INTRODUCTION

This report summarizes data collected by the Virginia Institute of Marine Science (VIMS) monthly trawl survey cruises for January to December 1999. The trawl survey is a long-term, broad scope monitoring program. Its primary goal is to monitor juvenile abundance for marine and estuarine finfish and invertebrates. A major objective is to provide annual indices of juvenile abundance for recreationally, commercially, and ecologically important species of sufficient accuracy and precision for both immediate resource management needs and long-term understanding of environmental influences on fishery resources. A second important product of this effort is the documentation and monitoring of habitat utilization by juveniles and small adults of these species. The program also provides a sound framework for the procurement of biological samples for life history studies and other investigations relevant to fisheries resource management.

VIMS has conducted a bottom trawl survey of some fashion since 1955 (Figure 1). Historically, sampling has occurred as mid-channel transects at fixed locations (non-random) spaced at approximately five mile intervals on Virginia's major tributaries (James, York and Rappahannock Rivers). In the early 1970's, work was performed on the Mobjack Bay and Piankatank River using both the standard fishing gear from a large research platform, and a similar but smaller gear towed from an outboard skiff or Chesapeake dead-rise at shallow water locations (≤ 12 ft.). The first random sampling design was implemented in 1971 on the York River by Linda Pushee Mercer as part of a pipefish study. This survey, and the increasing need for a random survey of the main stem Bay and tributaries, were factors in implementing a bay wide random stratified survey in 1973. This program had a very large spatial coverage in various depth strata, but was very limited in its temporal component. Sampling occurred on a semi-annual basis primarily in January to February, and again in July (Wojcik and Van Engel, 1988a, 1988b, 1988c, and 1989). A statistical review of accumulated trawl data indicated the monthly surveys did not provide enough samples to obtain the desired margin of error (300-700 trawls per survey necessary). This random survey was discontinued by May 1981, due to decreasing funding and the recognition that many species use the estuary as nursery grounds in various temporal manners which directly conflicted with the semi-annual design. Subsequently, the program returned to the small, monthly, fixed station transect design. These monthly river transects continued unabated until 1988, when the Chesapeake Bay Stock Assessment Committee (CBSAC) encouraged and directly supported pilot studies to develop a comprehensive Bay-wide trawl survey. In Virginia this support was the initiation of a random stratified monthly trawl survey of the lower Chesapeake Bay in January 1988 (Chittenden, 1989). It was hoped this survey would produce similar surveys of Virginia's major tributaries, the James, York, and Rappahannock Rivers. With this in mind, a pilot survey similar in design was established and implemented for the York River, beginning in October 1989. This work was performed independent of, and with a different vessel and smaller fishing gear than the primary sampling of the Bay and tributaries (Land et al. 1996b). With the purchase of the solely dedicated trawler R/V *Fish Hawk*, this random survey of the York was incorporated and sampled along with the historic fixed stations (Land et. al. 1996a). In September 1995, a similar survey was designed and implemented for the Rappahannock River, with the James River initiated in March of 1996.

The Virginia-wide random stratified design (RSD) survey continues in 1999 with historical fixed mid-channel stations on the tributaries incorporated into the design. For each tributary, 22

stations were sampled monthly (James: 14 random, 8 fixed; York: 13 random, 9 fixed; and Rappahannock: 14 random, 8 fixed), with monthly sampling in the Bay either 39 stations (cold water months) or 45 stations (warm water months). Additionally, the furthest upriver stations which previously were only sampled during cold water months (December to April) are sampled on a continuous monthly basis.

After completing the March 1997 survey, the engine of the fishing platform R/V *Fish Hawk* was upgraded from a 210 horsepower diesel to a similar make and model 310 HP turbo-diesel. Examination of mean tow distances prior to, and after the engine modification indicated no significant difference (Hata 1997, *Attachment in Geer and Austin 1997*).

In May of 1998, habitat and invertebrate data began being collected. Continuing for 1999 is the recording of habitat type as a description of bottom structures/substrate and the collection of presence/absence information on mega-invertebrates ($\geq 5\text{mm}$), with counts made for selected species. Table 1 indicates the substrate categories and the major species included in each category, and Appendix A lists all species captured in 1999 and their sampling status.

Sampling was continued in several small secondary water systems of the Chesapeake Bay. A random stratified design with additional fixed sites was followed for Mobjack Bay, Piankatank River, Pocomoke Sound and Great Wicomico River. The fixed sites were selected based on location and frequency of sampling in the past. Each system was sampled once per quarter. The sampling order was randomly selected when the surveys were first established, and rotated each quarter. The necessity for information on these systems became evident in the late summer of 1997, when concerns of pfiesteria complex organisms effected the Pocomoke and Great Wicomico Rivers. More importantly, the additional information from these systems will assist in our knowledge of essential fish habitat for important Chesapeake Bay fishes.

The Elizabeth River was sampled approximately every six weeks from November 1999 to May 2000 as part of a contract with the Virginia Department of Transportation to assess Essential Fish Habitat. Sampling was performed at fixed stations with replicates. The data from November and December 1999 are included in this report.

The following tables and figures include data for all finfish and mega-invertebrates ($\geq 5\text{ mm}$) caught during 1999. The most commonly captured species of kingfish, southern kingfish (*Menticirrhus americanus*) and northern kingfish (*M. saxatilis*), have been difficult to identify in the field at small sizes due to overlapping, and non-distinct, meristic characteristics. As a result, the decision was made to combine these species under one heading (kingfish, *Menticirrhus* sp.) until further identification protocol can be examined. There are four classifications of blue crabs (*Callinectes sapidus*) that appear in the tables, (males, juvenile females, adult females, and unclassified, or sex unknown). Each is provided its own species code in the databases and appear in the tables as separate species. The "unclassified" category is usually reserved for small crabs ($< 20\text{mm}$) or when subsampling is necessary. Other data are also presented showing station locations, and atmospheric and hydrographic data collected at each station. The figures include all data collected during the 1999 sampling season.

METHODS

All sampling was performed aboard the research vessel *Fish Hawk*. The sampling gear was a 30 ft (9.144m) semi-balloon otter trawl (Marinovich Gulf Shrimp Trawl) with a 1½ inch (38.1mm) stretch mesh body, a ¼ inch (6.35mm) mesh cod end liner, attached tickler chain, 60 ft (18.29m) bridle length, and a 3:1 warp, using steel china-v doors (28 x 19 inches, 71 x 48 cm). The tow duration was typically five minutes bottom time at a speed of approximately 2½ knots (1.29m/sec). A sample day was defined as the period between sunrise and sunset.

At each station, station identification, beginning and ending latitude and longitude, depth, tidal current stage, secchi depth, tow direction (upstream vs. downstream and relative to current), beginning and ending time, tow duration, scope, net number, speed over ground, air temperature, wind direction, wind speed, weather conditions, and sea state were recorded. Surface and bottom hydrographic data (temperature, salinity and dissolved oxygen), were recorded immediately following the tow at a depth consistent with that of the trawling depth. Onboard processing of catches involved separating them according to species, and measuring individual lengths (to the nearest millimeter). For fish species, all lengths were taken as fork lengths unless no fork was present for a given species, in which case total length was measured. Invertebrates were separated and the appropriate information collected. Information for those species in which just presence or total counts were collected were placed on datasheets. For blue crabs, point-to-point carapace width was measured (called long carapace width) and fecundity of adult females was assessed with individual egg stage being determined. The penaeid shrimp were measured for total length while the squid species were measured for mantle length. Jellyfish (gelatinous zooplankton) were estimated by volume in liters and are reported in this report as such. Other selected invertebrates were measured by the appropriate meristic characteristic. These data were entered directly into computer files using electronic measuring boards. Fish species with any anomalies (lesions, fin rot, open sores) were recorded with the individual's length. Subsampling was performed when the catch of a species was large and homogeneous. When subsampling, lengths were taken on a representative sample of the species, and total number was determined by direct counting or by measuring total volume and enumerating specimens contained in a certain volume, then multiplying the count by total volume. For habitat type, items in the net were roughly categorized based on abundance. Estimates were made using a commercial nest tote (internal dimensions 25.7"x16.7"x10", approximately 18 gallons), relative to the capacity of the tote (bin) (0.1 trace, 1 = ¼ bin, 2 = ½ bin, etc.). Station, environmental, habitat type, and selected invertebrate data were recorded first on paper and later transferred to the computer database. A sample data sheet appears in Appendix B.

SAMPLING DESIGN

Chesapeake Bay

The random stratified sampling design of the main stem bay is based on latitude and water depth. The Bay is latitudinally divided into four 15 minute blocks (regions) labeled bottom (below

37°10'N), lower (37°10'-37°25'N), upper (37°25'-37°40'N), and top (above 37°40'N). Within each region, depth strata were defined as eastern shore shallow areas (4-12 ft), eastern shore shoal areas (12-30 ft), western shore shallow areas (4-12 ft), western shore shoal areas (12-30 ft), plain areas (30-42 ft), and deep areas (\geq 42 ft), resulting in a total of 24 strata. A map of these strata and the accompanying tributary strata appears in Appendix C. The northernmost portion of Virginia's waters (i.e. Top Bay) has not been sampled since 1988 because of funding and logistic constraints.

Station selection for each cruise was made randomly through use of the National Ocean Survey's Chesapeake Bay bathymetric grid system computerized files. This system contains position and depth records at $\frac{1}{4}$ mile intervals, approximately the same value as the average tow length. Four stations were selected monthly in each central plain strata and three stations from each deep strata. During warm water months (May through November) three stations were sampled in each shoal strata; during cold water months (January through April, and December) only two shoal stations were sampled per strata. One station is sampled monthly in each of the six shallow water strata.

Previous cruises have indicated few individuals of targeted species occupy the main stem Chesapeake Bay during winter months. With this in mind, a combined January/February survey was conducted for the bay in both 1992 and 1993, in order to better allocate sampling resources. Further investigation indicated no significant difference in abundance for several key species during the months of January through March (Geer, unpublished). As a result, a single bay survey in February was conducted beginning in 1994 to represent the period January through March.

Major Tributaries

The tributaries have historically been sampled with fixed mid-channel river transects, with stations designated at approximate 5-mile intervals from the river mouths to the freshwater interface. Generally one tow was made at each station each month. A second tow, opposite in direction, which had been made at selected *blue crab index stations* during the warm water months (May through November), was discontinued in June 1995. Analysis revealed no significant difference in catch in regards to tow direction up versus down river (Bonzek, unpublished), and sampling effort could be better utilized with the random stratified surveys. Prior to 1997, during the cold water months, additional stations were occupied upstream to extend the range of the survey, enabling better monitoring of some anadromous species. Sampling of these sites was expanded to include all months beginning in 1997. These historic fixed sampling sites will continue to be monitored along with the RSD, with each site assigned the appropriate strata based on its depth and location.

The random stratified surveys were initiated in 1989 on the York River using a smaller vessel and a 22 ft version of the present gear. It was discontinued in August 1990, and re-established in June 1991 in parallel with the fixed station transects aboard the R/V *Fish Hawk*, with the standard 30ft fishing gear. In September 1995, a similar survey was implemented on the Rappahannock, with a James River survey following in March 1996. Each river is divided into four regions (bottom, lower, upper, and top) of approximately ten miles each. Within each region there are four depth strata (4-12 ft, 12-30ft, 30-42ft and \geq 42ft), inclusive of the lower value. In areas where certain depths were minimal, strata were collapsed to provide adequate coverage. In the York River system, the top region (Pamunkey River) is not sampled with random stations due to its homogenous water

depth, limited area, and the fact that three fixed locations can provide the necessary information for the area. The York has 13 random and 9 fixed stations in 11 strata; the Rappahannock has 14 random and 8 fixed stations in 13 strata; and the James River has 14 random and 8 fixed stations in 12 strata. Reports for the York River random survey have been prepared for the years prior to 1995 (Land et al., 1996a, and Land et al., 1996b), with the York and Rappahannock surveys appearing in Geer and Austin, 1996a. Appendix D provides a description of each stratum.

Secondary Water Systems

The secondary water systems of the Mobjack Bay, Pocomoke Sound, Piankatank and Great Wicomico Rivers were sampled on a quarterly basis beginning in July 1998. The design was similar to the major tributaries with historic fixed sites incorporated into a random stratified survey. One system was sampled per month (Piankatank and Great Wicomico Rivers sampled in the same month). The sampling order was randomly selected when the surveys were first established, and rotated each quarter, ie., Jul-Sep (1,2,3), Oct-Dec (2,3,1), Jan-Mar (3,1,2), Apr-Jun (1,2,3). If, after a period of time, it becomes apparent a system represents target species best during certain months, then sampling may be revised to target those systems and time frames. Strata for these systems is shown in Appendix D.

Sampling of the Elizabeth River was started in November 1999 and was performed approximately every six weeks until May 2000. Four fixed stations were chosen and two trawls were done at each station. The stations were selected to cover an area above, below, and at the site of a proposed bridge crossing by the Virginia Department of Transportation.

RESULTS

Catch data in this report represent total numbers caught. The average weights were removed from these reports beginning in 1994 because, in most cases, weights were not typically taken in the field except for subsampling purposes or for unusually large specimens. Weights taken on individual specimens are not usually representative of the catch and are thus biased, prompting the removal of that information from the report. For some species, representative samples were brought back to the laboratory in order to establish accurate weight estimates and length-weight relationships. The effort to establish length-weight relationships will continue to be expanded in the future so that biomass estimates of the trawl catch can be presented along with abundance estimates. A new variable has been added to this report to indicate the frequency of occurrence. This variable is particularly useful for the invertebrate species in which only presence is recorded, however, it is equally important in indicating how common a species is found in trawl samples.

Table 1 shows the codes used for the various station, hydrographic, atmospheric, and habitat parameters. The corresponding station information is located in Tables 2-13 (major tributaries and secondary water systems) and Tables 14-25 (Chesapeake Bay). The hydrographic and atmospheric data for the tributaries and secondary water systems are found in Tables 26-37, with the Bay in Tables 38-49.

Catch, catch per unit effort (CPUE), and length statistics for data pooled from all sampling for the entire year are given in Table 50. Data for the Chesapeake Bay, the tributaries and secondary water systems by system, pooled over months, is presented in Tables 51-58. In previous Summary Reports, data for the Chesapeake Bay survey only, by segment, was pooled by months and shown in a separate table. In an effort to conserve printed space, the Bay data has been included together with the other water systems. Tables 59-136 contain analogous data summaries by each month and system for the Chesapeake Bay and the tributary and secondary surveys.

Comments are often necessary to convey concerns, note unique occurrences, and provide general information about a particular sample. These comments are often written on data sheets then transferred to the database. They provide insight into observations which may be of interest. Comment information are provided in Tables 137-148. No attempt has been made to correct grammatical mistakes within these comments, they are presented as a means of clarifying observations of concern.

Figures 2-13 show the locations of stations occupied each month in 1999, with Figure 14 showing relative position of the fixed mid-channel stations. Figures 15-49 geographically illustrate catch by month for the predominant species (the 18 most abundant finfish species - historically, four categories of blue crabs, plus other species of interest, arranged alphabetically) over the entire sampling area. These illustrations provide a helpful synopsis for showing temporal and geographic distribution of these species. With the additional sampling taking place in the tributaries and secondary water systems it was necessary to remove zero catch values to clarify the maps. As a result, the data shown represents only where and when specimens were captured. This is a change from volumes prior to 1997. Figures 50-84 provide monthly length-frequency summaries for the above selected species. These graphs and accompanying statistics are useful in separating young-of-year from older fish since the age of each fish is not taken. Calendar year is not the optimal way to present such data for species that spawn late in the year, however the figures are presented this way for convenience and consistency. All data collected in 1999 are presented in these figures.

The appendices at the end of this volume provide additional background into the methods and operations of this program. Appendix A provides common and scientific names of all species captured in 1999 along with the standard sampling protocol for each species. Appendix B shows a sample data sheet from the Chesapeake Bay in October 1999, along with the associated invertebrate and habitat data sheets for the particular day of sampling. Appendix C displays the survey's depth strata and associated geographic regions for the Chesapeake Bay and its tributaries. Appendix D describes the strata for the random stratified design surveys.

Observations on the 1999 Sampling Season

Due to an unusually dry Spring and Summer in 1999, the salinity gradient was extended farther upstream in the tributaries than in recent years. This possibly had the effect of extending the

blue catfish population upstream to lower salinity since the uppermost river stations showed a decrease in numbers. Higher than usual salinity in the Bay may also explain why greater numbers of Atlantic cutlassfish, banded drum, star drum, and silver seatrout were caught this year. Other species caught in higher numbers this year were hickory shad, threadfin shad, Atlantic herring, and silver perch. Also of note were the large numbers of penaeid shrimp (pinks and whites) caught in the fall months of 1999. Spot, scup, and blue crabs remained at low levels, while weakfish seemed to increase slightly. There was a drop in the numbers of Atlantic croaker and American eels caught in the survey.

On September 15th 1999, localized flooding caused by Hurricane Floyd sent fresh water into the rivers which affected the salinity gradients. By the time sampling started for October, hydrographic data was back within normal ranges and there seemed to be no lasting effect.

DISCUSSION

The purpose of this report is to present a quick visual summary of the data collected during the 1999 VIMS trawl survey. A more analytical review of these data for target species for 1979-1995 is presented by Geer and Austin, 1998.

With a Virginia-wide random stratified design (RSD) survey of the Bay and tributaries fully established, the program can provide better statistical results for species of concern. The fixed transect sampling has provided a historical perspective for over forty years, and will continue to do so as part of the present RSD. The results from these surveys are already providing dividends: catching target species over a broader temporal scale than the fixed station transects; providing first-time observations for several species; and indications to size variations based on depth and/or strata (Geer and Austin, 1996a). With several long-term goals completed, the program is setting new goals for the future. These include an extensive evaluation of historical data, to correct possible erroneous values, examining data of similar studies for inclusion into the database, and using these historical values as a way to judge present sampling. Additionally, these data are available on-line under the program's 'home page' (www.fisheries.vims.edu/trawlseine/mainpage.htm). Conversion factors for gear and vessel have been provisionally applied to these data to standardize catch rates for all survey years back to 1955 (Geer and Austin 1998). These results will provide a longer reliable time series of juvenile abundance. The addition of habitat data allows the program to explore essential fish habitat for various life stages, while the records of invertebrate species will further enhance the knowledge of the trophic interactions taking place in the Chesapeake Bay.

TABLES

THIS PAGE LEFT INTENTIONALLY BLANK

Table 1. VIMS codes for selected parameters as used in the trawl survey database.
These same codes appear in several of the included tables and figures.

TOWDIR 1: Tow Direction, up or down stream

- 1: Upstream
- 2: Downstream

TOWDIR2: Tow Direction, relative to current

- | | |
|------------------|--------------------|
| 1: With | 4: Oblique with |
| 2: Against | 5: Oblique against |
| 3: Perpendicular | 6: Slack |

TIDE: Tidal stage

- | | |
|---------------------|-----------------------|
| 1: Early flood | 5: Early ebb |
| 2: Maximum flood | 6: Maximum ebb |
| 3: Late flood | 7: Late ebb |
| 4: Slack before ebb | 8: Slack before flood |

SEASTATE

- | | |
|-----------------------------|--------------------|
| 0: Calm-glassy 0m | 5: Rough 2.5-4m |
| 1: Calm-rippled 0-0.1m | 6: Very rough 4-6m |
| 2: Smooth-wavelets 0.1-0.5m | 7: High 6-9m |
| 3: Slight 0.5-1.25m | 8: Very high 9-14m |
| 4: Moderate 1.25-2.5m | 9: Phenomenal >14m |

WEATHER: Observed weather

- | | |
|--------------------------------------|---------------------------|
| 0: Clear-no cloud at any level | 5: Drizzle |
| 1: Partly cloudy-scattered or broken | 6: Rain |
| 2: Overcast | 7: Snow-rain and snow mix |
| 3: Sand, dust storm, or blowing snow | 8: Showers |
| 4: Fog-thick, dust, or haze | 9: Thunderstorms |

STRATUM: Geographic stratum

Chesapeake Bay

- 1: Bottom Western Shore; 12-30 ft
- 2: Bottom Eastern Shore; 12-30 ft
- 3: Bottom Plain; 30-42 ft
- 4: Bottom Deep; \geq 42 ft
- S1: Bottom Western Shallow; 4-12 ft
- S2: Bottom Eastern Shallow; 4-12 ft
- 5: Lower Western Shore; 12-30 ft
- 6: Lower Eastern Shore; 12-30 ft
- 7: Lower Plain; 30-42 ft
- 8: Lower Deep; \geq 42 ft
- S5: Lower Western Shallow; 4-12 ft
- S6: Lower Eastern Shallow; 4-12 ft
- 9: Upper Western Shore; 12-30 ft
- 10: Upper Eastern Shore; 12-30 ft
- 11: Upper Plain; 30-42 ft
- 12: Upper Deep; \geq 42 ft
- S9: Upper Western Shallow 4-12 ft
- S10: Upper Eastern Shallow 4-12 ft

York R.

- 30: Bottom; 4-12 ft
- 31: Bottom; 12-30 ft
- 32: Bottom; 30-42 ft
- 33: Bot. & Lower; \geq 42 ft
- 34: Lower; 4-12 ft
- 35: Lower; 12-30 ft
- 36: Lower; 30-42 ft
- 37: Upper & Top; 4-12 ft
- 38: Upper; 12-30 ft
- 39: Upper & Top; \geq 30 ft
- 40: Top; 12-30 ft

Rappahannock R.

- 50: Bottom; 4-12 ft
- 51: Bottom; 12-30 ft
- 52: Bottom; 30-42 ft
- 53: Bottom; \geq 42 ft
- 54: Lower; 4-12 ft
- 55: Lower; 12-30 ft
- 56: Lower; 30-42 ft
- 57: Lower; \geq 42 ft
- 58: Upper; 4-12 ft
- 59: Upper; 12-30 ft
- 60: Up. & Top; \geq 30 ft
- 61: Top; 4-12 ft
- 62: Top; 12-30 ft

James R.

- 70: Bottom; 4-12 ft
- 71: Bottom; 12-30 ft
- 72: Bottom; 30-42 ft
- 73: Bot. & Lower; \geq 42 ft
- 74: Lower; 4-12 ft
- 75: Lower; 12-30 ft
- 76: Lower; 30-42 ft
- 77: Upper; 4-12 ft
- 78: Upper; 12-30 ft
- 79: Upper & Top; \geq 30 ft
- 80: Top; 4-12 ft
- 81: Top; 12-30 ft

Table 1. Continued.

Habitat Data

<u>Code</u>	<u>Description</u>
SND	Sand (hard) bottom
MUD	Mud (soft) bottom
HYD	Hydroids: <i>Sertularia cupressina</i> - "White Hair" <i>Garveia franciscana</i> - "Rope Grass" <i>Pennaria disticha</i> - "Feather Hydroid"
DMF	Dead man's fingers/Rubbery Bryozoan: <i>Alcyonidium sp.</i>
SPG	Sponges: <i>Microciona prolifera</i> - "Redbeard Sponge" <i>Haliclona loosanoffi</i> - "Loosanoff's Haliclona"
SQT	Sea squirts: <i>Mogula sp.</i>
SHL	Shell bottom: <i>Crassostrea virginica</i> - "Common Oyster" <i>Rangia cuneata</i> - "Wedge Rangia" <i>Ischadium recurvum</i> - "Bent Mussel" <i>Mytilus edulis</i> - "Blue Mussel"
SAV	Submerged Aquatic Vegetation: <i>Zostera marina</i> - "Eelgrass" <i>Ruppia maritima</i> - "Widgeon grass"
SWD	Seaweeds: <i>Ulva lactuca</i> - "Sea Lettuce" <i>Agardhiella tenera</i> - "Tapered Red Weed" <i>Gracilaria sp.</i>
COR	Coral: <i>Leptogorgia virgulata</i> - "Sea Whip" <i>Astrangia danae</i> - "Star Coral"
TUB	Tube Worms: <i>Chaetopterus sp.</i>
DET	Detritus
ART	Artificial (Trap Stakes, Ballast Rocks, Coal, Tires, Trash, etc.)
UNK	Undetermined

Abundance is estimated relative to the capacity of a commercial nest tote (internal dimensions 25.7"x16.7"x10", approximately 18 gallons). Categories include: 0.1 = trace, 1 = $\frac{1}{4}$ bin, 2 = $\frac{1}{2}$ bin, 3 = $\frac{3}{4}$ bin, 4 = full bin, etc.

Tables 2-13. Station data for the tributaries (James, York, and Rappahannock Rivers) and the secondary water systems (Pocomoke Sound, Mobjack Bay, Piankatank and Great Wicomico Rivers) by month.

The secondary water systems were sampled once per quarter beginning in July, 1998.

Explanation: To conserve space, some variables are presented as coded values. Code keys are shown in Table 1. (p. 11).

Table 2.
January 1999

System+ Cruise Number	Stat# or River Mile						Location				Tow Parameters				Sea State	Tidal Stage

Tables 14-25. Station data for the Chesapeake Bay by month. The survey is not conducted in the Bay in January and March.

Explanation: To conserve space, some variables are presented as coded values. Code keys are presented in Table 1 (p. 11).

Table 14.
January 1999

System+		Stat# or					Location				Tow Parameters				
Cruise	River	Stat.	Stratum	Station	Time	Beginning	Beginning	Ending	Ending	Distance	Duration	Depth	Direction	Sea Tidal	
Number	River	Mile	Type	Code	Date	Latitude	Longitude	Latitude	Longitude	(m)	(min)	(m)	One	Two	State Stage

Tables 26-37. Atmospheric and hydrographic data for the tributaries (James, York, and Rappahannock Rivers) and the secondary water systems (Pocomoke Sound, Mobjack Bay, Piankatank and Great Wicomico Rivers) by month.

- Explanation:
- A. To conserve space, some variables are presented as coded values. Code keys are presented in Table 1 (p. 11).
 - B. Due to measurement error (calibration differences and instrument drift) associated with the hydrographic equipment used to measure temperature, salinity and dissolved oxygen, some calculated saturations presented here are greater than 100%.
 - C. The secondary water systems were sampled once per quarter beginning in July, 1998.

Table 26.
January 1999

Tables 38-49.

Atmospheric and hydrographic data for the Chesapeake Bay by month. The survey is not performed in the Bay in January or March.

Explanation:

A. To conserve space, some variables are presented as coded values. Code keys are presented in Table 1 (p. 11).

B. Due to measurement error (calibration differences and instrument drift) associated with the hydrographic equipment used to measure temperature, salinity and dissolved oxygen, some calculated saturations presented here are greater than 100%.

Table 38.
January 1999

System+ Cruise Number	Stat #	Air			Wind		Weather		Surface				Bottom

Table 50. Species composition, number caught, catch per trawl, and length statistics for all months, all areas, and all water systems.

- A. The ‘Number of Species’ notation in the table header includes each of four categories of blue crabs (male, juvenile female, adult female, and unclassified) as unique species.

‘Number of Species’ also includes only the species which were measured or counted and does not include those invertebrates which were processed as presence/absence.

NOTE: Invertebrate processing began in 1998. The programs used to calculate ‘Number of Species’ did not include presence/absence invertebrate species in the 1998 Summary Report and in this report. Future reports will show the number of fish species and invertebrate species.

- B. Catch per trawl for species other than blue crabs is based on the value ‘Number of Fish Trawls Made’ while the catch per trawl for blue crabs is based on the sum of ‘Number of Fish Trawls made’ and ‘Number of Additional Crab Trawls Made’.
- C. ‘Adjusted Percent of Catch’ excludes bay anchovy and hogchoker due to the low biomass estimates in relation to total number of fish caught.
- D. ‘Frequency’ is the number of samples in which a species was captured.

Table 50.

Month - All - Pooled, 1999

River - All - Pooled

No. of Random Trawls Made - 1019

No. of Fixed Trawls Made - 363

No. of Species - 123

Adjusted Percent of Catch Excludes Bay Anchovy and Hogchoker

Species	Number of Fish (All)	Frequency	Percent of Catch	Catch Per Trawl	Adjusted Percent of Catch	Number of Fish YOY	Average Length (mm)	Standard Error (length)	Minimum Length (mm)	Maximum Length (mm)

All Species Combined

634,537

Table 51-58. Species composition, number caught, catch per trawl, and length statistics for **all months, by system** for the Chesapeake Bay, the tributary surveys of the James, Rappahannock, and York Rivers, and the secondary water systems of the Mobjack Bay, Pocomoke Sound, Piankatank and Great Wicomico Rivers.

- A. The ‘Number of Species’ notation in the table header includes each of four categories of blue crabs (male, juvenile female, adult female, and unclassified) as unique species.
‘Number of Species’ also includes only the species which were measured or counted and does not include those invertebrates which were processed as presence/absence.

NOTE: Invertebrate processing began in 1998. The programs used to calculate ‘Number of Species’ did not include presence/absence invertebrate species in the 1998 Summary Report and in this report. Future reports will show the number of fish species and invertebrate species.

- B. Catch per trawl for species other than blue crabs is based on the value ‘Number of Fish Trawls Made’ while the catch per trawl for blue crabs is based on the sum of ‘Number of Fish Trawls made’ and ‘Number of Additional Crab Trawls Made’.
- C. ‘Adjusted Percent of Catch’ excludes bay anchovy and hogchoker due to the low biomass estimates in relation to total number of fish caught.
- D. ‘Frequency’ is the number of samples in which a species was captured.

Table 51.

Month - All - Pooled, 1999

System - Chesapeake Bay

No. of Random Trawls Made - 402

No. of Fixed Trawls Made - 0

No. of Species - 93

All Species Combined

17,166

Table 59-136.

Species composition, number caught, catch per trawl, and length statistics by **month and system** for the Chesapeake Bay and the tributary (James, York, and Rappahannock Rivers), and secondary water system (Pocomoke Sound, Mobjack Bay, Piankatank and Great Wicomico Rivers) surveys. The Elizabeth River was added in November and December as an extra monitoring project.

- A. The 'Number of Species' notation in the table header includes each of four categories of blue crabs (male, juvenile female, adult female, and unclassified) as unique species.

'Number of Species' also includes only the species which were measured or counted and does not include those invertebrates which were processed as presence/absence.

NOTE: Invertebrate processing began in 1998. The programs used to calculate 'Number of Species' did not include presence/absence invertebrate species in the 1998 Summary Report and in this report. Future reports will show the number of fish species and invertebrate species.

- B. Catch per trawl for species other than blue crabs is based on the value 'Number of Fish Trawls Made' while the catch per trawl for blue crabs is based on the sum of 'Number of Fish Trawls made' and 'Number of Additional Crab Trawls Made'.

- C. 'Adjusted Percent of Catch' excludes bay anchovy and hogchoker due to the low biomass estimates in relation to total number of fish caught.

- D. 'Frequency' is the number of samples in which a species was captured.

- E. Tables pooled for all systems for each month appear as follows:

Tables 137-148: Station comments for the Chesapeake Bay, tributary, and secondary water systems sampling by month. Comments are used to note unusual circumstances, concerns which may have occurred, or other items of interest which cannot be placed in some pre-defined variable. No attempt has been made to correct grammatical mistakes.

- A. The 'Stat. #' or River Mile' refers to the actual station number if a random station, or river and river mile if a fixed station. The 'Record Number' indicates a consecutive number of comments for a given station. Due to the limited variable length, many comments may be placed on more than one line (ie., multiple record numbers). Records pertaining to vessel speed over ground were removed since they are now incorporated into the database.

Table 137.
January 1999

System & Cruise No.	Stat# or River Mile	Record Number	Comment
GW990121	1	1	MOVED STATION FROM ORGINIAL LOCATION/ OUTSIDE OF CREEK TO FIND CORRECT .
GW990121	1	2	DEPTH .

VIMS Juvenile Fish Trawl Survey

Sampling Changes 1955 - 2000

Vessel

VL = Virginia Lee
PA = Pathfinder
LA = Langley
BR = Brooks
RE = Restless
JS = Capt. John Smith
FH = Fish Hawk

Gear Type

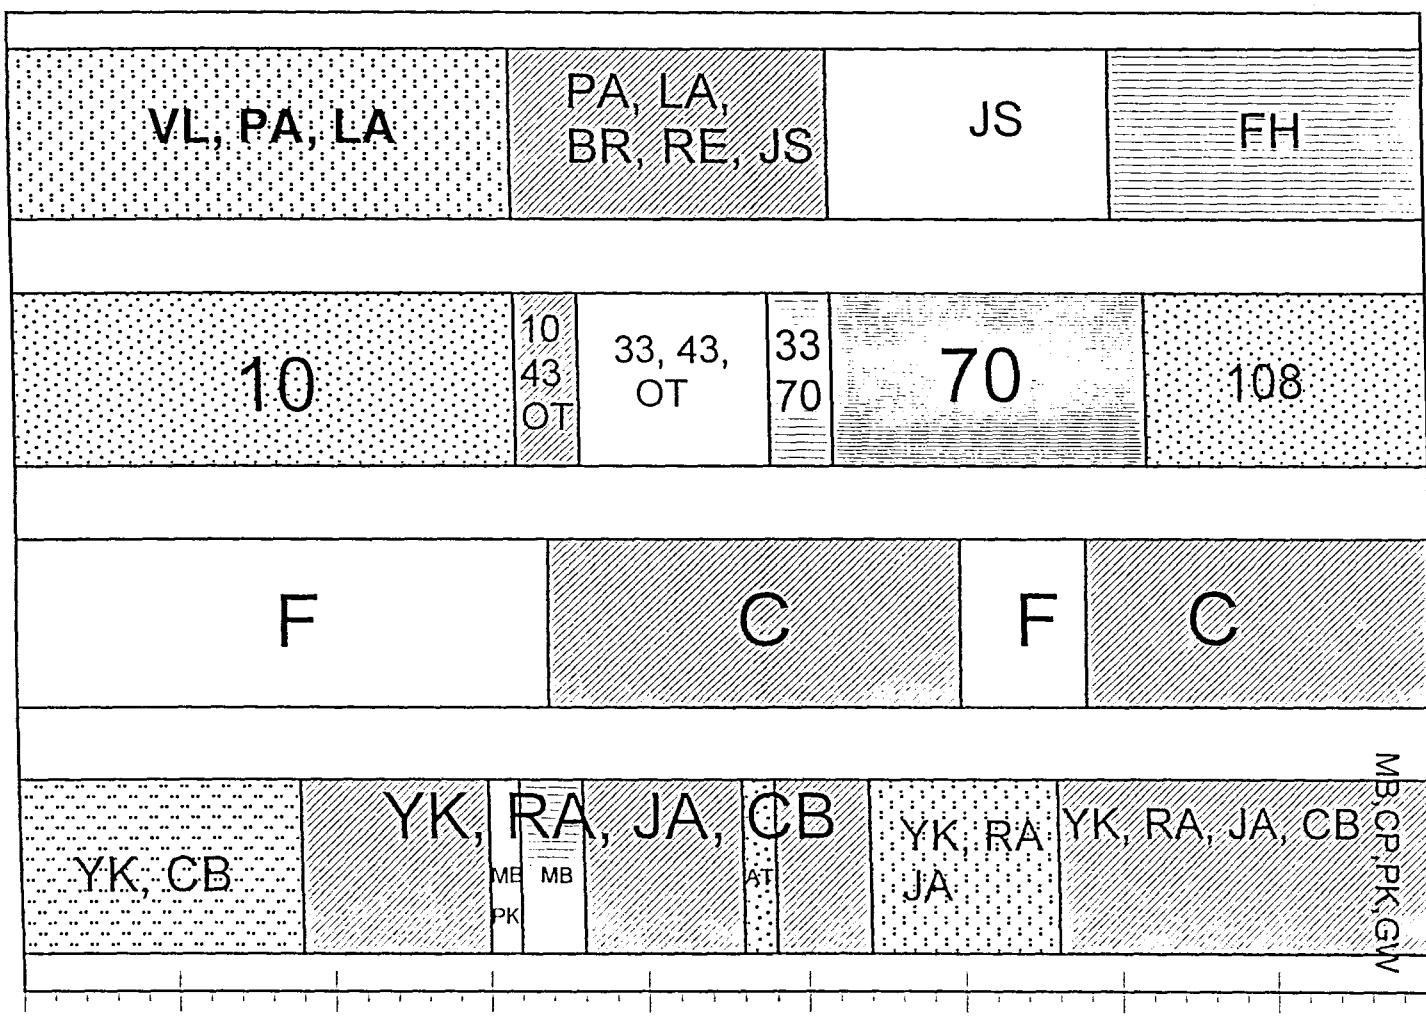

10 = Unlined/No Tickler
33 = Lined/No Tickler
43 = Unlined/Tickler
OT = 16' Nets
70 = Lined/Tickler
108 = Lined/Tickler/China-V

157

Sampling System
F = Fixed
R = Random
C = Combination

System

YK = York River
RA = Rappahannock River
JA = James River
CB = Chesapeake Bay
MB = Mobjack Bay
PK = Piankatank River
AT = Atlantic Ocean
GW = Great Wicomico River
CP = Pocomoke Sound

1955 1960 1965 1970 1975 1980 1985 1990 1995 2000

Gear Type is 30 foot otter trawl if not specified.

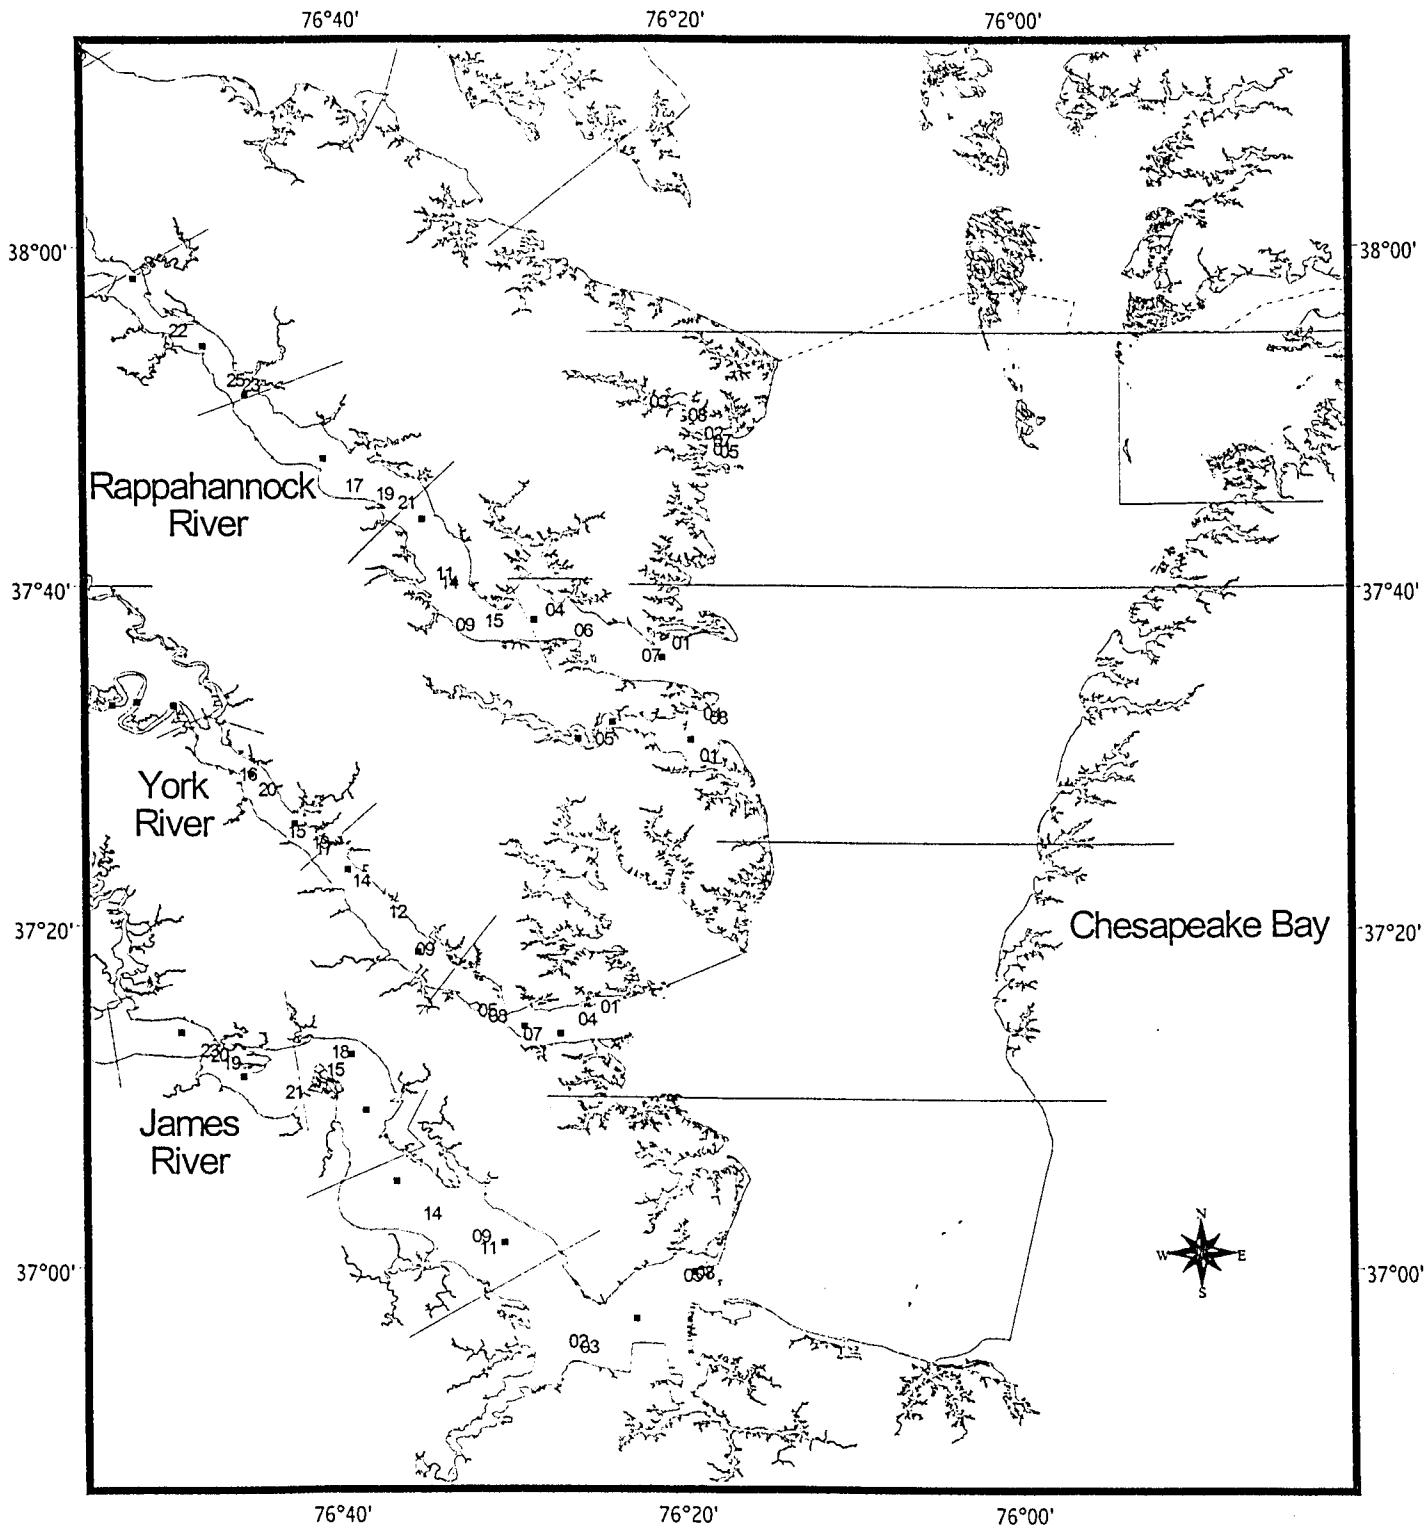

Figure 1. Sampling system, design, and gear changes for the VIMS trawl survey, 1955-2000.

Figures 2-14 Stations sampled in 1999 by month.

- Notes:
- A. Due to GPS distortion at upriver stations and to computer software control of the placement of figures on these maps, the locations shown may vary slightly from the actual stations occupied. For exact coordinates refer to Tables 2-13 (rivers) and 14-25 (bay).
 - B. A single winter survey was conducted in February for the Chesapeake Bay to represent the period from January through March 1999.
 - C. Fixed stations are represented by squares for each month. Figure 14 shows the relative position and station numbers of the fixed stations.
 - D. Solid lines mark regions of the rivers and segments of the bay. The Virginia/Maryland state line is shown by a dotted line.

and numbers indicate random stations.

Figure 14

Trawl Survey Fixed Station Locations 1999

Figures 15-49. Geographic distribution, by month, of selected species. Density values represent total number of specimens caught.

- Notes:
- A. Due to GPS distortion at upriver stations and to computer software control of the placement of figures on these maps, the locations shown may vary slightly from the actual stations occupied. For exact latitude and longitude refer to Tables 2-25.
 - B. A single winter cruise was conducted in February for the Chesapeake Bay during the period from January through March 1999.
 - C. For purposes of clarity, if a second tow was performed at a given station, the second tow will be offset two minutes north and two minutes east from the original coordinates.
 - D. The brief and long-fin squid are presented under one heading as "Squid Species". The three species of penaeid shrimp are also combined. Three of the blue crab categories (male, juvenile female, and adult female) are shown independently, as well as summed, "All Crabs".

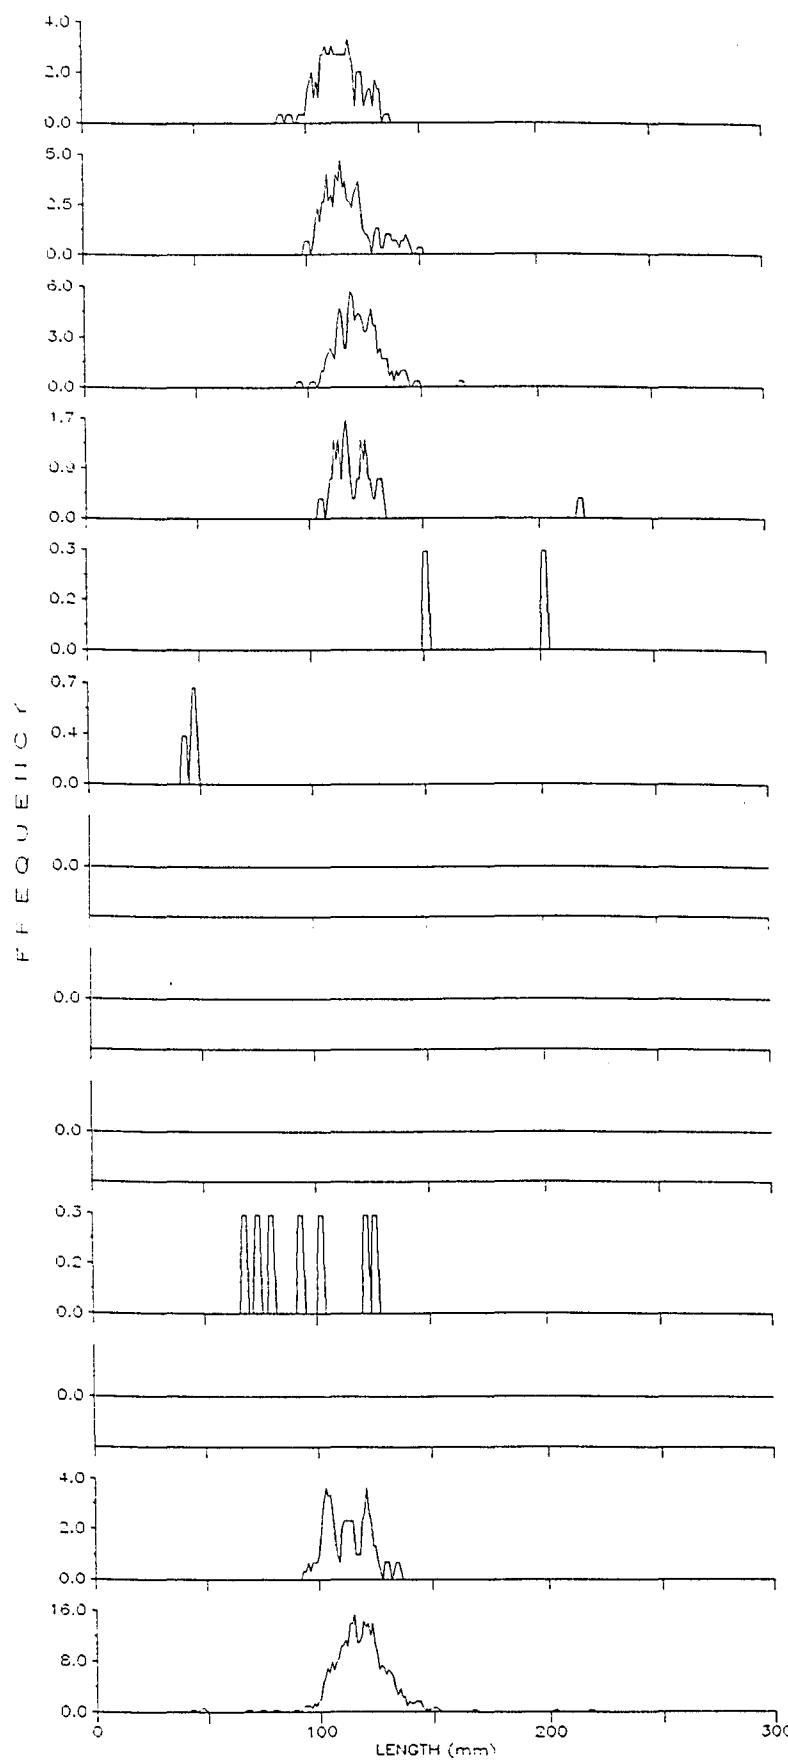

Figure 49. (cont.)

Figures 50-84. Monthly length frequency summaries for selected species.

- Explanations:
- A. These figures represent all specimens of each species sampled in 1999.
 - B. The y axis represents the total number caught for each size class (in mm).
 - C. For curve smoothing, the values plotted are a moving average of three of the number of fish caught at each millimeter length group; therefore fractional values can occur.
 - D. The bottom plot on each page is a summary of all fish for the entire year.
 - E. The values to the right of the month name on each plot represent the inclusive dates of the cruises during the month, in format year-month-day.
 - F. The catch per haul data presented here should not be used as a young-of-year (YOY) index. No distinction has been made in these calculations between YOY and older fish.
 - G. The brief and long-fin squid are presented under one heading as "Squid Species". The three species of penaeid shrimp are also combined. Three of the blue crab categories (male, juvenile female, and adult female) are shown independently, as well as summed, "All Crabs".

APPENDICES

Appendix A. Common and scientific names of species captured in 1999, with reference to the appropriate sampling protocol for each species.

Species Names - Common Name Order		Species Names - Latin Name Order	
Common Name	Latin Name	Latin Name	Common Name
Sampling Key: P = Presence/Absence typically recorded. C = Counts taken. Nothing = Lengths taken			
alewife	<i>Alosa pseudoharengus</i>	<i>Acipenser oxyrinchus</i>	Atlantic sturgeon
American eel	<i>Anguilla rostrata</i>	<i>Alosa aestivalis</i>	blueback herring
American shad	<i>Alosa sapidissima</i>	<i>Alosa mediocris</i>	hickory shad
Amphipod spp (P)	<i>Amphipoda sp.</i>	<i>Alosa pseudoharengus</i>	alewife
Atlantic bumper	<i>Chloroscombrus chrysurus</i>	<i>Alosa sapidissima</i>	American shad
Atlantic croaker	<i>Micropogonias undulatus</i>	<i>Alpheus heterochaelis</i>	big-clawed snapping shrimp (P)
Atlantic cutlassfish	<i>Trichiurus lepturus</i>	<i>Amphipoda sp.</i>	Amphipod spp (P)
Atlantic herring	<i>Clupea harengus</i>	<i>Anadara ovalis</i>	blood ark/clam (P)
Atlantic menhaden	<i>Brevoortia tyrannus</i>	<i>Anadara transversa</i>	transverse ark (clam) (P)
Atlantic moonfish	<i>Selene setapinnis</i>	<i>Anchoa hepsetus</i>	striped anchovy
Atlantic silverside	<i>Menidia menidia</i>	<i>Anchoa mitchilli</i>	bay anchovy
Atlantic spadefish	<i>Chaetodipterus faber</i>	<i>Anguilla rostrata</i>	American eel
Atlantic stingray	<i>Dasyatis sabina</i>	<i>Annelida-(Polychaeta)</i>	worm spp (P)
Atlantic sturgeon	<i>Acipenser oxyrinchus</i>	<i>Anthozoa</i>	sea anenome spp (P)
Atlantic thread herring	<i>Opisthonema oglinum</i>	<i>Archosargus probatocephalus</i>	sheepshead
banded drum	<i>Larimus fasciatus</i>	<i>Arenaeus cibrarius</i>	speckled crab (C)
bay anchovy	<i>Anchoa mitchilli</i>	<i>Asterias forbesii</i>	forbes common sea star (P)
bent mussel (P)	<i>Ischadium recurvum</i>	<i>Astroscopus guttatus</i>	northern stargazer
big-clawed snapping shrimp (P)	<i>Alpheus heterochaelis</i>	<i>Bairdiella chrysoura</i>	silver perch
bighead searobin	<i>Prionotus tribulus</i>	<i>Brevoortia tyrannus</i>	Atlantic menhaden
black drum	<i>Pogonius cromis</i>	<i>Busycon canaliculatus</i>	channel (smooth) whelk (C)
black seabass	<i>Centropristes striata</i>	<i>Busycon carica</i>	knobbed whelk (C)
blackcheek tonguefish	<i>Syphurus plagiusa</i>	<i>Callinectes ornatus</i>	shelligs blue crab (C)
blood ark/clam (P)	<i>Anadara ovalis</i>	<i>Callinectes sapidus</i>	blue crab, sex unknown
blotted swimming crab (C)	<i>Portunus spinimanus</i>	<i>Callinectes sapidus, adult fem</i>	blue crab, adult female
blue catfish	<i>Ictalurus furcatus</i>	<i>Callinectes sapidus, juv fem</i>	blue crab, juvenile female
blue crab, adult female	<i>Callinectes sapidus, adult fem</i>	<i>Callinectes sapidus, male</i>	blue crab, male
blue crab, juvenile female	<i>Callinectes sapidus, juv fem</i>	<i>Callinectes similis</i>	lesser blue crab (C)
blue crab, male	<i>Callinectes sapidus, male</i>	<i>Cancer irroratus</i>	rock crab
blue crab, sex unknown	<i>Callinectes sapidus</i>	<i>Caprellidae sp</i>	skeleton shrimp spp (P)
blue mussel (P)	<i>Mytilus edulis</i>	<i>Caranx cryos</i>	blue runner
blue runner	<i>Caranx cryos</i>	<i>Centropristes striata</i>	black seabass
blueback herring	<i>Alosa aestivalis</i>	<i>Chaetodipterus faber</i>	Atlantic spadefish

Species Names - Common Name Order		Species Names - Latin Name Order	
Common Name	Latin Name	Latin Name	Common Name
Sampling Key: P = Presence/Absence typically recorded. C = Counts taken. Nothing = Lengths taken			
bluefish	<i>Pomatomus saltatrix</i>	<i>Chaetodon ocellatus</i>	spotted butterflyfish
bluegill	<i>Lepomis macrochirus</i>	<i>Chasmodes bosquianus</i>	striped blenny
bluespotted cornetfish	<i>Fistularia tabacaria</i>	<i>Chilomycterus schoepfi</i>	striped burrfish
bluntnose stingray	<i>Dasyatis sayi</i>	<i>Chloroscombrus chrysurus</i>	Atlantic bumper
brittle/serpent star spp (P)	<i>Ophiuroides</i>	<i>Clupea harengus</i>	Atlantic herring
brown bullhead	<i>Ictalurus nebulosus</i>	<i>Conger oceanicus</i>	conger eel
brown shrimp	<i>Penaeus aztecus</i>	<i>Crangon septemspinosa</i>	sand shrimp (P)
butterfish	<i>Peprius triacanthus</i>	<i>Crassostrea virginica</i>	oyster, common (P)
channel (smooth) whelk (C)	<i>Busycon canaliculatus</i>	<i>Crepidula spp.</i>	slipper shell spp (P)
channel catfish	<i>Ictalurus punctatus</i>	<i>Cynoscion nebulosus</i>	spotted seatrout
clearnose skate	<i>Raja eglanteria</i>	<i>Cynoscion nothus</i>	silver seatrout
coarse hand lady crab (C)	<i>Ovalipes stephensoni</i>	<i>Cynoscion regalis</i>	weakfish
commensal crab spp (P)	<i>Pinnixa sp.</i>	<i>Cyprinus carpio</i>	common carp
common carp	<i>Cyprinus carpio</i>	<i>Dasyatis americana</i>	southern stingray
conger eel	<i>Conger oceanicus</i>	<i>Dasyatis sabina</i>	Atlantic stingray
cownose ray	<i>Rhinoptera bonasus</i>	<i>Dasyatis sayi</i>	bluntnose stingray
drill & snail spp (P)	<i>drill & snail spp</i>	<i>Dorosoma cepedianum</i>	gizzard shad
false angel wing (P)	<i>Petricola pholadiformes</i>	<i>Dorosoma petenense</i>	threadfin shad
feather blenny	<i>Hypsoblennius hentzi</i>	<i>drill & snail spp</i>	drill & snail spp (P)
flat-browed mud shrimp (P)	<i>Upogebia affinis</i>	<i>Echeneis naucrates</i>	sharksucker
forbes common sea star (P)	<i>Asterias forbesii</i>	<i>Echinachnius parma</i>	sand dollar (P)
fringed flounder	<i>Etropus crossotus</i>	<i>Etheostoma olmstedi</i>	tessellated darter
gizzard shad	<i>Dorosoma cepedianum</i>	<i>Etropus crossotus</i>	fringed flounder
glassy lyonsia (P)	<i>Lyonsia hyalina</i>	<i>Etropus microstomus</i>	smallmouth flounder
grass shrimp spp (P)	<i>Palaemonetes spp.</i>	<i>Eucinostomus argenteus</i>	spotted mojarra
gray snapper	<i>Lutjanus griseus</i>	<i>Eucinostomus gula</i>	silver jenny
green goby	<i>Microgobius thalassinus</i>	<i>Fistularia tabacaria</i>	bluespotted cornetfish
harvestfish	<i>Peprius alepidotus</i>	<i>Fundulus majalis</i>	striped killifish
hickory shad	<i>Alosa mediocris</i>	<i>gelatinous zooplankton</i>	jellyfish spp (C)
hogchoker	<i>Trinectes maculatus</i>	<i>Gobiesox strumosus</i>	skilletfish
horseshoe crab	<i>Limulus polyphemus</i>	<i>Gobiosoma boscii</i>	naked goby
inshore lizardfish	<i>Synodus foetens</i>	<i>Gobiosoma ginsburgi</i>	seaboard goby
iridescent swimming crab (C)	<i>Portunus gibbesii</i>	<i>Gymnura altavela</i>	spiny butterfly ray

Appendix C. Description of the VIMS Trawl Survey sampling strata.

- Note: A. The "No. of Points" indicates the number of possible trawl sites within a strata. '*' indicates areas not presently sampled with a RSD.
- B. Strata for the York and Rappahannock Rivers were slightly different prior to 1995. These strata have been adjusted to the present sampling system. Conversions appear in Geer et. al., 1997.

Appendix C. Chesapeake Bay Strata.
