### Summary

Permitted vegetated tidal wetland impacts in Virginia for the period 1993 through 2000 averaged 7.5 acres per year. This compares with annual impacts during the years 1988 through 1992 which averaged 18.1 acres per annum. 1988 was the first year VIMS began tracking wetland losses in Virginia through the tidal wetland data base.

Permitted nonvegetated tidal wetland impacts in Virginia during the years 1993 through 2000 averaged 24.2 acres per year. Matching numbers for the years 1988 through 1992 show average nonvegetated impacts were 21 acres per annum.

Over the eight year period, 1993 through 2000, an average of 12.7 miles of Virginia shoreline were treated with riprap each year and an average 4.8 miles were bulkheaded. The totals were 82.9 miles of riprap and 38 miles of bulkhead for a total for the eight year period of 120.9 miles of hardened shoreline.

### Introduction

The management of wetland resources has always been hampered by the lack of knowledge regarding the rates of wetlands loss from permitted activities. These statistics have usually been the most intractable data to acquire because of the numerous agencies involved in the permit process, the frequent modifications of permit applications and the difficulties involved with ensuring the inclusion of all projects proposed. The development of this database which documents tidal wetland losses in Virginia provides a number of new perspectives on the management process. First, it can help determine the effectiveness of management efforts by documenting the permitted losses of tidal wetlands. Secondly, it allows an assessment of the cumulative impact of incremental wetland losses on the resource as a whole. Thirdly, the data are a critical baseline element necessary to assess the Commonwealth's relationship to the goal of "no net loss" of wetlands, a current management priority. Lastly, interpretation of these data may illuminate trends in construction activity or impacts requiring special management attention.

## Methods

This report summarizes data from 1993-2000 that were collected by personnel from the Wetlands Advisory Group at the Virginia Institute of Marine Science. It is almost always based on a visit to the site to assess the anticipated impacts. Impacts to tidal wetlands are classified by date, locality, immediate water body, primary waterway, watershed, type and extent of proposed activity, and wetland community type. These data are entered into a computer database and a report is generated which summarizes proposed tidal

wetland impacts by location and community type, and includes advisory comments about the project.

The data set for this time period is based on the year in which the application was received. These data are representative of some of the highest years of permit activity (Fig. 1, previous page).

The data are also organized according to a standardized set of watersheds which are depicted in Figure 2 to help simplify geographical interpretation.

## Tidewater Virginia Watersheds

The impacts reported for the 1993-2000 data include both habitat lost to filling and habitat impacted but not lost to the system, such as the conversion of intertidal mudflat to subtidal bottom by dredging or conversion of a sand beach to intertidal riprap. Impacts to vegetated wetlands estimated in the database are based on those activities actually permitted by the local wetlands boards and the Virginia Marine Resources Commission.

The database has several limitations which should be taken into account when analyzing or

interpreting the data. These permitted losses must be viewed in the context of natural changes from erosion and accretion as well as unpermitted activities which could involve larger or smaller areas than the losses reported here but are currently unquantified. In most instances, permitted projects are eventually constructed, however, there may be occasions where the projects are

never constructed and the impacts never accrue to the environment. Additionally, the 1993-2000 database does not exclude projects approved by a locality or the state that may have been subsequently denied by the Corps of Engineers. It also does not account for any compensation which may have been required.

## A Sampling of the Wetland Science and Management Information Now Available Online from the VIMS Home Page, <http://www.vims.edu/>

**The Teaching Marsh:** <http://www.vims.edu/tour/tmarsh/>

**VIMS Wetlands Permit Application Reports:** <http://www.vims.edu/ccrm/newpermits.html>

***Phragmites australis* research, monitoring and information:** <http://www.vims.edu/ccrm/phragmites/>

**Hardwood Mineral Flats:** <http://www.vims.edu/ccrm/wetlands/hmf/>

**Tidal Wetlands Impact Data:** <http://www.vims.edu/rmap/wetlands/cgi-bin/index.htm>

**Nontidal Wetlands Impact Data:** <http://www.vims.edu/rmap/wetlands/nontidal/>

**Shoreline Situation Reports by Locality:** <http://www.vims.edu/ccrm/gisdata.html>

**James and York River Watershed Maps:** <http://www.vims.edu/ccrm/cci/gallery.html>

**Publications:** <http://www.vims.edu/ccrm/publications.html>

**Note:**

Most of the publications listed at this address, (particularly the *Wetlands Technical Reports*, *Flora Reports*, *Virginia Wetlands Report*, and *Think Green*) are written for consumption by the general public. If you are interested in information pertaining to wetland functions and values, mitigation/compensation, wetland "critters." or just looking for an interesting place to visit, you may find some of these writings to be of interest.

Further information is available by calling (804) 684-7380.
