Cover: The map illustrates tuberculosis case rates by reporting jurisdiction in 2007. Twelve jurisdictions (including Long Beach, not represented) have tuberculosis case rates above the state average of 7.2 cases per 100,000 population. Ten jurisdictions (including Pasadena, not represented) have tuberculosis case rates below the 2007 national rate of 4.4 per 100,000 population. Eleven jurisdictions (including Berkeley, not represented) have case rates between the national and state rates (4.4 to 7.2 per 100,000 population). Case rates were not calculated for 28 jurisdictions because there were fewer than five cases in these areas.

Introduction

Reportable cases of tuberculosis (TB) are submitted to the California Department of Public Health (CDPH), TB Control Branch (TBCB), by the 61 local health jurisdictions (58 counties, and the cities of Berkeley, Long Beach, and Pasadena). In 1993, the Centers for Disease Control and Prevention (CDC), in conjunction with state and local health departments, began using the expanded Report of Verified Case of Tuberculosis (RVCT) to collect information on each case of TB. In addition to the demographic and clinical features of TB that were previously collected, the RVCT includes information on drug resistance, risk factors for TB, and treatment outcomes. In 1998, CDC implemented the Tuberculosis Information Management System (TIMS) for data entry and transmission of case reports. Today, TIMS is in use in 19 of the largest jurisdictions, allowing 93 percent of TB cases to be reported electronically to TBCB. The CDPH Division of Communicable Disease Control is currently implementing a web-based surveillance system for reportable diseases, including TB, that will allow all jurisdictions in California to submit TB case reports and access their local data on-line.

Acknowledgment

The TBCB would like to thank surveillance and reporting staff in all local reporting jurisdictions. Without their hard work we would not have data for this publication. We also acknowledge the support of our partners at CDC's Division of Tuberculosis Elimination.

Executive Summary

In 2007, 2,725 cases of tuberculosis (TB) were reported in California, the lowest case count ever recorded. However, the rate of decline in the number of cases has stalled compared to earlier years. The number of TB cases reported in 2007 was less than two percent below the number of cases in 2006, while the average decline between 2003-2006 was nearly five percent. California continues to contribute the greatest number of cases to the nation's total TB morbidity. Of 13,299 cases of TB reported in the United States in 2007, California contributed 20 percent. Although the case rate has declined 59 percent since the peak of the epidemic in 1992, with a rate of 7.2 cases per 100,000 in 2007, California continues to have the second highest rate of TB in the nation. The rate of tuberculosis in the United States in 2007 was 4.4 cases per 100,000 population.

The decline in TB in California represents major successes in state and local efforts to control and prevent tuberculosis throughout the state. However, the epidemiology of TB in subpopulations in California highlights areas where TB continues to pose an ongoing threat to the public's health.

Geographic Distribution

In 2007, TB was reported in 44 of 61 (72 percent) local health jurisdictions (LHJ) in California. Twenty-two jurisdictions had an increase in TB cases over 2006 (Table 13). Of the 11 LHJ with higher TB morbidity (greater than 55 cases in 2007), seven (64 percent) had a case increase of five percent or greater compared to 2006. Over eight percent of California's cases were reported in 27 rural or small health jurisdictions (RSHJ), representing a significant challenge to local TB programs where expertise and resources to detect and treat TB may be less available. The California Tuberculosis Controllers Association RSHJ workgroup in conjunction with the California Department of Public Health, Tuberculosis Control Branch (CDPH/TBCB) continues to implement a statewide strategic plan to ensure basic TB control infrastructure in the RSHJ.

Demographic Characteristics of TB Cases

The majority of California's TB cases are Asian/Pacific Islander (46 percent) or Hispanic (36 percent) (Table 2). Black non-Hispanics and Asian/Pacific Islanders experienced an increase in TB cases and TB rates in 2007. Large disparities in TB rates continue to exist among race/ethnic groups. Compared to White non-Hispanics, the rate of TB among Asian/Pacific Islanders was 18 times greater, among Black non-Hispanics the rate was six times greater, and among Hispanics the rate was five times greater (Table 3).

Individuals born outside the United States accounted for over 77 percent of the cases of TB in California in 2007 (Table 2). The majority of cases were from Mexico (n=603), followed by the Philippines (n=477), Vietnam (n=257), China (n=130), and India (n=102) (Table 10). The rate of TB among foreign-born persons is nearly 10 times

greater than the rate among persons born in the United States (Table 3). These rates may reflect the higher burden of tuberculosis, and the increased likelihood of exposure to disease, in the countries of origin of the foreign-born TB cases.

Seventeen percent of foreign-born cases are identified within one year of the patient's arrival in the United States (Table 10). The Centers for Disease Control and Prevention's Division of Global Migration and Quarantine (DGMQ) has recently implemented an electronic notification system for immigrants and refugees entering the U.S. with suspected TB, which will enhance domestic follow-up evaluation and reporting on this group. In addition, in 2007 DGMQ began implementation of revised Technical Instructions for use in overseas screening of immigrants and refugees applying for permanent residency in the U.S. The new Technical Instructions will increase the number of persons identified and treated with a TB condition prior to entry to the U.S., which will ultimately reduce TB in recent arrivers. However, it is estimated that less than 60 percent of TB cases are screened prior to entry to this country. National, state, and local efforts to improve TB control in Mexican-born persons include Cure-TB (a San Diego-based referral service to ensure continuity of care for patients who move across the U.S.-Mexico border), and the Bi-national Card (a portable medical record which includes vital clinical, laboratory, and treatment information for TB patients). CDPH/TBCB is also participating in an investigation with the national Tuberculosis Epidemiology Studies Consortium to identify opportunities to prevent TB disease in persons born outside the United States.

There were 87 cases of TB reported in children under five years of age in 2007 (Tables 2, 6, 15). TB rates among children in this age group are 6-7 times greater among Hispanics, Asian/Pacific Islanders, and Black non-Hispanics (TB rate = 4.5, 4.4, 3.7 per 100,000, respectively), compared to White non-Hispanics (TB rate = 0.6 per 100,000) (Table 7). A diagnosis of TB in a young child represents ongoing TB transmission and, therefore, a missed public health opportunity for TB control. To interrupt TB transmission, the TBCB offers assistance to local TB programs in outbreak response and contact investigation.

HIV/AIDS

In 2004, the most recent year for which data is available, 122 (4 percent) TB cases had a co-diagnosis of AIDS (Table 11). The percentage of AIDS/TB cases who are foreign-born increased from 38 percent in 1993 to 65 percent in 2004. The percentage of Hispanic AIDS/TB cases has increased from 41 percent to 57 percent in the same time period. The changing profile of TB cases with AIDS underscores the need for HIV testing of all TB cases to identify and appropriately treat these patients. Human immunodeficiency virus (HIV) counseling and testing policy recommendations were emphasized in the 2003 California Department of Health Services/California Tuberculosis Controllers Association Guidelines for Treatment of Active Tuberculosis Disease (available at www.ctca.org).

Drug Resistance

The frequency of resistance to isoniazid (INH), one of the primary drugs used to treat TB, rose to 11 percent in 2007 (Table 45) from less than 10 percent in 2006 (Table 45). Among those with a prior episode of TB, the frequency of INH resistance was nearly 18 percent (Table 38). Where INH resistance exceeds four percent, the recommendation is to start all TB cases on an initial four drug regimen. In 2007, over 88 percent of cases began TB treatment with a four drug regimen (Table 26).

California continues to report the largest number of multidrug resistant (MDR; resistant to at least isoniazid and rifampin) TB cases in the nation. Between 27 and 39 cases of MDR TB were reported per year in California between 2003 and 2007 (Table 43, Figure 13). During this five year period, MDR TB cases were reported in 25 (41 percent) of California's 61 local health jurisdictions, including several rural and smaller health jurisdictions where experience in treating MDR TB may be limited. Although the overall proportion of MDR TB cases remains low (1.3 percent in 2007), the potential consequences of these deadly strains of TB to the patient and to the public can be costly in terms of human mortality, transmission of disease, and resource requirements. Three cases of the most severe form of drug resistance, termed extensively drug resistant TB (XDR TB) were reported between 2003-2007 (data not shown). XDR TB is defined by the World Health Organization as resistance to isoniazid and rifampin, as well as at least one fluoroquinolone and any of the second-line injectable agents, amikacin, kanamycin, or capreomycin.

Due to the increased duration of treatment that these cases require, the number of newly diagnosed MDR TB cases in one year underestimates the workload that these cases represent for local TB programs. Approximately 70-80 MDR TB cases are currently under treatment in California. The MDR TB service of the TBCB was developed in 2002 to increase access to consultation and tools to manage MDR TB patients in California, including ensuring appropriate treatment and public health follow-up of all MDR TB cases. In 2007, CDC initiated enhanced surveillance of MDR TB cases to ensure complete reporting of MDR TB cases, and to inform potential on-going surveillance of MDR TB cases.

Treatment Outcomes

Because treatment of TB disease may last from 6 to 24 months, the most recent complete data on TB treatment outcomes are from 2005. Among all pan-sensitive patients, 77 percent completed within one year, and 11 percent completed in more than one year for a total of 88 percent of patients completing treatment (Figure 17). A key activity to promote timely completion of treatment is the use of Directly Observed Therapy (DOT) for patients at high risk of defaulting from treatment. The use of DOT has improved greatly, with 83 percent of TB cases receiving at least part of their treatment under supervision in 2005, compared to 55 percent in 1996 (data not shown).

Approximately seven percent of patients died during treatment for tuberculosis in

2005 (Table 47). In addition, each year approximately two percent of reported cases have TB diagnosed after death or before treatment for TB disease is initiated (Table 25). Because it is not known how many of these deaths are TB-related, TBCB has developed a tool to assist local health jurisdictions in determining whether TB contributed to death and whether missed prevention opportunities were present for TB-related deaths. This information will inform local and state interventions to prevent future TB-related deaths. CDPH/TBCB is participating in a national Tuberculosis Epidemiology Studies Consortium investigation to describe the mortality of patients diagnosed with TB, to determine the proportion of deaths that are TB-related and preventable, and to assess risk factors associated with TB-related deaths.

Each year approximately two percent of patients default (refuse treatment or become lost) before completing an adequate course of anti-TB treatment (Table 47). The TBCB has provided a Patient Locating Service which is available to provide local TB programs with technical and/or direct assistance with locating their lost TB patients.

Moved

Of patients beginning therapy in 2005, 219 (7.8 percent) moved prior to completing treatment (Table 47). Of these, approximately 41 percent moved to another jurisdiction in California, 20 percent moved to another state, and 39 percent moved out of the country. Of patients moving in California or the United States, 69 percent are known to have completed treatment in their destination jurisdiction, and 10 percent had “adverse” outcomes (lost, refused treatment, died). No further information is available on the remaining 21 percent of cases, therefore, the outcomes for these patients remain “moved.”

Among patients moving out of the country, the predominant destination was Mexico (46 percent). Cure-TB, located in San Diego, continues to ensure continuity of care for this group of patients by providing medical referrals for patients moving into and out of Mexico.

California has experienced considerable success in the prevention and control of TB disease since the peak of the epidemic in 1992. The on-going challenges, including TB disparities among race/ethnic groups, the intersection of TB and HIV disease, and drug resistant TB, underscore the importance of maintaining strong local and state TB programs so that TB can be identified and treated to break the cycle of transmission, and to protect the public's health.

Table 1. Tuberculosis Cases and Case Rates per 100,000 Population: California, 1985-2007

Year	Cases	Rate	Percent Change From Previous Year	
			Cases	Rate

* First-line drugs include isoniazid, rifampin, ethambutol and pyrazinamide.

** Sum of cases with prior TB and without prior TB may not equal all cases due to inclusion of those with unknown history of TB.

- Indicates zero cases or zero percent.

* At the time of report preparation, initial drug susceptibility testing was 97 percent complete for culture positive cases reported in 2007. As additional Initial Drug Susceptibility Reports are submitted, overall proportions of drug resistance may change slightly.

** INH=isoniazid, RIF=rifampin

- Indicates zero cases or zero percent.

Note: Excludes cases with rifampin resistant disease, cases with meningeal disease, cases less than 15 years of age with disseminated tuberculosis disease, and those that died during treatment.

Technical Notes

Reporting Jurisdictions

California has 61 jurisdictions reporting on TB morbidity. There are 58 counties and the cities of Berkeley, Long Beach, and Pasadena. Reports from Alameda County exclude TB cases from the city of Berkeley, and reports from Los Angeles County exclude cases from the cities of Long Beach and Pasadena.

TB Cases

A TB case submitted to the TBCB Registry by January 15, 2008 was included in this report if the case was confirmed as active TB between January 1 and December 31, 2007. After reporting the case, a jurisdiction may subsequently decide that a reported case did not have TB. Also, a few cases may be reported after the submission deadline. These changes will be reflected in future reports. Therefore, the total number of TB cases counted in a given year may change, although usually by a very small number of cases. For historical data in Tables 1–5 and 12–14, we used the original number of reported cases, not the revised number. For all other tables, the revised number of cases was used.

Population Data

State and county population totals, and data by age, sex, and race/ethnic group for California are from the following sources published by the State of California, Department of Finance: *Race/Ethnic Population with Age and Sex Detail, 1970–1989*, December 1998; *Race/Ethnic Population with Age and Sex Detail, 1990–1999*, May 2004; and *Population Projections by Race/Ethnicity for California, 2000–2050*, May 2004.

Population data for 1985–2000 for the cities of Berkeley, Long Beach, and Pasadena are from the following sources: State of California, Department of Finance, *E–4 Population Estimates for California Cities and Counties, January 1, 1981, to January 1, 1990*, Sacramento, California, May 2005; State of California, Department of Finance, *E–4 Revised Historical City, County, and State Population Estimates, 1991–2000, with 1990 and 2000 Census Counts*, Sacramento, California, March 2002. City population data for 2001–2007 are from the annual series: State of California, Department of Finance, *E–1 Population Estimates for City County Population Estimates with Annual Percentage Change, Sacramento, California*. Population totals for the jurisdiction of Alameda were calculated by subtracting Berkeley totals from Alameda County totals; population totals for the jurisdiction of Los Angeles were calculated by subtracting Long Beach and Pasadena totals from Los Angeles County totals.

Population data used to calculate rates of TB among foreign-born and U.S.-born persons are from the *Current Population Survey*, published annually by the California Department of Finance.

To calculate 2000–2007 TB rates for race/ethnic groups that are comparable to the race/ethnic categories prior to 2000, the multi-race category in the 2000–2007 population data was reallocated to a single race/ethnic group according to the allocation table in this source: State of California, Department of Finance, *Suggested Allocations of the Multi-race Category for Use with Projections by Race/Ethnicity for California and Its Counties, 2000–2050*, Sacramento, California, June 2004.

Small Case Numbers

While there are different methods for reporting the rates of rare events, we have chosen not to report rates when the total number of TB cases is less than five. Rates of zero, based on no TB cases, are also not reported. Where the rate is not reported, changes in rate over time are also not reported.

In tables that report demographics of, and risk factors for, TB cases by reporting jurisdictions (Tables 15–19, 29–36), data from jurisdictions with less than five cases of TB are aggregated to reduce the likelihood that individual TB cases in a given jurisdiction can be identified.

The following 11 jurisdictions had one to four cases of TB in 2007: Butte, Calaveras, El Dorado, Glenn, Lake, Madera, Mendocino, San Luis Obispo, Shasta, Sutter, and Tehama counties. The following 17 jurisdictions had no TB cases in 2007: Alpine, Amador, Colusa, Del Norte, Humboldt, Inyo, Lassen, Mariposa, Modoc, Mono, Nevada, Plumas, San Benito, Sierra, Siskiyou, Trinity, and Tuolumne counties.

Race/Ethnicity

The RVCT has one variable for race and one for ethnicity. If a case is classified as “Hispanic” on the RVCT, then the case is reported as “Hispanic” in this report, regardless of race.

Beginning in 2003, the federal Office of Management and Budget (OMB) reporting mandates required separate reporting of Asian and Pacific Islander/Native Hawaiian races, as well as the opportunity for persons to identify themselves by one or more racial groups. In 2007, 1,243 persons with TB in California were reported as Asian only (not Hispanic), and 17 persons were reported as Pacific Islander or Native Hawaiian only (not Hispanic). In tables where data on race/ethnicity are presented (except Table 17) these persons are combined in the Asian/Pacific Islander race/ethnic group, in order to provide comparability to previous years’ data. In 2007, of the four persons reporting

more than one race category, none were Hispanic. One person reported as White and Black, and one person reported as Asian and Black are included in the Black race/ethnicity group. One person reported as White and Asian, and one person reported as Asian and Native Hawaiian/Pacific Islander are included in the Asian/Pacific Islander race/ethnicity group.

AIDS–associated TB

TB cases co-infected with the human immunodeficiency virus (HIV), and diagnosed and reported with acquired immunodeficiency syndrome (AIDS), are identified by matching TBCB Registry data with the AIDS case registry in the California Department of Public Health, Office of AIDS. At the time of this report, the match results were not available for 2005 - 2007.

Ranking of Jurisdictions

For Table 12, jurisdictions are ranked in order of decreasing 2007 case rates with the highest rank first. Those jurisdictions with one to four cases are not given a rate and are given the same rank; they are listed according to decreasing number of cases. Jurisdictions with no cases of TB are given the same rank and they are listed in alphabetical order. Jurisdictions with the same rate are given the higher rank; the subsequent rank is skipped.

Case Completion Reports

Because the Case Completion Report (Follow-up 2) is not submitted until many months after a TB case is initially reported, 2005 data on health care provider type, directly observed therapy (DOT) and treatment outcomes (Tables 27, 28, 47–51, Figures 14–17) are the most recently available and are reported here. The source of data for these tables and figures is the jurisdiction that originally reported the case. Thus, the data in these tables reflect the practices and outcomes of case management in the jurisdiction that counted the case. For example, if a patient moved from jurisdiction A to jurisdiction B and completed therapy in jurisdiction B, he is counted as a “moved” case in jurisdiction A; the subsequent completion of therapy is not included in our tables. Or, if a patient received DOT in jurisdiction A, but not in jurisdiction B, these tables reflect only that he received DOT in jurisdiction A.

Data for Figure 17 (Completion of Tuberculosis Therapy: California, 1996–2005) are from the final Follow-up 2 submitted and, therefore, represent the overall treatment completion rate for cases beginning therapy for TB disease in California. Treatment completion may have occurred in the jurisdiction reporting the case, in another California jurisdiction, or in another state.

Drug Susceptibility Reports

Tables 37–44 present the results of initial drug susceptibility testing for the most recent year (2007). Because the Initial Drug Susceptibility Report (Follow-up 1) may be submitted several months after the initial case report, all results may not have been available at the time this report was prepared. At the time of report preparation, drug susceptibility testing was approximately 97 percent complete for culture-positive TB cases. As additional Follow-up 1 reports are submitted, overall proportions of drug resistance may change slightly. These updated results will be available in future reports, in tables presenting trends in drug resistance (Tables 45, 46, Figure 12).

Figure 12 presents multidrug-resistant TB cases (defined as cases with an isolate resistant to at least isoniazid and rifampin) reported on the Initial Drug Susceptibility Report (Follow-up 1) or the Case Completion Report (Follow-up 2).

Treatment Outcomes

Categories for completion of therapy (Tables 47–51, Figures 14–17) are: completed therapy in 12 months or less (includes patients whose treatment was completed in 365 days or less); completed therapy in more than 12 months (treatment completed in more than 365 days, or treatment completed in an undetermined amount of time). If the day of the month is missing from the treatment start or stop date (but the month and year are available), the missing day is set to the first of the month. Because the day of the month is much more likely to be missing from the stop date than the start date, the bias in calculating the duration of therapy is toward shorter duration of therapy.

Cases known to have started treatment, but for whom no Follow-up 2 is available are included in the “No Information” category. All other outcome categories reflect the “Reason Therapy Stopped” (question 37) variable of the Follow-up 2.

Table 48 and Figure 15 present outcomes of TB treatment for cases expected to complete TB therapy in one year or less. Thus, cases with rifampin-resistant disease, those with meningeal disease, and children less than 15 years of age with disseminated TB disease are excluded. Treatment outcomes for those cases not expected to complete therapy in one year (rifampin-resistant disease, meningeal disease, and children less than 15 with disseminated disease) are presented in Table 49 and Figure 16.

Figure 17 presents completion of TB therapy using methodology identical to that used by CDC. Patients with rifampin-resistant disease, patients with meningeal disease, patients under 15 years of age with disseminated disease, and patients who died during treatment are excluded. The percentage of patients who completed therapy in one year or less is presented, as well as the percentage of patients who completed therapy, regardless of duration.
