ABSTRACT. A checklist of aphidiine parasitoids (Hymenoptera: Braconidae: Aphidiinae) associated with various aphid species occurring in Kashmir was compiled. The paper deals with 61 species belonging to 15 genera, occurring in diverse areas and localities of Kashmir valley. The database pertaining to aphidid-fauna has been updated not only in the light of recent systematic and nomenclatural changes but also host names, host plants etc. Aphid parasitoids are natural enemies of aphids and form one of the potential biological control measures. Systematic study on parasitoids will form a baseline data in devising management strategies for controlling aphids.

Key words: Aphid, Parasitoid, Host, Pest, Kashmir.

RESUMEN. Se publica una lista de especies de parasitoides afidiinos (Hymenoptera: Braconidae: Aphidiinae) asociados con varias especies de áfidos en Kashmir, India. El trabajo menciona a 61 especies de 15 géneros que se distribuyen en diversas localidades y áreas del valle de Kashmir. La base de datos sobre fauna de áfidos ha sido actualizada con cambios recientes de sistemática, nomenclatura, nombres de hospederos y plantas hospederas. Los parasitoides de áfidos son enemigos naturales de áfidos y pueden ser considerados como potenciales agentes de control biológico. El estudio sistemático de estos parasitoides, ayudará en la implementación de estrategias de manejo para controlar a los áfidos.

INTRODUCTION

Aphids have been considered as economically important agricultural pests. These tiny insects, like other insects have their natural enemies as parasitoid wasps belonging to subfamily Aphidiinae within the family Braconidae. Members of this subfamily can be distinguished structurally by their medium body size usually about 1.5-3.5 mm

long; females with short ovipositor; metasomal tergum weakly sclerotized; antenna short with 10 to 28 segments; ovipositor sheath or hypopygium in females often modified; a single, large median cell in the fore wing in most species; smooth scutellar sulcus present; cross vein cu-a absent in the hind wing and occipital carina present (at least laterally) (Stary 1970; Achterberg 1997). Most of the species of Aphidiinae are being used against aphid pests in various parts of the world. Aphid pest problems are known worldwide (Stary and Ghosh 1983). This is complicated by many well known reasons, *viz.*, their biological peculiarities along with intensification of agriculture and introduction of new plant varieties, along with extensive, injudicious and indiscriminate use of agricultural chemicals.

The first work on Aphid parasitoids was done in 1818 by Nees Esenback; Haliday (1836) was the first who proposed the generic classification of Aphidiids. Marshall (1896) published first monographs on European Aphidiids fauna. Stary & Bhagat (1978) reported species of aphid parasitoids from Kashmir. Takada & Rishi (1980) reported 15 species of Aphidiinae from Kashmir, India, with description of three new species.

Approximately 400 species placed under 60 genera of subfamily Aphidiinae have been described (Stary 1988; Dolphin & Quicke 2001). The members of this subfamily are known to occur in all the major habitats of the world. This subfamily was traditionally represented by four tribes, *viz.*, Ephedrini, Praini, Aphidiini and Trioxini (Mackauer 1968; Belshaw & Quicke 1997) but molecular phylogenetic analysis have proved to be inconclusive, indicating the presence of three *viz.*, Ephedrini, Praini and Aphidiini (Smith *et al.* 1999; Sanchis *et al.*, 2000) or five *viz.*, Ephedrini, Praini, Monoctonini, Trioxini and Aphidiini (Sanchis *et al.* 2000) tribes. To facilitate research on aphid parasitoids in Kashmir, this checklist was created.

MATERIAL AND METHODS

Host data were recorded for each species in Kashmir valley. Host data were generally presented with in order of the host aphid (Homoptera; Aphididae) on the host plant, when host plant is available, followed by the reference citing that association.
