XIX, suspend any non-complying member from the exercise of the privileges and rights of membership.

ARTICLE XIII

Reimbursement of members

Unless otherwise agreed upon between the Board of Governors and the member furnishing to the Agency materials, services, equipment, or facili-

ties, the Board shall enter into an agreement with such member providing for reimbursement for the items furnished.

ARTICLE XIV

Finance

A. The Board of Governors shall submit to the General Conference the annual budget estimates for the expenses of the Agency. To facilitate the work of the Board in this regard, the Director General shall initially prepare the budget estimates. If the General Conference does not approve the estimates, it shall return them together with its recommendations to the Board. The Board shall then submit further estimates to the General Conference for its approval.

B. Expenditures of the Agency shall be classified under the following categories:

1. Administrative expenses: these shall include:

(*a*) Costs of the staff of the Agency other than the staff employed in connection with materials, services, equipment, and facilities referred to in sub-paragraph B-2 below; costs of meetings; and expenditures required for the preparation of Agency projects and for the distribution of information;

(*b*) Costs of implementing the safeguards referred to in article XII in relation to Agency projects or, under sub-paragraph A-5 of article III, in relation to any bilateral or multilateral arrangement, together with the costs of handling and storage of special fissionable material by the Agency other than the storage and handling charges referred to in paragraph E below;

2. Expenses, other than those included in sub-paragraph 1 of this paragraph, in connexion with any materials, facilities, plant, and equipment acquired or established by the Agency in carrying out its authorized functions, and the costs of materials, services, equipment, and facilities provided by it under agreements with one or more members.

C. In fixing the expenditures under sub-paragraph B-1 (*b*) above, the Board of Governors shall deduct such amounts as are recoverable under agreements regarding the application of safeguards between the Agency and parties to bilateral or multilateral arrangements.

D. The Board of Governors shall apportion the expenses referred to in sub-paragraph B-1 above, among members in accordance with a scale to be fixed by the General Conference. In fixing the scale the General Conference shall be guided by the principles adopted by the United Nations in assessing contributions of Member States to the regular budget of the United Nations.

E. The Board of Governors shall establish periodically a scale of charges, including reasonable uniform storage and handling charges, for materials, services, equipment, and facilities furnished to members by the Agency. The scale shall be designed to produce revenues for the Agency adequate to meet the expenses and costs referred to in sub-paragraph B-2 above, less

any voluntary contributions which the Board of Governors may, in accordance with paragraph F, apply for this purpose. The proceeds of such charges shall be placed in a separate fund which shall be used to pay members for any materials, services, equipment, or facilities furnished by them and to meet other expenses referred to in sub-paragraph B-2 above which may be incurred by the Agency itself.

F. Any excess of revenues referred to in paragraph E over the expenses and costs there referred to, and any voluntary contributions to the Agency, shall be placed in a general fund which may be used as the Board of Governors, with the approval of the General Conference, may determine.

G. Subject to rules and limitations approved by the General Conference, the Board of Governors shall have the authority to exercise borrowing powers on behalf of the Agency without, however, imposing on members of the Agency any liability in respect of loans entered into pursuant to this authority, and to accept voluntary contributions made to the Agency.

H. Decisions of the General Conference on financial questions and of the Board of Governors on the amount of the Agency's budget shall require a two-thirds majority of those present and voting.

Article XV

Privileges and immunities

A. The Agency shall enjoy in the territory of each member such legal capacity and such privileges and immunities as are necessary for the exercise of its functions.

B. Delegates of members together with their alternates and advisers, Governors appointed to the Board together with their alternates and advisers, and the Director General and the staff of the Agency, shall enjoy such privileges and immunities as are necessary in the independent exercise of their functions in connexion with the Agency.

C. The legal capacity, privileges, and immunities referred to in this article shall be defined in a separate agreement or agreements between the Agency, represented for this purpose by the Director General acting under instructions of the Board of Governors, and the members.

Article XVI

Relationship with other organizations

A. The Board of Governors, with the approval of the General Conference, is authorized to enter into an agreement or agreements establishing an appropriate relationship between the Agency and the United Nations and any other organizations the work of which is related to that of the Agency.

B. The agreement or agreements establishing the relationship of the Agency and the United Nations shall provide for:

1. Submission by the Agency of reports as provided for in subparagraphs B-4 and B-5 of article III;

2. Consideration by the Agency of resolutions relating to it adopted by the General Assembly or any of the Councils of the United Nations and the submission of reports, when requested, to the appropriate organ of the United Nations on the action taken by the Agency or by its members in accordance with this Statute as a result of such consideration.

ARTICLE XVII

Settlement of disputes

A. Any question or dispute concerning the interpretation or application of this Statute which is not settled by negotiation shall be referred to the International Court of Justice in conformity with the Statute of the Court, unless the parties concerned agree on another mode of settlement.

B. The General Conference and the Board of Governors are separately empowered, subject to authorization from the General Assembly of the United Nations, to request the International Court of Justice to give an advisory opinion on any legal question arising within the scope of the Agency's activities.

ARTICLE XVIII

Amendments and withdrawals

A. Amendments to this Statute may be proposed by any member. Certified copies of the text of any amendment proposed shall be prepared by the Director General and communicated by him to all members at least ninety days in advance of its consideration by the General Conference.

B. At the fifth annual session of the General Conference following the coming into force of this Statute, the question of a general review of the provisions of this Statute shall be placed on the agenda of that session. On approval by a majority of the members present and voting, the review will take place at the following General Conference. Thereafter, proposals on the question of a general review of this Statute may be submitted for decision by the General Conference under the same procedure.

C. Amendments shall come into force for all members when:

(i) Approved by the General Conference by a two-thirds majority of those present and voting after consideration of observations submitted by the Board of Governors on each proposed amendment, and

(ii) Accepted by two-thirds of all the members in accordance with their respective constitutional processes. Acceptance by a member shall be

effected by the deposit of an instrument of acceptance with the depositary Government referred to in paragraph C of article XXI.

D. At any time after five years from the date when this Statute shall take effect in accordance with paragraph E of article XXI or whenever a member is unwilling to accept an amendment to this Statute, it may withdraw from the Agency by notice in writing to that effect given to the depositary Government referred to in paragraph C of article XXI, which shall promptly inform the Board of Governors and all members.

E. Withdrawal by a member from the Agency shall not affect its contractual obligations entered into pursuant to article XI or its budgetary obligations for the year in which it withdraws.

ARTICLE XIX

Suspension of privileges

A. A member of the Agency which is in arrears in the payment of its financial contributions to the Agency shall have no vote in the Agency if the amount of its arrears equals or exceeds the amount of the contributions due from it for the preceding two years. The General Conference may, nevertheless, permit such a member to vote if it is satisfied that the failure to pay is due to conditions beyond the control of the member.

B. A member which has persistently violated the provisions of this Statute or of any agreement entered into by it pursuant to this Statute may be suspended from the exercise of the privileges and rights of membership by the General Conference acting by a two-thirds majority of the members present and voting upon recommendation by the Board of Governors.

ARTICLE XX

Definitions

As used in this Statute:

1. The term "special fissionable material" means plutonium-239; uranium-233; uranium enriched in the isotopes 235 or 233; any material containing one or more of the foregoing; and such other fissionable material as the Board of Governors shall from time to time determine; but the term "special fissionable material" does not include source material.

2. The term "uranium enriched in the isotopes 235 or 233" means uranium containing the isotopes 235 or 233 or both in an amount such that the abundance ratio of the sum of these isotopes to the isotope 238 is greater than the ratio of the isotope 235 to the isotope 238 occurring in nature.

3. The term "source material" means uranium containing the mixture of isotopes occurring in nature; uranium depleted in the isotope 235; thorium; any of the foregoing in the form of metal, alloy, chemical com-

pound, or concentrate; any other material containing one or more of the foregoing in such concentration as the Board of Governors shall from time to time determine; and such other material as the Board of Governors shall from time to time determine.

ARTICLE XXI

Signature, acceptance, and entry into force

A. This Statute shall be open for signature on 26 October 1956 by all States Members of the United Nations or of any of the specialized agencies and shall remain open for signature by those States for a period of ninety days.

B. The signatory States shall become parties to this Statute by deposit of an instrument of ratification.

C. Instruments of ratification by signatory States and instruments of acceptance by States whose membership has been approved under paragraph B of article IV of this Statute shall be deposited with the Government of the United States of America, hereby designated as depositary Government.

D. Ratification or acceptance of this Statute shall be effected by States in accordance with their respective constitutional process.

E. This Statute, apart from the Annex, shall come into force when eighteen States have deposited instruments of ratification in accordance with paragraph B of this article, provided that such eighteen States shall include at least three of the following States: Canada, France, The Union of Soviet Socialist Republics, the United Kingdom of Great Britain and Northern Ireland, and the United States of America. Instruments of ratification and instruments of acceptance deposited thereafter shall take effect on the date of their receipt.

F. The depositary Government shall promptly inform all States signatory to this Statute of the date of each deposit of ratification and the date of entry into force of the Statute. The depositary Government shall promptly inform all signatories and members of the dates on which States subsequently become parties thereto.

G. The Annex to this Statute shall come into force on the first day this Statute is open for signature.

ARTICLE XXII

Registration with the United Nations

A. This Statute shall be registered by the depositary Government pursuant to Article 102 of the Charter of the United Nations.

B. Agreements between the Agency and any member or members, agreements between the Agency and any other organization or organizations, and

agreements between members subject to approval of the Agency, shall be registered with the Agency. Such agreements shall be registered by the Agency with the United Nations if registration is required under Article 102 of the Charter of the United Nations.

ARTICLE XXIII

Authentic texts and certified copies

This Statute, done in the Chinese, English, French, Russian and Spanish languages, each being equally authentic, shall be deposited in the archives of the depositary Government. Duly certified copies of this Statute shall be transmitted by the depositary Government to the Governments of the other signatory States and to the Governments of States admitted to membership under paragraph B of article IV.

In witness whereof the undersigned, duly authorized, have signed this Statute.

DONE at the Headquarters of the United Nations, this twenty-sixth day of October, one thousand nine hundred and fifty-six.

ANNEX I

Preparatory Commission

A. A Preparatory Commission shall come into existence on the first day this Statute is open for signature. It shall be composed of one representative each of Australia, Belgium, Brazil, Canada, Czechoslovakia, France, India, Portugal, Union of South Africa, Union of Soviet Socialist Republics, United Kingdom of Great Britain and Northern Ireland, and United States of America, and one representative each of six other States to be chosen by the International Conference on the Statute of the International Atomic Energy Agency. The Preparatory Commission shall remain in existence until this Statute comes into force and thereafter until the General Conference has convened and a Board of Governors has been selected in accordance with article VI.

B. The expenses of the Preparatory Commission may be met by a loan provided by the United Nations and for this purpose the Preparatory Commision shall make the necessary arrangements with the appropriate authorities of the United Nations, including arrangements for repayment of the loan by the Agency. Should these funds be insufficient, the Preparatory Commission may accept advances from Governments. Such advances may be set off against the contributions of the Governments concerned to the Agency.

C. The Preparatory Commission shall:

1. Elect its own officers, adopt its own rules of procedure, meet as often as necessary, determine its own place of meeting and establish such committees as it deems necessary;

2. Appoint an executive secretary and staff as shall be necessary, who shall exercise such powers and perform such duties as the Commission may determine;

3. Make arrangements for the first session of the General Conference, including the preparation of a provisional agenda and draft rules of procedure, such session to be held as soon as possible after the entry into force of this Statute;

4. Make designations for membership on the first Board of Governors in accordance with sub-paragraphs A-1 and A-2 and paragraph B of article VI;

5. Make studies, reports, and recommendations for the first session of the General Conference and for the first meeting of the Board of Governors on subjects of concern to the Agency requiring immediate attention, including (*a*) the financing of the Agency; (*b*) the programmes and budget for the first year of the Agency; (*c*) technical problems relevant to advance planning of Agency operations; (*d*) the establishment of a permanent Agency staff; and (*e*) the location of the permanent headquarters of the Agency;

6. Make recommendations for the first meeting of the Board of Governors concerning the provisions of a headquarters agreement defining the status of the Agency and the rights and obligations which will exist in the relationship between the Agency and the host Government;

7. (*a*) Enter into negotiations with the United Nations with a view to the preparation of a draft agreement in accordance with article XVI of this Statute, such draft agreement to be submitted to the first session of the General Conference and to the first meetings of the Board of Governors; and (*b*) make recommendations to the first session of the General Conference and to the first meeting of the Board of Governors concerning the relationship of the Agency to other international organizations as contemplated in article XVI of this Statute.

Appendix B

ITEM 1 *

Agreement on the Establishment of a Joint Nuclear Research Institute

Article 1

To insure joint theoretical and experimental research into nuclear physics by scientists of the states signatories of the present agreement, an international scientific research organization known as the Joint Institute of Nuclear Research is hereby established.

Article 2

The Joint Institute of Nuclear Research shall conduct all its activities in accordance with a charter, the draft of which shall be prepared by the Institute's management and approved by the governments of the states members of the Institute. The Joint Institute of Nuclear Research shall have the rights of a juridical person. It may cooperate in its work with appropriate institutes and laboratories in the territories of the states members of the Institute. The Institute shall be located in Kalinin region, the USSR.

Article 3

The membership of the Joint Institute of Nuclear Research consists of the signatory states of the present agreement. Other states, wishing to take part in the work of the Joint Institute of Nuclear Research, shall declare their concurrence with the provisions of the present agreement and shall become members of the Institute by decision of the majority of the states members of the Institute.

Article 4

The Joint Institute of Nuclear Research shall comprise the following research organizations:

1—A laboratory of nuclear problems with a synchrocyclotron with proton energy of 680 megelectron volts (former Nuclear Problems Institute of the USSR Academy of Sciences).

2—A high energy physics laboratory with a proton synchrotron of a planned proton energy of 10,000 megelectron volts (former Electrophysics Laboratory of the USSR Academy of Sciences).

The aforementioned Nuclear Problems Institute and the Electrophysics

* The basic English text of this Agreement was published in a TASS press release dated July 11, 1956.

Laboratory of the USSR Academy of Sciences shall be delivered by the Government of the USSR to the Joint Institute of Nuclear Research with all equipment, principal, auxiliary and administrative installations and buildings, on the date the present agreement comes into force.

With a view to the further development of nuclear research the following installation shall be built at the Joint Institute:

1—A laboratory of theoretical physics with a calculating department and electronic computing machinery;

2—A laboratory of neutron physics with an experimental nuclear reactor with a high density of the neutron current;

3—A cyclotron for accelerating multicharged ions of various elements and for experiments with them as part of the nuclear problems laboratory;

4—Other experimental installations and laboratories.

Article 5

The Joint Institute of Nuclear Research shall be managed by a director and two deputies, elected by the majority of states members of the Institute from among scientists of these states. The director shall be elected for a term of three years, and deputy directors for two-year terms. The Institute director and his two deputies shall be elected in due manner by the plenipotentiaries of the states members of the Institute.

The Institute's director is a plenipotentiary person effecting relations with appropriate institutions in the states members of the Institute on all questions bearing on the latter's work. The management of the Joint Institute of Nuclear Research is responsible to the governments of the states members of the Institute for the Institute's work and shall report regularly to them.

A scientific council shall be established at the Institute to discuss and approve research plans, the results of their fulfillment, and other questions bearing on the Institute's scientific activities. The members of the scientific council shall be appointed by the states members of the Institute from among their scientists, each state appointing three persons. The director of the Joint Institute shall appoint a deputy in charge of construction and the business affairs of the Institute.

Article 6

Each state member of the Joint Institute of Nuclear Research shall make annual contributions for the maintenance of the Institute and the building of new research facilities, and shall participate in the material maintenance of the Institute.

The shares of the founder states in expenditures on the building and maintenance of the Institute are determined by the following scale: Albania—0.05 percent; Bulgaria—3.6 percent; Hungary—4 percent; Ger-

man Democratic Republic 6.75 percent; Poland—6.75 percent; Rumania—5.75 percent; USSR—47.25 percent; Czechoslovakia—5.75 percent.

In the case of new members joining the Institute or the withdrawal of any state from the Institute, the shares of the states in the expenditures on the building and maintenance of the Institute are subject to revision, and the new scale shall be submitted for the approval of the governments of the states members of the Institute. The share of the states members of the Institute shall have no bearing on the degree of participation of a member state in the Institute's scientific work and administration.

ARTICLE 7

A financial committee composed of representatives of all states members of the Institute shall be formed to prepare the budget and control the Institute's financial affairs. Each member state shall have one representative on the financial committee. The committee members shall be appointed by the governments of the states concerned. The chairmanship of the financial committee meetings shall rotate among the representatives of every state.

ARTICLE 8

Any state member of the Joint Institute of Nuclear Research has the right to withdraw from the Institute. Written notification of the withdrawal from the Institute shall be sent by the plenipotentiary of the government of the member state desiring to leave the Institute to the Institute's director not later than three months before the end of the current year.[1]

ARTICLE 9

The Joint Institute of Nuclear Research may be liquidated by agreement among the governments of all the states members of the Institute. In case of liquidation, all equipment, principal, auxiliary and administrative installations shall become the property of the USSR on whose territory the Institute is located. The other member states shall be compensated in accordance with their share in the capital expenditures of the Institute.

In case of the Institute's liquidation, the cash resources, with the exception of the part to be used to meet the Institute's obligations, shall be divided among the states members of the Institute at the time of the Insitute's disbandment proportionally to the actual cash contributions made by these states during their membership in the Institute.

ARTICLE 10

This agreement shall become effective on the date of its signature by all member states. For each country joining the Institute thereafter the

[1] The eighth article of the Institute's Charter states that "resignation from the Institute shall become official upon termination of that fiscal year in which the state declared its withdrawal from the Institute."

agreement shall become effective on the date of its admission to membership according to the procedure provided for in Article 3.

The present agreement was signed in Moscow on March 26, 1956. It was done in one copy, in Russian. Certified copies of the agreement shall be communicated by the Government of the USSR to all other signatories.

ITEM 2*

CHARTER OF THE JOINT NUCLEAR RESEARCH INSTITUTE

SECTION I

Creation and Location of the Institute

ARTICLE 1

The Joint Nuclear Research Institute, hereinafter referred to as the "Institute," shall be an international scientific-research organization, created by the Agreement for the organization of such an institute which was concluded among the following governments on the 26th of March, 1956:

The People's Republic of Albania, the People's Republic of Bulgaria, the Hungarian People's Republic, the German Democratic Republic, the Chinese People's Republic, the Korean Popular-Democratic Republic, the Mongolian People's Republic, the Polish People's Republic, the Rumanian People's Republic, the Union of Soviet Socialist Republics, and the Czechoslovakian Republic.

ARTICLE 2

The Institute shall be located in the Union of Soviet Socialist Republics, in the town of Dubna, Moscow district.

Mailing address: P.O. Box 79, Central Post Office, Moscow

ARTICLE 3

The Institute shall be a legal entity and, according to the laws of the country wherein it is situated, shall possess the capacity and status necessary to achieve its aims and functions.

The Institute shall have the right of free access to foreign publications.

The Institute shall have its own seal, an impression of which is affixed to this Charter.

* The Russian text of this Charter is to be found in 2 Atomnaya Energiya, No. 1, 76-82 (Russia 1957). An English text may be found in the English translation of this periodical (published by Consultant's Bureau, New York).

SECTION II

Aims and Functions of the Joint Nuclear Research Institute

ARTICLE 4

The purpose of the Joint Nuclear Research Institute is:

(1) to guarantee the coordination of theoretical and experimental research done by scientists of member-states in nuclear physics;

(2) to further the development of nuclear physics in the member-states by the exchange of experience and of theoretical and experimental research results;

(3) to maintain communication between the national and international scientific-research organizations and other organizations interested in the development of nuclear physics and in the exploration of new possibilities for the peaceful utilization of atomic energy;

(4) to help develop specialized skills of every description in the scientific-research personnel of the member-states.

The Institute will concern itself exclusively with the development of peaceful uses of atomic energy to benefit all mankind.

Results of scientific research done at the Institute shall be announced either by publication or at scientific conferences and meetings.

Reports on the work accomplished shall be sent to all member-states.

SECTION III

Membership in the Joint Nuclear Research Institute

ARTICLE 5

The members of the Joint Nuclear Research Institute are those states which signed the agreement concerning the organization of this Institute.

Other states, wishing to participate in the work of the Institute and concurring with the conditions of the Agreement concerning the organization of the Institute, shall become Institute members upon the decision of a majority of the member-states.

The amount of participation in the Institute's maintenance and construction expenses allotted newly-joined member-states shall be decided by the Finance Committee and approved by the governments of the member-states.

ARTICLE 6

All members of the Institute shall participate equally in the scientific work and management of the Institute.

ARTICLE 7

The Institute's Board of Directors, with regarding to the principle of cooperation, shall decide individually all questions regard the use of the Institute for work by non-member state scientists.

The Institute Board shall determine the size and form of compensation required for the use of Institute equipment and materials according to the agreement reached with the interested state, scientists, or scientific institution.

ARTICLE 8

Any Institute member-state can resign from membership.

Written notice of withdrawal from the Institute shall be submitted by the government of the state wishing to withdraw from the Institute to the Institute's Board no later than three months before the termination of the current fiscal year.

Resignation from the Institute shall become official upon termination of that fiscal year in which the state declared its withdrawal from the Institute. After reviewing the budget for the fiscal year in which the state announced its withdrawal from the Institute, the Finance Committee shall determine the amount of monetary reimbursement due the resigning state, according to the share of capital outlay for the Institute apportioned that state.

SECTION IV

Finance Committee and Budget

ARTICLE 9

A Finance Committee consisting of representatives from all member-states shall be set up to control the financial affairs of the Institute and to approve the budget.

Each member-state shall have one representative on the Finance Committee. Members of the Committee shall be appointed by the governments of the respective states.

The Finance Committee shall convene at least once a year. Representatives of each state in turn shall preside over the sessions.

The Finance Committee's resolutions shall require a two-thirds majority vote for adoption.

ARTICLE 10

The Finance Committee shall examine and approve:

a) the estimated costs of financing Institute scientific and economic works;

b) the departmental structure, personnel, and official pay rates for all categories of Institute workers;

c) amounts and terms of monetary payments toward Institute construction and maintenance from member-states, according to the proportionary scale provided in the Agreement of the member-states;

d) the plan for financing capital construction.

The Finance Committee shall generally control all financial affairs of the Institute.

Article 11

A budget for the Institute covering the period from January 1st to December 31st inclusive shall be drawn up each year.

Article 12

In the budget presented by the Board to the Finance Committee, provision shall be made for all Institute expenses, itemized as follows:

a) financing of scientific research and payment of Institute workers;

b) cost of developing scientific research and other Institute objectives;

c) money to reward and encourage Institute workers, for length of service, etc., and to give financial help to workers when and if needed;

d) other expenses incurred in the course of the Institute's activities.

Article 13

Each member-state shall produce on the dates specified monetary payments, according to the budget approved by the Finance Committee, toward the maintenance and development of the Institute and its objectives.

These payments shall be payable in the currency of the country wherein the Institute is situated.

In those cases where the Joint Nuclear Research Institute requires currency to purchase equipment, instruments, materials, technical scientific literature or periodicals from states not belonging to the Institute, member-states shall pay a portion of the sum allotted them by the Agreement in the currency of those states. The amount of the sum in this currency will be established by the Finance Committee.

The value of equipment, materials, and instruments supplied by member-states, as well as the value of individual work accomplished according to Institute laws may be computed as part of the allotted participation.

The manner of computation shall be established by the Finance Committee.

Article 14

The scale of allotted participation in the Institute development and maintenance costs shall be revised both upon the admittance of new member-states and upon the withdrawal of any state from membership, and a new scale shall be presented to the governments of the member-states for approval.

Article 15

During the fiscal year, the Institute may partially redistribute the monies itemized in the budget under the divisions of capital construction and exploratory work.

ARTICLE 16

At the end of each fiscal year, the Institute Board shall report to the Finance Committee on the budget balance according to its status at that time.

The Finance Committee shall specify the date on which the report is to be presented.

SECTION V

The Scientific Council of the Joint Nuclear Research Institute

ARTICLE 17

The Scientific Council of the Institute shall consist of three scientists from each member-state, to be appointed by their states.

The staff of the Scientific Council shall include the Director and Vice-Directors of the Institute (who are chosen according to article 20 of this statute), who shall have the right to vote.

Laboratory Directors, who have not been appointed members of the Scientific Council by their various governments, shall be included in the staff of the Scientific Council with the right of participating in the debates.

ARTICLE 18

The Scientific Council of the Institute shall:

a) consider and approve the Institute's scientific research programs;

b) examine the results of completed scientific research programs and also the results of individual studies;

c) consider other questions concerning the scientific work of the Institute.

The Scientific Council shall convene at least twice a year.

ARTICLE 19

The Institute Director shall be president of the Scientific Council.

The Scientific Council shall announce its own rules of procedure.

SECTION VI

Board of Directors of the Joint Nuclear Research Institute

ARTICLE 20

The Institute shall be headed by a Board of Directors consisting of an Institute Director and two Vice-Directors, to be elected from the scientists of the member-states by a majority of these states. The Director shall be elected for a three-year term, the Vice-Directors for a two-year term.

The Board of Directors shall be elected by the plenipotentiary representatives of the member-states.

ARTICLE 21

The Institute Director shall be a plenipotentiary officer, who shall maintain relations with the appropriate institutions of the member-states in all questions regarding the Institute's work.

The Institute may establish direct communication with scientists and scientific organizations of other countries.

The Institute Vice-Directors shall assist the Director in the management of the Institute, substitute for him in his absence, and shall have a responsibility equal to his for all activity of the Institute.

ARTICLE 22

The Institute Board is responsible to the Governments of the member-states for the activity of the Institute and shall report to them periodically.

Only decisions of the Finance Committee and the Scientific Council may direct the Institute Board in the management of the Institute; the Institute Board shall not obey any orders from individual member-states.

ARTICLE 23

On the appointed dates, the Institute Board shall present a yearly budget estimate and a report of the budget balance to the Finance Committee.

ARTICLE 24

The Institute Board shall direct the scientific work of the Institute according to the program for scientific research procedure approved by the Institute's Scientific Council, and shall direct the financial affairs according to the decisions of the Finance Committee.

The Institute Board shall have the right of partially altering the scientific research programs assigned to the various Institute Laboratories.

The Board must inform the Institute's Scientific Council of all such changes or modifications.

ARTICLE 25

Each year, the Institute Board shall present to the Institute's Scientific Council for review and approval drafts of summary programs for scientific research works, drafts of programs for the future development of the Institute, and a report of the Institute's scientific work.

ARTICLE 26

The Institute Director shall be manager in chief of Institute assets. He shall be in charge of all the Institute resources and property.

Article 27

The Institute Director shall have the right:

a) to hire and discharge employees according to the Institute's personnel statute;

b) to establish or alter within the official wage limits approved by the Finance Committee the wages of all employees, and to initiate individual pay raises for highly-skilled workers of up to 50% of the original wage within the limits of the sums estimated for this.

SECTION VII

Laboratories of the Joint Nuclear Research Institute

Article 28

The Institute staff shall include: a Nuclear Problems Laboratory, a High Energy Laboratory, a Neutron Physics Laboratory, and a Theoretical Physics Laboratory, each of which shall coordinate the research in their respective fields of nuclear physics.

The Institute Laboratories shall consist of scientific departments and sections.

Decision of the Institute's Scientific Council can change the number of Laboratories to fit the requirements of the work at hand, and decision of the Institute Board can change the number of departments and sections.

Article 29

Scientists from member-states will be chosen by the Institute Board to serve as Laboratory Directors and subsequently approved by the Scientific Council; their function shall be the management of the Laboratories.

The Laboratory Directors shall be responsible to the Institute Board for their actions and for the work of their Laboratories.

Article 30

The Laboratory Directors shall direct all scientific research work in their Laboratories according to the program approved by the Institute Scientific Council; their function shall be the management of the Laboratories.

The Laboratory Directors shall be responsible to the Institute Board for their actions and for the work of their Laboratories.

Through the Institute Board, Laboratory Directors may select personnel, hire and discharge Laboratory employees, determine and alter, within the approved pay-rate limits, wages paid Laboratory employees according to the extent and quality of each employee's work, and may declare bonuses or fines.

ARTICLE 31

A Scientific Council shall be set up in each Laboratory, the staff of which shall be approved by the Institute Scientific Council.

The Laboratory Director shall be the president of the Laboratory Scientific Council.

The Laboratory Scientific Council:

a) shall prepare programs for the scientific research work assigned the Laboratory;

b) shall examine results obtained by such scientific research work and by individual studies;

c) shall confer doctorates and bachelors degrees in the mathematico-physical and technical sciences;

d) shall consider other questions concerning the scientific work of the Laboratory.

ARTICLE 32

On specified dates, the Laboratory Directors shall present a draft program of the Laboratory's scientific research work, a report on the Laboratory's work, and requests for needed materials and equipment to the Institute Board.

SECTION VIII

Administrative-Economic Management of the Joint Nuclear Research Institute

ARTICLE 33

The Institute Director shall appoint one of his assistants as Administrative Director to manage the administrative-economic work and construction of the Institute.

ARTICLE 34

The Administrative Director shall direct the work of the departments within his jurisdiction, which departments provide the framework of the Institute. He shall have the right of hiring and discharging workers in these departments.

ARTICLE 35

The Administrative Director as proxy for the Institute Director shall manage the assets and shall be responsible for the correct expenditure of Institute funds as outlined in the budget approved by the Finance Committee.

The Administrative Director shall be subordinate to and responsible for his actions to the Institute Director.

SECTION IX

Concerning Personnel at the Joint Nuclear Research Institute

ARTICLE 36

All persons on the Institute staff shall be employees of the said international scientific organization and under obligation to further its aims and undertakings.

ARTICLE 37

Institute employees shall be recruited from member-state citizens.

The Institute's Board shall consider the proposed contingents from each member-state, and the Scientific Council shall approve them.

The question of scientific workers sent by member-states for short-term work at the Institute shall be decided by the Institute Board.

ARTICLE 38

The obligations and rights of Institute personnel shall be determined by a Code of Regulations for personnel of the Joint Nuclear Research Institute. Personnel of the Institute shall be subject to the laws of the country in which the Institute is located.

ARTICLE 39

The Institute Board may take university students or graduates who are citizens of member-states for practical study in the Institute's Laboratories. In such cases, the states shall stand the expenses incurred by their students or novices. The form and term of this practical study shall be determined by the Institute Board.

SECTION X

Liquidation of the Joint Nuclear Research Institute

ARTICLE 40

The Joint Nuclear Research Institute can be liquidated by agreement of the member-states' governments.

Upon liquidation, all Institute equipment and all principal, subsidiary and administrative buildings shall become the property of the Union of Soviet Socialist Republics, wherein the Institute is located. Other member-states shall receive monetary reimbursement proportionate to the amount of participation assigned each of these states in capital outlay for the Institute.

Upon liquidation all Institute monetary assets on hand, except those portions required to pay Institute obligations, shall be distributed among those states who are members of the Institute at the time of its liquidation,

in proportion to the amounts of monetary payments actually contributed by these states during their participation in the work of the Institute.

SECTION XI

Ratification of the Charter

ARTICLE 41

This Charter shall be ratified by the Council of Plenipotentiary Representatives of the member-states.

The ratified copy of the Charter shall be kept at the Institute.

SECTION XII

Amendments to the Charter

This Charter may be amended or changed.

Proposals to change the Charter shall be directed to the Institute Board. The Board shall also have the right to propose changes in the Charter. Upon the acceptance of such proposals by a majority of the member-states, the Institute Board shall consider those changes as part of the Charter.

This Charter for the Institute has been drawn up in the Russian language on the 23d of September, in the year 1956. Witnessed copies of this document shall be sent by the Institute Board to all Institute member-states.

In witness whereof the plenipotentiary representatives of the Institute member-states' governments have signed this document and certified it with the Institute's seal.

ITEM 3*

Soviet Government Statement on General European Cooperation in the Peaceful Use of Atomic Energy

On July 12, the USSR Foreign Affairs Ministry sent to the Governments of Austria, Albania, Belgium, Bulgaria, Great Britain, Hungary, the German Democratic Republic, Greece, Denmark, Iceland, Italy, Luxembourg, the Netherlands, Norway, Poland, Rumania, the Federal Republic of Germany, Finland, France, Czechoslovakia, Switzerland, Sweden, Yugoslavia, and to the Government of the United States, through their embassies and legations in Moscow, the text of the Soviet Government statement: "On general European cooperation in the peaceful uses of atomic energy."

The text of the aforementioned statement was simultaneously brought to the attention of the Government of the Chinese People's Republic, the People's Democratic Republic of Korea, the Mongolian People's Republic, and the Democratic Republic of Vietnam, through their embassies in Moscow.

Here is the text of the statement of the Soviet Government.

The great discoveries in the sphere of atomic energy have considerably expanded the opportunities for technical progress, development of power, industry, agriculture, transport, science, and culture, and for improving the welfare of the people. Further development in the field of atomic energy and its practical application in science and engineering call for an appropriate industrial and scientific-technical base, call for collective efforts of states in organizing production and utilizing atomic energy for peaceful aims.

At present, when the Cold War and mutual nonconfidence in relations between states, which hampered the development of general international cooperation are receding into the past, more favorable conditions are appearing for the efforts of scientists, engineers, and other atomic specialists to be directed not toward military uses of atomic energy, but toward its use for peaceful aims, for the benefit of mankind.

* The English text of this statement was published in a TASS press release dated July 13, 1956.

The Soviet Government considers that the attainment of an international agreement on the unconditional prohibition of atomic and hydrogen weapons and on their withdrawal from the armaments of the states would open wide prospects for the peaceful uses of atomic energy and make it possible to switch over the huge material-scientific-technical and other resources from the production of means of destruction to the creation of material benefits and spiritual values.

Working consistently for unconditional prohibition of atomic and hydrogen weapons and for the use of atomic energy for peaceful purposes, the Soviet Government is already taking the necessary steps for a general development of international cooperation in the field of the peaceful uses for atomic energy. Moreover, the Soviet Government bases itself on the fact that international cooperation in this field must completely exclude the use for military aims of atomic materials which are provided on the basis of corresponding agreements.

It goes without saying that cooperation in the field of peaceful uses of atomic energy can be effective only under conditions of equality of all the interested parties, in the presence of strict respect of national sovereignty of the states and noninterference in their internal affairs, in the strict observance of the high principles expressed in the U. N. Charter. Such cooperation can be fruitful only if it will not harm the security of any of the states, and the assistance granted is not conditioned by any kind of demands of a political or military nature.

The Soviet Union, as one of the states which is developing the production of atomic energy and which possesses atomic raw material, is actively taking part in the development of international cooperation in the cause of the use of atomic energy for peaceful purposes. The USSR, together with other states, is taking part in the measures for the creation of an international agency for the peaceful uses of atomic energy.

The Soviet Government considers that the possibilities for development of international cooperation in the field of application of atomic energy are far from exhausted. In particular, this refers to development of cooperation in this field on a regional basis.

At the present moment the attention of broad public circles is being more and more attracted to the question of the organization of cooperation in the field of peaceful uses of atomic energy between the European states. The development of such cooperation between the European countries would have contributed considerably to the strengthening of confidence among them and would have been in accord with the interests of general European security. In present conditions it is the European states, together with the United States, which have the most favorable prospects, including the existence of highly-developed industry, qualified manpower, well-trained scientific and engineering cadres, and the necessary reserves, for the devel-

opment of cooperation in the field of the peaceful uses of atomic energy between European countries, and to render corresponding assistance to other states.

Nevertheless, one must but note that lately in some of the Western European states definite attempts are being made to exploit the understandable aspirations of the peoples for development of international cooperation in the field of peaceful uses of atomic energy, for the creation in this field of a closed grouping of a few states—which will hamper the broad cooperation in this field on a general European basis. Such a grouping is envisaged by the plans for setting up the so-called Euratom, an atomic merger of six European countries—France, the Federal Republic of Germany, Italy, Belgium, Holland, and Luxembourg.

According to the plan for the establishment of Euratom, drawn up by a special inter-governmental committee of the aforementioned six states, a monopoly of rights is to be given to this organization for the possession of all the nuclear materials as well as the right to distribute these materials among states of the group. The authors of this plan propose to grant the executive organs of Euratom rights and authority which would enable this organization to control, in fact, the whole atomic industry, and, to a considerable extent, branches of national economy connected with it in the states participating in this merger. Thus, in substance, a supranational character has been contemplated for this organization.

One cannot fail to see that the creation of such an organization under circumstances in which several West European states are members of closed military blocs which oppose other European states would result in the fact that the activity of the Euratom would be subject to the military-strategic aims of these blocs. By the nature of the organization of Euratom, it naturally could not be expected to carry out its activity in the interest of those states which have no opportunity to develop the production of atomic energy in their countries.

This means that economically stronger states and, in fact, the corresponding large monopolies of these countries, will have an opportunity to use Euratom to impose conditions on other countries which are much weaker economically. Obviously, this could lead only to the increasing of distrust in relations between states and would create additional difficulties in the organization of a system of effective European security.

One must also take into consideration the fact that the creation of this organization, to which only a part of Germany will belong, would lead to an even greater consolidation of the division of Germany into two parts and would make more difficult the achievement of measures for the creation of a single peace-loving and democratic German state.

One must also note the circumstance that the creation of Euratom would, in fact, lead to the removal of any restrictions in the production of atomic

energy, which are now being contemplated in relation to West Germany. This would permit the revenge-seeking West German circles to organize in their country production of atomic weapons, which would create a serious threat to the cause of peace in Europe.

The Soviet Union has always stood and continues to stand for wide international cooperation in the peaceful use of atomic energy. It does not make a secret of its achievements in the peaceful application of atomic energy and willingly shares it with all countries. It is giving effective assistance to several countries in the development of research in the fields of nuclear physics and the uses of atomic energy for peaceful aims, in the construction of atomic reactors, training of specialists, and so forth.

To bring about the cooperation of scientists in various countries in theoretical and experimental research in the field of nuclear physics and to broaden the possibilities for the use of atomic energy for peaceful purposes, on the initiative of the Soviet Union a conference was convened in Moscow in March 1956 of representatives of eleven countries of Europe and Asia who concluded an agreement on setting up an international scientific research organization under the name of the Joint Institute of Nuclear Research. In accordance with the agreement, the Soviet Government has handed over to the Joint Institute of Nuclear Research, the Institute of Nuclear Problems and the Electro-Physical Laboratory with all their unique equipment.

It is clearly provided for in the agreement that other states, wishing in the future to take part in the work of the Institute, can state their agreement with the articles of the agreement, and, following a decision of the majority of the members of the Institute, become members of the latter, with equal rights. Thus, the Joint Institute of Nuclear Research, open to other countries for participation, is destined to become an important center of cooperation between scientists of different states.

Proceeding from the fact that exchange of knowledge and experience in the field of the peaceful utilization of atomic energy will be a powerful incentive for the further development of atomic science and will contribute to the elimination of suspicion and distrust in this field, the Soviet Union submitted in April 1956, for examination by the 11th session of the European Economic Commission, a proposal on creating, within the framework of this organization, a body to deal with questions of the utilization of atomic energy for peaceful purposes.

Introducing this proposal, the Soviet Government proceeded from the fact that some countries, especially small countries, do not have the ability to solve by themselves the complex questions connected with the peaceful utilization of atomic energy. Such questions as the training of scientific cadres, the creation of a material base for the development of scientific research work, the setting up and development of the production of atomic

energy for peaceful purposes are very complex matters which demand huge expenditures and the existence of a corresponding technical base. Without doubt, the broad cooperation of all European states in this field will speed up the development of the production of atomic energy for peaceful purposes and will to a large extent, contribute to raising the well-being of the peoples.

Attributing great importance to cooperation in the field of peaceful utilization of atomic energy, the Soviet Government holds that the time has come for convening a conference of the countries of Europe for the discussion of the question of setting up a general European regional body for the peaceful utilization of atomic energy. Such a body could be set up on an inter-government basis, with the participation of all the European states wishing to join. The United States could also participate in such a body.

In the opinion of the Soviet Government, such a conference could discuss the question of the rights and powers of the above-mentioned body, while bearing in mind that its competence should include such questions as, for instance, the study of the economic aspects of the peaceful utilization of atomic energy; study of the possibility of coordinating the utilization of raw material resources; the rendering of technical assistance; exchange of information; granting of technical and scientific consultation by states advanced in the atomic field, to other states; assistance through cadres; discussion of the question of maintaining permanent relations between the international and national organizations existing in Europe in the field of the utilization of atomic energy for peaceful purposes.

The conference could, of course, examine any other proposals of states regarding the extension of international cooperation in the field of peaceful utilization of atomic energy.

It goes without saying that a broad development of general European cooperation in the task of peaceful utilization of atomic energy by no means excludes bilateral agreements in this field. On the contrary, bilateral agreements, concluded on the basis of equality and without imposing on one of the parties any political, economic, military, or other demands incompatible with the principles of respect for the sovereignty and independence of states, will contribute to the unification of the efforts of the states and to cooperate between them in the field of utilization of atomic energy for peaceful purposes.

The Soviet Government expresses its conviction that the governments of all interested countries will respond with suitable attention to the appeal of the Soviet Union for uniting their efforts in this important field. It expresses its conviction that such cooperation of all European states would contribute to a large extent to reaching an agreement on banning the atomic and hydrogen weapons and eliminate them from the armaments of the

states—which, in its turn, would secure the utilization of all nuclear materials exclusively for peaceful purposes, for the progress of science and technology, for the use of the people.

ITEM 4

Declaration of the U.S.S.R. Ministry of Foreign Affairs on Plans to Create Euratom and a "Common Market" *

At the present time the governments of France, the German Federal Republic, Italy, Belgium, Holland and Luxemburg are preparing the creation in Western Europe of two new closed organizations, a "partnership" of the six named countries in atomic energy (the so-called "Euratom") and a "common market," within whose framework is planned the gradual abolition of customs duties in the economy of each of the countries, "free" movement of labor force and capital, and joint exploitation by the participating countries of French, Belgian and Dutch colonial domains.

In view of the fact that the plans to create Euratom and the "common market," which concern problems of economic cooperation and cooperation in the use of atomic energy (problems which are important ones for all European countries), envisage measures whose fulfillment will entail dangerous consequences for the peoples of Europe, the U.S.S.R. Ministry of Foreign Affairs has been authorized to make the following declaration.

The Soviet Union has constantly sought, and now seeks, the fullest development of international economic cooperation, including cooperation in the use of atomic energy for peaceful purposes, since such cooperation corresponds to the interests of all countries, strengthens confidence between peoples, and creates a solid basis for the peaceful co-existence of states.

The Soviet Union attaches special importance to the establishment of such cooperation in Europe on an all-European basis, inasmuch as it would contribute to overcoming the division of Europe into opposed military groupings, which (division) has been the result of the Western powers' policies, and would contribute to European peace.

The devolopment of peaceful production of atomic energy on a wide scale in European countries would open up favorable perspectives for the development of economy, science and culture, and for the increased well-being of the peoples. The use of the tremendous opportunities which peaceful utilization of atomic energy gives naturally requires a corresponding productive and scientific-technical base, and the united efforts of the states in organizing the broad industrial production of atomic energy. Therefore the Soviet government regards with understanding the aspira-

* Pravda, March 17, 1957, p. 3.

tions of various European states, especially those which do not have sufficient resources and technical experience at their disposal to carry out work in this field, to unite their efforts and opportunities for peaceful use of atomic energy and to make use of the scientific and technical experience which has been accumulated by other countries.

The Soviet government understands equally well the interest of European countries in establishing broad economic cooperation in all other fields. The broadening of economic cooperation between European countries would have a highly favorable effect on the development of these countries' economy, on increased employment, and on the improvement of the living standard of the population. It would exert a positive influence on the world economic situation as a whole. Economic cooperation on an all-European basis would assist in restoring traditional trade ties and scientific-technical ties which have been destroyed; it would help overcome artificial obstacles and limitations in the area of commercial and other economic relationships; it would bring European states closer to one another, and would increase the European peoples' sense of security and faith in the morrow.

However, the plans to create Euratom and the "common market" stand in clear contradiction to these aims. One's attention is drawn first of all to the fact that all the members of Euratom and the "common market" are members of the military grouping, NATO. It is obvious that the entire activity of Euratom and the "common market" will be subordinated to the aims of NATO, whose aggressive character is widely known.

Under such conditions the fulfillment of plans to create Euratom and the "common market" will inevitably lead to a further deepening of the division which splits Europe, to the increase of tension in Europe; it will greatly complicate the establishment of economic and political cooperation on an all-European basis; it will create new difficulties in solving the problems of European security.

New and serious obstacles will also arise in the path of restoring the national unity of the German people, since Western Germany will be still more deeply drawn into the system of closed military groupings of the Western powers which are opposed to other European states. In this connection it is necessary to note the understandable concern expressed by the Social Democratic Party through its leader Ollenhauer in his declaration of March 6th of this year, in which he pointed out a number of dangerous consequences for the German people in the plans to create Euratom and the "common market."

The affirmations of certain leading statesmen in the Western countries to the effect that Euratom and the "common market" will concern themselves exclusively with problems of peaceful cooperation among the participating countries represent nothing more than a concealment of the actual

plotting of their organizers and originators. One must not forget that certain United States circles which actively support the creation of Euratom are seeking the earliest possible restoration of German militarism and the equipment of the already-created West German army with all types of modern arms, including atomic arms. As is known, it was on the initiative of the United States that a decision was made on this question at a NATO Council session in December, 1956. The creation of Euratom will be a practical step in the fulfillment of these aggressive plans, so dangerous for all peoples.

There can be no doubt that revenge-seeking circles in Western Germany will miss no opportunity to use Euratom for accumulating atomic materials and raw materials in order more quickly to prepare for the production of their own atomic weapons. In this way, the creation of Euratom will clear the way for German militarism to prepare for new military adventures; in the middle of Europe there will again arise a dangerous center of unrest. In this connection, however, it must again be noted that the equipment of the West German army with nuclear weapons will be pregnant with dangerous consequences, above all for the population of West Germany itself, which may find itself the object of a retaliatory atomic blow.

Concerning the plans of the ruling circles of certain West European countries to use Euratom as a means of controlling the production of atomic energy in Western Germany, such plans have been shown by experience to be without foundation. It is well known that when the European Coal and Steel Union was created, the French government, seeking to ensure ratification of the agreement to create this Union by the French parliament, also declared that it would be possible by way of this Union to gain control over Western Germany's war-industry potential. Seeking the ratification of the Paris agreements, the French government asserted that these agreements would be a means of achieving military control over Western Germany. It is now clear to all that these calculations proved illusory. The creation of Euratom—regardless of others' wishes—will inevitably lead to the removal of all limitations in the field of atomic arms production in Western Germany, and this will create a direct threat to the people of France as well as to the peoples of other West European nations.

Equally without foundation are the plans of certain circles in France, Italy, and other West European states that the creation of Euratom will contribute to a lessening of these countries' economic dependence on the United States. On the contrary, their dependence on the U.S.A. will only increase, to the detriment of the national sovereignty of the countries participating in this grouping, since the United States—and nobody attempts to conceal this fact—will in reality control Euratom, acting in the capacity of chief supplier of fissionable materials and of equipment for atomic

production in Euratom countries. It is not by accident that influential circles in England have come out against England's joining Euratom, realizing full well the consequences which participation in it would have for England.

The plan to create a "common market" likewise represents a serious threat for the peoples of European countries. . . .

. . . Proceeding from these considerations, the Soviet Union has already put forth a number of suggestions aimed at establishing genuinely all-European cooperation:

1. In April, 1956, at the eleventh session of the European Economic Commission of the United Nations, the Soviet Union introduced a proposal to create, within the framework of this commission, an organ dealing with questions of utilizing atomic energy for peaceful purposes. This proposal is included in the agenda of the twelfth session of the United Nations' European Economic Commission, which opened on April 29th of this year.

2. In its declaration "On All-European Cooperation in Peaceful Utilization of Atomic Energy" of July 12, 1956, the Soviet government proposed that a conference of all the European countries be convened to discuss the question of creating an all-European organization on peaceful utilization of atomic energy, bearing in mind that this organization would be a regional division or department of the International Atomic Energy Agency. In the opinion of the Soviet government, such an organization could be founded on an inter-governmental basis, with participation in it by all interested European states, and also by the United States.

This regional organization for peaceful use of atomic energy, as suggested by the Soviet Union, would not be directed against any state or group of states and would not act counter to any national interests whatever.

Cooperation in the framework of an all-European regional organization on atomic energy would, beyond any doubt, be able to contribute to the progress of each of the European countries in the peaceful utilization of atomic energy and to the raising of the European peoples' living standards, not to mention the fact that it would be an important means of improving the situation in Europe generally.

The establishment of all-European cooperation in peaceful utilization of atomic energy would contribute in many respects to a solution of the most urgent modern-day problem: the prohibition of atomic and hydrogen weapons as weapons of mass destruction.

Guided by its desire to contribute to a positive solution of the problem of all-European cooperation in the peaceful utilization of atomic energy, the Soviet government proposes that certain supplementary problems be considered, including the following:

a) the creation of a scientific-research institute or institutes in atomic energy, on an all-European basis;

b) cooperation in creating enterprises for producing atomic energy for industrial and scientific-research purposes, including problems of ensuring a supply of raw materials for these enterprises.

It goes without saying that, when cooperation in peaceful utilization of atomic energy is made possible on an all-European basis, European countries will have the opportunity to take advantage of the Soviet Union's experience in this field. . . .

. . . The Soviet government is ready to consider any other proposals concerning principles and forms of all-European economic cooperation, as well as cooperation in the peaceful use of atomic energy.

The Soviet government believes that the proposals outlined above for all-European economic cooperation and cooperation in peaceful use of atomic energy may be considered at the twelfth session of the United Nations' European Economic Commission.

The Soviet government hopes that the governments of all interested lands will give due attention to the Soviet Union's proposal on the question of all-European economic cooperation and of cooperation in the field of peaceful use of atomic energy.
