INTRODUCTION

The Chesapeake Bay Water Quality Monitoring Program (WQMP) has three main objectives: (1) characterization of water quality conditions, (2) detection of temporal and spatial trends in water quality, and (3) creation of a data base that furthers our understanding of the processes that control water quality in the Chesapeake Bay system. The purpose of this report is to characterize water quality conditions in the Virginia portion of Chesapeake Bay during the 1993 water year, which runs from October 1992 through September 1993. These monitoring efforts have been conducted with funding from the US Environmental Protection Agency and the Commonwealth of Virginia.

DESCRIPTION OF MONITORING PROGRAM

Water quality is monitored at some fifty stations within Chesapeake Bay and at the confluence of a tributary and the main stem of the bay. Twenty-seven of those stations are located in Virginia (see Figure 1). Responsibility for sampling is shared between the Virginia Institute of Marine Science (VIMS) of the College of William & Mary and the Applied Marine Research Laboratory (AMRL) at Old Dominion University (ODU), as indicated in Table 1. Standard protocols are employed throughout the WQMP. VIMS' field procedures are described in the *Field Procedures Manual* (1989) and the *Instrument Calibration Manual* (1989). Similar documents are available for the other institutions.

Monitoring occurs once each month during the cooler months (October through March) and twice each month during the warmer months (April through September). The

* Samples are collected 1 m below the surface and 1 m above the bottom at all stations; samples also are collected 1 m above and 1 m below the pycnocline at the designated stations.

** These stations are referred to as EE3.4 and EE3.5 in Chesapeake Bay Program reports.

institutions responsible for the monitoring program in both Virginia and Maryland attempt to collect all samples within a three-day window, typically Monday through Wednesday of the chosen week. No attempt is made to schedule the sampling for particular phases of the semi-diurnal tide or for times within the lunar month. Adverse weather is the primary reason for not meeting the established schedule. The sampling dates for water year 1993 are listed in Table 2.

Observations on sea state, weather conditions, water clarity and other notable features are recorded at each station. The physical setting is characterized using continuous profiling instruments. Water temperature, conductivity, dissolved oxygen (DO), pH and *in vivo* fluorescence measurements are recorded at one-meter intervals vertically through the water column, except at depths greater than 15 meters, when measurements are made at two-meter intervals. Light attenuation and secchi depth measurements are also made at each station. *In vivo* fluorescence measurements are recorded as the vessel moves from one station to another; water is taken from about 1 m depth.

Water samples are collected at 1 m below the surface and 1 m above the bottom at all stations. At the stations located along the deep trough of Chesapeake Bay (see Table 1), samples are also collected one meter above and one meter below the pycnocline, except when there is minimal density stratification. For the latter case, samples are collected at 1/3rd and 2/3rds of the water column depth.

Water samples are analyzed for a number of nutrient species (see Table 3) following standard analytical procedures (for details see *Laboratory Procedures Manual*, 1989).

Table 3. Water Quality Analyses

<i>Carbon</i>	Particulate carbon Dissolved organic carbon	
<i>Nitrogen</i>	Particulate nitrogen Total dissolved nitrogen Ammonia-nitrogen Nitrite-nitrogen Nitrate+Nitrite-nitrogen	
<i>Phosphorus</i>	Particulate phosphorus Total dissolved phosphorus Ortho-phosphorus	
<i>Silica</i>	Dissolved silicate	
<i>Chlorophyll-a</i> <i>Total suspended solids</i>		
<i>Dissolved oxygen and salinity</i>		(typically one sample per station as a check on <i>in situ</i> measurement systems)

RESULTS

The data for water year 1993 are presented in the appendices by water quality analysis. For each measure of water quality, maximum, minimum, and mean values for the year are reported for each station. These statistics are given for both the surface and bottom sampling points, and therefore illustrate not only the range of conditions occurring over the year, but also whether surface-to-bottom differences are large. Following the table are the graphs for each station. The data for both the surface and bottom sampling points have been plotted, with the exception of Secchi depth, for which there is only one measurement per station. The maximum and minimum values at the surface are presented as "whiskers", while maximum and minimum values at the bottom are shown as "boxes".

When there were two cruises during a given month, the data from the two cruises have been combined into a single monthly data set.

No results have been listed in the tables or plotted in the figures for the samples taken above and below the pycnocline. Individuals interested in values for the surface mixed layer or the bottom mixed layer should access the entire data base and examine the pycnocline results.

Perhaps the single most important measure of water quality is the dissolved oxygen (DO) concentration. For estuarine waters, state water quality standards specify that the daily average DO concentration should be 5.0 mg/l or greater, and that no observation should be below 4.0 mg/l. The portion of the DO measurements below 5 mg/l and below 4 mg/l have been calculated for each station and are included in the DO section.

In addition to those water quality parameters which are measured directly, several other parameters have been calculated. Salinity is determined using water temperature and conductivity observations and the UNESCO Equations of State (UNESCO, 1983). Total phosphorus and total nitrogen have been calculated by summing the values for the particulate and total dissolved fractions. Chlorophyll-a has been calculated using a trichromatic formula (ASTM, 19979; Method D 3731-79).

OTHER REPORTS AND OTHER MONITORING EFFORTS

The water quality monitoring in the Virginia portion of Chesapeake Bay is shared between the Applied Marine Research Lab (AMRL) and the Virginia Institute of Marine

Science (VIMS). During the first few years of the program, separate contract reports were prepared. Subsequently, VIMS began producing water quality data reports that covered the entire Virginia portion of Chesapeake Bay. These are listed below:

Water Year	VIMS Data Report No.
1985	36
1988	38
1989	35
1990	37
1991	49
1992	51

The data for the entire Chesapeake Bay Water Quality Monitoring Program (main stem and tributaries in Virginia and Maryland) from 1984 through 1991 is also available in graphical format on CD-ROM (Rennie and Neilson, 1994).

The scientists at ODU redirected their data analysis efforts to synthesizing water quality and living resource data (*c. f.* Alden *et al*, 1992) and to an examination of the power of the data set to detect temporal trends. For copies of these reports, contact the principal investigator, Dr. Raymond Alden at AMRL.

A comparable monitoring program is conducted in the major tributaries to Chesapeake Bay by the Virginia State Water Control Board (SWCB), now the water division of the Department of Environmental Quality (DEQ). The SWCB has issued tributary water quality characterization reports for 1984-85, 1986, 1987 and 1988. For copies of these reports, contact the Chesapeake Bay Office at DEQ in Richmond.

The US Environmental Protection Agency, Chesapeake Bay Program Office, has examined the water quality data for the main stem of Chesapeake Bay to determine

whether conditions are changing. Reports have been issued as part of the Chesapeake Bay Programs's Technical Report Series (see below). A similar examination of tributary data was made by Bishop *et al* (1990).

Dissolved Oxygen (1984-1990)	CBP/TRS 66/91
Phosphorus (1984-1990)	CBP/TRS 67/91
Nitrogen (1984-1990)	CBP/TRS 68/92
Phosphorus, Nitrogen, Secchi Depth & Dissolved Oxygen (1984-1992)	CBP/TRS 90/93

The Chesapeake Bay program also includes programs to monitor the living resources; phytoplankton, zooplankton and benthos have been monitored in the Virginia tributaries and in the Virginia portion of Chesapeake Bay since 1984 (see Alden *et al.*, 1992). Other elements deal with toxic substances, nonpoint source pollution and modelling of water quality. The Chesapeake Bay Program will provide water quality data to users; it is recommended that interested parties acquire the *Guide to Using Chesapeake Bay Program Water Quality Monitoring Data* (1993) prior to making a request for data. Contact the Chesapeake Bay Program Office at 1-800-968-7229 to obtain the guide.

SALINITY

Salinity is calculated using UNESCO 83 EOS
and is reported as practical salinity (PS).

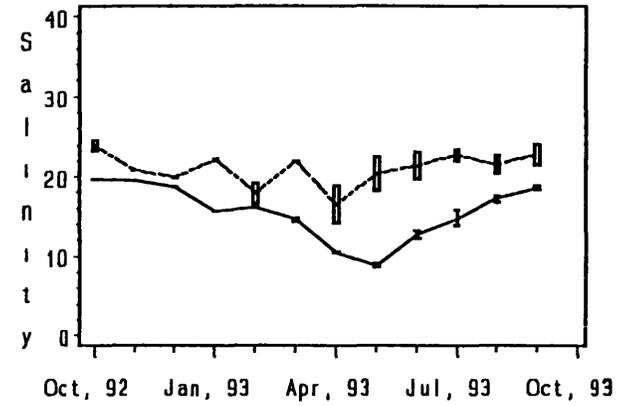

Salinity
October, 1992 - September, 1993

	Salinity

TOTAL PHOSPHORUS

Total Phosphorus is the sum of
Particulate Phosphorus and Total Dissolved Phosphorus.
Values reported as mg/l.

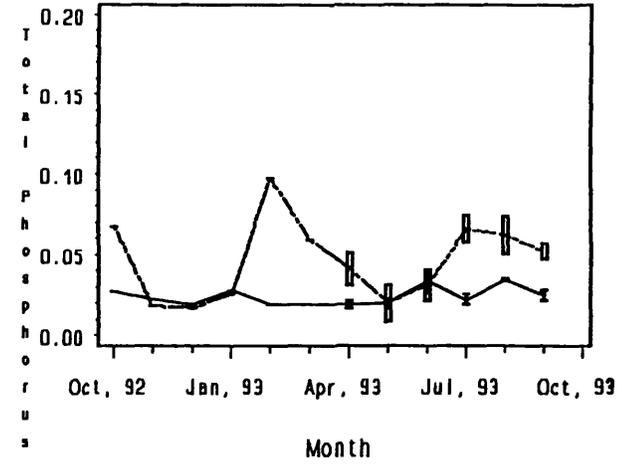

Total Phosphorus
October, 1992 - September, 1993

TOTAL NITROGEN

Total Nitrogen is the sum of
Particulate Nitrogen and Total Dissolved Nitrogen
Values reported as mg/l.

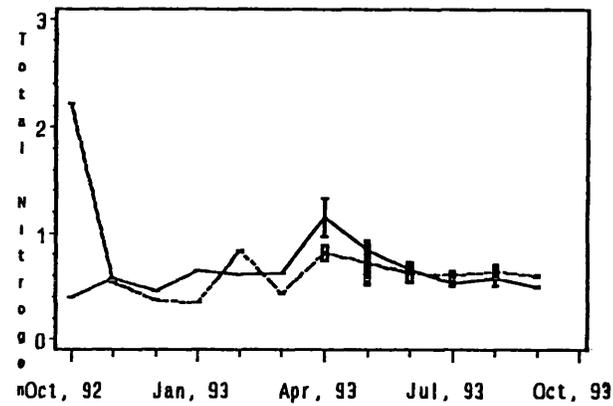

Total Nitrogen
October, 1992 - September, 1993

	Total Nitrogen (mg/l)					
	Surface			Bottom		
	Max	Mean	Min	Max	Mean	Min
