

Mollusca of the Magellan region. A checklist of the species and their distribution*

KATRIN LINSE

Zoological Institute and Zoological Museum, University of Hamburg, Martin-Luther-King-Platz 3,
D-20146 Hamburg, Germany.

SUMMARY: The Molluscan species collected during the “Victor Hensen” Joint Magellan Campaign 1994 served as the basis for this species list. The list was then completed by literature data on the distribution of molluscs around the Falkland Islands, the other Scotia Arc Islands, Antarctica and the Kerguelen Islands. 397 Magellan species are known: 10 species of Aplacophora, 250 species of Gastropoda, 6 species of Scaphopoda and 131 species of Bivalvia. Polyplacophora and Cephalopoda are not included because both taxa need revision.

Key words: Mollusca, Magellan region, checklist, biogeography.

RESUMEN: MOLUSCOS DE LA REGIÓN DE MAGALLANES. LISTA DE ESPECIES Y SU DISTRIBUCIÓN. — La base para esta lista está formada por las especies de moluscos recolectados durante la campaña internacional multidisciplinaria magallánica “Victor Hensen” en el año 1994. La lista se completó con datos de la literatura y estos se compararon con los datos existentes sobre la distribución en las Islas Malvinas, las Islas del Arco de Escocia, Antártida y las Islas Kerguelen. La lista de moluscos de Magallanes se compone de 397 especies: 10 especies de aplacóforos, 250 especies de gasterópodos, 6 especies de escafópodos y 131 especies de bivalvos. Polyplacóforos y cefalópodos no están incorporados en esta lista porque ambos taxones necesitan revisión.

Palabras clave: Moluscos, región de Magallanes, lista de especies, biogeografía.

INTRODUCTION

This species list will serve to provide an inventory of the marine Magellanic Mollusca. Since the last century many expeditions have been undertaken to the Magellan region. The first taxonomic studies on molluscs were performed by King and Broderip (1831), D’Orbigny (1835-1846) and Philippi (1845). Later, important results on the Magellanic malacofauna were published by Smith (1881), Mabille and Rochebrune (1889), Strebler (1904, 1905a, b, 1906, 1907, 1908) and Odhner (1926). After expeditions with RVs *Challenger*, *Belgica*,

Albatross and *Discovery* (Bergh, 1884; Smith, 1885; Pelseneer, 1903; Dall, 1890, 1908; Powell, 1951; Dell, 1964), the Scottish National Antarctic Expedition (Melvill and Standen, 1907, 1912), and the Swedish Lund University Chile Expedition (Marcus, 1959; Soot-Ryen, 1959) further taxonomic results were published.

Carcelles and Williamson (1951) published the first species list of marine molluscs from the Magellan Province and later Osorio and Bahamonde (1970) gave a preliminary list of Chilean bivalves, comprising 217 species with 97 of them recorded in the Magellan region. Since those published accounts taxonomic revisions (e.g. McLean, 1984; Castellanos, 1989-1993; Ponder and Worsfold, 1994;

*Accepted September 17, 1998.

Schrödl, 1996) have been made for several taxa. Therefore Carcelles and Williamson's lists had to be checked for synonyms and new species. Regional zoogeographic studies of the Chilean marine benthos including Polyplacophora, Gastropoda and Bivalvia were performed by Brattström and Johanssen (1983). However, these authors mainly examined shallow water taxa; the sublittoral fauna was under-represented in their account.

In recent years new expeditions were undertaken to the Magellan region, like the Chilean-Italian cruises in 1989-90 and 1990-91 or the German-Chilean-Italian „Joint Magellan“ campaign in 1994. Some new species were discovered during taxonomic studies of these new molluscan samples (e.g. Di Geronimo *et al.*, 1995). Linse (1997) published an inventory of marine Mollusca of the Beagle Channel. The biogeography of Crustacea and Mollusca is presented and discussed by Brandt *et al.* (this volume), zoogeographic relationships of the Nudibranchia by Schrödl (1997; 1999).

The present list includes also the Aplacophora (Caudofoveata and Solenogastres), Gastropoda, Scaphopoda and Bivalvia. In total 118 molluscan species were collected in the Beagle Channel by means of an epibenthic sledge (Linse, 1997; Linse and Brandt, in press), these species served as the basis for this checklist. It was later completed with distribution data from the literature from the areas of the Subantarctic Islands and High Antarctica (e.g., Powell, 1960; Mühlenhardt-Siegel, 1989; Hain, 1990).

The Magellan region in this study is defined as the Patagonian shelf south of about 41°S on both the Pacific and Atlantic sides. Although Powell (1965) excluded the Falkland Islands from the Magellan region, they are included in this study (compare Brandt *et al.*, this volume).

SPECIES CHECKLIST

(Geographic abbreviations at the end of the list.)

Aplacophora	
Caudofoveata	
Limifossoridae	
<i>Limifossor holopeltatus</i> Salvini Plawen, 1986	RC, MR
<i>Scutopus chilensis</i> Salvini-Plawen, 1972	RC, MR
<i>Scutopus</i> sp.	MR
Chaetodermatidae	
<i>Chaetoderma</i> sp.	MR
<i>Falcidens</i> sp.1	MR

<i>Falcidens</i> sp.2	MR
<i>Caudofoveata</i> sp.	MR
Solenogastres

Abbreviations used for geographic areas or islands:

AD - Adelie Land; AU - Auckland Island; BB - Burdwood Bank; BI - Bouvet Island; BS - Bellinghausen Sea; CA - Campbell Island; CI - Crozet Island; DS - Davis Sea; EC - Ecuador; EL - Enderby Land; FI - Falkland Islands; HI - Heart Island; KI - Kerguelen Islands; MA - Macquarie Island; MB - Mary Byrd Land; MI - Marion Island; MR - Magellan region; OL - Oates Land; PA - Palmer Archipelago; PE - Peru; PI - Antarctic Peninsula; RA - Argentina; RC - Chile; RS - Ross Sea; SG - South Georgia; SH - South Shetland Islands; SO - South Orkney Islands; SR - Shag Rocks; SS - South Sandwich Islands; WS - Weddell Sea.

DISCUSSION

The species checklist for the Magellan molluscs summarizes the present knowledge of the distribution of the known species. Because the focus lies on the zoogeography of the species, species synonyms are not presented herein. This is the task of taxonomic contributions.

The most recent checklist for Mollusca of the Magellan region was published by Carcelles and Williamson (1951) nearly 50 years ago. It comprised 614 species, 276 families and 125 genera of the taxa Polyplacophora (45 spp./ 15 gen./ 6 fam.), Aplacophora (0/0/0), Gastropoda (352/163/67), Scaphopoda (4/1/1), Bivalvia (184/82/42) and Cephalopoda (27/15/9). They considered the region between 37° S on the Pacific coast (Concepción) and 43° S on the Atlantic side (Golfo Nuevo) and included the Falkland Islands and Burdwood Bank.

Powell (1960) published a systematic checklist for Antarctic and Subantarctic Mollusca excluding the mainland of the Magellan region but including the Falkland Islands; however, he only mentioned the species of the Magellan region in footnotes.

Recent studies on taxonomy (e.g. Ponder and Worsfold, 1994; Di Geronimo *et al.*, 1995; Schrödl,

1996) have either increased the number of species or decreased the number due to synonymizations of species (e.g. McLean, 1984; Castellanos, 1989 - 1993). New zoogeographic records are the result of recent collections; e.g. Linse (1997) recorded 43 species - 8 Aplacophora, 11 Gastropoda, 2 Scaphopoda, 23 Bivalvia - new for the Magellan region and collected in sublittoral waters of the Beagle Channel. According to Dell (1971) and Brattström and Johanssen (1983), the northern boundaries of the Magellan region lie at about 41° S, some degrees further south on the Pacific coast than defined by Carcelles and Williamson (1951). Due to the new records and these inconsistent zoogeographic definitions an updated Magellan mollusc checklist was urgently needed.

This present list comprises 397 species of Mollusca belonging to 211 genera and 101 families, excluding Polyplacophora and Cephalopoda. 10 species of Aplacophora of 7 genera and 5 families occur in the Magellan region, 250 species of Gastropoda (124 gen./ 58 fam.), 6 species of Scaphopoda (5 gen./ 2 fam.) and 131 species of Bivalvia (75 gen./ 36 fam.). Some families, like the Fissurellidae (McLean, 1984), Littorinidae and Rissoidae (Ponder and Worsfold, 1994), or Nudibranchia (Schrödl, 1999), have already been revised but revisions for others, such as the Trochidae, Pectinidae or Carditidae, are still waiting. Dr. B. Sirenko is currently revising the Polyplacophora collected during the "Victor Hensen" campaign.

ACKNOWLEDGEMENTS

I am grateful to M. Schrödl for providing his partly unpublished Nudibranchia data base. I thank Dr. A. Crame and Prof. A. Clarke for discussions about zoogeographic relationships of the Southern Ocean molluscan fauna. Thanks also to Prof. A. Brandt for helpful comments on the manuscript. The study was supported by the DFG (German Science Foundation) grant BR 1121/4-1.
