# ONE BY ONE EMBEDDING THE CROSSED HYPERCUBE INTO PANCAKE GRAPH 

M.F. ZERARKA<br>Laboratory of Applied Mathematics, University of Biskra, BP 145 RP Biskra 07000 Algéria.<br>faouzi.zerarka@univ-biskra.dz.

#### Abstract

Let $G$ and $H$ be two simple undirected graphs. An embedding of the graph $G$ into the graph H is an injective mapping $f$ from vertices of $G$ to the vertices of $H$. The dilation of embedding is the maximum distance between $f(u), f(v)$ taken over edges $(u, v)$ of $G$. The Pancake graph is one as viable interconnection scheme for parallel computers, which has been examined by a number of researchers. The Pancake was proposed as alternatives to the hypercube for interconnecting processors in parallel computer. Some good attractive properties of this interconnection network include: vertex symmetry, small degree, a sublogarithmic diameter, extendability, and high connectivity (robustness), easy routing and regularity of topology, fault tolerance, extensibility and embeddability of others topologies. In this paper, we give a construction of one by one embedding of dilation 5 of crossed hypercube into Pancake graph.

Keywords: Embedding, n-dimensional Crossed Hypercube, n-dimensional Pancake, dilation.

## 1 INTRODUCTION

In the field of interconnection networks, the study of graph embedding is motivated by the problem: Efficient simulation of interconnection networks and parallel algorithms on a different network, layout of circuits in VLSI. Akers and Krishnamurthy 1990 [1] proposed the Pancake as an attractive alternative to the hypercube and their variations for interconnecting processors in large scale parallel computers. This graph belongs to the family of Cayley graphs. It has very many interesting properties: small diameter and fixed degree, ( $n-1$ ) regular, high connectivity, vertex symmetry, Hamiltonian, fault tolerance, pancyclicity, extensibility and embeddability of others topologies. Akers and al. 1990[1], Kanevsky and Feng 1995 [16], Hwang and Chen 2000 [15], Hung and Al. 2003 [10], Heydari and Sudborough 1997 [8], Hsieh and Chang 2006 [12], Hsieh and Lee 2009 [13], 2010 [14]. The embedding capabilities are important in evaluating an interconnection network. Let $G$ and $H$ denote the simple undirected graphs. In general, an embedding of the graph $G$ into the graph $H$ is an injective mapping $f$ from vertices of $G$ to the vertices of $H$ together with mapping Path $_{j}$ which assigns to each edge ( $u, v$ ) of $G$ to a path between $f(u)$ and $f(v)$ in $H$. Let $\operatorname{dil}(f)$ denote the dilation of given embedding $f$., is defined to be the maximum of length $\left\{\operatorname{Path}_{j}(u, v)\right.$ : $(u, v) € E(G)\}$. Menn and Somani 1992 [20], Fan 2002 [5], Qiu 1992 [24], Fang and Hsu 2000 [6], Hsieh and al 1999 [11], Lin and al. 2008 [18], 2010 [19], Aschheim and al. 2012 [2], Femmam and al. 2012 [20]. To compare with crossed hypercube, the pancake offers a good and simple simulation of the others interconnection networks Sennoussi and Lavault 1997 [22].

In this paper, we consider the one by one embedding of $n$ dimensional Crossed hypercube into the $n$-dimensional Pancake graph. Our goal is to construct the dilation 5 one by one embedding $n$-dimensional Crossed hypercube into $n$-dimensional Pancake graph. The paper is organized as follows: We introduce some definitions and properties of Crossed hypercube and Pancake graph in the preliminaries. In the section 3, we present the construction of one by one embedding of $n$-dimensional Crossed hypercube into $n$ dimensional Pancake graph. In the section 4 we show that the dilation of one by one embedding Crossed hypercube into Pancake is equal 5. Finally, we give our conclusion in the section 5.

## 2 PRELIMINARIES

Definition 1. Let $n$ be a positive integer. The star graph $S_{n}$ and Pancake graph $P_{n}=\left(G_{n}, E_{n}\right)$ of dimension $n$ are graphs whose vertex set $G_{n}$ consists of all of permutations $G_{n=}\left(\left(g_{1}, g_{2}, \ldots, g_{n}\right) \mid g_{i} \in I=\{1,2, \ldots . n\} ., \mathrm{g}_{i} \neq \mathrm{g}_{i}\right.$ for $\left.i \neq j\right)$. The ith position of the vertex $x_{l} x_{2} \ldots x_{n}$ of star or Pancake will be referred to as the $i^{\text {th }}$ coordinate of the vertex. In the star graph $S_{n}$ a vertex $x_{l} x_{2} \ldots x_{n}$ is adjacent to the vertices obtained $x_{i} x_{2} \ldots x_{i-1} x_{1} x_{i+1} \ldots x_{n}$ for $2 \leq i \leq n$. In the Pancake graph $P_{n}$ a vertex $x_{1} x_{2} \ldots x_{n}$ is adjacent to the vertices $x_{i} x_{i-}$ ${ }_{1} \ldots \ldots x_{1} x_{i+1} \ldots x_{n}$ for $2 \leq i \leq n$. i.e. vertices obtained by reversing the order of the symbols in the first $i$ coordinates of the vertex for $2 \leq i \leq n . \quad E_{n}=\left\{\left(\left(g_{i} g_{i}\right.\right.\right.$ $\left.{ }_{1} \ldots g_{1} g_{i+1} \ldots g_{n}\right),\left(\mathrm{g}_{i} g_{2} \ldots g_{i-1} g_{1} g_{i+1} \ldots g_{n}\right) . g_{i} \in G_{n}$ for $\left.\left.2 \leq i \leq n.\right)\right\}$, $\left|E_{n}\right|=.(\mathrm{n}-1) \mathrm{n}!/ 2$.. Thus, the star or Pancake graph of dimension $n$ has $n$ ! vertices and each of its vertices is adjacent to $n-1$ other vertices. The graph $P_{n}$ is made of $n$ copies of $G_{n-1}$ namely $P_{n}[n, k]$ for $1 \leq k \leq n$. Considering each $P_{n}[n, k]$ as a super node. It follows that $P_{n}[n, s], P_{n}[n, t]$ are connected by a collection of edges of the form
$\left(\left(t, g_{2}, g_{3}, \ldots . ., g_{n-1}, s\right),\left(s, g_{n-1}, \ldots . ., g_{2}, t\right)\right)$ Thus, the are $(n-2)$ ! edges connecting $P_{n}[n, s]$ and $P_{n}[n, t]$ Kanevsky and Feng, 1995 [15] The $n$-pancake $P_{n}$ is a complete graph on the super nodes connected by the super edges.

Definition 2. The n-dimensional hypercube $Q_{n}$ and the crossed hypercube $C Q_{n}$ have a same set of vertices. We represent the address of each vertex in $Q_{n}\left(C Q_{n}\right)$ as a binary string of length $n$. In such away, we don't distinguish between vertices and their binary address. In $Q_{n}$ two vertices are adjacent if and only if their binary labels differ only in one bit position. For $C Q_{n}$, adjacency requirement are little more involved.

Two binary strings $x=x_{1} x_{0}$ and $y=y_{1} y_{0}$ of length two are pair-related if and only if $(x, y) \quad €$ $\{(00,00),(10,10),(01,11),(11,01)\}$.

The n-dimensional Crossed hypercube $C Q_{n}$ is recursively defined as follows: $C Q_{n}$ is the complete graph base on two vertices labeled 0 and 1.K. Efe 1992 [4]. $C Q_{n}$ consists of two subcubes $0 C Q_{n-1}$ and $1 C Q_{n-1}$. The most significant bit of the labels of the vertices in $0 C Q_{n-1}$ and $1 C Q_{n-1}$ is $0(1) . U$ is the set of vertices $u=u_{n-1} u_{n-2} \ldots u_{1} u_{0} \in 0 C Q_{n-1}$ with $u_{n-1}=0$ and $v=\mathrm{v}_{n-1} v_{n-2} \ldots v_{l} v_{0} \in 1 C Q_{n-1}$ with $v_{n-1}=1$ are joined by an edge in $C Q_{n}$ if and only if:

$$
u_{n-2}=v_{n-2} \text { if } n \text { is even }
$$

$\left(u_{2 i+1} u_{2 i}, v_{2 i+1} u_{2 i}\right)$ are pair-related.
The $n$-dimensional Crossed hypercube $C Q_{n}$ as an alternative of the hypercube, has the same number of vertices and degree as the $n$-dimensional hypercube. The Crossed hypercube is a variation of hypercube which is derived with some twisted edges. Due to these twisted edges, the diameter of $C Q_{n}$ is only half of the hypercube one. Nice properties include relatively small degree, embedding capabilities, scalability, robustness and the fault tolerant of hamiltonicity of $C Q_{n}$. Huang et al., 2002 [23], Hsieh et al., 1999 [16]). The multiply twisted hypercube graph is not vertex-transitive for $n \geq 5$ (Kulasinghe and Bettayeb, 1995 [17]).

## 3 EMBEDDING ONE BY ONE $N$ DIMENSIONAL CROSSED HYPERCUBE INTO $N$-DIMENSIONAL PANCAKE GRAPH.

In this section, we present a new function, the one by one embedding $n$-dimensional Crossed hypercube denoted $C Q_{n}$ into $n$-dimensional Pancake graph denoted by $P_{n}$. The main steps of one by one embedding are as follows:

- Find the first node of $C Q_{n}$ and the first node of $P_{n}$. Example 00000 of $C Q Q_{4}$ and 1234 of $P_{4}$.
- One by one embedding vertex of $C Q_{n}$ into $P_{n}$
- One by one embedding all edges of $C Q_{n}$ into paths $P_{n}$.

### 3.1 One by one embedding vertex of $C Q_{n}$ into $\boldsymbol{P}_{\boldsymbol{n}}$.

The One by one embedding vertex of $C Q_{n}$ into $P_{n}$ is done in the following way:

The basic function of this one by one embedding vertex is produced as follows: $C Q_{4}$ is made recursively by two copies of $C Q_{3}$. One copy is prefixed bi $0\left(0 C Q_{3}\right)$ and the other one is prefixed by $1\left(1 C Q_{3}\right)$. The $P_{4}$ is made by four copies of $P_{3}$ named $P_{4}[4, k]$ for $k=1.4$. The one by one applies all following actions:
a) The vertex of $0 C Q_{3}$ are respectively embedded into $P_{4}[4,4]$ and $P_{4}[4,1]$ using:
$\mathrm{X}=\operatorname{PremG}($ node $), \operatorname{inv1}(\mathrm{X})$, flip(X), flip(inv1(X)).
$\mathrm{Y}=\operatorname{Inv} 4(\mathrm{X})$, ), flip(X), inv1(X), inv1(flip(X).
b) The vertex of $1 C Q_{3}$ are respectively embedded into $P_{4}[4,2]$ and $P_{4}[4,3]$ using:
$\mathrm{Z}=\operatorname{Inv} 4(\operatorname{Inv1} 1(\operatorname{Inv} 1(\mathrm{z}))$ ), inv1(Y), flip(Y), flip(inv1(Y). $\mathrm{T}=\operatorname{Inv} 4(\mathrm{Y}), \operatorname{flip}(\mathrm{T}), \operatorname{inv} 1(\mathrm{~T}), \operatorname{inv} 1(f \operatorname{lip}(\mathrm{~T}))$.

Remarque that only the first action is changed.

Figure 1: The one by one embedding vertex of $C Q_{4}$ into $P_{4}$

The case for $\boldsymbol{n} \geq \mathbf{5}$. The $n$-dimensional crossed hypercube $C Q_{n}$ is produced the composition of two copies of $C Q_{n-1}$. The first one is prefixed by $0\left(0 C Q_{n-1}\right)$ and the second is prefixed by $1\left(1 C Q_{n-1}\right)$. The $n$-Pancake $P_{n}$ is made by $n-1$ copies of $P_{n-1}$ The are two stated situations. The first one is when $n$ is odd, we use two components. Example shown in figure 2 .

Figure 2: One by one embedding $0 \subset Q_{4}$ into $P_{5}[5,1]$

The first for one by one embedding all nodes of $0 C Q_{n-1}$ uses the actions of the basic function of the one by one embedding with $\mathrm{X}=\mathrm{PremG}$ (node) (the first node) in the super node $P_{n-1}[n-1, n-1]$. and in the second one for one by one embedding vertex of $1 C Q_{n-1}$, we applied the actions of the basic function of the one by one embedding with $\mathrm{Y}=\operatorname{Inv}(\mathrm{X})$ (the first node) in $P_{n-1}[n-1,1]$.

The second situation is when $n$ is even, we use four super nodes of $P_{n}$. Example shown in figure 3. We embed in the first super node of $P_{n-1}$ all nodes of $00 C Q_{n-2}$ are embedded
into $P_{n-1}[n-1, n-1]$ using the actions of basic function one by one embedding $C Q_{n}$ into $P_{n-1}$ with the first node $\mathrm{X}=\operatorname{PremG}$ (node). In the second super node $P_{n-1}[n-1,1]$ of $P_{n}$, all nodes of $01 C Q_{n-2}$ are one by one embedded with the same basic actions for $\mathrm{Y}=\operatorname{Inv}(\mathrm{X})$. all nodes $10 C Q_{n-2}$ are embedded into the third component $P_{n-1}[n-1,2]$ using the same actions with $Z=\operatorname{Inv1}(\operatorname{Inv}((\operatorname{Inv} 1(\operatorname{PremG}($ nœud $)))$, finally, we embed all vertex of $11 C Q_{n-2}$ in the fourth super node $P_{n-1}[n-1,3]$ with $\mathrm{T}=\operatorname{Inv}((f l i p(i n v 4(\operatorname{PremG}(\mathrm{n} œ u d)))$ and using the actions of the basic function, Figure 3.

Figure 3 : One by one embedding $00 C Q_{4}$ into $P_{5}[5,5], 01 C Q 4$ into $P_{5}[5,1], 10 C Q_{4}$ into $P_{5}[5,3]$ and $11 C Q_{4}$ into $P_{5}[5,4]$

### 3.2 One by one embedding edges of $C Q_{n}$ into $P_{n}$.

There are two stated situations. The first one is when the paths are in the same $P_{4}$ of any super node of $P_{n}$. the second is when the path is between to $P_{4}$ of any component of $P_{n}$.
In the first situation, the one by one embedding edges of $C Q_{n}$ into paths of $P_{n}$ uses two ways realizing as follows:

The first one is to one by one embedding all edges of $C Q_{n}$ with extremities are Prefaaaa-prefbbbb that $a, b \in[0,1]$ in the other word the embedded path is the same $P_{3}$ or between the different $P_{3}$ of any super node of $P_{n}$. We use the actions depicted in Table 1.
The second one is the one by one embedding edges between two $P_{4}$ of any component of $P_{n}$. In this situation, we use actions depicted in, Table 3, Table 4 and Table 5.

Table 1: One by one embedding edges of $C Q_{n}$ into paths between the $P_{3}$ in the same $P_{4}$ of any super node of $P_{n}$

1. In the second situation, the one by one embedding edges of $C Q_{n}$ into paths of $P_{n}$ uses two cases realizing as follows:
a) The first way is to one by one embedding all edges of $C Q_{n}$ with extremities are Prefaaaaa-Prefbbbbb that $a, b \in[0,1]$ in other word the embedded path is between two different component $P_{4}$ of the same $P_{5}$ of any super node of $P_{n}$, when $n$ is odd for any $n \geq 5$. We use in this case the following actions depicted in Table 6, Table 7.
b) The second way is to one by one embedding all edges of CQn with extremities are PrefaaaaaaPrefbbbbbb that a,b $\in[0,1]$ in other word the embedded path is between four different component P4 of the same P5 of any super node of Pn , when n is even for any $\mathrm{n} \geq 5$. We use in this case the following actions depicted in Table 8, Table 9, Table 10, Table 11.

## 4 DILATIONS OF ONE BY ONE EMBEDDING $N$-DIMENSIONAL CROSSED HYPERCUBE INTO $N$ PANCAKE.

## Lemma

The $n$-dimensional crossed hypercube $C Q_{n}^{\prime}=\left(A, U^{\prime}\right)$ has one by one dilation 4 embedding into the $n$-pancake $P_{n}^{\prime}$ $=\left(G^{\prime}, E^{\prime}\right)$ for any $n>4$.

## Proof

We prove this lemma by induction.

## Base

For $n=4$, the Table1, presents all paths between the embedded nodes into $P_{4}^{\prime}$ with dilation 4.

For $n=5$, The Table2, Table3, Table4, Table5, presents the one by one embedding edges between two $P_{3}^{\prime}$ of any component of $P_{n}^{\prime}$ with dilation 4.

## Induction hypothesis

Suppose that for $k \leq n-1$, the one to one dilation 4 embedding of $C Q_{k}^{\prime}$ into $P_{n}^{\prime}$ is true. Let us now prove that is true for $k=n$.

We have the following cases:
$k$ is odd.
$C Q_{k}^{\prime}=\left(A, U^{\prime}\right)$ is constructed by two copies of $C Q_{k-1}^{\prime}$, the first is prefixed by $0\left(C Q_{k-1}^{\prime}\right)$, the second one by $1\left(C Q_{k-1}^{\prime}\right)$, such that $X \in A$ is denoted by 0 Prefa $_{k-3} a_{k-2} a_{k-1}, 0$ Prefa $_{k-3} a_{k-}$ ${ }_{2} a_{k-1}, 1$ PrefO $a_{k-3} a_{k-2} a_{k-1}, 1$ Prefl $a_{k-3} a_{k-2} a_{k-1}$ or Pref 1 Iak-3 $a_{k-2} a_{k-1}$ or $\operatorname{Pref}_{1} O a k_{-3} a_{k-2} a_{k-1}$ or or $\operatorname{Prff}_{2} 0 a_{k-3} a_{k-2} a_{k-1}$ or Pref $_{2} a_{k-3} a_{k-}$ ${ }_{2} a_{k-1}$. The first node of the super node $0\left(C Q_{k-1}^{\prime}\right)$ is $\mathrm{XX}=x_{1} x_{2} x_{3} x_{4} \operatorname{Suf}\left(P_{n}[n, n]\right)$, we adding only 0 to the prefix of $C Q_{k-1}^{\prime}$, that is to say, all edges in $0\left(C Q_{k-1}^{\prime}\right)$ are embedded into $P_{k-1}[\mathrm{k}-1, k-1]$ (hypothesis of induction). However, we use the different actions depicted by Table1, Table2, Table3, Table4, Table5 In other words the dilation is 4 . For the edges between two nodes labeled by $\operatorname{Pref}_{2} 0 a_{k-3} a_{k-2} a_{k-1}$ or $\operatorname{Pref}_{2} l a_{k-3} a_{k-2} a_{k-1}$, we added only 1 to the prefix of $C Q_{k-1}^{\prime}$. The first node of the super node $1\left(C Q_{k-1}^{\prime}\right)$ is embedded into $\mathrm{YY}=\operatorname{INV}\left(x_{1} x_{2} x_{3} x_{4} \operatorname{Suf}\left(P_{k-1}[k-1,1]\right)\right.$, we apply the same actions of embedding all edges of $C Q_{k-1}^{\prime}$ into the path in component of $P_{k-1}$ (hypothesis of induction) and we use the different actions cited in Table1, Table2, Table3, Table4, Table5. The dilation in this case is equal 4.
$k$ is even.
$C Q_{k}^{\prime}=\left(A, U^{\prime}\right)$ is constructed by two copies of $C Q_{k-1}^{\prime}$, the first is prefixed by $0\left(C Q_{k-1}^{\prime}\right)$, the second one by $1\left(\left(C Q_{k-1}^{\prime}\right)\right.$, such that $X \in A$ is denoted by 00Prefa ${ }_{k-4} a_{k-3} a_{k-2} a_{k-1} 01$ Prefa $_{k-}$ ${ }_{4} a_{k-3} a_{k-2} a_{k-1}, 10$ Prefa $_{k-4} a_{k-3} a_{k-2} a_{k-1}$, 11Pref $a_{k-4} a_{k-3} a_{k-2} a_{k-1}$. For the edges between nodes labeled 00Prefa $a_{k-4} a_{k-3} a_{k-2} a_{k-1}$ (first super node of $C Q_{k}^{\prime}$ ) are embedded into the paths of the first component of $P_{k-1}[k-1, k-1]$ named $\mathrm{XX}=\operatorname{Prem}\left(P_{k-1}[k-1, k-1]\right.$. (Hypothesis of induction).However the dilation is 4.The second one concern edges between nodes of $C Q_{k}^{\prime}$ labeled $0^{1 P r e f a_{k-4}} a_{k-3} a_{k-2} a_{k-1}$. This situation is similar that the one by one embedding edges between nodes labeled by $\operatorname{Pref}_{2} 0 a_{k-3} a_{k-2} a_{k-1}$ or $\operatorname{Pref}_{2} 1 a_{k-3} a_{k-2} a_{k-1}$, we add only 1 to the prefix of $C Q_{k-1}^{\prime}$ and the first node of the super node $1\left(C Q_{k-1}^{\prime}\right)$ is embedded into $\mathrm{YY}=\mathrm{INV}(\mathrm{XX})$ (first node of $P_{k-}$ ${ }_{I}[k-1,1]$ ).(Hypothesis of induction). However, the dilation is 4. The third situation is the embedding the edges between the nodes labelled 11Prefa $a_{k-4} a_{k-3} a_{k-2} a_{k-1}$ into the third component of $P_{k-1}[k-1,2]$. We use the same actions except that the first node of this component of $C Q_{k-1}^{\prime}$ is embedded into $\mathrm{ZZ}=$ INV1 (Flip (YY)). (The first of $P_{k-1}[k-1,2]$ ). (Hypothesis of induction). The dilation is 4.the latest case is idem except that the first node of the forth component of $P_{k}$ ${ }_{I}[k-1,3]$ TT= INV1 (ZZ).(Hypothesis of induction). However, the dilation is 4 .

## Theorem

The n-dimensional crossed hypercube $C Q_{n}=(A, U)$ has one by one dilation 5 embedding into $P_{n}=(G, E)$ for any $\mathrm{n} \geq 5$.

## Base

Case, $n$ is odd: $n=5$. Table 6, Table 7 presents the different actions of one by one embedding all edges of $C Q_{n}$ into paths of $P_{n}$.
Case when $n$ is even: $n=6$. Table 8, Table 9, Table 10, Table 11 presents the cases of different actions of one by one embedding edges of $C Q_{n}$ into paths of $P_{n}$.

## Hypothesis of induction

Assume that this theorem holds for $k<n-1$.That is $C Q_{k-1}$ one by one embedding dilation 5 into $P_{k-1}$.

Now we prove that this is true for $k=n$.
Case $1, k$ is odd. There are two sub-cases:
One by one embedding edges of $0\left(C Q_{k-1}^{\prime}\right)$ and $1\left(C Q_{k-1}^{\prime}\right)$ in respectively the first component of $P_{k}[k-1, k]$ and the second $P_{k}[k-1,1]$.In this situation we use the hypothesis of induction except the prefix and suffixes respectively augmented by $0, k$. In the second, we use the same actions like the first situation except $\operatorname{Prem}\left(. P_{k}[k-1,1]\right)=$ $\operatorname{INV}\left(\operatorname{Prem}\left(P_{k}[k-1, k]\right)\right)$ and the prefix and suffixes respectively augmented by $1, k$.(hypothesis of induction). However, the dilation is 5 .

One by one embedding edges between $0\left(C Q_{k-1}^{\prime}\right)$ and $1\left(C Q_{k-1}^{\prime}\right)$, or paths between $P_{k}[k-1, k]$ and $P_{k}[k-1,1]$. We use the different actions outlined in Table 6, Table7. In all cases, the dilation is 5 .

Case 2, $k$ is even. There are two sub-cases:
There are four situations in this sub-case of one by one embedding edges between the same components of $C Q_{k}$. The first is between nodes labeled by 00Prefa $a_{k-4} a_{k-3} a_{k-2} a_{k-1}$, the second one is between nodes labeled 01Prefa $a_{k-4} a_{k-3} a_{k-2} a_{k-}$ 1, the third is between nodes labeled 10Prefa $a_{k-4} a_{k-3} a_{k-2} a_{k-1}$ and the latest is between nodes labeled 11 Prefa $a_{k-4} a_{k-3} a_{k-2} a_{k-}$ ${ }_{1}$.in the all situation, we use $00 \operatorname{Prefa}_{k-4} a_{k-3} a_{k-2} a_{k-1}$ In this situation we use the hypothesis of induction except the prefix and suffixes respectively augmented by $0, k$. In the second, we use the same actions like the first situation except $\operatorname{Prem}\left(. P_{k}[k-1,1]\right)=\operatorname{INV}\left(\operatorname{Prem}\left(P_{k}[k-1, k]\right)\right)$ and the prefix and suffixes respectively augmented by $1, k$ .(Hypothesis of induction). However, the dilation is 5. Idem for the remaining situation, except the first node of the third used component is $\operatorname{Prem}\left(. P_{k}[k-1,2) \quad=\right.$ $\operatorname{INV}\left(\operatorname{INV} 1\left(\operatorname{Prem}\left(P_{k}[k-1,1]\right)\right)\right.$ and the first node of the forth used component is $\operatorname{Prem}\left(P_{k}[k-1,3]\right)=\operatorname{INV}\left(\operatorname{Prem}\left(P_{k}[k-\right.\right.$ $1,2 \jmath)$ ).

The second sub-case is one by one embedding edges between $00\left(C Q_{k-2}^{\prime}\right)$ and $01\left(C Q_{k-2}^{\prime}\right) \quad 00\left(C Q_{k-2}^{\prime}\right)$ and $10\left(C Q_{k-2}^{\prime}\right), 10\left(C Q_{k-2}^{\prime}\right)$ and $11\left(C Q_{k-2}^{\prime}\right), 01\left(C Q_{k-2}^{\prime}\right)$ and $11\left(C Q_{k-2}^{\prime}\right)$ onto respectively paths between $P_{k}[k-1, k]$ and $P_{k}[k-1,1], P_{k}[k-1,2]$ and $P_{k}[k-1,3], P_{k}[k-1,2]$ and $P_{k}[k-$ $1,4]$.and finally between $P_{k}[k-1,1]$ and $P_{k}[k-1,4]$. We use respectively the different actions outlined in Table 11, Table 8, Table 9 Table10, .In all cases the dilation is 5.

## Proof

We prove this theorem by induction.

## 5 CONCLUSION

It is both practically significant and theoretically interesting to investigate the embeddability of different architecture into pancake (ref).in this paper, the main purpose is the one by one dilation 5 embedding crossed hypercube into Pancake. The study of dilation of this function is explained in two steps. The first step is the one by one dilation 4 embedding of all edges in the same $P_{4}$ of any super node of $P_{n}$ as proved by lemma. The second step is the general one by one dilation 5 embedding of all edges of crossed hypercube into paths between two super nodes of Pancake is proved by theorem.

In the future of this work, it is more interesting to study the fault-tolerant embedding of crossed hypercube into Pancake.
