ABSTRACT

The Army Project Manager for Training Devices (PM TRADE) identified a need in 1988 to categorize training relevant technology. The need was driven by PM TRADE's desire to provide investment guidance to industry and government, and to identify technology gaps in training technology. A strategy to manage this technology investment has been implemented for PM TRADE by the University of Central Florida's Institute for Simulation and Training. Key elements of the strategy include a technology integration plan, an automated data base of supporting facts and specific information, and a news bulletin published quarterly for PM TRADE. These elements will be used to communicate and coordinate technology initiatives with industry, academia and other government organizations. The framework for the technology integration plan and the data base is comprised of descriptions of fields of endeavor (technology areas, such as visual systems technology). The information in the relational data base fuels the continuing assessment of technology trends, and summarizes technology activities. Consideration is being given to making as much of the data base as possible open to wide spread access while including industry sensitive information for use within the government only. The total strategy is expected to be beneficial by: (1) leveraging available Army funding for training technology, (2) aiding PM TRADE incorporation of advanced technology into fielded training systems, and (3) publicizing key technology efforts supporting Army training systems.

PREFACE

This is the final report for a component of a contract from the Army Project Manager for Training Devices (PM TRADE) to the Institute for Simulation and Training (IST) of the University of Central Florida (Contract N61339-88-D-0009, Delivery Order 0001). This report deals with PM TRADE's technology investment strategy and specifically several ways of gathering, evaluating and disseminating information relating to research and development for Army training systems. The authors wish to express their appreciation to the following PM TRADE personnel for their contributions to the research described in this report: Dr. Ronald Hofer, Mr. Stan Goodman, Ms. Connie Fischer, Mr. Dennis Kriha, and Mr. Ray Green. Mr. Ernie Smart of IST served as Program Manager. Other IST personnel contributing to the project included Mr. Kevin Uliano and Dr. Norm Lane (consultant).

An Information Base for PM TRADE'S Technology Investment Strategy

INTRODUCTION

The state-of-the-art in simulation and training technology must be advanced in order to meet the increasing training requirements caused by increased weapon system complexity. In its technology investment strategy, PM TRADE has the mission to develop and advance the state-of-the-art in simulation and training device technology with the overall goal of producing more efficient Army training systems.

In creating an investment strategy, the agency making the investment must be considered. This report discusses the investment being made primarily by the government, and to a lesser extent by industry. The primary objective of the technology investment strategy is to identify and promote the transfer of technology into fielded capabilities. A fundamental element of the strategy is to capitalize on existing government, university and industrial programs and facilities. It is critically important that government communicate its research needs and thrusts to a broad community in order for technology advancements to occur across several fronts. It is the goal of PM TRADE to communicate these research needs in order to facilitate a dialogue with various laboratories. This dialogue will provide the seed for specific research efforts which can be funded in a variety of ways.

Three vehicles developed in this project for communicating technology needs and accomplishments are described in this report:

- Technology Research Integration Plan, organized around technology areas, called "fields of endeavor."
- data base residing on PM TRADE's LAN (local area network) which contains descriptions of projects and technoques important for the technology base supporting the Army's training systems.
- news bulletin, Training Systems and Devices, which highlights PM TRADE'S key research and development projects.

Technology Investment

In order to describe technology investments properly, it is necessary to define who the investor is, what the investment consists of, and what can be expected as a return on the investment. In the case of technology, the investor is a government, industry, or academic entity. Although these investors make their investments for different reasons, the outcomes of the investment are not necessarily inconsistent.

The government (particularly PM TRADE) makes financial investments in the technology base in order to keep an active industrial base able to meet emerging training requirements in a cost and training-effective manner.

Firms in the industrial sector make investments in technology to meet customer requirements and enhance their competitive position in future procurements.

Groups in the the academic sector make technology investments to increase the knowledge base, to satisfy man's inquisitive nature, and to provide an environment conducive to learning.

Several disturbing trends in technology investment are noteworthy. Research funding from all government sources has been declining for several years. Industrial investment in Internal Research and Development (IRAD) is stagnating in order to keep overhead costs down. Research funding in the academic community is being fueled to an increasing extent through foreign investment. These trends have been related with a decline in technology investment, profits and competitiveness.

Technology Assessment

The goal of technology assessment is to provide insight into the use of research efforts which impact training and simulation. In addition, the goals of technology assessment must be related in time to short term and long term efforts. The timing of research is critical. Short term technology efforts tend to be oriented to a specific training device or training deficiency, while long term efforts tend to be less specific with respect to product application. (For the purpose of this report, five years or less is considered a short term assessment.)

Technology has a profound impact on the simulation and training development process. Technological advances affect simulation and training from the definition of the requirements of a training system to the logistics support of fielded devices. In addition, technological impacts on a particular weapon system often drive training device capabilities and requirements.

In order to limit the scope of PM TRADE's technology assessment and data base development, technology assessment and categorization was limited to technologies which manifest themselves in a piece of training equipment. This includes not only hardware and software systems, but also innovative ways which must be developed to assess the cost and training effectiveness of a particular implementation of technology.

Managing the sheer bulk of technological information relating to simulation and training has been a problem. Industry has not always had access to necessary information from the government to make informed decisions in managing their technology investment.

It is important to have a consistent set of rules in order to assess technology. The Technology Research and Integration Plan and associated data base developed by IST provide these ground rules. The construct of a field of endeavor provides the primary building block for developing the integration plan and data base. These fields of endeavor are technology thrusts considered vital for emerging training systems.

Both the data base and the technology integration plan are organized around the following fields of endeavor:

- Engagement Simulation and Instrumentation Technology
- Real-time, Man-in-the-loop Simulation Technology
- Low Cost, Complexity Training Simulation Technology
- Visual Simulation Technology.
- Training Acquisition Technology
- Artificial Intelligence and Interactive Information Technology

Each field of endeavor discussion establishes a domain of emerging or advancing technological opportunity. The goal of the integration plan and data base is to provide a means to capitalize on technology investment by assessing research efforts within the context of long term Army training requirements. These requirements include:

- increased substitution of simulation approaches (stand-alone devices and/or embedded capabilities) for conventional training and practice on operational equipment.
- the need to prepare for lower aptitude personnel operating and maintaining increasingly sophisticated equipment.
- systematic approaches for reducing recurring and nonrecurring training costs.
- training capabilities suited for National Guard and Reserve Component use.
- increased use of artificial intelligence (AI) technologies.
- increased application and system integration of new and emerging techniques for graphical representation of ideas, concepts, and simulated battle environments.
- use of microcomputers for delivering technical information and training.
- use of large-scale multi-player simulation networking.

These general requirements provide a framework for considering investment strategies which can be applied by the government and industry to meet specific emerging training requirements.

SPECIFIC PRODUCTS

Technology Research and Integration Plan

This document describes fields of endeavor (see Appendix E) and provides a baseline assessment of relevant technology's impact on training and simulation. The methodology can also provide research entities a forum to inform the government of research, and a means to receive feedback on the Army's perception and assessment of current technology efforts. The major fields of endeavor currently contained in the integration plan include:

Engagement Simulation and Instrumentation

- Pairing Systems*
- Range Instrumentation*
- Targets*
- Robotics*

Real Time Man-in the-Loop Simulation Technology

- Simulation Networks*
- Battlefield Simulations*
- Modular Design Standards*
- Standard, Reusable, Rapidly Reconfigurable Data Bases*

Low Cost/Complexity Simulation

- Novel Techniques for Low Fidelity Training Devices*
- Test Bed for Cost/Training Effectiveness Evaluations*
- Generic Reconfigurable Designs*

Visual Simulation Technology

- Visual Presentation Technologies*
- Visual Performance*

Training Acquisition Technology

- Total Training System*
- Representation and Simulation*
- Optimization of Training Device Cost and Effectiveness*
- Embedded Training*
- Training Cost Effectiveness Relationships and Data Bases*

Artificial Intelligence and Interactive Informational Processes

- Automated Instructional Process*
- Job Aiding*
- Natural Language Interfaces*
- Voice Technology*

In developing the technology integration plan, IST was faced with the task of devising a way to accumulate and catalogue current technology thrusts. This may appear to be a straightforward task, but it proved and still proves to be a challenging effort. The first challenge was to devise a way to manage the sheer magnitude of available data related to training and simulation. The second challenge was to develop a methodology to organize the data in a manner suitable to the consumers of such data. The third challenge was to develop a means to safeguard sensitive data, and fourth was to provide an incentive for data providers to provide such data.

IST used classical systems engineering principles to meet these challenges in developing a system which can capture, catalogue, and assess technology. The systems engineering process recognizes the need for refinement and therefore offers a series of feedback loops to allow refinement of processes and procedures as development proceeds. This process began and continues to evolve to meet the needs of both consumers and providers of technology relevant to training and simulation.

The amount of information necessary to assess the impact of technology on a particular field of endeavor is quite large. Initially, members of IST thought visits to industrial, government and academic sites would provide the required information. This approach proved to be unsatisfactory for several reasons. The first reason relates to the efficient use of resources. Data gathering is a time consuming matter when the data is located in diverse geographic locations and in diverse forms. IST's staff simply was not prepared to embark on such a task.

Secondly, two other constraints would make such a task impractical even if resources were available. Researchers are often constrained by the nature of desired data. In the case of technology development, much of the data was proprietary in nature and there was a natural reluctance of many industrial organizations to part with their Internal Research and Development efforts to an intermediary, such as IST.

Also, research and development efforts tend to be dynamic. Therefore, gathering such data would prove to be impractical unless the entity was staffed to such a degree that data could be gathered on an almost continuous basis.

PM TRADE and IST have developed a method to alleviate the problems noted above with respect to data gathering. IST has reviewed pertinent training and simulation documentation with respect to research and development initiatives from all three services. Such documents as the Army's Aviation Simulation Master Plan and Navy 2000 documentation have been reviewed by IST.

In addition, specific laboratory programs, such as the Air Force's Helmet Mounted Display efforts, have been reviewed. These documents, available from many government sources (in the unclassified versions) formed a basis for an initial technology assessment. This assessment is reflected in the Technology Integration Plan for Training Systems and Devices.

Data Base

The data base to cross-reference research programs is being developed using the Technogy Integration Plan. Data base development is at an early stage of development, but once fully developed, the data base will serve multiple purposes. It will be used as a source of information to analysts and engineers seeking information on the state-of-the-art in training and simulation. This data base will also be used to identify the technology thrusts necessary to meet the training requirements of the future. A sample data entry form is provided in Figure 1.

Figure 1 Sample Data Entry Screen for Data Base

The form is suitable to report research efforts and references which have an impact on training and simulation.

IST has been making inputs into this data base for several months. As part of the data base entry process, IST has been evaluating the man-machine interface of the data base in an alpha test site mode.

Consideration is being given to upgrading the data base to accept industrial inputs with limited access applied to protect proprietary data. As much of the data base as possible would be accessible; industry-sensitive information would be for use within the government only. Using any combination of government, academic, or industrial entities, providers of information will be able to designate what type of users can view the data. This limited access capability should eliminate industry reluctance to share R&D efforts.

The information in the data base fuels the continuing assessment of technology trends and summarizes known technology activities. A relational structure will allow accessing information in the data base according to goals and objectives developed within the fields of endeavor.

The data base includes four secondary categories for organization: Lead Systems Engineering, Mission Area Management, Areas of Technology, and Training Device categories. Topics falling under these secondary categories are listed in Table 1.

Lead System Engineering

Air Defense Artillery or Air Defense
 Aviation
 Battle Simulation
 Command and Control
 Close Combat Heavy
 Close Combat Light
 Communications
 Combat Service Support
 Combat Training Centers Communications
 Engagement Simulation
 Engineer, Mine Warfare
 Fire Support
 Intelligence, Electronic Warfare
 Maneuver Simulation
 Nuclear, Biological, Chemical
 Ranges and Targets
 Special Operations Forces
 Technical Integration Liason Officer
 Technical Planning and Integration

Mission Areas Managers

Air Defense Artillery or Air Defense
 Ammunition
 Aviation
 Base Support
 Command and Control
 Close Combat Heavy
 Close Combat Light
 Communications
 Combat Service Support
 Engineer, Mine Warfare
 Fire Support
 Intelligence Systems Management
 Information Systems Management
 Nuclear, Biological, and Chemical
 Science and Tech Base
 Special Operations Forces
 Test and Evaluation
 Training

Areas of Technology

Artificial Intelligence
 Computer Hardware
 Computer Image Generation
 Computer Software
 English
 Flight Dynamics Simulation
 Field Training Devices
 Human Factors
 Neural Networks
 Terrain Data Bases
 Training Transfer

Training Devices

Air Defense Artillery or Air Defense
 Aviation
 Command and Control
 Close Combat Heavy
 Close Combat Light
 Communications
 Combat Service Support
 Engineer Mine Warfare
 Fire Support
 Intelligence, Electronic Warfare
 Nuclear, Biological, and Chemical
 Ordnance
 Quartermaster
 Special Operations Forces
 Transportation

Table 1 Additional Categories for Data Base Organization

Figure 2 depicts how these key descriptors are linked.

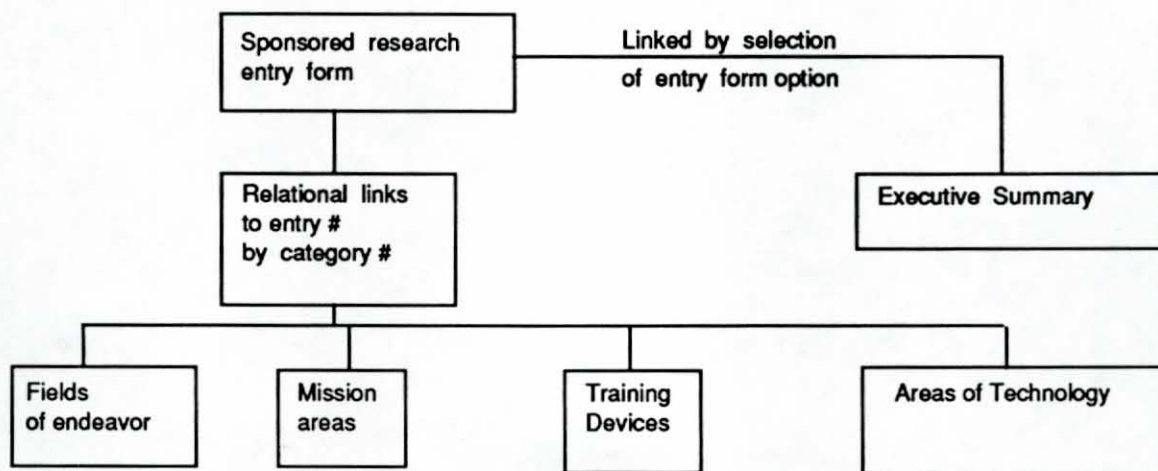

Figure 2 Data Base Approach Showing Linking of Key Descriptors

Data Base Overview The data base is written in Informix and resides on the TRADE LAN which runs under a Xenix operating system. The data base is designed to be used by engineers and scientist at PM TRADE. IST is responsible for filling the data base.

The data base production involves three major efforts: 1) designing and implementing the data base at PM TRADE, 2) designing in-house data base at IST, 3) filling the data base with appropriate material. Figure 3 depicts the process of data into the PM TRADE base. It also shows the process of creating data at IST and batch transmissions to PM TRADE using sending/receiving utilities.

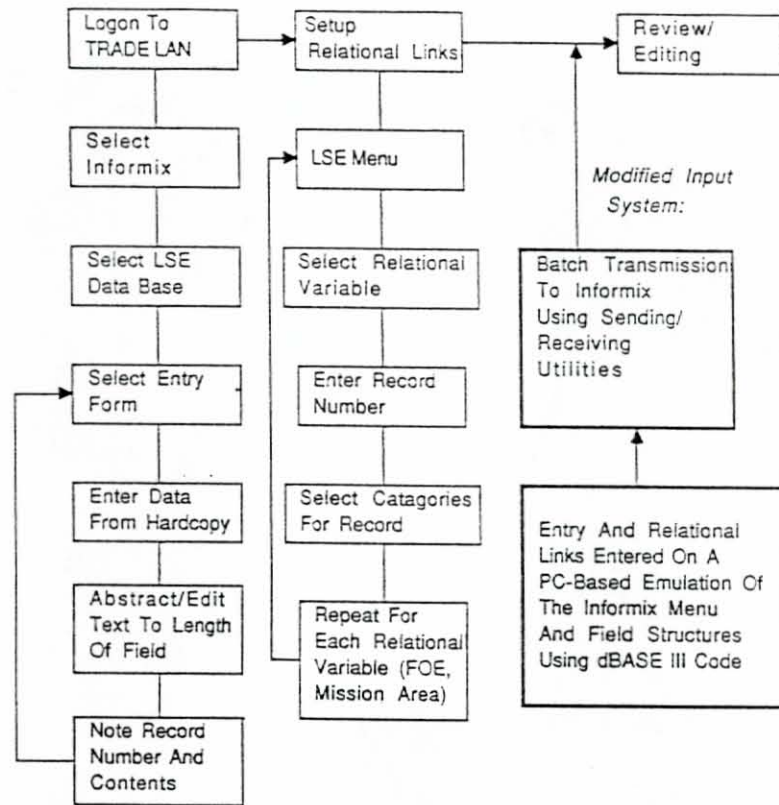

Figure 3 Data Base Entry Procedure

The in-house data base is designed to emulate the IST/PM TRADE data base. It is made to be used by IST personnel for data entry - the use of the in-house version reduces entry time by approximately 2/3. It is written in Clipper and can be used on any DOS based PC. The data is stored in three separate data bases. Once the data is entered and edited (usually between 20 and thirty records) it is batched and delivered to PM TRADE to be entered into the main data base. For more information on the batching procedure reference, see Appendix B. Appendix C contains the computer code to allow an interface between IST and PM TRADE interfaces.

Data Dictionary Description The full data dictionary is contained Appendix A. Information within the fields in the first screen of the database are as follows:

- *Field Number:* Each field is assigned a unique number. The fields are arranged within the dictionary in Field Number order. Field Numbers have no effect on searching.
- *Field Name:* This is the name of the field that must be used to formulate searches and displays.
- *Full Name:* Full Name is a more complete name of the field, and appears whenever that field is displayed.

- *Format:* Format defines the maximum length and the type of characters within the field. N indicates numeric and C indicates alphabetic character. For example, Field 1, Entry Number, has a format N5, which means the field may contain anywhere from 1 to 5 numeric characters.
- *Content:* Content is a narrative explanation of the purpose and nature of the field. Content can also provide special notes about the data. Sometimes an abbreviation is entered in a field in place of data.
- *Examples:* Unlike the other elements of the data dictionary, Examples does not always appear. It appears only when needed to better illustrate the nature of the data beyond what is provided in the Format and Content elements.

News Bulletin

Training Systems and Devices is a newsletter produced quarterly by the Institute for Simulation and Training under contract to PM TRADE. The newsletter is designed to highlight new programs and technology thrusts important for emerging training systems and devices.

The TSD newsletter was first distributed at the 1988 Interservice/Industry Training Systems Conference and has been mailed out upon publication since. Circulation is over 1000 and includes agencies in government, industry, and academia. Additional copies are given out at various meetings and conferences, bringing total readership to 2000.

Although most of the articles have dealt with PM TRADE projects, plans are to solicit manuscripts from outside agencies. Currently, the articles are written based on interviews conducted by TSD editors. The articles then enter a review cycle, followed by layout and publication.

The Spring 1989 issue of TSD is contained in Appendix D. Topics covered in this issue include:

- Shoot Through Obscuration Miles (STOM)
- Upgrade of Opposing Force (OPFOR) Vehicles
- Reduced Crew Vehicles
- Computer Simulation.

CONCLUSIONS

Anticipated benefits of the total strategy (the plan, the news bulletin and the data base) include:

- Communicating and coordinating trends, goals, and objectives of Army training and simulation technology.
- An investment strategy which uses available Army funding to leverage the advancement of technology without duplication.
- A source of current information for use by PM TRADE technical personnel for enhancing technology transfer into fielded applications.
- A source of information by industry, academia, and other government agencies of key PM TRADE R&D projects in support of training systems.

Appendices

Appendix A

PM TRADE Data Dictionary

APPENDIX A

PM TRADE DATA DICTIONARY

FIELD NO: 1
FIELD NAME: ENTRY_NUM
FULL NAME: ENTRY NUMBER
FORMAT: N5
CONTENT: The number is assigned automatically by the data base. The user can query certain records by using wildcards. For example, >3 instructs the system to search for all records greater than 3.

FIELD NO: 2
FIELD NAME: ENTRY_DATE
FULL NAME: ENTRY DATE
FORMAT: C8
CONTENT: The date the data were entered into the system.

FIELD NO: 3
FIELD NAME: SUBJ
FULL NAME: SUBJECT
FORMAT: C60
CONTENT: As much of the article title as can be fitted into the field.

FIELD NO: 4
FIELD NAME: EXEC_S
FULL NAME: EXECUTIVE SUMMARY
FORMAT: C1
CONTENT: The data base has the capability of including or linking an executive summary along with the regular abstract. This capability is quite helpful especially when dealing with complex articles that cannot be summarized within the boundaries of the regular abstract. When X is present, it tells the user there is a more elaborate summary included.

FIELD NO: 5-11
FIELD NAME: SUMMARY1-SUMMARY7
FULL NAME: SUMMARY
FORMAT: C60
CONTENT: Narrative description of the technical objective and/or research approach of an effort.

FIELD NO: 12
FIELD NAME: CHG_DATE
FULL NAME: DATE OF LAST CHANGE
FORMAT: C8; MM/DD/YY
CONTENT: Used to identify the date that minor corrections (spelling, etc.) were made to the record.

FIELD NO: 13
FIELD NAME: ORIG
FULL NAME: ORIGINATOR
FORMAT: C40
CONTENT: Name of first author, publishing company, or institution.

FIELD NO: 14
FIELD NAME: LOC
FULL NAME: LOCATION
FORMAT: C20
CONTENT: Location of the complete article, report, 1498, etc. in the library. To our purposes it will be IST followed by a letter and a number.

EXAMPLES: IST E-40, IST A-01

FIELD NO: 15
FIELD NAME: TYPE_DOC
FULL NAME: DOCUMENT TYPE
FORMAT: C5
CONTENT: Specifies which of the nine different types of document the record pertains to. Acceptable values:

TCHR	-	Technical Report
JART	-	Journal Article
SART	-	Symposium Article
BOOK	-	Book
UREP	-	Unpublished Report
TREP	-	Trip Report
GRF	-	Government Reporting Forms
CREP	-	Contract Report
BF	-	Briefings

FIELD NO: 16
FIELD NAME: REVIEWED
FULL NAME: REVIEWED (LSE/FOE): Y/N
FORMAT: C1; YES/NO
CONTENT: This entry will reveal if the information was reviewed by a Subject Matter Expert (SME).

FIELD NO: 17
FIELD NAME: INITIALS
FULL NAME: INITIALS
FORMAT: C3
CONTENT: Name initials of the SME.
EXAMPLES: JPK (J. Peter Kincaid)

FIELD NO: 18
FIELD NAME: IST
FULL NAME: IST: (Y/N)
FORMAT: C1; YES/NO
CONTENT: Verifies if the SME is from IST (Institute for Simulation & Training)

FIELD NO: 19
FIELD NAME: CLASSIF
FULL NAME: CLASSIFICATION
FORMAT: C1
CONTENT: Acceptable values:

U - Unclassified
C - Classified

FIELD NO: 20
FIELD NAME: GRAPHICS
FULL NAME: GRAPHICS FILE
FORMAT: C40
CONTENT: This field informs that there is an off-line graphic file included. For our purposes, we do not have the resources to add these kind of files.
EXAMPLES: CAT files

FIELD NO: 21
FIELD NAME: GRANT
FULL NAME: CONTRACT\GRANT
FORMAT: C40
CONTENT: The name and/or number of the contract or grant funding the project.

FIELD NO: 22
FIELD NAME: NUM
FULL NAME: NUMBER
FORMAT: C26
CONTENT: Numbers of the contract instrument used to fund the contract or grant associated with Field 21. Contract numbers are entered as found in the source data, except that semicolons are removed. Multiple contracts are separated by semicolons.
EXAMPLES: N66001-83-C-0358; MDA903-85-C-0169

FIELD NO: 23

FIELD NAME: S_DATE
FULL NAME: START DATE
FORMAT: C8; (MM/DD/YY)
CONTENT: Date the effort began or will begin. If date is unknown, the default value is 00/00/00. If day is unknown, 01 should be entered; for example, June 1984 is stored 06/01/84.

FIELD NO: 24
FIELD NAME: C_DATE
FULL NAME: EST COMP DATE
FORMAT: C8; (MM/DD/YY)
CONTENT: Date the work was completed or the estimated completion date. If date is unknown the default is 00/00/00.

FIELD NO: 25
FIELD NAME: ORG
FULL NAME: FUNDING ORGANIZATION
FORMAT: C40
CONTENT: Name of the funding organization providing the contract\grant in Field 21.

FIELD NO: 26
FIELD NAME: METHOD
FULL NAME: PERFORMANCE METHOD
FORMAT: C10
CONTENT: Describes the method used to perform the study.
EXAMPLES: Survey, literature review, operational testing

FIELD NO: 27
FIELD NAME: SOA
FULL NAME: ADVANCED S.O.A.
FORMAT: C3
CONTENT: An X in this field indicates that the research is intended to advance the state of the art.

FIELD NO: 28
FIELD NAME: ECD
FULL NAME: ENHANCING CURRENT DEVICES/SIMULATIONS;
IDENTIFY DEVICES
FORMAT: C3
CONTENT: An X in this field indicates that the scope of the research is to enhance current devices in relation to the field of simulation and/or identify devices.

FIELD NO: 29
FIELD NAME: RA
FULL NAME: RISK AVOIDANCE
FORMAT: C3
CONTENT: An X in this field indicates that the research is intended to avoid risk in the development of simulation and training devices (by for example, making the equipment more reliable.)

FIELD NO: 30
FIELD NAME: FY_RES
FULL NAME: FY
FORMAT: C4
CONTENT: Last two digits of the fiscal year of which funding information is provided in Field 21, Contract/Grant.
EXAMPLES: 89

FIELD NO: 31
FIELD NAME: WORK_YRS
FULL NAME: PROF WORK YEARS
FORMAT: C4
CONTENT: Pertains to the standard man (work) years, which is equivalent to 2080 hrs, that will take to finish the project. When dealings with 1498's, it refers to the estimated resources for the fiscal year, Field 30.

FIELD NO: 32
FIELD NAME: FUNDS
FULL NAME: FUNDS
FORMAT: C8
CONTENT: Total amount of financial resources available for the project. When dealing with 1498's, it refers to the estimated funding for the fiscal year, Field 30.

FIELD NO: 33
FIELD NAME: DOD_NAME
FULL NAME: DOD ORGANIZATION NAME
FORMAT: C40
CONTENT: DoD organization responsible for the project.
EXAMPLES: Marine Corps Development and Education Office,
Army Research Institute

FIELD NO: 34
FIELD NAME: DOD_ADDR1
FULL NAME: DOD ORGANIZATION ADDRESS
FORMAT: C53
CONTENT: First line of postal address of the responsible DoD organization named in Field 33.
EXAMPLES: Building 5

FIELD NO: 35
FIELD NAME: DOD_ADDR2
FULL NAME: DOD ORGANIZATION ADDRESS
FORMAT: C53
CONTENT: Second Line of postal address of the responsible DoD organization named in Field 33.
EXAMPLES: Cameron Station

FIELD NO: 36
FIELD NAME: DOD_ADDR3
FULL NAME: DOD ORGANIZATION ADDRESS
FORMAT: C53
CONTENT: Third line of postal address of the responsible DoD organization named in Field 33.
EXAMPLES: Alexandria, VA 22314

FIELD NO: 37
FIELD NAME: DOD_CONT
FULL NAME: CONTACT
FORMAT: C40
CONTENT: Name of the individual, from the responsible DoD organization, from whom additional information may be obtained. Entered as last name, first initial (without a period), and military rank (if appropriate). Other titles (e.g., Dr.) are not used. Each portion is separated by a space.

FIELD NO: 38
FIELD NAME: DOD_PHONE
FULL NAME: PHONE
FORMAT: C12
CONTENT: Telephone number (commercial, Autovon, or both) for the responsible individual in Field 37. Entered in standard telephone number format.
EXAMPLES: 619-225-2056;933-2056

FIELD NO: 39
FIELD NAME: PERF_NAME
FULL NAME: PERFORMING ORGANIZATION NAME
FORMAT: C40
CONTENT: The organization actually performing the project. Abbreviations are used where necessary.
EXAMPLES: Essex Corp., Boeing Inc, Arizona State Univ.

FIELD NO: 40
FIELD NAME: PERF_ADDR1
FULL NAME: PERFORMING ORGANIZATION ADDRESS
FORMAT: C53
CONTENT: First line of postal address of the performing organization named in Field 39.
EXAMPLES: Building 5

FIELD NO: 41
FIELD NAME: PERF_ADDR2
FULL NAME: PERFORMING ORGANIZATION ADDRESS
FORMAT: C53
CONTENT: Second line of postal address of the performing organization named in Field 39.
EXAMPLES: Cameron Station

FIELD NO: 42
FIELD NAME: PERF_ADDR3
FULL NAME: PERFORMING ORGANIZATION ADDRESS
FORMAT: C53
CONTENT: Third line of postal address of the performing organization named in Field 39.
EXAMPLES: Alexandria, VA 22314

FIELD NO: 43
FIELD NAME: PERF_CONT
FULL NAME: PERFORMING ORGANIZATION CONTACT
FORMAT: C40
CONTENT: Name of the individual, from the performing organization, from whom additional information may be obtained. Entered as last name, first initial (without a period), and military rank (if appropriate). Other titles (e.g., Dr.) are not used. Each portion is separated by a space. Acceptable abbreviations of military ranks are the same as Field 37.

FIELD NO: 44
FIELD NAME: PERF_PHONE
FULL NAME: PERFORMING ORGANIZATION PHONE
FORMAT: C13
CONTENT: Telephone number (commercial, Autovon, or both) for the responsible individual in Field 43.
EXAMPLES: 619-225-2056;933-2056

FIELD NO: 45-49
FIELD NAME: PROGRESS1-PROGRESS5
FULL NAME: PROGRESS
FORMAT: C60
CONTENT: Narrative description of the project's progress.

FIELD NO: 50-55
FIELD NAME: KEY1-KEY6
FULL NAME: KEY WORDS
FORMAT: C30
CONTENT: Any words or phrases that identify the principal subjects covered in the report, and that conform to standard terminology and are exact enough to be used as subject index entries. Certain acronyms or buzz words may be used if they are recognized by specialists in the field and have the potential for becoming accepted terms.

EXAMPLES: Laser, Reversed osmosis

FIELD NO: 56-59
FIELD NAME: AUTHOR1-AUTHOR4
FULL NAME: AUTHORS
FORMAT: C24
CONTENT: Name of the investigators of the research. See Field 43, for the structured of the data.

FIELD NO: 60
FIELD NAME: TITLE1
FULL NAME: TITLE
FORMAT: C140
CONTENT: The title of the work as it appears in the source documentation.

FIELD NO: 62
FIELD NAME: PUBLISHER
FULL NAME: ORG/PUBLISHER (BOOK), JOURNAL (ARTICLE):
FORMAT: C60
CONTENT: Narrative descriptions and bibliographic citations of end products, such as technical documents, journal articles, etc., produced as a result of the research.

FIELD NO: 63
FIELD NAME: PUB_YR

APPENDIX B

IST/PM TRADE IN-HOUSE DATA BASE

Batch Procedure Instructions

Introduction

The purpose of these instructions is to guide the user in archiving, converting, and batching to PM TRADE data created using the IST/ PM TRADE In-house data base. All of the facilities needed are located on the Zenith PC at IST. The following information is a step-by-step guide to insure successful transfer of data from IST to PM TRADE.

Contact PM TRADE for Last Record Number

1. Call Dennis Kriha of PM TRADE at 380-4457
2. Ask Dennis for the entry number of the last record in the IST/ PM TRADE data base
3. Save the number for use later in the process
4. Repeat steps 1-3 until successfully completed

Logging on to the Zenith PC

1. Turn on the PC using the switch on the power strip
2. At the C:\> prompt type cd \dbase3
Press <Enter>
3. If the dBASE files are on a floppy disk insert the disk into the appropriate drive

Converting dBASE Files to ASCII Files

1. If the dBASE files are on drive A, type copya
Press <Enter>

If the dBASE files are on drive B, type copyb
Press <Enter>

If the dBASE files are on drive C, type copyc
Press <Enter>
2. Type renum
Press <Enter>
3. When prompted for the entry number enter the number obtained from Dennis at PM TRADE
4. Type trans
Press <Enter>
5. Respond to any prompts by typing Y

Retrieve ASCII Files for Delivery

1. Insert a formatted disk into drive A:
2. Type `copy trans*.txt A:`
Press `<Enter>`
3. The disk is now ready to be delivered to PM TRADE

Clear dBASE Files

1. Type `zapall`
Press `<Enter>`
2. Respond to prompt with correct disk drive
3. The dBASE files are now cleared and ready for more data

TRAINING SYSTEMS AND DEVICES

A News Bulletin Promoting Technology Transfer

Summer 89

PM TRADE

Vol. 1 No. 3

Training capabilities upgraded at NTC

This issue has several articles devoted to technology developments for upgrading the training capabilities at the National Training Center (NTC) at Fort Irwin, California.

These projects are being conducted in response to an initiative of the Army Chief of Staff in 1987 following a decision brief presented by the Army staff.

A centerpiece of the plan called for a phased increase in the Blue Force from the current Heavy Battalion to a Brigade. In order to maintain doctrinally correct force ratios between the Blue Force and the OPFOR, the OPFOR needed to be increased from

the Motorized Rifle Regiment to a Motorized Rifle Division.

Upgrade projects include:

- Shoot Through Obscuration Miles (STOM)
- Upgrade of Opposing Force (OPFOR) Vehicles
- Reduced Crewed Vehicles
- Computer Simulation (Role player's assistant and automated OPFOR)

In January 1987, PM TRADE was designated as the technical agent for materiel acquisition at the NTC in support of the planned expansion. As part of

PM TRADE's overall strategy for addressing NTC materiel requirements, an Industry Day was held in May, 1987, at the NTC. Industry was asked to submit white papers to present new concepts and extend ideas that surfaced during these discussions.

In February 1988, PM TRADE released the NTC BAA. Forty-six proposals were submitted by industry which included the technology areas described above. These projects represent a substantial commitment by PM TRADE to develop advanced technology that will increase training realism and effectiveness, and reduce required resources.

NTC upgrade reduces personnel requirements

The goal of a PM TRADE research project is to save personnel resources by providing a role player's assistant and Automated OPFOR (Opposing Forces) for the computer simulation of the rear and adjacent forces.

The project is funded through the NTC BAA to investigate the use of Artificial Intelligence techniques for supplementing the battle

simulation which will be fielded at the National Training Center (NTC).

According to Lead Systems Engineer Robert Paulson, "Running man-in-the-loop battle simulations is resource intensive and the size of the support team increases as the size of the exercises grows." A goal of the NTC upgrade is to reduce personnel costs through application of technology while expanding the operation from battalion to brigade size. The approach for the computer simulation is unique in that it will combine live players and simulated

forces in the same training exercise.

The role player's assistant and the automated OPFOR are expert systems. The role player's assistant provides information to the role player through interrogation of the expert system, and by recognizing events and prompting the role player.

The assistant supports the role player on the BLUE side. In its initial configuration, the assistant will be a computer console housed

see Reduces, page 2

IST and FHTIC host network symposium

Interactive Networked Simulation for Training was the theme of the first in a series of annual symposia sponsored by Institute for Simulation and Training. This first symposium was co-sponsored by the Florida High Technology and Industry Council.

Over 200 researchers from the U.S. and Europe attended the symposium on April 26-27, held at the Holiday Inn, University in Orlando, Florida.

"We had a very good response," Dr. Peter Kincaid, Symposium Co-Chair, said.

The purpose of the symposium was to provide a forum for the identification of user networking requirements and the related research areas that must be investigated to resolve behavioral, engineering, and training questions.

April's symposium featured keynote speakers Dr. Earl Alluisi, Office of the Under Secretary of Defense, and Col. Jack Thorpe, DARPA.

Dr. Earl Alluisi speaks to more than 200 researchers at the symposium.

"We have a vision," Alluisi said in his keynote address. "The vision is of an interactive network that can be used for training individual troops, sailors, marines, and airmen as parts of the crews to which they belong. The network is the key."

Alluisi said the goal of using interactive networks is to attain a new level of peacetime readiness, with troops trained to the levels of combat skills and effectiveness as seasoned combat veterans.

A panel discussion and 20 presentations covering a variety of topics were included in the symposium. As a result of questions raised during discussions, a committee was formed to address the problems of networking standards.

In addition to providing information, the symposium offered the opportunity to interact with people involved in diverse aspects of network simulation.

Tentative dates for next year's symposium are February 27-28.

Reduces continued

in the Computer Instrumentation System building at the NTC (designated the Star Wars Center). The assistant will contain much of the knowledge of an experienced and senior tactical officer.

Two benefits may be produced through use of the assistant: reducing the skill level required of the role player, or reducing the number of required role players. For

example, a less experienced role player could replace a battalion commander by relying on the advice given by the role player's assistant. Similarly, a single battalion commander could take on the roles of many battalion commanders.

The Automated OPFOR will perform a similar function for the RED side. Paulson emphasized that the current OPFOR at NTC (played by U.S. soldiers dressed in

aggressor uniforms) will be augmented, but not replaced by the simulated OPFOR. The soldier-to-soldier play at the Forward Line of Troops (FLOT) is essential for realism.

Paulson said plans call for a technology demonstration in one year of a subset of the system recognizable as useful by military tacticians. Long term plans are to have something on the ground in the '92-'93 timeframe at NTC.

New STOM technology looks promising

PM TRADE is sponsoring the development of Shoot Through Obscuration MILES (STOM), which has the potential to considerably enhance the training utility of training systems based on MILES. According to Mr. Jim Surhigh, Lead Systems Engineer at PM TRADE, STOM has the potential to provide MILES-based training in fog, smoke and dust, conditions which are routinely

encountered in such training sites as the National Training Center and in Germany.

The technical breakthrough that could make STOM practical is the use of carbon dioxide lasers and pyroelectric detectors which operate at room temperature. Previous detectors for carbon dioxide lasers had to be cooled below the temperature of liquid nitrogen, making them impractical for field use.

Lasers currently used in MILES systems are based on the use of gallium arsenide and the associated detectors, which work

well at room temperature but the laser beams will not cut through obscurants. Soldiers also report that even though they can see targets through their thermal sights in foggy, smoky or dusty conditions, they are unable to shoot the targets with MILES weapon simulators. The new STOM technology has the potential to solve this training problem. Surhigh emphasized that the goal of the STOM project is to establish proof of principle. He added that the technology looks

see STOM, page 8

PM TRADE studying options for Opposing Force (OPFOR) vehicles

The OPFOR program will provide a family of replacement OPFOR vehicles at the NTC (Ft. Irwin, California), the Joint Readiness Training Center (JRTC, Ft. Chaffee, Arkansas), and the Combat Maneuver Training Center (CMTC, Hohenfels, Germany). The fleet of Sheridan tanks (M551s) currently used as OPFOR vehicles at the NTC are aging and becoming expensive to maintain. The OPFOR Vehicle program will replace and expand the aging fleet at the NTC. The program will also provide a fleet of OPFOR vehicles at the JRTC and CMTC, where there is no objective OPFOR contingent.

PM TRADE, with active industry input, is working with several Army agencies to determine materiel alternatives for a new generation of Opposing Force (OPFOR) vehicles. The ultimate

goal of this program is to increase the cost/training effectiveness of Army Combat Training Centers. Other programs (described in this issue) will provide the technology to be inserted into the OPFOR vehicle program.

Five different threat systems are required to be represented:

- tank
- infantry fighting vehicle
- air defense weapon
- self propelled howitzer
- antitank guided missile

"We've involved industry in the planning of this project from the onset," Dennis Heath, PM TRADE's Lead Systems Engineer for the project, said. "We started with the identification of the need during Industry Day which was held in May 1987. We've also had excellent industry input,

first in the form of white papers, following Industry Day, and more recently, written responses to a CBD announcement, which helps define formal requirements for the program." He added that a second draft of these requirements was sent out to industry in February 1989 and comments and insights have been instrumental in shaping the program.

Heath stressed that five separate chassis may not be needed to represent the five threat variants; several of these threat vehicles may be combined on a single chassis. "To the extent that we can represent more than one threat variant on a single chassis and make the vehicle 'fleet common'," said Heath, "we can save the Army money, and still meet the training need." Heath added that much time has been spent in looking at cost and effectiveness tradeoffs for this program.

PM TRADE is acting as executive agent for the program,

see OPFOR, page 5

IST conducting advanced networking research

The Institute for Simulation and Training has been awarded three related contracts by PM TRADE to conduct advanced research on networking of simulation for training. The contracts are sponsored by the Defense Advanced Research Projects Agency and will be administered by PM TRADE.

According to Brian Goldiez, program manager, the work to be conducted over the next two years will support various aspects of combined arms training, including:

- networking/communication technology
- intelligent simulated forces
- low cost aviation training

These technologies are vital to developing the capability to provide real-time interactive simulated representation of battlefield environments at an affordable price. General Thurman, TRADOC Commander, has said that one objective is to be capable of training the Army without having to go to the field by the year 2004. Development over the next 10 to 20 years is expected to increasingly depend on networking technology for large scale combined arms training and force development test and evaluation.

Ernie Smart, the general program manager, said work on these projects will include personnel from the State University System

and other universities throughout Florida and the nation. According to Smart, approximately 30 faculty members and students will be involved in the project at some point.

Networking/Communication Technology

Advanced concepts of networking applied to team training has been the object of a large scale R&D project by the Defense Advanced Research Projects Agency (DARPA). The focus of this research has been Simulated Networking (SIMNET). For most researchers, networking is new enough that problems are still being explored for efficiency, interface technologies, and communication protocols.

A laboratory will be developed which will have the capability to evaluate the impact of new technologies related to networking.

Test beds will be developed to support research in networking, aviation technology, and intelligent semi-automated forces. These test beds will provide flexible and open interfaces for new technologies.

Another important task in this research is the development of networking standards. As a result of the recent Networking Symposium (see IST and FHTIC host networking symposium, page 2),

more than 40 companies have offered to comment on networking standards and protocols. The goal of this networking standards group is to prepare a draft specification and convene a working meeting August 22-23 to finalize the specification. This workshop will address the establishment of technical standards for network protocols and architectures for interfacing defense simulation

We want to train the Army without going to the field by the year 2004.

General Thurman, TRADOC Cmdr.

systems. Industry standards will be heavily considered. (Contact Brian Goldiez at 407-658-5015 if you would like to review the draft or attend the meeting.)

This research will provide two main benefits for the simulation and training community. The first benefit will be the establishment of a standard technique to evaluate network performance and interoperability.

The second benefit will be the provision of a laboratory environment available to the simulation and training community that develops and evaluates advancements in networking technology. These benefits will allow simulation and networking technology to proceed in an orderly manner.

Intelligent Simulated Forces

This research addresses issues related to the development of intelligent opposing forces. Researchers will examine current approaches to simulation of opposing forces, develop a flexible evaluation environment for opposing force simulations, and establish benchmarks for evaluating alternative opposing force simulation concepts and prototypes.

IST will work with industry to evaluate and enhance new opposing force models, and explore new technological approaches to implement these forces.

The problem addressed by this research is that present approaches to semi-automating forces are computational intensive and not totally realistic in all respects. "The OPFOR at a distance looks fine," Goldiez said, "but individual targets in view (which are semi-automated) frequently don't behave like real targets. They just aren't

'smart' enough yet. We intend to improve the situation."

One of the first steps in conducting this research is the development of a taxonomy organized according to three factors: fidelity of the simulation, size of the force being simulated, and computational or modeling constraints. Approaches to developing semiautomated opposing forces will be analyzed according to these three factors.

Another technical problem to be addressed is that many computer programming languages, such as FORTRAN and Ada, are mixed in the same simulator. Goldiez added "exchanging information in this environment in real time is no trivial task."

Low Cost Aviation Trainer

There are two objectives in this area of research. The primary objective is to increase the model fidelity of aviation tactical train-

ing using microprocessor technology. According to Goldiez, this requires better understanding of the assumptions used to model the aircraft which are ultimately contained in the software.

"We need to understand what simplifying assumptions do collectively and individually to the simulated vehicle fidelity in all flight regimes," Goldiez said. "Once these assumptions are understood, we can selectively implement them based on the fidelity required by the user."

The secondary objective of this research is to network aviation units with ground units. "This has been done before," Goldiez said, "but only by putting the aviation units on the same network with the SIMNETs. We're going to use bridging technologies to network the units."

IST will create a testbed using commercially available systems to conduct this research.

Simulation networks show promise and problems

The networking of simulation training systems departs from traditional use of a computer network which allows the sharing of computer resources among multiple computers. In the application of the networking of simulators, the network is used almost exclusively for communication of process states between vehicles engaged in the training exercise.

Simulation networks make it possible for crews to train force-on-force in real-time battles. In this free-play world, there is no instructor to set rules or generate scenarios.

Although these networks provide enhanced training, there are many inherent limitations to using networks in this application. The disadvantage arises when attempts are made to apply traditional techniques of performance evaluation. The complexities and dynamics of team performance present problems in constructing appropriate instructional scenarios. These problems need systematic, validated and concerted design approaches.

Another problem is that as the number of simulators on the network and workload per simulator increases, there will be a deterioration in the throughput of the net-

work and degradation of other performance measures. If these delays become significant, the effectiveness of real-time training simulation may be compromised due to response requirements which are time-critical.

Depending on communication protocols, there may be an increase in the frequency of retransmissions and lost or distorted messages. The magnitude of this problem is related to how well data is distributed throughout the networked system, and the soundness of the network access and internal network protocols.

PM TRADE explores reduced crewed vehicles concept at NTC

Editor's note: The last issue of Training Systems and Devices carried a story on the Robot Vehicle Working Group Meeting, hosted by PM TRADE. We promised a more complete description of PM TRADE's efforts in Allrobotics augmentation at the National Training Center (NTC). This article addresses the effort to reduce crew size of the first echelon vehicles at the NTC. Another article to appear in a future issue will describe a proposed project to apply robotics technology to second echelon vehicles at the NTC.

The Hughes Advanced System Facility, teamed with Honeywell's Systems and Research Center, has started a research project to explore ways to reduce crew sizes for operating OPFOR (opposing force) vehicles.

According to Mr. Admiral Piper, who heads the project for PM TRADE, "One of the best ways to do this in a cost-effective way is to take a careful look at what tasks can be automated and what crew positions can be combined."

The demand for personnel resources is already substantial and continues to grow at a time when personnel is in increasingly shorter supply. The goal is to reduce the crew size from the current three or four crew members to two members. Previous work which Hughes and Honeywell have done for NATO and DARPA examined ways to reduce crew sizes for future main battle tanks. The gunner has been identified as

the key crew position to examine for potential elimination. According to Piper, the research starts with the assumption that the gunner's function can be automated to a large extent, and those functions and tasks which can not be automated can be distributed between the driver and the tank commander. The unique constraint placed on the reduced crew concept for training is that the vehicle crewed by two men must function and appear in all aspects to be a fully crewed vehicle.

This research was initiated because of the NTC's plans to increase the opposing force substantially—from a motorized Soviet rifle regiment to a Soviet motorized rifle division which has many more vehicles. The goal of the Army is to achieve this increase without a corresponding increase of personnel resources.

According to the Hughes' Principal Investigator, Dr. David Baum, "The combat vehicle experts on the Hughes team will work with the human engineering and training staff to identify and examine the feasibility of various automation and soldier-machine interface concepts."

Several considerations constrain the conceptual analysis:

- The system should be operable by current armor and mechanized infantry personnel.
 - An on-board, self-contained solution is preferred.
 - The solution should be applicable across vehicle types to the maximum extent possible.
- A concept being explored is based on automatic target recognition technology. The concept includes equipping each OPFOR vehicle with an imaging sensor package and sensor processing module. No change is required of the Blue Force equipment.
- The sensor processor, called the automated target recognizer (ATR), controls the sensors and processes the range data to perform the functions of target search, detection, and classification. Having detected and classified a Blue Force tank (using, for example, a low light level TV camera, or a FLIR), the ATR would cue the tank commander for target verification and prioritization, and perform other "human" functions automatically.
- Long term goals of the project call for a study phase and a possible technology demonstration within the next 36 months. At that time, applicability of the results of the project to retrofitting vehicles at NTC will be examined.
- For further information, contact Mr. Piper at 407/380-4287 or (Autovon) 960-4287.
- The reduction in crew size by function automation must not change the fighting capability of the OPFOR vehicle and crew, or jeopardize soldier safety.

OPFOR continued

integrating the inputs of several other Army agencies, including:

- the Tank and Automotive Command (TACOM), which is providing technical expertise relating to chassis.

- the Armament Research, Development, and Engineering Center, (ARDEC), which is providing technical expertise relating to turret and particularly fire control systems.

- the Army Training Support Center (ATSC), which is providing information about visual modification (VISMOD) for the vehicles.

- the Missile and Space Intelligence Center (MSIC), which is providing threat characteristics

- the Combined Armed Training Center (CATA) of TRADOC, which is performing the Tradeoff Analysis (TOA).

PM TRADE is also providing technical expertise for the tactical engagement systems,, weapons engagement simulation subsystems, and instrumentation.

Three major options are being considered in the ongoing Tradeoff Determination (TOD) study:

- full scale development, designing vehicles from scratch
- modification of vehicles in the current Army inventory
- non-developmental items

(having contractors integrate vehicles from existing components and subsystems, both commercial and mil-spec, or buy threat vehicles).

The results of the TOD and TOA will be briefed to the CSA in summer. The resulting decision will determine the direction of the OPFOR Vehicle Program.

LTC Steve Overstreet, Product Manager for Combat Training Centers, and Dave Manning have been active in this program. Manning is on a six month assignment to PM TRADE specifically to serve as Program Manager.

For more information, contact Mr. Heath at (Autovon) 960-4370 or (407) 380-4370.

Training symposium videos available

The Training Technology Symposium held in March by TRADOC's Futures Training Division was videotaped and edited to eight hours. High level speakers from industry addressed more than a dozen general officers at the symposium, held at Fort Leavenworth, Kansas.

The video set includes the opening and closing remarks by General Thurman, Commander, TRADOC, and excerpts from 13 presentations. For information on the availability of the video set, contact LTC Bill Samuelson at (804) 727-4265, or write :

LTC Samuelson, TRADOC
Futures Training Division
Department of the Army
Ft. Monroe, Virginia 23651
ATTN: ATTG-C

Listed in order of appearance, the presentations are:

Dr. Linda Fenty, Electronic Data Systems *Training: Challenge for Readiness and Warfighting*

Mr. Nick Handres, Electronic Data Systems *AI Mechanical Maintenance*

Dr. Don Stamper, Electronic Data Systems *Technology Migration*

Dr. Richard Farson, Western Science Behavioral Institute *Computer Conferencing*

Dr. Alan Chute, AT&T *Teletraining*

Dr. Paul Caro, Flight Safety Corp. *Simulators*

Mr. John Zidek, GE *AEGIS Training Systems*

Mr. Robert Holkan, NASA, Johnson Space Center *Crew Training*

Mr. Scott Fischer, NASA Ames Research Center *Virtual Environment Technology*

General Paul Gorman (retired), Cardinal Point *Vision for the 90's*

Mr. John Larson, EER Systems Inc., and Mr. Bruce Ballentine, Scott Instruments *Speech Recognition & Voice Input/Output Technology*

Mr. Marc Petrin, Sanders Associates/Lockheed *Maintenance Training*

Dr. Alan Chute, AT&T *Integrated Learning Center for the Future*

Stom continued

promising and the resulting detector devices may be relatively inexpensive.

Simulaser Corporation is working under a contract through PM TRADE's Broad Agency Announcement to conduct this project. Their design goal is to demonstrate successful pairing through a 30 meter fog oil cloud and a 10 meter dust cloud at ranges up to 4 km. The prototype system is sched-

uled for testing during FY90 at the National Training Center, Ft. Irwin, California.

If the STOM equipment proves reliable and effective, it will be considered for incorporation in next generation MILES training devices and Tank Weapon Gunnery Simulation System/Precision Gunnery System (TWGS/PGS) training devices.

Mr. Surhigh may be reached at (Autovon) 960-4351 or 407/380-4351 for further information.

IST hosts workshop

A workshop to address the establishment of technical standards for the interoperability of defense simulations will be held August 22-23 by the Institute for Simulation and Training for the Department of Defense.

If interested, contact Brian Goldiez at (407) 658-5015, or write: IST, 12424 Research Parkway, Suite 300, Orlando, FL 32826.
