# INTELLIGENT SIMULATED FORCES LITERATURE REVIEW

## 1.0 INTRODUCTION

### 1.1 Purpose

The purpose of this report is to document the results of a literature search/information survey performed in the area of intelligent simulated forces. This information search was undertaken to assess the effectiveness and resource requirements of current intelligent simulated forces efforts, and to provide guidance for future enhancements.

### 1.2 Statement of the Problem

There is a need for a semi-automated opposing force offering a variable user interface that can accommodate controllers with different levels of expertise. Such an environment would most likely require the use of artificial intelligence and expert system techniques. This literature review investigated not only simulated forces design paradigms, but also traditional and artificially intelligent hardware and software strategies.

## 2.0 INVESTIGATION METHODOLOGY

### 2.1 Procedures

Relevant information was garnered by investigating existing documentation, interviewing experts, and visiting the sites of ongoing efforts.

#### 2.1.1 Existing Documentation

##### 2.1.1.1 Publications

An on-line search was performed, which originally resulted in more than three hundred (300) articles. A copy of the results are included in Appendix A. A review of the

titles led to the request for sixty-eight (68) abstracts. A copy of the abstracts is located in Appendix B.

Articles and abstracts were gleaned from magazines, journals, and conference and symposium proceedings. Some of the proceedings represented include those from Interservice/Industry Training Systems Conferences, the Florida Artificial Intelligence Research Symposium, the Annual AI Systems in Government Conference, and the Summer Simulation Conference. Documentation published by both Perceptronics and BBN for SIMNET was also encompassed in the literature review. A bibliography of this material may be found in Appendix C.

Copies of the books, papers, and articles deemed relevant were acquired from several sources, and placed on file in the IST library. All material contained in the IST library is available for review upon request. Additionally, IST library information has been shared with the PM TRADE data base on a limited basis. A copy of the titles and IST library file numbers of articles of relevance to the simulated forces effort is contained in Appendix D.

#### **2.1.1.2 Commerce Business Daily Postings**

The Commerce Business Daily publications for the months of January 1989 through July 1989 were reviewed for postings that related to intelligent simulated forces. Twenty-six (26) postings were considered relevant. Among the sponsoring organizations were the Rome Air Development Center, the Naval Underwater Systems Center, Kirtland Air Force Base, the Defense Nuclear Agency, and the Naval Training Systems Center. These organizations posted an interest in funding work in the area of intelligent simulated forces; the respondent firms were not investigated in the course of this literature search. The results of this review are included in Appendix E.

#### **2.1.2 Interviewing Experts**

Experts working in the simulated forces field were queried by members of the IST staff. Reports delineating the results of these interviews were included in the monthly status reports already delivered. Additional copies are attached in Appendix F.

#### **2.1.3 Site Visits**

Multiple vendor sites were visited. Trip reports describing the information garnered were included in the status reports submitted monthly. Copies are included in Appendix G.

3.0

#### SUMMARY

This Intelligent Simulated Forces literature search was undertaken to evaluate current intelligent simulated forces efforts, and ascertain possible future trends and areas of augmentation. The effort included locating and acquiring the data, and entering it into the IST library. Access to all literature located in the IST library is available upon request.

1358578 PB89-116859/XAB  
Langage Modulaire de Specifications de Programmes  
Paralleles et Sa Compilation (These) (Modular Language of  
Parallel Program Specifications and Its Compilation)  
NTIS Prices: PC E10/MF E10

2/6/76  
1358316 N89-10216/4/XAB  
High Speed Fiber Optics Local Area Networks: Design and  
Implementation. Final Report, January 1, 1984-December 31,  
1987  
NTIS Prices: PC A02/MF A01

2/6/77  
1358248 N89-10096/0/XAB  
Advanced Data Management Design for Autonomous  
Telerobotic Systems in Space Using Spaceborne Symbolic

Processors

NTIS Prices: (Order as N89-10063/0, PC A99/MF E04)

2/6/78

1358229 N89-10077/0/XAB

Hierarchically Distributed Architecture for Fault Isolation Expert Systems on the Space Station

NTIS Prices: (Order as N89-10063/0, PC A99/MF E04)

2/6/79

1356758 PB89-122394/XAB

GRAMPS (General Real-Time Asynchronous Multiprocessor System) Operating System: User's Guide

NTIS Prices: PC A03/MF A01

2/6/80

1356433 PB89-116388/XAB

Platinum Jubilee Conference on Systems and Signal Processing. Held at Bangalore, India on December 11-13, 1986

NTIS Prices: PC E15/MF A01

2/6/81

1356360 PB89-115349/XAB

Languages and Methods for the Interface I1

NTIS Prices: PC E03/MF E03

2/6/82

1356357 PB89-115315/XAB

ESPRIT SPAN Project: A Kernel System for Integrating Parallel Symbolic and Numeric Processing (Technical rept.)

NTIS Prices: PC E05/MF E05

2/6/83

1356037 N88-30350/8/XAB

Parallel and Distributed Computation for Fault-Tolerant Object Recognition

NTIS Prices: (Order as N88-30330/0, PC A19/MF A01)

2/6/84

1356011 N88-30321/9/XAB

Performance Analysis of FDDI (Fiber Distributed Data Interface)

NTIS Prices: PC A03/MF A01

2/6/85

1355342 NTN88-0747

Bibliography on Multiprocessors and Distributed Processing: This computerized data base yields citations, indexes, and cross-references (NTIS Tech Note)

Correctness Criteria for Process Migration  
NTIS Prices: PC A03/MF A01

2/6/104  
1342170 AD-A196 931/0/XAB  
Parallel Programming Paradigms (Doctoral thesis)

NTIS Prices: PC A07/MF A01

2/6/105

1341664 AD-A196 419/6/XAB

Poker (4.1): A Programmer's Reference Guide (Technical rept.)

NTIS Prices: PC A05/MF A01

2/6/106

1341661 AD-A196 416/2/XAB

Type Architectures, Shared Memory and the Corollary of Modest Potential (Technical rept.)

NTIS Prices: PC A03/MF A01

2/6/107

1341275 PB88-868625/XAB

DECNET: Digital Equipment Corporation Network Architecture. January 1976-September 1988 (Citations from the INSPEC: Information Services for the Physics and Engineering Communities Database) (Rept. for Jan 76-Sep 88)

NTIS Prices: PC N01/MF N01

2/6/108

1340814 PB88-234927/XAB

Introduction to CSP (Communicating Sequential Processes) (Technical rept.)

NTIS Prices: PC E04/MF E04

2/6/109

1339597 AD-A196 133/3/XAB

Exploiting Replication (Special rept.)

NTIS Prices: PC A04/MF A01

2/6/110

1339013 AD-A195 520/2/XAB

TAC-1: A Knowledge-Based Air Force Tactical Battle Management Testbed (Interim rept. Oct 86-Sep 87)

NTIS Prices: PC A05/MF A01

2/6/111

1337246 AD-A195 395/9/XAB

ACCESS: A Communicating and Cooperating Expert Systems System

(Final rept. 30 Jun 87-31 Jan 88)

NTIS Prices: PC A06/MF A01

2/6/112

1335868 PB88-221056/XAB

Ship Performance Monitoring System Development (Final rept.)

NTIS Prices: PC A09/MF A01

2/6/113

1335651 N88-24206/0/XAB

Aerospace Energy Systems Laboratory: Requirements and Design Approach

NTIS Prices: PC A03/MF A01

2/6/114

1335646 N88-24199/7/XAB

Mentat: An Object-Oriented Macro Data Flow System

NTIS Prices: PC A03/MF A01

2/6/115

1335640 N88-24193/0/XAB

TALOS (Telemetry Analysis Logic for Operating Spacecraft):  
A Distributed Architecture for Intelligent Monitoring and  
Anomaly Diagnosis of the Hubble Space Telescope

NTIS Prices: (Order as N88-24188/0, PC A04/MF A01)

2/6/116

1335635 N88-24188/0/XAB

Third Conference on Artificial Intelligence for Space  
Applications, Part 2

NTIS Prices: PC A04/MF A01

2/6/117

1333285 N88-23489/3/XAB

Timestamp Ordering Mechanism with Dynamic Selection of  
Rollback Objects

NTIS Prices: (Order as N88-23485/1, PC A06/MF A01)

2/6/118

1333269 N88-23467/9/XAB

Distributed Matchmaking

NTIS Prices: PC A03/MF A01

2/6/119

1333254 N88-23436/4/XAB

Very Simple Construction for Atomic Multiwriter Register

NTIS Prices: PC A02/MF A01

2/6/120

1332983 N88-23083/4/XAB

Strategies for Concurrent Processing of Complex Algorithms  
in Data Driven Architectures

NTIS Prices: PC A04/MF A01

2/6/121

1332768 DE88008019/XAB

Graphical Multiprocessing Analysis Tool (GMAT)

NTIS Prices: PC A03/MF A01

2/6/122

1332523 AD-A194 128/5/XAB

Cauldrons: An Abstraction for Concurrent Problems Solving.  
Revision (Memorandum rept.)

NTIS Prices: PC A03/MF A01

2/6/123  
 1332082 AD-A193 681/4/XAB  
 Programming N-Cubes with a Graphical Parallel  
 Programming Environment Versus an Extended Sequential Language  
 (Technical rept.)  
 NTIS Prices: PC A03/MF A01

2/6/124  
 1332050 AD-A193 648/3/XAB  
 Combined And-Or Parallel Execution of Logic Programs  
 NTIS Prices: PC A03/MF A01

2/6/125  
 1331894 AD-A193 465/2/XAB  
 Programming Language Concepts for Multiprocessors  
 (Interim rept.)  
 NTIS Prices: PC A03/MF A01

2/6/126  
 1331892 AD-A193 463/7/XAB  
 Force. (Parallel Programming Language) (Interim rept.)  
 NTIS Prices: PC A03/MF A01

2/6/127  
 1331037 PB88-203997/XAB  
 Distributed Application Programming with Extended Prolog  
 (Distribuerad Applikationsprogrammering med Utvidgad Prolog)  
 NTIS Prices: PC E03/MF A01

2/6/128  
 1330891 N88-22589/1/XAB  
 Colored Stochastic Petri net (Cs-Pn) Software:  
 Application to the Validation and the Performance Evaluation  
 of Distributed Systems  
 NTIS Prices: PC A03/MF A01

2/6/129  
 1330817 N88-22399/5/XAB  
 Computational Structural Mechanics for Engine Structures  
 NTIS Prices: (Order as N88-22382/1, PC A14/MF A01)

2/6/130  
 1330042 AD-A193 466/0/XAB  
 Comparing Barrier Algorithms (Interim rept.)  
 NTIS Prices: PC A03/MF A01

2/6/131  
 1329891 AD-A193 298/7/XAB  
 Hearts: A Dialect of the Poker Programming Environment  
 Specialized to Systolic Computation (Technical rept.)  
 NTIS Prices: PC A02/MF A01

2/6/132  
 1329890 AD-A193 297/9/XAB  
 Poker on the Cosmic Cube: The First Retargetable  
 Parallel Programming Language and Environment (Technical  
 rept.)  
 NTIS Prices: PC A03/MF A01

2/6/133  
 1329888 AD-A193 295/3/XAB  
 Programming Solutions to the Algorithm Contraction Problem  
 (Technical rept.)  
 NTIS Prices: PC A02/MF A01

2/6/134  
 1329298 PB88-211156/XAB  
 Architecture for Distributed Data Management in  
 Computer Integrated Manufacturing  
 NTIS Prices: PC A04/MF A01

2/6/135  
 1329055 PB88-201769/XAB  
 Optimal Database Allocation in Distributed Computer Network  
 Systems Included in Mitsubishi Denki Giho, v61 n12 p26-29  
 1987.  
 NTIS Prices: (Order as PB88-201751, PC E04/MF A01)

2/6/136  
 1328768 N88-21841/7/XAB  
 Optimal CMOS Structure for the Design of a Cell Library  
 NTIS Prices: PC A04/MF A01

2/6/137  
 1328685 N88-21709/6/XAB  
 Technology Mapping from Boolean Expressions to Standard  
 Cells  
 (Master's thesis)  
 NTIS Prices: PC A04/MF A01

2/6/138  
 1328676 N88-21696/5/XAB  
 Proposta de Um Sistema Paralelo Com Aplicacoes Em  
 Processamento de Imagens (Proposal for a Parallel System with  
 Image Processing Applications)  
 NTIS Prices: PC A03/MF A01

2/6/139  
 1328674 N88-21694/0/XAB  
 Conception of a Knowledge-Based System for Designing  
 Distributed Systems (Thesis)  
 NTIS Prices: PC A10/MF A01

2/6/140  
 1328670 N88-21688/2/XAB  
 Distributed Operating Systems: An Overview

NTIS Prices: PC A03/MF A01

2/6/141

1328650 N88-21659/3/XAB

ESKISS: A Program for Optimal State Assignment  
(Master's thesis)

NTIS Prices: PC A04/MF A01

2/6/142

1328649 N88-21658/5/XAB

Generating Layouts for Random Logic: Cell Generation Schemes

NTIS Prices: PC A03/MF A01

2/6/143

1328642 N88-21650/2/XAB

Higher Levels of a Silicon Compiler (Master's thesis)

NTIS Prices: PC A05/MF A01

2/6/144

1328498 N88-21396/2/XAB

GADL: A Gate Array Description Language (Master's thesis)

NTIS Prices: PC A06/MF A01

2/6/145

1328156 NTN88-0343

Position and Force Control for Multiple-Arm Robots: The number of arms can be increased without introducing undue complexity

(NTIS Tech Note)

2/6/181  
1314289 N88-17211/9/XAB  
Development of a Comprehensive Software Engineering  
Environment NTIS Prices: (Order as N88-17206/9, PC A23/MF  
A01)

2/6/182  
1314284 N88-17206/9/XAB  
First Annual Workshop on Space Operations Automation and  
Robotics (SOAR 87)  
NTIS Prices: PC A23/MF A01

2/6/183  
1312882 AD-A189 569/7/XAB  
Why We Can't Program Multiprocessors the Way We're Trying  
to Do It Now (Technical rept.)  
NTIS Prices: PC A03/MF A01

2/6/184  
1312569 AD-A189 245/4/XAB  
Interface between Object-Oriented Systems (Technical  
rept.)

NTIS Prices: PC A03/MF A01

2/6/185

1312531 AD-A189 202/5/XAB

Design of the CONSUL Programming Language (Technical rept.)

NTIS Prices: PC A03/MF A01

2/6/186

1311249 N88-16576/6/XAB

Proposta de Uma Metodologia Para O Projeto Conceitual de Bancos de Dados Distribuidos (Proposal of a Methodology for the Conceptual Design of the Distributed Data Base) (Master's thesis) NTIS Prices: PC A09/MF A01

2/6/187

1311169 N88-16442/1/XAB

Prototype Space Station Automation System Delivered and Demonstrated at NASA (National Aeronautics and Space Administration)

NTIS Prices: (Order as N88-16360/5, PC A18/MF A01)

2/6/188

1311167 N88-16440/5/XAB

Framework for Real-Time Distributed Expert Systems: On-Orbit Spacecraft Fault Diagnosis, Monitoring and Control

NTIS Prices: (Order as N88-16360/5, PC A18/MF A01)

2/6/189

1311156 N88-16429/8/XAB

Neural Network Based Speech Synthesizer: A Preliminary Report

NTIS Prices: (Order as N88-16360/5, PC A18/MF A01)

2/6/190

1311120 N88-16393/6/XAB

Application of Parallel Distributed Processing to Space Based Systems

NTIS Prices: (Order as N88-16360/5, PC A18/MF A01)

2/6/191

1311119 N88-16392/8/XAB

Problem Solving as Intelligent Retrieval from Distributed Knowledge Sources

NTIS Prices: (Order as N88-16360/5, PC A18/MF A01)

2/6/192

1311107 N88-16380/3/XAB

Knowledge-Based System for Monitoring the Electrical Power System of the Hubble Space Telescope

NTIS Prices: (Order as N88-16360/5, PC A18/MF A01)

2/6/193

1311106 N88-16379/5/XAB

Distributed Architecture for Intelligent Monitoring and Anomaly Diagnosis of the Hubble Space Telescope (Abstract Only)

NTIS Prices: (Order as N88-16360/5, PC A18/MF A01)

2/6/194

1311087 N88-16360/5/XAB

Third Conference on Artificial Intelligence for Space Applications, Part 1

NTIS Prices: PC A18/MF A01

2/6/195

1310087 DE88003582/XAB

Parallel Discrete Event Simulation: A Shared Memory Approach

Portions of this document are illegible in microfiche products. NTIS Prices: PC A03/MF A01

2/6/196

1308401 PB88-162896/XAB

Objects and Actions in Reliable Distributed Systems (Technical rept.)

NTIS Prices: PC E04/MF E04

2/6/197

1308115 PB88-159223/XAB

Mitsubishi Denki Giho, Vol. 61, No. 10, 1987

NTIS Prices: PC E04

2/6/198

1307787 N88-15731/8/XAB

Interface between Astrophysical Datasets and Distributed Database Management Systems (DAVID) (Progress rept.)

NTIS Prices: PC A03/MF A01

2/6/199

1307775 N88-15635/1/XAB

Expert System Development for Commonality Analysis in Space Programs

NTIS Prices: (Order as N88-15601/3, PC A99/MF E03)

2/6/200

1307755 N88-15615/3/XAB

Microprocessor Control and Networking for the AMPS Breadboard

NTIS Prices: (Order as N88-15601/3, PC A99/MF E03)

2/6/201

1307587 N88-15114/7/XAB

Study of Communication Options in a Distributed Data Handling System and Survey of Advanced Man Machine Communications Schemes. Work Package 1: Interprocess Communication (Final rept.) NTIS Prices: PC A04/MF A01

2/6/202  
1306589 AD-A188 142/4/XAB  
Implementing Dynamic Arrays: A Challenge for  
High-Performance Machines  
NTIS Prices: PC A02/MF A01

2/6/203  
1306289 AD-A187 824/8/XAB  
Performance Measurements of Distributed Simulation  
Strategies  
(Technical rept.)  
NTIS Prices: PC A03/MF A01

2/6/204  
1306288 AD-A187 823/0/XAB  
Roll Back Chip: Hardware Support for Distributed  
Simulation Using Time Warp (Technical rept.)  
NTIS Prices: PC A03/MF A01

2/6/205  
1306285 AD-A187 820/6/XAB  
Shared Memory Algorithm and Proof for the Alternative  
Construct in CSP (Communicating Sequential Processes)  
(Technical rept.)  
NTIS Prices: PC A03/MF A01

2/6/206  
1305006 N88-14641/0/XAB  
Algorithms and Programming Tools for Image Processing on the  
MPP:3. Final Report, May 1984-July 1987  
NTIS Prices: PC A09/MF A01

2/6/207  
1302419 N88-13886/2/XAB  
Introduction to Local Area Network Design on Ariane  
5 and Future Launchers  
NTIS Prices: PC A03/MF A01

2/6/208  
1301283 AD-A187 559/0/XAB  
Theory and Practice of Fault Tolerance in Distributed  
Systems  
(Final rept. 15 Jun 85-14 Oct 86)  
NTIS Prices: PC A03/MF A01

2/6/209  
1301241 AD-A187 516/0/XAB  
Advanced Teleprocessing Systems Defense Advanced Research  
Projects Agency (Technical rept. (Final) 1 Oct 81-30 Sep 87)  
  
NTIS Prices: PC A03/MF A01

2/6/210

1299807 N88-12934/1/XAB  
Comparing Barrier Algorithms (Final rept.)  
NTIS Prices: PC A03/MF A01

2/6/211  
1297430 PB88-126693/XAB  
Strongly Sequential Term Rewriting Systems  
NTIS Prices: PC E03/MF A01

2/6/212  
1297257 N88-12287/4/XAB  
Mapping a Battlefield Simulation onto  
Message-Passing Parallel Architectures (Final rept.)  
NTIS Prices: PC A03/MF A01

2/6/213  
1294485 DE88000714/XAB  
Managing Distributed Derived Data: A Preliminary Proposal  
Portions of this document are illegible in microfiche  
products. Original copy available until stock is exhausted.  
NTIS Prices: PC A03/MF A01

2/6/214  
1293593 DE87013093/XAB  
Domain Decomposition in Distributed and Shared Memory  
Environments: 1, A Uniform Decomposition and Performance  
Analysis for the NCUBE and JPL Mark IIIfp Hypercubes  
Portions of this document are illegible in microfiche  
products.  
NTIS Prices: PC A03/MF A01

2/6/215  
1293232 AD-A185 616/0/XAB  
Air Force Scientific Report for AFOSR Grant AFOSR-85-0252  
(Final rept. 15 Jun 85-14 Oct 86)  
NTIS Prices: PC A03/MF A01

2/6/216  
1293195 AD-A185 579/0/XAB  
Communications for the DTroll Distributed Database System  
(Master's thesis)  
NTIS Prices: PC A03/MF A01

2/6/217  
1291994 PB88-105499/XAB  
Multi-Processor Architectures for Artificial Intelligence  
Processing  
NTIS Prices: PC E05/MF E05

2/6/218  
1291923 N88-11440/0/XAB  
Methodologie d'Evaluation des Performances des Systemes  
Repartis en Temps Reel (Methodology of Performance  
Evaluation of Real Time Distributed Systems)

NTIS Prices: PC A06/MF A01

2/6/219

1291911 N88-11402/0/XAB

Report from the MPP (Massively Parallel Processor) Working Group to the NASA (National Aeronautics and Space Administration) Associate Administrator for Space Science and Applications. Technical Memorandum Report, October 1, 1985-September 30, 1986

NTIS Prices: PC A04/MF A01

2/6/220

1291909 N88-11398/0/XAB

Cache-Based Error Recovery for Shared Memory Multiprocessor Systems

NTIS Prices: PC A03/MF A01

2/6/221

1291899 N88-11379/0/XAB

Système Memoire pour Architecture Multiprocesseur sur Bus Unique. Application au Système SCQM (Memory Systems for Single Bus Multiprocessor Architecture. Application to the SCQM System)

(Doctoral thesis)

NTIS Prices: PC A11/MF A01

2/6/222

1289457 PB88-110853/XAB

Summary Record of Presentations to the Federal Telecommunication Standards Committee/Fiber Optics Task Group

NTIS Prices: PC A07/MF A01

2/6/223

1289249 PB88-105218/XAB

Early Stopping Algorithms for Distributed Agreement under Fail-Stop, Omission, and Timing Fault Types (Technical rept. series)

NTIS Prices: PC E03/MF E03

2/6/224

1289032 N88-10513/5/XAB

Nonmythical Generalization of Dekker's Algorithm and Its Ramifications

NTIS Prices: PC A03/MF A01

2/6/225

1289026 N88-10506/9/XAB

Associative Memory ME7

NTIS Prices: PC A04/MF A01

2/6/226

1285508 DE87012519/XAB

Unified Approach to Parallel Computation: Performance Evaluation and Architecturally Independent Parallel

Programming: Progress Report, September 1, 1986-August 31, 1987

NTIS Prices: PC A02/MF A01

2/6/227

1285013 AD-A184 969/4/XAB

Test and Evaluation of the Transputer in a Multi-Transputer System (Master's thesis)

NTIS Prices: PC A09/MF A01

2/6/228

1284195 N87-29173/8/XAB

Votierungsverfahren als Teil der Fehlertoleranz in Verteilten Pdv-Systemen (Vote Methods as a Part of the Fault Tolerance in Distribution Process Data Processing Systems)

(Doctoral thesis)

NTIS Prices: PC A09/MF A01

2/6/229

1281120 PB87-234969/XAB

Distributed Infimum Approximation (Technical rept.)

NTIS Prices: PC E03/MF A01

2/6/230

1280257 N87-28325/5/XAB

Support Architecture for Reliable Distributed Computing Systems. Interim Report, November 9, 1983-December 3, 1985 C" k wi l rept.)

NTIS Prices: PC A04/MF A01

2/6/231

1280248 N87-28307/3/XAB

Performance Issues for Domain-Oriented Time-Driven Distributed Simulations

NTIS Prices: PC A02/MF A01

2/6/232

1280235 N87-28294/3/XAB

Ada Pilot Project (Final rept.)

NTIS Prices: PC A03/MF A01

2/6/233

1280017 N87-27894/1/XAB

Sistema de Comunicacao Para Ambiente de Multiprocessamento (Communication System for a Multiprocessing Environment)

NTIS Prices: PC A02/MF A01

2/6/234

1278782 DE87010832/XAB

Prescriptive Concepts for Advanced Nuclear Materials Control and Accountability Systems

Portions of this document are illegible in microfiche products. Original copy available until stock is exhausted.

NTIS Prices: PC A02/MF A01

2/6/235

1277652 AD-A184 266/5/XAB

Exploiting Virtual Synchrony in Distributed Systems.  
Revision

(Special technical rept.)

NTIS Prices: PC A02/MF A01

2/6/236

1277155 PB87-867958/XAB

DECNET: Digital Equipment Corporation Network  
Architecture. January 1976-September 1987 (Citations from  
the INSPEC: Information Services for the Physics and  
Engineering Communities Database) (Rept. for Jan 76-Sep 87)

NTIS Prices: PC N01/MF N01

2/6/237

1276980 PB87-226098/XAB

Network Protocols: Proceedings of the Joint IBM  
(International Business Machines)/University of Newcastle  
upon Tyne Seminar Held in the University Computing Laboratory,  
September 3-6, 1985

NTIS Prices: PC E12/MF E12

2/6/238

1276525 N87-27444/5/XAB

Automated Problem Scheduling and Reduction of  
Synchronization Delay Effects (Final rept.)

NTIS Prices: PC A03/MF A01

2/6/239

1276515 N87-27433/8/XAB

Detection of Faults and Software Reliability Analysis.  
Annual Report, July 1, 1985-June 30, 1987 (Progress rept.)

NTIS Prices: PC A02/MF A01

2/6/240

1276514 N87-27432/0/XAB

Implementation and Use of ADA on Distributed  
Systems with High Reliability Requirements. Semiannual  
Report, March 5, 1982-February 14, 1988 (Progress rept.)

NTIS Prices: PC A03/MF A01

2/6/241

1276511 N87-27425/4/XAB

Parallel Software Support for Computational  
Structural Mechanics. Semiannual Report, December 1, 1986-May  
31, 1987

NTIS Prices: PC A02/MF A01

2/6/242

1276506 N87-27420/5/XAB

Parallel Simulated Annealing Algorithm for Standard Cell

Placement on a Hypercube Computer  
NTIS Prices: PC A05/MF A01

2/6/243  
1276504 N87-27418/9/XAB  
Implementation and Use of ADA on Distributed  
Systems with High Reliability Requirements. Semiannual  
Report, March 5, 1982-December 31, 1986  
NTIS Prices: PC A06/MF A01

2/6/244  
1276064 N87-26555/9/XAB  
Experience in Highly Parallel Processing Using DAP  
(Distributed Array Processor)  
NTIS Prices: (Order as N87-26531 PC A13/MF A01)

2/6/245  
1274820 AD-A183 946/3/XAB  
Data Multiplex System (DMS) - Aspects of Fleet Introduction  
NTIS Prices: PC A02/MF A01

2/6/246  
1274207 PB87-867149/XAB  
Distributed Data Base Management Systems. October  
1984-September 1987 (Citations from the INSPEC:  
Information Services for the Physics and Engineering  
Communities Database)  
(Rept. for Oct 84-Sep 87)  
NTIS Prices: PC N01/MF N01

2/6/247  
1273956 PB87-219937/XAB  
Replicated Distributed Processing  
(Technical rept. series)  
NTIS Prices: PC E03/MF E03

2/6/248  
1273786 PB87-217592/XAB  
Distributed Computer System for Factory Automation  
Included in Mitsubishi Denki Giho, v61 n4 p17-20 1987.  
NTIS Prices: (Order as PB87-217584, PC E05/MF A01)

2/6/249  
1273334 N87-26581/5/XAB  
Comparison Between Sparsely Distributed Memory and  
Hopfield-Type Neural Network Models  
NTIS Prices: PC A03/MF A01

2/6/250  
1273332 N87-26577/3/XAB  
EOS: A Project to Investigate the Design and Construction  
of Real-Time Distributed Embedded Operating Systems. Mid-Year  
Report, 1987  
NTIS Prices: PC A11/MF A01

2/6/251  
1273331 N87-26576/5/XAB  
Parallel Discrete Event Simulation: A Shared Memory Approach

NTIS Prices: PC A03/MF A01

2/6/252  
1273329 N87-26574/0/XAB  
PISCES 2 Users Manual  
NTIS Prices: PC A03/MF A01

2/6/253  
1273328 N87-26573/2/XAB  
PISCES 2 Parallel Programming Environment (Final rept.)  
NTIS Prices: PC A02/MF A01

2/6/254  
1273325 N87-26568/2/XAB  
Network Protocols for Real-Time Applications  
NTIS Prices: PC A02/MF A01

2/6/255  
1273324 N87-26567/4/XAB  
Two Demonstrators and a Simulator for a Sparse, Distributed  
Memory  
NTIS Prices: PC A02/MF A01

2/6/256  
1273314 N87-26520/3/XAB  
Force User's Manual (Revised)  
NTIS Prices: PC A03/MF A01

2/6/257  
1273312 N87-26518/7/XAB  
Parallel Algorithm for Channel Routing on a Hypercube  
NTIS Prices: PC A02/MF A01

2/6/258  
1272530 DE87010147/XAB  
Performance of Three Hypercubes  
Portions of this document are illegible in microfiche  
products. Original copy available until stock is exhausted.  
NTIS Prices: PC A02/MF A01

2/6/259  
1271733 AD-A183 216/1/XAB  
Methodologies for Concurrent Programming  
(Final rept. for 1 Mar 86-28 Feb 87)  
NTIS Prices: PC A02/MF A01

2/6/260  
1271456 AD-A182 935/7/XAB  
Parallel and Distributed Computing

(Final rept. 1 Jun 85-30 Nov 86)  
NTIS Prices: PC A02/MF A01

2/6/261  
1270513 PB87-200960/XAB  
Bus-Type Home Control System Using Coaxial Cables  
Included in National Technical Report (Matsushita  
Electric Industrial Company), v32 n6 p37-44 Dec 86.  
NTIS Prices: (Order as PB87-200945, PC E07/MF E01)

2/6/262  
1270383 N87-25890/1/XAB  
Integration of Communications and Tracking Data Processing  
Simulation for Space Station  
NTIS Prices: (Order as N87-25884 PC A13/MF A01)

2/6/263  
1269083 AD-A182 557/9/XAB  
Mediation and Automatization  
(Technical rept. for period ending Dec 86)  
NTIS Prices: PC A02/MF A01

2/6/264  
1269040 AD-A182 513/2/XAB  
CRONUS, A Distributed Operating System: CRONUS DOS  
Implementation (Final rept. Oct 84-Jan 86)  
NTIS Prices: PC A04/MF A01

2/6/265  
1267878 N87-24949/6/XAB  
New Technology Impacts on Future Avionics Architectures  
NTIS Prices: (Order as N87-24940 PC A07/MF A01)

2/6/266  
1266715 DE87008558/XAB  
Parallel Solution of Triangular Systems on  
Distributed-Memory Multiprocessors  
Portions of this document are illegible in microfiche  
products. Original copy available until stock is exhausted.  
NTIS Prices: PC A03/MF A01

2/6/267  
1265970 AD-A182 240/2/XAB  
Exact Performance Analysis of Two Distributed  
Processes with One Synchronization Point (Technical rept.)  
  
NTIS Prices: PC A03/MF A01

2/6/268  
1265948 AD-A182 216/2/XAB  
Distributed Sensor Networks (Semiannual technical summary  
rept. 1 Apr-30 Sep 86)  
NTIS Prices: PC A03/MF A01

2/6/269  
1265911 AD-A182 178/4/XAB  
Data Replication in Nested Transaction Systems (Technical  
rept.)  
NTIS Prices: PC A05/MF A01

2/6/270  
1265909 AD-A182 176/8/XAB  
Remote Pipes and Procedures for Efficient Distributed  
Communication (Technical rept.)  
NTIS Prices: PC A03/MF A01

2/6/271  
1265908 AD-A182 175/0/XAB  
Correctness of Orphan Elimination Algorithms (Master's  
thesis)  
NTIS Prices: PC A03/MF A01

2/6/272  
1265037 PB87-180857  
Programming the Parallel Processor (Final rept.)  
Pub. in The Role of Language in Problem Solving 2, p321-333  
1987. NTIS Prices: Not available NTIS

2/6/273  
1264037 DE87008229/XAB  
Effect of Distributed Computing Technology on Wide Area  
Network Capacity Requirements Portions of this document are  
illegible in microfiche products.  
NTIS Prices: PC A02/MF A01

2/6/274  
1262291 PB87-196010/XAB  
Graph Model for Efficient Reachability Analysis of  
Description Languages, Series B, Number 34 (Research rept.)  
NTIS Prices: PC E03/MF E01

Contract No.: ESA-6572/85-NL-PP  
Use of Ada technology for the design and  
implementation of large distributed systems in the context  
of the Columbus space station program was assessed by  
developing in Ada a prototype of an on-board data  
management system (DMS). Results and lessons learned by  
applying a virtual node approach together with hierarchical  
object oriented design contribute to a better understanding  
and management of the use of Ada technology. This  
approach provides the definition of a development  
framework very well adapted to the Columbus DMS context. By  
defining applications and services software as Ada virtual  
nodes it is possible to design the whole system as a single  
Ada program, structured according to the architecture adopted  
for DMS. The applications could be developed in parallel  
on geographically  
distributed sites and be validated individually using this  
initial model and the corresponding interface  
specification. The final integration process could  
concentrate on the operational validation of the system in  
distributed configuration (the functional validation  
in centralized configuration being obtained at the end of  
the first phase). The efficient implementation of this  
method requires support tools for: checking the rules  
imposed by the virtual node approach; and scanning  
virtual node specifications (Ada packages) in order to  
generate a surrogate software layer to provide  
syntactically transparent communication between virtual nodes  
located on distinct physical processors.

The goal of the Qlisp project at Stanford is to gain experience with the shared-memory, queue-based approach to parallel Lisp, by implementing the Qlisp language on an actual multiprocessor, and by developing a symbolic algebra system as a testbed application. The experiments performed on the simulator included: 1. Algorithms for sorting and basic data structure manipulation for polynomials. 2. Partitioning and scheduling methods for parallel programming. 3. Parallelizing the production rule system OPS5. Computer programs. (jes)

Country of Publication: United States

The Ada programming language provides a means of specifying logical concurrency by using multitasking. Extending the Ada multitasking concurrency mechanism into a physically concurrent distributed environment which imposes its own requirements can lead to incompatibilities. These problems are discussed. Using distributed Ada for a target system may be appropriate, but when using the Ada language in a host environment, a multiprocessing model may be more suitable than retargeting an Ada compiler for the distributed environment. The tradeoffs between multitasking on distributed targets and multiprocessing on distributed hosts are discussed. Comparisons of the multitasking and multiprocessing models indicate different areas of application.

Country of Publication: United States

Certain types of software facilities are needed in a Space Station Information Systems Environment; the Common APSE (Ada Program Support Environment) Interface Set (CAIS) was proposed as a means of satisfying them. The reasonableness of this is discussed by examining the current CAIS, considering the changes due to the latest Requirements and Criteria (RAC) document, and postulating the effects on the CAIS 2.0. Finally, a few additional comments are made on the problems inherent in the Ada language itself, especially on its deficiencies when used for implementing large distributed processing and data base applications.

Despite considerable commercial exploitation of fault  
tolerance systems, significant and difficult research  
problems remain in such areas as fault detection and  
correction. A research project is described which constructs  
a distributed computing test bed for loosely coupled  
computers. The project is constructing a tool kit to  
support research into distributed control algorithms,  
including a distributed Ada compiler, distributed debugger,  
test harnesses, and environment monitors. The Ada compiler is  
being written in Ada and will implement distributed computing  
at the subsystem level. The design goal is to provide a  
variety of control mechanics for distributed programming while  
retaining total transparency at the code level.

Country of Publication: United States

This paper first describes a hierarchical model for  
very large area networks (VLAN). Space communication  
problems whose solution could profit by the model are  
discussed and then an enhanced version of this model  
incorporating the knowledge needed for the missile  
detection-destruction problem is presented. A satellite  
network or VLAN is a network which includes at least one  
satellite. Due to the complexity, a compromise between  
fully centralized and fully distributed network management has  
been adopted. Network nodes are assigned to a physically

localized group, called a partition. Partitions consist of groups of cell nodes with one cell node acting as the organizer or master, called the Group Master (GM). Coordinating the group masters is a Partition Master (PM). Knowledge is also distributed hierarchically existing in at least two nodes. Each satellite node has a back-up earth node. Knowledge must be distributed in such a way so as to minimize information loss when a node fails. Thus the model is hierarchical both physically and informationally.

The Fiber Distributed Data Interface (FDDI)  
high-speed token-ring protocol provides support for two  
classes of service: synchronous, to support applications  
which require deterministic access to the channel, and  
asynchronous, to support applications which do not have  
such stringent response-time requirements. The purpose of  
this paper is to determine how  
to set ring parameters to support synchronous traffic most  
efficiently. Both theoretical results and results obtained  
from a simulation study are presented.

Country of Publication: United States

There is a need to explore methods for reducing lengthly computer turnaround or clock time associated with engineering design problems. Different strategies can be employed to reduce this turnaround time. One strategy is to run validated analysis software on a network of existing smaller computers so that portions of the computation can be done in parallel. This paper focuses on the implementation of this method using two types of problems. The first type is a traditional structural design optimization problem, which is characterized by a simple data flow and a complicated analysis. The second type of problem uses an existing computer program designed to study multilevel optimization techniques. This problem is characterized by complicated data flow and a simple analysis. The paper shows that distributed computing can be a viable means for reducing computational turnaround time for engineering design problems that lend themselves to decomposition. Parallel computing can be accomplished with a minimal cost in terms of hardware and software.

This work presents a distributed system developed at INPE, designed for the Multiprocessor for Network Communications (MCR). The system supports execution of application processes by request from other processes or external events. These processes communicate with each other by asynchronously exchanging messages; the use of a logical entity called channel permits the interprocess communications, independently of where the processes are being executed. The MCR was designed to be part of a packet-switching communications subnetwork node, among other applications; therefore the system must support the implementation of the lower layers of a communications protocol (layers 2 and 3 in the ISO/OSI architecture).

After taking a look at the present situation of energy supply in the Federal Republic of Germany the book reports on the non-nuclear energy research of 1972-1982. The topic is divided into following main points: 1) Criteria of supporting technologies; 2) A comprehensive look at the support programs and the classification of the individual areas; 3) The program 'non-nuclear energy systems'; 4) The partial program 'rational utilization of energy in the spheres of application and secondary energy'; 5) The partial program 'new energy sources'; and 6) The partial program 'coal and other fossil energy sources'. Designing software environments for parallel computers is a central issue in parallel computing research. This paper discusses this issue and the alternate approaches to resolving it which are being studied. We also look at the way in which the type of parallel architecture constrains the design of the programming environments. Shared memory multiprocessors provide the most freedom in the design of effective programming environments, but are more costly than nonshared memory architectures of comparable power. After this general discussion, we describe two new parallel programming languages, BLAZE 2 and KALI. The first of these, BLAZE 2, is a high level language for shared memory multiprocessors. The second, KALI, is a moderately high-level language for distributed memory architectures. We conclude with a brief discussion of the differences between these two languages, which are a consequence of the difference between shared and non-shared memory

multiprocessors. 13 refs., 3 figs. (ERA citation 13:052904)

The design of high speed local area networks (HSLAN) for communication among distributed devices requires solving problems in three areas: (1) the network medium and its topology; (2) the medium access control; and (3) the network interface. Considerable progress has been made in all areas. Accomplishments are divided into two groups according to their theoretical or experimental nature. A brief summary is given in Section 2, including references to papers which appeared in the literature, as well as to Ph.D. dissertations and technical reports published at Stanford University.

Paradigms for the development of sequential  
algorithms, such as divide-and-conquer and the greedy  
method, are well known. Paradigms for the development of  
parallel algorithms, especially algorithms for non-shared  
memory MIMD machines, are not well known. These paradigms  
are important, not only as tools for the development of new  
algorithms, but also because algorithms using the same  
paradigm often have common properties that can be  
exploited by operations such as contraction. This  
dissertation identifies four primary paradigms used by  
non-shared memory MIMD algorithms. They are  
compute-aggregate-broadcast, divide-and-conquer, pipelining,  
and reduction. Compute-aggregate-broadcast is used, for  
example, in numerical approximation algorithms like

the conjugate gradient iterations. Three variations of the compute-aggregate-broadcast paradigm are studied. Divide-and-conquer is shown to be applicable to parallel algorithms. The relationship between divide-and-conquer algorithms and the n-cube is studied. Systolic techniques are known to be broadly applicable for the development of MIMD algorithms. Systolic algorithms are shown to be members of the more general pipelining paradigm. Finally, the reduction paradigm is briefly studied. The contraction problem, the problem arising when an algorithm requires more processors than are available on the execution machine, is studied. Special attention is given to common solutions to the contraction problem in each paradigm. (KR)

This document gives a succinct description of the facilities available with the Poker Parallel Programming Environment. The emphasis is on what is available rather than how to achieve particular results. Although the sections are self-contained, so that they may be referred to independently, there are a few things you should know: 1) Poker uses interactive graphics. The graphics are described in Section 2; the interaction is described in Section 3; 2) The usual programming language notion of a 'source program' as a monolithic piece of symbolic text has been replaced in Poker by a database. The way to create, view, and change the database is described in Section 4; 3) Object programs (the 'compiled database') are executed or emulated by Poker and snapshots of the execution can be continuously displayed; 4) Poker supports a variety of CHiP architectures; the current one can be displayed or changed using the CHiP Parameters facility; Section 7; 5) The back page of this document gives a summary of the commands; and 6) Other versions of Poker exists; consult Appendix B for your particular system. This bibliography contains citations concerning the network architecture DECNET provided by the Digital Equipment Corporation. Topics include hardware and software for implementing communications between different computer operating systems. DECNET's ability to create resource sharing, communications networks, and distributed computing is examined by employing specialized protocol layers which serve the functions of network control, data access control, interprogram communications, and automatic error detection and retransmission. Applications for medical information systems, chemical laboratories, electronic mail systems, and industrial process control are presented. (This updated bibliography contains 126 citations, 40 of which are new entries to the previous edition.)

Within ESPRIT, Europe's \$3 billion Information Technology research program, projects are developing next generation parallel computers. Each project is undertaken by a consortium of companies and universities. One such consortium (SPAN) is investigating the integration of numeric and symbolic processing involving research at the applications, language, and architecture levels. The core of the SPAN project consists of a Kernel System which connects languages and applications to a range of parallel computer architectures. The Kernel System comprises a Target Machine Language and its corresponding Virtual Machine. The paper describes the design of the SPAN Target Machine Language and its Virtual Machine. The Target Machine Language is a procedural programming language providing explicit constructs to facilitate parallel execution of programs and primitive n-ary list operations to support array and list-processing in a uniform way.

Contract No.: NCC2-387

The Fiber Distributed Data Interface (FDDI) is an emerging ANSI and ISO standard for a 100 megabit per second fiber optic token ring. The performance of the FDDI media access control protocol is analyzed using a simulation developed at NASA Ames. Both analyses using standard measures of performance (including average delay for asynchronous traffic, channel utilization, and transmission queue length) and analyses of characteristics of ring behavior which can be attributed to constraints imposed by the timed token protocol on token holding time (including bounded token rotation time, support for synchronous traffic, and fairness of channel access for nodes transmitting asynchronous traffic) are included.

The price performance benefits of network systems is well  
documented. The ability to share expensive resources sold  
timesharing for mainframes, department clusters of  
minicomputers, and now local area networks of workstations  
and servers. In the process, other fundamental system  
requirements emerged. These have now been generalized  
with open system requirements for hardware, software,  
applications and tools. The ability to interconnect a  
variety of vendor products has led to a specification of  
interfaces that allow new techniques to extend existing  
systems for new and exciting applications. As an example  
of the message passing system, local area networks provide  
a testbed for many of the issues addressed by future  
concurrent architectures: synchronization, load balancing,  
fault tolerance and scalability. Gold Hill has been  
working with a number of vendors on distributed architectures  
that range from a network of workstations to a hypercube of  
microprocessors with distributed memory. Results from early  
applications are promising both for performance and  
scalability.

Country of Publication: United States  
As the hardware trends for artificial intelligence (AI)

involve more and more complexity, the process of optimizing the computer system design for a particular problem will also increase in complexity. Space applications of knowledge based systems (KBS) will often require an ability to perform both numerically intensive vector computations and real time symbolic computations. Although parallel machines can theoretically achieve the speeds necessary for most of these problems, if the application itself is not highly parallel, the machine's power cannot be utilized. A scheme is presented which will provide the computer systems engineer with a tool for analyzing machines with various configurations of array, symbolic, scaler, and multiprocessors. High speed networks and interconnections make customized, distributed, intelligent systems feasible for the application of AI in space. The method presented can be used to optimize such AI system configurations and to make comparisons between existing computer systems. It is an open question whether or not, for a given mission requirement, a suitable computer system design can be constructed for any amount of money.

Country of Publication: United States

The problem addressed by this expert system concerns the expansion of capability of a Real Time Trainer for the Spacelab flight crew. As requirements for more models or fidelity are placed upon the system, expansion is necessary. The simulator can be expanded using a larger processor or by going to a distributed system and expand by adding additional processors. The distributed system is preferable because it is more economical and can be expanded in a more incremental manner. An expert system was developed to evaluate modeling and timing capability within a real time training simulator. The expert system is based upon a distributed configuration. Components of the modeled system are control tasks, network tasks, emulator tasks, processors, displays, and a network. The distributed module expert system (DMES) allows the configuring of processors, tasks, display use, keyboard use, and selection of alternate methods

to update the data buffer. Modules can be defined with execution occurring in a specific processor on a network. The system consists of a knowledge front end editor to interactively generate or update the knowledge base, an inference engine, a display module, and a recording module.

A mobile inspection robot has been proposed for the NASA Space Station. It will be a free flying autonomous vehicle that will leave a berthing unit to accomplish a variety of inspection tasks around the Space Station, and then return to its berth to recharge, refuel, and transfer information. The Flying Eye robot will receive voice communication to change its attitude, move at a constant velocity, and move to a predefined location along a self generated path. This mobile robot control system requires integration of traditional command and control techniques with a number of AI technologies. Speech recognition, natural language understanding, task and path planning, sensory abstraction and pattern recognition are all required for successful implementation. The interface between the traditional numeric control techniques and the symbolic processing to the AI technologies must be developed, and a distributed computing approach will be needed to meet the real time computing requirements. To study the integration of the elements of this project, a novel mobile robot control architecture and simulation based on the blackboard architecture was developed. The control system operation and structure is discussed.

This report describes the framework for, and a demonstration vehicle of, a knowledge-based testbed for integrating multiple artificial intelligence systems into a distributed processing network for purposes for evaluation and exploitation. TAC-1 is a version of the testbed applied to the domain of Air Force tactical battle management. The domain-independent framework includes a centralized control subnet, including a message router and a common protocol language for message passing among component systems. A Common Database and a Common Knowledge Base are essential components of the testbed. The Router directs data queries to the Common Database (one of the hosted systems) and, through the use of a Common Knowledge Base, directs service requests to the systems which can handle them. Keywords: Knowledge based systems, Distributed artificial intelligence, Cooperating knowledge based systems, Knowledge based tactical battle management. (sdw)

Contract No.: DAAB10-87-C-0053

The primary focus of Phase I was to prototype a development environment, ACCESS, for A Communicating and Cooperating Expert Systems System. More generally, this work explored the question of what capabilities were needed in a development environment for embedding distributed knowledge-based systems applications on personal computer or work-station class platforms. The stated goal of the Phase I research and development effort was to investigate and implement a software environment for the realization of cooperating knowledge sources on personal computers. This system was to be Lisp based, distributed processing was to be facilitated

by message passing using TCP/IP, control was to be accomplished by meta-level objects and a variety of features were to be provided to aid developers in building such systems. Underlying these goals was the assumption that the tools needed to support such an effort, mainly Common Lisp, Portable Common Loops and TCP/IP, were adequate to do so. During the course of this work Symbiotics found several short-comings in these software tools and identified a need for higher level tools to facilitate distributed processing development. This report documents that work and the results of the Phase I effort.

Contract No.: NAG1-683

Research directed at developing a graph theoretical model for describing data and control flow associated with the execution of large grained algorithms in a special distributed computer environment is presented. This model is identified by the acronym ATAMM which represents Algorithms To Architecture Mapping Model. The purpose of such a model is to provide a basis for establishing rules for relating an algorithm to its execution in a multiprocessor environment. Specifications derived from the model lead directly to the description of a data flow architecture which is a consequence of the inherent behavior of the data and control flow described by the model. The purpose of the ATAMM based architecture is to provide an analytical basis for performance evaluation. The ATAMM model and architecture specifications are demonstrated on a prototype system for concept validation.

The design and debugging of parallel programs is a difficult task due to the complex synchronization and data scoping issues involved to aid the programmer in parallel code development we have developed two methodologies for the graphical display of execution of parallel codes. The Graphical Multiprocessing Analysis Tools (GMAT) consist of stategraph, which represents an inheritance tree of task states, and timeliness, which represents task as flowing sequence of events. Information about the code can be displayed as the application runs (dynamic mode) or played back with time under user control (static mode). This document discusses the design and user interface issues involved in developing the parallel application display GMAT family. Also, we present an introductory user's guide for both tools. 4 figs. The abstractions we have for serial programming are powerful: concepts like data types, variable binding, generalized operators, the subroutine. We do not yet have the same sort of powerful abstractions for distributed computation, but I believe that the place to look for them is the same place that we found many of our abstractions for serial computation--in our own minds. This research extends a tradition of distributed theories of mind into the implementation of a distributed problem solver. In this problem solver a number of ideas from Minsky's Society of Mind are implemented and are found to provide powerful abstractions for the programming of distributed systems. These abstractions are the cauldron, a mechanism for instantiating reasoning contexts, the frame, a way of modularly describing those contexts and the goal-mode, a mechanism for bringing a particular context to bear

on a specific task. The implementation of both these abstractions and the distributed problem solver in which they run is described, accompanied by examples of their application to various domains.

Contract No.: N00014-86-K-0680; NSF-DCR86-03609

A number of approaches have recently been proposed for the parallel execution of logic programming languages, but most of them deal with either or-parallelism or and-parallelism but not both. This paper describes a high-level design for efficiently supporting both and-parallelism and or-parallelism. Our approach is based on the binding arrays method for or-parallelism and the RAP method for and-parallelism. Extensions to the binding-arrays method are proposed in order to achieve constant access-time to variables in the presence of and-parallelism. The RAP (Restricted And-Parallelism) method becomes simplified because backtracking is unnecessary in the presence of or-parallelism. The author's approach has the added effect of eliminating redundant computations when goals exhibit both and-and or-parallelism. The paper first briefly describes the basic issues in pure and-parallelism and or-parallelism, states desirable criteria for their implementation (with respect to variable access, task creation and switching), and then describes the combined and-or implementation.

Contract No.: N00014-86-K-0204

It is currently possible to build multiprocessor

systems which will support the tightly coupled activity of hundreds to thousands of different instruction streams, or processes. This can be done by coupling many monoprocessors, or a smaller number of pipelined multiprocessors, through a high concurrency switching network. The switching network may be couple processors to memory modules, resulting in a shared memory multiprocessor system, or it may couple processor/memory pairs, resulting in a distributed memory system. The need to direct the activity of very many processes simultaneously places qualitatively different demands on a programming language than the direction of a single process. In spite of the different requirements, most languages for multiprocessors have been simple extensions of conventional, single stream programming languages. The extensions are often implemented by way of subroutine calls and have little impact on the basic structure of the language. This paper attempts to examine the underlying conceptual structure of parallel languages for large scale multiprocessors on the basis of an existing language for shared memory multiprocessors, known as the FORCE, and to extend the concepts in this language to distributed memory systems.

The FORCE is a parallel programming language and methodology based on the shared memory multiprocessor model of computation. It is an extension to Fortran which allows a user to write a parallel program that is independent of the number of processes executing it and in which the management of processes is suppressed. Multiple instruction streams are managed as a group by operations that synchronize them and allocate work. The system is implemented on several machines as a macro preprocessor which expands FORCE programs into Fortran code for the host system.

Many tasks in office oriented environments engage several experts and office workers. The increasing use of workstation based tools for such tasks calls for simpler and more appropriate ways to specify program distribution and user communication. The authors propose a facility to specify such task sharing. The main point in the approach is the localization term, which is an extension to a Prolog-like language. This allows us to describe a multi-user application as one unified program instead of as a set of distributed single-user programs.

This paper describes a technique for retargeting Poker, the first complete parallel programming environment, to new parallel architectures. The specifics are illustrated by describing the retarget of Poker to CalTech's Cosmic Cube. Poker requires only three features from the target architecture: MIMD operation, message passing inter-process communication, and a sequential language (e.g. C) for the processor elements. In return Poker gives the new architecture a complete parallel programming environment which will compile Poker parallel programs without modification, into efficient object code for the new architecture.

The report concerns optimal database allocation and optimal location of processors in the distributed processing networks used for sales and product distribution management systems. The problems are formulated, and a mathematical methodology for solving these problems is presented. To minimize the system expense, the methodology is used to analyze the hardware cost of the distributed processors, the cost of the magnetic disk drive for database storage, the cost of communications over a packet switching network, and the cost of leased lines.

The Graphics and Video Laboratory of the Department of Computer Science has a growing need for easy to use programming tools in support of distributed processing applications. The most pressing need is for software on three UNIX-based workstations connected via Ethernet. The remote interprocess communication tools that UNIX provides for using Ethernet are effective but complicated to learn. This requires researchers to spend much of their time becoming proficient with them instead of concentrating on the distributed application at hand. This work presents the design and implementation of several programming tools that allow programmers to establish and experiment with distributed programs in the graphics laboratory environment. The tools allow a higher level of abstraction for remote interprocess communications and establish a straightforward method for implementing distributed programs. Additionally, they support code reuseability with software templates and are modularized to be both understandable and changeable. Recommendations are made for future research and management efforts that have been highlighted by these new tools.

A method is developed for distributing the computation of graphics primitives on a parallel processing network. Off-the-shelf transputer boards are used to perform the graphics transformations and scan-conversion tasks that would normally be assigned to a single transputer based display processor. Each node in the network performs a single graphics primitive computation. Frequently requested tasks can be duplicated on several nodes. The results indicate that the current distribution of commands on the graphics network shows a performance degradation when compared to the graphics display board alone. A change to more computation per node for every communication (perform more complex tasks on each node) may cause the desired increase in throughput.

A conceptual framework is examined for task allocation in distributed systems. Application and computing system parameters critical to task allocation decision processes are discussed. Task allocation techniques are addressed which focus on achieving a balance in the load distribution among the system's processors. Equalization of computing load among the processing elements is the goal. Examples of system performance are presented for specific applications. Both static and dynamic allocation of tasks are considered and system performance is evaluated using different task allocation methodologies.

Parallel computation is an area in which software technology lags considerably behind hardware technology. The need for parallel computing in a number of applications (e.g., scientific computing, machine vision, artificial

intelligence) is unquestioned, and computers with hundreds of processors are now readily available (for instance, the Butterfly or the many derivatives of the Cosmic Cube). However, these machines are programmed in essentially the same way as existing sequential machines. The best available parallel programming languages are variants of standard sequential languages, with extensions to let the programmer explicitly divide a program into tasks and pass information between those tasks. Although designers of these languages claim that they are no harder to use than conventional sequential ones, programmers still face the problem of figuring out how to partition their application into tasks in addition to the usual problem of translating it into a program. An appealing alternative is to leave partitioning of programs to compilers. By hiding partitioning problems from programmers, this approach should make multi-processor computers easier to program than they are now. Unfortunately efforts to develop parallelizing compilers have so far been rather unsuccessful.

The Chrysalis operating system for the Butterfly Parallel Processor presents an object-oriented programming environment based on shared memory. However, because of Chrysalis's low level orientation and its use of type-unsafe features of the C programming language, programs using the environment are difficult to program and highly error-prone. Using C as the primary programming language for the Butterfly does not fully realize the benefit of Chrysalis's object orientation. An object-oriented programming language is natural candidate for improving the Chrysalis environment. The C ++ programming language provides a number of advantages in developing such an interface. This paper reports the successes and problems encountered in the development of Chrysalis ++, a C ++ interface to Chrysalis ++ uncovered many strengths and weakness in C ++. Some apply to C ++ in general, others apply only to its adaptation

to a parallel programming environment. It is important to note that C++ is a sequential language; its use in a parallel programming environment is therefore outside the bounds of its design.

Contract No.: DAAL03-86-G-0050

There is an increasing need for high-performance AI machines. What is unusual about AI is that its programs are typically dynamic in the way their execution unfolds and in the data structures they use. AI therefore needs machines that are late-binding. Multiprocessors are often held out as the answer to AI's computing requirements. However, most success with

multiprocessing has come from exploiting numerical computations' basic data structure-the static array (as in FORTRAN). A static array's structure does not change, so its elements (and the processing on them) may be readily distributed. In AI, the ability to change and manipulate the structure of data is paramount; hence, the pre-eminence of the LISP list. Unfortunately, the traditional pointer-based list has serious drawbacks for distributed processing. The dynamic array is a data structure that allows random access to its elements (like static arrays) yet whose structure-size and dimensions-can be easily changed, i.e., bound and re-bound at run-time. It combines the flexibility that AI requires with the potential for high performance through parallel operation. A machine's implementation of

dynamic arrays gives a good insight into its potential usefulness for AI applications. Therefore, the authors outline the implementation of dynamic arrays on a machine that we are developing.

Although many distributed simulation strategies have been developed, to date, little empirical data is available to evaluate their performance. A multiprocessor-based, distributed simulation testbed is described that was designed to facilitate controlled experimentation with distributed simulation algorithms. Using this testbed, the performance of simulation strategies using deadlock avoidance and deadlock detection and recovery techniques was examined under various synthetic workloads. The distributed simulators were compared with a uniprocessor-based event list implementation. Results of a series of experiments are reported that demonstrate that message population and the degree to which processes can look ahead in simulated time play critical roles in the performance of distributed simulators using these algorithms. An avalanche phenomenon was observed in the deadlock detection and recovery simulators as message population was increased, and was found to be a necessary condition for achieving good performance. It is demonstrated that these distributed simulation algorithms can provide significant speedups over sequential event list implementations for some workloads, even in the presence of only a moderate amount of parallelism and many feedback loops. However, a moderate to high degree of parallelism was not sufficient to guarantee good performance for all workloads that were tested.

Contract No.: NAS1-18107

Perhaps the most critical problem in distributed simulation is that of mapping: without an effective mapping of workload to processors the speedup potential of parallel processing cannot be realized. Mapping a simulation onto a message-passing architecture is especially difficult when the computational workload dynamically changes as a function of time and space; this is exactly the situation faced by battlefield simulations. This paper studies an approach where the simulated battlefield domain is first partitioned into many regions of equal size; typically there are more regions than processors. The regions are then assigned to processors; a processor is responsible for performing all simulation activity associated with the regions. The assignment algorithm is quite simple and attempts to balance load by exploiting locality of workload intensity. The performance

of this technique is studied on a simple battlefield simulation implemented on the Flex/32 multiprocessor. Measurements show that the proposed method achieves reasonable processor efficiencies. Furthermore, the method shows promise for use in dynamic remapping of the simulation.

NASA's Office of Space Science and Applications (OSSA) gave a select group of scientists the opportunity to test and implement their computational algorithms on the Massively Parallel Processor (MPP) located at Goddard Space Flight Center, beginning in late 1985. One year later, the Working Group presented its report, which addressed the following: algorithms, programming languages, architecture, programming environments, the way theory relates, and performance measured. The findings point to a number of demonstrated computational techniques for which the MPP architecture is ideally suited. For example, besides executing much faster on the MPP than on conventional computers, systolic VLSI simulation (where distances are short), lattice simulation, neural network simulation, and image problems were found to be easier to program on the MPP's architecture than on a CYBER 205 or even a VAX. The report also makes technical recommendations covering all aspects of MPP use, and recommendations concerning the future of the MPP and machines based on similar architectures, expansion of the Working Group, and study of the role of future parallel processors for space station, EOS, and the Great Observatories era.

Country of Publication: United States

Contract No.: NAG1-613

The problem of recovering from processor failures in shared memory multiprocessor systems is examined. A cache-based checkpointing scheme is developed utilizing a checkpointing algorithm which guarantees that a consistent global state is always maintained. Processes can recover from errors due to a faulty processor by restarting from

the consistent saved computation state. There are no difficulties with checkpoint propagation in that when a process p takes a checkpoint, no other process is forced to join p in the checkpoint. The recovery algorithm allows only those processes encountering errors to perform rollback recovery while other unaffected processes on fault free processors continue normal execution. The checkpointing recovery schemes are shown to be easily integrated into standard bus-based cache coherence protocols. An analytical model is used to estimate the checkpointing frequency and the performance degradation incurred by the checkpointing scheme during normal execution.

The purpose of this thesis is to start the evaluation of the Transputer, a 32 bit microprocessor on a chip, to verify its potentials and limitations for real time applications, in distributed systems. The evaluation concentrates on the four physical communication links, and its advertised capability to operate in parallel with the main processor (CPU), each one

of them at rate of 10 mbit/sec in each direction. It also presents to the reader an introduction to the machine itself, to the Occam Programming Language, a description of the environment at the Naval Postgraduate School (NPS), and suggests to the novice a learning sequence. The evaluation programs and other example programs presented in this thesis were implemented using the Occam Programming Language (Proto-Occam) in either the Occam Programming System (OPS) or the Transputer Development System (TDS), both resident on the VAX 11/780 computer under the VMS Operating System (VAX/VMS).

This bibliography contains citations concerning the network architecture DECNET provided by the Digital Equipment Corporation. Topics include hardware and software for implementing communications between different computer operating systems. DECNET's ability to create resource sharing, communications networks, and distributed computing is examined by employing specialized protocol layers which serve the functions of network control, data access control, interprogram communications, and automatic error detection and retransmission. Applications for medical information systems, chemical laboratories, electronic mail systems, and industrial process control are presented. (This updated bibliography contains 86 citations, 28 of which are new entries to the previous edition.)

Contract No.: NCC2-387

The Fiber Distributed Data Interface (FDDI) and the SAE AE-9B High Speed Ring Bus (HSRB) are emerging standards for high-performance token ring local area networks. FDDI was designed to be a general-purpose high-performance network. HSRB was designed specifically for military real-time applications. A workshop was conducted at NASA Ames Research Center in January, 1987 to compare and contrast these protocols with respect to their ability to support real-time applications. This report summarizes workshop presentations and includes an independent comparison of the two protocols. A conclusion reached at the workshop was that current protocols for the upper layers of the Open Systems Interconnection (OSI) network model are inadequate for real-time applications.

This is the final report for the second contract phase for development of the CRONUS Project. CRONUS is the name given to the distributed operating system (DOS) and system architecture for distributed application development environment being designed and implemented by BBN Laboratories for the Air Force Rome Air Development Center (RADC). The project was begun in 1981. The CRONUS distributed operating system is intended to promote resources which are shared. Its major purpose is to provide a coherent and integrated system based on clusters of interconnected heterogeneous computers to support the development and use of distributed applications. Distributed applications range from simple programs that merely require convenient reference to remote data, to collections of

complex subsystems tailored to take advantage of a distributed architecture. One of the main contributions of CRONUS is a unifying architecture and model for developing these distributed applications; as well as support for a number of system-provided functions which are common to many applications.

An interpretation of avionics architecture is provided with respect to system components, organization, and design factors. Initially, general avionics architecture characteristics are addressed followed by discussions on emerging technologies and their impact on advanced systems. Information handling requirements are projected for future tactical aircraft. In addition, advanced avionics architecture design consideration and technical issues are addressed relative to achieving improved performance, reliability, survivability, flexibility, and low life cycle cost.

Country of Publication: United States

Contract No.: AC03-76SF00098

This report identifies a need to increase wide area network capacity by as much as three orders of magnitude over the next ten years. These increases are necessary to support new distributed computing products. Such products increase productivity, but are currently available only on local area networks. There is no technical reason for limiting these products to tightly constrained geographical areas, however. They can operate perfectly well over any terrestrial distance provided sufficient bandwidth is available. Such bandwidth is available today with fiber optics. To quantify capacity requirements, network traffic generated by this newer technology is compared with traditional traffic in a local network environment. An extrapolation to wide area networks is made. Speculation about the long term future of distributed computing technology and its effect on network capacity requirements is offered. It is argued that an increase of network capacity by one order of magnitude is sufficient to accommodate new distributed computing technology on existing wide area networks. Two orders of magnitude are needed to accommodate a fully integrated distributed system such as interactive graphics. Three orders of magnitude are needed to accommodate increases in hardware speed anticipated in the next five to ten years. Availability of highly integrated, nationwide distributed computing service would significantly increase the competitive edge of the United States in science and computing. (ERA citation 12:028235)

Contract No.: AC02-76ER03077; W-7405-ENG-36

We describe numerical computations on the Connection Machine, a massively parallel hypercube architecture with 65,536 single-bit processors and 32 Mbytes of memory. A parallel extension of COMMON LISP, provides access to the processors and network. The rich software environment is further enhanced by a powerful virtual processor capability, which extends the degree of fine-grained parallelism beyond 1,000,000. We briefly describe the hardware and indicate the principal features of the parallel programming environment. We then present

implementations of SOR, multigrid and pre-conditioned conjugate gradient algorithms for solving partial differential equations on the Connection Machine. Despite the lack of floating point hardware, computation rates above 100 megaflops have been achieved in PDE solution. Virtual processors prove to be a real advantage, easing the effort of software development while improving system performance significantly. The software development effort is also facilitated by the fact that hypercube communications prove to be fast and essentially independent of distance. 29 refs., 4 figs.

Durra is a language designed to support the development of large-grained parallel programming applications. This document is a preliminary reference manual for the syntax and semantics of the language. We are using the term description language rather than programming language to emphasize that a task-level application description is not translated into object code of some kind of executable machine language. Rather, it is to be understood as a description of the structure and behavior of a logical machine, that will be synthesized into resource allocation and scheduling directives. These directives are to be interpreted by a combination of software, firmware, and hardware in a heterogeneous machine. Although our ultimate goal is to design and implement a task-level description language that can be used for different machines and for varying applications, our first pass is influenced by both a specific architecture and by a specific application, the Autonomous Land Vehicle (ALV), and more specifically, the perception components of the ALV. We assume there is a cross-bar switch, intelligent buffers on the switch sockets, and a scheduler that can communicate with all processors, buffers, and I/O devices.

A rule-based expert system for configuring Local Area Networks (LAN) and for designing distributed database applications over them is described. The system includes a general-purpose inference machine for solving synthesis problems, based on two separated modules: the Tree Traversal and the Matcher. The former performs a recursive descent on a tree-structured solution space

and generates a description of requirements that the final solution should possess; the latter matches these requirements to existing commercial products. The inference machine and its concrete application to the design and configuration of LAN information systems are described.

A new method of automatic generation of concurrent programs which constructs arrays defined by sets of recursive equations is described. It is assumed that the time of computation of an array element is a linear combination of its indices, and integer programming is used to seek a succession of hyperplanes along which array elements can be computed concurrently. The method can be used to schedule equations involving variable length dependency vectors and mutually recursive arrays. Portions of the work reported here have been implemented in the PS automatic program generation system.

The optimal partitioning of random distributed programs is discussed. It is concluded that the optimal partitioning of a homogeneous random program over a homogeneous distributed system either assigns all modules to a single processor, or distributes the modules as evenly as possible among all processors. The analysis rests heavily on the approximation which equates the expected maximum of a set of independent random variables with the set's maximum expectation. The results are strengthened by providing an approximation-free proof of this result for two processors under general conditions on the module execution time distribution. It is also shown that use of this approximation causes two of the previous central results to be

false.

A large class of computational problems is characterized by frequent synchronization, and computational requirements which change as a function of time. When such a problem must be solved on a message passing multiprocessor machine, the combination of these characteristics lead to system performance which decreases in time. Performance can be improved with periodic redistribution of computational load; however, redistribution can exact a sometimes large delay cost. We study the issue of deciding when to invoke a global load remapping mechanism. Such a decision policy must effectively weigh the costs of remapping against the performance benefits. We treat this problem by constructing two analytic models which exhibit stochastically decreasing performance. One model is quite tractable; we are able to describe the optimal remapping algorithm, and the optimal decision policy governing when to invoke that algorithm. However, computational complexity prohibits the use of the optimal remapping decision policy. We

then study the performance of a general remapping policy on both analytic models. This policy attempts to minimize a statistic  $W(n)$  which measures the system degradation (including the cost of remapping) per computation step over a period of  $n$  steps. We show that as a function of time, the expected value of  $W(n)$  has at most one minimum, and that when this minimum exists it defines the optimal fixed-interval remapping policy. Our decision policy appeals to this result by remapping when it estimates that  $W(n)$  is minimized. Our performance data suggests that this policy effectively finds the natural frequency of remapping. We also use the analytic models to express the relationship between performance and remapping cost, number of processors, and the computation's stochastic activity.

Contract No.: NAS1-17070; NAS1-18107

The problem of optimally assigning the modules of a parallel/pipelined program over the processors of a multiple computer system under certain restrictions on the interconnection structure of the program as well as the multiple computer system was considered. For a variety of such programs it is possible to find linear time if a partition of the program exists in which the load on any processor is within a certain bound. This method, when combined with a binary search over a finite range, provides an approximate solution to the partitioning problem. The specific problems considered were: a chain structured parallel program over a chain-like computer system, multiple chain-like programs over a host-satellite system,

and a tree structured parallel program over a host-satellite system. For a problem with  $m$  modules and  $n$  processors, the complexity of the algorithm is no worse than  $O(mn \log(W \text{ sub } T/\epsilon))$ , where  $W \text{ sub } T$  is the cost of assigning all modules to one processor, and  $\epsilon$  the desired accuracy.

SUBJ: E-Mail with Mike Sullivan of Texas Instruments

In place of a trip to Texas Instruments which is not practical in the immediate future, I initiated an Arpanet E-mail conversation with Mike Sullivan of TI with regard to the implementation issues of putting their SARGE intelligent command and control system into a SIMNET SAFOR.

SARGE runs under TI's CACTUS simulation environment. CACTUS uses a hexagonal terrain data base. Sullivan indicates that they have in the past converted DTED databases to CACTUS so that converting the SIMNET terrain data base should be no problem.

SARGE now is implemented on Mac II hosted TI microExplorer in Lisp. Sullivan says that SARGE is for the most part Common Lisp compatible, but that parts use the Flavors object-oriented extensions. Thus porting to another Common Lisp platform would involve converting that portion of the code to CLOS (Common Lisp Object System). Also the user interfaces make use of the Mac II host graphics environment and Explorer window system. Thus another host would require complete rework of the user interface.

In order to use SARGE as part of a SIMNET SAFOR it would thus be necessary to add a MacII/microExplorer to the testbed. Since SARGE is under continual development there is also little in the way of documentation available, the best way to transfer it to IST would be to fund a visit to IST by TI personnel (or vice versa). Mike Sullivan thinks that incorporating SARGE into SIMNET should be doable.

Using this opportunity to mount a philosophical soap-box, it seems that the Command and Control portion of the SAFOR testbed is driven by the availability of software. TI's SARGE requires a microExplorer/MacII, Lawrence Livermore's ConMod requires a microVAX/Tektronix.

Rather than choose a SAFOR Command and Control software package now, it would be possible to acquire the hardware to host both SARGE and ConMod. The hardware costs are relatively minor compared to the savings in project labor. Project personnel would be assigned to establish a SIMNET interface protocol so that the two Command and Control packages could access a common SIMNET interface.

The strengths, weaknesses, computational requirements of these packages could then be evaluated as part of the SIMNET SAFOR. Any other packages that can be adapted to the SAFOR protocol (BBN, Perceptronics?) could also be hosted and evaluated.

Organizationally, it would be best to assign an individual to each the care and feeding of each Command and Control package. SARGE's skilled Lisper and ConMod's Ada-adept are not likely to be the same individual.

## CONFERENCE REPORT

DATES: April 26 & 27

NAME: Michael Companion  
Thomas Clarke

LOCATION: Orlando, Fl.

CONFERENCE: Interactive Networked Simulation for Training

SPONSOR: Institute for Simulation and Training/UCF

During the IST Simulation Symposium, the BBN Semi-automated Opposing Forces Software was discussed with Dr. Duncan Miller of BBN. Dr. Miller stated that the BBN OpFor software was not stable and would be unsuitable as the basis of a benchmark for the IST work. The software was undergoing extensive revision in light of performance limitations discovered during the March '89 Simnet exercise. Dr. Miller went on to discuss the OpFor software in more detail.

The BBN OpFor software runs on a multi-mode BBN Butterfly computer linked to several Symbolics workstations. In addition to handling Simnet interface, the Butterfly is programmed in C to handle the numerically intensive terrain-following, dead-reckoning, and trajectory-calculation tasks for the simulated vehicles in the opposing forces. The Symbolics workstations are "just that"; that is they are used to provide a user-friendly interface to the operators of the simulated forces. There appears to be very little expert system or rule-based software in the workstations.

The major performance bottleneck uncovered during the Simnet exercise was in the communication links within the OpFor software. Apparently the OpFor software is structured after a Command and Control model. Each simulated vehicle communicates reports, sightings, events etc., to the operator of the OpFor through the workstation. There is apparently no intelligence included for combining reports so that the reporting traffic is reduced. With the high density of vehicles that occurred during the exercise, the OpFor overloaded and missed frame updates.

Another remark by Dr. Miller indicated that the OpFor software was terrain dependent. This is a given, since the simulated vehicles have to follow terrain, allow for terrain in line-of-sight calculations and the like. However, Dr. Miller's remarks seemed to imply additional dependence, perhaps caused by having to hand optimize the software for a particular set of terrain.

In view of these considerations, the BBN OpFor package is not suitable for this research. It appears to be an unfinished product which applies only to a specialized terrain data base. It is interesting to note that BBN's partitioning of tasks, numerically intensive to Butterfly, human interface to Symbolics workstation, is similar to the kind of task partition that will be investigated with the test bed.

Another interesting conversation was had with Chuck Benton of TSI who has a DARPA SBIR grant to look at low-cost applications of transputers to Simnet. His experience may come be useful.

A possible source of benchmark software was identified in Betty Armistead of Simulation Technologies Inc. She is involved with the DWS (Distributed Wargaming Systems) project which is charge with being ultimately compatible with Simnet. Most interesting is that the software she used is considered GFE.

APPENDIX G

## TRIP REPORT

NAME: M. Companion

DATES: June 30, 1989

LOCATION: SPARTA, Inc., Huntsville Ala.

CONTACTS: Dr. G. Hassin, J. Watson, R. REynolds, C. Case and A. Jones.

I travelled to Huntsville to visit Sparta, Inc to discuss two topic areas. The first area was to explore and discuss a statement of work Sparta to develop a transputer based intervisibility model to support the Simulated Forces Project. The second area was to discuss Sparta's capabilities and ongoing/past efforts in the area of force-on-force simulation.

Sparta had reviewed the draft SOW and develop an estimate of the time and cost to develop a transputer based intervisibility model. The intent of this task is to explore the transputer requirements for the testbed and develop a baseline intervisibility model for the simulated forces model. We discuss the assumptions that Sparta had made in deriving their resource estimates and concluded that they had interpreted several task to be more detailed and formal than we intended. After agreeing to the basic output that was desired it would appear that it is possible to accomplish the transputer based intervisibility model within the targeted level of resources.

Sparta provided a detailed briefing of their force-on-force simulation capabilities. They have been involved in a number of efforts force a wide variety of customers. Their primary thrust has been in the area of simulating laser threats within the battlefield simulation. They are beginning some work for DARPA on laser threats for the SIMNET. The attached pages summarize their force-on-force simulation experience and the SIMNET force-on-force related activity.

One of the simulation models that Sparta has been developed is extremely relevant is AWSIM. This effort has been sponsored by MICOM, AMSAA and LABCOM. It is a computer simulation of close combat for combined arms armys. It utilizes digitized terrain, smoke/artillery dust effects and simulates up to battalion/regiment size scenarios. This model/simulation should be looked into in more depth for potential input to our effort. More detail is provided in the attachment.

It looks like Sparta is one of the companies that we will want to bid on the larger support effort to the simulated forces program. I have added to the statement of work we are discussing 20 hours to support front end analysis.

Attached is a hard copy of the Sparta force-on-force briefing.

- ESTABLISHED SOFTWARE TEST AND EVALUATION FUNCTION

TRIP REPORT  
JUNE 25-27, 1989  
BRIAN GOLDIEZ  
PITTSBURGH, PA & AKRON, OH

PITTSBURGH, PA

PURPOSE: Visit the Software Engineering Institute (SEI) at Carnegie-Mellon University

INDIVIDUALS CONTACTED: Dr. Mario Barbacci, Senior Member of the Technical Staff

DISCUSSION: The primary of this trip was to find out more about a software development environment called Durra. Several other activities of the SEI were also discussed which could be beneficial to the training and simulation community. The SEI is a Federally Funded Research and Development Center (FFRDC). They are funded by DARPA and chartered to do research work for the DoD.

Durra is a software development environment for heterogeneous computing systems. IST's interest in such a programming environment is dictated by trends toward the use of microprocessors and/or distributed computing architectures in training devices. Programming in environments where several different computing architectures are employed is not a straightforward matter. Systems issues related to timing of synchronous tasks, memory usage, communication, control, programming, etc. are not immediately apparent in heterogeneous environments. In addition, dynamic allocation of computing resources is normally not a feature considered in training devices.

Durra provides a development to develop software in heterogeneous environments. Its applicability to training devices is not clear, due to host computers used, timing, monitoring features, and control structures which would have to be developed for specific training applications. IST, though, will be receiving and installing Durra in our lab to address these issues. Initial applications will be with respect to our Networking and Intelligent Semi-Automated Opposing Forces tasks on the BAA. These two tasks represent loosely coupled and tightly coupled computer systems, respectively. IST will be the first sight to experiment with Durra.

Other activities at the SEI could be extremely appropriate to training. The SEI has developed training software using AI and the new Digital Video Interactive (DVI) chip technology being developed by Intel and IBM. This technology could be appropriate to Embedded Training, the classroom of the future, and other training technologies which could benefit from an on screen graphics capability. The SEI is also doing Object Oriented Design of simulation software modules. They have developed an OOD for a flight simulator engine module in Ada. Although this module operates correctly, it does not execute in realtime nor do I believe it is responsive to external interrupts typical of a realtime operating system. However, further insight into Ada development environments at the SEI could be useful to IST.

AKRON, OH

PURPOSE: Visit Loral Corporation to get information on multi-spectral data base

INDIVIDUALS CONTACTED:

James Horton, Manager of Business Development  
George Snyder, Manager of Radar Image Generator  
Andy Jansen, Engineering Manager HOT SHOT products

DISCUSSION: IST had expressed interest in data base generation and correlation techniques to Loral at several previous meetings. This visit was to review Loral capabilities in the data base generation and correlation area. Loral (formerly Goodyear Aerospace) has been involved in data base generation and correlation for over 40 years. This work had been primarily applied to weapon system application. The F-15 WST program, though, required radar generation capabilities which were not available. Loral has developed a radar simulator with correlation to actual terrain and the other sensors (several E-O sensors) on the F-15 aircraft. In addition, Loral makes several products for the DMA and Army (in support of Pershing II) which can generate and correlate sensor data with actual terrain rapidly. These products could potentially be applied to training devices.

Loral has also developed a part task trainer known as the HOT SHOT. This product simulates an F-15 or F-16 aircraft. Many of the training features of this device were explained and demonstrated. This device appears to offer training capability in some of the target engagement tasks of the design basis aircraft.

SUBJ: Trip Report of Visit to Perceptronics and LLNL

On June 28 and 29 Ernie Smart and I traveled to Perceptronics and Lawrence Livermore National Laboratory. Ernie traveled in support of the Army IQC and I traveled to gather information for the SAFOR project. In what follows I will discuss the results of the trip primarily from the SAFOR viewpoint as I believe Ernie has covered the business and IQC aspects of the trip in his report.

#### Perceptronics

At Perceptronics we met with Azad Madni, Phil Handley and Michael Fielding. Madni is the Division Manager of AI and Man-Machine Systems at Perceptronics. Fielding is a Division manager of same, and Handley is a Product line manager for simulation systems.

The discussion at Perceptronics centered on their COMBAT-SIM battle simulation system. This system is based on either PC/AT or MicroVAX computers. Visuals are provided by a videodisc player.

COMBAT-SIM is designed to simulate the military command environment to train commanders. It has no intelligence at echelons below the user interface level. Because of its lack of intelligence, and dependence of canned images, COMBAT-SIM would have little utility in SAFOR.

There was also some discussion with Madni of a proposal that Perceptronics was submitting to IST "Context Template-Driven SAFOR Modeling and Simulation". I was able to examine this proposal in detail after the trip. It proposes research designed to produce a design for a SAFOR using the template AI technique. Since the proposal is for design, not implementation, and since implemented SAFOR command and control systems are available from Texas Instruments (see companion report) and from Lawrence Livermore (see below), this proposal should not be considered as part of the IST SAFOR effort.

Lawrence Livermore National Laboratory  
Conflict Simulation Laboratory

At LLNL's CSL we met with Dr. Ralph Toms and Arnold S. Warshawsky. Toms and Warshawsky are the principal scientists in CSL. The LLNL management structure is such that CSL has only two line positions. Other positions are staffed by military personnel and by personnel borrowed from other parts of LLNL.

The mission of CSL is to simulate conflict in order to evaluate the utility of the weapons developed at LLNL. The emphasis at CSL is thus a bit different from battle simulations developed for training purposes. CSL simulations include extensive logging and analysis capability. The emphasis is on making it easy for the operator to control the simulation, not on accurately modelling the military command environment. The learning curve for CSL simulations is reported to be very short. Nevertheless, some CSL simulations have found use in training.

The most mature simulation product of CSL is Janus (the Roman god, not an acronym). Janus is a "classic" battle simulation with players sitting at graphics control stations and interacting through the simulated battle. It has no internal intelligence for simulated echelon levels not explicitly controlled by players. Janus is written in FORTRAN, is hosted on a VAX/VMS and used Tektronix 4225 terminals as display stations. Because of its lack of intelligence, Janus will probably be of little use in SAFOR.

The CSL product that may be of use in the SAFOR project is ConMod. As the attachment indicates, ConMod explicitly models the military command and control hierarchy. Echelons below the user level have intelligence needed to develop Operation and Task Orders for lower echelons, to Coordinate with parallel echelons, and to submit Status reports to higher echelons. Like Janus ConMod has an easy to learn graphic user interface.

Significantly, ConMod separates modeling the physical world of actual force-on-force conflict, from the cognitive world of military command and control. This explicit separation should facilitate using ConMod as the intelligent command and control interface to a SIMNET SAFOR. The model or simulation of the physical conflict would be replaced by an interface to the SIMNET environment. ConMod appears to be a data driven system, so that customizing the force structure for the SIMNET SAFOR should be just a matter of creating the appropriate data files.

ConMod is written in Ada and runs on a VAX/VMS and uses a Tektronix 4225 for interface. Since ConMod should be available at nominal cost, it would seem wise to insure that the testbed has the capability of hosting ConMod. Ada is allegedly portable between machines so that one of the 80386 hosts should be able to run ConMod. There are always nagging machine dependent incompatibilities however, so that it might be easier to procure a MicroVax host. No decision has to be made now as the IST Networking Lab is procuring a VaxStation with Ada so that the various possibilities can be explored. The graphic interface depends on the availability of Tektronix hardware, so that a Tek 4225 needs to be procured to insure ConMod compatibility.

---

## The ConMod Simulation

The Conflict Model (ConMod) is an automated, high-resolution, large-scale, AirLand Battle simulation at the corps level with the capability to model echelons-above-the-corps. It is designed as an analytic tool to enable the user to examine activities of a military conflict involving air and ground forces engaged in deep, rear, and close combat. It simulates selected aspects of combat, combat support, and combat service support, covering a geographical extent of hundreds of kilometers, with a time period of days. ConMod is primarily intended for evaluating existing and proposed combat systems, tactics, and doctrine in order to provide timely evaluation and recommendations to policy makers. While designed as an analytic tool, ConMod is also adaptable to research, operational support, and training purposes.

Founded on control system theory, ConMod takes an object-oriented approach to the modeling of military systems. Generic military objects with scenario dependent links form military organization hierarchies and command and control networks. Planning may be automated below a selectable organizational level. The model uses high resolution physics for the simulation of movement, acquisition, engagement, and communication. Physics calculations are based on the engineering data for individual item systems.

Using 3D digitized terrain, typically on a 250-meter grid, the model has a comprehensive system support environment. ConMod is written in the Ada programming language under the VAX/VMS operating system and is currently under further development on computer systems of the VAX 8000 class. Currently, its high-resolution, color graphics user interface runs on Tektronix 4120/4225 series workstations.

---

---

## CONMOD DESIGN CONCEPTS

ConMod emphasizes five significant features in its conceptual design. These are: (1) command and control (C2) representation based on control system theory, (2) separation of the cognitive aspects of the simulation from the physical aspects, (3) cause and effect audit trail, (4) discrete event simulation, and (5) extensible model architecture. The rationale for these features stems from ConMod's objectives. Each of these will be discussed in turn, bearing in mind that the aim of this or any simulation is to represent those characteristics of the system that are pertinent to the problem under study.

### Theoretical Background

For automated command and control, a control theory approach to organizations provides a theoretical foundation. In this structure, the cognitive aspects of the problem, namely, command and control, can be viewed separately from the physical aspects. Each military entity is viewed as a generic object residing in a control system, receiving and sending signals which effect its state or alter the states of other objects. The signals become the generic events of a discrete event simulation. Objects are, therefore, related not to other objects but to the actions they are effected by and cause. Within this overall organizational framework, the control agent is modeled using a theory of management.

### Cognitive Plane and Physical Plane Separation

The organizations interact on two separate but related planes: the cognitive plane and the physical plane. Each independent organization has its own cognitive plane, but it shares a physical plane with all other independent organizations. Thus, there is a single physical plane but a cognitive plane for each of the opposing forces.

This separation of the problem recognizes two distinct types of modeling effort. The physical plane deals with physical processes such as sensing, moving, engaging, and communicating. The cognitive plane emphasizes the management processes; planning, directing, controlling, coordinating and reporting.

### Cause and Effect Audit Trail

In a model whose purpose is analysis, the ability to identify cause and effect is vital. In the ConMod design, a mechanistic viewpoint is imposed whereby all effects have a known cause and all effects are calculable. This is achieved by requiring two entities: objects and actions. When two objects interact through an action, there are also two events: the cause event and the effect event.

---

---

### Discrete Event Simulation

The need for a cause and effect audit trail combined with the need to examine individual item systems leads to a discrete event simulation. ConMod is conceived as an event driven, variable resolution model. The simulation proceeds through the execution of scheduled (queued) events. One event is either an object initiating an action (cause event) or an object being acted upon (effect event).

Since ConMod resolves events down to selected item systems on digitized 3-D terrain, it becomes possible to use actual locations for determining range and range-dependent variables, such as the probability of hit and probability of kill (Ph and Pk). This allows cause and effect to be established using the actual locations and actual times for discrete events, particularly sensing and engaging. These low-level events are modeled stochastically.

### Extensible Model Architecture

Constant change is the norm of the military world. In order to accommodate the future changes in weapons systems, organizations, operations, tactics, and doctrine, ConMod adopted an object-oriented development method. Since a clear distinction is made between cognitive and physical processes, future extensions that utilize knowledge based system concepts can be facilitated.

---

---

## COMMAND AND CONTROL SIMULATION CHARACTERISTICS

In this section, the important simulation features relating to command and control are further developed. First the control system and organizational theory are applied to combat simulation. Then the cognitive/physical separation is described. Next military organizations are shown as they fit into the structure, and their management functions are described.

### Control System Theory

A system can be defined as a group of objects interacting with each other through well defined actions and behaving as a unified whole with respect to the system's environment.

A control system is composed of two subsystems: (1) a controller and (2) a producer. The controller attempts to control the producer's behavior in the presence of environmental interactions.

A metacontrol system is a special kind of control system. Metacontrol is the control of a controller. This has the effect of distributing or stacking control through various levels, as is commonly done in organizations.

An organization behaves as a control system. It attempts to control its producers in the presence of interactions with the physical environment. An organization is the union of a management metacontrol system and a production control system.

A hierarchical organization has a layering of management metacontrollers in its management metacontrol system in order to provide the desired span of control of a number of specialized production control systems. Typical organizational structures may be constructed by combining features from a centralized structure and a decentralized structure. In the centralized organization, high level managers may exert control down several levels, including control of production controllers, while in the decentralized organization, high level management controllers only control other management controllers.

### Cognitive and Physical Separation

As described previously under design concepts, the C2 system in ConMod is separated from the physical combat processes. In the model, this is expressed in terms of planes—two cognitive planes, one for each opposing side in the conflict; and one physical plane, for the interaction of forces. In terms of organizational theory, the C2 system is the management metacontroller, and the force system is the production control system.

The C2 system is composed of cognitive objects related by cognitive actions. It lies entirely in the cognitive plane of its respective side. The configuration of a C2 system may be customized to reflect a particular hierarchical organizational structure.

The force system is composed of active and passive physical objects. Active physical objects include such things as single weapon systems, tactical groupings (aircraft flights, tank platoons, etc.), command posts, logistics centers, and communications centers. Passive physical objects include such things as unissued supplies, unissued equipment, unassigned personnel, and barriers. The force system may interact with the C2 system through the management actions;

---

---

planning, directing, controlling, coordinating, and reporting. The force system also interacts with the common environment system and may cause physical actions which affect objects in the common environment.

Common environment objects lie in the physical plane. They include terrain, vegetation, hydrographic features, and cultural features, as well as weather, radiation, and chemical contamination.

It should be noted that the interaction between two opposing sides occurs only in the common physical plane. There is no direct connection between cognitive planes. Thus, ConMod excludes what might be termed political processes, such as direct negotiations between the cognitive parts of opposing sides. Blue has no way of directly manipulating Red's cognitive processes. This implies, for example, that if Blue wants to deceive Red, it has to manipulate objects or events in the physical plane that Red might misinterpret.

#### Generic Objects in Military Organization Hierarchies

The extensibility objective of ConMod's development requires a conceptual architecture and software design which will allow for continuous expansion of the number and kinds of military functionalities represented. It is recognized that the partitioning of military activities into functional areas is largely doctrinal. Military entities typically perform tasks in more than one functional area. In consideration of differing organizational doctrine on both sides as well as to allow for future developments, the discussion of military entities is in generic terms.

ConMod must be able to model a wide variety of military forces and organizations. Because of the differences in doctrine, size, organization, procedures, and equipment between scenarios that can be modeled, ConMod uses a number of generic objects whose characteristics are specified by the analyst to represent real world decision making groups or fighting objects. ConMod also allows the analyst to specify lines of command and communication so that he can assemble these customized objects into a military structure that represents the real world structure of whatever force is being modeled. This modeling approach is called object-oriented.

The object-oriented approach satisfies the need for flexibility and extensibility. An analyst examines the military forces and weapon systems of interest and chooses a generic modeling object that best performs the operational functions required at each of the real world command organizations or by each of the fighting units. After selecting the appropriate generic objects, the analyst must customize them by specifying a data base of characteristics that direct their performance during the simulation. For example, if the analyst wants to model a U.S. M1A1 tank platoon, he would choose a generic Close Combat Unit (CCUN) and specify the speed, range, firepower, vulnerability, etc. of M1A1 tanks. After establishing the appropriate characteristics, the analyst specifies the chain of command that ties subordinates and superiors together as well as communications links that allow coordination within the chain of command or with organizations in other command structures.

In ConMod each object is a finite state machine. The state of each object at any time during the simulation depends on: (1) its characteristics specified at the beginning of the simulation, (2) the actions of other objects on it, (3) its actions on other objects. The actions on a cognitive object by other cognitive objects in the C2 system are: (1) directives it receives from its superiors through the command lines, (2) coordinations it receives through communication links, (3) reports it receives from subordinates. If the object is a physical object in the force system, its state is not only influenced by the directives it receives from superiors, and coordinations it receives through communication links but also by the environment, by what its sensors detect, and by the result of any combat action.

---

---

Objects within the force system of each side are tactical groupings appropriate to the resolution of the simulation. Some examples are artillery batteries, command posts, and aircraft flights. Active force system objects are capable of performing specialized tasks in the physical plane. One way to express this specialization is to consider that each force system object has its own specific language. For example, artillery batteries use a language that is distinct from that used by aircraft flights. The language specific activities performed in the C2 system are represented by what may be termed authority centers.

The cognitive authority centers are mapped into real world military objects. The mapping allows flexibility in designating, for any particular force structure, who performs a specific cognitive activity. By closely relating these objects to real world entities, such as command posts, their behavioral characteristics can be demonstrated.

Two types of authority centers have been included in the ConMod concept: (1) control authorities at the lowest level, and (2) mission authorities at higher levels. These are shown in Figure 1.

A control authority exercises tactical control over a group of specialized force system objects. Some examples are Artillery Control Authorities (ARTYCA), Close Combat Control Authorities (CCCA), and Air Defense Control Authorities (ADCA). Control authorities receive an operation order from a superior and attempt to execute the order by issuing detailed tasking to assigned force system objects. Control authorities report their status to their superior and may request support for their operation through coordination channels when authorized.

Mission authorities exercise operational control over subordinate forces. They receive a broad directive which includes allotments of forces and resources. The language of mission authorities reflects the types of operations their subordinate control authorities can execute. Mission authorities may also control other mission authorities of the same type. This is indicated in Figures 2 and 3. Examples are Force Mission Authorities (FMA), Ground Mission Authorities (GMA), and Air Mission Authorities (AMA). Mission authorities issue mission directives and operation orders to their subordinates. They may request support for their mission through coordination channels when authorized.

#### Management Processes for Command and Control Objects

Each C2 object is a management entity capable of performing five processes: (1) planning, (2) directing, (3) controlling, (4) reporting, and (5) coordinating. Management processes must be customized for a particular C2 object; however, the data flow between processes is generic to all C2 objects.

Key to the management process is the local data maintained by each C2 object: (1) the plan, (2) the perceived situation, and (3) policy data. The plan may be either the result of an automated planning process or, for those objects in a manual planning mode, a manually prepared plan. Plans conform to constraints imposed by a superior on its subordinate through a directive. The perceived situation is updated from information received through feedback and coordination. The perceived situation has three aspects: (1) environmental perception, (2) threat perception, and (3) friendly perception. The environmental perception includes current knowledge of objects in the common environment. Threat perception includes current knowledge of objects in the opposing organization's force, fused to the appropriate level for planning. The friendly perception includes current knowledge of other objects in the same organization, including immediate subordinates. Policy data is characteristic data used by the management processes. Policy data contains information with doctrinal and procedural implications.

---

CONMOD COMMAND AND CONTROL THEORY

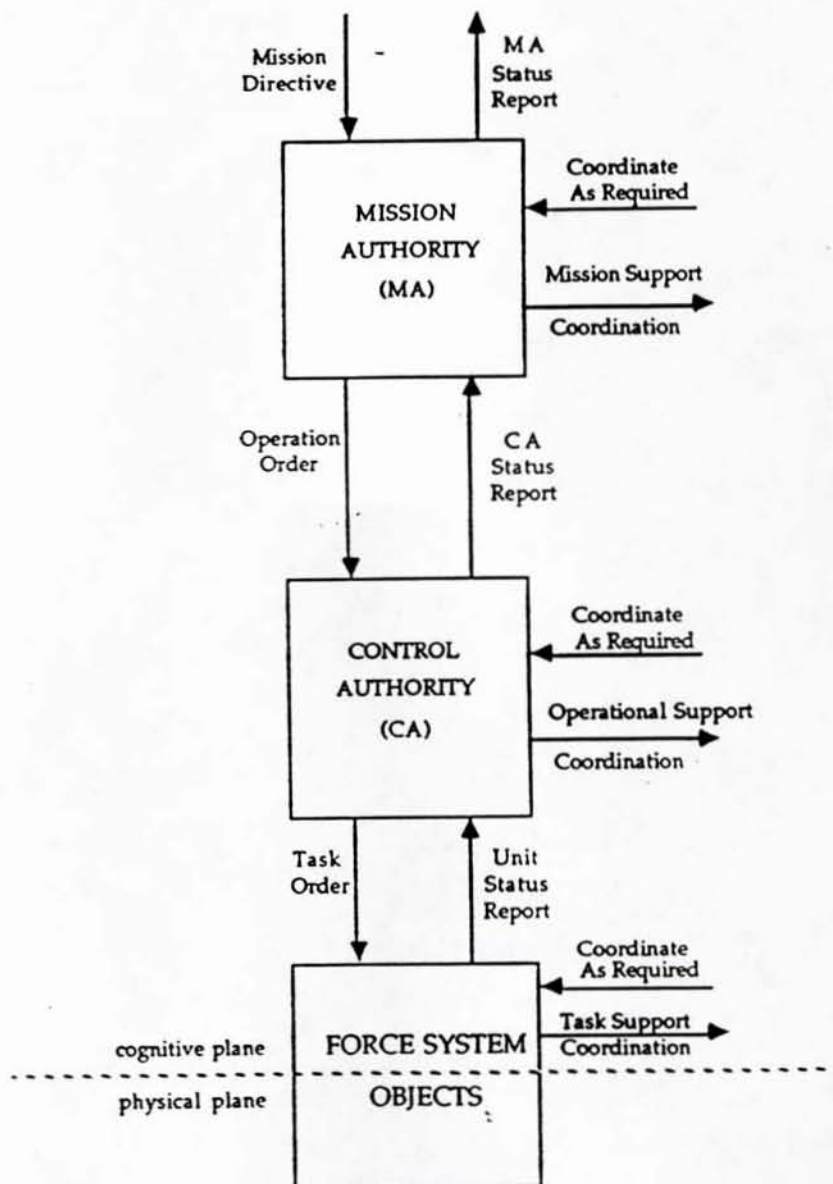

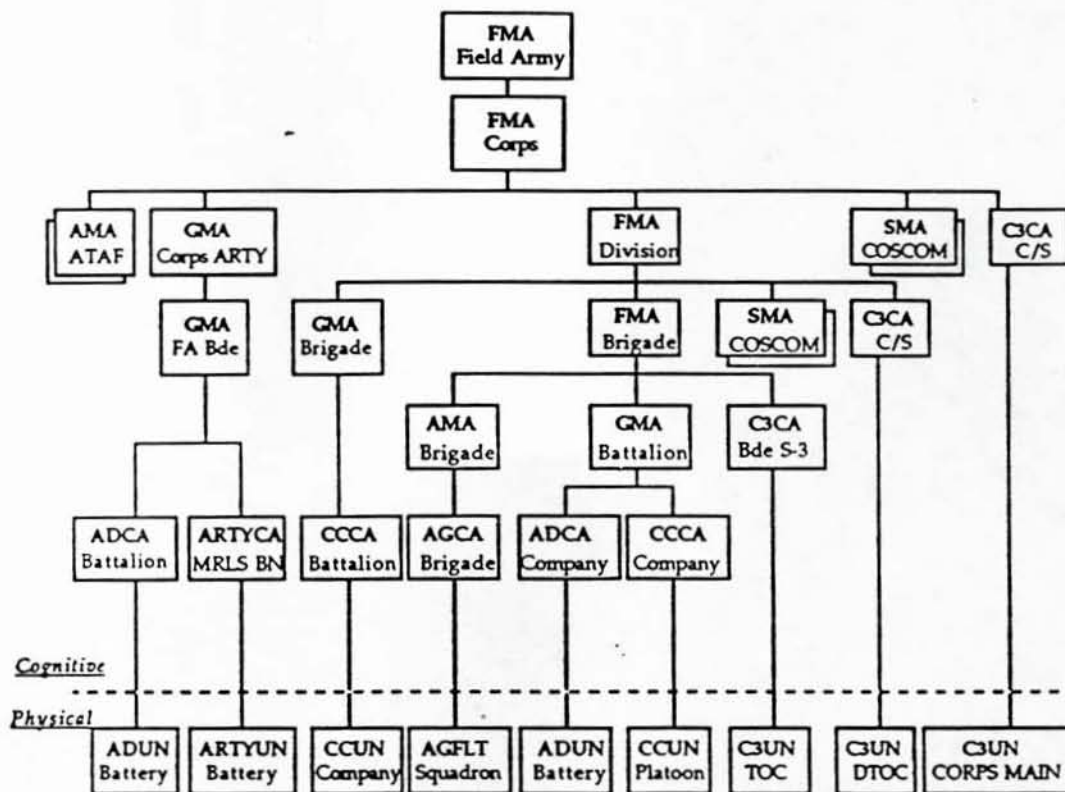

Figure 1.

One possible arrangement of  
GROUND COMPONENT COMMAND AND CONTROL

In this diagram, the generic military objects (FMAs, GMAs,...) depict various levels of command. Modeling the simulation with generic objects results in the same generic object representing different levels of military activity. For example, depending on the level of abstraction, FMAs and GMAs occur at various echelons of command.

Figure 2.

One possible arrangement of  
AIR COMPONENT COMMAND AND CONTROL

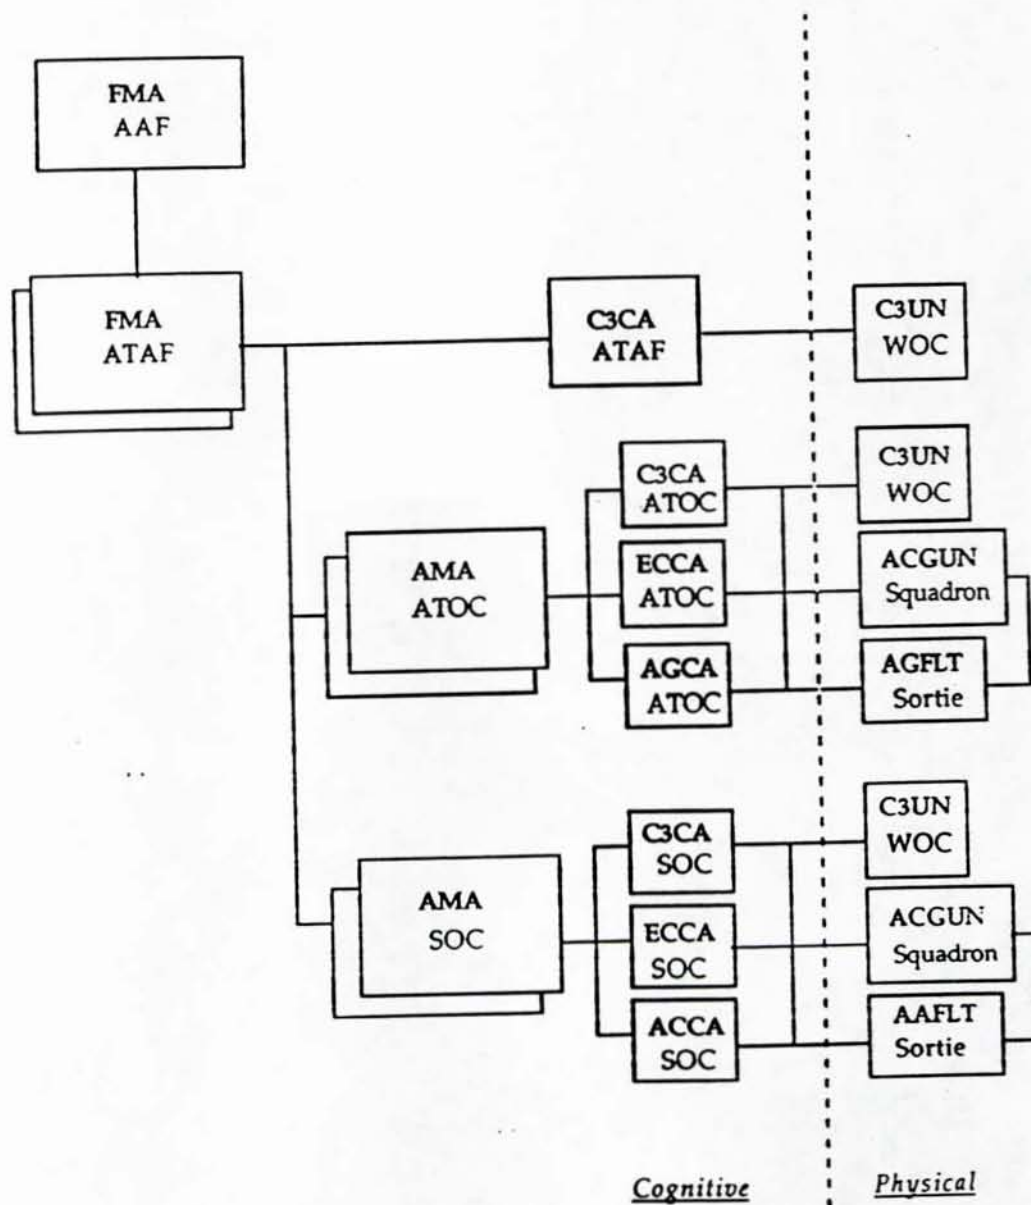

Figure 3.

## OBJECTS

Objects are the significant military entities in the simulation whose state changes are recorded in the simulation history for analysis purposes. Listed below are the objects that represent the cognitive authority centers and the physical force objects.

### Mission Authorities:

Force Mission Authority	(FMA)
Ground Mission Authority	(GMA)
Air Mission Authority	(AMA)

### Control Authorities:

#### Command, Control, and Communication:

C3 Control Authority	(C3CA)
----------------------	--------

#### Ground Combat:

Close Combat Control Authority	(CCCA)
Artillery Control Authority	(ARTYCA)
Military Intelligence Control Authority	(MICA)
Electronic Warfare Control Authority	(EWCA)
Air Defense Control Authority	(ADCA)

#### Air Combat:

Air to Ground Control Authority	(AGCA)
Air to Air Control Authority	(AACA)
Reconnaissance Control Authority	(RCCA)
Resource Management Control Authority	(RMCA)

### Force Objects

#### Command, Control and Communication:

C3 Unit	(C3UN)
---------	--------

#### Ground Combat:

Close Combat Unit	(CCUN)
Artillery Unit	(ARTYUN)
Fire Support Target Generator	(FSTG)
Military Intelligence Unit	(MIUN)
Electronic Warfare Unit	(EWUN)
Air Defense Unit	(ADUN)
Air Defense Target Generator	(ADTG)

---

---

Air Combat:

Air to Ground Flight	(AGFLT)
Air to Air Flight	(AAFLT)
Aircraft Generation Unit	(ACGUN)

Force Mission Authority (FMA)

The FMA is the combined arms manager. It provides the campaign guidance and operational control of assigned FMA's, GMA's, AMA's, and C3CA's. The FMA receives a Mission Directive and graphic control measures from a superior FMA or the analyst/planner. The FMA then: analyzes its environment, threat and friendly situation; develops its plan; coordinates as required; and issues the appropriate FMA Mission Directives, GMA Mission Directives, AMA Mission Directives, and C3CA Operations Orders with associated graphic control measures. It receives the status reports of assigned FMA's, GMA's, AMA's and C3CA's and issues its own status report to its superior FMA.

The FMA is the cognitive activity which plans and provides high level force integration command and control. It does not provide detailed air and ground directives to its subordinate FMA's, GMA's, AMA's and C3CA's. It provides only the commander's intent in terms of a broad directive and the allotment of major forces and resources in support of a main effort or campaign.

A scenario example of an FMA is a US Corps.

Ground Mission Authority (GMA)

The GMA provides campaign guidance to subordinate GMA's and operational control of assigned C3CA's, ARTYCA's, and C3CA's. The GMA receives a Mission Directive and graphic control measures from its controlling GMA or FMA. The GMA then: analyzes its environment, threat, and friendly situation; coordinates as required; develops its plan; and issues GMA Mission Directives, C3CA Operations Orders, ARTYCA Operations Orders, and C3CA Operations Orders. It assesses the ground campaign through information received from the status reports of subordinate GMA's, C3CA's, and ARTYCA's. The GMA provides operational control of its C3 infrastructure through subordinate C3CA's.

A scenario example of a GMA is a US Armored Battalion.

Air Mission Authority (AMA)

The AMA provides campaign guidance to subordinate AMA's and operational control of assigned AGCA's, AACCA's, RMCA's, and C3CA's. It receives an AMA Mission Directive and issues AMA Mission Directives and subordinate CA Operations Orders. It assesses air campaigns through information received from the status reports of subordinate AMA's. It assesses air to ground and air to air operations through information received from CA status reports. The AMA may coordinate with other mission authorities when authorized. It provides operational control of its C3 infrastructure through a subordinate C3CA.

A scenario example of an AMA is an Allied Tactical Air Force.

---

---

#### Command, Control and Communication Control Authority (C3CA)

A C3CA is assigned to a mission authority to provide tactical control of the C3UN's which comprise the mission authority's C3 infrastructure. The C3CA receives a C3CA Operations Order from a mission authority and composes tasking orders for its assigned C3UN's. The C3CA receives coordinations and issues C3CA Operation Support Coordinations. These coordinations are the means by which messages are passed from cognitive objects for transmission by a physical C3UN.

A scenario example of a C3CA is a US TAC Command Post.

#### Close Combat Control Authority (CCCA)

The CCCA provides tactical control of assigned CCUNs. The CCCA receives an Operations Order and graphic control measures from a GMA. The CCCA then: analyzes its environment, threat, and friendly situation; develops its plan; coordinates as required; and issues CCUN Task Orders and graphic control measures. It receives the status reports of assigned CCUNs and issues its own status report to its GMA. It is the cognitive activity which plans and controls the execution of a close combat operation. The CCCA does not provide support to other agencies but does have other agencies supporting it. Supporting agents may be Air Ground Flights (AGFLT's), Artillery Units (ARTYUN's), Fire Support Target Generator's (FSTG's), or Artillery Control Authorities (ARTYCA's).

A scenario example of a CCCA is a US Mechanized Battalion.

#### Air Ground Control Authority (AGCA)

The AGCA provides tactical control of assigned Air Ground Flights (AGFLT's). The AGCA receives an operations order including graphic control measures from an Air Mission Authority (AMA). The AGCA creates a plan and implements the plan by issuing AGFLT Task Order and coordinating with others as required. It receives the status reports of its subordinates and issues a status report to its superior AMA. It is the cognitive activity which controls the execution of air to ground operations to include: Battlefield Air Interdiction (BAI), Close Air Support (CAS), Air Interdiction (AI), and Offensive Counter Air (OCA).

A scenario example of an AGCA is a US Tactical Air Control Center (TACC).

#### Command, Control and Communication Unit (C3UN)

The C3UN is the force system object which provides a physical signature representing command posts, communications posts, and sensor posts. It may serve as a physical host unit for mission authorities and control authorities. It is tactically controlled by a C3CA.

A scenario example of a C3UN is an E-3A Airborne Warning and Control System (AWACS) aircraft.

---

---

#### Close Combat Unit (CCUN)

The CCUN is the force system object which provides for physical execution of close combat tasks. The CCUN is normally a grouping of individual homogeneous items systems, but can be an individual item system. Moving and sensing are performing from a single location within the unit template, with capabilities determined from the aggregate of its individual item system properties and template. The CCUN selects which item systems will engage, and engagement is performed at item system resolution. It is tactically controlled by a CCCA.

A scenario example of a CCUN is a US Tank Company.

#### Air Ground Flight (AGFLT)

The AGFLT is the force system object that provides for the physical execution of an air to ground attack mission. The AGFLT is normally a flight or grouping of aircraft item systems although it can consist of a single item. Moving, sensing and engaging are all performed using the flight as the object. The AGFLT is launched and recovered by an Aircraft Generation Unit (ACGUN) and is tactically controlled by an AGCA.

A scenario example of a AGFLT is a flight of four F-16s.

---

# Conflicting Organizations

Each organization performs distinctively cognitive and physical activities.

# Planning

The planning activity creates a plan which meets the requirements of the directive and tasks each subordinate in accordance with its capabilities.

The planning activity follows a METT-TC (mission, enemy, troops, terrain, time) methodology appropriate to the function of the planner.

## Reporting

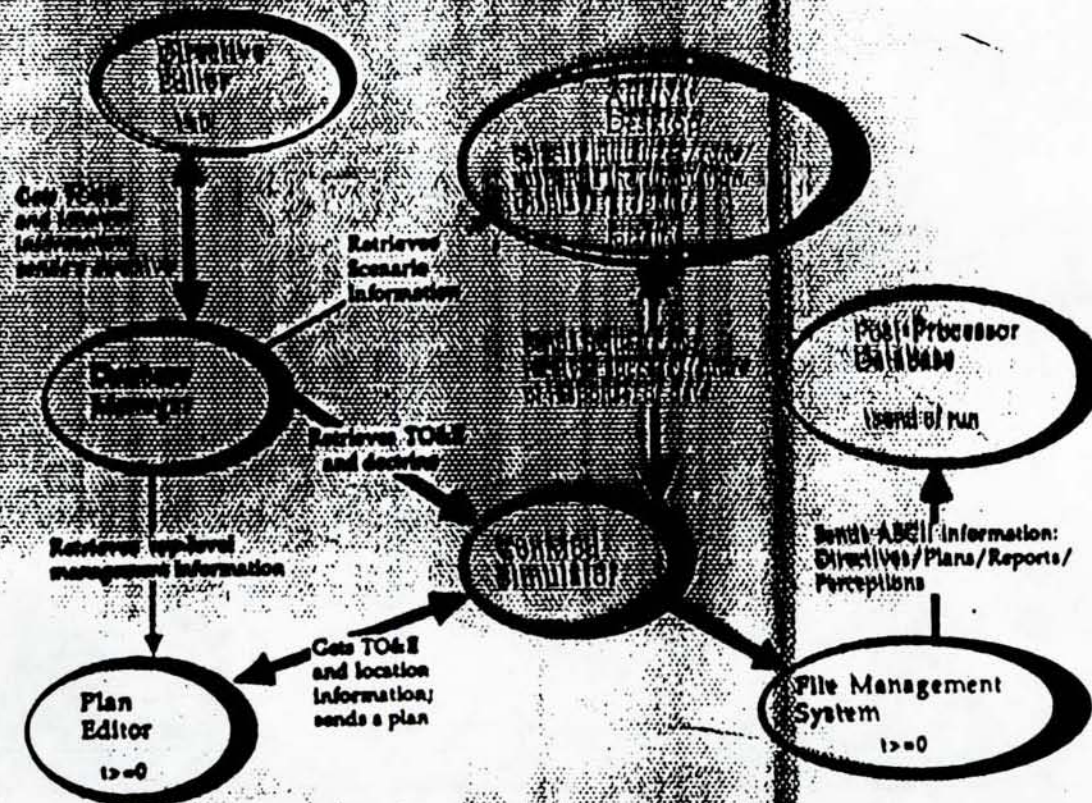

The reporting activity consolidates subordinate status reports to maintain current perceptions.

# ConMod's Design Allows for Distributed Processing

## TRIP REPORT

NAME: E. Smart

DATES: May 1989

LOCATION: Ft. Leavenworth, BDM, Monterey CA., Perceptronics, Los Angeles

Several locations were visited during this trip. The trip was taken in support of the PM TRADE IQC. During the trip issues related to simulated forces were pursued with the intent of paving the way for follow up visits by technical people on the simulated forces project.

BDM and Perceptronics are both involved in work related to simulated forces. Invitations for follow-up visits to both locations were received.

A number of contacts related to the simulated forces effort were made at Ft. Leavenworth. Initial discussions were held with Mr. Herb Westmoreland of the Battle Command Training Program Office, Lt. Col. John Strand of the Future Battle Laboratory and Mr. Bernard of the Combined Arms Training Activity (CATA). The Future Battle Laboratory is the primary contact for the seamless simulation issues which we will need to address. At the CATA, which is responsible for battle simulation hardware requirements, a demonstration of a prototype PC-based data logger was viewed. The prototype development was sponsored by Ft. Knox. This low cost alternative data logger appears suited to our needs.

## TRIP REPORT

NAME: T. Clarke  
DATES: May 10, 1989  
LOCATION: SPARTA, Inc., Huntsville Ala.

On May 10 I met travelled to Huntsville to visit SPARTA Inc. SPARTA desires to use transputers on the SIMNET and had contacted DARPA who referred them to PM TRADE who referred them to IST. I decided to visit them under the RISC HiTech grant to investigate, and see whether there might be any possibility of collaboration.

I met with James Watson, head of SPARTA's Advanced Data Processing Laboratory in Huntsville, and was introduced to Bill Fiorentino who manages the Development Engineering Operations. Dave Auld, an Inmos sales engineer, drove over from Atlanta.

Sparta has developed their XP (Xpandable Parallel) coprocessing system under sponsorship of Rome Air Defense Center and NASA. The XP consists of AT bus expansion chassis containing Inmos T800 transputer cards interfaced to an AT host. The demonstrated the XP running an SDI battle simulation using 22 processors and also executing finite element structural analysis (NASTRAN) using 32 processors. The NASTRAN code was ported from FORTRAN to the Occam language used in the XP using a SPARTA developed FORTRAN to Occam translator. Jim Watson said that arrangements could be made for IST to use this translator to translate the NTSC flight simulator benchmark. SPARTA is also a beta site for transputer Ada and would work with us on Ada applications.

SPARTA's desire is to use their transputer expertise together with hardware support from Inmos to develop a transputer based visual system for use on SIMNET/C<sup>2</sup>T<sup>2</sup>. Dave Auld's back of the envelope calculations indicate that 256 T212 (16 bit) transputers could meet C<sup>2</sup>T<sup>2</sup> CIG requirements for less than \$100K. They are probably a little late for this round of C<sup>2</sup>T<sup>2</sup> but their system would be a very intriguing SIMNET CIG.

Inmos has a university grant program that would pay for the CIG hardware at IST. Jim Watson indicates that he needs about \$50K to cover expenses of doing work at IST.

I think we should pursue the IST/SPARTA/Inmos collaboration. I was very impressed with SPARTA's transputer expertise and this is a very good opportunity to learn a lot about this technology rapidly. For a fairly small sum we can leverage a lot of hardware and software expertise. As the attached white paper details, the SPARTA/Inmos technology will also have applications in OpFor as well as the visual area. The SPARTA/Inmos CIG is a RISC simulator application so a few \$K from the RISC HiTech would be very appropriate (maybe SPARTA will open an Orlando office.) The remainder could come from some combination of visual and DARPA OpFor funds.

Note that SPARTA is a small business and they are willing to come to Orlando for discussions.

## TRIP REPORT

NAME: M. Companion

DATES: May 18, 1989

LOCATION: CCI (Consultant's Choice Inc.), Roswell GA.

While on personal business in Atlanta, I scheduled a visit to Consultant's Choice Inc. (CCI) in Roswell, GA. This visit was arranged subsequent to discussions with IIM (Integrated Inference Machines) who develop LISP based coprocessors boxes for AT class machines. They indicated that CCI was developing a neural network based battle simulation that ran on their machine. At CCI I met with Paul Lampru, Senior Project Manager responsible for their intelligent systems work.

CCI is a small business that is a spin-off from Georgia Tech Research Institute. Their initial area of endeavor was in the intelligence area and they are still heavily involved in that area. The primary areas that we discussed were in the areas of battle simulation and terrain data bases.

The project that CCI is working on with IIM is the development of a battlefield situation assessment simulation based on nested neural nets. They are heavily involved in systems which integrate both symbolic (rule-based) processes and neural nets. They are one of the few people that we have found to have actual experience in multi-architecture software systems for battle simulation. This expertise is directly applicable to some of our initial concepts for the testbed.

They are also heavily involved in the development of tactical terrain data bases for the Army based on object oriented programming which has direct application to our simulated forces activities.

They identified several potential areas where they might be considered for technical support to the program.

1. Object oriented programming for terrain and transfer into the IIM machine.
2. Providing tactical synthetic terrain data.
3. The development of neural networks, their application and integration with other software simulations.
4. Conversion of programs from sequential to transputer architectures.

6000031
