Cover: The map illustrates tuberculosis case rates by reporting jurisdiction in 2009. Eleven jurisdictions (including Long Beach, not represented) have tuberculosis case rates above the state average of 6.4 cases per 100,000 population. Seven jurisdictions have tuberculosis case rates below the 2009 national rate of 3.8 per 100,000 population. Twelve jurisdictions have case rates between the national and state rates (3.8 to 6.4 cases per 100,000 population). Case rates were not calculated for 31 jurisdictions (including Berkeley and Pasadena, not represented) because there were fewer than five cases in these areas.

Introduction

Tuberculosis (TB) case reports are submitted to the California Department of Public Health (CDPH), TB Control Branch (TBCB), by the 61 local health jurisdictions (58 counties, and the cities of Berkeley, Long Beach, and Pasadena). In 1993, the Centers for Disease Control and Prevention (CDC), in conjunction with state and local health departments, began using the expanded Report of Verified Case of Tuberculosis (RVCT) to collect information on each case of TB. In addition to the demographic and clinical features of TB that were previously collected, the RVCT includes information on drug resistance, risk factors for TB, and treatment outcomes. In 2009, CDC released a revised RVCT that collects additional information to address the changing epidemiology of TB in terms of risk factors, new drug treatments, and enhanced laboratory capacity for diagnostic tests. California implemented this revised RVCT January 1, 2010.

CDPH Division of Communicable Disease Control is currently implementing an internet-based surveillance system for reportable diseases including TB. The system, California Reportable Disease Information Exchange (CalREDIE), will allow all jurisdictions in California to submit TB case reports and access their local data on-line in a timely manner. The Tuberculosis Information Management System (TIMS), in use since 1998 for data entry and transmission of case reports, is being retired in 2010.

Acknowledgment

TBCB would like to thank surveillance and reporting staff in all local reporting jurisdictions. Without their hard work we would not have data for this publication. We also acknowledge the support of our partners at CDC's Division of Tuberculosis Elimination.

Executive Summary

In 2009, 2,472 cases of tuberculosis (TB) were reported in California. The 8.3 percent decline from the 2,695 cases reported in 2008 marks the largest decrease in TB cases since 2000. Decreases in cases were seen across all race/ethnic and age groups, as well as in persons born in the United States (U.S.) and in other countries. Initial analysis suggests that reduced overall immigration to the U.S. and improved screening of immigrants before arrival are major contributors to the decline in case numbers among the foreign-born. The decline in U.S.-born cases also indicates that efforts to identify and treat newly-infected TB cases and to interrupt transmission have been successful. Investigation to more fully understand the reasons for the sizable one-year decrease in case numbers is ongoing.

California continues to contribute the greatest number of cases to the nation's total TB morbidity. Of 11,540 cases of TB reported in the United States in 2009, California contributed 21 percent. California continues to be the state with the second highest TB rate in the nation at 6.4 cases per 100,000 population, compared to a national rate of 3.8 cases per 100,000 population.¹ The decline in TB in California reflects major successes in national, state, and local efforts to control and prevent tuberculosis. However, the increased risk of TB in certain subpopulations in California highlights areas where TB continues to pose an ongoing threat to the public's health.

Geographic Distribution

In 2009, TB was reported in 43 of 61 (70 percent) local health jurisdictions in California. In spite of the overall case decline in California, 14 (23 percent) jurisdictions had an increase in TB cases compared to 2008 (Table 13). Nearly two-thirds of the areas reporting a case increase were rural or small health jurisdictions. This poses significant challenges to local TB programs where expertise and resources to detect and treat TB may be less available.

Demographic Characteristics of TB Cases

The majority of persons reported with TB in California are Asian/Pacific Islanders (46 percent) or Hispanic (37 percent) (Table 2, Figure 3). The Asian/Pacific Islander group had the smallest case decline (1.6 percent) from 2008, while White non-Hispanics had the largest decline (17.2 percent). The disproportionate case declines resulted in increasing disparities between race/ethnic groups compared to 2008. The rate of TB in 2009 among Asian/Pacific Islanders was 17 times greater, the rate among Black non-Hispanics was six times greater, and the rate among Hispanics was five times greater than that of White non-Hispanics (Table 3, Figure 4).

¹ CDC. Decrease in Reported Tuberculosis Cases --- United States, 2009. *Morbidity and Mortality Weekly Report* 2010; 59 (No. RR 10); 289-294

Individuals born outside the United States accounted for nearly 76 percent of the cases of TB in California in 2009 (Table 2). The majority of cases were from Mexico (n=542, 29 percent), followed by the Philippines (n=392, 21 percent), Vietnam (n=201, 11 percent), China (n=135, 7 percent) and India (n=103, 5.5 percent) (Table 10). The number of cases from each country of origin decreased compared to 2008. However, the rate of TB among foreign-born persons remains eight times higher than the rate among persons born in the United States (Table 3). The higher rate of TB among foreign-born persons may reflect the increased likelihood of exposure to TB in many countries.

Among foreign-born persons with TB, the proportion of new arrivers to the United States has declined in recent years. In 2009, less than ten percent of foreign-born cases were identified within one year of the patient's arrival in the United States (Table 10), compared to 18 percent in 2006. In 2007, the Centers for Disease Control and Prevention implemented new procedures for overseas screening of immigrants and refugees applying for permanent residency in the U.S. These new procedures have increased the number of persons identified and treated with TB prior to entry to the U.S. However, because overseas screening is limited to persons applying for permanent residence and refugees, it is estimated that less than 60 percent of foreign-born persons with TB were screened prior to entry to this country. Thus, persons with active TB who were not screened overseas and with latent TB infection will continue to enter California, and ongoing efforts to prevent and control TB in foreign-born persons are needed. The California Department of Public Health (CDPH) provides financial and technical support to local health jurisdictions for TB control in California. CDPH also supports several strategies to improve TB control in foreign-born persons including Cure-TB (a San Diego-based referral service to ensure continuity of care for patients who move across the U.S.-Mexico border), and the Bi-national Card (a portable medical record which includes vital clinical, laboratory, and treatment information for TB patients).

There were 70 cases of TB reported in children under five years of age in 2009 (Tables 2, 6, 15), the first notable decrease in this group since 2005. Two-thirds of the TB cases among children in this age group are among Hispanics (Table 7). TB in a young child is a marker for ongoing TB transmission and, therefore, a missed public health opportunity for TB control. The pattern of childhood TB suggests that certain communities in California have increased risk of transmission and that additional efforts are needed to further reduce TB transmission in California. To interrupt TB transmission, CDPH provides financial and technical assistance to local TB programs.

HIV/AIDS

Infection with the Human Immunodeficiency Virus (HIV) is a powerful risk factor for the development of TB. In 2008, the most recent year for which data are available, 126 (4.7 percent) TB cases had a co-diagnosis of Acquired Immunodeficiency Syndrome (AIDS) (Table 11). The percentage of AIDS/TB patients who are foreign-born increased from 37 percent in 1996 to 59 percent in 2008. The percentage of

AIDS/TB patients who are Hispanic increased from 41 percent to 57 percent, and the percentage who are Asian/Pacific Islander doubled from less than four percent to nearly eight percent in the same time period. The changing profile of TB cases with AIDS underscores the need for HIV testing of all TB cases to identify and appropriately treat these patients as outlined in CDPH (www.ctca.org) and national guidelines <http://www.cdc.gov/mmwr/preview/mmwrhtml/rr5804a1.htm>). TB testing is also universally recommended for HIV infected persons to identify opportunities to prevent progression to active TB in this high risk population.

Drug Resistance

The frequency of resistance to isoniazid (INH), one of the primary drugs used to treat TB, has remained between 9 and 11 percent in recent years (Table 45). Among those with a prior episode of TB, the frequency of INH resistance was greater than 20 percent in 2009 (Table 38). Where INH resistance exceeds four percent, the CDC recommends starting all TB cases on an initial four drug regimen. In 2009, 88 percent of cases began TB treatment with a four drug regimen (Table 26).

In 2009, the frequency of resistance to pyrazinamide (PZA), another of the most useful drugs against TB, was greater than four percent (Table 41). Since 2000, the proportion of TB cases with PZA resistance has increased gradually, ranging from 3.5 to 5.4 percent. PZA mono-resistance is a marker for infection with *Mycobacterium bovis*, which is more common among young Hispanic persons, as well as those with HIV infection.² Infection with *M. bovis* may arise from ingestion of unpasteurized dairy products, and therefore has implications for control efforts.

Multidrug-resistant (MDR) TB is defined as a TB isolate resistant to at least isoniazid, and either rifampin or rifabutin, the most powerful drugs used to treat TB. Between 28 and 39 cases of culture-confirmed MDR TB were reported per year in California between 2003 and 2009 (Table 46), reflecting little change in the proportion of TB cases that are MDR over time. Populations at an increased risk for MDR TB include those with a history of TB treatment, and recent arrivers to the U.S., especially from former Soviet republics, and the nations of Southeast Asia. The consequences of the spread of these strains of TB to the patient and to the public can be grave in terms of human mortality and the very high cost associated with treatment. Since 1993, 23 cases of the most severe form of drug resistance, termed extensively drug resistant (XDR) TB, have been reported in California (data not shown). No new XDR cases were reported in 2009. XDR TB is defined by the World Health Organization as resistance to isoniazid and rifampin, as well as at least one fluoroquinolone and any of the second-line injectable agents, amikacin, kanamycin, or capreomycin.

The CDPH MDR TB service was developed in 2002 to increase access to consultation and tools to manage MDR TB patients in California. In partnership with

² Hlavsa et al. Human Tuberculosis due to *Mycobacterium bovis* in the United States, Clinical Infectious Diseases 2008; 47:168-75.

local TB control programs, this service works to ensure appropriate treatment and public health follow-up of all MDR TB cases. CDPH also carries out enhanced surveillance of MDR TB cases to ensure complete reporting of MDR TB cases, and to inform ongoing control efforts.

Treatment Outcomes

Because treatment of TB disease may last from 6 to 24 months, the most recent complete data on TB treatment outcomes are from 2007. Among all patients for whom TB was susceptible to all first-line medicines, 75 percent completed treatment within one year, and 13 percent completed in more than one year for a total of 88 percent of patients overall completing treatment (Figure 17). A key activity to promote timely completion of treatment is the use of directly observed therapy (DOT) for patients at high risk of defaulting from treatment. The use of DOT has improved significantly, with 85 percent of TB cases receiving at least part of their treatment under supervision in 2007 (Table 28), compared to 55 percent in 1996 (data not shown). Of patients beginning therapy in 2007, 197 (7.4 percent) moved prior to completing treatment (Table 47). Final treatment outcomes remain unknown for more than 50 percent of these patients, many of whom moved out of the country.

Approximately six percent of patients died during treatment for tuberculosis in 2007 (Table 25). In addition, more than two percent of reported cases had TB diagnosed after death or before treatment for TB disease was initiated. The proportion of TB cases dying with TB has varied between eight and ten percent in the past decade. CDPH is participating in a national study to describe TB mortality, to determine the proportion of deaths that are TB-related and preventable, and to assess risk factors associated with TB-related deaths.

California has experienced considerable success in the prevention and control of TB. The ongoing challenges to TB control, including the impact of global migration and the global TB epidemic, ongoing TB transmission in California, TB disparities among race/ethnic groups, the intersection of TB and HIV disease, ongoing high rates of deaths among TB patients, and drug resistant TB, underscore the importance of maintaining strong local and state TB control programs. State and local TB programs work to protect the health of all Californians by breaking the cycle of TB transmission.

Figure 14. Tuberculosis Cases¹ by Outcome of Therapy: California, 2007

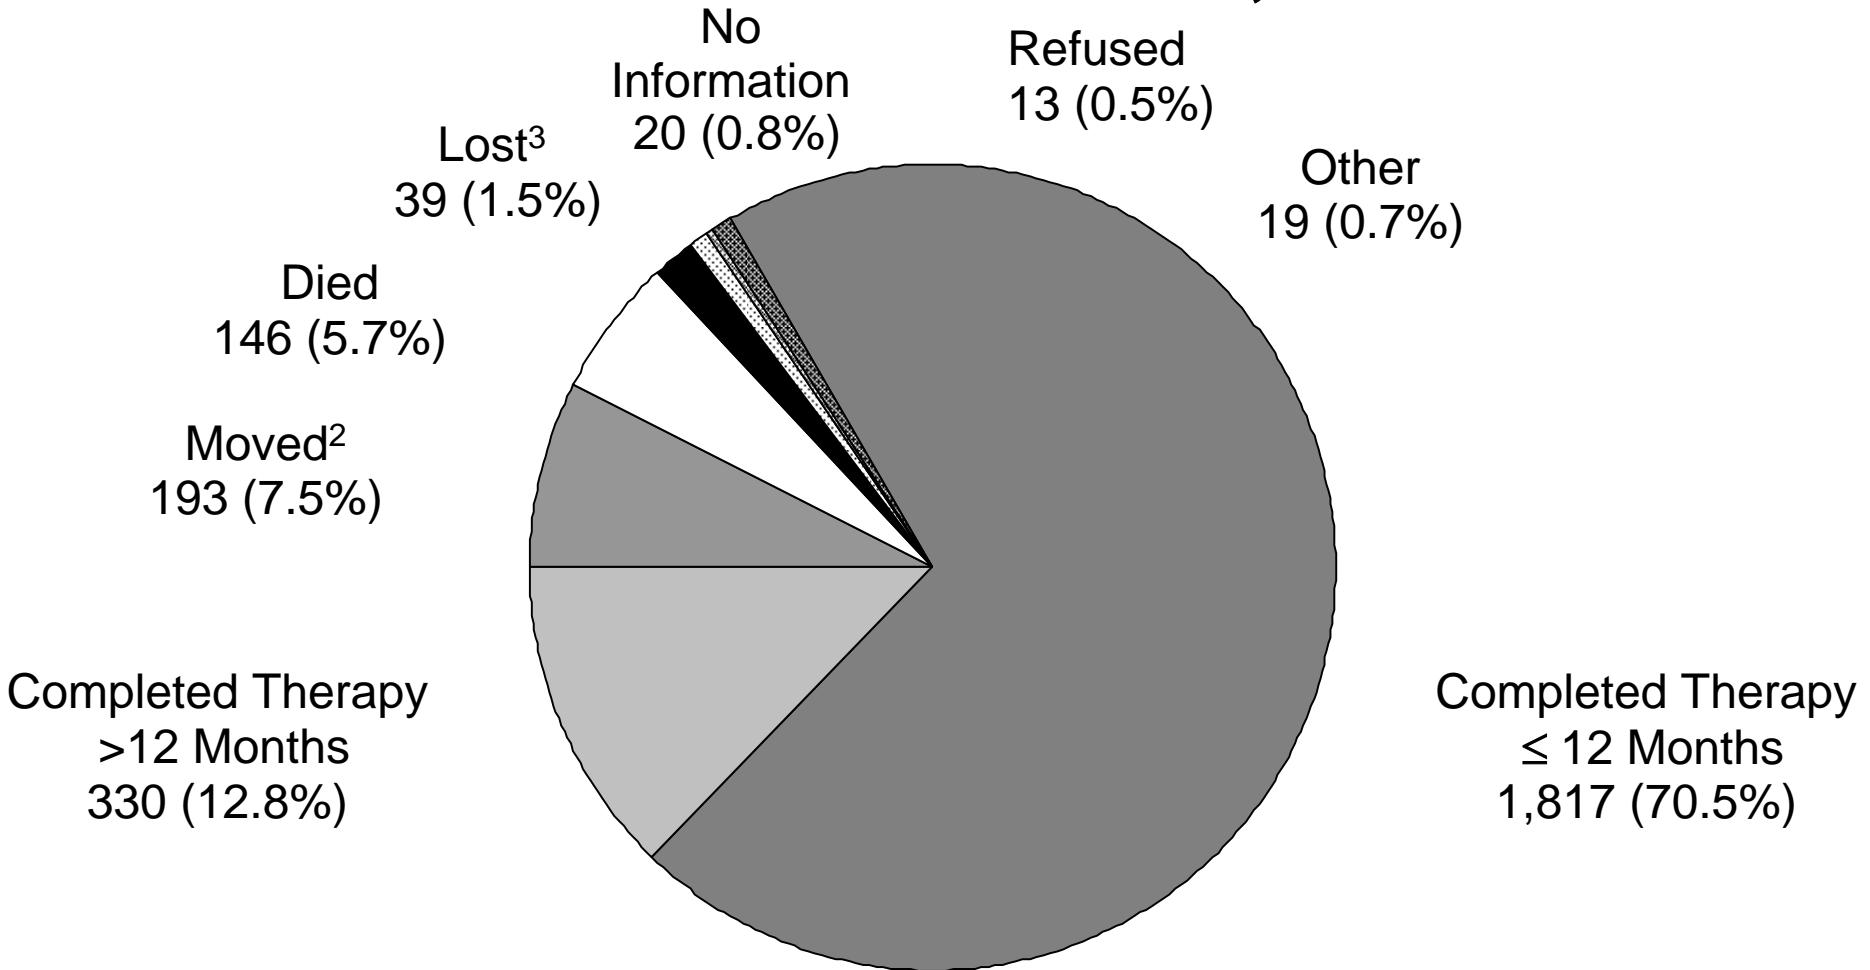

¹ Patient alive at diagnosis and started on an initial drug regimen of one or more drugs.

² Patient moved to another jurisdiction with a known forwarding address before treatment was completed.

³ Patient could not be located prior to the completion of treatment.

Figure 15. Outcome in Tuberculosis Cases for Whom One Year or Less of Treatment was Indicated¹: California, 2007

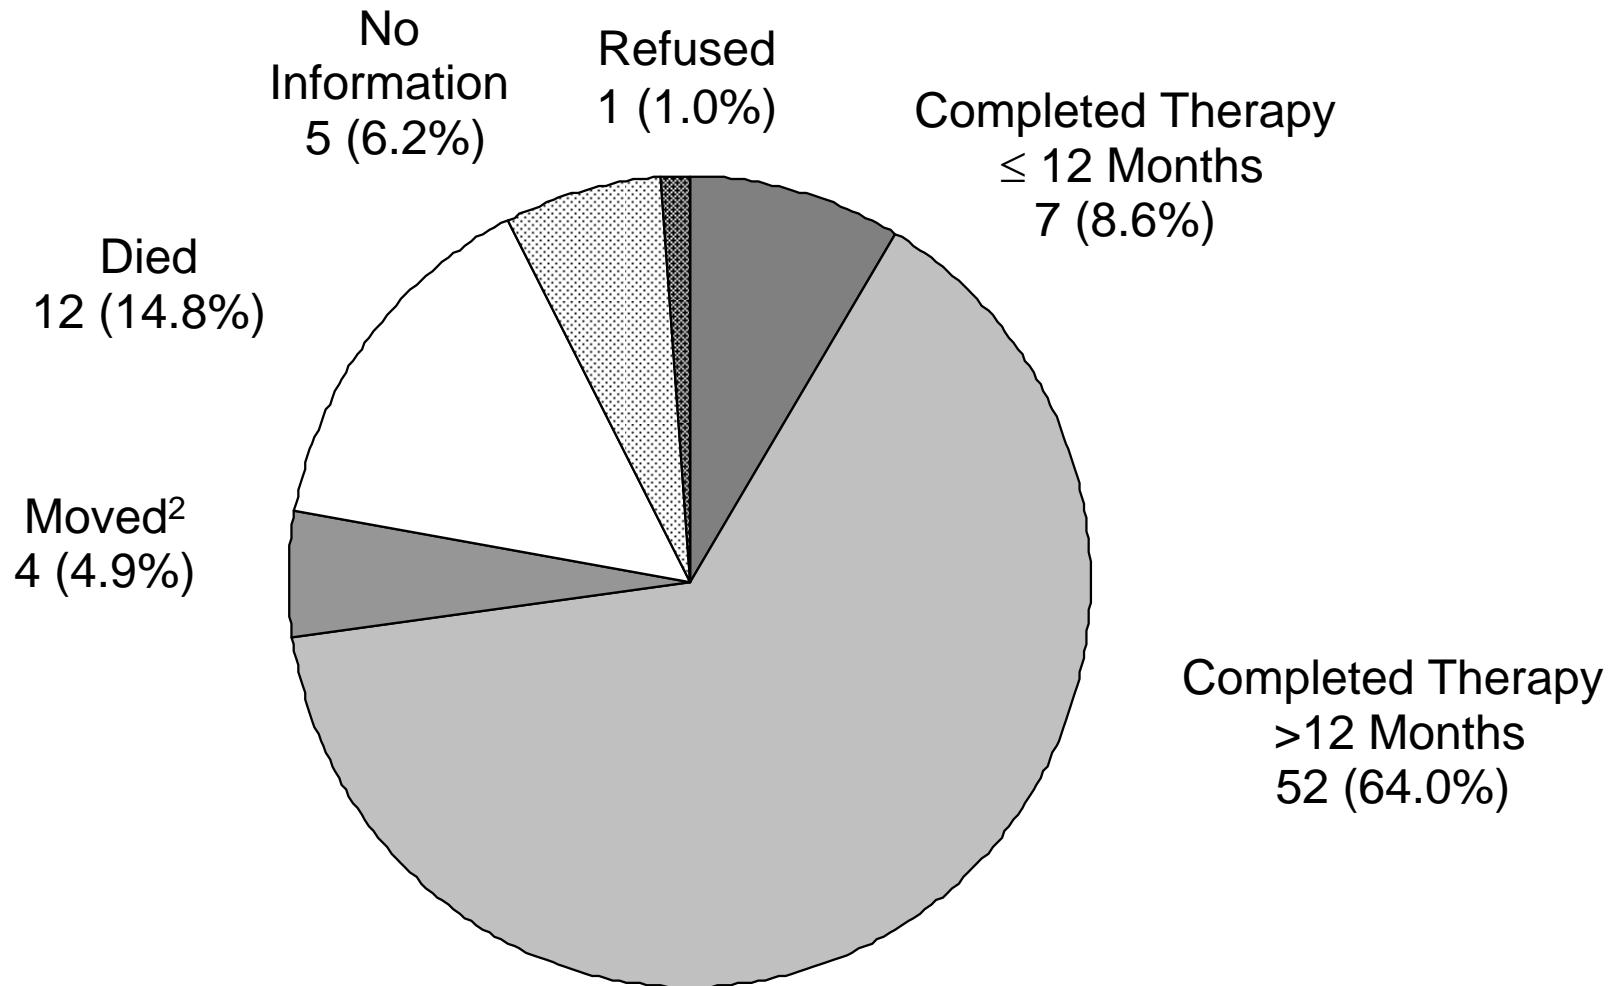

¹ Excludes cases with rifampin resistant disease, cases with meningeal disease, and cases less than 15 years of age with disseminated tuberculosis disease.

² Moved to another jurisdiction with a known forwarding address before treatment was completed.

³ Patient could not be located prior to the completion of treatment.

Figure 16. Outcome in Tuberculosis Cases for Whom Greater than One Year of Treatment was Indicated¹: California, 2007

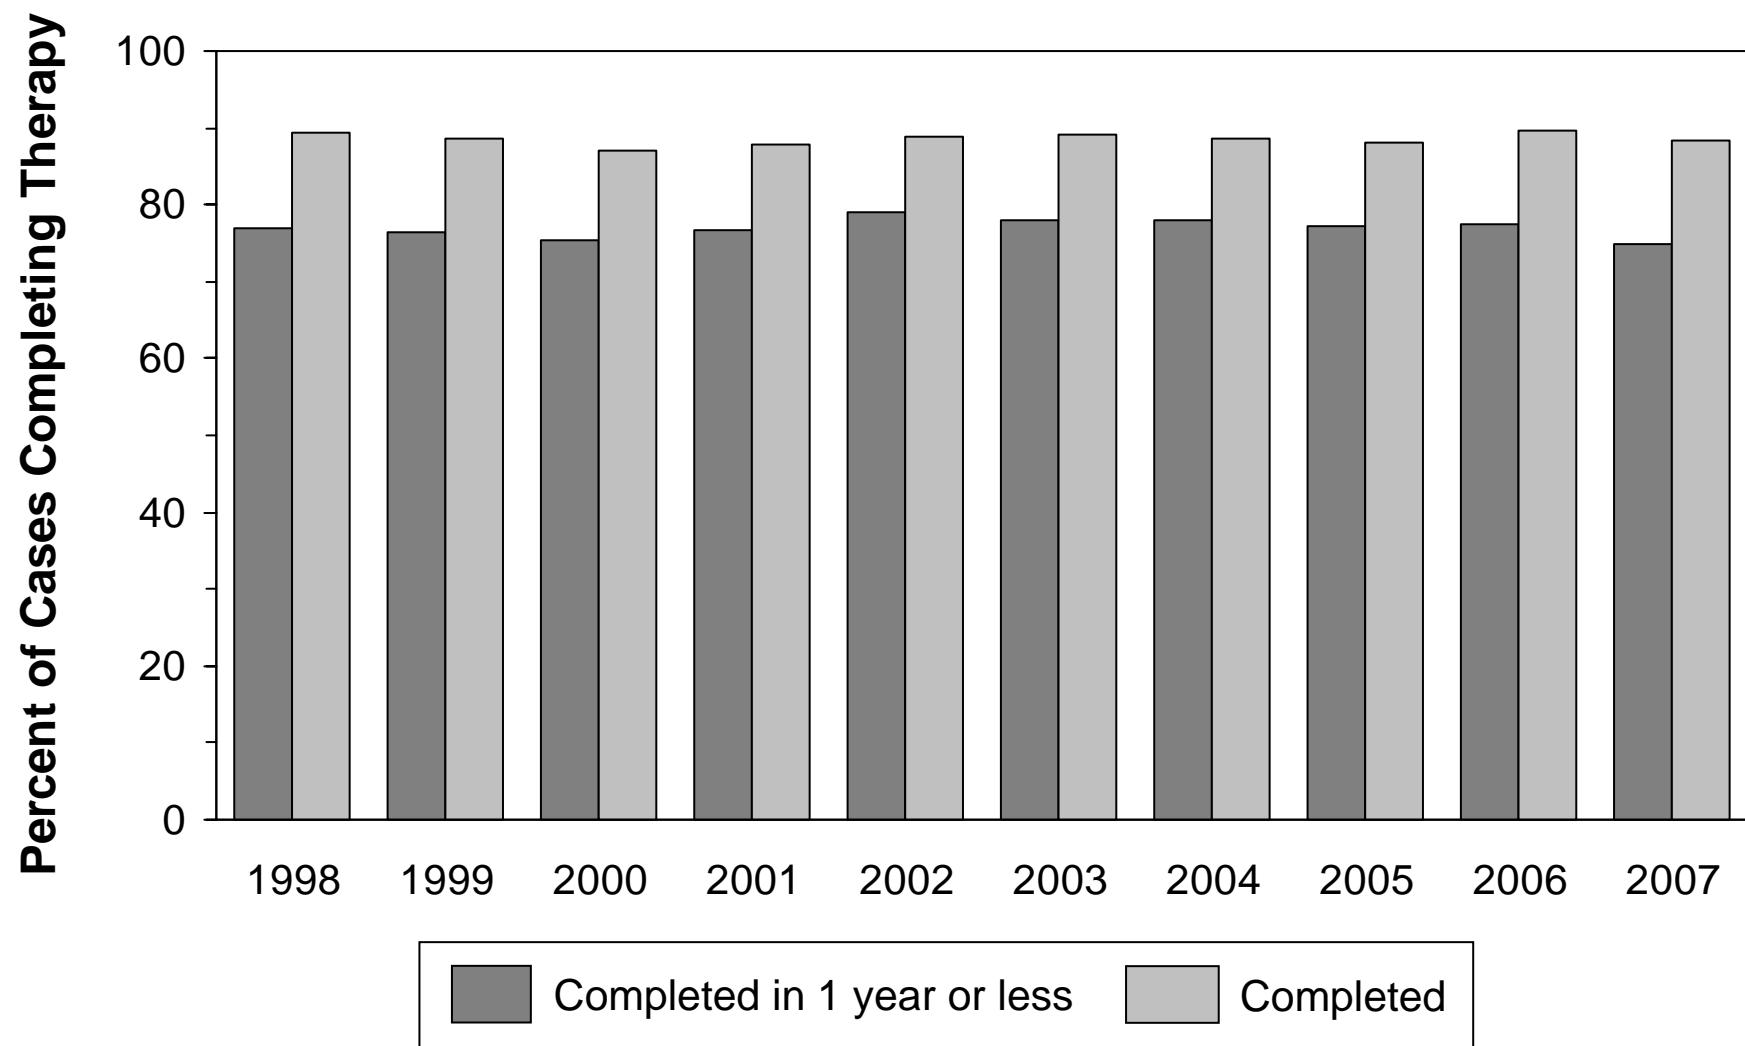

¹Includes cases with rifampin resistant disease, cases with meningeal disease, and cases less than 15 years of age with disseminated tuberculosis disease.

²Patient moved to another jurisdiction with a known forwarding address before treatment was completed.

³Patient could not be located prior to the completion of treatment.

Figure 17. Completion of Tuberculosis Therapy: California, 1998-2007

Note: Excludes cases with rifampin resistant disease, cases with meningeal disease, cases less than 15 years of age with disseminated tuberculosis disease, and those that died during treatment.

Technical Notes

Reporting Jurisdictions

California has 61 jurisdictions reporting on TB morbidity. There are 58 counties and the cities of Berkeley, Long Beach, and Pasadena. Reports from Alameda County exclude TB cases from the city of Berkeley, and reports from Los Angeles County exclude cases from the cities of Long Beach and Pasadena.

TB Cases

A TB case submitted to the TBCB Registry by January 15, 2010 was included in this report if the case was confirmed as active TB between January 1 and December 31, 2009. After reporting the case, a jurisdiction may subsequently decide that a reported case did not have TB. Also, a few cases may be reported after the submission deadline. These changes will be reflected in future reports. Therefore, the total number of TB cases counted in a given year may change, although usually by a very small number of cases. For historical data in Tables 1–5 and 12–14, we used the original number of reported cases, not the revised number. For all other tables, the revised number of cases was used.

Population Data

State and county population totals, and data by age, sex, and race/ethnic group for California are from the following sources published by the State of California, Department of Finance: *Race/Ethnic Population with Age and Sex Detail, 1970–1989*, December 1998; *Race/Ethnic Population with Age and Sex Detail, 1990–1999*, May 2009; and *Population Projections by Race/Ethnicity for California, 2000–2050*, May 2004.

Population data for 1985–2000 for the cities of Berkeley, Long Beach, and Pasadena are from the following sources: State of California, Department of Finance, *E–4 Population Estimates for California Cities and Counties, January 1, 1981, to January 1, 1990*, Sacramento, California, May 2005; State of California, Department of Finance, *E–4 Revised Historical City, County, and State Population Estimates, 1991–2000, with 1990 and 2000 Census Counts*, Sacramento, California, August 2007. City population data for 2001–2009 are from the annual series: State of California, Department of Finance, *E–1 Population Estimates for Cities, Counties, and the State with Annual Percentage Change*, Sacramento, California. For this report, the population of Alameda County was calculated by subtracting the population of Berkeley; similarly, the population of Los Angeles County was were calculated by subtracting Long Beach and Pasadena.

Population data used to calculate rates of TB among foreign-born and U.S.-born persons are from the *Current Population Survey*, published annually by the California Department of Finance.

To calculate 2000–2009 TB rates for race/ethnic groups that are comparable to the race/ethnic categories prior to 2000, the multi-race category in the 2000–2009 population data was reallocated to a single race/ethnic group according to the allocation table in this source: State of California, Department of Finance, *Suggested Allocations of the Multi-race Category for Use with Projections by Race/Ethnicity for California and Its Counties, 2000–2050*, Sacramento, California, June 2004.

Small Case Numbers

While there are different methods for reporting the rates of rare events, we have chosen not to report rates when the total number of TB cases is less than five. Rates of zero, based on no TB cases, are also not reported. Where the rate is not reported, changes in rate over time are also not reported.

In tables that report demographics of, and risk factors for, TB cases by reporting jurisdictions (Tables 15–19, 29–36), data from jurisdictions with less than five cases of TB are aggregated to reduce the likelihood that individual TB cases in a given jurisdiction can be identified.

The following 13 jurisdictions had one to four cases of TB in 2009: Berkeley, Butte, Calaveras, El Dorado, Humboldt, Kings, Mendocino, Pasadena, San Luis Obispo, Shasta, Sutter, Tehama, and Tuolumne counties. The following 18 jurisdictions had no TB cases in 2009: Alpine, Amador, Colusa, Del Norte, Glenn, Inyo, Lake, Lassen, Mariposa, Modoc, Mono, Nevada, Plumas, San Benito, Sierra, Siskiyou, Trinity, and Yuba counties.

Race/Ethnicity

The RVCT has one variable for race and one for ethnicity. If a case is classified as “Hispanic” on the RVCT, then the case is reported as “Hispanic” in this report, regardless of race.

Beginning in 2003, the federal Office of Management and Budget (OMB) reporting mandates required separate reporting of Asian and Pacific Islander/Native Hawaiian races, as well as the opportunity for persons to identify themselves by one or more racial groups. In 2009, 1,121 persons with TB in California were reported as Asian only (not Hispanic), and 13 persons were reported as Pacific Islander or Native Hawaiian only (not Hispanic). In tables where data on race/ethnicity are presented (except Table 17) these persons are combined in the Asian/Pacific Islander race/ethnic group, in order to provide comparability to previous years’ data. In 2009, there were seven non-Hispanic persons reporting more than one race category. Two persons reported as White

and Asian, and one person reported as Asian and Native Hawaiian/Pacific Islander are included in the Asian/Pacific Islander race/ethnicity group. One person reported as White and American Indian/Alaska Native, and one person reported as Native Hawaiian/Pacific Islander and American Indian/Alaska Native are included in the American Indian/Alaska Native race/ethnicity group. One person reported as White and Black, and one person reported as Asian and Black are included in the Black race/ethnicity group.

AIDS-associated TB

TB cases diagnosed and reported with HIV or AIDS are identified by matching TBCB Registry data with the HIV/AIDS registry in the California Department of Public Health, Office of AIDS. At the time of this report, the match results were not available for 2009.

Ranking of Jurisdictions

For Table 12, jurisdictions are ranked in order of decreasing 2009 case rates with the highest rank first. Those jurisdictions with one to four cases are not given a rate and are given the same rank; they are listed according to decreasing number of cases. Jurisdictions with no cases of TB are given the same rank and they are listed in alphabetical order. Jurisdictions with the same rate are given the higher rank; the subsequent rank is skipped.

Case Completion Reports

Because the Case Completion Report (Follow-up 2) is not submitted until many months after a TB case is initially reported, 2007 data on health care provider type, DOT and treatment outcomes (Tables 27, 28, 47–51, Figures 14–17) are the most recent available and are reported here. The source of data for these tables and figures is the jurisdiction that originally reported the case. Thus, the data in these tables reflect the practices and outcomes of case management in the jurisdiction that counted the case. For example, if a patient moved from jurisdiction A to jurisdiction B and completed therapy in jurisdiction B, he is counted as a “moved” case in jurisdiction A; the subsequent completion of therapy is not included in our tables. Or, if a patient received DOT in jurisdiction A, but not in jurisdiction B, these tables reflect only that he received DOT in jurisdiction A.

Data for Figure 17 (Completion of Tuberculosis Therapy: California, 1998–2007) are from the final Follow-up 2 submitted and, therefore, represent the overall treatment completion rate for cases beginning therapy for TB disease in California. Treatment completion may have occurred in the jurisdiction reporting the case, in another California jurisdiction, or in another state.

Drug Susceptibility Reports

Tables 37–44 present the results of initial drug susceptibility testing for the most recent year (2009). Because the Initial Drug Susceptibility Report (Follow-up 1) may be submitted several months after the initial case report, all results may not have been available at the time this report was prepared. At the time of report preparation, drug susceptibility testing was approximately 97 percent complete for culture-positive TB cases. As additional Follow-up 1 reports are submitted, overall proportions of drug resistance may change slightly. These updated results will be available in future reports, in tables presenting trends in drug resistance (Tables 45, 46, Figure 12).

Figure 12 presents MDR TB cases (defined as cases with an isolate resistant to at least isoniazid, and either rifampin or rifabutin) reported on the Initial Drug Susceptibility Report (Follow-up 1) or the Case Completion Report (Follow-up 2).

Treatment Outcomes

Categories for completion of therapy (Tables 47–51, Figures 14–17) are: completed therapy in 12 months or less (includes patients whose treatment was completed in 365 days or less); completed therapy in more than 12 months (treatment completed in more than 365 days, or treatment completed in an undetermined amount of time). If the day of the month is missing from the treatment start or stop date (but the month and year are available), the missing day is set to the first of the month. Because the day of the month is much more likely to be missing from the stop date than the start date, the bias in calculating the duration of therapy is toward shorter duration of therapy.

Cases known to have started treatment, but for whom no Follow-up 2 is available are included in the “No Information” category. All other outcome categories reflect the “Reason Therapy Stopped” (question 37) variable of the Follow-up 2.

Table 48 and Figure 15 present outcomes of TB treatment for cases expected to complete TB therapy in one year or less. Thus, cases with rifampin-resistant disease, those with meningeal disease, and children less than 15 years of age with disseminated TB disease are excluded. Treatment outcomes for those cases not expected to complete therapy in one year (rifampin-resistant disease, meningeal disease, and children less than 15 with disseminated disease) are presented in Table 49 and Figure 16.

Figure 17 presents completion of TB therapy using methodology identical to that used by CDC. Patients with rifampin-resistant disease, patients with meningeal disease, patients under 15 years of age with disseminated disease,

and patients who died during treatment are excluded. The percentage of patients who completed therapy in one year or less is presented, as well as the percentage of patients who completed therapy, regardless of duration.
