Abstract.—The eucoiline genus *Zaeucoila* Ashmead is revised. Following a re-evaluation combining previously published phylogenetic data and new specimens, *Agrostocynips* Díaz is synonymized with *Zaeucoila*. All species included in *Zaeucoila* are systematically treated, and now amounts to twelve, seven of which are described as new here: *Zaeucoila bitiburculata* **new species**, *Z. fidalgoii* **new species**, *Z. infuscata* **new species**, *Z. johnsonii* **new species**, *Z. lignys* **new species**, *Z. normae* **new species**, *Z. patera* **new species**. The following new combinations are proposed and species redescribed: *Zaeucoila grenadensis* (Ashmead), **new combination**; *Z. robusta* (Ashmead), **new combination**; *Z. flavipes* (Ashmead), **new combination**. *Agrostocynips diastrophi* (Ashmead), *Agrostocynips clavatus* Díaz, and *Agrostocynips enneatoma* (Díaz) are **new synonyms** of *Zaeucoila robusta*. *Zaeucoila incompleta* (Kieffer), *Z. triangulifera* Kieffer, and *Z. unicarinata* Ashmead are redescribed. *Zaeucoila* is an unusual genus of Zaeucoilini in its wide distribution area: it can be found from southern Argentina well into the eastern United States and southern Canada; no other zaeucoiline genus shows such a pattern. Host records and geographic data for *Zaeucoila* are brought up to date, as well as a key to species. *Zaeucoila* are primary parasitoids of Agromyzidae, including *Liriomyza trifolii* and other species that are notable economic pests of agriculture. *Tropideucoila fulvonotata* (Kieffer) is transferred to *Marthiella* (**new combination**).

Key Words: Cynipoidea, new species, distribution records, species key, Agromyzidae, parasitoid, redescription, new species

Zaeucoila Ashmead, 1903, (Hymenoptera: Figitidae: Eucoilinae) was described based on specimens (from Brazil) sent to William Ashmead of the US National Museum (National Museum of Natural History, Smithsonian Institution). Jean Jacques Kieffer (1907) later added two more species collected by C. F. Baker in the Caribbean. The genus was not actively researched over the following five decades, but was included in the keys of Weld (1952). Focus was renewed on *Zaeucoila* s.l. through the work of Norma Díaz of La Plata, Argentina, in the 1970's. During this time, research was conducted on natural enemies of agromyzid flies of economic concern, and through this research, *Agrostocynips* Díaz was described, containing *A. clavatus* Díaz (Díaz 1975, 1976) and later *A. enneatoma* (Díaz) (Gallardo and Díaz 1997). These species looked superficially like *Zaeucoila*, but differed in a number of characters (e.g., genal carina absent; mesoscutum lacking a keel) that seemed to justify the circumscription of a new genus.

Through Nordlander's ground-breaking research on eucoilines in the late 1970s and early 1980s, it was determined that *Zaeucoila*, along with several other lineages of eucoilines associated with agromyzids, formed what appeared to be a natural group of genera, and was so named the *Gronotoma*-group of genera (Nordlander 1982). Díaz and Gallardo (1997) disagreed with this original treatment, and instead placed three of the Neotropical genera included originally in the *Gronotoma*-group into a new group called the *Zaeucoila*-group (these genera being *Rhabdeucoila* Kieffer, *Penteucoila* Weld and *Zaeucoila*); to this group, over subsequent years, they added *Agrostocynips*

Díaz, *Tropideucoila* Ashmead, *Lopheucoila* Weld, *Dettmeria* Borgmeier and *Moneucoila* Kieffer (Díaz and Gallardo 1997, 1998; Gallardo and Díaz 1999). The phylogenies of Fontal-Cazalla et al. (2002) and Buffington et al. (2007) supported the monophyly of the *Zaeucoila*-group; as a follow-up, the group was formally recognized as *Zaeucoilini* by Buffington (2009). The majority of species in this tribe were exclusively Neotropical in distribution, and only *Agrostocynips* was commonly encountered throughout middle and eastern North America (Forshage et al. 2012) in addition to Central and South America (Buffington and Scheffer 2008).

During the research leading to the publication of Fontal-Cazalla et al. (2002), it was discovered that one taxon included in that work as a *Tropideucoila* was not actually a member of that genus, and there was no genus to accommodate it; hence, Buffington (2002) erected *Aegeseucoila* to contain *A. flavotincta* (Kieffer) and *A. grenadensis* (Ashmead), two species whose original generic assignment was suspect (Nordlander, pers. comm.). In the years following the publication of Buffington (2009), two issues became clear that would further confuse *Zaeucoilini* classification if not dealt with: *Aegeseucoila flavotincta* (Kieffer) warranted its own, new genus, and *Aegeseucoila grenadensis* (Ashmead) was actually a species of *Agrostocynips*. As a result, *Marthiella* Buffington was erected to contain *A. flavotincta*, and the combination *A. grenadensis* was established (and as *grenadensis* was the type-species of *Aegeseucoila*, *Aegeseucoila* became a junior synonym of *Agrostocynips*) (Buffington 2009).

In Buffington (2009), it was shown unambiguously that *Agrostocynips* and *Zaeucoila*, and the species therein, were difficult to circumscribe, and these taxonomic concepts were more or less unsatisfactory. *Agrostocynips* was defined by lacking certain characters present in *Zaeucoila*, a situation that often results in unwieldy keys and frequently indicates paraphyly. The phylogeny presented in Buffington (2009) reflects this, with species of the two genera more or less intertwined in the tree. MLB and FEG, working with newly obtained specimens from throughout the New World, began addressing this problem independently, and have concluded that species of *Agrostocynips* are *Zaeucoila*. This revision of the generic boundaries necessitates a re-description of *Zaeucoila* clarifying the morphological concept. It also provides an opportunity to key and redescribe the included species. The recircumscription also significantly enlarges the distribution area of the genus, which now covers the majority of South and North America, a more extensive distribution than any other Zaeucoiline genus. It is our conviction that the changes made resolves the problems concerning *Agrostocynips*, and consequently results in clear generic limits in the whole Zaeucoilini. As some species of *Zaeucoila* have been reared from economically important Agromyzidae (Buffington et al. 2012), we feel this taxonomic clarification, as well as new host and distribution data, might have a positive impact for future research programs in economic entomology and biological control.

The second author noted, based on images supplied by Bob Zuparko (California Academy of Arts and Science, San Francisco), that *Rhabdeucoila fulvonotata* Kieffer, 1907, belonged in *Marthiella*, rather than in *Tropideucoila* where it was placed by Weld (1952) and where it was cited in Buffington (2009);

hence we are here making the new combination *Marthiella fulvonotata* (Kieffer), **new combination**.

MATERIALS AND METHODS

List of depositories.—The specimens used in this study are deposited in the following institutions: AEIC, American Entomological Institute, Gainesville, FL, U.S.A. (D. Wahl); CASC, California Academy of Sciences, San Francisco, CA, U.S.A. (R. Zuparko); CNCI, Canadian National Collection of Insects, Ottawa, Canada (J. Read); MLP, Museo de La Plata, La Plata, Argentina (A. Lanteri); INSUE, Instituto Superior de Entomología “Dr. Abraham Willink”, Tucumán, Argentina, (M.V. Colomo); NHMUK, The Natural History Museum, London, U.K. (D. Notton); TAMU, Texas A&M University Insect Collection, College Station, TX, U.S.A. (E. Riley); UCRC, University of California at Riverside, Riverside, CA, U.S.A. (D. Yanega); USNM, United States National Museum (Smithsonian Institution), Washington, D.C., U.S.A. (M. Buffington); MZSP, Museu de Zoologia da Universidade de São Paulo, SP, Brazil (C.R.F. Brandão); MALUZ, Museo de Artrópodos de la Universidad del Zulia, Maracaibo, Venezuela (J. Camacho).

Specimen illustration and observation.—Scanning electron microscope (SEM) images were obtained using a Hitachi TM3000 desktop scanning electron microscope; specimens were shot uncoated at ‘analysis’ voltage, running in ‘compo’ mode. Color light microscope images were generated using the EntoVision multiple-focus imaging system. Methods for generating these photographs follow those in Buffington and van Noort (2009). Diffused lighting was achieved using techniques summarized in Buffington et al. (2005), Kerr et al. (2009) and Buffington and Gates (2009). Resulting images were

edited in Adobe CS4. All images are available from Morphbank.

Descriptive format.—Specimen-level data for all specimens of each species were uploaded to vSyslab (Johnson 2008), and these data were linked to species concepts in the database. For each species concept, a matrix of characters was coded, and this matrix of characters were used to automatically generate the descriptions in natural language. Only species-level characters are focused on in the species descriptions; generic-level characters are covered in the redescription of the genus (which largely follows that of Buffington (2009)), and are not repeated for each species. Morphological terminology follows Buffington (2009); surface sculpture terminology follows that of Harris (1979).

SYSTEMATIC TREATMENT

Zaeucoila Ashmead, 1903

Zaeucoila Ashmead, 1903a: 222; Dalla Torre and Kieffer, 1910: 102, 891; Rohwer and Fagan, 1917: 378; Weld, 1921: 444, 1952: 105, 193 (redescription); Borgmeier, 1935: 116; Nordlander 1982: 16, 21–22; Díaz & Gallardo, 1997: 34 (revision), 1998: 111; Gallardo & Díaz, 1999: 20; Marchiori & Oliveira, 2001: 337; Fontal-Cazalla et al., 2002: 179; Selegatto et. al., 2004: 624; Fontal and Nieves-Aldrey, 2004: 64, 77; Buffington, 2009: 184–185 (redescription).

Zaeucoela Ashmead, 1903b: 66, 71. Mis-spelling.

Agrostocynips Díaz, 1976: 33 (in De Santis et al.); **new synonymy**.

Aegeseucoela Buffington, 2002: 593. **Synonymy by Buffington (2009).**

Type species.—*Zaeucoila unicarinata* Ashmead, 1903a: 222, by original designation.

Redescription.—**Head:** Nearly glabrous with scattered setae along lower face, clypeus and gena; ocelar hair patch absent (only present in *Z. grenadensis*). Orbital

furrows originating at torulus, terminating at malar sulcus. Malar sulcus simple. Malar space smooth; ventral margin with a single prominent conical protuberance. Genal carina running from malar space to dorsal margin of compound eyes, or only along ventral margin of malar space.

Antenna: Female: 13 segments, semi-clavate; segments 3–13 of subequal size; placoidal sensillae present on segments 2–13, 3–13, 4–13 or 5–13. Male: 15 segments, 4–15 of subequal size; placoidal sensillae present on segments 3–15, segment 3 modified, slightly longer than 4, curved, excavated laterally. In both sexes, segments pubescent, subcircular in cross-section.

Pronotum: Pronotal plate wide, with setae along the dorsal margin, dorsal margin marginate. Pronotal fovea open. Pronotal triangle absent or present. Pronotal impression absent. Lateral pronotal carina absent. Lateral aspect of pronotum glabrous, smooth.

Mesoscutum: Mesoscutal carina absent or present, at least anteriorly, tapering towards posterior margin of mesoscutum. Parascutal impression incomplete, narrow. Notauli, parapsidal ridges and parapsidal hair lines usually absent.

Mesopectus: Upper part and lower part of mesopleuron smooth and glabrous. Dorsal margin of mesopleural triangle well defined, rounded ventrally. Mesopleural carina simple. Lower part of mesopleuron bounded by distinct precoxal carina.

Scutellum: Scutellar plate ranging from smaller to large; posterior margin rounded or truncate. Glandular release pit placed in the center or between center point of plate and posterior margin of plate; rim of plate translucent; tubercles commonly found along the entire rim. Dorsal surface of scutellum either areolate/foveate or having large, radiating ridges, rounded laterally and posteriorly, laterodorsal and

posterior projections of scutellum absent. Lateral bars as long as wide; ventral lobe present, scutellar fovea oval, smooth and deep.

Metapectal-propodeal complex: Anterior part of complex glabrous, posterior part setose. Spiracular groove with a well defined dorsal margin, ventral margin sometimes reduced. Metapleural ridge reduced to absent, submetapleural ridge absent. Anterior impressions of metepimeron and metepisternum present. Anteroventral cavity semioval, setose. Propodeum covered in both long and short setae. Lateral propodeal carinae semiparalell, bowed at junction with the auxiliary propodeal carinae; propodeal carinae reduced. Nucha glabrous, crenulate or reticulate.

Wings: Base of wing hyaline or infuscate, setose or glabrous. R1 complete. Marginal cell typically as long as deep, open or closed. Apical fringe present, medium in length.

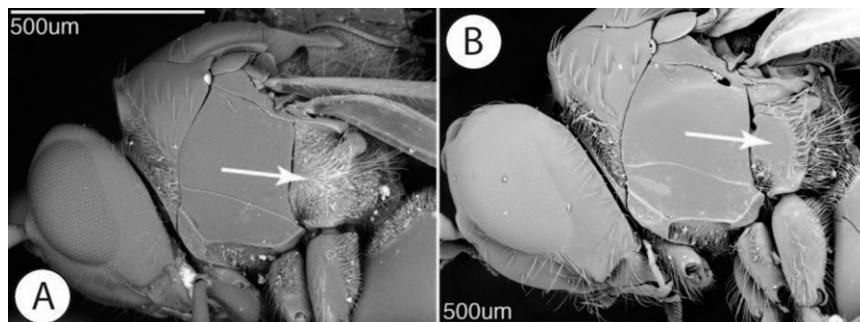

Legs: Fore and mid coxa subequal in size, hind coxa twice the size of either

fore or mid coxa. Fore coxa variably setose; mid and hind coxa with distinct lateral and posterior dorsoventral lateral setal bands. Femora and tibiae sparsely setose; tarsomeres with dense setae.

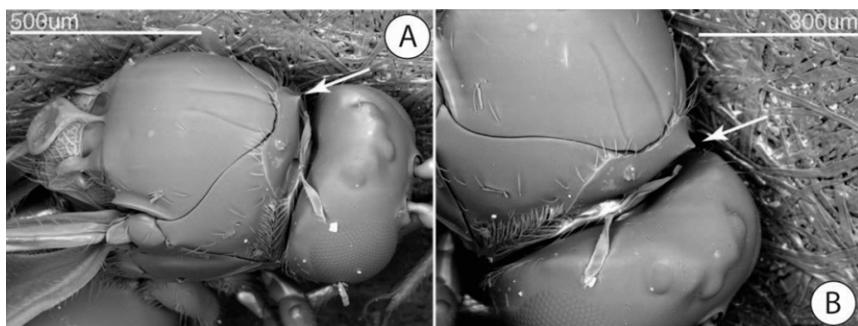

Metasoma: Female: subequal in size to mesosoma. Base of syntergum with hairy ring present, remainder of metasoma glabrous. Terga posterior to syntergum directed posteroventrally, resulting in a 70° or in a near 90° degree angle between syntergum and terga. Male: as in female with terga posterior to syntergum abruptly angled ventrally, resulting in a 90° angle between syntergum and remaining terga. Micropunctures present on posterior quarter of syntergum, and on remaining terga.

Biology.—Koinobiont endoparasitoids of Agromyzidae (Diptera). The host is parasitized while still in the leaf, typically in the first or second instar. The parasitoid consumes the host after the host has dropped from the host plant and created the puparium in the soil below. The parasitoid later emerges from the puparium, in the soil, below the host plant.

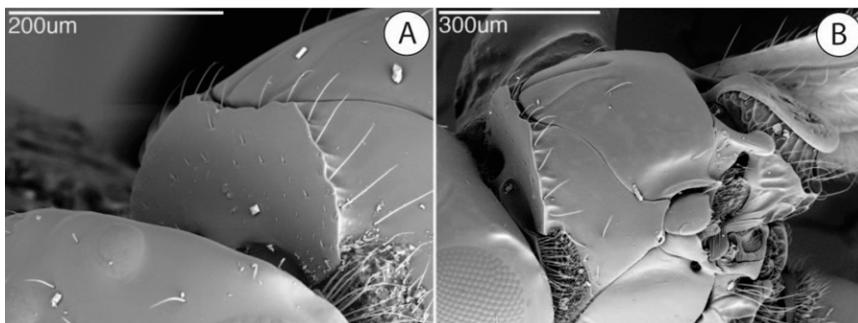

KEY TO SPECIES OF *ZAEUCOILA*

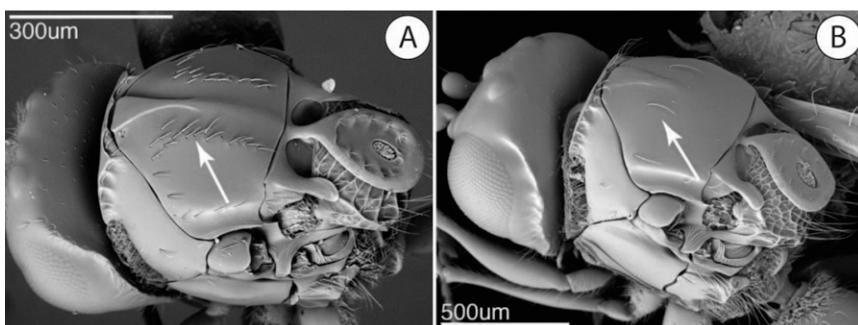

1. Metapleuron entirely setose (arrow, A)..... *Zaeucoila normae* n. sp.
- Metapleuron, at most, with posterior half of metapleuron setose; –remainder of metapleuron glabrous (arrow, B)..... 2

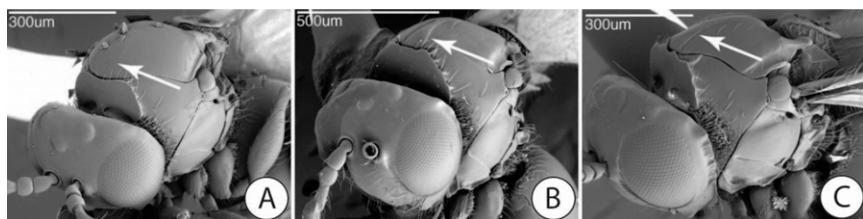

2. Anterior face of pronotal plate with a pair of forward-projecting conical protuberances (arrows, A and B) *Zaeucoila bituberculata* n. sp.

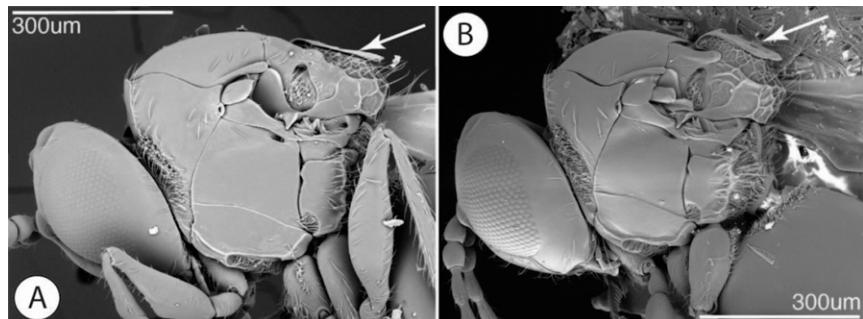

- Anterior face of pronotal plate entirely flat, no conical protuberances present (A and B) 3

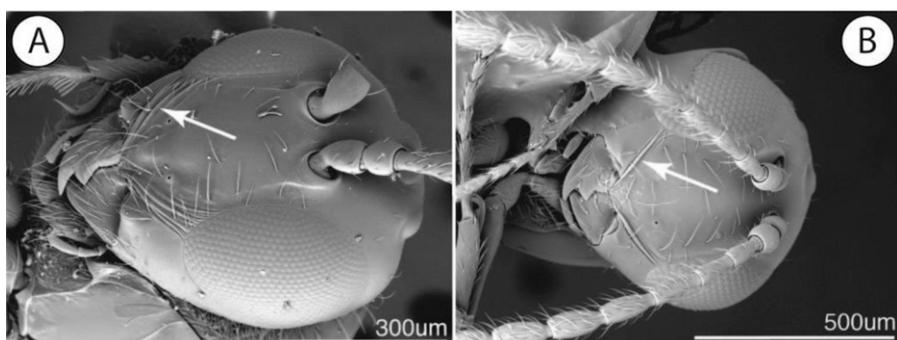

3. Mesoscutum with a well developed mesocutal keel and dense setal tracks parallel to the keel (A) *Zaeucoila grenadensis*
— Mesoscutum without dense setal tracks, with at most, thin setal tracks; mesocutal keel present to absent (B) 4

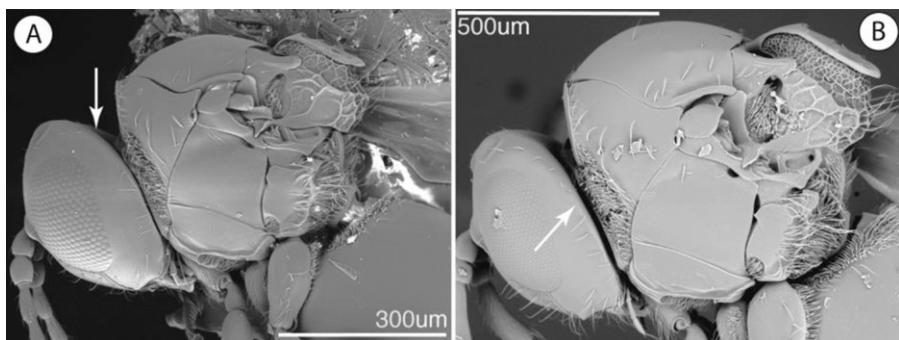

4. Mesoscutum with no trace of admedial lines or mesocutal keel (arrow, A) 5
 – Mesoscutum ranging from distinct admedial lines (arrow, B) to a well-developed mesoscutal keel (arrow, C) 8

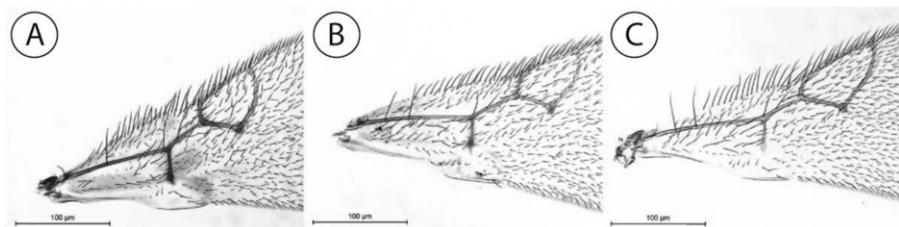

5. Scutellum, when viewed laterally, at the same level as mesoscutum (scutellum flattened) (arrow, A) *Zaeucoila patera* n. sp.
 – Scutellum, when viewed laterally, distinctly rising above the level of the mesoscutum (arrow, B) 6

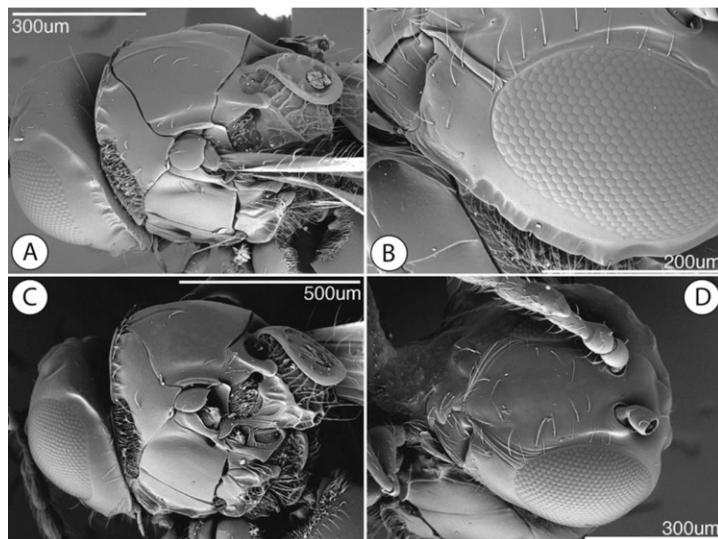

6. Malar sulcus composed of a series of striae (arrow, A) *Zaeucoila fidalgoii* n. sp.
 – Malar sulcus simple, composed of a single or two striae (arrow, B) 7.

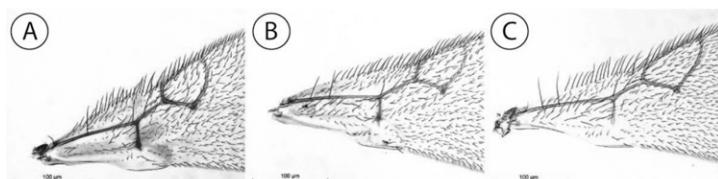

7. Genal carina clearly present, extending beyond dorsal margin of eye (seen in lateral view) (arrow, A).....*Zaeucoila triangulifera*
– Genal carina apparently absent; when visible, the genal carina can only be seen extending to, at most, halfway up the length of the eye (seen in lateral view) (arrow, B).....*Zaeucoila robusta*

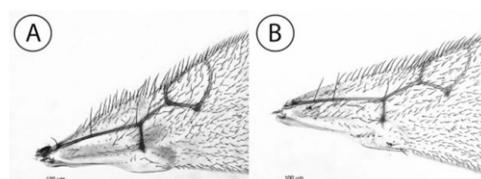

8. Base of forewing with at least some indication of infuscation (A and B).....9
– Base of forewing entirely clear, no indication of any infuscation (C).....11

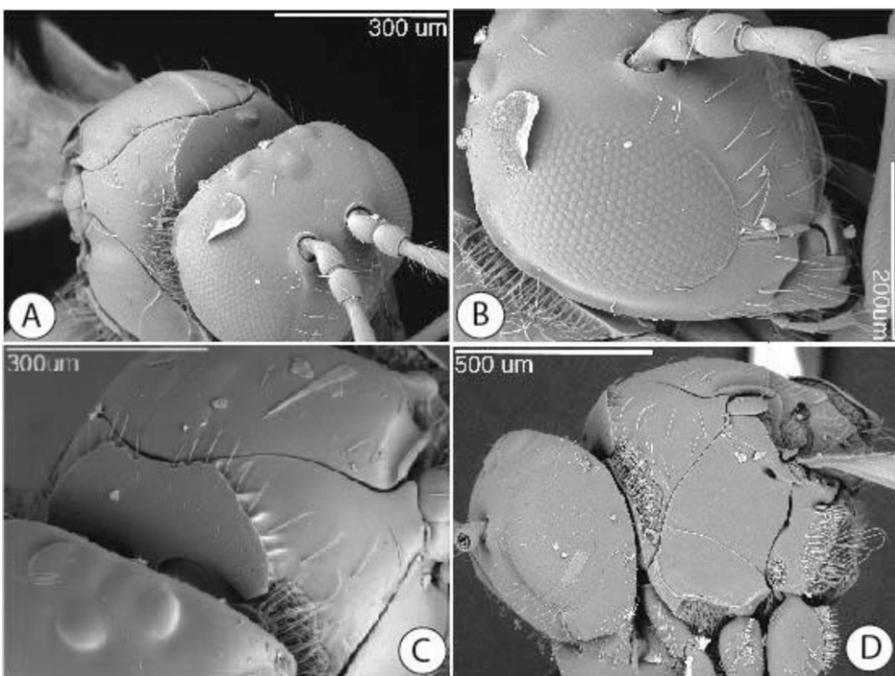

9. Inner orbital furrow sharply defined along its entire length (B); malar sulcus simple, composed of single ridge (B); sparse setal tracks usually present on mesoscutum (A); genal carina always heavily scalloped (A and B); mesoscutal keel frequently reaching past the midline of the mesoscutum (A).....*Z. johnsonii* n. sp.
- Inner orbital furrow defined dorsally near toruli, less so ventrally (D); malar sulcus typically composed of a series of striae, especially at the end meeting the eye (D); no setal tracks present on mesoscutum (C); genal carina typically smooth, sometimes scalloped (C); mesoscutal carina extending, at most, to midline of mesoscutum (C).....10

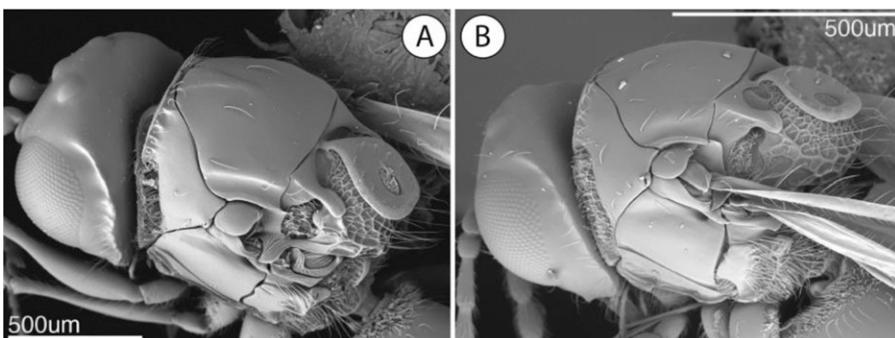

10. Area at base of forewing with broad areas of distinct infuscation, sometimes quite dark (A and B).....11
- Area at base of forewing hyaline, with no visible infuscation.....13

11. Area at base of forewing with broad areas of distinct infuscation, sometimes quite dark (A).....*Zaeucoila infuscata* n. sp.
- Area at base of forewing with limited infuscation, specifically restricted to space surrounding the wing veins (B).....12

12. Mesoscutal carina extending from the pronotal plate to at least one-half the length of the mesoscutum (A); orbital grooves distinctly present along the medial edge of the compound eye (B); malar sulcus simple, composed of a few striae merging into a single ridge (B); genal carina most often distinctly scalloped (A and B). *Zaeucoila unicarinata*
 – Mesoscutal carina typically absent; if present, only indicated anteriorly behind the pronotal plate (C), never reaching half-way across the mesoscutum; orbital grooves present but weakly indicated along medial edge of compound eye (D); malar sulcus composed of a series of striae (D). *Zaeucoila lignys* n. sp.

13. Legs entirely honey yellow; two long seta present on either side of the mesoscutal keel about halfway along its length (A); genal carina distinctly scalloped. *Zaeucoila flavipes*.
 – Base of legs dark brown to mahogany in color, remaining segments orange-yellow; one, sometimes two short seta present on either side of the mesoscutal keel, along with other short setae (B); genal carina most often smooth, occasionally gently scalloped. *Zaeucoila incompleta*

Distribution.—Southern Canada, USA, Central America, South America, Caribbean (Buffington 2004, 2009; De Santis et al. 1975, 1976; Díaz and Gallardo 1997; Fontal and Nieves-Aldrey 2004). A summary map of all species of *Zaeucoila* can be found here: <http://hol.osu.edu/map-full.html?id=244108>.

DESCRIPTIONS AND REDESCRIPTIONS

***Zaeucoila bituberculata* Buffington and Gallardo, new species**

urn:lsid:zoobank.org:act:576ACC14-BEE5-4CD0-84F9-9E8CF399D7B8

http://bioguid.osu.edu/xbiol_concepts/407938

(Figs. 2–7)

Description.—Coloration with head, mesosoma, metasoma black to dark brown; legs with coxae and femora dark brown, rest yellow. Lateral margin of occiput defined by evenly rounded, raised, sharp carina. Vertical carina adjacent to ventral margin of antennal socket present, leading to shallow inner orbital groove. Malar space adjacent to anterior articulation of mandible with distinct conical protuberance, smooth. Malar sulcus present, composed of single line. Orbital furrows rounded, ill defined, running from lateral edge of torulus to ventral margin of compound eye. Dorsal aspect of vertex smooth with a few short, scattered setae. Posterior aspect of vertex smooth with fine setae. Hair punctures on lateral aspect of vertex absent. Placoidal sensilla present on F3–11. Pubescence on lateral surface of pronotum present, sparse, consisting of few short hairs. Ridges extending posteriorly from lateral margin of pronotal plate absent. Sculpture on mesoscutum absent, entire surface smooth, shiny. Median mesoscutal carina present, composed of anteriorly broad elevation, narrowing posteriorly, ending at midline of mesoscutum. Anterior admedial lines

present, in conjunction with mesoscutal carina. Lateroventral mesopleural carina present, marking abrupt change of slope of mesopectus, terminating anteriorly at anterior flange of mesosubpleuron. Mesopleural triangle present, gently impressed lacking dorsal and ventral border; smooth. Dorsal surface of scutellum foveate-areolet. Latero-ventral margin of scutellum posterior to auricula smooth, with weak longitudinal striae. Subalar area abruptly broadened anteriorly, with an indicated longitudinal division. Pubescence present along posterior and ventral margins of metapleuron, long, dense; long and thin on propodeum. Pubescence of fore wing absent on mesal half of wing, sparse distally. Coloration of wing absent, entire wing hyaline. Hair fringe along apical margin of fore wing present, very short.

Inter propodeal carinae space smooth with confined setal patch.

Diagnosis.—This species is unique with the possession of twin conical protuberances on the anterior face of the pronotal plate. This character state has not been observed in any other eucoiline species.

Etymology.—Name refers to the twin corniculae on the pronotal plate.

Link to Distribution Map.—[<http://hol.osu.edu/map-full.html?id=407938>]

Material Examined.—Holotype, female: MARTINIQUE: Trinité Arrond., MP 49, L'Ajoupa-Bouillon, 26.IV.1994, reared, J. Etienne, USNMENT00977920 (deposited in USNM).

Distribution.—Neotropical Region: Martinique.

Biology.—Host not observed.

***Zaeucoila fidalgoi* Buffington and Gallardo, new species**

urn:lsid:zoobank.org:act:A48570CB-C568-4C1E-96AA-A7D8FA188516

http://bioguid.osu.edu/xbiol_concepts/410040

(Figs. 8–13)

Plate 1, Fig. 1. Digital painting of a female *Zaeucoila robusta*.

Description.—Coloration with head, mesosoma, metasoma black to dark brown; legs with coxae and femora dark brown, rest yellow. Lateral margin of occiput defined by distinctly angled, raised, sharp carina. Vertical carina adjacent to ventral margin of antennal socket present, leading to shallow inner orbital groove. Malar space adjacent to anterior articulation of mandible with distinct conical protuberance, smooth. Malar sulcus present, composed of series of small striae. Orbital furrows rounded, divergent ledges running from antennal sockets to dorsal

end of malar sulcus. Dorsal aspect of vertex smooth with a few short, scattered setae. Posterior aspect of vertex smooth with fine setae. Hair punctures on lateral aspect of vertex absent. Placoidal sensilla present on F2-11. Pubescence on lateral surface of pronotum present, sparse, consisting of few short hairs. Ridges extending posteriorly from lateral margin of pronotal plate distinct but short, not extending to the dorsal margin of pronotum. Sculpture on mesoscutum absent, entire surface smooth, shiny. Median mesoscutal carina absent. Anterior admedial lines absent.

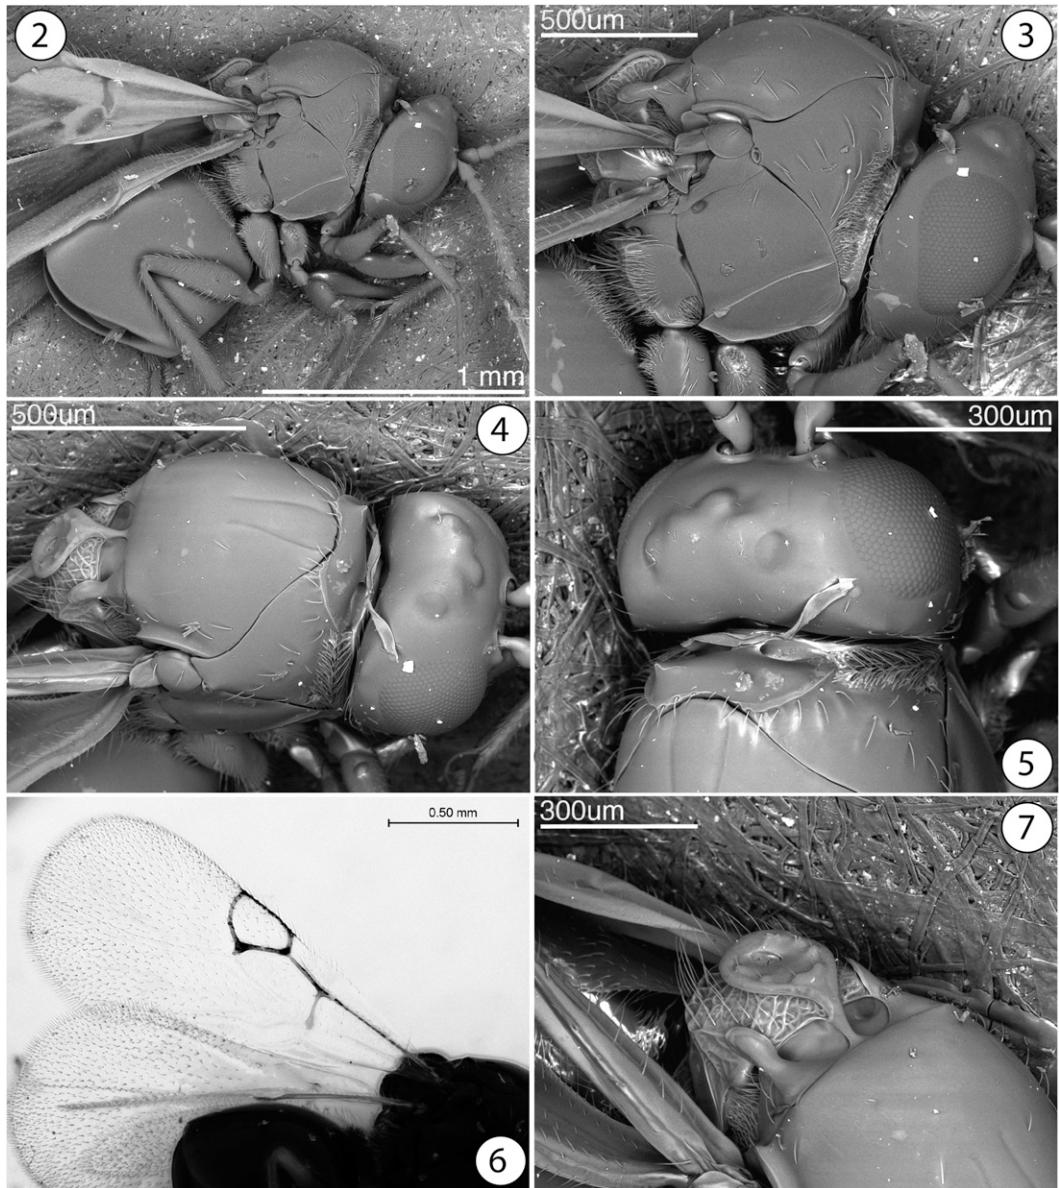

Plate 2, Figs. 2–7. *Zaeucoila bituberculata*, new species. 10, habitus, lateral; 11, head and mesosoma, lateral; 12, head and mesosoma, dorsal; 13, head and pronotum, dorsal; 14, forewings; 15, scutellum, dorsal view.

Lateroventral mesopleural carina present, marking abrupt change of slope of mesopectus, terminating anteriorly at large, oblique notch. Mesopleural triangle present, gently impressed with distinct dorsal border, ventral border lacking;

smooth. Dorsal surface of scutellum foveate-areolet. Latero-ventral margin of scutellum posterior to auricula smooth ventrally, longitudinally striate dorsally. Subalar area slightly broadened anteriorly, with distinct laterally protruding lobe

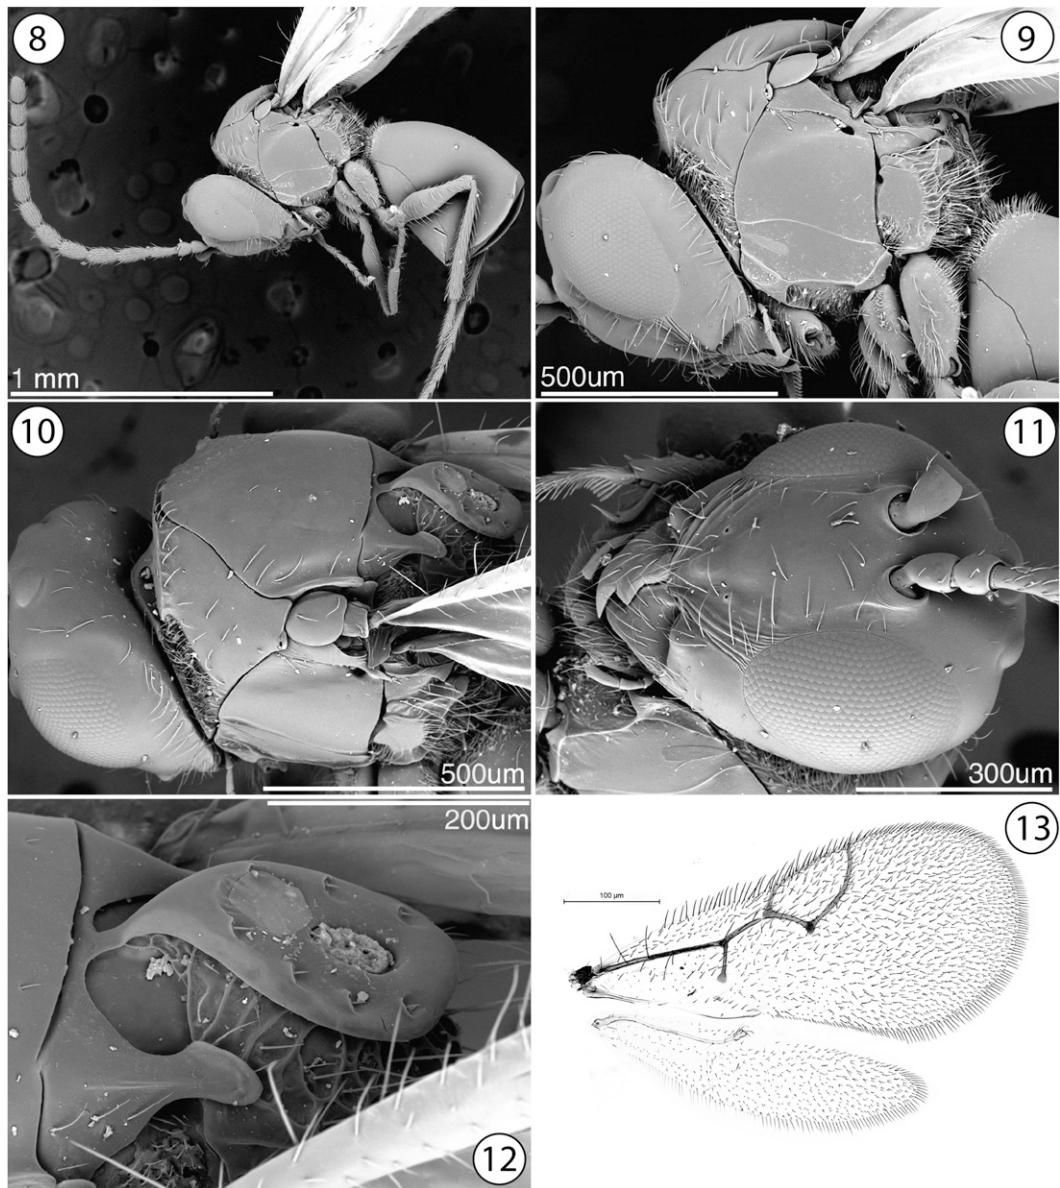

Plate 3, Figs. 8–13. *Zaeucoila fidalgoii*, new species. 16, habitus, lateral view; 17, head and mesosoma, lateral view; 18, head and mesosoma, dorsal view; 19, head, anterior view; 20, scutellum, dorso-lateral view; 21, fore and hind wings.

ventrally. Pubescence consisting of few hairs on posterior part of metapleuron, dense hair on propodeum. Pubescence of fore wing mesally sparse, gradually becoming denser distally. Coloration of

wing absent, entire wing hyaline. Hair fringe along apical margin of fore wing present, with particularly longer setae along the mesal anterior margin. Interpropodeal carinae space moderately

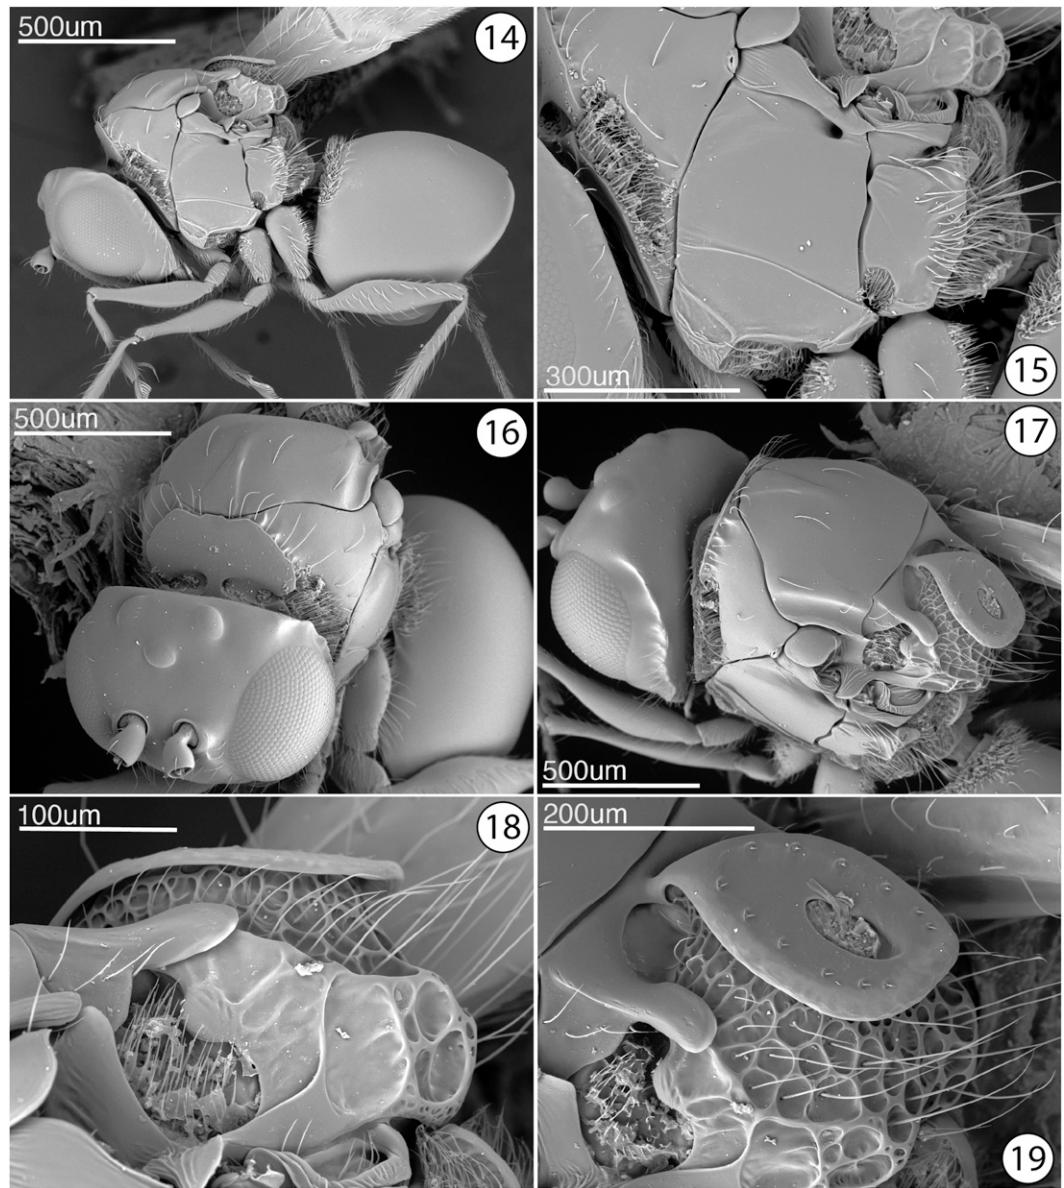

Plate 4, Figs. 14–19. *Zaeucoila flavipes*, new combination. 2, habitus; 3, mesosoma, lateral view; 4, head and mesosoma, anterodorsal view; 5, head and mesosoma, laterodorsal view; 6, scutellum, lateral view; 7, scutellum, posterolateral view.

setose, with long, thin setae evenly filling the space; surface underneath smooth.

Diagnosis.—Many *Zaeucoila* have a series of striae that compose the malar sulcus at the end connecting to the

compound eye, but these striae merge to a single, or at most, double sulcus. In the case of *Z. fildalgoii*, the malar sulcus is entirely composed of a series of striae, with no single dominant ridge. The marginal cell of the forewing is

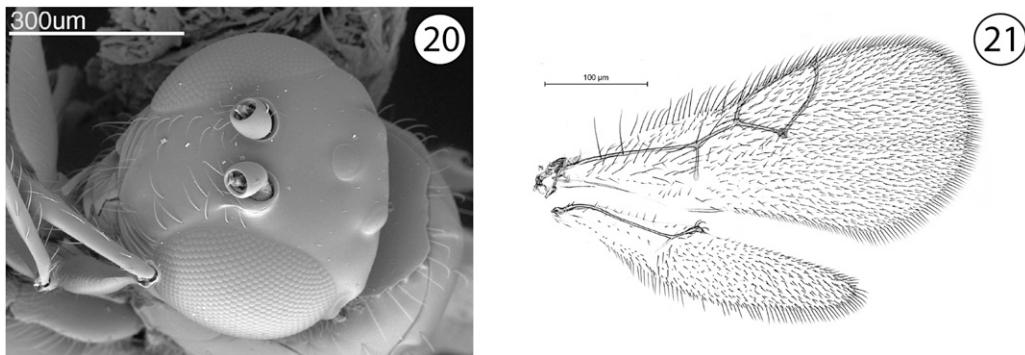

Plate 5, Figs. 20–21. *Zaeucoila flavipes*, new combination. 8, head, anterior view; 9, fore and hind wings.

somewhat unique, too, in that its length is much greater than its depth, resulting in what appears to be a very large marginal cell for the size of the wing.

Etymology.—Named in honor of the eminent hymenopterist and collector of this species, Dr. Patricio Fidalgo (CONICET, Anillaco, La Rioja, Argentina).

Link to Distribution Map.—[<http://hol.osu.edu/map-full.html?id=410040>]

Material Examined.—Holotype, male: ARGENTINA: La Rioja Prov., Santa Cruz, 15.IX-14.X.2002, Fidalgo, USNMENT00993727 (deposited in USNM). Paratypes: (1 female, 5 males) ARGENTINA: La Rioja Prov., Santa Cruz, 15.IX-14.X.2002, Fidalgo (5 males, USNMENT00993716, 00993725, 00993729, 00993733, 00993740 (USNM)). COSTA RICA: Guanacaste Prov., H.3.O, Santa Rosa National Park, 300m, 11.V-1.VI.1985, Malaise trap, D. Janzen & I. Gauld (1 female, USNMENT01223590 (USNM)).

Distribution.—Neotropical Region: Argentina and Costa Rica.

Biology.—Unknown.

Zaeucoila flavipes (Ashmead), new combination

http://bioguid.osu.edu/xbiol_concepts/386611

(Figs. 14–21)

Chrestosema flavipes Ashmead, 1896: 753 (original description).

Description.—Coloration. Lateral margin of occiput defined by scalloped, sharp carina. Vertical carina adjacent to ventral margin of antennal socket present, leading to shallow inner orbital groove. Malar space adjacent to anterior articulation of mandible with distinct pyramidal protuberance, smooth. Malar sulcus present, composed of series of small striae. Orbital furrows rounded, ill defined, running from lateral edge of torulus to ventral margin of compound eye. Dorsal aspect of vertex smooth with a few short, scattered setae. Posterior aspect of vertex smooth with fine setae. Hair punctures on lateral aspect of vertex absent. Placoidal sensilla present on F2-11. Pubescence on lateral surface of pronotum present, sparse, with distinct row behind pronotal plate. Ridges extending posteriorly from lateral margin of pronotal plate present, typically short, with single prominent ridge extending to anterior margin of mesoscutum. Median mesoscutal carina present, composed of anteriorly broad elevation, narrowing posteriorly, ending at midline of mesoscutum, with four long, slender setae, one pair on each side of mesoscutal carina. Anterior admedial lines present, in conjunction

with mesoscutal carina. Lateroventral mesopleural carina present, marking abrupt change of slope of mesopectus, terminating anteriorly at large, oblique notch. Mesopleural triangle present, distinctly impressed with distinct dorsal and ventral border, with single, long seta. Dorsal surface of scutellum foveate-areolate. Latero-ventral margin of scutellum posterior to auricula smooth ventrally, longitudinally striate dorsally. Subalar area slightly broadened anteriorly, with an indicated longitudinal division. Pubescence consisting of few hairs on posterior part of metapleuron, dense hair on propodeum. Pubescence of fore wing mesally sparse, gradually becoming denser distally. Coloration of wing absent, entire wing hyaline. Hair fringe along apical margin of fore wing present, with particularly longer setae along the mesal anterior margin. Interpropodeal carinae space moderately setose, with short, thin setae evenly filling the space; surface underneath smooth.

Diagnosis.—*Zaeucoila flavipes* has a distinctly scalloped genal carina, shared only with *Z. uncarinata* and *Z. johnsonii*. *Zaeucoila flavipes* differs from these two species by the possession of two distinct, long, pairs of setae, one pair on each side of the mesoscutal keel. This species may also be confused with *Z. incompleta*, as some specimens of this latter species have been observed with a partially scalloped genal carina. However, in these specimens, the paired setae are not present, but instead, there are more mesoscutal setae scattered across the mesoscutum.

Biology.—Host not observed.

Zaeucoila grenadensis (Ashmead, 1900), new combination

http://bioguid.osu.edu/xbiol_concepts/407941

Figures 22–27

Diranchis grenadensis Ashmead, 1900: 248 (original description).

Moneucoela grenadensis (Ashmead): Dalla Torre and Kieffer, 1910: 103 (generic transfer).

Aegeseucoela grenadensis (Ashmead): Buffington, 2002: 595 (generic transfer).

Agrostocynips grenadensis (Ashmead): Buffington, 2009: 172 (generic transfer, listed).

Redescription.—Coloration with head, mesosoma, metasoma black to dark brown; legs with coxae and femora dark brown, rest yellow. Lateral margin of occiput defined by evenly rounded, raised, sharp carina. Vertical carina adjacent to ventral margin of antennal socket present, leading to shallow inner orbital groove. Malar space adjacent to anterior articulation of mandible with short, blunt, smooth protuberance. Malar sulcus present, composed of single line. Orbital furrows rounded, ill defined, running from lateral edge of torulus to middle of compound eye. Dorsal aspect of vertex smooth with a few short, scattered setae. Posterior aspect of vertex smooth with fine setae. Hair punctures on lateral aspect of vertex present, indistinct. Placoidal sensilla present on F3-11. Pubescence on lateral surface of pronotum present, sparse, with distinct row behind pronotal plate. Ridges extending posteriorly from lateral margin of pronotal plate present, variable, short to medium long, in some cases running to anterior margin of mesoscutum. Sculpture on mesoscutum absent, with medium density setal tracks along anterior margin, following parallel to mesoscutal carina. Median mesoscutal carina present, composed of anteriorly broad elevation, narrowing posteriorly, typically ending at midline of mesoscutum, but with distinct burm continuing to posterior margin of mesoscutum. Anterior admedial lines present, in conjunction with mesoscutal carina. Lateroventral mesopleural carina present, marking abrupt change of slope of mesopectus, terminating anteriorly just ventral to large, oblique notch. Mesopleural triangle present, gently impressed with distinct dorsal border, ventral border lacking; smooth. Dorsal surface of scutellum laterally with distinct ridges

radiating from plate, posteriorly with deep fovea and ridges. Latero-ventral margin of scutellum posterior to auricula deeply foveate. Subalar area abruptly broadened anteriorly, with an indicated longitudinal division. Pubescence present, but very sparse, along posterior and ventral margins of metapleuron; short and dense on propodeum. Pubescence of fore wing mesally sparse, gradually becoming denser distally. Coloration of wing basally infuscate, apically hyaline. Hair fringe along apical margin of fore wing present, with particularly longer setae along the mesal anterior margin. Interpropodeal carinae space moderately setose, with long, thin setae evenly filling the space; surface underneath smooth.

Diagnosis.—The only *Zaeucoila* with distinct ocellar hair patches present, as well as complete parapsidal hair lines.

Comments.—Both diagnostic characters (above) are shared with *Martiella*. However, the species does not fit

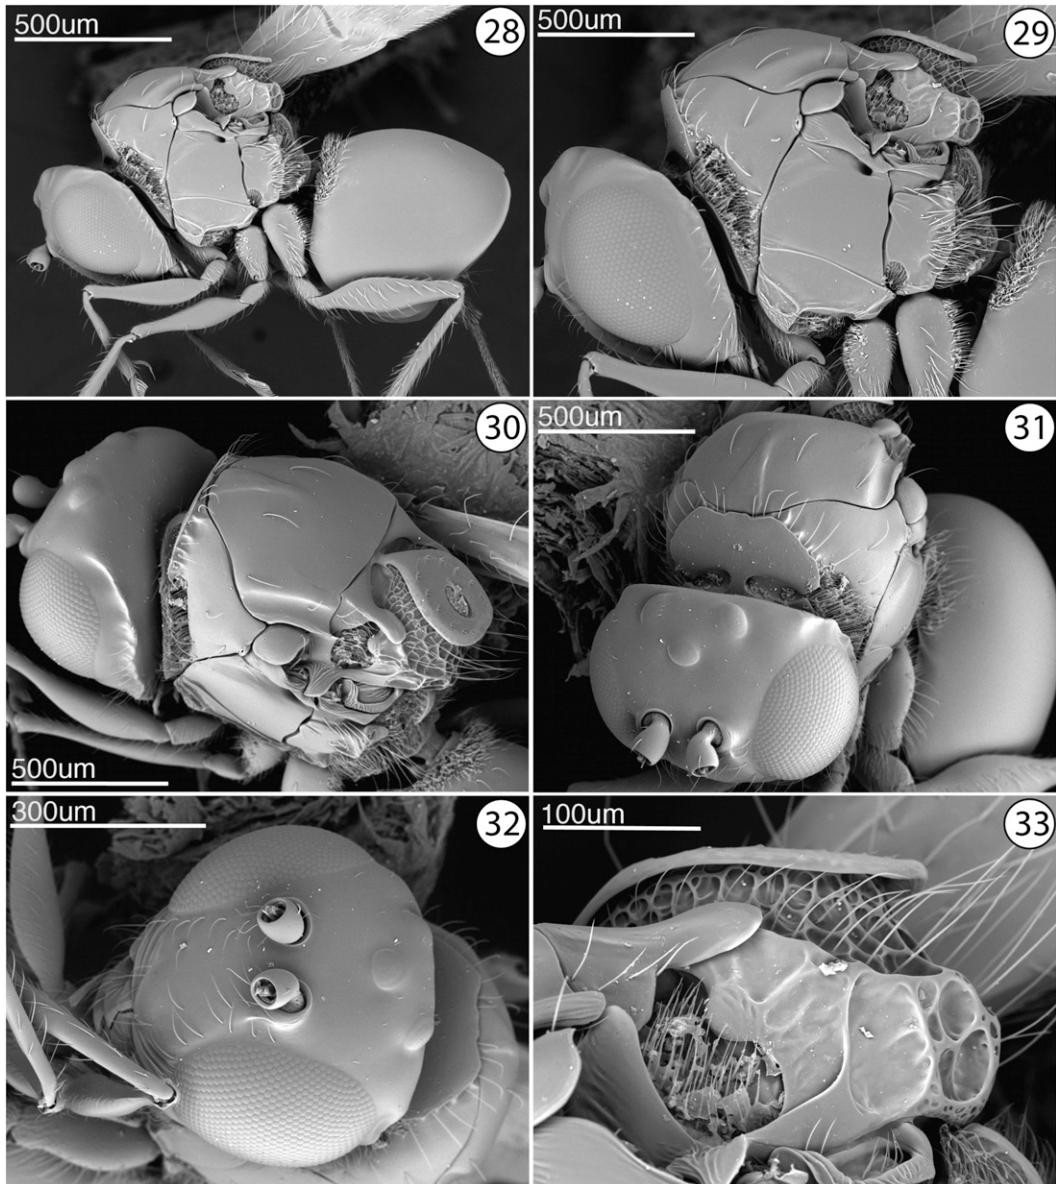

Plate 7. Figs. 28–33. *Zaeucoila incompleta* (Ashmead). 28, habitus, lateral view; 29, head and mesosoma, lateral view; 30, head and mesosoma, postero-dorsal view; 31, head and mesosoma, antero-dorsal view; 32, head, anterior view; 33, scutellum, lateral view.

well into any other genus than that of *Zaeucoila*. Buffington (2009) recovered this species interspersed among *Aegezeucoila*, *Zaeucoila* and *Agrostocynips*, species of which are all treated here as *Zaeucoila*.

Distribution.—Neotropical Region: Argentina, Belize, Grenada, Mexico, Panama, Venezuela (Ashmead 1900, Buffington 2002, Salvo 2008). New country record for Brazil, Ecuador and Peru.

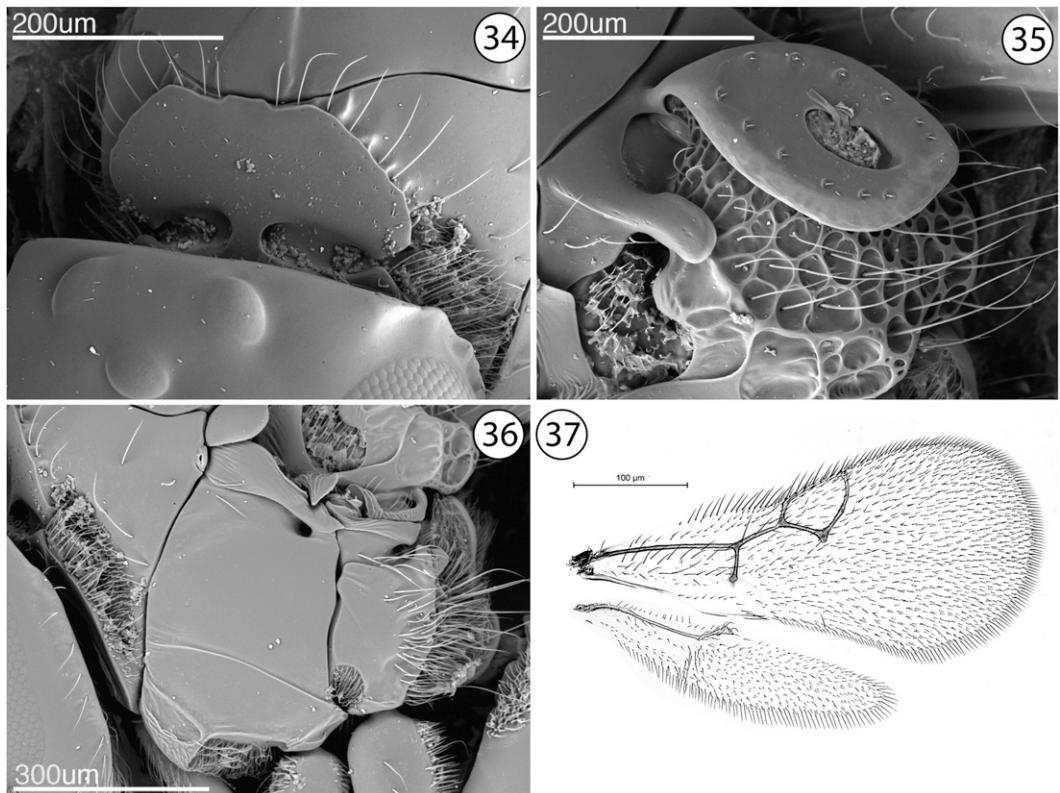

Plate 8, Figs. 34–37. *Zaeucoila incompleta* (Ashmead). 34, pronotal plate, antero-dorsal view; 35, scutellum, postero-dorsal view; 36, mesopleuron and metapleuron, lateral view; 37, fore and hind wings.

Biology.—Reared from Diptera Agromyzidae: *Calycomyza verbenivora* Spencer on *Verbena* sp. (Verbenaceae), *Calycomyza* cf. *cassiae* Frost on *Senna cobanensis* (Britton & Rose) (Fabaceae), *Haplopeodes* sp. on *Solanum erianthum* D. Don (Solanaceae) (Buffington 2002); *Calycomyza hiptidis* Spencer, *Calycomyza servilis* Spencer, *Calycomyza eupatorivora* Spencer, and an unidentified *Calycomyza* species are recorded here as new agromyzid host records (based on label data).

Zaeucoila incompleta (Kieffer)

http://bioguid.osu.edu/xbiod_concepts/389225

(Figs. 28–37)

Rhabdeucoila incompleta Kieffer, 1907: 70 (original description, keyed); Kieffer, 1907: 90 (description, distribution).

Zaeucoila incompleta (Kieffer): Weld, 1952: 193 (generic transfer); Díaz and Gallardo, 1997: 37 (description); Buffington, 2009: 185 (listed, host association).

Redescription.—Coloration with head, mesosoma, metasoma black to dark brown; legs variable, ranging from all leg segments entirely orange-yellow to coxae and femora dark brown, rest yellow. Lateral margin of occiput defined by scalloped, sharp carina. Vertical carina adjacent to ventral margin of antennal socket present, leading to deep inner orbital groove. Malar space adjacent to anterior articulation of mandible with

distinct conical protuberance, smooth. Malar sulcus present, composed of series of small striae. Orbital furrows sharp, divergent groove running from antennal sockets to dorsal end of malar sulcus. Dorsal aspect of vertex smooth with a few short, scattered setae. Posterior aspect of vertex smooth with fine setae. Hair punctures on lateral aspect of vertex absent. Placoidal sensilla present on F 2-11. Pubescence on lateral surface of pronotum present, sparse, with distinct row behind pronotal plate. Ridges extending posteriorly from lateral margin of pronotal plate present, typically short, with single prominent ridge extending to anterior margin of mesoscutum. Sculpture on mesoscutum absent, with sparse long hairs. Median mesoscutal carina present, composed of anteriorly broad elevation, narrowing posteriorly, ending before midline of mesoscutum. Anterior admedial lines present, in conjunction with mesoscutal carina. Lateroventral mesopleural carina present, marking abrupt change of slope of mesopectus, terminating anteriorly at large, oblique notch. Mesopleural triangle present, gently impressed with distinct dorsal border, ventral border lacking; smooth. Dorsal surface of scutellum foveate-areolet. Latero-ventral margin of scutellum posterior to auricula smooth with irregular rugae. Subalar area slightly broadened anteriorly, with an indicated longitudinal division. Pubescence present, medium density, along posterior and ventral margins of metapleuron; short and dense on propodeum. Pubescence of fore wing present, long, dense on most of surface. Coloration of wing absent, entire wing hyaline. Hair fringe along apical margin of fore wing present, with particularly longer setae along the mesal anterior margin. Inter propodeal carinae space moderately setose,

with long, thin setae evenly filling the space; surface underneath smooth.

Diagnosis.—This species is most readily confused with *Z. flavipes*, but can be separated from this species by having a smooth genal carina (scalloped in *Z. flavipes*) and lacking a distinct pair of elongate setae on each side of the mesoscutal keel.

Tunapuna/Piarco Reg., Trinidad Isl., wasteground, Saint Augustine, no date, J. S. Noyes (1 male, USNMENT00969555 (BMNH)).

Distribution.—Neotropical Region: Cuba, Panama, Brazil and Argentina (Kieffer 1907; Díaz and Gallardo 1997; Marchiori and Oliveira 2001; Fontal and Nieves-Aldrey 2004). Belize, Bolivia, Colombia, Costa Rica, Dominica, Dominican Republic, Ecuador, El Salvador, Guadeloupe, Guatemala, Guyana, Honduras,

Mexico, Nicaragua, Peru, Puerto Rico, Saint Vincent and the Grenadines and Trinidad and Tobago (new records) and new provinces record for Argentina: Buenos Aires, Cordoba, Salta and Tucuman and new states records for Brazil: Minas Gerais, Rio de Janeiro and Sao Paulo.

Biology.—Recorded hosts are Diptera: Agromyzidae: *Nemorimyza maculosa* (Malloch) (in Buffington 2009); *Calycomyza servilis* and *Liryomyza huidobrensis* are new records reported here (based on label data).

***Zaeucoila infuscata* Gallardo and Buffington, new species**

urn:lsid:zoobank.org:act:102E27EC-41C4-460D-B9F8-BDFA14CEA70E
http://bioguid.osu.edu/xbiol_concepts/408247

(Figs. 38–43)

Description.—Coloration with head, mesosoma, metasoma black to dark brown; legs with coxae and hind femora dark brown, rest yellow. Lateral margin of occiput variable, ranging from gently scalloped to smooth, sharp carina. Vertical carina adjacent to ventral margin of antennal socket present, leading to deep inner orbital groove. Malar space adjacent to anterior articulation of mandible with short, blunt, smooth protuberance. Malar sulcus present, composed of series of small striae dorsally, leading to single line ventrally. Orbital furrows sharp, divergent groove running from antennal sockets to dorsal end of malar sulcus. Dorsal aspect of vertex smooth with a few short, scattered setae. Posterior aspect of vertex smooth. Hair punctures on lateral aspect of vertex absent. Placoidal sensilla present on F 2–11. Pubescence on lateral surface of pronotum present, sparse, with distinct row behind

pronotal plate. Ridges extending posteriorly from lateral margin of pronotal plate present, typically short, with single prominent ridge extending to anterior margin of mesoscutum. Sculpture on mesoscutum absent, with sparse long hairs. Median mesoscutal carina present, composed of anteriorly broad elevation, narrowing posteriorly, ending at midline of mesoscutum. Anterior admedial lines present, in conjunction with mesoscutal carina. Lateroventral mesopleural carina present, marking abrupt change of slope of mesopectus, terminating anteriorly at large, oblique notch. Mesopleural triangle present, gently impressed with distinct dorsal border, ventral border lacking; smooth. Dorsal surface of scutellum laterally with distinct ridges radiating from plate, posteriorly with deep fovea and ridges. Latero-ventral margin of scutellum posterior to auricula smooth, with weak longitudinal striae. Subalar area abruptly broadened anteriorly, with an indicated longitudinal division. Pubescence present, but very sparse, along posterior and ventral margins of metapleuron; short and dense on propodeum. Pubescence of fore wing mesally sparse, gradually becoming denser distally. Coloration of wing variable, ranging entirely infuscate basally to blotchy infuscation basally. Hair fringe along apical margin of fore wing present, with particularly longer setae along the mesal anterior margin. Interpropodeal carinae space moderately setose, with long, thin setae evenly filling the space; surface underneath smooth.

Diagnosis.—This species is unique in its possession of a heavily infuscate mesal 1/3 of the forewing. This character is also shared with *Z. grenadensis*, but can be separated from this species by the lack of ocellar hair patches and parapsidal hair lines (both present in *Z. grenadensis*).

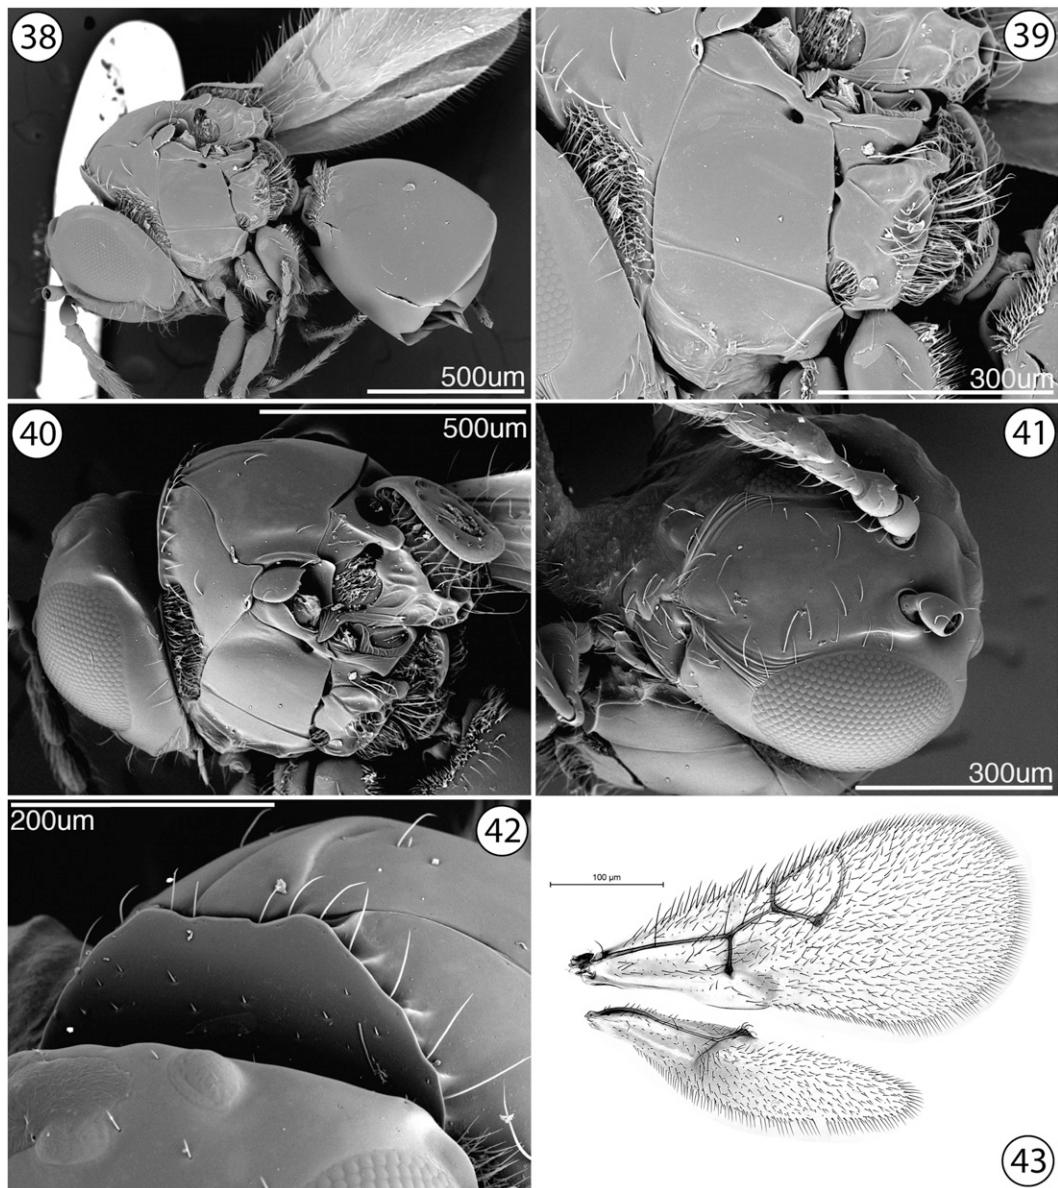

Plate 9, Figs. 38–43. *Zaeucoila infuscata*, new species. 38, habitus, lateral view; 39, mesopleuron and metapleuron, lateral view; 40, head and mesosoma, postero-dorsal view; 41, head, anterior view; 42, pronotal plate, antero-dorsal view; 43, fore and hind wings.

Etymology.—Name refers to the infuscation at the base of the fore and hind wings.

Anduze (1 female, USNMENT00977564 (USNM)).

Distribution.—Neotropical Region: Argentina, Bolivia, Brazil, Colombia, Costa Rica, Dominica, Ecuador, Guadeloupe, Mexico, Nicaragua, Panama, Paraguay, Peru, Saint Vincent and the Grenadines, Trinidad and Tobago and Venezuela.

Biology.—No host recorded.

Comments.—The degree of infuscation is somewhat variable, and looking at the wing against a light background helps to reveal this character.

***Zaeucoila johnsoni* Buffington and Gallardo, new species**

urn:lsid:zoobank.org:act:B5F047AB-9E5D-448A-A951-3BDBFDD6A28C
http://bioguid.osu.edu/xbiol_concepts/409616

(Figs. 44–51)

Description.—Coloration with head, mesosoma, metasoma black to dark brown; legs with coxae and hind femora

dark brown, rest yellow. Lateral margin of occiput defined by scalloped, sharp carina, with variable striae joining posterior margin of eye. Vertical carina adjacent to ventral margin of antennal socket present, leading to deep inner orbital groove. Malar space adjacent to anterior articulation of mandible with distinct conical protuberance, smooth. Malar sulcus present, composed of single line. Orbital furrows sharp, divergent groove running from antennal sockets to dorsal end of malar sulcus. Dorsal aspect of vertex smooth with a few short, scattered setae. Posterior aspect of vertex smooth with fine setae. Hair punctures on lateral aspect of vertex present, indistinct. Placoidal sensilla present on F 2-11. Pubescence on lateral surface of pronotum present, sparse, with distinct row behind pronotal plate. Ridges extending posteriorly from lateral margin of pronotal plate present, typically short, with single prominent ridge extending to anterior margin of mesoscutum. Sculpture on mesoscutum absent, with sparse long hairs. Median mesoscutal carina present, composed of anteriorly broad elevation, narrowing posteriorly, ending at posterior margin of mesoscutum. Anterior admedial lines present, in conjunction with mesoscutal carina. Lateroventral mesopleural carina present, marking abrupt change of slope of mesopectus, terminating anteriorly just ventral to large, oblique notch. Mesopleural triangle present, distinctly impressed with distinct dorsal and ventral border, with single, long seta. Dorsal surface of scutellum laterally with distinct ridges radiating from plate, posteriorly with deep fovea and ridges. Latero-ventral margin of scutellum posterior to auricula deeply foveate. Subalar area abruptly broadened anteriorly, with an indicated longitudinal division. Pubescence consisting of few hairs on posterior part of metapleuron,

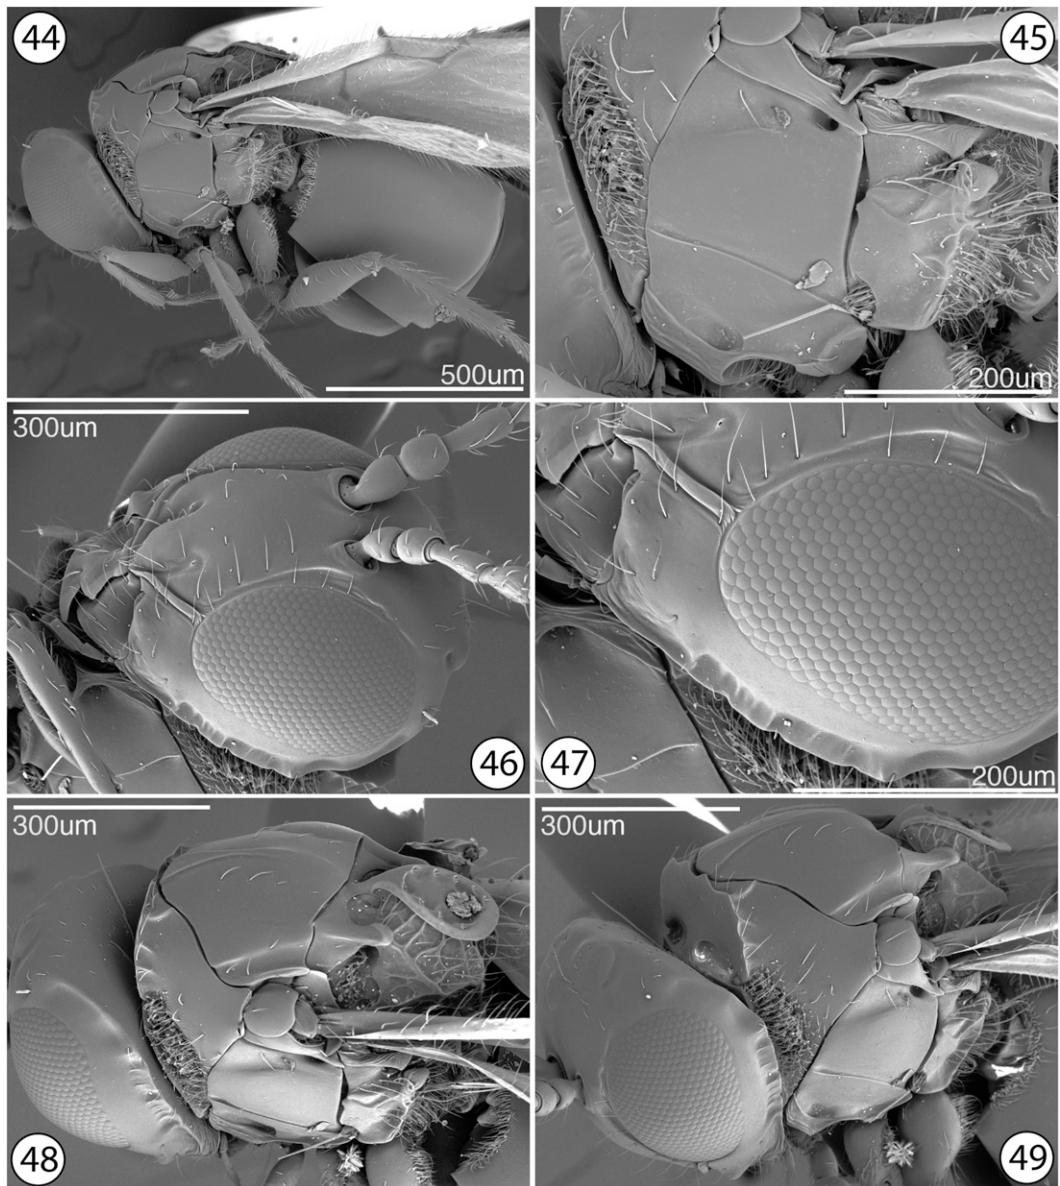

Plate 10, Figs. 44–49. *Zaeucoila johnsonii*, new species. 44, habitus, lateral view; 45, mesopleuron and metapleuron, lateral view; 46, head, anterolateral view; 47, head, lateral view; 48, head and mesosoma, dorsolateral view; 49, head and mesosoma, anterodorsal view.

dense hair on propodeum. Pubescence of fore wing mesally sparse, gradually becoming denser distally. Coloration of wing absent, entire wing hyaline. Hair fringe along apical margin of fore wing

present, with particularly longer setae along the mesal anterior margin. Interpropodeal carinae space moderately setose, with long, thin setae evenly filling the space; surface underneath smooth.

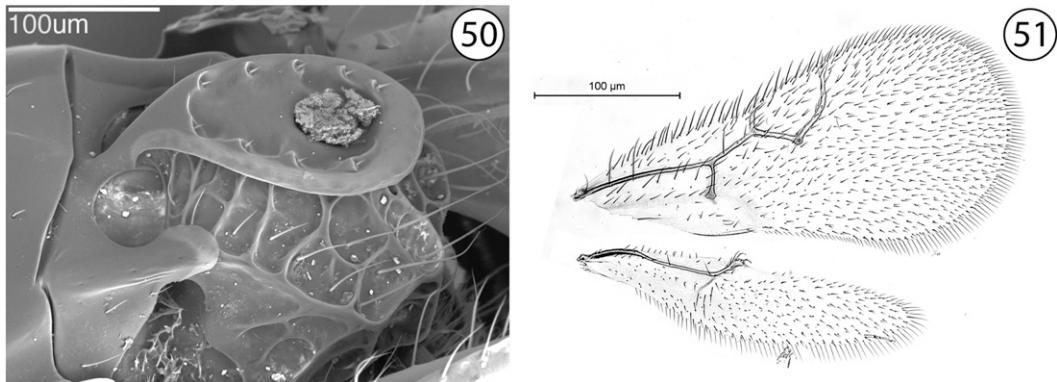

Plate 11, Figs. 50–51. *Zaeucoila johnsonii*, new species. 50, scutellum, laterodorsal view; 51, fore and hind wing.

Diagnosis.—*Zaeucoila johnsonii* is morphologically most similar to *Z. grenadensis*. However, *Z. johnsonii* lacks the ocellar hair patches, and also lacks distinct parapsidal hair lines (though, trace tracks are still present). *Zaeucoila johnsonii* also has a very scalloped genal carina as well as a very simple, bold malar sulcus. While other species may have a scalloped genal carina, the very simple malar sulcus appears to be unique.

Etymology.—Named in honor of the eminent hymenopterist Dr. Norman Johnson (The Ohio State University). Dr. Johnson is a good friend of the first author, and has helped manage and format the data in this project for publication through vSysLab.

Biology.—Unknown.

Zaeucoila lignys Buffington and Gallardo, new species

urn:lsid:zoobank.org:act:98549C1A-86DA-470E-B836-C5470918E022
http://bioguid.osu.edu/xbiol_concepts/409606

(Figs. 52–57)

Description.—Coloration with head, mesosoma, metasoma black to dark brown; legs with coxae and hind femora dark brown, rest yellow. Lateral margin of occiput defined by evenly rounded, raised, sharp carina. Vertical carina adjacent to ventral margin of antennal socket present, leading to shallow inner orbital groove. Malar space adjacent to

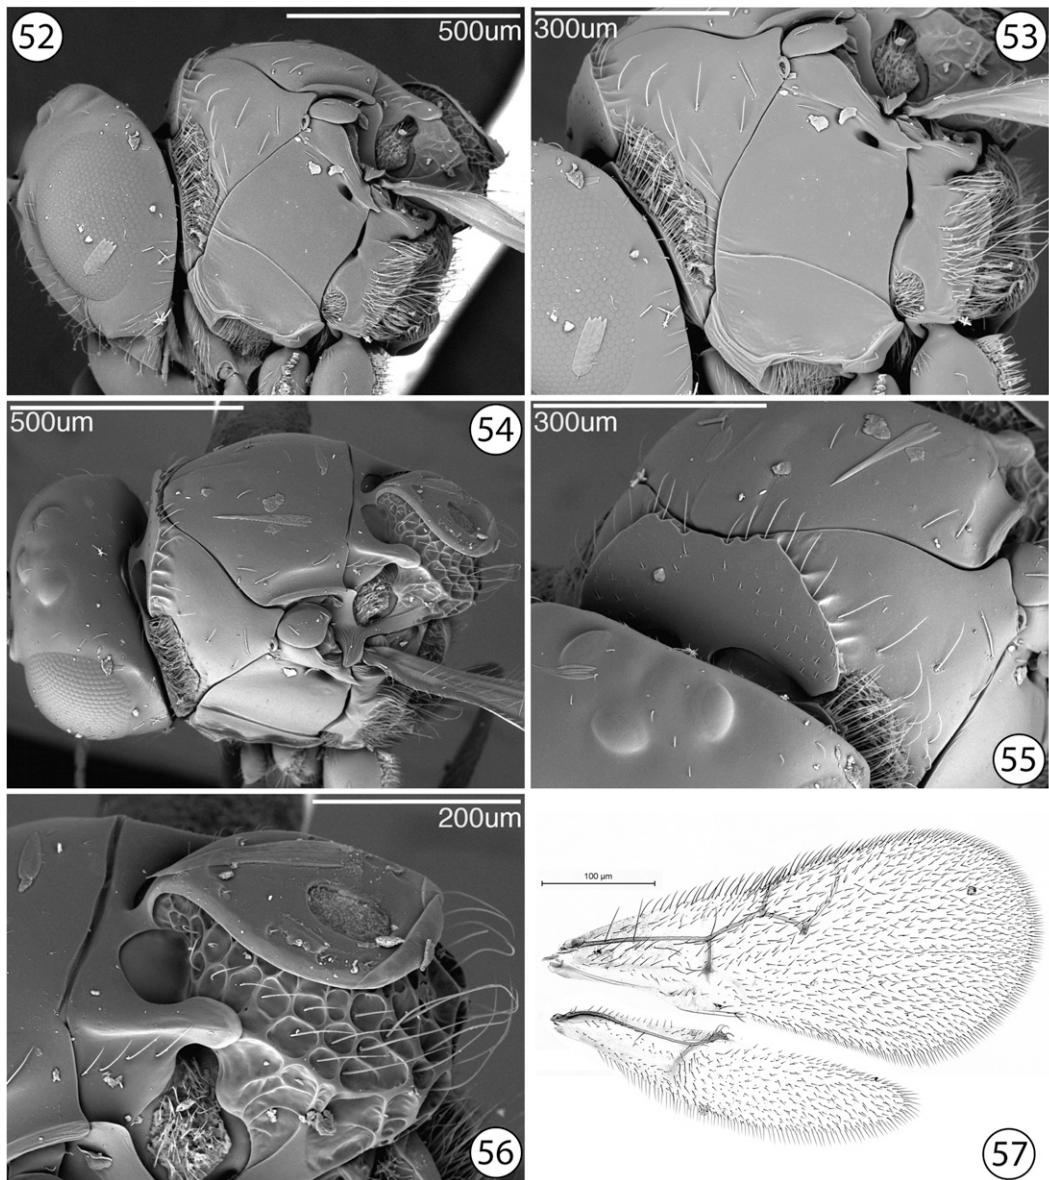

Plate 12, Figs. 52–57. *Zaeucoila lignys*, new species. 52, head and mesosoma, lateral view; 53, mesosoma, lateral view; 54, head and mesosoma, dorso-lateral view; 55, pronotal plate, antero-dorsal view; 56, scutellum, dorso-lateral view; 57, fore and hind wings.

anterior articulation of mandible with distinct pyramidal protuberance, smooth. Malar sulcus present, composed of series of small striae dorsally, leading to single line ventrally. Orbital furrows rounded, ill defined, running from lateral edge of

torulus to ventral margin of compound eye. Dorsal aspect of vertex smooth with a few short, scattered setae. Posterior aspect of vertex smooth with fine setae. Hair punctures on lateral aspect of vertex absent. Placoidal sensilla present

on F 2-11. Pubescence on lateral surface of pronotum present, sparse, with distinct row behind pronotal plate. Ridges extending posteriorly from lateral margin of pronotal plate present, variable, short to medium long, in some cases running to anterior margin of mesoscutum. Sculpture on mesoscutum absent, entire surface smooth, shiny. Median mesoscutal carina variable, present to absent; when present, merely indicated by an outline of the carina, never reaching midline of mesoscutum. Anterior admedial lines present, with adjacent cuticular surface smooth.

Lateroventral mesopleural carina present, marking abrupt change of slope of mesopectus, terminating anteriorly at anterior flange of mesosubpleuron. Mesopleural triangle present, gently impressed with distinct dorsal border, ventral border lacking; smooth. Dorsal surface of scutellum foveate-areolet. Latero-ventral margin of scutellum posterior to auricula deeply foveate. Subalar area slightly broadened anteriorly, without longitudinal division indicated. Pubescence present, medium density, along posterior and ventral margins of metapleuron; short and dense on propodeum. Pubescence of fore wing mesally sparse, gradually becoming denser distally. Coloration of wing variable mesally, ranging from very light blotchy infuscation to restricted infuscation immediately adjacent to the basalis the ventral bulb of basalts; rest of wing hyaline. Hair fringe along apical margin of fore wing present, with particularly longer setae along the mesal anterior margin. Inter propodeal carinae space densely setose, surface smooth.

Diagnosis.—This unusual species has the unique combination of a highly reduced to absent mesoscutal carina, and the possession of a very slight infuscation surrounding the posterior wing veins in the

forewing. This latter character is shared with *Z. unicarinata*, but can be separated from this species by the lack of a mesoscutal carina (present in *Z. unicarinata*).

Etymology.—The name 'lignys' is Greek for smoke, in reference to the condition of wing membrane around and near the wing veins. The name is a noun in apposition.

Biology.—Host not recorded.

Zaeucoila normae Gallardo and Buffington, new species

urn:lsid:zoobank.org:act:E1794018-B48E-4C1F-AE4E-7AEDE95BA25D
http://bioguid.osu.edu/xbiol_concepts/409608

(Figs. 58–63)

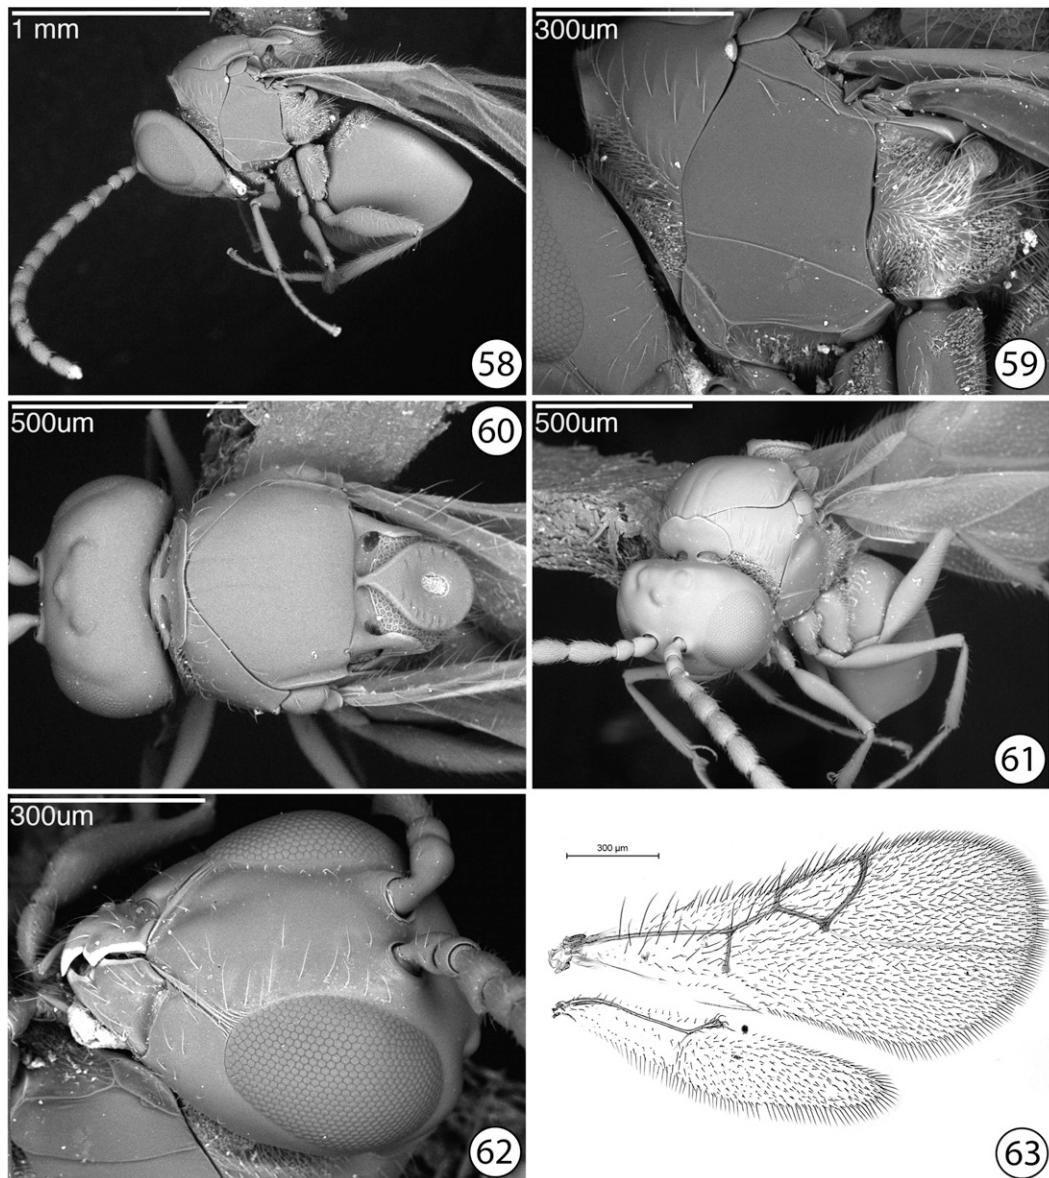

Plate 13, Figs. 58–63. *Zaeucoila normae*, new species. 58, habitus, lateral view; 59, mesopleuron and metapleuron, lateral view; 60, head and mesosoma, dorsal view; 61, habitus, antero-lateral view; 62, head, anterior view; 63, fore and hind wings.

Description.—Coloration with head, mesosoma, metasoma black to dark brown; legs yellow-orange. Lateral margin of occiput defined by evenly rounded, raised, sharp carina. Vertical carina adjacent to ventral margin of

antennal socket absent. Malar space adjacent to anterior articulation of mandible with short, blunt, smooth protuberance. Malar sulcus present, composed of series of small striae dorsally, leading to single line ventrally. Orbital furrows absent.

Dorsal aspect of vertex smooth. Posterior aspect of vertex smooth. Hair punctures on lateral aspect of vertex absent. Placoidal sensilla present on F2-11. Pubescence on lateral surface of pronotum present, sparse, with distinct row behind pronotal plate. Ridges extending posteriorly from lateral margin of pronotal plate absent. Sculpture on mesoscutum absent, entire surface smooth, shiny. Median mesoscutal carina absent. Anterior admedial lines present, with adjacent cuticular surface smooth. Lateroventral mesopleural carina present, marking abrupt change of slope of mesopectus, terminating anteriorly at large, oblique notch. Mesopleural triangle present, gently impressed with distinct dorsal border, ventral border lacking; smooth. Dorsal surface of scutellum foveate-areolet. Latero-ventral margin of scutellum posterior to auricula almost entirely smooth, weakly rugulose dorsally. Subalar area antero-ventrally broadened, excavated, median area smooth with setae. Pubescence long, dense, silvery on metapleuron; long, thin on propodeum. Pubescence of fore wing mesally sparse, gradually becoming denser distally. Coloration of wing absent, entire wing hyaline. Hair fringe along apical margin of fore wing present, with particularly longer setae along the mesal anterior margin. Inter propodeal carinae space moderately setose, with long, thin setae evenly filling the space; surface underneath smooth.

Diagnosis.—Wholly unique amongst *Zaeucoila*, and zaeucoilines in general, by having an entire setose metapleuron. At most, some species will have the latter third of the metapleuron setose, but never the entire sclerite as in *Z. normae*.

Etymology.—Named in honor of the eminent hymenopterist Dr. Norma Díaz of Museo de La Plata, Argentina. Dr. Díaz's research on Neotropical eucoiline

wasps was ahead of its time in the 1970's and 1980's.

Zaeucoila patera Buffington and Gallardo, new species

urn:lsid:zoobank.org:act:FBCA09FF-D2A6-4347-B593-934E375D6EC5
http://bioguid.osu.edu/xbiol_concepts/408249

(Figs. 64-69)

Description.—Coloration with head, mesosoma, metasoma black to dark brown; legs with coxae and femora dark brown, rest yellow. Lateral margin of occiput defined by evenly rounded, raised, sharp carina. Vertical carina adjacent to ventral margin of antennal socket present, leading to shallow inner orbital groove. Malar space adjacent to anterior articulation of mandible with short, blunt, smooth protuberance. Malar sulcus present, composed of series of small striae dorsally, leading to single line ventrally. Orbital furrows rounded, divergent ledges running from antennal sockets to dorsal end of malar sulcus. Dorsal aspect of vertex smooth with a few short, scattered setae. Posterior aspect of vertex smooth. Hair punctures on lateral aspect of vertex absent. Placoidal sensilla present on F 2-11. Pubescence on lateral surface of pronotum

present, sparse, with distinct row behind pronotal plate. Ridges extending posteriorly from lateral margin of pronotal plate absent. Sculpture on mesoscutum absent, entire surface smooth, shiny. Median mesoscutal carina absent. Anterior ad-medial lines absent. Lateroventral mesopleural carina present, marking abrupt change of slope of mesopectus, terminating anteriorly at anterior flange of mesosubpleuron. Mesopleural triangle present, distinctly impressed with distinct dorsal and ventral border, with single, long seta. Dorsal surface of scutellum irregularly rugulose. Latero-ventral margin of scutellum posterior to auricula smooth, with weak longitudinal striae. Subalar area slightly broadened anteriorly, with an indicated longitudinal division. Pubescence consisting of few hairs on posterior part of metapleuron, dense hair on propodeum. Pubescence of fore wing mesally sparse, gradually becoming denser distally. Coloration of wing absent, entire wing hyaline. Hair fringe along apical margin of fore wing present, with particularly longer setae along the mesal anterior margin. Inter propodeal carinae space moderately setose, with long, thin setae evenly filling the space; surface underneath smooth.

Diagnosis.—*Zaeucoila patera* is unique among the species of *Zaeucoila* in the morphology of the scutellar plate when viewed laterally. In all other *Zaeucoila*, the disk of the scutellum is raised distinction above the surface of the mesoscutum; in the case of the *Z. patera*, the disk of the scutellum is distinctly (albeit, slightly) below the surface of the mesoscutum.

Etymology.—Latin for saucer or plate, in reference to the very flat scutellar plate in lateral view. The name is a noun in apposition.

Link to Distribution Map.—[<http://hol.osu.edu/map-full.html?id=408249>]

Material Examined.—Holotype, male: COSTA RICA: Guanacaste Prov., H.3.O, Santa Rosa National Park, 300m, 14.VIII-6.IX.1985, Malaise trap, D. Janzen & I. Gauld, USNM 00993567 (deposited in USNM). Paratype: COSTA RICA: Guanacaste Prov., H.3.O, Santa Rosa National Park, 300m, 14.VIII-6.IX.1985, Malaise trap, D. Janzen & I. Gauld (1 male, USNM 00993572 (USNM)).

Distribution.—Neotropical region: Costa Rica.

Biology.—Host not recorded.

Agrostocynips clavatus Díaz, 1976: 32 (in De Santis et al. 1976) (original description), new synonym.

Zaeucoila enneatoma Díaz, 1975: 1999. new synonym.

Agrostocynips enneatoma (Díaz): Díaz and Gallardo, 1997: 39 (generic transfer)

Ganaspis diastrophi Ashmead 1896: 184–185. new synonym.

Agrostocynips diastrophi (Ashmead): Buffington 2004: 10 (generic transfer); Forshage et al., 2012 (catalogued).

Redescription.—Coloration with head, mesosoma, metasoma black to dark brown; legs variable, ranging from all leg segments entirely orange-yellow to coxae and femora dark brown, rest yellow. Lateral margin of occiput with distinct sharp

carina ventrally, running midway to eye; dorsally absent, margin evenly rounded. Vertical carina adjacent to ventral margin of antennal socket absent. Malar space adjacent to anterior articulation of mandible with distinct pyramidal protuberance,

smooth. Malar sulcus present, composed of series of small striae dorsally, leading to single line ventrally. Orbital furrows absent. Dorsal aspect of vertex smooth with a few short, scattered setae. Posterior aspect of vertex smooth with fine setae. Hair

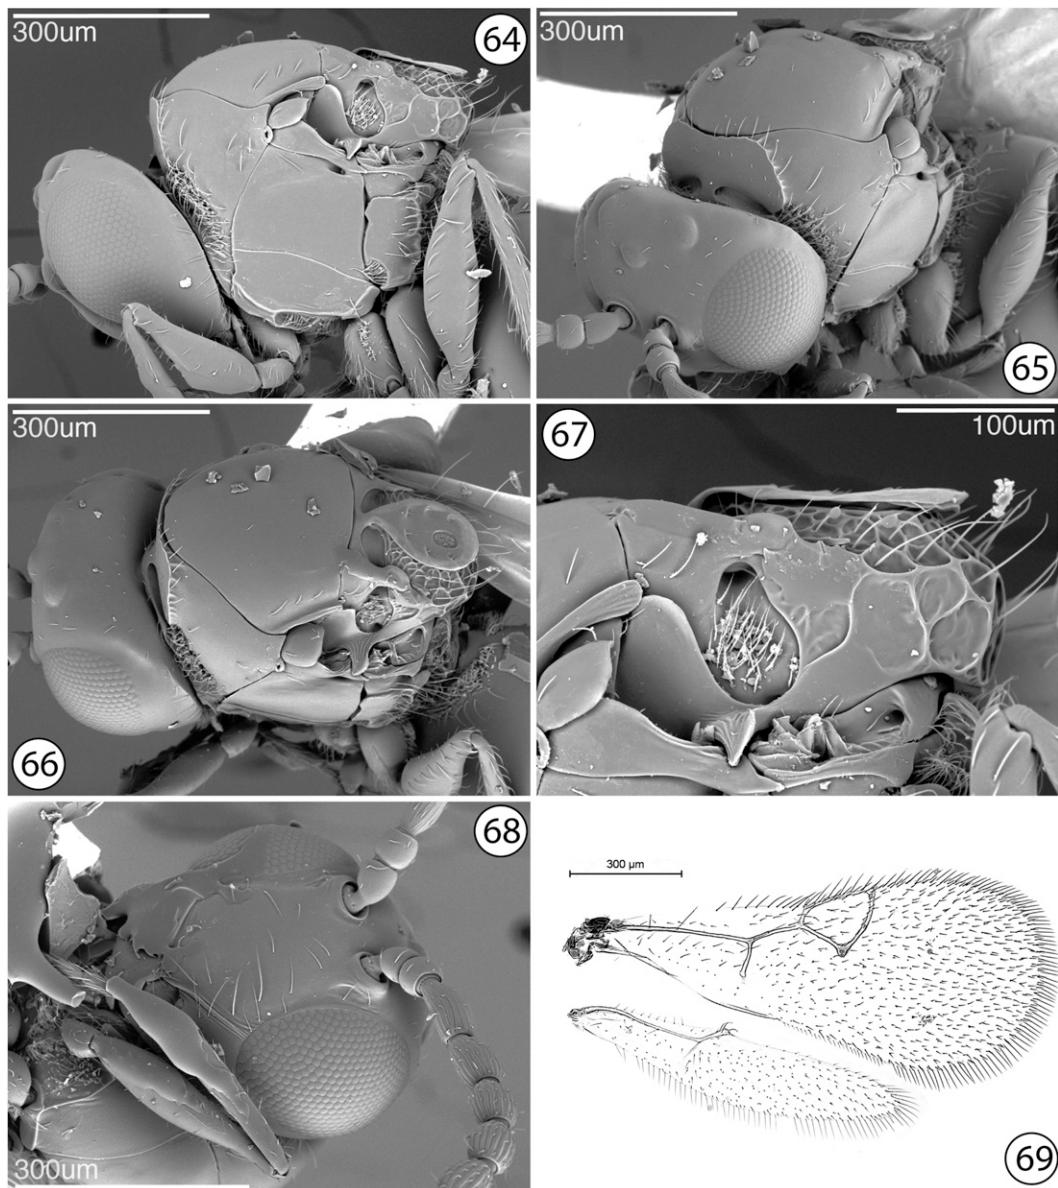

Plate 14, Figs. 64–69. *Zaeucoila patera*, new species. 64, head and mesosoma, lateral view; 65, head and mesosoma, antero-dorsal view; 66, head and mesosoma, dorso-lateral view; 67, scutellum, lateral view; 68, head, antero-lateral view; 69, fore and hind wings.

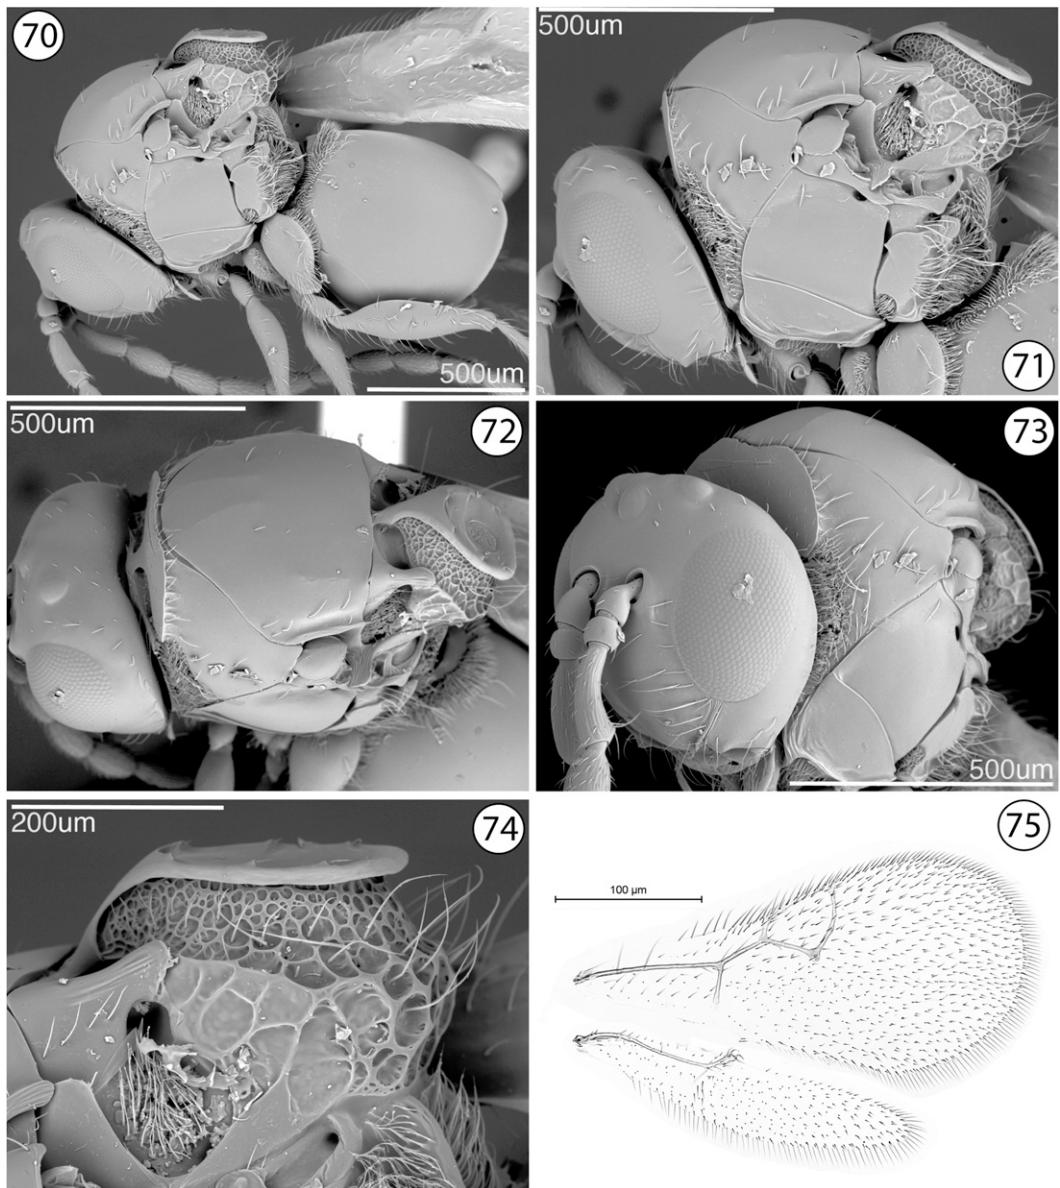

Plate 13, Figs. 70–75. *Zaeucoila robusta* (Ashmead). 70, habitus, lateral view; 71, head and mesosoma, lateral view; 72, head and mesosoma, dorso-lateral view; 73, head and mesosoma, antero-lateral view; 74, scutellum, lateral view; 75, fore and hind wings.

punctures on lateral aspect of vertex absent. Placoidal sensilla present on F 2–11. Pubescence on lateral surface of pronotum present, sparse, with distinct row behind pronotal plate. Ridges extending posteriorly from lateral margin of pronotal plate

distinct but short, not extending to the dorsal margin of pronotum. Sculpture on mesoscutum absent, entire surface smooth, shiny. Median mesoscutal carina variable, present to absent; when present, merely indicated by an outline of the carina, never

reaching midline of mesoscutum. Anterior admedial lines present, with adjacent cuticular surface smooth. Lateroventral mesopleural carina present, marking abrupt change of slope of mesopectus, terminating anteriorly at anterior flange of mesosubpleuron. Mesopleural triangle present, gently impressed with distinct dorsal border, ventral border lacking; smooth. Dorsal surface of scutellum foveate-areolet. Latero-ventral margin of scutellum posterior to auricula deeply foveate. Subalar area slightly broadened anteriorly, with an indicated longitudinal division. Pubescence present, but very sparse, along posterior and ventral margins of metapleuron; short and dense on propodeum. Pubescence of fore wing mesally sparse, gradually becoming denser distally. Coloration of wing absent, entire wing hyaline. Hair fringe along apical margin of fore wing present, with particularly longer setae along the mesal anterior margin. Interpropodeal carinae space smooth with confined setal patch.

Diagnosis.—*Zaeucoila robusta* is the only known species in the genus with an incomplete genal carina. With a specimen in lateral view, the carina is visible from the posterior articulation of the mandible to the midpoint of the compound eye. In all other species, the carina continues clearly beyond the dorsal margin of the eye.

Comments.—Buffington and Scheffer (2008) recognized both *Agrostocynips diastrophi* and *A. robusta* as separate species. With the acquisition of additional specimens in the course of this research, it was determined that *diastrophi* and *robusta* represent opposite ends of a morphological spectrum. Specifically, traps in Kansas and Maryland yielded specimens of both morphotypes, as well as intermediates, in precisely the

same location and over the same span of time. Hence, we recognize *diastrophi* as a junior synonym of *robusta*: **syn. nov.** The same applies to *A. clavatus* **syn. nov.** and *A. enneatoma*: **syn. nov.** This species is one of those clearly belonging in *Zaeucoila* with the revised circumscription, and thus the combination *Zaeucoila robusta* **n.comb.** is made here.

Distribution.—Nearctic Region: Canada, United States and Northeastern Mexico (Buffington and Scheffer 2008). Neotropical region: Argentina, Brazil and St. Vincent (De Santis and Díaz 1975; De Santis et al. 1976). New country records: Anguilla, Chile, Colombia, Costa Rica, Cuba, Dominica, Ecuador, Guadeloupe, Guatemala, Jamaica, Martinique, Mexico, Panama, Peru, Saint Kitts and Nevis, Saint Vincent and The Grenadines and Trinidad and Tobago. New province records for Argentina: Jujuy, Mendoza, Neuquén and Tucuman.

Biology.—Hosts include *Melanagromyza cunctanoides* Blanchard (De Santis et al. 1976) and *Liriomyza huidobrensis* (Blanchard) (Díaz and Valladares 1979).

Zaeucoila trianguligera Kieffer

http://bioguid.osu.edu/xbiol_concepts/399055

(Figs. 76–81)

Zaeucoila trianguligera Kieffer, 1907: 91 (original description); Buffington, 2009: 185 (listed, host association).

Zaeucoila triangulifera (incorrect subsequent spelling) Kieffer: Díaz and Gallardo, 1997: 39 (description).

Redescription.—Coloration with head, mesosoma, metasoma black to dark brown; legs with coxae and femora dark brown, rest yellow. Lateral margin of occiput defined by distinctly angled, raised, sharp carina. Vertical carina

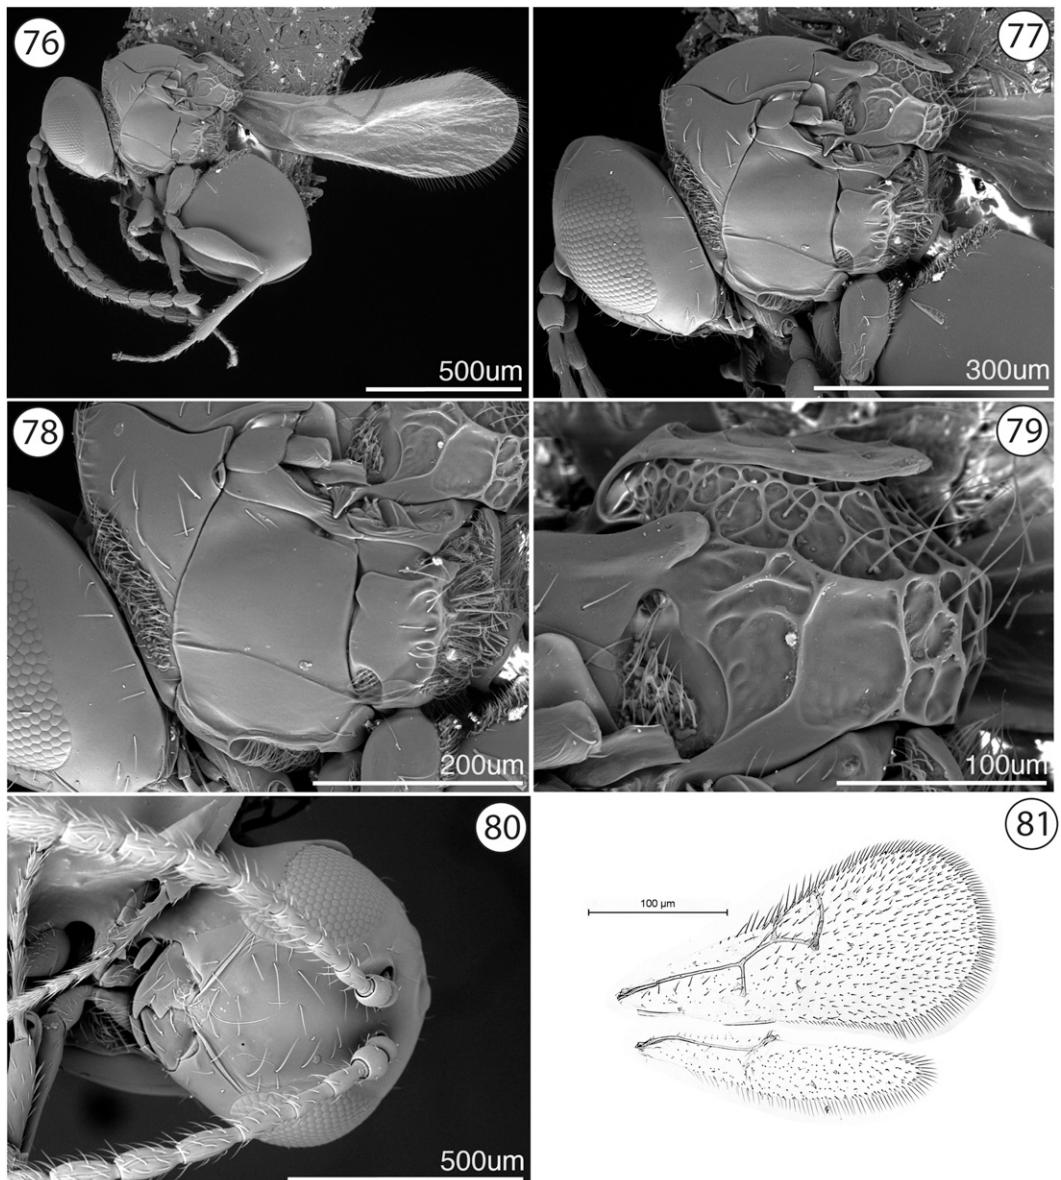

Plate 14, Figs. 76–81. *Zaeucoila trianguligera* Kieffer. 76, habitus, lateral view; 77, head and mesosoma, lateral view; 78, mesosoma, lateral view; 79, scutellum, lateral view; 80, head, anterior view; 81, fore and hind wings.

adjacent to ventral margin of antennal socket present, leading to shallow inner orbital groove. Malar space adjacent to anterior articulation of mandible evenly rounded, smooth. Malar sulcus present, composed of single line. Orbital

furrows rounded, ill defined, running from lateral edge of torulus to ventral margin of compound eye. Dorsal aspect of vertex smooth with a few short, scattered setae. Posterior aspect of vertex smooth. Hair punctures on lateral aspect

of vertex absent. Placoidal sensilla present on F3-11. Pubescence on lateral surface of pronotum present, sparse, consisting of few short hairs. Ridges extending posteriorly from lateral margin of pronotal plate distinct but short, not extending to the dorsal margin of pronotum. Sculpture on mesoscutum absent, entire surface smooth, shiny. Median mesoscutal carina present, composed of anteriorly broad elevation, narrowing posteriorly, ending before midline of mesoscutum. Anterior admedial lines present, in conjunction with mesoscutal carina. Lateroventral mesopleural carina present, marking abrupt change of slope of mesopectus, terminating anteriorly at large, oblique notch. Mesopleural triangle present, gently impressed with distinct dorsal border, ventral border lacking; smooth. Dorsal surface of scutellum foveate-areolet. Latero-ventral margin of scutellum posterior to auricula smooth ventrally, weakly rugulose dorsally. Subalar area abruptly broadened anteriorly, with an indicated longitudinal division. Pubescence present, but very sparse, along posterior and ventral margins of metapleuron; short and dense on propodeum. Pubescence of fore wing mesally sparse, gradually becoming denser distally. Coloration of wing absent, entire wing hyaline. Hair fringe along apical margin of fore wing present, with particularly longer setae along the mesal anterior margin. Interpropodeal carinae space moderately setose, with long, thin setae evenly filling the space; surface underneath smooth.

Diagnosis.—Due to the reduced state of the mesoscutellar carina, this species is most readily confused with *Z. robusta*. The clearest character for separating these species is the extent of the genal carina: in *Z. triangulifera*, complete, reaching the dorsal margin of the compound

eye; in *Z. robusta*, reduced, only reaching the middle of the compound eye. Lighting is critical to see this character. Lastly, *Z. robusta* is known from North America north of Mexico, and *Z. triangulifera* is not.

Distribution.—Neotropical region: Argentina, Brazil, Nicaragua and Panama (Kieffer 1907; Díaz and Gallardo 1997; Fontal and Nieves-Aldrey 2004; Marchiori et al. 2004). New state record for Brazil: Rio de Janeiro.

Biology.—Recorded hosts include *Liriomyza* sp. on *Lactuca sativa* L., *Amauromyza maculosa* (Malloch) and *Agromyza fusca* Spencer (in Buffington 2009). *Calycomyza* sp. is reported here as a new agromyzid host record (based on label data).

***Zaeucoila unicarinata* Ashmead**

http://bioguid.osu.edu/xbiol_concepts/387823

(Figs. 82–87)

Zaeucoila unicarinata Ashmead: Dalla Torre and Kieffer, 1910: 103 (description); Weld, 1921: 445–446 (original description); Díaz and Gallardo, 1997: 38 (description); Buffington, 2009: 185 (listed).

Redescription.—Coloration with head, mesosoma, metasoma black to dark brown; legs yellow-orange. Lateral margin of occiput defined by scalloped, sharp carina. Vertical carina adjacent to ventral margin of antennal socket present, leading to deep inner orbital groove. Malar space adjacent to anterior articulation of mandible with distinct pyramidal protuberance, smooth. Malar sulcus present, composed of series of

small striae dorsally, leading to single line ventrally. Orbital furrows rounded, divergent ledges running from antennal sockets to dorsal end of malar sulcus. Dorsal aspect of vertex smooth. Posterior aspect of vertex smooth. Hair punctures on lateral aspect of vertex absent. Placoidal sensilla present on F 2–11. Pubescence on lateral surface of pronotum present, sparse, with distinct row behind pronotal plate. Ridges extending posteriorly from lateral margin of pronotal plate present, variable, short to medium long, in some cases running to anterior margin of mesoscutum. Sculpture on mesoscutum absent, entire surface smooth, shiny. Median mesoscutal carina present, composed of anteriorly broad elevation, narrowing posteriorly, ending at midline of mesoscutum. Anterior admedial lines present, in conjunction with mesoscutal carina. Lateroventral mesopleural carina present, marking abrupt change of slope of mesopectus, terminating anteriorly at large, oblique notch. Mesopleural triangle present, gently impressed with distinct dorsal border, ventral border lacking; smooth. Dorsal surface of scutellum laterally with distinct ridges radiating from plate, posteriorly with deep fovea and ridges. Latero-ventral margin of scutellum posterior to auricula deeply foveate. Subalar area slightly broadened anteriorly, with an indicated longitudinal division. Pubescence consisting of few hairs on posterior part of metapleuron, dense hair on propodeum. Pubescence of fore wing mesally sparse, gradually becoming denser distally. Coloration of wing variable mesally, ranging from very light blotchy infuscation to restricted infuscation immediately adjacent to the basalis the ventral bulb of basalts; rest of wing hyaline. Hair fringe along apical margin of fore wing present, with particularly longer setae along the

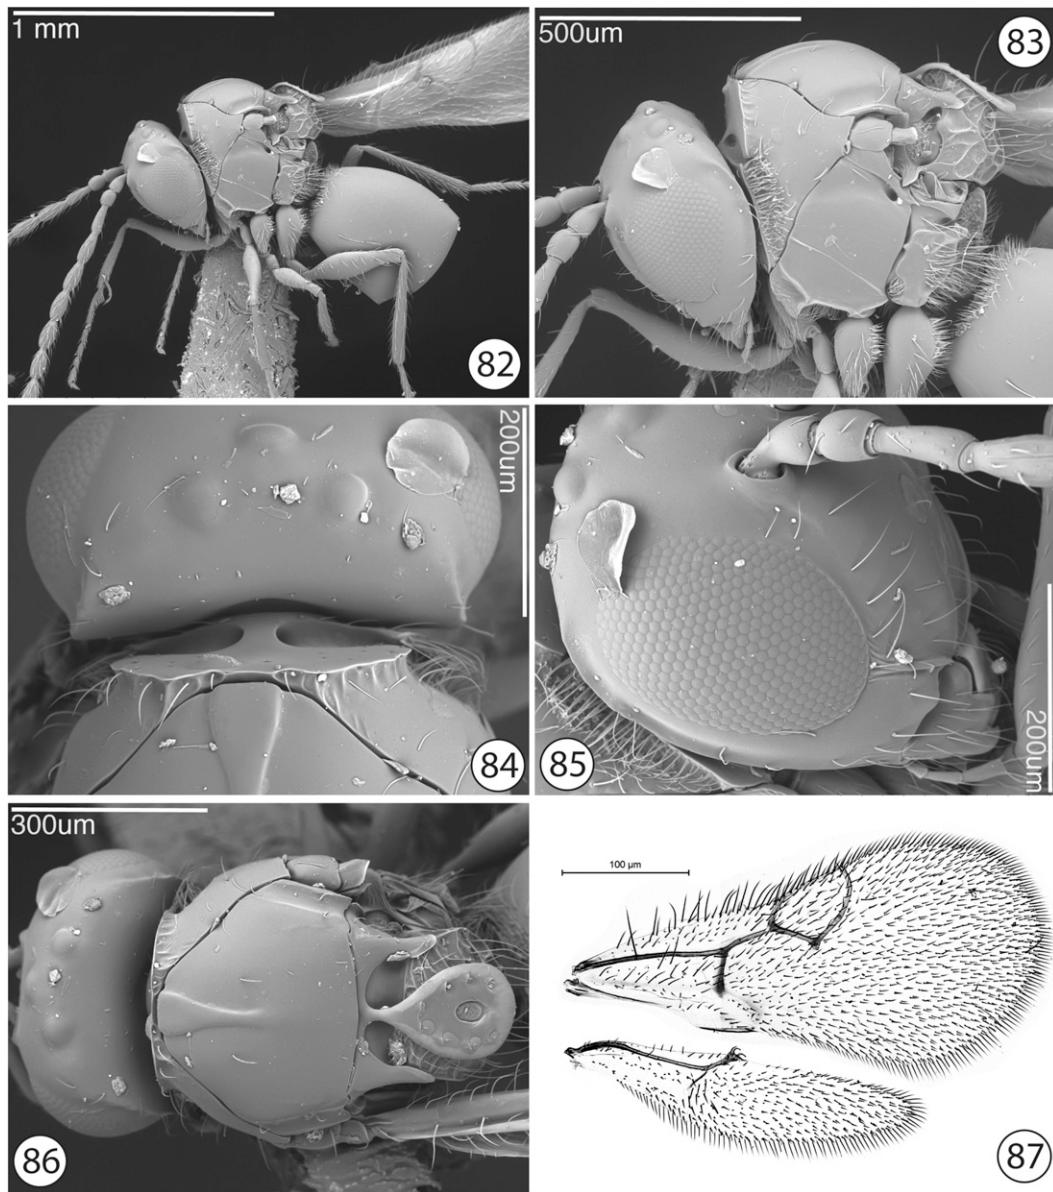

Plate 15, Figs. 82–87. *Zaeucoila unicarinata* Ashmead. 74, habitus, lateral view; 75, head and mesosoma, dorso-lateral view; 76, head and mesosoma, antero-dorsal view; 77, scutellum, dorso-lateral view; 78, head, antero-lateral view; 79, fore and hind wings.

mesal anterior margin. Inter propodeal carinae space densely setose.

Diagnosis.—The distinctly scalloped genal carina of the head, and complete and readily visible mesoscutal carina of the mesoscutum, separate this species from *Z.*

lignys, which is the species *Z. unicarinata* is most readily confused with. Some *Z. flavipes* look similar to *Z. unicarinata*, but in *Z. flavipes*, the two pairs of hairs are distinctly long, and the only hairs present on the mesoscutum; in *Z. unicarinata*, if

Fig. 88. Distribution map of *Zaeucoila* species.

there are paired hairs, they are not very long and are typically present with other hairs.

VENEZUELA: Zulia St., 51km SW Machiques, Los Angeles del Tucuco, 1.VI-24.VI.1983, E. Inciarte (1 female, USNMENT01223585 (MALUZ)).

Distribution.—Neotropical region: Argentina, Brazil, and Panama, (Ashmead 1903a, Díaz and Gallardo 1997, Fontal and Nieves-Aldrey 2004, Gallardo and Dughetti 2013). New country record for Costa Rica and Venezuela; new state record for Brazil: Goias.

Biology.—Recorded hosts include *Liriomyza sativa* Blanchard on *Cucumis sativus* L. (Lorini and Foerster 1985), *Liriomyza* sp. on *Allium cepa* L. (Gallardo and Dughetti 2013).

CONCLUSION

The geographic distribution of *Zaeucoila* as circumscribed now range from southern Canada to the north, through Central and South America, and to Patagonia in Argentina, thus expanding the general distribution of Zaeucoilini further south than previously recorded (Buffington 2009). This is not surprising given the number of specimens examined in this study; additional studies on other zaeucoiline genera may indeed expand the general distribution of the tribe even further. A striking apparent distribution ‘hole’ is Brazil, as specimens from this country were difficult to obtain for this study. It is likely *Zaeucoila* species are present throughout Brazil, and there are also likely undescribed species awaiting discovery. Interestingly, *Zaeucoila* is the

only zaeucoiline genus that is commonly observed in North America north of Mexico. Buffington (2009), treating the North American species of *Zaeucoila* under *Agrostocynips*, speculated that agromyzid hosts in North America are dominated by diglyphosematine Eucoiliinae, the putative sister-group of Zaeucoiliinae. A follow up divergence analysis by Buffington et al. (2015) suggested the zaeucoiline lineage is much younger than the diglyphosematine lineage, and speculate that Zaeucoiliinae emerged within the Neotropical Region, with a single species (*Z. robusta*) able to carve out niche in North America. Future research may yield how these two major lineages of eucoilines intermingle in central and northern Mexico, and possibly how the two lineages avoid competing for similar (or identical) hosts.

The new country and provinces/states records given in this paper for previously described species are the following: for *Zaeucoila grenadensis*: Brazil, Ecuador, and Peru; for *Z. incompleta*: Belize, Bolivia, Colombia, Costa Rica, Dominica, Dominican Republic, Ecuador, El Salvador, Guadeloupe, Guatemala, Guyana, Honduras, Mexico, Nicaragua, Peru, Puerto Rico, Saint Vincent and the Grenadines and Trinidad and Tobago; new province records for Argentina: Buenos Aires, Cordoba, Salta and Tucuman; new state records for Brazil: Minas Gerais, Rio de Janeiro and Sao Paulo; *Zaeucoila robusta*: Anguilla, Chile, Colombia, Costa Rica, Cuba, Dominica, Ecuador, Guadeloupe, Guatemala, Jamaica, Martinique, Mexico, Panama, Peru, Saint Kitts and Nevis, Saint Vincent and The Grenadines and Trinidad and Tobago; new province records for Argentina: Jujuy, Mendoza, Neuquén and Tucuman; for *Z. triangulifera*: new state record for Brazil: Rio de Janeiro; for *Z. unicarinata*: Costa Rica and Venezuela; new state record for Brazil: Goias.

Nearctic species of *Zaeucoila* have been reared from agromyzids in *Agromyza* Fallén on *Panicum* L. (Poaceae), *Liriomyza huidobrensis* on commercial *Capsicum* (Buffington, pers. obsv.) and *Phytomyza* Fallén on *Ilex cassine* L. and *Ilex myrtifolia* Walter (Buffington 2009). Neotropical species of this genus have been recorded from *Liriomyza*, *Melanagromyza*, *Nemorimyza* Frey, *Amauromyza* Hendel, *Agromyza* Fallén and *Calycomyza* Hendel. The new hosts records given in this paper are the following for *Zaeucoila grenadensis*: *Calycomyza hipitidis* Spencer, *Calycomyza servilis* Spencer, *Calycomyza eupatorivora* Spencer, and an unidentified *Calycomyza* species; for *Zaeucoila incompleta*: *Calycomyza servilis* and *Liriomyza huidobrensis*; for *Z. trianguligera*: an undescribed species of *Calycomyza*. As many species of agromyzids are considered pestiferous, we hope this treatment of *Zaeucoila* will aid in endeavors focused on natural control of these pests.

ACKNOWLEDGMENTS

The authors wish to thank J. M. Maes, C. Marchiori and R. Monteiro for the donation of specimens. We would also like to thank the curators at all of the lending institutions listed under the Materials and Methods, especially Bob Zuparko (CASC), Doug Yanega (UCRC) and David Nottan (NHM), all of whom extended loans for this project. We also extend our gratitude to Taina Litwak (Systematic Entomology Laboratory, ARS-USDA) for the amazing digital painting of *Zaeucoila robusta* in Figure 1. Dr. Norm Johnson (The Ohio State University), Sara Hemly (The Ohio State University) and Elijah Talamas (Systematic Entomology Laboratory, ARS-USDA) helped immensely in the data management for this project through vSyslab. Morgan Rondonali (intern,

Smithsonian Institution) and Elizabeth Roberts (Systematic Entomology Laboratory, ARS-USDA) carefully and efficiently databased most of the specimens used in this study. Smithsonian Institution interns Emily Fisher, Corrinne Cusick, Lauren McDevitt, and Matthew Johnson helped with the massive effort of mounting and labeling many of the specimens used in this study. Part of this study was supported by Comisión de Investigaciones Científicas de la Provincia de Buenos Aires (CIC) and Universidad Nacional de La Plata (UNLP). MLB was supported by the Systematic Entomology Laboratory, ARS-USDA. We also thank two anonymous reviewers for improving this manuscript. Mention of trade names or commercial products in this publication is solely for the purpose of providing specific information and does not imply recommendation or endorsement by the USDA. USDA is an equal opportunity provider and employer.
