Introduction

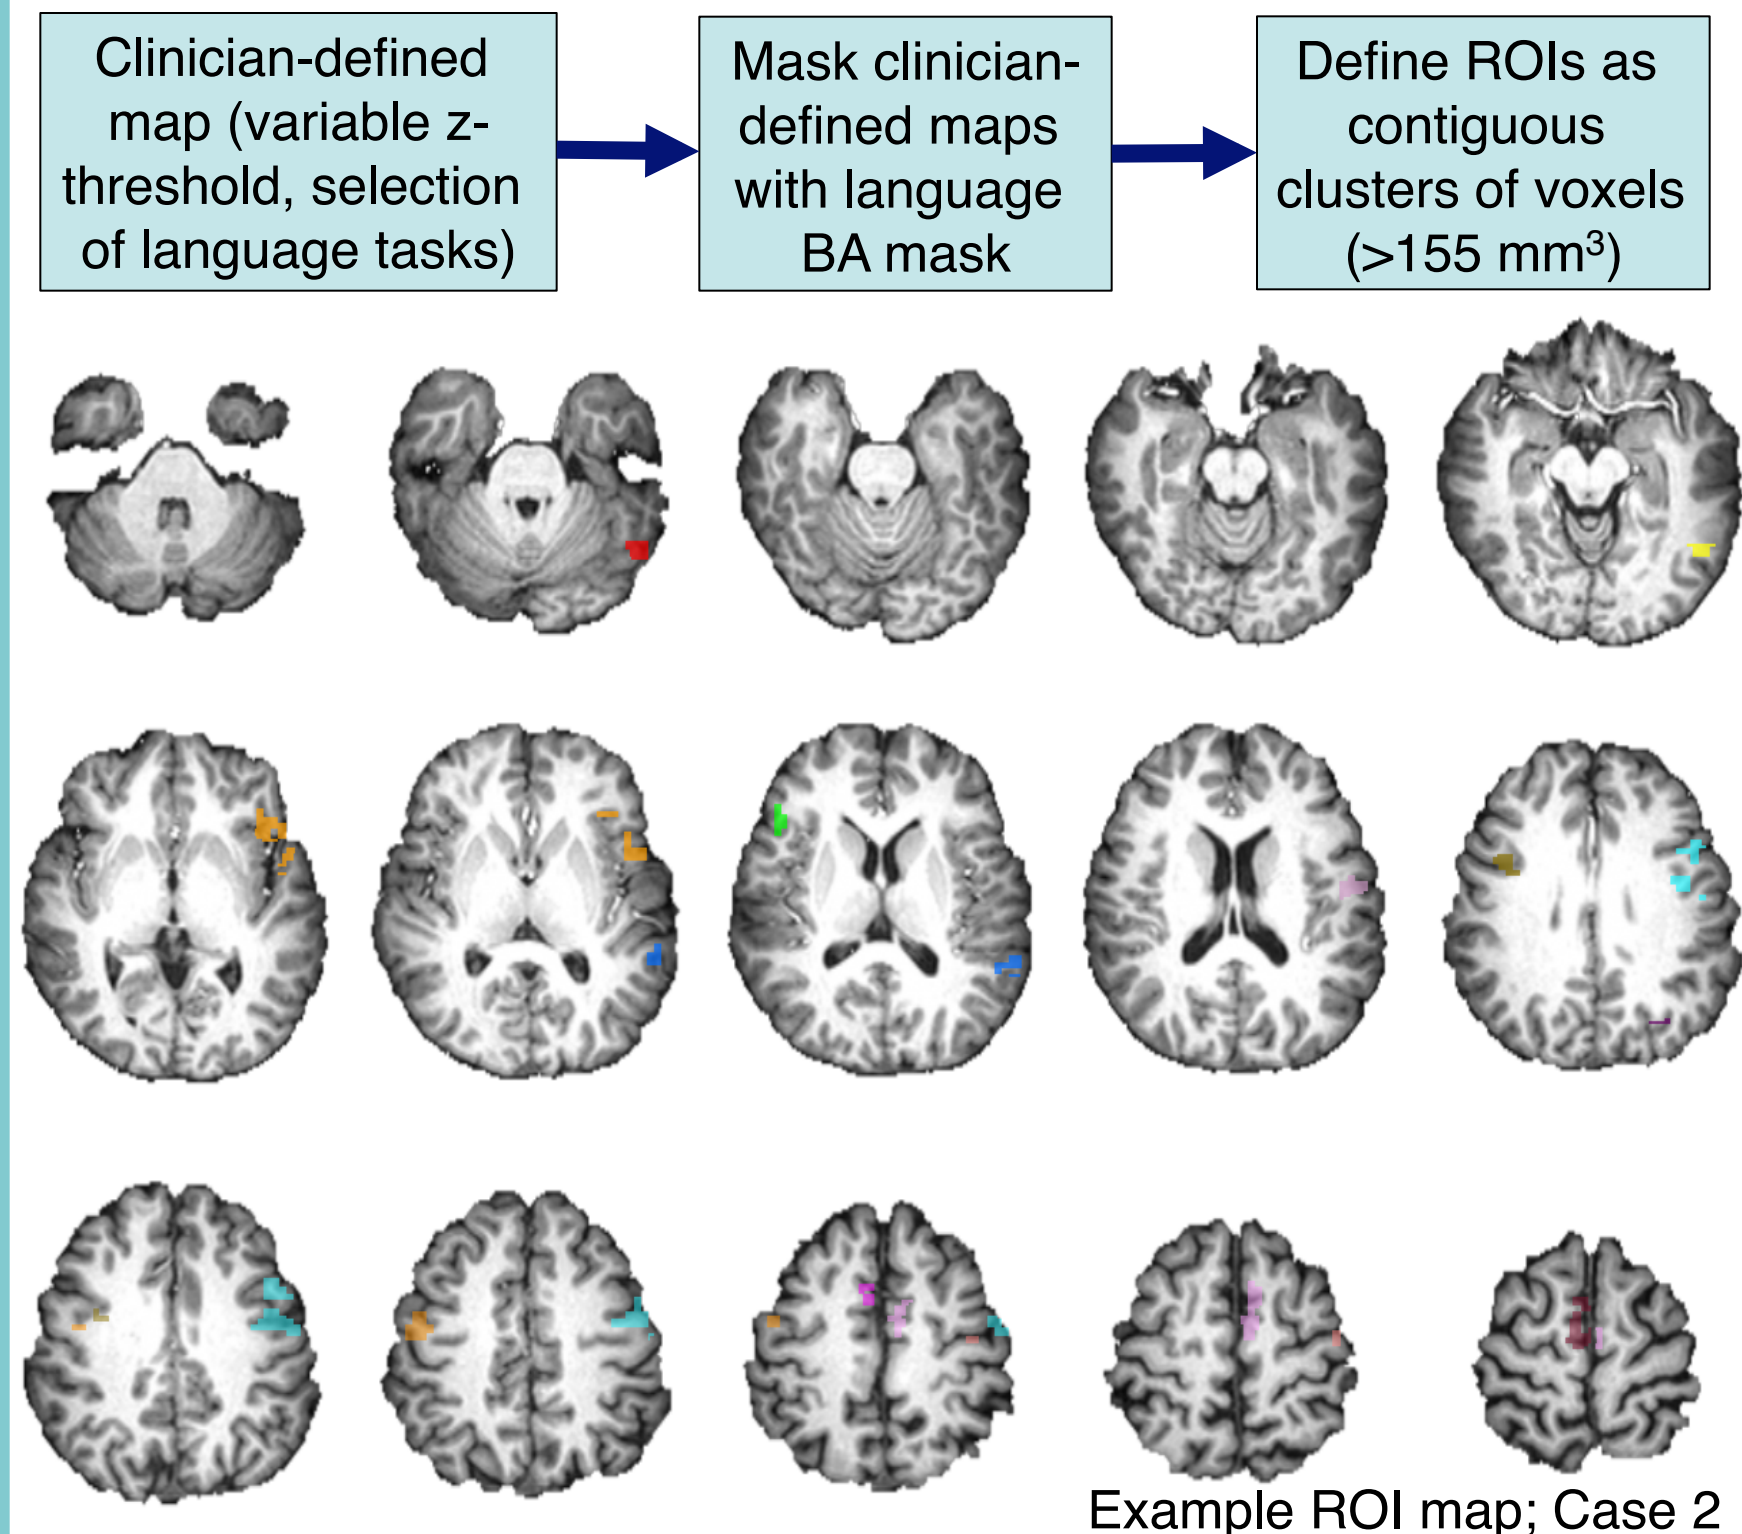

Neurosurgery is potentially curative in chronic epilepsy but can only be offered to patients if the surgical risk to language is known. Clinical functional magnetic resonance imaging (fMRI) is a potentially ideal, noninvasive method for localizing language cortex yet remains to be validated for this purpose. Connectivity analyses presented here provide preliminary validation for this method by demonstrating that such maps are likely to be functionally-cohesive.

Subjects and Methods

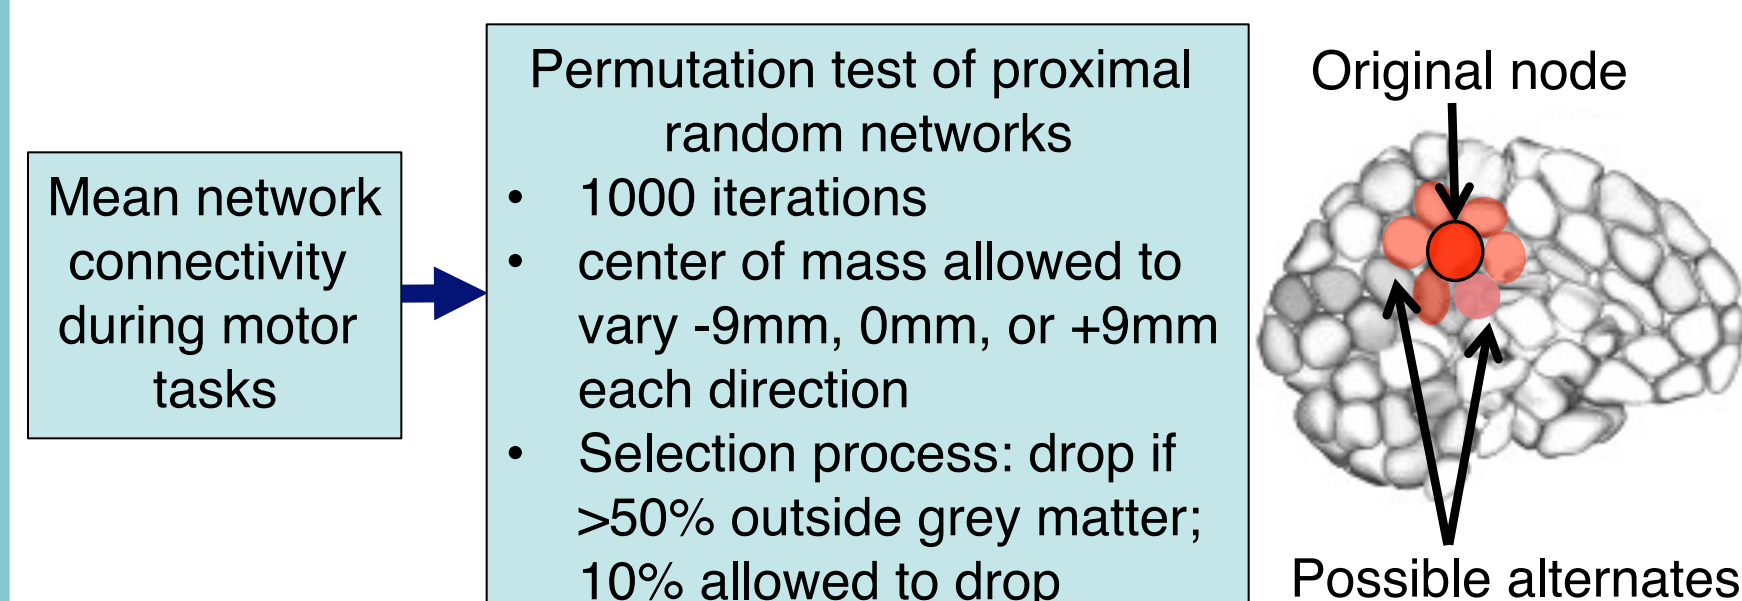

- 16 temporal lobe epilepsy (TLE) patients
 - undergoing evaluation for surgery
 - mean age 38.9, sd 11.4
 - 14 left language-dominant, 1 right, 1 mixed (Wada)
- 4 min runs of language and motor tasks
 - language tasks: auditory responsive naming, object naming, visual responsive naming
 - motor tasks: foot-tapping, finger-tapping, tongue motor

Analysis

Majority weak (MW): >50% nodes weakly correlated ($r < 0.1$) with network

Validated + no MW	Validated + MW
Not validated + no MW	Not validated + MW

Percent scans with MW

Summary

- 69% of clinician-derived language maps exhibited mean connectivity greater than proximal random networks ($p < 0.05$)
- 77% of clinician-derived language maps exhibited mean connectivity greater than fully random networks ($p < 0.05$)
- 75% of networks not passing the proximal permutation test contained a majority of weak nodes. In contrast, only 22% of networks passing the test contained a majority of weak nodes

Discussion

- The majority of clinician-derived language maps demonstrated significant functional connectivity, indicating that these regions are functionally related
- The networks that do not pass the permutation test may contain many nodes that are not part of the network
- Next steps include: relating these results to surgical outcomes, and comparing fMRI language maps using this technique with the results of direct stimulation mapping

Conclusion

- This study provides preliminary validity for a novel, clinician-based approach to presurgical language localization
- This complements our recent work showing this method is reliable, and supports future work validating this method
