UNIVERSITY

Sirsi Integration with a Discovery Tool

Denise O'Shea
Head of Access Services & Systems
Harry A. Sprague Library

Task List

1. Provide vendor with answers to questions about how to customize your catalog within the discovery service.
2. Export MARC data, with holdings, from your ILS and upload file(s) to vendor's FTP server.
3. Establish procedures for updating the data.
4. Look at customizing the interface.
5. Test, modify, re-test, document.

Vendor Setup & Profile

▶ Catalog

- ▶ technical questions that help the vendor implement your catalog within the discovery service.

▶ Content

- ▶ information about how the vendor should configure custom linking to full text as well as information about which Link Resolver, if any, your institution is using.

▶ Branding

- ▶ options for customizing the look and feel of your discovery service.

Preparing for Data Extracts

- ▶ Get vendor's FTP account information for uploading your catalog MARC data
- ▶ Find out
 - ▶ what fields to include when exporting your catalog records (including RDA fields)
 - ▶ how to upload your catalog data (in an uncompressed format) to the FTP account

MARC Data Exports

- ▶ The following metadata elements should be included in your export in a machine-readable format:
 - ▶ A unique identifier in each record.
 - ▶ Holdings data (also known as item data). This may include location codes, call numbers, other copy information, etc.
 - ▶ URLs for e-resource content. Usually this is in the 856 field.

Record Formats

- ▶ Find out what formats your vendor supports:
 - ▶ MARC-8
 - ▶ UNICODE
 - ▶ UNIMARC
 - ▶ MARC21
 - ▶ KORMARC
 - ▶ CNMARC
 - ▶ MARCXML
 - ▶ Other formats...

Machine-Readable Format

Unique Identifiers

- ▶ All data uploaded to the vendor's FTP server **must** contain unique identifiers.
- ▶ Identify the MARC field/subfield that contains a persistent, unique identifier for each record:
 - ▶ Example: 001, 907 \$a, 035 \$a

Holdings Information

- ▶ Tell the vendor the MARC fields, subfields, and/or values in your data that are used for holdings fields.
- ▶ The values you identify will display on the results page and detailed records.
- ▶ The vendor may use these values to create location limiters and to index call numbers and locations.

Decide What's Not Included

- ▶ At MSU decided not to include:
 - ▶ Items on Order
 - ▶ Laptops, AV equipment
 - ▶ Lost, Withdrawn, Long Overdue or Missing items
 - ▶ Personal Print Reserves materials

Real-time availability checking (RTAC)

- ▶ RTAC is used to retrieve and display holdings (status, location, call number, etc.) in real-time for your catalog items.
- ▶ RTAC can be implemented via your z39.50 service or the REST API.

Direct Links

- ▶ Provide the permalink and URL syntax that links to each item record in Sirsi.
- ▶ Adding the link enables users to go directly from the Discovery Tool to the item in Sirsi:
 - ▶ `http://{YourCatalogURL}/uhtbin/cgisirsi.exe/x/0/0/57/5/3?searchdateI={UniqueID}%7BCKEY%7D`

Other Considerations

- ▶ Do you want URLs contained in the record to display on the Results page?
- ▶ How should ebooks , audiobooks and streaming media be identified?
- ▶ Create a location look-up table (optional)
- ▶ Does Sirsi support harvesting data via Open Archives Initiative Protocol for Metadata Harvesting (OAI-PMH)?
Why is this imp?

FTP Decisions

- ▶ Full set of data, size of collection
 - ▶ Single file
 - ▶ Multiple files
- ▶ Updates
 - ▶ Adding new records
 - ▶ Modifying existing records
 - ▶ Deleting records
- ▶ Frequency of updates

Sirsi Data Extract and FTP Options

- ▶ 3 Options:
 - ▶ Manual, via Sirsi reports and utilities
 - ▶ Automated, via the API
 - ▶ Library must have API training
 - ▶ Automated, via script provided by Sirsi
 - ▶ Get cost (\$) from your Sirsi sales rep

The Manual process

- ▶ A 3 part process
 - ▶ Run Extract Keys for Marc Export report to select the records
 - ▶ Use the Marc Export Utility to export the records selected by the report
 - ▶ FTP file to vendor

Extract Keys for Marc Export

- ▶ Identifies records to be exported and creates a single file of record keys (“dumpkeys”).
- ▶ Dumpkeys is used by the MARC Export utility for creating the file(s) of exported records.
- ▶ Records may be selected either by their common characteristics such as title creation date, format, or item type, etc.
- ▶ After running the report, use the MARC Export Utility Wizard to create files of exported records.

Common Tasks

-  Report Session
-  Schedule New Reports
-  Scheduled Reports
-  Finished Reports
-  Item Search and Display
-  Check Item Status
-  Item Search and Display
-  Print
-  Help

Schedule New Reports : Schedule ExtractKeysforMarcExport(EBSCO)

MARC Export Utility Wizard

- ▶ Used to export catalog records from the SirsiDynix Symphony database and copy them to a file on the workstation or the SirsiDynix Symphony server.
- ▶ The files of exported records are always saved to the /temp directory on your server.
 - ▶ This may be an issue for SaaS libraries
- ▶ The wizard reads only the latest dumpkeys file created. You must run a single Extract Keys for MARC Export report, then export the records identified by the dumpkeys file *before* running another Extract Keys for MARC Export report.

Export Properties

- ▶ Include local (999) holdings and junk tags
- ▶ # of files, # of records
- ▶ File name, save file location
- ▶ Preview records

Common Tasks

- MARC Import
- MARC Export
- MARC Order Import
- MARC Selection Import
- EDI Manager
- Holding Code Table For EDI
- Load Properties
- Save Properties
- Toolbar management
- Scanner
- Barcode Verify
- Update Staff Client Management
- Item Search and Display
- Check Item Status
- Help

MARC Export : Property

Defaults

Include 999 holdings tag

include local and junk tags

Export Symphony catalog key to MARC tag

Format of the output file: Marc Flat

Encoding scheme: MARC8 UNICODE UNIMARC

Export all records to one file Include records in each file

View all records Include records in each file

Export | Preview

Records selected on: Wed May 22 10:07:19 Record count: 620339

Save exported records: On server On clientFile name on server: File name on client:

FTPing Your Files

- ▶ If you are a SaaS library, you must first FTP the file from the SaaS server to a local workstation, then
- ▶ FTP the file from your workstation to the vendor.
- ▶ We use Filezilla for secure FTP file transfer but there are other tools you can use.

Interface Customization

- ▶ Convened several meetings with our OPAC committee to discuss:
 - ▶ Integration of Sirsi catalog records within the discovery tool
 - ▶ Display of catalog records in the discovery tool
 - ▶ Problems, issues, and concerns

OPAC Committee Recommendations

- ▶ A team approach to implementing the discovery tool.
- ▶ That the Library include a feedback form in the discovery tool search box on the library's homepage.
- ▶ We look at how other schools implemented their discovery tool and identify best practices.

Problems & Questions, part 1

- ▶ Confusing icons for the different item types
- ▶ Call numbers not appearing for some item types – e.g., streaming music, gov docs
- ▶ Incorrect field mapping (status mixed up with location)
- ▶ Records loaded from vendors that our library does not subscribe to
- ▶ Questions about how the tool handles book chapters, essays, and dissertations
- ▶ Definition of some terms and phrases such as ‘peer review’ and ‘available in library collection’

Problems & Questions, part 2

- ▶ **Boolean logic**
 - ▶ How is it defined?
- ▶ **Options for limiting searches**
 - ▶ Languages not sorted alphabetically, why?
 - ▶ Books did not appear as the first option under limits by source type
- ▶ **Periodicals List**
 - ▶ How is searching defined and what does it include?

Review of Tasks

1. Provide vendor with answers to questions about how to customize your catalog within the discovery service.
2. Export MARC data, with holdings, from your ILS and upload file(s) to vendor's FTP server.
3. Establish procedures for updating the data.
4. Look at customizing the interface.
5. Test, modify, re-test, document.
