ABSTRACT

Therioaphis bonjeaniae Hille Ris Lambers & van den Bosch, 1964, recorded for the first time from Continental Portugal allows us to enlarge the distributional data of the species in the Iberian Peninsula. Information on morphometric characters of the studied samples is also provided.

Key words: *Therioaphis bonjeaniae*; *Dorycnium rectum*; Continental Portugal.

RESUMEN

Presencia de *Therioaphis bonjeaniae* Hille Ris Lambers & van den Bosch, 1964 (Hemiptera, Aphidoidea, Drepanosiphidae) en Portugal continental

Se actualiza la distribución en la Península Ibérica del pulgón *Therioaphis bonjeaniae* Hille Ris Lambers & van den Bosch, 1964, citado por primera vez en Portugal Continental. Se aporta también información sobre caracteres morfológicos de las muestras estudiadas.

Palabras clave: *Therioaphis bonjeaniae*; *Dorycnium rectum*; Portugal Continental.

Recibido/Received: 3/06/2015; **Aceptado/Accepted:** 20/01/2016; **Publicado en línea/Published online:** 01/03/2016

In this note *Therioaphis* is included in family Drepanosiphidae based on general classification by Heie (1980) that is also followed by Ilharco (1992).

The apterous and alate females of *Therioaphis bonjeaniae* are whitish to yellowish. The body is coated with mammiform tubercles, almost always darkened, varying in number in accordance with the segment on which they are, each bearing a single capitate setae. Nieto Nafria & Mier Durante (1998) and Quednau (2003) mention this species in France and Spain. Its life cycle is unknown, but possibly

anholocyclic (Nieto Nafria & Mier Durante, 1998) living on *Dorycnium rectum* and *D. hirsutum* (Fabaceae).

The Portuguese samples of *T. bonjeaniae* were identified from the original description and by comparison with paratypes loaned by The Natural History Museum, London, and specimens of the Museum National d'Histoire Naturelle, Paris. The Portuguese material is now deposited in the Aphid Collection of the National Agronomic Station (Colecção de Afídeos da Estação Agronómica Nacional - CAEAN), Oeiras, Portugal.

Apterous viviparous females collected on *Dorycnium rectum* and alate collected on the same host or like vagrant, at the following localities and dates have been studied: Aljezur, 1977 and 1978; Oeiras, 1978, 1979, 1983 and 2005.

Apterous viviparous females

Morphological characters based upon 30 specimens. Body length varies from 1.387 to 1.850 mm. Antennae 0.699-0.944 times as long as the body. Secondary rhinaria 8-13, distributed above the III antennal segment forming a straight line. VI antennal segment with process terminalis 0.55-0.77 times as long as the base

of the segment. Rostrum extends to the mid coxae; ultimate rostral segment with 4-6 accessory setae, 0.55-0.76 times as long as the length of second segment of hind tarsi. First tarsal segment with 2 dorsal setae, and 4 to 6 ventral setae. Body carrying mammiforms tubercles, almost always darkened, each one bearing a single capitate setae. In the abdomen, first tergite with 5 to 9 setae varying between 0.030-0.071 mm. Second tergite with 7 to 9 setae varying between 0.026-0.071 mm. Third tergite with 6 to 10 setae varying between 0.027-0.076 mm. Fourth tergite with 7 to 9 setae varying between 0.029-0.061 mm. Fifth tergite with 8 to 9 setae varying between

0.026-0.070 mm. Sixth tergite with 5 to 7 setae varying between 0.014-0.074 mm. Seventh tergite with 4 setae varying between 0.016-0.090 mm. Eighth tergite showing 2 to 4 setae varying between 0.017-0.070 mm, (Table 1).

Alate viviparous females

Morphological characters based upon 19 specimens. Body length varies from 1.476 to 2.070 mm. Antennae 0.817 to 0.953 times as long as the body. Secondary rhinaria, 11-16, distributed in a straight line above the III antennal segment. VI antennal segment with processus terminalis 0.675-0.690 times the length of the basal part. Rostrum does not extend to the mid coxae. Ultimate rostral segment with 4-6 secondary setae and is 0.450-0.635 times the length of the second segment of the hind tarsi. First tarsal segment with 2 dorsal setae, ventral with 4-6. First abdominal tergite with 6 to 9 setae varying between 0.015-0.062 mm. Second tergite with 7 to 11 setae varying between 0.023-0.062 mm. Third tergite with 7 to 10 setae varying between 0.025-0.065 mm. Fourth tergite with 7 to 10 setae varying between 0.017-0.069 mm. Fifth tergite with 6 to 10 setae varying between 0.019-0.061 mm. Sixth tergite with 5 to 8 setae varying between 0.08-0.062 mm. Seventh tergite with 4 setae varying between 0.027-0.075 mm.

Eighth tergite showing 2 to 4 setae varying between 0.012-0.064 mm (Table 2).

Acknowledgements

The authors thank Drs. Paul Brown (Department of Entomology The Natural History Museum, London) and Prof. Georges Remaudière *in memoriam* (Museum national d'Histoire naturelle, Paris) for the loan of the slides with specimens of *Therioaphis bonjeaniae*, used for comparison with the Portuguese material, and Dr. Chris J Hodgson for suggestions and correction of the English language. The first author thanks the Foundation for Science and Technology (FCT), Lisbon, for the scholarship granted.
