Cover: The map illustrates tuberculosis case rates by reporting jurisdiction in 2003. Twelve jurisdictions have tuberculosis case rates above the state average of 8.9 cases per 100,000 population. Eleven jurisdictions have tuberculosis case rates below the 2003 national rate of 5.1 per 100,000 population. Eleven jurisdictions have case rates between the national and state rates (5.1 to 8.9 per 100,000 population). Case rates were not calculated for 24 jurisdictions because there were fewer than five cases in these areas. Jurisdictions of Berkeley, Long Beach, and Pasadena are not represented on the map.

Dear Colleagues,

In these first years of the new millennium, the decline in the number of tuberculosis (TB) cases and rates has halted. Following years of decline from the peak of the epidemic in 1992, TB cases rose slightly in 2001 and again in 2003. In 2003, the number of cases increased in all racial and ethnic groups except non-Hispanic blacks. While 75 percent of California's cases are reported in persons born outside the United States, for the first time in a decade the number of TB cases in U.S.-born persons increased in 2003. TB cases co-infected with HIV and multidrug-resistant tuberculosis continue to challenge TB programs throughout the state.

In the face of rising TB cases and difficult economic times, information contained in this report is critical to helping us prioritize and target our efforts. I hope you will find this eighth annual Report on Tuberculosis in California helpful in your efforts to strengthen TB control in our state.

Sincerely,

A handwritten signature in black ink that reads "Sarah Royce".

Technical Notes	79
-----------------------	----

Introduction

Reportable cases of tuberculosis (TB) are submitted to the TB Control Branch (TBCB), California Department of Health Services, by the 61 local health jurisdictions (58 counties, and the cities of Berkeley, Long Beach, and Pasadena). In 1993, the Centers for Disease Control and Prevention (CDC), in conjunction with state and local health departments, began using the expanded Report of Verified Case of Tuberculosis (RVCT) to collect information on each case of TB. In addition to the demographic and clinical features of TB that were previously collected, the RVCT includes information on drug resistance, risk factors for tuberculosis, and treatment outcomes. In 1998, CDC implemented the Tuberculosis Information Management System (TIMS) for data entry and transmission of case reports. Today, TIMS is in use in 19 of the largest jurisdictions, allowing 93 percent of TB cases to be reported electronically to TBCB. The Division of Communicable Disease Control is currently implementing a web-based surveillance system for notifiable diseases, including tuberculosis, that will allow all jurisdictions in California to submit TB cases and access their local data on-line.

Acknowledgment

The TBCB would like to thank surveillance and reporting staff in all local reporting jurisdictions. Without their hard work we would not have data for this publication. We also acknowledge the support of our partners at CDC's Division of Tuberculosis Elimination.

Executive Summary

TB cases rose in California in 2001 and again in 2003, following eight years of decreasing numbers from the peak of the TB epidemic in 1992. This halt in the decline of cases has resulted in an estimated 750 excess cases of TB, and approximately 60 deaths above what was expected had California's cases continued to decline at an average of six percent per year as they had from 1992–2000. California reported 3,227 cases in 2003, the largest number of cases of any state, and 22 percent of the nation's 14,874 cases.

California's 2003 case rate of 8.9 per 100,000 was the second highest in the nation. The rate of TB remains well above both the U.S. rate of 5.1 per 100,000 and the Healthy People 2000 objective of 3.5 cases per 100,000.

Geographic Distribution

TBCB examined TB cases from jurisdictions reporting an average of 30 or more cases per year during the period 1998–2000. In 2003, these 19 jurisdictions accounted for 93 percent of the cases, with a case rate of 9.7 per 100,000. The remaining seven percent of the state's cases (n=242) were reported from the 42 rural and smaller jurisdictions, where the case rate was 4.3 per 100,000. Both categories of jurisdictions showed a decline in case numbers of over 16 percent from 1998–2003. However, between 2002 and 2003, cases increased 16 percent in the rural and smaller jurisdictions, compared to less than one percent increase in the high morbidity jurisdictions.

Thirteen jurisdictions reported zero cases in 2003, representing little change in the number of jurisdictions reporting zero cases since 1993. Of note, only four jurisdictions reported zero cases throughout the entire period 1998–2003.

Demographics

The only decline in cases among racial and ethnic groups between 2002–03 was in non-Hispanic blacks, where the number of cases decreased by ten percent. Cases among Asians/Pacific Islanders, comprising 42 percent of California's total TB cases, increased by five percent, while cases among Hispanics (40 percent of total cases), increased by less than one percent. Cases among non-Hispanic whites (ten percent of total cases), increased by nearly three percent.

In 2003, rates of TB for Asians/Pacific Islanders and Hispanics were 16 (sixteen) and 6 (six) times that of non-Hispanic whites, respectively. Despite the decrease in case numbers among non-Hispanic blacks, the case rate in this group remains five times higher than among non-Hispanic whites. Since the TB epidemic peak in 1992, the disparity in TB rates among racial and ethnic groups

has narrowed somewhat for blacks, a predominately U.S.-born group, but has widened for the other racial and ethnic groups.

Pediatric TB cases, age 0–4 years, increased by four percent in California between 2002–03. Of the 132 pediatric cases in 2003, nearly three-fourths (73 percent) were born in the U.S. Seventy-five percent of the pediatric cases were Hispanic. These youngest children continue to comprise four percent of all cases in California. As they reflect recent infection, these children serve as a sentinel warning of the infectious TB threats in their environments.

TB in Foreign-born Persons

In 2003, three-fourths of California's TB cases were in foreign-born persons. California reported over 30 percent of the nation's total foreign-born cases, 40 percent of the nation's Mexican-born cases, and 50 percent of cases from the Philippines. Mexican-born persons comprise one-fourth of California's total cases. Devising culturally and linguistically appropriate interventions to promptly detect and prevent TB in California's immigrants remains a major challenge.

TB in U.S.-born Persons

The number of TB cases born in the United States increased from 758 to 771 between 2002–03, marking the first increase since the epidemic peak in 1992. Cases among U.S.-born, non-Hispanic whites increased by ten percent in 2003, and U.S.-born Hispanic cases increased by four percent. In 2003, although U.S.-born cases comprised less than 25 percent of all California cases, they represented 57 percent of the state's homeless cases, 49 percent of those with excess alcohol use, and 62 percent of those using injecting drugs. These characteristics represent risk factors for non-adherence to treatment, which can result in sustained infectiousness with potential for transmission to others.

AIDS-associated TB

From 1993–2000, the number of TB cases with a co-diagnosis of AIDS decreased 71 percent, from 515 to 147. However, beginning in 2001, both the number of AIDS-TB cases, as well as the proportion of TB cases with AIDS, has increased slightly. In 2002, 1 in 20 TB patients in California had AIDS. Increases in both the number and percentage of cases with a co-diagnosis have occurred among non-Hispanic blacks, Hispanics and Asians/Pacific Islanders, as well as among TB cases born outside the U.S. TB-AIDS co-infection is disproportionately represented in the homeless and substance abusing populations in California.

Drug Resistance

In 2003, 37 percent of the nation's multidrug-resistant TB (MDR-TB) cases were reported in California. Between 1994–2003, 407 (1.4 percent) newly reported culture-positive TB cases in California had MDR-TB, 84 percent of whom were born outside the U.S. During this time, MDR-TB cases have been

reported in over half of California's local health jurisdictions, including 19 of the 42 (45 percent) rural and smaller health jurisdictions. In 2003, in these jurisdictions, MDR-TB cases comprised four percent of all cases, compared to 1.4 percent statewide. The increased duration of treatment required for MDR-TB cases means that the number of newly diagnosed MDR-TB cases underestimates the workload that this group of patients represents to local health departments. Approximately 80 MDR-TB cases are under treatment in California at any point in time. The MDR-TB Service of the California Department of Health Services (DHS) TBCB assists local health departments to ensure that these cases and their contacts are appropriately evaluated, treated, and followed up.

Single drug (isoniazid) resistance among culture-positive cases has fluctuated between 9 to 12 percent since 1994. Without proper treatment, these cases can develop additional resistance and become MDR-TB. In 2003, nearly 14 percent of TB cases were resistant to one or more of the primary drugs used in the treatment of TB (Table 44).

TB in Homeless Persons and Persons with Substance Abuse

The percentage of cases reporting homelessness, excess alcohol use, or injecting or non-injecting drug use has decreased slightly since 1994. In 2003, nearly 300 cases were reported with at least one of these risk factors, each of which complicates the treatment of TB. Two or more of these risk factors were reported in 165 TB cases. Despite the overall decline during the past decade, from 2002–03 the number of homeless cases increased by 12 percent, and cases using excess alcohol increased by seven percent.

Treatment Outcomes

Among drug-susceptible TB cases reported in 2001, 71 percent completed therapy in the reporting jurisdiction in one year or less, while another ten percent completed therapy in over one year (Table 48). Because outcomes in the reporting jurisdictions do not include final treatment outcomes for patients who moved and are known to have completed therapy in another jurisdiction, we also report final treatment outcomes (excluding patients who died during treatment) (Figure 17). Using this methodology, which corresponds to that used by the Centers for Disease Control and Prevention, 80 percent of TB patients completed therapy in one year or less, and an additional 11 percent completed in more than one year.

Approximately two percent of patients default (are lost to follow-up or refuse treatment) from therapy each year, and an additional eight percent move before treatment is completed (Table 48). Achieving the Healthy People 2010 objective of 90 percent completion of therapy in one year or less will require interventions to reduce the proportion of patients with delayed therapy completion, movement, or defaulting. The TBCB Patient Locating Service is available to provide local programs with technical and/or direct assistance with locating lost TB patients.

One method to improve treatment completion rates is the use of Directly Observed Therapy (DOT) in patients at high risk for not completing therapy. Of all patients reported in 2001, 76 percent received at least some therapy via DOT (Table 28). Statewide efforts are underway to ensure that DOT is utilized in treating the highest priority patients.

Of patients reported in 2001, seven percent (n=227) died during treatment for TB (Table 47). An additional two percent (n=63) died before the diagnosis of TB was made, or prior to treatment initiation (Table 25). In 2005, the DHS TBCB will provide investigative tools to assist local health jurisdictions determine whether deaths associated with TB were preventable, and to develop interventions to prevent future deaths.

TB Patients Who Move

Approximately eight percent of patients (n=255) starting treatment for TB disease in California in 2001 moved out of their reporting jurisdiction prior to treatment completion (Table 47). Of these, 41 percent moved to another jurisdiction in California, 21 percent moved to another state, and 38 percent moved out of the country. Of the 97 patients moving out of the country, 54 (56 percent) listed Mexico as their destination. Records indicate that nearly all Mexico-bound patients were referred through CureTB, the San Diego-based program designed to foster continuity of care for patients who move across the U.S.-Mexico border. A similar referral program would benefit patients moving to the Philippines, the destination of 13 percent of California's patients who move out of the country.

For patients who moved within California or to another state, reporting final treatment outcomes (other than moved) improved from 58 percent in 1997 to 67 percent in 2001. In 2001, of 106 moved patients whose final outcomes were determined, 96 percent completed treatment. Reporting of treatment outcomes of moved patients will continue to improve following the recent implementation of the DHS TBCB protocol to verify whether moved patients completed or continued treatment after relocating to another jurisdiction.

Table 1. Tuberculosis Cases and Case Rates per 100,000 Population: California, 1985-2003

Year	Cases	Rate	Percent Change From Previous Year

*Total cases does not equal sum of other categories due to inclusion of those with unknown site of disease.

**Includes cases with pulmonary listed as major site of disease and no additional site of disease.

*** Includes cases with pleural, lymphatic, bone and/or joint, meningeal, miliary, peritoneal, or other site listed as major site of disease. No cases with pulmonary listed as either major or additional site of disease are included.

- Indicates zero cases or zero percent.

*Includes cases susceptible to isoniazid, rifampin and pyrazinamide, cases without culture confirmation and cases without drug susceptibility results.

** Patient outcome in jurisdiction reporting the case.

- Indicates zero cases or zero percent.

Figure 14. Tuberculosis Cases¹ by Reason Therapy Stopped: California, 2001

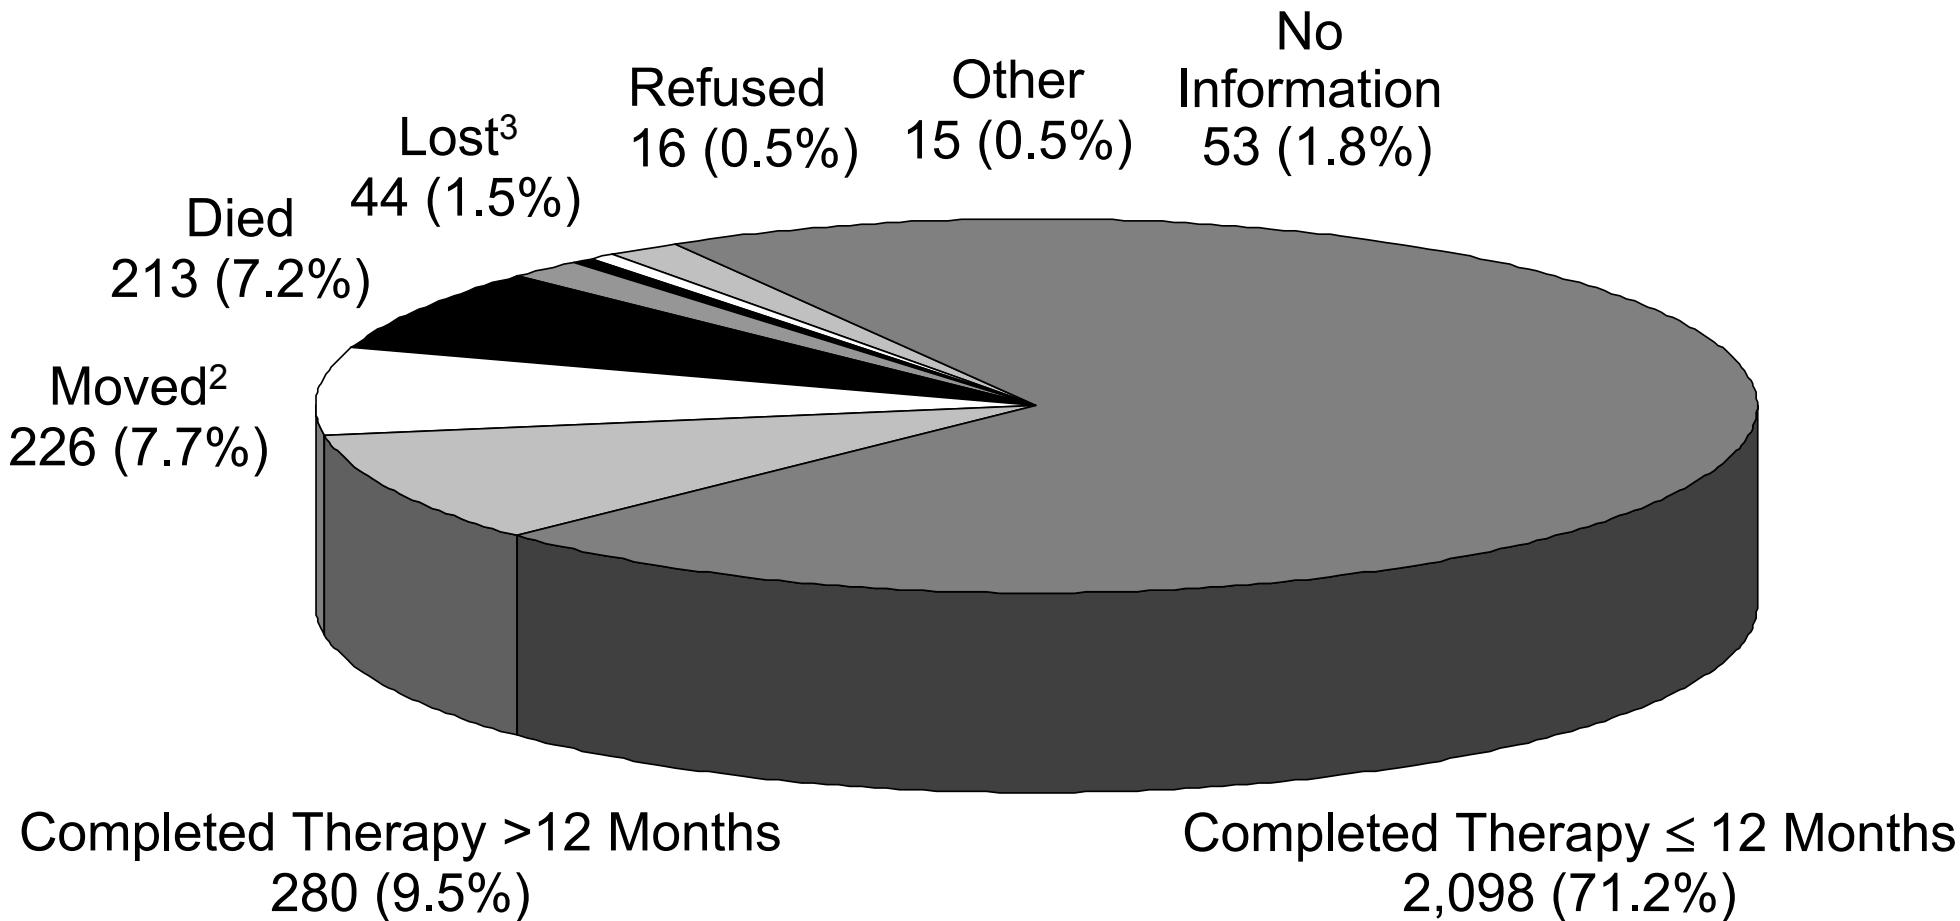

¹ Patient alive at diagnosis and started on an initial drug regimen of one or more drugs.

² Patient moved to another jurisdiction with a known forwarding address before treatment was completed.

³ Patient could not be located prior to the completion of treatment.

Figure 15. Drug-Susceptible Tuberculosis Cases¹ by Reason Therapy Stopped: California, 2001

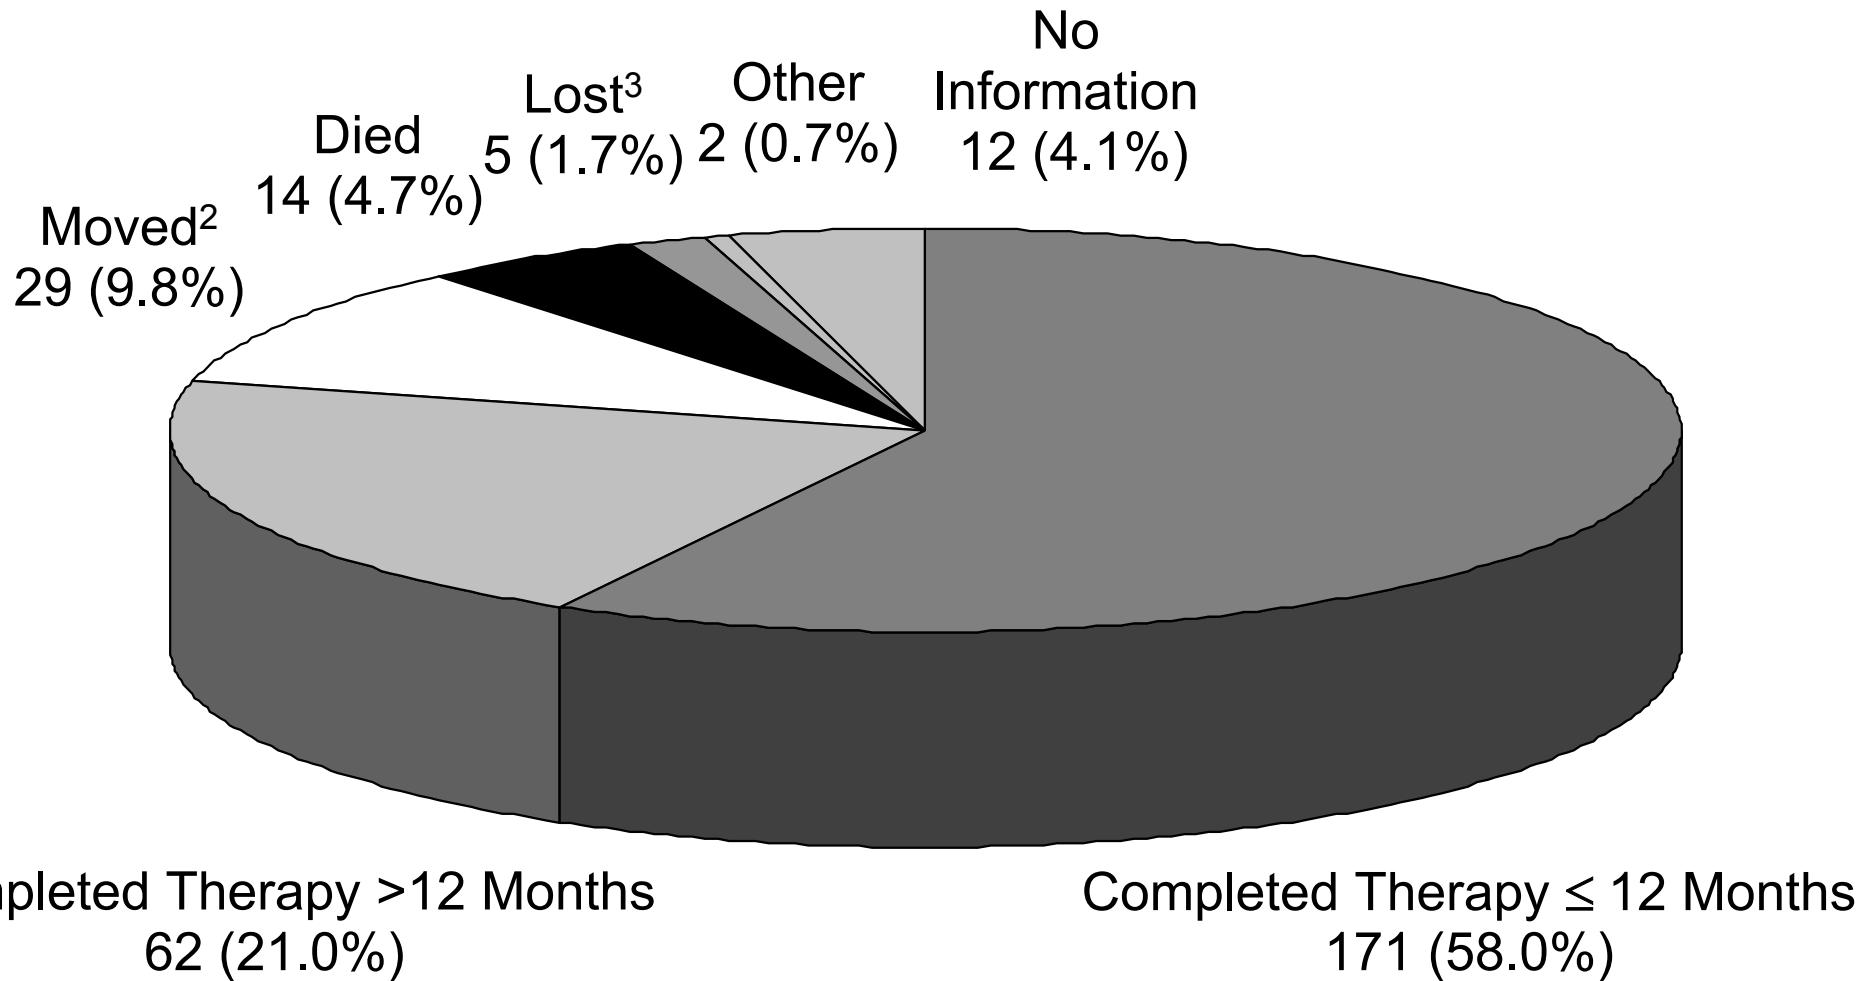

¹ Patient alive at diagnosis and started on an initial drug regimen of one or more drugs, including cases with disease that is susceptible to isoniazid, rifampin, and pyrazinamide, cases without culture confirmation and cases without drug susceptibility results.

² Patient moved to another jurisdiction with a known forwarding address before treatment was completed.

³ Patient could not be located prior to the completion of treatment.

Figure 16. Drug-Resistant Tuberculosis Cases¹ by Reason Therapy Stopped: California, 2001

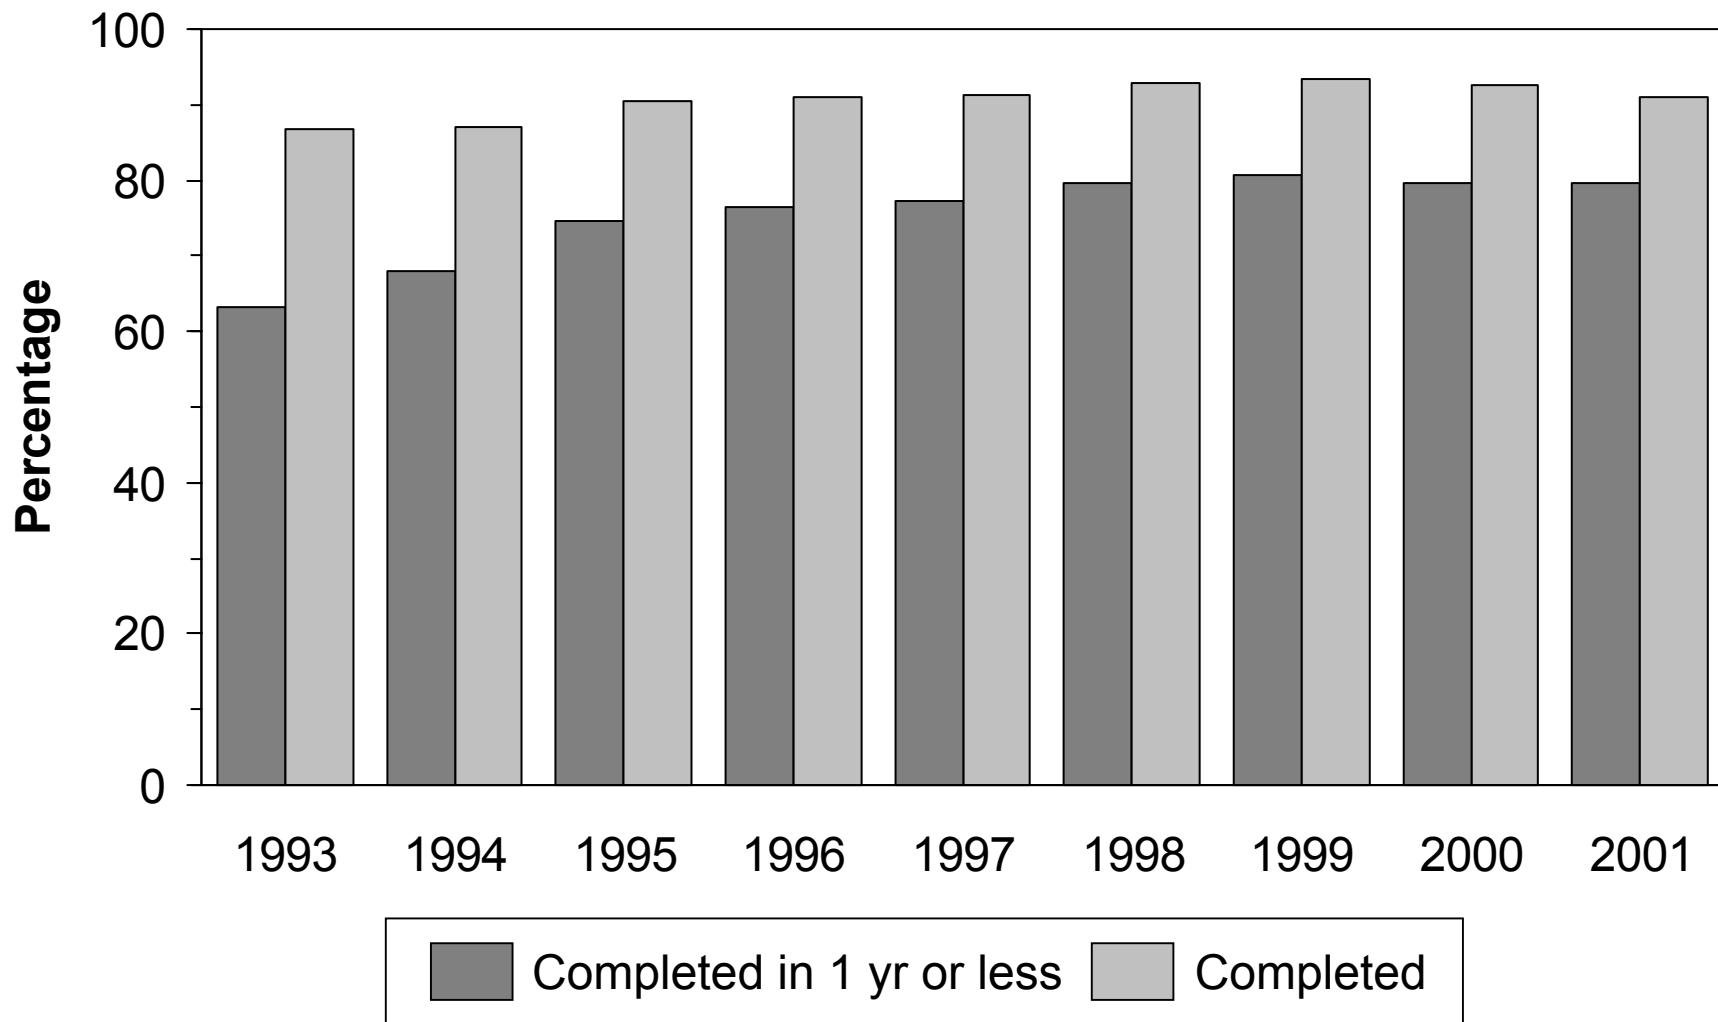

¹ Patient alive at diagnosis and started on an initial drug regimen of one or more drugs; all patients have disease that is resistant to isoniazid, rifampin, and/or pyrazinamide.

² Patient moved to another jurisdiction with a known forwarding address before treatment was completed.

³ Patient could not be located prior to the completion of treatment.

Figure 17. Completion of Tuberculosis Therapy, California, 1993-2001

Note: Persons with initial isolate resistant to rifampin, children under 15 years old with meningeal, bone or joint, or miliary disease and all persons who died during treatment were excluded.

Appendix

Technical Notes

Reporting Jurisdictions

California has 61 jurisdictions reporting on TB morbidity. There are 58 counties and the three cities of Berkeley, Long Beach, and Pasadena. Reports from Alameda County exclude TB cases from the city of Berkeley, and reports from Los Angeles exclude cases from the cities of Long Beach and Pasadena.

Tuberculosis Cases

TB cases submitted to the TBCB Registry by January 15, 2004, were counted as cases in 2003. After reporting the case, a jurisdiction may subsequently decide that a reported case did not have TB, and this case will be deleted from the TB database. Also, a few cases may be reported after the submission deadline; these additions will be reflected in future reports. Therefore, the total number of TB cases counted in a given year may change, although usually by a very small number of cases. For Tables 1-5 and 12-14, we used the original number of reported cases, not the revised number. For all other tables, the revised number of cases was used.

Population Data

County population totals, and data by age, sex, and race/ethnic group for California are from the following reference: State of California, Department of Finance, *Race/Ethnic Population with Age and Sex Detail, 1970-2040*, Sacramento, California, December 1998. At the time this report was created, the population files had not been revised with data from the 2000 U.S. census. To provide comparable city population estimates, the annual percent increases in population between 2000 and 2003 reported in the E-1 reports (State of California, Department of Finance, *E-1 City/County Population Estimates, with Annual Percent Change, Sacramento, California, May 2001, May 2002, May 2003*) which were benchmarked to the 2000 U.S. census were applied to the 2000 city estimates from: State of California, Department of Finance, *City/County Population Estimates with Annual Percentage Change, January 1, 1999 and 2000*, Sacramento, California, May 2000, benchmarked to the 1990 census.

Small Case Numbers

While there are different methods for reporting the rates of rare events, we have chosen not to report rates when the total number of TB cases is less than five. Rates of zero, based on no TB cases, are also not reported. Where the rate is not reported, changes in rate over time are also not reported.

In tables that report demographics of and risk factors for TB cases by reporting jurisdictions (Tables 15-19, 29-36), data from jurisdictions with less than five cases of TB are aggregated to reduce the likelihood that individual TB cases in a given jurisdiction can be identified.

The following 11 jurisdictions had one to four cases of TB in 2003: Colusa, Del Norte, Glenn, Humboldt, Inyo, Kings, Lake, Nevada, San Benito, Tehama, and Yuba. The following 13 jurisdictions had no TB cases in 2003: Alpine, Amador, Calaveras, El Dorado, Lassen, Mariposa, Modoc, Mono, Plumas, Sierra, Siskiyou, Trinity, and Tuolumne.

Race/Ethnicity

The Report of Verified Case of Tuberculosis (RVCT) has one variable for race and one for ethnicity. If a case is classified as "Hispanic" on the RVCT, then the case is reported as "Hispanic" in this report, regardless of race.

Beginning in 2003, the federal Office of Management and Budget (OMB) reporting mandates required separate reporting of Asian and Pacific Islander/Native Hawaiian races, as well as the opportunity for persons to identify themselves by one or more race groups. In 2003, 1,321 persons were reported as Asian only (not Hispanic), and 26 persons were reported as Pacific Islander or Native Hawaiian only (not Hispanic). In tables where data on race/ethnicity are presented (except Table 17), these persons are combined in the Asian/Pacific Islander race/ethnic group, in order to provide comparability to previous years' data. Five persons reported more than one race category: four persons reported as both Asian and Pacific Islander/Native Hawaiian (not Hispanic) are included in the combined Asian/Pacific Islander group. One person reported as both Black and White (not Hispanic) is included in the Black race/ethnic group. Reassignment of race category is based on the Deterministic Whole Assignment (Smallest Group) method. In Table 17, (Tuberculosis Cases by Race/Ethnicity: Reporting Jurisdictions in California, 2003), the new, extended, race/ethnic categories are reported.

AIDS-associated Tuberculosis

Tuberculosis cases co-infected with the HIV virus, and diagnosed and reported with AIDS, are identified by matching TBCB Registry data with the case registry in the Office of AIDS, California Department of Health Services. At the time of this report, the match results were not available for 2003.

Ranking of Jurisdictions

For Table 12, jurisdictions are ranked in order of decreasing 2003 case rates with the highest rank first. Those jurisdictions with one to four cases are not given a rate and are given the same rank; they are listed according to

decreasing number of cases. Jurisdictions with no cases of TB are given the same rank and they are listed in alphabetical order. Jurisdictions with the same rate are both given the higher rank; the subsequent rank is skipped.

Case Completion Reports

The source of data for tables and figures on directly observed therapy (DOT), health care provider type, and treatment outcomes (Tables 27, 28, 47-51, Figures 14-16) is the Case Completion Report (Follow-up 2) submitted by the jurisdiction that originally reported the case. Thus, the data in these tables reflect the practices and outcomes of case management in the jurisdiction that counted the case. For example, if a case moved from jurisdiction A to jurisdiction B and completes therapy there, he is counted as a “moved” case in jurisdiction A; the subsequent completion of therapy is not included in our tables. Or, if a patient receives DOT in jurisdiction A, but not in jurisdiction B, these tables reflect only that he received DOT in jurisdiction A.

Data for Figure 17 (Completion of Tuberculosis Therapy, California, 1993-2001) are from the final Follow-up 2 submitted, and therefore represent the overall treatment completion rate for cases beginning therapy for TB disease in California. Treatment completion may have occurred in the jurisdiction reporting the case, in another California jurisdiction, or in another state. The calculations for this figure are identical to the methodology used by the CDC to calculate completion of TB therapy. Patients with resistance to rifampin, patients under 15 years of age with meningeal, bone or joint, or miliary disease, and patients who died during treatment were excluded from this analysis. The percentage of patients who completed therapy in one year or less are presented, as well as the percentage of patients who completed therapy, regardless of duration.

Drug Susceptibility Reports

This report presents drug susceptibility results for the most recent year (2003). Because the Initial Drug Susceptibility Report (Follow-up 1) may be submitted several months after the initial case report, all results may not have been available at the time this report was prepared. At the time of preparation, drug susceptibility testing was approximately 94 percent complete for culture positive TB cases. As the final Follow-up 1 reports are submitted, overall proportions of drug resistance may change slightly. These updated results will be available in future reports, in tables presenting trends in drug resistance (Tables 45, 46).

Treatment Outcomes

Categories for completion of therapy (Tables 47-51, Figures 14-17) are: completed therapy in 12 months or less (includes patients whose treatment was completed in 366 days or less); completed therapy in more than 12 months

(treatment completed in more than 366 days, or treatment completed in undetermined amount of time). If the day of the month is missing from the treatment start or stop date (but the month and year are available), the missing day is set to the first of the month. Because the day of the month is much more likely to be missing from the stop date than the start date, the bias in calculating the duration of therapy is toward shorter duration of therapy.

Cases known to have started treatment, but for whom no Follow-up 2 is available are included in the “No Information” category. All other outcome categories reflect the “Reason Therapy Stopped” (question 37) variable of the Follow-up 2.
