ORGANIZATIONAL LEARNING AND CAPABILITIES FOR ONSHORE AND OFFSHORE BPO

Abstract

This paper identifies and analyses firm-level characteristics that facilitate onshore and offshore business process outsourcing (BPO). We complement and extend prior IS outsourcing research using organizational economics by using organizational learning and capabilities to develop a conceptual model. We test the conceptual model with archival data on a broad cross-section of U.S. firms. Our empirical findings indicate that firms with experience in onshore IT outsourcing (ITO) and capabilities related to IT coordination applications and business process codification are more likely to engage in BPO, firms with experience in internationalization are more likely to engage in offshore BPO, IT coordination applications have a greater impact on onshore BPO than on offshore BPO, and the effect of business process codification is partly mediated through ITO.

Keywords: BPO, capabilities, information systems, IT, offshoring, organizational economics, organizational learning, outsourcing.

“Rather, therefore, than ask the question ‘What is the best generic mode (market, hybrid, firm, or bureau) to organize X?’, which is the traditional transaction cost query, the question to be put instead is ‘How should firm A—which has pre-existing strengths and weaknesses (core competencies and disabilities) –organize X?’” Williamson [92, p. 1103].

“Experience, learning and adaptation can bring about improvement, or even an approximate local optimization, with respect to...the determination of the firm’s boundaries at the micro level of a make-or-buy decision.” Winter [93, p. 177].

1. INTRODUCTION

Firms are increasingly utilizing onshore and offshore business process outsourcing (BPO) to manage their operations and achieve their strategic objectives [5]. In BPO, a firm delegates one or more business processes to be delivered by an external vendor. Gartner estimates that the worldwide BPO market grew from \$65 billion in 2001 to \$110 billion in 2009, and forecasts growth to \$130 billion in 2013 [94]. Offshore BPO is growing at a particularly rapid pace – Gartner estimates that 2008 revenue grew 24% for India BPO vendors and 33% for China BPO vendors [70].

Although the growth of onshore and offshore BPO is recognized by practitioners and researchers, there is only a partial understanding of the factors that drive this growth. Prior research has shown that IT reduces the coordination cost and lowers the transaction risk of outsourcing by facilitating deeper relationships with a smaller number of suppliers [27]. While research suggests that differences in levels of outsourcing and returns to outsourcing may be based on differences in managerial and technical capabilities [45], these managerial and technical capabilities need to be more fully articulated and elaborated. Recent research has

called for further firm-level work to understand the factors that drive outsourcing and offshoring [6, 23]. For example, Arora and Forman [6, p. 99] asked “...some firms are systematically more capable in offshoring than others...What is it that makes a firm more or less capable?”

The current partial understanding of factors that drive outsourcing and offshoring can be illustrated by the following quote on Wachovia Bank (now owned by Wells Fargo): “Wachovia chief executive Ken Thompson initially expressed reluctance about offshoring but joined the trend after a trip to India in 2005. The company now partners with a number of outside vendors...After first shifting some technology functions to vendors, Wachovia teamed with Genpact in 2005 to handle a variety of back-office processes...including loan review functions, collections and investment banking analysis...Wachovia’s latest offshoring venture is a call center in the Philippines...It’s the banks first customer-service operation overseas” [77]. The types of questions that can be asked are as follows. Why did Wachovia initially not engage in offshoring? How did Wachovia overcome this initial state? How did Wachovia progress from a state of no offshoring to a state of offshoring some IT processes, to a state of offshoring back-office processes, to a state of offshoring customer-facing processes?

Williamson [92] suggests that these types of questions on firm-specific decisions can be studied using theory on organizational capabilities: “One possibility...is that transaction cost economics informs the *generic* decision to make-or-buy while competence brings in *particulars*” [92, p. 1097] (emphasis in original). While prior IS research has developed insights on outsourcing and offshoring, primarily using theory from organizational economics, there is a need to supplement this research with “particulars” at the firm-level. How do firms learn to engage in BPO? What are the capabilities to engage in BPO? Do these capabilities differ between onshore and offshore BPO?

This paper complements and extends prior outsourcing research using organizational economics by using organizational capabilities to explain firm-level BPO. We use prior theory to develop a conceptual model for the following research question: *What are the firm-level technical and managerial capabilities that facilitate outsourcing and offshoring?* We build on prior theory to argue that firms use organizational learning to develop capabilities, and we articulate the relevant capabilities for onshore and offshore BPO. There is also managerial value to understand the characteristics of firms that engage in onshore and offshore BPO.

We test the conceptual model by conducting an empirical study using archival data on a broad cross-section of firms publicly traded in the U.S. Our findings validate the manner in which firms develop capabilities through learning and experience, and provide insights on the incremental experience necessary for offshore BPO as compared with onshore BPO. We demonstrate the roles of systems and process capabilities in BPO, and we perform additional analysis to show the differential effects of systems and process capabilities for onshore and offshore BPO.

2. THEORY AND RESEARCH MODEL

2.1 Prior Literature

Table 1 categorizes prior IS outsourcing research based on two dimensions – level of analysis and theoretical perspective. We include level of analysis as one dimension, because the adoption of procurement and outsourcing strategies and the establishment of buyer-supplier relationships are frequently driven by factors at various levels [30, 50]. The highest level of analysis is the economy or industry level, as outsourcing and offshoring can be driven by economy-wide factors and different industries can experience differential returns to outsourcing [34, 45]. A second level is the organization level, at which firms engage in outsourcing

relationships [2, 59]. A third level is the process or project level, at which firms structure buyer-supplier outsourcing contracts. The lowest level of analysis is the occupation level, at which managers make day-to-day decisions related to outsourcing and offshoring [68].

- Insert Table 1 about here -

In Table 1, the theoretical dimension suggests that most IS outsourcing research has used theory from organizational economics such as transaction cost economics, incomplete contracts theory, and agency theory [9, 26], along with perspectives from competitive strategy [54]. The level of analysis dimension suggests that research at the lower levels is relatively more recent compared with research at the higher levels [76]. The lack of research at some intersections of levels of analysis and theoretical perspectives suggests potential research opportunities. For example, while recent IS outsourcing research has incorporated a capabilities view at the process / project level [62] and a learning-based view at the firm level [23], there has not yet been the use of capabilities to explain firm-level outsourcing and offshoring decisions as called for in prior research [6, 92]. The contribution of this paper is to complement research on organizational economics by using organizational learning and capabilities to define firm-level technical and managerial capabilities that enable firms to engage in onshore and offshore BPO.

2.2 Organizational learning

Organizational learning enables firms to create capabilities, and capabilities in turn form the basis for competitive strategies [16, 42]. Organizations learn by evaluating their past activities, and using their past activities as a guide for present and future activities [49]. As a firm gains experience with an activity, the firm develops routines associated with the activity. The firm gains confidence and expertise in the routines, which increases the probability that the firm will repeat the routines in the future [43]. For example, as a firm gains acquisition

experience, the firm is more likely to make subsequent acquisitions, and a firm that makes a particular type of acquisition is more likely to make the same type of acquisition in the future [1].

Organizational learning also applies to the inter-firm context, as illustrated by the literature on alliances and sourcing. Similar to BPO, in alliances critical resources span firm boundaries through inter-firm processes and complementary resources of partners [85]. Once a firm begins to collaborate with alliance partners, the firm develops experience in cooperation and partnering. Based on this experience, the firm develops the knowledge to identify alliance opportunities, form alliances, manage alliance relationships, and transfer information to and from alliance partners [33]. Similar to alliances, sourcing experience contributes to development of routines that enable firms to collaborate with a range of partners [56]. Experienced firms can more effectively identify and select trustworthy suppliers, negotiate and organize relationships, monitor and enforce terms, and anticipate and respond to contingencies based on learning from prior sourcing engagements [95]. Firms with greater sourcing experience are more likely to outsource, because they have learned the administrative routines that enhance their abilities to engage in successful sourcing partnerships.

We extend the concept of organizational learning from the inter-firm alliance and sourcing contexts to the inter-firm BPO context. BPO requires the client firm to perform a set of routines. The client firm must identify and negotiate with a qualified vendor, and monitor and exchange information throughout the BPO relationship. Because business processes are highly interconnected and interdependent, BPO requires extensive communication and coordination to manage outsourced processes across firm boundaries and to transfer process outputs from the vendor to the client's internal operations [23]. These activities are particularly important for BPO, because of the extent to which BPO vendors interact directly with the client firm's

customers and suppliers. Any breakdown in service quality can negatively impact the client firm's ability to maintain and expand its customer base, and directly hinder the client firm's ability to accomplish its strategic objectives [61]. Organizations with experience in outsourcing another corporate function will have learned to perform these activities for BPO.

BPO shares some characteristics with ITO, including the need to coordinate a vendor relationship and the nature of potential benefits and risks [91]. Another shared characteristic is that ITO and BPO can be delivered via domestic or international resources [22, 76]. These common characteristics suggest that client firms can apply learning from ITO to engage in BPO.

This theory is supported by case examples such as General Motors (GM) and Prudential Insurance. GM was one of the first large North American corporations to engage in wholesale ITO, when it spun off and outsourced all IT operations to EDS in 1996. As GM learned to coordinate with its ITO vendor, GM was able to apply this knowledge to engage in large scale BPO for other business processes. For example, in 1999 GM engaged Sitel to perform customer service, marketing and dealer support for all GM brands, using 2,000 agents based at three U.S. call centers [72]. GM also engaged in BPO of its financial and accounting functions with Arthur Andersen in a 10-year \$250 million contract, including payroll, billing, accounts receivable, accounts payable, and fixed asset accounting [73]. Affiliated Computer Services (ACS, now owned by Xerox) acquired the BPO business from Arthur Andersen and signed a new 10-year contract with GM in 2002.

Prudential Financial is another firm that gained outsourcing experience through ITO, signing a 5-year \$350-million contract with IBM in 1996 [69]. The contract called for IBM to provide maintenance for customer information and database applications related to insurance, mutual funds, annuities and securities. After this ITO contract, Prudential Financial then

engaged in a 10-year \$700-million BPO contract with Exult (now owned by Hewitt) for HR services, including payroll, benefits, HR call center, and employee data and records management [39]. Consistent with the discussion and examples above that firms apply learning from ITO to engage in BPO, we hypothesize that:

H1: (Onshore ITO Influence on BPO Hypothesis) Firms that are engaged in onshore ITO will be more likely to engage in (a) onshore BPO and (b) offshore BPO.

While organizational learning in the domestic context supports future domestic and international partnerships [33], for offshore BPO further learning is required to overcome differences between the domestic and international contexts. Differences and distance between countries pose obstacles to the flow of information and transfer of knowledge between partner firms, which can impact the governance of inter-firm relationships [12]. In the same way that differences between countries present challenges in the inter-firm context, these differences are not yet fully understood in the offshore outsourcing context, and present unique financial, legal and managerial risks compared with onshore outsourcing [52].

To internationalize, or transfer processes and technologies from one country to another country, a firm must develop information processing and control routines to coordinate activities across national boundaries [12]. Firms that operate in international markets encounter a diversity of potential suppliers and partners that are initially unfamiliar. As the firm gains familiarity and experience with international partners, the firm learns to overcome cultural distance and communication barriers, and improve governance of relationships. The firm's accumulated experience with international partners helps the firm recognize and bridge the cultural, administrative, geographic and economic differences between countries [38]. The firm's experience in hiring local employees through international subsidiaries also helps reduce the

cultural distance to partners in those countries. Learning enhances the firm's ability to explore international partnership opportunities, seek partners, coordinate and allocate activities, and resolve conflicts. The firm establishes specialization in international partnerships, which enables the firm to develop and apply coordination routines in internationalization [55].

Once a firm learns to coordinate internationally based on its experience with international partners, the firm is able to establish future international operations more smoothly and manage those operations more efficiently, and this knowledge influences the firm's future decisions [90]. While onshore outsourcing experience helps the firm learn cooperation and collaboration in a partnership setting, offshore outsourcing gives the firm experience with the partnership *and* international dimensions necessary to establish further international operations such as offshore BPO.

The application of organizational learning from international experience to offshore BPO is evidenced by the cases of Aetna and Microsoft. The health insurance firm Aetna learned to coordinate international vendors through an IT offshoring contract with Infosys. In 1999, Aetna engaged Infosys to standardize IT platforms, migrate applications, centralize data, and develop Internet-based health care and financial services offerings [41]. Aetna planned to have 300 Infosys personnel involved on its account by the end of 2000, and to save \$12 million dollars on its 2000 IT budget. Within two years, Aetna was able to apply this learning in the management of international vendors to engage in an offshore BPO contract with ACS to process medical and dental claims data [37].

Microsoft learned to coordinate international employees by opening the Microsoft India Development Center (MIDC) in Hyderabad in 1998. The MIDC began with a \$3 million dollar investment and 20 employees, growing to 40 employees the next year, and 200 employees in

2003. In 2002, Bill Gates visited India and announced that Microsoft would invest \$75 - \$100 million dollars to grow the MIDC to 500 employees, and would also establish a .NET lab in Bangalore with 100 Microsoft employees and 250 outsourced personnel [82]. Microsoft's learning on international coordination is illustrated by this quote from the MIDC general manager "The Microsoft India Development Center is an extension of the product teams in Redmond (Microsoft headquarters) and we are focused on ensuring that we integrate with our product development activity in progress around the world" [21]. Microsoft applied this learning to engage in a BPO contract with Sykes for customer service processes, and Sykes fulfilled this contract largely through offshore call centers [10]. Consistent with the discussion and examples above that firms apply learning from internationalization to engage in offshore BPO, we hypothesize that:

H2: (Internationalization Influence on Offshore BPO Hypothesis) Organizations that are engaged in coordination of (a) international vendors, (b) suppliers, or (c) employees will be more likely to engage in offshore BPO.

2.3 Organizational capabilities

By developing, accessing and integrating knowledge, an organization develops capabilities that are the basis for competitive strategies. Researchers have placed knowledge-related organizational capabilities into two categories – systems capabilities and process capabilities [40]. *Systems capabilities* involve the technology-oriented facets of knowledge transfer, including technical infrastructure and IT systems that bridge time and space in the exchange of knowledge between dispersed entities. *Process capabilities* involve the people- and process-oriented facets of knowledge transfer, including the routines, procedures and coordination that facilitate knowledge exchange.

This categorization of systems vs. process capabilities is widely echoed in the literature [65]. For example, IT assets (*systems*) along with workplace organizational and practices (*process*) influence firm productivity and performance [4, 18]. The sophistication of modern software (*systems*) plus standardization of business processes (*process*) are among the motivators for increased external partnering [19]. IT integration capability (*systems*) and process capability (*process*) enable firms to manage activities with supply chain partners [75]. Information intensity (*systems*) and codification (*process*) facilitate the global disaggregation of occupations [68]. Building on this literature, we discuss the role of systems capabilities and process capabilities to facilitate BPO.

IT systems enhance communication and coordination within the firm and between a firm and its partners [44, 60]. Firms with stronger IT systems capabilities are more focused, less hierarchical, and more likely to engage in external partnering with other firms [20, 48]. IT systems serve as standard interfaces for business processes, which reduces monitoring and enforcement costs and allows firms to efficiently exchange with multiple partners [27, 78]. “Digitization technologies have ... enabled the creation of atomized and modular business processes that ... can be accessed from anywhere through electronic interfaces, greatly enhancing their reach.” [79, p. 47]. Process-level research calls for more work on firm-level characteristics that can facilitate process modularity [88]. IT coordination applications can be viewed as a strategic option that gives a firm the capability to deploy an outsourcing strategy [14, 25].

Cisco is an example of a firm that first established systems capabilities, and then applied these capabilities to engage in BPO. After Cisco’s rudimentary IT systems failed and shut the company down for two days in 1994, over the following two years Cisco implemented a new

ERP system and replaced nearly all of its existing technology [64]. These IT applications enabled Cisco to build out its Internet resources, including an intranet for employees, online ordering and technical support for customers, and supply chain automation and management for suppliers. In addition to enabling Cisco to coordinate and integrate with customers and suppliers, these systems capabilities enabled Cisco to coordinate and integrate with BPO vendors, as Cisco outsourced order processing work to Infosys and customer call center support to Convergys [36]. Because IT systems represent a firm-level capability that provides a standard interface and facilitates communication, monitoring and enforcement, we hypothesize that:

H3: (Systems Capabilities Influence on BPO Hypothesis) Organizations with systems capabilities related to IT coordination applications will be more likely to engage in (a) onshore BPO and (b) offshore BPO.

While IT systems provide a standard interface to facilitate the exchange of knowledge, the knowledge must be recorded in a suitable form in order for knowledge transfer to take place. Codification is the compression of knowledge and experience into a structure, involving the use of codes and models to translate rules and actions into procedures, guidelines, specifications and documents [81]. Codification is a process capability that facilitates the capture, transformation, storage and retrieval of knowledge, and the transmission of knowledge across units, firms and locations, which contributes to modifying the spatial organization and division of labor [28]. Codification contributes to outsourcing by making it possible for buyers and sellers to enter into contractual relationships, because codification provides a representation of the services the buyer can expect the seller to provide [57]. Codification enables an improved specification of roles, goals, operating procedures and contractual obligations to facilitate the coordination of complex activities and the split of business processes across business units and firm boundaries.

Harvard Pilgrim Health Care, a \$2.5 billion health care insurance plan, illustrates the relationship between process capabilities and BPO. In 2000, Harvard Pilgrim performed an extensive analysis of its capabilities in various processes, such as customer service, product development, actuarial services, contracting, and sales and marketing [66]. This analysis enabled Harvard Pilgrim to place its business processes into four categories – activities that should be kept in house, activities that could be shared with other divisions in the firm, activities that could be automated, and activities that could be outsourced. Based on the analysis, Harvard Pilgrim outsourced some business processes including pharmacy benefits management and claims processing. “With the benefit of the capabilities-analysis results, the company could spell out precisely what it expected its dozens of contractors to deliver in terms of quality, cost, volume, and cycle time – and then could closely track their success...” [66, p. 78].

Process capabilities are relevant in both the domestic and international contexts. Codification facilitates the globalization of local knowledge, and reduces the time to transfer knowledge internationally [53]. “The move abroad, therefore, is likely to involve organizational functions that trade in well codified information...” [17, p. 152]. Occupation-level research reinforces that codification facilitates disaggregation across geographic platforms [68]. Because codification of business processes represents a firm-level capability that facilitates the transfer of business processes across vendor and geographic platforms, we hypothesize that:

H4: (Process Capabilities Influence on BPO Hypothesis) Organizations with process capabilities related to codification will be more likely to engage in (a) onshore BPO and (b) offshore BPO.

Above we argued that systems and process capabilities facilitate firms to engage in BPO. We now posit that the relationship of systems and process capabilities with BPO is mediated by

outsourcing experience. Capabilities enable firms to identify and select qualified vendors, and monitor and manage outsourcing relationships [61]. Firms develop these capabilities through learning based on experience, and the capabilities in turn enable the firm to engage in further outsourcing [56]. Firms are likely to develop outsourcing experience through functions where outsourcing is a more mature business practice [88], consistent with our case examples of GM and Prudential above and with the substantial body of IS outsourcing literature [32]. Process capabilities facilitate outsourcing, and systems capabilities are required to interface with systems that are outsourced. Therefore, in addition to considering the direct effect of systems capabilities and process capabilities on BPO, we also consider the indirect effects of systems capabilities and process capabilities on BPO mediated through outsourcing experience.

H5: (Outsourcing Experience Mediation Hypothesis) Outsourcing experience mediates the effect of (a) IT coordination applications and (b) business process codification on onshore and offshore BPO.

We develop our conceptual model in Figure 1 based on the discussion above.

- Insert Figure 1 about here -

3. RESEARCH DESIGN AND METHODOLOGY

This study is based on data from the 2004 *InformationWeek* 500 survey [29].

InformationWeek is a leading and widely circulated IT publication, and previous academic studies have used *InformationWeek* data [15, 80]. The *InformationWeek* 500 survey is an annual benchmarking survey that targets top IT managers in large firms, and collects data on the IT department and operations, along with an overview of major IT initiatives. In administering the survey, *InformationWeek* makes efforts to ensure that respondents are in appropriate management positions with sufficient knowledge of the firm's IT department and operations [86].

Two hundred and fifty-five firms that are publicly traded in the U.S. responded to this survey and provided complete responses to the variables of interest. Of the 255 firms, 122 represent Fortune 500 companies. Our empirical model uses the *InformationWeek* survey data on BPO, ITO, internationalization, IT coordination applications, and process codification. We complement the *InformationWeek* data with revenue and industry data from Compustat and Dun & Bradstreet.

3.1 Variable Definitions

The following are dependent variables in the study.

Onshore BPO: Binary variable that indicates whether the firm engages in onshore business process outsourcing (1=yes, 0=no). This variable is from the *InformationWeek* 500 survey.

Offshore BPO: Binary variable that indicates whether the firm engages in offshore business process outsourcing (1=yes, 0=no). The variable is from the *InformationWeek* 500 survey. In the *InformationWeek* survey, offshore BPO is a separate response option from onshore BPO. This provides a degree of richness, enabling the data to identify whether a firm engages in only one form of BPO, both forms, or neither form.

The following are explanatory and mediator variables in the study.

Onshore ITO: Binary variable that indicates whether the firm engages in onshore IT outsourcing (1=yes, 0=no). We use this variable as a proxy for prior experience with onshore IT outsourcing. This variable is from the *InformationWeek* 500 survey.

Offshore ITO: Binary variable that indicates whether the firm engages in offshore IT outsourcing (1=yes, 0=no). We use this variable as a proxy for prior experience with offshore IT outsourcing. This variable is from the *InformationWeek* 500 survey. In the survey, the responses

for onshore and offshore IT outsourcing are separate from each other, and also separate from the responses for onshore and offshore BPO.

The following are explanatory variables in the study.

Internationalization: Four item formative index that indicates the extent to which the firm has internationalized its business operations. Items covered by the index are workers or subsidiaries in foreign countries, direct purchase from foreign suppliers, reliance on global distributors, and reliance on joint ventures with global suppliers. These items are summed together to create a variable that ranges from 0 for firms that have none of these indicators to a value of 4 for firms that have all four indicators. This variable is from the *InformationWeek 500* survey. In the survey, the response for each indicator is separate from the response for the other three indicators. The richness of this variable responds to a call from researchers for a more sophisticated measure of internationalization compared with the traditional measure of international revenue, which does not fully reflect the degree of internationalization for a firm [47].

IT Employees Offshore: Proportion of the firm's IT employees based outside of the United States. The value of this variable ranges from 0.00 to 1.00. This variable is from the *InformationWeek 500* survey, and provides additional information on the internationalization of the firm.

IT Coordination Applications: Nine item formative index that indicates whether the firm has widely deployed each of nine IT coordination applications. These applications relate to the coordination of operations within the firm and across business partners [78]. IT coordination applications covered by the index are enterprise resource planning (ERP), supply chain planning (SCM), customer relationship management (CRM), business intelligence (BI), business process

management (BPM), business performance management, mobile commerce, content management, and product lifecycle management (PLM). These items are summed together to create a variable that ranges from 0 for firms that have not widely deployed any IT coordination applications to 9 for firms that have widely deployed all nine IT coordination applications. This variable is from the *InformationWeek* 500 survey. Our variable construction differentiates coordination applications from infrastructure technologies (see description of control variables below), consistent with recent IS research that IT consists of various types of assets and is not a monolithic concept [4].

Business Process Codification: Two item formative index that indicates the extent to which the firm has codified business processes. Codification is indicated by whether the firm defined its business processes, and modeled business processes using CASE or related tool. These items are summed together to create a variable that ranges from 0 for firms that have not defined or modeled business processes to 2 for firms that have defined and modeled business processes. This variable is from the *InformationWeek* 500 survey.

The following are control variables in the study.

IT Network / Storage Infrastructure: Nine item formative index that indicates whether the firm has widely deployed each of nine IT network and storage infrastructure technologies. IT network and storage infrastructure technologies covered by the index are data warehouse, networked storage, web services, Windows server, wireless fidelity (WiFi), voice over Internet protocol (VoIP), content filtering/anti-spam, intrusion detection, and grid computing. These items are summed together to create a variable that ranges from 0 for firms that have not widely deployed any IT network / storage infrastructure technologies to 9 for firms that have deployed all nine IT network / storage infrastructure technologies. This variable is from the

InformationWeek 500 survey. As discussed above, our variable construction differentiates coordination applications from infrastructure technologies.

Firm Size: Natural log of annual firm revenue. Firm size may influence a firm's propensity to outsource and/or offshore. This variable is from Compustat and Dun & Bradstreet.

Industry Sector (finance, services, trade, other industrial): Binary variable (1=yes, 0=no) for the finance, services, trade, and other industrial sectors, based on the North American Industry Classification System (NAICS) code for each firm. The manufacturing sector is the base category. These five sectors represent substantially all industries in the U.S., and are similar to sectors used in other IS research [20]. The NAICS data is from Compustat and Dun & Bradstreet, and the sector groupings are based on the NAICS codes (www.census.gov).

The relevant questionnaire items from the *InformationWeek* 500 survey are included in Appendix A. We use formative (i.e. summative) indices for internationalization, IT coordination applications and process codification, because these variables are unobserved latent variables that we assume are caused by observed index items in our data [31]. The routine tests for reliability of variables are not applicable for formative indices [8].

3.2 Summary Statistics

Table 2 provides descriptive statistics for all firms in the sample, and for the subgroups of firms that engage in onshore BPO, firms that engage in offshore BPO, and firms that do not engage in BPO. Table 3 provides zero-order correlations for the variables in our study.

- Insert Table 2 about here -

Column 1 of Table 2 shows that for our sample of firms, 34% of firms use onshore BPO, 17% use offshore BPO, 55% use onshore ITO, and 53% use offshore ITO. These mean values suggests that onshore BPO is a more common business practice than offshore BPO, and ITO is a

more common business practice than BPO. Columns 2, 3 and 4 of Table 2 show that the means of onshore ITO, IT coordination applications, process codification for firms that engage in onshore BPO and offshore BPO are above the means of those variables for firms that do not engage in BPO. The means of offshore BPO and internationalization for firms that engage in offshore ITO are above the means for firms that do not engage in BPO.

- Insert Table 3 about here -

Table 3 shows that onshore BPO is positively correlated with offshore BPO, onshore ITO is positively correlated with onshore BPO and offshore BPO, and offshore ITO is positively correlated with offshore BPO, suggesting that some firms use multiple forms of outsourcing. Internationalization is positively correlated with offshore BPO, offshore ITO, and offshore IT employees, suggesting that some firms internationalize along multiple dimensions. IT coordination applications and process codification are positively correlated with onshore BPO and offshore BPO. Together, the mean values and correlations suggest that there may be some relationship among ITO, systems and process capabilities with onshore and offshore BPO, and that there may be some relationship between international experience and offshore BPO.

3.3 Empirical Model

In our dataset, the dependent variables onshore BPO and offshore BPO appear as binary choices. The ordinary least squares approach for modeling binary dependent variables is not appropriate because of heteroskedastic error distribution, and a linear model may result in predicted probabilities below zero or above one. To overcome estimation problems in the ordinary least squares approach, we conducted our analysis using a bivariate probit model [7]. A bivariate probit model enables us to account for two binary response variables (onshore BPO and

offshore BPO) that vary jointly, and to estimate the coefficients needed to account for this joint distribution. The functional form of our empirical model can be written as:

$$(Onshore\ BPO) \quad y_1^* = \beta_1 X_1 + \varepsilon_1, \quad y_1 = 1 \text{ if } y_1^* > 0, 0 \text{ otherwise} \quad (1)$$

$$(Offshore\ BPO) \quad y_2^* = \beta_2 X_2 + \varepsilon_2, \quad y_2 = 1 \text{ if } y_2^* > 0, 0 \text{ otherwise} \quad (2)$$

$$\rho = Cov(\varepsilon_1, \varepsilon_2) \quad (3)$$

where y_1 and y_2 are the observable counterparts to the two latent variables y_1^* and y_2^* , X 's are variables such as IT coordination applications and business process codification, β 's are parameters for the respective variables, and ρ measures the correlation between the error terms. A nonzero and statistically significant ρ indicates that the two likelihoods are jointly determined and a bivariate probit model is more appropriate than two separate probit models.^{1,2}

For our mediation analysis, we used the procedure described by Baron and Kenny in [13]. We tested whether the independent variables (IT coordination applications and business process codification) are correlated with the dependent variables (onshore BPO and offshore BPO). We then tested whether the independent variables are correlated with the mediator variables (ITO), and whether the mediator variables are correlated with the dependent variables in a model that also includes independent variables. Finally, we assessed the extent of mediation.

¹ As a robustness check, we ran two separate probit models for onshore BPO and offshore BPO. Coefficients and significance levels in the separate probit models are virtually identical to those in the bivariate probit model.

² For our dataset, a bivariate probit equation is more appropriate than a multinomial probit equation, because a multinomial probit model would assume some theoretical difference between one form of onshore or offshore BPO individually and both forms of BPO together. The theoretical difference might imply that both forms of BPO together represent a higher volume of BPO than one form. Our data does not enable us to make a distinction in volume, because volume of BPO is not captured by our data.

3.4 Empirical Results

Table 4 provides results from empirical estimation of the bivariate probit model using equations (1) and (2). Table 5 provides parameters for the mediation analysis, and Table 6 provides results of the mediation analysis.

- Insert Table 4 about here -

Hypothesis 1a predicted a positive association of onshore ITO with onshore BPO, and Hypothesis 1b predicted a positive association of onshore ITO with offshore BPO. These hypotheses are supported for onshore BPO ($\beta_{11}=0.898$, $p<0.000$) and offshore BPO ($\beta_{21}=0.913$, $p<0.001$). Hypothesis 2a predicted a positive association of offshore ITO with offshore BPO, hypothesis 2b predicted a positive association of internationalization with offshore BPO, and hypothesis 2c predicted a positive association of offshore IT employees with offshore BPO. Offshore ITO ($\beta_{22}=0.451$, $p<0.042$) and internationalization ($\beta_{23}=0.217$, $p<0.010$) are positively associated with offshore BPO, providing support for hypotheses 2a and 2b. Hypothesis 2c is not supported, perhaps because offshore IT employees and offshore BPO may be substitutes rather than complements [46].

Hypothesis 2 addresses some differences between onshore and offshore BPO, in that organizational learning from international experience is expected to relate with offshore BPO but not onshore BPO. In addition to international experience, we also want to study whether other explanatory variables have differential relationships with onshore and offshore BPO. Figures 2a–d show the relationship of four explanatory variables with onshore BPO and offshore BPO. Figure 2a compares the effect of onshore ITO, Figure 2b compares the effect of offshore ITO, Figure 2c compares the effect of IT coordination applications, and Figure 2d compares the effect of business process codification.

- Insert Figures 2a-d about here -

Figure 2a shows that onshore ITO has a larger effect on onshore BPO (0.312) than on offshore BPO (0.131). Figure 2b shows that offshore ITO has a negative effect on onshore BPO (-0.150) and a positive effect on offshore BPO (0.083). Figure 2c shows that IT coordination applications have a larger effect on onshore BPO (0.303) than on offshore BPO (0.133). Figure 2d shows that business process codification has a similar effect on onshore BPO (0.133) and offshore BPO (0.088).

Hypothesis 3a predicted a positive association of IT coordination applications with onshore BPO, and hypothesis 3b predicted a positive association of IT coordination applications with offshore BPO. These hypotheses are supported for onshore BPO ($\beta_{15}=0.106, p<0.026$) and offshore BPO ($\beta_{25}=0.093, p<0.088$), though the relationship with offshore BPO is only moderately statistically significant. Hypothesis 4a predicted a positive association of business process codification with onshore BPO, and hypothesis 4b predicted a positive association of business process codification with offshore BPO. These hypotheses are supported for onshore BPO ($\beta_{16}=0.248, p<0.043$) and offshore BPO ($\beta_{26}=0.449, p<0.007$).

- Insert Table 5 about here -

- Insert Table 6 about here -

Hypothesis 5a predicted that ITO would mediate the relationship of IT coordination applications with BPO. This hypothesis is not supported, as table 6 shows that this relationship is not mediated by onshore ITO or offshore ITO. Hypothesis 5b predicted that ITO would mediate the relationship of business process codification with BPO. Table 6 shows that the relationship of business process codification with onshore and offshore BPO is partly mediated

through the relationship of business process codification with onshore and offshore ITO, which supports hypothesis 5b.

The results showing the relationship of control variables with BPO also provide useful insights. We find that larger firms are more likely to engage in onshore BPO ($\beta_{18}=0.236$, $p<0.003$), consistent with prior research that large firms are more likely to adopt administrative innovations [51]. We also find that financial firms ($\beta_{29}=0.890$, $p<0.007$) and services firms ($\beta_{2-10}=0.763$, $p<0.011$) are more likely to engage in offshore BPO than are manufacturing firms, consistent with published reports that many large financial firms have engaged in significant offshore initiatives [63]. The results for control variables provide added confidence in our model.

4. DISCUSSION AND CONCLUSION

4.1 Findings and Implications

This paper complements prior IS outsourcing research using organizational economics by using organizational learning and capabilities to define the managerial and technical capabilities that facilitate onshore and offshore BPO. Consistent with organizational learning theory, we find that firms engaged in onshore ITO, a more established and mature management practice than BPO, are more likely to engage in onshore and offshore BPO. These firms have learned from experience to identify, negotiate with, monitor and manage outsourcing vendors, and are able to apply this learning to BPO. We also find that firms with internationalization experience are more likely to engage in offshore BPO. These firms have learned from experience with international partners to overcome cultural distance and communication barriers, and are able to apply this learning to govern relationships with offshore BPO vendors.

We also studied the relationship of systems and process capabilities with onshore and offshore BPO. We find that firms with systems capabilities related to IT coordination applications are more likely to engage in onshore and offshore BPO. IT coordination applications, such as enterprise resource planning (ERP), customer relationship management (CRM) and supply chain management (SCM), enable firms to better integrate the outcomes of BPO vendors into their core business operations. We also find that firms with process capabilities related to codification are more likely to engage in onshore and offshore BPO. Codification provides firms with a better understanding of their business processes, which in turn enables firms to identify processes as candidates for outsourcing, scope projects, select vendors, and monitor and evaluate vendor performance. IT coordination applications and process codification reduce coordination cost and operational risk as processes are placed with outside vendors, and may give firms increased confidence to proceed with BPO.

We find differential relationships of systems and process capabilities with onshore BPO and offshore BPO. For example, we find that onshore ITO has a larger effect on onshore BPO than on offshore BPO. This suggests that there may be significant common elements in onshore coordination across ITO and BPO, and that the learning and capabilities developed in onshore outsourcing are more applicable to the onshore context than to the offshore context. We also find that IT coordination applications have a larger effect on onshore BPO than on offshore BPO. While IT coordination applications can enhance communications to a certain degree, there may be a difference in distance that is better bridged through international experience than through communication technologies. This is consistent with the notion that there are differences between the offshore and onshore contexts. While onshore ITO and IT coordination applications have a smaller effect on offshore BPO than on onshore BPO, offshore ITO has a larger effect on

offshore BPO. Because the IT function was one of the first functions to be performed offshore on a large scale, firms may be able to learn from their offshore IT experience and apply this learning to other functions in the firm. This is similar to the manner in which during the 1990's firms applied learning about process reengineering from the IT function to other functions in the firm. Business process codification has a positive relationship with onshore and offshore BPO, and with onshore and offshore ITO. This suggests that business process codification may be a more fundamental capability that facilitates multiple forms of outsourcing, and demonstrates the importance of managerial capabilities alongside technical capabilities for firms to develop and implement competitive strategies. The finding that process codification facilitates ITO, which in turn facilitates BPO, is consistent with research showing that outsourcing can provide a firm with flexibility and benefits [11].

This study has two implications for practice. First, from a BPO client perspective, a firm considering BPO must evaluate its IT coordination applications and business process codification. A strong IT portfolio would give the firm more confidence that it can successfully connect with the BPO vendor to integrate BPO outcomes back into its core business operations, while a weak IT portfolio would indicate that the firm may need to make some internal investments prior to pursuing BPO. Firms must also evaluate their understanding of the business process to be outsourced. Good documentation and understanding of the business process would give the firm confidence that it can properly identify and scope the BPO project, and select and manage the BPO vendor, while a poor understanding of the process may put the firm in a disadvantageous position, where it may not be able to properly identify the project or the vendor and may be subject to suboptimal vendor performance and/or financial savings.

Second, from a BPO vendor perspective, as vendors make increased investments to deliver BPO services from onshore and offshore locations, they will be competing for the client firms that would establish mutually beneficial relationships. Vendors will want to identify firms that are prepared to field BPO engagements, and will need to know the characteristics of these firms. A prepared client firm can reduce problems in the BPO implementation, reduce the workload of BPO vendors, and lead to more positive outcomes. Our findings suggest that vendors should focus their marketing efforts on firms with outsourcing experience and strong IT coordination applications and business process codification.

4.2 Limitations and Future Research

This study has two primary limitations. The first limitation is that while firms learn and develop capabilities over time, our cross-sectional data set does not allow us to confirm the temporal relationships indicated by the theory. We are not able to confirm whether firms engage in and learn from ITO before they engage in BPO, and not able to confirm whether firms demonstrate systems and process capabilities before they engage in BPO. We attempt to account for this limitation by taking two steps. First, we use robust case examples of firms such as GM, Prudential Insurance, Aetna, Microsoft, Cisco and Harvard Pilgrim to establish a temporal relationship of ITO and capabilities with BPO. Second, we theorize and test mediation to establish the temporal relationship. We acknowledge the limitation of a cross-sectional data to test a temporal theory, and we recommend future research with panel data to enable researchers to better understand how organizational learning and capabilities influence outsourcing decisions and governance of vendor relationships over time.

A second limitation relates to the sample and archival survey instrument design by *InformationWeek* magazine. To evaluate the generalizability of our findings, we compared the

distribution of the firms in our study based on two-digit North American Industry Classification System (NAICS) code to the distribution of all publicly-traded firms in Compustat that reported 2003 net sales. We find that while the distribution is reasonably similar across most two-digit NAICS codes, our sample contains a slightly higher proportion of wholesale trading firms and a slightly lower proportion of financial and information firms than all publicly traded firms in Compustat. For the survey instrument design, while some questions and response items (provided in Appendix A) may not fully capture the theoretical constructs in the most complete manner, future research can address this limitation by designing instruments with questions and response items drawing on the academic literature to more fully capture the desired theoretical constructs.

In addition to the two future research opportunities mentioned above, there are at least two other opportunities to extend this work. While prior research has studied outsourcing and offshoring at the industry, firm or process level, there is a need for research to incorporate multiple levels of outsourcing and offshoring considerations in the same study. Such a study would require more in-depth data on the characteristics of outsourced processes and the extent to which each process is outsourced, along with data on the relevant firm-level and industry-level characteristics. Future studies can gather a richer description of BPO within a firm, in terms of the number of business processes outsourced and the proportion to which each process is outsourced, and by validating a firm's use of onshore and offshore BPO using internal and external sources. Second, while many firms pursue BPO with the belief that BPO will reduce costs and enable the firm to focus on its core business operations, firms may also be able to use BPO to achieve quality and time benefits. There is a need for further research to test the cost,

quality and time outcomes of BPO, and other outcomes including increased innovation and productivity [11, 45, 74].

This paper complements and extends prior IS outsourcing research using organizational economics by using organizational learning and capabilities to develop a conceptual model for onshore and offshore BPO. We test the conceptual model with archival data on a broad cross-section of U.S. firms. We find that onshore IT experience is positively associated with onshore and offshore BPO, and internationalization experience is positively associated with offshore BPO. We also find that systems capabilities related to IT coordination applications and process capabilities related to codification are positively associated with onshore and offshore BPO, and that ITO partly mediates the relationship between process capabilities and BPO. The theory and findings provide a better understanding of the managerial and technical capabilities that facilitate onshore and offshore BPO, and are important as firms more broadly incorporate BPO into their global sourcing strategies.

Table 1. Theoretical Perspectives and Levels of Analysis in IS Outsourcing Research

This list of representative research is not intended to be all-inclusive (see Dibbern et al. [32] for a more extensive review).

Theoretical Perspective	Level of Analysis			
	Economy / Industry	Organization / Firm	Process / Project / Buyer-Supplier Dyad	Occupation
Transaction cost economics / Incomplete contracts		Ang and Straub [2] Bakos and Brynjolfsson [9] Clemons, Reddi and Row [27]	Mithas, Jones and Mitchell [67]	
Agency theory		Chaudhury, Nam and Rao [24] Gurbaxani and Whang [44]		
Competitive strategy		Loh and Venkatraman [59] Palvia [71] Smith, Mitra and Narasimhan [84] Teng, Cheon and Grover [89]	Lacity and Willcocks [54]	Slaughter and Ang [83]
Theory of production	Han, Kauffman and Nault [45]			
Systems dynamics	Dutta and Roy [34]			
Service disaggregation / Modularity			Arora and Forman [6] Tanriverdi, Konana and Ge [88]	Apte and Mason [3] Mithas and Whitaker [68] Tambe and Hitt [87]
Learning view			Cha, Pingry and Thatcher [2009] Ramasubbu et. al. [76]	
Capabilities view		<i>This paper</i>	Levina and Ross [58] Mani, Barua and Whinston [62]	

Table 2. Descriptive Statistics

	(1) All Firms n=255				(2) Onshore BPO n=87		(3) Offshore BPO n=43		(4) No BPO n=159	
	Min	Max	Mean	SD	Mean	SD	Mean	SD	Mean	SD
1 Onshore BPO	0.00	1.00	0.34	0.48	1.00	0.00	0.79	0.41	0.00	0.00

Figure 1. Conceptual Model

Figures 2a–d. Differential Effects for Onshore BPO and Offshore BPO

Appendix A. InformationWeek 500 Questionnaire Items Used for this Study

Variable	Questionnaire Items
Onshore and Offshore BPO	<p>What forms of outside consulting or IT services does your organization currently use? (<i>choose all that apply</i>) Selections include:</p> <ul style="list-style-type: none"> • Business process outsourcing (onshore) • Business process outsourcing (offshore)
Onshore and Offshore ITO	<p>What forms of outside consulting or IT services does your organization currently use? (<i>choose all that apply</i>) Selections include:</p> <ul style="list-style-type: none"> • Onshore application development or maintenance • Offshore application development or maintenance
Internationalization	<p>What is the hallmark of your organization's global sourcing strategy? (<i>choose all that apply</i>) Selections include:</p> <ul style="list-style-type: none"> • We have workers or subsidiaries in foreign countries • We buy direct from foreign suppliers • We rely upon global distributors • We rely upon joint ventures with foreign suppliers
IT Employees Offshore	<p>Proportion based on two questions:</p> <p>Number of full-time IT employees in your IT organization in (the) U.S.</p> <p>Number of full-time IT employees in your IT organization outside (the) U.S.</p>
IT Coordination Applications and IT Network/Storage Infrastructure	<p>Which of the following products or technologies are widely deployed in your organization? (<i>choose all that apply</i>) Selections include (author categories in parentheses):</p> <ul style="list-style-type: none"> • ERP (coordination application) • Supply-chain planning (coordination application) • CRM systems (coordination application) • Business-intelligence tools (coordination application) • Business-process management software (coordination application) • Business-performance management software (coordination application) • Mobile commerce applications (coordination application) • Content management software (coordination application) • Product lifecycle management software (coordination application) • Data warehouse (network / storage infrastructure) • Networked storage (SANs) (network / storage infrastructure) • Web services (network / storage infrastructure) • Windows server 2003 (network / storage infrastructure) • Wireless fidelity (Wi-Fi) (network / storage infrastructure) • Voice Over IP applications (network / storage infrastructure) • Content filtering/anti-spam software (network / storage infrastructure) • Intrusion-detection software (network / storage infrastructure) • Grid computing (network / storage infrastructure)
Business Process Codification	<p>Formative index drawn from two questions:</p> <p>What steps has your organization taken to optimize the efficiency of its technology processes in the past 12 months? (<i>choose all that apply</i>) Selections include:</p> <ul style="list-style-type: none"> • Defined business processes <p>Which of the following are the most effective technology steps managers in your organization have made in the past 12 months to raise company productivity? (<i>choose all that apply</i>) Selections include:</p> <ul style="list-style-type: none"> • Modeled business processes using CASE or related tool

Author Biographies

Jonathan Whitaker is an Assistant Professor at the University of Richmond Robins School of Business. He earned a PhD in Business Information Technology at the University of Michigan Ross School of Business. Prior to pursuing the PhD, he worked 10 years in technology strategy consulting and professional services with A.T. Kearney and Price Waterhouse, and earned his MBA at the University of Chicago. His primary research focus is the use of information technology to reshape the operating characteristics of firms, with resulting implications for firms, employees and consumers. His research has been published in *Information Systems Research*, *Journal of Management Information Systems*, and *Production and Operations Management*, and profiled in the *Wall Street Journal* and *MIT Sloan Management Review*.

Sunil Mithas is an Assistant Professor at the Robert H. Smith School of Business at the University of Maryland. He has a PhD in Business from the Ross School of Business at the University of Michigan and an Engineering degree from IIT, Roorkee. Prior to pursuing the PhD, he worked for about ten years with the Tata Group. His research focuses on strategic management and the impact of information technology resources, and has appeared in *Management Science*, *Information Systems Research*, *MIS Quarterly*, *Marketing Science*, *Journal of Marketing*, and *Production and Operations Management*. His research has earned best paper award and best paper nomination recognition, and received coverage in practice-oriented publications such as *Harvard Business Review*, *Sloan Management Review*, *Bloomberg*, *Computerworld*, and *InformationWeek*.

M. S. Krishnan is Mary and Mike Hallman e-Business Fellow, Area Chairman and Professor of Business Information Technology at the University of Michigan Ross School of Business. Dr. Krishnan is also a Co-Director of the Center for Global Resource Leverage: India at the Ross School of Business. Dr. Krishnan received his PhD in Information Systems from the Graduate School of Industrial Administration at Carnegie Mellon University. His research interests include corporate IT strategy, business value of IT investments, management of distributed business processes, software engineering economics, metrics and measures for quality, and productivity and customer satisfaction for the software and information technology industries. His research articles have appeared in *Management Science*, *Information Systems Research*, *MIS Quarterly*, *Strategic Management Journal*, *IEEE Transactions on Software Engineering*, *Decision Support Systems*, *Harvard Business Review*, and *Sloan Management Review*. He has also co-authored with C.K. Prahalad the book *The New Age of Innovation: Driving Co-Created Value with Global Networks*.
