Dr. Michael Adelaine  
Professor and Director  
Agriculture Information Technology  
South Dakota State University

## **ABSTRACT**

Prior to the development of this project, the South Dakota Cooperative Extension Service did not have an online registration system. Workshop participants registered manually; by telephone, by mail or at the door. This was an inefficient use of employee time and other resources. It was also inconvenient for participants. To answer this need, an online registration system was developed. ColdFusion was used as a database-to-web gateway. This database driven system allows the workshop manager to setup and manage the registration pages. The manager and the administrator pages are located on the Extension Services private intranet site. These include workshop management pages and participant management pages. The public pages are located the internet site and include the workshop search page and the individual registration pages.

## INTRODUCTION

The purpose of this report is to describe the planning and development of an online registration system for the South Dakota Extension Service. This system solves the need to make workshop registration more convenient and efficient.

The report discusses the database-to-web technology which makes the system possible. There are three user groups; administrator, manager and public. The administrator and the manager pages are located on the secure, private side of the Extension Service website. The registration pages will be located on the public internet.

The Extension Service Online Registration System will be a tool to help the County Extension Educator educate the people of South Dakota. The Registration System is a flexible system where an employee involved in a particular workshop creates, manages and deletes the online registration page. This will increase the efficiency of employee resources. It will also be more convenient for the participants to register for workshops.

In 1914 the Federal government passed the "Smith Lever Act Which established the extension mission for the land-grant colleges". It was within this structure, in "1915 the South Dakota legislature enacted legislation for the formation of the South Dakota Cooperative Extension Service (CES)" (Cholick, 2000, p. 3). The function of the Extension Service is to serve and educate the people of South Dakota. Today there are 66 County extension offices across South Dakota with 102 county educators. The Cooperative Extension Service began at a time when farming was done by horses and plows. Today technology has changed not only for agriculture, but also for CES. The Extension Service Online Registration System is a further use of technology.

## **STATEMENT OF PROBLEM**

The mission of South Dakota Cooperative Extension Service (CES) is “to serve the people of South Dakota thorough an educational process that helps them improve their lives by applying unbiased, science-based knowledge focused on issues and needs.” (Cholick, 2000, p. 4). Much of the education is done through workshops, classes and seminars which are open to the public.

Currently the registration for these workshops is handled manually. To hand process the registration is an inefficient use of employee’s time. When no pre-registration is required, it is difficult to know the number of participants. This can lead to inefficient use of employee time if only a few participants attend the meeting. It is also difficult to know the quantity of supplies needed.

At a time of budget reductions, there is an urgent need to operate in a more efficient manner. An electronic workshop registration system would improve efficiency in several ways. First it would reduce the man-hours required for processing the registrations. Second, it would better utilize resources by tracking the number of participants planning to attend any given workshop. Third, it also will be more convenient for the participants to register.

### **Current Situation**

At this time, there is no electronic registration in place at the CES. Currently, to register a participant must contact the CES office that is presenting the workshop. There are several ways this is accomplished.

1. Registration by phone. The disadvantage with this is that it requires employees to receive the call and to record the registration.
2. Registration by mail. This still requires the use of employee’s time to process and record the registration form. It is also inconvenient for participants.
3. Registration at the door. This can have a bottleneck effect if many participants are registering at the same time. Also, if participants do not register before the workshop, it is difficult to know if minimum attendance has been reached.

### **Current Technology**

CES has both a public internet website and an intranet website which is accessible only to employees. Currently the internet site is being used only to inform the public of upcoming workshops. There are individual web pages for each county. Information about upcoming workshops can be posted here. Also the website includes a calendar for upcoming events across the state.

Currently both the intranet and the internet are running on dual Xeon Pentium 4 processors. The operating system is Microsoft Windows 2000 Server. ColdFusion version 5 is also running on the server.

## **OBJECTIVE OF THE PROJECT**

My goal is to build a registration system that integrates with the current internet and intranet websites. It must be flexible to meet the needs of many different types of workshops and situations, yet it must be simple to operate so that staff with limited technical skills will find it easy to use. This system allows flexibility by letting the manager (employee) set up the registration page to meet the specific needs of the workshop.

The registration page will allow the participants to register for the workshop. It also should be easy to access and use.

### **Deliverables**

The registration system includes the following pages:

#### **1. Administration Home Page**

This page is on the private intranet. It allows the CES Information Administrator to supervise the registration system. It displays information regarding all the workshops that are in the system. It contains a link to the Administrator Detail page which displays more details for each workshop.

#### **2. Participant Search Pages**

This page is a location for the administrator and manager to search for a participant and will search by the following fields:

- 2.1 Participant's first name
- 2.2 Participant's last name
- 2.3 Invoice Number

#### **3. Workshop Information Management**

These pages allow the administrator and manager to change or delete information regarding a workshop. It consists of four pages:

- 3.1 Workshop Edit
- 3.2 Participant Report
- 3.3 Email Distribution
- 3.4 Purge

#### **4. Participant Information Management**

These pages allow the administrator and manager to change the information regarding a participant. It consists of three main features:

- 4.1 Edit Participant Information
- 4.2 Change invoice status
- 4.3 Delete a Participant from database

## **5. Manager Home Page**

This page is on the private intranet. It allows the manager to manage the registration page. It contains a link to the Manager Detail page which displays complete details for each workshop.

## **6. Setup Page**

This page is on the private intranet and will include the following fields:

- 6.1 Meeting name
- 6.2 Meeting date
- 6.3 Contact person
- 6.4 Meeting location
- 6.5 Meeting description
- 6.6 Registration cost
- 6.7 Submit button
- 6.8 Other (this can be used for any other information)

## **7. Registration Pages**

These pages are on the public internet website and will allow participants to register for the workshop. It includes the following fields:

- 7.1 Participant's name
- 7.2 Participant's address
- 7.3 Phone number
- 7.4 E-mail address
- 7.5 Payment method
- 7.6 Submit button

## **8. Workshop Search Page**

This page is a location where participants can search to locate a particular workshop by the following fields:

- 8.1 Workshop name
- 8.2 Date
- 8.3 Location
- 8.4 Manager name

## **9. Database Tables**

This stores data from all the workshops and will include three tables.

- 9.1 Workshop Table
- 9.2 Participant Table
- 9.3 Personnel Table

# SCOPE

## Project Overview

This project was to design and construct an online registration system for Cooperative Extension service. Because there are such a variety of different types of workshop, a dynamic approach was taken. The manager of a workshop fills out the setup page and when the form is submitted, the new registration page is dynamically created. Also, the manager can dynamically manage and delete the workshop and participant pages.

## How the Registration System Works

The registration system is programmed using ColdFusion. "At the heart of the program is the database-to-web gateway." Records from the database files are displayed dynamically. This allow for changes in the data without having to create a new HTML file for each change. (Mohnike, 2000, p. 8) The web application server works together with the web server to process the ColdFusion Pages. If the page that the client request ends with a ColdFusion extension (CFM), the web server sends it to the application server for processing. The client is unaware of this because, it is done before the page is sent to the client browser.

### The processing steps:

1. "The web browser requests a web page.
2. Web server receives the page request
3. Web server instructs application server to process the page
4. The application server processes the page and generates output.
5. The web server sends the output to the browser." (Macromedia Inc., 2002 ,p. 3)

### Using Database-to-Web Technology

A database drives the registration system. Different items are displayed on the same web page depending on who the client is or what items they request to view. The database consists of three tables:

#### 1. Personnel.

This table drives the manager information. Manager name is displayed based on Personal ID that is set in a cookie when the manager logs on to the intranet. The remittance address is also from this table.

#### 2. Workshop.

This table drives the workshop information. These include items such as workshop name, date, location and cost.

#### 3. Participants.

This table drives the participant information. These include items such as Participant's name, address and date of registration.

**Example:**

The invoice pulls information from all three tables. The remittance address is from the Personnel table. The Bill-to address and invoice number are from the Participant table. The amount due is the cost from the workshop table.

**How it differs from what is current**

The online registration system is a new program for CES. Currently, the registrations are processed manually by telephone, mail or at the door. Even though the online registration system is new, the technology was in place to facilitate its development. The existing public internet was essential to post the registration pages. The private intranet was needed to give a secure location for the manager to manage his or her workshops. No additional software or hardware was installed in the development of the registration system.

**Implementation**

Implementation will be completed in two steps.

1. Test Implementation

Initially, the registration system was installed in a non-public folder on the CES server. This will limit employee access to only those that are involved in the testing of the new system.

2. Complete Implementation

After the test period has been satisfactorily completed, the registration system will be integrated into the regular internet and intranet folders.

**Software:**

This registration system must be integrated into the current system used at the CES. The following are software that is currently being used:

1. ColdFusion

It will be used to code most of the pages. Also, ColdFusion will be used to verify the manager's identity before granting access to the manager pages

2. Access

This Database will be used to store the tables.

3. Microsoft Server

It is the system on which the internet and intranet sites run.

**Registration System Users:**

These are the primary registration system users:

1. Administrator:

This is the person that supervises the entire registration system. Although the manager is responsible to create, manage and remove the registration page for each workshop, the administrator oversees the whole process.

2. Manager:

This will be the person that will set up, manage and remove the registration page for a particular workshop. At any given time, there may be many different managers in charge of different workshops.

3. Participant:

This is the general public that registers for a workshop.

# PROJECT DETAILS

## Administration Only Access

### *Administration Home Page*

This page is only accessible to the information department administration. It lists all the workshops that are currently in the system. For each, it lists workshop name, date, manager, and the workshop status. There is also a link to the Administration Detail page which show more detail for each workshop

### *Workshop Status*

The workshops are listed in order by date; the oldest first. The workshop status has two categories; current and past due. At a glimpse the administrator knows which workshops are current. The current category shows all the workshops that have not happened yet. Past due category lists all the workshops that have a workshop date that is older than the current date. The numbers of days past due are displayed on the administrator home page. To accomplish this, a comparison is made between the workshop date and the system date. The function dateDiff() is used to calculate the number of days between the two.

```
<cfset daysdue = #dateDiff('d',now(),WS_date)#>
  <cfif daysdue lte -1>
    #daysdue# days past due.
  <cfelse>
    Current.
  </cfif>
```

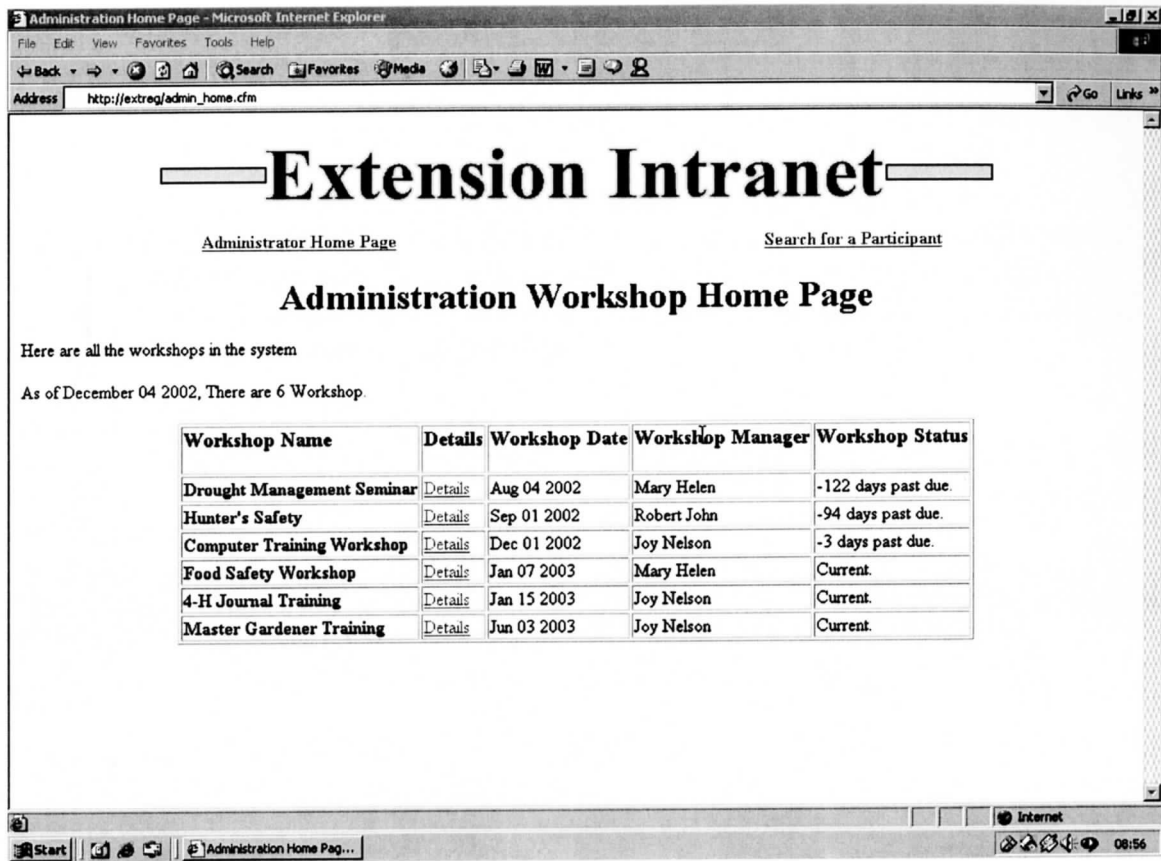

Figure 1: Administrator Home Page

## *Administration Detail Page*

This page shows more detail about a specific workshop. It is accessed by a link on the Administration Home page which also sends a URL variable of URLname = #URLname#. The page then displays all the information regarding the workshop indicated by the variable.

Links on Page:

1. Workshop Edit page
2. Purge Page
3. Email Participants
4. Report Page

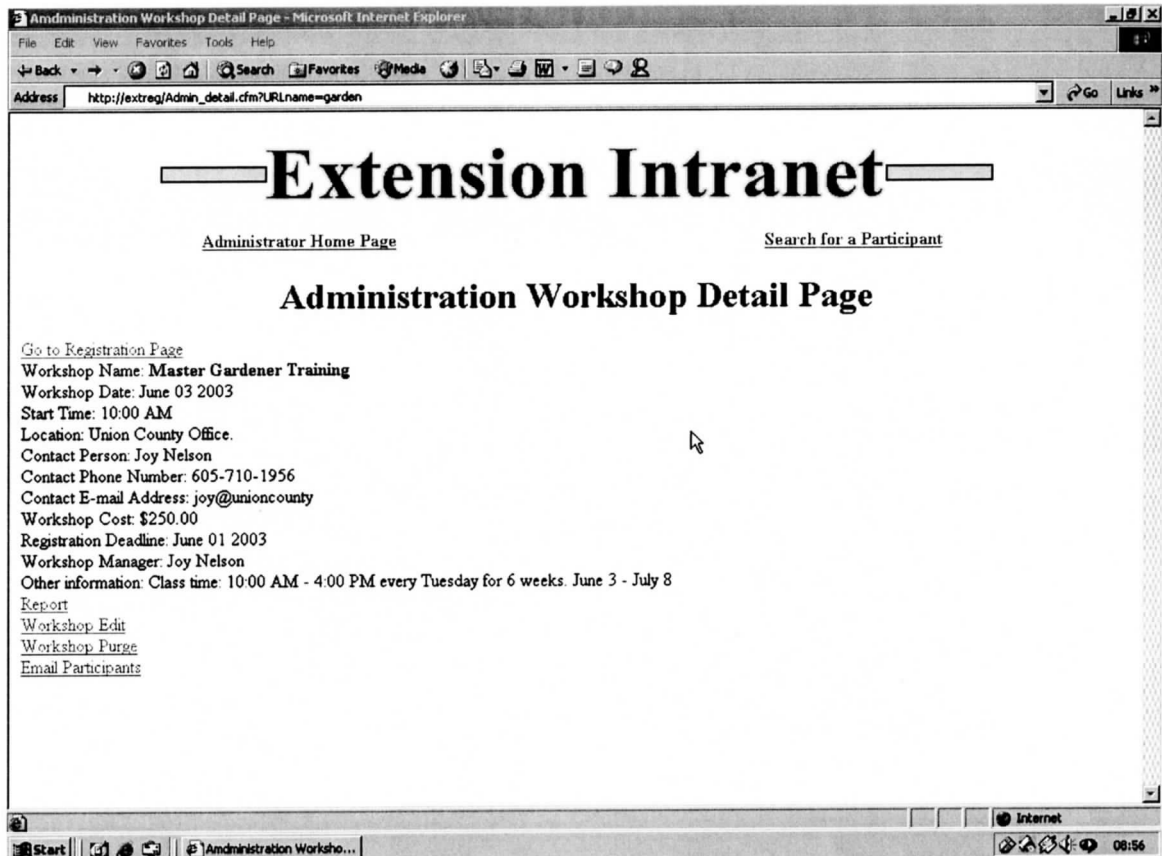

Figure 2: Administration Detail Page

## Administration and Manager Access

### *Workshop Management Pages*

These pages are used to edit and delete workshop information. There are links on the Manager Detail Page and Administration Detail page to these pages.

### *Workshop Edit Page*

The edit page consists of a form with the same fields as the setup page. The input fields are populated with the current value for a particular record. The user can change the value of any of the fields. When the form is submitted, the record is updated in the database.

Figure 3: Workshop Edit Page

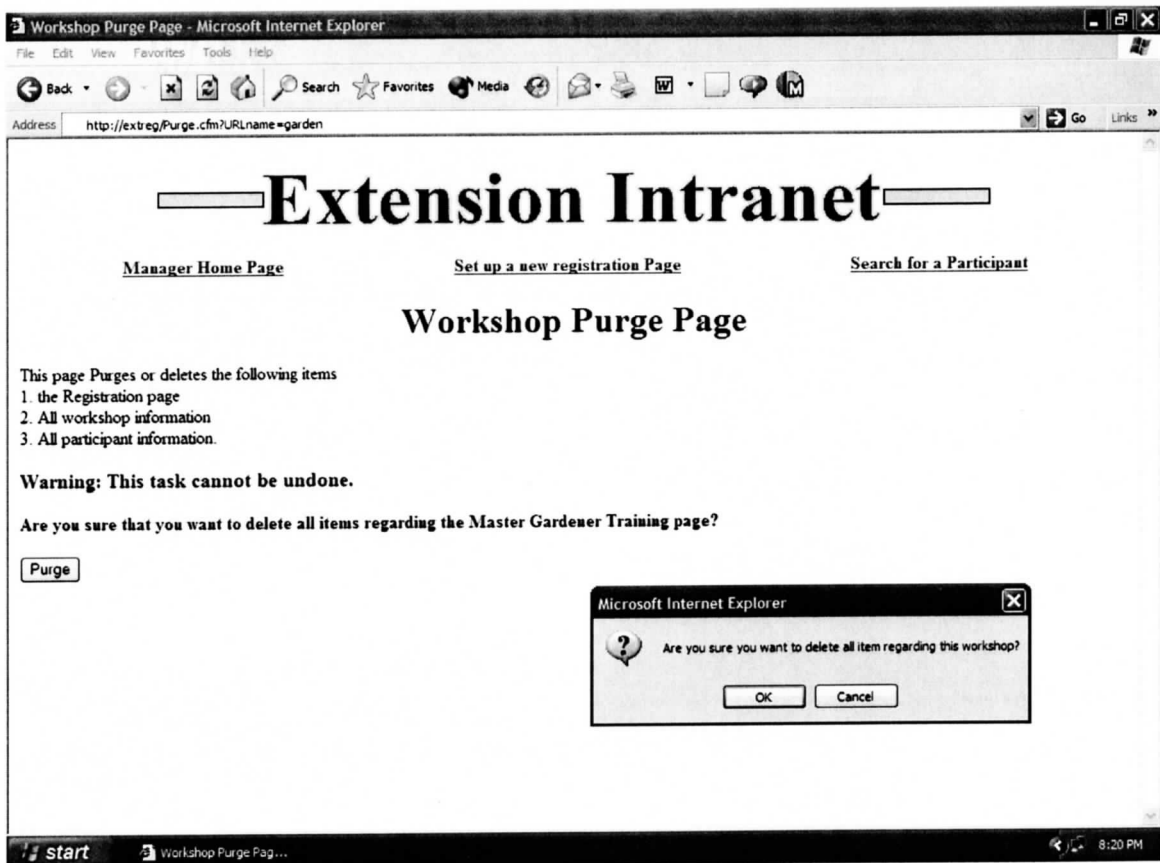

### **Purge Page**

The Purge link on the Administrator Detail and Manager Detail page sends the user to purge.cfm. It also sends a URL variable that is set to the URLname (this is the variable that uniquely identifies the workshop). The purge page deletes all items relating to that particular workshop. When the purge button is clicked, a confirm box asks the user "Are you sure you want to delete all items regarding this workshop." If yes is selected, then the user is directed to Purge\_Process.cfm to delete the workshop information. This is done in three steps.

1. It deletes the workshop record in the Workshop table where the URLname matches the URL variable.
2. It deletes all the participant records in the Participant table where the URLname matches the URL variable.
3. It deletes the actual web page by using <cffile> where the last extension of the URL address matches the URL variable.

```
<cffile action="delete"file="\ URL path \#URLname#.cfm">
```

**Figure 4: Purge Page**

### ***Email Distribution***

The Email Distribution page is a quick and easy way for the administrator or manager to send a message to the participants of a particular workshop. The workshop selected is based on which URL variable was sent when the page was opened. The form includes an input box that allows the user to enter the email subject line and a text box to enter the body of the email. When the form is submitted, a confirm box asks the user "Are you sure that you want to send this email to all participants of this workshop?" If the user clicks yes, he or she is redirected to the Email\_Process.cfm page for processing. The email is to be sent only to the participants of a particular workshop, therefore the URL variable is used to query which participants to email. Participants are not required to enter an email address on the registration page, but if they do not have an address they are to enter NONE. To not select these participants, the SQL condition <> is used. This excludes all NONE from the email field in the database.

```
<cfquery name="info" datasource="extreg" >
  SELECT *
  FROM participant
  WHERE P_email <> 'NONE'
  AND URLname= '#URLname#'
</cfquery>
```

The return address on the email will be the email address of the contact person.

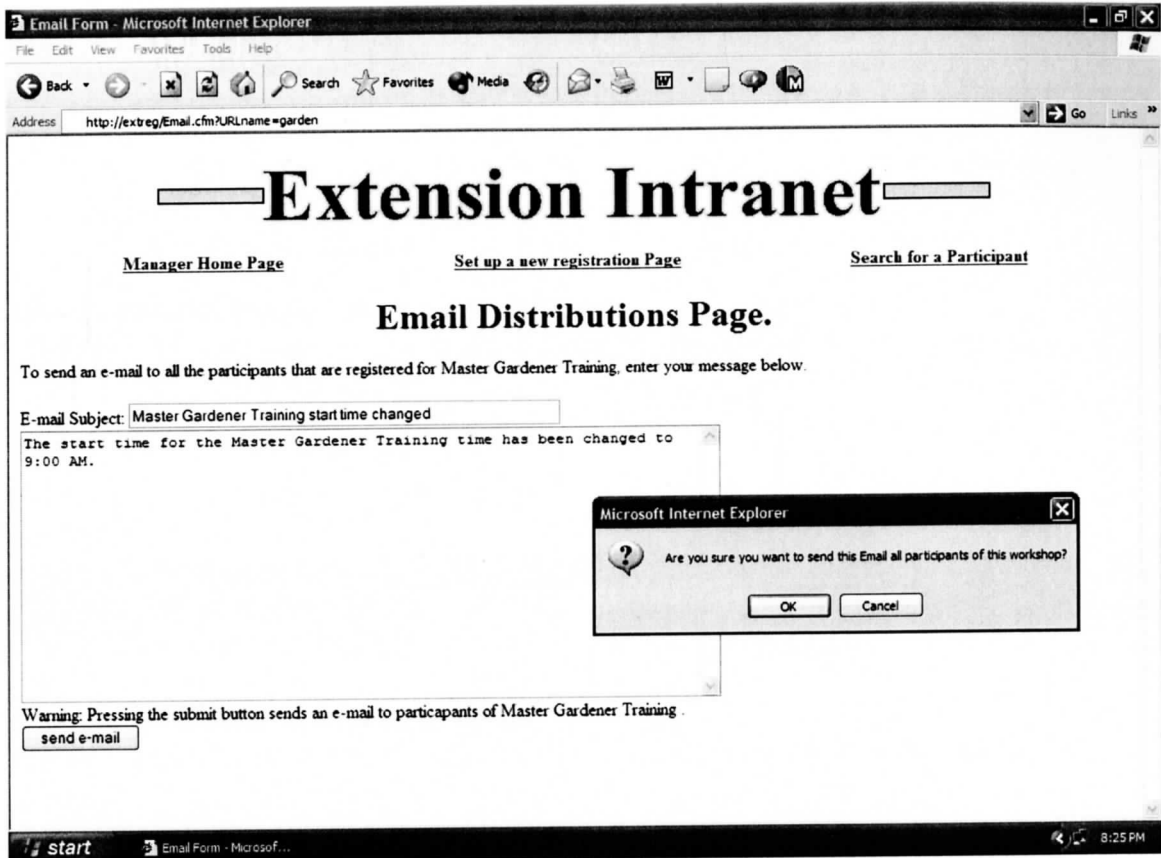

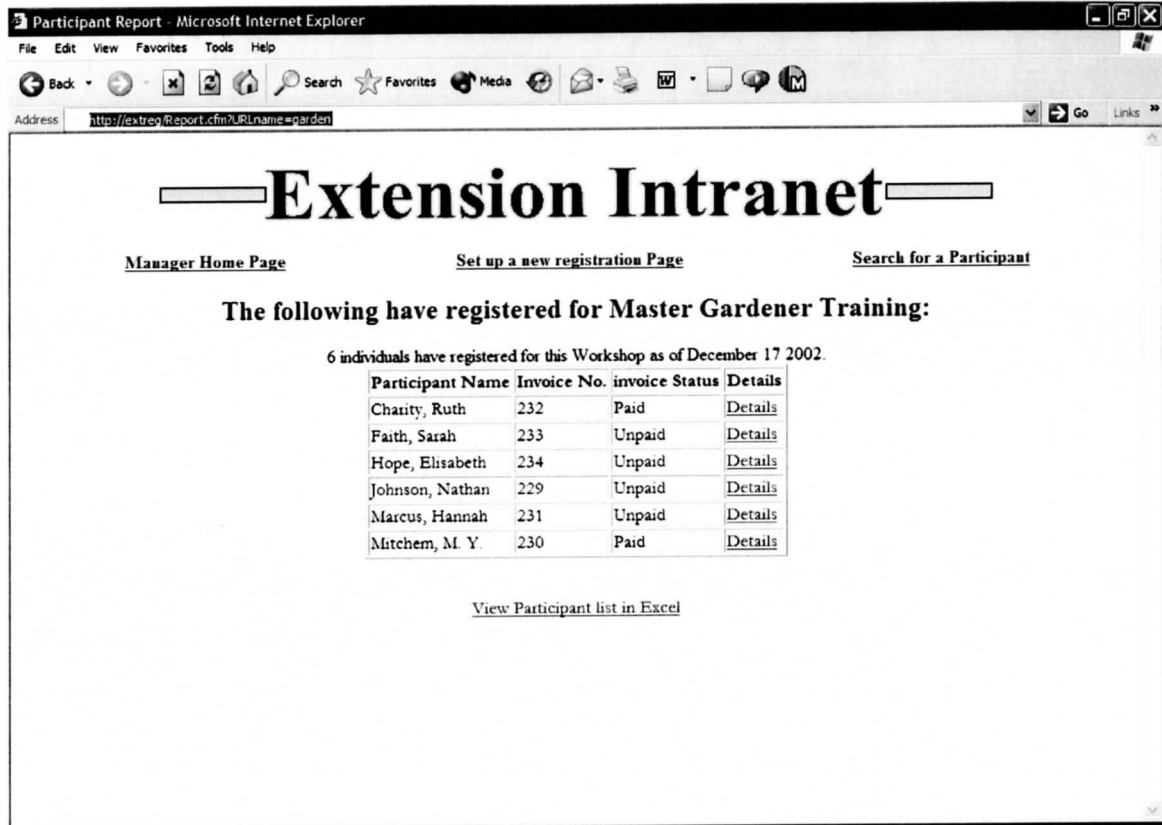

Figure 5: Email Distribution Page

## Report Page

The Report link on the Administrator's Home or Manager's Home page sends the user to report.cfm. It also sends a URL variable that is set to the URLName (this is the variable that uniquely identifies the workshop). The report page then displays the participants that are registered for that particular workshop. The page displays Participant name, invoice number, invoice status and a link to the Participant Detail page. Also, there is link to a page that will show the participant report as an Excel file.

[Manager Home Page](#)      [Set up a new registration Page](#)      [Search for a Participant](#)

**The following have registered for Master Gardener Training:**

6 individuals have registered for this Workshop as of December 17 2002.

Participant Name	Invoice No.	invoice Status	Details
Charity, Ruth	232	Paid	<a href="#">Details</a>
Faith, Sarah	233	Unpaid	<a href="#">Details</a>
Hope, Elisabeth	234	Unpaid	<a href="#">Details</a>
Johnson, Nathan	229	Unpaid	<a href="#">Details</a>
Marcus, Hannah	231	Unpaid	<a href="#">Details</a>
Mitchem, M. Y.	230	Paid	<a href="#">Details</a>

[View Participant list in Excel](#)

Figure 6: Report Page

## Report Detail Page

This page displays the complete participant information. The page contains links that give the administrator the means to edit or delete the participant information.

The screenshot shows a Microsoft Internet Explorer browser window with the title 'Workshop Registration Details - Microsoft Internet Explorer'. The address bar contains the URL 'http://extreg/report\_details.cfm?PartID=235'. The main content area features the 'Extension Intranet' logo at the top, followed by navigation links: 'Manager Home Page', 'Set up a new registration Page', and 'Search for a Participant'. Below these is the 'Participant Detail' section, which states 'This person is registered for Master Gardener Training.' The participant's information is listed as follows:

Name:	Nathan Johnson
Invoice No.	235
Invoice Status	Unpaid
Address:	123 4th Ave.
City:	Pumpkin Center
State:	SD
Zip Code:	57000
Phone:	605-111-1111
Email Address:	NONE

Below the information, there are links for 'Edit' and 'Delete'. A 'Change Invoice Status' form is visible, containing radio buttons for 'Paid' and 'Unpaid', and a 'change' button. The browser's taskbar at the bottom shows the Start button, a taskbar with 'Workshop Registration D...', and the system tray with the time '09:14'.

Figure 1: Report Detail page

### ***Participant Management Pages***

The links on the Administration Detail page give the Administrator a means to manage the participant information. These same pages are accessible for the manager from the Manager Detail page. When any of the links are clicked, the PartID is sent as an URL variable to the new page. The PartID is used to uniquely identify which participant is to be selected.

#### ***Change Invoice Status***

The Report Detail page contains a radio box which consists of two options; paid and unpaid. To change the status the manager selects on one of these options and clicks on the Change Invoice Status button. This directs the user to the Change\_Inv.cfm to process the change. The database is updated and the change is displayed.

#### ***Participant Edit Page***

The edit page consists of a form with the same fields as the registration page. The input fields are populated with the current value for a particular record. The user can change the value of any of the fields. When the form is submitted, the record is updated in the database. This page functions similar to the Workshop Edit page.

## Participant Delete Page

The Participant Delete page is used to remove a particular participant from the database.

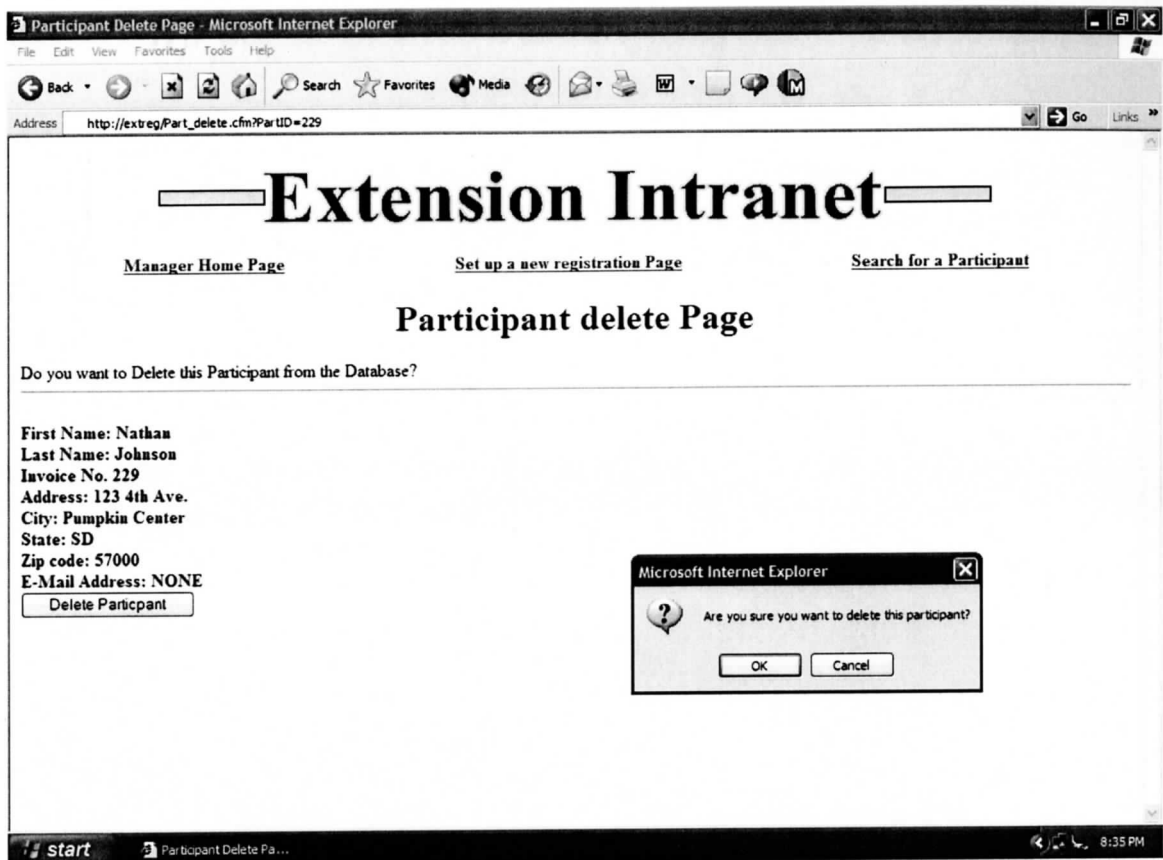

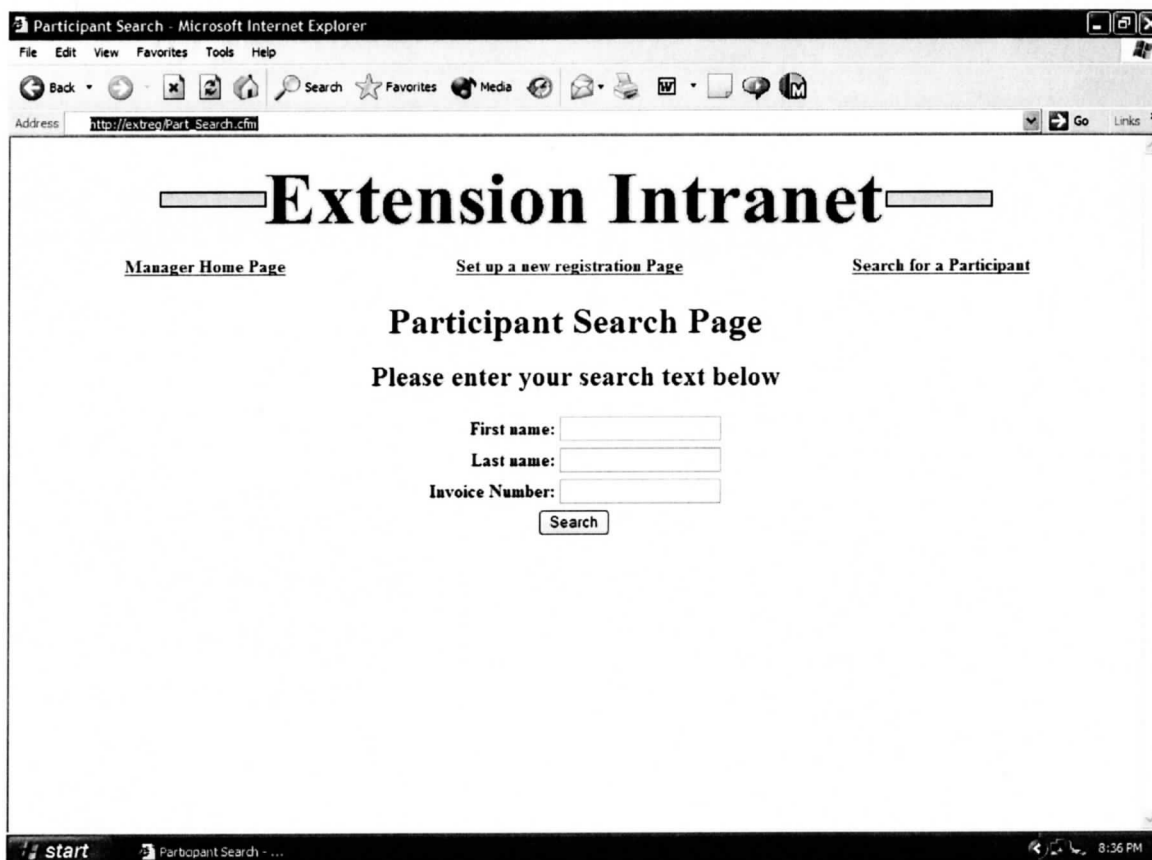

Figure 2: Participant Delete Page

## ***Participant Search Page***

This page gives the manager a way to search for participant information. This will be useful when a participant calls with questions regarding their invoice. There are three input fields to enter search words; first name, last name or invoice number. The user can use one or all three of the input fields.

When the page is submitted, it redirects the user to Part\_Search\_Process.cfm which processes the search. It uses the SQL condition LIKE to compare the items entered into the input fields with the database and returns a match if they are similar. It disregards capitalization and also finds a match in a string that is contained within a word. Example: If the user enters SIOUX and Sioux Falls is in the database, it would return a match.

The screenshot shows a Microsoft Internet Explorer browser window titled "Participant Search - Microsoft Internet Explorer". The address bar displays "http://extreg/Part\_Search.cfm". The main content area features the "Extension Intranet" logo at the top, followed by three navigation links: "Manager Home Page", "Set up a new registration Page", and "Search for a Participant". Below these links is the heading "Participant Search Page" and the instruction "Please enter your search text below". There are three input fields labeled "First name:", "Last name:", and "Invoice Number:". A "Search" button is positioned below the "Invoice Number" field. The Windows taskbar at the bottom shows the "start" button, the active window title "Participant Search - ...", and the system clock displaying "8:36 PM".

**Figure 3: Participant Search**

## Manager Only Access

### *Log-in*

To access any of the manager pages the employee must first log into the intranet. This is a password protected site. This sets a cookie with the manager's personal ID number. The cookie is then used to identify the manager to personalize the page. More importantly, it is used to keep track of who is in charge of which workshops.

### *Manager Home Page*

The Manager Home page is on the private intranet and it provides a central location to access the manager pages. It is personalized to display only the workshops that that the manager has setup. For each workshop, this page lists Workshop Name, Date and workshop status. There is also a link labeled Detail which takes the user to the Manager\_Detail.cfm which gives complete details regard a specific workshop.

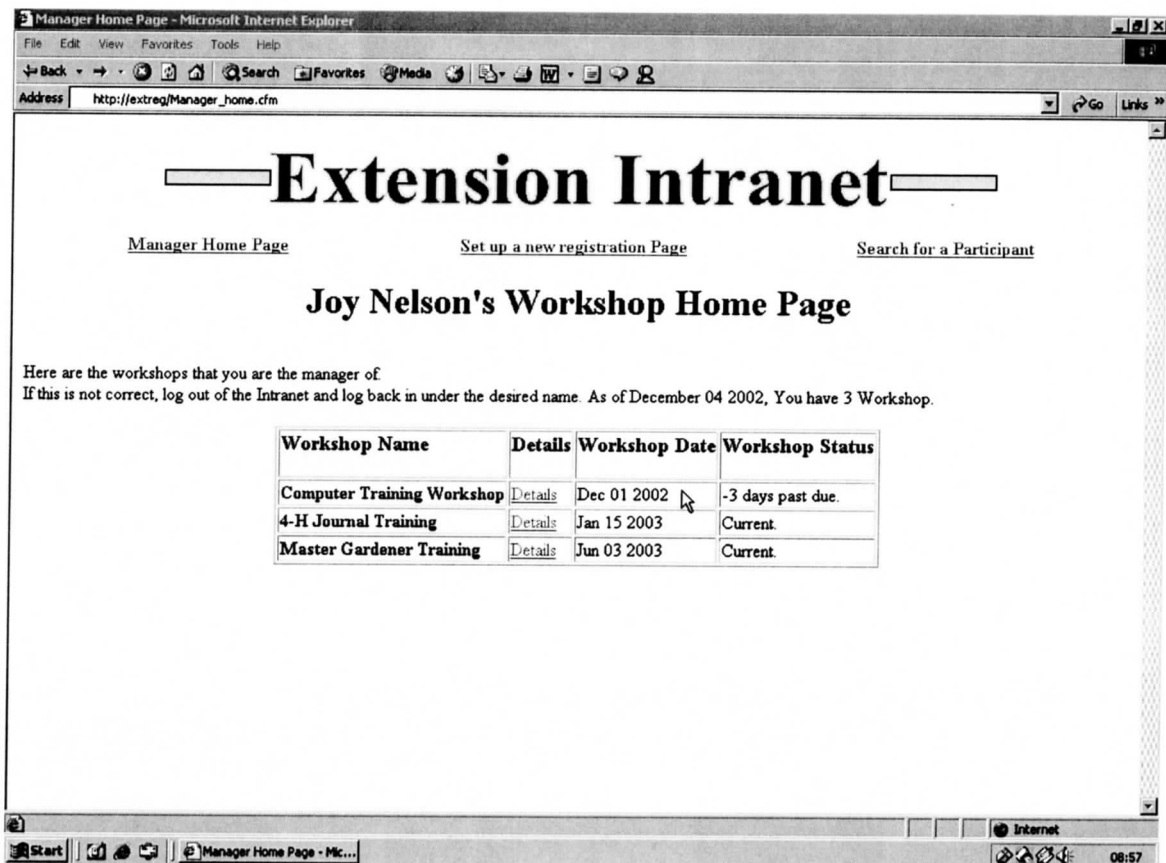

Figure 4: Manager Home Page

### *Manager Detail Page*

The detail link on the Manager Home page sends the user to the Manager\_Detail.cfm. It also sends a URL variable that is set to the URLname. The Manager Detail page then

displays the information of the workshop with this workshopID. This page is very similar to the Administration Detail page.

## *Create New Registration Page*

### *Setup Page*

This is a form where the manager enters the workshop information. Items entered include workshop name, date, time, location, contact name, contact phone number, other information and cost. Also, URLname is entered. This is the unique name given the workshop that will be used as the final part of the URL Address. An if-statement is used to check if the URLname that the manager entered has been used before. The URLname is the primary key for the database record, so the value must be unique.

When the form is submitted, these items are entered in the workshop table. Also submitted is the manager ID. This is taken for the cookie and is passed by a hidden input tag. When submitted the user is redirected to the Setup\_process.cfm

Figure 5: Setup Page

### ***Setup Process***

The setup process is completed in two steps. First, it updates the database with the workshop information that was entered on the Setup.cfm. Second, it creates a new registration page.

#### **1. Update the Database**

Items that the manager entered on the Setup.cfm form are added into the workshop table of the Extreg database.

#### **2. Create New Page**

To create the new page the <CFFile Action = Write> tag is used. This copies all items inside of the tag to a new page. This includes the basic layout of the new registration page.

```
<cffile action="write"  
    File="\\ URL path \#form.URLname#.cfm"  
    Output=" The compete code for the new registration page ">
```

The URL of the new page will be specified inside the tag by file="name of the folder\#form.URLname#". The variable #form.URLname# is the unique name given to this workshop and is the name the manager entered on the "Setup.cfm".

The new registration page consists of two parts

##### **1. Workshop Registration Information**

This is general workshop information displayed on the page for the participants. It is dynamically populated from the workshop table.

##### **2. Registration Form**

This is a form that the participants fill out with personal data. It includes their name, address, phone number and email address. When the form is submitted, the data is entered into the participant table. Included in this form is a hidden input tag that has the value of the URLname. This value is then added to the participant table with each registration. The URLname is then used when query the participant that are registered for a particular workshop.

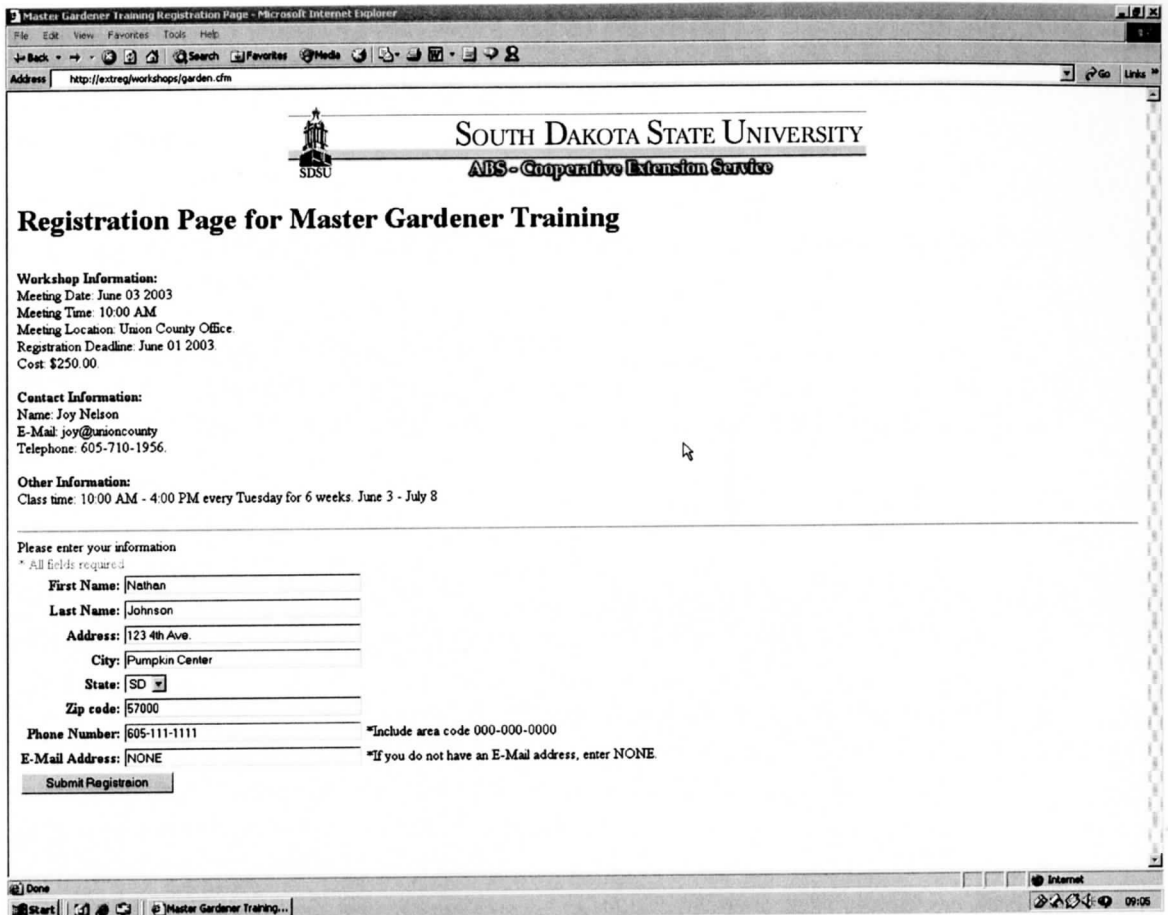

Figure 6: New Registration Page

### Variables

Inside the <cffile> tag variables are handled in two different ways.

#### 1. Constant Variable.

If a variable is to become a constant on the new registration page then single # is used around the variable. Example, the URLname will be constant on a new registration page.

This is how the code would look in the Setup\_process.cfm:

```
<CFQUERY DATASOURCE='Extreg' NAME='workshop_info'>
  SELECT *
  FROM Workshop
  Where URLname = '#form.URLname#'
</CFQUERY>
```

This is the same segment of code on the new registration page where the manager entered "training" at the URLname.

```
<CFQUERY DATASOURCE='Extreg' NAME='workshop_info'>
  SELECT *
```

```
FROM Workshop
  Where URLname = 'training'
</CFQUERY>
```

2. The second way that variables are handled within the <cffile> is to keep them as variable on a new registration page. This is accomplished by putting double # around the variable

Example:

On the Setup\_submit:

Meeting Location: ##WS\_Location##.

On the New registration page:

Meeting Location: #WS\_Location#.

## Public Access

All these pages are on the public side of the CES website.

### *Workshop Search Page*

This page is the main page for the public to access and search for a workshop. It is labeled Index.cfm. There are four input fields; workshop name, location, date and contact person. There are two submit buttons; Submit Search and View All. If the “Submit Search” button is clicked, it returns a match of items that were in the input fields. If “View All” button is clicked, it returns all workshops in the database. When either of these buttons is clicked, the browser is redirected to Index\_Process.cfm where the search is processed.

**Figure 8: Workshop Search Process**

## Registration Pages

These are the pages that the managers generate, manage and delete.

The screenshot shows a Microsoft Internet Explorer browser window displaying the registration page for Master Gardener Training. The browser's address bar shows the URL: <http://extreg/workshops/garden.cfm>. The page header features the South Dakota State University logo and the text "SOUTH DAKOTA STATE UNIVERSITY" and "ABS - Cooperative Extension Service".

### Registration Page for Master Gardener Training

**Workshop Information:**  
Meeting Date: June 03 2003  
Meeting Time: 10:00 AM  
Meeting Location: Union County Office  
Registration Deadline: June 01 2003  
Cost: \$250.00

**Contact Information:**  
Name: Joy Nelson  
E-Mail: [joy@unioncounty](mailto:joy@unioncounty)  
Telephone: 605-710-1956

**Other Information:**  
Class time: 10:00 AM - 4:00 PM every Tuesday for 6 weeks: June 3 - July 8

---

Please enter your information  
\* All fields required.

First Name:   
Last Name:   
Address:   
City:   
State:   
Zip code:   
Phone Number:  \*Include area code 000-000-0000  
E-Mail Address:  \*If you do not have an E-Mail address, enter NONE

The browser's status bar at the bottom shows "Done", "Start", and "Master Gardener Training..." along with the system clock "09:05".

Figure 9: Registration Page

### **Registration Process**

This page processes the information that was entered on the registration page. They are added to the database. This includes the following items:

1. First name
2. Last name
3. Address
4. City
5. State (a select box to choose a state)
6. Zip code
7. Email Address (optional)

URLname is passed by a hidden input tag. This is then used to identify the workshop for which a person is registering. Also, the current date is added to the database in the RegistDate field. This will be used as the invoice date.

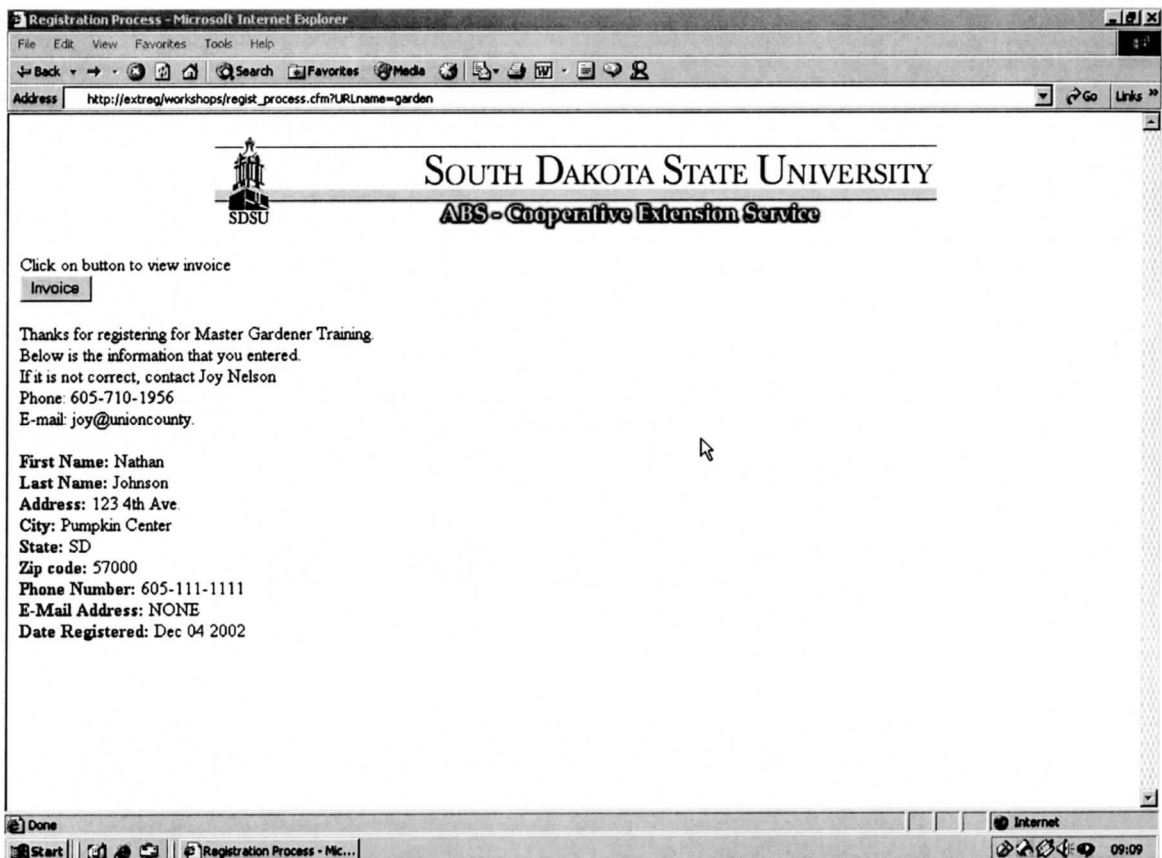

Figure 10: Registration Process Page

## Invoice

The invoice gives the participant a confirmation of their registration and a document to send with the remittance payment. When setting up a workshop, the manager may enter the cost of zero. This will indicate that the workshop is free and no invoice is generated. An if statement evaluates the cost and when it is not free, an invoice is generated

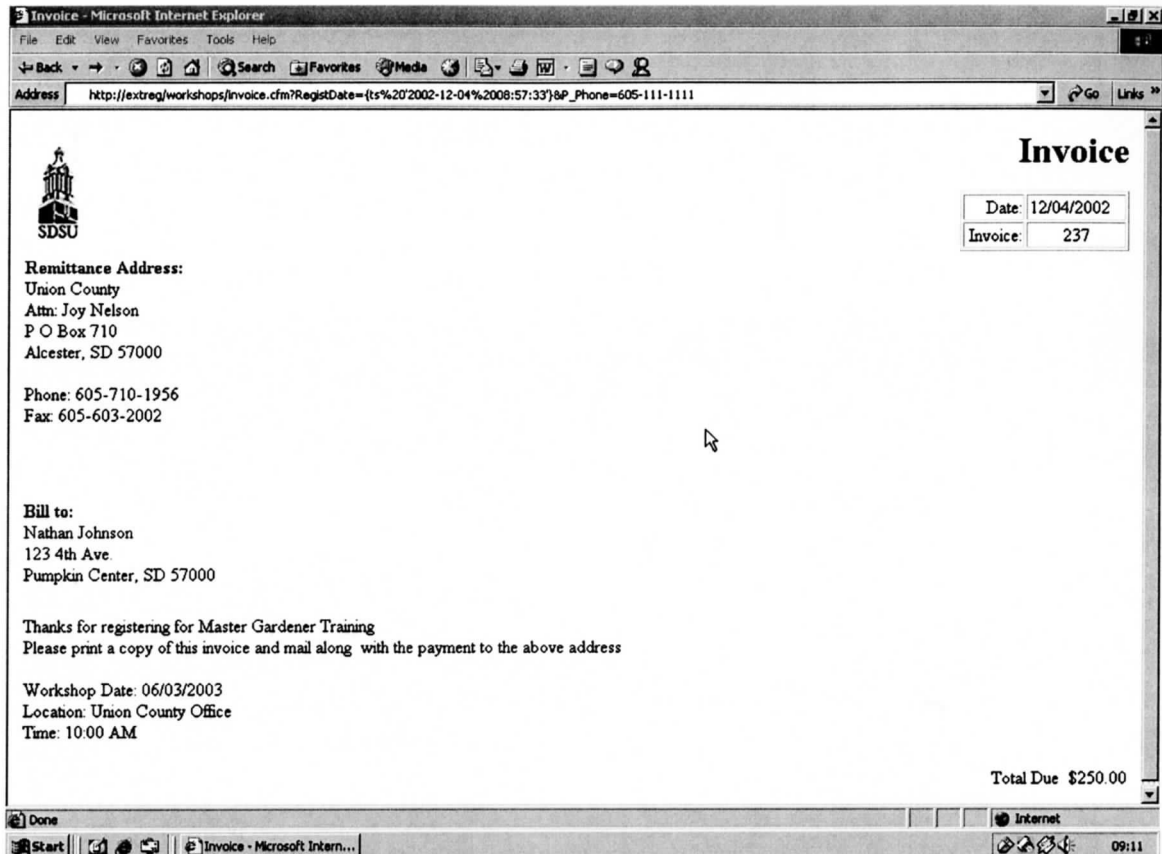

Figure 11: Invoice

. Items on the invoice include:

1. Bill To Address

This is information is populated from the Participant table and are the items that were entered on the registration page.

2. Remittance Address

This contains the name of the contact person. The address is pulled from the Personnel table where the WS\_Manager is equal to the PersonalID.

3. Invoice Date

The invoice date is the RegistDate.

4. Invoice Number

The invoice number is the PartID from the Participant table. This number is automatically generated when the participant information is entered into the database. To access the PartID the following query is used.

```
<CFQUERY datasource='extreg' name='P_info'>
  SELECT *
  FROM Participant
  WHERE RegistDate = #RegistDate# and P_Phone = '#P_Phone#'
</cfquery>
```

The variables P\_Phone and RegistDate are passed to this page by URL variables. The RegistDate consists of a date and time. Querying the Participants where the RegistDate is equal to the RegistDate passed in the URL variable would match all those participants that registered within a particular second in time. To narrow the query, P\_Phone is also used.

5. Workshop Information
6. Amount Due

The participant may view the invoice in two different ways.

1. Email

When a participant leaves the Registration Process page an email containing the invoice is automatically sent to the participant. The reason that the email is sent upon unloading of the page is to give time to update the database. This option is only available to those who enter an email address when they register.

2. Invoice Page

The Registration process page contains a link to the invoice page. When a participant clicks on this button, they are directed to the invoice page that contains a complete invoice.

# RESULTS

## How the project differs from the project proposal

The implementation of the project follows closely to the project proposal. The following changes that were made:

1. Change in the registration page removal process.
  - 1.1. Proposed: The remove page was planned to allow the manager to delete the registration page when the workshop was finished.
  - 1.2. Actual: There is an if-statement on the registration page that compares the system date to the registration deadline date. If the registration date is older then the current system date, the participant is redirected to a page that notify that they have missed the registration deadline.
  - 1.3. Why: The proposed plan would have given the user an error message; “the page is not available”, when attempting to load the registration page after it has been removed. The new plan is also automatic and simplifies the manager’s duties.

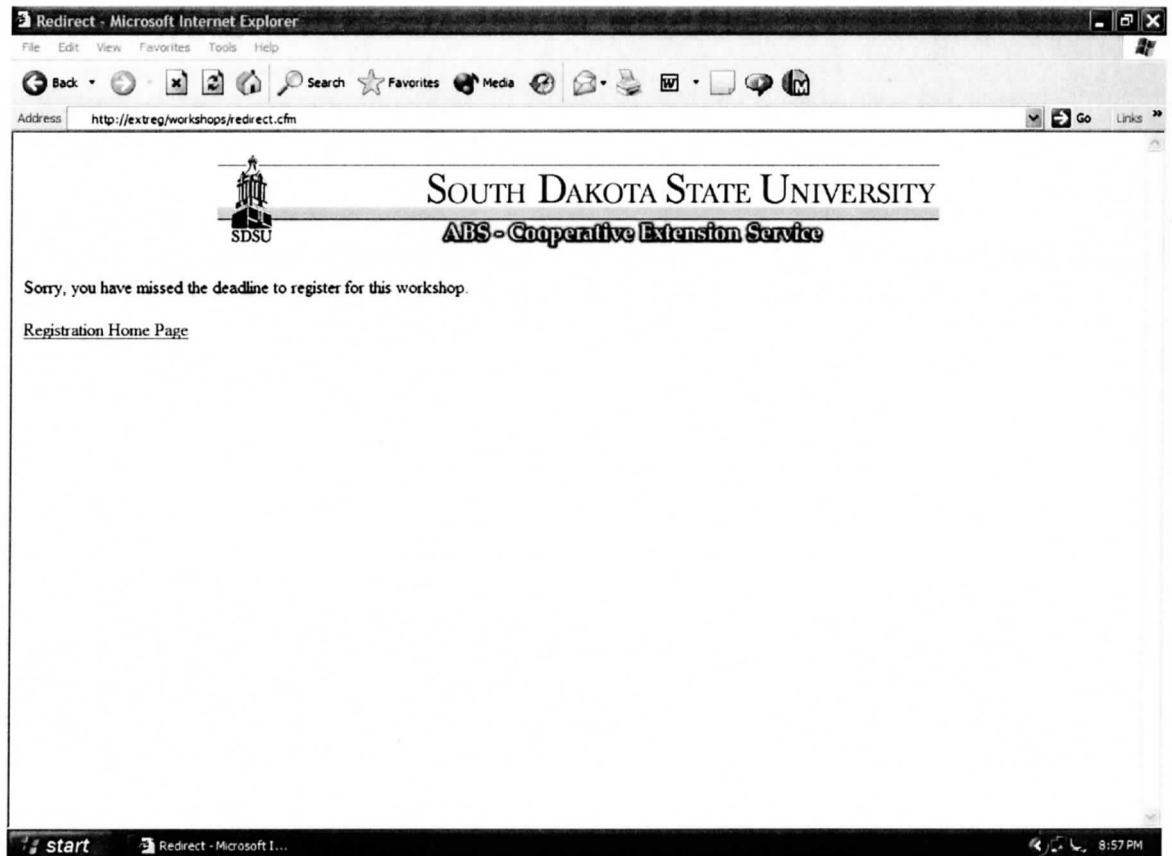

Figure 12: Redirect Page

## 2. Adding Participant Information Management

- 2.1. Proposed: There was no planned way to manage the participant information.

Cooperative Extension Service Online Registration System  
Project Report

- 2.2. Actual: Two additional pages were added to the system; Participant Edit and Delete Participant information
  - 2.3. Why: The registration system needed to have a means to manage the participant if the system was to be efficient
3. Administration Pages
    - 3.1. Proposed: There were no planned administrator pages.
    - 3.2. Actual: The administrator pages provide the administrator a way to view and edit both the workshop and participant information
    - 3.3. Why: The administrator's duty is to monitor and supervise the registration system. To accomplish this, an interface was needed between the administrator and the information.

## **Future**

The registration system meets the project design requirements. Here are some suggestions for future development:

1. Credit Card Payment

Currently, the finance department of South Dakota State University does not allow payments to be received over the internet. If this policy is changed in the future, credit card payment will be a logical function of the registration system.

2. Frequently Asked Question Page

Both participants and managers may have questions regarding how the registration system functions. A page on the intranet could be used to post question about the setup, management and deletion of the workshop information. A page on the internet could be used to post participant questions and answers.

3. Security information

The public has the right to know the security policy for the registration system. This statement should be on the public pages. This should be done before the system is completely implemented.

## **Conclusion**

This report documents the development of the Extension Online Registration system. The system increases the efficiency of the workshop registration. It is installed on the CES web server and is ready for the initial test phase.

The use of Cold Fusion gives the system flexibility. The database-to-web technology allows the manager to add, edit and delete workshops. It reduces the administrator's burden of developing the registration pages by allowing the manager to setup the registration pages. This is accomplished without the manager accessing the source code.

In today's workplace environment, technology is the driving factor behind productivity. The CES Online Registration System will increase productivity by reducing the labor to process registration manually.

## APPENDIX A: DATABASE DESIGN

### Workshop Table

This table was developed for this program. It contains all the complete information regarding the workshops. The primary key is URLname. The manager enters this value when the workshop is setup. Before the value is entered, the table is queried to see if the value already exists.

Table 1: Workshop Table

<u>Field</u>	<u>Type</u>	<u>Description</u>
WS_Name	Text	Workshop name
Date	Date/Time	Date of the Workshop
Time	Date/Time	Time the workshop starts
AM_PM	Text	AM or PM; workshop start time
WS_Location	Text	Location of the workshop
Contact_Name	Text	Contact name
Contact_Phone	Text	Contact phone
Contact_Email	Text	Contact email
WS_Manager	Integer	The personal ID number of the manager
WS_Cost	Float	Workshop cost
WS_Deadline	Date/Time	Date of the last day to register
URLname	Text	Text that uniquely identifies the workshop and is used for the page name in the URL address
WS_Other	Text	Other information to be displayed on registration page

### Participant table

This table was developed for the registration system. It contains the information about the participant that register for any of the workshops.

**Table 2: Participant Table**

<u>Field</u>	<u>Type</u>	<u>Description</u>
PartID	Auto/Num	Participant ID number
P_First_Name	Text	Participant's first name
P_Last_Name	Text	Participant's last name
P_Address	Text	Participant address
P_City	Text	Participant's city
P_State	Text	Participant's State
P_Zipcode	Integer	Participant's zip code
P_Phone	Text	Participant's telephone number
P_Email	Text	Participant's email address
RegistDate	Date/Time	Date of registration
URLname	Text	Text that uniquely identifies the workshop and is used for the page name in the URL address
Pay_Stat	Boolean	Status of the invoice; paid or unpaid

### Personnel Table

The table existed prior to the development of the registration system. It is used to handle the log-in to the intranet website.

**Table 3: Personnel Table**

<u>Field</u>	<u>Type</u>	<u>Description</u>
PersonalID	Auto/num	Manager Personal ID number
Firstname	Text	Manager's first name
Lastname	Text	Manager's last name
Street	Text	Manager's work address
State	Text	Manager's state
Zip	Integer	Manager's work zip code
County	Text	The county where the manager is employed

# APPENDIX B: WBS AND PROJECT SCHEDULE

## Work Breakdown Schedule

1. Registration Systems Planning
  - 1.1 Data flow diagram
  - 1.2 Entity relationship model
2. Registration System Design
  - 2.1 User interface
    - 2.1.1 Administrator pages design
    - 2.1.2 Manager pages design
    - 2.1.3 Participants pages design 1 1
  - 2.2 Database tables design
3. Registration System Implementation
  - 3.1 Construction
    - 3.1.1 Programming
    - 3.1.2 Testing
  - 3.2 Installation

## Project Schedule

CES Online Registration System Project																																																	
Task	Duration	September														October
