## 1.0 Introduction

This technical report is a deliverable funded under STRICOM contract N61339-94-C-0080 in fulfillment of IST's requirement specified in the "Technical Report and Management Work Plan for Integration of the High Level Architecture for Distributed Interactive Simulation," CDRL A001 under Task 2.3, "Develop a DIS "Super FOM." The goal of this report is to describe in detail the procedure required to generate the DIS "Super FOM." This document describes 1) how to extract the DIS FOM from the provided diskette 2) a detailed procedure as to how the DIS FOM was generated and 3) a note on the accuracy of the enumeration data used to generate the Class Structure Table.

## 2.0 Background

IST has produced a DIS Federation Object Model (FOM) in accordance with the requirements of the DMSO Department of Defense High Level Architecture Object Model Template (OMT) Version 1.0. The goal of the DIS FOM is to document key information about simulations and the DIS federation. A common template facilitates understanding and comparisons of different simulations and federations. Further, all the information contained in the "Super FOM" will aid assessment of interoperability and reuse. The OMT document provides the format for a contract between members of a federation on the types of objects and interactions that will be supported across its multiple interoperating simulations. An overarching goal of the DIS FOM is to remain flexible to serve the needs of the broad DIS community as it moves through the Federation Development and Execution Process as described in the OMT.

## 3.0 The DIS FOM

HLA models are composed of a group of interrelated components specifying information about classes of objects, their attributes, and their interactions. The current HLA object model framework requires the documentation of these components in the form of tables. The template for the core of the HLA object model uses a tabular format and consists of the following components:

- A Class Structure Table - to record the subclass-superclass relations between different types of simulation/federation objects.
- An Object Interaction Table - to record the types of interactions possible between different classes of objects, their affected attributes and the interaction parameters.
- An Attribute Table - to specify features of the public attributes of objects in a simulation/federation.
- And, a FOM/SOM Lexicon to define all the terms used in the tables.

Although called for in the ‘Technical Report and Management Work Plan for Integration of the High Level Architecture Into Standards Development for Distributed Interactive Simulation,’ the current version of the OMT does not specify the following tables:

- A Component Structure Table
- An Association Table

The DIS FOM contains both a Class Structure Table and an Object Interaction Table. The Attribute, Component Structure, and the Association Tables were chosen not to be included in the DIS FOM in order to meet the overarching goal to remain flexible to meet the needs of the broad DIS community. Also, the FOM Lexicon was chosen not to be included. It is expected that the DIS Data Dictionary will meet the purpose of the FOM/SOM Lexicon.

#### 4.0 Extracting the DIS FOM from Disk

The DIS FOM data files were compressed in “pkzip” format and stored on the floppy diskette labeled “HLA DIS Federation Object Manager (FOM).” To retrieve the DIS FOM, first copy the diskette to a suitable hard drive directory. Use “pkunzip” to decompress the file “dis\_fom.zip”. The directory will now contain the Excel 5.0 worksheet file containing the final DIS FOM product as well as an Access 2.0 DIS FOM database used to create the DIS FOM. For clarity, listed below are two tables: The first table lists the files of the DIS FOM. The second table lists the names of the files of the database used to generate the DIS FOM.

| DIS FOM WORKSHEET            | FILE          |
|------------------------------|---------------|
| Object Class Structure Table | “dis_fom.xlw” |
| FOM Interaction Table        | “dis_fom.xlw” |

Table 1: Excel 5.0 file components of the DIS FOM spreadsheet.

| DIS FOM DATABASE       | FILE          |
|------------------------|---------------|
| Object Class Structure | “dis-fom.mdb” |
|                        | “dis-fom.ldb” |

Table 2: Access 2.0 file components of the DIS FOM database.

## 5.0 DIS FOM Generation, Detailed Procedures

The DIS FOM is intended to be a flexible document which will be updated and revised on an as needed basis as HLA continues to evolve. In addition, the document will need to be regenerated as the DIS Data Dictionary is updated to new versions. Listed below are the detailed steps IST followed to generate the DIS FOM Class Structure and Object Interaction Table.

### 5.1 Procedure for Generating a DIS FOM Class Structure Table

The Class Structure Table is designed to mirror the DIS enumerations data compiled in the DIS Data Dictionary. Class hierarchy is arranged in the order of Entity Kind, Domain, Country, Category, Subcategory and Specific. In general, the procedure for creating the Class Structure Table involves sorting and manipulating the table "tmptbleEBVdoc1" provided by the DIS Data Dictionary, Version 1.0a. Following are the steps taken to generate the Class Structure Table.

- 1) In binary mode, FTP the DIS Data Dictionary compressed file "instld3.exe" under the "dis-cd" directory at internet site "huachuca-www1.army.mil". Log in as anonymous and use your e-mail address as the password. Future versions of the DIS Data Dictionary may be found at the IST Standards web site "<http://ftp.sc.ist.ucf.edu/STDS/docs/>".
- 2) Uncompress and install the DIS Data Dictionary to a Personnel Computer.
- 3) Copy the DIS Data Dictionary file "dis\_dd.mdb" and rename the file as deemed appropriate. IST named the file supplied on diskette "dis\_fom.mdb". This file is "write" protected to prevent accidental erasure of the PDU table "PDU Fields and Data Types" which is not included as part of the DIS Data Dictionary.
- 4) From Microsoft Access, version 2.0, open the database, "dis\_fom.mdb", or the new database which was assigned a new name in step 3.
- 5) Under the Access Table menu, open the table "tmptbleEBVdoc1".

6) Under the Access Query menu, open and run the query named "class." The "class" query should be designed to sort in ascending numerical order the following fields of table "tmptBLEBVdoc1". In the following list, the "\*\_ORD" field correlates to the enumeration number. The "\*\_Description" field is the description of the class.

KND\_ORD, KND\_Description,  
DMN\_ORD, DMN\_Description,  
CTY\_ORD, CTY\_Description,  
CAT\_ORD, CAT\_Description,  
SCT\_ORD, SCT\_Description,  
SPC\_ORD, SPC\_Description

7) Export the sorted table to Microsoft Excel 5.0 under the file name "class.xls". Before printing the spreadsheet, set up the header name, date, and version number.

## 5.2 Procedure for Generating the DIS FOM Object Interaction Table

The DIS FOM Object Interaction Table is a derivation of the PDU attributes listed in the 1995 1278.1 DIS Standard. With exception for the SIMAN family, IST entered into the provided DIS\_FOM Access database a table of DIS PDUs. The PDU table, "PDU Fields and Data Types," is used as a menu to select which attributes are pertinent to an interaction. A query of attributes marked as "YES" becomes the Interaction Table.

1) In the Access 2.0 database file, "dis\_fom.mdb," open and/or design the table "PDU Fields and Data Types". The file should be configured with the following fields:

PDU Name ..... The PDU name, i.e. Entity State, Collision, etc.  
Attribute..... The fields of each PDU such as PDU Header, Entity Location, etc.  
Field..... The subfields of each attribute, i.e. X component, Y component, etc.  
Data Type..... Description of the field data type as enumeration, integer, etc.  
Attribute size..... The size in data bits of the attribute.  
Interaction..... A "YES" or "NO" to designate the attribute as an interaction.

2) From the PDU tables listed in the "IEEE 1278.1 Standard for Distributed Interactive Simulation--Application Protocols" document, type in the PDU data.

3) Specify with a "YES" or "NO" in the table's "interaction" column which PDU parameters are to be included in the FOM object interaction table. The selection of PDU parameters is based on whether or not the particular parameter will be used in an interaction. Entity State parameters, for example, such as velocity, location and orientation were selected knowing that another entity's radar or electronic warfare instrument may interact with that entity.

4) Perform a query on the table, "PDU Fields and Data Types," with the criteria to select only the PDU parameters marked with a "YES" in the "interaction" column. Display only the PDU, Attribute, and Field columns. Save the query as "FOM Interactions."

5) Export the Access query table, "FOM Interactions," to the Excel Spreadsheet "fom\_inte.xls".

6) Using the column insertion tool of Excel, place both "initiating object" and "receiving object" columns between the "interaction" and "PDU" columns of the FOM. IST manually typed in the initiating and receiving objects were appropriate. For example, the Weapons Fire interaction is initiated by a munitions object and received by a platform object. IST restricted the list of initiating and receiving objects to its broadest capacity, the Entity Kind Enumerations. Listed below are the Entity Kind Enumerations.

- Platform
- Munitions
- Lifeform
- Environmental
- Cultural Feature
- Supply
- Radio

7) Before printing the spreadsheet, hide the "ID" and the "Yes or No" column. Also, configure the page header. The header should include the date, version number and spreadsheet title. In the supplied Excel document, the file "fom\_inte.xls" was "dragged" to the "class" worksheet to create the single file workbook entitled "DIS\_FOM.XLW".

## 6.0 Accuracy of the DIS FOM Class Structure Table

The DIS Data Dictionary, Version 1.0a, is designed to reflect the 1995 IEEE 1278.1 Standard for DIS. However, in reviewing the current data of the DIS Data Dictionary, several omissions of Entity Kind enumerations, specifically Lifeform and Radio were found. IST is in the process of upgrading the DIS Data Dictionary with the missing enumerations. Once upgrades have been made to the DIS Data Dictionary, the DIS FOM can then be regenerated.

Following is a comparison of specific DIS Entity Kind and Platform Domain enumerations found in the 1995 IEEE 1278.1 Enumeration document versus data found in the DIS Data Dictionary Version 1.0a. Bullet items indicate the enumeration is included in Version 1.0a of the dictionary, diamond items are not included.

Entity Kind enumerations supported are:

- Platform
- Munitions
- ◇ Lifeform
- Environmental
- Cultural Feature
- Supply
- ◇ Radio

Platform Domain enumerations supported are:

- Land
- Air
- Surface
- Subsurface
- Space

Munitions Domain enumerations supported are:

- Anti-Air
- Anti-Armor
- Anti-Guided
- Anti-Radar
- Anti-Satellite
- Anti-Ship
- Anti-Submarine
- Anti-Personnel
- Battlefield Support
- Strategic
- Tactical

Environmental Domain enumerations supported are:

- ◇ Land
- ◇ Air
- ◇ Surface
- Subsurface
- ◇ Space

Cultural Domain enumerations supported are:

- Land
- ◇ Air
- ◇ Surface
- ◇ Subsurface
- ◇ Space

Supply Domain enumerations supported are:

- ◇ Unused
