Abstract:

The responses of government, public, researchers and professionals alike could have been boosted in need to tenaciously tackle residential neighborhood crime if there were enough research and publication on the diverse consequences of residential neighborhood crime. The main objective of this article is to critically evaluate the consequences of residential neighborhood crime. The research finding revealed a triangular nature of the consequences in that it burdens on the property and its environs; on government and its agencies and thirdly on the residents. This study believes that tackling residential neighborhood crime portends some benefits like the removal of fear of crime which will inferably boost residents' health status towards efficiency of labour, boost housing investment, increase government revenue from property tax and in turn reduce public spending on crime control. All these efforts would translate to environmental sustainability.

Keywords: consequences; government; property; residents; residential neighborhood crime

1. Introduction

Globally, urban violence is said to be soaring due to uncontrolled urbanization and advent of industrialization[1]. However, residential neighborhoods have been seen to

ⁱ Correspondence: email gp140026@siswa.uthm.edu.my

be more negatively affected by property crime, which is otherwise called residential neighborhood crime, in the forms of burglary, larceny, vandalism, theft, assault, robbery, rape and even homicide. This is due to the fact that valuables are kept in the house and residents are in better part of the day and week, (with exception to retirees' homes) have to leave their homes empty to workplaces, schools, recreation and place of worship among others thereby making their homes target of attack by prospective offenders. Also, crimes like rape and homicide are pronounced in residential neighborhoods due to the fundamental function of serving as living accommodation after the day's activities.

Property crime especially within the urban setting has globally become a subject of discussion among urban planners, policy makers, researchers, international organizations in charge of environmental sustainability and other allied professionals. This is due to the devastating effect it has on almost every sector of the economy. Essentially, the consequences of property crime cut across the residents, neighborhood and government. To the residents, property crime has been found to be capable of having the psychological effect of fear which studies have discovered to cause health impairment on the residents[2]. Research also shows that property crime does unnecessarily increase family budget because of the need to provide security gadget to the building[1]. Furthermore, property crime, especially in the area of violent crime (e.g. armed robbery) has seldom resulted in loss of lives and less productivity.

Considering the incidence of property crime to the residential neighborhood, it has been discovered to have a negative impact on property investment[3]. This is unveiled through negative residential mobility, neighborhood decline through stigmatization, negative effect on environmental sustainability and general real estate practice. The effect of property crime on government activities include dwindling revenue from property tax, adverse effect of street crime on governance, avoidable excessive government spending on procurement and maintenance of community policing and its negative effect on the general economy[4].

From another perspective, the cost of crime and fear of crime can be divided into four categories[5]. These include (i) community justice system (CJS) costs which relate to expenditure on police, courts, prosecutions, and prisons; (ii) crime career costs which relate to the opportunity costs of an offender's option to participate in illegal, other than legitimate and productive behaviour; (iii) victim costs which relates to the economic losses of victims of crime and include medical expenses, lost earnings and property damage and destruction; (iv) intangible costs which relate to indirect losses and pains, suffering, reduced quality of life and psychological stress. All these according to the study are likely to impact on the well-being of citizens and communities significantly.

Anderson[6] examined the effects of crime on government and society from four (4) related angles. These included (i) crime-induced production (this explains that crime may occur as a result the distribution of resources toward commodities and services that do not add to society except in their connection with crime); (ii) opportunity costs (as the number of imprisoned individuals steadily increases, society suffers the enormous and growing loss of the potential workers' productivity); (iii) the value of risks to life and health (the express consequence of violent crime relate to the fear of being killed or injured, the hazard associated with the inability to respond as expected, and the agony of being a victim); (iv) transfers (one outcome of fraud or theft is a transfer of assets from victim to offender).

This paper is considered desirable on the hypothesis that residential neighborhood crime is soaring globally and most especially in the developing nations due to the paucity of research and publications on its consequences which are seen to be devastating. This paper, therefore, agrees with the position that the evil effect of residential property crime could be alleviated only when the stakeholders concerned are awake to its consequences with a view to enhancing housing sustainability.

2. Nature of Residential Neighbourhood Crime

The social menace of crime has become a principal component in the discussion of urban issues, and the prevention of crime is now as much an urban policy issue as is housing shortage and poverty[7]. It is gradually manifesting that these problems are interrelated. Property crime, especially in homes, is said to be badly affected.

The unlawful entry into other peoples' residential apartment for the purpose of committing a crime is referred to as 'residential burglary'[8,9]. Offenses that constitute 'break and enter' include violent entry into someone's house possibly with a decision to steal. For the purpose of this research, residential burglary is used to represent both break and enter—dwelling and stealing from dwelling offenses. The fact that homes are usually left vacant during the day accounts for the frequent burglary offending. Many urban dwellers especially the high-income class are mostly victimized due to their massive acquisition of personal effects (valuables) and the fact that a large number of a detached dwelling with many accessible entry points like doors and windows[10].

The cumulative impacts of crime on the socio-economic restructuring, or concentration of particular groups, within neighborhoods, play out over time. However, transformation levels of offending are likely to cause instant responses at the individual level. Increases in offending will have direct influence on individual's perception of security in a neighborhood. Hence, as perceptions concerning the safety of one's community deteriorate, urban residents often choose to move from highly

populated communities in the search for a secure neighborhood[11,12,13]. Primarily, crime and fear of crime lead to flight from the city to the suburbs. It leaves in its wake areas of concentrated poverty and racial/ethnic enclaves in the urban core[14,15].

As housing markets serve as the arena in which the influence of crime first proves itself, these markets can essentially serve as early indicators of neighborhood decline. Consequently, a comprehensive examination of how crime affects local housing prices will essentially lead to a clear understanding of the larger discourse about small crime impacts on residential stability[16,17].

3. Methodology

The research work is a combination of qualitative (observations and interview) and a review of related literature on the consequences as well as general impact of residential neighborhood crime (RNC). Secondary data were acquired through different databases which included Scopus, Web of Science (ISI), SAGE journal online, Ebscohost, Emerald and ScienceDirect among others. An attempt was made to critically appraise the related articles through the analysis of previous studies to further validate the burden of residential neighborhood crime after diagnosing the severity of the costs of RNC to the residents, immediate neighborhood, and government/society. The interview was conducted on adults (working class) using snowball method of sampling with a total number of 47 respondents basically on the general effects of RNC as highlighted in the literature. The policy implication of the research was later highlighted with a view to enhancing housing sustainability.

4. Analysis of Previous Studies on Consequences of Residential Neighbourhood Crime

Through the literature, empirical works associated with the consequences of residential neighborhood crime have been identified. Table 1 is presented to give the summary of the related work.

Table 1: Analysis of previous studies on consequences of residential neighbourhood crime

Incidence OF Crime	Author & Year	Title	Purpose	Result(s)
	Gibbons[1]	The costs of urban property crime	To examine the cost of property crime on urban settlements.	Property crime causes high residential mobility, stigmatization & discourages property investment

Residential Environment	Pope & Pope[4]	Crime and property values: Evidence from the 1990s crime	To examine the link between crime and property values by exploiting the dramatic, nationwide decrease in crime that occurred in 1990s	The result indicated that negative relationship between crime changes and property value were substantially significant & economically large
	Lynch & Rasmussen[3]	Measuring the impact of crime on house prices	To estimate the impact of crime on house prices	The cost of crime has virtually no impact on house prices overall but that homes were highly discounted in high crime areas.
	Crutchfield, Geerken, & Gove[18]	Crime rate and social integration: The impact on metropolitan mobility	To determine the impact of property crime on immediate neighbourhood	Neighbourhood crime is capable of causing residential mobility and negatively affect social integration
Residents	Cohen[19]	A note on the cost of crime on victims	To determine the cost of property crime on residents	Property crime increases family budget, causes fear, health hazard & death
	Green, G <i>et al.</i> [20]	Fear of crime and health in residential tower blocks in Liverpool, UK	To seek to assess the relationship between fear of crime and residents' health	There was significant associations between fear of crime and health status
	Dugan[12]	The Effect of criminal victimization on a household's moving decision	To determine the impact of criminal victimization on a household's moving decision	The cost included monetary costs on lease - breaking penalties, realty mortgage and transfer tax cost. It can cause emotional and social stress
	Anderson[6]	The aggregate burden of crime	To estimate all the direct and indirect costs of crime for the entire US nation.	There was huge loss to the victims as well as the general economy
Government/ Society	Mayhew[21]	Counting the cost of crime in Australia	To analyse the cost of crime to the society and government.	Cost of acquiring more police increases government budget/expenditure
	Jaliliyan & Heydari[22]	Crime cost kinds and their assessing	To analyse kinds of crime cost and their assessment methods	Crime is capable of increasing government expenditure

		methods.		
	McCollister, French, Fang[5]	The cost of crime to society: New crime- specific estimate for policy and program evaluation	The study presented a comprehensive methodology for calculating the cost to society of various criminal acts.	The societal costs of crime cut across victim costs, criminal justice system costs, crime career costs and intangible costs.

Table 2: Analysis of public response to the consequence of RNC

S/N	Question	Yes	No	%tage Of Yes	%tage Of No
1.	RNC is capable of causing psychological fear	45	2	95.7	4.3
2.	RNC can increase household budget	43	4	91.5	8.5
3.	RNC is capable of reducing public revenue	41	6	87.2	12.8
4.	RNC is capable of increasing government budget	39	8	83.0	17.0
5.	RNC is capable of reducing health status	42	5	89.4	10.6
6.	RNC is capable of leading to sudden death	46	1	97.9	2.1
7.	RNC can reduce efficiency of labour	38	9	80.9	19.1
8.	RNC can increase residential mobility	35	12	74.5	25.5
9.	RNC can lead to neighbourhood decline	38	9	80.9	19.1
10.	RNC can have negative impact on housing sustainability	40	7	85.1	14.9
11.	RNC through incivility can have negative impact on governance	41	6	87.2	12.8

5. Results and Discussion

Essentially, a cursory search into the literature as shown in Figure 1 revealed that the consequences of the residential neighborhood crime (RNC) could be discussed under three main headings: effect on residents; effect on the immediate neighborhood and effect on government activities. Hence, this subject is discussed under the triangular incidences of RNC.

5.1 Effect on Residents

Over the years, research has proven that residential neighbourhood crime is capable of causing emotional psychology of fear which has been found of degenerating to health impairment and sudden loss of life. Green[20] established a schematic links between fear of crime and health (See Figure 2). The study opined that feelings of safety in the dark especially when out alone is the most accurate predictor of the state of health and that fear of crime expressly affect quality of life which they opined was associated with poorer health. In the same vein, Cozens[2] posited that RNC could as well reduce

general level of physical activity and increase of fear and worry about crime have been linked to poor mental and physical health[23].

5.2 Effect on immediate neighborhood

Researchers have shown that residential neighborhood crime impacts negatively on the immediate environment. This is manifested in various ways like discouraging property investment[1], leading to residential mobility with its attendant consequences[12], environmental decline through neighborhood stigmatization[4], the negative effect on environmental sustainability[3]. Residential Property investments over the years have been seen as a lucrative business due to many benefits attached to it such as regularity and security of income and investment, serving as a hedge against inflation, the possibility of creating freehold interest, acting as collateral for obtaining a loan, and a host of others. Nevertheless, all these have been threatened by the soaring rate of property crime globally [19].

Furthermore, residential neighborhood crime has been seen to have a negative influence on real estate transactions [1,27]. Thaler[27] found a negative impact between residential neighborhood crimes per capita and housing prices. His estimates infer that a one-standard-deviation increase in the consequence of residential neighborhood crime reduces by about three per cent. While Gibbons[1] in his empirical work found a reduction in property values of ten per cent for a one-standard-deviation increase in neighbourhood crime. However, these research works faced potential omitted variable challenges in the cross section as well as the time series[28]. According to the studies, using the cross section crime, rates are likely to co-vary with other neighborhood amenities for which researchers cannot adequately control as crime rates may change as the composition and attributes of neighborhoods change.

5.3 Effect on government activities and the society

Apart from the significant negative effects of RNC on the residents as well as the immediate environment, reliable findings have also established the fact that RNC is capable of having negative influence on government activities. These cover the reduction of government revenue accruable from property tax, an effect of offending on governance, increase in government expenditure in the procurement police, fire arms, building and maintenance costs of more prisons, and employment of more judges among others and its negative effect on the general economy.

Anderson[6] estimated both the indirect and direct costs of crime for the entire US nation. The study stated that aggregating costs commonly associated with criminal activities and considered incidental costs that were yet to be included in an overall formula for the aggregate cost of crime. The study also emphasized that this included

expenses of the legal system, victim damages and crime-prevention departments, the consequence of crime comprises of the opportunity cost of victims, criminal and prisoners' time. The cost of private deterrence and the fear of being victimized. According to Anderson[6], the net annual incident of crime was found to soar above \$1 trillion. In the same vein, Dambazau[29] argued that Nigerian government spent not less than ten billion Naira annually to feed prison inmates which are considered to be outrageous and avoidable. This huge sum could as well be spent on more laudable projects. Estimating the burden of crime to US government, Anderson[6] found that crime-induced production gulped \$397 billion, opportunity cost at \$130 billion, risk of life and health at \$574 billion, transfers at \$603 billion, gross burden at \$1,705 billion, net of transfer at \$1,102 billion and per capita at \$4,118 billion. The study believed these sums took the chunk of the Budget which could be judiciously used for other purposes.

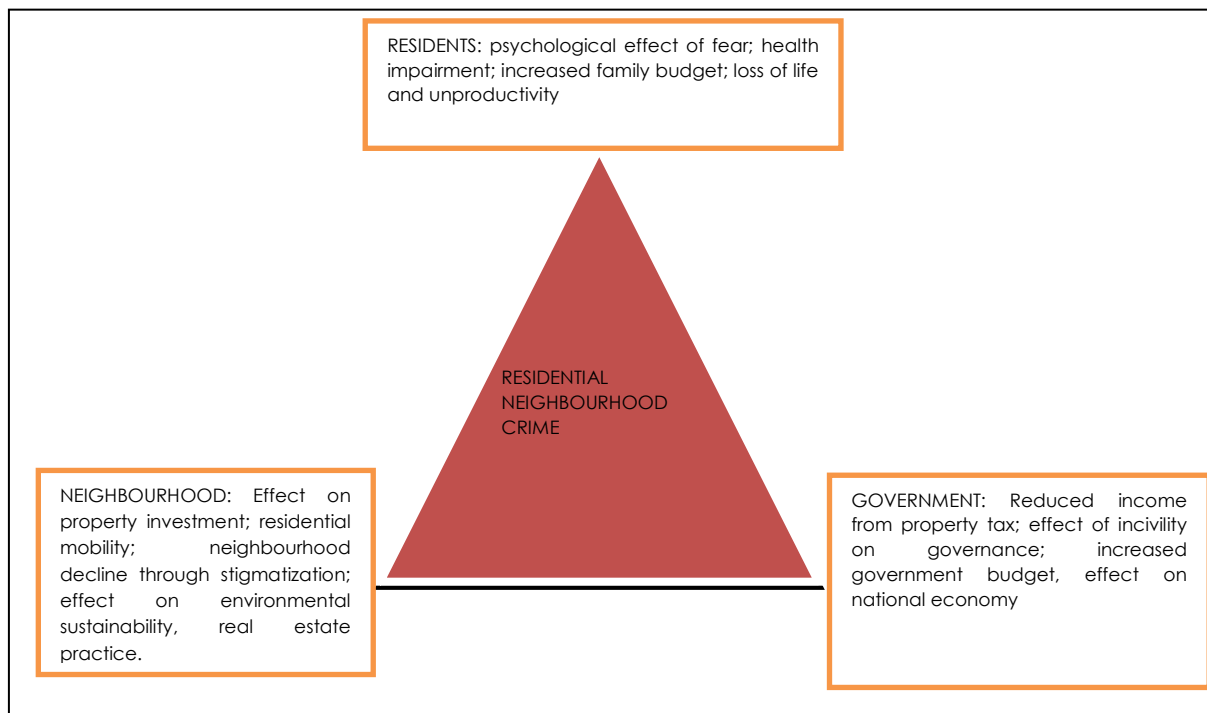

Figure 1: Triangular consequences of residential neighbourhood crime

Figure 2: Relationship between fear of crime and health (Green *et. al.*[20])

6. Conclusion

This paper dwelled on the consequences of residential neighborhood crime on the immediate environment, the residents as well as government. The findings have shown that the effect of residential neighborhood crime is completely negative and its soaring trend especially in the developing nations, where the penal system (use of police, court, and prison) is still prevalent gives one a worrisome concern.

Furthermore, the paper has directly or indirectly revealed the benefits inherent in tackling residential neighborhood crime. These include: removal of fear of crime within the neighbourhood, elimination of abnormal residential mobility, cure of residential neighbourhood decline, increase in government revenue through property tax which could transform to the nation's economic prosperity, reduction in government spending on crime prevention like the procurement of additional police, construction of additional prisons and recruitment of more judges. Also, a meaningful attention paid to the consequences of residential neighborhood crime could translate to a boosted housing investment and general sustainability of housing environment.

This article is also meant to serve as a clarion call to urban planners, property managers, researchers, policy makers and government agencies to see residential neighborhood crime as a menace that must be severely dealt with for the purpose of enhancing housing and environmental sustainability.
